

## **APPENDIX A**

DOEE Comprehensive Site Assessment Directive Letter, dated December 10, 2020, Approved  
Comprehensive Site Assessment Work Plan, dated May 7, 2021

GOVERNMENT OF THE DISTRICT OF COLUMBIA  
Department of Energy and Environment  
**Environmental Services Administration**

**Toxic Substances Division**

**Underground Storage Tank Branch**

**Directive for Comprehensive Site Assessment**

December 10, 2020

Ms. Claire Fox  
Washington Metropolitan Area Transit Authority  
Office of Environmental Management & Industrial Hygiene  
3500 Pennsy Drive  
Landover, MD 20785

**Re: FACILITY NAME: WMATA Northern Bus Division**  
**FACILITY ADDRESS: 4615 14th Street, NW, Washington, DC 20011**  
**FACILITY ID #: 4000709**  
**LUSTCASE #: 2021011**

**Dear Ms. Fox:**

The Department of Energy and Environment (DOEE), Underground Storage Tank Branch (UST Branch), is issuing this Directive Letter in reference to the property located at **4615 14th Street, NW, Washington, DC 20011 (the “Site”)**, pursuant to the Underground Storage Tank Management Act of 1990 (D.C. Code § 8-113.01 *et seq.*) (the “Act”) and the District of Columbia Underground Storage Tank Regulations, as set forth at Title 20 of the District of Columbia Municipal Regulations (DCMR), Chapters 55-70 (20 DCMR §§ 5500-7099), updated February 21, 2020.

The UST Branch has received and reviewed the Environmental Subsurface Investigation Report dated February 7, 2020 prepared by Intertek PSI for the above mentioned Site. The results indicate concentrations for several chemicals of concern (COCs) above DC Risk Based Corrective Action (DRBCA) Tier 1 Risk Based Screening Level for the applicable exposure pathways and receptors. We are also aware of USTs onsite pending removal, source removal is a critical first step in LUST corrective action. Therefore, the UST Branch has reopened the LUST Case with a new LUST Case #2021011 associated with this property.

In accordance with the above laws and regulations, based on the determination of the UST Branch, the Responsible Party is hereby directed to perform the followings:

- 1. Work Plan - Within 45 days** of this CSA Directive Letter (i.e. by **January 25, 2020**) submit a work plan that defines the scope, schedule, and approaches for the task required for the comprehensive site assessment. The work plan should include a site diagram depicting the placement of all borings, wells, and soil vapor monitoring points.

The sampling work plan should show the position of existing and new ground water monitoring wells, if any, ground water flow direction, as well as proposed monitoring well and soil sampling locations. Monitoring wells and sampling locations must be positioned so that samples taken from them accurately represent the nature and extent of contamination associated with the release of petroleum product(s) on the Site. Please note that the work plan may need to include investigation for potential offsite impact.

2. **Comprehensive Site Assessment Report** - Within sixty (60) days following DOEE approval of the Work Plan, submit a complete Comprehensive Site Assessment (CSA) Report to delineate the extent of both groundwater and soil contamination and include a site conceptual model. This CSA must be prepared in accordance with the District's Comprehensive Site Assessment Protocol (<https://doee.dc.gov/node/8332>). Please note that the results of the CSA report may require additional data collection and further assessment.
3. **Corrective Action Plan** - Upon review and approval of the CSA Report and any subsequent assessment or monitoring reports, a Corrective Action Plan (CAP) may be required. Within forty-five (45) days of submission of the CSA Report, if the contamination levels are found to be higher than DOEE's regulatory standards,<sup>1</sup> prepare and submit a CAP for DOEE approval that proposes a remedial strategy to address contamination in soil and/or ground water. The CAP must be prepared in accordance with the provisions of 20 DCMR § 6207.

**Chemicals of Concern** - Analyze soil and groundwater samples in accordance with DCRBCA Table 4-1 including: i) full list volatile organic compounds using EPA Method 8260B and polycyclic aromatic hydrocarbons (PAHs) using EPA Method 8270; ii) total petroleum hydrocarbon-diesel range organics (TPH-DRO) using EPA Method 8015; and iii) the Resource Conservation and Recovery Act (RCRA) metals using EPA Method SW846.

4. **CAP Implementation** - Within thirty (30) days of DOEE's approval of the CAP, begin implementation of the CAP on the Site, pursuant to 20 DCMR § 6207.
5. **Monitoring Reports** – Throughout the assessment and CAP implementation and after CAP implementation, continuous groundwater monitoring the Site may be required – a directive to initiate regular periodic groundwater monitoring will be issued by the LUST case manager based on findings of the initial CSA Report. If so, monitoring reports must be submitted on a quarterly basis until DOEE determines that no further action (NFA) is necessary on the Site. Case closure and issuance of a NFA letter by DOEE is contingent upon all closure requirements being met, such as proper abandonment of monitoring wells and removal of equipment from the Site (*see* 20 DCMR § 6211 for a detailed listing of closure requirements).
6. Note a **LUST Activity Notification** shall be sent to the UST Branch at least seven (7) days before the actual field activities.

---

<sup>1</sup> DOEE's regulatory standards for ground water and soil may be found at 20 DCMR §§ 6208 and 6209.

7. **Greener Cleanups/Green Remediation** – DOEE strongly encourages responsible parties to consider and report green remediation strategies for LUST sites. The UST Branch has begun an initiative to track green remediation strategies being implemented in the District. In alignment with EPA’s “policy to evaluate and minimize the environmental ‘footprint’ of activities undertaken when cleaning up a contaminated site” (U.S. EPA Principles for Greener Cleanups, August 27, 2009), DOEE is making efforts to better track green cleanups and **requests that a statement of the extent of green remediation being used at LUST case sites is included in every CSA and CAP**. RPs may consult ASTM E2893 for standard guidance on greener cleanups. Helpful links to green remediation practices may also be found here:

<https://www.epa.gov/remedytech/green-remediation-best-management-practices-site-investigation>; and

<https://www.epa.gov/remedytech/green-remediation-incorporating-sustainable-environmental-practices-remediation>.

8. A property owner or developer who is not deemed the responsible party may be eligible to enter **Voluntary Remediation Action Program (VRAP)** or Voluntary Cleanup Program (VCP) to clean-up the property during redevelopment. Please see details in link <https://doee.dc.gov/service/voluntary-remediation-action-program-vrap>.

Please note that a permit is required for well installation from the DOEE Regulatory Review Division and a Department of Consumer and Regulatory Affairs (DCRA) construction permit is required for any site operations.

Any requests for extensions of time in which to complete each of the tasks listed above must be received by the UST Branch in writing, no later than ten (10) days before the prescribed deadline. DOEE reserves the right to amend this schedule at any time. If changes are made to the schedule, you will be notified in writing.

Please note that pursuant to D.C. Code § 8-113.08(a) and 20 DCMR § 6300, DOEE is authorized to enter the Site at any reasonable time, including while remediation is in progress, to inspect, obtain copies of relevant documents, obtain samples or conduct monitoring or testing of any tanks, associated equipment, contents, surrounding soils, air, surface water, or groundwater. The UST Branch will review the results of this assessment in accordance with the above-referenced laws and regulations to determine the necessity for additional assessment or corrective action.

Should you have any questions concerning this directive, please do not hesitate to contact me or Nazmul Haque via telephone at 202-499-0438 or via e-mail at [nazmul.haque@dc.gov](mailto:nazmul.haque@dc.gov).

Sincerely,

Fianna Phill, Chief  
Underground Storage Tank Branch

## 1 INTRODUCTION

Professional Service Industries, Inc. (PSI), an Intertek company, has prepared this Comprehensive Site Assessment (CSA) Work Plan for the Washington Metropolitan Area Transit Authority (WMATA) Northern Bus Garage on behalf of STV Incorporated (STV). The project is located at 4615 14<sup>th</sup> Street NW in Washington, District of Columbia (D.C.). This document has been prepared in general accordance with the Washington D.C. Department of Energy and Environment (DOEE) Directive for Comprehensive Site Assessment letter, dated December 10, 2020 and is a continuation of the assessment activities presented in the previously submitted Preliminary Environmental Investigation (PEI) report, dated February 7, 2020. To comply with DOEE's request, the activities described in this work plan will be conducted to complete the requirements of the CSA. Please note, a CSA work plan was previously submitted in February of 2021; therefore, the activities described herein supplant the previously submitted document.

The activities described in this work plan will be conducted in accordance with the DOEE Risk-Based Corrective Action Technical Guidance document, dated June 2011 (<https://doee.dc.gov/publication/dc-risk-based-corrective-action-dcrbca-or-risk-based-decision-making-dcrbdm-process>). This Work Plan is organized in the following manner:

- Section 2.0 – Site Description and History
- Section 3.0 – Environmental Setting
- Section 4.0 – Current Site Environmental Conditions
- Section 5.0 – Proposed CSA Activities
- Section 6.0 – Proposed Schedule

## 2 SITE DESCRIPTION AND HISTORY

### 2.1 Site Location

The subject property is located in a mixed-use neighborhood surrounded by residential housing and commercial properties. The site is improved with an approximately 270,000 square foot multi-story building, with the oldest portion of the building constructed in 1906. The subject property is owned by WMATA and is located on Square 2811/2815 and Property ID 2811 0802 of the Washington D.C. Real Estate Map. The on-site building historically has been used for bus storage and maintenance, and consists of administrative offices, employee parking deck, maintenance/repair bays, bus wash areas, storage rooms, and a garage with capacity for approximately 175 buses.

#### Site Location Map

Currently, the site is inactive as a WMATA bus division and has limited occupancy for staff planning the reconstruction; however, infrastructure associated with the former bus storage/maintenance facility remains on-site. WMATA plans to demolish the majority of the existing on-site building to redevelop the site for mixed use (new bus garage and retail space) and will preserve a limited portion of the original 1906 trolley barn. The site is bounded by residential and commercial properties to the north and east along Iowa Ave NW and Arkansas Ave NW, to the west by 14th St NW, and to the south by Buchanan St NW.

The site is fully serviced by public utilities including water and sewer. Groundwater is not used as a source of potable water on or in the vicinity of the site.

## 2.2 Site History

A public transit support facility has operated at the 4615 14th Street NW, Washington, D.C. location since approximately 1906. The location has primarily been utilized for the operation and maintenance of transit vehicles beginning with trolley cars. The facility was managed by a private busing business in the 1940s-1950s; however, in the mid-1970s, WMATA assumed control of operation and maintenance responsibilities of the facility and buses in the metropolitan area. Historically usage of portions of the subject property included use as a trolley carriage house, bus storage and maintenance, vehicle fueling, auto-maintenance and vehicle washing.

