    - a) Tensile strength, minimum percentage of unaged value: 100.
    - b) Elongation at rupture, minimum percentage of unaged value: 80.
  - 4) Oil immersion: 18 hours at 121degree C, plus or minus one degree C, ASTM D471, Table 1, No. 2 oil:
    - a) Tensile strength, minimum percentage of unaged value: 80.
    - b) Elongation at rupture, minimum percentage of unaged value: 80.
  - 5) Jacket materials other than cross-linked polyolefin complying with ICEAS-68-516, NEMA WC8. Jacket material free of PVC and PVC-based compounds.
7. Flame retardancy: Single-conductor and multiple-conductor cable demonstrating flame retardancy in accordance with IEEE-383. Not required for medium voltage cable.
- a. Single-conductor cable and individual conductors of multiple-conductor cable passing vertical flame test. Cable size for testing: 14 AWG.
  - b. Single-conductor cable, Size 1/0 AWG and larger, passing vertical tray flame test, using ribbon gas burner in accordance with UL 44. Cable size for testing: 1/0 AWG.
  - c. Multiple-conductor cable passing vertical tray flame test, using ribbon gas burner. Cable size for testing: 7/C or 9/C with 12 AWG or 14 AWG conductors.
8. Applied Voltage testing:
- a. Single-conductor cable and individual conductors of multiple-conductor cable to be given applied ac voltage dielectric strength test, i.e., six-hour water immersion test.
  - b. For single conductors of multiple-conductor cable, conduct tests prior to assembly as multiple-conductor cable
  - c. Test procedures:
    - 1) Polyethylene-insulated conductors: In accordance with paragraphs 6.14.1, 6.14.2, 6.14.5, and 3.5.2 of ICEA S-66-524.
    - 2) Other conductors: In accordance with paragraphs 3.5.2, 6.27.1 and 6.27.2 of ICEA S068-516.
- B. Smoke generation: Single-and-multiple-conductor cable jacket materials demonstrating low-smoke generation when tested in accordance with ASTM E662 by independent, nationally recognized testing agency.
1. Conduct tests on specimens of overall jacket material for multiple-conductor cable and of jacket material for single-conductor cable.
  2. Prepare slab specimens for each material .100 inch, plus-or-minus .005-inch thick, identical to those of finished cables and meeting minimum physical requirements specified.
  3. Prior to testing, submit six-inch square portion of each specimen.Tag sample with manufacture's jacket or insulation identification code or number.
  4. Test values for cross-linked polyolefin not to exceed the following:
    - a. Flaming mode:

- 1) Uncorrected maximum specific optical density during first four minutes of test: 150.
  - 2) Uncorrected maximum specific optical density for entire 20-minute test: 300.
  - b. Nonflaming mode:
    - 1) Uncorrected maximum specific optical density during first four minutes of test: 150.
    - 2) Uncorrected maximum specific optical density for entire 20-minute test: 300.
    - 3) Other conductors: In accordance with paragraphs 3.5.2, 6.27.1 and 6.27.2 of ICEA S-68-516.
- C. 15-kV Single-Conductor Cable:
1. Rated voltage: 15-kV.
  2. Conductor: As specified and with an extruded semi-conducting strand screen.
  3. Insulation: Ethylene-propylene rubber, 133 percent insulation level, with an extruded semi-conducting insulation screen.
  4. Shield: Copper tape, minimum thickness 2.5 mils.
  5. Jacket: Overall nonmetallic jacket of chlorosulfonated polyethylene or cross-linked polyolefin.
- D. 2000-Volt Single-Conductor Cable:
1. Rated voltage: 2000 volts.
  2. Conductor:
    - a. Extra-flexible, 1000 KCMIL cable, Class G stranded for power feeder between cable connector assembly and contact rail.
    - b. Standard 1000 KCMIL cable, Class D stranded for traction power feeder installed in conduit and cable tray.
    - c. 6 AWG cable for connecting DC surge arrester to ground.
  3. Insulation: Ethylene-propylene rubber, ICEA Type II, 90 degree C, suitable for dry and wet locations.
  4. Jacket: Overall nonmetallic jacket of T-33-655 thermoset type II or cross-linked polyolefin.
  5. UL labeling: Type RHW-2.
  6. Additional requirements:
    - a. Insulation power factor: Two percent maximum.
    - b. Bond jacketed to insulation to prevent moisture pockets. Minimum peel strength of the jacket from insulation: Four pounds per inch width for cross-linked polyolefin, and 10 pound per inch for heavy-duty neoprene.
- E. 2000-Volt, Aluminum-Sheathed Multiple-Conductor Cable for Polarity Reference for Tie Breaker Stations:
1. Individual conductors:
    - a. Rated voltage: 2000 volts.
    - b. Conductor Size: 6 AWG, Class B stranded.
    - c. Number of conductors: As shown.
    - d. Insulated with ethylene-propylene-rubber, with nonmetallic jacket.
    - e. UL-listed as Type RHW-2 or XHHW-2.
    - f. Insulation power factor: Two percent maximum.
    - g. Bond jacket to insulation to prevent moisture pockets. Minimum peel strength of the jacket from insulation: Four pounds per inch width for chlorosulfonated polyethylene or cross-linked polyolefin and 10 pound per inch for heavy-duty neoprene.
  2. Conductors assembled with non-wicking, flame-retardant filler to form cable of circular cross section.

3. Metallic-sheath:
    - a. Continuous corrugated sheath in accordance with ICEA S-19-81, Table 4-26A or UL 1569.
  4. Jacket: Overall nonmetallic jacket of T-33-655 thermoset type II or cross-linked polyolefin.
  5. Cable UL-listed: Type MC, suitable for wet and dry locations.
  6. Color coding:
    - a. Individual conductors shall be black.
- F. 600-Volt, Single-Conductor Cable:
1. Rated voltage: 600 volts.
  2. Insulated with jacketed ethylene-propylene-rubber with nonmetallic jacket UL-labeled Type RHW or unjacketed filled cross-linked polyethylene, UL-labeled Type XHHW-2 or RHW-2.
  3. Color coding: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
- G. 600-Volt, Nonmetallic Sheathed Multiple-Conductor Cable:
1. Individual conductors:
    - a. Rated voltage: 600 volts.
    - b. Number of conductors: As shown.
    - c. Construction: Complying with one of the following:
      - 1) Insulated with ethylene-propylene-rubber, with nonmetallic jacket.
      - 2) Insulated with composite compound of ethylene-propylene-rubber and polyethylene, UL Class EPCV, without outer jacket.
      - 3) Insulated with filled cross-linked polyethylene without outer jacket.
    - d. Phase and neutral conductors: Individually insulated.
    - e. Neutral conductors: Same size as phase conductors.
    - f. Insulated ground conductors: Sized in accordance with the NEC, unless otherwise shown.
    - g. UL-listed as Type RHW-2 or XHHW-2.
  2. Conductors assembled with non-wicking, flame-retardant filler to form cable of circular cross section.
  3. Multiple-conductor cable provided with overall nonmetallic jacket of T-33-655 thermoset type II or cross-linked polyolefin.
  4. Cable UL-listed as follows:
    - a. Nonmetallic-sheathed cable: Type TC, suitable for wet and dry locations.
  5. Color coding:
    - a. Power cables: In accordance with paragraph 200-6, 200-7 and 210-5 of the NEC.
    - b. Control cables: In accordance with ICEA S-66-524, Table K-2.
- H. 600-Volt, Aluminum-Sheathed Multiple-Conductor Cable (ALS) for connection between ETS and between Junction Box and Type 9 Light Fixture Cabinet and ETS in Tunnels:
1. Individual conductors:
    - a. Rated voltage: 600 volts.
    - b. Number of conductors: As shown.
    - c. Construction: Complying with one of the following:
      - 1) Insulated with ethylene-propylene-rubber, with nonmetallic jacket.
      - 2) Insulated with composite compound of ethylene-propylene-rubber and polyethylene, UL Class EPCV, without outer jacket.
      - 3) Insulated with filled cross-linked polyethylene without outer jacket.
    - d. Phase and neutral conductors: Individually insulated.
    - e. Neutral conductors: Same size as phase conductors.
    - f. Insulated ground conductors: Sized in accordance with the NEC, unless otherwise shown.

- g. UL-listed as Type RHW-2 or XHHW-2.
  - 2. Conductors assembled with non-wicking, flame-retardant filler to form cable of circular cross section.
    - a. Metallic-sheath:
    - b. Provide continuous corrugated sheath in accordance with ICEA S-19-81, Table 4-26A.
  - 3. Multiple-conductor cables provided with overall non-metallic jacket of T-33-655 thermostat type II or cross-linked polyolefin.
  - 4. Cable UL-listed as follows:
    - a. Metallic-sheathed cable: Type MC, suitable for wet and dry locations.
  - 5. Color coding:
    - a. In accordance with ICEA S-66-524, Table K-2.
    - b. Power cables: In accordance with ICEA S-66-524, Table K-1.
- I. Instrumentation Cable: 2/C, twisted pairs:
  - 1. Individual conductors:
    - a. Rated voltage: 600 volts.
    - b. Number of conductors: As shown.
    - c. Construction: Insulated with polyethylene insulation.
  - 2. Conductors twisted and covered with a tinned copper braided shield; Class B stranded.
  - 3. Provided with overall jacket.
- J. Bare Conductor: ASTM B3, annealed copper conductor; 8 AWG and larger, Class B stranded.
- K. Medium Voltage Cable Terminations:
  - 1. Except as otherwise specified, heat shrinkable tubing kit type, with grounding accessory kits, in accordance with the characteristics of the medium voltage cable shall be furnished.
    - a. Shrinkable tubing kits to be pre-stretched shrinkable tubing and shall contain all necessary components to reinstate cable insulation, metallic shielding/grounding system and overall jacket.
- L. Cable Pulling Calculations:
  - 1. The Contractor shall perform pulling calculations in accordance with the cable manufacturer's recommendations, and these specifications. The calculations shall be made by an Electrical Engineer registered in the State of Maryland, or State of Virginia (depending on the location), and District of Columbia, depending on the location and bear the seal and signature of the engineer who is responsible for the calculations. Calculations shall be made for all conductors including DC power cable, 15kV cable, and multiconductor control cable when installed in conduit under the following conditions:
    - a. The conduit run exceeds 100 feet vertically;
    - b. The conduit run exceeds 300 feet horizontally; and
    - c. The conduit run contains a total of over 180 degrees of bend.
  - 2. The Contractor shall also provide calculations for any additional run under any condition when requested by the Engineer. The calculations shall establish that the Contractor's cable installation can be implemented without damage to any wire or cable.
  - 3. For pulling calculations, consideration shall be given to the following parameters - fill, coefficient of friction, clearance configuration, jam ratio of the cables and conduit, weight correction factor, bend radii, training of cables on entering and existing the conduits, maximum allowable tension, sidewall load, the method of attaching the conductors to the pulling equipment, and weight of the cables. These factors shall

be calculated for each pull as required. The contractor shall not exceed the maximum allowable values of sidewall pressure, pulling strain on conductors or sheath, limits of pulling device, and pulling tension.

4. In general, the Contractor shall not exceed the following guidelines:
  - a. The maximum pulling strain on the cable with a pulling eye attached to the conductors is a function of the conductor area as follows:  $TM = 0.008 \times n \times CM.$ , where TM = Maximum tension (lbs), n = number of conductors, CM = area of each conductor circular miles.
  - b. When a basket-weave grip is used in lieu of a pulling eye, the maximum tension shall not exceed the value calculated for the pulling eye method or 1000 lbs per grip, whichever is less.
  - c. The sidewall pressure loads shall not exceed 300 lb/ft of bend radius, or the Wire and Cable Manufacturer's recommendation, whichever is less.
  - d. The jam ratio shall not fall between 2.8 and 3.2.
  - e. The coefficient of the friction for the cables with lubrication shall be taken to be 0.5.
5. Cable pulling calculations shall be submitted to the Engineer for approval. Cable shall not be installed until the contractor receives approval from the Engineer for the pulling calculations and cable installation.

## **PART 3 EXECUTION**

### **3.01 INSTALLATION**

- A. Install all wiring continuous, without splices, between terminations, except as otherwise noted.
- B. Install single-conductor cable in conduit or cable tray as shown. Install UL Type TC multiple-conductor cable in cable trays. Install UL Type MC multiple-conductor cable and ground cable on channel inserts, cable trays or racks, using straps and fasteners as specified in Section 16052 (Basic Materials and Methods). Install UL Type MC multiple-conductor cable in conduit where shown or required. On walls or ceilings, fasten cable directly to channel inserts, or use expansion bolt anchors to attach to concrete and toggle bolts to attach to concrete masonry walls.
- C. Use nylon straps to bundle and secure wire and cable located in panelboards, cabinets, switchboards, switchgear and control panels.
- D. Minimum bending radius 12 times outer diameter of cable. Where shown, use shorter bending radius as permitted by NEC, Appendix H of ICEA S-66-524, NEMA WC7 and cable manufacturer.
- E. To facilitate pulling cable, use UL-listed lubricant recommended by cable manufacturer.
- F. Use polyethylene or other suitable nonmetallic rope for pulling cable. Attach to cable by means of either woven basket grips or pulling eyes attached directly to the conductors.
- G. In damp and dusty indoor locations, manholes and outdoor locations, seal cable at conduit termination using duct sealing compound.
- H. Support cable installed in manholes at each invert location with cable brackets, racks and insulators specified in Section 16052 (Basic Materials and Methods). Provide brackets of suitable length with one insulator for each cable.
- I. Support traction power cable installed in vertical risers with nonmetallic cable grip support at

top of riser and with nonmetallic or aluminum multiple segment wedging plug type cable support at intermediate pull box provided as specified in Section 16052 (Basic Materials and Methods)

- J. Where shown or necessary, install cable seal fitting specified in Section 16052 to prevent entry of water into electrical facilities. Where approved, use seal compound specified in Section 16052 (Basic Materials and Methods).
- K. Terminate medium voltage cable, using the specified termination kits, in accordance with the manufacturer's recommendations.
- L. The splicing of power and control cables is not permitted in ductbanks, cable troughs or cable trenches. However, if permitted by the Engineer, make watertight splices as approved.
- M. The Contractor shall hook up 1000 KCMIL traction power cables at switchgear end and trackside (negative and positive rails) when directed by the Engineer.
- N. All 1000 KCMIL cables shall be secured at every rung on the cable tray with tie wraps.
- O. Identify cable terminations, feeders, power and control circuits using the following:
  - 1. Cable Tags: Stainless steel tags punched with conduit or cable number as shown.
  - 2. Wire Labels: Sleeve-type, heat shrinkable, flame retardant Raychem TMS product line, Type XPE or equal and conforming to UL 224. Wire identification same as corresponding terminal block identification unless otherwise shown. The labels on 1000 KCMIL cable shall be clear, heat shrinkable with 1/2" height yellow lettering stamped on inside. The labels shall have reference of substation or tie breaker station breaker Supervisory control ID number and cable sequence in the branch of the feeder (e.g. BRK. 32-A) at both ends.
  - 3. Attach tags to cable with slip-free plastic lacing or nylon bundling straps. Use designation shown.

### **3.02 FIELD QUALITY CONTROL**

- A. Furnish equipment required to perform tests. Prior to insulation and high potential tests, disconnect instruments and equipment which might be damaged during such tests. Conduct tests in presence of the Engineer. Schedule all tests through the Engineer and provide a minimum 48 hours notice.
- B. Submit test procedure for approval and perform approved tests. Do not perform tests without approved test procedure. Schedule all tests through the Engineer. Tests include but not limited to the following:
  - 1. 600-volt non-metallic sheathed multiple-conductor cable:
    - a. Test continuity of cable conductors using ohmmeter.
    - b. Proof-test insulation resistance to ground and between insulated conductors for minimum of one minute using 1000-volt megger. Insulation resistance: one megohm minimum, corrected to 15.6 C. Testing procedures shall be as follows:
      - 1) Disconnect all wires of the cable under test at both ends and tape the far end of the wire under test with insulating tape of 600-volt class. Connect the bare end of the wire under test to the positive terminal of 1000-volt megger.
      - 2) Connect the negative terminal of 1000-volt megger to the nearest available ground terminal.
      - 3) Measure the insulation resistance of the wire under test by cranking the megger.
    - c. When cable shows insulation resistance of less than one megohm, perform

- high potential test at 80 percent of factory dc test voltage or as recommended by cable manufacturer. A gradual decrease of leakage current with time indicates an acceptable cable installation.
2. 600-volt aluminum sheathed multiple-conductor cable:
    - a. Test continuity of each conductor using ohmmeter.
    - b. Disconnect the cable under test at both ends. Proof-test insulation resistance between each conductor and the metal sheath. While conducting the test, all conductors of the cable and the metallic sheath other than that under test shall be grounded. Insulation resistance shall be measured with a 1000-volt megger for minimum of one minute between the wire under test and ground. Insulation resistance: one megohm minimum, corrected to 15.6 degree C.
    - c. When cable shows insulation resistance of less than one megohm, perform high potential test at 80 percent of factory dc test voltage or as recommended by cable manufacturer. A gradual decrease of leakage current with time indicates an acceptable cable installation.
  3. 600-volt single-conductor cable:
    - a. Test continuity of conductors using ohmmeter.
    - b. Disconnect cable under test at both ends. Proof-test insulation resistance between each cable and the conduit in which the cable runs. While conducting the test, all other cables installed in the same conduit with the cable under test shall be connected to ground at one end. Insulation resistance shall be measured with a 1000-volt megger for minimum of one minute between the cable under test and the ground. Insulation resistance: One megohm minimum corrected to 15.6 degree C.
    - c. When cable shows insulation resistance of less than one megohm, perform high potential test at 80 percent of factory dc test voltage or as recommended by cable manufacturer. A gradual decrease of leakage current with time indicates an acceptable cable installation.
  4. 2000-volt single-conductor cable:
    - a. Test continuity of conductors using ohmmeter.
    - b. Proof-test insulation resistance to ground of the cable under test for a minimum of one minute using a 2500-volt three-terminal megger. Insulation resistance: 500 megohms, minimum, corrected to 15.6 degree C. Testing shall be done prior to termination of the cables at the two ends. Terminal lugs shall be installed prior to cable testing. Testing procedure shall be as follows:
      - 1) Proof-test the system insulation resistance to ground of the cable under test using step-voltage testing method.
      - 2) Insulation resistance: 500 megohms, corrected to 15.6 degree C. Testing shall be done after all cables have been installed and lugged.
      - 3) Isolate all cables at trackside and in the switchgear.
      - 4) Secure each cable under test and connect the positive test lead of the megger to one end of the cable under test. Connect the megger ground lead to the station ground busbar.
      - 5) Apply a 1000-volt dc test voltage to the cable for one minute and record the end test reading on the data sheet.
      - 6) If the megger reading is greater than or equal to 500 megohms, proceed with testing the next cable in the test plan. If the test value is lower than 500 megohms, proceed with the step-voltage test as described below.
      - 7) Step-voltage test:
        - a) Examine and clean cable termination for presence of moisture or contamination.

- b) Make a second megger test at 1000 volts dc for one minute and record end test reading on data sheet. If reading is less than 500 megohms, proceed with step (c) below, otherwise record new test reading on data sheet with comments depicting corrective action and proceed with testing next cable in the test plan.
    - c) Increase the megger test voltage in increments of 500 volts starting at 1500 volts dc up to 2500 volts dc and perform one minute insulation resistance measurement tests. Record end test readings on data sheet for each incremental test.
    - d) Compare insulation test readings at all levels of test voltage. A decrease of insulation resistance from the 1000 volts dc test voltage to the 2500 volts dc test voltage indicates the cable insulation has incipient weakness and the cable shall be replaced at no cost to the Authority.
  - 8) Repeat the above procedures for all the positive and negative traction power cables.
- 5. 2000-volt aluminum-sheathed multiple-conductor cable:
  - a. Test continuity of each conductor using ohmmeter.
  - b. Disconnect the cable under test at both ends. Proof test insulation resistance between each conductor and the metal sheath. While conducting the test, all conductors of the cable and the metallic sheath other than that under test shall be grounded. Insulation resistance shall be measured with a 2500-volt megger for minimum of one minute. Insulation resistance: 500 megohms minimum corrected to 15.6 degree C.
  - c. When cable shows insulation resistance less than 500 megohms, perform high potential test at 80 percent of factory test voltage or as recommended by cable manufacturer. A gradual decrease of leakage current with time indicates an acceptable cable installation.
- 6. 15-kV single-conductor cable:
  - a. Test continuity of conductors using ohmmeter.
  - b. Proof-test insulation resistance between conductor and the metallic shield. While conducting the test, the metal shield shall be tied to ground. Insulation resistance shall be measured with a 2500-volt megger for minimum of one minute. Insulation resistance: 500 megohm minimum corrected to 15.6 degree C.
  - c. Submit certified test reports within 10 days after completion of test.

**END OF SECTION**

## SECTION 16129

### 2000 VOLT SHIELDED CABLE FOR TRACTION POWER

#### PART 1. GENERAL

##### 1.01 SUMMARY

- A. This section specifies furnishing, installing and testing shielded, low-smoke, halogen-free, low toxicity, single conductor 2000V cable, with standard and "extra-flexible" stranding. Size as shown on the contract drawings.
- B. Compensation for work specified in this section will be made in accordance with the Unit Price Schedule.
- C. Related sections include:
  - 1. Section 16051 - Scope of Work For Traction Power
  - 2. Section 16052 - Basic Materials and Methods For Traction Power
  - 3. Section 16128 - Wire and Cable For Traction Power
  - 4. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power

##### 1.02 REFERENCES

- A. Pertinent provisions of the current edition of the following listed Codes, Regulations, Reference Standards and Specifications shall apply to the work of this Section, except as they may be modified herein, and are hereby made a part of this Specification to the extent required. In instances of conflict, the more stringent requirement will take precedence.
  - 1. Latest codes and regulations of the jurisdictional authorities.
  - 2. NEC, NESC.C2.
  - 3. ICEA: S-95-658, S-96-659, S-93-639, T-26-465, T-27-581, T-28-562, T-33-655.
  - 4. IEEE: 383.
  - 5. NEMA: WC53, WC54, WC70, WC71, WC74.
  - 6. ASTM: B3, B8, B173, D412, D471, D572, D573, E662.
  - 7. UL: 1072, 1581, 1685
  - 8. MIL: C-24643

##### 1.03 SUBMITTALS

Submit the following for approval in accordance with the Special Conditions and with the additional requirements as specified for each:

- A. Shop Drawings: Submit shop drawings for each type of cable in accordance with Section 16051.
- B. Samples: Specified smoke-density test sample will become property of the Authority.
- C. Certification
  - 1. Certified flame retardancy test reports and data for tests performed not more than 36 months prior to submittal, for materials which are identical to those of the furnished cable.
  - 2. Submit smoke-density test reports and data from tests performed not more than

36 months prior to the submittal for materials that are identical to those of the furnished cable.

3. Certified test reports demonstrating that cable complies with specified requirements and those of referenced ICEA and NEMA Standards.
4. Certificates from manufacturer and the Underwriters Laboratories Inc.(UL Listing) verifying that products conform to specified requirements. Include certificates with submittal of shop drawings and with each cable shipment.

#### **1.04 QUALITY ASSURANCE**

- A. Qualifications: Select a manufacturer who is regularly engaged in production of similar wire and cable, particularly to Railway or Transit industry in USA. The manufacturer must have in place a quality system in accordance with ISO 9001 or 9002 and be registered by an independent registration organization.
- B. For Codes, Regulations, Reference Standards and Specifications, refer to Article 1.02.

#### **1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Mark each single-conductor cable to show UL Listing, size, voltage, manufacturer, etc. in accordance with NEC, ICEA/NEMA and UL requirements.
- B. Ship each unit securely packaged and labeled for safe handling and shipment.
- C. Store products in a dry and secure facility.

### **PART 2 PRODUCTS**

#### **2.01 MATERIALS**

- A. General Requirements for Single-Conductor Shielded Cable:
  1. Type and rating: Type II shielded, low smoke, halogen free, low toxicity 2000 Volt jacketed cable.
  2. Conductors:
    - a. ASTM and ICEA standards.
    - b. Standard 1000kcmil, 127 strand Class D tinned copper.
    - c. Other constructions, as specified or shown on the contract drawings.
    - d. Cable suitable for dry and wet locations and hostile environmental conditions associated with underground heavy rail transit systems.
  3. Standards: Except as modified, cable shall comply with the Article 1.02.
  4. Conductor insulation: Low smoke, halogen free, low toxicity Ethylene-Propylene Rubber (EPR), ICEA Type II, and have the following properties:
    - a. The low smoke, halogen free, low toxicity EPR insulation shall be capable of withstanding operating copper conductor temperature of 90 degrees C continuous, 130 degrees C emergency overload for standard prescribed periods and 250 degrees C for short circuits. The insulation shall be highly moisture resistant, shall be free-stripping and leave the surface of the conductor clean. An opaque mylar separator may be used between the conductor and the insulation to ease stripping. Any additional tapes (e.g., flame-retardant fiberglass over the tinned copper tape, etc.) deemed necessary by the manufacturer shall be clearly noted.
    - b. Insulation thickness:

- 1) Minimum average thickness of the EPR insulation wall over the conductor: 90 mils (0.090 inches).
- 2) Minimum average thickness of the supplemental EPR insulation wall over the shield: 80 mils (0.080 inches).

The minimum point thickness for both layers of insulation shall not be less than 90% of the minimum average thickness.

c. The EPR insulation will have the following physical and electrical characteristics when tested in strict accordance with Article 1.02 standards:

- 1) Tensile strength (minimum): 1200 PSI .
- 2) Elongation (minimum): 150 percent.
- 3) Tensile stress at 100 percent elongation (minimum): 500 PSI.
- 4) When air oven tested for 168 hours at 121 degrees C  $\pm$  1 degree C:
  - a) Tensile strength: 75 percent
  - b) Elongation: 75 percent.
- 5) When Hot Creep tested after conditioning at 150 degrees C  $\pm$  2 degrees C:
  - a) Elongation (maximum): 50 percent
  - b) Set (maximum): 5 percent.
- 6) Electrical properties after water immersion at 75 degrees C  $\pm$  1 degree C:
  - a) Permittivity after 24 hours (maximum): 6.0
  - b) One to 14 days immersion (maximum increase in capacitance): 5 percent
  - c) Seven to 14 days immersion (maximum increase in capacitance): 3 percent
  - d) Stability factor after 4 days (maximum): 1.0,  
 - OR -  
 Stability factor difference (maximum) 1 - 14 days: 0.5
- 7) Insulation resistance constant at 15.6 degrees C (minimum): 10,000 meg/1000 feet.

5. Shield:

- a. The shield shall consist of a continuous layer of tin-coated copper tape at least 5 mils (0.005 inches) thick. The tape shall be a minimum width of 0.75 inches and be applied with an overlap of at least 0.25 inches or 25 % of its width.
- b. The tape shall be free from burrs and shall be applied in such a manner that electrical continuity or contiguity will not be distorted or disrupted during normal installation bending. Joints in tapes shall be made electrically continuous by welding, soldering or brazing. Butted tapes shall not be permitted.

Note: Reminder: Apply supplemental EPR over shield before non metallic jacket. See 2.01 A.4.b.2), above.

6. Nonmetallic jacket for single-conductor cable:

- a. Cross-linked polyolefin (XLPO) Thermoset Type II complying with the following physical requirements. Minimum average wall thickness shall be 0.095 inches, minimum thickness at any point 0.080 inches. Properties tested in accordance with ASTM, ICEA, UL, IEEE and MIL specifications, refer to Article 1.02. Jacket material shall be low-smoke,

halogen-free, low toxicity, fire retardant. Bond jacket to insulation to prevent moisture pockets between the jacket and insulation. The minimum peel strength of the jacket from insulation shall be four pounds per inch width.

- 1) Tensile strength, minimum pounds per square inch: 1,600.
  - 2) Elongation at rupture, minimum percent: 150.
  - 3) Aging requirement: After 168 hours in air oven test at 121degrees C  $\pm$  1 degree C:
    - a) Tensile strength, minimum percentage of unaged value: 85.
    - b) Elongation at rupture, minimum percentage of unaged value: 75.
  - 4) When Hot Creep tested after conditioning at 150 degrees C  $\pm$  2 degrees C:
    - a) Elongation (maximum): 100 percent
    - b) Set (maximum): 10 percent.
  - 5) Cold Bend Temperature: minus 25 degrees C.
  - 6) Gravimetric Method - Water Absorption (maximum): 50 mg/in<sup>2</sup>.
  - 7) When oil immersion tested for 18 hours at 121 degrees C  $\pm$  1 degree C:
    - a) Tensile strength: 50 percent
    - b) Elongation: 50 percent.
  - 8) Smoke density, 100 mil slab:
    - a) Flaming mode:  
Uncorrected maximum specific optical density during first four minutes of test Ds4: 50  
Uncorrected maximum specific optical density for entire 20-minute test, Dm: 250
    - b) Non-flaming mode:  
Uncorrected maximum specific optical density during first four minutes of test, Ds4: 50  
Uncorrected maximum specific optical density for entire 20-minute test, Dm: 350
7. The completed cable (including insulation and jacket) will be tested in accordance with ASTM, UL and MIL standards by an independent, nationally recognized testing agency. The combustion requirements and characteristics are:
- a. Acid gas equivalent (maximum): 2 percent
  - b. Halogen content: 0.2 percent
  - c. Smoke density, 100 mil slab:  
Prepare 100 mil (0.100 inches), plus-or-minus 0.005 inches, thick slab specimens for each material identical to those of finished cables and meeting minimum physical requirements specified. Prior to testing, submit six-inch square portion of each specimen. Tag sample with manufacture's jacket or insulation identification code or number.
    - 1) Flaming mode:  
Uncorrected maximum specific optical density during first four minutes of test Ds4: 50  
Uncorrected maximum specific optical density for entire 20-minute test, Dm: 250
    - 2) Non-flaming mode:  
Uncorrected maximum specific optical density during first four minutes of test, Ds4: 50  
Uncorrected maximum specific optical density for entire 20-minute test, Dm: 350

- d. Flame retardancy: All 2000-volt shielded power cables shall be flame-retardant and shall pass the vertical tray flame test as described in the IEEE - 383, ICEA S-95-658, T-30-520 and UL-1581, 1685. Cable size for testing shall be a minimum 250 kcmil.

8. Applied Voltage testing:

- a. All 2000-volt shielded cable to be given applied AC voltage dielectric strength test, i.e., six-hour water-immersion test.
- b. Test procedures:  
Conductor shall be immersed in water for a minimum of six hours before test. Shielded cables shall be tested from conductor to shield, and tested from shield to water at 11.0 kV AC. Test in accordance with methods outlined in appropriate sections of ICEA, NEMA and UL standards.

B. Cable Pulling Calculations

The Contractor shall perform pulling calculations in accordance with the cable manufacturer's recommendations, and these specifications. The calculations shall be made by an Electrical Engineer registered in the State of Maryland, or the State of Virginia, and District of Columbia, depending on the installation location and bear the seal and signature of the engineer who is responsible for the calculations. Calculations shall be made for all conductors including DC power cable, 15kV cable, and multiconductor control cable when installed in conduit under the following conditions:

1. The conduit run exceeds 100 feet vertically;
2. The conduit run exceeds 300 feet horizontally; and
3. The conduit run contains a total of over 180 degrees of bend.

The Contractor shall also provide calculations for any additional run under any condition when requested by the Engineer. The calculations shall establish that the Contractor's cable installation can be implemented without damage to any wire or cable.

For pulling calculations, consideration shall be given to the following parameters - fill, coefficient of friction, clearance configuration, jam ratio of the cables and conduit, weight correction factor, bend radii, training of cables on entering and existing the conduits, maximum allowable tension, sidewall load, the method of attaching the conductors to the pulling equipment, and weight of the cables. These factors shall be calculated for each pull as required. The contractor shall not exceed the maximum allowable values of sidewall pressure, pulling strain on conductors or sheath, limits of pulling device, and pulling tension.

In general, the Contractor shall not exceed the following guidelines:

1. The maximum pulling strain on the cable with a pulling eye attached to the conductors is a function of the conductor area as follows:  $TM = 0.008 \times n \times CM$ ., where TM = Maximum tension (lbs), n = number of conductors, CM = area of each conductor circular mils.
2. When a basket-weave grip is used in lieu of a pulling eye, the maximum tension shall not exceed the value calculated for the pulling eye method or 1000 lbs per grip, whichever is less.
3. The sidewall pressure loads shall not exceed 300 lb/ft of bend radius, or the Wire and Cable Manufacturer's recommendation, which ever is less.
4. The jam ratio shall not fall between 2.8 and 3.2.
5. The coefficient of the friction for the cables with lubrication shall be taken to be 0.5

Cable pulling calculations shall be submitted to the Engineer for approval. Cable shall not be installed until the contractor receives approval from the Engineer for the pulling calculations and cable installation.

## **PART 3 EXECUTION**

### **3.01 INSTALLATION**

- A. Install all cable continuous, without splices, between terminations, except as otherwise noted.
- B. Install single-conductor cable in conduit or cable tray as shown. On walls or ceilings, fasten cable directly to channel inserts, or use expansion bolt anchors to attach to concrete and toggle bolts to attach to concrete masonry walls.
- C. Minimum bending radius 12 times outer diameter of cable. Where shown, use shorter bending radius as permitted by NEC, and/or appropriate sections of ICEA/NEMA standards and cable manufacturer.
- D. To facilitate pulling cable, use UL-listed lubricant recommended by cable manufacturer.
- E. Use polyethylene or other suitable nonmetallic material for the line to pull the cable. The pulling line should be adequately sized to safely pull the cable into the raceway. The pulling line should be high strength, low stretch and abrasion resistant. Attach to cable by means of either woven basket grips or pulling eyes attached directly to the conductors.
- F. In damp and dusty indoor locations, manholes and outdoor locations, seal cable at conduit termination using duct sealing compound prior to cable pulling.
- G. Support cable installed in manholes at each invert location with cable brackets, racks and insulators specified in Section 16052 (Basic Materials and Methods). Provide brackets of suitable length with one insulator for each cable.
- H. Support traction power cable installed in vertical risers with nonmetallic cable grip support at top of riser and with nonmetallic or aluminum multiple segment wedging plug type cable support at intermediate pull box provided as specified in Section 16052 (Basic Materials and Methods).
- I. Install cable seal fitting specified in Section 16052 to prevent entry of water into electrical facilities. Where approved, use seal compound specified in Section 16052 (Basic Materials and Methods).
- J. The splicing of power cables is not permitted in ductbanks, cable troughs or cable trenches. However, if permitted by the Engineer, make watertight splices as approved and note on as-built drawings.
- K. The Contractor shall hook up 1000 KCMIL traction power cables at switchgear end and track side (negative and positive rails) when directed by the Engineer.
- L. All 1000 KCMIL cables shall be secured at every rung on the cable tray with tie wraps.
- M. Identify cable terminations, feeders, power and control circuits using the following:
  - 1. Cable Tags: Non-ferrous tags or pressure sensitive labels, stamped or printed with cable number as shown.
  - 2. Labels: The labels on 1000 KCMIL cable shall be clear, heat shrinkable with ½" height yellow lettering stamped on inside. The labels shall have reference of substation or tie breaker station breaker Supervisory control ID number and cable sequence in the branch of the feeder (e.g. BRK. 32-A) at both ends, as well as at each entry and exit point or stub up, from concealed raceways.
  - 3. Attach tags to cable with slip-free plastic lacing or nylon bundling straps. Use designation shown.
- N. Refer to WMATA's procedure for shielded cable terminations.
- O. Refer to WMATA's procedure for shielded cable monitoring system.

- P. Provide fire proofing on exposed cables.

### 3.02 FIELD QUALITY CONTROL

- A. Furnish equipment required to perform tests. Prior to insulation and high potential tests, disconnect instruments and equipment that might be damaged during such tests. Conduct tests in presence of the Engineer. Schedule all tests through the Engineer and provide a minimum 48 hours notice.
- B. Submit test procedure for approval and perform approved tests. Do not perform tests without approved test procedure. Schedule all tests through the Engineer. Tests include but not limited to the following:
  - 1. 2000-volt single-conductor shielded cable:
    - a. Test continuity of conductors using ohmmeter.
    - b. Proof-test insulation resistance to shield or to ground of the cable under test for a minimum of one minute using a 2500-volt three-terminal megger. Insulation resistance: 10,000 megohms, minimum, corrected to 15.6 degrees C. Testing shall be done prior to termination of the cables at the two ends. Terminal lugs shall be installed prior to cable testing. Testing procedure shall be as follows:
      - 1) For shielded cables, proof-test insulation resistance between conductor and the metallic shield. While conducting the test, the metal shield shall be tied to ground. For unshielded cables, proof-test the system insulation resistance to ground of the cable. The step-voltage testing method shall be used.
      - 2) Testing shall be done after all cables have been installed and lugged. Isolate all cables at track side and in the switchgear.
      - 3) Secure each cable under test and connect the positive test lead of the megger to one end of the cable under test. Connect the megger ground lead to the station ground busbar and/or cable shield, as appropriate.
      - 4) Apply a 1000-volt dc test voltage to the cable for one minute and record the end test reading on the data sheet.
      - 5) If the megger reading is greater than or equal to 10,000 megohms, proceed with testing the next cable in the test plan. If the test value is lower than 10,000 megohms, proceed with the step-voltage test as described below.
      - 6) Step-voltage test:
        - a) Examine and clean cable termination for presence of moisture or contamination.
        - b) Make a second megger test at 1000 volts dc for one minute and record end test reading on data sheet. If reading is less than 10,000 megohms, proceed with step (c) below, otherwise record new test reading on data sheet with comments depicting corrective action and proceed with testing next cable in the test plan.
        - c) Increase the megger test voltage in increments of 500 volts starting at 1500 volts dc up to 2500 volts dc and perform one minute insulation resistance measurement

tests. Record end test readings on data sheet for each incremental test.

- d) Compare insulation test readings at all levels of test voltage. A decrease of insulation resistance from the 1000 volts dc test voltage to the 2500 volts dc test voltage indicates the cable insulation has incipient weakness and the cable shall be replaced at no cost to the Authority.
- 7) Repeat the above procedures for all the positive and negative traction power cables.

END OF SECTION

## SECTION 16130

### RACEWAYS, BOXES AND CABINETS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing conduit, raceways, cable trays, boxes and cabinets to form raceway and support system for power, communication and control cables.
- B. Related Work Specified Elsewhere:
  - 1. Underground electrical and communications distribution systems: Section 02585.
  - 2. Concrete formwork: Section 03100.
  - 3. Cast-in-place structural concrete: Section 03300.
  - 4. Structural precast concrete: Section 03400.
  - 5. Grounding and bonding: Section 16060.
  - 6. Firestopping: Section 07841.

##### 1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is engaged in production of similar raceways, boxes and cabinets.
- B. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. National Electrical Code (NEC).
  - 3. National Electrical Manufacturers Association (NEMA): 250, Enclosures for Electrical Equipment (1000 Volts Maximum); VE 1, Metallic Cable Tray Systems; TC-2, Electrical Polyvinyl Chloride (PVC) Tubing and Conduit.
  - 4. American National Standards Institute (ANSI): C80.1, Rigid Steel Conduit - Zinc Coated; C80.5, Aluminum Rigid Conduit - (ARC); and Z55.1, Gray Finishes for Industrial Apparatus and Equipment.
  - 5. UL: 5, Surface Metal Raceways and Fittings; 6, Rigid Metal Conduit; 50, Enclosures for Electrical Equipment; 94, Test for Flammability of Plastic Materials for Parts in Devices and Appliances; 360, Liquid Tight Flexible Steel Conduit; 514A, Metallic Outlet Boxes; 514B, Fittings for Conduit and Outlet Boxes; 514C, Nonmetallic Outlet Boxes, Flush-Device Boxes and Covers; 651, Schedule 40 and 80 Rigid PVC Conduit; 884, Underfloor Raceways and Fittings; and 1684, Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.
  - 6. Federal Specifications (FS): FF-S-325C, FF-S-760, TT-S-227.
  - 7. American Standards of Testing and Materials (ASTM): A47/A47M-99, Standard Specification for Ferritic Malleable Iron Castings; A123/A123M-00, Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products; A185-97, Standard Specification for Steel Welded Wire Fabric, Plain, for Concrete Reinforcement; A276-00a, Standard Specification for Stainless Steel Bars and Shapes; A507-00, Standard Specification for Drawing Alloy Steel, Sheet and Strip, Hot-Rolled and Cold-Rolled; A532/A532M-93a(1999)e1, Standard Specification for Abrasion-Resistant Cast Irons; A536-84(1999)e1, Standard Specification for Ductile Iron Castings; A615/A615M-00, Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement; A653/A653M-00, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process; B138-96, Standard Specification for Manganese Bronze Rod, Bar and Shapes; B455-96, Standard Specification for Copper-Zinc-Lead Alloy (Leaded-Brass) Extruded Shapes; B584-00, Standard Specification for Copper Alloy

Sand Castings for General Applications; B633-98, Standard Specification for Electrodeposited Coatings of Zinc on Iron and Steel; C109/C109M-99, Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in. or [50-mm] Cube Specimens); C173-94ae1, Standard Test Method for Air Content of Freshly Mixed Concrete by the Volumetric Method; C231-97e1, Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method; D149-97a, Standard Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies; D495-99, Standard Test Method for High-Voltage, Low-Current, Dry Arc Resistance of Solid Electrical Insulation; D570-98, Standard Test Method for Water Absorption of Plastics; D638-00, Standard Test Method for Tensile Properties of Plastics; D648-00a, Standard Test Method for Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position; and D790-00, Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.

8. American Association of State Highway and Transportation Officials (AASHTO): Standard Specifications for Highway Bridges (SSHB).
9. ITS: Directory of ITS listed products.

- C. The following items to be listed or labeled per referenced UL or ITS directory:
1. Conduit and fittings.
  2. Surface raceways and fittings.
  3. Underfloor raceways and fittings.
  4. Boxes.
  5. Cabinets.

### **1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings.
  2. Certification.

### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- C. Store products in secure and dry storage facility.

## **PART 2 - PRODUCTS**

### **2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements for Conduit, Raceways, Cable Trays, Boxes, Cabinets and Fittings:
1. Size: As shown, minimum conduit size 3/4 inch.
  2. Materials:
    - a. Steel sheet: ASTM A507-00.
    - b. Zinc-coated steel sheet: ASTM A653/A653M-00.
    - c. Cast iron: ASTM A532/532M-93a(1999)e1.
    - d. Ductile iron: ASTM A536-84(1999)e1.
    - e. Malleable iron: ASTM A47/A47M-99.
    - f. Bronze extrusion: ASTM B455-96, Alloy C38500.

- g. Bronze casting: ASTM B584-00, Alloy C83600.
  - h. Rigid fiberglass reinforced epoxy: UL 1684.
  - i. Stainless steel: ASTM A276-00a, Type 304.
- 3. Zinc coating:
  - a. Hot-dip galvanizing: ASTM A123/A123M-00.
  - b. Electro galvanizing: ASTM B633-98.
- B. Galvanized-Steel Rigid Conduit and Fittings: UL 6 and ANSI C80.1, zinc coating tested in accordance with reference test in appendix.
- C. Plastic Conduit and Fittings:
  - 1. PVC, UL 651, NEMA TC-2, Schedule 40 and 80 heavy-wall, for use with 90C conductors.
  - 2. Solvent cement: Manufacturer's standard.
- D. Aluminum Rigid Conduit and Fittings:
  - 1. ANSI C80.5 and UL 6.
- E. Liquid-Tight Flexible Conduit and Fittings:
  - 1. Applicable requirements of UL 360.
  - 2. Flexible galvanized-steel core with extruded liquid-tight neoprene or PVC jacket overall.
  - 3. Sizes up to 1-1/4 inch provided with continuous copper bonding conductor, spiral wound between convolutions.
  - 4. Sizes 1-1/2 inch and above provided with separate grounding conductor.
- F. Conduit Expansion Fittings and Expansion and Deflection Fittings:
  - 1. Materials:
    - a. For galvanized-steel rigid conduit:
      - 1) Expansion fittings: Steel or malleable iron, hot-dip galvanized.
      - 2) Expansion/deflection fittings: Bronze or ductile iron end couplings, neoprene sleeve and stainless steel clamping bands.
    - b. For PVC conduit: Rigid metal expansion/deflection fitting with galvanized rigid steel to PVC conduit adapters at each end.
  - 2. Conduit expansion fitting: Weatherproof.
  - 3. Conduit expansion and deflection fitting: Watertight.
  - 4. Metallic fittings equipped with bonding jumper cable to provide electrical continuity.
- G. Conduit Connector Fittings:
  - 1. UL 514B, material and finish similar to that of conduit with which they are to be used.
  - 2. For enclosures, cabinets, boxes and gutters in electrical rooms and aboveground indoor locations: Threaded nylon-insulated bushing and locknuts.
  - 3. For enclosure, cabinets, boxes and gutters with hub in outdoor, tunnel and underground locations, except electrical rooms: Threaded watertight hub fitting with gasket.
  - 4. For enclosure having punched or formed knockout for conduit entry in outdoor and underground locations, except electrical rooms: Threaded watertight fitting with gasket, nylon-insulated throat and sealing locknut.
- H. Conduit and Cable-Seal Fittings:
  - 1. Conduit seal:
    - a. To provide watertight seal between concrete and conduit where it penetrates wall, floor or ceiling.
    - b. Size as shown or necessary.

- c. Materials: Body and pressure clamp of malleable or cast iron with a neoprene sealing grommet and PVC-coated or galvanized-steel pressure rings, oversized sleeve of FRE or galvanized steel.
    - d. Seal between conduit and concrete to withstand pressure from 50-foot head of water without leakage.
  - 2. Cable seal:
    - a. To provide watertight seal between cable and conduit for use with single-conductor or multiple-conductor cable as necessary.
    - b. Size as necessary, drilled to accommodate cable.
    - c. Pressure discs of PVC-coated steel and sealing ring of neoprene.
    - d. Seal between cable and conduit to withstand water pressure of 50 psi without leakage.
  - 3. Seal compound:
    - a. FS TT-S-227, two-component, fast-setting, polymeric sealing compound to provide watertight seal between concrete and conduit, between cable and conduit.
    - b. Pour-type for horizontal and gun-grade for vertical or overhead application.
    - c. When cured, sealant to have rubber-like flexibility allowing minimum movement of conduit and cable in temperature range of minus 40F to plus 150F without loss of watertight seal.
    - d. Pot life: 15 minutes.
    - e. Minimum ambient temperature for application: 35F.
    - f. Initial cure: 15 minutes.
    - g. Final cure: Seven days.
    - h. Hardness, Durometer A: 20-35.
    - i. Seal between conduit and concrete to withstand pressure from 50-foot head of water without leakage.
    - j. Seal between conduit and single-conductor or multiple-conductor cable to withstand water pressure of 70 psi without leakage.
    - k. Fox Industries, Type FX-571G or approved equal.
- I. Conduit and Cable Supports:
  - 1. Retaining straps and fasteners: FS FF-S-760, with the following additional requirements:
    - a. Type, style and size: As necessary.
    - b. Material and finish: Stainless steel, Type 304, or approved equal.
    - c. For separating conduit from masonry surface: Hot-dip galvanized malleable-iron spacer assembled with Style A strap.
    - d. For vertical run of metallic-sheath cable: Basket-weave cable support.
    - e. For fastening conduit or cable to channel inserts: Stainless steel, Type 304, or approved equal.
  - 2. Multiple pipe hangers (trapeze-type): Consisting of two or more hanger rods, horizontal member, U-bolt clamp and other attachment necessary for securing hanger rods and conduit, with the following additional requirements:
    - a. Material and finish: Stainless steel, Type 304, or approved equal.
    - b. Hanger rod: Not smaller than 3/8-inch diameter, threaded for sufficient distance at each end to permit at least 1-1/2 inches of adjustment.
    - c. Horizontal member: Channel, 1-1/2 inches square or 1-5/8 inches square by 12 gauge or heavier. Weld two or more channels together for greater strength if necessary.
    - d. Design: Capable of supporting load equal to sum of weights of conduit, cable and hanger plus 200 pounds. At design load, stress at root of thread on hanger rod 9,500-psi maximum; stress in horizontal member 12,500-psi maximum.
  - 3. Channel inserts:

- a. Size and shape as shown, 12 gauge or heavier stainless steel, Type 304, or approved equal, with 7/8-inch wide slot.
    - b. For surface mounting: Channel inserts with 9/16-inch base slot, eight inches on center with minimum pullout-load rating of 1,000 pounds per linear foot.
  - 4. Spot inserts: Rated 800 pounds with safety factor of five, fabricated from steel galvanized after fabrication, covered to prevent entrance of concrete during installation.
- J. Surface Raceways and Fittings: UL 5, fabricated from galvanized steel.
- K. Underfloor Raceways and Fittings:
  - 1. UL 884.
  - 2. Size: As shown.
  - 3. Fabricated from steel 14 gauge or heavier steel sheet.
  - 4. Finish: Corrosion-resistant coating listed per referenced UL or ITS directory.
- L. Boxes and Cabinets:
  - 1. Outlet boxes:
    - a. UL 514A, capable of accommodating conduit as shown.
    - b. Material and finish:
      - 1) Steel, malleable iron, cast iron or ductile iron.
      - 2) Hot-dip galvanized or electro galvanized after fabrication.
    - c. For aboveground indoor locations and electrical rooms: Punched or formed knockouts.
    - d. For outdoor and underground locations, except electrical rooms:
      - 1) Threaded-conduit entrance hub.
      - 2) Threaded watertight fitting with gasket, nylon-insulated throat and sealing locknuts for enclosures having punched or formed knockouts for conduit entry.
    - e. For wall receptacles and switches, single or double devices: Outlet boxes 4-11/16 inch square by 1-1/2 inch deep.
    - f. For floor receptacles: Watertight cast-iron outlet boxes, four inches diameter, of suitable depth and complete with the following:
      - 1) Adjustment screws for final leveling.
      - 2) Bronze floor plate with flush-mounted screw plug, without exposed fastener, M32 finish.
      - 3) Screw plug attached to outlet-box assembly by chain or other means, M32 finish.
      - 4) Bronze floor plate flange, five inches in diameter, extending beyond box 1/2-inch above finished floor, M32 finish.
      - 5) One special screw-plug removal tool with every 10 receptacles.
    - g. For recessed wall-mounted receptacles: Watertight cast-iron outlet box, three-inch diameter, of suitable depth and complete with the following:
      - 1) Bronze faceplate with flush-mounted screw plug, without exposed fasteners, M32 finish.
      - 2) Screw plug attached to outlet-box assembly by chain or other approved means, M32 finish.
      - 3) Bronze faceplate flange, five inches in diameter, extending beyond box, M32 finish.
      - 4) One special screw-plug removal tool with every 10 receptacles.
  - 2. Junction and pull boxes:
    - a. Internal volume up to 100 cubic inches, metallic boxes: UL 514A, non-metallic boxes: UL514C; internal volume above 100 cubic inches, UL 50.
    - b. Flush-mounted or surface-mounted as shown.

- c. Size: Suitable to accommodate conduit, raceways, ducts, number of cables and splices shown.
- d. Material and finish:
  - 1) Metallic boxes:
    - a) Steel, malleable iron, cast iron or ductile iron.
    - b) Hot-dip galvanized or electro galvanized after fabrication.
    - c) Stainless steel in tunnel areas.
  - 2) Non-metallic boxes:
    - a) Precast concrete: Compressive strength 3,500 psi; air entrainment six-percent minimum, ASTM C173-94ae1 or C231-97e1; Section 03300 and Section 03400 and in accordance with the following:
      - 1) Box: Concrete formed with closed bottom and sides and recess at top of box or at edge of cover to provide mating surfaces to prevent lateral movement of flush-mounted cover. Knockouts provided to accommodate conduits as shown.
      - 2) Cover:
        - (a) Material same as for box. Use of metallic cover and cover frame prohibited.
        - (b) Metro Type "B" logo with 3-1/8 inch by 4-inch envelope and service designation recessed in center of cover.
        - (c) Non-protruding provisions provided for lifting.
      - 3) Reinforcement:
        - (a) Sidewalk and landscape locations: Welded wire fabric, ASTM A185-97.
        - (b) Areas subject to vehicular traffic: Deformed steel bars, ASTM A615/A615M-00.
      - 4) Loading:
        - (a) Sidewalk and landscape locations: AASHTO 's SSHB H15-44.
        - (b) Areas subject to vehicular traffic: AASHTO's SSHB H20-44.
        - (c) Hardware: Stainless steel.
        - (d) Size: As shown or next available larger size.
    - b) Composite material: Sand and gravel bound together with a polymer and reinforced with continuous woven glass strands and in accordance with the following:

Physical Properties	Values	Method
Compressive strength	11,000 psi	ASTM C109
Tensile strength	1,700 psi	ASTM D638
Flexural strength	7,500 psi	ASTM D790
Water Absorption (24 hours)	0.5 percent	ASTM D570

- 1) Box: Gray-color material formed with closed bottom and sides and flange with recess at top of box to accommodate flush-mounted cover.

- 2) Cover:
    - (a) Material same as for box.
    - (b) Skid-resistant top surface with minimum 0.5 coefficient of friction.
    - (c) Metro Type "B" logo with 3-1/8 inch by 4-inch envelope and service designation recessed in center of cover.
    - (d) Secured to box with bolts.
    - (e) Non-protruding provisions provided for lifting.
  - 3) Loading:
    - (a) Sidewalk and landscape locations: AASHTO's SSHB H15-44.
    - (b) Areas subject to vehicular traffic: AASHTO's SSHB H20-44.
  - 4) Hardware: Stainless steel.
  - 5) Size: As shown or next available larger size.
- c) Molded fiberglass-reinforced polyester 1/8-inch thickness, minimum, and in accordance with the following requirements:

Physical Properties	Values	Method
Flexural strength	17,000 psi	ASTM D790
Deflection temperature	400F	ASTM D648
Water absorption (24 hours)	0.5 percent	ASTM D570
Tensile strength	6,500 psi	ASTM D638
Specific gravity	1.8	ASTM D794
Flammability	94-5V	UL 94
Dielectric strength	400 volts per mil	ASTM D149
Arc resistance	180 seconds	ASTM D495

- 1) Ultraviolet protection: Fiberglass material containing ultraviolet-inhibitor, or coated with polyurethane paint, 1.5 mils minimum dry-film thickness on both inside and outside surfaces.
  - 2) Color: Fiberglass material, gray inside and outside.
  - d) Molded polyvinyl chloride 1/8-inch thickness, minimum.
- e. For aboveground indoor locations and electrical rooms: Punched or formed knockouts.
- f. For outdoor and underground locations, except electrical rooms:
- 1) Threaded conduit entrance hub.
  - 2) Threaded watertight fitting with gasket, nylon-insulated throat and sealing locknuts for boxes having punched or formed knockouts for conduit entry.
3. Cabinets:

- a. UL 50, fabricated from galvanized steel.
  - b. Surface-mounted, unless otherwise shown.
  - c. Backplate of reinforced steel for mounting interior components and to ensure rigid support and accurate alignment.
  - d. Provision for cabinet grounding.
  - e. Provide latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.
  - f. Finish: Metallic surface thoroughly cleaned, degreased, primed with zinc primer and coated after fabrication with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
- M. Cable Trays:
- 1. NEMA VE1, ventilated-steel ladder-type.
  - 2. Dimensions: Three inches inside depth; nine inches rung spacing unless otherwise shown.
  - 3. Maximum load rating: 50 pounds per linear foot with safety factor of 1.5 at 12-foot support span.
  - 4. Bend radius:
    - a. For incoming service cable: As required by power company.
    - b. For all other cable: 24 inches or as necessary and approved.
  - 5. Finish: Cable trays, fittings and accessories hot-dip galvanized or electro galvanized after fabrication.
- N. Expansion Bolt Anchors: FS FF-S-325C Group II, stainless steel, Type 304, or approved equal.
- O. Data-Transmission System (DTS) Cabinet:
- 1. Wall-mounted, single-door, NEMA 250 Type 12, with panel, Hoffman Engineering Company, as shown, or approved equal.
  - 2. Enclosure: Formed of minimum 14-gauge steel, seams continuously welded and ground, without openings or knockouts, with threaded-conduit entrance hubs, lugs for mounting enclosure and collar studs for mounting panel. Rolled lip formed on all sides of door opening. Enclosure and door reinforced when size exceeds 30 inches square. Size as shown.
  - 3. Door: Formed of minimum 14-gauge steel, with rolled lip along top and sides to mate with enclosure. Fitted with removable print pocket. Closed-cell neoprene gasket attached with oil-resistant adhesive and steel retaining clips.
  - 4. Hardware: Corrosion-resistant steel continuous piano hinge with removable pin. Hasp and staple for padlocking.
  - 5. Panel: Formed of 12-gauge steel.
  - 6. Finish: Galvanized enclosure, door, panel and latch mechanism. Prepared for painting by manufacturer's standard method in accordance with the following:
    - a. Outside: Phosphatized, primed and finished with two coats of light-gray enamel or epoxy coating, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
    - b. Inside including panel: Two coats of white enamel or epoxy coating.
  - 7. Breather drain: One 1/2-inch diameter, Crouse-Hinds Catalog No. ECD11, or approved equal.
  - 8. Grounding stud: Manganese bronze, ASTM B138-96, Alloy No. 675 hard, 3/8-inch high; Evedur GSI, American Brass Company or approved equal.
  - 9. Terminations: Assembly rail and modular terminals, Weidmuller Terminations, Incorporated or approved equal.
    - a. Terminal: Modular test terminal, Melamine plastic, screw-clamp connections, with socket screws; Type SAKC4, Catalog No. 3406.2 or approved equal, with the following additional requirements:
      - 1) Amperes: 25.

- 2) Volts: 300.
- 3) Wire-gauge range: 22AWG to 12AWG.
- 4) Thickness: 0.256 inch.
- 5) Listed per referenced UL or ITS directory.
- 6) Standard accessories; compatible with terminal, with the following additional requirements:
  - a) End section: Type AP, No. 1179.2 or approved equal.
  - b) End bracket: Type EWK1, No. 2061.6 or approved equal.
  - c) Test plug: Type PS, No. 1804.0 or approved equal.
  - d) Cross-connection combination: QB25, No. 91455.D or approved equal.
  - e) Disconnect plug for SAKC4 terminal: Type TST, No. 3399.0 or approved equal.
- b. Assembly rail: Type TS32 steel standard section compatible with terminals, with fixing slots, Catalog No. 1228.0 and standard rail-mounting screws or approved equal.
- c. Marking tags: Dekafix 6.5-FS or approved equal, consecutive vertical, Number 4682.6 or Number 5766.6 as approved. Consecutive numbering conforming to that of DTS box.
- d. Group marking carrier with paper marking strip and transparent cover.
  - 1) Type SCHAT5, Catalog No. 2924.6 or approved equal.
  - 2) Type ESO5, Catalog No. 2937.0 or approved equal.
  - 3) SST5, Catalog No. 2940.0 or approved equal.

P. Fiberglass Conduit and Fittings:

1. Rigid fiberglass reinforced epoxy conduit, UL 1684, IPS (Iron Pipe Size) based conduit.
2. Conduit shall be manufactured by using filament winding process with minimum fiberglass content of 65 percent by weight and no fillers.
3. IPS based conduit with nominal wall thickness of 0.09 inches for five-inch nominal conduit size.
4. Conduits, elbows and fittings manufactured from the same material and using the same manufacturing process.
5. Conduit sections formed with integral bell and spigot type couplings. Rubber sealing gasket at bell end is prohibited.
6. Conduits, elbows and fittings provided with protection from exposure to sunlight by pigmentation uniformly dispersed through resin material.
7. Adhesive as recommended by conduit manufacturer.
8. Conduits, elbows and fittings are specified for use throughout a temperature range of -40°F to 230°F, and they are to be protected from exposure to sunlight by pigmentation uniformly dispersed through the resin material.
9. Conduits, elbows and fittings shall be suitable for encasement in concrete below grade and conform to UL 1684, and listed and labeled by UL meeting the requirements of NEC Article 347 for Rigid Nonmetallic Conduit and its use.
10. Each piece of the straight length conduit and each piece of the elbow and other bend made from and for use with such conduit is to be labeled with the following information, mark clearly legible and durable every 10 feet or as recommended by the manufacturer.
  - a. "Reinforced Thermosetting Resin Conduit", "RTRC"; "Fiberglass Reinforced Epoxy Conduit", "FRECE"; or equivalent, as applicable.
  - b. Normal Size: (IPS)
  - c. Manufacturer's name and trademark.
  - d. Temperature range for conduit application.
  - e. "Above Ground", "AG", "Below Ground", "BG", or equivalent wording, as applicable.

## PART 3 - EXECUTION

### 3.01 INSTALLATION:

- A. General:
1. Use size, type, general routing, location of conduit, raceways, boxes and cabinets as shown and specified.
  2. Install metallic raceway, fittings, boxes and cabinets free from contact with reinforcing steel.
  3. Where aluminum is placed in contact with dissimilar metal or with concrete, separate contact surfaces by means of gasket, nonabsorptive tape or coating to prevent corrosion.
  4. Make metallic conduit, raceways, ducts and cable trays, electrically and mechanically continuous and ground them in accordance with Section 16060.
  5. Install FRE conduit where conduit runs are embedded in concrete and where conduit is shown as direct-burial.
- B. Conduit:
1. Run exposed conduit parallel to building lines.
  2. Install exposed conduit to avoid interference with other work.
  3. Traction-power substations, tie-breaker stations, ac-switchboard, electrical, train-control, communication and mechanical rooms: Where shown or where necessary to prevent seepage of subsoil or water into such areas, seal where conduits in contact with concrete and seal cable inside conduit using cable seal or sealing compound in accordance with the following requirements:
    - a. Where shown and as necessary, install cable seal and conduit seal in accordance with the manufacturer's recommendations.
    - b. Use sealing compound where approved and in accordance with manufacturer's recommendations, with the following additional requirements:
      - 1) Before applying sealing compound, prime concrete, conduit and cable surface using primer recommended by manufacturer.
      - 2) Pour or inject compound to prevent voids inside seal and to keep cable centered in conduit.
      - 3) Use FRE sleeve for conduit seal installed on traction-power, train-control and communication conduit.
    - c. For 34.5 kv incoming-service cable with concentric neutral, install cable seal in traction-power substations, ac-switchboard rooms and 34.5 kv utility company manholes adjacent to WMATA facilities in accordance with the following requirements:
      - 1) Do all work in coordination with a utility company representative.
      - 2) Install O-Z CSBI cable seal at each end of the conduit for the service entrance cables ( one at the last utility company manhole and one at the WMATA facility entrance). Use torque recommended by manufacturer for this type of cable seal, do not over-torque.
    - d. For 13.8 kv incoming-service cable, install cable seal in traction-power substation, ac-switchboard rooms and utility company manholes adjacent to WMATA facilities. Coordinate the work with utility company representative.
    - e. In empty conduit installed for future use, install blank cable seal inside conduit to prevent seepage of water.
    - f. All conduits free of water before conduit seals are installed.
  4. Apply lead-free conductive anti-seize compound to threaded-conduit joints.

5. In outdoor and underground locations, except electrical rooms, use threaded-conduit hub to attach conduit to equipment enclosure. Use watertight conduit fitting with gasket, nylon-insulated throat and sealing locknuts for attachment of conduit to enclosure having punched or formed knockout.
6. In aboveground indoor locations and electrical rooms, use locknut and nylon-insulated bushing to attach conduit to enclosure.
7. Install suitable caps or plugs in empty conduit for future extension. Leave approved nylon or polyester pull line in each conduit.
8. Thread and ream ends of field-cut conduit to remove rough edges. Use bushing at conduit entrance to boxes, cabinets and equipment enclosures.

9. Bends:

- a. Unless otherwise shown or specified, install conduit bends in accordance with reference codes.
- b. Install bends in buried conduit in accordance with the following:

Size of Conduit (in inches)	Minimum Radius of Factory-Bend (in inches)	Minimum Radius of Field-Bend (in inches)
3	18	24
4	24	30
5	48	48
6	48	48

- c. Total bends in each conduit run for traction-power cable: 225 degrees maximum.
- d. Bend conduit so that field-made bend is free from cuts, dents and other surface damage.
10. Support conduit during construction to prevent distortion and to ensure independent support.
11. Support horizontal conduit with one-hole pipe straps or individual pipe hangers.
12. Secure conduit supported on multiple-hangers (trapeze) or channel inserts by fasteners suitable for such purpose.
13. Where conduit is attached to masonry surface, use malleable-iron spacers with Style A pipe straps.
14. Support and secure vertical conduit spanning open areas at intervals not exceeding 10 feet.
15. Support conduit above suspended ceiling using applicable specified methods.
16. Install conduit so as to drain moisture to nearest outlet or pull box.
17. Use minimum of 18-inch long liquid-tight flexible-conduit connection for equipment enclosure subject to vibration.
18. Do not use wire for support of conduit and cable.
19. Install expansion fitting in exposed conduit runs longer than 300 feet and where shown. Install expansion/deflection fittings where embedded conduits cross structural expansion joints. Where embedded conduits cross a structural contraction joint, paint the external surface of conduit with linseed oil or other compatible bond breaker for two feet on each side of contraction joint.
20. Buried FRE conduit: Install in accordance with the following requirements in addition to those specified elsewhere:
  - a. Arrange conduit to cross each expansion joint at right angle to joint.
  - b. Prevent concrete and other materials from obstructing the conduit. Pack outlets, pull boxes and junction boxes and cap conduit ends prior to pouring concrete.
  - c. Use Tight Lock Joint method to join conduit sections for providing water tightness and pull out strength.

- d. Provide compatible conduit supports and spacers to maintain position of conduit during placement of concrete.
  - e. Install buried non-metallic conduit for cable over 600 volts in accordance with reference code.
  - f. Waterproof conduit connections.
  - g. Rod and swab conduit after installation so as to remove water, cement and other foreign matter; cap conduit ends. If obstructions cannot be removed or if condition exists which may result in damage to cable, replace conduit.
  - h. Leave approved nylon or polyester pull-line in each conduit.
  - 21. Use metallic conduit or above ground FRE conduit in exposed locations.
  - 22. Conduit installed in outdoor location: Waterproof conduit connection.
  - 23. Use IPS FRE conduit for all concrete-encased applications except as follows:
    - a. Use FRE conduit with minimum wall thickness of 0.95 inch for train control conduit direct buried without concrete encasement where shown.
    - b. Install conduits encased in concrete ductbanks, associated manholes and handholes outside the structural work in accordance with Section 02585.
- C. Channel Inserts and Spot Inserts:
- 1. Surface-mount channel inserts as shown.
- D. Surface Raceways:
- 1. Install as shown.
- E. Underfloor Raceways:
- 1. Install underfloor raceways as specified in Section 03100. Align and level raceways accurately. Hold raceways in place during placing of concrete.
- F. Outlet, Junction and Pull Boxes:
- 1. Mount outlet boxes as shown.
  - 2. Arrange front of box or attached plaster cover flush with finished wall or ceiling.
  - 3. Keep number of knock-outs to minimum.
  - 4. Clean boxes thoroughly after installation and correct damage to boxes and to finish.
  - 5. Install covers on boxes mounted on walls and ceilings.
  - 6. Measure height of wall-mounted outlet box from finished floor to horizontal centerline of cover plate.
  - 7. Fasten floor boxes securely in place.
  - 8. Install junction and pull boxes so that covers are readily accessible.
  - 9. Do not install boxes above suspended ceilings except where ceilings are removable or definite provision is made for access to boxes.
  - 10. Use stainless steel (Type 304) mounting channels, retaining straps and fasteners, pipe hangers for conduits and cables; expansion bolt anchors, junction boxes, outlet boxes, cover plates for receptacles, enclosures for load centers in tunnel environment which includes vent and fan shafts and underplatform areas.
  - 11. Use non-metallic boxes as follows:
    - a. Buried with cover flush-mounted with finish grade: Precast concrete or composite material junction and pull boxes within AASHTO load designations as specified.
    - b. For indoor and outdoor locations not subject to pedestrian or vehicular traffic: Molded fiberglass-reinforced polyester junction and pull boxes.
    - c. For outdoor locations but not for burial: Molded polyvinyl chloride junction and pull boxes.
- G. Cabinets:
- 1. Fasten cabinet securely using expansion bolts, toggle bolts or mounting ears.
  - 2. Touch-up damaged painted finish.

- H. Cable Trays:
  - 1. Install cable trays neatly, adequately supported and as shown.
  - 2. For incoming-service cable from power company, install cable tray as approved by the power company.
- I. Use expansion-bolt anchors to secure equipment to concrete surfaces.
- J. Attachments to Prestressed-Concrete Girders:
  - 1. Attach pipes, conduits, boxes or similar items to prestressed girders by welding to embedded plates or bolting to embedded fittings. Drilling into prestressed girders is prohibited, except for track fasteners and appurtenances as shown.
- K. DTS Cabinet and Terminals:
  - 1. Install as shown.
- L. Car Wash Areas:
  - 1. Use PVC-coated galvanized steel conduit.

### **3.02 FILLING OF OPENINGS:**

- A. Where conduit and raceway pass through fire-rated walls, ceilings or floors, provide seals to prevent passage of fire and fumes and to maintain integrity of fire-rated structure in accordance with Section 07481.
- B. Where openings are provided for passage of conduit and raceways in walls, ceilings or floors, use fire-resistant fibrous-glass safing or similar material to seal unused openings to prevent passage of fire and fumes in accordance with Section 07841.
- C. Close unused openings or spaces in floors, walls and ceilings. Plug or cap unused conduit and sleeves.

### **3.03 IDENTIFICATION:**

- A. At end of each run, use stainless steel or aluminum tags, minimum 1-1/2 inch diameter, with stamped markings, minimum 1/4-inch high lettering, and tag holders attached to conduit using a stainless steel band with worm screw clamping device to establish identification of conduits and raceways in accordance with designations shown. Where conduits are terminated flush with concrete structure, install three-ply laminated phenolic plate, engraved through black face to white core and attached adjacent to conduits' entrance by means of non-metallic screws. Engrave conduits' designations within circles arranged in pattern similar to that of conduits.
- B. Identify by red painted color code and by marking EMERGENCY SYSTEM on all boxes and enclosures for emergency circuits to identify them as part of an emergency system in accordance with the NEC.

### **3.04 FIELD QUALITY CONTROL:**

- A. Arrange with the Engineer for inspection and approval of embedded conduit and boxes prior to concrete placement.
- B. Arrange with the Engineer for inspection by electrical utility company representative of incoming-service conduit prior to placing concrete.

- C. Test metallic conduit and boxes for electrical continuity. Conduct tests in presence of Engineer.
- D. Test not less than 0.5 percent of total installed channel inserts and spot inserts as directed for compliance with specified pullout-load rating. Replace and retest inserts which fail. Conduct tests in presence of Engineer.
- E. Arrange with the Engineer for inspection and approval of direct-buried conduits for future train control circuits prior to backfilling.

**END OF SECTION**

## SECTION 16145

### WIRING AND CONTROL DEVICES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing switches, cover plates, limit switches, occupancy sensors, receptacles, plugs, magnetic contactors, automatic transfer switches, photoelectric controls and time switches.
- B. Related Work Specified Elsewhere:
  - 1. Ornamental metal: Section 05700.
  - 2. Wire connection accessories: Section 16125.
  - 3. Grounding and bonding: Section 16060.
  - 4. Raceways, boxes and cabinets: Section 16130.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. National Electrical Code (NEC).
  - 3. National Electrical Manufacturers Association (NEMA):WD1, General Color Requirements for Wiring Devices; KS1, Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum); ICS 2, Industrial Control and Systems: Controllers, Contactors, and Overload Relays, Rated Not More Than 2000 Volts AC or 750 Volts DC; ICS 12, Profiles of Networked Industrial Devices--Part 1: General Rules; NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
  - 4. American National Standards Institute (ANSI): Z55.1, Gray Finishes for Industrial Apparatus and Equipment.
  - 5. UL: 98, Enclosed and Dead-Front Switches; 198D, Class K Fuses; 198E, Class R Fuses; 508, Industrial Control Equipment; 773, Plug-In Locking-Type Photocontrols for Use With Area Lighting; 1008, Transfer Switch Equipment.
  - 6. American Standards of Testing and Materials (ASTM): A47/A47M-99, Standard Specification for Ferritic Malleable Iron Castings; A276-00a, Standard Specification for Stainless Steel Bars and Shapes; and A507-00, Standard Specification for Drawing Alloy Steel, Sheet and Strip, Hot-Rolled and Cold-Rolled.
  - 7. ITS: Directory of ITS Listed Products
- B. Source Quality Control:
  - 1. Following items listed per referenced UL or ITS directory:
    - a. Snap switches.
    - b. Disconnect switches.
    - c. Receptacles and plugs.
    - d. Automatic transfer switch.
    - e. Lighting contactor.
    - f. Photoelectric control.
    - g. Time switch.
    - h. Occupancy sensor.
- C. Qualifications: Select a manufacturer who is regularly engaged in the production of automatic transfer switches.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification:
    - a. Certified test reports of factory tests performed on each automatic transfer-switch unit in accordance with reference standards.
    - b. Furnish certificate from manufacturer verifying that automatic transfer switches conform to specified requirements. Include certificate with submittal of shop drawings.
  - 3. Documentation for Automatic Transfer Switch:
    - a. Submit field test plan within 60 days after award with accompanying documentation in the form of test data recording sheets and list of proposed test equipment for approval prior to testing.
    - b. Submit certified copies of test data, dated and clearly identified within two weeks after completion of testing.
  - 4. Operation and Maintenance Manuals for Automatic Transfer Switch.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling and to avoid damage
- C. Store products in secure and dry storage facility.

### **PART 2 - PRODUCTS**

#### **2.01 PRODUCTS AND MATERIALS:**

- A. Snap Switches:
  - 1. NEMA WD1, specification grade.
  - 2. Rating:
    - a. Twenty amperes at 120-277 volts ac.
    - b. Horsepower-rated when used as disconnecting device for motor circuit.
  - 3. Body and base: Fully enclosed, brown, fire-resistant, non-absorptive thermosetting urea or nylon.
  - 4. Contacts: Silver alloy.
  - 5. Mounting yoke: Corrosion-resistant metal with plaster ears.
  - 6. Poles: Single-pole, double-pole, three-way or four-way as shown.
- B. Disconnect (Safety) Switches:
  - 1. UL 98, NEMA KS1, heavy-duty, fusible or non-fusible as shown.
  - 2. Voltage rating: 240 volts ac, 480 volts ac or 250 volts dc as shown and as necessary.
  - 3. Number of poles and current rating: As shown and as necessary.
  - 4. Fuses:
    - a. UL 198D.
    - b. For fused disconnect switch associated with motor load: UL Class RK5 with time delay or as shown.
    - c. For fused disconnect switch associated with other loads: UL Class RK1 or as shown.
    - d. Current rating: As shown.
  - 5. Enclosure: (NEMA 250)

- a. Type:
    - 1) For aboveground indoor locations and electrical rooms: Type 1.
    - 2) For tunnel and underground locations, except electrical rooms: Type 4.
    - 3) For outdoor locations: Type 3R.
  - b. Materials:
    - 1) Steel sheet: ASTM A507-00.
    - 2) Malleable iron: ASTM A47/A47M-99.
  - c. Finish: Metallic surface cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
6. Quick-make/quick-break switching mechanism with operating handle external to enclosure with positions labeled ON/OFF and capable of being padlocked in OFF position, defeatable interlock to prevent opening of enclosure door when switch is closed.

C. Receptacles and Plugs:

- 1. NEMA WD1, specification grade.
- 2. Rating: 20 amperes at 125 or 250 volts as shown.
- 3. Base and body: Brown, fire-resistant, non-absorptive thermosetting urea or nylon.
- 4. Receptacles:
  - a. Outlet: Single or duplex as shown.
  - b. Mounting yoke: Corrosion-resistant metal with plaster ears.
  - c. Configuration:

Rating	NEMA Configuration
Two-pole, three-wire, 20 amps, 125 volts	5-20 R
Two-pole, three-wire, 20 amps, 250 volts	6-20 R

- d. For use in restroom; water service room; locker room; wash rooms; elevator machine room, pit and hoistway; and outdoor locations: Equipped with solid-state ground-fault circuit interrupter with five-milliampere trip level.
5. Plugs:
- a. Configuration and design: As follows unless otherwise shown:

Rating		NEMA Configuration
Two-pole, three-wire, 20 amps, 125 volts	Urea or neoprene with cord grip	5-20 P
Two-pole, three-wire, 20 amps, 250 volts	Armored cap with cord grip	6-20 P

D. Cover Plates:

- 1. Wall plates:
  - a. NEMA WD1, suitable for specified receptacles and switches, size suitable for recess-mounted or surface-mounted associated outlet box, stainless steel, ASTM A276-00a, Type 304, or approved equal.

- b. For use in indoor public areas: Bronze, with M32 medium satin finish as specified in Section 05700.
  - c. For above ground indoor service areas and electrical rooms: Steel, stainless steel or aluminum plate, as standard with the manufacturer.
  - d. For receptacles in outdoor and underground locations, except electrical rooms: Stainless steel, ASTM A276-00a, Type 304, wall plate with gasketed spring-loaded hinged cover.
2. Floor plates: Section 16130.
- E. Automatic transfer switch: UL-1008, electromechanical, in surface-mounted enclosure as shown, with the following additional requirements:
- 1. Operating and electrical characteristics:
    - a. Capable of transferring load automatically from normal source to alternate source when the voltage drops to 85 percent of rated voltage on any phase for set time. Operating point adjustable over range of 80 to 90 percent of rated voltage and time-delay adjustable over range from zero to five minutes in increments of at least eight steps.
    - b. Capable of transferring load automatically from alternate source to normal source when normal source returns to 90 percent of rated voltage for set time. Operating point adjustable over range of 85 to 100 percent of rated voltage and time-delay adjustable over range from zero to five minutes in increments of at least eight steps.
    - c. Capable of transferring load automatically from normal source to alternate source when normal source failure is simulated by integral test switch.
    - d. Rating:
      - 1) Number of poles: Three or four as shown.
      - 2) Voltage rating: 480-volt, three-phase, three-wire or 480Y/277-volt, three-phase, four-wire, 60 Hertz system as shown.
      - 3) Current rating: As shown and rated 100 percent.
      - 4) Transfer time: Ten cycles maximum on 60-Hertz base after initiation signal.
      - 5) Short-circuit current rating, rms symmetrical amperes: 14,000; 22,000; 25,000; 30,000; 35,000; or 50,000 as required and shown.
      - 6) Capacity to close into available short-circuit current or let-through current of fuses without functional degrading.
    - e. Solid-state control panel for sensing and control logic with accuracy of plus-or-minus two percent on voltage and frequency settings over a temperature range of minus 20 degrees to plus 70 degrees.
  - 2. Design and construction features:
    - a. Mechanically held, electrically operated, double-throw switch.
    - b. Electrical and mechanical interlock to prevent maintained neutral position.
    - c. Designed to break-before-make on transfer and retransfer.
    - d. Equipped with renewable silver-alloy contact.
    - e. Neutral bus or terminal provided on 480Y/277-volt, three-phase, four-wire unit to allow interconnection of neutral conductors.
    - f. Pilot lights on door to indicate switch position as follows:
      - 1) On normal source: Green light.
      - 2) On alternate source: Red light.
    - g. Pilot lights on door to indicate:
      - 1) Normal source available: Green or white light.
      - 2) Alternate source available: Red or white light.
    - h. Contacts opened by single solenoid, motor operator or stored energy mechanism.
    - i. Handle provided to permit manual operation of automatic transfer switch for maintenance purposes.
    - j. Power conductors made of silver-plated copper bus.

- k. Equipment ground lug provided.
      - 3. Enclosure:
        - a. Type:
          - 1) For aboveground indoor locations and electrical rooms: NEMA Type 1.
          - 2) For tunnel and underground locations, except electrical rooms: NEMA Type 12.
        - b. Door: Hinged with handle and latch.
        - c. Material: Steel.
        - d. Finish: Metallic surface thoroughly cleaned, degreased, primed with zinc primer and finished with gray enamel, ANSI Z55.1, Color No. 61; two mils minimum DFT.
- F. Lighting Contactors:
  - 1. NEMA ICS 2, UL 508, electrically held, equipped with silver-alloy contacts, designed to control incandescent, tungsten, halogen, fluorescent, high-intensity discharge lamp load.
  - 2. Number of poles: As shown.
  - 3. Continuous current rating: As shown.
  - 4. Line and load voltage: 480-volt or 208-volt three-phase or 277-volt or 120-volt single-phase as shown.
  - 5. Control coil rated 120 volts.
  - 6. 480-volt or 277-volt to 120-volt control transformer fused on secondary and primary as required.
  - 7. Control:
    - a. Heavy-duty, three-position selector switch with positions labeled HAND/OFF/AUTO for lights controlled by photo-electric cell.
    - b. ON-OFF push button for indoor lights.
  - 8. Enclosure: NEMA 250, Type 1; fabricated from steel, cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
- G. Photoelectric Control:
  - 1. UL 773, designed to respond to natural daylight with 15-second inherent delay to prevent functioning due to sudden bright light such as vehicle lights or lightning and to operate in ambient temperature from minus 50C to plus 60C.
  - 2. Adjust to turn lights ON at two plus-or-minus one foot-candles, unless otherwise specified. ON to OFF ratio: One to three.
  - 3. Rating: 1,800VA at 120 volts or 277 volts, 60 Hertz, as shown.
  - 4. Contacts:
    - a. For control of outdoor lights: SPST, NC contact.
    - b. For control of tunnel lights at portals: SPST, NO contact
  - 5. Cells: Hermetically sealed.
  - 6. Enclosure: Weatherproof and tamper proof aluminum or non-metallic enclosure equipped with locking receptacles when mounted on fixture or designed for mounting on outlet box as shown and as necessary.
  - 7. At tunnel portal, set photoelectric control to turn on selected lights at dawn and turn off lights at dusk, as shown.
- H. Limit Switches:
  - 1. NEMA ICS 2, industrial-control.
  - 2. Suitable for mounting in folding-gate cabinet. Switch contacts closed when cabinet door is fully closed and latched. Switch contacts opened when respective cabinet door is not fully closed.
  - 3. Voltage rating: 120 volts ac.
  - 4. Current rating: 10-amperes continuous.

5. Enclosure: NEMA 250, Type 13.
  6. Actuator: Lever-operated and adjustable, with spring return.
  7. Mounting: Plug-in type with receptacle tapped for conduit size as shown.
  8. Contacts: Single-pole double-throw; one NO, one NC; snap action.
- I. Time Switch:
1. Seven-day and 24-hour calibration for each day time switch, listed per referenced UL or ITS directory, heavy-duty type suitable for controlling type of lighting fixtures shown.
  2. Type: As shown, with contacts capable of switching continuous load of 20 or 40 amperes per pole at 277 volts as necessary.
  3. Seven-day, 24-hour dial with day and night zones and 24-hour calibration for each hour clearly marked.
  4. Providing up to four automatic ON/OFF operations each day.
  5. Removable ON/OFF trippers designed for minimum ON period of one hour and minimum two-hour period between one OFF operation and next ON operation.
  6. Provision for manual ON and OFF operation of switch by hand without disturbing weekly preset schedule.
  7. Provision for omitting operation of switch on selected days.
  8. Spring-driven reserve power suitable for operation of switch for 16 hours minimum after failure of power. On restoration of power, switch transfers to synchronous motor drive and automatically rewinds spring.
  9. Terminals designed to accommodate up to 8AWG conductor cable.
  10. Operation at 480/277Y or 208Y/120 volts, 60 Hertz as shown and within temperature range of zero degree F to plus 140F.
  11. Enclosure:
    - a. NEMA 250, Type 1, steel, surface-mounted.
    - b. Hinged flush front door with catches and spring-loaded door pull.
    - c. Finish: Metallic surfaces cleaned and degreased, primed with zinc primer and finished with one coat of light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
- J. Occupancy Sensor:
1. UL 508, passive infra-red motion detector designed for wall mounting over single-gang outlet box, minimum radio frequency interference and use with incandescent and fluorescent lighting fixtures and electronic ballasts.
  2. Voltage rating: 120-277 volts ac.
  3. Switching capacity:
    - a. 120-volt operation: 800 watts minimum.
    - b. 277-volt operation: 1,500 watts minimum.
  4. Coverage area: 1,000 square feet.
  5. Detection zone:
    - a. Horizontal: 180 degrees.
    - b. Vertical: 5 degrees.
  6. Ambient light sensing: Photocell for preventing operation of lights at ambient light levels above an adjustable setting.
  7. Adjustments: Adjustable settings for time delay, sensitivity and light level concealed by tamper proof cover. Time delay adjustable from 10 seconds to 15 minutes after motion stops.
  8. Operating mode: OFF/AUTO.
  9. Detection indicator: LED.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Install switches, limit switches, occupancy sensors, receptacles, automatic transfer switches, lighting contactor, photoelectric controls and time switches as shown and in accordance with referenced codes and standards in Article 1.2, and manufacturer's instructions.
- B. Install cover plate on switch and receptacle.
- C. Install cover plate with gasketed spring-loaded cover, on each receptacle in outdoor and underground locations except electrical rooms.
- D. Ground disconnect switch, time switches, automatic transfer switches, receptacles, snap switches, photoelectric controls and lighting-contactor enclosures in accordance with Section 16060.
- E. Make power cable connections to snap switches, plugs, time switches, occupancy sensors, photoelectric controls, receptacles, automatic transfer switches and lighting contactors by means of integral mechanical connectors. If such items are not furnished with integral mechanical connectors, make connections using compression connectors in accordance with Section 16125.
- F. Make power cable connections to snap switches and receptacles using their side screw wiring connection terminals.
- G. Apply matching touch-up paint as necessary.

### **3.02 FIELD QUALITY CONTROL:**

- A. Furnish necessary test equipment and perform the following in the presence of the Engineer, in accordance with approved procedures:
  - 1. Test time switches, receptacles and contactors for connection in accordance with wiring diagram.
  - 2. Test equipment enclosure for continuity to grounding system.
  - 3. Check tightness of cable connections of snap switches, receptacles, time switches, occupancy sensors, disconnect switches, automatic transfer switches, lighting contactors, photoelectric controls and limit switches.
  - 4. Test operations of circuits and controls of switches, occupancy sensors, receptacles and contactors.
  - 5. Automatic transfer switches:
    - a. Test switches for connection in accordance with wiring diagrams.
    - b. Calibrate and set voltage-sensing device for each source and time delay for transfer and retransfer as follows and as approved:
      - 1) Automatic transfer switches for fan shafts and drainage pumping stations: Time delay setting for transfer equal to total of 30 seconds for each connected motor or additional time as required.
      - 2) Time delay setting for retransfer equal to or greater than time delay setting for transfer.
    - c. Perform automatic transfer of load in accordance with the following requirements:
      - 1) With power available on both the normal and alternate sources, initiate automatic transfer from the normal source to the alternate source by opening the disconnect switch or circuit breaker on the line side of the automatic transfer switch for the normal source. Check that the switch position changes to the alternate source and remains connected to the alternate source.
      - 2) With power available on the alternate source and the switch connected to the alternate source, initiate automatic transfer to the normal source by closing the disconnect switch or circuit breaker on the line side of the automatic transfer switch for the normal source.

Check that the switch position changes to the normal source and remains connected to the normal source.

- 3) If testing indicates failure to comply with specified requirements, modify settings for the automatic transfer switch so that the specified requirements are met. Conduct additional tests witnessed by the Engineer to prove compliance with specified requirements.

- B. Submit certified test reports for compliance with field quality control requirements.

**END OF SECTION**

## SECTION 16220

### EMERGENCY STANDBY GENERATOR SYSTEM

#### PART1 - GENERAL

##### 1.01 DESCRIPTION

- A. This Section includes the following:
  - 1. A diesel engine-driven electric generator package, complete with weatherproof walk-in housing and skid mounted fuel tank and rupture basin kit.
  - 2. A engine start-stop control system mounted on the generating set.
  - 3. An automatic load transfer control to provide automatic starting and stopping of the engine and switching of the load.
- B. This system shall be built, tested and shipped by the manufacturer of the engine-generator so there is one source of supply and responsibility. The performance of the generating set shall be certified by an independent testing laboratory.

##### 1.02 SUBMITTALS:

- A. Product Data: Submit manufacturer's data on engine-driven electric generator systems and components. Include manufacturer's standard product warranty (for not less than one-year period) for replacement of materials and equipment used in standby engine-driven system.
- B. Shop Drawings: Submit dimensioned drawings of engine-driven generator unit, walk-in housing and accessories including, but not limited to, automatic transfer switch, fuel line piping, remote start-stop stations, and instruments, showing accurately scaled generator set layout within the housing enclosure and its special relationship to associated equipment, and connections to remote equipment.
- C. Submit certified final factory test reports certifying unit's full power rating, stability, voltage and frequency regulation.
- D. Submit Operation and Maintenance Manual in accordance with General Requirements.
- E. Submit Operation and Training program plan in accordance with General Requirements.

##### 1.03 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Maintain a service center capable of emergency maintenance and repairs of the Project with eight hours' maximum response time.
- B. Source Limitations: Obtain packaged engine generator and auxiliary components specified in this Section through one source from a single manufacturer.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

- D. Comply with NFPA 70.
- E. Comply with NFPA 110 requirements for Level 2 emergency power system.
- F. Noise Emission: Comply with applicable state and local government requirements.
- G. Comply with MG1.

## **PART 2 - PRODUCTS**

### **2.01 MANUFACTURERS**

- A. Generator Manufacturer: Subject to compliance with requirements, provide standby generator system and transfer switch from one of the following (for each type of electric generator unit):
  - 1. Onan/Cummins Engine Company
  - 2. Caterpillar Tractor Company
  - 3. Kohler Company
  - 4. Or approved equal
- B. Transfer Switch
  - 1. Onan
  - 2. Russell Electric
  - 3. Automatic Switch Company
  - 4. Or approved equal

### **2.02 ENGINE-GENERATOR UNITS**

- A. Diesel Engine-Driven Generator: Provide an alternating-current standby diesel engine-driven generator unit as indicated and rated in the drawing for continuous standby operation, 460/265 -volt, 3-phase, 4-wire, 60 Hz; equipped with 4-cycle, 6 -cylinder, 1800 RPM,(BHP as indicated in the drawing), liquid-cooled, with unit mounted radiator, diesel engine; connected directly to 4-pole revolving-field type single-bearing generator through semi-flexible steel disk coupling. Equip set with associated control equipment to automatically start engine, transfer load to standby power upon failure of normal power source, transfer load back to normal power upon its restoration, and stop engine. Cushion-mount engine-generator on heavy steel base with vibration isolators to reduce possibility of torsional vibration. Equip engine with low-oil pressure, high-water temperature, and automatic overspeed safety shutdown devices. Equip generator with exciter and voltage regulator to maintain voltage within 2% of rated value. Generator shall be brushless type. Generator shall be connected directly to fly wheel by semi-flexible steel disk coupling. Provide unit capable of voltage recovery, within regulated range, of 7 seconds following a sudden load increase from 0 percent to 100 percent of rated load, and with voltage dip not to exceed 5% upon application of rated load at rated power factor. Construct unit in compliance with applicable standards; and with additional construction features as indicated. Frequency regulation shall not exceed 3-hertz from no load to rated load. The insulation system of the generator shall be class F as defined by NEMA MG1-1.65 and the temperature shall be within MG1-22.40 definition.
  - 1. Starter: Provide engine with 24-volt starting system including batteries, starting motor, and charging generator with automatic charging rate regulator. Provide SCR

type battery float charger 24-volt, 10-amp, fully automatic, constant voltage Le Marche A46 or approved equal

2. Instrument Control Panel: Provide standby generator unit with engine oil-pressure and water-temperature indicators, battery charge-rate ammeter, START and STOP button for manual operation of unit, reset circuit breaker, (static) voltage regulator, voltage-adjusting rheostat, voltmeter, ammeter with phase selector switch with OFF position, and with running time and frequency meters. Provide NFPA 110 light monitor panel with common alarm contact.

### **2.03 ENGINE-GENERATOR UNIT ACCESSORIES**

- A. Provide two auxiliary contacts for emergency elevator operations. Both contacts shall close on emergency power. One contact time controlled upon return to normal power. This timed contact shall open approximately one minute before normal power is restored to the elevator feeder.
- B. Provide skid mounted diesel oil transfer tank (capacity of the tank as per manufacturer) with positive displacement fuel pump and control switch for maintaining supply of fuel in tank at predetermined levels. Also provide rupture basin kit complete with rupture basin alarm switch for collection of fuel due to overflow or fuel tank rupture. Rupture basin to be sized for 150% of fuel tank capacity. Provide low voltage transformer as required for controls.
- C. Provide annunciator panel with visual and audible alarm to warn of emergency operating conditions affecting auxiliary power source. Locate in communications room or as directed by the Authority representative.
- D. Provide critical grade exhaust silencer and tubing.
- E. Provide anchor Bolts of galvanized steel, of types and sizes indicated.
- F. Provide molded case circuit breaker on or adjacent to engine generator set to serve as on site generator service disconnect.
- G. Fill engine and radiator with premium grade anti-freeze/coolant solution of a type recommended by the manufacturer.
- H. Provide jacket heaters on engine generator set to prevent freezing. Manifold and jacket heaters shall be sized as recommended by engine manufacturer.
- I. Make connections to high level and low level switches in oil storage tank. Provide and make connection to low level alarm bell located in communications room or as directed by the Authority representative. Provide and make connections to high level alarm bell with name plate adjacent oil fill pipe.

### **2.04 WEATHERPROOF WALK-IN HOUSING**

- A. The factory fabricated housing shall be designed to provide adequate cooling air in ambient as high as 122°F.

- B. Base Frame: Structural Steel Wide Flange beams shall be utilized as side rails with crossmembers designed to support genset. Concrete floor pad for enclosure will be provided by others.
- C. Side and End Walls: Construct from high strength aluminum with pre-painted and baked urethane finish. Wall panels shall be pre-painted gloss white on inside and out, and attached to wall posts by hard rivets.
- D. Walls shall be framed by extruded aluminum rails and corner posts. The rails and corner posts shall be heavy duty extruded high tensile aluminum.
  - 1. Roof: Provide a single sheet aluminum cover over the formed galvanized steel cambered roof bows.
  - 2. Personnel Access: Provide a single personnel door at the end of the enclosure for easy access to the genset control. The door shall be equipped with a heavy duty industrial grade bar lock with top and bottom cams for positive two (2) point locking. The hardware shall include provision for padlock for security. Additional service access shall be provided by hinged inlet air louvers.
  - 3. Cooling/Combustion Air Intake: Provide fixed blade inlet louvers with hinging and internal latch to open for service access. Louvers shall incorporate special drainable blade design to inhibit water penetration. Provide expanded aluminum bird/rodent screen on inside of louver. Louver assembly and mounting frame shall be of all aluminum construction utilizing high tensile strength extrusions.
  - 4. Radiator Discharge: Design to permit cooling air to exit the enclosure via expanded aluminum screen, sized appropriately.
  - 5. Exhaust Provisions: Roof mounting brackets shall be provided for standard silencers. Rainshields shall be included to eliminate water entry through roof penetrations for exhaust. Bracketry for silencers shall be aluminum construction, mill finish. All hardware for installation of exhaust shall be included.
  - 6. Provide electrical distribution panel to include enclosure lights and wiring of coolant heaters and battery charger.
  - 7. Provide housing insulation and interior lining.

## **2.05 FUEL SUPPLY SYSTEM**

- A. Comply with NFPA 30 and NFPA 37.
- B. Tank: Capacity shall supply adequate fuel to engine for uninterrupted period of eight hours' continuous operation at 100 percent of rated power output without being refilled.

## **2.06 AUTOMATIC TRANSFER SWITCH**

- A. The load transfer controls shall be rated for continuous duty and for all classes of load. The ampere rating of the automatic transfer switch (ATS) shall be sufficient to handle the capacity of the loads being transferred. The control components shall be compatible with the electrical requirements of the standby genset. The ATS shall be capable of performing the following functions:
  - 1. Automatically start standby generator unit when power line voltage drops to 70% of normal value, transfer load to generator, and transfer load back to normal source when voltage is restored to 90% normal. Equip electrically operated, mechanically

- held, transfer switch with limiter to open starting circuit after 45 seconds if engine fails to start.
2. Provide time-delay features for engine starting to override momentary power dips, load retransfer and engine shutdown.
  3. Provide adjustable time delay and co-ordinate with elevator contractor. Provide all necessary components to prevent more than one elevator from operating simultaneously. Time delay shall be adjustable from 1 to 30 seconds.
  4. Equip unit with test switch for manual simulation of power outage including standby unit operation and load transfer, and time-clock exerciser circuit for automatic periodic exercise of engine-generator unit.
  5. Install the ATS in NEMA 1 enclosure
- B. The transfer switch shall be 480/277V, 4-pole, UL listed, Onan,OTIII series or approved equal, complete with battery charger, programmed transition, exerciser, and all auxiliary contacts for starting and stopping generator from fire alarm annunciator panel.

## **2.07 AUTOMATED ENERGY MANAGEMENT SYSTEM (AEMS) INTERFACE**

- A. The supplier of the emergency generator shall provide interface to the AEMS per point list in Table 2 of Section 16601 for generator status points and generator control points. Provide raceways and wiring from the generator to the AEMS interface box per Section 16601.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION OF ENGINE-GENERATOR SYSTEMS**

- A. Install standby engine-generator set complete with walk-in housing as indicated, in accordance with the equipment manufacturer's written instructions, and with recognized industry practices, to ensure that engine-generator set fulfills requirements. Comply with NFPA and NEMA standards pertaining to installation of standby engine-generator systems and accessories.
- B. Coordinate with other work as necessary to interface installation of standby generator system work with other work.
- C. Install units on spring vibration isolators and comply with manufacturer's indicated installation method if any.
- D. Align shafts of engine and generator within tolerances recommended by equipment manufacturer
- E. The manufacturer shall provide Operation and Maintenance manuals and provide WMATA maintenance personnel a 4 - hour instruction period for maintenance and general service of the generator in accordance with the General Requirements.

### **3.02 TESTING**

- A. Upon completion of installation of engine-generator system and after parking structure electrical circuitry has been energized with normal power source, test engine-generator under full load conditions to demonstrate standby capability and compliance with

requirements. Where possible, field correct malfunctioning units, then retest to demonstrate compliance.

**END OF SECTION**

## SECTION 16225

### MOTORS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTIONS:

- A. This section specifies providing motors.
- B. Related Work Specified Elsewhere:
  - 1. Grounding and bonding: Section 16060.
  - 2. Wire connection accessories: Section 16125.
  - 3. Raceways, boxes and cabinets: Section 16130.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. IEEE: 85, 112.
  - 4. NEMA: MG1.
  - 5. ANSI: Z55.1.
  - 6. ASTM: A582.
  - 7. OSHA: 1910.95.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Outline dimensions.
    - b. Cross section showing internal construction and weight.
    - c. Connection diagram.
  - 2. Certification.
  - 3. Operation and Maintenance Manuals.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship each motor securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Store motors in secure and dry storage facility.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. Motors:
  - 1. NEMA MG1, squirrel-cage, induction-type, unless otherwise shown.
  - 2. Rating:
    - a. Horsepower: As shown.
    - b. Voltage and frequency:
      - 1) Motors, 1/2 HP and smaller: 115-volt, single-phase, 60 Hertz.

- 2) Above 1/2 HP: 460-volt, three-phase, 60 Hertz, unless otherwise specified or shown.
- 3) For motors in air-conditioning units:
  - a) For units up to and including 10,000 BTUH: 115-volt, single-phase, 60 Hertz.
  - b) For units from over 10,000 BTUH up to and including 36,000 BTUH: 208-volt, single-phase, 60 Hertz.
  - c) For units over 36,000 BTUH: 460-volt, three-phase, 60 Hertz.
- c. RPM: As shown.
- d. Time rating: Continuous, unless otherwise shown.
- e. Nominal full-load efficiency: Premium Efficiency when tested in accordance with NEMA MG1 and IEEE 112.
3. Design:
  - a. Single-phase motors: Design N, suitable for full-voltage across-the-line starting.
  - b. Three-phase motors: Design B, unless otherwise shown, with the following additional requirements:
    - 1) Up to and including 50-HP motors: Suitable for full-voltage across-the-line starting.
    - 2) Above 50-HP motors: Suitable for reduced-voltage starting.
4. Service factor:
  - a. Motors, one HP and smaller: In accordance with NEMA MG1.
  - b. Above one-HP up to and including 200-HP motors: 1.15.
  - c. Above 200-HP motors: 1.00.
5. Insulation: Class and allowable temperature rise above average ambient temperature of 30C and maximum ambient temperature of 40C as follows:
  - a. Integral-horsepower motors:
    - 1) Dripproof motors: Class B insulation with Class B temperature rise.
    - 2) Totally enclosed motors: Class F insulation with Class B temperature rise, unless otherwise shown or specified.
  - b. Fractional-horsepower motors: In accordance with NEMA MG1.
6. Noise level: NEMA MG1-12.49 but not to exceed requirements of OSHA 1910.95 when measured in accordance with IEEE 85.
7. Enclosure:
  - a. Dripproof, fully guarded; totally enclosed fan-cooled guarded; or totally enclosed air-over as specified.
  - b. Heavy-duty steel or cast-iron frame.
  - c. End bell:
    - 1) Up to 10HP: With cast-iron or aluminum end bells.
    - 2) 10HP and above: With cast-iron end bells.
  - d. Mounting: Foot-mounted on pad or adjustable pad, if necessary or as otherwise shown.
  - e. Provision for grounding.
  - f. Finish: Red-oxide zinc-chromate primer with finish coat of light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
  - g. Totally enclosed air-over:
    - 1) Variation to totally enclosed fan-cooled machines with air flow for cooling supplied by fan specified elsewhere.
    - 2) Fan/motor application factory-engineered for air flow shown or specified.
8. Conduit box:
  - a. Diagonally split, suitably gasketed.
  - b. Type:
    - 1) Up to 10HP: Steel, cast iron or aluminum with threaded or punched conduit holes.

- 2) 10HP and above: Cast iron with threaded conduit holes.
  - c. Size suitable to accommodate motor and line leads including taping.
  - d. Capable of rotation in each 90-degree position.
- 9. Bearings:
  - a. Unless otherwise specified, average life 15 years, but not less than three years at continuous operation, with double shields.
  - b. Integral-horsepower motors:
    - 1) Five HP and smaller: Sealed ball bearings or roller bearings.
    - 2) Above five HP: Ball bearings or roller bearings with grease fittings and pressure-relief fittings for in-service lubrication.
  - c. Fractional-horsepower motors:
    - 1) 1/6 HP and larger: Sealed ball bearings.
    - 2) Below 1/6 HP: Sealed ball bearings or sleeve.
- 10. Motors for hermetically sealed and semi-hermetically sealed compressors: NEMA MG1, 18.076 through 18.093.
- 11. Motors for close-coupled pumps: Stainless-steel shaft in accordance with ASTM A582, Type 303.
- 12. Provide nameplate on each motor in accordance with NEMA MG1-10.37.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Install motors where shown and in accordance with the NEC.
- B. Install conduit in accordance with Section 16130.
- C. Connect power cable as shown and in accordance with Section 16125.
- D. Ground motor enclosure in accordance with Section 16060.

#### **3.02 FIELD QUALITY CONTROL:**

- A. Furnish necessary equipment and perform the following tests:
  - 1. Check and test wiring connections in accordance with wiring diagram.
  - 2. Test to ensure that insulation resistance of motor winding is 10 megohms minimum.
  - 3. Test motor enclosure for continuity to grounding system.
  - 4. Test motors for proper operation with their associated controls.
- B. Submit certified test reports.

**END OF SECTION**

## SECTION 16260

### UNINTERRUPTIBLE POWER SYSTEM

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing uninterruptible power system (UPS) consisting of rectifier/charger, storage battery, battery-disconnect circuit breaker, inverter, power transfer switch, main emergency panelboard, and floor mat.
- B. Related Work Specified Elsewhere:
  - 1. Raceways, boxes and cabinets: Section 16130.
  - 2. Wire, cable and busways: Section 16120.
  - 3. Grounding and bonding: Section 16060.
  - 4. Circuit breakers, panelboards and load centers: Section 16440.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. National Electrical Code (NEC).
  - 3. National Electrical Manufacturers Association (NEMA): PE1, Uninterruptible Power Systems
  - 4. American National Standards Institute (ANSI): C39.1, Requirements, Electrical Analog Indicating Instrum; and Z55.1, Gray Finishes for Industrial Apparatus and Equipment.
  - 5. ANSI/NEMA: PB1, Panelboards, and 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
  - 6. ANSI/IEEE: C57.12.90, Test Code for Liquid-Immersed Distribution, Power, and Regulating Transformers; 450, IEEE Recommended Practice for Maintenance, Testing, and Replacement of Vented Lead- Acid Batteries for Stationary Applications, and 484, IEEE Recommended Practice for Installation Design and Installation of Vented Lead-Acid Batteries for Stationary Applications.
  - 7. UL: 50, Enclosures for Electrical Equipment; 67, Panelboards; 94, Tests for Flammability of Plastic Materials for Parts in Devices and Appliances; and 198C, High-Interrupting-Capacity Fuses, Current Limiting Type.
  - 8. American Standards of Testing and Materials (ASTM):B187-00 Standard Specification for Copper Bar, Bus Bar, Rod, and Shapes; and D635-98 Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position.
  - 9. ANSI/American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc. (ASHRAE): 52.1, Gravimetric and Dust Spot Procedures for Testing Air-Cleaning Devices Used in General Ventilation for Removing Particulate Matter.
  - 10. ANSI/American Hardboard Association (AHA): 135.4, Basic Hardboard.
  - 11. The equipment manufacturer shall maintain ISO 9001 or ISO 9002 certification
- B. Source Quality Control:
  - 1. Design and production tests: Perform and submit, in accordance with the General Requirements certified test results for the following tests on the uninterruptible power

system or provide certified test reports on identical unit. Furnish certified test reports showing test data and results as well as manufacturer's comments on oscillograph traces obtained during in-rush test and short-circuit coordination tests.

- a. Storage battery: Perform tests to determine the following:
  - 1) Ampere-hour rating of battery during three-hour discharge period.
  - 2) Charge rate starting from fully discharged state based on 105-volt terminal voltage, to 90-percent of fully charged state within 12 hours.
  - 3) Maximum short-circuit current available at battery terminals at full charge.
- b. Rectifier/Charger: Perform tests to ensure that:
  - 1) Unit has capacity to feed specified load including overload capacity of static inverter.
  - 2) Output voltage regulation is within specified tolerance.
  - 3) Unit has specified efficiency at rated output.
  - 4) Unit is current limiting when activated by an external contact closure from an engine driven generator.
- c. Static inverter: Perform tests to ensure that:
  - 1) Unit has capacity to feed rated kVA into load which has power factor of 0.8 lagging.
  - 2) Unit has capacity to deliver specified overload.
  - 3) Output voltage has sine wave with maximum of five-percent total harmonic distortion.
  - 4) Output voltage and frequency regulation are within specified limits.
  - 5) Efficiency at rated output at unity power factor of load is within specified limits.
- d. Power transfer switch: Perform tests as recommended by the manufacturer and verify compliance with specified requirements.
- e. Uninterruptible power system: Perform following tests with UPS in normal operating mode and alternate power available on transfer switch:
  - 1) In-rush test: Test to verify that power transfer switch and inverter power circuits remain operative without reset or replacement of protective devices while the following test is performed:
    - a) 480-208Y/120-volt transformer with primary protection and full-load on secondary side as specified below connected to load side of power transfer switch, close transformer primary switch 10 times to provide maximum magnetizing in-rush. Record calibrated oscillograph traces of three-phase output voltages and line currents on load side of power transfer switch. Include oscillograph traces with the submittals.
      - 1) Inverter below 25 kVA: Nine-kVA transformer with disconnect switch fused at 20 amperes on primary side.
      - 2) Inverter 25 kVA or larger: 15-kVA transformer with disconnect switch fused at 30 amperes on primary side.
  - 2) Short-circuit coordination test: Test to verify that distribution-panel fuses clear fault and that protective devices in inverter and power transfer switch continue to function without reset and equipment remains fully operable while the following test is performed:

- a) With main emergency panelboard connected to load side of power transfer switch using 10 feet of 1/0-AWG three-conductor cable, with UL Class J or RK1 fuses sized as follows, in one panelboard feeder, with specified short-circuit current available at input terminals of rectifier/charger and at bypass-circuit terminals of power transfer switch, close fuse switch on bolted three-phase fault at load terminals of branch circuit. Repeat test three times and record calibrated oscillograph traces of three-phase voltages of inverter output and bypass source, and fault current from power transfer switch.
    - 1) In panelboard fed by inverter below 25 kVA: 20-ampere fuses.
    - 2) In panelboard fed by inverter 25 kVA and larger: 30-ampere fuses.
  - 3) Input power factor: Test to determine input power factor at rated inverter output.
- C. Furnish products of a manufacturer regularly engaged in the manufacture of uninterruptible power systems.
- D. Qualifications of Instructor for Operation and Maintenance Training: Qualifications will be considered adequate when the following is demonstrated:
- 1. Instructor has in-depth knowledge of the design, packaging, operations, maintenance and trouble-shooting of the systems to be taught.
  - 2. Instructor has been trained in teaching methods or has previous satisfactory experience in teaching with emphasis on the subject matter to be covered in the course of instruction.

### **1.03 SUBMITTALS:**

- A. General: Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
- 1. Shop Drawings: In accordance with Table 16260-1.
  - 2. Certification.
  - 3. Documentation:
    - a. Submit field-test plan and documentation within 60 days after award with accompanying documentation in the form of test-data recording sheets and list of proposed test equipment.
    - b. Do not proceed with testing until plan and documentation are approved.
    - c. Indicate in scope of test plan method of testing equipment in order to ensure safe and orderly transition from installation, through initial energizing, to specified field testing.
    - d. Accompanying documentation to include data-recording sheets as used by manufacturer for in-plant testing of equipment and devices or as used by large industrial users of specified equipment.
    - e. Submit certified copies of test data, dated and clearly identified within two weeks after completion of testing.
  - 4. Certified test data for specified enclosure intake filter performances.

5. Instructor qualifications: Five copies of resume which outlines each instructor's qualifications and skills not later than 180 calendar days prior to commencement of training.
6. Operations and maintenance training material: Five copies not later than 180 calendar days prior to commencement of training.
7. Operations and Maintenance Manuals:
  - a. Include in manuals general theory of operation of the Uninterruptible Power System including description, purpose and function of:
    - 1) Battery.
    - 2) Rectifier/Charger.
    - 3) Inverter.
    - 4) Transfer switch.
    - 5) Maintenance bypass arrangement.
    - 6) Logic power supplies.
    - 7) All logic boards.
  - b. Describe and include in manuals procedures for:
    - 1) Battery testing and for optimizing:
      - a) Float voltages.
      - b) Equalizing voltages.
      - c) Equalizing time adjustments.
    - 2) Operational checks of:
      - a) Transfer to bypass source.
      - b) Retransfer from bypass to inverter.
    - 3) Alignment and adjustment of operating, detector and alarm circuits including rectifier, inverter and power transfer switch logic boards.
    - 4) Troubleshooting to include test procedures and system logic in identifying malfunctions.
  - c. Include in manual the shop drawings listed in Table 16260-1. Print shop drawings on folded pages in accordance with the General Requirements.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Ship battery cells assembled and filled to proper level with electrolyte and fully charged.
- C. Temporary Bracing: Where necessary, brace each unit for hoisting, lowering and skidding into position. Temporary internal bracing of the equipment labeled as follows: TEMPORARY-REMOVE BEFORE OPERATION.
- D. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit in accordance with the General Requirements impact chart with manufacturer's recommendations for disposition of damaged materials.
- E. Store equipment in secure and dry storage facility.

**1.05 WARRANTY FOR STORAGE BATTERY:**

- A. In addition to warranty requirements of the General Provisions, furnish a four-year warranty for a total of five years against defective parts and workmanship and a 19-year warranty for intended operation for a total of 20 years.

**1.06 OPERATION AND MAINTENANCE TRAINING:**

- A. Perform operation and maintenance training in accordance with the General Requirements and the following additional requirements for development and performance of operation and maintenance training for uninterruptible power system:.
- B. Use only instructors who are fully qualified for their presentations as required above under Quality Assurance.
- C. Concept of Training:
  - 1. Design classroom and field instruction to cover in detail the functions of each item of equipment. Cover fault isolation and troubleshooting technique to the extent necessary to permit a technician to diagnose and repair faulty modules. Design instruction to provide Authority maintenance personnel with practical experience in the performance of preventive and corrective maintenance. Provide troubleshooting and fault isolation of simulated faults for each item of equipment in the unit substation.
  - 2. Develop and provide all operation and maintenance training necessary for Authority-designated personnel to support the power equipment. Have classroom instruction include not only the anatomy and functioning of the parts under discussion, but the essentials of their routine care, including lubrication schedules, adjustments, limits, test frequency, inspection frequency, troubleshooting, removal and replacement. Have instruction cover theory of operation of the power systems, individual modules and special protective circuits. Use flow diagrams to show sequence of events and time required to complete each event.
  - 3. Have the course include performance of preventive maintenance operations on the equipment and hands-on troubleshooting of each subsystem.
  - 4. In training, assume the Authority's employees have no knowledge of the features of the new equipment. The Authority is permitted to videotape all class presentations.
- D. Training materials:
  - 1. Develop first-generation reproducible training material.
  - 2. Conduct training using final manuals approved by the Authority and certified by the Contractor as being correct, as-built and reproducible. These materials become the property of the Authority at the end of program.
  - 3. Develop the following training materials for each course:
    - a. Instructor material for each course.
    - b. Course outline: Course outline with learning objectives. Include a topic outline for each item of equipment. Include in maintenance training a section devoted to system-fault analysis and troubleshooting. State the learning objectives for each topic.
    - c. Lesson plans: A set of lesson plans for each item of equipment, corresponding to the topic outline, and containing the following information:
      - 1) Lesson title.
      - 2) Instruction time.
      - 3) Objectives.
      - 4) Training aids required.

- 5) Instruction sequence (outline).
  - 6) Tests.
  - 7) Summary.
- d. Training aids: For each topic, develop optimum use of visual aids, including transparencies size eight-inch by 10-inch, 35-mm slides, films, and mockups. Provide approved shop drawings in transparency.
  - e. Instructional material: Use the applicable equipment operation and maintenance manuals as the primary source of instructional material. In addition, develop notebooks for each course containing such additional drawings, descriptive information and procedures necessary to ensure that the learning objectives are met in an orderly and timely manner. Arrange notebook material by each item of equipment and sequence according to the topic outline.
  - f. Course topic outlines and schedules: Have the topic outline and schedules for each course contain the following:
    - 1) Description of course including course objectives and training program level.
    - 2) Course length and recommended numbers of students per course.
    - 3) List of training materials required including documentation and equipment.
    - 4) For each topic outline for the course, a topic objective and the time allotted to the topic.
    - 5) Schedules listing the major topics and subtopics on a time allocation for each topic.
  - g. Instructor guides and training aids: Have the instructor guide for each course include:
    - 1) Table of contents listing each topic and the time allotted.
    - 2) List of applicable documents.
    - 3) List of training materials.
    - 4) Course learning objectives, course length and recommended number of students.
    - 5) Provide each topic with a cover sheet listing topic, objective, time allotted and training aids required.
    - 6) Include training aids with the instructor guides.
  - h. Student workbook: Reproduce diagrams, drawings and procedures from engineering data and manuals and include them in student handout.
- E. Instructional Equipment: Conduct training utilizing installed equipment in normal operating conditions, permitting the trainees to perform hands-on work.
- F. Course of Instruction:
1. Conduct this course for Authority-designated individuals; providing in-depth instruction on the fundamentals involved in the design of the complete system combined with practical aspects of operation and maintenance. Include also the following:
    - a. Practical exercises that require the trainees to make use of the operation and maintenance manuals.
    - b. Familiarization with the assembly, subassembly and components that make up a total system. Include instruction and practical exercises in troubleshooting at a level higher than that performed by equipment operators.

- c. Use and replacement of original assemblies, subassemblies and components with compatible assemblies, subassemblies and components manufactured by others.
  - d. Handouts to each trainee that include information drawings, shop drawings, catalog cuts, manufacturer's literature, equipment maintenance check lists and other literature describing the total system.
  - e. Video and color slide presentations showing system installation, operation, troubleshooting, maintenance, module removal and replacement.
  - f. Tools and test equipment necessary to conduct operation and equipment maintenance troubleshooting.
2. Supplemental Training: In the event Contractor changes or performs modifications to equipment subsequent to the training that impact form, fit or function; provide supplementary training to the Authority's training instructor on a one-time basis.

G. Scope: The training program consists of the following:

Course Title	Length of Course Hours	Number of Persons Per Course	Number of Courses	Total Number of Course Hours
Operation and Maintenance Training	80	10	2	160

- 1. Provide practical training on equipment for not less than 60-percent of the course duration.
  - a. Location: Conduct training classes at facilities provided by the Authority.
  - b. Times: Set class times at the convenience of the Authority.
- 2. Contractor may propose four courses at 40 hours each in lieu of two courses at 80 hours each subject to approval.

H. Equipment:

- 1. Training equipment: Supply and deliver to the Engineer after completion of the course special tools required for maintenance training.
- 2. Test equipment: Supply and deliver to the Engineer after completion of the course test equipment required for maintenance training.

**PART 2 - PRODUCTS**

**2.01 PRODUCTS AND MATERIALS:**

- A. General: Comply with NEMA PE1.
  - 1. Interchangeability: Components of same type, size, rating, functional characteristics and make are to be interchangeable.
  - 2. Enclosure:
    - a. Rectifier/charger, inverter, and power transfer switch provided with common ANSI/NEMA 250, Type 1-EFVF enclosure (Evacuated forced ventilation with

- inlet air filters), or ANSI/NEMA 250, Type 1-FVFF enclosure (Forced ventilation with inlet air filter and outlet air filter), with gasketed dust-tight doors.
- b. Intake filter: Intake filter easily removable from front of unit, throw-away or washable, providing an average ANSI/ASHRAE 52.1 efficiency of 30-percent and an average ANSI/ASHRAE 52.1 arrestance of 95-percent.
  - c. Design: Panel-type, with hinged front door suitable for mounting meters and accessories, ventilated for satisfactory operation of equipment under ambient temperature up to 105F.
  - d. Fabricated from minimum 14-gauge steel sheet and reinforced with steel framework to form rigid structure with smooth outer surface free of burrs, ridges or other blemishes.
  - e. Equipped with latch and handle; screw fastenings will not be accepted in lieu of latch.
  - f. Provision for grounding enclosure.
  - g. Finish: Metallic surfaces cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1 Color 61, two mils minimum DFT.
3. Control and instrument wiring:
- a. Factory-installed.
  - b. Wire: Type SIS tinned-copper wire, 22AWG minimum for control logic and printed circuit card and 18AWG minimum for other control circuits. Class C or D stranded wire used for wiring across hinged joints.
  - c. Wire terminals: Tinned-copper ring or spade-type compression terminals with insulated sleeve installed in accordance with manufacturer's recommendations.
  - d. Wire identification: Each wire identified with the circuit number corresponding to that shown on wiring diagrams adjacent to terminal connections.
4. Fuses: Current-limiting fuse installed in each control circuit and where necessary for protection and coordination in power circuits.
5. Nameplates:
- a. Provide nameplate on each UPS in accordance with reference standards.
  - b. Three-ply, laminated phenolic plates; engraved through black face to white core and attached by means of steel rivets or screws.
    - 1) Lettering to be vertical Gothic using a round or square cutter. V-shaped groove not acceptable.
    - 2) Each UPS enclosure labeled with nameplate 1-1/2 inches high with letters one-inch high: UNINTERRUPTIBLE POWER SYSTEM.
    - 3) Each main emergency panelboard labeled with nameplate one-inch high with letters 1/2-inch high: EMERGENCY POWER PANEL.
  - c. Provide nameplate on each charger, battery, inverter and power transfer switch showing manufacturer's name, brand designation, reference standard, type, class, rating, wiring diagram and serial number, as applicable.
  - d. In addition to other information normally displayed on the equipment, provide nameplates showing switch positions, meaning of indicator lamps and other pertinent information.
6. System controls and indicators: Located on the front of the UPS cabinet; and as per manufacturer standard product with the following minimum requirements:

- a. Monitoring and control: Provide a microprocessor based unit status display and controls section designed for convenient and reliable user operation. The monitoring functions such as metering status and alarms shall be displayed on a graphical LCD display. Additional feature of the monitoring and control system shall include graphical display of single line diagram of the UPS, menu-driven with pushbutton navigation, real time clock, alarm history with time and date, and battery back-up memory. All operation and parameters are firmware controlled, thus eliminating the need for manual adjustments or potentiometers.
  - b. Metering display:
    - 1) Input AC voltage, line to line, and line to neutral for each phase.
    - 2) Input AC current for each phase.
    - 3) Input frequency.
    - 4) DC bus voltage.
    - 5) Battery current and direction (charge/discharge).
    - 6) System output AC voltage, line to line and line to neutral for each phase.
    - 7) System output AC current for each phase.
    - 8) System output frequency.
    - 9) Bypass input voltage, line to line, line to neutral for each phase.
    - 10) Elapsed time-discharging battery.
7. Status displays, alarm messages and indication lights: Minimum requirement as specified for the rectifier/charger, inverter and power transfer switch units with the following additional requirements:
- a. Indication lights: Long-life LED.
  - b. Clear identification of each indication light.
  - c. All alarm messages and indications resettable with push-button.
  - d. Controls: A graphical LCD mimic screen to depict a single line diagram of the UPS with switch positions and power flow.
  - e. Operation Instructions: Display to provide all necessary instructions and step-by-step procedure for each sequence of operation
8. Accessibility of circuit boards and components:
- a. Front accessibility to rectifier/charger, inverter, and power transfer switch, including all cable connections.
  - b. Where a circuit-alignment procedure is required and adjustments require measurement of circuit points on circuit boards: Accessible test points on cards with appropriate designations and supplementary removable extender boards provided for making points accessible.
  - c. Sub-assemblies, parts and circuit boards that may require replacement: Arranged and mounted so that replacement requires no soldering or special tools.
  - d. All cable and conduit connections: Through top of cabinet.
9. Operational noise level: Not exceeding 70dB measured six feet from the equipment on the A weighting network of a general-purpose sound-level meter at slow response. Test conditions and correction factors in accordance with ANSI/IEEE C57.12.90.
10. Supervisory contacts: As specified for the rectifier/charger, inverter and power transfer switch units, with the following additional requirements:
- a. Dry-type sealed contacts rated to switch 500 milliamperes at 250 volts dc or three amperes at 24 volts dc.
  - b. Contact resistance: 0.10-ohm maximum.

- c. Contact bounce: Five milliseconds maximum.
- d. Wired to terminal block for remote connection to supervisory system.

B. Storage Battery:

- 1. Complete with accessories and battery racks.
- 2. Battery: UPS Cycle Duty, Industrial Flooded Lead Acid Cell.
  - a. Round cell or equal. Plate construction: Pure lead cylindrical cone-shaped. Positive grid minimum 0.2 inches thick.
  - b. Discharge capacity: Capable of providing dc inverter input to give rated inverter output at 0.8 power factor for three hours at 77F while simultaneously providing average load of 1.8 kW dc for switchgear operation and control, with peak demands of six kW for five seconds at each 30-minute interval during specified duration. Minimum battery-terminal voltage: 105 volts under full-load at end of three-hour discharge period.
  - c. Cycling duty: Capable of numerous cycling discharges at full load. Corresponding number of cycles for each discharge duration representing 100-percent of the available cycles: 30 seconds, up to 10,000 events; 30 seconds to 1.5 minutes, up to 2,000 events; 1.5 minutes to 4 minutes, up to 600 events and 3 hours, 50 events minimum.
  - d. Cell container:
    - 1) Extra-strength transparent plastic providing clear view of cell interior.
    - 2) Flammability rating: UL 94-V2, ASTM D635-98 self extinguishing, minimum Low Oxygen Index (LOI) 30-percent.
    - 3) Integral molded ribs for supporting internal elements without developing stresses caused by variation of temperature.
    - 4) Ample sediment space below cell plate to prevent premature battery failure.
    - 5) Mark indicating level of electrolyte to be maintained.
  - e. Post type: Two or four, square copper insert posts with dual bolt holes.
  - f. Container cover:
    - 1) Sealed to provide permanent leakproof seal. Sufficient clearance from plate grids to allow for expansion and contraction of plate without cracking or splitting. Replace cells determined to have a cover leak within the warranty period at no additional cost to the Authority.
    - 2) Insulating material: Free from circuit leakage and impurities detrimental to plates or separators and impervious to absorption of electrolyte.
    - 3) NEMA flame arrester vent plugs.
    - 4) Flammability Rating: UL 94-VO, ASTM D635-98, self extinguishing.
  - g. Post seal: Historically proven and demonstrated leak-proof design. Replace cells determined to have a post seal leak within the warranty period at no additional cost to the Authority.
  - h. Factory test and shipping capacity: 100-percent capacity at time of delivery from factory. Factory tested for similar float and end of discharge voltages. Batteries tested together with a maximum difference of plus and minus 0.03 volts from the average cell voltage.
- 3. Accessory equipment:
  - a. One syringe hydrometer with specific-gravity scale range no greater than 1.100 to 1.300.

- b. One thermometer.
  - c. One torque wrench for battery connection.
  - d. Two cell-lifting devices complete with strap and spreader.
  - e. Two sets of stainless steel connecting bolts, nuts and washers.
  - f. Two sets of intercell connectors.
  - g. One set of manufacturer-recommended interrack cable and load-terminal lugs.
  - h. Pegboard: Hard board, ANSI/AHA 135.4, tempered, one smooth side (S1S), 1/4-inch nominal thickness, perforated, sized to accommodate all products specified above. Framed with one-inch by one-inch hardwood. Paint frame and hardboard in color selected by the Engineer. Include hardware for wall-mounting and pegboard accessories suited to the products to be mounted. Provide one-inch high nameplates as specified, with accessory names inscribed in 1/2-inch-high letters.
  - i. One portable lifting jig for battery, as recommended by battery manufacturer, in each battery room.
  - j. Battery Cycle Monitor: C&D BCM1100 or equal, electronic logging and event recorder/monitor to provide summary information for validating battery manufacturer's warranty. Install monitor in accordance with manufacturer instructions and requirements. Provide signal wiring, power wiring and conduits to ensure correct operation. Provide power wiring and conduits from nearest available distribution panel as selected by the Engineer. Ensure that Monitor meets manufacturer's requirements for verifying load cycling warranty. As a minimum, make monitor able to:
    - 1) Measure battery room temperature, present, maximum and minimum values. Maintain a register of the dates and values of the minimum and maximum occurrences.
    - 2) Indicate float voltage with record retrieval of the maximum and minimum values.
    - 3) Monitor the following parameters during discharge:
      - a) Time of day the event started.
      - b) Battery voltage at start and end of discharge.
      - c) Battery load current during discharge.
      - d) Length of time of the discharge.
    - 4) Provide a summary read-out showing detailed information on number of cycles on the battery.
    - 5) Provide alarm contacts to signal an event is occurring on the battery.
    - 6) Indicate total Kilowatt hours taken out of the battery.
    - 7) Indicate total ampere-hours taken out of battery.
    - 8) Indicate percent of cycle life remaining in battery.
4. Battery rack:
- a. Round Cell Battery:
    - 1) Two-tier type fabricated from polyester-glass-composite that is acid resistant, flame retarding, maintenance-free, electrical insulator.
    - 2) Floor mat: Durable, 1/4-inch thick, electrolyte-resistant black rubber mat
5. Enclosed dc circuit breaker:
- a. Two-pole, 250-volt dc, molded-case circuit breaker as specified in Section 16440.

- b. Enclosure: ANSI/NEMA 250, Type 1, marked ON/OFF, capable of being padlocked in OFF position.
- c. Location: In battery room.

C. Rectifier/Charger:

1. Solid-state, three-phase: Continuous-duty rectifier including the following requirements:
  - a. Bridge rectifiers: Silicon-controlled or power transistor.
  - b. Six-pulse minimum, each pulse fully controlled.
  - c. Electronic current-limiting control for output.
  - d. Output voltage: Maximum six-percent rms ripple with battery not connected.
2. Electrical characteristics:
  - a. For converting 480-volt, three-phase, 60 Hertz alternating current to direct current with characteristics suitable for charging associated battery and for providing input to the associated inverter.
  - b. Float and equalizing charge rate: As necessary for proper charging of associated battery, with the following additional requirements:
    - 1) Float voltage adjustable between 125 and 135 volts.
    - 2) Equalizing voltage adjustable between 135 and 144 volts.
  - c. Output rating: To provide dc input to inverter for giving rated inverter output while simultaneously providing average load of 1.8-kW dc for switchgear loads as specified, with sufficient rating to simultaneously recharge the battery to 90-percent or more of fully charged condition in a 12-hour period from a discharged battery voltage of 105 volts.
  - d. Output voltage regulation: Within plus-or-minus one percent from zero to 100-percent of charger rated capacity for ac supply-voltage variation of plus-or-minus 10-percent at 480 volts and supply-frequency variation of plus-or-minus five-percent at 60 Hertz.
  - e. Efficiency: 95-percent minimum at nominal input voltage with rectifier/charger supplying 100-percent of rated load.
  - f. Power factor: Input power factor minimum 0.7 with rated input voltage, UPS supplying 100-percent load, and battery on minimum float voltage.
3. Accessory equipment:
  - a. Meters: As specified in Article 2.1.A.6.b
  - b. Indicating lights or status displays:
    - 1) One to monitor ac supply voltage (low voltage or loss on any phase).
    - 2) Status displays:
      - a) Input circuit breaker closed.
      - b) Rectifier/charger in float or equalizing mode.
      - c) Rectifier/charger failed.
      - d) For ungrounded dc system: Ground-fault indication lights.
  - c. Relay equipped with one NO contact and one NC contact for indicating normal and failure status of rectifier/charger output at remote location.
  - d. One 480-volt, three-pole, molded-case circuit breaker or one integrally fused circuit breaker in accordance with Section 16440 for incoming power to protect against available short-circuit current of rms symmetrical amperes at 0.15 power factor not less than the following based on substation-transformer capacity as shown:
    - 1) 750-kVA transformer: 17,500.
    - 2) 1,000-kVA transformer: 25,000.

- 3) 1,500-kVA transformer: 35,000.
  - 4) 2,000-kVA transformer: 42,000.
  - 4. Automatic control:
    - a. Current-limiting device or circuit capable of limiting output current to rating of charger without disconnecting charger from battery or ac power supply. Provide a current limit, 0% to 25%(adjustable) of nominal full load current to limit the battery recharge current when activated by a remote
    - b. Automatic recharging on equalizing cycle after return of input ac voltage following an outage. Input current rate of increase limited (ramped) to achieve full-load input capability in no more than 15 seconds after turn-on.
    - c. Adjustable equalizing timer with range from one-hour to 60 hours minimum. Timer-adjustment function identified.
    - d. Built-in overload protection including short circuit at output terminals.
  - 5. Manual control:
    - a. Manual momentary contact switch to initiate equalizing operation and timer.
    - b. Manual momentary contact switch to stop equalizing operation, restore float operation and reset timer.
    - c. Screwdriver slot or locking knob-operated devices for adjusting float voltage and equalizing voltage, with function identified.
- D. Static Inverter:
- 1. Solid-state design using Insulated Gate Bipolar Transistor (IGBT) with Pulse Width Modulation/Stepwave.
  - 2. Electrical characteristics:
    - a. Input voltage: Nominal input-voltage range from low voltage of 105 volt to highest equalizing voltage of 144 volts as specified for battery.
    - b. Output voltage: 480Y/277-volt, three-phase, four-wire, 60 Hertz.
    - c. Output rating:
      - 1) kVA rating: As shown.
      - 2) Capable of delivering rated three-phase KVA with any one phase 30-percent unbalanced from the other two phases within the dc input-voltage limits, and not exceeding three-percent voltage unbalance for any phase combination with no manual adjustment.
      - 3) Capable of delivering rated KVA into load which has power factor of 0.8 lagging.
    - d. Output-wave form: Sine wave, maximum of five-percent total harmonic distortion.
    - e. Output-voltage regulation: Zero to 100-percent rated load and dc input voltage within stated limits:
      - 1) Balanced load: Plus-or-minus one percent.
      - 2) Unbalanced load at 30-percent of rated load: Plus-or-minus 2.5 percent.
    - f. Output-voltage stability: With 100-percent step-load change, balanced load: Plus-or-minus 10-percent maximum deviation. Recovery to stated regulation band within six cycles.
    - g. Output-frequency control and synchronization:
      - 1) Inverter-output frequency phase locked to bypass source whenever source frequency is within plus-or-minus two-percent of standard 60 Hertz.
      - 2) Inverter-frequency control to shift to crystal- controlled oscillator in inverter whenever utility reference frequency goes outside limits.

- Whenever utility source returns within the frequency limits, frequency control to return to bypass source.
- 3) Crystal-controlled oscillator to maintain a stable, continuous, standard 60-Hertz frequency within plus-or-minus one-half percent.
  - 4) Phase-lock control to maintain output-voltage wave of each phase to within six electrical degrees of the utility voltage wave (bypass source).
- h. Overload rating: 125-percent of rated load for 15 minutes (without bypass source); 200-percent for 30 seconds (without bypass source).
  - i. Starting characteristics: Capacity to start at any load within overload rating with and without external ac power source.
  - j. Fault and surge override: Capacity to:
    - 1) Sustain fault at load terminals of main emergency panelboard until fault is cleared or load is transferred.
    - 2) Override magnetizing in-rush current of transformer as follows:
      - a) Inverter below 15 kVA: Nine-kVA transformer.
      - b) Inverter 25 kVA and larger: 15-kVA transformer.
  - k. Inverter automatic shutdown: To occur when battery voltage reaches lower limit of 105 volts. Battery to continue to supply the specified switchgear load.
  - l. Inverter to restart automatically when dc voltage reaches nominal value of 125 volts.
  - m. Efficiency: Not less than the following with load power factor of 0.8 lagging.
    - 1) 15 kVA or less: 80-percent.
    - 2) 20 kVA through 50 kVA: 84-percent.
3. Accessory equipment:
- a. Meters: As specified in Article 2.1A.6.b
  - b. Indicating lights or status displays:
    - 1) Inverter operating in normal mode.
    - 2) Inverter operating in standby mode or power transfer switch in bypass mode.
    - 3) Inverter operating and phase locked.
    - 4) DC voltage below minimum float voltage or above maximum equalizing voltage.
    - 5) Overtemperature.
    - 6) Low cooling air flow.
    - 7) Overload.
  - c. Relays and controls:
    - 1) Adjustable three-phase undervoltage relay or static circuitry to sense each phase of inverter output for initiating transfer to bypass power source. Initiation voltage adjustable over range of 80-percent to 90-percent of rated voltage.
    - 2) Voltage-sensing circuitry to prevent retransfer of load to the inverter unless voltage is within specified tolerance and frequency is phase locked within tolerance.
    - 3) Signals from the frequency and synchronization control to be used to inhibit retransfer from bypass to inverter if out-of-tolerance.
    - 4) Inverter control for restarting of a shutdown inverter.
    - 5) Manual ON/OFF control switch. ON position of switch to restart inverter for full-automatic operation.

- 6) Devices and circuitry to protect inverter from dc over/under voltage, overload, short-circuit, and overtemperature.
  - 7) Device and circuitry equipped with two supervisory contacts, one NC and one NO, for remote monitoring inverter-output status.
- E. Static Transfer Switch: An integral part of the UPS, silicon-controlled rectifier-type with the following requirements:
1. Automatic transfer of inverter load to bypass source: Transfer to be made under the following conditions provided transfer/retransfer selector switch is in automatic position:
    - a. Inverter-output failure occurs.
    - b. Overload is equal to or less than 25-percent for more than 15 minutes.
    - c. Overload greater than 25-percent occurs.
    - d. Inverter is shutdown with manual switch.
  2. Automatic retransfer of load to inverter: Retransfer to be made under following conditions provided transfer/retransfer selector switch is in automatic position:
    - a. The overload condition is removed.
    - b. Inverter-output voltage is within specified tolerance for magnitude and frequency and within six electrical degrees of the bypass-source voltage.
  3. Manual transfer and retransfer:
    - a. Transfer of inverter load to the bypass source initiated by a switch closure. Inverter to remain operating and ready to accept the load.
    - b. Retransfer initiated by automatic control when transfer/retransfer selector switch is in automatic position.
  4. Switch identified as a transfer/retransfer selector switch: Two-position selector switch with positions labeled as follows:
    - a. AUTOMATIC (TRANSFER AND RETRANSFER).
    - b. MANUAL TRANSFER (INHIBIT RETRANSFER).
  5. Electrical characteristics:
    - a. Rated voltage: 480/277-volt, three-phase, 60 Hertz with neutral bus for four-wire bypass-source service and UPS-output neutral connection.
    - b. Rated continuous current: 125% rated load continuously and 200% rated load for 30 seconds.
    - c. Withstand capability: Withstand short-circuit current available at bypass source. Vendor may provide current-limiting protection to provide required withstand. Current-limiting fuses to provide coordination with the bypass source and the branch-circuit protection in the main emergency panelboard.
    - d. Capacity to close into short-circuit or let-through of fuses without functional degrading other than fuse clearing.
  6. Indicating lights or status displays:
    - a. Bypass-source undervoltage, overvoltage, loss of a phase, or out-of-frequency tolerance.
    - b. Power transfer switch on bypass.
  7. Maintenance bypass capability:
    - a. A manually operated maintenance bypass switching arrangement to transfer the UPS output load to the bypass ac source without interruption of UPS output while electronically isolating or permitting the isolation of the static transfer switch and the inverter from the bypass source.
  8. Circuit and device with two supervisory contacts, one NO and one NC for monitoring status of power transfer switch feeding load from inverter output or from bypass source.

- F. Main Emergency Panelboard:
1. ANSI/NEMA PB1, UL 67 fused-switch panelboard.
  2. Enclosure:
    - a. ANSI/NEMA 250, Type 1, fabricated from galvanized steel, surface-mounted, unless otherwise shown.
    - b. Minimum of four-inch side gutter and six-inch top and bottom gutters.
    - c. Mounting channel drilled and tapped to accommodate any combination of fused switches.
    - d. Provide latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.
    - e. Provisions for enclosure grounding.
    - f. Finish: Metallic surfaces degreased, cleaned, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1 Color 61; two mils minimum DFT.
  3. Busbar:
    - a. ASTM B187-00, 98-percent-conductivity copper with silver-plated or tin-plated contact surface, drilled and tapped to accommodate any combination of fused switch units.
    - b. Neutral and ground bus of the same rating as that of phase bus. Neutral bus mounted on insulated block.
    - c. Rated at minimum 150-percent of inverter rating and not less than power transfer switch bypass overcurrent protection.
  4. Type of service: 277/480 volts, three-phase, four-wire, 60 Hertz.
  5. Type of mains: Main lugs only, located at top or bottom as shown.
  6. Branch circuit: Equipped with fused switch unit, number of circuits as shown.
  7. Fused switch unit:
    - a. Individually enclosed, quick-make/quick-break switching mechanism with silver-alloy contacts, external operating handle with provision for padlocking in ON or OFF positions.
    - b. Mechanical defeatable door interlock to prevent opening door when the switch is in ON Position.
    - c. Pressure-type fuse clip, with Class J cartridge fuse conforming to UL 198C.
    - d. Number of poles: As shown.
    - e. Current rating: As shown. Maximum rating 30 amperes.
    - f. If single-pole fused switch unit is not available, use a two-pole or three-pole fused switch unit for each circuit shown with a single-pole fused switch unit. Two or more separate circuits are not to be fed from a two-pole or three-pole fused switch unit.
  8. Fuse time-current characteristic coordinated with upstream fuse time-current characteristic for providing selective overcurrent tripping.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Install UPS where shown in accordance with the following requirements:
1. Storage battery: Anchor battery rack to floor, then mount and connect battery cells in accordance with manufacturer's recommendations, with the following additional requirements:
    - a. For connecting cells mounted on same rack, use lead-plated or tin-plated solid-copper conductor as recommended by battery manufacturer.

- b. For connecting cells mounted on different racks, use Class D stranded single-conductor insulated cable sized the same as the battery cable. Run cable in two-inch, galvanized-steel rigid conduit in accordance with Section 16130.
    - c. Use nylon-insulated bushing at each end of conduit where cable passes through conduit to protect cable insulation from damage.
    - d. Install conduit and cable to connect battery to UPS as shown.
    - e. Use two-tier battery racks as specified for battery type used. All batteries to be easily accessible from floor. Three-tier and three-step racks are prohibited.
  - 2. Anchor UPS enclosure to floor as shown and approved. Install input and output power and control wiring as shown and as approved in accordance with Section 16120. Ground enclosure in accordance with Section 16060.
  - 3. Main emergency panelboard: Install as shown and in accordance with Section 16440.
  - 4. Install pegboard at location approved by the Engineer. Mount accessories and associated nameplates on pegboard.
- B. Initial Energizing:
  - 1. Initial energizing of each UPS will be under the guidance of the manufacturer's engineering representative who will advise Contractor and Authority personnel on step-by-step procedures.
- C. Apply touch-up paint where necessary.
- D. Floor Mat for Battery Rack: Cover walking area with floor mat cut to fit entire room layout, six inches larger than the overall width and length of rack to protect floor from electrolyte.

### **3.02 FIELD QUALITY CONTROL:**

- A. Field Testing and Inspection:
  - 1. General:
    - a. Conduct field inspection and field testing at each ac switchboard room to ensure proper operation of devices and equipment provided.
    - b. Operation and protective-device setting: The Contractor is responsible for setting and calibration of protective devices for proper operation during field testing.
  - 2. Field inspection:
    - a. Prior to field testing, check equipment installation in accordance with manufacturer's recommendations and applicable IEEE and ANSI standards, including verification of the following:
      - 1) Connection of circuit in accordance with wiring diagram.
      - 2) Tightness of cable and busbar connections.
      - 3) Battery-intercell bus-link integrity.
  - 3. Field Testing:
    - a. Furnish equipment to perform tests.
    - b. Provide services of manufacturer's engineering representative and supporting field crew for a period not less than three man-days. Conduct tests in the presence of the Engineer. Perform approved tests including, but not limited to, those specified.

- c. Test grounding conductors and enclosures on equipment for continuity to room ground bus.
- d. Storage battery:
  - 1) Measure battery-charging voltage, electrolyte specific gravity and level.
  - 2) Compare measured value and correct to manufacturer's specified tolerances.
- e. Power transfer switch:
  - 1) Calibrate and set voltage-sensing device and transfer time-delay as specified and as approved.
  - 2) Perform automatic transfer by:
    - a) Simulating loss of inverter output.
    - b) Return to normal power.
- f. Uninterruptible power system:
  - 1) Perform load test at inverter rated output with UPS operating in normal mode. Provide equipment necessary to achieve rated capacity load.
  - 2) Under the following conditions, perform automatic-throwover operation and manual restoration of utility service in associated ac switchboard room and check for normal operation of UPS:
    - a) With UPS in normal mode and feeding connected load.
    - b) With battery fully charged, no ac power fed to rectifier/charger and alternate feeder to power transfer switch and UPS feeding connected load.
  - 3) In combined ac switchboard room: Check for normal operation of UPS when feeding rated load during simultaneous loss of both 13.8-kV or 34.5-kV, as applicable, feeders and subsequent manual restoration of both services.
  - 4) With no ac power available to UPS, stop and restart inverter five times.
  - 5) Acceptance testing:
    - a) Perform installation related measurement and acceptance testing in accordance with ANSI/IEEE 450 and ANSI/IEEE 484. In the event of a conflict between this procedure and the ANSI/IEEE documents, this procedure will take precedence.
    - b) Calibrate test equipment used during this procedure, calibration date not older than one year from the date of testing, calibrations traceable to NIST. Have calibration stickers visible on all applicable equipment. As a minimum, calibrate the following equipment with accuracy as stated:

<u>Equipment</u>	<u>Accuracy</u>
1) Multimeter	± 0.1%
2) Microhm meter	± 0.5%
3) Current measuring equipment	± 1 amp
4) Cell voltage monitor equipment	± 0.5%

c) Initial measurements:

- 1) Read and record individual cell voltages to two decimal places while the battery is on a normal float charge.
  - 2) Read and record the ac ripple voltage out of the rectifier utilizing an ungrounded oscilloscope. Read and record ac ripple current utilizing an ac clamp on meter.
  - 3) Read and record intercell connection resistance using a microhm meter . Remake and re-measure any connection that has a resistance measurement more than 10-percent or 5 microhms, whichever is greater, over the average for each type of connection.
  - 4) Read and record each cell's internal impedance or conductance. Note make and model of meter.
  - 5) Read and record the specific gravity of each cell.
  - 6) Read and record the temperature of each cell and the ambient temperature of the room.
- d) Rectifier test:
- 1) Apply ac load at inverter rated output with UPS operating in normal mode. Have battery connected and fully charged.
  - 2) Using infrared thermography, scan accessible UPS internal components. Also, scan UPS fuses, circuit breakers, associated circuit breakers, and UPS ac feed networks where accessible. Record abnormal heating and save these images for incorporation into the report.
  - 3) With full ac load still applied, attached dc load to UPS output. Slowly increase dc load until the point where the UPS rectifier is at current limit. This will occur when the voltage begins to sag to a pint where current will begin to flow from the battery. Reduce load slightly so that no current is being drawn from the battery. Record the total dc current out of the UPS rectifier at the current limit point. Leave the rectifier at this current limit point for 20 minutes. During the 20 minutes, utilize infrared thermography to scan components as outlined above. Record abnormal heating and save these images for incorporation into the report. Utilizing an ungrounded oscilloscope, read and record the ac ripple voltage out of the rectifier at the current limit point. Also, measure and record the ac ripple current using an ac clamp on meter.
  - 4) Remove the load from both the rectifier section and the UPS ac output.
- e) Full UPS test:
- 1) Attach a monitor to the battery to measure every individual cell voltage. Ensure that this monitor

can read and record every cell voltage not less than once per minute. Also use the monitor to measure and record overall battery voltage and total battery discharge current

- 2) Attach an automatic load bank to the battery. When initiated, have the load bank provide a constant 1.8 KW load to the battery until the end of the full UPS test. Every 30 minutes increase this load to 6.0 kW for five seconds and then return it to 1.8 KW. Program this to occur automatically until the end of the full UPS test.
  - 3) Apply ac load at inverter rated output with UPS operating in normal mode. Have battery connected and fully charged.
  - 4) Trip breaker feeding ac power to rectifier/charger. This will initiate the UPS to operate on battery. Simultaneously, initiate the dc load bank and the battery voltage/current monitor. While test is running, utilize infrared thermography to scan the battery, associated interconnects, and ups components where accessible. Record abnormal heating and save these images for incorporation into the report. Continue the test until the under-voltage device operates on the UPS. Record the time and the battery voltage when this occurs. Turn off the dc load bank and stop the battery voltage/current monitor.
  - 5) Attach a current monitor to the battery that can measure and record current into the battery every 10 minutes. Disconnect all other load equipment and monitors. Re-energize circuit breaker to UPS. Start monitoring current. Check monitor after 12 hours. Record ampere hours that have been returned to the battery.
  - 6) Remove all equipment from UPS area. Read and record float voltages.
- f) Pass-fail criteria:
- 1) The UPS battery is acceptable only if the battery operates for a minimum of three hours and the battery capacity is a least 90-percent. No individual cell capacity may be less than 80-percent. Base capacity on a temperature correction to 77F.
  - 2) Specific gravities are to be within the manufacturer's specified values.
  - 3) Intercell connection resistances are to be within 10-percent or five microhms, whichever is greater, over the average for each type of connection.
  - 4) Have the battery 90-percent charged within 12 hours after returning normal power to the UPS. This can be determined by the ampere hours

returned to the battery after the 12-hour period. At least 100-percent of the ampere hours removed from the battery must be returned to the battery in order to be 90-percent charged.

- g) Report: Include the following items:
  - 1) Abnormal heating detected by the infrared thermography.
  - 2) Time of battery operation under full load. Include final overall battery voltage at time of UPS under-voltage device operation.
  - 3) Battery capacity percentage corrected to 77F. Base this on the battery manufacturer's's constant power data.
  - 4) Graph of overall battery voltage versus time. Supply this data also in tabular form.
  - 5) Graph of individual cell voltages at the three-hour point, at the final reading, and at the 80-percent, 90-percent and 100-percent capacity points. Supply this data also in tabular form.
  - 6) Graphical display of cell float voltages before and after test, with the required minimum and maximum values annotated. Supply this data also in tabular form.
  - 7) Graphical display of temperature-corrected cell specific gravities with the required minimum and maximum values annotated. Supply this data also in tabular form.
  - 8) Graphical display of impedance/conductance values. Supply this data also in tabular form.
  - 9) Current limit value of rectifier section of UPS.
  - 10) Print-out of ac ripple voltage wave form during full-load and no-load conditions. Include ac ripple current values.
- 6) After battery is discharged to level of 105 volts, initiate equalizing mode. After 12 hours, measure ampere hours to determine that 90-percent of recharge condition remains; then recharge to 100-percent level.
- 7) Simulate operations of rectifier/charger, inverter and power transfer switch operations for verifying equipment-status indication at DTS cabinet.
- 8) Set UPS to normal mode with rectifier/charger on automatic control.
- g. Compliance:
  - 1) If testing indicates failure to comply with specified requirements, replace, correct or modify equipment so that it does comply.
  - 2) Conduct additional tests witnessed by the Engineer to prove compliance with specified requirements.

B. Field-Testing Personnel:

- 1. Provide services of manufacturer's engineering representative to perform specified field-testing program.

2. When more than one representative is involved, Contractor to ensure proper coordination.
  3. Provide engineering, technicians and journeymen personnel as necessary to set-up and implement testing.
- C. Authority Tests:
1. The Authority reserves the right to require the Contractor to conduct acceptance tests of voltage regulation and sound level on each UPS at each passenger station within one-year after installation.
  2. In order to perform sound-level tests, the Contractor may re-create test conditions of applicable standards to the extent possible without disturbing existing structure or installed equipment or materials.
- D. Submit certified test report

## SECTION 16261

### TRANSFORMER-RECTIFIER UNITS FOR TRACTION POWER

#### PART 1. GENERAL

##### 1.01 SUMMARY

- A. This section specifies furnishing, delivering and installing transformer-rectifier units and spare parts.
- B. Transformer-rectifier units consist of equipment from the high-voltage cable entrance on the transformer side to the dc bus connections on the rectifier end, including the low-voltage ac busduct connecting the transformer secondary to the rectifier input.
- C. Related sections include:
  - 1. Section 16051 - Traction Power Scope of Work For Traction Power
  - 2. Section 16052 - Basic Materials and Methods For Traction Power
  - 3. Section 16128 - Wire and Cable For Traction Power
  - 4. Section 16291 - Local Annunciator Panel For Traction Power
  - 5. Section 16321 - High Voltage AC Switchgear (13.8kV) For Traction Power
  - 6. Section 16322 - High Voltage AC Switchgear (34.5kV) For Traction Power
  - 7. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power
  - 8. Section 16441 - Drainage and Negative Switchboard For Traction Power
  - 9. Section 16451 - Substation Busways For Traction Power
- D. Compensation for work related to the traction power equipment specified in this section will be made in the following manner:
  - 1. Equipment For Traction Power Substation: Lump Sum
- E. Compensation for work related to installation specified in this section will be made in the following manner:
  - 1. Included in the lump sum installation cost of each traction power substation.

##### 1.02 REFERENCE

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of jurisdictional authorities
  - 2. NEC
  - 3. NEMA: CC1, BU1
  - 4. ANSI: C34.2, C57.12.00, C57.12.01, C57.12.90, C57.12.91, C57.113, C57.124, Z55.1, C39.1, C12
  - 5. EIA: RS-282
  - 6. ASTM: D3487

##### 1.03 SYSTEM DESCRIPTION

- A. Design Criteria:
  - 1. Transformer-rectifier units shall be designed for extra heavy duty traction service, capable of carrying two peak period loading cycles per day within a six hour interval of each other as shown in Figure 16261-1 at the end of this section.
  - 2. Connections: The transformer-rectifier units at each sub-station shall be connected per ANSI C34.2 Circuit No. 25, 26 or 31 as shown.,
  - 3. Transformer-rectifier units shall be capable of operating in parallel with two additional units without exceeding 10% maximum deviation from the proportionate share of its

- load when carrying any load between 50 and 150% of rated load.
4. Transformer-rectifier units shall be capable of withstanding 100% of the theoretical short circuit current, with the short circuit applied at the load terminals of the dc cathode circuit breaker, without damage to any component, including diodes and diode fuses, until cleared by the cathode circuit breaker.
  5. Transformer-rectifier unit efficiency shall be greater than the following:
    - a. 97% at 25% of full load rating
    - b. 97.5% at 50% of full load rating
    - c. 98% at 100% of full load rating
    - d. 97% at 150% of full load rating
    - e. 95% at 450% of full load rating.
  6. Transformer-rectifier unit voltage regulation: Inherent dc voltage regulation of six percent plus or minus 0.5% when load is reduced from 100 to one percent of rated load, and when rated tap primary voltage having a sinusoidal wave form is applied to any tap on the ac winding. No load voltage not exceeding 780 Volts dc. Voltage regulation linear between 100% and 450% load. Output voltage not below 535 Volts at 450% load.
  7. Transformer-rectifier unit displacement power factor: 0.945 or greater from 25% to 100% at rated ac voltage.
  8. Rectifier transformers:
    - a. Temperature limits:
      - 1) Oil-filled transformer: Average winding temperature rise 65°C at end of two hour overload cycle (see Figure 16261-1). Average winding temperature rise by resistance not to exceed 55°C after stabilized continuous operation at 100% rated ac voltage and dc load, insulation system class thermally upgraded 120°C
      - 2) Dry-type transformer: Average temperature rise by resistance 80°C at end of two hour Transformer-Rectifier Unit Test (see Figure 16261-1). Average winding temperature rise by resistance not to exceed 65°C after stabilized continuous operation at 100% rated ac voltage and dc load. Insulation system class 220°C.
    - b. Windings (for dry-type transformers): The windings shall be designed not to absorb moisture, and shall be suitable for both storage and operation in adverse environments, including prolonged storage in 100% humidity at ambient temperatures ranging from minus 50°C to plus 50°C, and shall be capable of being switched on immediately after such storage without predrying.
    - c. Impedance: selected to comply with specified voltage regulation requirements.
    - d. Audible sound levels:
      - 1) Oil-filled transformer: 62 dB, maximum, at rated voltage, frequency and no load, with excitation on the transformer, per ANSI C57.12.90.
      - 2) Dry-type transformer: 65 dB, maximum, at rated voltage, frequency and no load, with excitation on the transformer, per ANSI C57.12.91.
  9. Rectifiers:
    - a. Type and rating: Indoor, 700V DC rated output, convection cooled, diodes mounted on air-cooled heatsink, in a free standing enclosure.
      - 1) Continuous rating
        - a) DC voltage: 700 Volts at 400% load.
        - b) DC amperes: 4286A for 3000 kW and 2857A for 2000 kW
        - c) Kilowatts: 3000 kW or 2000 kW, as shown on contract drawings.
      - 2) Overload Ratings: After constant full-load temperatures are reached, operation at 150% of rated load Amperes for two hours

and a superimposed cycle of overloads consisting of five periods of one minute each at 300% of rated load Amperes followed by one period of 450% of rated load Amperes for fifteen seconds at the end of the period. Periods shall be evenly spaced throughout the two hour period as shown in Figure 16261-1.

- 3) An interphase transformer shall be provided between the direct outputs of the six pulse sections to absorb the instantaneous direct voltage differences of the transformer-rectifier is connected per C34.2 circuit no. 31.

- b. Audible sound levels: Octave band sound pressure level at three feet from the rectifier assembly at any location not exceeding the following: Sound Pressure Level, dB,

<u>Octave Band, Hertz</u>	<u>re: 0.0002 Microbar</u>
1) 20 - 75	83
2) 75 - 300	78
3) 300 - 600	75
4) 600 - 1200	71
5) 1200 - 2400	68
6) 2400 - 4800	58
7) 4800 - 9600	48

- c. Surge Protection Devices to limit the reverse voltage across the silicon diodes to a value within the peak-reverse-voltage rating on the diode irrespective of whether the voltage transient originates in either the alternating current or direct current power circuits. Protection also provided against lightning surges on the cathode and anode circuits equivalent to a 1.2 x 50 microsecond wave with a crest voltage of 3500 Volts.

- d. Interference Noise Suppression: The rectifier shall be designed to limit the noise emissions outside the natural inherent harmonic frequencies. The Contractor shall investigate and remediate any potential effect from rectifier generated harmonics and/or noise interfering with electronic communication systems used by the Authority. Harmonic suppression equipment shall be provided to limit noise and harmonic output from the output of the Transformer-Rectifier Unit if the rectifier generated harmonics and/or noise levels interfere with the Authority's operating electronic communication equipment. Frequencies most likely to be affected include:

1)	F1	-	2100 Hz, +/- 30 Hz
2)	F2	-	2320 Hz, +/- 30 Hz
3)	F3	-	2580 Hz, +/- 30 Hz
4)	F4	-	2820 Hz, +/- 30 Hz
5)	F5	-	3100 Hz, +/- 30 Hz
6)	F6	-	3370 Hz, +/- 30 Hz
7)	F7	-	3660 Hz, +/- 30 Hz
8)	F8	-	3900 Hz, +/- 30 Hz
9)	F9	-	4550 Hz, +/- 100 Hz
10)	F10	-	5525 Hz, +/- 100 Hz
11)	TWC	-	9800 Hz, +/- 250 Hz

- e. Current Balance Scheme: Designed to maintain balance between parallel connected diodes in each phase within plus and minus 10% of their proportionate share under all load conditions. Current balancing scheme holds individual diode currents within their capabilities under all load conditions with one fuse per leg open. Current balancing by use of selectively matched diodes shall not be allowed.

#### 1.04 SUBMITTALS

- A. Submit the following for approval in accordance with the Special Conditions and with the

additional requirements as specified for each:

1. Shop Drawings: In accordance with Section 16051 Table I.
2. Certification:
  - a. Certified test reports of design tests performed on each type and rating of Transformer and Rectifier, and of tests performed on each type and rating of Transformer-Rectifier Unit.
  - b. Certified test reports for Routine tests performed on Transformer, Rectifier and Transformer-Rectifier Units.
  - c. Certificates from manufacturers verifying that equipment conforms to specified requirements.
3. Operations and Maintenance Manuals: In accordance with Special Conditions.
4. Spare Parts Lists.

## 1.05 QUALITY ASSURANCE

- A. For Codes, Regulations, Reference Standards and Specifications, refer to Article 1.02 above.
- B. Factory Testing: All design criteria and qualities of the transformer-rectifier units shall be proven by actual test on transformers, rectifiers and transformer-rectifier units to be provided. Tests shall be of three types; Design Tests, made on a single transformer, rectifier of each type and rating to be provided under this Contract, Routine Tests, made on each transformer, rectifier and diode to be provided under this Contract, and Transformer-Rectifier Unit Tests, made on a transformer-rectifier unit of each type and rating. Design and Routine Tests shall be conducted according to guidelines given by applicable ANSI Standards. Transformer-Rectifier Unit Tests shall be done as specified. Factory testing may be accomplished at the manufacturers' facilities, or at an independent testing facility upon approval by the Engineer. Test plans and procedures shall be submitted for approval at least 20 working days in advance of scheduled test dates. Design and Routine Tests for transformers and rectifiers may be combined with Transformer-Rectifier Unit Tests where feasible and approved in advance. No test results will be accepted prior to receipt and approval of test plans and procedures. Field Inspection and Testing is defined in Section 16051 (Scope of Work). Test requirements are as follows:
  1. Transformer testing in accordance with ANSI C57.12.90, C57.12.91, C57.113 and C57.124 and as follows:
    - a. Transformer Design Tests, including temperature and two hour loading cycle test specified in Figure 16261-1 to verify the temperature limits specified. Transformers wired per ANSI 34.2 Circuit No. 25, ANSI 34.2 Circuit No. 26 and ANSI C34.2 circuit no. 31 are considered different types for purposes of design testing.
    - b. Routine tests including the following:
      - 1) Resistance measurement.
      - 2) Ratio test.
      - 3) Polarity and phase relation test.
      - 4) No-load loss test and excitation current test.
      - 5) Impedance voltage and load loss test.
      - 6) Applied potential test.
      - 7) Induced potential test.
      - 8) Reduced, chopped and full-wave impulse tests.
      - 9) Partial Discharge test.
        - a) Perform partial discharge test to certify the transformer has a minimum partial discharge-free voltage of 120% of rated voltage. Provide oscillograph recordings of measured test. Measure partial discharge inception and extinction voltage during induced voltage test in accordance with ANSI/IEEE C57.113 (oil type) and C57.124 (dry type) and the following requirements.

- b) Measure partial discharge inception voltage when the voltage is raised, in 10% increments, from 70% to 200% and lowered, in 10% decrements, from 200% to 70% of rated voltage during the induced voltage test to verify the following requirements:
    - c) Inception of partial discharge occurs above 120% of rated voltage when voltage is raised from 70% to 200%. At 120%, the partial discharge reading shall be discharge-free.
    - d) Extinction of partial discharge occurs above 120% of rated voltage when voltage is lowered from 200% to 70%.
- 2. Rectifier tests in accordance with ANSI C34.2, EIA RS-282 and as follows:
  - a. Rectifier design tests including:
    - 1) Reduced voltage load test, including overloads shown in Figure 16261-1 after temperature stabilization at rated load. Test shall be conducted with one string of diodes in series removed from service from each major branch of the rectifier circuit, without exceeding safe junction temperature on the active diodes.
    - 2) Current balance test to demonstrate proportional sharing between parallel diodes with plus or minus 10% at 161% overload.
    - 3) Loss measurement test in accordance with ANSI C34.2 Section 6.3.2 and 6.3.3.
    - 4) At loads of one, 25, 50, 100, 150, and 450% of rated load, determine efficiency, voltage regulation and power factor.
  - b. Rectifier routine testing including:
    - 1) Dielectric strength test.
    - 2) Rated voltage test.
- 3. Diode Tests in accordance with EIA RS-282:
  - a. Diode design tests Including:
    - 1) Surge current test.
    - 2) Life test.
    - 3) Thermal resistance test.
    - 4) Reverse recovery time test.
  - b. Diode routine tests including:
    - 1) Diode routine tests for characteristics of forward voltage drop and reverse current.
    - 2) Dielectric tests.
- 4. Transformer-Rectifier Unit Tests shall be conducted on each type and rating of transformer-rectifier unit furnished under this Contract.
  - a. After rectifier temperature stabilization at 100% load, the transformer-rectifier unit Peak Period Loading Cycle Test shall be performed as specified in figure 16261-1 followed by a 6 hour 100% load cycle. Testing shall be in accordance with ANSI C34.2, Section 5.3.4.3. Test results shall prove that the temperature rise for the transformer at the end of the overload cycle does not exceed 65°C for an oil filled type, 80°C for a dry type, followed by a 6 hour 100% load cycle with a temperature rise at the end of the 6 hour limit, not to exceed 55°C for an oil filled type and 65°C for a dry type transformer. Test shall also prove that rectifier diode junction temperature does not exceed the safe operating limit. The ac busduct (copper bus and enclosure) temperature rise does not exceed 65°C for copper bus and 40°C for enclosure.
  - b. Transformer-rectifier Unit efficiency, voltage regulation and power factor shall be determined at one, 25, 50, 100, 150, and 450% of rated load in accordance with ANSI C 34.2, prior to, during, or immediately following the Peak Period Loading Cycle. Test Circuit No. 2, as described in Section 6.3.2.2 of ANSI C 34.2, shall be used to make loss measurements at the

specified loads.

- C. Test Acceptance Criteria:
  - 1. Transformers:
    - a. Successfully pass all specified Design, Routine and Transformer-Rectifier Unit Tests with no physical damage to and meet all temperature limits, including the duty cycle.
    - b. Satisfy all design criteria as demonstrated by measured tests results.
  - 2. Rectifiers:
    - a. Successfully pass all specified Design, Routine and Transformer-Rectifier Unit Tests with no physical damage and meet all temperature limits.
    - b. Satisfy all design criteria as demonstrated by measured test results.
  - 3. Transformer-Rectifier Units:
    - a. Successfully pass all specified Design, Routine and Transformer-Rectifier Unit Tests with no physical damage and meet all temperature limits.
    - b. Satisfy all design criteria as demonstrated by measured test results.

## **1.06 DELIVERY, STORAGE, AND HANDLING**

Equipment shall be delivered after its completion and testing in accordance with the access dates. Arrangement for delivery shall be made in coordination with the Engineer.

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Design enclosures to permit lifting by jacks or slings and moving horizontally on rollers or skidding in any direction.
- C. Maximum dimensions of shipping sections to be coordinated with the dimensions of equipment access to ensure shipping dimensions will allow movement of the transformer and rectifier equipment through structure without damage to equipment or structure or undue difficulty.
- D. Temporary Bracing: Where necessary, brace transformer and rectifier for hoisting, lowering and skidding into position. Label temporary internal bracing: TEMPORARY-REMOVE BEFORE OPERATION.
- E. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact chart with manufacturer's instructions for disposition of damaged material.
- F. Store transformers and rectifiers in secure and dry storage facility.

## **PART 2 PRODUCTS**

### **2.01 MANUFACTURERS**

- A. Qualifications: Select manufacturers/installation contractors who are regularly engaged in production of similar transformers or rectifiers and have demonstrated successful record of providing equipment and installation of similar type and rating for extra heavy duty traction service, for at least five similar projects.
- B. Rectifier transformers shall be manufactured by one of the following manufacturers or equal:
  - 1. Asea Brown Boveri
  - 2. Niagara Transformer
  - 3. Ferranti-Packard

4. Virginia Transformer Corporation
5. Powell-ESCO

## 2.02 EQUIPMENT

- A. Requirements for transformer-rectifier units:
  1. Nameplates:
    - a. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless steel rivets or screws. Vertical gothic lettering using a round or square cutter. V-shaped groove is prohibited.
    - b. Provide nameplate on each transformer and rectifier showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable in accordance with reference standard.
    - c. Provide additional functional nameplates for each component.
      - 1) Each transformer and rectifier labeled, front and back, with nameplate 2-1/2 inches by 6-1/2 inches, inscribed in letters 1/2 inch high: RECTIFIER-TRANSFORMER NO. 1 (2), (3) or RECTIFIER NO.1 (2), (3) as appropriate.
      - 2) In addition to other information normally displayed on equipment, provide one-inch nameplate showing in letters 1/2 inch high switch positions, meaning of indicator lamp and other pertinent information.
- B. Rectifier Transformers:
  1. Type and rating: Indoor dry-type or outdoor oil filled, self-cooled, designed for extra heavy duty traction service with kVA rating suitable for the specified rectifier.
  2. Windings:
    - a. High voltage: Copper only rated 13.8 kV, 110 kV BIL or 34.5 kV, 200 kV BIL.
    - b. Low voltage: Copper only, suitable voltage rating for supplying rectifier to produce 700 Volt dc rated output, 10 kV BIL for dry type indoor and 30kV BIL for outdoor oil filled.
    - c. Connections: As specified.
    - d. Electrostatic shield: Between primary and secondary windings to suppress electrical noise.
  3. Tap Changer:
    - a. Oil filled transformer: Manually operated no-load full capacity, on the high voltage winding. Four 2.5% taps above rated voltage providing rated kVA and four 2.5% taps below rated voltage providing rated kVA. Operating handle conveniently located on exterior of tank arranged for operation at no-load only through key interlocking with the transformer feeder breaker. Operating handle lockable in any position. Position indicator clearly visible from the ground.
    - b. Dry-type transformer: No-load full capacity, on the high voltage winding. Four 2.5% taps above rated voltage providing rated kVA and four 2.5% taps below rated voltage providing rated kVA. Taps changed by removable links on a tap board with taps and connections identified. Tap board accessible through a door key interlocked with transformer feeder breaker to prevent access to the tap board when transformer is energized. Tap board segregated from the winding so that winding cannot be touched when changing taps.
  4. Bushings: In accordance with ANSI and NEMA standards for indoor interchangeable bushings. Silver plated terminal pads.
    - a. High Voltage: Glazed porcelain jacket, mounted in a suitable air filled junction box on transformer sidewall, rated 13.8 kV, 110 kV BIL or 34.5 kV,

- 200 kV BIL.
- b. Low Voltage: Rated 1.2 kV, 10 kV BIL for dry type indoor and 30kV BIL for outdoor oil filled. Parallel bushings are allowable if they are solidly connected at the terminals.
5. High voltage Connections:
- a. Oil filled transformer: High voltage bushings connected to terminators with stress cones for single conductor shielded cables enclosed in a junction box with removable covers and designed for termination of one conduit with three single-conductor and one single conductor cables entering from above or below as shown on contract drawings.
  - b. Dry-Type Transformer: Clamp-type terminators with stress cones for single conductor shielded cables enclosed in a junction box with removable covers and designed for termination of one conduit with three single-conductor and one single conductor shielded cable from above as shown on contract drawings.
6. Low Voltage Connection: Bus connections for bolted connection to ac multi-phase bus designed to align, match, connect and be compatible with the flange and busbar connections of the ac bus duct specified. Bonding strap for bonding bus enclosure to transformer case.
7. Monitoring and Protective devices for dry type transformers. All contacts electrically separate. All devices shall be heavy duty industrial type.
- a. Winding temperature indicator, with maximum reading pointer to detect transformer winding over temperature, and with factory-set two-stage contact device. The first stage provided with a contact which opens on temperature increase to initiate annunciation. The second higher temperature stage shall be provided with two contacts; one opening on temperature increase to initiate annunciation and one closing on temperature increase to actuate the rectifier-transformer ac feeder breaker lock-out relay. Settings as recommended by the manufacturer (Devices 49T1 & 49T2).
8. Monitoring and Protective devices for oil filled transformers: All contacts electrically separate. All devices shall be heavy duty industrial type.
- a. Winding temperature indicator, with maximum reading pointer to detect transformer winding over temperature, and with factory-set two-stage contact device. The first stage provided with a contact which opens on temperature increase to initiate annunciation. The second higher temperature stage shall be provided with two contacts; one opening on temperature increase to initiate annunciation and one closing on temperature increase to actuate the rectifier-transformer ac feeder breaker lock-out relay. Settings as recommended by the manufacturer (Devices 49T1 & 49T2).
  - b. Low oil level indicator with factory set contact device. Contact opens on decrease of oil level to initiate annunciation (Device 63QL).
  - c. Dial-type top oil thermometer, with maximum reading pointer to detect transformer oil over temperature, and with factory-set two-stage contact device. The first stage provided with a contact which opens on temperature increase to initiate annunciation. The second higher temperature stage shall be provided with two contacts; one opening on temperature increase to initiate annunciation and one closing on temperature increase to actuate the rectifier-transformer ac feeder breaker lock-out relay. Settings as recommended by the manufacturer (Devices 26T1 & 26T2).
  - d. Pressure relief device, self resetting type, factory set contact device and hand reset contact. The pressure relief device shall be provided with three contacts, one opening on gas pressure increase in the transformer to initiate the alarm and two closing on the gas pressure increase to initiate the tripping of ac rectifier transformer ac feeder breaker and actuate the rectifier

- transformer ac feeder breaker lock-out relay. Settings as recommended by the manufacturer (Device 63MR).
- e. Sudden pressure relay, designed for alarm and tripping on occurrence of a fault in the transformer, causing an abnormal rise of pressure. The relay shall have a pressure-sensitive device which would detect a pressure differential and through a occurrence would energize the relay. The relay shall have three contacts. On energization of relay, one opened contact shall initiate the alarm and two closed contacts shall initiate the tripping of the rectifier transformer ac feeder breaker and actuate the rectifier-transformer ac feeder breaker lock-out relay (Device 63SP).
  - f. Pressure gauge.
  - g. Combination lower drain and filter valve, upper filter valve and sampling valve.
9. Ground Pads: Copper-faced steel grounding pads two-hole with NEMA standard CC1 mounting holes for connection of grounding cables, mounted on diagonally opposite corners of each transformer, near the bottom.
10. Design and Construction of Dry-Type Transformer:
- a. Design so that all parts are readily accessible for maintenance.
  - b. Enclosures: Ventilated metal enclosure, substantial enough to prevent physical damage to transformer coils. Provided with louvers in side panels only for ventilation. Enclosure top cover shall be without openings to prevent entrance of falling dirt and liquid. Designed to keep out moisture. Base constructed of I-beams or formed channel. Suitable for skidding in any direction on rails or rollers and with jacking facilities at each corner.
  - c. Insulation System Class: 220 degree C.
  - d. Core Assembly: Joints in winding or at terminals either brazed or clamped. Core-bolt insulation high temperature resistant. Stepped mitered lap core construction and entire assembly braced or bolted adequately to prevent displacement and distortion under all normal conditions of handling and operation under normal, overload and short circuit conditions. Locking provisions for units at all inside bolted members or connections. Serial number stamped on core in conspicuous place.
  - e. Windings: The windings shall be designed for harsh environment using an enhanced Vacuum Pressure Impregnated (VPI) process. Each coil shall be oven dried at atmospheric pressure through which hot air is continuously circulated to remove any moisture. After the coil is preheated and dried, the bottom coil ends shall be sealed with a cast-in-place epoxy end ring formulated to match the material characteristic of the coil. Each coil shall be vacuum pressure impregnated with a flexible silicon varnish under vacuum of 3 to 5 mm mercury minimum for at least three hours, then pressurized at four or more atmospheres of pressure for 3 hours to allow trapped air bubbles to be purged. Immediately following each VPI cycle, the coil shall be oven baked and cured following an established temperature vs time baking cycle in a hot air circulating oven. The vacuum pressure impregnation process and baking cycle shall be completed four times for each coil. Adequate drying time shall be allotted to allow curing of the insulating liquid. Upon completion of the four step VPI process, the second cast-in-place coil end ring shall be made to seal the top coil end. Each coil shall receive a final seal using a modified 220C epoxy cladding. The entire transformer assembly shall be dipped in a cladding mixture of high temperature varnish, resin and silica baked to impart the final seal against the environment. All resins shall be oven cured under controlled temperature and air circulation.
  - f. Wiring: All control, auxiliary power and alarm circuits completely wired in the factory. Wiring run in rigid metallic raceway, except that watertight fittings may be used on runs of two feet or less. All connections to external circuits

- brought to one junction box equipped with bolted gasketed cover and terminated on terminal blocks.
- g. Finish: Metallic surfaces degreased, primed and finished with light gray enamel, Color No. 61 ANSI Z55.1 in accordance with referenced standard.
11. Design and Construction of Oil Filled Transformer:
- a. Transformers shall be so designed that parts are easily accessible for maintenance.
  - b. Tank Construction for Oil Filled Transformers: Sealed tank, welded cover type, liquid tight with all fittings in place. Designed to withstand internal pressure under normal and fault conditions without leaks and suitable for full-vacuum filling and drying in the field; with tanking guides to center core and coil assembly, handholes sized for convenient access to required devices or connections with covers sealed by corrosion and insulating liquid resistant gaskets; with lifting eyes on tank and tank cover. Tank base constructed of I-beams or formed channel, suitable for skidding in any direction on rails or rollers and with jacking facilities at each corner.
  - c. Joints and Gaskets: All gasketed joints shall have machined surfaces on both sides, and shall be provided with gasket retainers and metal-to metal stops so as to assure even and effective pressure and avoid overstressing gasket. Gaskets shall maintain liquid and gas tightness of joints under all service and fault conditions.
  - d. Insulating Oil: ASTM D3487, free of PCB and PCB based compounds.
  - e. Core and Coil Assembly: Laminations shall be non-aging alloy. Joints in winding or at terminals to be either brazed or multi-indent clamped. Insulation material, varnish and compounds in contact with liquid shall neither affect the liquid nor be affected by it. Core bolt insulation shall be high temperature resistant. Entire assembly shall be braced or bolted adequately to prevent displacement and distortion under all normal conditions of handling and operation under short-circuit conditions. Locking provision shall be made for all inside bolted members or connections. Serial number shall be stamped on core or core clamp in conspicuous place.
  - f. Wiring: All control, auxiliary power and alarm circuits completely wired in the factory. Wiring run in rigid metallic raceway, except that watertight fittings may be used on runs of two feet or less. All connections to external circuits brought to one junction box equipped with bolted gasketed cover and terminated on terminal blocks.
  - g. Insulation System Class: Thermally upgraded 120°C.
  - h. Finish: Metallic surfaces degreased, primed and finished with light gray enamel, Color No. 61 ANSI Z55.1 in accordance with referenced standard.
- C. Silicon Rectifier: Operative assembly consisting of silicon diodes, protective fuses, cooling system and all necessary accessories.
- 1. Rectifiers shall be manufactured by one of the following, or equal:
    - a. Asea Brown Boveri/Impulse
    - b. English Electric
    - c. Siemens
    - d. Powell Power Electronics Company
    - e. SMC
  - 2. Silicon Diodes
    - a. Description: Hermetically sealed and mounted on adequate heat sinks, rated and tested in accordance with EIA Publication No. RS-282. Parallel strings of diodes electrically and geometrically similar and as symmetrical as practical to help balance the normal and surge electrical characteristics of each string.
    - b. Rating: Such that the rectifier is capable of carrying the specified overloads and short-circuit loads with one diode removed from service from each major branch of the rectifier circuit, and without exceeding safe junction

- temperature on the active diodes. Each diode capable of withstanding, at its maximum operating temperature during blocking periods, voltages having a value of 2.5 times its working peak reverse voltage without permanent change in diode characteristics.
- c. Current Balance Scheme: Designed to maintain current balance between parallel-connected diodes within plus and minus 10 percent of their proportional share in each phase under all load conditions. Current balancing scheme holds individual diode currents within their capabilities under all load conditions with one fuse per leg open. Current balancing by use of selectively matched diodes not allowed.
  - d. Voltage Equalizing Devices: For diodes connected in series proportion reverse voltage equally across each individual diode. Transformers, bleeder resistors, or capacitors are devices which may be used to achieve reverse voltage division.
  - e. Fuses: Current limiting, provided to protect each diode individually. Designed to disconnect the diode in case of failure and protect the other components of the rectifier. Sized so that they will not blow on any external dc fault or loading condition but will blow to clear any fault permitting reverse conduction.
3. Cooling System:
- a. Convection cooled, designed for 40C ambient air temperature. Heat transfer surfaces designed for easy cleaning and to minimize accumulations of dust and other contaminants. If heat pipes are used for convection cooling, the Contractor shall:
    - 1) Provide for each type and rating of heat sink assembly, 2 each, complete spare heat sink assemblies.
    - 2) Provide the Authority with complete detailed manufacturing shop drawings (mylar) and manufacturing specifications for each type and rating of heat sink assembly.
    - 3) Provide at a minimum, three manufacturing sources capable of providing the heat pipe/heat sink assembly. Include manufacturer's part numbers and certification by an officer of each company that the entire assembly can be provided as specified.
4. Protective Devices: Coordinated to prevent false tripping or misoperation. All relays devices and connections accessible without disassembling interior portions of the rectifier assembly. Drawout type, semi-flush mounted on the front of the rectifier enclosure where possible; otherwise mounted internally and provided with insulating dust covers. All devices shall be heavy duty industrial type.
- a. A rectifier over temperature device (1st stage) provided to detect an abnormal rise in diode heat sink temperature, furnished with a factory-set NC contact to initiate alarm at the annunciation panel upon excessive temperature increase. Temperature setting as recommended by the manufacturer (Device 26RT1).
  - b. A second rectifier over temperature device with a factory set stage to detect a diode heat sink temperature higher than the first stage setting, furnished with a NC contact to initiate alarm at the annunciation panel and a NO contact to initiate the tripping of the rectifier-transformer ac circuit breaker and the rectifier cathode breaker via lockout relay. Temperature setting as recommended by the manufacturer (Device 26RT2).
  - c. A diode failure device provided to detect the loss of one or more diode paths, furnished with a NC contact to initiate annunciation and a NO contact to initiate tripping. One diode failure shall initiate an alarm at the annunciator panel and two diode failures in one string shall initiate the tripping of the rectifier-transformer ac circuit breaker and the rectifier cathode breaker via lockout relay. In addition, each diode shall be supervised by a readily visible diode-failure indicating lamp or self-indicating

- fuse (Device 95).
- d. Enclosure Ground Detection System: Provided to monitor enclosure insulation and including the following relays:
    - 1) A high-resistance ground relay, connected between the rectifier metal enclosure and ground, to detect any accidental grounding of the rectifier metal enclosure, furnished with a NC contact to initiate alarm at the annunciation panel upon metal enclosure grounding or malfunction of the ground relaying network (Device 64X).
    - 2) A rectifier hot structure relay, connected between the rectifier metal enclosure and ground, to detect any part of the metal enclosure becoming energized in the event of a fault between the enclosure and any of the current carrying components, furnished with a NC contact to initiate alarm at the annunciation panel and three NO contacts to initiate tripping of the dc rectifier cathode air circuit breaker, the ac rectifier-transformer feeder circuit breaker and actuate the ac rectifier-transformer feeder breaker lock-out relay. Relaying network to be fail-safe, and supervised by the high-resistance ground relay (Device 64C).
  - e. Door interlocks: Provide interlock contacts in trip and close circuits to trip and prevent closing of both rectifier-transformer feeder breaker and cathode circuit breaker with any rectifier enclosure door open. (Device 33)
  - f. Control power: 125 Volt dc, ungrounded for all devices.
5. Meters: ANSI C39.1 and ANSI C12. Switchboard type with 250 degree or 270 degree scale and plus or minus 1% accuracy.
    - a. One, dc voltmeter with zero to 1000 Volt scale, complete with current limiting fuses.
  6. Enclosure:
    - a. Description: High resistance grounded, ventilated structure, mounted on a rigid self-supporting structural steel or formed metal framework with all principal members bonded together and containing louvered expanded metal or mesh opening for ventilation.
    - b. Materials: Chosen to preclude the possibility of corrosion or galvanic action interfering with the proper operation or appearance during the life of the equipment. Similar and completely compatible materials used for diode cases, studs and the heat sinks.
    - c. Openings: Openings and mounting holes for front-mounted indicating and control devices neatly cut out, drilled or punched without marring or distorting the exposed finished surfaces.
    - d. Accessibility: Convenient access provided for all normal maintenance and inspection. Each door equipped with a mechanical latch and door stop to hold the door in the open position.
    - e. Diode Visibility: Diodes and fuses located and internal lighting provided to allow visual inspection of all fuses and diodes without opening enclosure doors. Source of power for light fixture shall be from 125V dc control bus.
    - f. Finish: Metallic surfaces degreased, primed and finished with light gray enamel, Color No. 61, ANSI Z55.1 in accordance with referenced standard.
  7. Anode Negative Disconnect Switch:
    - a. Location: Located within a separate metal enclosed space in the rectifier unit.
    - b. Rating: Single pole, hook stick operated, 1000 Volts dc, ampere rating to match with the rating of the negative bus duct.
    - c. Key Interlocks: Provided to prevent switch operation unless the cathode circuit breaker is open and to prevent closing the cathode circuit breaker unless the disconnect switch is closed.
    - d. If a door access is provided, door interlock shall be provided to trip the associated cathode breaker when door is opened.

8. Buses and Bus Terminations: NEMA BU1
  - a. Design and construction: High quality, electrical conductivity grade copper suitably braced between each other and the enclosure with high-strength, non-tracking insulators and designed to safely withstand the available short circuit current without damage to the bus or enclosure.
  - b. Bus connections and terminations: Bus connections to be bolted with silver or tin plated surfaces or welded. Bus connections for terminations to be silver or tin plated. Anode disconnect switch connected to negative bus duct. Negative bus duct connected through an insulating throat section at the rectifier.
  - c. Rectifier negative terminal: Bus connected to the anode disconnect switch.
  - d. Rectifier ac input: Three phase, bus duct with insulated throat section with minimum insulation level of 1000 Volts provided between the rectifier enclosure and the ac bus duct enclosure, three feet long if horizontally mounted.
  - e. Rectifier dc Output: Positive bus, connected to the cathode bus duct through a metal enclosed throat with enclosure insulated from the cathode bus duct enclosure but bonded with a removable link of at least 1000 Amperes continuous capacity.
9. Interference Noise Suppression: Harmonic suppression equipment shall be provided to limit noise and harmonic output from the output of the transformer-rectifier unit if the rectifier generated harmonics and/or noise levels interfere with the Authority's electronic communication systems.

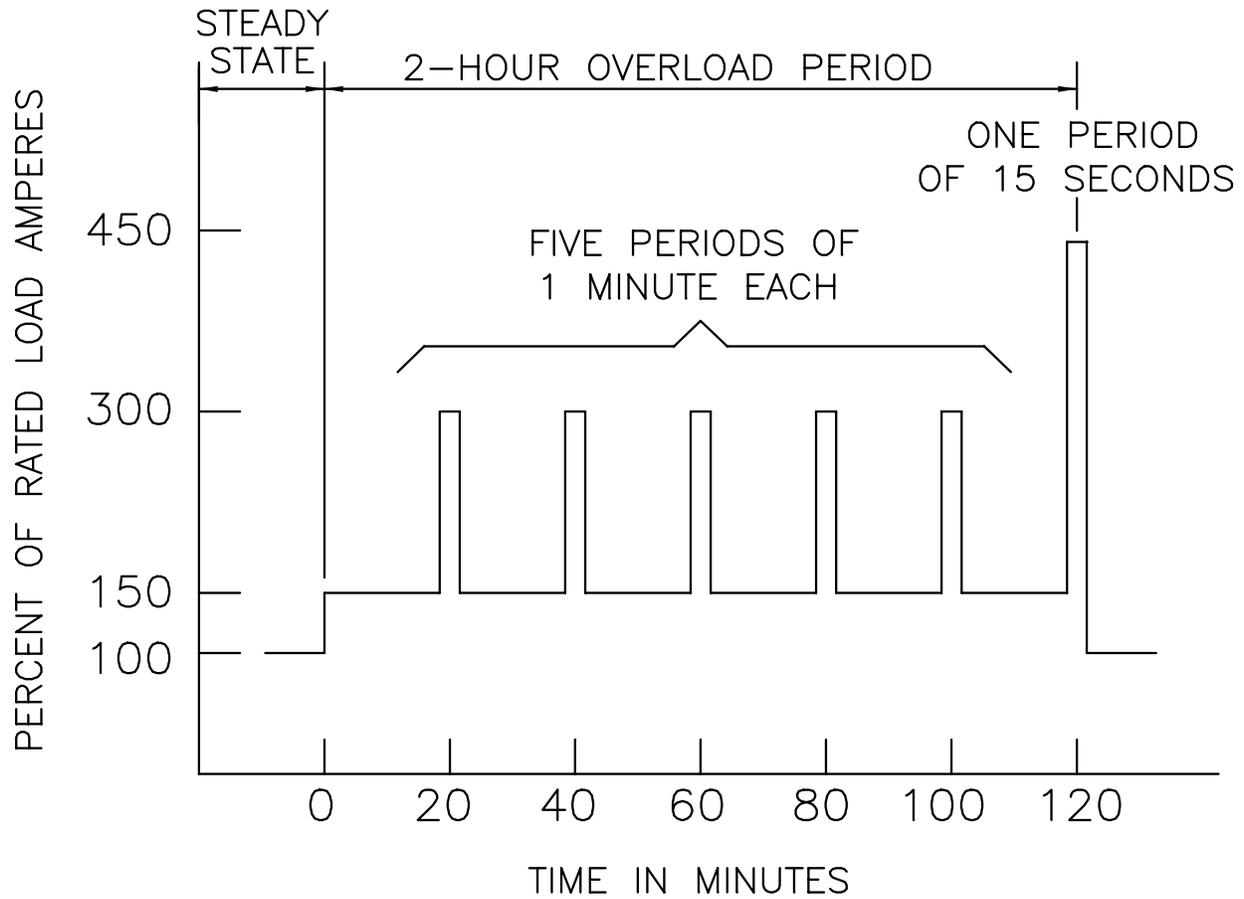

## **PART 3 EXECUTION**

### **3.01 INSTALLATION**

- A. Install insulated floor topping as shown and in accordance with Section 16052 (Basic Materials and Methods). Furnish and install floor anchors, in accordance with approved design documents.
- B. Install transformer-rectifier units and busways in accordance with approved shop drawings.
- C. Install conduit and wire connections as approved and in accordance with Section 16052 (Basic Materials and Methods).
- D. Use services of manufacturer's engineering representative for assistance in field assembly and installation in accordance with Section 16051 (Scope of Work).

### **3.02 FIELD QUALITY CONTROL**

- A. Field Testing and Inspection: As specified in Section 16051.
- B. Interference Noise Suppression: In accordance with ANSI C34.2, Section 7.1, the Contractor shall, at no additional cost to the Authority, investigate and remediate any interference problem with the Authority's communication electronic systems which result from transformer-rectifier generated noise and harmonics during transformer-rectifier unit operation.

## SECTION 16270

### TRANSFORMERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing transformers and automatic voltage regulators.
- B. Related Work Specified Elsewhere:
  - 1. Wire connection accessories: Section 16125
  - 2. Grounding and bonding: Section 16060.
  - 3. Unit substations: Section 16360.
- C. Design Criteria:
  - 1. Floor loading: Transformer base compatible with floor design-loading of 250 pounds per square foot.

##### 1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is regularly engaged in the repetitive production of transformers and automatic voltage regulators of the types and ratings described in these specifications using the latest technology and who has a proven record of successful manufacturing and testing of same or similar type equipment. The equipment manufacturer shall have and maintain ISO 9001 or ISO 9002 certification.
- B. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. NEMA: ST1, ST20, 107, 250.
  - 4. ANSI: C57.12.50, C57.12.51, Z55.1.
  - 5. ASTM: D3487.
  - 6. ANSI/IEEE: C57.12.00, C57.12.90, C57.12.91, C57.15, C57.94, C57.113, C57.124, C62.11.
  - 7. IEEE: C57.12.01.
  - 8. UL: 506, 1561, 1562.
- C. Factory Testing:
  - 1. General requirements for distribution transformers:
    - a. Perform design tests and short-circuit tests on one transformer of each type and rating furnished in this Contract.
    - b. Perform routine tests, impulse test and partial discharge test on each transformer furnished in this Contract.
  - 2. Dry-type transformers: Perform design and routine tests in accordance with IEEE C57.12.01 and ANSI/IEEE C57.12.91 and the following additional tests:
    - a. Perform impulse test without using surge arrestors to protect the transformer.
    - b. Perform partial discharge test to establish partial discharge inception and extinction voltage during induced voltage test in accordance with ANSI/IEEE C57.124 and the following requirements:
      - 1) Measure partial discharge in pico-coulombs at 10-percent increments when the voltage is raised from 70 percent to 200 percent and lowered from 200 percent to 70 percent of rated

- voltage during the induced voltage test to verify the following requirements:
- a) Inception of partial discharge occurs above 120 percent of rated voltage when voltage is raised from 70 percent to 200 percent. At 120 percent, the partial discharge reading shall be 10 pico-coulombs or less.
  - b) Extinction of partial discharge occurs above 120 percent of rated voltage when voltage is lowered from 200 percent to 70 percent and partial discharge level is below 10 pico-coulombs.
- c. Perform short-circuit tests in accordance with IEEE C57.12.01 and ANSI/IEEE C57.12.91.
3. Oil-filled transformers: Perform design and routine tests in accordance with ANSI/IEEE C57.12.00 and C57.12.90 and the following additional tests:
- a. Perform lightning impulse test without using surge arrestors to protect the transformer.
  - b. Perform partial discharge test using one of the following test methods:
    - 1) Perform partial discharge test to determine radio-influence voltage and associated partial discharge inception and extinction in accordance with NEMA 107 and the following requirements:
      - a) Measure radio-influence voltage in micro-volts at 25-percent increments when the voltage is raised from 100 percent to 200 percent and lowered from 200 percent to 100 percent of rated voltage during the induced voltage test to verify the following requirements:
        - (1) Radio-influence voltage not to exceed 250 micro-volts for transformers with 13.8 kV primary voltage and 650 micro-volts for transformers with 34.5 kV primary voltage.
        - (2) Inception (i.e. sudden increase in radio-influence voltage as the voltage is raised from 100 percent to 200 percent) occurs above 120 percent of the highest tap voltage.
        - (3) Extinction (i.e. sudden decrease in radio-influence voltage as the voltage is lowered from 200 percent to 100 percent) occurs above 120 percent of the highest tap voltage.
    - 2) Perform partial discharge test to determine terminal partial discharge level and partial discharge at five-minute intervals on each terminal during a 60-minute period of induced voltage test in accordance with ANSI/IEEE C57.113 and to verify the following requirements:
      - a) Terminal partial discharge level not-to-exceed 200 pico-coulombs.
      - b) Partial discharge measurements during a 60-minute period meet the requirements of ANSI/IEEE C57.113.
    - 3) Perform short-circuit tests in accordance with ANSI/IEEE C57.12.00 and C57.12.90.
4. Perform design and routine tests for general-purpose transformers in accordance with NEMA ST20.
5. Notify the Engineer not less than 14 days prior to factory testing to allow witnessing of tests.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings: In accordance with Section 16360.
  - 2. Certification:
    - a. Furnish certified test report of all design and short-circuit tests performed on one transformer of each type and rating furnished in this Contract or on identical transformers built by same manufacturer within the last five years.
    - b. Furnish certified test report of all routine, impulse and partial discharge tests performed on each transformer furnished in this Contract.
    - c. Furnish certificates from manufacturers verifying that products conform to specified requirements. Include certificates with submittal of shop drawings.
  - 3. Documentation:
    - a. Field-testing plan: In accordance with Section 16360.
  - 4. Operation and Maintenance Manuals: In accordance with Section 16360.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Temporary Bracing: Where necessary, brace transformer for hoisting, lowering and skidding into position. Label temporary internal bracing: TEMPORARY - REMOVE BEFORE OPERATION.
- C. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact-record chart with manufacturer's instructions for disposition of damaged materials.
- D. Store transformers in secure and dry storage facility.

**1.05 OPERATION AND MAINTENANCE TRAINING:**

- A. In accordance with the General Requirements and Section 16360.

**PART 2 - PRODUCTS**

**2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements for Transformers:
  - 1. Interchangeability: Components of the same type, size, rating, functional characteristics, and make are to be interchangeable.
  - 2. Nameplate provided on each transformer in accordance with reference standard.
  - 3. Efficiency/losses:
    - a. Dry-type, three-phase transformers, 501 kVA and larger:
      - 1) Full-load efficiency: 98.0-percent minimum.
      - 2) Half-load efficiency: 98.5-percent minimum.
      - 3) No-load loss, maximum, of nameplate kVA rating:
        - a) 34.5 kV - 480Y/277-volt units: 0.7 percent.
        - b) 13.8 kV - 480Y/277-volt units: 0.5 percent.
    - b. Oil-filled, three-phase transformers, 501 kVA and larger:
      - 1) Full-load efficiency: 98-percent minimum.
      - 2) Half-load efficiency: 98.5-percent minimum.
      - 3) No-load loss: 0.4-percent maximum of nameplate kVA rating.
  - 4. Impedance voltages:

- a. Three-phase transformers, 501 kVA and larger:
    - 1) 34.5 kV - 480Y/277 volt units: 5.75 or 6.25 percent.
    - 2) 13.8 kV - 480Y/277 volt units: 5.75 percent.
  - b. Other transformers, lower ratings or lower voltages: In accordance with applicable standard or manufacturer's standard.
5. Magnetic circuit:
- a. Material: Best quality non-aging silicon steel sheet with high-magnetic permeability and low hysteresis and eddy-current losses. Sheet insulated on both sides with inorganic material to minimize eddy current.
  - b. Laminations cut in direction of grain, free of burrs and uniformly stacked in same direction without gap. Lap and butt joints closely fitted and rigidly clamped to minimize core loss and noise level.
  - c. Capable of up to 10-percent overvoltage excitation while maintaining magnetic-flux density below saturation level.
6. Audible sound level: Distribution transformers designed to limit average sound level to within the following maximum values when measured at the factory in accordance with ANSI/IEEE C57.12.91 for dry-type transformers and in accordance with ANSI/IEEE C57.12.90 for oil-filled transformers:
- a. Dry-type, three-phase transformers:

Transformer Rating in kVA	Sound Level in dB for Ventilated, Self-Cooled Rating	Sound Level in dB for Ventilated, Forced-Air-Cooled Rating
150	55	-
225, 300	58	-
500	60	67
750, 1,000	64	67
1,500	65	68
2,000	66	69
3,500	68	71
3,750	70	73

- b. Oil-filled, three-phase transformers:

Transformer Rating in kVA	Sound Level in dB for Ventilated, Self-Cooled Rating	Sound Level in dB for Ventilated, Forced-Air-Cooled Rating
150, 225, 300	55	-
500	56	61
750	57	61
1,000	58	61

- c. General-purpose transformers designed to limit average sound level to within maximum values in NEMA ST20.

7. Winding:
  - a. Dry-type, 3-phase transformer , 501KVA and larger.
    - 1) Copper conductors free from burrs, kinks or slivers. Each winding braced for high-mechanical strength and spaced to provide adequate circulation for coolant.
  - b. Dry-type, 3-phase and single-phase transformer 500KVA and smaller.
    - 1) Copper or aluminum conductors free from burrs, kinks or slivers. Each winding braced for high-mechanical strength and spaced to provide adequate circulation for coolant.
    - 2) Aluminum-to-aluminum conductor joints welded to withstand mechanical and electrical short-circuit stresses.
    - 3) Copper-to-aluminum conductor joints outside winding made using one of the following:
      - a) AMP Copalum crimp connector consisting of tin-plated copper barrel with one perforated tin-plated brass cylinder inserted inside barrel or equal. Hydraulic crimping tool used for electrical and mechanical effectiveness of joint.
      - b) Du Pont Detaclad explosively bonded aluminum and copper plate bus connection at transition consisting of aluminum face of Detaclad piece welded to aluminum leads from winding and copper face of Detaclad piece silver-soldered to copper bus.
8. Buses: Transformers equipped with adequately supported copper or aluminum buses, with the following additional requirements:
  - a. Busbar silver-plated or tin-plated at bolted connection point.
  - b. Joints welded or bolted for mechanical and electrical short-circuit stresses.
  - c. For bolted connections on aluminum busbar, mark recommended torque permanently and legibly at points of connection. Joints treated to prevent corrosion.
  - d. For bolted connection of aluminum-to-aluminum or aluminum-to-copper buses, provide Belleville washers or helical spring locknuts to maintain positive pressure on joint.
9. Ground pad: Enclosure equipped with grounding pad, drilled and tapped for connection to station grounding system.
10. Finish: Metallic surfaces degreased, cleaned with iron-phosphate solution, rinsed with chromic acid solution, dried and finished with light-gray coating, ANSI Z55.1, Color 61; two mils minimum DFT as follows:
  - a. Indoor location: Electrostatically deposited polymer polyester powder or epoxy powder, cured by baking and UL recognized, or spray enamel.
  - b. Outdoor location: Epoxy enamel.
11. Nameplate: Provided on each transformer showing manufacturer's name and brand designation, reference standard, type, class, rating and other required information as applicable in accordance with reference standard.
12. Space heaters:
  - a. Each distribution transformer for indoor use provided with 120-volt, single-phase, 60 Hertz heating element to facilitate drying and prevent condensation under no load or light load conditions.
  - b. Heaters enclosed in grille guard with no sharp edges and located so that they are accessible for replacement. Heaters controlled by thermostat adjustable from 40F to 80F. Panel ammeter, approximately 2-1/2 inches square, marked to indicate heater load. Thermostat set in accordance with manufacturer's recommendations.
  - c. Power and control circuits to heaters and thermostat connected and protected up to devices and to incoming junction box with galvanized-steel rigid conduit or liquid-tight flexible conduit. Heater power junction box sized four inches square by two inches minimum depth and located at top of

transformer for top entry of minimum 3/4-inch conduit. Remote connection leads to power source labeled: 120-volt and NEUTRAL.

B. Distribution Transformers:

1. Transformers for indoor use:
  - a. IEEE C57.12.01, ANSI C57.12.50, C57.12.51, ANSI/IEEE C57.12.91, UL 1562, floor-mounted, dry-type, ventilated self-cooled/forced-air-cooled, Class AA/FA, or ventilated self-cooled, Class AA, as specified, double-wound, three-phase, 60 Hertz with secondary neutral brought out, and using the following type of winding construction for both primary and secondary windings of a transformer:
    - 1) Solid cast-epoxy windings.
  - b. kVA rating:
    - 1) Transformers, 501 kVA and larger: Ventiladed self-cooled kVA rating as shown, with capacity in current-carrying parts to permit 33-1/3 percent increase in kVA rating (Class AA/FA) by operation of integral forced-air cooling fans.
    - 2) Transformers, 300 kVA and smaller: Ventiladed self-cooled, Class AA, kVA rating as shown.
  - c. Voltage rating: 34.5 kV delta to 480Y/277 volts or 13.8 kV delta to 480Y/277 volts, as shown.
  - d. Enclosure:
    - 1) NEMA 250, Type 2 dripproof enclosure with removable front and rear panels and ventilation louvers to prevent entrance of falling dirt and liquids and accidental access to live parts.
    - 2) Provision for jacking, lifting, skidding, and towing in any direction.
    - 3) Provision for complete isolation of core and coils from the enclosure using rubber vibration isolation pads or other suitable means.
    - 4) Core visibly grounded to ground pad with flexible grounding conductor sized in accordance with applicable ANSI and UL Standards.
    - 5) Exterior surfaces of core and structural members of core and coil assembly protected from corrosion after assembly with a coating having a temperature rating exceeding the temperature rating of the associated transformer insulation system.
  - e. Rated insulation-level withstand:
    - 1) 34.5 kV - 480Y/277 volt units:
      - a) High-voltage winding, lightning basic-impulse voltage (BIL) without the use of surge arrestors: 150 kV
      - b) High-voltage winding, low-frequency withstand: 50 kV.
      - c) Low-voltage winding, lightning basic-impulse voltage (BIL):
        - (1) Transformers with solid cast-epoxy windings: 30 kV.
      - d) Low-voltage winding, low-frequency withstand: 4kV.
    - 2) 13.8 kV - 480Y/277 volt units:
      - a) High-voltage winding, lightning basic-impulse voltage (BIL) without the use of surge arrestors: 95 kV.
      - b) High-voltage winding, low-frequency withstand: 34 kV.
      - c) Low-voltage winding, lightning basic-impulse voltage (BIL):
        - (1) Transformers with solid cast-epoxy windings: 30 kV.
      - d) Low-voltage winding, low-frequency withstand: 4 kV.
  - f. Transformer terminals:
    - 1) High-voltage side: Provide tin-plated terminal pads in air-filled transition compartment suitable to receive and terminate cable or bus connections from high-voltage switchgear, as applicable.

- Bushings or terminations through sidewall of transformer enclosure to have minimum BIL equal to that of transformer.
- 2) Low-voltage side: Provide tin-plated terminal pads in air-filled transition compartment opposite high-voltage side, suitable for bus connection to low-voltage switchgear. Terminations and transformer secondary bus or terminal supports to have short-circuit current-withstand equal to that of low-voltage switchgear; minimum BIL equal to that of transformer.
- g. Insulation system:
- 1) 185°C insulation system for dry-type transformers having solid cast-epoxy windings with maximum allowable continuous full-load temperature rise above average ambient temperature of 30C and maximum ambient temperature of 40°C:
    - a) By winding resistance: 80C.
    - b) By hottest spot in winding: 110C.
  - 2) 185C insulation system for dry-type transformers having solid cast-epoxy windings with maximum allowable continuous full-load temperature rise above average ambient temperature of 30C and maximum ambient temperature of 40C:
    - a) By winding resistance: 80C.
    - b) By hottest spot in winding: 110C.
- h. Taps:
- 1) Capable of delivering rated output at each setting.
  - 2) 34.5 kV - 480Y/277 volt units: Two 2-1/2 percent taps above and two 2-1/2 percent taps below rated voltage on primary side.
  - 3) 13.8 kV - 480Y/277 volt units: Two 2-1/2 percent taps above and four 2-1/2 percent taps below rated voltage on primary side.
  - 4) Tap changing on face of coil using removable links accessible from front or back of transformer.
- i. Thermometer/auxiliary relay:
- 1) Digital-type thermometer with scale range as required and two sets of contacts.
  - 2) One set of thermometer contacts designed to operate two auxiliary relays powered by associated transformer:
    - a) First relay with minimum of one NC and one NO contact for remote supervisory indication.
    - b) Second relay for operation of forced-air cooling fans through an automatic-manual selector switch on transformers rated 501 kVA and larger.
  - 3) Second set of thermometer contacts to trip essential main feeder at impermissible transformer over temperature.
  - 4) Contacts set in accordance with manufacturer's recommendations.
  - 5) Auxiliary relay may be located in associated low-voltage switchgear.
  - 6) Relay contacts for remote indication to be wired to accessible terminal block, with the following additional requirements:
    - a) Rated 250 milliamperes at 250 volts dc or three amperes at 24 volts dc.
    - b) Dry-sealed, with resistance of 0.10 ohms maximum.
    - c) Contact bounce: Five milliseconds maximum.
- j. Solid cast-epoxy winding construction:
- 1) Each winding for each phase separately cast as a rigid tubular coil and installed coaxially around the core.
  - 2) Each winding reinforced with glass cloth.
  - 3) Epoxy characteristics:
    - a) High electrical, mechanical and thermal strength.

- b) Non-flammable and self-extinguishing.
        - c) Coefficient of expansion compatible with that of copper windings.
        - d) Suitable for operation in ambient temperature range from minus 40C to plus 40C without cracking or degradation.
        - e) Nonhygroscopic and suitable for operation at 40C ambient temperature and 100-percent humidity.
      - 4) Epoxy cast in metal mold under vacuum to ensure homogeneous casting free from voids.
      - 5) Windings fabricated in a facility with successful experience in the manufacture of solid cast-epoxy transformer windings.
    - k. Forced-air cooling fans and control panel:
      - 1) Forced-air cooling fans to permit 33-1/3 percent increase in transformer ventilated self-cooled kVA rating.
      - 2) Power supply for fans and control panel provided from associated transformer. Fans, control panel and associated circuits equipped with protective devices.
      - 3) Control panel flush-mounted with transformer enclosure and equipped with the following:
        - a) Automatic-manual selector switch for controlling forced-air cooling fans. Fans activated by thermometer in automatic position.
        - b) Indicating lights:
          - (1) Green light for control power available.
          - (2) Amber light for fans operating.
        - c) Automatic exercising of fans once a month.
2. Transformers for outdoor use:
  - a. ANSI/IEEE C57.12.00, C57.12.90, floor-mounted, oil-filled, self-cooled/forced-air cooled, Class OA/FA or self-cooled, Class OA, as specified, double-wound, three-phase, 60 Hertz with secondary neutral brought out through insulating bushing.
  - b. kVA rating:
    - 1) Transformers, 501 kVA and larger: Self-cooled kVA rating as shown, with capacity in current-carrying parts to permit 15-percent increase in kVA rating (Class OA/FA) by operation of integral forced-air cooling fans.
    - 2) Transformers, 300 kVA and smaller: Self-cooled, Class OA, kVA rating as shown.
  - c. Voltage rating: 34.5 kV delta to 480Y/277 volts or 13.8 kV delta to 480Y/277 volts as shown.
  - d. Enclosure:
    - 1) Sealed-tank construction with lifting brackets, cooling radiator, braced and anchored to withstand jacking, skidding and towing.
    - 2) Equipped with two one-inch pipe fittings, one at top and one at bottom of tank, for filling and filter connection; one one-inch drain valve; and one 3/8-inch sampling valve.
  - e. Insulating oil: ASTM D3487. Mineral insulating oil free from polychlorinated biphenyl (PCB) contamination.
  - f. Rated insulation level:
    - 1) For 13.8 kV to 480Y/277-volt transformers: Class 15 kV, capable of withstanding:
      - a) Low-frequency voltage: 70 kV.
      - b) Full-wave basic-impulse voltage: 200 kV.
    - 2) For 34.5 kV to 480Y/277-volt transformers: Class 34.5 kV, capable of withstanding:
      - a) Low-frequency voltage: 70 kV.

- b) Full-wave basic-impulse voltage: 200 kV.
- g. Bushings:
  - 1) 34.5 kV - 480Y/277-volt transformers:
    - a) Primary bushings with glazed-porcelain surface, located on sidewall of transformer, with 34.5 kV insulation class with minimum 200 kV BIL in an air-filled junction box.
    - b) Secondary-line bushings with glazed-porcelain surface, located on sidewall of transformer opposite primary bushings, with 1.2 kV insulation class with minimum 10 kV BIL in an air-filled junction box.
  - 2) 13.8 kV - 480Y/277-volt transformers:
    - a) Primary bushings with glazed-porcelain surface, located on sidewall of transformer, with 15 kV insulation class with minimum 110 kV BIL in an air-filled junction box.
    - b) Secondary-line bushings with glazed-porcelain surface, located on sidewall of transformer opposite primary bushings, with 1.2 kV insulation class with minimum 10 kV BIL in an air-filled junction box.
  - 3) Secondary neutral bushings:
    - a) Low-voltage neutral bushings to be provided for each transformer.
    - b) Low-voltage neutral bushings same as low-voltage line bushings, except neutral bushings may have reduced low-frequency insulation level in accordance with ANSI/IEEE C57.12.00.
  - 4) Provide silver-plated terminal pads suitable to receive cable terminals on high-voltage side and to receive cable terminals or bus connectors on low-voltage side, as necessary.
- h. Maximum allowable temperature rise under continuous full-load above ambient temperature of 30C average, 40C maximum.
  - 1) By winding resistance: 55C.
  - 2) By hottest spot in winding: 65C
- i. Taps:
  - 1) Capable of delivering rated output in each position.
  - 2) For 13.8 kV to 480Y/277-volt transformers: Two 2-1/2 percent taps above and four 2-1/2 percent taps below rated voltage on primary side.
  - 3) For 34.5 kV to 480Y/277-volt transformers: Two 2-1/2 percent taps above and two 2-1/2 percent taps below rated voltage on primary side.
- j. Tap changer:
  - 1) Externally mounted and manually operated no-load tap changer with locking provision for each position.
  - 2) Tap-change operating handle arranged for operation at no-load only through key interlocking with associated primary breaker in open position.
- k. Thermometer/auxiliary relay: As specified for transformers for indoor use.
- l. Liquid-level indicator: Float-operated magnetic-type continuously indicating liquid level, installed for easy removal and replacement without unsealing transformer enclosure.
- m. Pressure-relief device: Mechanically operated self-resetting and self-reclosing type with manually resettable visual indicator and set of NO contacts to initiate tripping of associated primary breaker when pressure-relief device is activated.
- n. Pressure vacuum-gauge range: Minus 10 to plus 10 psig.
- o. Forced-air cooling fans and control panel:

- 1) Forced-air cooling fans to permit 15-percent increase in transformer self-cooled kVA rating.
  - 2) Power supply for fans and control panel provided from associated transformer. Fans, control panel and associated circuits equipped with protective devices.
  - 3) Control panel with NEMA 250, Type 3R enclosure and equipped with the following:
    - a) Automatic-manual selector switch for controlling forced-air cooling fans. Fans activated by thermometer in automatic position.
    - b) Indicating lights:
      - (1) Green light for control power available.
      - (2) Amber light for fans operating.
      - (3) Automatic exercising of fans once a month.
- p. Surge arrester: ANSI/IEEE C62.11, intermediate class with metal-oxide varistor construction, one per phase, mounted on high-voltage terminals in air-filled junction box with the following requirements:
- 1) For 13.8 kV - 480Y/277 volt unit: Hubbell/The Ohio Brass Company Type PVR, Catalog Number 218613, or equal, with ratings as follows:
    - a) Duty-cycle voltage, kV, rms: 15.
    - b) Maximum continuous operating voltage, kV, rms: 12.7.
    - c) Insulation-withstand impulse test voltage, kV: 110.
  - 2) For 34.5 kV - 480Y/277 volt unit: Hubbell/The Ohio Brass Company Type PVR, Catalog Number 218629; General Electric Company Tranquell XE, Catalog Number 9L12PGB036; or equal; with ratings as follows:
    - a) Duty-cycle voltage, kV, rms: 36.
    - b) Maximum continuous operating voltage, kV, rms: 29.
    - c) Insulation-withstand impulse test voltage, kV: 200.

