INTRODUCTION AND SUMMARY OF FINDINGS

Study Purpose

This Traffic Impact Analysis was prepared to address the proposed development of the "south side" of the New Carrollton Metro Station located in Prince George's County, Maryland. This property has development proposed along the north and south sides of the track, both of which are within close proximity to the Metro Station/Marc Station/Amtrak Station Tracks.

Study Criteria/Methodology

This Traffic Impact Analysis was prepared in accordance with the requirements outlined by the Maryland-National Capital Park and Planning Commission (M-NCPPC) and in coordination with WMATA and the Maryland State Highway Administration (SHA). The parameters for this traffic study were established in an approved Traffic Impact Study Scoping Agreement executed with M-NCPPC. A copy of this agreement is contained in Appendix A of this report.

Exhibit 1A was prepared to show the location of the subject property and the intersections that were determined to be critical to this analysis. It should be noted that Mainline I-495, Mainline MD-410, and Mainline US 50 were not studied or analyzed as part of this report.

Scope of Services

The following is the scope of work undertaken in this analysis.

- Review of the AECOM Traffic Study prepared for WMATA.
- Preparation and submittal of a Scoping Letter dated May 4, 2016 to M-NCPPC outlining trip distribution and trip generation and the suggested study area for the proposed study.
- Utilization of the trip distributions established in the AECOM Study for the background development that was contained in the AECOM Study for the south side of the New Carrollton Metro Station.
- Review of M-NCPPC's PG's Atlas information for background developments planned in the vicinity of the subject site.

- Trip Generation Rates and Totals used by both M-NCPPC and AECOM for the Transit Overlay District (TOD).

- Conduct Capacity Analysis utilizing the Critical Lane Volume Technology detailed by the M-NCPPC Guidelines.

- Conduct a Vissim simulation and evaluation of the study area roadways.

Summary of Findings and Recommendations

The following sections of this report will outline the methodology used to undertake this traffic study as well as the results and recommendations resulting from the analysis.

The methodology used to undertake this study is contained in the sections to follow.

EXISTING TRAFFIC CONDITIONS

Study Area

Exhibit 2 has been prepared to show the study area and each of the 15 intersections that have been included as part of this Traffic Impact Evaluation. Shown on Exhibit 2 is the existing lane use at each of these study area intersections as well as the existing traffic control that exists at each location.

Existing Traffic Volumes

Intersection Turning Movement Counts were conducted at all the study area intersections in May 2016 while schools were in session. The total vehicles observed during these counts are shown on the summary sheets contained in Appendix A to this report. The 2016 existing peak hour traffic volumes are shown on Exhibit 3.

Analysis of Existing Traffic Conditions

Intersection Capacity Analyses were conducted using the CLV Methodology for each of the study area intersections, and the results are shown on Exhibit 14. A review of Exhibit 14 indicates that all of the study area intersections are projected to operate at acceptable Levels of Service "C" or better under the existing the traffic conditions. Copies of the capacity worksheets are contained in Appendix B.

BACKGROUND TRAFFIC CONDITIONS

Design Year 2026

For the purposes of this report, it has been assumed that the proposed development planned for the subject site will occur over a ten-year period. In order to determine the base traffic conditions in the Year 2026, we have increased the existing peak hour volumes determined by the turning movement counts to reflect a .5% growth per year for a 10-year period. The incremental increase associated with this growth is shown on Exhibit 4.

The incremental growth over the next 10 years was combined with the existing peak hour traffic volumes resulting in the 2026 base peak hour volumes shown on Exhibit 5.

Nearby Approved Developments

In addition to regional growth, traffic projected to be generated by other approved developments planned in the vicinity of the subject site was also included in our analysis and the formation of the background traffic conditions.

Based on information obtained from other studies for the Garden City Project, as well as, the proposed development planned on the north side of the New Carrollton Station, we have prepared Exhibit 6 which shows the location of these two planned developments in this area.

Exhibit 7 was prepared to show the approved trip generation rates and total trips projected to be generated by each of these developments which were previously used in the earlier studies. The peak hour trips projected to be generated by these other nearby developments were then distributed and assigned to the adjacent road system as shown on the exhibits contained in Appendix C to this report. The combined peak hour trips generated by these developments are reflected on Exhibit 8.

Combining the trips to be generated by the other approved developments and the 2026 base peak hour volumes results in the 2026 background peak hour volumes shown on Exhibit 9A.

Analysis of Background Traffic Conditions

Intersection Capacity Analyses were conducted for the background peak hour traffic conditions, and the results are shown on Exhibit 14. Copies of the Capacity Worksheets are contained in Appendix B to this report.

A review of Exhibit 14 indicated that all of the study area intersections are projected to operate at an acceptable level of service “C” or better during both of the peak periods.

NEW CARROLLTON METRO STATION

Site Information

The New Carrollton TOD is planned to be developed with a variety of uses on the subject site. The following is a list of the total development planned on the site.

- 265 High-Rise Apartments
- 1,045 Mid-Rise Apartments
- 1,125,000 Sq Ft of Office Space
- 155,000 Sq Ft of Retail Space
- 180 Hotel Rooms

The breakdown of the development is shown on Exhibit 11.

Trip Generation/Distribution

In order to establish the peak hour trips projected to be generated by each of the proposed uses on the subject site, we have consulted the *M-NCPPC Trip Generation Guidelines* and the *Institute of Transportation Engineers Trip Generation Report (9th Edition)* to prepare Exhibit 10 which shows the peak hour trip generation rate projected to be generated by each of the uses planned on the subject site.

Exhibit 11 was prepared to show the peak hour trips projected to be generated by Buildings 1 through 11 planned on the subject site. The peak hour trips projected to be generated by the subject site were then distributed and assigned to the road system based on the information contained in Appendix D. Combining the trip assignments for each of the buildings results in the total trip assignments shown on Exhibit 12.

Combining the trip assignments for the subject site with the 2026 peak hour volumes results in the 2026 total peak hour traffic volumes shown on Exhibit 13..

Analysis of Total Traffic Conditions

Intersection Capacity Analyses were conducted for each of the study area intersections based on the 2026 total peak hour volumes, and the results are shown on Exhibit 14.

A review of Exhibit 14 indicates that using the CLV Methodology shows that all the study area intersections are projected to operate at acceptable Levels of Service “D” or better during the peak periods.

The CLV Methodology is an analysis methodology required by Prince George’s County to determine whether sufficient capacity exists at an intersection. Other methodologies exist which evaluate the road network in more detail based on operational concerns. For the purposes of this analysis, it was requested that the Vissim software program be used to develop a traffic simulation model based on the Year 2030 conditions, along Garden City Drive to determine whether sufficient storage space is available for turning vehicles based on a future development, and whether any operational concerns are identified.