Various facility modifications were performed between the early 1980s through early 2000s, which included the construction of a wall around the facility to minimize community impacts from the on-site activities. During a site geotechnical investigation for the planned renovations/construction activities performed in late 2019/early 2020, petroleum-related vapors were identified in the site soils in the vicinity of the existing on-site underground storage tanks (USTs). Previous USTs were removed from the ground during the renovation/construction activities, which were completed in the early 1990s.

Complete historic information regarding maintenance practices and chemical usage at the facility is not available. Several petroleum USTs and aboveground storage tanks (ASTs) have been installed and removed from the site. Additionally, laundry/dry-cleaning facilities existed along 14th Street (west of the subject property) between 1927 and 1985. Additional information is provided in Section 2.3.

A review of available fire insurance maps (Sanborn) and aerial photographs indicated the following information:

- 1927 (Sanborn) - The site depicts the original Car Barn structure for Washington Rapid Transit Co. Bus Station, built in 1907. Structures depicting shops and garages also appear on the southern portion of the property.
- 1951- 1960 (Aerials & Sanborn) - The site is improved with a bus garage with a gas pump to the eastern portion of the original building. The Sanborn depicts a filling station to the southwest corner.
- 1963-1985 (Aerials) – Bus operations continue.
- 1988-1991 (Aerials) - The shops and garage structures on the southern portion of the property have been removed by approximately 1989.
- 1992-2017 (Aerials) - The on-site structure was improved with a roof parking lot and bus repair shop over the eastern and southern portion of the property.

## 2.3 Summary of Previous Investigations

Previous investigations at the Site have been conducted by Versar, Inc., PSI, and others. This section provides a basic overview of activities.

#### Petroleum Impacts (Information obtained from Versar 2003 ESA report)

Based on historical information provided in the Versar 2003 ESA report, petroleum-related soil and/or groundwater impacts have been identified on the subject property at various times during the facility operation. The petroleum-related impacts have been attributed to leaking USTs utilized at the facility for storing fuel and/or automotive oils. During a geotechnical investigation performed in 1984, petroleum-related odors were observed in soils in the vicinity of several on-site USTs. Following the discovery of the soil impacts, the USTs were scheduled to be removed from the site during planned renovation work. A preliminary contamination assessment (PCA) was performed in 1989 during which five (5) monitoring wells were installed for groundwater monitoring purposes. A groundwater recovery and treatment system was installed in the southeastern portion of the subject property in late 1989 and removed in mid-1990. Site renovation activities were also performed from 1990-1991, during which the USTs and approximately 13,750 cubic yards of petroleum-impacted soil were removed from the site for proper disposal.

An aquifer pump test was performed in 1992 to collect hydrologic information for the design of a groundwater treatment system to remediate the identified on-site petroleum-related groundwater impacts. A in-well separator free product recovery pump was installed in one of the on-site monitoring wells with plumbing connected to a storage tank located within the bus garage where the free product would be collected. In 1999, an air sparge unit replaced the in-well separator due to insufficient product recovery.

The historical information additionally indicated that the on-site petroleum-related groundwater impacts appear to be degrading and/or are naturally attenuating. The report also stated that the lack of off-site detected impacts indicate that the bus garage operations and maintenance activities have not significantly impacted the surrounding area.

#### Chlorinated Solvents (Information obtained from Versar 2003 ESA Report)

In 1993, chlorinated solvent groundwater impacts were identified on the southern portion of the subject property. A risk assessment was performed to address concerns regarding the detected concentrations in the groundwater samples collected from Monitoring Wells MW-21 and MW-22. The risk assessment concluded that the detected concentrations posed no excess risk to human health at that time. An ESA report prepared in 2003, indicated that chlorinated solvents impacts were still present in the vicinity of Monitoring Wells MW-21 and MW-22; however, appear to be natural attenuating as observed by the breakdown components associated with tetrachloroethylene (PCE). Additionally, the ESA indicates that the most likely source of these chlorinated solvent groundwater impacts to be historic dry-cleaning facilities previously located adjacent-west of the subject property along 14<sup>th</sup> Street NW.

The findings of PEI report and the current site environmental conditions are discussed in Section 4.0 of this work plan. Soil and groundwater sampling results (PSI, November/December 2019) and the most recent soil and groundwater sampling results (Versar, September/July 2020) have been included on Figures 1 and 2.

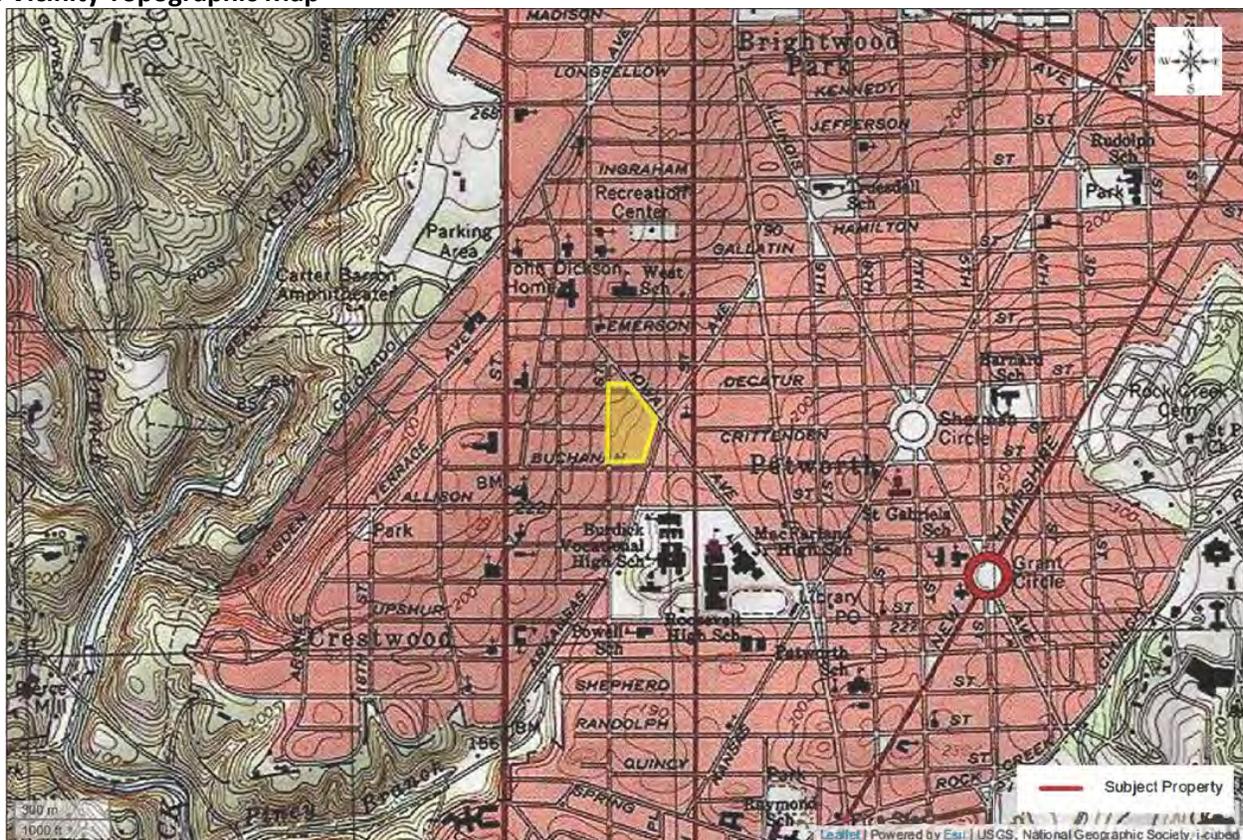

### 3 ENVIRONMENTAL SETTING

#### 3.1 Regional Geology

The subject property is located within the Piedmont physiographic province and is mapped as the Laurel Gneiss (granitic gneiss) which grades into early Paleozoic-aged Wissahickon Formation. The Laurel Gneiss was apparently derived from the Wissahickon Formation rock by hydrothermal alteration. The Wissahickon Formation, as seen in the Washington, D.C. area, consists of quartz-mica schist, phyllite, and quartzite (Johnston, 1964). At lower elevations (eastern and southern portions of the site), the subject property is underlain by unconsolidated valley bottom materials (soil) of the Patuxent Formation containing clay, silt, sand, gravel, along with weathered/decomposed rock fragments from upslope areas.

