  - 2. Objects penetrating fireproofing, including clips, hangers, support sleeves, and similar items, are securely attached to substrate.
  - 3. Substrate is not obstructed by ducts, piping, equipment, and other suspended construction that will interfere with applying the fireproofing.
- B. Conduct tests according to sprayed fireproofing manufacturer's recommendations to verify that substrates are free of oil, rolling compounds, and other substances capable of interfering with bond where there is any doubt as to their presence.
- C. Do not proceed with installation of fireproofing until unsatisfactory conditions have been corrected.

### **3.02 PREPARATION:**

- A. Clean substrates of substances that could impair bond of fireproofing, including oil, grease, rolling compounds, incompatible primers, and loose mill scale.
- B. Prime substrates unless fireproofing manufacturer recommends against priming or unless compatible shop primer acceptable to fireproofing manufacturer has been applied and is in satisfactory condition to receive fireproofing.

- C. Cover other work subject to damage from fall-out or overspray of fireproofing materials during application. Provide temporary enclosure as required to confine spraying operations, protect the environment and ensure maintaining adequate ambient conditions for optimal temperature and ventilation.
- D. Install metal lath, anchorage devices and accessories where necessary to comply with tested fire resistance rating and with recommendations of fireproofing manufacturer for conditions of exposure and intended use. Securely attach lath to substrate in position required for support and reinforcement of fireproofing.

### **3.03 APPLICATION:**

- A. Comply with fireproofing manufacturer's instructions as applicable to the particular conditions of installation and as required to achieve fire-resistance ratings indicated.
- B. Match fireproofing design and assemblies per UL or other testing and inspecting agency acceptable to authorities having jurisdiction. Apply fireproofing in thicknesses indicated for each area in approved shop drawings.
- C. Coat substrate with adhesive prior to applying fireproofing where required to achieve fire-resistance rating or as recommended by fireproofing manufacturer for material and application indicated.
- D. Extend fireproofing in full thickness over entire area of each substrate to be protected. Unless otherwise recommended by fireproofing manufacturer, install body of fireproof covering in a single course.
- E. Apply fireproofing materials by sprayed-on method to maximum extent possible. Following the spraying operation in each area, complete the coverage by trowel application or other placement method recommended by manufacturer.
- F. Where sealers are used, apply products that are tinted to differentiate them from the sprayed-on fireproofing over which they are applied.

### **3.04 CLEANING, CURING, REPAIR, AND PROTECTION:**

- A. Cleaning: Immediately after completing spraying operations in each containable area, remove material over-spray and fall-out from surfaces of other construction and clean exposed surfaces to remove evidence of soiling.
- B. Cure cementitious fireproofing materials according to fireproofing manufacturer's recommendations to prevent premature drying.
- C. Protect fireproofing, according to advice of fireproofing manufacturer and installer, from damage resulting from construction operations or other causes so that fireproofing will be without damage or deterioration at time of final acceptance.
- D. As installation of other construction proceeds, inspect fireproofing and patch any areas where fireproofing was removed or damaged.
- E. Repair or replace work that has not been successfully protected.

**END OF SECTION**

**SECTION 07841  
FIRESTOPPING**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This Section perimeter fire containment systems and specifies through-penetration firestop systems for penetrations through the following fire-resistance-rated assemblies:
  - 1. Floors.
  - 2. Roofs.
  - 3. Walls and partitions.
  - 4. Construction enclosing compartmentalized areas.
  - 5. Smoke barriers
  
- B. Related Work Specified Elsewhere:
  - 1. Cast-in-Place Structural Concrete: Section 03300 for construction of openings in concrete slabs and walls.
  - 2. Division 15 Sections specifying duct and piping penetrations.
  - 3. Division 16 Sections specifying cable and conduit penetrations.

**1.02 PERFORMANCE REQUIREMENTS:**

- A. General: For the following constructions, provide through-penetration firestop systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of assembly penetrated.
  - 1. Fire-resistance-rated non-load-bearing walls, including partitions, with fire-protection-rated openings.
  - 2. Fire-resistance-rated floor assemblies
  - 3. Fire-resistance-rated roof assemblies.
  
- B. F-Rated Systems: Provide through-penetration firestop systems with F-ratings indicated, as determined per ASTM E 814, but not less than that equaling or exceeding fire-resistance rating of constructions penetrated.
  
- C. T-Rated Systems: For the following conditions, provide through-penetration firestop systems with T-ratings indicated, as well as F-ratings, as determined per ASTM E 814, where systems protect penetrating items exposed to potential contact with adjacent materials in occupiable floor areas:
  - 1. Penetrations located outside wall cavities.
  - 2. Penetrations located outside fire-resistive shaft enclosures.
  - 3. Penetrations located in construction containing fire-protection-rated openings.
  - 4. Penetrating items larger than 4-inch diameter nominal pipe or 16 sq. in. in overall cross-sectional area.
  
- D. For through-penetration firestop systems exposed to view, traffic, moisture, and physical damage, provide products that after curing do not deteriorate when exposed to these conditions both during and after construction.
  - 1. For piping penetrations for plumbing and wet-pipe sprinkler systems, provide moisture-resistant through-penetration firestop systems.
  - 2. For floor penetrations with annular spaces exceeding 4 inches in width and exposed to possible loading and traffic, provide firestop systems capable of supporting floor loads involved either by installing floor plates or by other means.

3. For penetrations involving insulated piping, provide through-penetration firestop systems not requiring removal of insulation.
- E. For through-penetration firestop systems exposed to view, provide products with flame-spread ratings of less than 25 and smoke-developed ratings of less than 450, as determined per ASTM E 84.

### **1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the Special Conditions and with the additional requirements as specified for each:
  - B. Product Data: For each type of through-penetration firestop system product indicated.
  - C. Shop Drawings: For each through-penetration firestop system, show each kind of construction condition penetrated, relationships to adjoining construction, and kind of penetrating item. Include firestop design designation of testing and inspecting agency acceptable to authorities having jurisdiction that evidences compliance with requirements for each condition indicated.
    1. Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each through-penetration firestop system configuration for construction and penetrating items.
  - D. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
  - E. Certification: Signed by manufacturers of through-penetration firestop system products certifying that products furnished comply with requirements.

### **1.04 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of the jurisdictional authorities.
  2. ASTM E 84, E 814.
  3. UL - 1479.
- B. Installer Qualifications: An experienced installer who has completed through-penetration firestop systems similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- C. Source Limitations: Obtain through-penetration firestop systems, for each kind of penetration and construction condition indicated, from a single manufacturer.
- D. Fire-Test-Response Characteristics: Provide through-penetration firestop systems that comply with the following requirements and those specified in "Performance Requirements" Article:
  1. Through-penetration firestop systems are identical to those tested per ASTM E 814. Provide rated systems complying with the following requirements:
    - a. Through-penetration firestop system products bear classification marking of qualified testing and inspecting agency.
    - b. Through-penetration firestop systems correspond to UL in Fire Resistance Directory reference to through-penetration firestop system designations listed by the following:

### **1.05 DELIVERY, STORAGE, AND HANDLING:**

- A. Deliver through-penetration firestop system products to Project site in original, unopened containers or packages with intact and legible manufacturers' labels identifying product and manufacturer; date of manufacture; lot number; shelf life, if applicable; qualified testing and inspecting agency's classification marking applicable to Project; curing time; and mixing instructions for multicomponent materials.
- B. Store and handle materials for through-penetration firestop systems to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

### **1.06 PROJECT CONDITIONS:**

- A. Environmental Limitations: Do not install through-penetration firestop systems when ambient or substrate temperatures are outside limits permitted by through-penetration firestop system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.
- B. Ventilate through-penetration firestop systems per manufacturer's written instructions by natural means or, where this is inadequate, forced-air circulation.

### **1.07 COORDINATION:**

- A. Coordinate construction of openings and penetrating items to ensure that through-penetration firestop systems are installed according to specified requirements.
- B. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems.
- C. Do not cover up through-penetration firestop system installations that will become concealed behind other construction until the Engineer has examined each installation.

## **PART 2 - PRODUCTS**

### **2.01 FIRESTOPPING, GENERAL:**

- A. Compatibility: Provide through-penetration firestop systems that are compatible with one another, with the substrates forming openings, and with the items, if any, penetrating through-penetration firestop systems, under conditions of service and application, as demonstrated by through-penetration firestop system manufacturer based on testing and field experience.
- B. Accessories: Provide components for each through-penetration firestop system that are needed to install fill materials and to comply with "Performance Requirements" Article. Use only components specified by through-penetration firestop system manufacturer and approved by the qualified testing and inspecting agency for firestop systems indicated. Accessories include, but are not limited to, the following items:
  - 1. Permanent forming/damming/backing materials, including the following:
    - a. Slag-/rock-wool-fiber insulation.
    - b. Sealants used in combination with other forming/damming/backing materials to prevent leakage of fill materials in liquid state.
    - c. Fire-rated form board.
    - d. Fillers for sealants.
  - 2. Temporary forming materials.

3. Substrate primers.
4. Collars.
5. Steel sleeves.

## 2.02 FILL MATERIALS:

- A. General: Provide through-penetration firestop systems containing the types of fill materials indicated in the Through-Penetration Firestop System Schedule at the end of Part 3 by reference to the types of materials described in this Article. Fill materials are those referred to in directories of the referenced testing and inspecting agencies as fill, void, or cavity materials.
- B. Cast-in-Place Firestop Devices: Factory-assembled devices for use in cast-in-place concrete floors and consisting of an outer metallic sleeve lined with an intumescent strip, a radial extended flange attached to one end of the sleeve for fastening to concrete formwork, and a neoprene gasket.
- C. Latex Sealants: Single-component latex formulations that after cure do not re-emulsify during exposure to moisture
- D. Firestop Devices: Factory-assembled collars formed from galvanized steel and lined with intumescent material sized to fit specific diameter of penetrant.
- E. Intumescent Composite Sheets: Rigid panels consisting of aluminum-foil-faced elastomeric sheet bonded to galvanized steel sheet.
- F. Intumescent Putties: Nonhardening dielectric, water-resistant putties containing no solvents, inorganic fibers, or silicone compounds.
- G. Intumescent Wrap Strips: Single-component intumescent elastomeric sheets with aluminum foil on one side.
- H. Mortars: Prepackaged, dry mixes consisting of a blend of inorganic binders, hydraulic cement, fillers, and lightweight aggregate formulated for mixing with water at Project site to form a nonshrinking, homogeneous mortar.
- I. Pillows/Bags: Reusable, heat-expanding pillows/bags consisting of glass-fiber cloth cases filled with a combination of mineral-fiber, water-insoluble expansion agents and fire-retardant additives.
- J. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.
- K. Silicone Sealants: Moisture-curing, single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below:
  1. Grade for Horizontal Surfaces: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces.
  2. Grade for Vertical Surfaces: Nonsag formulation for openings in vertical and other surfaces.

## 2.03 PERIMETER FIRE-CONTAINMENT SYSTEMS:

- A. Where indicated for gaps between the perimeter edge of fire-resistance-rated floor assemblies and non-fire-resistance-rated exterior curtain walls, provide a perimeter fire-containment system with the fire-test response characteristics indicated, as determined by

testing identical systems per UBC Standard 26-9 and UL 2079 by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Materials shall be identified with appropriate markings of applicable testing and inspecting agency.

### **PART 3 - EXECUTION**

#### **3.01 EXAMINATION:**

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.02 PREPARATION:**

- A. Surface Cleaning: Clean out openings immediately before installing through-penetration firestop systems to comply with written recommendations of firestop system manufacturer and the following requirements:
  - 1. Remove from surfaces of opening substrates and from penetrating items foreign materials that could interfere with adhesion of through-penetration firestop systems.
  - 2. Clean opening substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with through-penetration firestop systems. Remove loose particles remaining from cleaning operation.
  - 3. Remove laitance and form-release agents from concrete.
- B. Priming: Prime substrates where recommended in writing by through-penetration firestop system manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.
- C. Masking Tape: Use masking tape to prevent through-penetration firestop systems from contacting adjoining surfaces that will remain exposed on completion of Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove smears from firestop system materials. Remove tape as soon as possible without disturbing firestop system's seal with substrates.

#### **3.03 THROUGH-PENETRATION FIRESTOP SYSTEM INSTALLATION:**

- A. General: Install through-penetration firestop systems to comply with "Performance Requirements" Article and firestop system manufacturer's written installation instructions and published drawings for products and applications indicated.
- B. Install forming/damming/backing materials and other accessories of types required to support fill materials during their application and in the position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.
- C. Install fill materials for firestop systems by proven techniques to produce the following results:
  - 1. Fill voids and cavities formed by openings, forming materials, accessories, and penetrating items as required to achieve fire-resistance ratings indicated.
  - 2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.
  - 3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

#### **3.04 FIELD QUALITY CONTROL:**

- A. Where deficiencies are found, repair or replace through-penetration firestop systems so they comply with requirements.

**3.05 IDENTIFICATION:**

- A. In areas not exposed to public view, identify through-penetration firestop systems with pressure-sensitive, self-adhesive, preprinted vinyl labels. Attach labels permanently to surfaces of penetrated construction on both sides of each firestop system installation where labels will be visible to anyone seeking to remove penetrating items or firestop systems. Include the following information on labels:
  - 1. The words: "Warning--Through-Penetration Firestop System--Do Not Disturb."

**3.06 CLEANING AND PROTECTION:**

- A. Clean off excess fill materials adjacent to openings as Work progresses by methods and with cleaning materials that are approved in writing by through-penetration firestop system manufacturers and that do not damage materials in which openings occur.
- B. Provide final protection and maintain conditions during and after installation that ensure through-penetration firestop systems are without damage or deterioration at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated through-penetration firestop systems immediately and install new materials to produce through-penetration firestop systems complying with specified requirements.

**3.07 THROUGH-PENETRATION FIRESTOP SYSTEM SCHEDULE:**

- A. Where UL-classified systems are indicated, they refer to the alpha-alpha-numeric designations listed in UL's "Fire Resistance Directory" under product Category XHEZ.
- B. Firestop Systems for Metallic and Non-metallic Conduit, Tubing, Sleeves, Cable Trays and Cables:
  - 1. UL-1479: Fire rated for 3 hours.
  - 2. Type of fill materials: One or more of the following:
    - a. Silicone sealant.
    - b. Intumescent putty.
    - c. Silicone foam.
- C. Firestop Systems for Insulated Pipes: Comply with the following:
  - 1. UL- 1479: CAJ 5087.
  - 2. Type of Fill Materials: Intumescent putty.
- D. Firestop Systems for Miscellaneous Mechanical Penetrations: Comply with the following:
  - 1. UL- 1479: CAS 8033.
  - 2. Type of Fill Materials: Mortar.
- E. Firestop Systems for Ductwork: Comply with the following:
  - 1. UL- 1479: WJ7007.
  - 2. Type of Fill Materials: Intumescent sealant.

**END OF SECTION**

## SECTION 07900

### SEALS AND SEALANTS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing compression seals and sealants not specified elsewhere.
- B. Related Work Specified Elsewhere:
  - 1. Rabbet for compression seal in granite edging: Section 04415.
  - 2. Expansion joint cover assemblies and systems: Sections 05810 and 05811.
  - 3. Sealant for metal thresholds: Section 08710.
  - 4. Glazing sealant: Section 08800.
  - 5. Acoustical sealant: Section 09255.
  - 6. Ceramic tile sealant: Section 09320.
  - 7. Caulk for painting preparation: Section 09920.
  - 8. Paver tile sealant: Section 09340.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: C920, C1193, D412, D1752, D2628.
- B. Manufacturer Qualification:
  - 1. General: Provide the products of established manufacturers. Insofar as possible, provide products from a single manufacturer.
  - 2. Sealant color-selection capability: Have color-selection capability resolved early in the submittals process to prevent delay of the work.
    - a. Where sealants are exposed, provide products of a manufacturer who can match the colors of adjacent materials by either having an acceptable range of standard colors or by factory blending custom colors as acceptable to the Engineer and at no additional cost to the Authority.
    - b. Where a manufacturer's colors are insufficient for proper color-match, use acceptable colors from another acceptable manufacturer.
  - 3. On-site representation: Use only a sealant manufacturer who has a local, knowledgeable representative who can visit the project site prior to construction and at least twice during sealant installation to observe conditions and recommend solutions at no additional cost to the Authority.
- C. Design Criteria:
  - 1. Designed width of exterior joints: Joint widths indicated on drawings are shown at their designed width. This is measured when the joint would be at the average air temperature for the year, which is approximately 50F, based on an average minimum air temperature of zero degrees F and an average maximum air temperature of 100F.
  - 2. Designed width of interior joints: Joint widths indicated on the drawings are shown at their designed width at 50F.
  - 3. Joint width at time of seal or sealant application: Make joint widths at time of installation never less than the calculated width, which at 0 degrees F is 25 percent wider than the designed width and at 100F is 25 percent narrower than the designed width for exterior joints and 1-1/2 percent smaller than the designed width for each

degree the ambient temperature exceeds 50F, and 1-1/2 percent larger than the designed width for each degree the ambient temperature is less than 50F.

- a. It is recommended that seals and sealant be installed when the average daily air temperature is 50 degrees F plus or minus five degrees, when joint should be at its designed width.
  - b. If joints are less than the calculated width at the time of proposed installation, take corrective action, which may include saw cutting of joint or other remedial measures approved by the Engineer and by the seal or sealant manufacturer.
  - c. If the joint depth is not sufficient for the designed width of the joint, sealant and backup, cut out the joint to the required depth for the sealant and backup.
  - d. Perform cutting and remedial measures that are acceptable to the Engineer. Cost of cutting and remedial measures are at no additional cost to the Authority.
4. Joint size and sealant size: Except as otherwise indicated, make sealant at least 1/4-inch wide x 1/4-inch deep. In joints 3/8 inches wide, make sealant 1/4-inch deep. In joints wider than 3/8-inch and up to 1-inch wide, make sealant depth 1/2 of the joint width. For joints wider than 1 inch, make sealant depth as recommended by the sealant manufacturer.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Samples:
    - a. Material samples: Four of each type of the following materials used in the work:
      - 1) Compression seals: 12 inches long, plus each factory-made corner unit.
      - 2) Sealant and lubricant-adhesive: Half-pint containers.
      - 3) Sealant colors: Fully cured beads of each color used, each six inches long.
      - 4) Backup material: 12 inches long.
      - 5) Joint filler: 12 inches long.
      - 6) Color chips: 12 inches long, one for each color used in the work.
    - b. Demonstration samples: Make demonstration installation of each seal and sealant installation type and color. Use approved materials, installed and cured as required. Remove demonstration samples as directed. Perform testing on sealant demonstration samples as specified under Field Testing.
  2. Shop Drawings:
    - a. General: Submit manufacturers technical product data for each product proposed to be used, together with standard and custom color-selection samples.
    - b. Compression seals: Detail correct size and placement of each type and size of compression seal in its joint.
    - c. Test results: Inspection and adhesion test results performed by sealant manufacturer.
  3. Certification by each manufacturer that the products provided will perform as required and will not stain adjacent materials.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to jobsite in original unopened containers clearly marked with manufacturer's name and brand designation, referenced specification number, type and class as applicable.
- B. Store products in approved dry area and protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products to prevent breakage of containers and damage to products.

**1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  - 1. Application of seals or sealants, including their related products, when ambient temperature is lower than 40F or when there is ice, frost or dampness visible on surfaces to be sealed is prohibited.
  - 2. Comply with manufacturer's environmental recommendation.

**PART 2 - PRODUCTS**

**2.01 COMPRESSION-SEAL MATERIALS:**

- A. Preformed compression seals: ASTM D2628, rectangular design unless otherwise shown.
  - 1. Width: Size compression seals for full amount of joint movement as required, plus the thickness of the compressed seal as recommended by the manufacturer.
  - 2. Corners: Provide factory pre-molded or factory pre-cut and welded corner units for angular changes in direction, vertically as well as horizontally, including 30, 60, 45, 90, 120, 135, and 150 degrees as required by joint location.
- B. Lubricant-adhesive, general: One-part moisture-curing polyurethane as recommended by compression seal manufacturer, with the following additional requirements:

Physical Property	Requirement	ASTM Test Method
Average weight per gallon	8.00 pounds plus-or-minus 10 percent	-
Solids content	65 - 74 percent by weight	-
Adhesive	Fluid from 5F to 120F	-
Film strength	1200 psi, minimum	D412
Elongation	250 percent	D412

- C. Lubricant-adhesive for compression seal in granite: Same as above, but also tested for nonstaining over a three-month period on samples of granite to be used.

**2.02 SEALANT AND ACCESSORIES:**

- A. General: Provide joint sealant, backup rod, primer, and other related materials that are compatible with one another and with the joint substrates under conditions of service and application, as demonstrated by sealant manufacturer based on field experience and submitted test reports.
- B. Sealant (Polyurethane): Polyurethane-based or epoxidized polyurethane based, multi-part elastomeric sealant, ASTM C920, Type M (multi-component), Class 25 (withstands an increase or decrease of 25 percent of the joint width) as follows:
  - 1. For joints in horizontal surfaces: Grade P (pourable or self-leveling), Uses T (traffic areas), M (on masonry) or O (other than standard substrates).
  - 2. For joints in sloped surfaces: Grade NS (nonsag), Uses T (traffic areas), M (on masonry) or O (other than standard substrates).
  - 3. For joints in overhead and vertical surfaces: Grade NS (nonsag), Uses NT (nontraffic areas), M (on masonry), A (on aluminum), or O (other than standard substrates).
- C. Primer: Colorless, nonstaining liquid material of types suited to each substrate surface, as tested and recommended in writing by the manufacturer of each sealant to be used.
- D. Backup Rod: Preformed, compressible, resilient, non-waxed, non-extruding, nonstaining, closed-cell rod stock of polyethylene or polyethylene-jacketed foam which will maintain a uniform round or oval cross-sectional shape when compressed into the joint.
  - 1. Select backup rods as recommended by the manufacturer of each sealant to be used; compatible with joint substrates, sealants, primers, and other joint fillers; that will not bond with sealants and primers; and are approved for applications indicated based on field experience and laboratory testing.
  - 2. Select backup rod of the sizes and shapes to suit the various conditions and at about 30 percent wider than the joint width.
    - a. Where depth of joint is too shallow for round backup rod use 1/2-round backup rod, factory manufactured with cut surface fused by heat process so that it cannot release gas.
    - b. Where depth is too shallow for 1/2-round rod, use bond breaker tape.
- E. Bond-Breaker Tape: Polyethylene tape, as recommended by the manufacturer of each sealant to be used, for preventing sealant from adhering to joint-filler materials or joint surfaces at back of joint where such adhesion would promote sealant failure, or result in less than optimal performance. Provide tape sized properly for the joint. Provide self-adhesive tape where applicable.
- F. Cleaning Agent: Joint cleaning compound tested and recommended in writing by sealant manufacturer for cleaning joint surfaces before priming. Use only a cleaner which is nonstaining, non-harmful to masonry, does not leave oily residues, and does not have a detrimental effect on adhesion or in-service performance.
- G. Weep Tubes: Vinyl tubing, 3/8-inch diameter.
- H. Masking Tape: Nonstaining, nonabsorbent type, compatible with joint sealants and to surfaces adjacent to joints. Use only a masking tape which will easily come off entirely, including adhesive.
- I. Joint Filler for Sealant Joints : Nonstaining joint filler compatible with backer rod and sealant:
  - 1. Sponge rubber: Preformed strips complying with ASTM D1752 Type I.
- J. Joint Filler for Pavers and Walkways: Nonstaining joint filler compatible with backer rod and sealant; one of the following. Where filler is not shown covered by sealant, see Section 03300:
  - 1. Cork: Preformed strips complying with ASTM D1752 Type II.

2. Self-expanding cork: Preformed strips complying with ASTM D1752 Type III.

### **PART 3 - EXECUTION**

#### **3.01 INSPECTION AND PREPARATION:**

- A. Inspection:
  1. With installer present, examine joints for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting the performance of joint seals and sealants.
  2. Have sealant manufacturer's representative visit the site and review the project joint conditions and details for sealant work of this Project and perform adhesion testing. Have sealant manufacturer representative report to the Engineer in writing the results of his inspections and tests.
  3. Do not proceed with work of this section until unsatisfactory conditions have been corrected.
- B. Preparation: Comply with the recommendations of ASTM C1193 and the following:
  1. Cleaning:
    - a. Clean joint surfaces receiving seals or sealants. Ensure that they are sound, smooth, clean, dry, and free of foreign substances and contaminants, including curing compounds and release agents.
    - b. Remove factory or field-applied coatings that will be detrimental to adhesion of seals, sealants or primers.
  2. Masking: Use masking where required to prevent contact of sealant and primers with adjoining surfaces that otherwise would be stained or damaged by such contact or by cleaning methods required to remove sealant or primer smears.
- C. Priming: Unless sealant manufacturer specifically recommends in writing against priming, apply primer to prepared surfaces that will receive sealant. Apply primer on clean, dry surfaces, and prior to installation of backup rod. Completely wet both inner faces of the joint with primer.
- D. Backup rod: Install backup rod in joints (after primer is dry) to provide backup and give proper shape for sealant bead. Where there is insufficient joint depth for backup rod, install half-round backup rod or bond breaker tape as approved in lieu of backup rod.
  1. Proper cross-sectional shape for sealant bead is a very slight hourglass shape with back and front faces having slight concave curvature, unless indicated otherwise. Use special blunt T-shaped tool or roller to install backup rod to the proper and uniform depth required for the sealant.
  2. Install size of backup rod that will provide approximately 30 percent compression.
  3. Do not stretch, twist, braid, puncture, or tear backup rod. A broken surface will emit gas (out-gassing) that blisters the installed sealant, thereby requiring complete removal and reinstallation of primer, backup rod, and sealant.
  4. Tightly butt backup rods at joints and intersections. At outside corners, provide sufficient length of backer rod so that rod can be bent around corner rather than cut at corner, so that out-gassing will not occur.
- E. Bond breaker tape: Where space for a backup rod is inadequate, use bond breaker tape to prevent three-sided adhesion. Install bond breaker tape smoothly over back of joints so that sealant adheres to the sides of joint but not to the back of joint.

#### **3.02 INSTALLATION:**

- A. Compression Seals:
1. If adjacent surfaces are to receive waterproofing, install compression seals prior to application of waterproofing.
  2. Prime interfaces, edges and corners of joints as necessary.
  3. Prime and lubricate joints by coating both sides of joint with lubricant-adhesive to wet-film thickness of 20 mils.
  4. While lubricant-adhesive is still wet, install compression seals to depth shown.
  5. Recess exposed edges slightly behind adjoining surfaces, unless otherwise shown, so that compressed units will not protrude from joints.
  6. Bond ends together with materials and methods recommended by manufacturer to ensure continuous watertight and airtight performance. Where factory pre-molded or pre-welded corner units are unavailable, miter-cut and bond ends at corners.
- B. Sealant:
1. Comply with ASTM C1193 and with manufacturer's recommendations, except where more stringent requirements are shown or specified.
  2. Set joint-filler units at depth or position in joint as shown to coordinate with other work, including installation of bond breakers, backer rods and sealants. Do not leave voids or gaps between ends of joint-filler units.
  3. Install back-up material, except where shown to be omitted or recommended to be omitted by sealant manufacturer for application used.
  4. Install bond-breaker tape where shown and where recommended by manufacturer to ensure that sealants will perform as intended.
  5. Employ installation techniques which will ensure that sealants are deposited in uniform, continuous ribbons without gaps or air pockets, with complete wetting of joint bond surfaces equally on opposite sides.
    - a. Except as otherwise shown, fill sealant rabbet to slightly concave surface, slightly below adjoining surfaces. Where horizontal joints are between horizontal surface and vertical surface, fill joint to form slight cove, so that joint will not trap moisture and dirt.
    - b. Fill joints to a depth equal to 50 percent of joint width, but not more than 1/2-inch deep nor less than 1/4-inch deep.
    - c. Ensure that temperature of sealant, as well as of substrates, at time of sealant application, is as recommended by sealant manufacturer and as specified herein. Apply sealant at optimum time after primer application.
    - d. Remove masking immediately after tooling of sealant and before sealant face starts to skin over. Do not cause dislocation of sealant, or migration of sealant to adjacent surfaces when removing masking tape.
  6. Spillage: Do not allow sealants or compounds to overflow from confines of joints, to spill onto adjoining work or to migrate into voids of exposed finishes. If spillage occurs, eliminate evidence of spillage to the Engineer's satisfaction.
  7. Seal joints in granite work with sealant, except granite-paving joints and pylon-apron joints that are shown to be grouted. Ensure joint depths of at least 3/4 inch before placing backup. If necessary, rake-out joints to a minimum depth of 3/4 inch.
  8. Weep Holes: Install weep tubes, sloping to expel water, where required to allow free drainage of hollow spaces. Where so shown, install tubes through sealant and backing to ensure an unobstructed drainage path. Do not seal over weep holes provided by other trades.

### **3.03 CURING AND PROTECTING:**

- A. Cure sealants in compliance with manufacturer's recommendations, to obtain high early bond strength, internal cohesive strength and surface durability.

- B. Cure and protect joint sealers during construction period, so that they will be without deterioration, soiling or damage, other than normal wear and weathering, at time of final acceptance.
- C. Cure and protect sealants so as to minimize increases in modulus of elasticity and other accelerated aging effects.
- D. Replace or restore sealants damaged or deteriorated during construction and from testing as directed. Cut out or remove damaged sealant immediately and properly prepare and reseal joint with new materials to produce sealant installation with repaired areas indistinguishable from other work.

#### **3.04 FIELD TESTING:**

- A. Sealant: Field test cured sealant installations in the presence of and where directed by the Engineer. Test each type of joint sealant for adhesion to joint substrates by hand-pull method as follows:
  - 1. Make knife cuts as follows: A transverse cut from one side of joint to the other, followed by parallel cuts approximately 2 inches long at each side of joint and meeting the transverse cut at the end of the 2-inch cuts. Place a mark 1 inch from the top of 2-inch piece.
  - 2. Use fingers to grasp the 2-inch piece of sealant just above the 1-inch mark; pull firmly away at a 90-degree angle while holding a ruler along side of sealant; pull sealant out of joint to the distance recommended by sealant manufacturer for testing adhesive capability, but not less than the distance equaling the specified maximum movement capability in extension; hold this position for 10 seconds.
  - 3. Report whether or not the sealant in joint (connected to pulled-out portion) failed to adhere to joint substrates or failed cohesively or adhesively. Include data on pull distance used to test each type of sealant and joint substrate.
  - 4. Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered acceptable, subject to certification of design and performance criteria by the manufacturer.
  - 5. Make a minimum of 10 such tests unless otherwise directed by the Engineer. Submit report of testing to the Engineer.

#### **3.05 CLEANING:**

- A. Immediately clean off excess primers, drippings, sealants and sealant smears as work progresses, using methods and with cleaning materials approved by manufacturer of each joint primer and sealant and by manufacturers of materials where joints occur.
- B. Use only materials and methods acceptable to the Engineer.

**DIVISION 8 - DOORS AND WINDOWS**

08110	HOLLOW METAL DOORS AND FRAMES
08305	ACCESS DOORS AND FRAMES
08331	OVERHEAD COILING DOORS
08334	OVERHEAD COILING GRILLES
08410	ALUMINUM ENTRANCES AND STOREFRONTS
08481	METAL CONCAVE MANDOORS
08520	ALUMINUM WINDOWS
08710	FINISH HARDWARE
08800	GLASS AND GLAZING

**END OF SECTION**

## SECTION 08110

### HOLLOW METAL DOORS AND FRAMES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing metal doors and frames.
- B. Related Work Specified Elsewhere:
  - 1. Finish hardware: Section 08710.
  - 2. Glass and glazing: Section 08800.
  - 3. Field painting: Section 09920.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Details of construction, connections, anchors, schedules, setting diagrams and interface with work of other trades.
    - b. Schedule of doors and frames using the same reference numbers for details and openings as those on the Contract Documents.
  - 2. Certification.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NFPA: 80 (Standard for Fire Doors and Fire Windows).
  - 3. UL: Building Materials Directory.
  - 4. NAAMM: Standards HMMA 861 and 862.
  - 5. SDI: 100.
  - 6. FS: TT-F-322.
  - 7. ASTM: A153, A366, A526, A569, A780, C236, C976.
  - 8. DHI (Door and Hardware Institute): A115, Recommended Locations for Builder's Hardware.
  - 9. ADA (Americans With Disabilities Act).
- B. Fire-Rated Assemblies: Where UL-listing, UL-label or UL Building Materials Directory is specified, another testing and inspection agency acceptable to the Engineer and to authorities having jurisdiction may be used.

##### 1.04 PRODUCT, DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the jobsite in original unopened containers or wrappings clearly labeled with manufacturer's name and brand designation, door schedule number, referenced specification number, type, class and rating as applicable.
- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements.
- C. Handle products so as to prevent breakage of containers and damage to products.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Hot-Rolled Steel Sheets and Strip: Commercial quality carbon steel, pickled and oiled, complying with ASTM A569, free of scale, pitting or surface defects.
- B. Cold-Rolled Steel Sheets: Commercial quality, level, carbon steel, complying with ASTM A366.
- C. Galvanized Steel Sheets: Zinc-coated carbon steel sheets of commercial quality, complying with ASTM A526, G60 zinc coating, mill phosphatized.
- D. Shop-Applied Primer: Rust-inhibitive baked-on primer, suitable as base for specified finish paint systems.
- E. Finish Paint Systems: Section 09920.
- F. Supports and Anchors: Sheet steel, gauge in accordance with HMMA reference standards, unless specified otherwise. After fabricating, galvanize units to be built into or attached to exterior walls, wet areas such as doors to toilet rooms and janitor's room, or attached to slabs on grade; complying with ASTM A153, Class B.
- G. Inserts, Bolts and Fasteners: Manufacturer's standard units unless specified otherwise. Hot-dip galvanized items to be used in exterior walls, wet areas such as doors to toilet rooms and janitor's rooms, or attached to slabs on grade; complying with ASTM A153, Class C or D as applicable.
- H. Metallic Filler: FS TT-F-322.
- I. Galvanizing Repair Compound: Stick form, melting point 600F to 650F, GALVABAR or equal.

### **2.02 FABRICATION, GENERAL:**

- A. Fabricate hollow metal door and frame units to be rigid, neat in appearance, and free from defects, warp or buckle. Wherever practicable, fit and assemble units in manufacturer's plant. Clearly identify work that cannot be permanently factory-assembled before shipment, to ensure proper assembly at project site.
- B. Galvanize exterior door and frame assemblies, and wet area door and frame assemblies such as at toilet room and janitor's room; including but not limited to face sheets, reinforcements, closures, dust covers, mortar shields, glazing and louver beads, clips, anchor bolts, screws, rivets and welds.
- C. Exposed fasteners are not allowed on door frames and door faces; elsewhere, provide countersunk flat philips heads for exposed screws and bolts.
- D. Door Hardware Preparation:
  - 1. Prepare and reinforce doors and frames to receive mortised and concealed hardware in accordance with final Hardware Schedule and templates provided by hardware supplier. Comply with applicable requirements of DHI A115-series, Steel Door Prep Standards, for door and frame preparation for hardware.
  - 2. Reinforce doors and frames to receive surface-applied hardware. Drilling and tapping for surface-applied hardware may be done at project site.

3. Locate hardware as indicated on approved shop drawings or, if not indicated, in accordance with ADA requirements pertaining to operating hardware locations, and the Recommended Locations for Builder's Hardware, published by the DHI.
- E. Shop Painting:
1. Clean, treat and paint exposed surfaces of steel door and frame units, including galvanized surfaces.
  2. Chemically clean steel surfaces of mill scale, rust, oil, grease, dirt and other foreign materials before application of paint.
  3. Apply phosphate conversion pretreatment coating.
  4. Apply shop coat of prime paint of even consistency to provide a uniformly finished surface ready to receive finish paint. Apply primer immediately after surface preparation and pretreatment.
- F. Insulated Metal Assemblies: Where schedules, provide doors and frames fabricated as thermal-insulating assemblies and tested according to ASTM C236 or ASTM C976.

### **2.03 FRAMES:**

- A. General:
1. Fabricate frames to uniform profile as shown of full-welded unit construction, with corners mitered and reinforced. Continuously weld full depth and width of frame, except for knock-down frames.
  2. Mullions and Transom Bars: Provide closed or tubular mullions and transom bars where indicated.
    - a. Fasten mullions and transom bars at crossings and to jambs by butt welding, except for knock-down frames.
    - b. Reinforce joints between frame members with concealed clip angles or sleeves of the same metal and thickness as frame.
  3. Jamb anchors: Provide in accordance with NAAMM Standards HMMA 861 and 862:
    - a. Provide T-type anchors or strap-and-stirrup type anchors at new masonry.
    - b. Provide Z-type anchors at metal stud partitions.
    - c. Provide bolt-type anchors with pipe spacers at in-place construction.
  4. Floor anchors: Provide floor anchors for each jamb and mullion that extends to floor, formed of galvanized steel sheet, as follows:
    - a. Monolithic concrete slabs: Clip-type anchors, with two holes to receive fasteners, welded to bottom of jambs and mullions.
    - b. Separate topping concrete slabs: Adjustable type with extension clips, allowing not less than two-inch height adjustment. Terminate bottom of frames at finish floor surface.
  5. Head anchors: Provide two anchors at head of frames exceeding 42 inches wide for frames mounted in steel stud walls.
  6. Head strut supports:
    - a. Provide 3/8-inch by two-inch vertical steel struts extending from top of frame at each jamb to supporting construction above, unless frame is anchored to masonry or to other structural support at each jamb.
    - b. Bend top of struts to provide flush contact for securing to supporting construction above.
    - c. Provide adjustable bolted anchorage to frame jamb members.
  7. Structural reinforcing members: Provide structural reinforcing members as a part of frame assembly, where indicated at mullions, transoms or other locations which are to be built into frame.
  8. Spreader bars: Across bottom of welded frames, provide removable spreader bar, tack welded to jambs and mullions.
  9. Door silencers:

- a. Drill stop to receive three silencers on single door frames and two silencers on double door frames.
  - b. Install plastic plugs to keep holes clear during construction.
- 10. Plaster guards: Provide 18-gauge steel plaster guards or dust-cover boxes (galvanized at exterior locations), welded to frame, at back of hardware cutouts, where mortar or other materials might obstruct hardware installation or operation and to close off interior of openings.
- B. Interior Hollow Metal Frames: NAAMM Standard HMMA 861, Guide Specifications for Commercial Hollow Metal Doors and Frames except as follows:
  - 1. Openings over four feet wide: 12-gauge.
  - 2. Cart-storage rooms and other doors as indicated: Use security hollow metal frames specified below.
  - 3. Knock-down frames may be used in drywall construction as specified below.
- C. Exterior and Security Hollow Metal Frames: NAAMM Standard HMMA 862, Guide Specifications for Security Hollow Metal Doors and Frames, except as follows:
  - 1. Use for exterior doors and for indicated security doors including cart-storage room.
  - 2. Cart-storage-room frame anchors: Hot-dipped galvanized anchor bolts, not less than 1/2-inch by six inches, inaccessible from the safety walk, eight per frame.
- D. Interior Knock-Down Hollow Metal Frames: SDI 100, and as follows:
  - 1. Knock-down frames may be used only in interior drywall construction.
  - 2. Openings four foot wide or less: 16-gauge.
  - 3. Openings over four feet wide: 12-gauge.

#### **2.04 DOORS:**

- A. Thermal Insulation: Provide exterior doors and panels with internal thermal insulation of extruded polystyrene. Aged R-value of door or panel is to be 5.0 or greater.
- B. Interior Hollow Metal Doors: NAAMM Standard HMMA 861, Guide Specifications for Commercial Hollow Metal Doors and Frames except for cart-storage room and other doors as indicated.
- C. Exterior and Security Hollow metal Doors: NAAMM Standard HMMA 862, Guide Specifications for Security Hollow Metal Doors and Frames.
  - 1. Use for exterior doors and for indicated security doors including cart-storage room.

#### **2.05 FIRE-DOOR ASSEMBLIES:**

- A. Where fire-rated door and frame assemblies are required for code compliance, or are otherwise indicated, provide door, frame and hardware assemblies in compliance with NFPA 80, which are labeled and listed by UL.
- B. Fabrication and assembly requirements necessary to obtain labels will take precedence over requirements shown or specified, except where requirements shown or specified exceed sizes or gauges required for labeling.
- C. Where oversized fire doors are required, furnish manufacturer's certification that assembly has been constructed with materials and methods equivalent to labeled construction.
- D. Louvers: Equip louvers in fire-rated doors with UL-listed self-closing fire dampers with fusible links.

- E. Identify each fire door and frame with permanent UL labels, indicating the applicable fire rating of both the door and the frame. Secure labels to vertical edge of doors and frames where readily visible. Protect labels from painting operations.

## **2.06 TRANSOM ASSEMBLIES:**

- A. Removable Transom Bar: Formed as shown of same material as frame, with manufacturer's standard bolted connection.
- B. Removable Transom Panel: Formed as shown of the same construction as the door or doors below, through-bolted to frame eight inches on-center maximum.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Deliver work, ready to set up and erect in place as rapidly as general construction work permits. Set work in place in accordance with approved shop drawings, plumb and level, strongly secured against displacement and with built-in anchors. In masonry construction, set frames in advance of masonry work. Limit field-cutting, drilling and punching to minimum necessary.
- B. Anchor metal frames in accordance with NAAMM Standards HMMA 861 and 862.
- C. Anchor fire-door assemblies in accordance with NFPA 80.
- D. Install doors after masonry work has been completed; accurately fit and adjust to work properly.
- E. Maintain installation clearances and tolerances in accordance with NAAMM Standards HMMA 861 and 862.
- F. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
  - 1. Wire-brush welds and other repair areas to bright metal.
  - 2. Apply galvanizing repair compound at rate of two ounces per square foot.
- G. Touch-up shop applied primer as recommended by manufacturer for compatibility with finish paint system.
- H. Application of finish hardware: Section 08710.
- I. Glazing materials and installation: Section 08800.

### **3.02 CLEAN UP:**

- A. Upon completion of installation, clean surfaces of doors and frames as recommended by door manufacturer.
- B. Remove from the site rubbish and debris caused by this work.
- C. Leave areas surrounding openings in broom-clean condition.

**END OF SECTION**

## SECTION 08305

### ACCESS DOORS AND FRAMES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing wall and ceiling access doors and frames, fire-rated wall access doors and frames, access hatches, tile covered access hatches and passenger emergency-egress hatches.
- B. Work Specified Elsewhere:
  - 1. Cast-In-Place Concrete: Section 03300.
  - 2. Mortar, Grout and Masonry Accessories: Section 04050.
  - 3. Brick Masonry: Section 04125.
  - 4. Concrete Unit Masonry: Section 04220.
  - 5. Structural Steel: Section 05120.
  - 6. Roof Hatches: Section 07730.
  - 7. Finish Hardware: Section 08710.
  - 8. Tile: Section 09320.
  - 9. Paver Tile: Section 09340.
  - 10. Acoustical Panel Ceilings: Section 09511.
  - 11. Field Painting: Section 09920.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For each type of door and frame indicated. Include construction details relative to materials, individual components and profiles, finishes, and fire ratings (if required) for access doors and frames.
  - 2. Shop Drawings: Show fabrication and installation details. Include plans, elevations, sections, hardware, fittings, fastenings, details, and attachments to other Work. Manufacturer's standard drawings may be submitted in lieu of Contractor prepared shop drawings if manufacturer's standard drawings show required details.
  - 3. Samples: For each door face material, at least 3 by 5 inches in size, in specified finish.
  - 4. Schedule: Provide complete door and frame schedule, including types, general locations, sizes, construction details, latching or locking provisions, and other data pertinent to installation.
  - 5. Coordination Drawings: Reflected ceiling plans drawn to scale and coordinating penetrations and ceiling-mounted items with concealed framing, suspension systems, piping, ductwork, and other construction. Show the following:
    - a. Method of attaching door frames to surrounding construction.
    - b. Ceiling-mounted items including access doors and frames, lighting fixtures, diffusers, grilles, speakers, sprinklers, and special trim.
  - 6. Certification:
    - a. Certification from manufacturer of steel gratings verifying that gratings are capable of supporting loading as shown.
    - b. Certified test reports of successful factory testing performed on passenger emergency-egress hatches. Certification of previous successful testing of hatches of same design furnished under similar Authority contracts acceptable in lieu of specified testing.
    - c. Certification that welding personnel are currently qualified in accordance

with AWS D1.1.

### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: Standard Specifications for Highway Bridges: HS-20-44 Loading.
  - 3. AGA: The Design and Fabrication of Galvanized Products.
  - 4. AISC: Specification for Structural Steel for Buildings-Allowable Stress Design
  - 5. ASTM: A36, A53, A90, A123, A143, A153, A167, A193, A276, A307, A384, A413, A501, A588, A593, A633, A666, A780, A786, B221, B633, D1187, F594.
  - 6. AWS: D1.1, D1.2, D1.3, D1.4.
  - 7. FS; FF-B-588, FF-P-395, FF-S-325, RR-G-661, TT-P-664.
  - 8. MS: MIL-P-21305.
  - 9. NAAMM: Metal Finishes Manual for Architectural Metal Products
  - 10. NFPA: 101 (Fire Exit Hardware), 252 (Standard Method of Fire Tests for Door Assemblies)
  - 11. SSPC: SP 11, Paint 12.
  - 12. UL: 10B (Fire Tests of Door Assemblies)
  
- B. Source Limitations: Obtain doors and frames through one source from a single manufacturer.
  
- C. Fire-Rated Access Doors and Frames: Units complying with NFPA 80 that are identical to access door and frame assemblies tested for fire-test-response characteristics per the following test method and that are labeled and listed by UL, ITS, or another testing and inspecting agency acceptable to authorities having jurisdiction:
  - 1. [NFPA 252] [or] [UL 10B] for vertical access doors.
  
- D. Size Variations: Obtain the Engineer's acceptance of manufacturer's standard-size units, which may vary slightly from sizes indicated.
  
- E. Welding: Qualify procedures and personnel according to the following:
  - 1. AWS D1.1, "Structural Welding Code-Steel."
  - 2. AWS D1.2, "Structural Welding Code-Aluminum."
  - 3. AWS D1.3, "Structural Welding Code-Sheet Steel."
  - 4. AWS D1.4, "Structural Welding Code-Reinforcing Steel."
  - 5. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification. Such certification is to remain in force for the duration of the welding operations under this Contract.
  
- F. Passenger Emergency-Egress Hatches Meeting AASHTO HS-20-44 Loading:
  - 1. Performance Requirements:
    - a. Design exit hardware so that:
      - 1) Force of not more than 15 pounds on pull ring will actuate release bar and latches and outward force of not exceeding 30 pounds will open hatch.
      - 2) Force of not more than 50 pounds on pull ring will actuate release bar and latches when latched leaf is subjected to outward force of 250 pounds applied against latching edge adjacent to latch or to flush grip handle in direction in which latch opens.
    - b. Provide one-inch minimum distance between bar and other door parts, when bar has traveled to fully open position.
    - c. Provide sufficient supports on latch bars to prevent damage and misalignment.

- d. Design and provide sufficient latch bar springs for proper operation.
  - e. Coordinate design with design-specialty applications which interface with hatch design
  - f. Make recommendations for specialty-design actions to be performed by other specialties.
2. Factory testing:
- a. Perform endurance testing in which hatch leaf is attached to frame assembly and, complete with exit hardware, is subjected to 1,000 opening-and-closing cycles. Hatch, including release mechanism, exit hardware and latches, to operate without failure and show no signs of excessive wear.
  - b. Perform opening tests in which hatch leaf is subjected to the 15-pound test before and after endurance test and in which hatch leaf is subjected to 250-pound-outward-force test after endurance test. With spring scales, or by other approved means, test and record force required to open hatch. Opening force not to exceed 30 pounds for normal test and 50 pounds for 250-pound-outward-force test.
  - c. Test data to be recorded and certified by the manufacturer.
  - d. Notify the Authority at least 14 calendar days prior to each test.
3. Covers: Shall be reinforced to support a minimum live load of 300 psf (1464 kg/m<sup>2</sup>) with a maximum deflection of 1/150th of the span. Operation shall be smooth and easy with controlled operation throughout the entire arc of opening and closing. Operation shall not be affected by temperature.
4. AASHTO-HS-20-44 load or higher load if required by the jurisdictional authority where the hatch is installed: Structural steel plate with load-carrier beams.

#### **1.04 PROJECT CONDITIONS:**

- A. Field Measurements: Where doors and hatches are indicated to fit in walls and other construction, verify dimensions by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
  - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating metal fabrications without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions. Allow for trimming and fitting.

#### **1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products undamaged
- B. Store products so as to prevent rust
- C. Handle products so as to prevent damage.
- D. After completion of factory testing, package and ship hatches as directed.

#### **1.06 COORDINATION:**

- A. Verification: Determine specific locations and sizes for access doors needed to gain access to concealed equipment, and indicate on a schedule.
- B. Concrete Work: Coordinate with concrete work so that frames are available for placing integrally with floor slabs or concrete walls unless frames are to be installed during related interior floor work.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. General Requirements:
  - 1. Insofar as practicable, furnish similar products of a single manufacturer.
  - 2. Metal Surfaces, General: For metal fabrications exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

### **2.02 FERROUS METALS:**

- A. Structural Steel: Plates, shapes, bars and angles: ASTM A36.
- B. Rolled-Steel Floor Plate: ASTM A786/A786M, raised pattern floor plates from rolled-steel floor plate, galvanized after fabrication, of thickness and in pattern indicated below:
  - 1. Thickness: Minimum 1/4 inch, unless otherwise shown or calculated.
  - 2. Pattern: No. 2, or as selected from manufacturer's standard patterns; flat back.
- C. Load-carrier beams: ASTM A588.
- D. Structural Tubing: ASTM A501.
- E. Steel Pipe: ASTM A53, standard weight (Schedule 40), unless another weight is indicated or required by structural loads. Galvanized unless otherwise shown or specified.
- F. Pipe Sleeves and Pipe Fittings: ASTM A53. Galvanized unless otherwise shown or specified.
- G. Stainless Steel Sheets, Strips, Plates, Shapes, and Flat Bars: ASTM A666, Type 304. Type 316L for corrosive environments.
- H. Stainless Steel Bars and Shapes: ASTM A276, Type 304. Type 316L for corrosive environment.
- I. Guard Chain: ASTM A413, Class Grade 28, galvanized steel, 9/32-inch thick, complete with stainless steel eyes, spring-loaded catches and mounting components.
- J. Grating: Steel, bar and crossbar type shown, hot-dipped galvanized after fabrication and sizing, FS RR-G-661, Type 1, Class 1 or 2.

### **2.03 ALUMINUM:**

- A. Aluminum Extrusions: ASTM B221, Alloy 6063.
- B. Aluminum-Alloy Rolled Tread Plate: ASTM B 632, alloy 6061.

### **2.04 FASTENERS:**

- A. General: Provide Type 302 or 316 stainless steel fasteners for exterior use and zinc-plated fasteners complying with ASTM B633, Class Fe/Zn 5, where built into exterior walls. Select fasteners for type, grade, and class required.
- B. Screws: Material, type and size to suit purpose; steel, except stainless., cadmium-plated.

1. Stainless steel, ASTM A193, Alloy S30400.
- C. Machine Bolts: Material, type and size best suited to the purpose. Minimum tensile strength 60,000 psi.
1. Carbon steel: ASTM A307, Grade B, galvanized.
  2. Stainless steel: ASTM A193, Class 1A.
- D. Toggle bolt: FS FF-B-588.
- E. Drive stud: FS FF-S-325, Group 6.
- F. Expansion shield: FS FF-S-325 Group I, Type 2, Class 2, Style 1; Group II, Type 3, Class 1; Group IV, Type 1; best suited to the purpose.
- G. Screw anchors: Lead or plastic for wood or metal screws.
- H. Anchor bolt sleeve: Corrugated high-density polyethylene plastic.
- I. Powder actuated: FS FF-P-395.
- J. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488, conducted by a qualified independent testing agency.
1. Material: Alloy Group 1 or 2 stainless steel bolts complying with ASTM F593 and nuts complying with ASTM F594.

## **2.05 CONCRETE AND GROUT:**

- A. Nonshrink Grout: Section 04050.
- B. Surface hardener: Water-soluble, inorganic fluosilicate compound for curing, hardening and dustproofing fresh concrete.

## **2.06 COATINGS:**

- A. Shop Primer for Ferrous Metals: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.
- B. Galvanizing (zinc-coating by hot-dipped process): ASTM A90, ASTM A123, or ASTM A143, ASTM A153 or ASTM A384, as applicable.
- C. Zinc-rich paint: MS MIL-P-21305.
- D. Electro deposited zinc coating: ASTM B633.
- E. Galvanizing Repair Compound: Stick form, melting point 600-degree F to 650-degree F, GALVABAR or equal.
- F. Bituminous Coating: Cold-applied asphalt mastic complying with SSPC Paint 12, except containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D1187.

## **2.07 FABRICATION, GENERAL:**

- A. Shop Assembly: Preassemble items in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
- B. Provide access door assemblies manufactured as integral units ready for installation.
- C. Fabricate and prepare products required to be galvanized in accordance with recommendations of AGA.
- D. Provide material that is free from mill scale, flake rust and mill pitting.
- E. Cut, reinforce, drill and tap metal fabrications as indicated to receive finish hardware, screws, and similar items. Provide plates welded on for mounting hardware.
- F. Shear and punch metals cleanly and accurately. Remove burrs.
- G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners whenever possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat-head (countersunk) screws or bolts. Locate joints where least conspicuous.
- H. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- I. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
- J. Where miscellaneous access openings, with exception of gratings, occur in finished floor areas, include stainless steel edge rims of depth to accommodate floor finishing materials.
- K. Welding corners and seams continuously to comply with the following:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove welding flux immediately.
  - 4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- L. Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.
- M. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges.
- N. Remove sharp or rough areas on exposed traffic surfaces.
- O. Painting: Shop paint (prime) before shipment. Phosphatize galvanized surfaces before priming.

## **2.08 WALL AND CEILING ACCESS DOORS AND FRAMES:**

- A. Access Doors: Steel, baked-enamel prime coat; 12-inches square, minimum size.
  - 1. Wall-mounted, sheet steel type: Sizes under four square feet.
    - a. Door:
      - 1) Fixed: 1/4-inch steel plate screwed to frame 18 inches on centers maximum, with flathead, countersunk, tap screws.
      - 2) Operable: Equipped with spring hinges and lockset conforming to requirements of Section 08710; locks keyed into group with mechanical rooms.
    - b. Frame: Structural steel shapes and corners mitered and welded. Strap anchors places not more than 18 inches on centers and extending 18 inches minimum into masonry or concrete.
  - 2. Wall-mounted, hollow metal type: Size over four square feet.
    - a. Door and frame: Conform to the requirements of Section 08110; galvanized in exterior walls.
    - b. Hardware: Equipped with spring hinges and lockset conforming to requirements of Section 08710; locks keyed into group with mechanical rooms.
    - c. Fire rated: UL 1-1/2 hour B-Label, with labeled hardware.
  - 3. Ceiling mounted: Galvanized steel, door and frame 16-gauge minimum; continuous piano hinge; with sleeve and plastic grommet for screwdriver from the room side; for gypsum board ceiling.
    - a. Door and frame: Flush with ceiling surface; flush metal door fitting neatly into the frame.
    - b. Size and locations: As required to access equipment indicated or as shown.
    - c. Insulation: Provide upper side of doors with one-inch thick mineral fiberboard permanently cemented in place.
    - d. Manufactured by the C. M. Walsh Company of Boston, Massachusetts, or equal.
  - 4. Wall or ceiling mounted in plaster walls or ceilings: Size 16 inches square.
    - a. Flush door panel mounted to frame on concealed spring hinges opening to 175 degrees.
    - b. Fire rated: UL 1-1/2 hour B-Label, with key operated flush lock.
    - c. Manufactured by MILCOR, K-access door or equal.

**2.09 ACCESS HATCH, TYPE A:**

- A. Fabricated by a manufacturer regularly engaged in the production of access hatches; and designed to meet the requirements of AASHTO-HS-20-44 load or higher load if required by the jurisdictional authority where the hatch is installed.
- B. Door:
  - 1. Grating: Steel, ASTM A36.
  - 2. Side Plate: Floor plate, diamond pattern, flat back.
  - 3. Bearing bars: 2-1/2 inches by 1/4 inch at 13/16-inch on centers and cross bars at four inches on centers.
- C. Frame: Structural steel angle framed on three sides, formed steel plate on the hinge side.
- D. Ferrous-metal components: Galvanized after fabrication.
- E. Hardware:
  - 1. Hinges: Forged brass with stainless steel pins.
  - 2. Lifting mechanism: Stainless steel compression-spring mechanism balancing door leaves through entire arc acting as check to downward motion. Force necessary to open the hatch not to exceed 50 pounds.

3. Hold-open devices: Automatic, 90-degree hold-open arms with vinyl-covered release handles.
4. Locking devices: Snap locks with handles on the underside and removable key handles on top side. Include removable plugs for concealing key holes.

#### **2.10 PASSENGER EMERGENCY-EGRESS HATCH:**

- A. Fabricated by a manufacturer regularly engaged in the production of access hatches; and designed to meet the following requirements:
- B. Door leaves: Fabricated in accordance with approved shop drawings.
  1. 250 pounds per-square-foot loading: Rolled Steel Floor plate, diamond pattern, flat back. Galvanized after fabrication.
- C. Frame: 1/4-inch structural steel with formed gutters with drainage couplings. Frames welded to eight-inch supporting channels on four sides with full flange around perimeter. Galvanized after fabrication.
- D. Drain Coupling: Provide a 1-1/2" drain coupling located in the right front corner of the channel frame (note: can be placed at a different location if directed by the Engineer).
- E. Hardware:
  1. Hinges: Forged brass or Type 316 stainless steel. Hinge pins of stainless steel. Each hinge equipped with two pressure-lubrication fittings, Lincoln No. 5012, or equal.
  2. Lifting Mechanism: Stainless steel compression-spring mechanism balancing door leaves through entire arc acting as check to downward motion. Force necessary to open the hatch when applied to inner edge of exit release bar not to exceed 30 pounds. Manufacturer shall provide the required number and size of compression spring operators enclosed in telescopic tubes to provide, smooth, easy, and controlled cover operation throughout the entire arc of opening and to act as a check in retarding downward motion of the cover when closing. The upper tube shall be the outer tube to prevent accumulation of moisture, grit, and debris inside the lower tube assembly. The lower tube shall interlock with a flanged support shoe fastened to a formed 1/4" gusset support plate.
  3. Hold-open devices: Covers shall be equipped with a hold open arm which automatically locks the covers in the open position.
  4. Locking devices:
    - a. Interior: Stainless steel panic bar fabricated and installed to meet NFPA 101 requirements.
    - b. Exterior: A removable exterior turn/lift handle with a spring loaded ball detent shall be provided to open the leaf and the latch release shall be protected by a flush, gasketed, removable screw plug.
    - c. Miscellaneous: Flush grip handles, pull rings with removable caps, handrails on leaves and guard chains of type standard with manufacturer.

#### **2.11 TILE-COVERED FLOOR HATCH:**

- A. General: Commercially manufactured to support a uniformly distributed live load of 150 psf and a maximum deflection of 1/150 of the span. Custom sized heavy duty aluminum frame and cover with aluminum or brass exposed edges, and complete with reinforcing, support beams (where necessary), and related accessories.
- B. Aluminum Frames and Covers: Extruded aluminum, ASTM B 221, alloy 6063-T6, with

mitered and keyed corners and factory coated with zinc chromate primer or manufacturer's standard protective paint where surfaces will be in contact with concrete.

1. Exposed Edge Finishes: Mill finish, No. 385 alloy bronze.
  2. Cover Reinforcing: ASTM A 185 (mesh) or ASTM A 615 (bars), factory engineered to meet design load requirements for medium and heavy duty applications.
- C. Steel Support Beams: ASTM A 36, factory engineered to meet design load requirements where maximum spans for single cover are exceeded and elsewhere when required. 1. Furnish steel beam pocket and bearing plate for support beams
- D. Hardware:
1. Lifting/Locking Device: Lifting blocks (one each corner typically) secured to hatch cover and fitted with threaded bolt
    - a. Furnish threaded handle for lifting, with integral hex head drive for removing securing bolt (for covers equipped with double seals) or blanking bolt (for non-sealed covers).
  2. Seals: Continuous EPDM perimeter seal.
  3. Concrete Fill: Section 0330
- E. Fabrication:
1. Shop fabricate floor access hatches and covers in sizes and configurations shown for single unit pit access, or multiple unit trench access.
  2. Sizes (Single Unit Maximum): 48 inches square (clear opening).
    - a. Where size requirements exceed those shown, multiple covers can be joined together to obtain the desired sizes.
    - b. Where very large covers are required, a small inspection cover may be integrated into the large cover for convenience.
  3. Sizes (Multiple Units Maximum): 36 inches square (clear opening).
  4. Furnish reinforcement assembly loose for field positioning.
  5. All aluminum surfaces in contact with concrete shall receive a factory applied primer or protective paint.
  6. Dissimilar metals shall be protected against electrolytic action.

## 2.12 FINISHES:

- A. General:
1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
  2. Finish metal fabrications after assembly.
  3. Galvanize ferrous metal unless other finish is shown or specified.
- B. Galvanizing:
1. Clean ferrous metal thoroughly before applying zinc coating.
  2. Apply zinc coating to products after fabrication, by hot-dip method, using coating weighing not less than two ounces per-square-foot.
- C. Shop Paint:
1. Ferrous metal thoroughly cleaned as recommended by primer manufacturer and in accordance with SSPC SP11 and, except for items to be encased in concrete, given prime coat of paint.
  2. Zinc yellow iron-oxide primer or red-lead based primer applied so as to thoroughly cover surfaces without leaving runs or sags
- D. Stainless Steel: Remove tool and die marks and stretch lines or blend into finish. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of

- E. cross scratches. Run grain with long dimension of each piece.  
Aluminum: AA-M10 (Mechanical Finish: as fabricated, unspecified).

### **PART 3 - EXECUTION**

#### **3.01 PREPARATION:**

- A. Advise installers of other work about specific requirements relating to access door and floor door installation, including sizes of openings to receive access door and frame, as well as locations of supports, inserts, and anchoring devices.
- B. Examine the substrates and conditions under which the work is to be performed, and notify the General Contractor in writing of conditions detrimental to the proper and timely completion of the work. Do not proceed with the installation until unsatisfactory conditions have been corrected.
- C. Remove foreign substances from surfaces to receive metal items.
- D. Protect surrounding surfaces from damage while performing the work of this section.

#### **3.02 INSTALLATION, GENERAL:**

- A. Coordinate placement of doors with the work of other trades
- B. Comply with manufacturer's written instructions for installing all access doors and hatches.
- C. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal fabrications to in-place construction. Include threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws, and other connectors.
- D. Cutting, Fitting and Placement: Perform cutting, drilling, and fitting required for installing doors and hatches. Set frames, doors and hatches accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- E. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry or similar construction.
- F. Provide anchors and inserts in sufficient numbers for proper fastening of doors and hatches.
- G. Provide bar anchors with turned ends extending six inches minimum into concrete and 12 inches minimum into masonry. Lay anchors flat in masonry joints.
- H. Embed anchors accurately in concrete to permit aligning door in proper position.
- I. For fabricated items, use fastenings and anchors of size and type shown on approved shop drawings or manufacturer's standard drawings.

#### **3.03 INSTALLING PASSENGER EMERGENCY-EGRESS HATCH:**

- A. Lift hatches by means of slings attached at four corners of each hatch frame.
- B. Set hatch in framed opening; shim as necessary to ensure even support of hatch and alignment with adjoining work and in accordance with manufacturer's recommendations. Shim pattern, as shown

- C. After shimming, ensure hatch is not racked and weld in place as shown.
- D. After welding is completed, repair damaged zinc-coating and abraded shop coatings.
- E. Field-weld steel inserts to hatch frame and opening frame at hatch hinge points and coat completely with galvanizing repair compound at rate of two ounces per-square-foot.
- F. Fill space between hatch and frame and framed opening with nonshrink grout.
- G. Install 1-1/2 inch steel, Schedule 40, piping from hatch frame drain to floor drain, or if no drain, to floor. Piping not to encroach on egress pathway or headroom clearance (six-feet,eight-inches, minimum). Drain not to discharge into egress pathway.

#### **3.04 TILE-COVERED ACCESS HATCHES:**

- A. Set aluminum frames in recess, level and in proper relationship to adjacent finished flooring. For multiple covers and where maximum span for single covers is exceeded, install beam pockets and set support beams on base plates grouted to required heights. Grout frames solid with Portland cement concrete.
- B. Place cover in frame properly aligned. Clip reinforcement assembly into proper position and fill cover with Portland cement concrete to height necessary to receive scheduled finish flooring material. Hand trowel to smooth dense surface.

#### **3.05 PAINTING AND REPAIRING COATED SURFACES:**

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finish work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.
- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
  - 1. Wire brush areas to be coated to bright metal.
  - 2. Apply galvanizing repair compound at rate of two ounces per-square-foot.

#### **3.06 FIELD QUALITY CONTROL OF PASSENGER EMERGENCY-EGRESS HATCH:**

- A. Field Testing of Passenger Emergency-Egress Hatch:
  - 1. Upon completion of installation of passenger emergency-egress hatch, verify with spring scales that each leaf of each access hatch will open when force of 30 pounds or less is applied at inner end of exit release bar.
  - 2. Operate leaf no less than three times. Record opening force required each time. If adjustments are necessary to achieve specified results, repeat the test.
  - 3. Perform field tests in the presence of the Engineer.
  - 4. At the time of final inspection for substantial completion, repeat field tests as specified.
  - 5. If hatch fails field tests, make necessary adjustments until it operates as specified.
  - 6. During the life of the Contract, check operation of hatch leaves at periods not

exceeding 90 days. Lubricate moving parts and check for proper operation.

**3.07 ADJUSTING AND CLEANING:**

- A. Adjust doors and hardware after installation for proper operation.
- B. Remove and replace doors and frames that are warped, bowed, or otherwise damaged.
- C. Tile-Covered Access Hatches: If necessary for alignment after finish flooring is installed, exposed edges of frame and cover may be ground to remove up to 1/8 inch and provide flush surface.

**END OF SECTION**

## SECTION 08331

### OVERHEAD COILING DOORS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing overhead coiling doors.
- B. Related Work Specified Elsewhere:
  - 1. Miscellaneous Metal: Section 05500.
  - 2. Finish Hardware: Section 08710.
  - 3. Field Painting: Section 09920.

##### 1.02 DEFINITIONS:

- A. Operation Cycle: One complete cycle of a door begins with the door in the closed position. The door is then moved to the open position and back to the closed position.

##### 1.03 PERFORMANCE REQUIREMENTS:

- A. Structural Performance: Provide overhead coiling doors capable of withstanding the effects of gravity loads and the following loads and stresses without evidencing permanent deformation of door components:
  - 1. Wind Load: Uniform pressure (velocity pressure) of 20 lbf/sq. ft., acting inward and outward.
- B. Operation-Cycle Requirements: Design overhead coiling door components and operator to operate for not less than 20,000 cycles.

##### 1.04 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For each type and size of overhead coiling door and accessory. Include details of construction relative to materials, dimensions of individual components, profiles, and finishes. Provide roughing-in diagrams, operating instructions, and maintenance information. Include the following:
    - a. Setting drawings, templates, and installation instructions for built-in or embedded anchor devices.
    - b. Summary of forces and loads on walls and jambs.
    - c. Motors: Show nameplate data and ratings; characteristics; mounting arrangements; size and location of winding termination lugs, conduit entry, and grounding lug; and coatings.
    - d. Fire-Rated Doors: Information describing fire-release system, including testing and resetting instructions.
  - 2. Shop Drawings: For special components and installations not dimensioned or detailed in manufacturer's data sheets.
    - a. Wiring Diagrams: Detail wiring for power, signal, and control systems. Differentiate between manufacturer-installed and field-installed wiring and between components provided by door manufacturer and those provided by others.
  - 3. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for units with factory-applied finishes.

4. Samples for Verification: Of each type of exposed finish required, prepared on Samples of size indicated below and of same thickness and material indicated for Work. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.
  - a. Curtain Slats: 12-inch length.
  - b. Bottom Bar: 6-inch length
  - c. Guides: 6-inch length.
  - d. Brackets: 6 inches square.
  - e. Hood: 6 inches square.
5. Installer Certificates: Signed by manufacturer certifying that installers comply with specified requirements.

#### **1.05 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of the jurisdictional authorities.
  2. ASTM: A36, A123, A653, E84.
  3. NAAMM: Metal Finishes Manual for Architectural and Metal Products.
  4. NEMA: ICS 1, ICS 2, ICS 6, MG-1.
  5. NFPA: 70, 80.
  6. UL: 10B.
- B. Installer Qualifications: Engage an experienced installer who is an authorized representative of the overhead coiling door manufacturer for both installation and maintenance of units required for this Project.
- C. Source Limitations: Obtain overhead coiling doors through one source from a single manufacturer.
  1. Obtain operators and controls from the overhead coiling door manufacturer.
- D. Fire-Rated Door Assemblies: Provide assemblies complying with NFPA 80 that are identical to door and frame assemblies tested for fire-test-response characteristics per UL 10b, and that are labeled and listed for fire ratings by UL, FM, ITS/Warnock Hersey, or another testing and inspection agency acceptable to authorities having jurisdiction.
- E. Listing and Labeling: Provide electrically operated fixtures specified in this Section that are listed and labeled.
  1. The Terms "Listed" and "Labeled": As defined in NFPA 70, Article 100.

#### **1.06 PRODUCT DELIVERY, HANDLING AND STORAGE:**

- A. Deliver products in the original unopened packages, containers or bundles each bearing name of manufacturer, brand designation, referenced number, type and class as applicable.
- B. Store materials inside, under cover, and dry, protected from weather, direct sunlight, surface contamination, aging, corrosion, and damage from construction traffic and other causes. Use platforms or other means to protect products and materials from contact with the soil. Do not store materials on finished floors.
- C. Handle materials so as to preclude breakage of packages or containers and damage to materials.