C. General-Purpose and Specialty Transformer:

1. NEMA ST20 and ST1, UL 506 and 1561, indoor, dry, double-wound with insulated copper conductor, suitable for operation on 60 Hertz.
2. Rating:
  - a. kVA rating: As shown.
  - b. Voltage rating:
    - 1) Three-phase transformers: 480 volts primary to 208Y/120 volts secondary with secondary neutral brought out.
    - 2) Single-phase transformers: 480 or 277 volts primary to 120 volts secondary.
3. Enclosures:
  - a. 9 kVA and below: Non-ventilated, NEMA 250, Type 3R weatherproof enclosure with encapsulated core and coils.
  - b. Above 9 kVA: Ventilated, NEMA 250, Type 2 drip-proof enclosure with removable front panel and louvers to prevent entrance of falling dirt and accidental access to live parts, and with lifting brackets or holes.
  - c. 45 kVA and below: Wall-mounted unless otherwise shown.
  - d. Above 45 kVA: Floor-mounted or platform-mounted as shown.
4. Insulation system as specified below, capable of withstanding full-wave impulse of 10 kV.

kVA Rating	Insulation System
1 - 2	150C
3 - 30	185C
Above 30	220C

5. Maximum allowable temperature rise under continuous full-load above an average ambient temperature of 30C and maximum of 40C.

kVA Rating	1 - 2	3 - 30	Above 30
By winding resistance	150C	115C	150C
By hottest spot in winding	185C	145C	180C

6. Taps:
- Tap-changing links providing taps as follows, capable of delivering rated output in each position.
  - Single-phase transformers: Provide taps on primary side in accordance with the following:

kVA Rating	Taps		
	Quantity	Size:	Percent-age of rated voltage
3 - 15	2	5	below
25 - 100	4	2-1/2	below
	2	2-1/2	above

- Three-phase transformers: Provide taps on primary side in accordance with the following:

kVA Rating	Taps		
	Quantity	Size:	Percent-age of rated voltage
30 - 300	4	2-1/2	below
	2	2-1/2	above
9 - 15	2	5	below
6 and below	None	required	

- D. Automatic Voltage Regulator:
- ANSI/IEEE C57.15, indoor, self-air-cooled, induction-type.
  - Compensating automatically for voltage drop on long feeder runs of nominal 480-volt, three-phase, three-wire or nominal 480/277-volt, three-phase, four-wire, 60 Hertz system as shown.
  - Range of regulation: As necessary to maintain output voltage of regulator at receiving end of feeder not less than 466 volts or 480 volts as specified, minimum

range of plus 10 percent and minus 10 percent range of regulation. Regulation adjustable over full range in increments of one percent or less.

4. Circuit kVA rating: As shown.
5. Equipped with automatic solid-state control for maintaining output voltage within plus-or-minus one percent of pre-selected voltage level over temperature range of minus 30C to plus 40C.
6. Speed of response: Voltage correction to start within four cycles and complete within three seconds for two-percent change and within 10 seconds for adjustment to required voltage.
7. Capable of withstanding a minimum of 15 times rated full-load current under short-circuit condition.
8. Operating mechanism permanently lubricated.
9. Full-load efficiency: 98-percent minimum.
10. 150C insulation system; maximum allowable temperature rise under continuous full-load above an average ambient temperature of 30C and maximum ambient temperature of 40C: 80C.
11. Enclosure: Fabricated from sheet steel, wall-mounted or floor-mounted as appropriate, as follows:
  - a. Electric rooms, traction-power substations and tie-breaker stations: NEMA 250, Type 1.
  - b. Fan shafts and pumping stations: NEMA 250, Type 3R.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Install each transformer and automatic voltage regulator in position shown and in accordance with manufacturer's recommendations and NEC requirements.
- B. Make power-conductor and control-wire connections in accordance with manufacturer's drawings, Section 16125 and as shown.
- C. Ground each transformer and automatic voltage regulator as shown and in accordance with Section 16060.
- D. Connect space heater circuit to prevent condensation during installation.

#### **3.02 FIELD QUALITY CONTROL:**

- A. Prior to testing, check transformer installation in accordance with ANSI/IEEE C57.94.
- B. Submit field-testing plan including, but not limited to, the following tests. Furnish equipment and perform the following tests in the presence of Engineer, in accordance with approved procedure:
  1. Distribution transformers: In accordance with Section 16360.
  2. General-purpose and specialty transformers:
    - a. Perform insulation-resistance tests winding-to-winding and winding-to-ground. Record and correct resistance value to temperature.
    - b. Perform ac high-voltage tests between high-voltage winding and low-voltage winding, between high-voltage winding and ground and between low-voltage winding and ground. Perform tests at 65 percent of factory test voltage for one-minute duration.
    - c. Test voltage ratio of each tap. Results not to deviate more than 0.5 percent from calculated ratio. Set taps as directed.
    - d. Check polarity by means of vector check.

3. Automatic voltage regulator:
  - a. Test circuit for connection in accordance with wiring diagram.
  - b. Test insulation of nongrounded conductors to ensure 10-megohms minimum resistance to ground.
  - c. Test regulator enclosure for continuity to grounding bus.
  - d. Set output voltage and check actual output voltage and speed of voltage correction as follows:
    - 1) For regulator supplying ventilation fans in fan shaft, set output voltage to 466 volts minimum and check actual output voltage and speed of voltage correction for providing required voltage output within specified time for each increment of additional load brought on line by sequential automatic starting of fan motors when load is supplied by each of two sources.
    - 2) For regulator supplying pumps in drainage pumping station, set output voltage to 466 volts minimum and check actual output voltage and speed of voltage correction for providing required voltage output within specified time for each increment of additional load brought on line by automatic starting of the first pump followed by the second pump when load is supplied by each of two sources.
    - 3) For regulator supplying facilities other than fan shafts and drainage pumping stations described above, set output voltage to nominal 480 volts and check actual output voltage and speed of voltage correction for providing required voltage output within specified time to the connected load.
  - e. For regulators supplying ventilation fans in fan shafts and pumps in drainage pumping stations, check actual output voltage and speed of voltage correction for providing required output when total load of all connected motors is transferred from one source to the second source by simulating power failure in each of the two sources connected to the automatic transfer switch.
- C. Submit certified test reports.

**END OF SECTION**

## SECTION 16291

### LOCAL ANNUNCIATOR PANEL FOR TRACTION POWER

#### PART 1. GENERAL

##### 1.01 SUMMARY

- A. This section includes the following:
  - 1. Furnishing, delivering to the job-site and installation of local annunciator panels and furnishing spare parts.
  
- B. Related sections
  - 1. Section 16051 - Scope of Work For Traction Power
  - 2. Section 16052 - Basic Materials and Methods For Traction Power
  - 3. Section 16128 - Wire and Cable For Traction Power
  - 4. Section 16260 - Uninterruptible Power System (Static)
  - 5. Section 16261 - Transformer-Rectifier Units For Traction Power
  - 6. Section 16321 - High Voltage AC Switchgear (13.8kV) For Traction Power
  - 7. Section 16322 - High Voltage Switchgear (34.5kV) For Traction Power.
  - 8. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power
  
- C. Payment and measurement basis:
  - 1. Compensation for work specified in this section associated with equipment will be made in the manner of lump sum.
  - 2. Compensation for work specified in this section associated with installation will be made in the lump sum installation cost of each traction power substation, tie-breaker station and Yard Control Tower.

##### 1.02 REFERENCES

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of jurisdictional authorities.
  - 2. NEC
  - 3. NEMA: 250
  - 4. ANSI/IEEE: C37.90.1
  - 5. UL: 94

##### 1.03 SUBMITTALS

- A. Submit the following for approval in accordance with the Division 1 and with the additional requirements as specified for each:
  - 1. Shop Drawing: In accordance with Section 16051 Table I.
  - 2. Certification:
    - a. Certificates from manufacturer verifying that equipment conforms to the specified requirements.
  - 3. Operation and Maintenance Manuals: In accordance with Special Conditions.
  - 4. Spare Parts Lists.

##### 1.04 QUALITY ASSURANCE

- A. Qualifications: Select a manufacturer who is regularly engaged in production of similar equipment and has supplied for at least five similar projects.

- B. For Codes, Regulations, Reference Standards, and Specifications, refer to Article 1.02 above.

#### **1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Equipment for each facility shall be delivered in accordance with the access dates in Special Conditions, and shall be coordinated with the Engineer
- B. Ship each unit securely packaged, braced and labeled for safe handling in shipment and to avoid damage or distortion.
- C. Temporary Bracing: Where necessary, brace each unit for hoisting, lowering and skidding into position. Temporary internal bracing of the equipment labeled as follows:  
TEMPORARY-REMOVE BEFORE OPERATION
- D. Store equipment in secure and dry storage facility.

#### **1.06 OPERATION AND MAINTENANCE TRAINING:**

- A. In accordance with Section 16053.

### **PART 2 PRODUCTS**

#### **2.01 PRODUCTS AND MATERIALS:**

- A. Local Annunciator Panel:
  - 1. General Requirements
    - a. Solid-state circuitry utilizing microprocessor technology.
    - b. Signal input circuits passing Surge Withstand Capability Test in accordance with ANSI/IEEE C37.90.1.
    - c. Solderless, universal bus network suitable for field modification. Buses and terminals made of tin-plated copper alloy.
    - d. UL plastic rating of 94-VO.
- B. Cabinet:
  - 1. Modular design with each module capable of housing up to four plug-in cards. Each card socket provided with a seven-point, barrier-type terminal block at the bottom of the module array for field use. Terminals capable of accepting up to two #14 AWG wires with or without lugs. Plug-in-cards accessible from the front of the cabinet upon removal of the lightboxes.
  - 2. NEMA 250, Type 12, 16 gauge minimum steel enclosure with lightboxes and back-lighted nameplates suitable for surface mounting on wall.
  - 3. Each vertical and horizontal row provided with two conduit knockouts.
  - 4. Panalarm Series 90, or RIS AN-3100A or approved equal with the following total quantities of modules of accommodate active nameplate displays and blank nameplates:
    - a. Forty-two (42) modules for traction power substation arranged in six rows and seven columns. Panalarm Model 94CAS67 or approved equal.
    - b. Eight (8) modules for tie breaker station arranged in two rows and four columns. Panalarm Model 94CAS24 or approved equal.
    - c. Twelve (12) modules for yard control tower.
    - d. Zinc-plated blue chromate dipped finish.
- C. Lightboxes:

1. Each lightbox displays one annunciation point using LED display lamp.
  2. Each nameplate minimum 3 inches high by 3 - 5/16 inches wide molded of translucent white polycarbonate plastic and fitted to front of lightbox with snap action.
  3. Points identified as trip functions provided with a red filter or film located behind the white nameplate to show a display with red background when lamps in lightbox behind nameplate are illuminated.
  4. Nameplates engraved with black characters or blank with no characters.
  5. Each lightbox removable from cabinet with pull-out plates.
  6. Each lightbox keyed to prevent improper installation.
- D. Sequence cards:
1. Plug-in type with a plastic ejection handle on one end.
  2. Each card provided with a selectable (dip-type) switch for field selection of normally open or normally closed field contacts and an LED display to indicate a change in the position for the field contacts.
  3. Each card provided with a selectable (dip-type) switch for the lock-in or non-lock-in of the input signal.
  4. Flashing sequence provided.
  5. Each card designed with a nominal response time of 20 milliseconds.
- E. Flasher card:
1. Flasher card similar in construction to sequence cards.
  2. One card containing capacity to generate fast flash and slow flash rates for all lightbox displays on annunciator panel.
  3. Card equipped with three LED displays to monitor the fast flash/slow flash buses, the alert audible drives and the return audible driver.
  4. Card input and output circuits provided with overload protection.
- F. Power supply;
1. Input power supply circuit to integral annunciator power supply rated at 125 volts DC and protected with fuses.
  2. Nominal output from power supply consisting of 24 volts DC for logic circuits and 125 volts DC for signal contact circuits, or as required. Signal contact circuits provided with short circuit protection.
- G. Auxiliary contacts:
1. One Form C sealed relay for each point with the following additional requirements:
    - a. Dry contacts with a maximum load rating of 5 amperes at 250 volts AC or 28 volts DC resistive.
    - b. Contacts with a maximum series current of 3 milliamperes, maximum series resistance of 5 kilo-ohms and minimum leakage resistance of 150 kilo-ohms at 125 volts DC.
    - c. Contact bounce not to exceed five milliseconds.
  2. Relay field selectable via removable jumper for fail-safer or non fail-safe operation.
    - a. Auxiliary contacts to follow the signal contact and not operate on test or follow the horn circuit.
    - b. Located on sequence card and accessible via the cards associated with the rear terminal block
- H. Pushbuttons:
1. Two, black, heavy-duty, oil-tight, each with one normally open and one normally closed double break momentary contact mounted on door of cabinet and identified as ACKNOWLEDGE and TEST.
  2. Pushbutton interlock to prevent operation of buttons out of proper sequence from affecting sequence card function.
- I. Annunciator power "ON" indicating light: White, heavy-duty, oil-tight, 125 volts DC.

- J. Audible devices:
  - 1. Electronic device capable of generating multiple tones that are selectable via dip switches with a maximum sound rating of 80 dB at a distance of 10 feet. Mounted on door of cabinet.
  - 2. Or, provided with a horn with a minimum sound rating of 68 dB at a distance of 10 feet capable of producing either a continuous or fast pulse tone. Mounted on door of cabinet.
  
- K. Operation: Arranged for operation from normally closed trouble contacts with the following sequence:
  - 1. Alarm: On opening of any trouble contact, alarm locks in and causes lamps in lightbox behind nameplate for that point to flash at regular intervals.
  - 2. Acknowledge: Operation of ACKNOWLEDGE pushbutton causes lamps behind nameplate to change from the flashing to continuous illuminated display.
  - 3. Return to normal: Lamps behind nameplate are extinguished.
  - 4. Test: Operation of TEST pushbutton causes all alarm cards to go through their operations and lamps behind nameplates flash.

### **PART 3 EXECUTION**

#### **3.01 INSTALLATION**

- A. Install local and remote annunciator panel as shown and in accordance with approved shop drawings.
- B. Make connections as shown and approved in accordance with Section 16052 (Basic Materials and Methods).
- C. Use services of manufacturer's engineering representative for assistance during field assembly and installation of the equipment in accordance with Section 16051 (Scope of Work).

#### **3.02 FIELD QUALITY CONTROL**

- A. Field Testing and Inspection: As specified in Section 16051 (Scope of Work)

**END OF SECTION**

## SECTION 16293

### MIMIC PANEL FOR TRACTION POWER - STORAGE YARD

#### PART 1. GENERAL

##### 1.01 SUMMARY

- A. This section specifies furnishing and installing a Mimic Display Panel for remote supervision of equipment status, display of storage Yard third-rail layout, yard dc one-line and selected analog data, and control of specified circuit breakers in storage Yard Substation, from the Yard Control Tower.
- B. Related Sections:
  - 1. Section 16051- Scope of Work For Traction Power
  - 2. Section 16052 - Basic Materials and Methods For Traction Power
  - 3. Section 16121 - Wire and Cable For Traction Power
- C. Payment and Measurement: Compensation for work specified in this section will be made in the following manner:
  - 1. Materials: Lump Sum.
  - 2. Installation: Lump Sum.

##### 1.02 SUBMITTALS

- A. Submit the following for review in accordance with the Special Conditions and with the additional requirements as specified for each:
  - 1. Shop Drawings: Shop drawings for complete supervisory system including mimic panel, Schematic diagrams, terminal block diagrams and interconnections.
  - 2. Certification: Certificates from manufacturers verifying that equipment furnished conforms to the specified requirements.
  - 3. Product Data: Manufacturer's product data for all components used.
  - 4. Screen Mock-Ups: Provide color plans which depict mimic panel displays as shown and specified. Provide narrative description of the means of operator interaction and displayed results for the selection of operand, object and execution of available commands.
  - 5. Field Test Plan: Submit test procedure describing component level tests and end-to-end operational test to comply with system performance requirements.

##### 1.03 QUALITY ASSURANCE

- A. Qualifications: Select manufacturers/installation contractor who are regularly engaged in production/installation of specified materials.
- B. The equipment shall be tested and certified at the factory in accordance with the manufacturer's recommendations and product specifications.

##### 1.04 DELIVERY, STORAGE, AND HANDLING

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage.

- C. Store products in secure and dry storage facility.
- D. O & M Manuals: In accordance with Special Conditions.

**1.05 OPERATION AND MAINTENANCE TRAINING:**

- A. In accordance with Section 16053.

**PART 2 PRODUCTS**

**2.01 MANUFACTURERS**

- A. The Mimic panel shall be manufactured by one of the following or equal:
  - 1. Panalarm Ametek.
  - 2. Mosaik EMK.

**2.02 EQUIPMENT**

- A. Remote Control and Monitoring System Description:
  - 1. General Requirements
    - a. The system shall consist of a Mimic Display Panel located at the Yard Control Tower, an interface cabinet (Remote Control & Monitoring Cabinet) at the Yard Traction Power Substation, hard wired connections between substation equipment and interface cabinet, and between interface cabinet and mimic panel through relays isolating mimic panel and the R, M and C cabinet.
  - 2. System Description
    - a. The system shall provide control and indication functions per Table below, or as applicable (Site Specific) display of yard layout, as shown and comply with the following requirements.

<b>Remote Control and Indication Point Count</b>			
<u>Equipment/Device</u>	<u>No. Off</u>	<u>Control</u>	<u>Indication</u>
DC Feeder Breaker	[ TBD ]	X	X
DC Cathode Breaker	[ TBD ]	-	X
DC Positive Tie Breaker	[ TBD ]	-	X
DC Negative Tie Breaker	[ TBD ]	-	X
15kV RT Feeder Breaker	[ TBD ]	-	X
Yard Isolation Switch	[ TBD ]	X	X
Yard Master Trip	[ TBD ]	X	X
DC Bus Voltage	[ TBD ]	-	X

- b. Control dc and ac circuit breakers: Allow the operator at the yard control tower to trip and close breakers from heavy duty pistol grip miniature switches on the mimic panel.

- c. Permit "Yard Isolation" from the mainline and vice-versa through a single switching device, which in turn operates the dc positive and negative tie breakers in accordance with interlocks provided.
- d. Trip all dc feeder breakers connected to the yard third-rail system when the "Yard Master Trip" switch is activated.
- e. Monitor circuit breaker status and provide an audible and visual alarm when these change.
- f. Monitor system analog outputs and provide visual display.

B. Mimic Panel

- 1. The Graphic Display Mimic Panel shall be custom-designed with dimensions of 6 feet (wide) x 3 feet (high), suitable for wall mounting, and with the following additional requirements:
  - a. Graphic panel: Constructed from modular tiles using either a self-locking, self-supporting design or mounted on non-metallic grid system, supported on aluminum frame, completely factory-assembled, wired and tested for operation.
  - b. Tiles:
    - 1) Material: Polycarbonate or equal, non-reflecting, ultraviolet-resistant with anti-static surface.
    - 2) Size: Nominal one inch by one inch.
    - 3) Color:
      - a) Tiles used for background with light color to provide maximum contrast with dark uncolored and colored graphic displays.
      - b) Tiles used for illuminating graphic display lines with translucent narrow rectangular area aligned with non-illuminated graphic display lines on adjacent tiles.
      - c) Tiles used for illuminating circuit breaker and isolation switch positions with opaque (black) color, formed-outline and translucent lens inserts. Inscriptions identifying device positions appear in illuminated areas of lens inserts.
    - 4) Graphic display lines and inscriptions: Engraved or painted characters or silk screen stencil.
  - c. Illuminated display: Plug-in type LED used for illuminating lines and inscriptions through translucent tiles or lens inserts as specified. LED shall be General Electric Company Type ET-16 or equal.
  - d. Overall graphic and illuminated display: Alternating array of five consecutive background tiles with individual matching graphic lines and one translucent tile backlit with LED of appropriate color.
  - e. Inscription and symbol size: Proportional to overall mimic panel size shown with dimensions as follows:
    - 1) Inscriptions for nameplates: ½ inch high minimum.
    - 2) Inscriptions for circuit breaker and isolation switch positions: Maximum size that can be accommodated in illuminated area of tile lens insert.
    - 3) Symbols: One inch by one inch minimum.
  - f. Cabinet: NEMA 12 cabinet with 6 feet wide by 3 feet high opening in hinged front cover to accommodate mimic panel, with the following additional requirements:
    - 1) Construction: Fabricated from minimum 14-gauge galvanized steel with continuously welded seams ground smooth and rolled lip on perimeter of open end of cabinet. Top of cabinet reinforced with structural steel brackets or braces in a minimum of two locations to support weight of mimic panel attached to cover without causing stress or deflection in the cabinet.

- 2) Size: Size as required to accommodate mimic panel attached to cover with adequate space reserved to mount terminal strips. Depth not to exceed 16 inches.
- 3) Cover: Cover with rolled lip on perimeter to match rolled lip on cabinet, closed-cell neoprene gasket, piano hinge at top edge to permit 90 degrees of movement and reinforcement as required to rigidly support mimic panel without twisting or distorting when cover is opened or closed. Cover provided with mechanical or gas-strut devices to hold cover safely in fully-open position and a mechanical latch to secure cover in the closed position.
- 4) Finish: Phosphatized, primed and finished with two coats of lightgray enamel or epoxy coating, ANSI Z55.1, Color 61, minimum dry film thickness, two mils.
- g. Control and Indication Devices:
  - 1) Circuit Breaker Control Switch: Pistol Grip three-position, Selector switch, momentary type with CLOSE/OPEN positions clearly marked. Rating 125V dc, 10 Amps.
  - 2) Pushbutton Switch (Master Trip): Momentary push-button, normally-closed contact with illuminated display showing ON/OFF position. Rating 125V dc, 10 Amps.
  - 3) Indication Device: The circuit breaker status shall be shown using two illuminated displays on the tile. The "CLOSED" position shall be illuminated in red color; the "OPEN" position in green color.
  - 4) Voltmeter: Digital voltmeter, 1000V dc range, displaying Yard dc bus voltage, suitable for 0-1 mA signal obtained from voltage transducer in Yard Substation.
- h. Nameplates: Provided for all contact rails identified by CR numbers, control and indication functions. Permanently engraved on tiles with descriptions as shown.
- i. Terminal strips: 1000V DC suitable for terminating external multiconductor cables between Yard Substation RC&M cabinet and mimic panel and for wiring internal devices like lamps, switches, pushbuttons. Number of terminals to accommodate all incoming and outgoing cables and wires and include ten percent spare terminals.
- 2. System Description
  - a. Graphic display of Storage Yard Contact- Rail Layout and dc one-line diagram using color-coded power zones as shown. The Third Rail System and dc one-line display shall consist of translucent tiles with behind-the-tile LED lamp assembly, and applicable color coding. The color-coded power zones shall be illuminated when the associated dc feeder breaker is closed and not illuminated when the associated dc feeder breaker is open.
  - b. The panel shall be hard-wired back to the Remote Control and Monitoring Cabinet in Yard Substation through isolation relays. All signals to and from the substation equipment shall be terminated in this cabinet for interfacing with the remote system.
  - c. Power supply: Suitable for 125V DC supply from local power panel.
- C. Spares: As recommended by the manufacturer for two years operation beyond the warranty period.

## **PART 3 EXECUTION**

### **3.01 INSTALLATION**

- A. Install in accordance with approved shop drawings.

- B. Nameplates, Tags and Wire Labels:
  - 1. Nameplates: Provide nameplate descriptions on mimic panel as shown.
  - 2. Cable Tags: Attach cable tags to each cable at all pull boxes, manholes and terminations.
  - 3. Wire labels: Attach wire labels to all control, annunciation and supervisory wiring at each terminal point. Attach label to a clean, dry section of wire as close as possible to the terminal point.

### **3.02 FIELD QUALITY CONTROL**

- A. The Contractor shall demonstrate the proper functioning of all system components in the presence of the Engineer by systematically operating the circuit breakers, master-trip and yard isolation switch from the mimic panel, observing status points, and annunciating all functions.
- B. Submit Certified test report within ten days.

**END OF SECTION**

## SECTION 16294

### CONSTANT WATTAGE CONTACT RAIL HEATING SYSTEM FOR TRACTION POWER

#### PART 1. GENERAL

##### 1.01 SUMMARY

- A. This section specifies furnishing installation of a complete contact rail heating system (comprised of numerous sub-systems and components) or of any identified subcomponents or systems at various locations of WMATA rail systems.
- B. This work includes but is not limited to the following:
  - 1. Furnishing and delivery to job site of all materials.
  - 2. Installation of a complete contact rail heating system comprised of individual sub-systems (or of any identified subcomponents) at various locations of WMATA rail system. Each sub-system requires removal of contact rail protection cover assemblies where required, cleaning of contact rail, installation of contact rail heater, contact rail protection cover assemblies, trackside heater control panel, trackside fusebox disconnect, zone heater control panel, master heater control panel, remote heater controller, installation and connection of power and control cable and other associated items as specified, shown and required for completion of the work to provide an operational system. Regardless of whether the contract requirements call for partial or complete replacement of the contact rail heater system, the completed work shall provide for an integrated system whose components (whether new or existing-to-remain) function together as a complete system in the manner described herein.
  - 3. Furnishing and installing trackside heater control panels, zone heater control panels, fusebox disconnects, master heater control panel, remote heater controller and associated wiring and control connections.
  - 4. Providing contact rail heaters and heater components for the purpose of deicing contact rails whose third rail voltage will vary from 900V DC to 450V DC during normal operating conditions.
- C. Related Work Specified Elsewhere
  - 1. Section 16051 - Scope Of Work For Traction Power
  - 2. Section 16052 - Basic Materials and Methods For Traction Power
  - 3. Section 16053 - Operation and Maintenance Training for traction power
  - 4. Section 16128 - Wire and Cable For Traction Power

##### 1.02 DEFINITIONS

- A. Definitions:

1. Contact Rail Heater: A heating cable installed on the contact rail to electrically heat the mass of the rail. The cable is one of parallel circuit design utilizing a metal alloy/fiber composite heating element spirally wrapped around the parallel bus wires of the cable.
2. 32°F Substrate: A metal surface that is maintained at 32°F.
3. Nominal service voltage: The voltage at which the heater cables are expected to operate when in normal operation, i.e., 750V DC.
4. Rated Power Output: The watt/foot of heating cable, eight feet or longer, energized at 750V DC, when mounted on a 32°F substrate.
5. Sheath Temperature: The temperature of the outermost jacket.
6. Maximum Sheath Temperature: The highest sheath temperature that a heater is capable of generating when powered at 900V DC in still air.
7. Factory Fabricated: A heating cable including terminations and lead wires completely assembled and tested at the manufacturer's plant prior to shipment.
8. Heat Transfer Aids: Includes any materials that are extruded on to the heater for the purpose of conducting heat from the heater to the contact rail.
9. Traction Power Zone: Includes all contact rail fed from a DC switchgear feeder breaker.

### **1.03 SYSTEM DESCRIPTION**

- A. Interpretation of Drawings and Specifications
  1. Lengths of jumper cable between segments of heater are approximate. Field verify actual lengths.
  2. The contract drawings are diagrammatical and do not show all offsets and other details at every point of the contact rail. Make all field measurements required to install a complete and operational contact rail heating system. Furnish and install, at no extra cost to Authority, any additional fittings, conduits, cable/wire or specialties, and other appurtenances necessary due to field conditions.

### **1.04 SUBMITTALS**

Submit the following for approval in accordance with the Division 1 and with the additional requirements as specified for each:

- A. Heater controller shop drawings including the following:
  1. Manufacturer's catalog cuts and literature for each item.
  2. Power and control internal wiring diagram and equipment layout for the following:
    - a. Trackside heater control panel.
    - b. Zone heater control panel.
    - c. Fusebox disconnect.

- d. Master heater control panel.
    - e. Remote heater controller.
  3. Time-current curve for fuses.
  4. Drawings showing full details of each type of enclosure.
- B. Heater assembly shop drawings including the following:
  1. Drawings showing details of heater, termination, fiberglass channel or extrusion and clip.
  2. Installation details on steel or composite contact rail and at contact rail joints.
  3. Manufacturers catalog cuts and literature.
  4. Submit samples of the following items to the Engineer for approval: Heater cable, fiberglass channel, spring clip for steel rail and composite rail, spring clip for composite rail and steel rail splice joint, end cap kit, splice kit, power lead termination kit.
- C. Heater system shop drawings:
  1. Within seven (7) days after receipt of notice to proceed, submit shop drawings for the following:
    - a. Power and control wiring for each typical sub-system consisting of contact rail heater assemblies, fusebox disconnects, trackside heater control panels, zone heater control panels, master heater control panel and remote heater controller.
    - b. Inrush current type test data for heater cables on log-log time-current graphs for 450 to 750V DC for 0 C to 40 C.
    - c. Proposed fuse time-current curve for main fuse disconnect and for individual heater circuit fuses.
    - d. Maximum Sheath Temperature.
- D. Heater Controllers and Contact Rail Heater Assembly Certification: Certificates from manufacturers verifying that equipment furnished conforms to WMATA's requirements as specified in this document.
- E. Contact Rail Heater Assembly Certification of Test Results:
  1. Two original copies of certified test reports for factory design and production tests for the Authority's approval prior to the shipment of heaters.
- F. Documentation:
  1. Contact rail heater assembly documentation includes:
    - a. Projected power outputs of the heater as a function of rail temperature, voltage and circuit length.
    - b. Start-up current characteristics.

- c. A list of minimum two transit authorities with contact information where a third rail heater by the same manufacturer has been used for de-icing contact rails on 600V DC or above system.
2. Documentation for Contact Rail Heating System includes:
- a. Submit composite coordination curves of main fuse, circuit fuse and heater maximum in-rush currents to demonstrate that the proposed fuse will not cause nuisance blowing under all operating conditions.
  - b. Field Test Plan and Documentation:
    - 1) Submit field test plan within 60 days before shipment of Equipment, with accompanying documentation in the form of test data recording sheets and list of proposed test equipment.
    - 2) Do not proceed with testing until the plan and documentation are approved.
    - 3) Indicate in scope of test plan how equipment will be tested to ensure safe and orderly transition from installation, through initial energizing to approved field tests.
    - 4) Submit certified copies of test data, within two weeks after completion of testing.
3. Submit Operations and Maintenance Manuals and Preventive Maintenance Instructions(PMI): Section 16053 and as required by Division 1.

**1.05 QUALITY ASSURANCE**

- A. Qualifications:
- 1. The heater controller manufacturer selected shall be regularly engaged in production of similar control panel fuse-box disconnects.
  - 2. The contact rail heater assembly manufacturer shall be regularly engaged in the production of contact rail heaters and heater components for de-icing contact rails for transit systems.
- B. Codes, Regulations, Reference Standards and Specifications:
- 1. Codes and regulations of jurisdictional authorities.
  - 2. NEMA: ICS2, ST-20, WC3.
  - 3. UL: 94, 224, 1087.
  - 4. ASTM: A283, B368, B633, D88, D130, D149, D217, D256, D495, D543, D570, D638, D648, D696, D790, D792, D942, D1056, D1263, D1264, D2509, D2565, D3032, F593, G3, PRACTICE G26 METHOD 1.
  - 5. ANSI: Z55.1.
  - 6. MIL-STD-202F Methods 101D, 106E, 107G.
  - 7. IEEE STD 515

8. ICEA: S-95-658 (NEMA WC70)
9. AAR: 581.
10. NESC.C2

C. Factory Testing

1. Submit certified original copies of test reports performed on identical types of heaters and heater components in the heater assembly.  
Tests shall have been conducted not more than 36 months prior to submittal to the Authority, for materials which are identical to those of the furnished components.
2. Heater Tests:
  - a. Design Tests: All design tests shall be performed on heater samples of two to ten feet long, unless otherwise dictated by the respective testing standard(s). Pass/fail criteria are as indicated herein, or within the respective standard.
    - 1) Voltage withstand test (on a new sample) in accordance with ASTM D3032:
      - (a) Withstand 500V DC with a maximum current leakage of 50 microamps/ft.
    - 2) Insulation Resistance test (on a new sample) in accordance with ASTM D3032:
      - (a) Insulation resistance greater than 1000 megohm-ft.
    - 3) Dielectric test (on a new sample) in accordance with IEEE 515 4.1.1. At the completion of this test, conduct insulation resistance test per IEEE 515 4.1.2.
    - 4) Water resistance test (on a new sample) in accordance with IEEE 515 4.1.3.
    - 5) Connection/termination water resistance test (on new samples) in accordance with IEEE 515 4.1.4.
    - 6) Elevated temperature exposure dielectric test (on a new sample) in accordance with IEEE 515 4.1.5.
    - 7) Deformation test (on a new sample) in accordance with IEEE 515 4.1.7, except performed at maximum sheath temperature..
    - 8) Impact test (on a new sample) in accordance with IEEE 515 4.1.8. Verify no loss of heater element continuity after test.
    - 9) Cold bend test (on a new sample) in accordance with IEEE 515 4.1.9.
    - 10) Flammability test (on a new sample) in accordance with IEEE 515 4.1.10.
    - 11) Power output test (on a new sample) on 32F substrate 15 minutes after energization in accordance with IEEE 515 4.1.11:
      - (a) Nominal power output: 30 or 40 watt, as specified in the

contract for the heater, per foot at 750V DC.

- (b) Maximum Sheath Temperature shall be verified in accordance with IEEE 515 4.2 during power output test.
- 12) Over voltage test (on a new sample): Use 1200V DC for one hour and determine sheath temperature with sheath not in contact with substrate in still air and air temperature not less than 50°F:
- (a) Sheath temperature not to exceed 400°F.
  - (b) No melting, charring or burning of heater elements or outer jacket occur during test.
  - (c) Pass voltage withstand and resistance test after over voltage test.
- 13) Corrosion test (on a new sample) in accordance with MIL-STD-202F Method 101D, Test condition A with outer jacket removed:
- (a) No pitting or cracking of heater element during test.
- 14) Light Exposure Test (on a new sample) in accordance with ASTM D2565 practice G26, Method 1:
- (a) No cracking or splitting of material during test.
  - (b) Pass voltage withstand and insulation resistance test after light exposure test.
- 15) Perform Voltage Spikes Test (on new sample) by applying 1000 cycles with 5000 volt impulse having 1.2 microsecond rise time and 50 microsecond fall time. After voltage spikes test:
- (a) Retain 90 percent minimum of initial power.
  - (b) Pass voltage withstand and insulation resistance test.
- 16) Performance After Thermal Aging Test (on new samples, per IEEE 515 4.1.6): Conduct indicated test. Aging temperature shall be 104 degrees F. For the purposes of this test, the heat tape should be considered as not having an intermittent temperature exposure rating. Test shall consist of operation (energized) for 120 hours, followed by output measurement, followed by operation (energized, with a 12 minute "on" 3 minute "off" cycle) for 32 weeks, followed by output measurement. This test may be completed concurrently with supply on a multi-year contract with engineering approval.
- (a) Power output shall change no more than 15% (including experimental tolerance) from the original power value prior to thermal aging.

b. Production Test:

- 1) Each completed heater length, including terminations shall be subjected to the following tests:
  - (a) Pass voltage withstand test in accordance with ASTM

D3032. Withstand voltage in accordance with IEEE 515 4.1.1.

- (b) Insulation Resistance Test in accordance with ASTM D3032. Insulation resistance greater than 1000 megohm-ft.
  - (c) Upon completion of test, thoroughly clean each length to remove saline solution residue.
- 2) Nominal Power Output Test: Test a minimum of three (3) heater samples out of each 10,000 feet of heater production as below:
- (a) Method of sampling: Obtain one or more test samples of two feet minimum length per 1,000 feet of heater production. Choose three samples at random from the set of samples taken from a given production run.
  - (b) Nominal power output: 30 or 40 watt per foot at 750V DC on a 32°F substrate 15 minutes after energization.
  - (c) If any sample has a power output value less than 95 percent of specified watts per ft., then that particular production run heater produced is to be considered as rejected by Authority. If the Contractor chooses, a retest on three (3) additional samples for that production run of 10,000 ft. tests may be made by the Contractor at no additional cost to Authority. Submit the results of all tests for review and a decision on approval by the Authority.
- 3) Authority reserves the right to require the Contractor to supply production samples at no cost to Authority in order that Authority can have samples tested for compliance by an independent laboratory selected by Authority. These test costs will be paid by Authority.
- 4) Authority reserves the right to witness manufacture of and to witness all tests conducted upon the heater. Notify Authority in writing at least two weeks in advance of the first heater testing date so that they can witness the test, if so desired. All materials to be furnished under the Contract are subjected at all times during manufacture, fabrication, construction and testing to such inspection by the Authority as to give due assurance that the terms and requirements of this Specification are being complied with.

3. Fiberglass Channel/Extrusion Tests:

a. Design Tests:

- 1) Tensile modulus in accordance with ASTM D638:
  - (a) Greater than  $1 \times 10^6$  psi.
- 2) IZOD impact strength in accordance with ASTM D256:
  - (a) Notch impact strength greater than 10 ft lbs/in of notch.
- 3) Thermal co-efficient of expansion in accordance with ASTM-D696:

- (a) Thermal Co-efficient:  $13 \times 10^{-6}$  in/in/°F maximum.
    - 4) Solvent resistance in accordance with ASTM D543:
      - (a) Less than 2 percent weight change in diesel fuel, gasoline, and salt water. Less than 0.5 percent change in water.
    - 5) Accelerated aging in accordance with ASTM G23:
      - (a) A minimum of 2000 hours.
    - 6) Flammability Test in accordance with UL 94:
      - (a) Flammability Classification: VO
  - b. Production Tests:
    - 1) Visual examination for overall uniformity and acceptable surface quality.
    - 2) Dimensional check according to manufacturing tolerances.
4. Attachment Clip Tests:
  - a. Design Tests:
    - 1) Finish in accordance with ASTM B633, zinc chromate or coating providing equivalent corrosion protection.
    - 2) Corrosion test in accordance with ASTM B368:
      - (a) No rusting after 130 hours in a copper acetic acid bath.
  - b. Production Tests:
    - 1) Visual examination for quality of finish and absence of burrs, sharp edges and cracks.
    - 2) Dimensional check of at least 3 clips per 1000 chosen at random according to manufacturing drawing tolerances.
5. Splice and Termination Tests:
  - a. Design tests:
    - 1) Pull out strength at least 40 lbs measured under static load for one hour with no evidence of slippage.
    - 2) Thermal Shock Test in accordance with MIL STD 202E, Method 107G, Test Condition A:
      - (a) Heater pass voltage withstand and insulation resistance tests after thermal shock test.
    - 3) Light Exposure Test in accordance with ASTM D 2565 practice G26, Method 1:

- (a) No cracking or splitting of material during test.
    - (b) Heater pass voltage withstand and insulation resistance tests after weather-resistance test.
  - 4) Corrosion Test in accordance with MIL STD 202F, Method 101D, Test Condition A:
    - (a) No pitting or cracking of heater element during test.
    - (b) Heater pass voltage withstand and insulation resistance tests after corrosion test.
  - 5) Moisture resistance test in accordance with MIL STD-202F Method 106E:
    - (a) No cracking or splitting of material during test.
    - (b) Heater pass voltage withstand and insulation resistance tests after moisture resistance test.
- b. Production Tests:
  - 1) Visual Examination for overall uniformity and acceptable surface quality.

**1.06 DELIVERY, STORAGE, AND HANDLING**

- A. Delivery, storage and handling for trackside, zone, master and remote heater controllers shall include:
  - 1. Mark each item in accordance with applicable reference standards.
  - 2. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage and distortion.
  - 3. Store products in secure and dry facility.
  - 4. Deliver spare parts to be stored to Rail System Maintenance Facility, 195 Telegraph Road, Alexandria, Virginia 22314.
- B. Delivery, storage and handling for contact rail heater assembly shall include:
  - 1. Stamp with permanent ink on the finished length of the heater cable, the following information on the outside surface (side away from rail) in ¼" high (minimum) black letters repeated every six (6) feet (maximum):
    - a. Manufacturer's name
    - b. Manufacturer's part number
    - c. Voltage rating
    - d. Wattage per foot
  - 2. Supply heater cable on approximately five-foot diameter reels for the A and B sides of the trackside heater control panel in the lengths as required per contact rail heater plan on each side of control panel as developed by the contractor. Length of heater

cable on each side (A or B) of controller shall not exceed 500 feet. Terminate each heater circuit in the factory to circuit lengths as required, and in accordance with contact rail heating plan.

- a. Designate each reel by the trackside heater control panel number.
  - b. Where the combined length of the heating cable on side A and B of a control panel is 500 feet or less, contractor has the option of placing each of them on the same reel.
3. Ship items securely packaged and labeled for safe handling in shipment and to avoid damage.

## **1.07 WARRANTY**

1. In addition to the Division 1 "Warranty of Construction". Warrant each heater cable length covered by this Specification to be free from defects in material and workmanship, for an additional period of one year for a total of two years after date of final installation and acceptance.
2. If any product furnished under this Section has an annual failure rate of twelve percent or more of the total of heater sections supplied and the failure is determined to be a fault of the product as supplied, replace all such products required to eliminate the cause of the failures without any additional cost to the Authority. The five (5) year warranty period shall be applied to all replaced heaters. Output below ninety percent of rated output at 750V DC at specified rail temperature is considered as failure.

## **PART 2 PRODUCTS**

### **2.01 EQUIPMENT - CONTACT RAIL HEATER ASSEMBLY**

- A. Contact rail heater shall be manufactured by Thermon Manufacturing or approved equal.
- B. Contact rail heater assembly: Consisting of following items suitable for installation on aluminum-clad (composite) contact rail or steel contact rail as required per WMATA contact rail system:
  1. Contact rail heater cable: Constant wattage output (i.e., effectively independent of rail temperature):
    - a. The heater cable shall consist of two (2) parallel 10 AWG (30 or 40 watt per foot) nickel plated copper conductors. Each of the two (2) conductors is insulated with fluoropolymer resin. Over these two (2) parallel insulated conductors, a pairing jacket is extruded to form a parallel core. This core is then alternately notched at the outermost edge exposing the bare conductors. A nickel alloy/fiber composite resistance wire is then spirally wrapped around the core. The wrapper core is then covered with a fluoropolymer jacket minimum 30 mils thick. The jacket material shall be free of PVC and PVC base compounds. The heater assembly is then covered with a metallic braid of nickel-plated copper.
    - b. A silicone based composition is extruded over the cable assembly to aid in even heat distribution to the contact rail. This outer covering also protects the cable assembly and is electrically non-conductive for ease of installation. The silicone composition shall be suitable for extended exposures to high temperatures.

- c. Nominal power output on 32°F substrate after 15 minutes of energization.
  - (1) Nominal Output: 30 or 40 watt per foot at 750V DC.
  - (2) Maximum sheath temperature of heater cable not in contact with substrate, operating at 750V DC in still air at 50°F ambient air temperature: 400°F.
- d. Suitable to pass specified design and production tests.
- e. Length: As required per contact rail heating plans developed by the contractor subject to a maximum tolerance of minus three percent. Number of splice in any section of heater tape not to exceed the following:

<u>Length of Heater Tape</u>	<u>Number of Splices</u>
100 ft. or less	None
100 ft. to 200 ft	One
200 ft. to 500 ft.	Two

- f. Marking: Mark heater cable sheath at intervals of not more than 6 feet in ¼ inch high letters with manufacturer's name, system voltage, rated power output and product batch number.
2. Fiberglass Channel or Extrusion: Designed to hold contact rail heater cable in intimate contact with steel or aluminum clad (composite) contact rail as shown on contract drawings, with the following additional requirements:
    - a. Size and Shape: As required by heater manufacturer.
    - b. Material: Ultra-violet stabilized fiberglass reinforced polyester.
    - c. Suitable to pass specified design and production test.
  3. Attachment Clips: Designed to hold the fiberglass channel with heater cable in intimate contact with steel or aluminum clad (composite) contact rail, as shown on contract drawings, with the following additional requirements:
    - a. Suitable for easy installation and removal and not interfering with coverboard assembly.
    - b. Material: Spring steel, minimum of 1-¼ inch wide and 64 mils thick.
    - c. Heat treated after fabrication to Rockwell scale hardness of C30-C40.
    - d. Finish: Zinc chromate coating, 0.9 mils thick for service condition SC-4, Type 2, in accordance with ASTM B633.
    - e. Suitable to pass specified design and production tests.
    - f. Spacing of clips: As specified by heater cable manufacturer, nominally eighteen-inch center to center or as approved by the Engineer.
  4. Heater Factory Terminations: Terminate power leads at both ends or for power leads at one end and end cap at the other end as shown on contract drawings with following additional requirements:

- a. Power lead and end cap terminations designed to provide water tight seal using polymeric and/or adhesive materials.
  - b. Power lead terminations: The heater element bus wires are connected to the power lead wires using crimp connectors. The power lead wires shall be Exane or approved equal, 110°C, #10 stranded minimum, single conductor copper wire insulated with heat resistant rubber compound, with a 2000 volt rating. Standard lead length is 10 feet and complying with the following requirements:
    - 1) Conforming to NEMA WC 70, ICEA S-95-658 and AAR 581.
    - 2) Suitable for use in wet and dry outdoor locations, open air, conduit, cable trench, underground ducts or direct buried.
    - 3) Lead wire ends suitably protected to prevent ingress of moisture during shipment.
    - 4) Each lead wire marked with manufacturer's name, conductor size, insulation material and voltage rating.
    - 5) Furnish compression splice terminals and heat shrinkable tube with each lead wire end for field connections with # 10 AWG minimum, 2000 volt insulated wire specified in Section 16128. Do not provide splices in cables at other than at indicated locations without approval of the Engineer.
6. Shop Assembled Terminations: Terminate using materials recommended by heater manufacturer and in accordance with manufacturer's instruction in a clean and dry area. Each termination shall be subjected to the following tests:
- a. Perform a voltage withstand test in accordance with ASTM D3032 at 500V DC without failure.
  - b. Perform insulation resistance test in accordance with ASTM D3032 at 500V DC. Insulation resistance must be greater than 1000 megohms-ft.
7. Abrasion Pad:
- a. Continuous extruded EPDM rubber.
  - b. Durometer Hardness (Shore A± B): 60.
8. Operating Requirements:
- a. The design and fabrication of the contact rail heater system, comprising of materials and components described herein, shall assure successful operation when installed on Authority contact rail installation.
  - b. The contact rail heater cable system is to be designed to withstand ambient temperatures of -40°F to +120°F, with rail temperature excursions to +180°F; also rain, sleet, snow, vibration (as generated by passing rapid transit vehicles), roadway salts, common chemicals found in the Metropolitan Washington Area Rapid Rail Transit environments, solar exposure and rail expansion/contraction without deleterious effect.

## 2.02 EQUIPMENT - HEATER CONTROLLERS

A. General Requirements for Trackside Heater Control Panel, Zone Heater Control Panel, Master Heater Control Panel, Remote Heater Controller and Fuse-Box Disconnect:

1. Auxiliary Relays:

- a. Type - Electrically held.
- b. Standard - NEMA ICS2 - 212.
- c. Contacts:
  - 1) Number and type - 2 N.O., 2 N.C. or as specified.
  - 2) Voltage - 120V AC or DC as specified.
  - 3) Current - 0.45A resistor load and 0.3A inductive load.
- d. Coil - 125V DC.
- e. General Electric - CR120BD01141

2. Auxiliary Time-Delay Relays:

- a. Type - Electrically held.
- b. Standard - NEMA ICS2.
- c. Contacts:
  - 1) Number and Type - Two normally open, or 1 N.O., 1 N.C. as required.
  - 2) Voltage - 120V AC or DC as required.
  - 3) Current - 1.0 A DC resistive load, 2.0A AC inductive load.
  - 4) Time-Delay - Time Delay pick up adjustable as specified.
- d. Coil - 120V DC.
- e. AGASTAT Series 7012, or approved equal.

3. Magnetic Current Relays / Shunt Device:

- a. Type - Current actuated magnetic. Supervisory indications via shunt device.
- b. Standard - NEMA ICS2.
- c. Contacts:
  - 1) Number and type - Two, normally open.
  - 2) Voltage - 120V DC.
- d. Coil:
  - 1) Connection - In series with load.

- 2) Insulation - 1000V DC to ground or contacts.
  - 3) Continuous current rating of series coil - coil rating suitable for pick-up as required for length of heater to indicate heater energization.
- e. G.E. Cat. #IC2820A100WB or approved equal.
- 4. 24V DC Auxiliary Relays (Supervisory Control):
  - a. Type - Dual-coil, mechanically latching, with electrical reset coil.
  - b. Standard - NEMA ICS2.
  - c. Contacts:
    - 1) Number and type - 2 form 'C' with N.O. Contact for HCR-ON, as shown on drawings.
    - 2) Voltage - 125V DC.
    - 3) Current - 0.45A DC. resistive load.
  - d. Coil - 24V DC.
  - e. Clifford and Snell, catalog number D2600/LES; Potter & Brumfield, catalog number KBP-11D-G-24 with screw terminal socket catalog number 27E123; or approved equal.
- 5. D.C. Contactors:
  - a. Type - Electrically held.
  - b. Standard - NEMA ICS2.
  - c. Size - NEMA Size 3.
  - d. Poles:
    - 1) Number - Two.
    - 2) Voltage - 1000V DC.
    - 3) Current - 100 A continuous.
    - 4) Withstand: 3000V DC high pot test for 10 seconds.
  - e. Arc chute - With 50 A blowout coils.
  - f. Auxiliary contacts - 1 N.O., 1 N.C. at 10A, 120V AC.
  - g. Coil - DC, for operation from 120 VAC via rectifier and dropping resistor.
  - h. G.E. Cat. #DS 303 Form B3 C01FXA 650 interlock XH or approved equal.
- 6. Indicating Lights for Trackside Heater Control Panel:
  - a. Type - Rain-tight, factory sealed.

- b. Housing - Aluminum guard and body assembly with steel clamping ring. Maintain NEMA 3R rating when installed to enclosure.
  - c. Lamps:
    - 1) Type - LED.
    - 2) Voltage - 120V AC.
  - d. Lens color - Amber
  - e. GE Type ET-16 or approved equal.
7. Indicating Lights for Zone Heater Control Panels and Master Heater Control Panels:
- a. Type - Oil tight, heavy duty push-to-test.
  - b. Standard - NEMA ICS 2.
  - c. Lamps:
    - 1) Type - Incandescent.
    - 2) Voltage - 125V DC.
  - d. Lens - Color as shown on drawings.
  - e. Contacts - 1 N.O., 1 N.C., 1.0 A. 125V DC.
  - f. G.E. CR 104P LT 22 or approved equal.
  - g. DTS
8. Lamp Test Switch for Trackage Heater Control Panel:
- a. Type - Push button, rain-tight construction to maintain NEMA 3R rating when installed to enclosure.
  - b. Standard - NEMA ICS 2.
  - c. Contacts:
    - 1) Number and type - 2 NO.
    - 2) Voltage - 120V AC.
    - 3) Current - 10 A continuous.
    - 4) Momentary contact.
  - d. Surface mounted, location as shown on drawings.
  - e. G.E. CR104P BG92B1 or approved equal.
9. Selector Switches:
- a. Type - Oil tight NEMA 3R, to maintain NEMA 3R rating when installed to trackage enclosures, otherwise NEMA 12.

- b. Standard - NEMA ICS 2.
  - c. Switch - Knob operated.
    - 1) 1-pole 2-position, 1-pole 3-position, or 2-pole 2-position as shown on drawings and required.
  - d. Contacts:
    - 1) Number and type - As shown on drawings.
    - 2) Voltage - 120V AC.
    - 3) Current - 10 A continuous.
    - 4) Maintained contact.
  - e) GE SG21B91, GE SG34B91, or approved equal.
10. Fuse and Fuseblock:
- a. 120V AC. Rating:
    - 1) Fuse - UL Class H with current rating as required and approved.
    - 2) Fuseblock - Porcelain, phenolic or polycarbonate, surface mounted single pole for 30 ampere Class H fuse. G.E. # CR151KJC21AQ or approved equal.
  - b. 480V AC rating:
    - 1) Fuse - UL Class H with current rating as required and approved.
    - 2) Fuseblock - Porcelain, phenolic or polycarbonate, surface mounted, two pole for 30 ampere Class H fuses. G.E. CR151KJC22CQ or approved equal.
  - c. 120V DC Rating:
    - 1) Fuse - UL Class RK5 with current rating as required and approved.
    - 2) Fuseblock - Porcelain, phenolic or polycarbonate, surface mounted single pole for 30 ampere Class RK5 fuse.
    - 3) Mounting track - Suitable for mounting of 120V DC fuseblock. Size as required, G.E. CR 151 or approved equal.
11. 1000V DC Fuse and Fuseblock:
- a. Fuse:
    - 1) Type - Current limiting, blade type, for stud bolt-on mounting.
    - 2) Voltage - 1000V DC.
    - 3) Gould Shawmut, Form 101 AMP-TRAP, Cat. A150X Type 4, current rating as shown on drawings, or approved equal.

- 4) Interrupting capacity - Capable of interrupting up to 80,000 A. fault current with system time constant of 40 milliseconds.
  - b. Fuseblock:
    - 1) Surface mounted type.
    - 2) Insulating material - Phenolic or polycarbonate.
    - 3) Two fuse-mounting studs for bolt-on mounting.
    - 4) Type and size - As appropriate for type of fuse used.
12. Molded Case Switches (Non-Automatic Molded Case Circuit Breaker):
  - a. Type - Non-automatic molded case circuit breaker.
  - b. Standard - UL 1087.
  - c. Contacts:
    - 1) 3 Pole.
    - 2) Voltage - 600V AC, 250V DC, (3 poles connected in series to provide 750V, DC isolation).
    - 3) Current rating - 100A. continuous.
  - d. G.E. Cat. #TED 136 Y 100 or approved equal.
13. Space Heater for Trackside Heater Control Panel:
  - a. Rating:
    - 1) Voltage - 120V, 60Hz.
    - 2) Rating - 35 Watts.
  - b. Housing - Grill guard with no sharp edges with low operating surface temperature.
14. Terminal Boards for Control Wiring:
  - a. Type - Box terminal.
  - b. Number of terminals - As shown on drawings.
  - c. Voltage - 300V AC or DC.
  - d. Current - 30 A.
  - e. Mounting - Direct mounted or rail mounted as shown.
  - f. G.E. CR 151A or approved equal.
15. Terminal Board for DC Power:
  - a. Type - Heavy duty stud terminal.

- b. Number of terminals - As shown on drawings.
  - c. Voltage - 1000V DC.
  - d. Current - 300A DC.
  - e. G.E. CR 2960, SY 139D3A or approved equal.
16. Limit Switch (Door Interlock):
- a. Type - Precision plunger or roller-plunger, snap action.
  - b. Contact - Minimum rating 5A, 250V AC.
  - c. G.E. Cat. CR115MB, G.E. Cat. CR115H or approved equal.
17. Control Power Transformers for Trackside Heater Control Panels:
- a. Type: Indoor dry type.
  - b. Standard: NEMA ST-20.
  - c. Rating:
    - 1) Voltage ratio: 480V to 120V, 60 Hz.
    - 2) VA rating: 100.
  - d. Insulation System: 150°C - Allowable temperature rise under continuous full load above an average ambient temperature of 30C and maximum of 40C.
    - 1) By winding resistance - 80C.
    - 2) By hot spot in winding - 110C.
  - e. GE 9T58B2804 or approved equal.
18. Fiberglass Enclosure for Trackside Heater Control Panels:
- a. Type - NEMA Type 3R.
  - b. Material:
    - 1) Molded fiberglass reinforced polyester material 1/8 inch minimum thickness and in accordance with the following:

<u>Physical Properties</u>	<u>Value</u>	<u>Method</u>
Flexural Strength	17,000 psi	ASTM D790
Deflection Temperature	400 degree F	ASTM D570
Water Absorption (24 hours)	0.5%	ASTM D570
Tensile Strength	6,500 psi	ASTM D638

Specific Gravity	1.8	ASTM D792
Flammability	94-5V	UL 94
Dielectric Strength	400 Volts/Mil	ASTM D149
Arc Resistance	180 Sec.	ASTM D495

- c. Ultra-violet protection: Fiberglass material containing ultra-violet inhibitor, or coated with polyurethane paint, 1.5 mils minimum dry film thickness on both inside and outside surfaces.
  - d. Gasket: Oil-resistant 100 percent neoprene ASTM-D1056 grade SCE-42 with oil-resistant adhesive.
  - e. Provide each front panel with 8 stainless steel quick-release fasteners and handle as shown and approved.
  - f. Back plates: 10 gauge Type 304 stainless steel or fiberglass reinforced polyester or equal, ¼" minimum thickness as shown. Plate to be electrically connected to terminal board ground terminal
  - g. Hardware: Type 316 stainless steel bolts, nuts and screws; ASTM F593, size as shown on drawings and required.
  - h. Drainage: As shown on drawings and approved.
  - i. Ventilators: As shown on drawings and approved to maintain NEMA 3R integrity with wind-driven rain.
  - j. Color: Fiberglass material, gray inside and outside.
19. Enclosure for Zone Heater Control Panels, Master Heater Control Panel and Remote Heater Controller:
- a. Wall-mounted type, single-door, NEMA 12, with panel, Hoffman Engineering Company or equal, as shown on drawings.
  - b. Enclosure: Formed of minimum 14-gauge steel, seams continuously welded and ground smooth, without opening or knockouts, with threaded conduit entrance hubs, lugs for mounting enclosure and collar studs for mounting panel. Rolled lip formed on all sides of door opening. Enclosure reinforced when size exceeds 30 inches square. Size as required.
  - c. Door: Formed of minimum 14-gauge steel, with rolled lip along top and sides to match with enclosure. Fitted with removable print pocket. Closed-cell neoprene gasket attached with oil-resistant adhesive and steel retaining clips.
  - d. Hardware: Corrosion-resistant steel continuous piano hinge with removable pin. Hasp and staple for padlocking.
  - e. Panel: Formed of 12-gauge steel.
  - f. Breather drain: One ½-inch diameter, Crouse-Hinds Catalog No. ECD11 or equal.
  - g. Finish: Galvanized enclosure, door, panel and latch mechanism. Prepared for painting by manufacture's standard method in accordance with the

following:

- 1) Outside: Phosphatized, primed and finish with two coats of light gray enamel or epoxy coating, ANSI Z55.1, Color 61; minimum dry film thickness, two mils.
- 2) Inside, including panel: Two coats of white enamel or epoxy coating.

20. Nameplates, Tags and Wire Labels:

a. Nameplates:

- 1) Three-ply, laminated phenolic plates, engraved through black face to white core, attached by stainless steel rivets or screws.
- 2) Lettering: Vertical gothic using round or square cutter. V-shape groove is prohibited.
- 3) Size: 1 ½-inch high with 1-inch high lettering, one-inch high with ½-inch high lettering or ½-inch high with ¼-inch high lettering as specified and required.

b. Cable Tags: Non-ferrous tags or pressure sensitive labels, stamped or printed with cable number shown on wiring diagram.

c. Wire labels: Sleeve-type, heat shrinkable, flame retardant Raychem TMS product line, Type XLPE or equal and conforming to UL 224. Wire identification same as corresponding terminal block identification unless otherwise shown.

21. Control Wiring: All internal control wiring in each control panel factory installed in accordance with the following requirements:

a. Wire: Copper conductor minimum 14 AWG, insulation rated 600V, or as shown Type SIS or equal. Use flexible Class C or high-strand insulated copper wire for wiring across hinged joints.

b. Use one continuous length of wire from terminal to terminal without splice or tap.

c. Design and install control wiring so that trouble in one circuit can not be communicated to control wiring of another circuit.

d. Make connections only at terminals of device, on terminal blocks or on control buses. Make wiring connections using insulated-shank ring-type terminals.

e. Terminal blocks: With washerhead screw-type terminals, circuit-marking strips for indicating control wire number, phenolic laminated dust cover and 10 percent minimum spare terminal points.

f. For each wire, use corresponding identification on terminal block marking strips and identify internal wiring at each termination, with same number as that shown on wiring diagram, using plastic sleeve.

g. External wiring:

- 1) External control wiring to enter from top or bottom as required.

- 2) Allow space to route and terminate external single-conductor or multiple-conductor control cable.

B. Trackside Heater Control Panels:

1. Equipped with the following components mounted in a fiberglass enclosure.
  - a. 2 - Molded case switches.
  - b. 2 - Magnetic current relays (IA & IB).
  - c. 1 - Auxiliary time delay relay (Contactor Closing Relay CX) with 125V DC coil, 5 to 50 seconds adjustable delay on pick-up.
  - d. 1 - Control power transformer.
  - e. 1 - 480V AC fuseblock with two fuses.
  - f. 1 - 120V AC fuseblock with one fuse.
  - g. 1 - DC contactor (with bridge rectifier & dropping resistance).
  - h. 2 - 1000V DC fuses and fuseblocks.
  - i. 1 - 14-point terminal board for control wiring.
  - j. 1 - 3-stud terminal board for nominal 750V DC heater power.
  - k. 1 - Space heater.
2. Insulated barrier around DC contactor for isolation from other equipment.
3. Indicating lights, lamp test switch, and selector switch (ON-OFF-REMOTE) mounted on sides of enclosure, as shown on drawings, so as to maintain NEMA 3R rating of the enclosure.
4. Two limit switches (door interlock) provided so as to de-energize DC contactor upon removal of front panel.
5. All internal wiring of components up to terminal boards completed and tested at the factory.
6. All control wiring within trackside heater control panels shall leave a minimum voltage rating of not less than 1000V.
7. Nameplates:
  - a. Each lamp test and selector switch provided with ½-inch high nameplate inscribed with lettering ¼-inch high as shown below and applicable.
    - 1) LAMP TEST SWITCH
    - 2) SELECTOR SWITCH
  - b. Each panel provided with 1-½-inch high nameplate inscribed with 1-inch high lettering identifying the trackside heater control panel and associated number as shown below. A typical example of engraving is as follows:

- 1) TRACKSIDE HEATER CONTROL PANEL
- 2) HC-J02-62-1\*

SPECIFIER'S NOTE (\*): NUMBER SHOWN IS AN EXAMPLE. SPECIFIER SHALL COORDINATE AND PROVIDE CORRECT DESIGNATION.

8. Provide one spare fuse of each type and rating for each panel.

C. Zone Heater Control Panels provided in tie breaker stations and traction power substations.

1. Equipped with the following components mounted in an enclosure: (Quantities may be adjusted to suit site conditions and contact rail heating plans/zones.)

- a. 4 - Auxiliary relays with 125V DC coils (1X1-A, 1X1-B, 1X2-A, & 1X2-B).
- b. 2 - 24V DC auxiliary relays for Supervisory Control (HCR-1,HCR-2).
- c. 4 - 125V DC fuses and fuseblocks on mounting tracks.
- d. 1 - 24-Point terminal board for power and control wiring.
- e. 1 - 18-Point terminal board for future remote control and indication.

2. Following components mounted on the door: (Quantities may be adjusted to suit site conditions and contact rail heating plans/zones.)

- a. 4 - Indicating lights (push to test).
- b. 2 - Selector switches (ON-OFF), two pole.
- c. 1 - Selector switch (LOCAL/REMOTE), two pole.

3. All internal wiring of components up to terminal boards completed and tested at the factory.

4. Nameplates:

- a. Each indicating light and selector switch provided with ½-inch high nameplate inscribed with ¼-inch high lettering identifying the track number as per contact rail heating plans developed by the contractor. A typical example of engraving is as follows:

TRACK #1-A

- b. Each panel provided with 1-½-inch high nameplate inscribed with 1-inch high lettering identifying the zone heater control panel and associated number as per traction power zones. A typical example of engraving is as follows:

ZONE HEATER CONTROL PANEL

E-J02-60\*

SPECIFIER'S NOTE (\*): NUMBER SHOWN IS AN EXAMPLE. SPECIFIER SHALL COORDINATE AND PROVIDE CORRECT DESIGNATION.

5. Provide one spare fuse of each type and rating for each panel.

D. Fusebox Disconnect:

1. Weatherproof outdoor construction box equipped with cover which removes fuse and disconnects 750V DC circuit when cover is removed. Rated for 100A at 1000V DC.
2. Fuse:
  - a. Type - Current limiting blade type.
  - b. Voltage rating - 1000V DC.
  - c. Current rating - 70 A.
  - d. Interrupting capacity - Capable of interrupting up to 80,000A fault current for bolted fault with system time constant of 40 milliseconds.
  - e. Gould Shawmut Form 101 AMP-TRAP Cat A150C - Type 4 or approved equal.
3. Box: "Shoe Box" shaped enclosure. Gasketed cover with insulated handle and weatherproof hold down devices, with the following additional requirements:
  - a. Removable cover designed to hold fuse and provide connections to the fixed terminals inside the box, minimum pull-out force of 6 pounds.
  - b. Fixed terminals provided in box with spring reinforced clips for making connection to fuse, and bolted connection for cable lugs.
  - c. Material: ½"-thick NEMA grade GPO-3 fiberglass laminate, flame and track resistant material.
  - d. Drain hole: ½"-diameter with nylon screen in bottom.
  - e. Mounting: For side mounting to galvanized steel plate with studs or bolts as furnished with the box.
  - f. Cable entry at one end for 1-#4 AWG, 2000V, single - conductor cable and at other end for 2-#8 AWG, 2000V single-conductor cables. Seal fittings with compression gasket to suit as approved.
  - g. Ultra-violet protection: Fiberglass material containing ultra-violet inhibitor or coated with polyurethane paint 1.5 mils minimum dry film thickness on both inside and outside surfaces.
  - h. Cover gasket: Oil-resistant neoprene with oil-resistant adhesive to cover.
  - i. Danger labels: Both sides of box shall be labeled with prominent and permanent labels with red background and white letters stating:

DANGER-750 VOLTS - DO NOT OPERATE UNDER LOAD:
4. Provide one spare fuse for each fusebox disconnect.
5. Fusebox disconnect shall be manufactured by Mining & Urban Transit System Corporation or approved equal.

E. Master Heater Control Panel:

1. Yard Substation
    - a. Equipped with the following components mounted in an enclosure: (QUANTITIES TO BE SPECIFIED BY SPECIFIER).
      - 1) Auxiliary time delay relays (T) with 125V DC coil adjustable from 5 to 50 seconds, AGASTAT 7012 PD or Equal. Provide one relay per traction power zone.
      - 2) Auxiliary relays with 125V DC coil (IX1). Provide one relay per traction power zone.
      - 3) One auxiliary relay with 125V DC coil (RX)
      - 4) 125V DC fuses and fuseblocks on a mounting track.
      - 5) 42-Point terminal board for power and control wiring.
      - 6) 42-Point terminal board for future use.
    - b. Following components mounted on the door: (QUANTITIES TO BE SPECIFIED BY SPECIFIER).
      - 1) Indicating lights. One light per traction power zone.
      - 2) Selector switches (ON-OFF), single pole. One selector switch per traction power zone.
      - 3) Selector switch (LOCAL-REMOTE), single pole.
  2. All internal wiring of components up to terminal board shall be completed and tested at the factory.
  3. Nameplates:
    - a. Each indicating light and selector switch provided with ½-inch high nameplate inscribed with ¼-inch high lettering identifying the zone number as per contact rail heating plans developed by contractor. A typical example of engraving is as follows:
 

ZONE #1
    - b. Each panel provided with 1-½-inch high nameplate inscribed with 1-inch high lettering identifying the master heater control panel and associated number as per contact rail heating plans developed by contractor. A typical example of engraving is as follows:
 

MASTER HEATER CONTROL PANEL  
E-GY-B98-30\*
- SPECIFIER'S NOTE (\*): NUMBER SHOWN IS AN EXAMPLE. SPECIFIER SHALL COORDINATE AND PROVIDE CORRECT DESIGNATION.
4. Provide one spare fuse of each type and rating for each panel.

F. Remote Heater Controller (Yard Control Tower):

1. Equipped with the following components mounted in a metallic, NEMA 12, heavy duty enclosure as shown:
  - 1-Selector switch (ON-OFF)
  - 2-Indicating lights, lens color as shown on drawings.
2. Nameplates:
  - a. Each controller provided with 1½-inch high nameplate inscribed with 1-inch high lettering stating:

REMOTE HEATER CONTROLLER

**2.07 SOURCE QUALITY CONTROL**

- A. Trackside heater control panel, zone heater control panel, fusebox disconnects, master heater control panel and remote heater controller:
  1. Verify that wiring is in accordance with approved wiring diagrams.
  2. Check wiring for accuracy, open circuits, short circuits, ground connections and insulation integrity by means of high-potential, continuity and operational tests.
  3. Subject wiring to high-potential test of 2,500 volts, 60 Hertz to ground for one minute.

**PART 3 EXECUTION**

**3.01 INSTALLATION**

- A. Install trackside heater control panels, zone heater control panels, fusebox disconnects, master heater control panel and remote heater controller where shown by contractor and approved by the Engineer.
- B. Complete the power wiring circuits and the control power circuits as shown on drawings and in accordance with approved shop drawings.
- C. Contact Rail Preparation:
  1. Steel or Aluminum-Clad (Composite) Contact Rail: Clean the side of contact rail where heater cable is to be installed in accordance with manufacturers instructions. Exercise extreme care when cleaning the aluminum extrusion (composite rail) to prevent surface gouging.
  2. Install heater cable elements within four (4) hours of rail surface preparation at each individual job location.
  3. Obtain written approval from Engineer when motorized tools are to be used to accomplish wire brushing of rail surface.
- D. Installation of Heater Cable:
  1. Heater circuit lengths shown on contract drawings are diagrammatic. Contractor may make field survey and measurements for actual lengths in order to avoid wastage.
  2. Prepare contact rail surfaces prior to heater cable installation.

3. Where heater cable is installed on field side, terminate the heater cable as close as possible to either the end-approach or the traction power cable connections to the third rail. Do not install heater cable over end-approach, power cable connections or expansion joint.
4. Where heater cable is installed on railside, terminate the heater cable as close as possible to the end-approach of the contact rail. The cables for connections and power termination on either side shall be routed to the field side for continuation of circuits and shall be secured safely without any slack to avoid their interference with rail or equipment movement on the rail side.
5. Adhere to the installation instructions noted in these Specifications, as well as those contained on the Plans and in the heater cable manufacturer's installation instructions. Bring any differences to the immediate attention of the Engineer for clarification.
6. For aluminum clad contact rail, and for steel contact rail, install heater cable on side of contact rail. Installed location as indicated on drawings is on the side of the web of the rail, near the foot of the rail. However, an alternate (and preferred) location for the heater cable is on the side of the rail web as close as possible to the underside of the rail head, to maximize transfer of heat from the heater cable into the rail head (provided that such an installation maintains contact between the heater cable and the rail during typical temperature cycles and extremes.) Regardless of location, make sure that complete heater assembly does not interfere with operation of collector shoe or contact rail protection covers, assemblies, etc.
7. In general, installation of heater cable involves utilization of a fiberglass channel and clip system to provide intimate contact between the element itself and the rail surface. Mechanical strain relief clamps are also used when going around rail splice bars and at element ends.
8. Each particular contact rail site scheduled for heater installation work, will require discrete heater cable lengths. Provide all required heater cable lengths.
9. Provide special abrasion pads for protection of the heater cable at any protrusion or burrs on rail and splice plates. Do not install fiberglass channel on such locations.
10. Route power lead wires away from the head of the rail and secure to prevent damage by passing trains.

### **3.02 IDENTIFICATION**

- A. Identify field assembled heaters at the power termination and with Circuit number description using a heat shrinkable permanent ink labeling system.

### **3.03 FIELD QUALITY CONTROL**

- A. Furnish equipment required to perform tests. Prior to insulation resistance tests, isolate the heater circuit. Conduct tests in the presence of the Engineer.
- B. Perform heating system testing (which includes all of the control panels and the fusebox disconnects) in each subsystem to complete the testing of the total installed system specified in Article 1.05.
- C. Submit test procedure for approval and perform approved tests. Do not perform tests without approved test procedure. Schedule all tests through the WMATA Engineer. Tests include but not limited to the following:

1. Visually inspect heater for continuous coverage by the containment channel, sufficient attachment clips, and abrasion pads at all welds, brackets, and obstructions.
2. Measure insulation resistance using 1000V DC megger between heater conductors and contact rail. Must be greater than 1000 megohms - ft.
3. Perform operation tests.

D. Field Testing and Inspection:

1. General Requirements:

- a. Conduct field testing and inspection of each sub-system to ensure proper operation of equipment provided.

2. Field Inspection:

- a. Prior to field testing, check equipment installation, including verification of the following:
  - 1) Integrity of insulation.
  - 2) Integrity of #4 AWG cable exothermic connection to contact rail and running rail.
  - 3) Tightness of connections for control, power and ground wiring.
  - 4) Adequate support to provide proper contact between heater cable and contact rail.
  - 5) Adjustment of pick-up current of each magnetic current relay.
  - 6) Adjustment of time-delay pick-up time for each time-delay relay.
  - 7) Proper operation of door safety interlocking in track-side heater control panel.

3. Field Testing:

- a. Furnish equipment required to perform tests and provide evidence of calibration.
- b. Provide services of manufacturer's engineering representative and supporting field crew.
- c. Prior to insulation resistance tests, disconnect instruments and equipment which might be damaged during such tests. Conduct tests in presence of the WMATA Engineer.
- d. Submit test procedure for approval and perform approved tests. Do not perform tests without approved test procedure. Schedule all test through the WMATA Engineer.
- e. Perform insulation resistance test of 60-second duration on all equipment in accordance with the following requirements:
  - 1) Test Voltage:

Voltage Rating

Test Voltage

150-750V

1,000V, DC

2) Insulation resistance: kV rating plus one megohm but not less than minimum value recommended by manufacturer.

f. Continuity Check

g. Perform functional tests on control, interlocking, and supervisory indication circuits, including verification of interconnections between equipment and interface points.

h. Energize and test each heater circuit for proper operation.

D. Field Testing Personnel:

1. Provide services of qualified manufacturer's engineering representatives to perform specified field testing program.
2. When more than one representative is involved, the Contractor is responsible for coordination of testing effort.
3. Provide engineers, technicians and journeymen as necessary to set up and implement testing.

E. Submit certified test reports within seven days after field tests.

**END OF SECTION**

## SECTION 16320

### HIGH-VOLTAGE SWITCHGEAR

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing 13.8 kV and 34.5 kV metal-clad switchgear.
- B. Related Work Specified Elsewhere:
  - 1. Raceways, boxes, and cabinets: Section 16130.
  - 2. Wire, cable and busways: Section 16120.
  - 3. Wire connection accessories: Section 16125.
  - 4. Grounding and bonding: Section 16060.
  - 5. Unit substations: Section 16360.
- C. Design Criteria:
  - 1. Floor loading: Switchgear compatible with floor design-loading of 250 pounds per square foot.
  - 2. Switchgear suitable for anchoring to a concrete floor steel-trowel finished to tolerance level of 1/8 inch in 10'-0".

##### 1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is regularly engaged in production of similar switchgear.
- B. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. NEMA: SG4.
  - 4. ANSI: C37.06, Z55.1.
  - 5. ANSI/IEEE: C37.09, C37.20.2, C37.90, C57.13, C62.11.
  - 6. AHA: IS1.
- C. Factory Testing: Submit design tests or certified copies of test reports for identical units performed for each type and rating of circuit breaker as assembled in its complete switchgear unit including bus compartment.
  - 1. Circuit-breaker tests: In accordance with the requirements of ANSI/IEEE C37.09 including the following:
    - a. Design tests:
      - 1) Rated maximum voltage.
      - 2) Rated voltage-range factor.
      - 3) Rated frequency.
      - 4) Rated continuous-current test.
      - 5) Short-circuit rating.
      - 6) Rated standard operating duty.
      - 7) Rated permissible tripping delay.
      - 8) Rated interrupting time.
      - 9) Rated reclosing time.
      - 10) Rated dielectric strength.
      - 11) Rated control voltage.
      - 12) Load-current switching.
      - 13) Mechanical life.

- b. Production tests: Applicable tests in accordance with ANSI/IEEE C37.09.
  - 2. Switchgear assembly tests: In accordance with ANSI/IEEE C37.20.2 and including the following:
    - a. Design tests for metal-clad switchgear:
      - 1) Dielectric tests.
      - 2) Rated continuous-current tests.
      - 3) Short-time current-withstand test.
      - 4) Momentary-current test.
      - 5) Mechanical endurance tests.
      - 6) Flame-resistance and tracking-resistance tests for sheet, molded or cast insulating materials for support of primary buses and connections.
      - 7) Flame-resistance test for applied insulation metal-clad switchgear.
      - 8) Paint qualification test.
    - b. Production tests for metal-clad switchgear: Applicable tests in accordance with ANSI/IEEE C37.20.2.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings: In accordance with Section 16360.
  - 2. Certification:
    - a. Certify switchgear complies with 250 pounds per square foot floor-load design.
    - b. Certified test reports for specified factory testing.
  - 3. Documentation:
    - a. Short-circuit calculations and coordination study: In accordance with Section 16360.
    - b. Field-testing plan: In accordance with Section 16360.
  - 4. Operations and Maintenance Manuals: In accordance with Section 16360.

### 1.04 PRODUCT DELIVERY, STORAGE, AND HANDLING:

- A. Ship each unit securely packaged, braced and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Temporary Bracing:
  - 1. Where necessary, brace switchgear for hoisting, lowering and skidding into position. Label temporary internal bracing of switchgear:
    - a. TEMPORARY-REMOVE BEFORE OPERATION
- C. Protection Against Concealed Damage:
  - 1. Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact-record chart with manufacturer's instructions for disposition of damaged material.
- D. Assembly for Shipment:
  - 1. Design enclosures to permit lifting by jacks or slings and moving horizontally on rollers or skidding in any direction.
  - 2. Maximum dimensions of shipping sections to be coordinated with the dimensions of access hatches, corridors and doors to ensure shipping dimensions will allow movement of switchgear through structure without damage to equipment or structure or undue difficulty.

3. For shipping split, coil interconnecting wiring on one side of the shipping split with matching terminal block on other side of split. Identify wiring and terminal-block points for reconnection.
  4. Draw-out relays mounted in their proper cases with moving parts properly secured and packed for shipment.
  5. Removable circuit-breaker elements packaged separately.
- E. Store switchgear in secure and dry storage facility.

#### **1.05 OPERATION AND MAINTENANCE TRAINING:**

- A. In accordance with the General Requirements and with Section 16360.

### **PART 2 - PRODUCTS**

#### **2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements for 13.8 kV and 34.5 kV Metal-Clad Switchgear:
1. ANSI/IEEE C37.20.2, for indoor use.
  2. Common ratings of switchgear:
    - a. Rated frequency: 60 Hertz.
    - b. Rated continuous current: 1,200 amperes.
    - c. Rated momentary current: Corresponding to circuit-breaker momentary ratings.
  3. Insulation structure:
    - a. Material not to support combustion, produce toxic gases, absorb moisture or track.
    - b. When subjected to electric arc, emission of conducting materials from insulating structure limited so as not to interfere with performance of circuit breaker.
  4. Primary circuit breaker:
    - a. NEMA SG4 and ANSI C37.06, for indoor use.
    - b. Type: Three-pole, single-throw, drawout-type.
    - c. Electrically powered, spring-charged, stored-energy operating mechanism, with the following additional requirements:
      - 1) Voltage requirements:
        - a) Charging of stored-energy operating mechanism: 125 volts dc.
        - b) Closing by means of closing release coil capable of operation from 100-140 volts dc.
        - c) Tripping by means of shunt trip coil capable of operation from 70-140 volts dc.
      - 2) Mechanically and electrically trip-free.
      - 3) Unless otherwise specified, closing release coil energized by means of push-button.
      - 4) Shunt trip coil energized manually by push-button or automatically by relay.
      - 5) Equipped with mechanical devices on front of breaker to actuate closing and tripping operations in case of failure of control power.
      - 6) Compressed-spring, stored-energy operating mechanism, with sufficient energy storage for closing/opening operation at rated short-circuit current or at related capabilities.
      - 7) Stored-energy mechanism automatically charged within 10 seconds following each closing of circuit breaker.

- 8) Stored-energy mechanism suitable for manual charging by means of removable handle in case of failure of control power.
  - 9) White indicator light on control panel of circuit-breaker unit or mechanical indicator on front of breaker to indicate that stored-energy closing mechanism is charged.
- d. Racking mechanism:
- 1) Horizontal-drawout breaker: Manually-operated mechanism designed to permit racking of breaker with door closed by inserting crank through opening of limited size in door.
  - 2) Vertical-lift breaker:
    - a) Racking accomplished electrically using control switch inserted into receptacle mounted on breaker door to permit racking with door closed.
    - b) White and amber indicator lights provided at raise/lower control switch.
    - c) Manual racking mechanism for emergency use.
  - 3) Racking-mechanism gear ratio: To permit one man to raise or lower breaker or rack it in and out manually in four minutes maximum.
  - 4) When breaker element is in fully-lowered or racked-out position, circuit breaker, complete with its operating mechanism, capable of being withdrawn from housing and moved on wheels integral with mechanism. Separate handling device for moving circuit breaker, other than transfer truck or fifth-wheel steering bar, is prohibited.
  - 5) Positive stops for preventing overtravel and guides for proper alignment of breaker.
- e. Grounding:
- 1) When breaker is in connected position, case and frame grounded by positive contact with ground bus.
  - 2) Breaker ground shoe designed to connect breaker frame to ground bus prior to engagement of primary-breaker terminals.
  - 3) Ground connection capable of carrying fault current equal to rated short-circuit current and related necessary capabilities.
- f. Interlocks: Provide suitable interlocks to perform the following functions:
- 1) Automatic discharge of stored-energy mechanism of the circuit breaker prior to its withdrawal from the unit.
  - 2) Prevent raising and lowering or racking in and out unless circuit breaker is in OPEN position.
  - 3) Prevent removal of vertical-lift breaker until it is entirely lowered.
  - 4) Prevent either electrical or manual operation of the breaker unless it is in the operating or test position.
  - 5) Automatically trip associated secondary main breaker when the primary breaker trips. This interlocking scheme does not prevent primary breaker from closing when associated secondary main breaker is open.
- g. Primary connection: Connection between the removable and stationary unit made by male-and-female contacts, with the following additional requirements:
- 1) Silver-plated, high-pressure contacts.
  - 2) Automatic shutter to cover contact orifice when breaker is withdrawn and to uncover orifice when breaker is returned to connected position.
  - 3) Automatic shutters constructed to withstand force of racking mechanism in case shutters fail to open when breaker is racked into position.

- h. Secondary connection: Control and interlocking-circuit connections between stationary and removable elements of switchgear made using device consisting of recessed stationary receptacle and set of self-aligning multiple-contact plugs on removable elements with sufficient number of contacts to accommodate control and interlock circuits, including spares, without resorting to auxiliary relays.
  - i. Non-resettable mechanical-operation counter registering one count for each circuit-breaker closing operation.
  - j. Mechanical position indicator, showing breaker as OPEN or CLOSED.
  - k. Auxiliary contacts for indicating CLOSED and OPEN position of the circuit breaker at remote location, with the following additional requirements:
    - 1) Dry contacts, minimum of one NC and one NO, rated 250 milliamperes at 250 volts or three amperes at 24 volts dc, wired to accessible terminal block.
    - 2) Contact resistance not to exceed 0.10 ohm in closed state when operating in circuit with open-circuit voltage of three volts dc and closed-circuit current of 10 milliamperes.
    - 3) Contact bounce not to exceed five milliseconds.
5. Current transformers:
- a. ANSI/IEEE C57.13, molded rubber or epoxy construction, wound-type transformer, complying with ANSI/IEEE requirements for relaying accuracy classification under burden imposed by devices specified. Minimum relay current transformer accuracy class is C-200. Mounted in a compartment isolated from the control panel. When approved by the Engineer, fully insulated, window-type current transformer may be used.
  - b. Quantity: Three.
  - c. Current ratio: As shown and determined by approved coordination study.
  - d. Insulation class:
    - 1) 13.8 kV with basic-impulse insulation level of 95 kV full-wave.
    - 2) 34.5 kV with basic-impulse insulation level of 150 kV full-wave.
  - e. Capable of withstanding thermal and magnetic stresses from flow of current equal to the momentary and interrupting rating of the circuit breaker.
  - f. Maximum allowable-temperature rise under continuous full load above an average ambient temperature of 55C:
    - 1) By winding resistance: 30C.
    - 2) By hottest spot in winding: 40C.
  - g. Transformer secondary neutral and frame individually grounded by copper wire to switchgear ground bus. Keep each ground connection run as short as possible. Avoid grouping such connections with control or other wiring.
6. Potential transformers:
- a. ANSI/IEEE C57.13, molded rubber or epoxy, one of the following configurations:
    - 1) Current-limiting primary fuses mounted on drawout carriage.
    - 2) Drawout transformer with integrally mounted fuses.
  - b. Quantity: One.
  - c. Connection:
    - 1) For 13.8 kV source: Phase-to-ground.
    - 2) For 34.5 kV source: Phase-to-phase.
  - d. Voltage ratio:
    - 1) For 13.8 kV source: 14.4 kV to 120 volts.
    - 2) For 34.5 kV source: 34.5 kV to 115 volts.
  - e. Insulation class:
    - 1) For 13.8 kV source: 13.8 kV with basic-impulse insulation level of 95 kV full-wave.
    - 2) For 34.5 kV source: 34.5 kV with basic-impulse insulation level of 150 kV full-wave.

- f. Maximum allowable temperature rise under continuous full load above average ambient temperature of 55C:
    - 1) By winding resistance: 30C.
    - 2) By hottest spot in winding: 40C.
  - g. Install in switchgear so as to allow access from the floor without use of ladder.
7. Protective relays:
- a. General requirements:
    - 1) Semi-flush mounted, adjustable drawout relays each with test switches.
    - 2) Rustproof-metal rectangular cases finished in dull black.
    - 3) With targets, hand reset for targets and seal-in units.
    - 4) Contact and adjusting device readily visible, accessible and adjustable from front of relay.
    - 5) Designed, constructed and tested in accordance with applicable requirements of ANSI/IEEE C37.90.
  - b. Overcurrent relays:
    - 1) Three 50/51 phase-time and instantaneous-overcurrent relays and one 50N/51N residual ground-time and instantaneous-overcurrent relay for 34.5 kV service or three 50/51 phase-time and instantaneous-overcurrent relay and one 50N residual-ground instantaneous-overcurrent relay for 13.8 kV service, as appropriate.
    - 2) Exact characteristics and settings determined by manufacturer to provide necessary protection and coordination.
    - 3) Having very inverse time characteristics where protection and coordination permit.
    - 4) Relays set as low as practicable, time-dial setting and current tap, to provide fault protection and coordination with overcurrent device on associated secondary main breaker.
    - 5) Relays operating associated lockout relay as follows:
      - a) 13.8 kV switchgear: Relays 50/51 and 50N.
      - b) 34.5 kV switchgear: Relays 50/51 and 50N/51N.
  - c. Voltage relay:
    - 1) For 13.8 kV source: One undervoltage/overvoltage (27/59), single-phase, time-voltage relay.
    - 2) For 34.5 kV source: One undervoltage (27), single-phase, time-voltage relay.
  - d. One rotary, hand-reset, 125-volt dc lockout relay, equipped with green light for indicating reset position.
  - e. Auxiliary relays: Provided where required, General Electric Company Type HGA or HFA or equal, mounted inside instrument compartment.
  - f. Relay test equipment: One test set suitable for testing all solid-state relays furnished.
8. Circuit-breaker control switch:
- a. Heavy-duty, rotary, with red pistol-grip operating handle, switch position marked TRIP/NORMAL/CLOSE, with spring return to normal and indicator lights as follows:
    - 1) Red light: Circuit breaker is closed.
    - 2) Green light: Circuit breaker is open.
    - 3) Amber light: Circuit breaker is automatically tripped.
9. Test switches:
- a. Provided between instrument transformers and the protection relays as follows:
    - 1) One test switch on line side of overcurrent relays and lockout relay.
    - 2) One test switch on line side of undervoltage/overvoltage relay.
10. Control panel:

- a. For relays, meters and control equipment, hinged panel of formed steel, with rolled edges and conveniently located handle for opening.
11. Line-voltage indicators:
- a. Three neon glow-tube, capacitance-coupled, high-voltage indicators, Airco Type RS or equal.
12. Surge arrester:
- a. ANSI/IEEE C62.11, intermediate class with metal-oxide varistor construction, one per phase, mounted on line side of circuit breaker with the following requirements:
    - 1) For 13.8 kV source: Hubbell/The Ohio Brass Company Type PVI, Catalog Number 218613, or equal, with ratings as follows:
      - a) Duty-cycle voltage kV, rms: 15.
      - b) Maximum continuous operating voltage, kV, rms: 12.7.
      - c) Insulation-withstand impulse test voltage, kV: 110.
    - 2) For 34.5 kV source: Hubbell/The Ohio Brass Company Type PVR, Catalog Number 218629; General Electric Company Tranquell XE, Catalog Number 9L12PGB036; or equal; with ratings as follows:
      - a) Duty-cycle voltage, kV, rms: 36.
      - b) Maximum continuous operating voltage, kV, rms: 29.
      - c) Insulation-withstand impulse test voltage, kV: 200.
13. Indicator lights:
- a. LED
14. Space heaters:
- a. Each unit of switchgear provided with 120-volt, single-phase, 60-Hertz heating element to facilitate drying and prevent condensation.
  - b. Heaters enclosed in grille guard with no sharp edges and located so that they are accessible for replacement without requiring de-energization of switchgear bus. Heaters controlled by thermostat adjustable from 40F to 80F. Panel ammeter, approximately 2-1/2 inches square, marked to indicate heater load. Thermostat set in accordance with manufacturer's recommendations.
  - c. Power and control circuits to heaters and thermostat connected and protected up to devices and to incoming junction box with 1/2-inch minimum size conduit. Heater-power junction box sized four inches square by two inches minimum and located at top of switchgear for top entry of minimum 3/4-inch conduit.
15. Instrument and control wiring:
- a. Instrument and control wiring including electrical interlocks and intercompartment wiring factory-installed in accordance with the following requirements:
    - 1) Wire:
      - a) Copper conductor minimum 14AWG, insulation rated 600 volts, Type SIS or equal. Use flexible Class C or higher stranded, insulated copper wire for wiring across hinged joints.
    - 2) Use one continuous length of wire from terminal to terminal without splice or tap.
    - 3) Install and connect removable-element control wiring in accordance with manufacturer's standards for circuit-breaker wiring.
    - 4) Design and install control wiring so that trouble in one main circuit cannot be communicated to control wiring of another main circuit.
    - 5) Make connections only at terminals of device, on terminal blocks or on control buses. Make wiring connections using insulated-shank ring-type terminals.
    - 6) Terminate interconnecting wiring between cubicles and compartments on terminal blocks before wiring to components.

- 7) Terminal blocks: With washerhead screw-type terminals, circuit-marking strips for indicating control-wire number, phenolic laminated dust cover and 10-percent minimum spare terminal points.
  - 8) For each wire, use corresponding identification on terminal-block marking strips and identify internal wiring at each termination, with same number as that shown on wiring diagram, using plastic sleeve.
  - 9) External wiring:
    - a) External control wiring to enter from bottom or top.
    - b) Allow space to route and terminate external single-conductor or multiple-conductor control cable.
    - c) Top entrances provided with removable coverplates for field-drilling of conduit and cable entrance holes.
  - 10) Tests:
    - a) Check wiring for accuracy, open circuits, short-circuits, ground connections and insulation integrity by means of high-potential, continuity and operational tests.
    - b) Subject wiring to high-potential test of 1,500 volts to ground for one minute.
    - c) Verify that wiring is in accordance with manufacturer's wiring diagrams. Check complete wiring, including interconnections at shipping breaks.
16. Enclosure:
- a. Dead-front, free-standing, indoor metal enclosure designed for lineup with 13.8 kV to 480Y/277-volt transformer or with 34.5 kV to 480Y/277-volt transformer, as applicable.
  - b. Steel structure with framework of welded or bolted structural steel, free from distortion and welding strain and sufficiently rigid to support equipment under normal and short-circuit conditions.
  - c. Switchgear cubicles and circuit-breaker compartment equipped as follows:
    - 1) 13.8 kV enclosure:
      - a) Front: Hinged door.
      - b) Rear: Bolted cover with alignment pins or hinged door with padlock provisions.
    - 2) 34.5 kV enclosure:
      - a) Front: Breaker-drawout door or hinged door.
      - b) Rear: Bolted cover or hinged door with padlock provisions.
    - 3) Bolted cover furnished with alignment studs and keyhole slots for positioning prior to bolting.
    - 4) Hinged front door in accordance with the following:
      - a) Handle and three-point latch to hold door securely closed.
      - b) Doorstop to hold door open.
      - c) Structural reinforcing provided as necessary to prevent sagging of door.
      - d) Circuit-breaker compartment door designed not to hinder movement of breaker in and out of compartment when door is open and doorstop set.
    - 5) Circuit breaker cubicles to provide for interchangeability of removable circuit-breaker elements.
  - d. Transition compartment sized as necessary, with front and rear bolted covers to line up and coordinate with transformer.
  - e. Finish:
    - 1) Metallic surfaces degreased, primed and finished light-gray enamel, Color No. 61, ANSI Z55.1 in accordance with reference standard; two mils minimum dry-film thickness.

17. Nameplates:
- a. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless-steel rivets or screws. Vertical Gothic lettering using a round or square cutter. V-shaped groove is prohibited.
  - b. Provide nameplate on each switchgear showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable in accordance with reference standard.
  - c. Provide additional functional nameplates for each component.
    - 1) Each switchgear labeled with nameplate 1-1/2 inches high, inscribed in letters one-inch high: 13.8 kV METAL-CLAD SWITCHGEAR or 34.5 kV METAL-CLAD SWITCHGEAR, as appropriate.
    - 2) Each switchgear compartment labeled with nameplate one-inch high, inscribed in letters 1/2-inch high: INCOMING LINE PRIMARY BREAKER or AUXILIARY COMPARTMENT, as appropriate.
    - 3) In addition to other information normally displayed on equipment, provide one-inch nameplate showing in letters 1/2-inch high switch positions, meaning of indicator lamp and other pertinent information.
18. Major components to be products of the same manufacturer.
19. Switchgear accessories:
- a. One set of the following accessories for each substation as applicable:
    - 1) One breaker test cabinet with provision for electrical operation of circuit breaker with control switch and provision for other accessories as necessary.
    - 2) One transfer truck or fifth-wheel steering bar.
    - 3) Crank for manually racking circuit breaker in switchgear cubicle.
    - 4) One circuit-breaker maintenance lever.
    - 5) One spare set of each type of high-voltage fuse.
    - 6) One complete set of relay test plugs and relay test switch.
    - 7) One set of special tools necessary for erection, operation and maintenance of switchgear including ones recommended by relay manufacturer including breaker secondary or control disconnect coupler.
    - 8) Pegboard: Hardboard, AHA IS1, tempered, S1S, 1/4-inch nominal thickness, perforated, sized to accommodate all products specified in paragraphs 2.1 A.19.a. through 2.1 A.19.g. Framed with one-inch by one-inch hardwood. Frame and hardboard painted color selected by the Engineer. Include hardware for wall mounting and pegboard accessories suited to the products to be mounted. Provide nameplates as specified in paragraph 2.1 A.17. one-inch wide, with accessory names inscribed in 1/2-inch vertical letters.
    - 9) 13.8 kV grounding, phasing and testing device: Designed to be inserted into the switchgear unit in place of and in the same manner as the circuit breaker removable elements, to permit grounding either the bus or the line, or making external connections to either the bus or the line for phasing purposes, testing purposes or both, with the following additional requirements.
      - a) Momentary and three-second current carrying capacities equal to or greater than those of the circuit breaker removable elements.
      - b) BIL rating: 95 kV.
      - c) Include a power-operated circuit closing device (grounding switch) so arranged with a gang-operated three-pole selector disconnect switch to effectively ground either the

bus or the line when the device is inserted into the unit and closed, with the following additional requirements:

- (1) Closing by means of a portable remote control push-button station mounted on the end of a 50-foot, four-conductor, flexible (class C Stranding) cable providing common, close, trip and ground conductors.
  - (2) Power obtained through the secondary disconnecting device in the switchgear unit.
- d) Grounding device solidly connected to the switchgear ground bus in the operated or grounded position. Make provisions for padlocking in the grounded position.
  - e) No automatic tripping provided.
  - f) Provide suitable windows or transparent enclosure and barriers to permit visual observation of the position of all selector switch blades before the device is inserted into the stationary housing.
  - g) Fabricate steel panels from No. 11 USSG steel.
  - h) Connect the selector switch hinge end directly to the grounding switch.
  - i) Provide insulated covers for bolt heads used to attach insulated panel to the front of the device if not at ground potential.
  - j) External connections for testing made by insulated plug connectors for insertion in deep ports or wells accessible at the face of the device. One set of test ports connected directly to the bus. A second set of test ports connected directly to the line terminals.
    - (1) Mount ports on insulating material and provide closing shutters of like material.
    - (2) Provide separate closing shutter for each set of test ports; each shutter with provisions for padlocking in the closed position.
    - (3) Provide three test plugs or probes for each grounding, phasing and testing device for external connections.
  - k) The Contractor is responsible for obtaining approval of shop drawings and submittal including catalog data from electric utility company for the grounding, phasing and testing device prior to manufacturing. Make submittals to the Engineer for obtaining electric utility company approval.

B. 13.8 kV Metal-Clad Switchgear:

1. Rating for switchgear assembly:
  - a. Rated nominal voltage: 13.8 kV.
  - b. Rated maximum voltage: 15.0 kV.
  - c. Insulation level, 60 Hertz withstand: 36 kV, rms.
  - d. Insulation level, impulse withstand: 95 kV.
2. Potheads or terminators:
  - a. Provision for mounting one three-phase pothead or three single-phase terminators or cables terminated with stress cones furnished by 13.8 kV-source electric utility company (Potomac Electric Power Company) for incoming line connections and grounding.
  - b. Short flexible connector installed between each pothead or terminator connecting lug and rigid bus. Where cables are terminated without potheads or terminators, provide two-hole NEMA drilling for cable terminal

- lugs furnished by 13.8 kV-source electric utility company and furnish cable support.
- c. Pothead or terminator mounted in inverted position with incoming service cable at the top and connecting lugs below unless otherwise shown.
3. Primary circuit breaker:
- a. Type: Air-break or vacuum-break.
  - b. Rating on symmetrical basis:
    - 1) Nominal voltage class, kV, rms: 13.8.
    - 2) Nominal three-phase MVA Class: 750.
    - 3) Rated maximum voltage, kV, rms: 15.
    - 4) Rated withstand test voltage:
      - a) Low frequency, kV, rms: 36.
      - b) Impulse, kV: 95.
    - 5) Rated continuous current at 60 Hertz, amp, rms: 1,200.
    - 6) Rated interrupting-time cycles: Five maximum.
    - 7) Rated voltage-range factor (k): 1.30.
    - 8) Rated short-circuit current at rated maximum, kV, amp, rms: 28,000.
    - 9) Maximum symmetrical interrupting capability, amp, rms: 36,000.
    - 10) Closing and latching capability, amp, crest: 97,000.
4. Buses:
- a. General requirements:
    - 1) Copper bus bars of sufficient size to carry specified current without exceeding allowable-temperature rise stated in ANSI, NEMA and IEEE Standards.
    - 2) Capable of withstanding the mechanical stresses and heat from maximum short-circuit current.
    - 3) Bus connections bolted or welded. Contact surfaces of bolted connections silver-plated or tin-plated.
    - 4) Each joint having impedance not more than that of bus bar of equal length and clamped to maintain such impedance throughout life of equipment.
    - 5) Connection coordinated for proper mating with adjacent equipment terminals and enclosures. Provide flexible joint at transformer connection to avoid overstressing transformer or circuit-breaker insulators and coordinated with transformer-bushing locations. Flexible connection to be leaf or braid-type. Provide access plates for assembly and inspection of connections and joints.
  - b. Power buses: Three-phase, three-wire buses fully insulated with factory-installed, flame-retardant, nonhygroscopic, track-resistant insulation. Provide each bolted connection with minimum of four bolts equipped with palnut or equal and fully insulated.
  - c. Incoming-line bus device for connecting portable ground clamp:
    - 1) Connecting device consisting of copper bracket with 7/16-inch diameter bronze or copper rod positioned horizontally and parallel to rear of switchgear.
    - 2) Connecting device mounted near pothead on each incoming bus.
    - 3) Connecting device to provide three-inch length between end supports of rod and minimum 2-1/2 inch radial clearance around rod.
    - 4) Connecting device accessible from rear of switchgear following removal of bolted cover or opening of padlockable door.
    - 5) Six-inch insulating barriers to be provided on each side of connecting devices or stirrups and extending to rear of switchgear a minimum of six inches all around.

- 6) Size, thickness, insulating material and placement of insulating barriers designed to achieve adequate mechanical strength without compromising voltage withstand specified for switchgear.
  - 7) Design coordinated and approved by 13.8 kV-source electric utility company.
- d. Ground bus:
- 1) Copper bus, not less than two inches by 1/4-inch provided throughout length of switchgear section.
  - 2) In switchgear unit where power cables enter or leave switchgear at top as shown, copper ground bus not less than one inch by 1/8 inch extending from main ground bus to top of unit for grounding incoming cable-ground sheath or shielding tape by short connection to bus.
  - 3) Joints in ground bus made with two bolts minimum and overlap of four inches.
  - 4) Mechanical connector provided in each unit for field connection of 4/0 to 500 KCMIL ground cable to switchgear ground bus.
- e. Control bus:
- 1) 125-volt dc bus not less than 6AWG copper.
  - 2) One two-pole knife switch provided in switchgear cubicle for disconnecting control circuit.
  - 3) UL Class J or RK-5 fuses used for control and auxiliary-service protection.
  - 4) Closing circuit fused; tripping circuit unfused.
  - 5) White light mounted on control panel to indicate availability of dc control power.
5. Auxiliary cubicle:
- a. Indoor metal cubicle for installing metering transformers, design coordinated with 13.8 kV-source electric utility company.
  - b. Separate compartment for mounting two 15 kV current transformers furnished by 13.8 kV-source electric utility company, with the following additional requirements:
    - 1) Current transformer accessible through sealable hinged door. Bolted access plates prohibited.
    - 2) Connection between bus and current transformer of same size and current rating as that of main bus.
    - 3) Compartment sized and arranged so that current transformer can be readily removed or replaced after cubicle is installed as integral part of switchgear assembly.
  - c. Separate compartment for mounting two 14,400/120-volt potential transformers furnished by 13.8 kV-source electric utility company, with the following additional requirements:
    - 1) Equipped with sealable hinged door. Bolted access plates prohibited.
    - 2) Fuse clips one-inch long, mounted on 11-1/2 inch centers for accommodating fuse size 1-9/16 inch diameter ferrules and 12-7/8 inches long.
    - 3) Provide silver-plated contact designed to provide adequate contact pressure.
    - 4) Drawout carriage designed so that contacts are disconnected and visibly grounded before fuses become accessible for checking or replacement.
      - a) Sealable in closed and operating positions.
      - b) Equipped with high-voltage connectors and fuse clips.
    - 5) For grounding cases of transformers, one connection extended from ground bus to the potential-transformer compartment.

- 6) Compartment designed to provide access to potential transformers from the floor without use of ladder.
  - d. One 10-inch square by six-inch deep pull box for secondary connecting of electric utility company metering transformers, with the following additional requirements:
    - 1) Equipped with two 1-1/2 inch conduits, one to current-transformer compartment and one to potential-transformer compartment.
    - 2) Provision for installing one 1-1/2 inch conduit from pullbox to electric utility company metering panel.
- C. 34.5 kV Metal-Clad Switchgear:
- 1. Rating for switchgear assembly:
    - a. Rated nominal voltage: 34.5 kV.
    - b. Rated maximum voltage: 38.0 kV.
    - c. Insulation level, 60 Hertz, withstand: 80 kV, rms.
    - d. Insulation level, impulse withstand: 150 kV.
  - 2. Terminators:
    - a. Provision for mounting one double three-phase pothead or six single-phase terminators furnished by 34.5 kV-source electric utility company for incoming-loop line connections and grounding.
    - b. Short flexible connector installed between each pothead or terminator connecting lug and rigid bus.
    - c. Terminator mounted in inverted position with incoming-service cable at top and connecting lugs below unless otherwise shown.
  - 3. Primary circuit breaker:
    - a. Vacuum-break type.
    - b. Rating on symmetrical basis:
      - 1) Nominal voltage class, kV, rms: 34.5.
      - 2) Nominal three-phase MVA Class: 1,500.
      - 3) Rated maximum voltage, kV, rms: 38.
      - 4) Rated withstand test voltage:
        - a) Low frequency, kV, rms: 80.
        - b) Impulse, kV: 150.
      - 5) Rated continuous current at 60 Hertz, amp, rms: 1,200.
      - 6) Rated interrupting-time cycles: Five maximum.
      - 7) Rated voltage-range factor (k): 1.41.
      - 8) Rated short-circuit current at rated maximum, kV, amp, rms: 21,000.
      - 9) Maximum symmetrical interrupting capability, amp, rms: 35,000.
      - 10) Closing and latching capability, amp, crest: 95,000.
  - 4. Buses:
    - a. General requirements:
      - 1) Copper or aluminum bus bars of sufficient size to carry specified current without exceeding allowable temperature rise stated in ANSI, NEMA and IEEE Standards.
      - 2) Capable of withstanding mechanical stresses and heat from maximum short-circuit current.
      - 3) Bus connections bolted or welded.
      - 4) Contact surfaces of bolted connections silver-plated or tin-plated.
      - 5) Each joint having impedance not more than that of bus bar of equal length and clamped to maintain such impedance throughout life of equipment.
      - 6) Aluminum buses having torque requirements for bolted connections stamped on buses near connection point. Where such stamping is impracticable, use approved alternative methods of providing near

- connection durable and plainly visible statement of torque requirements.
- 7) Make copper-to-aluminum joints using connectors especially designed for the purpose.
  - 8) For each bolted connection of aluminum or aluminum-to-copper buses, provide belleville washer to maintain positive pressure on joint.
  - 9) Connection coordinated for proper mating with adjacent equipment terminals and enclosures. Provide flexible joint at transformer connection to avoid overstressing transformer or circuit-breaker insulators and coordinated with transformer-bushing locations. Flexible connections shall be leaf or braid-type. Provide access plates for assembly and inspection of connections and joints. Where aluminum bus is provided, make connections, between circuit breaker and power bus and between terminators and power bus by means of copper bus or connectors.
- b. Power buses: Three-phase, three-wire buses fully insulated with factory-installed, flame-retardant, nonhygroscopic, track-resistant insulation. Provide each bolted connection with minimum of four bolts equipped with palnut or equal and fully insulated.
- c. Incoming line bus device for connection of portable ground clamp:
- 1) Connecting device consisting of copper bracket with 7/16-inch diameter bronze or copper rod positioned horizontally and parallel to rear of switchgear.
  - 2) Connecting device mounted near pothead on each incoming bus.
  - 3) Connecting device to provide three-inch length between end supports of rod and minimum 2-1/2 inch radial clearance around rod.
  - 4) Connecting device accessible from rear of switchgear following removal of bolted cover or opening of padlockable door.
  - 5) Six-inch insulating barriers to be provided on each side of connecting devices or stirrups and extending to rear of switchgear a minimum of six inches all around.
  - 6) Size, thickness, insulating material and placement of insulating barriers designed to achieve adequate mechanical strength without compromising voltage withstand specified for switchgear.
  - 7) Design coordinated and approved by 34.5 kV-source electric utility company.
- d. Ground bus:
- 1) Copper bus, not less than two inches by 1/4 inch provided throughout the length of the switchgear section.
  - 2) In switchgear unit where power cables enter or leave switchgear at top as shown, bus not less than one-inch by 1/8-inch extending from main ground bus to top of unit for grounding incoming cable-ground sheath or shielding tape by short connection to bus.
  - 3) Joints in bus made with two bolts minimum and overlap of four inches.
  - 4) Mechanical connector provided in each unit for field connection of 4/0 to 500 KCMIL ground cable to switchgear ground bus.
- e. Control bus:
- 1) 125-volt dc bus not less than 6AWG copper.
  - 2) One two-pole knife switch provided in switchgear cubicle for disconnecting control circuit.
  - 3) UL Class J or RK-5 fuses used for control and auxiliary-service protection.
  - 4) Closing circuit fused; tripping circuit unfused.

- 5) White light to indicate availability of dc control power.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Install switchgear in position as shown and in accordance with manufacturer's recommendation and the NEC.
- B. Install conduit, raceways, boxes and cabinets as shown and in accordance with Section 16130.
- C. Make power-cable and control-wire connections as shown and in accordance with Section 16125.
- D. Make grounding connections as shown and in accordance with Section 16060.
- E. Make arrangements with applicable electric utility company for making connections with incoming lines.
- F. Use services of manufacturer's engineering representative for assistance in field assembly, installation and testing of the switchgear in accordance with Section 16360.
- G. Connect space-heater circuit to prevent condensation during installation.
- H. Install breaker test cabinet and connect it to 125-volt dc supply.
- I. Install pegboard at location approved by the Engineer. Mount switchgear accessories and associated nameplate on pegboard.
- J. Install wire, cable and busways in accordance with Section 16120.

#### **3.02 FIELD QUALITY CONTROL:**

- A. Switchgear Field-Testing and Inspection: As specified in Section 16360.

**END OF SECTION**

## SECTION 16321

### HIGH VOLTAGE AC SWITCHGEAR (13.8 KV) FOR TRACTION POWER

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. The scope includes furnishing, delivering, installing 13.8 kV metal-clad switchgear and spare parts for Traction Power Substations.
- B. Compensation for work specified in equipment will be made in the following manner:
  - 1. Equipment For Traction Power Substation: Lump Sum.
  - 2. 13.8 kV AC Circuit Breaker removable element, 1,200 amps: Each.
  - 3. 13.8 kV ground, phase and test device: Each.
- C. Compensation for work specified related to installation will be made in the lump sum installation price for each traction power substation.
- D. Related sections:
  - 1. Section 16051 - Scope of Work For Traction Power for
  - 2. Section 16052 - Basic Materials and Methods For Traction Power
  - 3. Section 16128 - Wire and Cable For Traction Power
  - 4. Section 16260 - Uninterruptible Power System (Static)
  - 5. Section 16261 - Transformer-Rectifier Units For Traction Power
  - 6. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power
  - 7. Section 16291 - Local Annunciator Panel For Traction Power
  - 8. Section 16292 - Remote Terminal Units (AEMS RTU) For Traction Power

##### 1.02 REFERENCES

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. NEMA: CCI, SG4, SG5.
  - 4. ANSI: C37.06, Z55.1, C39.1, C12.
  - 5. ANSI/IEEE: 141, 242, C37.09, C.37.20.2, C37.90, C37.90.1, C57.13.
  - 6. ANSI, NEMA and IEEE standards as applicable to temperature rise.
  - 7. UL: 1244.
  - 8. AHA: ISI.

##### 1.03 SYSTEM DESCRIPTION

- A. Design Criteria:
  - 1. Floor loading: Switchgear compatible with floor design loading of 250 pounds per square foot.
  - 2. Switchgear suitable for anchoring to a concrete floor steel trowel finished to tolerance level of 1/8 inch in 10 feet.
  - 3. Numbers, types and arrangement of switchgear units as shown on drawings and Table 16051-III.
- B. The switchgear shall be manufactured in accordance with specified standards and shall have prior ANSI/NEMA certification as applicable.

- C. NEMA SG5, ANSI C37.20.2 for indoor use.
- D. Ratings of switchgear:
  - 1. Rated nominal voltage: 13.8 kV.
  - 2. Rated maximum voltage: 15.0 kV.
  - 3. Insulation level, low frequency withstand: 36 kV, rms.
  - 4. Insulation level, impulse withstand: 95 kV.
  - 5. Rated frequency: 60 Hertz.
  - 6. Rated continuous current: 1,200 Amperes
  - 7. Rated momentary current: Corresponding to circuit breaker momentary ratings.
- E. Insulation structure:
  - 1. Material not to support combustion, produce toxic gases, or absorb moisture.
  - 2. When subjected to electric arc, emission of conducting materials from insulating structure limited so as not to interfere with performance of circuit breaker.

#### 1.04 SUBMITTALS

- A. Submit the following for approval in accordance with the Division 1 and with the additional requirements as specified for each:
  - 1. Shop Drawings for installation: In accordance with Table 16051-II.
    - a. Submit drawings showing utility incoming supply cable termination details to the appropriate power company for approval through the Engineer.
  - 2. Shop Drawings for equipment: In accordance with Section 16051, Table II. Additionally, submit five (5) sets of the following to the Engineer for appropriate power company approval:
    - a. Drawings showing utility supply cable termination details.
    - b. Incoming line relay ranges and style numbers for 13.8 KV.
    - c. Drawings and catalogs for 13.8 KV switchgear grounding, phasing and testing devices for appropriate power company approval.
    - d. Drawings and catalog cuts of two (2) incoming feeder cubicles and of two (2) auxiliary cubicles including mounting details for metering current and potential transformers.
  - 3. Certification:
    - a. Certify that switchgear complies with floor design loading of 250 pounds per square foot.
    - b. Design test reports or certified copies of design test reports for identical units, performed for each type and rating of circuit breaker as assembled in its complete switchgear unit including bus compartment.
    - c. Certified test reports for specified factory production testing.
    - d. Certificates from manufacturers verifying that equipment conforms to specified requirements.
  - 4. Documentation:
    - a. Submit short-circuit calculations and protective relay coordination study for system protection and selective overcurrent tripping in accordance with Section 16051.
      - 1) In accordance with ANSI/IEEE 141 and ANSI/IEEE 242 for fault calculations and coordinated system protection.
      - 2) Include high-voltage source, relays on high-voltage switchgear, transformer-rectifier units and dc switchgear, and capability curves of rectifiers, rectifier transformers.
      - 3) Available short-circuit currents based on power company contribution of 750 MVA for 13.8 kV service.
      - 4) Recommended settings and adjustment of protective devices
  - 5. Operations and Maintenance Manuals: In accordance with Division 1.

6. Spare Parts Lists.

**1.05 QUALITY ASSURANCE**

- A. Qualification:
  - 1. Select a manufacturer who is regularly engaged in production of similar switchgear and has demonstrated a successful record of providing equipment of similar type and rating for extra heavy duty traction service for at least five similar projects.
  - 2. The proposed switchgear and circuit breaker shall have prior ANSI and NEMA certification.
  
- B. For Codes, Regulations, Reference Standards and Specifications, refer to Article 1.02 above
  
- C. Factory Testing:
  - 1. Submit test plans and procedures and scheduled test date for approval at least 20 working days in advance of scheduled test dates. No test results will be accepted prior to receipt and approval of test plans and procedures. Factory test requirements are as follows:
    - a. Circuit breaker tests: In accordance with the requirements of ANSI/IEEE C37.09 and including the following:
      - 1) Design tests:
        - a) Rated maximum voltage.
        - b) Rated voltage range factor.
        - c) Rated frequency.
        - d) Rated continuous current test.
        - e) Short-circuit rating test.
        - f) Rated standard operating duty.
        - g) Rated permissible tripping delay.
        - h) Rated interrupting time.
        - i) Rated dielectric strength.
        - j) Rated control voltage.
        - k) Load current switching.
        - l) Mechanical life.
        - m) Rated transient recovery voltage.
        - n) Rated reclosing time.
      - 2) Production test: All tests in accordance with ANSI/IEEE C37.09.
    - b. Switchgear assembly tests: In accordance with ANSI/IEEE C37.20.2, including the following:
      - 1) Design tests:
        - a) Dielectric tests.
        - b) Rated continuous current test.
        - c) Momentary current test.
        - d) Short-time current withstand test.
        - e) Mechanical endurance test.
        - f) Paint qualification test.
        - g) Flame resistance test for insulation
      - 2) Production tests: All tests in accordance with ANSI/IEEE C37.20.2.
    - c. Instrument and control wiring tests:
      - 1) Check wiring for accuracy, open circuits, short circuits, ground connections and insulation integrity by means of high-potential, continuity and operational tests.
      - 2) Subject wiring to high-potential test of 1,500 volts 60 Hertz to ground for one minute.
      - 3) Verify that wiring is in accordance with manufacturer's wiring diagrams. Check complete wiring, including interconnections of shipping breaks.

## **1.06 DELIVERY, STORAGE AND HANDLING**

- A. Equipment for each facility shall be delivered after its completion in accordance with the delivery dates indicated in Division 1. Arrangement for delivery shall be made in coordination with the Engineer.
- B. Ship each unit securely packaged, braced and labeled for safe handling in shipment and to avoid damage or distortion.
- C. Temporary Bracing: Where necessary, brace switchgear for hoisting lowering and skidding into position. Label temporary internal bracing of switchgear: TEMPORARY-REMOVE BEFORE OPERATION.
- D. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact record chart with manufacturer's instructions for disposition of damaged material.
- E. Assembly for Shipment:
  - 1. Design enclosures to permit lifting by jacks or slings and moving horizontally on rollers or skidding in any direction.
  - 2. Maximum dimensions of shipping sections to be coordinated with the dimensions of equipment access to ensure shipping dimensions will allow movement of switchgear through structure without damage to equipment or structure or undue difficulty.
  - 3. For shipping split, coil interconnecting wiring on one side of the shipping split with matching terminal block on other side of split. Identify wiring and terminal block points for reconnecting.
  - 4. Drawout relays mounted in their proper cases with moving parts properly secured and packed for shipment.
  - 5. Removable circuit breaker elements packaged separately.
- F. Store switchgear in secure and dry storage facility.

## **PART 2 - PRODUCTS**

### **2.01 MANUFACTURERS**

- A. The switchgear shall be manufactured by one of the following equipment suppliers, or equal:
  - 1. Asea Brown Boveri
  - 2. General Electric
  - 3. Westinghouse
  - 4. Controlled Power Corporation

### **2.02 COMPONENTS**

- A. Circuit breaker:
  - 1. NEMA SG4 and ANSI C37.06 for indoor use.
  - 2. Type: Three-pole, single throw, single interrupter per phase, drawout type, vacuum break, one drawout breaker per cubicle. The circuit breaker shall have its own set of wheels for drawout and shall not require a lifting device for this purpose.
  - 3. Rating on symmetrical basis:
    - a. Nominal voltage class, kV, rms: 13.8.
    - b. Nominal three-phase MVA Class: 750.
    - c. Rated maximum voltage, kV, rms: 15.
    - d. Rated withstand test voltage:

- 1) Low frequency, kV, rms; 36.
  - 2) Impulse, kV: 95.
  - e. Rated continuous current at 60 Hertz, amperes, rms: 1,200.
  - f. Rated interrupting time, cycle: Five maximum.
  - g. Rated permissible tripping delay, sec: Two.
  - h. Rated voltage range factor (K): 1.30.
  - i. Rated short-circuit current at rated maximum kV, Amperes, rms: 28,000.
  - j. Maximum symmetrical interrupting capability, Amperes, rms: 36,000.
  - k. Three-second short time current carrying capability, Amperes, rms: 36,000.
  - l. Closing and latching capability, ampere, rms: 58,000.
4. Electrically powered, spring-charged, stored-energy operating mechanism, with the following additional requirements:
- a. Voltage requirements:
    - 1) Charging of stored-energy operating mechanism: 125 Volts dc.
    - 2) Closing by means of closing release coil capable of operation from 100-140 Volts dc.
    - 3) Tripping by means of shunt trip coil capable of operation from 70-140 Volts dc.
  - b. Mechanically and electrically trip-free.
  - c. Equipped with mechanical devices on front of breaker to actuate closing and tripping operations, in case of failure of control power.
  - d. Compressed spring stored-energy operating mechanism, with sufficient energy storage for opening/closing/ opening operation at rated short-circuit current or at rated required capabilities.
  - e. Stored-energy mechanism automatically charged within 10 seconds following each closing of circuit breaker.
  - f. Stored-energy mechanism suitable for manual charging by means of removable handle in case of failure of control power.
  - g. Mechanical indicator on front. of breaker to indicate that stored-energy closing mechanism is charged.
5. Racking mechanism:
- a. Horizontal drawout breaker: manually-operated mechanism designed to permit racking of breaker with door closed by inserting crank through opening of limited size maximum.
  - b. Racking mechanism gear ratio: To permit one man to rack breaker in and out manually in four minutes maximum.
  - c. When breaker element is in fully lowered or racked out position, circuit breaker, complete with its operating mechanism, capable of being withdrawn from housing and moved on wheels integral with mechanism. Separate handling device for moving circuit breaker, other than transfer truck of fifth-wheel steering bar, is prohibited.
  - d. Positive stops for preventing overtravel and guides for proper alignment of breaker.
6. Grounding:
- a. When breaker is in connected position, case and frame grounded by positive contact with ground bus.
  - b. Breaker ground shoe designed to connect breaker frame to ground bus prior to engagement of primary breaker terminals.
  - c. Ground connection capable of carrying fault current equal to rated short-circuit current and related required capabilities
7. Interlocks:
- a. provide suitable interlocks to perform the following functions:
    - 1) Automatic discharge of stored-energy mechanism of the circuit breaker prior to its racking in or withdrawal from the unit.
    - 2) Prevent racking in and out unless circuit breaker is in OPEN position.

- 3) Prevent either electrical or manual operation of the breaker unless it is in the operating or test position. All circuit breakers to operate in test position and in the test position all remote and interlocking signals inhibited to and from the breaker.
  - 4) Automatically close rectifier cathode circuit breaker (Device 72) when rectifier transformer feeder circuit breaker (Device 52R) is closed, unless the rectifier cathode circuit breaker has been locked out by Device 86.
  - 5) Automatically trip the rectifier cathode circuit breaker (Device 72) when the rectifier transformer feeder breaker trips (Device 52R).
  - 6) Automatically trip and prevent closing the rectifier transformer feeder circuit breaker (Device 52R) and rectifier cathode circuit breaker (Device 72) if the rectifier doors are opened.
  - 7) Electrically interlock the two incoming line circuit breakers and the bus tie circuit breaker so that all three circuit breakers cannot be closed simultaneously. Interlocking scheme shall not prevent closing of one incoming line breaker when the bus tie breaker only is closed and the other incoming line breaker is open.
  - 8) Mode of operation: Normal mode with both incoming line circuit breakers closed and with the bus tie circuit breaker open. Loss of voltage on either incoming line shall initiate automatic transfer of its bus section to the other incoming line provided that the bus section lockout relay has not operated. Re-transfer after restoration of service shall be manual, interlocked for dead transfer.
  - 9) Rectifier Transformer Feeder Breaker key interlocked with Transformer tapboard as specified in Section 16261.
8. Primary Connection:
    - a. Connection between the removable and stationary unit made by male-and-female contacts, with the following additional requirements:
      - 1) Silver-plated, high pressure contacts.
      - 2) Automatic shutter to cover contact orifice when breaker is withdrawn to test position and to uncover orifice when breaker is returned to connected position.
      - 3) Automatic shutters constructed to withstand force of racking mechanism in case shutters fail to open when breaker is racked into positions.
  9. Secondary connection:
    - a. Control, protection, and interlocking circuit connections between stationary and removable elements of switchgear shall be made using device consisting of recessed stationary receptacle and set of self-aligning multiple-contact plugs on removable elements with sufficient number of contacts to accommodate control, protection and interlock circuits, including spares, without resorting to auxiliary relay.
  10. Nonresettable mechanical operation counter registering one count for each circuit breaker closing operation.
  11. Mechanical position indicator, showing breaker as OPEN or CLOSED.
  12. Auxiliary switches:
    - a. Equip each circuit breaker with auxiliary switches, rotary type, operated in both the connected and test position with sufficient number of contacts for operation, indication and interlocking of the breaker together with at least eight spare contacts, four type "a" and four type "b", each wired through secondary disconnect device contacts to accessible terminal blocks.
- B. Potheads and Terminal Connectors
    1. Utility incoming line:

- a. Space and provisions for mounting 3 single-conductor cables terminated in stress cones or slip-on terminators furnished and installed by the appropriate power company. The location, spacing and method of mounting shall be approved by the appropriate power company.
  - b. Provide 2-hole NEMA drilled terminations in switchgear bus to suit appropriate power company's 2-hole lugs and provide cable supports, as required.
  - c. All connections shall be insulated to 95kV BIL.
2. Feeder breakers:
- a. NEMA CC1
    - 1) Long barrel, double indentation compression type with NEMA standard two-hole contact pad for copper conductor. One piece tubular construction formed of tin plated copper.
- C. Buses:
- 1. General requirements:
    - a. Copper or aluminum bus bars of sufficient size to carry specified current without exceeding allowable temperature rise stated in ANSI, NEMA and IEEE Standards. Maximum current density of 800 Amperes per square inch.
    - b. Capable of withstanding the mechanical stresses and heat from maximum short circuit current.
    - c. Bus connections bolted or welded. Contact surfaces of bolted connections silver-plated or tin-plated.
    - d. Each joint having impedance not more than that of bus bar of equal length and clamped to maintain such impedance throughout life of equipment.
  - 2. Power buses:
    - a. Three-phase, three-wire buses fully insulated to 95 kV BIL, with flame-retardant, nonhygroscopic, track-resistant insulation. Provide each bolted connection with minimum of four bolts equipped with palnut or equal and fully insulated.
  - 3. Ground bus:
    - a. Cooper bus, not less than two inches by 1/4 inch provided throughout length of switchgear section. Each unit shall be grounded directly to this bus. A clamp type terminal shall be provided at each end of the ground bus for connection to the station ground.
    - b. In switchgear unit where power cables enter or leave switchgear at top as shown, copper ground bus not less than one inch by 1/8-inch extending from main ground bus to top of unit for grounding of incoming cable ground sheath or shielding tape.
    - c. Joints in ground bus made with tow bolts minimum.
    - d. Mechanical connector provided in each unit for field connection of 4/0 AWG to 500 KCMIL ground cable to switchgear ground bus.
  - 4. Control bus:
    - a. 125 Volt dc bus not less than 6 AWG copper.
    - b. One two-pole knife switch provided in each switchgear cubicle for disconnecting control circuit.
    - c. UL Class J fuses used for control and auxiliary service unfused.
    - d. Closing circuit Fused: tripping circuit unfused.
    - e. White light mounted on control panel to indicate availability of dc control power.
- D. Auxiliary unit:
- 1. Indoor metal cubicle for installing metering transformers furnished by the appropriate power company. The switchgear design shall be in accordance with appropriate

power company's Guide Specification, and shall be coordinated through the Engineer for appropriate power company approval.

2. Separate compartment for mounting two Westinghouse Electric Company Type KIR-11 or equal, 15kV current transformers furnished by appropriate power company with the following additional requirements:
  - a. Current transformer accessible through sealable hinged door. Bolted access plates prohibited.
  - b. Connection between bus and current transformer of same size and current ratings as that of main bus.
  - c. Compartment sized and arranged so that current transformer can be readily removed or replaced after cubicle is installed as integral part of switchgear assembly.
3. Separate compartment in accordance with the latest revision of appropriate power company's guide specification for mounting two Westinghouse Electric Corporation Type VIZ-11 or equal 14,400 -120 Volt potential transformers and a separate drawout fuse carriage for mounting primary fuses furnished by appropriate power company with the following additional requirements:
  - a. Potential Transformer accessible through sealable hinged door. Bolted access plates prohibited. Potential transformers shall be fixed mounted as approved by appropriate power company.
  - b. Fuse clips one inch long, mounted on 12 inch centers for accommodating fuse size 1-9/16 inch diameter ferrules and 12-7/8 inches long.
  - c. Provide silver-plated contact designed to provide adequate contact pressure.
  - d. The fuse drawout carriage for primary fuses shall be designed so that all contacts will be disconnected from the energized circuit and visibly grounded before the fuses become accessible for checking or replacement. This includes the load and line sides of the fuses and the line side of the potential transformer. A 95kV BIL is required in the open position.
    - 1) The fuse drawout carriage shall be grounded in all positions. This may be accomplished by use of a grounding strap. Sliding or rolling ground connections are not acceptable.
    - 2) The fuse drawout carriage shall be sealable in the closed or operating position.
  - e. Details of the design and arrangements of grounding shall be submitted to the Engineer for appropriate power company's specific approval.
4. One 10-inch square by six-inch deep pull box for secondary connection of appropriate power company metering transformers, with the following additional requirements:
  - a. Equipped with two 1-1/2 inch conduits, one to current transformer compartment and the other to potential transformer compartment.
  - b. Provision for installing one 1-1/2 inch conduit from pullbox to appropriate power company metering panel.

E. Current transformers:

1. ANSI C57.13, molded rubber or epoxy construction, wound type complying with ANSI requirements for relaying accuracy classification under burden imposed by devices specified. Mounted in a compartment isolated from the control panel.
2. Current ratio: As specified or as determined by approved coordination study.
  - a. Multi-ratio type MR for incoming feeders and Tie buses.
3. Insulation class:
  - a. 13.8 kV with basic impulse insulation level of 95 kV full-wave.
4. Capable of withstanding thermal and magnetic stresses from flow of current equal to the momentary and interrupting rating of the circuit breaker.
5. Maximum allowable temperature rise under continuous full load above an average ambient temperature of 55°C

- a. By winding resistance: 30°C
    - b. By hottest spot in winding: 40°C
  - 6. Transformer secondary neutral and frame individually grounded by copper wire to switchgear ground bus. Keep each ground connection run as short as possible. Avoid grouping such connections with control or other wiring. Minimum ground wire size: size 8 AWG for secondary and size 6 AWG for frames.
  - 7. Transformer secondary equipped with covers and integral shorting bars. Secondary wiring run to readily identifiable terminal block points with integral shorting bars, in the control compartment.
- F. Potential transformers:
  - 1. ANSI C57.13, molded-rubber or epoxy, of the following configurations:
    - a. Current-limiting primary fuses mounted on integral drawout carriage. Carriage to be pad locked with incoming breaker.
    - b. Drawout transformers with integrally mounted fuses.
  - 2. Connection:
    - a. phase-to-phase for digital power meter and phase to ground for device 27/59.
  - 3. Voltage ratio:
    - a. 14.4kV to 120 Volts.
  - 4. Insulation class:
    - a. 13.8 kV with basic BIL impulse insulation level of 95 kV full-wave.
  - 5. Maximum allowable temperature rise under continuous full load above average ambient temperature of 55°C:
    - a. By winding resistance: 30°C.
    - b. By hottest spot in winding: 40°C.
  - 6. The fuse and PT drawout carriage shall be design so that all contacts will be disconnected from the energized circuit and visibly grounded before the fuses become accessible for checking or replacement. This includes the load and line sides of the fuses and the line side of the potential transformer. A 95 kV BIL is required in the open position.
    - a. The fuse and PT drawout carriage shall be grounded in all positions. This may be accomplished by use of a grounding strap. Sliding or rolling ground connections are not acceptable.
    - b. The fuse and PT drawout carriage shall be sealable in the closed or operating position.
- G. Meters:
  - 1. Ammeters:
    - a. ANSI C39.1 and ANSI C12, switchboard type with 250 or 270 degree scale, approximately seven inches long with plus or minus one percent accuracy:
      - 1) Ammeters:
        - a) Five-ampere, transformer-rated with scale range equal to the associated current transformer primary rating.
      - 2) Voltmeters:
        - a) Rated 0-150 volts for use with 0-18 kV scale.
  - 2. Digital Power Meter:
    - a. ANSI C37.90.1 and ANSI C12.
    - b. A digital power meter, Siemens 4700 or equal, shall be provided to monitor circuits shown on the one-line diagram and specified here. The meter shall measure the real-time RMS values of phase currents, ampere demand, and phase and line voltages plus power measurements including kw, kw demand, kWhours, kVA, kVARS hours. Power factor and frequency shall also be measured. Resettable minimum and maximum values for each measured value shall be recorded in nonvolatile memory. The kW and ampere demand period shall be user programmable from one to sixty minutes. A one volt nominal auxiliary voltage input shall also be provided.

Accuracy of current and voltage measurements shall be .25% and kW, kW hour and other power measurements shall be .50% or better. The power meter shall be capable of high sampling of wave form for power quality analysis and measurement of harmonics in current and voltage wave forms.

- c. The digital power meter shall be listed under UL1244 and meet requirements of applicable ANSI Standards including ANSI C37.90.1 requirements for surge withstand and fast transient tests. All configuration information such as CT ratios, voltage scales, and communications address shall be stored in nonvolatile memory so that it can be set either from the integral display or remotely using the communications module. No batteries shall be required to maintain configuration information indefinitely. The meter shall derive power from a separate 125 V ac or dc source.

- d. Display:

- 1) The digital power meter shall include an integral illuminated display for reading all real-time and min/max measured values as well as programming initial configuration and any relay set-points. The display shall consist of at least twenty 0.4 inch high alphanumeric characters and be operated using clearly labeled sealed membrane keys with stainless steel switch elements for long mechanical life and resistance to atmospheric contamination. The digital power meter with integral display shall be flush mounted on equipment doors or panels. Operation of the power meter to read real-time or min/max measured values or to program configuration and any relay setpoints shall not require opening door or removing panels. A user-defined password shall be required to change configuration, reset min/max log and kW/kVAR hours or change any relay set-points.

- e. Relay:

- 1) Three programmable relay outputs shall be provided to activate and release based on threshold and time-delay values associated with any of the measured parameters. Remote relay operation shall be possible through the communications module. The relay shall be form C rated 10A 120Vac/24Vdc. Activation and release of the relays shall be recorded in a non-volatile log with cause of operation. The log shall record at least the last 50 events. Four discrete inputs shall also be provided to monitor status of NO or NC contacts. One of the discrete inputs shall also be capable of counting state changes. A programmable auxiliary 0 to 1mA or 4 to 20mA analog output shall also be provided.

- f. Communications:

- 1) A communications module shall be provided using an industry standard RS-485 (or RS-232) serial bus to remotely read real-time and min/max measured values, interrogate the event log, reset min/max and kW/kVAR hours and program configuration and any relay setpoints. A means shall be provided to periodically synchronize the meter's internal clock with a master bus clock so that the meter's event and min/max logs are accurately time-stamped within one second. The RS-485 module shall provide at least 500V galvanic isolation between the meter and other devices on the communications bus. Up to 6 channels 0 to 1 or 4 to 20mA dc analog transmission of output data shall also be provided.

- g. Extended memory:

- 1) The power meter shall include extended nonvolatile memory to record at least 100 snapshots of each measured parameter. The interval between snapshots shall be readable using the communications module.

- h. Portable Computer:
  - 1) Portable, Notebook Design with:
    - a) Latest Intel-based Processor,
    - b) 128 MB RAM
    - c) 2 PCMCIA Slots Type II,
    - d) Local Bus Graphics
    - e) Color Active Matrix Screen (256 colors
    - f) 3 Hours Batter w/Charger and AC Adapter,
    - g) 3.5", 1.44 MB Floppy Drive,
    - h) CD Rom,
    - i) 4+GB Hard Drive,
    - j) Built-in Center Trackball and external Mouse
    - k) Internal Fax Modem;56K Baud,
    - l) Carrying Case
  - 2) Provided with the following latest versions of software:
    - a) Latest version of Microsoft Windows Operating System for PC
    - b) Latest version Microsoft word on PC
    - c) Latest Version Microsoft Excel on PC
    - d) Exclusive communication software and 10' cables to interface DPM communication protocol, plus DOS 6.x Operating System

H. Protective relays:

- 1. General requirements:
  - a. Semi-flush mounted, electro-magnetic induction disc adjustable drawout relays, overcurrent and under/over voltage type, each with test switches, except clapper type relays, when used, surface mounted on a fixed portion of the structure. Solid state relays shall not be allowed.
  - b. Rustproof metal rectangular cases finished in dull black.
  - c. With targets, hand reset for targets and seal-in units.
  - d. Contact and adjusting device readily visible, accessible and adjustable from front of relay.
  - e. Designed, constructed and tested in accordance with applicable requirements of ANSI C37.90.
- 2. Overcurrent relay general requirements:
  - a. Select overcurrent relay characteristics, ranges and settings to provide the protection and coordination specified.
- 3. Transformer-rectifier feeder unit overcurrent relays:
  - a. Device 50/51 phase inverse time and instantaneous overcurrent relays, one(1) 50N/51N residual ground inverse time and instantaneous overcurrent relay, three (3) 51-A phase inverse time overcurrent relay and three(3) relays 51B phase inverse time overcurrent relay.
  - b. Relay 51A to protect against overloads beyond the 300 percent, one minute capability of the units.
  - c. Relay 51B to protect against overloads beyond the 450 percent, 15 second capability of the units and coordinated with relay 51A.
  - d. Relays 50/51 and 50N/51N set as low as practicable to provide maximum fault protection and to coordinate with relays 51A and 51B.
  - e. Relays 51A, 50/51 and 50N/51N operating associated lockout relay, to trip the transformer-rectifier feeder breaker.
  - f. Relay 51B equipped with auxiliary relays 51BX to trip all dc track feeder breakers on the associated dc bus.
- 4. Bus tie unit Overcurrent relays.

- a. Device 50/51 phase inverse time and instantaneous overcurrent relays, device 50N/51N residual ground inverse time and instantaneous overcurrent relays.
  - b. Relays 50/51 and 50N/51N operate relay 86BT to trip the bus tie circuit breaker.
  - c. Relays 50/51 and 50N/51N set as low as practicable to provide maximum bus fault protection and to coordinate with transformer-rectifier unit overcurrent relays.
5. Incoming line unit Overcurrent relays
- a. Device 50/51 phase inverse time and instantaneous overcurrent relays, device 50N/51N residual ground inverse time and instantaneous overcurrent relay.
  - b. Relays 50/51 and 50N/51N operate relay 86 to trip incoming line breaker.
  - c. Relays 50/51 and 50N/51N set as low as practicable to provide maximum fault protection and to coordinate with bus tie unit and transformer-rectifier unit overcurrent relays.
  - d. Setting of overcurrent relays to be coordinated with and approved by appropriate power company.
  - e. Current test switch, 10-pole, Westinghouse Style 129A517G01 or equal, provided between current transformer and relay.
6. Voltage relays:
- a. Relays 27/59 undervoltage/overvoltage, single-phase, time voltage relay.
  - b. Relay 27/59 trips incoming line breaker.
  - c. General Electric Company No. 12IAV53K1A, Westinghouse style 289B970A28, or equal. Adjustable range: 55 to 140 Volts or 30 to 120 Volts.
  - d. Potential test switch, 4-pole, Westinghouse Style 129A506G01 or equal, provided between potential transformer and relay.
7. Lockout relays:
- a. Rotary, hand-reset, 125 Volt dc, lockout relay, equipped with green light for indicating reset position, GE HEA or equal.
8. Auxiliary relays:
- a. Provided where required, General Electric Company Type HGA or HFA or equal, mounted inside instrument compartment.
9. Relay test equipment:
- a. One test set for testing all electromagnetic relays furnished.
- I. Switch and Indicating Lights:
- 1. General:
    - a. Rotary type, cam actuated switches with escutcheon and silver to silver contacts rated 20 Amperes. Contacts enclosed in easily removable covers.
  - 2. Circuit breaker control switch:
    - a. Equipped with heavy duty pistol-grip handles and operation targets. Escutcheon engraved "Trip-Close" with spring return to normal. Wired to operate the associated circuit breaker when the Local Remote selector switch is in the Local position. With indicating lights as follows:
      - 1) Red light: Circuit breaker closed, wired to supervise the trip coil.
      - 2) Green light: Circuit breaker is open.
      - 3) Amber light: Circuit breaker is automatically tripped.
  - 3. Circuit breaker supervisory control selector switch:
    - a. Equipped with oval handle. Escutcheon engraved "Local Remote" positions and white indicating light showing switch position in the local mode.
  - 4. Ammeter selector switch:
    - a. Equipped with knurled handle. Escutcheon engraved "OFF-1-2-3".
  - 5. Test switches:

- a. Provided for ammeters and voltmeters and between instrument transformers and the protective relays.
  - 6. Indicating lights:
    - a. LED panel indicator lamp, General Electric Company Type ET-16 or equal.
- J. Control panel:
  - 1. For relays, meters and control equipment, hinged panel of formed steel, with rolled edges, door stop and conveniently located handle for opening.
- K. Line voltage indicators:
  - 1. Neon glow-tube capacitance-coupled high-voltage indicators, Airco Type RS or equal. Glow tube shall be visible without opening the rear door of breaker cubicle.
- L. Surge arresters:
  - 1. Provide station class metal oxide type surge arresters, rated 12.7kV maximum continuous operating voltage (MCOV).
  - 2. Provided at each circuit breaker on incoming lines and rectifier transformer feeders.
- M. Space heaters:
  - 1. Each vertical section unit of switchgear provided with 120-volt, single-phase, 60 hertz heating element to facilitate drying and prevent condensation.
    - a. Two strip heaters shall be installed in each unit. One heater located in the front shall be controlled by a humidistat, adjustable from 60% to 100% relative humidity and set to operate when the relative humidity exceeds 90% or in accordance with manufacturer's recommendations. The other heater located in the rear is to operate continuously. Current for both heaters indicated by an approximate scaled ammeter located in front panel.
    - b. Two 120-volt circuits will be provided. Divide heater load evenly between the two circuits.
  - 2. Heaters enclosed in grill guard with no sharp edges and located so that they are accessible for replacement without requiring de-energization of switchgear bus. Panel ammeter, approximately 2-1/2 inches square, marked to indicate heater load.
  - 3. Power and control circuits to heaters and humidistat connected and protected up to devices and to incoming junction box with 3/4-inch minimum size conduit. Heater power junction box sized four inches square by two inches minimum depth and located at top of switchgear for top entry of minimum 3/4 inch conduit. Remote connection leads to power source labeled: 120V and NEUTRAL.
- N. Instrument and control wiring: Instrument and control wiring including electrical interlocks and intercompartment wiring factory installed in accordance with the following requirements:
  - 1. Wire:
    - a. Copper conductor minimum 14 AWG, insulation rated 600 Volt, type SIS or equal. Use flexible Class C or higher stranded insulated copper wire for wiring across hinged joints. Use twisted, shielded pair wires for overcurrent and voltage relays.
  - 2. Use one continuous length of wire from terminal to terminal without splice or tap. Wire troughs provided for routing wire between devices.
  - 3. Install and connect removable element control wiring in accordance with manufacturer's standard for circuit breaker wiring.
  - 4. Design and install control wiring so that trouble in one main circuit can not be communicated to control wiring of another main circuit.
  - 5. Make connections only at terminals of device, on terminal blocks or on control buses. Make wiring connections using insulated flange fork tongue type terminals.
  - 6. Terminate interconnecting wiring between cubicles and compartments on terminal blocks before wiring to components.
  - 7. Terminal blocks:

- a. With washerhead screw-type terminals, circuit-marking strips for indicating control wire number, phenolic laminated dust cover and 10% minimum spare terminal points.
  - 8. For each wire, use corresponding identification on terminal block marking strips and identify internal wiring at each termination, with same number as that shown on wiring diagram, using plastic sleeve.
  - 9. External wiring:
    - a. External control wiring to enter from top.
    - b. Allow space to route and terminate external single-conductor or multiple-conductor control cable.
    - c. Top entrances provided with removable cover plates for field drilling of conduit and cable entrance holes.
- O. Supervisory Control and Indication:
  - 1. Control: Provisions for closing and tripping each circuit breaker from the remote supervisory control system. Interposing relays for interface having 24 volt dc, 15 VA maximum coils and equipped with arc suppression network. Supervisory control enabled only with Local-Remote switch in Remote position and circuit breaker in the connected position.
  - 2. Indication:
    - a. Contact from each circuit breaker from remote indication circuit breaker position as follows:
      - 1) Closed: Circuit breaker closed and in the connected position.
      - 2) Tripped: Circuit breaker open or in the test or disconnected position.
    - b. Contact from each lockout relay and each incoming line undervoltage relay for remote indication of relay status (Normal-Abnormal).
    - c. Contact requirements:
      - 1) Dry contacts with a maximum load rating of 15 Volt Amperes, a maximum dc current of one Ampere and maximum switching voltage of 250 Volts dc.
      - 2) Contact resistance not to exceed 0.1 ohm in the closed state when operating in a circuit with open-circuit voltage of three Volts dc and closed circuit current of ten milliamperes. Open state resistance greater than 50 megohms.
      - 3) Contact bounce not to exceed five milliseconds.
- P. Maximum Mounting Height of Relays, Instruments, Meters and Devices: 90 inches above finished floor. If necessary, rectifier transformer feeder relays may be mounted on the rectifier.
- Q. Enclosure:
  - 1. Dead-front, free-standing indoor metal enclosure.
  - 2. Steel structure with frame work of welded or bolted structural steel, free from distortion and welding strain and sufficiently rigid to support equipment under normal and short-circuit conditions.
  - 3. Switchgear units equipped with doors as follows:
    - a. 13.8 kV enclosure
      - 1) Front: Hinged front door in accordance with the following:
        - a) Handle and three-point latch to hold door securely closed, with provisions for padlocking.
        - b) Door stop to hold door open.
        - c) Structural reinforcing provided as necessary to prevent sagging of door.
        - d) Circuit breaker compartment door designed not to hinder movement of breaker in and out of compartment when door is open and door-stop set.

- 2) Rear: Hinged door with handle and three-point latch and provisions for padlocking.
    - b. Circuit breaker cubicles to provide for interchangeability of removable circuit breaker elements.
  - 4. Finish: Metallic surfaces degreased, primed and finished with light gray enamel, Color No. 61, ANSI Z55.1 in accordance with reference standard unless other wise specified; two mils minimum dry film thickness.
  - 5. Switchgear assemblies shall include provisions for future extension from either end.
- R. Leveling Channels:
- 1. Steel.
  - 2. Size and configuration as recommended by the switchgear manufacturer.
- S. Additional Circuit Breaker Elements:
- 1. Additional circuit breaker elements as indicated in Section 16051 Table III.
- T. Nameplates:
- 1. Three-ply, laminated plastic plates, engraved through black face to white core and attached by means of stainless steel rivets or screws. Vertical gothic lettering using a round or square cutter. V-shaped groove is prohibited.
  - 2. Provide nameplate on each switchgear showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable in accordance with reference standard.
  - 3. Provide additional functional nameplates for each component including relay, terminal block and other devices.
    - a. Each switchgear compartment labeled, front and back, with nameplates 2-1/2 inches by 6-1/2 inches, inscribed in letters 1/2 inch high: INCOMING LINE PRIMARY BREAKER NO. 1, (2); RECTIFIER-TRANSFORMER FEEDER BREAKER NO.1, (2), (3); or AUXILIARY COMPARTMENT NO. 1, (2), as appropriate.
    - b. Each circuit breaker compartment labeled, front only, with nameplate 2-1/2 inches by 6-1/2 inches, inscribed in letters 1/2 inch high with the circuit breaker Supervisory Control Identification Number, as shown in Section 16051 Table II. A typical example of engraving is as follows:  
SUPV CONTROL NO.  
E-D13-11
    - c. In addition to other information normally displayed on equipment, provide nameplate one-inch by length as required, showing in letters 1/2 inch high switch positions, meaning of indicator lamp and other pertinent information.
- U. Major components shall be products of same manufacturer.
- V. Unit Functional Component Listings: Items of equipment required for each switchgear unit shall be as follows as minimum, and as shown on drawings:
- 1. Incoming line unit:
    - a. One - Metal-Clad Stationary Unit
    - b. One - Bus, 3-phase, 1200 Amperes
    - c. One - Circuit Breaker, 1200 Amperes
    - d. One - Provision for Power Company Terminal Connectors.
    - e. Three - Current Transformers, GE Type BP or equal, ratio as required for relaying
    - f. Three - Single Phase Inverse time and Instantaneous Overcurrent Relays, Device 50/51
    - g. One - Residual Ground Inverse Time and Instantaneous Overcurrent Relay, Device 50N/51N
    - h. One - Lockout Relay, Device 86

- i. One - Inverse Time Undervoltage/ Overvoltage Relay, Device 27/59
  - j. One - Digital Power Meter
  - k. One - Test Switch, Westinghouse No. 129A517G01 on line side of overcurrent relays.
  - l. One - Test Switch, Westinghouse No. 129A506G01 on line side of undervoltage/overvoltage relay.
  - m. One - Circuit Breaker Control Switch
  - n. One - Local Remote Selector Switch
  - o. Three - High Voltage Neon Indicating Lights.
  - p. Three - Metal Oxide Surge Arresters.
  - q. Two - Incoming line potential transformers. Connected phase - to - phase with primary and secondary fuses for connecting to Digital Power Meter.
  - r. One - Incoming line potential transformer connected phase - to - ground with primary and secondary fuses for device 27/59.
  - s. One - Humidistat and ammeter for space heaters .
  - t. Two - Space heaters.
2. Bus tie unit:
- a. One - Metal-Clad Stationary Unit
  - b. One - Bus, 3-phase, 1200 Amperes
  - c. One - Circuit Breaker, 1200 Amperes
  - d. Three - Current Transformers, ratio as required for relaying
  - e. Three - Single Phase Inverse Time and Instantaneous Overcurrent Relays, Device 50/51
  - f. One - Residual Ground Inverse Time and Instantaneous Overcurrent Relay, Device 50N/51N
  - g. One - Lockout Relay
  - h. One - Test Switch Westinghouse No. 129A517G01, for protective relays.
  - i. One - Circuit Breaker Control Switch
  - j. One - Auto-Manual Switch
  - k. One - Humidistat and ammeter for space heaters.
  - l. Two - Space heaters.
  - m. One - DPM DP-9 Plug.
3. Rectifier-transformer feeder unit:
- a. One - Metal-Clad Stationary Unit
  - b. One - Bus, 3-phase, 1200 Amperes
  - c. One - Circuit Breaker, 1200 Amperes
  - d. Three - Terminal connections for 1/C # 4/0 cable.
  - e. Three - Current Transformers, ratio as required for relaying, with test switch
  - f. Three - Single Phase Inverse Time and Instantaneous Overcurrent Relays, Device 50/51
  - g. Three - Single Phase Inverse Time Overcurrent Relays, Device 51A.
  - h. Three - Single Phase Inverse Time Overcurrent Relays, Device 51B, with Auxiliary Relays, Device 51BXas required.
  - i. One - Residual Ground Inverse Time and Instantaneous Overcurrent Relay, Device 50N/51N.
  - j. One - Lockout Relay
  - k. One - Ammeter, Suitable Scale, with Test Switch
  - l. One - Ammeter Switch
  - m. One - Test Switch, Westinghouse No. 129A517G01 for protective relays.
  - n. One - Circuit Breaker Control Switch.
  - o. One - Local-Remote Selector Switch.
  - p. One - Kirk key interlock for use with no-load tap changer on rectifier transformer (to be coordinated with supplier of rectifier transformer).
  - q. Three - Metal Oxide Surge Arrestors.
  - r. One - Humidistat and ammeter for space heaters.
  - s. Two - Space heaters.

4. Auxiliary unit:
  - a. One - Metal-Clad Stationary Unit.
  - b. One - Bus 3-phase, 1200 Amperes.
  - c. One - Drawout carriage for primary fuse of two (2) power company metering potential transformers. in conformance with appropriate power company requirements.
  - d. One - Set of Primary Fuses, furnished by appropriate power company, for power company metering potential transformers.
  - e. Provisions for mounting two power company metering current transformers in conformance with appropriate power company requirements.
  - f. One - Humidistat and ammeter for space heaters.
  - g. Two - Space heaters.
5. Leveling Channels:
  - a. Steel.
  - b. Size and configuration as recommended by the switchgear manufacturer.
6. Additional Circuit Breaker Elements:
  - a. Additional circuit breaker elements as indicated in Section 16051 Table III.

### 2.03 ACCESSORIES

- A. There shall be one set of the following accessories for each substation:
  1. One breaker test cabinet with provision for electrical operation of circuit breaker with control switch and provision for other accessories as necessary.
  2. Crank for manually racking circuit breaker in switchgear cubicle.
  3. One circuit breaker maintenance lever with insulated handle.
  4. Fifth wheel provided for moving the circuit breaker outside its enclosure.
  5. One spare set of each type of high-voltage fuse.
  6. One complete set of relay test plugs and relay test switch.
  7. One set of special tool necessary for erection, operation and maintenance of switchgear including those recommended by relay manufacturer and including breaker secondary or control disconnect coupler.
  8. Pegboard: Hardboard, AHA IS 1, tempered, SIS, 1/4 -inch nominal thickness, perforated, sized to accommodate all products specified, framed with one-inch by one-inch hardwood. Frame and hardboard painted color selected by the Engineer. Include hardware for wall mounting and pegboard accessories suited to the products to be mounted. Provide nameplates as specified, one inch high by length as required with accessory names inscribed in 1/2 inch vertical letters.
  9. 13.8 kV grounding, phasing and testing device: (One device located in each traction power substation): Designed to be inserted into the switchgear unit in place of and in the same manner as the circuit breaker removable elements, to permit grounding either the bus or line, or making external connections to either the line for phasing and/or testing purposes with the following additional requirements:
    - a. Momentary and three-second current carrying capacities equal to or greater than those of the circuit breaker removable elements.
    - b. BIL Rating: 95 kV
    - c. Include a power-operated circuit closing device (grounding switch) so arranged with a gang-operated 3-pole selector disconnect switch to

effectively ground either the bus or line when the device is inserted into the unit and closed, with the following additional requirements:

- 1) Closing by means of a portable remote control pushbutton station mounted on the end of a 50-foot, four-conductor, flexible (class C stranding) cable providing common, close trip and ground conductors.
  - 2) Power obtained through the secondary disconnecting device in the switchgear unit.
- d. Grounding device solidly connected to the switchgear ground bus in the operated or grounded position. Make provisions for padlocking in the grounded position.
- e. No automatic tripping provided.
- f. Provide suitable windows or transparent enclosure and barriers to permit visual observation of the position of all selector switch blades before the device is inserted into the stationary housing.
- g. Fabricate steel panels from No. 11 United States Standard gauge steel.
- h. Connect the selector switch hinge end directly to the grounding switch.
- i. Provide insulated covers for bolt heads used to attach insulated panel to the front of the device if not at ground potential.
- j. External connections for testing made by insulated plug connectors for insertion in deep ports or wells accessible at the face of the device. One set of test ports connected directly to the bus. A second set of test ports connected directly to the line terminals. Additional requirements as follow:
  - 1) Mount ports on insulating material and provide closing shutters of like material.
  - 2) Provide separate closing shutter for each set of test ports. Each shutter with provisions for padlocking in closed position.
  - 3) Provide three test plugs or probes for each grounding, phasing and testing device for external connections.
- k. The Contractor is responsible for obtaining approval of shop drawings and submittal including Catalog data from appropriate power company for the grounding, phasing and testing device prior to manufacturing. Submittals shall be made to the Engineer for obtaining appropriate power company approval.

## PART 3- EXECUTION

### 3.01 INSTALLATION

- A. Floor Preparation:
1. Fill floor depression with concrete flush with finish floor. Finish concrete to the tolerances recommended by the switchgear manufacturer. Install leveling channels as recommended by the switchgear manufacturer and as shown on the approved shop drawings.
- B. Install switchgear as shown on drawings, in accordance with approved shop drawings, and as follows:
1. Contractor shall make the bus connections at each shipping split.
  2. The number of shipping splits in ac switchgear for each substation is given below:
- | <u>NAME OF SUBSTATION</u> | <u>No. of shipping Splits</u> |
|---------------------------|-------------------------------|
| [LOCATION-TBD ] TPS       | [ TBD ]                       |
- C. Install conduit and raceways as approved and in accordance with Section 16052.

- D. Make power cable and control wire connections as approved and in accordance with Section 16052.
- E. Make grounding connections as shown on drawings and approved.
- F. Arrange with the power companies for making connections with incoming lines; and for installation of CT, PT, PT fuses, and metering equipment.
- G. Use services of manufacturer's engineering representative for assistance in field assembly and installation in accordance with Section 16051.
- H. Connect space heater circuit to prevent condensation during installation.
- I. Install ac circuit breaker test cabinet and connect it to 125-volt dc supply as shown on drawings.
- J. Install pegboard at location approved by the Engineer. Mount switchgear accessories and associated nameplates on pegboard.

**3.02 FIELD QUALITY CONTROL**

- A. Verify tolerances of concrete floor finish and level of channels.
- B. Switchgear Field Testing and Inspection: In accordance with Section 16051

**END OF SECTION**

## SECTION 16322

### HIGH VOLTAGE AC SWITCH GEAR (34.5 KV) FOR TRACTION POWER

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. The scope includes furnishing, delivering, installing 34.5 kV metal-clad switchgear and spare parts.
- B. Compensation for work specified in equipment will be made in the following manner:
  - 1. Equipment For Traction Power Substation: Lump Sum.
  - 2. 34.5 kV AC Circuit Breaker removable element, 1,200 amps: Each.
  - 3. 34.5 kV ground, phase and test device: Each.
- C. Compensation for work specified related to installation will be made in the lump sum installation price for each traction power substation
- D. Related sections:
  - 1. Section 16051 - Scope of Work For Traction Power
  - 2. Section 16052 - Basic Materials and Methods For Traction Power
  - 3. Section 16128 - Wire and Cable For Traction Power
  - 4. Section 16260 -Uninterruptible Power System (Static)
  - 5. Section 16261 - Transformer-Rectifier Units For Traction Power
  - 6. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power
  - 7. Section 16291 - Local Annunciator Panel For Traction Power
  - 8. Section 16292 - Remote Terminal Units (AEMS RTU) For Traction Power

##### 1.02 REFERENCES

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. NEMA: CCI, SG4, SG5.
  - 4. ANSI: C37.06, Z55.1, C39.1, C12.
  - 5. ANSI/IEEE: 141, 242, C37.09, C.37.20.2, C37.90, C37.90.1, C57.13.
  - 6. ANSI, NEMA and IEEE standards as applicable to temperature rise.
  - 7. UL: 1244.
  - 8. AHA: ISI.

##### 1.03 SYSTEM DESCRIPTION

- A. Design Criteria:
  - 1. Floor loading: Switchgear compatible with floor design loading of 250 pounds per square foot.
  - 2. Switchgear suitable for anchoring to a concrete floor steel trowel finished to tolerance level of 1/8 inch in 10 feet.
  - 3. Numbers, types and arrangement of switchgear units as shown on drawings and Table 16051-III.
- B. The switchgear shall be manufactured in accordance with specified standards and shall have prior ANSI/NEMA certification as applicable.

- C. NEMA SG5, ANSI C37.20.2 for indoor use.
- D. Ratings of switchgear:
  - 1. Rated nominal voltage: 34.5 kV.
  - 2. Rated maximum voltage: 38.0 kV.
  - 3. Insulation level, low frequency withstand: 80 kV, rms.
  - 4. Insulation level, impulse withstand: 150 kV.
  - 5. Rated frequency: 60 Hertz.
  - 6. Rated continuous current: 1,200 Amperes
  - 7. Rated momentary current: Corresponding to circuit breaker monetary ratings.
- E. Insulation structure:
  - 1. Material not to support combustion, produce toxic gases, or absorb moisture.
  - 2. When subjected to electric arc, emission of conducting materials from insulating structure limited so as not to interfere with performance of circuit breaker.

#### 1.04 SUBMITTALS

- A. Submit the following for approval in accordance with the Division 1 and with the additional requirements as specified for each:
  - 1. Shop Drawings for installation: In accordance with Table 16051 Table-II.
    - a. Submit drawings showing utility incoming supply cable termination details to Utility Company for approval through the Engineer.
  - 2. Shop Drawings for equipment: In accordance with 16051 Table-II. Additionally, submit five (5) sets of the following to the Engineer for Utility Company approval:
    - a. Drawings showing utility supply cable termination details.
    - b. Incoming line relay ranges and style numbers for 34.5 KV.
    - c. Drawings and catalog cuts of two (2) incoming feeder cubicles and of two (2) auxiliary cubicles including mounting details for metering current and potential transformers.
  - 3. Certification:
    - a. Certify that switchgear complies with floor design loading of 250 pounds per square foot.
    - b. Design test reports or certified copies of design test reports for identical units, performed for each type and rating of circuit breaker as assembled in its complete switchgear unit including bus compartment.
    - c. Certified test reports for specified factory production testing.
    - d. Certificates from manufacturers verifying that equipment conforms to specified requirements.
  - 4. Documentation:
    - a. Submit short-circuit calculations and protective relay coordination study for system protection and selective overcurrent tripping within 150 days of NTP. Submit relay coordination study to the Engineer for approval.
      - 1) In accordance with ANSI/IEEE 141 and ANSI/IEEE 242 for fault calculations and coordinated system protection.
      - 2) Include high-voltage source, relays on high-voltage switchgear, transformer-rectifier units and dc switchgear, and capability curves of rectifiers, rectifier transformers and auxiliary power transformer.
      - 3) Available short-circuit currents based on power company contribution of 1500 MVA for 34.5 kV service.
      - 4) Recommended settings and adjustment of protective devices.
  - 5. Operations and Maintenance Manuals: In accordance with Special Conditions and Section 16053.
  - 6. Spare Parts Lists.

## 1.05 QUALITY ASSURANCE

- A. Qualification:
1. Select a manufacturer who is regularly engaged in production of similar switchgear and has demonstrated a successful record of providing equipment of similar type and rating for extra heavy duty traction service for at least five similar projects.
  2. The proposed switchgear and circuit breaker shall have prior ANSI and NEMA certification.
- B. For Codes, Regulations, Reference Standards and Specifications, refer to Article 1.02 above
- C. Factory Testing: Submit test plans and procedures and scheduled test date for approval at least 20 working days in advance of scheduled test dates. No test results will be accepted prior to receipt and approval of test plans and procedures. Factory test requirements are as follows:
1. Circuit breaker tests: In accordance with the requirements of ANSI/IEEE C37.09 and including the following:
    - a. Design tests:
      - 1) Rated maximum voltage.
      - 2) Rated voltage range factor.
      - 3) Rated frequency.
      - 4) Rated continuous current test
      - 5) Short-circuit rating test.
      - 6) Rated standard operating duty.
      - 7) Rated permissible tripping delay
      - 8) Rated interrupting time.
      - 9) Rated dielectric strength.
      - 10) Rated control voltage.
      - 11) Load current switching.
      - 12) Mechanical life.
      - 13) Rated transient recovery voltage.
      - 14) Rated reclosing time.
    - b. Production test: All tests in accordance with ANSI/IEEE C37.09.
  2. Switchgear assembly tests: In accordance with ANSI/IEEE C37.20.2, including the following:
    - a. Design tests:
      - 1) Dielectric tests.
      - 2) Rated continuous current test.
      - 3) Momentary current test.
      - 4) Short-time current withstand test.
      - 5) Mechanical endurance test.
      - 6) Paint qualification test.
      - 7) Flame resistance test for insulation
    - b. Production tests: All tests in accordance with ANSI/IEEE C37.20.2.
  3. Instrument and control wiring tests:
    - a. Check wiring for accuracy, open circuits, short circuits, ground connections and insulation integrity by means of high-potential, continuity and operational tests.
    - b. Subject wiring to high-potential test of 1,500 volts 60 Hertz to ground for one minute.
    - c. Verify that wiring is in accordance with manufacturer's wiring diagrams. Check complete wiring, including interconnections of shipping breaks.

## 1.06 DELIVERY, STORAGE AND HANDLING

- A. Equipment for each facility shall be delivered after its completion in accordance with the delivery dates indicated in Division 1. Arrangement for delivery shall be made in coordination with the Engineer.
- B. Ship each unit securely packaged, braced and labeled for safe handling in shipment and to avoid damage or distortion.
- C. Temporary Bracing: Where necessary, brace switchgear for hoisting lowering and skidding into position. Label temporary internal bracing of switchgear:
  - 1. TEMPORARY-REMOVE BEFORE OPERATION.
- D. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact record chart with manufacturer's instructions for disposition of damaged material.
- E. Assembly for Shipment:
  - 1. Design enclosures to permit lifting by jacks or slings and moving horizontally on rollers or skidding in any direction.
  - 2. Maximum dimensions of shipping sections to be coordinated with the dimensions of equipment access to ensure shipping dimensions will allow movement of switchgear through structure without damage to equipment or structure or undue difficulty.
  - 3. For shipping split, coil interconnecting wiring on one side of the shipping split with matching terminal block on other side of split. Identify wiring and terminal block points for reconnecting.
  - 4. Drawout relays mounted in their proper cases with moving parts properly secured and packed for shipment.
  - 5. Removable circuit breaker elements packaged separately.
- F. Store switchgear in secure and dry storage facility.

## **PART 2 - PRODUCTS**

### **2.01 MANUFACTURERS**

- A. The switchgear shall be manufactured by one of the following equipment suppliers, or equal:
  - 1. Asea Brown Boveri
  - 2. General Electric
  - 3. Westinghouse
  - 4. Controlled Power Corporation

### **2.02 COMPONENTS**

- A. Circuit breaker:
  - 1. NEMA SG4 and ANSI C37.06 for indoor use.
  - 2. Type: Three-pole, single throw, single interrupter per phase, drawout type, vacuum break, one drawout breaker per cubicle. The circuit breaker shall have its own set of wheels for drawout and shall not require a lifting device for this purpose.
  - 3. Rating on symmetrical basis:
    - a. Nominal voltage class, kV, rms: 34.5.
    - b. Nominal three-phase MVA Class: 1500.
    - c. Rated maximum voltage, kV, rms: 38.
    - d. Rated withstand test voltage:
      - 1) Low frequency, kV, rms; 80.
      - 2) Impulse, kV: 150.

- e. Rated continuous current at 60 Hertz, amperes, rms: 1,200.
  - f. Rated interrupting time, cycle: Five maximum.
  - g. Rated permissible tripping delay, sec: Two.
  - h. Rated voltage range factor (K): 1.65.
  - i. Rated short-circuit current at rated maximum kV, Amperes, rms: 21,000.
  - j. Maximum symmetrical interrupting capability, Amperes, rms: 35,000.
  - k. Three-second short time current carrying capability, Amperes, rms: 35,000.
  - l. Closing and latching capability, amperes, rms: 56,000.
4. Electrically powered, spring-charged, stored-energy operating mechanism, with the following additional requirements:
- a. Voltage requirements:
    - 1) Charging of stored-energy operating mechanism: 125 Volts dc.
    - 2) Closing by means of closing release coil capable of operation from 100-140 Volts dc.
    - 3) Tripping by means of shunt trip coil capable of operation from 70-140 Volts dc.
  - b. Mechanically and electrically trip-free.
  - c. Equipped with mechanical devices on front of breaker to actuate closing and tripping operations, in case of failure of control power.
  - d. Compressed spring stored-energy operating mechanism, with sufficient energy storage for opening/closing/ opening operation at rated short-circuit current or at rated required capabilities.
  - e. Stored-energy mechanism automatically charged within 10 seconds following each closing of circuit breaker.
  - f. Stored-energy mechanism suitable for manual charging by means of removable handle in case of failure of control power.
  - g. Mechanical indicator on front. of breaker to indicate that stored-energy closing mechanism is charged.
5. Racking mechanism:
- a. Horizontal drawout breaker: manually-operated mechanism designed to permit racking of breaker with door closed by inserting crank through opening of limited size maximum.
  - b. Racking mechanism gear ratio: To permit one man to rack breaker in and out manually in four minutes maximum.
  - c. When breaker element is in racked-out position, circuit breaker, complete with its operating mechanism, capable of being withdrawn from housing and moved on wheels integral with mechanism. Separate handling device for moving circuit breaker, other than transfer truck or fifth-wheel steering bar, is prohibited.
  - d. Positive stops for preventing overtravel and guides for proper alignment of breaker.
6. Grounding:
- a. When breaker is in connected position, case and frame grounded by positive contact with ground bus.
  - b. Breaker ground shoe designed to connect breaker frame to ground bus prior to engagement of primary breaker terminals.
  - c. Ground connection capable of carrying fault current equal to rated short-circuit current and related required capabilities.
7. Interlocks:
- a. provide suitable interlocks to perform the following functions:
    - 1) Automatic discharge of stored-energy mechanism of the circuit breaker prior to its racking in or withdrawal from the unit.
    - 2) Prevent racking in and out unless circuit breaker is in OPEN position.
    - 3) Prevent either electrical or manual operation of the breaker unless it is in the operating or test position. All circuit breakers to operate

- in test position and in the test position all remote and interlocking signals inhibited to and from the breaker.
- 4) Automatically close rectifier cathode circuit breaker (Device 72) when rectifier transformer feeder circuit breaker (Device 52R) is closed, unless the rectifier cathode circuit breaker has been locked out by Device 86.
  - 5) Automatically trip the rectifier cathode circuit breaker (Device 72) when the rectifier transformer feeder breaker trips (Device 52R).
  - 6) Automatically trip and prevent closing the rectifier transformer feeder circuit breaker (Device 52R) and rectifier cathode circuit breaker (Device 72) if the rectifier doors are opened.
  - 7) Electrically interlock the two incoming line circuit breakers and the bus tie circuit breaker so that all three circuit breakers cannot be closed simultaneously. Interlocking scheme shall not prevent closing of one incoming line breaker when the bus tie breaker only is closed and the other incoming line breaker is open.
- b. Mode of operation:
    - 1) Normal mode with both incoming line circuit breakers closed and with the bus tie circuit breaker open. Loss of voltage on either incoming line shall initiate automatic transfer of its bus section to the other incoming line provided that the bus section lockout relay has not operated. Re-transfer after restoration of service shall be manual, interlocked for dead transfer.
8. Primary Connection:
    - a. Connection between the removable and stationary unit made by male-and-female contacts, with the following additional requirements:
      - 1) Silver-plated, high pressure contacts.
      - 2) Automatic shutter to cover contact orifice when breaker is withdrawn to test position and to uncover orifice when breaker is returned to connected position.
      - 3) Automatic shutters constructed to withstand force of racking mechanism in case shutters fail to open when breaker is racked into positions.
  9. Secondary connection:
    - a. Control and interlocking circuit connections between stationary and removable elements of switchgear shall be made using device consisting of recessed stationary receptacle and set of self-aligning multiple-contacts to accommodate control, protection and interlock circuits, including spares, without resorting to auxiliary relays.
  10. Non-resettable mechanical operation counter registering one count for each circuit breaker closing operation.
  11. Mechanical position indicator, showing breaker as OPEN or CLOSED.
  12. Auxiliary switches:
    - a. Equip each circuit breaker with auxiliary switches, rotary type, operated in both the connected and test position with sufficient number of contacts for operation, indication and interlocking of the breaker together with at least eight spare contacts, four type "a" and four type "b", each wired through secondary disconnect device contacts to accessible terminal blocks.
- B. Potheads and Terminal Connectors
    1. Utility incoming line:
      - a. Provisions for mounting one double three-phase pothead or six single phase terminators furnished by Utility Company for incoming loop line connections and grounding.

- b. Short flexible connector installed between each pothead or terminator connecting lugs and rigid bus.
        - c. Pothead or terminator mounted in inverted position with incoming service cable at the top and connecting lugs below unless otherwise shown.
      - 2. Feeder breakers: NEMA CC1
        - a. Long barrel, double indentation compression type with NEMA standard two-hole contact pad for copper conductor. One piece tubular construction formed of tin plated copper.
- C. Buses:
- 1. General requirements:
    - a. Copper or aluminum bus bars of sufficient size to carry specified current without exceeding allowable temperature rise stated in ANSI, NEMA and IEEE Standards.
    - b. Capable of withstanding the mechanical stresses and heat from maximum short circuit current.
    - c. Bus connections bolted or welded. Contact surfaces of bolted connections silver-plated or tin-plated.
    - d. Each joint having impedance not more than that of bus bar of equal length and clamped to maintain such impedance throughout life of equipment.
  - 2. Power buses:
    - a. Three-phase, three-wire buses fully insulated to 150 kV BIL, with flame-retardant, nonhygroscopic, track-resistant insulation. Provide each bolted connection with minimum of four bolts equipped with palnut or equal and fully insulated.
  - 3. Ground bus:
    - a. Copper bus, not less than two inches by 1/4 inch provided throughout length of switchgear section.
    - b. In switchgear unit where power cables enter or leave switchgear at top as shown, copper ground bus not less than one inch by 1/8-inch extending from main ground bus to top of unit for grounding of incoming cable ground sheath or shielding tape.
    - c. Joints in ground bus made with tow bolts minimum.
    - d. Mechanical connector provided in each unit for field connection of 4/0 AWG to 500 KCMIL ground cable to switchgear ground bus.
  - 4. Control bus:
    - a. 125 Volt dc bus not less than 6 AWG copper.
    - b. One two-pole knife switch provided in each switchgear cubicle for disconnecting control circuit.
    - c. UL Class J fuses used for control and auxiliary service unfused.
    - d. Closing circuit fused: tripping circuit unfused.
    - e. White light mounted on control panel to indicate availability of dc control power.
  - 5. Incoming-line bus device for connecting portable ground clam
    - a. Connecting device consisting of copper bracket with 7/16-inch diameter bronze or copper rod positioned horizontally and parallel to rear of switchgear.
    - b. Connecting device mounted near cable termination on each incoming bus.
    - c. Connecting device to provide three-inch length between end supports of rod and minimum 2-1/2 inch radial clearance around rod.
    - d. Connecting device accessible from rear of switchgear following removal of bolted cover or opening of padlocked door.
    - e. 6-inch insulating barriers to be provided on each side of connecting devices or stirrups and extending to rear of switchgear a minimum of six inches all around.

- f. Size, thickness, insulating material and placement of insulating barriers designed to achieve adequate mechanical strength without compromising voltage withstand specified for switchgear.
    - g. Design coordinated and approved by Utility Company.
- D. Auxiliary unit:
  - 1. Indoor metal cubicle for installing potential transformers.
- E. Current transformers:
  - 1. ANSI C57.13, molded rubber or epoxy construction, wound type complying with ANSI requirements for relaying accuracy classification under burden imposed by devices specified. Mounted in a compartment isolated from the control panel.
  - 2. Current ratio: As specified or as determined by approved coordination study
  - 3. Insulation class:
    - a. 34.5 kV with basic impulse insulation level of 150 kV full-wave.
  - 4. Capable of withstanding thermal and magnetic stresses from flow of current equal to the momentary and interrupting rating of the circuit breaker.
  - 5. Maximum allowable temperature rise under continuous full load above an average ambient temperature of 55°C
    - a. By winding resistance: 30°C
    - b. By hottest spot in winding: 40°C
  - 6. Transformer secondary neutral and frame individually grounded by copper wire to switchgear ground bus. Keep each ground connection run as short as possible. Avoid grouping such connections with control or other wiring. Minimum ground wire size: size 8 AWG for secondary and size 6 AWG for frames.
  - 7. Transformer secondary equipped with covers and integral shorting bars. Secondary wiring run to readily identifiable terminal block points with integral shorting bars, in the control compartment.
- F. Potential transformers:
  - 1. ANSI C57.13, molded-rubber or epoxy, of the following configurations:
    - a. Current-limiting primary fuses mounted on drawout carriage.
    - b. Drawout transformers with integrally mounted fuses.
  - 2. Connection: phase-to-phase
  - 3. Voltage ratio: 34.5 kV to 120 Volts.
  - 4. Insulation class: 34.5 kV with basic BIL impulse insulation level of 150 kV full-wave.
  - 5. Maximum allowable temperature rise under continuous full load above average ambient temperature of 55°C:
    - a. By winding resistance: 30°C.
    - b. By hottest spot in winding: 40°C.
  - 6. Fuse grounding contacts: HV terminal of primary fuses grounded with carriage at drawout position.
- G. Meters:
  - 1. Ammeters: ANSI C39.1 and ANSI C12, switchboard type with 250 or 270 degree scale, approximately seven inches long with plus or minus one percent accuracy:
    - a. Ammeters: Five-ampere, transformer-rated with scale range equal to the associated current transformer primary rating.
    - b. Voltmeters: Rated 0-150 volts for use with 0-18 scale
  - 2. Digital Power Meter: ANSI C37.90.1 and ANSI C12.
    - a. A digital power meter, Siemens 4700 or equal, shall be provided to monitor circuits shown on the one-line diagram and specified here. The meter shall measure the real-time RMS values of phase currents, ampere demand, and phase and line voltages plus power measurements including kW, kW demand, kW hours, kVA, kVAR hours. Power factor and frequency shall also be measured. Resettable minimum and maximum values for each

measured value shall be recorded in nonvolatile memory. The kW and ampere demand period shall be user programmable from one to sixty minutes. A one volt nominal auxiliary voltage input shall also be provided. Accuracy of current and voltage measurements shall be 0.25% and kW, kW hour and other power measurements shall be 0.50% or better. The power meter shall be capable of high sampling of wave form for power quality analysis and measurement of harmonics in current and voltage wave forms.

- b. The digital power meter shall be listed under UL1244 and meet requirements of applicable ANSI Standards including ANSI C37.90.1 requirements for surge withstand and fast transient tests. All configuration information such as CT ratios, voltage scales, and communications address shall be stored in nonvolatile memory so that it can be set either from the integral display or remotely using the communications module. No batteries shall be required to maintain configuration information indefinitely. The meter shall derive power from a separate 125 V ac or dc source.
- c. Display: The digital power meter shall include an integral illuminated display for reading all real-time and min/max measured values as well as programming initial configuration and any relay set-points. The display shall consist of at least twenty .4 inch high alphanumeric characters and be operated using clearly labeled sealed membrane keys with stainless steel switch elements for long mechanical life and resistance to atmospheric contamination. The digital power meter with integral display shall be flush mounted on equipment doors or panels. Operation of the power meter to read real-time or min/max measured values or to program configuration and any relay set points shall not require opening door or removing panels. A user-defined password shall be required to change configuration, reset min/max log and kW/kVAR hours or change any relay set-points.
- d. Relay: Three programmable relay outputs shall be provided to activate and release based on threshold and time-delay values associated with any of the measured parameters. Remote relay operation shall be possible through the communications module. The relay shall be form C rated 10A 120Vac/24Vdc. Activation and release of the relays shall be recorded in a non-volatile log with cause of operation. The log shall record at least the last 50 events. Four discrete inputs shall also be provided to monitor status of NO or NC contacts. One of the discrete inputs shall also be capable of counting state changes. A programmable auxiliary 0 to 1mA or 4 to 20mA analog output shall also be provided.
- e. Communications: A communications module shall be provided using an industry standard RS-485 (or RS-232) serial bus to remotely read real-time and min/max measured values, interrogate the event log, reset min/max and kW/kVAR hours and program configuration and any relay setpoints. A means shall be provided to periodically synchronize the meter's internal clock with a master bus clock so that the meter's event and min/max logs are accurately time-stamped within one second. The RS-485 module shall provide at least 500V galvanic isolation between the meter and other devices on the communications bus. Up to 6 channels 0 to 1 or 4 to 20mA dc analog transmission of output data shall also be provided.
- f. Extended memory: The power meter shall include extended nonvolatile memory to record at least 100 snapshots of each measured parameter. The interval between snapshots shall be readable using the communications module.
- g. Portable Computer:
  - 1) Portable, Notebook Design with:
    - a) Latest Intel-based Processor (Pentium III as of year 2000).
    - b) 128 MB RAM

- c) 2 PCMCIA Slots Type II,
  - d) Local Bus Graphics,
  - e) Color Active Matrix Screen (256 colors)
  - f) 3 Hours Batter w/Charger and AC Adapter,
  - g) 3.5", 1.44 MB Floppy Drive,
  - h) CD Rom,
  - i) 4+GB Hard Drive,
  - j) Built-in Center Trackball and external Mouse
  - k) Internal Fax Modem;56K Baud,
  - l) Carrying Case
- 2) Provided with the following latest versions of software:
- a) Latest version of Microsoft Windows Operating System for PC (Windows 98 as of year 2000)
  - b) Latest version Microsoft word on PC
  - c) Latest Version Microsoft Excel on PC
  - d) Exclusive communication software and 10' cables to interface DPM communication protocol, plus DOS 6.x Operating System

H. Protective relays:

1. General requirements:
  - a. Semi-flush mounted, electro-magnetic induction disc adjustable drawout relays, overcurrent and under/over voltage type, each with test switches, except clapper type relays, when used, surface mounted on a fixed portion of the structure. Solid state relays shall not be allowed.
  - b. Rustproof metal rectangular cases finished in dull black.
  - c. With targets, hand reset for targets and seal-in units.
  - d. Contact and adjusting device readily visible, accessible and adjustable from front of relay.
  - e. Designed, constructed and tested in accordance with applicable requirements of ANSI C37.90.
2. Overcurrent relay general requirements: Select overcurrent relay characteristics, ranges and settings to provide the protection and coordination specified.
3. Transformer-rectifier feeder unit overcurrent relays
  - a. Relays 50/51 phase-time and instantaneous overcurrent relays, relays 50N/51N residual ground-time and instantaneous overcurrent relay, relays 51A phase-time overcurrent relay and relays 51B phase-time overcurrent relay.
  - b. Relay 51A to protect against overloads beyond the 300 percent, one minute capability of the units.
  - c. Relay 51B to protect against overloads beyond the 450 percent, 15 second capability of the units and coordinated with relay 51A.
  - d. Relays 50/51 and 50/51N set as low as practicable to provide maximum fault protection and to coordinate with relays 51A and 51B.
  - e. Relays 51A, 50/51 and 50/51N operating associated lockout relay, which in turn trips the unit cathode breaker and the transformer-rectifier feeder breaker.
  - f. Relay 51B equipped with auxiliary relays to trip all dc track feeder breakers on the associated dc bus.
4. Bus tie unit Overcurrent relays.
  - a. Relays 50/51 phase-time and instantaneous overcurrent relays, relays 50N/51N residual ground-time and instantaneous overcurrent relays.
  - b. Relays 50/51 and 50N/51N set as low as practicable to provide maximum bus fault protection and to coordinate with transformer-rectifier unit overcurrent relays.
5. Incoming line unit Overcurrent relays

- a. Relays 50/51 phase-time and instantaneous overcurrent relays, relays 50N/51N residual ground-time and instantaneous overcurrent relays.
    - b. Relays 50/51 and 50N/51N set as low as practicable to provide maximum fault protection and to coordinate with bus tie unit and transformer-rectifier unit overcurrent relays.
  - 6. Voltage relays
    - a. Relays 27/59 undervoltage/overvoltage, single-phase, time voltage relay.
    - b. General Electric Company Type IAV or equal.
  - 7. Lockout relays: Rotary, hand-reset, 125 Volt dc, lockout relay, equipped with green light for indicating reset position.
  - 8. Auxiliary relays: Provided where required, General Electric Company Type HGA or HFA or equal, mounted inside instrument compartment.
- I. Switch and Indicating Lights:
  - 1. General: Rotary type, cam actuated switches with escutcheon and silver to silver contacts rated 20 Amperes. Contacts enclosed in easily removable covers.
  - 2. Circuit breaker control switch: Equipped with heavy duty pistol-grip handles and operation targets. Escutcheon engraved "Trip-Close" with spring return to normal. Wired to operate the associated circuit breaker when the Local Remote selector switch is in the Local position. With indicating lights as follows:
    - a. Red light: Circuit breaker closed, wired to supervise the trip coil.
    - b. Green light: Circuit breaker is open.
    - c. Amber light: Circuit breaker is automatically tripped.
  - 3. Supervisory control selector switch: Equipped with oval handle. Escutcheon engraved "Local Remote". With a white indicating light to indicate when the switch is in the local position.
  - 4. Test switches: Provided between instrument transformers and the protective relays.
  - 5. Indicating lights: LED panel indicator lamp, CPC Part Number 6038-600-1 or equal.
- J. Control panel:
  - 1. For relays, meters and control equipment, hinged panel of formed steel, with rolled edges, door stop and conveniently located handle for opening.
- K. Line voltage indicators: Neon glow-tube capacitance-coupled high-voltage indicators, Airco Type RS or equal. Glow tube shall be visible without opening the rear door of breaker cubicle.
- L. Surge arresters:
  - 1. Provide metal oxide type surge arresters, rated 27kV line to ground, for each circuit breaker (except bus tie breaker) for the suppression of switching surges
- M. Space heaters:
  - 1. Each vertical section unit of switchgear provided with 120-volt, single-phase, 60 hertz heating element to facilitate drying and prevent condensation.
  - 2. Two 120-volt circuits will be provided. Divide heater load evenly between the two circuits.
  - 3. Heaters enclosed in grill guard with no sharp edges and located so that they are accessible for replacement without requiring de-energization of switchgear bus. Heaters controlled by thermostat adjustable from 40F to 80F. Panel ammeter, approximately 2-1/2 inches square, marked to indicate heater load. Thermostat set in accordance with manufacturer's recommendations.
  - 4. Power and control circuits to heaters and thermostat connected and protected up to devices and to incoming junction box with 3/4-inch minimum size conduit. Heater power junction box sized four inches square by two inches minimum depth and located at top of switchgear for top entry of minimum 3/4 inch conduit. Remote connection leads to power source labeled: 120V and NEUTRAL.

- N. Instrument and control wiring:
1. Instrument and control wiring includes electrical interlocks and intercompartment wiring factory installed in accordance with the following requirements:
    - a. Wire: Copper conductor minimum 14 AWG, insulation rated 600 Volt, type SIS or equal. Use flexible Class C or higher stranded insulated copper wire for wiring across hinged joints. Use twisted, shielded pair wires for overcurrent and voltage relays.
    - b. Use one continuous length of wire from terminal to terminal without splice or tap.
    - c. Install and connect removable element control wiring in accordance with manufacturer's standard for circuit breaker wiring.
    - d. Design and install control wiring so that trouble in one main circuit can not be communicated to control wiring of another main circuit.
    - e. Make connections only at terminals of device, on terminal blocks or on control buses. Make wiring connections using insulated flange fork tongue type terminals.
    - f. Terminate interconnecting wiring between cubicles and compartments on terminal blocks before wiring to components.
    - g. Terminal blocks: With washerhead screw-type terminals, circuit-marking strips for indicating control wire number, phenolic laminated dust cover and 10% minimum spare terminal points.
    - h. For each wire, use corresponding identification on terminal block marking strips and identify internal wiring at each termination, with same number as that shown on wiring diagram, using plastic sleeve
    - i. External wiring:
      - 1) External control wiring to enter from top.
      - 2) Allow space to route and terminate external single-conductor or multiple-conductor control cable.
      - 3) Top entrances provided with removable cover plates for field drilling of conduit and cable entrance holes.
- O. Supervisory control and indication:
1. Control:
    - a. Provisions for closing and tripping each circuit breaker from the remote supervisory control system. Interposing relays for interface having 24 volt dc, 15 VA maximum coils and equipped with arc suppression network. Supervisory control enabled only with Local-Remote switch in Remote position and circuit breaker in the connected position.
    - b. Indication:
      - 1) Contact from each circuit breaker from remote indication circuit breaker position as follows:
        - a) Closed: Circuit breaker closed and in the connected position.
        - b) Tripped: Circuit breaker open or in the test or disconnected position.
    - c. Contact from each lockout relay and each incoming line undervoltage relay for remote indication of relay status (Normal-Abnormal).
    - d. Contact requirements:
      - 1) Dry contacts with a maximum load rating of 15 Volt Amperes, a maximum dc current of one Ampere and maximum switching voltage of 250 Volts dc.
      - 2) Contact bounce not to exceed five milliseconds.

- P. Maximum Mounting Height of Relays, Instruments, Meters and Devices shall be 90 inches above finished floor. If necessary, rectifier transformer feeder relays may be mounted on the rectifier.
- Q. Enclosure:
1. Dead-front, free-standing indoor metal enclosure.
  2. Steel structure with frame work of welded or bolted structural steel, free from distortion and welding strain and sufficiently rigid to support equipment under normal and short-circuit conditions.
  3. Switchgear cubicles and circuit breaker compartment equipped as follows:
    - a. 34.5 kV enclosure
      - 1) Front: Hinged door :
      - 2) Rear: Hinged door with provisions for padlocking with the following additional requirements for Utility Company Incoming Cubicles:
      - 3) Rear hinged door capable of 180 degree swing.
    - b. Hinged front door in accordance with the following:
      - 1) Handle and three-point latch to hold door securely closed.
      - 2) Door stop to hold door open.
      - 3) Structural reinforcing provided as necessary to prevent sagging of door.
      - 4) Circuit breaker compartment door designed not to hinder movement of breaker in and out of compartment when door is open and door-stop set.
    - c. Circuit breaker cubicles to provide for interchangeability of removable circuit breaker elements.
  4. Finish: Metallic surfaces degreased, primed and finished with light gray enamel, Color No. 61, ANSI Z55.1 in accordance with reference standard unless other wise specified; two mils minimum dry film thickness.
  5. Switchgear assemblies shall include provisions for future extension from either end.
- R. Nameplates:
1. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless steel rivets or screws. Vertical gothic lettering using a round or square cutter. V-shaped groove is prohibited.
  2. Provide nameplate on each switchgear showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable in accordance with reference standard.
  3. Provide additional functional nameplates for each component including relay, terminal block and other devices.
    - a. Each switchgear compartment labeled, front and back, with nameplates 2-1/2 inches by 6-1/2 inches, inscribed in letters 1/2 high: INCOMING LINE PRIMARY BREAKER NO. 1,(2); RECTIFIER-TRANSFORMER FEEDER BREAKER NO. 1, (2), (3); or AUXILIARY COMPARTMENT, as appropriate.
    - b. Each circuit breaker compartment labeled, front only, with nameplate 2-1/2 inches by 6-1/2 inches, inscribed in letters 1/2 inch high with the circuit breaker Supervisory Control Identification Number, as shown in Section 16051 Table II. A typical example of engraving is as follows:  
 SUPV CONTROL NO.  
 E-D13-11
    - c. In addition to other information normally displayed on equipment, provide one-inch nameplate showing in letters 1/2 inch high switch positions, meaning of indicator lamp and other pertinent information.
- S. Major components shall be products of same manufacturer.

- T. Unit Functional Component Listings: Items of equipment required for each switchgear unit shall be as follows as minimum, and as shown on drawings:
1. Incoming line unit:
    - a. One - Metal-Clad Stationary Unit
    - b. One - Bus, 3-phase, 1200 Amperes
    - c. One - Circuit Breaker, 1200 Amperes
    - d. One - Provisions for Power Company Cable Terminator
    - e. Three - Current Transformers, ratio as required for relaying
    - f. Three - Phase time and Instantaneous Overcurrent Relays, Device 50/51
    - g. One - Residual Ground Time and Instantaneous Overcurrent Relay, Device 50N/51N
    - h. One - Lockout Relay.
    - i. One - Time Under and Over Voltage Relay, Device 27/59
    - j. One - Digital Power Meter
    - k. One - Test Switch, Westinghouse No. 129A517G01 on line side of overcurrent relays.
    - l. Two - Test Switch, Westinghouse No. 129A517G01 on line side of undervoltage relays and for lockout relays.
    - m. One - Circuit Breaker Control Switch
    - n. One - Supervisory Control Selector Switch
    - o. Three - High Voltage Neon Indicating Lights.
    - p. Three - Metal Oxide Surge Arresters.
  2. Bus tie unit:
    - a. One - Metal-Clad Stationary Unit
    - b. One - Bus, 3-phase, 1200 Amperes
    - c. One - Circuit Breaker, 1200 Amperes
    - d. Three - Current Transformers, ratio as required for relaying
    - e. Three - Phase Time and Instantaneous Overcurrent Relays, Device 50/51
    - f. One - Residual Ground Time and Instantaneous Overcurrent Relay, Device 50N/51N
    - g. One - Lockout Relay
    - h. One - Test Switch Westinghouse No. 129A517G01, for protective relays.
    - i. One - Circuit Breaker Control Switch
    - j. One - Supervisory Control Selector Switch
  3. Rectifier-transformer feeder unit:
    - a. One - Metal-Clad Stationary Unit
    - b. One - Bus, 3-phase, 1200 Amperes
    - c. One - Circuit Breaker, 1200 Amperes
    - d. Three - Terminal connectors for 1/C #1/0 cables.
    - e. Three - Current Transformers, ratio as required for relaying, with test switch
    - f. Three - Phase Time and Instantaneous Overcurrent Relays, Device 50/51
    - g. Three - Phase Time Overcurrent Relays, Device 51A.
    - h. Three - Phase Time Overcurrent Relays, Device 51B, with Auxiliary Relays, Device 51BX, as required.
    - i. One - Residual Ground Time and Instantaneous Overcurrent Relay, Device 50N/51N.
    - j. One - Lockout Relay
    - k. One - Ammeter, Suitable Scale, with Test Switch
    - l. One - Circuit Breaker Control Switch.
    - m. One - Supervisory Control Selector Switch.
    - n. One - Kirk key interlock for use with no-load tap changer on rectifier transformer (to be coordinated with supplier of rectifier transformer).
    - o. Three - Metal Oxide Surge Arresters.
  4. Auxiliary unit:
    - a. One - Metal-Clad Stationary Unit.
    - b. One - Bus 3-phase, 1200 Amperes.

- c. Two - Incoming Line Potential transformers 34.5 kV - 120 volt, with Primary Fuses.
- 5. Leveling Channels:
  - a. Steel.
  - b. Size and configuration as recommended by the switchgear manufacturer.
- 6. Additional Circuit Breaker Elements:
  - a. Additional circuit breaker elements as indicated in Section 16051 Table III.

**2.03 ACCESSORIES**

There shall be one set of the following accessories for each substation:

- A. One breaker test cabinet with provision for electrical operation of circuit breaker with control switch and provision for other accessories as necessary.
- B. Crank for manually racking circuit breaker in switchgear cubicle
- C. One circuit breaker maintenance lever with insulated handle.
- D. One spare set of each type of high-voltage fuse.
- E. One complete set of relay test plugs and relay test switch.
- F. One set of special tool necessary for erection, operation and maintenance of switchgear including those recommended by relay manufacturer and including breaker secondary or control disconnect coupler.
- G. Pegboard: Hardboard, AHA IS 1, tempered, SIS, 1/4 -inch nominal thickness, perforated, sized to accommodate all products specified. Framed with one-inch by one-inch hardwood. Frame and hardboard painted color selected by the Engineer. Include hardware for wall mounting and pegboard accessories suited to the products to be mounted. Provide nameplates as specified, one inch wide with accessory names inscribed in 1/2 inch vertical letters.

**PART 3 - EXECUTION**

**3.01 INSTALLATION**

- A. Floor Preparation:
  - 1. Fill existing floor depression with concrete flush with finish floor. Finish concrete to the tolerances recommended by the switchgear manufacturer. Install leveling channels as recommended by the switchgear manufacturer and as shown on the approved shop drawings.
- B. Install switchgear as shown on drawing, in accordance with approved shop drawings, and as follows:
  - 1. Contractor shall make the bus connections at each shipping split.
  - 2. The number of shipping splits in ac switchgear for each substation is given below:

<u>NAME OF SUBSTATION</u>	<u>No. of shipping Splits</u>
---------------------------	-------------------------------

[LOCATION-TBD ] TPS	[ TBD ]
---------------------	---------

- C. Install conduit and raceways as approved and in accordance with Section 16052.

- D. Make power cable and control wire connections as approved and in accordance with Section 16052.
- E. Make grounding connections as shown on drawings and approved.
- F. Arrange with the power companies for making connections with incoming lines; and for installation of CT, PT, PT fuses, and metering equipment.
- G. Use services of manufacturer's engineering representative for assistance in field assembly and installation in accordance with Section 16051.
- H. Connect space heater circuit to prevent condensation during installation.
- I. Install ac circuit breaker test cabinet and connect it to 125-volt dc supply as shown.
- J. Install pegboard at location approved by Engineer. Mount switchgear accessories and associated nameplates on pegboard.

### **3.02 FIELD QUALITY CONTROL**

- A. Verify tolerances of concrete floor finish and level of channels.
- B. Switchgear Field Testing and Inspection: In accordance with Section 16051.

**END OF SECTION**

## SECTION 16341

### METAL-ENCLOSED DC SWITCHGEAR FOR TRACTION POWER

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This section includes
1. furnishing, delivering and installing 700 Volt dc switchgear and spare parts.
- B. Related Sections:
1. Section 16051- Scope of Work For Traction Power
  2. Section 16052 - Basic Materials and Methods For Traction Power
  3. Section 16128 - Wire and Cable For Traction Power
  4. Section 16129 - 2000 Volt Shielded Cable for Traction Power
  5. Section 16261 - Transformer-Rectifier Units For Traction Power
  6. Section 16291 - Local Annunciator Panel For Traction Power
  7. Section 16292 - Remote Terminal Unit (AEMS RTU) For Traction Power
  8. Section 16293 - Mimic Panel-Storage Yard
  9. Section 16321 - High Voltage AC Switchgear (13.8kV) For Traction Power
  10. Section 16322 - High Voltage AC Switchgear (34.5kV) For Traction Power
  11. Section 16441 - Drainage and Negative Switchboard For Traction Power
  12. Section 16451 - Substation Busways For Traction Power
- C. Compensation for work specified in this section related to Equipment will be made in the manner of Lump Sum. In addition, other payment as described below will be paid on a unit basis.
1. 750 Volt DC Cathode Circuit Breaker removable element, 6,000 amps: Each
  2. 750 Volt DC Cathode Circuit Breaker removable element, 8,000 amps: Each
  3. 750 Volt DC Feeder Circuit Breaker removable element, 6,000 amps: Each
  4. 750 Volt DC Positive/Negative Tie Circuit Breaker removable element, 8,000 amps: Each
- D. Compensation for work specified in section associated with installation will be made in the following manner:
1. Included in the lump sum installation cost of each traction power substation and tie-breaker station.

##### 1.02 REFERENCES:

- A. Codes, Regulations and latest editions of the Reference Standards and Specifications:
1. Codes and regulations of jurisdictional authorities.
  2. NEC, NESC.C2.
  3. NEMA: CC1
  4. ANSI/IEEE: C37.100, C37.14, C37.16, C37.16a, C37.17, C37.20.1, C39.1, Z55.1.
  5. ASTM: B187
  6. AHA: IS1.
  7. ISO: 9001

##### 1.03 SYSTEM DESCRIPTION

- A. Design Criteria:
1. Floor loading: Compatible with floor design loading of 250 pounds per square foot.
  2. Switchgear suitable for anchoring to a concrete floor steel float finished to tolerance

- level of 1/8 inch in 10 feet and covered with insulating topping material.
- 3. Numbers, types and arrangements of switchgear units as shown on contract drawings.
- 4. Switchgear design shall be provided with the cable shield monitoring systems, suitable for installation of shielded feeder cables, including termination of cable shields and feeder conductors in the switchgear cubicles.

#### 1.04 SUBMITTALS

Submit the following for approval in accordance with Special Conditions and with the additional requirements as specified for each:

- A. Shop Drawings: In accordance with Section 16051, Table I.
- B. Certification:
  - 1. Design Tests reports or certified copies of test reports for identical units performed for each type and rating of switchgear and circuit breaker as assembled in its complete switchgear unit, furnished under this contract. Test shall have been conducted not more than four (4) years prior to submittal to the Authority. Certified test reports shall be certified by an independent ANSI certified factory in the USA.
  - 2. Certified test reports for specified factory production testing.
  - 3. Certificates from manufacturer verifying that equipment conforms to the specified requirements.
  - 4. Certify switchgear complies with floor design loading of 250 pounds per square foot.
- C. Documentation:
  - 1. Short-circuit calculations and system coordination study in accordance with Section 16051.
- D. Operations, Maintenance Manuals and PMI: In accordance with the following:
  - 1. **Preventive Maintenance Instruction (PMI)**

The O&M Manual provided for contractually furnished or installed equipment shall include a "Preventive Maintenance Instruction" (PMI) section, to ensure the continued safe and reliable operation of the specific system or equipment. This section of the manual shall contain the manufacturer's and/or installer's recommended procedures for periodic inspection and maintenance of the equipment. Training on these procedures shall be included in the contractor provided maintainer training curriculum. If the section contains more than one PMI procedure the section shall begin with a Table Of Contents.

The PMI procedures shall be written in language easily understood by every maintainer skill level of the responsible WMATA maintenance discipline. Prior to acceptance, clarity and effectiveness of each PMI procedure shall be demonstrated in coordination with the maintenance discipline using the recommended minimum number of the lowest skill level maintainers. The maintenance team or individual must be able to understand and successfully perform the draft PMI without coaching from contractors or engineers. Each procedure shall be formatted similar to standard PMI formatting as currently approved by the WMATA maintenance discipline responsible for future maintenance of the equipment, including a standard approval

signature cover sheet. Sample PMIs, as formatting examples, may be obtained from the appropriate maintenance discipline after contract award. Each procedure shall contain:

- a. A recommended performance frequency (interval) that is adjusted to the installed environment and expected level of use
- b. the maintenance crew size and average time for performance of the PMI
- c. the system-specific and/or equipment-specific objectives of the PMI.
- d. lists of:
  - 1). prerequisites
  - 2). required reference documents
  - 3). industry standards or regulations governing the performance of the maintenance action.
  - 4). necessary tools and test equipment
- e. definitions and graphics, as much as practical to clarify instructions
- f. Warnings, Cautions and Safety Notices, plentifully and prominently interspersed to prevent injury, damage or unsafe operating conditions before any procedure step to which they apply
- g. data-sheets and check-lists, for data collection regarding conditions that are measured and to ensure that important steps are not skipped
- h. step-by-step instructions to verify and document that all safety features of the equipment or circuit are operational, functioning properly and .are not being defeated or compromised
- i. step-by-step instructions to verify and document that the tested mechanism or circuit or subsystem functions within design parameters
- j. step-by-step instructions, types of solvents, cleansers and lubricants with intervals for lubrication and cleaning of mechanisms to prevent or minimize grime, corrosion and wear
- k. step-by-step instructions to verify the adjustment of the system, equipment or circuit which will allow it to operate properly (safely, reliably and without causing excessive wear) until the next scheduled PMI

- l. step-by-step instructions to verify the integrity of all fasteners, couplings, electrical connections, etc. which may fail or loosen between scheduled maintenance intervals
- m. step-by-step instructions to document the measured condition of the equipment or circuit, to be used for abatement of deterioration, future failure analyses and in case of catastrophe
- n. step-by-step detailed adjustment instructions for any mechanism or circuit found to be out-of-adjustment

E. Spare Parts Lists.

### 1.05 QUALITY ASSURANCE

- A. Qualification: Select a manufacturer/installation contractor who is regularly engaged in production of similar switchgear and has demonstrated a successful record of providing/installing equipment of similar type and rating for extra heavy duty traction service for at least five similar projects. **The equipment manufacturer will be required to submit documentation to support these qualifications as part of the Pre-Award process.** The equipment manufacturer shall have **as a minimum** ISO 9001 certification.
- B. For codes, Regulation, Reference Standards and Specifications refer to Article 1.02 above.
- C. Factory Testing: Submit test plans and procedures for all production tests and scheduled test date for approval at least **30** working days in advance of scheduled test dates. No test results will be accepted prior to receipt and approval of test plans and procedures. Factory test requirements are as follows:
  - 1. Circuit breaker design and production tests in accordance with the latest edition of ANSI/IEEE C37.14, ANSI/C37.16/16a, including the following as applicable:
  - 2. Design tests:
    - a. Sequence 1:
      - 1) Short-time current test.
      - 2) Continuous current test.
      - 3) Load (low) current switching tests.
      - 4) Endurance test.
      - 5) AC dielectric withstand test at 60%
    - b. Sequence 2:
      - 1) Trip device calibration check test.
      - 2) AC dielectric withstand test
      - 3) Peak current test.
      - 4) Short-circuit current test.
      - 5) Trip device calibration check test.
      - 6) AC dielectric withstand test at 60%.
    - c. Production tests shall include the following:
      - 1) Calibration test.

- 2) Control, secondary wiring, and device check
  - 3) Dielectric withstand voltage test.
  - 4) No-load operation test.
3. Switchgear assembly tests: **Table of compliance for these requirements shall be included, with all laboratory test data, photographs, etc. provided as attachments. For any tests conducted after contract award, notify the Authority Representative prior to testing to allow witnessing of tests. The following tests are required in accordance with the requirements of ANSI C37.20.1.**
- a. Design Tests:
    - 1) Dielectric tests.
    - 2) Rated continuous current test.
    - 3) Momentary current tests.
    - 4) Mechanical endurance tests.
    - 5) Rod entry test.
    - 6) Flame resistance tests for applied insulation.
    - 7) Short time current withstand test.
    - 8) Paint qualification test.
    - 9) Short circuit current withstand test.
  - b. Notify the Engineer not less than **21** days prior to factory testing to allow witnessing of tests.
  - c. Production Tests: All tests in accordance with requirements of ANSI C37.20.1
  - d. Control wiring tests:
    - 1) Check wiring for accuracy, open circuits and short circuits, ground connections, and insulation integrity by means of high-potential, continuity and operational tests.
    - 2) Subject wiring to high-potential test of 1,500 Volts 60 Hertz to ground for one minute.
    - 3) Verify that wiring is in accordance with manufacturer's wiring diagrams.
    - 4) Check wiring complete, including interconnections at shipping breaks.
- D. Major Components: Products of the same manufacturer.
- E. **Components, Limit Switches, Relays, Assemblies and Sub-assemblies: All shall be listed or labeled and be rated for utility or heavy-duty industrial use. All components that are not Listed shall be identified as NOT LISTED in the parts list submitted for approval prior to manufacture. The Authority may direct the manufacturer to use an alternative that is Listed if another comparable Listed device is available.**

#### **1.06 DELIVERY, STORAGE, AND HANDLING**

- A. Equipment for each facility shall be delivered after its completion and in accordance with the facility access dates in Special Condition and shall be coordinated with the Engineer.
- B. Ship each unit securely packaged, braced and labeled for safe handling in shipment and to avoid damage or distortion.

- C. Temporary Bracing: Where necessary, brace switchgear for hoisting, lowering and skidding into position. Label temporary internal bracing: TEMPORARY-REMOVE BEFORE OPERATION
- D. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact record chart with manufacturer's instructions for disposition of damaged material.
- E. Assembly for Shipment:
  - 1. Design enclosures to permit lifting by jacks or slings and moving horizontally on rollers or skidding in any direction.
  - 2. Maximum dimensions of shipping sections to be coordinated with the dimension of doors and access hatches to ensure shipping dimension will allow movement of switchgear through structure without damage to equipment or structure or undue difficulty.
  - 3. Draw-out relays mounted in their proper cases with moving parts properly secured and packed for shipment.
  - 4. Removable circuit breaker elements packaged separately.
  - 5. For shipping split, interconnecting wiring coiled on one side of the shipping split with matching terminal block on other side of split. Wiring and terminal block points identified for reconnection.
- F. Store switchgear in secure and dry storage facility.
- G. Temporary Bracing: Where necessary, brace switchgear for hoisting, lowering and skidding into position.

## **PART 2 - PRODUCTS**

### **2.01 MANUFACTURERS**

- A. The switchgear shall be manufactured by one of the following or equal:
  - 1. English Electric
  - 2. Whipp & Bourne
  - 3. Control Power Corporation

### **2.02 EQUIPMENT**

- A. DC Switchgear: Metal-enclosed, drawout power circuit breaker switchgear in accordance with the following:
  - 1. The switchgear shall be manufactured in accordance with specified standards and shall have latest ANSI/NEMA/IEEE certification as applicable, prior to award of contract.
  - 2. NEMA SG5 and ANSI C37.20.1 for indoor use.
- B. Ratings:
  - 1. Maximum voltage: 800 Volts, dc.
  - 2. Rated voltage: 750 Volts, dc.
  - 3. Power frequency withstand: 4.2 kV, rms.

- C. Insulation structure:
1. Not to support combustion, produce toxic gases, absorb moisture or track.
  2. When subjected to electric arc, emission of conducting materials from insulating structure limited so as not to interfere with performance of circuit breaker.
- D. Power circuit breakers:
1. NEMA SG5, ANSI/IEEE C37.14, ANSI C37.16/16a, C37.17, single-pole, single-throw, air break, drawout type, **high-speed, with electrically controlled solenoid closing, mechanically latching, and electrically controlled tripping, mechanically** and electrically trip-free, complying with applicable parameters in Table 11 of ANSI C37.16a and with the following additional requirements. For the purposes of this specification, a single-pole breaker constitutes a switching device with a single current path and a single arcing path during current interruption
    - a. Rated voltage: 750 Volts dc.
    - b. Rated maximum voltage: 800 Volts dc.
    - c. Insulation dielectric withstand: **4200** Volts.
    - d. Continuous Current ratings:
      - 1) Cathode circuit breaker: 8,000 Amperes, dc, as indicated, capable of carrying the rated overloads **corresponding to 3000kW extra heavy duty traction rated silicon rectifier.**
      - 2) **Feeder circuit breaker: 6000 ampere dc, as indicated.**
      - 3) Positive and Negative Bus Tie Breakers: Ampere ratings, **8000 ampere.**
    - e. Short-circuit interrupting capacity: **200kA. In addition**, feeder breakers high speed, capable of interrupting the theoretical maximum fault current supplied from silicon rectifier units with a total capacity of 9000 kW. Cathode circuit breakers complying with rated peak current and short-time current ratings in Table 11, ANSI C37.16a.
    - f. Operation counter: Non-resettable with at least four digits for recording trip operations.
    - g. Endurance: Electrical and mechanical endurance performance not less than requirements in ANSI C37.16/16a.
    - h. Control voltage:
      - 1) 125 Volts dc nominal, individually fused
      - 2) Upon loss of control voltage, a DC feeder circuit breaker shall automatically open. The under voltage release mechanism shall be designed and rated to operate at 135V DC without overheating.
    - i. **Racking mechanism: The circuit breaker alignment, shutter mechanism and racking mechanism are considered an integral part of the circuit breaker. There shall be adequate clearance between equipment of the circuit breaker element and all equipment mounted on the switchgear enclosure. The racking mechanism shall be designed and constructed for moving the breaker between three (3) positions : the disconnected, test and connected positions. By rotating the racking mechanism clockwise the breaker moves toward the connected position and when in the fully racked-in connected position the**

racking mechanism turns freely. Rotating counterclockwise the breaker will withdraw from the connected to the test and then to the disconnected position. Use of electro-mechanical toggle device for racking mechanisms shall not be permitted. With connected, test and disconnected positions; manually operated closed-door mechanism by preventing overtravel, guides for alignment of breaker with stationary unit and an indicator to show breaker position within the compartment; racking mechanism gear ratio shall be designed in combination with design of shutters covering main stationary disconnect, such that shutters can withstand the force of racking mechanism if shutters fail to open as breaker is racked in.