#### Site Vicinity Topographic Map

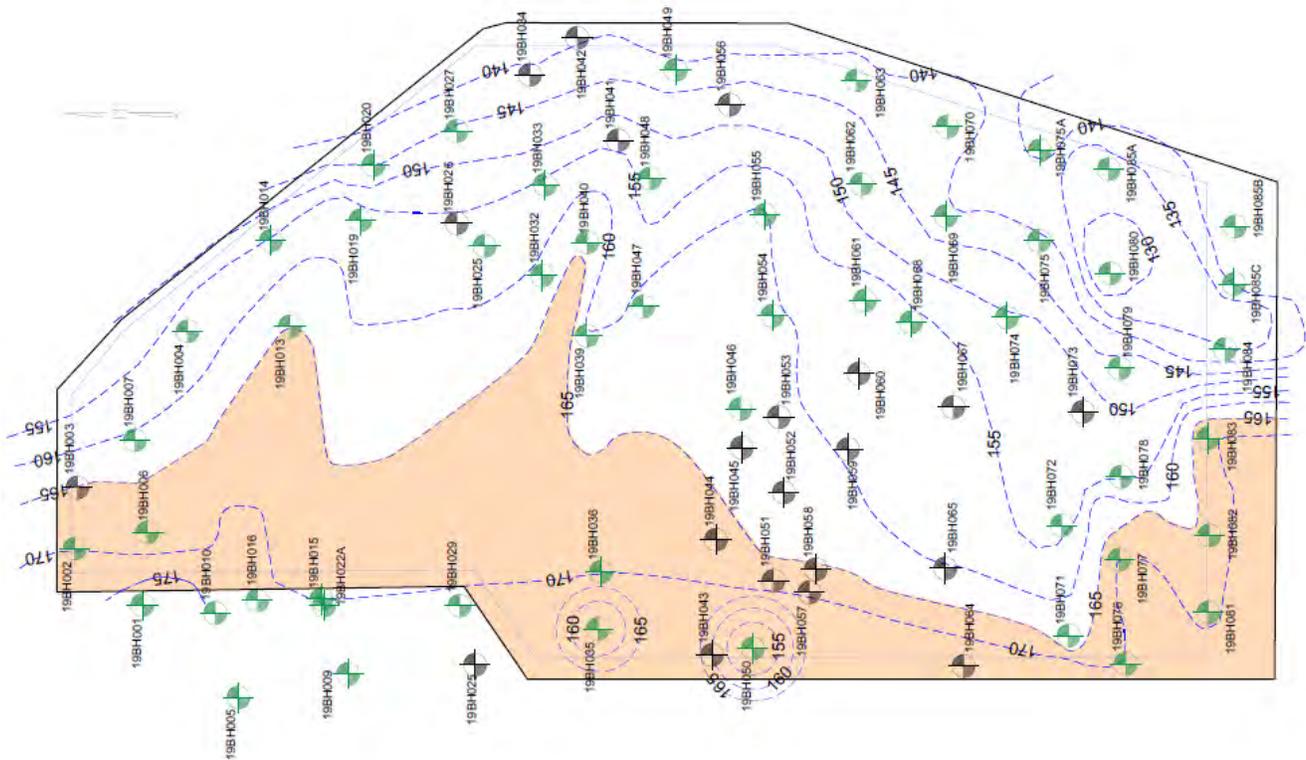

#### 3.2 Site Topography/Geology

The subject property is situated at an approximate average elevation of 199 feet above mean sea level (AMSL) to the north, with a gradual topographic slope to 177 feet AMSL to the south.

The United States Department of Agriculture (USDA) 1976 Soil Survey for the District of Columbia and the current USDA Web Soil Survey listing identify site soils primarily as Urban Land. Urban Land is used to designate areas where natural soils have been disturbed by development or are covered by impervious surface or structures.

## Bedrock Contour Map

**Shading indicates bedrock to be excavated during construction; bedrock is sloping towards the southeast.**

Based on the sub surface investigations, the subject property generally is underlain by two units; bedrock and unconsolidated sedimentary/saprolitic material. The groundwater flow has been mapped on the subject property towards the southeast. The bedrock topographic gradient slopes downwards towards the southeast as well.

Refer to Figure 4 for cross-sections of select portions of the subject property.

### 3.3 Hydrology

Groundwater on the subject property is encountered under unconfined conditions in the shallow saprolitic aquifer matrix. The depth to groundwater in the shallow monitoring wells varied between approximately 9 and 12 feet below land surface (BLS). The more competent underlying fractured bedrock aquifer becomes semi-confined with increasing depth.

Based on groundwater velocity calculations provided in the Versar Site Assessment Report, the hydraulic gradient (I) across the site for the shallow soils has historically been documented to be approximately 0.07 (foot/foot, dimensionless) in both the northern portion and the southern portion of the site. Previous pumping tests performed on the subject property calculated the average hydraulic conductivity (K) in the vicinity as  $9.5 \times 10^3$  feet/min with a flow velocity of 1.7 feet per day. Based on the well yield data obtained from the well sampling, this average hydraulic conductivity is likely close to a maximum value for the site.

A top of casing (TOC) survey of temporary monitoring wells installed during performance of the PEI in 2020, indicated a local groundwater flow direction towards the south-southeast. Groundwater elevations and groundwater flow from combined open borehole and monitoring well data are provided on Figure 5.

## 4 CURRENT SITE ENVIRONMENTAL CONDITIONS

Results of the most recent assessment of site environmental conditions were previously provided to DOEE in the February 7, 2021 PEI report. A summary of the PEI findings is provided below.

### 4.1 Summary of Unsaturated Soil Conditions

Analytical results for the soil samples collected during the November-December 2019 PEI investigation indicated the presence of metals and petroleum-related compounds at concentrations above their respective DOEE Tier 0 site screening levels (SSLs), District of Columbia Risk-Based Closure Assessment (DCRBCA) contact levels, and/or U.S. Environmental Protection Agency (EPA) regional screening levels (RSLs) at the following locations:

- Lower level east UST; PAHs, DRO
- Former AST storage area; PAHs, DRO
- Bus Wash Area, fuel dispenser; Lead, Arsenic, PAHs, DRO
- Bus wash area, sand filter; PAHs
- North sand filter; PAHs
- OWS, hydraulic lift; DRO
- Bus wash bay, OWS; PAHs, DRO
- Upper floor USTs; GRO, DRO
- Former AST storage area, Non-Haz Waste AST; Arsenic, PAHs, DRO
- Former AST storage area, Non-Haz waste AST; PAHs, DRO
- Bus wash area; Arsenic, PAHs, GRO, DRO
- Bus wash area, fuel dispenser; PAHs, GRO, DRO, Ethylbenzene
- South sand filter; PAHs, DRO
- Lower level southeast wall, storage area, coverage purposes; PAHs, DRO
- Coverage purposes; Arsenic, PAHs, DRO
- Bus wash area, coverage purposes; DRO
- Lower level south AST, pump room AST; Arsenic, GRO, DRO
- Storage area, coverage purposes; DRO
- Lower level south wall, coverage purposes; GRO, DRO
- Lower level south wall, coverage purposes; GRO, Ethylbenzene

## 4.2 Summary of Groundwater Conditions

Analytical results indicated the presence of PCBs, petroleum-, and/or chlorinated solvent-related test parameters at concentrations above their respective DOEE Tier 1 Screening Levels for Groundwater, DOEE Groundwater Quality Standards, and/or EPA national primary drinking water regulations (NPDWR) maximum contaminant levels (MCLs) in the shallow aquifer. A summary of the locations and types of groundwater impact is provided below:

- Lower level east UST; PCBs
- North sand filter; DRO
- Lower level southern extent, coverage purposes; SVOCs, VOCs
- South sand filter, coverage purposes; VOCs
- Bus wash bay, OWS; VOCs
- Lower level storage room; SVOCs

The PCB and petroleum-related ground water impacts appeared to be localized in areas near conveyances for surface water drainage, which may indicate leakage of this system in these areas or residual impacts from historic discharges. The chlorinated-solvent groundwater impacts appeared to be localized in the southern portion of the subject property; however, based on review of historical environmental assessments performed at the site as well as review of subsurface groundwater flow and bedrock topography, the chlorinated solvents might originate from an offsite source.

Soil and groundwater sampling results (November/December 2019) and the most recent soil and groundwater sampling results performed by Versar are presented on Figures 1 and 2. The report on the most recent (late 2019/early 2020) site assessment activities including a more detailed discussion of the current environmental site conditions is presented in the PEI report, which is attached as Appendix B.

## 5 PROPOSED CSA ACTIVITIES

This CSA work plan describes additional groundwater investigation activities and confirmatory soil samples from areas planned to be disturbed and those with previously identified impacted soil.

### 5.1 Groundwater Investigation

As previously discussed, groundwater flows south-southeast. A more refined delineation of the VOC groundwater plume requires collection of samples to determine if the VOCs have migrated beyond the footprint of the bus garage property. Additional assessment activities will be conducted to collect the necessary hydrogeologic data required to prepare an updated comprehensive conceptual site model and complete the required updated baseline risk assessment for the Site. This information will be used to complete the CSA report and, ultimately, prepare a corrective action plan for the site, if necessary. Details of the proposed additional assessment activities are provided below.

#### 5.1.1 Direct Groundwater Sampling

Groundwater samples will be collected at 18 locations throughout the subject property and adjacent areas. At each location, groundwater samples will be collected from the same borehole; however, at two (2) depths; the soil/groundwater interface and at the top of bedrock utilizing low-flow methodologies. Following reaching the desired sampling depth, the direct groundwater sampling point will be purged to clear the direct groundwater sampling point of suspended silts and/or sediment. Upon completion of purging, personnel will then collect groundwater samples for laboratory analysis by EPA Method 8260 for VOCs and EPA Method 8270 for SVOCs.

Additionally, soil samples will be collected at continuous 2-foot intervals to depths extending to two-feet into the groundwater table, or refusal, whichever is encountered first at three locations. Each soil sample will be visually classified, and field screened for organic vapors utilizing a organic vapor analyzer equipped with a photoionization detector (OVA-PID). Based on field observation and OVA-PID screening responses, personnel will collect up to two (2) soil samples from each borehole. One soil sample will be collected from the soil/groundwater interface and one soil sample will be collected from the soil interval exhibiting the highest OVA-PID response. The soil samples will be submitted for laboratory analysis by EPA Method 8260 for VOCs, EPA Method 8270 for SVOCs, TPH-GRO/DRO/ORO, and 4 RCRA metals.

Please note, analysis of the soil/groundwater samples collected on the north side of Arkansas Avenue, may be requested to be held pending receipt of the soil/groundwater analytical results for the samples collected along the south side portion of Arkansas Avenue. Refer to Figure 6 for the locations of the proposed direct groundwater sampling locations.

#### 5.1.2 Monitoring Well Installation

Four monitoring wells will be installed to a depth of up to 25 feet below grade within the eastern portion of the on-site building. Soil samples will be collected at continuous 2-foot intervals to depths extending to 25 feet BLS, bedrock, or refusal, whichever is encountered first. Each soil sample will be visually classified, and field screened for organic vapors utilizing a OVA-PID.

Upon reaching the depth of termination, a shallow (soil) temporary monitoring well will be installed within three (3) of the soil borings, and one deep temporary monitoring well will be installed within the remaining borehole. The deep temporary monitoring well will be installed in the vicinity of one of the shallow

temporary monitoring wells to determine vertical contaminant migration; however, the wells will not be installed as nested pairs. The shallow wells will be installed utilizing hand auger and hollow stem auger (HSA) methodologies to top of rock and will be constructed of 2-inch diameter schedule 40 polyvinyl chloride (PVC) 0.006-inch factory slotted screen coupled with a 2-inch diameter solid PVC riser. The shallow well screen will be placed so that it brackets the water table and a filter pack will be placed around the screen interval followed by fine sand and a hydrated bentonite seal. The deep monitoring well will be similarly installed/constructed; however, the deep monitoring well will be installed with the bottom of the screen interval placed at the top of the bedrock.

Refer to Figure 6 for the proposed monitoring well installation locations.