### **PART 2 - PRODUCTS**

#### **2.01 DOOR CURTAIN MATERIALS AND CONSTRUCTION:**

- A. Door Curtain: Fabricate overhead coiling door curtain of interlocking slats, designed to withstand wind loading indicated, in a continuous length for width of door without splices. Unless otherwise indicated, provide slats of material thickness recommended by door manufacturer for performance, size, and type of door indicated, and as follows:
  - 1. Steel Door Curtain Slats: Structural-quality, cold-rolled galvanized steel sheets complying with ASTM A653, with G90 zinc coating.
    - a. Provide manufacturer's standard flat-profile slats.
  - 2. Insulation: Fill slat with manufacturer's standard rigid cellular polystyrene or polyurethane-foam-type thermal insulation with minimum aged R-value of 5.0 complying with maximum flame-spread and smoke-developed indices of 75 and 450, respectively, according to ASTM E84. Enclose insulation completely within metal slat faces.
  - 3. Inside Curtain Slat Face: To match material of outside metal curtain slat and as follows:
    - a. Galvanized Steel Sheet Thickness: Not less than 0.028 inch.
- B. Endlocks: Malleable-iron castings galvanized after fabrication, secured to curtain slats with galvanized rivets, or high-strength nylon. Provide locks on not less than alternate curtain slats for curtain alignment and resistance against lateral movement.
- C. Windlocks: Malleable-iron castings secured to curtain slats with galvanized rivets or high-strength nylon, as required to comply with wind load.
- D. Bottom Bar: Consisting of 2 angles, each not less than 1-1/2 by 1-1/2 by 1/8 inch thick, galvanized to suit type of curtain slats.
  - 1. Astragal: Provide a replaceable, adjustable, continuous, compressible gasket of flexible vinyl, rubber, or neoprene, between angles or fitted to shape, as a cushion bumper for interior door.
  - 2. Provide motor-operated doors with combination bottom astragal and sensor edge.
- E. Curtain Jamb Guides: Fabricate curtain jamb guides of steel angles, or channels and angles, with sufficient depth and strength to retain curtain, to allow curtain to operate smoothly, and to withstand loading. Build up units with not less than 3/16-inch-thick, galvanized steel sections complying with ASTM A36, and ASTM A123. Slot bolt holes for guide adjustment. Provide removable stops on guides to prevent overtravel of curtain and a continuous bar for holding windlocks.
- F. Wicket doors where shown, equipped with cylinder locks capable of operating with cylinders specified in Section 08710. Provide construction cylinders.
- G. Supports: Galvanized structural steel tubing and fastenings as shown and as specified in Section 05500.

## **2.02 HOODS AND ACCESSORIES:**

- A. Hood: Form to entirely enclose coiled curtain and operating mechanism at opening head and act as weatherseal. Contour to suit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Provide closed ends for surface-mounted hoods and fascia for any portion of between-jamb mounting projecting beyond wall face. Provide intermediate support brackets for doors over 14 feet in width or as required to prevent sag.
  - 1. Fabricate steel hoods, for steel doors, of not less than 0.028-inch-thick, hot-dip galvanized steel sheet with G90 zinc coating, complying with ASTM A653.
  - 2. Include automatic drop baffle to guard against passage of smoke or flame.

- B. Smoke Seals: Provide UL-listed and -tested smoke-seal perimeter gaskets.
- C. Weatherseals: Provide replaceable, adjustable, continuous, compressible weather-stripping gaskets fitted to bottom and at top of exterior doors, unless otherwise indicated. At door head, use 1/8-inch-thick, replaceable, continuous sheet secured to inside of curtain coil hood.
  - 1. Provide motor-operated doors with combination bottom weatherseal and sensor edge.
  - 2. In addition, provide replaceable, adjustable, continuous, flexible, 1/8-inch-thick seals of flexible vinyl, rubber, or neoprene at door jambs for a weathertight installation.
- D. Windows: Provide windows of 1/4-inch clear, transparent acrylic sheet, of size and in arrangement shown. Set glazing in vinyl, rubber or neoprene glazing channel secured to curtain slats.
- E. Slide Bolt: Fabricate with side locking bolts to engage through slots in tracks for locking by padlock, located on both left and right jamb sides, operable from coil side.
- F. Cylinder Locks: Provide cylinder locks capable of operating with cylinders specified in Section 08710. Provide construction cylinders.
- G. Chain Lock Keeper: Suitable for padlock.
- H. Where door unit is power operated, provide safety interlock switch to disengage power supply when door is locked.
- I. Provide automatic-closing device inoperative during normal operations, with governor unit complying with requirements of NFPA 80, with easily tested and reset release mechanism, and designed to be activated by the following:
  - 1. Governor: Oscillating type.
  - 2. Temperature rise and melting point of 165 deg F replaceable fusible links, interconnected and on both sides of wall of door opening.
  - 3. Building fire alarm and detection system and door-holder-release devices.

### **2.03 COUNTERBALANCING MECHANISM:**

- A. General: Counterbalance doors by means of adjustable-tension steel helical torsion spring, mounted around a steel shaft and contained in a spring barrel connected to door curtain with required barrel rings. Use grease-sealed bearings or self-lubricating graphite bearings for rotating members.
- B. Counterbalance Barrel: Fabricate spring barrel of hot-formed, structural-quality, welded or seamless carbon-steel pipe, of sufficient diameter and wall thickness to support rolled-up curtain without distortion of slats and to limit barrel deflection to not more than 0.03 in./ft. of span under full load.
- C. Provide spring balance of one or more oil-tempered, heat-treated steel helical torsion springs. Size springs to counterbalance weight of curtain, with uniform adjustment accessible from outside barrel. Provide cast-steel barrel plugs to secure ends of springs to barrel and shaft.
- D. Fabricate torsion rod for counterbalance shaft of cold-rolled steel, sized to hold fixed spring ends and carry torsional load.
- E. Brackets: Provide mounting brackets of manufacturer's standard design, 1/4-inch minimum thickness, galvanized cold-rolled steel plate with bell-mouth guide groove for curtain.

#### **2.04 FINISHES, GENERAL:**

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

#### **2.05 STEEL AND GALVANIZED STEEL FINISHES:**

- A. Factory Primer for Field Finish: Apply manufacturer's standard primer, compatible with field-applied finish according to coating manufacturer's written instructions for cleaning, pretreatment, application, and minimum dry film thickness. Field applied finish specified in Section 09920.
- B. Thermoset Finish: Apply manufacturer's standard baked finish consisting of primer and thermosetting topcoat according to coating manufacturer's written instructions for cleaning, pretreatment, application, thermosetting, and minimum dry film thickness.
- C. Field Painting: Section 07900.

#### **2.06 MANUAL DOOR OPERATORS:**

- A. Provide manual operators, unless electric door operators are indicated. When not shown, provide chain-hoist operator unit.
- B. Chain-Hoist Operator: Provide manual chain-hoist operator consisting of endless steel hand chain, chain pocket wheel and guard, and gear-reduction unit with a maximum 35-lbf effort for door operation, equipped with weatherproof enclosure when mounted in exterior locations. Provide alloy steel hand chain with chain holder secured to operator guide.

#### **2.07 ELECTRIC DOOR OPERATORS:**

- A. General: Provide electric door operator assembly of size and capacity recommended and provided by door manufacturer for door and operational life specified, with electric motor and factory-prewired motor controls, starter, gear-reduction unit, solenoid-operated brake, clutch, remote-control stations, control devices, integral gearing for locking door, and accessories required for proper operation
- B. Comply with NFPA 70.
- C. Disconnect Device: Provide hand-operated disconnect or mechanism for automatically engaging sprocket-chain operator and releasing brake for emergency manual operation while disconnecting motor, without affecting timing of limit switch. Mount disconnect and operator so they are accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.
- D. Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency auxiliary operator.
- E. Provide control equipment complying with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6, with NFPA 70 Class 2 control circuit, maximum 24-V, ac.

- F. Door-Operator Type: Provide wall-, hood-, or bracket-mounted, jackshaft, gear-head hoist-type door operator unit consisting of electric motor, enclosed worm-gear running-in-oil primary drive, chain and sprocket secondary drive, and auxiliary chain-hoist for manual operation with interlock to prevent motor operation when chain is engaged; operable with maximum chain pulling force of 35-lbf and floor level disconnect.
- G. Electric Motors: Provide high-starting torque, reversible, continuous-duty, Class A insulated, electric motors, complying with NEMA MG 1, with overload protection, sized to start, accelerate, and operate door in either direction, from any position, at 2/3 fps, without exceeding nameplate ratings or considering service factor, from a push-button station, minimum 3/4 HP, 460-volt ac, three-phase.
  - 1. Geared limit switches and solenoid-operated brakes.
  - 2. Motor removable without affecting chain operation or limit-switch setting.
  - 3. Weatherproof enclosure for use when mounted in exterior locations.
  - 4. Electric control for motor-operated unit: 24-volt, ac.
  - 5. Coordinate wiring requirements and electric characteristics of motors with building electrical system
- H. Remote-Control Station: Provide momentary-contact, 3-button control station with push-button controls labeled "Open," "Close," and "Stop."
  - 1. Provide interior units, full-guarded, surface-mounted, heavy-duty type, with general-purpose NEMA ICS 6, Type 1 enclosure.
  - 2. Provide exterior units, full-guarded, standard-duty, surface-mounted, weatherproof type, NEMA ICS 6, Type 4 enclosure, key operated.
- I. Obstruction Detection Device: Provide each motorized door with indicated external automatic safety sensor able to protect full width of door opening. Activation of sensor immediately stops and reverses downward door travel.
  - 1. Photoelectric Sensor: Manufacturer's standard system designed to detect an obstruction in door opening without contact between door and obstruction.
    - a. Self-Monitoring Type: Provide self-monitoring sensor designed to interface with door operator control circuit to detect damage to or disconnection of sensing device. When self-monitoring feature is activated, door operates to close only with constant pressure on close button.
- J. Limit Switches: Provide adjustable switches, interlocked with motor controls and set to automatically stop door at fully opened and fully closed positions.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Verify dimensions before proceeding; obtain measurements at structure for work to be fitted to other construction, including wall-to-wall dimensions, floor-to-ceiling dimensions and those controlled by other trades.
- B. Remove foreign substances from surfaces receiving doors.

### **3.02 INSTALLATION:**

- A. Coordinate work of this section with work of other trades.

- B. Install door and operating equipment complete with necessary hardware, jamb and head mold strips, anchors, inserts, hangers, and equipment supports according to approved Shop Drawings, manufacturer's written instructions, and as specified.
- C. Install fire-rated doors to comply with NFPA 80.

**3.03 ADJUSTING:**

- A. Lubricate bearings and sliding parts; adjust doors to operate easily, free from warp, twist, or distortion and fitting weathertight for entire perimeter.

**3.04 DEMONSTRATION:**

- A. Startup Services: Engage a factory-authorized service representative to perform startup services and to train Owner's maintenance personnel as specified below:
  - 1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
    - a. Test door closing when activated by detector or alarm connected fire-release system. Reset door-closing mechanism after successful test.
  - 2. Train Owner's maintenance personnel on procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance, and procedures for testing and resetting release devices.
  - 3. Review data in the maintenance manuals.

**3.05 CLEANING:**

- A. Remove from site rubbish and debris caused by this work..
- B. Leave areas surrounding doors in broom-clean condition.

**END OF SECTION**

## SECTION 08334

### OVERHEAD COILING GRILLES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing overhead coiling grilles.
- B. Related Work Specified Elsewhere:
  - 1. Lock cylinders: Section 08710.

##### 1.02 PERFORMANCE REQUIREMENTS:

- A. Operation-Cycle Requirements: Design overhead coiling grille components and operator to operate for not less than 20,000 cycles.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For each type and size of overhead coiling grille and accessory. Include details of construction relative to materials, dimensions of individual components, profiles, and finishes. Provide roughing-in diagrams, operating instructions, and maintenance information. Include the following:
    - a. Setting drawings, templates, and installation instructions for built-in or embedded anchor devices.
    - b. Summary of forces and loads on walls and jambs.
    - c. Motors: Show nameplate data and ratings; characteristics; mounting arrangements; size and location of winding termination lugs, conduit entry, and grounding lug; and coatings.
  - 2. Shop Drawings: For special components and installations not dimensioned or detailed in manufacturer's data sheets.
    - a. Wiring Diagrams: Detail wiring for power, signal, and control systems. Differentiate between manufacturer-installed and field-installed wiring and between components provided by grille manufacturer and those provided by others.
  - 3. Samples for Verification: Of each type of exposed finish required, prepared on Samples of size indicated below and of same thickness and material indicated for Work. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.
    - a. Grille Curtain: 12 inches square.
    - b. Grille Curtain with Glazed Panels: Not less than 12 inches square, with full-size panels.
    - c. Bottom Bar: 6-inch length
    - d. Guides: 6-inch length
    - e. Brackets: 6 inches square.
    - f. Hood: 6 inches square.
  - 4. Certification.

##### 1.04 QUALITY ASSURANCE:

- A. Reference Codes and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.

2. NFPA 70.
  3. NAAMM.
  4. ASTM: A666.
  5. NEMA.
  6. ADA.
- B. Installer Qualifications: Engage an experienced installer who is an authorized representative of the overhead coiling grille manufacturer for both installation and maintenance of units required for this Project.
- C. Source Limitations: Obtain overhead coiling grilles through one source from a single manufacturer.
1. Obtain operators and controls from the overhead coiling grille manufacturer.

#### **1.05 PRODUCT DELIVERY, STORAGE, AND HANDLING:**

- A. Deliver products to the jobsite in original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type and class as applicable.
- B. Store products in an approved area, protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

### **PART 2 - PRODUCTS**

#### **2.01 GRILLE CURTAIN MATERIALS AND CONSTRUCTION:**

- A. General: Fabricate overhead coiling grille curtain consisting of a network of 5/16-inch minimum diameter horizontal rods, or rods covered with tube spacers, spaced as indicated. Interconnect rods by vertical links approximately 5/8 inch wide, spaced as indicated and rotating on rods.
1. Space rods at approximately 2 inches o.c.
  2. Space links in line at approximately 9 inches apart.
  3. Stainless-Steel Grilles: ASTM A 666, Type 300 series.
- B. Endlocks: Continuous end links, chains, or other devices at ends of rods, locking and retaining grille curtain in guides against excessive pressures, maintaining curtain alignment, and preventing lateral movement.
- C. Bottom Bar: Manufacturer's standard continuous channel, tubular shape, or 2 angles, finished to match grille.
1. Astragal: Provide a replaceable, adjustable, continuous, compressible gasket of flexible vinyl, rubber, or neoprene, between angles or fitted to shape, as a cushion bumper for interior grille.
  2. Provide motor-operated grilles with combination bottom astragal and sensor edge.
- D. Curtain Jamb Guides: Manufacturer's standard extruded-aluminum shape having curtain groove with return lips or bars to retain curtain. Provide continuous integral wear strips to prevent metal-to-metal contact and minimize noise of travel. Provide removable stops on guides to prevent overtravel of curtain.

#### **2.02 HOODS AND ACCESSORIES:**

- A. Hood: Form to entirely enclose coiled curtain and operating mechanism at opening head. Contour to suit end brackets to which hood is attached. Roll and reinforce top and bottom edges for stiffness. Provide closed ends for surface-mounted hoods and fascia for any portion of between-jamb mounting projecting beyond wall face. Provide intermediate support brackets as required to prevent sag.
  - 1. Fabricate hoods of stainless-steel sheet, complying with ASTM A 666, Type 300 series, and not less than 0.025-inch thick, for stainless-steel grilles..
  - 2. Provide removable metal soffit when hood is mounted above ceiling of same material and finish of curtain, unless otherwise indicated.
- B. Fabricate locking device assembly with lock, spring-loaded dead bolt, operating handle, cam plate, and adjustable locking bar to engage through slots in tracks.
  - 1. Locking Bars: Single-jamb side, operable from inside only.
  - 2. Lock cylinder is specified in another Section 08710.
- C. Chain Lock Keeper: Suitable for padlock.
- D. Where grille unit is power operated, provide safety interlock switch to disengage power supply when grille is locked.

## **2.02 COUNTERBALANCING MECHANISM:**

- A. General: Counterbalance grille by means of adjustable-tension steel helical torsion spring, mounted around a steel shaft and contained in a spring barrel connected to the curtain. Use grease-sealed bearings or self-lubricating graphite bearings for rotating members.
- B. Counterbalance Barrel: Fabricate spring barrel of hot-formed, structural-quality, welded or seamless carbon-steel pipe, of sufficient diameter and wall thickness to support rolled-up curtain without distortion of curtain and to limit barrel deflection to not more than 0.03 in./ft. of span under full load.
- C. Provide spring balance of one or more oil-tempered, heat-treated steel helical torsion springs. Size springs to counterbalance weight of curtain, with uniform adjustment accessible from outside barrel. Provide cast-steel barrel plugs to secure ends of springs to barrel and shaft.
- D. Fabricate torsion rod for counterbalance shaft of case-hardened steel, sized to hold fixed spring ends and carry torsional load.
- E. Brackets: Provide mounting brackets of manufacturer's standard design, either cast-iron or cold-rolled steel plate.

## **2.03 FINISHES, GENERAL:**

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast. Revise Article title below if galvanized surfaces are not finish painted. Always retain priming of bare steel.

## **2.04 STAINLESS-STEEL FINISHES:**

- A. General: Remove or blend tool and die marks and stretch lines into finish.
  - 1. Grind and polish surfaces to produce uniform, directional textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- B. No. 4 Finish.
- C. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

## **2.05 ELECTRIC GRILLE OPERATORS:**

- A. General: Provide electric grille operator assembly of size and capacity recommended and provided by grille manufacturer for grille and operational life specified, with electric motor and factory-prewired motor controls, starter, gear-reduction unit, solenoid-operated brake, clutch, remote-control stations, control devices, integral gearing for locking grille, and accessories required for proper operation.
- B. Comply with NFPA 70.
- C. Disconnect Device: Provide hand-operated disconnect or mechanism for automatically engaging sprocket-chain operator and releasing brake for emergency manual operation while disconnecting motor, without affecting timing of limit switch. Mount disconnect and operator so they are accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.
- D. Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency auxiliary operator.
- E. Provide control equipment complying with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6, with NFPA 70 Class 2 control circuit, maximum 24-V, ac or dc.
- F. Grille-Operator Type: Provide wall-, hood-, or bracket-mounted, jackshaft, gear-head hoist-type grille operator unit consisting of electric motor, enclosed worm-gear running-in-oil primary drive, chain and sprocket secondary drive, and auxiliary chain hoist and floor level disconnect.
- G. Electric Motors: Provide high-starting torque, reversible, continuous-duty, Class A insulated, electric motors, complying with NEMA MG 1, with overload protection, sized to start, accelerate, and operate grille in either direction, from any position, at not less than 2/3 fps and not more than 1 fps, without exceeding nameplate ratings or considering service factor.
  - 1. Type: single phase.
  - 2. Service Factor: According to NEMA MG 1, unless otherwise indicated.
  - 3. Coordinate wiring requirements and electric characteristics of motors with building electrical system.
  - 4. Provide open dripproof-type motor, and controller with NEMA ICS 6, Type 1 enclosure.
- H. Remote-Control Station: Provide momentary-contact, 3-button control station with push-button controls labeled "Open," "Close," and "Stop."
  - 1. Provide exterior units, full-guarded, standard-duty, surface-mounted, weatherproof type, NEMA ICS 6, Type 4 enclosure, key operated.
- I. Obstruction Detection Device: Provide each motorized grille with indicated external automatic safety sensor able to protect full width of grille opening. Activation of sensor immediately stops and reverses downward grille travel.

1. Sensor Edge: Provide each motorized grille with an automatic safety sensor edge, located within astragal or weather stripping mounted to bottom bar. Contact with sensor immediately stops and reverses downward grille travel. Connect to control circuit using manufacturer's standard take-up reel or self-coiling cable.
  - a. Provide pneumatically actuated automatic bottom bar.
- J. Limit Switches: Provide adjustable switches, interlocked with motor controls and set to automatically stop grille at fully opened and fully closed positions.
- K. Provide electric operators with ADA-compliant audible alarm and visual indicator lights.
- L. Emergency Egress Release: Provide grille with flush, wall-mounted handle mechanism, for ADA-compliant egress feature, not dependent on electric power, that allows grille to open to permit passage and automatically resets motor drive, without affecting limit switches, with return of handle to original position.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. General: Install grilles and operating equipment complete with necessary hardware, according to Shop Drawings, manufacturer's written instructions, and as specified.

#### **3.02 ADJUSTING:**

- A. Lubricate bearings and sliding parts; adjust grilles to operate easily, free from warp, twist, or distortion and fitting tight for entire perimeter.

#### **3.03 DEMONSTRATION:**

- A. Startup Services: Engage a factory-authorized service representative to perform startup services and to train Owner's maintenance personnel as specified below.
  1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
  2. Train Authority's personnel on procedures and schedules related to startup and shutdown, troubleshooting, servicing, preventive maintenance, and procedures for testing and resetting release devices.
  3. Review data in the approved maintenance manuals.

**END OF SECTION**

## SECTION 08410

### ALUMINUM ENTRANCES AND STOREFRONTS

#### PART 1 -GENERAL

##### 1.01 SUMMARY:

- A. This Section specifies provision of exterior aluminum entrances and storefronts including doors, hardware, weatherstripping, and framing members.
- B. Related Work Specified Elsewhere:
  - 1. Section 08800: Glass and Glazing.
  - 2. Section 08710: Finish Hardware.

##### 1.02 QUALITY ASSURANCE:

- A. Installer Qualifications: Engage an experienced installer to assume engineering responsibility and perform work of this Section who has specialized in installing entrances similar to those required for this Project and who is acceptable to manufacturer.

##### 1.03 DESCRIPTION:

- A. General: Provide aluminum entrances and storefronts capable of withstanding loads and thermal and structural movement requirements indicated without failure. Failure includes the following:
  - 1. Air infiltration and water penetration exceeding specified limits.
  - 2. Framing members transferring stresses, including those caused by thermal and structural movement, to glazing units.
- B. Glazing: Physically and thermally isolate glazing from framing members.
- C. Thermally Broken Construction: Provide aluminum entrances and storefronts that isolate aluminum exposed to exterior from aluminum exposed to interior with a material of low thermal conductance.
- D. Wind Loads: Provide aluminum entrances and storefronts, including anchorage, capable of withstanding wind-load design pressures calculated according to requirements of authorities having jurisdiction or the American Society of Civil Engineers' ASCE 7, "Minimum Design Loads for Buildings and Other Structures," 6.4.2, "Analytical Procedure," whichever are more stringent.
  - 1. Deflection of framing members in a direction normal to wall plane is limited to 1/175 of clear span or 3/4 inch whichever is smaller, unless otherwise indicated.
  - 2. Static-Pressure Test Performance: Provide aluminum entrances and storefronts that do not evidence material failures, structural distress, failure of operating components to function normally, or permanent deformation of main framing members exceeding 0.2 percent of clear span when tested according to ASTM E 330.
    - a. Pressure: 150 percent of inward and outward wind-load design pressures.
    - b. Duration: As required by design wind velocity; fastest 1 mile of wind for relevant exposure category.
- E. Dead Loads: Provide entrance-members that do not deflect an amount which will reduce glazing bite below 75 percent of design dimension when carrying full dead load.

1. Provide a minimum 1/8-inch clearance between members and top of glazing or other fixed part immediately below.
- F. Air Infiltration: Provide aluminum entrances and storefronts with permanent resistance to air leakage through fixed glazing and frame areas of not more than 0.06 cfm/sq. ft. of fixed wall area when tested according to ASTM E 283 at a static-air-pressure difference of 1.57 lbf/sq. ft
- G. Water Penetration: Provide aluminum entrances and storefronts that do not evidence water leakage through fixed glazing and frame areas when tested according to ASTM E331 at minimum differential pressure of 20 percent of inward-acting wind-load design pressure as defined by ASCE 7, "Minimum Design Loads for Buildings and Other Structures," but not less than 6.24 lbf/sq. ft. Water leakage is defined as follows:
1. Uncontrolled water infiltrating aluminum entrances and storefronts or appearing on normally exposed interior surfaces from sources other than condensation. Water controlled by flashing and gutters that is drained back to the exterior and cannot damage adjacent materials or finishes is not water leakage.
- H. Thermal Movements: Provide aluminum entrances and storefronts, including anchorage, that accommodate thermal movements of aluminum entrances and storefronts and supporting elements resulting from the following maximum change (range) in ambient and surface temperatures without buckling, damaging stresses on glazing, failure of joint sealants, damaging loads on fasteners, failure of doors or other operating units to function properly, and other detrimental effects.
1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- I. Structural-Support Movement: Provide aluminum entrances and storefronts that accommodate structural movements including, but not limited to, sway and deflection.
- J. Condensation Resistance: Provide aluminum entrances and storefronts with condensation resistance factor (CRF) of not less than 45 when tested according to AAMA 1503.1.
- K. Dimensional Tolerances: Provide aluminum entrances and storefronts that accommodate dimensional tolerances of building frame and other adjacent construction.

#### **1.04 SUBMITTALS:**

Submit the following in accordance with requirements elsewhere in this Contract and with the additional requirements as specified for each:

- A. Product Data: For each product specified. Include details of construction relative to materials, dimensions of individual components, profiles, and finishes.
- B. Shop Drawings: For aluminum entrances and storefronts show details of fabrication and installation, including plans, elevations, sections, details of components, glazing provisions for expansion and contraction, and attachments to other work.
  1. For aluminum entrances and storefronts, include hardware schedule and indicate operating hardware types, quantities, and location
- C. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for factory-applied color finishes.
- D. Samples for Verification: Of each type of exposed finish required. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.

- E. Cutaway Sample: Of vertical-to-horizontal framing intersection, made from minimum 6-inch lengths of full-size components and showing details of the following:
  - 1. Joinery.
  - 2. Anchorage.
  - 3. Expansion provisions.
  - 4. Glazing.
  - 5. Flashing and drainage.

#### **1.05 WARRANTY:**

- A. Warranty Period: 1 year in addition to the warranty requirements specified elsewhere in this Contract, for a total of 2 years from date of Substantial Completion.
  - 1. Failures include, but are not limited to, the following:
  - 2. Failure of aluminum entrances and storefronts to meet performance requirements.
  - 3. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
  - 4. Failure of operating components to function normally.
  - 5. Water leakage through fixed glazing and frame areas.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated, complying with the requirements of standards indicated below.
  - 1. Sheet and Plate: ASTM B 209.
  - 2. Extruded Bars, Rods, Shapes, and Tubes: ASTM B 221.
  - 3. Extruded Structural Pipe and Tubes: ASTM B 429.
  - 4. Bars, Rods, and Wire: ASTM B 211.
  - 5. Aluminum Finish: Dark bronze integral color anodized Class 1 finish, NAAMM AA-M12C22A44.
    - a. Provide all material, free of scratches and surfaces blemishes.
- B. Glazing as specified in Section 08800.
- C. Glazing Gaskets: Manufacturer's standard pressure-glazing system of black, resilient glazing gaskets, setting blocks, and shims or spacers, fabricated from an elastomer of type and in hardness recommended by system and gasket manufacturer to comply with system performance requirements. Provide gasket assemblies that have corners sealed with sealant recommended by gasket manufacturer. Insert specific gasket-material requirements, if any.
- D. Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC-Paint 12 requirements, except containing no asbestos, formulated for 30-mil thickness per coat.
- E. Sill Mastic: Butyl: Polymerized butyl rubber and inert fillers (pigments), solvent-based with minimum 75-percent solids, non-sag consistency, tack-free time of 24 hours or less, paintable, non-staining, and complying with FS TT-S-001657.

#### **2.02 COMPONENTS:**

- A. Doors: Provide manufacturer's standard 1-3/4-inch thick glazed doors with minimum 0.125-inch-thick, extruded tubular rail and stile members as approved. Mechanically fasten corners with reinforcing brackets that are deep penetration and fillet welded or that incorporate concealed tie-rods.

1. Glazing Stops and Gaskets: Provide manufacturer's standard snap-on extruded-aluminum glazing stops and preformed gaskets, as approved.
  2. Stile Design: As shown.
- B. Brackets and Reinforcements: Provide manufacturer's standard brackets and reinforcements that are compatible with adjacent materials, as approved. Provide nonstaining, nonferrous shims for aligning components as approved.
- C. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials, as approved.
1. Reinforce members as required to retain fastener threads.
  2. Do not use exposed fasteners, except for hardware application. For hardware application, use countersunk Phillips flat-head machine screws finished to match framing members or hardware being fastened, unless otherwise indicated.
- D. Concealed Flashing: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding flashing, compatible with adjacent materials, and of type approved.
- E. Weather Stripping: ANSI/BHMA A156.22, Finish 628 (satin aluminum clear anodized) with stainless steel sheet-metal screws and as follows:
1. Head and jamb: Head and jamb type, stop-applied; National Guard A626 or equal. Provide nylon brush gasketing or equal.
  2. Sill: Drip strip at sill; National Guard 15 or equal.
  3. Sweep: Door sweep type, surface mounted at bottom of door; National Guard D608 nylon brush gasketing or equal. Provide sweep on side opposite to drip strip where scheduled.

### **2.03 FINISH HARDWARE:**

- A. General: Provide heavy-duty hardware units indicated in sizes, number, and type recommended by manufacturer for entrances indicated as specified in Section 08710, and as approved. Finish exposed parts to match door finish, unless otherwise indicated.
- B. Offset Pivots where approved: ANSI/BHMA A156.4, Grade 1 with exposed parts of cast-aluminum alloy. Provide top, bottom, and intermediate pivots at each door leaf.
- C. Ball-Bearing Butts: ANSI/BHMA A156.1, Grade 1, 5-knuckle, ball-bearing butts. Provide nonremovable pins at hinges exposed to door outside and provide full-mortise Type 1 slip-in nonferrous hinges for applications exposed to weather. Provide 3 hinges at each leaf for doors up to 36 inches wide and 80 inches tall; provide 4 hinges at each leaf for taller doors.
- D. Closers, General: Comply with manufacturer's recommendations for closer size, depending on door size, exposure to weather, and anticipated frequency of use.
1. Closing Cycle: Comply with requirements of authorities having jurisdiction or the Americans with Disabilities Act (ADA), "Accessibility Guidelines for Buildings and Facilities (ADAAG)," whichever are more stringent.
  2. Opening Force: Comply with the following maximum opening-force requirements for locations indicated:
    - a. Exterior Doors: 15 lbf.
  3. Surface Mounted Overhead Closers: ANSI/BHMA 156.4, Grade 1, provide cover and the following:
    - a. Mounting: parallel arm, interior locations (room side of door unless otherwise specified).
    - b. Cushion stop: Adjustable at angle directed by the Engineer from manufacturer's standard options.

4. Door Stops: ANSI/BHMA A156.16, Grade 1, floor- or wall-mounted door stop, as appropriate for door location indicated, with integral rubber bumper. Retain appropriate cylinder requirements below.
- E. Cylinders and Keying for Yard Buildings: Match the Authority's existing keying and interchangeable core system as follows and at no additional cost to the Authority.
1. Cylinders: Finish 630.
    - a. For locksets: ANSI/BHMA A156.5, interchangeable-core type, designed to accept the Authority's existing Russwin Recore System. One core furnished for each lock, stamped with visual key control.
    - b. High security: Interlocking-pin type, Emhart High-Security Locking System or equal
  2. Construction cores: Provide construction cylinders until final cylinders and keying is approved and installed.
  3. Keys and keying:
    - a. Keys: Stamped with the inscription TRANSIT AUTHORITY - DO NOT DUPLICATE and with visual key-control data.
    - b. Quantity: Three keys for each core plus blanks equal to 10-percent of total keys furnished.
  4. Key tags and holders: ANSI/BHMA A156.5, inscribed with key-change number and key-control symbol.
  5. Cylinder Guard: Manufacturer's standard hardened-steel security ring with retainer plate for inside stile wall that protects lock cylinder from removal by wrenches, prying, or sawing.
- F. Deadlatch Locks: Manufacturer's standard mortise deadlatch with minimum 1/2-inch-12.7-mm- long latch bolt and auxiliary bolt located below latch bolt and complying with ANSI/BHMA A156.5, Grade 1 requirements.
1. Lever Handles: Manufacturer's standard cast-aluminum-alloy, inside-lever, deadlatch operating unit.
  2. Latch Paddle Devices: Manufacturer's standard extruded-aluminum deadlatch operating paddle.
    - a. Provide units for push applications.
    - b. Provide units for push and pull applications. Hook-bolt locks are recommended for pairs of doors, since they provide additional resistance to prying.
  3. Lockset Faceplates: Manufacturer's standard extruded-aluminum faceplate for lock type indicated that lays flush with door stile.
    - a. Provide radiused faceplate with weather sweep extending full length of lock at meeting stiles of pairs of doors.
  4. Flat Face Strikes: Manufacturer's standard stainless-steel, flat face strike with steel mounting plate and black-plastic dustbox.
  5. Retain one flush-bolt requirement below if required for inactive leaf of pairs of doors. Model codes prohibit manual flush bolts on means of egress doorways. If exit devices are not required, consider specifying 2- or 3-point locking systems listed above or inserting requirements for automatic flush bolts that comply with requirements of authorities having jurisdiction.
  6. Manual Flush Bolts: ANSI/BHMA A156.16, edge-mortised, lever-extension-type flush bolts.
    - a. Locate flush bolts at bottom of inactive leaf of pairs of doors.
    - b. Locate flush bolts at top and bottom of inactive leaf of pairs of doors.
- G. Pull Handles: Aluminum pull handles as indicated on Drawings.
- H. Push Bars: Aluminum push bars as indicated on Drawings.

- I. Thresholds: At exterior doors, provide manufacturer's standard threshold with cutouts coordinated for operating hardware, with anchors and jamb clips, and not more than 5/16-inch, with beveled edges providing a floor level change with a slope of not more than 1:2, and in the following material:
  - 1. Material: Aluminum, mill finish.
- J. Weatherstripping: ANSI/BHMA A156.22, Finish 628 (satin aluminum clear anodized) with stainless steel sheet-metal screws and as follows:
  - 1. Head and jamb: Head and jamb type, stop-applied; National Guard A626 or equal or compression type gasketing as approved.
  - 2. Sill: Drip strip at sill; National Guard 15 or equal.
  - 3. Sweep: Door sweep type, surface mounted at bottom of door; National Guard D608 nylon brush gasketing or equal. Provide sweep on side opposite to drip strip where scheduled.
- K. Special Security Alarmed Exit Device for Parking Structures: To sound alarm at unauthorized entry or exit at locations indicated and as required and approved.

## **2.04 FABRICATION:**

- A. General: Fabricate components that, when assembled, will have accurately fitted joints with ends coped or mitered to produce hairline joints free of burrs and distortion. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.
- B. Forming: Form shapes with sharp profiles, straight and free of defects or deformations, before finishing.
- C. Prepare components to receive concealed fasteners and anchor and connection devices.
- D. Fabricate components to drain water passing joints and condensation and moisture occurring or migrating within the aluminum entrances and storefronts to the exterior.
- E. Welding: Weld components to comply with referenced AWS standard. Weld before finishing components to greatest extent possible. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.
- F. Glazing Channels: Provide minimum clearances for thickness and type of glass indicated according to FGMA's "Glazing Manual."
- G. Metal Protection: Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.
- H. Entrances: Fabricate door framing in profiles indicated. Reinforce as required to support imposed loads. Factory assemble door and frame units and factory install hardware to greatest extent possible. Reinforce door and frame units as required for installing hardware indicated. Cut, drill, and tap for factory-installed hardware before finishing components.
  - 1. Exterior Doors: Provide nylon brush gasketing or compression weather stripping where indicated as approved.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION:**

- A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of aluminum entrances and storefronts. Do not proceed with installation until unsatisfactory conditions have been corrected.

### **3.02 INSTALLATION:**

- A. General: Protect and handle aluminum entrances and storefronts components to prevent damage; do not install damaged components. Fit frame joints to produce hairline joints free of burrs and distortion. Rigidly secure nonmovement joints. Seal joints watertight.
- B. Metal Protection: Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.
- C. Install components to drain water passing joints and condensation and moisture occurring or migrating within the aluminum entrances and storefronts to the exterior.
- D. Set continuous sill members and flashing in a full sealant bed to provide weathertight construction, unless otherwise indicated. Comply with requirements as specified in Section 07900.
- E. Install framing components plumb and true in alignment with established lines and grades without warp or rack of framing members.
- F. Install entrances plumb and true in alignment with established lines and grades without warp or rack. Lubricate operating hardware and other moving parts according to hardware manufacturers' written instructions.
  - 1. Install surface-mounted hardware in accordance with Section 08710 and according to manufacturer's written instructions using concealed fasteners to greatest extent possible.
- G. Install glazing to comply with requirements of Section 08800, unless otherwise indicated. Delete subparagraphs below if no structural-sealant-glazed systems.
- H. Install perimeter sealant to comply with manufacturer's requirements and Section 08800, unless otherwise indicated.
- I. Erection Tolerances: Install entrance and storefront aluminum entrances and storefronts to comply with the following maximum tolerances:
  - 1. Variation from Plane: Limit variation from plane or location shown to 1/8 inch in 12 feet 1/4 inch over total length.
  - 2. Alignment: Where surfaces abut in line, limit offset from true alignment to 1/16 inch. Where surfaces meet at corners, limit offset from true alignment to 1/32 inch.
  - 3. Diagonal Measurements: Limit difference between diagonal measurements to 1/8 inch.

### **3.03 FIELD QUALITY CONTROL:**

- A. Water Spray Test: After completing the installation of test areas indicated, test aluminum entrances and storefronts for water penetration according to AAMA 501.2 requirements.
- B. Repair or remove and replace Work as directed by the Engineer that does not meet requirements or that is damaged by testing; replace to conform to specified requirements.

**3.04 ADJUSTING:**

- A. Adjust doors and hardware to provide tight fit at contact points and weather stripping, smooth operation, and weathertight closure.

**3.05 PROTECTION:**

- A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure aluminum entrances and storefronts are without damage or deterioration at the time of Substantial Completion.

**END OF SECTION**

## SECTION 08481

### METAL CONCAVE MANDOORS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing and installing metal concave mandoors, frames and hardware.
- B. Related Work Specified Elsewhere:
  - 1. Mortar, Grout and Masonry Accessories: Section 04050.
  - 2. Metal Doors and Frames: Section 08110.
  - 3. Finish Hardware: Section 08710.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with additional requirements as specified for each:
  - 1. Shop-Drawings:
    - a. Details of construction, connections, anchors schedules, setting diagrams and interface with work of other trades.
  - 2. Certifications.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications.
  - 1. Codes and regulations of the jurisdictional authorities.
  - 2. ASTM: A36, A90, A366.
  - 3. UL: Building Materials Directory.
  - 4. NFPA: 80.
- B. Loading: Positive and Negative Air Pressure; 10 psi.
- C. Manufacturer and installer must have experience in the manufacturing and successful installations of high static pressure doors and frames.
- D. Fire-Rated Assemblies: Where UL-listing, UL-label or UL Building Materials Directory is specified, another testing and inspection agency acceptable to the Engineer and to authorities having jurisdiction may be used.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the job site in original unopened containers or wrappings clearly labeled with manufacturer's name and brand designation, door schedule number, referenced specification number, type, class and rating as applicable.
- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements.
- C. Handle products so as to prevent damage to products.

#### PART 2 - PRODUCTS

## 2.01 MATERIALS:

- A. Door Frames:
  - 1. Basic Materials: ASTM A36 structural steel for frames.
  - 2. Hardware Reinforcement: Steel
    - a. Torsion spring closing assembly constructed of stainless steel 2-5/8" inside diameter by 0.235" thickness by 6". Aluminum alloy spring fitting shall provide for adjustment of the spring to ensure proper door closing at all times.
    - b. Upper and lower door supports constructed of 1/4" mild steel plate, 1" stainless steel shafts and heavy-duty self aligning flange bearings.
  - 3. Door Stops: 1/8 inch minimum thickness steel stops. Stops shall be provided on both sides of door.
  - 4. Finish: Hot dipped galvanized coating unless indicated otherwise.
- B. Doors:
  - 1. Door panel: Constructed of 1/8" mild roll-formed steel sheet, ASTM A366. Upper and lower panel supports constructed of 1/4" mild steel plate and are to be secured to the door panel by a continuous weld.
  - 2. Door Frame: Constructed of structural steel ASTM A36 with 1" x 1" x 1/8" welded angles to control maximum door travel.
  - 3. Push/pull handle: 3/8 inch minimum thickness. Handle allows ease of rotating door to facilitate access.
  - 4. Bearings: The door shall be equipped with sealed support bearing at both the top and bottom of the door.
  - 5. All components of doors shall be hot dipped galvanized.
- C. Clips, Anchors, Bolts, Screws and Rivets: Hot dipped galvanized Steel types standard with manufacturer.
- D. Concave Mandoor Locking Mechanism:
  - 1. Locking mechanism, shall be Adams Rite Latch paddle device 4590. Paddle shall be extruded aluminum (satin anodized). Escutcheon to be zinc alloy (black) to house steel operating mechanism. Dead latch shall be Adams Rite 4722. Case shall be steel, plated for corrosion, resistance, and aluminum faceplate shall be satin anodized. Latch bolt shall be all metal construction with hardened steel pin. Mortise cylinder cam to be provided. See Section 802 for lock cylinder. Provide temporary lock cylinders.

## 2.02 FABRICATION:

- A. Frame:
  - 1. Formed to be installed into walls and locations shown.
  - 2. Welded for installation into wall of sheet steel construction.
  - 3. Corners and connections continuously welded with exposed welds ground flush and smooth.
  - 4. Reinforcement continuously welded in place as necessary for hardware application. Provide cutouts for hardware.
- B. Door:
  - 1. Hardware reinforcement continuously welded in place to support hardware application.

## 2.03 HOT DIPPED GALVANIZED:

- A. Galvanizing (zinc coating by hot dip process): ASTM A90 or similar galvanizing process.
- B. Galvanizing repair compound: Stick form, melting point 600F to 650F, GALVABAR or equal.

**2.04 FINISH HARDWARE COORDINATION:**

- A. The metal door and frame shall be prepared at factory for application of finish hardware at job site. Obtain templates from finish hardware manufacturer to ensure accurate preparation of doors and frames in accordance with hardware specified.

**PART 3 - EXECUTION**

**3.01 INSTALLATION:**

- A. Deliver work , ready to set up and erect in place as rapidly as general construction work permits. Set work in place in accordance with approved shop drawings, plumb and level, strongly secured against displacement and with built-in anchors. Limit field-cutting, drilling and punching to minimum necessary
- B. Anchor metal frames to slab with angle clips and minimum of two expansion bolts in each clip.
- C. Provide four adjustable anchors on each jamb. See Section 04050 for grouting of door frame.
- D. Install doors after hardware installation; accurately fit and adjust to work properly.
- E. Seal open joints at bottom of door frames, and between door frames and adjoining concrete.
- F. Install fire-rated door assemblies in accordance with NFPA 80.
- G. Upon completion of installations clean surfaces of doors and frame as recommended by door manufacturer.
  - 1. Remove from the site rubbish and debris caused by this work.
  - 2. Leave areas surrounding openings in broom-clean condition.

**END OF SECTION**

## SECTION 08520

### ALUMINUM WINDOWS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing extruded aluminum windows with fixed and operating sash.
- B. Related Work Specified Elsewhere:
  - 1. Seals and Sealants: Section 07900.
  - 2. Glass and Glazing: Section 08800.
  - 3. Aluminum Entrances and Storefronts: Section 08410.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of the jurisdictional authorities.
  - 2. AAMA: 608.1, 101.
  - 3. ASTM: A123, B221.
  - 4. FS: RR-W-365.
  - 5. SSPC: 20.

##### 1.03 SUBMITTALS:

- A. Shop Drawings:
  - 1. Product Data: Provide component dimensions, anchorage and fasteners, glass, internal drainage details.
  - 2. Shop Drawings: Indicate opening dimensions, framed opening tolerances, affected related work; installation requirements
  - 3. Submit two samples 12 x 12 inches in size illustrating window frame section, mullion section screen and frame, factory finished aluminum surfaces, glass units and glazing materials.
  - 4. Submit two samples of operating hardware.

##### 1.04 DELIVERY, STORAGE, AND PROTECTION:

- A. Transport, handle, store, and protect products.
- B. Handle work of this section in accordance with AAMA - Curtain Wall Manual #10.
- C. Protect factory finished aluminum surfaces with wrapping strippable coating. Do not use adhesive papers or sprayed coatings that bond when exposed to sunlight or weather.

#### PART - PRODUCTS

##### 2.01 MATERIALS:

- A. Extruded Aluminum: ASTM B221, 6063 alloy, T5 temper.
- B. Steel Sections: Profiled to suit mullion sections.
- C. Fasteners: Stainless steel.

## **2.02 COMPONENTS:**

- A. Frames: thermally broken with interior portion of frame insulated from exterior portion flush glass stops of snap-on type
- B. Reinforced Mullion: extruded aluminum with integral reinforcement of shaped steel structural section.
- C. Sills: extruded aluminum; sloped for positive wash: one piece full width of opening.
- D. Insect Screen Frame: Rolled aluminum steel frame of rectangular sections; fit with adjustable hardware; nominal size similar to operable glazed unit.
- E. Insect Screens: FS RR-W-365, woven aluminum mesh 14/18 mesh size.
- F. Operable Sash Weather Stripping: Wool pile permanently resilient, profiled to effect weather seal.
- G. Fasteners: Stainless steel.
- H. Window Washing Anchors: Stainless steel.
- I. Insulated Metal Infill Panels: Section 08410.

## **2.03 GLASS AND GLAZING MATERIALS:**

- A. Glass and Glazing Materials: Insulating glass units as specified in Section 08800.

## **2.04 SEALANT MATERIALS:**

- A. Sealant and Backing Materials: Section 07900.

## **2.05 HARDWARE:**

- A. Operator: Lever action handle fitted to projecting sash arms with limit stops.
- B. Projecting Sash Arms: Cadmium Zinc plated steel, friction pivot joints with nylon bearings, removable pivot clips for cleaning.
- C. Sash lock: Lever handle with cam lock.

## **2.06 FABRICATION:**

- A. Fabricate components with minimum clearances and shim spacing around perimeter of assembly, yet enabling installation and dynamic movement of perimeter seal.
- B. Accurately fit and secure joints and corners. Make joints flush, hairline, and weatherproof.
- C. Prepare components to receive anchor devices. Fabricate anchors.
- D. Arrange fasteners and attachments to ensure concealment from view.
- E. Prepare components with internal reinforcement for operating hardware.
- F. Provide internal reinforcement in mullions with galvanized steel members to maintain rigidity.

- G. Permit internal drainage weep holes and channels to migrate moisture to exterior. Provide internal drainage of glazing spaces to exterior through weep holes.
- H. Assemble insect screen frame, miter and reinforced frame corners. Fit mesh taut into frame and secure. Fit frame with retainers.
- I. Double weatherstrip operable units.

## **2.07 FINISHES:**

- A. Finish Coatings: Conform to AAMA 608.1.
- B. Exposed Aluminum Surfaces: AA A44 anodized to Dark Bronze color.
- C. Operator and Exposed Hardware: Enameled to color as selected.
- D. Touch-Up Primer for Galvanized Steel Surfaces: SSPC Paint 20 zinc rich.
- E. Concealed Steel Items: Galvanized in accordance with ASTM A123 to 2.0 oz/sq ft.
- F. Apply coats of bituminous paint to concealed aluminum and steel surfaces in contact with treated wood, cementitious, or dissimilar materials.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION:**

- A. Verification of existing conditions before starting work.
- B. Verify wall openings and adjoining air and vapor seal materials are ready to receive work of this Section.

### **3.02 INSTALLATION**

- A. Install window assembly in accordance with AAMA 101.
- B. Attach window frame and shims to perimeter opening to accommodate construction tolerances and other irregularities.
- C. Align window plumb and level, free of warp or twist. Maintain dimensional tolerances and alignment with adjacent work.
- D. Install sill.
- E. Provide thermal isolation where components penetrate or disrupt building insulation. Pack fibrous insulation in shim spaces at perimeter of assembly to maintain continuity of thermal barrier.
- F. Coordinate attachment and seal of perimeter air barrier and vapor retarder materials.
- G. Install operating hardware.
- H. Install glass and infill panels in accordance with Section 08800 and Section 08410.
- I. Install perimeter sealant backing materials, and installation criteria in accordance with Section 07900.

### **3.03 CLEANING**

- A. Remove protective material from factory finished aluminum surfaces.
- B. Wash surfaces by method recommended and acceptable to sealant and window manufacturer; rinse and wipe surfaces clean.
- C. Remove excess sealant by moderate use of mineral spirits or other solvent acceptable to sealant and window manufacturer.

**END OF SECTION**

## SECTION 08710

### FINISH HARDWARE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing finish hardware.
- B. Related Work Specified Elsewhere:
  - 1. Access Doors and Frames including locks and cylinders: Section 08305.
  - 2. Overhead Coiling Doors: Section 08331.
  - 3. Overhead Coiling Grilles: Section 08334.
  - 4. Cremone bolt to receive lock and chain provided under this section: Section 02877.
  - 5. Hollow Metal Doors and Frames: Section 08110.
  - 6. Aluminum Entrances and Storefronts: Section 08410.
  - 7. Metal Concave Mandoors: Section 08481.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulation of the jurisdictional authorities.
  - 2. ANSI/BHMA: A156-Series Standards for Builders Hardware.
  - 3. ASTM: A413
  - 4. FS: TT-S-001657.
  - 5. ADA: ADAAG.
  - 6. NFPA: 80, 101, 130.
  - 7. DHI: Recommended Locations for Builders Hardware for Standard Steel Doors and Frames, Recommended Locations for Builders Hardware for Custom Steel Doors and Frames.
- B. Hardware Supplier Qualifications: A recognized architectural finish hardware supplier, with warehousing facilities in the Project's vicinity, that has a record of successful in-service performance for supplying finish hardware similar in quantity, type, and quality to that indicated for this Project and that employs an experienced architectural hardware consultant (AHC) who is available to the Engineer and Contractor, at reasonable times during the course of the Work for consultation.
  - 1. Require supplier to have his AHC develop the hardware schedule.
  - 2. Require supplier's AHC to meet with the Engineer to discuss and finalize lock-functions and keying requirements.
- C. Fire-Rated Openings: Provide hardware for fire-rated openings that complies with NFPA 80 and requirements of authorities having jurisdiction. Provide only items of hardware that are listed and are identical to products tested by UL, Warnock Hersey, FM, or other testing and inspecting organization acceptable to authorities having jurisdiction for use on types and sizes of doors indicated in compliance with requirements of fire-rated door and door frame labels.
  - 1. Equip labeled doors with hinges of steel or stainless steel base metal, closers, and automatic latching devices in addition to the hardware requirements in the specified hardware sets.
  - 2. If a conflict appears between this paragraph and the hardware sets scheduled, the requirements of this paragraph govern.

- D. Americans With Disabilities Act (ADA): Comply with the ADA Accessibility Guidelines (ADAAG).

### 1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

A. Shop Drawings:

1. Product Data: Manufacturers' technical literature and catalog cuts, edited as necessary to indicate each item of hardware, model, selected options, finish, installation instructions, maintenance of operating parts and finish, and other information necessary to show compliance with requirements. Make coordinated submittals packages complete with all supporting data.
2. Hardware Schedule: Hardware schedule coordinated with doors, frames, gates and related work to ensure proper size, thickness, hand, function, design and finish of hardware. Base Hardware Schedule on hardware sets indicated in PART 3 of this section. Indicate complete designations of each item required for each door or opening, including the following information:
  - a. Explanation of each abbreviation, symbol, and code contained in hardware schedule. Schedules with unidentified notations will be rejected without review.
  - b. Door and frame number, size, and materials.
  - c. Type, style, function, size, and finish of each hardware item. Include lockset functions, angle of closer operation, lever and handle designs, lengths of flush bolts, types of stops, sizes of armor and kick plates, and other such data.
  - d. Name and manufacturer of each item.
  - e. Fastenings and other pertinent information.
  - f. Location of each hardware set cross-referenced to indications on Drawings, both on floor plans and in door schedule.
  - g. Mounting locations for hardware.
  - h. Keying information.
3. Submittal sequence: Submit hardware schedule at earliest possible date particularly where acceptance of hardware schedule must precede fabrication of other work that is critical in the Project construction schedule. Include with hardware schedule the product data, samples, shop drawings of work affected by finish hardware, and other information essential to a coordinated review of hardware schedule.
4. Templates: Transmit hardware templates directly to trades fabricating related work specified to be prepared for the installation of finish hardware under this section. Submit record copy of these transmittals to the Engineer.
5. Coordinating hardware preparation by other trades: Check shop drawings of other trades to ensure that correct provisions from transmitted templates are made for locating and installing finish hardware to comply with indicated requirements.

B. Samples:

1. Finishes: Two, minimum four-inch squares of each finish to be furnished. Submit with shop drawings.
2. Hardware units: Each type of exposed hardware unit in approved finish and tagged with full description for coordination with hardware schedule. Submit unit samples prior to submission of final hardware schedule.
  - a. When requested, samples will be returned to the supplier. Accepted units that remain undamaged through the submittal, review, and field-comparison process may, after final check of operation, be used in the Work, within limitations of keying coordination requirements.

- b. Submit the following:
    - 1) One sample of a lockset including, trim, escutcheon, strike box, lever, cylinder, and key.
    - 2) One sample of hinge.
    - 3) One sample of each miscellaneous item of finish hardware.
    - 4) Provide finishes so that color and surface finish or polish of various items of the same designated finish match throughout the work. Hardware with non-matching finishes will be rejected.
  - c. The Authority reserves the right to require samples of each specific item to be furnished.
- C. Certification.
- D. Documentation:
- 1. Construction keying schedule.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to jobsite in original unopened packages, clearly labeled with manufacturer's name, brand, specification identification data and identification as shown on approved hardware schedule.
- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

**1.05 MAINTENANCE TOOLS AND INSTRUCTIONS:**

- A. Furnish a complete set of specialized tools and maintenance instructions as needed for the Authority's continued adjustment, maintenance, removal and replacement of hardware.

**PART 2 - PRODUCTS**

**2.01 HARDWARE TYPES:**

- A. General:
  - 1. Hardware grade: Provide only Grade 1 hardware in accordance with ANSI/BHMA A156-Series Standards and with the additional requirements specified in this section, except where otherwise specified or approved in writing by the Engineer for each specific door number.
  - 2. Fire-rated hardware: Where applied to fire-rated labeled doors and frames, provide fire-rated listed hardware, tested by a fire-rating testing agency acceptable to authorities having jurisdiction.
  - 3. Finishes: Finish designations are ANSI/BHMA A156.18 standards and are subject to approval for color, texture and appearance.
    - a. Finish 630 (Formerly US 32D): Except where otherwise indicated, provide finish 630, satin-polish stainless steel on stainless steel base metal, matching sample on file with the Engineer.
    - b. Finish 626 (Formerly US 26D): Where indicated, provide finish 626, satin-polish chromium plated over nickel on brass or bronze base metal, matching finish 630 as specified above.
    - c. Finish 628 (Formerly US 28): Where indicated, provide finish 628, satin-polish aluminum clear anodized over aluminum base metal.

- d. Finish 652 (Formerly US 26D): Where indicated, provide finish 652, satin-polish chromium plated over nickel on steel base metal, matching finish 630 as specified above.
  - e. Finish 719 (Formerly US27): Mill finish aluminum uncoated.
  - f. Finish 613 (Formerly US10B): Where indicated, provide finish 613, satin-finish statuary bronze.
  - g. Finish 630 may be substituted for Finish 626 or Finish 652 at no additional cost to the Authority.
4. Single Source: Obtain each type of hardware from a single manufacturer.
- B. Hinges: ANSI/BHMA A156.1, full mortise butt hinges, anti-friction bearings, button tips (not flush), unless otherwise specified for each specific door number. Extruded butts may be used in lieu of wrought butts.
- 1. Quantity required per door leaf:
    - a. Doors 61 inches to 90 inches in height: 1-1/2 pairs.
    - b. Doors 91 inches to 120 inches in height: Two pairs.
  - 2. Types:
    - a. Exterior doors, doors from public passageways, and doors to wet areas such as showers: Stainless steel butts, Type A5111, finish 630.
    - b. Interior, non-public doors: Steel butts, Type A8111 (Grade 1), Finish 652.
    - c. Doors with reverse-bevel swing (out-swinging) having locks: Fit butts with non-removable pins effective when door is in closed position.
- C. Locksets:
- D. Hollow metal doors: ANSI/BHMA A156.13, full mortise, adjustable armored front, 3/4-inch-throw anti-friction latchbolt, one-inch-throw stainless steel deadbolt, Finish 630, Function as scheduled.
- 1. Trim design:
    - a. Cast lever handles, recurving to within 1/2-inch of door face, equal in appearance and dimensions to one of the following unless otherwise scheduled:
 

Series	Design	Producer
ML2200 Series	Newport NSA	Corbin/Russwin
8200 Series	KD rose, L lever	Sargent
8700 Series	PB lever, YK rose	Yale
    - b. Finish: 630 unless otherwise scheduled.
    - c. Roses: Concealed screw or screwless, 2-1/4 inch diameter.
    - d. Cylinder trim: Equip with flush or security-beveled solid cylinder collar as appropriate for flush or projecting cylinder.
  - 2. Aluminum doors in Yard Buildings:
    - a. Finish: 630 unless otherwise scheduled.
- E. Cylinders and Keying for all doors except aluminum doors in Parking Structures: Match the Authority's existing keying and interchangeable core system as follows and at no additional cost to the Authority.
- 1. Cylinders: Finish 630.
    - a. For locksets: ANSI/BHMA A156.5, interchangeable-core type, designed to accept the Authority's existing Russwin Recore System. One core furnished for each lock, stamped with visual key control.

- b. High security: Interlocking-pin type, Emhart High-Security Locking System or equal.
    - c. Construction cores: Provide construction cylinders until final cylinders and keying is approved and installed.
  - 2. Keys and keying:
    - a. Keys: Stamped with the inscription TRANSIT AUTHORITY - DO NOT DUPLICATE and with visual key-control data.
    - b. Quantity: Three keys for each core plus blanks equal to 10-percent of total keys furnished.
  - 3. Key tags and holders: ANSI/BHMA A156.5, inscribed with key-change number and key-control symbol.
- F. Push Plates and Door Pulls: ANSI/BHMA A156.6, Finish 630, with the following additional requirements:
  - 1. Push plate: 3/16 inch by 10 inches by 20 inches unless otherwise shown, with edges beveled.
  - 2. Door pull: 3/4-inch round bar, eight inches center-to-center, concealed fasteners; escutcheon plate same as push plate.
- G. Door Closers: ANSI/BHMA A156.4, Type C02xx1 (xx - indicates top-of-door-mounted, on interior side), Finish 630.
  - 1. Surface-mounted.
  - 2. Sweep period: Adjusted so that from an open position of 70 degrees, the door will take at least three seconds to move to a point 3 inches from the latch, measured to the leading edge of the door.
  - 3. Cover plate: Full metal cover, Finish 630.
  - 4. Parallel arms and drop brackets: Provide as necessary for mounting on interior side unless otherwise noted. Where hold-open feature is specified for closers, use type that permits doors to open 140 degrees, other conditions permitting.
  - 5. Maximum force for pushing or pulling open a door with closer (measured with a push-pull scale applied perpendicular to the door at the door opener or 30 inches from the hinged side, whichever is farther from the hinge):
    - a. Fire doors: Minimum opening force allowable by the jurisdictional authorities.
    - b. Interior hinged doors: 5 lbf.
- H. Stops:
  - 1. Overhead-type: ANSI/BHMA A156.8, Type C54511 holder/stop; holder deactivated on labeled doors, Finish 630.
  - 2. Wall-type: ANSI/BHMA A156.16, Type L02101, with vandal-resistant concealed fasteners, Finish 630. Use floor-type where wall-type is not practicable.
  - 3. Floor-type: ANSI/BHMA A156.16, Type L02141 or L02161 as necessary, with matching extender if necessary to properly engage door bottom, Finish 630.
- I. Flush Extension Bolts: ANSI/BHMA A156.8, Type L04081, Finish 630.
  - 1. Dustproof strikes, Type L04021, provided for bolts located at bottom of door leaf, except where metal thresholds are specified. Cut opening to suit bolt.
  - 2. Operating mechanism located approximately six feet from floor for top bolts and approximately 12 inches from floor for bottom bolts.
  - 3. Bolts located in edge of inactive leaf of pair of doors.
  - 4. Automatic Flush Bolts: Listed for 1-1/2 hour, B-labeled, Finish 630; Ives No. 559 or equal with strikes; with coordinator where recommended by manufacturer.
- J. Silencers: ANSI/BHMA A156.16, Type L03011. Provide silencers for each door:
  - 1. Three for each single door.

2. Two for each pair of doors.
- K. Exit Devices: ANSI/BHMA A156.3; complying with NFPA 80, listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction; lever trim as required for locksets; Finish 630.
1. Single door: Function F03 (mortise); latch bolt by push on crossbar inside and by key from outside; operation from outside is by lever.
  2. Double door: Active leaf Function F03 as above, inactive leaf (manual flush bolts) without outside trim.
  3. Maximum pushing force to operate exit device:
    - a. Fire doors: Minimum opening force allowable by the jurisdictional authorities.
    - b. Interior hinged doors: 5 lbf.
  4. Coordinators: ANSI/BHMA A156.3.
- L. Metal Thresholds: ANSI/BHMA A156.21; profiles as shown for each location; ADA compliant; metal thickness 0.125 inch; maximum height 5/16"; with countersunk matching screws.
1. Public passageways and mezzanines: Finish 630, stainless steel with abrasive finish or Finish 613, satin-finish statuary bronze.
  2. Other locations: Finish 719, mill finish aluminum with grooves.
- M. Weather Stripping /Smoke Seals: ANSI/BHMA A156.22, Finish 628 (satin aluminum clear anodized) with stainless steel sheet-metal screws and as follows:
1. Head and jamb: Head and jamb type, stop-applied; National Guard A626 or equal. Provide nylon brush gasketing or equal.
  2. Sill: Drip strip at sill; National Guard 15 or equal.
  3. Sweep: Door sweep type, surface mounted at bottom of door; National Guard D608 nylon brush gasketing or equal. Provide sweep in addition to drip strip where scheduled.
  4. Astragals: Provide nylon brush overlapping type: National Guard 600 or equal.
- N. Chain: ASTM A413, Class PT, case-hardened, carbon-steel security chain, 3/8-inch diameter.
- O. Padlock: Interchangeable-core type padlock, designed to accept the Authority's existing Russwin Recore System.
1. One core furnished for each lock, stamped with visual key control; with two keys, keyed and master-keyed as directed.
  2. Body: Solid extruded brass.
  3. Five-pin tumblers.
  4. Shackle: Hardened steel, zinc-plated, 1-3/4 inch opening height, self-locking spring-type.
- P. Deadlock: ANSI/BHMA A156.5 mortise dead lock, Grade 2 (1/2-inch minimum throw) with interchangeable-core cylinder; operation as scheduled.
- Q. Authority-Furnished Property:
1. Cross-bar lock: High-security locking bar with surface-mounted keepers, inside knob and high-security cylinder.

## 2.02 FASTENINGS:

- A. Provide hardware complete with screws, through-bolts and other fasteners of suitable type for secure anchorage to construction materials.

- B. Screws, through-bolts and other fasteners having spanner-type heads: As approved.
- C. Provide fasteners that harmonize in material, color and texture with finished appearance of hardware items.
- D. Provide concealed fastenings with door pull, flush pulls, wall door stops and other such items.
- E. Provide spanner-head through-bolts and hex bolts as applicable for surface-mounted hardware.
- F. Sheet-metal screws and self-tapping screws are prohibited except where specified.

**2.03 TEMPLATES:**

- A. Furnish templates of hardware to other trades, so that doors, frames and gates can be cut, reinforced and otherwise prepared in the shop for installation of finish hardware.

**2.04 THRESHOLD SEALANT:**

- A. Butyl: Polymerized butyl rubber and inert fillers (pigments), solvent-based with minimum 75 percent solids, non-sag consistency, tack-free time of 24 hours or less, paintable, non-staining, and complying with FS TT-S-001657.

**PART 3 - EXECUTION**

**3.01 INSTALLATION:**

- A. General:
  1. Coordinate work of this section with work of other trades.
  2. Install each hardware item in compliance with the manufacturer's instructions and recommendations.
  3. Apply finish hardware in a neat and workmanlike manner. Set units level, plumb, and true to line and location. Adjust and reinforce the attachment substrate as necessary for proper installation and operation.
  4. Cut mortises neat, clean and of proper net size. Drill and countersink units that are not factory prepared for anchorage fasteners. Space fasteners and anchors in accordance with industry standards.
  5. Where cutting and fitting is required to install hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation or application of surface protection with finishing work specified in other sections. Do not install surface-mounted items until finishes have been completed on the substrates involved.
  6. Provide keying in accordance with keying schedule prepared by and for the Contractor in accordance with the Authority's keying system. Deliver keying schedule and keys to the Engineer prior to final acceptance.
- B. Mounting Heights: Mount hardware units at heights indicated in the following publications, except as specifically indicated or required to comply with governing regulations and except as otherwise directed by the Engineer:
  1. Recommended Locations for Builders Hardware for Standard Steel Doors and Frames by DHI.
  2. Recommended Locations for Builders Hardware for Custom Steel Doors and Frames by DHI.
  3. ADA Accessibility Guidelines (ADAAG).

- C. Exterior Thresholds: Set thresholds for exterior doors in full bed of specified butyl sealant.
- D. Weatherstripping /*Smoke Seals*: Install weatherstripping around entire perimeter of door frame to form a complete seal and in accordance with manufacturers instructions.
  - 1. Position and install head and jamb weatherstripping so that door closes snugly against seal but does not inhibit latching of lockset.
  - 2. Position and install sill weatherstripping to seal snugly against threshold without inhibiting latching of lockset.
  - 3. Note that at fire-rated doors, lockset is to latch by closer operation only, without manual assistance.
- E. Adjustment: Adjust hardware to operate as designed and replace hardware that is missing, scratched, marred or otherwise damaged.
  - 1. Adjust and check each operating item of hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate freely and smoothly or as intended for the application made.
  - 2. Where door hardware is installed more than one month prior to acceptance or occupancy of a space or area, return to the installation during the week prior to acceptance or occupancy and make final check and adjustment of hardware items in such space or area. Clean operating items as necessary to restore proper function and finish of hardware and doors. Adjust door control devices to compensate for final operation of heating and ventilating equipment.
  - 3. Clean adjacent surfaces soiled by hardware installation.
- F. Instruction: At a time prescribed by the Engineer, have the hardware installer or knowledgeable operating-hardware-manufacturers' representatives instruct the Authority's personnel in the proper adjustment and maintenance of hardware and hardware finishes.

### **3.02 CLEAN-UP:**

- A. Remove from the site rubbish and debris caused by this work.
- B. Leave areas surrounding doors in broom-clean condition.

### **3.03 HARDWARE SETS:**

- A. Hardware Sets:
  - 1. Provide hardware sets in accordance with door schedule and the following set schedule.
  - 2. Provide the number of pairs of butt hinges in accordance with previously specified requirements.
  - 3. Designations used to describe hardware items by using a manufacturer's product name and number are for the purpose of describing a general level of quality and function. Products that are equal, complying with the requirements specified in this section may be used.

SET NO. 1

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F09
1 Each	Door Closer
1 Each	Wall-Type Stop
1 Each	Metal Threshold

SET NO. 2

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F07
1 Each	Door Closer
1 Each	Wall-Type Stop

SET NO. 3

Quantity	Hardware
As Necessary	Lock Cylinders *

\* Provide proper cam to engage lock mechanism by other trade.

SET NO. 4

Quantity	Hardware
1 Each	Deadlock, E06082

SET NO. 5

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Latchset, Function F01
1 Each	Door Closer
1 Each	Wall-Type Stop

SET NO. 6

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Exit Device, Function F03
1 Each	Door Closer
1 Each	Wall-Type Stop

SET NO. 7

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F13
1 Each	Door Closer with Hold-Open
1 Each	Wall-Type Stop
1 Each	Cross-Bar Lock

SET NO. 8

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F07
2 Each	Door Closer
2 Each	Wall-Type or Floor-Type Stop
2 Each	Automatic Flush Bolt
1 Each	Coordinator

SET NO. 9

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F07
2 Each	Door Closer
2 Each	Overhead-Type Stop
1 Each	Metal Threshold
2 Each	Automatic Flush Bolt
1 Each	Coordinator
1 Set	Weatherstripping

SET NO. 10

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
2 Each	Door Pulls
2 Each	Door Closer with Hold-Open
2 Each	Wall-Type or Floor-Type Stop, As Necessary

SET NO. 11

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F09
2 Each	Door Closer
1 Each	Wall-Type Stop
1 Each	Metal Threshold
2 Each	Automatic Flush Bolt
1 Each	Coordinator

SET NO. 12

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F07
1 Each	Door Closer
1 Each	Overhead-Type Stop
1 Each	Metal Threshold
1 Set	Weatherstripping

SET NO. 13

Quantity	Hardware
Previously Specified	Butt Hinges, 4-1/2 by 4-1/2
1 Each	Lockset, Function F14
1 Each	Door Closer
1 Each	Overhead-Type Stop
1 Each	Metal Threshold
1 Set	Weatherstripping

**END OF SECTION**

## SECTION 08800

### GLASS AND GLAZING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing glass and glazing (sealing) of glass areas.
- B. Related Work Specified Elsewhere:
  - 1. Elevators: Division 14. <sup>\*1</sup>
  - 2. Granite edge: Section 04415.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ANSI: Z97.1.
  - 3. ASTM: C509, C542, C864, C920, C1036, C1048, C1172, C1281, D635, D1044, D1925, E774, E1300.
  - 4. CPSC: 16 CFR 1201, Category II.
  - 5. UL: 9, 10B.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples:
    - a. Three each of the following:
      - 1) Glass and safety plastic: 12 inches square, each material and type.
      - 2) Cast glass lens.
      - 3) Glazing compound: Pint containers.
      - 4) Setting blocks and edge blocks.
      - 5) Sealant: Cured color samples.
        - a) Sealant for sealing platform granite edge glass lenses: Clear silicone sealant,, one six-inch long bead.
      - 6) Gasket material: 12 inches long.
  - 2. Certification:
    - a. When glass is not cut to size by manufacturer and is furnished unlabeled from local stock, submit certification stating location to be installed, quality, thickness, type and manufacturer of each unit of glass furnished.
    - b. All tempered safety and laminated tempered safety glass to be permanently marked with the name or trademark of the manufacturer and designation of the applicable safety glazing standard.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the jobsite in original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type, class and rating as applicable. Deliver glass with each light bearing manufacturer's label showing strength, grade, thickness, type, quality and safety marking. Do not remove labels from glass until it has been set and inspected.

- B. Store products in approved dry area; protect from contact with soil and from exposure to the elements.
- C. Handle products to prevent breakage of containers and damage to products.

#### 1.05 JOB CONDITIONS:

- A. Environmental Requirements:
  - 1. Do not install glass when the ambient temperature is below 40F or expected to fall below 40F, unless otherwise approved.
  - 2. Do not apply glazing materials to unprotected surfaces in wet weather or to surfaces on which ice, frost, water or dampness is visible.