- 1) Connected position: Both primary disconnect device and secondary disconnect device in full contact, breaker ready for normal operation.
  - 2) Test position: Primary disconnect device open and separated by a safe distance, secondary disconnect device in full contact.
  - 3) Disconnected position: Both primary disconnect device and secondary disconnect device open and separated by a safe distance.
- j. Primary connection (main disconnects): Connections between the removable and stationary unit made by male-and-female contacts, with the following additional requirements:
- 1) Silver-plated, high pressure contacts.
  - 2) Automatic shutter to cover the contact orifices when the breaker is withdrawn and uncover the orifices when breaker is returned to connected position.
  - 3) Automatic shutters constructed to withstand force of racking mechanism in case shutters fail to open when breaker is racked into connected position or shutter opening visible as breaker is racked into position.
- k. Secondary connection (control and auxiliary disconnects): Control and interlocking circuit connections between stationary and removable elements of switchgear made using device consisting of recessed stationary receptacle and set of self-aligning contacts to accommodate control and interlock circuits, including spares, without resorting to auxiliary relays.
- l. Auxiliary switch contacts: Operated by breaker mechanism in both the connected and test position with sufficient number of contacts for operation, indication and interlocking of the breaker together with at least four spare sets of reversible contacts, each wired through secondary disconnect device contacts to accessible terminal blocks.
- m. Electrically operated, **mechanically latched**, electrically and mechanically trip free, non-pumping, quick make, quick break mechanism insuring full contact pressure until the time of opening with following additional requirements:
- 1) Voltage requirement.
    - a) Closing by means of closing mechanism coil capable of operation from 90-140 Volts dc.
    - b) Tripping by means of tripping mechanism coil capable of operation from 70-140 Volts dc.
  - 2) Equipped with mechanical device on front of breaker, available with door closed, to manually (without electrical power) actuate tripping

operations and with indicator, visible with door closed, to show open or closed condition. Operable in the disconnected, test and connected positions.

- n. Arc chute: Provided to house the main contacts, confine and direct opening arcs until extinguished. **The arc chute shall be comprised of a number of vertical steel arc splitter plates designed to confine and direct the arc and break the arc into a number of smaller arcs which are cooled and extinguished as the arcs move toward the top of the plates. Ceramic plates are not permitted. Proper extinguishing devices are to be included in the metallic splitter plates. Splitter plates are to be insulated at the extremity to ensure that the arcs are extinguished. The arc chute is to be constructed to prevent the escape of arc plasma and the emission of metal from beneath the arc chute. The manufacturer will demonstrate to the satisfaction of the Authority that the design of the switchgear does not result in operation of Energized Structure Relay or Grounded Structure Relay under fault openings, and that a voltage is not impressed on control wiring under fault conditions. The design of the switchgear and associated control and relaying equipment shall ensure against breakdown of insulation to ground for all fault conditions.**
- o. Main contacts: Surfaced with silver, nonwelding silver alloy or equivalent combining high conductivity and necessary arc-resistant properties.
- p. For moving circuit breaker element in and out of cubicle: Breaker carriage mounted on wheels and shall not require use of lifting device.
- q. Removable elements for the same type and rating completely interchangeable. Removable element of different type or rating not interchangeable.

E. Space Heater:

- 1. Each unit of switchgear provided with 120 Volt, single phase, 60 Hertz heating element to facilitate drying and prevent condensation.
- 2. Heaters enclosed in grill guards with no sharp edges and located so that they are easily accessible for replacement without de-energization of switchgear bus and not located close to any equipment which may be adversely affected by their heat.
- 3. Heaters thermostatically controlled. Thermostat adjustable from 40 degree F to 80 degree F. Thermostat set in accordance with manufacturer's recommendation. Panel ammeter approximately 2-1/2 inches square, marked to indicate heater load.
- 4. **Provide ungrounded 120 VAC power circuit from an Isolation Transformer to supply heaters within the DC switchgear assemblies.**

F. Positive Bus Bars:

- 1. General requirements:
  - a. ASTM B187, 98% conductivity bare copper.
  - b. Voltage rating: 1,000 Volts.
  - c. Continuous current rating: **As shown on drawing.**
    - 1) Size sufficient to carry the overloads specified for the silicon rectifiers without exceeding the allowable temperature rise specified in ANSI and NEMA standards. Maximum current density of 800 amperes per square inch.

- d. Capable of withstanding mechanical stresses and heat due to maximum short-circuit current.
- e. Bus contact surface silver-plated or tin-plated at connection.
- f. Each joint having impedance not more than that of bus bar of same length, clamped to maintain that impedance throughout life of equipment and treated to prevent corrosion.
- g. All connections to bus made with cadmium plated, galvanized or similarly coated, high strength steel bolts of sufficient number and size to provide solidly bolted connections. Mounted on barrier type insulation or post type insulators of sufficient strength to withstand without damage or permanent distortion all stresses produced by short-circuit current equal to the interrupting rating of the circuit breakers.
- h. **The bus shall be mounted on barrier type insulation or post type insulators of sufficient strength to withstand without damage or permanent distortion all stresses produced by short-circuit current equal to the interrupting rating of the circuit breakers.**

G. Control Buses:

- 1. Switchgear control bus:
  - a. 125 Volt ungrounded dc bus; copper, #6 AWG minimum with 600 Volt insulation extending the full length of the switchgear assembly. **Terminated on a terminal blocks and marked in each cubicle for connection to individual cubicle for connection to supply source.**
  - b. One two-pole knife switch provided in each switchgear cubicle for disconnecting the control circuit of associated breaker only.
  - c. UL Class J fuses used for control and auxiliary service protection.
  - d. Separate fuses in the closing and tripping circuits of each breaker.
- 2. Switchgear negative bus:
  - a. 1,000 - Volt dc, copper bus, **insulated #6 AWG minimum wire, extended the full length of the switchgear assembly. The bus shall be terminated on terminal blocks in each cubicle for connection to individual cubicle control and metering functions.**
  - b. Substation: Extended the full length of the switchgear assembly and terminated on a terminal block for connection to the Drainage and Negative Switchboard.
  - c. Tie Breaker Station: #6 AWG minimum. Extend negative buses and terminate on terminal blocks for connection to the impedance bond on both trackside.
  - d. Tapped at each circuit breaker unit and extended to the load measuring circuit.

H. Enclosure:

- 1. Dead-front, free-standing, indoor ventilated steel enclosure, high resistance grounded and provided with suitable hardware for insulated anchoring to a concrete floor which has been steel float finished to a tolerance of 1/8 inch in ten feet and covered with an insulating topping
- 2. Steel structure with framework of welded or bolted structural steel, free from distortion and welding strain and sufficiently rigid to support equipment under normal and short-

circuit conditions. Reinforced as required to form a rigid self-supporting structure. All sheet-metal shall be 11-gauge minimum and each cubicle shall have edges formed by appropriate metal brake tooling with joints welded and grounded smooth and having insulated edges. The bottom of the cubicle shall be 1/8" steel plate provided with 1/2 inch steel angle minimum guide the wheels of the circuit breaker carriage.

3. Designed to allow adequate clearance to ground and dissipation of ionized gases from the breaker arc chutes without hazard to personnel or possibility of establishing a conducting path to grounded structure or objects when interrupting rated short circuit current at rated maximum voltage. Include adequate provisions for release of gases from the units by means of suitable stacks, louvered vent openings or vent opening covered with grilles and arranged in such a way that hot gases or other materials cannot be discharged in a manner hazardous to personnel. Ventilation openings on top are not permitted.
4. Switchgear cubicles and circuit breaker compartment equipped with hinged front and rear doors with suitable handle, latch and doorstop.
5. Each power circuit breaker in separate metal-enclosed compartment with a minimum of 24 inches wide, equipped with stationary disconnect device contacts and carriage with integral wheels to permit withdrawal without use of additional lifting device.
6. Circuit breaker compartment door designed not to hinder movement of breaker in and out of compartment when door is open and doorstop set. Capable of being closed with breaker in test or disconnected position.
7. Circuit breaker compartment to provide for interchangeability of removable elements within frames of same size and operating characteristics.
8. Barriers with removable cover plates to separate ionized gases.
9. Control panels: Dead-front, hinged swinging panels mounted on the switchgear frame.
  - a. Support flush and semi-flush devices without distortion from plane surface in any position.
  - b. Supported by hinges allowing the panel to swing open to provide free access to the equipment and wiring behind the panel.
  - c. Secured in the closed position by captive wing-headed bolts, captive knurled knobs or other captive devices capable of being tightened or loosened by hand.
  - d. Equipped with door stop to prevent damage to equipment due to overswing of the panel
10. Mechanical and electrical interlocks:
  - a. Prevent moving the circuit breaker in or out of the connected position with main contacts closed.
  - b. Prevent closing the circuit breaker mechanically unless the breaker is in the test or disconnected position.
  - c. Prevent closing the circuit breaker electrically unless the breaker is in the connected position and the compartment door fully closed and latched, or in the test position.
  - d. Mechanical or electrical interlock to prevent opening the compartment door when the circuit breaker is closed in the connected position.
  - e. Prevent racking in or out with the charging spring in charged position.
11. Key interlocks:
  - a. Prevent the cathode circuit breaker closing unless the rectifier anode disconnect switch is closed.

- for high voltage switchgear meters. Provide current limiting fuses at the connection to shunt.
8. Bus voltage metering: One dc voltmeter, ANSI C39.1 and C12, switchboard type with 250 or 270 degree scale with one percent accuracy complete with zero to 1000 Volt scale with current limiting fuses for each 750 Volt dc positive bus.
  9. Cathode circuit breaker equipped with reverse current trip device: Provided to trip the breaker in the event the current reverses. Reverse current series trip device range 500-2000A (Device 32).
  10. Cathode circuit breaker forward current trip device: Provided and coordinated with dc feeder breakers to trip the breaker upon failure of any feeder breaker to clear a fault (Device 76).
  11. Feeder breaker automatic reclosing equipment (including gap breaker): Provided for each main line feeder circuit breaker and including voltage divider type load measuring relay (Device 182), load measuring resistors, adjustable time delay reclosing relay (Device 183), time delay relays, counters and other devices required to perform the following functions; all assembled in a separate, isolated plug-in housing within the breaker cubicle. All equipment, except load measuring resistor, shall be panel-mounted as draw-out units for ease of removal.
    - a. Operates only when the breaker is in the connected position. Prevents reclosing and disconnects from 700 Volt dc potential when the circuit breaker is in test or disconnected position, or when the circuit breaker is tripped manually, including tripping by the emergency trip circuit, tripping from remote and tripping from the local control switch.
    - b. Closes circuit breaker only (1) if bus or third-rail voltage is above 500 Volts dc or (2) when bus or third-rail voltage is below 500 Vdc, if the load resistance is acceptable. Acceptable level of load resistance shall be adjustable. Provide Setting and calculations for WMATA engineer's approval.
    - c. Load measuring compensates for voltage drop in the track circuit.
    - d. Reclosing circuitry is disconnected if a prolonged closure of the circuit breaker does not occur within a preset time and after four closing attempts after the close signal is received. This automatic disconnection does not lock out the circuit breaker but merely requires an additional manual close signal to reinitiate the automatic reclosing sequence (Device 183).
    - e. All timers and counters are adjustable. Loss of control power is annunciated. Load adjustments shall have calibrated set points over the specified range and the indicators shall be visible from the front panel of the draw-out unit
    - f. The load measuring automatic reclosure circuit shall be designed to permit a breaker reclosure within the preset timeout limit (i.e within 4 attempts), with one chopper type, 8 car train, perched in the track awaiting power restoration after a loss of power.
    - g. The load measuring automatic reclosure equipment shall be designed for ease of calibration with convenient input terminals with either an internal or external calibrator provided for testing entire circuit operation. All calibration instructions shall be fully addressed in the O&M manual. Detailed circuit analysis and operation with corresponding drawings shall be provided for each circuit function, printed circuit board, etc., to permit component level troubleshooting.

- h. Gap breaker reclosure circuitry shall be interlocked with adjacent breakers such that it shall not commence load measuring until adjacent breakers close.
- 12. Feeder breaker and bus tie breaker series trip device: Direct acting, direct release, forward and reverse (bi-directional), series trip device adjustable between 200% and 400% of circuit breaker continuous current rating. Provided for each feeder circuit breaker and bus-tie breaker. Use of control power to accomplish series tripping shall not be permitted. (Device 176).
- 13. **Each feeder and gap breaker shall be equipped with a Rate-of-rise trip device (Device 150) equal to Swartz type 176/150 relays for feeder circuit breakers. The rate-of-rise current detection system shall be as manufacture by SMC Electrical Products or approved equal. Mult-function relays shall be acceptable.** Additional requirements as follows:
  - a. Includes rate of rise sensing circuitry, adjustable rate of rise trip level, adjustable time delay trip and a flag or indicator lamp to verify operation.
  - b. Designed to detect remote short circuit and initiate breaker tripping if the magnitude of short circuit current is below the setting of the breaker direct acting series overcurrent trip device. Capable of discriminating between remote short circuits and train accelerating inrush and insensitive to transients. **Make rate of rise trip device connections through a fused disconnect to a DC current shunt with appropriate device rating.**
- 14. **Surge arrestors for each feeder circuit breaker: dc surge arrester, metal-oxide type suitable for dc transit system distribution, rated 1000 volts maximum permissible line to ground dc voltage and 970 volts dc maximum continuous operating voltage. DC surge arrestors shall be enclosed in a fiberglass enclosures with visible windows, base insulated from switchgear enclosure, the discharge(ground) cable connected to the station ground shall be in a fiberglass conduit..**
- 15. Shunt/Isolation/Amplifier (Voltage Transducer): Provide one voltage transducer in the dc switchgear at each substation. The shunt amplifier shall be a linear amplifier designed to amplify dc shunt millivolt signals. The input shall be from 0-1,000 volt and output shall be 1 milliamp. Provide complete isolation of the input signal. A magnetic amplifier shall be used in the input circuit to isolate the inputs from all other circuits and grounds. The input shall be tested at 4,000 Volts dc for one minute to insure that no breakdown will occur when connected to shunts operating at high voltage above ground. The output shall be a hybrid amplifier operating in the transconductance mode to provide a constant current output. Load resistance variations from 0-10K shall have less than 0.1% effect on the output current to make the amplifier an ideal device for telemetering, scaling and recording applications. The output should be filtered.
  - a. A variation resistor from zero to maximum gain adjustment shall be provided and be accessible through the top cover. Large gain changes should be accomplished by changing the auxiliary gain resistor.
 

1)	Power Requirements	125 Vdc $\pm$ 10% 10VA (Max)
2)	Input Impedance	5000 ohms/Volt
3)	Load Impedance	Any load between 0-10K
4)	Accuracy	$\pm$ 0.5% RO @ 25°C
5)	Temperature Range	-10°C to + 70°C
6)	Temperature Coefficient	+ 0.04% °C

- b. The transducer shall be compatible with the rating of the dc switchgear . Contract.
  - c. The Shunt/Isolation/Amplifier shall be SWARTZ type or equal.
16. Shunt/Isolation/Amplifier (Current Transducer): Provide in each substation switchgear a current transducer for each of the cathode breakers as shown. The shunt amplifier shall be a linear amplifier designed to amplify dc shunt milliamp signals. The input shall be 50mV rated at 20,000 Amps for 8,000 Amps Cathode breaker with 1 milliamp output.
- a. Provide complete isolation of the input signal. A magnetic amplifier shall be used in the input circuit to isolate the inputs from all other circuits and grounds. The input shall be tested at 4,000 Volts dc for one minute to insure that no breakdown will occur when connected to shunts operating at high voltage above ground. The output shall be a hybrid amplifier operating in the transconductance mode to provide a consistent current output. Load resistance variations from 0-10K shall have less than 0.1% effect on the output current to make the amplifier an ideal device for telemetering, scaling and recording applications. The output should be filtered.
  - b. A variable resistor from zero to maximum gain adjustment shall be provided and be accessible through the top cover. Large gain changes should be accomplished by changing the auxiliary gain resistor.
    - 1) Power Requirements 125Vdc  $\pm$  10% 10VA (Max)
    - 2) Input Impedance 5000 ohms/Volt
    - 3) Load Impedance Any load between 0-10K
    - 4) Accuracy  $\pm$  0.5% RO @ 25°C
    - 5) Temperature Range -10°C to + 70°
    - 6) Temperature Coefficient \_\_\_\_\_ + 0.04% °C
  - c. The transducer shall be compatible with the rating of the dc switchgear furnished under the Contract.
17. D.C. Watt transducer: Provide in each substation dc switchgear a dc Watt Transducer for each of the cathode breakers as shown. The dc Watt transducer shall be able to measure direct current watts. The transducer shall be able to convert Digilogic Transducer Input Circuits to accept direct currents. The current input can be direct from a 50mV or 100mV internal shunt. The line-to-line voltage input shall be made for an internal multiplier resistance box for voltages from 600 Vdc to 2,000 Vdc.
- a. Potential Input Nominal 100 Vdc to 2,000 Vdc, for inputs above 600 Vdc, an external Multiplier Resistance Box should be supplied.
  - b. Overload Rated Voltage + 20
  - c. Burden 200 ohms/Volt Nominal
  - d. Current Input From External 50mV source
  - e. Nominal 100mV shunt
  - f. Overload 5 Vdc maximum
  - g. Burden 10.0 mA maximum
  - h. Auxiliary Power 125 Vdc  $\pm$  10%, 6 Watts
  - i. Dielectric Withstand 4,000 Vdc for 1 second
  - j. Temperature Operating Range -20°C to +80°C

	1)	Effects on Accuracy	$\pm 0.15\% / ^\circ\text{C}$
k.		Storage	$-40^\circ\text{C}$ to $+80^\circ\text{C}$
l.		Accuracy	$\pm 0.5\%$ of Rated Output for 100 mV Shunt
m.		Output	0-1 mA dc into 0-10,000 ohms

- 18. Transducer inputs to RTU: **Current, voltage and watt transducer-outputs shall be identified on terminals for connection to analog input modules on DTS/RTU I/O modules.**
- 19. Bus Meter: 0-1000 Volts  $\pm 1\%$

J. Control and indication:

- 1. Control switch: Provided on each circuit breaker for electrical closing and tripping of the breaker.
- 2. Local-Remote selector switch: Provided on each circuit breaker for transferring control from the local control switch to the remote control system.
- 3. Indicating lights: LED panel indicator lamp, General Electric Company Type ET-16 or equal provided on each circuit breaker as follows:
  - a. Red: Breaker closed.
  - b. Green: Breaker open.
  - c. White: Selector switch in local position.

K. Emergency tripping: Means provided on each feeder circuit breaker to electrically trip the breaker from a remote emergency trip system, when the breaker is in the connected position, regardless of Local-Remote selector switch position. The emergency tripping circuits shall be independent and isolated from other tripping circuits of the circuit breakers. **Emergency Trip System activation shall be monitored at the TPSS, TBS Annunciator Panel and MOC(via DTS).**

L. Loss of control power: Means provided on each feeder circuit breaker to automatically trip the breaker on loss of control power. A separate relay shall be provided to monitor loss of control power and provide 2NO and 2NC contacts for connection to annunciator panel.

M. Acceleration gap feeder circuit breaker control: Automatically trips when either adjacent contact rail section dc feeder circuit breakers trip. Allowed to close automatically when both adjacent contact rail section dc feeder circuit breakers are closed. Automatic reclosing should initiate only after both adjacent breakers are closed.

N. Positive and Negative Bus tie breaker control (Storage Yard TPS): Equipped with bi-directional overcurrent series-trip unit (Device 176) and coordinated with adjacent feeder breaker tripping. Negative bus tie breaker shall only operate (close or open) when the positive bus tie breaker is open. Positive bus tie breaker shall only close after the negative bus tie breaker is closed and shall only be opened prior to the negative breaker opening. In the remote mode, both positive and negative tie breakers shall be controlled by one control switch. Electrical interlocks shall be provided to automatically trip the positive breaker if the negative breaker trips, and vice versa.

O. Control and instrument wiring:

- 1. Factory-installed.

2. Insulation rated 2000 Volts as well as 600 volts, Type SIS, 14 AWG minimum copper conductor unless otherwise specified. Flexible Class C or higher stranded insulated copper wire used for wiring across hinged joints.
3. One continuous length of wire used from terminal to terminal without splices or taps.
4. Removable element control wiring installed and connected according to manufacturer's standard for circuit breaker wiring.
5. Control wiring so designed and installed that fault in one main circuit cannot be transferred to control wiring of another main circuit.
6. Connections made at terminals of device, on terminal blocks or on control buses. Wiring connection made using insulated flange fork tongue type terminals.
7. Interconnecting wiring between cubicles and compartments terminated on terminal blocks before being wired to components.
8. Terminal blocks: With screw terminals, circuit marking strips for indicating control wire number, phenolic laminated dust cover and minimum of 10% spare terminal points.
9. For each individual wire, corresponding identification used on terminal block marking strips.
10. Internal wiring identified at each termination, with same number shown on wiring diagram, using suitable plastic sleeve attached within six inches of terminal connections. Terminals shall be color-coated for ready identification of voltage (e.g. 750 Vdc, 125 Vdc, 24 Vdc etc.)
11. External wiring: Provision made for external control wiring to enter from top and with space allowed to terminate external multiple-conductor copper control cable. Top entrances provided with removable cover plates for field drilling of conduit and cable entrance holes.

P. Remote control and indications:

1. Control: Provisions for closing and tripping each circuit breaker except cathode circuit breakers, from the remote control system. Remote control enabled only with Local-Remote switch in Remote position and circuit breaker in connected position. Provide interposing relays for closing and tripping circuits to interface with remote control for each breaker. The relay coils shall be **General Electric Type HGA or HFA, equipped with arc suppression and have** 24 Vdc rating except for those serving Storage Yard and controlled from Yard Control Tower which shall be 125 Vdc rated.
2. Indication:
  - a. Contact from each circuit breaker for remote indication of circuit breaker position as follows:
    - 1) Closed: Circuit breaker closed and in the connected position.
    - 2) Tripped: Circuit breaker open or in the test or disconnected position.
    - 3) Contact bounce not to exceed five milliseconds.

:

3. 125 Volt DC Yard Control cables shall be shielded type cable.

Q. Auto Manual control of Cathode Breaker: An Auto/Manual selector switch shall be provided to control the cathode breakers locally when the selector switch is selected in the Manual position. When Auto Selection is made the cathode breaker shall be controlled by the position of 15 kV or 34.5 kV rectifier breakers described in Section 16321 and 16322.

R. Nameplates:

1. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless steel rivets or screws. Vertical gothic lettering using a round or square cutter. V-shaped groove is prohibited.
  2. Nameplate provided on each switchgear showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable in accordance with referenced standard.
  3. Additional functional nameplates for each component:
    - a. Each switchgear compartment labeled, front and back, with nameplate 2-1/2 inches by 6-1/2 inches, inscribed in letters 1/2 inch high: CATHODE CIRCUIT BREAKER NO. 2, FEEDER CIRCUIT BREAKER NO. 1, POSITIVE TIE BREAKER, NEGATIVE TIE BREAKER as appropriate.
    - b. Each circuit breaker compartment labeled, front only, with nameplates 2-1/2 inches by 6-1/2 inches, inscribed in letters 1/2 inch high with the circuit breaker Supervisory Control Identification Number, as shown on drawing.
    - c. Provide nameplates for all internal components such as relay, fuse, terminal block, etc.
    - d. In addition to other information normally displayed on equipment, provide one inch nameplates showing, in letters 1/2 inch high, switch positions, meaning of indicator lamp and other pertinent information.
- S. Accessory equipment: One set of the following provided for each substation and tie breaker station:
1. Cranking device to be used for moving the circuit breakers to and from the connected, test and disconnected positions.
  2. Removable closing lever or crank for manually closing the circuit breakers, if required.
  3. A set of test plugs for draw-out relays and instruments.
  4. A set of wrenches for the primary disconnecting devices of the circuit breaker, if required.
  5. Fuse tongs or hook sticks, depending on the requirements.
  6. Twenty-five feet of test cable for each switchgear assembly to permit operating a circuit breaker when completely removed from its compartment. This cable will be required to connect the control circuits of the withdrawn breaker and operate the breaker without the use of the test cabinet.
  7. Test cabinet, suitable for wall mounting, for operating, testing and inspecting the circuit breakers when removed from their compartments. **Include test jumper not less than twenty-five (25) long for connection between the breaker and the test cabinet.**
  8. Set of test jumpers for connecting breaker units to the test cabinet.
  9. Pegboard: Hardboard, AHA IS 1, tempered, SIS, 1/4-inch nominal thickness, perforated, sized to accommodate all products specified. Framed with one-inch by one-inch hardwood. Frame and hardboard painted with color selected by the Engineer. Include hardware for wall mounting and pegboard accessories suited to the products to be mounted. Provide nameplates as specified, one inch high with accessory names inscribed in 1/2-inch vertical letters.
- T. Additional Circuit Breaker Elements: There shall be an additional circuit breaker elements as indicated on drawing.
- U. **Cable Shield Monitoring System: Provide relay to monitor failure or degradation of insulation or jacket of the 1000MCM shielded track feeder cables. The associated relays and devices for this system shall be provided to all DC switchgear line-up.**

The relay shall function to indicate alarm for cable insulation/degradation failure. The cable shield relay and each component shall be isolated from the 750 VDC. The jacket failure alarm and insulation failure alarm shall be designed so as to facilitate cable identification with selective disabling switches in each feeder breaker(s) cubicle. The relay shall include sufficient filtering and adjustable trigger points and time delays to minimize nuisance alarms. The relay shall be manufactured by SMC Electrical Products or approved equal and include, but not be limited to the following:

- a. Provide two cable shield monitoring relays for each DC switchgear assembly containing five (5) feeder breakers or more. For less than five (5) feeder breakers, provide one relay.
- b. Provide and install single knife switches in each feeder breaker cable compartment door to provide means of isolation of single feeder cable. Suitable opening shall be provided in each switch enclosure for control cables to enter from the bottom. The switch shall be rated for 1000V, designed similar to ABB Flexitest switch and mounted as follows:
- c. Relay control wiring connected to the shield wire shall be insulated with minimum of 2kV, 12 AWG minimum copper conductors, Judd Wire or approved equal.
- d. The Contractor shall provide a working model of the cable shield monitoring system and demonstrate operation and submit test results of the same to WMATA engineers for approval before installation.
- e. Move to shield cable
- f. Shield monitoring system shall be connected to the substation annunciator and DTS for local and remote alarm monitoring.

**PART 3 - EXECUTION**

**3.01 INSTALLATION**

- A. Floor Preparation:
  - 1. Finish concrete to the tolerance recommended by the manufacturer.
  - 2. Install insulated floor topping in accordance with Section 16052.
- B. Install switchgear as shown and in accordance with approved shop drawings and as follows.
  - 1. The number of shipping splits at each facility is indicated below. Contractor shall make bus connections in accordance with manufacturer's requirement and connect all control wiring at the appropriate terminal blocks.

Name OF FACILITY	NO. OF SHIPPING SPLITS IN DC SWITCHGEAR	NO. OF PIECES
------------------	---	---------------

[TBD] TBS	[TBD]	[TBD]
-----------	-------	-------

2. Contractor shall furnish and install anchors in insulated floor for DC switchgear at locations indicated by the manufacturers and as shown in typical detail for anchoring DC switchgear to the insulated floor. The required number of anchors at each facility is given below:

NAME OF FACILITY	ANCHOR
[Location - TBD] TPS	[TBD]

- C. Install busways as shown and in accordance with approved shop drawings as Section 16451.
- D. Install conduit, raceways and bus duct as approved and in accordance with Section 16052.
- E. Make power cable and control wire connections as approved and in accordance with Section 16052. The required number of 1000 KCMIL cable lugs shall be furnished by the DC switchgear manufacturer.
- F. Use services of manufacturer's engineering representative for assistance in field assembly and installation of the switchgear in accordance with Section 16051.
- G. Connect space heater circuit to prevent condensation during installation. Connect space heater to 125-volt AC supply as shown.
- H. Install dc circuit breaker test cabinet and connect it to 125-volt dc supply as shown.
- I. **Coordinate installation of all DC Shielded cable terminations with specification section 16129 - 2000 Volt Shielded Cable For Traction Power.**

**END OF SECTION**

## SECTION 16360

### UNIT SUBSTATIONS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing substation equipment for 34.5 kV and 13.8 kV primary service.
- B. Related Work Specified Elsewhere:
  - 1. Wire connection accessories: Section 16125.
  - 2. Grounding and bonding: Section 16060.
  - 3. High-voltage switchgear: Section 16320.
  - 4. Low-voltage switchgear and switchboard: Section 16435.
  - 5. Transformers: Section 16270.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. ANSI/IEEE: 141.
  - 4. IEEE: C57.93, C57.94.
- B. Main Components for Substation: Produced for assembly as specified, factory-coordinated and tested before delivery to job site as follows:
  - 1. 34.5 kV or 13.8 kV metal-clad switchgear and 34.5 kV or 13.8 kV to 480Y/277-volt transformer: For in-line assembly.
  - 2. 480-volt switchgear and switchboard: For assembly of various sections as integral unit for in-line assembly with transformer where shown.
- C. Qualifications of Instructor for Operation and Maintenance Training: Qualifications will be considered adequate when either of the following is met:
  - 1. Designer of the system is the instructor and has the ability to communicate facts about the system in understandable terms.
  - 2. Instructor has been trained in teaching methods and is familiarized fully with the subject matter.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings: In accordance with Table 16360-1.
    - a. Submit shop drawings for high-voltage switchgear to electric utility company as applicable for the service area, for coordination and approval by the power company.
    - b. Submit to the Engineer shop drawings approved by the power company as well as shop drawings for complete unit-substation equipment.
  - 2. Certification.
  - 3. Documentation:
    - a. Short-circuit calculations and system coordination study for system protection and selective overcurrent tripping:

- 1) In accordance with ANSI/IEEE 141 for fault calculations and coordinated system protection.
- 2) Include high-voltage source, relays, fuses if used, on high-voltage switchgear, transformer, low-voltage switchgear, molded-case circuit breakers for low-voltage feeders in switchboards, panelboards, motor control centers and motor starters.
- 3) Available short-circuit currents based on power company contribution of 1,500 MVA for 34.5 kV service and 750 MVA for 13.8 kV service and actual motor contribution at low-voltage switchgear but not less than 25 percent of transformer kVA rating for motor contribution if the actual is less.
- 4) Recommended settings and adjustment of protective devices.
- b. Field-test plan and documentation:
  - 1) Submit field-test plan within 60 days after award, with accompanying documentation in the form of test-data recording sheets and list of proposed test equipment.
  - 2) Do not proceed with testing until plan and documentation are approved.
  - 3) Indicate in scope of test plan how equipment will be tested to ensure safe and orderly transition from installation, through initial energizing, to specified field-testing.
  - 4) Accompanying documentation to include standard data-recording sheets as used in manufacturer's in-plant testing of equipment and devices or as used by major utilities or large industrial users of specified equipment. Submit certified copies of test data, indexed by substation, within two weeks after completion of testing.
  - 5) Verify schematic diagrams for proper operation. Submit one complete set of certified yellow-line schematics at time of initial energizing of equipment. Schematic diagrams to indicate verification and tests of functional and protective devices. Indicate each circuitry correction or modification in red-line.
- c. Instructor qualifications: Five copies of resume which outlines each instructor's qualifications and skills not later than 180 calendar days prior to commencement of training.
4. Operations and maintenance training material: Five copies not later than 180 calendar days prior to commencement of training.
5. Operation and Maintenance Manuals: In accordance with Table 16360-2.

#### **1.04 OPERATION AND MAINTENANCE TRAINING:**

- A. Perform operation and maintenance training in accordance with the General Requirements and the following additional requirements for development and performance of operation and maintenance training for unit substation.
- B. Use only instructors who are fully qualified for their presentations as required above under Quality Assurance.
  1. Concept of Training: Design classroom and field instruction to cover in detail the functions of each item of equipment. Cover fault isolation and troubleshooting technique to the extent necessary to permit a technician to diagnose and repair faulty modules. Design instruction to provide Authority maintenance personnel with practical experience in the performance of preventive and corrective maintenance. Provide troubleshooting and fault isolation of simulated faults for each item of equipment in the unit substation.
  2. Develop and provide all operation and maintenance training necessary for Authority-designated personnel to support the power equipment. Have classroom instruction

include not only the anatomy and functioning of the parts under discussion, but the essentials of their routine care, including lubrication schedules, adjustments, limits, test frequency, inspection frequency, troubleshooting, removal and replacement. Have instruction cover theory of operation of the power systems, individual modules and special protective circuits. Use software flow diagrams in order to show sequence of events and timing of system operations.

3. Have the course include hands-on troubleshooting of all subsystems. Allot students adequate time for performing preventive-maintenance operations on the equipment in addition to troubleshooting "bugged" system.
4. In training, assume the Authority's employees have no knowledge of the features of the new equipment. The Authority is permitted to videotape all class presentations.

C. Training Methods and Materials:

1. Develop first-generation reproducible training material.
2. Conduct training using final manuals approved by the Authority and certified by the Contractor as being correct, as-built and reproducible. These materials become the property of the Authority at the end of program.
3. Develop and furnish the following training materials for each course for the Combined Training Program:
  - a. Instructor material for each course.
  - b. Course outline: Course outline with learning objectives. Include a topic outline for each item of equipment. Include in maintenance courses a section devoted to system-fault analysis and troubleshooting. State the learning objectives for each topic.
  - c. Lesson plans: A set of lesson plans for each item of equipment, corresponding to the topic outline, and containing the following information:
    - 1) Lesson title.
    - 2) Time.
    - 3) Objectives.
    - 4) Training aids required.
    - 5) Instruction sequence (outline).
    - 6) Tests.
    - 7) Summary.
  - d. Training aids: For each topic, develop optimum use of visual aids, including transparencies size 8-inch by 10-inch, 35-mm slides, films, and mockups. Provide approved shop drawings in transparency.
  - e. Instructional material: Use the applicable equipment operation and maintenance manuals as the primary source of instructional material. In addition, develop notebooks for each course containing such additional drawings, descriptive information and procedures necessary to ensure that the learning objectives are met in an orderly and timely manner. Arrange notebook material by each item of equipment and sequence according to the topic outline.
  - f. Course topic outlines and schedules: Have the topic outline and schedules for each course contain the following:
    - 1) Description of course including course objectives and type of training, Level One, Level Two or Level Three.
    - 2) Course length and recommended numbers of students per course.
    - 3) List of training materials required including documentation and equipment.
    - 4) For each topic outline for the course, a topic objective and the time allotted to the topic.
    - 5) Schedules listing the major topics and subtopics on a time allocation for each topic.
  - g. Instructor and training aids: Have the instructor guide for each course include:

- 1) Table of contents listing each topic and the time allotted.
  - 2) List of applicable documents.
  - 3) List of training materials.
  - 4) Course learning objectives, course length and recommended number of students.
  - 5) Provide each topic with a cover sheet listing topic, objective, time allotted and training aids required.
  - 6) Include training aids with the instructor guides.
- h. Students handouts: Reproduce diagrams, drawings and procedures from engineering data and manuals and include them in student handout.
- D. Instructional Equipment: Conduct training utilizing installed equipment in normal operating conditions, except use maintenance training-lab equipment for shop and maintenance instruction.
- E. Training Program:
1. Include the following:
    - a. Level One - Equipment-Operating Training Course: Conduct this course for Authority-designated personnel; providing training for equipment operation and troubleshooting, and basic theory of operation of each piece of equipment. In handouts include specific check lists on each piece of power equipment.
    - b. Level Two - Field-Maintenance Training Course: Conduct this course for Authority-designated personnel; emphasizing preventive maintenance, as well as location and correction of faults and equipment failures. Present sufficient training in operation, theory of operation and fault isolation to isolate problems to modules or subassemblies. Stress use of the maintenance manuals to help identify faults.
    - c. Level Three - Shop-Maintenance Training Course: Conduct this course for Authority-designated personnel; providing in-depth training on theory of operation of the systems, individual components, each subassembly (including Contractor-designed, off-the-shelf OEM and other vendor-supplied assemblies), special test equipment; shop test procedures, module and printed circuit board, all replacement and troubleshooting procedures to the circuit-board level, overhaul and testing procedures, operations procedures, and preventive-maintenance procedures. Provide information drawings, including schematics, bills of material and other material required to troubleshoot to the component level.
  2. Supplemental Training: In the event Contractor changes or performs modifications to equipment subsequent to the training that impact form, fit or function; provide supplementary training to the Authority's training instructor on a one-time basis.
- F. Scope: The following number of Authority personnel will attend the training program:

Course Title	Length of Course Hours	Number of Students Per Session	Number of Courses	Number of Course Hours
Field Maint.	80	6	2	160
Shop Maint.	40	8	1	40

1. Provide practical training on equipment for not less than 60 percent of the course duration.
  - a. Location: Conduct training classes at facilities provided by the Authority.
  - b. Times: Set class times at the convenience of the Authority.

2. For Level Two - Field-Maintenance Training Course, the Contractor may propose four courses at 40 hours each in lieu of two courses at 80 hours each subject to approval.
- G. Equipment:
1. Training equipment: Supply and deliver to the Engineer special tools required for maintenance training.
  2. Test equipment: The Field-Level maintenance training requires students to use test equipment provided by the Contractor. The Shop-Level maintenance training requires students to use test equipment provided by the Contractor.
  3. Service equipment: Prior to final turnover to the Authority, furnish and install the following for substation maintenance equipment:
    - a. 72" x 36" x 36" heavy-duty metal storage cabinet with four-shelf arrangement.
    - b. Eight-foot fiberglass step ladder.
    - c. Full set of approved, half-size electrical and equipment shop drawings, bound in stiff cover resistant to oil, water and wear. Make drawings capable of being stored in the metal cabinet.
    - d. Wall-mounted Maintenance Map/Single Line Diagram. Use frame made of metal with lexan or plexiglass. Mount frame as directed.
    - e. 30" x 48" x 34"-high heavy-duty metal work bench with task stool, reinforced steel top, 1/4-inch thick rubber matting covering entire top, and one 12-gauge steel shelf for full width and depth of bench with back turned up two inches.

#### **1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver and handle equipment as specified.
- B. Store equipment in secure and dry storage facility.

### **PART 2 - PRODUCTS**

#### **2.01 PRODUCTS AND MATERIALS:**

- A. High-Voltage Switchgear: Section 16320, kV rating, type and quantity as shown.
- B. Low-Voltage Switchgear and Switchboard: Section 16435, quantity as shown.
- C. Transformers: Section 16270, voltage rating, type and quantity as shown.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Install substation equipment at location shown in accordance with manufacturer's recommended installation procedure, the NEC and as follows:
  1. Install high-voltage switchgear in accordance with Section 16320, low-voltage switchgear in accordance with Section 16435 and transformers in accordance with Section 16270. Arrange and connect the switchgear and the transformers as shown.
  2. Make power-cable and control-wire connections as shown and in accordance with Section 16125.
  3. Make grounding connections as shown and in accordance with Section 16060.
  4. Interconnect secondary of two substations to form secondary selective network as shown. In combined switchboard room, use bus duct for secondary tie feeder.

5. Arrange with electric utility company for providing primary service to switchgear and coordinate incoming-service termination details.
  6. Apply touch-up paint where necessary.
- B. Manufacturer's Engineering Representative:
1. Arrange for assistance of manufacturer's engineering representative during field-assembly, installation and adjustment of substation equipment.
  2. Initial energizing of each substation to be under guidance of manufacturers' engineering representative who will advise Authority personnel on step-by-step procedure.

### 3.02 FIELD QUALITY CONTROL:

- A. Field-Testing and Inspection:
1. General requirements:
    - a. Conduct field-testing and inspection at each ac-switchboard room to ensure proper operation of equipment provided
    - b. Relays and trip-device setting: The Contractor is responsible for setting protective relays and trip devices in accordance with approved coordination study and their calibration for proper operation during field-testing.
  2. Field inspection:
    - a. Prior to field-testing, check equipment installation in accordance with manufacturer's recommendations and ANSI/IEEE 141 including, but not limited to, verification of the following:
      - 1) Integrity of bus insulation.
      - 2) Tightness of connections.
      - 3) Adequate support of busbars.
      - 4) Correct grounding, anchoring and alignment of switchgear in accordance with manufacturer's drawings.
      - 5) Ease of racking drawout breakers in and out of cubicle.
      - 6) Physical interchangeability of similar circuit breakers.
      - 7) Adjustment of circuit-breaker contact.
      - 8) Functioning of interlock and closing of safety shutter with breaker in disconnect or withdrawn position
      - 9) Transformer installation in accordance with IEEE C57.93 and C57.94.
      - 10) Verify mechanical clearances and proper operation of disconnecting and grounding devices associated with potential transformers.
      - 11) Tightness of bolted bus joints by calibrated torque-wrench method, based on manufacturer's recommended values.
      - 12) Ground-fault system:
        - (a) Inspect for physical damage and compliance with approved shop drawings. Verify location relative to sensors of main neutral-to-ground bus disconnect link and avoidance of multiple ground connections in combined-switchboard rooms.
        - (b) Inspect control-power transformer to ensure adequate capacity for system.
        - (c) Inspect zero-sequence system for symmetrical alignment of core-balance transformers about current-carrying conductors.
        - (d) Verify by device operation, ground-fault device circuit nameplate identification.

- 13) Calibrate protective devices/relays and set them in accordance with approved coordination study.

3. Field-testing:

- a. Furnish equipment required to perform tests.
- b. Provide services of manufacturer's engineering representative and supporting field crew for a period not less than three man-days. Conduct tests in the presence of the Engineer. For each item, submit for approval and perform approved tests including, but not limited to, those specified.
- c. Perform insulation-resistance test of 60-second duration in accordance with the following requirements:

- 1) Test voltage:

Voltage Rating	Test Voltage
150 - 600 volts	1,000 volts
601 - 5,000 volts	2,500 volts
Above 5,000 volts	5,000 volts

- 2) Insulation resistance: kV rating plus one megohm but not less than minimum value recommended by manufacturer.
- 3) Do not perform dielectric-withstand test unless insulation resistance is equal to or greater than minimum value specified.
- d. For high-voltage switchgear, low-voltage switchgear and switchboard:
  - 1) Perform insulation-resistance test between phase-to-phase and phase-to-ground.
  - 2) Test grounding conductors and enclosures for continuity to room ground bus.
  - 3) Test protective relays and trip devices, except power fuses in accordance with ANSI/IEEE 141 procedures, modified as necessary, for compliance with approved coordination study.
  - 4) Test operation of each circuit and control in accordance with approved sequence.
  - 5) Test interlock system as follows:
    - (a) Make closure attempt on locked open devices.
    - (b) Make opening attempt on locked closed devices.
  - 6) Dielectric-withstand tests: Perform dielectric-withstand test of 60-second duration on entire assembled and erected switchgear and switchboard lineup using 60-Hertz voltage level as specified. Perform tests in accordance with reference standards and as follows:
    - (a) 34.5 kV switchgear: 60,000 volts rms.
    - (b) 13.8 kV switchgear: 27,000 volts rms.
    - (c) 480-volt switchgear and switchboard: 2,500 volts rms.
    - (d) Control wiring: 1,500 volts rms.
  - 7) Test current-transformer circuits for polarity, ratio and protective-device operation by secondary-injection method.
  - 8) Test potential transformer ratio and polarity.
  - 9) Perform functional tests on control, interlocking, blocking and supervisory circuits, including verification of interconnections between equipment and interface points which have been installed by others. Verification of these tests to be substantiated by lined-in schematics and signed by the Contractor and the Engineer.
- e. Distribution transformers:
  - 1) Perform insulation-resistance test between winding-to-winding and winding-to-ground. Correct resistance value to temperature.

- 2) Test transformer shell and neutral terminal for continuity to ground bus.
  - 3) Perform ac high-voltage test between high-voltage winding and ground and low-voltage winding and ground. Perform test at 75 percent of factory test voltage for 60-second duration.
  - 4) Test voltage ratio for full-winding and taps. Test result not to deviate more than 0.5 percent from calculated ratio. Set transformer tap as directed.
  - 5) Check polarity or phase relation.
  - 6) Check contacts of dial-type thermometer for indicating normal and overtemperature condition of transformers at remote location and to initiate tripping of associated essential main-feeder breaker or primary breaker as appropriate under abnormal temperature conditions. Set thermometer contacts in consultation with manufacturer, as necessary.
  - 7) Transformer for outdoor use:
    - (a) Test transformer for oil leaks in accordance with IEEE C57.93.
    - (b) Test samples of insulating liquid from top and bottom of tank.
    - (c) Test to verify that dielectric strength is not less than 22 kV for mineral oil.
- f. Substation busway:
- 1) Where directed, test resistance of busway connections. Resistance not to exceed value recommended by manufacturer.
  - 2) Test insulation resistance to ground and between insulated busbar.
  - 3) On busway showing insulation resistance of less than one megohm, perform high-potential test of 60-second duration at 2,200 volts, rms.
  - 4) Check phase rotation and phase crossing on buses when energized from either source.
- g. Ground-fault systems:
- 1) Insulation resistance: Remove neutral-ground disconnect link and measure system neutral insulation resistance to ensure that no shunt ground paths exist. System neutral insulation to be 10,000 ohms minimum, preferably one megohm or greater. Reinstall link.
  - 2) Determine relay pickup current by primary injection at sensor and operation of circuit interrupting device. Pickup current to be within ten percent of device setting.
  - 3) Test relay timing by injecting 150 percent and 300 percent of pickup current into sensor. Relay timing to be within manufacturer's published time-current characteristic curve
- h. Proof of compliance:
- 1) If testing indicates failure to comply with specified requirements, replace, correct or modify equipment so that it does comply.
  - 2) Conduct additional tests witnessed by the Engineer to prove compliance with specified requirements.

**B. Field-Testing Personnel:**

1. Provide services of qualified manufacturer's engineering representatives to perform specified field-testing program.
2. When more than one representative is involved, the Contractor is responsible for coordination of testing effort.
3. Provide engineers, technicians and journeymen as necessary to set up and implement testing.

C. Authority Tests:

1. The Authority reserves the right to require the Contractor to conduct acceptance tests of sound level on each transformer unit at each passenger station within one year after installation.
2. In order to perform sound-level tests, the Contractor may recreate test conditions of applicable standards to the extent possible without disturbing existing structure or installed equipment or materials.

**THIS SPACE NOT USED.**

D. Submit certified test reports.

**END OF SECTION**

## SECTION 16425

### MOTOR STARTERS AND CONTROL CENTERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing motor starters and control centers.
- B. Related Work Specified Elsewhere:
  - 1. Grounding and bonding: Section 16060.
  - 2. Circuit breakers, panelboards and load centers: Section 16440.
  - 3. Motors: Section 16225.
  - 4. Wire connection accessories: Section 16125.
  - 5. Raceways, boxes and cabinets: Section 16130.
  - 6. Unit substation: Section 16360.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. NEMA AB1, ICS-2, ICS-2.3, 250.
  - 4. ANSI: Z55.1.
  - 5. ASTM: A47, A653, B187.
  - 6. UL: 845, Electrical Construction Materials Directory
  - 7. ITS: Directory of ITS Listed Products.
- B. The following items to be listed or labeled per referenced UL or ETL directory.
  - 1. Motor starter.
  - 2. Combination starters.
  - 3. Motor circuit protectors.
  - 4. Motor control centers.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Interconnection wiring diagrams.
  - 2. Certification.
  - 3. Operation and Maintenance Manuals.
  - 4. Short-circuit calculations and coordination study in accordance with Section 16360.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Store motor starters and control centers in secure and dry storage facility.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Motor Starters:
1. Interchangeability: Equipment of same type, size, rating, functional characteristics and make is to be interchangeable.
  2. NEMA ICS-2, ac general-purpose, Class A.
  3. Rating: Continuous-current rating suitable for associated motor as shown.
  4. Type:
    - a. Up to and including ½ HP: Manual starter operable on 120-volt, single-phase, 60 Hertz supply unless otherwise shown.
    - b. From above ½ HP up to and including 50 HP: Across-the-line magnetic starter operable on 480-volt, three-phase, 60 Hertz supply.
    - c. Above 50 HP: Closed-transition autotransformer starter operable on 480-volt, three-phase, 60 Hertz supply.
  5. Provide ground-fault protection with five-ampere pick-up in each motor starter for fans in fan shafts and pumps in drainage-pumping stations.
  6. Enclosure:
    - a. Type:
      - 1) For aboveground indoor locations and electrical rooms: NEMA 250, Type 1.
      - 2) For tunnel areas and underground locations except electrical rooms: NEMA 250, Type 12.
      - 3) For outdoor locations: NEMA 250, Type 3R.
    - b. Materials:
      - 1) Zinc-coated steel sheet: ASTM A653, coating designation G90, minimum thickness 14 gauge.
      - 2) Malleable iron: ASTM A47.
    - c. Finish: Metallic surface cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
  7. Nameplate:
    - a. Nameplate provided on each motor starter and control center in accordance with NEMA ICS, showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable.
    - b. Additional functional nameplates for each component as follows:
      - 1) Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless-steel rivets or screws.
      - 2) Lettering to be vertical gothic using a round or square cutter. V-shaped groove not acceptable.
      - 3) Each starter labeled with one-inch wide nameplate showing starter's designation and function in ½-inch high characters.
- B. Manual Starters: Quick-make/quick-break toggle mechanism, manual-reset thermal-overload device, position indicator showing ON/OFF/TRIPPED positions, red indicating light showing closed position.
- C. Across-The-Line Magnetic Starter:
1. Reversing or nonreversing as shown.
  2. NEMA size: As shown, not smaller than NEMA 1.
  3. 480-volt primary to 120-volt secondary control transformer with fuse in the primary circuit
  4. Manual-reset overload relay, one per phase, with the following additional requirements:
    - a. In starter for motors in fan shafts: Magnetic-type sensitive to current.
    - b. In starters for motors in other locations: Thermal-type.
  5. Two NO contacts with provision for addition of two NO or NC contacts.
  6. Nonreversing-type: START/STOP pushbutton mounted on door.

7. Reversing-type: FORWARD/REVERSE/STOP pushbutton mounted on door.
  8. HAND/OFF/AUTO selector switch provided when specified.
- D. Autotransformer Starter:
1. Reversing or nonreversing closed-transition type as shown.
  2. NEMA size: As shown.
  3. Adjustable taps for 50, 65 and 80 percent of line voltage.
  4. 480-volt primary to 120-volt secondary control transformer with fuse in primary circuit.
  5. Manual-reset overload relay, one per phase.
    - a. In starter for motors in fan shafts: Magnetic-type sensitive to current.
    - b. In starters for motors in other locations: Thermal-type.
  6. One pneumatic adjustable timing relay.
  7. Two NO contacts with provision for addition of two NO or NC contacts.
  8. Nonreversing-type: START/STOP pushbutton mounted on door.
  9. Reversing-type: FORWARD/REVERSE/STOP pushbutton mounted on door.
  10. HAND/OFF/AUTO selector switch provided when specified.
- E. Motor Circuit Protectors (MCP):
1. NEMA AB1, molded-case, quick-make/quick-break, mechanically trip-free switching mechanism with adjustable magnetic trip for instantaneous short-circuit protection.
  2. Rating:
    - a. Number of poles: Three.
    - b. Continuous-current rating: As shown, not less than full-load current of motor.
    - c. Voltage: 480-volt, three-phase, 60 Hertz.
    - d. Interrupting rating: As shown.
    - e. Trip range: As necessary to provide maximum protection to associated motor.
  3. Where shown or necessary, individually removable current limiter, internally mounted on load side of MCP, with the following additional requirements:
    - a. Limiter current rating and time-current limiting characteristics coordinated with time-current characteristics of MCP to provide the following:
      - 1) Interruption by MCP under fault-current level up to interrupting capacity of MCP.
      - 2) Interruption by current limiter in conjunction with the MCP of fault-current level above interrupting capacity of MCP.
      - 3) Where necessary to protect associated motor starter. Limit fault-current below withstand capability of the starter.
      - 4) Where necessary to protect associated motor-circuit conductors. Limit fault-current below withstand capability of cable insulation.
    - b. Current-limiter housing interlocked with MCP tripping mechanism so that breaker will trip upon removal of cover.
    - c. Equipped with common trip mechanism for tripping all poles simultaneously on blowing of current limiter to prevent single phasing.
    - d. Capable of interrupting minimum fault-current up to 100,000 rms symmetrical amperes at 480 volts ac.
- F. Combination Starter:
1. NEMA ICS-2, rated 480 volts, three-phase, 60 Hertz.
  2. Motor starter: Across-the-line magnetic or autotransformer starter as shown and specified.
  3. One 480-volt, three-pole MCP.
  4. Externally mounted operating handle with position indicator showing ON/OFF/TRIPPED condition of MCP. Operating handle interlocked for preventing

opening and closing of door when MCP is in ON position. Defeater provided to bypass interlock. Provision for padlocking in OFF position.

- G. Motor Control Centers:
1. NEMA ICS-2.3, Class 1, Type B, rated 480-volt, three-phase, 60 Hertz, totally enclosed, deadfront, free-standing, modular assembly having vertical and horizontal buses, wireways, compartments equipped with circuit breakers, MCP and starters as shown.
  2. Enclosure: Modular assembly allowing maximum of six compartment units in one vertical assembly and units' layout in any combination without structural interference, with the following additional requirements:
    - a. Type:
      - 1) Above ground indoor locations and electrical rooms: NEMA 250, Type 1.
      - 2) Tunnel areas and underground, except electrical rooms: NEMA 250, Type 12.
      - 3) Outdoor locations: NEMA 250, Type 3R.
    - b. Each unit compartment provided with individual door having concealed hinges. Unit door mechanically interlocked with unit circuit breaker to prevent opening or closing when the circuit breaker is in the ON position. Defeater provided to bypass interlock. Provision for padlocking in OFF position.
    - c. Horizontal wireway with removable coverplate provided at top and bottom for wiring between sections, incoming conduit and cable, motor and control wiring. Top trough separated by barrier from main horizontal bus.
    - d. Vertical wireway, with its own door, provided adjacent to each vertical assembly and accessible to two adjacent vertical assemblies when applicable.
    - e. Reinforced with adequate steel framework to form rigid structure with smooth outer surface free of burrs, ridges or other blemishes.
    - f. Zinc-coated steel sheet: ASTM A653 coating designation G90, minimum thickness 14 gauge
    - g. Finish: Metallic surface cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
  3. Horizontal and vertical buses: Main horizontal buses provided at top of structure. Vertical buses for feeding power to each compartment provided in each vertical assembly and securely bolted to main buses.
    - a. Busbar: ASTM B187, 98-percent-conductivity copper, contact surfaces tin-plated, fully insulated by extruded sleeve or wound tape.
    - b. Each horizontal and vertical bus rated for a minimum of 600 amperes and 300 amperes, respectively, with current density not to exceed 1,000 amperes psi or to meet ANSI temperature of 50-degree rise unless otherwise shown.
    - c. Each bus rigidly held by bus supports which have high-dielectric qualities, are moisture-resistant, noncarbonizing and nontracking and have vertical creepage surfaces to prevent faults due to buildup of conductive dirt.
    - d. Bus assembly braced to withstand short-circuit rating of 22,000 symmetrical amperes, rms or available short circuit determined by short-circuit calculations, whichever is greater.
    - e. Unit guides provided in unit compartment for aligning starter stubs.
    - f. Continuous bare-copper ground bus, 1/4-inch by two-inch cross-section, provided throughout length of control center.
  4. Motor starter: Across-the-line magnetic or autotransformer starter, as shown and specified, with tin-plated stub assembly for connecting to vertical buses in unit compartment.

5. Circuit breaker:
  - a. Main circuit breaker: One 480-volt, three-pole, rating as shown and in accordance with Section 16440.
  - b. Branch circuit breaker: One 480-volt, three-pole MCP for each unit compartment.
6. Indicator light: One red light mounted on each unit compartment showing ON position of circuit breaker.
7. Nameplate: As specified under General Requirements for motor starters, with the following additional requirement:
  - a. Each motor control center labeled with 1-1/2 inch wide nameplate showing designation in one-inch high characters.
  - b. Each compartment labeled with one-inch wide nameplate showing function and number of the motor controlled in 1/2-inch high characters.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Embed iron sills for anchoring motor control center flush with raised concrete pad as shown.
- B. Install motor starters and control centers as shown in accordance with manufacturer's recommendations.
- C. Install conduit in accordance with Section 16130 and the NEC.
- D. Connect power cable and control wire as recommended by manufacturers and as follows:
  1. Make power-cable and control-cable connections to manual starters, across-the-line magnetic starters and autotransformer starters by means of integral mechanical connectors. If such items are not furnished with integral mechanical connectors, make connections using compression connectors in accordance with Section 16125.
- E. Install motor starters and control centers as shown and in accordance with the NEC and Section 16225.
- F. Ground motor starter, complete motor control center in accordance with Section 16060.
- G. Apply touch-up paint as necessary.

#### **3.02 TESTING:**

- A. Furnish necessary equipment and perform the following tests:
  1. Test circuits for connections in accordance with wiring diagram.
  2. Test to ensure that insulation resistance to ground of nongrounded conductor is in accordance with Section 16060.
  3. Test equipment enclosures for continuity to grounding system.
  4. Test operation of circuits and controls.
- B. Submit certified test reports.

**END SECTION**

## SECTION 16435

### LOW-VOLTAGE SWITCHGEAR AND SWITCHBOARD

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing 480-volt switchgear and switchboard.
- B. Related Work Specified Elsewhere:
  - 1. Raceways, boxes, and cabinets: Section 16130.
  - 2. Wire connection accessories: Section 16125.
  - 3. Grounding and bonding: Section 16060.
  - 4. Circuit breakers, panelboards, and load centers: Section 16440.
  - 5. Unit substations: Section 16360.
  - 6. Uninterruptible power system: Section 16260.
- C. Design Criteria:
  - 1. Floor loading: Compatible with floor design loading of 250 pounds per square foot.
  - 2. Switchgear and switchboard suitable for anchoring to a concrete floor steel trowel finished to a tolerance level of 1/8 inch in 10 feet.

##### 1.02 QUALITY ASSURANCE:

- A. Qualifications:
  - 1. Select manufacturer regularly engaged in production of switchgears and switchboards.
  - 2. Furnish low-voltage switchgear, switchboard, and their main components from one manufacturer.
- B. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. NEMA: PB2.
  - 4. ANSI: C37.16, C37.17, C37.50, Z55.1.
  - 5. UL: 891.
  - 6. ASTM: B187.
  - 7. ANSI/IEEE: C37.13, C37.20.1, C57.13.
- C. Factory Testing: Submit design tests or certified copies of test reports on identical units performed for each type and rating of circuit breakers as assembled in its complete switchgear or switchboard unit including bus compartment.
  - 1. Circuit breaker tests in accordance with requirements of ANSI C37.50 and including the following:
    - a. Design test:
      - 1) Trip-device calibration-check test.
      - 2) AC dielectric withstand-voltage test.
      - 3) Continuous-current test.
      - 4) Overload-switching test.
      - 5) Endurance tests.
      - 6) Short-circuit current tests.
      - 7) Short-time current test.
    - b. Production tests: All applicable tests in accordance with the requirements

- of ANSI C37.50.
2. Switchgear assembly tests: In accordance with the requirements of ANSI/IEEE C37.20.1 and including the following:
    - a. Design tests:
      - 1) Dielectric tests.
      - 2) Rated continuous-current tests.
      - 3) Short-time current withstand tests.
      - 4) Short-circuit current withstand tests.
      - 5) Mechanical endurance tests.
      - 6) Flame-resistance tests.
      - 7) Rod entry test.
      - 8) Paint qualification test.
    - b. Production tests: All applicable tests in accordance with requirements of ANSI/IEEE C37.20.1.
  3. Switchboard assembly tests: In accordance with the requirements of NEMA PB2 and UL 891 and including the following:
    - a. Design tests:
      - 1) Temperature-rise tests.
      - 2) Short-circuit current tests.
      - 3) Enclosure tests.
      - 4) Dielectric test.
    - b. Production tests: All applicable tests in accordance with requirements of NEMA PB2 and UL 891.

### **1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  1. Shop Drawings: In accordance with Section 16360.
  2. Certification: Certified test reports for specified factory testing.
  3. Documentation:
    - a. Short-circuit calculations and system coordination study: In accordance with Section 16360.
    - b. Field-testing plan: In accordance with Section 16360.
  4. Operation and Maintenance Manuals: In accordance with Section 16360.

### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Ship each unit securely packaged, braced and labeled for safe handling in shipment and to avoid damage and distortion.
- B. Temporary Bracing: Where necessary brace switchgear for hoisting, lowering and skidding into position. Label temporary internal bracing: TEMPORARY - REMOVE BEFORE OPERATION.
- C. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact-record chart with manufacturer's instruction for disposition for damaged material.
- D. Assembly for Shipment:
  1. Design enclosures to permit lifting by jacks or slings and moving horizontally on rollers or skidding in any direction.
  2. Maximum dimensions of shipping sections to be coordinated with dimensions of access hatches, corridors and doors to ensure shipping dimensions will allow movement of switchgear through structure without damage to equipment or structure

- or undue difficulty.
- 3. Draw-out relays mounted in their proper cases with moving parts properly secured and packed for shipment.
- 4. Removable circuit-breaker elements packaged separately.
- 5. For shipping split, interconnecting wiring coiled on one side of shipping split with matching terminal block on other side of split. Wiring and terminal block points identified for reconnection.

E. Store switchgear in secure and dry storage facility.

## 1.05 OPERATIONS AND MAINTENANCE TRAINING:

A. In accordance with the General Requirements and Section 16360.

## PART 2 - PRODUCTS

### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Switchgear:
1. ANSI/IEEE C37.20.1, for indoor use.
  2. Ratings:
    - a. Maximum voltage: 508 volts.
    - b. Frequency: 60 Hertz.
    - c. Insulation level: Low-frequency withstand: 2.2 kV.
    - d. Continuous current: As shown and in accordance with reference standards.
    - e. Short-time current: In accordance with reference standards and approved coordination study.
  3. Insulation structure:
    - a. Not to support combustion, produce toxic gases, absorb moisture or track.
    - b. When subjected to electric arc, emission of conducting materials from insulating structure limited so as not to interfere with performance of circuit breaker.
  4. Power circuit breakers:
    - a. ANSI/IEEE C37.13, ANSI C37.16, three-pole, single-throw, air-break drawout-type, with manually or electrically controlled closing and electrically controlled tripping, mechanically and electrically trip-free, with the following additional requirements:
      - 1) System nominal voltage: 480 volts.
      - 2) Rated maximum voltage: 508 volts.
      - 3) Rated frequency: 60 Hertz.
      - 4) Insulation dielectric-withstand: 2,200 volts.
      - 5) Three-phase short-circuit current rating (symmetrical amperes): As shown and in accordance with reference standards and approved coordination study.
      - 6) Frame size (amperes):
        - (a) Secondary main circuit breaker: Minimum frame size suitable to carry continuous forced-air cooling rating of its distribution transformer.
        - (b) Essential main and secondary tie circuit breakers: Minimum frame size as shown.
      - 7) Equip each power circuit breaker with a solid-state tripping system consisting of three current sensors, microprocessor-based controlled-phase overcurrent trip device, time coordinated ground fault protection and flux-transfer shunt trip. Provide trip device complying with ANSI C37.16, and C37.17, with adjustable long-time

and short-time elements, communication interface, power metering and non-volatile memory for protective settings, Cutler Hammer Digitrip RMS 810, Siemens Static Trip III CP, or equal. Range of trip-device current rating in amperes and setting as shown and in accordance with approved coordination study. True RMS sensing protection to be achieved by analyzing the secondary current signals from the circuit breaker current sensors and initiating trip signals to the circuit breaker. Protective settings, metering values and stored data to be accessible from the data communication network interface and locally from a digital alpha-numeric display unit mounted on the trip unit or breaker. Additional features to include:

- (a) Provide the trip unit with an information system that provides LED's to indicate mode of trip following an automatic-trip operation. The indication of the mode to be retained after an automatic trip. Provide a trip reset button to turn off the LED indication after automatic trip.
  - (b) Provide the trip unit with a front panel display that indicates the protection-function settings. Have the unit continuously self-checking and provide a visual indication that the internal circuitry is being monitored and is fully operational.
  - (c) Provide the trip unit with a portable secondary current test set with matching connector plug or with an integral test panel, either of which enables the user to select the values of test currents within the range of available settings; with the basic protective settings not affected during testing operations.
  - (d) Provide an alpha-numeric display to indicate cause of trip, instantaneous value of maximum phase current and level of fault current that initiated an automatic-trip operation.
  - (e) Have the trip unit include a potential transformer module (PTM), suitable for operation up to 600 volts, 60 Hz; the primary of the PTM connected internally to the load side of the circuit breaker through a dielectric disconnect plug.
  - (f) Equip the trip unit with an energy-monitoring function processor to provide at a minimum; Phase Current (amps), Peak Demand (kilowatts), Present Demand (kilowatts), and Energy Consumption (kilowatt-hours).
  - (g) Equip the trip unit with a communication interface via a network twisted pair for remote monitoring and control.
  - (h) Provide the unit with an external power supply if voltage source is different than that provided to control the breaker; the main supply to the power supply to be 125 volts dc.
- 8) Operation counter.
  - 9) Endurance: Electrical and mechanical-endurance performance not less than requirements in reference standard.
  - 10) Control voltage: 125 volts dc nominal, individually fused.
  - 11) Racking mechanism: With connected, test and disconnected positions; manually operated closed-door mechanism by insertion of crank through small opening in door; positive stops for preventing overtravel and guides for alignment of breaker with stationary unit; racking- mechanism gear ratio and design such that in combination with design of shutters covering main stationary disconnect, force required to puncture or damage shutters or breaker disconnect will become sufficiently large and readily apparent to protect against failure of shutters to open as breaker is racked in.

- 12) Primary connection (main disconnects): Connection between the removable and stationary unit made by male-and-female contacts, with the following additional requirements:
  - (a) Silver-plated high-pressure contacts.
  - (b) Automatic shutter to cover the contact orifices when the breaker is withdrawn and uncover orifices when breaker is returned to connected position.
  - (c) Automatic shutters constructed to withstand force of racking mechanism in case shutters fail to open when breaker is racked into position or shutter opening visible as breaker is racked into position.
- 13) Secondary connection (control and auxiliary disconnects): Control and interlocking-circuit connections between stationary and removable elements of switchgear made using device consisting of recessed stationary receptacle and set of self-aligning multiple-contact plugs on removable elements with sufficient number of contacts to accommodate control and interlock circuits, including spares, without resorting to auxiliary relays.
- 14) Spare auxiliary contacts for DTS: As shown to indicate closed and open positions for circuit breaker at remote location. Dry-type minimum of one NC and one NO rated 15 voltamperes, 250 volts dc, five milliseconds contact-bounce maximum and not more than 0.10-ohm contact resistance. Wired through secondary contacts to terminal blocks.
- 15) Shunt trip device.
- 16) For electrically operated breakers: Electrically powered, spring-charged, stored-energy operating mechanism, with following additional requirements:
  - (a) Voltage requirement:
    - (1) Charging of stored-energy operating mechanism: 125 volts dc.
    - (2) Closing by means of closing release coil capable of operation from 100 - 140 volts dc.
    - (3) Tripping by means of shunt trip coil capable of operation from 70 - 140 volts dc.
  - (b) Closing release coil energized by means of pushbutton, control switch or automatically by interlocking/control signal.
  - (c) Shunt trip coil energized manually by pushbutton, control switch or automatically by interlocking/control signal.
  - (d) Equipped with mechanical devices on front of breaker to actuate closing and tripping operations in case of failure of control power.
  - (e) Compressed-spring stored-energy mechanism with energy storage sufficient for closing-opening operation at rated short-circuit current or at related required capabilities.
  - (f) Stored-energy mechanism automatically charged within 10 seconds following each closing of circuit breaker.
    - (1) Stored-energy mechanism suitable for manual charging by means of removable or built-in handle in case of failure of control power.
    - (2) Automatic discharge of stored-energy mechanism prior to circuit-breaker withdrawal.
  - (g) White indicating light or flag provided on escutcheon of each circuit-breaker unit to indicate that stored-energy closing mechanism is charged.

- 17) For manually operated breakers: Manually, spring-charged, stored-energy mechanism, with the following additional requirements:
    - (a) Built-in spring charging handle in front of breaker with indicator on escutcheon to indicate that stored-energy closing mechanism is charged.
    - (b) Closing by means of releasing stored energy by pushbutton or charging handle itself.
    - (c) Tripping by means of shunt trip coil capable of operation from 70 - 140 volts dc and by mechanical device on front of breaker.
    - (d) Compressed-spring stored-energy mechanism with energy storage sufficient for closing-opening operation at rated short circuit current or at related required capabilities.
    - (e) Automatic discharge of stored-energy mechanism prior to circuit-breaker withdrawal.
  - 18) Electrically controlled closing: On tie breakers only.
5. Space heater:
- a. Each vertical section of switchgear provided with 120-volt, single-phase, 60 Hertz heating element to facilitate drying and prevent condensation.
  - b. Heaters enclosed in grille guards with no sharp edges and located so that they are easily accessible for replacement without de-energization of switchgear bus. Heaters thermostatically controlled. Thermostat adjustable from 40F to 80F. Thermostat set in accordance with manufacturer's recommendation. Panel ammeter approximately 2-1/2 inches square, marked to indicate heater load.
6. Bus bars:
- a. General requirements:
    - 1) ASTM B187, 98-percent-conductivity copper.
    - 2) Current rating:
      - (a) Size sufficient to carry specified current and complying with applicable requirements of UL, ANSI, NEMA, IEEE and NEC.
      - (b) Bus rating for secondary main-breaker unit and bus connection to transformer sized for continuous forced-cooling rating of transformer.
    - 3) Capable of withstanding mechanical stresses and heat due to maximum short-circuit current.
    - 4) Bus contact surface silver-plated or tin-plated at connection.
    - 5) Each joint having impedance not more than that of bus bar of same length and clamped to maintain that impedance throughout life of equipment.
    - 6) Connection coordinated for proper mating with adjacent equipment terminals and enclosures. At transformer connection, flexible joint and access plate provided for assembly and inspection of such joints.
  - b. Power buses: Three-phase, four-wire copper buses, neutral bus of same rating as that of phase bus. Each bolted connection with four bolts minimum.
  - c. Ground bus:
    - 1) Copper bus, not less than two inches by 1/4 inch provided throughout length of switchgear section.
    - 2) In switchgear unit where power cables enter or leave switchgear at top, copper ground bus not less than one inch by 1/8 inch extended from main ground bus to top of unit.
    - 3) Joints in ground bus made with four bolts and overlap of four inches.

- 4) Mechanical connector provided in each unit for field connection of 4/0 through 500 kcmil ground cable to switchgear ground bus.
- d. Ground-to-neutral link provided at each ac switchgear in accordance with NEC for grounding of neutral. For services in same ac-switchboard room, single-grounding electrode connection to tie-point of neutral from each power source is permitted.
- e. Control bus:
  - 1) 125-volt dc bus; copper, No. 6 AWG minimum.
  - 2) One two-pole knife switch provided in switchgear cubicle for disconnecting the control circuit.
  - 3) UL Class J or RK-5 fuses used for control and auxiliary-service protection.
  - 4) Closing circuit fused; tripping circuit unfused.
  - 5) White light to indicate availability of dc control power.
- 7. Control and instrument wiring:
  - a. Factory-installed.
  - b. Insulation-rated, 600 volts, Type SIS, No. 14 AWG minimum copper conductor. Flexible Class C or higher stranded insulated copper wire used for wiring across hinged joints.
  - c. One continuous length of wire used from terminal to terminal without splices or taps.
  - d. Removable-element control wiring installed and connected according to manufacturer's standard for circuit-breaker wiring.
  - e. Control wiring so designed and installed that fault in one main circuit cannot be transferred to control wiring of another main circuit.
  - f. Connections made at terminals of device, on terminal blocks or on control buses. Wiring connection made using insulated-shank ring-type terminals.
  - g. Interconnecting wiring between cubicles and compartments terminated on terminal blocks before being wired to components.
  - h. Terminal blocks: With screw terminals, circuit-marking strips for indicating control wire number, phenolic-laminated dust cover and minimum of 10-percent spare terminal points.
  - i. For each individual wire, corresponding identification used on the wiring diagrams.
  - j. Internal wiring identified at each termination, with same number shown on wiring diagram, using suitable plastic sleeve attached within six inches of terminal connections.
  - k. External wiring: Provision made for external control wiring to enter from bottom or top and with space allowed to terminate external multiple-conductor copper control cable. Top entrances provided with removable coverplates for field-drilling of conduit and cable entrance holes.
  - l. Testing:
    - 1) Check wiring for accuracy, open circuits and short-circuits, ground connections and insulation integrity by means of high-potential, continuity and operational tests.
    - 2) Subject wiring to high-potential test of 1,500 volts to ground for one minute or as recommended by the manufacturer.
    - 3) Verify that wiring is in accordance with manufacturer's wiring diagrams.
    - 4) Check wiring completely, including interconnections at shipping breaks.
- 8. Fuses: Current-limiting fuse installed in each control circuit except tripping circuit. Tripping control circuit to include green and red indicating lights to monitor availability of trip power with the red light in series with the trip coil to also monitor continuity of trip coil.
- 9. Enclosure:

- a. Dead-front, free-standing, indoor steel enclosure designed for line up with 13.8 kV to 480Y/277-volt transformer.
  - b. Steel structure with framework of welded or bolted structural steel, free from distortion and welding strain and sufficiently rigid to support equipment under normal and short-circuit conditions.
  - c. Switchgear cubicles and circuit-breaker compartment equipped with hinged front door and either hinged rear door or bolted rear covers. Bolted covers furnished with alignment studs and keyhole slots for positioning prior to bolting.
  - d. Each power circuit breaker in separate metal-enclosed compartment.
  - e. Circuit-breaker compartment door designed not to hinder movement of breaker in and out of compartment when door is open and doorstop set.
  - f. Barriers provided in bus compartment to separate bus section as follows:
    - 1) Main bus from tie bus.
    - 2) Main bus from essential bus.
  - g. Transition compartment sized as necessary with front and rear bolted covers to line up and coordinate with transformer.
  - h. Circuit-breaker compartment to provide for interchangeability of removable elements within frames of same size and operating characteristics.
  - i. Finish: Metallic surfaces degreased and finished with light-gray enamel, ANSI Z55.1, Color 61 in accordance with ANSI/IEEE C37.20.1 two mils minimum DFT.
10. Nameplate:
- a. Nameplate provided on each switchgear showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable in accordance with reference standard.
  - b. Additional functional nameplates for each component, relay, meter, terminal block, etc. with the following requirements:
    - 1) Three-ply, laminated phenolic plates; engraved through black face to white core and attached by means of stainless-steel rivets or screws, provide on each switchgear and its components.
    - 2) Lettering: Vertical gothic using round or square cutter. V-shaped groove not acceptable.
    - 3) Each switchgear section labeled with nameplate one-inch high bearing the following inscription in letters ½-inch high: 480-VOLT SWITCHGEAR.
    - 4) Each switchgear compartment labeled with nameplate ½-inch high bearing, as appropriate one of the following inscriptions in letters 1/4-inch high: SECONDARY MAIN BREAKER, SECONDARY TIE BREAKER.
    - 5) In addition to other information normally displayed on equipment, provide nameplate to show switch positions, meaning of indicator lamp and other pertinent information.
11. Ground-fault protection system:
- a. Time coordinated and with solid-state microprocessor based trip unit with the following additional requirements:
    - 1) Current-adjustment range: 100 to 1,200 amperes, with three calibration marks minimum.
    - 2) Time-adjustment band: Instantaneous and six- and 12-cycle calibration marks.
    - 3) Setting: As shown and as necessary to maximize protection and proper coordination in accordance with approved coordination study.

B. Low-Voltage Switchgear:

- 1. Secondary main and tie cubicle: Equipped with the following:

- a. Secondary main circuit breaker: Power circuit breaker with microprocessor-based phase-overcurrent trip device, shunt trip device, ground-fault protection, position-indicating lights, spare auxiliary contacts for DTS, accessories and interlocks.
- b. Secondary tie circuit breaker: Power circuit breaker with microprocessor-based phase-overcurrent trip device, shunt trip device, electrical closing device, ground-fault protection, spare auxiliary contacts for DTS, position-indicating lights, accessories and interlocks. One or two tie breakers provided as shown.
- c. Current transformers:
  - 1) ANSI/IEEE C57.13, window-type with polarity markers to operate digital power metering.
  - 2) Quantity: Three.
  - 3) Current ratio: As necessary for forced-cooling rating of distribution transformer with five-ampere secondary.
  - 4) Insulation class: 600 volts with basic-impulse insulation level of 10 kV full-wave.
  - 5) Maximum allowable temperature rise under continuous full-load above average ambient temperature of 55C.
    - (a) By winding resistance: 30C.
    - (b) By hottest spot in winding: 40C.
  - 6) Accuracy class: 0.6B - 0.5 or better.
- d. Potential transformer:
  - 1) ANSI/IEEE C57.13, wound-type with polarity markers to operate voltage relay and meters.
  - 2) Quantity: Three.
  - 3) Voltage ratio: 480 volts primary to 120 volts secondary.
  - 4) Insulation class: 600 volts with basic impulse-insulation level of 10 kV full-wave.
  - 5) Maximum allowable temperature rise under continuous full-load above average ambient temperature of 55C.
    - (a) By winding resistance: 30C.
    - (b) By hottest spot in winding: 40C.
  - 6) Accuracy class: 0.6 W or X.
  - 7) Transformers connected WYE-WYE with three-phase and neutral potential bus.
- e. Power metering and communication interface:
  - 1) Each switchgear equipped with a digital power meter, Cutler Hammer IQ Data Plus II, Siemen 4700. Voltage inputs provided from potential transformers (PTs) connected to the main secondary 480-volt bus. Current inputs provided from external- mounted current transformers with five-amp secondary output, mounted to measure currents on the secondary main bus. CT and PT ratios to be field selective. Provide a communications option tied into the communication network.
  - 2) Each breaker equipped with a microprocessor-based trip device provided with a data communication interface tied into a local-area communication network.
  - 3) Each switchgear provided with a two-wire local-area network tied into a central monitoring system, Cutler Hammer Assemblies Electronic Monitor II (AEM II), Siemens Power Monitor. Have the monitor provide local status of all breakers, load data, metering parameters, cause of trip, min./max. values, etc. Install the local area network to mitigate problems associated from electrical fields and electromagnetic interference.
  - 4) Provide a separate RS-232 (DB-9) plug and network

interface/translator, panel mounted with protective dust cover, for customer interface from a Notebook- type computer (IBM Compatible). Provide networking software and any special network interface board/PCMCIA for use with Authority-furnished notebook-type computer. The user interface software to be a Windows version, providing data access to all device parameters and metering values.

- 5) Power Supply: All metering equipment control power or its external power supply(s) to be powered from 125-volt DC control power or 120-volt ac, 60 Hz provided from one of the following sources:
    - (a) Emergency panel.
    - (b) Load side of secondary breaker.
    - (c) Line side of secondary main breaker with necessary equipment including auxiliary relays to ensure that control power is available after operation of transfer scheme.
  - f. Test switches: Provided between instrument transformers, meters and relays as listed below:
    - 1) ABB Style FT-1.
  2. Feeder main cubicle: Equipped with the following:
    - a. Feeder circuit breakers: Each circuit breaker with microprocessor-based phase- overcurrent trip device, shunt trip, ground-fault protection, position-indicating lights and necessary accessories and interlocks.
- C. Electrical Interlocks: Provide interlocks and coordination with primary-service switchgear, as applicable, for performing the following functions:
1. Modes of operation: Normal, automatic throwover, manual restoration and maintenance throwover as follows:
    - a. Normal: All power circuit breakers, except tie breaker, are closed. Tie breaker is normally open.
    - b. Automatic throwover: Automatic throwover operation occurs only when an undervoltage condition occurs in one of the primary feeders and when other secondary main breaker is closed.
      - 1) Where primary service is through 13.8 kV metal-clad switchgear, tripping of primary breaker caused by undervoltage condition automatically trips secondary main breaker and initiates closing of secondary tie breaker. Automatic throwover operation is blocked if secondary main breaker or primary breaker has tripped because of overcurrent or ground-fault condition.
    - c. Manual restoration: When proper-voltage condition has been restored, substation may be retransferred to normal mode. After primary breaker has been closed or after primary voltage has been re-established as evidenced by return to normal of transformer secondary voltage, both tie breakers are tripped first from a common tie breaker trip switch, followed by closing of secondary main breaker, all manually.
    - d. Maintenance throwover: Same as automatic but initiated manually by simulating undervoltage condition at potential test switch followed by manual restoration as specified.
  2. To prevent paralleling two sources and to prevent feedback through transformer into primary lines.
  3. To trip secondary main breaker when primary breaker trips. Tripping of secondary main breaker does not trip primary breaker.
  4. To operate simultaneously two tie breakers in passenger stations having two separate ac-switchboard rooms.
  5. To allow each drawout circuit breaker in test position to be closed or tripped by local operation and to inhibit interlocking/control signals to or from breaker when in such position.

6. To provide time coordinated ground-fault protection. In addition, ground-fault protection for secondary main and tie circuit breakers to provide reliable operation under any operating condition without nuisance tripping because of partial cancellation of stray currents flowing in neutral.
  7. In combined ac switchboard room: Ground-fault protection on secondary main and tie breakers designed to trip secondary main breaker associated with fault and to prevent nuisance tripping of other secondary main breaker.
  8. Interconnecting control wiring between two remotely located unit substations to be designed for installation in a two-inch conduit minimum.
- D. General Requirements for Switchboards:
1. NEMA PB2, UL 891.
  2. Ratings:
    - a. Normal voltage: 480 volts.
    - b. Frequency: 60 Hertz.
    - c. Rated continuous current: As shown.
    - d. Short-circuit rating: As shown.
  3. Molded-case circuit breakers: Section 16440.
  4. UL listed.
  5. Bus:
    - a. ASTM B187, 98-percent-conductivity copper.
    - b. Continuous-current rating: As shown.
    - c. Capable of withstanding mechanical stresses and heat due to maximum short-circuit current.
    - d. Bus contact surfaces: Silver-plated or tin-plated at connection.
    - e. Neutral bus rating: Same as that of phase bus.
    - f. Control bus: 125-volt dc; copper, No. 6 AWG minimum; with UL Class J or RK-5 fuses for each compartment where necessary.
    - g. Ground bus secured to each vertical-section structure and extending entire length of switchboard.
  6. Control wiring:
    - a. Insulation rated 600 volts, Type SIS, copper, No. 14 AWG minimum. Flexible, Class C or higher, stranded wire used for wiring across hinged joints.
    - b. One continuous length of wire used between terminals without splices or taps.
    - c. Connections made at terminal of device, on terminal blocks or at control bus, using tinned copper-ring compression terminals with insulated sleeve.
    - d. Interconnect wiring between compartments terminated on terminal blocks before being wired to components.
    - e. Terminal blocks: With screw-type terminals, circuit-marking strips for indicating wire number, phenolic-laminated dustcover and 10-percent minimum spare terminal points.
    - f. For each individual wire, same identification used on each terminal block marking strip.
  7. Ground-fault protection system:
    - a. Time coordinated ground fault protection system with solid state adjustable tripping device.
      - 1) Solid-state, adjustable.
      - 2) Current adjustable range: As per manufacturer
      - 3) Time adjustment band: As per manufacturer.
      - 4) Setting: As shown or as necessary to maximize protection and coordination.
  8. Enclosure:
    - a. Dead-front, free-standing indoor steel enclosure designed for lineup with 480-volt switchgear, where applicable.

- b. Steel structure with framework of welded or bolted structural steel, free from distortion and welding strain and sufficiently rigid to support equipment under normal and short-circuit conditions.
  - c. Each breaker compartment equipped with hinged door or bolted cover in front and bolted rear cover. Bolted covers furnished with headed studs and keyhole slots for hanging in position before bolting.
  - d. Vertical barrier provided between feeder main cubicle and the essential switchboard.
  - e. Individually mounted feeder breakers externally operable. Highest breaker handle not more than six-feet six-inches above floor.
  - f. Interconnections between feeder-main cubicle bus and switchboard bus shall be provided by using internal busbar and rated, segregated and braced in accordance with applicable reference standards.
  - g. Spaces for future breakers to include necessary bus connections and device supports.
  - h. Finish: Metallic surfaces degreased and finished with light-gray enamel, ANSI Z55.1, Color 61, in accordance with ANSI/IEEE C37.20.1, two mils minimum DFT.
  - i. Adjustable breaker lifting device mounted on top of switchgear.
9. Nameplates:
- a. Nameplate provided on each switchboard and its components in accordance with reference standards.
  - b. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless-steel rivets or screws, provided on each switchboard and its components.
  - c. Lettering: Vertical gothic using round or square cutter. V-shaped groove not acceptable.
  - d. Each switchboard cubicle labeled with nameplate one-inch high bearing, as appropriate, one of the following inscription in letters ½-inch high: SWITCHBOARD or CHILLER PLANT SWITCHBOARD.
  - e. In addition to other information normally displayed on equipment, provide nameplate to show breaker handle positions, meaning of indicator lamp and other pertinent information.
- E. Switchboards:
- 1. Equipped with individually mounted circuit breaker, each with solid state trip device, with integral time coordinated ground-fault protection and space heater.
  - 2. Adjustable instantaneous (magnetic) trip settings: As necessary for coordination.
  - 3. Bus bars on load side extending to rear of cubicle.
  - 4. Phase, neutral and ground buses and 125-volt dc control bus.
  - 5. Suitable for service entrance.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Install switchgear in position as shown and in accordance with the NEC.
- B. Install conduits and raceways as shown and in accordance with the Section 16130.
- C. Make power-cable and control-wire connections as shown and as follows:
  - 1. Make power-cable and control-wire connections to circuit breakers, current-limiting circuit breakers and integrally fused circuit breakers by means of integral mechanical connectors. If such items are not furnished with integral mechanical connectors, make connections using compression connectors in accordance with Section 16125.

D. Make grounding connections as shown and in accordance with Section 16060.

**3.02 FIELD QUALITY CONTROL:**

A. In accordance with Section 16360.

**END OF SECTION**

## SECTION 16440

### CIRCUIT BREAKERS, PANELBOARDS AND LOAD CENTERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies furnishing, installing, connecting and testing of circuit breakers, panelboards and load centers.
- B. Related Work Specified Elsewhere:
  - 1. Raceways, boxes and cabinets: Section 16130.
  - 2. Wire, cable and busways: Section 16120.
  - 3. Wire connection accessories: Section 16125.
  - 4. Grounding and bonding: Section 16060.
  - 5. Field painting: Section 09920.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NEC.
  - 3. NEMA: AB1, PB1, ST20, 250.
  - 4. ANSI: Z55.1.
  - 5. UL: 50, 67, 198C, 489, 891, Electrical Construction Materials Directory.
  - 6. ASTM: A276, B187.
  - 7. ITS: Directory of ITS Listed Products.
- B. Source Quality Control:
  - 1. Each item listed per referenced UL or ITS directory.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each circuit breaker, panelboard and transformer in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling and to avoid damage or distortion.
- C. Store products in secure and dry storage facility.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:

1. Interchangeability: Components of the same type, size, rating, functional characteristics and make are to be interchangeable.
  2. Finish for enclosures for enclosed circuit breakers, panelboards, emergency-service panelboards and load centers:
    - a. Clean and degrease metallic surfaces.
    - b. Prime with zinc primer.
    - c. Finish with one coat of light-gray enamel, ANSI Z55.1, Color 61. Minimum dry-film thickness: Two mils.
- B. Circuit Breaker: NEMA AB1, UL 489, molded-case, bolt-on, quick-make/quick-break, mechanically trip-free switching mechanism, with thermal trip for inverse time-delay overcurrent protection and magnetic trip for instantaneous short-circuit protection. Shunt-trip device for tripping by ground-fault relay as shown. Frame size 225 amperes and above equipped with interchangeable thermal trip and adjustable magnetic-trip unit. Designed to carry continuous rating in ambient temperature of 40C with the following parameters as shown:
1. Number of poles.
  2. Rated voltage.
  3. Rated interrupting current.
  4. Trip setting.
  5. Frame size.
- C. Integrally Fused Circuit Breaker:
1. NEMA AB1, molded-case, quick-make/quick-break, mechanically trip-free switching mechanism.
  2. Thermal trip for inverse time-delay overload and magnetic trip for instantaneous short-circuit protection. Shunt-trip device for tripping by ground-fault relay as shown. Frame size 400 amperes and above equipped with interchangeable thermal and adjustable magnetic trips.
  3. Individually removable current limiter, internally mounted on load side of circuit breaker, with rating and time current limiting characteristics that coordinate with time current-tripping characteristics of circuit breakers to provide the following:
    - a. Interruption of circuit breaker under fault-current level up to interrupting capacity of circuit breaker.
    - b. Interruption by current limiter in conjunction with circuit breaker under fault-current level above interrupting capacity of circuit breaker.
    - c. Where necessary to protect downstream panelboard, limit fault current at branch circuit breakers below their interrupting capacity.
    - d. Where necessary to protect associated feeder/branch circuits, limit fault current below short-circuit current withstand capability of cable.
  4. Removable cover provided over current-limiter section of circuit breaker with interlock for tripping of breaker upon removal of cover and to prevent turning circuit breaker to ON position with cover removed.
  5. Equipped with common trip mechanism for tripping all breaker poles simultaneously on blowing of current limiter to prevent single phasing.
  6. Capable of interrupting minimum fault current of 100,000-rms symmetrical amperes at 480 volts ac.
  7. Circuit breaker rating:
    - a. Number of poles: As shown.
    - b. Frame size: As shown.
    - c. Voltage rating: 480 volts.
    - d. Interrupting capacity: As necessary to coordinate with current limiter.
    - e. Trip setting: As shown.
- D. Enclosed Circuit Breaker:
1. NEMA AB1.

2. Circuit breaker: As shown and as specified. Overcurrent trip device coordinated to provide selective tripping under overload conditions.
3. Enclosure:
  - a. Galvanized steel, surface-mounted, unless otherwise shown.
  - b. Type:
    - 1) Above-ground indoor locations and electrical rooms: NEMA 250, Type 1.
    - 2) Tunnel areas and underground locations, except electrical rooms: NEMA 250, Type 12.
    - 3) Outdoor locations: NEMA 250, Type 3R.

E. Panelboard:

1. NEMA PB1, UL 67.
2. Enclosure:
  - a. UL 50.
  - b. Galvanized steel, surface-mounted unless otherwise shown.
  - c. Type:
    - 1) Aboveground indoor locations and electrical rooms: NEMA 250, Type 1.
    - 2) Tunnel areas and underground locations, except electrical rooms: NEMA 250, Type 12.
    - 3) Outdoor locations: NEMA 250, Type 3R.
  - d. Gutter size:

Main Bus Rating Amperes	Minimum Top and Bottom Gutter Size in Inches	Minimum Side Gutter Size in Inches
100 and below	4	4
225	6	4
400 and over	8	4

- e. Interior components mounted on backplate of reinforced steel for rigid support and accurate alignment.
- f. Provide latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.
- g. Provision for enclosure grounding.
3. Busbars:
  - a. ASTM B187.
  - b. 98-percent-conductivity copper.
  - c. Contact surface silver-plated or tin-plated.
  - d. Rating of neutral and ground bus: Equal to that of phase bus.
  - e. Neutral bus mounted on insulating block.
  - f. Neutral and ground busbars equipped with integral mechanical connectors.
4. AC panelboards:
  - a. Type of service: Three-phase, four-wire, 277/480 volt or 120/208 volt or as shown.
  - b. Type of main: Main lugs or circuit breakers or integrally fused circuit breakers as shown, conforming to requirements specified, located at top or bottom as necessary
  - c. Branch circuit: Circuit breakers or integrally fused circuit breakers as shown, conforming to requirements specified, number of circuits as shown.
  - d. Circuit breaker: Trip device coordinated with that of upstream circuit breakers to provide selective tripping.
  - e. Suitable for service entrance where necessary.

5. DC Panelboard:
  - a. Type of service: 125-volt dc, two-wire.
  - b. Type of main: Two-pole circuit breaker, 100-ampere frame, 100-ampere trip and 10,000-ampere interrupting capacity, unless otherwise shown.
  - c. Branch circuit: Two-pole circuit breakers, 100-ampere frame and 10,000-ampere interrupting capacity, in accordance with specified requirements, quantities as follows unless otherwise shown:
    - 1) With 20-ampere trip: Two minimum.
    - 2) With 30-ampere trip: Two minimum.
    - 3) With 50-ampere trip: Two minimum.
  - d. Enclosure finish: As specified under General Requirements for this section, except color to be OSHA red as specified in Section 09920.
6. Emergency-power panelboard:
  - a. NEMA PB1, UL 67, fused-switch.
  - b. Enclosure:
    - 1) Galvanized steel, surface-mounted unless otherwise shown.
    - 2) Type:
      - a) Above-ground indoor locations and electrical rooms: NEMA 250, Type 1.
      - b) Tunnel areas and underground locations, except electrical rooms and tunnel areas: NEMA 250, Type 12.
      - c) Outdoor locations: NEMA 250, Type 3R.
    - 3) Minimum of four inches side gutter and six inches top and bottom gutter.
    - 4) Mounting channel drilled and tapped to accommodate any combination of fused switch.
  - c. Busbar:
    - 1) ASTM B187.
    - 2) 98-percent-conductivity copper.
    - 3) Contact surface silver-plated or tin-plated.
    - 4) Rating of neutral and ground bus: Equal to that of phase bus.
    - 5) Neutral bus mounted on insulating block.
    - 6) Drilled and tapped to accommodate any combination of fused switch unit.
    - 7) Neutral and ground bus equipped with integral mechanical connectors.
  - d. Type of service: As shown.
  - e. Type of mains: Main lugs or fused switch unit as shown, located at top or bottom as necessary.
  - f. Branch circuit: Equipped with fused switch unit, number of circuits as shown.
  - g. Fused switch unit:
    - 1) Individually enclosed, quick-make/quick-break switching mechanism.
    - 2) Equipped with the following:
      - a) Silver-alloy contacts.
      - b) External operating handle capable of being padlocked in ON or OFF position.
    - 3) Defeatable door interlock to prevent opening the door when operating handle is in ON position.
    - 4) Pressure-type fuse with Class J cartridge fuse conforming to UL 198C.
    - 5) Current rating and number of poles: As shown; maximum rating, 30 amperes.
    - 6) Use two-pole or three-pole switch unit if single-pole switch unit is not available.

7. Fuse time-current characteristic coordinated with upstream fuse time-current characteristic to provide selective overcurrent tripping.
- F. Nameplates:
1. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by stainless-steel rivets or screws.
  2. Lettering: Vertical gothic using round or square cutter. V-shape groove is prohibited.
  3. Each panelboard labeled with nameplate one-inch high bearing ½-inch high inscriptions as appropriate.
  4. Nameplate for emergency-power panelboard to bear inscription EMERGENCY POWER.
- G. Load Centers:
1. Enclosure:
    - a. UL 891, stainless steel, ASTM A276, Type 304, or approved equal.
    - b. Type:
      - 1) Above-ground indoor locations and electrical rooms: Non-ventilated indoor.
      - 2) Underground locations, except electrical rooms and tunnel areas: Non-ventilated outdoor.
      - 3) Outdoor locations and tunnel areas: Non-ventilated outdoor.
  2. Transformer:
    - a. NEMA ST20, dry, self-cooled, epoxy-encapsulated, double-wound with insulated copper conductor with 185C-insulation system capable of withstanding full-wave impulse voltage of 10KV.
    - b. Five kVa load center: Single-phase, 60 Hertz, 480 volts primary to 120/240 volts secondary.
    - c. Nine kVa load center: Three-phase, 60 Hertz, 480 volts primary to 120/208Y volts secondary.
    - d. Fifteen kVa load center: Three-phase, 60 Hertz, 480 volts primary to 120/208Y volts secondary.
    - e. Maximum allowable temperature rise under continuous full load above ambient temperature of 30C and 40C maximum:
      - 1) By winding resistance: 115C.
      - 2) By hottest spot in winding: 145C.
  3. Circuit breaker:
    - a. Bolt-on or plug-in, as specified.
    - b. Primary circuit breaker: 480 volts, bolt-on, 14,000-rms symmetrical amperes interrupting capacity, 100-ampere frame, with the following additional requirements:
      - 1) For five kVa load center: Two-pole breaker with 20-ampere trip setting.
      - 2) For nine kVa load center: Three-pole breaker with 25-ampere trip setting.
      - 3) For 15 kVa load center: Three-pole breaker with 40-ampere trip setting.
    - c. Secondary main circuit breaker:
      - 1) Bolt-on, two or three poles as shown, 240 volts, 10,000-rms symmetrical amperes interrupting capacity with trip setting as follows:
        - a) For five kVa load center: 25 amperes.
        - b) For nine kVa load center: 30 amperes.
        - c) For 15 kVa load center: 50 amperes.
    - d. Branch circuit breaker:

- 1) Single-pole, plug-in, 120 volts, 10,000-rms symmetrical amperes interrupting capacity.
    - a) For five kVa load center: Four breakers, each with 20-ampere trip setting.
    - b) For nine kVa load center: Six breakers, each with 20-ampere trip setting.
    - c) For 15 kVa load center: Twelve breakers, each with 20-ampere trip setting.
  - e. Nameplate: Laminated plastic, one-inch high, attached by means of stainless-steel rivets or screws, showing load-center number in 1/2-inch high white characters engraved on black background.
  4. Neutral and ground bus bar equipped with mechanical connectors.
- H. Current-Limiting Circuit Breaker:
1. NEMA AB1, UL 489, molded-case, quick-make/quick-break, mechanically trip-free switching mechanism.
  2. Thermal trip for inverse time-delay overcurrent protection and magnetic trip for instantaneous short-circuit protection. Shunt trip device for tripping by ground-fault relay as shown.
  3. Limit the fault current, without the use of fusible element, to provide the following:
    - a. Protect associated cable by limiting the fault let-through energy to a value below the short-circuit withstand capability of the cable.
    - b. Protect downstream panelboard by limiting fault current at branch circuit breakers within their interrupting capabilities.
  4. Circuit-breaker rating:
    - a. Number of poles: As shown.
    - b. Frame size: As shown.
    - c. Voltage rating: 480 volts.
    - d. Interrupting capacity: Minimum 100,000-symmetrical RMS amperes.
    - e. Trip setting: As shown.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Install panelboards at locations shown, with bottom not less than 12 inches above floor. Use multiple-section panelboards to meet such spacings if necessary.
- B. Mount panelboards and load centers with front straight and plumb.
- C. When feeder serves more than one panelboard or panelboard section, install separate junction box or provide adequate gutter area for termination of feeders and bus taps.
- D. Install single and/or multiple-conductor cable in accordance with Section 16120. Connect branch circuit wires as shown. Connect neutral wire of branch circuit to neutral bar in panelboard.
- E. Install load centers where shown.
- F. Make conduit connections in accordance with Section 16130.
- G. Make power cable connections to circuit breakers, integrally fused circuit breakers, fused switch units, neutral and ground bus bars in panelboard and load centers and enclosed circuit breakers by means of integral mechanical connectors. If such items are not furnished with

integral mechanical connectors, make connections using compression connectors in accordance with Section 16125.

- H. Ground panelboards, load centers and enclosed circuit-breaker enclosures in accordance with Section 16060 and the NEC.
- I. Apply matching touch-up paint where necessary.

**3.02 DIRECTORY OF CIRCUITS:**

- A. Furnish each panelboard and load center with legibly printed circuit directory located on inside of enclosure.

**3.03 FIELD QUALITY CONTROL:**

- A. Furnish necessary equipment and perform the following tests:
  1. Molded-case circuit breakers: Perform pole-to-pole and pole-to-ground insulation resistance tests with 1,000V dc megger. Insulation resistance to be 50 megohms minimum.
  2. Panel boards and load centers: Perform insulation-resistance tests of each bus section phase-to-phase and phase-to-ground for one minute using 1,000V megger. Insulation resistance to be not less than manufacturer's recommended minimum or two megohms minimum.
  3. Test circuit connections in accordance with wiring diagram.
  4. Test panelboard and load-center enclosures for continuity to grounding system.
  5. Check cable connections to circuit breakers and fused switch unit for tightness.
  6. Check setting of adjustable magnetic trips for compliance with approved coordination study.
- B. Submit certified test reports.

**END OF SECTION**

## SECTION 16441

### DRAINAGE AND NEGATIVE SWITCHBOARD FOR TRACTION POWER

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This scope includes:
  - 1. Furnishing drainage and negative switchboard and spare parts
  - 2. Installation of drainage and negative switchboards
- B. Related sections:
  - 1. Section 16051 - Scope of Work For Traction Power
  - 2. Section 16052 - Basic Materials and Methods For Traction Power
  - 3. Section 16128 - Wire and Cable For Traction Power
  - 4. Section 16261 - Transformer-Rectifier Units For Traction Power
  - 5. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power
  - 6. Section 16451 - Substation Busways For Traction Power
- C. Payment and Measurement Basis:
  - 1. Compensation for work specified in this section associated with equipment in traction power substations will be made in the lump sum manner.
  - 2. Compensation for work specified in this section associated with installation will be made in the Lump Sum Installation cost of each traction power substation.

##### 1.02 REFERENCES

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of jurisdictional authorities.
  - 2. NEC
  - 3. ANSI Z55.1
  - 4. NEMA CCI

##### 1.03 SUBMITTALS

- A. Submit the following for approval in accordance with the Division 1 and with additional requirements as specified for each:
  - 1. Shop Drawings: In accordance with Section 16051, Table II.
  - 2. Certification:
    - a. Certified test reports for specified factory testing.
    - b. Certificates from manufacturer verifying that equipment conforms to specified requirements.
  - 3. Operations and Maintenance Manuals: In accordance with Division 1.
  - 4. Spare Parts Lists.

##### 1.04 QUALITY ASSURANCE

- A. Qualifications: Select a manufacturer who is regularly engaged in production/installation of similar equipment and has demonstrated a successful record of providing equipment of similar type and rating for extra heavy duty traction service for at least five similar projects.
- B. Factory Testing: Submit test plans and procedures and scheduled test date for approval at least 20 working days in advance of scheduled test date. No test results will be accepted prior to receipt and approval of test plans and procedures. Factory test requirements are as

follows:

1. Switchboard dielectric withstand test: Test all live parts of the switchboard, completely assembled, except without reverse current switches at a voltage level of 2800 Volts, rms, 60 Hertz at 4100 Volts dc for 60 seconds.
- C. For Codes, Regulations, References, Standards and Specifications, refer to Article 1.02.

## **1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Equipment for each facility shall be delivered in accordance with the access dates in Division 1.
- B. Ship each unit securely packaged and labeled for safe handling, lowering and skidding into positions. Label temporary internal bracing: TEMPORARY-REMOVE BEFORE OPERATION.
- C. Temporary Bracing: Where necessary, brace for hoisting, lowering and skidding into position. Label temporary internal bracing: TEMPORARY-REMOVE BEFORE OPERATION.
- D. Store in secure and dry storage facility.

## **PART 2 - PRODUCTS**

### **2.01 EQUIPMENT**

- A. Drainage and Negative Switchboard:
1. Free standing, metal enclosed, suitable for indoor service and including the following equipment:
    - a. Negative switches.
    - b. DC negative bus and bus connections.
    - c. Stray current corrosion control equipment.
    - d. Drainage bus and bus connections to stray current corrosion control equipment.
    - e. Negative return cable terminal connectors.
    - f. Negative bus-tie circuit breaker in accordance with Section 16341.
  2. Enclosure:
    - a. Metal-enclosed, rigid, self-supporting, self-contained, ventilated steel structure, assembled as one unit, switchboard construction.
    - b. Designed and arranged to provide convenient access to all components for normal operation and maintenance.
    - c. Terminal connectors provided for connecting the switchboard metal enclosure to the substation ground bus.
    - d. Access opening for future negative bus extension covered by a removable metal cover.
    - e. Finish: Metallic surfaces degreased, primed and finished with light gray enamel, Color No. 61, ANSI Z55.1 in accordance with referenced standard; two mils minimum dry film thickness.
  3. Negative Switches
    - a. Description:
      - 1) No-load break, single pole unfused, enclosed knife switches, connected to the negative bus mounted in compartments in the switchboard with danger signs provided at each switch. Signs made of 20 gauge steel, seven inches by ten inches with corner mounting holes and worded to say NO LOAD BREAK SWITCHES - OPEN ALL RECTIFIER DC CATHODE CIRCUIT BREAKERS

- BEFORE OPENING THESE SWITCHES.
- 2) Back connected with provisions for connecting 1000 KCMIL negative return cables from the running rails as shown.
  - 3) All current carrying components electrically isolated from the switchboard enclosure.
  - 4) Designed so as to allow for the compartment doors to close with the negative switch in the open position.
- b. Rating: 750 Volts, 4,000 Amperes dc continuous and capable of withstanding short-circuit currents imposed by parallel silicon rectifier units of 9000 kW total capacity.
  - c. Connectors: Terminal connectors of the long barrel, double indentation compression type with two hole contact pad and of one piece tubular construction formed of pure electrolytic copper and tin-plated to resist corrosion. Terminal connectors in accordance with NEMA CC1. Number of connectors in accordance with Section 16051, Table III.
4. DC Negative Bus and Bus Connections:
- a. Material and rating: High quality copper or aluminum, electrical conductivity, 750 Volts dc, rated dc continuous current as shown. Size based on a maximum current density of 800 Amperes per square inch.
  - b. Insulation: Bare, except where close clearances may make insulation necessary. Bus bars mounted on barrier type insulation or post type insulators of sufficient strength to withstand, without damage or permanent distortion, all stresses produced by specified short-circuit currents.
  - c. Bus Connections:
    - 1) Connection surfaces silver or tin plated.
    - 2) Joints treated to prevent corrosion. Each joint having a conductivity at least equal to that of the bus bar.
    - 3) Bolted with cadmium plated, galvanized or similarly coated high-strength steel bolts of sufficient number and size to provide solidly bolted connection.
    - 4) Include provisions for possible future connector of dc negative bus to substation ground bus.
    - 5) Terminate negative bus on a terminal block for connection to the negative bus of the DC switchgear - size will be as shown on contract drawings.
5. Stray Current Corrosion Control Equipment
- a. Each stray current corrosion drainage circuit, number as indicated, consists of the following:
    - 1) Cable connector.
    - 2) Fuseholder and current limiting fuse.
    - 3) Shunt.
    - 4) Variable resistor.
    - 5) Reverse current switch.
    - 6) Disconnect switch.
    - 7) Connection to drainage bus.
  - b. Cable connector: Long barrel, double indentation compression type of one piece tubular construction, formed of pure electrolytic copper and tin plated to resist corrosion, for 250 KCMIL cable. In accordance with NEMA CC1 except contact pads may be one hole.
  - c. Fuseholders and fuses: Rated 1000 Volts dc.
  - d. Fuses; Current limiting, nonventing, rated and coordinated with the withstand capability of the drainage disconnect switches. Bolt-on, 60 Ampere, Chase-Shawmut Form 101, Catalog No. A100P60 or equal.
  - e. Shunts for test usage: Copper, rated to produce one millivolt drop per Ampere, 100 Ampere capacity, installed in each stray current control circuit
  - f. Disconnect switches:

- 1) Installed between the incoming stray current control cable and the substation negative bus as shown.
  - 2) Single-pole, load break, knife blade switch rated at 60 Amperes continuous at 600 Volts dc. Coordinate switch rating with current limiting fuse to provide adequate withstand capability under fault conditions.
  - 3) Mounted on an insulating base with adequate clearances to increase strike and creepage voltage levels to 750 Volts dc minimum.
- g. Reverse current switch: Low threshold solid state reverse current switch (diode) rated 60 Amperes, 200 Volts dc peak inverse voltage, 20 to 80 millivolt threshold voltage, complete with two 4/0 connectors. Specifically designed and tested for use as a stray current control device. Provide adequate ventilation for switch, associated protective devices, wiring and terminals.
- h. Variable Resistor: Rated 1.1 Ohms, 11 to 104 Amperes, 620 to 820 Watts heat dissipation per unit, cylindrical core type and furnished with an adjustable clamp type terminal.
6. Drainage Bus and Bus Connections:
- a. Description and rating: High quality copper or aluminum, electrical conductivity, rated 400 amperes dc continuous and 750 Volts dc.
  - b. Insulation: Bus bars mounted on barrier type insulation or post type insulators. Bare, except where close clearances may make insulation necessary.
  - c. Bus Connections:
    - 1) Connection surfaces silver or tin plated.
    - 2) Joints treated to prevent corrosion. Each joint having a conductivity at least equal to that of the bus bar.
    - 3) Bolted with cadmium plated, galvanized or similarly coated, high-strength steel bolts of sufficient number and size to provide solidly bolted connection.
    - 4) Drainage bus solidly connected to the dc negative bus.
  - d. Bus Compartment: Isolated from the stray current corrosion control equipment compartments. Includes drainage bus work, connection bars, bus supports, cable connections and cable supports.
- B. Negative Switchboard:
1. Free-standing, metal-enclosed, suitable for indoor installation and including the following equipment:
    - a. DC negative bus and bus connections in accordance with item 2.01.A.4 above.
    - b. Negative cable terminal enclosures in accordance with item 2.01.A.2.
    - c. Negative return cable terminal connections.
    - d. Negative bus tie circuit breaker and switchgear cubicle in accordance with Section 16341 and Section 16051, Table III, for number and ratings.
- C. Nameplates:
1. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless steel rivets or screws. Vertical gothic lettering using a round or square cutter.
  2. Provide nameplate on each switchboard showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable in accordance with referenced standard.
  3. Provide additional functional nameplates for each component
  4. Each enclosure labeled, front and back, with nameplate 2-1/2 inches by 6-1/2 inches, inscribed in letters 1/2 inch high: "DRAINAGE AND NEGATIVE SWITCHBOARD" or "NEGATIVE SWITCHBOARD" as appropriate.

5. In addition to other information normally displayed on equipment, provide one-inch nameplate showing in letters 1/2 inch high switch positions, meaning of indicator lamp and other pertinent information.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION**

- A. Install Drainage and Negative Switchboard and in accordance with approved shop drawings.
- B. Install conduit and raceway in accordance with approved shop drawings and Section 16052 (Basic Materials and Methods).
- B. Install negative bus duct as shown and in accordance with approved shop drawings and Section 16451 (Substation Busways).
- C. Make cable connection in accordance with approved shop drawings and Section 16052 (Basic Materials and Methods).
- D. Use services of manufacturer's engineering representative for assistance in field assembly and installation of the equipment in accordance with Section 16051.

#### **3.02 FIELD QUALITY CONTROL**

- A. Field Testing and Inspection is as specified in Section 16051 (Scope of Work).

**END OF SECTION**

## SECTION 16451

### SUBSTATION BUSWAYS FOR TRACTION POWER

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This section specifies:
  - 1. Furnishing and delivering to the job site substation busways (bus ducts)
  - 2. Installation of substation busways (bus ducts)
- B. Related work specified elsewhere
  - 1. Section 16051- Scope of Work For Traction Power
  - 2. Section 16261 - Transformer-Rectifier Units For Traction Power
  - 3. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power
  - 4. Section 16441 - Drainage and Negative Switchboard For Traction Power.
- C. Payment and measurement basis:
  - 1. Compensation for work specified in this section associated with installation will be made in the lump sum installation cost of each traction power substation.
  - 2. Compensation for work specified in this section associated with equipment will be made in the manner of lump sum per each traction power substation.
  - 3.

##### 1.02 REFERENCES

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of Jurisdictional authorities
  - 2. NEC
  - 3. NEMA BU1
  - 4. ANSI C37.23, Z55-1
  - 5. L 857

##### 1.03 SUBMITTALS

- A. Submit the following for approval in accordance with Division 1 and with the additional requirements specified for each:
  - 1. Shop Drawings: In accordance with Table 16051, Table I.
  - 2. Calculations: Surge suppression capacitor ratings.
  - 3. Certification:
    - a. Certified test reports or certified copies of test reports for identical units for specified factory testing.
    - b. Certificates from manufacturer verifying that equipment conforms to the specified requirements.
  - 4. Operations and Maintenance Manuals: In accordance with Division 1.

##### 1.04 QUALITY ASSURANCE

- A. Qualifications: Select a manufacturer who is regularly engaged in production of similar busway and has supplied for at least five similar projects.
- B. Factory Testing:
  - 1. Dielectric withstand test: Perform a 60 second dielectric withstand test on the busways as follows:

- a. Anode (ac) bus duct: Test between phases and phases to enclosure by applying 2200 volts, rms, 60 Hertz, or 3100 volts, dc.
  - b. Cathode bus duct: Test between live parts and enclosure by applying 3700 volts, rms, 60 Hertz or 5200 volts, dc.
  - c. Negative bus duct: Test between live parts and enclosure by applying 3700 volts, rms, 60 Hertz or 5200 volts, dc.
  - 2. Continuous current test: Perform tests to demonstrate that bus assembly meets the temperature rise limitations per ANSI C37.23.
  - 3. Short-circuit withstand test: To determine the electrical, thermal and mechanical adequacy of buses and connections under short-circuit conditions.
- C. For Codes, Regulation, References and Specifications, refer to Article 1.02.

## **1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Equipment for each facility shall be delivered after its completion and in accordance with the access dates indicated in Division 1 and in coordination with the Authority and the Installation Contractor.
- B. Ship each unit securely packaged, braced and labeled for safe handling in shipment and to avoid damage or distortion.
- C. Temporary Bracing: Where necessary, brace for hoisting, lowering and skidding into position. Label temporary internal bracing: TEMPORARY-REMOVE BEFORE OPERATION.
- D. Store in secure and dry storage facility.

## **PART 2 - PRODUCTS**

### **2.01 EQUIPMENT**

- A. General Requirements:
  - 1. In accordance with ANSI C37.23, NEMA BU1 and UL 857.
  - 2. Bus bars:
    - a. Electrical conductor, high quality copper of 98% electrical conductivity, having all joint and connection surfaces silver or tin plated and supported on insulators or self-extinguishing material. All bus connections bolted with cadmium plated, galvanized, or similarly coated, high strength steel bolts of sufficient number and size to provide solidly bolted connections.
    - b. Sizes shall be based on current density (800 Amperes per square inch maximum), maximum allowable temperature rise per NEMA/ANSI/IEEE Standards and as stated under Transformer-Rectifier unit design test in Section 16261 and short circuit stress withstand capability due to a bolted fault at the bus connection.
  - 3. Enclosure: Totally enclosed, non-ventilated type. All bus-bolted connections accessible through removable, gasketed covers.
  - 4. Finish: Metallic surfaces degreased, primed and finished with light gray enamel, Color No. 61, ANSI Z55.1 in accordance with referenced standard. Two mils minimum dry film thickness.
- B. AC Bus Duct:
  - 1. Three phase, designed for connecting transformer secondary terminals to rectifier.
  - 2. Rating: 1,000 Volts ac Amperes as indicated in power one line diagram or Section 16051 Table III, capable of carrying the rectifier loadings specified and capable of withstanding stresses due to a bolted short circuit at the ac bus connection in the

- rectifier with a fault level of 750 MVA for the 13.8 kV switchgear bus and 1500 MVA for the 34.5 kV switchgear bus
3. Connection: Flexible connectors of the braided or laminated type provided for connecting bus conductors to the transformer terminals.
  4. Surge suppression capacitors: Voltage surge suppression capacitors, connected between each of the bus bars and the ground bus within the bus duct enclosure. Capacitor sizes and ratings determined by the Contractor. Capacitors shall be fused with blown fuse indicators visible from the outside of rectifier enclosure.
  5. Strip heaters: Provide 120 V, 60Hz strip heaters, extending the entire length, mounted on the bottom, without thermostat and monitored by an ammeter located on the rectifier enclosure and with wiring terminated on a suitable molded case circuit breaker located in the rectifier enclosure.
  6. Enclosure:
    - a. Designed for flange bolting over the transformer secondary terminals and to the rectifier.
    - b. Electrically insulated from the rectifier enclosure as specified.
    - c. Equipped with a removable gasketed cover at the transformer connections for ease of maintenance and testing.
  7. Ground Bus:
    - a. Copper, rated at twenty-five percent of the main bus capacity provided for connecting the sections to form one continuous length without bridging the insulated section at the rectifier.
  8. Outdoor Construction: (For outdoor transformers) Provide 120V, 60 Hz. strip heaters, extending the entire length, mounted on the bottom, without thermostat and monitored by an ammeter located on the rectifier cubicle and with wiring terminated on a suitable molded case circuit breaker located in the rectifier cubicle.
- C. Cathode Bus Duct:
1. Positive bus, designed for connecting the positive bus of the rectifier to the cathode circuit breaker.
  2. Rating: 1,000 Volts dc ratings Ampere as indicated in power one line diagram or Section 16051 Table III, capable of carrying the rectifier loadings specified and capable of withstanding stresses due to short circuit currents.
  3. Enclosure:
    - a. Electrically insulated from the rectifier enclosure and dc switchgear enclosure as specified in Sections 16261 and 16341.
    - b. Equipped with a removable gasketed cover at the rectifier connection for ease of maintenance and testing.
    - c. Insulated from all supports to 1000 Volts.
- D. Negative Bus Duct:
1. Designed for connecting negative bus of the rectifier to the negative switchboard bus.
  2. Rating: 750 Volts dc, Amperes continuous, as shown in power one line diagram or as indicated in Table 16051-III, capable of carrying the rectifier loadings specified and capable of withstanding stresses due to short circuit currents.
  3. Enclosure:
    - a. Electrically insulated from the rectifier enclosure by an insulating gasket of suitable material and thickness.
    - b. Solidly tied to the drainage and negative switchboard enclosure.
    - c. Equipped with a removable gasketed cover at the rectifier connection for ease of maintenance and testing.

### **PART 3 - EXECUTION**

**3.01 INSTALLATION**

- A. Install bus duct in accordance with approved shop drawings. Provide bracing of bus ducts to prevent movement due to short circuit forces in accordance with manufacturer's recommendations. Submit calculations for forces exerted on bus ducts based on layout shown on approved shop drawings.
- B. Use services of manufacturer's engineering representative for assistance in field assembly and installation of the equipment in accordance with Section 16051.
- C. The Contractor shall make bolted bus connections at each shipping split indicated below in accordance with manufacturer's instructions.
  - 1. [As an example], the bus ducts will have the following number of shipping splits:

Name of SUBSTATION	NO. OF SPLITS	NO. OF PIECES
[Location - TBD]	[TBD]	[TBD]

**3.02 FIELD QUALITY CONTROL**

- A. Field Testing and Inspection: As specified in Section 16051 (Scope of Work).

**END OF SECTION**

## SECTION 16525

### LIGHTING FIXTURES AND MOUNTING POLES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing lighting fixtures and mounting poles.
- B. Related Work Specified Elsewhere:
  - 1. Grading, excavation and backfilling: Section 02320.
  - 2. Concrete formwork: Section 03100
  - 3. Concrete reinforcement: Section 03200.
  - 4. Cast-in-place structural concrete: Section 03300.
  - 5. Field painting: Section 09920.
  - 6. Grounding and bonding: Section 16060.
  - 7. Wire, cable and busways: Section 16120.
  - 8. Wire connection accessories: Section 16125.
  - 9. Raceways, boxes and cabinets: Section 16130.
  - 10. Wiring and control devices: Section 16145.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. UL: 496, 542, 1029, 1570, 1571, 1572, Electrical Construction Materials Directory.
  - 4. FS: FF-B-588, FF-P-395, FF-S-325C.
  - 5. MS: MIL-C-450.
  - 6. FED STD: 595.
  - 7. PEI: 1001.
  - 8. SSPC: SP-8, SP-10.
  - 9. ASTM: A53, A167, A276, A123, A507, A575, B26, B85, B117, B136, B137, B209, B221, B244, D635, D1056, D1400, D2240.
  - 10. AASHTO: M314, LTS-3.
  - 11. ITS: Directory of ITS Listed Products.
  - 12. AA: Standard finishes as designated by the Aluminum Association and referenced in NAAMM Metal Finishes Manual.
  - 13. ANSI/IEEE: C62.41.
  - 14. IEEE Publication 587.
  - 15. ANSI Standards.
  - 16. FCC Rules and Regulations, Part 15, Part 18.
  - 17. NEMA 1
  - 18. AISI.
  - 19. IES: RP-20
- B. Each lighting fixture to be labeled or listed per referenced UL or ITS directory.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Include photometric curves.

2. Samples: One of each type of fixture.
3. Certification:
  - a. Verification that each fixture is in compliance with applicable codes, regulations, reference standards and specifications for the location at which it is to be used. Indicate requirements that each fixture meets.
  - b. Calculations: Submit calculations by a professional engineer registered in the jurisdiction where material is to be installed certifying that assemblies of foundation, anchor bolts, pole, arms and luminaire will withstand specified wind pressure, wind speed, stress, deflection, vibration and fatigue.

#### **1.04 PRODUCT DELIVERY, STORAGE, AND HANDLING:**

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Store lighting fixtures and mounting poles in secure and dry storage facility.

#### **1.05 WARRANTY:**

- A. Globes and Diffusers: In addition to warranty requirements of the General Provisions, furnish warranty against discoloration and distortion for a total of four years.
- B. Lamps: Warrant the life of lamps for periods specified.

### **PART 2 - PRODUCTS**

#### **2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements for Lighting Fixtures:
  1. Interchangeability: Components of same type, size, rating, functional characteristics and make are to be interchangeable.
  2. In accordance with UL 1570, UL 1571 and UL 1572.
  3. Materials:
    - a. Steel:
      - 1) Sheet: ASTM A507, 22-gauge minimum.
      - 2) Bar: ASTM A575.
    - b. Steel pipe: ASTM A53, Type S.
    - c. Stainless steel:
      - 1) Sheet: ASTM A167, 22-gauge minimum.
      - 2) Bar: ASTM A276, Type 316.
      - 3) Finish: AISI Alloy S30400, NAAMM Finish No. 4, unless otherwise shown.
    - d. Aluminum: Alloy as recommended by manufacturer, unless otherwise shown or specified.
      - 1) Sheet and plate: ASTM B209.
      - 2) Extrusion: ASTM B221, 0.109-inch minimum thickness, unless otherwise shown.
      - 3) Cast:
        - a) Die cast: ASTM B85, 0.1875-inch minimum thickness, unless otherwise shown.
        - b) Sand cast: ASTM B26, 0.1875-inch minimum thickness, unless otherwise shown.
        - c) Color-anodized cast: Kalcator Casting Alloy No. 2 or equal.
4. Lamps:
  - a. In accordance with applicable ANSI Standards.

- b. Incandescent:
  - 1) Wattage: As shown or specified.
  - 2) Finish: Inside frosted unless otherwise shown.
  - 3) Base:
    - a) Up to 200 watts: Medium screw base
    - b) Above 200 watts: Mogul screw base.
  - 4) Operating voltage: 120 volts, 60 Hertz.
  - 5) Rated life: 2,500 hours.
  - 6) Bulb size: As shown.
- c. Mercury vapor:
  - 1) Watt rating: As shown.
  - 2) Color: Deluxe white.
  - 3) Finish: As shown.
  - 4) Base:
    - a) Up to 100 watts: Medium screw base.
    - b) Above 100 watts: Mogul screw base.
  - 5) Rated life: 24,000 hours.
  - 6) Bulb size: As shown.
- d. Fluorescent:
  - 1) Wattage and size: As shown or specified.
  - 2) Color: Warm white.
  - 3) Type:
    - a) PL7 compact, PL13 compact.
    - b) F6T5/CW and F20T12WW, Preheat start.
    - c) F32T8/WW, F48T12/WW/SHO, F72T12/WW/SHO, and F96T12/WW/SHO: Rapid start.
  - 4) Rated life:
    - a) Super-high output (SHO), very-high output (VHO) and high output (HO) lamps: 12,000 hours.
    - b) F32T8/WW: 20,000 hours.
    - c) PL compact lamps: 10,000 hours.
  - 5) Base:
    - a) Super-high output (SHO), very-high output (VHO) and high output (HO) lamps: Recessed double contact.
    - b) F32T8/WW: Medium bi-pin.
    - c) PL7 medium.
- e. Tungsten-halogen:
  - 1) Wattage: As shown.
  - 2) Size: T-3.
  - 3) Base: Recessed single contact.
  - 4) Rated life: 4,000 hrs.
  - 5) Operating voltage:
    - a) 1,500-watt lamps: 277 volts, 60 Hertz.
    - b) All other lamps: 120 volts, 60 Hertz.
- f. Metal-halide:
  - 1) Wattage: As shown.
  - 2) Size: As shown.
  - 3) Color: Clear unless otherwise noted.
  - 4) Lamp operating position: As shown.
  - 5) Base: Mogul.
  - 6) Rated life:
    - a) 175 watt: 7,500 hours.
    - b) 400 watt: 15,000 hours.
    - c) 1,000 watt: 10,000 hours.
- g. High-pressure sodium:
  - 1) Wattage: As shown.

- 2) Size: As shown.
  - 3) Coating: Clear, unless otherwise shown or specified.
  - 4) Base: Medium or mogul.
  - 5) Rated life: 24,000 hours.
5. Lampholders:
- a. Incandescent, mercury vapor, metal halide and high-pressure sodium:
    - 1) In accordance with UL 496.
    - 2) Black or white thermosetting phenolic compound, glazed-porcelain or neoprene base and body as shown. Neoprene unit molded in one-piece, weatherproof, oil-resistant, with vibration-absorbing socket construction.
    - 3) Incandescent: Rated 660 watts, 250 volts for medium screw base.
    - 4) Mercury vapor, high-pressure sodium and metal halide:
      - a) Rated 660 watts, 600 volts: Medium screw base.
      - b) Rated 1,500 watts, 600 volts: Mogul screw base.
    - 5) Provide mechanical self-retaining neoprene gasket for dust and moisture proof seal between lamp and lampholder.
    - 6) Provide vibration proof feature to prevent incandescent lamp from loosening in lampholder in S-1 fixture
  - b. Fluorescent:
    - 1) In accordance with UL 542.
    - 2) Rated 660 watts, 600 volts.
    - 3) Integral starter holder for preheat-type lamps, with starter.
    - 4) White, thermosetting phenolic-compound base and body, silver-plated phosphorous-bronze contacts, self-aligning neoprene gasket face.
  - c. Tungsten-halogen: Porcelain with silver-plated contacts, to suit RSC lamp base.
6. Ballasts:
- a. Mercury-vapor lamps, high-pressure sodium lamps and metal-halide lamps:
    - 1) UL 1029, high-power-factor type.
    - 2) Operable on 120-volt or 277-volt, 60 Hertz as shown or necessary, type and rating suitable for associated lamp.
    - 3) Capable of starting lamp at ambient temperature of minus 20F and above.
    - 4) Equip with individual fuse protection installed in ballast compartment of fixture.
  - b. Fluorescent lamps:
    - 1) FCC part 15 subpart J, UL listed Class P.
    - 2) Operable on 120-volt or 277-volt, 60 Hertz, as shown or necessary, type and load rating suitable for associated lamps.
    - 3) Capable of starting lamps at ambient temperature as follows:
      - a) F32T8/WW lamps: Zero degree F.
      - b) F48T12/WW/SHO, F72T12/WW/SHO, and F96T12/WW/SHO lamps: Minus 20F.
    - 4) Sound rating:
      - a) For use with F32T8/WW lamps installed in office areas: A.
      - b) For use with F32T8/WW lamps installed in ancillary areas: B or better.
      - c) For use with F48T12/WW/SHO, F72T12/WW/SHO, and F96T12/WW/SHO lamps: D or better.
    - 5) Maximum utilization of two-lamp ballasts in public-area lighting fixtures.
    - 6) Equipped with individual fuse protection, installed in the fixture wiring channel.
7. Fixture body and housing: Shape, size and material as shown.

8. Reflector: Shape, size and material as shown. Aluminum or stainless steel polished to mirror finish unless otherwise shown. Minimum thickness 22 gauge unless otherwise shown.
9. Diffusers:
  - a. Shape and size as shown, one-piece molded or extruded clear virgin acrylic or polycarbonate plastic having the following properties:
    - 1) Interior diffusing with smooth exterior surface.
    - 2) Self-extinguishing, in accordance with ASTM D635.
    - 3) No material color change when used with 4500K fluorescent lamp.
    - 4) No apparent yellowing after 500 hours exposure to fluorescent-lamp source under conditions similar to those existing in the lighting fixture.
    - 5) No alteration to optical properties of the fixture when finished diffuser treated with anti-static wax.
  - b. Formed by carefully controlled processes so that the finished piece retains its design contours and dimensions at normal operating temperature.
  - c. Resistance to shrinking, warping, crazing, cracking, or discoloring, either in service or when stored in the manufacturer's standard shipping containers under normal conditions.
10. Globes:
  - a. Clear seamless polycarbonate or high-impact heat-resistant glass as shown.
  - b. Shape and size: As shown.
  - c. Minimum thickness: 0.125 inch, surface free from visible mold seam.
  - d. Reduction in strength: 10-percent maximum after five years.
  - e. Maximum haze: Two percent.
  - f. Minimum light transmittance: 88 percent.
11. Lenses:
  - a. Plastic lenses: Clear polycarbonate as shown, minimum thickness 0.06 inch.
  - b. Glass lenses: 1/4-inch tempered glass, laminated glass, or 1/8-inch double-strength clear glass as shown, capable of absorbing ultraviolet rays when used with mercury-vapor or metal-halide lamps.
  - c. Refracted lenses: Heat-resistant, annealed, clear borosilicate glass, with the following additional requirements:
    - 1) Initial lumen distribution on horizontal plane evenly from zero to 90 degrees: 55 to 60 percent.
    - 2) Minimum efficiency: 85 percent.
12. Fixture wire: Section 16120.
13. Gasket:
  - a. Keyed gasket: One-piece, extruded solid neoprene having Type A durometer hardness of 30 plus-or-minus five when tested in accordance with ASTM D2240.
  - b. Self-retaining gasket:
    - 1) One-piece, closed-cell sponge neoprene, soft or medium density.
    - 2) Resistant to aging, heat, ultra-violet light, water, oil, weathering and setting as determined by ASTM D1056.
    - 3) Cemented to component with resilient neoprene sealing compound compatible with finish. Adhesive not applied to diffuser.
  - c. Silicone gasket equal to neoprene, at Contractor's option.
14. Hardware:
  - a. Latches, catches, release mechanisms, hinges, screws, bolts, studs, nuts, rivets, washers and springs. Heavy-duty stainless steel or bronze, as shown.
  - b. Latches and catches: Captive-type.
  - c. Operating hardware: Self-retaining type.
15. Construction:

- a. Fixture body, reflectors, wiring channels, end caps and castings formed so as to prevent buckling or distortion.
  - b. Minimum of two wire clips provided in wiring channel to support wiring. Self-cleaning air filter provided on breather ports.
  - c. Seams and joints continuously welded and ground smooth.
  - d. When aluminum will be in contact with dissimilar metal, separate contact surfaces with gasket, nonabsorptive tape, or coating to prevent corrosion.
16. Finish:
- a. Baked enamel: Nonspecular finish consisting of six-stage hot-cleaning wash, phosphate coat, prime coat, and finish coat of sprayed white or other color acrylic enamel as shown, baked at 350F for a minimum of 30 minutes, with the following additional requirements:
    - 1) Dry-film thickness (DFT) per ASTM D1400: 1.25 mils minimum.
    - 2) Undercutting of enamel film from scored line after exposing to 10-percent salt spray for 1,500 hours, per ASTM B117: 0.067-inch maximum.
    - 3) Baked white enamel after 100 hours exposure to fadeometer: 86-percent minimum reflectance factors, no appreciable visual color change.
    - 4) Bronze color: FED STD 595, Color No. 20040.
  - b. Porcelain enamel: Opaque, fused vitreous surface finish, 88-percent average reflectance factor, in accordance with the following standards:
    - 1) On steel: PEI 1001.
    - 2) On aluminum alloy: PEI 1001.
  - c. Specular anodized coating: 14-stage process for permanently sealed specular or semispecular finish, as shown, in accordance with patented electrolytic process, Alzak or equal. When shown dark-bronze color, match Duranodic 313 Dark Bronze.
  - d. Clear anodic coating: AA-M22C22-A41, minimum coating thickness 0.8 mil, coating weight 35 milligrams per square inch, hot-water seal overall, tested in accordance with the following requirements:
    - 1) Coating weight: ASTM B137.
    - 2) Coating thickness: ASTM B244.
    - 3) Sealing test: ASTM B136.
    - 4) Undercutting of anodic film from scored line after exposing to 10-percent salt spray for 1,500 hours, in accordance with ASTM B117: 0.067-inch maximum.
  - e. Color-anodized finish: NAAMM AA-M22-C22A42, minimum coating thickness 0.8 mil, coating weight 35 milligrams per square inch, hot-water seal overall, tested in accordance with the following requirements:
    - 1) Coating weight: ASTM B137.
    - 2) Coating thickness: ASTM B244.
    - 3) Sealing test: ASTM B136.
    - 4) Color: Dark Bronze. Kaiser Aluminum Color, Statuary Bronze; Alcoa Color, Dark Bronze, Duranodic 313.
  - f. Zinc coating: ASTM A123.
  - g. Factory-painting: Prepare surfaces by pickling in accordance with SSPC SP-8. Apply coating of 7.0-mil total DFT as follows:
    - 1) First coat: Inorganic zinc-silicate primer, 2.5-mil DFT.
    - 2) Second coat: High-build epoxy primer, 3.0-mil DFT.
    - 3) Third coat: Aliphatic polyurethane, 1.5-mil DFT, FED STD 595, Color No. 20040.
  - h. Field painting: Section 09920.
  - i. Electrostatic-powder coating: Prepare surfaces by sandblast cleaning complying with SSPC SP-10 near-white blast cleaning, applying coating promptly after cleaning. Ground material to be coated. Apply coating as

- electrostatically-charged dry powder using electrostatic spray gun to produce DFT of six mils plus-or-minus two mils. Cure by heat treatment.
17. Mark each fixture and its components in accordance with applicable reference standard.
  18. Conduit: Section 16130.
  19. Connectors: Section 16125.
  20. Fasteners: Size and type shown or best suited to use.
    - a. Expansion anchors: FS FF-S-325C, Group II, Type 3, Class 1, stainless steel, Type 303.
    - b. Toggle bolts: FS FF-B-588.
    - c. Powder-actuated: FS FF-P-395.
    - d. Finish: Where exposed, custom finish exposed parts to match surface being fastened.
  21. Anchor bolts, nuts and washers:
    - a. AASHTO M314, hot-dip galvanized.
    - b. Bolts hooked, unless otherwise shown or recommended by manufacturer of pole or structure being anchored.
    - c. Two nuts and one washer for each anchor bolt for plumbing pole or leveling structure.
    - d. Finish: Where exposed, custom finish exposed parts to match surface being fastened.
  22. Mounting poles:
    - a. Steel or aluminum, straight or tapered as shown. Complete assembly of anchor bolts, pole, arms and luminaire designed to withstand wind pressure (P) developed by wind speed (V) of 80 MPH in accordance with AASHTO LTS-3. Pole assembly to fully comply with AASHTO requirements for permissible stresses, deflection, vibration and fatigue. Ratio of deflection to pole height under action of applicable static loading not to exceed 1/60.<sup>\*1</sup>  
OR
    - b. Steel, straight or tapered as shown. Complete assembly of anchor bolts, pole, arms and luminaire designed to withstand wind pressure (P) developed by wind speed (V) of 80 MPH in accordance with AASHTO LTS-3. Pole assembly to fully comply with AASHTO requirements for permissible stresses, deflection, vibration and fatigue. Ratio of deflection to pole height under action of applicable static loading not to exceed 1/60.<sup>\*2</sup>
    - c. Size and shape: As shown.
    - d. Base assembly: Steel base plate, designed to withstand full-bending movement of shaft and welded to shaft; anchor bolts; and base cover.
    - e. Handhole size: As shown, with 12-gauge steel sheet coverplate.
    - f. Polygonal-shaped poles fabricated with sharp bends.
    - g. Longitudinally welded with welds continuous and ground smooth.
  23. Grout: Section 03300, nonshrink. Where recommended by manufacturer, prime surfaces to be grouted.
  24. Concrete base, including forms and reinforcement: Division 3, Sections 03100, 03200, and 03300.
  25. Bituminous coating: MS MIL-C-450.
  26. Photoelectric control: Section 16145.

## 2.02 LIGHTING FIXTURES:

- A. Tunnel and Ancillary-Space Lighting Fixtures: Types as shown and as follows:
  1. Type 1 fixture:
    - a. Open, industrial-type, fluorescent.
    - b. Lamps: Two 32-watt F32T8/WW.

- c. Body: Aluminum or 20-gauge steel channel-shaped body, end plates, cover and reflector. Knockouts in body and end plates as shown. Attach end plates to body with noncorrosive screws. Double-strength construction for steel channel.
  - d. Finish:
    - 1) Channel, end plates, and cover:
      - a) Steel: White baked enamel.
      - b) Aluminum: Clear anodic coating.
    - 2) Reflector: White baked enamel for aluminum and steel.
2. Type 2 fixture: Same as Type 1, except fixture equipped with one-piece acrylic-plastic diffuser in extruded aluminum or steel frame; with octolens surface.
3. Type 3 fixture:
- a. Open, strip-type, fluorescent.
  - b. Lamps: Two 20-watt F20T12/WW.
  - c. Body: Aluminum or 20-gauge steel channel, end plates and cover. Knockouts in body and end plates as shown. End plates attached to body with noncorrosive screws. Double-strength construction for steel channel.
  - d. Finish:
    - 1) Steel: White baked enamel, interior and exterior.
    - 2) Aluminum: Clear anodic coating.
4. Type 4 fixture:
- a. Enclosed, watertight, fluorescent, for mounting on channel inserts.
  - b. Lamp: One 32-watt F32T8/WW.
  - c. Enclosure:
    - 1) Body: Extruded-aluminum housing with die-cast aluminum end caps, flanged to provide solid seat for gasket between body and door frame.
    - 2) Door frame: Extruded aluminum, minimum of three hinges riveted to door and housing, 0.2-inch diameter stainless-steel hinge pins and minimum of three door-fastening screws.
    - 3) Door-fastening screws: Quick-turn, slotted, pan-head, captive, corrosion-resistant, location to provide uniform pressure on door gaskets.
    - 4) Diffuser: Clear, inside-ribbed polycarbonate plastic.
    - 5) Reflector: Aluminum, three-part, with portion concealing ballast flush-hinged to permit wiring connections and ballast replacement.
  - d. Finish:
    - 1) Enclosure: Clear anodic coating.
    - 2) Reflector: White baked enamel.
5. Type 4A fixture: Two tandem-mounted Type 4 fixtures, with two lamp ballasts, as shown.
6. Type 5 fixture:
- a. Enclosed fluorescent fixture.
  - b. Lamp: One 32-watt F32T8/WW.
  - c. Enclosure: Steel housing and end plates. Knockouts where shown. End plates attached to housing with noncorrosive screws. Diffuser: Clear acrylic plastic.
  - d. Finish:
    - 1) Enclosure: White baked enamel.
    - 2) Reflector: White baked enamel.
7. Type 6A fixture:
- a. Enclosed, vapor-tight, compact fluorescent, for pendant mounting.
  - b. Housing: Cast aluminum, with threaded hub for 3/4-inch conduit, and cast-aluminum guard.
  - c. Globe: Clear glass with high-impact resistance.
  - d. Finish: Clear anodic coating.

- e. Fluorescent lamp: One PL13 compact.
- 8. Type 6B fixture: Same as Type 6A, except for mounting on outlet box.
- 9. Type 6C fixture: Same as Type 6A, except bracket-type for mounting on wall.
- 10. Type 6D fixture: Same as Type 6C, except complete with outlet box.
- 11. Type 7A fixture:
  - a. Enclosed, vapor-tight, high-pressure sodium for ceiling mounting.
  - b. Housing: Cast aluminum, with ballast compartment cast aluminum, guard.
  - c. Globe: Clear glass with high-impact resistance.
  - d. Finish: Two coats of gray epoxy enamel.
  - e. Lamp: One 50-watt, clear, BT-25, high-pressure sodium.
- 12. Type 7B fixture: Same as 7A, except wall-mounted.
- 13. Type 7C fixture: Same as 7A, except pendant-mounted. Center topped and integrally counter-weighted so fixture hangs plumb.
- 14. Type 8 Fixture:
  - a. Enclosed, weatherproof high-pressure sodium for wall mounting, UL-listed "Suitable for Outdoor and Wet Locations".
  - b. Housing: Die-cast aluminum luminaire, integral ballast housing and grid guard, with tamper-resistant stainless-steel hardware.
  - c. Refractor: Pressed, clear, prismatic, single-piece, thermal/shock-resistant, borosilicate glass or polycarbonate.
  - d. Finish: Electrostatic powder-coated, FED STD 595 Color No. 20040.
  - e. Lamp: One clear, high-pressure sodium, wattage as shown.
- 15. Type 9 Fixture: Emergency trip station light:
  - a. Enclosed and gasketed weatherproof, mercury-vapor fixture mounted on steel channel and tube as shown, UL-listed as Suitable for Outdoor and Wet Locations.
  - b. Housing: Die-cast copper-free aluminum luminaire with 90-degree arm for wall mounting, integral ballast housing, grid guard and threaded globe seat, with tamper-resistant stainless steel hardware.
  - c. Globe: Thermal shock-resistant and impact-resistant blue, tempered glass with threads to ensure secure fit to housing.
  - d. Finish: Natural.
  - e. Lamp: Mercury-vapor, 40-watt B-17.
  - f. Ballast: H45 type, Class H insulated, capable of starting 40-watt mercury-vapor lamp at ambient temperature of minus 20F and above, suitable for remote mounting.
  - g. Remote ballast enclosure: Fiberglass or aluminum with polyester powder paint finish, front access, weathertight construction, 3/4-inch conduit entry and exit knockouts, with mounting lugs suitable for mounting on channel inserts or on wall as shown.
  - h. Source: Hubbell catalog number VMWX-5050C-R, or approved equal.
- 16. Type X fixture:
  - a. Exit sign for top, side, back or pendant-mounting, as shown. With directional arrows where shown. Color of lettering and arrows to comply with jurisdictional requirements.
  - b. Lamps: Ultra-long-life light-emitting diodes (LED) mounted on a circuit board to operate on 120V or 277V, single phase, 60-Hz supply. Have LED's protected by a clear panel and special optical diffuser.
  - c. Housing: Die-cast aluminum, 0.125-inch minimum wall thickness. Concealed hinges and latching mechanism.
  - d. Door: Die-cast aluminum, 0.125-inch minimum thickness; open-face with phosphorescent-glass panel and six-inch high letters; color of letters and field as required by the jurisdictional authority, using fired-on ceramic colors.
  - e. Finish: Clear-satin anodic coating, unless otherwise shown.

B. Station Kiosk Lighting:

1. Lighting Fixtures; Station Kiosk: UL 1570, and the following additional requirements:
  - a. Type K-4 lighting fixture: Open compact fluorescent downlight fixture, Prescolite Catalog Number CFR813EBDM-B572-MTR-120V/208V/240V/277V - RIF1 or approved equal, for recess mounting in the ceiling of the kiosk with the following additional requirements
    - 1) Two 13-watt compact fluorescent twin tube lamps with four-pin 2GX7 lamp base compatible with fixture lampholder and suitable for dimming application using electronic ballast.
    - 2) Encased and potted Class P electronic ballast capable of producing flicker-free light output range from five percent to 100 percent of rated output.
    - 3) Clear Alzak reflector with lower black baffle to provide 50° optical cutoff and maximum spacing to mounting height ratio of 1.1.
    - 4) Diecast aluminum trim ring with baked enamel finish, FS 595, Color No. 36586.
    - 5) Dimensions:
      - a) Nominal aperture size: 8 inches.
      - b) Maximum height: 8 inches.
      - c) Maximum overall dimensions of housing, including accessories, in vertical view above ceiling plane: 16 inches by 20 inches.
    - 6) Integral junction box approved for 90°C through wiring.
    - 7) Suitable for damp location.
    - 8) Radio interference filter for suppressing radio interference noise.
    - 9) Lighting fixture, dimming ballast and associated controls designed and manufactured for compatibility by a single manufacturer.
  - b. Ballast: Dimming compact fluorescent electronic ballast, Prescolite Model No. PUV-20RSD or approved equal, for mounting on the housing of the Type K-4 lighting fixture and with the following additional requirements:
    - 1) Capable of operating four-pin, 13-watt compact fluorescent lamps with circuitry that constantly monitors lamp conditions to provide constant light output regardless of voltage fluctuations.
    - 2) Equipped with a soft start/rapid start function which preheats cathode filaments and then ignites the lamp for maximum lamp life.
    - 3) Capable of dimming continuously from 100 percent to five percent of rated light output.
    - 4) Capable of maintaining full filament heat throughout the dimming range for long lamp life.
    - 5) Dimming circuitry UL Class 2 and fully isolated from ballast input power.
    - 6) Compatible with low voltage (2.5-12 volts dc) dimming systems.
    - 7) Compatible with phase controlled dimmers by utilizing a dimming interface box to provide the interface between the phase controlled ac output and the 2.5-12 volts dc signal required by the ballast.
    - 8) Equipped with push-in wire connections suitable for No.18 AWG solid copper wire.
    - 9) Input voltage universal and suitable for operation on 120-volt system.
    - 10) Maximum lamp current crest factor of 1.414.
    - 11) Power factor of 0.95 or higher.
    - 12) Input current total harmonic distortion not to exceed 10 percent.
    - 13) Operating frequency exceeding 30 kilohertz.
    - 14) Maximum control input current of 2 milliamperes at 12 volts dc output.
    - 15) Sound level not exceeding Class A ambient noise levels.
    - 16) Minimum starting temperature of 0°F.

- 17) Capable of withstanding line transients as defined in IEEE Publication 587, Category A, ANSI/IEEE C62.41, Category A.
  - 18) Capable of maintaining cathode filament voltage within ANSI standards.
  - 19) Meet requirements of FCC Rules and Regulations, Part 18.
  - 20) UL-listed, Class P, Type 1 Outdoor.
2. Lighting Control System; Station Kiosk: Lighting control system consisting of dimming interface box and dimmer switch as follows:
- a. Dimming interface box: Dimming interface box, Prescolite Model No. CIB or approved equal, to provide the interface between electronic dimming ballasts and the phase controlled wallbox dimmer and with the following additional requirements:
    - 1) Compatible with fluorescent wallbox dimmers and with lamp types used with electronic dimming ballasts.
    - 2) Dimming interface box to convert the dimmed (phase controlled) ac output from a wallbox dimmer to the 2.5-12 volts dc signal required by the electronic ballast. Lowest dimming level shall correspond to a 3 volts dc signal and maximum light output shall correspond to a 12 volts dc signal.
    - 3) DC control output to be isolated from the switched ac and dimmed ac inputs and protected internally from short circuits.
    - 4) Capable of operating from one to 100 electronic dimming ballasts.
    - 5) Input voltage autoranging and suitable for operation on 120-volt system.
    - 6) Constructed in a steel NEMA 1 enclosure with nominal 6-inch by 8-inch by 4-inch dimensions.
    - 7) UL-listed.
  - b. Dimmer switch: Commercial grade linear slide, phase controlled wallbox dimmer, Prescolite Model No. P6F-BR or approved equal, to provide the dimmed/phase controlled ac output to the dimming interface box and with the following additional requirements:
    - 1) Single pole, 120 volts for controlling up to 12 fluorescent lamps.
    - 2) Vertical slide intensity control with on/off illuminated switch.
    - 3) Soft start electronic circuit with voltage compensation to minimize flicker resulting from line voltage fluctuations.
    - 4) Toroidal radio frequency interference (RFI) filter to minimize radio and intercom interferences.
    - 5) Adjustable low-end trim to permit user to determine minimum light level based on particular ballast and lamp combinations.
    - 6) Cover finished with brown or bronze color.
    - 7) UL-listed.
- C. Parking Structure Lighting Fixtures: The low glare fixture shall comply with the latest IES Specifications, RP-20 (Lighting for Parking Facilities). The electrical components will carry a five year minimum warranty, with other components covered by a two(2) year warranty.
- 1. Housing: A die cast housing integrating the high power factor ballast and wiring splices. The wiring shall be rated for 90°C.
  - 2. Ballast: High power factor with multitap power feature 120/277V, 60HZ. UL listed and capable for starting at -20°F
  - 3. Lamp: 150 W, High Pressure Sodium, Medium base, clear . Average life of 24,000 hours.
  - 4. Fixture shall be fused, totally sealed and UL listed for wet location.
- D. Other Lighting Fixtures: Types as shown, with materials and finishes shown and specified

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Install lighting fixtures of types shown at locations shown as follows:
  - 1. Mount fixtures rigidly in place. Use expansion anchors and machine screws for concrete surfaces and toggle bolts for hollow concrete-masonry surfaces. Use appropriate fasteners for attachment to other surfaces. Support lighting fixtures independent of suspended acoustical-panel ceiling systems.
  - 2. Where aluminum contacts concrete or dissimilar metal, separate contact surfaces with gasket, nonabsorptive tape or bituminous coating to prevent corrosion. Use stainless-steel fasteners.
  - 3. Mount fixtures plumb, level and in straight lines. Install stems of suspended fixtures plumb. Group-mounted fluorescent fixtures to appear as one unit.
  - 4. Install 12-inch minimum length of liquid-tight flexible conduit for connection between fixture and outlet box unless otherwise shown in accordance with Section 16130. Use fixture wire from outlet box in branch circuit to lighting fixture in accordance with Section 16120, and connect fixtures to branch circuit in accordance with Section 16125
  - 5. Install chase nipple where fluorescent fixtures are installed in continuous groups. Clean lamps, diffusers, globes, reflectors and exposed-to-view surfaces of fixtures after aiming and adjusting has been approved.
  
- B. Installation of Pole-Mounted Fixtures:
  - 1. Prepare and compact that earth foundation for mounting in accordance with Section 02320. Form and reinforce concrete base as shown and in accordance with Sections 03100 and 03200. Mix and place concrete in accordance with Section 03300. Use finish Number 2 for exposed surfaces. Use templates for setting anchor bolts.
  - 2. Install mounting pole of type shown at location shown. Use double nuts to erect poles plumb. Pack void between concrete base and pole with grout in accordance with Section 03300.
  - 3. Install conductors in accordance with Section 16120, leaving three-foot minimum lengths of conductors for fixture connections; tape or otherwise secure in place pending final connection.
  - 4. Install lighting fixtures in accordance with approved shop drawings.
  - 5. Connect wiring using connectors in accordance with Section 16125. Tape connections.
  - 6. Install photoelectric controls as shown or in accordance with fixture manufacturer's instructions and in accordance with Section 16145.
  - 7. Ground lighting fixtures and mounting poles in accordance with NEC and Section 16060.
  - 8. Apply touch-up paint where necessary in accordance with Section 09920.

### **3.02 FIELD QUALITY CONTROL:**

- A. Ensure that earth foundation for mounting poles is prepared and compacted in accordance with Section 02320.
  
- B. Testing:
  - 1. Furnish necessary personnel and equipment and perform tests and adjustments in the presence of the Engineer. Schedule adjustment of exterior installations to occur during hours of darkness.
  - 2. Test lighting circuits for continuity and operation.
  - 3. Test fixtures and mounting poles for continuity of grounding system.

4. Aim and adjust fixtures to provide distribution pattern approximately as shown and as approved.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY DESIGNER.**

**ENDNOTES:**

- \*1. Use first version of 2.1 A.22.a. modification for all contracts requiring lighting fixture mounting poles for S&I yards.
- \*2. Use second version of 2.1 A.22.a. modification for all contracts requiring lighting fixture mounting poles at locations other than S&I yards.

**END OF SECTION**

## SECTION 16565

### FLASHER AND DIMMER CONTROL SYSTEM

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing flasher and dimmer control system for platform-edge lights.
- B. Related Work Specified Elsewhere:
  - 1. Grounding and bonding: Section 16060.
  - 2. Wire, cable and busways: Section 16120.
  - 3. Wire connection accessories: Section 16125.
  - 4. Raceways, boxes and cabinets: Section 16130.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. NEC.
  - 3. NEMA: ICS2, AB1, 250.
  - 4. ANSI: Z55.1.
  - 5. UL: 50, Electrical Construction Materials Directory.
  - 6. ITS: Directory of ITS Listed Products.
- B. Source Quality Control:
  - 1. Each item listed per referenced UL or ITS directory.

##### 1.01 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Drawing showing outline dimensions, cross section showing internal construction and weights.
    - b. Internal wiring diagram.
    - c. Characteristic data of 24-volt dc coil in flasher and dimmer control system.
  - 2. Certification.
  - 3. Operation and Maintenance Manuals.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage.
- B. Store products in secure and dry storage facility.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:

1. Components of the same type, size, rating, and functional characteristics to be interchangeable.
  2. Furnish similar items such as flasher and dimmer control unit, time switch and selector switch and associated components as products of single manufacturer.
- B. Flasher and Dimmer Control System: Rated to operate on 120/208-volt three-phase four-wire supply with continuous output of six kilowatts, guaranteed life of 10,000,000 flash cycles, all the lamps flashing simultaneously; having suitable protection device, with the following additional requirements:
1. Flasher:
    - a. Solid-state design.
    - b. Flash rate: 60 flashes per minute, plus-or-minus five percent.
    - c. Flash-mode intensity: Adjustable from 50 to 100 percent of lamp brightness.
    - d. Control relay coil:
      - 1) Nominal coil voltage: 24 volts dc.
      - 2) Coil pick-up voltage: 85 percent of nominal voltage, minimum.
      - 3) Coil resistance: 150 ohms, minimum.
      - 4) Suppression network adequate to limit inductive voltage to 250 volts and load to 15 volt-amperes maximum.
    - e. No interaction between intensity control and rate of flashing.
  2. Dimmer:
    - a. Solid-state design.
    - b. Continuous output: Six kilowatts.
    - c. Capable of operating within ambient temperature range of zero degree C to 40C and relative humidity of 20 percent to 90 percent.
    - d. Capable of varying lamp intensity from 50 to 100 percent.
    - e. Capable of withstanding current inrush to incandescent lamps when switched from zero-volt condition to 120-volt supply.
    - f. Designed to prevent false triggering of silicon-controlled rectifiers, interaction with other dimmer system and objectionable radio-frequency interference with communication and signal equipment.
    - g. Maximum voltage drop at full load: Three volts.
    - h. Output-voltage variation with input-voltage variation between 95 and 135 volts: One-volt maximum.
    - i. Equipped with filter choke to eliminate spurious harmonics and lamp-filament singing.
  3. Time switch:
    - a. Seven-day and 24-hour calibration for each day time switch, UL-listed, heavy-duty, suitable for controlling incandescent lighting fixtures when fed via flasher and dimmer control system.
    - b. Three-pole single-throw switch capable of switching a continuous load of 20 amperes at 208Y/120-volt system.
    - c. Seven-day and 24-hour dial dial with day and night zones and 24-hour calibration for each day clearly marked.
    - d. Providing up to four automatic ON/OFF operations each day.
    - e. Adjustable ON/OFF actuators designed for minimum ON period of one hour and minimum two-hour period between one OFF operation and next ON operation.
    - f. Provision for manual ON/OVERRIDE/OFF operation of switch without disturbing weekly preset schedule.
    - g. Provision for omitting operation of switch on selected days.
    - h. Spring-driven reserve power suitable for operation of switch for minimum of 16 hours after failure of power. On restoration of power, switch transfers to synchronous motor drive and automatically rewinds spring.
    - i. Terminals designed to accommodate up to 8AWG conductor cable.

- j. Operation at 208Y/120 volts, 60 Hertz and within temperature range of zero degree F to plus 140F.
4. Enclosure:
    - a. NEMA 250, Type 1, galvanized steel, surface-mounted.
    - b. Hinged, flush front door with latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.
    - c. Finish: Metallic surfaces cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
  5. Selector switch:
    - a. NEMA ICS2-216, UL-listed, heavy-duty rotary switch suitable for controlling incandescent lighting fixtures.
    - b. One three-pole switch or three single-pole switches capable of switching continuous load of 20 amperes at 208 volts.
    - c. Knob for manual operation of the switch to three positions labeled AUTO/OFF/ON. AUTO position provides for controlling the light by time switch through flasher and dimmer control unit, OFF position disconnects the power; ON position bypasses the time switch and turns lights on through flasher and dimmer control unit.
    - d. Selector switch furnished as an integral part of the time switch.
  6. Controls: Following controls provided on door:
    - a. Dimmer control: To vary lamp intensity from 50 to 100 percent, with scale marking.
    - b. Flash-mode intensity control: To vary flash-mode intensity from 50 to 100 percent, with scale marking.
    - c. Two-position selector switch marked MANUAL for manual operation of flasher for testing and AUTO for automatic operation of flasher by dc signal.
    - d. Flasher and dimmer control unit ON/OFF switch.
  7. Indicator lights: Following lights provided and identified on door:
    - a. Red light to indicate unit is ENERGIZED.
    - b. Green light to indicate dimmer is ON.
    - c. Amber light to indicate flasher is ON.
  8. Circuit Breaker: Three-pole, 20-ampere, molded-case, having interrupting capacity of 10,000 amperes conforming to NEMA AB1 provided on outgoing feeder.
  9. Nameplate:
    - a. Three-ply, laminated phenolic plate, engraved through black face to white core and attached by means of stainless-steel rivets or screws on each flasher and dimmer control system and its components. Lettering to be vertical gothic using round or square cutter. V-shaped groove not acceptable.
      - 1) Each flasher and dimmer control system labeled with nameplate 1-1/2 inches high inscribed in letters one-inch high: FLASHER AND DIMMER CONTROL SYSTEM.
      - 2) Each major component of flasher and dimmer control system labeled with nameplate one-inch high inscribed in letters 1/2-inch high: FLASHER AND DIMMER CONTROL SYSTEM or TIME SWITCH, as appropriate.
      - 3) In addition to other information normally displayed on equipment, provide one-inch nameplate showing in letters 1/2-inch high switch positions, meaning of indicator lamp and other pertinent information.
    - b. On each flasher and dimmer control unit and on each time switch, provide nameplate with manufacturer's name, brand designation, reference standard, type, class and rating as applicable.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Install flasher and dimmer control system at locations shown and in accordance with the NEC.
- B. Install conduit, as shown and as necessary, in accordance with Section 16130.
- C. Install and connect wire and cable as shown and as necessary, in accordance with Sections 16120 and 16125.
- D. Connect and adjust time switch so that it turns on flasher and dimmer control unit for seven-day time schedule as directed.
- E. Connect dc control coil in flasher and dimmer control unit to DTS-cabinet terminals for outbound-train signal or inbound-train signal as directed.
- F. Ground enclosure of flasher and dimmer control system in accordance with Section 16060.
- G. Set dimmer control at 50-percent and flasher-mode intensity control at 100-percent intensity of platform-edge lights.
- H. Apply touch-up paint where necessary.

### **3.02 DIRECTORY OF CIRCUITS:**

- A. Furnish each selector and time switch, flasher and dimmer control unit with legible circuit directory located on an accessible spot inside enclosure.

### **3.03 FIELD QUALITY CONTROL:**

- A. Furnish necessary equipment and perform the following tests:
  - 1. Test circuits for connections in accordance with the wiring diagram.
  - 2. Test cable in accordance with the requirements of Section 16120.
  - 3. Test flasher and dimmer control-system enclosure for continuity of the grounding system.
  - 4. Test operation of time switch for Automatic and OFF of ac power to flasher and dimmer control unit, and ON for manual bypass of time switch.
  - 5. Test operation of flasher and dimmer control unit in conjunction with the time switch with flasher controlled by 24-volt dc signal.
- B. Submit certified test reports.

**END OF SECTION**

## SECTION 16601

### AUTOMATED ENERGY MANAGEMENT SYSTEM (RTU & Interfaces)

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This section specifies a complete and operational automated energy management system. AEMS Remote Terminal Units are required at each Chiller plant, Traction Power Substation and passenger station AC switchgear room.
1. RTU's (Type 3) at Chiller Plants monitor the performance, temperatures and pressures and power usage of the chiller system and allows remote control of selected functions.
  2. RTU's (Type 2) at Traction Power Substations monitor the power usage and provide remote reporting and control of electronic relays.
  3. RTU's (Type 1) at Passenger Stations monitor and control selected lighting, fans, air conditioners, emergency generator unit and other HVAC equipment and electronic relays. The RTU also monitors power usage and the performance of escalators and elevators.
- B. Related Sections:
1. Section 16051- Scope of Work For Traction Power
  2. Section 16052- Basic Materials and Methods For Traction Power
  3. Section 16053- Operation and Maintenance Training
  4. Section 16128- Wire and Cable For Traction Power
  5. Section 16321- High Voltage AC Switchgear (13.8kV) For Traction Power.
  6. Section 16322- High Voltage AC Switchgear (34.5kV) For Traction Power.
  7. Section 16341- Metal-Enclosed DC Switchgear For Traction Power
  8. Section 16721 - Communications Telephone System
  9. Section 15900 - Control Equipment
  10. Section 16425 - Motor Starters and Control Centers
  11. Section 14300 - Heavy Duty Escalator
  12. Section 16145 - Wiring and Control Devices
  13. Section 16130 - Raceways, Boxes and Cabinets
  14. Section 16435 -Low Voltage Switchgear and Switchboard
  15. Section 13905 - Fire Protection, Suppression and Alarm
  16. Section 16220 - Emergency Standby Generator System
- C. Operating Requirements
1. Designed for continuous, unattended operation to perform:
    - a. Analog, digital and pulse data acquisition.
    - b. Digital control.
- D. Power Requirements
1. 120 Volts AC from Emergency Panel.

##### 1.02 REFERENCES

- A. Code, Regulations, Reference Standards and Specifications
1. Code and Regulation of jurisdictional authorities
  2. NEC
  3. NEMA 250, ICS-6, WC8, 12
  4. ANSI C37.90, Z55.1, C12

5. EIA: RS 232.C
6. ASTM: B138
7. ASHRAE/ANSI : 135P
8. ICEA: S-68-516

#### **1.04 QUALITY ASSURANCE**

- A. Qualifications:
  1. AEMS equipment manufacturer: Select manufacturer who maintains a full-time organization for installation and service in the Washington DC metropolitan area.
  2. AEMS installer: Have instruments, piping and wiring installed by a qualified installer approved by the AEMS equipment manufacturer.
- B. Coordination:
  1. The Contractor is responsible for the compatibility of the sensor and transmitters with the Authority's Energy Management System Remote Terminal Units (RTU). The RTUs are manufactured by QEI, Inc., model 4151.
  2. Have the AEMS installer and the AEMS equipment manufacturer review and modify existing mechanical and electric equipment designs to provide analog telemetering, operational status, and equipment control for items identified in the Interface Points List Requirements in PART 3 of this section.
  3. Have AEMS installer coordinate with electrical installers and other contractors as to the exact locations and sizes of new AEMS conduits to be buried in concrete in order to be used by Metro's RTU and AEMS wiring systems.
  4. Have AEMS installer coordinate with Related Work listed above.
- C. For Code, Regulations, Reference Standards and Specifications, refer to Article 1.02 above.
- D. The Contractor shall develop test procedures and obtain Engineer approval prior to testing
- E. Contractor shall perform progressive tests in accordance with an approved test procedure to verify compliance with specified system performance requirements, including as a minimum, proper component operation, module input and output signal operation and telemetry between equipment sensors and each RTU.
  1. Contractor's Quality Assurance Engineer shall witness all progressive testing.
  2. All test discrepancies shall be corrected and test reports submitted to the Engineer prior to scheduling end-to-end testing.
  3. Contractor shall notify the Engineer prior to commencing progressive testing and shall offer the Engineer the opportunity to witness the testing. Witnessing of any portion of the progressive testing by the Engineer shall not relieve the contractor from responsibility for any portion of follow-on testing.
- F. End-to-End Test:
  1. The Contractor shall demonstrate the proper functioning of the completed AEMS system including all components and telemetry between each piece of equipment monitored or controlled by the RTU by using a portable computer terminal connected to the RTU in the presence of the Engineer.
  2. The AEMS RTU must communicate with the existing Master Terminal at the Maintenance Operation Center.
  3. Each device monitored by a remote sensor shall be monitored from the RTU and operation of the device observed in the field.
  4. Each device controlled by the AEMS system shall be operated with the control command initiated at the RTU.
  5. Simulation of sensors by shorting contacts is to be avoided unless other activation is not possible.

- G. Submit certified test report within ten days after completion of field tests.

#### **1.04 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements in accordance with Division 1 and with the additional requirements as specified for each:
  - 1. Shop Drawings: Show the following as a minimum:
    - a. Proposed changes and revised equipment layouts
    - b. Electrical wiring diagrams and detail control schematics.
    - c. Electrical and mechanical details
    - d. Wire and cable schedules, interconnection diagrams, point assignment charts, and connection diagrams
    - e. RTU point count for various facilities in accordance with Table-1.
    - f. RTU data point assignments are listed in Table-2
    - g. Composite control/status and telemetering sensing equipment schedule.
  - 2. Product Data: Submit annotated product data for each item of equipment and resubmittal for mechanical or electrical equipment which changes as a result of required modification.
  - 3. As-Built Documents: Prior Substantial Completion develop an as-built documents as follows:
    - a. As-built drawings of the installation: 11-inch by 17-inch composite interconnection wiring diagram showing the entire energy management interface system. Provide sufficient copies to be stored in each AEMS interface cabinet door pocket.
    - b. Approved copies of each submittal.
  - 4. Operation and maintenance (O & M) manuals:
    - a. Complete printed operating instructions in manual or handbook form, completely and clearly indexed for ready reference during actual operation and for use as text during instruction of personnel.
    - b. Include descriptions of systems, background information and complete procedures for adjustment, calibration, replacement and repair of components in system.
    - c. Make data contained specific for and exclusive to the systems and equipment for the work of this Contract.
    - d. Field test data and reports.
  - 5. Certification:
    - a. Certified test results for the specified tests on the Remote Terminal Unit or provide certified test reports on identical unit.
    - b. Certificates from manufacturers verifying that equipment conforms to the specified requirements

#### **1.05 OPERATION AND MAINTENANCE TRAINING:**

- A. Operation and Maintenance Training is required only if an alternate vender for the RTU is selected. Operation and Maintenance will not be required if the contractor selects the QUICS 4150 RTU by QEI INC.
- B. Instructional Period: Three consecutive man-days minimum.
- C. Instruction:
  - 1. Train personnel in preventative maintenance on systems and to recognize malfunctions.
  - 2. A minimum of one day devoted to hands-on demonstration of the equipment operation, trouble analysis, repair, adjustment and maintenance.

3. Provide copies of the O & M manuals as specified above for each person being trained. Use these manuals in organizing the instruction.

## **PART 2 - PRODUCTS**

### **2.01 GENERAL:**

- A. Provide equipment identified for AEMS with stand-alone controls by the equipment manufacturer.
- B. Auxiliary contacts, modules and data interfaces added to equipment specified in other sections are to be provided by the particular equipment manufacturer or coordinated with the particular equipment manufacturer so as not to void any warranties.

### **2.01 REMOTE TERMINAL UNIT**

- A. Remote Terminal Units (RTU) for Energy Management, QEI INC. Model No. QUICS 4150 or equal.
  1. RTU to be compatible with existing master station manufactured by QEI.
  2. The contractor shall be responsible for all RTU to master station communication protocols.
  3. The RTU manufacturer shall provide a minimum of 1 week of on-site technical support for each RTU supplied.
  4. The contractor shall provide all software and hardware required for testing and configuration of the RTU's
- B. Remote Terminal Unit Controller
  1. Based on a microprocessor system, executing programs stored in non-volatile semiconductor memory.
  2. Incorporate a unique digital address or identifier. The addressing scheme shall allow operation of several RTUs on a common communications line as well as random access to individual RTU.
  3. The message exchange between the Master Station computer and the RTU shall be controlled and supervised by the master station computer. Commands to which the RTU shall respond may include, but not necessarily be limited to, the following:
    - a. Full scan request - Initiates transmission of all measurement and status.
    - b. Selective scan request - Initiates transmission of selected measurement and/or status points.
    - c. Report by exception - Initiates transmission of only those points which have changed since the last transmission. A range of values or deadband, which may be set by the operator, shall determine whether an analog variable shall be transmitted. If the variable has changed by less than the specified deadband since the last reported value, the value shall not be transmitted. If the variable has changed more than the specified amount since the last reported value, the value shall be retransmitted
    - d. Control point select and verify - Command to select a digital control point select.
  4. Transmit information only after receiving the proper address from the master station. Design RTU so that it will not respond to the reply messages of other RTUs. Replies of the RTU shall include, but not necessarily limited to, the following:
    - a. Analog and pulse data value message.
    - b. Digital data value message.
    - c. Check back response - Acknowledgment of control point select.
    - d. End message - End of block of data.

5. Provide watchdog timer capable of detecting malfunction of the microprocessor, power source, and communications with the master station. The watchdog timer shall operate independently of the microprocessor logic and clock. When a failure has been detected, the watchdog timer shall inhibit further output of all control signals by the microprocessor and force all output relays to the de-energized state.
  6. Provide an internal real-time clock to generate an interrupt to the microprocessor at regular intervals. The internal real-time clock shall be periodically synchronized by the master clock at the master station.
- C. Communication Interfaces
1. Provide a serial EIA RS-232C data communication port and a four-wire RJ11 telephone jack for connection to T1 telephone network.
  2. Generate required modem control signals and perform level translation of these and data lines to EIA RS-232C standard signal levels.
  3. Provide suitable protection equipment to protect the RTU from surges induced on the communications, power or instrumentation lines.
  4. Provide a serial communication port for a test/configuration via a portable computer.
- D. Instrumentation and Control Interfaces Input/Output Modules:
1. Include installed input/output modules to accommodate the specified point and spares. Provide signal conditioning and filtering for each point and include in the modules protection sufficient to meet the surge test requirements specified in ANSI C37.90. "Guide for Surge Withstand Capability (SWC) Tests".
  2. Analog Input Modules shall selectively connect analog data points to one or more analog-to-digital (A/D) converters under control of the common logic. The A/D converter shall have sufficient accuracy and conversion rate to satisfy the performance requirements specified previously. Design the analog input modules such that channel crosstalk is eliminated and a common mode rejection ratio of at least 80 dB and a normal mode noise rejection of at least 30 dB at 60 Hz can be achieved.
    - a. Data multiplexing and transducer termination techniques utilized shall not effectively degrade these noise immunity characteristics. Analog input modules shall be capable of accepting the analog output of transducer with a signal output level of 0-1 mA dc.
  3. Digital Input Modules:
    - a. Monitor status and alarm points via digital input modules. Provide each input point with an optical isolator to provide electrical isolation between the input and the RTU logic and with filtering to suppress relay contact bounce noise and electromagnetic interference impulses. Digital input modules shall accept dry contact inputs.
  4. Digital Control Output Modules:
    - a. Provide separate control relays for each digital output point to operate in a select-check-operate mode as specified by ANSI/IEEE C37.1. Outputs shall be latching continuous output contact closure. Receipt of a point selection address shall cause the RTU to return a verification message to the master station. Execute commands only after the dispatcher has verified that the selected point is the desired point and has issued an execute command for the function to be performed. Control relays shall be installed between the output modules and terminal strips. Contacts shall be rated for 10 Amperes at 120 Volts ac resistive load. Relays shall be factory-mounted and wired.
  5. Analog Control Output Modules:
    - a. Provide separate D/A converter for each analog output point to operate in a select-check-operate mode as specified by ANSI/IEEE C37.1. Receipt of a point selection address shall cause the RTU to return a verification message to the master station. Execute commands only after the dispatcher has issued an execute command for the function to be

performed. The analog output signal level shall be 4-20ma DC. The power source providing the output current shall be supplied internally by the RTU.

6. Pulse Input Modules:
    - a. Pulse input modules shall receive pulses in the form of contact open/closure from 3-wire (Form C) pulse initiators. The accumulated count shall not be altered, nor shall counting be interrupted when a count is transferred to the master station. Each counter shall have enough capacity to accumulate the number of pulses expected at the metering point in a 4-hour period without overflow, assuming an average pulse rate of 1 pulse per second. Pulse counter inputs shall be capable of accepting pulse inputs at a rate of 5 pulses per second. The pulse forming voltage, if required, shall be furnished from the RTU circuit.
    - b. The pulse count registers shall not be reset at the end of the interval and shall continue to accumulate and automatically roll over only when they reach maximum count.
  7. Communications Modules:
    - a. Communications modules shall be provided using an industry standard RS-485 (or RS-232) serial bus to remotely read real-time and min/max measured values, interrogate the event log, reset min/max and kW/kVAR hours and program configuration and any relay set points.
    - b. Isolated Multidrop RS-485/232 Converters shall be provided where daisy chained device communication ports are required.
  8. Terminal Strips:
    - a. Provide barrier-type terminal strips within the RTU cabinet for all external connections for instrumentation and control signal. Direct connections to relay terminals will not be allowed.
- E. Escalator LAN Adapter Panel
1. Provide PLC LAN Adapter panel for communication with escalator PLC's
  2. The panel network shall be equipped with RS232, RS485 or other industry standard network ports as required.
  3. Firmware licenses shall be supplied for the RTU to communicate over these ports to the escalator PLC's
  4. The contractor shall be responsible for all communication interfaces and protocols between the escalator PLC's and the AEMS RTU.

## 2.02 SENSORS AND TRANSMITTERS:

- A. General:
1. Power the transmitters by a 24 dc loop power supply located in the AEMS interface cabinet.
    - a. All transmitters shall be powered by 120-volt AC input, 24-volt DC output power supplies located in the AEMS interface cabinets.
    - b. DC power rating shall be capable of supplying the connected load plus 20-percent spare capacity.
- B. Sensors and Transmitters:
1. Room air temperature transmitters shall be an element contained within a cover, suitable for mounting on a wall
    - a. Insulated base temperature range: Minus 20F to plus 120F
    - b. Accuracy of calibrated points: Plus or Minus 0.5F.
    - c. Sensing elements: Platinum wire resistance type.
    - d. Transmitter output signal: 4 to 20 milliamperes DC.
  2. Single point duct temperature sensor transmitter:
    - a. Minus 20F to Plus 120F.

- b. Accuracy of calibrated points: Plus or Minus 1.2F.
  - c. Transmitter output signal: 4 to 20 milliamperes DC.
  - d. Junction box for wiring connections and gasket to prevent air leakage or vibration noise.
3. Pressure transmitters
- a. Range: Minus 15 to 30 psig
  - b. Accuracy at calibrated span: Plus or Minus 0.20 percent
  - c. Transmitter output signal shall be 4 to 20 milliamperes DC.
  - d. Source: Foxboro model IGP20 or equal.
4. Liquid Immersion Temperature Sensor Transmitter:
- a. Stainless steel thermal, sensor and connection head for wiring connections.
  - b. Temperature range: 30F to 70F.
  - c. Accuracy at calibrated span: Plus or minus 0.15 percent.
  - d. Transmitter output signal: Four to 20 milliamperes dc.
  - e. Sensing element: Platinum 100Ω RTD type.
  - f. Source: Foxboro model 893 or equal.
5. Outside air temperature sensors:
- a. sensor element shall have a tamper-proof protective cover
  - b. Range: Minus 20F to Plus 120F
  - c. Accuracy: Plus or Minus 1.3F.
  - d. Transmitter output: 4 to 20 milliamperes DC.
6. Outdoor humidity sensor transmitters:
- a. Sensor element shall have a tamper-proof shielded cover
  - b. Transmitter output signal: 4 to 20 milliamperes DC output.
  - c. Range: 0 to 100% relative humidity (RH)
  - d. Accuracy: Plus or Minus 5 percent
  - e. Junction box for wiring connections and gasket: NEMA 3R rating.
7. Flow Rate Sensors and Transmitter:
- a. Provide with appropriate orifices and venturis to accommodate flow sensors, pressure differentials, transducers, etc.
  - b. Calibrated in gallons per minute (GPM).
  - c. Transmitter output signal: Four to 20 milliamperes dc.

## 2.03 Cabinets

- A. RTU Cabinet:
- 1. Construction: NEMA 12.
  - 2. Accessories: 120 Volt AC GFI type receptacle and 120 Volt AC strip heater.
  - 3. Apply two finish coats, ANSI No. 61, Light Gray, to exterior surface.
  - 4. Paint interior per manufacturer's standard.
  - 5. Fabrication
    - a. Cabinet with fixed side, rear and roof panels, front swing, full hinged door with flush latch operable by screw driver, key, hasp and staple for padlock.
    - b. Provide protective pocket inside front cover with schematic diagram, connection diagram, operating instructions, and layout drawing of control wiring and components within enclosure.
  - 6. Terminal Blocks:
    - a. Power Terminals: Rated 30 Amp, 600 Volt with insulating barriers between poles and washer-head binding screws on each pole to accommodate up to 10 AWG wire.
    - b. Signal and Control Terminals: Rated 10 Amps, 300 volts, modular construction type, screws to accommodate up to 14 AWG wire.
  - 7. Field Wiring Terminals:
    - a. Provide terminal blocks in the RTU to accommodate all field wires including spares.

- b. The terminal blocks shall not be part of any RTU signal or control components.
    - c. The terminal blocks shall be rated 30 AMPS, 600 volts with insulating barriers between poles and washer-head binding screws on each pole to accommodate up to 10 AWG wire.
  - 8. Nameplate:
    - a. Black laminated plastic composition with permanent white engraved lettering, and beveled edges.
    - b. Fastened to panel using small round-head screws.
    - c. Installed inside cubicle and cabinets with cement.
    - d. Submitted for approval.
- B. AEMS Interface Cabinet
  - 1. NEMA 12 stainless steel Hoffman Engineering or equal in accordance with Section 16130 Data Transmission System (DTS) cabinet.
    - a. Terminal Blocks:
    - b. Assembly rail and modular terminals, Weidmuller Terminations Incorporated or equal in accordance with Section 16130 Data Transmission System (DTS) cabinet.
  - 2. Nameplate:
    - a. Black laminated plastic composition with permanent white engraved lettering, and beveled edges.
    - b. Fastened to panel using small round-head screws.
    - c. Installed inside cubicle and cabinets with cement.
    - d. Submitted for approval.

#### **2.04 Marking Tags:**

- A. Dekafix 6.5-FS or equal, consecutive vertical, No. 4682.2 or No. 5766.6 as approved.
- B. Group marking carrier with paper marking strip and transparent cover.
  - 1. Type SCHAT5, Catalog No. 2924.6.
  - 2. Type ES05, Catalog No. 2937.0.
  - 3. SST5, Catalog No. 2940.0.

#### **2.05 Raceways, Boxes and Conduit**

- A. Provide conduit, raceways, boxes and fittings in accordance with Section 16130

#### **2.06 Control Switch:**

- A. For control of chillers, condenser water pumps, chilled water pumps and cooling tower fans:
  - 1. Heavy duty three-position, selector switch with position labeled HAND/OFF/AUTO (HOA).
  - 2. Provide auxiliary contacts on Hand Operated Switches to indicate "HOA Local/Remote" position on Hand Operated Switches provided in accordance with the provisions of other sections.
- B. For control of station ACU fans, AC units, exterior lighting and unit heaters (over 10 KW):
  - 1. Heavy duty three-position selector switch with position labeled HAND/OFF/AUTO (HOA).
  - 2. Provide auxiliary contacts to indicate HOA position.

NOTE: In addition to AEMS interface connections there may also be DTS connection requirements for the same equipment.

## **2.07 Motor Starters and Contactors:**

- A. Provide auxiliary contacts at motor starters and equipment contactors to indicate equipment ON/OFF status. Equipment included are chillers, condenser water pumps, chilled water pumps, cooling tower fans, ACU fans, AC units, exterior lighting and unit heaters.
- B. Provide wiring and interconnection with motor starters and equipment contactors to AEMS interface cabinet.

## **2.08 WIRING:**

- A. Status, Control and Analog:
  - 1. Multicolor cable, No. 14 AWG, UL-listed conductors of 98-percent copper with type XHHW insulation rated 600 volts. Nonmetallic jacket material complying with ICEA S-68-516, NEMA WC8, free of PVC or PVC-based compounds.
  - 2. Jacket: Chlorosulfanated polyethylene, cross-linked polyolefin, or heavy duty neoprene.
  - 3. Use shielded twisted pair cable for analog inputs and outputs.
  - 4. Wiring to escalator PLC's shall conform with PLC manufacturer's requirements with plenum rated jacket free of PVC or PVC based components.

## **2.09 Electronic Power Meter**

- A. ANSI C37.90.1 and ANSI C12.

## **2.10 Spare Parts:**

- A. In accordance with special conditions and the following:
  - 1. Provide 2 spare of each type of circuit card, 2 power supplies, and 2 modems for each type used. Provide touch up paint in 1-quart container.

## **PART 3 - EXECUTION**

### **3.01 SOURCE QUALITY CONTROL**

- A. Design and Production Tests: Perform and submit in accordance with the General Provisions, certified test results for the tests on each unit of Remote Terminal Unit supplied under this contract.

### **3.02 INSTALLATION**

- A. RTUs shall be delivered and installed as shown in accordance with approved shop drawings at the following facilities:
  - 1. Traction Power Substations
  - 2. Passenger Stations
  - 3. Chiller Plants
- B. The Contractor shall terminate all wiring on terminal strips in accordance with approved shop drawings and interconnection diagrams.
- C. Perform work in accordance with the NEC.
- D. Terminate interface points in the AEMS interface cabinet. Wall-mount each AEMS interface cabinet in the room associated with the equipment.

- E. Raceways Boxes and Cabinets:
1. Install conduit, raceways, boxes, fittings in accordance with Section 16130 as necessary to facilitate connections in accordance with Table 2
  2. Install wall mounted AEMS interface cabinets as necessary in the vicinity of equipment other than AC switchgear, chillers or Traction Power equipment located in the same room where the RTU is installed.
    - a. Label the interface cabinet as the AEMS INTERFACE CABINET.
    - b. Install AEMS interface cabinets at locations in accordance with approved shop drawings.
  3. Install raceways, wiring and terminations between the interface boxes and the RTU unit in the AC switchgear room.
  4. Arrange terminations in AEMS interface cabinets in a sequence to facilitate maintenance. Terminations shall comply with the following requirements:
    - a. Terminal strips shall be identified with markings tags as TB-1, TB-2, TB-3, ext. as required from left to right.
    - b. Terminals shall be identified consecutively on the various terminal strips from top to bottom and from left to right.
    - c. Terminations for equipment shall be grouped by equipment identification with control functions located on top and indication functions located on the bottom within the grouping.
    - d. Terminations for various equipment of the same type/classification such as EF-1 and EF-2 shall be terminated on consecutive terminals from top to bottom in ascending equipment number sequence.
    - e. Spare terminals shall be concentrated in one area of the terminal strip to the extent possible.
- F. Wiring:
1. Use shielded twisted pair cable for analog input and control output signals and multi-conductor cable for all other functions.
  2. Install wiring for AEMS interface circuits for all points identified for branch circuits to power supplies located in selected AEMS interface cabinets and for circuits from power supplies to sensors and transmitters in accordance with the following requirements:
    - a. Terminate shield drain wire of two-conductor, shielded twisted-pair instrumentation cable on a terminal strip in the AEMS interface cabinet located directly below the associated two conductors for the cable. Drain wire shall not be grounded at the AEMS interface cabinet. (Drain will be grounded at the RTU)
    - b. Terminate twisted pair instrumentation cables for analog circuits on terminal strips that are separate from terminal strips used to terminate non-analog circuits.
    - c. Install twisted pair instrumentation cables for analog circuits in conduits that are separate from conduits used for non-analog circuits.
- G. Ground RTU, AEMS interface cabinets and power supplies in accordance with Section 16060
- H. Install auxiliary contacts as required for implementation of AEMS interface connections in contactors and starters specified in Section 16145 and Section 16425
- I. Install thermostats and sensors at locations indicated on drawings with top of thermostat 5'-0" above finished floor.
- J. Connections to escalators shall be via a single daisy-chained digital communications link between each escalator's PLC and the AEMS RTU

- K. Wiring terminations between the chiller and the AEMS located in the chiller plant may be made directly to the AEMS without the requirement for an interface cabinet.
- L. Wiring between the RTU in the traction power substation and traction power equipment may be made directly to the RTU without the requirement for an interface cabinet.
- M. Wiring in the AC switchgear room between the switchgear and the RTU may be made directly to the RTU without the requirement for an interface cabinet. Connections to mechanical equipment in the AC switchgear room shall require an interface cabinet.
- N. At locations where there is a combined AC switchgear room / traction power substation in the same room, the requirement for separate RTU's for each shall not be waived.

**3.03 FIELD TESTING:**

- A. The Contractor shall perform polarity and continuity test on all interconnection wiring.
- B. The Contractor shall perform system start-up for each RTU in the presence of the manufacturing representatives. The manufacturing representative shall verify correct operation of each input/output data card using a simulated master control interface test unit. Additional checkout shall be made to verify wiring terminations, modem operation, power supply operation and CPU operation.
- C. The Contractor shall label all wiring terminations to reflect the connection points.
- D. The Contractor is responsible for testing all RTU input signals to verify correct status and telemetry signal levels. A test data sheet shall be developed for each RTU/AEMS Interface Cabinet which list all I/O signal points. The data sheet shall be submitted as part of the Contractors test plan. The Contractor shall submit a list of discrepant I/O signal points to the Engineer. I/O equipment supplied under this contract that is not reporting properly shall be corrected and retested. The Contractor shall submit a discrepancy report for all I/O points indicating problems found and required action.

Table 1

RTU POINT COUNT

RTU Point	<u>RTU Type 1</u>	<u>RTU Type 2</u>	<u>RTU Type 3</u>
Analog input:			
1. 0-1 mA:	16	16	16
2. 4-20 mA:	16	16	32
Status input:	40	24	24
Control input:			
1. Latching:	16	4	8
2. Momentary	16	4	8
Analog output, 4-20 mA:	0	0	8

## SECTION 16701

### DEFINITIONS OF COMMUNICATION SYSTEM TERMS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. Standard Definitions
  - 1. Definitions pertaining to the communication design and equipment description shall conform to the standard definitions promulgated by the following organizations unless otherwise specified in this Section (16701)
    - a. Current versions of the Association of American Railroads (AAR)
    - b. Electronic Industries Alliance (EIA)
    - c. The Institute of Electrical and Electronics Engineers, Inc. (IEEE)
    - d. The National Fire Prevention Association (NFPA)
    - e. Local and state building and fire procedure codes not superseded by provision of the "Fire Protection Equipment and Life Safety Agreements" executed between WMATA and local jurisdictions.
- B. Order of Priority
  - 1. Where definitions conflict, the order of priority shall be:
    - a. Definitions of Communications Systems Terms (Section 16701)
    - b. Current versions of the Association of American Railroads (AAR);
    - c. EIA;
    - d. IEEE.
    - e. NFPA
- C. Glossary of Communication Terms Used in These Communication Specifications

##### 1.02 RELATED SECTIONS

- 1. All Sections in the 16700 and 16800 Series.

##### 1.03 REFERENCES

- A. Current versions of the Association of American Railroads (AAR)
- B. Electronic Industries Alliance (EIA)
- C. The Institute of Electrical and Electronics Engineers, Inc. (IEEE)
- A. "Fire Protection Equipment and Life Safety Agreements" executed between WMATA and local jurisdictions

##### 1.04 GLOSSARY OF COMMUNICATION TERMS

- A. Words, terms, and phrases used in these Communication System Specifications are defined as follows:
  - 1. AAR:
    - a. Association of American Railroads  
50 F Street, N.W.  
Washington, D.C. 20001-1564
  - 2. Absorption Losses:

- a. (Fiber Optics) Reduction in light amplitude or strength caused by impurities in the optical fiber and by the scattering of light from the optical fiber.
- 3. AC Service Room:
  - a. Room housing equipment and facilities for the distribution of ac power throughout an installation such as a passenger station or shop building.
- 4. Alarm
  - a. An alerting signal indicating an abnormal condition.
- 5. Alphanumeric:
  - a. Alphabetic and numeric representation, letters, numbers, and symbols.
- 6. Amplitude Modulation (AM):
  - a. The process of varying the amplitude of a carrier wave in accordance with the instantaneous value of a modulating signal.
- 7. Ambient:
  - a. Typical of the environment. Specifically used to designate properties of the surroundings which are measurable and distinguishable from absolute zero energy levels.
- 8. Angstrom:
  - a. (Fiber Optics) A unit of optical wavelength historically used in the field of optics, but not an International System unit.
- 9. 1 Angstrom = 0.1 nanometer
- 10. American Standard Code for Information Interchange (ASCII):
  - a. Consists of 10 or 11 bits per character - one start bit, seven information bits, one parity bit, one or two stop bits.
- 11. Ancillary Building:
  - a. A room, area or structure which is not considered typical to all Metrorail passenger stations.
- 12. Annunciator:
  - a. An audible signaling device which usually includes signal lights, each one indicating the conditions that exist or have existed in an associated circuit.
- 13. ANSI:  
1819 L Street, NW  
Suite 600  
Washington, DC 20036
- 14. Armored Cable:
  - a. A cable provided with a wrapping of metal primarily for the purpose of mechanical protection. The armor is sometimes used as an electrical shield.
- 15. ASTM:
  - a. American Society for Testing and Materials  
100 Barr Harbor Drive  
West Conshohocken, Pennsylvania 19428-2959
- 16. At-Grade:
  - a. That portion of the system which is constructed at the approximate elevation of the adjacent ground surface.
- 17. Attenuation:
  - a. A decrease in the amplitude of a signal as it travels along or through a transmission medium, usually expressed as a ratio or in dB.
  - b. (Fiber Optics) A measure of the decrease in energy transmission (loss of light) expressed in dB/km. In optical waveguides it is primarily due to absorption losses and scattering losses.
- 18. Attenuation Distortion:
  - a. Distortion caused by the non-uniform attenuation or gain of a system, with respect to frequency, under specified terminal conditions.
- 19. Audio Frequency:

- a. Frequency range approximately equal to 15 Hz to 20,000 Hz (i.e. frequencies typically audible by human ears).
20. Authority, The:
- a. Washington Metropolitan Area Transit Authority (WMATA).
21. Auto Scan:
- a. The automatic scan of the TV cameras in the horizontal (pan) plane.
22. Automatic Fare Collection (AFC):
- a. Computer controlled system for the collection of fares, control of access, and associated functions.
23. Automatic Frequency Control (AFC):
- a. Means whereby the frequency of a circuit is automatically maintained, within specified limits, with respect to a reference frequency.
24. Avalanche Photodiode (APD):
- a. (Fiber Optics) One type of receiver or detector used in the receiving portion of Fiber-Optics terminals or repeaters. It is called a detector or receiver, since it detects and converts the light signal to a copy of the original electrical signal.
25. Bandwidth:
- a. Limiting frequencies between which the performance of a device or system falls within specified limits.
  - b. (Fiber Optics) The capacity of an optical fiber to transmit information, expressed in bits of information transmitted per specific time period for a specific length of optical waveguide. Bandwidth is limited by pulse spreading or broadening due to dispersion, so that adjacent pulses overlap and cannot be distinguished.
26. Ballast:
- a. Crushed rock or stones placed between, under, and at the ends of railroad ties.
  - b. (Electronics) A device utilized to limit current flow.
27. Battery:
- a. An assembly of cells electrically connected for producing electric energy. In telephone systems, it usually refers to centralized dc source, located in the central office, nominally -48 volts.
28. Baud:
- a. Unit of signaling speed equal to the number of discrete signal events per second.
  - b. Binary Coded Decimal (BCD)
  - c. A notation in which each individual decimal digit is represented by a pattern of "ones" and "zeros."
29. Bit:
- a. A binary digit, 0 or 1 in number representation, with the radix 2.
30. Bus:
- a. A conductor, or group of conductors, that serve as a common connection for two or more circuits.
31. Cable Binder:
- a. A wrapping of tapes or cords around several conductors of a multiconductor cable used to hold them together which may be color coded to designate the group of conductors enclosed.
32. Cable Tray:
- a. A tray or rack used for the installation and support of cable.
  - b. Cable Trough
  - c. A trough used for the installation, support, and protection of cable.
33. Call:

- a. The act of establishing and completing a telephone connection from one telephone instrument to another.
- 34. Called Party
  - a. The telephone instrument at the "distant end" being called.
- 35. Calling Party:
  - a. The telephone instrument that originates the call.
- 36. Cardioid (Pattern):
  - a. A heart-shaped pattern obtained as a response or radiation characteristic of certain directional antennas, or as the response characteristic of certain types of microphones.
- 37. Cassette:
  - a. A small reel-to-reel tape magazine on which is recorded analog or digital information.
- 38. Cassette Recorder:
  - a. A tape recorder used to record or playback cassettes.
- 39. CCS:
  - a. Hundred-Call-Seconds - A measure of communications traffic equal to one hundred seconds of communicating. In practice, "CCS" is used for hundred call seconds per hour.
- 40. Central Office:
  - a. Equipment in a telephone system that provides centralized switching, battery, and supervision for a group of subscribers or terminals (i.e. a Main PABX or Satellite PABX Equipment Room).
- 41. Channel:
  - a. A path for transmitting electrical signals.
- 42. Character:
  - a. A combination of bits denoting a specific alphanumeric symbol.
- 43. Chromatic or Material Dispersion:
  - a. (Fiber Optics) This refers to "colors" or wavelengths in a lightwave source. Light rays with different wavelengths travel along a fiber at different speeds. The broader the range of wavelengths emitted, the more light pulse will spread as it traverses the length of the fiber.
- 44. Circuit:
  - a. A conductor or system of conductors through which an electric current is intended to flow. A network providing one or more closed paths.
- 45. Cladding:
  - a. (Fiber Optics) The low refractive index material which surrounds the core of the fiber and protects against surface contaminant scattering. The cladding may be glass or clear plastic. In interoffice telecommunication systems, glass cladding is used.
- 46. C-Message Weighting:
  - a. Noise weighting used in a noise measuring set to simulate use of the Type 500 telephone (which has characteristics that are typical of most modern telephone instruments in commercial use in this Metropolitan area).
- 47. Combined Distribution Frame (CDF):
  - a. A distribution frame which, in addition to the functions of an MDF, provides for the cross-connection of the PABX subscriber line multiple and the subscriber line circuits.
- 48. Command Message:
  - a. Digital message transmitted from the Mobile Radio System control console to base stations to query status or to direct action.
- 49. Command Message Enable:
  - a. Message used to cause selected base station(s) to be ready for two-way voice operation.
- 50. Command Message Station Connect:

- a. Message used to restore a base station(s) to service in the system in a quiescent mode with its receiver in a monitoring condition with squelch operating.
- 51. Command Message Station Disconnect:
  - a. Message used to intentionally remove a base station(s) from service in the system.
- 52. Commercial Telephone Network:
  - a. The public telephone system. In the WMATA area, usually Bell Atlantic for local public network and special services cable connections.
- 53. Communications Equipment Room:
  - a. Room housing centralized communications equipment for an installation such as a Metrorail passenger station or yard.
- 54. Communications Ground:
- 55. Compandor:
  - a. An earth ground connection of 5 ohms or less resistance that is provided in the Communications Equipment Room in each passenger station and yard for the sole purpose of grounding communications equipment. The Communications Ground in the Communications Equipment Room at Jackson Graham Building has a resistance of 1 ohm or less to earth.
  - b. A combination of a compressor at one point in a communications path for reducing the amplitude range of signals followed by an expander at another point for a complementary increase in the amplitude range. The purpose is to improve the ratio of the signal to the interference entering the path between the compressor and the expander.
- 56. Compartmental Cable:
  - a. A multiconductor cable with its core divided into two compartments, a transmit section and a receive section, which are separated by an insulated metallic divider.
- 57. Conduit:
  - a. A tube-like structure for electrical wires or cables. Conduit may be either rigid or flexible, metallic or non-metallic, as specified.
- 58. Conduit Stub Out:
  - a. A short length of conduit that is joined as a branch to a conduit run and, as used in these Specifications, is the termination of a conduit run.
- 59. Console:
  - a. A panel or cabinet on which are mounted switches or lamps for use by a human operator in monitoring and controlling equipment and functions.
- 60. Contact Rail:
  - a. A bus bar alongside a track that carries electric energy for the propulsion of trains.
- 61. (The) Contractor:
  - a. The person, partnership, corporation, or joint venture that is awarded the prime contract to provide the facilities, equipment, and installations described in these Specifications. The usage of this term in these Specifications also includes subcontractors, suppliers, vendors, and employees thereof, except as otherwise stated (subject at all times to the Contractor's responsibility therefore).
  - b. The person or company who is awarded a contract to provide all the facilities, equipment, and installations described in these Specifications.
- 62. Core:
  - a. (Fiber Optics) The light conducting portion of the optical fiber, defined by the high refractive index region. The core is normally in the center of the optical fiber, bounded by the cladding material.
- 63. Coverage:

- a. Inclusion within the range of a communications device, equipment unit, system or medium.
- 64. Crosstalk:
  - a. Undesired signal coupling between two different communications channels or signal components.
- 65. Data Acquisition and Display System (DADS):
  - a. A system for the collection, recording, consolidation, and display of fare collection data at the passenger stations.
- 66. Enhanced Data Acquisition and Display System (EDADS):
  - a. An upgraded version of the DADS System.
- 67. Data Transmission System (DTS):
  - a. The bi-directional, non-vital digital communications system between Central Control and the Train Control Room. The DTS utilizes a channel of the CTS as a transmission medium.
- 68. Decibel (dB):
  - a. Unit used to express the ratio between two amounts of electrical power, P1 and P2, defined as:

$$\text{dB} = 10 \log_{10} \frac{P_1}{P_2}$$

- b. Also used to express voltage and current ratios, defined as:(Voltages and currents must be measured with identical impedances.)

$$\text{dB} = 20 \text{Log}_{10} \frac{V_1}{V_2} = 20 \text{Log}_{10} \frac{I_1}{I_2}$$

- c. Also used to express intensity of sound; defined as equal to 20 times the common logarithm of the ratio of the sound pressure of a wave to a reference pressure of 0.0002 dyne per square centimeter.
- 69. dBm:
  - a. Measure of absolute electrical power in decibels referred to one milliwatt.
- 70. dBm0:
  - a. A measure of power, with reference to zero dBm, at the reference transmission level point (RTLTP).
- 71. dBmnc0:
  - a. A measure of noise power in dB above one picowatt measured with a C-message weighting network referred to or measured at an RTLTP.
- 72. Delay Distortion:
  - a. Distortion caused by differences in transit time for different frequencies within a specified system bandwidth.
- 73. Desk Telephone:
  - a. A telephone instrument designed for desk top use.
- 74. Detector:
  - a. A device used to sense a particular condition - smoke, temperature, open circuit, received signal, etc.
- 75. Dial:
  - a. Normally, a face plate which has been graduated into arbitrary units. As a special case, in telephony, the hand operated device used to generate pulses or tones for establishing connections over a telephone switching system.

76. Dialing:  
a. The act of operating a dial - specifically, a telephone dial. As used in this document, includes the act of operating a telephone instrument "touchtone" pad.
77. Diode Auctioneering:  
a. A method of obtaining redundancy in use of power supplies by utilizing diode coupling from each power supply to a common load.
78. Direct Burial:  
a. A method of installing cable underground, not in conduit or duct, in such a manner that it cannot be removed without disturbing the soil.
79. Dry Contact:  
a. An electrical contact through which no direct current flows.
80. Duct Bank:  
a. An arrangement of conduit providing more than one duct to accommodate and protect cables between two points.
81. DTMF:  
a. Dual Tone Multifrequency audio signaling scheme utilized as the standard subscriber line tone signaling method in the USA. Also known as Touch-tone dialing, which is a copyrighted Bell Telephone Company term for such signaling. (Utilized for some other remote control devices also.)
82. Duplex:  
a. Type of operation that permits simultaneous communications in both directions.
83. EIA:  
a. Electronic Industries Alliance  
2500 Wilson Boulevard  
Arlington, Virginia 22201
84. E&M Signaling:  
a. A signaling system characterized by the use of separate paths for the signaling and voice signals. The M lead transmits battery or ground to the distant end of the circuit while incoming signals are received as ground or open on the E lead.
85. E&M Trunk:  
a. An audio trunk circuit utilizing E&M signaling.
86. Electro-Mechanical:  
a. An electrical device with moving parts.
87. Elevated:  
a. That portion of the Metrorail System which is constructed above the adjacent ground surface.
88. Emergency Power:  
a. Electrical power provided to operate essential equipment during periods of failure of primary power source.
89. Emergency Trip Station: (ETS):  
a. An enclosure containing an emergency telephone and an electric switch to de-energize a section of the contact rail.
90. ETS Telephone:  
a. An emergency telephone generally located along Metrorail R.O.W. and collocated with or enclosed in Emergency Trip Station boxes in most instances.
91. Engineer (The):  
a. Wherever, on the Contract Drawings or in the Specifications, the term "Engineer" is used, it shall mean the Resident Engineer or other duly authorized representative of the Contracting Officer.
92. Engineering Services:

- a. Engineering Service to be provided, as detailed in Article 3.1, Article 3.20, and as required elsewhere in these Specifications and Contract Drawings.
- 93. Entrance Escalator:
  - a. Escalator from street level to a passenger station.
- 94. Environment:
  - a. The universe within which the system must operate, the elements over which the designer has no control.
- 95. Error Rate:
  - a. The ratio of the number of characters of a message(s) received incorrectly to the total number of characters of the message(s) received.
- 96. Factory Test:
  - a. Test of equipment at the manufacturer's plant.
- 97. Failure:
  - a. An inability to perform an intended function.
- 98. Fare Gates:
  - a. Gate in stations through which passengers pass separating FREE (UNPAID) and PAID areas.
- 99. FCC:
  - a. Federal Communications Commission  
445 12<sup>th</sup> Street, SW  
Washington, D.C. 20554
- 100. Fiber Buffer:
  - a. (Fiber Optics) A material that may be used to protect an optical fiber from physical damage, thus providing mechanical isolation and/or protection.
- 101. Fiber Bundle:
  - a. (Fiber Optics) In a fiber optics cable, a group of parallel optical fibers over which a loose-fitting jacket (fiber buffer) has been extruded. (As used in "loose tube" type fiber optic cables, for example).
- 102. Fiber Optics:
  - a. (Fiber Optics) The branch of optical technology concerned with the transmission of radiant power through fibers made of transparent materials such as glass, fused silica, or plastic.
- 103. Fiber Optics Cable:
  - a. A cable made up of several optical fibers incorporated into an assembly of organic materials arranged for providing the necessary tensile strength, external protection, and handling properties. (Communications cables usually utilize "loose tube" or "open channel" type internal construction.)
- 104. Fire Zone:
  - a. A portion of a building, installation or area designated for fire detection by a specific circuit.
- 105. Flutter:
  - a. Cyclic deviation of signaling power (with a period in the neighborhood of 10 Hz for audio, for example).
- 106. Foot Lambert (fl):
  - a. The amount of light energy reflected from an object or scene equal to the product of illumination in footcandles and the luminous reflectance of the object or scene.
- 107. 4-Wire Terminating Set:
  - a. A hybrid set for interconnecting a four-wire and a two-wire circuit (usually refers to audio frequency devices).
- 108. Free (Unpaid) Area:
  - a. Area of passenger station to which public has access prior to passing through fare gates.
- 109. Frequency Modulation (FM):

- a. The process of varying the instantaneous frequency of a sine wave carrier by an amount proportional to the instantaneous value of a modulating signal.
- 110. Frequency Response:
  - a. The measure of effectiveness with which a circuit or device receives or transmits a range of frequencies.
- 111. Frequency Shift Keying (FSK):
  - a. The form of frequency modulation in which the modulating wave shifts the output frequency between predetermined values, and the output wave has no phase discontinuity (usually accomplished at audio frequencies).
- 112. Fuse:
  - a. An overcurrent protective device with a circuit-opening part that is heated and severed by the passage of overcurrent through it.
- 113. Fuse Alarm:
  - a. A circuit which produces a visual or audible signal to indicate a blown fuse.
- 114. Fusion Splice:
  - a. (Fiber Optics) A splice accomplished by the application of localized heat sufficient to fuse or melt the ends of two lengths of optical fiber, forming a continuous, single fiber.
- 115. Gallery Place:
  - a. A Metrorail passenger station located at the junction of Routes B, E, and F, which is a secondary hub of the WMATA Rail Rapid Transit System.
- 116. Gatehouse:
  - a. A building at the entrance to a Metrorail train yard, from which control of pedestrian and vehicular (other than trains) access to the yard is exercised.
- 117. Graded-Index:
  - a. (Fiber Optics) An optical fiber type wherein the core refractive index decreases almost parabolically radially outward toward the cladding. This type of fiber combines high-bandwidth capacity with moderately high coupling efficiency.
- 118. Ground:
  - a. A conducting connection, whether intentional or accidental, by which an electric circuit or equipment is connected to the earth, or to some conducting body of relatively large extent that serves in place of the earth. A common return to a point of zero potential. (Intentional grounding for WMATA projects providing low resistance current return paths to the earth.)
- 119. Half Duplex:
  - a. A method of operation in which two-way communication is possible, but only one way at a time.
- 120. Handset/Speaker Station:
  - a. A self-contained terminal station of the paging-intercom subsystem of the Yard Public Address System.
- 121. Hardware:
  - a. Physical entities such as computers, equipment, and instruments. Also parts made of metal such as fasteners, straps, clamps, and anchors.
- 122. Harmonic Distortion:
  - a. Non-linear distortion of a system or transducer characterized by the appearance in the output of harmonics, other than the fundamental component, when the input wave is sinusoidal.
- 123. Hertz (Hz):
  - a. Unit of frequency equal to one cycle per second.
- 124. ICEA:

- a. Insulated Cable Engineers Association  
PO Box 440  
South Yarmouth, Massachusetts 02664
- 125. Identifying Digits:
  - a. Alphanumeric digits that identify each passenger station and yard.
- 126. Idle:
  - a. In communications systems, indicates a circuit, device or system is not in active use (i.e. in the quiescent state).
- 127. Idle Noise:
  - a. That noise which is inherent in a circuit or device and is not contingent upon modulation.
- 128. IEEE:
  - a. Institute of Electrical and Electronics Engineers, Inc.  
345 East 74th Street  
New York, N.Y. 10017
- 129. Impedance:
  - a. The opposition in an electrical circuit to the flow of alternating current.
- 130. Impulse Noise:
  - a. Noise characterized by transient disturbances separated in time by quiescent intervals.
- 131. Inbound Track:
  - a. Track that is normally used by trains traveling toward Metro Center passenger station in the A, B, C, D, G, and K routes; and towards the Gallery Place passenger station in the E, F, and L routes.
- 132. Incident Scene Illumination:
  - a. The amount of light expressed in foot-candles which is actually falling on an object.
- 133. Index of Refraction:
  - a. (Fiber Optics) The relative index of refraction is a fraction or ratio of the velocity of light in one medium, compared to the velocity of light in another medium.
- 134. Infrared:
  - a. (Fiber Optics) The region of the electromagnetic spectrum between the long-wavelength of the visible spectrum (about 750nm) and the shortest microwaves (about 1300nm). Infrared is used extensively in the transmission of light through optical waveguides.
- 135. Injection Laser Diode:
  - a. (Fiber Optics) A laser employing a forward-biased semiconductor junction as the active medium. Light is emitted from the diode edge.
- 136. Insertion Loss:
  - a. The loss resulting from the insertion of a transducer or other device in a transmission system.
- 137. Install:
  - a. When used in these Specifications, the verb install shall signify that the Contractor shall furnish, install, and test the equipment and materials specified, unless specifically indicated differently in the text.
- 138. Interface:
  - a. A shared boundary. The interconnection between two pieces of equipment or systems/facilities.
- 139. Interlocking:
  - a. An arrangement of signals and signal appliances interconnected so that their operations must succeed each other in proper sequence, thereby permitting train movements over controlled routes, only if safe conditions exist.
- 140. Intermodulation Noise:

- a. That noise which is contingent upon modulation and results from any non-linear characteristic in the path or device.
141. Interphone:
- a. Equipment used to provide telephone communications between personnel at various locations within a defined space. As used in these Specifications, provides communications between the Station Manager in the Kiosk and the public.
142. Intrusion Zone:
- a. A portion of a building, installation or an area designated for detection of intrusion by a specific circuit.
143. Jacket:
- a. A thermoplastic or thermosetting covering, sometimes fabric reinforced, applied over the insulation, core, metallic sheath or armor of a cable.
144. Jackfield:
- a. An arrangement of telephone jacks, usually grouped on a mounting strip, to provide convenient access to lines and equipment for testing.
145. Joint Electron Device Engineering Council (JEDEC):
- a. Cooperative effort of Electronic Industries Alliance (EIA) and National Electrical Manufacturers Association (NEMA).
146. Key Telephone System (KTS):
- a. Assemblage of telephone relay or electronic equipment which provides switching and control of telephone service within a localized area. KTS equipment is differentiated from PABX equipment primarily by more limited switching functions. Insofar as external telephone trunks are concerned, KTS equipment is generally limited to applications requiring less than 100 subscriber lines and the provision of service that is generally limited to a single building or area of a building.
147. Kiosk:
- a. A booth-like structure within Metrorail passenger stations which contains station monitoring and control facilities and from which an attendant may provide information and assistance to passengers.
148. Laser:
- a. (Fiber Optics) A device that produces optical radiation using population inversion to provide Light Amplification by Stimulated Emission of Radiation and (generally) an optical resonant cavity to provide positive feedback.
149. Light Emitting Diode (LED):
- a. A pn junction semiconductor device that emits incoherent optical radiation when biased in the forward direction.
150. Main Distribution Frame (MDF):
- a. Provides for the termination and cross connection of outside lines entering a building, including electrical protection devices, internal subscriber lines, and terminal equipment.
151. Manhole:
- a. A subsurface chamber or opening in the route of a conduit or duct run that provides facilities for splicing, testing, and maintaining cables and conductors.
152. Manual Pull Box:
- a. Specifically refers to FIRE alarm switch which, when operated manually, initiates a FIRE alarm.
153. MDF/Protector Cabinet:
- a. Specifically refers to a cabinet located in passenger stations and yard buildings containing MDF and cable protection facilities.
154. Major Items:

- a. Major Items are defined as items listed in Estimated Quantities Tables 3.1-X.X.
- 155. Mechanical Splice:
  - a. (Fiber Optics) An optical fiber splice accomplished by fixtures or materials, rather than by thermal fusion. Index matching material may be applied between the two fiber ends.
- 156. Metro Center:
  - a. A Metrorail passenger station located at the junction of routes A, B, C, and D which is the major hub of the WMATA Rail Rapid Transit System.
- 157. Microbar:
  - a. Unit of pressure equal to one dyne per square centimeter.
- 158. Millisecond (ms):
  - a. A unit of time equal to one one-thousandth of a second.
- 159. Mobile Radio Unit:
  - a. A radio transmitter/receiver designed for installation in a vehicle or train.
- 160. Modal Dispersion:
  - a. (Fiber Optics) The component of pulse spreading caused by differential optical path lengths in a multimode fiber.
- 161. Modem:
  - a. A modulator and demodulator housed in a common assembly.
- 162. Multi-Mode Fiber:
  - a. (Fiber Optics) An optical fiber that will allow more than one mode to propagate. May be either a graded index or step index configuration.
- 163. Multiline Telephone:
  - a. A telephone instrument with the capability of being connected to more than one line.
- 164. Multiplexer (MUX):
  - a. A device which combines several inputs into a single output.
- 165. Muting:
  - a. The action of reducing a sound level.
- 166. NEMA:
  - a. National Electrical Manufacturers Association  
1300 North 17<sup>th</sup> Street  
Suite 1847  
Rosslyn, Virginia 22209
- 167. Noise:
  - a. Any undesired, interfering signal contained in a communications channel or circuit.
- 168. Noise Weighting:
  - a. An amplitude-frequency characteristic of a noise measuring set. C-Message weighting is so designed as to give numerical readings which approximate the amount of transmission impairment, due to noise, that an average listener experiences using a specific commonly utilized modern class of telephone subset. "Flat" weighting and other wideband weighting may be utilized to measure noise on data channels. Meters designed to measure ambient noise (environmental) utilize other weighting networks (to obtain readings in dBa, for example).
- 169. Numerical Aperture:
  - a. (Fiber Optics) Measure of light acceptance of an optical fiber.
- 170. OCC:
  - a. Operations Control Center (now in the Jackson Graham Building which was previously designated as the OCC Building - OCCB on some WMATA documentation). The operational center for the WMATA Metrorail and Metrobus systems (includes centralized operations and communications functions). Also known as Central Control and Command Center.