### **5.1.3 Monitoring Well Development**

Upon the completion of each newly installed monitoring well, personnel will allow at least 24 hours to pass before development commences. A stainless-steel submersible pump in conjunction with a surge block as a means of removing fine sediment from the well will be used to develop/purge the wells. Once visual observations indicate a reduction in sediments, a submersible pump will be used in conjunction with a multi-parameter water meter and flow cell to collect field measurements. Measurements for pH, specific conductance, and temperature will be periodically taken until at least three consecutive measurements show temperature and specific conductance within 10 percent, and pH within 0.2 units. A separate turbidity meter will be used to take turbidity readings until stabilization is achieved.

### **5.1.4 Groundwater Monitoring/Analysis**

Following a period of stabilization (at least 24-hours after well development), groundwater samples will be collected from the monitoring wells and submitted for laboratory analysis. Parameters will include:

- EPA Method 8260 for VOCs
- EPA Method 8270 for SVOCs
- TPH – DRO/GRO
- 4 RCRA Metals

At the time of sample collection, field readings for pH, specific conductance, temperature, dissolved oxygen, and turbidity will be collected to ensure the samples collected are representative of groundwater in the aquifer.

The monitoring well installation and baseline sampling event will be documented in the initial CSA report. The report(s) will include a description of the field activities, analytical results, and provide conclusions and recommendations applicable to the planned site development. Groundwater analytical results will be compared to the DOEE Tier 1 Screenings Levels and applicable Federal regulatory limits for the test parameters identified in the applicable media.

## **5.2 Confirmatory Sampling**

During demolition and construction activities, soils in the vicinity of the structures being removed or installed will entail the removal of soils and bedrock from the work areas. Historic environmental assessments performed on the subject property have identified petroleum-related soil impacts along the eastern portion of the subject

property. Based on a discussion with DOEE, confirmatory soil samples will be collected from the subgrade of all major structure excavations prior to installation of new project underground features; however, the extent of soil excavation will be determined based on the presence of impacted soils above DOEE Tier 1 soil screening levels. All testing initially will be performed following removal of existing structures/soils associated with the demolition/installation of existing/planned site improvements. Below is a general outline of the sampling and analytical methodologies that will be employed for the confirmatory sampling activities.

### **5.2.1 Soil Sample Collection**

Soil sampling procedures will be performed in general accordance with the EPA Soil Sampling Operating Procedures, dated June 11, 2020, and Chapter 20 Sections 6100 and 6205 of the District of Columbia Municipal Regulations, where applicable.

At locations where site improvements will be removed/installed and/or soils removed from the ground, soils will be screened visually and with an OVA or PID of the bottoms of the excavations to identify any petroleum-related staining and/or odors. Soil samples will be collected from the bottom of the excavation approximately every 50 linear feet for large structures and linear trenches. The bottom of smaller excavations will be sampled approximately every 10 linear feet. At locations where existing USTs are present two (2) soil samples will be collected beneath each UST.

### **5.2.2 Soil Sample Analysis**

Based on previous environmental site assessments performed at the site, detected soil impacts, and usage of diesel, diesel exhaust fluid, and automotive oils, collected soil samples will be submitted for laboratory analysis for the following analysis/compounds:

- EPA Method 8260 for BTEX.
- EPA Method 8015 for ethanol
- EPA Method 8270 for PAHs
- TPH-GRO/DRO/ORO

Refer to Figures 3 and 4 for the locations of the planned structure demolition/installation where soil and rock removal will be required, as well as the planned soil sample locations associated with each area.

## **5.3 Investigative Derived Waste**

Due to the presence of contaminated soils at the site, it is anticipated that decontamination of the drilling equipment between boring locations will be required using a decontamination pad. Borings will be backfilled with grout. Boring cuttings, decontamination/development/purge water and disposable sampling equipment will be collected into clean, clearly labeled 55-gallon drums. The drums will be sealed and temporarily stored in designated areas established by WMATA at the site for management pending receipt of analytical results. A designated temporary storage area for up to 8 drums as well as space to work will be identified. Drums will remain on site until completion of logging, characterization, and disposal facility acceptance.

Based on the presence and nature of contamination, the most cost effective option to dispose of IDW containerized within drums at the subject property will be to assume all drums contain some level of impacted

material, perform composite sampling for additional analytical characterization required for disposal, and to dispose of all IDW at a licensed facility based on their acceptance of the composite sampling and environmental assessment analytical results.

To facilitate this necessary documentation, up to two (2) composite samples will be collected from the drums and submit the sample to a licensed laboratory following standard chain-of-custody and shipping procedures. The composite sample will be analyzed for Toxicity Characteristic Leaching Procedure (TCLP) including Resource Conservation and Recovery Act (RCRA)-8 Metals via EPA Method 1311, VOCs via EPA Method 8260, and SVOCs via EPA Method 8270. Upon the licensed disposal facility's receipt and acceptance of the analytical results, IDW drums to be shipped to the licensed disposal facility for processing.

#### **5.4 Surveying**

A certified land surveyor will survey the newly installed monitoring wells. The survey will include the ground elevation at each monitoring well location and top of casing elevations. The survey will facilitate preparation of an updated groundwater elevation contour map, which will be used to derive accurate direction of groundwater flow and gradients. All elevations will be logged against the NGVD 88 Geodetic datum

#### **5.5 CSA Report**

To comply with DOEE's request, the activities described in this work plan will be conducted to complete the requirements of the CSA. Field activities will be conducted in accordance with the procedures and methodology described in this workplan and the DOEE Risk-Based Corrective Action Technical Guidance document, dated June 2011 (<https://doee.dc.gov/publication/dc-risk-based-corrective-action-dcrbca-or-risk-based-decision-making-dcrbdm-process>).

The CSA will include all of the components required as detailed in the guidance document as well as the documentation of the installation and sampling activities associated with the requested monitoring wells; however, the second groundwater sampling event, and confirmatory soil sampling results and the documentation on the disposal of IDW will be provided via CSA addendums once those activities have been completed.

#### **5.6 Quality Assurance/Quality Control**

All field decontamination and sampling procedures will be performed in general accordance with the EPA Operating Procedures for Soil and Groundwater Sampling, and Chapter 20 Sections 6100 and 6205 of the District of Columbia Municipal Regulations, where applicable. Quality Assurance and Quality Control (QA/QC) samples included trip blanks for laboratory analysis of VOCs per EPA Method 8260 will be collect for laboratory analysis. All downhole equipment utilized during the field activities will be decontaminated prior to and between each soil boring. Decontamination of said equipment will be accomplished by washing the equipment with a non-phosphate detergent and distilled water solution followed by a final distilled water rinse. Single-use disposable gloves and disposable tubing will be used for each sampling point in an attempt to eliminate cross-contamination between sampling locations.

Laboratory analytical procedures will be performed by National Environmental Laboratory Accreditation Conference (NELAC)-certified Hampton-Clarke, Inc. (NELAC/NJ #07071) located in Fairfield, New Jersey.

## 6 PROPOSED SCHEDULE

A summary schedule of activities is presented in the following table.

**Summary Schedule Table**

<b>Task</b>	<b>Target Completion Date</b>
CSA Work Plan Submittal	May 7, 2021
CSA Work Plan Approval by DOEE (approximately 30 days)	June 7, 2021
Complete All Field Activities and Baseline Groundwater Sampling	June 28, 2021
Submit the CSA Report (60 days from work plan approval)	July 28, 2021

DOEE Comprehensive Site Assessment Directive Letter, dated December 10, 2020

GOVERNMENT OF THE DISTRICT OF COLUMBIA  
Department of Energy and Environment  
**Environmental Services Administration**

**Toxic Substances Division**

**Underground Storage Tank Branch**

**Directive for Comprehensive Site Assessment**

December 10, 2020

Ms. Claire Fox  
Washington Metropolitan Area Transit Authority  
Office of Environmental Management & Industrial Hygiene  
3500 Pennsy Drive  
Landover, MD 20785

**Re: FACILITY NAME: WMATA Northern Bus Division**  
**FACILITY ADDRESS: 4615 14th Street, NW, Washington, DC 20011**  
**FACILITY ID #: 4000709**  
**LUSTCASE #: 2021011**

**Dear Ms. Fox:**

The Department of Energy and Environment (DOEE), Underground Storage Tank Branch (UST Branch), is issuing this Directive Letter in reference to the property located at **4615 14th Street, NW, Washington, DC 20011 (the “Site”)**, pursuant to the Underground Storage Tank Management Act of 1990 (D.C. Code § 8-113.01 *et seq.*) (the “Act”) and the District of Columbia Underground Storage Tank Regulations, as set forth at Title 20 of the District of Columbia Municipal Regulations (DCMR), Chapters 55-70 (20 DCMR §§ 5500-7099), updated February 21, 2020.

The UST Branch has received and reviewed the Environmental Subsurface Investigation Report dated February 7, 2020 prepared by Intertek PSI for the above mentioned Site. The results indicate concentrations for several chemicals of concern (COCs) above DC Risk Based Corrective Action (DRBCA) Tier 1 Risk Based Screening Level for the applicable exposure pathways and receptors. We are also aware of USTs onsite pending removal, source removal is a critical first step in LUST corrective action. Therefore, the UST Branch has reopened the LUST Case with a new LUST Case #2021011 associated with this property.

In accordance with the above laws and regulations, based on the determination of the UST Branch, the Responsible Party is hereby directed to perform the followings:

- 1. Work Plan - Within 45 days** of this CSA Directive Letter (i.e. by **January 25, 2020**) submit a work plan that defines the scope, schedule, and approaches for the task required for the comprehensive site assessment. The work plan should include a site diagram depicting the placement of all borings, wells, and soil vapor monitoring points.

The sampling work plan should show the position of existing and new ground water monitoring wells, if any, ground water flow direction, as well as proposed monitoring well and soil sampling locations. Monitoring wells and sampling locations must be positioned so that samples taken from them accurately represent the nature and extent of contamination associated with the release of petroleum product(s) on the Site. Please note that the work plan may need to include investigation for potential offsite impact.

2. **Comprehensive Site Assessment Report** - Within sixty (60) days following DOEE approval of the Work Plan, submit a complete Comprehensive Site Assessment (CSA) Report to delineate the extent of both groundwater and soil contamination and include a site conceptual model. This CSA must be prepared in accordance with the District's Comprehensive Site Assessment Protocol (<https://doee.dc.gov/node/8332>). Please note that the results of the CSA report may require additional data collection and further assessment.
3. **Corrective Action Plan** - Upon review and approval of the CSA Report and any subsequent assessment or monitoring reports, a Corrective Action Plan (CAP) may be required. Within forty-five (45) days of submission of the CSA Report, if the contamination levels are found to be higher than DOEE's regulatory standards,<sup>1</sup> prepare and submit a CAP for DOEE approval that proposes a remedial strategy to address contamination in soil and/or ground water. The CAP must be prepared in accordance with the provisions of 20 DCMR § 6207.