We have conducted the analysis for the 2030 conditions, and the worksheets and results of this analysis are contained in Appendix E. A review of the results of the analysis using the Vissim software indicates that as with the results of the CLV Analysis, all of the intersections are projected to operate at acceptable levels of service. However, this analysis was based on projected 2030 volumes which indicated that two intersections should be considered for alternative improvements to address potential operational issues beyond the buildout of the site. These intersections are as follows:

- Garden City Drive and Corporate Drive
- Garden City Drive and Parking Access

Exhibit 15 has been prepared to show the alternate lane use which could be considered at these locations to avoid the potential for operational issues in the Year 2030 or beyond. We have rerun the analysis of the 2026 volumes using the CLV Methodology with these improvements, and the results are shown on Exhibit 14 under each of the intersections listed above on the line “alternate lane use.” A review of Exhibit 14 indicates that in addition to addressing the operational issues, these improvements would also enhance the capacity levels available at both locations.

Trip Generation Rates

RESULTS, RECOMMENDATIONS, AND CONCLUSIONS

Study Purpose

This Traffic Impact Analysis was prepared to address the proposed development of the "south side" of the New Carrollton Metro Station located in Prince George's County, Maryland. This property has development proposed along the north and south sides of the track, both of which are within close proximity to the Metro Station/Marc Station/Amtrak Station Tracks.

Study Criteria/Methodology

This Traffic Impact Analysis was prepared in accordance with the requirements outlined by the Maryland-National Capital Park and Planning Commission (M-NCPPC) and in coordination with WMATA and the Maryland State Highway Administration (SHA). The parameters for this traffic study were established in an approved Traffic Impact Study Scoping Agreement executed with M-NCPPC. A copy of this agreement is contained in Appendix A of this report.

Exhibit 1A was prepared to show the location of the subject property and the intersections that were determined to be critical to this analysis. It should be noted that Mainline I-495, Mainline MD-410, and Mainline US 50 were not studied or analyzed as part of this report.

Summary of Findings and Recommendations

The results of this analysis have indicated that the road network is capable of supporting the traffic projected to be generated by this site. Two intersection improvements have been recommended which will enhance traffic operations, however, are not needed for capacity reasons.

Intersection Turning Movement Counts,

and Photos

Figure 1: Traffic Impact Study Scoping Agreement, Pages 1 & 2

The Maryland-National Capital Park and Planning Commission
Prince George's County Planning Department
Transportation Planning Section, Countywide Planning Commission

This form must be completed prior to commencing a Traffic Impact Study (TIS). The completed and signed Scoping Agreement should be submitted to the Transportation Planning Section (TPS) by the traffic consultant for concurrence and signature. TPS will return a signed copy, with any comments, to the traffic consultant for inclusion in the TIS. Failure to conduct the study in accordance with the guidelines and the signed Scoping Agreement may be grounds for rejection of the study, thereby necessitating an addendum or a new study prior to the start of the staff review.

Is a cooperative funding arrangement (such as a SCRP, PFFIP, or some other pro rata) to be used? (circle one)	(Yes) POSSIBLY		No		If Yes, please provide explanation on seperate sheet, and note limitations in Section 3, Subsection E.
Will summer counts be used? (circle one)	Yes		(No)		The use of summer counts must have specific concurrence of TPS staff.
Have there been discussions with the permitting agency (DPW&T and/or SHA) regarding access to this site and the analysis requirements? (circle one)	(Yes)		No		Section 1, Subsection E strongly advises that these discussions occur early in the development review process. Note that driveway access onto arterial facilities must be justified and approved by the Planning Board as a part of the subdivision process.
Has a listing of background development been developed? (circle one)	Yes	NOT LIKELY ON SOUTH SIDE	(No)		If Yes, please provide the list so that TPS staff may either concur with it or provide changes.
Have the costs and feasibility of potential off-site transportation improvements been evaluated? (circle one)	Yes		(No)		If No, bear in mind that Section 3, Subsection D requires that ANY recommended physical off-site improvements include an evaluation of feasibility.

SIGNED: WES GICKERT — 5.4.16
Traffic Consultant — Date

APPROVED: Thomas H. Haller — 5/20/16
TPS Coordinator (or Supervisor) — Date

This form is not required for sites that do not require a TIS.

THE MARYLAND-NATIONAL CAPITAL PARK AND PLANNING COMMISSION

Prince George's County Planning Department **(301) 952-3680**
Countywide Planning Division, Transportation Planning Section **www.mncppc.org**

Scoping Agreement Notes

Site: **New Carrollton Station**
Firm: **The Traffic Group**

I 'll agree to the scope in general with the following comments/changes:

1. Based on the trip distribution provided, I would agree to the study area and the intersections under study.

2. Please note that links within the study area could become critical.

3. I would determine that the trip generation computations appear to have been done in general conformance with the "Transportation Review Guidelines, Part 1."

4. Notwithstanding the comment in 3 above, it is noted that a 30 percent credit for TOD has been assumed in the computations. While the credit is permissible to utilize in the study, the actual development will need to demonstrate strong conformance to the generally-accepted principles of transit-oriented development urban form. Be advised that the use of the credit will grant us leverage to require changes to plans or, in cases where plans cannot be amended to justify the credit, a revised traffic study using a lesser credit.

5. Please note that the study must conform to the new "Transportation Review Guidelines, Part 1."

6. Please remember that the feasibility of any recommendations must be reviewed, and if any recommendation will require the acquisition of property from a third party, the study must attest "that the applicant has or can obtain the necessary right-of-way."

7. Our submittal requirements have changed. Please note the guidance at the end of this document.

8. Provision of these written comments, dated January 28, 2013, by Thomas G. Masog, Planner Coordinator in the Transportation Planning Section of the Prince George's County Planning Department, shall be determined to constitute a signature approval of the final scoping. The initial Scoping Agreement plus these comments shall be included in the traffic study that is ultimately submitted in support of a development application. The Scoping Agreement combined with these comments shall be valid through January 28, 2014.

Traffic Studies: The primary means of submitting a TIS shall be an electronic file in Portable Document Format (PDF). Two hardcopies (one for the case file and one for the TPS staff person) plus a disc containing the electronic file will be provided to the Applications Section of the Development Review Division (DRD) for the official submittal. In submitting electronic files, the following shall be noted:

- Pictures and mapping should be readable, and need not be scanned or provided at the highest possible resolution. In many cases, 100 dots per inch (dpi) will be readable, and 300 dpi should generally be the maximum resolution used.
- The submitted file containing the report and the needed appendices must be 10 megabytes (MBs) or smaller in order to be sent electronically as an email attachment. Larger documents, items that are graphics-intensive, or large documents of a high resolution should consider strategies to make the document manageable, including the following:
  - Providing multiple files of 10 MBs or less each.
  - Providing either the file(s) or large figures within the study as a compressed (zip) file.