171. OCCS:  
a. Operations Control Center - Security. Usually refers to the consoles in the Security Center for the WMATA system.
172. Off-Hook:  
a. A telephone line condition or the signal indicating that the circuit is in use (i.e., the handset is off its switch-hook).
173. Omni-Directional:  
a. (Antenna) An antenna having essentially non-directional pattern in azimuth but that may have a directional pattern in elevation in many instances.  
b. (Microphone) A microphone, the response of which is essentially independent of the direction of sound input.
174. On-Hook:  
a. A telephone line condition or the signal indicating that the circuit is idle - not in use.
175. On-Site Test:  
a. Test of equipment or system after installation in its operational location.
176. Open:  
a. A break or discontinuity in a circuit which normally passes a current.
177. Optical Fiber:  
a. (Fiber Optics) Any filament or fiber, made of dielectric material, that guides light.
178. Outbound Track:  
a. Track normally used by trains traveling away from Metro Center passenger station in the A, B, C, D, G, and K routes, and away from Gallery Place passenger station in the E, F, and L routes.
179. Override:  
a. A communications trunk feature whereby one call has a greater priority of using a common facility over another call.
180. PABX:  
a. A designation used in the national telephone system to denote a privately owned telephone switching center which operates by the use of dialing (i.e. Private Automatic Branch Exchange). PABXs can be differentiated from KTS systems by their generally more extensive trunk and remote line switching capability, and by the fact that they generally handle 60 or more subscriber lines.
181. PABX Extension:  
a. A telephone instrument connected to a PABX.
182. PAID Area:  
a. Area of passenger station to which the passengers have access after passing through fare gates.
183. Paging-Intercom:  
a. A system which provides for public address type paging and telephone type intercom service.
184. Parity:  
a. Used in digital code formats for self-checking in which the total number of 1s or 0s in an acceptable code is always odd or always even, depending on whether an odd or even parity check is used.
185. Passenger Station:  
a. A location which provides the public access to the WMATA Rail Rapid Transit System (Metrorail System). Provides facilities for payment of fares, train information, entrance and exit of passengers.
186. Phase Modulation (PM):  
a. The process of varying the angle of a carrier from its reference value by an amount proportional to the instantaneous value of a modulating signal.
187. Pin Photodiode:

- a. (Fiber Optics) A diode with a large intrinsic region sandwiched between p-doped and n-doped semiconducting regions. A commonly used detector or receiver in fiber systems.
188. Plug-In Unit:
- a. A communications device so designed that connections to the device may be completed through pins, plugs, jacks, sockets, receptacles or other forms of ready connectors.
189. Portable Radio:
- a. A radio transmitter/receiver designed to be carried by or on a person.
190. Power Distribution Panel:
- a. A facility which provides for the distribution of power circuits and overload protection for those circuits.
191. Power Supply:
- a. A unit for converting power from an ac or dc source into ac or dc power at voltages suitable for supplying power to equipment.
192. Pre-empt:
- a. A communications trunk feature whereby one call takes a common trunk facility away from another call.
193. Primary Cable:
- a. Specifically refers to the normally on-line cable of the dual redundant communications cable facility of the Fiber Optics/Carrier Transmission Systems.
194. Protection Tube:
- a. An expulsion arrestor or glow-discharge cold cathode tube that employs a low-voltage breakdown between two or more electrodes to protect circuits against over-voltage.
195. Pulse Dispersion:
- a. (Fiber Optics) The separation or spreading of the input characteristics of the optical signal that appears along the length of the optical fiber and limits the useful transmission bandwidth of the fiber. Expressed in time and distance as nanoseconds per kilometer. Three basic mechanisms for dispersion are the material effect, the waveguide effect, and the multimode effect.
196. PT&Z Camera(Pan, Tilt, Zoom):
- a. A television camera with facility for remote control of azimuth, elevation, and zoom.
197. Public Address System:
- a. A system which provides transmission, amplification, and reproduction of speech with high communications band fidelity and sufficient power to make sound simultaneously available, and fully intelligible, to large numbers of people.
198. Pulse Code Modulation (PCM):
- a. A modulation process involving the conversion of a wave form from analog to digital by means of coding. Usually a form of pulse modulation in which a code is used to represent quantized values of instantaneous samples of the signal waves.
199. Push-To-Talk (Operation):
- a. Voice communications on a circuit in one direction at a time requiring activation of a switch prior to and during transmission.
200. Quench:
- a. An action whereby an active circuit is stifled or inhibited.
201. Radio Base Station:
- a. A complete assemblage of equipment for radio transmission and reception including antenna(s) and control devices or interfacing equipment accommodating remote control devices.

202. Rail Rapid Transit System:  
a. The portion of the WMATA transportation system that is a third rail electrified system as distinguished from the motor bus operations.
203. Rapid Battery Charger:  
a. Electrical device used for rapidly charging storage batteries.
204. Redundancy :  
a. The existence in a system of more than one means of accomplishing a given function, for the purpose of increasing security or reliability.
205. Reliability :  
a. The probability of performing a specified function, without failure and within design parameters, for the period of time intended under actual operating conditions.
206. Redundant Cable:  
a. Specifically refers to the secondary cable of the dual cable facility of the Fiber Optic/Carrier Transmission Systems.
207. Reference Transmission Level Point (RTLTP):  
a. In a communications system it is an arbitrarily chosen point to which the levels at all other points in the system are referenced. It is frequently the input to the 2-wire side of the 2-wire/4-wire terminating set at the transmitting end of a telephone channel.
208. Remote Building:  
a. An area or structure (frequently containing support equipment, such as: Fan shafts, chiller plants, substations, and tie breaker stations) generally within or along the WMATA right-of-way, but not part of a passenger station or yard. Remote buildings may also include MRS Two-Way Line Drivers, Fire and/or Intrusions alarm detectors, wayside telephones, etc.
209. Relay Contact Types:  
a. FORM-A: SPNO (Single-Pole, Normally Open) Contact  
b. FORM-B: SPNC (Single-Pole, Normally Closed) Contact  
c. FORM-C: SPDT (Single-Pole, Double-Throw) Contact
210. Remote Terminal Unit (RTU):  
a. A modem installed at each ATC field control location (usually at passenger station TCRs) to act as the interface unit between the Data Transmission System (DTS) and the local ATC and support system functions.
211. Response Message:  
a. Digital message transmitted from base station(s) of the Mobile Radio System to the control console with information in reply to a command message initiated at the control console.
212. Revenue Service:  
a. The transportation of passengers who have paid a fare.
213. Revenue System:  
a. The portion of the METRO System on which revenue service is conducted.
214. Right-of-Way (R.O.W.):  
a. The land or structure surface occupied by the Metrorail Transit System, especially for its mainline. Also, the land or structure surface used by another transportation facility such as a railroad or highway.  
b. The right of traffic on a given route to take precedence.
215. Ringdown:  
a. A method of signaling in which ringing current is transmitted over a circuit to operate a device or circuit to produce a steady signal.
216. Ringing:  
a. The audible or visual signal produced by an alternating or pulsating current to signal a telephone station, central office or other terminating equipment.
217. Root Mean Square (rms):

- a. The square root of the mean of the squares of the sum of instantaneous voltages or currents during a complete cycle.
- 218. Rotary Hunting Group (RHG):
  - a. A group of telephone lines which are accessible under a common calling number and are used sequentially as calls are received.
- 219. Scene Highlight Brightness:
  - a. The amount of illumination which is reflected off an object of interest expressed in foot lamberts.
- 220. Seize:
  - a. In communications signaling terminology, to take control of a connecting circuit.
- 221. Sensitivity:
  - a. The degree to which a component, circuit or system is affected by some condition.
- 222. Sensor:
  - a. A device for detection of a condition or change in condition - such as smoke, temperature, humidity, light level, open circuit, closed circuit.
- 223. Service and Inspection (S&I) Yard:
  - a. Yard which provides for the make-up, cleaning, maintenance, inspection, and repair of trains.
- 224. Shield:
  - a. A housing, screen or other object, usually conductive, that substantially reduces the effect of electric or magnetic fields on one side and upon devices or circuits on the other side.
- 225. Shop Building:
  - a. Building within a Metrorail yard or elsewhere which houses repair facilities.
- 226. Short Circuit:
  - a. An abnormal connection of relatively low resistance between two points of different potential in a circuit.
- 227. Simplex:
  - a. A method of operation in which communications takes place in one direction only.
- 228. Singing Point:
  - a. The point at which the gain is just sufficient to make the circuit break into oscillation.
- 229. Single Mode Fiber:
  - a. (Fiber Optics) An optical fiber in which only the lowest order mode can propagate at the wavelength of interest.
- 230. Slotted Coaxial Cable:
  - a. A coaxial cable with slots cut into the outer conductor, thereby permitting radio frequency radiation into and from the cable.
- 231. Software:
  - a. Computer programs and routines; a collection of related utility, assembly, and other programs that are desirable for proper utilization of a device or equipment; detailed procedures, documents, manuals, drawings, and diagrams relating to a device, equipment or system.
- 232. Solid State:
  - a. A device or system whose operation is dependent upon a combination of optical, electrical or magnetic phenomena occurring within a solid. Functions are performed by semiconductors and wholly static components, i.e., resistors, capacitors, etc.
- 233. Span Section:
  - a. A span section is defined in these Specifications as a transmission segment of the Fiber Optic System or Carrier Transmission System that

- extends from the Control Center to and including the passenger station, yard or other intermediate repeater or terminal of the span.
234. Spare:  
a. Equipment, assemblies or components, complete or in parts, on hand for repair or replacement.
235. Speech-Plus:  
a. Method of operation that permits the simultaneous transmission of speech and telegraph signals over a single voice channel.
236. Sound Pressure Level (SPL):  
a. A measure, in dB, of acoustic loudness, usually designated to be the effective rms sound pressure referenced to 0.0002 dyne per square centimeter.
237. Squelch:  
a. An action whereby a signal is completely cut off, unless a predetermined threshold level is attained.
238. Stationing:  
a. A system for establishing reference points along the Rail System. Civil stationing is used in initial design and development of the Rail Right-Of-Way. Train Control Stationing is later established as a permanent reference for operation of the Rail System.
239. Storage and Inspection Yard:  
a. A Metrorail yard which provides for the make up of trains and for the cleaning and minor maintenance of cars. No major repair facilities are provided.
240. Sub-Ballast:  
a. Crushed rock or stone that is placed between the ballast and the sub-grade.
241. Subscriber Loop:  
a. A circuit that is formed by the subscriber's telephone, the cable pairs and other conductors, and the telephone central office, PABX or other terminating equipment.
242. Substation, Traction Power:  
a. Building housing equipment and facilities for providing electrical energy to the trains via the contact rail.
243. Subway:  
a. That portion of the system which is constructed beneath the ground surface (i.e. underground Metrorail facilities).
244. Supervision:  
a. The process of monitoring the condition of a circuit to determine its status.
245. Supervisory Alarm Subsystem (SAS):  
a. A subsystem of the Technical Control Facility which provides for the transmission of alarm information from a remote terminal in passenger stations and yards to the Control Center.
246. Talkback System:  
a. A system of the yard which provides two-way voice communications between the Yard Communications Console and the track areas.
247. Talk Path:  
a. In a telephone or radio system, the circuit or channel which provides for the transmission of voice signals.
248. Terminal Strip (Board):  
a. An insulating base equipped with terminals for connecting wires.
249. Third Rail:  
a. See contact rail.
250. Tie Breaker Station:

- a. Building housing power switching equipment for the purpose of sectionalizing contact rail power.
- 251. Tone Call:
  - a. A system of exchanging calling or alerting signals and acknowledgment signals between mobile radio units and base stations that utilize modulated tones in the voice band.
- 252. Tone Dialing:
  - a. The transfer of digital information from a telephone instrument to a central office or other terminal device utilizing multi-frequency tones. (Typically by standard DTMF tone signaling)
- 253. Tone Generator:
  - a. A device for providing audio frequency currents suitable for signaling purposes.
- 254. Total Harmonic Distortion (THD):
  - a. A measure of the total effect of the various higher order harmonics of a sinusoidal signal.
- 255. Trackbed:
  - a. The area and material directly under the track which provides support to the track. It includes ties, ballast or other supporting material.
- 256. Train Control Contractor:
  - a. The contractor who has been awarded a contract to provide Automatic Train Control System.
- 257. Train Control Room:
  - a. A room located in a passenger station or at some other strategic point to house wayside ATC equipment including a Remote Terminal Unit. A major wayside control point for the ATC system.
- 258. Trunk:
  - a. A one or two-way channel connecting two telephone central offices, or a central office and an individual terminal.
- 259. Vehicular Radio:
  - a. Radio transmitter/receiver and associated equipment designed to be installed in and operated from vehicles.
- 260. Voltage Standing Wave Ratio (VSWR):
  - a. The ratio of the highest to the lowest voltage of a standing wave at a feed through point.
- 261. Wayside Telephone System:
  - a. A subsystem of the WMATA Telephone System.
- 262. Wet Contact:
  - a. An electrical contact through which direct current flows.
- 263. WMATA:
  - a. Washington Metropolitan Area Transit Authority
- 264. Headquarters Building:
  - a. Jackson Graham Building  
600 Fifth Street, N.W.  
Washington, D.C. 20001
- 265. WMATA Configuration:
  - a. The arrangement of hardware or software, wiring, etc. within the equipment, equipment racks, rooms, or systems utilized by WMATA.
- 266. WOW:
  - a. The slow cyclic deviation of audio signaling power with an approximate period of 0.5 Hz.
- 267. Yard:

- a. A system of Metrorail tracks and buildings within defined limits provided for the make-up of trains, storage of cars, and for cleaning, maintenance, inspection, and repair of trains.
268. Yard Control Room:
- a. The room in the yard which contains the yard train control console.

## SECTION 16702

### COMMUNICATIONS ABBREVIATIONS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION

- A. Article 1.03 COMMUNICATION ABBREVIATION LIST, of this Section lists various abbreviations for terms and organizations and prescribes the meanings for the abbreviations as used in the Communication Specifications. For further definition of the terms abbreviated, see Section 16701, Definition of Communication Terms.

##### 1.02 SECTION INCLUDES

- A. Communication Abbreviation List

##### 1.03 RELATED SECTIONS

- A. All Sections in the 16700 and 16800 series.

##### 1.04 COMMUNICATION ABBREVIATION LIST

<u>Abbreviation</u>	<u>Meaning</u>
AAR	Association of American Railroads 50 F St., N.W. Washington D.C. 20001-1564
AASHTO	American Association of State Highway and Transportation Officials
ACD	Automatic Call Distributor
ac	Alternating Current
AFC	Automatic Fare Collection Automatic Frequency Control
AG	Above Ground
AGC	Automatic Gain Control
AHA	American Hardboard Association
AM	Amplitude Modulation
ANSI	American National Standards Institute, Inc. 1819 L Street, NW Suite 600 Washington, DC 20036

amp	Ampere
APAAS	Automatic Public Address Announcement System
APA	American Plywood Association
APL	Average Peak Level
APD	Avalanche Photodiode
AR	As Required
ASCII	American Standard Code for Information Interchange
ASHRAE	American Society of Heating, Refrigerating and Air-Conditioning Engineers
ASTM	American Society for Testing and Materials 100 Barr Harbor Drive West Conshohocken, Pennsylvania 19428-2959
ATC	Automatic Train Control
AWG	American Wire Gauge
<b><u>B</u></b>	
BCD	Binary Coded Decimal
BER	Bit Error Rate
BG	Below Ground
bps	Bits Per Second
BUS OCC	Metrobus Operation Control Center
BW	Bandwidth
<b><u>C</u></b>	
C	Celsius (Centigrade)
CCITT	International Telegraph and Telephone Consultative Committee
CCS	Hundred Call - Seconds
CTV	Closed Circuit Television (System)
CDF	Combined Distribution Frame
CHP	Chilled Water Plant
cm	Centimeter

CMF	Central Maintenance Facility (building) now FMC
COMM	Communications
CPU	Central Processing Unit
CRT	Cathode Ray Tube
CTS	Carrier Transmission System

### D

DADS	Data Acquisition and Display System
dB	Decibel
dc	Direct Current
DCDPW	District of Columbia, Department of Public Works
DPS	Drainage Pumping Station
DS	Digital Signal
DTMF	Dual Tone Multiple Frequency
DTS	Data Transmission System

### E

ECS	Emergency Communications System
EDADS	Enhanced Data Acquisition and Display System
EE	Emergency Exit
EIA	Electronics Industries Alliance 2500 Wilson Boulevard Arlington, VA 2201
EMS	Emergency Medical Service
EMT	Electrical Metallic Tubing
EPR	Ethylene-Propylene-Rubber
ETS	Emergency Trip Station

### F

F	Fahrenheit
FCC	Federal Communications Commission

FD	Fire Department
FDM	Frequency Division Multiplex
FEP	Fluorinated Ethylene Propylene
FIA	Fire and Intrusion Alarm (System)
Fig	Figure
FM	Frequency Modulation
FMC	Facility Maintenance Center
FMFB	Facilities Maintenance Field Base
FMNT	Facilities Maintenance
FOS	Fiber-Optics System
FRE	Fiberglass Reinforced Epoxy
FREC	Fiberglass Reinforced Epoxy Conduit
FRTS	Fire and Rescue Telephone System
FS	Fan Shaft Federal Specification
FSK	Frequency Shift Keying
ft	Foot, Feet
FVD	Flammable Vapor Detection (System)

### G

GAC	General Architectural Consultant
GCC	General Construction Consultant
GEC	General Engineering Consultant
GMFB	General Maintenance Field Base (building) now FMFB

### H

H	Horizontal
HIB	Halon Interface Box
HVAC	Heating, Ventilation, and Air Conditioning
Hz	Hertz

**I**

IC	Integrated Circuit
ICEA	Insulated Cable Engineers Association PO Box 440 South Yarmouth, Massachusetts 02664
ID	Identification or Identifier
IDF	Intermediate Distribution Frame
IDW	Intrusion Detection and Warning (System)
IEEE	Institute of Electrical and Electronics Engineers, Inc.
ILD	Injection Laser Diode
IMC	Intermediate Metal Conduit
ips	Inches Per Second
IR	Infrared

**J**

JEDEC	Joint Electronic Device Engineering Council
JGB	Jackson Graham Building 600 5th St., N.W. Washington, D.C. 20001

**K**

K	Kelvin
kHz	Kilohertz
km	Kilometer
KTS	Key Telephone System

**L**

LA	Line Applique
LED	Light Emitting Diode
LF	Linear Feet
LOI	Low Oxygen Index

**M**

M&TE	Measuring and Test Equipment
mA	Milliampere
Main PABX	Main PABX (at the JGB)
max	Maximum
MDF	Main Distribution Frame
mF	Microfarad
mFd	Microfarad
MHz	Megahertz
min	Minimum or Minute
mm	Millimeter
MPH	Miles Per Hour
MRS	Mobile Radio System
ms	Millisecond
MTBF	Mean Time Between Failures
MTPD	METRO Transit Police Department
MTTR	Mean Time to Repair
MUX	Multiplexer
mV	Millivolt
mW	Milliwatt
μm	Micrometer
<b><u>N</u></b>	
N	Newton, North
NA	Numerical Aperture
N/A	Not Applicable
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association 1300 North 17 <sup>th</sup> Street Suite 1847 Rosslyn, Virginia 22209

NFPA	National Fire Prevention Association
NIC	Not Included in (this) Contract
NIST	National Institute of Standards and Technology
nm	Nanometer
NRZ	None Return to Zero
NTSC	National Television System Committee

**O**

O&M	Operations and Maintenance
OCC	Operations Control Center
OCCB	Operations Control Center Bus
OCCB	Jackson Graham Building (formerly the Operations Control Center Building or Operations Command Center Building)
OCCS	Operations Control Center Security (Console)
OD	Outside Diameter
OEM	Original Equipment Manufacturer
OTDR	Optical Time Domain Reflectometer

**P**

PA	Public Address (System)
PABX	Private Automatic Branch Exchange
PAM	Pulse Amplitude Modulation
PAS	Public Address System
PC	Printed Circuit
PCM	Pulse Code Modulation
PD	Police Department
PEP	Peak Envelop Power
PERS	Passenger Emergency Reporting System
PERT	Program Evaluation and Review Technique
PIN	Positive-Intrinsic-Negative (refers to solid state structure of device)

PLJ	Primary Local Jurisdiction (Radio System)
PM	Phase Modulation
P/O	Part of
Pr	Pair
psi	Pounds Per Square Inch
p to p	Peak to Peak
PT&Z	Pan, Tilt, and Zoom
PVC	Polyvinylchloride

**Q**

QC	Quality Control
----	-----------------

**R**

RCA	Radio Corporation of America
RCF	Revenue Collection Facility (building)
RCV	Receive
RCVR	Receiver
REA	Rural Electrification Administration
RF	Radio Frequency
RHG	Rotary Hunt Group
RMFB	RAIL Maintenance Field Base
rms	Root Mean Square
ROW	Right-of-Way
RPTR, RPT	Repeater
RTCR	Remote Train Control Room
RTLTP	Reference Transmission Level Point
RTRC	Reinforced Thermosetting Resin Conduit
RTU	Remote Terminal Unit
RZ	Return to Zero

S

S&I	Service and Inspection (Yard)
SAS	Supervisory Alarm Subsystem
SCI	Substantial Completion Inspection
SPABX	Satellite PABX
SEJ	Sewage Ejector
SMADS	Station Monitor and Display System
SP	Sump Pump
SPDT	Single-Pole, Double-Throw Contact
SPL	Sound Pressure Level
SPNO	Single-Pole, Normally Open Contact
SPNC	Single-Pole, Normally Closed Contact
SSHB	Standard Specifications for Highway Bridges

T

TBS	Tie Breaker Station
TC	Train Control
TC/COMM	Train Control/Communications
TCR	Train Control Room
TDM	Time Division Multiplex
TDR	Time Domain Reflectometry
THD	Total Harmonic Distortion
TPSS	Traction Power Substation
TS,TEL	Telephone System
TV	Television
TX	Transmit

U

UHF	Ultra High Frequency
-----	----------------------

UL Underwriters Laboratories  
UPS Uninterruptible Power Supply

**V**

V Vertical  
Vac Volts, Alternating Current  
Vdc Volts, Direct Current  
Vpp Volts, Peak to Peak  
VS Vent Shaft  
VSWR Voltage Standing Wave Ratio

**W**

WDM Wavelength Division Multiplex  
WMATA Washington Metropolitan Area Transit Authority (METRO).  
Also referred to as: "the Authority"  
600 Fifth St., N.W.  
Washington, D.C. 20001

**X**

X Transmit  
XLPE Cross-Linked Polyethylene  
XMT Transmit  
XMIT Transmit  
XMTR Transmitter

## SECTION 16703

### COMMUNICATIONS STANDARD SPECIFICATIONS - ENGINEERING SERVICES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION OF ENGINEERING SERVICES

- A. The Contractor is required, under WMATA Communications Systems Specifications, to design, furnish, install, test, and document communications systems that conform to WMATA operational, performance and other requirements outlined therein. Standard Specifications apply where more specific requirements are not included in other (specific systems) specifications.

##### 1.02 SECTION INCLUDES

- A. Standard Specifications for Contractor-furnished engineering services. These Specifications apply to all engineering services and to all equipment furnished unless otherwise specified elsewhere in this Contract (i.e. conflicting Specification requirements found in other Specification sections or on Contract Drawings take precedence over Standard Specifications in this section).

##### 1.03 UNIT PRICES

- A. Unit Prices include all Required Contractor furnished engineering services for the communications systems and facilities and incidental items, not specifically mentioned, but required for complete and proper system operation.

##### 1.04 RELATED SECTIONS

- A. Section 16706 - Communications System Submittals & Services
- B. Section 16710 - Communications Grounding.
- C. Section 16721 - Communications Telephone System.
- D. Section 16723 - Communications Garage Emergency Telephone System.
- E. Section 16727 - Communications Passenger Emergency Reporting System.
- F. Section 16731 - Communications Fire and Intrusion Alarm System.
- G. Section 16733 - Communications Kiosk System.
- H. Section 16771 - Communications Carrier Transmission System.
- I. Section 16776 - Communications Fiber Optics System.
- J. Section 16791 - Communications Mobile Radio System.
- K. Section 16820 - Communications Public Address System.
- L. Section 16821 - Communications Automatic Public Address Announcement System.

- M. Section 16851 - Communications Passenger Station Closed Circuit Television System.
- N. Section 16852 -Communications Parking Garage Closed Circuit Television System

#### **1.05 REFERENCES**

- A. Federal Communications Commission (FCC) (Specifically Parts 15, 90 and other applicable regulations).
- B. National Electrical Code. (NEC).
- C. Underwriters Laboratories.(UL).
- D. American National Standards Institute.(ANSI).
- E. Rural Electrification Administration.(REA).
- F. Insulated Cable Engineers Association.(ICEA)
- G. Electronic Industries Alliance (EIA).
- H. National Electrical Manufacturers Association.(NEMA).
- I. Institute of Electrical and Electronic Engineers , Inc. (IEEE).
- J. Association of American Railroads.(AAR).
- K. WMATA General Provisions and Standards Specifications for Construction Projects.

#### **1.06 SUBMITTALS**

- A. Submit under provisions of Section 16706.

#### **1.07 ENVIRONMENTAL**

- A. The communications system/facility shall be such that, when operating within the specified environmental limits, the maximum temperature attained by any component shall be lower than that which will adversely affect the life or performance of equipment.
- B. Unless otherwise specified, equipment shall be fully operable without damage or functional degradation under any combination of the following:
  - 1. Ambient Temperature -18EC to 55EC.
  - 2. Relative Humidity 0 percent to 95 percent.(This requirement does not apply to equipment installed at the Jackson Graham Building).
- C. Permanently mounted equipment, exclusive of the equipment installed and operated in the Jackson Graham Building, shall be so constructed or installed that it will remain fully operative while being vibrated with simple harmonic motion having an amplitude of 0.005 inch (total excursion of 0.01 inch), with the frequency varied uniformly from 10 cycles to 55 cycles per second for a period of 30 minutes in each of three mutually perpendicular planes.
- D. All moving contacts (including relay contacts, jack contacts, switch contacts) shall be protected from dust.

- E. Equipment panels shall be furnished with dust covers. Proper internal air flow shall be provided when dust covers are in position during operation of the equipment.
- F. Unused mounting spaces in equipment racks, equipment cabinets, Kiosk cabinetry and consoles shall be provided with blank panels which are consistent with the arrangement of the assembly.
- G. The circuitry of Kiosk equipment panels, yard console equipment panels, and other custom-developed equipment shall be completely enclosed to protect against moisture and dust.
- H. Each system, facility, and subsystem element will generally be operated in the unfavorable electrical environment of a Rail Rapid Transit System characterized by heavy direct-current and chopper-controlled pulsating direct-current propulsion equipment, which will cause electrostatic, electromagnetic, and radiated interference. Suitable effective engineering techniques and installation practices shall be incorporated to eliminate the effects of such interference on the performance of the systems, equipment, and devices furnished or installed by the Contractor, and those provided by others for use within or outside of the Metrorail System.
- A. Some sources of interference are: 60 Hz ac system, dc traction power system, propulsion power contact shoe and third rail arcing, rotating machinery, lightning discharges and high energy level, chopper-controlled propulsion systems. The arcing between the transit car contact shoe and the third rail which is supplying up to 780 volts dc is a major source of electrical noise. The noise spectrum includes harmonics which vary in amplitude with the change in loading of the section. Relatively high amplitude noise impulses occur throughout the spectrum.

#### **1.08 INTERCHANGEABILITY**

- A. Standard commercial products shall be furnished whenever such equipment and materials will satisfy the stated Specifications. Suitable modified standard commercial devices shall be furnished when required to satisfy Specification requirements. Custom developed and fabricated equipment units and devices shall be confined to those items for which suitable off-the-shelf commercial products are not available to guarantee compliance with the Specifications. When custom design, fabrication, or assembly is required, every effort shall be made to minimize the number of different modules, solid-state devices, etc. used.
- B. With each system, subsystem and facility, two or more like functions shall be performed by identical units. In no case shall the equipment or hardware used in one portion of a system, subsystem or facility be different from that used in another portion to perform the same function under similar operating and environmental conditions.
- C. Insofar as possible equipment shall be physically and plug compatible with recent versions of existing Authority equipment performing similar functions and used for comparable applications elsewhere in similar WMATA facilities. The use of adapter plugs, interface boxes, and replacement mounting brackets or enclosures that fit available space and mounting holes may be allowed by the Engineer to maintain interchangeability, when competitive products that do not require such devices are determined to be unavailable (applicable to off-the-shelf major equipment items only). Custom designed and custom fabricated equipment must be fully interchangeable without requiring the use of such devices. If a determination is made to allow use of such devices, the Contractor shall provide all necessary adapters and interface devices with each item of equipment furnished, at no additional cost to the Authority.

- D. Major items of equipment furnished by the Contractor shall be within the physical size and configuration limitations specified in provisions of this Contract. If such specifications are not included in the provisions of this Contract, major items of equipment shall be of a physical size and configuration closely comparable to equipment currently in use for comparable applications elsewhere in similar WMATA facilities.
- E. Exception: Lighter weight and smaller sized, more modern versions of equipment are sought by the Authority where their use presents significant advantages. The use of new generations of equipment that differ in size and are not fully interchangeable will be considered for approval by the Engineer, in order to take advantage of significant technological improvements developed by industry.

#### **1.09 MAINTAINABILITY AND RELIABILITY**

- A. The physical and mechanical configurations of equipment and rack assemblies shall give a high priority to the ease with which units may be inspected and removed.
- B. Except as otherwise specified, rack mounted equipment shall be mounted on standard equipment racks or in standard equipment cabinets. Each rack and cabinet configuration shall present a neat and orderly appearance and shall be uniform for like systems/facilities at all Communications Equipment Rooms.
- C. Equipment units or subassemblies shall be easily removable from rack, cabinet, or equipment cases without the need to disturb unit rack/cabinet/case wiring.
- D. Equipment units shall utilize plug-in printed circuit cards or plug-in assemblies whenever the quantity, equipment, size and weight of the components lend themselves to this technique
- E. Printed circuit cards in rack mounting equipment units shall plug into either card files or card drawers, whenever feasible and practical.
- F. Printed circuit cards shall be keyed to prevent incorrect interchange of cards. However, cards performing a given function in a subsystem or subsystem element shall be interchangeable with cards of another subsystem element performing the same function whenever practical.
- G. The replacement of a printed circuit card plug-in subassembly, or component by a new unit shall not require compensating adjustments of devices other than the circuit card or component replaced.
- H. Equipment and installation engineering services and designs shall incorporate accepted industry standards and good engineering practices selected to enhance maintainability and reliability.
- I. Test points shall be provided for printed circuit cards to permit detection of a failure without removal of wiring. Go/No-Go techniques shall be used to localize failures where possible. Card extenders may be used for this purpose.
- J. Test points shall be readily accessible and clearly designated, and shall be capable of accepting probes and connectors furnished with standard test equipment. All testing shall be performed at the front of racks whenever practical.
- K. Appropriate equipment, electrical test points, fuses, and adjustment controls shall be available at the front panel.

- L. Equipment units shall be of ample capacity and of proper arrangement to perform the functions specified, under the conditions specified, and shall operate in accordance with the specified reliability criteria.

**1.10 CUSTOM DEVELOPED AND CONTRACTOR MODIFIED OFF-THE-SHELF EQUIPMENT**

- A. The construction, panel and chassis layouts, circuit arrangements, components, graphics, and component layouts of custom-developed equipment shall be approved by the Engineer. Drawings detailing all aspects of the developed equipment shall be submitted for preliminary review and comment. The submitted drawings shall include details of the required external connections. After incorporating the comments and obtaining acceptance by the Engineer, the Contractor shall fabricate prototypes of the custom-developed equipment (one for each custom-developed item) in accordance with the approved configurations. The prototypes shall be submitted for evaluation, inspection, testing, and acceptance or rejection by the Authority. Production models shall not be manufactured until the acceptance of the corresponding prototype by the Engineer (including incorporating any additional comments). Only production models shall be furnished to fulfill the requirements of these Specifications.
- B. Contractor modified "off-the-shelf" commercial product major items shall be subject to the same review, and all prototype requirements specified above for custom developed equipment, except as otherwise directed by the Engineer. Relief from these requirements will be considered in instances where only minor modifications are proposed.
- C. At the discretion of the Engineer, equipment developed and manufactured specifically to fulfill a WMATA requirement, although considered by the manufacturer as "off-the-shelf," shall be considered as developed equipment and shall comply with the requirements specified herein.

**PART 2 - PRODUCTS**

**NOT USED**

**PART 3 - EXECUTION**

**NOT USED**

**END OF SECTION**

## SECTION 16704

### COMMUNICATIONS STANDARD SPECIFICATIONS - INSTALLATION

#### PART 1 -GENERAL

##### 1.01 SECTION INCLUDES

- A. Standard Specifications for Contractor-furnished installation services. These Specifications apply to all Contractor installation services, unless otherwise specified elsewhere in this Contract (i.e. conflicting Specification requirements found in other Specification sections, or on Contract Drawings take precedence over Standard Specifications in this section). Unless otherwise specified, communications, electronics and electrical installations shall be governed by the provisions of the "National Electrical Code, Standard of the National Board of Fire Underwriters for Electrical Wiring and Apparatus." All provisions of this code must be considered applicable, whether specifically mentioned in the body of these Specifications or not. In no case shall the installation in one portion of the system be different from the installation in other portions for similar configurations under similar operating and environmental conditions, unless specified.

##### 1.02 UNIT PRICES

- A. Unit Prices include all Required Contractor furnished installation services for the communications systems and facilities and incidental items, not specifically mentioned, but required for complete and proper system operation.

##### 1.03 RELATED SECTIONS

- A. Section 16706 - Communications System Submittals & Services
- B. Section 16710 -Communications Grounding.
- C. Section 16721 -Communications Telephone System.
- D. Section 16723 -Communications Garage Emergency Telephone System.
- E. Section 16727 -Communications Passenger Emergency Reporting System.
- F. Section 16731 -Communications Fire and Intrusion Alarm System.
- G. Section 16733 -Communications Kiosk System.
- H. Section 16771 -Communications Carrier Transmission System.
- I. Section 16776 -Communications Fiber Optics System.
- J. Section 16791 -Communications Mobile Radio System.
- K. Section 16820 -Communications Public Address System.
- L. Section 16821 -Communications Automatic Public Address Announcement System.
- M. Section 16851 -Communications Passenger Station Closed Circuit Television System.

- N. Section 16852 -Communications Parking Garage Closed Circuit Television System

#### **1.04 REFERENCES**

- K. WMATA General Provisions and Standards Specifications for Construction Projects.

#### **1.05 SUBMITTALS**

- A. Submit under provisions of Section 16706.

#### **1.06 CONDUIT PLANT**

- A. Unless otherwise specified, all wiring in structures and tunnels that is external to equipment enclosures and racks, shall be installed in suitable Intermediate Metal Conduit (IMC), or shall be installed in existing cable tray, underfloor duct, or racked to existing channel inserts on tunnel walls, if space is available and assigned by the Engineer. All conduit and cable installations shall be subject to the approval of the Engineer.
- B. Available embedded conduit will be assigned for use by the Contractor when not reserved for other requirements. Conduit cleaning, the construction of conduit extensions or rearrangements, cable rerouting, and the construction of conduit plant to enclose all remaining wiring shall be furnished by the Contractor. Surface conduit construction shall not be permitted in most public areas of stations or in a few other places. Core boring of structures may be required to obtain means of passage during conduit plant construction.
- C. Inside diameters of conduit shall be determined by the Contractor, based on the NEC, using the appropriate fill factors for the class of service and number and size of conductors. The proposed conduit sizes shall be submitted to the Engineer for approval. Conduits smaller than 0.75 inch shall not be used.
- D. All exposed conduit runs shall be installed parallel to walls, floors and ceilings, whenever possible, except where pitch is required for proper drainage. Conduits shall be rigidly

supported at intervals not to exceed eight feet. Standard one-hole, malleable iron galvanized pipe straps of the proper size shall be used for single conduit runs on concrete surfaces. Where conduits are supported on concrete surfaces, machine-bolt type expansion shields and bolts of the proper size shall be used. All screws, bolts and fittings for conduit supports shall be galvanized or cadmium plated. Stainless steel 304 conduit spacers shall be used for conduits running on flat surfaces. Standard conduit elbows or field bends are permitted; they shall not be less than the minimum radius, as required by the NEC, .

- E. Conduits shall be connected to equipment metal enclosures using two locknuts and a bushing, except where conduit hubs are provided. Where enclosures, fittings with openings, or boxes of any type are installed in locations determined by the Authority to be subject to moisture, watertight conduit fittings shall be used. Watertight covers with seals shall be provided, and approved sealant applied to openings to effectively prevent the entry of moisture.
- F. All conduit entering Communications Equipment Rooms of passenger stations and yards shall be covered and sealed. Watertight conduit and cable seals shall be used where the building or structure penetration is at a lower elevation than the manhole or below the water table. Details are furnished in the Information Drawings.
- G. All terminal ends of conduits shall be provided with insulated metallic bushings.
- H. Whenever a conduit or exposed cable enters or leaves a box, it shall be permanently tagged, external to the box, with a plastic tag approved by the Engineer. The tags shall be permanently stenciled with a number which shall identify the conduit or cable with an assigned circuit.
- I. All conduits installed shall be free of burrs and other sharp edges throughout the entire length. Conduit fittings or boxes shall be installed in conduit runs, where required, to limit the number of bends to a maximum of three 90-degree bends or equal. All conduits used shall be thoroughly cleared by pulling through a mandrel tool, and shall be blown clean by forcing compressed air through the run before wires or cables are pulled.

#### **1.07 CUTTING AND PATCHING**

- A. All necessary cutting and patching of existing construction shall be provided by the Contractor for the installation of the equipment and cables.
- B. All cuttings shall be of the appropriate required sizes and shapes for the materials, cables and equipment to be installed. All cuttings shall be performed using the appropriate type of tools and equipment for the corresponding surfaces and material. The locations, sizes, shapes, and methods of performance for all cuttings shall be subject to approval by the Authority.
- C. All patching shall match existing adjacent construction to the satisfaction of the Authority, using the best possible workmanship of the various trades involved. All required material, compounds, sealants and hardware for all patching shall be provided. Fire wall integrity shall be maintained in appropriate construction.
- D. Services shall be provided by the Contractor for the removal and reinstallation of all necessary existing items (i.e., platform tiles, manhole covers) to accomplish the installations. Replacement shall be provided for any removed items that are damaged or missing during the performance of work, at no additional cost to the Authority. Replacements shall be identical in manufacture and type to the damaged or missing items.

- E. All existing items and construction (i.e., platform tiles, plenums, ceilings, floors, lighting fixtures, junction boxes, structures, and finishes) that are damaged, changed, or modified in the performance of work shall be restored to their original condition and/or surfaces. Appropriate required material, hardware, paints, finishes, and compounds shall be provided. Any items that are damaged, which are determined to be unrepairable, are to be replaced at no additional cost to the Authority. Replacements shall be identical in manufacture and type to the damaged items.

#### **1.08 JUNCTION BOXES**

- A. Junction boxes shall be furnished and installed for terminating cable runs and for pulling of cables. Boxes provided in conduit runs, to minimize the number of 90-degree bends in a run, shall be considered junction boxes, although used only for the pulling of cable.
- B. All boxes shall be mounted plumb and level and shall be rigidly anchored to the supporting surface. Machine bolt type expansion anchors shall be used to fasten boxes to concrete surfaces where inserts are not otherwise provided. In no case shall bolts of less than 0.25-inch diameter be used. Stainless steel spacers shall be used on bolts to provide a 0.25-inch air space between boxes and mounting surfaces.
- C. All boxes shall have a number stenciled on the cover. Numbers shall identify the service of the circuits in the box, as approved by the Engineer.

#### **1.09 CABLE TRAYS**

- A. Unless otherwise specified, cable tray construction shall be allowed only in Communications Equipment Rooms and other equipment rooms assigned for the installation of significant quantities of communications-related equipment. Tray supports shall be located on eight-foot centers, maximum, and shall be subject to the approval of the Engineer. Sufficient supports shall be provided to keep the loaded cable tray deflection to 0.25 inch maximum at mid-span. Tray supports and trays shall be mounted plumb and level.
- B. Tray supports, angle iron, or prefabricated channels shall be anchored to ceilings or walls by machine-bolt type expansion anchors and 0.5-inch minimum diameter bolts. Where cable tray fittings occur in a run, trays shall be supported immediately adjacent to, and on both sides of, the fittings.
- C. Trays shall be bolted to support members. Precautions shall be taken to prevent anchoring bolts from damaging cables placed in the trays.
- D. Cable tray fill shall not exceed 75 percent of the cross-sectional area of the tray, assuming an area of each cable to be equal to the square of the cable diameter.

#### **1.10 EQUIPMENT MOUNTING**

- A. Unless otherwise specified, equipment shall be anchored to the concrete walls, floors, or ceilings by machine-bolt type expansion shields and 0.5-inch minimum diameter bolts. The number of bolts shall be adequate to provide a rigid and safe support. Where required, concrete bases or pedestals shall be provided by the Contractor with anchor bolts cast in place for the mounting of equipment. All equipment shall be mounted plumb and level.

#### **1.11 PAINTING**

- A. All painted areas damaged in route to, or at the installation site, shall be repainted with matching colors by the Contractor. The surfaces of equipment and material not accessible after mounting shall be painted prior to installation.

#### **1.12 WIRE AND CABLE**

- A. Powdered soapstone or other suitable lubricating medium non-injurious to insulation shall be used, if required, when pulling wires or cables in conduits or ducts.
- B. Each conduit, duct and pipe shall be cleaned before installing cables therein. The conduits, ducts and pipes shall be maintained in a clean and dry condition during the installation process up to and including the time which each conduit, duct, and pipe is sealed
- C. Wires shall not cross one another when they are pulled into a conduit nor shall the conductors be pulled tight or kinked in conduit fittings or boxes.
- D. Cables shall be laid, not pulled, into trays or in troughs provided by others. Cables shall be installed with a minimum amount of crossover in the trays and troughs and shall not be placed tightly around bends. Where cables enter or leave trays via conduits, such conduits shall be rigidly affixed and supported at their ends by suitable brackets and conduit straps from the sides of the trays.
- E. Wires and cables shall be permanently tagged with plastic tags at each entry to and exit from all equipment terminal blocks. Tags shall be permanently marked to identify the system in which the wire or cable is used. Tags and markings shall be subject to the approval of the Engineer.
- F. All cable pairs, including spares, shall be terminated on connectors, protectors, or line terminating blocks on the MDF.
- G. Solder with a minimum of 60 percent tin and 40 percent lead with non-corrosive flux shall be used in soldering wires and cables.
- H. The Contractor shall seal all openings through which cable, conduit and cable trays pass. The material used to seal the openings shall be furnished and installed by the Contractor. It shall be a fire retardant, non-toxic material and shall comply with the local fire prevention code.
- I. All exposed wires and cables entering or leaving equipment housing or junction boxes shall be protected from abrasion by sharp metallic edges. Chase nipples shall be provided in openings having conduit hubs. Chase nipples and locknuts shall be provided in drilled or punched openings.
- J. The Contractor shall seal all openings in equipment enclosures and junction boxes where exposed cables enter the enclosure or box. A pliable sealing compound made expressly for the purpose shall be furnished and installed after the cables are in place.
- K. Nylon straps shall be furnished and installed for bundling and cabling of conductors where two or more single conductors of the same circuit are run exposed in cable trays or in cable troughs. Straps shall be installed approximately every five (5) feet along the cable run. Wires of multi-conductor cables exposed by the stripping of the cable jacket for termination shall be trimmed in a neat, workmanlike manner and tied approximately every three inches with nylon straps. Care shall be taken in terminating or splicing cable. Removal of insulation shall be done in a manner which does not nick the conductor material. In no case shall the conductor be kinked or bent at sharp angles. Smooth bends shall be utilized.

- L. Appropriate exposed cables entering or leaving equipment enclosures and junction boxes shall be protected from abrasion by sharp metallic edges. Chase nipples shall be provided in openings having conduit hubs. Chase nipples and locknuts shall be provided in drilled or punched openings.
- M. All cables and wires installed in environmental air plenums, cable vaults, and under passenger station platforms shall be placed in appropriately sized electrical metallic tubing (EMT) unless otherwise specified.
- N. Appropriate channel inserts, arms and insulators shall be provided to support cables in the manholes of the duct bank.
- O. Dewatering and removal of all dirt and trash from trenches, manholes, pull chambers, cable troughs, surface trenches, conduit and duct banks shall be provided prior to, and maintained during, the installation of cables.
- P. Cables shall be permanently tagged with plastic tags at each entry to and exit from all junction boxes, cable trays, cable ladders, equipment enclosures, conduits, ducts and pipe. Appropriate identification shall be permanently marked on each tag. These plastic tags shall be provided in two forms: Sleeve and flat. The sleeve form shall be of the heat shrinkable type and shall be properly sized to fit the cable for which it is intended. The sleeve form type may be used on cables with an outer diameter of 1/2 inch or less. The flat form type shall be made of flat sheet stock with slots for installation with nylon tie-wrap fasteners. The markings on the tags shall be provided in a color that will contrast sharply with the color of the associated tags. The plastic tags shall be properly installed.
- Q. Low-smoke, low-toxicity (not PVC) plenum rated wire and cable shall be utilized throughout installations of equipment in the Jackson Graham Building Communications Equipment Room (i.e., for cables extending outside of equipment enclosures, for inside plant cables extending to other rooms and floors, but not for outside plant cables extending to areas outside of the building), unless otherwise specified. Exceptions may be allowed by the Engineer when such plenum rated cable is not commercially obtainable only from equipment manufacturers, and when appropriate to avoid potential electrical signal mismatching, or to otherwise improve system performance or reliability.

### **1.13 DIRECT FIXATION IN TUNNEL AREAS**

- A. Unless otherwise directed, cables shall be installed along the tunnel walls in an organized fashion within the area allotted for communications cables. Cable crosses shall be kept to a minimum.
- B. Channel inserts have been provided by others, mounted on approximately four-foot centers, in the tunnel walls. Stainless steel type fasteners or mounting devices shall be provided to secure the cables to the channel inserts. Cables shall be individually mounted to the channel inserts. Cable shall be secured to each channel insert. The fasteners or mounting devices shall be properly sized to the cable, or shall be adjustable to the proper size to support the cable without undue compression. Prior to cable installation, the channel inserts shall be cleaned and foreign material shall be removed, where necessary.
- C. Unless otherwise specified, cables shall be installed on the channel inserts in the space allocated for communications cables.
- D. In those areas where the specified locations for cables within the tunnels do not coincide with the channel inserts provided by others, or when channel inserts are not available for communications cables, and as necessary to secure MRS antennas, and other cables,

appropriate type cable ladder with hardware, cement anchors, fasteners, and mounting devices, shall be provided to secure cables to the tunnel structure. Appropriate type cement anchors, fasteners, and mounting devices, shall also be provided to secure cables to the tunnel structure when routed to equipment, equipment housings, junction boxes, terminals, and conduits.

- E. Sufficient slack shall be provided in the cables between fasteners and mounting devices to allow for expansion and contraction of the cables without damage to the cables or the fasteners and mounting devices.
- F. The Authority is installing Tunnel Ventilation Barriers in the tunnels between passenger stations in the vicinity of some fan shafts. The Contractor shall install communications cables running along the tunnel walls through the cable openings that are provided in the Tunnel Ventilation Barrier structures. Openings are either provided on the side near the cable runs or at the top near the ceiling area of the tunnel.

#### **1.14 CABLE TROUGHS ALONG THE TRACK RIGHTS-OF-WAY**

- A. Cable troughs along the track rights-of-way are utilized for the installation of Communications cables, Automatic Train Control cables and Traction Power Substation (TPSS) control cables.
- B. A vertical metal divider has been installed throughout most of the length of the track right-of-way cable troughs to separate the TPSS control cables from the Automatic Train Control and Communications cables. In some locations, the metal divider has been omitted in favor of a small TPSS-control-cable trough mounted within the regular cable troughs.
- C. The following conditions and potential problems with the track rights-of-way cable troughs are noted:
  - 1. The covers for the cable troughs may not be of uniform length of drilling, i.e., each cover section should be regarded as unique to that particular section of trough.
  - 2. The pressure of ballast on the outside of all metallic constructed cable troughs may cause the outer side to deflect somewhat when the top covers are removed, a condition which may interfere with reinstallation of the trough covers.
  - 3. The covers are not watertight.
- D. The following required installation services shall be provided by the Contractor when installing cables in the track rights-of-way cable troughs:
  - 1. Removal of snow, ice, dirt and debris from the metal trough covers to obtain access.
  - 2. Removal of all the metal trough covers.
  - 3. Removal of fluids, snow, ice, dirt and debris from the troughs.
  - 4. Protection of all cables already installed in the cable troughs.
  - 5. Provision for access to conduits entering the cable troughs (possibility of shifting already installed cables).
  - 6. Proper reinstallation of the trough covers when cable installation is completed.

#### **1.15 FIBER-OPTIC COMMUNICATION CABLE**

- A. Splicing of single mode fiber-optic communications cable is authorized only at designated cable terminal locations and in Communications Equipment Rooms (splicing trays or enclosures) at passenger stations and transit yards, and in other approved locations, only when essential to join the ends of one or more standard or larger sized full reels of cable together with one partial reel of cable. Only low loss (0.20 dB or less) fusion type splicing and splicing to factory installed pigtailed connectors will be authorized. Approval of the

exact location and methods utilized to make and protect each splice shall be obtained from the Engineer prior to commencing field work.

#### **1.16 COPPER INSIDE PLANT CABLE**

- A. Splicing is not authorized in cables within the passenger station limits, or within ancillary structures, garages, parking lots, and transit yard S&I Shop and Operations Buildings.

#### **1.17 COAXIAL, TRIAXIAL AND SPECIAL PURPOSE CABLE**

- A. Splicing is not authorized in coaxial and triaxial cables, or in cable or cable harnesses designated by equipment manufacturers or the Engineer as "special purpose cable." Properly installed and protected connectors shall be used in lieu of splicing.

#### **1.18 COPPER OUTSIDE PLANT CABLE**

- A. Outside plant cables extending beyond passenger station limits shall be free of splices, unless approval for splicing is obtained from the Engineer. Approval may be granted for splice(s) in cable runs or CTS cable spans, only if the following conditions exist:
- B. No more than one splice in each individual cable run (or individual CTS cable span) shall be authorized except where deemed necessary to join two or more standard sized full reels plus one partial reel of cable together to make up the required length for an individual cable run (or individual CTS cable span) which extends between two cable end terminations.
- C. Exception:
  - 1. Splicing of multi-pair copper CTS cables shall not be allowed within 400 feet of either end of the span.

#### **1.19 SPLICE CASE TYPES**

- A. Highly durable, watertight splice cases shall be furnished and installed in accordance with the manufacturer's instructions, when splicing is authorized. Filled splice cases shall be utilized when splicing filled cable (REA PE-39 telephone and CTS cable, for example).

#### **1.20 SPLICE CASE (AND FIBER-OPTIC CONNECTOR) TECHNICAL SPECIFICATIONS**

- A. Splice case (and fiber-optic connector) technical specifications and samples must be submitted to the Engineer for review and approval prior to installation.

#### **1.21 SPLICE CASE PHYSICAL PROTECTION**

- A. Splice cases must be protected from physical damage and must be accessible (i.e. in manholes, hand-holes, cable troughs, terminal or junction boxes, or other protected locations readily accessible for maintenance purposes.) Splices shall not be placed in conduit.

#### **1.22 MAINTENANCE OF FIBER-OPTIC AND COPPER CONDUCTOR IDENTIFICATION**

- A. When multi-conductor copper or fiber-optic cables are spliced, the same color code, number and group identification shall be maintained throughout the entire cable run. Conductors and individual fibers shall be clearly identified at both end terminals (or cable ends - if not terminated).

### **1.23 SIGNAL ATTENUATION, CONTINUITY, CROSSTALK AND GROUNDING**

- A. Splicing shall be accomplished in such a manner that optical or electrical signal attenuation, discontinuities, or cross-talk, do not appreciably increase as a result of such splicing. Cable shields, armor, and all other metallic elements shall be bonded across splices with copper straps and clamps or other approved hardware, to maintain electrical continuity with less than 0.2 ohm increase in resistance. Grounding for electrical protection shall be accomplished as specified or as approved by the Engineer (or, if not specified or detailed in the Engineer's approval, in accordance with applicable NEC provisions).

### **1.24 AS-BUILT RECORD DRAWING REQUIREMENTS**

- A. The Contractor shall clearly indicate the location, size, and type of all splices and terminals on As-Built Record Drawings.

### **1.25 EQUIPMENT ENCLOSURES AND JUNCTION BOXES**

- A. All equipment enclosures and junction boxes shall be mounted plumb and level, and shall be rigidly anchored to the supporting surface. Appropriate type expansion anchors and bolts shall be used to fasten the enclosures and boxes to support surfaces. An adequate number of bolts of the proper diameter with lock washers shall be used, but in no case shall bolts of less than 0.25 inch diameter be used. Stainless steel 304 spacers shall be used on bolts to provide a 0.25-inch air space between all enclosures/boxes and mounting surfaces.
- B. Where equipment enclosures and junction boxes are to be mounted on walls of material other than concrete, the method of mounting and the hardware to be used shall be approved by the Authority.
- C. All junction boxes and equipment enclosures shall have a unique identification stenciled on one exposed accessible surface and on the exterior of the cover. The painted stencil markings shall be applied with a procedure that produces clear, legible letters/numbers without voids and without paint running between the stencil and the surface being marked. The marking paint shall provide a definite contrast with the surface on which it is applied.

### **1.26 BURIED CABLES**

- A. When direct burial of cable is specified, the following shall apply:
  - 1. Only cable and wire specified by the manufacturer to be for direct burial shall be buried.
  - 2. Cable shall be buried not less than 42 inches below grade and shall be below the frost line. The cable trench shall have a minimum width of 12 inches or three times the cable diameter, whichever is greater. The trench floor shall be free of rock, roots and debris, and shall provide a smooth bed for the cable. A minimum of four inches of sand shall be placed on the trench floor. The cable shall be placed in the trench, on the top of the sand, with slack and without kinks or bends. The cable shall be covered with four inches of sand before backfilling. If the trench spoil is used for backfill, it shall be free of rock, stone and debris. The backfill shall be compacted and leveled at specified grade. At no time shall a communications cable or wire be buried within 12 inches of a power conductor.
  - 3. The Contractor shall provide all shoring required. The Contractor shall mark the cable trench for future location and identification.

4. No digging below the ties within the trackbed shall be permitted. The trackbed is defined as the area along the track extending one foot beyond the end of each track tie.
5. When it is necessary to drive conduit under the trackbed, Authority approval shall be obtained for each case prior to commencement of work. The request for approval shall include details on the type of conduit, depth below surface and method.
6. All wires and cables shall be tested after installation as detailed in Table 3.22-1 and other applicable specification provisions. Installation Completion Tests shall verify that cable shields and armor are bonded across each splice or junction box authorized (if any), and that twisted pairs maintain their identity and continuity end-to-end without crosses, shorts, opens, transpositions or splits. Insulation resistance tests shall be made either with an insulation resistance test set or a dc megohm meter utilizing a test voltage of 250 Vdc or greater, and shall be made in the presence of the Engineer's representative.

#### **1.27 SPECIAL REQUIREMENTS FOR STAINLESS STEEL CORROSION RESISTANT HARDWARE**

- A. Except as otherwise specified, equipment enclosures, cabinets, boxes and hardware of all types in tunnels, tunnel crossovers, along the surface rights-of-way, and in all ancillary structures that are open to tunnels (vent shafts, fan shafts, pumping stations, etc. - excluding rooms within these areas that are heated/air conditioned) shall consist of stainless steel 304 material. Also, except as otherwise specified, equipment enclosures, cabinets, boxes and hardware of all types; in platform plenums (and including track side walls and under-platform slab and extensions into service rooms); along station train room safety walks, in stairways, corridors, and plenums that are not heated/air conditioned; and in all shafts to the surface and dome reliefs, escalator well ways, elevator pits and surface elevator shafts, shall consist of stainless steel 304 material.
- B. Exception: Galvanized conduit may be used with stainless steel 304 mounting hardware. Electronic equipment connectors, and other relatively small sized specialty items that are not available in Stainless Steel 304 material may be allowed by the Engineer as exceptions (Ref. Article 3.1 Request for Approval Of Minor Technical Specification Deviation).
- C. Unless otherwise specified, stainless steel equipment enclosures, cabinets, and boxes with dull gray colored epoxy paint applied shall be utilized in areas where surface glare may be visible to rail car operators, to avoid glare.
- D. Definitions: "Hardware" includes bolts, screws, clamping devices, anchoring devices, threaded rods, nuts, washers, hangers, covers/wall plates etc. "Boxes" includes junction boxes, outlet boxes, disconnect switch boxes, circuit breaker boxes, and terminal boxes, etc. "Cabinets" includes terminal cabinets, equipment cabinets, MDF cabinets, and power distribution panelboards. (Note: Definitions include, but are not limited to, the items listed herein.)

TABLE 3.22-1

INSTALLED CABLE AND WIRE CONTINUITY  
INSTALLATION RESISTANCE AND MISCELLANEOUS TEST REQUIREMENTS

<u>Application</u>	<u>Type(s)/ Characteristics</u>	<u>Continuity</u> Conductor loop resistance, each pair: Shield resistance, each: Armor resistance, each: <u>Insulation Resistance</u> Conductor to Conductor (all): Conductor (all) to core separator and shield: Shield to armor: Armor to ground:	<u>Required Minimum Reading</u> <u>Calculated Value</u> <u>+7%</u> <u>+15%</u> <u>+20%</u> <u>Megohms</u> 500 500 500 50 100 <u>Calculated Value</u> <u>+10%</u> <u>+20%</u> <u>Calculated Value</u> <u>+10%</u> <u>+20%</u> <u>Megohms</u> 100 30 <u>Calculated Value</u> <u>+10%</u> <u>Megohms</u> 10 10
(Tunnel, wall shaft, duct bank and direct burial outside plant applications - terminal-to-terminal, including extensions through en-trance conduits and to inside terminal(s)).	With Compartmentalized Core	Shield resistance, each: Armor to ground: <u>Continuity</u>	<u>Calculated Value</u> <u>+10%</u> <u>+20%</u> <u>Megohms</u> 100

	Insulated wire, 600 volt or less rating	<u>Continuity</u> Conductor resistance: <u>Insulation Resistance</u> Conductor to Conductors (all) - if applicable: Conductor (each) to ground:	<u>Calculated Value</u> <u>+10%</u> <u>Megohms</u> 10 10

Measurement Description

NOTES:

1. Additional tests may be required in accordance with other applicable Specification provisions.
2. The Authority may require the testing, or may elect to re-test, the insulation resistance of tunnel wall, duct bank, or direct burial outside plant cable during periods of high dampness or high ground water. Any single failure to obtain the minimum required readings shall be considered conclusive in determining that defects requiring Contractor repair or replacement are present.
3. Disconnect grounded and terminated cable elements as necessary to facilitate testing.
4. Full information concerning the type, application, to/from terminal destinations, junction boxes/splices (if any), size, conductor size, and actual installed length, must be included on test data sheets for each cable tested.
5. Notwithstanding manufacturers specifications or REA standards, cable(s) that does not meet minimum readings specified shall be replaced by the Contractor, at no additional cost to the Authority.

**PART 2 PRODUCTS**

**NOT USED**

**PART 3 EXECUTION**

**NOT USED**

**END OF SECTION**

## **SECTION 16705**

### **COMMUNICATIONS STANDARD SPECIFICATIONS - EQUIPMENT AND MATERIAL**

#### **PART 1 - GENERAL**

##### **1.01 SECTION INCLUDES**

- A. Standard Specifications for Contractor-furnished equipment and materials. These Specifications shall apply to all equipment and materials furnished, unless otherwise specified elsewhere in this Contract (i.e. conflicting Specification requirements found in other Specification sections or on Contract Drawings take precedence over Standard Specifications in this section).

##### **1.02 UNIT PRICES**

- A. Unit Prices include all Required conduits and fittings, wiring, and cabling to provide rack, cabinets and enclosures for the communications systems and facilities and incidental items, not specifically mentioned, but required for complete and proper system operation.

##### **1.03 RELATED SECTIONS**

- A. Section 16706 - Communications System Submittals & Services
- B. Section 16710 - Communications Grounding.
- C. Section 16721 - Communications Telephone System.
- D. Section 16723 - Communications Garage Emergency Telephone System.
- E. Section 16727 - Communications Passenger Emergency Reporting System.
- F. Section 16731 - Communications Fire and Intrusion Alarm System.
- G. Section 16733 - Communications Kiosk System.
- H. Section 16771 - Communications Carrier Transmission System.
- I. Section 16776 - Communications Fiber Optics System.
- J. Section 16791 - Communications Mobile Radio System.
- K. Section 16820 - Communications Public Address System.
- L. Section 16821 - Communications Automatic Public Address Announcement System.
- M. Section 16851 - Communications Passenger Station Closed Circuit Television System.
- N. Section 16852 - Communications Parking Garage Closed Circuit Television System

##### **1.04 REFERENCES**

- A. Federal Communications Commission (FCC) (Specifically Parts 15, 90 and other applicable regulations).
- B. National Electrical Code (NEC).
- C. Underwriters Laboratories (UL).
- D. American National Standards Institute (ANSI).

- K. WMATA General Provisions and Standards Specifications for Construction Projects.

#### **1.05 SUBMITTALS**

- A. Submit under provisions of Section 16706.

### **PART 2 - PRODUCTS**

#### **2.01 EQUIPMENT RACKS**

- A. Construction: Open Frame, Aluminum 3-Inch X 1.410 Channel, 1/4 Inch Thick.
- B. Panel Mounting Size: Standard 19-inch or 23-inch panels.
- C. Finish: Baked Enamel.
- D. Color: ANSI 61 Gray.
- E. Hole Spacing: Standard EIA 1.75-inch vertical rack mounting spaces.
- F. Hole Size: No. 12-24.
- G. Base Width: 20.25 inches for 19-inch panels and 24.25 inches for 23-inch.
- H. Base Depth: 15-inches.
- I. Base Mounting Holes: Front-to-back centers of 12.5-inches and side-to-side centers of 16.0-inches and 20.0-inches.
- J. Rack Height: Maximum 7.5 feet.

- K. Equipment racks shall have a ground bus bar, bolt mounted near the top of the rack, consisting of a 6.0-inch by 0.25-inch by 0.5-inch copper bar drilled and tapped for six connections. The ground bus bar shall be electrically connected to the equipment rack.

## **2.02 EQUIPMENT CABINETS**

- A. Construction: Assembled frame with a flush frame base, suitable side panels and top panel, a front door and a rear door.
- B. Assembled frame: Zinc plated 14-gauge steel and shall have the required front-to-back stiffeners to distribute the equipment load.
- C. Base: Zinc plated 14-gauge steel or greater.
- D. Panel Mounting Rails: Drilled and tapped in accordance with EIA Standard RS-310-C.
- E. Front Door and Rear Door: 16-gauge steel with a lockable handle.
- F. Ventilation: Louvers front door and/or the rear.
- G. Finish: Baked enamel/acrylic, gray color.
- H. Cabinet Height: Maximum 7.5 feet.
- I. Equipment cabinets shall have a ground bus bar, bolt mounted near the top of the rack, consisting of a 6.0-inch by 0.25-inch by 0.5-inch copper bar drilled and tapped for six connections. The ground bus bar shall be electrically connected to the equipment cabinet.

## **2.03 DISTRIBUTION FRAMES**

- A. All systems distribution frames, including the Main Distribution Frame (MDF)/Protector Cabinet, shall consist of the required multisection cable terminal housings, top and bottom assemblies for each housing, a hinged end section at both ends of the distribution frame, a lift-out door for each housing, and a fungus resistant solid plywood backboard in each housing. Each housing of the distribution frame shall contain four distribution rings to permit neat installation of wires and cables within the housing.
- B. Finish: Baked enamel gray color.
- C. Multisection cable terminal housings shall have a ground bus bar installed near the bottom on the plywood backboard, consisting of a 6.0-inch by 0.25-inch by 0.5-inch copper bar. The ground bus bar shall be drilled and tapped for the required ground connections within the housing. The ground bus bar shall be electrically isolated from the distribution frame enclosures.

## **2.04 JUNCTION BOXES**

- A. Junction boxes shall be constructed of 12-gauge sheet steel, except for sizes 24-inch x 36-inch and smaller, which shall be constructed of 14-gauge sheet steel. Boxes shall have all seams welded. The boxes shall be finished to be a NEMA Type 4 rating with the door/cover gasket with an oil resistant gasket material and adhesive. Boxes shall be either galvanized, and painted with ANSI 61 gray paint after priming or shall be a phosphatized surface with ANSI 61 gray polyester powder coating applied. Associated hardware shall be constructed of stainless steel. Junction boxes shall be sized to provide ample space for terminating the

wires and cables installed at each location, including terminal blocks and considering the minimum bending radii of cables. Junction boxes exposed to the weather shall have all wire entrances protected from weather and dust with a pliable sealing compound, and shall be equipped with a drain plug.

- B. Junction boxes shall be furnished and installed complete with terminals, fittings, mounting brackets, cable supports and all other necessary hardware. All conductors within a junction box (including spares) shall be terminated on terminal blocks. Junction boxes to be used only for the pulling of cable do not require terminals.
- C. Where the Contractor furnishes and installs junction boxes as means of terminating cables, cable supports shall be provided in the boxes.
- D. The Contractor may request a waiver to use outlet boxes in lieu of junction boxes for specific application(s) in specific locations. The request must be approved by the Authority prior to the purchase of material or the beginning of installation.

## **2.05 CONDUIT PLANT**

- A. All conduit, except as noted, shall be intermediate metal conduit (IMC). The rigid metal conduit shall conform to UL Standard Number 6, Rigid Metal Conduit and National Electric Code Article 345 Intermediate Metal Conduit. The exterior surface shall be thoroughly and evenly coated with metallic zinc applied directly to the surface of the steel (electroplated zinc coating). The conduit furnished shall be supplied in nominal 10-foot lengths, threaded on each end with one coupling attached. The intermediate metal conduit, elbows, coupling, and fittings shall be protected by corrosion protection when subject to severe corrosive influences. Conduit fittings selected for removable covers shall be complete with gaskets and blank covers.
- B. Flexible conduit shall be provided only where specifically required by these Specifications or where, at the request of the Contractor, its use has been approved by the Engineer and allowed by the National Electrical Code. The flexible conduit shall be constructed of interlocking spiral strip steel of the best quality. The flexible conduit shall be thoroughly annealed and fully coated with metallic zinc. The flexible conduit shall conform to Underwriters Laboratories standards and Federal Specification WW-C-5568. The flexible conduit shall have an extruded liquid-tight neoprene jacket in those locations where the conduit will be exposed to a wet environment, or required by the Engineer for an approved installation. Appropriate type and sized connectors, couplings and fittings supplied or recommended by the manufacturer for the specific flexible conduits shall be provided.
- C. Rigid non-metallic conduit shall be provided only where specifically required by these Specifications or where, at the request of the Contractor, its use has been approved by the Engineer and allowed by the National Electrical Code. Unless otherwise specified, the rigid non-metallic conduit shall be classified as heavy wall type construction. Appropriate type and sized connectors, couplings and fittings supplied or recommended by the manufacturer for the rigid non-metallic conduit shall be provided.
- D. The Contractor shall furnish systems and facilities and select equipment with features that will allow for the utilization of cables sized to fit existing conduit (if any), or the Contractor shall be required to furnish and install suitable conduit to Authority standards to accommodate the communications cables required.

## **2.06 CABLE TRAYS**

- A. Cable trays shall be prefabricated aluminum, open ladder type, approximately 3 inches in depth and shall conform to NEMA Standard VE-1. The width of cable trays shall be determined by the Contractor, but shall be a minimum of 6 inches. Cable tray bottoms shall have rungs on 4-inch centers. Where applicable, a cantilevered single "wall support" type of tray shall be used.
- B. The cable trays shall support a 100 pound per linear-foot load, with a maximum mid-span deflection of 0.25 inch when considered as a simple beam with supports on eight-foot centers.
- C. Appropriate type and size curved sections, cross sections, tee sections, fittings, accessories and supports shall be furnished in accordance with the manufacturer's recommendations.

## **2.07 CABLE LADDERS**

- A. Cable ladders shall be prefabricated aluminum, open ladder type, approximately three (3) inches in depth and shall conform to NEMA Standard VE-1. The width of cable ladders shall be determined by the Contractor to support cables in cable vault or mounted on wall when conduit is not available or conduit is not suitable for installation.

## **2.08 HARDWARE**

- A. Unless otherwise specified, all mounting hardware shall be galvanized. Appropriate type mounting hardware shall be provided for the corresponding supporting surfaces.
- B. Unless otherwise specified, brackets for the mounting and supporting of equipment and material in passenger station areas, yard buildings and other facility buildings shall be painted. Unless otherwise specified, brackets installed in tunnel or outdoor areas shall be galvanized after fabrication in accordance with ASTM A386.
- C. All bolts, nuts and washers for mounting and supporting of equipment within equipment enclosures shall be cadmium plated.

## **2.09 PAINTING**

- A. Equipment furnished and installed by the Contractor other than galvanized, copper, plastic and electrical contact surfaces shall be factory painted internally and externally, except as otherwise specified.
- B. Paint colors shall be selected to match existing equipment, where applicable, and shall be subject to the approval of the Engineer.

## **2.10 SPECIAL REQUIREMENTS FOR STAINLESS STEEL CORROSION RESISTANT HARDWARE**

- A. Except as otherwise specified, equipment enclosures, cabinets, boxes and hardware of all types in tunnels, tunnel crossovers, along the surface right-of-way, and in all ancillary structures that are open to tunnels (vent shafts, fan shafts, pumping stations, etc. - excluding rooms within these areas that are heated/air conditioned) shall consist of stainless steel 304 material. Also, except as otherwise specified, equipment enclosures, cabinets, boxes and hardware of all types; in platform plenums (and including track side walls and under-platform slab and extensions into service rooms); along station train room safety walks, in stairways, corridors, and plenums that are not heated/air conditioned; and in all shafts to the surface and dome reliefs, escalator well ways, elevator pits and surface elevator shafts, shall consist of stainless steel 304 material.

- B. Exceptions: Galvanized conduit may be used with stainless steel 304 mounting hardware. Gray colored fiberglass boxes may be utilized for Emergency Trip Station(ETS) Telephones (Ref. Article 3.7 for product specifications). Non-metallic mounting hardware may be utilized for tunnel and passenger station Mobile Radio System (MRS) antenna cable mounting (Ref. Article 3.13 for product specifications). Electronic equipment connectors, and other relatively small sized specialty items, that are not available in Stainless Steel 304 material, may be allowed by the Engineer as exceptions (Ref. Article 3.1, Request for Approval Of Minor Technical Specification Deviation).
- C. Unless otherwise specified, dull "powder gray" colored Original Equipment Manufacturer (OEM) factory painted exterior surfaces of stainless steel 304 equipment enclosures, cabinets, and boxes shall be utilized in areas where surface glare may be visible to rail car operators, or the Contractor shall neatly apply dull colored epoxy paint to surfaces to avoid glare. McMaster-Carr Supply Company (New Brunswick, NJ) Catalog No. 7892T78 (from Cat. #98) gray primer (or approved equal) shall be utilized for the Contractor applied paint.
- D. Definition: "Hardware" includes bolts, screws, clamping devices, anchoring devices, threaded rods, nuts, washers, hangers, covers/wall plates etc. "Boxes" includes junction boxes, outlet boxes, disconnect switch boxes, circuit breaker boxes, and terminal boxes, etc. "Cabinets" includes terminal cabinets, equipment cabinets, MDF cabinets, and power distribution panelboards. (Note: definitions include but are not limited to the items listed herein.)

## **2.11 ELECTRICAL**

- A. All electrical and electronic components furnished in accordance with this Contract shall be:
  - 1. New and free of manufacturing defects;
  - 2. Free of storage and handling damages;
  - 3. Clearly and permanently labeled with value or identification type;
  - 4. Rated to operate at power, voltage, and current levels exceeding, by at least 20 percent, those which the components will be subject to in service, unless otherwise noted;
  - 5. Commercially available;
  - 6. Capable of operating in the environment specified in these Specifications;
  - 7. Identical, if performing the same function; and
  - 8. Selected with tolerance limits such that the equipment fabricated from the components shall not malfunction over the specified system/facility or equipment operating range.
- B. The selection of the electrical and electronic components shall be such as to provide maximum convenience and safety to personnel in installing, operating and interchanging a complete assembly or component part. Provisions shall be made to prevent personnel from accidentally coming into contact with hazardous voltages. Components shall be selected to prevent reversed assembly or installation of connectors and cables. Cables shall be suitably identified with their mating connections.
- C. Any deviation from these requirements and the requirements detailed herein, including those inherent in standard production equipment, shall be subject to the approval of the Engineer.

## **2.12 TRANSISTORS AND DIODES**

- A. All transistors and diodes shall carry a Joint Electronic Device Engineering Council (JEDEC) number, shall be available from at least two manufacturers, and shall be silicon. Specially selected transistors and diodes within a type number shall not be permitted.
- B. Resistors shall have a maximum tolerance of plus-or-minus 5 percent and shall be rated to dissipate a minimum of 1.5 times the maximum power they will be required to dissipate in operation.
- C. Zener diodes used for voltage regulation or reference levels shall be of such rating that they will not be damaged if the entire load is removed abruptly, and shall have a Zener voltage tolerance of plus-or-minus 5 percent or better.
- D. Zener diodes used for transient protection shall be of such a rating that they will not be damaged in performing their function within all actual conditions encountered in the operating system/facility.

### **2.13 CAPACITORS**

- A. Wet electrolytic capacitors shall not be used. Only dry electrolytic capacitors shall be provided.
- B. Capacitors shall have a maximum tolerance of plus-or-minus 10 percent and shall be rated for at least 1.5 times the maximum peak voltage they will be subjected to in operation.

### **2.14 OTHER SEMICONDUCTORS**

- A. All other semiconductors shall carry a Joint Electronic Device Engineering Council (JEDEC) number and shall be available from at least two manufacturers. All other semiconductors shall be of the silicon type, unless otherwise approved, in writing, by the Engineer.

### **2.15 INTEGRATED CIRCUITS**

- A. All integrated circuits (ICs) shall be available from at least two manufacturers. The Contractor shall take all necessary precautions to ensure that no system or facility using ICs shall malfunction in any fashion due to internally or externally generated noise or cross-talk.
- B. Integrated circuits shall not be damaged by the failure or partial failure of any one or any combination of the various supply voltages. Integrated circuits shall not be damaged by overvoltage of 1.4 times the normal supply voltage, or by short circuits on their inputs and/or outputs.

### **2.16 TRANSFORMERS**

- A. All transformers provided under this Contract shall be of air-cooled, dry type, unless otherwise approved by the Engineer.
- B. Unless otherwise specified, all transformers shall have minimum interwinding and winding to core breakdown voltage of 600 Vdc. Transformers used in electronic circuitry are an exception.
- C. Unless otherwise specified, all transformers shall conform to the following requirements:

1. Core laminations shall be grain oriented silicon steel. Maximum flux densities shall be substantially below saturation level. The core volume shall allow efficient transformer operation at 10 percent above the highest tap voltage. All laminations must be core plated or annealed, free of burrs and firmly butted. The core laminations shall be tightly clamped and compressed to provide quiet operation. Transformers shall not emit audible noise in excess of 50 dB referenced to .0002 dynes per sq. cm., at a distance of three feet, while operating at rated voltage and load.
  2. Coil conductors shall be continuous with terminations brazed or welded without auxiliary flux material. The entire core and coil assembly shall be pre-dried by heat, impregnated with varnish or other approved compound, and cured at a minimum of 350 degrees F to reduce hotspots and seal out moisture. Coils shall be protected with an outer layer of glass tape or similar quality insulation.
- D. Unless otherwise specified, all transformers provided under this Contract shall be equipped with suitably insulated screw terminals for all primary and secondary lead wires. Transformers used in electronic circuitry and video isolation transformers are an exception. Appropriate type video connectors shall be provided for the input and output leads of video isolation transformers.

## **2.17 POWER SUPPLIES**

- A. Unless otherwise specified, all power supplies shall have the characteristics and meet the requirements listed herein.
- B. Power supplies shall be for continuous duty and shall be rated at a minimum of 120 percent of maximum load at 50 degrees C.
- C. Power supplies shall be selected for mounting in a standard 19-inch equipment rack and shall be housed in a metal panel-chassis combination with no exposed electrical connections or wires. Appropriate type terminals shall be provided on the rear of the chassis for the connections of all external input and output power leads. An appropriate sized power cord (internally connected) may be provided for the input power leads.
- D. Power supplies shall be selected for natural convection cooling. No supplementary fans or other cooling devices will be allowed.
- E. The power supplies shall not be damaged by a sustained input voltage varying from 0 to 150 percent of the rated input voltage. Power supplies shall have current limiting, which shall protect the power supplies from damage due to overload or short circuits. Overvoltage protection shall be contained on those power supplies driving solid-state circuitry.
- F. Each power supply shall have an output voltmeter, an output ammeter, and a normally illuminated power light (lamp or LED) mounted on its front cover. All panel mounted indicating, adjusting, and protective devices, or openings for such devices, shall be legible and permanently labeled.
- G. Each power supply shall be equipped with a failure alarm device, which shall detect any internal failure that will impair the ability of the power supply to deliver its full rated load. This device shall be normally energized by a small percentage of the rated load current of the power supply. Upon detection of a failure, the failure alarm device shall provide an independent contact closure for an external alarm indication circuit. The contacts shall be wired to appropriate type terminals on the rear of the chassis. In addition, the failure alarm

device shall extinguish the normally illuminated power light on the front cover, when a failure is detected.

- H. Unless otherwise specified, all redundant power supplies shall be diode coupled to the loads with the corresponding main power supplies.

## **2.18 CONNECTORS**

- A. Connectors shall be provided on wires, multi-conductor cables, coaxial cables, and triaxial cables, when required to permit the connection to or removal of equipment items for maintenance, as determined by the Engineer. In-line connectors shall be provided only where specifically required by these Specifications or where, at the request of the Contractor, its use has been approved by the Engineer. Appropriate type and size connectors shall be provided for the joining, splicing, and terminating of all coaxial cables and triaxial cables.
- B. Unless otherwise specified, connectors shall not be required for the termination of wires and cables to those equipment items which contain screw type terminals as the interface connection for wires and cables. Connectors shall not be provided in system distribution frames. Appropriate type mating connectors, recommended by the manufacturers, shall be provided for those equipment items requiring connectors for the interfacing of wires and cables. Appropriate type connector assemblies and mating connectors shall be provided to interface wires and cables to all equipment (including system control panels) in the Kiosk and yard consoles.
- C. Appropriate type, size, and rated power connectors (plugs) shall be provided to interface equipment power cords and cables to ac power receptacle strips, ac power outlet assemblies, and ac outlets.
- D. Unless otherwise specified, all multi-conductor cable connectors (including those provided for custom-made equipment and control panels) shall consist of a molded plastic connector block equipped to hold the required number of contacts, a protective shell (plastic or metal), a mechanical keying device, a device to grip the external wiring firmly in order to prevent strain on the contacts, and the required solderless contacts (pins or sockets). The pin and socket contacts shall be fabricated from commercial bronze or brass and have a minimum 0.00003-inch gold plating over nickel underplate. The pins and sockets shall be appropriately sized to interface the corresponding conductor sizes that are to be terminated to the connector. Connectors provided on equipment for the interfacing of wires and cables shall be firmly secured to the chassis.
- E. All connector assemblies shall be easily connected and disconnected by hand. Tools used to apply connector contacts to wires and cable conductors shall be of the size and type recommended by the manufacturer of the connector.
- F. Each connector shall be marked in such a manner that its mating half shall be distinctly identified as being related to each other, but to no other connector within the immediate area. These identification markings shall be applied in such a manner that they will not be obscured or worn off in normal use.
- G. All conductors (including spares) within a cable that interfaces with a connector shall be terminated in the connector.
- H. All in-line connectors installed in wires and cables located inside structures, within tunnel areas, and all connectors installed to equipment which are not located within rooms of passenger stations, ancillary buildings and yards shall be protected by silicon sealer

coating, enclosed by heat shrinkable tubing (sleeves). This requirement shall be excluded for all connections with a weatherproof classification.

- I. All in-line connections installed in manholes, hand-holes, cable troughs or cable trenches (direct burial) shall be enclosed in filler splice cases, utilizing products and methods approved by the Engineer.
- J. In-line connection shall not be allowed in conduits, ducts, pipes and cable trays.
- K. All locations of in-line connections shall be documented on As-Built drawings.

## **2.19 RELAYS, SWITCHES AND PUSHBUTTONS**

- A. All electromagnetic relays shall be plug-in type and secured to their corresponding socket to reduce the effects of shock and extreme vibration. Where applicable, retaining wire springs shall be provided with the relays. The contacts of the electromagnetic relays shall be palladium, silver, or gold plated, or shall be mercury-wetted. All contacts shall be bifurcated and shall have a wiping action. The coil and contacts of each electromagnetic relay shall be enclosed in a protective dust cover. Unless otherwise specified or required for a specific function within the associated circuitry, all double throw contacts shall be break-make type (Form "C").
- B. All solid-state relays shall be completely encapsulated in a rugged epoxy case. A minimum of 2500-Vrms isolation shall be provided between the input and the output of all solid-state relays.
- C. All relays shall be of the appropriate type (Vac or Vdc operation) and be of the required input control rating for their intended use. The contacts of the electromagnetic relays and the isolated outputs of the solid state relays shall have ratings that equal or exceed the corresponding connected load requirements (voltage and current).
- D. Arc suppression circuits shall be provided for all relays used in electronic circuitry. Arc suppression may be built into the relays or provided on the printed circuit cards on which the relays are mounted. All time delay relays shall have solid-state timing circuits.
- E. All switch and pushbutton contacts shall be palladium, silver or gold-plated. The contacts shall have a wiping action and shall be rated for their intended use. All switches and pushbuttons shall have a long life expectancy of more than 10,000 operations.
- F. Unless otherwise specified, the types of switches (rocker, toggle, etc.), the operation of the pushbuttons and switches (momentary action, maintained action, etc.), and the configuration of the pushbuttons and switches on developed equipment shall be determined by the Contractor and approved by the Engineer. Unless otherwise specified, all pushbuttons and switches on developed equipment shall contain LEDs, if indicators are required. Mechanical interlocking shall be provided when required. Full guard bezel which surrounds the button to help prevent accidental operation and barriers between pushbuttons and switches shall be provided, upon request by the Authority.
- G. All switches and pushbuttons on equipment shall be permanently labeled. Labeling of the switches and pushbuttons shall either be provided on the surface of the equipment to which they are mounted or provided on the switches and pushbuttons themselves. All graphics on pushbuttons and switches shall be hot stamped in a color that will contrast with the color of the buttons (lenses).

## **2.20 TEST POINTS**

- A. Test points shall be provided for each major function. Labeled test points on printed circuit boards and other plug-in modules shall be accessible while the device is in operation.

## **2.21 PRINTED CIRCUIT BOARDS**

- A. All printed circuit boards (cards) shall be constructed of fire-resistant glass epoxy material of NEMA quality FR4 or better. Cards shall have sufficient thickness to permit easy insertion and removal without buckling or breaking and shall be keyed to prevent incorrect interchange. All circuits on the printed circuit boards shall be formed by etching. Conductor material shall be copper and shall be protected from exposure to air.
- B. Boards shall be produced with plated through holes, for component mounting and connecting, and for interfacial connections. If all interconnecting circuitry is confined to one side of the board, the board may be produced with unsupported holes for mounting the components which will be soldered to the pattern side of the board.
- C. Printed circuit boards shall be coated with an approved moisture-proofing compound after assembly, except when this requirement is waived by the Engineer, due to non-availability from manufacturers of approved off-the-shelf dust protected equipment units.
- D. Each printed circuit board shall be permanently and legibly marked with a unique number identifying that type of circuit board (i.e., model number). In addition, each printed circuit board shall be permanently and legibly marked with a unique serial number.

## **2.22 LED AND INDICATING LAMPS**

- A. All indicating lights (LEDs and lamps) shall have a life expectancy of 25,000 hours minimum. All indicating lights shall be operated between 85 percent and 95 percent of their rated voltage.
- B. All indicating lights on equipment shall be permanently labeled. Labeling of the indicating lights shall either be provided on the surface of the equipment to which they are mounted or provided on their associated lenses. All graphics on the lenses shall be hot stamped in a color that will contrast with the color of the lenses.
- C. Unless otherwise specified, all indicating lights (LEDs and lamps) shall be replaceable from the front of the light assemblies.
- D. Unless otherwise specified, all numeric and alphanumeric displays shall be solid state LED display or liquid crystal display. Numeric characters shall be 7-segment type display and alphanumeric characters shall be 14-segment type display. However, a dot matrix display will be considered upon request by the Contractor. Unless otherwise specified, all character displays shall be a minimum of 1/2-inch. Appropriate filters and windows shall be provided.

## **2.23 METERS**

- A. Unless otherwise specified, traditional meter movements shall have a full scale accuracy of  $\pm 2$  percent.
- B. All meters shall be of the appropriate type for their intended use; i.e., a meter with an ampere scale shall not be acceptable for the measurement of milli-amperes. All meters shall be legible and permanently labeled.

## **2.24 TERMINAL BLOCKS**

- A. All terminal blocks and terminal strips shall be rated for service at 300 volts minimum. All terminal blocks and terminal strips shall be of the appropriate current rating for corresponding terminated circuits. All terminals of the terminal blocks and terminal strips shall be sized to accept corresponding terminated wire and cable conductor sizes (gauges). Resistance of the terminals shall not exceed 0.0002 ohms.
- B. Unless otherwise specified, terminal blocks and terminal strips provided in junction boxes, equipment enclosures, system distribution frames, equipment cabinets, and termination facilities shall be of the modular, feed-thru type mounted to a metal channel or be of the single molded construction barrier type.
- C. Unless otherwise specified, the modular, feed-thru type terminal blocks and terminal strips shall have pressure clamp contact terminals suitable for solid and stranded wire. Appropriate sized (length) continuous mounting channel shall be provided for each terminal block and terminal strip. Appropriate accessories (end sections, channel clamps, partitions, mounting hardware, etc.) shall be provided for each terminal block and terminal strip. Disconnect apparatus (without removing wires) shall be provided in the terminal assemblies of those terminal blocks and terminal strips, which are utilized in conjunction with protector block assemblies, or otherwise specified within these Specifications.
- D. The barrier type terminal blocks and terminal strips shall be constructed of molded fire-retardant thermoplastic with double row terminals. The terminals shall consist of binding head screws, with the two screws associated with each terminal electrically connected with a brass strip. Appropriate mounting hardware shall be provided for each terminal block and terminal strip.

## **2.25 PROTECTOR BLOCKS**

- A. Unless otherwise specified, each protector block shall be selected for the termination of two pairs (four conductors). The base of each protector block shall be constructed of molded fire-retardant thermoplastic and shall be equipped with four binding posts and four related screw-in arrester units. The four binding posts shall be connected internally to the corresponding arrester units. Each binding post shall be equipped with two nuts and four beveled washers. A ground plate shall be provided on the face of the base of each protector block between the arrester units. The arrester units shall be 2-electrode gas type and provide 400 Vdc fail-short protection.
- B. Multiple protector blocks (two pair type) shall be provided and installed adjacent to each other (vertical rows) for the termination of multi-conductor cables containing more than two pairs.
- C. Appropriate length brass or copper mounting and ground bar assemblies shall be provided for the installation and grounding of the protector blocks. Each mounting and ground bar assembly shall have a minimum of two binding posts with appropriate nuts and washers for the termination of ground wires. Appropriate hardware shall be provided to secure and ground the protector blocks to the mounting and ground bar assemblies. Appropriate mounting hardware shall be provided to install the mounting and ground bar assemblies.
- D. Unless otherwise specified, all wires and cables that enter/exit the Communications Equipment Rooms of passenger stations and yards to/from the WMATA right-of-way shall be terminated on protector blocks in the Communications Equipment Room. All wires and cables that enter/exit equipment within the WMATA right-of-way and enter/exit remote ancillary buildings shall be terminated on protector blocks at the equipment and in the remote ancillary buildings. All wires and cables that enter/exit yard buildings and other

special buildings shall be terminated on protector blocks in the yard buildings and special buildings. All wires and cable conductors (including spares) shall be terminated on protector blocks at each location. Coaxial cables and triaxial cables are exceptions.

## **2.26 FUSES AND CIRCUIT BREAKERS**

- A. All equipment shall be protected by fuses or circuit breakers of the appropriate size. Fuses and circuit breakers shall be readily accessible, surface mounted, on all equipment. Fuse wire within the equipment shall not be acceptable.

## **2.27 WIRES AND CABLES**

- A. Only continuously extruded outer jackets free of polyvinylchloride (PVC) and PVC-based compounds shall be furnished on cables provided in these Specifications. Exceptions may be allowed by the Engineer when such cable is not commercially obtainable only from equipment manufacturers, and when appropriate to avoid potential electrical signal mismatching, or to otherwise improve system performance or reliability.
- B. All single conductor wire and individual conductors of multi-conductor cables shall be copper and shall be insulated.
- C. Multi-conductor cable shall be made by assembling individual or twisted pairs of insulated conductors into a tight cylindrical form. Individual conductors or twisted pairs in a cable having more than two wires shall be assembled helically and with adjacent layers wound in opposite directions. Twisted pairs shall consist of two individually insulated conductor cables with a length of lay as short as good construction will permit, but not longer than ten inches. Where more than one twisted pair is included, length of lay of adjacent pairs shall differ by at least one-half inch.
- D. Unless otherwise specified, all multi-conductor cables installed within the WMATA right-of-way shall contain a metallic shield and a corrugated metallic tape armor. The shield and armor shall be separated by an inner jacket.
- E. Multi-conductor cables containing more than two conductors shall contain 20 percent spare conductors, or two spare conductors (two spare pairs if composed of twisted pairs), whichever is greater.

## **2.28 HOOK-UP-WIRE**

- A. All wiring within electronic equipment selected, or wired by the Contractor shall have passed the Underwriters Laboratories VW-I Vertical Flame Test. The wire size shall be commensurate with the application.
- B. All wires within electronic subassemblies and assemblies shall be identified by adequate color-coding, in accordance with best commercial practices.

## **2.29 GROUNDING**

- A. Communications systems and facilities, equipment and cables shall be grounded using a single-point grounding scheme. Each Communications Equipment Room will have a separate isolated ground bus bar, provided by others, designated as "communications ground."

- B. Unless otherwise specified, the shields of all single shielded communications cables, the shields of multi-conductor cables that have individually shielded pairs, and the inner shield of all double shielded communications cables and communications cables with separate shield and armor, shall be grounded only at a single point and only to the "communications ground." These shields shall be electrically continuous throughout the cable length by bonding across all splices and terminations in equipment enclosures and junction boxes.
- C. The outer shield of all double shielded communications cables and the armor of all communications cables with separate shield and armor shall be grounded only at a single point in each cable section. The single point ground shall be located at the end of the cable section nearest to the associated Communications Equipment Room. Cable sections originating at Communications Equipment Rooms shall have the outer shield or armor grounded to the "communications ground."
- D. The Contract Drawings show details of the cable grounding scheme.
- E. Equipment racks and equipment cabinets shall be electrically isolated from the building structure, adjacent equipment racks and equipment cabinets. Minimum resistance between adjacent equipment racks and equipment cabinets, and between equipment racks and equipment cabinets and the building structure, shall be 10 megohms. Each equipment rack and equipment cabinet shall be individually wired to the communications ground, via the copper ground bus bar on the equipment rack and equipment cabinet, by a No. 6 AWG, stranded, insulated wire, Type XHHW.
- F. Each copper ground bus bar in the multi-section cable terminal housings of the MDF/Protector Cabinet and the systems distribution frames shall be wired to the communications ground by a No. 6 AWG, stranded, insulated wire, Type XHHW.
- G. All power conductors shall be electrically insulated from equipment racks and equipment cabinets, and power ground shall be separate and isolated from communications ground. Conduit containing power conductors running from ac distribution boxes to equipment racks, equipment cabinets, ac receptacle boxes on equipment racks and equipment cabinets shall be insulated from the equipment cabinet or equipment rack by means of short lengths of non-conducting conduit.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Adjacent equipment racks and equipment cabinets shall have a 0.25-inch separation between upright members. They shall be mechanically secured to each other by 0.25-inch nylon bolts and spacers.
- B. Adjacent equipment racks and equipment cabinets shall use rigid non-metallic conduit for interconnecting wiring.

**END OF SECTION**

## **SECTION 16706**

### **COMMUNICATIONS SYSTEM SUBMITTALS & SERVICES**

#### **PART 1 - GENERAL**

##### **1.01 SECTION INCLUDES**

- A. Submittal procedures.
- B. Construction progress schedules.
- C. Proposed Products list.
- D. Product Data.
- E. Shop Drawings.
- F. Contract Record Drawings
- G. Spare Parts
- H. Equipment Manuals
- I. Training
- J. Samples.
- K. Design data.
- L. Test reports.
- M. Certificates.
- N. Manufacturer's instructions.
- O. Manufacturer's field reports.

##### **1.02 RELATED SECTIONS**

- A. Division 1
- B. Section 16707 - Communications Systems Quality Assurance & Testing.

##### **1.03 REFERENCES**

- A. AGC (Associated General Contractors of America) publication "The Use of CPM in Construction - A Manual for General Contractors and the Construction Industry."

##### **1.04 SUBMITTAL PROCEDURES**

- A. Transmit each submittal with Engineer accepted form.
- B. Sequentially number the transmittal form. Revise submittals with original number and a

sequential alphabetic suffix.

- C. Identify Project, Contractor, Subcontractor or supplier, pertinent drawing and detail number, and specification section number, as appropriate.
- D. Apply Contractor's stamp, signed certifying that review, approval, verification of Products required, field dimensions, adjacent construction Work, and coordination of information is in accordance with the requirements of the Work and Contract Documents.
- E. Schedule submittals to expedite the Project, and deliver to Engineer. Coordinate submission of related items.
- F. For each submittal for review, allow 30 days excluding delivery time to and from the contractor.
- G. Identify variations from Contract Documents and Product or system limitations that may be detrimental to successful performance of the completed Work.
- H. Provide space for Contractor and Engineer review stamps.
- I. When revised for resubmission, identify all changes made since previous submission.
- J. Distribute copies of reviewed submittals as appropriate. Instruct parties to promptly report any inability to comply with requirements.

#### **1.05 CONSTRUCTION PROGRESS SCHEDULES**

- A. Submit initial schedule in duplicate within 20 days after date established in Notice to Proceed.
- B. Revise and resubmit as required.
- C. Submit revised schedules with each Application for Payment, identifying changes since previous version.
- D. Submit a computer generated network analysis diagram using the Program Evaluation and Review Technique (PERT) Technique method, as outlined in AGC - The Use of CPM in Construction.
- E. Show complete sequence of construction by activity, identifying Work of separate stages and other logically grouped activities. Indicate the early and late start, early and late finish, float dates, and duration.
- F. Indicate estimated percentage of completion for each item of Work at each submission.
- G. Indicate submittal dates required for shop drawings, product data, samples, and product delivery dates.

#### **1.06 PROPOSED PRODUCTS LIST**

- A. Within 30 days after date of Notice to Proceed, submit list of major products proposed for use, with name of manufacturer, trade name, and model number of each product.
- B. For products specified only by reference standards, give manufacturer, trade name, model or catalog designation, and reference standards.

- C. The Contractor shall use the major products described in the Communications Sections when practical, to avoid increasing WMATA's maintenance requirements.
- D. If "equal" products are proposed by the Contractor, he shall insure that the proposed products will interface and operate properly with other Contractor-supplied products, subsystems and systems, and with existing communications products, subsystems, and systems.
- E. Whenever the Contractor proposes a new major product (one where salient characteristics have been described in any Communications Section) that has not been previously used on the Transit System, the Contractor shall include that new product in his training program to be conducted for WMATA operations and maintenance personnel.

#### **1.07 PRODUCT DATA**

- A. Product Data For Review:
  - 1. Submitted to Engineer for review for the limited purpose of checking for conformance with information given and the design concept expressed in the contract documents.
  - 2. After review, provide copies and distribute in accordance with SUBMITTAL PROCEDURES article above and for record documents purposes.
- B. Product Data For Information:
  - 1. Submitted for the Engineer's review.
- C. Product Data For Project Close-out:
  - 1. Submitted for the Authority's benefit during and after project completion.
- D. Submit the number of copies that the Contractor requires, plus two copies that will be retained by the Engineer.
- E. Mark each copy to identify applicable products, models, options, and other data. Supplement the manufacturers' standard data to provide information specific to this Project.
- F. Indicate Product utility and electrical characteristics, utility connection requirements, and location of utility outlets for service for functional equipment and appliances.
- G. After review distribute in accordance with the Submittal Procedures article above and provide copies for record documents.

#### **1.08 SHOP DRAWINGS**

The Contractor is not required to prepare new Shop Drawings for the Kiosk Fabrication. The Contract Drawings specify the details for fabrication of the Kiosk. These Kiosk Fabrication Drawings may be submitted by the Contractor as Shop Drawings, with a notation on each drawing stating that the Contractor has elected not to change the drawing, or with the Contractor's changes clearly marked. Alternatively, the Contractor may elect to submit individual sheets of Contractor developed Shop Drawings, which replace specific Kiosk Fabrication Contract Drawing Sheets.

- A. The Contractor shall, unless otherwise directed, submit one reproducible original and four black ink on white paper copies of all communications system shop drawings to the

Engineer for approval using standard transmittal forms in accordance with detailed instructions furnished by the Engineer. Shop drawings shall be 11" x 17" except for drawings designated by the Authority to be full size.

- B. The Contractor shall develop an Engineering Drawing Index which shall be submitted to the Engineer for review and approval. The drawing index shall include descriptive titles, drawing numbers, revision numbers, and the dates of completion of drawings for communications systems and facilities covered in these Specifications and for all Contractor-furnished equipment. The Engineering Drawing Index shall be definitive as to the availability and content of subsequent drawings. It shall be compatible in format and drawing number sequence with Authority Drawing Index for previous Communications Contracts and subject to approval. The Engineer shall assign the drawing number sequence. The drawing number sequence shall be 15XXX. The Contractor shall be responsible for maintaining, revising and updating the Engineering Drawing Index for the duration of the Contract. The Engineering Drawing Index shall be revised and updated quarterly, or as required by the Engineer. A completed Final Drawing Index shall be provided to the Engineer at the conclusion of the Contract.
- C. Shop drawings shall be complete, detailed and dimensioned. All necessary shop drawings shall be provided for use in fabricating, assembling, handling, erecting, installing, connecting, trouble-shooting, testing, and maintaining each complete system/facility, all changes to existing systems, facilities and equipment, and all equipment furnished, as follows:
1. Equipment installation drawings, including sections, elevations, and floor plans showing dimensions necessary for installation, equipment base or mounting details, and location of entrance/exit for cable(s).
  2. Outline drawings indicating overall dimensions, aisle space requirements, locations of all devices mounted on equipment racks/cabinets and panels, locations of all terminal blocks or connectors for connections to external cable, and removable plates for cable entry; sufficient detail shall be provided to show accessibility for maintenance.
  3. Complete detail system/facility block and level diagrams for each system/facility and for all equipment that is provided by the Contractor; each block shall represent one specific function, and each apparatus shall be divided into as many blocks as required. Such system/facility diagrams shall also include existing equipment details.
  4. Complete cable/wire plan and riser diagrams for each system/facility and all equipment that is provided by the Contractor; including designations, destinations, color codes, and termination details for the conductors of each cable and wire.
  5. Separate and complete schematic and logic functional diagrams for circuits of equipment furnished by the Contractor; circuits which are repetitive may be shown as a single schematic and/or logic functional diagram with identical parts indicated. All variations in circuitry must be clearly shown on individual diagrams for each subsystem. Notes which indicate exceptions to typical layout schematics or logics will not be acceptable. Schematic and logic diagrams shall indicate signal flow for all inputs and outputs, bus connections, and all terminal points for external connection. These shall be clearly identified and in agreement with corresponding terminal points on the wiring diagrams. Functional blocks plus their module schematic diagrams on separate drawings will be acceptable for solid-state portions of the logic servicing a specific function. Logic diagrams and schematic diagrams shall conform to the applicable IEEE standards or to alternate approved standards.
  6. Interconnecting wiring drawing(s) for each piece of equipment, indicating all terminal points for external cable connections, including cable designations, wire

- colors or designations; the number of conductors in each cable; and the destination of each cable, by reference to the appropriate unit and Contractor's drawing number or point device and drawing number as provided in the Contract Drawings.
7. Wiring drawings with all terminals, relays, modules, and other devices shown in their relative physical locations shall be provided. Each drawing shall indicate exact point-to-point connections between interconnected devices and between devices and terminals for external connections. Wire lists and cable running lists will be accepted if they include a description and a diagram of the system/facility. The Contractor shall be responsible for the accuracy of the wiring, terminal point identifications, device identifications, and device designations which shall be in exact agreement with schematic functional diagrams accepted by the Engineer.
  8. Schematics and wiring diagrams for all printed circuit boards with all electronic components and test points shown in their relative locations.
  9. Both the schematic functional diagrams and the wiring drawings shall indicate all the points essential for troubleshooting, with their respective operating voltage levels, logic state, current, or other applicable measurable parameters.
  10. Fabrication and assembly drawings for developed equipment, including panel and chassis layouts, circuit designs, components, graphics, component layouts and list of material.
  11. Additional requirements specified in the various Communications Sections.
- D. Groups of associated drawings shall be submitted together, so that Authority reviewers can evaluate the composite design and interface considerations involved for specification compliance. Submissions not in compliance with the foregoing requirement may be returned by the Authority without action.
- E. Separate drawings shall be furnished for each passenger station, building structure, yard, and site along the right-of-way. Notes which indicate exceptions to a typical drawing for a passenger station, building structure, yard, or site along the right-of-way shall not be acceptable.
- F. During construction, (after Shop Drawing approval) the Contractor shall maintain for inspection by the Engineer a record set of Shop Drawings annotated to show all authorized changes incorporated as work progresses. Three set of annotated Shop Drawing shall be submitted not later than three working days after changes are authorized by the Engineer. Information shall include, but not be limited to, the following:
1. Field changes of any type.
  2. Changes accomplished by Change Orders (Change Orders may also specify requirements for the prior submission and approval of Shop Drawings before work commences).
- G. Before Substantial Completion Inspection (SCI), the Contractor shall furnish to the Engineer one set (2 vellum and 1 black on white paper print) of Shop Drawings for the record, all clearly revised and completed and brought up to date, showing the permanent construction as actually accomplished. Not later than 15 calendar days after Substantial Completion, updated shop drawings shall also be submitted on electronic media (optical compact disk or 3.5 inch magnetic disk) using either AutoCad Version 14 (.DWG) or other Authority approved drawing file formats. In addition to these submission requirements for SCI, additional submissions are required subsequently in accordance with the CONTRACT RECORD DRAWINGS article.
- H. Work in the Contract requires modifications, reconfigurations and connections of various existing communications systems and facilities in the passenger stations, transit yards, sites along the rights-of-way and the Jackson Graham Building. Upon request by the Contractor,

and approved by the Engineer, existing Authority Record Drawings may be obtained to incorporate the requirements of this Contract and may be submitted as Contract Shop Drawings. Process for utilizing the Authority Record Drawings shall be in accordance with the requirements of the CONTRACT RECORD DRAWINGS article of this Section.

**1.09 CONTRACT RECORD DRAWINGS**

- A. General:
  - 1. Before the scheduled date of the Final Acceptance of all Contract work, the Contractor shall submit approved as-built mylar original drawings, electronic media, and microfilmed aperture cards for the completed work.
  - 2. As-built drawings shall be on 22 inch by 34 inch Mylar.
  
- B. As-built Drawings:
  - 1. As-built CONTRACT RECORD DRAWINGS shall include Installation Drawings, Shop Drawings, Working Drawings, kiosk data file drawings and revisions to all affected existing Authority Record Drawings.
  - 2. Authority Record Drawings are as-built drawings provided to the Authority in previous communications contracts. The Contractor shall coordinate with the Authority to determine which existing Authority Record Drawings require revisions.
  - 3. The Authority will furnish the original mylars of the Authority Record Drawings which require revisions from which the Contractor shall make reproductions for his use in preparing as-built drawings. Such reproductions shall be on three-mil plastic film for black line Diazo printing, both sides matte, similar to mylar and Estar. Images shall be clear, sharp and readily legible. The original Authority Record Drawings shall be returned to the Authority not later than 10 calendar days after their receipt from the Authority.
  - 4. Revisions to Authority Record Drawings shall match the base drawings in line weights, symbols, and lettering style and size. Drafting shall be performed with AutoCad software, and shall match original Contract Drawings in line weights, symbols, and lettering style and size.
  - 5. The Contractor shall submit three sets of prints of as-built drawings in a timely manner for review and approval.
  - 6. Additions and corrections resulting from Authority review comments shall be incorporated by the Contractor. One mylar original and two copies shall be submitted to the Authority not later than the applicable date specified in the Contract Schedule. Final As-Built Drawings shall also be submitted on electronic media (5 sets of CD-ROM's) using either AutoCAD(.DWG) or other Authority approved drawing file formats.
  - 7. Completed as-built Contract Record Drawings shall bear the signature of an officer of the Contractor's organization, certifying compliance with as-built conditions using a rubber stamp, or electronic facsimile, as follows:

<p>As-Built</p> <p>Date _____</p> <p>I certify that this drawing accurately depicts the work as constructed.</p> <p><u>An Officer of the Company</u></p> <p>Signature _____ Title _____</p> <p>CONTRACTOR'S NAME</p>
--

## 1.10 SPARE PARTS

- A. This Contract includes the requirement for Communications spare parts. The Contractor shall assure that all spare parts required by this Contract are provided and delivered in accordance with the requirements of Division 1.

## 1.11 EQUIPMENT MANUALS

- A. The Contractor shall furnish Operations and Maintenance (O&M) Manuals for communications systems, as specified in Division 1. The Contractor shall also furnish complete sets of O&M Manuals for each type and variation of Contractor furnished equipment - including all communications equipment and other electronic equipment and associated peripheral equipment, of the communications systems (Contractor furnished items only - unless otherwise specified). Sets of manuals shall generally describe the operation, specifications and characteristics, theory of operation, maintenance, and troubleshooting procedures for each type of equipment. Complete parts lists and detailed information concerning specific equipment options installed at WMATA shall be included in equipment manuals. The communications manuals shall be divided into three (3) categories and will meet the additional requirements, as follows:
1. Volume A Manuals shall consist of system-related manual(s) with contents as specified herein.
  2. Volume B Manuals shall consist of equipment-related manual(s) with contents as specified herein.
  3. Manufacturers Service Manuals shall consist of the most complete and most extensive manufacturers' service manual sets available for each item of equipment (applicable to test equipment, or as otherwise specified). (No Contractor furnished supplements or oil resistant covers are required for this category of manuals.)
  4. Accurate, technically correct, easily understandable, concise text, charts, tables, illustrations, photographs, and drawings; all of which are directly applicable to the subject matter and are highly appropriate for their intended purpose; shall be provided by the Contractor subject to review and approval by the Engineer.
  5. Page layouts, formats, spelling and grammar utilized, and reproduction quality, shall be of good commercial quality and shall be subject to review and approval by the Engineer.
  6. Dividers with custom printed tab labels shall be provided for each major subsection (1-1, 1-2, 1-3, etc.), and a distinctive type of divider with custom printed labels shall be provided to separate major parts of each multi-part manual.
  7. Secure screw-down, or other equivalent manual bindings shall be furnished by the Contractor, subject to approval by the Engineer. Standard 3-ring binders will not be acceptable for these manuals. Binders shall have front or back (preferably both) pockets for convenient document storage, if this feature is available as an option to the binders otherwise approved by the Engineer.
  8. Revision Log sheet shall be included in the front of each manual.
  9. The Authority will grant access to all available technical documentation pertaining to prior versions of Communication Systems to aid the Contractor in developing Communication System Manuals.
  10. The Authority will provide one copy of manufacturer's specification sheets for existing equipment installed in prior systems at the start of the Contract. Most of these Specifications will not be of reproducible quality and will require retyping before including them in the manuals. Whenever good reproductions of manufacturers' specification sheets can be made, especially those with photos or illustrations, their use in manuals is preferred.

- B. Adequacy and Completeness
  - 1. Each complete manual set shall contain a significant amount of detail and significant degree of depth of technical content, including all available details for subsystems. Completeness and accuracy to best commercial standards shall be required. Printing, reproduction, drafting, photographs, graphics, illustrations, and organization, shall be to best commercial standards. All manuals shall be written in English. Each individual manual furnished shall be subject to examination by the Authority for Specification compliance. The Engineer will exercise wide latitude in determining Specification compliance, and may reject manual(s) for noncompliance in minor degrees thereof.
  
- C. Volume A System Related O&M Manuals
  - 1. The Contractor shall furnish complete sets of Volume A Manuals for each of the individual systems.
  
- D. Volume B Equipment Related O&M Manuals
  - 1. The Volume B Manuals shall be equipment-related manual(s). Complete sets of the most extensive and complete Manufacturers' Manuals available shall be provided, with contractor-developed supplemental parts lists, data covering specific options utilized at WMATA, etc. - when applicable.
  - 2. As an exception to the requirements stated herein, abbreviated requirements shall apply to all "Test Equipment," and "Additional Equipment" (i.e. only standard Manufacturers' Service Manuals shall be required, in the quantity specified for such equipment).
  
- E. Submittals Required for Each Volume A and Volume B Manual
  - 1. Five copies of sample formats and Table of Contents outlines (with or prior to the Engineering Development Review).
  - 2. Three copies of complete manuals in draft form prior to Installation Completion Testing.
  - 3. See Tables for quantities of final manuals.

Table of Contents Outline with Minimum Content Requirements:  
 Carrier Transmission System O&M Manual  
 (Volume A - CTS Systems Manual)

<u>SECTION</u>	<u>TITLE/CONTENTS</u>	<u>QTY</u>	<u>MAKEUP</u>
1-1	<b>INTRODUCTION</b> (scope of manual coverage, i.e. all types of carrier transmission systems installed in WMATA passenger stations)	1	page (text)

1-2	<b>SYSTEM DESCRIPTION</b> (detailed description of the latest system, with brief information about major differences in prior systems installed in WMATA passenger stations)	9+ 2+ 1+	pages (text) photographs illustration (sketch)
1-3	<b>SYSTEM SPECIFICATIONS</b> (complete detailed specifications for the latest system, with major differences for prior versions still in use)	1	table
1-4	<b>SYSTEM THEORY OF OPERATION</b> (system theory of operation in detail, covering the latest version of the WMATA Carrier Transmission System)	5+	pages (text)
1-5	<b>INSTALLED SYSTEM CONFIGURATIONS</b> (include written and photographic details covering all types of carrier transmission systems in use)	3+ 15+	pages (text) photographs
1-6	<b>EQUIPMENT LIST</b> (separate lists for each configuration installed in WMATA passenger stations)	1+	page (text)
1-7	<b>EQUIPMENT CHARACTERISTICS</b> (including all models of equipment utilized in various types of WMATA carrier transmission systems)	100+ 60+ 92+	pages (text) photographs tables of equipment specs (derived manufacture's spec sheet info/options, etc.)(WMATA will provide.)
1-8	<b>SYSTEM TROUBLESHOOTING CHARTS</b> (decision tree type flow charts, and horiz. symptom/test/result charts)	1+ 4+	page (text) charts
1-9	<b>SYSTEM/INSTALLATION DRAWINGS</b> (one complete set of system and installation drawings for the current version system, plus block and level diagrams for each prior version)	8+	drawings

OVERRIDING MINIMUM REQUIREMENT TOTALS

Total Page Requirement includes at least 90 full text pages, plus partial text pages; plus pages with photos, charts, tables, illustrations, and title pages	200 (or more)
Total Drawing Requirement, fold-out sizes	10 (or more)
Grand Total of Pages and Drawings Required (minimum acceptable count)	210

Note: The Engineer may allow minor variations to individual section minimum page requirements, when such actions are in the best interest of the Authority, so long as overriding minimum requirements are satisfied.

Table of Contents Outline with Minimum Content Requirements:  
 Fiber Optic System O&M Manual  
 (Volume A - FOS Systems Manual)

<u>SECTION</u>	<u>TITLE/CONTENTS</u>	<u>QTY</u>	<u>MAKEUP</u>

 Mobile Radio System O&M Manual  
 (Volume A - MRS Systems Manual)

<u>SECTION</u>	<u>TITLE/CONTENTS</u>	<u>QTY</u>	<u>MAKEUP</u>
1-1	<b>INTRODUCTION</b> (scope of manual coverage, i.e. all types of mobile radio systems installed in WMATA facilities) (WMATA will provide brief section on Rail Car radios system.)	1	page (text)
1-2	<b>SYSTEM DESCRIPTION</b> (detailed description of the latest system, with brief information about major differences in prior system installed in WMATA facilities) (WMATA will provide brief section on Rail Car radios system)	9+ 2+ 1+	pages (text) photographs illustration (sketch)
1-3	<b>SYSTEM SPECIFICATIONS</b> (complete detailed specification for the latest system, with major differences for prior versions still in use) (WMATA will provide brief section on Rail Car radios system)	1+	table
1-4	<b>SYSTEM THEORY OF OPERATION</b> (system theory of operation in detail, covering the latest version of WMATA mobile radio systems) (WMATA will provide brief section on Rail Car radios system)	5+	pages (text)
1-5	<b>INSTALLED SYSTEM CONFIGURATIONS</b> (include written and photographic details covering all types of mobile radio systems in use) (WMATA will provide brief section on Rail Car radios system)	3+ 15+	pages (text) photographs
1-6	<b>EQUIPMENT LIST</b> (separate lists for each configuration installed in WMATA passenger stations and yards) (WMATA will provide brief section on Rail Car radios system)	1+	page (text)

1-7	<b>EQUIPMENT CHARACTERISTICS</b> (including all models of equipment utilized in various types of WMATA mobile radio systems)	8+ 8+ 8+	pages (text) photographs tables of equipment specs (derived manufacture's spec sheet info/options, etc.)(WMATA will provide.)
1-8	<b>SYSTEM TROUBLESHOOTING CHARTS</b> (decision tree type flow charts, and horiz. symptom/test/result charts) (WMATA will provide brief section on Rail Car radios system)	1+ 4+	page (text) charts
1-9	<b>SYSTEM/INSTALLATION DRAWINGS</b> (one complete set of system and installation drawings for the current version system, plus block and level diagrams for each prior version) (WMATA will provide brief section on Rail Car radios system)	8+	drawings

OVERRIDING MINIMUM REQUIREMENT TOTALS

Total Page Requirement includes at least 60 full text pages, plus partial text pages; plus pages with photos, charts, tables, illustrations, and title pages)	230+
Total Drawing Requirement, fold-out sizes	15+
Grand Total of Pages and Drawings Required (minimum acceptable count)	245+

Note: The Engineer may allow minor variations to individual section minimum page requirements when such actions are in the best interest of the Authority, so long as overriding minimum requirements are satisfied.

**1.12 TRAINING**

- A. The objective of the training program shall be to qualify WMATA training instructors, field engineers, and key supervisory personnel to train WMATA maintenance and operating personnel to properly operate, diagnose, troubleshoot and maintain the communications equipment and/or systems provided by, or affected by, work in this Contract.
- B. The Contractor shall provide training for Authority training instructors, engineers, key supervisory technical personnel, and a cadre of maintenance personnel. Training in operating and maintaining equipment shall be provided in accordance with these Specifications. Training shall consist of a combination of formal classroom instruction and hands-on equipment training. Classrooms and on-site training locations will be provided by WMATA. All test equipment and tools for training equipment installation and training course work shall be provided by the Contractor, (for both Contractor personnel and WMATA Trainee use) until training is complete.
- C. Scope of Training Program
  - 1. The training program shall be devoted to overall system functioning and instruction on key items of equipment. The training shall be a combination of formal and hands-on training, including demonstrations. Training shall be conducted at Authority training facilities.
  - 2. The Contractor shall provide the instruction and training sessions specified herein.
  - 3. As part of the Engineering Development Review, the Contractor shall submit a Training Concept Plan to the Authority for approval. It shall include the subject matter to be covered, a tabulation of the hours of instruction to be provided, and the equipment to be included in the training program. It shall include a list of proposed

Contractor training to be conducted at various Authority facilities and locations. The Authority will select training sessions from this list.

- D. Training Course Objectives
1. The Contractor shall develop an individual Training Course designed to cover basic maintenance of the Fiber Optic System using new Training Equipment Mockups supplied by the Contractor.
  2. The maintenance course shall provide each student with instruction designed to meet the following objectives:
    - a. Understanding of the basic overall operation of the Mockup as it relates to an equivalent installed Passenger Station Communications subsystem.
    - b. Understanding of the nature of each of the signal and power inputs and outputs of major Communications equipment items.
    - c. Knowledge of the location of all equipment test points and the best strategy for using the test points.
    - d. Familiarity with the Operation and Maintenance Manuals, and knowledge of how to contact the equipment manufacturers for parts, and information.
    - e. Qualification of the student to begin assuming maintenance (or operations) responsibilities for the system and equipment items.
- E. The Contractor's training program shall be conducted by fully qualified instructors. The instructors shall have thoroughly mastered the specific specialized subject matter involved and shall have the ability to impart technical information to others in easily understood terms. The Contractor shall provide a professional resume for each instructor for review and approval by the Authority. Contractor installation, repair and technical personnel shall also be provided to do installation tasks, with WMATA trainee participation (to the extent agreed to by the Engineer).
- F. Training Aids and Materials
1. The training shall be organized to make optimum use of Volume "B" O&M Manuals, Contract Specifications and Drawings, approved Progress Review material, approved Contractor Shop Drawings, and the test equipment furnished to the Authority, in accordance with other provisions of this Contract. The Contractor shall furnish all other required training aids and materials necessary for the training program.
  2. The Contractor shall provide copies of each Course Outline, copies of each Lesson Plan, copies of Instructor's Guide(s) and copies of Student Work Books. Operations and Maintenance Manuals, Volume "A" System Manuals and Volume "B" Equipment Manuals, furnished by the Contractor, shall be furnished to each student attending the Maintenance Courses, along with additional copies as required.
  3. Training materials, such as lesson plans, study guides, and student handouts, as well as training aids, such as transparencies, slides, photographs, dynamic mockups, models for hands-on demonstration training and hardware cut-aways, utilized in the courses shall become property of the Authority.
- G. WMATA requires the following training course materials to be delivered by the Contractor, according to the following specifications:
1. An instructor's guide, containing all the information and directions necessary for the instructor to make an effective presentation. It shall include adequate guidelines to conduct a comprehensive training program. Individual lessons within the course shall be organized as separate blocks (or modules) which may be taught individually. The Instructor Guide should contain, at a minimum:
    - a. Discussion of student prerequisites (if any);

- b. Program overview;
  - c. Statement of overall program goals;
  - d. Lesson plans (a session by session outline containing the following):
    - 1) Student learning objectives, stated in measurable terms;
    - 2) Overview of each lesson;
    - 3) Suggested instructional methods/ learning activities;
    - 4) Required equipment and/or resources.
2. Student work books, to include all materials for the student to interact in the learning situation. It shall contain, at a minimum:
- a. Program overview/introduction;
  - b. Statement of overall program goals
  - c. Learning objectives, stated in measurable terms, that specifically describe desired behaviors or knowledge to be gained;
  - d. A fully-developed prose treatment (not outline format) of content presentation, developed in the same modular format as the Instructor's Guide;
  - e. Illustrations, charts, or graphics, as needed to enhance text presentation;
  - f. Problems/questions related to lesson content, as appropriate.
3. Audio-visual aids, (handouts, transparencies, slides, films, and mock-ups used to conduct the Training Courses).
4. Supplemental materials, a functional mockup, or a functional representation, is required of any equipment item which requires theoretical discussion. This may be in the form of an animated schematic, a model of the equipment, an actual device, an interactive video training device, or a WMATA approved substitute. All mockups become the property of WMATA.
5. The Contractor shall deliver final copies to WMATA as follows:
- a. Two complete sets of training materials that are completely camera-ready. Camera-ready copy is defined as typewritten or typeset originals or high-quality copies from which further copies can be made with no noticeable decrease in copy quality.
  - b. Five copies of all student and instructor materials, to be used for archival purposes in the WMATA Technical Library.
- H. The Contractor shall meet the following specifications in instructional delivery.
- 1. A description of instructor qualifications, resume, curriculum vitae, or other similar credentials must be submitted to WMATA at least 60 days prior to the presentation of training. The description should document a thorough knowledge of the equipment being taught, an understanding of the adult learning process, and demonstrated experience in vocational instruction.
  - 2. The course shall include at least 4 hours of instruction for each major system, and at least 1 hour of instruction for each significant minor system/subsystem (course layout and time allotment shall be submitted for approval by the Authority at least 30 days prior to scheduled classes).
  - 3. For the purposes of course development and presentation, contractors should assume all WMATA students are high school graduates (or equivalent), and that maintenance personnel possess the ability to use basic hand tools and electronic test equipment, and that most trainees have some experience with the systems to be taught.
  - 4. Instructors shall include written and/or practical tests in the Training Courses. Whenever possible, a practical hands-on test shall be developed to demonstrate the transference of operational/ maintenance skills. Results and student evaluations will be provided to the Engineer on a confidential basis, for WMATA use.

### **1.13 SAMPLES**

- A. Samples For Review:
  - 1. Submitted to Engineer for review for the limited purpose of checking for conformance with information given and the design concept expressed in the contract documents.
  - 2. After review, produce duplicates and distribute in accordance with Submittal Procedures article above and for record documents purposes.
- B. Samples For Information:
  - 1. Submitted for the Engineer's knowledge.
- C. Samples For Selection:
  - 1. Submitted to Engineer for aesthetic, color, or finish selection.
  - 2. Submit samples of finishes from the full range of manufacturers' standard colors, textures, and patterns for Engineer selection.
  - 3. After review, produce duplicates and distribute in accordance with Submittal Procedures article above and for record documents purposes.
- D. Submit samples to illustrate functional and aesthetic characteristics of the Product, with integral parts and attachment devices. Coordinate sample submittals for interfacing work.
- E. Include identification on each sample, with full Project information.
- F. Submit the number of samples specified in individual specification sections, one of which will be retained by Engineer.
- G. Reviewed samples that may be used in the Work are indicated in individual specification sections.
- H. Samples will not be used for testing purposes unless specifically stated in the specification section.

### **1.14 DESIGN DATA**

- A. Submitted for the Engineer's review.
- B. Submit for information for the purpose of assessing conformance with information given and the design concept expressed in the contract documents

### **1.15 TEST REPORTS**

- A. Submitted for the Engineer's review.
- B. Submit test reports for information for the purpose of assessing conformance with information given and the design concept expressed in the contract documents.

### **1.16 CERTIFICATES**

- A. When specified in individual specification sections, submit certification by the manufacturer, installation/application subcontractor, or the Contractor to Engineer, in quantities specified for Product Data.
- B. Indicate material or Product conforms to or exceeds specified requirements. Submit

supporting reference data, affidavits, and certifications as appropriate.

- C. Certificates may be recent or previous test results on material or Product, but must be acceptable to Engineer.

#### **1.17 MANUFACTURER'S INSTRUCTIONS**

- A. When specified in individual specification sections, submit printed instructions for delivery, storage, assembly, installation, start-up, adjusting, and finishing, to Engineer for delivery to Authority in quantities specified for Product Data.
- B. Indicate special procedures, perimeter conditions requiring special attention, and special environmental criteria required for application or installation.
- C. Refer to Section 16707 - Quality Control, Manufacturers' Field Services article.

#### **1.18 MANUFACTURER'S FIELD REPORTS**

- A. Submitted for the Engineer's review.
- B. Submit report within 30 days of observation to Engineer for information.
- C. Submit for information for the purpose of assessing conformance with information given and the design concept expressed in the contract documents.

### **PART 2- PRODUCTS**

**NOT USED**

### **PART 3 - EXECUTION**

**NOT USED**

**END OF SECTION**

## SECTION 16707

### COMMUNICATIONS SYSTEMS QUALITY ASSURANCE & TESTING

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. These quality control (QC) system requirements define characteristics, in addition to those in Division 1 of the Specification, of the quality control system that must be implemented by the Contractor during the course of Communications System design, equipment procurement, factory testing, installation and acceptance testing.
- B. The Contractor shall provide and maintain a Quality Assurance Plan, and an Inspection and Testing Plan covering the equipment, materials, and services specified herein.
- C. The CQCS Quality Assurance Program, Quality Assurance Plan, and Inspection and Testing Plan, including related directives, procedures, processes, instructions, forms and schedules, shall be submitted to the Engineer for approval. The basis for approval shall be the Engineer's acceptance of a document describing how the Quality Assurance Program requirements, set forth herein, shall be met and the acceptance of the form and substance of each document submitted for approval. The approved program and plans shall be used by the Contractor in the performance of any inspection of the equipment, materials and services being furnished. If program/plans are returned as unacceptable, the Contractor shall revise and resubmit the Quality Assurance Program or plans to the Engineer within 30 calendar days.
- D. The basis for this quality control (QC) system requirements are the American National Standards Institute (ANSI) Standard ANSI/ISO/ASQC Q9002-1994 entitled "Quality Systems -Model for Quality Assurance in Production and Installation and Servicing.." Quality control systems based on other standards may also be acceptable provided they contain elements that meet these requirements.

##### 1.02 RELATED SECTIONS

- A. Division 1
- B. Division 16 - Communications Sections

##### 1.03 REFERENCES

- A. American National Standards Institute (ANSI) Standard ANSI/ISO/ASQC Q9002-1994

##### 1.04 DEFINITION OF TERMS

- A. Quality Assurance Program: The document containing the Contractor's quality-related policies, practices, procedures and methods, which are utilized to assure compliance with Contract Specifications.
- B. Quality Assurance Plan: A document detailing how the Contractor will implement the Quality Assurance Program

- C. Inspection and Test Plan: A document detailing how the Contractor will inspect and test Contract equipment, materials, workmanship, and services.
- D. Inspection: The physical act of verifying, by measurement and examination of the equipment, materials, workmanship, and services, that they conform to approved documents and established quality requirements.
- E. Audit: An examination of the Contractor's implementation of the approved Quality Assurance Program for the purpose of determining compliance with and conformance to the Quality Assurance Plan and other related documents.

#### **1.05 QUALITY POLICY**

- A. The Supplier shall establish and document policies to implement quality control systematically in a manner that meets these QC system requirements. These policies shall be revised or amended until they are accepted by the Engineer.

#### **1.06 QUALITY SYSTEM**

- A. The Contractor shall document and implement a quality control system consistent with the policies accepted by the Engineer. The quality system shall include:
  - 1. Written procedures and instructions governing the work covered by this contract.
  - 2. Effective and verifiable implementation of these procedures and instructions.
- B. Activities affecting quality shall be prescribed via documented instructions, procedures, or drawings of a type appropriate to the circumstances and shall be accomplished in accordance with these instructions, procedures, or drawings.
- C. Instructions, procedures, or drawings shall include appropriate measurable or otherwise verifiable criteria for determining that important activities have been satisfactorily accomplished.

#### **1.07 ORGANIZATION**

- A. The submitted Quality Assurance Program document shall be organized as follows:
  - 1. Name of Contractor and Contract
  - 2. Revision Dates
  - 3. Index
  - 4. Contents
- B. The Contractor shall identify the elements of its organization involved with this Contract, including subcontractors and Original Equipment Manufacturers (OEMs), and the scope of responsibility and authority of these parties.
- C. Interfaces with OEMs, subcontractors, and WMATA shall be identified and the scope of each group's responsibilities described
- D. The responsibility, authority and the interrelation of personnel who manage, supervise, perform and verify work affecting the quality of items intended for WMATA shall be defined, particularly for personnel who must exercise authority to:
  - 1. Initiate, recommend or provide solutions through designated channels to eliminate identified noncompliance or nonconformance,
  - 2. Control further processing, delivery or installation of items until the noncompliance or nonconformance has been corrected, and

3. Initiate action to prevent the occurrence of noncompliance or nonconformance.
- E. Inspection and testing functions shall have sufficient resources and organizational independence to perform their responsibilities. Except in-process monitoring, they shall not report to the same management as those who performed the work nor have had input as to how the work was accomplished or accepted.

#### **1.08 SCOPE**

- A. The Contractor shall provide a statement that identifies the functional areas of Contractor work and the locations where such work is performed. The Quality Assurance Program shall apply to all equipment, systems, and services included in these Specifications, except as otherwise stated. The Contractor's functional work area breakdown shall include, but shall not be limited to, management, engineering, procurement, manufacturing, installation, and inspection.

#### **1.09 SUBMITTALS**

- A. The Quality Assurance documents shall be submitted within 30 calendar days after Notice-To-Proceed. Contractor test and inspection procedures shall be added to the approved Quality Assurance Program within 30 days after they are developed. Details concerning fabrication processes for equipment and systems that require development shall be added to the approved Quality Assurance Program as the development work progresses (within 30 days after they are developed).

#### **1.10 DELIVERY, STORAGE AND HANDLING**

- A. The Contractor shall establish and implement measures for maintaining the integrity, security, and acceptability of items during receiving, handling, storage, movement or placement of items.
- B. The Contractor shall maintain packing and preservation of items to the extent necessary to ensure conformance with this contract until these items are installed. The packaging of items inspected at the receiving point shall be resealed upon completion of the inspection.
- C. The Contractor shall provide secure storage areas to prevent loss of, damage to, or deterioration of items pending their use:
1. Items of different types shall be segregated while in storage;
  2. Measures shall ensure that the shelf life of items which deteriorate over time are reported, and that those with expired shelf life are scrapped;
  3. Special environment, maintenance (when items are stored for long periods), and stacking limits required by the manufacturer shall be observed.
  4. In order to detect deterioration, the condition of items in storage shall be checked and assessed at appropriate intervals.
  5. Appropriate methods shall be established for authorizing receipt or release of items at these storage areas.
- D. Handling
1. The Contractor shall employ qualified personnel, methods and equipment to prevent damage during handling.
  2. Handling equipment and rigging shall be periodically inspected, maintained and tested. Load capacities or ratings shall be visible on the equipment; capacities and ratings shall not be exceeded.

3. Operators shall be trained, and, where required by local codes or elsewhere in this contract, certified. WMATA requirements and rules for use of handling equipment shall also be observed at all WMATA properties, leased premises, or construction sites.

## **PART 2 - PRODUCT**

### **NOT USED**

## **PART 3 EXECUTION**

### **3.01 QUALITY MANAGEMENT**

- A. The Contractor shall identify and describe the organizational units having responsibility and authority for development, implementation, and management of the Quality Assurance Program. Achievement of quality objectives shall be verified by individuals and organizations that are responsible for checking, inspecting, auditing, or otherwise verifying that the work has been performed satisfactorily.
- B. The Contractor shall identify the program for assuring that sufficient records are maintained to provide documentary evidence of the performance of activities affecting quality and for use in managing the Contract. Typical records shall include Quality Assurance plans, procedures, instructions, nonconformance or defect reports, corrective action reports, and such other quality-related documents as are specified in the Contract Specifications.
- C. The Contractor shall identify the program for verifying and determining the cause of unsatisfactory product or workmanship quality and for initiating necessary improvements and corrections to preclude repetition. The Contractor's program should extend, when necessary, to the performance of subcontractors and suppliers.

### **3.02 DESIGN (AND DEVELOPMENT)**

- A. The Contractor shall prepare and maintain a plan for inspecting the quality of engineering, development, testing, and documentation activities. The Contractor shall identify the procedures, practices, tables, charts and diagrams applicable to the effort.
- B. The Contractor shall document the engineering criteria applicable to the product being supplied. Include performance objectives, operating ranges and conditions, requirements for safety, reliability, availability, the requirements (codes, standards, and practices) for materials, fabrication, construction, testing, operation, maintenance, and quality assurance.
- C. Studies, to be conducted in support of the engineering (or development) activity, shall be identified by the Contractor. They shall include analysis of allowable "tradeoffs" and alternatives, identification of potential weaknesses, and the appropriate preventative engineering features, operating and maintenance practices, and safety precautions.
- D. The Contractor shall identify the program for assuring that specifications, drawings, and other engineering documents will delineate, as applicable:
  1. Materials and methods, including fabrication, construction, installation, inspection, maintenance cleaning, packaging, shipping, handling, and storage.
  2. Traceability of materials, parts, components, and processes through appropriate lot, piece part, serial, or other appropriate numbers.
  3. Product or workmanship acceptance criteria and the checkpoints during the work process for verifying compliance with the criteria.

- E. The Contractor shall identify the methods and procedures for defining and controlling engineering interfaces with other project participants and design organizations. The procedures shall cover the exchange of required engineering data, analysis and resolution of engineering interface problems.
- F. The Contractor shall identify procedures for controlling release of documents for authorized use.
- G. The Contractor shall identify procedures for documenting the reporting, verifying, analysis, and correcting of troubles that occur during development.
- H. Design criteria and input, including computer applications software, shall be identified, documented, and their selection reviewed by those responsible for the technical adequacy of the design. In all cases, the names of the preparer, checker, and the date the checker accepted the document shall be shown.
- I. Incomplete, ambiguous, or conflicting requirements shall be resolved by those who drew up the design criteria and input and those who approved their selection.
- J. The design input obtained from surveys of existing systems, structures, or facilities shall be documented and identified.
- K. Design output (calculations, specifications, and drawings) shall be documented as requirements in a clear, logical, and uniform manner.
- L. In all cases, the names of the preparer, checker and the date the checker accepted the document shall be shown.
- M. Where required by the applicable Code, design standard, or this contract, design output shall be certified and/or sealed by the appropriate professional practitioner.
- N. The calculation method or computer program shall be identified (including computer software version). The reference source of special, state-of-the-art, or experimental features that are not widely accepted in the railroad industry shall also be identified and those features briefly summarized.
- O. Where the design output is a computer or computer software, specifications, user manuals, and testing and validation files shall be provided. Where the contract conveys to WMATA the license to duplicate, upgrade, repair, and modify the computer or computer code, detailed schematic diagrams, specifications, any special tools, and working standards shall be provided to enable the exercise of the license.
- P. The design shall be verified to have met the requirements of this Contract. Design verification shall be documented and may take the form of design review, checking, alternative analysis or calculation, comparison with proven design, or performance of qualification tests and demonstrations. Design verification documentation. (including OEM equipment qualification testing) shall be made available to the Engineer upon request.
- Q. The Contractor shall establish and implement measures to identify, control, and assess the impact of proposed design changes (including those from the OEMs) on specified functional, safety, and quality requirements, and added cost and schedule changes are identified and justified.

- R. Design changes shall be reviewed, verified and approved in the same manner as the original version. The Contractor shall assign qualified personnel to review and coordinate design changes.
- S. The Contractor shall obtain the Engineer's approval of proposed changes prior to implementing these.

### **3.03 DOCUMENT CONTROL**

- A. The Contractor shall establish and implement measures to control reports, procedures, contract technical deliverable documents, OEM and subcontractor technical submittals, and other records and information it generates or receives that relate to equipment performance characteristics, qualification testing, factory testing, installation, inspection, and acceptance testing. This control shall ensure that:
  - 1. The latest, approved versions of documents or information described above are available where affected Supplier's activities are performed.
  - 2. Revised documents are redistributed to those who received the previous issue.
  - 3. Superseded or obsolete documents are promptly removed from areas of work and stations where controlled documents must be distributed.
  - 4. Changes are reviewed and approved by the same functions or organizations that performed the original review and approval or their designated successors.
  - 5. A means (such as a list or computerized database) to identify the current revision of instructions, procedures, drawings, specifications, or calculations is available.
  - 6. Communications (memorandums of meetings, requests for clarification, etc.) and reports are issued or responded to in a timely manner.
- B. The Contractor shall establish and implement measures to revise and maintain procedures and other records that relate to the performance characteristics, installation, inspection, and testing of components, equipment, or systems in an updated condition. Current as-built condition of equipment shall be retained on file.
- C. Purchasing documents shall contain data clearly describing the product ordered, including, where applicable:
  - 1. The type, class, style, grade, or other precise requirements,
  - 2. The title, number designation and revision of specifications, drawings, process requirements, inspection/test requirements and other relevant technical and quality control requirements, including requirements for approval or qualification of product, procedures, process or inspection equipment and personnel.
  - 3. The title, number and revision of any applicable technical and quality standards to be applied to the product.
  - 4. As a minimum, OEMs shall be required to furnish Certificates of Conformance to the design and manufacturing standards specified by the Supplier, together with the equipment supplied.

### **3.04 PROCUREMENT**

- A. The Contractor shall identify the procedures for controlling the receipt, inspection, testing, handling, storage, and distribution of received equipment and its protection from damage, deterioration, loss or substitution. Inspection instructions and test procedures shall provide for verification of characteristics required by the Contract Drawings and Specifications, and documentation of results.

- B. The Contractor shall identify the procedures for controlling purchased items that do not conform to Specifications. The procedures shall provide for prompt identification, documentation, segregation, technical review, and disposition of non-conforming items.
- C. The Contractor shall establish and implement measures for obtaining items and services from suppliers or subcontractors that conform with specified requirements:
  - 1. The Contractor shall select its OEMs, subcontractors and other sub-suppliers on the basis of their ability to meet specified requirements
  - 2. Any procurement requirement which differs from those in the selected OEM, subcontractor, or other sub-supplier's proposal or offer is resolved and the resolution incorporated into the purchase order or contract, and
  - 3. Records are maintained to show acceptability of the selected OEM, subcontractor, or other sub-supplier (where available, records of previously demonstrated capability and performance should be provided to show acceptability of the selected supplier).

### **3.05 MANUFACTURING, FABRICATION, AND ASSEMBLY**

- A. The Contractor shall identify the procedure and instructions that will be used to assure that fabrication, processing, and assembly operations are being satisfactorily performed.
- B. The Contractor shall identify the inspection and test plans that will be applied to all manufacturing activities for the purpose of verifying conformance to procedures and instructions.
- C. The Contractor shall identify the method employed for tracing the identity of materials and items throughout fabrication, processing, or assembly operations.
- D. The Contractor shall identify the procedures, instructions, and checklists for the control of the fabrication and assembly processes. This shall include such items as shop orders, process sheets, travelers, and inspection instructions, covering all mechanical, electrical, and metallurgical processes. Inspection instructions shall identify the nondestructive examination processes employed.
- E. The Contractor shall identify the methodology of the program including record maintenance.
- F. The Contractor shall identify the procedures for prompt identification, documentation, segregation, technical review, and disposition of non-conforming items.
- G. The Contractor shall identify the procedures and instructions for handling, preserving, packing, packaging, storing, and shipping items shipped to the construction site.

### **3.06 INSTALLATION**

- A. The Contractor shall identify the procedures, check off lists, and instructions governing receipt inspection of equipment on arrival at the construction site. The Contractor shall include in the procedures the control of non-conforming items.
- B. The Contractor shall identify the procedures for on-site configuration control. This shall include the control of drawings, specifications, work instructions, quality-control procedures, inspection instructions, and testing procedures, used in connection with installation.
- C. The Contractor shall identify the procedures and work instructions that apply to installation methods, tests, repairs and rework, cleaning and protection.

- D. The Contractor shall identify the inspections and tests to be performed to verify installation suitability.
- E. The Contractor shall identify the procedures for controlling the on-site identification, documentation, segregation, technical review, and disposition of non-conforming supplies or workmanship.

### **3.07 INSPECTION AND TESTING**

- A. The Contractor shall establish and implement a Unified Test Program that will ensure all communications and related systems, equipment, material and services, furnished during the performance of this Contract, meet the technical requirements and standards specified, as well as all performance criteria.
- B. As part of the Contractor's area of responsibility for the Unified Test Program, the Contractor will be required to:
  - 1. Develop a comprehensive Test Plan detailing methods and test procedures to be utilized to ensure compliance with all applicable specifications.
  - 2. Develop detailed test procedures for each individual test within each category of testing, except Authority tests.
  - 3. Submit the Test Plan (including Authority System Validation Tests, Substantial Completion Acceptance, and Final Acceptance Programs) and all test procedures to the Engineer for evaluation, review, and acceptance or rejection. Revise and resubmit until acceptance by the Engineer is received.
  - 4. Furnish personnel, calibrated test equipment, tools, and miscellaneous supplies as necessary to perform all tests and retests, and to maintain all systems and equipment during the test period and until acceptance by the Authority.
  - 5. Coordinate Unified Test Program activities with the schedules and activities of other contractors and with the Engineer, to avoid conflicts with Authority operational requirements.
  - 6. Perform tests and inspections as detailed in all approved test procedures.
  - 7. Evaluate test procedure and inspection results and documentation. Prepare detailed test evaluation reports, summary reports and progress reports.
  - 8. Submit all raw test data, test results, evaluations, and summary reports for evaluation, review and acceptance or rejection by the Engineer.
  - 9. Prepare and submit revised test procedures and test plans to correct procedural and technical errors or omissions discovered in those documents, after their initial Authority acceptance.
  - 10. Furnish corrective actions to effect Specification compliance, including: Remedy test program deficiencies, and system, equipment, material, workmanship, and documentation deficiencies promptly upon request by the Engineer.
  - 11. Perform retesting and additional inspections until successful results are obtained, evaluated, and accepted by the Engineer.
  - 12. Participate in Authority Pre-final Inspections, Substantial Completion (if any), and Final Acceptance activities. Clean the equipment and work site, secure the equipment, and remain responsible for prompt repair or replacement in the event of loss or damage until acceptance by the Authority is received. Furnish inventory services and demonstrate system or equipment operation in support of requests by the Authority. Provide support and access so that the Authority Engineers, Technicians, Mechanics and Inspectors can inspect and test any portion of the work during normal work hours.

13. Provide Unified Test Program reports on a monthly basis beginning within 30 days after the Engineer's acceptance of the Test Plan, and continuing until the final completion of all contract work.
- C. The performance of each task requirement shall be subject to the Engineer's acceptance of methods, procedures, and results, for Specification compliance, and as to scheduling for the benefit of the Authority.
- D. A Preliminary Test Plan shall be submitted to the Engineer for review. Subsequently, the Final Test Plan shall be submitted to the Engineer for review and acceptance or rejection. In the event of rejection or subsequent rejections, corrected re-submissions shall be delivered to the Engineer within 15 days after the receipt of each rejection. An accepted Test Plan shall be required prior to implementing any category of tests except for factory tests and inspections, installation and completion tests, inspections for cable, and associated terminal equipment, which may be accepted on an individual basis for equipment, and materials that are scheduled to be installed or delivered prior to NTP + ###.
- E. Detailed test procedures shall be submitted to the Engineer for review and acceptance or rejection. In the event of rejection or subsequent rejections, corrected re-submissions shall be delivered to the Engineer within 15 days after receipt of each rejection. Approved test procedures shall be required prior to commencing any associated test.
- F. Each individual test procedure shall include, but not be limited to: An outline of test objectives, detailed step-by-step procedures with required results and allowable tolerances for each measurement or observation, diagrams illustrating all required test set-ups, manufacturer and model number of each unit and accessory item of required test equipment, and further details as may be required by the Engineer to ensure that both Contractor and Authority field forces are presented with a totally comprehensive, understandable and accurate working procedure.
- G. The Contractor shall include complete and adequate safety procedures, warnings, and emergency instructions in Test Plans and test procedures, as appropriate. Test procedures shall also include complete examples of test Data Record Forms with required resultant values and allowable tolerances, in accordance with Specification requirements.
- H. The Authority reserves the right to perform additional non-destructive tests and inspections at any time during the course of the contract work. Results indicating deficiencies involving noncompliance with Specification requirements will be reported to the Contractor for corrective action.

### **3.08 DEFICIENCIES**

- A. If the Engineer determines from test data acquired from any category of test(s) that the system, equipment, materials, technical documentation, or services furnished do not conform to any Specification requirement(s), the Contractor shall recommend appropriate remedial action based on an analysis of test results within fifteen days after receipt of the Engineer's notice of deficiency. When such recommendations relate to engineering deficiencies, the Contractor shall, upon receipt of the Engineer's approval, make the necessary changes to all equipment and documentation of the type to be delivered or previously delivered (even if previously accepted) during the course of the Contract, at no additional cost to the Authority.
- B. When recommendations relate to other deficiencies such as quality control and installation workmanship, the Contractor shall correct all deficiencies at each location, at no additional

cost to the Authority. Retesting after the changes have been completed (Factory Tests and Inspections, Installation Completion Tests and Inspections, and Technical Documentation Verifications) shall be required in whole or part, as determined by the Engineer, at no additional cost to the Authority. If the timely correction of all deficiencies is not completed to effect Specification compliance, as evidenced by the Engineer's acceptance of retest results, the Engineer will initiate remedial actions to the benefit of the Authority. Such actions may include the exercise of warranty, correction of deficiency, delay of payments, disputes or default, and termination actions, in accordance with the General Provisions, or actions of benefit to the Authority, in accordance with any combination of these and other Specification provisions.

### **3.09 CATEGORIES OF TESTS**

- A. Tests and inspections shall be required in each of seven categories, as listed below:
  - 1. Factory tests and inspections, including factory certifications and factory calibration certifications.
  - 2. Installation completion tests and inspections.
  - 3. System and integration tests.
  - 4. System validation tests and evaluations (Authority Conducted Program).
  - 5. Substantial Completion acceptance tests and inspections (if any) (Authority Conducted Program).
  - 6. Technical documentation verification inspections.
  - 7. Final acceptance tests and inspections (Authority Conducted Program).
- B. Each test and inspection in each category shall be comprehensive, so that sufficient test result data and inspection result data is furnished to permit complete detailed examination and evaluation, as determined by the Engineer.
- C. Additional specialized testing shall also be furnished, as defined in individual system specification Sections .
- D. Retesting, and the acceptance or rejection of test results, documentation, and evaluations, shall be within the discretion of the Engineer.

### **3.10 FACTORY TESTS AND INSPECTIONS**

- A. All equipment and materials, including custom developed Additional Equipment and any custom developed Test Equipment, furnished in accordance with these Specifications, shall be subject at all times and during all stages of manufacture and assembly, to inspection, test, and rejection by the Engineer. The Engineer may elect to accept factory or Contractor certifications in lieu of complete test result data for certain items when, 1) a WMATA accepted factory test has been previously conducted on one or more production samples or identical deliverable products, 2) the same brand and model of the product to be furnished has proven reliable in Authority revenue service for one year or more, or 3) to simplify test program administration when not adverse to achieving Test Program objectives.
- B. Before offering items for inspection or test, the Contractor shall furnish a complete set of applicable drawings for Authority use including, but not limited to, schematics, wiring diagrams, major assembly drawings, manufacturing drawings for custom developed equipment, and detailed specifications for the equipment and materials to be tested.
- C. The Contractor shall submit Factory Test and Inspection Plans and Procedures to the Engineer for review. Tests required shall be performed at the point of manufacture and the

point of assembly before shipment to the field. The Contractor shall furnish additional testing by an independent testing laboratory if the manufacturer's Factory Test Plan or Procedures are determined by the Engineer to be inadequate to verify Specification compliance (a maximum of three major items may be designated by the Engineer for independent laboratory testing at no additional cost to the Authority).

- D. After the Engineering Development Review for each system has been submitted and approved by the Engineer, Factory Tests and Inspections shall be scheduled for major items, custom prototypes, and other items of equipment and material designated for such testing by the Engineer, to verify compliance with environmental criteria, quality assurance, specified performance, grade of components, reliability, and workmanship including manufacturing processes. The Contractor shall advise the Engineer, in writing, when manufacturing of equipment begins and again two weeks prior to date of scheduled inspection or tests.
- E. A "Report of Factory Visit" for the purpose of confirmation and subsequent agreement of any decisions made on site shall be prepared by the Contractor and submitted to the Engineer ten working days subsequent to each factory visit by the Contractor, Engineer, or designated Authority Representative. Each report shall include the purpose of the visit, summary of tests performed and decisions made or required prior to factory certification and shipment.
- F. Two copies of test results certified by the manufacturer or an independent laboratory shall be furnished to the Engineer for review and acceptance or rejection prior to shipment. Equipment shall not be shipped before the factory test results have been accepted by the Engineer. Optionally, the Authority may elect to accept Contractor certified test and inspection results in lieu of manufacturer or independent laboratory certified test results.
- G. A 200 hour burn-in period (power on - attended or unattended) shall be required for all units of electrically operated and powered custom-made major items of equipment prior to installation, in accordance with instructions from the Engineer. Each unit of custom made equipment shall be set up and powered on the Contractor's, Subcontractor's, or supplier's premises. Reports of such activity shall be furnished to the Engineer.
- H. The Contractor shall assemble all of the rack-mounted equipment for a Passenger Station Communications Equipment Room and test prior to shipment to the installation site.

### **3.11 INSTALLATION COMPLETION TESTS AND INSPECTIONS**

- A. Installation Completion Tests and Inspections shall be performed after installation to ensure that equipment and materials were not damaged in shipment and that they are properly installed and functioning in accordance with specified criteria, parameters and good commercial practice. Installation Completion Tests and Inspections shall consist of:
  - 1. Visual inspection with check-off lists to verify the following:
    - a. That full compliance with requirements detailed in the General Equipment and Material Standards and General Installation Standards sections of these Specifications has been met.
    - b. That only approved products have been used.
    - c. That Factory Tests and Inspections have been satisfactorily completed for major items, as required.
    - d. That inventory of major equipment and material items is available and accurate.
    - e. That equipment is installed in agreement with approved installation shop drawings.

- f. That wire and cable terminations as to location, cable identification, routing, color code, and workmanship have been identified.
  - g. That Time Domain Reflectometry (TDR) measurements of all coaxial and outside plant cables have been made. Printed TDR records of each coaxial and outside plant cable shall be delivered to the Authority to illustrate the length of cable run (proven by demonstrating an open and a short condition before final termination), and the absence of any detectable faults on each coaxial cable and each outside plant cable pair after installation of the cable.
2. Detailed testing shall be required to demonstrate that material and equipment installed meet the criteria and possess the characteristics and parameters contained in the Contract Specifications; including additional requirements and stated tolerances that are specified in Contractor engineering and product approval data submissions and in manufacturer's published specifications attributed to approved products.
- B. The testing of all items of equipment and material shall include electrical, mechanical, operational, and functional parameters. Such parameters include, but are not limited to: Levels of voltages, currents, power, distortion, noise, cross-talk, insulation resistance, continuity, attenuation (optical and electrical), physical strength, suitability of mounting method, paint and marking quality, graphics quality and style, location of operating controls and adjustments, and maintainability.
  - C. These tests shall be performed after the installation of material and equipment and shall be in addition to any Factory Tests and Inspections previously performed. The Contractor shall perform all necessary alignments, adjustments, and maintenance prior to requesting the scheduling of Installation Completion Tests and Inspections.
  - D. The Contractor shall advise the Engineer, in writing, two weeks prior to the date(s) of scheduled tests and inspections. The Engineer will witness these tests. Two certified copies of Installation Completion Test and Inspection data shall be submitted to the Engineer within seven (7) days after test completion for review and acceptance or rejection.

### **3.12 SYSTEM AND INTEGRATION TESTS**

- A. System and Integration Tests shall be on-site performance tests to verify that all operating parameters and functions perform as specified and that each system performs as specified in conjunction with each system or subsystem with which it interfaces. The Contractor shall demonstrate that all material and equipment elements of each installed system function together to meet the system criteria specified. Each system shall be powered a minimum of 48 hours prior to commencing system and integration tests. The Engineer shall be notified, in writing, seven (7) days prior to equipment being powered. Failures shall be recorded by the Contractor and findings furnished to the Engineer at the end of the 40 hours. The Contractor shall also include a description of corrective actions taken.
- B. The Contractor shall be responsible for meeting all System and Integration Test requirements including testing and documenting interface compatibility and integration with existing Authority-owned systems and equipment.
- C. Each and every interface shall be verified as to operation, function, level, and voltage. The Contractor shall test across the interface points; however, these tests shall only be made under the supervision of appropriate Authority personnel. When minor adjustment to, or reconfiguration of, existing equipment is required, the Contractor shall notify the Engineer, in writing, of the required adjustment or reconfiguration. Authority personnel will make the

adjustment or reconfiguration in the presence of the Contractor. The Contractor shall be responsible for the necessary adjustments or reconfigurations of Contractor-furnished equipment to ensure proper functioning, as specified.

- D. The successful completion of all specified Factory Tests and Inspections, and Installation Completion Tests and Inspections, including the correction of all outstanding discrepancies and subsequent retesting, is required as a prerequisite to System and Integration Tests.
- E. The tests will vary with each specific system. However, each test shall include all operating parameters and functions. Tests shall be conducted on a location-by-location basis with all failures and discrepancies noted. The Contractor shall not engage in further testing until the Engineer has verified that the Contractor has taken necessary corrective action with respect to those failures and discrepancies. The Contractor shall retest after each successive failure and corrective action to verify Specification compliance.
- F. The Contractor shall advise the Engineer, in writing, two weeks prior to the date(s) of scheduled tests. Prior to commencing the System and Integration Tests, the Contractor shall provide failures recorded and corrective action taken, at the conclusion of powering equipment a minimum of 40 hours. The Engineer will witness these tests. Two certified copies of System and Integration Test data sheets shall be submitted to the Engineer within seven (7) days after test completion for review and acceptance or rejection.

### **3.13 MEASURING AND TEST EQUIPMENT**

- A. The Contractor shall establish and implement measures for the selection, calibration, and control of measuring and test equipment (M&TE) used to determine conformance.
- B. M&TE of a range, accuracy, and sensitivity conforming with measurement tolerances specified within this contract shall be selected and used.
- C. Calibration procedures shall require M&TE identification and establish frequency of calibration, calibration method, acceptance criteria, records to be generated, and the action to be taken when results are unsatisfactory.
- D. M&TE shall be periodically calibrated using certified references traceable to the National Institute of Standards and Technology (NIST), to other nationally recognized standards when no such NIST standards exist, or to a documented standard acceptable to the Engineer when none of the preceding standards exist.
- E. The calibration of M&TE shall be checked at prescribed intervals if testing or inspection will continue over an extended period.

### **3.14 INSPECTION AND TEST STATUS**

- A. The Contractor shall establish and implement measures to identify and maintain the inspection and test status of systems, equipment or components until these are accepted by the Engineer, to ensure that only purchased items that have passed the required inspection and test have been used.
- B. The means for status identification shall be such that the surface of the item is not damaged nor its use impaired. Status identification may also be via inspection records, test software, physical location, or other suitable means, which indicate the conformance or nonconformance of these items with regard to inspection and tests performed.

### **3.15 CONTROL OF NONCONFORMANCE**

- A. The Contractor shall establish and implement measures to prevent the inadvertent use or installation of nonconforming items.
- B. Procedures shall provide for identification, segregation, documentation, evaluation, and disposition of nonconforming items, define the responsibility and authority for the disposition of nonconforming item.
- C. Nonconforming items shall be positively identified and the matter brought to the attention of Supplier's management representative, the Engineer, and the appropriate OEM, subcontractor or sub-supplier.
- D. The Contractor shall hold the nonconforming item from further work and, where possible, shall be physically segregated in an area clearly marked, until the responsible parties have provided for the disposition of the item.
- E. The disposition of a nonconforming item may be:
  - 1. Reworked (to meet original requirements)
  - 2. Accepted as-is
  - 3. Repaired (to meet an alternative criteria)
  - 4. Re-graded (for alternative use)
  - 5. Rejected, returned to vendor, or scrapped
- F. The Contractor shall obtain written approval from the Engineer prior to using a nonconforming item as-is or repairing it to be acceptable to a standard different from the original standard.
- G. Nonconforming items that have been repaired or reworked shall be re-inspected or retested by the party responsible for the original inspection or test in accordance with approved acceptance standards before being declared acceptable.
- H. The technical details of nonconformity that have been accepted as-is and of any repairs made shall be included in "as-built" documentation.
- I. Items for return to vendor shall be removed from the area of work and controls placed to prevent the reuse of the item or any part of it.
- J. Rejected or scrapped items shall be removed from the area of work and rendered unusable in a manner that prevents their inadvertent use.

### **3.16 CORRECTIVE ACTION**

- A. The Contractor shall establish and implement measures to:
  - 1. Investigate the cause(s) of noncompliance and nonconformance, and identify action(s) to prevent recurrence.
  - 2. Implement corrective action to minimize or eliminate noncompliance or nonconformance.
  - 3. Apply controls over the implementation of corrective action.
  - 4. Incorporate the preventive action into procedures.

### **3.17 QUALITY CONTROL RECORDS**

- A. The Contractor shall establish and implement measures to identify, collect, index, file, and store quality control records as required in the Special Conditions of this Contract.
- B. Quality control records shall be available at designated, controlled, but accessible areas at work locations. Procedures shall identify the responsible custodians for these records.
- C. Quality control records shall be stored and maintained in such a way that they are readily retrievable and provided with a suitable environment that minimize deterioration or damage, and prevent unauthorized alteration or loss.
- D. Quality control records shall be legible, reproducible, identifiable with the item involved, and contain the date of origination and identity of the originator, verifier, and/or responsible supervisor.
- E. Retention period for quality control records shall be defined, and shall be at least as long as the term required in the Special Conditions of this Contract. Quality control records shall be made available to WMATA or its representative throughout the retention period.

### **3.18 AUDITS**

- A. By WMATA
  - B. Quality audits may be conducted by WMATA or its representatives. Direct access to Contractor personnel, original records, items in process, and facilities where work is performed shall be provided by the Contractor. The Contractor shall ensure, via procurement documents, that such access are also provided by their subcontractors and suppliers.
    - 1. The Contractor shall provide a written response within 15 days after receipt of the audit report, fully describing the methods and timetable by which compliance will be achieved. Deficiencies shall be corrected within 30 days after receipt of the audit report.
    - 2. Any survey, audit or inspection performed by WMATA or its representatives shall not relieve the Contractor of any of the responsibilities under this contract.
- C. By The Contractor
  - 1. The Contractor shall carry out a comprehensive system of planned and documented audits to verify whether activities within its scope of responsibility are performed in compliance with applicable portions of this Quality Control system requirements, and to determine the effectiveness of quality control.
  - 2. Audits and follow-up actions shall be carried out in accordance with documented procedures and by qualified personnel. Audit schedules shall be established to ensure coverage of the scope of the quality control system at least once in the life of this Contract.
  - 3. Results of the audits shall be documented and brought to the attention of the personnel having responsibility in the area audited. Management responsible for the area shall take timely corrective action on the deficiencies found by the audit.

### **3.19 TRAINING AND PERSONNEL QUALIFICATION**

- A. The Contractor shall ensure that the Quality Policy are understood and implemented by all elements of its organization that affect the quality of the items or services provided to WMATA.
- B. When qualified personnel are required by this Contract, personnel qualification shall be based on an appropriate combination of education, training and experience. Where

required by the applicable code or standard, personnel qualification shall also be certified. Appropriate records of qualification, training and certification shall be maintained as quality records.

### **3.20 STATISTICAL TECHNIQUES**

- A. The Contractor shall identify any statistical technique to be used for sampling inspections or testing. Acceptance by means of representative sampling shall be in accordance with generally accepted statistical methods.

**END OF SECTION**

## SECTION 16708

### CORRECTION OF COMMUNICATIONS SYSTEMS DEFICIENCIES

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. Definitions: As used in this Section
- B. General Conditions
- C. Deficiencies of Accepted Communications System Materials, Equipment, Systems or Subsystems
- D. Pre-Acceptance Recognition of Deficiencies in Communications System Materials, Equipment, Systems or Subsystems
- E. Time for Performance, Contract Price
- F. Transportation Charges
- G. Failure to Correct
- H. Correction of Deficient Replacements and Re-performances
- I. Disassembly/Reassembly Expense
- J. Warranties

##### 1.02 RELATED SECTIONS

- A. All 16700 and 16800 - Series Sections

##### 1.03 DEFINITIONS: AS USED IN THIS SECTION

- A. Deficiency:
  - 1. Communications System materials or equipment will be regarded as having a deficiency if a type of material or equipment in like service accumulates a failure rate greater than five percent within a period of 24 months following final acceptance by the Authority.
  - 2. Communications System systems or subsystems will be regarded as having a deficiency if they exhibit any condition or characteristics which are not in compliance with the requirements and intent of this Contract anytime during a period extending for 24 months following their final acceptance by the Authority.
- B. Correction
  - 1. Correction of Communications System materials or equipment exhibiting a failure rate greater than five percent means taking of any and all actions necessary to correct the deficiencies, including removal and replacement of all pieces of material or equipment in like service in a manner satisfactory to the designated Resident Engineer.
  - 2. Correction of Communications System systems or subsystems exhibiting one or more deficiencies means taking any and all actions to eliminate any and all deficiencies in a manner satisfactory to the designated Resident Engineer.

#### **1.04 GENERAL CONDITIONS**

- A. The rights and remedies of the Authority provided in this Section:
  - 1. Shall not be affected in any way by any other provisions under this Contract concerning the conclusiveness of inspections and acceptance, and;
  - 2. Are in addition to and do not limit any rights afforded to the Authority by any other Section of this Contract.
- B. This Section shall apply only to those deficiencies discovered by either the Authority or the Contractor within 24 months after acceptance.
- C. The Contractor shall not be responsible under this Section for the correction of deficiencies in Authority-furnished property, except for deficiencies in installation, unless the Contractor performs or is obligated to perform any modifications or other work on such property. In that event, the Contractor shall be responsible for correction of deficiencies to the extent of such modifications or other work.
- D. The Contractor shall not be responsible under this Section for the correction of deficiencies caused by the Authority.

#### **1.05 DEFICIENCIES OF ACCEPTED COMMUNICATIONS SYSTEM MATERIALS, EQUIPMENT ,SYSTEMS OR SUBSYSTEMS**

- A. Notice of Deficiency to Contractor: If the Contracting Officer determines that a deficiency exists in any of the Communications System materials, equipment, systems or subsystems provided to the Authority under this Contract, he will promptly notify the Contractor of the deficiency, in writing, within 30 days.
- B. Recommendation for Correction: Upon timely notification of the existence of such a deficiency, or if the Contractor independently discovers a deficiency in accepted Communications System materials, equipment, systems or subsystems, the Contractor shall promptly submit to the Contracting Officer his recommendation for corrective actions, together with supporting information in sufficient detail for the Contracting Officer to determine what corrective action, if any, shall be taken. The recommendation shall be submitted to the Contracting Officer within 15 working days of notice of the deficiency.
- C. Direction to Contractor Concerning Correction of Communications System Deficiencies: Within 30 days after receipt of the Contractor's recommendations for corrective action and adequate supporting information, the Contracting Officer, at his sole discretion, will give the Contractor written notice not to correct the subject deficiency, or to correct or partially correct the subject deficiency within a reasonable time and at a specified location.
- D. Correction of Communications System Deficiencies by Contractor: The Contractor shall promptly comply with any timely direction by the Contracting Officer to correct or partially correct a Communications System deficiency, at no increase in the Contract price. The Contractor shall also prepare and furnish to the Authority data and reports applicable to any correction required under this Section (including revision and updating of all other affected data called for under this Contract) at no increase in the Contract price.
- E. Schedule of Deficiency Corrections: The Contractor shall prepare a Schedule of Deficiency Corrections and deliver it to the Authority for approval within 15 working days of discovery of a Communications System deficiency by the Authority.
- F. Modification of Contract with respect to Uncorrected Communications System Deficiencies: In the event of timely notice of a decision not to correct, or only to partially correct a

Communications System deficiency, the Contractor shall submit within 15 working days, a technical and cost proposal to amend the Contract to permit acceptance of the affected materials, equipment, systems or subsystems in accordance with the revised requirements, and an equitable reduction in Contract price shall promptly be negotiated by the parties and stated in a modification to this Contract.

**1.06 PRE-ACCEPTANCE RECOGNITION OF DEFICIENCIES IN COMMUNICATIONS SYSTEM MATERIALS, EQUIPMENT, SYSTEMS OR SUBSYSTEMS**

- A. If the Contractor becomes aware at any time before acceptance by the Authority (whether before or after tender to the Authority) that a deficiency exists in any Communications System materials, equipment, system or subsystems, he shall promptly correct the deficiency or, if he elects to invoke the procedures specified in Part 1.05, he shall promptly communicate information concerning the deficiency to the Contracting Officer in writing, together with his detailed recommendation for corrective action.

**1.07 TIME FOR PERFORMANCE; CONTRACT PRICE**

- A. In no event will the Authority be responsible for extension or delays in the scheduled deliveries or periods of performance under this Contract as a result of the Contractor's obligations to correct Communications System deficiencies, nor shall there be any adjustment of the delivery schedule or period of performance as a result of such correction of deficiencies, except as may be agreed to by the Authority in a supplemental agreement with adequate consideration.
- B. It is hereby specifically recognized and agreed by the parties hereto that this Section shall not be construed as obligating the Authority to increase the Contract price of this Contract.

**1.08 TRANSPORTATION CHARGES**

- A. When the Authority returns supplies to the Contractor for correction or replacement pursuant to this Section, the Contractor shall be liable for transportation charges up to an amount equal to the cost of transportation by the usual commercial method of shipment from the designated destination point under this Contract to the Contractor's plant, in addition to any charges specified in Part 1.08.B. The Contractor shall also bear the responsibility for the supplies while in transit.
- B. When compliance with the terms of this Section by the Contractor involves shipment of corrected or replacement supplies from the Contractor to the Authority, the Contractor shall be liable for transportation charges up to an amount equal to the cost of transportation by the usual commercial method of shipment from the Contractor's plant to the designated destination point under this Contract, in addition to any charges specified in Part 1.08.A. The Contractor shall also bear the responsibility for the supplies while in transit.

**1.09 FAILURE TO CORRECT**

- A. If the Contractor fails or refuses to:
  - 1. present a detailed recommendation for corrective action in accordance with Part 1.05,
  - 2. correct deficiencies in accordance with Part 1.05 C, or
  - 3. prepare and furnish data reports in accordance with Part 1.05 D., the Contracting Officer will give the Contractor written notice specifying the failure or refusal and setting a period after receipt of the notice within which it must be corrected.
- B. If the failure or refusal is not corrected within the specified period, the Contracting Officer may, by contract or otherwise, as required:

1. Obtain detailed recommendations for corrective action;
  - a. Correct the materials, equipment, systems or subsystems, or;
  - b. Replace the materials, equipment, systems or subsystems, and if the Contractor fails to furnish timely disposition instructions, the Contracting Officer may dispose of non-conforming materials, equipment, systems or subsystems for the Contractor's account in a reasonable manner, in which the Authority is entitled to reimbursement from the Contractor or from the proceeds for the reasonable expense of care and disposition, as well as for excess costs incurred or to be incurred, and;
2. Obtain applicable data and reports; and charge to the Contractor the cost occasioned to the Authority thereby.

**1.10 CORRECTION OF DEFICIENT REPLACEMENTS AND RE-PERFORMANCES**

- A. Any Communications System materials or equipment corrected or furnished in replacement, and any Communications Systems or subsystems revised pursuant to this Section shall also be subject to all the provisions of the Contract to the same extent as Communications System materials, equipment, systems or subsystems initially accepted, i.e., for a new 24-month period.

**1.11 DISASSEMBLY/REASSEMBLY EXPENSE**

- A. The Contractor shall be liable for reasonable cost of assembly/reassembly of larger items necessary to remove the materials or equipment to be inspected and/or returned for correction or replacement.

**1.12 WARRANTIES**

- A. All Communications System materials and equipment provided under this Contract shall be warranted for a period of 24 months beginning with final acceptance by the Authority.
- B. All subcontractors', manufactures', and suppliers' warranties and guarantees, expressed or implied, respecting any part of the Communications System work, and any materials or equipment used therein shall be deemed obtained and shall be enforced by the Contractor as the agent and for the benefit of the Authority without the necessity of separate transfer or assignment thereof. Furthermore, if directed by the Contracting Officer, the Contractor shall require such subcontractors, manufacturers and suppliers to execute such warranties and guarantees in writing to the Authority.

**PART 2 PRODUCTS**

**NOT USED**

**PART 3 EXECUTION**

**NOT USED**

**END OF SECTION**

## **SECTION 16710**

### **COMMUNICATIONS GROUNDING**

#### **PART 1 - GENERAL**

##### **1.01 SECTION INCLUDES**

- A. This section describes hardware, and installation methods that the Contractor shall use to insure the installation of a competent grounding system that will avoid/minimize ground-loops, and Electromagnetic Interference (EMI) problems in the operation of the communications systems installed under this Contract. In addition to the methods detailed in this Section, the Contractor shall insure that his crews adhere to all generally accepted installation practices that are meant to minimize interference between communications systems.
- B. Equipment and Rack Grounding.
- C. Cable Shield Grounding.

##### **1.02 UNIT PRICES**

- A. Unit Prices include all Required conduits and fittings, junction boxes, wiring, and cabling to provide grounding to the communications systems and facilities and incidental items, not specifically mentioned, but required for complete and proper system operation.

##### **1.03 RELATED SECTIONS**

- A. Section 16705 – Communications Standard Specifications - Equipment & Material.
- B. Section 16706 - Communications System Submittals & Services
- C. Section 16721 -Communications -Telephone System.
- D. Section 16723 -Communications -Garage Emergency Telephone System.
- E. Section 16727 -Communications -Passenger Emergency Reporting System.
- F. Section 16731 -Communications -Fire and Intrusion Alarm System.
- G. Section 16733 -Communications -Kiosk System.
- H. Section 16771 -Communications - Carrier Transmission System.
- I. Section 16776 -Communications - Fiber Optics System.
- J. Section 16791 -Communications - Mobile Radio System.
- K. Section 16820 -Communications - Public Address System.
- L. Section 16821 -Communications - Automatic Public Address Announcement System.
- M. Section 16851 -Communications - Closed Circuit Television System.

#### **1.04 REFERENCES**

- A. NFPA 130 - Standard for Fixed Guideway Transit Systems

#### **1.05 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical system wiring diagram.

### **PART 2 - PRODUCTS**

**NOT USED**

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION**

- A. Ground Communication system and facilities, equipment and cables using a single-point grounding scheme. Each Communication Equipment Room will have a separate isolated ground bus bar designated as "communications ground."
- B. Unless otherwise specified, ground the shields of all single shielded communications cables, the shields of multi-conductor cables that have individual shielded pairs, and the inner shield of all double shielded communications cables and communications cables with separate shield and armor only at a single point and only to the "communications ground." These shields shall be electrically continuous throughout the cable length by bonding across all splices and terminations in equipment enclosures and junction boxes.
- C. Ground the outer shield of all double-shielded communications cables and the armor of all communications cables with separate shield and armor only at a single point in each cable section. Locate the single point ground at the end of the cable section nearest to the associated Communications Equipment Room. Ground outer shield or armor Cable sections originating at Communications Equipment Rooms to the "communications ground."
- D. Electrically isolate equipment racks and equipment cabinets from the building structure, adjacent equipment racks and equipment cabinets. Minimum resistance between adjacent equipment racks and equipment cabinets, and between equipment racks and equipment cabinets and the building structure, shall be 10 megohms. Individually wire each equipment rack and equipment cabinet to the communications ground, via the copper ground bus bar on the equipment rack and equipment cabinet, by a No. 6 AWG, stranded, insulated wire, Type XHHW.
- E. Wire each copper ground bus bar in the multi-section cable terminal housings of the Main Distribution Frame (MDF)/ MDF/Protector Cabinet and the systems distribution frames to the communications ground by a No. 6 AWG, stranded, insulated wire, Type XHHW.
- F. Electrically insulate all power conductors from equipment racks and equipment cabinets, with a separate power ground isolated from communications ground. Insulate Conduit containing power conductors running from ac distribution boxes to equipment racks, equipment cabinets, ac receptacle boxes on equipment racks and equipment cabinets from the equipment cabinet or equipment rack by means of short lengths of non-conducting conduit.

**END OF SECTION**

**SECTION 16711  
COMMUNICATIONS PARKING STRUCTURES**

**PART 1 - GENERAL**

**1.01 SECTION DESCRIPTIONS AND BASIC REQUIREMENTS / CONTRACTOR'S TOTAL SYSTEM RESPONSIBILITY**

**SYSTEM A. CLOSED CIRCUIT TELEVISION (CCTV)**

The design philosophy for the garage CCTV coverage is based on the following requirements: Vehicles can only enter the garage through entry lanes or illegally through exit lanes. At the entry point the licence tag number of the vehicle is recorded as the vehicle passes into the camera view. With the license tag and a clear image of the vehicle recorded, the vehicle is then tracked by entering and exiting camera views using camera long shots as it progresses through the levels of the garage. The long view cameras need to obtain a minimum of 85% coverage as the vehicle progresses through the garage. The combined views from all the cameras throughout the structure shall achieve 95% coverage of the garage public areas. Images of persons entering or exiting the coverage area shall be recorded by the long shot cameras. High resolution images of patrons entering and exiting via pedestrian walkways shall be recorded. Elevator lobbies which are often garage entry points shall also provide a high resolution image of pedestrians. Inside the elevators, activity is recorded using a covert or smoke detector camera. When a vehicle exits the garage through any exit lane or illegally through an entrance lane, a high quality video image that can be enhanced to identify the driver and license plate are to be recorded. Also recorded is any transaction with a gate attendant. Monitoring of all cameras shall be possible in the police room and remotely by means of the WMATA's existing Video Management System via the Local Area Network. The parking office shall have a monitoring console and shall be able to monitor gate activity and transactions by gate attendants.

**SYSTEM B. GARAGE FIRE AND INTRUSION SYSTEM**

WMATA FIA system is manufactured by Edwards and was installed by ADT. The design and installation of the FIA system is the contractor's full responsibility including NFPA requirements and any local occupancy permit requirement.

The contractor is responsible for providing, integrating and testing a fire and intrusion alarm system that is identical, compatible and fully integrated with the existing fire and Intrusion alarm system currently in operation throughout the Metrorail System. The new Fire and Intrusion equipment shall be integrated into the WMATA central monitoring facility at OCC (both JGB and Carman Turner Facility). This requires modifying the station FIA panel to provide new device loops, extending the new loops to and throughout the garage, providing new kiosk data files for the passenger station, and programming services to configure the central monitoring station at OCC with the new garage F&I alarm indications. The contractor is also responsible for modification of the Station F&I system to allow the kiosk to receive a garage fire and intrusion alarms.

**SYSTEM C. GARAGE TELEPHONE**

The contractor shall be responsible for design, installation and testing of the garage telephone network. The contractor shall design an extension of WMATA phone system to the garage. Multiline telephones are required in the police room, communications room and parking operations room. Single line telephones are required in all other service rooms. A single line wall mounted analog telephone and a fax machine is also required in the police room in addition to any VOIP phones.

Analog telephones are to be connected to the VOIP telephone system through appropriate interface devices. The interface devices shall be designed to provide analog dial-around service to an analog line if the LAN connection should fail. Safety critical telephones may require connection to a second LAN consistent with the configuration of the WMATA telephone system design.

#### **SYSTEM D. GARAGE EMERGENCY TELEPHONE SYSTEM (GETS)**

The contractor shall engineer, design, furnish, install and test the Garage Emergency Telephone System (GETS) for the Parking Structure. The Garage Emergency Telephone System shall provide WMATA patrons with the capabilities to report emergency situations in the parking structure to WMATA Transit Police Department (MTPD) located in MTPD Communications Center at both Jackson Graham Building and Carman Turner Facility.

Emergency telephones are to be installed throughout the garage at stair entrances at each level, elevator lobbies and as needed in the public areas so no distance is greater than 200 feet from a GETS phone. A call shall be initiated by pressing a button on the emergency telephone, activating a strobe light located above the telephone instrument. The phone shall capture the initiating line and dial or connect via LAN to a call station or console in the transit police dispatcher's office in JGB and CTF. If the line (or console) is busy or the call is not answered, the phone shall disconnect and automatically initiate a new call on the MTPD consoles or dial a number that will be provided during the design phase. When the police dispatcher answers the call, either location shall be displayed on the console screen or an announcement shall be provided giving the location of the GETS telephone that initiated the call. On IP based systems, a camera view of the area where the phone is located shall be displayed on the police console when available. As soon as the announcement has played (analog systems), the line shall be made available for full duplex communications and the police dispatcher can start a conversation with the patron who initiated the call. The police dispatcher shall be able to control the GETS instrument and strobe remotely using a telephone keypad or the console Graphical User Interface.

The existing GETS performs a self diagnostic test at a programmed time. The central GETS computer calls each GETS telephone instrument in the system and verifies the instrument is functioning properly and provides a printed report on demand. It shall be the contractor's responsibility to update the equipment at MTPD at both JGB and CTF which includes software database, consoles, VOIP equipment and processors. The contractor shall assure the computer is automatically testing the instruments installed under this contract.

#### **SYSTEM E. LOCAL AREA NETWORK**

The Contractor shall extend the WMATA LAN from the passenger station communications room to the garage communications room and install a LAN ethernet drops in the communications room, police room, garage operations office, elevator machine room and AEMS RTU location or generator.

A composite fiberoptic cable with both single mode and multimode strands is required between the passenger station communications room and the garage communications room. To extend the LAN, the contractor shall survey the existing LAN in the passenger station to determine if an upgrade to the existing data switches are required to facilitate the additional fiber feeds to the garage. Any upgrades or additional equipment required shall be designed and provided under the base contract.

The network shall be extended from the passenger station to the garage communications room. The garage communications room shall require a managed ethernet switch that can be remotely managed using WMATA's existing LAN management system. The LAN shall be connected by fiber optic cable to the passenger station LAN. The LAN shall be used to accommodate all the IP cameras, the Network Video Recorder/Server/Encoders, Video

keyboard controllers or Client Work Stations, PC connections, VOIP telephones, ethernet drops to the remote rooms and all analog telephones and GETS telephones via gateways. The various rooms in the garage may require more than one ethernet drop to accommodate the required connectivity depending on the contractor's design. Rooms with VOIP telephones require appropriate LAN drops.

Fiberoptic cable is required for long LAN runs or where the data rate exceeds 1 MB, however CAT-6 copper cable may be used for runs within the rating of the cable (usually under 300 meters). Contractor is responsible for the full functionality of the LAN. WMATA shall assist the contractor by providing IP addresses for the applicable devices. All LAN switches shall support 802.3af (power over ethernet), have dual power supplies, and have a minimum of two SX GBIC ports. Local power is required for any VOIP phone located over 300 feet from the LAN switch (or fed by fiber).

#### **SYSTEM F. PARKING ACCESS AND REVENUE CONTROL SYSTEM**

Each parking booth will be provided with equipment necessary for control of the entry/exit gates and revenue collection through a separate parking lot equipment contract. This equipment will be connected to the garage central processing computer located in the parking operations room. All conduits and network connectivity required shall be provided under this contract.

All booths shall have a pushbutton operated autodial telephone for the attendant to use for conversations with garage management. Booths shall have a silent alarm system with a pushbutton installed at a location that can be covertly operated during a robbery attempt.

Each exit lane shall be equipped with a Smart Trip sensor. Wiring for this sensor shall be extended to the passenger station kiosk and connected as directed to the revenue collection equipment.

Connectivity to entry/exit booths located away from the garage and or on adjacent parking lots installed under this contract are the responsibility of the contractor.

Conduit and cable for credit card readers shall be installed at each exit array.

#### **SYSTEM G. PUBLIC TELEPHONE SYSTEM**

Public telephone instruments and wiring shall be installed by the local telephone company (Verizon in most cases). The contractor is responsible for coordinating with the telephone company to determine the quantity and locations of public telephones. Contractor shall provide proven raceways with pull strings from specific telephone locations to the bell room. Conduit shall also be provided between the bell room to the telephone company interface point outside of the garage structure as agreed to by the telephone company. A sheet of 3/4" fire retardant plywood shall be provided on the wall in the bell room for Verizon demarcation block and protectors. Each pay telephone array shall have one additional conduit installed with a 110 volt circuit for future installation of devices for the hearing disabled.

#### **SYSTEM H. GARAGE RADIO SYSTEMS**

WMATA uses 2-way radio systems for operations, maintenance, security and police operations throughout the Metrorail system and connected structures including garages. The contractor shall assure 2-way radio communications is available throughout all levels of the garage. In areas where 2-way radio communications using the 490 MHz trunk radio system (CRCS) is not satisfactory, the contractor shall design and provide amplifiers, antennas, cabling or other equipment as necessary to enable satisfactory communications on the CRCS radio systems throughout all levels.

## **1.02 RELATED SECTIONS**

## **1.03 REFERENCES**

- A. National Electrical Code (NEC).
- B. Electronics Industries Alliance (EIA) Standard RS 170
- C. Federal Standard 595B, Colors Used in Government Procurement

## **1.04 DESCRIPTION OF WORK TO BE PERFORMED**

- A. The Contractor shall bear total system responsibility for all specified work, specified additions and changes to WMATA systems of any type (except Contract deliverables not requiring Contractor installation). The Contractor's total system responsibility includes engineering services per Section 16703, installation per Section 16704, testing per Section 16707, documentation, warranty, and other areas of responsibility which are subject to periodic review and acceptance by WMATA (as specified elsewhere). The Contractor has the responsibility to integrate the various necessary elements of Contract work so that overall specification performance goals are met.
- B. WMATA retains rights to review the Contractor's system and component configuration and products selected, and to accept or not accept for reasons of specification compliance or noncompliance. The Contractor shall remain responsible for providing an acceptable design and final product that meets the intent of this specification. The Contractor shall remain responsible for bearing any additional costs associated with changes necessary to satisfy the performance requirements of this specification.
- C. The Contractor shall design, furnish, install and test all communications cabling and conduit within the garage structure and between the Parking Structure Communications Room and the Metrorail Passenger Stations Communications Room necessary to support the systems and subsystems required by this specification.
- D. See Division 01 for Spare Parts Requirements.
- E. Training materials, maintenance manuals and technician training shall be provided in compliance with these provisions. See Division 01 for details.
- F. New and updated printed As-Built Drawing pages and CAD files shall be provided to reflect any changes made in the passenger station communications room. As-Built Drawings shall

be provided for the Garage communications system in both printed and electronic format. The contractor shall update the Passenger Station Kiosk Data Files to reflect the garage and any changes to the station FIA system.

## **1.05 SYSTEM PERFORMANCE REQUIREMENTS**

The Contractor shall be responsible for the overall performance of the all systems provided under this specification. The system performance requirements are designed to ensure the systems delivered under this specification meet the performance requirements of the Washington Metropolitan Area Transit WMATA.

### **A. Closed Circuit Television (CCTV)**

1. Elevator lobbies , passageways on all levels and entrances shall be monitored by CCTV cameras. All cameras shall provide image quality capable of recording images that can be electronically enhanced to identify facial features and license tags. Camera coverage outside of the garage structure is not required.
2. Color image cameras inside elevator cars shall be mounted in a concealed housing such as an artificial smoke detector and shall capture all activity in the elevator. High resolution detail is not required in the elevators.
3. Camera coverage of vehicle areas shall be minimum 85% and include all pedestrian and vehicle entry/exit points.
4. Wide Dynamic Range cameras are required anywhere lighting conditions are not consistent. This includes cameras subject to viewing headlights, general illumination lighting and views with light and dark scenes in the same view.
5. All cameras except covert cameras shall be high resolution day/night cameras.

### **B. Fire and Intrusion Alarm System (FIA)**

1. The contractor shall be responsible for designing and installing a garage FIA system that shall satisfy all local jurisdictional code requirements. Requirements include submittals of plans to the municipality as required for permits, demonstrations and any remedial work necessary to bring the system into code compliance for the municipal occupancy permit.
2. The system shall function similarly to the passenger station FIA system and provide detailed alarm annunciation to the head end system at JGB and CTF. The garage FIA system may be provided as an extension of the station FIA system if the local jurisdiction allows.
3. The Garage FIA system shall be interfaced with the Station FIA system to facilitate kiosk viewing and reset capabilities of alarms.

### **C. Telephone System**

The Contractor shall be responsible for the overall performance of the telephone extensions. The following overall system performance requirements are designed to ensure that telephone extensions delivered under these Specifications meet the performance requirements of the Washington Metropolitan Area Transit WMATA.

Regardless of the minimum requirements noted below, the telephone system shall provide clear and noise free communications with no degradation to volume or intelligibility. Contractor will not be responsible for line quality on existing analog circuits that were not provided under

this specification. Contractor will be responsible for demonstrating line quality to the point of interface with existing circuits.

VOIP telephones shall be fully compatible and interface with the existing WMATA telephone system.

**D. Garage Emergency Telephone System (GETS)**

The Contractor shall be responsible for the overall performance and interface of the Garage Emergency Telephone System (GETS), as specified herein. The following overall system performance requirements are designed to ensure that the GETS delivered under these Specifications meet the performance requirements of the Washington Metropolitan Area Transit WMATA.

**SYSTEM PARAMETER REQUIRED PERFORMANCE**

1. Emergency Telephone Input sensitivity: The Emergency Telephone microphone shall be sensitive to (accept) any normal speaking voice from a distance of 20 inches or less from in front of the microphone, while moving to positions up to 30 degrees off center in any quadrant.
2. Emergency Telephone Sound Pressure Level: The Emergency Telephone shall produce clear and continuous speech (to persons who are not significantly hearing impaired within the 300 to 3,600 Hz audio range) to a distance of up to 36 inches or less, while moving to positions 40 degrees off-center in any quadrant. Interfering signals, hum, or objectionable noise shall not be discernible to listeners during or between speech messages.
3. System Noise Noise from the Emergency Telephone speaker shall not exceed -45 dB below a 1 kHz test tone level when all system and equipment controls are operated to any possible combination of positions. Momentary switching transients may peak to -30 dB below a 1 kHz test tone level for a duration not to exceed 10 milliseconds.
4. Note: Persons not significantly hearing impaired within the 300 to 3,600 Hz audio range are defined for the purpose of these performance specifications as males or females with hearing capabilities that are normal, or slightly impaired to the extent that their response to audio tones in the 300 to 3,600 Hz frequency range is within -15 dB at all test frequencies, and averages within -10 dB of "NORMAL" standard values for their classification (sex, age, etc.) as defined in ANSI Standards.

**E. WMATA Radio Coverage**

Provide amplifiers, antennas, wiring as needed to extend off-air radio coverage of all WMATA frequencies within the CRCS radio system throughout all areas of the garage structure.

1. BDAs shall be located in a service area that is not subject to vandalism.
2. Donor antennas may be located off the parapet wall at the top of the elevator shaft at a location out of reach of the general public.
3. Antennas or radiating cable shall be installed in a manner that will avoid vandalism.
4. All exposed antenna cable except for service loops or radiating cable shall be protected by IMC or Rigid conduit depending on the risk of damage.
5. Radio coverage of at least 95% at DAQ 3.4 (Delivered Audio Quality) shall be

achieved in all public areas and service rooms.

#### **1.06 CUSTOM DEVELOPED AND CONTRACTOR MODIFIED OFF-THE-SHELF EQUIPMENT**

Commercially available off the shelf equipment shall be used for all applications unless otherwise unavoidable. Prior to proceeding with any design or fabrication of custom developed or modified equipment, the contractor shall attempt to locate alternative off the shelf equipment with an equivalent level of performance and provide WMATA engineer with sufficient data to determine if the substitution is acceptable. Only when equivalent equipment is not acceptable or completely unavailable shall the contractor proceed with design, fabrication and acceptance of custom developed or contractor modified equipment. Design and fabrication of custom developed equipment shall be included in the base contract cost. Reference Section 16707 for additional requirements relating to custom developed equipment.

#### **1.07 INTERFACE CRITERIA AND RESPONSIBILITIES**

The Contractor shall be responsible per Section 16866 for interfacing of the systems, subsystems, facilities and equipment that are provided under this Contract with the existing WMATA communications systems, subsystems, facilities, and with the facilities and equipment furnished by WMATA and other contractors.

Integrations services shall include but are not limited to integration with:

1. Video systems with WMATA's existing WEB based Video Management System and the Protect system and with GETS console at MTPD control center (when VIOP is used)
2. GETS system with the WMATA telephone system.
3. FIA system with the station FIA system and the central monitoring system at OCC and with the video system.
4. Garage LAN with the existing station LAN/WAN and with connected systems within the garage (AEMS, Elevator, Parking equipment, video system, VOIP gateways and telephones, ext)
5. Telephone systems with existing WMATA telephone system including any leased lines required.
6. Interfaces with local communications carriers (voice, data, RF, fiber, copper as applicable)
7. Garage radio system (if needed for coverage) with the WMATA CRCS radio system and legacy 160 MHz radio system.

#### **1.08 TEST PROGRAM AND TEST REQUIREMENTS**

##### **TEST RESPONSIBILITY TASKS**

- A. The Contractor shall develop and implement per Section 16707 a Test Program that shall ensure all communications and related systems, equipment, material and services, furnished during the performance of this Contract including integration with existing systems and integration with systems provided by others, meet all performance criteria of this specification as well as WMATA design criteria and standard specifications.
  1. Develop and submit for approval an overall Test Plan that includes a detailed testing schedule and identifies all test procedures.
  2. Develop and submit for approval detailed test procedures and data sheets for each

individual test. Pre-printed data sheets shall be generated for each location prior to testing and submitted for approval. Data sheets shall include the specified acceptable measurement range so the test technician can determine if the results are valid at the time of test.

3. Use only test procedures approved by WMATA during the execution of the testing program. Testing data shall be recorded on preprinted data sheets.
4. Provide qualified test personnel with calibrated test equipment, tools, and miscellaneous supplies as necessary to perform all tests and retests.
5. Provide WMATA representative with advance notice and facilities as required to observe all testing that WMATA representative elects to witness. WMATA representative shall reserve the right to not observe any particular test.
6. Review test data, correct deficiencies, perform any required retesting prior to submitting test data for review. Submit raw test data showing any corrective action and retesting on preprinted data sheets for review and acceptance by WMATA's Representative.

#### **1.09 TECHNICAL DOCUMENTATION**

The Contractor shall develop and utilize procedures with checklists to assure the following submittals are complete and accurate prior to submission.

- A. Shop Drawings - Engineering, As-Built, etc.
- B. Operations and Maintenance Manuals.
- C. Progress Schedule Submissions.
- D. As-Built Drawings - printed and electronic
  1. As-built drawings shall be submitted on CD formatted in AutoCAD and PDF.
  2. AutoCAD drawings shall be in vector line format. EXCEPTION: TIFF images may be utilized when vector line images are not available from manufacturers and specific product data or graphics must be scanned.
  3. AutoCAD As-built drawings of all field installed wiring shall be in vector format. The complete AutoCAD as-built drawing package shall be replicated and submitted in PDF format.
  4. Printed as-built drawings shall be provided with an additional copy provided in each garage communications room. Updated drawing pages shall be provided in any Passenger Station Communications Room where changes or modifications are made. Superseded drawings shall be marked, removed and archived as directed by WMATA's representative.
  5. A working set of drawings shall be maintained in the communications room at all times during construction and updated to reflect any changes made during the construction process.
- E. Test Procedures - Printed and Electronic
  1. One complete collection of all test procedures (after approval and acceptance) shall be provided electronically on CD in PDF format. Microsoft Word or WordPerfect shall

also be acceptable.

2. In addition to the complete test procedure collection noted above, PDF versions of individual test procedures shall be transmitted to WMATA's representative upon receipt of approval after WMATA review. E-mail is acceptable if the file size shall allow.
3. Printed versions of test procedure and test data shall be submitted for review.

#### **1.10 COMPLETION ACCEPTANCE**

- A. *Substantial completion inspection and acceptance shall be provided in compliance with these provisions. See Division 01 for details.*
- B. *Final Acceptance shall be provided in compliance with these provisions. See Division 01 for details.*

#### **1.11 MAINTENANCE REQUIREMENTS**

*Maintenance requirements shall be provided in compliance with these provisions. See Division 01 for details.*

#### **1.12 SUBMITTALS**

*Submittals shall be provided in compliance with these provisions. See Division 01 for details.*

#### **1.13 PRODUCT APPROVALS**

- A. Equipment to be installed under these Specifications (except for "WMATA Furnished" items and miscellaneous hardware), shall be submitted for approval by WMATA's Representative prior to purchase and installation.
- B. WMATA approval of a product that does not meet the specifications shall not relieve the contractor of any contractual obligations unless a deviation request is submitted with the product submittal.
- C. It is the responsibility of the contractor's QA team to assure contractual compliance of items submitted for approval. Items submitted that deviate from the requirements of this specification without an attached request for deviation may require replacement or modification at the contractor's expense regardless of WMATA approval status.

#### **1.14 COORDINATION**

Accomplishment of the work included in these Specifications requires the Contractor to coordinate activities with WMATA and other contractors. The contractor shall be responsible for:

- A. Coordination of work schedules with WMATA through the use of site specific work plans (SSWP). The SSWP is outlined in WMATA OAP 200-33 available on request. SSWPs must be submitted 45 days in advance for approval of work within MertoRail operating facilities or work that requires WMATA maintenance support.

- B. Coordination with WMATA's Representative to determine the location and availability of electrical power or other resources within WMATA owned facilities if needed.
- C. Coordination with WMATA's Representative and WMATA technicians to determine IP addresses for LAN equipment and the availability of telephone lines.
- D. Coordinate design with local fire authorities to ensure compliance with local fire codes, and to obtain all required permits and inspections. (Copies of all related documentation including an occupancy permit shall be furnished to WMATA's Representative within 3 working days of receipt.)

#### **1.15 OPERATIONS AND MAINTENANCE MANUALS**

See Division 01 for operation and maintenance manual requirements

#### **1.16 OPERATION AND MAINTENANCE TRAINING:**

See Division 01 for operation and maintenance training requirements.

#### **1.17 SPECIALIZED TOOLS AND TEST EQUIPMENT**

Provide all specialized tools and test equipment required to maintain, adjust, configure, repair or replace any portion of the communications system installed under this contract.

1. Provide all software with any required license. Install the appropriate software and databases on the communications room computer (provided by contractor in the garage communications room) and install cabling between the computer and the respective equipment.
2. Provide one additional notebook computer (DELL Latitude series) with all maintenance, adjustment and configuration software loaded. Provide all required databases, cables and adapters to interface with all installed equipment. Provide a suitable carrying case. Contractor to specify the appropriate Dell laptop. WMATA's Office of Information Technology (OIT) will, using project monies, procure the specified equipment and, upon delivery, turn over to the contractor all procured Dell equipment. The contractor will configure the computers to OIT's specifications and install the appropriate maintenance, adjustment and configuration software.
3. Specialized test equipment is considered anything other than a digital multi-meter.
4. Specialized tools are considered anything other than screwdrivers, pliers, standard wrenches (1/4" thru 3/4"), wire strippers and soldering iron.
5. All non-function-specific general use computers received and owned by WMATA shall be procured and processed per WMATA Published P/I (Policy and Instruction).
6. A licensed copy of all software and any configuration files required to repair, monitor, troubleshoot, maintain, program or make modifications to any of the systems installed under this contract shall be provided.

#### **1.18 GARAGE FARE COLLECTION FACILITY**

Provide conduits and UFT cabling as necessary for connection of revenue collection entrance and exit smart card targets between each gate array and the kiosk.

1. Cables from all booths may be consolidated in the garage communications room so a minimal conduit runs can be used between the garage and passenger station

kiosk.

2. Coordinate with the garage parking revenue equipment supplier to determine the quantity and type of UFT cables required.
3. Provide 2" conduit between each gate array booth and the garage communications room for future credit card equipment.

## **PART 2 - PRODUCTS**

### **2.00 GENERAL**

All components furnished in accordance with this Contract shall be:

- A. Clearly and permanently labeled with value, part number, manufacturer & model or otherwise identified to facilitate off-the-shelf procurement and replacement.
- B. All electrical, electronic and mechanical components shall be designed and selected to operate under normal conditions at not more than 80 percent of the manufacturer's maximum rating range.

### **2.01 TRANSFORMERS**

All transformers provided under this Contract shall be of air-cooled, dry type, unless otherwise approved by WMATA's Representative.

### **2.02 POWER SUPPLIES**

- A. Power supplies shall be for continuous duty and shall be rated at a minimum of 120 percent of maximum load at 50 degrees C.
- B. Power supplies not integral to other equipment shall be selected for mounting in a standard 19-inch equipment rack and shall be housed in a metal panel-chassis combination with no exposed electrical connections or wires. Appropriate type terminals shall be provided on the rear of the chassis for the connections of all external input and output power leads. An appropriate sized power cord (internally connected) may be provided for the input power leads. Exception: camera power supplies may be remotely mounted in equipment cases near the cameras.
- C. Power supplies shall be selected for natural convection cooling. No supplementary fans or other cooling devices shall be allowed.
- D. The power supplies shall not be damaged by a sustained input voltage varying from 0 to 150 percent of the rated input voltage. Power supplies shall have current limiting, which shall protect the power supplies from damage due to overload or short circuits. Over voltage protection shall be contained on those power supplies driving solid state circuitry.
- E. Unless otherwise specified, all redundant power supplies shall be diode coupled to the loads with the corresponding main power supplies.

### **2.03 CONNECTORS**

- A. Connectors shall be provided to connect wires and cables to equipment to permit easy removal of equipment for maintenance. In-line connectors may only be used when approved

by WMATA's Representative and shall be documented on As-Built drawings.

- B. Unless otherwise specified, connectors are not required for the termination to equipment which contains screw type terminals, distribution frames or protector blocks.
- C. Each connector shall be uniquely identified and marked in such a manner that they shall not be obscured or worn off in normal use.
- D. All conductors (including spares) within a cable that interfaces with a connector shall be terminated in the connector or folded back and protected with heat-shrink tubing and noted on the as-built drawings.
- E. All connectors which are not located within environmentally controlled rooms shall have a weatherproof classification.
- F. Connections installed in manholes, handholes, conduits, pipes, cable trays cable troughs or cable trenches (direct burial) are prohibited. Cables shall be extended outside the raceway and spliced or terminated in junction boxes.

#### **2.04 TERMINAL BLOCKS**

- A. All terminal blocks and terminal strips shall be rated for service at 300 volts minimum. All terminal blocks and terminal strips shall be of the appropriate current rating for corresponding terminated circuits. All terminals of the terminal blocks and terminal strips shall be sized to accept corresponding terminated wire and cable conductor sizes (gauges). Resistance of the terminals shall not exceed 0.0002 ohms.
- B. Unless otherwise specified, terminal blocks and terminal strips provided in junction boxes, equipment enclosures, system distribution frames, equipment cabinets, and termination facilities shall be of the modular, feed-thru type mounted to a metal channel or be of the single molded construction barrier type.
- C. Unless otherwise specified, the modular, feed-thru type terminal blocks and terminal strips shall have pressure clamp contact terminals suitable for solid and stranded wire. Type "66" blocks shall be used for telephone applications. Type "110" terminals shall be used for data and LAN terminations. Appropriate sized (length) continuous mounting channel shall be provided for each terminal block and terminal strip. Appropriate accessories (end sections, channel clamps, partitions, mounting hardware, etc.) shall be provided for each terminal block and terminal strip. Disconnect apparatus (without removing wires) shall be provided in the terminal assemblies of those terminal blocks and terminal strips, which are utilized in conjunction with protector block assemblies, or otherwise specified within these Specifications.

#### **2.05 PROTECTOR BLOCKS & TERMINALS**

- A. Unless otherwise specified, each protector block shall be selected for the termination of the appropriate number of pairs (minimum four conductors). The base of each protector block shall be constructed of molded fire-retardant thermoplastic and shall be equipped with four binding posts and four related screw-in arrester units. The binding posts shall be connected internally to the corresponding arrester units. Each binding post shall be equipped with two nuts and four beveled washers. A ground plate shall be provided on the face of the base of each protector block between the arrester units. The arrester units shall be 2-electrode gas type and provide 400 Vdc fail-short protection.

1. Cook Electric W492-LCGX (or WMATA approved equal).
  2. With 400 VDC gas style arresters.
  3. With required mounting hardware and appropriately sized enclosure.
  4. Porta Systems Model 24025-66-F66P (or WMATA approved equal).
  5. Three-element gas tube protector modules.
  6. 25 pair termination with 66 type clips for analog telephone.
  7. 110 type clips for LAN field connections to patch panels and subscriber outlets.
- B. Multiple protector blocks (two pair type) shall be provided and installed adjacent to each other (vertical rows) for the termination of multiconductor cables containing more than two pairs.
- C. Appropriate length brass or copper mounting and ground bar assemblies shall be provided for the installation and grounding of the protector blocks. Each mounting and ground bar assembly shall have a minimum of two binding posts with appropriate nuts and washers for the termination of ground wires. Appropriate hardware shall be provided to secure and ground the protector blocks to the mounting and ground bar assemblies. Appropriate mounting hardware shall be provided to install the mounting and ground bar assemblies.
- D. Unless otherwise specified, all wires and cables that enter/exit the Communications Equipment Rooms and remote ancillary buildings shall be terminated on protector blocks at both ends. Coaxial cables and triaxial cables are exceptions. Contractor shall select appropriate devices to protect LAN data cables in a manor that does not degrade the bandwidth.

## **2.06 DISTRIBUTION FRAMES**

- A. Distribution frames including the MDF/Protector Cabinet shall consist of the required multisection cable terminal housings, top and bottom assemblies for each housing, a hinged end section at both ends of the distribution frame, a lift-out door for each housing, and a fungus resistant solid plywood backboard in each housing. Each housing of the distribution frame shall contain four distribution rings to permit neat installation of wires and cables within the housing. All multisection cable terminal housings, including the top and bottom assemblies, the door, and the end sections, shall have a baked enamel gray color finish. In the event *distribution frames* are not available that meet this standard, an alternate shall be submitted for approval along with references with contact information, identifying users of the proposed product in the telecom industry.
- B. Each of the cable terminal housings shall be equipped with the required number of three-element gas tube protector modules with 66-type clips for termination of all conductors of the cable provided for the separate communications systems.
- C. All cables and wires that are to be installed to/from the distribution frames shall enter/exit through the top and bottom assemblies of the housings. Appropriate connectors and protected passages for the cables and wires shall be provided.
- D. As a minimum, each multisection cable terminal housing shall have a ground bus bar installed near the bottom on the plywood backboard, consisting of a 6.0-inch by 0.25 inch by 0.5-inch copper bar. The ground bus bar shall be drilled and tapped for the required ground

connections within each housing. The ground bus bar shall be electrically isolated from the distribution frame enclosures.

## **2.07 FUSES AND CIRCUIT BREAKERS**

All equipment shall be protected by fuses or circuit breakers of the appropriate size. Fuses and circuit breakers shall be readily accessible, surface mounted, on all equipment. Fuse wire within the equipment shall not be acceptable.

## **2.08 WIRES AND CABLES**

- A. Only continuously extruded outer jackets free of PVC and PVC-based compounds shall be furnished on cables provided in this Specification. Exceptions may be allowed by WMATA's Representative when such cable is not commercially obtainable from equipment manufacturers, and when appropriate to avoid potential electrical signal mismatching, or to otherwise improve system performance or reliability. Exceptions shall be allowed for small diameter cables which is anticipated to be submerged in water.
- B. All single conductor wire and individual conductors of multiconductor cables shall be copper and shall be insulated.
- C. Unless otherwise specified, all multiconductor cables installed within WMATA railroad right-of-way shall contain a metallic shield and a corrugated metallic tape armor. The shield and armor shall be separated by an inner jacket.
- D. Multiconductor cables containing more than two conductors (or fibers) shall contain a minimum of 20 percent spare conductors or two spare conductors (or fibers), (two spare pairs if composed of twisted pairs), whichever is greater.
- E. All wires and cables shall be marked with approved tags at both ends. Telephone wires may be marked in pairs at the end of the twist. Markings shall include nomenclature and destination of the wire or cable.

## **2.09 OUTSIDE PLANT CABLE**

- A. Essex CASPIC-F+M 19 AWG. (or WMATA approved equal).
- B. Filled, shielded telephone cable with mechanical protection, sized as required.
- C. Conductors: Solid annealed copper conductors insulated with color coded polyolefin, standard telephone color code, twisted into pairs.
- D. Core covering: Non-hygroscopic dielectric tape.
- E. Shield: Inner polymer coated .2mm aluminum and outer polymer coated .15mm steel. Interstices of the shielding system flooded with waterproofing compound.
- F. Mechanical Protection: .15mm corrugated steel shield, flooded both sides.
- G. Outer Jacket: Black, low-density, high molecular weight polyethylene.
- H. Shall meet REA Specification PE-39.

## **2.10 INSIDE PLANT CABLE**

- A. If not in conduit, plenum approved cable shall be provided. Plenum cable shall meet the low-smoke/low flame characteristics required by UL to be classified for installation in air handling plenums without conduit.
- B. If installed in conduit, plenum approved cable not required.
- C. Minimum three twisted pairs, 22 AWG. solid copper conductors with overall shield and single polyethylene jacket.
- D. Shall conform to the National Electrical Code requirements.
- E. In cases where specific cables shall be subjected to water damage, PVC cable may be used with permission of WMATA's Engineer.

## **2.11 25-PAIR/22 AWG. TIE CABLE**

- A. Anixer Model No. E-002522AAC (or WMATA approved equal).
- B. 25 pair, 22 AWG. single jacketed, shielded telephone cable.
- C. Solid copper conductors, insulation with standard telephone color code, twisted into pairs.
- D. Core covering: Non-hygroscopic dielectric tape.
- E. Shield: .008 inch corrugated, copolymer coated aluminum.
- F. Jacket: Black polyethylene.
- G. Shall meet REA Specification PE-22.

## **2.12 GROUNDING**

- A. Communications systems and facilities, equipment and cables shall be grounded using a single point grounding scheme. Each Communications Equipment Room shall have a separate isolated ground bus bar designated as "communications ground." Please reference Section 16710 for additional grounding requirements.
- B. Unless otherwise specified, the shields of all single shielded communications cables, the shields of multiconductor cables with individually shielded pairs, the inner shield of all double shielded communications cables and communications cables with separate shield & armor, shall be grounded only at a single point and only to the "communications ground." These shields shall be electrically continuous throughout the cable length by bonding across all splices and terminations in equipment enclosures and junction boxes. Cable sections originating at Passenger Station Communications Equipment Rooms shall have the shield or armor grounded to the passenger station "communications ground."

## **2.13 JUNCTION BOXES**

- A. Junction boxes shall be constructed of 12-gauge stainless steel or fiberglass, except for sizes 24-inch x 36-inch and smaller, which may be constructed of 14-gauge stainless steel or fiberglass. Boxes shall have all seams welded. The boxes shall be finished to be a NEMA

Type 4 rating with the door/cover gasket with an oil resistant gasket material and adhesive. Boxes within the railroad right of way in areas where reflection may distract a train operator shall be painted with ANSI 61 gray paint after priming or shall be a phosphatized surface with ANSI 61 gray polyester powder coating applied. Associated hardware shall be constructed of stainless steel. Junction boxes shall be sized to provide ample space for terminating the wires and cables installed at each location, including terminal blocks and considering the minimum bending radii of cables. Junction boxes exposed to the weather shall have all wire entrances protected from weather and dust with a weather-tight connector, and shall be equipped with a drain plug. EXCEPTION: Junction boxes in environmentally controlled (heated and air conditioned) rooms may be galvanized steel.

- B. Junction boxes shall be furnished and installed complete with terminals, fittings, mounting brackets, cable supports and all other necessary hardware. All conductors within a junction box (including spares) shall be terminated on terminal blocks. Junction boxes to be used only for the pulling of cable do not require terminals.
- C. All boxes shall be mounted plumb and level and shall be rigidly anchored to the supporting surface. Machine-bolt type expansion anchors shall be used to fasten boxes to concrete surfaces where inserts are not otherwise provided. In no case shall bolts of less than 0.25 inch diameter be used. Stainless steel spacers shall be used on bolts to provide a 0.25 inch air space between boxes and mounting surfaces.
- D. All boxes shall have an embossed metal tag on the cover. To identify the service of the circuits in the box, as approved by WMATA's Representative.

#### **2.14 CONDUIT**

- A. All conduit, except as noted, shall be intermediate metal conduit (IMC). Conduit fittings selected shall have removable covers shall be complete with gaskets and blank covers.
- B. Flexible conduit shall be provided where specifically required.
- C. Rigid non-metallic conduit shall be provided only where specifically required by these Specifications. Minimum schedule 40 shall be used in concrete encased duct banks. Schedule 80 shall be used for non-concrete encased runs when approved.

#### **2.15 HARDWARE**

- A. Unless otherwise specified, all mounting hardware (screws, nuts, bolts, straps) shall be stainless steel or brass. Appropriate type mounting hardware shall be provided for the corresponding supporting surfaces.
- B. Brackets installed in tunnel or outdoor areas shall be stainless steel or hot dipped galvanized after fabrication in accordance with ASTM A386.
- C. Non metallic mounting hardware may be used for radiating antenna cable installation.