### PART 2 - PRODUCTS

#### 2.01 MATERIALS:

- A. Glass:
  - 1. Plate glass: ASTM C1036, Type I (transparent glass, flat), Class 1 (clear), Quality q3.
  - 2. Safety glass: CPSC 16 CFR 1201, Category II and ANSI Z97.1 and as follows:
    - a. Tempered: ASTM C1048, Kind FT (fully tempered), Condition A (uncoated surfaces), Type I (transparent glass, flat), Class 1 (clear), Quality q3; 1/4-inch thick unless otherwise shown.
    - b. Laminated: ASTM C1172, Kind LT (fully tempered), 0.060-inch thick polyvinyl-butylal (PVB) interlayer factory-laminated between two pieces of tempered safety glass with protective edgecoat on the assembly to prevent contact of interlayer with water or joint materials; edgecoat such as Edgeseal by PPG, special polyurethane seal on Solaflex glazing by Monsanto, Sommer Macca Urethane E#2 by SX Chemical Company, or equal.
    - c. Laminated fritted glass:
      - 1) Construction: ASTM C1172, Kind LT, Laminated glass consisting of two pieces of fully tempered clear glass with one of the following fritting methods to make the laminated assembly translucent but not transparent:
        - a) A hue-white fritted surface permanently fused onto the laminated surface of one piece of glass with a clear 0.60-inch polyvinyl-butylal (PVB) interlayer between.
        - b) Two pieces of clear glass with a hue-white 0.30-inch PVB interlayer (fritting) sandwiched between two 0.15-inch clear PVB interlayers.
      - 2) Opacity: 80 percent coverage of translucent white fritting. Pattern of fritting to be selected by the Engineer from manufacturer's whole range of fritting patterns.
      - 3) Provide protective edgecoat to prevent contact of interlayers with water or joint materials.
  - 3. Wired: ASTM C1036, Type II (wired), Class 1 (translucent), Form 1 (wired, polished both sides), Quality q8; Mesh m1 (diamond), unless otherwise shown.
  - 4. Fire-rated glass (without wire): CPSC 16 CFR 1201 and ANSI Z97.1; fire-rated clear glass without wire; polished both sides.
    - a. Rating: 45 minutes or as shown, tested in accordance with UL9 (door assemblies) and UL10B (window assemblies).
    - b. Label: Each piece of glass bearing UL label for fire resistance.

- c. Thickness: As necessary to achieve the required fire rating; thickness coordinated with submitted shop drawings for the related doors and windows.
  - d. Sources: Subject to meeting the requirements, provide one of the following or equal:
    - 1) Premium FireLite by Nippon Electric Glass Company, Ltd. and distributed by Technical Glass Products, Kirkland, WA; 800/426-0279.
    - 2) Contraflam by Saint-Gobain and distributed by Euroglass Glasrep Corp., White Plains, NY; 914/683-6704.
    - 3) Inferno-Lite by Globe Amerada Glass Co., Elk Grove Village, IL; 800/323-8776.
- B. Insulating Glass: ASTM E774, Class CBA; factory preassembled, sealed insulating glass units with 1/2-inch air space; aluminum spacer tube with desiccant held captive within, and dual seal construction.
- 1. Outer lite: 1/4-inch clear plate glass or tempered safety glass as shown or specified, with low-emissivity (low-E) coating equal to Viracon's Solarscreen 80 on the number-two (inside) surface.
  - 2. Inner lite: 1/4-inch clear plate glass or tempered safety glass as shown or specified.
- C. Safety Plastic: Clear, monolithic polycarbonate sheet complying with the following:
- 1. Abrasion resistance: Maximum 3.1 percent change in haze when tested in accordance with ASTM D1044 for both surfaces.
  - 2. UV-resistance: Maximum 2.0 yellowing index after three years exposure per ASTM D1925.
  - 3. Flammability: Meet BOCA combustibility classification C1: Horizontal burn rate of one inch per minute or less when tested at a nominal thickness of 0.060 inch, or in the thickness intended for use, in accordance with ASTM D635.
- D. Glass Lens: Cast, clear glass, flat top with light sandblast texture, or acid etched if approved, to make it translucent, not transparent; vertical side (perimeter) roughened; top outer perimeter edge chamfered to 1/16 inch. Corning Glass Works, Pittsburgh Plate Glass Co., Blenko Glass Company distributed by Southern Plate Glass Company, or equal. Match texture, quality limiting defects, and translucency of existing units within the Metro system as directed by Engineer.
- 1. Defects shall be limited to a maximum of six air bubbles of 3/16 inch diameter or less with not more than three air bubbles occurring within the central three-inch diameter of lens.
  - 2. Single-component clear silicone sealant: ASTM C920, Type S, Grade NS, Class 25, Use T; as manufactured by Dow, GE and Pecora, or approved equal.
  - 3. Lead shims or lead rope: Section Shims die-cut from soft sheet lead; sized to suit field conditions, generally 6-1/2 inch outside diameter, five-inch inside diameter; 1/16-inch and 1/8-inch thicknesses as approved; ropes of lead wool may be substituted for shims as approved; fabricated to ensure that glass lenses can be set flush with granite.
- E. Glazing Accessories:
- 1. Sealant: Multi-component polyurethane; ASTM C920, Type M, Grade NS, Class 25, Use G; colored as required to match framing system in which installed.
  - 2. Glazing compound: Single-component polyurethane; ASTM C920, Type S, Grade NS, Class 25, Use G; colored as required to match framing system in which installed.
  - 3. Glazing tape: Preformed butyl tape, ASTM C1281; 100 percent solids, nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod (pre-shimming) as recommended in writing by tape and glass manufacturers for

application indicated; packaged on rolls with a release paper backing; by 3M Company, Tremco Manufacturing Co., or equal.

4. Pressure-sensitive tape: Vinyl electrical tape, 3M Company or equal.
5. Lock-Strip Gaskets: ASTM C542 dense neoprene extrusions; profile shown or required.
6. Compression Seal Gaskets: ASTM C864 neoprene extrusions; profile and hardness as shown or as required to maintain watertight seal.
7. Setting blocks: ASTM C864 neoprene extrusions, 70-90 durometer Shore A hardness; approximately full channel width, four inches long and high enough to afford correct cover and 3/8-inch edge clearance for the glass.
8. Edge blocks (spacers): ASTM C864 neoprene extrusions, 40-50 durometer Shore A hardness; approximately full channel width, three inches long and providing 3/8-inch edge clearance for the glass.
9. Glazing clips and points: Type, material and quantities as required and recommended by the manufacturers of the glazing media.
10. Glazing (face) gasket: Neoprene, formulated of compound meeting or exceeding physical property requirements of ASTM C509, continuous, 50 durometer hardness, providing 3/16-inch face clearance inside and outside.
11. Lead-shim ring: Continuous ring of sheet lead, of thickness required to bring top of cast glass lens level with surrounding granite.
12. Dielectric screw shield: Nylon expansion anchor, round head, sized to ensure snug fit in predrilled hole and to accommodate size of screw used.

### **PART 3 - EXECUTION**

#### **3.01 PREPARATION:**

- A. Verify dimensions before proceeding; obtain measurements at structure for work to be fitted to other construction, including wall-to-wall dimensions, floor-to-ceiling dimensions and those controlled by other trades.
- B. Remove dirt, dust, oil, moisture and other foreign substances from surfaces to receive glass and glazing accessories.
- C. Clean glass surfaces and wipe dry.

#### **3.02 INSTALLATION:**

- A. Coordinate work of this section with work of other trades.
- B. Use only tempered safety glass in doors, sidelights and transoms.
- C. Use only fire-rated glass in doors and windows located in fire-rated wall construction, except where wire glass is shown.
- D. Size glass by measuring actual frames or sash. Sizes shown are approximate and are intended for estimating purposes only. Cut glass to form 3/8-inch bite on all sides, except as otherwise required by manufacturer's product data as submitted and approved.
- E. Install glass or plastic using glazing gaskets or other glazing accessories as shown.
- F. Set glass on setting blocks at each quarter point of sill with equal bearing for entire width of each panel. Accurately cut glass to fit frames and provide smooth edges with no sharp or ragged surfaces. Provide edge blocks to prevent glass from contact with side frames.

- G. Unless otherwise shown, set glass in metal interior frames and doors or by back-face glazing with glazing compound; tape to prevent rattling. Reset glazing beads, if necessary, without marring or injuring finish.
- H. Tape Glazing:
  1. Position tape on fixed stops so that, when compressed by glass, exposed edges of tape are flush with or protrude slightly above sightline of stops.
  2. Install tape continuously, but not necessarily in one continuous length. Do not stretch tape to make it fit opening. Do not overlap butt ends. Cut tape with sharp shears. Place joints in tape at corners of opening with adjoining lengths butted together, not lapped.
  3. Seal joints in tape with compatible sealant approved by tape manufacturer.
  4. Where framing joints are vertical, cover these joints by applying tape to head and sill first and then to jambs. Where framing joints are horizontal, cover these joints by applying tape to jambs and then to head and sill.
  5. Place spacer or centering shims, three inches in length, 3/16 inch in height and 3/32 inch in thickness, every 18 inches under tape. Hold spacers in position by gently placing them in contact with underedge of tape.
  6. Position setting blocks for installation of glass. Use setting blocks 1/4 inch in height.
  7. Do not remove release paper from tape until just before each glazing unit is installed.
  8. Align glass carefully to opening and press glass firmly in place. Apply removable stops and repeat application of spacers or centering shims. Ensure that they are seated as deeply as possible in channel. Fill interior opening in conventional manner with glazing compound.
  9. Apply cap bead of sealant over exterior exposed edge of tape.
- I. Set glass in exterior metal windows and doors with neoprene setting blocks at quarter points and neoprene spacers two inches long placed 18 inches on center, and glaze with sealants.
- J. Install glass and glazing accessories in accordance with manufacturer's recommendations. Neatly apply sealants, compounds and tapes in straight lines parallel with glazing rebates and as shown.
- K. Perform direct glazing in dry weather, 40F or warmer.
- L. Tape edges of laminated glass and insulating glass with pressure-sensitive tape if sealant or glazing tape is incompatible with interlayer or seals of insulating glass. Do not expose edges of laminated glass to solvents, cleaners or prolonged contact with water.
- M. Set lead-shim rings on lips at bottom of openings and glass lenses. Set glass lenses to bring flat face level with the top of granite, centered in openings. Use spacers to maintain lenses in position while filling the annular space with backer rod and sealant as shown.

### **3.03 INSTALLATION OF ELEVATOR HOISTWAYS:**

- A. Install glazing at elevator hoistways as shown and in accordance with applicable requirements for glass and glazing.
- B. Size screw holes for dielectric screw shields to permit installation so as to prevent metal-to-metal contact between screws and frame.
- C. Apply sealant around entire frame, inside and outside of exterior hoistways only, and at other areas where metals are joined resulting in unfilled space. <sup>2</sup>

- D. Apply sealant around entire frame, inside and outside, and at other areas where metals are joined resulting in unfilled space. <sup>\*3</sup>

**3.04 INSTALLATION/RE-INSTALLATION OF PLATFORM GRANITE EDGE GLASS LENSES:**

- A. Install lead shims or lead rope.
- B. Install glass lenses.
- C. Apply sealant.

**3.05 FIELD QUALITY CONTROL:**

- A. Hose Tests:
  - 1. Upon completion of glazing and sealing, perform hose test against exterior glazing and framing members in the presence of the Engineer.
  - 2. Use 5/8-inch minimum diameter hose operated at 40-psi pressure for a minimum of 10 minutes. Repair leaks as soon as surfaces are dry; retest until approved.
- B. Breakage: Prior to final acceptance, replace damaged glass.
- C. Dielectric Testing:
  - 1. After installation at elevator hoistways, test for electrical isolation between screws and hoistway metal, using ohmmeter.
  - 2. Resistance requirement: 10,000 ohms.
  - 3. Replace screws and shields that do not meet resistance requirements and retest as for initial installation. Repeat as necessary until all screws meet resistance requirement.

**3.06 CLEAN-UP:**

- D. At completion of work, remove labels, except fire labels, clean glass and remove excess glazing compound and sealant from frames and surrounding finish work.
- E. Remove from site rubbish and debris resulting from work of this section.
- F. Leave areas surrounding work in broom-clean condition.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

**ENDNOTES**

**\*1.** Add 1.1 B. including 1. modification to all contracts requiring glass and glazing work for elevator hoistways.

**\*2.** Use first version of 3.3 C. for all contracts requiring glass and glazing work for elevator hoistways.

**\*3.** Use second version of 3.3 C. for all contracts not requiring glass and glazing work for elevator hoistways.

## SECTION 09205

### FURRING AND LATHING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing furring, lathing and accessories.
- B. Related Work Specified Elsewhere:
  - 1. Access Doors and Frames: Section 08305.
  - 2. Plaster systems: Section 09215.
  - 3. Portland cement plaster: Section 09220.

##### 1.02 PERFORMANCE REQUIREMENTS:

- A. Structural Performance of Ceiling Support Systems: Limit deflection of ceiling to less than 1/360 of span.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data for each product specified.
  - 2. Shop Drawings: Furring layouts; locations of access panels, mechanical openings, light fixtures and electrical openings; and construction details.
  - 3. Samples:
    - a. Four of each of the following products used in the work:
      - 1) Furring Channels: 12 inches long
      - 2) Metal lath: 12 inches square.
      - 3) Studs, runner and caps: 12 inches long.
      - 4) Tie wire: 12 inches long.
      - 5) Fasteners, hangers and accessories.

##### 1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: A36, A641, A653, B69, C645, C847, C1063, E488.
  - 3. ML/SFA: Guide Specifications for Metal Lathing and Furring.
- B. Mockups: At the start of installation, construct panels for each type of finish and application required to verify selections made under Sample submittals and to demonstrate aesthetic effects as well as qualities of materials and execution. The mockups shall be a part of the Work. The work must be approved by the Engineer before installation can continue. Delete below if no fire-rated plaster assemblies.

##### 1.05 PRODUCT DELIVERY, STORAGE, AND HANDLING:

- A. Deliver products in the original unopened packages, containers or bundles each bearing name of manufacturer, brand designation, referenced number, type and class as applicable.

- B. Store materials inside, under cover, and dry, protected from weather, direct sunlight, surface contamination, aging, corrosion, and damage from construction traffic and other causes. Use platforms or other means to protect products and materials from contact with the soil. Do not store materials on finished floors.
- C. Handle materials so as to preclude breakage of packages or containers and damage to materials.

## **PART 2 - PRODUCTS**

### **2.01 METAL SUPPORTS FOR SUSPENDED AND FURRED CEILINGS:**

- A. General: Size metal ceiling supports to comply with ASTM C1063, unless otherwise indicated.
- B. Cast-in-Place and Post-installed Anchors in Concrete: Anchors of type indicated below, fabricated from corrosion-resistant materials, with holes or loops for attaching hanger wires; and with capability to sustain, without failure, a load equal to 5 times that imposed by ceiling construction, as determined by testing according to ASTM E488 conducted by a qualified independent testing agency.
  - 1. Expansion anchor.
- C. Wire for Hangers: ASTM A641, Galvanized carbon-steel wire, eight-gauge minimum, medium-temper, Class 3 coating.
- D. Wire for Ties: ASTM A641, Galvanized carbon-steel wire, 16-gauge minimum for securing metal furring, 18-gauge minimum for securing metal lathe, medium-temper, Class 1 coating.
- E. Resilient Furring Channels: Galvanized steel, minimum 0.0209-inch-thick base (uncoated) metal, approved type, standard with the manufacturer, similar to RC-1, U.S. Gypsum Company.
- F. Channels: Cold-rolled steel, minimum 0.0598-inch-thick base (uncoated) metal and 7/16-inch-wide flanges, and as follows:
  - 1. Carrying Channels: 1-1/2 inches deep, 475 lb/1000 feet.
  - 2. Furring Channels: 3/4 inch deep, 300 lb/1000 feet.
  - 3. Finish: ASTM A653, G60 hot-dip galvanized coating for framing.
- G. Steel Studs for Furring Channels: ASTM C645, with flange edges of studs bent back 90 degrees and doubled over to form 3/16-inch-wide minimum lip (return), and complying with the following requirements for minimum thickness of base (uncoated) metal and for depth:
  - 1. Thickness: 0.0478 inch, unless otherwise indicated.
  - 2. Depth: As indicated.
  - 3. Protective Coating: ASTM A653, G40 galvanized coating.

### **2.02 STEEL STUDS AND RUNNERS:**

- A. General: Provide steel studs and runners complying with the following requirements:
  - 1. Protective Coating: ASTM A653, G40 hot-dip galvanized coating. Retain above or below. Verify availability and weight of galvanized coatings with manufacturers. Retain below if galvanized coating is only required at exterior and building perimeter locations.
- B. Non-Load-Bearing Studs and Runners: ASTM C645 and complying with the following requirements for minimum thickness of base (uncoated) metal and other characteristics:

1. Thickness: 0.0478 inch.
2. Depth: As indicated.

### **2.03 VERTICAL METAL FURRING:**

- A. General: Provide vertical furring complying with the following requirements:
  1. Protective Coating: ASTM A653, G40 hot-dip galvanized coating.
- B. Channel Furring and Braces: Cold-rolled steel, minimum 0.0598-inch-thick base (uncoated) metal and 3/4-inch-deep-by-7/16-inch-wide flanges, 300 lb/1000 feet.
- C. Hat Channels: Hat-shaped screwable furring channels, 7/8 inch deep, formed from zinc-coated (galvanized) steel sheet, minimum 0.0179-inch-thick, Grade 33.
- D. Furring Brackets: Serrated-arm type, minimum 0.0329-inch-thick base (uncoated) metal, adjustable from 1/4- to 2-1/4-inch wall clearance for channel furring.

### **2.04 LATH:**

- A. Expanded-Metal Lath: Comply with ASTM C847 for material, type, configuration, and other characteristics indicated below.
  1. Material: Fabricate expanded-metal lath from sheet metal conforming to the following:
    - a. Galvanized Steel: Structural-quality, zinc-coated (galvanized) steel sheet complying with ASTM A653, G60 minimum coating designation, unless otherwise indicated.
  2. Diamond-Mesh Lath: Comply with the following requirements:
    - a. For applications directly to masonry or concrete:
      - 1) Configuration: Self-furring.
      - 2) Weight: 2.5-lb/sq. Yd.
    - b. For reinforcing at corners of opening or at internal corners:
      - 1) Configuration: Flat.
      - 2) Weight: 2.5-lb/sq. Yd.
    - c. For all other applications:
      - 1) Configuration: Flat.
      - 2) Weight: 3.4-lb/sq. Yd.

### **2.05 ACCESSORIES:**

- A. General: Comply with material provisions of ASTM C1063 and the requirements indicated below; coordinate depth of accessories with thicknesses and number of plaster coats required.
  1. Galvanized Steel Components: Fabricated from zinc-coated (galvanized) steel sheet complying with ASTM A653, G40 minimum coating designation.
  2. Zinc-Alloy Components: ASTM B69, 99 percent pure zinc.
- B. Metal Corner Reinforcement: Expanded, large-mesh, diamond-metal lath fabricated from zinc-alloy or welded-wire mesh fabricated from 0.0475-inch-diameter, zinc-coated (galvanized) wire and specially formed to reinforce external corners of portland cement plaster on exterior exposures while allowing full plaster encasement.
- C. Cornerbeads: Small nose cornerbeads fabricated from the following metal, with expanded flanges of large-mesh diamond-metal lath allowing full plaster encasement.
  1. Zinc Alloy: Minimum 0.0207-inch-thick.
  2. Galvanized Steel: Minimum 0.0179-inch-thick.

- D. Casing Beads: Square-edged style, with expanded flanges of the following material: Retain 1 of first 4 below or retain last with 2 or more of first 4.
  - 1. Zinc Alloy: Minimum 0.0207-inch-thick.
  - 2. Galvanized Steel: Minimum 0.0179-inch-thick.
- E. Curved Casing Beads: Square-edged style, fabricated from aluminum coated with clear plastic, preformed into curve of radius indicated.
- F. Control Joints: Prefabricated, of material and type indicated below:
  - 1. Zinc Alloy: Minimum 0.0207-inch-thick.
  - 2. Galvanized Steel: Minimum 0.0179-inch-thick.
  - 3. One-Piece Type: Folded pair of nonperforated screeds in M-shaped configuration, with expanded or perforated flanges.
  - 4. Two-Piece Type: Pair of casing beads with back flanges formed to provide slip-joint action, adjustable for joint widths from 1/8 to 5/8 inch.
    - a. Provide removable protective tape on plaster face of control joints.
- G. Lath Attachment Devices: Material and type required by ASTM C1063 for installations indicated.
- H. Fasteners: Clips and nails, standard with furring and lathing manufacturer.
- I. Anchors: Stainless steel, Alloy 303 or 304, with the following additional requirements:
  - 1. Type: Through bolt in steel; expansion bolt in concrete; toggle bolt in CMU.
  - 2. Pull-out strength: 1,200 pounds minimum
  - 3. Shear strength: 1,500 pounds minimum.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION OF LATH AND FURRING, GENERAL:**

- A. Standards: Comply with ML/SFA 920, "Guide Specifications for Metal Lathing and Furring," and with the requirements of ASTM C841 and ASTM C1063.
- B. Install supplementary framing, blocking, and bracing at terminations in work and for support of fixtures, equipment services, heavy trim, grab bars, handrails, furnishings, and similar work to comply with details indicated or, if not otherwise indicated, to comply with applicable written instructions of lath and furring manufacturer.
- C. Isolation: Where lathing and metal support system abuts building structure horizontally and where partition or wall abuts overhead structure, sufficiently isolate from structural movement to prevent transfer of loading from building structure. Install slip- or cushion-type joints to absorb deflections but maintain lateral support.
  - 1. Frame both sides of control joints independently and do not bridge joints with furring and lathing or accessories.
- D. Install additional framing, furring, runners, lath, and beads, as required to form openings and frames for other work as indicated. Coordinate support system for proper support of framed work that is not indicated to be supported independently of metal furring and lathing system.

#### **3.02 INSTALLATION OF CEILING SYSTEMS:**

- A. Preparation and Coordination:

1. Do not install furring until pipe, conduits and other equipment are in place and inspected.
  2. Coordinate installation of ceiling suspension system with installation of overhead structural systems to ensure inserts and other structural anchorage provisions have been installed to receive ceiling hangers in a manner that will develop their full strength and at spacings required to support ceiling.
    - a. Furnish concrete inserts, and other anchorage devices indicated, to other trades for installations well in advance of time needed for coordination with other work.
    - b. Perform cutting of construction necessary to install furring and lathing around ducts, conduits, pipes and equipment.
- B. Hanger Installation: Attach hangers to structure above ceiling to comply with ML/SFA 920, "Guide Specifications for Metal Lathing and Furring," and with referenced standards.
1. Do not attach hangers to metal deck tabs.
- C. Install ceiling suspension system components of sizes and spacings indicated, but not in smaller sizes or greater spacings than those required by referenced lathing and furring installation standards.
1. Wire Hangers: Suspend hangers from overhead construction. Coordinate work with construction work from which it is suspended. Space wire hangers not over 42 inches o.c., parallel with and not over 36 inches perpendicular to direction of carrying channels, unless otherwise indicated, and within 6 inches of carrying channel ends. Wrap wire hanger around carrying channel so as to develop full strength of hangers.
  2. Carrying Channels: Space carrying channels not over 42 inches o.c. with 36-inch o.c. hanger spacing. Use shims or other methods, if necessary, to level channels before securing in place.
  3. Furring Channels to Receive Metal Lath: Space furring channels not over 12 inches o.c. Secure furring channels to carrying channels, saddle-tied with tie wire or fastened with approved clips.
- D. Where masonry partitions are erected to ceiling height only, continue suspended ceilings across partition tops without bearing on partitions. Place carrying channels, which are adjacent to and parallel to partitions, not more than six inches from face of partition.
- E. Where furred ceilings are shown or specified, attach furring channels directly to the overhead construction.
- F. Where shown or specified provide resilient furring channels in lieu of conventional furring channels.
- G. Provide additional rods, clips and other accessories as necessary to achieve complete furring and lathing job.

### **3.03 INSTALLATION OF STEEL STUD WALL AND PARTITION SUPPORT SYSTEMS:**

- A. General: Install components of systems to comply with written instructions of steel stud manufacturer for applications indicated and as follows:
1. For non-load-bearing stud systems, comply with ASTM C754.
- B. Steel Stud Systems to Receive Metal Lath: Comply with requirements of ML/SFA 920, "Guide Specifications for Metal Lathing and Furring," applicable to each installation condition and type of metal stud system indicated.
1. Extend and attach partition support systems to structure above suspended ceilings, unless otherwise indicated.

### **3.04 INSTALLATION OF VERTICAL METAL FURRING:**

- A. Install vertical metal furring components of sizes and spacings indicated, but not in smaller sizes or greater spacings than those required by referenced ML/SFA standard.
- B. For furring on interior side of exterior walls, provide furring brackets, unless otherwise indicated
- C. Metal Furring to Receive Metal Lath: Comply with requirements of ML/SFA 920, "Guide Specifications for Metal Lathing and Furring," applicable to each installation condition indicated.

### **3.05 INSTALLATION OF LATHING:**

- A. Install metal lath for the following applications where plaster base coats are required. Provide appropriate type, configuration, and weight of metal lath selected from materials indicated that comply with referenced ML/SFA specifications and ASTM lathing installation standards.
  - 1. For applications directly to masonry or concrete use 2.5-lb/sq. Yd. minimum weight, self-furring, diamond-mesh lath.
  - 2. For reinforcing at corners of opening or at internal corners 2.5-lb/sq. Yd. minimum weight, diamond-mesh lath.
  - 3. For all other applications use 3.4-lb/sq. Yd. minimum weight, diamond-mesh lath.
- B. Lathing on Ceilings:
  - 1. Apply metal lath with long dimension of sheet at right angle to furring channels.
  - 2. Securely tie metal lath to supporting framing with tie wire.
  - 3. Tie each sheet of lath at least four times in width to each support. Lap ends and sides of sheet not less than ½-inch and lace together at approximately six inches on center. Stagger ends of sheets.
- C. Lathing on Stud Partitions and Furred Walls:
  - 1. Provide metal lath where shown.
  - 2. Attach metal lath to furring channels and studs with tie wire. Insert other applications if required.

### **3.06 CLEANING:**

- A. Remove from site rubbish and debris caused by this work..
- B. Leave rooms and areas in broom-clean condition.

**END OF SECTION**

**SECTION 09215**  
**PLASTER SYSTEMS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing plaster systems.
- B. Related Work Specified Elsewhere:
  - 1. Furring and lathing: Section 09205.

**1.02 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each.
  - 1. Shop Drawings:
    - a. Include manufacturer's product specifications and installation instructions for each material.
    - b. Samples: Panels at least 48 inches square of each type of finish for color, pattern and texture; showing the full range of variations.
  - 2. Certification.

**1.03 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: C28, C35, C150, C206, C842, C897, C926.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products in the original unopened packages, containers or bundles each bearing name of manufacturer, brand designation, referenced number, type and class as applicable.
- B. Keep plaster and cementitious materials dry until ready to be used. Store materials off ground, under cover and away from sweating walls and other damp surfaces.
- C. Handle materials so as to preclude breakage of packages or containers and damage to materials.

**1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
- B. Do not apply plaster unless temperature within areas to be plastered is at least 55F for 48-hour period prior to application of plaster. Maintain this minimum temperature during application and curing operation.
  - 1. Keep area fully enclosed in hot, dry weather for 24 hours after application of plaster and otherwise provide proper environment to properly dry plaster. Screen openings with polyethylene or similar approved materials.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Neat Gypsum Plaster: ASTM C28.

- B. Portland Cement: ASTM C150, Type I.
- C. Hydrated Lime: ASTM C206, Type S.
- D. Sand for Gypsum Plaster: ASTM C35.
- E. Sand for Portland-Cement Plaster: ASTM C897.
- F. Water: Potable.

## **2.02 MIXES:**

- A. Gypsum Plaster:
  - 1. Mix for scratch coat and brown coats: Proportions of neat gypsum and sand in accordance with ASTM C842, Table 3.
  - 2. Lime putty with gypsum gauging: Proportions in accordance with ASTM C842, Table 4A.
- B. Portland-Cement Plaster:
  - 1. Mix in accordance with ASTM C926. Do not use masonry cement, blended cement or plastic cement.
- C. For Restoration Work:
  - 1. Mix to match existing adjacent plaster work.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Do not apply plaster directly on painted surfaces, old plastered surfaces, bituminous-coated surfaces, or surfaces covered with waterproofing agents. Before covering such surfaces, apply furring and lathing.
- B. Check metal grounds, corner beads, screeds and other accessories for alignment. Ensure that surfaces to receive plaster are square, plumb and level.
- C. Remove foreign matter from surfaces to receive plaster.
- D. Thoroughly wet masonry surfaces with fine fog spray of clean water to produce uniformly moist condition before plastering.

### **3.02 MIXING:**

- A. Mix plaster in mechanical mixer in accordance with ASTM C842 for gypsum and plaster and ASTM C926 for portland cement plaster. Clean mixer of set or hardened material before loading materials for new batch.
- B. Keep mixing tools and equipment clean. Mix each batch separately.
- C. Follow referenced specifications and manufacturer's directions for mixing sequence, cycle of operations, time and other mixing requirements.
- D. Do not mix plaster over finished floors.

### **3.03 APPLICATION:**

- A. Apply gypsum plaster in accordance with ASTM C842 for gypsum and plaster and ASTM C926 for portland cement plaster, except as otherwise specified.
- B. Perform plastering work under direction of competent superintendent or foreman in coordination with work of other trades.
- C. Provide three-coat plastering, except as backing for tile work.
- D. Do not retemper plaster. Do not use frozen, caked, lumpy or partially set plaster.
- E. Apply portland-cement plaster over metal lath to minimum overall thickness of 3/4 inch, measured from face of metal lath to finish plaster surface, unless otherwise shown or specified.
- F. Provide portland-cement plaster on metal lath for ceramic-tile backing.
  - 1. Apply base coat not less than 24 hours nor more than 60 hours before tile is to be set. Prior to final set, scratch or score base coat to produce suitable bond for leveling coat.
  - 2. Protect base coat and keep moist during curing period.
  - 3. Apply leveling coat to tolerance of 1/8-inch in 10 feet and bring base coat up to minimum thickness of 3/4-inch. Scratch leveling coat and cure for 24 hours. Leveling coat may be omitted if base coat meets tolerance and thickness requirements.

#### **3.04 PATCH AND FINISH:**

- A. When so directed and after other trades have finished their work, point-up and patch plastering where necessary, point-up around trim and other set work and leave plaster work complete and perfect at final completion.
- B. Replace plastering having cracks, blisters, pits, checks or discolorations. Leave plastering clean and perfect in every respect.
- C. Use same mixes for patching as used for original work.
- D. For one year after acceptance, repair cracks that develop.
  - 1. Cut plaster back to the full depth perpendicular to surface for junction with repair work.
  - 2. Remove entirely the plaster that has separated from its backing; back to soundly bonded plaster, to masonry, to furring or to lath undersurface, as necessary.
  - 3. Clean substrate of loose particles and dust. Then coat with an approved bonding agent and replaster as specified.

#### **3.05 PROTECT AND CLEAN:**

- A. Protect finish work, particularly wood, aluminum and glass during plastering; repair damage or replace damaged materials.
- B. Remove plaster from floors, glass and other surfaces, leaving entire work in first-class condition.
- C. Remove plaster rubbish from premises and leave in broom-clean condition.

**END OF SECTION**

## SECTION 09255

### DRYWALL SYSTEMS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing non-loadbearing drywall systems, including metal studs, metal furring and acoustical insulation.
- B. Related Work Specified Elsewhere:
  - 1. Seals and Sealants: Section 07900.
  - 2. Building Insulation: Section 07210.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements for approval and with the additional requirements as specified for each.
  - 1. Product Data: For each type of the product indicated.
  - 2. Samples:
    - a. Trim Accessories: Full-size sample in 12-inch long length for each trim accessory indicated.
    - b. Textured Finishes: Manufacturer's standard size for each textured finish indicated and on same backing indicated for Work.
  - 3. Certification.
    - a. Certificates from the gypsum-wallboard manufacturer verifying that materials furnished meet specified requirements.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: C36, C423, C475, C641, C645, C665, C754, C834, C840, C931, C954, C919, C1002, C1177, C1047, D226, E84, E90, E119, E413, E497.
  - 3. ASTM A 118.9, C 919.
- B. Fire-Test-Response Characteristics: For gypsum board assemblies with fire-resistance ratings, provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
- C. Sound Transmission Characteristics: For gypsum board assemblies with STC ratings, provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413 by a qualified independent testing agency.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver materials in original packages, containers, or bundles bearing brand name and identification of manufacturer or supplier.
- B. Store materials inside under cover and keep them dry and protected against damage from weather, direct sunlight, surface contamination, corrosion, construction traffic, and other causes. Stack gypsum panels flat to prevent sagging.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Limitations: Comply with ASTM C 840 requirements or gypsum board manufacturer's written recommendations, whichever are more stringent.

### **PART 2 - PRODUCTS**

#### **2.01 STEEL PARTITION AND SOFFIT FRAMING:**

- A. Components, General: As follows:
  - 1. Comply with ASTM C 754 for conditions indicated.
  - 2. Steel Sheet Components: Complying with ASTM C 645 requirements for metal and with manufacturer's standard corrosion-resistant zinc coating.
- B. Steel Studs and Runners: ASTM C 645, non-loadbearing
  - 1. Minimum Base Metal Thickness: 20 ga.
  - 2. Depth: As shown.
- C. Deep-Leg Deflection Track: ASTM C 645 top runner with 2-inch- deep flanges.
- D. Proprietary Deflection Track: Steel sheet top runner manufactured to prevent cracking of gypsum board applied to interior partitions resulting from deflection of structure above; in thickness indicated for studs and in width to accommodate depth of studs.
- E. Proprietary Firestop Track: Top runner manufactured to allow partition heads to expand and contract with movement of the structure while maintaining continuity of fire-resistance-rated assembly indicated; in thickness not less than indicated for studs and in width to accommodate depth of studs.
- F. Flat Strap and Backing Plate: Steel sheet for blocking and bracing in length and width indicated.
- G. Cold-Rolled Channel Bridging: 0.0538-inch bare steel thickness, with minimum 1/2-inch- wide flange.
  - 1. Depth: As shown.
  - 2. Clip Angle: 1-1/2 by 1-1/2 inch, 0.068-inch-thick, galvanized steel.
- H. Hat-Shaped, Rigid Furring Channels: ASTM C 645.
- I. Resilient Furring Channels: 1/2-inch deep, steel sheet members designed to reduce sound transmission.

- J. Cold-Rolled Furring Channels: 0.0538-inch bare steel thickness, with minimum 1/2-inch-wide flange.
  - 1. Depth: As indicated.
  - 2. Furring Brackets: Adjustable, corrugated-edge type of steel sheet with minimum bare steel thickness of 0.0312 inch.
  - 3. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.0625-inch diameter wire, or double strand of 0.0475-inch diameter wire.
- K. Z-Shaped Furring: With slotted or nonslotted web, face flange of 1-1/4 inches, wall attachment flange of 7/8 inch, minimum bare metal thickness of 0.0179 inch, and depth required to fit insulation thickness indicated.
- L. Fasteners for Metal Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.

## **2.02 INTERIOR GYPSUM WALLBOARD**

- A. Panel Size: Provide in maximum lengths and widths available that will minimize joints in each area and correspond with support system indicated.
- B. Gypsum Wallboard: ASTM C 36.
  - 1. Regular Type: Regular-type gypsum panels are also available in 1/4- and 3/8-inch (6.4- and 9.5-mm) thicknesses for limited applications.
    - a. Thickness: 1/2 inch, unless otherwise indicated.
    - b. Long Edges: Tapered and featured (rounded or beveled) for prefilling.
    - c. Location: As indicated.
  - 2. Type X:
    - a. Thickness: 5/8 inch.
    - b. Long Edges: Tapered and featured (rounded or beveled) for prefilling.
    - c. Location: Where required for fire-resistance-rated assembly or as indicated
- C. Flexible Gypsum Wallboard: ASTM C 36, manufactured to bend to fit tight radii and to be more flexible than standard regular-type panels of the same thickness.
  - 1. Thickness: 1/4 inch.
  - 2. Long Edges: Tapered.
  - 3. Location: As indicated
- D. Sag-Resistant Gypsum Wallboard: ASTM C 36, manufactured to have more sag resistance than regular-type gypsum board.
  - 1. Thickness: 1/2 inch.
  - 2. Long Edges: Tapered.
  - 3. Location: Ceiling surfaces
- E. Proprietary, Special Fire-Resistive Type: ASTM C 36, having improved fire resistance over standard Type X.
- F. Foil-Backed Gypsum Wallboard: ASTM C 36.
- G. Proprietary Abuse-Resistant Gypsum Wallboard: ASTM C 36, manufactured to produce greater resistance to surface indentation and through-penetration than standard gypsum panels.

### **2.03 EXTERIOR GYPSUM PANELS FOR CEILINGS AND SOFFITS**

- A. Panel Size: Provide in maximum lengths and widths available that will minimize joints in each area and correspond with support system indicated.
- B. Exterior Gypsum Soffit Board: ASTM C 931/C 931M, with manufacturer's standard edges.
  - 1. Core: ½ inch, regular type or 5/8 inch Type X.
- C. Glass-Mat Gypsum Sheathing Board: ASTM C 1177/C 1177M.

### **2.04 TILE BACKING PANELS**

- A. Panel Size: Provide in maximum lengths and widths available that will minimize joints in each area and correspond with support system indicated.
- B. Cementitious Backer Units: ASTM A 118.9

### **2.05 TRIM ACCESSORIES:**

- A. Interior Trim: ASTM C 1047
  - 1. Material: , manufacturer's standard metal trim, formed from galvanized or aluminum-coated steel, or rolled zinc.
  - 2. Shapes:
    - a. Cornerbead: Use at outside corners.
    - b. Bullnose Bead: Use where indicated.
    - c. LC-Bead (J Bead): Use at exposed panel edges.
    - d. L-Bead: Use where indicated.
    - e. U-Bead: Use where indicated.
    - f. Expansion Joint Use where indicated.
    - g. Curved-Edge Cornerbead: With notched or flexible flanges; use at curved openings.
- B. Exterior Trim: ASTM C 1047.
  - 1. Material: Hot-dip galvanized steel sheet or rolled zinc.
  - 2. Shapes:
    - a. Cornerbead: Use at outside corners.
    - b. LC-Bead (J-Bead): Use at exposed panel edges.
    - c. Expansion (Control) Joint.

### **2.06 JOINT TREATMENT MATERIALS:**

- A. General: Comply with ASTM C 475.
- B. Joint Tape:
  - 1. Interior Gypsum Wallboard: Paper.
  - 2. Exterior Gypsum Soffit Board: Paper.
  - 3. Glass-Mat Gypsum Sheathing Board: 10-by-10 glass mesh.
- C. Joint Compound for Interior Gypsum Wallboard: For each coat use formulation that is compatible with other compounds applied on previous or for successive coats.
- D. Joint Compound for Exterior Applications:

1. Exterior Gypsum Soffit Board: Use setting-type taping and setting-type, sandable topping compounds.
  2. Glass-Mat Gypsum Sheathing Board: As recommended by manufacturer.
- E. Joint Compound for Tile Backing Panel:
1. Cementitious Backer Units: As recommended by manufacturer

## **2.07 ACOUSTICAL SEALANT:**

- A. Acoustical Sealant for Exposed and Concealed Joints: Nonsag, paintable, nonstaining, latex sealant complying with ASTM C 834 that effectively reduces airborne sound transmission through perimeter joints and openings in building construction.

## **2.08 AUXILIARY MATERIALS**

- A. General : Provide auxiliary materials that comply with referenced installation standards and manufacturer's written recommendations.
- B. Laminating Adhesive: Adhesive or joint compound recommended for directly adhering gypsum panels to continuous substrate.
- C. Steel Drill Screws: ASTM C 1002, unless otherwise indicated
1. Use screws complying with ASTM C 954 for fastening panels to steel members from 0.033 to 0.112 inch thick.
  2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.
- D. Isolation Strip at Exterior Walls:
1. Asphalt-Saturated Organic Felt: ASTM D 226, Type I (No. 15 asphalt felt), nonperforated.
  2. Foam Gasket: Adhesive-backed, closed-cell vinyl foam strips that allow fastener penetration without foam displacement, 1/8 inch thick, in width to suit steel stud size.
- E. Sound Attenuation Blankets: ASTM C 665, Type I (blankets without membrane facing) produced by combining thermosetting resins with mineral fibers manufactured from glass, slag wool, or rock wool.
1. Fire-Resistance-Rated Assemblies: Comply with mineral-fiber requirements of assembly.
- F. Thermal Insulation: As specified in Section 07210.
- G. Vapor Barrier: As specified in Section 07210.

## **2.09 TEXTURE FINISHES**

- A. Primer: As recommended by textured finish manufacturer.
- B. Polystyrene Aggregate Ceiling Finish: Water-based, job-mixed, polystyrene aggregate finish with flame-spread and smoke-developed indices of not more than 25 when tested according to ASTM E 84.

- C. Aggregate Finish: Water-based, job-mixed, aggregated, drying-type texture finish for spray application.
- D. Acoustical Finish: Water-based, chemical-setting or drying-type, job-mixed texture finish for spray application:
  - 1. Application Thickness: 1/2 inch.
  - 2. Fire-Test-Response Characteristics: Indices when tested according to ASTM E 84 as follows:
    - a. Flame Spread: Less than 25.
    - b. Smoke Developed: Less than 450.
  - 3. NRC: 0.55 according to ASTM C 423.

### **PART 3 - EXECUTION**

#### **3.01 EXAMINATION:**

- A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames, cast-in anchors, and structural framing, for compliance with requirements and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.02 INSTALLING STEEL PARTITION AND SOFFIT FRAMING:**

- A. Install tracks (runners) at floors, ceilings, and structural walls and columns where gypsum board assemblies abut other construction.
  - 1. Where studs are installed directly against exterior walls, install asphalt-felt or foam-gasket isolation strip between studs and wall.
- B. Installation Tolerance: Install each steel framing and furring member so fastening surfaces vary not more than 1/8 inch3 mm from the plane formed by the faces of adjacent framing.
- C. Extend partition framing full height to structural supports or substrates above suspended ceilings, except where partitions are indicated to terminate at suspended ceilings. Continue framing over frames for doors and openings and frame around ducts penetrating partitions above ceiling to provide support for gypsum board.
  - 1. Cut studs 1/2 inch13 mm short of full height to provide perimeter relief.
  - 2. For fire-resistance-rated and STC-rated partitions that extend to the underside of floor/roof slabs and decks or other continuous solid-structure surfaces to obtain ratings, install framing around structural and other members extending below floor/roof slabs and decks, as needed to support gypsum board closures and to make partitions continuous from floor to underside of solid structure.
    - a. Terminate partition framing at suspended ceilings where indicated
- D. Install steel studs so flanges point in the same direction and leading edge or end of each panel can be attached to open (unsupported) edges of stud flanges first.
- E. Frame door openings to comply with GA-600 and with gypsum board manufacturer's applicable written recommendations, unless otherwise indicated. Screw vertical studs at jambs to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.
  - 1. Install two studs at each jamb, unless otherwise indicated.

2. Install cripple studs at head adjacent to each jamb stud, with a minimum 1/2-inch clearance from jamb stud to allow for installation of control joint.
  3. Extend jamb studs through suspended ceilings and attach to underside of floor or roof structure above.
  4. Frame openings other than door openings the same as required for door openings, unless otherwise indicated. Install framing below sills of openings to match framing required above door heads.
- F. Z-Furring Members:
1. Erect insulation vertically and hold in place with Z-furring members spaced 24 inches o.c.
  2. Except at exterior corners, securely attach narrow flanges of furring members to wall with concrete stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced 24 inches o.c.
  3. At exterior corners, attach wide flange of furring members to wall with short flange extending beyond corner; on adjacent wall surface, screw-attach short flange of furring channel to web of attached channel. At interior corners, space second member no more than 12 inches from corner and cut insulation to fit.
  4. Until gypsum board is installed, hold insulation in place with 10-inch staples fabricated from 0.0625-inch- diameter, tie wire and inserted through slot in web of member.
- G. Vapor Barrier: Install to comply with requirements specified in Section 07210.

### **3.03 APPLYING AND FINISHING PANELS, GENERAL:**

- A. Gypsum Board Application and Finishing Standards: ASTM C 840 and GA-216.
- B. Install sound attenuation blankets before installing gypsum panels, unless blankets are readily installed after panels have been installed on one side.
- C. Install ceiling board panels across framing to minimize the number of abutting end joints and to avoid abutting end joints in the central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member.
- D. Install gypsum panels with face side out. Butt panels together for a light contact at edges and ends with not more than 1/16 inch of open space between panels. Do not force into place.
- E. Locate edge and end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Do not make joints other than control joints at corners of framed openings.
- F. Attach gypsum panels to steel studs so leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.
- G. Attach gypsum panels to framing provided at openings and cutouts.
- H. Do not attach gypsum panels across the flat grain of wide-dimension lumber, including floor joists and headers. Float gypsum panels over these members using resilient channels, or provide control joints to counteract wood shrinkage.

- I. Form control and expansion joints with space between edges of adjoining gypsum panels.
- J. Cover both faces of steel stud partition framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chases braced internally.
- K. Unless concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. 0.7 sq. m in area.
- L. Fit gypsum panels around ducts, pipes, and conduits.
- M. Where partitions intersect open concrete coffers, concrete joists, and other structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by coffers, joists, and other structural members; allow 1/4- to 3/8-inch- wide joints to install sealant.
- N. Isolate perimeter of non-load-bearing gypsum board partitions at structural abutments, except floors. Provide 1/4- to 1/2-inch- wide spaces at these locations, and trim edges with U-bead edge trim where edges of gypsum panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.
- O. Floating Construction: Where feasible, including where recommended in writing by manufacturer, install gypsum panels over wood framing, with floating internal corner construction.
- P. STC-Rated Assemblies: Seal construction at perimeters, behind control and expansion joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both faces of partitions at perimeters and through penetrations. Comply with ASTM C 919 and manufacturer's written recommendations for locating edge trim and closing off sound-flanking paths around or through gypsum board assemblies, including sealing partitions above acoustical ceilings.
- Q. Space fasteners in gypsum panels according to referenced gypsum board application and finishing standard and manufacturer's written recommendations.
  - 1. Space screws a maximum of 12 inches o.c. for vertical applications.
- R. Space fasteners in panels that are tile substrates a maximum of 8 inches o.c.

### **3.04 PANEL APPLICATION METHODS:**

- A. Single-Layer Application:
  - 1. On ceilings, apply gypsum panels before wall/partition board application to the greatest extent possible and at right angles to framing, unless otherwise indicated.
  - 2. On partitions/walls, apply gypsum panels vertically (parallel to framing), unless otherwise indicated or required by fire-resistance-rated assembly, and minimize end joints.
    - a. Stagger abutting end joints not less than one framing member in alternate courses of board.
    - b. At stairwells and other high walls, install panels horizontally, unless otherwise indicated or required by fire-resistance-rated assembly.
  - 3. On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.

- B. Multilayer Application on Ceilings: Apply gypsum board indicated for base layers before applying base layers on walls/partitions; apply face layers in same sequence. Apply base layers at right angles to framing members and offset face-layer joints 1 framing member, 16 inches minimum, from parallel base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly.
- C. Multilayer Application on Partitions/Walls: Apply gypsum board indicated for base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.
1. Z-Furring Members: Apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.
- D. Single-Layer Fastening Methods: Apply gypsum panels to supports with steel drill screws.
- E. Multilayer Fastening Methods: Fasten base layers and face layers separately to supports with screws.
- F. Laminating to Substrate: Where gypsum panels are indicated as directly adhered to a substrate (other than studs, joists, furring members, or base layer of gypsum board), comply with gypsum board manufacturer's written recommendations and temporarily brace or fasten gypsum panels until fastening adhesive has set.
- G. Curved Partitions:
1. Install panels horizontally and unbroken, to the extent possible, across curved surface plus 12-inch/300-mm-long straight sections at ends of curves and tangent to them.
  2. On convex sides of partitions, begin installation at one end of curved surface and fasten gypsum panels to studs as they are wrapped around curve. On concave side, start fastening panels to stud at center of curve and work outward to panel ends. Fasten panels to framing with screws spaced 12 inches o.c.
  3. For double-layer construction, fasten base layer to studs with screws 16 inches o.c. Center gypsum board face layer over joints in base layer, and fasten to studs with screws spaced 12 inches o.c.
- H. Exterior Soffits and Ceilings: Apply exterior gypsum soffit board panels perpendicular to supports, with end joints staggered and located over supports.
1. Install with 1/4-inch open space where panels abut other construction or structural penetrations.
  2. Fasten with corrosion-resistant screws.
- I. Tile Backing Panels:
1. Cementitious Backer Units: ANSI A108.11, at locations indicated to receive tile.
  2. Areas Not Subject to Wetting: Install standard gypsum wallboard panels to produce a flat surface except at showers, tubs, and other locations indicated to receive water-resistant panels.
  3. Where tile backing panels abut other types of panels in the same plane, shim surfaces to produce a uniform plane across panel surfaces.

### **3.05 INSTALLING TRIM ACCESSORIES:**

- A. General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.
- B. Control Joints: Install control joints at locations shown or indicated. Install control joints according to ASTM C 840 and in specific locations approved by the Engineer for visual effect.

### **3.06 FINISHING GYPSUM BOARD ASSEMBLIES:**

- A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.
- B. Prefill open joints, beveled edges, and damaged surface areas.
- C. Apply joint tape over gypsum board joints, except those with trim having flanges not intended for tape.
- D. Gypsum Board Finish Levels: Finish panels to levels indicated below, according to ASTM C 840, for locations indicated:
  - 1. Level 2: Embed tape and apply separate first coat of joint compound to tape, fasteners, and trim flanges where.
  - 2. Level 3: Embed tape and apply separate first and fill coats of joint compound to tape, fasteners, and trim flanges at surfaces receiving textured finish.
- E. Glass-Mat Gypsum Sheathing Board: Finish according to manufacturer's written instructions for use as exposed soffit board.
- F. Cementitious Backer Units: Finish according to manufacturer's written instructions.

### **3.07 APPLYING TEXTURE FINISHES:**

- A. Surface Preparation and Primer: Prepare and apply primer to gypsum panels and other surfaces receiving texture finishes. Apply primer to surfaces that are clean, dry, and smooth.
- B. Texture Finish Application: Mix and apply finish using powered spray equipment, to produce a uniform texture matching approved mockup and free of starved spots or other evidence of thin application or of application patterns.
- C. Prevent texture finishes from coming into contact with surfaces not indicated to receive texture finish by covering them with masking agents, polyethylene film, or other means. If, despite these precautions, texture finishes contact these surfaces, immediately remove droppings and overspray to prevent damage according to texture finish manufacturer's written recommendations.

### **3.08 FIELD QUALITY CONTROL:**

- A. Above-Ceiling Observation: Before Contractor installs gypsum board ceilings, Architect will conduct an above-ceiling observation and report deficiencies in the Work observed. Do not

proceed with installation of gypsum board to ceiling support framing until deficiencies have been corrected.

1. Notify the Engineer in advance of date and time when Project, or part of Project, will be ready for above-ceiling observation.
2. Before notifying the Engineer, complete the following in areas to receive gypsum board ceilings:
  - a. Installation of 80 percent of lighting fixtures, powered for operation.
  - b. Installation, insulation, and leak and pressure testing of water piping systems.
  - c. Installation of air-duct systems.
  - d. Installation of air devices.
  - e. Installation of mechanical system control-air tubing.
  - f. Installation of ceiling support framing.

**END OF SECTION**

## SECTION 09320

### TILE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing ceramic tile, ceramic mosaic tile, quarry tile and marble thresholds, typically in restricted areas as shown.
- B. Related Work Specified Elsewhere:
  - 1. Cast-in-Place Structural Concrete: Section 03300.
  - 2. Seals and Sealants: Section 07900.
  - 3. Paver Tile: Section 09340.

##### 1.02 PERFORMANCE REQUIREMENTS:

- A. Static Coefficient of Friction: For tile installed on walkway surfaces, provide products with the following values as determined by testing identical products per ASTM C1028:
  - 1. Level Surfaces: Minimum 0.6.
  - 2. Ramp Surfaces (slope greater than 1:20): Minimum 0.8.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For each type of tile, mortar, grout, and other products specified. Include recommendations for product application and use.
  - 2. Shop Drawings: For the following:
    - a. Tile patterns and locations.
    - b. Widths, details, and locations of expansion, contraction, control, and isolation joints in tile substrates and finished tile surfaces.
  - 3. Tile Samples for Initial Selection: Manufacturer's color charts consisting of actual tiles or sections of tiles showing the full range of colors, textures, and patterns available for each type and composition of tile indicated. Include Samples of accessories involving color selection.
  - 4. Grout Samples for Initial Selection: Manufacturer's color charts consisting of actual sections of grout showing the full range of colors available for each type of grout indicated.
  - 5. Samples for Verification: Of each item listed below, prepared on Samples of size and construction indicated. Where products involve normal color and texture variations, include Sample sets showing the full range of variations expected.
    - a. Ceramic and Ceramic Mosaic Tile: Three panels of each type and composition of tile and for each color and texture required, 12 inches square, mounted on 16 inches square by 1/4-inch thick hardboard with grouted joints using product complying with specified requirements and approved for completed work in color or colors selected by the Engineer.
    - b. Full-size units of each type of trim and accessory for each color required.
    - c. Quarry Tile: Four standard size units mounted on 16 inches square by 1/4-inch thick hardboard with grouted joints using product complying with specified requirements and approved for completed work in color or colors selected by the Engineer.
    - d. Marble Threshold: Three 12-inch lengths showing range of color, veining and finish.

6. Master Grade Certificates: For each shipment, type, and composition of tile, per ANSI A137.1, bearing TCA-Certification Mark, signed by tile manufacturer and Installer stating type and quality of material. Submit at time of shipment..
7. Product Certificates: Signed by manufacturers certifying that the products furnished comply with requirements.
8. Tile Test Reports: Certified test reports in accordance with ANSI A118.1 through A118.4.

#### **1.04 QUALITY ASSURANCE:**

- A. Codes Regulations, Reference Standards and Specifications:
  1. Comply with the codes and regulations of the jurisdictional authorities.
  2. ADA: Americans with Disabilities Act.
  3. ANSI: A108.1C, A108.5, A108.6, A108.10, A118.1, A118.2, A118.3, A118.4, A118.6, A137.1.
  4. ASTM: A82, A185, C144, C150, C206, C207, C241, C503, C920, C1028, D4397.
  5. FS: UU-B-790.
  6. TCA: Handbook for Ceramic Tile Installation.
- B. Installer Qualifications: Engage an experienced installer who has completed tile installations similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- C. Source Limitations for Tile: Obtain each color, grade, finish, type, composition, and variety of tile from one source with resources to provide products from the same production run for each contiguous area of consistent quality in appearance and physical properties without delaying the Work.
- D. Source Limitations for Setting and Grouting Materials: Obtain ingredients of a uniform quality for each mortar, adhesive, and grout component from a single manufacturer and each aggregate from one source or producer.
- E. Mockups: Before installing floor and wall tile, construct mockups for each form of construction and finish required to verify selections made under Sample submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for completed Work.
  1. Mockups shall be minimum four feet square and in the location as directed by the Engineer.
  2. Notify the Engineer seven days in advance of the dates and times when mockups will be constructed.
  3. Demonstrate the proposed range of aesthetic effects and workmanship.
  4. Obtain the Engineer's approval of mockups before proceeding with final unit of Work.
  5. Approved mockups may become part of the completed Work.

#### **1.05 DELIVERY, STORAGE, AND HANDLING:**

- A. Deliver materials to the site in original unopened containers, clearly labeled with the manufacturer's name, brand designation, type, grade and color. Comply with requirement of ANSI A137.1 for labeling sealed tile packages.
- B. Store materials so as to prevent damage or contamination to materials by water, freezing, foreign matter, and other causes.
- C. Handle materials so as to prevent breakage of containers and damage to materials.

**1.06 PROJECT CONDITIONS:**

- A. Environmental Limitations: Do not start tile work unless ambient temperature of area in which work occurs is at least 50 deg. F and rising and is maintained at not less than 50 deg. F without interruption while work is being done and for at least 72 hours after completion.
- B. Substrate Conditions: Do not start tile work unless surfaces to receive tile are in satisfactory condition. Commencement of tile work constitutes Contractor's acceptance of the subfloor condition in accordance with ANSI A108-AN-2, General Requirements for Subsurfaces.

**1.07 EXTRA MATERIALS:**

- A. Deliver extra materials to Owner. Furnish and store extra materials in locations as directed on pallets and in original containers with protective covering for storage, and are clearly identified with labels describing contents and area of placement.
  - 1. Tile and Trim Units: Furnish quantity of full-size units equal to 5 percent of amount installed, for each type, composition, color, pattern, and size indicated.

**PART 2 - PRODUCTS**

**2.01 PRODUCTS, GENERAL:**

- A. ANSI Ceramic Tile Standard: Provide tile that complies with ANSI A137.1, "Specifications for Ceramic Tile," for types, compositions, and other characteristics indicated.
  - 1. Provide tile complying with Standard Grade requirements, unless otherwise indicated.
- B. ANSI Standards for Tile Installation Materials: Provide materials complying with ANSI standards referenced in "Setting and Grouting Materials" article.
- C. Colors, Textures, and Patterns: Where manufacturer's standard products are indicated for tile, grout, and other products requiring selection of colors, surface textures, patterns, and other appearance characteristics, provide specific products or materials complying with the following requirements:
  - 1. Provide Engineer's selections from manufacturer's full range of colors, textures, and patterns for products of type indicated.
  - 2. Provide tile trim and accessories that match color and finish of adjoining flat tile.
- D. Factory Blending: For tile exhibiting color variations within the ranges selected during Sample submittals, blend tile in the factory and package so tile units taken from one package show the same range in colors as those taken from other packages and match approved Samples.

**2.02 TILE PRODUCTS:**

- A. Unglazed Ceramic Mosaic Floor Tile: Provide factory-mounted flat tile complying with the following requirements:
  - 1. Composition: Porcelain or porcelain with abrasive admixture, as indicated.
  - 2. Module Size: 2 by 2 inches (nominal).
  - 3. Nominal Thickness: 1/4 inch.
  - 4. Face: Plain with cushion edges.
- B. Unglazed Quarry Tile: Provide square-edged flat tile complying with the following requirements:

1. Wearing Surface: Nonabrasive or abrasive aggregate embedded in surface, as indicated.
  2. Facial Dimensions: 6 by 6 inches (nominal).
  3. Thickness: 1/2 inch.
  4. Face: Plain.
- C. Glazed Wall Tile: Provide flat tile complying with the following requirements:
1. Module Size: 4-1/4 by 4-1/4 inches.
  2. Thickness: 5/16 inch.
  3. Face: Plain with cushion edges.
  4. Color: White.
- D. Trim Units: Provide tile trim units to match characteristics of adjoining flat tile and to comply with the following requirements:
1. Size: As indicated, coordinated with sizes and coursing of adjoining flat tile where applicable.
  2. Shapes: As follows, selected from manufacturer's standard shapes:
    - a. Base for Thin-Set Mortar Installations: Straight.
    - b. External Corners for Thin-Set Mortar Installations: Surface bullnose.
    - c. Internal Corners: Field-buttet square corners, except with coved base and cap angle pieces designed to member with stretcher shapes.

### **2.03 STONE THRESHOLDS:**

- A. General: Provide stone thresholds that are uniform in color and finish, fabricated to sizes and profiles indicated to provide transition between tile surfaces and adjoining finished floor surfaces.
1. Fabricate thresholds to heights indicated, but not more than 1/2-inch above adjoining finished floor surfaces, with transition edges beveled on a slope of no greater than 1:2.
- B. Marble Thresholds: Provide marble thresholds complying with ASTM C503 requirements for exterior use and with a minimum abrasive-hardness value (Ha) of 10 per ASTM C241.
1. Provide white, honed marble complying with the Marble Institute of America's Group A requirements for soundness.

### **2.04 SETTING AND GROUTING MATERIALS:**

- A. Portland Cement: ASTM C150, Type I.
- B. Sand: ASTM C144.
- C. Hydrated Lime: ASTM C206 or ASTM C207, Type S.
- D. Water: Potable.
- E. Portland Cement Mortar Installation Materials: Provide materials complying with ANSI A108.1A and as specified below:
1. Cleavage Membrane: Polyethylene sheeting ASTM D4397, 4.0 mils thick.
  2. Reinforcing Wire Fabric: Galvanized, welded wire fabric, 2 by 2 inches by 0.062-inch diameter; comply with ASTM A185 and ASTM A82, except for minimum wire size.
- F. Dry-Set Portland Cement Mortar: ANSI A118.1.

- G. Chemical-Resistant, Water-Cleanable, Ceramic Tile-Setting and -Grouting Epoxy: ANSI A118.3.
  - 1. Provide product capable of resisting continuous and intermittent exposure to temperatures of up to 140 deg F and 212 deg F, respectively, as certified by mortar manufacturer for intended use.
- H. Sand-Portland Cement Grout: ANSI A108.10, composed of white or gray cement and white or colored aggregate as required to produce color indicated.
- I. Dry-Set Grout: ANSI A118.6, color as indicated.
- J. Chemical-Resistant Epoxy Grout: ANSI A118.3, color as indicated.
  - 1. Provide product capable of resisting continuous and intermittent exposure to temperatures of up to 140 deg F and 212 deg F, respectively, as certified by mortar manufacturer for intended use.

#### **2.05 ELASTOMERIC SEALANTS AND BACKUP JOINT FILLER:**

- A. General: Provide manufacturer's standard chemically curing, elastomeric sealants of base polymer and characteristics indicated that comply with applicable requirements of Section 07900.
- B. Colors: Provide colors of exposed sealants to match colors of grout in tile adjoining sealed joints, unless otherwise indicated.
- C. One-Part, Mildew-Resistant Silicone Sealant: ASTM C920; Type S; Grade NS; Class 25; Uses NT, G, A, and, as applicable to nonporous joint substrates indicated, O; formulated with fungicide, intended for sealing interior ceramic tile joints and other nonporous substrates that are subject to in-service exposures of high humidity and temperature extremes.
- D. Multipart, Pourable Urethane Sealant for Use T: ASTM C920; Type M; Grade P; Class 25; Uses T, M, A, and, as applicable to joint substrates indicated, O.
- E. Backup Material: As recommended by sealant manufacturer and as required in Section 07900.
- F. Prime and Joint Cleaner: Use products as recommended by sealant manufacturer.

#### **2.06 MISCELLANEOUS MATERIALS:**

- A. Trowelable Underlayments and Patching Compounds: Latex-modified, portland-cement-based formulation provided or approved by manufacturer of tile-setting materials for installations indicated.
- B. Concrete Leveling Bed: In accordance with Section 03300, Class 3500 concrete, pea gravel course aggregate 1/4-inch minimum to 3/8-inch maximum. Adjust slump with plasticizers to maintain proper water-cement ratio.
- C. Building Paper: FS UU-B-790, red-rosin-sized building, Type I, Style 1B.
- D. Tile Cleaner: A neutral cleaner capable of removing soil and residue without harming tile and grout surfaces, specifically approved for materials and installations indicated by tile and grout manufacturers.

#### **2.07 MIXING MORTARS AND GROUT:**

- A. Mix mortars and grouts to comply with referenced standards and mortar and grout manufacturers' written instructions.
- B. Add materials, water, and additives in accurate proportions.
- C. Obtain and use type of mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures to produce mortars and grouts of uniform quality with optimum performance characteristics for installations indicated.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION:**

- A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.
  - 1. Verify that substrates for setting tile are firm; dry; clean; free from oil, waxy films, and curing compounds; and within flatness tolerances required by referenced ANSI A108 series of tile installation standards for installations indicated.
  - 2. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile has been completed before installing tile.
  - 3. Verify that joints and cracks in tile substrates are coordinated with tile joint locations; if not coordinated, adjust latter in consultation with the Engineer.
- B. Do not proceed with installation until unsatisfactory conditions have been corrected.

### **3.02 PREPARATION:**

- A. Remove coatings, including curing compounds, and other substances that contain soap, wax, oil, or silicone and are incompatible with tile-setting materials by using a terrazzo or concrete grinder, a drum sander, or a polishing machine equipped with a heavy-duty wire brush.
- B. Provide concrete substrates for tile floors installed with dry-set or latex-portland cement mortars that comply with flatness tolerances specified in referenced ANSI A108 series of tile installation standards for installations indicated.
  - 1. Use trowelable leveling and patching compounds per tile-setting material manufacturer's written instructions to fill cracks, holes, and depressions.
  - 2. Remove protrusions, bumps, and ridges by sanding or grinding.
- C. Provide leveling course for masonry or concrete-wall when variation exceeds 1/4-inch in eight feet. Leveling course shall consist of dry-set mortar to which an equal volume of a mixture of one-part portland cement and 1-1/2 parts sand has been added. Apply leveling course to maximum thickness of 1/4-inch.
- D. Blending: For tile exhibiting color variations within the ranges selected during Sample submittals, verify that tile has been blended in the factory and packaged so tile units taken from one package show the same range in colors as those taken from other packages and match approved Samples. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.

### **3.03 INSTALLATION, GENERAL:**

- A. ANSI Tile Installation Standards: Comply with parts of ANSI A108 series of tile installation standards in "Specifications for Installation of Ceramic Tile" that apply to types of setting and grouting materials and to methods indicated in ceramic tile installation schedules.
- B. TCA Installation Guidelines: TCA's "Handbook for Ceramic Tile Installation." Comply with TCA installation methods indicated in ceramic tile installation schedules.
- C. Coordinate tile work with work of other trades.
- D. Extend tile work into recesses and under or behind equipment and fixtures to form a complete covering without interruptions, unless otherwise indicated. Terminate work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.
- E. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built-in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.
- F. Jointing Pattern: Lay tile in grid pattern, unless otherwise indicated. Align joints when adjoining tiles on floor, base, walls, and trim are the same size. Lay out tile work and center tile fields in both directions in each space or on each wall area. Adjust to minimize tile cutting. Provide uniform joint widths, unless otherwise indicated.
  - 1. For tile mounted in sheets, use plastic spacers to make joints between tile sheets the same width as joints within tile sheets so joints between sheets are not apparent in finished work.

#### **3.04 FLOOR TILE INSTALLATION:**

- A. General: Install floor tile by the portland cement mortar method in accordance with ANSI A108.1C.
- B. Tile Type: Unglazed ceramic mosaic tile and quarry tile.
- C. Setting Bed and Grout: ANSI A108.1C with the following mortar and grout:
  - 1. Dry-set portland cement mortar.
  - 2. Dry-set grout.
- D. Joint Widths: Install tile on floors joint widths as recommended by the tile manufacturer.
- E. Grout: Dry-set grout in accordance with ANSI A108.10.
- F. Where depression is not provided for mortar setting bed, install floor tile by the epoxy method in accordance with ANSI A108.6.

#### **3.05 WALL TILE INSTALLATION:**

- A. General: Install wall tile by the dry-set mortar method in accordance with ANSI A108.5.
- B. Tile Type: Glazed wall tile.
- C. Setting Bed and Grout: ANSI A108.5 with the following mortar and grout:
  - 1. Dry-set portland cement mortar.
  - 2. Dry-set grout.
- D. Joint Widths: Install tile on floors joint widths as recommended by the tile manufacturer.

- E. Grout: Dry-set grout in accordance with ANSI A108.10.
- F. Where inside corners are shown as flat tiles, make corner joint a sealant joint as specified for expansion joints below.

**3.06 STONE THRESHOLD INSTALLATION:**

- A. Stone Thresholds: Install stone thresholds at locations indicated; set in same type of setting bed as abutting field tile, unless otherwise indicated.
  - 1. Set thresholds in latex-portland cement mortar for locations where mortar bed would otherwise be exposed above adjacent nontile floor finish.

**3.07 EXPANSION AND CONTROL JOINT INSTALLATION:**

- A. Provide expansion and control joints around floor perimeters, at interior corners of tiled walls, in tile surfaces directly above joints in concrete substrates and where recommended by the TCA Handbook for Ceramic Tile Installation.
- B. Do not saw-cut joints after installing tiles.
- C. Install removable divider strips of the same depth as the finished tile system, including setting bed, to keep sealant joints free of setting bed, mortar and grout. Remove strips after grouting and curing operations in order to install sealant.
- D. Install and cure sealant in accordance with manufacturer's instructions. Use primer unless sealant manufacturer recommends against priming.

**3.08 CLEANING AND PROTECTING:**

- A. Cleaning: On completion of placement and grouting, clean tile surfaces with warm water and washing compound in accordance with recommendations of tile manufacturer. Sponge and wash tile thoroughly and polish with clean dry cloths.
  - 1. The use of acid or acid cleaners on tile is prohibited.
- B. Finished Tile Work: Leave finished installation clean and free of cracked, chipped, broken, unbonded, and otherwise defective tile work.
- C. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure tile is without damage or deterioration at the time of Substantial Completion.
  - 1. When recommended by tile manufacturer, apply a protective coat of neutral protective cleaner to completed tile walls and floors. Protect installed tile work with building paper taped to tile to prevent staining, damage, and wear. Lay board walkways on floors to be used as passageways.
  - 2. Prohibit foot and wheel traffic from tiled floors for at least seven days after grouting is completed.
- D. Before final inspection, remove protective coverings and rinse neutral cleaner from tile surfaces.

**END OF SECTION**

## SECTION 09340

### PAVER TILE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing paver tiles, typically in patron areas as shown. These tiles are noted on Drawings as:
  - 1. Paver tile.
  - 2. Truncated dome quarry tile.
- B. Related Work Specified Elsewhere:
  - 1. Concrete overlay: Section 03300.
  - 2. Expansion joint assembly: Sections 05810 and 05811.
  - 3. Sealant backup material and sealant joint installation requirements: Section 07900.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ANSI: A108-AN-2, A108.1C, A108.4, A108.5, A108.6, A108.10, A118.3, A118.4, A118.6, A136.1, A137.1.
  - 3. AASHTO: M153.
  - 4. ASTM: A185, C171, C501, C373, C485, C499, C836, C920, C1028.
  - 5. TCA: TCA Handbook for Ceramic Tile Installation.
  - 6. Americans With Disabilities Act (ADA).

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: Manufacturer's product data for each product required. Include recommendations for product application and use.
  - 2. Shop Drawings:
    - a. Include layout of paver tile, locations and sizes of expansion joints and control joints, details of installation, materials manufacturers' catalogs, recommendations and applicable specifications.
    - b. Indicate limits of ramps (surfaces with a slope greater than 1:20) and areas where tile with abrasive aggregate is required according to its coefficient of friction.
  - 3. Samples:
    - a. Three 24-inch square panels showing paver tile, bonding method, joint materials, expansion-joint sealants, color and texture.
    - b. Demonstration sample of platform edge paver installation where directed, minimum six feet wide by 16 feet long along platform edge granite. Approved sample may be used in work.
  - 4. Certification:
    - a. Master Grade Certificate: ANSI A137.1.
    - b. Mortar and grout manufacturer's certification that materials furnished are suitable for intended use and meet specified requirements.
    - c. Certified test reports by approved independent testing facility for specified properties and tests.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver materials to site in original unopened moisture proof containers clearly labeled indicating manufacturer's name, type, grade and color.
- B. Provide mortar and grout materials with labels certifying compliance with specifications and that they are of the types recommended by manufacturer for this application.
- C. Store materials on pallets so as to prevent damage and moisture penetration.
- D. Handle materials so as to prevent breakage of containers and damage to materials.