Both the hardcopies and the PDF must be received before acceptance review of a study can commence. All submittals of a TIS or other traffic data for the record must be made via DRD. Every TIS received by DRD staff is immediately logged and forwarded to TPS staff.

Trip Generation Details &

Trips Assignment for

Subject Site

4.1.1.2 Trip Generation

The 'Guidelines for the Analysis of the Traffic Impact of Development Proposals', proposed by the Maryland-National Capital Park and Planning Commission (MNCPPC), was used as a guideline to estimate the hourly traffic volumes generated from the proposed development at the New Carrollton Metro Station. The ITE Trip Generation Manual 9th Edition was used as a supplementary guideline to estimate the trip generation for land use not documented in the MNCPPC Guidelines.

Table 5 shows the land use type and trip generation rates/equations used to estimate total generated trips. Table 6 shows the calculated site-generated trips for each land use type. Please note the total site-generated trips shown in Table 6 include all the trips made by transit, vehicle, and walk/bike. Column "In" shows entering trips and column "Out" shows exiting trips. The internal trips, pass-by trips and trips made by transit and walk/bike will be subtracted from Table 6 to calculate the hourly vehicular trips, which will be discussed in detailed in the following sections.

Table 5: Land Use Type and Trip Generation Rates/Equations

Use	Land Use Type	Source	Feature	Rate/ Equations (AM)[2]	In/Out Rate (AM)	Rate/ Equations (PM)[2]	In/Out Rate (PM)
Office (≤108k)[1]	General Office Building	MNCPPC Guideline	150K SF	$2.0 \times Area$	90%/10%	$1.85 \times Area$	19%/81%
Office (>108k)[1]	General Office Building	ITE	700K SF	$Exp(0.8 \times Ln(Area+1.57)$	88%/12%	$1.12 \times Area + 78.45$	17%/83%
Res.	Apartments (garden and mid-rise)	MNCPPC Guideline	1,080 Units	$0.52 \times Unit$	19%/81%	$0.6 \times Unit$	65%/35%
Retail	Specialty Retail Center	ITE	140K SF	$3.25 \times Area$	48%/52%	$2.71 \times Area$	44%/56%
Hotel	Hotel	ITE	150 Rooms	$0.53 \times Room$	58%/42%	$0.6 \times Room$	51%/49%

Notes:

1. M-NCPPC Guidelines notes "office aggregations greater than 108,000 square feet should use the fitted curve for 'general office building' in the ITE Trip Generation Manual with in/out distributions."

Table 6: Site-Generated Total Trips (including Various Modes)

Land Use	AM			PM		
	Total Trips	In	Out	Total Trips	In	Out
Office	1,425	1,259	166	1,296	227	1,069
Residential	456	220	236	380	168	212
Retail	606	115	491	700	456	244
Hotel	80	46	34	90	46	44
Total	2,567	1,640	927	2,466	897	1,569

4.1.1.3 Internal Trips

Internal trips are the trips made within the development area. Internal trips have been removed from the total generated trips (shown in Table 6) to estimate the total external trips – the trips generated from the outside of the development site. The 'NCHRP Report 684 – Enhancing Internal Trip Capture Estimation for Mixed- Use Development' was used to estimate internal trips for the proposed development at the New Carrollton station. The methodology presented in the NCHRP report is an improvement to the internal trip estimation process provided in the ITE Trip Generation Handbook. This enhanced method

expands the internal trip estimation to cover both AM and PM peak periods, including six land uses typically found at mixed use developments and takes into account the proximity of interacting land uses.

Table 7 shows the internal trip rates of each land use pair presented in NCHPR Report 684. Table 8 shows the total estimated internal and external trips for the proposed developments. Please note the external trips include transit, vehicle and walk/bike trips.

Table 7: Internal Trip Rates (source: NCHRP Report 684 – Table 105 and 106)

4.1.1.4 Mode Share

The external trips were divided into transit, vehicle and walk/bike trips by defining the mode share of the development. The vehicle trips were used for the traffic analysis. The study used the data from the '2005 Development-Related Ridership Survey', conducted by WMATA. The 2005 Survey studies the mode share of office, residential, hotel and retail trips near Metrorail stations in the Washington D.C. metropolitan area. Table 9 shows the average mode share of the studied Metro stations in the 2005 Survey within the ¼ mile of walking distance to the Metro station by land use. Future development at the New Carrollton Metro Station is assumed the same mode share as shown in Table 9. Table 10 shows the hourly entering and exiting vehicular trips generated from the development (excluding retail trips). Please

note the retail trips shown in Table 10 include the pass-by trips. The following section will discuss the estimation of retail pass-by trips.

Table 9: Mode Share in 2005 Survey and Assumed for New Carrollton Metro Station

	Transit	Auto	Walk/Bike
Office Trips	35%	61%	4%
Retail Trips	36%	31%	33%
Residential Trips	48%	41%	11%
Hotel Trips	36%	25%	39%

Table 10: Entering and Exiting Vehicular Trips excluding Transit and Walk/Bike Trips

Land Use	AM		PM	
	In	Out	In	Out
Office	716	73	130	633
Retail	51	57	42	45
Residential	46	195	157	87
Hotel	12	1	8	10
Total	**813**	**325**	**329**	**765**

4.1.1.5 Pass-by Trips

Pass-by trips are those of the existing trips on the adjacent roadway and are drawn from adjacent streets to the retail stores in the development site. Therefore, pass-by trips are not newly generated trips and they should be removed from entering and exiting trips of retail shown in Table 10.

Prince George's County's "Transportation Review Guidelines" indicates 40% of pass-by trips to the retail during the PM peak hour. It is assumed that during the AM peak hour the percentage of pass-by trips is identical to the percentage during the PM peak hour. Table 11 shows the pass-by trips and generated vehicular trips of the retail stores at the Metro Core of the New Carrollton Metro Station.

Table 11: Pass-by and Generated Retail Trips

Grocery/Retail	AM		PM	
	In	Out	In	Out
Pass-by Trips	22	22	17	17
Generated Retail Trips	29	35	25	28

Table 12 presents a summary of trip generation results, including internal trips, non-auto trips, pass-by trips and net new trips generated within the new developments at the Metro Core of New Carrollton Metro Station.