#### **2.16 COMMUNICATIONS DUCTBANK**

- A. The Contractor shall design, furnish and install a communications ductbank between the Parking Structure Communications Room and the Passenger Station Communications Room. The communications ductbank shall accommodate all Parking structure Communications cabling requiring connection to existing WMATA facilities. The ductbank shall also accommodate cabling required for the Parking Access and Revenue Control

System, LAN/WAN and a minimum of two empty 4-inch ducts shall be provided for future use. The communications ductbank shall be a minimum size of six, 4-inch ducts with one duct assigned exclusively for Fire and Intrusion Alarm cabling. The Contractor shall be responsible to determine the method of transition from the parking structure to the station. A minimum of two 2" conduits shall also be provided between the garage operations room and the passenger station kiosk for fare collection use. It is the contractor's responsibility to determine the quantity and sizes of conduits required. Conduit size and quantity may not be less than the minimum requirements. The adopted method shall be approved by WMATA's Representative in addition to all required approvals by the State and local Department of Transportation, the County and any other authorities having jurisdiction. The ductbank shall include the following major items:

1. Manholes, Precast or Cast-in-Place Concrete.
  2. Handholes, Fiberglass reinforced polymer concrete.
  3. Reinforced Concrete Encased PVC Ducts.
  4. Rigid Galvanized Steel Conduits.
  5. Galvanized Steel Pull Boxes
- B. Related Work Specified Elsewhere:
1. NOT USED
  2. Concrete Reinforcement: Section 03200.
  3. Cast-in-Place Concrete: Section 03300.
  4. Precast Concrete: Section 03400
  5. Raceways, boxes and cabinets: Section 16130.
- C. Communications ductbanks shall be constructed using appropriately sized precast or cast-in-place manholes and handholes spaced at maximum intervals of 400 feet unless otherwise prevented by a highway, railroad or other feature that would limit or prevent access. The construction materials shall meet the requirements specified and shall fully comply with applicable loading requirements for the planned locations of the manholes and handholes. Manholes and handholes shall be fitted with appropriately rated covers and be located with regard for accessibility with the Parking Structure in operation. Manholes shall be equipped with lifting rings, pulling eyes, steps, drainage sump, ground rod hole and surface mounted channel inserts on the two sides perpendicular to duct entrances. Manhole and handhole covers shall be installed flush with the finish grade or pavement and oriented so the steps can be used from the top of the collar to the bottom of the vault.
- D. The ducts shall be Schedule 40 PVC with reinforced concrete encasement. To the extent practical, the ducts within the ductbank shall be installed without bends except for building entrances and with a slight slope toward the adjoining manholes or handholes to promote drainage. Any 90 degree bends in the underground ductbank shall utilize wide-sweep elbows in compliance with the NEC. The ductbank shall be installed at a minimum depth of 30 inches below finished grade and in locations subject to highway vehicular traffic the minimum depth shall be increased to satisfy the requirements of appropriate jurisdictions. Any exposed conduits required to complete the ductbank route between the parking structure and the

passenger station shall be heavy duty galvanized steel with appropriately sized galvanized steel pull boxes located as required to facilitate cable installation. Duct entrances into buildings and manholes shall be equipped with conduit seals and duct entrances into buildings shall be equipped with cable seals. Each duct shall be assigned a conduit number with a prefix "C" to identify it as a communications conduit. The numbers shall be shown on design drawings and non-corrosive, metallic tags with the conduit numbers shall be affixed to the structure near the entrances of ducts into buildings, manholes and handholes.

- E. Multiple interduct runs shall be used in larger conduits to provide future raceways if less than 50% of the conduit's capacity is used. If interduct is used in a conduit to protect a small cable, the maximum quantity of interduct runs shall be installed in the conduit to maximize the future availability of the conduit.

## **2.17 SYSTEM (A) CCTV EQUIPMENT**

- A. Cameras shall meet or exceed the picture quality as specified herein as required with resolution appropriate for their intended purpose.
- B. Cameras shall be day/night NTSC with Wide Dynamic Range. Camera shall produce high resolution color images when lighting is adequate for color images and switch to high resolution black and white images when lighting is less than adequate for color images. Camera shall maintain high resolution video of dark objects and very light objects or background when both are in the same frame.
  - 1. PTZ cameras - Camera - Pelco Spectra III w/ environmental dome - Pelco model SD53CBW-PG-E1 (or WMATA approved equal)
  - 2. Fixed cameras -
    - a. Camera - Pelco CCC1390-H6 (or WMATA approved equal)
    - b. Lens - Pelco 13VDIR7.5-50 (or WMATA approved equal)
    - c. Dome enclosure - Pelco DF5-PG-E1 (or WMATA approved equal)
  - 3. 1/3 inch Super Wide Dynamic Range SIMD imagery
  - 4. Day/Night NTSC High Resolution with WDR
  - 5. Smoke Detector "covert" Cameras for elevator cars (Kalatel GBC-SD-850-P3 or WMATA approved equal)
- C. Noise: Operation of any aspect of the system shall not produce any discernible noise on the CCTV monitor. The signal-to-noise ratio under all transit system operating conditions shall be degraded by no more than 3 dB.

### **2.17.1 (A) FIXED LENS CAMERA WALL MOUNTS**

- A. Supports DF5 Dome Cameras
- B. Finish: gray

### **2.17.2 (A) FIXED LENS CAMERA CEILING MOUNT**

- A. Pelco Model No. BB5-PCA-GY (or WMATA approved equal).
- B. Supports DF5 Dome Cameras

- C. Finish: gray

**2.18 (A) 19-INCH CCTV MONITOR**

- A. Dell Model No 1907 FP or Pelco Model PMCL-219 (or WMATA approved equal).  
Note: WMATA's preferred supplier is Dell. Samsung monitors are also acceptable when LiveWave systems are used.
- B. Resolution: 1280 X 1024.
- C. 110 Vac operation.

**2.19 (A) NETWORK VIDEO RECORDER, ENCODERS AND KEYBOARD**

The NVR equipment listed is for reference only to demonstrate the components required to construct a complete system. A client workstation may be used instead of a keyboard controller video display console and workstation. The video encoder, server and network video recorder may be combined. There are no requirements to solely use the manufacturer listed, however the equipment selected by the contractor must interface with the cameras required in this specification and with WMATA's First-View monitoring system in use by OCC and MTPD.

- A. Keyboard controller (WMATA approved ).
- B. Network Video Recorder - Dell Server class computer with redundant power supplies (or WMATA approved ).
- C. Video display Console - Dell or (WMATA approved )
- D. Video Encoder - capable of video codecs including both M-JPEG and ASP compliant MPEG-4 JPEG or MPEG. Must communicate directly with existing First View video management.
- E. Workstation - Dell Optiplex (or WMATA approved )
- F. WMATA standard components are provided by Smiths Detection-LiveWave
- G. The system shall provide low latency video distribution and camera control over IP networks (under 60 ms) with support for video data scaling, compression and frame rate adjustments for low bandwidth connections
- H. The software shall provide full screen software multiplexer displays with intuitive drag & drop of any networked camera feed or device (1, 4, 9, 16, 32) and video sequencer capabilities to program camera sources,
- I. The system shall support map interfaces with the ability to select cameras and pop-up video windows.
- J. The system shall connect to a variety of high-quality video storage options (DAS/NAS/SAN) with both on-site and off-site recording and playback of archived video via standard Windows Media Player.
- K. Each server shall support at least 500 simultaneous users of real time video and use a distributed server architecture to enable thousands of video channels and users to be added to the system.
- L. The system shall include free and unlimited user/client licenses. No per seat licenses are

or proprietary software or hardware required to access system.

- M. The system shall include a modular design enabling easy integration and customization options to be added.
- N. The system shall be able to integrate with advanced sensors for chemical detection (CWA and TIC) with proven commercial deployments.
- O. The software shall be a mature COTS product that has been commercialized for at least 5 years with documented deployments in major transit systems, homeland security and military operations. At least 5 references shall be provided and will be validated.
- P. The system must provide a Software Development Kit SDK to allow future customer and third party extension and integration of the system. This SDK must be computer language and operating system agnostic.
- Q. The system shall be compatible with the PROTECT programs CBEIMS software for advanced alerts from PROTECT managed CWA sensors.
- R. The system shall have the capability of creating a video alert window on alarm. Video associated with any alarm will "pop up" in a matrix screen as a visual alert to console operators.
- S. The system must integrate with the FIA panel and GETS to provide incident based markers on the recorded video and provide video of incident areas along with the alarm annunciation at MTPD consoles.

## **2.20 (A) COAXIAL VIDEO CABLE**

- A. Belden Type 1153A (or WMATA approved equal).
- B. 75-ohm impedance.
- C. Double shielded with foil wrap and copper braid.
- D. Attenuation (at 10 MHz): 0.66 dB/100 ft. (nominal).
- E. Type: RG-11/U.
- F. Teflon jacket.

## **2.21 (A) FIBEROPTIC CABLE**

- A. Composite, Armored composite Single-mode/ Multimode between the passenger station communications room and the garage communications room. Minimum fiber count 12 single mode and 12 multimode fibers.
- B. Fiberoptic cables to cameras shall have minimum one spare strand to each camera.
- C. All fiberoptic strands including spare strands shall be terminated with SC type connectors on fiber patch panels. Patch panels are not required at camera locations. Some cameras require ST connectors.

- D. All strands shall be labeled at both ends indicating usage and destination.

**2.22 (A) TWO-CONDUCTOR SHIELDED POWER CABLES**

- A. Belden Type 83321 (or WMATA approved equal).
- B. 18 AWG conductors.
- C. 600V UL rated Class-1.
- D. TFE Teflon insulation (No PVC).

**2.23 (A) CCTV CAMERA POWER DISTRIBUTION PANEL**

- A. AC Power Distribution modules by APC, Rurman Pluzzi Engineering or TrippLite providing superior surge and lightning protection will be acceptable.
- B. Ten 120 Vac Receptacles (NEMA 5-15R), 12-amp service.
- C. Common and Differential Mode EMI/RFI Filtering.
- D. UL approved.
- E. 19-inch rack mount when used in the communications room. Surface mount acceptable in equipment cases.
- F. Includes 20-amp circuit breaker.

**2.24 (A) FIBER OPTIC VIDEO TRANSMITTERS AND RECEIVERS**

- A. International Fiber Systems (IFS)
- B. American Fibertek Inc. Model 20 Series.
- C. Force, Incorporated Model 2792.
- D. Lascomm Model 145/195.
- E. Transition Networks Model J/VD series.
- F. Philips Model TC4641/TC4642
- G. Other manufacturers and product variations will be considered based on warranty, performance, interface requirements and environmental limitations.
- E. Format: NTSC video format.
- F. ST connectors.

**2.26 (A) GARAGE FURNITURE**

- A. The contractor shall provide furniture in the garage communications room, the police room and the parking operations office.
- B. Communications Room Furniture
  1. Step Ladder (Werner Pro 6206 Granger 3W 141 or WMATA approved equal)
  2. Stool (SAFCO 3401 Granger 4KH38 or WMATA approved equal)
  3. Work Bench (Edsal BML7236T Granger 1PB59 or WMATA approved equal)

- C. Police room and Parking Office Furniture
  - 1. Desk (MBI DP6030-PU Granger 1JU34 or WMATA approved equal)
  - 2. Chair (Global 2239-6 Granger 1BP63 or WMATA approved equal)
  - 3. Fax Machine - police office only (Canon LC 2060)

**2.27 (B) FIRE & INTRUSION ALARM (FIA) SYSTEM EQUIPMENT**

WMATA has installed a standardized FIA system throughout the entire Metrorail system with central monitoring stations at JGB and CTF. The WMATA FIA system is model EST3 manufactured by Edwards and was installed by ADT. Design and installation of the FIA system shall remain the contractor's full responsibility including any local requirements required for occupancy permitting.

Portions of the equipment noted below may or may not be required depending on jurisdictional requirements. Designer may elect to extend new zones from the existing station FIA system if allowed by the local jurisdictional authority.

Other components not identified below may be required.

**2.28 (B) EDWARDS 3000 CABINET, CHASSIS AND 3-RCC7R BATTERY CABINET**

- A. Manufacturer: Edwards Systems Technology
  - 1. Part No. 3-CAB21B (or WMATA approved equal), including the following:
  - 2. Part No. Edwards-CAB21DR door assembly kit (or WMATA approved equal).
  - 3. Part No. 3-CHAS7 chassis assembly mounting various rail modules (or WMATA approved equal).
  - 4. Part No. 3-RCC7R Battery Cabinet 24 Vdc, 50 amp/hour batteries. (2/12 V batteries) (or WMATA approved equal).
    - a. Battery: Sealed lead-acid or nickel cadmium type. Provide sufficient capacity to operate the complete alarm system in normal or supervisory (non-alarm) mode for a period of 24 hours. Following this period of operation on battery power, the battery shall have sufficient capacity to operate all components of the system, including all alarm indicating devices in alarm or supervisory mode for a period of 15 minutes.

**2.29 (B) CENTRAL PROCESSING UNIT MODULE**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. 3-CPU1 (or WMATA approved equal), including the following:
- C. Provides all input and output processing for each FIA control unit. Up to 64 nodes interconnect on a peer-to-peer multi-priority token ring protocol network.
- D. Part No. 3-RS 232 Communication Card (or WMATA approved equal).

1. Provides a port for downloading the network programming into the 3-CPU1. Supports connection to a printer and/or an external command center.

E. Part No. 3-RS 485B Network Communication Card (or WMATA approved equal).

1. 3-CPU1 interfaces to the remote annunciator in the Kiosk and other Network Nodes, via the Network Communication Card. Supports a Class B (Style 4) or a Class A (Style 7) circuit.

### **2.30 (B) PRIMARY POWER SUPPLY**

A. Manufacturer: Edwards Systems Technology

B. Part No. 3-PPS/M (or WMATA approved equal).

C. Provides all power for all modules and accessories.

D. Charges the batteries and sends fault status conditions to the 3-CPU1.

1. Power Input 120 VAC, 3.0A, 50/60 Hz.

2. Output Totals Internal DC 24 Vdc @ 7.0 A Max, Auxiliary DC Two 24 Vdc @ 3.5 Max.

### **2.31 (B) MAIN LIQUID CRYSTAL DISPLAY MODULE**

A. Manufacturer: Edwards Systems Technology

B. Part No. 3-LCD (or WMATA approved equal).

C. Local Annunciator and user control interface in the FIA control unit.

1. Eight (8) lines by 20 characters graphic LCD display-168 characters.

2. Uses queues to sort events (i.e. Alarm, Supervisory, Trouble and Monitor).

### **2.32 (B) SIGNATURE DRIVER CONTROLLER MODULE**

A. Manufacturer: Edwards Systems Technology

B. Part No. 3-SDDC (or WMATA approved equal).

C. Dedicated microprocessor control.

1. Loops alarms in less than 750 ms.

2. Supports up to 250 Intelligent Signatures Detectors and 250 Intelligent Signature Modules.

3. Ground fault detection by loop and by Signature Module Circuit.

### **2.33 (B) SECURITY / ACCESS CONTROL MODULE**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. 3-SAC (or WMATA approved equal).
- C. Provides two (2) RS-485 Class "B" communication circuits that link the Edwards-3000 to all field installed "smart readers" 3-CRC interfaces. The 3-SAC continuously polls all 3-CRC interfaces on each 2-wire circuit and reports any status or communication faults changes to the 3-CPU1.

**2.34 (B) MODEM COMMUNICATOR**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. 3-MODCOM (or WMATA approved equal).
- C. The 3-MODCOM is a combination digital dialer/modem utilized by the Edwards 3000 system, to communicate to industry standards digital dialer receivers for status reports.  
The 3-MODCOM also communicates via an integral modem to computers equipped with a 3-ACDB (Access Controlled Database Program) for downloading user access levels. The 3-MODCOM is a dual-line capable digital dialer V.32bis 14.4K full duplex modem.

**2.35 (B) INTELLIGENT PHOTOELECTRIC SMOKE DETECTOR**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. Edwards-PS (or WMATA approved equal).
- C. The Edwards-PS is a Signature Series Intelligent Photoelectric type smoke detector that communicates status changes to the Edwards 3000 FIA system via the 3-SDDC polling circuits.
  - 1. Photoelectric- Light Scattering Principle or Particle Detection.
  - 2. 300 to 4000-ft/min air velocity range.
  - 3. Five user programmable sensitivity levels.
  - 4. 20 user programmable pre-alarm levels.
  - 5. Automatic day/night sensitivity selection.
  - 6. Standard Detector Base SIGA-SB (or WMATA approved equal).

**2.36 (B) PHOTOELECTRIC SMOKE/HEAT DETECTOR**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. Edwards-PHS (or WMATA approved equal).
- C. The Edwards-PHS is a Signature Series Intelligent Photoelectric smoke and fixed-temperature heat multisensor detector that communicated status changes to the Edwards 3000 FIA System via the 3-SDDC polling circuits.

1. Photoelectric- Light Scattering Principle or Particle detection and 135 degree fixed heat detection.
2. Standard 900 sq. Ft spacing.
3. Five user programmable sensitivity levels.
4. Automatic day/night sensitivity selection.

#### **2.37 (B) DUCT SMOKE DETECTOR HOUSING**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. Edwards-DH (or WMATA approved equal).
- C. The Edwards-DH is a duct detector housing that accommodates the installation of one Signature Series Intelligent Photoelectric type smoke detector and standard base. The Edwards-DH mounts in the field on air ducts and utilizes various length sampling tubes, as required, to sample air for possible smoke detection.
  1. Edwards-PS Photoelectric Smoke Detector (or WMATA approved equal).
  2. SIGA-SB detector base (or WMATA approved equal).
  3. Series 6261 sampling tubes (8, 24, 42, 78, 120 inch lengths).

#### **2.38 (B) INTELLIGENT HEAT DETECTORS**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. Edwards-HFS (or WMATA approved equal).
- C. The Edwards-HFS is a Signature Series Intelligent Heat Detector that communicates status changes to the Edwards 3000 system via the 3-SDDC polling circuit. The Edwards-HFS is uniquely addressed and identified at the FIA control unit.
  1. Edwards-HFS is a 135 degree fixed heat detector.
  2. 4900 sq. Ft spacing at 10 ft ceiling height.
  3. SIGA-SB detector base (or WMATA approved equal).

#### **2.39 (B) INTELLIGENT HEAT DETECTOR**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. Edwards-HRS (or WMATA approved equal).
- C. The Edwards-HRS is a Signature Series Intelligent Heat Detector that communicates status changes to the Edwards 3000 system via the 3-SDDC polling circuit. The Edwards-HRS is uniquely addressed and identified at the FIA control unit, the Edwards-HRS is a fixed and rate-of-rise heat detector.

1. 135 degree fixed and 15-degree/min. rate of rise heat detector.
2. 4900 sq. Ft spacing at 10 ft ceiling height.
3. SIGA-SB detector base (or WMATA approved equal).

#### **2.40 (B) INPUT MODULES**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. SIGA-CT1/2 and MCT2 (or WMATA approved equal).
- C. The SIGA input modules are used to make connection to hard-wired, non-addressable devices like waterflow detectors, valve switches, suppression systems.
- D. Multi-application Class "B" input modules used to monitor various fire and supervisory devices.
  1. The SIGA-CT1 monitors one (1) input circuit, and the SIGA CT-2 and MCT2 each monitor two (2) input circuits.
  2. 47k ohm EOL resistor
  3. UIO series motherboard ("M" series only) (or WMATA approved equal).

#### **2.41 (B) CONTROL RELAY MODULES**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. SIGA-CR and MCR (or WMATA approved equal).
- C. The SIGA-CR and MCR are multi-application commendable output relay modules. These modules are used to control activation and de-activation of various output functions, such as, fan shut down, escalator shutdown, elevator recall, DTS. SIGA-UIO Series Motherboard (or WMATA approved equal).

#### **2.42 (B) UNIVERSAL I/O MODULE MOTHERBOARD**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. SIGA-U106 and U102R (or WMATA approved equal).
- C. The SIGA-U106/2R are motherboards that provide mounting and wire terminations for SIGA "M" series modules. The SIGA-U106 supports up to six modules, and the U102R has the capacity for up to two (2) modules.
- D. Locations: Communication Equipment Room, and Ancillary locations. (Edwards-MFC-A cabinet).

#### **2.43 (B) ADDRESSABLE MANUAL PULL STATIONS**

- A. Manufacturer: Edwards Systems Technology

- B. Part No. Edwards-278 (or WMATA approved equal).
- C. The Addressable manual Pull Station communicates status changes to the Edwards 3000 FIA system via the 3-SDDC polling circuit. Function: Double-Action, single stage alarm.

**2.44 (B) 12/24 VDC POWER SUPPLY**

- A. Manufacturer: Altronix.
- B. Part No. OLS75 (or WMATA approved equal).
- C. The Power Supply provides 24VDC at 2.5 amps for ancillary building "Smart Reader" application. The OLS75 shall supply power for the SPX 2000, HID 5355, and other required accessories in ancillary buildings applications. Functions: Filtered and Regulated 24VDC.

**2.45 (B) STAINLESS STEEL ENCLOSURE**

- A. Manufacturer: Hammond.
- B. Part No. 1414N4PHSSK (or WMATA approved equal).
- C. This enclosure provides a housing in ancillary buildings for, "Smart Readers", OLS75 Power Supply, SPX 2000, Electronic Toggle Relay and the Edwards-SEC2 Dual Input Security Module. Functions: NEMA 4, Stainless Steel, hinged door.

**2.46 (B) DUAL INPUT SECURITY MODULE**

- A. Manufacturer: Edwards Systems Technology
- B. Part No. Edwards-SEC2 (or WMATA approved equal).
- C. The Dual Security Module is used to monitor intrusion devices, such as, door contacts and duress buttons.
- D. The SEC2 monitors two (2) input circuits. Functions: Normally open or Closed contact operation.

**2.47 (B) DIGITAL KEYPAD (DUMB READERS)**

- A. Manufacturer: Securitron.
- B. Part No. DK-26SS (or approved equal).
- C. The Digital Keypad is a programmable intrusion alarm shunt keypad that will be used for all "Dumb Reader" applications.
  - 1. 59 programmable user codes.
  - 2. Momentary and latching capability.
  - 3. Non-volatile memory.

#### **2.48 (B) MAGNETIC DOOR CONTACTS**

- A. Manufacturer: Sentrol.
- B. Part No. 2507A (or WMATA approved equal).
- C. The Magnetic Door Contact shall be used for door intrusion detection in most applications.
- D. The 2507A provides a SPDT (Single Pull Double Throw) contact for connection to either a SEC2 Module.
  - 1. Functions: SPDT contact.
  - 2. Wide Gap distance (approx 3").
  - 3. Stainless Steel Cable.

#### **2.50 (B) RAIL MOUNTED TERMINAL BLOCK**

- A. Manufacture: Weidmuller.
- B. Part No. 0412860000 (or WMATA approved equal).
- C. The Rail Mounted Terminal Blocks shall be installed in all Communication Equipment Rooms Distribution Frames.
  - 1. Clamping Type: Screw Clamp.
  - 2. Series: SAK Series.
  - 3. Wire size: # 22...12AWG.
  - 4. Current: 10 A.
  - 5. Voltage: 300 V.
  - 6. Special Req. 2 StB.

#### **2.51 (B) PROTECTOR BLOCKS**

- A. Manufacture: Reliable Electric Co.
- B. Part No. Model No. 361VSR2 (or WMATA approved equal).
- C. Arrester Type: Gas.
- D. Connector Type: Type 66 Quick-Clip.
- E. Stackable.

**2.52 (B) 3/4" PLYWOOD MOUNTING BACK BOARD**

- A. 3' x 3' x 3/4" Fire Retardant Plywood.

**2.53 (B) VARIOUS ELECTRICAL ACCESSORIES**

- A. Manufacture: West Penn.
- B. Part No. 60980 (or WMATA approved equal).
- C. The West Penn wire shall be used for all new hard-wired device cabling, such as, door contacts and request to exit devices.
  - 1. No. Of Conductors 1 pair.
  - 2. AWG Size 18 Solid.
  - 3. Tunnel Tested Yes.
  - 4. Temp. Range -10°C to 75°C.
  - 5. Voltage 300 V.

**2.54 (B) VARIOUS ELECTRICAL ACCESSORIES**

- A. Manufacture: West Penn.
- B. Part No. 60991 (or WMATA approved equal).
- C. This West Penn wire shall be used for all new SLC (Signaling Line Circuits) cabling to Intelligent Signature Series devices such as, smoke detectors, heat detectors, modules.
  - 1. No. Of Conductors 1 pair.
  - 2. AWG Size 16 Solid.
  - 3. Tunnel Tested Yes.
  - 4. Temp. Range -10°C to 75°C.
  - 5. Voltage 300 V.

**2.55 (B) VARIOUS ELECTRICAL ACCESSORIES**

- A. Manufacture: West Penn.
- B. Part No .60993 (or WMATA approved equal).
- C. This West Penn wire shall be used for all new 24 VDC power cabling, such as, annunciators and reader interfaces.
  - 1. No. Of Conductors 1 pair.

- 2. AWG Size 14 Solid.
- 3. Tunnel Tested Yes.
- 4. Temp. Range -10°C to 75°C.
- 5. Voltage 300 V.

**2.56 (B) VARIOUS ELECTRICAL ACCESSORIES**

- A. Manufacture: West Penn.
- B. Part No. D990 (or WMATA approved equal).
- C. This West Penn wire shall be used for all new RS485 data lines, such as, annunciators reader interfaces.
  - 1. No. Of Conductors 1 pair.
  - 2. AWG Size 16 Solid.
  - 3. Temp. Range -20°C to 75°C.
  - 4. Voltage 300 V.

**2.57 (B) VARIOUS ELECTRICAL ACCESSORIES**

- A. Manufacture: Superior/Essex.
- B. Part No. Filled ASP.
- C. The cable shall be used to interconnect ancillary locations to stations, where no interconnection currently exists.
  - 1. No. Of Conductors 6 pair.
  - 2. AWG Size 19.

**2.58 (B) VARIOUS MOUNTING HARDWARE**

- A. Manufacture: Various manufactures.
- B. Part No. Assorted.
- C. The contractor shall indicate and provide documentation on all mounting hardware, fittings and conduit etc. to WMATA for acceptability in this contract.

**2.59 (C) GARAGE TELEPHONE SYSTEM EQUIPMENT**

**2.60 MULTI-LINE AND SINGLE LINE VOIP TELEPHONE INSTRUMENT**

- A. Cisco, Polycom or other compatible VOIP instrument. (Or WMATA approved equal).
- B. Desk type,

1. Multi-line
  2. DTMF emulating keypad
  3. fully modular.
  4. Built-in speaker/microphone for hands free two-way conversation
  5. Capable of initiating conference calling, call transfer and call forwarding features.
- C. Wall mounted Single-line DTMF emulating keypad, fully modular
- D. IP Addressable

**2.61 SINGLE-LINE ANALOG WALL TELEPHONE INSTRUMENT**

- A. Cortelco, Product No. 2554-BE (or WMATA approved equal).
- B. Fully Modular.
- C. Beige.
- D. DTMF Keypad.

**2.62 (D) GARAGE EMERGENCY TELEPHONE SYSTEM (GETS) EQUIPMENT**

The GETS telephone system is described as follows:

**2.63 (D) EMERGENCY TELEPHONE**

- A. Vandal-Proof Products, Inc. Model No. T2100 (or WMATA approved equal).
- B. Fully ADA compliant as specified in ADAAG 4.10.14 and ASME 17.1.
- C. 3/4 inch "PUSH FOR HELP" call button.
- D. Red LED for "CALLING" light.
- E. Green LED for "RECEIVING" light.
- F. Grade 2 Braille and raised lettering to aid sight impaired persons in identifying the Emergency Telephone.
- G. Full duplex speakerphone
- H. Ability to record two different voice messages.
- I. Programmable from any touch-tone telephone (password protected).
- J. Equipped with four number autodial capability, and monitor the progress of incoming and outgoing calls.
- K. Hang up after called party hangs up or after a remotely

programmable period of time, whichever comes first.

- L. Power Requirement: 5 to 25 VDC.
- M. Face Plate: 304 brushed stainless steel.
- N. Auxiliary Output Contacts: Two normal open contacts.
- O. Surface Mount Enclosure: Stainless Steel 16 GA. Vandal-Proof Products, Inc Model No. AE740 vandal resistant hooded enclosure.

**2.64 (D) BLUE AREA LIGHT WITH STROBE WALL MOUNT**

- A. Vandal-Proof Products, Inc. Model No. A703SLB Area Light with Strobe Wall Mount (or WMATA approved equal).
- B. Blue Light remains illuminated at all times.
- C. White Strobe Light Flashes upon Call Activation.
- D. Shock and Vibration Resistant Filaments.
- E. Power Requirements: 120 VAC 5 Amps.
- F. Expected Life: 50,000 hours.
- G. 6"x6"x6" Steel Enclosure.

**2.65 (D) POWER DISTRIBUTION MODULE**

- A. Vandal-Proof Products, Inc. Model No. A705 (or WMATA approved equal).
- B. Input Voltage: 120 VAC.
- C. Telephone Line inputs: 8 RJ11.
- D. Telephone Line/24 VDC outputs: Quick Release type for Tip-Ring and Plus-Minus 24 VDC.

**2.66 (D) FOUR PAIR 22 AWG CABLE**

- A. Belden Cable Part No. 88757 (or WMATA approved equal).
- B. Four-Pair, 22-AWG, Unshielded Twisted Pair (UTP).
- C. Conforms to NEC CMP Category five.
- D. NEC Plenum Rated.
- E. Insulation (non-PVC) FEP Teflon (or WMATA approved equal).
- F. Jacket, (non-PVC), Teflon (or WMATA approved equal).

**2.67 (D) 25 PAIR CABLE TERMINAL HOUSING**

- A. Porta Systems, Model 24025-66-F66P.
- B. Three-element gas tube protector modules.
- C. 25-pair termination.
- D. With 66-type clips.

**2.68 (D) 12 PAIR CABLE TERMINAL HOUSING**

- A. Reltec, Model No. 3650 housing with six (6) three-element gas tube protector modules (each module protects two pairs), Model 1304VSR2 (or WMATA approved equal).
- B. 12-pair termination.
- C. With 66-type clips.

**2.69 (D) 12 PAIR 19 AWG TIE CABLE**

- A. Superior Model TEL G 194 (or WMATA approved equal).
- B. 12 pair, 19 AWG, single jacketed, shielded telephone cable.
- C. Solid, bare copper conductors, solid high-density polyethylene insulation with standard telephone color code, twisted into pairs.
- D. Core filling: ETPR compound.
- E. Core covering: Non-hygroscopic dielectric tape.
- F. Shield: .008 inch corrugated, copolymer coated aluminum.
- G. Armor: Corrugated bare 6 or 7-mil copper alloy 194 tape (TEL G194) applied longitudinally over the core.
- H. Jacket: Black polyethylene.
- I. Shall conform to and meet the requirements of ANSI/ICEA S-84-608-1988 and REA-PE-39.

**2.70 (E) LOCAL AREA NETWORK**

- A. The Local Area Network at the Passenger Station shall be extended to the garage. The LAN shall be used to facilitate connectivity of the Network Video Recorder, the parking operations computer, AEMS, the FIA system (if a separate system is installed), the police room desktop PC, VOIP telephones and media gateways.
- B. The LAN shall be connected to the passenger station LAN by using the composite fiber optic cable. The contractor shall be responsible for determining if single mode or multimode fibers are appropriate based on distance between the garage communications room and passenger station communications room.
- C. At locations where the passenger station has a fiber switch with spare GBIC ports, the fiberoptic connection may be made to the existing fiber switch. If a fiber switch does not

exist or does not have sufficient spare capacity, the contractor shall provide a 1 GB managed fiberoptic switch Cisco model 3760G-24 Port (or WMATA approved equal) in the passenger station communications room.

- D. 48 port managed switches Cisco model 3750G-48PS (or WMATA approved equal) shall be furnished and installed for each LAN shall be installed in the garage communications room. This switch shall accept a SX-GBIC fiberoptic input and shall provide 48 copper ethernet ports. Additional 24 and 48 port switches may also be used to accommodate cameras. Inputs or chaining of switches shall be accommodated via fiber optic connection.
- E. Category 6 cabling shall be used to extend ethernet service from a RJ-45 patch panel located in the garage communications room to wall mounted RJ-45 connections at remote locations which shall include the elevator machine room, the police room, the parking operations room, the location of the AEMS RTU and the communications room desk area.
  - 1. Police room (2 drops - PC & VOIP telephone)
  - 2. Parking operations room (as required for - Parking equipment computer, VOIP telephone, video monitoring station and Network Video Decoders if needed)
  - 3. Communications room desk area (1 drop - PC)
  - 4. Elevator machine room (1 drop - future)
  - 5. AEMS location (1 drop - AEMS)
  - 6. Use Standard EIA/TIA T568B pinouts
- F. Commercially manufactured jumpers shall be used to connect equipment within the racks. Custom jumpers may be acceptable with WMATA's representative approval to promote a neater installation.
- G. WMATA shall provide IP addresses for any connected equipment.
- H. All strands of the composite fiber cable shall be terminated on patch panels. A fiberoptic patch panel sized to accommodate the composite tie cable and all camera fibers shall be provided in the garage communications room. The existing fiber patch panel in the passenger station communications room may be only used if sufficient spare space is available for the tie cable plus at least 10 unused spaces. Contractor shall provide an appropriate sized fiber patch panel in the passenger station communications room if the existing panel does not have sufficient spare capacity.
- I. Terminate all fiber connections using type SC ends unless otherwise approved by WMATA's engineer.
- J. All cables (fiber and copper) shall be labeled at both ends of the run (at the station or destination end and at the patch panel).
- K. All cable drop numbers shall be recorded into an AutoCAD document. This document shall be included in the as-built electronic deliverables. A printed copy shall be maintained in the permanent room set of communications room drawings.

- L. All copper drops shall be tested and certified to meet or exceed ISO 11801:2002. Certified test data shall be submitted to WMATA's engineer for review.
- M. All fiber cable terminations shall be tested and certified to meet or exceed ANSI/TIA/EIA-526-14A [B14], method B; and ANSI/TIA/EIA-526-7 [B15], method A . Certified test data shall be submitted to WMATA's engineer for review.
- N. RJ-45 patch panel assignments for the Secure Operational LAN shall be segregated together as much as is possible.

#### **2.71 (H) GARAGE SUPPLEMENTAL RADIO**

- A. The contractor shall test all Public areas and service rooms for WMATA radio system coverage utilizing a WMATA provided portable radio on the CRCS frequencies.
- B. Provide amplifiers, cabling and antennas as needed to achieve 95 percent radio coverage in all areas of the garage.

### **PART 3 EXECUTION**

#### **3.00 GENERAL**

- A. All design, installation, testing and training shall be conducted in compliance with these specifications.
- B. Unless otherwise specified, communications, electronics and electrical installations shall be governed by the provisions of the "National Electrical Code, Standard of the National Board of Fire Underwriters for Electrical Wiring and Apparatus." And any local or jurisdictional codes. All provisions of this code must be considered applicable, whether specifically mentioned in the body of these Specifications or not.
- C. Unless otherwise specified, all wiring in structures that is external to equipment enclosures and racks, shall be installed in suitable Intermediate Metal Conduit (IMC), or shall be installed in existing cable tray, underfloor duct, or racked to existing channel inserts, if space is available and assigned by WMATA's Representative. All conduit and cable installations shall be subject to the approval of WMATA's Representative.
- B. Existing embedded conduit shall be assigned for use by the Contractor when not reserved for other requirements. Conduit cleaning, the construction of conduit extensions or rearrangements, cable rerouting, and the construction of conduit plant to enclose all remaining wiring shall be furnished by the Contractor. Surface conduit construction shall not be permitted in most public areas of stations or in a few other places. Core boring of structures may be required to obtain means of passage during conduit plant construction. Core boring of a concrete member shall be performed only if the structural integrity of the concrete member is not compromised. The location of embedded items, such as post tensioning tendons, steel reinforcement, conduit and cables shall be determined by the contractor and core boring shall be performed without damage to embedded items.
- C. Inside diameters of conduit shall be determined by the Contractor, based on the National Electric Code, using the appropriate fill factors for the class of service and number and size of conductors. The proposed conduit sizes shall be submitted to WMATA's Representative for approval. Conduits smaller than 0.75 inch shall not be used.

- D. All exposed conduit runs shall be installed parallel to walls, floors and ceilings, whenever possible, except where pitch is required for proper drainage. Conduits shall be rigidly supported at intervals not to exceed eight feet. Standard one-hole, malleable iron galvanized pipe straps of the proper size shall be used for single conduit runs on concrete surfaces. Where conduits are supported on concrete surfaces, stainless steel machine-bolt type expansion shields and bolts of the proper size shall be used. Standard conduit elbows or field bends are permitted; they shall not be less than the minimum radius, as required by the National Electrical Code.
- E. Conduits shall be connected to equipment metal enclosures using two locknuts and a bushing, except where conduit hubs are provided. Where enclosures, fittings with openings, or boxes of any type are installed in locations determined by WMATA to be subject to moisture, watertight conduit fittings shall be used. Watertight covers with seals shall be provided, and approved sealant applied to openings to effectively prevent the entry of moisture.
- F. All conduit entering Communications Equipment Rooms of passenger stations and parking structure shall be sealed. Watertight conduit and cable seals shall be used where the building or structure penetration is at a lower elevation than the manhole or below the water table.
- G. All terminal ends of conduits shall be provided with insulated metallic bushings.
- H. Whenever a conduit or exposed cable enters or leaves a box, it shall be permanently tagged, external to the box, with a plastic tag approved by WMATA's Representative. The tags shall be permanently stenciled or stamped with a number which shall identify the conduit or cable with an assigned circuit. Metallic tags shall be attached with stainless steel wire, straps or screws as applicable.
- I. All conduits installed shall be free of burrs and other sharp edges throughout the entire length. Conduit fittings or boxes shall be installed in conduit runs, where required, to limit the number of bends to a maximum of three 90-degree bends or equal. All conduits used shall be thoroughly cleared by pulling through a mandrel tool, and shall be blown clean by forcing compressed air through the run before wires or cables are pulled.

### **3.01 CUTTING AND PATCHING**

- A. All necessary cutting and patching of existing construction shall be provided by the Contractor for the installation of the equipment, conduit and cables.
- B. All cuttings shall be of the appropriate required sizes and shapes for the materials, conduits, cables and equipment to be installed. All cuttings shall be performed using the appropriate type of tools and equipment for the corresponding surfaces and material. The locations, sizes, shapes, and methods of performance for all cuttings shall be subject to approval by WMATA.
- C. All patching shall match existing adjacent construction to the satisfaction of WMATA, using the best possible workmanship of the various trades involved. All required material, compounds, sealants and hardware for all patching shall be provided. Fire wall integrity shall be maintained in appropriate construction.
- D. Removal and reinstallation of any existing items (i.e., platform tiles, manhole covers) to accomplish the installations shall remain the responsibility of the contractor. Replacement shall be provided for any removed items that are damaged or missing during the

performance of work, at no additional cost to WMATA. Replacements shall be identical in manufacture and type to the damaged or missing items.

- E. When it is necessary to cut reinforcing steel, the contractor shall provide engineering certification that the structure has not been weakened.

### **3.02 EQUIPMENT MOUNTING**

Unless otherwise specified, equipment shall be anchored to the concrete walls, floors, or ceilings by stainless steel machine-bolt type expansion shields and 0.5 inch minimum diameter bolts. The number of bolts shall be adequate to provide a rigid and safe support. Where required, concrete bases or pedestals shall be provided by the Contractor with anchor bolts cast in place for the mounting of equipment. All equipment shall be mounted plumb and level.

### **3.03 PAINTING**

All painted areas damaged in route to, or at the installation site, shall be repainted with matching colors by the Contractor. The surfaces of equipment and material not accessible after mounting shall be painted prior to installation.

### **3.04 WIRE AND CABLE INSTALLATION**

- A. Powdered soapstone or other suitable lubricating medium non-injurious to insulation shall be used, if required, when pulling wire cables in conduits or ducts.
- B. Each conduit, duct and pipe shall be cleaned before installing cables therein. The conduits, ducts and pipes shall be maintained in a clean and dry condition during the installation process up to and including the time which each conduit, duct and pipe is sealed.
- C. Wires and cables shall not cross one another when they are pulled into a conduit nor shall the conductors be pulled tight or kinked in conduit fittings or boxes.
- D. Cables shall be laid, not pulled, into trays or in troughs. Cables shall be installed with a minimum amount of crossover in the trays and troughs and shall not be placed tightly around bends. Where cables enter or leave trays via conduits, such conduits shall be rigidly affixed and supported at their ends by suitable brackets and conduit straps from the sides of the trays.
- E. Wires, cables and individual cable conductors shall be permanently tagged with plastic tags at each entry to and exit from all equipment terminal blocks. Tags shall be permanently marked to identify the system in which the cable and conductor is used. Fiberoptic cables shall have tags installed periodically along any exposed run. Tags and markings shall be subject to the approval of WMATA's Representative.
- F. All cable pairs, including spares, shall be terminated on connectors, protectors, or line terminating blocks on the MDF.
- G. The Contractor shall seal all openings through which cable, conduit and cable trays pass. The material used to seal the openings shall be furnished and installed by the Contractor. It shall be a fire retardant, non-toxic material and shall comply with the local fire prevention code.

- H. All exposed wires and cables entering or leaving equipment housing or junction boxes shall be protected from abrasion by sharp metallic edges. Chase nipples shall be provided in openings having conduit hubs. Chase nipples and locknuts shall be provided in drilled or punched openings.
- I. The Contractor shall seal all openings in equipment enclosures and junction boxes where exposed cables enter the enclosure or box. A pliable sealing compound made expressly for the purpose shall be furnished and installed after the cables are in place.
- J. Nylon straps shall be furnished and installed for bundling and cabling of conductors where two or more single conductors of the same circuit are run exposed in cable trays or in cable troughs. Straps shall be installed approximately every five (5) feet along the cable run. Wires of multiconductor cables exposed by the stripping of the cable jacket for termination shall be trimmed in a neat, workmanlike manner and tied approximately every three inches with nylon straps. Care shall be taken in terminating or splicing cable. Removal of insulation shall be done in a manner which does not nick the conductor material. In no case shall the conductor be kinked or bent at sharp angles. Smooth bends shall be utilized. Stainless steel or Aluminum cable ties shall be used where exposed to sunlight or the ties are the cable support system. A cable tie tool shall be used to install the nylon ties and to cut the ends to avoid sharp edges.
- K. All cables and wires installed in environmental air plenums, cable vaults, and under passenger station platforms shall be placed in appropriately sized electrical metallic tubing (IMC) unless otherwise specified.
- L. Appropriate channel inserts, arms and insulators shall be provided to support cables in the manholes of the duct bank.
- M. Dewatering and removal of all dirt and trash from trenches, manholes, pull chambers, cable troughs, surface trenches, conduit and duct banks shall be the contractor's responsibility during, the installation of cables. All trash and debris shall be removed after the cable installation has been completed and before closing.
- N. Fiberoptic cables shall be terminated in communications rooms on appropriate sized fiberoptic patch panels.
- O. If inter-duct is used for fiberoptic cable installation in ductbanks, multiple innerduct tubes shall be installed in the conduit to facilitate future use of the conduit. Innerduct is not required for one fiberoptic cable in an appropriate sized conduit. New technology innerduct products are commercially available that shall provide future capacity with reduced installation effort and may be used with WMATA's representative approval.

### **3.05 (A) PARKING STRUCTURE EQUIPMENT ROOM CCTV INSTALLATION**

- A. The Contractor shall design, install and test a CCTV system that satisfies the intended system use as noted in the design philosophy in this specification.
- B. Install one Network Video keyboard console or client workstation with 19" monitor(s) in the parking operations room on the desk provided under this contract and connect the viewing system to the Network Video Recorder via LAN connections. The parking office viewing station shall be configured to monitor all cameras observing entry/exit lanes and booths.

- C. Install Network Video Recorder and support equipment (video encoders, memory modules or recording media, programming and maintenance console, keyboard, monitor, ext) on 19" racks in the garage communications room. The garage communications room shall be equipped with any accessory needed to configure, troubleshoot or maintain the NVR system. In lieu of installing the keyboard and monitor in the racks, the workbench maintenance PC may be configured to include all support functions.
- D. Connect all networked video equipment home runs to the garage LAN through an appropriately sized RG-45 patch panel. RG-45 Jumpers between equipment located within the communications room racks may be used as required by the equipment manufacturer and design documents.
- E. The garage police room shall be equipped with a desk, chair and a PC based camera viewing station with a 19" desk top monitor and appropriate software to view any image recorded on the network video recorder and control any PTZ camera in the garage. The PC based viewing station shall function as a regular PC computer when not being used to view video. The PC shall be connected to the NVR by means of a LAN connection.
- F. Provide WMATA's engineer with all software license, log-on identifications and passwords.
- G. Each exit booth and entry lane and all other garage access points shall be monitored by a CCTV camera. This is in addition to the 85% coverage requirement.
- H. All camera video output shall be connected to the Network Video Recorder. The video recorder shall be set to record appropriate quality video for 30 days before overwriting the oldest files.
- I. Contractor shall consult WMATA's engineer during camera design and layout to assure the intent of garage CCTV monitoring is achieved with the minimal quantity of cameras.
- J. CCTV camera video signal shall be transported over fiber optic cable. Exception: video feeds of less than 150 feet from the garage communications room containing the NVR or video encoder room may utilize coaxial cable transmission. IP cameras may utilize cat-6 cable provided the cable run is within the range as specified by the manufacturer and all EMI interference is mitigated.
- K. Elevators shall be equipped with a camera concealed within a housing resembling a smoke detector.
- L. The garage communications room shall be equipped with a workbench mounted PC based video maintenance and viewing station with a 19" desk top monitor. Appropriate software shall be installed to view any camera in the garage system or any image recorded on the network video recorder and control any PTZ camera in the garage. Any additional software required for programming, troubleshooting or maintenance of the Garage Video System shall be provided and installed. The PC shall be interconnected to the video equipment. In cases where interconnection to the equipment can only occur during programming or test modes, permanently installed cables from the equipment location to the PC location shall be installed between the PC and the equipment port and clearly tagged at both ends. The PC shall be connected to LAN. Equipment that is configurable from the PC via the LAN connection will not require redundant cabling.
- M. Bathroom hallways shall have camera coverage.

### 3.06 (B) FIRE AND INTRUSION ALARM SYSTEM INSTALLATION

- A. The Contractor shall install a Fire and Intrusion Alarm System in the Parking Garage in accordance with NFPA National Fire Codes, requirements of local jurisdictions, the Contractor's WMATA approved design and the manufacturer's instructions. Any conflicting requirements shall be resolved to the satisfaction of WMATA's Representative.
- B. If an independent system is provided, the FIA Power disconnect switch shall be installed in the Garage Communications Room on the same wall with the FIA Control Unit and shall be wired to the feed side of the incoming power in such a way to permit power to be removed from Communications Room feeder disconnect switch without interrupting the FIA power.
- C. Intrusion Detectors Installation Requirements - For doors leading from a non-protected area to a protected area, the bypass (or dumb) keypad shall be installed on the wall adjacent to the door lock assembly on the unprotected area side. The protected areas shall include the garage service and equipment rooms, elevators and all attendants booths. Keypads shall be installed on elevator service rooms, communication rooms, power and generator rooms, parking office and police office. Entries into protected areas shall provide a searchable marker on the CCTV video recording for the camera with the closest view of the area.
- D. Elevator Intrusion Interface - The Contractor shall coordinate with the elevator contractor and install conductors and conduit to interconnect the Fire and Intrusion System Control Unit to the FA/FIB to the elevator Junction Box in the Elevator Machine Room. The contractor shall insure connections are made to the elevator intrusion switches
- E. If required by the local jurisdiction, a Graphic Fire Annunciator Panel/Cabinet shall be installed on the outside wall of the Garage Police Room. The Contractor shall install the conduit and circuits as necessary from, the Common Control Unit to the graphic annunciator panel to permit activation of the LEDs of the Annunciator Panel. If an intelligent display is permitted and the contractor elects this option, the display shall be installed in a likewise manner as the graphic annunciator. The contractor shall be responsible for providing tamper proof protection for the display unit.
- F. The Contractor shall program and install the additional modules in the Passenger Station FIA Common Control Unit and provide any additional cabling and conduit for displaying the Garage FIA alarms. The Contractor shall provide any required additional wiring between the Station Common Control Unit, the F&I Interconnect Wall Terminal and the TC/Comm Interface Cabinet in the Station Communications Room for the transmission of Garage FIA alarms to WMATA's Operations Control Center via the passenger station Data Transmission System. Contractor is responsible for connectivity to the terminals on the E-Rack in the station Train Control Room. Any changes and additions to the Data Transmission System shall be performed by others; However, the Contractor shall participate in end-to-end testing of the alarm transmissions and be responsible for any required remedial work in his installations. All work within the Passenger Station shall be subject to the approval and under the supervision of WMATA's Representative.
- G. All cabling, connections, terminal boxes, terminals, 3/4 inch EMT metallic diameter or larger surface conduit (with pressure fittings throughout) between all equipment and between equipment and FIA devices of all types, installation of power disconnect switch equipment and any other installation work and testing and technical documentation services necessary to the completion and functioning of this entire Fire and Intrusion Alarm System as specified, shall be furnished by the Contractor.

### 3.07 GARAGE TELEPHONE

- A. The telephone extensions shall provide telephone service in service and equipment rooms and areas within the Parking Structure. Telephone switching functions shall be provided by the existing telephone processing equipment in WMATA's Jackson Graham Building and at the Carman Turner Facility. Telephone circuits shall be connected to WMATA's telephone system as VOIP extensions through the LAN/WAN which shall be extended from the passenger station under this contract.
- B. Single-line wall-mounted analog telephone extensions shall be provided in the Electrical Room, the Generator Room, the Elevator Machine room, the Elevator Pit and any other rooms or areas within the Parking Structure considered necessary by WMATA's Representative. A full featured desk type VOIP telephone shall be provided in the Garage Police Room, the Parking Operations Office and in the Garage Communications Room.
  - 1. Analog telephone instruments located in the Garage shall have a dedicated Cat-6 cable from the telephone location to the Garage Communications Room (no bridge cable taps shall be permitted).
  - 2. Analog telephones instruments located in the Garage shall be wired to the protector cable terminals located in the Garage Communications Room.
  - 3. Wall-mounted type telephone instruments shall be mounted to NEMA 12 enclosures. The Contractor shall furnish and install an appropriately sized connecting block in the NEMA 12 enclosure.
  - 4. The multi-line VOIP telephone instrument in the Garage Police Room, communications room and parking operations office shall be installed on top of a desk in a location approved by the Engineer. The Contractor shall install a standard surface mount RJ-45 connecting block at floor level near the approved location.
  - 5. A spare cat-6 cable shall be routed from each analog telephone location to the garage communications room MDF and terminated on a 110-block terminal strip. Three feet of cable shall be coiled in the telephone junction box for future use.
- C. All copper telephone and data wiring shall terminate on the distribution frame before connecting to equipment in the communications room. Voice wiring shall terminate on 66-blocks. Data wiring shall terminate on 110-blocks. Additional terminals and protector blocks shall be added as needed to the Metrorail Passenger Station Communications Equipment Room.
- D. Analog telephones and GETS shall be connected to the LAN by means of media gateways located in the garage communications room. The analog emergency modem port or dial around ports of each media gateway which is used during LAN failures shall be connected to separate analog telephone circuits in the passenger station communications room via the 25-pair cable.
- E. A 25-pair, 19 AWG. cable shall be provided between the Garage Communications Room and the Passenger Station Communications Room. The Contractor shall determine and provide cable routing within the Passenger Station without the use of surface mounting of cables or conduits in public areas of the station.

- F. The Contractor shall tag all telephone extension cables and stencil all termination cabinets.
- G. One analog wall telephone and an analog RJ-11 surface mounted connector for a fax machine shall be installed in the police room in addition to the VOIP multiline telephone. The wall mounted analog telephone and fax line shall be cross connected in the garage communications room and routed through the multiconductor copper cable to the passenger station communications room. WMATA's engineer shall provide direction on connection points to the existing WMATA's telephone system.

### **3.08 (D) GARAGE EMERGENCY TELEPHONE SYSTEM**

The GETS system shall include the following equipment installation:

- A. Emergency Telephones (located at the entrances to the stairs and near elevator lobbies in the parking structure and as needed so walking distance to a GETS instrument is no greater than 200 feet from any public area within the garage).
- B. Blue Emergency Telephone Locator Lights and White Strobe Lights (one for each Emergency Telephone)
- C. Power distribution module (located in the parking garage communication equipment room).
- D. Media Gateways (located in the parking garage communication equipment room).
- E. Cabling and termination equipment for connections to WMATA's Carrier Transmission System and Local Area Network.
- F. Any necessary additions or modifications to the GETS System to properly interface with the existing WMATA's telephone system and personal computer and software located in the Jackson Graham Building and Carman Turner Facility.
- G. The Emergency Telephones shall provide a fully automated, touch of a button means for emergency communications between WMATA patrons and the Transit Police Dispatcher with easy to understand instructions in English and braille.
- H.  pressing the momentary contact pushbutton switch on the Emergency Telephone shall illuminate a red indicator marked "CALLING" and start the white strobe light. When the call is answered by MTPD a green indicator marked "RECEIVED" shall illuminate and the pre-recorded message shall play for both the caller and MTPD. If the pre-programmed telephone number is busy or not answered after 30 seconds, the Emergency Telephone shall hang up and dial the number again. This process shall continue until the call is answered. WMATA's existing telephone system shall be programmed to roll-over to the second MTPD number, in the event that the primary number is busy.
- I. An Emergency Telephone call is terminated when MTPD hangs up (goes on-hook), or after the pre-programmed time out has expired - whichever occurs first. This shall cause the Emergency Telephone to hang up (go on-hook) or to be reset. When the call is terminated the white strobe light shall be extinguished. An Emergency Telephone call can not be terminated by any action taken at the Emergency Telephone.
- J. When a call is placed to the Emergency Telephone from the MTPD office, the Emergency Telephone shall be programmed to answer the call and hang up if no keystrokes (via the touch-tone pad) are entered after it has answered an incoming call. MTPD may then enter a

silent monitor mode by entering the proper code number via the touch-tone pad on the telephone.

- K. The blue colored Emergency Telephone Location Lights are normally illuminated (steady on) and are intended to help identify the Emergency Telephone locations to WMATA patrons. When the call button is pressed on the Emergency Telephone, it shall cause the white light to strobe until the call is completed.
- M. The power distribution module shall provide 24 volts DC power to the Emergency Telephones from 120 volts AC.
- N. Telephone Media Gateway Installations:
  - 1. The telephone media gateways shall be used to convert dedicated PABX extensions to Internet Protocol compatible with the existing WMATA's telephone system. Media gateways shall have a dial-around feature installed that shall dial an analog telephone number if the LAN system is not able to complete the transmission.
  - 2. If more than one Emergency Telephone on a media gateway is activated while in the dial-around mode, each Emergency Telephone -except the first one activated- on that media gateway shall receive a busy signal requiring the units to redial until the outgoing line becomes available.
- O. Computer Supervision System and Software Installation:
  - 1. The existing WMATA MTPD personal computer and software shall provide diagnostic testing of all Emergency Telephones and provide printed test results. The existing software shall call each telephone instrument and test whether the Emergency Telephone is receiving power, the integrity of the telephone circuit, the Emergency Telephone circuitry, and the Emergency Telephone microprocessor for proper operation.
  - 2. Updates to the existing software shall be made to incorporate all new Emergency Telephones into the diagnostic system.
  - 3. When IP based GETS are installed and MTPD consoles are available, the database shall be updated to reflect all of the GETS instruments in the garage.
- P. The Contractor shall furnish install and test all instruments, equipment racks, media gateways, LAN interfaces, power supplies, terminals, hardware, protector blocks, enclosures, connecting blocks, wiring and cabling, conduits and fittings, and make all the connections and cross-connections required for a complete and operational installation of the Garage Emergency Telephone System (GETS). This includes all required installations within the passenger station limits, along the right-of-way and in the parking structure. All spare pairs in cables shall be terminated. If future levels of the parking structure are not built under this contract, the Contractor shall terminate the cabling for any noted future level Emergency Telephones and Blue Area /Strobe Lights in appropriate junction boxes as near as practical to the anticipated riser locations for the future level installations. Equipment for the future levels installations shall be packed for storage and stored in the Parking Garage Communications Room.
- Q. Emergency Telephone Instrument Installation:
  - 1. The Contractor shall install the Emergency Telephones and Blue Area and Strobe Lights near the entrance to each stairwell and near each elevator lobby and as

required in public areas so no walking distance is greater than 200 feet from a GETS instrument. The Contractor shall install conduit and a dedicated 4-pair cable from each Emergency Telephone located at entrances to each stair well on each level to the Garage Communications Equipment Room (no bridge cable taps shall be permitted). In the communications room, two of the pairs shall be terminated on the distribution frame through protector blocks for voice and power and the other two pairs in each cable shall be terminated on the distribution frame and marked as spares.

2. The Contractor shall install the required conduit and connect the Blue Area and Strobe Lights to the nearest emergency 277 VAC source using a 277 to 120 VAC transformer supplied by the Contractor. The transformer shall be installed in an appropriately sized stainless steel box and shall be mount under the associated Blue Area and Strobe Light.
3. The Contractor shall install the required conduit and connect the Strobe Lights to the Emergency Telephone's Auxiliary contacts.
4. The Contractor shall install 19-inch equipment racks as required in the Parking Garage Communications Equipment Room. The Contractor shall install the power distribution modules and media gateways (one set for each level of the parking structure) on the 19-inch equipment racks.
5. The Contractor shall program the Emergency Telephone to dial 40000 when the "PUSH FOR HELP" button is pressed.
6. The Contractor shall record a voice message on each Emergency Telephone to identify its location (i.e. "Phone number 6, north side stairwell, level number 4"). The voice message to be programmed into each telephone shall be approved by the Engineer, prior to being programmed. Each voice message shall be scripted and submitted to WMATA's Representative for approval.

R. Passenger Station Installation

1. The Contractor shall install a minimum sized 25 pair 19 AWG cable from the Parking Garage Communications Equipment Room Distribution Frame GETS cable terminal housing to the Passenger Station Communications Equipment Room Distribution Frame GETS cable terminal housing.
2. The Contractor shall terminate the GETS Emergency Telephone media gateway dial around lines in the terminal block in the Contractor provided Distribution Frame of the Passenger Station Communication Equipment Room and extend the wiring to an appropriately sized interface terminal block. WMATA shall provide location information for Cross-connections between the interface terminal block and the existing telephone system.

S. Jackson Graham Building/ Carman Turner Facility Installation:

1. Contractor is responsible for updating configuring the existing GETS diagnostic PC to incorporate all of the GETS instruments installed under this contract into the daily testing software.
2. GETS telephone numbers required for programming the database shall be provided to the Contractor by WMATA's Representative. Contractor shall provide WMATA's

representative with a matrix similar to Table 3.2-1 detailing each GETS telephone instrument location for WMATA to populate with telephone numbers.

3. Any central office telephone switch equipment modifications or adjustments shall be performed by WMATA personnel. All modifications or upgrades to the GETS PC shall remain the responsibility of the contractor.

**Table 3.2-1**  
**EMERGENCY TELEPHONE NUMBER ASSIGNMENTS FOR PARKING Structure GETS**  
**EXAMPLE**

LOCATION	TELEPHONE NUMBER	Media Gateway IP Address
Level 1 - Northeast Stair		
Level 1 - Southwest Stair		
Level 1 - Elevator Lobby		
Level 2 - Northeast Stair		
Level 2 - Southwest Stair		
Level 2 - Elevator Lobby		

### 3.10 (E) LOCAL AREA NETWORK

- A. The Local Area Network from the Passenger Station shall be extended to the garage.
  - 1. The Network Video Recorder, the parking operations computer, the police room desktop computer and computer wall jacks in the AEMS room, generator room, communications room, VOIP phones and elevator machine room, AEMS, GETS and telephones via media gateways shall be connected to the LAN.
- B. WMATA shall provide IP addresses for all connected equipment.
- C. Coordinate with WMATA's Engineer before connecting the new LAN extensions to the active WMATA LAN equipment .
- D. Installation shall follow the following standards:
  - 1. If any data switches are needed to support new construction, the contractor shall identify and provide equipment as is needed. Equipment proposed other than the Cisco switch/router as specified shall be submitted for WMATA - OIT review and approval prior to procurement.
  - 2. Cat-6 LAN drops shall be tested and certified using an OIT approved Cat-6 cable tester.
  - 3. Cat-6 LAN drops shall be labeled and dressed in a professional manner and subject to WMATA -OIT inspection and approval. Failure to pass WMATA - OIT inspection will require the contractor to remedy the cable installation to meet WMATA - OIT approval at the contractor's cost.
  - 4. Fiber terminations shall be on a contractor recommended and WMATA - OIT approved fiber patch panel.
  - 5. Cat-6 terminations shall comply with the eia/tia 568B termination standard.
  - 6. The contractor shall provide all fiber or Cat-6 patch cables required for patching. Cables shall be of an appropriate length for use with the patch panel.

### 3.11 (H) SUPPLEMENTAL RADIO COVERAGE

- A. CS radio equipment shall be installed as needed to provide supplemental coverage in areas where off air service is not available within the garage structure.

Contractor shall select antennas, amplifiers and other equipment as needed to achieve required radio coverage.

**END OF SECTION**

## SECTION 16715

### COMMUNICATIONS ELECTRICAL POWER DISTRIBUTION

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The Electrical Power Distribution System provides power distribution from the 3-phase, 4-wire, 120/208 Vac, primary power feed to the communications systems. The Electrical Power Distribution System described herein includes the following facilities:
  - 1. 120 Vac Emergency Power (from station UPS) for communications equipment in the Communications Equipment Rooms, and Kiosks.
  - 2. -48 Vdc power for communications equipment in the Communications Equipment Rooms.
- B. The 120 Vac Emergency Power Distribution System described herein includes for each Passenger Station, but is not limited to, the following components:
  - 1. In the Communications Equipment Room:
    - a. Power Distribution Panelboard.
    - b. AC Power Receptacles.
- C. In the Kiosk - AC Power Receptacles.
  - 1. Required conduits and fittings, junction boxes, feeder wires, branch circuit wiring, and cabling to apportion the 120 Vac power to the communications systems and facilities equipment.
- D. The -48 Vdc Power Distribution System described herein includes, but is not limited to, the following components:
  - 1. -48 Vdc Power Supply(s).
  - 2. -48 Vdc Status Panel.
- E. The -48 Vdc Power Distribution System provides fail-safe service by load-sharing several power supplies. Power supplies may be removed from the active -48 Vdc Power Distribution System for repair, or added for increased capacity, without disrupting communications services.
- F. The Status Panel provides voltage and current metering for the -48 Vdc Power Distribution System. The Status Panel also distributes -48 Vdc power to the Telephone (TEL), Carrier Transmission System(CTS) and Fiber Optic System(FOS) Systems equipment racks or, as needed, to any other communications equipment racks requiring a source of -48 Vdc power.

##### 1.02 SECTION INCLUDES

- A. Power Distribution Panelboard.
- B. AC Power Receptacles.
- C. -48 VDC Power Supply(s).
- D. -48 VDC Status Panel.

### **1.03 UNIT PRICES**

- A. Unit Prices include all Required conduits and fittings, junction boxes, feeder wires, branch circuit wiring, and cabling to apportion the 120 VAC power and –48VDC power to the communications systems and facilities and incidental items, not specifically mentioned, but required for complete and proper system operation.

### **1.04 RELATED SECTIONS**

- A. Section 16706 - Communications System Submittals & Services.
- B. Section 16707 - Communications Systems Quality Assurance & Testing
- C. Section 16710 - Communications Grounding.
- D. Section 16721 -Communications Telephone System.
- E. Section 16771 -Communications Carrier Transmission System.
- F. Section 16776 -Communications Fiber Optics System.
- G. Section 16851 -Communications Closed Circuit Television System.

### **1.05 REFERENCES**

- A. National Electrical Manufacturers Association (NEMA) Standard Publication 250-1997, Enclosures for Electrical Equipment (1000 Volts Maximum).
- B. NEMA Standard AB-1, Molded Case Circuit Breakers and Molded Case Switches
- C. National Electric Code (NEC).
- D. Insulated Cable Engineers Association (ICEA) S-95-658/NEMA WC70, Nonshielded 0 - 2kV Cables; ICEA S-96-659/NEMA WC71, Nonshielded 2001 - 5kV Cables; ICEA S-93-639/NEMA WC74, Shielded Power Cables 5 - 46 kV; ICEA S-94-649, Concentric Neutral Cables Rated 5 - 46 kV; ICEA S-97-682, Utility Shielded Power Cable Rated 5 - 46 kV; ICEA S-105-692, 600V Single Layer Thermoset Insulated Utility Underground Distribution Cable; and ICEA S-81-570, Direct Burial, 600V, Ruggedized Insulation.

### **1.06 SYSTEM DESCRIPTION**

- A. Description: The Communication Electrical Power Distribution provides power distribution from the 3-phase, 4-wire, 120/208 VAC, primary power feed to the communications systems.
- B. Capacity:
  - 1. The Power Distribution Panelboard shall be sized to provide separate power circuits to each freestanding or wall-mounted equipment rack and cabinet, and any other equipment requiring an ac circuit feed. The Panelboard shall also include at least 20% unused (spare) circuit-breaker spaces.

2. The AC Power Disconnect Switch shall be rated to switch the calculated worst-case ac current load, plus 50% spare capacity.
  3. The Communications Equipment -48 Vdc Power Supply shall be rated to provide the calculated worst-case dc current load, plus 100% spare capacity.
  4. The -48 VDC Power System Status Panel shall be chosen to be fully compatible with the -48 Vdc Power Supply throughout its rated operating range.
- C. The -48 VDC Power Distribution System provides fail-safe service by load-sharing two, or more, power supplies. At least one power supply may be removed from the active -48 VDC Power Distribution System for repair, or added for increased capacity, without disrupting communications services.
- D. The Status Panel provides voltage and current metering for the -48 VDC Power Distribution System. The Status Panel also distributes -48 VDC power to the Telephone System (TEL), Carrier Transmission System (CTS) and Fiber Optic System (FOS) Systems equipment racks or, as needed, to any other communications equipment racks requiring a source of -48 VDC power.
- E. The GETS system includes an existing personal computer (PC) (located in the Jackson Graham Building) equipped with software to interrogate the Emergency Telephones and telephone circuits to assure reliable emergency communications. The PC software also provides for remote programming of the Emergency Telephones in the parking garages.

#### **1.07 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.
- C. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.
- E. Calculate full load ac power requirements per branch circuit and shall configure each panelboard for an optimum phase load balance. Submit the calculations to the Engineer for approval. The calculations shall indicate the full load ac power requirements for each item of equipment connected to each branch circuit.

#### **1.07 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Service facilities within 50 miles of Project.

## **1.08 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Electrical Power Distribution System until Final Completion.

## **PART 2 - PRODUCTS**

### **2.01 POWER DISTRIBUTION PANELBOARD**

- A. Manufacturers:
  - 1. Square D Co., Model No. NQOD424L100CU (or approved equal).
- B. Type: NQOD, 3-phase, 4 wire, 120/208 Vac, main lugs only with isolated solid neutral bus and a ground bus.
- C. Enclosure: NEMA Type 12 surface mounting and surface screw front cover with hinged door and flush lock.
- D. Minimum Ratings:
  - 1. Capacity: 20 single-pole branch circuit breakers.
  - 2. Panel Amperage: 750,000.
  - 3. Power Requirements: Main Lugs, 100 Amps.
  - 4. Minimum Circuit Breakers: 16 single-pole NEMA Standard AB-1.

### **2.02 TERMINAL SUPERVISOR'S AC POWER DISCONNECT SWITCH**

- A. Manufacturers:
  - 1. Square D Co., Model No. H221NAWK, (or approved equal).
- B. Minimum Ratings:
  - 1. Type: NEMA Type 12 surface mounting and surface screw front cover with hinged door and flush lock.
  - 2. Amperage Rating: 30 Amps.

### **2.03 10 - OUTLET AC POWER RECEPTACLE**

- A. Manufacturers:
  - 1. Wiremold Company, Multi-outlet System/Plugmold 2000, Series GB, Model No. 20GB506, (or approved equal).
- B. Minimum Ratings:
  - 1. Pre-wired receptacles on 6-inch centers.
  - 2. 3-wire circuit, insulated ground conductor.
  - 3. Receptacles grounded to raceway.

### **2.04 6-OUTLET AC POWER RECEPTACLE**

- A. Manufacturers:
  - 1. Wiremold Company, Multi-outlet System/Plugmold 2000, Series GB, Model No. 20GB306, (or approved equal).
- B. Minimum Ratings:

1. Pre-wired receptacles on 6-inch centers.
2. 3-wire circuit, insulated ground conductor.
3. Receptacles grounded to raceway.

## **2.05 DUPLEX AC POWER RECEPTACLE**

- A. Manufacturers:
1. Arrow Hart Division, Cooper Industries, Model No. IG5362 with Model No. IG8248 wall plate, (or approved equal).
- B. Minimum Ratings:
1. Rated for 20 Amps, 125 VAC.
  2. Isolated ground receptacle.
  3. Color: Orange.

## **2.06 WIRE**

- A. Manufacturers:
1. Triangle PWC, Inc., Everene, Model No. USE/RHW, (or approved equal).
- B. Minimum Ratings:
1. Insulation Type: Cross-linked Polyethylene in accordance with ICEA S-95-658/NEMA WC70, ICEA S-96-659/NEMA WC71, ICEA S-93-639/NEMA WC74, ICEA S-94-649, ICEA S-97-682, ICEA S-105-692, and ICEA S-81-570.
  2. Conductor: 12 AWG or larger Class B stranded copper.
  3. Voltage Rating: 600 volts.

## **2.07 GROUND CLAMP**

- A. Manufacturers:
1. Wiremold Company, Multi-outlet System/Plugmold 2000, Model No. 2009, (or approved equal).
- B. Ratings:
1. Compatible with Plugmold 2000.
  2. For use on multi-outlet systems.
  3. Plated.

## **2.08 COMMUNICATIONS EQUIPMENT -48 VDC POWER SUPPLY**

- A. Manufacturers:
1. Power Conversion Products, Model No. PS-19 shelf complete with PCP Model No. MOD-4812 rectifier modules (quantity of 2 per shelf), (or approved equal).
- B. Minimum Ratings:
1. Input: 95-130 VAC, 60-Hz (nominal), Power Factor: PF>90%.
  2. Output: -48 VDC, 24-amp (load sharing).
  3. Alarms: Rectifier Output Failure indicator with Form "C" alarm contacts.
  4. High dc voltage shutdown.
  5. Mounting: 19-inch rack complete with 23-inch rack mount adapters and hardware.

## **2.09 -48 VDC POWER SYSTEM STATUS PANEL**

- A. Manufacturers:
  - 1. Power Conversion Products, Mini Load Center Model No. MDM-48-75, complete with 6 appropriately-sized alarm breakers, (or approved equal).
- B. Minimum Features:
  - 1. Metering: Voltage and current.
  - 2. Alarms: High/low dc voltage Form-C contacts.
  - 3. Alarm breaker power distribution center: 6-position
  - 4. Mounting: 19-inch rack complete with 23-inch rack mount adapters and hardware.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Calculate full load ac power requirements per branch circuit and configure each panelboard for an optimum phase load balance.
- B. Communications Equipment Room
  - 1. Surface mount the completely assembled Communications Equipment Room Power Distribution Panelboard adjacent to the Communications Equipment Room feeder disconnect switch. Install power feeders (power phases, neutral and equipment ground) from the Communications Equipment Room feeder disconnect switch to the Communications Equipment Room Power Distribution Panelboard using appropriately sized steel conduit and make the necessary connections.
  - 2. Install an ac power receptacle strip on each equipment rack and in each equipment cabinet. Install the required mounting hardware to secure the ac power receptacle strips to the equipment racks and cabinets. Install a ground clamp in each raceway of the ac power receptacle strips to ensure that the raceway base is grounded to the equipment rack or cabinet. The ac power receptacle strips shall be installed so that they do not create obstructions to mounted equipment within the equipment racks and equipment cabinets and so that all outlets are accessible.
  - 3. Install the branch circuit conductors (power phases and neutral) from the Communications Equipment Room Power Distribution Panelboard to each ac power receptacle strip on the equipment racks and in the equipment cabinets, using appropriately sized rigid steel conduit.
  - 4. Install branch circuit conductors (power phases, neutral and equipment ground) from the Communications Equipment Room Power Distribution Panelboard to the Power Isolation Transformer of the passenger station Closed Circuit Television System using appropriately sized rigid steel conduit. Install branch circuit conductors (power phases and neutral) from the Power Isolation Transformer to the Closed Circuit Television Camera Power Distribution Panel(s) using appropriately sized rigid steel conduit.
  - 5. Install and wire the -48 VDC Communications Equipment Power Supplies and status panel in the telephone equipment rack. The -48 VDC power supplies shall be paralleled for load sharing operation.
  - 6. Install the appropriate wiring to distribute -48 VDC power from the power distribution center in the status panel to the following locations within the Communications Equipment Room:
    - a. Fuse, Alarm and Distribution Panel(s) in the CTS equipment rack(s).
    - b. Fuse, Alarm and Distribution Panel(s) in the FOS equipment rack(s).
    - c. Fuse, Alarm and Distribution Panel in the TEL equipment rack.

- C. Kiosk
  - 1. Install the duplex receptacles, associated enclosures and cover plates within the Kiosk cabinetry of the passenger station Kiosk. Install the required mounting brackets and hardware to secure the enclosures of the duplex receptacles to the Kiosk structure and/or Kiosk cabinetry. The duplex receptacles shall be installed so that they do not create obstructions to mounted equipment within the Kiosk cabinetry and so that all receptacles are accessible.
  - 2. Install branch circuit conductors (power phases, neutral and equipment ground) using appropriately sized, flexible, metallic conduit from the Kiosk Emergency Panelboard to the duplex receptacles within the Kiosk. Install the required conduit fittings, hardware, junction boxes, connectors and grounding hardware, and make the necessary connections.
  
- D. Dispatcher's Room
  - 1. Surface mount the Dispatcher's Facility ac power disconnect switch and panelboard in the vicinity of the Dispatcher's Facility. The Contractor shall install power feeders (power phases, neutral and equipment ground) from the Communications Equipment Room feeder disconnect switch to the Dispatcher's Facility ac power disconnect switch, and from the disconnect switch to the panelboard. Install appropriately sized rigid conduit, the required conduit fittings and hardware, and make the necessary connections. The power feeders to the Dispatcher's Facility ac power disconnect switch shall be connected to the Communications Equipment Room feeder disconnect switch at the input side.
  - 2. Install branch circuit conductors (power phases and neutral) from the Dispatcher's ac power panelboard to the ac receptacles in the Dispatcher's Facility using appropriately sized rigid conduit. Install the required conduit fittings, hardware, junction boxes, terminals, connectors, grounding hardware, and make the necessary connections and cross-connections.
  
- E. Grounding
  - 1. Electrically insulate all conduits from equipment racks and equipment cabinets; power ground shall be separate and isolated from the communications ground. Conduit containing branch circuit conductors shall be insulated from the equipment racks and cabinets by means of short lengths of non-conducting conduits.
  - 2. Provide short lengths of flexible metallic conduit in the equipment cabinets and on the equipment racks between the non-conducting conduit and the ac power receptacle strips. Each branch circuit shall contain a separate neutral conductor to the Communications Equipment Room Power Distribution Panelboard.

### **3.02 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

### **3.03 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

### **3.04 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to designated WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with designated WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**END OF SECTION**

## SECTION 16721

### COMMUNICATIONS - TELEPHONE SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The Telephone and Data System is part of the WMATA telecommunications network. Its purpose is to provide telephone service to WMATA personnel in selected locations within, and associated with, the passenger station and data circuits between the Jackson Graham Building and the passenger stations. The Telephone System is not intended to provide telephone service to passengers.
- B. The Telephone System provides telephone service at selected locations along the right-of-way, in selected rooms and areas within the passenger station, and in selected ancillary buildings associated with the passenger station. Telephone switching functions are provided by the existing Rolm CBX in the Jackson Graham Building. Telephone circuits are connected to the Rolm CBX via the Carrier Transmission System and the Fiber Optic System. All telephone instruments are wired to the Communications Equipment Room using a dedicated cable pair. The Telephone System includes two subsystems: The Wayside Telephone System and the Passenger Station Telephone System.
- C. The Wayside Telephone System includes all telephone instruments wired to the Passenger Station Communications Equipment Room using outside plant cable. All wayside telephone circuits are terminated on protector blocks and terminal blocks at the Main Distribution Frame and at the Wayside Telephone Instrument locations. The Wayside Telephone System includes, but is not limited to, the following:
  - 1. Telephone instruments installed in selected remote ancillary buildings outside the passenger station limits.
  - 2. Telephone instruments installed in Emergency Trip Station (ETS) enclosures along the right-of-way.
- D. The Emergency Trip Station telephones are grouped into circuits. Inbound and outbound Emergency Trip Station telephones at the same location are wired to the same group circuit. No more than four Emergency Trip Station telephones are wired to any one circuit.
- E. The Passenger Station Telephone System includes, but is not limited to, telephone instruments installed in selected rooms, areas within the passenger station, and ancillary buildings within the limits of the passenger station. Passenger station telephone instruments are wired to the Communications Equipment Room using inside plant cable, and are terminated on terminal blocks at the Main Distribution Frame.
- F. The Communications Equipment Room shall be provided with the following equipment for the operation of the Telephone System:
  - 1. Key telephone equipment to perform key hold and lamp functions for multi-line telephone instruments.
  - 2. A redundant single-frequency ringing generator to provide ringing current for the telephone instruments.
  - 3. A 23-inch equipment rack to be used to mount telephone equipment and a -48 Vdc power supply facility. (See Section 16715 - Communications Electrical Power Distribution)

- G. A cable terminal housing equipped with terminals and protectors shall be located in the Bell System Room. A 25-pair, 22-AWG cable shall be provided between the passenger station Bell System Room and the passenger station Communications Equipment Room to accommodate interconnects between WMATA facilities and leased lines.
- H. Dustproof Dual Tone Multiple Frequency (DTMF) single-line telephone instruments shall be located in Emergency Trip Station enclosures installed along the right-of-way and at each end of the station platforms. The Emergency Trip Station telephones are normally used for either Emergency or Maintenance purposes. Emergency Trip Station telephones shall function as extensions off of the Rolm CBX in the Jackson Graham Building.
- I. In the event of an emergency, the ETS telephone instrument in the vicinity of the incident will be used to contact the Operations Control Center. Depressing the "0" button shall be recognized by the Rolm CBX as an Emergency Trip Station Emergency Communications call. The call is automatically switched by the Rolm CBX to a telephone instrument in the Operations Control Center assigned to respond to that specific area of the rapid rail system.
- J. All other telephone instruments operate as standard off-premise extensions of the Rolm CBX in the Jackson Graham Building.

#### **1.02 SECTION INCLUDES**

- A. Telephone instruments at selected locations along the right-of-way, in selected rooms and areas within the passenger station, and in selected ancillary buildings associated with the passenger station.
- B. Telephone instruments at selected remote ancillary buildings outside the passenger station limits.
- C. Telephone instruments in Emergency Trip Station (ETS) enclosures along the right-of-way.
- D. Key telephone equipment.

#### **1.03 UNIT PRICES [THESE ARTICLES MAY NOT BE APPLICABLE UNDER CURRENT CONTRACTING PRACTICE.]**

- A. Unit Prices include all equipment racks, terminals, hardware, protector blocks, enclosures, connecting blocks, wiring and cabling, conduits and fittings, all the connections and cross-connections required for a complete operational installation of the Telephone System and incidental items, not specifically mentioned, but required for complete and proper system operation.

#### **1.04 RELATED SECTIONS**

- B. Section 16706 - Communications System Submittals & Services.
- C. Section 16707 - Communications Systems Quality Assurance & Testing.
- D. Section 16710 - Communications Grounding.
- E. Section 16715 - Communication Electrical Power Distribution.

- F. Section 16771 - Communications - Carrier Transmission System.

#### **1.05 REFERENCES**

- A. National Electrical Manufacturers Association (NEMA) Standard Publication 250-1997, Enclosures for Electrical Equipment (1000 Volts Maximum).
- B. Code of Federal Regulations, Title 7, Agriculture, Subtitle B, Regulations of the Department of Agriculture, Chapter XVII - Rural Utilities Service, Department of Agriculture, Part 1755 - Telecommunications Standards and Specifications for Materials, Equipment and Construction, Section 1755.390, RUS Specification for Filled Telephone Cables.
- C. National Electric Code (NEC).
- D. American National Standards Institute (ANSI)/Insulated Cable Engineers Association (ICEA) S-84-608-1994, Telecommunications Cable, Filled Polyolefin Insulated Copper Conductor.

#### **1.06 SYSTEM DESCRIPTION**

- A. Description: Provides telephone service to WMATA personnel in selected locations within, and associated with, the passenger station and data circuits between the Jackson Graham Building and the passenger stations.
- B. Capacity:
  - 1. The Key System shall be sized to provide multi-line telephone service to each of the Kiosks in the Station.
  - 2. Single-Line Wall Telephone shall be provided in Train Control, Communications, and other frequently occupied rooms in a passenger station, as well as in Traction Power Substations, and other frequently occupied facilities along the rail right-of-way.
  - 3. Single-Line Desk Telephones shall be provided in End-Of-Line Station Terminal Supervisor's Offices.
  - 4. Multi-Line Telephones shall be provided in each Passenger Station Kiosk.
  - 5. Emergency Trip Station Telephones shall be provided in Traction Power Substations and at Emergency Trip Station locations along the rail right-of-way.
  - 6. Emergency Telephones shall be installed in Area of Rescue Assistance Rooms.
  - 7. A dual 5-way Active Data Bridge shall be installed in the 19-inch CTS Rack in the Passenger Station(s).
- C. Emergency Trip Station telephones are grouped into circuits. Inbound and outbound Emergency Trip Station telephones at the same location are wired to the same group circuit. No more than four Emergency Trip Station telephones are wired to any one circuit.
- D. A cable terminal housing equipped with terminals and protectors shall be located in the Bell System Room. A 25-pair, 22-AWG, cable between the passenger station Bell System Room and the passenger station Communications Equipment Room shall provide interconnects between WMATA facilities and leased lines.

#### **1.07 SYSTEM PERFORMANCE REQUIREMENTS**

- A. The following overall system performance objectives are applicable to WMATA's existing Telephone System, and shall be maintained when performing the work in this Contract.

1. Frequency Response: (end-to-end) 300 Hz to 3000 Hz, maximum 6 dB at 3000 Hz.
2. Maximum Loss: shall not exceed 8.5 dB at 1000 Hz (from Communications Equipment Room to telephone instrument).
3. Noise Objective: 20 dBrnC with 30 dBrnC maximum noise terminated into 900-ohm impedance.
4. Loop Resistance: shall not exceed 1300 ohms (terminated into a short circuit).
5. Loop dc Current: not less than 23 mA.
6. Balance Ratio: not less than -50 dB.

#### **1.08 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system-wiring diagram.
- C. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

#### **1.09 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Service facilities within 50 miles of Project.

#### **1.10 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Telephone System until Final Completion.

### **PART 2 - PRODUCTS**

#### **2.01 KEY SHELF ASSEMBLY WITH POWER SUPPLY**

- A. Manufacturer:
  1. Plant, Model No. 584C (or approved equal).
- B. Description: Key System shelf with power supply for KTU cards.
- C. Capacity: 13 KTU Cards (18-pin).
- D. Accessories:
  1. 4517 Interrupter.
  2. PE 1204 Power Supply.
  3. A75A-SE connector cable.

- E. Ratings:
  - 1. Power Input: 120 VAC.
  - 2. Mounting: 23-inch rack

## **2.02 KEY TELEPHONE KTU CARD**

- A. Manufacturer:
  - 1. Plant, Model No. PE400H Key Telephone Unit (KTU) Card (or approved equal).
- B. Description: Plug-in circuit card for Key System.
- C. Provides 1A2 functions for multi-line telephone instruments.

## **2.03 REDUNDANT RINGING GENERATOR WITH AUTOMATIC TRANSFER ASSEMBLY**

- A. Manufacturer:
  - 1. Peco Model No. PEC 3877 (or approved equal).
- B. Mounting Frame: Part No. 6064108S.
- C. Mounting: Adapter brackets to fit in 23-inch equipment rack, Model No. 4320554.
- D. Monitor and automatic transfer circuitry to provide contact closure to the Technical Control Facility when a transfer occurs.
- E. Ratings:
  - 1. Two 50 Watt ringing generator modules, Part No. 63134035S.
  - 2. Input: -48 VDC
  - 3. Output: 105 VAC, 20 Hz signal.
  - 4. Output Waveform: Sinewave.
  - 5. Frequency Stability: 0.33 Hertz or 1% whichever is greater.
  - 6. Harmonic Distortion: Less than 5% at 53.1 Vdc input and full rated resistive load.

## **2.04 MULTI-LINE TELEPHONE INSTRUMENT**

- A. Manufacturer:
  - 1. Cortelco Model No. 2830 (or approved equal).
- B. Ratings:
  - 1. Color: Beige.
  - 2. Type: Desk.
  - 3. Keypad Type: DTMF.
  - 4. Capacity: 10 Lines.

## **2.05 SINGLE-LINE DESK TELEPHONE INSTRUMENT**

- A. Manufacturer:
  - 1. Cortelco Model No. 2500-BE (or approved equal).
- B. Ratings:
  - 1. Color: Beige.
  - 2. Type: Desk.

3. Keypad Type: DTMF.

## **2.06 SINGLE-LINE WALL TELEPHONE INSTRUMENT**

- A. Manufacturer Cortelco Model No. 2554-BE (or approved equal).
- B. Ratings:
  1. Color: Beige.
  2. Type: Wall.
  3. Keypad Type: DTMF.

## **2.07 EMERGENCY TRIP STATION TELEPHONE INSTRUMENT**

- A. Manufacturer:
  1. Gai-Tronics Model No. K93112 (or approved equal)
- B. Face plate of heavy gauge steel, corrosion resistant, dustproof.
- C. Handset: Cradle of cast aluminum with nylon coating with heavy duty handset cord of appropriate length to fit into enclosure.
- D. With 4-position terminal block and gas discharge tube surge protector.
- E. With protector blocks and Weidmuller AKZ 2.5 terminal blocks, as required.
- F. Compatible with the Emergency Trip Station enclosures..
- G. Ratings:
  1. Type: Analog Telephone Instrument with electronic ringer
  2. Keypad Type: DTMF covered with protective seal.

## **2.08 EMERGENCY TELEPHONE INSTRUMENT**

- A. Manufacturer:
  1. Gai-Tronics Model No. 283 (or approved equal).
- B. Description: Analog telephone Instrument with hands-free, one button automatic dialing.
- C. Constructed of bright yellow, high impact, glass reinforced polyester.
- D. Remotely programmable, programmable disconnect, auto answer and remote diagnostics to verify operational integrity.

## **2.09 PROTECTOR BLOCKS**

- A. Manufacturer:
  1. Reliable Electric (RELTEC) Model R128VSR2 (or approved equal).
- B. With required mounting hardware and appropriately sized enclosures.
- C. Ratings:
  1. Type: 350-400 VDC gas style arrestors.

## 2.10 OUTSIDE PLANT CABLE

- A. Manufacturer:
  - 1. Essex Model No. CASPIC-F 22-AWG (or approved equal).
- B. Description: Filled, shielded telephone cable with mechanical protection, sized as required.
- C. Construction: Meets Code of Federal Regulations, Title 7, Subtitle B, Chapter XVII, Part 1755, Section 1755.390.
- D. Ratings:
  - 1. Conductors: Solid annealed copper conductors insulated with color coded polyolefin, standard telephone color code, twisted into pairs.
  - 2. Core covering: Non-hygroscopic dielectric tape.
  - 3. Shield: Inner polymer coated .2mm aluminum and outer polymer coated .15mm steel. Interfaces of shielding system flooded with waterproofing compound.
  - 4. Outer jacket: Black, low density, high molecular weight polyethylene.

## 2.11 INSIDE PLANT CABLE

- A. Manufacturer:
  - 1. Remeo Stock No. 725020 (or approved equal).
- B. If not in conduit, plenum approved cable shall be provided. Plenum cable shall meet the low-smoke/low-flame characteristics required by UL to be classified for installation in air handling plenums without conduit.
- C. If installed in conduit, plenum approved cable not required.
- D. Ratings
  - 1. Size: 3-twisted pairs.
  - 2. Gauge: 22-AWG
  - 3. Conductors: Solid copper with overall shield and color coded ECTFE insulation.
  - 4. Jacket: Fluoropolymer/co-polymer.
  - 5. Conforms to the National Electrical Code requirements

## 2.12 25 PAIR/22 AWG TIE CABLE

- A. Manufacturer:
  - 1. Superior Model TEL G 194 (or approved equal).
- B. Ratings:
  - 1. Size: 25 pair.
  - 2. Gauge: 22-AWG.
  - 3. Conductors: Solid, bare copper conductors, solid high-density polyethylene insulation with standard telephone color code, twisted into pairs.
  - 4. Core filling: ETPR compound.
  - 5. Core covering: Non-hygroscopic dielectric tape.
  - 6. Shield: .008 inch corrugated, copolymer coated aluminum.
  - 7. Armor: Corrugated bare 6 or 7-mil copper alloy 194 tape (TEL G194) applied longitudinally over the core.
  - 8. Jacket: Black polyethylene.

9. Conforms to ANSI/ICEA S-84-608-1994 and Code of Federal Regulations, Title 7, Subtitle B, Chapter XVII, Part 1755, Section 1755.390.

### **2.13 25 PAIR CABLE TERMINAL HOUSING**

- A. Manufacturers:
  1. Reltec, Model No. 36526VSR2 (or approved equal).
- B. Description: Three-element gas tube protector modules.
- C. Ratings:
  1. Size: 25-pair termination.
  2. Clips : 66-type.

### **2.14 FUSE, ALARM AND DISTRIBUTION PANEL**

- A. Manufacturer:
  1. Hendry Model No. HMW 06020-05 (or approved equal).
- B. Description: Distribution panel designed for -48 Vdc power supply distribution.
- C. Ratings:
  1. Mounting: Universal 19-inch or 23-inch relay racks.
  2. Fuse Positions: Minimum of 10.
  3. Panel Load Minimum: 40 amps.
  4. Alarm Circuit: visual alarm indication(s) and external alarm contacts.
  5. Fuses:
    - a. Appropriate type GMT complement panel alarm circuitry/visual indication(s).
    - b. Each fuse shall be appropriately rated for the corresponding equipment to which it distributes power.
    - c. Quantity of fuses to be provided within each fuse panel shall correspond to the number of equipment items requiring -48 VDC power within the associated equipment rack.

### **2.15 SMADS-DIGITAL CABLE**

- A. Manufacturer:
  1. Okonite Model No: 261-40-2204 (or approved equal).
- B. Ratings:
  1. Configuration: 4-pair individually shielded twisted pairs.
  2. Conductors: Stranded, 20-AWG, copper.
  3. Jacket: Okozel (No PVC).

### **2.16 ACI/RDDS (REMOTE DIGITAL DISPLAY SYSTEM) CABLE**

- A. Manufacturer:
  1. Okonite Model No: 261-40-2212 (or approved equal).
- B. Ratings:
  1. Configuration: 12-pair individually shielded twisted pairs.
  2. Conductors: Stranded, 20-AWG, copper.

3. Jacket: Okozel (No PVC).

## **2.17 DUAL 5-WAY ACTIVE DATA BRIDGE**

- A. Manufacturer:
  1. Tellabs 4445A (or approved equal).
- B. Description: Dual five-way Balanced Active Data Bridge.
- C. Ratings:
  1. Power Requirement: -48 Vdc.
  2. Port Impedance: 600 ohm.
- D. Each transformer-coupled port adjustable from -10 to +10 dB.

## **2.18 DATA BRIDGE MOUNTING SHELF**

- A. Manufacturer:
  1. Tellabs Type 10 Part Number 1011 (or approved equal).
- B. Description: Wire Wrap Mounting Shelf.
- C. Ratings:
  1. Mounting: standard 19-inch equipment rack.
  2. Accepts up to 11 standard Tellabs Type 10 or Wescom modules.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Telephone Instrument Installation
  1. Telephone instruments located in the service rooms and ancillary buildings within the passenger station limits shall have a dedicated 3-pair cable from the telephone location to the passenger station Communications Equipment Room (no bridge cable taps shall be permitted).
  2. Wire the telephone instruments located in the service rooms and ancillary buildings within the passenger station limits to Main Distribution Frame terminal blocks in the Communications Equipment Room using shielded inside plant telephone cable. Ground the inside plant cable shield at the Main Distribution Frame.
  3. Each Wayside telephone instrument shall have a dedicated cable pair from the telephone location to the passenger station Communications Equipment Room. Wayside telephones shall be wired to protector blocks at both the telephone instrument location and at the Main Distribution Frame in the Communications Equipment Room. Wayside telephones shall be wired using filled, armored, outside plant telephone cable.
  4. Install the Emergency Trip Station (ETS) telephone instruments along the right-of-way, including at the ends of each platform, and in the ETS enclosures. Install protector blocks and terminal blocks in each ETS enclosure and terminate the ETS telephone instruments. Terminate all ETS telephone instruments to protector blocks in the Main Distribution Frame.
  5. Mount the wall-mounted type telephone instruments, except for the Emergency Telephones, to a NEMA 12 enclosure. Install an appropriately sized connecting block in each NEMA 12 enclosure. In remote locations, install a protector block and

- ground bar assembly in each NEMA 12 enclosure. All cable pairs of outside plant cable shall be terminated to protector blocks.
6. Install the multi-line telephone instrument in the Kiosk on the counter top of the Kiosk cabinetry in a location approved by the Engineer. Install a 25-pair multi-conductor paired cable from the terminal block in the Kiosk Cable Termination Rack to the Kiosk multi-line telephone instrument.
  7. Install the telephone instrument in the Terminal Supervisor's Office on top of the desk in a location approved by the Engineer. Install a standard surface mount 4-conductor connecting block at floor level near the approved location for the Terminal Supervisor's telephone instrument.
  8. In the "Area of Rescue Assistance" label the NEMA 12 enclosures with "FOR WMATA USE ONLY" with letters one inch high.
  9. Program the Emergency Telephone to dial the telephone number provided by the Engineer.
- B. Passenger Station Communications Equipment Room installation
1. Install a 23-inch equipment rack with a Fuse, Alarm and Distribution Panel in the passenger station Communications Equipment Room.
  2. Install the Redundant Ringing Generator and Key Telephone Equipment on the 23-inch equipment rack.
  3. Cross-connect all telephone circuits to Carrier Transmission System channels.
- C. Jackson Graham Building Installation
1. Connect the appropriate assigned telephone extensions of the existing Rolm CBX to the appropriate channels of the Carrier Transmission System terminal assemblies in the Jackson Graham Building .Refer to Section 16771, Communications -Carrier Transmission System for channel assignments.
- D. Passenger station Bell System Room Installation
1. Install a cable terminal housing in the Bell System Room of the passenger station in location approved by the Engineer. Install and terminate a 25-pair cable from the cable terminal housing in the Bell System Room to the Main Distribution Frame in the Communications Equipment Room.
- E. SMADS-Data System Installation
1. Set the Office Channel Unit Data Port (OCUDP) in Digroup "B", channel 1 in the Passenger Station(s) CTS and the Jackson Graham Building CTS to 19.2 Kbps.
  2. Connect the (SMADS-Data System) DSU with a 4-shielded pair cable from the Kiosk to Digroup "B", channel 1, via the MDF in the Communications Equipment Room of the passenger station(s).
- F. ACI/RDDS (Remote Digital Display System) cable plant (end-of line passenger station only)
1. Install two 12-pair, 20 AWG cables between the Main Distribution Frame within the Communications Equipment Room and the Terminal Supervisor's Room. This cable shall provide support for the ACI/RDDS Terminals. Terminate the cable to a terminal block within the Main Distribution Frame. Install a junction box with terminals in the Terminal Supervisor's Room. Terminate the cables to terminals in the junction box and clearly tag and identify these cables as being for ACI/RDDS use. Extend six pairs of one ACI/RDDS cable to the desktop dual RJ-11 surface mounted jack installed in the Terminal Supervisor's Room at a location approved by the Engineer.
- G. Automatic Energy Management System (AEMS) Installation

1. Install a 5-way Active Data Bridge in the 19-inch CTS Rack in the passenger station(s). Connect the output of the 5-way bridge at the passenger station, via the MDF, to a 4W-E&M channel card in Digroup "B" Channel 24. Connect four ports of each 5-way bridge, via the MDF, to RTU's in rooms and/or areas as indicated by the Engineer. The connections from the Data Bridge to the RTU's shall be no less than 3-pair shielded, 19-AWG cables. Outside of the passenger station limits armored, direct burial type cables shall be used.
  2. Use an existing port on a 9-way bridge installed in the Communications Equipment Room of the Jackson Graham Building, or furnish and install a new 9-way bridge. Connect one of these ports via the CDF, to 4W-E&M channel cards in the Jackson Graham Building CTS Terminals: Digroup "B", Channel 24 of the associated passengers station(s).
- H. Circuit Identification
1. The Contractor shall tag all telephone and data cables. The Contractor shall stencil all termination cabinets.

### **3.02 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

### **3.03 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

### **3.04 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to designated WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with designated WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**END OF SECTION**

## SECTION 16723

### COMMUNICATIONS - GARAGE EMERGENCY TELEPHONE SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. This Section describes the basic requirements for the installation of the Garage Emergency Telephone System (GETS). The GETS consists of emergency telephones installed in the public area of parking garages and linked to WMATA Metro Transit Police Department (MTPD) located in the Jackson Graham Building.
- B. The GETS provides WMATA customers with the capability of reporting emergency situations from the passenger station parking garages to WMATA Metro Transit Police Department (MTPD) located in the Jackson Graham Building.
- C. Emergency telephones shall be located at the entrance to the stairs and at designated locations on each level in the parking garage. The telephones shall be ADA compliant and shall be housed in rugged weatherproof enclosures. Approximately five GETS telephones are installed at each level of each garage.
- D. Each telephone shall have a blue indicator light mounted above the telephone. The blue light shall be constantly illuminated as an indicator of the telephone location. Within the same blue light housing shall be a strobe light, which will activate when a call is initiated to the MTPD office.
- E. Each MTPD console is pre-equipped with two telephone lines dedicated to GETS. Whenever an emergency call is initiated at one of the garages, the call will be indicated on the console's Rolm RP400HR telephone if one of the two numbers is not occupied. WMATA's PABX is programmed to display on the Rolm RP400HR telephones on the MTPD consoles the name of the parking garage and garage level where the call was originated.
- F. When the telephone is answered, the emergency telephone in the garage will send a pre-recorded audio announcement stating the location of the emergency telephone. If MTPD requires the audio message to be repeated, a pre-determined key on the Rolm RP400HR telephone touch-tone pad is pressed. All voice conversations will be recorded at the JGB.
- G. The GETS system shall contain a maintenance personal computer (PC) located in the Communications Equipment Room of the Jackson Graham Building. The computer will be equipped with software to interrogate the emergency telephones and telephone lines to assure reliable emergency communications. The PC software shall also provide remote programming of the emergency telephones in the parking garages.
- H. Through the PC computer the GETS system will be provided with end-to-end supervision, testing and logging of supervision and maintenance functions. This computer will be capable of dialing a specific telephone and performing diagnostics at the request of the Systems Maintenance (SMNT) attendant. The computer must also be capable of automatically dialing and checking all of the telephones in accordance with a number of pre-programmed schedules selectable from the computer by the SMNT attendant.
- I. The GETS system shall include the following equipment:
  - 1. Emergency telephones located at the entrance to the stairs in the parking garages and at other designated locations on each garage parking level.
  - 2. Strobe/blue lights located above the emergency telephones.

3. Power distribution modules located in the garage communication equipment room.
  4. Telephone line consolidators located in the garage communication equipment room.
  5. Personal computer and software located in the Jackson Graham Building.
- J. The GETS emergency telephones shall provide man/machine interface points between WMATA customers and GETS. The emergency telephone shall provide controls, indications, input/output devices, and instructions that are necessary for the customers to operate the GETS.
1. Depressing the momentary contact pushbutton switch on the emergency telephone shall illuminate the red indicator marked "CALLING" and start the strobe light. When the call is answered by MTPD the green indicator marked "RECEIVED" shall illuminate and the pre-recorded message shall play for both the caller and MTPD. If the pre-programmed telephone number is busy or not answered after 30 seconds, the emergency telephone shall hang up and dial the number again. This process shall continue until the call is answered.
  2. When the call is completed and the MTPD hangs up or after a remotely programmable period of time, whichever comes first the emergency telephone shall hang up.
- K. The strobe/blue light shall provide a means of locating an emergency telephone in the parking garage and indicate when it is in use. When the call button is pressed on the emergency telephone, it shall cause the strobe to flash until the telephone call is completed.
- L. The power distribution module shall provide a convenient method of supplying power from 120-Vac to the emergency telephone that requires 24-Vdc.
- M. The telephone line consolidator shall be used to reduce the number of dedicated PABX extensions required for each level of the parking garage. The telephone line consolidator shall provide up to eight line outputs per one line input while still maintaining the ability to remotely program each emergency telephone.
- N. If more than one emergency telephone on a level is activated all units above and beyond the first emergency telephone on that level shall receive a busy signal requiring the units to redial until the outgoing line becomes available.
- O. The personal computer and software shall provide automatic diagnostic test of all emergency telephones. Tests shall be performed on command or at regular prescheduled times. The results shall be saved for subsequent print out.
- P. The software shall test, as a minimum, whether the telephone is receiving power, the integrity of the telephone line, the emergency telephone circuitry, and the emergency telephone microprocessor for proper operation.
- Q. To initiate an emergency call, a WMATA customer will depress the "PUSH FOR HELP" pushbutton on the emergency telephone which shall cause:
1. The emergency telephone to dial the pre-programmed telephone number, the red LED light labeled "CALLING" to be illuminated, and the strobe light to be activated. If busy, the emergency telephone to redial the pre-programmed telephone number until the call is answered.
  2. When the call is answered by MTPD the LED light labeled "RECEIVED" to be illuminated and a pre-recorded message will play for both the WMATA patron and MTPD.
- R. An emergency telephone call shall be terminated by MTPD hanging up, which shall cause the emergency telephone to hang up, or after the emergency telephone's pre-programmed time out has expired, whichever comes first. When the call is terminated the strobe light shall extinguish.

## **1.02 SECTION INCLUDES**

- A. Emergency telephones located at the entrance to the stairs in the parking garages and at other designated points on each parking garage level.
- B. Strobe/blue lights, one for each emergency telephone.
- C. Power distribution module located in the parking garage communication equipment room.
- D. Telephone line consolidator located in the parking garage communication equipment room.

## **1.03 UNIT PRICES [THESE ARTICLES MAY NOT BE APPLICABLE UNDER CURRENT CONTRACT PACKAGING.]**

- A. Unit Prices include all equipment racks, terminals, hardware, protector blocks, enclosures, connecting blocks, wiring and cabling, conduits and fittings, all the connections and cross-connections required for a complete operational installation of the GETS and incidental items, not specifically mentioned, but required for complete and proper system operation.

## **1.04 RELATED SECTIONS**

## **1.06 SYSTEM DESCRIPTION**

- A. Description: The GETS provides WMATA patrons with the capability of reporting emergency situations from the passenger station parking garages to WMATA MTPD located in the Jackson Graham Building.
- B. Capacity:
  - 1. The Contractor shall provide an emergency telephone for each entrance to each stairway and at other designated locations on every level of a garage.
  - 2. The Contractor shall provide a strobe/blue light to accompany each emergency telephone in the garage.
  - 3. The Contractor shall provide Power Distribution Modules, or other dc power equipment suitable to provide dependable, separately-fused 24 Vdc circuits to the emergency telephones.
  - 4. The Contractor shall provide Telephone Line Consolidators in quantities based on the number of emergency telephones required in the garage.
- C. The GETS provides a means of reporting emergency situations from the passenger station parking garages to MTPD in the Jackson Graham Building. Emergency telephones located at the entrance to the stairs and at designated locations on each level in the parking garages, when activated, automatically call telephones located in the MTPD office in the Jackson Graham Building.
- D. Each of the MTPD consoles has an existing Rolm RP400HR telephone dedicated to GETS. Two telephone numbers, for receiving incoming GETS calls, have been assigned and distributed to each of these telephone instruments. These telephones are also connected to the MTPD voice recorder and record all conversation on the two assigned telephone numbers. Whenever an emergency call is initiated at a GETS telephone, the call is answered on the MTPD console's Rolm RP400HR telephone if one of the two numbers is not occupied. WMATA's PABX is programmed to display the name of the parking garage and garage level that originated the call on the Rolm RP400HR telephones. When the telephone is answered, the emergency telephone in the garage sends a prerecorded audio announcement stating the location of the emergency telephone. If MTPD requires the audio message to be repeated, a pre-determined key on the Rolm RP400HR telephone touch-tone pad is pressed.
- E. The GETS system includes an existing personal computer (PC) (located in the Jackson Graham Building) equipped with software to interrogate the emergency telephones and telephone circuits to assure reliable emergency communications. The PC software also provides for remote programming of the emergency telephones in the parking garages.

## **1.07 SYSTEM PERFORMANCE REQUIREMENTS**

- A. The following overall system performance objectives are applicable to WMATA's existing telephone system, and shall be maintained when performing the work in this Contract:
  - 1. Emergency telephone input sensitivity: The emergency telephone microphone shall be sensitive to (accept) any normal speaking voice from a distance of 20-inches or less from in front of the microphone, while moving to positions up to 30-degrees off center in any gradient.
  - 2. Emergency Telephone Sound Pressure Level: The emergency telephone shall produce clear and continuous speech (to persons who are not significantly hearing impaired within the 300 to 3,600 Hz audio range) to a distance of up to 36-inches or less, while moving to positions 40-degrees off-center in any quadrant. Interfering signals, hum, or objectionable noise shall not be discernible to listeners during or between speech messages.

3. System Noise: Noise from the emergency telephone speaker shall not exceed -45 dB below a 1-kHz test tone level when all system and equipment controls are operated to any possible combination of positions. Momentary switching transients may peak to -30 dB below a 1-kHz test tone level for a duration not to exceed 10-milliseconds.
4. Note: Persons not significantly hearing impaired within the 300 to 3,600 Hz audio range are defined for the purpose of these performance specifications as males or females with hearing capabilities that are normal, or slightly impaired to the extent that their response to audio tones in the 300 to 3,600 Hz frequency range is within -15 dB at all test frequencies, and averages within -10 dB of "NORMAL" standard values for their classification (sex, age, etc.) as defined in ANSI Standards

#### **1.08 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.
- C. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

#### **1.09 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Service facilities within 50 miles of Project.

#### **1.10 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Garage Emergency Telephone System until Final Completion.

### **PART 2 - PRODUCTS**

#### **2.01 EMERGENCY TELEPHONE**

- A. Manufacturers:
  1. Vandal-Proof Products, Inc. Model No. T1240 (or approved equal).
- B. Fully ADA compliant as specified in ADAAG 4.10.14 and ASME A17.1.
- C. Surface Mount Enclosure: Stainless Steel 16-GA. Vandal-Proof Products, Inc Model No. AE740 vandal resistant hooded enclosure.
- D. Features:

1. 3/4-inch "PUSH FOR HELP" call button.
2. Red LED for "CALLING" light.
3. Green LED for "RECEIVING" light.
4. Grade-2 Braille and raised lettering to aid sight-impaired persons in identifying the emergency telephone.
5. Full duplex speakerphone.
6. Ability to record two different voice messages.
7. Programmable from any touch-tone telephone (password protected).
8. Equipped with four number autodial capability, and monitor the progress of incoming and outgoing calls.
9. Hang up after called party hangs up or after a remotely programmable period of time, whichever comes first.
10. Face Plate: 304 brushed stainless steel.
11. Auxiliary Output Contacts: Two normal open contacts.

E. Ratings:

1. Power Input: 5 to 25-Vdc.

## 2.02 STROBE/BLUE LIGHT

A. Manufacturers:

1. Vandal-Proof Products, Inc. Model No. A703 with stainless steel mounting bracket (or approved equal).

B. Description: Strobe/blue light normally illuminated (steady on). When the call button is pressed on the emergency telephone, it shall cause the blue light to strobe flash until the telephone call is completed.

C. Ratings:

1. Flash Rate: 80 flashes per minute.
2. Strobe Peak Candlepower: 750,000.
3. Power Requirements: 120-Vac, 5-Amps.
4. Blue light remains lit at all times.

## 2.03 POWER DISTRIBUTION MODULE

A. Manufacturers:

1. Vandal-Proof Products, Inc. Model No. A705 (or approved equal).

B. Ratings:

1. Input Voltage: 120-Vac.
2. Telephone Line inputs: RJ11.
3. Telephone Line/24-Vdc outputs: Quick Release type for Tip-Ring and Plus-Minus 24-Vdc.

## 2.04 TELEPHONE LINE CONSOLIDATOR

A. Ratings:

1. Telephone Line Inputs: One.
2. Telephone Line Outputs: Eight.
3. Power requirements: 120-Vac.
4. Provide busy signal tone to seven telephones when one is off hook.
5. Provide selective routing from one input telephone line to one of eight output lines.

## **2.05 FOUR PAIR 22-AWG CABLE**

- A. Manufacturers:
  - 1. Champlain Cable Part Number Plus-22-4UTP (or approved equal).
- B. Ratings:
  - 1. Four-Pair, 22-AWG, Unshielded Twisted Pair (UTP).
  - 2. Conforms to NEC CMP Category five.
  - 3. NEC Plenum Rated.
  - 4. Insulation (non-PVC) FEP Teflon (or approved equal).
  - 5. Jacket, (non-PVC), Halar® (or approved equal).

## **2.06 25-PAIR CABLE TERMINAL HOUSING**

- A. Manufacturers:
  - 1. Reltec, Model No. 36526VSR2 (or approved equal).
- B. Ratings:
  - 1. Protector Modules: Three-element gas tube.
  - 2. Termination: 25-pair.
  - 3. Clips: 66-type.

## **2.07 12-PAIR CABLE TERMINAL HOUSING**

- A. Manufacturers:
  - 1. Reltec, Model No. 3636VSR2 (or approved equal).
- B. Ratings:
  - 1. Protector Modules: Three-element gas tube.
  - 2. Termination: 25-pair.
  - 3. Clips: 66-type.

## **2.08 12-PAIR, 19-AWG TIE CABLE**

- A. Manufacturers:
  - 1. Superior Model TEL G 194 (or approved equal).
- B. Ratings:
  - 1. 12-pair, 19-AWG, single jacketed, shielded telephone cable.
  - 2. Solid, bare copper conductors, solid high-density polyethylene insulation with standard telephone color code, twisted into pairs.
  - 3. Core filling: ETPR compound.
  - 4. Core covering: Non-hygroscopic dielectric tape.
  - 5. Shield: .008 inch corrugated, copolymer coated aluminum.
  - 6. Armor: Corrugated bare 6 or 7-mil copper alloy 194 tape (TEL G194) applied longitudinally over the core.
  - 7. Jacket: Black polyethylene.
  - 8. Conforms to and meets the requirements of ANSI/ICEA S-84-608-1994 and Code of Federal Regulations, Title 7, Subtitle B, Chapter XVII, Part 1755, Section 1755.390.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Emergency telephone instrument installation
  - 1. Install the emergency telephones and strobe/blue lights in the locations shown on the Contract drawings.
  - 2. Install the required conduit and connect the strobe/blue lights to the nearest emergency 277-Vac source using a 277 to 120-Vac transformer. The transformer shall be installed in the appropriate sized stainless steel box and mount under the strobe/blue lights.
  - 3. Install the required conduit and connect the strobe/blue lights to the emergency telephone's auxiliary contacts
  - 4. Install a 19-inch equipment rack in the garage Communications Equipment Room. Install the power distribution modules and telephone line consolidators (one set for each level of the garage) on the 19-inch equipment rack.
  - 5. Install conduit and a dedicated 4-pair cable from each emergency telephone on each level to the garage Communications Equipment Room (no bridge cable taps shall be permitted).
  - 6. Connect two of the four cable pairs from each of the emergency telephone locations to protector blocks in the garage Communications Equipment Room. The other two pairs in each cable shall be terminated and marked as spares.
  - 7. From the protector blocks, connect one cable pair for each emergency telephone to the associated tip and ring terminals on the power distribution module. Connect the second cable pair on the protector blocks from the emergency telephones to the associated plus and minus terminals on the power distribution module.
  - 8. From the power distribution modules connect the tip and ring line outputs to the telephone line consolidators.
  - 9. Cross-connect the inputs of the telephone line consolidators to the cables, from the passenger station Communications Equipment Room, in the cable entrance box of the garage Communications Equipment Room.
  - 10. Install a 12-pair, 19-AWG cable from the garage Communications Equipment Room to the passenger station Communications Equipment Room MD
  - 11. From the protector blocks in the cable entrance box of the garage Communications Equipment Room connect the cables from the passenger station Communications Equipment Room.
  - 12. Program the emergency telephone to dial 40000 when the "PUSH FOR HELP" button is pressed.
  - 13. Record a voice message on each emergency telephone to identify its location (i.e. "Phone number 6, north side stairwell, level number 4).
- B. Passenger station installation
  - 1. Cross-connect the GETS emergency telephone lines, in the cable entrance box of the passenger station Communication Equipment Room, to the Carrier Transmission System channels.
- C. Jackson Graham Building installation
  - 1. Connect the appropriate assigned telephone extensions of the existing Rolm CBX to the appropriate channels of the Carrier Transmission System terminal assemblies in the Jackson Graham Building. Refer to the Carrier Transmission System Article for channel assignments.

### **3.02 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

**3.03 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

**3.04 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to Owner's personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**3.05 TABLES**

**Table 3.05-1**

**END OF SECTION**

## SECTION 16727

### COMMUNICATIONS - PASSENGER EMERGENCY REPORTING SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The Passenger Emergency Reporting System (PERS) shall provide a means of reporting emergency situations from the passenger station platforms to the station manager(s). Intercom facilities between call-station panels mounted on pylons (approximately 200 feet from the end of each platform) and the kiosk telephone(s) shall permit easy verbal communications between the station manager and customers. The Operations Control Center (OCC) will be rung if the kiosk(s) do not answer.
- B. The PERS shall include the following equipment, which shall be located in the passenger station Communications Equipment Room, except as noted:
1. Power distribution Module.
  2. Line Sharing Switch.
  3. Call Process Tone Detector.
  4. Double pull double throw relay to activate the strobe light.
  5. Emergency phones, complete with mounting brackets located at designated positions on the station platform.
  6. Yellow strobe light in the kiosk, which will activate when a call is initiated. These lights are provided in the kiosks as part of the elevator phone system. They are Amesco No. 05733, UL listed, 24 V Strobe lights with orange lenses, Model SL-1, 150 ma.
  7. Personal computer and software located in the Jackson Graham Building, provided by and shared with the Garage Emergency Telephone System (GETS) system.
- C. The kiosk telephones shall provide the interface point between the station manager and the Passenger Emergency Reporting System. Answering the phone when a call station is activated shall result in the following actions:
1. The full-duplex audio path between the answerer and the emergency phone, shall be connected.
  2. When the telephone is answered, the emergency phone will send a pre-recorded audio announcement stating its location. If the answerer requires the audio message to be repeated, a pre-determined key on the answering telephone touch tone pad is pressed.
- D. The equipment shall provide the required interfaces between the kiosk telephone(s) and the emergency phones. The equipment shall accommodate eight emergency phones and shall be able to:
1. Establish and control the audio paths between the emergency phones, the kiosk and the OCC.
  2. Provide the appropriate dc power, ground and audio paths to the emergency phones.
  3. Automatically terminate an unanswered call, after the preset time period.
- E. The PERS system shall share the GETS maintenance personal computer (PC) located in the Communications Equipment Room of the Jackson Graham Building. The computer will be equipped with software to interrogate the emergency telephones and telephone lines to assure reliable emergency communications. The PC software shall also provide remote programming of the emergency phones, such as changing the autodial numbers.
- F. Through the PC, the PERS system will be provided with end-to-end supervision, testing and logging of supervision and maintenance functions. This computer will be capable of

automatically dialing and checking all of the telephones in accordance with a number of pre-programmed schedules selectable from the computer by the Systems Maintenance (SMNT) attendant.

- G. The PERS emergency phones shall provide human/machine interface points between WMATA customers and PERS. The emergency phone shall provide controls, indicators, input/output devices, and instructions that are necessary for the customers to operate the PERS.
  - 1. Pressing the "PUSH FOR HELP" button on the emergency phone shall illuminate the red indicator marked "CALLING," and start the strobe light in the nearest kiosk. It will also ring the first number programmed. When the call is answered, the green indicator marked "RECEIVED" shall illuminate and the prerecorded message shall play so that it can be heard by both the caller and the answerer. If the pre-programmed telephone number is busy or not answered after 30 seconds, the emergency phone shall hang up and dial the other programmed numbers. The process shall continue until the call is answered, or each number has been called three times.
  - 2. When the call is completed and the answerer hangs up, or after a remotely programmable period of time, whichever comes first, the emergency telephone shall hang up and the strobe shall revert to elevator use.
- H. The line sharing switch shall be used to reduce the number of dedicated PABX extensions required for each rail station. The line sharing switch shall provide up to eight line outputs per one line input while still maintaining the ability to remotely program each emergency phone. The strobe light shall provide a means of notifying the station manager that a call has been placed. When the call button is pressed on the emergency phone, it shall cause the strobe on the nearest kiosk to flash until the telephone call is terminated.
- I. When one emergency phones in a station is in use, if any other emergency phones in the station is activated, it shall receive a busy signal. It will redial until the outgoing line becomes available, or it times out.
- J. The PC and software shall provide automatic diagnostic testing of all emergency phones. Tests shall be performed on command or at regular, prescheduled times. The results shall be saved for subsequent printing.
- K. The software shall test, as a minimum, whether the telephone is receiving power, the integrity of the telephone line, the emergency phone circuitry, and the emergency phone microprocessor for proper operation.
- L. An emergency telephone call shall be terminated by the answerer hanging up, which shall cause the emergency phone to hang up, or after the emergency phone's pre-programmed time out has expired, whichever comes first.
- M. Hanging up shall:
  - 1. Cause the lights at the associated emergency phone to be extinguished.
  - 2. Cause the call from that emergency phone to be terminated.
  - 3. Cause the strobe light to revert to elevator use.
- N. When a call is initiated from an emergency phone, and it is not answered by a station manager or the OCC, the call shall be automatically terminated after a preset time period adjustable from one to four minutes.
- O. The dc voltage for the emergency phone shall be backed up by a NiCd battery with a four hour capacity.

## **1.02 SECTION INCLUDES**

- A. Emergency Phones.
- B. Power Distribution Module.
- C. Line Sharing Switch.
- D. Call Progress Monitoring Tone Detector.

## **1.03 UNIT PRICES**

- A. Unit Prices include incidental items, not specifically mentioned, but required for complete and proper system operation.

## **1.04 RELATED SECTIONS**

- A. Section 14200 - Hydraulic Elevators
- B. Section 16705 - Communications Standard Specifications - Equipment & Material.
- C. Section 16706 - Communications System Submittals & Services
- D. Section 16707 - Communications Systems Quality Assurance and Testing.
- E. Section 16710 - Communications Grounding.
- F. Section 16715 - Communications Electrical Power Distribution.
- G. Section 16733 - Communications - Kiosk Systems.
- H. Section 16771 - Communications - Carrier Transmission System

## **1.05 REFERENCES**

- A. National Electrical Manufacturers Association (NEMA) Standard Publication 250-1997, Enclosures for Electrical Equipment (1000 Volts Maximum).
- B. Latest National Electric Code (NEC).
- C. Americans with Disabilities Act Accessibility Guidelines (ADAAG) 4.10.14, Emergency Communications.

## **1.06 SYSTEM DESCRIPTION**

- A. Description: The Passenger Emergency Reporting System (PERS) provides WMATA Rail System customers with the capability of reporting emergency situations from the passenger station platforms to WMATA personnel.
- B. Capacity:
  - 1. The Contractor shall provide and install all emergency phones.
  - 2. The Contractor shall provide and install a Line Sharing Switch.
  - 3. The Contractor shall provide and install a Power Distribution Module.
  - 4. The Contractor shall provide and install a Call Progress Monitoring Tone Detector.

5. The Contractor shall provide a double pull double throw relay to transfer the strobe light from elevator control to PERS control. It will be connected to the phones and the power supply so that when a call is placed, the light is activated. It shall remain on and under the control of the PERS system until the call is terminated.
6. The PERS system shall be interfaced to an existing PC, located in the Jackson Graham Building, equipped with software to interrogate the emergency phones and telephone circuits to assure reliable emergency communications. The PC software also provides for remote programming of the emergency telephones.

#### **1.07 SYSTEM PERFORMANCE REQUIREMENTS**

- A. The Contractor shall be responsible for the overall performance of the Passenger Emergency Reporting System. The following overall System performance requirements are designed to ensure that the PERS, delivered under these Specifications, meets the performance requirements of the Authority.
  1. Emergency Phone Sound Pressure Level: The emergency phones shall produce clear and continuous speech and call waiting tones (to persons who are not significantly hearing impaired within the 300-Hz to 3,600-Hz audio range) to a distance of up to 36-inches or less, while moving to positions 40-degrees off-center in any quadrant. Interfering signals, hum, or objectionable noise shall not be discernible to listeners during or between speech messages or tone generations.
  2. Emergency Phone Input Sensitivity: The emergency phone microphone shall be sensitive to (accept) any normal speaking voice from a distance of up to 20-inches or less from the front of the speaker, while moving to positions up to 30-degrees off center in any quadrant.
  3. System Noise: Shall not exceed -45 dB below a 1-kHz test tone level when all system and equipment controls are operated to any possible combination of positions. Momentary switching transients may peak to -30dB below a 1-kHz test tone level for a duration that does not exceed 10-milliseconds.
  4. Note: Persons not significantly hearing impaired within the 300-Hz to 3,600-Hz audio range are defined for the purpose of these performance specifications as males or females with hearing capabilities that are normal, or slightly impaired to the extent that their response to audio tones in the 300-Hz to 3,600-Hz frequency range is within -15 dB at all test frequencies, and averages within -10 dB of "NORMAL" standard values for their classification (sex, age, etc.) as defined in ANSI Standards.

#### **1.08 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.
- C. Product Data: Provide data showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

#### **1.09 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.

- C. Installer: Authorized installer of specified manufacturer with service facilities within 50 miles of Project.

## **1.10 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of the PERS until Final Completion.

## **PART 2 PRODUCTS**

### **2.01 EMERGENCY PHONE**

- A. Manufacturers:
  - 1. Vandal-Proof Products, Inc. Model No. 2100 (or approved equal).
- B. Fully ADA compliant as specified in ADAAG 4.10.14 and ASME A17.1.
- C. Surface Mount Enclosure: Stainless Steel 16-GA. Vandal-Proof Products, Inc. Model No. AE740 vandal resistant hooded enclosure.
  - 1. Features:
    - a. 3/4-inch "PUSH FOR HELP" call button.
    - b. Red LED for "CALLING" light.
    - c. Green LED for "RECEIVING" light.
    - d. Grade-2 Braille and raised lettering to aid sight-impaired persons in identifying the emergency phone.
    - e. Full duplex speakerphone.
    - f. Ability to record two different voice messages.
    - g. Programmable from any touch-tone telephone (password protected).
    - h. Equipped with four number autodial capability, and to monitor the progress of incoming and outgoing calls.
    - i. Hang up after called party hangs up or after a remotely programmable period of time, whichever comes first.
    - j. Face Plate: 304 brushed stainless steel.
    - k. Auxiliary Output Contacts: Two normally open contacts.
- D. Ratings:
  - 1. Power Input: 5 to 25-Vdc.

### **2.02 POWER DISTRIBUTION MODULE**

- A. Manufacturers:
  - 1. Vandal-Proof Products, Inc. Model No. A705 (or approved equal).
- B. Ratings:
  - 1. Input Voltage: 120-Vdc.
  - 2. Telephone Line Inputs: RJ11.
  - 3. Telephone Line/24-Vdc outputs: Quick Release type for Tip-Ring and Plus-Minus 24-Vdc.

### **2.03 LINE SHARING SWITCH**

- A. Ratings:
  - 1. Telephone Line Inputs: One.
  - 2. Telephone Line Outputs: Eight.
  - 3. Power requirements: 120-Vac.
  - 4. Provide busy signal tone to seven telephones when one is off hook.

5. Provide selective routing from one input telephone line to one of the eight output lines.

#### 2.04 PROGRESS MONITORING TONE DETECTOR

- A. Manufacturers:
- B. Vandal-Proof Products, Inc. Model A782-1 (or approved equal).

#### 2.05 FOUR PAIR 22-AWG CABLE

- A. Manufacturers:
  1. Champlain Cable Part Number Plus-22-4UTP (or approved equal).
- B. Ratings:
  1. Four-Pair, 22-AWG, Unshielded Twisted Pair (UTP).
  2. Conforms to NEC CMP Category five.
  3. NEC Plenum Rated.
  4. Insulated (non-PVC) FEP Teflon (or approved equal).
  5. Jacket, (non-PVC), Halar (c) (or approved equal).

#### 2.06 DOUBLE PULL, DOUBLE THROW RELAY

- A. Ratings:
  1. 24 V dc.
  2. At least 150 ma contacts.

### PART 3 EXECUTION

#### 3.01 INSTALLATION

- A. Emergency phone panel locations
  1. Install two emergency phones on each platform of the passenger stations. The emergency phones shall be surface mounted on selected pylons along the platform areas via mounting brackets.
  2. At passenger stations where the three-inch diameter circular opening exists in the designated panel of the selected pylons, the Contractor shall utilize these openings in his installation. These openings will have a four-inch diameter circular cover plate installed to conceal the opening. Remove the cover plate and deliver it to the Engineer.
  3. When required, provide the appropriate modifications to, or relocations of, the panel support bars of the pylon steel structure and the panel metal clips, which secure the panel to the pylon steel structure, so that the opening in the designated panel can be accomplished. All modifications and/or relocations, including the methods of accomplishing the changes, shall be approved by the Engineer.
  4. Install an appropriately sized rigid steel conduit passage from the interior of the pylon steel structure of each selected pylon to the nearest cable vault, environmental air plenum, cable trough, or area under the platform which has been assigned for the installation of cables through the platform area. There shall be no exposed conduit from the pylons to the nearest cable installation area of the platform. Restore all items removed, changed, modified, or damaged (such as platform tiles, granite apron around pylon base, parapets, floors, structures and finishes) due to installation of these conduit passages, to their original condition. Install an appropriately-sized junction box, and conduit fittings, and make the necessary connections to terminate each conduit passage from the selected pylon in the cable installation area of the

platform. Each conduit passage shall stub-up approximately six-inches into the steel pylon structure and shall be threaded at the end.

5. Install the emergency phones on the pylons via the mounting brackets. Verify, at each designated pylon, that the installation of the emergency phone does not interfere with pylon graphics before cutting the opening. Remove the handicapped decal and cleanse the panel surface if the installation will partially obscure the symbol. All other existing graphics shall not be tampered with. Conflicts between existing pylon graphics, other than the handicapped decal, and the installation of the emergency phone shall be referred to the Engineer for resolution.
6. To prevent tampering with the emergency phone, removal of the phone from the associated mounting bracket shall require special tools.
7. Install a 4-pair cable from each emergency phone to the MDF/Protector Cabinet in each station Communications Equipment Room. The one pair will attach to the tip and ring contacts, one pair to the plus and minus and one pair to the auxiliary contacts. The other pair in each cable shall be terminated and marked as spare.
8. Install a 4-pair cable from the strobe light in the kiosk to the Communications Equipment Room.

B. Kiosk

1. Cut the two wires to the strobe light from the elevator machine room. Secure the four ends to the terminal strip. Connect two of the four cable pairs from the Communications Equipment Room to the wires to the strobe light, one pair to each wire. The other two pairs in each cable shall be terminated and marked as spares

C. Communications Equipment Room

1. Install the power distribution module, line sharing switch, progress monitoring tone detector and relay on the 19-inch equipment rack.
2. Install the required cabling, connectors and plugs, and make the necessary connections and cross-connections to provide 120-Vdc, 60-Hz power to the various equipment from an ac power receptacle strip on uninterruptible power.
3. Install conduit and a dedicated 4-pair cable from each emergency phone to the Communications Equipment Room (no bridge cable taps shall be permitted).
4. Connect three of the four cable pairs from each of the emergency phone locations to protector blocks in the Communications Equipment Room. The other pair in each cable shall be terminated and marked as spare.
5. From the protector blocks, connect one cable pair for each emergency telephone to the associated tip and ring terminals on the power distribution module. Connect the second cable pair on the protector blocks from the emergency telephones to the associated plus and minus terminals on the power distribution module. Connect the third to the Auxiliary Output 1 terminals. These will be connected in parallel with each other and in series with the relay coil and a 24 V dc power supply from the Power distribution module, to activate the strobe light.
6. From the power distribution modules connect the tip and ring line outputs to the line sharing switch.
7. Program the emergency telephone to dial a) the nearest kiosk, b) the second number at that kiosk, other station kiosk(s), if any, and c) the OCC, when the "PUSH FOR HELP: button is pressed.
8. Record a voice message on each emergency telephone to identify its location (i.e. "North side of platform, Summerfield Station. To repeat this, press 5")
9. Cross-connect the PERS emergency telephone lines from the line sharing switch through the progress monitoring tone detector to the Carrier Transmission System channels, in the cable entrance box.

D. Jackson Graham Building installation

1. Connect the appropriate assigned telephone extensions of the existing Rolm PABX to the appropriate channels of the Carrier Transmission System terminal assemblies in the Jackson Graham Building. Refer to the Carrier Transmission System Article for channel assignments.

**3.02 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

**3.03 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

**3.04 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with Authority personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**3.05 TABLES**

**END OF SECTION**

**SECTION 16728  
CALL FOR AID**

**PART 1: GENERAL**

**1.01 SUMMARY**

- A. Call-for-Aid consists of a communications system that integrates the Passenger Emergency Reporting System, the Kiosk Attendant/Passenger Intercoms and the Elevator Intercoms with the centralized state-of-the-art, Voice over Internet Protocol (VoIP) system. The Call-for-Aid shall provide a means of establishing clear and easy to use voice communications between passengers and the Station Manager(s)/Kiosk Attendant(s) for the following purposes:
1. Reporting emergency situations from the passenger station platforms using intercom call-station panels mounted on columns at the station platforms. The Emergency Call Stations on the platform no more than 200 feet apart and shall be clearly visible to the general public.
  2. Providing Passenger/Kiosk Attendant intercom facilities using call-station panels mounted on both the "paid" and "unpaid" areas of each station Kiosk.
  3. Providing intercom facilities between Kiosk attendants in stations with multiple Kiosks.
  4. Providing elevator intercom facilities from inside station elevators using the call-station panel mounted inside the elevator cab.
  5. Providing intercom facilities from all elevator machine rooms and elevator landings within each passenger station.
  6. Providing elevator intercom facilities within elevator cars and at elevator landings within the passenger stations.
  7. Providing intercom reporting emergency situations in the Areas Refuge and Dispersal Areas
  8. Providing intercom facilities from all main entrances into the station.
  9. Providing a means of connecting a portable Master Station intercom unit to a jack mounted on the top of each elevator car for maintenance communications between the top-of-car (TOC) and the Elevator Machine Room (EMR).
  10. Providing call transfer, or roll-over, capability to the Operations Control Center (OCC) through 5 digit DTMF dialing over local stations assigned to the VoIP telephone system in the event a Kiosk station manager does not answer or acknowledge within a predetermined time a call from any of the call stations.
  11. Providing a Call-for-Aid Call Station at each entrance pavilion and pedestrian bridge gated entry point.
- B. The communication Subcontractor will provide a Master Station for the Kiosk, and remote stations in each elevator, and on each elevator landing. All other components for the Call-for-Aid shall be designed, furnished, and installed under this specification. Design, coordination, integration, and documentation of the Call-for-Aid system shall be accomplished under this specification.

- C. The Call-for-Aid shall be a state-of-the-art VoIP system which shall be software-programmable, and shall be supplied with all software, programming devices and training needed for programming or reprogramming.
- D. The Call-for-Aid Intercom System shall be easily configurable to meet the varied requirements of the existing Metrorail system and future Metrorail extensions. For example, calls initiated from remote call-stations, within elevator cars, platforms and passenger walkway entrances, areas refuge, dispersal areas and/or from elevator landings could be directed to:
1. Specific Kiosk within a station location.
  2. All Kiosks within a station location simultaneously.
  3. Kiosk and then to remote-monitoring facilities based on a preprogrammed roll-over sequence through the VoIP telephone system.
  4. Remote monitoring facilities immediately, if so desired, through the VoIP telephone system.
  5. Call-for-Aid equipment gives the station location to both Rail Operation Control Centers when reporting emergency.
- E. The Call-for-Aid shall be capable of handling calls from multiple call stations. The Intercom Master Station at each Station Kiosk shall display the identification code of the originating instrument of each connected incoming emergency call, shall allow scrolling of identification codes of subsequently received emergency calls waiting to be connected, and shall provide a means to switch from one call to another without disconnecting either call, until a call-disconnect button is pushed.
- F. The Call-for-Aid system shall be scalable, so that additional remote call stations are easily added into the Call-for-Aid system, and supported by programming the VoIP call manager server and the Kiosk Master Station.
- G. The Call-for-Aid System shall meet all technical requirements for accessibility by individuals with disability under the Americans with Disability Act (ADA). These technical requirements are to be applied during the design and installation of the system. The Call-for-Aid shall fully comply with the following requirements:
1. ADA requirement 4.10.14 for providing emergency two-way communications between an elevator and a point outside the hoist way (the Kiosk).
  2. ASME A17.1-2007. The highest operable part of the two-way communication system shall be a maximum of 48 inches from the floor.
  3. ADA Standards 4.30. Raised symbol and lettering (Signage) located adjacent to the device.
- H. The Call-for-Aid shall be equipped with a programmable autodial capability, allowing the system to dial up to two additional phone numbers if the primary number or Kiosk intercom station is busy, and/or a call is not answered by the Kiosk Station Manager. This roll-over capability is especially important, to make certain that no call originated by a patron goes unanswered.

- I. The Call-for-Aid shall be provided with a full duplex speaker and microphone system to assure clear and continuous communication between the passenger and Kiosk (or remote telephone if rolled-over by the auto-dialer). It is essential that all information and instructions are transmitted and received by both parties of the conversation, including during the presence of high noise levels. The Call Stations shall be equipped with devices that shall allow adjustment of speaker volume and microphone sensitivity to overcome any background noise.
  
- J. The Call-for-Aid shall include the following equipment, which shall be located in the passenger station Kiosk, except as noted:
  - 1. Emergency Call-Stations complete with mounting plates and graphic panels located at designated locations.
  - 2. Yellow strobe light and horn mounted on top of the Kiosk, and a networked relay module which will activate the strobe light and horn when a call is initiated from an Call-for-Aid call station on the platform, at the entrances and/or in an elevator. The strobe light and horn should not be activated when a Kiosk Attendant/Passenger intercom call is initiated.
  - 3. Kiosk Master Station for communication with, and identification of, a calling station. The Kiosk Master Station shall provide the interface point between the Station Manager and the Integrated Intercommunication System. When a call station is activated, it shall result in the following actions at the Kiosk master station:
    - a. Provide a digital display identifying the calling station, together with a call tone that is repeated until the call is acknowledged or cancelled.
    - b. Once the call is answered by depressing the assigned button at the Kiosk master station, an audio path between the answerer and calling station shall be established.
    - c. For programmable Call-for-Aid units provide on answer, at Kiosk, OCC roll, and/or EOC over, call identify of itself by using a prerecorded audio message.
  
- K. The Master Station to be installed in the Kiosk shall operate much as a telephone so that it could be used to initiate calls, as well as receive and answer calls. The Master Station shall be programmed so that the Kiosk operator (manager) can identify the origination of the calling party.
  
- L. The Call-stations shall be equipped with two visual indicators allowing hearing-impaired individuals to follow the progress of the emergency call. One indicator shall show that the call has been placed, and the other indicator shall show that the call has been answered. These LED indicators shall be large and bright (high intensity/wide angle type) so that a patron can see and identify the progress of the call during bright daylight.
  
- M. The Call Stations shall be equipped with large red protruding Call Buttons (Approximately 1 1/4 inches in diameter) to allow easy patron identification and use.

Depending upon space availability, brail labels shall be installed either to the left, or below, the button.

- N. Activation of an intercom call station shall function in the following sequence:
  - 1. Pressing the "PUSH TO TALK" button on the call-station shall illuminate the red "call initiated" LED indicator and activate the strobe light in the nearest Kiosk. The strobe light should not be activated if the call-station located in the "paid" and/or "unpaid" areas of the Kiosk is used. When the call is answered, a green, "call acknowledged" LED indicator shall illuminate, and a full-duplex audio path shall be established with the master station. If the master station doesn't answer within a preset time, the call shall be automatically routed either to the secondary Kiosk or to a pre-assigned OCC telephone number within the WMATA PBX system. If there is no answer at OCC, the call shall terminate after a preset time period adjustable from one to four minutes. If no answer at OCC, then the call should roll over to MOC, if no answer, then the call should roll over to a third party that WMATA will specify.
  - 2. When the call is completed, and the answerer hangs up, or after a remotely-programmable period of time, whichever comes first, the emergency call station shall hang up, and the strobe shall be deactivated.
- O. The Subcontractor shall be responsible for design of the interface of the Call-for-Aid and/or the VoIP telephone system. The Call-for-Aid system shall utilize and be supported by the VoIP call manager server of the VoIP telephone system. Call-for-Aid equipment shall be connected through the VoIP telephone system and the Ethernet LAN/WAN network.

## **1.02 RELATED DOCUMENTS**

- A. Section 27 065 10 – Communication Standard Specifications Equipment and Materials.
- B. Section 27 05 26 – Grounding and Bonding for Communications Grounding Systems.
- C. Section 27 05 14 – Communication Electrical Power Distribution.
- D. Section 27 20 00 – Local Area Network / Wide Area Network (LAN/WAN)
- E. Section 27 31 23 – Communications – VoIP Telephone System
- F. Section 27 02 10 – Communications – KIOSK Systems

## **1.03 REFERENCES**

- A. The equipment shall meet ADA (Americans with Disability Act) requirements 4.10.14, when applicable, and installation shall comply with the current provisions of the following (applicable) standards and codes:

1. Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG).
  2. National Electrical Code (NEC).
  3. ASME A17.1 and A17.2.
  4. Elevator Code of the local jurisdictions hereinafter referred to as the Code.
  5. National Electrical Manufacturers' Association (NEMA).
  6. Federal Transit Administration (FTA).
  7. Underwriters' Laboratories, Inc. (UL).
- B. These specifications are not to be construed as supplanting any code requirements.
- C. In the event of a conflict between codes, regulations, these specifications or standards, the most stringent requirements as determined by the Contractor shall take precedence unless specifically addressed herein.

#### **1.04 SUBMITTALS**

- A. See the Division 1 specifications of the Contract Documents for this section.

#### **1.05 SUBCONTRACTOR'S TOTAL SYSTEM RESPONSIBILITY**

- A. The Subcontractor shall bear total system responsibility for all specified work, including specified or otherwise required additions and modifications to existing WMATA systems of any type. The Subcontractor's responsibility includes engineering services, design, fabrication, installation, testing, cut-over, commissioning, documentation, training and warranty. The Subcontractor has the responsibility to integrate the various necessary elements of work so that overall specification performance goals are met.
- B. All Subcontractor-provided systems, equipment and services shall perform and be suitable for their intended purpose, in accordance with best commercial practices (as a minimum), and in compliance with all applicable specification requirements.
- C. Subcontractor shall provide a complete and operable Integrated Intercom System meeting all performance specification requirements, notwithstanding any errors or omissions in Technical Specifications or Contract Drawings that would otherwise prevent such delivery shall be delivered. Clarification shall be requested from the Contractor if conflicts or errors are suspected.
- D. The Subcontractor shall assume total responsibility for configuration of equipment, parts, interconnecting wiring, powering and surge protection devices, software, and other materials and services furnished. Systems provided by the Subcontractor that do not meet performance levels required by these Specifications shall be modified, at the Subcontractor's expense, until the performance levels specified in this Subcontract are achieved. Any modifications to approved system design shall be subject to prior approval.

- E. The Subcontractor shall assume total responsibility for the correction of any degradation of the performance of existing systems or equipment, which results from the installation of any system or equipment interface required by these Specifications.
- F. Although the Contractor retains rights to review the Subcontractor's system and component configuration compliance or noncompliance; the Subcontractor retains sufficient latitude to ensure compliance with all specified performance and availability requirements. The Subcontractor shall, therefore, present engineering data, technical documentation, test program and quality assurance program data, and product selections that will ensure compliance with the system technical specifications. In the event these submissions are not accepted, the Subcontractor shall resubmit with corrections, or resubmit completely revised documentation. The Subcontractor shall remain responsible for bearing any additional cost associated with charges necessary to affect compliance with all specified performance and availability standards, and all other specifications.
- G. Contractor support will be limited to those items of work that are expressly stated to be "Contractor-Furnished" or "Contractor-Provided" in these Specifications or on the Contract Drawings. Certain other items of work may be performed by others. Such work is identified as "Work by others" or "Not in Contract (NIC)" means it is not part of this section, but may be part of the overall Subcontract. When (NIC) items are encountered, it is the Subcontractor's responsibility to coordinate with the Contractor to assure the system is fully integrated. All other items of work specified are the responsibility of the Subcontractor.
- H. The Subcontract price shall provide full compensation for complete operational system, and all items and work furnished in compliance with these provisions. The Subcontractor shall remove rubbish and debris resulting from his work on a daily basis. Removal of debris and rubbish from the premises shall be coordinated with the WMATA Representative and/or the Station Manager when working in active passenger stations.
- I. Quantities of equipment, material, and services specified in any of the following locations shall be furnished:
  - 1. Section entitled "...Equipment, Material, Spares..."
  - 2. Contract Drawings.
  - 3. Quantities determined from Contractor-approved final designs.
  - 4. This specification
- J. Participate in Contractor Pre-final Inspections, Substantial Completion and Final Acceptance activities.
- K. Clean the equipment and work site, secure the equipment, and remain responsible for prompt repair or replacement in case of loss or damage until acceptance by the Contractor is received. Furnish inventory services and demonstrate system or equipment operation in support of requests by the Contractor. Provide support and access so that

the Contractor Technicians, Mechanics and Inspectors can inspect and test any portion of the work during normal work hours.

- L. New record As-Built/In-Service drawings (hard copies, and electronic media) to reflect the systems installed and/or modified under this Contract shall be furnished to the Contractor.

## **1.06 SYSTEM PERFORMANCE REQUIREMENTS**

- A. The following overall System performance requirements are designed to ensure that the system delivered under these Specifications, meets the performance requirements of WMATA.
  - 1. Emergency call station Sound Pressure Level: The emergency call stations shall produce clear and continuous speech and call-waiting tones (to persons who are not significantly hearing impaired within the 300-Hz to 8,200-Hz audio range) to a distance of up to 36-inches or less, while moving to positions 40-degrees off-center in any quadrant. Interfering signals hum, or objectionable noise shall not be discernible to listeners during, or between, speech messages or tone generations.
  - 2. Emergency Call Station Input Sensitivity: The emergency call station microphones shall be sensitive to (accept) any normal speaking voice from a distance of up to 20-inches, or less, from the front of the speaker, while moving to positions up to 30- degrees off center in any quadrant.
  - 3. System Noise: Shall not exceed -45 dB below a 1-kHz test tone level when all system and equipment controls are operated to any possible combination of positions. Momentary switching transients may peak to -30dB below a 1-kHz test tone level for a duration that does not exceed 10-milliseconds. Note: Persons not significantly hearing-impaired within the 300-Hz to 3,600-Hz audio range are defined for the purpose of these performance specifications as males or females with hearing capabilities that are normal, or slightly impaired to the extent that their response to audio tones in the 300-Hz to 3,600-Hz frequency range is within -15 dB at all test frequencies, and averages within - 10 dB of "NORMAL" standard values for their classification (sex, age, etc.) as defined in ANSI Standards.

## **1.07 PRODUCT APPROVALS**

- A. Equipment to be installed under these Specifications (except for "Contractor-Furnished" items and miscellaneous hardware), shall be approved prior to purchase and installation. Exception: Product approval shall not be required prior to purchase and installation when the "Brand Name" or "Trade Name" products, as specified herein (without substitutions, option changes, deviations from specifications, etc.) are furnished. Record copies of such product data shall be furnished in lieu of product approval submitted (same schedule requirements, but not later than 30 days prior to installation or delivery to the Contractor, in any event).

- B. Data for product approval shall be submitted with complete descriptions of the item, intended locations and functions, catalog cut-sheets, and technical literature and supporting data required to ascertain compliance with these Specifications. Approval or rejection shall not relieve the Subcontractor of any contractual responsibility.
- C. Substitutions of items specified will only be acceptable if a Variance Request submitted by the Subcontractor has been approved.

#### **1.08 QUALITY ASSURANCE**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of the Authority Having Jurisdictions.
  - 2. 47 CFR 15, Subparts A and B.
  - 3. UL 50.
  - 4. NEMA AB 1 and NEMA KS 1.
  - 5. ITU-T
  - 6. ASME 17.1-2007 ADAAG
  - 7. NFPA 130.5, 2010
- B. Design and production tests: Perform the test and submit, certified test results, or provide certified test results on identical units. Furnish certified test reports showing test data and results as well as manufacturer's comments on tests.
- C. Interchangeability: Refer to the Contract Documents. Furnish products of a manufacturer regularly engaged in the manufacture of applicable systems. In addition:
  - 1. Standard commercial products shall be furnished whenever such equipment and materials will satisfy the stated specifications. Suitable modified standard commercial devices shall be furnished when required to satisfy specification requirements. Custom developed and fabricated equipment units and devices shall be confined to those items for which suitable commercial off-the-shelf (COTS) products are not available to guarantee compliance with the Specifications. When custom design, fabrication, or assembly is required, every effort shall be made to minimize the number of different modules, solid-state devices used.
  - 2. With each system, subsystem and facility, two or more like functions shall be performed by identical units. In no case shall the equipment or hardware used in one portion of a system, subsystem or facility be different from that used in another portion to perform the same function under similar operating and environmental conditions (outdoor systems are distinct from indoor systems).
  - 3. Equipment shall be physically and plug compatible with recent versions of existing WMATA equipment performing similar functions and used for comparable applications elsewhere in similar WMATA's facilities, insofar as possible. The use of adapter plugs, interface boxes, and replacement mounting brackets or enclosures that fit available space and mounting holes may be allowed by the Airports Authority to maintain interchangeability when competitive

products that do not require such devices are determined to be unavailable (applicable to COTS major equipment items only). Custom designed and fabricated equipment must be fully interchangeable without requiring the use of such devices. If a determination is made to allow use of such devices, all necessary adapters and interface devices shall be provided with each item of equipment furnished, at no additional cost to the Airports Authority.

4. Equipment shall be software compatible with recent versions of existing WMATA equipment performing similar functions and used for comparable applications elsewhere in similar WMATA facilities.
5. Major items of equipment furnished shall be within the physical size and configuration limitations specified in provisions of this Subcontract. If such specifications are not included in the provisions, major items of equipment shall be of a physical size and configuration closely comparable to equipment currently in use of comparable applications elsewhere in similar WMATA facilities.
6. Exception: Lighter weight and smaller sized more modern versions of equipment are sought by the Airports Authority where their use presents significant advantages. The use of new generations of equipment that differ in size and are not fully interchangeable will be considered for approval by the Airports Authority, in order to take advantage of significant technological improvements developed by industry.

D. Qualifications of Instructor for Operation and Maintenance Training:

1. Instructor has in-depth knowledge of the design, packaging, operations, maintenance and trouble-shooting of the systems to be taught.
2. Instructor has been trained in teaching methods or has previous satisfactory experience in teaching with emphasis on the subject matter to be covered in the course of instruction.

#### **1.09 SUBCONTRACTOR COORDINATION**

- A. Accomplishment of the work included in these Specifications may require the Subcontractor to coordinate with the Contractor representing the operating elements of WMATA and other subcontractors, to develop work schedules, to determine assignment of space and the availability of equipment, and to ascertain means of access to work areas.
- B. Work schedules shall be coordinated with operating elements of WMATA through the Contractor, for assignments of space and access to operating facilities and for assignments of space and access to areas and rooms within the passenger stations, and the OCC, if applicable. All work performed at in-service Metrorail passenger stations shall be in accordance with WMATA Operating procedures, and at the discretion of the Contractor, and may require WMATA Escorts.

- C. The Subcontractor shall coordinate with the Contractor to determine the availability and quantity of telephone lines roll-over or direct dial telephone numbers and call time-out details.
- D. The Subcontractor shall (if applicable) coordinate with local fire authorities to ensure compliance with local fire codes, and to obtain all required permits and inspections. (Copies of all related documentation shall be furnished to the Contractor within 3 working days of receipt.)
- E. The Subcontractor shall make every reasonable effort to resolve conflicts with other subcontractors and agencies. Those conflicts that cannot be resolved to the satisfaction of all parties concerned shall be referred to the Contractor for resolution.
- F. Specific coordination with the elevator subcontractor will be required for the elevator intercom for elevator construction and certification. The Subcontractor shall coordinate design of wire and conduit plant, and connection of call stations, with the elevator subcontractor(s).

#### **1.10 INITIAL SPARES**

- A. The Subcontractor shall develop a Recommended Spare Parts list for the system being provided in this contract and shall furnish the items in the quantities indicated in the Recommended Spare Parts list, subject to the agreement and approval of selected by the Authority.
- B. All spare equipment and material shall be packed for warehouse storage. Like items (only) shall be grouped together and boxed as lots, as designated by the Contractor. Lots shall be marked as to item nomenclature, WMATA part number, contact number, specification reference, and end use (WMATA project identification data), as directed by the Contractor. Each individual item shall also be tagged with a WMATA part number, if a number is assigned by WMATA.
- C. Spare equipment and materials shall be delivered for the newly-installed Intercom System to any of the various locations designated by the Contractor.

#### **1.11 WARRANTY**

- A. Furnish a one (1) year service and maintenance program on Intercom equipment after final completion.

### **PART 2: PRODUCTS**

#### **2.01 CENTRAL EXCHANGE UNIT - EQUIPPED FOR 100 PLUS STATIONS**

- A. Manufacturer: Commend Model GE800 or approved equal
- B. IP Intercom Server (Central Exchange Unit)

1. Central Exchange Unit (CEU) shall be installed in the passenger station Communications Room for control of the Integrated Intercommunications System equipment. Connect unit's power supply to an Uninterrupted Power Supply (UPS) backed source.
2. Configure the complete Central Exchange Unit so that it is capable of supporting up to 100 subscribers and include all subscriber cards required.
3. Install an analog telephone auto-dialer card to provide roll-over of calls to the WMATA Operations Control Center (OCC), Elevator Control Center (EOC), or other continuously staffed WMATA designated Control Center, when a call goes unanswered at the Kiosk. Connect this card to an analog telephone line.
4. Power supply: 24 VAC/40VA/16 subscribers or 24-35 VDC/40W/16 subscribers.
5. Relay outputs: maximum switching capacity 60W / 125VA, maximum switching current: 2 A, maximum switching voltage: 60 VDC/40 VAC.

## **2.02 MASTER STATION FOR KIOSK**

- A. Manufacturer: Commend Model EE320AS or approved equal
- B. Kiosk - Master Station:
  1. Integrated electret microphone and speaker for high fidelity audio.
  2. Wall-mounted master station can be used as a handset or hands- free unit.
  3. Telephone handset, with coiled cord.
  4. Equipped with multifunction LED to indicate incoming calls.
  5. Equipped with 6-character, alphanumeric (16-segment) display for identification of calling party.
  6. Equipped with reinforced silicon keypad with additional function keys.
  7. Modern DSP technology.
  8. Frequency Range: 200-7000 Hz.
  9. Color: Light grey

## **2.03 ELEVATOR MACHINE ROOM INTERCOM CALL STATION**

- A. Manufacturer: Command Model WS800FI or approved equal
- B. Master Station for Elevator Machine Room:
  1. Integrated microphone and speaker for high fidelity audio.
  2. Surfaced mounted.
  3. One-touch access to key Avaya features.
  4. Equipped with red light indicating the station is in use.
  5. Equipped with alphanumeric high-resolution backlit display for identification of calling party.
  6. Includes a membrane keypad designed for harsh/or industrial environment.

7. VoIP Technology: IETF RFC 3261 (Session Initiation Protocol – SIP).
8. Power over LAN: IEEE802.3af.
9. Frequency Range: 200-16000 Hz.
10. Color: Light grey.

#### **2.04 CALL STATIONS FOR ELEVATOR CARS/LANDINGS, KIOSKS AND PLATFORMS**

- A. Manufacturer: Commend Model ET508-DC Rev. B or approved equal
- B. Elevator Cars/Landings, Kiosk and Platform Call Station:
  1. Consists of a vandal resistant 11 AWG steel panel, custom painted to the Contractor required color.
  2. Speaker, microphone and associated electronic circuitry are mounted behind the panel.
  3. Includes a red mushroom-type call button.
  4. Unit will include LED indications, one for call made, (red), and one for call answered, (green).
  5. Relay contact.
  6. VoIP Technology: IETF RFC 3261 (Session Initiation Protocol – SIP).
  7. Power over LAN: IEEE 802.3af.

#### **2.05 KIOSK PAID/UNPAID AND STATION GATED ENTRY- CALL STATIONS**

- A. Manufacturer: Commend Model ES931 A or approved equal
- B. Kiosk Paid/Unpaid and Station Gated Entry - Call Stations:
  1. Integrated weather resistant, vandal proof electret microphone and speaker for high fidelity audio.
  2. Tamper and weather resistant construction.
  3. Rugged, tamper resistant call button.
  4. Faceplate Dimensions: 6-9/16" wide x 4-15/16" high.
  5. Wiring: 4 twisted pair (Category 5 or higher).
  6. Interface: RJ 45 (Static IP).
  7. Power Requirement: 12-24VAC or 15-35VDC, 500mA or PoE (with PoE switch).
  8. Frequency Range: 50-16,000 Hz.
  9. Mounting: Standard 3-gang backbox. Backbox painted Benjamin Moore (Color 2) HC-170 Stonington Gray or other approved color.
  10. LED for indication of conversations.
  11. Protocol: IP-Protocol based on UDP/IP.

#### **2.06 KIOSK CALL-ALERT STROBE LIGHT AND SONALERT UNIT**

- A. Manufacturers: Custom-built Kiosk Strobe and Sonalert Unit.

- B. Strobe light and son-alert unit for Kiosk:
1. Unit is comprised of a weather resistant amber colored strobe light mounted to a short length of pipe for better visibility and a weather resistant outdoor speaker horn. Both the strobe light and speaker are mounted to a heavy duty box for installation on the roof of the Kiosk.
  2. Power Requirements: .75 Amps @ 24VDC. (Power supply included).
  3. Strobe Luminosity & Life: 1800 mcd @ 30MilliAmperes 100,000+ Hours.
  4. Lens & Material: 5-3/4" diam., diffused lens optimum visibility and reliability for effective visual signaling.
  5. Speaker: 15 Watt, 8 Ohm nominal.
  6. Tone Frequency: Solid state generated square wave at approx. 800 Hz.
  7. Tone Level Settings: Volume control, screw driver type located at rear of unit.
  8. Functionality: Configured and installed as an integral unit of the Washington DC Metrorail System to provide features and functions per CALL-FOR-AID design in existing stations.
  9. Two-piece screw terminal wiring means for ease of installation and maintenance.
  10. Connect unit to ET901-D Ethernet IP converter & EB2E2A Option board in the Kiosk for activation control

## **2.07 PORTABLE MASTER STATION (MAINTENANCE-INTERCOM UNIT)**

- A. Manufacturer: Commend Model EE311AS or approved equal
- B. Portable Master Station:
1. Integrated electret microphone and speaker for high fidelity audio.
  2. Telephone handset with line cord for connection to elevator top-of-car jack.
  3. Equipped with multifunction LED.
  4. Equipped with 6-character, alphanumeric (16-segment) display for identification of calling party.
  5. Equipped with reinforced silicon keypad with additional function keys.
  6. Modern DSP technology.
  7. Frequency Range: IP-Protocol based on UDP/IP
  8. Color: Light grey.

## **2.08 IP-INTERCOM INTERFACE UNIT**

- A. Manufacturer: Commend Models ET901-A & ET901-D or approved equal
- B. IP-Intercom Interface Unit:

1. Establishes the bridge between an Ethernet network with IP- protocol and any 2-wire digital or 4-wire analog intercom terminal.
2. utilizes the latest DSP technology which enables features such as Loudspeaker-/Microphone Surveillance and Audio Monitoring for any terminal connected.
3. Unit can be upgraded to handle additional inputs and outputs with an EB2E2A Option board.
4. Available as an open PC board unit; with a standard housing; or with a weatherproof housing.
5. Power: 24VAC +/- 5% or 28-35 VDC or PoE.
- 6 PoE (Power over Ethernet): IEEE 802.3af standard. Power connection of terminal device: Class 0 (0.44 W to 12.95 W).
7. Protocol: IP-Protocol based on UDP/IP.
8. Data Rate: 2 x 10/100 MBit/s (full/half duplex).

## **2.09 OPTION BOARD - (FOR KIOSK STROBE AND SONALERT UNIT ACTIVATION**

- A. Manufacturer: Commend Model EB2E2A or approved equal
- B. Option Board:
  1. Provides Intercom terminals with an expansion plug to be upgraded to handle additional inputs and outputs.
  2. Unit can be integrated in the housing of the IP-Intercom Box ET 901.
  3. Inputs: 2 inputs for floating contacts, max. 1 kOhm.
  4. Outputs: 2 relay outputs (changeover contacts) rated 30V.

## **2.10 ELEVATOR MACHINE ROOM - IP CONVERTER ENCLOSURE**

- A. Manufacturer: Hoffman A30H20BLP or approved equal.
- B. Interface Enclosure:
  1. NEMA 4 enclosure for housing the IP converters associated with the elevator car units, elevator landing units and top-of-car jacks.
  2. Provide backplate inside enclosure for mounting purposes.
  3. The size of this enclosure may be adjusted to meet the needs of the devices being housed within it for each Elevator Machine Room but it shall be a NEMA 4 rated enclosure.

## **2.11 ELEVATOR MACHINE ROOM - PORTABLE MASTER STATION STORAGE ENCLOSURE**

- A. Manufacturer: Hoffman AHE12X8X4 w/T-Handle Latch or approved equal.

B. Interface Enclosure:

1. NEMA 1 enclosure to be installed in the Elevator Machine Room for housing the portable master station when not in use.

**2.12 ELEVATOR TOP-OF-CAR JACK/MODULE**

A. Manufacturer: Ortronics - OR-404IP22 Two-port industrial grade surface box, cover plate and watertight cable gaskets & plugs. Ortronics - OR-IPJ6 Category 6 industrial jack with protective cover cap or approved equals

B. Elevator Top-of-Car (TOC) jacks:

1. Provides a connection jack on top of each elevator car for the Portable Master Station Maintenance-Intercom Unit.
2. Assembly consists of a Category 6 telephone jack mounted in a weatherproof box with a weatherproof cover.

**2.13 PLATFORM-EMERGENCY CALL STATION**

A. Manufacturer: Commend Model EF963AM or approved equal

B. Platform-Emergency Call Station:

1. Provides a means for rail passengers located along the station platform to report emergencies to the Station Manager in the Kiosk.
2. The Emergency Call Station shall be located within signage, provided by others, that identifies the Call Station as an emergency reporting communications device.
3. Vandal-proof Stainless steel faceplate.
4. Integrated omnidirectional electret microphone and special membrane type loudspeaker for optimal sound quality.
5. Integrated amplifier class "D" 1.5 W.
6. Input: 3 inputs for floating contacts max. 1kOhm.
7. Output: 2 relay outputs.
8. Display: red operation LED.
9. Call button: red mushroom.
10. Frequency range: 200-7,000 Hz.
11. Power: external power supply 12-24 VAC or 15-35 VDC, 500mA, or PoE.
12. PoE: IEEE 802.3af standard. Power consumption of terminal device: Class 0 (0.44 W to 12.95 W).
13. Protocol: IP-Protocol based on UDP/IP.
14. Data rate: Autosense (10/100 MBit/s, full/half Duplex).
15. Cabling: Category 5 (minimum) required.
16. Surface mount using GUEF 63 backbox inside an EF 63G hood.

## **2.14 IP SUBSCRIBER CARD**

- A. Manufacturer: Commend Model G3-IP-4B or approved equal
- B. IP Subscriber Card:
  - 1. Cards install in Intercom Server for the connection of up to 8 Intercom terminals via Ethernet networks with IP-protocol.
  - 2. Cards connect directly to a LAN/WAN without the need of media converters or multiplexers.
  - 3. Available with 4 or 8 subscribers per card.
  - 4. Provide with license upgrades L3-IP-8D and L3-IP-8B to allow connection of up to 8 subscribers per card.
  - 5. Install proper number of cards with upgrade licenses to accommodate at least 100 subscribers (intercom units) per station.

## **2.15 MULTI-FUNCTION TELEPHONE INTERFACE CARD**

- A. Manufacturer: Commend Model G8-TEL4 or approved equal
- B. Telephone Interface Card:
  - 1. Integrated auto-dialer and telephone interface.
  - 2. Powered from intercom server.
  - 3. Telephone connection: RJ11.

## **2.16 CATEGORY-6 UNSHIELDED TWISTED PAIR (UTP) CABLE**

- A. Manufacturer: Berk-Tek LANMARK-1000 100 ohm, Category 6, 23 AWG, 4-pair shielded twisted pair (UTP) (or equal).
- B. Cable to provide signal and power (POE) for ISS call stations and Master Stations:
  - 1. 4-pair, unshielded twisted pair (UTP).
  - 2. Meet TIA and ISO Category-6.
  - 3. 23-AWG solid bare copper.
  - 4. Insertion loss: 32.9 dB/100 meters at 250MHz.
  - 5. Cable outside diameter: 0.220 inches.
  - 6. Color: Blue (other color may be submitted for approval).
  - 7. Primary insulation: FEP.
  - 8. Jacket: Low-smoke PVC rated CMP (plenum).

## **2.17 TEST AND PROGRAMMING EQUIPMENT**

- A. Provide a minimum of one set of all equipment, adapters, software, manuals and external processors required to program, or reprogram, any portion or subsystem of the system.

## **PART 3 : EXECUTION**

### **3.01 INSTALLATION**

- A. The new Call-for-Aid shall be installed and configured to provide the following Communications capabilities:
1. From the Kiosk Master Station to the "Paid" and "Unpaid" sides of the Kiosk.
  2. From Elevator Car and Elevator Landing call stations to the Kiosk Master Stations.
  3. From the passenger emergency Call Stations on the station platform(s) to the Kiosk Master Stations.
  4. From the station entrance emergency Call Station to the Kiosk Master Stations.
  5. From inside the gated entry points to the Entrance Pavilions or Pedestrian Bridges that end at a gated entry
  6. The Area Refuge and Dispersal Areas.
  6. From top of elevator cars utilizing a waterproof jack as a connection means for a portable master stations maintenance intercom unit
  7. Roll-over capabilities to other Kiosk Call-Stations or to external facilities as pre-programmed into the system, if a Kiosk Master Station doesn't respond to the incoming call.
  8. The Subcontractor shall coordinate and work with the Contractor and WMATA to develop a call routing plan designating numbers to be dialed and roll-over functions in the event that calls are unanswered at specific locations.
- B. **KIOSK**
1. Install a dedicated AC circuit for the Intercom System, originating from the Communications Room Power Distribution Panel supplied by the station UPS (Uninterrupted Power Source).
  2. Install the Passenger/Kiosk Attendant call-stations in the "paid" and "unpaid" areas of the Kiosk(s), and wire to the 24-Port Category-6 Patch Panel for connection to the Kiosk Data Switch.
  3. Install the Intercom Master Station in the Kiosk(s) and wire to the 24-Port Category-6 Patch Panel for connection to the Kiosk Data Switch.
  4. Install the Kiosk-mounted strobe light in view of one of the Kiosk windows, and wire to the Networked Relay Module for connection to the Kiosk Data Switch.
  5. The Call-for-Aid equipment and the VoIP call manager server shall be programmed to provide the necessary features and functions for all Call Stations (Elevator Car(s), Elevator Landings, Kiosk Intercom Call Stations and Master Station, and the Platform Stations). The Call-for-Aid equipment and the VoIP call manager server shall be completely programmed for all the correct Call- Station addresses and user-defined message, and roll-over functions where applicable.

### **C. Platform Call-Stations**

1. Install two Emergency Call Stations on each platform of the passenger stations. The Emergency Call Stations shall be surface-mounted on selected columns along the platform areas via mounting brackets or back-plates. The call station shall be clearly visible to the general public.
2. Install the Emergency Call Stations on the columns via the mounting brackets or back-plates. Verify, at each designated column, that the installation of the Emergency Call Station does not interfere with signage graphics. Conflicts between column graphics and the installation of the Emergency Call Station shall be referred to the Contractor for resolution.
3. To prevent tampering with the Emergency Call Station, removal of the phone from the associated mounting bracket shall require special tools.
4. Install two Category-6 cables from each Emergency Call Station to the nearest Category-6 Patch Panel in the Kiosk or in the Communications Equipment Room. One cable will be connected to the Data Switch. The other cable shall be terminated and marked as spare.

### **D. Elevator Call-Stations**

1. Install an Emergency Call Station in each elevator car and elevator landing location. The Subcontractor shall interface with the elevator subcontractor concerning the mounting method, and location of the call station inside the elevator car, and its' wiring connection to the Kiosk via the LAN/WAN outlet in the associated Elevator Machine Room. The Subcontractor shall submit drawing details of the proposed mounting method and location for approval prior to installation.
2. Install a Master Call-Station in each Elevator Machine Room and provide Category-6 wiring connection to the nearest Data Switch in the Kiosk or in the Communications Equipment Room.
3. Provide one portable Master Station for maintenance purposes locate in the storage enclosure of each Elevator Machine Room. The portable Master Station will be provided with a line cord for connection to the top-of-car jack for use during elevator maintenance

### **E. Communications Equipment Room**

1. Install a Call-for-Aid Central Exchange Unit (CEU GE 800) in the Communications Equipment Room at each passenger station and connect it to the Comm. Room LAN Data Switch for function control of all associated Call-for-Aid call stations.
2. Program the CEU and LAN Data Switches to provide all the system functions required by this specification.

3. Install and properly program a telephone auto-dialer card within the CEU in the Communications Equipment Room to allow calls that go unanswered by the Kiosk Call-for-Aid Master Station to be routed to WMATA Operations Control Center (OCC) or other continuously manned Control Center as designated by WMATA for handling of these calls. Connect the telephone auto-dialer to an analog phone line via the G450 unit in the Comm. Room.

#### **F. Entrance Pavilions and Pedestrian Bridges Gated Entry Points**

1. Install Call-for-Aid Call Station on the interior side of each Entrance Pavilion or Pedestrian Bridge gated entry point to provide emergency communications for persons that may become trapped at these gated entry points during hours when the passenger station is closed.
2. Provide Category-6 wiring from the Call-for-Aid Call Station to the nearest designated Patch Panel and LAN Data Switch.
  - a. Install one Emergency Call Stations immediately next to each main entrance into the passenger stations. The Emergency Call Stations shall be surface-mounted via mounting brackets or back-plates.
  - b. Verify that the installation of the Emergency Call Station does not interfere with signage and does not impede passenger entrance.
  - c. To prevent tampering with the Emergency Call Station, removal of the phone from the associated mounting bracket shall require special tools.

#### **3.02 FIELD QUALITY CONTROL**

- A. The new Intercom System shall be installed and fully tested with current calibrated equipment, under the supervision of trained manufacturers' representative. The system shall be demonstrated to perform all functions as specified.

#### **3.03 SYSTEM TESTINGS**

1. The completely-installed Intercom System shall be fully tested (on a station-by-station basis) with the Contractor-Approved test procedures. The Contractor reserves the right to witness system acceptance testing of the supplied Call-for-Aid at each location.
2. All test equipment, instruments, tools and labor required to conduct the tests shall be made available by the installing Subcontractor. All test equipment shall have a current calibrated test data tag.

#### **3.04 CLOSEOUT ACTIVITIES**

- A. Demonstrate operation and maintenance of Products to WMATA's personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA's personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component

**END OF SECTION**

## SECTION 16729

### PASSENGER INFORMATION DISPLAY SYSTEM

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION

- A. This Section describes the Passenger Information Display System (PIDS). The equipment consists of Variable Message Sign (VMS) displays and associated mounting equipment located throughout the station platform and entrance areas, one Station Control Unit (SCU) and modem located in the Station Communications Room, and one Kiosk Control Panel (KCP) located in the Station Manager's Kiosk. The related communications equipment shall be installed in the Station Communications Room. All software and hardware shall operate seamlessly with the existing PIDS.
- B. Related Work Specified Elsewhere:
- |  |                |
|--|----------------|
| 1. Grounding and bonding:                          | Section 16060. |
| 2. Wire, cable and busways:                        | Section 16120. |
| 3. Raceways, boxes and cabinets:                   | Section 16130. |
| 4. Uninterruptible power system:                   | Section 16260. |
| 5. Circuit breakers, panelboards and load centers: | Section 16440. |
- C. The following abbreviations apply to this Section:
- |   |
|---|
| 1. ADA: Americans with Disabilities Act |
| 2. CPU: Central Processing Unit         |
| 3. EMI: Electromagnetic Interference    |
| 4. KCP: Kiosk Control Panel             |
| 5. LED: Light Emitting Diode            |
| 6. SCU: Station Control Unit            |
| 7. VMS: Variable Message Sign           |
| 8. PA: Public Address                   |
| 9. RH: Relative Humidity                |
| 10. LAN: Local Area Network             |
| 11. JGB: Jackson Graham Building        |
| 12. CTS: Carrier Transmission System    |
| 13. CD: Compact Disk                    |
- D. Listing and labelling: Provide products specified in this Section that are UL listed and labelled.
- E. Coordinate features, accessories, and functions of each VMS with corresponding SCU and KCP.
- F. Coordinate features of distribution equipment and VMS components to form an integrated interconnection of compatible components. Match components and interconnections for optimum performance of specified functions.
- G. Coordinate with general construction work and arrange in building structure during progress of construction to facilitate the electrical installations that follow.
- H. Coordinate work in this Section with that in Sections specifying distribution components that are monitored or controlled by VMS equipment.

- I. Environmental Limitations: Rate equipment for continuous operation under the following conditions, unless otherwise indicated:
  - 1. Operating Temperature: 0 to 50 degrees C.
  - 2. Storage Temperature: -20 to 70 degrees C.
  - 3. Humidity Range: 5% to 90% RH, non-condensing.

**1.02 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of jurisdictional authorities.
  - 2. 47 CFR 15, Subparts A and B
  - 3. NFPA 130
  - 4. UL 50
  - 5. NEMA AB 1 and NEMA KS 1
  - 6. ITU-T
  - 7. ADA Sections 4.30.2 and 4.30.3
  - 8. MIL-I-46058C
- B. Design and production tests: Perform and submit, in accordance with the General Requirements certified test results on the PIDS or provide certified test results on an identical unit. Furnish certified test reports showing test data and results as well as manufacturer's comments on tests.
- C. Interchangeability: Furnish products of a manufacturer regularly engaged in the manufacture of display systems. In addition:
  - 1. Standard commercial products shall be furnished whenever such equipment and materials will satisfy the stated specifications. Suitable modified standard commercial devices shall be furnished when required to satisfy specification requirements. Custom developed and fabricated equipment units and devices shall be confined to those items for which suitable commercial off-the-shelf (COTS) products are not available to guarantee compliance with the Specifications. When custom design, fabrication, or assembly is required, every effort shall be made to minimize the number of different modules, solid-state devices used.
  - 2. With each system, subsystem and facility, two or more like functions shall be performed by identical units. In no case shall the equipment or hardware used in one portion of a system, subsystem or facility be different from that used in another portion to perform the same function under similar operating and environmental conditions (outdoor display systems are distinct from indoor display systems).
  - 3. Equipment shall be physically and plug compatible with recent versions of existing Authority equipment performing similar functions and used for comparable applications elsewhere in similar WMATA facilities insofar as possible. The use of adapter plugs, interface boxes, and replacement mounting brackets or enclosures that fit available space and mounting holes may be allowed by the Engineer to maintain interchangeability when competitive products that do not require such devices are determined to be unavailable (applicable to COTS major equipment items only). Custom designed and fabricated equipment must be fully interchangeable without requiring the use of such devices. If a determination is made to allow use of such devices, the Contractor shall provide all necessary adapters and interface devices with each item of equipment furnished, at no additional cost to the Authority.
  - 4. Equipment shall be software compatible with recent versions of existing Authority equipment performing similar functions and used for comparable applications elsewhere in similar WMATA facilities.

5. Major items of equipment furnished by the Contractor shall be within the physical size and configuration limitations specified in provisions of this contract. If such specifications are not included in the provisions of this contract, major items of equipment shall be of a physical size and configuration closely comparable to equipment currently in use of comparable applications elsewhere in similar WMATA facilities.
  6. Exception: Lighter weight and smaller sized more modern versions of equipment are sought by the Authority where their use presents significant advantages. The use of new generations of equipment that differ in size and are not fully interchangeable will be considered for approval by the Engineer, in order to take advantage of significant technological improvements developed by industry.
- D. Qualifications of Instructor for Operation and Maintenance Training: Perform operation and maintenance training in accordance with the General Requirements for development and performance of operation and maintenance training for PIDS. Qualifications will be considered adequate when the following is demonstrated:
1. Instructor has in-depth knowledge of the design, packaging, operations, maintenance and trouble-shooting of the systems to be taught.
  2. Instructor has been trained in teaching methods or has previous satisfactory experience in teaching with emphasis on the subject matter to be covered in the course of instruction.

### 1.03 SUBMITTALS:

- A. Product Data: For each type of VMS, SCU, KCP, and modem. Include dimensions and manufacturer's technical data on features, performance, electrical characteristics, ratings, and finishes.
- B. Product Data for each type of fixture below. Include data on features and accessories.
1. Cantilever single side, Inova sketch E2 C-Mount
  2. Cantilever double side, Inova sketch E2 C-Mount
  3. Wall mount single side, Inova sketch E2 W-Mount
  4. Wall mount double side, Inova sketch E2 W-Mount
  5. Cantilever "T" Inova sketch E2 T-Mount
  6. Ceiling mount, single side, Inova sketch E2 O-Mount
  7. Ceiling mount, double side, Inova sketch E2 O-Mount
- C. Shop Drawings: For each type of VMS, SCU, KCP and modem:
1. Dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include: enclosure types and details, nameplate legends, short-circuit current rating of integrated unit.
  2. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer-installed and field-installed wiring.
- D. Certification, including:
- a. Dimensioned Outline Drawing of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
  - b. Detailed description of anchorage devices on which the certification is based and their installation requirements.
- E. Documentation:

1. Submit field-test plan and documentation within 60 days after award with accompanying documentation in the form of test-data recording sheets and list of proposed test equipment.
  2. Do not proceed with testing until plan and documentation are approved.
  3. Indicate in scope of test plan method of testing in order to ensure safe and orderly transition from installation, through initial energizing, to specified field testing.
  4. Accompanying documentation to include data-recording sheets as used by manufacturer for in-plant testing of equipment and devices.
  5. Submit certified copies of test data, dated and clearly identified within two weeks after completion of testing. Testing shall be witnessed by WMATA representatives.
  6. Instructor qualifications: Five copies of resume which outlines each instructor's qualifications and skills not later than 180 calendar days prior to commencement of training.
- F. Field Test Reports to include the following:
1. Test procedures used.
  2. Test results that comply with requirements.
  3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
- G. Operations and maintenance training material:
1. Five copies in paper format and five copies in CD format not later than 30 calendar days prior to commencement of training.
- H. Operations and Maintenance Manuals:
1. Include in manuals general theory of operation of the PIDS including description, purpose and function of:
    - a. VMS.
    - b. SCU.
    - c. KCP.
    - d. Modem.
  2. Describe and include in manuals procedures for:
    - a. PIDS testing.
    - b. Operational checks of PIDS.
    - c. Troubleshooting to include test procedures and system logic in identifying malfunctions.
    - d. Preventive maintenance inspection.
    - e. Maintenance actions to be performed by the contractor.
    - f. Maintenance actions to be performed by the Authority.
  3. Include in manual the shop drawings listed in C above. Print shop drawings on folded pages in accordance with the General Requirements.
  4. Five complete sets of As Built Drawings in paper format and five complete sets of As Built Drawings in CD format
  5. Maintenance training certificates.
- I. Manufacturer's factory-authorized service representatives inspectors reports.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Temporary Bracing: Where necessary, brace each unit for hoisting, lowering and sliding into position. Temporary bracing of the equipment labeled as follows: TEMPORARY-REMOVE BEFORE OPERATION.

- C. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit in accordance with the General Requirements impact chart with manufacturer's recommendations for disposition of damaged materials.
- D. Store equipment in secure and dry storage facility.

## **PART 2 - PRODUCTS**

### **2.01 PRODUCTS AND MATERIALS**

- A. General:
  - 1. Interchangeability: Components of same type, size, rating, functional characteristics and make are to be interchangeable.
  - 2. Integration: Coordinate features to form an integrated system. Match components and interconnections for optimum performance of specified functions.
  - 3. Expansion Capability: Unless otherwise indicated, provide spare fibers and conductor pairs in cables, positions in patch panels, cross connects, terminal strips, and space in backbone cable trays and wireways to accommodate a 100% future increase in VMS number per Metrorail station.
  - 4. Enclosures: Comply with NEMA 250 and NEMA KS 1 to meet environmental conditions of installed location.
- B. VMS General Description: Four-line, tri-color (Red, Amber, Green) LED Dot Matrix Display, with full text, and graphics capability, outdoor enclosure. Manufacturer: INOVA or a manufacturer of buyer-approved equal. Models: NTDI (indoor, double-sided), NTDO (outdoor, double-sided), WSI (mezzanine, single-sided), or equivalents.
- C. SCU General Description: Station Control Unit, PC, Rack Mount. Manufacturer: Avnet or a manufacturer of buyer-approved equal. Model: #72209 or equivalent.
- D. KCP General Description: KCP is a keypad that allows the Station Manager to activate message(s) for a special condition or emergency situation. Manufacturer: Avnet or a manufacturer of buyer-approved equal. Model: refer to KCP drawing #690023.
- E. Modem General Description: Modem is a unit which provides synchronous and asynchronous data communication to meet networking requirements. Manufacturer: Motorola or a manufacturer of buyer-approved equal. Model: Fast'R 3460 or equivalent.
- F. Equipment: Modular type, using solid-state components, fully rated for continuous duty, unless otherwise indicated.
- G. Waterproof Equipment: Listed and labelled for duty outdoors or in damp locations.
- H. VMS Finishes:
  - 1. Paint Finish: VMS painted Metro Bronze, Dupont Imron, or stainless steel, as required.
  - 2. Metallic Finish: All metallic housing components and fasteners are corrosion-resistant.
- I. VMS Housing: Case material is Aluminum. The housing shall have the capability to swivel (rotate) 90 degrees to a position parallel to the track.

- J. VMS Service Access: All electronics are mounted to a single sheet metal plate (backplate) for easy removal. Backplate is accessed from a removable front per specification.
- K. VMS Service access: Each enclosure shall be equipped with a keyed power switch that is capable of rebooting power to the backplate(s). The switch shall be made accessible through the bottom of the enclosure.
- L. Each VMS shall have an electrical disconnect provided within line of sight of sign to allow isolation of each ungrounded conductor in accordance with National Electrical Code.
- M. LED: Minimum features include the following:
  - 1. Outdoor Displays LED Panel Display Unit (Panasonic LNP175031S) 16X32 interchangeable modules
  - 2. Indoor Displays LED Panel Display Unit (Panasonic LNP175011S) 16X32 interchangeable modules
- N. LED Dot Size and Pitch: Dot dimension 5.0mm, Pitch 6.0mm
- O. VMS Display Size: 64 LEDs high X 192 LEDs wide (15.1" X 45.3")
- P. LED Brightness:
  - 1. Red: Typ. 600 cd/sq.m
  - 2. Green: Typ. 450 cd/sq.m
- Q. LED Wavelength:
  - 1. Red: Typ. 630 nm
  - 2. Green: Typ. 565 nm
- R. VMS Minimum Viewing Angle:
  - 1. Indoor: >45 degrees from the center viewing axis
  - 2. Outdoor: >30 degrees from the center viewing axis
- S. Ambient Light Adjust: Automatic dimming of LED's in darkened ambient light to prevent eyestrain on outdoor models.
- T. Internal Processor: CPU utilizing the Motorola MPC860 PowerPC PowerQUICC processor.
- U. Internal Memory: 4 megabyte.
- V. Display Capability: Programmable alphanumeric and graphic.
- W. Clock: Built-in time and day.
- X. VMS Speaker: One Pioneer 6" speaker mounted in the bottom of the sign projecting sound downward. The speaker and associated audio components should be mounted on a hinged assembly that can be accessed through the bottom of the enclosure.
- Y. Message Storage: Greater than 100 50-character messages.
- Z. VMS Standard Font Heights:
  - 1. Note that the ADA standard is a minimum of 3" for any sign mounted over 80" high.
    - a. There should be no display of transit information of less than 3" at any time.
      - 1) 1.60" 7 LED's high
      - 2) 1.85" 8 LED's high

- 3) 3.27" 14 LED's high
- 4) 3.78" 16 LED's high

- AA. VMS Fonts: Narrow, Bold, Wide, ADA compliant aspect ratios. VMS Background: Matte black.
- BB. VMS Weight: Approximately 325 lbs for double-sided signs.
- CC. Case Size: Approximately 50" X 23" X maximum thickness of 22".
- DD. VMS Display Face Plate: Polycarbonate, Lexan MR5, clear, anti-glare, 0.236" or equivalent.
- EE. Communications Interface: RS-485, full duplex, 2400-9600 baud.
- FF. Conformal Coating: Circuit boards conformal coated to MIL-I-46058C.
- GG. Addressability: Individual two byte address allows 255 displays with zone assignment allowed.
- HH. VMS Temperature Monitoring and Cooling: Fan cooled. Airflow sensor monitors the airflow through filters on fan, and notifies operator in the event of reduced airflow through air filters. Temperature sensor monitors overall temperature in case, and each is equipped with a bypass switch to allow for troubleshooting of a faulty sensor. Automatic shutoff in the event of high temperature. Operator in JGB notified through a screen error message.
- II. SCU Base Unit: Industrial computer chassis, ruggedized, 19" rack mount, filtered air, passive backplate, 8 slot, 3 ISA, 4 PCI, 1 shared.
- JJ. SCU Processor: Pentium III 750/100 FC-PGA.
- KK. SCU Floppy Disk Drive: 1.44 MB, 3.5" floppy drive.
- LL. SCU Operating System: Microsoft NT 4.0 on CD, factory installed.
- MM. SCU Memory: 128 MB SDRAM, 100 MHz.
- NN. SCU CD ROM: 48X CD ROM drive.
- OO. SCU Hard Drives: 10.2 GB hard drive, quantity 1.
- PP. SCU Sound Card: Soundwave PRO PCI 32 bit PCI.
- QQ. SCU Monitor Shelf: Dalco Electronics / Hubbell center weight shelf.
- RR. Modem Synchronous data rates up to 33.6 KBPS and asynchronous data rates up to 230.4 KBPS.
- SS. PIDS Plug-In Accessories Power Requirements: Emergency power, 120 V, 1 KVA in the communications room and 100 W, 120 V in the kiosk.
- TT. Platform VMS Electrical Power Service Requirement: A 2-pole, 480 V, 20 A circuit shall be provided from the nearest AC Switchboard Room's Fused Switch Emergency Panel and terminated in a NEMA 4X rated disconnect (safety) switch near where the VMS will be

located. The disconnect (safety) switch shall provide input power to a 5 KVA, single-phase, 480/240-120V transformer which will supply the 120-volt power to the platform VMS.

UU. Mezzanine VMS Electrical Power Service Requirement: A 120 V, 20 A circuit shall be provided from the nearest Emergency Panel to where the mezzanine VMS is located.

VV. Modem Power Requirements:

1. AC Power Supply Module
  - a. Voltage: 100/120/220/240 VAC nominal (switch-selectable)
  - b. Frequency: 50/60 Hz
2. DC Power Supply Module
  - a. Voltage: -48 VDC nominal

WW. Performance Requirements: VMS is capable of the following functions:

1. Sunlight Readability Due to the inconsistent rating of LED brightness by manufacturers, no minimum candella rating is specified. The outdoor displays should be readable in direct sunlight. A demonstration to the Authority will be required before full manufacturing approval.
2. VMS Message Storage - Each VMS shall have the ability to store a minimum of one hundred 50-character messages. The user shall be able to retrieve any stored message for display from local VMS storage using the VMS Server control software. The VMS shall have the capability of displaying and broadcasting emergency messages.
3. Fonts - An extensive font set shall be included with the VMS. All VMS fonts shall meet ADA requirements for signage. ADA Section 4.30.2 and 4.30.3 describe requirements for width-to-height ratio, stroke width-to-height ratio, and character height. Fonts shall include a robust character set containing all characters required to express messages in standard Spanish and English languages. The character sets include upper case, lower case, numerical digits, non-alphabetic and non-numeric special characters
4. VMS Self Diagnostics - Each VMS display shall be capable of self diagnosis and communicating its operational status to the VMS operator workstations. The VMS Server shall automatically request status from individual VMS displays. In addition to identifying errors, the status reports shall also serve as an independent and redundant means of verifying the message content of each VMS, allowing the effects of any spontaneous communication errors to be corrected. The proper execution of commands sent from the Station Manager's Kiosk, or from any workstation shall be verifiable, with the capability of dispatching service calls in the event of error messages. The VMS Server shall maintain a database which contains a description of each message within every VMS display. Through the status reporting, the VMS Server shall be in a position to query the entire system, compare the message content of each VMS with the control database, and automatically take corrective action if necessary. In the event that the sign lose communication with the server at JGB, the sign shall reboot automatically; if the failure persists, the sign shall stop displaying information (all LED's off).
5. VMS Environmental Design - The proposed VMS equipment shall be designed and manufactured to withstand a harsh transit environment including the effects of weather conditions on outdoor deployed equipment. Operating temperatures will be from -20 C to +50 C (-4 F to 122 F). All electronic components will be sealed using conformal coating. The VMS shall be designed to resist electromagnetic interference (EMI). VMS outdoor units shall be waterproof and sealed against particulate matter invasion such as steel and other metallic particulate matter typically found in a transit environment. The hardware will be modular and designed for ease of service. All VMS outdoor units shall be equipped with sunlight readable

LED's, and shall automatically adjust brightness based upon ambient lighting so not to hurt the readers' eyes in darkened conditions.

6. The LED matrix shall be composed of an array of replaceable LED modules. The VMS Unit shall use tri-color (Red, Amber, Green) LED Dot Matrix Display, with full text, and graphics capability, and housed in outdoor enclosure.

XX. Performance Requirements: SCU is capable of the following functions:

1. The SCU shall provide for data acquisition and control of the display and speaker VMS subsystems.
2. Network audio messages shall be in a standard format and shall be loaded to and stored in the SCU over the LAN communications network and output from the sound card to the Audio Interface Board. The Station Control Unit shall provide positive announcement verification and/or announcement failure indication locally and to OCC.
3. The SCU shall control the Carrier Transmission System modem and communications interface.
4. The SCU shall receive inputs from the Kiosk Control Panel for display of messages at the local station.
5. The SCU shall distribute control commands from the VMS Server to the VMS displays, and route VMS responses back to the Server.
6. The SCU shall provide SCU status reports back to the VMS Server, which collate the VMS status reports for the station.
7. Because of its open architecture, the SCU shall be suitable for expansion to additional inputs, outputs and system functions. For example, it can easily be adapted to read or generate switch closures, or to read or issue serial data.
8. The SCU shall have automatic reboot capability in the event of PIDS failure.
9. The SCU shall be equipped with a filter that has the capacity to remove from the filtered air stream particulate matter such as steel and other particulate matter typically found in a transit environment.

YY. Performance Requirements: KCP is capable of the following functions:

1. The KCP shall have 15 buttons that can be assigned messages by OCC, plus 1 message activation button.
2. Messages shall be created, stored and assigned by the system operator at the Operations Control Center, and activated by the Station Manager.
3. A single pushbutton reset for all PIDS signs at a station shall be provided from each SCU at the station.
4. The Station Manager shall not have the capability to generate original messages.

ZZ. Performance Requirements: Modem is capable of the following functions:

1. Synchronous and asynchronous communication in one unit, with two preset configurations for typical applications.
2. Automode with telephone-number linking and auto-redial.
3. Industry-standard error detection and data compression.
4. Automated software download and flash memory for easy upgrades.
5. V.54 diagnostic test suite.
6. LED displays that indicate modem activity.
7. Light bar displays (stand-alone modem only) that indicates line, data, and link-utilization rates.
8. Support for the Motorola 9000 Open Management System (OMS) Network Management System.
9. Support for secondary-channel modem management.
10. Support for a four-wire leased-line configuration, using Authority's in-house wiring.

11. Restoral: automatic rerouting of data traffic to the Public Switched Telephone Network (PSTN), over a two-wire dial line, for backup of critical leased-line applications when a leased line fails or signal quality deteriorates.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Installer Qualifications: An experienced installer who is an authorized representative of equipment manufacturer for both installation and maintenance of equipment required for this Section.
- B. The Contractor is to run the communications wiring and is also to install the associated modems from the server in the JGB B1 Computer Room through the CTS infrastructure to the Station COMM Room. The Contractor must provide connectivity from the sign back to the server. The Contractor must insure sufficient server capacity to handle the additional signs.
- C. Install transmission media where applicable without damaging conductors, shield, or jacket. Do not bend cable, in handling or installation, to smaller radii than minimum recommended by manufacturer.
- D. Pull cables without exceeding cable manufacturer's recommended pulling tensions.
  1. Use pulling compound or lubricant where necessary.
  2. Use pulling means that will not damage media or raceway.
- E. Install exposed cables parallel and perpendicular to surfaces or exposed structural members, and follow surface contours where possible.
- F. All below-ground conduits with communications cable installed should be checked for water infiltration. No cable shall be installed in conduits that are wet.
- G. Support cables according to Section 16130.
- H. All new conduits shall be properly tagged for power and communications. Power and communications cables should be in separate conduits.
- I. Make no splices except at indicated splice points. Use splice and tap connectors compatible with cable material.
- J. Seal around cables penetrating fire-rated elements according to Section 07841 "Firestopping".
- K. Bond shields and drain conductors to ground at only one point in each circuit.
- L. Connect components to wiring system and to ground.
- M. Match input and output impedances and signal levels at signal interfaces. Provide matching networks where required.
- N. Line Matching Transformer Connections: Make initial connections using tap settings indicated on Drawings.
- O. Identify cables according to Section 16120.

- P. Headroom Maintenance: If mounting heights or other location criteria are not indicated, arrange and install components and equipment to provide the maximum possible headroom. ADA requires a minimum mounting height of 80"; if less, barriers must be provided.
- Q. Equipment: Install to facilitate service, maintenance, and repair or replacement of components. Connect for ease of disconnecting, with minimum interference with other locations.
- R. Install equipment level and plumb and according to manufacturer's written instructions.
- S. Arrange equipment to provide adequate spacing for access and for circulation of cooling air.
- T. Weatherproof Equipment: Install units that are mounted in damp locations or are exposed to weather, consistent with requirements of weatherproof rating.

### **3.02 FIELD QUALITY CONTROL**

- A. Field Testing and Inspection:
  - 1. General:
    - a. Conduct field inspection and field testing at each station to ensure proper operation of PIDS equipment and devices provided.
    - b. Operation and protective-device setting: the Contractor is responsible for setting and calibration of protective devices for proper operation during field testing.
  - 2. Field inspection:
    - a. Prior to field testing, check equipment installation in accordance with manufacturer's recommendations.
  - 3. Field Testing:
    - a. Furnish equipment to perform tests.
    - b. Provide services of manufacturer's engineering representative and supporting field crew for a period not less than three man-days. Conduct tests in the presence of the Engineer. Perform tests in accordance with approved test procedure.
  - 4. All conductors (power and communication) shall be meggered and continuity-tested.
  - 5. Certify compliance with test parameters.
  - 6. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
- B. Demonstration: Engage a factory-authorized service representative to train Owner's operations and maintenance personnel to adjust, operate, and maintain systems.
  - 1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
  - 2. Train designated personnel in management and messaging operations.
  - 3. Review data in maintenance manuals.
  - 4. Schedule training with Owner, through Authority's Training Office.
- C. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installations, including connections. Report results in writing.

- D. Field-Testing Personnel:
  - 1. When more than one representative is involved, Contractor to ensure proper coordination.
  - 2. Provide engineering, technicians and journeymen personnel as necessary to set-up and implement testing.
  
- E. Authority Tests:
  - 1. The Authority reserves the right to require the Contractor to conduct acceptance tests on each VMS at each passenger station within one-year after installation.
  - 2. In order to perform VMS tests, the Contractor may re-create test conditions of applicable standards to the extent possible without disturbing existing structure or installed equipment or materials.
  
- F. Submit certified test reports.

**END OF SECTION**

**SECTION 16729**  
**INFORMATION DISPLAY SYSTEM**

**PART 1 – GENERAL**

**1.01 SUMMARY**

- A. This section describes the Passenger Information Display System (PIDS) and the Kiosk Information Display System (KIDS). The equipment consists of Variable Message Sign (VMS) displays and associated mounting equipment located throughout the station platform and entrance areas, one Protocol Converter (PC) and one DB.25 Male Terminal Block Converter located in the Station Communications Room. All software and hardware shall operate seamlessly with the existing PIDS and KIDS.
- B. Related Sections:
  - 1. Section 16060 – Grounding and Bonding
  - 2. Section 16120 – Wire, Cable and Busways
  - 3. Section 16130 – Raceways, Boxes and Cabinets
  - 4. Section 16260 – Uninterruptible Power System
  - 5. Section 16440 – Circuit Breakers, Panelboards and Load Centers
- C. Listing and labeling: Provide products specified in this section that are UL or ETL listed and labeled.
- D. Environmental Limitations: Rate equipment for continuous operation under the following conditions, unless otherwise indicated:
  - 1. Operating Temperature: 0 to 50 degrees Celsius.
  - 2. Storage Temperature: -20 to 70 degrees Celsius.
  - 3. Humidity Range: 5% to 90% RH, non-condensing.

**1.02 REFERENCES**

- A. Abbreviations and Acronyms:
  - 1. ADA: Americans with Disabilities Act.
  - 2. CPU: Central Processing Unit.
  - 3. EMI: Electromagnetic Interference.
  - 4. LAN: Local Area Network.
  - 5. LCD: Liquid Crystal Display
  - 6. LED: Light Emitting Diode.
  - 7. PA: Public Address.
  - 8. PC: Protocol Converter
  - 9. VMS: Variable Message Sign.

B. Reference Standards:

1. Codes and regulations of jurisdictional authorities.
2. Code of Federal Regulations, Title 47 Telecommunications, Part 15 – Radio Frequency Devices (47 CFR 15), Subparts A and B.
3. UL 50 – Enclosures for Electrical Equipment, Non-Environmental Considerations
4. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures
5. NEMA KS 1 - Heavy Duty Enclosed and Dead-Front Switches (600 Volts Maximum)
6. ITU-T and EIA/TIA. Recommendations
7. ADA Sections 4.30.2 and 4.30.3.
8. MIL-I-46058C, Insulating Compound, Electrical
9. Standard for Fixed Guideway Transit and Passenger Rail Systems (NFPA 130), 2014 Edition.

**1.03 QUALITY ASSURANCE**

A. Qualifications:

1. Manufacturers: Select a manufacturer who is engaged in production of similar Information Display products and accessories.
2. Suppliers: An authorized distributor of specified manufacturer with a minimum of three years documented experience.
3. Installers: A manufacturer authorized installer of specified products with service facilities within 100 miles of WMATA.
4. Testing Agencies:
5. Licensed Professionals:

B. Codes, Regulations, Reference Standards and Specifications, refer to Article 1.02 above.

C. Design and production tests: Perform and submit, in accordance with the General Requirements certified test results on the VMS or provide certified test results on an identical unit. Furnish certified test reports showing test data and results as well as manufacturer's comments on tests.

D. Interchangeability: Refer to Division 1 specifications of the Contract Documents. Furnish products of a manufacturer regularly engaged in the manufacture of display systems. In addition:

1. Standard commercial products shall be furnished whenever such equipment and materials will satisfy the stated specifications. Suitable modified standard commercial devices shall be furnished when required to satisfy specification requirements. Custom developed and fabricated equipment units and devices shall be confined to those items for which suitable commercial off-the-shelf (COTS) products are not available to guarantee compliance with the Specifications. When custom design, fabrication, or assembly is required, every effort shall be made to minimize the number of different modules, solid-state devices used.
2. With each system, subsystem and facility, two or more like functions shall be performed by identical units. In no case shall the equipment or hardware used in one portion of a system, subsystem or facility be different from that used in another portion to perform the same function under similar operating and environmental conditions (outdoor display systems are distinct from indoor display systems).

3. Equipment shall be physically and plug compatible with recent versions of existing WMATA equipment performing similar functions and used for comparable applications elsewhere in similar WMATA facilities insofar as possible. The use of adapter plugs, interface boxes, and replacement mounting brackets or enclosures that fit available space and mounting holes may be allowed by the subcontractor to maintain interchangeability when competitive products that do not require such devices are determined to be unavailable (applicable to COTS major equipment items only). Custom designed and fabricated equipment must be fully interchangeable without requiring the use of such devices. If a determination is made to allow use of such devices, all necessary adapters and interface devices shall be provided with each item of equipment furnished, at no additional cost.
  4. Equipment shall be software compatible with recent versions of existing WMATA equipment performing similar functions and used for comparable applications elsewhere in similar WMATA facilities.
  5. Major items of equipment furnished shall be within the physical size and configuration limitations specified in provisions of this Subcontract. If such specifications are not included in the provisions, major items of equipment shall be of a physical size and configuration closely comparable to equipment currently in use of comparable applications elsewhere in similar WMATA facilities.
  6. Exception: Lighter weight and smaller sized more modern versions of equipment are sought by the Contractor where their use presents significant advantages. The use of new generations of equipment that differ in size and are not fully interchangeable will be considered for approval, in order to take advantage of significant technological improvements developed by industry.
- E. Qualifications of Instructor for Operation and Maintenance Training: Perform operation and maintenance training in accordance with the Division1 specifications of the Contract Documents for development and performance of operation and maintenance training for PIDS. Qualifications will be considered adequate when the following is demonstrated:
1. Instructor has in-depth knowledge of the design, packaging, operations, maintenance and trouble-shooting of the systems to be taught.
  2. Instructor has been trained in teaching methods or has previous satisfactory experience in teaching with emphasis on the subject matter to be covered in the course of instruction.

#### **1.04 SUBMITTALS**

A. Product Data:

1. For each type of VMS. Include dimensions and manufacturers technical data on features, performance, electrical characteristics, ratings and finishes.
2. For each type of VMS. Include data on features and accessories for mounting VMS.

B. Shop Drawings:

1. Dimensioned plans, elevations, sections and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features and ratings. Include enclosure type and detail, nameplate legend; short-circuit current rating of integrated unit.
2. Wiring Diagrams: Power, signal, and control wiring. Differentiate between manufacturer installed and field installed wiring.

C. Certificates:

1. Dimensioned outline drawing of equipment unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
  2. Detailed description of anchorage devices on which the certification is based and their installation requirements.
- D. Documentation:
1. Submit field test plan and documentation within 90 days prior to testing with accompanying documentation in the form of test-data recording sheets and list of proposed test equipment.
  2. Do not proceed with testing until plan and documentation are approved.
  3. Indicate in scope of test plan method of testing in order to ensure safe and orderly transition from installation, through initial energizing, to specified field testing.
  4. Accompanying documentation to include data-recording sheets as used by manufacturer for in-plant testing of equipment and devices.
  5. Submit certified copies of test data, dated and clearly identified within two (2) weeks after completion of testing. Testing shall be witnessed by owner representatives.
- E. Field Test Reports:
1. Test procedures used
  2. Test results that comply with requirements.
  3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.
- F. Operations and Maintenance (O&M) Manuals:
1. Include in manuals general theory of operation of the PIDS including description, purpose and function of VMS.
  2. Describe and include in manuals procedures for:
    - a. PIDS testing
    - b. Operational checks for PIDS
    - c. Troubleshooting to include test procedures and system logic in identifying malfunctions.\
    - d. Preventive maintenance inspection
    - e. Maintenance actions to be performed by the Subcontractor
    - f. Maintenance actions to be performed by OWNER
  3. Include in manual the Shop Drawings listed in B above. Print shop drawings on folded pages in accordance with the General Requirements.
  4. As-Built Drawings in CD format; refer to General Requirements 01331.
  5. Maintenance training certificates.
- G. Manufacturer's factory-authorized service representatives' inspectors reports.

## **1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Temporary Bracing: Where necessary, brace each unit for hoisting, lowering and sliding into position. Temporary bracing of the equipment labeled as follows: TEMPORARY – REMOVE BEFORE OPERATION.
- C. Protection against Concealed Damage: Include within shipping container; mechanical impact recorder of rating recommended by the manufacturer for shipment by railroad and submit in accordance with the General Requirements impact chart with manufacturer's recommendations for disposition of damaged materials.
- D. Store equipment in secure and dry storage facility

## **PART 2 – PRODUCTS**

### **2.01 PASSENGER INFORMATION DISPLAYS (PIDS)**

- A. New Products: GDS Model No. G4600106
- B. VMS General Description: Four-line, tri-color (Red, Green, Blue) Display, with full text, and graphics capability, outdoor enclosure.
- C. Equipment: Modular type, using solid-state components, fully rated for continuous duty, unless otherwise indicated.
- D. Waterproof Equipment: Listed and labeled for duty outdoors or in damp locations.
- E. VMS Finishes:
  - 1. Paint Finish: VMS painted Metro Benjamin Moore, Stonington Gray, #Hc-170, as required.
  - 2. Metallic Finish: All metallic housing components and fasteners shall be corrosion resistant.
- F. LCD Display Specifications
  - 1. Product: GDS Model No. G4600106
  - 2. Display Colors: 16.7 Million Colors (Maximum)
  - 3. Viewing Angle: 176° (H) 178° (V) with CR ≥ 10
  - 4. Active Display Area: 46"
  - 5. Resolution: 1920 x 1080
  - 6. Pixel Pitch:
  - 7. Contrast Ratio: 4000:1
  - 8. Brightness: 1500 cd/m<sup>2</sup>
  - 9. Backlight: LED
  - 10. Video: VGA, DVI-D, HDMI
  - 11. Power Consumption: 300W
  - 12. Electrical: 85 to 264 VAC, 47-63 Hz

13. Luminance (nits typ): 850 nits
  14. Operating Temperature:
    - a. Maximum: +50°C (+122°F)
    - b. Minimum: -30°C (-22°F)
  15. Life Expectancy: 87,600 hours
  16. Lines of text (Maximum): 4
  17. Character Height: 3.3 inches
  18. Characters per line:
    - a. 20-24 single high characters
    - b. 17 double high characters
  19. Enclosure Dimensions: 27.83"H X 46.85" W X 8.66"D (Single-sided)
  20. Weight: 110lbs
- G. VMS Housing: Case material shall be Aluminum.
- H. VMS Service Access: Each PIDS shall be mounted far enough from the platform edge so as not to foul train movement when being serviced. All internal electronics and components shall be accessible through bottom.
- I. Each enclosure shall be equipped with a keyed power switch that is capable of rebooting power to the backplate(s). The switch shall be made accessible through the bottom of the enclosure.
- J. Each VMS shall have an electrical disconnect provided within line of sight of sign to allow isolation of each ungrounded conductor in accordance with National Electrical Code.
- K. Display Capability: Programmable alphanumeric and graphic.
- L. Clock: Built-in time and day
- M. Message Storage: Greater than 100 50-character messages
- N. Message Storage: VMS Standard Font Heights:
  1. Note that the ADA standard is a minimum of 3" for any sign mounted over 80-inch high. All transit information displayed shall be a minimum of 3 inches.
- O. VMS Fonts: Narrow, Bold, Wide, ADA compliant aspect ratios. VMS Background: Matte black.
- P. Conformal Coating: Circuit boards conformal coated to MIL-I-46058C.
- Q. Addressability: Individual two-byte address allows 255 displays with zone assignment allowed.
- R. VMS Temperature Monitoring and Cooling Temperature sensor will read internal temperature and report the temperature to the server when polled. Over temp thermostat will disable power to the sign should the temperature go past a pre-set limit of about 140 degrees F. When power is cut off, the sign will appear to the server as being disabled since all communications will be severed with power loss to the display.
- S. Integrated 10/100 BaseT TCP/IP Ethernet Communications support.

- T. PIDS Plug-In Accessories Power Requirements: Emergency power, 120 V, 1 KVA in the communications room.
- U. Platform VMS Electrical Power Service Requirement: A 1-pole, 120 V, 20 A circuit shall be provided from the Communications Room and terminated in a NEMA 4X rated disconnect (safety) switch near where the VMS will be located. The disconnect (safety) switch shall provide input power to the platform VMS.
- V. Mezzanine VMS Electrical Power Service Requirement: A 120 V, 20 A circuit shall be provided from the nearest Emergency Panel to where the mezzanine VMS is located.
- W. Performance Requirements: VMS shall be capable of the following functions:
  1. VMS Message Storage - Each VMS shall have the ability to store a minimum of one hundred 50-character messages. The user shall be able to retrieve any stored message for display from local VMS storage using the VMS Server control software. The VMS shall have the capability of displaying and broadcasting emergency messages.
  2. Fonts - An extensive font set shall be included with the VMS. All VMS fonts shall meet ADA requirements for signage. ADA Section 4.30.2 and 4.30.3 describe requirements for width-to-height ratio, stroke width-to-height ratio, and character height. Fonts shall include a robust character set containing all characters required to express messages in standard Spanish and English languages. The character sets include upper case, lower case, numerical digits, non-alphabetic and non-numeric special characters
  3. VMS Self Diagnostics - Each display may be polled by the server to retrieve the status of each sign. See Appendix A at the end of this document to review the information sent to the server when the display is polled. When messages are sent to the display an 'ACK' is sent back acknowledging the received message was valid and complete. If a message was corrupted or fragmented, the display will send back a 'NAK' for message not received. This will also serve as verification to the overall health of the display. A timer can be set in the sign so that after a pre-determined period of time, if the display does not receive ANY message or command, the display will then reset itself, or go 'blank' until it receives a new message or command. VMS Environmental Design - The proposed VMS equipment shall be designed and manufactured to withstand a harsh transit environment including the effects of weather conditions on outdoor deployed equipment. Operating temperatures will be from -20 degrees Celsius to +50 degrees Celsius (-4 degrees Fahrenheit to 122 degrees Fahrenheit). All electronic components will be sealed using conformal coating. The VMS shall be designed to resist electromagnetic interference (EMI). VMS outdoor units shall be waterproof and sealed against particulate matter invasion such as steel and other metallic particulate matter typically found in a transit environment. The hardware will be modular and designed for ease of service.

## **2.02 KIOSK INFORMATION DISPLAY SYSTEM (KIDS)**

- A. New Products: Ciil Model No. CL-47PLC68
- B. VMS General Description: Four-line, tri-color (Red, Green, Blue) Display, with full text, and graphics capability.
- C. Equipment: Modular type, using solid-state components, fully rated for continuous duty, unless otherwise indicated.
- D. Waterproof Equipment: Listed and labeled for duty outdoors or in damp locations.
- E. VMS Finishes:
  1. Paint Finish: VMS painted Metro Benjamin Moore, Stonington Gray, #Hc-170, as required.
  2. Metallic Finish: All metallic housing components and fasteners shall be corrosion resistant.

F. LCD Display Specifications

1. Product: Ciil Model No. CL-47PLC68
2. Display Colors: 16.7 Million Colors (Maximum)
3. Viewing Angle: 178° vertical/horizontal
4. Active Display Area: 47"
5. Resolution: 1920 x 1080
6. Contrast Ratio: 1000:1
7. Aspect Ratio: 16:9
8. Brightness: 700 cd/m<sup>2</sup>
9. Backlight: LED
10. Video: VGA, DVI-D, HDMI, S-Video, RCA
11. Power Consumption: 235W
12. Safety: UL/FCC Class B
13. Operating Temperature:
  - a. Maximum: +60°C (+140°F)
  - b. Minimum: -40°C (-40°F)
14. Life Expectancy: 87,600 hours
15. Lines of text (Maximum): 4
16. Character Height: 3.3 inches
17. Characters per line:
  - a. 20-24 single high characters
  - b. 17 double high characters
18. Weight: 110lbs

G. Display Capability: Programmable alphanumeric and graphic.

H. Clock: Built-in time and day

I. Message Storage: Greater than 100 50-character messages

J. Message Storage: VMS Standard Font Heights:

1. Note that the ADA standard is a minimum of 3" for any sign mounted over 80-inch high. All transit information displayed shall be a minimum of 3 inches.

K. VMS Fonts: Narrow, Bold, Wide, ADA compliant aspect ratios. VMS Background: Matte black.

L. Conformal Coating: Circuit boards conformal coated to MIL-I-46058C.

M. Addressability: Individual two-byte address allows 255 displays with zone assignment allowed.

- N. Integrated 10/100 BaseT TCP/IP Ethernet Communications support.
- O. KIDS Plug-In Accessories Power Requirements: Emergency power, 120 V, 1 KVA in the Kiosk.
- P. Kiosk Electrical Power Service Requirement: A 120 V, 20 A circuit shall be provided from the Kiosk or nearest Emergency Panel.
- Q. Performance Requirements: VMS shall be capable of the following functions:
  1. VMS Message Storage - Each VMS shall have the ability to store a minimum of one hundred 50-character messages. The user shall be able to retrieve any stored message for display from local VMS storage using the VMS Server control software. The VMS shall have the capability of displaying and broadcasting emergency messages.
  2. Fonts - An extensive font set shall be included with the VMS. All VMS fonts shall meet ADA requirements for signage. ADA Section 4.30.2 and 4.30.3 describe requirements for width-to-height ratio, stroke width-to-height ratio, and character height. Fonts shall include a robust character set containing all characters required to express messages in standard Spanish and English languages. The character sets include upper case, lower case, numerical digits, non-alphabetic and non-numeric special characters

VMS Self Diagnostics - Each display may be polled by the server to retrieve the status of each sign. See Appendix A at the end of this document to review the information sent to the server when the display is polled. When messages are sent to the display an 'ACK' is sent back acknowledging the received message was valid and complete. If a message was corrupted or fragmented, the display will send back a 'NAK' for message not received. This will also serve as verification to the overall health of the display. A timer can be set in the sign so that after a pre-determined period of time, if the display does not receive ANY message or command, the display will then reset itself, or go 'blank' until it receives a new message or command. VMS Environmental Design - The proposed VMS equipment shall be designed and manufactured to withstand a harsh transit environment including the effects of weather conditions on outdoor deployed equipment. Operating temperatures will be from -20 degrees Celsius to +50 degrees Celsius (-4 degrees Fahrenheit to 122 degrees Fahrenheit). All electronic components will be sealed using conformal coating. The VMS shall be designed to resist electromagnetic interference (EMI). VMS outdoor units shall be waterproof and sealed against particulate matter invasion such as steel and other metallic particulate matter typically found in a transit environment. The hardware will be modular and designed for ease of service.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Installer Qualifications: An experienced installer who is an authorized representative of equipment manufacturer for both installation and maintenance of equipment required for this section.
- B. The Contractor is to run the communications wiring and conduit in accordance with the WMATA Design Criteria.
- C. Install transmission media where applicable without damaging conductors, shield, or jacket. Do not bend cable, in handling or installation, to smaller radii than minimum recommended by manufacturer.
- D. Identify cables according to Section 16120.
- E. Headroom Maintenance: If mounting heights or other location criteria are not indicated, arrange and install components and equipment to provide the maximum possible headroom. ADA requires a minimum mounting height of 80"; if less, barriers must be provided.
- F. Equipment: Install to facilitate service, maintenance, and repair or replacement of components. Connect for ease of disconnecting, with minimum interference with other locations.

- G. Install equipment level and plumb and according to manufacturer's written instructions.
- H. Arrange equipment to provide adequate spacing for access and for circulation of cooling air.

### **3.02 FIELD QUALITY CONTROL**

#### **A. Field Testing and Inspection:**

##### **1. General:**

- a. Conduct field inspection and field testing at each station to ensure proper operation of PIDS equipment and devices provided.
- b. Operation and protective-device setting: the Contractor is responsible for setting and calibration of protective devices for proper operation during field testing.