**Chemicals of Concern** - Analyze soil and groundwater samples in accordance with DCRBCA Table 4-1 including: i) full list volatile organic compounds using EPA Method 8260B and polycyclic aromatic hydrocarbons (PAHs) using EPA Method 8270; ii) total petroleum hydrocarbon-diesel range organics (TPH-DRO) using EPA Method 8015; and iii) the Resource Conservation and Recovery Act (RCRA) metals using EPA Method SW846.

4. **CAP Implementation** - Within thirty (30) days of DOEE's approval of the CAP, begin implementation of the CAP on the Site, pursuant to 20 DCMR § 6207.
5. **Monitoring Reports** – Throughout the assessment and CAP implementation and after CAP implementation, continuous groundwater monitoring the Site may be required – a directive to initiate regular periodic groundwater monitoring will be issued by the LUST case manager based on findings of the initial CSA Report. If so, monitoring reports must be submitted on a quarterly basis until DOEE determines that no further action (NFA) is necessary on the Site. Case closure and issuance of a NFA letter by DOEE is contingent upon all closure requirements being met, such as proper abandonment of monitoring wells and removal of equipment from the Site (*see* 20 DCMR § 6211 for a detailed listing of closure requirements).
6. Note a **LUST Activity Notification** shall be sent to the UST Branch at least seven (7) days before the actual field activities.

---

<sup>1</sup> DOEE's regulatory standards for ground water and soil may be found at 20 DCMR §§ 6208 and 6209.

7. **Greener Cleanups/Green Remediation** – DOEE strongly encourages responsible parties to consider and report green remediation strategies for LUST sites. The UST Branch has begun an initiative to track green remediation strategies being implemented in the District. In alignment with EPA’s “policy to evaluate and minimize the environmental ‘footprint’ of activities undertaken when cleaning up a contaminated site” (U.S. EPA Principles for Greener Cleanups, August 27, 2009), DOEE is making efforts to better track green cleanups and **requests that a statement of the extent of green remediation being used at LUST case sites is included in every CSA and CAP**. RPs may consult ASTM E2893 for standard guidance on greener cleanups. Helpful links to green remediation practices may also be found here:

<https://www.epa.gov/remedytech/green-remediation-best-management-practices-site-investigation>; and

<https://www.epa.gov/remedytech/green-remediation-incorporating-sustainable-environmental-practices-remediation>.

8. A property owner or developer who is not deemed the responsible party may be eligible to enter **Voluntary Remediation Action Program (VRAP)** or Voluntary Cleanup Program (VCP) to clean-up the property during redevelopment. Please see details in link <https://doee.dc.gov/service/voluntary-remediation-action-program-vrap>.

Please note that a permit is required for well installation from the DOEE Regulatory Review Division and a Department of Consumer and Regulatory Affairs (DCRA) construction permit is required for any site operations.

Any requests for extensions of time in which to complete each of the tasks listed above must be received by the UST Branch in writing, no later than ten (10) days before the prescribed deadline. DOEE reserves the right to amend this schedule at any time. If changes are made to the schedule, you will be notified in writing.

Please note that pursuant to D.C. Code § 8-113.08(a) and 20 DCMR § 6300, DOEE is authorized to enter the Site at any reasonable time, including while remediation is in progress, to inspect, obtain copies of relevant documents, obtain samples or conduct monitoring or testing of any tanks, associated equipment, contents, surrounding soils, air, surface water, or groundwater. The UST Branch will review the results of this assessment in accordance with the above-referenced laws and regulations to determine the necessity for additional assessment or corrective action.

Should you have any questions concerning this directive, please do not hesitate to contact me or Nazmul Haque via telephone at 202-499-0438 or via e-mail at [nazmul.haque@dc.gov](mailto:nazmul.haque@dc.gov).

Sincerely,

Fianna Phill, Chief  
Underground Storage Tank Branch

Subject: Preliminary Environmental Investigation Report  
WMATA Northern Bus Station  
4615 14<sup>th</sup> Street NW  
Washington, D.C 20011

Dear Mr. Belser:

Pursuant to your request, Professional Service Industries, Inc. (PSI), an Intertek company, has prepared this Preliminary Environmental Investigation (PEI) report for the above-referenced property. One electronic copy of the PEI report has been prepared for your use.

Thank you for choosing PSI as your consultant for this project. If you have any questions regarding the information contained herein, or if we can be of additional service, please contact the undersigned at (703) 698 9300.

Respectfully submitted,

**PROFESSIONAL SERVICE INDUSTRIES, INC.**

Rinzo Rentheli, EIT

## 1 EXECUTIVE SUMMARY

Professional Service Industries, Inc. (PSI), an Intertek company, has performed Preliminary Environmental Investigation (PEI) activities at the subject property, located at 4615 14<sup>th</sup> Street NW in Washington D.C. Authorization to perform the PEI activities was given via approval of PSI's Proposal No. 0448-279750, between STV, Inc. (STV) and PSI.

### Site Description

The subject property is located in a mixed-use neighborhood surrounded by residential housing and commercial properties. The site is improved with an approximately 270,000 square foot multi-story building with the oldest portion of the building being constructed in 1907. The subject property is owned by Washington Metropolitan Area Transit Authority (WMATA) and is located on Square 2811/2815 and Property ID 2811 0802 of the Washington DC Real Estate Map. The on-site building historically has been used for bus storage/maintenance and consists of an administrative building, parking deck, maintenance/repair bays, living quarters, bus wash areas, storage rooms, and a garage with capacity for 175 buses.

### Preliminary Environmental Investigation Activities

In November and December 2019, PSI personnel performed PEI activities to evaluate if the subject property has been negatively affected by the identified items of environmental concern (i.e. hydraulic lifts, underground storage tanks [USTs], aboveground storage tanks [ASTs], fuel dispensers, oil-water separators [OWS], sand filters, floor/trench drains, etc.) and for coverage purposes. The general scope of services performed included advancing 54 soil borings to a maximum depth of approximately 25 feet below land surface (BLS) for soil screening purposes utilizing an organic vapor analyzer equipped with a photoionization detector (OVA-PID), collection of 27 soil samples for laboratory analysis, installation of 10 temporary monitoring wells, and collection of nine (9) groundwater samples in the areas identified as environmental concerns.

### Conclusions

Based on the field screening and laboratory analytical data, the following conclusions have been made with regards to the quality of the soil/groundwater in the areas investigated.

- Generally, the majority of the 54 soil borings advanced at the site were extended to a depth approximately two (2) feet into the groundwater table. In soil borings where groundwater or saturated soils were not obviously encountered, the soil borings were advanced to a maximum depth of approximately 25 feet BLS. Refusal was generally encountered at various depths in the soil borings advanced in the bus maintenance/repair area, along the exterior walls, and the entirety of the upper floor.
- OVA-PID responses in the soil samples collected for screening purposes ranged from below the minimum equipment detection limit of 0.1 parts per million (ppm) to a maximum of 1,483 ppm. The highest OVA-PID response was recorded in the soil sample collected from Soil Boring SB-51

at approximately 10 feet BLS. Soil Boring SB-51 is located adjacent to the south entrance to the lower level parking garage.

- Petroleum related odors and/or staining were observed in the soil samples collected for screening purposes from soil borings generally located along the southern wall of the lower level parking garage, in the bus maintenance/repair area, in the lower level bus wash area, in the former/current areas of ASTs, in the former/current locations of USTs, and in the area of the sand filters. Please note, petroleum related odors were generally observed within the smear/saturated zones in the majority of the soil borings performed in the lower level, indicating the potential for widespread groundwater impact at the site. However, vadose zone (dry) petroleum related odors were generally isolated to specific areas (south wall of the lower level parking garage, bus maintenance/repair area, lower level bus wash area, AST south of bus maintenance/repair area, lower level UST, and southernmost sand filter).
- Based on the soil laboratory analytical results, of the 27 soil samples collected, 20 contained concentrations of metals- and/or petroleum-related test parameters above their respective Washington D.C. Department of Energy & Environment (DOEE) Tier 0 Soil Screening Levels (SSLs), Washington D.C. Risk Based Closure Assessment (DCRBCA) contact levels, and/or U.S. Environmental Protection Agency (EPA) Regional Screening Levels (RSLs).
- Additional non-petroleum or metals related test parameters were detected in several of the soil samples analyzed; however, at concentrations below their respective regulatory criteria. This may indicate additional source areas of contamination have not yet been identified. Those test parameters and the soil samples they were detected in are provided below.
  - Tetrachloroethene (PCE; chlorinated solvent) – SB-40@19', SB-46@22', SB-59@1'
  - Polychlorinated biphenyls (PCBs) – SB-51@10'
  - 2-butanone (methyl ethyl ketone [MEK]; solvent) – SB-08@9', SB-11@1', SB-28@9', SB-29@1', SB-30@7', SB-32@1', SB-33@3'
- Of the 10 temporary monitoring wells installed at the site, only nine (9) were sampled and submitted for laboratory analysis. At the time of the groundwater sampling activities, Temporary Monitoring Well TMW-06 was observed to contain approximately 0.2 inches of free product; therefore, following EPA groundwater sampling guidelines, no groundwater sample was collected from this temporary monitoring well.
- Based on the groundwater laboratory analytical results, of the nine (9) groundwater samples collected, six (6) were reported to be impacted by polychlorinated biphenyls (PCBs), petroleum-, and/or chlorinated solvent-related test parameters at concentrations above their respective DOEE Tier 1 Screening Levels for Groundwater, DOEE Groundwater Quality Standards, and/or EPA National Primary Drinking Water Regulation (NPDWR) Maximum Contaminant Levels (MCLs)
- PSI personnel collected depth-to-groundwater measurements from the 10 on-site temporary monitoring wells. Utilizing TOC elevation measurements and the depth-to-groundwater measurements, groundwater elevations were calculated by subtracting the depth-to-water

measurements from the TOC elevations for each temporary monitoring well. Based on these calculations, the groundwater flow direction in the shallow aquifer appears to be towards the southeast.

- Following collection of depth-to-groundwater measurements, on December 30, 2019, the temporary monitoring wells were properly abandoned by removing the well casing and filling the boreholes with bentonite, followed by grout at the surface.