Table 12: Summary of Trip Generation Calculation

	AM			PM		
	Total	In	Out	Total	In	Out
Office Generated	1,425	1,259	166	1,296	227	1,069
(Internal)	132	86	46	45	14	31
(Non-auto)	504	457	47	488	83	405

Total Net New Trips (Hourly)	**1,108**	**803**	**304**	**1,077**	**320**	**758**

4.1.1.6 Trip Distribution

The Prince George's County's "Transportation Review Guidelines" suggests using the existing traffic distribution as a guidance to determine the distribution of the generated trips from the development. Figure 7 shows distribution of existing arrival/departure trips to/from the Metro station area during the AM and PM peak hour, from four major roadways connecting to the Metro station area. The total numbers of entering and exiting trips to/from the Metro station area are distributed on near-by roadways based on the distribution rate which is proportional to the existing turning movement counts at each intersection.

Figure 7: Trip Distribution

4.1.2 Adjustment of Park & Ride Trips

The existing WMATA surface parking lots A and B and MTA surface parking lot will be displaced by the future development, and vehicles currently using these facilities will use new parking facilities at Landover Metro Station, which is about 2 miles west of the New Carrollton Metro Station. Thus approximately 360 hourly arrival Park & Ride trips in the AM and 320 hourly departure vehicles in the PM will be removed from the study area in the future.

As an alternative scenario, WMATA proposed to provide 575 Park & Ride spaces within the future new parking garage serving building 4 and 5 (in the northwest corner of the development area). Traffic analysis for this alternative Park & Ride scenario is documented in Appendix C.

4.1.3 Other Development

New development in Garden City and improvements of the Metro Yard will also generate new trips and impose traffic impacts on the east side of the New Carrollton Metro Station. Figure 8 shows the development site of Garden City and Metro Yard. The methodology to estimate the background traffic and the trip generation results are discussed in the following sections.

EVENING PEAK HOUR TRAFFIC		
1. Garden City Dr & Corporate Dr	B/15.1	B/15.5
2. Garden City Dr & Metrostation	A/2.6	B/15.8
3. Garden City Dr & SHA Parking	A/6.8 *	A/7.4
4. Garden City Dr & US 50 Offramp	B/14.1 *	A/9.7
5. Garden City Dr & County Parking	B/11.9 *	n/a
6. Garden City Dr & new Kaiser Rd	n/a	B/17.5

NOTE:

1. An * indicates worst movement delay at an unsignalized intersection.

2. Intersections 1 and 2 are signalized under Existing condition, and all are signalized under 2030 Total condition.

3. Total Traffic is derived from combining Existing Traffic, growth, nearby projects and subject site.

RESULTS OF INTERSECTION CAPACITY ANALYSIS (VISSIM)

QUEUING ANALYSIS (VISSIM)

(Average Queue/Maximum Queue) in feet

	EXISTING	2030 TOTAL
MORNING PEAK HOUR TRAFFIC		
1. Garden City Dr & Corporate Dr		
NB LT on Garden City Dr	16/111	13/112
SB LT on Garden City Dr	27/406	31/348
WB on Corporate Dr	22/139	66/371
EB from Garages	1/34	1/32
2. Garden City Dr & Metrostation		
NB LT on Garden City Dr	11/170	52/188
3. Garden City Dr & SHA Parking		
WB exiting Parking Lot	0/26	13/113
4. Garden City Dr & US 50 Offramp

APPENDIX C:

Approved 2013 Natural Resources Inventory Plan

NEW CARROLLTON

NATURAL RESOURCE INVENTORY PLAN

GENERAL NOTES:

1. THIS SITE IS ZONED M-X-T AND IS LOCATED IN THE DEVELOPED TIER AS DEFINED IN THE APPROVED GENERAL PLAN.
2. THE SOURCE OF THE PROPERTY BOUNDARIES ON THIS PLAN IS FROM A BOUNDARY SURVEY COMPLETED BY LOIEDERMAN SOLTESZ ASSOCIATES.
3. THE TOPOGRAPHY SHOWN WAS AERIALLY FLOWN IN BY VIRGINIA RESOURCE MAPPING ON 01/30/2012.
4. THE SOURCE OF THE SOILS INFORMATION ON THIS PLAN IS FROM THE USDA NRCS WEB SOIL SURVEY (WSS) IN A CUSTOM SOIL RESOURCE REPORT FOR AN AREA OF INTEREST (AOI) ESTABLISHED FOR THE SUBJECT SITE ONLY AND GENERATED ON APRIL 30, 2012.
5. 100 YEAR FLOODPLAIN IS FROM A FLOODPLAIN STUDY DONE BY GREENHORNE & O'MARA, INC., DATED DECEMBER 17, 1991.
6. THE WETLAND AND STREAM INFORMATION ON THIS PLAN IS FROM A STUDY PREPARED BY TERRA CONSULTANTS, INC., IN A STUDY DATED APRIL 30, 2012.
7. THIS SITE DOES NOT CONTAIN WETLANDS OF SPECIAL STATE CONCERN AS DEFINED IN COMAR 26.23.06.01.
8. THIS SITE DOES NOT CONTAIN A TIER II WATER BODY AS DEFINED IN COMAR 26.08.02.04.
9. THIS SITE IS NOT LOCATED WITHIN A STRONGHOLD WATERSHED AS ESTABLISHED BY THE MD DNR.
10. IN A LETTER DATED APRIL 2, 2012 WILDLIFE AND HERITAGE SERVICE, MD DNR, INDICATES THAT THERE IS NO RECORD OF RARE, THREATENED, OR ENDANGERED SPECIES ON SITE.
11. THE SITE DOES NOT INCLUDE FOREST INTERIOR DWELLING SPECIES HABITAT.
12. THE SITE IS NOT SUBJECT TO A PREVIOUSLY APPROVED TCP.
13. THERE ARE NO SPECIMEN, CHAMPION AND/OR HISTORIC TREES LOCATED ON THE PROPERTY.
14. THERE ARE NO SCENIC ROADS ON OR ADJACENT TO THIS PROPERTY.
15. THE SUBJECT PROPERTY IS NOT LOCATED WITHIN A REGISTERED HISTORIC DISTRICT.
16. THERE ARE NO KNOWN ARCHEOLOGICAL SITES LOCATED ON THE SUBJECT PROPERTY
17. MARLBORO CLAY AND CHRISTIANA CLAY ARE NOT FOUND TO OCCUR ON OR WITHIN THE IMMEDIATE VICINITY OF THIS PROPERTY.
18. THE SITE IS LOCATED IN THE VICINITY OF A MASTERPLANNED ROADWAY DESIGNATED AS A FREEWAY (JOHN HANSON HIGHWAY (US ROUTE 50)).
19. THE SUBJECT PROPERTY IS NOT LOCATED WITHIN THE 65-80 DBA NOISE CONTOURS AS FOUND IN THE 2008 AIR INSTALLATION COMPATIBLE USE ZONE (AICUZ) STUDY FOR ANDREWS AIR FORCE BASE.
20. THE SITE IS NOT LOCATED WITHIN AN AVIATION POLICY AREA (APA).
21. THE SITE IS NOT LOCATED WITHIN THE CHESAPEAKE BAY CRITICAL AREA (CBCA).
22. AN APPROVED NRI IS VALID FOR FIVE YEARS FROM THE DATE OF SIGNATURE BY STAFF, OR UNTIL INFORMATION USED TO PREPARE THE NRI CHANGES. NRIS WILL BE REQUIRED TO BE REVISED AND RE-APPROVED IF THE BASE INFORMATION CHANGES SIGNIFICANTLY. APPROVAL OF THIS NRI IN NO WAY IMPARTS ANY OTHER DEVELOPMENT APPLICATION APPROVALS.
23. THE SITE IS LOCATED WITHIN A PRIORITY FUNDING AREA