##### **2. Field Inspection:**

- a. Prior to field testing, check equipment installation in accordance with manufacturer's recommendations.

##### **3. Field Testing:**

- a. Furnish equipment to perform test.
- b. Provide services of manufacturer's engineering representative and supporting field crew for a period not less than three man-days. Conduct tests in the presence of the Engineer. Perform tests in accordance with approved test procedure.

##### **4. All conductors (power and communication) shall be meggered and continuity tested.**

##### **5. Certify compliance with test parameters.**

##### **6. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.**

#### **B. Demonstration: Engage a factory-authorized service representative to train Owner's operations and maintenance personnel to adjust, operate, and maintain systems.**

- 1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
- 2. Train designated personnel in management and messaging operations.
- 3. Review data in maintenance manuals.
- 4. Schedule training with Owner, through Authority's Training Office.

#### **C. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installations, including connections. Report results in writing.**

#### **D. Field-Testing Personnel:**

- 1. When more than one representative is involved, the Contractor shall ensure proper coordination.
- 2. Provide engineering, technicians and journeymen personnel as necessary to set-up and implement testing.

E. Authority Tests:

1. The Authority reserves the right to require the Contractor to conduct acceptance tests on each VMS at each passenger station within one-year after installation.
  2. In order to perform VMS tests, the Contractor may re-create test conditions of applicable standards to the extent possible without disturbing existing structure or installed equipment or materials.
- F. Submit certified test reports.

**END OF SECTION**

## SECTION 16731

### COMMUNICATIONS - FIRE AND INTRUSION ALARM SYSTEM

#### PART 1 -GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The purpose of the Fire and Intrusion Alarm (FIA) System is to provide alarm warnings to assist Washington Metropolitan Area Transit Authority (WMATA) employees in protecting the public, employees, and property. Fire Detectors and Intrusion Detectors are located in passenger stations and associated ancillary buildings. The FIA System is monitored at each passenger station by the station manager. Fire and Intrusion Alarms report to monitoring equipment located in the WMATA Rail Operations Control Center (OCC) via the Data Transmission System (DTS). The Fire and Intrusion Alarm System described herein includes, but is not limited to, the following components:]
1. Common Control Unit.
  2. Kiosk FIA Liquid Crystal Display (LCD) Annunciator Panel
  3. Fire Detection System.
  4. Intrusion Detection System.
- B. The Common Control Unit located in the station Communications Equipment Room contains all the logic and circuitry required to supervise and control the Fire and Intrusion Detectors. Fire Detectors and Intrusion Detectors are grouped into zones. Fire Zones and Intrusion Zones are independent of each other. Fire Zones and Intrusion Zones are connected to the Common Control Unit. The Common Control Unit contains trouble circuitry powered from a dedicated power source that electrically supervises all zone circuit wiring for a "Short" or an "Open." The Common Control Unit performs the following functions:
1. Provides Alarm detection of each zone.
  2. Provides Trouble detection of each zone
  3. Provides audible and visual "Trouble" and "Alarm" indications at the kiosk FIA LCD Annunciator Panel.
  4. Provides common system controls to the kiosk FIA LCD Annunciator Panel.
  5. Provides contact closures to the Data Transmission System (DTS) to indicate "Alarm" conditions.
  6. Provide contact closures to indicate "Trouble" conditions.
  7. Provide special interfacing between the FIA System and the following systems and equipment:
    - a. Automatic Fare Collection (AFC) System.
    - b. Automatic Public Address Announcement System (APAAS).
    - c. Escalators and elevators.
    - d. Fan shut-down controls to selected rooms/areas within the passenger station.
    - e. Audible/visual fire alarms.
  8. Provides electrical power for the Fire and Intrusion Zone circuits.
- C. The Common Control Unit is modular in construction to provide for ease of maintenance and expansion. The following types of modules are used in a typical passenger station FIA System:
1. Zone Modules - Contain circuitry to recognize and accept alarms, and to provide supervision of detector circuits. Zone Module outputs shall be sent to the Control Module(s) or used directly.

2. Control Modules - Contain the circuitry and logic to generate all necessary interface signals, accept and generate kiosk FIA LCD Annunciator signals, and send Zone Module outputs to their proper destinations.
  3. Power Supply Modules - Provide primary and backup power, and supervision for the Fire and Intrusion Alarm System.
- D. The Common Control Unit shall be designed to operate with "smart sensors" (sensors which transmit a digital data message to the Common Control Unit when triggered).
- E. A kiosk FIA LCD Annunciator Panel shall be located in each passenger station kiosk, and shall contain a multi-line LCD display capable of displaying text messages. The FIA annunciator panel must be mountable "horizontally" in the standard 5" x 19" space provided in the kiosk cabinetry. The LCD Annunciator Panel shall provide the following features:
1. Alarm, Supervisory, and Trouble conditions shall be indicated on the multi-line display and by a tone-alert.
  2. Each reported condition shall allow a push-button to silence the tone-alert, but retain the display text until the reported condition is returned to normal.
  3. System display shall indicate alarm status, identification of "smart" alarm, type of alarm, number of alarms, supervisory conditions, and system troubles.
- F. Fire Detectors are located in the passenger stations, in ancillary buildings located within the passenger station limits, and in ancillary buildings located along the right-of-way. Limited use of Ionization Detectors are permitted in the arrangement. All Fire Detectors shall contain "smart" circuitry that transmits a programmable data message to the Common Control Unit when alarmed. All fire detector Zone Alarms and Trouble Indications report directly to the Common Control Unit, which displays the alarms on the kiosk FIA LCD Annunciator Panel. The Fire Detection System provides controls to and/or interfaces with the following systems and equipment:
1. Ventilation Fans.
  2. Wet Fire Suppression System.
  3. Fare Gates.
  4. Elevators and Escalators.
  5. Manual Pull Stations.
  6. Data Transmission System (DTS).
  7. Automatic Public Address Announcement System (APAAS).
  8. Automatic Fare Collection (AFC).
- G. Combination Detectors (Rate-of-Rise and Fixed Temperature) shall be used to monitor room and area ambient temperature and temperature change to include elevator hoistways. Fixed Temperature Detectors shall be used to monitor room and area temperature. Combustion Product (Ionization) Detectors shall be used to detect the presence of smoke. Duct Detectors shall be used to detect the presence of smoke in ventilation duct work. Both Combination Detectors and Fixed Temperature Detectors shall be used in AC Switchboard Rooms.
- H. The Fire Detection System shall provide for ventilation fan shutdown when triggered by a Fire Alarm. Selected ventilation fans within the passenger station are remotely controlled by the Common Control Unit. Upon receipt of a Fire Alarm associated with an area being serviced by a ventilation fan, the Common Control Unit shall provide an "open" in the control circuit to a relay located in the Fire Alarm/Fan Interface Box (FA/FIB) of that particular area, thereby disabling the fan. Solid-state control relays are provided for each fan motor control circuit in the FA/FIB. A separate control relay circuit is provided from the Common Control Unit to each solid-state control relay in the FA/FIB.

- I. There are two basic configurations employed for local fan shutdown; One for control by Combination Detectors and one for control by Ionization Detectors:
  - 1. Combination Detectors - When the detector triggers an alarm, its ancillary contacts close. The contacts are wired to the associated normally de-energized control relay(s) in the FA/FIB. The contact closure from the detector(s) energizes the control relay(s), thereby opening the fan motor control circuit(s).
  - 2. Ionization Detectors - When the detector triggers an alarm, its ancillary contacts open. The contacts are wired to the associated normally-energized control relay(s) in the FA/FIB. The "open" contacts from the detector(s) de-energize the control relay(s), thereby opening the fan motor control circuits.
  
- J. The Wet Fire Suppression (Sprinkler) System is monitored by the Common Control Unit and displayed on the kiosk FIA LCD Annunciator Panel. Tamper switches detect any movement of the fire main manual shut-off valves and provide a "Trouble" condition in the Fire Zone associated with that Sprinkler System. Upon activation of the sprinkler system, a flow valve detector provides a contact closure, thereby creating an "Alarm" condition in the Fire Zone associated with that sprinkler system.
  
- K. A Fire Alarm associated with a passenger station room or an ancillary building within the passenger station limits (except Tie Breaker Stations and Traction Power Substations) shall cause an output from the Common Control Unit to open the Fare Gates. After a preset period of time, the Common Control Unit shall stop the entering escalators in the passenger station. Alarms from remote ancillary buildings along the right-of-way shall not affect the fare collection equipment or escalators in the passenger station.
  
- L. Upon detection of smoke within an Elevator Machine Room, all elevators associated with the Elevator Machine Room shall immediately return to a designated level. The elevator(s) shall remain at this designated level and elevator cab controls (except for emergency controls) are rendered inoperative as long as smoke is detected within the associated Elevator Machine Room.
  
- M. Manual Pull Stations with local audible/ visual alarms (typically a horn/strobe-light) shall be located in hallways connecting passenger station service rooms to the public areas. Activation of a Manual Pull Station shall cause a Fire Alarm in the Fire Zone associated with the hallway and energize the local audible/visual alarm. The audible/visual alarm is energized only by activation of a Manual Pull Station.
  
- N. A contact closure in the Common Control Unit shall provide a single alarm output (contact closure) to the DTS for the following Fire Alarms:
  - 1. Each Ancillary Structure.
  - 2. A Station Fire Alarm.
  - 3. Each Tie Breaker Station.
  - 4. Each Traction Power Substation.
  - 5. Each Elevator Machine Room.
  
- O. The Fire and Intrusion Alarm System/Automatic Public Address Announcement System (FIA/APAAS) interface shall be accomplished as follows:
  - 1. Upon detection of a Fire Alarm within the passenger station limits (except Tie Breaker Stations and Traction Power Substations), the Automatic Public Address Announcement System shall be activated after a predetermined time delay during which a "Reset" circuit shall attempt (3 times) to reset. . A "Reset" circuit shall be provided that will permit the Automatic Public Address Announcement System to reset the FIA Common Control Unit. Alarms from remote ancillary buildings along

the right-of-way shall not activate the Automatic Public Address Announcement System.

- P. Fire Zones are assigned in accordance with the following criteria:
1. No Fire Zone shall contain more than 10,000 square feet. The 10,000 square feet zone shall be contiguous.
  2. No Fire Zone shall contain more than four rooms plus a connecting passageway.
  3. No Fire Zone shall contain more than ten Ionization Detectors.
  4. A separate Fire Zone shall be assigned to each remote ancillary building along the main line, unless otherwise specified.
  5. The maximum distance between any two points of a Fire Zone shall not exceed 300 feet.
  6. Each Tie Breaker Station shall be assigned a separate Fire Zone.
  7. Each Traction Power Substation shall be assigned a separate Fire Zone.
  8. Each Elevator Machine Room shall be assigned a separate Fire Zone.
- Q. Intrusion Detectors shall be located in the passenger station rooms and equipment areas, ancillary buildings within the passenger station limits and ancillary buildings or outside areas located along the right-of-way that are accessible to the public. All Intrusion Detectors shall contain "smart" circuitry that transmits a programmable data message to the Common Control Unit when alarmed. Intrusion Detectors shall provide alarms upon unauthorized entry for each of the following conditions:
1. A broken or opened window connected to a public or outside area.
  2. A broken or opened air duct cover, louver or grating connected to a public or outside area, if the shortest side is greater than six inches.
  3. A protected door when opened.
- R. The following types of Intrusion Detectors are used:
1. Trip Wire - Provided across louver openings. When the wire is broken or disturbed, a relay associated with the wire shall place +24 Vdc on the "Alarm" lead.
  2. Magnetic Switch - Used on grates and doors to detect when they are opened. Each magnetic switch shall be weather tight or installed in a weather tight enclosure.
- S. Doors leading from an outside or public area into a protected zone, including roll-up doors, are furnished with additional features. At these locations, a key-operated access control switch, a non-locking pushbutton switch, and a magnetic switch are provided. Roll-up doors are equipped with only a key-operated access control switch and a magnetic switch.
- T. The Fare Collection System, furnished, installed and wired to the Kiosk by others, will be equipped with Intrusion Detectors. These Intrusion Detectors shall be combined so that there is one Fare Collection Intrusion Zone for the Kiosk. The Contractor shall interface the Intrusion Detection System with the Fare Collection Intrusion Detector circuit at the Kiosk.
- U. Intrusion Detectors will be provided by others in entrance elevators. One Intrusion Zone shall be allocated for each entrance elevator. The Contractor shall interface with the Intrusion Detectors via the junction box provided by others in the Elevator Machine Room(s).
- V. A contact closure in the Common Control Unit provides a single alarm output (contact closure) to the DTS for the following intrusion alarms
1. Automatic Fare Collection Equipment and Revenue Cart Storage Areas.
  2. Each Ancillary Structure.
  3. A Station Intrusion Alarm.
  4. Each Tie Breaker Station.

5. Each Traction Power Substation.
- W. The "tamper proof" intrusion detectors to be furnished are arranged so that a single alarm indication is given for each zone encompassing a number of rooms directly accessible to each other and, as a group, accessible from a public or outside area. A single alarm is given for a single room only if it is directly accessible from a public or outside area and is not directly connected to other rooms. Although the Intrusion Zones need not match the coverage of the Fire Protection Zones in detail (due to criteria differences), the general areas of coverage are matched where practical. The number of Intrusion Zones for each FIA System varies with the passenger station configuration and number of ancillary buildings. Intrusion Zones are assigned in accordance with the following criteria:
1. A separate zone to be assigned to each street-level entrance elevator doors.
  2. A separate zone to be assigned to the fare collection equipment for each station.
  3. A separate zone to be assigned for protected doors to areas containing multiple rooms.
  4. A separate zone to be assigned to each remote ancillary building along the right-of-way.
  5. A separate zone to be assigned for each Tie Breaker Station.
  6. A separate zone to be assigned for each Traction Power Substation.
  7. No zone may contain more than 10,000 square feet. Zone areas are contiguous.
- X. The Fire and Intrusion Alarm (FIA) System is to provide an immediate alarm indication on the kiosk FIA LCD Annunciator Panel upon the activation of any Fire and/or Intrusion Detector, flow valves and tamper switches.
- Y. The audible alarm signal and an LED are activated upon receipt of a Detector Alarm. Depressing the "Alarm Acknowledge" pushbutton shall silence the audible signal. The LED light shall extinguish after the Fire Detector initiating the alarm has been attended, repaired or replaced, or the Intrusion Detector initiating the alarm has been returned to its original state. Depressing the "Alarm Acknowledge" pushbutton in response to an alarm in any zone shall not inhibit the audible alarm signal from being activated upon receipt of a detector alarm in subsequent zones.
- Z. A Manual Fire Alarm Pushbutton and the Manual Intrusion Alarm Pushbutton shall be installed in the Kiosk to provide the Station Manager with the means to manually activate either a Fire Alarm or an Intrusion Alarm in the FIA zones associated with the Kiosk.
- AA. A wiring fault (trouble condition) affecting circuit operation shall cause an audible and visual trouble indication at the Kiosk FIA LCD Annunciator Panel and shall cause a "Trouble" signal (contact closure) to be activated. A trouble condition shall not activate FIA System zone alarms. Additionally, the FIA System shall provide some alarm information (specified herein) to the Rail Operations Control Center (OCC) via the existing Data Transmission System (DTS). The operation of a pushbutton to acknowledge a trouble alarm shall silence the audible trouble signal, but the associated LED indicator shall remain on until the fault is corrected. Correcting the fault shall extinguish the associated LED.
- BB. Activation of a Manual Pull Station to be installed in a passenger station equipment room hallway shall cause an audible and visual indication at the Kiosk FIA LCD Annunciator Panel and shall also energize an audible/visual alarm to be installed in the hallway. The audible and visual indications on the Kiosk FIA LCD Annunciator Panel shall be similar to any other detected Fire Alarm.
- CC. Doors leading from a non-protected zone, within a station, to a protected zone shall operate as follows:

1. The magnetic switch shall detect the door opening.
  2. An authorized key-operated access control switch shall have two positions: "Secure" and "Access." Opening the door from an unprotected area with the switch in the "Secure" position shall cause an alarm. When the door is opened with the switch in the "Access" position, no alarm shall be given.
- DD. The key, which operates the key-operated switch, shall be removable after the door has been opened, but not with the switch remaining in the "Access" position. Removal of the key with the door open shall not cause an alarm nor shall any device have to be operated to prevent an alarm. The keys for all access control switches shall be master keys, which shall work in all existing Authority access control switches. When the authorized access control key switch is within the view of the general public, it shall be mounted and installed with all connecting conduit and wiring entering from the back concealed from view.
- EE. The non-locking pushbutton shall be located on the protected area side of the door and shall serve the same function from that side as the "Access" position of the access control switch. Releasing the pushbutton once the door is open shall not cause an alarm nor shall any device have to be operated to prevent an alarm. Closing of the door with the key-operated switch in the "Secure" position and the pushbutton not depressed shall automatically re-arm the alarm. Releasing the pushbutton when the door is closed and the key-operated switch is in the "Secure" position shall automatically re-arm the alarm. Securing the key-operated switch when the door is closed and the pushbutton is not depressed shall automatically re-arm the alarm.

#### **1.02 SECTION INCLUDES**

- A. Fire and Intrusion Alarm common control panel.
- B. Manual fire alarm stations.
- C. Smoke and heat detectors.
- D. Signaling devices.
- E. Kiosk Fire and Intrusion Alarm LCD Annunciator panel.

#### **1.03 RELATED SECTIONS**

- A. Section 08331 - Overhead Coiling Doors.
- B. Section 08710 - Finish Hardware.
- C. Section 13905 - Fire Protection, Suppression and Alarm.
- D. Section 14200 - Hydraulic Elevators.
- E. Section 14240 - Traction Elevators..
- F. Section 14300 - Heavy-Duty Escalator.
- G. Section 16120 - Wire, Cable and Busways.
- H. Section 16705 - Communications Standard Specifications - Equipment & Material.

- I. Section 16706 - Communications System Submittals & Services.
- J. Section 16707 - Communications Systems Quality Assurance & Testing.
- K. Section 16710 - Communications Grounding.
- L. Section 16715 - Communications Electrical Power Distribution.
- M. Section 16733 - Communications - Kiosk Systems.
- N. Section 16821 - Communications - Automatic Public Address Announcement System.
- O. Section 16925 - ATC - Data Transmission System

#### **1.04 REFERENCES**

- A. NFPA 130 - Standard for Fixed Guideway Transit Systems.
- B. UL 1076 - Proprietary Burglar Alarm Units and Systems

#### **1.05 SYSTEM DESCRIPTION**

- A. Fire and Intrusion Alarm System: A state-of-the-art “smart, addressable, software-programmable” Fire and Intrusion Alarm System shall be designed, installed, tested, and documented. The “smart addressable, software-programmable” system shall be designed to report detected events using data messages to the LCD Annunciator Panel via the Common Control Unit. Fire Detectors and Intrusion Detectors are to be installed in passenger stations and associated ancillary facilities. The FIA System shall be designed to be monitored at each passenger station by the station manager. Summary Fire and Intrusion Alarms shall also report to monitoring equipment located in the OCC via the DTS.
- B. Capacity:
  1. The Common Control Unit shall be equipped to supervise the number of alarm points needed to meet Specification coverage requirements and to allow the addition of at least 25% additional sensors without the addition of modules or other modifications.
  2. The kiosk LCD Annunciator Panel shall be equipped to allow the supervision of at least 25% additional alarm points without panel hardware modifications.
  3. The number of Fixed-Temperature Detectors shall be determined by the contractor using the coverage requirements detailed in this specification.
  4. The number of Combination Rate-of-Rise and Fixed-Temperature Detectors (Single-Pole) shall be determined by the contractor using the coverage requirements detailed in this specification.
  5. The number of Combination Rate-of-Rise and Fixed-Temperature Detectors (Double-Pole) shall be determined by the contractor using the coverage requirements detailed in this specification.
  6. The number of Ionization Detectors shall be determined by the contractor using the coverage requirements detailed in this specification.
  7. The number of Photoelectric Detectors shall be determined by the contractor using the coverage requirements detailed in this specification.
  8. The number of Duct Detectors shall be determined by the contractor using the coverage requirements detailed in this specification.

9. The number of Manual Pull Stations shall be determined by the contractor using the coverage requirements detailed in this specification.
10. The number of Audible/Visible Notification Appliances shall be determined by the contractor using the coverage requirements detailed in this specification.
11. The number of Fan Relays (Normally-closed Contracts) shall be determined by the contractor using the coverage requirements detailed in this specification.
12. The number of Magnetic Switches shall be determined by the contractor using the coverage requirements detailed in this specification.
13. The number of Limit Switches shall be determined by the contractor using the coverage requirements detailed in this specification.
14. The number of Pushbutton Switches shall be determined by the contractor using the coverage requirements detailed in this specification.
15. The number of Keyswitches (Access Control) shall be determined by the contractor using the coverage requirements detailed in this specification.
16. The FIA Distribution Frame shall be sized by the contractor using the coverage requirements detailed in this specification.
17. The number of Ancillary facility Protector/Terminal Enclosures shall be determined by the contractor using the coverage requirements detailed in this specification.

#### **1.06 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Provide LCD Annunciator layout and system wiring diagram showing each device and wiring connection required.
- C. Product Data: Provide electrical characteristics and connection requirements.
- D. Test Reports: Indicate satisfactory completion of required tests and inspections.
- E. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of products.

#### **1.07 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the products specified in this section with minimum three years documented experience, and with service facilities within 100 miles of Project.
- B. Installer: Company specializing in installing the products specified in this section with minimum three years documented experience, and certified as fire alarm installer in the State, or District of Columbia, where the equipment is being installed.

#### **1.08 REGULATORY REQUIREMENTS**

- A. Conform to requirements of NFPA 130
- B. Furnish products listed and classified by UL as suitable for purpose specified and indicated.

#### **1.09 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of fire alarm system until Final Completion.

## **1.10 EXTRA MATERIALS**

- A. Provide a spare manual station break-glass rod for each manual station being installed.
- B. Provide a spare key of each lock being installed.
- C. Provide one, or 20% (whichever is greater), additional (spare) detectors of each type of automatic smoke detector [without base].

## **PART 2 - PRODUCTS**

### **2.01 FIRE AND INTRUSION ALARM COMMON CONTROL PANEL**

- A. Manufacturer
  - 1. Simplex Model 4100(or approved equal).
- B. Control Panel: Modular construction with surface wall-mounted enclosure.
- C. Zone Capacity: 128 Zones minimum.
- D. Power supply: Adequate to serve control panel modules, remote detectors, remote LCD Annunciators, relays, and alarm signaling devices. Include battery-operated emergency power supply with capacity for operating system in standby mode for 12 hours followed by alarm mode for 10 minutes.
- E. System Supervision: Component or power supply failure places system in trouble mode.
- F. Initiating Device Circuits: Supervised zone module with alarm and trouble indication; occurrence of single ground or open condition places circuit in trouble mode but does not disable that circuit from initiating an alarm.
- G. Indicating Appliance Circuits: Supervised signal module, sufficient for signal devices connected to system; occurrence of single ground or open condition places circuit in trouble mode but does not disable that circuit from signaling an alarm.

### **2.02 INITIATING DEVICES**

- A. Manufacturer
  - 1. Simplex (or approved equal).
- B. Manual Station: Surface mounted, non-coded type, dual action manual station. Provide manufacturer's standard backbox.
- C. Spot Heat Detector: Fixed temperature, 135 degrees F (57 degrees C).
- D. Spot Heat Detector: Combination rate-of-rise and fixed temperature, rated 135 degrees F (57 degrees C), and temperature rate of rise of 15 degrees F (8.3 degrees C).
- E. Spot Heat Detector: Combination rate-of-rise and fixed temperature, rated 135 degrees F (57 degrees C), and temperature rate of rise of 15 degrees F (8.3 degrees C) with ancillary normally-open contact which closes when the detector is triggered (used to control ventilation fans).

- F. Ceiling Mounted Smoke Detector: NFPA 72E, ionization type with adjustable sensitivity, plug-in base. Provide two-wire detector with common power supply and signal circuits.
- G. Ceiling Mounted Smoke Detector: NFPA 72E, ionization type with adjustable sensitivity, plug-in base. Provide four-wire detector with separate power supply and signal circuits.
- H. Ceiling Mounted Smoke Detector: NFPA 72E, photoelectric type with adjustable sensitivity, plug-in base. Provide two-wire detector with common power supply and signal circuits.
- I. Duct Mounted Smoke Detector: NFPA 72E photoelectric type with auxiliary SPDT relay contact.

### **2.03 SIGNALING APPLIANCES**

- A. Manufacturer
  - 1. Simplex (or approved equal).
- B. Alarm Horn: NFPA 72G, surface type fire alarm horn. Sound Rating: 87 dB at 10 feet (3M). Provide integral strobe lamp and flasher .
- C. Kiosk LCD Annunciator Panel: Provide remote LCD Annunciator including audible and visual indication of fire and intrusion alarm by zone, and audible and visual indication of system trouble. Install in kiosk cabinet in designated space. The annunciator panel shall be one that is designed to operate exclusively with the Common Control Unit.

### **2.04 SOLID-STATE FAN RELAYS (NORMALLY-OPEN CONTACTS)**

- A. Manufacturer
  - 1. Teledyne Part No. SSR1200480D25 (or approved equal).
- B. Contact Configuration: Normally open.
- C. Output current rating: 25-amps.

### **2.05 FAN RELAYS (NORMALLY-CLOSED CONTACTS)**

- A. Manufacturer
  - 1. Teledyne Part No. S2840B5SSR (or approved equal).
- B. Contact Configuration: Normally closed.
- C. Output current rating: 25-amps.

### **2.06 WINDOW FOIL AND VARNISH**

- A. Window Foil Manufacturer
  - 1. Ademco Part No. RR-1000 (or approved equal).
- B. Varnish Manufacturer
  - 1. Ademco Part No. AB-177 (or approved equal).

### **2.07 TRIP WIRE**

- A. Manufacturer

1. Ademco Part No. CL-171000608 (or approved equal)
2. Ratings:
3. Gauge: 22AWG.
4. Insulation: 300 Volts.

**2.08 WINDOW FOIL/TRIP WIRE RELAY**

- A. Manufacturer
1. Stancore RBM Part No. 84D903 (or approved equal).

**2.09 MAGNETIC SWITCH**

- A. Manufacturer
1. Ademco Part No. 40-2SP (or approved equal).

**2.10 WEATHER-TIGHT ENCLOSURE**

- A. Manufacturer
1. Ademco Part No. 42 (or approved equal).

**2.11 LIMIT SWITCH**

- A. Manufacturer
1. Cutler-Hammer Part No. 10316H187 (or approved equal).

**2.12 PUSHBUTTON SWITCH (ACCESS CONTROL)**

- A. Manufacturer
1. Cutler-Hammer Part No. 10250T23B (or approved equal).

**2.13 KEYSWITCH (ACCESS CONTROL)**

- A. Manufacturer
1. Chicago Lock Co. Part No. 3039 (or approved equal).
  2. Keyed to WMATA Key Switch currently in operation: Key No. AMP- 585

**2.14 FIA DISTRIBUTION FRAME**

- A. Manufacturer
1. Reltec cabinet model Series BEPNP (or approved equal).

**2.15 TERMINALS**

- A. Manufacturer
1. Weidmuller, Model No. SAKR (or approved equal).
- B. Disconnect feature: Knife switch design, remains attached to terminal block body.
- C. Complete with test sockets, labeling, and all required terminal block mounting hardware and accessories.

**2.16 ANCILLARY FACILITY PROTECTOR/TERMINAL ENCLOSURES**

- A. Manufacturer
1. Hoffman Model CHNF (or approved equal).

- B. NEMA 4 complete with required terminals and protector blocks.

## **2.17 INTRA-BUILDING CONDUIT WIRING**

- A. Manufacturer
  - 1. Remece, Part No. 760186 (or approved equal).
- B. Number of conductors shall be determined by the Contractor based on interface requirement.
- C. Ratings:
  - 1. Type: Plenum Fire Alarm Cable.
  - 2. Gauge: 18 AWG Solid
  - 3. Insulation (non-PVC), plenum Polymer Alloy (75°C).
  - 4. Jacket: Non-PVC, Fluoropolymer Resin - Allied Chemical's Halar® (or approved equal) or Dupont's FEP Telfon® (or approved equal).
  - 5. Conforms to UL/NEC FPLP Subject 1424, NEC Article 760, and CSA FT6.

## **PART 3 - EXECUTION**

### **3.01 TEMPORARY FIRE AND INTRUSION ALARM DETECTION SYSTEM INSTALLATION (OPTIONAL)**

- A. Install the Temporary Fire and Intrusion Alarm Detection equipment if needed to protect the buildings and equipment during construction.
- B. The need for and timing for the installation of the temporary fire and intrusion alarm equipment shall be determined by the Engineer.

### **3.02 INSTALLATION**

- A. Install products in accordance with manufacturer's instructions.
- B. Install manual station with operating handle 4 feet 6 inches [1.4 M] above floor. Install audible and visual signal devices 7 feet 6 inches [2.3 M] above floor.
- C. Use 18 AWG minimum size conductors for fire alarm detection and signal circuit conductors. Install wiring in conduit.
- D. Mount end-of-line device box with last device or separate box adjacent to last device in circuit.
- E. Make conduit and wiring connections to door magnetic switches, keyswitches, and pushbutton switches.
- F. Make conduit and wiring connections to sprinkler flow switches, sprinkler valve tamper switches, duct smoke detectors and fan shutdown relays.
- G. Install conductors and appropriate zone wiring to interconnect the FIA System Common Control Unit to the intrusion circuit terminals for the Farecard Vending Machines on the Kiosk Cable Termination Rack.

- H. Provide and install the necessary wiring to interface the FIA Common Control Unit with the Fare Gate Control Panel. This interface shall cause the Fare Gates to be activated by the FIA System.
- I. Provide and install all necessary cables, wiring, relays, additional components, connections, and cross-connections needed to interface the FIA System to the Kiosk Escalator Control Panel. This interface shall allow the FIA System to control all escalators within the passenger station(s). Any relays installed to shut down escalators (in response to a Fire Alarm) shall be installed within the station Communications Equipment Room.
- J. Install conductors and appropriate zone wiring to interconnect the FIA System Common Control Unit to the terminal block in the Entrance Elevator Machine Room(s) where the Entrance Elevator Intrusion circuit is terminated. Provide and install all required junction boxes, terminal strips and cabling from the intrusion detector in the associated Elevator Machine Room(s) to the FIA Common Control Unit.
- K. Interface the ionization detector ancillary contacts to the elevator control equipment. This interface shall cause all elevators traveling more than 25 feet to return to a designated level upon activation of the ionization detector. This action shall override the elevator cab controls. (emergency controls shall not be effected.) Install within the Elevator Machine Room conduit, wires and cables, junction boxes, terminal strips, and any other mechanical and/or electronic equipment necessary to effect the interface described herein.

### **3.03 TEMPORARY FIRE AND INTRUSION ALARM DETECTION SYSTEM REMOVAL**

- A. If a Temporary Fire and Intrusion System is installed, the Contractor shall remove the Temporary System upon commissioning of the permanent system.

### **3.04 AUTOMATIC PUBLIC ADDRESS ANNOUNCEMENT SYSTEM INTERFACE**

- A. Provide and install all necessary cables, wiring, additional components, connections, and cross-connections needed to interface the FIA System to the Automatic Public Address Announcement System (APAAS), as described in Section 16821.

### **3.05 FIELD QUALITY CONTROL**

- A. Field inspection and testing will be performed under provisions of Section [16707.]
- B. Test in accordance with NFPA 72H and local fire department requirements.

### **3.06 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section [16707.]
- B. Include services of certified technician to supervise installation, adjustments, final connections, and system testing.

### **3.07 FIRE ALARM WIRE AND CABLE COLOR CODE**

- A. Provide fire alarm circuit conductors with insulation color coded as follows, or using colored tape at each conductor termination and in each junction box.
- B. Power Branch Circuit Conductors: Black, red, white.

- C. Initiating Device Circuit: Black, red.
- D. Detector Power Supply: Violet, brown.
- E. Signal Device Circuit: Blue (positive), white (negative).

### **3.08 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

### **3.09 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

### **3.10 SCHEDULES AND TABLES**

- A. The Contractor shall provide schedules and tables at each Design Review depicting how the Installation of the Fire and Intrusion Alarm systems will be integrated into the overall project schedule.

**END OF SECTION**

**SECTION 16732**  
**FIRE ALARM, DETECTION AND NOTIFICATION SYSTEM**

**PART 1 – GENERAL**

**1.01 SUMMARY**

- A. The work covered by this Section of the Specification shall include all labor, equipment, materials and services to furnish and install a complete fire alarm system.
1. Fire Alarm Control Panel.
  2. Remote Annunciator.
  3. Manual pull stations.
  4. Smoke detectors.
  5. Heat detectors.
  6. Fire Alarm System Interface Controls- Proprietary supervising station, magnetic door/card access release override, and air handling system.
  7. Notification appliances.
  8. Air handling systems shutdown control.
  9. Magnetic door holder release.
  10. Fire Suppression Supervision- Wet pipe, dry pipe, deluge valve, pre-action System, kitchen hood, clean agent and Halon system monitoring.
- B. Related Sections:
1. Section 08331 – Overhead Coiling Doors.
  2. Section 08710 – Finish Hardware.
  3. Section 13905 – Fire Protection, Suppression and Alarm.
  4. Section 14200 – Hydraulic Elevators.
  5. Section 14240 – Traction Elevators.
  6. Section 14300 – Heavy-Duty Escalator.
  7. Section 16120 – Wire, Cable and Busways.
  8. Section 16130 – Raceways, Boxes and Cabinets.
  9. Section 16705 – Communications Standard Specifications – Equipment & Material.
  10. Section 16706 – Communications Systems Submittals & Services.
  11. Section 16707 – Communications Systems Quality Assurance & Testing.
  12. Section 16710 – Communications Grounding. Section 16715 – Communications Electrical Power Distribution.
  13. Section 16733 – Communications – Kiosk Systems.

14. Section 16925 – ATC – Data Transmission System.

1.02 REFERENCES

- A. The system and all components shall be approved by insurance provider for use in fire protection systems and compliant with all insurance provider guidelines. If insurance provider approval is not available, insurance representatives must be consulted to ensure system is acceptable and components must at least be listed by Underwriters Laboratories, Inc. for use in fire protective signaling systems.
- B. The installation shall comply with:
  - 1. State and Local Building and Fire Codes.
  - 2. Americans with Disabilities Act (ADA).
  - 3. NFPA 70 – National Electrical Code.
  - 4. NFPA 72 – National Fire Alarm and Signaling Code.
  - 5. Local and State Authorities Having Jurisdiction.
  - 6. NFPA 130 - Standard for Fixed Guideway Transit and Passenger Rail Systems
  - 7. NFPA 70 - National Electrical Code
  - 8. NFPA 101 - Life Safety Code

1.03 SUBMITTALS

- A. Provide a list of all types of equipment and components provided. This shall be incorporated as part of a Table of Contents, which shall also indicate the manufacturer's part number, the description of the part, and the part number of the manufacturer's product data sheet on which the information can be found. See Division 1 for specific details about submissions.
- B. Provide a Sequence of Operation matrix. The sequence of operation shall be building specific, and shall provide individual sequences for every type of alarm, supervisory or trouble condition which may occur as part of normal or off-normal system use.
- C. Provide manufacturer's original printed product data, catalog cuts and description of any special installation procedures. Photocopied and/or illegible product data sheets shall not be acceptable. All product datasheets shall be highlighted or stamped with arrows to indicate the specific components being submitted for approval.
- D. Provide manufacturer's installation instruction manual for specified system.
- E. Provide samples of various items when requested.
- F. Provide copy of state License to perform such work.
- G. Provide copies of NICET Level IV Fire Alarm certifications for a minimum of two (2) technicians assigned to this project also responsible for Fire Alarm Control Panel (FACP) programming.
- H. Provide shop drawings as follows:
  - 1. Coversheet with project name, address and drawing index.
  - 2. General notes drawing with peripheral device back-box size information, part numbers, device mounting height information, and the names, addresses, point of contact, and telephone numbers of all contact project team members.

3. Building specific device riser diagram, which individually depicts all control panels, annunciators, addressable devices, and notification appliances. Include a specific, proposed point descriptor above each addressable device. Include a specific discrete point address that shall correspond to address depicted on the device layout floor plans. Drawing shall provide wire specifications, and wire tags shown on all conductors depicted on the riser diagram. All circuits shall have designations that shall correspond with those required on the control panel and floor plan drawings. End-of-line resistors (and values) shall be depicted.
  4. Control panel termination drawing(s). Include internal component placement and all internal and field termination points. Drawing shall provide a detail indicating where conduit penetrations shall be made, so as to avoid conflicts with internally mounted batteries. For each additional data gathering panel, a separate control panel drawing shall be provided, which clearly indicates the designation, service and location of the control enclosure. End-of-line resistors (and values) shall be depicted.
  5. Building specific device wiring diagram drawing(s) shall be provided which depict all system components, and their respective field wiring termination points. Wire type, gauge, and jacket shall also be indicated. When an addressable module is used in multiple configurations for monitoring or controlling various types of equipment, different device typical diagrams shall be provided. End-of-line resistors (and values) shall be depicted.
  6. See section 3.05 CLOSEOUT ACTIVITIES for other documents relating to this section.
- I. Battery calculations shall be provided on a per power supply/charger basis. These calculations shall clearly indicate
    1. The quantity of devices
    2. The device part numbers
    3. The supervisory current draw
    4. The alarm current draw
    5. Totals for all categories, and the calculated battery requirements (which reflect a 20% DEGRADE, for 24 hour supervisory, 5 minute alarm operation).
    6. Battery calculations shall also reflect all control panel components, remote annunciator, and auxiliary relay current draws.
  - J. Scale drawing sets shall be submitted along with the submittal book. These drawings shall be 22" x 34" and of a sufficient resolution to be completely legible when reduced to 11" x 17" size.
  - K. Written proof of proper disposal by the installing contractor shall be required prior to release of outstanding retainage.
  - L. Turnover of all software database hard/soft copies to WMATA prior to the end of the one (1) year warranty period (or period as amended earlier in this specification). This shall include all possible programming software logs, exported project files, hard copies of all device maps, the revision number of the version of programming utility used, and all required passwords. This information shall be provided to WMATA on a flash drive.

#### 1.04 QUALITY ASSURANCE

- A. Qualifications: Company specializing in installation of work in this Section with minimum of three years documented experience, approved by manufacturer.
- B. System Standards:
  1. NFPA 72.

2. CEC, Article 760.

C. Design criteria:

1. Comply with all system standards.
2. Meet all requirements of fire authorities having jurisdictions.
3. The Building Electronics contractor shall provide complete fire detection and alarm system design, wiring diagrams, interphase wiring diagrams, and operational details.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Protect equipment delivered and placed in storage from the weather, humidity and temperature variation, dirt, dust and any other contaminants.
- B. Project staging may be provided at stakeholders' convenience. A staging area is not guaranteed.

1.06 RELATED WORK

- A. The fire alarm and detection system provides controls to and/or interfaces with the following systems and equipment:
  1. Ventilation fans.
  2. Fire suppression systems.
  3. Elevators and escalators.
  4. Data Transmission Systems (DTS).
  5. Automatic Fare Collection (AFC).
  6. Automatic public address.
  7. Fire standpipe systems.
  8. Clean agent systems.
  9. Combustible gas detection.
  10. Carbon monoxide detection.

PART 2 – PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Manufacturers capable of meeting the system requirements of Part 2 of this specification.
- B. New fire alarm equipment shall be compatible with the existing WMATA fire alarm equipment. New equipment shall be able to provide two-way command and control communication between an EST Fireworks® head end and all protected premise fire alarm control panels and field devices.

2.02 EQUIPMENT

- A. Fire Alarm Control Panel (FACP)
  1. The fire alarm control panel(s) shall be an Edwards EST-3 or equivalent. System devices (notification appliances, pull stations, smoke and heat detectors, etc.) shall be compatible with one another. All components will be labeled "FM approved" for the use of fire alarm systems in this area of the United States of America.

2. Fire alarm control panel cabinet shall be 3-CAB series or equivalent. Cabinet shall be manufactured from #14 AWG cold rolled steel with a gray baked enamel finish. Operating controls shall be located behind a locked door with a viewing window.
3. Fire alarm control panel enclosures shall have engraved labels indicating, "FIRE ALARM SYSTEM", and the areas of the building served by that panel.
4. All control modules shall be labeled, and all zone locations shall be identified.
5. Conventional fire alarm panel supporting 1/3/5/10 initiating device circuits and 1 through 4 notification appliance, Class B circuits as required in the space. If the panel is not a slave provide Digital Alarm Communicator Transmitter (DACT) for off premises communication.
6. The system shall store all basic system functionality and job specific data in non-volatile memory. All site specific and operating data shall survive a complete power failure intact. Passwords shall protect any changes to system operations.
7. The system shall have built-in automatic system programming to automatically address and map all system devices attached to the main controller. A minimum default single stage alarm system operation shall be supported with alarm silence, event silence, drill, lamp test, and reset common controls.
8. The system shall support distributed processor intelligent detectors with the following operational attributes: integral multiple differential sensors, automatic device mapping, electronic addressing, environmental compensation, pre-alarm, dirty detector identification, automatic day/night sensitivity adjustment, normal/alarm LEDs, relay bases, sounder bases and isolator bases.
9. The system shall use full digital communications to supervise all addressable loop devices for placement, *correct location*, and operation. It shall allow swapping of "same type" devices without the need of addressing and impose the "location" parameters on replacement device. It shall initiate and maintain a trouble if a device is added to a loop and clear the trouble when the new device is mapped and defined into the system.
10. The fire alarm panel shall provide integral security system interfaces.

#### B. User Interface

1. The display module shall be of membrane style construction with a 24 line by 40-character (960 total characters) Liquid Crystal Display (LCD). The LCD shall use super-twist technology and backlighting for high contrast visual clarity and a colored grey/black and white display.
  - 1.1 In the normal mode the LCD shall display the time, a customer facility name, and the number of history events.
  - 1.2 In the alarm mode the LCD shall display the total number of events and the type of event. The LCD shall display the first event of the highest priority as well as the previous seven (7) alarm events "hands free" in chronological order so that the arriving firefighter may track the fire progression. The LCD shall reserve 42 characters of display space for each user custom message by addressable device.
2. There shall be common control keys and visual indicators for reset, alarm silence, panel silence and drill.
  - 2.1 Provide four pairs of display control keys for selection of event display by type (alarm, supervisory, monitor and trouble) and forward/backward scrolling through event listings.

2.2 The operation of these keys shall be integrated with the related common control indicators to flash the indicators when un-displayed events are available for display and turn on steady when all events have been displayed.

3. Provide system function keys for status, reports, enable, disable, activate, restore, program and test. The module shall have a numeric keypad, zero through nine with delete and enter keys.
4. Provide field programmable 12 switch 12 LEDs control display module.

As an alternate if the above cannot be provided, provide UL 864, 9<sup>th</sup> edition PC graphics display.

#### C. Software

1. Windows-based System Utility with Program Version Reporting to document any and all changes made during system start-up or system commissioning shall be used to maintain site specific programming. Time and Date Stamps of all modifications made to the program must be included to allow full retention of all previous program version data. Software will be Edwards EST-3 or equivalent and capable of coordination with EST fireworks head end. It shall support programming of any input point to any output point. The system shall support the use of Bar Code readers to assist custom programming functions. It shall allow authorized customization of fundamental system operations using initiating events to start actions, timers, sequences and logical algorithms. The system program shall meet the requirements of this project, current codes and standards, and satisfy the local Authority Having Jurisdiction.

#### D. Digital Alarm Communicator Transmitter (DACT)

1. The FACP shall have a DACT module to transmit alarm, supervisory and trouble signals to a central monitoring or proprietary supervising station.
2. The DACT shall support dual telephone lines, Contact I.D. communications, and configured for dual tone multi-frequency (DTMF) or pulse modes.
3. It shall be possible to delay AC power failure reports, auto test call, and be site programmable.
4. The dialer shall be capable of transmitting every individual alarm condition to the central station or proprietary supervising station.

#### E. Network Communications Card

1. A network communication card shall be provided for each building to allow building to building, peer to peer networking.

#### F. Fiber Optics Communications Interface

1. Fiber optics communications interface shall be provided for buildings, where available, to allow building to building networking in a Class A configuration.

#### G. System Controllers

1. The main controller shall be supervised, site programmable, and of modular design supporting at least 125 detectors and 125 remote modules per addressable Signaling Line Circuit (SLC).
2. The controllers shall support up to 10 SLC's per panel for a total system capacity of 2,500 intelligent addressable points.
3. The system shall be designed with peer-to-peer networking capability for enhanced survivability, with support for up to 64 nodes, each with up to 2,500 points and an overall capacity of 160,000 points.

4. The cabinets shall be steel, with a red finish.
5. The main controller module shall control and monitor all local or remote peripherals. It shall support at least a large 960 character LCD, power supply, remote LCD and zone display annunciators, printers, and support standard communication interface protocol devices such as color computer annunciators and color graphic displays. If configured as a network, each system shall display every point in the system and shall support up to 64 remote LCD display annunciators. Remote LCD annunciators shall also display every point in the system and be sized with the same number of characters as in the main FACP display.
6. Each controller shall contain a communication card which contains two RS232 ports. A computer for programming locally and a printer shall be provided and connected to the RS232 ports, a RS232 printer/programming port for programming locally via PC. When operational, each controller shall support a printer through the RS232 port and be capable of message routing.
7. Single stage operations shall be provided.
8. The system shall have a listed Detector Sensitivity test feature, which will be a function of the smoke detectors and performed automatically every 4 hours.
9. The system shall support 100% of all remote devices in alarm and provide support for a 100% compliment of detector isolator bases.

#### H. Power Supplies

1. Provide a power supply with power input of 120 VAC, 3.0A, 50/60 Hz and power output of Internal DC 24 Vdc @ 7.0A Max, Auxiliary DC Two 24 Vdc @ 3.5A Max. The battery charger shall be included in the power supply.
2. The power supply shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection.
3. The power supply shall provide internal power and 24VDC at 7.0A continuous for notification appliance circuits.
4. The power supply shall be capable of providing 7.0A to output circuits for a maximum period of 100 milliseconds. All outputs shall be power limited.
5. The battery shall be sized to support the system for 24 hours of supervisory and trouble signal current plus general alarm for 5 minutes.

#### I. Auxiliary Power Supplies

1. The power supply shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection.
2. The power supply shall provide internal power and 24VDC at 7.0A continuous for notification appliance circuits.
3. The power supply shall be capable of providing 7.0A to output circuits for a maximum period of 100 milliseconds. All outputs shall be power limited.
4. The battery shall be sized to support the system for 24 hours of supervisory and trouble signal current plus general alarm for 5 minutes.

#### J. Annunciators

1. The graphic remote annunciators shall be mounted in stand-alone enclosures or integrated into the network panels. The annunciator graphical diagram shall be 1/16 inch per foot scale minimum and operating on normal 24 Vdc. All annunciator switches shall be system input points and shall be capable of controlling any system output or function. The graphic annunciator shall be UL and ULC listed. The graphic shall be back-lit using high intensity LEDs. The unit shall be semi-flush or surface mounted. The main graphic door shall be tamper resistant and equipped with a key lock. It shall be possible to update the graphic image in the field without replacing the entire graphic.
2. Network alpha-numeric annunciators shall be located throughout the facility as indicated on the design drawings. The system shall have the capacity to support 64 network annunciators or network panel nodes. Each annunciator shall contain a supervised, back lit LCD with a minimum of 8 lines with 21 characters per line. Where required, the annunciator shall include additional zonal annunciation and manual control without additional enclosures.
3. The annunciator shall support full ability to serve as the operating interface to the system and shall include the following features:
  - a. Matched appearance with other system displays.
  - b. Each LCD on each node (cabinet) in the system shall be configurable to show the status of any or all of the following functions anywhere in the system: Alarm, Supervisory, Trouble and Monitor.
4. Each annunciator shall be capable of supporting custom messages as well as system event annunciation. It shall be possible to filter unwanted annunciation of trouble, alarm or supervisory functions by point or by geographic area.

#### K. Intelligent Devices

1. Each remote device shall have a microprocessor with non-volatile memory to support its functionality and serviceability. Each device shall store as required for its functionality the device serial number, device address, device type, personality code, date of manufacture, hours in use, time and date of last alarm, amount of environmental compensation left/used, last maintenance date, job/project number, current detector sensitivity values, diagnostic information (trouble codes) and algorithms required to process sensor data and perform communications with the loop controller. Each device shall be capable of electronic addressing, either automatically or application programmed assigned, to support physical/electrical mapping and supervision by location. Setting a device's address by physical means shall not be necessary.

#### L. Intelligent Detectors

1. The system intelligent detectors shall be capable of full digital communications using both broadcast and polling protocol. Each detector shall be capable of performing independent fire detection algorithms. The fire detection algorithm shall measure sensor signal dimensions, time patterns and combine different fire parameters to increase reliability and distinguish real fire conditions from unwanted deceptive nuisance alarms. Signal patterns that are not typical of fires shall be eliminated by digital filters. Devices not capable of combining different fire parameters or employing digital filters shall not be acceptable.
2. Each detector shall have an integral microprocessor capable of making alarm decisions based on fire parameter information stored in the detector head. Distributed intelligence shall improve response time by decreasing the data flow between detector and analog loop controller. Maximum total analog loop response time for detectors changing state shall be 0.5 seconds.

3. Each detector shall have a separate means of displaying communication and alarm status. A green LED shall flash to confirm communication with the analog loop controller. A red LED shall flash to display alarm status.
4. The detector shall be capable of identifying up to 32 diagnostic codes. This information shall be available for system maintenance. The diagnostic code shall be stored at the detector. Each smoke detector shall be capable of transmitting pre-alarm and alarm signals in addition to the normal, trouble and need cleaning information. It shall be possible to program control panel activity to each level.
5. Each smoke detector may be individually programmed to operate at any one of five (5) sensitivity settings. Each detector microprocessor shall contain an environmental compensation algorithm that identifies and sets ambient "Environmental Thresholds" approximately six times an hour. The microprocessor shall continually monitor the environmental impact of temperature, humidity, other contaminants as well as detector aging. The process shall employ digital compensation to adapt the detector to both 24-hour long term and 4-hour short-term environmental changes. The microprocessor shall monitor the environmental compensation value and alert the system operator when the detector approaches 80% and 100% of the allowable environmental compensation value. Differential sensing algorithms shall maintain a constant differential between selected detector sensitivity and the "learned" base line sensitivity. The base line sensitivity information shall be updated and permanently stored at the detector approximately once every hour.
6. The intelligent analog detectors shall be suitable for mounting on a variety of orientation/condition-specific detector mounting bases.

#### M. Fixed Temperature/Rate of Rise Detector

1. Heat detectors shall have a low mass thermistor heat sensor and operate at a fixed temperature and at a temperature rate-of-rise. It shall continually monitor the temperature of the air in its surroundings to minimize thermal lag to the time required to process an alarm. The integral microprocessor shall determine if an alarm condition exists and initiate an alarm based on the analysis of the data. The intelligent heat detector shall have a nominal fixed temperature alarm point rating of 135<sup>0</sup>F and a rate-of-rise alarm point of 15<sup>0</sup>F per minute. The heat detector shall be rated for ceiling installation at a minimum of 70 ft centers and be suitable for wall mount applications.

#### N. Photoelectric Smoke Detector

1. Analog photoelectric detectors shall utilize a light scattering type photoelectric smoke sensor to sense changes in air samples from its surroundings. The integral microprocessor shall dynamically examine values from the sensor and initiate an alarm based on the analysis of data. Systems using central intelligence for alarm decisions shall not be acceptable. The detector shall continually monitor any changes in sensitivity due to the environmental effects of dirt, smoke, temperature, aging and humidity. The information shall be stored in the integral processor and transferred to the analog loop controller for retrieval using a laptop PC or other equivalent program/service tool. The photo detector shall be rated for ceiling installation at a minimum of 30 ft centers and be suitable for wall mount applications. The photoelectric smoke detector shall be suitable for direct insertion into air ducts up to 3 ft high and 3 ft wide with air velocities up to 4,000 ft/min. without requiring specific duct detector housings or supply tubes. The percent smoke obscuration per foot alarm set point shall be field selectable to any of five sensitivity settings ranging from 1.0% to 3.5%. The photo detector shall be suitable for operation in the following environment: Temperature: 32<sup>0</sup>F to 120<sup>0</sup>F, Humidity: 0-93% RH, non-condensing, Elevation: no limit.

#### O. Multi-sensor Detector

1. Provide intelligent multi-sensor smoke detectors. The multi-sensor analog detector shall use a light scattering type photoelectric smoke sensor, a unipolar ionization smoke sensor and an

ambient temperature sensor to sense changes in air samples from its surroundings. The integral microprocessor shall employ time based algorithms to dynamically examine values from the three sensors simultaneously and initiate an alarm based on that data. The multi-sensor detector shall be capable of adapting to ambient environmental conditions. The temperature sensor shall self-adjust to the ambient temperature of the surrounding air and input an alarm when there is a change of 65°F in ambient temperature. Systems using central intelligence for alarm decisions shall not be acceptable. The detector shall continually monitor any changes in sensitivity due to the environmental effects of dirt, smoke, temperature, age and humidity. The information shall be stored in the integral processor and transferred to the analog loop controller for retrieval using a laptop PC. Separately mounted photoelectric detectors, ionization detectors and heat detectors in the same location are not acceptable alternatives. The multi-sensor smoke detector shall be rated for ceiling installation at a minimum of 30 ft centers and suitable for wall mount applications.

**P. Detector Mounting Base**

1. Detector mounting bases shall be suitable for mounting on North American 1-gang, 3½" or 4" octagon box and 4" square box. The base shall contain no electronics, support all detector types and have the following minimum requirements: Removal of the respective detector shall not affect communications with other detectors, Terminal connections shall be made on the room side of the base; bases that must be removed to gain access to the terminals shall not be acceptable. The base shall be capable of supporting one (1) remote alarm LED Indicator. Provide remote LED alarm indicators where shown on the plans.

**Q. Duct Detector Housing**

1. Provide low profile intelligent addressable duct smoke detector as indicated on the project plans. Provide for variations in duct air velocity between 100 and 4,000 feet per minute and include a wide sensitivity range of .79 to 2.46%/ft. Obscuration. Include one shut down relay rated 2.0 amps @ 30 Vdc and also include slave high contact relays if required. Provide an air exhaust tube and an air sampling inlet tube that extends into the duct air stream up to ten feet. The addressable duct housing shall be suitable for extreme environments, including a temperature range of -20 to 158 degrees F and offer a harsh environment gasket option. Provide remote alarm LED Indicators and/or remote test station as indicated on the project plans.

**R. Intelligent Modules**

1. It shall be possible to address each module without the use of DIP or rotary switches. Devices using DIP switches for addressing shall not be acceptable. The personality of multifunction modules shall be programmable at site to suit conditions and may be changed at any time using a code downloaded from the Analog Loop Controller. Modules requiring EPROM, PROM, ROM changes or DIP switch and/or jumper changes shall not be acceptable. The modules shall have a minimum of 2 diagnostic LEDs mounted behind a finished cover plate. A green LED shall flash to confirm communication with the loop controller. A red LED shall flash to display alarm status. The module shall be capable of storing up to 24 diagnostic codes which can be retrieved for troubleshooting assistance. Input and output circuit wiring shall be supervised for open and ground faults. The module shall be suitable for operation in the following environment: Temperature: 32°F to 120°F, Humidity: 0-93% RH, non- condensing.

**S. Single Input Module**

1. Provide intelligent single input modules. The Single Input Module shall provide one (1) supervised Class B input circuit capable of a minimum of 4 "personalities", each with a distinct operation. The module shall be suitable for mounting on North American 2 ½" deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers. The single input module shall support the following circuit types: Normally- Open Alarm Latching (Manual Stations, Heat Detectors, etc.), Normally-Open Alarm Delayed Latching (Waterflow Switches), Normally-

Open Active Non-Latching (Monitor, Fans, Dampers, Doors, etc.), Normally-Open Active Latching (Supervisory, Tamper Switches).

T. Dual Input Module

1. Provide intelligent dual input modules. The Dual Input Module shall provide two (2) supervised Class B input circuits each capable of a minimum of 4 "personalities", each with a distinct operation. The module shall be suitable for mounting on North American 2 ½" deep 1-gang boxes and 1 ½" deep 4" square boxes with 1-gang covers. The dual input module shall support the following circuit types: Normally-Open Alarm Latching (Manual Stations, Heat Detectors, etc.), Normally-Open Alarm Delayed Latching (Waterflow Switches), Normally-Open Active Non-Latching (Monitor, Fans, Dampers, Doors, etc.), Normally-Open Active Latching (Supervisory, Tamper Switches).

U. Monitor Module

1. Provide intelligent monitor modules. The Monitor Module shall be factory set to support one (1) supervised Class B Normally-Open Active Non-Latching Monitor circuit. The monitor module shall be suitable for mounting on North American 2 ½" deep 1-gang boxes and 1 ½" deep 4" square boxes with 1-gang covers.

V. Universal I/O

1. Provide motherboards that provide mounting and wire terminations for modules. The motherboard shall support up to six modules. Locations: Communication Equipment Room, and Ancillary locations.

W. Waterflow/Tamper Module

1. Provide intelligent waterflow/tamper modules. The Waterflow/Tamper Module shall be factory set to support two (2) supervised Class B input circuits. Channel A shall support a Normally-Open Alarm Delayed Latching Waterflow Switch circuit. Channel B shall support a Normally-Open Active Latching Tamper Switch. The waterflow/tamper module shall be suitable for mounting on North American 2 ½" deep 1-gang boxes and 1 ½" deep 4" square boxes with 1-gang covers.

X. Single Input Signal Module

1. Provide intelligent single input signal modules. The Single Input (Single Riser Select) Signal Module shall provide one (1) supervised Class B output circuit capable of a minimum of 2 "personalities", each with a distinct operation. When selected as a telephone power selector, the module shall be capable of generating its own "ring tone". The module shall be suitable for mounting on North American 2 ½" deep 2-gang boxes and 1 ½" deep 4" square boxes with 2-gang covers. The single input signal module shall support the following operations: Audible/Visible Signal Power Selector (Polarized 24 Vdc @ 2A).

Y. Control Relay Module

1. Provide intelligent control relay modules. The Control Relay Module shall provide one form "R" dry relay contact rated at 2 amps @ 24 Vdc to control external appliances or equipment shutdown. The control relay shall be rated for pilot duty and releasing systems. The position of the relay contact shall be confirmed by the system firmware. The control relay module shall be suitable for mounting on 2 ½" deep 1-gang boxes and 1 ½" deep 4" square boxes with 1-gang covers.

Z. Conventional Manual Pull Stations

1. It shall be double action model with single pole contact used for pre-signal or general alarm initiation. The model shall have terminals for field connection of wire. The manual stations

shall be provided with a key lock matching the FACP. The manual pull station shall not be provided with a glass break operation. Surface mount the manual pull station unless flush mount is possible. The fire alarm pull station shall be suitable for operation in the following environment: Temperature: 32°F to 120°F, Humidity: 0-93% RH, non- condensing. Provide accessories as required for the installation.

#### AA. Intelligent Manual Pull Stations

1. It shall be possible to address each fire alarm pull station without the use of DIP or rotary switches. Devices using DIP switches for addressing shall not be acceptable. The manual stations shall have a minimum of 2 diagnostic LEDs mounted on their integral, factory assembled single or two stage input module. A green LED shall flash to confirm communication with the loop controller. A red LED shall flash to display alarm status. The station shall be capable of storing up to 24 diagnostic codes that can be retrieved for troubleshooting assistance. Input circuit wiring shall be supervised for open and ground faults. The fire alarm pull station shall be suitable for operation in the following environment: Temperature: 32°F to 120°F, Humidity: 0-93% RH, non-condensing.

#### BB. Manual Pull Station

1. Provide intelligent double action, single stage fire alarm stations. The fire alarm station shall be of metal construction with an internal toggle switch. Provide a locked test feature. Finish the station in red with silver "PULL IN CASE OF FIRE" English lettering. The manual station shall be suitable for mounting on North American 2 ½" deep 1-gang boxes and 1½" deep 4" square boxes with 1-gang covers.

#### CC. Notification Appliances

1. All appliances shall be FM Approved for Fire Protective Service. All strobe appliances or combination appliances with strobes shall be capable of providing the "Equivalent Facilitation" which is allowed under the Americans with Disabilities Act accessibility guidelines (ADA (AG)), and shall be UL 1971. All appliances shall be of the same manufacturer as the Fire Alarm Control Panel (NO EXCEPTIONS) specified to insure absolute compatibility between the appliances and the control panels, and to insure that the application of the appliances are done in accordance with the single manufacturers' instructions. Any appliances that do not meet the above requirements, and are submitted for use must show written proof of their compatibility for the purpose intended. Such proof shall be in the form of documentation from THE CONTROL PANEL MANUFACTURER clearly stating that the control equipment (as submitted) is 100% compatible with the submitted Notification Appliances.

#### DD. Strobes

1. Provide low profile wall mounted strobes at the locations shown on the drawings. Strobes shall provide synchronized flash outputs. Strobe output shall be field selectable as indicated on the drawings in one of the following intensity levels; 15/75, 15cd, 30cd, 75cd or 110cd\*. Low profile strobes shall mount in a North American 1-gang box or surface mounted on a matching back box provided by the manufacturer, as directed in the field. Provide weatherproof type and associated components when strobe is located outside or in areas requiring weather proofing.

#### EE. Temporal Horn/Strobes

1. Provide low profile wall mount horn/strobes at the locations shown on the drawings. The horn/strobe shall provide an audible output of 84.4 dBA at 10 ft at the high setting and for smaller room size locations (as indicated on the plans) a low dB setting (field selectable) of 79.4 dB at 10 ft. when measured in reverberation room per UL-464. Strobes shall provide synchronized flash outputs. The strobe output shall be as indicated on the drawings in one of the following field selectable intensity levels\*; 15/75, 15cd, 30cd, 75cd & 110cd devices. The horn shall have a selectable steady or synchronized temporal 3-3-3 output. Low profile

horn/strobes shall mount in a North American 1-gang box or surface mounted on a matching back box provided by the manufacturer, as directed in the field.

#### FF. Temporal Horn

1. Provide low profile wall mount horn at the locations shown on the drawings. The horn shall provide an audible output of 84.4 dBA at 10 ft at the high setting and for smaller room size locations (as indicated on the plans) a low dB setting (field selectable) of 79.4 dB at 10 ft. when measured in reverberation room per UL-464. The horn shall have a selectable steady or synchronized temporal 3-3-3 output. Low profile horn shall mount in a North American 1-gang box or surface mounted on a matching back box provided by the manufacturer, as directed in the field.

#### GG. Speaker/Strobe

1. Provide low profile wall mount speaker/strobes at the locations shown on the drawings. The strobe output shall be as indicated on the drawings in one of the following field selectable intensity levels; 15cd, 30cd, 75cd & 110cd devices. Speakers shall operate between ¼ Watt and 2 Watts and shall provide an audible output between 80 dBA and 89 dBA.

#### HH. Speaker

1. Provide low profile wall mount speakers at the locations shown on the drawings. Speakers shall operate between ¼ Watt to 2 Watts and shall provide an audible output between 80 dBA and 89 dBA.

#### II. Multi-Voltage Control Relays

1. Provide remote control relays connected to supervised ancillary circuits for control of fans, dampers, door releases, etc. Relay contact ratings shall be DPDT and rated for 10 amperes at 115 Vac. A single relay may be energized from a voltage source of 24 Vdc, 24 Vac, 115 Vac, or 230 Vac. A red LED shall indicate the relay is energized. A metal enclosure shall be provided.

#### JJ. Electromagnetic Door Holders

1. Electromagnetic door holders submitted for use must have written proof of their compatibility for the purposes intended. Such proof shall be in the form of documentation from all manufacturers that clearly states that their equipment (as submitted) is 100% compatible with each other for the purposes intended.
2. Wall mounted, provide flush, semi-flush or surface wall mounted electromagnetic door holder/releases rated at 24 Vac/dc. Finish shall be brushed zinc.

#### KK. Surge Suppressor

1. Surge suppressors shall be multi-stage, hardwired base, field replaceable, with multiple voltage settings. 2 pairs shall be protected per module. UL497B listed with 10AWG max screw terminals. 0-75 service voltage, 6.6-108V list through voltage.

#### LL. Manual Pull Station Guards

1. Manual pull stations shall be provided with guards as required on the plans. They shall be surface or flush mounting, as required for each individual device.

#### MM. Voice Evacuation

1. The audio system must provide simultaneous page, alert, and evacuation signals. Systems that cause signaling devices to go silent while performing signaling functions will not be acceptable. The system must provide operation to 25Vrms or 70.7Vrms speakers. The system

must provide as a minimum the following paging common controls and indicators: Ready to page LED, VU display of paging output level, single switch function for paging to all — Alert zones, Evacuation zones, and areas not programmed for signaling. The system must provide high quality analog to digital conversion of paging sources. Digital transmission of paging must be provided between system nodes. The analog sources must be sampled and converted to digital with a sampling rate no less than 9600 samples per second. It must be possible to transmit signal sources (Alert, Alarm, Page, etc.) together over a single pair of wires between nodes. System amplifiers must be distributed zoned type. Centrally banked systems are not acceptable. An integral circuit for operating traditional Network Access Control (NAC) devices must be provided with each system amplifier. The circuit must carry a minimum rating of 3.5 Amps for operating 24 VDC signals. The system shall provide fully integrated fire fighters' telephone system that shall provide 2-way communication between the fire alarm control panel and any fire fighters' telephone station. The system shall include an alphanumeric user display and controls. When a telephone is activated, a call-in buzzer shall sound, and the location of the phone shall be shown on the alphanumeric display. The display shall be capable of bilingual operation, displaying English, Dutch, Finnish, French, German, Italian, Portuguese or Spanish messages. The incoming call shall be selected by activating a single button. All subsequent telephone call locations shall be displayed in full text. The system shall display all incoming calls, all connected phone(s) on the alphanumeric display. The system shall be configured so that page messages may be issued from any firefighter's telephone connected to the system, as directed by the emergency operator.

## PART 3 – EXECUTION

### 3.01 INSTALLATION

- A. Shop drawings must be submitted and approved prior to execution of any installation or demolition activity.
- B. Circuiting
  1. Addressable analog signaling line circuit, initiating device circuit and notification appliance circuit loops shall be Class B. Conventional signaling line circuit, initiating device circuit and notification appliance circuit loops shall be Class B. Network communication and annunciator communication loops shall be Class A. Tee tapping is not permitted for any circuit.
  2. Device loading shall not exceed 80% of loop capacity for each addressable or conventional analog loop to accommodate the installation of future devices.
  3. Provide intelligent input modules to supervise Class B zone wiring where required to interface conventional initiating devices.
  4. Sprinkler systems shall be supervised as follows:
    - a. Provide one (1) supervisory module for each sprinkler valve supervisory switch.
    - b. Provide one (1) dual input addressable module where water flow and tamper switches exist at the same location.
    - c. Provide one (1) additional single input addressable module where odd numbers of devices exist at a single location.
  5. Notification appliance circuits:
    - a. Audible Signals: Provide sufficient spare capacity to assure that an increase of 20% of the audible devices can be supported without the need for additional components (power supplies, signal circuit modules, batteries, etc.).

- b. Visual Signals: Provide sufficient spare capacity to assure that an increase of 20% of the visual devices can be supported without the need for additional components (power supplies, signal circuit modules, batteries, etc.).
6. Each of the following types of remote equipment associated with the fire alarm system shall be provided with a form 'C' control relay contact as follows, unless otherwise noted on the drawings:
  - a. HVAC Fan Systems: Provide one (1) shutdown control relay contact for each HVAC fan system.
  - b. HVAC Supply Fans: Provide one (1) shutdown control relay contact for each HVAC supply fan.
  - c. HVAC Return Fans: Provide one (1) shutdown control relay contact for each HVAC return fan.
7. Provide a dedicated 24VDC circuit to feed all auxiliary relays required for inductive loads. Circuits shall be supervised via an end-of-line relay and addressable input module. Auxiliary relays shall not derive their power from the starter or load being controlled.
8. Each control or data gathering panel shall have a dedicated 20 Amp, 120VAC feed. This feed shall come from an emergency circuit breaker panel where available, and shall have a locked circuit breaker. Earth grounds shall also terminate to the same circuit breaker panel from each respective control panel.
9. The system shall have a CPU "watchdog" circuit to initiate trouble should the CPU fail.
10. All low voltage wiring terminated to the fire alarm system shall be plenum rated with no exceptions and no less than No. 18 AWG in size, and solid copper.
11. All line voltage (120VAC) wiring shall be no less than No. 12 AWG in size, and solid copper. This shall include all system grounding. FACP must have a dedicated 20 Amp circuit marked back at the power panel no exceptions.
12. All wiring shall be color-coded throughout, to National Electrical Code standards.
13. Power-limited/non-power-limited NEC wiring standards shall be observed.
14. All junction box covers shall be painted federal safety red and labeled FIRE ALARM SYSTEM ONLY in black letters.
15. Fire alarm system wiring shall not co-mingle with any other system wiring in the facility. Conduits shall not be shared under any circumstance. Only when fire alarm wiring enters the enclosure of a monitored or controlled system will co-habitation be permitted (i.e. at fan starters or elevator controllers).
16. Auxiliary relays shall be appropriately labeled to indicate "FIRE ALARM SYSTEM" and their specific function (i.e. FAN S-1 SHUTDOWN).
17. All fire alarm wiring shall be continuous and without splices. Terminations shall only occur at fire alarm devices or control panel enclosures under terminal screws. All other splicing methods are specifically disallowed (i.e. plastic wire nuts).
18. All fire alarm wiring shall be installed in conduit. See Specification Section 16120.
19. All fire alarm wiring shall be sleeved when passing through any wall, using conduit sleeves (1"min.) with bushings, and fire stopped in accordance with Code.

20. The fire alarm system shall be arranged to receive power from one three wire 120 Vac, 20 A supply. All low voltage operation shall be provided from the fire alarm control panel.
21. End of Line Resistors shall be furnished as required for mounting as directed by the manufacturer. Devices containing end-of-line resistors shall be appropriately labeled. Devices should be labeled so removal of the device is not required to identify the EOL device.
22. New door holders shall derive their 24VAC/VDC power from a separate power supply housed in a dedicated, metal enclosure. The power supply shall have a 120VAC feed, and is to be centrally located to serve door holders on a per floor or area basis. All existing door holders shall be connected to new FACP. E.C. shall extend all existing wiring in order to make this work.
23. All WMATA protected premises report to two proprietary supervising station locations. The supervising station locations are located at the Jackson Graham Building and at the Carmen Turner Facility.

#### C. Fire Alarm System Sequence of Operation

1. The system shall identify any off normal condition and log each condition into the system database as an event.
  - a. The system shall automatically display on the control panel Liquid Crystal Display the first event of the highest priority by type. The priorities and types shall be alarm, supervisory, trouble and monitor.
  - b. The system shall have a Queue operation, and shall not require event acknowledgement by the system operator. The system shall have a labeled color coded indicator for each type of event; alarm shall be red, supervisory shall be yellow, trouble shall be yellow, monitor shall be yellow. When an unseen event exists for a given type, the indicator shall be lit.
  - c. For each event, the display shall include the current time, the total number of events, the type of event, the time the event occurred and up to a 42 character custom user description.
  - d. The user shall be able to review each event by scrolling keys (up-down) for each event type.
  - e. New alarm, supervisory or trouble events shall sound an audible signal at the control panel; the operator shall be able to silence this audible signal.
2. Operation of any alarm initiating device shall automatically:
  - a. Update the control/display as described in this Section.
  - b. Sound all audible appliances in a Temporal-3 pattern. All audible appliances shall be synchronized with each other when two or more horns can be heard. Audible devices shall have the ability to be silenced.
  - c. Activate all strobe appliances throughout the facility. All strobe appliances shall be synchronized with each other in any location with two or more devices in a common field of view. Visual devices shall be non-silenced unless the system is successfully reset.
  - d. Operate control relay contacts to shutdown HVAC units in accordance with IMC requirements.

- e. Operate control relay contacts to return all elevators that serve the floor of alarm initiation to the ground floor. If the alarm originates from the ground floor, operate control circuits contacts to return all elevators to the floor above or to a level as directed by the local fire department.
  - f. Operate control relay contacts to release all magnetically held smoke doors throughout the building.
  - g. Visually annunciate the individual point of alarm on all remote annunciator panels. The visual indication shall remain activated until the alarm condition is reset to normal.
  - h. Transmit an alarm condition to central station/local fire department and/or proprietary supervising station (as required by the AHJ/WMATA).
3. Elevator smoke and heat detector sequences shall comply with ANSI A17.1 Safety Code for Elevators and Escalators requirements and local code requirements for main/alternate floor recalls, and shunt trip activations.
  4. Activation of a sprinkler supervisory initiating device shall:
    - a. Update the control/display as described in this Section.
    - b. Transmit a supervisory condition to central station/local fire department and/or proprietary supervising station (as required by the AHJ/WMATA).
    - c. Visually annunciate the individual point of alarm on all remote annunciator panels. The visual indication shall remain on until the alarm condition is reset to normal.
  5. All fire alarm system wiring shall be electrically supervised to automatically detect and report trouble conditions to the fire alarm control panel. Any opens, grounds or disarrangement of system wiring and shorts across alarm signaling wiring shall automatically:
    - a. Update the control/display as described in this Section.
    - b. Transmit a trouble condition, via the integral central station communicator, to the central station/local fire department and proprietary supervising station (as required by the AHJ).
    - c. Visually and audibly annunciate a general trouble condition on the remote annunciator panels. The visual indication shall remain on until the trouble condition is repaired.
  6. Purge/Smoke Control
    - a. Smoke control panels shall be UUKL listed specifically for smoke control operation to allow the smoke purge control to be housed in the FACP cabinet. The smoke control switches shall be located behind a locked glass door.
    - b. Where required, each floor shall have a dedicated switch for fan shutdown via a listed addressable control module. Each damper shall also be monitored at the panel for open/close position via control module. This module shall illuminate the associated green LED when the damper is open and the red LED when the damper is closed. The dampers shall be interlocked with the fans to prevent the fan from activating while the damper is closed.
  7. All panel modules shall be supervised for placement and return trouble if damaged or removed.
  8. All WMATA protected premises report to two proprietary supervising station locations, and to the WMATA contracted third party monitoring location. The supervising station locations are located at the Jackson Graham Building and at the Carmen Turner Facility.

#### D. Device Mounting

1. The entire system shall be installed with aesthetics in mind as approved by WMATA. All control panels and remote annunciators installed in public spaces shall be semi-flush mounted with no exposed conduit or cable trays unless approved by WMATA.
2. All manual pull stations shall be mounted 48 inches above the finished floor, as measured to the handle.
3. Wall-mounted appliances shall be mounted such that the entire lens is not less than 80 in. and not greater than 96 in. above the finished floor. Where low ceiling heights do not permit mounting at a minimum of 80 in., appliances shall be mounted within 6 in. of the ceiling. All audiovisual devices shall have lexan covers in all areas.
4. No area smoke detectors shall be mounted within 36 inches of any HVAC supply, return air register or lighting fixture.
5. No area smoke or heat detector shall be mounted within 12 inches of any wall. All detectors shall be installed in strict accordance with NFPA 72 guidelines for such devices.
6. All addressable modules shall be mounted within 36 inches of the monitored or controlled point of termination. This shall include, but is not necessarily limited to, fan shutdown, elevator recall, shunt trip, sprinkler status points, or door release. Label all addressable modules as to their function.
7. All fire alarm devices shall be accessible for periodic maintenance. Should a device location indicated on the Contract Drawings not meet this requirement, it shall be the responsibility of the installing contractor to bring it, in writing, to the attention of WMATA. Failure to bring such issues to the attention of WMATA shall be the exclusive liability of the installing Contractor.

### 3.02 CONSTRUCTION

- A. System cable and devices shall be installed and inspected based on Fire Marshal approved drawings. Original contract drawings are for bidding purposes only. The entire system shall be installed in accordance with approved manufacturer's wiring diagram. The contractor shall furnish all conduit, wiring, outlet boxes, junction boxes, cabinets and similar devices necessary for the complete installation. All wiring shall be of the type recommended by the manufacturer, approved by the local Fire Department and specified herein.
- B. All penetration of floor slabs and firewalls shall be sleeved (1" conduit minimum) fire stopped in accordance with all local fire codes.
- C. The existing fire alarm system shall remain in operation until such time that approval has been granted for its removal.
- D. After acceptance of the new building fire alarm system, the installing Contractor shall be responsible for the removal of entire existing fire alarm system components and controls, upon approval of the AHJ and WMATA. WMATA reserves the right to retain any existing fire alarm system components, upon their request. All existing fire alarm system components requiring special handling for disposal (due to radioactivity) shall be the responsibility of the installing contractor.
- E. Prior to commencement and after completion of work notify Authorities Having Jurisdiction

### 3.03 FIELD/SITE QUALITY CONTROL

- A. The system shall be installed and fully tested under the supervision of a trained manufacturer's representative. The system shall be demonstrated to perform all of the function as specified.

- B. The installing contractor or fire alarm equipment vendor shall have no less than two (2) NICET Level III fire alarm technicians dedicated to this project.
- C. The Installing Contractor and the Fire Alarm System Vendor shall, upon the request of the Consulting Engineer or WMATA attend any and all project meetings for the purpose of accurately determining progress.
- D. It shall be the responsibility of the installing contractor to assure that construction debris does not adversely affect any sensing devices installed as part of this project. Should it be deemed necessary by the WMATA construction manager, the installing contractor shall be responsible for the cleaning of all smoke detectors prior to final acceptance.

### 3.04 SYSTEM STARTUP

#### A. Tests

1. The fire alarm system vendor shall test the system in accordance with the manufacturer's requirements and NFPA 72. The vendor shall provide final acceptance test reports to WMATA for review and approval prior to final acceptance.
2. Each individual system operation on a circuit by circuit basis shall be tested for its complete operation in accordance with NFPA 72 (2010ed.), Table 14.4.2.2 (see appropriate section from other editions). The procedure for testing the entire fire alarm system shall be set forth with the consent of the code enforcement official, the Engineer and the manufacturer.
3. Provide a NFPA 72 System Record of Completion Form for each part of the fire alarm system as required.

### 3.05 CLOSEOUT ACTIVITIES

#### A. Documentation and Training

1. The contractor shall compile and provide to WMATA a complete manual on the completed system to include site specific operating and maintenance instruction, catalog cuts of all equipment and components, as-built wiring diagrams and a manufacturer's suggested spare parts list. An operational Video, on DVD media, shall also be included.
2. The Contractor shall provide the onsite services of a manufacturer's trained representative for two (2) separate calendar days for a period of eight (8) hours per day to instruct the WMATA's designated personnel on the operation and maintenance of the entire system.
3. Submit letter of approval for installation before requesting acceptance of system.

#### B. As-built Drawings

1. Revise existing drawings to incorporate contract work.
2. Point-to-point depiction of all device wiring on the device layout floor plans.
3. Full size, as-built drawings.
4. All drawings should be readable and printable in 11 x 17.
5. Provide electronic copies in AutoCAD and PDF.
6. Provide one copy inside PVC pipe next to FACP.

### 3.06 MAINTENANCE

- A. Provide a coded one-man walk test feature. Allow audible or silent testing. Signal alarms and troubles during test. Ensure receipt of alarms and programmed operations for alarms from areas not under test.
- B. Provide internal system diagnostics and maintenance user interface controls to display/report the power, communication, and general status of specific panel components, detectors, and modules.
- C. Provide loop controller diagnostics to identify common alarm, trouble, ground fault, NFPA 72 Class A fault, and map faults. Map faults include wire changes, device type changes by location, device additions/deletions and conventional open, short, and ground conditions. Ground faults on the circuit wiring of remote module shall be identified by device address.
- D. Allow the user to display/report the condition of addressable analog detectors. Include device address, device type, percent obscuration, and maintenance indicator. The maintenance indicator shall provide the user with a measure of contamination of a device upon which cleaning decisions can confidently be made.
- E. Allow the user to report history for alarm, supervisory, monitor, trouble, smoke verification, watchdog, and restore activity. Include Facility Name, Licensee, Project Program Compilation date, Compiler Version, Project Revision Number, and the time and date of the History Report.
- F. Allow the user to disable/enable devices, zones, actions, timers and sequences. Protect the disable function with a password.
- G. Allow the user to activate/restore outputs, actions, sequences, and simulate detector smoke levels.
- H. Allow the service user to enter time and date, reconfigure an external port for download programming, initiate auto programming and change passwords. Protect these functions with a password.
- I. WMATA shall retain complete rights and ownership to all software running in the system. The fire alarm equipment vendor shall provide useable hard and soft copies of the software database to WMATA at the end of the warranty period. The database provided shall be useable by any authorized and certified distributor of the product line, and shall include all applicable passwords necessary for total and unrestricted use and modification of the database.

END OF SECTION

## SECTION 16733

### COMMUNICATIONS - KIOSK SYSTEMS

#### PART 1 GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The purpose of the Kiosk System is to provide the kiosk with the equipment needed to monitor and control passenger station Communications Systems, Fire and Intrusion Alarm Systems, to provide data signals to fare collection equipment, elevators and escalators, and to provide an effective communications interface with the public (customers).
- B. At least one kiosk is located in each passenger station of the Washington Metropolitan Area Transit Authority (WMATA) Rail Rapid Transit System. It is the focal point of activity at each passenger station. At large passenger stations, each operational level may contain more than one kiosk. Where more than one kiosk is located on a single level, one kiosk is designated as the "Major Kiosk." All other kiosks are designated "Minor Kiosks." In those stations where a single kiosk exists, it is considered to be the "Major Kiosk."
- C. Facilities are to be provided in each kiosk for the station manager to monitor and control passenger station systems. The contractor shall provide a complete "Kiosk Facility" which shall include kiosk cabinets, system interface panels, cables, cable termination facilities, loudspeakers, wiring and all hardware needed to complete the installation of Station Monitor/Control Systems in the kiosk. The requirements for the individual monitor/control panels and systems, to be installed in the kiosk under this contract, are included in the respective System Specification Sections.
- D. The contractor shall provide Cabinet Bays #1 through #6 in the Kiosk(s) included in this contract, as indicated on the contract drawings. Kiosk Cabinet Bay #7 will be furnished and installed by other trades.
- E. The contractor shall provide a Cable Termination Rack in Cabinet Bay # 3 of the kiosk(s) covered by this contract. The kiosk Cable Termination Rack shall consist of seven Terminal Strips and a Line Terminal Block. Terminal Strips shall be equally spaced on the Termination Rack. Each Terminal Strip within the kiosk Cable Termination Rack shall consist of sixty (60) individual terminals. The kiosk Cable Termination Rack shall be provided in the kiosk(s) to terminate all cables and wires that are to be installed into the kiosk(s) under this contract, with the following exceptions:
  - 1. Coaxial video cables.
  - 2. Automatic Public Address Announcement System cables.
  - 3. Passenger Emergency Reporting System cables.
  - 4. Kiosk Multiline Telephone Cable Connections.
- F. The coaxial cables from the station Communications Equipment Room are terminated on the Coaxial Cable Termination Panel in Bay # 3. The coaxial cables from the kiosk video equipment shall also be terminated on the Coaxial Cable Termination Panel. The Automatic Public Address Announcement System cables and the Passenger Emergency Reporting System cables are terminated on the Emergency Communications Kiosk Terminal Panel.
- G. The Contractor shall provide an Emergency Communications Kiosk Terminal Panel in Bay # 3 of the cabinetry in the kiosk(s) included in this contract. The Emergency

Communications Kiosk Terminal Panel shall be the interface point for cables from the station Communications Equipment Room to the kiosk control panels, for the Automatic Public Address Announcement System and the Passenger Emergency Reporting System. The Emergency Communications Kiosk Terminal Panel shall consist of three terminal blocks mounted on a 16-gauge steel plate. Two blocks shall have a minimum of 23 miniature terminals, and the other block shall have a minimum of 20 miniature terminals. Details on the layout, mounting and lettering of the Emergency Communications Kiosk Terminal Panel are included on the contract drawings.

- H. The contractor shall provide a 24-Vdc Power Supply in the Public Address System Equipment Rack located in the station(s) Communications Equipment Room, and shall interconnect it to the kiosk Cable Termination Rack. The 24-Vdc Power Supply will be used to power the Escalator Display Panel in the kiosk(s).
- I. The contractor shall engineer, draw, print and deliver to the Authority, Kiosk Data Files for the passenger station(s) under this Contract. The Kiosk Data Files shall be designed to be a convenient source of information on the layout of the following systems:
  - 1. Passenger Station Telephones.
  - 2. Right-of-Way and Ancillary Building Telephones.
  - 3. Passenger Station Fire Zones.
  - 4. Ancillary Building Fire Zones.
  - 5. Passenger Station Intrusion Zones.
  - 6. Ancillary Building Intrusion Zones.
  - 7. Escalators.
  - 8. Closed Circuit Television System.
  - 9. Passenger Emergency Reporting System.
- J. Contractor shall also provide laminated Fire and Intrusion Zone tables for the passenger station(s).
- K. The Escalator Display Panel provides four status indicators and one identification indicator for each of up to 16 escalators. The following indicators are provided for each escalator:
  - 1. Direction of Travel - "UP" or "DOWN."
  - 2. Automatic Operation - "AUTO OPER."
  - 3. Out of Service - "OUT SERV."
  - 4. Escalator Identification - "ESC XX" where "XX" is the number of the escalator.
- L. The Escalator Display Panel also includes a momentary, non-illuminating, pushbutton switch to permit a lamp test of all indicators on the panel.
- M. Kiosk Monitor/Controls provide the station manager with a means to effectively manage passenger station activities. The operation of the monitor/control panels and systems, to be installed in the kiosk under this contract (except the Escalator Control Panel described in this Section), is described in the individual system specifications.

## **1.02 SECTION INCLUDES**

- A. Kiosk Cabinet Bays #1 through #6C in the Kiosk(s).
- B. 24-Vdc Power Supply.
- C. Escalator Display Panel.
- D. Kiosk Data File.

- E. Kiosk Cable Termination Rack.

### **1.03 UNIT PRICES**

- A. Unit Prices include all required conduits and fittings, junction boxes, feeder wires, branch circuit wiring, and cabling to the communications systems and facilities and incidental items, not specifically mentioned, but required for complete and proper system operation.

### **1.04 RELATED SECTIONS**

- A. Section 14200 - Hydraulic Elevators.
- B. Section 14240 - Traction Elevators.
- C. Section 14300 - Heavy-Duty Escalator.
- D. Section 16705 - Communications Standard Specifications - Equipment & Material.
- E. Section 16706 - Communications System Submittals & Services..
- F. Section 16707 - Communications Systems Quality Assurance & Testing
- G. Section 16710 - Communications Grounding.
- H. Section 16715 - Communications Electrical Power Distribution.
- I. Section 16721 - Communications - Telephone System
- J. Section 16727 - Communications - Passenger Emergency Reporting System.
- K. Section 16771 - Communications - Carrier Transmission System
- L. Section 16776 - Communications - Fiber Optic System..
- M. Section 16731 - Communications - Fire Alarm System..
- N. Section 16820 - Communications - Public Address System..
- O. Section 16821 - Communications - Automatic Public Address Announcement System.
- P. Section 16851 - Communications - Passenger Station Closed-Circuit Television System.

### **1.05 REFERENCES**

- A. National Electric Code (NEC).

### **1.06 SYSTEM DESCRIPTION**

- A. Description: The Kiosk System provides the kiosk with the equipment needed to monitor and control passenger station Communications Systems, Fire and Intrusion Alarm Systems, to provide data signals to fare collection equipment, elevators and escalators, and to provide an effective communications interface with the public (customers).

- B. Capacity:
1. The Contractor shall furnish and install a 24-Vdc Power Supply for the kiosk that is sufficient to power all the 24-Vac equipment located in the kiosk, plus 50% spare capacity.
  2. The Contractor shall furnish and install kiosk Cabinet Bays #1 through #6C in the kiosk(s).
  3. The Contractor shall install the Escalator Display Panel(s) furnished by other trades.
  4. The Contractor shall author, publish and furnish one set of Kiosk Data Files for each kiosk in each passenger station, and 12 additional sets of Kiosk Data Files to the Authority for each passenger station.
  5. The Contractor shall furnish and install a Kiosk Cable Termination Rack in each kiosk.
  6. The Contractor shall furnish and install an Emergency Communications Kiosk Terminal Panel in each kiosk.
  7. The contractor shall install an Elevator Control Panel (provided under Section 14200 - Hydraulic Elevators or Section 14240 - Traction Elevators) in the kiosk.
- C. The Kiosk Cable Termination Rack consists of seven Terminal Strips and a Line Terminal Block in Cabinet Bay 6B. Each Terminal Strip within the Kiosk Cable Termination Rack consists of sixty (60) individual terminals. The Kiosk Cable Termination Rack terminates all cables and wires that are to be installed into the kiosk(s) in this contract, with the following exceptions:
1. Coaxial video cables.
  2. Automatic Public Address Announcement System cables.
  3. Passenger Emergency Reporting System cables.
  4. Kiosk Multi-line Telephone Cable Connections.
- D. The coaxial cables from the station Communications Equipment Room are terminated on the Coaxial Cable Termination Panel in Bay 6B. The coaxial cables from the kiosk video equipment are also terminated on the Coaxial Cable Termination Panel. The Automatic Public Address Announcement System cables and the Passenger Emergency Reporting System cables are terminated on the Emergency Communications Kiosk Terminal Panel.
- E. The Emergency Communications Kiosk Terminal Panel in Bay 6B is the interface point for cables from the station Communications Equipment Room to the Kiosk control panels, for the Automatic Public Address Announcement System and the Passenger Emergency Reporting System.
- F. A 24-Vdc Power Supply in the Public Address System Equipment Rack located in the station(s) Communications Equipment Room, and interconnects to the kiosk Cable Termination Rack to provide power to the Escalator Display Panel in the kiosk(s).
- G. The Kiosk Data Files provide a convenient source of information on the layout of the following systems:
1. Passenger Station Telephones.
  2. Right-of-Way and Ancillary Building Telephones.
  3. Passenger Station Fire Zones.
  4. Ancillary Building Fire Zones.
  5. Passenger Station Intrusion Zones.
  6. Ancillary Building Intrusion Zones.
  7. Escalators.
  8. Closed Circuit Television System.
  9. Passenger Emergency Reporting System.

- H. The Escalator Display Panel provides four status indicators and one identification indicator for each of up to 16 escalators. The following indicators are provided for each escalator:
1. Direction of Travel - "UP" or "DOWN."
  2. Automatic Operation - "AUTO OPER."
  3. Out of Service -"OUT SERV."
  4. Escalator Identification - "ESC XX" where "XX" is the number of the escalator.

#### **1.07 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram and mechanical layout.
- C. Product Data: Provide data showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.
- E. Submitted to the Engineer for approval prior to reproduction, lamination and assembly a draft copy of each Kiosk Data File for the passenger station(s).
- F. Furnish a complete set of Mylar reproducible drawings for the Kiosk Data File of the passenger station(s), and electronic copies (in AutoCAD, latest release format) on diskette and compact disk.

#### **1.08 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Service facilities within 50 miles of Project.

#### **1.09 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Kiosk Systems until Final Completion.

### **PART 2 - PRODUCTS**

#### **2.01 TERMINALS**

- A. Manufacturers:
1. Weidmuller, Model No. SAKC4 Complete with Channel Mounting System (or approved equal).
- B. Ratings:
1. Terminal Type: Modular Micro Terminal with Screw Clamp Connection.
  2. Wire size accommodated: #22 thru #12-AWG.
  3. Rated Current: 27-Amps.

4. Rated Voltage: 300-Vdc.
5. Center-to-Center Spacing: 6-mm.

## **2.02 LINE TERMINAL BLOCK**

- A. Manufacturers:
  1. Siecor, Model No. A0293268 (or approved equal).
- B. Ratings:
  1. Terminal Type: Wire Wrapping Terminals.
  2. Terminal Configuration: 4 rows x 26 clips.
  3. Mounting Base: Adjustable from 7-inches to 9-inches.

## **2.03 24-VDC POWER SUPPLY**

- A. Manufacturers:
  1. Acopian, Model No. 24PH30 (or approved equal).
- B. Ratings:
  1. Input Voltage: 105-125 Vac, 60 Hz, Single Phase.
  2. Output Voltage: 24-Vdc  $\pm$  .5-Vdc (adjustable).
  3. Output Current (minimum): 30-Amps @ 40°C. 23-Amps @ 55°C.
  4. Ambient Operating Temperature: -20 to +55° C.
  5. Regulation (line/load):  $\pm$  .05%.
  6. Size: Not greater than 3 vertical rack units (19-inch rack).
  7. Standard RETMA 19-inch cabinet rack mount.

## **2.04 KIOSK CABINET BAY ASSEMBLY**

- A. Manufacturers:
  1. Custom made.
- B. Ratings:
  1. Frame Material: 16-Gauge Galvanized Steel.
  2. Exposed Metal Finish: Metro Bronze Color 20040 (Federal Standard 595B).
  3. Desk Tops: 1-inch Marine Plywood (MARINE AA EXT-APA).
  4. Hardware: Cadmium Plated.
  5. Desk-Top Laminate: Formica Grade 10 (or approved equal).
  6. Desk-Top Laminate Color: Neutral White #918.

## **2.05 KIOSK DATA FILE**

- A. Manufacturers:
  1. Custom made.
- B. Description: Each Kiosk Data File shall consist of eight or more 11" x 17" drawings.
- C. Prepared Kiosk Data File drawings to document each of the following subjects:
  1. Telephones (passenger station) - A cross-reference of telephone numbers and telephone locations within a passenger station.
  2. Telephones (Right-of-Way and Ancillary Facilities) - A cross-reference, by telephone numbers and locations, of the telephones along the right-of-way and in ancillary facilities associated with a passenger station.

3. Fire Zones (Passenger Station) - A cross-reference of the designated fire zones, room numbers and room descriptions for all areas within a passenger station, including ancillary facilities within the passenger station limits.
  4. Fire Zones (Ancillary Facilities) - A cross-reference of the designated fire zones in remote ancillary facilities associated with a passenger station.
  5. Intrusion Zones (passenger station) - A cross-reference of the designated intrusion zones, room numbers and room descriptions for all areas of a passenger station, including ancillary facilities within the passenger station limits.
  6. Intrusion Zones (Ancillary Facilities) - A cross-reference of the designated intrusion zones in remote ancillary facilities associated with a passenger station.
  7. Escalators - A cross-reference of assigned escalator numbers and escalator locations within a passenger station.
  8. CCTV - A cross-reference of television monitor assignments and arrangements, and television camera designations, locations and areas of coverage for all television cameras and television monitors within a passenger station.
  9. Passenger Emergency Reporting System - A layout of platform(s) showing locations and designations of call stations.
- D. Ratings:
1. Seal Kiosk Data File drawings in a protective plastic laminate.
  2. Each Kiosk Data File set shall be in loose-leaf booklet form.
  3. Covers: 11" x 17", minimum of 60-pound punched paper with holes reinforced with plastic, cloth or metal, and sealed in a protective plastic laminate.

## **2.06 EMERGENCY COMMUNICATIONS KIOSK TERMINAL PANEL**

- A. Manufacturers:
1. Custom made.
- B. Description: The Emergency Communications Kiosk Terminal Panel consist of three terminal blocks mounted on a 16-gauge steel plate and have the following characteristics:
1. Two of the terminal blocks shall each have a minimum of 23 miniature terminals.
  2. The other terminal block shall have a minimum of 20 miniature terminals.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Kiosk cabinet bay assembly installation
1. Install the assembled kiosk cabinetry in the kiosk of the passenger station(s). Cabinet assembly installation shall be as follows: Bays #1, #2A, 2B, 2C and #3 as a single unit; Bays #4, #5, and #6A, 6B, and 6C as a single unit. Secured to the floor of the kiosk. Kiosk cabinets may be secured to the kiosk sides with the approval of the Engineer; however, the securing hardware shall not carry any vertical load. Hardware installed in the kiosk sides shall only be used to prevent horizontal movement.
- B. Kiosk cable termination rack installation
1. Install a Kiosk Cable Termination Rack in Kiosk Cabinet Bay 6B of the kiosk. Install structure elements in the Kiosk Cabinet Bay 6B to accommodate the Terminal Strips and the Line Terminal Block of the Kiosk Cable Termination Rack.
- C. Emergency communications kiosk terminal panel

1. Install an Emergency Communications Kiosk Terminal Panel in Kiosk Cabinet Bay 6B of the kiosk, as indicated on the contract drawings. Installation shall not interfere with the Cable Termination Rack Terminal Strips. Secure Cables to the Emergency Communications Kiosk Terminal Panel to the panel to prevent interference with the Kiosk Cable Termination Rack wiring and cabling.
- D. Escalator display panel
1. Install an Escalator Display Panel in Cabinet Bay 3 of the Kiosk. install the required wiring harness(es) between the panel and the Kiosk Cable Termination Rack in Bay 6B, and make all necessary connections and cross-connections. Install one 9-conductor, 18-AWG, shielded cable for each escalator associated with the passenger station(s) between the Kiosk Cable Termination Rack in Bay 6B of the Kiosk and the Escalator Terminal Box in the escalator wellways. Terminate the cables in the kiosk and at the escalators and make all necessary connections and cross-connections.
- E. Standard time cable
1. Install a six-pair individually shielded "Standard Time" cable between the TC/COMM Interface Cabinet in the station Communications Equipment Room and the kiosk. Terminate the pairs at the TC/COMM Interface Cabinet and at the kiosk Cable Termination Rack in Bay 6B of the kiosk cabinets and make all necessary connections and cross-connections.
- F. Kiosk 24-vdc power facility
1. Install the 24-Vdc Power Supply in the Public Address System Equipment Rack located in the station Communications Equipment Room.
  2. Install the required cabling and connectors and make the necessary connections and cross-connections between the 24-Vdc Power Supply in the Communications Equipment Room and the Kiosk Cable Termination Rack in the kiosk.
- G. Elevator control panel
1. The Elevator Control Panel will be installed in Bay 3 of the kiosk under Section 14200 or Section 14240..

### **3.02 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

### **3.03 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

### **3.04 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.

- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**END OF SECTION**

**SECTION 16733**  
**KIOSK SYSTEMS**

**PART 1 – GENERAL**

**1.01 SUMMARY**

- A. The purpose of the Kiosk System is to provide the kiosk with the equipment needed to monitor and control passenger station Communications Systems, Fire and Intrusion Alarm Systems, to provide data signals to fare collection equipment, elevators and escalators, and to provide an effective communications interface with the public (customers).
- B. Facilities shall be provided in each kiosk for the station manager to monitor and control passenger station systems. A complete “Kiosk Facility” shall be provided including kiosk cabinets, system interface panels, cables, cable termination facilities, loudspeakers, wiring and all hardware needed to complete the installation of Station Monitor/Control Systems in the kiosk. The requirements for the individual monitor/control panels and systems, to be installed in the kiosk, are included in the respective System Specification Sections.
- C. Cabinet Bays #1 through #6 shall be provided in the Kiosk(s) included in this Contract, as indicated on the Contract Drawings. Kiosk Cabinet Bay #7 will be furnished and installed by other trades.
- D. A Cable Termination Rack shall be provided in Cabinet Bay # 3 of the kiosk(s).
  - 1. The kiosk Cable Termination Rack shall consist of seven Terminal Strips and a Line Terminal Block. Terminal Strips shall be equally spaced on the Termination Rack. Each Terminal Strip within the kiosk Cable Termination Rack shall consist of sixty individual terminals. The kiosk Cable Termination Rack shall be provided in the kiosk(s) to terminate all cables and wires that are to be installed into the kiosk(s), with the following exceptions:
    - a. Call for Aid
    - b. Kiosk Multiline Telephone Cable Connections.
    - c. Fire and Intrusion Alarm System cables
    - d. Public Address System cables
    - e. 24-MM Optical Cable
- E. The fiber optic cables from the station Communications Room are terminated on the kiosk fiber optic patch panel.
- F. Kiosk Data Files for the passenger station(s) shall be engineered, drawn, printed, and delivered to the Contracting Officer Representative. The Kiosk Data Files shall be designed to be a convenient source of information on the layout of the following systems:
  - 1. Passenger Station Telephones
  - 2. Right-of-Way and Ancillary Building Telephones
  - 3. Passenger Station Fire Zones
  - 4. Ancillary Building Fire Zones
  - 5. Passenger Station Intrusion Zones
  - 6. Ancillary Building Intrusion Zones
  - 7. Escalators

8. Closed Circuit Television System
  9. Call for Aid System
- G. Laminated Fire and Intrusion Zone tables shall be provided for the passenger station(s).
- H. The Escalator Display Panel provides four status indicators and one identification indicator for each of up to 16 escalators. The following indicators are provided for each escalator:
1. Direction of Travel - "UP" or "DOWN"
  2. Automatic Operation - "AUTO OPER"
  3. Out of Service -"OUT SERV"
  4. Escalator Identification - "ESC XX" where "XX" is the number of the escalator
- I. The Escalator Display Panel also includes a momentary, non-illuminating, pushbutton switch to permit a lamp test of all indicators on the panel.
- J. Kiosk Monitor/Controls provide the station manager with a means to effectively manage passenger station activities. The operation of the monitor/control panels and systems, to be installed in the kiosk (except the Escalator Control Panel described in this Section), is described in the individual system specifications.
- K. Kiosk Information Display System (KIDs) shall be furnished, installed, and tested by the Contractor. KIDs shall consist of, but not be limited to, the following components:
1. 47-inch flat LCD panel (Ciil CL-47PLCC68/CL-47PLC68-S or approved equal):
    - a. 1920 x 1080 resolution
    - b. IP68 rated
    - c. 120 VAC power input
    - d. Anti-reflective impact-resistant and UV protected glass
    - e. Ambient light
    - f. UL Listed
    - g. Weight of 120 lbs maximum
  2. HDMI cable, male to male: Blackbox EVHDMI01T or approved equal
    - a. 28 AWG conductors
    - b. Copper contacts with gold plate
    - c. Black PVC jacket
    - d. Aluminum Mylar and tinned copper shielding
    - e. Rated for high bandwidth uncompressed video
  3. Cisco Edge 300 or approved equal
    - a. Shall be installed in adjacent or in same bay cabinet as kiosk LAN switch.

## 1.02 SYSTEM DESCRIPTION

- A. Description: The Kiosk System provides the kiosk with the equipment needed to monitor and control passenger station Communications Systems, Fire and Intrusion Alarm Systems, to

provide data links for fare collection equipment, elevators and escalators, and to provide an effective communications interface with the public (customers).

**B. Capacity**

1. Kiosk Cabinet Bays #1 through #6C shall be furnished and installed in the kiosk(s).
2. Furnish and install the Escalator Display Panel(s) and associated conduit and cabling.
3. One set of Kiosk Data Files for each kiosk in each passenger station, and twelve additional sets of Kiosk Data Files shall be created, published, and delivered for each passenger station
4. A Kiosk Cable Termination Rack shall be furnished and installed in each kiosk.
5. An Emergency Communications Kiosk Terminal Panel shall be furnished and installed in each kiosk, Bay 2C.
6. An Elevator Control Panel (provided under Section 14240, ELECTRIC TRACTION ELEVATORS) shall be installed in the kiosk, Bay 3.
7. A Remote Fire Annunciator panel shall be furnished and installed in each Kiosk. Refer to Section 16732, FIRE ALARM SYSTEM, for description, Bay 6B.
8. A Closed Circuit Television console shall be furnished and installed in each Kiosk. Refer to Section 16851, CLOSED CIRCUIT TELEVISION SYSTEM, Bay 2B.
9. A Public Address System console shall be furnished and installed in each Kiosk. Refer to Section 16820, PUBLIC ADDRESS SYSTEM, Bay 3
10. Cat6 cables for New Electronic Payment Program (NEPP) shall land in Bay 1.
11. The fiber optic cables from the station Communications Room and Cat6 (yellow) from local cameras shall be terminated on the appropriate patch panels in Bay 2A.
12. Equipment for video management and KIDS shall be placed in Bay 2B
13. Electrical panel of appropriate size shall be provided.

C. The Kiosk Cable Termination Rack consists of seven Terminal Strips and a Line Terminal Block in Cabinet Bay 6B. Each Terminal Strip within the Kiosk Cable Termination Rack consists of sixty individual terminals. The Kiosk Cable Termination Rack terminates all cables and wires that are to be installed into the kiosk(s), with the following exceptions:

1. Fiber-optic video cables
2. Integrated Intercommunications' System cables
3. Kiosk Multi-line Telephone Cable Connections

D. The fiber optic cables from the station Communications Room are terminated on the fiber optic patch Panel in Bay 2A.

**1.03 RELATED SECTIONS**

- A. Section 14200, HYDRAULIC ELEVATORS
- B. Section 14240, ELECTRIC TRACTION ELEVATORS
- C. Section 16705, COMMUNICATION EQUIPMENT AND MATERIAL
- D. Section 16710, GROUNDING AND BONDING FOR COMMUNICATION SYSTEMS

- E. Section 16715, COMMUNICATION ELECTRICAL POWER DISTRIBUTION
- F. Section 16820, PUBLIC ADDRESS SYSTEM
- G. Section 16851, CLOSED CIRCUIT TELEVISION SYSTEM
- H. Section 16732, FIRE ALARM SYSTEM
- I. Section 16728, CALL FOR AID SYSTEM
- J. Section 16740, ACCESS CONTROL SYSTEM

#### 1.04 REFERENCES

- A. Code of Federal Regulations, Title 47 Telecommunications, Part 15 – Radio Frequency Devices (47 CFR 15), Subparts A and B
- B. UL 50 – Enclosures for Electrical Equipment, Non-Environmental Considerations
- C. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures
- D. NEMA KS 1 - Heavy Duty Enclosed and Dead-Front Switches (600 Volts Maximum)
- E. ITU-T and EIA/TIA Recommendations
- F. Standard for Fixed Guideway Transit and Passenger Rail Systems (NFPA 130)
- G. National Electric Code (NEC, NFPA 70) 2014 edition

#### 1.05 QUALITY ASSURANCE

- A. Design and production tests: Refer to the Contract Documents. Submit certified test results, or provide certified test results on identical units. Furnish certified test reports showing test data and results as well as manufacturer's comments on tests.
- B. Interchangeability: Refer to the Contract Documents. Furnish products of a manufacturer regularly engaged in the manufacture of applicable systems. In addition:
  1. Standard commercial products shall be furnished whenever such equipment and materials will satisfy the stated specifications. Suitable modified standard commercial devices shall be furnished when required to satisfy specification requirements. Custom developed and fabricated equipment units and devices shall be confined to those items for which suitable commercial off-the-shelf (COTS) products are not available to guarantee compliance with the Specifications. When custom design, fabrication, or assembly is required, every effort shall be made to minimize the number of different modules, solid-state devices used.
  2. With each system, subsystem, and facility, two or more like functions shall be performed by identical units. In no case shall the equipment or hardware used in one portion of a system, subsystem or facility be different from that used in another portion to perform the same function under similar operating and environmental conditions (outdoor systems are distinct from indoor systems).
  3. Equipment shall be physically and plug compatible with recent versions of existing WMATA equipment performing similar functions and used for comparable applications elsewhere in similar WMATA's facilities, insofar as possible. The use of adapter plugs, interface boxes, and replacement mounting brackets or enclosures that fit available space and mounting holes may be allowed by the Authority to maintain interchangeability when competitive products that do not require such devices are determined to be unavailable (applicable to COTS major equipment items only). Custom designed and fabricated equipment must be fully interchangeable without requiring the use of such devices. If a determination is made to allow use of such devices, all

necessary adapters and interface devices shall be provided with each item of equipment furnished, at no additional cost to the Authority.

4. Equipment shall be software compatible with recent versions of existing WMATA equipment performing similar functions and used for comparable applications elsewhere in similar WMATA facilities.
  5. Major items of equipment furnished shall be within the physical size and configuration limitations specified in provisions of this Subcontract. If such specifications are not included in the provisions, major items of equipment shall be of a physical size and configuration closely comparable to equipment currently in use of comparable applications elsewhere in similar WMATA facilities.
  6. Exception: Lighter weight and smaller sized more modern versions of equipment are sought by the Authority where their use presents significant advantages. The use of new generations of equipment that differ in size and are not fully interchangeable will be considered for approval by the Authority, in order to take advantage of significant technological improvements developed by industry.
- C. Qualifications of Instructor for Operation and Maintenance Training: Perform operation and maintenance training for applicable systems. Qualifications will be considered adequate when the following is demonstrated:
1. Instructor has in-depth knowledge of the design, packaging, operations, maintenance, and trouble-shooting of the systems to be taught.
  2. Instructor has been trained in teaching methods or has previous satisfactory experience in teaching with emphasis on the subject matter to be covered in the course of instruction.

#### 1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this Section with minimum 3 years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum 3 years documented experience.

#### 1.07 MAINTENANCE SERVICE

- A. Furnish service and maintenance of Kiosk Systems until final Acceptance.

#### 1.08 FLOOR COVERING

- A. This Article specifies the furnishing and installation of rubber floor covering and stair treads.
- B. Qualifications of Manufacture: Provide the Product of an established manufacture regularly engaged in the production of the floor covering specified.
- C. Deliver products to the job site in their original unopened containers clearly labeled with the manufactures' name, brand designation, and type as applicable.
- D. Store products in a dry area protected from contact with soil and from exposure to the elements.
- E. Handle the products in a manner that will prevent breakage of containers, damage to products and moisture intrusion.

## **PART 2 – PRODUCTS**

### **2.01 TERMINALS**

#### **A. Ratings**

1. Terminal Type: Modular Micro Terminal with Screw Clamp Connection
2. Wire size accommodated: #22 through #12-AWG
3. Rated Current: 27 Amps
4. Rated Voltage: 300 VDC
5. Center-to-Center Spacing: 6 mm

### **2.02 KIOSK CABINET BAY ASSEMBLY**

#### **A. Ratings**

1. Frame Material: 16-Gauge Galvanized Steel
  1. Exposed Metal Finish: Metro Bronze color 20040 (Federal Standard 595B)
2. Desk Tops: 1-inch Marine Plywood (MARINE AA EXT-APA)
3. Hardware: Cadmium Plated
4. Desk-Top Laminate: DuPont Corian with bull nose edge
5. Desk-Top Laminate Color: Neutral White #918.Aurora
6. Blank Panels-16-Gauge Galvanized Steel, painted to match kiosk cabinets

### **2.03 KIOSK DATA FILE**

- A. Description: Each Kiosk Data File shall consist of eight or more 11-inch by 17-inch drawings.
- B. Prepared Kiosk Data File drawings to document each of the following subjects:
  1. Telephones (passenger station) - A cross-reference of telephone numbers and telephone locations within a passenger station
  2. Telephones (Right-of-Way and Ancillary Facilities) - A cross- reference, by telephone numbers and locations, of the telephones along the right-of-way and in ancillary facilities associated with a passenger station
  3. Fire Zones (Passenger Station) - A cross-reference of the designated fire zones, room numbers and room descriptions for all areas within a passenger station including ancillary facilities within the passenger station limits.
  4. Fire Zones (Ancillary Facilities) - A cross-reference of the designated fire zones in remote ancillary facilities associated with a passenger station.
  5. Intrusion Zones (passenger station) - A cross-reference of the designated intrusion zones, room numbers, and room descriptions for all areas of a passenger station, including ancillary facilities within the passenger station limits.
  6. Intrusion Zones (Ancillary Facilities) - A cross-reference of the designated intrusion zones in remote ancillary facilities associated with a passenger station.
  7. Escalators - A cross-reference of assigned escalator numbers and escalator locations within a passenger station.

8. CCTV - A cross-reference of television monitor assignments and arrangements, and television camera designations, locations and areas of coverage for all television cameras and television monitors within a passenger station.
9. Integrated Intercommunications System - A layout of platform(s) showing locations and designations of call stations

C. Rating

1. Seal Kiosk Data File drawings in a protective plastic laminate
2. Each Kiosk Data File set shall be in loose-leaf booklet form
3. Covers: 11-inch by 17-inch minimum of 60-pound punched paper with holes reinforced with plastic, cloth or metal, and sealed in a protective plastic laminate

2.04 EMERGENCY COMMUNICATIONS KIOSK TERMINAL PANEL

A. Description: The Emergency Communications Kiosk Terminal Panel consists of three terminal blocks mounted on a 16-gauge steel plate and has the following characteristics:

1. Two of the terminal blocks shall each have a minimum of 23 miniature terminals
2. The other terminal block shall have a minimum of 20 miniature terminals

2.05 FLOOR COVERING

- A. Floor Covering: Heavy-duty rubber mat with ribbed surface and smooth back, all rubber compound 3/16-inch thick, terra cotta color.
- B. Rubber Stair Tread: Molded tread, all rubber compound, free of blemishes, 5/16 inch thick; with light color nosing 1/2 inch wide, terra cotta color. Abrade at least 80 percent of back of tread and nosing to assure adhesion to substrate.
- C. Stair Tread Adhesive: Permanent, as recommended by tread manufacturer for adhesion to galvanized steel substrate.
- D. Fabricate floor covering in five pieces to fit area shown, with edges square and true, without overlapping.
- E. Verify configuration of equipment in Kiosk to ensure fit of flooring within 1/16-inch tolerance.
- F. Fabricate nosing of stair tread to wrap around curved ends of step, to provide uniform elevation appearance on three sides of step. Fabricate and adhere nosing so that it will not delaminate or otherwise separate from the stair tread material.

**PART 3 – EXECUTION**

3.01 INSTALLATION

A. Kiosk Cabinet Bay Assembly Installation

1. Install the assembled kiosk cabinetry in the kiosk of the passenger station(s). Cabinet assembly installation shall be as follows:
  - a. Bays # 1, #2A, 2B, 2C and #3 as a single unit; Bays #4, #5, and #6A, 6B, and 6C as a single unit, secured to the floor of the kiosk. Kiosk cabinets may be secured to the kiosk sides with approval; however, the securing hardware shall not carry any vertical load. Hardware installed in the kiosk sides shall only be used to prevent horizontal movement.

B. Kiosk Cable Termination Rack Installation

1. Install a Kiosk Cable Termination Rack in Kiosk Cabinet Bay 6B of the kiosk. Install structure elements in the Kiosk Cabinet Bay 6B to accommodate the Terminal Strips and the Line Terminal Block of the Kiosk Cable Termination Rack.
- C. Emergency Communications Kiosk Terminal Panel
1. Install an Emergency Communications Kiosk Terminal Panel in Kiosk Cabinet Bay 6B of the kiosk, as indicated on Contract Drawings. Installation shall not interfere with the Cable Termination Rack Terminal Strips. Secure Cables to the Emergency Communications Kiosk Terminal Panel to the panel to prevent interference with the Kiosk Cable Termination Rack wiring and cabling.
- D. Escalator Display Panel
1. Install an Escalator Display Panel in Cabinet Bay 3 of the Kiosk.
    - a. Install the required wiring harness (es) between the panel and the Kiosk Cable Termination Rack in Bay 6B, and make all necessary connections and cross-connections. Install one 9-conductor, 18-AWG, shielded cable for each escalator associated with the passenger station(s) between the Kiosk Cable Termination Rack in Bay 6B of the Kiosk and the Escalator Terminal Box in the escalator wellways. Terminate the cables in the kiosk and at the escalators and make all necessary connections and cross-connections.
- E. Elevator Control Panel
1. The Elevator Control Panel will be installed in Bay 3 of the kiosk under Section 14240, ELECTRIC TRACTION ELEVATORS.
- F. 24-MM/ Optical Cable
1. A fiber-optic cable containing twenty-four multi-mode fibers shall be installed between the Kiosk and the Communications Room. The multimode fiber shall be 50  $\mu$ m laser optimized (OM3). The cable should be terminated, on Type SC bulkhead adapters on an optical patch/termination panel on both ends, in Bay 2A.
- G. One 25 pair VF plenum rated copper twisted pair cable shall be installed from the main communications room to the kiosk. This cable shall terminate on a wall mount style 110 termination block at each end and will be used to extend emergency telephone service to the Kiosk in the event of VoIP system failure. Cable must be NFPA 130 compliant.
- H. Public Address Control Panel
1. Install a Public Address Control Panel in Cabinet Bay 3 of the Kiosk.
    - a. Install the required wiring harness (es) between the panel and the Public Address equipment located in the communication room, and make all necessary connections and cross-connections.
- I. Closed Circuit Television
1. Install 2 touch screen monitors above Cabinet Bays 2B, and 2C. Install 4 viewing monitor on a mounting beam at the top of the window above Bays 2A and 2B. Install the required wiring to the workstation in Bay 2B. The Video Management Server shall be located in the communication room, connect via network switch.
- J. Fire and Intrusion Control Panel
1. Install a remote Annunciator Fire and Intrusion Panel in Cabinet Bay 6B. Install all required parallel wiring to the Common Control Unit located in the communication room, and the connection to the LAN/WAN that is connected to the Head-End in the Jackson Graham/Carmen Turner Buildings OCCs.

K. Kiosk Information Display System (KIDS)

1. KIDs display shall be mounted on face of station entrance kiosk. Mounting bracket for display is preferred to be built into structure of kiosk. Location of display shall be coordinated with location of kiosk-mounted cameras. Color of display body shall match that of the kiosk. Maximize visibility to riders in the kiosk area. The unique lighting conditions, including glare, at each kiosk shall be considered to optimize visibility. Typically the KID shall be mounted on the kiosk front face. The Contractor may recommend another kiosk face if it thinks it may provide better utility, visibility and usefulness to passengers. WMATA shall have final approval of any recommended deviations, and approval must be received before installation may begin. HDMI cables shall not exceed 30 feet in length. Final integration of KIDs will be performed by WMATA.

3.02 MANUFACTURER'S FIELD SERVICES

- A. Prepare and start systems
- B. Inspect final wiring connections and supervise or perform system adjustments

3.03 ADJUSTING

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation

3.04 FLOOR COVERING

- A. After installation, prohibit traffic and protect floor covering with plastic sheets or heavy building paper with taped joints. Use plywood protection boards when moving equipment. Maintain protection until Acceptance.

**END OF SECTION**

## SECTION 16740

### COMMUNICATIONS – ELECTRONIC ACCESS CONTROL SYSTEM

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This section specifies a complete and operational Access Control system for Authority-wide including WMATA's rail system, parking garages, bus divisions, and support facilities.
- B. Related Sections:
  - 1. Section 08331 – Overhead Coiling Doors
  - 2. Section 08710 - Finish Hardware
  - 3. Section 16703 – Communications Standard Specifications-Engineering Services
  - 4. Section 16704 – Communications Standard Specifications-Installation
  - 5. Section 16705 – Communications Standard Specifications-Equipment & Material
  - 6. Section 16706 – Communications System Submittals & Services
  - 7. Section 16707 – Communications Quality Assurance & Testing
  - 8. Section 16710 – Communications Grounding
  - 9. Section 16715 – Communications Electrical Power Distribution
  - 10. Section 16120 - Wire Cable, and Busways
  - 11. Section 16733 – Communications – Kiosk Systems

##### 1.02 REFERENCES

- A. Code, Regulations, Reference Standards, and Specifications:
  - 1. National Electrical Code (NEC)
  - 2. NFPA 130 – Standard for Fixed Guideway Transit Systems
  - 3. UL 1076 – Proprietary Burglar Alarm Units and Systems
  - 4. ADA Standards
  - 5. Electronics Industries Alliance (EIA) Standard RS 170
  - 6. Federal Standard 595B, Colors Used in Government Procurement
  - 7. WMATA Design and Wiring Standards rev1 May 2014
  - 8. WMATA Standards Access Control drawings

##### 1.03 QUALITY ASSURANCE

- A. Qualifications:
  - 1. Equipment manufacturer: Select a manufacturer who is engaged in production of similar Access Control products and accessories.
  - 2. Equipment supplier: A manufacturer authorized distributor of specified products with minimum of three years documented experience.
  - 3. Equipment installer: A manufacturer authorized installer of specified products with service facilities within 100 miles of WMATA.

- B. Coordination
  - 1. Installer shall coordinate Access Control installation with all other concurrently running work at the location specified under this task.
- C. The Contractor shall develop test procedures and obtain Engineer approval prior to final acceptance testing.
- D. The Contractor shall perform progressive tests in accordance with the approved test procedure to verify compliance with specified system performance requirements, including but not limited to proper component operation, and software operations.
  - 1. The Contractor's Quality Assurance Engineer shall witness all progressive testing.
  - 2. All discrepancies found during testing shall be corrected and test reports submitted prior to scheduling end-to-end testing.
  - 3. The Contractor shall notify the Engineer prior to commencing progressive testing and shall offer the Engineer the opportunity to witness the testing. Witnessing of any portion of the progressive testing by the Engineer shall not relieve the contractor from responsibility for any portion of follow-on testing.
- E. End-to-End Test:
  - 1. The Contractor shall demonstrate the proper functioning of the completed Access Control system.
  - 2. Each access control device shall operate as specified in the design drawings and be properly configured on the access control software.
  - 3. The Contractor shall submit certified test reports within 10 working days after completion of field tests.

**1.04 SUBMITTALS**

- A. Submit the following for approval in accordance with Section 16706 and with the additional requirements as specified for each:
  - 1. Design Drawings
    - a. Proposed changes and revised equipment layouts
    - b. System riser diagrams to include source of power.
    - c. Access Control equipment mounting details.
    - d. Completed door controllers and equipment schedules
  - 2. Product Data: Provide product data sheets for each item of equipment and resubmittal for equipment which changes as a result of required modification.
  - 3. Manufacturer's Installation Instructions
    - a. Indicate application conditions and limitations of use, stipulated by Product testing agency.
    - b. Include instructions for storage, handling, protection, examination, preparation, installation, and start-up of Product.
- B. As-Built Documents: Prior to Substantial Completion, develop As-Built documents as follows:
  - 1. As-Built Drawings of the Access Control system installation to include, but not be limited to camera layouts, communication and power cable pathways and wiring, equipment details and equipment schedules.
  - 2. Approved copies of each submittal

- C. Operation and Maintenance (O & M) manuals
  - 1. Complete printed operating instructions in manual or handbook form, completely and clearly indexed for ready reference during actual operation and for use as text during instruction of personnel.
  - 2. Include descriptions of systems, background information, and complete procedures for adjustment, calibration, replacement, and repair of components in system.
  - 3. Make data contained specific for and exclusive to the systems and equipment for the work of this Contract.
  - 4. Field test data and reports.
- D. Certification
  - 1. Certificates from manufacturers verifying that equipment conforms to the specified requirements.

**1.05 OPERATION AND MAINTENANCE TRAINING**

- A. In accordance with the General Requirements.

**PART 2 - PRODUCTS**

**2.01 SECTION INCLUDES:**

- A. Access Control Hardware
- B. Software Licensing

**2.02 PoE DOOR CONTROLLER**

- A. Make and Model: Honeywell PW6K1ICE or approved equal
- B. Power Input:
  - 1. Power over Ethernet (PoE) 12.95W
  - 2. 12 VDC, 200 mA min, 900 mA max
- C. Power Output:
  - 1. 12 VDC @ 650 mA (reader and AUX outputs combined)
  - 2. 10.3 – 12.6 VDC reader output @ 150 mA max
  - 3. 10.7 – 13.0 VDC AUX power output @ 700 mA max
- D. Environmental Factors:
  - 1. Operating temperature: 0°C to 70°C (32°F to 158°F)
  - 2. Humidity: 10 - 95% RHNC
  - 3. Storage conditions: -55°C to 85°C (-67°F to 185°F)
- E. Host Communication: RJ-45 for 10BASE-T/100BASE-TX PoE interface
- F. Inputs: 2 supervised, programmable end of line resistors, 1k/1k-ohm 1% 1/4 watt standard, and dedicated tamper switch
- G. Relays: 2 outputs, Form-C contacts: 2A @ 30 VDC
- H. Reader Module:
  - 1. Configuration: wiegand or OSDP
  - 2. Reader Power: 12VDC 10% or local power supply
  - 3. Reader Data Inputs: Two TTL reader ports or one 2-wire RS-485 reader port

capable of supporting two readers

- I. Cable Requirements:
  - 1. Power: 1 twisted pair, 18 AWG
  - 2. Ethernet: CAT-6
  - 3. Reader Data (TTL): 18 AWG – 6 conductors, 500 ft. (150 m) max
  - 4. Reader Data (RS-485): 24 AWG, 120Ω impedance, twisted pair with shield, 4,000 ft. (1,219 m) max
  - 5. Alarm Input: 1 twisted pair per input (30Ω max loop resistance)
- J. Compatibility:
  - 1. Access Control Software: the door controller shall be compatible with the access control server. The access control software configures the door controller. The door controller sends a transaction log on real time to the access control server through the WMATA's WAN network.
  - 2. Card Readers: the reader module which is part of the door controller shall be compatible with the wiegand output of Mifare Plus S and 125 kHz proximity readers.
- K. Warranty: 1-year warranty

### **2.03 PoE DOWNSTREAM DOOR CONTROLLER**

- A. Make and Model: Honeywell PW6K1R1E or approved equal. Up to 26 PW6K1R1E downstream boards can be connected to PW6K1ICE controller board
- B. Power Input:
  - 1. Power over Ethernet (PoE) 12.95W
  - 2. 12 VDC, 200 mA min, 900 mA max
- C. Power Output:
  - 1. 12 VDC @ 700 mA max (reader and AUX outputs combined)
  - 2. 10.3 – 12.6 VDC reader output @ 150 mA max
  - 3. 10.7 – 13.0 VDC AUX power output @ 700 mA max
- D. Environmental Factors:
  - 1. Operating temperature: -40°C to 75°C (-40°F to 167°F)
  - 2. Humidity: 10 - 95% RHNC
  - 3. Storage conditions: -55°C to 85°C (-67°F to 185°F)
- E. Host Communication: RJ-45 for 10BASE-T/100BASE-TX PoE interface
- F. Inputs: 4 unsupervised/supervised, Programmable End of Line resistors, 1k/1k-ohm 1% 1/4 watt standard, and dedicated tamper switch
- G. Relays: 2 outputs, Form-C contacts: 5A @ 28 VDC
- H. Reader Module:
  - 1. Reader Power: 12VDC 10% or local power supply
  - 2. Reader Data Inputs: Two TTL reader ports or one 2-wire RS-485 reader port capable of supporting two readers
- I. Cable Requirements:
  - 1. Power: 1 twisted pair, 18 AWG

2. Ethernet: CAT-5 (minimum)
  3. Reader Data (TTL): 18 AWG – 6 conductors, 500 ft. (150 m) max
  4. Reader Data (RS-485): 24 AWG, 120Ω impedance, twisted pair with shield, 4,000 ft. (1,219 m) max
  5. Alarm Input: 1 twisted pair per input (30Ω max loop resistance)
- J. Reader Data Inputs: Two TTL reader ports or one 2-wire RS-485 reader port capable s:
- K. Compatibility:
1. Access Control Software: the downstream door controller shall be compatible with the access control server. The access control software configures the downstream door controller. The downstream door controller sends a transaction log to the access control server on real time through the WMATA's WAN network.
  2. Card Readers: the reader module which is part of the door controller shall be compatible with the wiegand output of Mifare Plus S and 125 kHz proximity readers.
- L. Warranty: 1-year warranty

#### **2.04 CARD READER WITH KEY PAD**

- A. Make and Model: Oberthur ID One Secure Pac reader. Model 125 14443 DF PIN 500-5045 with WMATA profile or approved equal
- B. Power Supply: 7 – 24 VDC (12 VDC recommended)
- C. Current Consumption @ 12 VDC:
  1. Average: 110 mA
  2. Peak: 171 mA
- D. Typical Read Range:
  1. Mifare ISO card: 60 mm (2.4 inch)
  2. LF Proximity ISO card: 30 – 60 mm (1.2 – 2.4 inch)
- E. Host Communication: RJ-45 for 10BASE-T/100BASE-TX PoE interface
- F. Operating Temperature: -25°C - 65°C (-15°F - 150°F)
- G. Protection Class: IP54
- H. Cards: Mifare Plus S, 26-Bit and 37-Bit 125 kHz proximity cards.
- I. Warranty: 2-year warranty

#### **2.05 CARD READER WITHOUT KEY PAD**

- A. Make and Model: Oberthur ID One Secure Pac reader. Model 125 14443 DF 500-5045 with WMATA profile
- B. Power Supply: 7 – 24 VDC (12 VDC recommended)
- C. Current Consumption @ 12 VDC:
  1. Average: 110 mA
  2. Peak: 146 mA
- D. Typical Read Range:
  1. Mifare ISO card: 60 mm (2.4 inch)
  2. LF Proximity ISO card: 30 – 60 mm (1.2 – 2.4 inch)

- E. Host Communication: RJ-45 for 10BASE-T/100BASE-TX PoE interface
- F. Operating Temperature: -25°C - 65°C (-15°F - 150°F)
- G. Protection Class: IP54
- H. Cards: Mifare Plus S, 26-Bit and 37-Bit 125 kHz proximity cards.
- I. Warranty: 2-year warranty

## **2.06 MOTION SENSORS**

All motion sensors shall be able to be powered by either 12VDC or 24 VDC.

- A. Ceiling Mount: high performance panoramic, dual element sensor Bosch DS938Z or approved equal
- B. Wall Mount: high performance panoramic, dual element sensor Bosch DS778Z or approved equal
- C. Request to Exit (REX) Motion Sensor: Bosch DS150i or Securitron XMS, or approved equal

## **2.07 CREDENTIALS**

- A. Mifare Plus S which supports ISO/IEC 14443 Type A with communication speed up to 848 kbit/s. Make and Model: NXP model MF1SPLUS6001DA4 in MOA4 module form

## **2.08 REQUEST TO EXIT (REX) PUSHBUTTON**

- A. Plastic button: Alarm Controls TS-2 or approved equal
- B. Metal button: Schlage Locknetics 620 series or approved equal

## **2.09 DOOR STRIKES**

- A. Refer to the Access Control Standard Drawings for door details and door strikes type. Door strikes to be able to be powered by either 12VDC or 24VDC.

## **2.010 MAGNETIC LOCKS (MAGLOCKS)**

- A. All Maglocks shall be able to be powered by either 12VDC or 24VDC. Make/Model: Securitron M62 series or approved equal

## **2.011 DOOR POSITION SWITCH**

- A. Make and Model: Sentrol 1076C or approved equal. Similar color of the door frame.

## **2.012 POWER SUPPLY**

- A. All power supplies to deliver at least 2 Amps @ 12VDC or 24 VDC. Make/Model: SDC 602RF or approved equal

## **2.013 ACCESS CONTROL ENCLOSURE**

Refer to the access control enclosure standard drawing for devices installed inside and mounting details

## **2.014 SOFTWARE LICENSE**

- A. Stand Alone Applications: access control software compatible with card readers described above and the use of Mifare Plus S cards. Pro-Watch corporate edition or approved equal
- B. Addition to the existing system: new access controlled doors shall be configured on the existing access control software adding the proper amount of card licenses

## **PART 3 - EXECUTION**

### **3.01 DESIGN**

- A. Submit the optimum design layout of the new access controlled doors and devices specifications prior to installing any equipment. The Contractor will use the layout to determine the adequacy of the design and, in conjunction with a field survey, determine the exact location of each Access Control device

### **3.02 INSTALLATION**

- A. Installation of devices covered by these specifications shall comply with the Access Control Standard drawings
- B. Installation of access control devices shall be performed in a neat and professional manner and retain all elements of the rail and bus system's architectural excellence
- C. Installation of access control devices shall be coordinated with work of other trades
- D. Access Control equipment shall be installed in accordance with manufacturer's instructions
- E. Access Control equipment shall not be installed over tracks or extend beyond the inside of the platform edge granite unless otherwise specified and approved.
- F. All cables shall be installed and tested in accordance with the most current WMATA Design and Wiring Standards
- G. For conduit, raceways and cabinet installation see Section 16130
- H. For wire cable and busways installation, see Section 16120

### **3.03 SOFTWARE CONFIGURATION**

- A. Configure and document all parameters chosen during the configuration of all new devices the access control software
- B. The Contractor shall configure new devices on the access control software with the supervision of the WMATA engineer

### **3.04 FIELD QUALITY CONTROL**

- A. Design and Performance Testing: Perform tests and submit results in accordance with the General Provisions, certified test results for the Access Control system installed under this contract
- B. Acceptance Testing:
  - 1. Furnish equipment required to perform tests
  - 2. Comply with WMATA approved system testing
  - 3. Perform approved tests to verify that the Access Control systems comply with requirements shown and specified
- C. The Contractor is responsible for testing all power and communications signals in accordance with WMATA's Design and Wiring Standards

### **3.05 DEMONSTRATION**

- A. Conduct walking tour of Project and briefly describe function, operation and maintenance of the system components
- B. Demonstrate operation and maintenance of the system to WMATA personnel two weeks prior to date of Substantial Completion
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing,

maintenance and shutdown of each item of equipment at equipment location

- E. Prepare and insert additional data in operations and maintenance manuals as needed for additional data becomes apparent during instruction

**3.06 SPARE PARTS**

- A. In accordance with special conditions and the following:

- 1. Provide spare parts and/or equipment for no less than 10% of new items that are added to WMATA's inventory under this task

**PART 4 - END OF SECTION**

## SECTION 16771

### COMMUNICATIONS - CARRIER TRANSMISSION SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. This Section describes the basic requirements for the installation of the Carrier Transmission System (CTS). The CTS System consists of Integrated Access Device (IAD) terminals and/or related equipment in Passenger Stations. The Carrier Transmission System is an integral part of the WMATA telecommunications network used to multiplex voice and data transmissions of the WMATA Rail Rapid Transit System into a dedicated digital carrier. The CTS uses a T1 digital format to transmit trunked information between the CTS hub at the Jackson Graham Building and terminal locations (passenger stations, yards and selected buildings) along the WMATA right-of-way
- B. The transmission medium for the Telecommunications Network shall be fiber-optic cable.
- C. At each terminal location, the equipment associated with the Carrier Transmission System is powered from a 48-Vdc power system. (See Power System Specifications.)

##### 1.02 SECTION INCLUDES

- A. Integrated Access Device (IAD) Equipment.
- B. Fuse, Alarm and Distribution Panel.
- C. Multi-Section Main Distribution Frame

##### 1.03 UNIT PRICES

- A. Unit Prices include incidental items, not specifically mentioned, but required for complete and proper system operation.

##### 1.04 RELATED SECTIONS

- A. Section 16705 - Communications Standard Specifications - Equipment & Material
- B. Section 16706 - Communications System Submittals & Services
- C. Section 16707 - Communications Systems Quality Assurance & Testing
- D. Section 16710 - Communications Grounding.
- E. Section 16715 - Communications Electrical Power Distribution.
- F. Section 16776 - Communications - Fiber Optics System.

##### 1.05 REFERENCES

- A. Bell Communications Research (Bellcore) Publication 43801, Digital Channel Bank - Requirements and Objectives.
- B. FCC Part 15, Radio Frequency Devices.

## 1.06 SYSTEM DESCRIPTION

- A. Description: The CTS uses a T1 digital format to transmit trunked information between the CTS hub at the Jackson Graham Building and terminal locations (passenger stations, yards and selected buildings) along the WMATA right-of-way using the Fiber Optic System described in Section 16776.
- B. An Integrated Access Device (IAD) terminal is connected to the fiber-optic terminal at each location to convert information into a format suitable for transmission on the fiber-optic system. In the transmit direction, channel units and common equipment shall convert data, voice and signaling information from base band channels into a digital bit stream. In the receive direction, the received digital bit stream shall be converted into base band channels of data, voice and signaling information. A single terminal can support up to 64 voice channels, each of which can be allocated or reallocated to any desired time slot within a T-1 bit stream, using the terminal's firmware. Additionally, DSO signals can be cross connected from one T-1 bit stream to another, using the terminal's software. The 1518 IAD Multiplex Equipment consists of the following equipment and channel cards mounted in a connectorized multiplex shelf:
1. The chassis provides 18 card slots, front and rear load, not counting ring generator cards or power supply units. The front side supports connectivity for up to two CPU cards, three server cards, and four WAN cards, (Ref. Dual T1/E1 Line Interface Unit). Additionally, there are two slots available for Power Supply Units. The rear side supports connectivity for up to one Interface card (Ref. T1/E1 Interface Card) and up to eight voice cards. Additionally, there are five slots available for optional Power Supply units and Ringing Generator cards.
  2. The Interface Card provides the interface between the IAD and the Network Management System (Computer, WAN, or VT-100 Terminal). Connectivity is available on the card at the RJ-11 Modem Port, RS-485 Node Port, RS232 Ports, and the T1/E1 WAN Link Connector
  3. The DC Power Supply provides the -48Vdc to the system, including the Ringing Generator Unit.
  4. The Ringing Generator Unit provides the 105Vac, 20Hz ringing voltage required for FXO/FXS card operation. The unit is capable of driving 11 simultaneously ringing voice ports.
  5. The Dual T-1/E-1 Line Interface Unit (WAN CARD) terminates T1 and/or E1 lines and generates and receives network timing clocks. Additionally, the unit operates in conjunction with the CPU card, to perform cross connecting of DSO time slots from a T1 or E1 line to another, as required. Two cross connections are supported per card.
  6. The DSX/CEPT Plug In Module plugs into the Line Interface Unit (WAN Card) and provides the near-end termination point for the T1 or E1 line. Two modules are required for every Line Interface Unit.
  7. The FXS/FXO cards manage the flow of FXS voice traffic over the network. Subscriber cards (FXS) installed in 1518 IAD terminals at passenger stations and Office cards (FXO) installed in IAD terminals at the Central Office (JGB) encodes analog voice signals to a digital bit stream for transmission over the T1/E1 network. Each card also decodes the digital bit stream to an analog voice signal, sent by the remote terminal. Each card has 8 ports and can support up to 8 voice channels.
  8. The 5 Port OCU-DP provides direct access to a selected voice channel within the T1 /E1 digital bit stream.
  9. The E/M cards manage the flow of toll grade voice traffic through the T1/E1 network. Traffic flow is dependent on status of the signals on the card's E (Ear) and M (Mouth) pins. Each unit encodes an analog voice signal to a digital bit stream for transmission over the T1/E1 network. Each unit also decodes the digital bit stream to an analog

voice signal, sent by the remote terminal. Each unit has 8 ports and can support up to 8 voice channels.

10. The CPU Card performs a self-test on all cards plugged into the chassis, processes all incoming operator commands, stores the system software in flash memory, includes a test pattern generator for T1 and E1 line testing, and works in conjunction with the Dual T1/E1 Line Interface Unit, to provide cross connecting of DSO time slots from one T1 or E1 line to another as required.
- C. A Multi-Section Main Distribution Frame, located in each Communications Equipment Room, is used to house protector blocks and terminal blocks required to protect and terminate all communications cables.
- D. Capacity:
  1. The Contractor shall furnish and install Integrated Access Device (IAD) multiplex carrier systems in quantities mandated by the design of the overall communications system for each station, and design goals outlined in this specification.
  2. The Contractor shall furnish and install Fuse, Alarm and Distribution Panels in each equipment rack in which 48-Vdc equipment is installed.
  3. The Contractor shall design, furnish, and install a Multi-Section Main Distribution Frame in each Station Communications Equipment Room.

#### 1.07 SYSTEM PERFORMANCE REQUIREMENTS

- A. The Contractor shall be responsible for the overall performance of the Carrier Transmission System. The following overall System performance requirements are designed to ensure that the Carrier Transmission System, delivered under these Specifications, meets the performance requirements of the Washington Metropolitan Area Transit Authority.
  1. Total System Error Rate: less than 1 in  $10^{-6}$
  2. Crosstalk Coupling Loss: 65-dB minimum (700 to 1100 Hz)
  3. Loss Stability:  $\pm 0.6$  dB over life in 95% of the circuits.
  4. Tracking: -37 to +3 dBm<sub>0</sub> Input: 0.6 dB maximum deviation
  5. Tracking: -50 to -37 dBm<sub>0</sub> Input: 1.2 dB maximum deviation
  6. Idle Channel Noise: 25-dBm<sub>0</sub> maximum
  7. Frequency Response 4-Wire E&M Channel Units (Referenced 1020 Hz end to end):
    - a. 200-Hz: +0.3 to -3.2 dB
    - b. 300-Hz to 3000-Hz: +0.4 dB
    - c. 3200-Hz: +0.4 to -1.5 dB
    - d. 3400-Hz: +0.3 to -3.2 dB
  8. Frequency Response 2-Wire E&M Channel Units (Referenced at 1000 Hz at 0 dBm<sub>0</sub>, end to end):
    - a. 600-Hz to 2400-Hz: +1.2 dB
    - b. 300-Hz to 3400-Hz: +1.2 to -3.2 dB
  9. Frequency Response 2-Wire FXO/FXS Channel Units (Referenced 1020 Hz end to end):
    - a. 60-Hz: 20.0 dB minimum loss
    - b. 600-Hz to 2400-Hz: +1.0 dB
    - c. 300-Hz to 3400-Hz: -1.0 to -3.0 dB

#### 1.08 SUBMITTALS

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.

- C. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

#### **1.09 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Authorized installer of specified manufacturer with service facilities within 50 miles of Project.

#### **1.10 REGULATORY REQUIREMENTS**

- A. Conform to requirements of Bellcore Pub. 43801 and FCC Part 15.

#### **1.10 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Carrier Transmission System until Final Completion.

### **PART 2 - PRODUCTS**

#### **2.01 CTS MULTIPLEX SHELF (18 CARD SLOT)**

- A. Manufacturers:
  - 1. Alcatel part number 259-8004-523 (or approved equal)
- B. 19 inch rack mount with ear adaptors for 23 inch rack
- C. Front and rear load
  - 1. 9 front (plus 2 for power supply)
  - 2. 9 rear (plus 5 for ringing generator and generator supply)
- D. Meets requirements of FCC rules, part 15.

#### **2.02 INTERFACE CARD WITH MODEM (INF+M)**

- A. Manufacturers:
  - 1. Alcatel part number 259-8004-197 (or approved equal)
- B. Internal MODEM with 32K non-volatile RAM
- C. Connectors as follows:
  - 1. One RJ-1 1 (connects to phone line)
  - 2. One RS-485 (provides contacts to report alarms)
  - 3. One RS-233 Terminal Port (connects to VT1 00 terminals)
  - 4. One RS-232 Computer Port (connects to computer)
  - 5. One T-1/E-1 WAN Port (up to 8 connections supported)

#### **2.03 DC POWER SUPPLY (-48 VDC)**

- A. Manufacturers:
  - 1. Alcatel part number 259-5001-099 (or approved equal)
- B. Compatible with multiplex shelf and all plug-in modules
- C. Adequate power for fully equipped multiplex shelf

#### **2.04 -48 VOLT RINGING GENERATOR**

- A. Manufacturers:
  - 1. Alcatel part number 259-8004-725 (or approved equal)
- B. Compatible with multiplex shelf and all plug-in modules
- C. Ringing voltage = 105 Vac @ 20 Hz (up to 11 simultaneous ports)
- D. Includes master/slave jumpers for ganging signals together

#### **2.05 DUAL T-1/E-1 LINE INTERFACE UNIT (WAN CARD)**

- A. Manufacturers:
  - 1. Alcatel part number 259-8004-205 (or approved equal)
- B. WAN-Dual (S60) installed in slots W1, W2, or W3
- C. WAN-R (S60) installed in slot W4. Includes relays for auto activation upon failure of cards in slots W1, W2, or W3.
- D. Connects to two T1/E1 ports or combination thereof
- E. Power consumption
  - 1. WAN-Dual (S60)=1.5 watts
  - 2. WAN-R(S60) = 2 watts

#### **2.06 DSX/CEPT PLUG-IN MODULES**

- A. Manufacturers:
  - 1. Alcatel part number 259-8004-314 (or approved equal)
- B. Provides termination point for near-end T-1/E-1 line
- C. Two modules required per Interface Unit, WAN Dual (S60)
- D. Power consumption = 0.45 watts per module

#### **2.07 2 WIRE FXO CHANNEL UNIT (8 PORTS)**

- A. Manufacturers:
  - 1. Alcatel part number 2598004275 (or approved equal)
- B. Compatible with multiplex shelf
- C. Eight ports per unit

- D. Jumpers for Foreign Exchange (FXO) or Manual Ring-down (MRD) operation
- E. Frequency response (referenced to 1020 Hz, end to end) from 300 to 3000 Hz: +0.5 to 1.0 dB, or better
- F. Idle channel noise (end to end); 23 dBrcO maximum
- G. Termination impedance = 600 ohms (each port)
- H. Power consumption = 9.7 watts

#### **2.08 2 WIRE FXS CHANNEL UNIT (8 PORTS)**

- A. Manufacturers:
  - 1. Alcatel part number 259-8004-274 (or approved equal)
- B. Compatible with multiplex shelf
- C. Eight ports per unit
- D. Frequency response (referenced to 1020 Hz, end to end) from 300 to 3000 Hz: +0.5 to -1.0 dB, or better
- E. Idle channel noise (end to end); 23 dBmcO maximum
- F. Termination impedance = 600 ohms (each port)
- G. Power consumption = 9.7 watts

#### **2.09 OFFICE CHANNEL UNIT DATA PORT (5 PORTS)**

- A. Manufacturers:
  - 1. Alcatel part number 259-8004-519 (or approved equal)
- B. Compatible with multiplex shelf five (5) ports
- C. Multiple data rates up to 56 KBPS

#### **2.10 4 WIRE E&M CHANNEL UNIT**

- A. Manufacturers:
  - 1. Alcatel part number 259-8004-207 (or approved equal)
- B. Compatible with multiplex shelf
- C. Eight (8) ports with associated switches (S1-S4) for selecting E&M signaling type
- D. Termination impedance = 600 ohms (each port)
- E. Extended Transmit Range (TLP) included: provides -17.5 to+15 dB for dedicated 4 wire modem applications (required for data speeds of 19.2 KBPS and higher)
- F. Power consumption = 3.5 watts

#### **2.11 CPU CARD WITH CROSS CONNECTS**

- A. Manufacturers:
  - 1. Alcatel part number 259-8004-746 (or approved equal)
- B. Compatible with multiplex shelf
- C. Power consumption = 3.63 watts

## **2.12 FUSE, ALARM AND DISTRIBUTION PANEL**

- A. Manufacturers:
  - 1. Hendry Model Number HMW 06020-05, (or approved equal).
- B. Universal mounting for 19-inch or 23-inch relay rack
- C. Designed for -48 Vdc power supply distribution.
- D. Minimum of 10 fuse positions.
- E. 40 amp panel capacity.
- F. Alarm circuit with visual alarm indication(s), and external alarm contacts.
- G. Fuses:
  - 1. Appropriate type GMT complement panel alarm circuitry/visual indication(s).
  - 2. Each fuse shall be appropriately rated for the corresponding equipment to which it distributes power.
  - 3. Quantity of fuses to be provided within each fuse panel shall correspond to the number of equipment items requiring -48 Vdc power within the associated equipment rack.

## **2.13 MULTI-SECTION MAIN DISTRIBUTION FRAME**

- A. Manufacturers:
  - 1. Sun West Model PBI-50V zinc coated steel (NEMA-3R) terminal housing with hinged access door (or approved equal).
- B. With 3/4" plywood backboard.
- C. Stainless Steel Hinge.
- D. Ground Bar.
- E. With 66 type distribution blocks, as required.

## **2.14 PROTECTOR BLOCKS**

- A. Manufacturers:
  - 1. Reliable Electric (RELTEC) Model R128VSR2 (or approved equal).
- B. 2-electrode fail-short gas arrestors.
- C. Arrestor striking voltage 350-400 Vdc.
- D. Two-pair protection.

## **2.15 STATION TELEPHONE WIRE**

- A. Manufacturers:
  - 1. Champlain Cable Part Number Plus-24-4UTP (or approved equal).
- B. Ratings:
  - 1. Size: Four-Pair.
  - 2. Gauge: 24-AWG, Unshielded Twisted Pair (UTP).
  - 3. Conforms to NEC CMP Category five
  - 4. NEC Plenum Rated.
  - 5. Insulation: (non-PVC) FEP Teflon (or approved equal).
  - 6. Jacket: (non-PVC), Halar<sup>®</sup> (or approved equal).

## **PART 3 - EXECUTION**

### **3.01 PASSENGER STATION INSTALLATION**

- A. Install and wire the following equipment on the fiber optics 23-inch equipment rack in the Communications Equipment Room of Passenger Station:
  - 1. CTS Terminal Equipment
  - 2. Fuse, Alarm and Distribution Panel.
- B. Install the cabling, connectors, and plugs to provide 120-Vac, 60-Hz power to the various equipment from the ac power receptacle strip on the equipment rack.
- C. Install the required cabling and connectors to distribute the -48 Vdc to the appropriate equipment via the Fuse, Alarm and Distribution Panel
- D. Mount the Multi-Section Main Distribution Frame Cabinets to the wall of the Communications Equipment Room of the Passenger Stations, in a location approved by the Engineer.
- E. Wire the channel units, including audio, data and signaling information from channels of the IAD CTS terminal assemblies, to the Multi-Section Main Distribution Frame in the Communications Equipment Room.
- F. Connect 4-wire E&M channel, Channel Number 18 for the Passenger Information Display System. Tag the Multi-Section Main Distribution Frame for this channel "PIDS".

### **3.02 JACKSON GRAHAM BUILDING INSTALLATIONS**

- A. The Contractor shall install the following equipment on an existing 19-inch equipment rack in the Communications Equipment Room of the Jackson Graham Building:
  - 1. IAD CTS Terminal Equipment.
  - 2. Fuse, Alarm and Distribution Panel.
- B. Install the cabling, connectors, and plugs to provide 120-Vac, 60-Hz power to the various equipment from the ac power receptacle strip on the equipment rack.
- C. Install the required cabling and connectors to distribute the -48-Vdc from the Main 48-Vdc Power Distribution Bus to the appropriate equipment via the Fuse, Alarm and Distribution Panel.
- D. Wire the channel units of the IAD CTS Terminal Assemblies to the existing Combined Distribution Frame (CDF).

- E. Connect the IAD CTS Terminal Assemblies to the FOS terminals.

**3.03 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

**3.04 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

**3.05 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to Owner's personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with Owners' personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**END OF SECTION**

## SECTION 16776

### COMMUNICATIONS - FIBER OPTIC SYSTEM

#### PART 1- GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. This Section describes the basic requirements for the design and installation of the Fiber-Optic System (FOS). The Fiber-Optics System will provide the transmission medium for multiplexed voice and data signal transmissions between the Jackson Graham Building and the passenger station(s). The Carrier Transmission System (CTS), described in Section 16771, is utilized to multiplex voice and data signals into T1 data formats prior to being interconnected to the FOS. To maintain maximum reliability, route diversity is required for the fiber-optic (PRIMARY) and (REDUNDANT) cable installations.
- B. New fiber optic cables shall be installed under this contract to provide a medium for the FOS. The contractor shall design a system that has optical-fiber paths all the way from each passenger station to the Jackson Graham Building. Depending on the location of the passenger station being designed, the contractor shall install redundant fiber-optic cables from the passenger stations being built to the nearest location where previously installed optical-fiber cables have been designed to support the new passenger station, or in the worst case, the contractor shall install new redundant fiber-optic cables all the way to the Jackson Graham Building Communications Equipment Room.
- C. The FOS shall be designed to operate in a two-fiber, unidirectional, path-switched, ring configuration, in accordance with the requirements defined in Bellcore's GR-1400-CORE, SONET Dual-Fed Unidirectional Path Switch Ring Equipment Generic Criteria. In this ring configuration, one fiber carries information in one direction (say clockwise), and the second fiber carries information in the opposite direction (counter-clockwise). This ring design shall provide reliable and efficient network protection from cable cuts or node failures. In addition, it shall minimize disruption of unaffected traffic by performing switching at the VT1.5 as well as the STS-1/DS3 levels.
- D. The FOS in conjunction with the Carrier Transmission System, is designed to provide voice and data transmission capabilities to accommodate the communications requirements of each of the passenger stations, as well as other selected buildings along the WMATA rights-of-way.
- E. The FOS shall also provide for CCTV video transmission from the new passenger stations to the Jackson Graham Building.
- F. The multiplexed voice and data transmission facility shall be independent from the video transmission facility of the FOS. However, both facilities shall share a common fiber optic cable plant.
- G. The voice and data transmission equipment of the FOS described herein includes, but is not limited to, the following components:
  - 1. Fiber Optic Cable Plant.
  - 2. Optical/Multiplex Equipment.
  - 3. Optical Fiber Termination Facilities.
  - 4. Maintenance Facilities.
  - 5. Power Facilities.

- H. The fiber optic cable plant shall be composed of separate fiber optic cable runs for the various WMATA transit routes from the Jackson Graham Building. In some cases, locations associated with different transit routes are combined in a single fiber optic cable run.
  - 1. The fiber optic cable runs shall be composed of individual fiber optic cable spans installed along the WMATA rights-of-way between the Communications Equipment Rooms of the Jackson Graham Building, passenger stations, yards and selected buildings.
  - 2. The fiber optic PRIMARY and REDUNDANT cable runs shall contain the necessary optical fibers (including spares) for the voice and data transmission requirements, in both directions of transmission, and for the video transmission requirements of the associated transit route. In addition, the fiber optic PRIMARY and REDUNDANT cables shall contain optical fibers for future use.
    - a. The quantity of spare optical fibers for the voice and data transmission within each fiber optic cable span shall be based on a one-to-one ratio with the active optical fibers within the span.
    - b. Two optical fibers will be provided for the video transmission facility within each fiber optic PRIMARY cable run. All groups in a cable run shall share the video fibers.
    - c. The fiber optic cables shall be installed within fiber optic cable innerducts in all conduits, cable ducts and cable troughs along the rights-of-way and within all passenger stations.
- I. The fiber optic terminal at the Jackson Graham Building shall multiplex at least twenty-eight (28) DS1 circuits onto the OC-12 digital transmission bit stream associated with the group of five passenger stations, sharing a dedicated pair of optical fibers in a ring configuration.
- J. The optical fiber termination facilities shall consist of fiber splice panels and fiber patch panels in the passenger stations and the Jackson Graham Building for the PRIMARY and REDUNDANT fiber cables. Fiber termination facilities shall allow the appropriate optical fibers of the fiber optic cables to be terminated and shall provide splice panel organizers for the splicing of optical fibers that "pass through" any location.
- K. The maintenance facilities shall consist of Digital Signal Cross-Connect (DSX) jackfields and Digital Service Units in the passenger station(s) and in the Jackson Graham Building.
  - 1. The Digital Signal Cross-Connect jackfields provide capabilities to test/monitor the DS1 circuits associated with the Optical/Multiplex Equipment at each location.
  - 2. The Digital Service Units provide a voice and data maintenance communications channel among the various locations that share the dedicated pair of fibers to/from the Jackson Graham Building.
- L. The power facilities in the passenger stations shall include a redundant output -48 Vdc power supply unit and a Fuse, Alarm and Distribution Panel. Power facilities shall provide and/or distribute necessary power to the equipment of the FOS from the filtered side of the Fuse, Alarm and Distribution Panel.
- M. All equipment of the Fiber Optic System at the passenger stations shall be mounted on equipment racks within the Communications Equipment Room.

## **1.02 SECTION INCLUDES**

- A. Fiber Optic Cable Plant.
- B. Optical/Multiplex Equipment.
- C. Optical Fiber Termination Facilities.

- D. Maintenance Facilities.
- E. Power Facilities

### **1.03 UNIT PRICES**

- A. Unit Prices include incidental items, not specifically mentioned, but required for complete and proper system operation.

### **1.04 RELATED SECTIONS**

- A. Section 16705 - Communications Standard Specifications - Equipment & Material..
- B. Section 16706 - Communications System Submittals & Services
- C. Section 16707 - Communications Systems Quality Assurance & Testing.
- D. Section 16710 - Communications Grounding..
- E. Section 16715 - Communications Electrical Power Distribution.
- F. Section 16771 - Communications - Carrier Transmission System.

### **1.06 SYSTEM DESCRIPTION**

- A. Description: The FOS provides the transmission medium for multiplexed voice and data signal transmissions between the Jackson Graham Building, passenger station(s) and yards. The Carrier Transmission System (CTS), described in Section 16771, is utilized to multiplex voice and data signals. To maintain maximum reliability, route diversity for the fiber-optic (PRIMARY) and (REDUNDANT) cable installations is used.
- B. Capacity:
  - 1. The contractor shall design, furnish, and install fiber optic Add/Drop Repeaters at each new passenger station, and rail yard.
  - 2. The contractor shall design, furnish, and install a fiber optic terminal at the Jackson Graham Building to service each new group of passenger stations and/or rail yard. In some cases, an existing fiber optic terminal at the Jackson Graham may already be configured to accommodate an additional passenger station. The contractor shall be responsible for any design/modifications to interface new passenger stations to existing systems.

3. The contractor shall design, furnish, and install new Digital Service Unit (Service Channel Equipment) at new passenger stations/yards to provide two-way voice and data communications for maintenance purposes.
4. The Contractor shall design, furnish, and install DSX jackfields at the new fiber-optic terminal locations to interconnect/service the new digital circuits.
5. The contractor shall design, furnish, and install fiber splice and/or patch panels at the new fiber-optic terminal locations, and at interface locations along the fiber cable route to interconnect/service the new fiber-optic circuits.
6. The contractor shall furnish and install Fuse, Alarm And Distribution Panels in each new equipment rack containing 48-Vdc equipment.
7. The contractor shall furnish fiber optic patch cords in quantities to accommodate all patch possibilities on each furnished patch panel.

C. Configuration: Mode 3 Operation.

## 1.07 SYSTEM PERFORMANCE REQUIREMENTS

- A. The Contractor shall be responsible for the overall performance of the FOS. The following overall system performance requirements are designed to ensure that the FOS, delivered in accordance with these Specifications, meet the requirements of the Washington Metropolitan Area Transit Authority.
1. Optical Line Rate: Shall support an OC-12 digital line rate of (622.08) Mb/s supporting at least 84 multiplexed DS1 circuits (1.544Mb/s) plus a service channel
  2. Crosstalk Coupling Loss: 65 dB minimum (700 to 1100 Hz)
  3. Span Line Transmission: 1300 nanometer optical wavelength on two optical fibers; one in each direction.
  4. Span Line Gain:
    - a. Optical link adequate to support a minimum of 9 dB of margin in the span line loss budget (for equipment degradation, temperature variation and future splices) and maintain a Bit Error Rate (BER) of less than 1 in  $10^{10}$ . There shall be no inter-nodal repeaters.
    - b. Optical Attenuation: Receiver optical line input shall be regulated with optical attenuators to ensure that the input optical power to the receiver (without the loss margin) does not exceed the maximum allowable input power indicated by the manufacturer.
    - c. Splice Losses: 0.20 dB or less average, 0.30 dB max.
    - d. Connector Losses: No greater than 0.70dB per connector.

## 1.08 SUBMITTALS

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.
- C. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

## 1.09 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.

- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Authorized installer of specified manufacturer with service facilities within 50 miles of Project.

#### **1.10 REGULATORY REQUIREMENTS**

- A. Conform to requirements of FCC Part 15.

#### **1.11 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Fiber Optic System until Final Completion.

### **PART 2 - PRODUCTS**

#### **2.01 48-CHANNEL CTS MULTIPLEX SHELF**

- A. Manufacturers:
  - 1. Alcatel Part Number 1603 SM SONET (or approved equal).
- B. 23-inch rack mount.
- C. OC-12 Optical Interfaces:
  - 1. Transmit Parameters:
    - a. Data Rate: 622.08 Mb/s (OC-12).
    - b. Frequency Tolerance: 20 ppm.
    - c. Line Code: SONET, NRZ.
    - d. Jitter: Category II (per GR-253).
    - e. Optical Device: FP-MLM Laser.
  - 2. Operational Parameters:
    - a. Protection: 1+1, nested switching
    - b. Switching Time: 50 ms max after detection of fault
    - c. Reframe Time: 250  $\mu$ s max
  - 3. Connectors.
    - a. SC
- D. DS3/STS-1 Electrical Interfaces.
  - 1. Electrical Parameters
    - a. Data Rate: 44.736 Mb/s (DS3) or 51.84 Mb/s (STS-1)
    - b. Frequency Tolerance: 20 ppm
    - c. Line Code: B3ZS encoded SONET
    - d. Signal-to-Noise Ratio: >25 dB, at unit input
    - e. Return Loss: >20 dB, at unit input (with redundant configuration)
    - f. Output Power Level: Defined at cross-connect point per GR-499
    - g. Pulse Specifications: Defined at cross-connect point per GR-499 and GR-253 (STS-1)
    - h. Impedance: 75 ohms unbalanced
    - i. Physical Interface: BNC connectors
    - j. Max. Distance to Cross Connect: 450 feet (with AT&T 728A) or equivalent cabling)
  - 2. Operational Parameters
    - a. Protection: 1+1 (nested switching)
    - b. Switching Time: 50 ms after detection of fault
    - c. Reframe Time: 250  $\mu$ s

- d. Equipment Loopback: Yes
  - e. Facility Loopback: Yes
- E. DS1 Interfaces
1. Electrical Parameters
    - a. Data Rate: 1.544 Mb/s
    - b. Frequency Tolerance: 130 ppm
    - c. Line Code: B8ZS, AMI
    - d. Electrical Interface: DSX-1 (Per GR-499)
    - e. Interface Impedance: 100 ohms  $\pm$  5%
    - f. Physical Interface: Connector
    - g. Max Distance to DSX-1 Cross Connect: 655 feet
    - h. Cross Connect Cable Requirements: ABAM
  2. Operational Parameters
    - a. Capacity: At least
    - b. Grooming: DS1 (any DS1 to/from any VT
    - c. VT type: Floating
    - d. VT Format: Asynchronous
    - e. Protection: 1:7
    - f. Facility Loopback: Yes
    - g. Equipment Loopback: Yes
- F. Transmission Delay Characteristic:
1. High Speed (RX + TX) - VT grooming: 50 us max
  2. High Speed (RX + TX) - no VT grooming: 25 us max
  3. Add/Drop: 100 ms max (DS1)
- G. Synchronization:
1. Inputs:
    - a. 1.544Mb/s (pri, sec)
    - b. OC-3 or OC-12 loop/line timing
    - c. Low-speed interface group (OC-12, OC-3, STS-1)
    - d. Internal 4.6 ppm oscillator
  2. Outputs: 1.544 Mb/s sync and composite clock outputs
- H. USI Interface
1. Local
    - a. Electrical Interface: RS232.
    - b. Speed: 300, 1200, 2400, 4800, 9600, 19,200, and autobaud.
    - c. Number of Interfaces: 1 with TBOS or X.25 2 without TBOS or X.25.
    - d. Physical Interface
      - 1) Front Access: 9-pin "D" connector.
      - 2) Rear Access: Wire-wrap pins.
    - e. Modem Interface: Duplex interface type DCE or DTE
  2. Remote: Remote login via D1-D3 overhead channels
  3. LAN: 10BaseT
- I. Orderwire Interfaces
1. Coding:  $\mu$  255.
  2. Interface: 4-wire.
  3. Transmit Level at 1.02 kHz: 0 dBm  $\pm$  0.25 db (25°C), 0 dBm  $\pm$  0.60 db (40°C to 65°C).
  4. Receive Level at 1.02 kHz: 0 dBm  $\pm$  0.25 db (25c), 0 dBm  $\pm$  0.40 db (40°C to 65°C).
  5. Frequency Response: 300 Hz to 3,000 Hz  $\pm$  0.25 dB (25°C).
  6. Impedance: 600 ohms  $\pm$  5%.
  7. Physical Interface: Connector.

- J. Office Alarm Interfaces.
  - 1. Visual Indicator Alarms: Critical major, minor.
  - 2. Audible Alarms: Critical, major, minor.
  - 3. Relay Contact Types: Form "C" contacts (rated 48V, 1A).
  - 4. Physical Interface: Wire-wrap pins or connector.
  
- K. E2A Interfaces.
  - 1. Parallel E2A:
    - a. Non-multiplied: Critical, major, minor.
    - b. Multiplied: Critical, major, minor, ID.
    - c. Contact Capacity: Rated 48V, 25 mA
    - d. Physical Interface: Wire-wrap pins or connector
  - 2. TBOS (Serial E2A).
    - a. Electrical Interface: RS422/RS422 tri-state.
    - b. Number of Displays:
      - 1) Outputs: 1 alarm/status.
      - 2) Inputs: 1 control.
    - c. Speed: 2400 baud.
    - d. Protocol: TBOS.
    - e. Physical Interface: Wire-wrap.
  
- L. Site Alarms and Controls (CDAC).
  - 1. Number of Input Alarms: 12.
  - 2. Input Sensing: Open/ground.
  - 3. Control Points:
    - a. With TBOS: 12 control points total; 4 control points with readable status (rated 48V, 1A).
    - b. With OS: 12 control points with readable status (4 rated 48V, 1 A and 8 rated 48V, 25 mA).
  - 4. Interface Contact Type: Form "C".
  - 5. Physical Interface: Wire-wrap pins.
  
- M. Power
  - 1. Input Voltage Range: -40 to -57 Vdc.
  - 2. Transient Input Voltage: -200 Vdc @ 1 ms -100 Vdc @ 10 ms.
  - 3. Physical Interface: Screw lugs with optional power and ground cable assembly.
  - 4. Consumption (depending on options): 250 watts.

## **2.02 FIBER OPTIC TERMINAL**

- A. The fiber optic terminal shall be the same as the add/drop repeater, except that it shall be equipped to handle 28 DS1 circuits. The 1301 NM User System Interface software and 1301 On-line Troubleshooting Guide software shall also be furnished with the terminal.

## **2.03 DIGITAL SERVICE UNIT (SERVICE CHANNEL EQUIPMENT)**

- A. DANTEL B-13-14096-01 - three Circuit Order Wire Control and Speaker Monitor Panels to include DTSS3A Order Wire Terminals. This is required to interface with the existing Order Wire.
- B. Provides two independent voice and data channel capabilities.
- C. Data channel interface: RS-232.
- D. Contains alarm circuitry with external alarm contacts

- E. The Digital Service Unit Mounting: 23-inch EIA Standard rack.

#### **2.04 DSX JACKFIELD**

- A. Manufacturers:
  - 1. ADC Telecommunications, Inc. Model No. Mini-DSX-1/Q (or approved equal).
- B. Mounting: 23-inch EIA standard rack.
- C. Jackfield suitable for operation of DS1 (1.544 Mb/s) line rate with better than -50 dB isolation.
- D. Provides termination and test/monitor facilities for a minimum of four DS1 circuits (transmit and receive).
- E. Test/monitor facilities shall provide jacks for each DS1 circuit to test both circuit line directions (IN and OUT) and to monitor/bridge without circuit interruption.
- F. Jacks construction: Steel frame, with cad-chromate finish; nickel silver springs with gold cross bar contacts.

#### **2.05 FIBER SPLICE PANEL**

- A. Manufacturers:
  - 1. Telect Model No. 055-2310-0000 with three 015-0000-0301 (or approved equal).
- B. Mounting: 23-inch EIA standard rack.
- C. The Splice Panel includes:
  - 1. At least three splice trays; each splice tray shall accommodate a minimum of 12 fusion type splices.
  - 2. Storage of excess lengths of the pigtail assemblies and buffer tubes/optical fibers of Fiber optic cables.
  - 3. Sufficient tray areas for excess optical fiber storage with provisions to assure that the remaining unassigned optical fibers do not exceed a 2-inch bend radius.
- D. Provide cable clamps to secure fiber optics cables to the chassis. Cable clamps include the necessary hardware to ground the metallic central strength members (if provided) and corrugated steel shield armor of the fiber optic cables.

#### **2.06 FIBER PATCH PANEL**

- A. Manufacturers:
  - 1. Telect Model No. 055-2630-0000 with six 055-0000-6010 (or approved equal).
- B. Mounting: 23-inch EIA standard rack.
- C. The termination/distribution cable trays includes:
  - 1. 36 optical bulkhead adapters; single-mode optical fiber Type SC.
  - 2. 36 corresponding single-mode optical fiber pigtail assemblies with appropriate type optical connectors to mate with optical bulkhead adapters
  - 3. Designation strips for identification of the 36 optical bulkhead adapters.

#### **2.07 FUSE, ALARM AND DISTRIBUTION PANEL**

- A. Manufacturers:

1. Hendry Model Number HMW 06020-05, (or approved equal).
- B. Universal mounting for 19-inch or 23-inch relay racks.
- C. Designed for -48 Vdc power supply distribution.
- D. Minimum of 10 fuse positions.
- E. 40-amp panel capacity.
- F. Alarm circuit with visual alarm indication(s), and external alarm contacts.
- G. Fuses:
  1. Appropriate type GMT complement panel alarm circuitry/visual indication(s).
  2. Each fuse shall be appropriately rated for the corresponding equipment to which it distributes power.
  3. Quantity of fuses to be provided within each fuse panel shall correspond to the number of equipment items requiring -48 Vdc power within the associated equipment rack.

## 2.08 FIBER OPTIC CABLES

- A. General.
  1. The fiber optic cables shall be of an open-channel type configuration or of a loose-tube type configuration.
  2. The quantity of optical fibers within each fiber optic cable shall be chosen to fulfill the operational requirements of the Authority, and continue the fiber-optic design philosophy for operational and spare fibers used in prior constructed rail sections/stations, and depicted in a typical configuration on the contract drawings.
  3. Shall conform to REA PE-90.
- B. Cable Composition - Loose Tube Type Configuration
  1. Central Strength Member:
    - a. Stranded galvanized steel wire with polyethylene overcoat or dielectric glass fiber reinforced plastic (overcoat is optional).
  2. Over-length Loose Tubes:
    - a. Hard, abrasion-resistant compound
    - b. Provides mechanical and environmental protection of the optical fiber
    - c. Appropriate quantity to accommodate optical fiber requirements.
    - d. Each loose tube individually color-coded.
  3. Single-mode Optical Fibers.
  4. Water-Blocking Compound:
    - a. Provided within and between the over-length loose tubes.
    - b. Compound to be non-toxic, non-nutrient to fungus and non-conducting.
  5. Core Wrap:
    - a. Polyester core tape applied longitudinally over slotted-core to contain water-blocking compound.
  6. Inner Jacket:
    - a. Medium-density polyethylene.
    - b. Carbon black in color for protection against ultraviolet radiation.
  7. Corrugated Steel Shield Armor:
    - a. Electrochrome steel coated with ethylene-acrylic copolymer on both sides.
    - b. Applied longitudinally over inner jacket.
    - c. Electrically continuous.
  8. Outer Jacket:
    - a. Low smoke and zero halogen..

- b. Carbon black in color for protection against ultraviolet radiation.
- C. Overall Physical Cable Characteristics
  1. Pulling load (Installation):  $\geq 600$ -lbf (2669-Newtons).
  2. Operating Load:  $\geq 225$ -lbf (1000-Newtons).
  3. Crushing Resistance:  $\geq 344$ -lb/in (600-Newtons/cm).
  4. Operating Temperature Range:  $-40^{\circ}$  C to  $+70^{\circ}$  C.
- D. Optical Fiber Characteristics
  1. Type: Single-mode.
  2. Operating Wavelength: 1310-nm.
  3. Attenuation @ 1310-nm: 0.5-dB/km maximum.
  4. Maximum Dispersion:  $<3.5$  ps/km-nm over the wavelength range of 1285-nm to 1335-nm.
  5. Cut-off Wavelength:  $1200 + 70$  nm.
  6. Fiber Mode Diameter:  $8 + 1$   $\mu$ m.
  7. Fiber Outer Diameter:  $125 + 3$   $\mu$ m.
  8. Protective-Coating Diameter:  $250 + 20$   $\mu$ m (minimum coating thickness of 40  $\mu$ m).
  9. Each optical fiber shall be individually color-coded.

## **2.09 FIBER OPTIC PATCH CORD**

- A. Manufacturers:
  1. ADC Communications, Inc., Model No. FPC-SPSC-S-3M (or approved equal).
- B. Connector: Type SC on one end and SC or equipment related on the other end; single-mode fiber.
- C. Length: Three meters.

## **2.10 FIBER OPTIC CABLE WARNING TAG**

- A. Manufacturers:
  1. Uticom System, Inc. Model No. 807-41C (or approved equal).
- B. Weatherproof.
- C. 22-Mil PVC with UV inhibitors with silicon adhesives.
- D. UV Type II Ink Graphics.
- E. Graphics to include "CAUTION-FIBER-OPTIC CABLE - PROPERTY OF WMATA".

## **2.11 FIBER OPTIC CABLE INNERDUCT**

- A. Manufacturers:
  1. Carlon Optic/Gard Model No. DF4X1C (or approved equal).
- B. Color: Orange.
- C. Nominal Size: 1" diameter; O.D. =1.3"; I.D. =1.05".

## **2.12 FIBER OPTIC CABLE ATTENUATORS**

- A. Manufacturers:

1. Telect Attenuators Model Nos. 106676, 106677, 106678 or 106679 No. FOA-SDXdb (or approved equal).
- B. Attenuators direct-mount into patch panel mounting holes.
- C. Attenuator adapter style "D4."
- D. Decibel Level: 5db, 10db, 15db, 20db (as required) to meet receiver specifications.

### **PART 3 - EXECUTION**

#### **3.01 FIBER OPTIC CABLE - GENERAL INSTALLATION**

- A. Installation practices shall conform to the fiber-optic cable manufacturer's installation recommendations, especially those concerning allowable bending radius of the cable and/or individual fibers.

#### **3.02 PASSENGER STATION INSTALLATION**

- A. Install the following equipment in the Communications Equipment Room of the passenger station (exact location to be approved by the Engineer) on a 23-inch EIA standard equipment rack:
  1. Fiber optic Add/Drop Repeater.
  2. Digital Service Unit.
  3. DSX Jackfield.
  4. Primary Fiber Splice Panel.
  5. Redundant Fiber Splice Panel.
  6. Primary Fiber Patch Panel.
  7. Redundant Fiber Patch Panel.
  8. Fuse, Alarm and Distribution Panel.
- B. Provide 120-Vac, 60-Hz to the appropriate equipment from the ac power receptacle strip on the equipment rack.
- C. Distribute the -48 Vdc of the station power supply unit to the appropriate equipment, via the Fuse, Alarm and Distribution Panel.
- D. Connect the DS1 circuits of the Fiber optic Add/Drop Repeater assigned to the passenger station to the DSX Jackfield.
- E. Install assembled optical fiber patch cords to connect the Fiber optic Add/Drop Repeater to the Fiber Patch Panels.
- F. Install appropriate optical attenuators at the Fiber Patch Panels.
- G. Connect all terminal assemblies of the Carrier Transmission System to the appropriate DS1 circuits of the Fiber optic Add/Drop Repeater at the DSX Jackfield. Each of the two digroups of the D448 terminal assembly shall be connected as a separate DS1 circuit.
- H. Provide appropriate type fiber optic hazard warning signs/tags (approved by the Engineer) on the Fiber Splice Panel, the Fiber Patch Panel, the Fiber optic Add/Drop Repeater, and the optical fiber patch cords.

#### **3.03 EXISTING PASSENGER STATION INSTALLATION**

- A. The Contractor shall install the following equipment in an existing passenger station, as required to provide the fiber-optic cable connectivity contained in his system design:
  - 1. PRIMARY and REDUNDANT Fiber Splice Panel.
  - 2. PRIMARY and REDUNDANT Fiber Patch Panel.
- B. Provide appropriate type fiber optic hazard warning signs/tags (approved by the Engineer) on the Fiber Splice Panel, the Fiber Patch Panel and the optical fiber patch cords.

### **3.04 INSTALLATION ALONG THE RIGHTS-OF-WAY**

- A. Fiber Optic Cable Innerduct
  - 1. Install fiber optic cable innerduct in all conduits, cable ducts within duct banks, and cable troughs along the rights-of-way and within the passenger station, to facilitate the installation and protection of the fiber optic cables in accordance with the contractor's system design.
  - 2. Fiber optic cable innerduct shall not be provided for the installation of fiber optic cables that are to be secured to tunnel walls.
  - 3. Provide appropriate fiber optic hazard warning tags (approved by the Engineer) for the fiber optic cable innerduct. Installed hazard warning tags on the fiber optic cable innerduct:
    - a. Every 100 feet within the cable troughs.
    - b. At each manhole location in the duct bank of the rights-of-way.
- B. Fiber Optic Cable
  - 1. Install the PRIMARY fiber optic cables following the track plans for the PRIMARY side of the cable plant. Install the REDUNDANT fiber-optic cables along a different physical route than the PRIMARY fiber-optic cables following the REDUNDANT cable track plan for the entire cable run, including cable troughs and duct banks. Install the fiber optic cables along the tunnel walls on existing channel inserts (exposed), in contractor furnished conduit, and in duct banks and cable troughs, on existing rights-of-way, along the rights-of-way.
  - 2. Route the fiber optic cables through the passenger station in cable ducts, conduit, cable troughs and/or air plenums under passenger station platforms. Conduit plants should be utilized when available. Provide independent conduit plant dedicated for fiber optic cable under the passenger station platforms and in plenums. Furnish other conduit and hardware as required.
  - 3. Connect the PRIMARY fiber optic cables to the PRIMARY Fiber Patch Panels within each passenger station Communications Equipment Room. Connect the REDUNDANT fiber optic cables to the REDUNDANT Fiber Patch Panels within each passenger station Communications Equipment Room and the Jackson Graham Building.
  - 4. Provide appropriate weatherproof fiber optic cable warning tags. Install hazard warning tags on the fiber optic cables:
    - a. Every 100 feet within the tunnel areas
    - b. Every 10 feet within the passenger station Communications Equipment Rooms, and the Jackson Graham Building
    - c. At each location where the fiber optic cables enter/exit the conduit plant and cable ducts.
  - 5. Ground the armor and the steel central strength member (if applicable) of all fiber optic cables using a single-point grounding scheme.
- C. Splicing
  - 1. All splices within the passenger stations Communications Equipment Rooms shall be fusion type and arranged within the splice trays of the Fiber Splice Panels, in accordance with the organizational design of the splice trays.

2. Splices along the rights-of-way will not be permitted unless specifically approved by the Engineer, in writing, on a case-by-case basis.
  - a. Splices Type: Fusion.
  - b. Contain splices within re-enterable splice enclosures that are designed specifically for the splicing of fiber optic cables. Provide appropriate type splice tray(s) within each splice enclosure.
  - c. The armor and the steel central strength member (if applicable) of the fiber optic cables shall be electrically continuous across the splices.
3. Applied appropriate protective coating to all fusion splices.
4. If splices are not made immediately after cable installation, seal the ends of the cables as recommended by the manufacturer to prevent entry of moisture.

### **3.05 JACKSON GRAHAM BUILDING INSTALLATION**

- A. Install the fiber optic terminal equipment on a 23-inch rack(s) in the Communications Equipment Room in locations approved by the Engineer.
- B. Provide 120-Vac, 60-Hz to the appropriate equipment from the ac power receptacle strip on the equipment rack.
- C. Connect the Jackson Graham Building -48 Vdc to the appropriate equipment, via the Fuse, Alarm and Distribution Panel.
- D. Connect the DS1 circuits of the fiber optic terminal to the DSX Jackfield.
- E. At the REDUNDANT Fiber Patch Panel within the Communications Equipment Room, terminate the optical fibers of the REDUNDANT fiber optic cables to the optical bulkhead adapters, via the corresponding single-mode optical-fiber pigtail assemblies. Splice the optical fibers to the single-mode optical-fiber pigtail assemblies within the REDUNDANT splice tray(s).
- F. Install assembled optical-fiber patch cords to connect the fiber optic terminal to the PRIMARY and REDUNDANT Fiber Patch Panel.
- G. Provide appropriate optical attenuators at the PRIMARY and REDUNDANT Fiber Patch Panel, if needed, to avoid over driving the terminal input circuits.
- H. Connect all terminal assemblies of the Carrier Transmission System to the appropriate DS1 circuits of the fiber optic terminal at the DSX Jackfield. Each of the two digroups of the D448 terminal assemblies shall be connected as a separate DS1 circuit.
- I. Connect the output contacts of all major alarms of the fiber optic terminal to the appropriate terminal block on the Main Distribution Frame.
- J. Provide appropriate fiber optic hazard warning signs/tags (approved by the Engineer) on the Fiber Splice Panel, the Fiber Patch Panel, the Fiber optic Terminal, the REDUNDANT fiber optic cable and the optical-fiber patch cords.

### **3.06 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

### **3.07 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

**3.08 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**END OF SECTION**

## SECTION 16791

### COMMUNICATIONS - MOBILE RADIO SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. This Section describes the basic components of the WMATA Mobile Radio System (MRS). The WMATA Mobile Radio System consists of a Metrorail Mobile Radio Subsystem, a Primary Local Jurisdictional (PLJ) Radio Subsystem, and a Terminal Supervisor's Radio at End-Of-Line Stations.
- B. The purpose of the WMATA Metrorail Mobile Radio Subsystem is to provide two-way voice communications between control consoles, provided by others, located within the WMATA Rail Operations Control Center (RAIL OCC), and portable, vehicular and rail car radios, utilized throughout the WMATA Rail Rapid Transit System and the Washington Metropolitan Area.
- C. The purpose of the Primary Local Jurisdictional (PLJ) Radio Subsystem is to provide two-way voice communications between control center facilities of local Fire Department, Police Department, and Emergency Medical Services (EMS) authorities and their corresponding portable radios, when utilized within the tunnel and underground station areas of the WMATA Rail Rapid Transit System.
- D. The purpose of an End-Of-Line Terminal Supervisor's Radio is to provide limited communications between the End-Of-Line Terminal Supervisor and train operators near or at the station platform.
- E. The WMATA Rail Mobile Radio Subsystem (MRS) is a frequency modulated voice radio system operating in the 490 MHz portion of the frequency band. The WMATA MRS consists of five networks: Operations 1, 2, 3, Maintenance, and Metro Transit Police Department (MTPD). Each network operates as a separate system with its individual transmitter/receiver (T/R) equipment, control consoles, control logic, frequency(s), and portable and vehicular radios.
- F. The WMATA Rail MRS consists of surface and underground radio base stations located along the WMATA right-of-ways to provide radio coverage for the entire WMATA Rail Rapid Transit System. Surface radio base stations (not included in this contract) provide coverage for all surface and aerial portions, while underground radio base stations (required under this contract) cover underground passenger stations and tunnel areas of the WMATA Rail Rapid Transit System.
- G. Each underground radio base station includes one transmitter/receiver for the Operations Network, the Maintenance Network, and the MTPD Normal Network. In addition, the MTPD Emergency Network includes a second receiver.
- H. All network radios and the second MTPD receiver are multiplexed onto a single slotted coaxial cable antenna system installed in underground stations and tunnels. Each radio is connected to the Rail OCC by a 4-wire, 4 kHz voice channel of the Carrier Transmission System (CTS).
- I. The Operations and Maintenance Network radios are connected to master control consoles located in the Jackson Graham Building. The MTPD Network is connected to its master

control console through an interface arrangement in the Communications Equipment Room at the Jackson Graham Building.

- J. The PLJ Radio Subsystem is a frequency-modulated voice radio system operating in the 150-155 MHz, the 450-512 MHz, and in the 850 MHz portions of the frequency band. The PLJ radio base stations shall be co-located in the passenger station Communications Equipment Rooms with the WMATA Rail MRS base stations. The PLJ radios provide coverage for PLJ portable radios in underground stations and tunnels.
- K. The PLJ radio base stations are multiplexed onto the same slotted coaxial cable antenna system used by the WMATA Rail MRS. Each PLJ network radio base station is connected to its Local Jurisdiction Radio Control Facility by leased telephone lines within the station.
- L. The Slotted Coaxial Cable Antenna System shall act as the medium for receiving/transmitting the radio frequency waves to/from the WMATA Rail Mobile Radio Subsystem and the PLJ Radio Subsystem Base Stations.
- M. A WMATA Rail End-Of-Line Terminal Supervisor's Radio Subsystem facility shall be provided in the Terminal Supervisor's Office in an End-Of-Line passenger station. The WMATA Rail End-Of-Line Terminal Supervisor's Radio Subsystem facility is completely independent and provides two-way voice communications between the Terminal Supervisor's Office and WMATA personnel within the passenger station.
- N. Vehicular and portable radios shall be provided under this contract. The contractor shall program and test the portable radios for operation with the MRS.
- O. Metro Transit Police Department Network (MTPD) Operation
  1. In the normal mode of operation, a call can be initiated by a portable radio, a vehicular radio, or the MTPD Network Master Control Console using the primary frequency (Channel 1 on the portable and vehicular radios). The operation is simplex, push-to-talk. The call is initiated by operating the push-to-talk switch and speaking into the microphone.
  2. Emergency Mode Operation - In emergency mode operation, a call can be initiated by a portable radio or a vehicular radio using the auxiliary frequency (Channel 2). The call is initiated by operating the push-to-talk switch and speaking into the microphone.
  3. The MTPD Network Master Control Console monitors the normal mode channel and the emergency mode channel simultaneously at all times. An emergency mode call will be received by the MTPD Network Master Control Console even if a normal mode call is in progress. Transmission from the MTPD Network Master Control Console is on the primary frequency.
  4. When a portable radio or a vehicular radio is in the Channel 2 position, it receives on Channel 1 (primary frequency) and transmits on Channel 2 (auxiliary frequency).
  5. In the emergency mode operation, simplex cross-patch is also available by operator initiation at the MTPD Network Master Control Console by interconnecting selected base stations. In this function, the received transmissions on the auxiliary frequency (Channel 2) from a portable or vehicular radio are retransmitted on the primary frequency (Channel 1) by Voice Operated Relay (VOX) console circuitry. This function permits portable-to-portable communications on a limited basis between radios located in other tunnel areas and the surface.
- P. Each Primary Local Jurisdictional Radio Subsystem network operates as duplex, push-to-talk. A call can be initiated by a portable radio or the control facility by operating the push-to-talk switch and speaking into the microphone. Portable-to-portable radio operation is available for each network within the tunnel and underground passenger station areas. (In

addition, communications between portable radios in the tunnel and underground passenger station areas and vehicular and portable radios above ground is available).

#### **1.02 SECTION INCLUDES**

- A. WMATA Rail Mobile Communications System
- B. Primary Local Jurisdictional Radio Subsystem
- C. End-Of-Line Terminal Supervisor's Radio.

#### **1.03 UNIT PRICES**

- A. Unit Prices include incidental items, not specifically mentioned, but required for complete and proper system operation.

#### **1.04 RELATED SECTIONS**

- A. Section 16705 -Communications Standard Specifications - Equipment & Material
- B. Section 16706 - Communications System Submittals & Services
- C. Section 16707 - Communications Systems Quality Assurance & Testing
- D. Section 16710 -Communications Grounding
- E. Section 16715 - Communications Electrical Power Distribution.

#### **1.05 REFERENCES**

- A. National Electric Code (NEC).
- B. Federal Communication Commission (FCC).

#### **1.06 SYSTEM DESCRIPTION**

- A. Description: The WMATA Rail End-Of-Line Terminal Supervisor's Radio Subsystem facility is completely independent and provides two-way voice communications between the Terminal Supervisor's Office and WMATA personnel within the passenger station.
- B. Capacity:
  - 1. The contractor shall design, furnish, and install an End-Of-Line Terminal Supervisor's mobile radio in each end-of-line passenger being built.
  - 2. The contractor shall design, furnish, and install an End-Of-Line Terminal Supervisor's mobile radio antenna in each end-of-line passenger station being built.
  - 3. The contractor shall design, furnish, and install RF coaxial cable between the mobile radio and the antenna in each end-of-line passenger being built.
  - 4. The contractor shall design, furnish, and install the necessary PLJ Radio Subsystem within the tunnels and under ground passenger stations.
  - 5. The contractor shall design, furnish, and install the necessary MRS Radio System within the tunnels and under ground passenger stations.

#### **1.07 SYSTEM PERFORMANCE REQUIREMENTS**

- A. Frequency Stability:  $\pm 0.0002\%$  of assigned carrier frequency between 30°C and +60°C.

- B. Audio Response: Within +1 and -3dB of 6dB per octave pre-emphasis 300-3000Hz referenced to 1000 Hz.
- C. Audio Distortion: Less than 3% deviation @ 1000 Hz @ 1 kHz.
- D. RF Impedance: 50 ohms.
- E. Modulation: 16F3,  $\pm$  5 kHz for 100% deviation at 1 kHz.

#### **1.08 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.
- C. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

#### **1.09 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Authorized installer of specified manufacturer with service facilities within 50 miles of Project.

#### **1.10 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Mobile Radio System until Final Completion.

### **PART 2 - PRODUCTS**

#### **2.01 END-OF-LINE TERMINAL SUPERVISOR'S MOBILE RADIO**

- A. Manufacturers:
  - 1. Ericsson-GE MVS Mobile Radio Model No. MLS II with Model No. MLMK1P control panel.
  - 2. Motorola MaxTrac 300, 40-Watt, 16-Channel Radio.
  - 3. Or approved equal.
- B. Ratings:
  - 1. Frequency: 490 MHz band
  - 2. RF Input impedance: 50-ohms.
  - 3. Power Input: 120-Vac, 60-Hz.
  - 4. Equipped with desk microphone.

#### **2.02 TERMINAL SUPERVISOR'S MOBILE RADIO ANTENNA**

- A. Manufacturer:
  1. Decibel Products Model DB201 (or approved equal)
- B. Description: Omni-directional, roof-mounted, UHF ground-plane antenna complete with mounting hardware.
- C. Ratings:
  1. Impedance: 50-ohms.
  2. Minimum power: 100-watts.
  3. Frequency Range: 490 MHz band
  4. Minimum Vertical beamwidth: 75-degrees

**2.03 PLJ POLICE, FIRE DEPARTMENT, and EMS RADIO BASE STATIONS**

- A. Manufacturers:
  1. Ericsson-GE Master III Base Station
  2. Motorola MRS 2000
  3. Or approved equal.
- B. Description:
  1. Equipped for PLJ Police and Fire Department frequencies as indicated under Frequency Assignments.
  2. Equipped with four channels for duplex operation
  3. Rated Power of 100 watts RF output power on a continuous basis
  4. Receiver shall be equipped for operations utilizing low noise pre-amplifiers
  5. Tone controlled.
  6. Continuous
  7. Shall be shielded against problems due to collocated site RF sources
  8. Shall have a receiver voting encoder.
  9. Shall have control line protection and compensation
  10. Shall have power line protection
  11. The PLJ Police Department Radio Base Station, PLJ Fire Department Radio Base Station, and the PLJ EMS Radio Base Station shall be enclosed in a single equipment cabinet

**2.04 FLEXIBLE FOAM-DIELECTRIC ½-INCH COAXIAL CABLE**

- A. Manufacturers:
  1. Andrew Corporation Superflexible HELIAX Model No. FSJ4RN-50B (or approved equal).
- B. Ratings:
  1. Impedance: 50 ohms.
  2. Jacket: Non-halogenated, flame-retardant and smoke-resistant

**PART 3 - EXECUTION**

**3.01 INSTALLATION**

- A. End-Of-Line Terminal Supervisor's Office
  1. Install the End-Of-Line Terminal Supervisor's Mobile Radio, as shown on the contract drawings, in a location approved by the Engineer.
  2. Install the required power cable, connectors, and associated hardware to provide 120-Vac, 60-Hz power for the Mobile Radio from an available ac receptacle in the Terminal Supervisor's Office.

3. Adjust the transmitter for minimum power output to minimize interference to other WMATA frequencies.
- B. PLJ Police, Fire Department, and EMS Radio Base Stations
1. Install the PLJ Radio Subsystem, as shown on the contract drawings, in a location approved by the Engineer.
  2. Install the required power cable, connectors, and associated hardware to provide 120-Vac, 60-Hz power for the Mobile Radio from an available ac receptacle in the Terminal Supervisor's Office.
  3. Adjust the transmitter for minimum power output to minimize interference to other WMATA frequencies.
- C. Metrorail Mobile Radio Subsystem
1. Install the Metrorail Radio Subsystem, as shown on the contract drawings, in a location approved by the Engineer.
  2. Install the required power cable, connectors, and associated hardware to provide 120-Vac, 60-Hz power for the Mobile Radio from an available ac receptacle in the Terminal Supervisor's Office.
  3. Adjust the transmitter for minimum power output to minimize interference to other WMATA frequencies.

### **3.02 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

### **3.03 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

### **3.04 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**END OF SECTION**

**SECTION 16791  
COMMUNICATIONS - COMPREHENSIVE RADIO COMMUNICATION SYSTEM**

**PART 1 - GENERAL**

**1.1 SECTION DESCRIPTION AND BASIC REQUIREMENTS**

- A. This Section describes the basic components of the WMATA Comprehensive Radio Communication System (CRCS). The WMATA Radio Communication System consists of a Comprehensive Radio Communication System (CRCS) Subsystem above and below Ground, a Public Safety Radio System (PSRS) Subsystem below ground, a Terminal Supervisor's Radio at End-Of-Line Stations, a Mobile Radio at Rail Yard Tower stations and Gate House, a Distributed Antenna System for providing Coverage at WMATA Stations, buildings and Wayside Structures and Tunnels.

**1.2 SECTION INCLUDES**

- A. End-Of-Line Terminal Supervisor's Radio.
- B. Mobile Radio at Rail Yard Tower stations and Gate House
- C. Distributed Antenna System for providing Coverage at WMATA Stations, buildings and Wayside Structures

**1.3 RELATED SECTIONS**

- A. Section 16705 - Communications Standard Specifications - Equipment & Material
- B. Section 16706 - Communications System Submittals & Services
- C. Section 16707 - Communications Systems Quality Assurance & Testing
- D. Section 16710 - Communications Grounding
- E. Section 16715 - Communications Electrical Power Distribution.

**1.4 REFERENCES**

- A. National Electric Code (NEC - latest).
- B. Federal Communication Commission (FCC part 15).
- C. National Fire Protection Association (NFPA 130 / NFPA 101)
- D. Underwriters Laboratories (UL)

## 1.5 SYSTEM DESCRIPTION

- A. Description: The WMATA Rail End-Of-Line Terminal Supervisor's Radio Subsystem facility is completely independent and provides two-way voice communications between the Terminal Supervisor's Office and WMATA personnel (usually train operators) within the passenger station interfacing with the existing WMATA Simulcast radio system.

Capacity: An End-Of-Line Terminal Supervisor's mobile radio, antenna and RF coaxial cable shall be designed, furnished, and installed in the end-of-line passenger station (Station).

- B. Description: The WMATA Mobile Radio at Rail Yard Tower stations and Gate House Provides two-way voice communications between the Rail Yard Tower towers, gate House and WMATA personnel (train operators, maintenance personnel within the yard facility interfacing with the existing WMATA Simulcast radio system.

Capacity: The Rail Yard Tower and Gate House mobile radio, antenna and RF coaxial cable shall be designed, furnished, and installed at those locations.

- C. Description: The WMATA Distributed Antenna System (DAS) shall provide mobile radio coverage in poor radio coverage areas by repeating existing above-ground simulcast radio signal communications in areas of metro rail facilities having deficient radio coverage. The Off-The-Air Radio Repeater System shall be designed to support rail operations and maintenance, transit police, and support the Integration of the Public Safety Radio System (PSRS)

Capacity: The contractor shall use the installed Radiax Cable provided by WMATA to create a Distributed Antenna System (DAS) for use in the underground sections of WMATA rail system. The DAS shall consist of Below Station Bi-Directional Amplifier (BDA) sites and Tunnel BDA sites. The Contractor shall perform a link budget analysis to determine the placement of BDAs, cabling, and radiating elements. The contractor shall expand the WMATA supplied Radiax system to obtain required coverage. The Contractor shall be responsible for installation of additional radiating cable and or antennas (Omni or panel), in the ancillary spaces, sufficient to achieve stated system requirements for minimum acceptable coverage. All rooms and spaces accessible to personnel within or near the ancillary location shall be provided with minimum acceptable coverage. This includes the entire egress route to the surface (stairs or ladder); if such a personnel egress shaft exists. Ancillary Space DAS components shall meet the following minimum requirements:

Radiating Cable: Same specifications as the existing tunnel "WMATA DAS" radiating cable  
Antennas: Omni or Panel, as required for area covered 490 to 1000 MHz  
broadband or better.

- D. The purpose of the WMATA CRCS Subsystem is to provide two-way voice communications between control consoles to Rail Operations Control Center (RAIL OCC), and portable, vehicular and rail car radios, the Washington Metropolitan Area Transit Police Department (MTPD), Bus, Maintenance departments utilized throughout the WMATA Transit System in tunnels, stations and all areas above ground where the WMATA service extends.
- E. The purpose of the Public Safety Radio System (PSRS) Radio Subsystem is to provide two-way voice communications between control center facilities of local Fire Department, Police Department, and Emergency Medical Services (EMS) authorities and their corresponding portable radios, when utilized within the tunnel and underground station areas of the WMATA Transit System.

- F. The purpose of the Mobile Radio at Rail Yard Tower station and guard booth is to provide limited communications between the tower, train operators entering and leaving yard buildings and other areas within the facility.
- G. The purpose of an End-Of-Line Terminal Supervisor's Radio is to provide limited communications between the End-Of-Line Terminal Supervisor and train operators near or at the station platform.
- H. The purpose of the Distributed Antenna System Stations, buildings, Wayside Structures and tunnels is to provide adequate radio communications coverage to each room, public and non-public space within these facilities to which MTPD, emergency responders, maintenance or WMATA employees can access using their radios throughout the CRCS coverage area.
- I. The WMATA Comprehensive Radio Communication System (CRCS) is a frequency modulated, UHF T-Band, (operating in the 470-512 MHz portions of the frequency band) digital, single-cell simulcast trunked Motorola Smart Zone 3.0z radio system, used for communicating with radio users throughout the entire WMATA service area. The WMATA CRCS consists of several networks: Operations 1, 2, 3, 4, Metro Transit Police Department (MTPD) Maintenance and Bus. Each network operates as a separate system with its individual transmitter/receiver (T/R) equipment, control consoles, portable and vehicular radios.
- J. The WMATA CRCS consists of surface and underground Bi-Directional Amplifier (BDA) network located along the WMATA right-of-ways to provide radio coverage for the entire WMATA Transit System. The Surface design composed of 10 remote above ground sites, 15 voice channels, 4 data AVL (bus) channels, one mobile data channel and one paging channel to provide coverage for all surface and aerial portions, while an underground BDA system cover underground passenger stations and tunnel areas of the WMATA Transit System.
- K. The underground CRCS is divided up into 26 segments. Each segment consists of several Bi-Directional Amplifiers (BDA) cascaded together. The first Amplifier in the chain is a fiber-fed BDA connected to the main Prime site location at JGB. All BDAs are cascaded along the tunnel segment using a single slotted coaxial cable antenna system installed in underground stations and tunnels.
- L. The PSRS Radio Subsystem is a frequency-modulated voice radio system operating in the 850 MHz portions of the frequency band. The Public Safety Radio System (PSRS) is multiplexed into the same radiating cable used by WMATA CRCS using a Cross-Band Coupler (CBC). The PSRS subsystem is similar design utilizing the 850 MHz frequency band and associated components. The PSRS Head-end equipment shall be co-located in the passenger station Communications Equipment rooms and BDAs inside the tunnels. The PSRS radios provide coverage for PSRS portable radios in underground stations and tunnels.
- M. The Slotted Coaxial Cable Antenna System shall act as the medium for receiving/transmitting the radio frequency waves to/from the WMATA Comprehensive Radio Communication Subsystem and the Public Safety Radio System (PSRS) Subsystem. T
- N. The Slotted Coaxial Cables Antenna System shall be installed as required to achieve 95% coverage at a 3.4 DAQ level requirements throughout the Metrorail Project coverage area.
- O. A WMATA Rail End-Of-Line Terminal Supervisor's Radio Subsystem facility shall be provided in the Terminal Supervisor's Office in an End-Of-Line passenger station. The WMATA Rail End-Of-Line Terminal Supervisor's Radio Subsystem facility is completely independent and provides two-way voice communications between the Terminal Supervisor's Office and WMATA personnel within the passenger station.

- P. Distributed Antenna System shall be designed using any combination of BDAs (fiber-fed, off-air or RF-fed), Optical master units, Antennas ( Omni, Yagi, Flat panel), radiating coax and non-radiating coax for providing Coverage at WMATA Stations, buildings, Wayside Structures and tunnel segments.
- Q. Vehicular and portable radios shall be provided to interface and operate over the CRCS system built on Motorola Smartzone technology
- R. Each Public Safety Radio System Subsystem network operates as duplex, push-to- talk. A call can be initiated by a portable radio or the control facility by operating the push-to- talk switch and speaking into the microphone. Portable-to-portable radio operation is available for each network within the tunnel and underground passenger station areas. (In addition, communications between portable radios in the tunnel and underground passenger station areas and vehicular and portable radios above ground is available).

## 1.6 SYSTEM PERFORMANCE REQUIREMENTS – RADIO

### A. Radio:

1. Frequency range: 450-520 MHz
2. Channel Spacing: 12.5/25 KHz
3. Maximum Frequency Separation: Full Band split
4. Rated RF Output Adj: 1 to 5 Watts
5. Frequency Stability:  $\pm 0.0002\%$  of assigned carrier frequency between 30°C and +60°C.
6. Audio Response: Within +1 and -3dB of 6dB per octave pre-emphasis 300-3000Hz referenced to 1000 Hz.
7. Emissions (Conducted and Radiated): -70 dBc
8. Audio Distortion: Less than 3% deviation @ 1000 Hz @ 1 kHz.
9. RF Impedance: 50 ohms.
10. Modulation: 16F3,  $\pm 5$  kHz for 100% deviation at 1 kHz.
11. Receive Analog Sensitivity (12 dB SINAD): 0.25 $\mu$ V
12. Receive Digital Sensitivity (1% BER/ 5% BER): 0.35 $\mu$ V / 0.25 $\mu$ V

### B. Distributed Antenna System (DAS)

1. Frequency range: U/L (489.5125 – 490.9625 MHz, 496.3375 – 496.6125MHz)  
D/L (492.5125 – 493.9625 MHz, 499.3375 – 499.6125MHz)
2. Channel Spacing: 12.5/25 KHz
3. Channel Bandwidth: User selectable, 15 KHz, 30 KHz DSP filters Both either Low Selectivity or High Selectivity 400 KHz or 1.5 MHz band select filter
4. Rated RF Output Adj: 1 to 5 Watts per Band
5. RF Impedance: 50 ohms.
6. Maximum Gain: 80 dB
7. Gain Adjustment: 0 – 30dB in 1dB steps per channel
8. Passband Ripple: +/-2dB
9. Uplink Noise Figure: < 8dB (at maximum gain).

## **PART 2 - PRODUCTS**

### **2.1 END-OF-LINE TERMINAL SUPERVISOR'S MOBILE RADIO ANTENNA RAIL YARD TOWER RADIO ANTENNA AND GATE HOUSE RADIO ANTENNA**

- A. Manufacturers:
1. Motorola APX4500 (M22SSS9PW1AN) radio R2 with:
    - Dash mount (G66AW)
    - Control station desk mic(W382AM)
    - Control Station Power supply ( G91AE)
    - Trunking Baud Single System (QA01749AB)
    - Base Station APEXWWM ( W665BJ)
    - Dash mount 02 wwm (G66AW)
    - APX 02 Control Head (GA00804AB)
  2. Or approved equal.
- B. Ratings:
1. Frequency: 450-520 MHz band
  2. RF Input impedance: 50-ohms.
  3. Power Input: 120-Vac, 60-Hz. adaptor
  4. Equipped with desk microphone and tray.

### **2.2 FLEXIBLE FOAM-DIELECTRIC ½-INCH COAXIAL CABLE FOR DAS**

- A. Manufacturers:
1. Commscope FXL-540-NHR
  2. Or approved equal
- B. Ratings:
1. Impedance: 50 ohms.
  2. Jacket: Non-halogenated, fire retardant polyolefin
  3. Dielectric Material: Foam PE
  4. Operating Temperature -30 °C to +70 °C (-22 °F to +158 °F)
  5. Peak Power: 41.8 kW
  6. Operating Frequency Band: 100 – 8800 MHz
  7. Fire Retardancy Test Method: IEC 60332-3-24 | UL 1666/CATVR/CMR
  8. Smoke Index Test Method : IEC 61034
  9. Toxicity Index Test Method : IEC 60754-1 | IEC 60754-2

### **2.3 RADIAX COAXIAL RADIATING CABLE 1-5/8-INCH for DAS**

- A. Manufacturers:
1. Commscope RCT7-WBC-2A-RNAM
  2. Or approved equal
- B. Ratings:
1. Impedance: 50 ohms.
  2. Jacket: Non-halogenated, fire retardant polyolefin
  3. Tape Barrier: Mica
  4. Dielectric Material: Foam PE
  5. Operating Temperature -30 °C to +80 °C (-22 °F to +176 °F)
  6. Peak Power: 302.0 kW
  7. Operating Frequency Band: 50 – 2700 MHz
  8. Fire Retardancy Test Method: IEC 60332-3-24 | IEC 60332-3C-24 | NFPA-130-2010

9. Smoke Index Test Method : IEC 61034
10. Toxicity Index Test Method : IEC 60754-1 | IEC 60754-2

**2.4 RADIO REPEATER AND DONOR ANTENNAS FOR DAS SYSTEM**

- A. Manufacturers:
  1. MARS Antenna and RF system - MA-CQ27-1X ( OMNI 490/800 MHz)
  2. Sunol Sciences – LP425PCB ( Broadband Directional Antenna 490/800 MHz)
  3. Sunol Sciences – LP425 ( Broadband Directional Antenna 490/800 MHz)
  4. Telewave, Inc. – ANT450D ( Freq: 406-512 MHz Dipole Antenna / Off- Air)
  5. PCTEL - BMOY4705 (470-512 MHz 9dBd 5 Element Yagi Antenna/ Off-Air)
  6. Or approved equal.
- B. Ratings:
  1. Impedance: 50 ohms.
  2. Frequency Range: 490 MHz / 800 MHz

**2.5 OFF-THE-AIR RADIO REPEATER SYSTEM COMPONENTS FOR DAS**

- A. The nature of the Off-The-Air Radio Repeater Systems mandate custom- designed and fabricated components tailored around the required operating frequencies. Detailed specifications shall be provided for each custom-designed component for approval prior to fabrication.  
Manufacturers:
  1. Axell Wireless BDA: 50-206801
  2. Andrew/Commscope BDA: Node A4
  3. Or approved equal
- B. The coaxial cables, radiating cables, and/or fixed antennas selected for use in this system shall be submitted for approval prior to procurement. The cables shall be rated Low-Smoke, Halogen-Free (LSHF)
- C. The Off-The-Air Radio Repeater Systems shall be provided with a backup power system that will assure the system will continue to provide service during interruptions of commercial power to the system lasting up to 8-hours
- D. Ratings:
  1. Impedance: 50 ohms.
  2. Frequency:

TDR Channel No.	Band	Tx Channels (MHz)	Rx Channels (MHz)
1	LB	490.8625	493.8625
2	LB	490.7875	493.7875
3	HB	496.4375	499.4375
4	HB	496.5375	499.5375
5	HB	496.6125	499.6125
6	HB	496.5625	499.5625
7	HB	496.4875	499.4875
8	HB	496.3375	499.3375
9	LB	490.9625	493.9625
10	LB	490.9125	493.9125
11	LB	490.8875	493.8875

SMNT	HB	496.5125	499.5125

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION**

- A. End-Of-Line Terminal Supervisor's Office / Rail Yard Tower Office / Gate House
  - 1. Install the End-Of-Line Terminal Supervisor's Mobile Radio / Rail Yard Tower Radio and Gate House Radio, as shown on the contract drawings, in a location approved by the Engineer.
  - 2. Install the required power cable, connectors, and associated hardware to provide 120-Vac, 60-Hz power for the Mobile Radio from an available ac receptacle at the different locations.
  - 3. Adjust the transmitter for minimum power output to minimize interference to other WMATA frequencies.
  
- B. The WMATA Distributed Antenna System (DAS)
  - 1. Install the Metrorail CRCS Radio Subsystem, as shown on the contract drawings, in a location approved by the Engineer.
  - 2. Install the required power cable, connectors, and associated hardware to provide 120-Vac, 60-Hz power for the Mobile Radio from an available ac receptacle at the different locations.
  - 3. Adjust the transmitter for minimum power output to minimize interference to other WMATA frequencies.

#### **3.2 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions as specified in the contract documents.
- B. Supervise final wiring connections and system adjustments.

#### **3.3 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

#### **3.4 TEST**

- A. All End-Of-Line Terminal Supervisor's Radio, Yard Tower Radios and Gate house radios shall be tested for 2-way communication. For measuring the audio quality of the communications during the RF coverage tests, the Delivered Audio Quality (DAQ) levels from ANSI/TIA Technical Service Bulletin (TSB)-88 were used. A DAQ of 3.4 or better is expected
  
- B. All Distributed Antenna Systems (DAS) installed in stations and other WMATA facilities to provide supplemental coverage shall be tested for 2-way communication and maintain a signal level exceeding -95 dBm for 95% of the time in the entire station and provide Delivered Audio Quality rating of 3.4 (DAQ 3.4) or better in all

areas specified in this document . Open areas shall be divided up into 5 feet x 5 feet grids. Radio checks and downlink control channel levels will be measured in each grid. Two or more radio check failures after moving 3 feet in either direction within a grid will be considered a failure. Radio coverage shall also be performed in all station public areas, service rooms and other non-public areas that are part of the station or facility as defined in drawings.

C. Test Requirement for DAQ (3.4 and better) :

DAQ 5.0	Speech easily understood.
DAQ 4.5	Speech easily understood. Infrequent noise/distortion.
DAQ 4.0	Speech easily understood. Occasional noise/distortion.
<b>DAQ 3.4</b>	<b>Speech understandable with repetition only rarely required. Some noise/distortion.</b>

**3.5 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

## SECTION 16793

### COMMUNICATIONS - PUBLIC SAFETY SERVICE DISTRIBUTED ANTENNA SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. This Section describes the purpose, basic components, and requirements of the WMATA Public Service System (PSS) Radio Tunnel Antenna.
- B. The purpose of the WMATA PSS Radio Tunnel Antenna is to provide a seamless extension of the external radio coverage throughout the WMATA Rail Rapid Transit System underground tunnel and station areas. The PSS System repeats the aboveground two-way RF communications for all existing Public Service 800 MHz band radio systems located within the Washington Metropolitan Area.
- C. Beginning in 1993, WMATA installed an 800 MHz 75 ohm leaky antenna system throughout the under ground rail and passenger station system. This system, known as the Public Service System or PSS, consists of 5/8-inch leaky feeder running along the tunnel walls at train window level in each of the two tunnels to maximize portable coverage on the trains. The PSS antenna system uses 800 MHz band bi-directional Radio Frequency(RF) amplifiers to boost the radio signals along the tunnel route and in the underground stations and ancillary areas. Also, discrete antennas in the stations are interconnected with 1/2-inch non-radiating cable to provide radio coverage in selected areas.
- D. The existing 800 MHz PSS system occupies most of the approximately 102 miles of WMATA underground single-track tunnels and passenger stations. This system was implemented for use by the public safety forces in the WMATA area. Currently Arlington County, VA, the District of Columbia Fire Department and Montgomery County have plans to use the PSS cable antenna system. The Bell Atlantic cellular system, also installed throughout WMATA underground facilities, is a similar, parallel radio system but is not connected in any way to the PSS radio tunnel antenna system.
- E. Each of the existing PSS radio segments have been custom designed. It consists of a head-end location at the end of a passenger station and 5000 to 7500 feet of leaky feeder in each of the two (inbound & outbound) tunnels. Allen Telecom Systems Division Micro Fill amplifiers provide the needed amplification for the leaky feeder and for the discrete station antennas. Kaval amplifiers provide the needed amplification for the leaky feeder and for the discrete station antennas for this outer B, E, F, G, C/J and Mid E Routes. Allen Telecom Micro amplifiers support remains underlaying areas.
- F. It will be the responsibility of the contractor to perform surveys of the existing PSS system to know exactly what has been installed and gather information necessary for the design and construction of the present route extension PSS radio tunnel antenna system.
- G. The contractor shall design, provide, install, coordinate, interface, test, start-up and fully document an 800 MHz PSS Radio Tunnel Antenna System and its associated support subsystems throughout the entire tunnels, passenger stations, and all associated rail service system facilities.