#### 1.05 JOB CONDITIONS:

- A. Environmental Conditions:
  - 1. Do not start paver-tile work unless the ambient temperature of the area in which the work occurs is at least 50F and rising and is maintained at not less than 50F without interruption while the work is being done and for at least 72 hours after completion of the work.
- B. Substrate Conditions:
  - 1. Do not start paver-tile work unless surfaces to receive tile are in satisfactory condition.
  - 2. Commencement of paver-tile work constitutes Contractor's acceptance of the subfloor condition in accordance with ANSI A108-AN-2, General Requirement for Subsurfaces.

### PART 2 - PRODUCTS

#### 2.01 MATERIALS:

- A. Paver Tile:
  - 1. Standard Grade, ANSI A137.1, Section 5.3, Paver Tile.
  - 2. Types: Natural clay paver tile as follows:
    - a. Hexagonal: Either nominal eight inches or nominal six inches across flats by 3/4 inch thick; flat face, cushion (not square) edges.
    - b. Base: 8-inch by 12-inch by 3/4 inch thick.
    - c. Stair treads and risers: Bullnose tread, sizes as shown.
  - 3. Face of tile: Unglazed, slip-resistant wearing surface integral with body of tile. Furnish tiles with or without embedded abrasive aggregate, as required to provide the specific minimum slip resistance specified below for each area of work.
  - 4. Backs: Raised pattern.
  - 5. Compressive strength: 8,000-psi, minimum.
  - 6. Slip Resistance: Minimum static coefficients of friction as required by the ADA, tested in accordance with ASTM C1028, but not less than the following:
    - a. Level surfaces: 0.60 wet and dry.
    - b. Ramps (slope greater than 1:20): 0.80 wet and dry.
    - c. Stair treads: 0.80 wet and dry.
  - 7. Color and flash: Deep red color with factory-applied flash, matching samples on file with the Engineer. Make flashing natural in appearance across each paver unit; not linear, paint-like, or streaked; and with coverage varying from 10-percent to 50-percent of unit face area.
  - 8. Abrasive hardness: 50 or greater, ASTM C501.
  - 9. Water absorption: 0.5 percent to 3.0 percent, ASTM C373
  - 10. Dimensional tolerances:
    - a. Thickness: 0.040 inch maximum range of thickness, ASTM C499.

- b. Facial dimensions: 3.0 percent maximum facial-dimension variation, maximum 1.5-percent range of facial dimension variation; ASTM C499.
  - c. Warpage: 1.0 percent maximum along any edge, 0.75-percent maximum on either diagonal; ASTM C485.
- B. Truncated Dome Quarry Tile:
- 1. Standard Grade, ANSI A137.1, Section 5.3, Paver Tile (not quarry tile).
  - 2. Types: Natural clay paver tile as follows:
    - a. Domed form: Re-pressed tile to produce ADA-compliant raised domes.
      - 1) Nominal six-inch square by 1/2-inch thick at base of domes; square edges; actual measurement maximum 5-3/4 inch by 5-3/4 inch.
      - 2) Produce two projecting dome patterns, Style A and Style B, which are required to make a consistent ADA-required pattern for the detectable warning surface as shown.
    - b. Flat form: Nominal six-inch square tile by 1/2-inch thick; flat face, square edges; actual measurement maximum 5-3/4 inch by 5-3/4 inch.
  - 3. Face of tile: Unglazed, slip-resistant wearing surface integral with body of tile. Furnish tiles with or without embedded abrasive aggregate, as required to provide the specific minimum slip resistance specified below for each area of work.
  - 4. Backs: Raised pattern.
  - 5. Compressive strength: 8,000-psi, minimum.
  - 6. Slip Resistance: Minimum static coefficients of friction as required by the ADA, tested in accordance with ASTM C1028, but not less than the following:
    - a. Level surfaces: 0.60 wet and dry.
  - 7. Color and flash: Deep red color with factory-applied flash, matching samples on file with the Engineer. Make flashing natural in appearance across each paver unit; not linear, paint-like, or streaked; and with coverage varying from 10-percent to 50-percent of unit face area.
  - 8. Abrasive hardness: 50 or greater, ASTM C501.
  - 9. Water absorption: 0.5 percent to 3.0 percent, ASTM C373
  - 10. Dimensional tolerances:
    - a. Thickness: 0.040 inch maximum range of thickness, ASTM C499.
    - b. Facial dimensions: 3.0 percent maximum facial-dimension variation, maximum 1.5-percent range of facial dimension variation; ASTM C499.
    - c. Warpage: 1.0 percent maximum along any edge, 0.75-percent maximum on either diagonal; ASTM C485.
- C. Tile Mortar:
- 1. Type 1: Latex-portland cement mortar, ANSI A118.4.
  - 2. Type 2 (polyurethane adhesive): One-part or two-part polyurethane adhesive for exterior use, complying with the requirements of ASTM C836 and ANSI A136.1, with the following additional minimum requirements:
    - a. Shear strength, conditioned, dry; ANSI A136.1: 80 psi, no bond breakage.
    - b. Shear strength, conditioned, after water immersion; ANSI A136.1: 90 psi, no bond breakage.
    - c. Shear strength after accelerated aging; ANSI A136.1: 150 psi, no bond breakage.
    - d. Tensile bond strength: 350 psi minimum, for adhesive and for cohesive bond failure.
    - e. Viscosity: Non-sag, trowelable. If necessary to maintain viscosity at higher ambient temperatures, provide thickening agent which will not reduce required properties below the requirements.
    - f. Flammability when cured: Noncombustible.
    - g. Pot life: 60 minutes.
    - h. Primer: As recommended by manufacturer.

- i. Sources: Subject to compliance with requirements, use one of the following or equal:
  - 1) FX-552 Tile Adhesive by Fox Industries, Baltimore, MD, 301/243-8856.
  - 2) Hydroment Ultra-Set by Bostik Division of Emhart, Huntington Valley, PA, 800/523-6530.
  - 3) Planicrete-W by MAPEI U.S.A., Elk Grove Village, IL, 800/426-2734.
- D. Epoxy Mortar and Grout: ANSI A118.3.
- E. Tile Grout:
  - 1. Latex-portland-cement grout, ANSI A118.6.
  - 2. Commercial portland-cement grout, presanded and pigmented. For narrow joints, grade sand to maximum sieve size as required to ensure full joints.
  - 3. Latex manufactured or recommended by mortar and grout manufacturer; included in factory dry-mix or field-mixed with gauging liquid.
  - 4. Color matching color of paver tile.
- F. Polyurethane Sealant:
  - 1. ASTM C920, Type M, Grade P or Grade NS as required for slope, Class 25, Use T.
  - 2. Color matching grout color when moist.
  - 3. Primer and joint cleaner: Use products recommended by sealant manufacturer, unless sealant manufacturer recommends against using primer and joint cleaner.
- G. Sealant Backup Material: As recommended by the sealant manufacturer, and as required in Section 07900.
- H. Expansion Joint Assembly: Sections 05810 and 05811.
- I. Premolded Expansion-Joint Filler: AASHTO M153, Type I.
- J. Concrete Overlay: Section 03300, Class 5000 concrete, pea gravel course aggregate 1/4-inch minimum to 3/8-inch maximum.
- K. Mortar Bed for Bases: ANSI A108.1C.
- L. Welded Steel-Wire Fabric: ASTM A185, size as shown.
- M. Bond Breaker: Polyethylene sheeting, ASTM C171, minimum 0.004-inch thick.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. General Requirements:
  - 1. Saw-cut paver tiles; breaking is prohibited.
  - 2. Cutting domed tiles:
    - a. Plan layout of tiles to avoid cuts through domes of domed tiles to the greatest extent possible. If domes are cut grind the remaining area around the domes flush with the flat face of the tiles.
  - 3. Install paver tile on level surfaces and ramps to meet specified static coefficients of friction.
  - 4. Lay out work in advance for accurate spacing of surface bond patterns with uniform joint widths and for accurate locating of openings and movement-type joints.

5. Set truncated dome tiles, both domed and flat forms, with plastic joint spacers, except where such tiles are factory premounted at correct pattern and uniform spacing. Use two spacers along each side of a tile when field-setting. Remove spacers after mortar has fully cured, immediately prior to grouting.
  6. Use grout of moist but stiff consistency, not a slurry. At narrow joints 1/4-inch and less, fill joints in two or more layers from bottom to top, applied before each layer cures, tooling each layer to compact grout and eliminate voids. At wider joints, fill in layers where needed and tool thoroughly to compact grout and prevent voids.
  7. At sealant joints, execute work in accordance with Section 07900.
- B. Latex Portland-Cement Mortar Method:
1. Use for installation of paver-tile only in fully enclosed areas without exposure to weather, such as below-grade platforms and mezzanines except where epoxy mortar method is required.
  2. TCA Handbook Method F102 and ANSI A108.5, using tile mortar Type 1.
  3. Obtain 100-percent contact with raised pattern back of tile with mortar by applying not less than 1/32-inch thick layer of mortar on back of each tile prior to placement in freshly notched mortar.
  4. Grout installation: Use tile grout, ANSI A108.10.
- C. Epoxy Mortar Method, ANSI A108.6:
1. Use for installation on metal surfaces.
  2. Follow mortar manufacturer's recommendations.
- D. Polyurethane Adhesive Method:
1. Use for installation of paver tile work wholly or partly exposed to weather, except where epoxy mortar method is required.
  2. TCA Handbook Method F102-98 and ANSI A108.4, using tile mortar Type 2 and as follows, except as otherwise necessary to comply with the printed instructions of the polyurethane-adhesive manufacturer.
    - a. Prime substrate surface in accordance with manufacturer's instructions before applying polyurethane adhesive. Primer is required unless manufacturer provides written certification recommending against priming.
    - b. Allow primer to dry for 12 hours before applying polyurethane adhesive, unless otherwise recommended in writing by manufacturer.
    - c. Use the manufacturers recommended filler in the polyurethane adhesive so as to thicken adhesive sufficiently to accomplish the required application and also to accomplish filling the raised pattern back of tile with adhesive prior to placement. Adjust quantity of filler for the ambient temperature as instructed by manufacturer of adhesive.
    - d. Obtain 100 percent coverage of substrate with the adhesive, which also functions as a membrane waterproofing, in accordance with ANSI A108.4. Use no more mortar than is necessary to obtain adhesion and coating of substrate. Remove excess mortar between tiles and from sides of joints to accommodate grouting for full depth of tile.
    - e. Before allowing pedestrian traffic, allow set tiles to cure for 24 hours in temperatures between 60F and 90F. At temperatures between 50F and 60F, allow 72 hours.
  3. Grout installation: Use tile grout; ANSI A108.10.
- E. Portland Cement Mortar Bed Method:
1. Use for installation of paver tile base and wall finish.
  2. TCA Handbook Method W221-98 and ANSI A108.1C and A108.10.
  3. Back-butter tile with bond coat before setting.

**3.02 MAINTENANCE MATERIALS:**

- A. Furnish one-percent extra paver tile of each type and style.
- B. Store tile in original containers, clearly marked as to contents and area of placement, in location directed.

**END OF SECTION**

## SECTION 09511

### ACOUSTICAL PANEL CEILINGS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing lay-in acoustical panels and exposed suspension systems.
- B. Related Work Specified Elsewhere:
  - 1. Acoustical Snap-In Metal Pan Ceilings: Section 09513.

##### 1.02 DEFINITIONS:

- A. CAC: Ceiling Attenuation Class.
- B. LR: Light Reflectance coefficient.
- C. NRC: Noise Reduction Coefficient.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For each type of product specified provide manufacturer's printed product information including maintenance information.
  - 2. Coordination Drawings: Reflected ceiling plans drawn to scale and coordinating penetrations and ceiling-mounted items. Show the following:
    - a. Ceiling suspension system members.
    - b. Method of attaching suspension system hangers to building structure.
    - c. Ceiling-mounted items including light fixtures; air outlets and inlets; speakers; sprinklers; and special moldings at walls, column penetrations, and other junctures of acoustical ceilings with adjoining construction.
    - d. Minimum Drawing Scale: 1/8 inch = 1 foot.
  - 3. Samples for Initial Selection: Manufacturer's color charts consisting of actual acoustical panels or sections of acoustical panels, suspension systems, and moldings showing the full range of colors, textures, and patterns available for each type of ceiling assembly indicated.
  - 4. Samples for Verification: Full-size units of each type of ceiling assembly indicated; in sets for each color, texture, and pattern specified, showing the full range of variations expected in these characteristics. Provide three of each type.
    - a. Full-size samples of each acoustical panel type, pattern, and color.
    - b. Set of 12-inch-long samples of exposed suspension system members, including moldings, for each color and system type required.
    - c. Fasteners: Each type.
    - d. Accessories.
  - 5. Product Test Reports: Indicate compliance of acoustical panel ceilings and components with requirements based on comprehensive testing of current products.

##### 1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of the jurisdictional authorities.

2. ASTM: A635, A641, B633, C635, CC636, 834, E84, E90, E488, E795, E1190, E1264.
  3. Cisca: Ceiling Systems Handbook.
  4. NAAMM: Metal Finishes Manual for Architectural and Metal Products.
- B. Installer Qualifications: Engage an experienced installer who has completed acoustical panel ceilings similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- C. Source Limitations for Ceiling Units: Obtain each acoustical ceiling panel from one source with resources to provide products of consistent quality in appearance and physical properties without delaying the Work.
- D. Source Limitations for Suspension System: Obtain each suspension system from one source with resources to provide products of consistent quality in appearance and physical properties without delaying the Work.
- E. Fire-Test-Response Characteristics: Provide acoustical panel ceilings that comply with the following requirements:
1. Fire-response tests were performed by UL, ITS/Warnock Hersey, or another independent testing and inspecting agency that is acceptable to authorities having jurisdiction and that performs testing and follow-up services.
  2. Surface-burning characteristics of acoustical panels comply with ASTM E1264 for Class A materials as determined by testing identical products per ASTM E84.
  3. Products are identified with appropriate markings of applicable testing and inspecting agency.

#### **1.05 DELIVERY, STORAGE, AND HANDLING:**

- A. Deliver acoustical panels and suspension system components to Project site in original, unopened packages, clearly labeled with the manufacturer's name, brand designation, specification number, type, class and ratings as applicable.
- B. Store acoustical panels and suspensions system components in a fully enclosed space where they will be protected against damage from moisture, direct sunlight, surface contamination, and other causes.
- C. Before installing acoustical panels, permit them to reach room temperature and a stabilized moisture content.
- D. Handle acoustical panels carefully to avoid chipping edges or damaging units in any way.

#### **1.06 PROJECT CONDITIONS:**

- A. Environmental Limitations: Do not install acoustical panel ceilings until spaces are enclosed and weatherproof, wet-work in spaces is complete and dry, and work above ceilings is complete. Maintain temperature of 70 deg F minimum and relative humidity of 55-percent maximum in spaces in which acoustical panel work is being done.

#### **1.07 COORDINATION:**

- A. Coordinate layout and installation of acoustical panels and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

## **1.08 EXTRA MATERIALS:**

- A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.
  - 1. Acoustical Ceiling Units: Full-size units equal to 5.0 percent of amount installed.
  - 2. Suspension System Components: Quantity of each exposed component equal to 2.0 percent of amount installed.

## **PART 2 - PRODUCTS:**

### **2.01 ACOUSTICAL PANELS, GENERAL:**

- A. Acoustical Panel Standard: Provide manufacturer's standard panels of configuration indicated that comply with ASTM E1264 classifications as designated by types, patterns, acoustical ratings, and light reflectances, unless otherwise indicated.
  - 1. Mounting Method for Measuring Noise Reduction Coefficient: Type E-400; plenum mounting in which face of test specimen is 15-3/4 inches away from test surface per ASTM E795.

### **2.02 METAL SUSPENSION SYSTEMS, GENERAL:**

- A. Metal Suspension System Standard: Provide manufacturer's standard direct-hung metal suspension systems of types, structural classifications, and finishes indicated that comply with applicable ASTM C635 requirements.
- B. Finishes and Colors, General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes. Provide manufacturer's standard factory-applied finish for type of system indicated.
- C. Attachment Devices: Size for five times design load indicated in ASTM C635, Table 1, Direct Hung, unless otherwise indicated.
  - 1. Cast-in-Place and Post-installed Anchors in Concrete: Anchors of type and material indicated below, with holes or loops for attaching hangers of type indicated and with capability to sustain, without failure, a load equal to five times that imposed by ceiling construction, as determined by testing per ASTM E488, conducted by a qualified testing and inspecting agency.
    - a. Type: Cast-in-place anchors.
    - b. Type: Post-installed expansion anchors.
    - c. Corrosion Protection: Carbon-steel components zinc plated to comply with ASTM B633, Class Fe/Zn 5 (0.005 mm) for Class SC service condition (mild).
  - 2. Post-installed Powder-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hangers of type indicated, and with capability to sustain, without failure, a load equal to 10 times that imposed by ceiling construction, as determined by testing per ASTM E1190, conducted by a qualified testing and inspecting agency.
- D. Wire Hangers, Braces, and Ties: Provide wires complying with the following requirements:
  - 1. Zinc-Coated Carbon-Steel Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper.
  - 2. Size: Select wire diameter so its stress at five times hanger design load (ASTM C635, Table 1, Direct Hung) will be less than yield stress of wire, but provide not less than 12 gauge.

- E. Sheet-Metal Edge Moldings and Trim: Type and profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that fit acoustical panel edge details and suspension systems indicated; formed from sheet metal of same material and finish as that used for exposed flanges of suspension system runners. Provide moldings with exposed flange of the same width as exposed runner.
- F. Metal Finish: Baked-Enamel Finish. Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-enamel finish consisting of prime coat and thermosetting topcoat, with not less than 1.0-mil dry film thickness for topcoat. Comply with paint manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 2.0 mils.
  - 1. Color and Gloss: Matte white or as selected by the Engineer from manufacturer's full range of colors and glosses.

### **2.03 ACOUSTICAL SEALANT:**

- A. Acoustical Sealant for Exposed and Concealed Joints: Manufacturer's standard nonsag, paintable, nonstaining latex sealant complying with ASTM C834 and the following requirements:
  - 1. Product is effective in reducing airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E90.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION:**

- A. Examine substrates and structural framing to which acoustical panel ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage, and other conditions affecting performance of acoustical panel ceilings.
  - 1. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.02 PREPARATION:**

- A. Coordination: Furnish layouts for cast-in-place anchors, clips, and other ceiling anchors whose installation is specified in other Sections.
  - 1. If indicated, furnish cast-in-place anchors and similar devices to other trades for installation well in advance of time needed for coordinating other work.
- B. Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders, and comply with layout shown on reflected ceiling plans.

### **3.03 INSTALLATION:**

- A. General: Install acoustical panel ceilings to comply with publications referenced below per manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."
  - 1. Standard for Ceiling Suspension System Installations: Comply with ASTM C636.
- B. Suspend ceiling hangers from building's structural members and as follows:
  - 1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.

2. Splay hangers only where required to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
  3. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and publications.
  4. Secure wire hangers to ceiling suspension members and to supports above with a minimum of three tight turns. Connect hangers directly either to structures or to inserts, eye screws, or other devices that are secure; that are appropriate for substrate; and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
  5. Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, powder-actuated fasteners, or drilled-in anchors that extend through forms into concrete.
  6. Do not attach hangers to steel deck tabs.
  7. Do not attach hangers to steel roof deck. Attach hangers to structural members.
  8. Space hangers not more than 48 inches o.c. along each member supported directly from hangers, unless otherwise indicated; and provide hangers not more than 6 inches from ends of each member.
- C. Install edge moldings and trim of type indicated at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical panels.
1. Apply acoustical sealant in a continuous ribbon concealed on back of vertical legs of moldings before they are installed.
  2. Screw attach moldings to substrate at intervals not more than 16 inches o.c. and not more than 3 inches from ends, leveling with ceiling suspension system to a tolerance of 1/8 inch in 12 feet. Miter inside and outside corners accurately and connect securely.
  3. Do not use exposed fasteners, including pop rivets, on moldings and trim.
- D. Install suspension system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.
- E. Install acoustical panels with undamaged edges and fitted accurately into suspension system runners and edge moldings. Scribe and cut panels at borders and penetrations to provide a neat, precise fit.
1. For square-edged panels, install panels with edges fully hidden from view by flanges of suspension system runners and moldings.
  2. Install hold-down clips in areas indicated, in areas required by authorities having jurisdiction, and for fire-resistance ratings; space as recommended by panel manufacturer's written instructions, unless otherwise indicated or required.

### **3.04 FIELD QUALITY CONTROL OF POWER-ACTUATED FASTENERS AND POST-INSTALLED ANCHORS:**

- A. Testing Agency: Contractor will engage a qualified independent testing agency to perform field quality-control testing.
- B. Extent and Testing Frequency: Testing will take place in successive stages in areas described below. Proceed with installation of acoustical panel ceilings only after test results for previously installed hangers comply with requirements.
1. Extent of Each Test Area: When installation of ceiling suspension systems on each floor has reached 20 percent completion but no panels have been installed.

2. Within each test area, testing agency will select one of every 10 powder-actuated fasteners and postinstalled anchors used to attach hangers to concrete and will test them for 200 lbf of tension; it will also select one of every two postinstalled anchors used to attach bracing wires to concrete and will test them for 440 lbf of tension.
  3. When testing discovers fasteners and anchors that do not comply with requirements, testing agency will test those anchors not previously tested until 20 consecutively pass and then will resume initial testing frequency.
- C. Testing agency will report test results promptly and in writing to Contractor and Engineer.
  - D. Remove and replace those fasteners and anchors that test results indicate do not comply with specified requirements
  - E. Additional Testing: Where fasteners and anchors are removed and replaced, additional testing will be performed to determine compliance with specified requirements.

**3.05 CLEANING:**

- A. Replace damaged and broken acoustical panels.
- B. Clean exposed surfaces of acoustical panel ceilings, including trim, edge moldings, and suspension system members. Comply with manufacturer's written instructions for cleaning and touchup of minor finish damage. Remove and replace ceiling components that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.
- C. Clean up rubbish and debris and remove from site.
- D. Leave work areas in a broom clean condition.

**END OF SECTION**

## SECTION 09650

### RESILIENT FLOORING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing rubber floor covering, vinyl composition floor tile, vinyl wall base, rubber stair treads and accessories.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For each type of product specified provide manufacturer's printed product information.
  - 2. Samples for Initial Selection: Manufacturer's color charts consisting of units or sections of units showing the full range of colors and patterns available for each type of product indicated.
  - 3. Samples for Verification: Four of each type, color and pattern of the following materials used in the Work, showing the full range of variations expected:
    - a. Floor Tile: 12 inches square.
    - b. Wall Base: 12 inches long.
    - c. Edge Strips: 12 inches long.
    - d. Adhesive: Pint container.
  - 4. Product Certificates: Signed by manufacturers of resilient products certifying that each product furnished complies with requirements.
  - 5. Maintenance Data: For each type of product specified.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: D2240, E648, E662, F710, F1066, F1344.
  - 3. FS: RR-T-650, SS-T-312, SS-W-40, UU-B-790.
- B. Installer Qualifications: Engage an experienced installer to perform work of this Section who has specialized in installing resilient products similar to those required for this Project and with a record of successful in-service performance.
- C. Source Limitations: Obtain each type, color, and pattern of product specified from one source with resources to provide products of consistent quality in appearance and physical properties without delaying the Work.
- D. Fire-Test-Response Characteristics: Provide products with the following fire-test-response characteristics as determined by testing identical products per test method indicated below by a testing and inspecting agency acceptable to authorities having jurisdiction.
  - 1. Critical Radiant Flux: 0.45 W/sq. cm or greater when tested per ASTM E648.
  - 2. Smoke Density: Maximum specific optical density of 450 or less when tested per ASTM E662.

##### 1.04 DELIVERY, STORAGE, AND HANDLING:

- A. Deliver products to Project site in manufacturer's original, unopened cartons and containers, clearly labeled with manufacturer's name and brand designation, referenced specification number, type and color, and shipping and handling instructions.
- B. Store products in dry spaces protected from the weather, with ambient temperatures maintained between 50 and 90 deg F.
- C. Store tiles on flat surfaces.
- D. Handle products to prevent breakage of containers and damage to products.
- E. Move products into spaces where they will be installed at least 48 hours before installation, unless longer conditioning period is recommended in writing by manufacturer.

**1.05 PROJECT CONDITIONS:**

- A. Maintain a temperature of not less than 70 deg F or more than 90 deg F in spaces to receive products for at least 48 hours before installation, during installation, and for at least 48 hours after installation, unless manufacturer's written recommendations specify longer time periods. After post-installation period, maintain a temperature of not less than 55 deg F or more than 95 deg F.
- B. Do not install products until they are at the same temperature as
- C. Do not install base until plaster or other backing material has thoroughly dried.
- D. Close spaces to traffic during flooring installation and for time period after installation recommended in writing by manufacturer.
- E. Install tiles and accessories after other finishing operations, including painting, have been completed. Where demountable partitions and other items are indicated for installation on top of resilient tile flooring, install tile before these items are installed.
- F. Do not install flooring over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive, as determined by flooring manufacturer's recommended bond and moisture test.

**1.06 EXTRA MATERIALS:**

- A. Furnish and store where directed extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels describing contents.
  - 1. Furnish not less than one percent of the total quantity of each type, color, pattern, class, wearing surface, and size of resilient tile flooring installed, but not less than one full unopened container.
  - 2. Furnish not less than one percent of the total quantity of each type, color, and size of base material installed, but not less than one full unopened container.

**PART 2 - PRODUCTS**

**2.01 RESILIENT FLOORING:**

- A. Rubber Floor Covering: Products complying with ASTM F1344 and with requirements specified.
  - 1. Manufacturers: including but not limited to:

- a. R.C.A. Rubber Company.
    - b. Or equal.
  2. Color and Pattern: Terra Cotta.
  3. Class: I-A.
  4. Hardness: Durometer hardness not less than 85 Shore, Type A per ASTM D2240 as required according to ASTM F1344.
  5. Wearing Surface: Textured.
  6. Thickness: 3/16 inch.
  7. Fabrication: Fabricate heavy duty rubber mat with interlocking joints in five pieces to fit area shown, with edges square and true, without overlap.
- B. Vinyl Composition Floor Tile: Products complying with ASTM F1066 and with requirements specified:
1. Manufacturers: including but not limited to
    - a. Armstrong.
    - b. Azrock.
    - c. GAF.
    - d. Kentile.
    - e. Or equal.
  2. Color and Pattern: As selected by the Engineer from manufacturer's full range of colors and patterns produced for tile complying with requirements indicated.
  3. Class: Class 2 (through-pattern tile).
  4. Wearing Surface: Smooth unless otherwise indicated.
  5. Thickness: 1/8 inch.
  6. Size: 12 by 12 inches.

## 2.02 RESILIENT ACCESSORIES:

- A. Vinyl Wall Base: Products complying with FS SS-W-40, Type II and with requirements specified:
1. Color and Pattern: As selected by the Engineer from manufacturer's full range of colors and patterns produced for vinyl wall base complying with requirements indicated
  2. Style: Cove with top-set toe unless otherwise indicated.
  3. Minimum Thickness: 1/8 inch.
  4. Height: 4 inches.
  5. Lengths: Cut lengths longest practicable or coils in lengths standard with manufacturer, but not less than 96 feet.
  6. Outside Corners: Job formed.
  7. Inside Corners: Job formed.
  8. Surface: Smooth.
- B. Rubber Stair Treads: Products of style suitable for use indicated and complying with FS RR-T-650, Composition A and with requirements specified:
1. Manufacturers: including but not limited to:
    - a. R.C.A. Rubber Company.
    - b. Or equal.
  2. Color and Pattern: Terra Cotta.
  3. Design: Type 1 (smooth).
  4. Abrasive Strips: Provide abrasive strips as specified by the product designation indicated above in color selected by the Engineer from manufacturer's full range of colors.
  5. Nosing Style: Round.
  6. Nosing Height: 1/2 inch light color.
  7. Thickness: 5/16-inch tapering to 3/16-inch at back edge.

8. Size: Lengths and depths to fit each stair tread in one piece.
9. Fabrication: Fabricate nosing of stair tread to wrap around curved ends of step, to provide a uniform elevation appearance on three sides of step. Abrade at least 80 percent of the back of tread and nosing to assure adhesion to substrate. Fabricate nosing so that it will not delaminate or otherwise separate from the stair tread material.

### **2.03 INSTALLATION ACCESSORIES:**

- A. Tile Reducer Edge Strip: Products complying with FS SS-T-312, beveled, one-inch wide, 1/8-inch thick. Color to match vinyl wall base.
- B. Trowelable Leveling and Patching Compounds: Latex-modified, portland-cement-based formulation provided or approved by flooring manufacturer for applications indicated.
- C. Tile Adhesive: Waterproof asphalt cut-back cement recommended by manufacturer to suit resilient products and substrate conditions indicated.
- D. Stair Tread Adhesive: Permanent, as recommended by tread manufacturer for adhesion to galvanized steel substrate.
- E. Stair Tread Nose Filler: Two-part epoxy compound recommended by tread manufacturer to fill nosing substrates that do not conform to tread contours.
- F. Primer: As recommended by adhesive manufacturer.
- G. Base Cement: Water-resistant, type recommended by manufacturer of vinyl wall base.
- H. Building Paper: FS UU-B-790.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION:**

- A. Examine substrates, areas, and conditions where installation of resilient products will occur, with Installer present, for compliance with manufacturer's requirements. Verify that substrates and conditions are satisfactory for resilient product installation and comply with requirements specified
- B. Concrete Sub-floors: Verify that concrete slabs comply with ASTM F710 and the following:
  1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by flooring manufacturer.
- C. Kiosk Equipment: Verify configuration of equipment in kiosk to ensure fit of flooring within 1/16-inch tolerance.

### **3.02 PREPARATION:**

- A. General: Comply with resilient product manufacturer's written installation instructions for preparing substrates indicated to receive resilient products.
- B. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, and depressions in substrates.

- C. Remove coatings, including curing compounds, and other substances that are incompatible with flooring adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
- D. Broom and vacuum clean substrates to be covered immediately before product installation. After cleaning, examine substrates for moisture, alkaline salts, carbonation, or dust. Do not proceed with installation until unsatisfactory conditions have been corrected.

### **3.03 RESILIENT FLOORING INSTALLATION:**

- A. General: Comply with flooring manufacturer's written installation instructions.
- B. Leveling Floor: Level floor by grinding high spots and filling low spots with leveling and patching compound following manufacturer's recommendations to ensure plane surface free of imperfections.
- C. Lay out tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half of a tile at perimeter.
  - 1. Lay tiles square with room axis, unless otherwise indicated.
- D. Uniformity of Color: Use tiles alternately from at least two cartons so that pattern will be uniform and not spotty due to variation that may be found in different cartons. Match tiles for color and pattern by selecting tiles from cartons in the same sequence as manufactured and packaged, if so numbered. Cut tiles neatly around all fixtures. Discard broken, cracked, chipped, or deformed tiles.
- E. Application of Primer: Unless adhesive manufacturer recommends against priming, apply primer at rate and by method recommended.
- F. Application of Adhesive: Adhere tiles to flooring substrates using a full spread of adhesive applied to substrate to comply with tile manufacturer's written instructions, including those for trowel notching, adhesive mixing, and adhesive open and working times.
  - 1. Provide completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.
- G. Laying of Tile:
  - 1. Scribe, cut, and fit tiles to butt neatly and tightly to vertical surfaces and permanent fixtures, including built-in furniture, cabinets, pipes, outlets, edgings, door frames, thresholds, and nosings.
  - 2. Extend tiles into toe spaces, door reveals, closets, and similar openings.
  - 3. Provide joints cut straight and true. Seal tile joints at pipes with waterproof cement.
  - 4. Embed tiles level, flush with surface and with tightly butted joints against adjoining tiles.
  - 5. Hand roll tiles according to tile manufacturer's written instructions.
- H. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use chalk or other nonpermanent, nonstaining marking device.

### **3.04 RESILIENT ACCESSORY INSTALLATION:**

- A. General: Install resilient accessories according to manufacturer's written installation instructions.

- B. Vinyl Wall Base: Apply resilient wall base to walls, columns, pilasters, casework and cabinets in toe spaces, and other permanent fixtures in rooms and areas where base is required. Extend wall base into closets and offsets adjoining areas to receive wall base.
  - 1. Install wall base in lengths as long as practicable without gaps at seams and with tops of adjacent pieces aligned.
  - 2. Tightly adhere wall base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.
  - 3. Do not stretch base during installation.
  - 4. On masonry surfaces or other similar irregular substrates, fill voids along top edge of resilient wall base with manufacturer's recommended adhesive filler material.
  - 5. Form outside corners on job from straight pieces of maximum lengths possible, without whitening at bends. Shave back of base at points where bends occur and remove strips perpendicular to length of base that are only deep enough to produce a snug fit without removing more than half the wall base thickness.
  - 6. Form inside corners on job, from straight pieces of maximum lengths possible, by cutting an inverted V-shaped notch in toe of wall base at the point where corner is formed. Shave back of base where necessary to produce a snug fit to substrate.
- C. Rubber Stair Tread: Adhere nosing so that it will not delaminate or otherwise separate from the stair tread material.
- D. Tile Reducer Edge Strip: Install edge strips at edges of flooring that would otherwise be exposed.
  - 1. Where tile stops at doorways without saddles or thresholds, set edge strips directly under doors.
- E. Place resilient accessories so they are butted to adjacent materials and bond to substrates with adhesive.

### **3.05 CLEANING AND PROTECTING:**

- A. Perform the following operations immediately after installing resilient products:
  - 1. Remove adhesive and other surface blemishes using cleaner recommended by resilient product manufacturers.
- B. After flooring is laid and adhesive thoroughly cured, clean and finish resilient floors as recommended by the resilient product manufacturer with approved compatible products.
- C. Keep traffic off finished floors during the remainder of construction period.
- D. Protect flooring against mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by flooring manufacturer.
  - 1. Cover products installed on floor surfaces with reinforced kraft building paper and tape joints. Maintain such cover and otherwise protect floor until final acceptance.
  - 2. Do not move heavy and sharp objects directly over floor surfaces. Place plywood or hardboard panels over flooring and under objects while they are being moved. Slide or roll objects over panels without moving panels.

### **3.06 MAINTENANCE MATERIALS:**

- A. After completion of the work, furnish and store where directed at least one percent of the total quantity of tile and one percent of base material, but not less than one full unopened container of each, for future maintenance.

- B. Include proportional quantities of each type and color in original containers clearly marked to show contents and area of placement of each type and color.

**END OF SECTION**

## SECTION 09920

### FIELD PAINTING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies furnishing and applying paint at the site.
  - 1. Specific surfaces and areas which require field painting and required paint systems are listed in the schedule of painting.
  - 2. Unless an item is shown not to be field painted or specified otherwise paint it in accordance with these specifications.
- B. Definitions:
  - 1. Paint: Includes primers and undercoaters, sealers, stains, paint, varnish, enamel, epoxy and special coatings.
- C. Items Not Included In Field Painting:
  - 1. Stainless steel, ornamental metals, glass, resilient tile, ceramic tile, paving, acoustical tile, plastic laminate and similar items which are prefinished.
  - 2. Mill-, factory- and shop-applied primers and finishes.
  - 3. Corrosion-resistant structural steel, ASTM A242.
  - 4. High-strength structural corrosion-resistant steel shapes, plates and bars, ASTM A588.
  - 5. Galvanized-metal surfaces except fire stand pipes, unless exposed to public view.
  - 6. UL labels on fire-rated doors and frames.
  - 7. Precast or prestressed concrete with a sandblast finish, concrete sealer, or other special finish unless noted otherwise
- D. Related Work Specified Elsewhere:
  - 1. Mill-, factory- and shop-applied prime and finish coats: Specified with the product.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples:
    - a. Three each of each color and texture, with identification of materials keyed to those specified and application methods.
    - b. Samples of paint scheduled for application to smooth finishes applied to 12-inch square hardboard or metal panels.
    - c. Samples of paint scheduled for application to concrete masonry units applied to 16-inch square by two-inch thick panel of concrete masonry units, including one tooled masonry joint. Subdivide panel to define prime or filler, intermediate and finish coats.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. FS: TT-E-489, TT-E-490, TT-E-509, TT-F-336, TT-F-1098, TT-P-19, TT-P-29, TT-P-636, TT-P-641, TT-P-645, TT-P-650, TT-P-664, TT-P-1510, TT-P-001984, TT-S-71, TT-S-300, TT-V-86, TT-V-119.
  - 3. ASME: A13.1.
  - 4. ANSI: Z535.1.

5. ASTM: A242, A588, B117, C476, C920.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to the jobsite in their original unopened containers clearly labeled with the manufacturer's name and brand designation, referenced specification number and type, as applicable.
- B. Store products in an approved ventilated dry area, protect from contact with soil and from exposure to the elements. Always keep products dry. Do not allow paint to freeze.
- C. Handle products in a manner that will prevent breakage of containers and damage to products.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  1. Do not apply paint to non-protected surfaces in wet weather or to surfaces on which ice, frost, water or dampness is visible.
  2. Do not apply exterior paint when the temperature is below 40F or expected to fall below this temperature. Do not apply interior paint when the temperature is lower than 60F or expected to fall below this temperature.
  3. Avoid painting steel which is at a temperature which can cause blistering, porosity, or otherwise be detrimental to the life of the paint. When paint is applied in hot weather or thinned in cold weather ensure that the specified thickness of paint coating is obtained.
  4. Do not apply paint in rain, wind, snow, fog or mist or when the steel surface temperature is below the dew point, resulting in condensation of moisture.
  5. Do not apply interior paint when, in the Engineer's opinion, satisfactory results cannot be obtained due to high humidity and excessive temperature; however, failure of the Engineer to notify the Contractor of the conditions will not relieve the Contractor of responsibility to produce satisfactory results.

### **PART 2 - PRODUCTS**

#### **2.01 GENERAL:**

- A. To the maximum extent practicable, use the materials of one manufacturer throughout the project. No claims as to the suitability of a material specified, or of inability to produce first-class work with these materials, will be considered unless such claims are made in writing and submitted with the Contractor's Bid Proposal.
- B. Provide a primer suitable for each substrate type and which is manufactured or recommended by the paint manufacturer as part of a complete painting system.
- C. Previously Primed Surfaces:
  1. If surfaces have been primed off-site at the mill, factory or shop, omit specified primer, but only if the off-site primer is acceptable to the paint system manufacturer for best performance of the specified paint system.
  2. For touch-up of off-site primer, use primer of the same composition as the mill, factory or shop primer.
- D. VOC Requirements: Provide products in compliance with local volatile organic compound regulations. If the listed product of a manufacturer does not comply, provide an accepted equivalent product which does comply.

- E. Colors:
1. Prior to beginning work, the Contractor will be furnished sample color chips and a Color and Material Schedule for surfaces to be painted.
  2. Match the colors of the chips and submit samples before proceeding. Label samples for surface finishes such as satin, flat or gloss as listed in the Color and Material Schedule.
  3. Tint each coat of paint slightly lighter or darker than the preceding coat or the finish coat.
  4. Final approval of colors will be made by the Engineer on samples applied on the job.
  5. Safety Colors: Items specified to be safety colors, e.g. OSHA red (safety red) and ANSI orange, to be in compliance with ANSI Z535.1, Safety Color Code.
- F. Listed materials are a guide to quality intended. Substitute materials and paint systems acceptable to the Engineer, as an equal or of superior quality for each intended use, may be used in the work at no additional cost to the Authority.
- G. Accessory Materials:
1. General: Provide miscellaneous materials and accessories, whether listed or not, as necessary to complete the work in an approved manner.
  2. Caulk: Single-component, chemically curing, synthetic rubber, non-sag, ASTM C920, Type S, NS, Class 25.
  3. Spackling compound: Ready-mixed type, U.S. Gypsum Ready-Mixed Joint Compound - Topping, ASTM C476 or equal.
  4. Thinner: As recommended by the paint manufacturer.

## 2.02 EXTERIOR PAINTING SYSTEMS:

- A. Exterior Paint Schedule: Provide the paint systems scheduled below for the various substrates, as indicated. Provide a complete paint system by one manufacturer for each substrate. Unless otherwise indicated, provide the following:
1. Concrete and masonry (except concrete masonry units): Acrylic, flat.
  2. Concrete masonry units: Acrylic, flat.
  3. Portland cement plaster (soffits): Acrylic, flat.
  4. Ferrous metal: Silicone-alkyd, semigloss.
  5. Zinc-coated metal: Silicone-alkyd, semigloss.
  6. Aluminum: Alkyd, semigloss.
  7. Wood: Acrylic-enamel, semigloss.
  8. Mechanical and electrical items (not finish painted): See substrate materials above.
- B. Concrete, Masonry (except concrete masonry units), and portland cement plaster - Acrylic, Flat: Two coats with total dry film thickness not less than 2.5 mils.
1. Undercoat: Quick-drying, flat, acrylic paint for use on the exterior over concrete, masonry, and portland cement plaster (FS TT-P-19):
    - a. Con-Lux: Mason-Plex 800 Series.
    - b. Devoe: 15XX Wonder-Shield Exterior Acrylic Latex Flat House Paint.
    - c. Moore: Moore's Flat Exterior Latex Masonry & House Paint #105.
  2. S-W:A-100 Acrylic Latex Flat Exterior Finish, A-6 Series. Finish Coat: Quick-drying, flat, acrylic paint for use on the exterior over concrete, masonry, and portland cement plaster (FS TT-P-19)
    - a. Con-Lux: Mason-Plex 800 Series.
    - b. Devoe: 15XX Wonder-Shield Exterior Acrylic Latex Flat House Paint.
    - c. Moore: Moore's Flat Exterior Latex Masonry & House Paint #105.

- d. S-W: A-100 Acrylic Latex Flat Exterior Finish, A-6 Series.
- C. Concrete Masonry Units - Acrylic, Flat: Two coats over block filler with total dry film thickness not less than 2.5 mils, excluding the block filler.
1. Block Filler: High performance latex block filler used for filling open textured concrete masonry block before application of top coats:
    - a. Con-Lux: Block-Plex 85 White.
    - b. Devoe: 52901 Bloxfil Acrylic Latex Block Filler.
    - c. Moore: Moorcraft Block Filler #145.
    - d. S-W: Heavy-Duty Block Filler B42W46.
  2. Undercoat: Quick-drying, flat, acrylic paint for use on the exterior over concrete masonry block (FS TT-P-19):
    - a. Con-Lux: Mason-Plex 800 Series.
    - b. Devoe: 15XX Wonder-Shield Exterior Acrylic Latex Flat House Paint.
    - c. Moore: Moore's Flat Exterior Latex Masonry & House Paint #105.
    - d. S-W: A-100 Acrylic Latex Flat Exterior Finish, A-6 Series.
  3. Finish Coat: Quick-drying, flat, acrylic paint for use on the exterior over concrete masonry block (FS TT-P-19):
    - a. Con-Lux: Mason-Plex 800 Series.
    - b. Devoe: 15XX Wonder-Shield Exterior Acrylic Latex Flat House Paint.
    - c. Moore: Moore's Flat Exterior Latex Masonry & House Paint #105.
    - d. S-W: A-100 Acrylic Latex Flat Exterior Finish, A-6 Series
- D. Ferrous Metal - Silicone-Alkyd, Semigloss: Two coats over primer.(Apply a second coat of primer on steel which is at grade, at slab, or passing through floor slabs. Apply to a uniform line six inches above top of grade or slab.)
1. Primer: Lead and chromate-free high solids primer which chemically inhibits rusting and is recommended by the manufacturer for application to steel which has been prepared in accordance with SSPC SP2. Rated 10 (less than 0.01% surface rusting) when tested in accordance with ASTM B117 for 500 hours. Exceeds performance requirements of FS TT-P-636:
    - a. Con-Lux: Rust Arrestor 50.
    - b. S-W: Kem Kromik Universal Metal Primer B50NZ6.
    - c. Tnemec: Series P10.
  2. Undercoat: Alkyd enamel recommended by manufacturer of finish coat as an intermediate coat over specified primer for application of silicone-alkyd finish coat:
    - a. Con-Lux: Ferrox Primer.
    - b. S-W: Silicone Alkyd Enamel B-56 Series.
    - c. Tnemec: Series 23 Enduratone.
  3. Finish Coat: Silicone-alkyd enamel with a minimum of 30% silicone content meeting the qualitative requirements of FS TT-E-490:
    - a. Con-Lux: Steel-Master 9500 Series.
    - b. S-W: Silicone Alkyd Enamel B-56 Series.
    - c. Tnemec: Series 82 Silicone-Alkyd Enamel.
- E. Ferrous Metal - Alkyd, Semigloss: Two coats over primer (primer is not required on shop-primed items):
1. Primer: Quick-drying, rust-inhibiting primer for priming ferrous metal under alkyd enamel (FS TT-P-664):
    - a. Con-Lux: Ferrox Primer, 25 Red.
    - b. Devoe: 41820 Bar-Ox Alkyd Shop/Field Primer.
    - c. Moore: Ironclad Retardo Rust-Inhibitive Paint #163.
    - d. S-W: Kem Kromik Metal Primer B50N2/B50W1.

2. Undercoat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated ferrous metal (FS TT-E-489, Class A):
    - a. Con-Lux: Enamelite Semi-Luster Series
    - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
    - c. Moore: Impervo Enamel #133.
    - d. S-W: Industrial Enamel, B-54Z Series.
  3. Finish Coat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated ferrous metal (FS TT-E-489, Class A):
    - a. Con-Lux: Enamelite Semi-Luster Series.
    - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
    - c. Moore: Impervo Enamel #133.
    - d. S-W: Industrial Enamel, B-54Z Series.
- F. Zinc-Coated Metal - Silicone-Alkyd, Semigloss: Two coats over factory-applied primer:
1. Primer: Galvanized metal primer used to prime zinc-coated (galvanized) metal surfaces (FS TT-P-641), or one of the following.
    - a. Con-Lux: Bond-Plex 46 Barrier Green.
    - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
    - c. Moore: Ironclad Galvanized Metal Latex Primer #155.
    - d. S-W: Industrial Water Based Acrylic Paint B42W110.
  2. Undercoat: Alkyd enamel recommended by manufacturer of finish coat as an intermediate coat over factory-applied primer for application of silicone-alkyd finish coat:
    - a. Con-Lux: FerroX Primer.
    - b. S-W: Silicone Alkyd Enamel B-56 Series.
    - c. Tnemec: Series 23 Enduratone.
  3. Finish Coat: Silicone-alkyd enamel with a minimum of 30% silicone content meeting the qualitative requirements of FS TT-E-490:
    - a. Con-Lux: Steel-Master 9500 Series.
    - b. S-W: Silicone Alkyd Enamel B-56 Series.
    - c. Tnemec: Series 82 Silicone-Alkyd Enamel.
- G. Zinc-Coated Metal - Alkyd, Semigloss: Two coats over primer:
1. Primer: Galvanized metal primer used to prime zinc-coated (galvanized) metal surfaces (FS TT-P-641), or one of the following:
    - a. Con-Lux: Bond-Plex 46 Barrier Green.
    - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
    - c. Moore: Ironclad Galvanized Metal Latex Primer #155.
    - d. S-W: Industrial Water Based Acrylic Paint B42W110.
  2. Undercoat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated zinc-coated (galvanized) metal (FS TT-E-489, Class A):
    - a. Con-Lux: Enamelite Semi-Luster Series.
    - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
    - c. Moore: Impervo Enamel #133.
    - d. S-W: Industrial Enamel, B-54Z Series.
  3. Finish Coat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated zinc-coated (galvanized) metal (FS TT-E-489, Class A):
    - a. Con-Lux: Enamelite Semi-Luster Series.
    - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
    - c. Moore: Impervo Enamel #133.
    - d. S-W: Industrial Enamel, B-54Z Series.
- H. Aluminum - Alkyd, Semigloss: Two coats over primer:
1. Primer: Alkyd-type zinc chromate primer used for priming aluminum under alkyd enamels (FS TT-P-645), or one of the following.
    - a. Con-Lux: Bond-Plex 46 Barrier Green.

- b. Devoe: 41839 Bar-Ox Zinc Chromate Primer.
    - c. Moore: Ironclad Retardo Rust Inhibitive Paint #163.
    - d. S-W: Zinc Chromate Primer B50Y1.
  - 2. Undercoat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated aluminum (FS TT-E-489, Class A):
    - a. Con-Lux: Enamelite Semi-Luster Series.
    - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
    - c. Moore: Impervo Enamel #133.
    - d. S-W: Industrial Enamel, B-54Z Series.
  - 3. Finish Coat: Weather-resistant, air-drying, semigloss alkyd enamel for use on the exterior over prime-coated aluminum (FS TT-E-489, Class A):
    - a. Con-Lux: Enamelite Semi-Luster Series
    - b. Devoe: 70XX Mirrolac Interior/Exterior Alkyd Enamel.
    - c. Moore: Impervo Enamel #133.
    - d. S-W: Industrial Enamel, B-54Z Series.
- I. Wood - Acrylic Enamel, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils:
  - 1. Primer: Exterior alkyd or latex primer made for use on wood under an acrylic enamel (FS TT-P-001984):
    - a. Con-Lux: Wood-Plex 700 Primer.
    - b. Devoe: 1102 All-Weather Exterior Alkyd House Paint Primer.
    - c. Moore: Moorwhite Primer #100.
    - d. S-W: A-100 Exterior Latex Wood Primer
  - 2. Undercoat: Semigloss, waterborne, exterior, acrylic enamel made for use as an undercoat over a primer on wood under an acrylic enamel (FS TT-P-1510):
    - a. Con-Lux: Weather-Plex 700 Series
    - b. Devoe: 17XX Wonder-Shield Semi-Gloss Exterior Acrylic latex House and Trim Paint.
    - c. Moore: MoorGlo Latex House and Trim Paint #096.
    - d. S-W: A-100 Exterior Latex Satin.
  - 3. Finish Coat: Semigloss, waterborne, exterior, acrylic enamel made for use as a finish coat over an acrylic enamel (FS TT-P-1510):
    - a. Con-Lux: Weather-Plex 700 Series.
    - b. Devoe: 17XX Wonder-Shield Semi-Gloss Exterior Acrylic latex House and Trim Paint.
    - c. Moore: MoorGlo Latex House and Trim Paint #096.
    - d. S-W: A-100 Exterior Latex Satin.
- J. Wood - Stained-Varnish: Two coats over sealer over stain plus filler on open-grain wood. Wipe filler before applying first varnish coat.
  - 1. Stain Coat: Match interior stained-varnish finish.
  - 2. Sealer: Phenolic varnish for use on exterior natural-finished woodwork (FS TT-V-119), thinned as recommended by manufacturer:
    - a. Con-Lux: Imperial 71 Spar Varnish.
    - b. Devoe: 87 Spar Varnish.
    - c. Moore: Impervo 440 Spar Varnish.
    - d. S-W: Exterior Varnish A67V4
  - 3. Undercoat: Phenolic varnish for use on exterior natural-finished woodwork (FS TT-V-119):
    - a. Con-Lux: Imperial 71 Spar Varnish.
    - b. Devoe: 87 Spar Varnish.
    - c. Moore: Impervo 440 Spar Varnish.
    - d. S-W: Exterior Varnish A67V4.
  - 4. Finish Coat: Phenolic varnish for use on exterior natural-finished woodwork (FS TT-V-119):

- a. Con-Lux: Imperial 71 Spar Varnish.
- b. Devoe: 87 Spar Varnish.
- c. Moore: Impervo 440 Spar Varnish.
- d. S-W: Exterior Varnish A67V4.

### 2.03 INTERIOR PAINTING SYSTEMS:

- A. Interior Paint Schedule: Provide the paint systems scheduled below for the various substrates, as indicated. Provide a complete paint system by one manufacturer for each substrate. Unless otherwise indicated, provide the following:
1. Concrete and masonry (except concrete masonry units and concrete floors): Latex, flat.
  2. Concrete masonry units (except ground-faced CMU, which is to be left unpainted): Latex, flat.
  3. Concrete floors: Epoxy, gloss, with anti-slip aggregate.
  4. Gypsum plaster, veneer plaster, and GFRG: Latex, eggshell.
  5. Acoustical plaster: Unpainted.
  6. Gypsum board: Latex, flat.
  7. Woodwork: Stained-varnish finish, except alkyd, semigloss where painted is indicated.
  8. Ferrous metal:
    - a. Exposed steel structure: Silicone-alkyd, semigloss.
    - b. Other interior ferrous metal: Alkyd, semigloss.
  9. Zinc-coated metal: Alkyd, semigloss; except silicone-alkyd where part of ferrous metal assemblies painted with silicone-alkyd.
  10. Non-ferrous metal: Alkyd, semigloss.
  11. Cotton and canvass covering over insulation: Latex, flat.
  12. Mechanical and electrical items (not finish painted): See substrate materials above.
- B. Concrete and Masonry (Except concrete masonry units) - Latex, Flat: Two coats.
1. Undercoat: Flat latex-based paint made for use as an undercoat over concrete and masonry under a flat latex paint (FS TT-P-29):
    - a. Con-Lux: Jet-Plex 495 Primer.
    - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
    - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
    - d. S-W: Pro-Mar 200 Latex Flat B30W200.
  2. Finish Coat: Flat latex-based paint made for use as a flat finish over concrete and masonry (FS TT-P-29):
    - a. Con-Lux: Wall-Plex 400 Series.
    - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
    - c. Moore: Regal Wall Satin 215.
    - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.
- C. Concrete and Masonry (Except concrete masonry units) - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 3.5 mils.
1. Primer: Flat latex-based paint made for use as a primer over concrete and masonry under an odorless alkyd enamel (FS TT-P-29):
    - a. Con-Lux: Wall-Plex 400 Series.
    - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
    - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
    - d. S-W: Pro-Mar 200 Latex Flat B30W200.
  2. Undercoat: Enamel undercoat made for use on the interior as an undercoat over a primer on concrete or masonry under an odorless alkyd enamel:
    - a. Con-Lux: Enamel Underbase 54 White.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.

- c. Moore: Moore's Alkyd Enamel Underbody 217.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
  - 3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on concrete and masonry (FS TT-E-509):
    - a. Con-Lux: Satin-Lite 900 Series
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
    - c. Moore: Moore's Satin Impervo Enamel 235.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
  
- D. Concrete and Masonry (Except concrete masonry units) - Epoxy, Semi-Gloss: Two coats over primed surface.
  - 1. Primer: Sealer made for use as a primer over masonry wall surfaces and under an epoxy enamel:
    - a. Con-Lux: Jet-Plex 495 Primer.
    - b. Duron: Acrylic Enamel Undercoater.
    - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
    - d. S-W: Kem Cati-Coat Epoxy Filler/Sealer.
  - 2. Undercoat: Epoxy enamel undercoat made for use under a semi-gloss epoxy enamel:
    - a. Con-Lux: Epolon Semi-Luster Series.
    - b. Duron: Polyamide Epoxy.
    - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
    - d. S-W: Heavy Duty Epoxy.
  - 3. Finish Coat: Semi-gloss epoxy enamel finish coat made for use over an epoxy enamel undercoat:
    - a. Con-Lux: Epolon Semi-Luster Series.
    - b. Duron: Polyamide Epoxy.
    - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
    - d. S-W: Heavy Duty Epoxy.
  
- E. Concrete Masonry Units (Except ground-faced CMU, which is to be left unpainted) - Latex, Flat: Two coats over filled surface.
  - 1. Block Filler: High-performance latex block filler made for use for filling open textured concrete masonry block before application of top coats (FS TT-F-1098):
    - a. Con-Lux: Block-Plex 85 White.
    - b. Devoe: 52901 Bloxfil Acrylic Latex Block Filler.
    - c. Moore: Moorcraft Interior and Exterior Block Filler 173.
    - d. S-W: Heavy-Duty Block Filler B42W46.
  - 2. Undercoat: Flat latex-based paint made for use as an undercoat over filled concrete masonry block under a flat latex paint (FS TT-P-29):
    - a. Con-Lux: Wall-Plex 400 Series.
    - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
    - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
    - d. S-W: Pro-Mar 200 Latex Flat B30W200.
  - 3. Finish Coat: Flat latex-based Paint made for use as a flat finish over filled concrete masonry block (FS TT-P-29):
    - a. Con-Lux: Wall-Plex 400 Series.
    - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
    - c. Moore: Regal Wall Satin 215.
    - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.
  
- F. Concrete Masonry Units (Except ground-faced CMU, which is to have clear anti-graffiti coating over unfilled surface) - Alkyd, Semigloss: Two coats over filled surface with total dry film thickness not less than 3.5 mils, excluding filler coat
  - 1. Block Filler: High-performance latex block filler made for use for filling open textured concrete masonry block before application of top coats (FS TT-F-1098):

- a. Con-Lux: Block-Plex 85 White.
  - b. Devoe: 52901 Bloxfil Acrylic Latex Block Filler.
  - c. Moore: Moorcraft Interior and Exterior Block Filler 173.
  - d. S-W: Heavy-Duty Block Filler B42W46.
2. Undercoat: Enamel undercoat made for use on the interior as an undercoat over a block filler on concrete masonry block under an odorless alkyd enamel:
- a. Con-Lux: Enamel Underbase 54 White.
  - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
  - c. Moore: Moore's Alkyd Enamel Underbody 217.
  - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
3. Finish Coat: Semigloss odorless alkyd enamel made for use over a block filler and undercoat on concrete masonry block (FS TT-E-509):
- a. Con-Lux: Satin-Lite 900 Series.
  - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
  - c. Moore: Moore's Satin Impervo Enamel 235.
  - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- G. Concrete Masonry Units (Except ground-faced CMU, which is to have clear anti-graffiti coating over unfilled surface) - Epoxy, Semi-Gloss: Two coats over filled surface.
1. Filler: Filler made for use as a primer over masonry wall surfaces and under an epoxy enamel:
- a. Con-Lux: Jet-Plex 495 Primer; or Block-Plex Block Filler.
  - b. Duron: Acrylic Enamel Undercoater; or Block Kote Latex Block Filler.
  - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel; or Moorcraft Interior and Exterior Block Filler.
  - d. S-W: Kem Cati-Coat Epoxy Filler/Sealer; or Heavy Duty Block Filler.
2. Undercoat: Epoxy enamel undercoat made for use under a semi-gloss epoxy enamel:
- a. Con-Lux: Epolon Semi-Luster Series.
  - b. Duron: Polyamide Epoxy.
  - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
  - d. S-W: Heavy Duty Epoxy.
3. Finish Coat: Semi-gloss epoxy enamel finish coat made for use over an epoxy enamel undercoat:
- a. Con-Lux: Epolon Semi-Luster Series.
  - b. Duron: Polyamide Epoxy
  - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
  - d. S-W: Heavy Duty Epoxy.
- H. Concrete Floor Surfaces - Epoxy, Gloss: Two coats over primer, with anti-slip aggregate in finish coat:
1. Primer: Epoxy sealer made for use as a primer over concrete floor surfaces and under an epoxy enamel:
- a. Con-Lux: None required.
  - b. Duron: Acrylic Enamel Undercoater
  - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
  - d. S-W: ArmorSeal 3300LV Epoxy Primer/Sealer.
2. Undercoat: Epoxy enamel undercoat made for use over an epoxy primer and under a gloss epoxy enamel:
- a. Con-Lux: Epolon Series with Epolon 145 Reducer.
  - b. Duron: Polyamide Epoxy.
  - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
  - d. S-W: ArmorSeal 1000HS.

3. Finish Coat: Epoxy enamel finish coat made for use over an epoxy enamel undercoat:
    - a. Con-Lux: Epolon Series with anti-slip aggregate.
    - b. Duron: Polyamide Epoxy with anti-slip aggregate.
    - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel with anti-slip aggregate.
    - d. S-W: ArmorSeal 1000HS with anti-slip aggregate.
- I. Gypsum Plaster, Veneer Plaster, and GFRG - Latex, Eggshell (Low-Gloss): Two coats over primer; plus sealer for GFRG.
1. Sealer for GFRG: Same as primer coat, to expose hot spots and facilitate sanding to remove "fiber bloom".
  2. Primer: Flat latex-based paint made for use as a primer on plaster under an eggshell latex paint (FS TT-P-29):
    - a. Con-Lux: Jet-Plex 495 Primer.
    - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
    - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
    - d. S-W: Wall and Wood Primer B99WZ2.
  3. Undercoat: Eggshell latex paint made for use over a primer on plaster (Performance requirements of FS TT-P-29):
    - a. Con-Lux: Luster-Plex 2000 Series.
    - b. Devoe: 34XX Wonder-Tones Interior Latex Eggshell Enamel.
    - c. Moore: Regal AquaVelvet 319.
    - d. S-W: Pro-Mar 200 Latex Eggshell Enamel B20W200 Series.
  4. Finish Coat: Eggshell latex paint made for use over a primer and undercoat on plaster (Performance requirements of FS TT-P-29):
    - a. Con-Lux: Luster-Plex 2000 Series.
    - b. Devoe: 34XX Wonder-Tones Interior Latex Eggshell Enamel.
    - c. Moore: Regal AquaVelvet 319.
    - d. S-W: Pro-Mar 200 Latex Eggshell Enamel B20W200 Series.
- J. Gypsum Plaster, Veneer Plaster, and GFRG - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils; plus sealer for GFRG.
1. Sealer for GFRG: Same as primer coat, to expose hot spots and facilitate sanding to remove "fiber bloom".
  2. Primer: Flat latex-based paint made for use as a primer on plaster under an odorless alkyd enamel (FS TT-P-29):
    - a. Con-Lux: Jet-Plex 495 Primer.
    - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
    - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
    - d. S-W: Wall and Wood Primer B99WZ2.
  3. Undercoat: Enamel undercoat made for use as an undercoat over a primer on plaster under an odorless alkyd enamel:
    - a. Con-Lux: Enamel Underbase 54 White.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel
    - c. Moore: Moore's Alkyd Enamel Underbody 217.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series
  4. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on plaster (FS TT-E-509):
    - a. Con-Lux: Satin-Lite 900 Series.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
    - c. Moore: Moore's Satin Impervo Enamel 235.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- K. Gypsum Board - Latex, Flat: 1 coat over primer.

1. Primer: Latex-based white primer made for use on interior gypsum board under a flat latex paint (FS TT-P-650):
    - a. Con-Lux: Jet-Plex 495 Primer.
    - b. Devoe: 50801 Wonder-Tones Latex Primer and Sealer.
    - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
    - d. S-W: Pro-Mar 200 Latex Wall Primer B28W200.
  2. Finish Coat: Flat latex-based paint made for use as a flat finish over prime-coated gypsum board (FS TT-P-29):
    - a. Con-Lux: Wall-Plex 400 Series.
    - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
    - c. Moore: Regal Wall Satin 215.
    - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.
- L. Gypsum Board - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils.
1. Primer: Latex-based white primer made for use on interior gypsum board under an odorless alkyd enamel (FS TT-P-650):
    - a. Con-Lux: Jet-Plex 495 Primer.
    - b. Devoe: 50801 Wonder-Tones Latex Primer and Sealer.
    - c. Moore: Moore's Latex Quick-Dry Prime Seal 201.
    - d. S-W: Pro-Mar 200 Latex Wall Primer B28W200.
  2. Undercoat: Enamel undercoat made for use on the interior as an undercoat over a primer on interior gypsum board under an odorless alkyd enamel:
    - a. Con-Lux: Enamel Underbase 54 White.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
    - c. Moore: Moore's Alkyd Enamel Underbody 217.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
  3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on interior gypsum board (FS TT-E-509):
    - a. Con-Lux: Satin-Lite 900 Series.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
    - c. Moore: Moore's Satin Impervo Enamel 235.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- M. Woodwork, Stained-Varnish: Two coats over sealer over stain plus filler on open-grain wood. Wipe filler before applying first varnish coat.
1. Stain Coat: Slow-penetrating oil-type wood stain made for general use on interior wood surfaces under a varnish finish (FS TT-S-71):
    - a. Devoe: 96XX Wonder Woodstain Alkyd Stain.
    - b. Moore: Moore's Interior Wood Finishes Penetrating Stain 241.
    - c. S-W: Oil Stain A-48 Series.
  2. Sealer: Quick-drying, rosin-free, clear, general-purpose shellac varnish made for use on the interior over stained-finished woodwork under a varnish finish (FS TT-S-300, Grade A):
    - a. Devoe: 4900 Wonder Woodsealer Quick-Dry Sealer.
    - b. Moore: Moore's Interior Wood Finishes, Quick-Dry Sanding Sealer 413.
    - c. S-W: Pro-Mar Varnish Sanding Sealer B26V3.
  3. Filler: Solvent-based, air-drying, paste-type wood filler made for use on open-grain wood on interior wood surfaces (FS TT-F-336):
    - a. Devoe: 4800 Wonder Woodstain Interior Paste Wood Filler.
    - b. Moore: Benwood Paste Wood Filler.
    - c. S-W: Sher-Wood Fast-Dry Filler.
  4. Undercoat: Clear varnish made for use on interior stained-finished woodwork (FS TT-V-86):
    - a. Devoe: 4600 Wonder Wood Satin Alkyd Satin Varnish.

- b. Moore: Benwood Satin Finish Varnish 404.
    - c. S-W: Oil Base Varnish, A66V91/A66F90.
  - 5. Finish Coat: Clear varnish made for use on interior stained-finished woodwork (FS TT-V-86):
    - a. Devoe: 4600 Wonder Wood Satin Alkyd Satin Varnish.
    - b. Moore: Benwood Satin Finish Varnish 404.
    - c. S-W: Oil Base Varnish, A66V91/A66F90.
  
- N. Woodwork, Painted - Alkyd, Semigloss: Two coats over primer.
  - 1. Primer: Enamel undercoat made for use as a primer over wood under an odorless alkyd enamel:
    - a. Con-Lux: Enamel Underbase 54 White.
    - b. Devoe: 50501 Interior Alkyd Primer and Vapor Barrier
    - c. Moore: Moore's Alkyd Enamel Underbody 217.
    - d. S-W: Wall and Wood Primer B49WZ2.
  - 2. Undercoat: Semigloss odorless alkyd enamel made for use over a primer on wood (FS TT-E-509):
    - a. Con-Lux: Satin-Lite 900 Series.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
    - c. Moore: Moore's Satin Impervo Enamel 235.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
  - 3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on wood (FS TT-E-509):
    - a. Con-Lux: Satin-Lite 900 Series.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
    - c. Moore: Moore's Satin Impervo Enamel 235.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
  
- O. Ferrous Metal - Silicone-Alkyd, Semigloss: Two coats over primer:
  - 1. Primer: Lead and chromate-free high solids primer which chemically inhibits rusting and is recommended by the manufacturer for application to steel which has been prepared in accordance with SSPC SP2. Rated 10 (less than 0.01% surface rusting) when tested in accordance with ASTM B117 for 500 hours. Exceeds performance requirements of FS TT-P-636:
    - a. Con-Lux: Rust Arrestor 50.
    - b. S-W: Kem Kromik Universal Metal Primer B50NZ6.
    - c. Tnemec: Series P10.
  - 2. Undercoat: Alkyd enamel recommended by manufacturer of finish coat as an intermediate coat over specified primer for application of silicone-alkyd finish coat:
    - a. Con-Lux: FerroX Primer.
    - b. S-W: Silicone Alkyd Enamel B-56 Series.
    - c. Tnemec: Series 23 Enduratone.
  - 3. Finish Coat: Silicone-alkyd enamel with a minimum of 30% silicone content meeting the qualitative requirements of FS TT-E-490:
    - a. Con-Lux: Steel-Master 9500 Series.
    - b. S-W: Silicone Alkyd Enamel B-56 Series.
    - c. Tnemec: Series 82 Silicone-Alkyd Enamel.
  
- P. Ferrous Metal - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils.
  - 1. Primer: Quick-drying, rust-inhibiting primer made for priming ferrous metal under an odorless alkyd enamel (FS TT-P-664):
    - a. Con-Lux: FerroX Primer.
    - b. Devoe: 41820 Bar-Ox Alkyd Shop/Field Primer.
    - c. Moore: Ironclad Retardo Rust-Inhibitive Paint 163
    - d. S-W: Kem Kromik Metal Primer B50N2/B50W1.

2. Undercoat: Enamel undercoat made for use as an undercoat over a primer on ferrous metal under an odorless alkyd enamel:
    - a. Con-Lux: Satin-Lite 900 Series.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
    - c. Moore: Moore's Alkyd Enamel Underbody 217.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
  3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on ferrous metal surfaces (FS TT-E-509):
    - a. Con-Lux: Satin-Lite 900 Series.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel
    - c. Moore: Moore's Satin Impervo Enamel 235.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
- Q. Ferrous Metal - Epoxy, Gloss: Two coats over primer:
1. Primer: Corrosion-inhibitive primer recommended by manufacturer for priming ferrous metal under an epoxy undercoat:
    - a. Con-Lux: Epolon Mastic 36 White.
    - b. Duron: Dura Clad Universal Phenolic Alkyd Fast Dry Metal Primer.
    - c. Moore: IronClad Epoxy Rust Inhibitive Primer
    - d. S-W: Recoatable Epoxy Primer.
  2. Undercoat: Epoxy undercoat made for use as an undercoat over a primer on metal under a gloss epoxy enamel:
    - a. Con-Lux: Epolon Series.
    - b. Duron: Dura Clad Polyamide Epoxy.
    - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
    - d. S-W: ArmorSeal 100HS Series.
  3. Finish Coat:
    - a. Gloss epoxy enamel made for use over a primer and epoxy undercoat on metal surfaces.
      - 1) When the finish coat is applied to a floor surface, add anti-slip aggregate.
    - b. Con-Lux: Epolon Series.
    - c. Duron: Dura Clad Polyamide Epoxy.
    - d. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
    - e. S-W: ArmorSeal 100HS Series.
- R. Zinc-coated Metal - Alkyd, Semigloss: Two coats over primer, with total dry film thickness not less than 2.5 mils.
1. Primer: Galvanized metal primer made for use on zinc-coated (galvanized) metal surfaces (FS TT-P-641), or one of the following:
    - a. Con-Lux: Bond-Plex 46 Barrier Green.
    - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
    - c. Moore: Ironclad Galvanized Metal Latex Primer 155.
    - d. S-W: Industrial Water Based Acrylic Paint B42W110.
  2. Undercoat: Enamel undercoat made for use as an undercoat over a primer on zinc-coated metal under an odorless alkyd enamel:
    - a. Con-Lux: Satin-Lite 900 Series.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
    - c. Moore: Moore's Alkyd Enamel Underbody 217.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
  3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on zinc-coated (galvanized) metal surfaces (FS TT-E-509):
    - a. Con-Lux: Satin-Lite 900 Series.
    - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
    - c. Moore: Moore's Satin Impervo Enamel 235.
    - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.