FOREST STAND NARRATIVE

The Maryland Forest Conservation Act of 1991 requires that a full Forest Stand Delineation must be prepared for development projects that impact 40,000 square feet or larger. This project encompasses several parcels, most of which are already partially to fully developed as part of the existing transit and parking facilities. The Parcels south of the tracks abut Garden City Drive, Corporate Drive and Route 50. The Parcels to the north side of the tracks abut and may be accessed from Ellin Road. Access to the southern parcels may be gained from Garden City Drive, a Route 50 Access ramp-Pennsy Drive and Corporate Drive. The total area of the Parcels is 39.18 acres.

The Site parcels include:

AREA #1 4.56 ACRES
P/O Parcel 122 which is in two portions divided by Pennsy Drive.

AREA #2 10.06 ACRES
P/O Parcel 122 which is in two portions divided by Pennsy Drive.

PENNSY DRIVE 1.17 ACRES
P/O Parcel 122 which is the roadbed and future r/w dedication area.

AREA #3 7.47 ACRES
Parcel A which has 2 tax accounts.

AREA #4 8.03 ACRES
Parcel B directly southwest of the westbound New Carrollton Station, Washington Mass Transit Authority.

AREA #5 7.89 ACRES
Parcels northwest of the tracks consisting of Parcels 220, 12, 55, 14-21(not 8 separate parcels, 14-21 is a description of one parcel), and Lots 10 – 27.

METHODOLOGY
This office investigated the site on two dates, in March and April. It was determined that there were few areas of actual woodland with canopy, understory, shrub and ground layer and that these were small and not configured in a way that 0.10ac sample plots could be executed. A vegetation description was prepared of each zone and each Parcel with individual trees notes and labeled.

OVERALL: These parcels are for the most part developed or highly disturbed areas, with poor soils and high concentrations of invasive species. Large areas are paved parking areas. There is a wetland complex running through the parcels. (See Wetlands Report). There is no evidence of rare, endangered or threatened species, in fact there is little evidence of many types of wildlife. There are areas of steeps slopes. Some songbirds, such as Mockingbird and Sparrows were apparent. There is a beaver dam on Area #2 and some Canada Geese.

AREA #1 FOREST STAND AND VEGETATION SUMMARY
Forest Stand A, Mature Bradford Pear 28,400sf or 0.65ac
Forest Stand B White Poplar, two stands; 2,800sf and 1,880sf: total 4,680sf or 0.10ac
The remainder of the site is non-wooded .
TOTAL AREA: 4.56ac
TOTAL WOODED AREA: 0.75ac or 16.5% of the site

AREA #2 FOREST STAND AND VEGETATION SUMMARY
Forest Stand A, Mature Bradford Pear; Three stands, 2,700sf or 0.06ac, 17,450sf or 0.40ac and 2,100sf or 0.05ac: Total 0.51ac.
Forest Stand C, Ailanthus -Box Elder; 19,180sf or 0.44ac.
Forest Stand D, Red Maple - BoxElder-Lowland; 14,260sf or 0.33ac
Forest Stand E, Red Maple-BoxElder-upland; 4,600sf or 0.11ac
The remainder of site is non wooded.
TOTAL AREA: 10.06ac
TOTAL WOODED AREA: 1.39ac or 13.8% of the site

PENNSY DRIVE FOREST STAND AND VEGETATION SUMMARY
TOTAL AREA: 1.17ac
TOTAL WOODED AREA: 0 ac or 0%

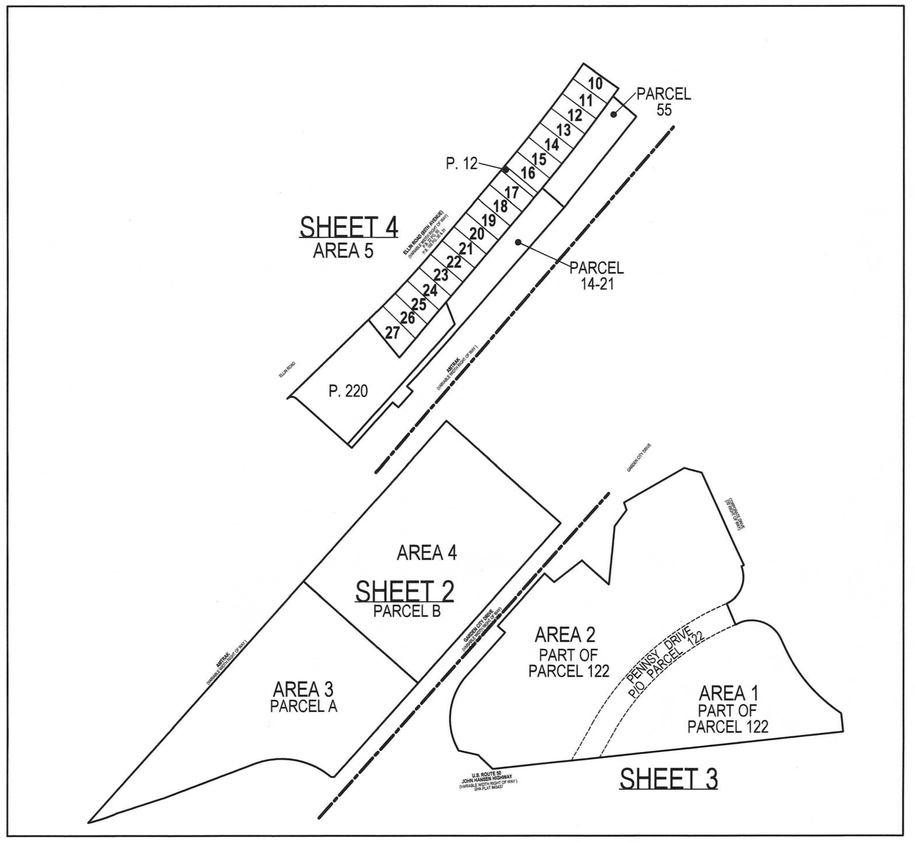
AREA #3 FOREST STAND AND VEGETATION SUMMARY
Forest Stand A, Mature Bradford Pear 1,800sf or 0.04ac
Forest Stand C, Ailanthus; 2,030sf or 0.05ac.
Forest Stand F, Red Maple; 1,000sf on site or 0.02ac
Forest Stand G, Sweet Gum; 18,800sf or 0.43ac