### **Recommendations**

Based on field observations, OVA-PID responses, laboratory analytical results, and the client's stated objectives, PSI recommends performing additional soil and groundwater sampling activities to:

1. Better define the horizontal and vertical extents of the soil and groundwater impacts identified at the site;
2. Obtain soil and groundwater quality data in the vicinity of those areas of refusal and where analytical data was not able to be obtained;
3. Collect field screening and laboratory analytical data where data gaps in the soil and groundwater investigation have been identified; and
4. Collect additional groundwater data to determine if the identified on-site groundwater impacts extend to the property boundaries.

Once completed, the data obtained from the above stated recommendations will be utilized to prepare a comprehensive soil and groundwater management plan for later use during the planned demolition and construction phases of the project.

This summary does not contain all of the information presented in the full report. The report should be read in its entirety to obtain a more complete understanding of the information provided and to aid in any decisions made or actions taken based on this information.

## 2 INTRODUCTION

PSI, an Intertek company, has conducted PEI activities at the subject property located at 4615 14<sup>th</sup> Street NW in Washington D.C. A USGS vicinity map is provided as Figure 1. A site aerial map is provided as Figure 2. A site vicinity map is provided as Figure 3.

### 2.1 AUTHORIZATION

Authorization to perform the perform the PEI activities was given via approval of PSI’s Proposal No. 0448-279750, between STV, Inc. and PSI.

### 2.2 SITE DESCRIPTION

The subject property is located in a mixed-use neighborhood surrounded by residential housing and commercial properties. The site is improved with an approximately 270,000 square foot multi-story building with the oldest portion of the building being constructed in 1907. The subject property is owned by WMATA and is located on Square 2811/2815 and Property ID 2811 0802 of the Washington DC Real Estate Map. The on-site building historically has been used for bus storage/maintenance and consists of an administrative building, parking deck, maintenance/repair bays, living quarters, bus wash areas, storage rooms, and a garage with capacity for 175 buses.

Currently, the site is inactive and not occupied; however, infrastructure associated with the former bus storage/maintenance facility remains on-site. WMATA has plans to demolish the existing on-site building to redevelop the site for mixed use (new bus garage and retail space). The site is bounded by residential and commercial properties to the north and east along Iowa Ave NW and Arkansas Ave NW, to the west by 14th St NW, and to the south by Buchanan St NW. The site location is illustrated on Figure 3. The soil boring and well locations are illustrated on Figures 4 through 7.

The site is fully serviced by public utilities including water and sewer. Groundwater is not used as a source of potable water on or in the vicinity of the site.

### 2.3 PHYSICAL SETTING

#### 2.3.1 TOPOGRAPHY

The site is situated at an approximate average elevation of 199 feet above mean sea level (AMSL) to the north, with a gradual topographic slope to 177 feet AMSL to the south.

The United States Department of Agriculture (USDA) 1976 Soil Survey for the District of Columbia and the current USDA Web Soil Survey listing identify site soils primarily as Urban Land. Urban Land is used to designate areas where natural soils have been disturbed by development or are covered by impervious surface or structures.

As provided in the Preliminary Geotechnical report prepared by PSI, at a regional scale Southworth et al. 2006 mapped the Project Site location as being an unconformable contact between the Laurel Formation (Lower Cambrian) and sand-dominated lithofacies of the Potomac Formation (Lower

Cretaceous). The mapped contact between the two formations approximately bisects the Project Site from north to south. As mapped, the Potomac Formation underlies the western portion of the Project Site and the Laurel Formation underlies the eastern portion of the Project Site.

The Laurel Formation is a sedimentary mélange that underwent metamorphism in areas, resulting in partial melting and migmatization. The Laurel Formation was subsequently intruded at depth in the crust by mafic and felsic magmas while the Rock Creek Park shear zone was active (Thornberry-Ehrlich, 2009).

Approximately a mile east of the Rock Creek Park shear zone, where the Project Site is located, the Potomac Formation consists of sand-dominated coastal plain sediments likely associated with the ancestral Potomac River. The ancestral Potomac River eroded and cut into regional bedrock, unconformably depositing fluvial terraces and flood plain sediments over the underlying rocks, including the Laurel Formation and intrusive igneous units (Southworth et al. 2006).

Subsurface characterization of bedrock at the Project Site conducted as part of a geotechnical engineering study performed by Intertek-PSI revealed that the underlying geology of the Project Site consists of intermediate to mafic igneous rocks, rather than the Laurel Formation or Potomac Formation as mapped. Rock cores collected at the Project Site were classified as massive to foliated metadiorite. The metadiorite is predominantly intermediate in composition, although variation was observed across the Project Site and in some areas the bedrock is more mafic, bordering on a gabbroic composition. In select areas of the Project Site the metadiorite is foliated enough to be considered a gneiss. The Laurel Formation was intruded throughout by igneous rocks, as mentioned above, many of which are known collectively as the Georgetown Intrusive Suite (Early Ordovician) (Southworth et al. 2006). Based on mineralogical assemblages, country rock xenoliths, and cross-cutting relationships of the rock samples recovered from the geotechnical investigation, bedrock at the Project Site location is likely associated with the Georgetown Intrusive Suite which intruded into the Laurel Formation.

### **2.3.2 HYDROLOGY**

According to the Flood Insurance Rate Map, the Site is located within a floodplain. Potable water is supplied to the Site by the District of Columbia Water and Sewer Authority.

A top of casing (TOC) survey was performed by Precision Measurements, Inc. (PMI) on December 19, 2019. The TOC survey measured the TOC for each temporary monitoring well and provided latitude and longitude elevations based on the 1988 North American Datum (NAD88). The TOC survey elevations were used in calculating groundwater elevations in each well at the site to determine the direction of local groundwater flow. The groundwater flow determination is discussed in detail in section 4.4.

## **2.4 SITE HISTORY**

Primary historic usage of the subject property included use as a carriage house, bus storage, vehicle fueling, auto-maintenance and vehicle washing.

## **2.5 PURPOSE AND SCOPE OF SERVICES**

The PEI activities were performed to evaluate if the subject property has been negatively affected by the identified items of environmental concern (i.e., hydraulic lifts, USTs, ASTs, fuel dispensers, OWSs, sand filters, floor/trench drains, etc.) and for coverage purposes. The general scope of services performed included advancing 54 soil borings to a maximum depth of approximately 25 feet BLS for soil screening purposes utilizing an OVA-PID, collection of 27 soil samples for laboratory analysis, installation of 10 temporary monitoring wells, and collection of nine (9) groundwater samples in the areas identified as environmental concerns. The sample locations are provided on Figure 4. A UST and AST Location Map is provided as Figure 8.

## **2.6 QUALITY ASSURANCE/QUALITY CONTROL MEASURES**

All field decontamination and sampling procedures were performed in general accordance with the EPA Operating Procedures for Soil and Groundwater Sampling. Quality Assurance and Quality Control (QA/QC) samples included trip blanks for laboratory analysis of VOCs per EPA Method 8260. All downhole equipment utilized during the field activities was decontaminated prior to and between each soil boring. Decontamination of said equipment was accomplished by washing the equipment with a non-phosphate detergent and distilled water solution followed by a final distilled water rinse. Single-use disposable gloves and disposable tubing was used for each sampling point in an attempt to eliminate cross-contamination between sampling locations.

Laboratory analytical procedures were performed by National Environmental Laboratory Accreditation Conference (NELAC)-certified Hampton-Clarke, Inc. (NELAC/NJ #07071) located in Fairfield, New Jersey.

### 3 SITE INVESTIGATION ACTIVITIES

Field investigation and sampling activities were performed by PSI personnel in November and December 2019. PSI was assisted by a representative of Clark Construction when accessing the property with locked gates. Soil cuttings generated during the performance of the soil borings, groundwater generated during development and sampling of the temporary monitoring wells, and decontamination water was placed into 55-gallon steel drums, and stored on-site for later disposal.

In accordance with DOEE requirements, PSI obtained a permit prior to performing the PEI activities. A copy of the Department of Consumer and Regulatory Affairs (Permit #SB1900434) is provided in Appendix A.

#### 3.1 SOIL INVESTIGATION ACTIVITIES

Utilizing hand auger and Geoprobe® drill-rig methodologies, PSI personnel observed the advancement of 54 soil borings. Five (5) additional soil borings were attempted; however, refusal was encountered in these borings at depths of less than 3.5 feet BLS. The groundwater table was encountered at depths ranging from 4.5 feet BLS to 16 feet BLS in the soil borings performed based on subsequent groundwater measurements in the temporary wells.

Soil samples were collected from each soil boring on approximate 1- to 2-foot intervals for field screening utilizing an OVA-PID. The termination depth of the soil borings ranged from 5 feet BLS to 25 feet BLS, depending on the lithology encountered and/or depth to the groundwater table. Airtight 1-quart capacity plastic bags were partially filled with the soil samples, sealed, and set aside to allow volatile gases, if any, to accumulate throughout the headspace. The organic vapor response for each soil sample was determined by inserting the probe of the OVA-PID into the headspace of the sample container and recording the highest sustained reading.

Based on field observations, OVA-PID responses, and for coverage purposes, PSI collected 27 soil samples for laboratory analysis by EPA Method 8260 for volatile organic compounds (VOCs), including benzene, toluene, ethylbenzene, and total xylenes (BTEX), EPA Method 8270 for semi-volatile organic compounds (SVOCs), EPA Method 8015D for Total Petroleum Hydrocarbons (TPH) and Diesel and Gasoline Range Organics (DRO/GRO), EPA Method 8082 for polychlorinated biphenyls (PCBs) and EPA Method 6010C and 7471B for 13 Priority Pollutant Metals (antimony, arsenic, barium, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, thallium, zinc)

Upon completion of the soil sampling activities, all boreholes were backfilled to the surrounding grade. The locations of the soil borings are provided on Figure 4. Copies of the field equipment calibration forms and soil OVA sample data sheets are provided in Appendix B.

#### 3.2 GROUNDWATER INVESTIGATION ACTIVITIES

Based on field observations, OVA-PID responses, and for coverage purposes, utilizing hand auger and Geoprobe® drill-rig methodologies, PSI observed the installation of 10 temporary monitoring wells (TMW-01 through TMW-06, TMW-08, TMW-10, TMW-11 and TMW-16) to total depths ranging from

approximately 10 to 25 feet BLS. The temporary monitoring wells were constructed utilizing 10 feet of 1-inch diameter factory slotted 0.010-inch polyvinyl chloride (PVC) screen coupled with solid PVC riser. The annulus between the well casing and borehole was filled with 20/40 grade silica sand followed by approximately 6-inches of grout for use as a surface seal. Each temporary monitoring well was then developed via the pump and surge method until the produced water was relatively clear. The development water was placed into 55-gallon steel drums and stored on-site for later disposal.