- S. Zinc-Coated Metal - Silicone-Alkyd, Semigloss: Two coats over factory-applied primer:
1. Primer: Galvanized metal primer used to prime zinc-coated (galvanized) metal surfaces (FS TT-P-641), or one of the following.
    - a. Con-Lux: Bond-Plex 46 Barrier Green.
    - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
    - c. Moore: Ironclad Galvanized Metal Latex Primer #155.
    - d. S-W: Industrial Water Based Acrylic Paint B42W110.
  2. Undercoat: Alkyd enamel recommended by manufacturer of finish coat as an intermediate coat over factory-applied primer for application of silicone-alkyd finish coat:
    - a. Con-Lux: FerroX Primer.
    - b. S-W: Silicone Alkyd Enamel B-56 Series.
    - c. Tnemec: Series 23 Enduratone.
  3. Finish Coat: Silicone-alkyd enamel with a minimum of 30% silicone content meeting the qualitative requirements of FS TT-E-490:
    - a. Con-Lux: Steel-Master 9500 Series.
    - b. S-W: Silicone Alkyd Enamel B-56 Series.
    - c. Tnemec: Series 82 Silicone-Alkyd Enamel.
- T. Zinc-Coated Metal - Epoxy, Gloss: Two coats over primer:
1. Primer: Primer recommended by manufacturer for priming galvanized metal under an epoxy undercoat:
    - a. Con-Lux: Metal Bond 47 Primer.
    - b. Duron:
      - 1) Vinyl Wash Primer for surfaces subject to abrasion;
      - 2) Dura Clad Acrylic Galvanized Metal Primer for surfaces not subject to abrasion.
    - c. Moore: IronClad Galvanized Metal latex Primer.
    - d. S-W: ArmorSeal 100HS Series.
  2. Undercoat: Epoxy undercoat made for use as an undercoat over a primer on metal under a gloss epoxy enamel:
    - a. Con-Lux: Epolon Series.
    - b. Duron: Dura Clad Polyamide Epoxy.
    - c. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
    - d. S-W: ArmorSeal 100HS Series.
  3. Finish Coat;
    - a. Gloss epoxy enamel made for use over a primer and epoxy undercoat on metal surfaces.
      - 1) When the finish coat is applied to a floor surface, add anti-slip aggregate.
    - b. Con-Lux: Epolon Series.
    - c. Duron: Dura Clad Polyamide Epoxy.
    - d. Moore: IronClad Chemical and Water Resistant Epoxy Enamel.
    - e. S-W: ArmorSeal 100HS Series.
- U. Non-Ferrous Metal - Alkyd, Semigloss: Two coats over primer with total dry film thickness not less than 2.5 mils.
1. Primer: Corrosion inhibitive primer recommended by manufacturer for priming non-ferrous metal under an odorless alkyd enamel:
    - a. Con-Lux: Bond-Plex 46 Barrier Green.
    - b. Devoe: 13201 Mirrolac Galvanized Metal Primer.
    - c. Moore: Ironclad Retardo Rust-Inhibitive Paint 163.
    - d. S-W: Kem Kromik Metal Primer B50N2/B50W1.
  2. Undercoat: Enamel undercoat made for use as an undercoat over a primer on non-ferrous metal under an odorless alkyd enamel:

- a. Con-Lux: Satin-Lite 900 Series.
  - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
  - c. Moore: Moore's Alkyd Enamel Underbody 217.
  - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100 Series.
3. Finish Coat: Semigloss odorless alkyd enamel made for use over a primer and undercoat on non-ferrous metal surfaces (FS TT-E-509):
- a. Con-Lux: Satin-Lite 900 Series.
  - b. Devoe: 26XX Velour Alkyd Semigloss Enamel.
  - c. Moore: Moore's Satin Impervo Enamel 235.
  - d. S-W: Pro-Mar Alkyd Semi-Gloss Enamel B34WZ1100
- V. Cotton or Canvas Covering over Insulation - Latex, Flat: 2 coats.
1. Undercoat: Flat latex-based paint with fungicidal agent added (to render fabric mildew-proof) made for use as a sealing coat (size) on cotton or canvas covering over insulation:
- a. Con-Lux: Wall-Plex 400 Series.
  - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
  - c. Moore: Regal Wall Satin 215.
  - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.
2. Finish Coat: Flat latex-based paint with fungicidal agent added (to render fabric mildew-proof) made for use as a sealing coat (size) on cotton or canvas covering over insulation:
- a. Con-Lux: Wall-Plex 400 Series.
  - b. Devoe: 36XX Wonder-Tones Latex Flat Wall Paint.
  - c. Moore: Regal Wall Satin 215.
  - d. S-W: Pro-Mar 200 Latex Flat Wall Paint B30W200 Series.

## **PART 3 - EXECUTION**

### **3.01 PREPARATORY WORK:**

- A. Inspect surfaces for their suitability to receive a finish. In the event that imperfections due to materials or workmanship appear on surfaces, make the appropriate corrections at no additional cost to the Authority. Correct damage to painted or decorated finishes due to carelessness or negligence of other trades.
- B. Protect hardware, hardware accessories, plates, lighting fixtures and similar items installed prior to painting; remove protection upon completion of each space. Where necessary to remove installed products to ensure their protection, arrange for removal and reinstallation by mechanics of the trade involved. Disconnect equipment adjacent to walls; where necessary, move to permit painting of wall surfaces, and following completion of painting, replace and reconnect.
- C. Clean surfaces to be painted as necessary to remove dust and dirt. Sand as necessary to properly prepare surfaces to receive paint or varnish.
- D. Wash metal surfaces with benzine or mineral spirits to remove dirt, oil or grease before applying paint. Where rust or scale is present, wire brush or sandpaper clean before painting. Apply galvanized metal primer to degreased galvanized metal before applying additional coats.
- E. Prepare masonry surfaces to be painted by removing dirt, dust, oil and grease stains and efflorescence. The method of surface preparation is at the discretion of the Contractor provided that the results are approved. Clean masonry and plaster surfaces to be painted

until they are free from alkali and thoroughly dry before applying paint. Test masonry and plaster surfaces for alkali, using red litmus paper, prior to painting.

- F. Clean concrete surfaces free from dirt, or film left from form oil or concrete curing compounds, or loose or excess mortar. Steam clean or wash the surfaces with water. Use cleaning additive with discretion, in accordance with paint manufacturer's recommendation and to the satisfaction of Engineer.
- G. Cut out cracks, scratches and other imperfections in plaster surfaces as required, fill with spackling compound and sand flush with adjacent surface. Fill voids in concrete with cement grout before painting.
- H. Fill nail holes and cracks after first coat with non-shrinking putty of a color to match that of the finish.
- I. Sand, dust and touch up scratches, abrasions or other disfigurements and remove foreign matter from prime coats before proceeding with the following coat. Featheredge spotpriming or spot coating into adjacent coatings to produce a smooth and level surface.
- J. Test concrete and plaster surfaces for moisture, using moisture meter, prior to painting. Do not apply paint to surfaces having meter reading above 15.
- K. Caulk joints between door and window frames and walls, and other joints as necessary.
- L. Coordinate the work of this section with the work of other trades.

### **3.02 APPLICATION:**

- A. Touch-up painting of structural steel, miscellaneous metal, hollow-metal doors and frames, and other materials which have been prime coated as may be required where the shop coat has been damaged by welding or abrasion during the handling and erection operations; also rivets, bolts and welds which are unpainted after assembly and erection.
- B. Apply paint by spray in accordance with the manufacturer's directions to achieve required dry film thickness (DFT). Where specifically approved by the Engineer, use rollers or brushes as best suited for material being applied. For covers on rollers use carpet with velvet back and high-pile sheep's wool or use short-hair covers, as best suited for material and texture specified. Except where otherwise noted, apply paint to a minimum dry-film thickness (DFT) of five mils, excluding filler coats, using no less than the number of coats specified in Part 2 – Products.
- C. Apply material evenly and smoothly without runs, sags or other defects with edges of paint adjoining other materials or color sharp and clean, without overlapping.
- D. Do not paint and finish while surfaces are damp. Allow sufficient time between coats, in accordance with manufacturer's directions to produce an evenly smooth finish.
- E. Do not apply final coats until after other trades, whose operations would be detrimental to finish painting, have finished their work in the areas to be painted and the areas have been approved for painting.

### **3.03 PROTECTION:**

- A. Dispose of soiled cleaning rags and waste at the close of each day's work or store such soiled rags and waste in metal containers with tight-fitting covers. Provide buckets of sand

during painting operations for use in the event of fire. Post NO SMOKING signs as necessary and as directed.

- B. Protect the work of other trades against damage or injury by use of suitable covering during the progress of the painting and finishing work. Repair damage to the satisfaction of the Engineer.

**3.04 CLEANING:**

- A. Upon completion of work, remove staging, scaffolding and containers from the site. Remove paint spots, oil or stains from glass, floors and other surfaces not to be painted, and leave job clean and acceptable to the Engineer.

**3.05 COLOR CODING OF PIPING AND EQUIPMENT:**

- A. General Requirements:
  - 1. Color coding is required for accessible piping systems and related equipment, except associated supports, brackets, hangers and similar accessories.
  - 2. Identify piping systems and related equipment which are to be color coded as follows:
    - a. Apply color to entire length of piping.
    - b. Apply lettered legends indicating the name of the contents of the system as specified.
- B. Location of Legends and Bands:
  - 1. Stencil lettered legends on the piping at the horizontal or vertical centerline. Where pipe lines are too close together and where located above the operator's normal line of vision, place the lettering below the horizontal centerline at a point which will be easily visible.
  - 2. Locate lettered legends and bands at points where pipes enter and leave rooms or spaces, at junction points and points of distribution, close to valves and equipment, at changes in direction, and at intervals along piping where necessary for identification.
  - 3. Stencil piping in accordance with ASME A13.1 and as follows to show service and direction of flow, space within sight of each other and not more than 40 feet apart on long runs.
- C. Size of Stencil Letters for Piping Identification:

Outside Diameter of Pipe Covering in Inches	Size of Letter in Inches	Width of Color Band in Inches
3/4 to 1-1/4	1/2	4
1-1/2 to 2-1/2	3/4	6
3 to 6	1-1/4	8
7 to 10	2-1/2	12
Over 10	3-1/2	12

D. Schedule of Colors and Legends:

Line	Pipe Color	Black Stenciled Legend
Hot water lines	Yellow	HW, HWR
Potable cold water lines	Blue	CW
Chilled water lines	Blue with yellow band	CHWS, CHWR
Fire lines	Red	F (use White Stencil instead of black)
Condensate lines	White	C
Condenser water lines	White with blue band	CWS, CWR
Soil and waste lines	White	S
Vent lines	Grey with white band	V
Storm Water lines	White	ST-W
Air and control air lines	Green	A

**DIVISION 10 - SPECIALTIES**

10155	TOILET PARTITIONS, COMPARTMENTS AND SCREENS
10180	STONE TOILET COMPARTMENT AND SCREENS
10200	METAL LOUVERS
10505	METAL LOCKERS
10605	WIRE MESH PARTITIONS
10810	TOILET ACCESSORIES

**END OF SECTION**

## SECTION 10155

### TOILET COMPARTMENTS AND SCREENS

#### PART1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing metal toilet compartments, urinal screens and metal screens for portable eye wash and body spray.
- B. Related Work Specified Elsewhere:
  - 1. Toilet Accessories: Section 10810.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For each type and style of toilet compartment and screen specified include details of construction relative to materials, fabrication, and installation. Include details of anchors, hardware, and fastenings.
  - 2. Shop Drawings: For fabrication and installation of toilet compartment and screen assemblies. Include plans, elevations, sections, details, and attachments to other work. Submit prior to ordering materials or beginning fabrication.
    - a. Show locations of reinforcement and cutouts for compartment-mounted toilet accessories.
    - b. Samples for Verification:
      - 1) Three of each type of the following products used in the Work:
        - a) Hardware.
        - b) Sheet metal: Three inches by five inches.
      - 2) Approved full-size samples will be returned and may be used in the Work.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ADA: Americans with Disabilities Act.
  - 3. ASTM: A666.
  - 4. NAAMM: Metal Finishes Manual for Architectural and Metal Products.
- B. Manufacturer Qualifications: Provide products of an established manufacturer regularly engaged in the production of toilet accessories.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver the products to the job site in original unopened containers clearly labeled with the manufacturer's name, brand designation and type as applicable.
- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

##### 1.05 PROJECT CONDITIONS:

- A. Field Measurements: Verify dimensions in areas of installation by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work
  - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating units without field measurements. Coordinate supports, adjacent construction, and fixture locations to ensure actual dimensions correspond to established dimensions.

## **PART 2- PRODUCTS**

### **2.01 MANUFACTURERS:**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
- B. Ampco Products, Inc.
- C. General Partitions Mfg. Corp.
- D. Global Steel Products Corp.
- E. Knickerbocker Partition Corporation.
- F. Sanymetal
- G. Or equal.

### **2.02 MATERIALS:**

- A. General: Provide materials that have been selected for surface flatness and smoothness. Exposed surfaces that exhibit pitting, seam marks, roller marks, stains, discolorations, telegraphing of core material, or other imperfections on finished units are unacceptable.
- B. Stainless-Steel Sheet: ASTM A666, Type 302 or 304, that is leveled to stretcher-leveled flatness, finished on exposed faces as indicated in the "Stainless-Steel Sheet Finishes" Article, and of the following minimum thicknesses:
  - 1. Pilasters (Overhead Braced): 0.0375 inch.
  - 2. Pilasters (Unbraced): 0.0500 inch.
  - 3. Panels and Screens: 0.0312 inch.
  - 4. Doors: 0.0312 inch.
  - 5. Tapping Reinforcement: 0.0781 inch.
- C. Core Material for Metal-Faced Units: Manufacturer's standard sound-deadening honeycomb of resin-impregnated kraft paper in thickness required to provide finished thickness of 1 inch minimum for doors, panels, and screens and 1-1/4 inches minimum for pilasters.
- D. Pilaster Shoes and Sleeves (Caps): ASTM A666, Type 302 or 304 stainless steel, not less than 0.0312 inch thick and 3 inches high, finished to match hardware.
- E. Stirrup Brackets: Manufacturer's standard ear or U-brackets for attaching panels and screens to walls and pilasters of the following material:
  - 1. Material: Stainless steel.
  - 2. Material: Chrome-plated brass.

- F. Full-Height (Continuous) Brackets: Manufacturer's standard design for attaching panels and screens to walls and pilasters of the following material:
  - 1. Material: Stainless steel.
  - 2. Material: Chrome-plated brass.
- G. Hardware and Accessories: Manufacturer's standard design, heavy-duty operating hardware and accessories of the following material:
  - 1. Material: Stainless steel.
  - 2. Material: Chrome-plated brass.
- H. Overhead Bracing: Manufacturer's standard continuous, extruded-aluminum head rail with antigrip profile in manufacturer's standard finish.
- I. Anchorages and Fasteners: Manufacturer's standard exposed fasteners of stainless steel or chrome-plated steel or brass, finished to match hardware, with theft-resistant-type heads. Provide sex-type bolts for through-bolt applications. For concealed anchors, use hot-dip galvanized or other rust-resistant, protective-coated steel.

**2.03 COMPARTMENT AND SCREEN FABRICATION:**

- A. General: Provide standard doors, panels, screens, and pilasters fabricated for compartment system. Provide units with cutouts and drilled holes to receive compartment-mounted hardware, accessories, and grab bars, as indicated.
  - 1. Provide internal reinforcement in metal units for compartment-mounted hardware, accessories, and grab bars.
- B. Metal-Faced Toilet Compartments and Screens: Pressure laminate seamless face sheets to core material and provide continuous, interlocking molding strip or lapped and formed edges. Seal corners by welding or clips. Grind exposed welds smooth.
- C. Overhead-Braced-and-Floor-Anchored Compartments: Provide manufacturer's standard corrosion-resistant supports, leveling mechanism, fasteners, and anchors at pilasters to suit floor conditions. Make provisions for setting and securing continuous head rail at top of each pilaster. Provide shoes at pilasters to conceal supports and leveling mechanism.
- D. Floor-Anchored Compartments: Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with threaded rods, lock washers, and leveling adjustment nuts at pilasters for structural connection to floor. Provide shoes at pilasters to conceal anchorage.
- E. Ceiling-Hung Compartments: Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with threaded rods, lock washers, and leveling adjustment nuts at pilasters for connection to structural support above finished ceiling. Provide assemblies that support pilasters from structure without transmitting load to finished ceiling. Provide sleeves (caps) at tops of pilasters to conceal anchorage.
  - 1. Provide manufacturer's standard 4-inch-high, overhead cross bracing.
- F. Floor-and-Ceiling-Anchored Compartments: Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with leveling adjustment at tops and bottoms of pilasters. Provide shoes and sleeves (caps) at pilasters to conceal anchorage.
- G. Wall-Hung Urinal Screens and Eyewash Screens: Provide units 18 inches wide by 42 inches high, nominal, or of size as indicated of same construction and finish as compartment panels, unless otherwise indicated.

1. Provide metal-faced screens with integral full-height flanges for attachment to wall.
- H. Floor-Anchored Screens: Provide pilasters and panels of same construction and finish as toilet compartments. Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with threaded rods, lock washers, and leveling adjustment nuts at pilasters for structural connection to floor. Provide shoes at pilasters to conceal anchorage.
- I. Ceiling-Hung Screens: Provide pilasters and panels of same construction and finish as toilet compartments. Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with threaded rods, lock washers, and leveling adjustment nuts at pilasters for connection to structural support above finished ceiling. Provide assemblies that support pilasters from structure without transmitting load to finished ceiling. Provide sleeves (caps) at tops of pilasters to conceal anchorage.
- J. Floor-and-Ceiling-Anchored Screens: Provide pilasters and panels of same construction and finish as toilet compartments. Provide manufacturer's standard corrosion-resistant anchoring assemblies complete with leveling adjustment at tops and bottoms of pilasters. Provide shoes and sleeves (caps) at pilasters to conceal anchorage.

#### **2.04 DOOR FABRICATION:**

- A. General: Unless otherwise indicated, provide 24-inch-wide in-swinging doors for standard toilet compartments and 36-inch-wide out-swinging doors with a minimum 32-inch-wide clear opening for compartments indicated to be handicapped accessible.
- B. Hardware: Provide doors with the following:
1. Hinges: Manufacturer's standard self-closing type that can be adjusted to hold door open at any angle up to 90 degrees.
  2. Latch: Concealed latch unit designed for emergency access. Provide units that comply with accessibility requirements of authorities having jurisdiction at compartments indicated to be handicapped accessible.
  3. Combination Stop/Keeper.
  4. Coat Hook: Manufacturer's standard combination hook and rubber-tipped bumper, sized to prevent door from hitting compartment-mounted accessories.
  5. Door Pull: Manufacturer's standard unit that complies with accessibility requirements of authorities having jurisdiction at out-swinging doors. Provide units on both sides of doors at compartments indicated to be handicapped accessible.

#### **2.05 STAINLESS-STEEL SHEET FINISHES:**

- A. General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations relative to applying and designating finishes.
1. Remove or blend tool and die marks and stretch lines into finish.
  2. Grind and polish surfaces to produce uniform, directional textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- B. Finish: Manufacturer's standard No. 4 directional polish.
- C. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
- D. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.

### **PART 3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Verify dimensions before proceeding and obtain measurements at the structure for work to be accurately fitted to other construction, including wall-to-wall dimensions, floor-to-ceiling dimensions and those controlled by other trades.
- B. Examine surfaces and parts of structure to which work is to be applied. Notify the Engineer of defects or conditions detrimental to proper installation so that remedial measures may be accomplished by trades involved.
- C. Remove foreign substances from surfaces to receive specified work.

### **3.02 INSTALLATION:**

- A. General: Install units to the adjoining construction as shown on Contract Drawings and approved shop drawings.
- B. General: Comply with manufacturer's written installation instructions. Install units rigid, straight, plumb, and level. Provide clearances of not more than 1/2inch between pilasters and panels and not more than 1 inch between panels and walls. Secure units in position with manufacturer's recommended anchoring devices.
  - 1. Secure panels to walls and panels with not less than 2 stirrup brackets attached near top and bottom of panel. Locate wall brackets so holes for wall anchors occur in masonry or tile joints. Align brackets at pilasters with brackets at walls.
- C. Overhead-Braced-and-Floor-Anchored Compartments: Secure pilasters to floor and level, plumb, and tighten. Secure continuous head rail to each pilaster with not less than 2 fasteners. Hang doors level and plumb without twist or warp and adjust so tops of doors are parallel with overhead brace when doors are in closed position and with maximum clearance of 3/16-inch at vertical edges.
- D. Floor-Anchored Compartments: Set pilaster units with anchors penetrating not less than 2 inches into structural floor, unless otherwise indicated in manufacturer's written instructions. Level, plumb, and tighten pilasters. Hang doors level and plumb without twist or warp and adjust so tops of doors are parallel with overhead brace when doors are in closed position and with maximum clearance of 3/16-inch at vertical edges.
- E. Ceiling-Hung Compartments: Secure pilasters to supporting structure and level, plumb, and tighten. Hang doors level and plumb without twist or warp and adjust so tops of doors are parallel with overhead brace when doors are in closed position and with maximum clearance of 3/16-inch at vertical edges.
- F. Floor-and-Ceiling-Anchored Compartments: Secure pilasters to supporting construction and level, plumb, and tighten. Hang doors level and plumb without twist or warp and adjust so tops of doors are parallel with overhead brace when doors are in closed position and with maximum clearance of 3/16-inch at vertical edges.
- G. Screens: Attach with anchoring devices according to manufacturer's written instructions and to suit supporting structure. Set units level and plumb and to resist lateral impact.
- H. Clean finished surfaces according to manufacturer's written instructions and leave them free from imperfections. Touch up marred painted surfaces with matching materials furnished by manufacturer.

- I. After installation, Provide final protection and maintain conditions that ensure toilet compartments and screens are without damage or deterioration at the time of Substantial Completion.

**3.03 TESTING AND ADJUSTING OF COMPLETED WORK:**

- A. Hardware:
  - 1. Test proper operation of hardware by opening and closed each door through ten cycles.
  - 2. Adjust and lubricate hardware according to manufacturer's written instructions for proper operation.
  - 3. Set hinges on in-swinging doors to hold open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors and swing doors in entrance screens to return to fully closed position.
  - 4. Adjust, repair or replace malfunctioning hardware.

**3.04 CLEANING:**

- A. Leave areas surrounding the work in broom-clean condition.

**END OF SECTION**

## SECTION 10180

### STONE TOILET COMPARTMENTS AND SCREENS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing floor-anchored stone toilet compartments, urinal screens and accessories.
- B. Related Work Specified Elsewhere:
  - 1. Seals and Sealants: Section 07900.
  - 2. Toilet Compartments & Shields: Section 10155.
  - 3. Toilet Accessories: Section 10810.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For each variety of stone, stone accessory, door, hardware, fitting, and other manufactured product specified.
    - a. For stone varieties, include data on physical properties required by referenced ASTM standards.
    - b. For doors, hardware, and fittings, include details of construction relative to materials, dimensions of individual components, profiles, and finishes.
  - 2. Shop Drawings: Show details of fabrication and installation of compartments and screens, including plans; elevations; sections; details of anchorages and attachments to other work; dimensions of stone units; and locations of fittings, doors, hardware, and compartment-mounted accessories.
  - 3. Door Samples for Initial Selection: Manufacturer's color charts consisting of sections of actual units showing the full range of colors, textures, and patterns available for each type of compartment door indicated.
  - 4. Sealant Samples for Initial Selection: Manufacturer's standard bead samples of actual products showing the full range of colors available for sealant.
  - 5. Samples for Verification: Three of each type of the following products used in the Work, in sizes indicated:
    - a. Stone: Sets for each color, grade, finish, and variety of stone required; not less than 12 inches square. Include two or more samples in each set showing the full range of variations in appearance characteristics expected in the completed Work.
    - b. Hardware and Fittings: Full-size samples of each hardware and fitting item required.
    - c. Sealant: Manufacturer's standard size sample for each type and color of joint sealant required.
  - 6. Maintenance Data: For stone to include precautions for cleaning materials and methods that could be detrimental to finishes and performance.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of the jurisdictional authorities.
  - 2. ADA: Americans with Disabilities Act.
  - 3. ASTM: A666, C503.
  - 4. MIA: Dimension Stone-Design Manual IV.

- B. Installer Qualifications: Engage an experienced installer who has completed stone toilet compartments similar in material, design, and extent to those indicated for this Project and with a record of successful in-service performance.
- C. Fabricator Qualifications: Engage an experienced fabricator who has fabricated stone for toilet compartments similar in material, design, and extent to those indicated for this Project and with a record of successful in-service performance.
- D. Source Limitations for Stone: Obtain each variety of stone from a single quarry with resources to provide materials of consistent quality in appearance and physical properties and to cut and finish material without delaying the Work.

#### **1.04 DELIVERY, STORAGE, AND HANDLING:**

- A. Deliver materials to Project site in undamaged condition.
- B. Store and handle stone and related materials to prevent deterioration or damage due to moisture, temperature changes, contaminants, corrosion, breakage, chipping, or other causes.
- C. Stack or brace stone on edge on leveled and adequate A-frames in a manner that prevents undue stresses in stone, chipping, cracking, and breaking. If exposed to moisture, cover stone with nonstaining, waterproof membrane.

#### **1.05 PROJECT CONDITIONS:**

- A. Field Measurements: Verify dimensions in areas of installation by field measurements before stone fabrication and indicate measurements on Shop Drawings. Coordinate stone fabrication schedule with construction progress to avoid delaying the Work.
  - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating stone units without field measurements. Coordinate supports, adjacent construction, and fixture locations to ensure actual dimensions correspond to established dimensions.

### **PART 2 - PRODUCTS**

#### **2.01 MANUFACTURERS:**

- A. Available Product: Subject to compliance with requirements, a product that may be incorporated into the Work includes, but is not limited to, "Marblstal" by Georgia Marble Company.

#### **2.02 MATERIALS:**

- A. Stone, General: Provide stone free of cracks, defects, geological flaws, and voids. Provide material that has been selected for surface flatness, smoothness, and uniform visual quality.
- B. Marble: ASTM C503, MIA Group A soundness classification. Polished with a hardness of Ha16 and absorption of 0.09 percent.
  - 1. Color: As selected by Engineer from manufacturer's full range of colors.
- C. Dowels: Provide 1/4-inch-diameter dowels fabricated from stainless steel, ASTM A666, Type 304. Furnish templates for positioning anchoring holes in structural supporting members.

- D. Brackets: Chrome-plated forged brass 1-3/4 by 1-3/4 inch by 1-1/4-long angle brackets capable of supporting stone units in bracket configuration indicated.
- E. Hardware: Manufacturer's standard design, stainless steel or chrome plated brass, heavy-duty operating hardware and accessories. Smooth and finished wherever visible; theft-resistant, permitting removal only by special tool. Furnish two such tools.
- F. Exposed Anchorages and Fasteners: Manufacturer's standard design, stainless steel or chrome-plated brass fasteners, finished to match hardware, with theft-resistant-type heads. Provide sex-type through bolts with theft-resistant spanner heads and threaded brass rods for attachments to stone.
- G. Doors: Manufacturer's standard polyurethane varnished one-inch thick solid hardwood or solid core hardwood flush doors with 3/4-inch particle board core and hardwood edge bands bonded on all four edges.
- H. Stone Sealer: Sealer recommended by fabricator and sealer manufacturer for protecting stone from surface staining and suitable for stone finish indicated.
- I. Sealant: Nonstaining, compatible sealant recommended by stone fabricator for stone varieties and joints indicated.

### **2.03 STONE FABRICATION:**

- A. General: Provide manufacturer's standard sizes and shapes of panels, screens, and stiles.
  - 1. For marble, comply with recommendations of MIA's "Dimension Stone--Design Manual IV."
- B. Cut stone to produce sizes and shapes indicated with surfaces not varying more than 1/32-inch from true plane. Provide even (gaged) thicknesses indicated, but not less than the following actual thicknesses:
  - 1. Panels and Screens: 7/8 inch.
    - a. Stiles: 1-1/4 inches.
- C. Cut stone so that, when installed, veining will be approximately vertical.
- D. Cut and drill sinkages and holes in stone for anchors and fasteners as indicated or needed to set stone securely in place. Drill holes for compartment-mounted accessories.
- E. Finish exposed faces and edges of stone to comply with requirements indicated for finish under each type of stone required and to match approved samples. Provide stone with eased, exposed edges.
- F. Urinal Screens: Provide units 18 inches wide by 42 inches high, nominal, or of size as indicated of same construction and finish as compartment panels with floor cutout as approved from manufacturer's standard option.

### **2.04 DOOR FABRICATION:**

- A. General: Unless otherwise indicated, provide 24-inch-wide in-swinging doors for standard toilet compartments and 36-inch-wide out-swinging doors with a minimum 32-inch-wide clear opening for compartments indicated to be handicapped accessible.
- B. Hardware: Provide doors with the following:
  - 1. Hinges: Manufacturer's standard spring or gravity-type top and bottom hinges.

2. Latch: Concealed latch unit designed for emergency access. Provide units that comply with accessibility requirements of authorities having jurisdiction at compartments indicated to be handicapped accessible.
3. Combination Stop/Keeper.
4. Coat Hook: Manufacturer's standard combination hook and rubber-tipped bumper, sized to prevent door from hitting compartment-mounted accessories.
5. Door Pull: Manufacturer's standard unit that complies with accessibility requirements of authorities having jurisdiction at out-swinging doors. Provide units on both sides of doors at compartments indicated to be handicapped accessible.

### **PART 3 - EXECUTION**

#### **3.01 EXAMINATION:**

- A. Examine substrates, areas, and conditions under which stone toilet compartments and screens will be installed, with Installer present, for compliance with requirements. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Coordinate layout and installation of supports, inserts, and anchors built into other units of work for stone toilet compartment and screen anchorage.

#### **3.02 INSTALLATION:**

- A. Set stone to comply with requirements indicated. Install anchors, fasteners, and other attachments indicated or necessary to secure stone in place. Shim and adjust anchors and supports to set stone accurately in locations indicated with uniform joints of widths indicated and with edges and faces aligned.
- B. Secure stone panels to walls and stiles with no fewer than 3 brackets. Provide back-to-back brackets at stile connections to walls and intermediate panels and at panel and screen connections to walls. Use through-bolt fasteners to attach brackets to stone. At wall connections, provide fasteners suitable for supporting construction.
- C. Do not allow stone to come in contact with plumbing sealant or putty.
- D. Floor-Anchored Units: Anchor units to floor rigid, level, and plumb. Hang doors and adjust so tops of doors are level with tops of stiles when doors are in closed position.
  1. Floor Anchorage: Set units into finished floor as indicated. Secure units with dowels epoxied into unit and structural floor in locations indicated, but not less than 2 dowels per unit. Provide minimum 1-inch dowel penetration of structural floor.
- E. Prepare joints and apply sealants at locations indicated to comply with applicable requirements of Section 07900.

#### **3.03 ADJUSTING AND CLEANING:**

- A. Hardware Adjustment: Adjust and lubricate hardware according to hardware manufacturer's written instructions for proper operation. Set hinges on in-swinging doors to hold open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors and swing doors in entrance screens to return to fully closed position.
- B. Clean stone using clean water and methods recommended by MIA. Do not use wire brushes, acid-type cleaning agents, cleaning compounds with caustic or harsh fillers, or other materials or methods that could damage stone.

- C. Seal stone surfaces according to sealer manufacturer's written instructions.

**3.04 PROTECTION:**

- A. Provide final protection and maintain conditions, in a manner acceptable to fabricator and Installer, that ensure stone toilet compartments and screens are without damage or deterioration at the time of Substantial Completion..

**END OF SECTION**

## SECTION 10200

### METAL LOUVERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing fixed, extruded aluminum and formed-metal louvers, blank-off panels and accessories.
- B. Related Work Specified Elsewhere:
  - 1. Seals and Sealants: Section 07900.
  - 2. Metal Doors and Frames: Section 08110.
  - 3. Field Painting: Section 09920.

##### 1.02 DEFINITIONS:

- A. Louver Terminology: Definitions of terms for metal louvers contained in AMCA 501 apply to this Section, unless otherwise defined in this Section or in referenced standards.
- B. Standard Free Area: Free area of a louver 48 inches wide by 48 inches high, identical to that provided.
- C. Maximum Standard Airflow: Airflow at point of beginning water penetration through a louver 48 inches wide by 48 inches high, identical to that provided.
- D. Drainable-Blade Louver: Louver designed to collect and drain water to exterior at sill by means of gutters in front edges of blades and channels in jambs and mullions.

##### 1.03 PERFORMANCE REQUIREMENTS:

- A. Structural Performance: Provide exterior metal louvers capable of withstanding the effects of loads and stresses from wind and normal thermal movement without evidencing permanent deformation of louver components including blades, frames, and supports; noise or metal fatigue caused by louver blade rattle or flutter; or permanent damage to fasteners and anchors.
  - 1. Wind Load: Uniform pressure (velocity pressure) of 20 lbf/sq. ft., acting inward or outward.
  - 2. Thermal Movements: Provide louvers that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, and other detrimental effects:
    - a. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- B. Air-Performance, Water-Penetration, and Air-Leakage Ratings: Provide louvers complying with performance requirements indicated, as demonstrated by testing manufacturer's stock units 48 inches wide by 48 inches high. Test units according to AMCA 500.
  - 1. Perform testing on unpainted, cleaned, degreased units.
  - 2. Perform water-penetration testing on louvers without screens.

##### 1.04 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

1. Product Data: For each type of product specified provide manufacturer's printed product information.
2. Shop Drawings: For louver units and accessories. Include plans; elevations; sections; and details showing profiles, angles, and spacing of louver blades. Show unit dimensions related to wall openings and construction; free area for each size indicated; profiles of frames at jambs, heads, and sills; and anchorage details and locations.
  - a. For installed louvers and vents indicated to comply with design loadings, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
3. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for units with factory-applied color finishes.
4. Samples for Verification: Of each type of metal finish required, prepared on Samples of same thickness and material indicated for final Work. Where finishes involve normal color and texture variations, include Sample sets showing the full range of variations expected.
5. Product Certificates: Signed by manufacturers of louvers certifying that the products furnished comply with requirements and are licensed to bear the AMCA seal based on tests made according to AMCA 500 and complying with AMCA's Certified Ratings Program.

#### **1.05 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Codes and regulations of the jurisdictional authorities.
  2. AAMA: 603.8, 605.2, 607.1.
  3. AMCA: 500, 501.
  4. ASTM: A653, a780, B26, B209, B221, C612, D1187.
  5. AWS: D1.2, D1.3.
  6. NAAMM: Metal Finishes Manual for Architectural and Metal Products.
  7. SMACNA: Architectural Sheet Metal Manual.
  8. SSPC: Paint 12.
- B. Codes, Regulations, Reference Standards and Specifications:
  9. Codes and regulations of the jurisdictional authorities.
  10. ASTM:
  11. AWS: D1.2., D1.3.
  12. NAAMM: Metal Finishes Manual for Architectural and Metal Products.SMACNA: Architectural Sheet Metal Manual.
- B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of kind indicated. Engineering services are defined as those performed for installations of louvers that are similar to those indicated for this Project in material, design, and extent.
- C. Source Limitations: Obtain louvers and vents through one source from a single manufacturer where alike in one or more respects regarding type, design, or factory-applied color finish.
- D. Welding Standards: As follows:
  1. Comply with AWS D1.2, "Structural Welding Code--Aluminum."
  2. Comply with AWS D1.3, "Structural Welding Code--Sheet Steel." Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone re-certification.

- E. SMACNA Standard: Comply with SMACNA's "Architectural Sheet Metal Manual" recommendations for fabrication, construction details, and installation procedures.

#### **1.06 PROJECT CONDITIONS:**

- A. Field Measurements: Verify louver openings by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
  - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish opening dimensions and proceed with fabricating louvers without field measurements. Coordinate construction to ensure that actual opening dimensions correspond to established dimensions.

### **PART 2 -PRODUCTS**

#### **2.01 MATERIALS:**

- A. Aluminum Extrusions: ASTM B221, alloy 6063-T5 or T-52
- B. Aluminum Sheet: ASTM B209, alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish
- C. Aluminum Castings: ASTM B26/B26M, alloy 319.
- D. Galvanized Sheet Steel: ASTM A653/A653M, G90 zinc coating, mill phosphatized.
- E. Fasteners: Of same basic metal and alloy as fastened metal or 300 series stainless steel, unless otherwise indicated. Do not use metals that are incompatible with joined materials.
  - 1. Use types and sizes to suit unit installation conditions.
  - 2. Use Phillips flat-head screws for exposed fasteners, unless otherwise indicated.
- F. Anchors and Inserts: Of type, size, and material required for loading and installation indicated. Use nonferrous metal or hot-dip galvanized anchors and inserts for exterior installations and elsewhere as needed for corrosion resistance. Use toothed steel or expansion bolt devices for drilled-in-place anchors.
- G. Bituminous Paint: Cold-applied asphalt mastic complying with SSPC-Paint 12 but containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D1187.

#### **2.02 FABRICATION, GENERAL:**

- A. Assemble louvers in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
  - 1. Continuous Vertical Assemblies: Where height of louver units exceeds fabrication and handling limitations, fabricate units to permit field-bolted assembly with close-fitting joints in jambs and mullions, reinforced with splice plates and without interrupting blade-spacing pattern.
- B. Maintain equal louver blade spacing to produce uniform appearance.
- C. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining materials' tolerances, and perimeter sealant joints.
- D. Include supports, anchorages, and accessories required for complete assembly. Provide vertical mullions of type and at spacings indicated, but not more than recommended by

manufacturer, or 72 inches o.c., whichever is less. At horizontal joints between louver units, provide horizontal mullions, unless continuous vertical assemblies are indicated.

- E. Provide sill extensions and loose sills made of same material as louvers where indicated or required for drainage to exterior and to prevent water penetrating to interior.
- F. Join frame members to one another and to fixed louver blades with fillet welds, threaded fasteners, or both, as standard with louver manufacturer, concealed from view; unless otherwise indicated or size of louver assembly makes bolted connections between frame members necessary.

### **2.03 FIXED, EXTRUDED-ALUMINUM LOUVERS:**

- A. Louver Construction: Provide fixed-blade louvers with extruded-aluminum frames and blades.
- B. Horizontal Louvers: Either drainable- or nondrainable-blade (as indicated) type complying with the following:
  - 1. Louver Depth: As indicated.
  - 2. Frame Thickness: 0.125 inch, or as indicated.
  - 3. Blade Thickness: 0.125 inch, or as indicated.
  - 4. Performance Requirements: As indicated.
  - 5. AMCA Seal: Mark units with AMCA Certified Ratings Seal.
- C. Continuous, Horizontal, Drainable-Blade Louvers: Fabricated with close-fitting, field-made splice joints in blades designed to permit expansion and contraction without deforming blades or framework and with mullions recessed from front edges of blades so blades have continuous appearance.
  - 1. Louver Depth: As indicated.
  - 2. Frame Thickness: 0.125 inch, or as indicated.
  - 3. Blade Thickness: 0.125 inch, or as indicated.
  - 4. Blade Profile: As indicated.
  - 5. Blade Angle and Spacing: As indicated.

### **2.04 FIXED, FORMED-METAL LOUVERS:**

- A. Louver Construction: Provide fixed-blade louvers with frames and blades formed from metal sheet of metal indicated.
- B. Horizontal Louvers: Either drainable- or nondrainable-blade type (as indicated) complying with the following:
  - 1. Louver Depth: As indicated.
  - 2. Frame and Blade Material: Galvanized steel sheet, 0.052 inch.
  - 3. Performance Requirements: As indicated.

### **2.05 LOUVER SCREENS:**

- A. General: Provide each exterior louver with louver screens complying with the following requirements:
  - 1. Screen Location for Fixed Louvers: Interior face.
  - 2. Screening Type: Bird screening, unless otherwise indicated.
  - 3. Screening Type: Insect screening, as indicated.
- B. Secure screens to louver frames with stainless-steel machine screws, spaced a maximum of 6 inches from each corner and at 12 inches o.c.

- C. Louver Screen Frames: Fabricate screen frames with mitered corners to louver sizes indicated and to comply with the following requirements:
  - 1. Metal: Same kind and form of metal as indicated for louver to which screens are attached..
    - a. Reinforce extruded-aluminum screen frames at corners with clips.
  - 2. Finish: Same finish as louver frames to which louver screens are attached.
  - 3. Type: Rewirable frames with a driven spline or insert for securing screen mesh.
- D. Louver Screening for Aluminum Louvers: As follows:
  - 1. Bird Screening: Aluminum, ½-inch-square mesh, 0.063-inch wire
  - 2. Insect Screening: Aluminum, 18-by-16 mesh, 0.012-inch wire.
- E. Louver Screening for Galvanized Steel Louvers: As follows:
  - 1. Bird Screening: Galvanized steel, ½-inch square mesh, 0.047-inch wire.
  - 2. Insect Screening: Galvanized steel, 18-by-14 mesh, 0.011-inch wire.
  - 3. Insect Screening: Aluminum, 18-by-16 mesh, 0.012-inch wire.
- F. Louver Screening for Galvanized Steel Louvers: As follows:
  - 1. Bird Screening: Galvanized steel, 1/2-inch-square mesh, 0.047-inch wire.
  - 2. Insect Screening: Galvanized steel, 18-by-14 mesh, 0.011-inch wire.

## **2.06 BLANK-OFF PANELS:**

- A. General: Fabricate blank-off panels from materials and to sizes indicated and comply with the following requirements:
  - 1. Finish: Same as finish applied to louvers.
  - 2. Attach blank-off panels to back of louver frames with clips.
- B. Insulated, Blank-off Panels: Laminated metal-faced panels consisting of insulating core surfaced on back and front with metal sheets, complying with the following requirements:
  - 1. Thickness: 1 inch.
  - 2. Metal Facing Sheets: Aluminum sheet, 0.032 inch thick.
  - 3. Insulating Core: Unfaced, rigid, glass-fiberboard insulation complying with ASTM C612, Class 1 and 2.
  - 4. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer's standard extruded-aluminum-channel frames 0.081 inch -thick, with corners mitered and with same finish as panels.

## **2.07 FINISHES, GENERAL:**

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Finish louvers after assembly.

## **2.08 ALUMINUM FINISHES:**

- A. Finish designations prefixed by AA comply with system established by the Aluminum Association for designating aluminum finishes.
- B. Class II, Clear Anodic Finish: AA-M12C22A31 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.010 mm or thicker) complying with AAMA 607.1.

- C. Baked-Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's specifications for cleaning, conversion coating, and painting.
  - 1. Organic Coating: Thermosetting, modified-acrylic enamel primer/topcoat system complying with AAMA 603.8, except with a minimum dry film thickness of 1.5 mils, medium gloss.
  - 2. Color: As selected by the Engineer from manufacturer's full range of colors.
- D. High-Performance Organic Coating Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
  - 1. Fluoropolymer Three-Coat Coating System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 605.2.
    - a. Color and Gloss: As selected by the Engineer from manufacturer's full range of colors and glosses.

## **2.09 GALVANIZED STEEL SHEET FINISHES:**

- A. Surface Preparation: Clean surfaces of dirt, grease, and other contaminants. Clean welds, mechanical connections, and abraded areas and repair galvanizing according to ASTM A780. Apply a conversion coating of type suited to organic coating applied over it.
- B. Baked-Enamel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-enamel finish consisting of prime coat and thermosetting topcoat, with not less than 1.0-mil dry film thickness for topcoat. Comply with paint manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 2.0 mils.
  - 1. Color and Gloss: As selected by the Engineer from manufacturer's full range of colors and glosses.

## **PART 2 - EXECUTION**

### **3.01 PREPARATION:**

- A. Coordinate Setting Drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

### **3.02 INSTALLATION:**

- A. Locate and place louver units level, plumb, and at indicated alignment with adjacent work.
- B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.
- C. Form closely fitted joints with exposed connections accurately located and secured.
- D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated

- E. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.
- F. Protect galvanized and nonferrous-metal surfaces from corrosion or galvanic action by applying a heavy coating of bituminous paint on surfaces that will be in contact with concrete, masonry, or dissimilar metals.
- G. Install concealed gaskets, flashings, joint fillers, and insulation, as louver installation progresses, where weathertight louver joints are required. Comply with Section 07900 for sealants applied during louver installation.

### **3.03 ADJUSTING, CLEANING, AND PROTECTING:**

- A. Test operation of adjustable louvers and adjust as needed to produce fully functioning units that comply with requirements.
- B. Periodically clean exposed surfaces of louvers and vents that are not protected by temporary covering to remove fingerprints and soil during construction period. Do not let soil accumulate until final cleaning.
- C. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.
- D. Protect louvers and vents from damage during construction. Use temporary protective coverings where needed and approved by louver manufacturer. Remove protective covering at the time of Substantial Completion.
- E. Restore louvers and vents damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Architect, remove damaged units and replace with new units.
  - 1. Clean and touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

**END OF SECTION**

## SECTION 10505

### METAL LOCKERS

#### PART 1 -GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing metal wardrobe lockers and wood benches.
- B. Related Work Specified Elsewhere:
  - 1. Cast-in-Place Structural Concrete: Section 03300.
  - 2. Concrete Unit Masonry: Section 04220.
  - 3. Rough Carpentry: Section 06100.
  - 4. Seals and Sealants: Section 07900.
  - 5. Tile: Section 09320.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of locker and bench.
  - 2. Shop Drawings: Include plans, elevations, sections, details, and attachments to other Work.
    - a. Show locker fillers, trim, base, sloping tops, and accessories. Include locker-numbering sequence.
  - 3. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for units with factory-applied color finishes.
  - 4. Samples for Verification: For the following products, in manufacturer's standard sizes, showing the full range of color, texture, and pattern variations expected. Prepare Samples from the same material to be used for the Work.
    - a. Lockers: Three samples, on metal, of each color and finish to be provided on lockers.
    - b. Locker benches: Three samples of finished wood.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ADA: Americans with Disabilities Act.
  - 3. ASTM: A366.
  - 4. NAAMM: Metal Finishes for Architectural and Metal Products.
- B. Source Limitations: Where practical, obtain locker units and accessories through one source from a single manufacturer.

##### 1.04 DELIVERY, STORAGE, AND HANDLING:

- A. Do not deliver lockers until spaces to receive them are clean, dry, and ready for locker installation
- B. Ship lockers assembled with number plates attached.
- C. Protect lockers from damage during delivery, handling, storage, and installation.

- D. Deliver master keys, control keys, and combination control charts to the Engineer.

#### **1.05 COORDINATION:**

- A. If applicable, coordinate size and location of concrete bases. Concrete, reinforcement, and formwork requirements are specified in Section 03300 "Cast-in-Place Concrete."

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Cold-Rolled Steel Sheet: ASTM A366/A366M, matte finish, suitable for exposed applications, and stretcher leveled or roller leveled to stretcher-leveled flatness.
- B. Fasteners: Zinc- or nickel-plated steel, slotless-type exposed bolt heads, and self-locking nuts or lock washers for nuts on moving parts.

#### **2.02 LOCKERS:**

- A. Body: Form backs, tops, bottoms, sides and intermediate partitions from steel sheet; flanged for double thickness at back vertical corners. Comply with the following:
  - 1. Back-Material Sheet Thickness: 0.0478-inch-thick minimum.
  - 2. Side-Material Sheet Thickness: 0.0598-inch-thick minimum.
- B. Frames: Form channel frames from minimum 0.0598-inch-thick steel sheet; lapped and welded at corners. Form continuous integral door strike on vertical frame members. Provide resilient bumpers to cushion door closing.
  - 1. Latch Hooks: Form from minimum 0.1046-inch-thick steel; welded or riveted to door frames.
  - 2. Cross Frames: Form intermediate channel cross frames between tiers from minimum 0.0598-inch-thick steel sheet. Weld to vertical frame members.
- C. Solid Steel Doors: One-piece steel sheet, formed into channel shape at vertical edges and flanged at right angles at top and bottom edges. Fabricate to prevent springing when opening or closing, and to swing 180 degrees. Comply with the following:
  - 1. Sheet Thickness: 0.0598 inch minimum.
  - 2. Reinforcement: Brace or reinforce inner face of doors more than 15 inches wide.
  - 3. Louvered Vents: Stamped, louvered vents in door face, as follows:
    - a. Single-Tier Lockers: No fewer than six louver openings at top and bottom.
    - b. Double-Tier Lockers: No fewer than three louver openings at top and bottom.
- D. Shelves: Provide hat shelf in single-tier units, fabricated from minimum 0.0598-inch-thick formed-steel sheet; flanged on all edges.
- E. Hinges: Steel, full loop, five or seven knuckle; tight pin; minimum 2 inches high. Weld to inside of door frame and attach to door with at least two factory-installed fasteners that are completely concealed and tamper resistant when door is closed.
  - 1. Provide at least three hinges for each door more than 42 inches high and at least two hinges for each door 42 inches high or less.
- F. Continuous Hinges: Manufacturer's standard, steel continuous hinge mounted to door and frame.

- G. Recessed Handle and Latch: Manufacturer's standard housing, formed from 0.0359-inch-thick nickel-plated steel or stainless steel, with integral door pull, recessed for latch lifter and locking devices; nonprotruding latch lifter; and automatic, prelocking, pry-resistant latch, as follows:
  - 1. Provide minimum three-point latching for each door more than 42 inches high; minimum two-point latching for each door 42 inches high or less.
    - a. Provide strike and eye for padlock.

### **2.03 LOCKER ACCESSORIES:**

- A. Interior Equipment: Furnish each locker with the following items, unless otherwise indicated:
  - 1. Hooks: Manufacturer's standard zinc-plated, ball-pointed steel. Provide one double-prong ceiling hook, and not fewer than two single-prong wall hooks for single-, double-, and triple-tier units. Attach hooks with at least two fasteners.
  - 2. Coat Rods: Manufacturer's standard galvanized steel. Provide rod in lieu of ceiling hook for lockers 18 inches deep or greater.
- B. Number Plates: Manufacturer's standard etched, embossed, or stamped, aluminum number plates with numerals at least 3/8 inch high. Number lockers in sequence as directed by Engineer. Attach plates to each locker door, near top, centered, with at least two aluminum rivets.
- C. Continuous Metal Base: Minimum 0.0598-inch-thick steel sheet, 4 inches high or as indicated on approved shop drawings, channel or zee profiled for stiffness, fabricated in lengths as long as practicable to enclose base and base ends of lockers, and finished to match lockers.
- D. Individually Sloping Tops: Manufacturer's standard, fabricated from minimum 0.0239-inch-thick steel sheet, for installation in place of flat locker tops. Fabricate tops in width to fit one locker frame, with integral back, finished to match lockers. Provide fasteners, filler plates, supports, and wedge-shaped divider panels for each locker upright.
- E. Recess Trim: Manufacturer's standard; fabricated from minimum 0.0478-inch-thick steel sheet, minimum 2-1/2-inch face width, and finished to match lockers. Fabricate trim in lengths as long as practicable.
- F. Filler Panels: Manufacturer's standard; fabricated from minimum 0.0478-inch-thick steel sheet in an unequal leg angle shape, and finished to match lockers. Provide slip joint filler angle formed to receive filler panel.
- G. Finished End Panels: Manufacturer's standard; fabricated from minimum 0.0239-inch-thick steel sheet, finished to match lockers, and designed for concealing exposed ends of nonrecessed lockers.
  - 1. Provide one-piece panels for double-row (back-to-back) locker ends.

### **2.04 LOCKER BENCHES:**

- A. Bench Tops: Provide manufacturer's standard one-piece units, of the following material, minimum 9-1/2 inches wide by 1-1/4 inches thick, with rounded corners and edges:
  - 1. Laminated maple with one coat of clear sealer on all surfaces, and one coat of clear lacquer on top and sides.
- B. Pedestals: Provide manufacturer's standard pedestal supports, with predrilled fastener holes, complete with fasteners and anchors, and as follows:

1. Type: Tubular steel, minimum 1-1/2-inch diameter, threaded on both ends, with standard pipe flange at top and bell-shaped cast base; baked-enamel finish; floor anchored with concealed fasteners.
  - a. Color: As selected by the Engineer from manufacturer's full range.
- C. Furnish a minimum of two pedestals for each bench, with pedestal spacing not more than 72 inches o.c.

## **2.05 FABRICATION:**

- A. Unit Principle: Fabricate each locker with an individual door and frame, individual top, bottom, back, and shelves, and common intermediate uprights separating compartments.
- B. All-Welded Construction: Preassemble lockers by welding all joints, seams, and connections, with no bolts, screws, or rivets used in assembly. Grind exposed welds flush.
- C. Fabricate lockers square, rigid, and without warp, with metal faces flat and free of dents or distortion. Make exposed metal edges free of sharp edges and burrs, and safe to touch. Weld frame members together to form a rigid, one-piece assembly.
  1. Form locker-body panels, doors, shelves and accessories from one-piece steel sheet, unless otherwise indicated.

## **2.06 FINISHES, GENERAL:**

- A. Finish all steel surfaces and accessories, except prefinished stainless-steel and chrome-plated surfaces.
- B. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- C. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- D. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## **2.07 STEEL SHEET FINISHES:**

- A. Surface Preparation: Clean surfaces of dirt, oil, grease, mill scale, rust, and other contaminants that could impair paint bond. Use manufacturer's standard methods.
- B. Baked-Enamel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard baked-enamel finish consisting of a thermosetting topcoat. Comply with paint manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 1.4 mils on doors, frames, and legs, and 1.1 mils elsewhere.
  1. Color and Gloss: As selected by the Engineer from manufacturer's full range.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION:**

- A. Examine concrete bases for suitable conditions where metal lockers are to be installed.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.02 INSTALLATION:**

- A. Install metal lockers and accessories level, plumb, rigid, and flush according to manufacturer's written instructions.
- B. Connect groups of all-welded lockers together with standard fasteners, with no exposed fasteners on face frames.
- C. Anchor lockers to floors and walls at intervals recommended by manufacturer, but not more than 36 inches o.c. Install anchors through backup reinforcing plates where necessary to avoid metal distortion, using concealed fasteners.
- D. Fit exposed connections of trim, fillers, and closures accurately together to form tight, hairline joints, with concealed fasteners and splice plates.
  1. Attach recess trim to recessed lockers with concealed clips.
  2. Attach sloping top units to lockers, with closures at exposed ends.
- E. Attach finished end panels with fasteners only at perimeter to conceal exposed ends of nonrecessed lockers.
- F. Anchor locker benches to floors Uniformly space pedestals not more than 72 inches apart, and securely fasten to bench top and anchor to floor.

### **3.03 ADJUSTING, CLEANING, AND PROTECTION:**

- A. Adjust doors and latches to operate easily without binding. Verify that integral locking devices operate properly.
- B. Clean interior and exposed exterior surfaces and polish stainless-steel and nonferrous-metal surfaces.
- C. Protect lockers from damage, abuse, dust, dirt, stain, or paint. Do not permit locker use during construction.
- D. Touch up marred finishes, or replace locker units that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by locker manufacturer.

**END OF SECTION**

## SECTION 10605

### WIRE MESH PARTITIONS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing woven wire mesh panels for the following:
  - 1. Wire mesh partitions.
  - 2. Wire mesh window guards.
  - 3. Wire mesh railing insert panels.
- B. Related Work Specified Elsewhere
  - 1. Handrails and Railings: Section 05521.
  - 2. Aluminum Entrances and Storefronts: Section 08410 for lock cylinders.

##### 1.02 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Engage a firm experienced in manufacturing wire mesh partitions similar to those indicated for this Project and that have a record of successful in-service performance.
- B. Structural Performance: As specified in Section 05521 for railing insert panels.
- C. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of wire mesh partitions and wire mesh insert panels that are similar to those indicated for this Project in material, design, and extent.

##### 1.03 DEFINITIONS

- A. The types of weaves for the wire mesh specified in this Section and defined in ASTM E 437 and its Appendix X4.2:
  - 1. Plain Weave: Wires pass over one and under the next adjacent wire in both directions.
  - 2. Lock Crimped: Deep crimps at points of intersection to lock the wires securely in place.
  - 3. Intercrimped: Similar to plain weave with extra crimps between the intersections.

##### 1.04 SUBMITTALS:

- A. Submit the following for approval in accordance with the Special Conditions and with the additional requirements as specified for each:
  - 1. Product Data for each type of product specified, consisting of manufacturer's specification, technical data, and installation instructions.
  - 2. Shop Drawings showing fabrication and installation of wire mesh partitions, window guards, railing insert panel and access panels, including plans, elevations, and large-scale details showing anchorage and accessory items. Provide location template drawings for items supported or anchored to permanent construction.
    - a) For steel channel and tube framing of wire mesh partitions and railing insert guards, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

3. Samples of a 12-by-12-inch 300-by-300-mm wire mesh panel constructed of specified frame members, wire mesh, and color charts.

#### **1.05 JOB CONDITIONS**

- A. Field Measurements: Check actual locations for wire mesh products by accurate field measurements before fabrication and show recorded measurements on Shop Drawings. Coordinate fabrication and delivery schedules with construction progress to avoid delaying the Work.
  1. Where field measurements cannot be made without delaying the Work, guarantee location dimensions and proceed with fabricating wire mesh products without field measurements. Coordinate wall, column, floor, and ceiling construction to ensure that actual location dimensions correspond to guaranteed dimensions.

### **PART 2 - PRODUCTS**

#### **2.01 MANUFACTURERS**

- A. Woven wire partitions, Window Guards and Insert Panels: Manufactured by the G - S Company, or provide systems, as approved by the Engineer, of similar quality and appearance to match construction quality and appearance of the specified manufacturer.

#### **2.02 MATERIALS**

- A. Steel Channels, Angles, Plates, and Bars: ASTM A 36 ASTM A 36M.
- B. Steel Sheet: ASTM A 568 ASTM A 568M.
- C. Cold-Rolled Steel Channels: Formed from steel sheet.
- D. Square Steel Tubing: Cold-formed structural steel tubing, ASTM A 500.
- E. Galvanized Steel Wire: ASTM A 641 ASTM A 641M.
- F. Galvanized Steel Sheet: Commercial-quality, hot-dip-coated steel sheet, ASTM A 653, with G60 or A60 ASTM A 653M, with Z180 or ZF180 coating.
- G. Bent Plate Channel: Formed from galvanized steel sheet.

#### **2.03 WIRE MESH PARTITIONS:**

- A. Mesh: 0.135-inch-3.4-mm- diameter, plain-weave, galvanized steel wire woven into 3 inch 38-mm square pattern, insert through frame members, and welded into frame square pattern, inserted through.
- B. Frames: Provide galvanized steel fasteners and other items shown or necessary for partition installation.
  1. Vertical Members: 1-1/4-by-5/8-by-0.108-inch hot dipped galvanized steel C-Section channels with 1/4-inch- diameter bolt holes approximately 18 inches 450 mm o.c.
  2. Horizontal Members: 1-by-1/2-by-1/8-inch hot dipped galvanized steel channels, mortised and tenoned to vertical members.
  3. Horizontal Reinforcing Members: 1-by-1/2-by-1/8-inch hot dipped galvanized steel channels with wire woven through or two 1-by-1/2-inch galvanized steel channels bolted or riveted toe-to-toe through mesh, and secured to vertical members. Provide number of horizontal reinforcing members to suit panel height as recommended by

partition manufacturer.

- C. Top Capping Bars: 2-1/4-by-1-inch hot dipped galvanized steel channels, secured to top framing channels with 1/4-inch- diameter, galvanized "U" bolts spaced not more than 28 inches o.c.
- D. Corner Posts: 1-1/4-by-1-1/4-by-1/8-inch hot dipped galvanized steel angles with floor shoe galvanized per ASTM A 123 and 1/4-inch- diameter bolt holes to align with bolt holes in vertical frame members.
- E. Floor Shoes: Cast aluminum or steel galvanized per ASTM A 123, sized to suit vertical framing and to provide approximately 3 inches 75 mm of clear space between finished floor and bottom horizontal frame members. Furnish units with set screws for leveling adjustment.

#### **2.04 DOORS:**

- A. Hinged Door: Door frame of 1-1/4-by-1/2-by-1/8-inch hot dipped galvanized steel c-section channels with 1-1/4-by-1/8-inch flat steel bar cover plates on 3 sides, and 1/8-inch- thick angle strike bar and cover on lock side. Provide 1-1/2 pairs of 3-by-3-inch butt hinges riveted or welded to door and frame, and mortise-type cylinder lock operated by key outside with recessed knob inside. Align bottom of door with bottom of adjacent panels.
- B. Provide manufacturer's standard cylinders for lock.

#### **2.05 WINDOW GUARDS**

- A. Mesh: 0.135-inch-diameter, lock-crimped galvanized steel wire woven into a 4-inch , 45 degree pattern, inserted through frame holes and welded into frame.
- B. Frames:
  - 1. Frames 1 1/4-by-1/2-by-1/8-inch hot dipped galvanized, cold-rolled steel channels.
  - 2. Frames at Window Guards: Hot dipped galvanized bent plate channel, sized to fit adjacent to curtainwall framing.
- C. Anchorage Devices: Furnish appropriate types and quantities of anchorage devices to provide adequate anchorage to adjacent structures.
- D. Access Panels: Provide the following at bridge walkway guards where shown:
  - 1. Jambs: Provide 1-1/4-by-1-1/4-by-1/8-inch steel angle jamb bars with bolt holes for anchorage spaced a maximum of 24 inches o.c.
  - 2. Hinging: Furnish 1 pair of 3-by-3-inch butt hinges.
  - 3. Locking Device: mortise l- type cylinder lock as specified in Section 08410.

#### **2.06 STAIRWAY PARTITIONS RAILING INSERT PANELS:**

- A. Mesh: 0.135-inch-diameter, plain-weave galvanized steel wire woven into a 3-inch square pattern, inserted through frame holes and welded into frame. Vertical wires are plumb. Horizontal wires are perpendicular to vertical wires.
- B. Frames: 1 1/4 -by-1/2-by-1/8-inch hot dipped galvanized cold-rolled steel channels.

#### **2.07 FABRICATION:**

- A. Do not use components less than sizes indicated. Use larger-size components as recommended by partition component manufacturer.

- B. Provide bolts, hardware, and accessories for complete installation.

## **2.08 FINISHES:**

- A. Wire Mesh Partitions and Doors: Manufacturer's standard shop - applied enamel finishes.
- B. Stairway Partitions and Railing insert panels:
  - 1. Manufacturer's standard shop - applied enamel finish.
- C. Window Guards:
  - 1. Manufacturer's standard polyester powder coat finish.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION**

- A. Coordinate and furnish anchorages, setting drawings, diagrams, templates, instructions, and directions for installing anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

### **3.02 INSTALLATION**

- A. Erect partitions plumb, rigid, properly aligned, and securely fastened in place, complying with Drawings and manufacturer's recommendations.
- B. Provide additional field bracing as shown on approved shop drawings or necessary for rigid, secure installation. Installer to provide additional clips and bracing as required.
- C. Attach window guards to inside face of aluminum curtain wall as shown on approved shop drawings. Fasten screws into pre-drilled holes with vinyl insert to prevent contact between dissimilar metals. Provide fasteners spaced evenly to screw to curtain wall system as shown on the approved shop drawings.

### **3.03 ADJUSTING AND CLEANING**

- A. Adjust moving components for smooth operation without binding.
- B. Touch up damaged finish after completing installation using field-applied paint to match color of shop-applied finish.

**END OF SECTION**

## SECTION 10810

### TOILET ACCESSORIES

#### PART 1 -GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing toilet accessories, including:
  - 1. Sanitary napkin vendors.
  - 2. Sanitary napkin disposal units.
  - 3. Framed mirrors with shelves.
  - 4. Framed mirrors without shelves.
  - 5. Liquid soap dispensers.
  - 6. Toilet paper dispensers.
  - 7. Clothes hook and bumpers.
  - 8. Paper towel dispensers.
  - 9. Waste receptacles.
  - 10. Grab bars.
  
- B. Related Work Specified Elsewhere:
  - 1. Tile: Section 09320.
  - 2. Toilet Compartments: Section 10155.
  - 3. Stone Toilet Compartments: Section 10180.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop drawings: Detailed shop drawings, including fastenings, manufacturer's installation instructions and other information. Submit prior to ordering materials or beginning installation.
  
  - 2. Samples:
    - a. For each accessory item to verify design, operation, and finish requirements. One each
    - b. Special anchors, plates or embedded items required because of the conditions in this project. One each. Submit with the related accessory samples. Delete subparagraph below if not applicable.
  
  - 3. Setting Drawings: For cutouts required in other work; include templates, substrate preparation instructions, and directions for preparing cutouts and installing anchoring devices.. Retain paragraph below for large, complicated projects. Revise to suit Project.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ADA (Americans with Disabilities Act).
  - 3. ASTM: A666, C1036, F446.
  - 4. FS: DD-M-411.
  
- B. Manufacturer Qualifications: Provide products of an established manufacturer regularly engaged in the production of toilet accessories.

- C. Source Limitations: Provide products of same manufacturer for each type of accessory unit and for units exposed to view in same areas, unless otherwise approved by the Engineer. Retain paragraph below if products are listed in schedule at the end of Part 3. See Evaluations. Retain one of three subparagraphs below, depending on Specification method selected. Correlate with Part 2 "Manufacturers" Article and schedule at the end of Part 3. See descriptions of specifying methods and examples of completed schedules in the Evaluations.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to the job site in original unopened containers clearly labeled with the manufacturer's name, brand designation and type as applicable.
- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

**1.05 COORDINATION:**

- A. Coordinate accessory locations with other work to prevent interference with clearances required for access by disabled persons, proper installation, adjustment, operation, cleaning, and servicing of accessories.
- B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work..

**PART 2 -PRODUCTS**

**2.01 MATERIALS, GENERAL:**

- A. Provide toilet accessories of an approved manufacturer; provided complete with fasteners appropriate for surface which applied. Satin-finish stainless steel unless otherwise noted.
- B. Exposed fastenings finished to match accessories.
- C. Labels, decals and cast-in or embossed identification in conspicuous places on accessories is prohibited.
- D. Use only products which comply with barrier-free accessibility guidelines of ADA.
- E. Quantity and location are as shown.

**2.02 MATERIALS:**

- A. Stainless Steel: ASTM A666, Type 304, with No. 4 finish (satin), in 0.0312-inch minimum nominal thickness, unless otherwise indicated.
- B. Mirror Glass: ASTM C1036, Type I, Class 1, Quality q2, nominal 6.0 mm thick, with silvering, electroplated copper coating, and protective organic coating complying with FS DD-M-411.
- C. Fasteners: Screws, bolts, and other devices of same material as accessory unit, tamper and theft resistant when exposed, and of galvanized steel when concealed.

**2.03 PRODUCTS:**

- A. Sanitary Napkin Vendor: Provide stainless-steel sanitary napkin vendor complying with the following:
1. Products: Bobrick B-2800, or equal.
  2. General: Fabricate cabinet of all-welded construction. Provide seamless door with returned edges and secured by tumbler lockset. Provide identification reading "Napkins" and "Tampons"; brand-name advertising is not allowed. Capacity not less than 15 napkins and 20 tampons.
  3. Mounting: Surface-mounted type.
  4. Operation: Single-coin operation, 10 cents.
- B. Sanitary Napkin Disposal Unit: Provide stainless-steel sanitary napkin disposal unit complying with the following:
1. Products: Bobrick 270, or equal.
  2. Surface-Mounted Type: With seamless exposed walls; self-closing top cover; locking bottom panel with stainless-steel, continuous hinge; and removable, reusable receptacle.
- C. Framed Mirror with Shelf: Provide framed mirror with shelf complying with the following:
1. Products: Bobrick B-166-1836, or equal.
  2. Glass: 1/4-inch float/plate glass, No. 1 quality.
  3. Stainless-Steel, Channel-Framed Mirror: Fabricate frame from stainless-steel channels in manufacturer's standard satin finish with square corners mitered to hairline joints and mechanically interlocked. Provide concealed wall mounting bracket for theft-proof installation.
    - a. Integral Shelf: Stainless steel in thickness recommended by manufacturer, but not less than thickness of mirror frame, approximately 5 inches deep by width of mirror, with edges turned down and returned for rigidity; secure shelf to bottom of mirror frame.
- D. Framed Mirror without Shelf: Provide framed mirror without shelf complying with the following:
1. Products: Bobrick B-165-1836, or equal.
  2. Glass: 1/4-inch float/plate glass, No. 1 quality.
  3. Stainless-Steel, Channel-Framed Mirror: Fabricate frame from stainless-steel channels in manufacturer's standard satin finish with square corners mitered to hairline joints and mechanically interlocked. Provide concealed wall mounting bracket for theft-proof installation.
- E. Liquid Soap Dispenser: Provide liquid soap dispenser complying with the following:
1. Products: Bobrick B-2112, or equal.
  2. Liquid Soap Dispenser, Horizontal-Tank Type: Surface-mounted type, minimum 40-oz. capacity tank with stainless-steel piston, springs, and internal parts designed to dispense soap in measured quantity by pump action; and stainless-steel cover with unbreakable window-type refill indicator. Vandal resistant.
    - a. Soap Valve: Designed for dispensing soap in liquid form.
- F. Toilet Tissue Dispenser: Provide toilet tissue dispenser complying with the following:
1. Products: Bobrick B-274, or equal.
  2. Type: Double-roll dispenser.
  3. Mounting: Surface mounted with concealed anchorage.
  4. Material: Satin-finish aluminum bracket with plastic spindle.
  5. Operation: Eccentric-shaped, molded-plastic spindle revolves one-half revolution per dispensing operation for controlled delivery; core cannot be removed until roll is empty.
  6. Capacity: Designed for tissue rolls up to 6-inch-diameter.
- G. Clothes Hook and Bumper: Provide clothes hook and bumper complying with the following:

1. Products: Bobrick B-212, or equal.
  2. Material: Solid aluminum casting with matte finish. Rubber bumper protects wall or partition surfaces.
- H. Paper Towel Dispenser: Provide stainless-steel paper towel dispenser complying with the following:
1. Products: Bobrick B-262, or equal.
  2. Surface-Mounted Type: Sized for minimum of 400 C-fold or 525 multifold paper towels without using special adapters; with hinged front equipped with tumbler lockset; and with refill indicators that are pierced slots at sides or front.
- I. Waste Receptacle: Provide stainless-steel waste receptacle complying with the following:
1. Products: Bobrick B-275, or equal.
  2. Surface-Mounted Type: With seamless exposed walls; continuously welded bottom pan; and minimum 20-gal. capacity, reusable, vinyl liner secured at not less than four points with grommets and hooks.
- J. Grab Bar: Provide stainless-steel grab bar complying with the following:
1. Products: Bobrick B-6106, or equal. Comply with ADA.
  2. Material: Bar 18-gauge wall Type 304 stainless steel.
  3. Mounting: Exposed with manufacturer's standard flanges and anchors.
  4. Gripping Surfaces: Smooth, satin finish, unless otherwise noted.
  5. Outside Diameter: 1-1/2 inches for heavy-duty applications.
  6. At water closets for the handicapped, provide the following unless otherwise shown:
    - a. Back wall: 36-inch minimum length grab bar behind the water closet.
    - b. Side wall: 42-inch minimum length grab bar to the side of the water closet.