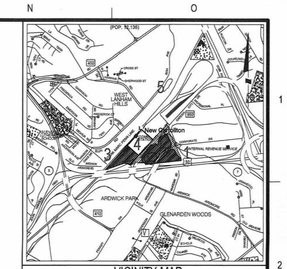
TOTAL AREA: 7.48ac
TOTAL WOODED AREA: 0.54ac or 7.2% of the site

AREA #4 FOREST STAND AND VEGETATION SUMMARY
TOTAL AREA: 8.03 ac
TOTAL WOODED AREA: 0ac or 0%

AREA #5 FOREST STAND AND VEGETATION SUMMARY
TOTAL AREA: 7.89ac
TOTAL WOODED AREA: 0 ac or 0%

TOTAL OF ALL SITE AREAS: 39.18 ac
TOTAL WOODED AREA FOR ALL PARCELS: 2.68ac or 6.8%





SHEET INDEX

SOILS
Soils are from Web Soil Survey of Prince George's County, Maryland

Historic Preservation/Archeology Pre-Submittal Checklist for Development Applications

Project Name: New Carrollton

Applicant's Name: New Carrollton Developer, LLC

Application Type: Preliminary Plan

Project Number (if applicable): PPS 4-16023

Contact/Agent: SOLTESZ, LLC

Phone/Fax: 301-794-7555

E-mail Address: (Young Roh)yroh@solteszco.com

Associated/Previous Project Numbers:

- Provide photographs of all standing structures or structural remains, such as foundations or man-made landscape features, on the property.
- Provide chain of title information on the property to at least 1900.
- Provide a list and location of any known historic resources or cemeteries on or adjacent to the property.

To be completed by Historic Preservation Section staff.

Required Information	Yes	No	N/A	Requirement for this Applicant
Photographs of all structures or structural remains			✓	If checked Yes or N/A, no further information needed.
Chain of title			✓	If checked Yes or N/A, no further information needed.
List of known historic resources and cemeteries			✓	If checked Yes or N/A, no further information needed.

Additional Information Required: This proposal will not affect any historic sites or resources or known archeological sites. Phase I archeology survey will not be recommended.

Online Certification Letter

Today's date: _____

Project: New Carrollton Development

Dear Applicant for online certification:

Thank you for using the U.S. Fish and Wildlife Service (Service) Chesapeake Bay Field Office online project review process. By printing this letter in conjunction with your project review package, you are certifying that you have completed the online project review process for the referenced project in accordance with all instructions provided, using the best available information to reach your conclusions. This letter, and the enclosed project review package, completes the review of your project in accordance with the Endangered Species Act of 1973 (16 U.S.C. 1531-1544, 87 Stat. 884), as amended (ESA).This letter also provides information for your project review under the National Environmental Policy Act of 1969 (P.L. 91-190, 42 U.S.C. 4321-4347, 83 Stat. 852), as amended. A copy of this letter and the project review package must be submitted to this office for this certification to be valid. This letter and the project review package will be maintained in our records.

Based on this information and in accordance with section 7 of the Endangered Species Act (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.), we certify that except for occasional transient individuals, no federally proposed or listed endangered or threatened species are known to exist within the project area. Therefore, no Biological Assessment or further section 7 consultation with the U.S. Fish and Wildlife Service is required. Should project plans change, or if additional information on the distribution of listed or proposed species becomes available, this determination may be reconsidered.

This response relates only to federally protected threatened or endangered species under our jurisdiction. For additional information on threatened or endangered species in Maryland, you should contact the Maryland Wildlife and Heritage Division at (410) 260-8573. For information in Delaware you should contact the Delaware Division of Fish and Wildlife, Wildlife Species Conservation and Research Program at (302) 735-8658. For information in the District of Columbia, you should contact the National Park Service at (202) 339-8309.

The U.S. Fish and Wildlife Service also works with other Federal agencies and states to minimize loss of wetlands, reduce impacts to fish and migratory birds, including bald eagles, and restore habitat for wildlife. Information on these conservation issues and how development projects can avoid affecting these resources can be found on our website (www.fws.gov/chesapeakebay)

We appreciate the opportunity to provide information relative to fish and wildlife issues, and thank you for your interest in these resources. If you have any questions or need further assistance, please contact Chesapeake Bay Field Office Threatened and Endangered Species program at (410) 573-4527.

Sincerely,

Genevieve LaRouche
Field Supervisor

7735 Old Georgetown Road, Suite 600
Bethesda, Maryland 20814

Reference: New Carrollton Metro Site
Vibration Analysis Results
Project No. UAD1601

Dear Mr. Lederman:

Phoenix Noise & Vibration has conducted an analysis of ground-borne vibration levels at the New Carrollton Metro Site in Prince George's County, Maryland. This was an analysis of vibration levels generated by Metro, Amtrak, Acela, MARC, and freight trains as measured under current site conditions, evaluated according to typically accepted levels for non-residential and residential building occupancy.

Under the current conceptual site plan design, ground-borne vibration levels generated by usage of the existing rail lines are in compliance with Federal Transit Administration guidelines for railway vibration impact upon residential and non-residential buildings. Furthermore, while an occasional train may generate vibration which is "feelable" within a building and, depending upon the sensitivity of the individual, perceived as annoying by a small percentage of building occupants, the vibration levels at the site will not result in structural damage.

SITE DESCRIPTION

Under the current conceptual site plan, the New Carrollton Metro site will include new development on both the north and south of the existing rail lines which serve the New Carrollton Metro Station and Amtrak/MARC station. The New Carrollton train stations include five railway tracks: three tracks used by Amtrak, Amtrak Acela, and MARC commuter trains and CSX and Norfolk & Southern freight trains, and two tracks used only by Metro trains. The New Carrollton Metro station is the last stop on the Orange line.

The current conceptual site plan (see enclosed Drawing 1) includes residential, hotel, office, and retail buildings. Table 1 presents the proposed building uses closest to both sets of railway tracks.

Table 1: New Carrollton Metro Site proposed building layout relative to existing railway tracks.