- H. The PSS antenna system provided under this contract shall operate throughout the entire 800 MHz Public Safety Band (805 MHz to 870 MHz).

## **1.02 UNIT PRICES**

- A. Unit Prices include incidental items, not specifically mentioned, but required for complete and proper system operation.

## **1.03 RELATED SECTIONS**

- A. Section 16704 - Communications Standard Specifications - Installation..
- B. Section 16705 - Communications Standard Specifications - Equipment & Materials.
- C. Section 16710 – Communications Grounding.
- D. Section 16706 - Communications System Submittals & Services.
- E. Section 16707 - Communications Systems Quality Assurance & Testing
- F. Section 16715 - Communications Electrical Power Distribution
- G. Section 16791 - Communications - Mobile Radio System

## **1.04 REFERENCES, CODES, STANDARDS AND SPECIFICATIONS**

- A. Issues of the following documents, in effect at the time of solicitations of bids, form a part of this specification document. In the event of conflict between this specification and the codes, standards listed below, the most stringent requirement shall govern.
  1. Federal Communications Commission (FCC) Rules & Regulations: Part 15, Radio Frequency Devices; Part 17, Construction, Marking, and Lighting of Antenna Structures; Part 22, Public Mobile Services; Part 68, Connection of Terminal Equipment to the Telephone Network; Part 90, Private Land Mobile Radio Services; and any other relevant section.
  2. National Fire Protection Association (NFPA): NFPA 130 - Standard for Fixed Guideway Transit Systems.
  3. MIL-HDBK-419A, Grounding, Bonding and Shielding for Electronic Equipments & Facilities, Volume 1 & 2..
  4. American Society for Testing and Materials (ASTM): ASTM B8-99, Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft; and ASTM B187, B187-00 Standard Specification for Copper Bar, Bus Bar, Rod, and Shapes
  5. American National Standards Institute, Inc.(ANSI): C57.12.00-2000, IEEE Standard General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers; C57.15-1999, Regulators, Requirements, Terminology, and Test Code for Step-Voltage and Induction-Voltage; C57.93-1995, IEEE Guide for Installation of Liquid-Immersed Power Transformers; C57.94-1982, IEEE Recommended Practice for Installation, Application, Operation, and Maintenance of Dry-Type General Purpose Distribution and Power Transformers; and Z55.1, Gray Finishes for Industrial Apparatus and Equipment.
  6. National Electrical Manufacturers Association (NEMA): ST20-1992 (R1997), Dry Type Transformers for General Applications; and TR1-1993, Transformers, Regulators, and Reactors.

- B. The contractor shall be familiar with all local codes and regulations that affect the work of this Contract. Where local ordinances specify higher standards and requirements than those represented in this specification, the local ordinances shall govern.

#### **1.04 SYSTEM DESCRIPTION**

- A. Description: The PSS Radio Tunnel Antenna System to be provided under this contract shall consist of two radio segments: Segment 41 and Segment 42, as described in the enclosed drawings. Each radio segment will have underground, at grade and aerial sections. The PSS radio antenna system shall provide total, complete and seamless radio coverage to all WMATA facilities within this project area in all underground, at grade and aerial route sections, passenger stations and ancillary areas.
- B. Each radio segment shall consist of:
  - 1. A radio Head-End unit located at a passenger station that shall transmit the underground signals to the external donor repeater/receiver via an external directional antenna and receive the external donor transmitter signal to be amplified and distributed to the underground antenna system.
  - 2. Bi-directional broadband amplifiers (BDA).
  - 3. Radiating Cable (distributed) antenna system.
  - 4. Non-radiating RF signal transmission cable sections.
  - 5. PSS equipment electric UPS Power Distribution System.
  - 6. Omni-directional and directional discrete antennas for open or/and larger area coverage.
  - 7. Coupling, splitter, termination, interconnection, and matching devices.
  - 8. Installation and accessory hardware.
  - 9. Grounding System.
- C. The PSS electric UPS power distribution system to be provided by this contract shall have additional spare capacity at each Head-End and PSS amplifier location to power two additional future amplifier equipment installations.
- D. Radiating cable antenna installation shall be accomplished at both tunnel routes as shown in drawings attached to the tunnel wall at rail vehicle window elevation as to provide RF radio coverage not only to vehicle radio equipment but also to portable radio units located inside the moving rail vehicles.
- E. Contractor shall size all equipments and materials included in contract and provide information in the Final Design Submittal.

#### **1.06 SYSTEM PERFORMANCE REQUIREMENTS**

- A. Radio coverage for requirements at all WMATA facilities within the project area (using portable radio units at hip level) shall be (whichever is better radio coverage):
  - 1. Delivered Audio Quality (DAQ) equal to 4.0.
  - 2. Equivalent to 98% availability or 99.0% of the area locations 99.0% of the time.
- B. The above radio coverage performance shall be verified by field-testing before project acceptance.

#### **1.07 SUBMITTALS**

- A. Submit under provisions of Section 16706.

- B. Systems Final Design.
- C. Shop Drawings: Indicate electrical characteristics and connection requirements, including complete and detailed system-wiring diagram.
- D. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- E. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.
- F. Radio coverage performance field test results.
- G. As built drawings, Operations and Maintenance Manuals.

## **1.08 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum five years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Authorized installer of specified manufacturer with service facilities within 50 miles of Project and with minimum five years documented experience.

## **PART 2 - PRODUCTS**

### **2.01 MAJOR ITEMS TECHNICAL REQUIREMENTS**

- A. The Major Items listed below shall conform to the operational and performance requirements of these Specifications. Incidental items, not specifically mentioned, but required for complete and proper system operation, shall be furnished and installed by the Contractor.

### **2.02 PSS HEAD END UNIT**

- A. KAVAL Telecom Inc., 80 db Bi-Directional Amplifier BDA 1200 (or approved equal).
  1. Equipped with Microprocessor control that allows installers and technicians the ability to set and check all system parameters, and the following:
    - a. Password protected.
    - b. Self Diagnosis & Continuous Monitoring.
    - c. Battery Backup & Management Control.
    - d. Thermal Management Control.
    - e. Over current/Under current Fault Monitoring.
    - f. Automatic (AGC) and Digital DGC) Gain Controls.
    - g. RS 232 Interface.
  2. Nominal maximum gain of 80 dB and a passband ripple of +/- 2.0 dB.
  3. Digital gain control that allows up to 31 dB adjustments in 1.0 dB increments.
  4. Broad Bandwidth: equipment shall provide unlimited channel capacity within the pass-band and capable of passing both Analog and Digital protocols.
  5. Down-link pass-band of 851 MHz to 869 MHz.
  6. Up-link pass-band of 806 MHz to 824 MHz.
  7. Automatic Gain Control (AGC) Dynamic range of 40 dB.

8. Capable of a maximum RF Input of +10.0 dBm.
9. 3<sup>rd</sup> Order Intercept Point of 45 dBm and Noise Figure less than 8 dB.
10. All subsystem components shall be Modular for quick replacement.
11. Input/output Impedance of 50 Ohms.
12. Operating Temperature of -30<sup>o</sup> C to +50<sup>o</sup> C.
13. N-Female Input and Output connectors.
14. Cabinets shall be NEMA #4, with approximate dimensions of 14W X 16H X 10D inches.

### **2.03 PSS LINE AMPLIFIER UNITS**

- A. KAVAL Telecom Inc., 80 dB to 40 dB (as required by System's Final Design) Bi-Directional Amplifier BDA 1200 (or approved equal). All required parameters are equal to above Head End unit except for:
  1. Nominal maximum gain of 65 dB or 40 dB (as required by Final Design).
  2. Digital Gain Adjustment of 26 dB or 15 dB (as required by Final Design).
  3. Equipped with remote alarm modules conforming with existing WMATA Kaval Remote Alarm Monitoring System.

### **2.04 5/8 INCH LOW-LOSS CO-AXIAL SLOTTED RADIATING ANTENNA CABLE**

- A. Trilogy Communications Inc, Model No. AR058F75 (or approved equal)
- B. Non-halogenated, flame retardant and smoke resistant jacket.
- C. Complete with mounting hardware.

### **2.05 1/2-INCH LOW-LOSS CO-AXIAL TRANSMISSION CABLE**

- A. Trilogy Communications Inc, Model No. AT012F75 (or approved equal)
- B. Non-halogenated, flame retardant and smoke resistant jacket.
- C. Complete with mounting hardware.

### **2.06 COAXIAL CABLE CONNECTORS**

- A. Appropriate for each type and size of cable.
- B. Type "N" connectors.
- C. Covered with shrink sleeving or other approved waterproof covering.

### **2.07 ANTENNA POWER SPLITTER**

- A. Four way, Pasternac Inc., Model No. 2038, (or approved equal).
- B. Two-way, Mini-Circuits Inc., Model No. ZAPD-1-N, (or approved equal).
- C. Type "N" connectors.
- D. 50 ohm impedance.
- E. Frequency Range: 806-870 MHz.

**2.08 50-OHM RF TERMINATION LOAD**

- A. Mini-Circuit Inc., Model No. NTRM-50 (or approved equal).
- B. Type "N" connectors.
- C. Covered with shrink sleeving or other approved waterproof covering.

**2.09 75 TO 50 OHMS IMPEDANCE MATCHER**

- A. KAVAL Telecom Inc., Model No. A65U (or approved equal).
- B. Type "N" connectors.
- C. Covered with shrink sleeving or other approved waterproof covering.

**2.10 JUMPER CABLE WITH 2 N-Male CONNECTORS**

- A. Four feet long, Connertec RF, Inc., Model No. CNT-4-NMNM (or approved equal).
- B. Three feet long, Connertec RF, Inc., Model No. CNT-3-NMNM (or approved equal).
- C. Two feet long, Connertec RF, Inc., Model No. CNT-2-NMNM (or approved equal).

**2.11 PANEL ANTENNA**

- A. TESSCO, Model No. 65541-DB871-H120 (or approved equal).
- B. Type "N" connectors.

**2.12 TUNNEL ANTENNA**

- A. TESSCO, Model No. 70419-DB471N-XY (or approved equal).
- B. Type "N" connectors.

**2.13 CABLE RF TAP**

- A. KAVAL Telecom Inc., Model No. CCT-12 (or approved equal).
- B. Type "N" connectors.

**2.14 PSS POWER TRANSFORMER**

- A. Totally enclosed 480V/120V Single Phase Power Transformer.
- B. At least, three (3) full rated taps at 480V, 456V and 432V.
- C. High Voltage winding shall be fused.
- D. Transformer shall be totally enclosed in NEMA 3R enclosure with the core and coils completely encapsulated, with only the insulated wire leads exiting from encapsulation.

- E. Transformer shall be provided with key-hole mounting slots in mounting angles that are welded to the enclosures.
- F. Minimum allowed insulation shall be 150°C and shall withstand full wave impulse level of 10 KV.
- G. At each PSS amplifier location the contractor shall size all equipment to power three Bidirectional amplifiers, as required in Section 16793, 1.04.C, above.
- H. Submittals: As part of the required Shop Drawing Submittal, the contractor shall submit the following information concerning the power transformer: Tap Details, Name Plate Details, Mounting Details, and Physical Dimensions.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. The Contractor shall install all terminals, hardware, connectors, wiring and cabling, conduits and fittings, and make all connections and cross-connections required for a complete installation.

### **3.02 PSS HEAD END RADIO UNITS**

- A. The Contractor shall install optimum location complete PSS HEAD END Radio Units in the passenger stations, as specified herein.
- B. The Contractor shall install the PSS HEAD END Radio Units, the signal splitter units, the station panel antennas, and all related equipment and material in the passenger stations, as shown on the Contract Drawings. The Contractor shall provide and install durable permanent labels on the Head End Units to advise technicians to maintain the prescribed operating levels and parameters.
- C. The Contractor shall install the required cabling, conduit and fittings, connectors, ac receptacles, junction boxes, and hardware and make the necessary connections and cross-connections to provide 120 Vac, 60 Hz power to each Head-End radio unit at each station.
- D. The Contractor shall install the required coaxial cable, and appropriate size and RF typeconnectors, to interconnect the various coupling equipment, station panel antennas, and distribution cables at each passenger station.
- E. The Contractor shall install donor signal receive and transmit antenna on a location above the passenger station building and shall connect coaxial transmission cable to the head-end unit. Lightning arrester equipment shall be installed at the outside end of circuit to protect head end radio units. Antenna shall be oriented for optimal received signal strength.
- F. The Contractor shall install label each end of every cable run to display cable use, cable number designation, and end terminal destinations.

### **3.03 SLOTTED COAXIAL CABLE (RADIAX) ANTENNA SYSTEM**

- A. The Contractor shall install a Slotted Coaxial Cable Antenna System in the passenger station and tunnel areas, as indicated on the Contract Drawings, to serve the PSS Radio System.

- B. The Slotted Coaxial Cable Antenna System shall be installed throughout the tunnel areas, in the train room (platform area) and in underground passageways.
- C. In tunnel areas, the slotted coaxial cable antenna shall be installed on the wall on the vertical embedded channels, as indicated on the Contract Drawings. The wall with the vertical embedded channels is the one with the safety walk. The slotted coaxial cable antenna shall be trimmed and terminated to conform to a maximum allowable signal overlap of 50 feet between contiguous slotted coaxial cable antenna sections
- D. The power splitters used to connect coaxial cable and the Slotted Coaxial Cable Antenna System shall be oriented as shown on the Contract Drawings.
- E. The slotted coaxial cable antenna shall be installed at rail vehicle window level. Slotted coaxial cable antenna shall be mounted with approved hardware. In tunnel areas, the slotted coaxial cable antenna shall be attached to the supporting surface at intervals not to exceed five feet, by use of hanger kits, and may deviate upward and back down again, for short distances, to avoid objects when necessary. Cable runs may be securely clamped to existing lighting or other conduit, and may be installed over such conduit or boxes only if the antenna cable remains at least one foot outside of the authorized rail car tunnel profile. Insofar as possible, the slotted coaxial cable shall not extend beyond other items mounted in the same area.
- F. The low-loss coaxial cable shall be installed in conduit and/or conduit sleeves and duct banks between the Head-End Equipment Rooms and the tunnel areas. The Contractor shall install the necessary conduit and fittings, and passages for cable and conduit from the Head End Equipment Rooms to the tunnel areas as required. The low-loss, coaxial cable shall only be exposed within the Head End Equipment Rooms and the tunnel areas.
- G. All coaxial connectors, couplers and cable terminations used in the installation of the Slotted Coaxial Cable Antenna System shall be completely covered and moisture-sealed with shrinkable sleeving or other approved waterproof covering.
- H. The Slotted Coaxial Cable Antenna System shall be grounded to a single point communications ground.

**END OF SECTION**

## SECTION 16820

### COMMUNICATIONS - PUBLIC ADDRESS SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. Public Address Systems are used to provide information to the public in passenger stations and trains. Public Address Systems are also used to communicate with personnel in station service rooms, yards and shops. Separate public address systems shall be provided at each passenger station, on board each train, in yards, and in shops.
- B. Access to each Public Address System shall be provided to a local control station on an individual basis and to the Operations Control Center on an individual select, group select, or "all call" select condition control.
- C. Transit vehicle public address systems allow for public announcements by the train operator. Also, through intervention by the train operator, public announcements can be made directly from the Operations Control Center.
- D. The Rail Operations Control Center (OCC) in the Jackson Graham Building uses the PENTA PA Control Equipment to select and broadcast in the following ways:
  - 1. Systemwide announcements to all Metro Rail Stations.
  - 2. Announcements to selected Lines (i.e., Red Line, Green Line, or Blue/Orange Lines).
  - 3. Individual passenger stations.
- E. Each passenger station in the WMATA Rail System shall be designed to have an independent Public Address (PA) system. The passenger station PA system provides for general purpose and emergency evacuation announcements throughout the passenger station. PA announcements originate from the kiosk, the Rail Operations Control Center (OCC) in the Jackson Graham Building, Automatic Public Address Announcement System (APAAS), and end-of-line station's dispatcher's room.
- F. A line mixer shall be used to control the level of these individual inputs. A single output shall be taken from the mixer and applied to a compressor-limiter, the output of the compressor-limiter is fed to the APAAS control unit through the APAAS/PA interface unit (described below) to the final power amplification.
- G. The PA system shall provide noise compensated circuits to the platform and mezzanine areas, where train noise must be overcome by automatically adjusting the PA volume.
- H. Non-noise compensated circuits shall be provided for service rooms and non-revenue passageways, these areas normally do not require noise compensation.
- I. The PA system design shall be such that announcements that are made over the PA system will be managed in accordance with the following access priority:
  - 1. Automatic Public Address Announcement System.
  - 2. Rail Operations Control Center (OCC) in the Jackson Graham Building.
  - 3. Kiosk.
  - 4. When an announcement of a higher priority is initiated, the lower priority announcement is removed from the amplifier's input until the high priority announcement is completed.

- J. The operation of the passenger station PA system from the kiosk is accomplished by simultaneously depressing the push-to-talk pushbuttons on the hand-held microphone and the kiosk PA Control Panel, then speaking into the hand-held microphone. Certain kiosks (generally those subject to "large event" traffic) shall be designed to have a portable wireless microphone transmitter, to be worn by the kiosk attendant, and a diversity wireless receiver. The diversity wireless receiver is connected to the PA system so as to by-pass and take the place of the normal kiosk microphone when the wireless microphone is keyed. This feature is used to allow the kiosk attendant freedom of movement beyond the kiosk for various reasons including crowd control.
- K. When a selection is made by a Passenger Operations Supervisor in the Rail OCC, the audio path of the console is connected to the PA system channel of the selected passenger station's Carrier Transmission System terminal for transmission to the selected passenger station(s). At the passenger station, the audio path from the assigned PA system channel of the Carrier Transmission System is connected to the station PA Control Unit.
- L. The Dispatcher's PA Control Panel shall function in an identical manner as the kiosk Public Address Control Panel. (Loudspeaker zone selection is not available at the kiosk).
- M. The PA system's design shall have redundant power amplifiers. The power amplifiers shall be connected to the Amplifier Supervisory Control Unit. One power amplifier shall be connected to the "MAIN CHANNEL" of the Amplifier Supervisory Control Unit, and the second power amplifier shall be connected to the "auxiliary channel" of the Amplifier Supervisory Control Unit. Each Amplifier Supervisory Control Unit shall monitor the associated power amplifiers and, upon sensing a malfunction of the "main channel" power amplifier, shall automatically transfer the audio path to the "auxiliary channel" power amplifier.
- N. The passenger station PA speakers shall be designed to be wired in either noise-compensated or non-noise compensated circuits. Noise-compensated circuits shall be used in areas where train noise must be overcome by automatically adjusting the PA volume. The station mezzanine area and platform areas are of noise compensated circuits, which use Automatic Level Control. For areas where noise compensation is required, circuits shall be wired to the Loudspeaker Distribution Panel designated for noise-compensated circuits. Non-noise compensated circuits shall be used in all other areas. In areas where noise-compensated circuits are not required, circuits shall be wired to the Loudspeaker Distribution Panel designated for non-noise compensated circuits. Passenger station service rooms and non-revenue passageways are examples of areas that require non-noise compensated speaker circuits.
- O. Each kiosk in the WMATA Rail System shall be designed to have an Attendant/Passenger Interphone System. The Attendant/Passenger Interphone System shall provide for communication between passengers and the kiosk attendant at the kiosk. The Attendant/Passenger Interphone System shall serve both the "PAID" and the "UNPAID" side of each kiosk.
- P. A sufficient quantity of speakers shall be placed in passenger stations to give even volume distribution without objectionable loudness from any one speaker location.
- Q. The PA amplifiers shall have a constant voltage output of 70.7 volts. Each loudspeaker shall be equipped with an audio transformer to match the 70.7-volt line with the loudspeaker. The transformers shall have various taps to allow for adjustment of the sound

level in a particular area. Each transformer shall have a minimum of four taps. The power rating for each of the taps shall be determined during installation.

- R. Design of public address systems in stations shall be coordinated with architectural design.

#### **1.02 SECTION INCLUDES**

- A. Loudspeakers in the passenger station and services areas.
- B. Control hardware in the Kiosk and End-Of-Line dispatcher office.
- C. Control and amplification equipment in the Communication Equipment Room.
- D. Wireless Microphone System in the Kiosk.
- E. Attendant/Passenger Interphone System in the Kiosk.
- F. Intercom System in the End-Of-Line dispatcher office.

#### **1.03 UNIT PRICES**

- A. Unit Prices include all equipment racks, terminals, hardware, protector blocks, enclosures, connecting blocks, wiring and cabling, conduits and fittings, all the connections and cross-connections required for a complete operational installation of the Public Address System and incidental items, not specifically mentioned, but required for complete and proper system operation.

#### **1.04 RELATED SECTIONS**

- A. Section 16705 - Communications Standard Specifications - Equipment & Materials.
- B. Section 16706 - Communications System Submittals & Services.
- C. Section 16707 - Communications Systems Quality Assurance & Testing
- D. Section 16710 -Communications Grounding.
- E. Section 16715 - Communications Electrical Power Distribution.
- F. Section 16733 - Communications - Kiosk Systems
- G. Section 16771 – Communications Carrier Transmission System.

#### **1.05 REFERENCES**

- A. National Electric Code (NEC).
- B. UL Standard 1480, Speakers for Fire Protective Signaling Systems.

#### **1.06 SYSTEM DESCRIPTION**

- A. Description: Provides for general purpose and emergency evacuation announcements throughout the passenger station. PA announcements originate from the kiosk, the Rail

OCC in the Jackson Graham Building, Automatic Public Address Announcement System (APAAS), or end-of-line station's dispatcher's room.

- B. The Attendant/Passenger Interphone System provides for communications between passengers and the Station Manager at the kiosk. The Attendant/Passenger Interphone System services both the "PAID" and the "UNPAID" side of the kiosk.
- C. The dispatcher PA System/Intercom, in end-of-line stations, shall provide access to the passenger station PA system to make announcements to the station platform and mezzanine at any time that the PA system is not already in use. Additionally, a separate intercom system shall be provided at the dispatcher's room in end-of-line stations to provide oral communications between the Train Control Room, the Dispatcher's Room, and the Operations Room.
- D. Capacity:
  - 1. The Contractor shall design the placement of Type 1 loudspeakers using sound coverage calculations and typical drawings from the communications drawing package
  - 2. The Contractor shall design the placement of Type 2 loudspeakers using sound coverage calculations and typical drawings from the communications drawing package.
  - 3. The Contractor shall design the placement of Type 3 loudspeakers using sound coverage calculations and typical drawings from the communications drawing package.
  - 4. The Contractor shall furnish and install a kiosk PA Control Panel(s) constructed in accordance with contract specifications and drawings.
  - 5. The Contractor shall furnish and install a station PA Control Unit(s) constructed in accordance with contract specifications and drawings.
  - 6. The contractor shall furnish, and install a kiosk Attendant/Passenger Interphone(s) in accordance with contract specifications and drawings.
  - 7. The contractor shall furnish, and install a voice Pre-Amp/Processor in accordance with contract specifications and drawings.
  - 8. The contractor shall furnish, and install a Dual Zone Priority Mixer in accordance with contract specifications and drawings.
  - 9. The Contractor shall furnish, and install a Compressor/Limiter in accordance with Contract Specifications and Drawings.
  - 10. The Contractor shall furnish, and install a Audio Distribution Amplifier in accordance with Contract Specifications and Drawings.
  - 11. The Contractor shall furnish, and install a Ambient Noise Sensor in accordance with Contract Specifications and Drawings.
  - 12. The Contractor shall furnish, and install a Digital Equalizer in accordance with Contract Specifications and Drawings.
  - 13. The Contractor shall furnish, and install a 60-Watt Power Amplifier in accordance with Contract Specifications and Drawings.
  - 14. The Contractor shall furnish, and install a 120-Watt Power Amplifier in accordance with Contract Specifications and Drawings.
  - 15. The Contractor shall furnish, and install a Wireless Microphone Transmitter and Receiver in accordance with Contract Specifications and Drawings.
  - 16. The Contractor shall furnish, and install a 24-Vdc Power Supply in accordance with Contract Specifications and Drawings.
  - 17. The Contractor shall design, furnish, and install a custom Loudspeaker Distribution Panel in accordance with Contract Specifications and Drawings.
  - 18. The Contractor shall design, furnish, and install a custom Audio and Control Distribution Panel in accordance with Contract Specifications and Drawings.

19. The Contractor shall design, furnish, and install a custom Loudspeaker Zone Attenuator Assembly in accordance with Contract Specifications and Drawings.
20. The Contractor shall furnish, and install a PA Patch Panel Assembly in accordance with Contract Specifications and Drawings.
21. The Contractor shall furnish, and install a End-Of-Line Dispatcher Intercom in accordance with Contract Specifications and Drawings.

#### **1.07 SYSTEM PERFORMANCE REQUIREMENTS**

- A. The contractor shall be responsible for the overall performance of the PA system. The following overall system performance requirements are designed to ensure that the PA system, delivered under these specifications, meets the performance requirements of the Washington Metropolitan Area Transit Authority.
  1. PA Overall Frequency Response:  $\pm 5$ db or better 200-Hz to 8,000-Hz
  2. PA Sound Pressure Levels: 100dB minimum measured 1 meter from front of each speaker.
  3. PA Overall Harmonic Distortion: Less than 1% 200-Hz to 8,000-Hz.
  4. Interphone Overall Frequency Response:  $\pm 5$ db or better 200-Hz to 5,000-Hz
  5. Interphone Sound Pressure Levels: 90dB minimum measured 1 meter from kiosk wall, 1.5 meters above floor.
  6. Interphone Overall Harmonic Distortion: Less than 5% 200-Hz to 5,500-Hz.

#### **1.08 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.
- C. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

#### **1.09 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Service facilities within 50 miles of Project.

#### **1.10 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Public Address System until Final Completion.

### **PART 2 - PRODUCTS**

#### **2.01 SPEAKERS ASSEMBLY TYPE 1 (PYLON) and TYPE 2 (CEILING)**

- A. Manufacturers:
  - 1. QUAM Model 8C10PAOTB/TBL70(Driver) W/Quam-Nichols SE1WVP (Enclosure Type 1) w/Quam-Nichols BS8WVP (Grill Type 1) (or approved equal).
- B. Description: Speakers for use in Pylons and Passenger Station ceiling.
- C. Ratings:
  - 1. Magnet:
    - a. Weight: 10-ounces.
    - b. Material: Ceramic.
    - c. Flux Density: 9K gauss.
    - d. DC Resistance: 7.4 ohms.
    - e. Diameter: One inch.
  - 2. Electrical:
    - a. Power Handling: 15-Watts.
    - b. Transformer: 70-volt multi-tap at 4,2,1,and .5watts.
    - c. Frequency Response: 80-Hz to 8-KHz.
    - d. Sensitivity: 95db.
  - 3. Mechanical:
    - a. Depth: 3-1/4 inches.
    - b. Transformer Mounting: Min 2 inches – Max 2-13/16 inches.
    - c. Mounting Hole Circle: 7-5/8 inches.
    - d. Baffle Opening: Seven inches.
    - e. Cone: 8-inch full range moisture proof.
    - f. Grill: Custom finish color to match current WMATA pylon color.

## **2.02 SPEAKERS ASSEMBLY TYPE 3 (STAFF SERVICE AREAS)**

- A. Manufacturers:
  - 1. Atlas/Soundolier Model No. VT-27UCN (or approved equal)
- B. Description: Speakers for use in service areas.
- C. Ratings:
  - 1. Transformer: 70.7-Volts.
  - 2. Power Taps: 1 and 2 Watts
  - 3. Frequency Response: 600-Hz to 5500-Hz (± 5db).
  - 4. Sensitivity: 96.9dB (1-watt at 1-meter).
  - 5. Dimensions: 4-1/2 inches, square.
  - 6. Mounting Box: Atlas/Soundolier Model No. SEN.
  - 7. Color: Neutral Gray.
  - 8. Construction: Die-cast zinc, water/moisture sealed.

## **2.03 KIOSK PA CONTROL PANEL**

- A. Manufacturers:
  - 1. Custom Item.
- B. Description: Station Manager's Public Address System Control Panel.
- C. Furnished by WMATA. [IS THIS STILL APPLICABLE?]

## **2.04 STATION PA CONTROL UNIT**

- A. Manufacturers:
  - 1. Custom Item.
- B. Description: Control and interface unit for the PA System.
- C. Furnished by WMATA.[IS THIS STILL APPLICABLE?]

## 2.05 KIOSK ATTENDANT/PASSENGER INTERPHONE

- A. Manufacturers:
  - 1. Norcon Communications Model No. TTU-7J electronic communications system (Norcon Communications, Inc., 516-239-0300 or www.norconcomm.com) (or approved equal).
- B. Description: Intercom between Kiosk attendant and passengers.
- C. Ratings:
  - 1. Audio Power: Two watts.
  - 2. Microphone: Removable Gooseneck.
  - 3. Power: 12-Vdc battery pack.
  - 4. Speaker Enclosure Finish: Metro Bronze, Federal Standard 595B, Color No. 20040.

## 2.06 VOICE PRE-AMP/PROCESSOR

- A. Manufacturers:
  - 1. Symetrix Model No. 572E (or approved equal) with Middle Atlantic Product SC-1 security cover (or approved equal).
- B. Description: Voice processor incorporating a high-quality microphone preamp coupled to three-band parametric equalizer, high and low pass filters, and a dynamic range processor
- C. Ratings:
  - 1. Mic Input:
    - a. Impedance: Balanced transformerless, low impedance..
    - b. Gain Range: 20 to +60 dB(pad out), 5 to 45 dB (pad in).
    - c. Max Input Level: 0 dBu (pad out).
    - d. Phantom Power: +48 Volts nominal
  - 2. Line Input:
    - a. Impedance: 10k ohms transformerless, balanced bridging.
    - b. Max Input Level: +20dBu.
  - 3. Parametric Equalizer:
    - a. Frequency: Low: 16-Hz to 500-Hz, Mid: 160-Hz to 6300-Hz, High: 680-Hz to 22-KHz.
    - b. Peak/Dip Bandwidth: 0.3 octaves, measured at maximum boost.
    - c. Maximum Boost/Cut:  $\pm$  15dB.
  - 4. Filters:
    - a. Low Cut Filter Slope: 12dB/octave.
    - b. Low Cutoff Frequency Range: 6-Hz to 260-Hz @ - 3dB.
    - c. High Cut Filter Slope: 12dB/octave.
    - d. High Cutoff Frequency Range: 3-KHz to 65-KHz.
  - 5. Metering:
    - a. Type: Multi-segment LED bar graph.
    - b. Output Level: -20, -10, 0, Clip (0 VU=+4dBu), VU calibrated, peak responding.
    - c. Expander Gain Reduction: 3, 6, 12, 20 dB.
    - d. Compressor Gain Reduction: 3, 6, 12 dB.
  - 6. Dynamic Range Processor:
    - a. Type: Interactive comp/limiter-downward expander.

- b. Comp/Limiter Ratio: 1:1 to 10:1.
- c. Downward Expansion ratio (mix): 1:1.8.
- 7. Output:
  - a. Output section Type: Balanced transformerless.
  - b. Maximum Output Level: +21dBu balanced.
  - c. Output Clip LED: Fires 3dB below clipping.
  - d. Output source Impedance: 200-Ohms, Balanced.
  - e. Output Gain:  $\pm 15$ dB.
- 8. Frequency Response: 20-Hz to 20-KHz.
- 9. Power Input: 120-Vac.
- 10. Mounting: 19" rack.

## 2.07 DUAL ZONE PRIORITY MIXER

- A. Manufacturers:
  - 1. Symetrix, Inc. Model 450 (or approved equal).
- B. Description: Mixer with three levels of priority .
- C. Ratings:
  - 1. Microphone inputs: Two, low impedance, balanced.
  - 2. Microphone Common Mode Rejection: >85dB @ 1KHz, 1 Volt RMS.
  - 3. Line Inputs: Four, stereo.
  - 4. Line Input Impedance: > 10K ohms, balanced.
  - 5. Line Common Mode Rejection: >40dB @ 1KHz, 1 Volt RMS.
  - 6. Line Input Level: +24dBu balanced, +18dBu unbalanced maximum.
  - 7. Frequency Response:  $\pm 1$  dB, 20-Hz to 20-KHz any input to any output.
  - 8. Mounting: 19-inch rack.
  - 9. Power Input: 120-Vac.

## 2.08 COMPRESSOR/LIMITER

- A. Manufacturers:
  - 1. Symetrix, Inc. Model 301 (or approved equal).
- B. Description: AGC-Leveler with mic/line input.
- C. Ratings:
  - 1. Line Inputs: 20k ohms balance, 10k ohms.
  - 2. Microphone Input: XLR-female & Screw Terminals.
  - 3. Outputs: XLR-male & Screw Terminals 200 ohms balanced.
  - 4. Attack Time: 500 $\mu$ S to 100 mS.
  - 5. Release Time: 50mS to 4 seconds.
  - 6. Threshold: -40dBu to +20dBu..
  - 7. Compressor Ratio: Bypass to 10:1.
  - 8. Power Input: 120-Vac, 7-pin DIN.
  - 9. Mounting: 19-inch rack.

## 2.09 AUDIO DISTRIBUTION AMPLIFIER

- A. Manufacturers:
  - 1. Symetrix, Inc. Model 301 (or approved equal).
- B. Description: One input/four output audio distribution amplifier.

- C. Ratings:
1. Maximum Input Level: +26dBu Balanced
  2. Maximum Output Level: +26dBu Balanced (20k ohm load), +22dBm (600 ohm load).
  3. Input Impedance: 20k ohms balanced, 10k ohms unbalanced.
  4. Output Impedance: 200 ohms balanced, 100 ohms unbalanced.
  5. Frequency Response:  $\pm 0.5$ dBm, 20-Hz to 20-KHz.
  6. Input Gain Range:  $\pm 15$ dB.
  7. Output Gain Range: 0 to  $-20$ dB.

## 2.10 AMBIENT NOISE SENSOR

- A. Manufacturers:
1. Symetrix Model No 571 (or approved equal)
- B. Description: Ambient sensing automatic level controlling device to regulate the operating level of a sound system in proportion to changing noise levels in the sound system's operating area.
- C. Ratings:
1. Inputs: Two sensing mic (-40dBu nominal) CMRR => 60dB at 1-KHz, one paging mic (-40dBu nominal) CMRR => 60dB at 1-KHz, one line (0dBu nominal) CMRR =< 40dB at 1-KHz, one music (-10dBu nominal) CMRR =< 40dB at 1-KHz
  2. Maximum Input Level: -30dBu (mic inputs), +18 (line inputs).
  3. Input Impedance: Mic: electronically balanced bridging 200 ohms, nominal (not phantom powered). Line: electronically balanced bridging 20 kilo ohms nominal.
  4. Phantom Power (on all mic inputs): 15-Vdc.
  5. Output: Balanced, transformerless.
  6. Output Impedance: 100 ohms.
  7. Maximum Control Range: 40dB.
  8. Ambient noise to Gain Ratio: Variable, 2:1 to 1:2.
  9. Averaging Time: 1.2 sec. To 5 min.
  10. Page-Over Music (ducking): Variable, 0 to 14 dB.
  11. Frequency Response: 20-Hz to 20-KHZ( + 1 dB,-0 dB).
  12. Power Input: 120-Vac 60-Hz.
  13. Mounting: 19-inch rack.

## 2.11 DIGITAL EQUALIZER

- A. Manufacturers:
1. Shure Model No. DFR-11EQ (or approved equal).
- B. Description: Digital 1/3 Octave graphic equalizer, automatic and manual acoustic feedback suppression for 10 frequencies, digital delay compressor/limiter..
- C. Ratings:
1. Remote Programming: RS232C serial port.
  2. Frequency Response: 20-Hz to 20-KHz  $\pm 1.0$ dB reference 1 KHz.
  3. Dynamic Range: 104db minimum, A-weighted, 20-Hz to 20-KHz.
  4. Sampling Rate: 48-KHz.
  5. Digital-to-Analog, Analog-to-digital Conversion: 20-bit resolution.
  6. Voltage Gain:
    - a. Power Off: -1 dB  $\pm$  1dB.

- b. Equal Input And Output Sensitivities: 0dB  $\pm$  2dB.
- c. Input -10dBv, Output +4dBu: 12dB  $\pm$  2dB.
- d. Input +4dBu, Output - 10dBv: -12dB  $\pm$  2dB.
- 7. LED Signal Indicators: Clip: 6dB down from input clipping.
- 8. Feedback Filters:
  - a. Ten 1/10-octave adaptive notch filters from 60-Hz to 20-KHz.
  - b. Deployed to 1-Hz resolution of feedback frequency
  - c. Deployed in depths of 3dB, 6dB, 9dB, 12dB and 18dB (12.5 Low Q in graphic EQ mode) attenuation.
  - d. Filter shape variable between HI Q and LOW Q.
- 9. Graphic Equalizer:
  - a. Frequency Bands: 30 bands on ISO, 1/3-octave centers.
  - b. Filter Type: 1/3- octave, constant Q.
  - c. Maximum Boost: 6dB per band.
  - d. Maximum Cut: 12dB per band, high- and low-pass filters, 12dB/octave nominal.
- 10. Parametric Equalizer:
  - a. Frequency Bands: 10 bands, variable frequency, variable Q.
  - b. Boost/Cut Range: + 6 to -18 dB per band.
  - c. Q Range: 1/40-octave to 2 octave.
  - d. Shelf/Rolloff Filters: Shelf, + 6 to - 18 dB per filter. Rolloff, 6dB, 12dB, 18dB, or 24dB per octave nominal.
- 11. Delay: Up to 1300ms.
- 12. Limiter:
  - a. Threshold: - 60dBFs to - 0.5dBFs, 0.5dB resolution
  - b. Attack: 1 ms to 200 ms.
  - c. Decay: 50 ms to 100 ms.
  - d. Ratio: 4 to 1.
- 13. Mounting: 19-inch rack.
- 14. Power Input: 120-Vac 60-Hz.

## 2.12 60-WATT POWER AMPLIFIER

- A. Manufacturers:
  - 1. TOA Model No. P-906MK2 with MB 35B rack mount kit (or approved equal).
- B. Description: Audio power amplifier.
- C. Ratings:
  - 1. Output Power: 60-watts RMS.
  - 2. Frequency Response: 20-20,000 Hz, +1dB/-3 dB.
  - 3. Inputs: One input port, one direct.
  - 4. Input Sensitivity/Impedance:
    - a. Input Port: 100 mV or 1000 mV (switchable)/10 K ohms.
    - b. Direct Input: 100 mV or 1000 mV (switchable)/10 K ohms.
  - 5. Output:
    - a. Main (Transformer): 8 ohms, 25 and 70 volts, balanced.
    - b. Main(Direct): 4 ohms, unbalanced.
  - 6. Indicators: One power LED, one protect LED, one signal LED, one normal LED, one peak LED.
  - 7. Power Input: 120-Vac 60-Hz, 100-watts.
  - 8. Mounting: 19-inch rack, maximum of two EIA rack units in height.
  - 9. Input Module: TOA Model No. B01F balanced line input, 10k ohms.

### 2.13 120-WATT POWER AMPLIFIER

- A. Manufacturers:
  - 1. TOA Model No. P-912MK2 with MB 35B rack mount kit (or approved equal)
- B. Description: Audio power amplifier.
- C. Ratings:
  - 1. Output Power: 120-watts RMS
  - 2. Frequency Response: 20-20,000 Hz, +1dB/-3dB.
  - 3. Inputs: One input port, one direct.
  - 4. Input Sensitivity/Impedance:
    - a. Input Port: 100 mV or 1000 mV (switchable)/10 K ohms.
    - b. Direct Input: 100 mV or 1000 mV (switchable)/10 K ohms.
  - 5. Output:
    - a. Main (Transformer): 8 ohms, 25 and 70 volts, balanced.
    - b. Main(Direct): 4 ohms, unbalanced.
  - 6. Indicators: One power LED, one protect LED, one signal LED, one normal LED, one peak LED.
  - 7. Power Input: 120-Vac 60-Hz, 180-watts.
  - 8. Mounting: 19-inch rack, maximum of two EIA rack units in height.
  - 9. Input Module: TOA Model No. B01F balanced line input, 10k ohms.

### 2.14 WIRELESS MICROPHONE TRANSMITTER AND RECEIVER

- A. Manufacturers:
  - 1. Shure Model No. UC2/UC4 UHF microphone system with UA500 remote antenna kit and PS40 Power Supply (or approved equal).
- B. Description: UHF Wireless Microphone System with head-worn microphone transmitter.
- C. Ratings:
  - 1. RF Carrier Frequency Range: 782 – 806 MHz.
  - 2. Working Range 500 ft. minimum under typical conditions.
  - 3. Audio Frequency response: 45 to 15,000 Hz  $\pm$ 2dB.
  - 4. Gain Adjustment Range: -6 to 26 dB.
  - 5. Receiver Audio Output Level (Maximum):
    - a. Unbalanced: + 5dBu typical.
    - b. Balanced: + 14dBu typical.
  - 6. RF Sensitivity: -108dBm at 12dB SINAD.
  - 7. Image Rejection 90dB typical.
  - 8. Spurious Rejection 70dB typical.
  - 9. Power Requirements:
    - a. UC2: 9V alkaline battery.
    - b. UC4: 15-Vdc, 600-mA.
  - 10. Mounting: 19 rack

### 2.15 24-VDC POWER SUPPLY

- A. Manufacturers:
  - 1. Acopian, Model No. 24PT10 (or approved equal).
- B. Ratings:
  - 1. Nominal Voltage: 24-Vdc (regulated).
  - 2. Rated Current: Three Amperes continuous (minimum).
  - 3. Regulation: Less than 2%.

4. Ripple: Less than 10 mV rms.
5. Power Required: 105 to 125 Vac, 50/60 Hz, 170-watts (nominal).

#### **2.16 LOUDSPEAKER DISTRIBUTION PANEL**

- A. Manufacturers:
  1. Custom assembly by contractor.
- B. Metal EIA rack mount panel:
  1. Middle Atlantic Products Rack Panel- PHBL Series or approved equal.
- C. Phoenix Captive Wire Terminal Block product or approved equal.
- D. Captive wire terminal blocks rated for not less than 120-Vac, 15-amp.
- E. Provide sufficient quantity of captive wire terminal blocks to support all loudspeaker zone cabling plus 10% spare terminations for expansion.
- F. Printed permanently affixed labeling strip identifying each numbered captive wire terminal.
- G. Provide all mounting hardware and cable terminations for a complete assembly.

#### **2.17 AUDIO AND CONTROL DISTRIBUTION PANEL**

- A. Manufacturers:
  1. Custom assembly by contractor.
- B. Metal EIA rack mount panel:
  1. Middle Atlantic Products Rack Panel- PHBL Series or approved equal.
- C. Phoenix Captive Wire Terminal Block product or approved equal.
- D. Captive wire terminal blocks rated for not less than 120-Vac, 15-amp.
- E. Provide sufficient quantity of captive wire terminal blocks to support all loudspeaker zone cabling plus 10% spare terminations for expansion.
- F. Printed permanently affixed labeling strip identifying each numbered captive wire terminal.
- G. Provide all mounting hardware and cable terminations for a complete assembly.

#### **2.18 LOUDSPEAKER ZONE ATTENUATOR ASSEMBLY**

- A. Manufacturers:
  1. Custom assembly by Contractor.
- B. Description: Volume control of Staff Service Area loudspeaker zones.
- C. Metal EIA Rack Mount Panel:
  1. Middle Atlantic Products Rack Panel – PHBL series or approved equal.
- D. 70-volt Loudspeaker attenuators:

1. Atlas-Soundolier AT-10RM or AT35RM attenuator or approved equal (actual model/wattage rating determined must exceed actual load of loudspeaker zone connected).
  2. With front panel knobs.
  3. Attenuation steps of 3dB.
  4. Non-shorting rotary switch.
  5. Ten steps, plus off position.
  6. Silver plated contacts.
  7. One attenuator per loudspeaker circuit.
- E. Custom engraving (or silk screening) identifying panel as STAFF SERVICE AREA LOUDSPEAKER ZONES @, .25-in. tall letters.
- F. Custom engraving (or silk screening) identifying each loudspeaker zone for each attenuator .375-inch tall letters.
- G. Rear mounted loudspeaker cabling captive wire terminal strip.
- H. Provide all mounting hardware and cable terminations for a complete assembly

## **2.19 PA PATCH PANEL ASSEMBLY**

- A. Manufacturers:
1. AVR Communications Group VERSAPATCH Model No. II-AB (or approved equal).
- B. Description: Patch panel assembly for the audio power amplifiers and audio signal
- C. Ratings
1. Number of Jacks: Two rows of 24
  2. Insertion Loss: Less than 0.1dB
  3. Jack Circuits Configuration: Top-to-bottom row jack circuits are normalled (looped) internally (AB).
  4. Punch Block: Rear mounted proprietary 66-terminal punch block for solid and stranded wire (Flexiblock)
  5. Chassis and Brackets: Aluminum
  6. Mounting: 19-inch rack.
  7. Compatibility: Standard ¼ inch 3-conductor phone shielded audio patch cords.
- D. Provide printed designation labeling for each jack.
- E. Sealed enclosure to keep out contaminants.
- F. Rear Cable strain relief bar.
- G. Provide sufficient quantity of normalled patch circuits to patch the combined total of all individual patch points

## **2.20 PATCH PANEL PUNCH TOOL**

- A. Manufacturers:
1. AVR Communications Group Model No. S-714 (or approved equal).
- B. Compatible with wiring punchblocks included with patch panel.

- C. Contractor shall locate/ Punch Tool in rack mounted storage drawer for use by WMATA Maintenance.

## **2.21 PATCH PANEL PUNCH TOOL**

- A. Manufacturers:
  - 1. AVR Communications Group Model No. 639-100-085 (or approved equal).
- B. Description: Audio patch cord compatible mating with provided Patch Panels..
- C. Ratings:
  - 1. Plugs: TSR ¼ inch phone connectors.
  - 2. Length: 60 inches.
  - 3. Cable: 22-gauge stranded twisted pair, with shield and overall insulator.
- D. Locate/store Patch Cord in rack mounted storage drawer for use by WMATA Maintenance.

## **2.22 END-OF-LINE DISPATCHER INTERCOM**

- A. Manufacturers:
  - 1. Aiphone Communication Systems Model No. LEF-3 (or approved equal).
- B. Description: An open voice, selective calling type intercom with individual selector switches for each station.
- C. Ratings:
  - 1. Output: 800 mW @ 20 ohms (reception), 500 mW @ 20 ohms (transmission).
  - 2. Communication: Press-to-talk, release-to-listen at master station. Hands free response.
  - 3. Capacity: Up to four stations, intermixable.
  - 4. Speaker Sensitivity: 40dB.
  - 5. Total Harmonic Distortion: Less than 5% at rated output power.
  - 6. Signal to Noise Ratio: 60dB.
  - 7. Frequency Response: -3dB, 770-6,800 Hz.
  - 8. Power Source: 12-Vdc, 300-mA per station (Use Aiphone PS-12C power supply).

## **2.23 INTERCOM POWER SUPPLY**

- A. Manufacturers:
  - 1. Aiphone Communication Systems Model No. PS-1C (or approved equal).
- B. Description: DC power supply for Aiphone LEF-3 intercom.
- C. Ratings:
  - 1. Input Voltage: 120-Vac, 50/60 Hz.
  - 2. Power Consumption: 28 watts.
  - 3. Output Voltage: 12-Vdc.
  - 4. Maximum Output Current: One Amp dc.

## **2.24 INTERCOM SUB STATION**

- A. Manufacturers:
  - 1. Aiphone Communication Systems Model No. LS-NVP with SBX-NVP surface mount box (or approved equal).

- B. Description: Vandal proof sub station for Aiphone LEF-3 intercom.
- C. Ratings:
  1. Speaker: 20 ohms, three-inch diameter, water and puncture resistant, 2.5 oz. Ceramic magnet.
  2. Call Button: SPST with mechanical stop, normally open.
  3. Faceplate: 11-gauge carbon steel with powder-coated white baked epoxy finish.
  4. Communication: Hands free at sub. Master station controls push-to-talk, release-to-listen.
  5. Mounting: Surface mount with SBX-NVP box.
  6. Mounting Hardware: Tamper-proof screws
  7. Dimensions: SBX-NVP 8-5/8"H x 6-5/8"W x 2-1/4"D.
  8. Power Source: Supplied by master.

## **2.25 CARDIOD DYNAMIC MICROPHONE WITH 18" GOOSENECK**

- A. Manufacturers:
  1. Shure SM57 (microphone) with Shure A12 (mounting flange), with Shure G18-CN(18" Gooseneck), with Shure A2WS (windscreen) (or approved equal).
- B. Description: Kiosk microphone.
- C. Ratings:
  1. Type: Unidirectional Dynamic Cardioid.
  2. Impedance: 150 ohm (310 actual).
  3. Frequency Response: 40-15 KHz.
  4. Output: Balanced 3-pin male XLR.

## **2.26 AC POWER LINE CONDITIONER-20 AMP**

- A. Manufacturers:
  1. New Frontier Electronics Surge-X SX2120 (or approved equal).
- B. Description: Electrical power line surge suppressor and line conditioner.
- C. Ratings:
  1. Mounting: 19-inch rack.
  2. Current: 20 amps at 120-Vac.
  3. Rear Outlets: 12 switched, two un-switched.
  4. Front Panel Indications: Electrical service and surge fault.
  5. Front Panel Switches: One for switched outlets.
- D. Automatic internal test of circuitry.
- E. UL Listed. Meeting or exceeding UL grade A-1-1 for power line surge suppression and EMI/RFI line conditioning.
- F. Series mode circuitry rated to immediately clamp 6000-Vac line surges.
- G. Series mode circuitry rated with unlimited surge current without ground contamination.

## **2.27 AC POWER LINE CONDITIONER, 15-AMP**

- A. Manufacturers:

1. New Frontier Electronics Surge-X SX115R (or approved equal).
- B. Description: Electrical power line surge suppressor and line conditioner.
- C. Ratings:
  1. Mounting: 19-inch rack.
  2. Current: 15-amps at 120-Vac.
  3. Rear Outlets: Six switched, two un-switched.
  4. Front Panel Indications: Electrical service and surge fault.
  5. Front Panel Switches: One for switched outlets.
- D. Automatic internal test of circuitry.
- E. UL Listed. Meeting or exceeding UL grade A-1-1 for power line surge suppression and EMI/RFI line conditioning.
- F. Series mode circuitry rated to immediately clamp 6000-Vac line surges.
- G. Series mode circuitry rated with unlimited surge current without ground contamination.

#### **2.28 SHIELDED TWISTED-PAIR CABLE (16-AWG)**

- A. Description: loudspeaker cable type, for loudspeaker zones not exceeding 60 watts.
- B. UL rated. NEC Type CMR with low smoke NON-PVC jacket.
- C. Ratings:
  1. Conductors: 16-AWG stranded twisted pair ASTM tinned copper with overall 100% foil shield.

#### **2.29 SHIELDED TWISTED-PAIR CABLE (14-AWG)**

- A. Description: loudspeaker cable type, for loudspeaker zones not exceeding 120 watts.
- B. UL rated. NEC Type CMR with low smoke NON-PVC jacket.
- C. Ratings:
  1. Conductors: 14-AWG stranded twisted pair ASTM tinned copper with overall 100% foil shield.

#### **2.30 SHIELDED MULTI-TWISTED-PAIR CABLE (20-AWG)**

- A. Description: Audio cable for all audio wiring and ambient noise and paging microphones.
- B. UL rated. NEC Type CMR with low smoke NON-PVC jacket.
- C. Ratings:
  1. Conductors: 20-AWG stranded twisted pair ASTM tinned copper with overall 100% foil shield.

#### **2.31 SHIELDED MULTI-TWISTED-PAIR CONTROL SIGNALING/AUDIO CABLE**

- A. Description: control signaling multi-pair cable type, for all control and DC voltage wiring.

- B. UL rated. NEC Type CMR with low smoke NON-PVC jacket.
- C. Ratings:
  - 1. Conductors: 18-AWG stranded twisted pairs ASTM tinned copper with overall 100% foil shield.

### **2.32 AMBIENT NOISE SENSOR MICROPHONE (ANS-MIC)**

- A. Manufacturers:
  - 1. Crown Model No.PZM-11 or approved equal.
- B. Ambient Noise Sensor Microphone, phantom powered boundary microphone mounted on single-gang wallplate.
- C. Color white.
- D. Ceiling mounted at locations shown on drawings, in metal junction box provided by Contractor.
- E. Hemispherical polar pattern.
- F. Electret condenser element.
- G. Frequency response 80Hz to 20,000Hz.
- H. Signal to noise ratio 68dB at 94dB SPL.
- I. 225 ohms balanced impedance.
- J. Provide with mounting hardware, conduit pathway and cabling.

### **2.33 DISPATCHER PA FACILITY-TABLETOP INSTRUMENT CABINET**

- A. Manufacturers:
  - 1. AMCO Engineering Company, Model No. IAPDM21-19-18-PT (or approved equal).
- B. 19-inch vertical rack mounting channels.
- C. Vinyl covered aluminum construction, rubber base feet, convection cooling.
- D. Dimensions (D, W, H): 18 3/4" x 19" x 21".
- E. Color: Light Blue.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION REQUIREMENTS**

- A. Install a complete and operational passenger station Public Address System, as described herein, in the passenger station(s). This includes installations in the Kiosk(s), Communications Equipment Room(s) and Dispatcher's Facility.

- B. Install all terminals, hardware, wiring and cabling, conduits, and fittings. The Contractor shall install the required connectors, attenuators, baluns, audio isolation transformers, and inter-rack wiring between the various equipment, and make all necessary connections and cross-connections required for complete installations. All inter-rack wiring between various equipment shall be shielded, twisted-pair cable.

### **3.02 PA SPEAKER INSTALLATION**

- A. In those locations where a PA Speaker enclosure is not imbedded, the Contractor shall install the appropriate type PA speaker enclosure. PA speaker enclosures are imbedded in the ceiling of the mezzanine areas, under the mezzanine structure, and in entrance passageways of the passenger station. No speaker enclosures are imbedded in service rooms and non-revenue passageways. Install surface mounted speaker enclosures or suspended ceiling mounted enclosures as appropriate.
- B. Submit a proposed PA speaker layout for the passenger station to the Engineer for approval. This layout shall show each PA speaker, the matching transformer tap to be used and the total power per circuit.
- C. Install the PA speaker, with matching transformer and associated speaker baffles, in the PA speaker enclosures.
- D. Install the PA speaker, with matching transformer and associated speaker baffles, in the Pylon on the station platform.
- E. Install the required cabling, hardware and material to connect the speakers (via matching transformers) to the appropriate Loudspeaker Distribution Panels. Furnish and install conduit between PA speaker.

### **3.03 COMMUNICATIONS EQUIPMENT ROOM INSTALLATION**

- A. Install the equipment on a 19-inch equipment rack in the Communications Equipment Room of the passenger station(s).
- B. Distribute the 70.7-volt amplified audio to all speakers in the passenger station(s) using a Loudspeaker Distribution Panel for each zone.
- C. All PA amplifiers shall be adjusted, internally or externally, via audio attenuators, to provide the full rated audio output for a 0 dBm input signal level.
- D. Install the required cabling, connectors and plugs to provide 120-Vac, 60-Hz to the various PA equipment from the ac power receptacle strip on the PA equipment rack.

### **3.04 KIOSK INSTALLATION**

- A. Install a Kiosk Public Address Control Panel in the appropriate bay of the Kiosk cabinetry.
- B. Install the voice pre-amp/processor in the appropriate bay of the Kiosk cabinetry.
- C. Install a hand-held Gooseneck microphone on the appropriate bay of the Kiosk cabinetry. Furnish and install the required wiring harness between the Kiosk PA Control Panel and the Kiosk Cable Termination Rack in the Kiosk.
- D. Install the wireless microphone receiver in the appropriate bay of the Kiosk cabinetry and mount the antenna on top of the Kiosk in a location approved by the Engineer. Furnish and

install the required wiring harness between the wireless microphone receiver and the Kiosk Cable Termination Rack in the Kiosk.

- E. Install individually-shielded, twisted, pair cables between the Kiosk Cable Termination Rack and the appropriate PA equipment in the Communications Equipment Room. The Contractor shall use these cables to connect the Kiosk PA Control Panel and wireless microphone receiver to the appropriate PA System equipment within the Communications Equipment Room.

### **3.05 KIOSK-ATTENDANT/PASSENGER INTERPHONE SUBSYSTEM INSTALLATION**

- A. Install a complete operational Kiosk-Attendant/Passenger Interphone Subsystem in the Kiosk of the passenger station(s).
- B. Surface-mount two Interphone Loudspeaker Enclosures to the exterior of the Kiosk structure at each passenger station. One Interphone Loudspeaker Enclosure shall be installed on the Kiosk door. The second Interphone Loudspeaker Enclosure shall be installed on the Kiosk structure associated with Bay Four of the Kiosk cabinetry. Exact locations shall be approved by the Engineer.

### **3.06 TERMINAL SUPERVISOR'S PUBLIC ADDRESS FACILITY INSTALLATION**

- A. Install a complete operational Dispatcher's Public Address Facility in the new end-of-line Passenger Station (if applicable).
- B. Install a Public Address System Control Panel (same as the Kiosk PA System Control Panel), with microphone and a Loudspeaker Zone Selection Panel in a Tabletop Instrument Cabinet. The Contractor shall install the Tabletop Instrument Cabinet on top of the table/desk within the End-of-Line Terminal Supervisor's Room.
- C. Install a junction box with terminals within the Terminal Supervisor's Room in a location approved by the Engineer.
- D. Install a Terminal Supervisor's PA Zone Selection System for the Dispatcher's Facility.
- E. Provide all components needed to implement the Terminal Supervisor's PA Zone Selection System, and install the following components as stated below:
  - 1. Install the Terminal Supervisor's PA Zone Selection Panel in the Terminal Supervisor's Room.
  - 2. Install the Terminal Supervisor's PA Zone Control Unit in the Station PA System Equipment Rack in the Communications Equipment Room.
- F. Install individually shielded, twisted, three-pair audio cables, as needed, from the PA equipment in the Terminal Supervisor's Room to the Station PA Equipment Rack in the Communications Equipment Room, via the junction box with terminals. Install the necessary connections and cross-connections between the cables and the Kiosk PA Control Panel, Terminal Supervisor's PA Control Panel, Terminal Supervisor's PA Zone Selection Panel, Terminal Supervisor's PA Zone Control Unit; and the Station PA Control Unit. Connect the Terminal Supervisor's PA Control Panel to the Station PA Control Unit and the Terminal Supervisor's Zone Control Unit via the audio and control circuit connections assigned for Kiosk No. 3.

### **3.07 TERMINAL SUPERVISOR'S/TRAIN CONTROL ROOM/OPERATIONS ROOM INTERCOM**

- A. Install the Intercom Sub Station and the Surface-Mounted Enclosure in the Train Control Room and the Operations Room of the new Passenger Station in a location approved by the Engineer.
- B. Install a junction box with terminals within the Train Control Room and the Operations Room in a location approved by the Engineer.
- C. Install a two (2)-conductor cable from the Intercom Master to the Intercom Sub Stations in the Train Control Room, and the Operations Room, via the junction box installed at each location. The Contractor shall install the necessary connections and cross-connections to connect the Intercom Sub Station to the Intercom Master.

### **3.08 INTERFACE**

- A. Install the hardware and wiring required to connect the Automatic Public Address Announcement System equipment to the Passenger Station Public Address System equipment.
- B. Install the required hardware and wiring to connect the alarm output of the Station PA Control Unit to the Main Distribution Frame.
- C. Install the required cabling, hardware and material to connect the Carrier Transmission System to the Station PA Control Unit to provide for the Rail Operations Control Center announcements. Included in the installation is the wiring of -48 Vdc from the Carrier Transmission System Power Supply to the Station PA Control Unit to provide "M" lead signaling.

### **3.09 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

### **3.10 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.
- B. Adjust levels for proper sound levels in the services areas.

### **3.11 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.

- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**END OF SECTION**

**SECTION 16820**  
**COMMUNICATIONS - PUBLIC ADDRESS SYSTEM**

**PART 1: GENERAL**

**1.01 SUMMARY**

- A. Public Address Systems are used to provide information to the public in passenger stations. Public Address Systems are also used to communicate with personnel in station service rooms. Separate public address systems shall be provided at each operational yard, facilities, and in shops.
- B. Access to each Public Address System shall be provided to a local control station on an individual basis and to Jackson Graham Building and Carmen Turner Facility on an individual select, group select, or "all call" select condition control.
- C. The Rail Operations Control Center (OCC) in the Jackson Graham Building and Carmen Turner Facility uses the PENTA PA Control Equipment to select and broadcast in the following ways:
  - 1. System wide announcements to all Metro Rail Stations.
  - 2. Announcements to selected Lines (i.e., Red Line, Green Line, Yellow line, Silver Line, or Blue/Orange lines).
  - 3. Individual passenger stations.
- D. Each passenger station in the WMATA Rail System shall be designed to have an independent Public Address (PA) system. The passenger station PA system provides for general purpose and emergency evacuation announcements throughout the passenger station. PA announcements originate from the kiosk, the Rail Operations Control Center (ROCC) in the Jackson Graham Building and Carmen Turner Facility, and end-of-line station's dispatcher's room.
- E. A line Priority mixer shall be used to control the level of these individual inputs.
- F. The PA system shall provide noise compensated circuits to the platform and mezzanine areas, where train noise must be overcome by automatically adjusting the PA volume.
- G. Non-noise compensated circuits shall be provided for service rooms and non-revenue passageways, these areas normally do not require noise compensation.
- H. The PA system design shall be such that announcements that are made over the PA system will be managed in accordance with the following access priority:
  - 1. Fire Emergency Evacuation Announcements.
  - 2. Wireless Microphone
  - 3. Rail Operations Control Center (ROCC) in the Jackson Graham Building and Carmen Turner Facility.
  - 4. Kiosk Microphone.
  - 5. End-of-line Dispatcher

When an announcement of a higher priority is initiated, the lower priority announcement is removed from the amplifier's input until the high priority announcement is completed.

- I. The operation of the passenger station PA system from the kiosk is accomplished by simultaneously depressing the push-to-talk pushbutton on the kiosk PA Control Panel, then speaking into the Goose Neck microphone. The diversity wireless receiver is connected to the PA system so as to by-pass and takes the place of the normal kiosk microphone when the wireless microphone is keyed. This feature is used to allow the kiosk attendant freedom of movement beyond the kiosk for various reasons including crowd control.
- J. When a selection is made by a Passenger Operations Supervisor in the Rail OCC, the audio path of the console is connected to the PA system channel of the selected passenger station's Carrier Transmission System terminal for transmission to the selected passenger station(s). At the passenger station, the audio path from the assigned PA system channel of the Carrier Transmission System is connected to the station PA Control Unit.
- K. The Dispatcher's PA Control Panel shall function in an identical manner as the kiosk Public Address Control Panel. (Loudspeaker zone selection is not available at the kiosk).
- L. The PA system's design shall have redundant power amplifiers. The power amplifiers shall be connected to the Amplifier Supervisory Control Unit. One power amplifier shall be connected to the "MAIN CHANNEL" of the Amplifier Supervisory Control Unit, and the second power amplifier shall be connected to the "auxiliary channel" of the Amplifier Supervisory Control Unit. Each Amplifier Supervisory Control Unit shall monitor the associated power amplifiers and, upon sensing a malfunction of the "main channel" power amplifier, shall automatically transfer the audio path to the "auxiliary channel" power amplifier.
- M. The passenger station PA speakers shall be designed to be wired in either noise-compensated or non-noise compensated circuits. Noise-compensated circuits shall be used in areas where train noise must be overcome by automatically adjusting the PA volume. The station mezzanine area and platform areas are of noise compensated circuits, which use Automatic Level Control. For areas where noise compensation is required, circuits shall be wired to the Loudspeaker Distribution Panel designated for noise-compensated circuits. Non-noise compensated circuits shall be used in all other areas. In areas where noise-compensated circuits are not required, circuits shall be wired to the Loudspeaker Distribution Panel designated for non-noise compensated circuits. Passenger station service rooms and non-revenue passageways are examples of areas that require non-noise compensated speaker circuits.
- N. Each kiosk in the WMATA Rail System shall be designed to have an Attendant/Passenger Interphone System. The Attendant/Passenger Interphone System

shall provide for communication between passengers and the kiosk attendant at the kiosk. The Attendant/Passenger Interphone System shall serve both the "PAID" and the "UNPAID" side of each kiosk.

- O. A sufficient quantity of speakers shall be placed in passenger stations to give even volume distribution without objectionable loudness from any one speaker location.
- P. The PA amplifiers shall have a constant voltage output of 70.7 volts. Each loudspeaker shall be equipped with an audio transformer to match the 70.7-volt line with the loudspeaker. The transformers shall have various taps to allow for adjustment of the sound level in a particular area. Each transformer shall have a minimum of four taps. The power rating for each of the taps shall be determined during installation.
- Q. Design of public address systems in stations shall be coordinated with architectural design.
- R. The Contractor shall have full responsibility to survey station, communication room, and services rooms and coordinate all work with WMATA's engineers.

#### **1.02 SECTION INCLUDES**

- A. Loudspeakers in the passenger station, passenger walkway, and services areas.
- B. Control hardware in the Kiosks and End-Of-Line dispatcher office.
- C. Control and amplification equipment in the Communication Equipment Room.
- D. Wireless Microphone System in the Kiosk.
- E. End-Of-Line dispatcher office.
- F. Fire Alarm System

#### **1.03 UNIT PRICES**

- A. Unit Prices include all equipment racks, terminals, hardware, protector blocks, enclosures, connecting blocks, wiring and cabling, conduits and fittings, all the connections and cross-connections required for a complete operational installation of the Public Address System and incidental items, not specifically mentioned, but required for complete and proper system operation.

#### **1.04 RELATED SECTIONS**

- A. Section 16705 - Communications Standard Specifications - Equipment & Materials.
- B. Section 16707 - Communications Systems Quality Assurance & Testing
- C. Section 16710 - Communications Grounding.
- D. Section 16715 - Communications Electrical Power Distribution.

- E. Section 16733 - Communications - Kiosk Systems
- F. Section 16820-2 – Communications Public Address System Facilities
- G. Section 16732 Communications Fire Alarm System

#### **1.05 REFERENCES**

- A. National Electric Code (NEC).
- B. National Fire Alarm Code (NFPA 72)
- C. UL Standard (*for the intend use*) 1480, Speakers for Fire Protective Signaling Systems.

#### **1.06 SYSTEM DESCRIPTION**

- A. Description: Provides for general purpose and emergency evacuation announcements throughout the passenger station. PA announcements originate from the Fire Alarm Equipment Panel, Kiosk Manager, End-of-line Dispatcher, the Rail OCC in the Jackson Graham Building and Carmen Turner Facility.
- B. The dispatcher PA system, in end-of-line stations, shall provide access to the passenger station PA system to make announcements to the station platform and mezzanine at any time that the PA system is not already in use.
- C. Capacity:
  - 1. The Contractor shall design the placement of Type 1 loudspeakers using sound coverage calculations and typical drawings from the communications drawing package.
  - 2. The Contractor shall design the placement of Type 2 loudspeakers using sound coverage calculations and typical drawings from the communications drawing package.
  - 3. The Contractor shall design the placement of Type 3 loudspeakers using sound coverage calculations and typical drawings from the communications drawing package.
  - 4. The Contractor shall furnish and install a kiosk PA Control Panel(s) constructed in accordance with contract specifications and drawings.
  - 5. The Contractor shall furnish and install a station PA Control Unit(s) constructed in accordance with contract specifications and drawings.
  - 6. The contractor shall furnish, and install gooseneck public address microphone and cables accordance with contract specifications and drawings.
  - 7. The contractor shall furnish, and install an audio voice processor in accordance with contract specifications and drawings.
  - 8. The contractor shall furnish, and install an audio priority mixer in accordance with contract specifications and drawings.
  - 9. The Contractor shall furnish, and install a DSP engine audio compressor/limiter in accordance with contract specifications and drawings.
  - 10. The Contractor shall furnish, and install an audio distribution amplifier in accordance with contract specifications and drawings.

11. The Contractor shall furnish, and install an ambient noise sensor in accordance with contract specifications and drawings.
12. The Contractor shall furnish, and install a digital equalizer in accordance with contract specifications and drawings.
13. The Contractor shall furnish, and install a 60-watt power amplifier in accordance with contract specifications and drawings.
14. The Contractor shall furnish, and install a 120-Watt Power Amplifier in accordance with contract specifications and drawings.
15. The Contractor shall furnish, and install wireless microphone transmitter equipment, wireless receiver equipment, antennas, and cables in accordance with contract specifications and drawings.
16. The Contractor shall furnish, and install a 24-Vdc power supply in accordance with contract specifications and drawings.
17. The Contractor shall design, furnish, and install a custom loudspeaker distribution panel in accordance with contract specifications and drawings.
18. The Contractor shall design, furnish, and install a custom Audio and control distribution panel in accordance with contract specifications and drawings.
19. The Contractor shall design, furnish, and install a custom Loudspeaker Zone Attenuator Assembly in accordance with contract specifications and drawings.
20. The Contractor shall furnish, and install a PA Patch Panel Assembly in accordance with contract specifications and drawings.
21. The Contractor shall furnish, and install end-of-line dispatcher PA equipment.
22. The Contractor shall design, furnish, and install Loudspeaker in accordance with contract specifications and drawings.
23. The contractor will take full responsibility for total design of the public address system with WMATA's engineer's approval.
24. The Contractor shall design, furnish, and install Wireless PA equipment in accordance with contract specifications and drawings.

#### **1.07 SYSTEM PERFORMANCE REQUIREMENTS**

- A. The contractor shall be responsible for the overall performance of the PA system. The following overall system performance requirements are designed to ensure that the PA system, delivered under these specifications, meets the performance requirements of the Washington Metropolitan Area Transit Authority.
  1. PA Overall Frequency Response:  $\pm 5$ db or better 200-Hz to 8,000-Hz
  2. PA Sound Pressure Levels: 85 dB minimum measured 3 meter from front of each canopy, pylon, ceiling, and passageway speaker.
  3. PA Overall Harmonic Distortion: Less than 1% 200-Hz to 8,000-Hz.

#### **1.08 SUBMITTALS**

- A. Submit under provisions of Section 16706.
  1. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.

2. Product Data: Provide showing electrical characteristics and connection requirements for each component.
3. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.
4. Final As-Built drawings.
5. Operation and Maintenance manuals, preventative maintenance recommendations, and product data sheets.

#### **1.09 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Service facilities within 50 miles of Project.

#### **1.10 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Public Address System until Final Completion.

### **PART 2: PRODUCTS**

#### **2.01 SPEAKERS ASSEMBLY PYLON, PARAPET, and CEILING**

- A. Manufacturers:
  1. Atlas- Sound loud speaker assembly Pylon Square or Round Horn Speaker (or approved equal)
  2. Atlas- Sound loud speaker assembly Pylon Vandal Resistant Square Speaker Grill (or approved equal)
  3. Atlas- Sound loud speaker assembly Pylon Weather Proof Square Surface Speakers Enclosure (or approved equal)
    - Weight: 10-ounces.
    - Material: Ceramic.
    - Flux Density: 9K gauss.
    - DC Resistance: 7.4 ohms.
    - Diameter: One inch.
    - Power Handling: 15-Watts.
    - Transformer: 70-volt multi-tap at 4, 2, 1, and .5watts.
    - Frequency Response: 80-Hz to 8-KHz.
    - Sensitivity: 95db.
    - Depth: 3-1/4 inches.

- Transformer Mounting: Min 2 inches – Max 2-13/16 inches.
  - Mounting Hole Circle: 7-5/8 inches.
  - Baffle Opening: Seven inches.
  - Cone: 8-inch full range moisture proof.
  - Grill: Custom finish color to match current WMATA pylon color.
4. Quam-Nichols loudspeaker assembly replacement (or approved equal)
  5. Quam-Nichols loudspeaker assembly parapet kit includes: speaker, TBLU transform, grill, and enclosure (or approved equal)

## **2.02 SPEAKERS ASSEMBLY STAFF SERVICE AREAS**

### **A. Manufacturers:**

1. Atlas- Sound loud speaker Loudspeaker assembly (VT 157U-C-N) Description: Speakers for use in service. (or approved equal)
  - Transformer: 70.7-Volts.
  - Power Taps: 1 and 2 Watts
  - Frequency Response: 600-Hz to 5500-Hz (± 5db).
  - Sensitivity: 96.9dB (1-watt at 1-meter).
  - Dimensions: 4-1/2 inches, square.
  - Color: Neutral Gray.
  - Construction: Die-cast zinc, water/moisture sealed.

## **2.03 KIOSK PA CONTROL PANEL**

### **A. Manufacturers:**

1. Custom Item.

### **B. Description: Station Manager's Public Address System Control Panel.**

## **2.04 STATION PA CONTROL UNIT**

### **A. Manufacturers:**

1. Custom Item.

### **B. Description: Control and interface unit for the PA system**

## **2.05 DUAL ZONE PRIORITY MIXER**

### **A. Manufacturers:**

1. Symetrix, Inc. Jupiter 8 (or approved equal).

### **B. Description: Mixer with eight (8) levels of priority.**

### **C. Ratings:**

1. Microphone inputs: Two, low impedance, balanced.
2. Microphone Common Mode Rejection: >85dB @ 1KHz, 1 Volt RMS.
3. Line Inputs: eight, stereo.
4. Line Input Impedance: > 10K ohms, balanced.
5. Line Common Mode Rejection: >40dB @ 1KHz, 1 Volt RMS.
6. Line Input Level: +24dBu balanced, +18dBu unbalanced maximum.
7. Frequency Response:  $\pm 1$  dB, 20-Hz to 20-KHz any input to any output.
8. Mounting: 19-inch rack.
9. Power Input: 120-Vac.

## **2.06 COMPRESSOR/LIMITER**

### **A. Manufacturers:**

1. Symetrix, Inc. Model 322 (or approved equal).

### **B. Description: DSP Engine Audio Leveler (Compressor/Limiter) Mounting: 19-inch rack**

## **2.07 AUDIO DISTRIBUTION AMPLIFIER**

### **A. Manufacturers:**

1. Symetrix, Inc. Model 581E (or approved equal).

### **B. Description: 4 input/ 16 output audio distribution amplifier.**

1. Maximum Output Level: +26dBu Balanced (20k ohm load), +22dBm (600 ohm load).
2. Input Impedance: 20k ohms balanced, 10k ohms unbalanced.
3. Output Impedance: 200 ohms balanced, 100 ohms unbalanced.
4. Frequency Response:  $\pm 0.5$ dBm, 20-Hz to 20-KHz.
5. Input Gain Range:  $\pm 15$ dB.
6. Output Gain Range: 0 to -20dB.

## **2.08 AMBIENT NOISE SENSOR MICROPHONE (ANSM)**

### **A. Manufacturers:**

1. Crown Model No PZM-11 (or approved equal)

## **2.09 AMBIENT NOISE COMPENSATION PROCESSOR (ANCP)**

### **A. Manufacturers:**

1. Symetrix Model No 371 (or approved equal)

### **B. Description: Ambient sensing automatic level controlling device to regulate the operating level of a sound system in proportion to changing noise levels in the sound system's operating area.**

C. Ratings:

1. Inputs: Two sensing mic (-40dBu nominal) CMRR => 60dB at 1-KHz, one paging mic (-40dBu nominal) CMRR => 60dB at 1-KHz, one line (0dBu nominal) CMRR=< 40dB at 1-KHz, one music (-10dBu nominal) CMRR =< 40dB at 1-KHz
2. Maximum Input Level: -30dBu (mic inputs), +18 (line inputs).
3. Input Impedance: Mic: electronically balanced bridging 200 ohms, nominal (not phantom powered). Line: electronically balanced bridging 20 kilo ohms nominal.
4. Phantom Power (on all mic inputs): 15-Vdc.
5. Output: Balanced, transformer.
6. Output Impedance: 100 ohms.
7. Maximum Control Range: 40dB.
8. Ambient noise to Gain Ratio: Variable, 2:1 to 1:2.
9. Averaging Time: 1.2 sec. to 5 min.
10. Page-Over Music (ducking): Variable, 0 to 14 dB
11. Frequency Response: 20-Hz to 20-KHZ (+ 1 dB,-0 dB).
12. Power Input: 120-Vac 60-Hz.
13. Mounting: 19-inch rack.

## 2.10 DIGITAL AUDIO EQUALIZER

A. Manufacturers:

1. Shure Model No. DFR-11EQ (or approved equal).

B. Description: Digital 1/3 Octave graphic equalizer, automatic and manual acoustic feedback suppression for 10 frequencies, digital delay compressor/limiter.

C. Ratings:

1. Remote Programming: RS232C serial port, USB, Category 6 .
2. Frequency Response: 20-Hz to 20-KHz  $\pm$  1.0dB reference 1 KHz.
3. Dynamic Range: 104db minimum, A-weighted, 20-Hz to 20-KHz.
4. Sampling Rate: 48-KHz.
5. Digital-to-Analog, Analog-to-digital Conversion: 20-bit resolution.
6. Voltage Gain:
7. LED Signal Indicators: Clip: 6dB down from input clipping.
8. Feedback Filters:
9. Graphic Equalizer:
10. Parametric Equalizer:
11. Delay: Up to 1300ms.
12. Limiter:
13. Mounting: 19-inch rack.
14. Power Input: 120-Vac 60-Hz.

## **2.11 60-WATTS POWER AMPLIFIER**

### **A. Manufacturers:**

1. Crown Model No. 180 A with rack mount kit (or approved equal).

### **B. Description: Audio power amplifier.**

### **C. Ratings:**

1. Output Power: 80-watts RMS.
2. Frequency Response: 20-20,000 Hz, +1dB/-3 dB
3. Inputs: One input port, one direct.
4. Input Sensitivity/Impedance:
5. Output:
  - a. Main (Transformer): 8 ohms, 25 and 70 volts, balanced.
  - b. Main (Direct): 4 ohms, unbalanced.
6. Indicators: One power LED, one protect LED, one signal LED, one normal LED, one peak LED.
7. Power Input: 120-Vac 60-Hz, 100-watts.
8. Mounting: 19-inch rack.
9. Input Module: balanced line input, 10k ohms.

## **2.12 120-WATTS POWER AMPLIFIER**

### **A. Manufacturers:**

1. Crown Model No. 1160A rack mounting kit (or approved equal)

### **B. Description: Audio power amplifier.**

### **C. Ratings:**

1. Output Power: 120-watts RMS
2. Frequency Response: 20-20,000 Hz, +1dB/-3dB.
3. Inputs: One input port, one direct.
4. Input Sensitivity/Impedance:
  - a. Input Port: 100 mV or 1000 mV (switchable)/10 K ohms.
  - b. Direct Input: 100 mV or 1000 mV (switchable)/10 K ohms.
5. Outputs:
  - a. Main (Transformer): 8 ohms, 25 and 70 volts, balanced.
  - b. Main (Direct): 4 ohms, unbalanced.
6. Indicators: One power LED, one protect LED, one signal LED, one normal LED, one peak LED.
7. Power Input: 120-Vac 60-Hz, 180-watts.
8. Mounting: 19-inch rack.
9. Input Module: line input, 10k ohms.

## **2.13 OCC AUDIO INPUT STATION CONTROLLERS**

### **A. Manufacturers:**

1. Barix Corporation (Annunicom100)
2. Penta Corporation (Firmware)

### **B. Description: Self-contained streaming VoIP with serial interface and digital I/O**

### **C. Features:**

1. Operates on 9 to 30 VDC / 12 to 24 VDC
2. 1 or 2 unit rack mounts kit (1RU)
3. 300 to 115.2K Baud RS-232 port
4. Web-based configuration
5. 10/100 Mbit Ethernet, TCP/IP UDP, SNMP
6. G7.11 and PCM Audio Compression
7. Mic In, Line In, Line Out, Speaker Out
8. Support Penta VoIP control protocol

### **D. Provide a Barix Rack Mount and install on the equipment racks in the Communication Equipment Room at each passenger station.**

## **2.14 WIRELESS MICROPHONE TRANSMITTER AND RECEIVER**

### **A. Manufacturers:**

1. Shure Model No. ULXP4: microphone receiver system (or approved equal).
2. Shure Model No. ULX2/58: microphone (or approved equal).
3. Shure Model No. UA505: remote antenna mounting brackets and BNC connectors.
4. Shure Model No. UA820: ½ wave dipole antenna UXL receiver.
5. Shure Model No. UA830: UHF in-line amplifier.
6. Shure Model No. A13HDB: mounting flange, heavy duty in amplifier.
7. Shure Model No. UA2212: passive antenna combiner/splitter.

### **B. Description: The wireless microphone receiver system equipment shall be mounted in the kiosk. The wireless antenna shall be placed on top on the kiosk. The wireless system shall cover 95% on the station.**

### **C. Ratings:**

1. RF Carrier Frequency Range: 554-590 MHz
2. Working Range 700 ft. minimum under typical conditions.
3. Audio Frequency response: 45 to 15,000 Hz ±2dB.
4. Gain Adjustment Range: -6 to 26 dB.

5. Receiver Audio Output Level (Maximum):
  - a. Unbalanced: + 5dBu typical.
  - b. Balanced: + 14dBu typical.
6. RF Sensitivity: -108dBm at 12dB SINAD.
7. Image Rejection 90dB typical.
8. Spurious Rejection 70dB typical.
9. Power Requirements:
10. Microphone 9V alkaline battery.

## **2.14 24-VDC POWER SUPPLY**

### **A. Manufacturers:**

1. ADC

## **2.15 LOUDSPEAKER DISTRIBUTION PANEL**

### **A. Manufacturers:**

1. Custom assembly by contractor.

## **2.16 LOUDSPEAKER ZONE ATTENUATOR ASSEMBLY**

### **A. Manufacturers:**

1. Atlas-Soundolier Model No. AT-10: Loudspeakers Attenuator 70 volts( or approved equal).

## **2.17 PA PATCH PANEL ASSEMBLY**

### **A. Manufacturers:**

1. ADC Model No.PPA3-14MKIVNS (or approved equal). Patch panel assembly for the audio power amplifiers and audio signal.

### **B. Ratings:**

1. Number of Jacks: Two rows of 24
2. Insertion Loss: Less than 0.1dB
3. Jack Circuits Configuration: Top-to-bottom row jack circuits.
4. Punch Block: Rear mounted proprietary 66-terminal punch block for solid and stranded wire (Flexi-block)
5. Chassis and Brackets: Aluminum
6. Mounting: 19-inch rack.
7. Compatibility: Standard ¼ inch 3-conductor phone shielded audio patch cords.  
Provide printed designation labeling for each jack.

## **2.18 PATCH PANEL PUNCH TOOL**

### A. Manufacturers:

1. ADC Model No. QB-4 (or approved equal). Compatible with wiring punch blocks included with patch panel.

## **2.19 MICROPHONE WITH 18" GOOSENECK**

### A. Manufacturers:

1. Shure SM57 (microphone) with Shure A12 (mounting flange), with Shure G18-CN (18" Gooseneck), with Shure A2WS (windscreen) (or approved equal).

## **2.20 AC POWER LINE CONDITIONER-20 AMP**

### A. Manufacturers:

1. New Frontier Electronics Surge-X SX2120 (or approved equal). B. Description: Electrical power line surge suppressor and line conditioner.

### B. Ratings:

1. Mounting: 19-inch rack.
2. Current: 20 amps at 120-Vac.
3. Rear Outlets: 12 switched, two un-switched.
4. Front Panel Indications: Electrical service and surge fault.
5. Front Panel Switches: One for switched outlets.

- C. UL Listed. Meeting or exceeding UL grade A-1-1 for power line surge suppression and EMI/RFI line conditioning.

## **2.21 AC POWER LINE CONDITIONER, 15-AMP**

### A. Manufacturers:

1. New Frontier Electronics Surge-X SX115R (or approved equal). B. Description: Electrical power line surge suppressor and line conditioner.

### B. Ratings:

1. Mounting: 19-inch rack.
2. Current: 15-amps at 120-Vac.
3. Rear Outlets: Six switched two un-switched.
4. Front Panel Indications: Electrical service and surge fault.
5. Front Panel Switches: One for switched outlets.

- C. UL Listed. Meeting or exceeding UL grade A-1-1 for power line surge suppression and EMI/RFI line conditioning.

## **2.22 SHIELDED TWISTED-PAIR CABLE (16-AWG)**

- A. Description: loudspeaker cable type, for loudspeaker zones not exceeding 60 watts. UL rated. NEC Type CMR with low smoke NON-PVC jacket.
- B. Ratings:
  - 1. Conductors: 16-AWG stranded twisted pair ASTM tinned copper with overall 100% foil shield.

## **2.23 SHIELDED TWISTED-PAIR CABLE (14-AWG)**

- A. Description: loudspeaker cable type, for loudspeaker zones not exceeding 120 watts. UL rated. NEC Type CMR with low smoke NON-PVC jacket.
- B. Ratings:
  - 1. Conductors: 14-AWG stranded twisted pair ASTM tinned copper with overall 100% foil shield.

## **2.24 SHIELDED MULTI-TWISTED-PAIR CABLE (20-AWG)**

- A. Description: Audio cable for all audio wiring and ambient noise and paging microphones. UL rated. NEC Type CMR with low smoke NON-PVC jacket.
- B. Ratings:
  - 1. Conductors: 20-AWG stranded twisted pair ASTM tinned copper with overall 100% foil shield.

## **2.25 SHIELDED MULTI-TWISTED-PAIR CONTROL SIGNALING/AUDIO CABLE**

- A. Description: control signaling multi-pair cable type, for all control and DC voltage wiring.
- B. UL rated. NEC Type CMR with low smoke NON-PVC jacket.
- C. Ratings:
  - 1. Conductors: 18-AWG stranded twisted pairs ASTM tinned copper with overall 100% foil shield.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION REQUIREMENTS**

- A. Install a complete and operational passenger station Public Address System, as described herein, in the passenger station(s). This includes installations in the Kiosk(s), Communications Equipment Room(s) and Dispatcher's Facility.

- B. Install all terminals, hardware, wiring and cabling, conduits, and fittings. The Contractor shall install the required connectors, attenuators, baluns, audio isolation transformers, and inter-rack wiring between the various equipment, and make all necessary connections and cross-connections required for complete installations. All inter-rack wiring between various equipment shall be shielded, twisted-pair cable.
- C. The Contractor shall have full responsibility to survey station, communication room, services rooms before any work is completed.

### **3.02 PA SPEAKER INSTALLATION**

- A. In those locations where a PA Speaker enclosure is not imbedded, the Contractor shall install the appropriate type PA speaker enclosure. PA speaker enclosures are imbedded in the ceiling of the mezzanine areas, under the mezzanine structure, and in entrance passageways of the passenger station. No speaker enclosures are imbedded in service rooms and non-revenue passageways. Install surface mounted speaker enclosures or suspended ceiling mounted enclosures as appropriate.
- B. Submit a proposed PA speaker layout for the passenger station to the Communication Engineer for approval. This layout shall show each PA speaker, the matching transformer tap to be used and the total power per circuit.
- C. Install the PA speaker, with matching transformer and associated speaker baffles, in the PA speaker enclosures.
- D. Install the PA speaker, with matching transformer and associated speaker baffles, in the Pylon on the station platform.
- E. Install the required cabling, hardware and material to connect the speakers (via matching transformers) to the appropriate Loudspeaker Distribution Panels. Furnish and install conduit between PA speakers.

### **3.03 COMMUNICATIONS EQUIPMENT ROOM INSTALLATION**

- A. Install the equipment on a 19-inch equipment rack in the Communications Equipment Room of the passenger station(s).
- B. Distribute the 70.7-volt amplified audio to all speakers in the passenger station(s) using a Loudspeaker Distribution Panel for each zone.
- C. All PA amplifiers shall be adjusted, internally or externally, via audio attenuators, to provide the full rated audio output for a 0 dBm input signal level.
- D. Install the required cabling, connectors and plugs to provide 120-Vac, 60-Hz to the various PA equipment from the ac power receptacle strip on the PA equipment rack.

### **3.04 KIOSK INSTALLATION**

- A. Install a Kiosk Public Address Control Panel in the designated bay of the Kiosk cabinetry.
- B. Install the voice pre-amp/processor in the appropriate bay of the Kiosk cabinetry.
- C. Install a hand-held Gooseneck microphone on the appropriate bay of the Kiosk cabinetry. Furnish and install the required wiring harness between the Kiosk PA Control Panel and the Kiosk Cable Termination Rack in the Kiosk.
- D. Install the wireless microphone receiver in the appropriate bay of the Kiosk cabinetry and mount the antenna on top of the Kiosk in a location approved by the Engineer. Furnish and install the required wiring harness between the wireless microphone receiver and the Kiosk Cable Termination Rack in the Kiosk.
- E. Install individually-shielded, twisted, pair cables between the Kiosk Cable Termination Rack and the appropriate PA equipment in the Communications Equipment Room. The Contractor shall use these cables to connect the Kiosk PA Control Panel and wireless microphone receiver to the appropriate PA system equipment within the Communications Equipment Room.

**3.05 TERMINAL SUPERVISOR'S PUBLIC ADDRESS FACILITY INSTALLATION (End of line)**

- A. Install a complete operational Dispatcher's Public Address Facility in the new end-of-line Passenger Station (if applicable).
- B. Install a Public Address System Control Panel (same as the Kiosk PA System Control Panel), with microphone and a Loudspeaker Zone Selection Panel in a Tabletop Instrument Cabinet. The Contractor shall install the Tabletop Instrument Cabinet on top of the table/desk within the End-of-Line Terminal Supervisor's Room.
- C. Install a junction box with terminals within the Terminal Supervisor's Room in a location approved by the Engineer.
- D. Install a Terminal Supervisor's PA Zone Selection System for the Dispatcher's Facility.
- E. Provide all components needed to implement the Terminal Supervisor's PA Zone Selection System, and install the following components as stated below:
  - 1. Install the Terminal Supervisor's PA Zone Selection Panel in the Terminal Supervisor's Room.
  - 2. Install the Terminal Supervisor's PA Zone Control Unit in the Station PA System Equipment Rack in the Communications Equipment Room.
- F. Install individually shielded, twisted, three-pair audio cables, as needed, from the PA equipment in the Terminal Supervisor's Room to the Station PA Equipment Rack in the Communications Equipment Room, via the junction box with terminals. Install the

necessary connections and cross-connections between the cables and the Kiosk PA Control Panel, Terminal Supervisor's PA Control Panel, Terminal Supervisor's PA Zone Selection Panel, Terminal Supervisor's PA Zone Control Unit; and the Station PA Control Unit. Connect the Terminal Supervisor's PA Control Panel to the Station PA Control Unit and the Terminal Supervisor's Zone Control Unit via the audio and control circuit connections assigned for Kiosk No. 3.

### **3.06 INTERFACE**

- A. Install the hardware and wiring required to connect the Fire Alarm System "Emergency Evacuation Announcements" to the Passenger Station Public Address System equipment.
- B. Install the required hardware and wiring to connect the alarm output of the Station PA Control Unit to the Priority Mixer.
- C. Install the required cabling, hardware and material to connect WMATA'S WAN/LAN system.

### **3.07 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.

### **3.09 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**END OF SECTION**

## SECTION 16821

### COMMUNICATIONS - AUTOMATIC PUBLIC ADDRESS ANNOUNCEMENT SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The Automatic Public Address Announcement System (APAAS) shall promote a safe and expeditious evacuation of WMATA Rail System patrons from a passenger station upon detection of a fire within that passenger station.
- B. The Automatic Public Address Announcement System shall provide a pre-programmed emergency announcement to be automatically broadcast within a passenger station upon detection of a fire within the limits of that particular passenger station. The announcement shall be activated (triggered) upon receipt of a fire alarm indication from the Fire and Intrusion Alarm System. A control panel located in the Kiosk within the passenger station shall provide the capabilities to initiate (activate) the announcement manually, to preempt the announcement and to cancel the announcement while in progress. The control panel allows specific functions of the Passenger Emergency Reporting System (PERS), the Automatic Public Address Announcement System and the Passenger Station Fire and Intrusion Alarm System (FIA) to be disabled.
- C. The Automatic Public Address Announcement System shall include the following equipment, which shall be located in the Communications Equipment Room of the station, except as noted:
  - 1. Kiosk APAAS Control Panel (located in the Kiosk).
  - 2. APAAS Control Unit.
  - 3. Life Safety Tape Playback Unit.
  - 4. Public Address Interface Unit.
  - 5. APAAS Patch Panel, complete with patch cords and holder.
  - 6. PERS/APAAS Dual Power Supply Assembly.
- D. The Kiosk APAAS Control Panel shall provide the interface point between the Station Manager and the Automatic Public Address Announcement System. The Kiosk APAAS Control Panel provides the following controls and indications necessary for the attendant to operate the Automatic Public Address Announcement System:
  - 1. Depressing the "MANUAL" pushbutton switch, which has an integral light emitting diode (LED) indicator, shall trigger the Life Safety Tape Playback Unit.
  - 2. Depressing the "CANCEL" pushbutton switch, which has an integral light emitting diode (LED) indicator, shall prohibit/inhibit the emergency announcement from being broadcast.
  - 3. The "AUTO" indicator, which is a light emitting diode (LED), shall indicate that the emergency announcement process has been initiated.
  - 4. Placing the "INTRUSION-APAAS-PERS" keyswitch in the "UNATTEND" position shall:
    - a. Inhibit the emergency announcement upon detection of a fire within the passenger station limits.
    - b. Cause previously disabled intrusion zones within the passenger station limits to be reactivated.
  - 5. Placing the "INTRUSION-APAAS-PERS" keyswitch in the "ATTEND" position shall cause selected intrusion zones within the passenger station limits to be disabled.
  - 6. Depressing the "LAMP TEST" pushbutton switch shall test all of the illuminating indicators on the panel except for the "POWER" indicator.
  - 7. The "POWER" indicator illuminates when power is being supplied to the panel.

- E. The APAAS Control Unit shall provide the required interfaces between the Kiosk APAAS Control Panel, the Life Safety Tape Playback Unit, the Public Address Interface Unit, the Passenger Station Fire and Intrusion Alarm System, the Passenger Station Public Address System, and the Passenger Emergency Reporting System. The APAAS Control Unit shall be able to:
1. Detect a fire alarm indication (STATION FIRE DTS-INPUT) from the Passenger Station Fire and Intrusion Alarm System.
  2. Provide the appropriate timing circuits for the activation of the emergency announcement and the automatic reset of the Passenger Station Fire and Intrusion Alarm System.
  3. Provide a fire alarm indication (STATION FIRE DTS-OUTPUT) for the fire zones within the passenger station limits to the Data Transmission System.
  4. Automatically reset the Passenger Station Fire and Intrusion Alarm System. A separate normally open contact and a separate normally closed contact shall be provided for the interface of the features to the Passenger Station Fire and Intrusion Alarm System.
  5. Provide the appropriate controls to the PERS Control Unit for the activation and termination of the external chime/tone to the speaker horn that is external to the Kiosk.
  6. Activate the Life Safety Tape Playback Unit for the broadcasting of the emergency announcement (automatically and manually).
  7. Connect the Life Safety Tape Playback Unit audio output (emergency announcement) to the audio path of the Public Address System.
  8. Provide the appropriate output controls to the PA Interface Unit to reroute the emergency announcement audio to the music input of the ambient noise compensation amplifier of the Passenger Station Public Address System.
  9. Accept the appropriate controls from the Kiosk APAAS Control Panel.
  10. Provide the appropriate indications to the Kiosk APAAS Control Panel.
  11. Disable the Life Safety Tape Playback Unit upon activation of the cancel feature.
  12. Provide the appropriate output contacts for the key-switch features.
- F. The Life Safety Tape Playback Unit shall function as the emergency announcement broadcasting device.
- G. The Public Address Interface Unit shall provide the required interfaces between the Passenger Station Automatic Public Address Announcement System and the Passenger Station Public Address System. The Public Address Interface Unit shall be able to:
1. Establish an audio path for a normal public address announcement to the normal input of the ambient noise compensation amplifier of the Passenger Station Public Address System. The audio path of the Passenger Station Public Address System shall be routed through the APAAS Patch Panel and the APAAS Control Unit.
  2. Reroute the emergency announcement audio of the APAAS to the music input of the ambient noise compensation amplifier of the Passenger Station Public Address System.
  3. Detect the appropriate output controls of the APAAS Control Unit to reroute the emergency announcement.
  4. Provide the appropriate output controls to the Station Control Unit of the Passenger Station Public Address System when the emergency announcement is being broadcast, to prevent a trouble alarm from being activated.
  5. Terminate the music input audio path of the ambient noise compensation amplifier of the Passenger Station Public Address System during the (idle) normal state.
- H. The APAAS Patch Panel shall enable audio connections and cross-connections to be easily made between the APAAS Control Unit and other equipment items of the Automatic Public Address Announcement System and the Public Address System.

- I. The PERS/APAAS Dual Power Supply Assembly shall provide redundant diode-coupled direct current power to operate the Automatic Public Address Announcement System and the Passenger Emergency Reporting System.
- J. Upon receipt of a fire alarm indication (STATION FIRE DTS) from the Passenger Station Fire and Intrusion Alarm System, the following actions shall occur:
  - 1. The "AUTO" indicator of the Kiosk APAAS Control Panel shall illuminate (flash).
  - 2. A chime/tone external to the Kiosk shall sound every five seconds. This external chime/tone is to alert the Station Manager (when the attendant is outside the Kiosk) that the Automatic Public Address Announcement System has been activated.
- K. Once 1.5 minutes have elapsed from the time the fire alarm indication was received, the Automatic Public Address Announcement System shall automatically reset the Passenger Station Fire and Intrusion Alarm System. The reset shall be for a duration of three (3) seconds and shall occur only one (1) time.
- L. If the reset restores all the fire zone circuits within the passenger station limits to a non-alarm state, then:
  - 1. The "AUTO" indicator of the Kiosk APAAS Control Panel shall be extinguished.
  - 2. The broadcasting of the external chime/tone shall cease.
  - 3. The Automatic Public Address Announcement System circuitry shall be restored to an idle (normal) condition.
- M. If the automatic reset does not restore all the fire zone circuits within the passenger station limits to a non-alarm state, then:
  - 1. The "AUTO" indicator on the Kiosk APAAS Control Panel shall remain illuminated.
  - 2. The external chime/tone shall continue to sound
  - 3. The Automatic Public Address Announcement System circuitry shall remain in the alarm receive mode.
- N. After a two (2) minute interval from the initial receipt of the fire alarm indication, if the automatic reset does not restore all fire zones to a non-alarm state, then:
  - 1. The broadcasting of the external chime/tone shall cease.
  - 2. The Life Safety Tape Playback Unit shall be activated.
  - 3. The pre-programmed emergency announcement shall be broadcast via the Passenger Station Public Address System. The emergency announcement shall be repeated and the "AUTO" indicator shall remain illuminated until these functions are canceled.
- O. Note that an audible tone shall not be provided in the Kiosk when the Automatic Public Address Announcement System is activated. This is because the Kiosk FIA Annunciator Panel will provide an audible alarm upon the detection of a fire alarm within the passenger station Fire and Intrusion Alarm System.
- P. The pre-programmed emergency announcement can be manually activated by depressing the "MANUAL" pushbutton switch on a Kiosk APAAS Control Panel, which shall:
  - 1. Cause the "MANUAL" pushbutton integral LED indicator on the Kiosk APAAS Control Panel to be illuminated (flash).
  - 2. Cause the "AUTO" indicator on the Kiosk APAAS Control Panel to be extinguished if previously illuminated.
  - 3. Activate the Life Safety Tape Playback Unit and cause the pre-programmed emergency announcement to be broadcast via the passenger station Public Address System. The emergency announcement shall be repeated until canceled.
- Q. The pre-programmed emergency announcement can be manually activated only when the Automatic Public Address Announcement System is not in the "CANCEL" mode.

- R. During a period of up to two (2) minutes after the fire alarm indication has been received by the Automatic Public Address Announcement System, the automatic broadcast of the emergency announcement can be prevented by depressing the "CANCEL" pushbutton on a Kiosk APAAS Control Panel to its locked position. Such action shall:
  1. Silence the external chime/tone.
  2. Extinguish the illuminated "AUTO" indicator on the Kiosk APAAS Control Panel.
  3. Cause the "CANCEL" pushbutton switch integral indicator on the Kiosk APAAS Control Panel to be illuminated (flash).
  4. Prohibit the Life Safety Tape Playback Unit from being activated.
- S. The "CANCEL" feature allows time for the Station Manager to investigate the location and magnitude of a fire before causing the emergency announcement to be broadcast.
- T. Depressing the "CANCEL" pushbutton switch to its locked position, while the pre-programmed emergency announcement is being broadcast, shall:
  1. Cause the "CANCEL" pushbutton switch integral indicator to be illuminated (flash).
  2. Extinguish any other indicators that were illuminated.
  3. Deactivate the Life Safety Tape Playback Unit and stop the emergency announcement broadcast.
- U. Activation of the "CANCEL" pushbutton shall cancel an automatic announcement or a manual announcement.
- V. Depressing the "CANCEL" pushbutton switch on a Kiosk APAAS Control Panel to its locked position to intentionally disable the APAAS System, while the Passenger Station Fire and Intrusion Alarm System is being serviced shall:
  1. Cause the "CANCEL" pushbutton switch integral indicator to be illuminated (flash).
  2. Cause the automatic and manual emergency announcement circuitry to be disabled to prevent the activation of the Life Safety Tape Playback Unit.
- W. The pre-programmed emergency announcement must be canceled before the Automatic Public Address Announcement System can be reset. Depressing the "CANCEL" pushbutton switch on a Kiosk APAAS Control Panel a second time shall:
  1. Release the pushbutton switch from its locked position.
  2. Extinguish the "CANCEL" pushbutton switch integral indicator.
  3. Restore the Automatic Public Address Announcement System circuitry to its normal (idle) condition.
- X. The passenger station Fire and Intrusion Alarm System must be reset, and all fire zone circuits associated with areas within the passenger station limits must be restored to a non-alarm state before the APAAS is reset. Failure to restore the fire zone circuits to a non-alarm state while resetting the APAAS will cause the passenger station Fire and Intrusion Alarm System to immediately initiate another automatic announcement.

**1.02 SECTION INCLUDES**

- A. Kiosk Automatic Public Address Announcement Control Panel.
- B. Automatic Public Address Announcement Control Unit
- C. Life Safety Tape Playback Unit.
- D. Public Address Interface Unit.
- E. Automatic Public Address Announcement Patch Panel.
- F. PERS/APAAS Dual Power Supply Assembly.

## **1.02 UNIT PRICES**

- A. Unit Prices include incidental items, not specifically mentioned, but required for complete and proper system operation.

## **1.03 RELATED SECTIONS**

- A. Section 16705 - Communications Standard Specifications - Equipment & Materials.
- B. Section 16706 - Communications System Submittals & Services.
- C. Section 16707 - Communications Systems Quality Assurance & Testing.
- D. Section 16710 - Communications Grounding.
- E. Section 16715 - Communication Electrical Power Distribution.
- F. Section 16727 - Communications - Passenger Emergency Reporting System
- G. Section 16731 - Communications - Fire and Intrusion Alarm System.
- H. Section 16733 - Communications - Kiosk Systems.
- I. Section 16820 - Communications - Public Address System.

## **1.05 REFERENCES**

- A. National Electric Code (NEC).

## **1.06 SYSTEM DESCRIPTION**

- A. Description: The Automatic Public Address Announcement (APAAS) provides a pre-programmed emergency announcement to be automatically broadcast within a passenger station upon detection of a fire within the limits of that particular passenger station.
- B. Operation: The announcement is activated (triggered) upon receipt of a fire alarm indication from the Fire and Intrusion Alarm System. A control panel located in the Kiosk within the passenger station provides the capabilities to initiate (activate) the announcement manually, to preempt the announcement and to cancel the announcement while in progress. The control panel allows specific functions of the Passenger Emergency Reporting System (PERS), the Automatic Public Address Announcement System and the Passenger Station Fire and Intrusion Alarm System (FIA) to be disabled.
- C. Capacity:
  - 1. The Authority (WMATA) will furnish Kiosk Automatic Public Address Announcement Control Panels, as required to support the required APAAS systems.
  - 2. The Authority (WMATA) will furnish Automatic Public Address Announcement Control Units, as required to support the required APAAS systems.
  - 3. The Contractor shall furnish and install the Life Safety Tape Playback Unit(s) in accordance with Contract Specifications and Drawings.
  - 4. The Contractor shall design, furnish, and install the Public Address Interface Unit(s) in accordance with Contract Specifications and Drawings.
  - 5. The Contractor shall furnish and install the Automatic Public Address Announcement Patch Panel(s) in accordance with Contract Specifications and Drawings.

6. The Contractor shall design, furnish, and install the Passenger Emergency Reporting System/Automatic Public Address Announcement Dual Power Supply Assembly(s) in accordance with Contract Specifications and Drawings.

**1.07 SYSTEM PERFORMANCE REQUIREMENTS**

- A. The Contractor shall be responsible for the overall performance and interface of the Automatic Public Address Announcement System, as specified herein. The following overall system performance requirements are designed to ensure that the Automatic Public Address Announcement System, delivered under these Specifications, meets the performance requirements of the Washington Metropolitan Area Transit Authority.

<u>SYSTEM PARAMETER</u>	<u>REQUIRED PERFORMANCE</u>
1. APAAS Audio Output @ the APAAS/PAS Interface Point	Clearly and continuously understood audio when monitored using a test box containing audio amplifier and loudspeaker (with a flat frequency response Hz $\pm 3$ dB or better) by any person that is not significantly hearing impaired within the 300 to 3,600 Hz range. Interfering signals, hum or objectionable noise shall not be discernible to any listener during or between speech messages.
2. Measured Frequency Response (terminated lines @ the APAAS/PAS interface point with normal operating levels)	Flat from 100 to 5,000 Hz, $\pm 3$ dB or better during the playback of a prerecorded test message.
3. Measured Wow and Flutter (terminated lines @ the APAAS/PAS interface point with normal operating levels)	Maximum 0.4% (weighted during the playback of a prerecorded test message).
4. Measured Total Harmonic Distortion (terminated lines @ the APAAS/PAS message. interface point with normal operating levels)	Maximum 1% during a prerecorded test.
5. Measured Signal to Noise Ratio the APAAS/PAS (terminated lines @ interface point with normal operating levels)	45dB or greater during the playback of a prerecorded message.
<u>SYSTEM PARAMETER</u>	<u>REQUIRED PERFORMANCE</u>
6. Measured System Noise (@ the APAAS/ PAS interface point)	Maximum of -45dB below 1kHz test tone level, when all APAAS system and equipment controls are operated to any possible combination of positions. Momentary switching transients, however may peak to -30dB below 1kHz test tone level, for a duration that does not exceed 10 milliseconds.

1. **NOTE:** Persons not significantly hearing impaired within the 300 to 3,600 Hz range are defined, for the purpose of these performance specifications, as males or females with hearing capabilities that are normal, or slightly impaired to the extent that their response to audio tones in the 300 to 3,600 Hz frequency range is within -15 dB at all test frequencies and averages within -10 dB of "NORMAL" standard values for their classification (sex, age, etc.) as defined by American National Standards Institute (ANSI) standards.

## **1.08 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.
- C. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

## **1.09 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Authorized installer of specified manufacturer with service facilities within 50 miles of Project.

## **1.10 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Automatic Public Address Announcement System until Final Completion.

## **1.11 AUTHORITY FURNISHED EQUIPMENT**

- A. Design data, copies of required shop drawings and other technical documentation for Authority Furnished Equipment, being provided from "Additional Equipment" stocks may be obtained from the Engineer. This will allow the Contractor to develop the required system design, installation drawings and other technical documentation prior to the actual receipt of the Authority Furnished Equipment.

## **PART 2 - PRODUCTS**

### **2.01 LIFE SAFETY TAPE PLAYBACK UNIT**

- A. Manufacturers:
  - 1. Wheelock, Inc, Model No. DV-100 (or approved equal)
- B. Ratings:
  - 1. Playback
    - a. Memory Type: EPROM.
    - b. Memory Time: One to eight minutes.
    - c. Bandwidth: 70-Hz to 4,000-Hz.
    - d. Signal to Noise Ratio: 51dB.
    - e. THD 1 KHz (full scale): 5.5%.
  - 2. Inputs:
    - a. Programming: With DV-200 through serial port.

- b. Message File Activation:
- c. File Input Terminals: Input terminals for 8 message files. Activate files for 300 millisecond minimum with a short across input )to sink up to 10 mA current with maximum 2 Vdc drop).
- d. Digital Command: Through serial port, RS232.
- 3. Outputs:
  - a. Audio Output: One to four output channels optionally provided; each through 600-ohm isolation transformer. Output level adjustable from 0.5 to 2.0 Vrms. Minimum load impedance 600 ohm.
  - b. Status Contact: Form C contacts normally energized. Contacts transfer during trouble. Rated 0.5 amps at 30 Vdc max, resistive load.
  - c. Channel Playing Contact: One for each channel. Normal open contacts closed when channel is playing. Rated 0.5 amps at 30 Vdc max, resistive load.
- 4. Input Voltage:
  - a. Operating: 11-29 Vdc.
  - b. Programming: 15 Vdc minimum.
  - c. Ripple: 500 mV.

## **2.02 APAAS PATCH PANEL**

- A. Manufacturers:
  - 1. Trompeter Electronics Model No. JSI-32S/MT-389 (or approved equal).
- B. Ratings:
  - 1. Accommodate sixteen (16) normal through telephone patch jacks. Constructed of black plastic with steel mounting brackets and reinforcing strips. Contains two (2) marking designation strips with clear plastic covers mounted at the top and bottom of the front side for identification of the patch jacks, and suitable for mounting in a standard 19-inch width equipment rack.

## **2.03 PATCH CORD HOLDER**

- A. Manufacturers:
  - 1. Trompeter, Model No. CH50 (or approved equal).
- B. Ratings:
  - 1. mounted to a blank panel on the APAAS/PERS equipment rack.

## **2.04 PERS/APAAS DUAL POWER SUPPLY ASSEMBLY**

- A. Manufacturers:
  - 1. Acopian Corp., Model No. R24M13H (or approved equal).
- B. Ratings:
  - 1. Input Power: 115-120 Vac, 60 Hz, fused.
  - 2. Outputs (each supply): 24 Vdc, 5.0 amps diode coupled for redundancy.
  - 3. Total loading of each discrete power supply shall not be more than 50% of its rated output. Failure of one power supply shall not result in failure of the other power supply.
  - 4. Suitable for mounting in the standard 19-inch equipment rack.

## **2.05 12-PAIR CABLE**

- A. Manufacturers:
  - 1. Okonite Model No. 261-40-2212 (or approved equal).
- B. Ratings:
  - 1. Pairs: 12 individually shielded, twisted pairs.
  - 2. Conductors: Stranded, 20 AWG, copper.
  - 3. Outer Jacket: Okozel.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. KIOSK
  - 1. Install a Kiosk APAAS Control Panel in Bay #5 of the Kiosk cabinetry of the Kiosk in each passenger station.
  - 2. Install the required cable harnesses, and connectors and make the necessary connections to connect the Kiosk APAAS Control Panel to the Emergency Communications Kiosk Terminal Panel in the Kiosk of each passenger station.
  - 3. Install a 12-pair cable from the Emergency Communications Kiosk Terminal Panel in the Kiosk to the MDF/Protector Cabinet in the Communications Equipment Room of the passenger station. Terminate the 12-pair cable to the Emergency Communications Kiosk Terminal Panel and to the appropriate Line Terminal Block in the MDF/Protector Cabinet in each passenger station.
- B. COMMUNICATIONS EQUIPMENT ROOM
  - 1. Install an APAAS Control Unit, an APAAS Patch Panel, a Life Safety Tape Playback Unit, a Public Address Interface Unit and a PERS/APAAS Dual Power Supply Assembly in the Communications Equipment Room of each passenger station. Install the equipment for the Automatic Public Address Announcement System in the same equipment rack as the Passenger Emergency Reporting System. Install the required intra-rack wiring and connectors, and make the necessary connections and cross-connections for a complete installation in the Communications Equipment Room of each passenger station.
  - 2. Install the required cabling, connectors and plugs and make the necessary connections and cross-connections to provide 120-Vac, 60-Hz power to the various equipment from the ac power receptacle strip on the equipment rack.
  - 3. Install the required cabling and connectors, and make the necessary connections and cross-connections to extend the 12-pair cable from the Kiosk terminated on the Line Terminal Block in the MDF/Protector Cabinet to the APAAS Control Unit.
  - 4. Install the required cables, wires and connectors, and make the necessary connections and cross-connections between the APAAS Control Unit and the PERS Control Unit for the APAAS Kiosk external tone activation/termination feature.
  - 5. Install the required cabling and connectors, and make the necessary connections and cross-connections between the PERS/APAAS Dual Power Supply Assembly, and the APAAS and PERS Control Units.
  - 6. Install the required cables, wires and connectors, and make the necessary connections and cross-connections between the appropriate equipment in the Automatic Public Address Announcement System and the appropriate equipment in the passenger station Public Address System.
  - 7. Install the required cabling and connectors, and make the necessary connections and cross-connections between the APAAS Control Unit and the various equipment in the passenger station Fire and Intrusion Alarm System for the Automatic FIA System reset feature, the fire indication APAAS activation feature and the station fire zones contact closure to the Data Transmission System.

8. Install the required cables, wires and connectors, and make the necessary connections and cross-connections from the APAAS Control Unit to the line terminal block in the MDF/Protector Cabinet for the intrusion zones disable feature associated with the INTRUSION-APAAS-PERS keyswitch.

C. **SYSTEM MODIFICATION**

1. Upon completing the engineering, installation and complete testing of the APAAS, deactivate the "Automatic Activation of Emergency Announcement" feature of the APAAS, via an external method, which can be reactivated at the option of the Authority for future use.
2. Disable the "Automatic Activation of Emergency Announcement" feature of the APAAS by Wiring Option "D".
3. Provide the necessary equipment and material and make the necessary connections and cross-connections for Wiring Option "D." The utilization of this option will result in the following modifications to System Operation:
  - a. The "Manual Activation of Emergency Announcement" feature shall still be operational by depressing the "Manual" pushbutton on a Kiosk APAAS Control Panel.
  - b. An active station fire alarm shall not cause the APAAS System to be activated.
  - c. An active station fire alarm shall report to the OCC via the Data Transmission System.
  - d. All modifications shall be made via external connections routed to or from the APAAS Control Unit.

**3.02 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

**3.03 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.

**3.04 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.

- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

**END OF SECTION**

## **SECTION 16851**

### **COMMUNICATIONS – CLOSED-CIRCUIT TELEVISION SYSTEM**

#### **PART 1 - GENERAL**

##### **1.01 SUMMARY**

- A. This section specifies a complete and operational CCTV system for Authority-wide monitoring of WMATA's rail system, parking garages, bus divisions and support facilities.
- B. Related Sections:
  - 1. Section 16703 – Communications Standard Specifications-Engineering Services
  - 2. Section 16704 – Communications Standard Specifications-Installation
  - 3. Section 16705 – Communications Standard Specifications-Equipment & Material
  - 4. Section 16706 – Communications System Submittals & Services
  - 5. Section 16707 – Communications Quality Assurance & Testing
  - 6. Section 16710 – Communications Grounding
  - 7. Section 16715 – Communications Electrical Power Distribution
  - 8. Section 16733 – Communications – Kiosk Systems

##### **1.02 REFERENCES**

- A. Code, Regulations, Reference Standards and Specifications:
  - 1. National Electrical Code (NEC)
  - 2. Electronics Industries Alliance (EIA) Standard RS 170
  - 3. Federal Standard 595B, Colors Used in Government Procurement

##### **1.03 QUALITY ASSURANCE**

- A. Qualifications:
  - 1. Equipment manufacturer: Select a manufacturer who is engaged in production of similar CCTV products and accessories.
  - 2. Equipment supplier: An authorized distributor of specified manufacturer with minimum three years documented experience.
  - 3. Equipment installer: A manufacturer authorized installer of specified products with service facilities within 100 miles of WMATA.
- B. Coordination
  - 1. Installer shall coordinate CCTV installation with all other concurrently running work at the location specified under this task.
- C. For Code, Regulations, Reference Standards and Specifications, refer to Article 1.02 above.
- D. The Contractor shall develop test procedures and obtain Engineer approval prior to final acceptance testing.
- E. The Contractor shall perform progressive tests in accordance with an approved test procedure to verify compliance with specified system performance requirements, including but not limited to proper component operation and input/output signal operations.
  - 1. The Contractor's Quality Assurance Engineer shall witness all progressive testing.

2. All discrepancies found during testing shall be corrected and test reports submitted prior to scheduling end-to-end testing.
  3. The Contractor shall notify the Engineer prior to commencing progressive testing and shall offer the Engineer the opportunity to witness the testing. Witnessing of any portion of the progressive testing by the Engineer shall not relieve the contractor from responsibility for any portion of follow-on testing.
- F. End-to-End Test:
1. The Contractor shall demonstrate the proper functioning of the completed CCTV system.
  2. Each camera shall be viewable from all points of monitoring as specified in the design drawings.
  3. The Contractor shall submit certified test reports within 10 working days after completion of field tests.

#### **1.04 SUBMITTALS**

- A. Submit the following for approval in accordance with Section 16706 and with the additional requirements as specified for each:
1. Design Drawings
    - a. Proposed changes and revised equipment layouts
    - b. System riser diagrams to include source of power.
    - c. CCTV equipment mounting details.
    - d. Completed camera and equipment schedules
  2. Product Data: Provide product data sheets for each item of equipment and resubmittal for equipment which changes as a result of required modification.
  3. Manufacturer's Installation Instructions
    - a. Indicate application conditions and limitations of use, stipulated by Product testing agency.
    - b. Include instructions for storage, handling, protection, examination, preparation, installation and start-up of Product.
- B. As-Built Documents: Prior to Substantial Completion, develop As-Built documents as follows:
1. As-Built Drawings of the CCTV system installation to include, but not be limited to camera layouts, communication and power cable pathways and wiring, equipment details and equipment schedules.
  2. Approved copies of each submittal
- C. Operation and maintenance (O & M) manuals
1. Complete printed operating instructions in manual or handbook form, completely and clearly indexed for ready reference during actual operation and for use as text during instruction of personnel.
  2. Include descriptions of systems, background information and complete procedures for adjustment, calibration, replacement and repair of components in system.
  3. Make data contained specific for and exclusive to the systems and equipment for the work of this Contract.
  4. Field test data and reports.

D. Certification

1. Certificates from manufacturers verifying that equipment conforms to the specified requirements.

**1.05 OPERATION AND MAINTENANCE TRAINING**

- A. In accordance with the General Requirements.

**PART 2 - PRODUCTS**

**2.01 SECTION INCLUDES:**

- A. Network-Based IP Cameras
- B. Networking Devices
- C. Mounting Hardware

**2.02 PTZ DOME NETWORK CAMERA**

- A. Make and Model: Axis Q6045-E or approved equal
- B. Environmental Factors:
  1. Operating temperature: -50°C to 50°C (-58°F to 122°F)
  2. Humidity: 10-100% RH (condensing)
  3. Storage conditions: -50°C to 50°C (-58°F to 122°F)
  4. IP-66, NEMA 4X and 1K10-rated
- C. Power Requirements:
  1. High Power over Ethernet (High PoE), max. 60W
  2. AXIS T8124 High PoE 60W Midspan 1-port: 100-240VAC, max 74W
- D. Mounting:
  1. Wall: Axis T91A61 Wall Mount
  2. Parapet: Pelco PP-Series Parapet Mount
  3. Ceiling: Axis T91A63 Ceiling Mount
  4. Pole: Axis T91A67 Pole Mount
- E. Interface: RJ-45 for 10BASE-T/100BASE-TX PoE interface
- F. Salient Characteristics:
  1. Camera:
    - a. Image sensor: 1/2.8 progressive scan CMOS
  2. Lens:
    - a. F=4.7-94mm, F1.6-3.5 autofocus
    - b. Automatic day/night
  3. Horizontal angle of view: 54.1° - 2.9° in HDTV 1080p
  4. Horizontal angle of view: 37.6° - 2° in HDTV 720p
  5. Min. Illumination:
    - a. Color: 0.8 lux @ 30 IRE F1.6
    - b. B&W: 0.04 lux @ 30 IRE F1.6

6. Pan/tilt/zoom:
  - a. 20x optical zoom and 12x digital zoom, total 240x zoom
  - b. Pan: 360° endless, 0.05°-450/s
  - c. Tilt: 220°, 0.05° - 450/s
7. Video:
  - a. Compression:
    - i. H.246 (MPEG-4 Part 10/AVC)
    - ii. Motion JPEG
  - b. Resolution:
    - i. HDTV 1080p 1920x1080 to 320x180
    - ii. HDTV 720p 1280x720 to 320x180
  - c. Frame Rate:
    - i. H.264: up to 30/25 fps (60/50 Hz) in HDTV 1080p
    - ii. H.264: up to 60/50 fps (60/50 Hz) in HDTV 720p
    - iii. Motion JPEG: up to 25 fps (60/50 Hz) in HDTV 1080p
    - iv. Motion JPEG: up to 50 fps (60/50 Hz) in HDTV 720p
  - d. Video Streaming:
    - i. Multiple, individual configurable streams in H.264 and Motion JPEG
    - ii. Controllable frame rate and bandwidth
8. Network:
  - a. Security:
    - i. Password protection
    - ii. IP address filtering
    - iii. HTTPS encryption
    - iv. IEEE 802.1X network access control
    - v. Digest authentication
    - vi. User access log
9. System integration:
  - a. Application Programming Interface:
    - i. Open API for software integration, including VAPIX and AXIS Camera Application Platform
    - ii. ONVIF specified
  - b. Intelligent video:
    - i. Video motion detection
    - ii. Auto-tracking
    - iii. Active Gatekeeper
    - iv. Enabled for installation of additional applications

- c. Alarm triggers:
  - i. Video motion detection
  - ii. Auto-tracking
  - iii. AXIS Camera Application Platform
  - iv. PTZ preset
  - v. Temperature
  - vi. Memory card full
- d. Alarm events:
  - i. File upload via FTP, HTTP and e-mail
  - ii. Notification via e-mail, HTTP and TCP
  - iii. PTZ preset, guard tour, local storage, auto-tracking
  - iv. Pre- and post-alarm video buffering

10. General

- a. Processors and memory: ARTPEC-3, 256 MB RAM, 128 MB flash
- b. Local storage: SD/SDHC memory card slot
- c. Included accessories:
  - i. Clear dome cover
  - ii. Installation guide
  - iii. User's manual (CD)
  - iv. Recording software
  - v. Installation and management tools
  - vi. Windows decoder 1-user license
  - vii. Sunshield
  - viii. IP-66 rated RJ-45 connector kit
  - ix. Axis T8124 High PoE Midspan, 1-port

G. Warranty: 3-year warranty

**2.03 MINI PTZ**

- A. Make and Model: Axis M5014 PTZ Dome Network Camera or approved equal
- B. Environmental Factors:
  - 1. Operating temperature: 0°C to 45°C (32°F to 113°F)
  - 2. Humidity: 10-85% RH (non-condensing)
  - 3. IP-51-rated
- C. Power Requirements: Power over Ethernet 802.3af/802.3at Type 1 Class 3
- D. Mounting:
  - 1. Wall: direct to wall
  - 2. Ceiling: direct to ceiling or AXIS ceiling mount
- E. Interface: RJ-45 for 10BASE-T/100BASE-TX PoE interface

- F. Salient Characteristics:
1. Camera:
    - a. Image sensor: 1/4" progressive scan RGB CMOS
    - b. Lens:
      - i. 3.6mm, F1.8
      - ii. 60° Horizontal angle of view
    - c. Min. Illumination: 1.4 lux, F1.8
    - d. Pan/tilt/zoom:
      - i. Pan: + 180°, 100°-450/s
      - ii. Tilt: 90°, 100°/s
      - iii. Zoom: 3x digital zoom
  2. Video:
    - a. Compression:
      - i. H.246 (MPEG-4 Part 10/AVC)
      - ii. Motion JPEG
    - b. Resolution: HDTV 720p 1280x720 to 320x180
    - c. Frame Rate:
      - i. H.264: 30 fps in all resolutions
      - ii. Motion JPEG: 30 fps in all resolutions
    - d. Video Streaming:
      - i. Multiple, individually configurable streams in H.264 and Motion JPEG
      - ii. Controllable frame rate and bandwidth, VBR/CBR H.264
  3. Audio:
    - a. Audio Streaming: one-way
    - b. Audio input: built-in microphone
  4. Network:
    - a. Security:
      - i. Password protection
      - ii. IP address filtering
      - iii. HTTPS encryption
      - iv. IEEE 802.1X network access control
      - v. Digest authentication
      - vi. User access log
    - b. Supported protocols: IPv4/v6, HTTP, HTTPS, SSL/TLS, QoS Layer 3 DiffServ, FTP, CIFS/SMB, SMTP, Bonjour, UPnP, SNMPv1/v2c/v3 (MIB-II), DNS, DynDNS, NTP, RTSP, RTP, TCP, UDP, IGMP, RTCP, ICMP, DHCP, ARP, SOCKS
  5. System integration:

- a. Application Programming Interface:
  - i. Open API for software integration, including VAPIX and AXIS Camera Application Platform
  - ii. ONVIF Profile S specified
- 6. Intelligent video:
  - a. Video motion detection
  - b. Audio detection
  - c. Enabled for installation of additional applications
- 7. Event triggers:
  - a. Video motion detection
  - b. Audio detection
  - c. AXIS Camera Application Platform
  - d. PTZ preset
  - e. Memory card full
- 8. Event actions:
  - a. File upload via FTP, HTTP, network share and e-mail
  - b. Notification via e-mail, HTTP and TCP
  - c. PTZ preset, video recording to edge storage
  - d. Pre- and post-alarm video buffering
- 9. General:
  - a. Processors and memory: 256 MB RAM, 128 MB flash
  - b. Local edge storage: SD/SDHC memory card slot
- 10. Included accessories:
  - a. Drill template
  - b. Mounting brackets for hard and soft ceiling
  - c. Installation guide
  - d. Installation and management software CD
  - e. Windows decoder 1-user license
  - f. Sunshield
- G. Warranty: 1-year

**2.04 EXTERIOR FIXED DOME NETWORK CAMERA**

- A. Make and Model: Axis P3367-VE, 5 MP, multi-stream viewing (or approved equal)
- B. Environmental Factors:
  - 1. Operating temperatures: -40°C to 55°C (-40°F to 131°F)
  - 2. Humidity: 0-100% RH (condensing)
  - 3. IP-66, NEMA 4X and 1K10-rated
- C. Power Requirements:

1. Power over Ethernet IEEE 802.3af
  2. Class 3; max 12.1W
- D. Mounting:
1. Wall: Axis T91A61 Wall Mount
  2. Parapet: Pelco PP-Series Parapet Mount
  3. Ceiling: Axis T91A63 Ceiling Mount
  4. Pole: Axis T91A67 Pole Mount
- E. Interface:
1. RJ-45 10 BASE-T/100BASE-TX PoE
  2. Terminal block for 1 alarm input and 1 output
  3. 3.5 mm/mic/line in, 3.5 mm line out
- F. Salient Characteristics:
1. Camera:
    - a. Image sensor: 1/3.2" progressive scan CMOS
    - b. Lens:
      - i. Varifocal
      - ii. Remote focus and zoom
      - iii. IR corrected
      - iv. P-Iris control
      - v. Megapixel resolution
      - vi. 3-9mm
    - c. Horizontal angle of view: 84° - 30°, F1.2
    - d. Day & Night: Automatically removable infrared-cut filter
    - e. Min. Illumination:
      - i. Color: 0.2 lux F1.2
      - ii. B&W: 0.04 lux F1.2
    - f. Shutter time: 1/28000 s to 2 s
    - g. Camera angle adjustment:
      - i. Pan: 360°
      - ii. Tilt: 160
      - iii. Rotation: 340°
  2. Video:
    - a. Compression:
      - i. H.246 Baseline and Main Profile (MPEG-4 Part 10/AVC)
      - ii. Motion JPEG
      - iii. Resolution: 2592 x 1944 (5MP) to 160 x 90
    - b. Frame Rate: 5 MP capture mode: 12 fps in all resolutions

- c. Video Streaming:
    - i. Multiple, individual configurable streams in H.264 and Motion JPEG
    - ii. Controllable frame rate and bandwidth
    - iii. VBR/CBR H.264
  - d. Multi-view streaming:
    - i. 5 MP capture mode: When streaming 4 view areas and 1 overview in VGA resolution, the frame rate is 12 fps per stream
    - ii. 3 MP capture mode: When streaming 4 view areas and 1 overview in VGA resolution, the frame rate is 20 fps per stream
  - e. Pan-tilt-zoom: Digital
3. Network:
- a. Security:
    - i. Password protection
    - ii. IP address filtering
    - iii. HTTPS encryption
    - iv. IEEE 802.1X network access control
    - v. Digest authentication
    - vi. User access log
  - b. Supported protocols: IPv4/v6, HTTP, HTTPS, SSL/TLS, QoS Layer 3 DiffServ, FTP, CIFS/SMB, SMTP, Bonjour, UPnP, SNMPv1/v2c/v3 (MIB-II), DNS, DynDNS, NTP, RTSP, RTP, TCP, UDP, IGMP, RTCP, ICMP, DHCP, ARP, SOCKS
4. System integration:
- a. Application Programming Interface:
    - i. Open API for software integration, including VAPIX and AXIS Camera Application Platform
    - ii. ONVIF specified
  - b. Intelligent video
    - i. Video motion detection
    - ii. Active tampering alarm
    - iii. Audio detection
    - iv. Enabled for installation of additional applications
  - c. Event triggers
    - i. Intelligent video
    - ii. External input
    - iii. Edge storage events
  - d. Event actions
    - i. File upload via FTP, HTTP, network share and e-mail
    - ii. Notification via e-mail, HTTP and TCP

- iii. External output activation
  - iv. Video and audio recording to edge storage
  - v. PTZ preset, guard tour
  - vi. Play audio clip
  - vii. Pre- and post-alarm video buffering
- 5. General
  - a. Processors and memory: ARTPEC-3, 256 MB RAM, 128 MB flash
  - b. Local edge storage: SD/SDHC memory card slot
- 6. Included accessories
  - a. Installation guide
  - b. Installation and management software CD
  - c. Windows decoder 1-user license
  - d. Sunshield
  - e. IP-66 rated RJ-45 connector kit
  - f. Mounting bracket
  - g. 5 m (16 ft.) network cable
  - h. Smoked transparent cover
- 7. Casing
  - a. IP-66 and NEMA 4X-rated, 1K10 impact-resistant casing with aluminum base and dehumidifying membrane.
  - b. Color: White NCS S 1002-B
- G. Warranty: 3-years

## **2.05 INTERIOR FIXED DOME NETWORK CAMERA**

- A. Make and Model: Axis P3367-V, 5 MP, multi-stream viewing, vandal resistant (or approved equal)
- B. Environmental Factors:
  - 1. Operating temperatures: 0°C to 50°C (-32°F to 122°F)
  - 2. Humidity: 0-85% RH (non-condensing)
- C. Power Requirements:
  - 1. Power over Ethernet IEEE 802.3af/802.3at Type 1
  - 2. Class 2; max 6.2 W
- D. Mounting:
  - 1. Wall: Axis T91A61 Wall Mount
  - 2. Parapet: Pelco PP-Series Parapet Mount
  - 3. Ceiling: Axis T91A63 Ceiling Mount
  - 4. Pole: Axis T91A67 Pole Mount
- E. Interface:
  - 1. RJ-45 10 BASE-T/100BASE-TX PoE

2. Terminal block for 1 alarm input and 1 output
  3. 3.5 mm/mic/line in, 3.5 mm line out
- F. Salient Characteristics
1. Camera:
    - a. Image sensor: 1/3.2" CMOS, progressive scan
    - b. Lens:
      - i. Varifocal
      - ii. Remote focus and zoom
      - iii. IR corrected
      - iv. P-Iris control
      - v. Megapixel resolution
      - vi. 3-9mm
    - c. Horizontal angle of view: 100° - 35°, F1.3
    - d. Day & Night: Automatically removable infrared-cut filter
    - e. Min. Illumination:
      - i. Color: 0.2 lux F1.2
      - ii. B&W: 0.04 lux F1.2
    - f. Shutter time: 1/28000 s to 2 s
    - g. Camera angle adjustment:
      - i. Pan: 360°
      - ii. Tilt: 160
      - iii. Rotation: 340°
  2. Video
    - a. Compression:
      - i. H.246 Baseline and Main Profile (MPEG-4 Part 10/AVC)
      - ii. Motion JPEG
    - b. Resolution: 2592 x 1944 (5MP) to 160 x 90
    - c. Frame Rate: 5 MP capture mode: 12 fps in all resolutions
    - d. Video Streaming:
      - i. Multiple, individual configurable streams in H.264 and Motion JPEG
      - ii. Controllable frame rate and bandwidth
      - iii. VBR/CBR H.264
      - iv. Multi-view streaming
      - v. 5 MP capture mode: When streaming 4 view areas and 1 overview in VGA resolution, the frame rate is 12 fps per stream
      - vi. 3 MP capture mode: When streaming 4 view areas and 1 overview in VGA resolution, the frame rate is 20 fps per stream
    - e. Pan-tilt-zoom: Digital

3. Audio:
  - a. Audio streaming: two-way audio
  - b. Audio input/output: External mic input or line input, Line output
4. Network:
  - a. Security:
    - i. Password protection
    - ii. IP address filtering
    - iii. HTTPS encryption
    - iv. IEEE 802.1X network access control
    - v. Digest authentication
    - vi. User access log
    - vii. Supported protocols: IPv4/v6, HTTP, HTTPS, SSL/TLS, QoS Layer 3 DiffServ, FTP, CIFS/SMB, SMTP, Bonjour, UPnP, SNMPv1/v2c/v3 (MIB-II), DNS, DynDNS, NTP, RTSP, RTP, TCP, UDP, IGMP, RTCP, ICMP, DHCP, ARP, SOCKS
5. System integration:
  - a. Application Programming Interface
  - b. Open API for software integration, including VAPIX and AXIS Camera Application Platform
  - c. ONVIF Profile S specified
6. Intelligent video:
  - a. Video motion detection
  - b. Active tampering alarm
  - c. Audio detection
  - d. Enabled for installation of additional applications
7. Event triggers:
  - a. Intelligent video
  - b. External input
  - c. Edge storage events
8. Event actions:
  - a. File upload via FTP, HTTP, network share and e-mail
  - b. Notification via e-mail, HTTP and TCP
  - c. External output activation
  - d. Video and audio recording to edge storage
  - e. PTZ preset, guard tour
  - f. Play audio clip
  - g. Pre- and post-alarm video buffering
9. General:

- a. Processors and memory: ARTPEC-3, 256 MB RAM, 128 MB flash
- b. Local edge storage: SD/SDHC/SDXC memory card slot
- 10. Included accessories:
  - a. Installation guide
  - b. Installation and management software CD
  - c. Windows decoder 1-user license
  - d. Drill hole template
- 11. Casing:
  - a. 1K10 impact-resistant casing with aluminum base and dehumidifying membrane.
  - b. Color: White NCS S 1002-B
- G. Warranty: 3-years

**2.06 360° CAMERA**

- A. Make and Model: Mobotix MX-Q24M-SEC-DN, 3.1 megapixel or approved equal
- B. Environmental Factors: Operating temperatures: -30°C to 60°C (-22°F to 140°F)
- C. Power Requirements:
  - 1. Power over Ethernet IEEE 802.3af
  - 2. PoE class varies with operation
  - 3. Power consumption: approx. 4.5W
- D. Mounting:
  - 1. Wall
  - 2. Ceiling
  - 3. Elevator cab ceiling mount MX-OPT-IC
- E. Interface:
  - 1. RJ-45 10 BASE-T/100BASE-TX PoE
  - 2. USB
- F. Salient Characteristics
  - 1. Camera:
    - a. Image sensor: 1/2" CMOS, progressive scan
    - b. Lens: L11 (hemispherical), L22 (90° x 67°)
    - c. Min. Illumination: Color: 1 lux (t=1/60 sec.), 0.05 lux (t=1/1 sec)
    - d. Video:
      - i. Compression
      - ii. MxPEG
      - iii. Motion JPEG
      - iv. JPG
      - v. H.263 (video – VoIP - telephony)

- e. Resolution: 2048 x 1536 (3MP)
  - f. Frame Rate:
    - i. VGA: 22 fps
    - ii. TV-PAL: 18 fps
    - iii. Mega: 8 fps
    - iv. 3MP: 4 fps
  - g. Video Streaming:
    - i. VGA: 30 fps
    - ii. TV-PAL: 30 fps
    - iii. Mega: 30 fps
    - iv. 3MP: 20 fps
  - h. Pan-tilt-zoom: Digital, continuous 8x zoom
2. Network:
- a. Security:
    - i. User-/Group management
    - ii. IP address filtering
    - iii. HTTPS/SSL
    - iv. IEEE 802.1X network access control
    - v. Intrusion detection
    - vi. Digital image signature
  - b. System integration:
    - i. Application Programming Interface
    - ii. Inclusive video management software MxEasy
  - c. Alarm/Events
    - i. Integrated multiple-window motion detection
    - ii. Temperature sensor
    - iii. Notification via e-mail, FTP, IP-Telephony (VoIP, SIP)
    - iv. Visual/acoustic alarm
    - v. Pre- and post-alarm images
3. General
- a. Memory: Internal 64 MB image memory
  - b. Local edge storage: MicroSD slot
  - c. Included accessories
    - i. Installation manual
    - ii. Software
    - iii. 4 GB MicroSD
    - iv. Mounting parts

- v. Patch cable
    - d. Casing
      - i. High-resistant composites – PBT-PC
      - ii. Color: White
    - e. Edge Storage: Micro SD memory card slot
  - G. Warranty: 1-year
- 2.07 THERMAL CAMERAS**
- A. Make/Model: Axis Q1922-E or approved equal
  - B. Environmental Factors:
    - 1. Operating temperatures: -40°C to 60°C (-40°F to 140°F)
    - 2. Humidity: 10-85% RH
    - 3. IP66-rated aluminum casing
  - C. Power Requirements:
    - 1. Power over Ethernet IEEE 802.3af Class 3
    - 2. 8-20 VDC, max 13W or 20-24 VAC 50-60 Hz, max 20 VA
  - D. Mounting:
    - 1. Wall: Axis T91A61 Wall Mount
    - 2. Parapet: Pelco PP-Series Parapet Mount
    - 3. Pole: Axis T91A67 Pole Mount
  - E. Interface:
    - 1. RJ-45 10 BASE-T/100BASE-TX PoE
    - 2. Terminal block for power
    - 3. Terminal block for 2 configurable inputs/outputs
    - 4. 3.5 mm/mic/line in, 3.5 mm line out
    - 5. RS-422/RS-485
    - 6. Terminal block for heater
  - F. Salient Characteristics:
    - 1. Camera:
      - a. Image sensor: Uncooled Micro bolometer 640x480, pixel size: 17µm, spectral range: 8-14 µm
      - b. Lens: 10 mm, 19 mm, 35 mm and 60 mm
      - c. Sensitivity: NETD < 100 mK
    - 2. Video:
      - a. Compression:
        - i. H.246 (MPEG-4 Part 10/AVC)
        - ii. Motion JPEG
        - iii. Resolution: Sensor is 640 x 480. Image can be scaled up to 800 x 600 (D1)

- iv. Frame Rate: Up to 30 fps
  - v. Video Streaming
  - vi. At least 3 H.264 and Motion JPEG streams using the same palette, simultaneous and individually configured in max. resolution at 30 fps.
  - vii. Controllable frame rate and bandwidth
  - viii. VBR/CBR H.264
3. Audio:
- a. Audio streaming: two-way audio, full duplex
  - b. Audio input/output: External mic input or line input, line output
4. Network
- a. Security:
    - i. Password protection
    - ii. IP address filtering
    - iii. HTTPS encryption
    - iv. IEEE 802.1X network access control
    - v. Digest authentication
    - vi. User access log
    - vii. Supported protocols: IPv4/v6, HTTP, HTTPS, SSL/TLS, QoS Layer 3 DiffServ, FTP, CIFS/SMB, SMTP, Bonjour, UPnP, SNMPv1/v2c/v3 (MIB-II), DNS, DynDNS, NTP, RTSP, RTP, TCP, UDP, IGMP, RTCP, ICMP, DHCP, ARP, SOCKS
5. System integration:
- a. Application Programming Interface
  - b. Open API for software integration, including VAPIX and AXIS Camera Application Platform
  - c. ONVIF specified
6. Intelligent video:
- a. Video motion detection
  - b. Active tampering alarm
  - c. Audio detection
  - d. Enabled for installation of additional applications
7. Event triggers:
- a. Intelligent video
  - b. External input
  - c. Event actions
  - d. File upload via FTP, HTTP, network share and e-mail
  - e. Notification via e-mail, HTTP and TCP
  - f. External output activation
  - g. Pre- and post-alarm video buffering

8. General:
  - a. Processors and memory: 128 MB RAM, 128 MB flash
  - b. Local edge storage: SD/SDHC memory card slot
  - c. Included accessories:
    - i. Installation guide
    - ii. Installation and management software CD
    - iii. Windows decoder 1-user license
    - iv. Wall-mount bracket

G. Warranty: 3-years

## **2.08 PERIPHERAL PoE NETWORK SWITCHES, SMALL FORM FACTOR**

- A. Make and Model: COMNET, CNGE2FE8MS Series Ethernet Managed Switch or approved equal
- B. Environmental Factors:
  1. MTBF: >100,000 Hours
  2. Operating Temp: -40° C to 75° C
  3. Storage Temp: -40° C to 85° C
  4. Relative Humidity: 0% to 95% (non-condensing).
- C. Power Requirements:
  1. Power: 12VDC to 24VDC @ 1A maximum
  2. Current Protection: Automatic re-settable solid-state current limiters
  3. Voltage Regulation: Solid-state, Independent on each board
  4. Circuit Board: UL 94 flame-rated and meets all IPC standards.
  5. Mounting: DIN Rail or wall-mount
- D. Interface:
  1. 8 (eight) 10-100TX RJ-45 ports
  2. 2 (two) 10-100/1000TX RJ-45 ports
  3. 2 (two) Gigabit SFP ports
- E. Salient Characteristics:
  1. General:
    - a. IEEE Networking Standards:
      - i. IEEE 802.3 10Base-T Ethernet
      - ii. IEEE 802.3u 100Base-TX Fast Ethernet
      - iii. IEEE 802.3ab 1000Base-TX
      - iv. IEEE 802.3z Gigabit Ethernet Fiber
      - v. IEEE 802.3x Flow Control and Back-pressure
      - vi. IEEE 802.1p class of service
      - vii. IEEE 802.1Q VLAN and GVRP

- viii. IEEE 802.1D-2004 Rapid Spanning Tree Protocol (RSTP)
  - ix. IEEE802.3ad LACP
  - x. IEEE802.1X Port-based Network Access Control
2. Switching Performance:
- a. Switch Technology: Store and Forward Technology with 32Gbps Switch Fabric
  - b. System Throughput: 14,880pps for 10M Ethernet; 148,800pps for 100M Fast Ethernet; 1,488,100 for Gigabit Ethernet
  - c. Transfer Packet Size: 64 bytes to 1522 bytes (with VLAN Tag)
  - d. MAC Address: 8K MAC
  - e. Packet Buffer: 1Mbits
  - f. Relay Alarm: Dry Relay output with 1A@24V ability
3. Management:
- a. Configuration: Web, HTTPS, SSH, TFTP/Web Update for firmware and configuration backup/restore, DHCP Client, Warm reboot, Reset to default, Admin password, Port Speed/Duplex control, status, statistic, MAC address table display, Static MAC, Aging time, SNMP v1, v2c, v3, Traps and RMON1. SNMP MIB: MIB-II, Bridge MIB, VLAN MIB, SNMP MIB, RMON and Private MIB
  - b. Port Trunk: Up to 5 Static Trunk and 802.3ad LACP
  - c. VLAN: IEEE802.1Q VLAN, GVRP. Up to 64 VLAN groups
  - d. Quality of Service: Four priority queues per port, IEEE802.1p COS and Layer 3 TOS/DiffServ
  - e. IGMP Snooping: IGMP Snooping V1/V2 for multicast filtering and IGMP Query
  - f. Rate Control: Ingress filtering for Broadcast, Multicast, Unknown DA or all packets, and Egress filtering for all packets
  - g. NTP: Network Time Protocol to synchronize time from Internet
  - h. Embedded Watchdog: Embedded hardware watchdog timer to auto reset system when switch system failure
  - i. Port Mirroring: Online traffic monitoring on multiple selected ports
  - j. Port Security: Assign authorized MAC to specific port
  - k. IP Security: IP security to prevent unauthorized access
  - l. 802.1x: Port-based Network Access Control
  - m. DHCP Server: Can assign 255 IP address, support IP and MAC binding
  - n. System Log: Supports both Local mode and Server mode
4. Network Redundancy:
- a. Rapid Spanning Tree Protocol: IEEE802.1D-2004 Rapid Spanning Tree Protocol. Compatible with Legacy STP and IEEE802.1w.
  - b. Rapid Super Ring (RSR): Ring Redundancy Technology. Failure recovery within 5ms.
  - c. Dual Homing II: Multiple uplink paths to upper switches

- d. Multiple Ring: Couple or multiple Rapid Super Rings
  - e. Legacy Super Ring: Backward compatible in client mode
  - f. Any Ring: Inter-operate with other vendors' ring Interface
5. Data Specifications:
    - a. Data Interface: Ethernet IEEE802.3
    - b. Data Rate: up to 1000 Mbps
    - c. Data Inputs/Outputs: up to 10
    - d. Operation Mode: Half or Full Duplex
    - e. Optical Specifications
  6. Number of Optical ports: up to 2 SFP-based
  7. Number of Fibers Required: 1 or 2, SFP-dependent
  8. Optical Wavelength: 1310 or 1550 nm, SFP-dependent
  9. Optical Power Budget: SFP-dependent
  10. Maximum Distance: up to 120 km (70 mi) single mode, SFP-dependent
  11. Status Indicators:
    - a. Power: Proper Power = Green
    - b. RJ-45 Link/Data: Green, No Link/No Data: Off
    - c. SFP Link/Data: Green, No Link/No Data: Off
  12. Connectors:
    - a. Optical: LC or SC, SFP-dependent
    - b. Power: Screw Clamp Terminal Strip.
    - c. Data: RJ-45
    - d. Console: RJ-45 serial communication
  13. Included Accessories:
    - a. Wall mount bracket automatically included
    - b. DIN Rail back mount automatically included
    - c. Warranty: Lifetime

## **2.09 PERIPHERAL PoE NETWORK SWITCHES, RACK MOUNT**

- A. Make and Model: COMNET, CNGE2FE24MS Series Ethernet Managed Switch or approved equal
- B. Environmental Factors:
  1. MTBF: >100,000 Hours
  2. Operating Temp: -40° C to 75° C
  3. Storage Temp: -40° C to 85° C
  4. Relative Humidity: 0% to 95% (non-condensing).
- C. Power Requirements:
  1. Power: 12VDC to 24VDC @ 1A maximum

2. Current Protection: Automatic re-settable solid-state current limiters
  3. Voltage Regulation: Solid-state, Independent on each board
  4. Circuit Board: UL 94 flame-rated and meets all IPC standards.
  5. Mounting: Rack
- D. Interface:
1. 8 (eight) 10-100TX RJ-45 ports
  2. 2 (two) 10-100/1000TX RJ-45 ports
  3. 2 (two) Gigabit SFP ports
- E. Salient Characteristics:
1. General:
    - a. IEEE Networking Standards:
      - i. IEEE 802.3 10Base-T Ethernet
      - ii. IEEE 802.3u 100Base-TX Fast Ethernet
      - iii. IEEE 802.3ab 1000Base-TX
      - iv. IEEE 802.3z Gigabit Ethernet Fiber
      - v. IEEE 802.3x Flow Control and Back-pressure
      - vi. IEEE 802.1p class of service
      - vii. IEEE 802.1Q VLAN and GVRP
      - viii. IEEE 802.1D-2004 Rapid Spanning Tree Protocol (RSTP)
      - ix. IEEE802.3ad LACP
      - x. IEEE802.1X Port-based Network Access Control
  2. Switching Performance:
    - a. Switch Technology: Store and Forward Technology with 32Gbps Switch Fabric
    - b. System Throughput: 14,880pps for 10M Ethernet; 148,800pps for 100M Fast Ethernet; 1,488,100 for Gigabit Ethernet
    - c. Transfer Packet Size: 64 bytes to 1522 bytes (with VLAN Tag)
    - d. MAC Address: 8K MAC
    - e. Packet Buffer: 1Mbits
    - f. Relay Alarm: Dry Relay output with 1A@24V ability
  3. Management:
    - a. Configuration: Web, HTTPS, SSH, TFTP/Web Update for firmware and configuration backup/restore, DHCP Client, Warm reboot, Reset to default, Admin password, Port Speed/Duplex control, status, statistic, MAC address table display, Static MAC, Aging time, SNMP v1, v2c, v3, Traps and RMON1. SNMP MIB: MIB-II, Bridge MIB, VLAN MIB, SNMP MIB, RMON and Private MIB
    - b. Port Trunk: Up to 5 Static Trunk and 802.3ad LACP
    - c. VLAN: IEEE802.1Q VLAN, GVRP. Up to 64 VLAN groups

- d. Quality of Service: Four priority queues per port, IEEE802.1p COS and Layer 3 TOS/DiffServ
  - e. IGMP Snooping: IGMP Snooping V1/V2 for multicast filtering and IGMP Query
  - f. Rate Control: Ingress filtering for Broadcast, Multicast, Unknown DA or all packets, and Egress filtering for all packets
  - g. NTP: Network Time Protocol to synchronize time from Internet
  - h. Embedded Watchdog: Embedded hardware watchdog timer to auto reset system when switch system failure
  - i. Port Mirroring: Online traffic monitoring on multiple selected ports
  - j. Port Security: Assign authorized MAC to specific port
  - k. IP Security: IP security to prevent unauthorized access
  - l. 802.1x: Port-based Network Access Control
  - m. DHCP Server: Can assign 255 IP address, support IP and MAC binding
  - n. System Log: Supports both Local mode and Server mode
4. Network Redundancy:
- a. Rapid Spanning Tree Protocol: IEEE802.1D-2004 Rapid Spanning Tree Protocol. Compatible with Legacy STP and IEEE802.1w.
  - b. Rapid Super Ring (RSR): Ring Redundancy Technology. Failure recovery within 5ms.
  - c. Dual Homing II: Multiple uplink paths to upper switches
  - d. Multiple Ring: Couple or multiple Rapid Super Rings
  - e. Legacy Super Ring: Backward compatible in client mode
  - f. Any Ring: Inter-operate with other vendors' ring Interface
5. Data Specifications:
- a. Data Interface: Ethernet IEEE802.3
  - b. Data Rate: up to 1000 Mbps
  - c. Data Inputs/Outputs: up to 10
  - d. Operation Mode: Half or Full Duplex
  - e. Optical Specifications
6. Number of Optical ports: up to 2 SFP-based
7. Number of Fibers Required: 1 or 2, SFP-dependent
8. Optical Wavelength: 1310 or 1550 nm, SFP-dependent
9. Optical Power Budget: SFP-dependent
10. Maximum Distance: up to 120 km (70 mi) single mode, SFP-dependent
11. Status Indicators:
- a. Power: Proper Power = Green
  - b. RJ-45 Link/Data: Green, No Link/No Data: Off
  - c. SFP Link/Data: Green, No Link/No Data: Off
12. Connectors:

- a. Optical: LC or SC, SFP-dependent
- b. Power: Screw Clamp Terminal Strip.
- c. Data: RJ-45
- d. Console: RJ-45 serial communication

**13. Included Accessories:**

- a. Wall mount bracket automatically included
- b. DIN Rail back mount automatically included
- c. Warranty: Lifetime

**2.010 MEDIA CONVERTERS**

- A. Make/Model: Axis T8604 Media Converter Switch
- B. Environmental Factors:
- C. Operating and Storage Temperatures: -40°C to 75°C (-40°F to 167°F)
- D. Operating and Storage Humidity: 10-85% RH (non-condensing)
- E. Power Requirements: 12.0-13.2 V DC max. 3.5 W
- F. Mounting: DIN Rail
- G. Interface:
  - 1. 2 (two) RJ45 connectors (10/100 Mbps)
  - 2. 2 (two) SFP connectors (100/1000 Mbps) for SFP fiber optic modules or SFP to copper modules
  - 3. 1x power
- H. Salient Characteristics:
  - 1. Display and Indicators: Power LED indicator; Network LED indicator (4x)
  - 2. Compliance: RoHS, REACH, WEEE, CE, EN 50022, IEC 60715, AS 2756
  - 3. Approvals: EN 55022 Class A, EN 61000-3-2, EN 61000-3-3, EN 61000-6-1, EN 61000-6-2, EN 55024, FCC Part 15 Subpart B Class A, ICES-003 Class A, VCCI Class A, C-tick AS/NZS CISPR 22, KCC KN22 Class A, KN24, IEC/EN 60950-1
  - 4. Included Accessories: Bracket Mount DIN Clip, Installation Guide
  - 5. Warranty: 3-year

**PART 3 - EXECUTION**

**3.01 DESIGN**

- A. Submit the optimum design layout of the cameras and camera specifications prior to installing any equipment. The Contractor will use the layout to determine the adequacy of the design and, in conjunction with a field survey, determine the exact location of each CCTV camera.

**3.02 INSTALLATION**

- A. Installation of the camera system shall be performed in a neat and professional manner and retain all elements of the rail system's architectural excellence.
- B. Installation of the camera system shall be coordinated with work of other trades.
- C. CCTV equipment shall be installed in accordance with manufacturer's instructions.

- D. Within rail station passenger areas, CCTV cameras shall be installed a minimum of 9'-0" above finished floor (AFF).
- E. CCTV cameras shall not be installed over tracks or extend beyond the inside of the platform edge granite unless otherwise specified or approved.
- F. Cameras mounted to suspended ceiling panels shall be installed flush with the ceiling panel and all wiring shall be concealed within the suspended ceiling.
- G. Enclosures shall be weather-proof, NEMA4X Stainless Steel enclosures with a padlock hasp.
- H. Enclosures shall be mounted no more than 5'-6" above finished floor.
- I. All cables shall be installed and tested in accordance with the most current WMATA Design and Wiring Standards.
- J. Grounding and/or bonding of the CCTV system shall be completed in accordance with
- K. For conduit, raceways and cabinet installation see Section 16130.
- L. For wire cable and busways installation, see Section 16120.

### **3.03 CONFIGURATION AND ADJUSTMENT**

- A. Configure and document all parameters required for optimized camera operation.
- B. Adjust cameras and document as required to capture the view as shown on approved drawings.
- C. Focus cameras using Rotakin focusing tool.

### **3.04 FIELD QUALITY CONTROL**

- A. Design and Performance Testing: Perform tests and submit results in accordance with the General Provisions, certified test results for the CCTV system installed under this contract.
- B. Acceptance Testing:
  - 1. Furnish equipment required to perform tests.
  - 2. Comply with WMATA approved system testing.
  - 3. Perform approved tests to verify that the CCTV systems comply with requirements shown and specified.
- C. The Contractor is responsible for testing all power and communications signals in accordance with

### **3.05 DEMONSTRATION**

- A. Conduct walking tour of Project and briefly describe function, operation and maintenance of the system components.
- B. Demonstrate operation and maintenance of the system to W MATA personnel two weeks prior to date of Substantial Completion.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with W MATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals as needed for additional data becomes apparent during instruction.

**3.06 SPARE PARTS**

A. In accordance with special conditions and the following:

1. Provide spare parts and/or equipment for no less than 10% of new items that are added to WMATA's inventory under this task.

**PART 4 - END OF SECTION**

## SECTION 16852

### COMMUNICATIONS - PARKING GARAGE CLOSED-CIRCUIT TELEVISION SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The Parking Garage Closed-Circuit Television (CCTV) System Provides monitoring of the parking garage exit gates from the Parking Garage Communication Equipment Room.
- B. The Closed-Circuit Television System described herein includes, but is not limited to, the following components:
  - 1. In designated parking garage locations;
  - 2. Color CCTV Cameras.
  - 3. Fiber-Optic Video Transmitters
  - 4. Fiber-Optic Cable and Conduit from the camera location to the Communications Equipment Room.
- C. In Parking Garage Communications Equipment Rooms;
  - 1. 17-inch CCTV Monitors.
  - 2. VHS Time Lapse Recorder/Players.
  - 3. Video Equipment Security Cabinets.
  - 4. Quad Video Processors.
  - 5. Fiber-Optic Video Receivers
- D. Video outputs from all CCTV cameras shall be connected to the Quad Video Processors located the Communications Equipment Room via fiber-optic transmitters, fiber-optic cable and fiber-optic receivers.
- E. A 17-inch CCTV monitor shall be installed in the Garage Communications Equipment Room and interfaced with the Quad Video Processor.
- F. A VHS Time Lapse Recorder/Player shall be installed in the Garage Communications Equipment Room and interfaced with the Quad Video Processor.

##### 1.02 SECTION INCLUDES

- A. Cameras.
- B. 17-inch CCTV Monitors.
- C. VHS Time Lapse Recorder/Players.
- D. Video Equipment Security Cabinets.
- E. Quad Video Processors.

##### 1.03 UNIT PRICES

- A. Unit Prices include incidental items, not specifically mentioned, but required for complete and proper system operation.

##### 1.04 RELATED SECTIONS

- A. Section 16705 -Communications Standard Specifications - Equipment & Materials.
- B. Section 16706 - Communications System Submittals & Services.
- C. Section 16707 - Communications Systems Quality Assurance & Testing.
- D. Section 16710 -Communications Grounding.
- E. Section 16715 - Communications Electrical Power Distribution.

#### **1.05 REFERENCES**

- A. National Electrical Code (NEC).
- B. Electronics Industries Alliance (EIA) Standard RS 170
- C. Federal Standard 595B, Colors Used in Government Procurement

#### **1.06 SYSTEM DESCRIPTION**

- A. Description: Provides monitoring of the exit gates from the Parking Garage Communication Equipment Room.
- B. Capacity:
  1. The Contractor shall design, furnish, and install Color CCTV Cameras to monitor all garage exit gates from each Parking Garage Communication Equipment Room.
  2. The Contractor shall furnish and install a 17-inch video monitor in each Parking Garage Communications Equipment Room.
  3. The Contractor shall furnish and install a Video Equipment Security Cabinet in each Garage Communications Equipment Room to house the following video equipment: 17-inch CCTV Monitors, VHS Time Lapse Recorder/Players, Video Equipment Security Cabinets, Quad Video Processors, and Fiber-Optic Video Receivers
  4. The Contractor shall furnish and install Quad Video Processors in each Parking Garage Communications Equipment Room.
- C. Configuration: RS-170 with 1 volt peak-to-peak across 75-ohms.

#### **1.07 SYSTEM PERFORMANCE REQUIREMENTS**

- A. The Contractor shall be responsible for the overall performance of the Closed-Circuit Television System. The following overall system performance requirements are designed to ensure that the Closed-Circuit Television System delivered under these Specifications meets the performance requirements of the Washington Metropolitan Area Transit Authority.
  1. Gray Scale Reproduction: Ten shades of gray shall be distinguishable when viewing a standard EIA Resolution Chart on each CCTV camera.
  2. Sensitivity: A faceplate illumination of 0.25 foot-candles (or less) using an Infrared (IR) filter and with the Automatic Gain Control (AGC) off shall cause a full video output from the CCTV camera.
  3. Minimum Scene Illumination: Each television camera shall provide a usable video output using an IR filter and with the AGC on with a faceplate illumination of 0.04 foot-candles (or less).
  4. Resolution: The vertical resolution as determined by viewing each CCTV monitor, as produced by a signal originating from each associated CCTV camera and

passing through the installed cable and distribution equipment in the CCTV System, shall not be less than 350 lines in the center of the picture, when all system equipment is operated to any combination of the previously stated system design capabilities. The horizontal resolution measured under these conditions shall not be less than 550 TV lines in the center of the picture on any Kiosk CCTV monitor.

5. Video Signal Level: Video signal levels shall conform to level requirements of EIA Standard RS-170 when measured at the signal input of the installed Kiosk monitors.
6. Scanning Lines: 525 lines per frame, interlaced 2:1 Standard RS-170 with no discernible interlace jitter or pairing on the monitor.
7. Frame Frequency: 30 frames per second.
8. Aspect Ratio: Height to width ratio of three (3) to four (4).
9. Environmental Standards: All equipment mounted outdoors shall be fully operational without damage or functional degradation under any combination of the following environmental/working conditions:
  - a. Ambient temperature  $-40^{\circ}\text{C}$  to  $+50^{\circ}\text{C}$ .
  - b. Relative humidity 0% to 100%.
  - c. Operation to  $+60^{\circ}\text{C}$  shall not reduce the horizontal resolution of the CCTV camera by more than 100 lines.
  - d. Rain, salt, dust, oil, and other pollutants.
  - e. Winds up to and including 90 MPH with rime icing.
  - f. Vigorous and normal use.
  - g. Train-related vibrations.
10. Noise: Operation of any aspect of the system shall not produce any discernible noise on the CCTV monitor. The signal-to-noise ratio under all transit system operating conditions shall be degraded by no more than 3-dB.

#### **1.08 SUBMITTALS**

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical characteristics and connection requirements, including system wiring diagram.
- C. Product Data: Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

#### **1.09 QUALIFICATIONS**

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Authorized installer of specified manufacturer with service facilities within 50 miles of Project.

#### **1.10 REGULATORY REQUIREMENTS**

- A. Conform to requirements of NFPA 130.
- B. Furnish Products listed and classified by Underwriters Laboratories, Inc. or testing firm acceptable to authority having jurisdiction as suitable for purpose specified and indicated.

### **1.11 MAINTENANCE SERVICE**

- A. Furnish service and maintenance of Closed-Circuit Television system until Final Completion.

## **PART 2 - PRODUCTS**

### **2.01 COLOR CCTV CAMERA**

- A. Manufacturers:
  - 1. Philips Model LTC 0600/60, (or approved equal).
- B. Description: High-resolution color video camera.
- C. Imager: ½-inch image format.
- D. AGC: 18 dB, (24 dB selectable)
- E. Lens Mount: C and CS
- F. Ratings:
  - 1. Input Power: 120-Vac, 60-Hz.
  - 2. Scene Illumination: 0.04 fc for usable picture, 0.15 fc for full video.
  - 3. Active Picture Elements: 768 (H) x 492 (V).
  - 4. Horizontal Resolution: 480 TVL.
- G. Features:
  - 1. Digital Signal Processor
  - 2. Backlight Compensation
  - 3. Automatic Picture Enhancement
- H. Power Supply: Integral 120-volts, 60-Hz.

### **2.02 3.7-MM FIXED LENS**

- A. Manufacturer:
  - 1. Philips Model LTC 3214/20, (or approved equal).
- B. Description: Fixed focal-length, auto-iris lens.
- C. Mount Style: CS
- D. Iris Range, max. to min. (f-stop): 1.6 to 300
- E. Focal Length: 3.7-mm.

### **2.03 8-MM FIXED LENS**

- A. Manufacturer:

1. Philips Model LTC 3123/40, (or approved equal).
- B. Description: Fixed focal-length, auto-iris lens.
- C. Mount Style: C
- D. Iris Range, max. to min. (f-stop): 1.4 to 360
- E. Focal Length: 8-mm.

#### **2.04 SEVENTEEN-INCH MONITORS**

- A. Manufacturers:
  1. Philips Model 9617C/R with LTC 9017/00 rack kit (or approved equal).
- B. Description: Rack-mounted monochrome television monitor.
- C. Viewable Picture Area: 17-inches.
- D. Ratings:
  1. Horizontal Resolution: 700 lines.
  2. Linearity: 2% Horizontal and Vertical measured diagonally.
  3. Video Input: EIA RS-170.
  4. Input Power: 120-Vac, 60-Hz.

#### **2.05 VHS TIME LAPSE RECORDER/PLAYER**

- A. Manufacturers:
  1. Philips Model LTC 3991/60 (or approved equal).
- B. S-VHS format.
- C. Selectable Speeds (recording & Playback) 2, 12, 24, 48, 72, 120, 168, 240, 360, 480, 600, and 720 hours with ST-120 tape.
- D. High Speed Video Scan: 5 x 2 hour speed.
- E. Rewind/Fast Forward Time: 4.5 minutes average.
- F. Video Signal Format: EIA Standard, 525 lines, 60 fields/second. National Television System Committee (NTSC) color/monochrome Auto-selection.
- G. Video Input: 1 V p-p, 75-ohms, unbalanced.
- H. Video Output: 1 V p-p, 75-ohms, unbalanced.
- I. Horizontal resolution 400 lines (monochrome and color).
- J. Date/Time/Recording Data Generator with Time/Memory Power-Loss Backup of one month minimum
- K. Connectors: BCN - Video In and Out
  1. Radio Corporation of America (RCA) Phono Jack - Audio in, audio out
  2. 15-Pin D-Connector
    - a. Alarm Commands in

- b. Alarm On signal out
- c. Alarm Record Reset
- d. Tape End Out
- e. Tape End Reset
- f. Switcher Control Pulse
- g. Record Start In
- h. Record Output
- i. Low Tape Out.
- j. Record Check In
- k. One-Shot Command In
- 3. S Connectors
  - a. S(Y/C)\_in
  - b. S(Y/C) out
- L. Rated Voltage: 120-Vac, 60-Hz.
- M. Power Record/Play: 26-watts
- N. Operating Temperature: 5 to 40 EC

## **2.06 VIDEO EQUIPMENT SECURITY CABINET**

- A. Manufacturers:
  - 1. Bud Model No. DC-8002-BT (or approved equal).
- B. 19-inch rack mounting.
- C. Locking Plexiglas Front Door.

## **2.07 QUAD VIDEO PROCESSOR**

- A. Manufacturers:
  - 1. Philips Model LTC 2272 (or approved equal).
- B. Digital Memory: 8-bit, 256 gray steps.
- C. Video Inputs: four BNC, 75-ohms, 0.5 to 2.0 V p-p composite video, sysnc negative, 2:1 interlaced
- D. Video Outputs: one BNC, 75 ohms, continuous quad presentation of the four inputs.
- E. Supply Voltage: 120-Vac, 60-Hz.
- F. Power at Rated Voltage: 8 watts
- G. Operating Temperature: +0 EC to +40 EC

## **2.08 FIBER OPTIC VIDEO TRANSMITTERS**

- A. Manufacturers:
- B. Philips Model LTC4641(or approved equal).
- C. Lascomm Model 145/195, (or approved equal).

- D. Force, Incorporated Model 2792, (or approved equal).
- E. American Fibertek Inc. Model 20 Series, (or approved equal).
- F. Description: Fiber optic video transmitter, multi-mode.
- G. Format: NTSC video format.
- H. Ratings:
  - 1. Bandwidth: 6-MHz.
  - 2. Optical mode: Multi-mode.
  - 3. Input: 1 volts peak-to-peak at 75 ohms.

## **2.09 FIBER OPTIC VIDEO RECEIVERS**

- A. Manufacturers:
  - 1. Philips Model LTC4642, (or approved equal).
  - 2. Lascomm Model 145/195, (or approved equal).
  - 3. Force, Incorporated Model 2792, (or approved equal).
  - 4. American Fibertek Inc. Model 20 Series, (or approved equal).
- B. Description: Fiber optic video receiver, multi-mode.
- C. Format: NTSC video format.
- D. Ratings:
  - 1. Bandwidth: 6-MHz.
  - 2. Optical mode: Multi-mode.
  - 3. Input: 1-volt peak-to-peak at 75-ohms.

## **2.10 CAMERA ENVIRONMENTAL HOUSING**

- A. Manufacturers:
  - 1. Philips Model LTC 9488/61, (or approved equal).
- B. Ratings:
  - 1. Environmental: Thermostatically-controlled heater/blower designed to minimize window fogging.
  - 2. Material: Aluminum and Advanced Polymer
- C. \*Finish: Metro Bronze, Federal Standard 595B, Color No. 20040.

## **2.11 CAMERA WALL MOUNTS**

- A. Manufacturers:
  - 1. Pelco Model EM22, (or approved equal).
  - 2. Philips Model LTC9216, (or approved equal).
- B. Ratings:

---

\*The required Metro Bronze finish may require a special manufacturer's part number or, if not available through the manufacturer, shall require the Contractor to provide the Metro Bronze finishing.

1. Load rating: 40 pounds.
2. Material: Aluminum.

C. \*Finish: Metro Bronze, Federal Standard 595B, Color No. 20040.

## **2.12 CAMERA CEILING MOUNTS**

A. Manufacturers:

1. Pelco Model MM22, (or approved equal).
2. Philips Model LTC9214, (or approved equal).

B. Ratings:

1. Load rating: 40 pounds.
2. Material: Aluminum.

C. \*Finish: Metro Bronze, Federal Standard 595B, Color No. 20040.

## **2.13 FIBER OPTIC CABLE (Riser)**

A. Manufacturers:

1. International Fiber Systems Model A-1-6-TB, (or approved equal).

B. Ratings:

1. Multi-mode, 850-nanometers
2. NEC Riser rated
3. Service Temperature: -20 EC to +80 EC.
4. Tensile Load (install/service): 112/25 lbs.
5. Fiber Core Diameter: 62.5 microns
6. Overall Diameter: .112

## **2.14 FIBER OPTIC CABLE (Plenum)**

A. Manufacturers:

1. International Fiber Systems Model A-1-6-PL, (or approved equal).

B. Ratings:

1. Multi-mode, 850-nanometers
2. NEC Riser rated
3. Service Temperature: 0C. to +80C.
4. Tensile Load (install/service): 112/25 lbs.
5. Fiber Core Diameter: 62.5 microns
6. Overall Diameter: .098

## **2.15 TWO-CONDUCTOR SHIELDED POWER CABLE**

A. Manufacturers:

1. Belden Type 83321, (or approved equal).

B. Ratings:

1. Type: 18-AWG, two-conductor stranded silver plated copper.
2. Conductor Insulation: Extruded TFE Teflon
3. Shielding: Silver-plated copper braid.
4. Rating: 600-Volt UL Class-1.
5. Jacket: TFE Teflon tape-wrapped (No PVC)

6. Vertical Wire Flame Test: Passes VW-1

## **2.16 POWER ISOLATION TRANSFORMER**

- A. Manufacturers:
  1. Acme Model T-3-53043-S, (or approved equal).
- B. Ratings:
  1. Primary: 120/240 Vac, single phase.
  2. Secondary: 120/240 Vac, single phase.

## **2.17 COAXIAL VIDEO CABLE**

- A. Manufactures:
  1. Belden Type 89120 (or approved equal).
- B. Description: Provides connection between equipment and fiber optic transmission equipment.
- C. Ratings:
  1. Type: RG-6/U.
  2. Shielding: Aluminum Foil-Polyester Tape-Aluminum Foil/Braid.
  3. Attenuation: 0.66 dB/100 Ft. (nominal at 10 MHz).
  4. Jacket: Fluorinated Ethylene-Propylene (FEP) (No PVC)
  5. Insulation: Foam Teflon.
  6. Rating: Meets NEC\_CMP.
  7. Impedance: 75-ohm.

## **2.18 POWER CABLES**

- A. Manufactures:
  1. Belden Type 83321 (or approved equal).
- B. Description: Provides connection between power between equipment at the camera location and the power distribution panel in the Communication Room.
- C. Ratings:
  1. Type: 18-AWG, two-conductor stranded silver plated copper.
  2. Conductor Insulation: Extruded TFE Teflon, color-coded.
  3. Shielding: Silver-plated copper braid.
  4. Rating: 600-Volt UL Class-1.
  5. Jacket: TFE Teflon tape-wrapped (No PVC).
  6. Vertical Wire Flame Test: Passes VW-1

## **PART 3 - EXECUTIONS**

### **3.01 INSTALLATION**

- A. Submit the optimum design layout of the cameras and lens types to the Engineer prior to installing any equipment. The Engineer shall use the design to determine the adequacy of the design and, in conjunction with a field survey, determine the exact location of each CCTV camera.

- B. Furnish and install all terminals, hardware, wiring and cabling, connectors and adapters, conduits and fittings; and make all the necessary connections and cross-connections required for a complete operational CCTV System for each parking garage required by these specifications.

### **3.02 CAMERA EQUIPMENT**

- A. Install the Color CCTV cameras in the parking garages with the appropriate type mounting brackets. Install conduit from the parking garage Communication Equipment Room to the camera location shown on the Contract Drawings. The Engineering Definition Review shall be used to assist the Engineer in determining the adequacy of the design and, in conjunction with a field survey, determining the exact location of each CCTV camera. The bottom of installed CCTV cameras shall, ideally, be nine feet or greater above the finished floor. The conduit routing shall be approved by the Engineer.
- B. Install conduit from the CCTV cameras to the nearest Parking Attendant Booth for power in the parking garage and/or to the Communications Equipment Room in the parking garage.
- C. The Contractor shall install a power isolation transformer and connect it to the 120-Vac power source.
- D. The Contractor shall install a 2-conductor 18-AWG shielded power cable from the isolation transformer to each CCTV camera.
- E. All installed video connectors and adapters shall be covered with shrink sleeving to electrically isolate the connectors from building and power ground.
- F. All equipment mounted outside of the Communication Room or Parking Attendant Booth, which is not weatherproof, shall be mounted in weatherproof boxes.
- G. Terminate all unused video inputs and outputs in 75 ohms using appropriate termination plugs/jacks.

### **3.03 PARKING GARAGE COMMUNICATIONS EQUIPMENT ROOM CCTV INSTALLATION**

- A. Install and connect the following equipment in a 19-inch equipment cabinet in the Communications Equipment Rooms of the parking garages:
  - 1. 17-inch CCTV Monitors.
  - 2. VHS Time Lapse Recorder/Players.
  - 3. Video Equipment Security Cabinets.
  - 4. Quad Video Processors.

### **3.04 VIDEO CABLE**

- A. Install coaxial video cable from the CCTV monitor to VHS Time Lapse Recorder/Player in the parking garage Communications Equipment Room. The Contractor shall use coaxial video cable for all video connections within the parking garage Communications Equipment Room.
- B. Install coaxial video cable from the Time Lapse Recorder/Player to the Quad Video Processors in the parking garage Communications Equipment Room

- C. Install coaxial video cable from each CCTV camera to the fiber optic transmitters and from the fiber optic receivers to the Quad Video Processors in the parking garage Communications Equipment Room.
- D. Install fiber optic video cable from each CCTV camera location to the parking garage Communications Equipment Room and install the required connectors.
- E. Install the required video connectors and adapters, and connect the video cables to the CCTV equipment. At each CCTV camera location, the Contractor shall install the appropriate mating connector on the coaxial cable. Video connectors shall be crimp type with weatherproof gaskets. Shrink sleeving (approved for outdoor use and installed per manufacturer's directions) shall be installed on connectors that are exposed in the parking garage, including splices. All splices shall be TDR tested and approved by the Engineer.

### **3.05 MANUFACTURER'S FIELD SERVICES**

- A. Prepare and start systems under provisions of Section 16707.
- B. Supervise final wiring connections and system adjustments.

### **3.06 ADJUSTING**

- A. Adjust operating Products and equipment to ensure smooth and unhindered operation.
- B. Adjust cameras for best view of required areas.

### **3.07 DEMONSTRATION**

- A. Demonstrate operation and maintenance of Products to Owner's personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with Owners' personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

### **3.08 SCHEDULES**

- A. Camera GTVC-1
  - 1. Lens: 3.7-mm, f/1.6 lens, with automatic iris.

- B. Camera GTVC-2
  - 1. Lens: 8-mm, f/1.4 lens, with automatic iris

**END OF SECTION**

## SECTION 16866

### INTERFACE CRITERIA AND RESPONSIBILITIES

#### PART 1 - GENERAL DESCRIPTION

##### 1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The Contractor shall identify all electrical, mechanical and physical interfaces associated with these Specifications. These shall include, but not be limited to, the following interfaces:
  - 1. Between the various communications systems, subsystems, equipment and materials included in these Specifications.
  - 2. Between the communications systems, subsystems, equipment and materials included in these Specifications, and existing WMATA systems, subsystems, and equipment.
  - 3. Between the Contractor-provided systems, subsystems, equipment and materials and those furnished by the Authority or other contractors (including structures, equipment, etc.).
- B. The Contractor-provided systems, subsystems, equipment and materials shall be designed to have the characteristics required to ensure that electrical, mechanical and physical interfaces achieve the specified grade of service and performance levels on a non-interfering basis with existing system and equipment functions (except as otherwise specified).
- C. The Contractor shall be fully responsible for the correct interfacing of the systems, facilities and equipment that are provided under this Contract with the existing WMATA communications systems, subsystems, facilities, and with the facilities and equipment furnished by the Authority. If any incompatibility is discovered, the Contractor shall correct the incompatibility by modifying the equipment provided and/or by providing additional required equipment and material at no additional cost to the Authority. Unless otherwise specified, modifications to the equipment of existing WMATA systems, subsystems and facilities and to equipment provided by the Authority will not be permitted.
- D. The Contractor shall be responsible for verifying product compatibility and system performance of all equipment, including equipment specified under the Major Items sections of this Contract.
- E. The Contractor shall ensure that continuing coordination is accomplished as defined. The Contractor shall submit an interface procedure which shall include the following:
  - 1. A detailed list specifically identifying each interface associated with this Contract.
  - 2. A description of the work involving interfaces to be performed by the Contractor under this Contract.
  - 3. Sketches or drawings showing details of interface points, where applicable.

##### 1.02 DEFINITION

- A. Interface Point
  - 1. An interface point is defined as the line(s) of demarcation between the various Contractor-furnished and/or installed systems, subsystems, equipment and materials, and those existing facilities including WMATA communications systems and equipment.
- B. Electrical/Mechanical Interface Compatibility

1. Electrical and mechanical interface compatibility is defined as the electrical and mechanical characteristics required to: Ensure that separate systems, subsystems, equipment and materials, and existing systems, subsystems, equipment and materials are compatible, retain their specified function, and perform a specified service in the specified manner, in conjunction with facilities to which they are connected; and that they do not impair, or have any adverse effect on, the specified operation of any system, subsystem or equipment to which they are directly or indirectly connected, or that may be influenced by them or their electromagnetic field(s).
- C. Physical Interface Compatibility
1. Physical interface compatibility is defined as the physical form and fit required to ensure that all items of equipment and materials are fully compatible with all other equipment, materials, facilities and structures with which they interface, including: Those furnished in accordance with these Specifications; and those owned or occupied by the Authority.
- D. Schedule Compatibility
1. Schedule compatibility is defined as the scheduling of contract work on the essentially non-interfering basis to WMATA. The Engineer's determination of what constitutes an "essentially non-interfering basis" shall be required whenever any degree of interference to WMATA is anticipated.

### **1.03 COMMUNICATIONS SYSTEMS/SUBSYSTEMS/FACILITIES INTERFACE**

- A. General
1. Some of the communications systems, subsystems and facilities to be furnished and installed in accordance with these Specifications are expansions and extensions of systems, subsystems and facilities furnished and installed by WMATA or local jurisdiction contracts.
  2. All systems, subsystems, equipment and materials furnished in accordance with the provisions of this Contract shall be fully compatible and operable to full specifications on an essentially non-interfering basis with all systems, subsystems, equipment and materials that are to be utilized by WMATA (including the electromagnetic compatibility of electrical, magnetic and radio frequency emissions of all types). The existing systems and facilities, and the extensions and expansions furnished in accordance with these Specifications, shall be fully compatible with each other, and each shall function as a single integrated system/facility.

### **1.04 PUBLIC ADDRESS SYSTEM**

- A. Passenger Station Public Address System interfaces shall include, but are not limited to, the Carrier Transmission System, the Technical Control Facility, the Automatic Public Address Announcement System, the Electrical Power Distribution System, the passenger station Kiosk, and the existing Public Address System equipment in the Jackson Graham Building. Points of interface include the passenger station's Communications Equipment Room, the Jackson Graham Building, the Kiosk, and locations within the passenger stations where loudspeakers are required.

### **1.05 CLOSED CIRCUIT TELEVISION SYSTEM**

- A. The Closed Circuit Television System interfaces include, but are not limited to, the passenger station's Kiosk and the Electrical Power Distribution System. Points of interface

include the passenger station's Communications Equipment Room, the Kiosk, and locations within the passenger stations where CCTV cameras are required.

#### **1.06 FIRE AND INTRUSION ALARM SYSTEM**

- A. Passenger Station Fire and Intrusion Alarm System interfaces include, but are not limited to, the existing partial Station Fire and Intrusion System, the Technical Control Facility, the passenger station Public Address System, the Data Transmission System, the Automatic Fare Collection equipment, the elevators, and the Electrical Power Distribution System.
- B. Points of interface in the passenger stations and ancillary buildings associated with this Contract include the Communications Equipment Room, the Kiosk, elevators and the Elevator Machine Room, selected air handling equipment, escalators and areas that contain deluge valves and water flow valves, and all locations where detectors are required.

#### **1.07 CARRIER TRANSMISSION SYSTEM**

- A. .Carrier Transmission System interfaces include, but are not limited to, the Fiber Optics System, the Telephone System, the Public Address System, the Passenger Emergency Reporting System, the Data Transmission System, the Technical Control Facility, the Mobile Radio System, and the Electrical Power Distribution System. Each system/facility shall be compatible with the channel(s) of the Carrier Transmission System which it utilizes.
- B. Points of interface exist in the Communications Equipment Rooms in the passenger stations, the Jackson Graham Building, and in the Communications Equipment Rooms and designated intermediate locations along the right-of-way.
- C. Carrier Transmission Systems, in addition to interfacing with each of the systems/facilities that use it as a transmission means, shall be compatible and operable with Carrier Transmission System equipment located at the Jackson Graham Building, in Communications Equipment Rooms along the right-of-way, and/or other specified locations. Space has been allocated in the Jackson Graham Building for Carrier Transmission System equipment to be furnished and installed in accordance with these Specifications.

#### **1.08 FIBER OPTICS SYSTEM**

- A. The Fiber Optics System interfaces include, but are not limited to, the Carrier Transmission System and the Electrical Power Distribution System for the passenger stations.
- B. Points of interface exist at the passenger station Communications Equipment Room, the Jackson Graham Building, and along the right-of-way.

#### **1.09 TELEPHONE SYSTEM**

- A. Passenger Station Telephone System interfaces include, but are not limited to, the Carrier Transmission System, the existing Computerized Branch Exchange (CBX) in the Jackson Graham Building, and the Electrical Power Distribution System. Points of interface include the passenger station's Communications Equipment Room, the Jackson Graham Building, the Kiosk; and in the passenger stations, ancillary buildings, and at Emergency Trip Station (ETS) enclosures along the right-of-way where telephone instruments are required.

#### **1.10 PASSENGER EMERGENCY REPORTING SYSTEM**

- A. Passenger Emergency Reporting System interfaces include, but are not limited to, the

passenger station Kiosk, the Electrical Power Distribution System and on the passenger station's platform. Points of interface exist in the Communications Equipment Room of the passenger stations, the Kiosk, and at locations within the passenger stations where Call Station Panels are required.

#### **1.11 AUTOMATIC PUBLIC ADDRESS ANNOUNCEMENT SYSTEM**

- A. Automatic Public Address Announcement System interfaces include, but are not limited to, the Public Address System, the Fire and Intrusion Alarm System, the passenger station Kiosk, and the Electrical Power Distribution System. Points of interface exist in the Communications Equipment Room of the passenger stations and the Kiosk within the passenger stations.

#### **1.12 PASSENGER STATION KIOSKS**

- A. Passenger Station Kiosk interfaces include, but are not limited to, the passenger station Public Address System, the passenger station Telephone System, the passenger station Closed Circuit Television System, the Passenger Station Fire and Intrusion Alarm System, the Technical Control Facility, the Passenger Emergency Reporting System, the Automatic Public Address Announcement System, the Electrical Power Distribution System, the Kiosk structures, the Data Transmission System, and the escalators and elevators. Points of interface exist within the Kiosk, in the passenger station Communications Equipment Room, in the AC Switchboard Room, and at the elevators and escalators.

#### **1.13 ELECTRICAL POWER DISTRIBUTION SYSTEM**

- A. Electrical Power Distribution System interfaces for the provision of uninterruptible 120 Vac power include, but are not limited to, the passenger station Public Address System, the passenger station Closed Circuit Television System, the passenger station Fire and Intrusion Alarm System, the Carrier Transmission System, the passenger station Telephone System, the Passenger Emergency Reporting System, the Automatic Public Address Announcement System, the passenger station Kiosk and the passenger station Mobile Radio System. Points of interface include the passenger station Communications Equipment Room, the Kiosk, and the AC Switchboard Room.
- B. For the provision of -48 Vdc power, Electrical Power Distribution System interfaces include, but are not limited to, the Carrier Transmission System, the Fiber Optics System and the passenger station Telephone System. Points of interface include the passenger station Communications Equipment Room.

#### **1.14 MOBILE RADIO SYSTEM**

- A. Mobile Radio System interfaces include, but are not limited to, the existing slotted coaxial cable antenna along the right-of-way and in other areas. Points of interface may exist within the tunnel areas where the existing slotted coaxial cable antenna is terminated, at the remote ancillary building(s) and passenger station(s) where UHF Two-Way Line Driver Units may be installed, and the passenger station Communications Equipment Room where a base station shall be installed.

#### **1.15 FARE COLLECTION SYSTEM**

- A. The Contractor shall interface with the Fare Collection System to determine the availability of the Kiosk fare collection console and fare collection equipment, and to coordinate work schedules and related details.

#### **1.16 INTERFACE WITH THE AUTHORITY**

- A. WMATA is an operating rapid transit system. The Contractor shall interface with the Authority to coordinate schedules and access to areas of the system where work is to be performed. Coordination is required for physical access to Communications Equipment Rooms, tunnel areas, the Jackson Graham Building, operations rooms, Kiosks, and platform areas (other than areas within the passenger stations in this Contract).
- B. Equipment installed in the Communications Equipment Rooms and Kiosks in operational passenger stations and in the Jackson Graham Building, contain working circuits supporting transit operations. Certain work in those areas may require special coordination, in accordance with instructions furnished by the Engineer, to ensure that work can be performed on an essentially non-interfering basis.
- C. Within Communications Equipment Rooms and Kiosks in operational passenger stations and yards, Contractors' work shall be performed with a representative of the Authority present. Connections to working circuits shall be made only by the Authority or with the permission of the Authority. The Contractor shall coordinate with the Authority all other work in operational passenger stations and yards to be performed in Communications Equipment Rooms and Kiosks. The Contractor shall advise the Authority of the work to be accomplished, including wiring and cross-connections, and the scheduled beginning and completion of each task.

#### **1.17 LOCAL FIRE AUTHORITY**

- A. The Contractor shall interface with the local fire authority having jurisdiction over the various areas within the limits of the Contract work area to obtain advisory opinions concerning compliance with proprietary "Fire Protection Equipment and Life Safety Agreements" and applicable provisions of the local fire codes, and to coordinate related details when so directed by the Engineer.

**PART 2 PRODUCTS (SECTION NOT USED)**

**PART 3 EXECUTION (SECTION NOT USED)**

**END OF SECTION**

## **SECTION 16900**

### **BASIC ATC DEFINITIONS, CHARACTERISTICS and BACKGROUND INFORMATION**

#### **PART 1 - GENERAL**

##### **1.01 SECTION INCLUDES**

- A. This SECTION lists all of the various 16900-series SECTIONS and sub-Sections comprising the Wayside Automatic Train Control System Specifications.
  
- B. BASIC ATC DEFINITIONS, CHARACTERISTICS and BACKGROUND INFORMATION
  - 1. Definition of ATC Terms (Section 16901)
  - 2. ATC Abbreviations (Section 16902)
  - 3. Initial Metrorail System (Section 16903)
  - 4. Current Automatic Train Control System (Section 16904)
  - 5. Transit Vehicle Characteristics (Section 16905)
  - 6. Determination of Payment for ATC Work (Section 16906)

**END OF SECTION**

## SECTION 16901

### DEFINITIONS OF ATC TERMS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section contains a Glossary of ATC Terms used in these Automatic Train Control Specifications which defines their meaning as used in these ATC Specifications, and provides references for the definition of standard terms used in these ATC Specifications.
- B. Standard Definitions
  - 1. Definitions pertaining to the train control design and equipment description shall conform to the standard definitions promulgated by the following organizations unless otherwise specified in the GLOSSARY of ATC Terms contained in Part 1.04 of this Section:
    - a. Part 1.1.1 of the American Railway Engineering and Maintenance of Way Association (AREMA) (formerly AAR) Signal Manual (of Recommended Practice).
    - b. Electronic Industries Association (EIA)
    - c. The Institute of Electrical and Electronics Engineers, Inc. (IEEE).
- C. Order of Priority
  - 1. Where definitions conflict, the order of priority shall be:
  - 2. Section 16901.1.04, Glossary of ATC Terms;
  - 3. AREMA Signal Manual;
  - 4. EIA;
  - 5. IEEE.

##### 1.02 RELATED SECTIONS

- A. All Sections in the 16900 Series.

##### 1.03 REFERENCES

- A. Part 1.1.1 of the American Railway Engineering and Maintenance of Way Association (AREMA) Signal Manual of Recommended Practice
- B. Electronic Industries Association (EIA)
- C. The Institute of Electrical and Electronics Engineers, Inc. (IEEE)

##### 1.04 GLOSSARY OF ATC TERMS

- A. Words, terms, and phrases, as used in these Wayside ATC System Specifications, are defined as follows:
  - 1. **Abnormal Condition** (as referred to in ATS description)
    - a. An event of unusual nature (i.e., associated with a low probability) exceeding the capabilities of Strategy Selection and Rescheduling.
  - 2. **Active Component**
    - a. An electronic component, such as a transistor, which requires power supply energy in addition to the input signal to function and produces current or voltage gain.
  - 3. Active Element
    - a. An electronic component which converts or controls energy (e.g., a single

- integrated circuit, transistor, diode, relay, or operational amplifier).
4. Active Element Group
    - a. A network of piece-part components functioning with an active element.
  5. Address
    - a. The bits of a message used to identify the destination or origin of the message.
  6. Aerial Structure
    - a. Track support structure that carries the track above the local surrounding ground level.
  7. Alarm Condition
    - a. Any off-normal condition which requires the attention of an operator, supervisor or maintainer.
  8. Ambiguity Level
    - a. In the context of Test Program Sets, the number of components to which a fault can be diagnosed. These components may be individual electronic components on a Printed Wiring Board Assembly; Active Element Groups, on a Printed Wiring Board Assembly, or individual Printed Wiring Board Assemblies in a chassis. Ambiguity Level is usually expressed in a table that indicates the percentage of the time that it is required to resolve faults to various limiting numbers of components.
  9. Aspect, Signal
    - a. See "Signal Aspect".
  10. At-Grade
    - a. That portion of the Metrorail system which is constructed at the approximate elevation of the adjacent ground surface.
  11. "... at the appropriate time ..."
    - a. The appropriate time as determined by the designated Resident Engineer (Engineer).
  12. Audible Alarm
    - a. The sounding of a bell, buzzer, or other acoustic device to draw the attention of a Train Operator, ATC Maintainer, or Central Control Supervisor to an alarm condition.
  13. (The) Authority,
    - a. Washington Metropolitan Area Transit Authority (WMATA).
  14. Automatic Local Control
    - a. A mode of system operation in which functions such as route initiation and dispatching are performed automatically by local wayside equipment.
  15. Automatic Speed Regulator
    - a. That portion of the carborne ATO System which measures actual train speed and controls positive and negative tractive effort to maintain the desired speed.
  16. Automatic Train Control (ATC)
    - a. The system for automatically controlling train movement, enforcing train safety, and directing train operations. ATC includes subsystems for Automatic Train Operation, Automatic Train Protection, and Automatic Train Supervision.
  17. Automatic Train Operation (ATO)
    - a. The subsystem within Automatic Train Control which performs the on-train functions of speed regulation, program stopping, and performance adjustment. This subsystem, in conjunction with the Train-to-Wayside Communications (TWC) System, may also control train door operation and train starting.
  18. Automatic Train Protection (ATP)

- a. The subsystem within Automatic Train Control which maintains safe train operation. ATP subsystems include train detection, train separation, interlocking, and speed-limit enforcement.
- 19. Automatic Train Supervision (ATS)
  - a. The subsystem within Automatic Train Control which monitors and provides controls necessary to direct the operation of a system of trains in order to maintain intended traffic patterns and minimize the effects of train delays on the operating schedule.
- 20. Auxiliary Switch Operation
  - a. The operation of a switch-and-lock movement by means of an independent manual control without clearing a signal or calling for a signal to clear.
- 21. Availability
  - a. The portion of total elapsed time that a system is operating or ready for operation.
- 22. B Point
  - a. An intermediate, direct-track-rail connection point, located between two successive impedance bonds on a single track, at which train detection frequency signals are received by one or two terminating receivers.
- 23. Back-to-Back Signals
  - a. See "Signals, Back-to-Back."
- 24. Ballast Resistance
  - a. The total interrail resistance caused by electrical leakage paths of a given section of electrically isolated unoccupied track.
- 25. Ballasted Track
  - a. Track structure in which the running rails and the propulsion rail insulators are affixed to individual crossties which are in turn supported by loose ballast.
  - b. (See also, "Direct Fixation Track").
- 26. Berth
  - a. The portion of track occupied by a train when stopped for loading and discharging passengers at a station platform.
- 27. Berthing
  - a. The precise positioning and stopping of a train at a passenger station platform.
- 28. Bipolar Mode
  - a. The connection of two channels in a manner that requires, for a single operation, a positive polarity on one and a negative polarity on the other. For instance, two input channels which are connected together in a way that requires an input of one polarity on one channel and an input of the opposite polarity on the other channel to produce a single permissive input.
- 29. Bit
  - a. A binary digit, 0 or 1 in number representation, with the radix 2.
- 30. Blending
  - a. The simultaneous action and proportional effort of both dynamic and mechanical braking to achieve the required total braking effort during the transition from all dynamic to all mechanical.
- 31. Block
  - a. A contiguous section of track of defined limits on which the movement of trains is governed by Automatic Train Control or wayside signals or both.
- 32. Block, Absolute
  - a. A block into which no train is permitted to enter while it is occupied by another train.
- 33. Block, Interlocking
  - a. A contiguous section of track within an interlocking plant, the entrance to which is governed by interlocked signals and the use of which is governed

- by interlocking rules for automatic or manual train operation. An interlocking block will contain one or more track switches and/or crossing frogs and one or more track circuits.
34. Block, Traffic
- a. A contiguous section of track between opposing wayside interlocking signals on which the prescribed direction of running can be reversed only when the block is unoccupied and no routes are established (or are timing out) for entry into that block.
35. Block, Turnback
- a. See "Turnback Block."
36. Block Design
- a. The process of dividing the METRO trackage into sections having defined limits for the purpose of train detection and ATP speed command transmission, and the determination of the speed commands to be transmitted in each of the blocks so determined. The locations of the block boundaries and the speeds to be transmitted are determined by:
- 1) The location of fixed facilities such as substation negative-propulsion return points, crossbonding locations, insulated rail joints and station platforms.
  - 2) Civil restrictions due to grades, curves, and special trackwork.
  - 3) Safety considerations based upon the acceleration and braking characteristics of the transit vehicles.
  - 4) Passenger comfort considerations for both the people on the transit vehicles and on station platforms.
37. Bond, Clamped
- a. A type of electrical bond attached to the base of one or more running rails by means of a mechanical clamp.
38. Bond, Compression-Bolted
- a. A type of electrical bond attached to the web of one or more running rails by means of a metal collar swaged onto a ribbed metal "pin" passing through the rail web and the bond connecting lug(s).
39. Bond, Cross
- a. An electrical connection between the negative-propulsion-return rails of adjacent tracks, used to equalize negative propulsion return currents in the running rails. In audio-frequency track circuit territory, these bonds must be connected between the center taps of impedance bonds on the adjacent tracks.
40. Bond, Exothermic
- a. A type of electrical bond attached to the running rails by exothermic means.
41. Bond, Impedance
- a. A copper, single-turn, center-tapped coil unit of low resistance, wound with coils for inductively coupling train detection, speed command and TWC frequencies, as required. These units are installed between the running rails of WMATA mainline tracks for one or more of the following purposes:
- 1) To provide a path for negative propulsion return currents around insulated joints and/or from running rails to crossbonding or substation-return cables.
  - 2) To delineate the boundaries of audio frequency track circuits.
  - 3) To inductively connect AF train detection signals between the running rails and ATP transmitter and/or receiver modules.
  - 4) To inductively connect AF speed commands and/or door control signals between the running rails and ATP transmitter and/or receiver modules.

- 5) To inductively connect TWC signals between the running rails and wayside TWC modules via the ATP modules.
42. Bond, Negative Return (or Propulsion Return)  
a. A type of electrical rail bond designed to carry heavy negative propulsion return current at impedance bonds, rail joints, frogs, and switch point rails.
43. Bond, Pin Type  
a. A type of electrical rail bond designed to be attached to the running rails by means of metal pins driven into holes in the web or head of the rails.
44. Bond, Railhead  
a. A type of rail bond consisting of a length of electrical conductor having a device on one or both ends to facilitate connection to the head portion of the rail(s) to be bonded.
45. Bond, Rail Web  
a. A type of rail bond consisting of a length of electrical conductor having a device on each end to facilitate connection to the web portion of the rails to be bonded together.  
b. A type of rail bond consisting of length of electrical conductor welded, bolted or otherwise connected to the web portion of a rail.
46. Bond, Signal  
a. A type of electrical rail bond designed to carry the relatively light current of a power frequency (60 Hz) track circuit.
47. Bond, Substation Return  
a. An electrical connection between the center tap of an impedance bond and a negative propulsion return bus from a substation.  
b. An impedance bond having its center tap used for the negative propulsion return connection to a substation.
48. Bonding  
a. The permanent joining of metallic parts to form an electrically conductive path which will assure electrical continuity and the capacity to conduct safely any current likely to be imposed.
49. Brake Rate  
a. The rate of deceleration caused by the braking system.
50. Bridging Receiver  
a. (OBSOLETE; See "Terminating Receiver")
51. Bus (Electrical)  
a. A conductor, or group of conductors, that serve as a common connection for two or more circuits.
52. Cab Signal  
a. See "Signal, Cab."
53. Cable Jacket  
a. A protective outer covering over the insulation, core, or sheath of a cable.
54. Cable Sheath  
a. A conductive protective covering applied to cables. Note: A cable sheath may consist of multiple layers of which one or more is conductive.
55. Central Computer Control  
a. A mode of system operation in which functions such as route initiation and dispatching are performed by the Central Control Computer through the local equipment.
56. Central Control (Central)  
a. The area in the Jackson Graham Building (JGB) where the main train control console, display units, and central automatic train supervision equipment and personnel are located.
57. Central Control Supervisor  
a. The ATC system control console operator on duty at Central Control.
58. Central Manual Control

- a. A mode of system operation in which ATC functions such as route initiation and dispatching are performed manually from Central Control through the local equipment.
59. Circuit, Track (See also "Track Circuit, Audio Frequency", "Track Circuit, Power Frequency", and "Track Circuit Vital.")
- a. An electrical or electronic circuit in which defined portions of one or both running rails of a track constitute a portion of the conductors, and in which the shunting of the running rails is used to detect the presence of trains or equipment on the track.
  - b. Single-Rail Track Circuit;
    - 1) A track circuit in which one running rail is an isolated signal rail and the other running rail is a common, non-isolated rail.
  - c. Double-Rail Track Circuit;
    - 1) A track circuit in which both running rails are isolated signal rails, or in which both running rails serve as both signal rails and negative-propulsion common-return rails.
  - d. Series-Type Track Circuit;
    - 1) A non-vital, single-rail track circuit which is energized only when shunted to the opposite running rail.
60. Circuit, Traffic
- a. A vital circuit used to determine the permissible direction of train operation over a segment of track between two interlockings and/or set(s) of back-to-back signals. (See "Block, Traffic.")
61. Circuit, Vital
- a. Any circuit whose function directly affects the safety of train operation.
62. Civil Speed Limit
- a. See "Speed Limit, Civil."
63. Clearance Point
- a. The location between the diverging tracks emanating from a turnout at which the Authority's required clearance is achieved between the diverging tracks. This point is usually defined by the distances (along each of the diverging tracks) from the point-of-switch.
64. Closing-In
- a. Operating a following train toward a preceding train which is either stopped or running slower than the following train.
65. Code Rate
- a. The rate of on/off modulation. See "Rate Coding."
66. Command (noun)
- a. As used with respect to ATP or TWC messages from TCRs to trains
    - 1) An electronic signal to start, stop, cancel, change or continue an operation governed by ATP or ATO, respectively.
  - b. As used with respect to DTS messages from Central Control to TCRs
    - 1) See "Request" and "Control."
67. Computer
- a. Any device capable of accepting information, applying prescribed processes to it and supplying the results of these processes in a usable form.
68. Conduit
- a. A tube-like structure for electrical wires or cables. Conduit may be either rigid or flexible, metallic or non-metallic, as specified.
69. Consist (noun)
- a. The number and specific identity of cars which make up a train.
70. Contact Rail Assembly
- a. An assembly of a special, insulated, non-running rail and its supports and

coverboards, which is installed alongside a track and which carries high voltage electrical energy for the propulsion of trains on that track. See also "Rail, Third."

71. (The) Contractor  
a. The successful Bidder who is awarded a Contract for providing all facilities and equipment described in these Specifications for the Automatic Train Control System.
72. Control (noun)- As used with respect to DTS messages from Central Control to wayside Train Control Rooms  
a. A "Control" is actually only a non-vital supervisory "request" for certain action. If the applicable function is non-vital, the "Control" will be acted upon, but if the applicable function is a vital Train Control function, the "Control" will be treated as a "request" to the vital ATC wayside logic circuits and equipment, and will be granted only if it is safe to do so. See:  
1) "Command"  
2) "Request."  
3) "Indication."
73. Control Limits  
a. The boundaries limiting the area of trackage controlled from a Train Control Room (and its satellite TCER, if applicable). (See TCR and TCER).
74. Controlled Signal  
a. See "Signal, Controlled."
75. Converging Route  
a. See "Route, Converging."
76. Coupling (verb)  
a. The act of connecting one married-pair of transit vehicles to another by pushing their aligned automatic couplers together.
77. Cross Bond  
a. See "Bond, Cross."
78. Crossover  
a. Two turnouts, with track between the frogs, arranged to form a continuous passage between two tracks.
79. Crossover, Diamond  
a. A double crossover which has the trailing point and facing point crossovers installed at approximately the same civil stationing on the two running tracks, and in which the two crossover tracks between the running track frogs cross each other in a "diamond" configuration.
80. Crossover, Double  
a. A pair of crossovers, one of the facing point type and another of the trailing point type, located in close proximity between the same two tracks. These two crossovers may be located either successively (Universal Crossover), or concurrently (Diamond Crossover).
81. Crossover, Facing Point  
a. A crossover installed in such a manner that trains traveling in the normal direction of traffic on the main tracks will move from the points to the frog of the first turnout encountered, i.e., in which the crossover represents a potential diverging route to such trains.
82. Crossover, Trailing Point  
a. A crossover installed in such a manner that trains traveling in the normal direction of traffic on the main tracks will move from the turnout frog to the switch points, i.e., in which the crossover represents a converging route to such trains.
83. Crossover, Universal

- a. A double crossover that has the trailing point and facing point crossovers installed successively between the same two running tracks.
- 84. Crosstalk
  - a. Undesirable interference created by inductive coupling between one system and another system or from one portion of a system to another portion of the same system.
- 85. Current Schedule
  - a. The schedule residing in the Control Computer which is the set point for system control by the Traffic Regulation Program.
- 86. Current Revised Schedule
  - a. A revised schedule replacing the existing current schedule in the Control Computer.
- 87. Daily Safety Test (DST)
  - a. The speed command cycle test performed on a complete train before permitting the train to operate in the automatic mode.
- 88. Data Bit
  - a. One of the bits used to convey information in a message. (As opposed to a "housekeeping" bit.)
- 89. Data Transmission System (DTS)
  - a. The bi-directional, non-vital, digital communications system between Central Control and the Train Control Rooms.
- 90. Days
  - a. Unless otherwise stated, days that are listed as multiples of the number "15" shall be considered calendar days. Days that are listed as less than the number "15" shall be considered as working days.
- 91. Deceleration Rate
  - a. The rate of deceleration due to braking effort, train resistance, grade and curve resistance, or some combination of the above factors, as specified.
- 92. Decoder
  - a. A device which responds to valid incoming data and converts the incoming data format to the data format required by the device for which the data is intended.
- 93. Derail
  - a. A track structure for derailing rolling stock in case of an emergency.
- 94. Designated Resident Engineer (Engineer)
  - a. person designated by the Authority to oversee the Automatic Train Control portion of the Contract.
- 95. Destination Code
  - a. A code consisting of two decimal digits assigned to a train to indicate the desired destination and type of service for the train. The code is used to control the destination signs on the train, and to select automatic routing for the train.
- 96. Diamond Crossover
  - a. See "Crossover, Diamond."
- 97. Direct Fixation
  - a. A type of track structure in which the running rails and the propulsion rail insulators are affixed to a concrete support slab or to special grout pads on the slab rather than to individual cross-ties set in ballast.
- 98. Dispatching
  - a. The process of starting a train into revenue service from a terminal yard, or intermediate location.
- 99. Dispatching Machine (*No longer being installed or used.*)
  - a. A locally installed device used to store and reproduce in real time the current operating schedules and, when required, to use this information to dispatch trains automatically.

- 100. Dispatch Receiver
  - a. A Train-to-Wayside Communications System receiver which is used to accept Train Ready and Train Length data from trains leaving a dispatch point other than a station platform.
- 101. Diverging Route
  - a. See "Route, Diverging."
- 102. Double Crossover
  - a. See "Crossover, Double."
- 103. Downstream
  - a. Relative to a specified reference point and for a given direction of travel, the area which will be reached after passing the specified reference point. Used in the same sense as the AAR/AREMA term "in advance of." (See also, "Upstream.")
- 104. Drop (or Drop-Out)
  - a. A relay is said to "drop" or "drop-out" when the energization of its coil(s) is reduced to the point where its front contacts open.
- 105. Duct
  - a. A single enclosed runway for wires or cable.
- 106. Duct Bank
  - a. An arrangement of conduit or ducts providing two or more continuous ducts between two points.
- 107. Dwell (or Dwell Time)
  - a. The period of time measured from the instant a train stops in its berth at a station until the instant it resumes motion.
- 108. Dynamic Train Tests
  - a. The field tests conducted by the Contractor utilizing trains under electrical power: WTPs 2.17, 2.18, 2.19, 2.20, and 2.21 as well as the Level F (Systems) Field Tests.
- 109. Elevated
  - a. That portion of the system which is constructed above the adjacent ground surface. See "Aerial Structure."
- 110. Encoder
  - a. A device that adds security to and converts the data format produced by input devices to the data format required by associated data transmission links.
- 111. (The) Engineer
  - a. Wherever on the Contract ATC Drawings or in the ATC Specifications the term "the Engineer" is used, it shall mean the designated (ATC) Resident Engineer or other duly authorized representative of the Contracting Officer.
- 112. Entrance-Exit Type Route Control
  - a. Automatic route control implemented by defining first an entrance point and then an exit point.
- 113. Fail-Safe
  - a. An inherent characteristic of a system or circuit which ensures that any malfunction affecting safety will cause the system or controlled function of the circuit to revert to a state that is known to be safe.
- 114. Failure
  - a. An inability to perform an intended function.
- 115. Field Side (of a Running Rail)
  - a. The side of the rail away from the centerline of the applicable track. (See also; "Gauge Side.")
- 116. Fleeting
  - a. A method of route control in which a route request is not canceled by the

- passage of a train, thus permitting safe automatic following moves over the same route.
117. Flyby Receiver  
 a. A Train-to-Wayside Communications System receiver which is used to accept and store destination codes from moving trains in approach to junctions and terminals.
118. Flyby Transmitter  
 a. A Train-to-Wayside Communications System transmitter which is used to transmit performance level information to moving trains at locations between passenger stations.
119. Frog  
 a. A trackwork component used at the intersection of two running rails to provide support for wheels and passageways for their flanges, thus permitting wheels on either rail to cross the other.
120. Gauge Side (of a Running Rail)  
 a. The side of the rail closest to the centerline of the applicable track. (See also; "Field Side.")
121. Guard Rail  
 a. A rail or other structure fastened between and parallel with the running rails of a track and used to prevent wheels from being derailed, or to hold wheels in correct alignment to prevent their flanges from striking either crossing frogs or the points of switches, or to prevent a derailed train from leaving the track right-of-way. See also, "Restraining Rail."
122. Headway  
 a. The time separation between two trains both traveling in the same direction on the same track. It is measured from the time the head-end of the leading train passes a given reference point to the time the head-end of the following train passes the same reference point.
123. Home Signal  
 a. See "Signal, Home."
124. Impedance Bond  
 a. See "Bond, Impedance."
125. Indication (as used with respect to messages from local equipment and trains)  
 a. A DTS message from the Train Control Room to Central or  
 b. a Train-to-Wayside Communications System message from the train to the Train Control Room which carries information concerning the status of some device or system.  
 c. See "Control."
126. Indication, Signal  
 a. See "Signal Indication."
127. Insulated Joint (IJ)  
 a. See "Joint, Insulated."
128. Interface  
 a. The interconnection and/or inter-relationship between two or more systems, subsystems, circuits, persons or contracts, required to ensure continuity and proper operation.
129. Interlocking  
 a. An arrangement of signals and signal appliances so interconnected that their operations must succeed each other in proper sequence, thereby permitting train movements over controlled routes only if safe conditions exist.
130. Interlocking Control Panel (I.C.P.)  
 a. A panel displaying a line diagram of the trackage in and near a particular interlocking or group of interlockings, and equipped with various pushbuttons, electrical switches, indicator lights and audible

- alarms to allow the control and monitoring of that section of trackage.
131. Interlocking Limits
- a. The boundaries of an area of trackage controlled by an interlocking, as defined by the insulated joints at the extreme opposing home signals of that interlocking. The term "within interlocking limits" denotes the area of trackage over which routes are established and protected by the signals and signal appliances comprising that interlocking.
132. Jerk (or Jerk Rate)
- a. Rate of change of acceleration or deceleration equal to the second derivative of velocity. The normal unit is miles per hour per second per second (mphpsps).
133. Jet Fan Control (JFC)
- a. Having to do with special controls and indications for ventilation fans mounted axially in the METRORAIL Transit tunnels.
134. Joint, Insulated (IJ)
- a. A rail joint designed to prevent the flow of electric current from rail to rail by means of insulations placed so as to separate the rail ends and other metal parts connecting them.
135. Joint, Rail
- a. A fastening design to unite the abutting ends of contiguous rails.
136. Joint Electron Device Engineering Council (JEDEC)
- a. Cooperative effort of Electronic Industries Association (EIA) and National Electrical Manufacturers Association (NEMA).
137. Junction
- a. A location where train routes converge or diverge.
138. Junction Box
- a. An enclosure for equipment and/or wire terminations.
139. LED
- a. Light Emitting Diode
140. Left-Hand Running
- a. See "Running, Reverse".
141. Line
- a. As used with a color prefix, e.g., "Blue Line," "Red Line," one of the operational routings over which revenue service is regularly scheduled by the Authority. A "Line" may include all or parts of one or more geographical "Routes." See also "Route."
142. Load Weighing
- a. A function incorporated in the rail transit vehicles which measures gross car weight. Its purpose is to permit control of tractive effort in order to achieve a constant effort-to-weight ratio.
143. Locking
144. The electrical or mechanical establishment of a condition for a switch, interlocked route, speed limit, or automatic function which cannot be altered except by a prescribed and inviolate sequence of unlocking.
145. Locking, Approach
- a. Electric locking effective while a train is approaching, within a specified distance, a signal displaying an "INTERLOCKING CLEAR" aspect, and which prevents, until after the expiration of a predetermined time interval after such signal has been caused to display a "STOP" aspect, the movement of any interlocked switch or derail in the route governed by the signal, and which prevents an "INTERLOCKING CLEAR" aspect from being displayed for any conflicting route.
146. Locking, Detector
- a. Electric locking, effective while a train occupies a given section of a route, which prevents operation of switch-and-lock movements within

- that section.
147. Locking, Route
    - a. Electric locking, effective when a train passes a signal displaying an "INTERLOCKING CLEAR" aspect, which prevents the clearing of an interlocked signal for any conflicting route. It also prevents the movement of any switch or derail downstream of the train within the route entered. When required, it may be arranged so that as a train clears a track section of the route, the locking affecting that section is released. See "Sectional Release"
  148. Locking, Time
    - a. Electrical locking which, after an interlocked signal is cleared, prevents the operation of any switch or derail in the route governed by that signal until the expiration of a predetermined time interval after that signal has displayed a STOP aspect. It also prevents other interlocked signals from being cleared for any conflicting route during the same time interval.
  149. Locking, Traffic
    - a. Electrical locking which prevents the effective manipulation of devices for changing the direction of traffic on a section of track while that section of track is occupied or while a request which would permit entry into that section is being processed.
  150. Logic Code
    - a. A tabular or graphic representation of control lines representing the speed commands that shall be transmitted in each block (for a given direction of traffic and route alignment) and the track occupancy conditions under which each of the speed commands shall be transmitted.
  151. Maintenance, Preventative
    - a. Maintenance procedure carried out on a routine basis in order to reduce in-service equipment failure.
  152. Manual Local Control
    - a. A mode of system operation in which functions such as route initiation and dispatching are performed manually by personnel using local wayside equipment such as a local Interlocking Control Panel.
  153. Marker (as used in the Program Stop System)
    - a. A wayside device used to transfer data to trains at a precise location.
  154. Married Pair
    - a. Two transit cars, semi-permanently connected together (by a drawbar), which share certain common equipment.
  155. Maximum Authorized Speed (MAS) (or Maximum Allowable Speed)
    - a. The highest ATP speed command that can safely be transmitted to a train in a block for the purpose of enforcing civil speed limits. MAS is independent of block occupancy downstream from the given block. In blocks which lie in the approach to crossovers or diverging junctions, MAS can depend on which route is aligned.
  156. Mean Time Between Failures (MTBF)
    - a. The arithmetic mean of the time between successive failures.
  157. Mean Time to Restore (MTTR)
    - a. The arithmetic mean of time required to restore service after a failure has occurred. This time is measured from the time troubleshooting or repair work begins until restoration is complete. Time the equipment is out of service prior to the beginning of the repair work is not included in the "MTTR."
  158. Modem
    - a. A modulator and demodulator housed in a common assembly.