#### **2.04 FABRICATION:**

- A. General: Names or labels are not permitted on exposed face of accessories. On interior surface not exposed to view or back surface of each accessory, provide printed, waterproof label or stamped nameplate indicating manufacturer's name and product model number.
- B. Surface-Mounted Toilet Accessories: Unless otherwise indicated, fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with continuous stainless-steel hinge. Provide concealed anchorage where possible.
- C. Framed Glass-Mirror Units: Fabricate frames for glass-mirror units to accommodate glass edge protection material. Provide mirror backing and support system that permits rigid, tamper-resistant glass installation and prevents moisture accumulation.
1. Provide galvanized steel backing sheet, not less than 0.034 inch and full mirror size, with nonabsorptive filler material. Corrugated cardboard is not an acceptable filler material.
- D. Mirror-Unit Hangers: Provide mirror-unit mounting system that permits rigid, tamper- and theft-resistant installation, as follows:
1. Heavy-duty wall brackets of galvanized steel, equipped with concealed locking devices requiring a special tool to remove
- E. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to the Engineer.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Coordinate with other trades for concealed back plates, blocking and anchoring devices embedded or built into work of other trades.
- B. After mounting surfaces have been painted, install accessories in accordance with manufacturer's recommendations.
- C. Install accessories according to manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights recommended by the manufacturer unless otherwise shown or required by regulations. Comply with ADA.
  - 1. At water closets for the handicapped, mount grab bars as follows unless otherwise shown:
    - a. Back wall: Mount grab bar at a height between 33 and 36 inches above finish floor and to extend a minimum of 12 inches beyond the center of the water closet toward the side wall and a minimum of 24 inches toward the open side for either a left or right side approach.
    - b. Side wall: Mount grab bar at a height between 33 and 36 inches above finish floor and spaced 12 inches maximum from the back wall and extending a minimum of 54 inches from the back wall.
  - 2. At water closets for the handicapped, mount toilet paper dispenser at a minimum height of 19 inches above finish floor.
- D. Secure mirrors to walls in concealed, tamper-resistant manner with special hangers, toggle bolts, or screws. Set units level, plumb, and square at locations indicated, according to manufacturer's written instructions for substrate indicated.
- E. Install grab bars to withstand a downward load of at least 250 lbf, when tested according to method in ASTM F446.
- F. After installation, protect the toilet accessories from damage and soiling.

**3.02 TESTING AND ADJUSTING OF COMPLETED WORK:**

- A. Test accessories for unencumbered, smooth operation and verify that mechanisms function properly.
- B. Replace damaged or defective items.
- C. Test for required strength and for pull-out and pull-off of grab bars. Remove and reattach as needed.

**3.02 CLEANING:**

- A. Remove temporary labels and protective coatings.
- B. Before final acceptance, clean and polish exposed surfaces according to manufacturer's written recommendations.
- C. Leave areas surrounding the work in broom-clean condition.

**END OF SECTION**

**DIVISION 11 - EQUIPMENT**

- 11010 ROOF ANCHORS
- 11150 PARKING ACCESS AND REVENUE CONTROL
- 11155 MECHANICAL PARKING METERS
- 11156 ELECTRONIC PARKING METERS

**END OF SECTION**

## SECTION 11010

### ROOF ANCHORS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. Work of this section includes the design, supply and installation of anchors for window washing/suspended maintenance equipment.
- B. Related work specified elsewhere:
  - 1. Division 3 - Concrete
  - 2. Division 5 - Metals
  - 3. Division 7 - Thermal And Moisture Protection

##### 1.02 REFERENCES:

- A. AISC publication "Load and Resistance Factor Design Specification for Structural Steel Buildings".
- B. AISI publication "Specification for Design of Cold-Formed Steel Structural Members (1986 & 1989 Addendum)".
- C. Aluminum Association publication No.30 "Specification for Aluminum Structures" and AWS D1.2-90 Structural Welding Code - Aluminum.
- D. AWS D1.1 Structural Welding Code - Steel.

##### 1.03 DESIGN REQUIREMENTS:

- A. Design window washing/suspended maintenance system to suit building and in accordance with plans, specifications, standards, and regulations/codes contained in section 1.4 and 1.8.
- B. Locate safety and tie-back anchors to suit suspension equipment which will be used on the building with respect to items such as reach, rigging, spacing, roof edge condition and similar items.
- C. Design all anchor components to provide adequate attachment to the building and suited to current window washing/suspended maintenance practices. Ensure compatibility with industry standard equipment.
- D. Ensure all anchor components conform to proper engineering principles and have been designed by a Professional Engineer qualified in the design of window washing/suspended maintenance equipment, its application and safety requirements.
- E. Design system fall arrest safety anchors to comply with the following structural requirements:
  - 1. Designed to resist a 5,000 lb. (22.2 kN) horizontal load in any direction without detachment or fracture occurring. This load is considered to be an ultimate peak dynamic load and yielding of the anchor and structure in the event of a fall is not precluded. To avoid deformation under normal usage, anchors are to be generally designed to resist a 1,000 lb. (4.5 kN) static horizontal load in any direction without yielding.

#### **1.04 SHOP DRAWINGS AND ENGINEERING CERTIFICATION**

- A. Submit shop drawings showing complete layout and configuration of complete window washing/suspended maintenance system, including all components and accessories. Clearly indicate design and fabrication details, window "drops", hardware, and installation details.
- B. Shop drawings to include installation and rigging instructions and all necessary Restrictive and Non- Restrictive Working Usage Notes and General Safety Notes.
- C. Shop drawings complete with calculations to be reviewed by and bearstamp of a professional engineer.

#### **1.05 QUALIFICATIONS**

- A. Manufacturer: Work of this Section to be executed by manufacturer specializing in the design, fabrication and installation of window washing/suspended maintenance systems having a minimum of 5 years documented experience
- B. Loading and safety assurance: Work of this Section to meet the requirements of governing codes and jurisdiction and to comply with properly engineered loading and safety criteria for the intended use.
- C. Insurance: Manufacturer to carry specific liability insurance (products and completed operations) in the amount of \$2,000,000.00 to protect against product/system failure.
- D. Welding to be executed by welders qualified to work in the State in which the project is being completed.

#### **1.06 REGULATORY REQUIREMENTS**

- A. Comply with the following OSHA regulations:
  - 1. 1910, Subpart D (Walking and Working Surfaces).
  - 2. Appendix C to 1910 (Personal Fall Arrest Systems).
  - 3. "OSHA Ruling on Window Cleaning by Bosun's Chair" Memorandum to Regional Administrators from P. K. Clark, Director, Directorate of Compliance Program
  - 4. 1910, Subpart F (Powered Platforms).

#### **1.07 MAINTENANCE DATA**

- A. Submit 1 copy of system Equipment Manual & Inspection Log Book, with "Initial Inspection - Certification for Use" and "Inspection Sign-Off" forms completed.
- B. Submit 2 copies of a reduced plastic laminated as-built shop drawing showing equipment locations and details. This drawing is to be posted near exits onto the roof.

### **PART 2 - PRODUCTS**

#### **2.01 MANUFACTURER**

- A. This specification is generally based on systems currently being manufactured by PRO-BEL, Telephone: (905) 427-0616, Fax: 905-427-2545, Toll free: 1-800-461-0575.
- B. Other manufactured products meeting this specification may be substituted provided that manufacturers show proof of product insurance. Equipment details to be approved by The

Engineer.Companies, such as miscellaneous metal fabricators, who are not normally engaged in the design and manufacture of window washing/suspended maintenance equipment are not permitted to bid.

## **2.02 EQUIPMENT**

- A. Through bolted roof anchors as manufactured by, but not limited to:
  - 1. PRO-BEL Model EPB-73S

## **2.03 MATERIALS**

- A. U-bar, anchor bolts Type 304 stainless steel with yield strength of 42 Ksi (290 MPa). U-bar to be not less than 3/4" (19 mm) diameter material with 1-1/2" (38 mm) eye opening.
- B. Hollow steel section (HSS) piers: galvanized steel as above with yield strength of 50 Ksi (345 MPa), [with] [without] urethane foam insulation.Wall thickness to suit application.
- C. Base plate and all other sections: galvanized mild steel as above with yield strength of 43 Ksi (297 MPa). Thickness and securement to suit application.
- D. Seamless spun aluminum flashing (for steel pier anchors): Type 6061-T6 alloy to ASTM B221 with deck flange flashed in to NRCA recommendations.Seal top of aluminum flashing with conformable mastic tape and torch applied heat-shrink rubber membrane.
- E. Bolts, nuts and washers: ASTM A36, galvanized to ASTM A123.

## **2.04 FABRICATION**

- A. General:
  - 1. Fabricate work true to dimension, square, plumb, level and free from distortion or defects detrimental to appearance and performance.
  - 2. Grind off surplus welding material and ensure exposed internal corners have smooth lines.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION**

- A. Examine surfaces and areas upon which the work of this Section depends. Report to the Contractor in writing, defects of work prepared by other trades and other unsatisfactory site conditions which would cause defective installation of products, or cause latent defects in workmanship and function.
- B. Verify site dimensions.
- C. Commencement of work will imply acceptance of prepared work.

### **3.02 INSTALLATION**

- A. Install equipment in accordance with approved shop drawings and manufacturer's recommendations.
- B. Co-ordinate installation with work of related trades.
- C. Install all work true, level, tightly fitted and flush with adjacent surfaces as required.

- D. Deform threads of tail end of anchor studs after nuts have been tightened to prevent accidental removal or vandalism.
- E. Manufacturer to assist and/or supervise installation of window washing/suspended maintenance equipment installed by others.
- F. Structural steel to receive rooftop anchors equipped with 4" (100 mm) diameter HSS pier to have minimum 5" (127 mm) wide bearing surface to ensure 100% weld.

### **3.03 FINAL ADJUSTING AND INSPECTION**

- A. Adjust and leave equipment in proper working order.
- B. Complete "Initial Inspection - Certification for Use" form included in Equipment Manual & Inspection Log Book.

### **3.04 TESTING**

- A. All anchorage systems relying upon chemical adhesive fasteners to be 100% tested on site using load cell test apparatus in accordance with manufacturer's recommendations.
- B. Load cell test to apply minimum 5,000 lb. (22.2 kN) load without detachment or fracture occurring.

**END OF SECTION**

## SECTION 11150

### PARKING ACCESS AND REVENUE CONTROL SYSTEM

#### PART 1 - GENERAL

##### 1.01 Related Documents

- A. Drawings and general provision of the Contract including General and Supplementary conditions apply to this Section.
- B. Work in other Sections related to "Parking Access and Revenue Control System":
  - 1. Parking Control Booth: Section 13125

##### 1.02 DESCRIPTION

- A. SYSTEM PERFORMANCE REQUIREMENTS
  - 1. These Specifications shall be considered by the Contractor to be based primarily on system Performance Requirements. Minimum acceptable technical characteristics have also been specified for major items of equipment and certain materials and services, in order to maintain desired standards of quality, and ensure that interchangeability, maintainability, and reliability goals of the Authority are achieved.
  - 2. The specification of "Brand Name or Equal" equipment herein is intended to control the quality of system components, not to indicate that the use of the "Brand Name or Equal" will, in itself, ensure required System Performance.
  - 3. When "Brand Name or Approved Equal" proprietary products have been specified, the manufacturer's specifications attributable to the "Brand Name" product (the "approved equal" product after Owner/WMATA approval has been granted) shall apply.
  - 4. The system and equipment descriptions contained herein, are applicable to equipment, materials, selections, installation workmanship, other services, and all other Contractor work, except as otherwise stated elsewhere in these Specifications.
- B. CONTRACTOR'S TOTAL SYSTEM RESPONSIBILITY
  - 1. The Contractor shall bear total system responsibility for all specified work and for specified additions and changes to Owner/WMATA systems of any type (except Contract deliverables not requiring Contractor services, construction, testing, documentation, warranty and other areas of responsibility which are subject to periodic review and acceptance by the Owner/WMATA (specified elsewhere).The Contractor has the responsibility to integrate the various necessary elements of Contract work so that overall specification performance goals are met.
  - 2. All Contractor provided systems, equipment and services shall perform and be suitable for their intended purpose, in accordance with best commercial practices, (as a minimum), and in compliance with all applicable specification requirements.
  - 3. The Contractor shall be required to deliver complete operable parking access and revenue control systems meeting all applicable performance and availability specification requirements, notwithstanding any errors or omissions in Technical Specifications that would otherwise prevent such delivery.
  - 4. The Contractor shall assume total responsibility for the configuration of equipment, parts, interconnecting wiring, software, and other materials and services furnished. Systems provided by the Contractor that do not meet performance levels required by the Specifications shall be modified, at the Contractor's expense, until the performance levels specified in the Contract are achieved. Any modifications to approved system designs shall be subject to prior approval by the Engineer/Architect.

5. The Contractor shall assume total responsibility for the correction of any degradation of the performance of existing systems or equipment, which results from the installation of any system or equipment interface required by the Specifications.
6. Although the ultimate Owner/WMATA retains rights to review the Contractor's system and component configuration and products selected and to accept or not accept for reasons of specification compliance or noncompliance; the Contractor retains sufficient latitude to ensure compliance with all specified performance and availability requirements. The Contractor shall, therefore, present engineering data, technical documentation, test program and quality assurance program data, and product selections that will ensure compliance with the system availability standards stated in the 30-Day System Functional Accuracy Test, Specification Paragraph 3.2 "Testing Requirements", and all other technical specifications. In the event, these submissions are not accepted by the Owner/WMATA, the Contractor shall resubmit with corrections, or resubmit completely revised documentation. The Contractor shall remain responsible for bearing any additional costs associated with change necessary to affect compliance with all specified performance and availability standards, as well as compliance with all applicable "Brand Name" products and all other specifications.
7. In the event the Contractor claims relief from specified performance or availability standards due to the application of "Brand Name" proprietary or detailed specifications, Owner/WMATA directed changes, Owner/WMATA engineering or drawing reviews, or any other Owner/WMATA actions claimed to be in conflict with such performance standards; the Contractor shall furnish written notice to the Engineer/Architect within 10 days after the discovery of such action attributed to the Owner/WMATA. The Engineer/Architect will then review the Owner/WMATA action cited and Contractor problem(s) involved, in an attempt to resolve these difficulties. In the absence of such timely notice, no such specification relief will be granted. The burden of proof for such claim(s) shall rest with the Contractor. The submission of timely Contractor claim(s) for specification relief as described, shall be required as a prerequisite to the acceptance of resulting claim(s) for increased Contract cost or performance time extensions.

C. DESCRIPTION

1. The Parking Access and Revenue Collection (PARC) System for the parking facility shall be designed, furnished, installed and tested to allow Owner/WMATA to operate this facility with regard to access control and revenue collection, in the same manner as other recently opened parking facilities. The PARC System shall incorporate features to permit Owner/WMATA to add certain enhancements to the PARC system as described herein, without replacement of the system components provided under this contract.
2. PARC shall include the following:
  - a. Gate and lane control signal control console(s).
  - b. Communications support installations.
  - c. Vehicle detector loops and loop leads to operate gates, lot full signs, card readers, magnetic ticket dispensers and vehicle counting equipment.
  - d. Vehicle detector loop amplifier electronics and logic, including associated software.
  - e. Programmable vehicle counting equipment, including associated software.
  - f. Differential counter, anti-coincidence and differential logic, lane entrance/exit point and facility occupancy totaling counters (may be hardware and/or software).
  - g. Barrier/lane control gates, with articulated arms suitable for applications with limited overhead clearance, as necessary.
  - h. Barrier/lane control gate controller/microprocessors.

- i. Fee computer system for parking control booths, including associated software, entry ticket mag strip ticket reader (provide only the ability to add this hardware/software system later under separate contract), external fee display driver, patron receipt issuance printer, cashier/shift activity report generator/printer, automated cash drawer, key pad, visual display, moisture resistance and all peripherals required to make the PARC system function as specified.
  - j. Modem, or equivalent data transmission means.
  - k. Back up power supplies for system equipment, including three hour uninterruptible power supply capability for the fee computer and for vehicle counting equipment.
  - l. Controls for FULL signs and land control signals.
  - m. Bollards.
  - n. Interfaces, wiring and miscellaneous equipment required to complete the system. Parking facility central processor is to be located in the PARC Operations Center, includes associated software, network connectivity on and off-line via modem or equivalent to the management computer local area network (LAN) in the office of PARK (located at 600 Fifth Street, N.W., Washington, D.C. 20001), printer, work station and peripherals.
  - o. Integrated Logistics Support (ILS).
  - p. Provisions and full compatibility with installation and operation of magnetic ticket dispensers and card readers (including proximity smart card read/write readers).
3. System Information:
- a. The parking facility will be operated in a pay on exit mode of operation with cashiers collecting predominately fixed (daily) fees with some validation fees both higher and lower than the fixed fees. Fees are to be assumed fixed, but may be overridden prior to entering payment by pressing one of several (not less than 5) specific validation keys representing the particular rate validation structures on the fee computer. By using magnetic strip ticket dispensers and readers to be installed by separate contract later, the fee computer(s) shall be able to charge multiple day (regular rate for first and a higher fixed rate per day for subsequent days for multi-day duration parking as a validation).
  - b. Cashiering and use of barrier gates will be between the hours of 2:00 p.m. and 10:00p.m., but hours will be subject to change. The secondary parking control booth will be staffed between the hours of 4:00p.m. to 7:00p.m., but hours are subject to change. The changing of hours will be controlled by the parking facility managers from the facility central processor or via remote modem access to the central processor. No changes in software shall be required, only simple parameter changes that are described in the user manual.
  - c. During collection hours when the secondary parking control booth is not operating, the lane(s) will be obstructed from both ends by barrier gates controlled from the principal parking control booth. Only one of the three lanes will require gates at both ends.
  - d. There will be provision for future installation of magnetic stripe ticket dispensers in the entry lanes and magnetic stripe ticket readers in the cashier's booth. The fee computer as furnished under this contract shall be hardware/software compatible and ready for magnetic stripe ticket dispenser / reader operation upon installation. All software for magnetic stripe ticket operations needed in the central processor and fee computers shall be furnished under this contract.
  - e. There shall be a system installed consisting of card readers in each cashiering lane (Target Module Units) to permit processing of "smart" debit

cards (WMATA "SmarTrip" cards) to be used in payment of regular parking fees at fixed fees from the exit lanes or for payment of higher non-Metro rider fees or multiple day rates, and as permits for access.

- f. The booths will be equipped with control switches for manual operation of all barrier gates in the event of automated equipment failure. The gates shall be equipped with a manual means of raising the barrier arm in the event of a power or gate motor failure.
- g. FULL signs, activated automatically by differential vehicle counter (hardware and/or software) with anti-coincidence and directional logic and, will be installed in advance of and at each roadway entrance to the parking lot/structure complex.
- h. All payment lane gates will be operated during collection periods from both the specific parking control booth and the principal active parking control booth(s). The principal active cashier control booth(s) will be the one(s) farthest to the right upon exiting of the three lanes in the arrays.
- i. Traffic lane control signals mounted over the cashier exiting arrays above traffic lanes will be controlled from the principal control booth of the respective arrays.
- j. A fee computer shall be provided in each parking control booth and be located on the counter. The fee computers shall have a keyboard (key-pad) for cashier input and shall be capable of accepting input from magnetically encoded tickets. The fee computer key board shall be specifically designed to be protected against moisture and dirt typically encountered in a parking control booth environment.
- k. The fee computer system shall track the activity of individual cashiers who may work a whole or partial shift for each parking control booth separately. The fee computer will require each cashier to log on the fee computer before any cashier activity may occur, and log off when cashier activity is terminated. The log-on process shall be controlled by a specific security system or code unique to each cashier, supervisor or manager.
- l. The fee computer will process, monitor and control fee payment transactions in each parking control booth for each individual cashier working a whole or partial shift.
- m. The fee computers will also print basic activity reports of cashier activity and issue (print) receipts upon command.
- n. Fee computers will be directly connected to and download/upload information, data, instructions from/to an on-line parking facility central processor to be located in the PARCS Operations Center.
- o. Fee computers will drive fee display units to be included under this Contract. The fee display units shall be mounted as to be visible to drivers making cashiered transactions.
- p. The central processor will monitor the fee calculators, receive input from and monitor the functioning of the vehicle counting equipment, consolidate vehicle counting data, and create custom reports upon command either automatically or upon specific requirements. Automatic report generation shall be user controlled (on/off).
- q. Any microprocessors or other peripherals in the parking control booths will be supervised by the central processor.
- r. The Parking Facility Central Processor shall be connected via a dial up modem to an existing personal computer based local area network (LAN) in the COMP/LAND, offices located at 600 Fifth Street, N.W., Washington, D.C. 20001.
- s. The Parking Facility Central Processor shall be sized to operate the parking lot being modified and the new garage being constructed. The exiting Park-and-Ride lot is currently comprised of approximately 641 spaces. After the

construction of the new garage, the size of the lot will be approximately 410 stalls. The new garage will accommodate approximately 1,500 stalls. Therefore, the Parking Facility Central Processor shall be sized to operate a minimum of 1,910 stalls.

- t. Users entering/exiting the surface lot (from lanes outside of the garage) will be controlled by a single entrance lane and two exit lanes (one parking control booth which would include SmarTrip processing and an auxiliary payment lane with SmarTrip payment processing only).
- u. There are two entrance portals into the garage, one on the garage's Ground tier level (with two entrance lanes) and one on the Second Tier (with one entrance lane). Users may exit the garage from garage's Second tier via an array of four exit lanes. The array is located on the east side of the garage's Second Tier. Two of the exit lanes will contain a parking control booth which would include SmarTrip processing technology while the other two payment lanes will utilize SmarTrip payment processing only.
- v. Users exiting the lot may use the lot's exit lanes or may exit through the garage's exit lanes. Similarly, users exiting from the garage may exit through the lot's exit lanes.
- w. The Parking Management office LAN (PARK) shall have off line interface with the Central Processor in the parking structure, but the Central Processor shall be considered as a remote work station of the LAN for purpose of integration of transfer of data files to the LAN File Server and access to all computer files. Working from any work station on the existing LAN shall give the same degree of access and control over the central processor as working on the central processor itself. This capability shall be provided by using the latest available version of the commercial software package "PC Anywhere" or an approved function and performance equal.
- x. Any software to be licensed for use on the PARC Parking Facility Central Processor, shall also be licensed for use on the Management LAN in general.

4. Definitions:

- a. System: All elements required to manage and control the parking lot/structure. This includes all equipment, software and sub-systems for collecting and monitoring fee collection activity, counting vehicles and SmarTrip transactions by type/value, storing and transmitting parking management information, on-sight/remote, setting or changing operational parameters, operating gates and FULL signs and monitoring the arrivals, departures and occupancy of this parking lot/structure along with all other park-and ride lots and structures as independent separate facilities at this Station (new 1,500 +/- space parking structure and 410 +/- space surface lot), which may be subsequently connected to and operated by the system central processor, operation of the parking facility, as well as, associated training and documentation.
- b. Entrance/Exit Array: The installed equipment and configuration of traffic lanes and islands for one entry lane, one reversible (payment or non-payment) lane and exit (payment) lane, with two parking control booths.
- c. Entry Lane: A lane in which entering traffic is controlled by a barrier gate with an arm (used only during revenue collection hours) and overhead lane control signals.
- d. Exit/Payment Lane: A lane in which exiting traffic is controlled by a barrier gate with an arm (used only during revenue collection hours).
- e. Reversible Lane: A lane used to allow selected types of traffic past the parking control booth, from either direction, depending upon the time of day and the setting of the overhead lane control signals. Payment will be made only during revenue collection hours. The gates will be held in an up position

for the remaining hours. In the event of a system failure the cashier will operate the gate by a toggle switch(s) and buttons from the nearest primary parking control booth.

- f. Primary Booth: The parking control booth located to the right upon exiting of each three lane array used for collection of fees from vehicles exiting the parking facility.
- g. Secondary Booth: The other parking control booth(s) located at a parking fee collection array (Entrance/Exit Array) for collection of fees from vehicles exiting through the array.
- h. Failure: A physical or functional breakdown of a part or group of part or a condition or parameter that is not compatible with the software, which prevents the equipment from performing its designed functions.

### **1.03 QUALITY ASSURANCE:**

- A. The quality assurance program shall meet the following requirements in addition to those stated in the General Requirements.
- B. Qualifications: Select a manufacturer regularly engaged in production of similar parking access and revenue control equipment.
- C. Codes, Regulations and Reference Standards:
  - 1. Codes and regulations of the jurisdictional authorities.
  - 2. All traffic control devices shall conform to the FHWA Manual on Uniform Control Devices, 1988 Edition or as subsequently revised.
  - 3. NEC
  - 4. The parking control booths and PARC Operations Center islands and access paths thereto shall meet or exceed, as required herein, the minimum provisions of ADA, Accessibility Guidelines as published by the Architectural and Transportation Barriers Compliance Board (A&TBCB)
  - 5. UL
  - 6. FED STD: 595.

### **1.04 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements, and with the additional requirements as specified for each.
- B. Within 120 days following NTP, a test plan for all installed equipment and systems, and the 30 Day System Functional Accuracy Test.
- C. Within 60 days following NTP, a detailed schedule of design, manufacture, installation, and testing of the equipment to be installed. Include request for modification of any drawings that may be necessary to accommodate specific equipment or space or performance requirements.
- D. Product data and drawings demonstrating that the installation design, equipment software and other system details satisfy the functional requirements and operational parameters. The equipment used in the system must be produced by a recognized firm regularly engaged in the appropriate industry and accomplish the functions intended.
- E. Shop Drawings (paper copies and CADD or Scanned CCITT Group 4 electronic media copies were available from the suppliers) for equipment and systems provided by the Contractor shall include.
  - 1. Installation details for:

- a. Gate and lane control signal control console.
  - b. Communications support installation.
  - c. Vehicle detector loops to operate gates, FULL signs card readers, magnetic strip ticket dispensers and vehicle counting. (Loops needed to operate gates and directional counting may also operate other equipment.)
  - d. SmarTrip, readers, processors and related equipment
  - e. Installation of all electronics in the system.
  - f. Traffic control barrier gates.
  - g. Fee computer, including patron's fee display, compatibility with installation of magnetic strip ticket, reader, receipt and report printer, and peripherals
  - h. PARC Parking Facility Central processor, including printer, network software installed on WMATA's Parking Management LAN - PCs or file server, communication servers and work stations; network connectivity and full operation.
  - i. Primary, backup and uninterruptible power supplies for facility parking access and revenue control equipment and processors
  - j. Control for gates and lane control signals.
  - k. Bollards
  - l. Interfaces, wiring and miscellaneous equipment required to complete the system.
  - m. Provision for installation of magnetic strip ticket dispensers and readers. Include manufacturer's recommended specification for these items as well as interface requirement to the system as furnished to ensure compatibility of equipment.
- F. Documentation shall be provided to the QC/QA Coordinator for approval as follows:
- 1. A detail schedule of design, manufacture, installation, and testing of the equipment to be installed. The QC/QA Coordinator shall submit five copies of the approved schedule to the Engineer/Architect.
  - 2. A test plan for all installed equipment and systems and performance testing. The QC/QA Coordinator shall submit one copy of all test reports within 10 days of test accomplishment to the Engineer/Architect.
  - 3. Software reference manuals and documentation to include source and code and object modules on any programs developed modified for this contract or for application templates of standard commercial software products. Source code and object modules do not need to be provided for modified commercial software products
  - 4. Operation and Maintenance Manuals and Parts Catalog.
  - 5. Training requirements.
  - 6. Certifications
    - a. Testing:
      - 1) The Contractor shall perform component or equipment level testing, system level testing and a 30-Day System Functional Accuracy Test. Certification that system is ready for operations and that the system will perform its continuing functions reliably shall be provided by the QC/QA Coordinator to the Engineer.

**1.05 PRODUCT, DELIVERY, STORAGE AND HANDLING:**

- A. Ship each unit securely packaged to avoid damage and labeled for safe handling in shipment.
- B. Store all equipment in secure and dry storage facility until ready for installation or turn over to the Owner/WMATA.

- C. The Contractor shall be responsible for receipt of all furnished equipment and supplies and for safeguarding equipment and supplies from pilferage and effects of weather until accepted by the Owner/WMATA in final installed configuration.
- D. Deliver spares to storage areas designated by the Engineer/Architect.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS AND EQUIPMENT:**

- A. Environmental Requirements: The system, with the exception of the central processor system, which shall operate in a normal office environment, all other equipment shall perform its function without degradation when operated within the following conditions:
  - 1. Temperature: Minus 29C to plus 70C.
  - 2. Humidity: To 100 percent at 35C.
  - 3. Sunlight: Full solar loading.
- B. Controls for all gates and lane control signals in the cashier lane shall be provided for each parking control booths on a panel. The control panel including all push buttons and toggle switches shall be weather and moisture proof. The control panel shall be on an incline sealed housing constructed of 16 gauge steel or aluminum with reinforced corners or framing.
  - 1. The face of the panel shall be provided with switches and buttons fully labeled as to their function and control item. The labels shall be permanent and shall not pull or wear off under normal usage. Toggle switches shall be used to either open and stop (hold) the gate in the open position or lower the gate (unless a vehicle detector loop at the gate detects a vehicle present) and allow the gate to operationally rest in the lower position. The push button will call for the gate to be opened and automatically lower once a vehicle has cleared the gate detector loop. The gate control panels in the principal booth for each three lane-cashiering array shall also have switches and buttons for all gates at the array. Each of the gate control panels for the principal parking control booths shall have a key switch to energize all gates controlling the entry drive aisle. Either principal booth shall be able to collectively open or close all entry gates and leave them in the up position when the gates are not needed for operation as after collection hours. Up and down position indicator lights, collectively for all entry gates, shall be provided on each principal parking control booth control panel. No gate shall come down on a vehicle passing through the gate, but shall lower only when all vehicles are clear.
  - 2. The control panel in each of the two principal parking control booths shall also provide for the lane control traffic signals. The principal parking control booths shall be provided with a separate key set on/off switch for each of the exit lanes. Reversible land control signals shall be provided for each lane with a key set on/off switch and a two position selector toggle switch. Toggle switch Position 1 shall provide for energizing green arrow signals with the red X signal dark for outbound. Toggle switch Position 2 shall provide for energizing a red X signal with the green arrow signal dark for the outbound direction.
  - 3. All key switches shall be keyed alike. Two such keys shall be provided for each parking control booth.
- C. The PARC Operations Center shall be provided with a two line desk phone to be installed in the counter at the middle of the end wall. This phone shall be connected to the WMATA PBAX system in station communications room. One of these phone lines shall be connected to the modem for the PARC central processor with the other line used for voice communications.

- D. Bollards: Bollards shall be six inch diameter of steel pipe construction. They shall be either filled with a rounded top for applications in poured concrete foundations or fitted with a steel top welded to the pipe and ground smooth with a flange plate or casting at the bottom for anchor bolt attachment to a concrete surface. All bollards shall be painted highway safety yellow.
- E. Parking fee and hour signs shall be located on both sides of the entrance roadway and at the leading ends of the cashier lanes at the exit point.
- F. Vehicle Counting and Telemetry:
1. A programmable vehicle counting function shall be furnished for the combined parking lot and structure facility. This function, by use of appropriate hardware and software, shall monitor all vehicles entering and exiting the facility in all lanes, store the data in the parking facility for a minimum of seven days, but transfer daily the calendar day data to the LAN computer system in the offices of PARK through the parking facility's central processor. The function shall determine and report the number of vehicles that have passed by direction through each entrance and exit lane at any given time interval during the day. It shall incrementally count by one each time a vehicle passes through a lane. It shall be capable of reading bi-directional traffic and differentiate between incoming and outgoing traffic through all entry or exit lanes, determining the direction of the vehicle from the loops set in the lanes. The detector loop amplifiers shall be self tuning.
  2. The vehicle count tabulation function shall be programmable with a real time clock in whole minutes for discrete reporting periods from one minute to one hour (1, 2, 3, 4, 5, 6, 10, 12, 15, 20, 30 and 60 minutes) yielding a maximum of 1,440 one minute tabulations during a 24 hour calendar day, 1,500 tabulations with Spring daylight savings time adjustments. Memory of sufficient size shall be provided and be addressable in the central processor to store tabulations addressable by calendar day for not less than 14 days. The data storage shall be in an ASCII file format.
    - a. The vehicle counting memory shall be provided with recharged uninterruptible power supply capable of supporting it for at least 48 hours in the event of power loss or interruption. There shall be a remote battery voltage monitoring system built into the hardware software.
    - b. An Anti-Coincidence Logic (ACL) function shall be provided by software that will decipher simultaneous counts, when more than one vehicle enters or exits the parking facility at one time. The ACL will put the counts in sequence and covers all lanes. It will take signals from the gate controllers.
    - c. The differential counting function shall, together with the ACL, monitor the total net number of vehicles in the parking structure, and shall activate the FULL signs when the parking capacity limit is reached. The parking capacity FULL sign on and off limits shall be locally set. Capability shall also be provided thru the parking structure central processor to be able to remotely set or revise the limits of the differential occupancy count from the PARK Office Management LAN computer system. The central processor shall record and store the total vehicle occupancy in the parking facility as it records the amount of vehicles counted for the unit of time. This shall be the same occupancy to be used to drive the FULL signs. Note that entering vehicles will not be required to stop to take a ticket or conduct any other type of transaction. Vehicles exiting at times either before or after collection hours will likewise not be required to stop and conduct any type of transaction. Gates will be in the up position at all times other than during revenue hours.
    - d. The count recording and differential occupancy tracking hardware and software shall be provided with all equipment and accessories including terminal capacity as necessary to activate relays, accept signals from

remote locations or from various loops or inputs, and be recorded or set locally remotely. This capability shall be provided for at least 10 channels of data and activity over and above that required to operate the count functions otherwise herein described. The 10 extra channels shall be grouped in their own matrix. The extra system shall accept count inputs at a rate up to 20 per second. Inputs shall be via Form A dry contacts.

3. An auto answer modem function shall be provided for the Central Processor which shall be full Bell compatible. The operation shall be full duplex on a two wire circuit, with a user selected 56K or higher baud rate as may be widely available at time of installation with automatic answer or switch-selected originate/answer.
  4. If necessary for system integration the Contractor shall provide a data module interface, to transfer data that has been field collected to the PARK office LAN computer system using Contractor provided software. All reports that the manufacturer's standard system provides to be printed on the on-site PC shall also be transmitted to the PARK office Management LAN computer system for printing upon command. This command shall be set by the end user manager as to be either automatic or upon specific LAN work station (remote) and/or central processor request.
  5. A combination of equipment and software shall provide a Programmable Vehicle Counting system (PVCS) for each array in the parking structure that will be resident in the on-site central processor. The PVCS shall take inputs from barrier gate controller/microprocessors and shall monitor and report with programmable summaries of vehicle activity in all lanes in each direction by array with programmable time increment sub-totals. The PVCS shall give calendar day totals. The data shall be stored on the Parking Structure central processor hard drive using ASCII text files that are addressable using standard PC based commercial software, database software, and spreadsheet software, Windows NT, are specifically included. The ASCII text files shall be organized so that each lane and direction of traffic data is consistently presented in the same location on a standard data matrix that will be used for all arrays. These data files may be retrieved by the PARK office Management LAN computer system via modem from the on-site central processor.
- G. Each parking control booth shall be equipped with cable pairs for installation of WMATA's SmarTrip proximity debit card Uniform Fare Technology Application (UFA) required for integration of automatic fare collection data. A low capacitance ( 20pF/ft) six pair, individually shielded, teflon insulated, stranded conductors for computer and instrumentation cable, Beldon 88778 or Beldon 87778 plus a 3-pair 22 AWG minimum telephone cable. For each SmarTrip card reader processor two cables shall be furnished and installed from each card reader to the Grosvenor Station kiosk through the station communications room for interface with the Automatic Fare Collection (A.F.C.) System.
- H. A parallel data file system to the above vehicle counting and recording system also on the on-site Central Processor hard drive shall provide for a file(s) listing fee computer and barrier gate controller/micro processor transactions or activity and shall contain data reporting.
1. The Fee Computer shall provide the following report files:
    - a. Transients.
    - b. SmarTrip Card users by type and transaction value amount.
    - c. Access card users
    - d. Back-out card users.
    - e. Back-out entry vehicles with or without dispenser ticket.
    - f. Total entering vehicles by array.
    - g. Total exiting vehicles by array.
    - h. Total number of validations by type.
    - i. Total cash revenue collected.

- j. Total electronic (debit) revenue collected along with detail breakdown of debit transactions.\
  - k. Any other data collected and reported which is normally furnished, advertised or listed in generally released product information for the fee computer delivered under this Contact.
  - l. Sub-totals of above by each cashier.
  - m. All related activity counts files, and transaction activity and revenue data shall have stored on the Parking Structure Central Processor hard drive for a minimum of 30 days after which files may be subject to being written over by new data the same source and subject.
  - n. All related connectors and accessories as required for the system to properly and fully operate shall be provided. All components shall be fully integrated and compatible with each other, and with the PARK office Management LAN computer system, both hardware and software. Incompatibility problems shall be resolved by the Contractor to the satisfaction of the Engineer/Architect and PARK staff.
- I. Fee Computer
1. The following parking revenue control system shall be provided and installed in the parking structure. The hardware and software furnished shall be based upon that routinely produced and furnished by the manufacturer for similar installation in parking facilities for purposes of supporting and controlling cashiering operations. The Fee Comptroller shall be a modular revenue control system that includes:
    - a. Multi-functional printer.
    - b. Fee computer terminal.
    - c. Integrated and electronically controlled cash drawer.
    - d. Power supply.
    - e. Both the printer and terminal shall be of durable corrosion and moisture resistant construction, in stainless steel or other equally durable and serviceable product.
    - f. The Fee Computer shall be user programmable and operate either through a communications network from the parking facility central processor or locally at the fee computer in the event of a communications mode failure or by a program parameter change by user.
    - g. The Fee Computer shall compute parking fees based upon time of entry, maintain a complete audit trail of transactions and revenue, display fee and Thank You, Paid, or equivalent message, on a fee display to the patron, print header programmed receipts upon command, calculate change due, have at least 3 preset fixed parking rates, accept 3 types of coupons each to be tied to a specific validation key, control cash drawer, interface with barrier gate and Fee Calculator arming loop.
    - h. The Fee Calculator shall be fully installed, operational and shall:
      - 1) Permit transaction activity only when a vehicle is over the arming detector loop.
      - 2) Provide displays to the patron of the fee amount due and Thank You or equivalent transaction-complete message.
      - 3) Print transaction receipts upon command or automatically as may be subsequently required by the Authority. The change in receipt generation shall be controlled by a simple parameter change at the Central Processor either directly or remotely from the PARK office Management LAN computer system.
      - 4) Collect data on transactions and revenue by cashier, booth and by exit lane.
      - 5) Provide reports on transaction and revenue collected by cashier, by booth, by array, total and by facility total. Permit reset to zero by supervisory personnel only. Reports shall be generated by the

central processor, but the cashier and booth reports shall also be printed in the respective parking control booth.

- 6) Collect data on vehicle activity by lane, by array total and by facility total. Permit reset to by supervisory personnel only.
  - 7) Provide alarm and trouble reports, including loss of communications with a booth loss of power at an array, failure of a peripheral, failure of communications between arrays and the central processor, failure of communications with the PARK office Management LAN computer system and software failure.
  - 8) Provide attendant log-in/log-out record by name and identification code. Prohibit fee transaction activity without a proper log-in.
  - 9) Be capable of incorporating a patron card reader debit card processing devices.
  - 10) Be capable of incorporating a patron card reader debit card processing devices.
  - 11) Be capable of incorporating a patron access card read and processing function.
  - 12) Be capable of functioning without the need of the cashier inserting a paper or magnetic strip ticket into the fee computer or peripheral devices for transactions, which are not dependent on the time of patron entry (fixed fee transactions).
- i. Parking control booth mounted displays to inform patrons of fee transaction amount and completion.
  - j. Fee Computers shall be tied to a time base generated by the Central Processor and shall all be on the same time reference. A change of the time in the Central processor shall change the time for all Fee Computers via a down load.
  - k. Fee Computers shall not operate collections for hours other than those established. The Central Processor shall be programed with the hours of collection for each of the fee computers, either as principal or as part-time secondary usage.

J. Parking Facility Central Processor

1. The contractor is to provide a Central Processor system in the PARC Parking Operations Facility, operations room. All on-site central processing software and data storage is to be done on this unit. The Contractor is responsible to fully integrate and make operational central processor. If the unit being herein specified is of sufficient capacity and or capability, the Contractor shall substitute one that is fully able to function as specified manufacturer, this unit is unable to perform required functions, the Contractor shall furnish a unit a that will efficiently perform and has at least the following features described below. This brand of the Central Processor shall be Authority standard personal computer (P.C.) Standard manufactured by Dell. No substitutions of the Dell brand of P.C. shall be allowed. The delivered unit/system shall include the latest version of the following (or approved equals):
  - a. Dell Intel Pentium 4 with 1.4 GHz minimum processor and 256 MB minimum Random Access Memory (RAM).
  - b. File System - 64 byte virtual memory
  - c. Hard Drive - 20 GB (minimum)
  - d. Diskette Drive - Generic IDEA Disk Type 55.
  - e. Diskette Drive - Generic NEC Floppy Disk 3-1/4: inch.
  - f. CD ROM Drive - Toshiba CD-ROM AM 63028.
  - g. Floppy Disk Controller - manufacturer's standard.
  - h. Hard Disk Controllers - Intel 8271, AB/BE P.I. Bus Master Controller, Primary IDEA Controller (dual FIFO) and Secondary IDEA Controller (dual FIFO).

- i. Keyboard - PC/r - T enhanced keyboard (101/102 keys).
  - j. Modem - U.S. Robotics 56K Fax Ext. (fastest option available)
  - k. Windows 98 or 2000, Windows NT 4.0 or higher
  - l. Printer - HP Laser Jet 6P
  - m. Monitor - Dell M781p 17"
  - n. Network Adapter - IBM P.I. Token Ring
  - o. Ports - Com and LPT
  - p. Controllers - Universal serial bus, sound, video and game.
  - q. Pieces of work station furniture for the Central Processor.
    - 1) 2 each - armed desk chair with adjustable seat height, swivel base and rolling casters, foam cushion seat and back with fabric covering. The chair arms shall not have fabric covering. The color shall be black or dark.
    - 2) The work station furniture shall include a 42 inch tall by 30 inch wide book shelf measuring 10 inches or greater deep. The bookshelf shall be installed in the operations room.
    - 3) Adjustable keyboard support mechanism - 6 inches wide by 30 inches deep by 29 inches high to be fastened to operations room counter top. It shall match the PARC operations room counter top in material and color.
    - 4) Free standing on rollers file drawer, to be stored under operations room counter top shall be 15 inches wide by 18 inches deep by 27 inches high.
    - 5) Product:
      - a) The basic bookshelf, keyboard support mechanism and file drawer 1 inch three-ply solid core construction with an oak or maple plastic laminate surface. Plastic laminate work surfaces shall be post-formed, top to bottom, front to back. All supports shall be constructed out of heavy gauge steel and shall be sand or beige in color. The specified components shall include brackets, panels, supports, and nuts and bolts to secure the components cohesive unitary work secure the components to the counter as required into one complete cohesive unitary work station. The work station components shall be assembled and installed by the Contractor.
      - b) The keyboard desk adjustable keyboard mechanism shall give front to back tilt of up to 15 degrees, with variable height adjustment of up to 8 inches and shall accommodate keyboards up to 21 inches wide.
- K. For integration with the PARK Office Management LAN computer system as a remote User/Server the following hardware/software shall be furnished and made fully operational:
- 1. U.S. Robotics 56K modem (furnish fastest modem available), or equal.
  - 2. 10 foot RJ-11 cable, or equal
  - 3. PC Anywhere software package or equal, latest version.
- L. The Central Processor shall be provided with a multilevel security access code system that provides for operation and printing of basic Fee Computer activity reports at level one and for total access to all central processor functions at level two. The security pass codes shall be established by the user and may be changed by the user operating at level two. Access to the Central Processor from the PARK office Management LAN will also have to go through the security code, normally level two.

- M. Management software shall be provided for monitoring the activities of the parking structure including parking facility vehicle counts and occupancy, transaction activity and revenue generation. This software shall enable the PARK OFFICE Management LAN computer system with the file server to access memory registers in the on-site Central Processor via telephone line modem 56k baud. The access shall be routinely off line. The system shall automatically dial the parking facility Central Processor to gain access, set parameters, and retrieve data. All code and custom software shall be a deliverable under this Contract. The software package shall perform the following functions:
1. Transfer and store formatted reports and data on the PARK office Management LAN file server.
  2. Generate the following reports:
    - a. Summary Reports
      - 1) Summary Entry/Exit Time Reports
      - 2) Duration of Stay Reports
    - b. Count Reports
      - 1) Totals.
      - 2) Statistics.
      - 3) Activity.
      - 4) Remote Vending.
      - 5) User Changes.
    - c. Revenue Reports
      - 1) Revenue Transactions.
      - 2) Parking Fees Collected (Value/Number).
      - 3) General Totals.
      - 4) Attendant Totals.
      - 5) Daily Revenue.
      - 6) Validations (Value/Number/Type).
      - 7) Attendant Reports.
        - a) Sign In/Sign Out.
        - b) Alarms.
  3. Raw data using the system manufacturer's standard formats. (Reports shall be generated upon user setting of a continuing automatic or special requirement report generation parameter.)
  4. Transaction and Revenue Data Reports using the manufacturer's standard formats. All transaction types and all revenue accumulations: cash, access cards and electronic debit media separately; shall be reported by cashier, booth, array and facility as a whole.
  5. From traffic count data stored in user setable time increments, report summaries covering inbound and outbound traffic resulting expected revenue from each of the respective lanes, arrays and for the total parking structure. These reports shall be in the report format system developed by WMATA staff. An example of the computer paper report is available upon request from PARK.
  6. The special software for report generation to be developed for WMATA's application shall be done so as to be Windows NT template applications or data base or spread sheet software for reading files. The Application templates shall allow the following variables to be input on a daily basis: (NOTE: Keeping these inputs for data to be entered on a daily basis separate from those done occasionally will simplify the application template use process).
    - a. Location.
    - b. Date.
    - c. Revenue Reported (for Traffic Count Data Based Revenue Report comparison with actual revenue).
  7. The software program application shall allow the following variables to be input (daily), by non-programmers with Windows NT application experience to change the format or defaults in the program as needed on an irregular basis:

- a. Location.
  - b. Facility Capacity.
  - c. Rate (hourly, daily (including various validation rates), and monthly rates).
  - d. Revenue Collection Period (2:00 p.m. to 10:00 p.m.).
8. For the Traffic Count Data Based Revenue Report comparison with actual revenue, the program will accept any time frame of raw data fee operation and tabulation (1,2,3,4,5,6,10,12,15,20,30 or 60 minutes, etc.) and automatically tabulate for the hours (including partial hours) required in the format system.
  9. All software program applications (Windows NT) or application templates shall be totally non-copy protected. The Owner/Wmata shall be fully authorized to copy, recode or modify the application template software for the Owner/Wmata's benefit.
  10. Software shall allow monitoring of traffic counts and revenue accumulations as they occur in real time.
  11. The program must archive merged (retrieved) data when given parameter dated of beginning and ending dates.
  12. Software shall provide for a parking facility time base that keeps all fee calculators and the central processors on the same time. The time base shall automatically adjust for daylight saving time adjustments twice per year.
  13. To interface with this and other facilities using the same software, the Contractor shall furnish and install a centralized management software package which shall permit communication and interface with multiple locations with the same general systems configuration in a single consolidated fashion from the parking management LAN. This central management package shall be the McGann Software Systems, Client V Web Browser or full function equal and be specifically written and developed to interface with multiple scattered sight PARC systems consisting of the Central Processor and PARC software of this contract. Multiple licensed copies ( eight) of the central management package local PARC interface software shall be furnished under this contract.
  14. Software shall be furnished under this contract which shall provide for automatic recalibration of the facility occupancy count each 24 hours. The recalibration shall consist of revising the occupancy count at 2:00AM each morning to reflect a Wmata, as end user ,entered set of occupancies (previously observed and projected) to be in the facility at 2:00 AM each of 7 days per week. The numbers will represent a seven day calendar of occupancies which the user will be entered in the central processor for each facility. Setting and changing the 7-day calendar settings shall be done as part of a menu driven exercise fully described in the user manual. Entering and changing the settings shall not require any software changes.
- N. FULL Signs: As shown and as follows:
1. FULL signs shall be activated and deactivated by the vehicle counting function.
- O. Overhead Lane Control Signals ceiling mounted, lighted signals, manually controlled from the attendant booth.
- P. Gates, Barrier Arms, Detectors, Loops and Operation.
1. Gates shall be UL approved and labeled.
  2. Each gate cabinet shall provide support for the barrier arm, and enclose and support the electro-mechanical equipment to operate the barrier arm and to protect the electrical/electronic detector and controller/microprocessor equipment, The cabinet shall protect internal components from the effects of wind, dust, rain, snow, ice and condensation. Lockable doors shall provide access for maintenance and protection against vandalism.
    - a. The weather tight, seam welded cabinet shall be constructed of galvanized steel or aluminum, measuring not more than 15 inches wide by 15 inches deep by 40 inches high. Four mounting anchor bolt holes, accessible only

from the inside cabinet, shall be provided. A weatherproof door, with flush mounted T-handle lock and two keys, shall enable easy access to components. The cabinet shall be finished with the manufacturer's standard primer system and two coats of semi-gloss finish of Federal Standard 595A, Color 20040 (Metro Brown).

b. Electrical components:

- 1) All electronic (micro-processor) controls shall be enclosed in a factory sealed plug-in controller, that shall plug into the low voltage terminal board, so that the controller shall be readily replaceable. Provide two terminal boards, one for low voltage and one for high voltage connections and operation. The high voltage terminals shall be enclosed in a galvanized connections box that will receive all high voltage wiring, and include: one 120 VAC grounded convenience outlet. Provide one 250-500 watt strip heater or 24 VAC reduced heater that shall be thermostatically controlled.
- 2) The gate arm shall be driven by a 1/3 to 1/2, single phase, instant reverse motor. The motor shall have thermal overload protection with a manual reset. All additional relays, contacts and wiring required to accomplish the proper operation shall be provided.
- 3) The gate shall be quick acting requiring less than 1-1/2 seconds to complete an opening or a closure. The gate shall automatically open upon loss of power. The gate shall be in wide use in public parking facilities with at least 200 gates in use for over 12 months. Mechanical power shall be transmitted from the motor to a gate arm drive shaft by harmonic acting crank shaft and connecting rod. Adjustable cams shall be positioned on the main shaft to activate limit switches from control of gate movement. Crank main shaft and connecting rod shall be constructed of stainless steel or steel that has been coated with zinc dichromate to prevent corrosion. All parts shall move on self lubricating bushings. There shall be provision for raising the gates in the event power loss. Limit switches shall be incorporated into the gates to control the up and down cycles. If one or both limit switches fail, the gate shall still operate in a proper manner. A signal shall be generated and sent to the on-site central processor that a failure has occurred. Once the defective limit switch has been replaced, a signal will be sent to the central processor noting the replacement of the limit switch. The gate shall incorporate a safety feature. The gate arm shall auto reverse when it strikes an object. If the gate arm strikes an object on the downward cycle, the gate arm will stop and return to the full up position. A user programmable timer will then be energized, time out, and then lower the gate arm. If the gate arm is broken, on the next cycle of the gate up or down, a signal shall be sent to the on-site central processor , which shall include the time and date of the occurrence.
- 4) The barrier gate arm shall present a physical and highly visible impediment to the passage of a vehicle. It shall be articulated (hinged) to operate within the limited overhead clearances of the parking structure as necessary. The barrier arm shall swing up on receipt of a valid control signal for the lane being controlled. After the vehicle has passed beyond the barrier, the barrier shall automatically return to its normal rest position and function. A signal shall be generated to sound an alarm located in the nearest principal parking control booth when a vehicle breaks through a remote entrance location barrier arm. Each barrier arm shall have a

one inch wide strip of rubber along the bottom edge of the arm to minimize vehicle damage in the event it strikes a vehicle. The rubber pad strip shall not permit the exposure of any metal fasteners.

3. Vehicle detector and loop installations shall be as indicated in the specifications (preformed loops in PVC conduit and installed as part of the cashier array drive aisle PCC payment pour) and as recommended by the manufacturer. The associated circuitry shall recognize vehicle movement onto the loop and an unlimited duration of vehicle presence. Detectors shall be part of the barrier gate controller/microprocessor and shall be modular. A directional logic feature shall be included that will interface two multipurpose loops in the lane and be able to distinguish the direction of traffic passing through the lane or if the vehicle backed out before passing through.
4. Gate operation:
  - a. Emergency and Owner/Wmata service vehicle egress (from Principal or Secondary Payment Lanes) during cashier operation shall be controlled by the specific cashiers using Fee Computer emergency/ service vehicle validation keys. Emergency and service from secondary lanes when there is not a cashier present in that lane will be manually controlled by the principal parking control booth during all other periods of revenue operation. The principal cashier will activate the exit gate from the gate control panel in the principal parking control booth. During non-revenue collection periods, the gates shall be left in the up position. Remote control of all gates shall be provided from the control panels in the parking control booths. The controls shall consist of toggle switches and buttons for each gate being controlled. The controls shall consist of toggle switches and buttons for each gate being controlled. The toggle switches and buttons are not to be used to operate the gates when the fee computer is operational for the particular lane being controlled. For gates to open during revenue collection periods, there must be a SmarTrip transaction or the fee computer must either process a payment or validation transaction, using one of not less than four exempt validation keys for emergency or service vehicles or for persons having insufficient funds or in protest of the fee. In the event of system failure causing shutdown of the fee computer or some element of it, and/or central processor and/or communications interface does not permit the fee computer to operate, the cashier or some fail safe operation shall permit the gate(s) to respond to actuation of a toggle switch or button by the cashier.
  - b. During periods of fee collection operation by cashiers, the exit or payment lane gate in the active lane shall be in the down (closed) position. The gate shall open upon actuation of a SmarTrip transaction, upon a fee computer/central processor command or upon the cashier logging off the fee computer and using a control panel switch. The exit payment gate(s) shall automatically return to the closed position when the vehicle clears the final loop upon completion of a fee computer, SmarTrip or manual exiting vehicle transaction. At all other times (non-revenue collection hours), the gate shall remain open (up). In a secondary payment lane cashier operated for fewer hours by a cashier than a principal payment lane, the remaining hours will have two gates remain in a closed position until the end of the collection period and no traffic will be permitted to pass. If the lane is to accommodate SmarTrip transactions, the Principal booth cashier shall activate the lane exit gate leaving the entrance gate open and allow the SmarTrip system to control the operation of the lane until the end of collection hours. At least one secondary non-cashier staffed exit lane will be used for SmarTrip transactions per array when a principal parking control booth is operating. Initiating SmarTrip control of a secondary exit lane shall occur by opening

the lane entry gates from the control panels in the principal parking control booth at the array. The entry exit lane gate controls shall be by use of toggle switches and buttons for the respective gates being controlled. In the event of system failure causing shutdown of the fee computer or some element of it, and/or central process and/or communications interface does not permit the fee computer to operate, the cashier or some fail safe operation shall permit the gate(s) to respond to actuation of a toggle switch or button by the cashier.

- c. If in the future ticket dispensers are installed automatic controls shall be provided to detect the presence of a vehicle in the entry lane, issue a control signal that will be used to arm a ticket dispenser to issue a magnetically encoded ticket, raise the barrier gate, detect the passage of the vehicle beyond the barrier and lower the gate. Controls and logic shall be provided to lower the barrier, if a vehicle backs out, with or without a ticket prior to passing beyond the final detector loop. When the barrier gate will close, controls will reset, and the lane will be ready to process another vehicle. Automatic operation of the ticket dispenser shall be disabled by the remote parking control booth mounded control panel toggle switch for the control gate in the up position.
- Q. Magnetic Coded Ticket Dispensers: These are future hardware items not to be delivered as part of this contract, but specifications are provided as the Contractor is to furnish system software for the dispensers and full compatibility.
- 1. Patron and detector loop armed/activated magnetic ticket dispensers.
  - 2. Ticket dispensers are to include a display of instructions to the patron.
  - 3. Encode and dispense magnetic strip ticket that includes magnetic codes for time and date of entry and ticket identification.
  - 4. Dispenser prints for the patron information the time date and identification data on the ticket.
  - 5. Retract and separately store tickets presented for a patron, but not taken within a set period of time.
  - 6. Ticket dispensers shall be mounted in the space reserved for them on the entrance islands for entrance and reversible lanes.
  - 7. Dispensers shall have a controller/micro-processor to control the functions of the dispenser. The controller/micro-processor shall have a real time clock, control all functions of the dispenser and communicate with the on-site central processor.
- R. Magnetic Strip Ticket Reader: These are future items not to be delivered as part of this contract, but specifications are provided as the Contractor is to furnish system software for the reader and full compatibility.
- 1. Magnetic Strip Ticket Readers shall be provided as part of the Fee Calculator console or as may be the manufacturer's standard practice.
  - 2. Parking control booth magnetic strip ticket readers shall read the magnetic coded strip on the ticket and, with the fee computer, shall display the proper fee for the patron and cashier.
  - 3. The Contractor shall furnish detailed specifications and electronic protocol for the card readers being furnished to interface with magnetic strip ticket dispensers or a combined magnetic ticket dispenser and card reader package and install the full capacity.
- S. WMATA "SmarTrip" Target Modules, Operator Displays, Parking Console Units, Target Mounting cabling, conduits & connectors.
- 1. This "SmarTrip" system is a basically stand alone smart microprocessor chip proximity debit card system which is principally components developed for WMATA and manufactured by Cubic Transportation Systems (CTS) 5650 Kearny Mesa Road,

San Diego, CA 92111 Attention: Roger Kuitie. Alternate sources of this system are not available. This CTS manufactured SmarTrip system shall include:

- a. A "Micro Tri-Reader" Target Module - includes patron display (9345-11104) for each of 6 revenue collection exit lanes: the principal and secondary cashier lanes.
- b. Parking Console Unit.
- c. Operator Display.
- d. Interconnection, cable conduit and connectors to connect "Micro Tri-Reader" Target Modules, Parking Console Unit and Operator displays with each other to achieve operation and all connectors supplementally required conduit and cable to connect with the SMADS computer in the Station kiosk, lane control gates, the fee computers and Central Processor.
- e. Target posts or brackets and connection assembly shall be bolted either the concrete island surface as an access card reader post assembly or parking control booth side wall connection bracket. Provide detailed shop drawings showing fabrication and installation details for approval. The Targets are to be mounted so that the working face of the target is 2-inches from the face of the curb and not an injury hazard to either cashiers or patrons paying for parking by cash or other means.
- f. All equipment shall be installed according to the manufacturer's instructions. In addition the following requirements shall be met:
  - 1) The parking control booth Target Module shall be installed on the outside of the parking control booth 6 inches under the opening window sill, centered on the opening.
  - 2) The Parking Console Unit shall be installed inside the parking control booth on the side wall near the window, but it shall not encroach under any circumstance into the 60 inch diameter wheel chair area required under the ADA-Accessibility Guidelines for the parking control booth. The side wall under the counter in front of the duplex AC outlet may be feasible. All cables and conduits connecting to the Parking Console Unit shall be installed in conduits which shall be run as unobtrusive as possible, tucked in under the sliding window track.
  - 3) The operator display shall be installed in a fixed position on the parking control booth counter, well to the left near the side wall and shall not interfere with reach of operation of Fee Computer or gate/lane control switches or with the working surface required to collect and process cash payments and handle coupons.
- g. The SmarTrip System shall interface with two other operating systems.
  - 1) There shall be an output of the SmarTrip system connected with appropriate lane exit control gate to operate (open) the gate upon completion of a payment transaction at the respective Target. The gate shall close immediately upon passage of the vehicle.
  - 2) The SmarTrip system manufacturer (Cubic Transportation Systems) shall provide a means to furnish an output of SmarTrip transactions by type and individual transaction completed value to the fee computer/central processor report at the close of revenue collection the electronic debit revenue to track the type and value of all transactions at the payment array and hold the cashiers accountable.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Sequence and Coordination Work:
1. The Contractor shall submit a detailed schedule of design, manufacture, installation and testing of the equipment to be installed under this Contract to the Engineer/Architect for review and approval.
  2. The Contractor shall perform system integration of all components and interfaces to ensure proper functioning of the entire system to include but not to be limited to: gate operation, booth environment and control functions, fee transaction, vehicle counting, and data collection, storage transfer and transmission.
  3. The Contractor's shall install a system that utilizes the equipment of a recognized and established manufacturer of parking facility controls. The equipment and software shall be approved by the Owner/WMATA in accordance with the Contract submittals delineated above. Any modification in equipment or software must be Authority approved and functionally satisfy all requirements of the specifications. The Contractor must submit detailed installation drawings and product approval documents for approval by Owner/WMATA prior to proceeding with a modified installation. The cost for any such modification shall be contained within the original bid submitted.
- B. Installation Procedures: Install all items in accordance with approved shop drawings, or other Contract plans and submittals.
1. Parking Fee and Hours Signs: Parking rate signs shall be free standing, and bolted to structurally adequate steel supports. Signs on islands will be mounted so that the top of the sign is 46 inches above the adjacent driving surface.
  2. Wiring and Raceway: Division 16 and as follows:
    - a. Electrical equipment cabinet terminal strips shall be used in equipment cabinets and all equipment harnesses shall be wired into terminal strips.
    - b. Sufficient slack shall be left in all wiring or cables to permit easy removal of equipment from the cabinet.
  3. Load Center: Division 16, as shown and as follows:
    - a. Mount so as not to obscure signage or parking control booth view of approaching vehicles.
  4. Loops: Pre-formed vehicle detector loops are to be placed in the traffic lanes as the PCC pavement is being placed. The preformed loops in PVC conduits are to be placed centered in the drive aisle and securely tied to the reinforcing and checked for connectivity and impedance before the concrete is poured. The loops shall have not less than 1-1/2 inch of PCC cover. The contractor shall install the proper loop size, shape, placement and the number of turns in accordance with the application and equipment installed and to provide precise and efficient counting and reporting of vehicle counts. The following provides guidance on the installation of the loops, but may be modified to suit specific installations with the approval of the Engineer/Architect.
    - a. Vehicle detector loops shall be positioned in each lane as required to perform the described functions. All loops are to be centered between the vehicle curbing. The vehicle detector loops shall be rectangular in shape or as specified by the equipment manufacturer.
    - b. The loops shall be located at a fixed and constant distance below the road surface. The loop sides must not be installed parallel within two inches of any rebar or other metal item.
    - c. No splices are to be made in the vehicle detector loop cabling. There shall be a single continuous wire to and from the connection point in the gate cabinet.
    - d. Sufficient loop wiring shall be provided to lead back to a vehicle detector amplified located in the appropriate gate cabinet plus six feet of slack.

- e. When two or more loops are installed in a single lane they shall be coiled in opposite directions to the adjacent loop(s). Loops in adjacent lanes shall be coiled in opposite directions from the loops in the same relative position
  - f. The vehicle detector loop wiring shall be 14 AWG THWN single-stranded conductor cable, or as specified and recommended by the amplifier equipment manufacturer.
  - g. The coils of loop wire shall be laid and incorporated into the preformed loops so that there are no kinks or curls in the loops. Each of the three or four continuously successive turns of loop wire, which number as specified or as recommended by the detector amplifier manufacturer, shall sit on top of the loop wire already coiled, in a vertical installed reference. The two lead wires shall be twisted together in a smooth symmetrically uniform with not less than 6 twists per foot of loop lead from the corner of the loop to the end of the lead. The top of the performed detector loop (conduit) shall be not less than 1/2 inch below the finished surface. Should the detector loop amplifier manufacturer specify other installation details for performed loops, they shall be submitted to the Engineer/Architect for approval.
  - h. Before the PCC is poured to bury the loop system, each loop shall be tested for continuity and insulation resistance. All tests shall be performed in the presence of a Owner/Wmata inspector. The loop shall also be tested with a vehicle detector amplifier of the type being furnished for the project by the Contractor. This test will simulate proper operation of the loops before the PCC is poured. Vehicle detector loops not passing the tests will be removed and replaced by the Contractor at the Contractor's expense.
5. Fee Computer Peripherals: The Fee Computer shall be installed on the counters in the individual booths. Holes with plastic or rubber grommet shields installed to protect cables from chafe shall be drilled/cut into the counter top. All cables connecting the Fee Computer and peripherals shall be lead thru the grommets holes to electrical box(s) below the counter where terminal strips are to be installed.
  6. Anti-Coincidence Logic Unit Function (ACLU): the Contractor shall provide software that will provide the ACLU function capabilities.
  7. Differential Counter Function: A software and/or hardware differential counting function (automatic vehicle counting and tabulating function) shall be provided to control the functioning of the FULL signs as well as provide data to the parking facility operations management.
  8. FULL signs: The contractor shall install FULL signs.
  9. Communications Installation: The Contractor shall install cables between the parking control booths, the structure equipment, operations and equipment, operations and equipment rooms, and the Grosvenor Passenger Station communication room to utilize the Wmata PABX system. The installation and routing shall be consistent with the National Electrical Code. The security alarm circuits inside the parking control booth(s) shall be 18 AWG solid RHW or XHHW insulation. The wiring for the telephone circuits inside of the attendant booth shall be 22 AWG solid conductors (pairs), telephone cable between each booth, parking structure operations room, parking structure communications room and the station communications room shall conform ESSEX CASPIC-F+M, 18 AWG telephone cable, or approved equal, and shall be terminated in the communications room via a combined protector block and terminal assembly similar to the Reliance Comm/Tec Model R66C1-6P, or approved equal. Cable to connect Fee Computers to Central Processor shall be of the Fee Computer manufacturer's recommendation
  10. The Contractor shall furnish and install cable and all needed conduits not otherwise available for the SmarTrip readers and processors between the parking control booth and the Station kiosk thru the station communications room. The cable shall conform to 22AWG 6 - Pair individually shielded Teflon insulated stranded computer

and instrumentation cables, Beldon 88778 or Beldon 87778 and a 3-pair 22 AWG minimum telephone cable.

11. Bollards: The bollards shall be installed so as to protect the equipment on the islands from damage by misdirected vehicles.
  12. Locks: The schedule of locks must be submitted and approved prior to their installation. Locks used to secure cabinets must be such that technicians who service the equipment do not have access to the drop safe, the revenue collection personnel who service and use the safe do not have access to the wiring of the electronic equipment and cashiers do not have access to either the safe or to the electronic equipment wiring.
  13. The existing PARK Management LAN equipment shall monitor the parking facility operations, via a communications link between the LAN computer and the garage central processor for parking structure fee computers and vehicle counting devices in the parking facility. The contractor shall be responsible for complete integration and test of the system from end to end.
  14. The SmarTrip system shall be installed and interfaced as described in Part @ - Equipment.
- C. The Contractor shall provide all additional work as indicated on the drawings and specifications to complete installation of a fully functioning parking facility in accordance with the Contract schedule.
- D. Deliverable Requirements:
1. Equipment and material provided as spares shall be delivered to a Owner/WMATA facility in the Washington, D.C. Metropolitan area as directed by the Engineer/Architect.
  2. Test reports, Maintenance Manuals and as-built drawings shall be delivered to the Engineer no later than 45 days after Owner/WMATA acceptance of the Parking Access and Revenue Control System installation.

### **3.02 TESTING REQUIREMENTS:**

- A. The Contractor shall perform component or equipment level testing, system level testing and a 30 day System Functional Accuracy Test. Two overall objectives of these tests are to establish system readiness for operations and ensure that the system will perform its continuing functions reliably.
- B. The Contractor shall prepare detailed test plans, procedures, pre-test check sheets, data entry forms and test report for all testing to be performed.
- C. The test plans shall provide objectives, requirements, approach and schedule for each test.
- D. The test procedure manuals shall include, but not to be limited to:
1. Pre-test inspection check list demonstrating equipment and system readiness for testing.
  2. As-built (installed) drawings.
  3. Listing, or table, of all cable identifications and equipment tags or name plates.
  4. Detailed steps to follow to accomplish the test.
  5. Listing of expected results, pass/fail criteria or parameters for the test.
  6. A listing of test reports required to establish readiness of the equipment or system for testing.
- E. Furnish equipment required to perform all tests. Test each installation and system in accordance with the approved procedures.

- F. The Contractor shall notify the Engineer/Architect a minimum of two working days prior to commencing any tests that are to be certified by the Engineer/Architect. For test coordinated with the PARK office, a minimum of 10 working days advance notice to the Engineer/Architect shall be provided.
- G. The Contractor shall furnish personnel, tools and test equipment as required to satisfactorily complete the tests. Test equipment used in performing the tests shall be in current calibration.
- H. Prepare certified test reports for each equipment installation test. For the system level 30 day System Functional Accuracy Test, copies of the equipment level certified test report forms shall be provided to the Engineer prior to the test.
- I. Tests encompassing system level parking facility management functions shall include complete end-to-end collection and transmission of data from each parking array, receipt of the data by the LAN computer system in the Jackson Graham Building and proper operation of the software provided by the Contractor.
- J. Equipment and system level requirements shall include testing of the following:
  - 1. Single-conductor cable and multi-conductor cable: Division 16, ohms.
  - 2. Grounding: Division 16; ground resistance not to exceed 25 ohms.
  - 3. Switches and receptacles: Division 16.
  - 4. Wire connection accessories: Division 16.
  - 5. Load centers: Perform insulation resistance test of each bus section phase-to-phase ground for one (1) minute using 1,000-volt megger. Insulation resistance to be not less than manufacturer's minimum, or two (2) megohms minimum, if no manufacturer's minimum is given.
  - 6. Demonstrate that all lanes and each gate functions properly (use vehicle to demonstrate. Demonstrate an automatic (fee calculator and independently SmarTrip) system failure mode for the gates.
  - 7. Demonstrate that the programmable vehicle counter functions in accordance with specification requirements.
  - 8. Demonstrate that the SmarTrip system and peripherals function in accordance with specification requirements.
  - 9. Demonstrate that the fee computers and peripherals function in accordance with specification requirements.
  - 10. Demonstrate that the central processor and peripherals function in accordance with specification requirements. Demonstration shall include transmission of data fee computers and vehicle counters to central processor. Demonstration shall also include storage of SmarTrip generated data on central processor and transmission of all PARC data to PARK office LAN computer system.
  - 11. Demonstrate operation of uninterruptible power supplies to data memory storage devices.
  - 12. Demonstrate operation of land control traffic signals.
  - 13. Demonstrate each security alarm. Note: TPAS Central Control must be notified in advance of an alarm test.
  - 14. Demonstration operation of two line desk phone in PARC Operations Center.
  - 15. Demonstrate proper operation of all locks and keys.
- K. After completion and inspection of all work, and following opening of the facility for patron use, the Contractor shall perform a 30 day system Functional Accuracy Test. The System Functional Accuracy Test shall include an end-to-end test of all functions of the system to include parking control booth functions, fee computers, software, gates, loops, counters, differential counters, FULL signs, security alarms, two-number automatic dial telephones,

logic packages, modems, communications, data collection and transmission from the parking structure and from the arrays, and data management in the PARK offices.