Subsequent to installation and following a period of stabilization (greater than 5 days), PSI personnel collected nine (9) groundwater samples from Temporary Monitoring Wells TMW-01 through TMW-05, TMW-08, TMW-10, TMW-11 and TMW-16. The groundwater samples were submitted for laboratory analysis by EPA Method 8260 for VOCs, including BTEX, EPA Method 8270 for SVOCs, EPA Method 8015D for TPH DRO/GRO, EPA Method 8082 for PCBs, and EPA Method 6010C and 7471B for 13 Priority Pollutant Metals (antimony, arsenic, barium, beryllium, cadmium, chromium, copper, lead, nickel, selenium, silver, thallium, zinc ) total and dissolved. Please note, at the time of sample collection, approximately 0.2-inches of free product was measured in Temporary Monitoring Well TMW-6; therefore, following EPA groundwater sampling guidelines, a groundwater sample was not collected from the temporary monitoring well.

On December 30, 2019, PSI personnel collected depth-to-groundwater measurements from all on-site temporary monitoring wells for later use in calculating groundwater flow direction at the site. The groundwater levels were collected within a 24-hour period and were measured from TOC and recorded to the nearest 0.01 of a foot. Following collection of the depth-to-groundwater measurements, the temporary monitoring wells were removed from the site and the boreholes were backfilled to the surrounding surface with bentonite and grout.

The temporary monitoring well locations are provided on Figures 4. Copies of the monitoring well construction data forms, field equipment calibration forms, and groundwater sampling forms are provided in Appendix B.

## 4 DATA ANALYSIS AND INTERPRETATION

Analysis and interpretation of the data generated during the field investigation and laboratory analyses is presented in the following sections. Where appropriate, the results are compared with regulatory limits for the test parameters identified in the applicable media. All laboratory analytical procedures were performed by Hampton-Clarke Inc. Copies of the laboratory analytical reports and chain-of-custody documentation are provided in Appendix C.

### 4.1 PHYSICAL CHARACTERISTICS OF THE SUBJECT AREA

The subject property lies in the United States Geological Survey “Washington West Quadrangle, District of Columbia-Maryland-Virginia” topographic map. General topography in the immediate vicinity of the subject property is gently rolling hills with higher elevations in the northwest sections and lower elevations in the southeast and south sections. Surface drainage appears to be via ground infiltration.

Information about the physical setting of the subject property is tabulated below:

General Soil Type, Slopes	<p>The soils in the area where the subject property is located consist of Urban Land, 0 to 8 percent slope and Sassasfras-Urban Land Complex, 8 to 15 percent slope.</p> <p>Urban Land soils are covered by pavement, concrete, buildings, and other structures underlain by wet soils material. The soil profile is typically disturbed and does not resemble any mapped soil unit due to anthropogenic modification of the profile.</p> <p>Sassasfras-Urban Land Complex soils consist of very deep and well drained soils. The capacity of the most limiting layer to transmit water is moderately high to high.</p>
On-Site Water Bodies	<p>No on-site water bodies are located within the subject property.</p>
Off-Site Water Bodies	<p>No on-site water bodies are located on the surrounding properties.</p>

### 4.2 SOIL INVESTIGATION RESULTS

OVA-PID responses in the soil samples collected for screening purposes ranged from below the minimum equipment detection limit of 0.1 ppm to a maximum of 1,483 ppm. The highest OVA-PID response was recorded in the soil sample collected from Soil Boring SB-51 at approximately 10 feet BLS. Soil Boring SB-51 is located adjacent to the south entrance to the lower level parking garage. Additionally, OVA-PID responses at least 10 ppm were observed in the vadose zone (approximately 0-7 feet BLS) soil samples collected from Soil Borings SB-3, SB-11, SB-15, SB-17, SB-21, SB-25, SB-28, SB-29, SB-30, SB-34, SB-37, SB-43, and SB-60.

Petroleum related odors and/or staining were observed in the soil samples collected for screening purposes generally located along the southern wall of the lower level parking garage, in the bus

maintenance/repair area, in the lower level bus wash area, in the former/current areas of ASTs, in the former/current locations of USTs, and in the area of the sand filters. Please note, petroleum related odors were generally observed within the smear/saturated zones in the majority of the soil borings performed in the lower level garage, indicating the potential for widespread groundwater impact at the site. However, vadose zone (dry) petroleum related odors were generally isolated to specific areas (south wall of the lower level parking garage, bus maintenance/repair area, lower level bus wash area, AST south of bus maintenance/repair area, lower level UST, and southernmost sand filter.

Based on the laboratory analytical results, 20 of the 26 soil samples collected and submitted for laboratory analysis were reported to contain metals and/or petroleum-related test parameters at concentrations above their respective DOEE Tier 0 SSLs, DCRBCA contact levels, and/or EPA RSLs. A summary of the soil samples exceeding their respective regulatory criteria, area/purpose of investigation, and contaminants of concern (COCs) is provided below.

Soil Sample ID	Area/Purpose of Collection	Contaminant(s) Exceeding Regulatory Criteria
SB-01 @ 11'	Lower level east UST	Polynuclear Aromatic Hydrocarbons (PAHs), DRO
SB-02 @ 11'	Former AST storage area	PAHs, DRO
SB-04 @ 7'	Bus Wash Area, fuel dispenser	Lead, Arsenic, PAHs, DRO
SB-05 @ 9'	Bus wash area, sand filter	PAHs
SB-06 @ 11'	North sand filter	PAHs
SB-08 @ 9'	OWS, hydraulic lift	DRO
SB-11 @ 1'	Bus wash bay, OWS	PAHs, DRO
SB-12 @ 17'	Upper floor USTs	GRO, DRO
SB-17 @ 3'	Former AST storage area, Non-Haz Waste AST	Arsenic, PAHs, DRO
SB-17 @ 11'	Former AST storage area, Non-Haz waste AST	PAHs, DRO
SB-28 @ 9'	Bus wash area	Arsenic, PAHs, GRO, DRO
SB-29 @ 1'	Bus wash area, fuel dispenser	PAHs, GRO, DRO, Ethylbenzene
SB-30 @ 7'	South sand filter	PAHs, DRO
SB-32 @ 1'	Lower level southeast wall, storage area, coverage purposes	PAHs, DRO
SB-33 @ 3'	Coverage purposes	Arsenic, PAHs, DRO
SB-34 @ 10'	Bus wash area, coverage purposes	DRO
SB-43 @ 11'	Lower level south AST, pump room AST	Arsenic, GRO, DRO
SB-43A @ 1'	Storage area, coverage purposes	DRO
SB-51 @ 10'	Lower level south wall, coverage purposes	GRO, DRO
SB-60 @ 5'	Lower level south wall, coverage purposes	GRO, Ethylbenzene

Please note, additional non-petroleum or metals related test parameters were detected in several of the soil samples analyzed; however, at concentrations below their respective regulatory criteria. This may indicate additional source areas of contamination have not yet been identified. Those test parameters and the soil samples they were detected in are provided below.

- Tetrachloroethene (PCE; chlorinated solvent) – SB-40@19’, SB-46@22’, SB-59@1’
- PCBs – SB-51@10’
- 2-butanone (methyl ethyl ketone [MEK]; solvent) – SB-08@9’, SB-11@1’, SB-28@9’, SB-29@1’, SB-30@7’, SB-32@1’, SB-33@3’

A soil analytical data summary is provided as Table 1. A soil analytical summary map (contaminants of concern only) is provided as Figure 5. Copies of the laboratory analytical reports and chain-of-custody documentation is provided in Appendix C.

### 4.3 GROUNDWATER INVESTIGATION RESULTS

Based on the laboratory analytical results, six (6) of the nine (9) groundwater samples collected for laboratory analysis were reported to contain PCBs, petroleum-, and/or chlorinated solvent-related test parameters at concentrations above their respective DOEE Tier 1 Screening Levels for Groundwater, DOEE Groundwater Quality Standards, and/or EPA NPDWR MCLs. A summary of the groundwater samples exceeding their respective regulatory criteria, area/purpose of investigation, and COCs is provided below.

Well ID	Area/Purpose of Collection	Contaminant Classification Exceeding Regulatory Criteria
TMW-1	Lower level east UST	PCBs
TMW-5	North sand filter	DRO
TMW-8	Lower level southern extent, coverage purposes	SVOCs, VOCs (chlorinated solvents)
TMW-10	South sand filter, coverage purposes	VOCs (chlorinated solvents)
TMW-11	Bus wash bay, OWS	VOCs (chlorinated solvents)
TMW-16	Lower level storage room	SVOCs

Additional test parameters were detected in the groundwater samples analyzed; however, at concentrations below their respective regulatory criteria. A groundwater analytical data summary is provided as Table 2. A groundwater analytical data summary map (contaminants of concern only) is provided as Figure 6.

### 4.4 GROUNDWATER FLOW DETERMINATION

Utilizing TOC elevation measurements and depth-to-groundwater measurements, groundwater elevations were calculated by subtracting the depth-to-groundwater measurements from the TOC elevations for each temporary monitoring well. Based on these calculations, the groundwater flow direction in the shallow aquifer appears to be towards the southeast. A groundwater elevation map is provided as Figure 7.