Railway Track	Closest Building Use to Railway Track	Approximate Distance (feet) to Closest Track
Amtrak/MARC/Freight	Residential/Retail	110
	Office/Retail	110
Metro	Residential/Retail	140
	Office/Retail	25

VIBRATION IMPACT CRITERIA

Prince George's County does not currently have a limit for ground-borne vibration levels as measured in residential, hotel, office, or retail structures; therefore the measured ground-borne vibration levels have been evaluated according to the Federal Transit Administration's (FTA) *Transit Noise and Vibration Impact Assessment* (May 2006). Table 8-1 of this document (enclosed, along with FTA Land Use Category definitions) specifies impact levels for various building types. The impact levels for ground-borne vibration applicable to the building uses proposed for the New Carrollton Metro site are shown in Table 2.

Table 2: Ground-borne vibration impact criteria for general assessment of various buildings.

Land Use Category	Event Type	Number of Vibration Events (per day)	GBV Impact Levels (VdB re 1 micro-inch/sec)
Category 2: Residences and buildings where people normally sleep.	Frequent	> 70	72
	Occasional	30 - 70	75
	Infrequent	< 30	80
Category 3: Institutional land uses with primarily daytime use.	Frequent	> 70	75
	Occasional	30 - 70	78
	Infrequent	< 30	83

These impact levels apply to frequencies from 8 to 80 Hz and are intended to be applied to vibration events lasting less than 10 seconds, such as those typical of commuter rail transit systems (Amtrak, MARC, and Metro trains); however, since no specific impact criteria exist for freight trains, these same impact levels may also be used for freight trains.[1] For a building to be considered impacted by ground-borne vibration, it must experience the number of vibration events within the table at a level equal to or greater than the presented impact level for that event type. For example, for a residential building, a "frequent" event type must have at least 70 vibration events within a day at a level equal to or greater than 72 VdB (re 1 micro-inch/sec) to be considered vibration impact upon a residential building.

[1] See Section 8.1.3: Application to Freight Trains, Page 8-5 of FTA's *Transit Noise and Vibration Impact Assessment* (May 2006).

It should be noted that the FTA describes a ground-borne vibration level of 72 VdB subjectively as "not feelable, but ground-borne vibration may be audible inside quiet rooms." Additionally, a level of 65 VdB is the threshold for human perception and subjectively characterized as "barely perceptible" by most people, while 75 VdB is the level at which the majority of people consider vibration "distinctly perceptible."[2]

The vibration impact criteria outlined in the FTA document are not necessarily standardized limits, but rather "a good foundation for predicting annoyance from ground-borne noise and vibration in residential areas as well as interference with vibration-sensitive activities." Furthermore, these are not values which produce any kind of structural damage, as the vibration levels required to do so are much higher.

As the FTA states that "it is extremely rare for vibration from train operations to cause any sort of building damage, even minor cosmetic damage," the limits shown in Table 2 are the ground-borne vibration levels which have been found to correlate well in predicting the threshold at which the majority of people exposed to that level will result in "human annoyance."

VIBRATION MEASUREMENTS

Phoenix Noise & Vibration conducted two 24-hour on-site vibration measurements to determine existing ground-borne railway vibration levels at the properties directly adjacent to the New Carrollton train stations. Measurements were made using PCB low noise accelerometers and a Sinus Harmonie multichannel frequency analyzer coupled with a laptop computer. All accelerometers were calibrated prior to the survey traceable to National Institute of Standards and Technology (NIST). Accelerometers were magnetically mounted on 18-inch steel spikes driven into the ground approximately 16 inches at each measurement location. The steel spikes were used to provide adequate coupling to the ground-borne vibration.

Vibration measurements were made at the four locations shown on enclosed Drawing 1. Measurement locations where chosen to represent those proposed buildings closest to the two sets of railway tracks under the current conceptual site plan. Ground-borne vibration levels at each location were measured in the vertical direction (z-axis). Each of the four accelerometers recorded the maximum amplitude (i.e. highest vibration level) generated over the duration of a railway event. At each location, a vibration threshold was set so that data was only recorded if a railway event exceeded that threshold. The threshold level was set such that vibration generated by a railway event would exceed the level, yet other events typical of the surroundings (e.g. people walking, cars driving in the parking lot, etc.) would not.

Vibration measurement results are summarized in Table 3 and presented graphically on enclosed Figures 1 through 4. Given that the sites are adjacent to commuter rail lines with vibration "events" (i.e. a train passing the site) easily exceeding 70 in a 24-hour period (note the number of recorded vibration events in Table 3), the more restrictive FTA "frequent" vibration impact criteria has been used to evaluate the measured ground-borne vibration levels.

[2] *Transit Noise and Vibration Impact Assessment* (May 2006), Chapter 7: Basic Ground-Borne Vibration Concepts.

Recall that to have vibration impact upon a building when there are at least 70 vibration events in a 24-hour period ("frequent" criteria), there must be at least 70 vibration events which exceed the criteria level (72 VdB for residential, 75 VdB for non-residential). Note that at Point A there were 42 train events which exceeded the non-residential level, well below the 70 required for vibration impact. At Points B and C, no train events exceeded either vibration criteria, while at Point D one train event exceeded both vibration criteria.

Table 3: New Carrollton Metro Site measured ground-borne vibration levels relative to FTA criteria.

Vibration Measurement Location	Measurement Date	Number of Vibration Events Recorded in 24-Hour Period	Number of Vibration Events Which Exceeded FTA "Frequent" Criteria Level		Vibration Impact According to FTA Criteria
			Residential (72 VdB)	Non-Residential (75 VdB)	
A	July 6 – 7, 2016	277	N/A	42	No
B			0	0	No
C			0	0	No
D	June 29 – 30, 2016	144	1	1	No

Also note on Figures 1 through 4 that all measured vibration levels are well below the threshold for even minor cosmetic damage in fragile buildings (100 VdB),[3] including those generated by the very few train events which resulted in the highest measured levels near 80 VdB at Points A and D. It is important to note that this is the threshold for minor cosmetic damage, not structural damage, which occurs at a much higher level of ground-borne vibration.

PURPLE LINE

The Purple Line is a light rail public transit system proposed to open in 2022 which will extend 16 miles between New Carrollton in Prince George's County and Bethesda in Montgomery County, providing connections between Metro stations throughout the area. The New Carrollton Purple Line station will be the end of the line, and located north of the existing Amtrak/MARC station which divides the two sections of the New Carrolton Metro Site development (shown on enclosed Drawing 1). The currently shown office and residential buildings on this portion of the site will be north of the Purple Line station and approximately 30 feet from the section of track that extends past the station. It is assumed this section of track is more of a storage yard (similar to the Metro storage yard across the racks for the end of the Orange Line) rather than track that will have trains traveling on it at speed.

Projected vibration impact from the Purple Line was addressed in the Final Environmental Impact Statement (FEIS),[4] which calculated vibration levels at various locations along the rail line. The closest location to the New Carrollton Metro Site for which the FEIS calculated a

[3] According to Figure 7-3: Typical Levels of Ground-Borne Vibration of FTA's *Transit Noise and Vibration Impact Assessment* (May 2006).