- L. Acceptance Criteria for the 30 Day System Functional Accuracy Test are:
1. That all installed equipment performs its intended function as described in this Contract and in the manufacturer's product literature where not in conflict.
  2. The Fee computer and parking control booth peripherals accurately and consistently record and report all transactions, to include operation of the patron reporting signage (fee display).
  3. The Central Processor and all peripherals accurately tabulates the traffic count data and Fee Computer activity and generates, upon command, standardized reports of same.
  4. The differential counting and FULL signs shall function with no more than a one percent error. The FULL signs are initially lit only when increasing parking structure occupancies actually reach a plateau between 99 and 101 percent of designated capacity. The FULL signs are extinguished when falling occupancies actually reach 101 to 99 percent of designated capacity, with some dampening control overpaid on/off switching due to very minor changes in counted occupancy up and down being evident.
  5. Entries and exits for each lane of each array must be counted with no more than 0.5 percent error (vehicle counts for each lane, by direction of travel, with an accuracy of at least plus or minus 1 in 200).
  6. The count related functions must be established by a counting means independent of the equipment being tested (including vehicle detectors). This must include a means of recording the count event and the time frame of event for analysis and comparison with the records and reports of PARK.
  7. Management software must produce accurate reports in formats set by PARK (Revenue Expected from Traffic Counts, adjustments for permit usage, and from SmarTrip activity) or the system manufacturer (Fee Calculator reports).
  8. If the system, or any part of it, fails to meet any criteria of the Systems Functional Accuracy Test, the Contractor will be given 30 days following discovery and reporting of the failure to make corrections at no additional cost to the Authority. More than three failures during the thirty (30) day test will result in a restart of the test period.

### **3.03 INTEGRATED LOGISTICS SUPPORT (ILS)**

- A. The spares, manuals and training shall provide the Authority with the capability to support the system. The spares, manuals and training must satisfy the following requirements, in addition to those stated in the General Requirements.
- B. Maintenance Support will be on two levels as follows:
1. Line Maintenance:
    - a. This level will be first link in the corrective maintenance chain with the requisite skills, tools and test equipment to analyze trouble calls and take corrective action. Line maintenance personnel will troubleshoot and repair malfunctions in the field.
    - b. Line maintenance personnel shall perform periodic scheduled preventive maintenance in accordance with Contractor published manuals. The Contractor's recommended preventive maintenance schedule shall be based upon the number of machine actions and/or machine service time.
  2. Shop Maintenance
    - a. Shop maintenance personnel shall have the skills, tools and test equipment to adjust, replace, repair, maintain and test the system in accordance with Contractor published manuals and instructions. Detailed assembly and sub-assembly engineering shall be developed by the Contractor and reviewed

by the Owner/WMATA for approval to support shop maintenance. Those drawings must be included in the applicable technical manuals. Nothing in this section is intended to require the disclosure of certified manufacturer's proprietary information. If certified manufacturer's proprietary information is involved with any assembly, sub-assembly or system, the Contractor shall so state, identify the assembly, sub assembly or system and shall alternately cover the Authority with an expressed in writing full labor and materials equipment lifetime repair and/or replacement warranty. The Owner/WMATA only has to identify the defective system, assembly or sub-assembly to the best degree possible and ship the defective item back to the manufacturer. The manufacturer will return the repaired unit or a new or reconditioned replacement within 10 working days of receipt. Widely available consumer computer hardware purchased from other manufacturers is exempt.

C. Spare Components

1. The Contractor shall provide spare components incidental to this contract. The total value of spares provided incidental to this contract shall be five percent of the price of the equipment and materials installed under this section of the Contract.
2. Submit a recommended spare parts list, with prices, showing the spare parts necessary to support the maintenance requirements for five years of revenue collection service. The recommended spare parts list shall be based on the following guidelines.
  - a. Group the list by subsystem and equipment item for stocking identification, include ordering and procurement information for subassemblies and components.
  - b. Include component name, description, rating accuracy, manufacturer's name, part number, drawing references, and correlate with the maintenance manuals. Prepare the list in a format that can be easily adapted for entry into a computer. Provide electronic media copies of the list.
  - c. Correlate the quantities recommended with reliability requirements and lead times, and considering the following classifications:
    - 1) Wear: Components which may be expected to require regular replacement under normal maintenance schedules, such as mechanical parts subject to continuous operation.
    - 2) Consumables: Components with an expected life of less than five years, such as indicator lamps.
    - 3) One Shot: Components which normally require replacement after performing their function only one time, such as fuses.
    - 4) Long lead: Components which are not available at short notice from commercial distributors or within 48 hours from the manufacturer, such as specially made or selected components
    - 5) Exchange assemblies: Assemblies which will be exchanged with malfunctioning on the supplied equipment during maintenance and which must be inventoried as complete assemblies.
    - 6) Cross referencing: Where replacement components are common to more than one system or subsystem.
    - 7) Non-unique parts: Items which are not unique to the system and have been manufactured by others.
3. The recommended spare parts shall be identical with all corresponding items of apparatus, components, assemblies and subassemblies incorporated into the system.
4. Package and label spare parts procure under this Contract for long term Owner/WMATA storage.
5. Delivery shall be to a location in the Washington metropolitan area as directed by the Engineer/Architect.

D. Manuals:

1. Operation and Maintenance Manual: This manual shall contain all information required to operate the system and perform scheduled maintenance including inspection, lubrication, adjustment and parts removal and all schematic and system operation required to accomplish on-line trouble shooting, fault isolation and repair. It shall include drawings depicting layout and locations of controls, indicators, cranks and cut offs, and emergency procedures and safety requirements. This manual shall contain assembly exploded views and isometric drawings and detailed step-by-step instructions for the removal, repair and replacement of all subsystems and components. Off line trouble shooting shall also be covered. For software developed or modified for this contract, the manual shall include a complete annotated source code to enable trouble shooting by Owner/WMATA users/and or programmers. The manual shall include reference and documentation for any commercial software used in the system.
2. Parts Catalog: Enumerate and describe every component with its related parts, including the supplier's number, the Contractor's number and commercial equivalents. Include provisions fore entry of an Owner/WMATA part number. Use cut-away and exploded drawings to permit identification of all parts. Parts common to different components (for example bolts and nuts) shall bear the same Contractor's number with a reference to the other components in which they are found, including cross reference and indexing system in the replacement components list. Items which have been manufactured by others shall be identified by the manufacturer's name and part number as well as by the Contractors component number, if any., Each part or component shall be identified to the next larger assembly.
3. Each manual shall be organized into the following parts:
  - a. Part One - Subsystem Characteristics
    - 1) A physical description of the subsystem and pertinent technical characteristics.
    - 2) A description of the functions the subsystem is designed to perform and the general methods employed to accomplish those functions.
  - b. Part Two - Principles of Operation
    - 1) Detailed discussion of the theory of operation.
    - 2) Interface between subsystem components.
    - 3) Signal flow sequence correlated to block diagrams.
  - c. Part Three - Operating Procedures
    - 1) Turn on and turn-off procedures.
    - 2) Detailed operator instructions sufficient to operate the equipment in each available mode of operation.
  - d. Part Four - Maintenance Procedures
    - 1) Preventive maintenance procedures and schedules.
    - 2) Fault isolation and analysis procedures and schedules.
    - 3) Corrective maintenance and repair procedures.
    - 4) System calibration and test procedures.
    - 5) Parts catalog.
4. Bind each copy of the above manuals as required by the General Requirements.
5. The quantity of manuals shall be as specified below. Revisions shall be supplied in the same quantities as specified for the manuals.

ITEM	QUANTITY
Operation and Maintenance Manual	10
Parts Catalog	10

6. Delivery: Final manuals shall be delivered no later than 45 days after acceptance by the Owner/WMATA of the parking facility installation.

E. Training:

1. The Equipment Familiarization Course shall provide management, supervisory and engineering personnel with a functional understanding of the equipment (hardware and software). The functions of each item shall be covered, including the interrelationships of the equipment with vehicles and patrons.
2. A Line Maintenance Course shall provide maintenance supervisors and technicians with the knowledge and skills required in the performance of preventive maintenance of all components of the system. Additionally, the course shall cover any deliverable software, and maintenance of special test equipment provided, whether portable or stationary, including built-in test features. The course shall emphasize preventive maintenance as well location and correction of malfunctions to the system. Sufficient training in operation, theory of operation and fault isolation to isolate problems to the equipment component or software module level shall be presented.
3. The Shop Maintenance Training Course shall provide maintenance supervisors and technicians with the knowledge and skills required in the performance of preventive and corrective maintenance of the entire system. Additionally, the course shall cover any deliverable software, and the maintenance of special test equipment provided, whether portable or stationary, including built-in test features. The course shall provide in-depth training on theory of operation of the system, individual software modules, printed circuit boards (including Contractor designed, off the shelf, OEM and all other vendor supplied not covered by written expressed Contractor full labor and material lifetime warranties), any other special test equipment, shop test procedures, module and printed circuit board repair procedures, and overhaul and testing procedures to the equipment component level. Operations procedures shall also be covered.
4. Training Criteria and Instructor Qualifications:
  - a. The Contractor shall develop and provide all familiarization, line and shop level training necessary for Owner/WMATA designated personnel to support the system, and shall have fully qualified instructors presenting the instruction. Classroom instruction shall include the anatomy and functioning of the parts under discussion, the essentials of their routine care including lubrication schedules, adjustments, limits test, and inspection frequency, troubleshooting, removal and replacement. Instruction shall cover theory of operation of the system, individual modules and all printed circuit boards. Software flow diagrams shall be used to show sequence of events and timing of system operations.
  - b. Instruction shall be designed to cover, in detail, the functions of each item of equipment. Fault isolation and troubleshooting technique will be covered to the extent necessary to permit a technician to diagnose and repair faulty items of equipment. There shall be instruction designed to permit Owner/WMATA maintenance personnel with practical experience in the performance of preventive and corrective maintenance. The course shall include hands on troubleshooting and fault isolation of all subsystems using simulated faults provided for each. Students shall be allocated adequate time to perform preventive maintenance operations on the system components in addition to troubleshooting bugged system components.
  - c. Instructors shall be experienced and fully qualified to teach the course as outlined. The Contractor shall provide a resume outlining the instructor's qualifications and skills. The Contractor shall obtain approval of instructors from the Engineer/Architect 120 days prior to the beginning of the training. Qualifications will be considered adequate when:

- 1) The Contractor's designer of the system is the instructor and has the ability to communicate facts about the system in understandable terms: or
  - 2) The instructor has been trained in teaching methods and is fully familiar with the subject matter.
- d. In all cases, lesson plans shall be prepared and submitted to the Owner/WMATA at least 120 days prior to the class. These lesson plans shall outline material to be presented and list training aids to be used. The course outline and material shall be approved by the Engineer/Architect before being presented. The Contractor shall assume that Owner/WMATA employees have no knowledge of the features of the new equipment. The Owner/WMATA shall be permitted to video tape all class presentations on a non-interference basis.
5. Provide first generation reproducible training materials that meet the following requirements:
- a. An instructor's Guide for each course, which shall include:
    - 1) Table of Contents listing each topic and the time allotted.
    - 2) List of applicable documents.
    - 3) List of training materials.
    - 4) Course learning objectives including course length and recommended number of students.
    - 5) Each topic shall have a cover sheet listing the topic, objectives, time allotted and training aids required.
    - 6) Examinations, if applicable.
    - 7) Training aids shall be developed with the instructor guides.
    - 8) Student and Training Course Evaluation forms.
  - b. A Course outline with learning objectives stated for each topic, shall be provided. It shall include a topic outline for each item of equipment. Maintenance courses shall include a section devoted to system fault analysis and troubleshooting.
    - 1) Description of course including course objectives and type of training.
    - 2) Course length and recommended number of students per course.
    - 3) List of training materials required including documentation and equipment.
    - 4) Each course outline shall list all topic objectives and the time allotted to each topic.
  - c. A set of lesson plans shall be developed for each item of equipment, corresponding to the topic outline, and shall contain the following information: lesson title, time, objectives, training aids required, instructing sequence (outline), tests and summary.
  - d. Visual training aids shall be developed for each topic.
  - e. The primary source of instructional material shall be the applicable sections of the operation and maintenance manual(s), approved by the Owner/WMATA and certified by the Contractor as being correct and reflective of as-built conditions and equipment. In addition, the Contractor shall develop, for each course, notebooks containing such additional drawings, descriptive information and procedures necessary to ensure meeting all learning objectives in an orderly and timely manner. Copies of diagrams, drawings and procedures shall be produced from engineering data and manuals by the Contractor for inclusion into the notebooks. Arrange notebook material by each item of equipment and sequence according to the topic outline. This material shall be submitted for Owner/WMATA approval not later than 120 days prior to the start of training.

- f. Training shall be concluded utilizing installed equipment in the normal operating condition, except in the case of classroom or shop and maintenance training lab equipment shall be used. The Contractor shall provide the production equipment for use during conduct of the training program described herein. Any special tools or test equipment required for maintenance shall be supplied by the Contractor and delivered to the Engineer/Architect.
6. Supplemental Training: In the event the Contractor changes or performs modifications to the equipment subsequent to the training that impacts form, fit or function, the Contractor shall provide supplementary training to the Owner's/WMATA's training instructor on a one time basis.
7. Location: Training classes will be conducted at facilities provided by the Owner/WMATA.
8. Practical training on equipment shall be no less than 60 percent of the course duration. Personnel attending training sessions will be identified by Owner/WMATA.
9. Time: Class time will be at the convenience of the Owner/WMATA.
10. Scope: The following number of Owner/WMATA personnel will attend the training program:
- | Course Title | Length of Course | Number of Students per Session | Number of Course |
|--------------|------------------|--------------------------------|------------------|
| Equipment    | 4 hours          | 8                              | 1                |
| Line         | 16 hours         | 8                              | 1                |
| Shop         | 8 hours          | 4                              | 2                |
11. Schedule: The Contractor shall develop a detailed training program plan.
- a. The Contractor shall submit a final outline and schedule of classes for the training program 120 days prior to scheduled completion of the parking facility.
- b. The Contractor shall submit lesson plans course materials for students and instructors, notebooks and instructor manuals, 120 days prior to course beginning. This material will become the property of the Owner/WMATA following the conclusion of the training course. Two copies of the material for each course shall be provided 120 days in advance of this course for Owner/WMATA approval.
12. Until final delivery of the product to the Owner/WMATA, a document configuration control system approved by the Engineer/Architect shall be used to maintain all training material. All revisions shall be identified at the beginning of each manual. Revisions shall be made for all design changes and, retrofit, error corrections and as otherwise required. Include a control list for each manual produced which shall show the date and latest revision of each page in the manual. Include the list as an index in each manual, to be issued with each revision of the manual until expiration

F. The following list of equipment shall be installed and made operational:

1. Gate and lane control signal control console(s).
2. Fee Calculators.
3. SmarTrip System.
4. Communication support installations.
5. Vehicle detector loops and loop leads to operate gates, lot full signs, card readers, magnetic ticket dispensers and vehicle counting equipment.
6. Vehicle detector loop amplifier electronics and logic, including associated software
7. Programmable vehicle counting equipment, including associated software.
8. Differential counter, anti-coincidence and differential logic, lane entrance/exit point and facility totalizing counters (may be hardware and/or software).

9. Barrier/lane control gates, with articulated arms suitable for applications with limited overhead clearance, as necessary.
  10. Lane Control signals.
  11. Modem, or equivalent data transmission means.
  12. Back up power supplies for system equipment, including three hour uninterruptible power supply capability for the fee computer and for vehicle counting equipment.
  13. Controls for FULL signs and lane control signals.
  14. Bollards.
  15. Interfaces, wiring and miscellaneous equipment required to complete the system.
  16. Video cameras, recorders and monitors to be located in PARC Operations Facility operations room including associated racks, video connections and power supplies.
  17. Parking facility central processor to be located in PARC Operations Facility operations room including associated software, network connectivity on and off-line via modem or equivalent to the management computer local area network (LAN) in the office of PARK (located at 600 Fifth Street, N.W., Washington, D.C. 20001), printer, work station and peripherals.
- G. The following list of equipment shall be installed and made operational:
1. Articulated arms for Barrier Control Gates as necessary for applications with limited overhead clearance.
  2. Fee Computer for parking control booths, including associated software, interface hardware and software for future magnetic strip ticket reader, external fee display driver, patron receipt printer, cashier/shift activity report generator/printer (if not otherwise needed in support of other systems now required), automated cash drawer, key pad, visual display, moisture resistance and peripherals.
  3. Back up power supplies for system equipment, including 3 hour uninterruptible power supply capability for the fee computers unless very same equipment/system is needed for the
  4. Provisions and full compatibility for future installation and operation of magnetic ticket dispensers and card readers
  5. Full system for provision for reading / writing and processing proximity smart cards (WMATA SmarTrip system) at each parking control booth and integrated transaction data reporting to Fee Computer or Central Processor. (including proximity smart card read/write readers).
  6. Integrated Logistics Support (ILS).

**END OF SECTION**

## SECTION 11155

### MECHANICAL PARKING METERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies mechanical parking meters, meter collection cart, collection boxes and associated features.
- B. Related Work Specified Elsewhere:
  - 1. Galvanized steel parking meter post: Section 05500.
- C. Definitions:
  - 1. Short Term spaces: Metered spaces for paid parking up to seven hours from 8:30 AM to 2:00 AM.
  - 2. Kiss and Ride spaces: Metered spaces for paid parking up to seven hours from 8:30 AM to 3:30 PM and from 7:00 PM to 2:00 AM. From 5:00 AM until 8:30 AM and from 3:30 PM to 7:00 PM these spaces are designated NO PARKING, intended to be used only for driver-attended drop-off and pick-up of Metro patrons. Long Term spaces: Metered spaces for paid parking up to 12 hours from 8:30 AM to 2:00 AM.
- D. WMATA Credit: If lock specified for the security vault doors cannot be installed due to unavailability from the lock manufacturer, a WMATA-determined credit or deduction for purchase and installation of the specified lock by WMATA will be applied and used in Bid evaluations

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of the jurisdictional authorities.
- B. Qualifications of the Manufacturer: Provide products of an established manufacturer of mechanical parking meters for at least the last 10 years.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings: Details and parts list of specified products. Include manufacturer's installation, operating and maintenance instructions.
  - 2. Samples:
    - a. One meter, meter collection cart and collection box.
    - b. One of each accessory material or tool used for the work or for servicing the meters.
    - c. After approval, samples may be installed in the work.
  - 3. Certification: Document that the parking meters and support equipment are current production models, which the manufacturer has delivered to other purchasers in substantial quantities, and which are in current operational use.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Follow manufacturer's instructions to protect mechanisms and finishes from damage.

- B. Deliver spare meters, meter collection carts, collection boxes and other material as directed by the Engineer.

## **PART 2 - PRODUCTS**

### **2.01 GENERAL:**

- A. Provide products and components that are new and unused.
- B. Provide parking meters and components of design and manufacture that have withstood five or more years of dependable on-street performance.
- C. Each meter consists of one mechanism with timer, enclosed in a zinc-alloy upper housing, and one coin canister, enclosed in a cast-iron security vault housing. Duplex meters include two each of the above plus one yoke.

### **2.02 MECHANISM:**

- A. Operation: After deposit of a proper coin and fully turning the operating handle, the time indicator displays the increment of time purchased. Existing time may be increased by deposit of additional proper coins until reaching the maximum time limit of the meter. Total amount of time purchased and time still available are shown after the deposit of each coin. Whenever the operating handle is turned from home position, the Violation Flag is displayed until the rotation cycle is completed.
- B. Mechanism Assembly: The meter operating mechanism is constructed as a completely assembled unit totally separate from the mechanism housing, removable from or replaced in the housing as a whole unit, for inspection or repair, without the use of special tools. The meter mechanism is to be a self-aligning, drop-in unit, that does not require locking studs, pins or screws to secure it into the housing.
- C. Coin Slot: Coin slot is to be on front of the meter next to operating handle and positioned so that coins enter the slot on edge vertically and perpendicular to face of the meter. Coin slot is to be either stainless steel or zinc alloy, sized to specific coin denomination. Meter mechanisms are to automatically close the coin slot entrance during turning of operating handle or in event of a jam, thereby preventing the insertion of additional coins until cleared. The mechanism is to be easily adjusted to maintain proper tolerance between the time winding component and the coin carrier.
- D. Washer Detector: Equip meter with a washer-sensing device to detect improper coinage or washers, passing them through without adding time.
- E. Flags: Mechanism is to have two-flags: TIME EXPIRED and VIOLATION.

### **2.03 TIMER:**

- A. Construction: Use high quality workmanship, with gears and pinions free from burrs, shock-resistant, and with gears, pinions and other components made of non-corrosive materials. Protect timer from dust, moisture and impact by using timer cover made of UV-resistant transparent thermoplastic material, so as to permit viewing of the time without requiring removal of the cover.
- B. Operation: Mechanism clock and timer is to function correctly at temperatures from minus 30F to plus 130F, with an error factor of exact run-out to plus three minutes per hour maximum.

- C. Adjustment: The front balance wheel pivot, or adjustment stud, is to be threaded so it may be used to adjust balance-wheel end play. The back, exposed end, of the arbor shaft is to be machined so that a timer key may be used to either place time on or remove it from the meter mechanism, as well as for use in winding the timer when servicing.

#### **2.04 MECHANISM HOUSING (UPPER HOUSING):**

- A. Construction: Rugged, weather-resistant zinc-alloy case constructed to resist tampering and abuse. Cap portion is to have a clear viewing window made of high-impact-resistant and UV-resistant polycarbonate material.
  - 1. Mechanism housing is to have capability of being set to at least two different housing positions by simple means from within the mechanism housing.
  - 2. Mechanism housing is to be fully interchangeable from one meter to another, or from single to duplex meter units; and vice-versa.
- B. Lock: Access to the mechanism is to be through a tumbler lock and key, but not allow access to the coin compartment
- C. Finish: Chip-and-scratch-resistant, UV-resistant, oven-cured polyester powder coating, with minimum dry film thickness of 2.5 to 3.5 mils. Color as determined by the Engineer.

#### **2.05 SECURITY VAULT (LOWER HOUSING):**

- A. Construction: One-piece cast-iron casting, rugged, weather-resistant, corrosion-resistant, and of such thickness as to resist tampering and abuse.
  - 1. Vault Door is to have same construction as the security vault. Vault door and door opening are to be machined to a tolerance of less than 1/32 inch. Door is to be hinged to the vault compartment using steel pins. Design is to prevent drilling out these steel pins to gain access to the coin compartment using a common hand-held drill and bits. Door locking mechanism is to have a latch arrangement to prevent prying open the door.
  - 2. Bottom of security vault is to fit into a nominal two-inch OD Schedule 40 (standard weight) galvanized-steel pipe, and to fasten securely to the pipe (post) with a self-adjusting three-piece wedge assembly designed so that the unit can only be removed from inside the security vault.
  - 3. Security vaults and vault doors are to be fully interchangeable from one meter to another.
- B. Lock: National KeSet High-Security Lock (part number N42002), matching the series and key combinations reserved for WMATA. Other locks are not to be furnished. See Article 1.1 paragraph entitled WMATA Credit.
- C. Keys: Keys for the lock are to be precision cut from materials ensuring long life, without damage to the lock or tumblers. Key blanks are not to be available from locksmiths. Key delivery is to be via registered letter only to the WMATA recipient designated by the Engineer.
- D. Finish: Chip-and-scratch-resistant, UV-resistant, oven-cured polyester powder coating, with minimum dry film thickness of 2.5 to 3.5 mils. Gray color as determined by the Engineer.

#### **2.06 COIN CANISTER:**

- A. Construction: Sealed box of largest-capacity-available; dent-resistant and of lightweight construction; made of corrosion-resistant metals, high-impact ABS plastic material or both. However, these containers are to be strong enough to resist entry with normal hand tools and breakage from dropping.

- B. Operation: When coin canister is removed from a meter for collection purposes, it can unlock only when inserted into a special receiving device (revenue-collection-head assembly) having an embedded key, which thereby allows coins to drop directly into the collection box mounted on a meter collection cart as specified below. The coin canister prevents coins from being removed by means of inverting or shaking the canister unless it is placed in the revenue-collection-head assembly on the collection box.
- C. Lock: Lock and keying for coin canisters are to be different from those of the mechanism housing and security vault, but are to be the same for all coin canisters and reserved for the exclusive use of WMATA.

**2.07 YOKE:**

- A. Construction: Heavy-duty cast-iron unit designed to receive two single meters as a duplex installation on a single post. Make yokes fully compatible with the parking meters. Bottom of yoke is to fit into a nominal two-inch OD Schedule 40 (standard weight) galvanized-steel pipe, and to fasten securely to the pipe (post) with a self-adjusting three-piece wedge assembly designed so that the unit can only be removed from the inside. There is to be no exposed mounting nut on the yoke or meters when assembled on the post.
- B. Finish: Chip-and-scratch-resistant, UV-resistant, oven-cured polyester powder coating, with minimum dry film thickness of 2.5 to 3.5 mils. Gray color as determined by the Engineer.
- C. Quantity: Provide yokes only where duplex meters are specifically shown.

**2.08 METER COLLECTION CART, COLLECTION BOX AND ACCESSORIES:**

- A. Meter Collection Cart is a wheeled cart designed to securely hold a collection box.
- B. Collection Box is a secure box having lock, hasp and security hinges on its access door. A revenue-collection-head assembly is on the lid of the collection box for receiving, unlocking and dumping contents from the parking meter coin canisters. Collection boxes are to be of rugged enough construction as to resist entry with normal hand tools.
- C. Revenue-Collection-Head Assembly: This is to be fully compatible with the coin canister, and includes an embedded key to unlock the sealed coin canister. The sealed coin canister thereby opens inside the revenue-collection-head assembly causing the canister's contents to empty directly into the collection box.
  - 1. Make embedded key for coin canisters different from keys for the mechanism housing and security vault, but able to open all coin canisters, and reserved for the exclusive use of WMATA.
  - 2. Head assembly is to be so constructed as to prevent unauthorized removal of coins from the collection box.
- D. Finish: Baked enamel or polyester powder coating. Color as determined by the Engineer.
- E. Quantity:
  - 1. Meter Collection Cart: One.
  - 2. Collection boxes: One for each isolated facility where meters are provided.

**2.09 DURATION, RATES, COINAGE AND RATE PLATE:**

- A. Short Term and Kiss-and-Ride Spaces: Make meters at these spaces capable of the following duration, rates and coinage, and equipped with rate plates:
  - 1. Duration: Seven hours maximum time on meter.
  - 2. Rate: \$.25 per hour to the maximum time on dial.

3. Coinage: Quarters only.
4. Short Term rate plate: Install in each meter an aluminum rate plate which lists duration, rate, coinage and periods of operation; reading as follows:

MAXIMUM SEVEN-HOUR DURATION PARKING  
EFFECTIVE FROM 8:30 A.M. TO 2:00 A.M.  
EXCEPT SATURDAYS, SUNDAYS AND HOLIDAYS  
\$0.25 PER HOUR TO MAXIMUM TIME ON DIAL  
USE QUARTERS ONLY

5. Kiss-and-Ride rate plate: Install in each meter an aluminum rate plate which lists duration, rate, coinage and periods of operation; reading as follows:

PARKING FROM 8:30 A.M. TO 3:30 P.M.  
AND 7:00 P.M. TO 2:00 A.M. ONLY  
EXCEPT SATURDAYS, SUNDAYS AND HOLIDAYS  
\$0.25 PER HOUR TO MAXIMUM TIME ON DIAL  
USE QUARTERS ONLY

- B. Long Term Spaces: Make meters at these spaces capable of the following duration, rates and coinage, and equipped with rate plates:
  1. Duration: 12-hour maximum time on meter.
  2. Rate: \$0.25 per 90 minutes to the maximum time on dial.
  3. Coinage: Quarters only.
  4. Long Term rate plate: Install in each meter an aluminum rate plate which lists duration, rate, coinage and periods of operation; reading as follows:

MAXIMUM TWELVE-HOUR DURATION PARKING  
EFFECTIVE FROM 8:30 A.M. TO 2:00 A.M.  
EXCEPT SATURDAYS, SUNDAYS AND HOLIDAYS  
\$0.25 PER 90 MINUTES TO MAXIMUM TIME ON DIAL  
USE QUARTERS ONLY

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Install meters in accordance with manufacturer's instructions on posts as shown in the Contract Drawings, providing the materials required for proper installation and operation.
- B. Orient meters facing the curb against which cars park.

**END OF SECTION**

## SECTION 11156

### ELECTRONIC PARKING METERS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES:

- A. Electronic parking meters, to control and collect revenue for "Short Term" or "Kiss and Ride" parking spaces. They shall be interchangeable with electronic parking meters previously purchased by the Authority. Mounting pole installation and meter location shall be as described below. Meter requirements shall be as described below and as required by manufacturer's instructions. Signs, for patron information concerning metered parking facilities, are not specifically addressed herein. Section 02890 addresses sign requirements.
  - 1. "Short Term" spaces are those metered spaces that authorize parking for up to seven hours between the hours of 5:00 AM to 2:00 AM.<sup>\*1</sup>
  - 2. "Kiss and Ride" spaces are those metered spaces that authorize parking for up to seven hours between the hours of 8:30 AM to 3:30 PM and from 7:00 PM to 2:00 AM. From 5:00 AM until 8:30 AM and from 3:30 PM to 7:00 PM the spaces shall be for drivers dropping off and picking up Metro patrons.<sup>\*2</sup>

##### 1.02 RELATED SECTIONS:

- A. Parking Access and Revenue Control System: Section 11150.
- B. Galvanized steel parking meter post: Section 05500.
- C. Signage: Section 02890.

##### 1.03 REFERENCES:

- A. Codes and regulations of the jurisdictional authorities.

##### 1.04 DELIVERY, STORAGE AND HANDLING:

- A. Delivery of meter communications devices, software, spares, collection cart(s) and other material shall be as directed by the Engineer.
- B. Keys for the meter security vault door lock shall be delivered via registered letter only to the authorized WMATA representative designated by the Engineer.
- C. Ship each unit securely packaged to avoid damage and labeled for safe handling in shipment.
- D. Store all equipment in a secure and dry storage facility until ready for installation or turn over to the Authority.
- E. The Contractor shall be responsible for receipt of all furnished equipment and supplies and for safeguarding the equipment and supplies from pilferage and the effects of weather until accepted by the Authority in final installed configuration.
- F. Deliver spares to storage area designated by the Engineer.

##### 1.05 ENVIRONMENTAL REQUIREMENTS:

- A. The meters shall automatically compensate to ensure accurate operation and coin discrimination at all temperatures between minus 20 degrees and plus 140 degrees Fahrenheit. It shall function properly under Metropolitan D.C. conditions of solar loading, rain, snow, sleet, grime and street vibrations.

**1.06 SUBMITTALS:**

- A. Documentation shall be submitted showing that the parking meters and support equipment are current production models, which the manufacturer has delivered in substantial quantities, and which are in operational use.
- B. Integrated Logistics Support shall be provided as required by Section 11150.

**1.07 DURATION, RATES AND COINAGE:**

- A. The meters shall be programmable, using personal computers already in the offices of PARK, Contractor-provided software and a Contractor-provided remote programming device. The program capabilities of the meters shall include ability to accept from one to a minimum of five different coins and the pre-paid stored value smart card (debit card), permit variable maximum times up to 12 hours, and vary the rates for different periods of the day and different days of the week. The meters shall be capable of field programming using the remote programming device.
- B. The following duration, rates and coinage shall be used for the initial factory setting:
  - 1. Seven-hour duration.
  - 2. Rate of one hour per quarter to seven hours.
  - 3. Accept debit cards or quarters only.
- C. In "Short Term" facilities the meter shall be provided with an installed aluminum rate plate which lists duration, rate, coinage accepted and periods of operation as follows:
  - 1. MAXIMUM SEVEN HOUR DURATION PARKING EFFECTIVE
  - 2. FROM 5:00 A.M. TO 2:00 A.M.
  - 3. EXCEPT SATURDAYS, SUNDAYS AND HOLIDAYS
  - 4. \$0.25 PER HOUR TO MAXIMUM TIME ON DIAL
    - a. USE QUARTERS OR DEBIT CARDS ONLY
- D. In "Kiss and Ride" facilities the meter shall be provided with an installed aluminum rate plate which lists duration, rate, coinage accepted and periods of operation as follows:
  - 1. PARKING FROM
    - a. 8:30 A.M. TO 3:30 P.M. AND 7:00 P.M. TO 2:00 A.M. ONLY
  - 2. EXCEPT SATURDAYS, SUNDAYS AND HOLIDAYS
  - 3. \$0.25 PER HOUR TO MAXIMUM TIME ON DIAL
    - a. USE QUARTERS OR DEBIT CARDS ONLY

**PART 2 - PRODUCTS**

**2.01 ELECTRONIC MECHANISM:**

- A. The meter mechanism shall be fully electronic with solid state modular components. It shall be capable of accepting a coin, a debit card, or a combination of coins and card. The electronics shall be resistant to electromagnetic interference.
  - 1. When using coins, the meter time indicator shall display the time purchased after deposit of a proper coin. Existing time shall be incrementally increased by the deposit of additional proper coins until the maximum time limit of the meter is

- reached. Total amount of time purchased shall be shown after the deposit of each coin.
2. When using the card, the meter time indicator shall display the amount of time purchased, increasing this amount until the card is removed, the debit limit on the card is reached, or to the maximum time limit of the meter.
  3. There shall be no requirement to turn handles or push thumb slides on the meter when purchasing time.
- B. The meter operating mechanism shall be constructed as a completely assembled modular unit separate from the meter housing. The mechanism frame, coin chute, battery and card reader shall be removed from or replaced in the meter housing, as separate units, without the use of special tools.
- C. The coin and card slots shall be flush on the front of the meter and so positioned that coins and cards enter the slot at a 90-degree angle to the mechanism display face. Slots shall be metal and vandal resistant.
- D. The coin chute shall be single slot, jam resistant, and made of stainless steel or zinc alloy. It shall deposit coins in the security vault coin cannister. It shall be equipped with a detector for washers, plastic discs, slugs and other spurious coin substitutes which shall pass while not adding any time. This detector shall not have any points susceptible to grime or moisture failure. Withdrawal of a valid coin through the coin chute shall remove the time purchased by the coins insertion.
- E. The power supply for the meters shall be a six-volt lithium battery. New batteries shall be supplied for each meter in the contract. The battery shall be capable of installation and removal without tools.

## **2.02 INDICATION:**

- A. The time display shall be a four-digit liquid crystal display (LCD) with one-half inch characters. It shall be mounted on the front of the meter tilted up for maximum patron visibility. The display shall be readable in bright sunlight and low light conditions. Two characters shall indicate hours and two shall indicate minutes. The hours and minutes characters shall be separated by a colon that flashes in one second beats. The display shall function at all temperatures between minus 20 degrees and plus 140 degrees Fahrenheit. The timer LCD shall also indicate when the meter is malfunctioning by an easily understood symbol or character display.
- B. On the rear of the meter shall be a status indicator similar in concept to the time expired and violation flags used on mechanical meters. This display shall be visible from a distance of at least 70 feet in both glare and low light conditions. The display shall be green when time is registered on the meter, bright red when time is expired and yellow when there is a meter jam or failure. This status indicator shall not require power to operate and maintain visibility of a status indicator except when changing status modes.
- C. The viewing lens shall be made of high impact resistant polycarbonate materials.

## **2.03 MECHANISM HOUSING:**

- A. The entire mechanism shall be enclosed in a rugged, weather-resistant zinc alloy case constructed of such a thickness as to resist tampering or abuse. The mechanism housing shall be coated with a corrosion and ultraviolet light resistant finish.

- B. Mechanism housing compartments shall be fully interchangeable from one meter to another, or from single to double meter units; or vice-versa. Access to the mechanism shall be through a separate lock combination and key, and shall not allow access to the coin compartment housing.
- C. Mechanism housings of double meter units shall be capable of being re-positioned to at least two different orientations by simple means from within the mechanism housing.
- D. All meter housings shall be designed to fit into a standard two-inch I.D. schedule 40ST galvanized steel pipe, and fasten securely with a self-adjusting three piece wedge assembly designed so that the unit can only be removed from inside the coin compartment housing.
- E. A single meter shall consist of one operating mechanism enclosed in a zinc alloy housing and one collection canister enclosed in a cast iron security vault housing.
- F. A yoke unit shall consist of a cast iron unit on which two single meters will be installed for mounting on a single post. The yokes shall be fully compatible with the parking meters furnished in this Contract. The yoke shall be designed to fit into a standard two-inch I.D. schedule 40ST galvanized steel pipe, and fasten securely with a self-adjusting three piece wedge assembly designed so that the unit can only be removed from the inside. There shall be no exposed mounting nut on the yoke and meters once assembled on the post.
- G. All parking meters shall have a separate coin collection cannister for each operating mechanism housing. Double meters shall not share a single collection cannister.
- H. Access to the mechanism housing shall be through a lock combination and key that shall not allow access to the meter security vault housing.

**2.04 METER SECURITY VAULT:**

- A. The security vault housing shall be a one-piece cast-iron casting. The housing shall be rugged in construction, weather and corrosion-resistant, and of such thickness as to resist tampering or abuse. It shall be coated with a corrosion-resistant gray finish.
- B. Vault doors shall be of the same material as the vault housing. The vault door and door opening shall be machined to a tolerance of less than one thirty-second of an inch. They shall be hinged to the vault compartment using steel pins. It shall not be possible to drill out these steel pins to gain access to the coin compartment using a common hand-held drill and bits. The door locking mechanism shall have a latch arrangement to prevent the door from being pried open.
- C. The meter security vault door lock shall be a National KeSet High Security Lock (part number N42002), or equal, matching the series and key combinations which have been reserved for WMATA.
- D. Keys for the lock shall be precision cut and manufactured of materials which ensure long life, without damage to the lock or tumblers. Key blanks shall not be available from locksmiths.

**2.05 COIN CANISTER:**

- A. Each meter shall include a sealed, expanded-capacity or largest capacity available coin canister, which shall be dent resistant and of lightweight construction. They shall be made of corrosion-resistant metals, high-impact plastic ABS or Cyclocac materials. However, these containers shall be of strong enough construction to resist entry with normal hand tools and breakage from dropping. When the coin cannister is removed from the meter for collection

purposes, it shall then be inserted into a receptacle with an embedded key to unlock the canister in the receiving device mounted on a collection cart, causing coins to drop into the cart container. The coin cannister shall be equipped with a device which restricts the coins from being removed by means of inverting or shaking the container when it is not inserted in the revenue-collection head assembly on the collection cart container.

- B. Lock combinations of the coin canisters shall be different from either the mechanism housing or meter security vaults.

#### **2.06 PREPAID STORED VALUE SMART CARD (DEBIT CARD):**

- A. The WMATA cards are pre-programmed, micro-chip technology with the following features:
  - 1. ISO 7816-1 and ISO 7816-2 compatible.
  - 2. Dimensions of 54.0 mm high by 85.6 mm wide by 0.76 mm deep. Corners rounded with a radius of 3.18 mm. Edge burrs normal to the card face not to exceed 0.08 mm above the card surface.
  - 3. Single five-volt power supply.
  - 4. CMOS technology.
- B. Cards have a pre-programmed value of \$50. This value will decrement as it is used at the times and rates described above.
- C. Cards operate in two memory modes, an issuer mode and a count down mode. After a card has been personalized, a count down mode is generated for use.

#### **2.07 COMMUNICATIONS AND DATA TRANSFER:**

- A. Meters shall be capable of communicating with a portable, battery-powered, hand-held computer communications device supplied with this Contract.
- B. The communications device shall be used to:
  - 1. Re-program time, coinage and rate structures.
  - 2. Retrieve audit information such as currently programmed time, coinage and rate structure, serial number, transaction information, battery charge, maintenance information and programming information.
  - 3. Assign serial numbers.
  - 4. Enter maintenance information.
- C. The Contractor shall provide the communications device interface and software to upload and download of programming and data on an existing IBM-compatible personal computer in the offices of PARK.
- D. The device shall communicate with meters on an infrared band.
- E. The device shall provide an audio and visual signal when sending or receiving.
- F. Device power supply shall be a Contractor-provided nine-volt, rechargeable, NICAD battery pack and recharger.

#### **2.08 METER COLLECTION CART:**

- A. Meter Collection Cart shall consist of a cart and parking meter head assembly compatible with the collection canisters for the meters.

- B. It shall be a wheeled cart with a security lock and security hinges on its access door. A revenue- collection head assembly is to be provided for receiving and dumping the coin canisters from the parking meters. This head assembly shall include an embedded key to unlock the sealed coin canisters. The coin canister is then opened inside the head assembly emptying the contents into the collection cart. All containers and embedded keys shall be of the same lock combination and shall be reserved for the exclusive use of WMATA. The head assembly shall be constructed to prevent unauthorized removal of coins from the collection cart. The carts shall be of rugged construction to resist entry with normal hand tools.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Installation at the indicated locations in accordance with manufacturer's instructions. Installed meters shall be oriented normal to the pavement marking lanes for parking space they serve. All pipe and other material required for accomplishment shall be provided by the Contractor. Mounting post pipes shall have a rainwater drain hole.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

#### **ENDNOTES**

- \*1. Not all facilities will include both "Short Term" and "Kiss and Ride" parking. This specification section will have to be tailored as appropriate. Add 1.1 A.1. modification to all contracts that include "Short Term" parking.
- \*2. Not all facilities will include both "Short Term" and "Kiss and Ride" parking. This specification section will have to be tailored as appropriate. Add 1.1 A.2. modification to all contracts that include "Kiss and Ride" parking.

13085	SOUND AND VIBRATION ISOLATION PADS
13110	STRAY CURRENT AND CATHODIC PROTECTION
13115	CORROSION CONTROL SYSTEM TESTING
13125	PARKING CONTROL BOOTH (NEW SECTION)
13905	FIRE PROTECTION, SUPPRESSION AND ALARM

**END OF SECTION**

## SECTION 13085

### SOUND AND VIBRATION ISOLATION PADS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing pads for sound and vibration isolation.
- B. Isolation pads for floating slabs are specified in Section 03305.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: B29, D395, D412, D573, D624, D1149, D2240, D3182, D3190.
- B. Allowable Tolerances:
  - 1. Pads:
    - a. Total thickness: Minus zero inch or plus 1/8 inch.
    - b. Length and width variation not more than 1/8 inch from dimensions shown.
- C. Testing of Pads:
  - 1. Have samples tested by an independent testing facility.
  - 2. Prepare test specimens in accordance with ASTM D3182 and ASTM D3190 and wipe with solvent before tests to remove any traces of surface impurities.
  - 3. Perform tests in accordance with the following requirements:

Original Physical Properties	ASTM Designation	Grade (Durometer)	
		60	70
Hardness, Durometer A	D2240	60 + 5	70 + 5
Tensile strength, minimum psi	D412	2,500	2,500
Elongation at break minimum percent	D412	350	350

Accelerated Test to Determine Longteristics Oven-Aged 70 Hours at 212F	ASTM Designation	Grade (Durometer)	
		60	70
Hardness, points change, maximum	D573	0 to + 15	0 to + 15
Tensile strength, percent change, maximum	D573	+ 15	+ 15
Elongation at break, percent change, maximum	D573	- 40	- 40

Ozone	ASTM Designation	Grade (Durometer)	
		60	70
One part per million (ppm) in air by volume; 20-Percent Strain, 100 Plus-or-Minus 2F, 100 Hours	D1149	No cracks	No cracks

Compression Set	ASTM Designation	Grade (Durometer)	
		60	70
22 hours at 158F; percent, maximum	D395 Method B	25	25

Low-Temperature Stiffness	ASTM Designation	Grade (Durometer)	
		60	70
At -40F, Young's Modulus, maximum psi	-	10,000	10,000
Tear test, pounds per linear inch, minimum	D624 Die C	250	250

### **1.03 SUBMITTALS:**

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Samples:
  - 1. Elastomer from each batch used, six by nine inches: Four.
  - 2. Each type of pad to be incorporated in the work, six inches by nine inches: Four.
- B. Certification.

### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to the jobsite in original unopened containers clearly labeled with manufacturer's name and brand designation, type, and class as applicable.
- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Pads: Plain elastomeric pads consisting of solid sheet of neoprene without laminations, molded individually to specified dimensions, cut from previously molded strips or slabs or extruded and cut to length.
- B. Adhesive: Epoxy, solvent-free, specifically compounded and recommended by the manufacturer as a high-quality, resilient adhesive compound, containing mildew-inhibiting agents and completely suitable for effective and permanent bonding of pads to supporting surfaces.
- C. Lead for Shims: ASTM B29, corroding-type.

### **2.02 FABRICATION:**

- A. Fabrication includes adaptation or assembly of components into complete pads of the type specified.
- B. Exterior surfaces, corners and edges of pads finished so as to present a smooth workmanlike appearance, as approved.
- C. Corners and edges may be rounded in accordance with the following:
  - 1. Corner radius: 3/8-inch maximum.
  - 2. Edge radius: 1/8-inch maximum.
- D. Pads fabricated to shapes shown.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Examine locations where pads are to be placed and correct unsatisfactory supporting areas as approved.

- B. Do not place upon areas which are improperly finished, deformed, irregular or soiled by paint, oil, grease or other substances that might induce sliding or otherwise prevent full, firm and stable adhesion to supporting areas. Thoroughly clean supporting areas immediately before placing pads.

**3.02 INSTALLATION:**

- A. Place pads to conform to lines, grades and other requirements of construction as shown.
- B. Where necessary, construct concrete surfaces intended as supporting areas slightly higher than specified elevation and grind surface down to exact elevation.
- C. Provide shims where directed and where necessary to secure even support.
- D. Use shims of necessary thickness, same size as pads, made of lead or manufactured from same material as specified pads.
- E. Where necessary, provide shims as follows:
  - 1. 1/4 inch or more in thickness: Same material as pads.
  - 2. 1/16-inch to 3/16-inch thick: Lead.
- F. Coat contact surfaces of shims, except top surface under bearing member, with epoxy resin before installing pads. Eliminate air bubbles.
- G. When supporting areas have been prepared in an approved manner, install pads in designated locations and hold securely in place as shown.

**3.03 CLEAN-UP:**

- A. Remove rubbish and debris caused by this work from site.
- B. Leave areas surrounding sound and vibration-isolation work in broom-clean condition.

**END OF SECTION**

## SECTION 13110

### STRAY CURRENT AND CATHODIC PROTECTION

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing and connecting stray-current and cathodic-protection equipment.
- B. Related Work Specified Elsewhere:
  - 1. Grading, excavation and backfilling: Section 02320.
  - 2. Corrosion control system testing: Section 13115.
  - 3. Grounding and bonding: Section 16060.
  - 4. Wire, cable and busways: Section 16120.
  - 5. Wire connection accessories: Section 16125.
  - 6. Raceways, boxes and cabinets: Section 16130.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
  - 2. ICEA: S-61-402.
  - 3. ASTM: B418, D256, D570, D638, D693, D1248, E11.
  - 4. MS: MIL-A-18001.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification:
    - a. Certified test reports of field quality-control testing.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each item with manufacturer's name, brand designation, referenced standard, type, class and rating, as applicable.
- B. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- C. Store equipment in secure and dry storage facility.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. Cast-Iron Anodes:
  - 1. Size and type: As shown.
  - 2. Chemical composition:

Element	Percent
Silicon	14.33
Chromium	4.5
Carbon	0.85
Manganese	0.65
Iron	Remainder

3. Physical properties:
  - a. Tensile strength: 15,000 psi.
  - b. Compressive strength: 100,000 psi.
  - c. Brinell hardness: 520.
  - d. Density: 7.0 grams per cubic centimeter.
  - e. Melting point: 2,300F.
  - f. Specific resistance: 72 microhms per centimeter cube at 20C.
  - g. Coefficient of expansion:  $7.33 \times 10^{-6}$  per degree F from 32F to 212F.
4. Lead wire: Single-conductor insulated cable, 8AWG minimum, factory-connected to anode with connection sealed with cast epoxy-resin encapsulation.
5. Anode packaged as follows:
  - a. Stove pipe: Galvanized steel, 30-gauge minimum, in accordance with the one of the following:
    - 1) Diameter: Eight inches; Length: Eight feet.
    - 2) Diameter: Five inches; Length: Six feet.
  - b. Ends of pipe crimped to end seal of ½-inch interior-grade plywood.
  - c. Containing compacted backfill of coke breeze of graded coal or recalcined petroleum coke, with the following additional requirements:
    - 1) Resistivity on dry basis: 60 ohms per centimeter cube, maximum.
    - 2) Chemical composition:

Material	Percent
Fixed carbon	78.22 - 78.40
Ash	18.6 maximum
Moisture	9.50 - 14.70
Volatile matter	3.00 - 3.14
Sulphur	1.2 maximum

- 3) Gradation:
  - a) Sieve size in accordance with ASTM E11.
  - b) Requirements:

Percent Passing	Sieve Size
½ inch	100
3/8 inch	85
No. 6	65

B. Magnesium Anodes:

1. Packaged anodes, type and size as shown.
2. Chemical composition for high-potential type anodes:

Element	Percent
Aluminum	0.010 maximum
Manganese	0.50 - 1.30
Zinc	0.050 maximum
Silicon	0.050 maximum
Copper	0.020 maximum
Nickel	0.001 maximum
Iron	0.030 maximum

Element (Cont.)	Percent (Cont.)
Other metallic elements	0.050 each or 0.300 maximum total
Magnesium	Remainder

3. Lead wire: Single-conductor insulated cable, 12AWG minimum, factory-connected to anode with connection sealed with cast epoxy-resin encapsulation.
4. Anode packaged in permeable cloth sack containing compacted backfill of mixture with the following requirements:

Material	Percent
Gypsum	75
Bentonite	20
Sodium sulphate	5

- C. Zinc Anodes: MS MIL-A-18001, bare-ribbon 5/8 by 7/8-inch section or packaged anode, type and size as shown, with the following additional requirements:
  1. Lead wire: Single-conductor insulated cable, 12AWG minimum, factory-connected to the anode with connection sealed with cast epoxy-resin encapsulation.
  2. Anode packaged in permeable cloth sack containing compacted backfill of mixture consisting of 50-percent hydrated gypsum and 50-percent bentonite.
- D. Reference Electrode: ASTM B418, Type II, one galvanized-steel rod, factory-connected to electrode and equipped with two bolted connectors suitable for 12AWG single-conductor insulated cable.
- E. Test Boxes:
  1. Cathodic-protection test boxes: Plastic, each five inches inside diameter by 18 inches long, with cast-iron lid, collar and terminal board.
  2. Stray-current test boxes: Six inches cubical, galvanized cast-iron box with watertight cover.

- F. Wire and Cable:
1. Header cable, bond wire and cast-iron anode lead wire in accordance with the following:
    - a. Single-conductor.
    - b. Size: As shown.
    - c. Insulation: HMWPE, 600 volt, in accordance with the following:
      - 1) ASTM D1248, Type I, Class C, Grade 5.
      - 2) ICEA S-61-402.
  2. Magnesium or zinc anode lead and test wire:
    - a. Single-conductor.
    - b. Size: 12AWG unless otherwise shown.
    - c. Color: As shown; anode lead as furnished.
    - d. Insulation: TW, 600-volt, moisture-resistant thermoplastic in accordance with UL 83.

- G. Pipeline-Casing Spacers:
1. Virgin polyethylene, molded.
  2. Runner height: Sufficient to provide ½-inch clearance between pipe, couplings and hubs as well as internal casing wall.
  3. Color: Natural.
  4. In accordance with the following:

Characteristic	Reference	Requirement
Compressive strength	ASTM D693	3,200 psi
Tensile strength	ASTM D638,	3,100 - 5,500 psi
Impact strength	ASTM D256	1.5 - 2.0 foot-pound per inch notch
Water absorption	ASTM D570	0.1 percent
Temperature	-	180F (80C) maximum

5. Bolts:
    - a. Steel, cadmium-plated.
    - b. Sizes: As standard with the manufacturer.
  6. Nuts:
    - a. Steel, cadmium-plated, square.
    - b. Sizes: To match bolts.
- H. Pipeline-Casing End Seals:
1. Type L:
    - a. Modular mechanical-type.
    - b. Consisting of interlocking synthetic-rubber links with cadmium-plated steel nuts and bolts.
    - c. Depth limitations: As shown.
  2. Type H:
    - a. Compression-ring seals.
    - b. Nonconductive sleeve: Fiberglass reinforced epoxy (FRE), Adyl Type D or equal, with cadmium-plated steel nuts and bolts.

- c. Depth limitations: As shown.
- I. Insulating Gasket:
  - 1. Asbestos, all-temperature.
  - 2. Full-face.
  - 3. Thickness: 1/8 inch.
  - 4. Johns-Mansville 71 or equal.
- J. Insulating Sleeves and Washers:
  - 1. Up to 300F:
    - a. Sleeve: Mylar tube, 1/32-inch thick.
    - b. Washer: Phenolic, 1/8-inch thick.
  - 2. 300F and above:
    - a. Sleeve: Klingerit or equal, 1/32-inch thick.
    - b. Washer: Johns-Mansville 71 or equal, Teflon.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Bury anodes or electrodes of type and at location shown. Excavate and backfill holes in accordance with Section 02320, with the following additional requirements:
  - 1. Wet packaged anode thoroughly before backfilling hole.
  - 2. Use fine clay soil, free from stones and bricks, for backfilling.
- B. Install header cable of size and at location shown, in accordance with Section 16120.
- C. Install test boxes of type and at location shown.
- D. Connect anode lead wires to header cable or test boxes as shown.
- E. Isolate pipes of different metals and Authority pipes from utility-company pipes using insulated union, compression insulating couplings, or insulated flange and bolt connections. Connect each side of insulated joints to test box using conductors as shown.
- F. Where Authority pipes cross utility-company pipes, connect Authority pipes to test boxes using two 12AWG and one 4AWG conductors as shown.
- G. Bond joints in buried metallic pipe and structure in accordance with Section 16060. Connect buried metallic pipe and structure to test boxes using single-conductor insulated cable of size shown.
- H. Install conduit of type shown, in accordance with Section 16130.
- I. Install single-conductor insulated cable in accordance with Section 16120. Leave one foot of slack in test boxes.
- J. Use thermit weld sealed with cast epoxy-resin encapsulation for splices made in direct-burial cable.
- K. Use compression-type connectors in accordance with Section 16125.
- L. Install casing spacers in accordance with manufacturer's recommendation, except maximum spacer distance not to exceed 10 feet.

**3.02 IDENTIFICATION:**

- A. Identify wire and cable in each test box using nonmetallic fiberboard or plastic tags or pressure-sensitive labels.

**3.03 FIELD QUALITY CONTROL:**

- A. Provide necessary equipment and perform testing in the presence of the Engineer in accordance with Section 13115.

**END OF SECTION**

## SECTION 13115

### CORROSION CONTROL SYSTEM TESTING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies test procedures for corrosion-control systems.
- B. Related Work Specified Elsewhere:
  - 1. Wire, cable and busways: Section 16120.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of jurisdictional authorities.
- B. Instrument Calibration:
  - 1. Calibrate test instruments within six months prior to use on this project.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Working Drawings:
    - a. Layout of system being tested, showing location of system components, including test stations.
    - b. Instrument hook-up for each test.
  - 2. Certification:
    - a. Certified test report for each test conducted including the following:
      - 1) Types, models, serial numbers, and dates of calibration of all instruments.
      - 2) Data resulting from specified test procedures, in approved format.
    - b. Certificates of inspection.

#### PART 2 - PRODUCTS

##### 2.01 MATERIALS:

- A. Wire and Cable: Section 16120.

#### PART 3 - EXECUTION

##### 3.01 TEST EQUIPMENT:

- A. DC Voltmeter: Multi-scale, center zero, minimum sensitivity 50,000 ohm/volt, accurate to within one percent of full scale, covering the following full-scale ranges: 0-10 and 0-100 millivolts; 0-1, 0-10, 0-100 volts.
- B. DC Ammeter: Multi-scale, maximum shunt drop of 20-mV sensitivity, or millivolt meter and shunts, accurate to within one percent of full scale, covering the following full-scale ranges: 0-1, 0-10, 0-100 amperes.

- C. Resistivity Meter: Self-contained, synchronous-vibrator, battery-powered unit. Instrument readings unaffected by resistance of leads or probes.
- D. DC-Power Sources: Automotive wet-cell batteries, six or 12 volts. For circuits with high internal resistance use two or more batteries, a dc generator or cathodic-protection rectifier.
- E. Test Cable: Single-conductor cable, stranded copper, assorted sizes and lengths to suit test conditions.
- F. Steel probes for making electrical contact to buried structures in absence of test stations.
- G. Slide-Wire Resistors: 0-400 ohm, 15-ampere capacity over full-range of adjustment.
- H. Reference Half-Cell: 7/8-inch diameter by eight inches long, saturated copper-copper sulfate.

### 3.02 TEST PROCEDURES:

- A. Electrical Continuity:
  - 1. Test the following items for continuity:
    - a. Mechanical and bell-and-spigot pipe joints: Test after backfilling is completed. Test individual and multiple bonds.
    - b. Metallic tunnel-liner joints: Test after invert has been cast. Test longitudinal bonds individually or in sections not to exceed 150-linear feet.
    - c. Concrete reinforcement in tunnel, station, retaining wall, reinforced-concrete pipe, aerial, floating slab and building structures: Test after concrete has been cast. Test bonded joints individually or in sections not to exceed 150 feet for tunnel and station structures, not to exceed 500-linear feet for other structures.
    - d. Underpinning, soldier and structural piles: Test prior to backfilling or use leads in structure after backfilling. Test bonded piles individually or in longitudinal sections not exceeding 600-linear feet.
  - 2. Test Procedure:
    - a. Single bond: Connect instruments across bond to be tested as shown. Use separate set of wires and contact points to structures for voltage and current circuits. Beginning with highest scales on voltmeter and ammeter, close switch and observe meter readings. Reduce meter ranges until lowest possible scale is reached. Adjust current level to less than five amperes. Read ON values of voltage and current, break circuit and immediately read OFF values. Record ON and OFF readings on data sheet and determine incremental change for current and voltage. Obtain minimum of three readings to ensure accuracy. Determine and record bond resistance for each reading. Resistance of bond not to exceed calculated theoretical resistance by more than 10 percent.
    - b. Multiple bonds in parallel: Where two structures are bonded by multiple bonds in parallel, test as specified for single bond. Record resistance readings obtained. Actual resistance not to exceed 10 percent of calculated theoretical resistance of bonds.
    - c. Multiple bonds in series: Connect instruments as shown. Determine and record resistance between points A and B, including bonds in series as specified for single-bond test. Total resistance measured between points A and B not to exceed 10 percent of theoretical resistance of sum of bonds plus theoretical resistance of structure between points A and B.

- d. Multiple bonds in parallel on reinforcing steel: Connect instruments as shown. Determine and record resistance between points A and B, including bonds in parallel as specified for single-bond test.
- B. Insulating Joints:
- 1. Test the following for zero-percentage leakage through insulation.
    - a. Insulated flanges and unions: Test buried flanges and fittings after backfilling is completed. Test exposed flanges and fittings after installation is completed. Test each flange or union individually, using existing test wires.
    - b. Casing and sleeve insulation: Test prior to backfilling. Test each casing or sleeve individually.
  - 2. Test Procedures:
    - a. Set up instrumentation as shown. If pipe length is too short for proper test-connection spacing, use maximum possible spacing for L-value. With switches open, read and record value of  $E_0$ . Close switch in I1 circuit. Read and record current, I1, and voltage, E1. Calculate calibration factor (K) for millivolt shunt using equation shown.
    - b. With switches open, read and record value of  $E_0$ . Close switch in I2 circuit. Read and record current, I2, and voltage, E2. Determine difference between  $E_0$  and E2.
    - c. Calculate and record percentage of leakage by equation shown.
- C. Cathodic-Protection Systems Using Cast-Iron Anode:
- 1. Test the following:
    - a. Hydraulic-elevator well casing: Test casing having cathodic-protection system after pit invert has been constructed. Test each system individually using test stations in elevator pit.
    - b. Buried chilled-water, steam and condensate piping: Test after backfilling is complete. Test each system individually, using existing test stations along pipeline.
  - 2. Procedures: Perform tests in the following order:
    - a. Electrical-continuity and insulating-joint tests as specified.
    - b. Anode tests:
      - 1) Structure-to-anode resistance:
        - a) Connect instruments as shown.
        - b) With switch open, record voltage reading 1 on E.
        - c) Close switch and record voltage and current readings.
        - d) Reduce current level to less than five amperes by adjusting power source. Record voltage and current readings.
        - e) Open switch and immediately record voltage as current-off value for potential.
        - f) Using different values of current and voltage, determine and record resistance using formula shown. Obtain a minimum of three sets of readings to ensure accuracy.
        - g) Take necessary corrective measures to ensure that resistance is not less than 0.3 ohms.
      - 2) Anode-to-earth resistance:
        - a) Procedure:
          - (1) Place copper-copper sulfate reference half-cell at least 50 feet away from anode location and connect voltmeter to read anode-to-earth voltage as shown.
          - (2) Perform test as specified for structure-to-anode resistance.

- b) Acceptance criteria: Actual anode-to-earth resistance not to exceed 20 percent of design soil resistance.
- c) Design resistance: As specified in Exhibit 13115-1.
- d) Soil resistivity:
  - (1) If anode-to-earth resistance exceeds 20 percent of design resistance, obtain average soil resistivity in anode-location area.
  - (2) Make measurements by four-pin method as shown.
  - (3) Make measurements using suitable resistivity instrument or by battery, voltmeter and ammeter.
  - (4) Place pins at least 1.5-times pin spacing horizontally from underground metallic structures.

D. Cathodic-Protection Systems Using Magnesium Anode:

- 1. Test galvanic-anode cathodic-protection system for the following structures and utilities:
  - a. Buried potable-water, chilled-water and fire piping; sewage-ejector piping; and sewage-pump piping using test stations.
  - b. Piling: Test structures having cathodic-protection systems. Test each structure individually. Test electrical continuity between piles.
- 2. Procedures: Perform tests in the following order:
  - a. Electrical-continuity and insulating-joint tests as specified.
  - b. Anode tests:
    - 1) Structure-to-anode resistance: Perform test as specified for cathodic-protection systems using cast-iron anode.
    - 2) Anode-to-earth resistance test and soil resistivity: Perform tests as specified for cathodic-protection systems using cast-iron anode.

E. Wire and Cable: Install in accordance with Section 16120.

F. Coal-Tar Epoxy Coating:

- 1. Subject final coating to spark test for capability of maintaining dielectric integrity at 5,000 volts minimum.
- 2. Visually inspect coating prior to installation; repair damaged areas in accordance with field-correction recommendations of the coating manufacturer.
- 3. Backfilling prior to approval of coating is prohibited.

**Exhibit 13115-1**

G. Design Resistance:

Structure	Soil Resistance	Anodes	Anode-to-Earth Resistance

**Exhibit 13115-1 (Cont.)**

H. Evaluation:

1. When anode-to-earth resistance exceeds 20 percent of design value, use data from soil-resistivity test to recalculate design resistance.
2. If actual anode-to-earth resistance exceeds recalculated design resistance, install additional anodes as directed.

I. Recalculation: Resistance is calculated by use of the following formulae:

1. Single horizontal anode:

$$a. \quad R_{H(N=1)} = \frac{0.00521e}{L} \left\{ 2.3 \log \frac{4L^2 + 4L(S^2 + L^2)^{0.5}}{dS} + \frac{S}{L} - \frac{(S^2 + L^2)^{0.5}}{L} - 1 \right\}$$

b. Where:

$R_{H(N=1)}$  = Resistance to earth of the horizontal-ground anode (ohms).

e = Effective soil resistivity (ohm-cm).

L = Horizontal-anode length (feet).

d = Anode diameter (feet).

S = Twice anode depth (feet).

2. Single vertical anode:

$$a. \quad R_{V(N=1)} = \frac{eK}{L}$$

b. Where:

$R_{V(N=1)}$  = Resistance of single vertical anode-to-earth (ohms).

e = Effective soil resistivity (ohm-cm).

L = Length of anode (feet).

K = Shape function (anode length/anode diameter) from Table 1.

**Exhibit 13115-1 (Cont.)**

c. Table 1: The Shape Function:

L/d	K	L/d	K
1	.0056	16	.0201
2	.0092	18	.0207
3	.0113	20	.0213
4	.0128	25	.0224
5	.0140	30	.0234
6	.0150	35	.0242
7	.0158	40	.0249
8	.0165	45	.0255
9	.0171	50	.0261
10	.0177	55	.0266
12	.0186	60	.0270
14	.0194	-	-

3. Multiple vertical anodes in parallel:

a.  $R_{V(N,S)} = \frac{R_{V(N=1)}}{N} + \frac{eP}{S}$

b. Where:

$R_{V(N,S)}$  = Resistance-to-earth of vertical anodes in parallel (ohms).

$R_{V(N=1)}$  = Resistance-to-earth of single anode (ohms).

e = Effective soil resistivity (ohm-cm).

N = Number of vertical anodes in parallel.

S = Spacing between anodes (feet).

P = Parallel factor from Table 2.

**Exhibit 13115-1 (Cont.)**

c. Table 2: Parallel Factor:

n	P	n	P
2	.00261	14	.00168
3	.00289	16	.00155
4	.00283	18	.00145
5	.00268	20	.00135
6	.00252	22	.00128
7	.00237	24	.00121
8	.00224	26	.00114
9	.00212	28	.00109
10	.00201	30	.00101
12	.00182	-	-

4. Resistance-to-earth of the horizontal ground bed:

a.  $R_{H(N,S)} = \frac{R_{V(N,S)}}{R_{V(N=1)}/N} \times \frac{R_{H(N=1)}}{N}$

b. Where:

$R_{H(N,S)}$  = Resistance-to-earth of the horizontal ground bed (ohms).

$R_{V(N,S)}$  = Resistance-to-earth of N anodes, at spacing S, installed vertically (ohms).

$R_{V(N=1)}$  = Resistance-to-earth of single vertical anode (ohms).

$R_{H(N=1)}$  = Resistance-to-earth of single horizontal anode (ohms)

N = Number of anodes.

**END OF SECTION**

## SECTION 13125

### PARKING CONTROL BOOTH

#### PART1 - GENERAL

##### 1.01 DESCRIPTION

- A. This section specifies prefabricated factory assembled parking cashier's booths including equipment and related services. Related work specified elsewhere:
  - 1. Cast-in-Place Concrete: Section 03300; for concrete islands, concrete foundations and anchor bolt installation.
  - 2. Parking Access and Revenue Control System: Section 11150.

##### 1.02 SUBMITTALS

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
- B. Product Data: For each item of parking control booths. Include manufacturer's standard details and installation and maintenance instructions.
- C. Shop Drawings: Include plans, elevations, and details of typical members and other components. Show layout and installation details, including anchorage details.
  - 1. Anchor-Bolt Plans: Include location, diameter, and projection of anchor bolts required to attach parking control booth to foundation or concrete pad.
  - 2. Wiring Diagrams: Detail wiring for parking control booth system and differentiate between manufacturer-installed and field-installed wiring.
    - a. Show locations of connections to electrical service provided in other Sections.
- D. Lock Schedule: For all keyed locks to safe, cashier's drawer, electrical equipment cabinet, and entrance door.
- E. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for the following finishes:
  - 1. Wall panels with factory-applied color finishes.
  - 2. Floor covering material and wall base.
- F. Samples for Verification: Provide 4-inch x 4-inch samples with finishes initially selected in manufacturer's standard sizes, showing the full range of color, texture, and pattern variations expected. Prepare Samples from same material to be used for the Work.
- G. Maintenance Data: For parking control booth components to include in the maintenance manuals specified in the General Requirements.
- H. Maintenance Instructions: Manufacturer's written instructions for maintenance of parking control booths.
  - 1. Include precautions against materials and methods that may be detrimental to finishes and performance.

##### 1.03 QUALITY ASSURANCE

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. FHWA Manual on Uniform Traffic Control Devices, Latest Edition.

2. NEC.
  3. ADA, ADAAG.
  4. UL 752, Level 3.
  5. NFPA.
  6. OSHA.
  7. ASTM: A60, A123, A336, A500, A513, A653, A666, C578, C1048, E331, E774, E1646, F1344.
  8. FS SS-W-40.
- B. Installer Qualifications: Engage an experienced installer who is an authorized representative of the parking control booth manufacturer for installation of the type of units required for this Project, and whose installations have resulted in construction with a record of successful in-service performance.
- C. Source Limitations: Obtain parking control booths through one source from a single manufacturer.
- D. Product Options: Drawings indicate size, profiles, and dimensional requirements of each parking control booth components and are based on the specific type and model indicated. Other manufacturers' individual components with equal performance characteristics may be considered provided deviations in dimensions and profiles are minor and do not change design concept.
1. Do not modify intended design concept, as judged solely by the Engineer, except with Engineers approval and only to extent needed to comply with performance requirements. Where modifications are proposed, submit comprehensive explanatory data to Engineer for review.
- E. Listing and Labeling: Provide internal electrical components required as part of parking control booth specified in this Section that are listed and labeled.
1. The Terms "Listed" and "Labeled": As defined in NFPA 70, Article 100.
  2. Listing and Labeling Agency Qualifications: A "Nationally Recognized Testing Laboratory" as defined in OSHA Regulation 1910.7.
- F. Accessible Booths: All components of parking control booths shall be designed, fabricated and installed to meet ADA guidelines for accessibility.

#### **1.04 PERFORMANCE REQUIREMENTS**

- A. General: Provide a complete, integrated set of parking control booths system manufacturer's standard mutually dependent components and assemblies that form a metal building system capable of withstanding structural and other loads, thermally induced movement, and exposure to weather without failure or infiltration of water into building interior. Include primary and secondary framing, roof and wall panels, and accessories complying with requirements indicated, including those in this Section.
- B. Thermal Movements: Provide metal building roof and wall panel systems that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- C. Water Penetration for Roof Panels: Provide roof panel assemblies with no water penetration as defined in the test method when tested according to ASTM E 1646 at a minimum

differential pressure of 20 percent of inward-acting, wind-load design pressure of not less than 6.24 lbf/sq. ft.300 and not more than 12 lbf/sq. ft.