- 159. Mole
  - a. A device containing four or more sockets for multiple connection of 1000-kcmil negative return cables.
- 160. Necessary
  - a. Regarded by the designated Resident Engineer as needed.
- 161. Negative Return
  - a. Related to the return of 750 VDC train propulsion current to the substations.
- 162. Negative Return Bond
  - a. See "Bond, Negative Return."
- 163. Negative Return Rail
  - a. See "Rail, Negative Return."
- 164. Negative Testing
  - a. Testing conducted to ensure that applicable systems and/or equipment are not performing in any manner which could have an unsafe or undesirable effect upon METRORAIL operations, METRO riders, or the public in general. See "Positive Testing."
- 165. Noise
  - a. Interference brought about by undesirable voltages or currents.
- 166. Nonsynchronized (as used in a data transmission system)
  - a. A type of code format that does not use timing as the basis for bit separation.
- 167. Non-Vital
  - a. Not affecting the safety of train operations.
- 168. Normal Direction (of Traffic)
  - a. For a given track, the direction in which all regularly scheduled revenue service operations are conducted. For a terminal station and its associated terminal crossover, when the crossover is on the "revenue service" end of the terminal station, the normal direction of traffic on a given platform track shall be the same as the normal direction of traffic on the same track on the opposite end of the terminal crossover. For pocket tracks, the normal direction of traffic shall be in the outbound direction.
- 169. Normal Position (of a track switch or derail)
  - a. The position arbitrarily defined by the track plans and control circuits as being the "normal" alignment. The "Normal Position" for a derail is the derailing position. See "Reverse Position."
- 170. Normal Route
  - a. See "Route, Normal."
- 171. Normal Running
  - a. See "Running, Normal."
- 172. Off-Normal Operation
  - a. Operation at other than the normal schedule.
- 173. Operator
  - a. See "Train Operator."
- 174. Overcurrent Protection
  - a. A form of protection that operates when electrical current exceeds a predetermined value.
- 175. Overspeed Control
  - a. The portion of the carborne ATP equipment which enforces speed limits.
- 176. Parallel Format
  - a. A data format in which a group of data bits are input or output simultaneously. (See also, "Serial Format")
- 177. Performance Level (PL)
  - a. A designation for one of four relative levels of operating speeds

- between successive stations or Fly-by Transmitter control points, where:
- 1) PL1 = MAXIMUM Level; to achieve minimum attainable run time between stations (or control points);
  - 2) PL2 = NORMAL Level; to achieve normal scheduled run time between stations (approximately 10% slower than PL1);
  - 3) PL3 = REDUCED Level; to proceed approximately 10% slower than normal, i.e., 10% slower than PL2;
  - 4) PL4 = RETARDED Level; to proceed approximately 20% slower than normal, i.e., 20% slower than PL2.
- b. The desired Performance Level is implemented by the transmission of a locally predetermined maximum ATS speed limit to the train at each station and fly-by transmitter. PL1 (the MAXIMUM Level) is implemented by transmitting a Maximum Authorized Speed (MAS) ATS speed limit command to the trains, which permits the fastest achievable operating time between the applicable stations. A locally predetermined set of lower ATS speed limits for each consecutive station pair is used to implement the PL2, PL3, and PL4 levels of performance, all under control of the OCC. A second set of Performance Levels (PL5, PL6, PL7, & PL8) incorporates the same relative speed limits, but is implemented with a lower acceleration rate.
178. Pick (or Pick-Up)
- a. A relay is said to "pick" or "pick-up" when energization of its coil(s) causes its front contacts to close.
179. Point-of-Switch
- a. The location on a track switch layout where the tips of the tapered switch-point rails touch the stock rails. See "Switch Point."
180. Portable
- a. Having all of the following characteristics:
    - 1) Weighing no more than 50 pounds;
    - 2) having a volume of no more than two cubic feet;
    - 3) having one or more handles,
    - 4) easily carried by one person of average strength and dexterity.
181. Positive Testing
- a. Testing to ensure that applicable equipment circuits, systems and subsystems are performing the tasks which they are required to perform, in the manner specified. See "Negative Testing."
182. Preconditioning
- a. The storage of a control or panel manipulation which will cause the clearing of a route, or movement of a track switch at some later time as the result of a timer operation or train movement.
183. Program Stop
- a. See "Stop, Program."
184. Propulsion Rail
- a. See "Rail, Third."
185. Propulsion Return Rail
- a. See "Rail, Negative Return."
186. Provide
- a. As used in the "Technical Provisions" section of these Specifications, the word "provide" means "complete the final design, furnish, install, test, place in service, and document, in the manner specified, and to the greatest extent possible compatible with the intent and limits of the Specifications," unless otherwise indicated.
187. Rack
- a. A free standing, shock mounted, metal support frame or enclosure for the mounting of terminal boards, power supplies, equipment modules,

- relays or other train control devices.
188. Rack, Entrance  
a. A rack equipped primarily with terminal boards for the termination of cables coming from outside the room or housing in which the rack is located.
189. Rack, Equipment  
a. A rack equipped primarily with relays, equipment modules and/or other ATC devices, other than power supplies.
190. Rack, Power  
a. A rack equipped primarily with ATC Power Supply units.
191. Rail (Track)  
a. A rolled steel shape, commonly a T-section, designed to be laid and fastened end-to-end in two parallel lines on cross ties or other suitable supports to form a track for railway rolling stock. See "Rail, Running."
192. Rail, Closure  
a. Either of the two rails of a turnout which connect the frog to the heels of the two switch point rails.
193. Rail, Contact  
a. See "Rail, Third."
194. Rail, Guard  
a. See "Guard Rail."
195. Rail, Negative Return  
a. A running rail used also for the return of electrical propulsion energy to a substation. Also known as a Propulsion Return Rail.
196. Rail, Propulsion  
a. See "Rail, Third."
197. Rail, Propulsion Return  
a. See "Rail, Negative Return."
198. Rail, Restraining  
a. See "Restraining Rail."
199. Rail, Running  
a. One of the two rails of a track which carry and guide the wheels of the rolling stock.
200. Rail, Signal  
a. A running rail which carries low voltage electrical signals used for the detection, and possibly the control, of rolling stock carried thereon.
201. Rail, Stock  
a. Either of the two continuous outside running rails of a turnout, against which the switch point rails bear.
202. Rail, Third  
a. A non-running rail, fastened parallel to, and outside of the running rails of a track, but isolated electrically from the running rails, and used to carry high-voltage electrical energy to be used for the propulsion of certain rolling stock on the track. Also known as the Propulsion Rail or Contact Rail.
203. Rails, Adjacent, Non-Sequential  
a. Running rails of separate tracks located in close proximity to each other, as at the end of a crossing frog.
204. Rate Coding  
a. A method of applying intelligence to a carrier by means of On/Off modulation at fixed sub-audio frequencies.
205. Reaction Time  
a. For automatic control:  
1) Time from the occurrence of a step change of control command or request to the first attainment of the new steady-state value of

- the controlled variable, within a designated accuracy.
  - b. For human control:
    - 1) The interval between the beginning of a stimulus and the beginning of the response of an observer.
- 206. Redundancy
  - a. The existence in a system of more than one means of accomplishing a given function, for purpose of increasing security or reliability.
- 207. Relay (noun)
  - a. An electrically-controlled, electromagnetically-operated switching device for controlling electrical circuits.
- 208. Reliability
  - a. The probability of performing a specified function, without failure and within design parameters, for the period of time intended under actual operating conditions.
- 209. Remote Terminal Unit (RTU)
  - a. A modem installed at each ATC field control location (usually at passenger station TCRs) to act as the interface unit between the Data Transmission System (DTS) and the local ATC and support system functions.
- 210. Request (noun)
  - a. As used with respect to DTS messages from Central Control to wayside Train Control Rooms
    - 1) An electronic signal indicating a desire to start, stop, cancel, change or continue some ATC or support system function. See
    - 2) "Command"
    - 3) "Control."
- 211. Rescheduling
  - a. The development of a new schedule based on a corrective strategy.
- 212. Restraining Rail
  - a. A special type of guard rail fastened in close proximity to the gauge side of the inside running rail on sharp curves. The purpose of the restraining rail is to bear upon the back of the transit vehicle wheels on the inner running rail in order to prevent undue pressure and head wear on the inside (gauge side) of the outer running rail of the curve. See "Guard Rail."
- 213. Revenue Service
  - a. The transportation of passengers who have paid a fare.
- 214. Revenue System
  - a. The portion of the METRO System on which revenue service is conducted.
- 215. Reverse Direction (of Traffic)
  - a. The direction opposite to the normal direction of traffic on a given track.
- 216. Reverse Position (of a track switch or derail)
  - a. The position opposite to the position arbitrarily defined by the track plans and control circuits as being the "normal" alignment. The "Reverse Position" for a derail is the non-derailing position. See also, "Normal Position."
- 217. Reverse Running
  - a. See "Running, Reverse."
- 218. Reverse Terminal
  - a. A temporary terminal located at the inbound end of a "Line" segment. See "Terminal."
- 219. Revised Schedule
  - a. A new schedule generated and/or selected as described under Strategy Selection and Rescheduling.

- 220. Right-Hand Running
  - a. See "Running, Normal"
- 221. Right-of-Way
  - a. The land or structure surface occupied by the METRORAIL transit system, especially for its main line. Also, the land or structure surface used by another transportation facility such as a railroad or highway.
  - b. The right of traffic on a given route to take precedence.
- 222. Right-of-Way, Track
  - a. An area encompassing the track ties and rails and extending two feet beyond each end of each crosstie.
- 223. Right-of-Way Hazard
  - a. An abnormal condition on or near the tracks which could impair safe train movement.
- 224. Route
  - a. A block or specified succession of contiguous blocks in a given direction over which trains operate between two controlled signals.
  - b. A continuous track path in a given direction from one controlled signal to another.
  - c. A designation, e.g., "E" Route or "Greenbelt" Route, for a specific, contiguous geographical segment of the METRORAIL System. See also, "Line."
- 225. Route, Conflicting
  - a. One of two or more routes (converging, crossing, or opposing), within an interlocking, or between two consecutive interlockings, which cannot be safely traversed at the same time, i.e., one of two or more routes that are mutually exclusive. See also, "Route, Parallel".
- 226. Route, Converging
  - a. One route of two or more routes (through an interlocking) having different originating (entrance) points, but coming together in the same direction to share the same destination (exit) point.
  - b. A route over one or more trailing-point switches, having an exit point in common with one or more other routes originating at other entrance points. See also, "Route, Diverging."
- 227. Route, Diverging
  - a. One of two or more routes (through an interlocking) from a common entrance point, passing over one or more facing-point switches, and having an exit point different than another route from that same entrance point. See also, "Route, Converging."
  - b. A route differing from the arbitrarily defined NORMAL or "through" route, i.e., a route in which at least one facing-point switch is lined in its "REVERSE" position. This is usually a route departing from the tangent alignment of the switch (or switches). See also, "Route, Through" and "Route, Converging."
- 228. Route, Following
  - a. A route for movement of a successive train in the same direction into a given track block as allowed by the immediately preceding route into that track block.
- 229. Route, Interlocked
  - a. A route within interlocking limits, i.e., a route (over special trackwork) which is protected by a fail-safe system of controls and controlled signals interlocked in such a manner that all conflicting or potentially conflicting routes must first be prevented. (See also, "Routes, Conflicting").
- 230. Route, Normal

- a. With regard to traffic direction, a route established in the normal direction of train travel, i.e., a route which results in normal running.
  - b. A route (through an interlocking) in which all switches are lined in their defined "NORMAL" position.
231. Route, Opposing
- a. A route which has as its destination or exit point a signal which serves as the entrance point for another route (over the same track) in the opposite direction.
232. Route, Parallel
- a. One of two or more routes within an interlocking which can be safely traversed at the same time, i.e., one of two or more routes that are not mutually exclusive. See also, "Conflicting Route".
233. Route, Reverse
- a. With regard to traffic direction, a route in which trains run opposite to the normal direction of train travel, i.e., a route which results in reverse running.
234. Route, Through
- a. The most commonly used or "main" route through a track switch, usually the tangent (straight) alignment. Also usually the route through the NORMAL setting of the switch. See also, "Route, Diverging."
235. Route Designation
- a. The input to a train supervision device reflecting a desired routing by means of a two-digit destination code.
236. Route Locking
- a. See "Locking, Route."
237. Route Request
- a. A non-vital electrical or electronic message ("command") from Central or a local Interlocking Control Panel to a wayside interlocking operational control point, requesting the establishment of a desired interlocking route.
238. Route Segment
- a. A defined portion of route consisting of contiguous ATC blocks.
239. Routes, Conflicting
- a. Two or more routes, opposing, converging, or intersecting, over which movements cannot be made simultaneously without possibility of collision. See also, "Routes, Parallel."
240. Routes, Parallel
- a. Two or more routes (through an interlocking) over which movements can be made simultaneously without possibility of collision. See also, "Routes, Conflicting."
241. Running, Normal
- a. Train movement forward on the right hand track, which is in the normal direction of traffic. Right-hand running.
242. Running, Reverse
- a. Train movement forward on the left hand track, which is opposed to the normal direction of traffic. Left-hand running.
243. Running Rail
- a. See "Rail, Running."
244. Safety Speed Limit
- a. See "Speed Limit, Safety."
245. Scan Sheets
- a. Sheets listing the successive "control" and "status" (indication) data points required for a given Remote Terminal Unit.
246. Schedule

- a. A set of data providing the time/location information for all trains to be operated in a feasible manner on a system or in a specified area of a system, over a fixed period of time such as a 24-hour day or portion thereof.
- 247. Schedule Control
  - a. Traffic regulation, corrective strategy selection and rescheduling performed by the ATS system.
- 248. Schedule Error
  - a. The difference between actual time and current schedule time for a given event (e.g., the arrival of a train at a station).
- 249. Schedule Tolerance
  - a. Maximum permissible schedule error; for each schedule, direction, location and time, a different schedule tolerance may exist.
- 250. Sectional Release:
  - a. Route Locking
    - 1) The release of route locking in sections behind a train as the train proceeds past the clearance point(s) of one or more diverging switches through an interlocking. This is for the purpose of expediting the establishment of subsequent routes through the interlocking.
  - b. Switch Control
    - 1) The release of switch locking in sections behind a train as it first occupies, then vacates, detector tracks for one or more diverging switches as it proceeds through an interlocked route.
- 251. Security Bit
  - a. A bit inserted in a message to permit a validity check of that message after it is decoded.
- 252. Serial Format
  - a. A data format in which the data bits are input or output one at a time in sequence. (See also, "Parallel Format".)
- 253. Service Brake
  - a. The primary train brake system which is used to control train deceleration under normal operating conditions.
- 254. Sign (noun)
  - a. A wayside appliance which conveys information concerning train operation or location.
- 255. Sign, Advance Warning (AWS)
  - a. A sign which, when illuminated, warns a train operator of some possible hazardous condition ahead.
- 256. Sign, Station Stop (SS)
  - a. A sign which denotes the start of the ATO approach limits to a passenger station.
- 257. Sign, Turnback (TB)
  - a. A sign which denotes the limit of an Automatic Turnback block, and the location of an imaginary Turnback Signal.
- 258. Signal (noun)
  - a. A wayside appliance which uses colored light aspects to convey information governing train movement. See "Signal Aspect."
- 259. Signal, Cab
  - a. A signal located in the operating cab of the transit car or locomotive.
- 260. Signal, Clear
  - a. A wayside signal displaying an aspect for an indication which permits movement of the train past the signal.
  - b. A cab signal displaying an aspect (speed limit) which permits forward motion of the train.

261. Signal, Controlled
- a. A wayside signal capable of displaying either a stop aspect or an aspect indicating that train movement is permissible, the aspect displayed being determined by fail-safe control circuitry.
262. Signal, Home
- a. A controlled signal located at the entrance to one or more interlocked routes to govern trains entering and using that route or those routes.
263. Signal, Marker
- a. A wayside signal capable of displaying only a stop aspect and used to mark end-of-track locations.
264. Signal, Turnback
- a. A simulated, controlled wayside signal located at a turnback point and used, when approached in its "non-cleared" state, to initiate automatic turnback operation through an interlocking. The location of the turnback point, i.e., the location of the simulated wayside signal, is indicated in the field by a Turnback Sign.
265. Signal, Wayside
- a. A signal located beside the track.
266. Signal Aspect
- a. The appearance of the illuminated lens(es) of a wayside signal conveying an indication, as viewed from the direction of an approaching train.
  - b. The appearance of a cab signal conveying an indication (speed limit) as viewed by an observer.
267. Signal Aspect Name
- a. The specific, unique term used to identify a particular wayside signal aspect; often used as an abbreviation for the indication conveyed by that signal aspect, e.g., "Diverging Clear."
268. Signal Indication
- a. The specific "operating instruction" information conveyed by the aspect of a signal.
269. Signal Rail
- a. See "Rail, Signal."
270. Signals, Back-to-Back
- a. A pair of controlled wayside signals mounted to face in opposite directions along the track, at a track circuit boundary and used to control train movements in both directions across that track circuit boundary.
  - b. Two controlled wayside signals physically mounted back-to-back, i.e., facing in opposite directions between two adjacent tracks, with one signal governing train movements in one direction on one track and the other governing train movements in the opposite direction on the adjacent track.
271. Skip-Stop
- a. The operating procedure or command which causes a train to pass a scheduled station-stop platform intentionally, without stopping.
272. Slide, Wheel
- a. An extreme wheel slip condition wherein the wheel has zero rotational speed and slip speed equals train speed.
273. Slip, Wheel
- a. The condition in which there is a difference between train speed and the surface speed of wheel tread at the rail, usually transient and sporadic.
274. Speed, Balancing
- a. The steady-state speed attained by the carborne traction system when resisting forces are exactly equal to applied forces.

275. Speed Limit, ATC  
a. The upper limit of safe train speed as enforced by the ATP subsystem.
276. Speed Limit, ATO  
a. The upper limit of train speed as enforced by the ATO Subsystem.
277. Speed Limit, Civil  
a. For a given section of track, the maximum speed allowed as determined by the physical characteristics of the track structure and limited to ensure the comfort of passengers on trains and on station platforms.
278. Speed Limit, Safety  
a. The maximum speed at which a train can safely negotiate a given section of track. The safety speed limit is set to minimize potential passenger injury.
279. Speed Sensor  
a. A device which produces an output signal whose frequency is proportional to axle angular velocity.
280. Speed Zone  
a. A section of track which has the same civil speed limit throughout its length. For a given direction of traffic, a more restrictive speed zone is one which has a lower civil speed limit than the preceding adjacent speed zone; a more permissive speed zone is one which has a higher civil speed limit than the preceding adjacent speed zone.
281. Static Testing  
a. All level A, B, C, D and E testing which can be completed without using an electrically energized train.
282. Stock Rail  
a. See "Rail, Stock."
283. Stop, Absolute  
a. A train stop which permits no exceptions such as reduced speed running, movement within restricting limits, or similar alternatives.
284. Stop, Emergency  
a. The stopping of a train by an emergency brake application. Once initiated, the brake application cannot be released until the train has stopped.
285. Stop, Program  
a. The stopping of a train at a station platform under closed-loop braking in accordance with a speed-distance profile which will cause the train to stop at a predetermined point.
286. Strategy Selection and Rescheduling  
a. A set of actions initiated by Central Control designed to compensate for major disturbances to METRO operation. These actions include altering the current schedule, skipping stations, changing routes, and changing the number of trains in revenue service.
287. Subsystem  
a. A subsystem comprises elements within a system which are interconnected to perform a specific function.
288. Subway  
a. That portion of the WMATA-METRORAIL system which is constructed beneath the ground surface.
289. Superelevation  
a. The increased elevation of the outer rail (above the inner rail) of a track on a curve to counteract overturning force. The actual superelevation (Ea) is measured in inches.
290. Superelevation, Unbalanced (Eu)  
a. For a given gauge, radius of curvature, and speed and configuration of rolling stock; the difference between the superelevation required to

- exactly balance the overturning force and the actual superelevation ( $E_a$ ) installed.
291. Switch (Electric)  
a. A device by means of which an electric circuit may be opened or closed.
292. Switch (Track)  
a. A pair of switch points with their fastenings and operating rods providing the means for establishing a route from one track to another. See also, "Turnout."
293. Switch-and-Lock Movement  
a. A device which performs the three functions of unlocking, operating (moving), and locking a derail mechanism or the points of a track switch.
294. Switch Correspondence  
a. Agreement between the called-for alignment of a switch and the actual alignment of that switch.
295. Switch Machine  
a. A general term for a mechanism used to control the movement of a derail mechanism or the points of a track switch.
296. Switch Point  
a. A moveable, tapered running rail, the point of which is designed to fit against one of the stock rails of a switch, and the heel of which is connected to one of the closure rails of the turnout.
297. Switch Position, Normal  
a. See "Normal Position."
298. Switch Position, Reverse  
a. See "Reverse Position."
299. Switch Test Key  
a. A device (twist button or toggle switch) which controls the operation of a turnout (or crossover) without calling for a route over that turnout. If a route over that turnout has already been called and locked, the Switch Test Key shall not be able to control the turnout until the route is unlocked and the Test Key has been restored to correspondence with the track switch position.
300. System  
a. When used alone as a proper noun shall refer to the WMATA Rail Rapid Transit System. When "system" is used alone as a common noun, it shall refer to the specific assemblage of equipment and circuitry under discussion.
301. Tail Track  
a. The portion of a mainline or storage track from a bumping post or other end-of-track location to the first interlocking special trackwork location encountered by that track.
302. Technician, Train Control  
a. An employee whose function is to maintain and repair Automatic Train Control equipment and to perform certain emergency manual operations as required.
303. Terminal  
a. A METRORAIL station and its associated turnback interlocking which is designated as the terminus of a route in the Regional METRORAIL System. Usually located at the outbound end of a "Line." See also "Reverse Terminal".  
b. A device to which electrical conductors may be connected conveniently.
304. Terminal, Temporary  
a. A station and its associated turnback interlocking which is not located at the planned permanent terminus of a route in the Regional METRORAIL System, but which is used as a terminal temporarily until the route can

- be completed.
305. Terminate
- a. To fasten or attach to one or more electrical terminals in a prescribed manner. As used in these Specifications, the term does not necessarily imply stub ending, i.e., a circuit which is "terminated" in a certain location does not necessarily end at that location; more than one wire may terminate on a given terminal.
306. Terminating Receiver
- a. A device for receiving and decoding train detection frequency signal(s) directly from the running rails and driving appropriate track relays. This "receiver" shall be tuned in such a manner that the applicable train detection frequency signal(s) will not be permitted to propagate beyond the point in the track at which the receiver is connected to the track.
307. Time, Door Open
- a. The elapsed time from the instant the train doors are fully open until they are requested to close.
308. Time, Down
- a. The elapsed time during which equipment is not capable of doing useful work because of misadjustment, malfunction, or maintenance in progress.
309. Time, Dwell
- a. The elapsed time from the instant a train stops at a Station Platform until the train begins to move away from that Station Platform.
310. Time, Reaction
- a. See "Reaction Time."
311. Time, Warm-up
- a. The elapsed time from application of power to an operable device until it is capable of performing its intended function.
312. Time Constant
- a. Time interval from the beginning of change of a controlled variable, in response to a step forcing function, to the attainment of a stated value.
313. Time Division Multiplexing (TDM)
- a. The process of transmitting two or more signals over a common path by using different time intervals for different signals.
314. Timetable
- a. A tabulation of the times that trains are expected to arrive at, or depart from certain locations based upon a feasible operating schedule, with time measured by the master clock. The time location information for passenger stations is the same as is found in the schedule to which the timetable is related.
315. Track
- a. An assembly of two running rails and the associated material used to fasten them in parallel a fixed distance apart, for the purpose of supporting the movement of trains of transit cars, locomotives and various work equipment.
316. Track, Main (or Mainline)
- a. A track which is normally under the control of the Automatic Train Control System.
317. Track Circuit, Audio Frequency (AF Track Circuit)
- a. A track circuit designed to be energized by alternating current in the Audio Frequency range.
318. Track Circuit, Power Frequency (60 Hz)
- a. A track circuit designed to be energized by 60 Hz alternating current.
319. Track Circuit, Vital

- a. A normally energized arrangement of electrical and/or electronic equipment and conductors which include defined lengths of the track running rails, and which permits detection of trains and broken rails within the defined limits of the running rails. See also "Circuit, Track."
- 320. Track Transformer
  - a. A transformer designed to couple signal energy to or from the rails of a track circuit.
- 321. Traction Power System (TPS), or Traction Supply System
  - a. The electrical system which supplies and distributes propulsion power.
- 322. Traction System
  - a. The system of wheels, motors, driving mechanism, brakes, direct controls and appurtenances which propel or brake a married pair of transit cars in response to input commands or requests from the train control system.
- 323. Tractive Effort, Negative
  - a. Retarding force developed by the train braking system.
- 324. Tractive Effort, Positive
  - a. Propelling force developed by the train propulsion system.
- 325. Traffic
  - a. Having to do with the direction of train operations over a segment of track between consecutive interlockings and/or sets of signals. See "Traffic, Normal" and "Traffic, Reverse."
- 326. Traffic Circuit
  - a. See "Circuit, Traffic."
- 327. Traffic, Normal
  - a. See "Normal Direction (of Traffic)."
- 328. Traffic, Reverse
  - a. See "Reverse Direction (of Traffic)."
- 329. Traffic Regulation
  - a. The use of changes in dwell time, performance level, and acceleration rate to return a train to its schedule.
- 330. Regulation Program
  - a. An ATS program to correct or stabilize schedule error within the schedule tolerance.
- 331. Train
  - a. A locomotive with or without cars, a single transit car, or a single married pair or multiple married pairs (of transit cars) coupled together to form a single unit, which shall be suitably identified.
- 332. Train, Non-Revenue
  - a. Any train in test, maintenance, emergency or inspection service, which may not be used by the public.
- 333. Train, Revenue
  - a. Any train in transit service on main tracks, which may be used by the public. See "Revenue Service."
- 334. Train Control
  - a. A general term indicating equipment, circuitry, material or documentation related to the controlled operation and routing of the transit vehicles.
- 335. Train Control Equipment Room (TCER)
  - a. A room housing wayside Train control equipment, but no Remote Terminal Unit. A "satellite" Train Control Room located and used primarily to house train control power equipment and AF track modules due to operational distance restrictions imposed by track circuit signal attenuation and voltage drop considerations. See Train Control Room (TCR).

- 336. Train Control Room (TCR)
  - a. A room located in a passenger station or at some other strategic point to house wayside ATC equipment including a Remote Terminal Unit. A major wayside control point for the ATC System.
- 337. Train Detection Equipment
  - a. The track circuits and associated equipment used to detect the presence of trains.
- 338. Train Identity (ID)
  - a. The code assigned to each train which contains the train destination, train number, and train length.
- 339. Train Operator
  - a. An Authority employee aboard the controlling cab of a train in service whose principal duties are to oversee safety and to execute non-automatic operation
- 340. Train Shunt Impedance
  - a. The interrail impedance affected by a train.
- 341. Train-to-Wayside Communications (TWC) System
  - a. A non-vital, bi-directional, digital data communications system for communication, at fixed points, between the trains and wayside.
- 342. Turnback Block
  - a. A contiguous section of track, defined at one end by an interlocking home signal and at the other end by a turnback sign, within which the direction of running of a train leaving the interlocking can be reversed while the track is occupied by that train when the associated turnback signal has not been cleared.
- 343. Turnback Point
  - a. That point along a mainline track, at least maximum train length downstream from the exit point from the Turnback interlocking limits, which will not be passed by a train which is to reverse direction at that interlocking. Required turnback points are indicated by appropriate symbols on the Contract Drawings. Turnback points are always located at a track circuit boundary and shall be identified by a wayside Turnback (TB) sign.
- 344. Turnback Signal
  - a. See "Signal, Turnback."
- 345. Turnout
  - a. An arrangement of a switch and a frog with closure rails by means of which rolling stock may be diverted from one track to another.
- 346. Unsafe Condition
  - a. Any condition which endangers human life or property.
- 347. Universal Crossover
  - a. See "Crossover, Universal."
- 348. Upstream
  - a. Relative to a specified reference point and for a given direction of travel, the area which will have been passed prior to reaching the specified reference point. Used in the same sense as the AAR/AREMA term "in approach of." See also, "Downstream.
- 349. Vital
  - a. Affecting the safety of train operations.
- 350. Wayside (adjective)
  - a. Having to do with, or located along, the trackwork right-of-way.

## SECTION 16902

### ATC ABBREVIATIONS

#### PART 1- GENERAL

##### 1.01 SECTION INCLUDES

- A. Part 1.03 (ATC ABBREVIATION LIST) of this Section lists abbreviations for various organizations and ATC terms and prescribes the meanings for the abbreviations as used in the ATC Specifications. For further definition of the terms abbreviated, see Section 16901, Definition of ATC Terms.
- B. Subsequent sub-sections list Vital and Non-Vital Relay Nomenclature used in the current WMATA ATC System, as follows:
  - 1. Vital ATC Relay Nomenclature
  - 2. Non-Vital ATC Relay Nomenclature
  - 3. Non-Vital Heavy-Duty Interfacing Relay Nomenclature
  - 4. Non-Vital General Purpose Interfacing Relay Nomenclature
- C. The Contractor shall not deviate from this nomenclature without the prior written approval of the designated Resident Engineer (Engineer).

##### 1.02 RELATED SECTIONS

- A. All Sections in the 16900 series.

##### 1.03 ATC ABBREVIATION LIST

<u>Abbreviation</u>	<u>Meaning</u>
A	Amber or Approach or Arrival or Ampere, (suffix) First Alternate
AAI	AAI Transportation Systems Division of AAI Corporation 300 Clubhouse Road P.O. Box 857 Hunt Valley, MD 21030-0857
AAR	Association of American Railroads 50 F Street, N.W. Washington, DC 20001
AC	Alternating Current
ACI	Automatic Car Identification
AEG	Active Element Group
AF	Audio Frequency
AFF	Above Finished Floor
AHD	Ahead

<u>Abbreviation</u>	<u>Meaning</u>
AIIM	Association for Information and Image Management 1100 Wayne Ave., Silver Spring, MD 2091
Amp	Ampere
ANSI	American National Standards Institute, Inc. 1430 Broadway New York, NY 10018
APTA	American Public Transit Association 1201 New York Ave., N.W. Washington, DC 20005
A.R.E.A.	American Railway Engineering Association (Obsolete; See "AREMA")
AREMA	American Railway Engineering and Maintenance-of-Way Association 8201 Corporate Dr., Ste. 1125 Landover, MD 20785-2230
ASQC	American Society for Quality Control 230 W. Wells Street Milwaukee, WI 53203
ASTM	American Society for Testing and Materials 1916 Race St. Philadelphia, PA 19103
ATC	Automatic Train Control
ATO	Automatic Train Operation
ATP	Automatic Train Protection
ATS	Automatic Train Supervision
ATU	Auxiliary Terminal Unit
AWG	American Wire Gauge
AWS	Advance Warning Sign, or; American Welding Society 550 N.W. LeJeune Road, P.O Box 351040 Miami, FL 33135
B	Back or (suffix) Second Alternate
BCD	Binary Coded Decimal

<u>Abbreviation</u>	<u>Meaning</u>
BK	Back
BP	Bumping Post or Bypass or Back Repeater
BR	Terminating Receiver
C	Centigrade (Celcius), or Check, or Central, or Case, or Correspondence, or Curve, or Control
CAU	Computerized Analyzer Unit
CB-CL	Crossbond Conduit Line
C.C.	Curve to Curve
CCW	Counter Clockwise
CD-ROM	Compact Disk - Read-Only Memory
CHK	Check
CHP	Chilled Water Plant
CIA	Communications Interface Assembly
CIOC	Communications Input/Output Channel
Ckt	Circuit
cm	Centimeter
CMOS	Complementary Metal Oxide Semiconductor
COMM	Communications or Communications Equipment Room
CRT	Cathode Ray Tube
C.S.	Curve to Spiral
C.S.A.	Canadian Standards Association
CSS	Covered Surface Structure
CSXT	CSX Transportation (Railroad)
CTS	Carrier Transmission System
CW	Clockwise

<u>Abbreviation</u>	<u>Meaning</u>
CWR	Continuous Welded Rail
DC	Direct Current
DEJ	WMATA IDW/Railroad Derailment/Dragging Equipment Interface Junction Box
DJ	Distribution Junction Box
DIO	Direct Input/Output
DL	Double Line
DOS	Disk Operating System
DPS	Drainage Pumping Station or Design Profile Speed
DR	Dispatch Receiver
DTS	Data Transmission System
E	Light, or East, or End, or Superelevation, or Equivalent, or Emergency
E <sub>a</sub> (E sub a)	Actual Superelevation (in inches)
E <sub>u</sub> (E sub u)	Unbalanced Superelevation (in inches)
E-CTFE	Ethylene-Chlorotrifluoroethylene
EE	Emergency Exit
EIA	Electronic Industries Association 1722 Eye Street, N.W. Washington, DC 20006
EMI	Electromagnetic Interference
EMS	Engineer's Monitoring System
ENTS	WMATA Office of Engineering and Technical Support
E.O.C.	End of Contract
E.O.L.	End of Loop
EOP	End of Platform

<u>Abbreviation</u>	<u>Meaning</u>
E.O.T.	End of Track
EPROM	Erasable Programmable Read-Only Memory
ES	East Stick
ETFE	Ethylene-Tetrafluoroethylene
ETLT	Equal To or Less Than
ETS	Emergency Trip Station
F	Fahrenheit, or Traffic, or Flashing, or Field, or Failure, or Fan
F&I	Fire and Intrusion
FIFO	First-in First-out
FA	Fire Alarm
Fig	Figure
FL	Flasher or Flashing or Fleeting
FOIS	Fiber Optic Interface System (A type of WCS)
FR	Flyby Receiver
FRA	Federal Railroad Administration (Part of U.S. Government – Dept. of Transportation) 400 7th Street, S.W. Room 8206 Washington, DC 20590
F.R.E.	Fiberglass Reinforced Epoxy
FS	Fan Shaft
FSK	Frequency Shift Keyed
ft	Foot, Feet
FT	Flyby Transmitter
FTA	Federal Transit Administration (Part of U.S. Government - Dept. of Transportation; formerly, Urban Mass Transportation Administration) 400 7th Street, S.W. Room 9400 Washington, DC 20590

<u>Abbreviation</u>	<u>Meaning</u>
FTP	Factory Test Procedure
FUT	Future
FUTU	Future (on RTU Scan Sheets)
G	Signal or Guard
G.R.S.	Galvanized Rigid Steel
GRS	ALSTOM Signaling Inc. (Formerly; General Railway Signal Company) P.O. Box 20600 Rochester, NY 14602-0600
GTET	Greater Than or Equal To
I	Interface or Interlocking or Insulated
I.B.	Inbound
ICEA	Insulated Cable Engineers Association 155 East 44th Street New York, NY 10017
I.C.P.	Interlocking Control Panel
ID	Train Identity
IDW	Intrusion Detection Warning
IEEE	Institute of Electrical and Electronics Engineers, Inc. 345 East 47th Street New York, NY 10017
IF	Interface
IFC	Interface Case
IFJ	Interface Junction Box
IJ	Insulated Joint, or Interlocking Junction Box
in	Inch, or Inches
IVP	Interlocking Vital Processor
J	Junction Box, or Jet
JB	Junction Box

<u>Abbreviation</u>	<u>Meaning</u>
JF	Jet Fan
JFC	Jet Fan Control (room, case, or housing)
K	Indication, or Thousand
kcmil	Thousand Circular Mils
L	Loop, or length, or light, or left
LCC	Local Console Controller
LCD	Liquid Crystal Display
LED	Light Emitting Diode
L.H.	Left Hand
LJ	Loop Junction Box
LNJ	Line Junction Box
LMC	Local Manual Control
LSTS	LS Transit Systems, Inc. (Obsolete; now SYSTRA) 2 Whipple Place, Suite 302 Lebanon, NH 03766-1356
LTET	Less Than or Equal To
LW	Lunar White
M	Marker Coil or Maintainer or Manual
mA	Milliampere
MAL	Malfunction
MAS	Maximum Authorized Speed, or Maximum Allowable Speed
max	Maximum
MDF	Main Distribution Frame
MDS	Maintainer's Diagnostic System
METRO	Washington Metropolitan Area Transit Authority See "WMATA"

<u>Abbreviation</u>	<u>Meaning</u>
mg	Milligram
min	Minimum or minute
MIS	Management Information System
MJ	Marker Junction Box
mm	Millimeter
MOV	Metal Oxide Varistor
MTBF	Mean Time Between Failure
MTTR	Mean Time to Restore
N	Normal or North or Negative or Next
NBD	Normal Braking Distance
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association 2101 L St., N.W., Suite 300 Washington, DC 20037
N.I.C.	Not Included in (this) Contract
N.I.S.T.	National Institute of Standards and Technology (Part of U.S. Government Department of Commerce; formerly, National Bureau of Standards) Gaithersburg, MD 20899
NMA	National Micrographics Association (VOID) See "AIIM"
N/mm <sup>2</sup>	Megapascal (Newtons per millimeter squared)
NS	North Stick
NTP	Notice to Proceed
N.T.S.	Not to Scale
NV	Non-Vital
NVIP	Non-Vital Interlocking Processor
O	Overload, or Operating, or Overlap, or On
O.B.	Outbound

<u>Abbreviation</u>	<u>Meaning</u>
OCC	(WMATA) Operations Control Center (Central) (Located in the Jackson Graham Building)
OFS	Order For Services
ORD	Operational Readiness Date
P	Repeater, or Processor, or Panel, or Platform, Or Position
PAU	Portable Analyzer Unit (See CAU)
PB	Pushbutton
PC	Printed Circuit
P.I.T.O.	Point of Intersection (of centerlines) of a Turnout
PL	Panel Lighting or Performance Level
P.O.C.	Point on Curve
P.O.T.	Point on Tangent
PROM	Programmable Read-Only Memory
PS	Point of Switch
PSS	Program Station Stop
PVC	Polyvinyl chloride
P.V.C.	Point of Vertical Curve (Begin Vertical Curve)
P.V.I.	Point of Vertical Intersection (of profile tangents)
P.V.T.	Point of Vertical Tangent (End Vertical Curve)
Q	Request, or Quality Factor
R	Radius, or Red, or Reverse, or Receive, or Right, or Route, or Retract, or Retracted, or Restriction, or Rail, or Restraining, or Resistance, or Remote, or, as a suffix, Vital Relay
RAFTS	Rail Audio Frequency Test Set
RAP	Rail Administrative Procedure (WMATA)
RCVR	Receiver

<u>Abbreviation</u>	<u>Meaning</u>
R.E.	Resident Engineer (WMATA)
R.H.	Right Hand, or Relative Humidity
rms	Root Mean Square
ROD	Revenue Operations Date
RTU	Remote Terminal Unit
R.W.	Retaining Wall
S	Stick, or South, or Station Stop, or Start, or Storage, or System, or Spiral, or Sign
SAS	Supervisory Alarm System
S&I	Service and Inspection (Yard)
SBD	Safe Braking Distance
S.C.	Spiral to Curve
SCI	Substantial Completion Inspection
S.C.&I.	Special Control & Indication (cable)
SEJ	Sewage Ejector
Sig	Signal
SM	Snowmelter
SMF	Snowmelter Failure
SOP	Standard Operating Procedure (WMATA)
SP	Sump Pump
SS	Substation or Station Stop or South Stick
SSR	Substation Return
SSR-CL	Substation Return Conduit Line
S.T.	Spiral to Tangent
STA	Station or Stationing
STAP	Station Processor

<u>Abbreviation</u>	<u>Meaning</u>
SYPM	(Obsolete) Formerly: WMATA Systems Program Management (Part of Department of Design and Construction) Replaced by: SYSP (Part of Department of Transit System Development)
SZJ	(IDW) Sub-Zone Junction Box
T	Track, or Time, or Transmit, or Tunnel, or Tangent
TAILS	Train Arrival Indication Light System
TAWL	Train Approach Warning Light
TB	Turnback, or Tie Breaker
TBS	Tie Breaker Station
TC	Train Control
TCER	Train Control Equipment Room
TCR	Train Control Room
TD	True Distance
TE	Time Element
TJ	Track Junction Box
TK	Track
TM	Track Module
TPS	Traction Power Substation
TRK	Track
TRN	Train
T.S.	Tangent to Spiral
TWC	Train-to-Wayside Communications
TYP	Typical
UE	Unauthorized Entrance
UG	Underground
UL	Underwriters Laboratories

<u>Abbreviation</u>	<u>Meaning</u>
US&S	Union Switch & Signal, Inc. 1000 Technology Drive P.O. Box 420 Pittsburgh, PA 15219-3120
V	Volt(s), or Vital, or Velocity
V <sub>c</sub> (V sub c)	Civil Speed Limit
V <sub>s</sub> (V sub s)	Safety Speed Limit
VAC, Vac	Volts Alternating Current
VC	Vertical Curve (Length)
VDC, Vdc	Volts Direct Current
VP	Vital Processor
VS	Vent Shaft
VXI	VMEbus eXtensions for Instrumentation
W	Switch or West or Warning or White or Wall
WCS	Wayside Coding System (See FOIS)
WMATA	Washington Metropolitan Area Transit Authority 600 Fifth Street, N.W. Washington, DC 20001
WS	West Stick
WTP	Wayside Test Procedure
W.W.	Wing Wall
X	Transmit, or Crossing
X-O	Crossover
XFMR	Transformer
XLPE	Cross-Linked Polyethylene
XMTR	Transmitter
Y	Combination or Collector

<u>Abbreviation</u>	<u>Meaning</u>
Z	Control, or call
ZB	Impedance Bond

#### 1.04 VITAL RELAY NOMENCLATURE

- A. The nomenclature for "vital" relays in the ATC wayside equipment shall always end with the letter "R".

<u>Vital Relay Nomenclature</u>	<u>Meaning</u>
AR	APPROACH RELAY
ASR	APPROACH STICK RELAY
ASAR	APPROACH STICK 1ST MULTIPLE RELAY
ANWR	SWITCH A, NORMAL SWITCH CONTROL RELAY
ARWR	SWITCH A, REVERSE SWITCH CONTROL RELAY
ASTER	APPROACH STICK TIMER RELAY
AVPCHKR	"A" VITAL PROCESSOR CHECK RELAY
AVPOLKR	"A" VITAL PROCESSOR ON-LINE INDICATION RELAY
BNWR	SWITCH B, NORMAL SWITCH CONTROL RELAY
BPR	BYPASS RELAY (IDW OR VBS)
BRWR	SWITCH B, REVERSE SWITCH CONTROL RELAY
BVPCHKR	"B" VITAL PROCESSOR CHECK RELAY
BVPOLKR	"B" VITAL PROCESSOR ON-LINE INDICATION RELAY
CTR	CODE RATE TRANSMITTER RELAY
DETOR	DERAIL TIME OUT RELAY
EASTER	EAST APPROACH STICK TIMER RELAY
ESR	EAST STICK RELAY
EASR	EAST APPROACH STICK RELAY
FOLPR	TRAFFIC EXTENDED OVERLAP STICK STORAGE RELAY
GDR	GROUND DETECTOR RELAY
GFLR	SIGNAL FLASHING RELAY
GOR	GO RELAY
HGR	SIGNAL CLEAR RELAY
HGPR	SIGNAL CLEAR REPEATER RELAY
HGPPR	SIGNAL CLEAR 2ND REPEATER RELAY
HGPAR	SIGNAL CLEAR REPEATER 1ST MULTIPLE RELAY
HGYPR	SIGNAL CLEAR COMBINATION REPEATER RELAY
HGTYP	SIGNAL CLEAR TRACK COMBINATION REPEATER RELAY

<u>Vital Relay Nomenclature</u>	<u>Meaning</u>
IDWR	INTRUSION DETECTION WARNING RELAY
IDWPR	INTRUSION DETECTION WARNING REPEATER RELAY
IDWPAR	INTRUSION DETECTION WARNING REPEATER 1ST MULTIPLE RELAY
LR	LOCK RELAY
LSR	LOCK STICK RELAY
LTYPR	LINE TRACK COMBINATION REPEATER RELAY
LTYPPR	LINE TRACK COMBINATION 2ND REPEATER RELAY
NADR	NORMAL BLOCK CONDITION DECODE RELAY (PRIMARY - DISTANT)
NBDR	NORMAL BLOCK CONDITION DECODE RELAY (SECONDARY - DISTANT)
NAHR	NORMAL BLOCK CONDITION DECODE RELAY (PRIMARY - HOME)
NBHR	NORMAL BLOCK CONDITION DECODE RELAY (SECONDARY - HOME)
NCDYPSR	NORMAL CODE DETECT COMBINATION REPEATER STICK RELAY
NFNR	NORMAL TRAFFIC ENTRANCE RELAY
NFR	NORMAL TRAFFIC RELAY
NFPR	NORMAL TRAFFIC REPEATER RELAY
NFPAR	NORMAL TRAFFIC REPEATER 1ST MULTIPLE RELAY
NFSR	NORMAL TRAFFIC STICK RELAY
NFSPR	NORMAL TRAFFIC STICK REPEATER RELAY
NFSPAR	NORMAL TRAFFIC STICK REPEATER 1ST MULTIPLE RELAY
NFSPBR	NORMAL TRAFFIC STICK REPEATER 2ND MULTIPLE RELAY
NFXR	NORMAL TRAFFIC EXIT RELAY
NFXTEPSR	NORMAL TRAFFIC TIMER REPEATER STICK RELAY
NFXTER	NORMAL TRAFFIC TIMER RELAY
NLCSR	NORMAL LOOP CONTROL STICK RELAY
NSCZR	NORMAL STICK CHECK CONTROL RELAY
NSR	NORMAL STICK RELAY
NSPR	NORMAL STICK REPEATER RELAY
NSAR	NORMAL STICK 1ST MULTIPLE RELAY
NSBR	NORMAL STICK 2ND MULTIPLE RELAY
NSAPR	NORMAL STICK 1ST MULTIPLE REPEATER RELAY
NTVBR	NORMAL TUNNEL VENTILATION BARRIER RELAY (VBS)
NWCAR	NORMAL SWITCH CORRESPONDENCE 1ST MULTIPLE RELAY
NWCBR	NORMAL SWITCH CORRESPONDENCE 2ND MULTIPLE RELAY
NWCCR	NORMAL SWITCH CORRESPONDENCE 3RD MULTIPLE RELAY
NWCAPR	NORMAL SWITCH CORRESPONDENCE 1ST MULTIPLE REPEATER RELAY

<u>Vital Relay Nomenclature</u>	<u>Meaning</u>
NWCR	NORMAL SWITCH CORRESPONDENCE RELAY
NWPR	NORMAL SWITCH POSITION REPEATER RELAY
NWZR	NORMAL SWITCH CALL (CONTROL) RELAY
NWZPR	NORMAL SWITCH CALL (CONTROL) REPEATER RELAY
ODR	OPEN DOOR RELAY
ODYR	OPEN DOOR COMBINATION RELAY
OLR	OVERLAP RELAY
OR	(SWITCH) OVERLOAD RELAY
ORR	OVERRUN RELAY
PBSR	PUSHBUTTON STICK RELAY
PBSAR	PUSHBUTTON STICK 1ST MULTIPLE RELAY
PBSBR	PUSHBUTTON STICK 2ND MULTIPLE RELAY
PBSYPR	PUSHBUTTON STICK COMBINATION REPEATER RELAY
QR	FREQUENCY SELECT RELAY
RADR	REVERSE BLOCK CONDITION DECODE RELAY (PRIMARY - DISTANT)
RBDR	REVERSE BLOCK CONDITION DECODE RELAY (SECONDARY - DISTANT)
RAHR	REVERSE BLOCK CONDITION DECODE RELAY (PRIMARY - HOME)
RBHR	REVERSE BLOCK CONDITION DECODE RELAY (SECONDARY - HOME)
RCDR	REVERSE CODE DETECT RELAY
RCDYPSR	REVERSE CODE DETECT COMBINATION REPEATER STICK RELAY
RCR	ROUTE CHECK RELAY
RCPR	ROUTE CHECK REPEATER RELAY
RFNR	REVERSE TRAFFIC ENTRANCE RELAY
RFR	REVERSE TRAFFIC RELAY
RFPR	REVERSE TRAFFIC REPEATER RELAY
RFPAR	REVERSE TRAFFIC REPEATER 1ST MULTIPLE RELAY
RFSR	REVERSE TRAFFIC STICK RELAY
RFSPR	REVERSE TRAFFIC STICK REPEATER RELAY
RFSPAR	REVERSE TRAFFIC STICK REPEATER 1ST MULTIPLE RELAY
RFSPBR	REVERSE TRAFFIC STICK REPEATER 2ND MULTIPLE RELAY
RFXR	REVERSE TRAFFIC EXIT RELAY
RFXTEPSR	REVERSE TRAFFIC TIMER REPEATER STICK RELAY
RFXTER	REVERSE TRAFFIC TIMER RELAY
RLCSR	REVERSE LOOP CONTROL STICK RELAY
RSCZR	REVERSE STICK CHECK CONTROL RELAY
RSR	REVERSE STICK RELAY

TYPSKB	TRACK COMBINATION REPEATER STICK INDICATION 2ND MULTIPLE RELAY
TYPSKC	TRACK COMBINATION REPEATER STICK INDICATION 3RD MULTIPLE RELAY
TYPSKS	TRACK COMBINATION REPEATER STICK INDICATION STICK RELAY

<u>N-V Relay Nomenclature</u>	<u>Meaning</u>
UIP	UNIDENTIFIED TRAIN REPEATER RELAY
UIPP	UNIDENTIFIED TRAIN 2ND REPEATER RELAY
UIPS	UNIDENTIFIED TRAIN REPEATER STICK RELAY
UIPSP	UNIDENTIFIED TRAIN REPEATER STICK REPEATER RELAY
WSK	WEST STICK INDICATION RELAY
WSKP	WEST STICK INDICATION REPEATER RELAY
X	FACING SWITCH INDICATION RELAY
XK	EXIT KEYING RELAY

#### 1.06 NON-VITAL HEAVY-DUTY INTERFACING RELAYS

- A. The following list is for non-vital relays having heavy-duty contacts.

<u>Nomenclature</u>	<u>Meaning</u>
NTRNP	NEXT TRAIN REPEATER RELAY
RK	ROUTE INDICATION RELAY
RESET IDW	RESET INTRUSION DETECTION WARNING SYSTEM RELAY
SMZ	SNOWMELTER CALL RELAY
SMZP	SNOWMELTER CALL REPEATER RELAY
SMZPA	SNOWMELTER CALL REPEATER 1ST MULTIPLE RELAY

#### 1.07 NON-VITAL GENERAL PURPOSE INTERFACING RELAYS

- A. The following list is for non-vital reed or crystal can relays mounted on printed circuit cards.

<u>Nomenclature</u>	<u>Meaning</u>
ACS	STAGE A ROUTE CODE STORAGE RELAY
ACSA	COMMON STAGE A ROUTE CODE STORAGE RELAY
BCS	STAGE B ROUTE CODE STORAGE RELAY
BCSA	COMMON STAGE B ROUTE CODE STORAGE RELAY
BF	BLOWN FUSE RELAY
CACS	STAGE A ROUTE CODE STORAGE RELAY
CBCS	STAGE B ROUTE CODE STORAGE RELAY
CIR,PWR,FLR	CIRCUIT POWER FAILURE INDICATION RELAY
DACS	STAGE D ROUTE CODE STORAGE RELAY

Nomenclature

Meaning

NF RECT	NORMAL TRAFFIC RECTIFIER POWER INDICATION RELAY
PSBF	POWER SUPPLY BLOWN FUSE INDICATION RELAY
ROUTE A	ROUTE A RELAY
ROUTE B	ROUTE B RELAY
ROUTE C	ROUTE C RELAY
RF RECT	REVERSE TRAFFIC RECTIFIER POWER INDICATION RELAY
TSR-1N	TEMPORARY SPEED RESTRICTION - 1 NORMAL
TSR-1R	TEMPORARY SPEED RESTRICTION - 1 REVERSE
TSR-2N	TEMPORARY SPEED RESTRICTION - 2 NORMAL
TSR-2R	TEMPORARY SPEED RESTRICTION - 2 REVERSE

**END OF SECTION**

**SECTION 16903  
ATC - INITIAL METRORAIL SYSTEM**

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

- A. Basic description of Initial Metrorail System.

**1.02 DESCRIPTION**

- A. The Approved Regional System, constructed in phases, is a 103 mile network serving Washington, D.C. and the nearby areas of Maryland and Virginia. It includes 38 miles of service in the District of Columbia, 35 miles in Maryland and 30 miles in Virginia.
- B. Eighty-three stations (including 4 Bi-Level Stations), of which 49 are in subways and 34 are at grade or on elevated structures. Forty-three of the stations are within the District of Columbia; 24 stations are in Maryland, and 20 stations are in Virginia.
- C. Forty-seven miles of the system have been constructed below the surface, most of it in the highly developed central area. Forty-nine miles are on the surface at grade, and eight miles are on elevated structures, primarily to achieve grade separation.
- D. Extensive use has been made, wherever feasible, of existing rights-of-way along established rail lines and in the medians of existing or proposed highways. The Metrorail System has exclusive rights-of-way for its operation without interruption by any outside vehicular or pedestrian traffic.
- E. The Regional Metrorail System has three main through routes traversing the District of Columbia. Transfer points linking the three main routes are provided at four double-level stations for passenger convenience. Emanating from these main routes are strategically oriented branch routes providing broad coverage throughout the central and suburban areas. The Metrorail System operates five color-designated "lines" over these various routes.
- F. Supporting the Regional Metrorail System are seven storage and maintenance yards situated to obtain the optimum flow of vehicles within the system.

**PART 2 - PRODUCTS**

NOT USED

**PART 3 - EXECUTION**

NOT USED

**END OF SECTION**

## SECTION 16904

### CURRENT AUTOMATIC TRAIN CONTROL SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section includes descriptions of the current WMATA METRO Rail Automatic Train Control (ATC) System and its various major sub-systems. All ATC design, systems and equipment provided by the Contractor under this Contract shall be fully compatible in all respects with the current WMATA METRO Rail Automatic Train Control System.

##### 1.02 AUTOMATIC TRAIN CONTROL SYSTEM

- A. The Automatic Train Control (ATC) System for the first 37 miles of the Regional METRO Rail System, the interlocking control for the major repair facility, the first 150 pairs of cars, and the operation control center were all procured under Contract 1Z2011. This Section briefly describes the ATC system provided by General Railway Signal Company in response to WMATA Contract 1Z2011, and subsequent revisions and additions to the ATC System.

##### 1.03 AUTOMATIC TRAIN PROTECTION

- A. The Automatic Train Protection (ATP) System is that part of the ATC System which provides protection against collisions and overspeed conditions. The ATP System also provides control of interlockings, route security through interlockings, and control of train door operation. Principal functions of the ATP System are Train Detection, Speed Command Selection, Speed Command Transmission, Interlocking Control and Security, Train Door Control, and all related carborne equipment to receive, decode, and safely act upon the ATP commands.
- B. Train Detection
  - 1. Track Circuits
    - a. Train detection is provided by jointless audio frequency track circuits except in certain areas of special trackwork. Mainline track circuits are conventional with tuning unit and impedance bond mounted between the rails at the block boundary. Audio frequency track circuits in special trackwork areas use a shunt bar and loop to inject the signal into the rails and an untuned impedance bond to couple the signal from the rails to the receiver in a center-receive configuration. Balancing impedance type, 60-Hz track circuits are used in the diamond of double crossovers and in the crossover track of single crossovers.
  - 2. Frequencies
    - a. The audio frequency track circuits use eight frequencies (two sets of four) for train detection purposes. The frequencies used are:
      - 1) Set 1 (for Tk 1 & Tk 3)
        - a) F1 - 2100 Hz
        - b) F3 - 2580 Hz
        - c) F5 - 3100 Hz
        - d) F7 - 3660 Hz

- 2) Set 2 (for Tk 2)
  - a) F2 - 2320 Hz
  - b) F4 - 2820 Hz
  - c) F6 - 3370 Hz
  - d) F8 - 3900 Hz

- b. Only one set of the above frequencies is used on a given track and the same set is not normally used on adjacent tracks.

- 3. Adjustment

- a. Audio frequency track circuits that have both the transmitter and receiver in the same room are adjusted for a shunting sensitivity of 0.1 ohm. Track circuits that have the transmitter and receiver in separate rooms are adjusted for a shunting sensitivity of 0.2 ohms.

- C. Speed Command Selection

- 1. Speed command selection is via vital relay contacts. The selection contacts represent the following:

- a. Traffic lockin
    - b. Occupancy of track circuit for which the speed command transmitter is effective
    - c. Occupancy of track circuits downstream of the speed command transmitter
    - d. Occupancy of track circuits upstream of the speed command transmitter if these circuits are within a more restrictive civil speed zone and the more restrictive civil speed limit is less than 2200 feet upstream of the speed command transmitter
    - e. Position of switches downstream of the speed command transmitter
    - f. Status of signal clearing networks downstream of the speed command transmitter
    - g. Position of switches upstream of the speed command transmitter, when the relative location of such switches can create a more restrictive civil speed limit as d. above
    - h. Condition of temporary speed restriction control
    - i. Additional conditions as required to provide safe train separation, speed, and door control and to provide schedule control at station platforms and dispatching locations.

- 2. Where track circuit occupancy and signal clearing network status must be transferred from one train control room to another for speed command selection purposes, such information transfer is accomplished via polar direct current line circuits.

- 3. Typical speed command selection networks and typical room-to-room line circuits are shown in the Contract Drawings.

- D. Speed Command Transmission

- 1. Speed command transmission is via one of two audio frequency carriers, 4550 Hz and 5525 Hz, ON/OFF AM modulated at one of five discrete frequency code rates. One additional code rate is used for the transmission of door opening commands. The command code chart is as follows:

Modulation Code Rate	Audio Frequency Carrier		
	F9 (4550 Hz)	F10 (5525 Hz)	$\overline{F9} + \overline{F10}$
1 3.0 Hz	Open Doors Left (when stopped)	Open Doors Right (when stopped)	Stop
2 4.5 Hz	15 MPH	45 MPH	Stop
3 6.83 Hz	22 MPH	50 MPH	Stop
4 10.1 Hz	28 MPH	55 MPH	Stop
5 15.3 Hz	35 MPH	65 MPH	Stop
6 21.5 Hz	40 MPH	75 MPH	Stop
None of the Above	Stop	Stop	Stop

2. The speed selection network selects a code rate generator output to drive the modulator, and energizes a carrier generator, in accordance with the above code chart, to cause the appropriate command to be transmitted.
3. In all areas, except special trackwork areas, speed command transmission is via the same transmitter as the train detection frequency. The transmitting equipment is shared between the train detection frequency and the selected speed command frequency on a time division multiplexing basis. The multiplexing is controlled by the selected code rate, which alternately keys the train detection and speed command frequencies.
4. In special trackwork areas two speed command transmission methods are used, as follows:
  - a. At shunt bar locations transmission is via the same equipment as the train detection frequency with the code rate slaved from the transmitter on the opposite side of the shunt bar.
  - b. At receive/receive locations and for the loops through 60 Hz track circuits, transmission is via an independent speed command transmitter, the output of which is directed through loop selection networks to energize the proper loop for the routing and position of the train.

#### E. Interlocking Control and Security

1. For purposes of this description, interlocking control and security is divided into the following categories:
  - a. Route Initiation
  - b. Route Completion
  - c. Time Released Approach Locking
  - d. Route Locking
  - e. Detector Locking
  - f. Switch Control and Indication
  - g. Signal Control
  - h. Loop Control
2. Route Initiation
  - a. Route initiation is accomplished by identifying the desired route in terms of the entering signal and the exiting signal. The following methods of accomplishing this function are used:
    - 1) Route Initiation by Local Control Panel
      - a) In this method of initiation, the first signal button actuated

on the local Interlocking Control Panel identifies the entering signal and the second signal button actuated on the local panel identifies the exit. Assuming that the desired exit is available and no conflicts are detected, the result is an energized pushbutton stick (PBS) relay associated with the entering signal and an energized exit stick (XS) relay associated with the exiting signal.

- 2) Route Initiation by Central Control
  - a) In this method of initiation, the central control computer sends a route request, associated with the entering signal, to the local equipment. Receipt of this control causes the same action in the local equipment as the first actuation of a signal button in (1) above. The local receipt of the first route request control is indicated back to central control. Receipt of the entrance received indication at central control keys the computer to stop sending the route request control associated with the entering signal and to start sending the route request associated with the exiting signal. Receipt of this second route request control causes the same action in the local equipment as the second actuation of a signal button in (1) above.
- 3) Route Initiation by Track Circuit Occupancy
  - a) In this method of route initiation, the presence of a train in certain track circuits causes wired logic to initiate a route which the train will subsequently accept. The wired logic provides for storage of route requests when a desired route cannot yet be initiated, priority determination, and determination of exiting signal when a choice exists. The result of this initiation method is an energized PBS relay associated with the entering signal and an energized XS relay associated with the exiting signal. This method of route initiation is used only at certain locations and can be enabled or inhibited from the local control panel or from central control. While this method of initiation is enabled, all other methods of initiation remain effective. In a variation of this method, the route request is not initiated until a "TRAIN READY" indication is received from the train occupying the track circuit.
- 4) Route Initiation by Train Identity
  - a) This method of initiation is the same as route initiation by track circuit occupancy, except that the trigger for an initiation request is the receipt of a train destination and the determination of the desired exiting signal is by the destination of the train. When this method is used, the transfer of the detected train destination information to Central must be coordinated with the occupancy of the designated ADVANCE APPROACH area by the train, and with route availability.
- 5) Route Initiation by Wayside Pushbutton
  - a) In this method of route initiation, the desired route is defined by actuation of a pushbutton located at the entering signal. The entering signal is determined by physical location of the pushbutton box and the exiting

signal is determined by which button in the box is actuated. The result is energization of a manual pushbutton stick (MPBS) relay associated with the entering signal and energization of an exit stick (XS) relay associated with the exiting signal. This method of route initiation is used only at certain signals, signals which also have initiation methods (3) or (4) above, and is active at all times.

- b. The five methods of route initiation described above are coordinated to protect against misrouting and lockups. Coordination includes:
    - 1) Local-remote control to prevent both local control and central control from being active at the same time;
    - 2) Lockout control to prevent any active initiation method from functioning while another method is being used to initiate a route, and;
    - 3) Time-out control to cancel an unidentified entering signal if an exit is not identified in a predetermined time.
  - c. The initiation circuits also include a search of possible routes associated with a defined entering signal. The result of this search is the energization of an exit (EX) relay associated with each "allowable-exit" signal location. The EX relay associated with a given "allowable-exit" signal location must be energized before the XS relay associated with that signal can be energized to identify it as the exiting signal.
  - d. All route initiation circuits are considered non-vital.
3. Route Completion
- a. After the route initiation is completed by identifying both the entering signal (PBS relay energized) and the exiting signal (XS relay energized), the route completion circuits complete the route by:
    - 1) Requesting the proper switch positions;
    - 2) De-energizing the unselected EX relays;
    - 3) Making a preliminary check of the route integrity;
    - 4) Initiating the vital locking, and;
    - 5) Initiating the request for signal clearing.
  - b. Route completion is accomplished as follows:
    - 1) The state of the search relays (BY and AY relays) and the identification of the exiting signal (XS relay) determines the desired position of each switch in the route. This information is used to request the proper switch positions by energizing the appropriate lever repeater (NLP and RLP) relays.
    - 2) Energizing the lever repeater relays causes the EX relays for unselected exit signals to become de-energized because of the requests for switch positions that would conflict with those exiting signals. Energizing the lever repeater relays also causes the switches to be properly positioned by the switch control and indication circuits if it is safe to do so.
    - 3) The identity of the entering signal, non-vital checks of switch correspondence, occupancy within the route, non-vital check of traffic availability beyond the exiting signal, and the identity of the exiting signal are used to provide a preliminary route integrity check. The result of this check is the energization of the Route Check Relay (RCR) associated with the entering signal.
    - 4) Energizing the RCR initiates the vital locking and signal clearing requests.

4. Time Released Approach Locking
  - a. Approach locking with timed release is provided for all mainline signals. One such locking circuit is provided for each signal. This form of locking is initiated when the Route Check Relay (RCR) becomes energized and remains in effect until released by one of the following:
    - 1) The signal is accepted by the train (two track release).
    - 2) The signal is set to stop and no train is within the approach limits.
    - 3) The signal is set to stop and a predetermined time has expired.
  - b. The approach locking relay (ASR) circuits are arranged such that a momentary interruption of track circuit energy will not release the locking. This is accomplished by:
    - 1) Using "two track release", with the two track circuits (the last track within the interlocking, and the first track exiting the interlocking) driven from different branch fuses, and;
    - 2) By cross checking the ASR relays such that, if opposing ASRs are both de-energized, as would be the case with a dc bus failure, time must be run to release the locking.
5. Route Locking
  - a. Route locking is provided to maintain security of the route ahead of the train as it progresses through the interlocking. Route locking is initiated by the initiation of approach locking and is released when approach locking is released and there are no occupancies in the route. In some cases the route is divided into contiguous sections for route locking purposes and locking of the section(s) of the route behind the train are released (sectional route release) as the train progresses through the route.
  - b. Route Locking is performed by Route Stick Relays (NSR and RSR).
6. Detector Locking
  - a. Detector locking is established by the track relay for the track circuit in which the switch is located and prevents switches from being thrown under a train. At interlockings with automatic route initiation, loss of shunt protection is provided by requiring track relays to be energized for a predetermined time before locking is released.
7. Switch Control and Indication
  - a. The switch control relays (NWZ and RWZ) are driven from the switch call relays (lever repeaters NLP and RLP) in the route completion network. The switch control relays are circuited to provide storage of the switch call, provide premature indication prevention, and prevent preconditioning.
  - b. The switch control repeater relays (NWZPR & RWZPR) are vital relays, primarily for maintenance convenience.
  - c. The switch control repeater relays control pole changed energy to the switch operating relays (NWR and RWR) through lock stick relay (LSR) contacts. The lock stick relay contacts are wired to provide a short circuit across the switch operating relays when the lock stick relay is de-energized.
  - d. The lock stick relay (LSR) is used to provide switch stroke completion in the event that the lock relay (LR) becomes de-energized prior to completion of the switch stroke.
  - e. Overload protection of the switch machine motor circuit is provided by the overload (stick) relay (OR), which has one coil in series with the motor circuit. The second coil is used as a stick coil and is energized through a front contact of the same (OR) relay from the drive circuit for the switch operating relays.
  - f. The switch machine motor circuit is a two- wire, pole-changed circuit

controlled by magnetic blow-out contacts on the switch operating relays (NWR & RWR).

- g. Switch position indication is controlled by a set of switch circuit controller contacts within the switch machine which are part of a two wire, pole changed circuit, driving a pair of biased switch repeater relays (NWPR and RWPR). Where two switch machines are operated as one, such as at a crossover, the indication circuit is controlled by the switch circuit controllers in both crossover switch machines to drive a single set of switch repeater relays.
- h. Switch correspondence relays (NWCR & RWCR) are provided to verify that the switch (position) repeater relays (NWPR & RWPR) are indicating that the applicable switch is in the position called for by its switch control repeater relays (NWZPR & RWZPR).

8. Signal Control

- a. Signals are controlled by vital home signal relays (HGR) which are energized by vital route check (RC) networks. The following checks are included in these route check networks:
  - 1) Approach locking is in effect.
  - 2) Route locking is in effect.
  - 3) Traffic locking beyond the exit signal is in effect.
  - 4) Lock and lock stick relays are de-energized.
  - 5) Switches are in proper correspondence.
  - 6) Route is not occupied.
  - 7) Timers associated with release of locking are at zero time.
  - 8) there has not been an overrun of a red signal at the interlocking.
- b. Where a number of control lines extend past a facing point signal location, route sensitive signal repeater relays are provided for use in the speed circuits.
- c. Signal lighting energy is controlled through front and back contacts of the home signal relays (HGR), and the two red lenses of the STOP aspect are independently lighted from different energy buses.

9. Loop Control

- a. Loop control and selection circuits are provided to sequence the transmission of speed commands through interlockings. The circuits and sequencing are such that a speed command never appears behind a train and only one loop is energized downstream of the track circuit occupied by the train.
- b. Loop control circuits are organized to require that the signal be clear and a train be on the first track circuit in the approach before the sequence can begin.
- c. Overrun protection is provided to interrupt the sequence and stop the transmission of all speed commands within the interlocking in the event of an overrun of a red signal.

F. Train Door Control

- 1. Train doors are controlled by commands transmitted via the vital, wayside-to-train command transmission system used for speed commands. Two commands are used; OPEN RIGHT DOORS and OPEN LEFT DOORS. The absence of either of these commands is interpreted as CLOSE DOORS.
- 2. Door control commands can be transmitted only at block boundaries associated with platform ends. Block boundaries associated with side platform stations are equipped to transmit the OPEN RIGHT DOORS command at the normal traffic-leaving end and the OPEN LEFT DOORS at the normal traffic-entering end. Block

boundaries associated with center platform stations are equipped to transmit the OPEN LEFT DOORS command at the normal traffic-leaving end and the OPEN RIGHT DOORS at the normal traffic-entering end.

3. Carborne ATP equipment compensates for direction of travel of the controlling "A" car and ensures that it is safe to open the train doors prior to acting upon the commands. One of the safety checks made is the verification that the train is at a passenger station. This check is accomplished by cycling a bit back and forth between the train and the station via the TWC system. The cycling of the TWC bit is used to keep a vital relay (PSCR) on the train energized as long as the train is in TWC communications with a passenger station.
4. The application of the door control commands is under control of the station dwell control circuits.

G. Carborne ATP

1. The carborne ATP equipment is organized to perform the following functions:
  - a. Receive and decode the speed limit and door control commands;
  - b. Measure train speed and compare it to the speed limit;
  - c. Control the door operations and check door position, and
  - d. Apply Full Service Braking in the event of overspeed or system failures which affect safety.

2. The carborne ATP System has the capacity to receive and decode 12 commands from the front of the train and two commands from the back of the train. The commands are:

<u>Command</u>	<u>Carrier Freq ±0.5%.</u>	<u>Code Rate ±5%.</u>
15 mph	4550 Hz (F9)	CR2- 4.5 Hz
22 mph	4550 Hz (F9)	CR3- 6.8 Hz
28 mph	4550 Hz (F9)	CR4-10.1 Hz
35 mph	4550 Hz (F9)	CR5-15.3 Hz
40 mph	4550 Hz (F9)	CR6-21.5 Hz
45 mph	5525 Hz (F10)	CR2- 4.5 Hz
50 mph	5525 Hz (F10)	CR3- 6.8 Hz
55 mph	5525 Hz (F10)	CR4-10.1 Hz
65 mph	5525 Hz (F10)	CR5-15.3 Hz
75 mph	5525 Hz (F10)	CR6-21.5 Hz
Open Rt.Doors	5525 Hz (F10)	CR1- 3.0 Hz
Open Lt.Doors	4550 Hz (F9)	CR1- 3.0 Hz

- a. Absence of an ATP command is interpreted by the equipment to mean "STOP" when operating in the Automatic mode and "STOP AND PROCEED at 15 MPH" when operating in the Manual mode.
3. Reception and Decoding
  - a. ATP command reception is accomplished through two coils mounted on the cab end of each car. The coils are rigidly mounted to the car body with the center of the coils 31.25 inches ahead of the centerline of the lead axle. The bottoms of the coils are nominally 8 inches above the top of rail and the lateral distance between coil center lines is 44 inches.
4. Receivers
  - a. Two receivers are provided on each "A" car. One receiver, hereafter referred to as the front-end receiver, receives and demodulates the ATP signals presented to the front of the train while the second receiver, hereafter referred to as the back-end receiver, receives and demodulates the ATP signals presented to the back of the train.
  - b. The front-end receiver meets the following specifications:

- 1) Dynamic range of input: 20 dB minimum
  - 2) Sensitivity:
    - a) 90 ma rail current min.
    - b) 60 ma rail current max.
  - 3) Selectivity: -40 dB, 125 Hz or more each side of each carrier frequency
- c. The back-end receiver meets the following specifications:
- 1) Dynamic range of input: 20 dB minimum
  - 2) Sensitivity:
    - a) 90 ma rail current min.
    - b) 60 ma rail current max.
  - 3) Selectivity: -40 dB, 125 Hz or more on each side of each carrier frequency
- d. The code output of the front-end receiver is monitored by six code-rate detectors, each of which drives a vital relay when its associated code rate is present. The worst case time between removal of a speed command to drop away of the associated code rate and carrier relays is 2 seconds. The normal time required to change speed commands is between 0.5 and 1.0 seconds.
5. Decoding
- a. The contacts of the six code-rate relays and the two carrier relays driven from the front-end receiver are fanned to decode the command. The decoding fans are such that the most restrictive command has priority. The command decoding fans output to the following:
    - 1) Speed selection circuits for overspeed protection;
    - 2) Speed selection circuits for automatic speed regulation;
    - 3) Automatic door control;
    - 4) Limiting speed indicators on the control consoles;
    - 5) Brake interface.
6. Overspeed Protection
- a. Overspeed protection equipment that compares the speed selected by the command decoding fan, in connection with the automatic-manual circuits, to the actual train speed is provided. Actual train speed is derived from a speed sensor monitoring the rotation of a gear in a gear unit. Wheel wear compensation is provided in discrete steps to correct for variations in wheel diameter on the axle monitored by the ATP speed sensor.
  - b. The overspeed protection unit energizes a vital relay to indicate that the actual train speed is less than the limiting speed and that the unit is operating properly. In the event of a failure, or if the actual train speed exceeds the speed limit, this vital relay becomes de-energized.
7. Speed Enforcement
- a. When the train is in automatic operation, an overspeed condition detected by the Overspeed Protection System results in the removal of all calls for positive tractive effort and initiates a Full Service Brake application. The Full Service Brake application is enforced until the overspeed condition no longer exists.
  - b. When the train is in the manual-operation-with-overspeed-protection mode, an overspeed condition detected by the Overspeed Protection System results in the removal of all calls for positive tractive effort and initiates a Full Service Brake application. An overspeed warning in the cab is also sounded and persists until the attendant places the master controller into the Full Service Brake position. The Full Service Brake application is enforced until the attendant has placed the master controller in the Full

- Service Brake position and the overspeed condition no longer exists. When the train is in the manual-operation-with-ATP-cutout mode, no action shall be taken by the ATC System as a result of an overspeed condition.
- c. The Overspeed Protection System also includes zero speed detection circuitry. The train is indicated as being at zero speed when the speed is being detected, in a fail-safe manner, to be below 1 mph
8. Door Control
    - a. Signals received by the front-end receiver of the train determine on which side of the train the doors are to open, and also prove that the frontmost side door of the train is within the platform limits. The signal received by the back-end receiver of the train proves that the rearmost side door of the train is within the platform limits.
    - b. The output of the back-end receiver is decoded to detect the presence of code rate 1 (3.0 Hz). The presence of this code rate causes energy to be applied to trainline wires at the back of the train. Door control circuits in the controlling "A" car monitor these trainline wires to provide back-end status.
    - c. A cycle check system is provided in the passenger stations, via the Train-to-Wayside Communications (TWC) System, which is used to confirm that the train is located in a passenger station before doors can be operated.

#### **1.04 AUTOMATIC TRAIN SUPERVISION**

- A. The Automatic Train Supervision (ATS) System is that part of the ATC system which provides centralized monitoring and supervision capabilities and certain automatic ATC supervision facilities at wayside. The ATS system consists of:
  1. A computer system and central control consoles located at the Operations Control Center (OCC) in the Jackson Graham Building;
  2. A Data Transmission System (DTS) linking the equipment at the OCC with that in the TCRs;
  3. Remote Terminal Units (RTUs) located at the wayside Train Control Rooms (TCRs) (The RTUs are hard-wired remote control devices dedicated to the monitoring and supervision of certain wayside ATC functions and devices as well as the electrical and support facilities at the location.);
  4. A Train-To-Wayside Communications (TWC) system to provide a two-way link between the TCR equipment and trains at stations;
  5. An Automatic Car Identification (ACI) system. This system has optical scanners located at certain points next to the tracks. These scanners read the car numbers from a train as it passes the scanner. The car identification is reported to the central computer, which can then determine the car mileage. This information can be used for maintenance purposes and analysis of operations.
- B. Central Control Facility Overview
  1. The central control facility contains a control computer, a hot backup computer, and a computer for software development, which also serves as the ultimate backup computer. The control computer receives and transmits messages between the operations control center and station locations via the DTS. It communicates with the central control operator by providing displays on a large-scale display and video monitors (CRTs), and by accepting operator input from console trackballs and keyboards. The control computer performs schedule adjustments by changing dwell times and interstation run times, both of which are sent to the station RTUs via the DTS. The METRO system can operate as a stand-alone entity without the computer complex at the OCC. However, without the capabilities provided by the ATS software in the central control computer, the display system, and the DTS, the

job of monitoring and controlling the METRO operations, especially to maintain schedules, would be more difficult. This is especially true when an abnormal condition (e.g., a malfunctioning train) is encountered. The general functions provided to aid the central control operators are:

- a. Display System
  - 1) Train System Displays
  - 2) Train and Interlocking Detail Displays
  - 3) Train Information Displays
  - 4) Electrical System Displays
  - 5) Train and Electrical System Alarm Display
  - 6) Geographic Displays
- b. Monitoring Traffic Regulation
  - 1) Schedule Control
  - 2) Schedule Adjustment Strategies
  - 3) Schedule linkage of train put-ins
- c. Supervisory Capability
  - 1) Train Control requests to wayside ATP system
  - 2) Interlocking requests to wayside ATP system
  - 3) Commands to wayside ATS equipment
  - 4) Commands to wayside support system devices
- d. Status Monitoring and Alarm Processing

C. Automatic Train Supervision Software

1. The software for the central computer has been designed in a building block approach and provides the primary functions of Traffic Regulation and Control and Display.
2. Traffic Regulation
  - a. All trains in the METRO system under central computer supervision enter revenue service, run, and terminate revenue service according to times provided by predetermined train schedules. These train schedules are the basis for Traffic Regulation control. A train schedule is defined as a set of arrival and departure times at successive locations which completely dictates a train's intended movement from entry into revenue service until lay up. A train schedule defines, among other things, the scheduled arrival time and the scheduled dwell time at every station traversed by a given train. A unique schedule is defined for each train that is in revenue service or is about to enter revenue service. The system schedules are selected by the central control operators at the start of revenue service on a particular day.
  - b. Traffic Regulation automatically maintains the scheduled headway between all of the trains operating in the territory and regulates train movements for time schedule adherence, proper merging of trains at rail line junction points, and optimum utilization of terminal locations. This is achieved by control of both station dwell time, and train performance (speed) and acceleration levels that govern the interstation running time.
  - c. The four main components of the Traffic Regulation software are Put-in Processing, the Line Algorithm, the Terminal Algorithm, and Strategy Selection. Also, statistics of the actual performance of trains are gathered for off-line analysis.
    - 1) Put-in Processing
      - a) The Put-in Processing software initiates train entry into revenue service either from a storage point, such as a yard or a pocket track, or from a terminal station after a

train reversal. The primary function of the Put-in Processing software is to construct a schedule for the next terminal-to-terminal run of the train so that the Terminal Algorithm and the Line Algorithm can control it. Another function performed is the lighting of warning lamps at yards prior to the scheduled dispatch of a train so that the yard personnel can prepare a train for revenue service.

2) Line Algorithm

- a) The primary function of the Line Algorithm is to attenuate delays due to minor line disturbances as quickly as possible and prior to the arrival of trains in areas where the probability of such delays is high. Line disturbances are events or conditions that cause a train to be early or late with respect to its schedule. Such events cause the Line Algorithm to affect the dwell time of a train at a station and the performance of a train departing from a station. The Line Algorithm minimizes or eliminates the effects of delays by adjusting the dwell and performance level of a train such that the departure schedule error at a station and the arrival schedule error at the next station are both minimized
- b) There are four "Performance Levels" for train operation. Performance Level 1 (PL1) (MAXIMUM) requests the train to run at the maximum safe interstation speed, resulting in the minimum safe interstation run time. The normal schedule for a train is based on PL2 (NORMAL), which is approximately 10 percent slower than PL1. This gives traffic regulation a catch-up capability by allowing it to request PL1 to reduce a train's lateness. PL3 (REDUCED) and PL4 (RETARDED) are approximately 10 percent and 20 percent slower than PL2 and are used when trains are ahead of schedule. The Performance Levels are implemented by imposing applicable maximum ATS speed limits on trains between successive station pairs.
- c) Each of the four performance levels may be combined with a request for either full or half acceleration, thus providing eight different interstation run times. For each station platform the program can select either a normal dwell time or another value which lies within the range of minimum and maximum dwell times for that platform. Dwell times available for some platforms can be varied with the time of day.

3) Terminal Algorithm

- a) A special case handled by a part of Traffic Regulation called the Terminal Algorithm is used to avoid conflicts between trains at terminals having a crossover interlocking located between the terminal station and the penultimate station. Since these interlockings are used to reverse trains, conflicts in the use of the interlockings can be generated by trains arriving at and departing from a terminal station at close headway. A route conflict exists whenever two trains attempt to traverse conflicting routes

- through an interlocking at the same time.
- 4) Strategy Selection
    - a) The central control operators have the capability of providing corrective strategies through the Strategy Selection program whenever required. The control philosophy employed here is that the operator is the best judge of what corrective action is most suitable in any given situation and the computer is most useful as a device to display the options available and to implement the selected option.
    - b) The Strategy Selection programs include Replace Train, Delete Train, Add Train, Eliminate Gap, Create Gap, Offset Schedule, Tilt Schedule and Skip Stop. All act to either modify or maintain the existing schedule.
3. Control and Display Software
    - a. The Control and Display software drives the displays and alarm printers and responds to central control operator inputs through the console trackballs and keyboards. The Control and Display software responds to field changes or when requested by an operator input to update train displays. It examines the data returned from the field and marked as changed by the Data Base Processor software. It then updates displays and alarm messages for the central operator as required.
    - b. The Control and Display software provides the processing of all operator inputs and coordinates execution of the software required by those inputs. These commands allow the central control operators to manually supervise system operation and to request specific displays.
- D. System Hardware
1. The system hardware is used to perform the required Automatic Train Supervision functions and backup functions. The individual components are integrated to provide the means by which the various software components perform their functions.
  2. General Purpose Computer Subsystem
    - a. Three interconnected computers comprise this subsystem. Each computer consists of a central processor with byte addressing, floating point and memory protection instructions, a priority interrupt system, and a power monitoring circuit.
    - b. The computer systems are networked to each other and to the peripheral devices through a dual Ethernet network.
  3. Communications Subsystem
    - a. To handle the specialized data transmission, the central computers are connected to two Front End Processors (FEPs) which are connected to a bank of modems. The modems are connected through the DTS to the various field devices and permit the transfer of data to and from the central control computer. The FEPs receive the raw data from the field and forward change information to the central processors.
  4. Control and Display Subsystem
    - a. The Control and Display subsystem, used by the central control operators in controlling the system, has as its main functions; the presentation of system status, operational data and alarms to the central operator, and; the execution of system commands from the console trackball and keyboard.
    - b. Video monitors (CRTs) provide the display facility with:
      - 1) "Closeup" views of the interlockings;
      - 2) System alarms (Train and E&S Alarms);

- 3) Performance statistics (Train Information);
  - 4) Electrification system (Traction Power) overview,
  - 5) State of mechanical support equipment at a station selected by the operator (Support Station).
- c. In the event that a CRT malfunctions, the central control operators have the capability of reconfiguring the displays so that a desired display can be moved to a working CRT.
  - d. A Large Scale Display System provides an overview display of the METRO System and can also be used to display any of the System's local or special displays.
  - e. All alarm conditions on the METRO System, whether the result of train control indications, calculations, traction power and support system indications or computer indications, are displayed in tabular form on the appropriate alarm display and can be output to a printer. Alarms are also displayed in the alarm area (bottom three lines) of the CRT screen. Each message is accompanied by an audible alarm. The alarm area contains up to three of the most current unacknowledged alarm messages. There is an indication if there are more than three currently unacknowledged alarms.

E. Wayside

1. The following portions of the ATS are located on the wayside, primarily in the Train Control Rooms at passenger stations:
2. Door and Dwell Controls
  - a. The door and dwell control modules provide the local hardware to implement the controls generated by central control or automatically by normal train operations. This hardware is configured to provide a backup means of door and dwell control in the event that control from central is interrupted. The configuration is such that the local backup provisions are exercised on each train movement to make failures self-evident. The sequence of operation is as follows:
    - 1) When an arriving train completes its station stop a TRAIN BERTHED signal is transmitted to the station via the TWC system. Receipt of this signal causes the speed commands to be removed from the platform block and the block downstream of the platform, the door open commands to be applied at both ends of the platform after a 2 second delay, and energy to be applied to the local dwell timer. The TRAIN BERTHED signal is also transmitted to central control via the DTS.
    - 2) Upon expiration of the preset time of the dwell timer, the door open commands are removed and speed commands restored unless override controls are received from central control.
    - 3) The dwell can be terminated prior to the expiration of the preset time by receipt of the TERMINATE DWELL control from central control or by manually closing the train doors.
    - 4) The dwell can be extended beyond the preset time with the doors held open by receipt of the HOLD WITH DOORS OPEN control from central control.
    - 5) The dwell can be extended beyond the preset time with the doors closed by receipt of the HOLD WITH DOORS CLOSED control from central control. In this case the door open commands are removed but the speed commands are not restored until the HOLD WITH DOORS CLOSED control is no longer received.

- 6) At selected stations a local train dispatching system was provided for schedule control in the event of failure of the central control function. At these locations the expiration of the preset dwell time would not terminate the dwell unless it was also time for the train to be dispatched from that station. (The automatic dispatching machines originally installed as parts of this system are no longer being used.)
3. Train-to-Wayside Communications (TWC)
    - a. The TWC system provides the communications link for the following ATS functions between revenue trains and the wayside.
      - 1) Train-To-Wayside
        - a) Train Destination
        - b) Train Number
        - c) Manual Pushbutton Right (Tk 1 & 2)
        - d) Manual Pushbutton Left (Tk 1 & 2)
        - e) Doors Closed Right (Tk 1 & 2)
        - f) Doors Closed Left (Tk 1 & 2)
        - g) PSS Active (Tk 1 & 2)
        - h) ATP in Effect (Tk 1 & 2)
        - i) Train in ATO (Tk 1 & 2)
        - j) Passenger Station Check
        - k) Train Ready
        - l) All Doors Closed
        - m) Train Berthed
        - n) Motion Detection
        - o) Train Length
      - 2) Wayside-To-Train
        - a) Train Destination
        - b) Train Number
        - c) Platform ID
        - d) Passenger Station Check
        - e) ATS Acceleration
        - f) Door Close Warning, Platform 1
        - g) Door Close Warning, Platform 2
        - h) ATS Speed Limit
      - 3) FOR C10 & K06 STATIONS ONLY:
        - a) Train-To-Wayside
          - (1) PSS Active (Tk 3 & 4)
          - (2) Train in ATO (Tk 3 & 4)
          - (3) ATP In Effect (Tk 3 & 4)
          - (4) Manual Pushbutton Right (Tk 3 & 4)
          - (5) Manual Pushbutton Left (Tk 3 & 4)
          - (6) Doors Closed Right (Tk 3 & 4)
          - (7) Doors Closed Left (Tk 3 & 4)
        - b) Wayside-To-Train
          - (1) Platform ID
          - (2) Platform 3 or 4
          - (3) Door Close Warning,
          - (4) Platform 3 & 4
    - b. The TWC System is a continuous-scanning, time-division multiplex transmission system in which communications transmitted to wayside and received from wayside are time-shared.

- c. The carborne TWC System is inductively coupled to the wayside TWC System via coils on the cars. At wayside receiver locations other than flyby locations, the area of effective two-way communications is at least 600 feet long.
- d. The following message formats are transmitted by the train and received by the wayside
- 1) SHORT MESSAGE FORMAT  
Bit No.

1-3	Message Prefix
4-11	Word 1 (Train Destination)
12	Parity, Word 1
13-15	Message Suffix
  - 2) LONG MESSAGE FORMAT  
Bit No.

1-3	Message Prefix
4-11	Word 1 (Train Destination)
12	Parity, Word 1
13-24	Word 2 (Train Number)
25	Parity, Word 2
26	Manual Pushbutton Right
27	Manual Pushbutton Left
28	Doors Closed Right
29	Doors Closed Left
30	PSS Active
31	ATP in Effect
32	Train in ATO
33	Spare
34	Spare
35	Spare
36	Spare
37	Spare
38	Parity, Word 3
39	Passenger Station Check
40	Train Ready
41	All Doors Closed
42	Train Berthed
43	Parity, Word 4
44	Motion Detection
45-47	Train Length
48	Parity, Word 5
49-51	Message Suffix
- e. The prefix bit configuration for the short message mode is MARK-SPACE-MARK. The prefix bit configuration for the long message mode is MARK-MARK-MARK. The suffix bit configuration for both long and short message modes is MARK-MARK-MARK.
- f. The message structure is a non-synchronous, return-to-zero, serial code at a bit rate of 100 bps. There is a 100-millisecond pause between successive message transmissions from the trains. The message starts 60 ms after the transmitter is keyed. The TWC carrier frequency is 9800 Hz.

- g. A frequency of 9950 Hz is interpreted as a "MARK." A frequency of 9650 Hz is interpreted as a "SPACE." Parity is "ODD."
- h. The existing impedance bonds that are tuned to transmit and receive the TWC signals exhibit impedance of approximately 1.0 ohms at 9800 Hz. With this impedance, the TWC system will work reliably with a receiving bond current of .016A rms to 0.3A rms. The transmit rail current produced by the bond is approximately 1.5A rms with a train adjacent to the bond. Input to the TWC receiver is 400-mV p'p'.
- i. The following message formats are transmitted to the trains depending upon the location of the transmitter:

1) SHORT MESSAGE FORMAT

Bit No.

1-3	Message Prefix
4-7	Word 1 (ATS Speed Limit)
8	Parity, Word 1
9-11	Message Suffix

2) LONG MESSAGE FORMAT

Bit No.

1-3	Message Prefix
4-11	Word 1 (Train Destination)
12	Parity, Word 1 (odd)
13-24	Word 2 (Train Number)
25	Parity, Word 2 (odd)
26-33	Word 3 (Platform ID)
34-37	Word 3 (Spares)
38	Parity, Word 3 (odd)
39	Word 4 (Passenger Station Check)
40	Word 4 (ATS Acceleration)
41	Word 4 (Door Close Warning)
42	Word 4 (Spare)
43	Parity, Word 4 (odd)
44-47	Word 5 (ATS Speed Limit)
48	Parity, Word 5 (odd)
49-51	Message Suffix

- j. The long messages are transmitted to trains in response to a received message from the train at all locations other than flyby locations. Short messages are transmitted to trains in response to a received message at flyby transmitter locations.

4. Automatic Car Identification (ACI)

- a. The ACI system provides a means of identifying train consists by car serial number. This data is transmitted to central control via a low speed data channel and presented to the central computer where it is associated with the appropriate train I.D. data. The system is an optical scanning system which recognizes color strip labels affixed to the cars. The labels are a short version (7 digits) of the former standard AAR label.
- b. The scanners are located in the downtown area such that six scanners are sufficient to read the consist of all revenue service train movements.

5. Performance Level Translators

- a. The performance level translator converts the two-bit performance level control received from Central Control into a four-bit binary code, which

identifies the ATS speed limit required to achieve the desired performance level.

- b. The ATS speed limit code produced by the performance level translator for a given performance level code input is determined by the wiring of a programming plug. The correlation between performance level and ATS speed limit (programming plug wiring) for a given station-to-station run is based on computer simulations of station-to-station runs with each of the ATS speed limits.
- c. The performance level translator is a part of the TWC transmitter module. The ATS speed limit code produced by the translator is transmitted to the train via the TWC system. The trains interpret the ATS speed limit code as follows:

<u>ATS</u> <u>CODE</u>	<u>SPEED</u> <u>LIMIT (mph)</u>	<u>ATS</u> <u>CODE</u>	<u>SPEED</u> <u>LIMIT (mph)</u>
0000	79	1000	44
0001	79	1001	49
0010	14	1010	54
0011	19	1011	59
0100	24	1100	64
0101	29	1101	69
0110	34	1110	74
0111	39	1111	79

- 6. Data Transmission System Remote Terminal Units
  - a. The wayside portion of the DTS consists of Remote Terminal Units (RTUs) and their associated interface hardware and wiring.
  - b. Earlier portions of the existing system use model 9600 RTUs manufactured by TRW Controls. These RTUs operate at a bit rate of 1200 or 2400 baud depending on the total number of controls and indications for which the RTU is equipped. The maximum capacity of these RTUs is 836 controls and 892 indications.
  - c. The model 9600 RTUs are interfaced to a voice grade channel between the RTU and central control via model P1224 modems manufactured by TRW Controls.
  - d. Newer portions of the existing system use OUTPOST Model 409 RTUs manufactured by Network Management Technologies, Inc., Sugar Land, Texas.

## 1.05 AUTOMATIC TRAIN OPERATION

- A. The Automatic Train Operation (ATO) System is that part of the ATC System which provides automatic train stopping and starting at passenger station platforms and provides speed control compensation for varying conditions of grade and curvature.
- B. Wayside Portion
  - 1. The wayside portion of the ATO system consists of the markers used to identify grade and curve information and the station stopping markers which provide the distance-to-centerline information as well as the type of stop (long, short, center, or skip) information.
  - 2. The markers are tuned circuits, the inductance of which is an air core coil with an inside diameter of approximately 11 inches. The coil is the coupling element to the carborne equipment and is located between the running rails with its axis vertical.

The top edge of the coil is between 1/4 and 3/4 inches below the top of rail. The relationship between the coil center and the track centerline is as follows:

<u>RADIUS OF CURVE</u>	<u>OFFSET FROM CENTERLINE OF TRACK</u>
Greater than 8500'	0"
8500' - 2900'	1"
2900' - 1750'	2"
1750' - 1250'	3"
1250' - 975'	4"
975' - 800'	5"
800' - 700'	6"
Less than 700'	7"

- a. Offset from centerline of track is toward the outside of the curve. See the Technical Appendix, "Marker Coil Offset vs. Curve Radius."
  3. Each marker location except the 160 ft. marker consists of two independent tuned circuit members. This configuration is used to provide for double direction running and to provide the required amount of data with fewer frequencies.
- C. Carborne Portion
1. The carborne portion of the ATO System consists of marker reception and decoding equipment, station stop control equipment, and speed regulation equipment.
  2. The marker reception and decoding equipment responds to the wayside markers, validates the data and passes the valid data to the speed regulation and station stopping equipment. The station stopping equipment generates a velocity vs. distance profile upon receipt of an initiating marker. The slope of the stopping profile is determined by the grade and curve data also received via the marker system. The stopping point within the station (point at which profile velocity reaches zero) is determined by the type of stop data received via the marker system and the train length determined by the carborne train length measuring circuits. Intermediate station stopping markers are used to correct the velocity vs. distance profile to compensate for differing wheel diameters and the effects of slip and slide.
  3. The speed regulator measures actual train speed and controls the power and braking to cause the actual speed to approximate the desired speed. The desired speed is defined as the lesser of ATP Speed Command, ATS Speed Limit, or Station Stopping Profile Velocity. In normal running the speed regulator will cause the actual speed to be equal to the desired speed +0 mph, -4 mph.
  4. The actual train speed and the distance base for the station stopping profile are derived from axle rotation. Manually adjusted wheel wear compensation is provided to minimize the errors due to changes in wheel diameter over the life of the wheels.

**END OF SECTION**

## SECTION 16905

### ATC - TRANSIT VEHICLE CHARACTERISTICS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section describes the ATC-related characteristics of the five types of existing Metrorail rapid transit vehicles and specifies values and formulae which the Contractor shall use to compute speed, deceleration and safe braking distances for trains of these cars.

##### 1.02 DESIGN CHARACTERISTICS

- A. Some of the basic characteristics of the five types of existing METRO passenger transit vehicles and trains, are shown on pages TA-3 through TA-6, inclusive, of the ATC Technical Appendix (Section 16996). These characteristics and the various acceleration and brake rates, inertia and jerk limits, resistance factors, and electrical equipment characteristics set forth in this Section shall be used in the design of the wayside ATC System under this Contract.

##### 1.03 ACCELERATION AND BRAKE RATES

- A. Maximum acceleration on level, tangent track is as shown on page TA-4 of the ATC Technical Appendix.
- B. The "Full Service" brake rate (negative level 4) for both the ROHR cars, the BREDA cars, and the AAI cars is 2.2 mphps from 50 mph to 0 mph. From 50 mph to 75 mph it decreases linearly to 75 percent of 2.2, i.e., 1.65 mphps.
- C. Full Service braking for the ROHR cars is fail-safe and does not require check circuits to verify retardation. Full Service braking for the BREDA and AAI cars is "brake assured."
- D. The Contractor shall use 75 percent of the Full Service brake rates defined above when computing safe braking distance (SBD).
- E. Load Compensation
  - 1. Since the cars carry a variable live load, a load compensation device has been incorporated into the cars which adjusts tractive effort (positive and negative) to the individual car weight. This compensation is effective up to the nominal gross weight of the car in the acceleration mode and up to the maximum (crush-load) gross weight of the car in the deceleration mode.
  - 2.

##### 1.04 INERTIA AND JERK LIMIT

- A. Inertia
  - 1. For acceleration calculations, total train inertia shall be taken to be 100 lbs./ton per mphps.
- B. Jerk Limit
  - 1. Jerk rate (second derivative of the velocity function) will not exceed 2.0 mphpsps for the ROHR cars and 2.2 mphpsps for the BREDA and AAI cars.
  - 2. For any 0.25 second period, acceleration rate will not experience a step

- change of more than 0.60 mphps.
3. Jerk limit control is effective for all changes in positive or negative tractive effort and for transitions between positive and negative tractive effort. Jerk limit control is provided for the final stop in accordance with the above-specified jerk rate limit, for all ATP and ATO initiated stops.

## 1.05 RESISTANCE FACTORS

- A. Grade Resistance ( $R_g$ )
  1.  $R_g = 20$  lbs/ton per percent of grade
- B. Curve Resistance ( $R_c$ )
  1.  $R_c = 0.8$  lbs/ton per degree of curvature
  2.  $= 0.8 \times (5730/R)$  lbs/ton
  3. Where: R = Radius of curvature in feet
- C. Inherent Car and Train Resistance
  1. The inherent car and train resistance on level, tangent track shall be determined as follows:
    - a. Leading car:
      - 1)  $R_{cl}$  (lbs/ton) =  $1.3 + 116/W + 0.045V + 0.0024AV^2/W$
    - b. Trailing cars:
      - 1)  $R_{ct}$  (lbs/ton) =  $1.3 + 116/W + 0.045V + 0.00034AV^2/W$
    - c. Total inherent train resistance:
      - 1)  $R_{tt}$  (lbs/ton) =  $R_{cl} + (n-1)R_{ct}$ 
        - a) Where:
          - (1) W = car weight in tons
          - (2) V = speed in mph
          - (3) A = car frontal area in square feet
          - (4) n = number of cars in train

## 1.06 ELECTRICAL EQUIPMENT CHARACTERISTICS

- A. The characteristics of the chopper-controlled BREDA vehicle electrical equipment are as follows:
  1. The normal operating frequency of the propulsion and braking chopper will be 273.0 Hz, with a tolerance of +/-6 Hz on the 15th harmonic, which is 4095 Hz.
  2. The normal range of frequency drift of the propulsion and braking chopper, will be +/-0.01 percent.
  3. The level of inductive interference produced by the propulsion chopper and all auxiliary choppers will be not greater than that shown in Graph 1, Level of Induced Interference (in the ATC Technical Appendix), which represents the magnitude of open-circuit rail-to-rail potential vs. the train control frequency spectrum. The open circuit rail-to-rail potential presented in Graph 1 is the worst-case rail-to-rail potential that would be measurable at any point beneath the vehicle with no train control equipment connected to the rails. The values given are a composite from all emitting sources on the married pair.
- B. The level of conductive interference produced by the propulsion chopper and all auxiliary choppers will be not greater than that shown in Graph 2, Level of Conductive Interference (in the ATC Technical Appendix), which represents the magnitude of the AC component of the return current from a single car (4 motors) vs. the train control frequency spectrum. The AC current component shown in Graph

2 is the worst-case composite of the interference produced by all of the electrical subsystems of a single married pair. The train control frequency spectrum is 50 Hz to 15,000 Hz.

**1.07 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
1. Section 16913 ATC Block Design

**PART 2 - PRODUCTS**  
NOT USED

**PART 3 - EXECUTION**  
NOT USED

**END OF SECTION**

**SECTION 16906  
DETERMINATION OF PAYMENT FOR ATC WORK**

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

- A. A listing of the various ATC Activity/Equipment items which will be paid for separately as part of the Automatic Train Control (ATC) System.
- B. Reference to guidelines for measuring various ATC subsystems, equipment items, and required design, documentation, testing, and training activities to determine partial payment schedules for same.

**1.02 SEPARATE ACTIVITIES AND EQUIPMENT INCLUDED IN ATC LUMP SUM PRICE**

- A. The total payments for the Automatic Train Control System will equal an ATC Lump Sum Price included in the Unit Price Schedule for the entire Construction Contract.
- B. The ATC System Lump Sum Price for this Contract will be allocated among the following ATC activity and equipment items:

<u>Item Number</u>	<u>Specification Section</u>	<u>Activity/Equipment Description</u>
1	Division 1, Art. VI.A.	
2	16900	ATC Progress Schedules
3	16900	ATC Design Engineering
4	16900	ATC Material & Fabrication
5	16911	ATC Installation
6	16918	Tunnel and Invert Cleaning
7	16919	Tie-In Work, ( <i>Location</i> )
8	16927	ATC System Safety Program
9	16927	Microprocessor Support Systems
10	16931	Drawing Editor Systems
11	16931	Shop Test Station for NVIP PCBs
12	16931	Basic ATC Test and Maintenance Equipment
13	16931	TWC Transmitter Test Fixture
14	16931	TWC Receiver Adjustment Test Fixture
15	16931	Portable Test Fixture for Vital DC Relays
16	16931	Portable Test Fixture for Vital AC Relays
17	16931	Portable Test Fixture for Non-Vital DC Relays
18	16931	Shop Test Fixture for Impedance Bonds
19	16931	Marker Coil Dynamic Test Unit
20	16931	Shop Test Fixture for RTUs
21	16931	Shop Test Fixture for ATP Modules
22	16931	Shop Test Fixtures for Non-Vital Station Processors
23	16931	Shop Test Fixtures for Non-Vital Interlocking Processors
24	16931	Shop Test Fixtures for Inter-locking Vital Processors

<u>Item Number</u>	<u>Specification Section</u>	<u>Activity/Equipment Description</u>
24	16931	Spare Equipment <sup>1</sup> (See Note 2 to Contractor)
25	16932	Selectable Tools and Equipment Components <sup>2</sup> (See Notes 1 & 2 to Contractor)
26	16933	Training Room Equipment/Activity (Where Required)
27	16980	Tie-In Location Testing
28	16980	Intermediate Interlocking Station Location(s) Testing(As Required)
29	16980	Intermediate In-Line Station Location(s) Testing(As Required)
30	16980	Terminal Station/Interlocking Location Testing(As Required)
31	16988	ATC QA Program
32	16991	ATC Drawings & Tracings
33	16992	ATC Instruction Manuals
34	16993	ATC Training Courses

- C. The Total Lump Sum Price for the ATC System shall be distributed over Activity/Equipment Items 1 through 34 inclusive, in a manner to be determined by the Authority.

### **1.03 ATC SYSTEM MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Automatic Train Control System equipment and activities will be measured for partial payments as described in the various individual 16900-series Sections of the Specifications, and in certain other Sections referenced by the 16900-series Sections.

### **1.04 RELATED SECTIONS**

- A. Division 1, General Requirements  
B. All 16900-series Sections

### **PART 2 - PRODUCTS**

NOT USED

### **PART 3 - EXECUTION**

NOT USED

#### **NOTES TO CONTRACTOR:**

- The payments for Item 25, Selectable ATC Tools and Equipment Components will equal a percentage (to be determined by the Authority) of the amount paid for Item 3, ATC Material and Fabrication.
- The payments for Item 25, Selectable ATC Tools and Equipment Components will equal a percentage (to be determined by the Authority) of the amount paid for Item 3, ATC Material and Fabrication.

## SECTION 16911

### SCOPE OF ATC WORK

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the physical and geographical extent of the work which shall be performed by the Contractor to fulfill the intent of the Automatic Train Control portion of this Contract. The intent of this part of the Contract is that the Contractor shall provide the following services in the manner specified:
- B. Description and Basic Requirements
  - 1. Provide, in the manner specified herein, the Block Design and the final design, fabrication, delivery, installation, testing, documentation and placing in service of every system, subsystem, circuit and piece of equipment described, required or implied by the Contract Documents to establish a safe, complete, workable, operating wayside Automatic Train Control (ATC) System for the portion of the METRORAIL System of the Washington Metropolitan Area Transit Authority included in this Contract.
  - 2. Employ a qualified railway signal engineer, approved by the designated Resident Engineer (Engineer):
    - a. To check all circuits shown on the Contract Drawings and to notify the Engineer of any discrepancies or omissions, and; To check and sign all circuit drawings furnished by the Contractor before submittal of such circuits to the Engineer.
  - 3. Provide accurate and timely preliminary documentation as a prerequisite to fabrication, procurement and installation work. This shall include complete, detailed cable/conduit/ ductbank/manhole/surface trench documentation submitted to the Engineer for review and approval for each TCR area of control prior to cable installation in each applicable area.
  - 4. Provide accurate ongoing and final documentation in a timely fashion, and in the specified medium(s), content and format. (See Section 16991, ATC Drawings and Tracings.)
  - 5. Provide all required and/or necessary spare equipment, test equipment, and support function hardware and software. (See Section 16930, ATC Facilities and Spare Equipment.)
  - 6. Provide instruction and training to designated Authority personnel concerning the operation and maintenance of certain equipment and subsystems comprising the ATC System. (See Section 16992, ATC Instruction Manuals, and Section 16993, ATC Training Courses).
- C. The ATC System and subsystems provided under this Contract shall be as specified in these documents, and shall be compatible in every respect with the existing Automatic Train Control System described in Section 16904, Current Automatic Train Control System.
- D. The ATC equipment and systems provided under this Contract shall be immune to interference from all transit vehicle electrical subsystems, and to interference from any WMATA VHF hand held radio transmitter or cell phone keyed at a distance of six inches from the equipment or system.
- E. The ATC equipment which the Contractor provides shall be capable of working safely during a temporary imbalance in the magnitude of negative propulsion return currents in the

- running rails in a ratio as high as 2-to-1 for durations as long as 1 second.
- F. The subsystems and equipment included in the ATC System provided under this Contract shall be designed for accessibility and ease of maintenance.
- G. All adjustable ATC equipment and components shall be designed to operate within their 25-percent-to-75-percent adjustment range under all normal conditions, wherever possible. Provide the reason and justification to the Engineer in writing wherever this condition cannot be obtained.
- H. Provide complete ATC lightning and surge protection systems which shall protect ATC equipment and systems from damage due to lightning or other external electrical discharge, and complete grounding systems which shall protect ATC equipment and personnel from damage or injury due to short circuits or overload conditions.
- I. Read and comply with all notes on the Contract Drawings for the Wayside ATC System.
- J. Provide the special facilities and capabilities, and perform the additional work specified in Section 16918, Special ATC Requirements for Specific Locations.
- K. The Contractor's ATC work schedules for the route segment included in this Contract shall be based upon a Notice to Proceed date and certain Access and Completion dates specified in elsewhere in this Specification, and in Section 16995 (Appendix "L").
- L. The Interlocking Vital Processor Systems which shall be used to implement certain vital interlocking control functions and vital speed selection functions shall meet all requirements specified in Section 16928, Interlocking Vital Processor Systems.
- M. Cooperate and coordinate with the appropriate Authority personnel to delineate the method of determining train length on the trains and transferring the indication of this length to the wayside via the existing TWC System.

**1.02 LIMITS OF WORK**

- A. The geographical limits of the segment of new METRO trackage for which the Contractor shall provide a complete, new wayside ATC System under this Contract shall be as follows:
  - 1. Geographical Description & Civil Stationing e.g.: "That portion of the "X" Route mainline tracks starting at TC Stationing Xyyy+zz I.B. & O.B. BK in (Name of City, County and State) and ending at TC Stationing Xggg+hh I.B. & O.B. BK, in (Name of City, County and State)"
  - 2. This area includes (**how many**) new Train Control Rooms and (**how many**) new Train Control Equipment Rooms (TCERs) (constructed by other disciplines) at the following locations:

a. EXAMPLE

Location Name	<u>Location Code</u>	<u>Station/Interlocking Configuration</u>
Naylor Road TCR	F-09	Surface Station. U.G. Emergency X- O
Suitland TCR	F-10	Surface Station

- B. Provide, in close cooperation and coordination with WMATA maintenance and operating personnel, modification and tie-in work at the following existing TCR which is already in Revenue Service:

1. EXAMPLE:

<u>Location Name</u>	<u>Location Code</u>	<u>Station/Interlocking Configuration</u>
Anacostia	F-06	Underground Interlocking; Convert Temporary Terminal to Emergency X-O

2. This work shall be performed at the appropriate times, in such a manner as to cause a minimum of disruption to Revenue Service. (See Section 16918, Special ATC Requirements for Specific Locations).

- C. Provide all ATC final design, equipment and circuitry, and perform all work required to complete the furnishing, installation, reprogramming, testing and documentation of the ATC System in the (designated) TCR area of control, and (EXAMPLE:) to convert the (designated) interlocking from an automatic terminal configuration to an emergency crossover configuration, as indicated on the Contract Drawings and as specified herein. This shall include all necessary additions, deletions and modifications to the existing circuitry and programming, and necessary modifications to, and/or replacement of, the existing interlocking control panel at the (designated ) TCR.
- D. Perform all ATC work stipulated in the Contract and altered or extra ATC work, and furnish all labor and supervision necessary for the prosecution and completion of the ATC work.

**1.03 MAJOR SUBSYSTEMS**

- A. The major wayside subsystems which shall be provided as components of the wayside Automatic Train Control System under this Contract are:
  - 1. Automatic Train Protection (ATP)
  - 2. Automatic Train Operation (ATO)
  - 3. Automatic Train Supervision (ATS)
- B. The Automatic Train Protection System shall be provided as specified herein and shall include all wayside subsystems necessary to provide safe operation of trains. This shall include the control of interlockings and the safe operation of car doors on the trains. This system shall be implemented with vital relays and with vital processor modules as specified in Section 16928, Interlocking Vital Processor Systems.
- C. The "new" interlocking(s) shall be equipped with Non-Vital Interlocking Processor Systems which shall perform the non-vital interlocking functions represented by the non-vital interlocking circuits shown in the Contract Drawings. Non-vital interlocking diagnostic functions shall also be accomplished by means of these microprocessor-based systems, as specified in Section 16926, Microprocessor Systems for Non-Vital Interlocking Functions. The "new" interlocking(s) shall also be equipped with Interlocking Vital Processor (IVP) Systems, as specified in Section 16928.
- D. The Automatic Train Operation System shall be provided as specified herein and shall include all wayside equipment and subsystems:
  - 1. To cause the trains to accelerate and decelerate at the proper rates,
  - 2. To cause the trains to maintain the desired speed under various conditions of grade and curvature;

3. To cause the trains to stop automatically at the proper position at station platforms;
  4. To cause the trains to be capable of automatic door opening and closing, and automatic dwell timing, and;
  5. To automatically control (future) platform train destination signs.
- E. The non-vital functions related to train/station operations shall be accomplished by microprocessor-based systems as specified in Section 16924, Non-Vital ATO & ATS Processor Systems.
- F. The Automatic Train Supervision System shall be provided as specified herein. It shall include all wayside equipment and subsystems necessary to supervise the scheduled performance of trains and to control and monitor certain transit system mechanical support facilities and electrical power facilities. It shall also include additions and modifications to the existing wayside Data Transmission System (DTS), and the furnishing, installation and testing of Remote Terminal Units (RTUs) at each new TCR as specified herein and as shown on the Contract Drawings.
- G. The RTUs at the new Train Control Rooms shall be as specified in Section 16925, Data Transmission System (DTS). In addition, a new RTU of the type specified in Section 16925 shall be provided and delivered to the Authority for training and emergency replacement use. See also Section 16932, Spare ATC Equipment and Selectable Items.

#### **1.04 SUPPORT SYSTEMS**

- A. Provide all systems, equipment and facilities required or necessary to support the major ATC subsystems listed above, and all ancillary support systems and facilities as specified herein.
- B. Electrical Systems
1. Provide ATC Power Distribution Systems as specified in Section 16921.
  2. Provide ATC Lightning/Surge Protection and Grounding Systems as specified in Section 16922.
- C. Provide additions to the Train Control Maintenance Telephone System as specified in Section 16923.
- D. Microprocessor Systems
1. Provide Non-Vital ATO & ATS Processor Systems as specified in Section 16924.
  2. Provide additions to the existing Data Transmission System as specified in Section 16925.
  3. Provide Microprocessor Systems for Non-Vital Interlocking Functions as specified in Section 16926.
  4. Provide Interlocking Vital Processor Systems as specified in Section 16928.
  5. Furnish Microprocessor Support Systems as specified in Section 16909.

#### **1.05 ENVIRONMENTAL REQUIREMENTS**

- E. Provide and maintain all ATC equipment and material under the provisions of Section 16914.
- F. Provide and maintain specific ATC equipment and material to the environmental requirements listed in individual Related Sections.

## **1.06 RELATED SECTIONS**

- A. Division 1 - General Requirements
- B. All Sections in the 16900 series.

## **1.07 REFERENCES**

- A. Listed in individual Related Sections, where applicable.

## **1.08 QUALITY ASSURANCE**

- A. Perform certain pre-design, pre-installation and pre-test field inspections as specified herein, and in Section 16988, ATC Quality Assurance. ATC Subsystems and components shall be inspected and tested as specified in the applicable individual ATC Sections of these Specifications.
- B. The installed wayside ATC equipment, systems and subsystems shall be field inspected and tested as specified in Section 16980, ATC Tests, Inspections and Quality Assurance.
- C. As a general requirement of these Specifications, the ATC test procedures and tests which the Contractor develops and performs shall not only ensure that the ATC equipment, circuits, systems and subsystems are performing the tasks which they are required to be performing, in the manner specified (POSITIVE TESTING), but shall also ensure that the ATC equipment, circuits, systems and subsystems are not performing in any manner which could have an unsafe or undesirable effect upon METRORAIL operations, METRO riders, or the public in general (NEGATIVE TESTING). While the POSITIVE TESTING requirements and some of the NEGATIVE TESTING requirements are set forth in these Specifications in considerable detail, it shall also be incumbent upon the Contractor, based upon past experience and familiarity with his own equipment, to include in the test procedures and tests, requirements for actions and verifications which shall either:
  - 1. Reveal any additional potential or existing unsafe or undesirable conditions, or;
  - 2. Prove that unsafe or undesirable conditions do not exist.
    - a. These requirements shall apply not only to conditions inherent to the ATC systems, but also to potentially unsafe or undesirable conditions resulting from interaction between the ATC systems and other systems or the operating environment.
- D. Comply with the requirements of Section 16988, ATC Quality Assurance.

## **1.09 HOURS OF WORK**

- A. Work such hours per shift, with or without overtime, as many shifts per day and as many days per week as necessary (with the exception of the restrictions noted below), to complete the various parts of the ATC work and the entire ATC work within the dates specified in Section 16995, ATC Appendix "M". This work shall be conducted in accordance with:
  - 1. The Authority's RAIL ADMINISTRATIVE PROCEDURE RAP 100-9, Access to Revenue or Start-Up Railroad Facilities, and;
  - 2. The following WMATA STANDARD OPERATING PROCEDURES:
    - a. SOP #19 - Maintenance and Testing on Revenue Facilities
    - b. SOP #33 - Removal and Restoration of Third Rail Power for Work by Contractor's Forces - Mainline, Revenue System.
- B. Work in the Operating Metro System

1. Submit a weekly work schedule ten days in advance, to the Engineer detailing the type of work, location and hours of work which will take place during the week.
2. Scheduled ATC work in the operating Metro Rail System shall conform to the following allowed hours of work:
 

a.	Track Level	Mon-Fri Sat-Sun	1:00 AM to 4:00 AM 3:00 AM to 6:00 AM
b.	Platform Level		Anytime except rush hours, as coordinated with the Authority
c.	TCR	Mon-Fri Sat-Sun	1:00 AM to 4:00 AM 3:00 AM to 6:00 AM
d.	Jackson Graham Building (OCC)		Possible Times: 10:00 AM to 2:00 PM 8:00 PM to 11:00 PM 1:00 AM to 5:00 AM as coordinated with the Authority
3. No work will be permitted at any location in the operating METRO SYSTEM during the following rush hours:
  - a. 7:00 AM until 9:30 AM - Mon. through Fri.
  - b. 11:30 AM until 2:00 PM - Mon. through Fri.
  - c. 4:00 PM until 8:00 PM - Mon. through Fri.
  - d. No rush hours exist on Saturday or Sunday, but access may be denied due to special events.

## **PART 2 - PRODUCTS**

### **2.01 BASIC REQUIREMENTS**

- A. Furnish, unless otherwise specified or provided in the Contract, all material, implements, machinery, equipment, tools, supplies, protective coverings, air conditioning, dehumidification, dewatering, transportation, cleaning, heat, water, light, and power required or necessary for the prosecution and completion of the ATC work.

### **2.02 SUBMITTALS**

- A. All ATC submittals shall conform to the requirements of Section 16912, Basic ATC Submittal Requirements.

### **2.03 SPECIAL INSTALLATION EQUIPMENT**

- A. Where local conditions, (e.g., close clearances, or tunnel cross adits, or other openings in tunnel walls or retaining walls) make it impossible to install cable or other ATC apparatus in the usual specified manner, it shall be the Contractor's responsibility to design, furnish and install appropriate cable tray and/or special mounting brackets of a type and design approved by the Engineer, at no additional cost to the Authority.

## **PART 3 - EXECUTION**

### **3.01 DESIGN**

- A. Develop and furnish to the Authority a complete block design for the route segment

included in this Contract within 120 days of receipt by the Contractor of NTP. This shall include coordination with, and any necessary modifications to the block design of the tie-in location(s) already in service. This block design shall be based upon the characteristics of imaginary, worst-case-composite WMATA transit vehicles, i.e., transit vehicles which incorporate the worst characteristics, from a safety point of view, of each of the types of WMATA METRORAIL passenger transit vehicles currently in Revenue Service. (See Section 16905, Transit Vehicle Characteristics.)

- B. The ATC block design for the route segment included in this Contract shall be in conformance with the requirements specified in Section 16913, ATC Block Design. This shall include design to meet special requirements set forth in Section 16918, Special Requirements for Specific Locations, and on the Contract Drawings.
- C. Complete the final ATC circuit and detail design in conformance with all requirements and restraints specified herein.
- D. Provide complete mechanical design for installation of the required wayside ATC equipment. The installation of the wayside ATC equipment shall be as specified herein and as indicated on the Contract Drawings wherever possible and practical to best meet the intent of these Specifications. Where local conditions prevent the specified typical installation, it shall be the Contractor's responsibility to design and implement alternate methods of equipment mounting, subject to the approval of the Engineer, at no additional cost to the Authority.
- E. Clearance
  - 1. Design for a clearance envelope four (4) inches larger than the dynamic outline of the transit cars, i.e., ATC equipment shall be so located that all parts of wayside ATC equipment, including open doors or covers of such equipment, are at least four (4) inches from the dynamic outline of the transit cars wherever possible. This shall include allowances for: middle and end overhang of the cars at turnouts and crossovers and on non-tangent track, and; tilting of the cars on superelevated track.
  - 2. Where, due to circumstances beyond the Contractor's control, it is impossible to comply with the "4-inch envelope" requirement for mounting ATC equipment in the normal manner or location, notify the Engineer in a timely fashion and submit one or more alternate mounting designs for the approval of the Engineer. In all cases, a clearance envelope two (2) inches larger (in all directions) than the dynamic outline of the transit cars shall be regarded as an absolute minimum clearance requirement for the mounting of ATC equipment. This envelope shall include allowances for all overhang and tilting of the cars.
- F. Electrical conductor sizes shown in the Specifications shall be regarded by the Contractor as the minimum sizes allowable for specific applications. The Contractor shall, as part of his final circuit design work, make the computations necessary to determine what conductor sizes are required to overcome line losses on cable runs to ensure that the proper operating voltage and current are available at each piece of ATC equipment to be used. These computations shall be submitted to the Engineer. Where conductor sizes larger than the minimum sizes shown in the Specifications are necessary for proper adjustment and operation of the ATC equipment, the Contractor shall include these larger conductor sizes in the final design and provide them at no additional cost to the Authority.

### **3.02 PRELIMINARY SITE INSPECTION**

- A. Conduct within 30 calendar days of individual site availability, a thorough inspection of all TCRs, ancillary rooms and other wayside locations where wayside ATC equipment and support system equipment required by these Specifications is to be installed. This inspection shall include, but not be limited to, the following:
1. Inspect the trackwork right-of-way and promptly notify the Engineer in writing, of any conditions which would interfere with the proper installation, safe operation or proper maintenance or replacement of the wayside ATC equipment.
  2. Inspect the trackwork provided by other disciplines to verify that the as-installed locations of insulated joints are necessary and correct to perform the ATC system functions required. Promptly notify the designated Resident Engineer in writing, of any missing, incorrectly located, extraneous, or obviously defective insulated joints observed in this inspection.
  3. Inspect the special trackwork provided by other disciplines to verify proper location and operation of switch points, correct placement and type of switch rods, and adequate drainage around switch layouts and throughout the interlocking.
  4. Inspect the concrete tunnel walls and, where applicable, the channel inserts installed therein, along the METRO trackage included in this Contract and note any conditions which would interfere with proper installation of cable or other required wayside ATC equipment thereon.
  5. Take special note of wayside conditions that might interfere with the required sight distances for signals.
  6. Take special note of wayside conditions which might interfere with the proper location, installation, replacement, operation or maintenance of switch-and-lock movements, switch rods, wayside signal and pushbutton layouts, impedance bonds, inductive track loops, signal or negative-return bonding, or marker coil layouts.
- B. Submit, within 15 calendar days of performance of each initial preliminary site inspection, a report of this initial preliminary inspection to the Engineer. This report shall list all potential problems noted and indicate the specific actions the Contractor proposes to surmount the problems.
- C. Following the initial site inspections, perform periodic on-site inspections to identify incomplete or incorrect work by other contractors or other disciplines which, if not corrected, will have either an immediate or eventual effect upon the design, installation, testing, operation and/or maintenance of the ATC System specified herein. These inspections shall be for the purpose of identifying any incorrect work by others, or by other disciplines, which must be corrected in order that the ATC systems will operate as specified.
- D. The Contractor shall have the responsibility for coordinating the scheduling of these inspections with the Engineer. However, the Contractor shall assume full responsibility for identifying any item of incorrect related work by others or by other disciplines well in advance of the completion date so that:
1. The Authority and other disciplines or contractors will have sufficient time to take the necessary corrective action.
  2. The Contractor will have sufficient time to install and test the specified Train Control system without impacting the project completion schedule.
- E. Examples of incorrect work include, but are not limited to the following:
1. Missing facilities, such as insulated joints or conduit runs.
  2. Incorrectly located facilities, such as insulated joints, or conduit runs.

3. Improperly prepared sites, e.g., intrusions into the ATC design envelope, or conditions that would prevent proper maintenance or replacement of the ATC equipment.
  4. Improperly installed equipment, e.g., switch rods.
  5. Equipment which is inadequate or otherwise unsuitable for the specified operation of the approved ATC system.
- F. Submit written reports of these inspections to the Engineer within 48 hours of the date they are performed. These reports shall contain the following information:
1. Location and date of inspection.
  2. Attendees at inspection.
  3. Descriptions of problems identified.
  4. Contractor's recommendations for the corrective action necessary.
  5. Contractor's estimate of the latest completion date for corrective action which will not impact his completion schedule.
  6. Contractor's reasons why the problem was not reported on his previous inspections.
  7. Description of the train control work, if any, which is impacted by the problem identified.
  8. If the Contractor fails to identify incorrect work by other contractors or disciplines (which will prevent proper or timely installation or testing of ATC work) and notify the Authority in a timely manner, he shall be responsible for correcting that work as part of this Contract at no additional cost to the Authority. Furthermore, the Contractor shall then be responsible for making any resulting necessary corrections or additions to his own work after the incorrect work of other contractors or disciplines has been corrected, all at no additional cost to the Authority.

### **3.03 FABRICATION AND PROCUREMENT**

- A. Upon receiving approval of required submittals, proceed with the procurement, manufacture, factory testing, shipment and/or storage of all approved material and equipment in such a manner that it is available in good working order, at the time and place scheduled.

### **3.04 DELIVERY, STORAGE AND HANDLING**

- A. Deliver the specified equipment, material and software included in this Contract to the various appropriate TCR and wayside locations no earlier than the respective access dates indicated in Section 16995 (Appendix "M") of the Contract Documents.
- B. Deliver products and material to site under provisions of Section 16911 3.04.
- C. Comply with delivery requirements specifically listed in individual Related Sections, where applicable.
- D. The Contractor shall be responsible for safe and protected transportation and storage of all ATC System equipment and materials from the time of its manufacture or procurement until such time that it is installed.

### **3.05 JOINT PRE-INSTALLATION INSPECTION**

- A. Prior to the field installation of wayside equipment along the track right-of-way in each

TCR area-of-control, participate with the Authority's Engineer in a joint field inspection to determine:

1. The suitability of the Contractor's final design for the installation of wayside equipment relative to existing field conditions, with special emphasis on clearance and sighting considerations;
  2. The final, exact location for each piece of ATC equipment which cannot be installed in the normally specified manner due to some obstruction or restriction.
- B. Produce dimensioned sketches, in duplicate, to document the final, non-standard equipment locations agreed upon. These sketches shall be initialed by the Contractor and the Engineer, and one copy retained by each.

### **3.06 INSTALLATION**

- A. Install all necessary and/or required Train Control Room ATC equipment in the TCRs constructed by others (or by other disciplines). The TCRs will be located in passenger stations wherever practical. Suggested layouts for these rooms are included in the Contract Drawings. Where the proposed or completed lighting arrangement by others (or by other disciplines) in a TCR conflicts with the requirements of the ATC portion of this Contract, the Contractor shall modify the lighting system in an acceptable manner, at no additional cost to the Authority.
- B. Install all necessary and/or required trackside ATC equipment. The types of construction involved are shown on the Contract Drawings furnished with these Specifications and on other drawings available to the Contractor. Any trackside ATC equipment that is installed in such a manner that it does not meet the clearance or sighting requirements specified herein shall be reinstalled properly by the Contractor at no additional cost to the Authority.
- C. All installation work shall be performed in accordance with stamped approved drawings. No installation work shall begin without a copy of the applicable approved drawings on site.
- D. Take all reasonable measures and perform all work necessary to protect the installed ATC equipment and circuitry from damage due to dust, moisture, heat, cold and other potentially damaging conditions, at no additional cost to the Authority.

### **3.07 FIELD DOCUMENTATION**

- A. An as-built copy of the Room Book of Plans shall be kept in each Train Control Room during all phases of installation and test. The room as-builts shall reflect the current status of room and wayside wiring at all times.
- B. Failure to maintain the room as-built plans will result in suspension of all activities until complete up-dates are made.

### **3.08 INSPECTIONS AND TESTING**

- A. Type Acceptance Testing
1. All ATC equipment proposed for use on the WMATA Metrorail System under this Contract which is not identical to ATC equipment already in regular use on the WMATA Metrorail System shall be subject to Type Acceptance Testing to determine whether it meets the specified requirements in a manner acceptable

to the designated Resident Engineer. The Contractor shall devise, perform and document such tests, subject to the direction and approval of, and observation by, the Engineer, at no additional cost to the Authority. The decision of the Engineer with regard to the acceptability of proposed new equipment, equipment configuration, methodology, circuitry and/or programming will be final.

- B. Factory Inspections and Tests
  - 1. Perform and document factory and procurement inspections and tests on ATC materials, equipment and systems to be installed under this Contract as specified in the Quality Assurance portions of the various articles specifying the materials, equipment and systems.
- C. Field Inspections and Tests
  - 1. Perform and document field inspections and tests on all ATC systems and equipment as specified in Section 16980, ATC Tests and Inspections, and as specified herein and in other individual Sections of these Specifications.

### **3.09 TIE-INS AND ACTIVATION**

- A. Work in close cooperation and coordination with the Authority when making the required modifications and additions to existing, operating ATC circuits and equipment in order to place the new ATC systems in operation in a safe and efficient manner without interfering with revenue service or other normal METRORAIL operations. This work shall be done as specified in Section 16918, Special ATC Requirements for Specific Locations.
- B. When the METRORAIL extension or expansion project included in this Contract is put into operation:
  - 1. Disconnect all applicable pre-existing ATC TCR equipment which is no longer required.
  - 2. Remove and deliver to the Authority, in good working condition, all of the Authority's pre-existing wayside ATC equipment which is no longer required, except for wall mounted cable and junction boxes, which shall be left in place.

### **3.10 SAFETY**

- A. Conduct an ATC System Safety Program for all areas of wayside and trackage equipped under this Contract, as specified in Section 16919, to ensure the safety of the ATC equipment, circuits and systems installed, and the safety of all personnel involved in the associated installation and testing activities.

### **3.11 TUNNEL AND INVERT CLEANING (Where Applicable)**

- A. Perform (at the appropriate time after all other installation work in the new "X" Route Trackwork area has been completed, and prior to dynamic train testing, on both the outbound and inbound tracks) the following tunnel cleaning and invert cleaning work in all underground trackwork areas within the limits of this Contract:
  - 1. Cover all drain openings with adequate filter media to prevent entry of wash down debris into the drainage system. Filter media shall be monitored and maintained during the wash down.
  - 2. Clean all tunnel, tunnel invert, safety walk, track and wayside equipment surfaces using a method adequate to remove dust and debris which may become airborne during dynamic train testing. This cleaning shall include, but

not be limited to, the surfaces of junction boxes, cables, fire lines, running rails, restraining rails, third rail, third rail cover boards, track fasteners, conduits, safety walks, cross adits, the areas under the running rails and the contact rails.

3. Remove all debris resulting from the tunnel and invert cleaning.
  4. Remove filter media from the drain openings once all cleaning operations have been completed.
- B. Furnish, through agreement with the local jurisdiction, any water needed for the cleaning operations.
  - C. Take appropriate measures to protect all equipment installed in the area being cleaned. The Contractor shall be responsible for damage to any equipment resulting from the cleaning operation.
  - D. Upon completion of the cleaning operation, inspect each of the drain openings for debris. Remove all debris and prove the drainage system using an adequately sized mandrel.
  - E. The Contractor shall remain responsible for the prevention of airborne dust in the inbound and outbound tunnels for the duration of all dynamic train testing including dynamic system testing.

### **3.12 ATC EQUIPMENT FAMILIARIZATION**

- A. Provide, as a minimum, adequate special instruction and training to thoroughly acquaint appropriate Authority operating and maintenance personnel with ATC equipment and circuits furnished under this Contract which are different from those used on previous operating segments of the METRO system. In addition, provide training as specified in Section 16993, ATC Training Courses, and various other Sections of these Specifications, for certain other specific equipment and systems.

### **3.13 ATC DOCUMENTATION**

- A. Provide both on-going and final, "AS-BUILT" documentation of all ATC equipment, systems, programs, tests, inspections, installation methods, procedures, block design and circuits required or necessary under this Contract in the manner specified in Section 16912, Basic ATC Submittal Requirements, Section 16990, ATC Documentation and Training, and as required by this Section and various other related Sections of these Specifications.
- B. Provide, for each TCR newly equipped or modified under this Contract, a separate magnetic media record (and a separate optical media record) in an Authority standard software program, which indexes each ATC relay coil and heel contact to a specific circuit drawing number in that Room Book of Plans. These records shall be in a spreadsheet or data base format and shall be known as Relay/Contact Location Charts. (See the Contract Drawings for an example format for these charts.) The charts shall be organized by the relay names. The relay names shall be shown on the charts in two sections. The first section is for relay names starting with numbers. The numbered names shall be entered into the chart in ascending order. All relays having the same number shall be entered consecutively into the chart in alphabetical suffix order. Relay names beginning with letters shall be entered into the second section of the chart. All relays beginning with the same letter shall be entered consecutively into the chart according to succeeding letters (alphabetically), numbers (in ascending order) or both.

- C. Provide "Equivalent Circuit" drawings in discrete-component logic style for every Boolean algebra software logic statement used to document the logic used in the ATC microprocessor units furnished under this Contract. These drawings shall include a complete, alphabetical listing of all terms used in the Boolean logic statements and their definition in clear and concise English.

### **3.14 ATC SYSTEM TESTING SUPPORT**

- A. Assist the Authority in the system testing of all mainline/OCC interface circuits, systems and subsystems at no additional cost to the Authority.

### **3.15 BASIS FOR PAYMENT**

- A. The basis for final, total payment for the Wayside ATC System included in this Contract will be the *applicable* lump sum and unit prices listed in the Contract Unit Price Schedule, which will constitute compensation for all ATC material and ATC work required to complete the Contract.
- B. No ATC material will be paid for until the applicable product submittals and Contractor produced drawings have been submitted in proper sequence by the Contractor and approved by the Engineer.
- C. For any given product or subsystem:
  - 1. No circuits will be approved until all applicable product submittals have been approved;
  - 2. No arrangement plans for layouts will be approved until all applicable circuits have been approved,
  - 3. No payments will be made until the applicable arrangement plans or layouts have been approved.
- D. No payment will be made for ATC work executed without approved drawings.

### **3.16 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. ATC equipment, circuits, systems, tests, special programs and documentation will be measured for partial payments as specified elsewhere in the Contract Documents, and as specified in the individual Sections of the ATC Technical Provisions of these Specifications.
- B. Partial payments for ATC work and equipment will be made periodically, based upon the payment schedules established by the Authority, which in turn will be based upon:
  - 1. Compliance with the specified requirements for such payments, to include the timely and accurate submittal of required documentation in the proper format;
  - 2. The percentage of equipment provided and work done in the manner specified,
  - 3. The acceptability of the equipment, systems, programs, or documentation provided, as applicable.
- C. Tunnel and Invert Cleaning (where applicable) will be measured for payment based upon:
  - 1. Satisfactory performance of the work required.
  - 2. Satisfactory completion of dynamic train testing in the tunnel areas.

### **3.17 MEASUREMENT FOR PARTIAL PAYMENTS FOR TUNNEL AND INVERT CLEANING**

- A. Factors which will be considered when determining partial payments for Tunnel and Invert Cleaning will include the following:
  - 1. Satisfactory completion of the required cleaning.
  - 2. Satisfactory completion of dynamic train testing in the applicable area.

**END OF SECTION**

## SECTION 16912

### ATC SUBMITTAL REQUIREMENTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the various types of ATC submittals and resubmittals required by this Contract, the preparation and delivery to the designated Resident Engineer (Engineer) of these submittals, and various other requirements of the ATC submittal and review process. In case of conflict between the requirements of this Section and those contained elsewhere in these contract documents, the requirements of this Section shall govern ATC Submittals.

##### 1.02 TYPES OF ATC SUBMITTALS

- A. The basic types of ATC submittals required include:
1. Train Control Drawings
  2. Technical Review Documentation
  3. Samples
  4. Certifications
  5. Special Documentation
  6. Inspection Reports
  7. Test Plans and Procedures
  8. Test Reports and Data Sheet
  9. Contract Record Drawings

##### 1.03 BASIC SUBMITTAL REQUIREMENTS

- A. It shall be the responsibility of the Contractor to ensure that competent personnel are assigned and retained for the task of preparing the required ATC submittals and all other documentation necessary to comply with the Specifications. Submitted documents shall be complete. Submitted circuit and equipment drawings shall have been thoroughly checked for completeness and accuracy and shall bear the initials or signature of a fully qualified checker in witness thereof before being submitted to the Engineer for approval.
- B. Submit performance data and final design and installation drawings to the Engineer for approval of all ATC equipment which the Contractor proposes to use under this Contract. The Contractor shall not proceed with the fabrication or procurement of equipment or materials, except at his own risk, until such items have been approved by the Engineer.
- C. When submitting drawings, manuals and other documentation to the Engineer for the initial approval of some product, subsystem, or location, the Contractor shall submit all drawings, manuals and other documentation germane to the subject, at one time. The submittal shall also include all applicable catalog cuts, certified test reports, and any other related items (including samples) which the Engineer considers necessary to evaluate the submittal. This logical grouping of documentation necessary to completely cover the subject concerned, shall be known as a submittal package.
- D. Unless otherwise specified, submittals shall be made at least 90 days prior to the necessary commencement of the work for which approval is required. Submit all required schedules, inspection procedures, inspection reports, progress reports, test procedures, test reports and other specified documentation to the Engineer on a timely basis with respect to the specified progression of the work. See Part 3.01.

##### 1.04 RESPONSIBILITY FOR DAMAGES

- A. The Contractor shall be responsible for, and bear all cost of damages which may result from the ordering of ATC material or from proceeding with any part of the ATC work prior to the approval of specified or directed submittals.

#### **1.05 TRANSPORTATION COSTS**

- A. The Contractor shall pay the transportation costs to facilitate priority shipping of ATC submittals and urgent correspondence from the Engineer's facility to the Contractor's designated point of receipt when priority shipment is necessary in order to meet or reduce delay in authorized work schedules.

#### **1.06 INTERPRETATION OF APPROVAL AND REVIEW**

- A. The approval or review of ATC submittals will be general; neither approval nor review shall be construed as:
  - 1. Permitting any departure from the Contract requirements,
  - 2. Relieving the Contractor of the responsibility for any errors including details, dimensions and materials, or,
  - 3. Approving departures from details furnished by the Engineer, except as otherwise specified
- B. The Engineer's approval will be for the purpose of minimizing changes and delays in the field and shall in no way relieve the Contractor of full responsibility for providing complete, safe, reliable, and coordinated working operating systems and subsystems for Automatic Train Control which are compatible with the current METRO ATC system in every respect.

#### **1.07 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 01250 Contract Modification Procedures
  - 2. Division 0 Contractor Requirements
  - 3. Division 1 Contractor's Submittals
  - 4. Section 16911 Scope of ATC Work
  - 5. Section 16990 ATC Documentation and Training
  - 6. Other 16900-Series Sections, as applicable

#### **1.08 REFERENCES**

- A. ASTM E329

- C. Association for Information and Image Management (AIIM) Specification MS32-1985
- D. ANSI PH1.41-1984.

### **PART 2 - PRODUCTS**

#### **2.01 FORMAT AND MEDIA**

- A. The format and media required for the various types of ATC submittals shall be as follows:
  - 1. Train Control Drawings
    - a. Submittals of the following drawings shall be made with the prescribed number of prints on magnetic media in the AUTOCAD format (AUTOCAD Level to be determined by the Authority), or on optical media (format to be determined by the Authority):
      - 1) Double Line Track Plans
      - 2) Cable Plans
      - 3) Control Line Diagrams
    - b. The final submittal of As-Built ATC drawings shall include:

- 1) Mylar Tracings
  - 2) Aperture Cards
  - 3) Magnetic Media in appropriate AUTOCAD format, or on optical media in a format approved by the Authority
  - 4) Prints
- c. See Section 16991, ATC Drawings and Tracings.
2. Technical Review Submittals
- a. The following Review Submittals shall be made with the prescribed number of hard copy sets, and on magnetic media in any MICROSOFT format included in Office Pro (Level to be determined by the Authority), or on optical media (format to be determined by the Authority):
- 1) Block Design
  - 2) Cable/Conduit/Ductbank/Manhole/Surface Trench Installation Layouts for each TCR Area of Control
  - 3) Relay Contact Location Charts
  - 4) All WTP Pre-printed Data Sheets (except for WTP 2.18 and WTP 2.20I)
- b. The following Marker Coil and Cab Signal Level Testing Review Submittals shall be made with the prescribed number of hard copy sets, and on magnetic media in a special, executive software format approved by the Engineer:
- 1) WTP 2.18 Pre-printed Data Sheets
  - 2) WTP 2.18 Test Results
  - 3) WTP 2.20I Data Sheets and Test Results
- c. All WTP series test data (except for WTP 2.18) shall be submitted with four hard copy sets, and on magnetic media in a Microsoft Excel format (Level to be determined by the Authority)
3. Contract Record ATC Drawings
- a. As-built ATC Drawings:
- b. As-built ATC drawings shall include all new Train Control Drawings for the Automatic Train Control System and revisions to all affected existing Authority Record Drawings.
- c. Reproducible As-built drawings, both new and revised, shall be furnished on three-mil plastic film for blackline diazo printing, both sides matte, similar to Mylar and Estar. Images shall be clear, sharp and readily legible.
- d. Revisions to Authority Record Drawings shall match the base drawings in line weights, symbols, and lettering style and size. Drawings shall be provided in AutoCAD magnetic media format. (Level to be determined by the Authority), or on optical media (format to be determined by the Authority).
- e. Completed as-built drawings shall bear the signature of an officer of the Contractor organization, certifying compliance with as-built conditions, using a rubber stamp as follows

AS-BUILT	
<i>Date</i>	
_____	
I certify that this drawing accurately depicts the work as constructed.	
<i>(An Officer of the Contractor)</i>	
_____	
Signature	Title
CONTRACTOR'S NAME	

- f. Microfilmed record drawings:
- g. Upon acceptance of the as-built drawings, the Contractor shall prepare microfilmed record drawings in accordance with the following:
- 1) Military Specification MIL-M-09868 and Association for Information and Image Management (AIIM) Specification MS32-1985, except that the reduction ratio shall be 29:1 and no master roll is required.
  - 2) Employ proper backlighting techniques in order to minimize extraneous background.
  - 3) Furnish three sets of aperture cards, punched, verified and interpreted.
    - a) One set of aperture cards shall contain the silver-gelatin negative camera masters in accordance with ANSI PH1.41-1984. Two sets of Diazo duplicate aperture cards shall also be furnished. Prior to delivery of aperture cards, submit for approval one set of half-size prints reproduced from aperture cards
    - b) The format for punching is:
    - c) columns 1-3                      Three-letter code which identifies the class of information contained in the film chip. See 4) below.
    - d) columns 5-14                    Contract number
    - e) columns 16-28                  Document number
    - f) columns 30-49                  Document description
    - g) columns 51-77                  Microfilm insert, including build-up area for adhesive
    - h) columns 79-80                  Document revision level
  - 4) The three-letter codes are:
    - a) ADJ - Adjacent construction
    - b) ADR - Adjacent restoration
    - c) AFC - Automatic fare collection, rail
    - d) ATC - Automatic train control
    - e) BBL - Bus building
    - f) BFC - Bus fare collection
    - g) BGR - Bus graphics
    - h) BIC - Bike racks and lockers
    - i) BSH - Bus passenger shelters
    - j) BSV - Bus vehicles
    - k) CAT - Cathodic protection
    - l) CCE - Control center equipment
    - m) COM - Communications

| xx) | YTC | - | Yard train control                                 |
- 5) The Contractor shall request additional codes for any subject matter not included in 4) above.
  - 6) Deliver three sets of aperture cards to the Engineer not later than sixty days after approval of the as-built drawings.
  - 7) Furnish and deliver with the aperture cards an index to the drawings on standard computer floppy disks in accordance with the following:
    - a) Each original disk shall have a duplicate back up. The disks shall be of the high-density type.
    - b) Originals and duplicates shall be shipped in separate packages, protected by bubble-pack and tightly-packed stiffeners. The shipping method selected shall preclude X-raying of the disks.
    - c) The information shall be furnished in an ACSII file.
    - d) There are 30 fields in the index:

<u>FIELD</u>	<u>SPACES</u>	<u>CONTENT</u>	<u>RESPONSIBILITY</u>
0	8	Control number	Contractor
1	1	Facility category	Contractor*
2	4	Facility	Contractor*
3	5	Facility detail	Contractor*
4	6	Subsystem	Contractor*
5	4	Subsystem element	Contractor
6	5	Document type	Contractor
7	15	Documentation identification (no.)	Contractor
8	35	Document Title/Description	Contractor
9	3	Revision	Contractor
10	6	Revision date (YYMMDD)	Contractor
11	6	Sheet number	Contractor
12	4	Number of sheets	Contractor
13	6	Document source	Contractor*
14	11	M number	Contractor
15	25	Street Address	Contractor
16	4	County/City	Contractor
17	6	Primary chains	Contractor
18	1	+	Contractor
19	5	Chain detail	Contractor
20	6	Secondary chains	Contractor
21	1	+	Contractor
22	5	Chain detail	Contractor
23	1	Aperture card available	Contractor
24	10	Aperture card (master) location	WMATA
25	8	Contract number	Contractor
26	4	PCO number	Contractor
27	10	Document location	WMATA
28	6	Data entry date (YYMMDD)	WMATA
29	3	Inventory	WMATA

\* The Contractor shall request information from the Authority as to the information to be entered in this field.

Field	0	contains eight characters; the first three are alphabetic, derived from the Contractor's business name, while the last five are sequential numbers, starting with 00001.
Field	1	contains a letter: B=Bus, O=Other, R=Rail.
Field	2	may contain a letter/number combination from the Authority's master list.
Field	3	may contain a letter/number combination from the Authority's master list.
Field	4	contains a letter/number combination which identifies a division of the physical plant by subsystem, such as ESC-7, for escalators in Phase VII.
Field	5	contains a letter/number combination, when applicable, which identifies a sub-division of the subsystem listed in Field 4.
Field	6	contains an alphabetic code to identify the type of document; ASBLT = As-Built, SHDWG = Shop Drawing, WKDWG = Working Drawing.

Field	7	contains the document identification, such as a drawing number.
Field	8	contains the document title, if any, or a brief description.
Field	9	contains the revision level.
Field	10	contains the date of the revision recorded in field 9.
Field	11	contains the sheet number.
Field	12	contains the number of sheets.
Field	13	contains the document source. This is an alphabetic code that identifies the organization that is responsible for the content of the document.
Field	14	contains the M number of the document, if any.
Field	15	contains the street address of the facility, if appropriate. Street addresses will not be used when chain markers are used.
Field	16	contains a code for the city or county part of the address, e.g.: District of Columbia - DC Prince George's County - PG
Field	17	contains the number of full chains included in the lower chain marker at one edge of the drawing information.
Field	18	contains a + for the chain marker format.
Field	19	contains the fractional chain marker digits for the lower chain marker at one edge of the drawing information in the format xx.xx.
Fields	20, 21 and 22	correspond to
Fields	17, 18 and 19	except they apply to the higher chain marker at the edge of the drawing information.
Field	23	contains a "Y" if an aperture card is furnished, an "N" if it is not.
Field	24	contains location information for the Authority's storage of the master aperture card.
Field	25	contains the contract number.
Field	26	contains the PCO number, if any.
Field	27	contains the location of the master document in WMATA storage.
Field	28	contains the date the information is entered in the Authority's data base.
Field	29	when Field 7 identifies a major item of equipment, contains the count of that item at that location.

## **PART 3 - EXECUTION**

### **3.01 TIME OF SUBMITTAL**

- A. Make ATC submittals sufficiently in advance of manufacturing/procurement and installation requirements to allow for checking and appropriate action as specified in Section 16911, Scope of ATC Work; Section 16991, ATC Drawings and Tracings, and; Section 16992, ATC Instruction Manuals. This "advance" time shall be no less than:
1. 90 calendar days for Room Book-of-Plans, RTUs, Instruction Manuals, and other large submittals, as deemed necessary by the Engineer.
  2. 30 calendar days for all other submittals.
- B. Large numbers of submittals shall not be made within a short period of time. No more than ten small, or two large submittals shall be made within any seven-consecutive-day period.

### **3.02 TRAIN CONTROL DRAWING SUBMITTALS**

- A. Submit, unless otherwise directed, one reproducible and three legible copies of all Train Control drawings to the Engineer for approval. These drawings shall be complete and detailed. Train Control drawings shall include, but not be limited to, the following:
1. Title Sheets
  2. Index Sheets
  3. Nomenclature Description Sheets
  4. Relay/Contact Location Charts
  5. Cable Plans
  6. Double Line Track Plans
  7. Arrangement Plans
  8. Product Drawings
  9. Equipment Installation Drawings
  10. Circuit Drawings
  11. Typical Drawings (circuits and/or equipment layouts)
  12. Energy Distribution Schematics
  13. Wiring Diagrams
  14. System Drawings
  15. Control Panel Drawings (to include Back-Panel Wiring)
  16. Tie-in Drawings
  17. Interface Drawings
  18. Cut-In Drawings (as applicable)
  19. TC Maintenance Telephone System Drawings
  20. Trenching Plans (both direct burial and surface trench, as applicable)
  21. ATP Speed Command Control Line Diagrams
- B. Submit Train Control Drawings using standard transmittal forms in accordance with detailed instructions furnished by the Engineer. A supply of these forms will be furnished without cost to the Contractor.
- C. Provide the services of a local reproduction service to prepare three copies of all ATC submittals. Reproduction time shall be less than two business days.
- D. Before submitting Train Control drawings to the Engineer for approval, ascertain that:
1. The drawings represent the coordinated efforts of all Train Control subcontractors involved;
  2. The equipment, circuits, or subsystems represented are compatible with the directly related equipment, circuits and subsystems provided by other disciplines, based upon the most up-to-date information available, and;
  3. The equipment, circuits, or subsystems represented, and the manner in which they are represented, are in conformance with the requirements of these Specifications.
- E. Train Control drawings submitted for the approval of the Engineer shall bear the Contractor's stamp of approval as evidence of such checking, coordination, and compatibility. Drawings submitted without this stamp of approval will be returned to the Contractor for resubmission.
- F. The form and content of Train Control drawings and tracings shall comply with the requirements set forth in the related sections of these Specifications. Criteria for the approval of these drawings are set forth in Section 16991, ATC Drawings and Tracings.
- G. Where ATC drawings show variations from the Contract requirements because of standard shop practice or for other reasons, the Contractor shall describe such variations in his letter of transmittal. If acceptable, the Engineer may approve any or all such variations, subject to a proper adjustment in the Contract. If the Contractor fails to describe such variations, he shall not be relieved of the responsibility for executing the work in accordance with the Contract, even though such drawings have been approved.
- H. If the drawings as submitted show variations per paragraph G. above, and show a departure

from the Contract requirements which the Engineer finds to be in the interest of the Authority and to be so minor as not to involve a change in the Contract price or time for performance, the Engineer may approve the drawings.

- I. Upon approval by the Engineer, each copy of the Train Control drawings will be identified as having received such approval by being so stamped and dated. One reproducible set of Train Control drawings will be returned to the Contractor. The Contractor shall return 2 sets of prints to the Engineer within 15 calendar days.
- J. Train Control drawings stamped "Not Approved" and with required corrections shown will be returned to the Contractor for correction and resubmittal by the Contractor within two weeks. The Contractor shall make any corrections required by the Engineer. If the Contractor considers any correction indicated on the ATC drawings to constitute a change to the Contract Drawings or Specifications, notice as required under Section 01250, Contract Modification Procedures shall be given to the Contracting Officer. Resubmittals will be handled in the same manner as first submittals.
- K. When resubmitting drawings, the Contractor shall direct specific attention, either in the transmittal letter or on the resubmitted Train Control drawings, to revisions other than the corrections requested by the Engineer on previous submissions. Resubmittals will be handled in the same manner as first submittals.
- L. When the Train Control drawings have been completed to the satisfaction of the Engineer, the Contractor shall carry out the installation in accordance therewith and shall make no further changes therein except upon written instruction from the Engineer.
- M. When drawings are approved by the Engineer subject to certain revisions, the Contractor shall supply the Engineer with four suitably revised prints of the approved drawings prior to installation of equipment.
- N. Before any payment is made for Train Control drawings, the Contractor shall furnish to the Engineer three sets of record Train Control drawings, all clearly revised and completed and brought up to date, showing the permanent installation as actually made.
- O. Upon written approval of the final ATC As-Built tracings and drawings by the Engineer, the Contractor shall reproduce the tracings on three sets of microfilm aperture cards of the type and size specified in Section 16991, ATC Drawings and Tracings, and deliver these tracings and aperture cards to the Engineer.

### **3.03 TECHNICAL DOCUMENTATION**

- A. Submit ATC technical documentation (other than drawings) as specified herein. This documentation shall include, but not be limited to, the following:
  - 1. Original and three copies of:
    - a. Inspection Procedures & Reports
    - b. Spare Material and Equipment Lists
    - c. Cable Lists
    - d. Test Equipment Lists
    - e. Power Tabulation Sheets
    - f. Operational Descriptions
    - g. Test Procedures & Reports
    - h. Cut-In Procedures
    - i. Progress Reports
- B. Original and five copies of:
  - 1. Instruction Manuals
  - 2. Training Course Outlines

### **3.04 SAMPLES**

- A. Submit samples for approval as specified or as directed, which shall be delivered to the Engineer as specified or directed. Prepay shipping charges on samples. Materials or equipment for which samples are required shall not be used in the work until approved.
- B. Each sample shall be labeled as follows:
  - 1. Name of project.
  - 2. Name of Contractor and subcontractor.
  - 3. Material or equipment represented.
  - 4. Place of origin.
  - 5. Name of producer and brand, if any.
  - 6. Location in project.
- C. Samples of finish material shall have additional markings identifying them under the schedules.
- D. The Contractor shall mail, under separate cover, a letter in triplicate submitting each shipment of samples and containing the information required in Paragraph B. above. He shall enclose a copy of this letter with the shipment and send a copy of this letter to the Engineer. Approval of a sample shall be only for the characteristics or use named in such approval and shall not be construed to change or modify Contract requirements. Substitutions will not be permitted unless they are considered to be in the best interests of the Authority.
- E. Approved ATC samples not destroyed in testing shall be sent to the Engineer. Approved ATC samples in good condition will be marked for identification and may be used in the work. Materials and equipment incorporated in the work shall match the approved samples. Samples which fail testing or are not approved will be disposed of, unless the Contractor requests, at the time of submittal, that they be returned to him at his expense.
- F. Failure of any material to pass the specified tests will be sufficient cause for refusal to consider, under this Contract, further samples of the same brand or make of that material. The Engineer reserves the right to disapprove any material or equipment that has previously proved unsatisfactory in service.
- G. Samples of various materials or equipment delivered on the site or in place may be taken by the Engineer for testing. When a sample fails to meet Contract requirements, it will automatically void previous approvals of the item(s) tested. The Contractor shall replace such materials and equipment to meet Contract requirements or proper adjustment of the Contract price shall be made as determined by the Engineer.
- H. When tests are required, only one test of each sample will be made at the expense of the Authority. Samples that do not meet specified requirements will be rejected. Retesting of additional samples will be performed by the Engineer at the expense of the Contractor.
- I. Copies of all applicable manufacturer's specifications and Contractor's specifications shall be enclosed with each sample for Authority evaluation.

### **3.05 CERTIFICATION**

- A. Submit the original and three copies of ATC certification, unless otherwise specified.
- B. Certificates:
  - 1. Submit the following:
    - a. Certificates to demonstrate proof of compliance with ATC requirements

specified in the technical specifications for each of the following:

- 1) Products and materials
  - 2) Functioning and testing of equipment and systems.
  - 3) Qualifications of personnel, manufacturers, fabricators and installers.
2. Each certificate shall be signed by an official authorized to certify in behalf of the issuing organization and shall bear the project name and location, and the name and address of the Contractor. The quantity and date(s) of shipment or delivery shall also be indicated if the certificates apply to a material.
  3. ATC Certification shall not be construed as relieving the Contractor from furnishing satisfactory material, if, after tests are performed on selected samples, the material is found not to meet the specified requirements.
- C. Certified ATC Material Test Reports:
1. Submit original.
  2. Unless otherwise specified, testing shall be conducted by an independent testing agency which certifies that the applicable testing complies with the recommended requirements of the American Council of Independent Laboratories or ASTM E329.

### **3.06 SPECIAL DOCUMENTATION**

- A. Submit to the Engineer the original and three copies of each of the following when so specified in the ATC technical specifications and as follows:
1. Test reports of previous testing:
    - a. Where specified in the ATC technical specifications, the Contractor may, in lieu of testing, submit certified test reports of previous testing of such items, if the reports were approved under similar Authority contracts.
    - b. Include the following :
      - 1) Certification that materials meet or exceed specified test requirements.
      - 2) Name and address of testing laboratory.
      - 3) Dates of tests to which reports apply.
      - 4) Certification that materials provided are exactly the same as those tested.
    - c. Calculations.
  2. Miscellaneous documentation:
    - a. Specified items such as delivery tickets, batch tickets and bills of materials

### **3.07 INSPECTION REPORTS**

- A. Submit the original and three copies of all ATC Inspection Reports.
- B. Inspections should be performed for acceptance in the areas of specification compliance, workmanship, reliability, possible damage and proper installation.
- C. Required inspection reports should include but not be limited to the following:
1. All wayside ATC equipment (incoming and installation).
  2. All ATC wayside cable (incoming and installation).
  3. All Train Control Equipment (incoming and installation).

### **3.08 TEST PLANS AND PROCEDURES**

- A. Submit an overall test plan to include all applicable factory and field tests by location. Submit a test schedule, which includes the anticipated order, and dates in which each required test will be performed. Submit a cutover plan when interface to an existing location is required.
- B. Submit all required factory and field test procedures.

- C. Required test procedures should include but not be limited to the following:
  - 1. Any general information that aids the test engineer.
  - 2. A general description of the objective of the test
  - 3. The required test equipment and tools needed to perform the test.
  - 4. The facility and location requirements needed to perform the test.
  - 5. The test prerequisite requirements.
  - 6. Test personnel requirements.
  - 7. The test method needed to perform the test.
  - 8. Pass/fail criteria.
  - 9. Sample data sheets and data cover sheets.

### **3.09 TEST REPORTS AND DATA SHEETS**

- A. Submit the original and three copies of pre-printed data sheets in advance of the test report for each required test procedure.
- B. Pre-printed data sheets should include all known variables prior to the collection of any actual test data. Examples:
  - 1. Known expected values (voltages, currents, resistances or frequencies).
  - 2. Track circuit, signal, marker coil, switch machine, cable and impedance bond names, etc.
  - 3. Wayside equipment locations and chain markers.
  - 4. Required routes.
- C. Submit the original and three copies of the completed test reports for all required factory and field test procedures.
- D. A completed test report should include, but not be limited to, the following:
  - 1. Completed cover sheets (standard cover sheet, standard circuit page, standard arrangement plan, equipment usage form and discrepancy action form)
  - 2. Completed data sheets.
  - 3. Any original test drawings needed to record data collection.

### **3.10 CONTRACT RECORD ATC DRAWINGS**

- A. Basic Requirements:
  - 1. During installation and testing of the Train Control system, the Contractor shall maintain a record set of ATC drawings annotated to show all changes incorporated as work progresses. Information shall include, but not be limited to, the following:
    - a. Field changes of equipment, dimensions, wiring and detail.
    - b. Changes accomplished by change orders.
  - 2. Before the scheduled date of the final acceptance of all Contract ATC work, the Contractor shall submit approved as-built mylar original drawings and microfilmed record drawings for the completed ATC work.
- B. As-built ATC drawings:
  - 1. As-built drawings shall include all new Train Control Drawings for the Automatic Train Control System and revisions to all affected existing Authority Record ATC Drawings.
  - 2. Authority Record ATC Drawings are as-built drawings provided to the Authority under previous or concurrent related contracts. The Contractor shall coordinate with the Authority to determine which existing Authority Record Drawings require revision.
  - 3. The Authority will furnish the original Mylars of the Authority Record ATC Drawings that require revision, from which the Contractor shall make reproductions for his use in preparing as-built drawings. The original Authority Record ATC Drawings shall be returned to the Authority not later than 10 calendar days after their receipt from the

Authority.

4. The Contractor shall submit three sets of prints and three electronic file copies of as-built drawings for initial review and approval.
5. Additions and corrections shall be incorporated by the Contractor and three sets of prints and three electronic file copies shall be prepared and submitted to the Authority for review and approval not later than 30 calendar days prior to the date scheduled for final acceptance of the Contractor's work.

### **3.11 REVIEW**

- A. If, in the opinion of the Engineer, a cursory review of a submittal (or resubmittal) indicates that it is substantially incomplete, incorrect or deficient in the furnishing of documentation of the subject concerned, the submittal will be disapproved and no attempt will be made by the Engineer to identify and correct every deficiency in the submittal.
- B. The Engineer's approval will be for the purpose of minimizing changes and delays in the field and shall in no way relieve the Contractor of full responsibility for providing complete, safe, reliable, and coordinated operating systems and subsystems for automatic train control which are compatible with the current WMATA Metrorail ATC system in every respect.

### **3.12 RESUBMITTAL**

- A. It is part of the intent of the ATC portion of this Contract that any ATC product, subsystem, or location shall receive final design approval with no more than one resubmittal. If more than one resubmittal for any product, subsystem or location is necessary, the Contractor shall reimburse the Authority for all costs incurred by the Engineer in reviewing those resubmittals made by the Contractor after the initial resubmittal. These costs will be deducted from the progress payments made to the Contractor under the Measurement for Partial Payments subsections of the applicable 16900-series Sections of these Specifications.
- B. The Engineer will review the initial submittal and no more than one resubmittal of each product, subsystem, or location as part of the requirements of this subsection. It is the responsibility of the Contractor to ensure that in the event a resubmittal of the initial submittal is necessary, he has, in the resubmittal, either:
  1. Responded in the manner suggested to all the Engineer's comments made in the first review, or;
  2. Taken exception in writing to any of the Engineer's first review comments which he believes should not be incorporated by him in his first resubmittal, and responded in the manner suggested to all the Engineer's other comments made in the first review. When taking exception to the Engineer's comments, the Contractor shall state his reasons for not complying, and offer a workable alternative consistent with the intent of the Specifications.
- C. In instances where a supposedly complete submittal or resubmittal is approved by the Engineer, but is later found to be in error or unworkable, the Engineer reserves the right to withdraw the earlier approval and require correction and resubmittal of the earlier submittal. The full cost of correcting such resubmittals, and the cost of the Engineer's time to review such resubmittals shall be borne by the Contractor at no additional cost to the Authority. These costs will be deducted from the progress payments made to the Contractor under the Measurement for Payment subsections of the applicable 16900-series Sections of these Specifications.

**END OF SECTION**

## SECTION 16913

### ATC BLOCK DESIGN

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the design criteria and basic information which the Contractor shall use in preparing the ATC Block Design for the portions of the Metro Rail Rapid Transit System included in this Contract and the responsibilities of the Contractor for simulating, implementing and documenting this block design.

##### 1.02 RELATED SECTIONS

- A. Section 16901 Definitions of ATC Terms
- B. Section 16902 ATC Abbreviations
- C. Section 16904 Current Automatic Train Control System
- D. Section 16905 Transit Vehicle Characteristics
- E. Section 16911 Scope of ATC Work
- F. Section 16917 Basic Interlocking Requirements
- G. Section 16918 Special ATC Requirements for Specific Locations
- H. Section 16924 Non-Vital ATO & ATS Processor Systems
- I. Section 16926 Microprocessor Systems for Non-Vital Interlocking Function
- J. Section 16928 Interlocking Vital Processor Systems
- K. Section 16980 ATC Tests, Inspections and Quality Assurance

##### 1.03 FUNCTIONS OF BLOCK DESIGN

- A. The primary functions of the block design shall be:
  - 1. To provide safe train operation;
  - 2. To enable all of the required "Design" and "Peak Capacity" headways to be achieved and maintained at all specified Performance Level speeds;
  - 3. To allow trains to travel as fast as possible, consistent with speed restrictions.
  - 4. To allow all Performance Level speed limit speeds to be attained in both the Normal and Reverse directions of Traffic.
- B. In addition, the block design shall include such track circuit boundaries as are necessary for the proper operation of the program stop and door control systems, for crossbonding and negative propulsion return requirements, for the operation of interlockings, and, where applicable, for automatic train routing and automatic terminal operation.
- C. The block design shall provide for the operation of both ideal trains and worst-case trains and must assume that an ideal train can become a worst-case train at any instant.

##### 1.04 BASIC INFORMATION

- A. Speed Limits
1. The civil speed limit of a speed zone shall be set for the comfort of passengers on trains and on station platforms. The safety speed limit shall be set to minimize potential passenger injury.
- B. Civil Speed Limits
1. The civil speed limit within all station approach limit areas shall not exceed 50 mph. The civil speed limit on all station platform tracks shall not exceed 40 MPH. The civil speed limit (in the direction approaching a station platform) for each track circuit within the programmed station stopping control limits of a station shall be the lowest ATP speed command (i.e., 40 mph, 45 mph or 50 mph) which can be applied without interfering with normal programmed station stopping at that station.
  2. For all sections of track other than station areas, the civil speed limit shall be the highest ATP speed command not exceeding the civil speed limit of the given section of track as indicated on the Contract Drawings. Civil speed limits for curves shall apply to adjacent spirals. In the case of compound curves, the connecting spiral shall be assumed to have a civil speed limit equal to the lower of the civil speed limits of the two curves.
- C. Safety Speed Limits
1. For speed zones where the civil speed limit is restricted by curves, the safety speed limit,  $V_s$  shall be:
    - a.  $V_s = V_c$  times the square root of the quantity  $1 + \frac{2}{E_a + E_u}$
    - b. Where:  $V_c$  is the civil speed limit of the speed zone (M.P.H.);  
 $E_a$  is the actual superelevation (inches);  
 $E_u$  is the unbalanced superelevation (inches).
    - c. The civil speed limit ( $V_c$ ) is given on the Contract Drawings for each curve.  $E_a$  and  $E_u$  shall be as shown on the applicable trackwork drawings. Safety speed limits for curves shall apply to adjacent spirals. In the case of compound curves, the connecting spiral shall be assumed to have a safety speed limit equal to the lower of the safety speed limits of the two curves.
  2. The safety speed limit in speed zones which result from passenger station areas shall be 60 mph. The safety speed limit where the civil speed limit is restricted by turnouts shall be set equal to the civil speed limit of the given speed zone.
  3. The safety speed limit shall not exceed 75 mph.
- D. Acceleration Factors
1. The acceleration capability of trains shall be determined by the following factors:
    - a. The curvature and the grade of the section of track beneath the train, which shall be based on the actual train length and which shall consider the train as a line mass. The curve and grade resistance factors which shall be used to determine the effect of curves and grades on train motion are given in Section 16905, Transit Vehicle Characteristics.
    - b. The characteristics of the transit cars, given in Section 16905, Transit Vehicle Characteristics.
    - c. The Car Acceleration vs. Speed Tables included in the Technical Appendix or furnished by the Authority.
    - d. The reaction time for power application for acceleration which shall be 1 second.

## 1.05 DECELERATION FORMULAS FOR DETERMINING SAFE BRAKING DISTANCE

- A. The following system of equations shall be used in an iterative procedure to determine the

Safe Braking Distance, SBD, which is the minimum distance that shall be allowed for a train to decelerate from an initial speed  $V(0)$  mph, at location  $L(0)$  feet, to a final speed of zero mph.

- B. The safe braking distance (SBD) is defined to be comprised of two components: the reaction distance (RD) and the braking distance (BD).
- C. The time for the reaction distance shall begin when a train crosses a block boundary into a block transmitting a lower (or zero) speed command. During this reaction-distance time the train shall be considered to maintain its speed while the new speed command (or lack thereof) is being detected and decoded, accelerate at maximum rate during the power removal time, and then maintain the speed reached after acceleration for half the braking buildup time.
- D. The braking distance, in which the brakes are fully applied, shall follow the reaction distance.
- E. To use these equations a train beginning an interval at  $(V(i), L(i))$ , where  $V(i)$  is the speed and  $L(i)$  the location at the beginning of the  $(i+1)$ th interval, shall be moved forward one computing interval at a time. The length of the interval is  $\Delta t$  seconds. The acceleration or deceleration calculated at the beginning of the interval shall be used to determine the speed at the end of the interval,  $V(i+1) - V(i)$ , and the distance traveled during the interval  $L(i+1) - L(i)$ . The coordinates  $(V(i+1), L(i+1))$  shall then be used as the beginning coordinates of the next computing interval. The procedure shall be continued until the speed after the  $n$ th computing interval,  $V(n)$ , is less than or equal to zero mph. If less than zero, the location at which the train's speed equals zero shall be calculated by interpolation using the coordinates  $(V(n-1), L(n-1))$  and  $(V(n), L(n))$ .
- F. The train acceleration shall be the algebraic sum of the acceleration due to tractive effort and the acceleration due to curves and grades. The train deceleration shall be the algebraic sum of the braking rate and the deceleration due to curves and grades. The acceleration and deceleration due to curves and grades shall be calculated at the beginning of each computing interval based upon the weighted average of the curves and grades beneath the train at the beginning of that interval. The weighting factor shall be the fraction of the train length on each of the curves or grades.
- G. Reaction distance, RD, is the distance traveled during the reaction-distance time. The reaction-distance time shall be comprised of three parts:
  - 1. Signal time, i.e., time to detect and decode a more restrictive speed command. This first time period is of 2 seconds duration.
  - 2. Speed regulator (overspeed detector) reaction time (0.75 seconds), plus time to remove power. The time to remove power depends upon the speed of the vehicle and shall be as specified in Section 16905, Transit Vehicle Characteristics.
  - 3. Half the maximum brake building time. Maximum brake buildup time shall be as specified in Section 16905.
- H. In the first part (2 seconds) of reaction-distance time the train shall maintain its initial speed  $V(0)$ :
  - 1.  $RD(1)$  (feet) =  $1.467 \times 2$  (sec.)  $\times V(0)$  (MPH)
  - 2. The location of the train at the end of these two seconds shall be:
    - a.  $L(1) = L(0) + RD(1)$
- I. In the second part of reaction-distance time, the train shall be under full power. The first five computing intervals ( $\Delta t(i)$ ,  $i = 1, 2, 3, 4, 5$ ) shall be of equal duration; the sixth computing interval,  $\Delta t(6)$ , in this part of the reaction-distance time, shall be of equal or less duration than each of the first five intervals. The following formulas shall be used to determine the change in speed and position during this computing interval:
  - 1.  $V(i+1) - V(i) = \Delta t(i) \times [A(V(i) - 0.2G(L(i)) - 0.008C(L(i)))]$

2.  $L(i+1)-L(i) = 1.467 \times \frac{V(i+1) + V(i)}{2} \times \text{delta } t(i)$
  3.  $RD(s) = L(7) - L(1)$
- J. In the third part (0.6 seconds) of reaction-distance time, the train shall maintain the speed  $V(7)$ .
1.  $RD(3) = 1.467 \times V(7) \times 0.6$
  2.  $L(8) = L(7) + RD(3)$
  3.  $RD = RD(1) + RD(2) + RD(3)$
- K. The braking distance, BD, is defined here as the portion of the safe braking distance in which the brakes are fully applied. It immediately follows the reaction distance. Each computing interval in the braking distance (BD) calculations shall be 0.5 seconds, except for the last where interpolation shall be used. The following formulas shall be used to determine the change in speed and position during each computing interval. In these formulas the sign of the deceleration term,  $D(V)$ , shall be negative.
1.  $V(i)-V(i+1) = 0.5 \times [D(V(i))+0.2G(L(i))+0.008C(L(i))]$
  2.  $L(i+1)-L(i) = 1.467 \times \frac{V(i+1) + V(i)}{2} \times 0.5$
  3. If  $L(n)$  is the location at which  $V = 0$ , then:
    - a.  $BD = L(n) - L(8) + 30.0$
  4. The 30.0-foot factor allows for coupler overhang and jerk rate while stopping.
- L. The safe braking distance shall be the sum of the reaction distance and the braking distance:
1.  $SBD = RD + BD$
- M. The following symbols are used in the preceding formulas:
1.  $L(i)$ : The location of the front end of the train after the  $i$  th computing interval.
  2.  $V(i)$ : The train speed (mph) after the  $i$  th computing interval.
  3.  $A(V)$ : Acceleration (mphps) vs. speed,  $V(\text{mph})$ , which shall be derived from the appropriate Car Acceleration vs. Speed Table(s) provided by the Authority.
  4.  $D(V)$ : Safety brake rate (mphps) vs. speed,  $V(\text{mph})$  curve. The safety brake rate equals -1.65 mphps from 0 mph to 50 mph and then tapers linearly to equal -1.24 mphps at 75 mph.
  5.  $C(L(I))$ : The weighted average of the curves in degrees curvature, under a train whose front end is at location  $L(i)$ . The weighting factor shall be the proportion of the train on each of the curves. The factor 0.008 transforms the degrees of curvature into deceleration due to curve resistance in miles per hour per second.
  6.  $G(L(I))$ : The weighted average of the grades, in percent grade, under a train whose front end is at location  $L(i)$ . The weighting factor shall be the proportion of the train on each of the grades. Uphill grades shall be designated as positive. The factor 0.2 transforms the percent grade into acceleration or deceleration (in miles per hour per second) due to grade.
- N. To determine the distance which shall be allowed for a train to decelerate from an initial speed  $V(0)$ , to a final speed limit,  $V$ , which is a more restrictive speed limit, the above formulas shall be modified as follows:
1. The train shall run the entire reaction-distance time at  $V(0)$  mph. Reaction-distance time shall depend on whether the train is an ideal train or a worst-case train. See Part 1.07-E (Train Performance Simulation) of this Section.
  2. At the end of reaction-distance time the brakes shall be assumed to be fully applied and the above formulas shall be used to calculate the distance required for the train to decelerate to the more restrictive speed limit.

- O. The speed limit shall be the civil speed limit for ideal trains and the safety speed limit for worst-case trains. The worst-case trains shall use a braking rate of -1.65 mphps from 0 mph to 50 mph tapering linearly to -1.24 mph at 75 mph. The ideal train shall use the full service braking rate of -2.2 mphps from 0 mph to 50 mph tapering linearly to -1.65 mphps at 75 mph.

## 1.06 BASIC CRITERIA

- A. Safety Requirements:
  - 1. No ideal train shall exceed the civil speed limit of any speed zone.
  - 2. No worst-case train shall exceed the safety speed limit of any speed zone.
  - 3. Every worst-case train shall be at least safe braking distance from the upstream end of any block which is occupied or which is controlled by an interlocked signal if this signal is displaying a STOP aspect.
  - 4. Safe Braking Distance calculations for trains located on vertical curves shall be modified and documented in a manner acceptable to the designated Resident Engineer.
  
- B. Headway Requirements
  - 1. In this section, a "station pair" is defined to be an ordered pair of successive passenger stations. The satisfaction of criteria for successive trains operating over specified routes at specified headways shall be demonstrated using models of ideal-case trains following the specified sets of speed command profiles.
  - 2. Normal Direction
    - a. The block design shall permit two 8-car ideal trains to run in the normal direction of traffic, terminal-to-terminal, over every revenue service route, stopping at each passenger station enroute at the design headway for each station pair, with both trains receiving design profile speed commands in each block. The dwell times for each route shall be those of the "Normal Dwell" column in the Table of Dwell Times, which appears in the Technical Appendix.
    - b. For each station pair, design headway is the lowest feasible headway, not more than 75 seconds, achievable for ideal trains by a block design which meets all the requirements given in the Safety Requirements and Location of Block Boundaries Parts of this Section. Each block shall transmit the same ATP speed command to the third train that was transmitted to the second train when the second train occupied that block. The dwell times shall be taken from the "Normal Dwell" column of the Table of Dwell Times which appears in the Technical Appendix.
    - c. For each station pair, design profile speeds are the highest possible ATP speed commands, not exceeding MAS, that can be transmitted to each of two successive ideal trains which permit these trains to operate at the design headway.
    - d. The block design shall further permit successive 8-car ideal trains to run in the normal direction of traffic, terminal-to-terminal, over every revenue service route, stopping at each passenger station en-route, at peak capacity headway for each station pair with each train receiving peak capacity profile speed commands in each block. The dwell times shall be taken from the "Minimum Dwell" column of the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
    - e. For each station pair, peak capacity headway is the lowest feasible headway, not more than 65 seconds, achievable for successive ideal trains by a block design which meets all the requirements given in the Safety Requirements and Location of Block Boundaries Parts of this Section. The dwell times for each route shall be taken from the "Minimum Dwell" column in the Table of Dwell Times in the ATC Technical Appendix (Section 16996).
    - f. For each station pair, peak capacity profile speeds are the highest possible

ATP speed commands that can be transmitted to successive ideal trains which will permit these trains to operate at the peak capacity headway.

3. Reverse Direction
  - a. The block design shall permit successive 8-car ideal trains to run terminal-to-terminal with both trains starting on the inbound track in the terminal, crossing to the opposite track at one interlocking, crossing back to the original track at another interlocking, and then continuing to the terminal on the original track, stopping at each passenger station enroute, at the design headway for the given route between each station pair, with both trains receiving design profile speed commands in each block for the given route. This shall be possible for every pair of adjacent and every pair of alternate crossover locations on the route. The dwell times at each station shall be those of the "Minimum Dwell" column in the Table of Dwell Times in the ATC Technical Appendix (Section 16996).
  - b. The design headway, determined for each route connecting each station pair, is the lowest feasible headway not more than 110 seconds, achievable for successive ideal trains by a block design which meets all the requirements given in the Safety Requirements and Locations of Block Boundaries Part 1.06 C of this Section. Each block shall transmit the same ATP speed command to the following train that it transmitted to the leading train when the leading train occupied that block. Those ATP speed commands need not be MAS commands. The dwell times shall be taken from the "Minimum Dwell" column of the Table of Dwell Times, which appears in the ATC Technical Appendix (Section 16996).
  - c. The design profile speeds, determined for routes connecting each station pair, are the highest possible ATP speed commands not exceeding MAS that can be transmitted to each of three successive ideal trains which permit these trains to operate at the design headway.
  - d. The block design shall further permit three successive 8-car ideal trains to run terminal-to-terminal with both trains starting on the inbound track in the terminal, crossing to the opposite track at one interlocking, crossing back to the original track at another interlocking, and then continuing to the terminal on the original track, stopping at each passenger station en-route, at the peak capacity headway for the given route between each station pair, with both trains receiving the peak capacity profile speed commands in each block for the given route. This shall be possible for every pair of adjacent and every pair of alternate crossover locations on the route. The dwell times at each station shall be those of the "Minimum Dwell" column in the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
  - e. The peak capacity headway, determined for each route connecting each station pair, is the lowest feasible headway, not more than 100 seconds, achievable for successive ideal trains by a block design which meets all the requirements of the Safety Requirements and Location of Block Boundaries Part 1.06 C of this Section. Each block shall transmit the same ATP command to the following train that it transmitted to the leading train when the leading train was occupying that block. These ATP speed commands need not be MAS commands. The dwell times shall be taken from the "Minimum Dwell" column of the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
  - f. The peak capacity profile speeds, determined for each route connecting each station pair, are the highest possible ATP speed commands, not exceeding MAS, that can be transmitted to successive ideal trains which will permit these trains to operate at the peak capacity headway.
4. Terminals
  - a. For e.1) and e.2) below, the design headway determined for each penultimate/terminal station pair, is the lowest feasible headway, not more

than 110 seconds, achievable for successive ideal trains by a block design which meets all the requirements given in the Safety Requirements and Location of Block Boundaries Parts of this Section. Each block shall transmit the same ATP speed command to the following train that it transmitted to the leading train when the leading train occupied that block. The dwell times shall be taken from the "Minimum Dwell" column of the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).

- b. For e.3) and e.4) below, the design headway determined for each penultimate/terminal station pair, is the lowest feasible headway, not more than 75 seconds, achievable for successive trains by any block design which meets all the requirements given in the Safety Requirements and Location of Block Boundaries Parts of this Section. In determining the lowest feasible headway, blocks need not be assumed to be transmitting the same ATP command to each of the successive trains. The successive trains shall be able to depart the penultimate station at the design headway and arrive at the terminal station at the design headway. The dwell times shall be those of the "Normal Dwell" column in the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
- c. For e.1) and e.2) below, the peak capacity headway determined for each penultimate/terminal station pair is the lowest feasible headway, not more than 100 seconds, achievable for successive ideal trains by any block design which meets the requirements given in the Safety Requirements and Location of Block Boundaries Parts of this Section. Each block shall transmit the same ATP speed commands to the following train that it transmitted to the leading train when the leading train occupied that block. These ATP speed commands need not be MAS commands. The dwell times shall be those of the "Minimum Dwell" column in the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
- d. For e.3) and e.4) below, the peak capacity headway, determined for each penultimate/ terminal station pair is the lowest feasible headway, not more than 65 seconds, achievable for successive trains by any block design which meets all the requirements of the Safety Requirements and Location of Block Boundaries Parts of this Section. In determining the lowest feasible headway, blocks need not be assumed to be transmitting the same ATP speed commands to successive trains. Successive trains shall be able to depart the penultimate station and arrive at the terminal station at the peak capacity headway. The dwell times shall be those of the "Minimum Dwell" column in the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
- e. For 1), 2), 3) and 4) below, the peak capacity profile speeds determined for each penultimate/ terminal station pair are the highest possible ATP speed commands not exceeding MAS, that can be transmitted to successive ideal trains which will permit these trains to operate at the peak capacity headway for each given route.
  - 1) "Outbound Track" Turnback
    - a) The block design shall permit successive 8-car ideal trains to depart the penultimate station in the normal direction of traffic and proceed to the adjacent terminal station on the same track, dwell, and reverse direction in the terminal, then cross to the inbound track through the terminal crossover and continue inbound at the design headway, with each train receiving the design profile speed command in each block. The dwell times shall be those of the "Minimum Dwell" column in the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
    - b) The block design shall permit successive 8-car ideal trains

to depart the penultimate station in the normal direction of traffic and proceed to the adjacent terminal station on the same track, dwell, and reverse direction in the terminal, then cross to the inbound track at the peak capacity headway, with each train receiving the peak capacity profile speed command in each block. The dwell times shall be those of the "Minimum Dwell" column in the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).

- 2) "Inbound Track" Turnback
  - a) The block design shall permit successive 8-car ideal trains to depart the penultimate station in the normal direction of traffic and cross to the opposite track through the adjacent terminal crossover, dwell, and reverse direction in the terminal, then depart the terminal and proceed inbound at the design headway, with each train receiving the design profile speed command in each block. The dwell times shall be those of the "Minimum Dwell" column of the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
  - b) The block design shall permit successive 8-car ideal trains to depart the penultimate station in the normal direction of traffic and cross to the opposite track through the adjacent terminal crossover, dwell, and reverse direction in the terminal, then depart the terminal and proceed inbound at the peak capacity headway, with each train receiving the peak capacity profile speed commands in each block. The dwell times shall be those of the "Minimum Dwell" column of the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
- 3) Successive "Outbound/Inbound Track" Turnbacks
  - a) The block design shall permit successive 8-car ideal trains to depart the penultimate station and arrive at the terminal at the design headway. The first train shall traverse the route described in 1) above, at the design profile speeds for its route. The second train shall traverse the route described in 2) above at the design profile speeds for its route. The dwell times shall be those of the "Normal Dwell" column in the Table of Dwell Times which appears in the ATC Technical Appendix.
  - b) The block design shall permit successive 8-car ideal trains to depart the penultimate station and arrive at the terminal station at the peak capacity headway. The first train shall traverse the route described in 1) above at the peak capacity profile speeds for its route. The second train shall traverse the route described in 2) above at the peak capacity profile speeds for its route. The dwell times shall be those of the "Minimum Dwell" column of the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).
- 4) Successive "Inbound/Outbound Track" Turnbacks
  - a) The block design shall permit successive 8-car ideal trains to depart the penultimate station and arrive at the terminal station at the design headway. The first train shall traverse the route described in 2) above at the design profile speeds for its route. The second train shall traverse the route described in 1) above at the design profile speeds for its

route. The dwell times shall be those of the "Normal Dwell" column in the Table of Dwell Times which appears in the ATC Technical Appendix.

- b) The block design shall permit successive 8-car ideal trains to depart the penultimate station and arrive at the terminal station at the peak capacity headway. The first train shall traverse the route described in 2) above at the peak capacity profile speeds for its route. The second train shall traverse the route described in 1) above at the peak capacity profile speeds for its route. The dwell times shall be those of the "Minimum Dwell" column of the Table of Dwell Times which appears in the ATC Technical Appendix (Section 16996).

5. Converging Junctions (Where Applicable)

- a. The block design shall permit successive converging 8-car ideal trains, operating at twice the design headway for each converging route, operating in the normal direction of traffic on each of two tracks which meet at the junction, to merge at the junction, with alternate trains exiting from the junction at the same point to form a series of trains at the design headway, with each train receiving the design profile ATP speed commands for its route.
- b. The design headway for both station pairs separated by a converging junction, shall be the lowest feasible headway, not more than 75 seconds, measured between arrival times at the station downstream from the junction, which is achievable by a block design which meets all the requirements specified in the Safety Requirements and Location of Block Boundaries Parts of this Section. The lowest headway shall be determined by successive converging ideal trains operating at twice the design headway on each of the tracks approaching the junction, merging to form a series of successive trains at the design headway downstream from the junction. Dwell times from the "Normal Dwell" column of the Table of Dwell Times shall be used in determining the design headway.
- c. The design profile speeds, determined for both sets of station pairs separated by a converging junction, shall be the highest possible ATP speed commands, not exceeding MAS, that can be transmitted to successive ideal trains operating between each set of station pairs, which will permit:
  - 1) alternately converging trains to operate at twice the design headway upstream from the junction, and which will permit merging pairs of such trains to operate at the design headway downstream from the junction, or;
  - 2) non-converging successive trains originating from either upstream station to operate at the normal design headway both upstream and downstream from the converging junction.
- d. The block design shall permit successive 8-car ideal trains, operating at twice the peak capacity headway for converging junctions, operating in the normal direction of traffic on each of two tracks which meet at the junction, to merge at the junction with alternate trains exiting from the junction at the same point to form a series of trains at the peak capacity headway, with each of these trains receiving the same ATP speed command in each block downstream from the junction.
- e. The peak capacity headway through a converging junction, determined for each set of station pairs separated by that junction, shall be the lowest feasible headway not more than 65 seconds, measured between arrival times at the station downstream from the junction, which is achievable by a block design which meets all the requirements specified in the Safety Requirements and Location of Block Boundaries Part 1.06 C of this Section. The peak capacity headway shall be determined with successive ideal trains

operating at twice the peak capacity headway on each of the tracks approaching the junction, merging to form a series of successive trains at the peak capacity headway downstream from the junction. Dwell times from the "Minimum Dwell" column of the Table of Dwell Times shall be used in determining the peak capacity headway.

- f. The peak capacity profile speeds, determined for both sets of station pairs separated by a converging junction, are the highest possible ATP speed commands, not exceeding MAS, that can be transmitted:
  - 1) to successive converging ideal trains operating between each set of station pairs, which will permit these trains to operate at twice the peak capacity headway upstream from the junction, and which will permit merging pairs of such trains to operate at the peak capacity headway downstream from the junction, and;
  - 2) to successive non-converging ideal trains operating between either set of station pairs, which will permit these trains to operate at the peak capacity headway through the junction between either applicable set of station pairs.

6. Diverging Junctions (Where Applicable)

- a. The block design shall permit successive 8-car trains, operating in the normal direction of traffic at the design headway in approach to a given diverging junction, to divide at the junction with consecutive trains exiting from the junction at different points, and with each train receiving the design profile ATP speed commands for its route.
- b. The design headway for both sets of station pairs separated by a diverging junction, shall be the lowest feasible headway not more than 75 seconds, measured between departure times at the station upstream from the junction, which is achievable by a block design which meets all the requirements specified in the Safety Requirements and Location of Block Boundaries Part 1.06 C of this Section. The design headway shall be determined with successive ideal trains, operating at the design headway departing the upstream station, taking different routes upon exit from the junction, with the trains operating on each diverging route at twice the design headway or better downstream from the junction. The dwell times used in determining design headway shall be those given in the "Normal Dwell" column of the Table of Dwell Times which appears in the ATC Technical Appendix.
- c. The design profile speeds, determined for each station pair separated by a diverging junction, shall be the highest possible ATP speed commands, not exceeding MAS, that can be transmitted:
  - 1) to successive diverging trains to permit these trains to operate at the design headway from the upstream station to the junction, and at twice the design headway or better downstream from the junction, and;
  - 2) to successive non-diverging trains to permit these trains to operate at the design headway between either applicable station pair.
- d. The block design shall permit successive 8-car ideal trains, operating in the normal direction of traffic at the peak capacity headway for a given diverging junction, approaching the junction in the normal direction of traffic, to divide at the junction so that consecutive trains exiting from the junction take different routes. Successive trains exiting the junction at the same diverging point shall receive the same ATP speed commands.
- e. The peak capacity headways for both sets of stations separated by a diverging junction, shall be the lowest feasible headway not more than 65 seconds, measured between successive departure times at the station upstream from the junction, which is achievable by a block design which meets all the requirements specified in Parts 1.06 A.& C. (Safety

Requirements and Location of Block Boundaries) of this Section. The peak capacity headway shall be determined by the steady state successive departure times of diverging ideal trains from the upstream station, with consecutive trains taking different routes through the junction and operating on each of the exiting routes at twice the peak capacity headway or better downstream from the junction. The dwell times given in the "Minimum Dwell" column of the Table of Dwell Times (which appears in Section 16996, ATC Technical Appendix) shall be used in determining the peak capacity headway.

- f. The peak capacity profile speeds, determined for each station pair separated by a diverging junction, shall be the highest possible ATP speed commands, not exceeding MAS, that can be transmitted:
  - 1) to successive diverging trains to permit these trains to operate at the peak capacity headway from the upstream station to the junction, and at twice the peak capacity headway or better downstream from the junction, and;
  - 2) to successive non-diverging trains to permit these trains to operate at the peak capacity headway between either applicable station pair.
7. The block design shall meet all specified headway requirements at all required Performance Level speeds. See Part 1.06 C.1.a.5.) The Contractor shall immediately notify the designated Resident Engineer in writing whenever in the design process it appears that it will be physically impossible to comply with this requirement. The Contractor shall furnish complete supporting documentation for each such situation encountered.

C. Location of Block Boundaries

1. Basic Requirements

- a. Block boundaries and associated track circuits shall be located:
  - 1) To ensure compliance with safety and headway criteria;
  - 2) To meet the requirements for negative propulsion return current connections at traction power substations;
  - 3) To provide crossbonding for negative-propulsion return current equalization at designated locations,
  - 4) To provide for proper operation of the wayside ATC system in the vicinity of station platforms and special trackwork locations, and;
  - 5) To enable all specified headway requirements to be complied with at all required Performance Level speeds. e.g., no track circuit shall be of such length that it causes headway degradation at Reduced (PL3) or Retarded (PL4) operating speeds. The Contractor shall furnish complete, accurate design and test documentation in support of this requirement.
- b. Successive Block Boundaries shall never result in a track circuit length of less than 50 feet.
- c. No track circuit shall be effectively cross-bonded at both ends.
- d. At least one of every two consecutive track circuits shall be long enough so that a train entering the track circuit at the MAS of the track circuit shall receive, react to, and charge the timing circuit for the carborne ATC speed command while the front end of the train is still in the track circuit.

2. Fixed Block Boundaries

- a. Fixed (mandatory) block boundaries to meet the requirements specified in 1.a.2), 1.a.3), and 1.a.4), above, are shown on the Contract Drawings at locations established by insulated rail joints, or impedance bonds (with stationings not shown in parenthesis) associated with the ends of station platforms, or with negative propulsion return stub-ups, or with negative propulsion crossbonding stub-ups. These "fixed" block boundaries shall be located as follows:

- 1) A block boundary for each track shall be located at each end of every passenger station platform. The boundary shall not be less than 299 feet and not more than 300 feet from the centerline of the station platform.
  - 2) At each interlocking, block boundaries in approach to facing point switches shall be located a minimum of 15 feet upstream from the point of switch, at the locations indicated on the Contract Drawings.
  - 3) The block design shall permit negative traction power-return bonding within 25 feet of the centerline of each traction power substation-return conduit stub-up. Preferably, these impedance bonds shall be located 10 feet from the negative-return conduit stub-up location, in the direction of the stub-up.
  - 4) The block design shall permit the installation of cross-bonding at intervals of 2000 feet (+\50 ft) maximum wherever it is possible to provide cross-bonding within such intervals. No track circuit shall be cross-bonded at both ends. Cross-bonding shall be provided at one end (only) of each passenger station, unless otherwise authorized in writing by the designated Resident Engineer. For the above purposes, substation return locations shall be considered as effective cross-bonding locations. The Contractor shall install impedance bonds at as many of the cross-bonding conduit locations indicated on the Contract Drawings as are required to meet the maximum cross-bonding interval limitations specified. The Contractor shall notify the designated Resident Engineer in writing of all locations where this maximum spacing requirement cannot be met due to the lack of provision of cross-bonding conduit by other disciplines. Preferably, impedance bonds for cross-bonding purposes shall be located 10 feet from the cross-bonding conduit stub-ups, in the direction of the stub-ups, but in all circumstances the bonds shall be installed within 25 feet of the cross-bond stub-ups unless otherwise authorized in writing by the designated Resident Engineer.
3. Intermediate Block Boundaries
- a. The number and location of all "intermediate" block boundary locations, i.e., additional block boundary locations necessary to meet the requirements specified in item 1.a.1) above, shall be determined by the Contractor in the manner further specified herein. (The "intermediate" block boundaries shown on the Contract Drawings, i.e., the block boundary impedance bonds with stationings shown in parentheses, are shown for illustrative purposes only and do not necessarily represent the number or location of block boundaries or track circuits required.)
  - b. A block boundary shall be located in the normal traffic direction approach to each more restrictive speed zone to slow a train traveling in the normal traffic direction. The distance from this block boundary to the beginning of the more restrictive speed zone shall be at least the larger of the following distances:
    - 1) The distance required for an ideal train to decelerate to the civil speed limit of the more restrictive speed zone;
    - 2) The distance required for a worst-case train to decelerate to the safety speed limit of the more restrictive speed zone.
  - c. The larger of the two distances specified in 3.a.1) and 3.a.2) above determines the closest allowable location for this block boundary (i.e., the "calculated location"). The actual location of the block boundary may be upstream from the calculated location up to a distance which would increase run time at MAS by two seconds compared to placing the block boundary at the calculated location.
  - d. Block boundaries for the normal direction of traffic shall also be used for the

reverse traffic direction. Additional block boundaries shall be provided in the reverse traffic direction approach to each more restrictive speed zone to slow a train traveling in the reverse direction whenever the lack of such a boundary would increase reverse direction run time by at least 10 seconds, compared with placing a block boundary at the calculated location for the reverse direction of traffic. Where an additional block boundary is not provided, the speed of trains running in the reverse direction of traffic shall be down to the appropriate speed limit (i.e., ideal trains to the civil speed limit and worst-case trains to the safety speed limit) of the more restrictive speed zone prior to entering this speed zone.

- e. A block boundary shall be located at the point of entry to a more permissive speed zone for trains traveling in the normal direction of traffic. As soon as the rear of the train, regardless of length, is clear of the more restrictive speed zone, the track circuits in the more permissive speed zone shall transmit the more permissive speed command to the train if the appropriate number of track circuits downstream are unoccupied. This block boundary may be located downstream from the end of the restricted speed zone not more than 50 feet or more than a distance which would increase run time by two seconds, compared with placing the block boundary at the end of the speed restriction. The location of this block boundary shall not be upstream from the end of the more restrictive speed zone by more than 10 feet. These criteria are also applicable for trains traveling in the reverse direction of traffic, except that the block boundary at the point of entry to a more permissive speed zone for trains traveling in the reverse direction of traffic may be located downstream from the end of the restricted speed zone not more than a distance which would increase run time by 10 seconds, compared with placing the block boundary at the end of the speed restriction.
- f. A block boundary shall be located at the entrance to a more permissive speed zone for trains traveling in the normal direction of traffic per the above criteria with the following exception. Suppose a train is entering a more permissive speed zone, with speed limit  $V$ , which is followed by a more restrictive speed zone. Assume that the sum of the four distances (train length, acceleration reaction distance, brake reaction distance, deceleration distance) is greater than the length of the more permissive speed zone. If basing the braking reaction distance and deceleration distance on a speed lower than  $V$ , but more permissive than that of the previous speed zone, can reduce the sum of the four distances to less than the length of the more permissive speed zone, then a block boundary should be located at the entrance of the more permissive speed zone. Under these conditions, the ATP speed shall be limited to the highest ATP speed which results in the sum of the four distances being less than the length of the more permissive speed zone.
- g. The block design shall permit worst-case 8-car trains and ideal 8-car trains, operating automatically, to approach each crossover on each track in both the normal direction of traffic and the reverse direction of traffic, to operate through the crossover using either route, and to be stopped automatically just beyond the crossover and clear of the trailing point of the switch in order to reverse direction manually.
- h. Where the centerlines of two successive passenger stations are less than 3000 feet apart, and where the civil speed limit of the speed zone in which the 1200-foot program stop marker of the downstream station is located is higher than the maximum speed from which an ideal train can execute a programmed stop in the downstream station, a block boundary shall be located a distance upstream from the 1200-foot marker. This distance shall be that required for an ideal train, traveling at the civil speed limit upstream from the 1200-foot marker, to decelerate to the speed required to execute

a programmed stop.

D. Logic Codes

1. The logic codes for each block shall be selected to provide compliance with safety and headway criteria.
2. All blocks shall have at least two ATP logic codes; one for trains entering the block in the normal direction of traffic, and one for trains entering the block in the reverse direction of traffic. In addition, if a crossover or diverging junction is within safe braking distance (as defined for the worst-case train) from the downstream end of a block, there shall be two logic codes in the given block for the direction of traffic approaching the crossover or diverging junction - one for each route through the crossover or junction.
3. Routes for Normal Direction of Traffic
  - a. To calculate all logic codes associated with revenue service routes in the normal direction of traffic, the Contractor shall determine the highest speed command that can be transmitted to a train entering a given block in such a way that safe braking distance from the command speed does not exceed the combined length of each successive number of consecutive unoccupied track circuits downstream from the given block. This shall be done for each number of such track circuits, beginning with the track circuit adjacent to and downstream from the given block. Safe braking distance shall be calculated from the downstream end of the given block.
  - b. MAS, the highest of the ATP speed commands, shall be transmitted as soon as the required track circuits are unoccupied. In addition, the ATP speed commands required in each block for trains to operate at a design headway and peak capacity headway shall be transmitted as soon as the required track circuits are unoccupied.
  - c. A logic code shall be provided (for each direction of traffic on each track) to permit a train to make a station stop at each station platform.
  - d. Intermediate speed commands shall be provided as necessary to meet specified design and operational requirements, subject to the approval of the designated Resident Engineer. This shall include speed commands for all Performance Level speed limits between successive passenger stations.
4. Routes for Reverse Traffic Direction and Emergency Crossovers
  - a. All logic codes associated with revenue service routes in the reverse direction of traffic, or routes using an emergency crossover, shall be provided with as many intermediate speed commands as are necessary to meet the specified design and operational requirements. The intermediate speed(s) used by the reverse traffic transmitter shall be the same as the intermediate speed(s) used for normal traffic transmission to the adjacent track circuit wherever possible.
  - b. Each of these speed commands shall be transmitted to a train entering a block as soon as the combined length of unoccupied track circuits downstream from the block is at least safe braking from the downstream end of that block for that speed.
5. Passenger Stations
  - a. Where there are two or more track circuits in one station platform track, the individual track circuits shall not appear unoccupied to a train upstream of the station unless one of the following conditions exists:
    - 1) All track circuits within the limits of that platform are unoccupied, or
    - 2) The track circuit for the upstream end of the platform track is unoccupied and the train occupying the remaining track circuit(s) has been determined to be leaving the station.
  - b. The determination that a train is leaving the station platform may be non-vital in origin, such as the lack of TWC reception in the platform block.
6. Routes Terminated by Turnback Point Control

- a. If a turnback point is within safe braking distance (as defined for the worst-case train) from the downstream end of a block, there shall be an additional logic code in the given block for the direction of traffic approaching the turnback point - with the turnback control at stop.
- b. Speed commands for the turnback point control at stop shall not permit a worst-case train to pass the turnback point. Speed command assignment for the turnback point control at stop shall permit all trains to clear the downstream exit of the interlocking before stopping. Speed command assignment for the turnback point control at stop shall permit an automatic programmed station stop in automatic mode where reasonable and practical.

## 1.07 QUALITY ASSURANCE

- A. Review and Evaluation
  - 1. The Contractor shall conduct a detailed review and evaluation of the logic codes, track circuits, and location of block boundaries contained in his initial block design.
- B. Review Criteria
  - 1. The Contractor shall review his block design to confirm that the design:
    - a. Meets the requirements specified for safety and headway.
    - b. Uses the minimum number of blocks required to meet the Specifications.
    - c. Complies with the Specifications for the location of block boundaries.
    - d. Complies with the Specifications for Logic Codes.
- C. Safety and Headway
  - 1. The Contractor's review and evaluation of safety and headway shall be based upon the following:
    - a. Safety.
      - 1) Determination that a length of unoccupied track at least equal to safe braking distance for worst-case trains is provided for every speed command in each block, utilizing the criteria for safe braking distance applied to the track profile involved.
    - b. Headway.
      - 1) Determination of the actual design profile speeds, design headways, and peak capacity headways attainable for each route connecting each station pair. Where the design headway or the peak capacity headway are not equal to or less than the upper bounds of headway specified below for each station pair, and where the design profile speeds are lower than MAS, the Contractor shall notify the designated Resident Engineer in writing.
- D. Upper Bounds for Headway
  - 1. Routes in the normal direction of traffic - 75 seconds for design headway; 65 seconds for peak capacity headway;
  - 2. Routes in the reverse direction of traffic or using emergency crossovers - 110 seconds for design headway; 100 seconds for peak capacity headway;
  - 3. Routes described in Parts 1.06 B.4.e.1) & 2), Headway Requirements for Terminals: 110 seconds for design headway; 100 seconds for peak capacity headway;
  - 4. Routes described in Parts 1.06 B.4.e.3) & 4), Headway Requirements for Terminals: 75 seconds for design headway; 65 seconds for peak capacity headway;
  - 5. For non-merging operation of trains in the normal direction of traffic through converging junctions, and for the merged operation of trains leaving converging junctions: 75 seconds for design headway; 65 seconds for peak capacity headway;
  - 6. For *non*-diverging operation of trains in the normal direction of traffic through diverging junctions, and for the operation of diverging trains in approach to diverging

junctions: 75 seconds for design headway; 65 seconds for peak capacity headway.

E. Train Performance Simulation

1. Model Type

a. The Contractor shall develop individual train performance models for; an ideal train, a worst-case eight-car train, and a worst-case two-car train.

1) Ideal Train

a) The model of ideal train performance shall be developed to verify that trains which accelerate and brake precisely as does an ideal train meet all the headway criteria and always obey the civil speed limits of every speed zone. The Ideal Train performance model shall be precisely determined by the following characteristics:

- (1) Acceleration shall be as indicated in Part 1.04-D, (Acceleration Factors) of this Section.
- (2) The braking rates shall be the full-service braking rates specified in Section 16905, Transit Vehicle Characteristics, (or as superceded by the Authority) as constrained by jerk rate limitations. The reaction-distance time shall be the sum of the equipment reaction time to detect and decode a more restrictive command (signal time, 0.8 sec.), plus the speed governor (overspeed detector) reaction time (0.5 sec.) and the time to remove power (1.0 sec. for speeds 40 mph or less and 0.5 sec. for speeds greater than 40 mph), plus one half the maximum brake buildup time (0.6 sec.). These values shall be used to determine the distance required for an ideal train to decelerate from one speed to a lower speed command.
- (3) Ideal trains shall stop in each station using the Program Stop braking profile for the given station.
- (4) The passenger load shall be crush load as specified in Section 16905, Transit Vehicle Characteristics.

2) Worst-Case Train

a) The performance models for the eight-car and two-car Worst-Case Trains shall be precisely determined by the following characteristics:

- (1) Acceleration shall be as indicated in Part 1.04-D., (Acceleration Factors) of this Section.
- (2) To calculate the distance that shall be allowed for a worst-case train to decelerate to obey the safety speed limit of a speed zone, the initial speed of the train shall be taken to be the greater of the ATP speed command which the train is receiving, and the actual train speed. The braking rate to be used shall be the full service braking rate specified in Section 16905, Transit Vehicle Characteristics, as constrained by jerk rate limitations and degraded by 25 percent to allow for inoperative brakes on one truck of each married-pair. The train shall be assumed to run the entire reaction distance at the initial speed. The overspeed detector reaction time shall be 0.75 seconds. Power removal time and maximum brake build-up time shall be based upon speed as specified in

Section 16905.

- (3) To calculate safe braking distance, the distance that shall be allowed for a worst-case train to stop when given a 0-mph speed command, the initial speed of the train shall be taken to be the greater of the ATP speed command which the train is receiving and the actual train speed. The braking rate to be used shall be the full service braking rate specified in Section 16905, Transit Vehicle Characteristics, as constrained by jerk-rate limitations and degraded by 25 percent to allow for inoperative brakes on one truck of each married-pair. The train shall be assumed to accelerate at the maximum rate during the reaction time of the overspeed detector and during the power removal time in order to account for the possibility of a carborne automatic speed regulator failure at the time of receipt of the zero speed command. The overspeed detector reaction time shall be 0.75 seconds. Power removal time shall be based upon speed as specified in Section 16905. An additional 30 feet shall be allowed in determining the safe braking distance. This is to allow for the distance between the front end of a worst-case train and its lead axle plus the distance between the rear end of the next train and its rear axle plus 10 feet for jerk limit flare-out.

2. Simulation

- a. The Contractor shall simulate the performance of a train operating in response to the MAS ATP speed commands and program stop commands, with dwell times as specified for the route in question. Safe braking distance shall be determined for each location on the simulated worst-case train's velocity-location profiles, taking into account the track and civil design characteristics, as well as the braking performance characteristics specified. The smallest theoretical headway between two trains with the resulting velocity-location profile shall then be determined for each station pair, with the trains always separated by at least safe braking distance, and by exactly safe braking distance at one or more locations.
- b. On the basis of the theoretical headway thus determined, the Contractor shall quantify the minimum headway achievable by his block design for trains operating at MAS. Where this minimum headway is larger than the lower bound specified above, the Contractor shall determine whether trains operating at reduced speeds can achieve the desired headway. The performance of trains responding to these revised speed commands shall be simulated. Safe braking distance and the theoretical minimum headways shall be determined as described above. The theoretical headways shall then be quantified into headways achievable by a block design for successive trains by operating at the indicated speeds.
- c. The Contractor shall compare these headways with those specified by the Authority. If the design headway and/or peak capacity headway determined by the review described above are higher than those specified by the Authority, the Contractor shall notify the designated Resident Engineer of these discrepancies and present substantiating data to the designated Resident Engineer to show that the headways specified by the Authority cannot be attained.
- d. Where a route segment included in this Contract does not begin at a passenger station, the Contractor shall include the nearest passenger

station in the current METRO rail system in the simulation.

## **1.08 SUBMITTALS**