## 5 CONCLUSIONS AND RECOMMENDATIONS

PSI has performed PEI activities at the subject property in accordance with PSI Proposal No. 0448-279750. Based on the results of the PEI activities, the following conclusions have been developed:

### 5.1 CONCLUSIONS

- Generally, the majority of the 54 soil borings advanced at the site were extended to a depth approximately two (2) feet into the groundwater table. In soil borings where groundwater or saturated soils were not obviously encountered, the soil borings were advanced to a maximum depth of approximately 25 feet BLS. Refusal was generally encountered at various depths in the soil borings advanced in the bus maintenance/repair area, along the exterior walls, and the entirety of the upper floor.
- OVA-PID responses in the soil samples collected for screening purposes ranged from below the minimum equipment detection limit of 0.1 ppm to a maximum of 1,483 ppm. The highest OVA-PID response was recorded in the soil sample collected from Soil Boring SB-51 at approximately 10 feet BLS. Soil Boring SB-51 is located adjacent to the south entrance to the lower level parking garage.
- Petroleum related odors and/or staining were observed in the soil samples collected for screening purposes from soil borings generally located along the southern wall of the lower level parking garage, in the bus maintenance/repair area, in the lower level bus wash area, in the former/current areas of ASTs, in the former/current locations of USTs, and in the area of the sand filters. Please note, petroleum related odors were generally observed within the smear/saturated zones in the majority of the soil borings performed in the lower level, indicating the potential for widespread groundwater impact at the site. However, vadose zone (dry) petroleum related odors were generally isolated to specific areas (south wall of the lower level parking garage, bus maintenance/repair area, lower level bus wash area, AST south of bus maintenance/repair area, lower level UST, and southernmost sand filter).
- Based on the soil laboratory analytical results, of the 27 soil samples collected, 20 contained concentrations of metals and/or petroleum-related test parameters above their respective DOEE Tier 0 SSLs, DCRBCA contact levels, and/or EPA RSLs.
- Additional non-petroleum or metals related test parameters were detected in several of the soil samples analyzed; however, at concentrations below their respective regulatory criteria. This may indicate additional source areas of contamination have not yet been identified. Those test parameters and the soil samples they were detected in are provided below.
  - PCE (chlorinated solvent) – SB-40@19', SB-46@22', SB-59@1'
  - PCBs – SB-51@10'
  - 2-butanone (MEK; solvent) – SB-08@9', SB-11@1', SB-28@9', SB-29@1', SB-30@7', SB-32@1', SB-33@3'

- Of the 10 temporary monitoring wells installed at the site, only nine (9) were sampled and submitted for laboratory analysis. At the time of the groundwater sampling activities, Temporary Monitoring Well TMW-06 was observed to contain approximately 0.2-inches of free product; therefore, following EPA groundwater sampling guidelines, no groundwater sample was collected from this temporary monitoring well.
- Based on the groundwater laboratory analytical results, of the nine (9) groundwater samples collected, six (6) were reported to be impacted by PCBs, petroleum-, and/or chlorinated solvent-related test parameters at concentrations above their respective DOEE Tier 1 Screening Levels for Groundwater, DOEE Groundwater Quality Standards, and/or EPA NPDWR MCLs
- Utilizing TOC elevation measurements and depth-to-groundwater measurements, groundwater elevations were calculated. Based on these calculations, the groundwater flow direction in the shallow aquifer appears to be towards the southeast.
- Following collection of depth-to-groundwater measurements, the temporary monitoring wells were properly abandoned by removing the well casing and filling the boreholes with bentonite, followed by grout at the surface.

## 5.2 RECOMMENDATIONS

Based on field observations, OVA-PID responses, laboratory analytical results, and the client's stated objectives, PSI recommends performing additional soil and groundwater sampling activities to:

1. Better define the horizontal and vertical extents of the soil and groundwater impacts identified at the site;
2. Obtain soil and groundwater quality data in the vicinity of those areas of refusal and where analytical data was not able to be obtained;
3. Collect field screening and laboratory analytical data where data gaps in the soil and groundwater investigation have been identified; and
4. Collect additional groundwater data to determine if the identified on-site groundwater impacts extend to the property boundaries.

Once completed, the data obtained from the above stated recommendations will be utilized to prepare a comprehensive soil and groundwater management plan for later use during the planned demolition and construction phases of the project.

## **6 REPRESENTATIONS**

### **6.1 WARRANTY**

The field observations, measurements, and research reported herein are considered sufficient in detail and scope to form a reasonable basis for a Preliminary Environmental Investigation of this property. The investigation and conclusions presented herein are based upon the subjective evaluation of limited data. They may not represent all conditions at the subject site as they reflect the information gathered from specific locations. PSI warrants that the findings and conclusions contained herein have been promulgated in accordance with generally accepted environmental investigation methodologies and only for the site described in this report. It is necessarily limited to the conditions observed and to the information available at the time of the work.

Due to the limited nature of the work, there is a possibility that there may exist conditions which could not be identified within the scope of the investigation or which were not apparent at the time of report preparation. It is also possible that the testing methods employed at the time of the report may later be superseded by other methods. The description, type, and composition of what are commonly referred to as "hazardous materials or conditions" can also change over time. PSI does not accept responsibility for changes in the state of the art, nor for changes in the scope of various lists of hazardous materials or conditions. PSI believes that the findings and conclusions provided in this report are reasonable. However, no other warranties are implied or expressed.

### **6.2 USE BY THIRD PARTIES**

This report was prepared pursuant to the contract PSI has with STV, Inc. Because of the importance of the communication between PSI and its client, reliance or any use of this report by anyone other than STV, Inc., Clark Construction, and WMATA for whom it was prepared, is prohibited and therefore not foreseeable to PSI.

Reliance or use by any such third party without explicit authorization in the report does not make said third party a third-party beneficiary to PSI's contract with STV, Inc. Any such unauthorized reliance on or use of this report, including any of its information or conclusions, will be at third party's risk. For the same reasons, no warranties or representations, expressed or implied in this report, are made to any such third party.

Notes:

Table 2  
Groundwater Analytical Summary Table  
WMATA Northern Bus Facility  
February 7, 2020

ID = identification

BLS = below land surface

DC DOEE = Department of Energy and Environment

DCRBCA = District of Columbia Risk Based Corrective Action Screening Levels, Ju- 2011

EPA-RSL = United States Environmental Protection Agency, Regional Screening Level (November 2019)

µg/L = micrograms per liter or parts per billion (ppb)

mg/L = milligrams per liter or parts per million (ppm)

ND = Analyte not detected above the laboratory minimum detection level (LMDL) for specified analyte

NPDWR = National Primary Drinking Water Regulations

 - Highlighted yellow indicates constituent concentration greater than atleast one of the local or federal standards listed

## MISCELLANEOUS SOIL BORING PERMIT

THIS PERMIT MUST ALWAYS BE CONSPICUOUSLY DISPLAYED AT THE ADDRESS OF WORK  
UNTIL WORK IS COMPLETED AND APPROVED

**PERMIT NO. SB1900434**

Date: 11/08/2019

Address of Project: <b>4615 14TH ST NW</b>		Zone: <b>PDR-1</b>	Ward: <b>4</b>	Square: <b>2811</b>	Suffix:	Lot: <b>0802</b>
Description of Work: The scope of work proposed in this work plan includes soil boring and well installation for environmental testing. This Work Plan has been prepared in accordance with the District of Columbia Department of the Energy and the Environment (DOEE) Well Regulations 21 DCMR chapter 18.						
Permissson Is Hereby Granted To <b>Washington Metropolitan Area Transit</b>		Owner Address: <b>REAL ESTATE OFFICE 600 5TH ST NW</b>			PERMIT FEE: <b>462.00</b>	
No. of Bores : <b>60</b>	Location of Bores: <b>Private Property</b>	Site Plan Submitted <b>Yes</b>	Exist Use:			
Contractor: <b>Wamata Wamata</b>	Address: <b>WAMATA WAMATA</b>		Tel No: <b>2025686065</b>		Lic No: <b>00000</b>	
Engineer Co:	Address:		Tel No:		Lic No:	
Conditions/ Restrictions:  <b>This approval is subject to compliance with 21 DCMR Chapter 18, and Well and Soil Boring Permit Conditions.</b>						
<b>ALL CONSTRUCTION DONE ACCORDING TO THE CURRENT BUILDING CODES AND ZONING REGULATIONS;</b>						
As a condition precedent to the issuance of this permit, the owner agrees to conform with all conditions set forth herein, and to perform the work authorized hereby in accordance with the approved application and plans on file with the District Government and in accordance with all applicable laws and regulations of the District of Columbia. The District of Columbia has the right to enter upon the property and to inspect all work authorized by this permit and to require any change in construction which may be necessary to ensure compliance with the permit and with all the applicable regulations of the District of Columbia. Work authorized under this Permit must start within one(1) year of the date appearing on this permit or the permit is automatically void. If work is started, any application for partial refund must be made						
Director: Ernest Chrappah <i>Ernest Chrappah</i>		Permit clerk <b>BQUINN</b>			Expiration Date:	
TO REPORT WASTE, FRAUD OR ABUSE BY ANY DC GOVERNMENT OFFICIAL, CALL THE DC INSPECTOR GENERAL AT 1-800-521-1639						
To schedule a CONSTRUCTION INSPECTION or for INQUIRIES CALL (202) 442-9557						
Call Miss Utility at 811 or 1-800-257-7777 at least 48 Hours prior to excavation to obtain a ticket. <a href="http://www.missutility.net/wshingtondc/dcstatelaw.asp">/www.missutility.net/wshingtondc/dcstatelaw.asp</a>

Comments, Notes, Special Requirements, HAZARDS

Indicate if low-level methods required to meet current groundwater standards (SPLP for soil):

VOC (8260C SIM or 8011)  BN or BNA (8270D SIM)  SPLP (BN, BNA, Metals)  1,4 Dioxane

Check if applicable:

Project-Specific Reporting Limits  High Contaminant Concentrations  NJ LSRP Project (also check boxes above/right)

For NJ LSRP projects, indicate which standards need to be met:

NUDEP GWQS  NUDEP SRS  NUDEP SPLP  Other (specify):

Cooler Temperature 2.6

11) Sampler (print name): \_\_\_\_\_ Date: \_\_\_\_\_

**Comments, Notes, Special Requirements, HAZARDS**

Indicate if low-level methods required to meet current groundwater standards (SPLP for soil):  
 BN or BNA (8270D SIM)   
 VOC (8260C SIM or 8011)   
 SPLP (BN, BNA, Metals)   
 1,4 Dioxane

For NJ LSRP projects, indicate which standards need to be met:  
 NUDEP GWQS   
 NUDEP SRS   
 NUDEP SPLP   
 Other (specify): \_\_\_\_\_

Additional Notes

Comments, Notes, Special Requirements, HAZARDS

Indicate if low-level methods required to meet current groundwater standards (SPLP for soil):  
 BN or BNA (8270D SIM)   
 VOC (8260C SIM or 8011)   
 SPLP (BN, BNA, Metals)   
 1,4 Dioxane

Check if applicable:  
 Project-Specific Reporting Limits   
 High Contaminant Concentrations   
 NJ LSRP Project (also check boxes above/right)   
 Please note NUMBERED items. If not completed your analytical work may be delayed.  
 A fee of \$5/sample will be assessed for storage should sample not be activated for any analysis.