[4] Entitled *Vibration Technical Report*, dated August 2013. Developed by Environmental Acoustics, Inc.

Purple Line vibration level is 4100 Hanson Oaks Drive, approximately 2,300 feet east of the New Carrollton Purple Line station as measured along the tracks. The FEIS projected a vibration level of 65 VdB (frequency not specified) at this location, which is approximately 110 feet from the track centerline. The vibration level projected at 4100 Hanson Oaks Drive cannot be used to accurately determine the expected vibration at the New Carrollton Metro Site due to the difference in track use between the two locations (active section of the future track versus a storage yard).

Since the Purple Line is not yet constructed, the vibration level at the site from the rail line cannot be measured; however given that the section of track closest to the New Carrollton Metro Site development is past the station, it is assumed that the vibration output would be low relative to the vibration generated by the other existing rail lines, such that while the Purple Line may generate vibration near the New Carrollton station, it will not be at a level which will be above the vibration produced by the existing activity on the Amtrak/MARC/freight and Metro lines. This is supported by the projected vibration level calculated at the closest location included in the FEIS (65 VdB at 110 feet from the centerline). Furthermore, the Purple Line is a light rail system, with trains which should generate much lower levels of vibration than the existing and heavier Amtrak, MARC, and freight trains.

CONCLUSION

Ground-borne vibration levels at the existing New Carrollton Metro Site due to the existing rail lines are well below the "frequent" events FTA criteria for vibration impact upon residential and non-residential buildings. Existing vibration levels will not result in structural damage; however an occasional train may generate vibration levels which may cause slight annoyance due to "feelable" vibration within the building. Since this is a subjective evaluation, the level of annoyance experienced will depend highly upon the tolerance of each individual; i.e. one resident may object to the vibration felt during a Metro train pass-by while the neighboring resident may not.

These results apply only to the site conditions present at the time of the measurements, and may change once the site has been developed. Stated differently, once the site has been re-graded and buildings have been added, the soil compaction and ground characteristics may be altered and produce different vibration levels. Likewise, vibration levels on different floors of the townhomes may be higher than those measured in the ground, as structures can amplify vibration levels such that vibration will increase with building height.

If you have any questions, feel free to contact me directly.

Sincerely,

Josh Curley

situations where potential impacts from freight train ground-borne vibration will need to be evaluated. The prime example is when freight train tracks must be relocated to provide space for a transit project within a railroad right-of-way. Some guidelines for applying these criteria to freight train operations are given later in this chapter.

8.1 VIBRATION IMPACT CRITERIA FOR GENERAL ASSESSMENT

8.1.1 Sensitive-Use Categories

The criteria for acceptable ground-borne vibration are expressed in terms of rms velocity levels in decibels and the criteria for acceptable ground-borne noise are expressed in terms of A-weighted sound levels. The limits are specified for the three land-use categories defined below:

- **Vibration Category 1 - High Sensitivity:** Included in Category 1 are buildings where vibration would interfere with operations within the building, including levels that may be well below those associated with human annoyance. Concert halls and other special-use facilities are covered separately in Table 8-2. Typical land uses covered by Category 1 are: vibration-sensitive research and manufacturing, hospitals with vibration-sensitive equipment, and university research operations. The degree of sensitivity to vibration will depend on the specific equipment that will be affected by the vibration. Equipment such as electron microscopes and high resolution lithographic equipment can be very sensitive to vibration, and even normal optical microscopes will sometimes be difficult to use when vibration is well below the human annoyance level. Manufacturing of computer chips is an example of a vibration-sensitive process.

  The vibration limits for Vibration Category 1 are based on acceptable vibration for moderately vibration-sensitive equipment such as optical microscopes and electron microscopes with vibration isolation systems. Defining limits for equipment that is even more sensitive requires a detailed review of the specific equipment involved. This type of review is usually performed during the Detailed Analysis associated with the final design phase and not as part of the environmental impact assessment. Mitigation of transit vibration that affects sensitive equipment typically involves modification of the equipment mounting system or relocation of the equipment rather than applying vibration control measures to the transit project.

  Note that this category does not include most computer installations or telephone switching equipment. Although the owners of this type of equipment often are very concerned about the potential of ground-borne vibration interrupting smooth operation of their equipment, it is rare for computer or other electronic equipment to be particularly sensitive to vibration. Most such equipment is designed to operate in typical building environments where the equipment may experience occasional shock from bumping and continuous background vibration caused by other equipment.

- **Vibration Category 2 - Residential:** This category covers all residential land uses and any buildings where people sleep, such as hotels and hospitals. No differentiation is made between different types of residential areas. This is primarily because ground-borne vibration and noise are experienced indoors and building occupants have practically no means to reduce their exposure. Even in a noisy

urban area, the bedrooms often will be quiet in buildings that have effective noise insulation and tightly closed windows. Moreover, street traffic often abates at night when transit continues to operate. Hence, an occupant of a bedroom in a noisy urban area is likely to be just as exposed to ground-borne noise and vibration as someone in a quiet suburban area. The criteria apply to the transit-generated ground-borne vibration and noise whether the source is subway or surface running trains.

- **Vibration Category 3 - Institutional:** Vibration Category 3 includes schools, churches, other institutions, and quiet offices that do not have vibration-sensitive equipment, but still have the potential for activity interference. Although it is generally appropriate to include office buildings in this category, it is not appropriate to include all buildings that have any office space. For example, most industrial buildings have office space, but it is not intended that buildings primarily for industrial use be included in this category.

Table 8-1. Ground-Borne Vibration (GBV) and Ground-Borne Noise (GBN) Impact Criteria for General Assessment

Land Use Category	GBV Impact Levels (VdB re 1 micro-inch /sec)			GBN Impact Levels (dB re 20 micro Pascals)		
	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]
Category 1: Buildings where vibration would interfere with interior operations.	65 VdB[4]	65 VdB[4]	65 VdB[4]	N/A[4]	N/A[4]	N/A[4]
Category 2: Residences and buildings where people normally sleep.	72 VdB	75 VdB	80 VdB	35 dBA	38 dBA	43 dBA
Category 3: Institutional land uses with primarily daytime use.	75 VdB	78 VdB	83 VdB	40 dBA	43 dBA	48 dBA

Notes:

1. "Frequent Events" is defined as more than 70 vibration events of the same source per day. Most rapid transit projects fall into this category.
2. "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day. Most commuter trunk lines have this many operations.
3. "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day. This category includes most commuter rail branch lines.
4. This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels. Ensuring lower vibration levels in a building often requires special design of the HVAC systems and stiffened floors.
5. Vibration-sensitive equipment is generally not sensitive to ground-borne noise.