- D. Water Penetration for Wall Panels: Provide wall panel assemblies with no water penetration as defined in the test method when tested according to ASTM E 331 at a minimum differential pressure of 20 percent of inward-acting, wind-load design pressure of not less than 6.24 lbf/sq. ft. and not more than 12 lbf/sq. ft..
- E. Structural Performance: Provide parking control booth systems capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:
  - 1. Design Loads: 50 psf live load.
  - 2. Wind Load: 30 psf.
- F. Thermal Performance: Provide metal building assemblies with the following thermal-resistance values (R-value):
  - 1. Roof Assemblies: R-17 or greater.
  - 2. Wall Assemblies: R-12 or greater.
  - 3. Floor Assemblies: R-11 or greater.
- G. Ballistic Design: Provide bullet resistant windows, wall panels and door assemblies complying with UL 752 specification for Level III protection. Bullet Resistant and insulated glazing assemblies for all fixed and operable window units. Confirm glass thicknesses by analyzing Project loads and in-service conditions.
- H. Mechanical System Performance: Provide HVAC and heating system performance meeting the temperature range requirements indicated:
  - 1. A/C Output: Maintain 75 degree F inside temperature, plus or minus 4 degree F in 100 degree F outside temperature in full sun exposure.
  - 2. Heat Output: Maintain 65 degree F inside temperature with 10 degree below zero F outside temperature in darkness.

#### **1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver booths and equipment in good conditions.
- B. Store booths so as to prevent corrosion, deterioration, and damage
- C. Handle booths and equipment so as to prevent damage.
- D. Protect products according to manufacturer's recommendations. Specifically, avoid damage to glass edges, and prevent damage from temperature changes, sunlight, and moisture.
- E. Deliver equipment to the site individually wrapped and packed to avoid damage. Protect from water, dirt, and other potentially harmful substances.

#### **1.06 PROJECT CONDITIONS:**

- A. Field Survey: Verify existing conditions prior to installation for coordination of anchor bolt locations, power stubs, clear dimensions of concrete islands and recessed box-out for booths, and headroom clearance for parking control booths roof and roof mounted equipment.

#### **1.07 COORDINATION:**

- A. Coordinate installation of anchorages for parking control booths. Furnish setting drawings, templates, and directions for installing electrical work, anchorages, including concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete. Deliver such items to the Project site in time for installation.

## **PART 2 - PRODUCTS**

### **2.01 MANUFACTURERS**

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering parking control booths that may be incorporated into the Work include, but are not limited to, the following: Retain above for nonproprietary or below for semiproprietary Specification. Refer to Division 1 Section "Materials and Equipment."
  - 1. B.I.G. Enterprises, Inc.
  - 2. Mardan Fabricators, Inc.
  - 3. Par-Kut International.
  - 4. Porta-King.

### **2.02 MATERIALS**

- A. Cold-Rolled Steel Sheet: ASTM A 366/A 366M.
- B. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, CS (Commercial Steel), Type B; with G60 zinc (galvanized) or A60 zinc-iron-alloy (galvannealed) coating designation.
- C. Steel Structural Tubing: ASTM A 500, cold-formed steel structural tubing, Grade B.
- D. Steel Mechanical Tubing: ASTM A 513, welded steel mechanical tubing.
  - 1. Hot-Dip Galvanized: According to ASTM A 123.
- E. Stainless-Steel Sheet: ASTM A 666, Type 302 or 304.
- F. Sealed Insulating Glazing Units: Factory-assembled multiple lites, separated by and sealed to spacers forming air-tight, dehydrated air spaces(s), complying with ASTM E 774, Class CBA:
  - 1. Outer Lite: Laminated polycarbonate sheet, with mar-resistant coating; 1.3 inches thick. Ballistics Resistance: UL 752, Super-Power Small Arms (SPSA), .44 Magnum.
  - 2. Air Space: 1/4 inch.
  - 3. Inner Lite: Clear Tempered Float Glass: ASTM C 1048, Condition A (uncoated surfaces), Class 1 (clear), Kind FT (fully tempered), 1/4 inch thick.
- G. Extruded-Polystyrene Board Insulation: Rigid, cellular, thermal insulation formed from polystyrene base resin by an extrusion process, complying with ASTM C 578, Type IV, 1.60-lb/cu. ft. minimum density.

### **2.03 BASE AND FLOOR ASSEMBLY**

- A. Structural: 4-inch-high assemblies consisting of a perimeter frame fabricated from 2-by-4-by-0.079-inch galvanized steel tubing with corners mitered and welded. Floor framing members consisting of 3-inch x 3-inch, 2-inch x 2-inch, and 2-inch x 4-inch x .079-inch galvanized steel tubing with spacing not to exceed 24-inch o.c.. Provide 2-inch x 3-inch x 1/4-inch galvanized steel exterior mounting brackets welded to base and extending outside the structure with a 5/8-inch pre-drilled hole to accept anchor bolt.

- B. Flooring: 0.108-inch thick galvanized steel floor plate over 3/4-inch thick, oriented strand board (OSB) sub-floor.
- C. Rubber Floor Covering: ASTM F1344; 3/16 inch thick heavy duty rubber mat with interlocking joints in five pieces to fit area shown, with edges square and true, without overlap.
  - 1. Textured wearing surface; terra cotta color.
- D. Vinyl Wall Base: FS SS-W-40, Type II; 1/8 inch thick, 4 inch high, cove profile with top-set toe.
  - 1. Color: As selected from manufacturer's full range of colors.

#### **2.04 WALL ASSEMBLY**

- A. General: Fabricate panels weathertight and in a manner that will prevent condensation on interior face.
- B. Wall Framing: 12 gauge, steel tubes, 2-inch x 2-inch, 2-inch x 4-inch, 3-inch x 3-inch minimum *structural steel tubing*.
- C. Wall Panels: Fabricate for bullet resistant assembly meeting UL Test 752, Level 3. Exterior panels: 14 gauge metallic coated sheet steel; interior panels: 18 gauge sheet steel, and rigid Insulation; R-12 between sheet steel.

#### **2.05 ROOF AND CANOPY ASSEMBLY:**

- A. Structural Framing: Galvanized steel shapes, not less than 16 gauge thickness.
- B. Roof Panels: Fabricated from 0.064-inch thick, galvanized steel sheet with continuously welded seams. Furnish canopy with 3-inch overhang, 8-inch high fascia, 1-inch high drip edge and two drains with downspouts. Provide four removable lifting ring on each corner of roof where shown.
- C. Fabricated from 0.079-inch-thick, galvanized steel ceiling panels. Provide manufacturer's standard insulation, R-17 or greater, in cavity between ceiling and roof.

#### **2.06 DOORS**

- A. General: Provide flush-design heavy-duty out-swinging doors, 2 inches thick. Construct doors with smooth, flush surfaces without visible joints or seams on exposed faces or stile edges. Provide door assembly and operation complying with UL 752 specification for Level III protection for ballistic protection and ADA for accessibility.
- B. Door Lite: Sealed Insulating Glazing Units as indicated.
- C. Hardware and Accessories: Lever type lockset and double lockset dead bolt, with weather protected finish of Satin Chrome, US 26D. Provide 32-inch x 16-inch stainless steel kickplate on each side of door. Aluminum threshold, 1/2-inch high. Provide manufacturer's standard weatherstripping.

#### **2.07 SECURITY WINDOWS**

- A. Framing: Fabricate perimeter framing, mullions, and glazing stops from metal sheet as follows:

1. Material: Cold-rolled steel sheet, factory primed with manufacturer's standard finish to match finish and color of wall panels.
- B. Bullet resistant and Insulating Sealed Glazing Units. Comply with UL 752 specification for Level III protection.
- C. Horizontal-Sliding Transaction Window: ADA compliant; one fixed glazed panel and one horizontal-sliding glazed panel:
  1. Sliding Window Hardware: Provide roller track designed for overhead support of two or four wheel carriage supporting horizontal-sliding glazed panel. Provide manufacturer's standard pull and laminated hook-bolt deadlock for each horizontal-sliding glazed panel. Provide weather stripping.
  2. Sill: Stainless-steel channel frame, designed for glazing.

## **2.08 ELECTRICAL**

- A. General: All electrical fixtures; lights, plugmolds, switches, etc., shall bear the Underwriter Laboratories label verifying that all of the electrical work conforms to the National Electric Code (NEC). The contractor shall certify that all electrical work in the booth conforms to the NEC.
- B. Electrical Service: Prewired booth ready for connection to service at site. Provide 3-wire, 125-A, 120/240-V, single-phase service; and electrical equipment box. Minimum wire size shall be 12 AWG.
- C. All wiring shall be concealed in water (fluid) tight flexible metal conduit or electrical metallic tubing (EMT) inside of walls.
- D. Terminate and label all conduits at 12-inch x 12-inch x 4-inch splice box. Feed to splice box is through 12-inch x 6-inch cutout in floor (front right side beneath counter) of booth.
- E. Provide a 5 foot long plug mold mounted to backsplash with standard 115 VAC electrical outlets, 6-inch maximum spacing
- F. Fasten all electrical connections with tamperproof screws and/or bolts.
- G. Provide minimum of two 115 VAC duplex outlets each side of walls.
- H. Provide control switch for manual operation of barrier gates.
- I. Electrical Equipment Cabinet: 12-circuit breaker box with keyed locks, mount to wall underside counter opposite cashier's window

## **2.09 LIGHTING**

- A. Provide two surface mounted 80-watt low temperature ballast fluorescent light fixtures, 4-feet long with 2 tubes, 40 foot candles minimum.
- B. Locate switch in wall frame adjacent to door.

## **2.10 MECHANICAL**

- A. Manufacturer: Provide self-contained thermostatically controlled heating units as manufactured by Chromalox Industrial, catalog number H1801, part number 261948, or approved equal.
- B. Heating Units: Provided two industrial application wall mounted heaters, mount units below counter one unit to side wall adjacent to cashiers window and one unit to end wall in front of cashier.
- C. Roof Mounted HVAC Unit: Provide roof mounted, thermostatically controlled 13,500 B.T.U. combination HVAC unit, . The heat strip shall be approximately 1500 watts. Mount to roof on a 3-inch to 4-inch high curb, with positive water dams fabricated with continuous welded metal lip to prevent water infiltration around the air conditioning unit. Provide continuous flexible seals and sealants around the unit. Controls: Provide thermostat(s) to control operation of the heating and air conditioning units such that the temperature of the booth will remain within limits indicated.

## 2.11 EQUIPMENT

- A. Drop Safe: Provide a rotary hopper type drop-safe, approximately 12-inches long x 12-inches wide x 18-inches high conforming to the Standard Safe Classification for fire resistance, burglary protection and tamper resistance. Install as indicated.
  - 1. Lock System: Protect safe door with a jimmy-proof, punch-proof and puncture proof dual lock system with changeable keys. Provide one local and one supervisory key for each control booth. Supervisory key shall open all safes in each control booth on the Project.
- B. Alarm System: Provide silent alarm system as manufactured by Ademco Security Group; model 219 or approved equal, with recessed push-button mechanism, locking type by key with open contact and compatible with existing WMATA system. Install as indicated.
  - 1. Reporting: Silent alarm shall report to and trigger an alarm in the Transit Police and Security Communications Room located in the Jackson Graham Building, 600 Fifth Street, N.W. Washington, D.C. via the Authority's telephone lines. The alarm dialer shall be key pad programmable. Reporting signal shall be number coded to identify the booth where signal originated from.
  - 2. Request from the Engineer, the appropriate WMATA numbers and PABX actuation 45 days prior to activation of the alarm system.
- C. Telephone System: Provide three-number, automatic dial, wall mounted telephone system as manufactured by GAI-Tronics Corp., model 187007, latest version, or approved equal with maximum overall dimensions of 8 1/2-inch height x 8 1/2-inches width x 2 1/2-inches depth.
  - 1. Provide three external push button controls, one for each location to which the telephone may call, mechanically interlocked so that the telephone cannot be in a no dial mode or neutral position.
  - 2. Provide two gong ringer and a noise canceling microphone.
  - 3. Provide handset cord, minimum 4-feet long, with flexible metal shielding, non-modular, directly wired to connections at ends of booth. The station line cord shall be of modular-to-spade lug configuration.
  - 4. Provide programmable automatic dialing circuitry via a touch tone key-pad contained within the telephone assembly and with the following automatic dialing functions from the booth:
    - a. Position One: to Communication Room in the Jackson Graham Building.
    - b. Position Two: to the WMATA phone mail system.
    - c. Position Three: to WMATA System Maintenance.
    - d. Telephone shall prohibit originating any other outgoing calls, but shall permit receipt of incoming calls.

- D. Lightning and Surge Arrestors: Provide lightning and surge arrestors for protecting equipment to cover voltages from 5 to 170V peak (AC and DC) and maximum surge current rating of 15,000 amperes for a typical wave shape.
- E. Transaction Display: Provide manufacturer's standard, booth mounted, digital display
- F. SmartCard Targets: Provide booth mounted Smartcard targets as specified in Section 11150.

## **2.12 FABRICATION, GENERAL**

- A. Fabricate parking control booth assemblies to meet the requirements of the ADA for accessibility and shall be equipped with an accessible workstation complying with the requirements of ADAAG 4.2 through 4.35.
- B. Provide manufacturer's standard, completely assembled, prefabricated parking control booth, ready for installation on Project site. Booth consists of a structural frame and pre-finished, insulated, wall and roof panels, door, and operable windows. Provide built-in cashier's work counter with storage drawer below. Equip booth with interior electric lighting, service outlets, and an electric heating and cooling units.
  - 1. Overall dimensions: 68-inches x 92-inches x 91-inches high, excluding height of HVAC unit. Fabricate base to install in a 4-inch deep recess in concrete curb. Floor of the booth to align flush with the elevation of the top of curb.

## **2.13 FABRICATION, WINDOWS**

- A. General: Fabricate security windows to comply with indicated standards. Include a complete system for assembly of components and anchorage of security windows.
  - 1. Provide security windows that are re-glazable from the secure side without dismantling the non-secure side of framing.
- B. Provide weep holes and internal water passages for exterior security windows to conduct infiltrating water to the exterior.
- C. Framing: Miter or cope corners the full depth of framing; weld, and dress smooth.
  - 1. Fabricate framing with manufacturer's standard, internal opaque armoring in thicknesses required for security windows to comply with ballistics-resistance performance indicated.
- D. Glazing Stops: Finish glazing stops to match security window framing.
  - 1. Secure-Side (Exterior) Glazing Stops: Welded or integral to framing.
  - 2. Non-secure-Side (Interior) Glazing Stops: Removable, coordinated with glazing indicated.
- E. Welding: Weld components to comply with referenced AWS standard. To greatest extent possible weld before finishing and in concealed locations to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.
- F. Metal Protection: Separate dissimilar metals to protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.

- G. Pre-glazed Fabrication: Pre-glaze security windows at the factory where possible and practical for applications indicated.
- H. Weather Stripping: Factory applied.
- I. Security Fasteners: Fabricate security windows using security fasteners with head style appropriate for fabrication requirements, strength, and finish of adjacent materials, except that a maximum of two different sets of tools shall be required to operate security fasteners for Project. Provide stainless-steel security fasteners in stainless-steel materials.

## **2.14 FABRICATION, WORK SURFACES**

- A. Work Counters: 24-inch deep, full-width, 14 gauge thickness, reinforced, stainless-steel work counter with hemmed edges and 4-inch integral backsplash. Mount top of counter 30-inches above floor. Include integral cash drawer below counter.
  - 1. Provide 3-inch wide clear space between back of backsplash and face of front wall for air circulation
- B. Integral Cash Drawer: 17-inch wide x 10-inch deep, 18 gauge steel drawer with high grade disc tumbler spring bolt lock, two keys, and chrome finished steel pull. Mount to underside of counter with exposed fasteners. Locate drawer adjacent to sliding window.

## **2.15 FINISHES**

- A. Exposed Finish for Wall Panels, Doors, Countertops, Ceilings and Roof: Prime coat all exposed steel surfaces, excluding aluminum, chrome and stainless steel surfaces, with manufacturer's standard two-part, rust-inhibitive epoxy primer.
  - 1. Polyurethane Two Coat System: Electrostatically applied catalyst polyurethane paint over undercoat application. Apply to all interior and exterior steel surfaces with finish coat of manufacturer's standard industrial polyurethane paint in colors as selected by the Engineer from manufacturer's full range of colors.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION**

- A. Before installation, examine areas to receive parking control booths. Verify that critical dimensions are correct and conditions are acceptable.
  - 1. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.02 PREPARATION**

- A. Provide templates for anchor bolts and other items encased in concrete or below finished surfaces so as not to delay the Work.

### **3.03 INSTALLATION**

- A. General: Install parking control booths according to manufacturer's written instructions and placement drawings.
  - 1. Coordinate placement of anchors and accessories encased in concrete with Section 03300.
- B. Prefabricated Cashier's Booth: Unload cashier's booth with forklift or crane. Set booth level, plumb, and aligned with the elevation of the top of the concrete curb slab.

- C. Install drop safe to floor under countertop adjacent to the service window. Bolt to steel floor plate with J bolts.
- D. Installation of alarm system to include, but not to be limited to, the installation of the following:
  - 1. Control Unit: alarm processor, transmitter with auto-dialer, power supply, back-up battery, and the interconnecting cable between the cashier booths, the parking structure Communications Room and the designated terminal in the Station Communications Room.
  - 2. Telephone lines: Connect PABX telephone lines to the WMATA Transit Police Communications Room in the Jackson Graham Building.
- E. Electrical Load Center: Section 16440.

### **3.04 CLEANING AND PROTECTING**

- A. After installing clean finished surfaces, touch up shop-applied finishes as required to restore damaged areas.
- B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure parking control equipment is without damage or deterioration at the time of Substantial Completion.

### **3.05 DEMONSTRATION**

- A. Instruct WMATA's maintenance personnel on proper operation and maintenance of parking control booth equipment. Train personnel on procedures to follow if operation fails or malfunctions.
- B. Coordinate testing of the alarm system with the Engineer.
- C. Demonstrate operation of all keyed locks.

**END OF SECTION**

## SECTION 13905

### FIRE PROTECTION, SUPPRESSION AND ALARM

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing dry standpipe, wet standpipe, sprinkler, exterior fire protection and clean agent fire-suppression systems.
- B. Related Work Specified Elsewhere:
  - 1. Water distribution system: Section 02515.
  - 2. Storm and sanitary system: Section 02535
  - 3. Firestopping: Section 07841.
  - 4. Field painting: Section 09920.
  - 5. Corrosion control system: Section 13115.
  - 6. Identification of mechanical equipment and piping: Section 15075.
  - 7. Piping system: Section 15205.
  - 8. Control equipment: Section 15900.
  - 9. Grounding and bonding: Section 16060.
  - 10. Wire and cable: Section 16120.
  - 11. Raceways, boxes and cabinets: Section 16130.
- C. Description of System:
  - 1. Dry standpipe system: Consists of siamese fire-department connection, dry fire line, check valves, automatic air vents, drain valves and angle hose valves.
  - 2. Wet standpipe system: Consists of siamese fire-department connection, wet fire line, check valves, drain valves, fire water-line surveillance valve, angle hose valves and capped branch connections for sprinkler systems where shown.
  - 3. Fire-suppression system for entrance escalators: Consists of fire line to point inside entrance escalator pit/machine room capped for future extension by escalator contractor, supplied from wet standpipe system.
  - 4. Sprinkler system, other than escalator: Consists of sprinkler lines, fire water-line surveillance valve, flow-alarm check valve, drain valve, and sprinkler heads as well as heating tracers in areas subject to freezing temperatures, supplied from wet standpipe system or from domestic water line as shown.
  - 5. Exterior fire-protection system: Consists of lead-ins to wet standpipe system, valves and accessories, supplied from the city water main.
  - 6. Automatic, total-flooding clean agent suppression system: Consists of smoke detectors, agent storage containers, nozzles, clean agent suppression system control and detection panel, manual pull station, alarm bell, evacuation horn, clean agent suppression system discharge visual alarm and necessary interface boxes for signals from and to HVAC and communications. Each room or hazard area to have its own system designed to provide a concentration of 7 percent by volume.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWS: A5.13
  - 3. FM Approval Guide.
  - 4. NFPA: 12A, 13, 14, 15, 24, 2001.
  - 5. UL: 262, 312, 1479, Fire Protection Directory.
  - 6. ANSI/ASME: B16.1, B16.5, B16.9, B31.1.

7. ANSI: Z535.1.
8. NEMA: 250.
9. FS: A-A-1992 SS-C-153, WW-P-421, WW-P-501, WW-U-516, WW-U-531.
10. MSS: SP-58.
11. ASTM: A36, A47, A53, A135, A183, A234, A 240, A276, B766, D1752, D2000.

B. Qualification of Welding Personnel: Section 05120.

C. Design Criteria:

1. NFPA 12A, 13, 14, 15 and 2001 as applicable.

### **1.03 SUBMITTALS:**

A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

1. Shop Drawings:
  - a. Methods of joining, welding, fastenings, and anchoring.
  - b. Materials and locations for wet standpipe, dry standpipe, sprinkler, clean agent suppression and external systems.
  - c. Pipes and piping layout, including pipe hangers and supports.
  - d. Pipe hangers and supports.
  - e. Valves.
  - f. Escutcheons.
  - g. Gauges.
  - h. Automatic air vents.
  - i. Pipe sleeves.
  - j. Mechanical couplings.
  - k. Layout of sprinkler and clean agent suppression systems and detail drawings approved by Fire Marshal of jurisdiction in which work is to be performed.
  - l. Reports covering test materials.
2. Certification:
  - a. Fire line test results.
  - b. Manufacturer's certification that pipe-joint gaskets and lubricants are satisfactory for use with pipe and fittings specified and that couplings are designed and tested as specified.
3. Samples: Paint, Section 09920.
4. Operation and Maintenance Manuals.

### **1.04 JOB CONDITIONS:**

- A. Do not perform welding when the temperature of the base metal is less than zero degree F.
- B. Do not perform welding when surfaces are wet or during periods of high winds unless operator and work are properly protected.
- C. Environmental Requirements: Paint, Section 09920.

### **1.05 OPERATION AND MAINTENANCE TRAINING:**

- A. Upon completion of installation and in accordance with the General Requirements furnish for a period of not less than two consecutive man-days services of a manufacturer's field engineer with specialized experience in the components of the system to instruct Authority personnel in the proper operation and maintenance of the systems.

## PART 2 - PRODUCTS

### 2.01 MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of piping and electrical equipment sub-assemblies, parts and relays.
- B. Pipe and Fittings:
  - 1. Exterior fire-protection system:
    - a. Ductile-iron pipe and fittings:
      - 1) Piping embedded or otherwise inaccessible: FS WW-P-421, Type III, Grade C, 250-pound pressure class.
      - 2) Piping from point of connection to inside of structure: FS WW-P-421, Grade C, 250-pound pressure class, flanged. Flanges: ANSI B16.1.
      - 3) Pipe coated on outside with bituminous coating and lined with cement mortar of twice standard thickness specified for pipe size used.
        - a) Cement-mortar lining having seal coat of nontoxic, tasteless and odor-free bituminous material.
      - 4) Neoprene gaskets furnished for joints.
    - 2. Interior fire-protection system:
      - a. Fire lines, embedded or otherwise inaccessible:
        - 1) Pipe: Galvanized steel, ASTM A53, Type E, Grade B, with the following additional requirements:
          - a) Fire-protection piping: Extra-strong weight, Schedule 80.
        - 2) Fittings and flanges: Galvanized, furnished with wall thickness equal to or greater than that of adjacent pipe, with the following additional requirements:
          - a) Fire lines: ASTM A234, Grade B, and ANSI B16.9 for dimensions and tolerances.
            - (1) Flanges: ASTM A234 and ANSI B16.5 for dimensions and tolerances.
      - b. Fire lines, exposed or otherwise accessible:
        - 1) Pipe:
          - a) Galvanized steel: One of the following:
            - (1) ASTM A53: One of the following:
              - (a) Type E, Grade B.
              - (b) Type F, Grade A.
            - (2) ASTM A13
          - b) Welded or seamless.
          - c) Standard weight, Schedule 40, with grooved ends. Use of Schedule 10 pipe is not allowed.
        - 2) Mechanical joint couplings: Keyed for joining grooved-end piping.
          - a) Coupling housing: Malleable iron in accordance with ASTM A47, Grade 32510, galvanized, fabricated in two or more parts enclosing resilient gasket seal, with keys to fit machined grooves on pipe ends. Rated at 300-psig minimum pressure and factory-finished with manufacturer's standard paint coating.
          - b) Coupling gasket: Chlorinated butyl, ASTM D2000, specification 3-BA-615-A14-B13, with following additional requirements:
            - (1) Molded grooves.

- (2) Pressure-responsive seal, integrity increasing with internal pressure.
    - c) Coupling bolts and nuts: Oval-neck track-type bolts with hexagonal nuts conforming to ASTM A183 permitting single-wrench assembly, having minimum tensile strength of 110,000 psi, with cadmium-plated finish ASTM B766, Type III.
  - 3) Fittings:
    - a) Grooved-end, fabricated of malleable-iron casting in accordance with ASTM A47, Grade 32510, galvanized; nonstandard fittings fabricated from Schedule 40 steel pipe.
    - b) Mechanical branch outlets:
      - (1) Victaulic 920 or equal.
      - (2) Victaulic Style 72 or equal.
    - c) Threaded pipe fittings: FS WW-P-501, Type 1, Class B.
    - d) Welding fittings made of same wall thickness as pipe.
      - (1) Factory-made welding fittings.
      - (2) Mitered-joint elbows and field-made reducers are prohibited.
    - e) Butt-welded fittings larger than 1-1/2 inches: ANSI B16.9.
    - f) Flanges for welded piping system: ANSI B16.5, galvanized forged steel, welded-neck type, 175 pressure class for stations and 250 pressure class for tunnels.
  - 4) Paint, Primer, and Undercoat: Alkyd Semigloss System as specified in Section 09920, Color: OSHA Red (Safety Red) in compliance with ANSI Z535.1 for piping, White for stenciling.
- c. Unions: WP 175 psig.
  - 1) 1-1/2 inches and smaller: Threaded, FS WW-U-531, Type B to match piping.
  - 2) Two inches and larger: Flanged.
    - a) Two union flanges, 2-1/2 and three inches: Steel, FSA WW-U-531, or cast iron, ANSI B16.1.
  - 3) Four inches and larger: Forged steel, slip-on weld neck flanges, ANSI B16.5.
  - 4) Nonferrous piping unions: Brass, FS WW-U-516.

C. Valves:

1. Fire-line valves, outside stem and yoke (OS&Y), UL Fire Protection Directory listed or FM Approval Guide listed for 175-psig minimum, meeting requirements of listed NFPA Standards, with UL or FM symbol cast or stamped on valve body.
2. Gate valves: UL 262 or FM Approval Guide listed, 175-psig WP
3. Check valves: UL 312 or FM Approval Guide listed, 175-psig WP, flanged-end connections, swing-type, metal-to-metal, rubber-faced or equivalent, valve seat 15 degrees from perpendicular to direction of flow.
4. Sprinkler flow-alarm check valves: Designed to operate on 10 gpm or more with restriction bypass which allows restricted flow of water to pass from supply to system side of alarm-valve clapper, to decrease possibility of false alarms resulting from increase in supply water pressure or from water hammer.
  - a. Furnished with retarding chamber, test and drain connections and electric contact unit.
  - b. Cast-iron bodies with nonferrous-metal seat, rings, bearings and renewable clapper facing.
  - c. Contacts: Section 15900.
5. Fire water-line surveillance valve:

- a. Double-disc, solid-wedge gate-type with outside stem and yoke (OS&Y) and renewable ring seats.
  - b. Designed for position indicator contact:
    - 1) Contacts open with valve fully open.
    - 2) Contacts close and alarm condition is initiated with two turns of hand wheel or when valve stem has moved one-fifth of distance from normal fully open position.
  - 6. Sprinkler alarm check-valve surveillance: Contact closes on flow amounting to 10 gpm or greater.
  - 7. Ball drip valves: 3/4 inch, threaded both ends and rated at 175-psig minimum.
  - 8. Air and vacuum valves:
    - a. Automatic.
    - b. High-capacity; minimum flow, 3.0 cfs; pressure differential, 5.0-psig maximum.
    - c. Designed for maximum system working pressure; 175-psig minimum; suitable for working pressures from zero psig to maximum capacity.
  - 9. Angle hose valves:
    - a. Cast bronze, male outlet, replaceable rubber disc and rising stem.
    - b. Rough-bronze body, polished-finish bonnet, nut and stem, complete with cap and chain.
    - c. Cast-iron or aluminum hand wheel, red-enameled.
    - d. Working pressure: 200 psig.
    - e. UL Fire Protection Directory listed with symbol cast or stamped on valve body.
    - f. American National Standard Fire Hose threads.
  - 10. In-line cut-off valves:
    - a. Flanged gate valve, with outside stem and yoke
    - b. Comply with UL 262, UL Fire Protection Directory listed or FM Approval Guide listed with symbol cast or stamped on valve body.
    - c. Working pressure, 175 psig.
    - d. Cast-iron or aluminum hand wheel, red-enameled.
- D. Fire Department Siamese Connection:
- 1. Free standing:
    - a. Paved areas: Double clapper, with sidewalk sleeve, sidewalk plate, two rocker-lug plugs and chains, polished brass, two female inlets with 2-1/2 inch American National Standard Fire Hose Threads, UL Fire Protection Directory listed or FM Approval Guide listed, working pressure of 200 psig and with cast recessed Type B Metro logo and inscription, as shown, except inside fenced Authority property.
    - b. Landscaped areas: As specified for paved areas, except no sidewalk sleeve or plate.
    - c. Paint, Primer, and Undercoat: Alkyd Semigloss System as specified in Section 09920, Color: OSHA Red (Safety Red) in compliance with ANSI Z535.1 for piping, White for stenciling.
  - 2. Wall-mounted: Double clapper rectangular wall plate for flush mounting, two rocker-lug plugs and chains, polished brass, two female inlets with 2-1/2 inch American National Standard Fire Hose Threads, UL Fire Protection Directory listed or FM Approval Guide listed, working pressure of 200 psig, and with cast raised Type B Metro logo and inscription as shown. Provide sill cock where necessary for drainage.
- E. Sprinkler Heads:
- 1. Standard fusible-link type.
  - 2. Bronze finish, exposed and temperature rating of 165F in accordance with listed NFPA Standards.

- F. Sprinkler Test Connections:
  - 1. Drain piping, valves and fittings necessary for testing in accordance with listed NFPA Standards.
- G. Control System: Except as specified for clean agent suppression systems: Provided by others.
- H. Supporting Devices:
  - 1. Pipe hangers and supports:
    - a. Adjustable, stainless steel, clevis-type, threaded full length, with diameter consistent with pipe size and the load imposed: MSS SP-58.
    - b. Hanger rods: 3/8-inch minimum diameter, stainless steel, ASTM A276, Type 304, threaded full length, with diameter consistent with pipe size and the load imposed: MSS SP-58.
    - c. Nuts and washers: Stainless steel.
    - d. Supported from stainless steel inserts in concrete slab: MSS SP-58.
  - 2. Adjustable U-bolt type:
    - a. U-Bolt: Fabricated from stainless steel, MSS SP-58.
    - b. Nuts and washers: Stainless steel..
    - c. Chair: Cast iron or fabricated from stainless steel.
  - 3. Z-bar: Fabricated from stainless steel: ASTM A240, Type 304.
  - 4. Pipe anchors:
    - a. Designed to withstand a minimum of five times anchor load.
    - b. Vertical pipes anchored by means of clamps welded around pipes and secured to wall or floor construction.
  - 5. Expansion-bolt anchors:
    - a. Consisting of bolt, expander, star lock washer and nut.
    - b. Fabricated of stainless steel, Alloy S30300 in accordance with ASTM E527, including expander and star lock washer.
    - c. Anchor assemblies: FS A-A-1992, Group II, Type 4, Class 1.
  - 6. Self-drilling anchors:
    - a. Self-drilling, expansion anchors with self-cutting annular broaching grooves.
    - b. Anchor and expander plug: Double-plated, FS A-A-1992, Group III, Type 1.
  - 7. Pipe sleeves:
    - a. Through interior masonry-unit walls: PVC, as shown, large enough to accommodate pipe but minimum two sizes larger than pipe size.
    - b. Through cast-in-place concrete interior walls and concrete ceilings: Factory-made cast iron with anchor flange and cast-iron plate collar screw-fastened to slab and pipe.
      - 1) Sleeves minimum two sizes larger than pipe; for floors and ceilings projecting four inches above finish floor.
    - c. Through exterior structural elements: Minimum two sizes larger than pipe and as shown.
    - d. Sleeves designed for pipe-movement allowance due to expansion and contraction.
  - 8. Escutcheon plates:
    - a. Polished brass or stainless steel, screw-fastened to wall or ceiling.
    - b. Plate collars caulked with silicone sealant or intumescent putty.
    - c. Sealant: UL-1479.
- I. Pressure Gauges: Spring pressure-type, 3-1/2 inch dial, in accordance with NFPA 14.
- J. Bonding Strap: 2AWG single-conductor cable: Section 16060.
- K. Preformed Joint Filler: ASTM D1752.

- L. Coal-Tar Epoxy: Section 02535.
  - 1. Thinner of type recommended by manufacturer of coating and used only when approved.
  
- M. Water-Flow Indicator: Vane-type water flow switch, UL Fire Protection Directory listed, FM Approval Guide listed. Electrical rating: 24 volts dc, 1.5 amperes, normally open contacts to actuate with flow of 10 gpm or more.
  
- N. Clean agent suppression system:
  - 1. Smoke detectors: Products of combustion, dual-chamber, ionization-type, operating voltage of 22 to 28 volts dc, 30 milli-amperes (ma) standby current drain at 24 volts dc and alarm current drain of 60 ma at 24 volts dc. Three amperes minimum alarm contact rating at 24 volts dc. Detector will activate alarm approximately five seconds after product of combustion particulate enters ionization chamber. Detectors equipped with indicator lamp which will remain lighted until reset. Unit listed by UL Fire Protection Directory and FM Approval Guide as signal and release device.
  - 2. Manual pull station: Contained in cast-metal housing for mounting on standard four-inch junction box unit to have dual-action release configuration such as discharge lever protected by lift cover, to prevent accidental discharge, and tamper-resistant screw to prevent unauthorized access to reset procedure. For operation at 24 volts dc. Listed by UL Fire Protection Directory as release device.
  - 3. Abort switch: A momentary, normally closed push-button switch. Time delay to restart at designated setting when abort switch is released. Switch to be accessible and labeled 'CLEAN AGENT ABORT.' Activation of the abort switch to silence discharge warning horn.
  - 4. Clean agent suppression system control equipment:
    - a. Control panel: Multizone for operation by smoke detectors and manual pull station, singly or in combination, to activate prealarm or release of agent as required. Power source for operating extinguishing system as well as specified auxiliary functions.
      - 1) Panel enclosure: NEMA 250, Type 1 surface-mounted, dead front; indicators and control switches visible, mounted on panel behind hinged, locked glass-paneled door, complete with relays, trouble and alarm bell, silencing switch with ring-back feature, LED indicating lamps, nameplates, switches and terminals to provide relays for fire-alarm system tie-in, for HVAC systems fan shut-down, HVAC-damper closing, for test delay switch with automatic reset to permit testing fire-alarm system without activating auxiliary control functions.
      - 2) Operating circuitry: Solid-state electronics with plug-in circuit modules for detection and release circuits; 120-volt ac, 60-Hertz supply; 24 volts dc signal and release circuits including power for operating extinguishing sub-system and other functions. Power consumption 10 watts steady state, 200 watts peak.
      - 3) Functional circuitry: Provide two detection zones and two output circuits for signal and release, all Class B supervised. Detection circuits to accommodate smoke detectors and manual stations intermixed. Signal output circuit of the polarity-reversal type. Release circuit to include supervised abort switch and adjustable time delay. Provide separate relay output for each zone alarm, general alarm, trouble, predischarge and system-fired circuit; utilize 10-ampere contact.
      - 4) Operation: Activation of detector, circuit to light zone alarm lamp on indication panel, sound audible local alarm, activate the extinguisher system and energize auxiliary relays for remote alarm

or equipment shut-down. Loss of dc power or discontinuity in detection circuits to light trouble lamp on indicator panel and actuate bell alarm; provide trouble bell silence switch with ring-back circuit to silence trouble bell alarm. Receipt of zone alarm to override trouble alarm. A single switch to reset control unit.

- 5) Indicator lights, as follows:
- a) POWER ON: Green.
  - b) TROUBLE: Yellow.
  - c) ALARM ZONE 1: Red.
  - d) ALARM ZONE 2: Red.
  - e) PRE-DISCHARGE: Red.
  - f) SYSTEM FIRED: Red.

b. Extinguishing system:

- 1) Provide system designed to discharge seven-percent volume concentration of extinguishing agent with discharge not to exceed 10 seconds. The system to comply with NFPA 2001. Each extinguishing system to include the following
- a) Agent storage container: Container fabricated of high-strength alloy steel with burst-disc actuator valve assembly, safety plug, cable assembly, 0 - 600-psig pressure gauge, pressure switch and lifting ring. Container to conform to applicable DOT specifications; to automatically relieve between 850 psi and 100 psi in event of excessive pressure buildup. Super-pressurize filled container with dry nitrogen to 390 psig at 70F to assist rapid distribution. Container designed for on-site reconditioning and refilling. Actuator valve assembly to be an integral part of container.
  - b) Discharge nozzle: Provide series of one-piece, nonclogging nozzles to distribute agent in protected volume. Nozzle size selection determined by container size and geometry of volume to be protected. Nozzles connected through reducer, elbow and piping. Nozzle discharge pattern to deliver uniform agent coverage to all areas of enclosed hazard.
  - c) Actuator: Electrical device to operate on demand to provide path for relief and discharge of agent.
  - d) Mounting bracket: Designed for wall-mounting agent storage container and capable of withstanding 1,000-pound thrust for five seconds in any direction.
  - e) Agent: Liquefied compressed clean agent suppression system conforming to requirements of NFPA 2001.
  - f) Alarm bell: Motor driven, with six-inch gong, 24-volt dc operating voltage, 90 dBA sound-pressure level at one meter and OSHA Safety Red finish.
  - g) Evacuation horn: Vibrating, 24-volt dc, 0.063 amperes, 97 dBA sound-pressure level at one meter.
  - h) Discharge indication light: Flashing device with legend CLEAN AGENT DISCHARGE; 24-volt dc.
  - i) Clean agent suppression system interface box: Data-transmission system (DTS) cabinet specified in Section 16130, with the following additional requirements:
    - (1) Cabinet: Hoffman A161206LP.
    - (2) Terminal strip: 16 terminals minimum.
    - (3) Exterior finish color: OSHA Safety Red.
    - (4) Identify cabinet on cover with COMMUNICATION INTERFACE in one-inch high yellow letters.

## PART 3 - EXECUTION

### 3.01 INSTALLATION:

- A. Fit equipment and appurtenances to space provided and make serviceable.
- B. Provide support beams, concrete pads, platforms, and hangers necessary for proper installation of equipment as recommended by manufacturer.
- C. Install complete fire-protection systems as shown and as specified. During installation, protect work, equipment, and materials. Plug or cap pipe openings.
- D. Flush underground mains before connection to wet-standpipe risers at following minimum flow rates:
  - 1. Six-inch pipe: 750 gpm.
  - 2. Eight-inch: 1,000 gpm.
  - 3. 10-inch pipe: 1,500 gpm.
  - 4. 12-inch pipe: 2,000 gpm.
- E. Fasten escutcheon plates to wall or ceiling. Seal plate collars watertight with mastic.
- F. Welding Procedure:
  - 1. As specified in Section 05120, with the following additional requirements:
    - a. Manual metallic arc process, except for pipe sizes four inches and smaller where oxyacetylene welding may be used.
      - 1) Use electrodes and rods of composition recommended by AWS A5.13 for pipe.
      - 2) Heat surface within three inches from point where weld will start to a temperature warm to hand before welding.
    - b. Leave joint surfaces smooth, uniform and free from fins, tears and other defects which adversely affect proper welding.
    - c. After each pass of weld on multiple-pass welding, clean weld free of slag and other deposits before applying next pass.
    - d. Peen with light blows of blunt-nosed peening hammer. Do not peen surface layers or first pass in groove welds.
    - e. For groove welds, center surface pass substantially on seam, smooth and free from depressions.
    - f. Fillet weld with minimum cutting back of outside surface of pipe.
      - 1) Leave throat of full fillet weld not less than 0.707 of thickness of pipe.
      - 2) Repair excess cutting back and undercutting of base metal in pipe adjoining the weld.
      - 3) Fill craters to full cross section.
    - g. Position pipes to be welded so that joints will be in alignment. Joints misaligned more than 20 percent of pipe wall thickness or maximum of 1/8 inch are prohibited.
    - h. Install welding pipe in accordance with ANSI B31.1.
  - 2. Cut ends of screw-jointed pipes squarely to seat in bottom of recess of fittings. Ream after cutting so waterway is not reduced in size.
  - 3. Apply thread dope or compound to male thread only.
  - 4. Where cathodic protection is shown, apply coal-tar epoxy coating as specified in Section 02535 and test as specified in Section 13115.

- G. Buried Ductile-Iron Pipe: Install as specified in Section 02515, except use mechanical joints.
- H. Steel-Pipe Installation:
1. Maintain OSHA required head clearance.
    - a. Install horizontal piping with minimum pitch of one inch in 40 feet.
    - b. Provide drains at low points: Minimum 3/4-inch valves with hose connection.
    - c. Install vertical pipes near wall from which they are supported.
  2. Make connections to equipment without placing strain on piping and equipment.
  3. Tunnel, vent and fan-shaft piping:
    - a. Joints of the following types:
      - 1) Butt weld joints in pipe recessed in tunnel lining.
      - 2) Use mechanical grooved couplings for remainder of joints in horizontal and vertical mains unless otherwise shown.
      - 3) Use threaded joints in branch lines 2-1/2 inches or smaller.
    - b. Provide number of mechanical couplings necessary to allow minimum 1-1/4 inch expansion per 100 feet of main.
    - c. Use reducing tee for mechanical couplings or mechanical branch outlet at main-to-branch connections.
    - d. Make in-line cut-off valves accessible from floor or walkway level.
  4. Underplatform station piping:
    - a. Provide the following types of joints or couplings:
      - 1) Couplings: Mechanical, grooved, at intervals not to exceed 21 feet.
      - 2) Where possible, cut grooves before galvanizing.
      - 3) Where grooves are cut after galvanizing, apply zinc coating.
      - 4) Other joints:
        - a) In lines four inches and larger: Welded joints.
        - b) In lines less than four inches: Welded or threaded joints.
    - b. Provide anchors, horizontally and vertically rigid, within one foot of one end of each length of pipe jointed with Victaulic-type mechanical couplings. Provide clevis-type support within one foot of other end, at midpoints between mechanical couplings and at each angle hose valve. Locate supports at angle hose valves to ensure resistance to rotation of valves and adjacent piping by water pressure at valve. Provide restraint for every third length of pipe to prevent excessive movement by a horizontal thrust. Roller-type hangers and pipeline guides are not required
  5. Other station piping: Joints in balance of station fireline piping of mechanical-type, grooved or welded couplings for lines four inches and larger and screwed or welded for lines under four inches, except that mechanical-type groove couplings must be accessible.
- I. Mechanical-Type Groove Couplings: Install couplings according to manufacturer's instructions and as follows:
1. After grooving, remove indentations, projections and roll warps as necessary. Cut pipe ends square to tolerance of plus-or-minus 0.03 inch. Provide zinc coating on exposed surface.
  2. Lightly coat pipe ends and coupling gasket with non-petroleum-based lubricant.
  3. Center gasket, install housing and ensure that keys are securely located in pipe grooves.
  4. In underplatform station piping, provide separation of 1/8 inch between ends of adjacent sections of pipe within coupling, based on air temperature of plus 60F. Adjust based on actual air temperature at time of installation.
  5. Install bolts and nuts tightened uniformly to manufacturer's recommended limits using torque wrench, without pinching gaskets.
  6. Provide bonding across couplings for stray-current protection.

- J. In-Line Valves: Install in-line valves by bolting fitting to valve and welding fitting to pipe.
- K. Pipe Anchors: Securely anchor piping as specified, where shown and where necessary for proper installation to force pipe expansion in proper direction.
- L. Expansion-Bolt Anchors: Drill holes and install expansion-bolt anchors in manner recommended by anchor-bolt manufacturer. Do not install less than eight inches from concrete edge.
- M. Pipe Sleeves: Fill annular space between pipe and sleeves with preformed joint filler, tightly placed to form effective seal against groundwater.
- N. Bonding: In accordance with Section 16060, and with the following additional requirements:
  - 1. Bond mechanical joints and fittings, including valves, by exothermic-welding method.
  - 2. Make welds in accordance with manufacturer's recommendations. Clean and coat with coal-tar epoxy.
  - 3. Bond pipe using bonding strap welded to each side of joint not less than six inches from joint. Allow sufficient slack in conductor for expansion of pipe.
- O. Air Vents: Install high-capacity automatic air vent(s) at opposite end(s) of dry-standpipe system from fire-department siamese connection or where shown. Pipe air-vent outlet to nearest drain or as directed.
- P. Firestopping: Section 07841.

### **3.02 PROTECTION OF PIPING AND EQUIPMENT:**

- A. Protect pipe, openings and valves from dirt, foreign objects and damage during construction.
- B. Replace damaged piping, valves and other appurtenances, should damage occur prior to final acceptance of the work.

### **3.03 FIELD QUALITY CONTROL:**

- A. Field Tests:
  - 1. Flush piping with water until clean and free of scale, slag, dirt, oil, grease and other foreign material.
  - 2. Perform final testing, acceptance, and certification in accordance with NFPA 13, 14, and 24, as applicable.
  - 3. Test electrical continuity of bonded joints by measuring resistance. Total resistive value of joint not to exceed calculated resistance of bond cable plus 10 percent.
- B. Water-Pressure Testing:
  - 1. In the presence of the Engineer, test piping, prior to burial or concealment, using specified procedures specified.
  - 2. In the presence of the Engineer, completely test piping system for leaks until approved.
  - 3. Notify the Engineer at least 36 hours prior to tests.
  - 4. Test piping at the following pressures:
    - a. Fire-protection piping, inaccessible: 400 psi-minimum.
    - b. Ductile-iron pipe: At lowest point in system, 150 psi or 1-1/2 times maximum working pressure, whichever is greater.
    - c. Fire-protection piping, exposed and accessible: At lowest point in system, 150 psi or 1-1/2 times maximum working pressure, whichever is greater.

- C. Test Procedures:
1. Test fire-protection piping in accordance with NFPA.
  2. Fire-protection piping, inaccessible:
    - a. Avoid excessive pressure on safety devices and mechanical seals.
    - b. Fill entire system with water and vent air from system at least 24 hours before test pressure is applied.
    - c. Apply test pressure when water and average ambient temperature are approximately equal and constant.
    - d. Maintain test pressure for six hours minimum without drop after force pump has been disconnected.
  3. Water-test entire system with pressure at highest point of 250 psig.
  4. After filling system, shut off water supply and allow it to stand for two hours under test without loss or leakage.
  5. Coordinate with and assist local fire department in performing flow tests. After performing hydrostatic test, drain water from firelines. Perform flow test at rate of 500 gpm with pumper connected to siamese connection, starting testing with sudden full flow into empty firelines.
  6. Drain system immediately after hydrostatic and flow testing.
- D. Repair of Leaks:
1. The following are prohibited:
    - a. Repair of leaks by mechanical caulking.
    - b. Introduction of material inside piping system to stop leakage.
  2. Repair leaks in threaded piping by breaking joint, cutting new threads on pipe and installing new pipe fitting.
  3. Coat field welds and repair damages to zinc-coated surfaces as follows:
    - a. Wire brush areas to be coated to bright metal.
    - b. Apply galvanizing repair compound at rate of two ounces per square foot.
  4. Replace defective coupling assembly as necessary.
  5. Remove defective welds by chipping or gouging.
    - a. Reweld the chipped-out places.
    - b. When base metals of fillet welds are cut back or throat of welds are less than specified, repair defect by adding additional weld metal.

### **3.04 CLEANING:**

- A. Flush firelines with water to remove sediment after completion of tests, repairs or replacements.
- B. Disinfect firelines connected to potable-water system as follows:
1. Use chlorine for disinfection in form of hypochlorite solution or in form of compressed gas applied through approved chlorinator.
  2. Operate valves and equipment during chlorination to ensure that chlorine reaches entire system.
  3. Feed water and chlorination agent into system at rate providing for 50 ppm of chlorine and allow to stand 24 hours before flushing.
  4. Residual chlorine, at end of 24-hour retention period, not less than 10 ppm.
  5. Flush treated water from system completely after disinfection.
  6. Continue flushing until samples show that quality of water delivered is comparable to public water supply and satisfactory to public-health authority having jurisdiction.
  7. Do not take samples from hydrants or through unsterilized hose.

### **3.05 FIELD PAINTING: Section 09920.**

- A. Prepare piping, apply primer, undercoat and finish coats in accordance with Section 09920.

**3.06 IDENTIFICATION OF PIPING AND VALVES: Section 15075.**

**3.07 CLEAN AGENT SUPPRESSION SYSTEM:**

- A. General:
1. Install clean agent suppression system sized and adjusted to discharge seven-percent concentration within protected spaces in accordance with NFPA 2001. Smoke detectors to be cross-zoned so that at least one detector from each loop shall react to smoke before extinguishing system will be activated. First detector actuated to sound alarm bell, illuminate indicator lamp for appropriate alarm zone and energize fan shut-down relays and close dampers of HVAC systems serving involved space. Second detector actuated to energize evacuation time-delay relay in clean agent suppression system control panel, sound evacuation horn and illuminate SYSTEM FIRED indicator light at clean agent suppression system control panel to indicate system discharged. Actuation of manual pull station to by-pass time-delay function, sound evacuation horn, energize fan shut-down relays of HVAC system serving area and release FM200.
- B. Trouble Operation:
1. Opens or ground in wiring to ring bell on FM200 control panel. Silencing switch to silence trouble bell during correcting of fault.
- C. Remote Alarms:
1. Activation of the following to generate alarm indicators at clean agent suppression system control panel:
    - a. Alarm Zone 1.
    - b. Alarm Zone 2.
    - c. System fired.
    - d. Trouble.
- D. Performance Testing:
1. Performance-test completed system except smoke detectors.
  2. Provide instrumentation and test gases-test systems including detection system in accordance with jurisdictional requirements.
  3. Operate mechanical and electrical systems.
  4. Inspect nozzles and agent storage containers.
  5. Full equivalent test of gas discharge into each zone area. Use meter to verify delivery of specified concentrations within required time and maintained for minimum of 10 minutes.
  6. After completion of satisfactory testing, refill storage containers.

**END OF SECTION**

**DIVISION 14 - CONVEYING SYSTEMS**

14000 CONVEYING SYSTEMS

14200 HYDRAULIC ELEVATORS

14210 HOLELESS HYDROLIC ELEVATORS

14240 GEARLESS TRACTION ELEVATORS

14245 GEARED TRACTION ELEVATORS

14300 HEAVY-DUTY ESCALATOR

**END OF SECTION**

**SECTION 14200  
HYDRAULIC ELEVATORS**

**PART 1 – GENERAL**

**1.01 DESCRIPTION**

A. This section specifies work pertaining to heavy-duty hydraulic passenger elevator systems including elevator cars, hoistway equipment, hydraulic piping, valves, cylinders, machinery, control systems, indicators, signs, elevator pit ladders and finish work in the vicinity of the hoistway doors. Work under this section also includes drilling of casing holes, furnishing and installation of 3/8-inch thick steel well hole casings, and concrete in the bottom of the well hole.

B. The following sections include related requirements and are performed by other trades:

1. Specifications Section 02000 – Site Construction
2. Specifications Section 05000 – Metal Fabrication
3. Specifications Section 08800 – Glass and Glazing
4. Specifications Section 09920 – Painting
5. Division 7 Section “Waterproofing” for water proofing of elevator pit
6. Division 15 Sections for heating, ventilating and/or air conditioning of elevator machine room.
7. Division 16 Sections for electrical service to elevator equipment, fire alarm systems and communications systems.

C. Definitions:

All terms in this specification have the meaning as defined in the ASME code.

1. Heavy duty elevator: An elevator designed specifically for the harsh environment and duty load cycles common to transportation system usage.
2. Elevator - a hoisting and lowering mechanism, equipped with a car or platform, which moves in guide rails or racks and serves two or more landings
3. Elevator, passenger - an elevator used primarily to carry persons other than the operator and persons necessary for loading and unloading.
4. Elevator, hydraulic - a power elevator in which the energy applied, by means of a liquid under pressure, in a hydraulic jack.
5. Contractor: The General Contractor.
6. Installer: The responsible party who installs the elevator.
7. OEM: Original Equipment Manufacturer.

8. Dwell time: The period of time the elevator is at a landing while the doors open, passengers transfer and doors close.
9. Substantial completion: The point at which the elevator is ready for use, whether the site is finished or not. This is where the jurisdictional inspection usually takes place.
10. Final Acceptance: The point at which the owner accepts the elevator project as being complete including all submittal requirements. This may be a different point in time than substantial completion.
11. Interim Maintenance: Maintenance from the point of substantial completion, but prior to Revenue Service.
12. Beneficial Use: When the elevator is placed into service, may be prior to the site being ready for public use.
13. Revenue Service: The station or facility opening date.
14. Notice to Proceed (NTP): within this document shall mean the date which the elevator installer is notified to proceed with the project.
15. Override Switch – A switch located in a kiosk panel, which disables the Hall Call Buttons.
16. MSDS - Material Safety Data Sheet.
17. BOM - Bill of Material
18. SMNT - Systems Maintenance (WMATA)
19. WMATA: Washington Metropolitan Area Transit Authority.

## 1.02 REFERENCES AND QUALITY ASSURANCE

### H. Codes, Regulations, Reference Standards and Specifications.

1. Comply with codes and regulations of the Authority Having Jurisdiction.
2. American Society of Mechanical Engineers (ASME) A17.1 Safety Code for Elevators & Escalators and A17.2 Guide for Inspection of Elevators, Escalators and Moving Walks.
3. WMATA Design Criteria requirements indicated in Section VI-Mechanical.
4. American Institute of Steel Construction (AISC).
5. American Iron and Steel Institute (AISI).
6. American National Standards Institute (ANSI): C80.1
7. American Society for Testing and Materials (ASTM): A36, A123, A153, A167, A240, A264, A276, A500, A653, B3, B8, D471.
8. American Wire Gauge (AWG).
9. Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG).

10. American Welding Society (AWS): D1.1.
11. Environmental Protection Agency (EPA).
12. Federal Transit Administration (FTA).
13. Institute of Electrical and Electronic Engineers (IEEE): 1202.
14. International Code Council (ICC) – International Building Code (IBC).
15. National Association of Architectural Metal Manufacturers. (NAAMM): C54, C55.
16. National Institute of Standards and Technology (NIST).
17. National Electrical Code (NEC).
18. National Electrical Manufacturers' Association (NEMA): WC 70, KS 1, AB 1, 250, PB 1, MG 1.
19. National Electrical Safety Code (NESC)
20. National Elevator Industry, Inc. (NEII)
21. National Fire Protection Association (NFPA): NFPA-130-2003.
22. Occupational Safety and Health Act (OSHA).
23. Society of the Plastics Industry (SPI).
24. Underwriters' Laboratories, Inc. (UL), UL-94HB, 6, 50, 62, 98, 360, 486, 489, 514, 1591.
25. United States Department of Transportation (DOT).
26. Any additional requirements imposed by local agencies and/or codes having jurisdiction shall be incorporated into elevator installation.
27. In the event of a conflict between codes, regulations, these specifications or standards, the most stringent requirement as determined by the Contractor and approved by the Authority shall take precedence unless specifically addressed herein.

**B. Elevator Manufacturer and/or Installer's Qualification:**

1. **Manufacturer Qualification:** : Shall provide documents stating that their firm has successfully produced elevators for transit system applications for a minimum of ten (10) years and regularly engaged for the past five (5) years in the manufacture of major components for hydraulic passenger elevators. As a standard of quality the elevator equipment design and installation shall comply with the Code.
2. **Installer's Qualifications:** Shall be the original manufacturer of elevator equipment or manufacturer's authorized agent who is trained and approved for installation of units required for this Project.
3. The Contractor shall obtain and pay for all permits and licenses and perform all required inspections.

**C. Quality Assurance:**

1. The elevator contractor shall guarantee the materials and workmanship of the apparatus furnished under these specifications and will correct any defects not due to ordinary wear and tear within two (2) years from date of completion of each elevator, inclusive of labor and traveling expenses. Defective work shall be repaired or replaced at no additional cost to the Authority.
2. Welding: Welding shall be performed in accordance with the requirements of AWS or CWB Welders shall produce evidence of current certification by AWS or CWB.
3. Labeling Requirements: Every elevator shall be clearly marked with rated load and speed, manufacture serial number and the designated Authority identification.
  - a. All elevators shall be permanently numbered with number designations corresponding to the indications on the kiosk annunciator panel. A station sketch showing the elevator numbers shall be submitted for WMATA ELES Engineering. The elevators shall be numbered in sequence, starting at the north entrance left to right facing to the elevator at each station and proceeding clockwise around the station. The numbering shall proceed into the station toward the end of the platform. Corresponding numerical identification shall be affixed to the equipment in the machine rooms. The elevator numbering shall be approved by the ELES Engineer.

### 1.03 SUBMITTALS

Submit the following for approval in accordance with the Contract Documents and with the additional requirements as specified.

#### A. Product Data

1. The summation of product information shall be submitted, in tabular form, of all parts incorporated in the entire group of elevators supplied under this Contract. Hard copies and electronic copies on the Flash Drive/Compact Discs (CDs) shall be submitted.
  - a. Manufacturer's design data, material specifications, drawings, installation and maintenance instructions including preventive, predictive and general maintenance, and other data pertinent to the components used in the elevator systems, including, but not limited to, detailed repair data for all components, including disassembly, inspection/gauging/torque requirements, reassembly, testing and other related information. Submittals shall cover all mechanical components, operating panels and indicators and electronic equipment to control and monitor elevator control functions. Exploded view drawings shall be included to facilitate repair and maintenance functions.
  - b. Lubricants, sealers, paints and any other potentially hazardous substances are subject to review and approval by the Authority. The Contractor shall submit the necessary Material Safety Data Sheets.
2. The following information shall be provided:

- a. Nomenclature of part.
  - b. Elevator Contractor's part number
  - c. Nomenclature of next higher assembly in which used.
  - d. Manufacturer and part number.
  - e. Model number(s) of elevator(s) on which used.
  - f. Total quantity in entire group of elevators.
  - g. Current unit price to the Authority.
  - h. Recommended spare parts list showing parts with prices for each part. The parts listing shall be provided on or before 90 days prior to scheduled completion
3. Loads on supporting members, reaction points, and deflections under varying loads.
    - a. Loads imposed on the structure shall be coordinated with the Authority and not exceed agreed limits. This requirement shall be verified, documented, and stamped by a registered Professional Engineer Supporting calculations shall be provided for record file.

B. Shop Drawings

The contractor to provide detailed drawings that shows the dimensions and tolerance, specification that may include the material specification, hardness or electrical rating for each component that is being used. In regards to assemblies they must provide a top level drawing with BOM and quantities with detailed material specifications and drawings with dimensional tolerances. The contractor also to provide as-built CAD models of all elevator components.

The name of the manufacturer and type or style designation shall be listed on the each page of the equipment shop drawings. Drawings submitted shall include, but not be limited to, the following.

- a. Fully dimensioned layout in plan and elevation, showing the arrangement of equipment and all pertinent details of each specified elevator unit, including as appropriate
  1. All equipment located in machine rooms.
  2. Location of circuit breaker, switchboard panel or disconnect switch, light switch, and feeder extension points in machine room. These electrical components shall not be blocked by anything.
  3. Location in hoistway of outlets for connection of traveling cables for car light, fire detectors, communication, and control system.
  4. Car, hydraulic cylinder and plunger, supporting beams, guide rails, buffers, and other components located in the hoistways.

5. Maximum guide rail bracket spacing. Guide rail brackets shall be provided at every horizontal structural member and shall be of sufficient strength to meet the ASME Code.
  6. Reactions at points of supports.
  7. Weight of principal parts.
  8. Top and bottom clearance and over-travel of car.
  9. Complete wiring diagram of the elevator system and subsystems. Complete data regarding electrical characteristics and connection requirements.
  10. Refuge space on top of car and pit.
  11. Cab design, dimensions and layout.
  12. Color/material schedule and selection chart for cab and entrance features.
  13. Hoistway Ventilation - Thermostatically Controlled, positive mechanical ventilation system.
  14. Hydraulic Jack Details
  15. Machine/Pump Room area, pit and hoistway layout.
  16. Hydraulic piping layout indicating layout, type, size, and schedule of piping from machine room to elevator pit(s) indicating orientation of valve(s), and location of shut-off valve(s), and shall include calculations of working pressures.
- b. Drawings of the hoistway entrances and doors showing their method of operation, details of construction, and fastenings to the structural members of the station structure.
  - c. Drawings of the car for each design specified, showing dimensions, details of construction, fastenings to platform, car-lighting, ventilation, air conditioning (if applicable), communication, and location of equipment.
  - d. Cuts or drawings showing details of all signal and operating devices, identifying graphics, and detailed design with diagram and schematic of kiosk annunciator panel.
  - e. Hydraulic drive:
    1. Cylinders and plunger.
    2. Power unit, including volume, rate of flow, working pressure, rpm of pump, and horsepower, voltage, frequency, service factor and rpm of the motor.
    3. Piping, fittings, and couplings.
    4. Valves.
    5. Storage tank.
    6. Muffler.

7. Hydraulic Jack Details Drawings
  8. Fluid flow diagram showing all valves, operating devices, and controls.
  9. Complete assembly detail of machine/pump, hydraulic tank mounting, with all load calculations.
- f. Elevator controller, including manufacturer's technical data and catalog cuts, and interface hardware and software requirements.
  - g. Power door operator.
  - h. Door interlocks and electrical contacts including test reports showing that hoistway door interlocks, car door contacts, and car top emergency contacts meet the requirements of the ASME Code and certification by the NIST or other approved laboratory.
  - i. Car ventilation fan.
  - j. Car Air Conditioning (if applicable)
  - k. Car lighting.
  - l. Cabling.
  - m. Buffer, including stroke and certified maximum striking speed for car.
  - n. Communication and intrusion system design details covering electrical, mechanical, and architectural aspects.
  - o. Design and architectural details, including light ray unit locations, of the electrical protective device for car doors.
  - p. Where the use of adjoining dissimilar metals is required, descriptions of protective measures to be employed to avoid corrosive damage.
  - q. Certification from independent testing laboratory that glazing gaskets meet the specified requirements.
  - r. Hall and car fixtures at each landing including the car operating panel (COP).
  - s. Interface wiring diagrams with other systems showing terminal board location and identification.
  - t. Expected heat dissipation of elevator equipment in machine room and control areas (i.e. BTU's/hr.) based on 240 round cycles per hour.
  - u. Complete wiring diagram of the elevator system and subsystems. Complete data regarding electrical characteristics and connection requirements.
  - v. Complete assembly detail of machine/pump, hydraulic tank mounting, with all load calculations.
  - w. Lubricants, sealers, paints and any other potentially hazardous substances are subject to review and approval by the Authority.

The Elevator Contractor shall submit the necessary Material Safety Data Sheets.

C. Samples

1. Three of each of the following samples shall be submitted for approval:
  - a. Steel cladding: Baked-enamel finish, six inches square. The sample shall show the rust-protected surface of the base metal on one side and the prime and finish coats (stepped) of enamel on the other side, although both sides of actual panels are to be enameled as specified.
  - b. Sheet metal: Six inches square of thickness and finish specified.
  - c. Stainless steel cladding: 12 inches square of thickness and finish specified.
  - d. Glass: 12 inches square.
  - e. Floor covering: 12 inches square in the color and finish to be supplied.
  - f. Neoprene gasket: Each type.
  - g. Landing selector button mounted in cover plate with identity marking alongside button.
  - h. Signs: One of each type.
  - i. Ceiling material.

D. Certification:

1. Certificates of inspection and acceptance issued by Jurisdictional Authority.
2. The Acceptance Inspection (Specifications and Code) by the Elevator and Escalator (ELES) Department shall take place prior to the Final Acceptance Inspection by the Jurisdictional Authority, and the elevators and associated equipment shall be free of defective material, imperfect work and faulty operation.

All defective work identified by ELES representatives shall be repaired or replaced at no additional cost to the Authority prior to the Final Acceptance Inspection by the Jurisdictional Authority.

E. Operation & Maintenance Manuals.

Six sets of the approved manuals, elevator installation, operation instructions, troubleshooting techniques and related equipment drawings and software (all publication must be in English) – two copies of which to be delivered to the WMATA/ELES Engineer representing of the Authority prior to installation. Each binder shall have the Binder Cover and Spine Insert which contain the Station Name and Unit ID.

Submit an additional electronic copy on Flash Drive(s)/CD(s). The Information shall be saved/presented as follows:

- a. Graphic images in “.dwg” AutoCad and “.pdf” formats. All revisions shall be made by

using computer software. Hand written changes are not acceptable.

b. Text in Microsoft Word .doc, “.pdf” or approved equal format.

The manuals shall include the following:

1. Complete operation and maintenance Instructions of the elevator equipment included complete illustrated, exploded views of all assemblies and a complete illustrated, exploded view for identification all system parts.
2. Complete nomenclature of replaceable parts, part numbers, current cost, and warehouse location. If product source is another vendor, Contractor shall include name and address of other vendor.
3. Furnish a summation, in tabular form, of all parts incorporated in the elevators supplied under the Contract. Include but not be limited to the following:
  - a. Nomenclature of part.
  - b. Contractor's part number.
  - c. Nomenclature of next higher assembly in which used.
  - d. Manufacturer and part number.
  - e. Model number of elevator on which used.
  - f. Total quantity.
  - g. Current unit price to the Authority.
  - h. Serial numbers of all serialized assemblies, subassemblies, motors, and other major components supplied and installed.
4. Control and schematic electrical wiring diagrams of controller including wiring of safety devices.
  - a. Wiring Diagrams shall be full size (11x17), ladder type, complete "as-built" wiring and single line diagrams showing the electrical connections, functions and sequence of operation of apparatus connected with each elevator, using standard symbols or proprietary symbols defined on the diagram, both in the machine room and in the hoistway, shall be furnished in duplicate for each elevator.
  - b. Wiring diagrams shall incorporate the wiring identification labeling to identify the controller and field wiring used for each circuit. Wiring diagrams shall have sheets numbered with an indication of the total number of sheets in the diagram set. Each page should include unit number where the diagram belongs to.
  - c. After approval, a copy of each print (11x17) shall be laminated and mounted with non-metallic holder in each elevator machine room. A reproducible .003 mil Mylar set of wiring diagrams for each elevator shall be delivered to ELES Engineering Office.
  - d. Coded diagrams are not acceptable.

5. Complete detailed drawings and wiring diagram of elevator system.
6. Lubricants, sealers, paints and any other potentially hazardous substances are subject to review and approval by the Authority.
  - a. Provide MSDS for all the lubricants/chemicals.
  - b. Provide manufacturer part number.
  - c. Provide name of the manufacturer.
7. Detailed lubrication and cleaning schedule.
8. Procedures for adjusting all elevator components.
9. Complete set of contract software including operating control software.
10. Detailed, record and as-built layout drawings.
11. The entire manual, all software upgrades and service tools for elevators shall be provided in an electronic format on Flash Drive/CD-ROM that is acceptable to the WMATA Engineering and Maintenance Department.
12. All hard copy publications shall be in loose-leaf form, on 30-pound paper and with punch holes reinforced with plastic, cloth or metallic material.
  - a. The O&M manual shall only contain information related to equipment installed under this contract. Generic information that does not pertain to the equipment installed shall not be included. Scanned documents are not allowed. The fonts should be standard format.
  - b. All covers shall be resistant to oil, moisture, and wear commensurate with their intended use. Diagrams and illustrations shall not be loose or in pockets. All printed material shall be capable of being reproduced on dry copying machines.
13. Each elevator shall be treated as a whole and not as a grouping of disassociated parts. The material in the Wiring Diagram Manual shall be organized and indexed by the elevator classifications included in this Specification. All manual sections shall be sub-divided, to the extent required by the subject matter, and shall include, but not necessarily limited to the following topics:
  - a. General system or sub-system description and operation.
  - b. Sequence of operation.
  - c. Replacement and step by step adjustment procedure for all components and systems.
  - d. Block diagrams.
  - e. Functional schematics.
  - f. Functional as-built wiring diagram.
  - g. Lubrication and cleaning, including frequency, methods, and trade identifications of recommended materials.
  - h. Component location and description.

- i. Inspection and maintenance standards including wear limits, settings, and tolerances.
  - j. Installation and removal sequence.
  - k. Test and evaluation procedures.
  - l. Spare parts lists and special tools.
14. The contractor shall provide all information: manuals, drawings, design changes, modifications, techniques, procedures and any other documents related to maintenance, safety, operations which relate to any part, component, system, subsystem or material and applicable to the elevator equipment. All operating, programming, control software and licensing keys (if applicable) to the PLC control system for the installation.
15. All of the above referenced shall be provided as it pertains to the original installation and for a period of ten (10) years after final acceptance of the elevator. During a ten (10) years period, In case of any items are obsolete or no longer available from the manufacturer the Elevator Contractor shall provide the alternative products.

#### **1.04 SYSTEM DESCRIPTION AND PERFORMANCE REQUIREMENTS**

##### **A. Design Requirements:**

##### **1. General:**

- a. Elevators furnished under this Contract shall be of the heavy duty automatic, hydraulic-type with direct-acting plunger.
- b. All parts shall be built to standard dimensions, tolerances, and clearances so that similar machines and devices supplied under contract are completely interchangeable. Elevators shall be designed with provision for thermal expansion and contraction of complete elevator assemblies and for any movement of the facility.
- c. Fasteners: Fasteners shall be compatible with materials being fastened. Fasteners shall be furnished with self-locking nuts or retaining rings (spring washers, toothed disks). Fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened. The mechanical fastening used throughout the equipment on parts subject to wear and requiring replacement shall be key and seat, nut, screw, or other removable and replaceable type not requiring physical deformation or field positioning. The use of rivets or similar devices will not be acceptable as mechanical fastenings for such parts.
- d. Doors of elevators shall be of the horizontal sliding type, single speed, center-opening. The doors shall be arranged for low-speed electric power operation.

##### **2. Capacity, Speed, Travel, Platform Size**

- a. All parts of the elevator equipment shall be of such design, size, and material as to satisfactorily function under all conditions of loading and operation within its rated load and speed, all with a proper factor of safety, maximum mechanical and electrical efficiency, and a minimum wear on parts.
  - b. Hydraulic elevators shall have sufficient capacity to lift the rated load at 150 feet per minute, with a tolerance of plus or minus 8.0 percent.
  - c. The rated load shall be exclusive of the weight of the complete car and shall be determined in accordance with ASME Code requirements for passenger-elevators required to carry freight, Class C3 (ASME A17.1 Section 2.16) or 4500 lbs, whichever is greater.
  - d. The travel, location, terminal floors, number of stops and openings, and the overall car platform size shall be as shown on the Contract Drawings.
  - e. The anticipated freight load (cart) will be approximately 4 feet-1 inch by 2 feet in plan, supported on four 8-inch wheels with 2-inch wide treads spaced approximately 2 feet-4 inches center-to-center longitudinally and one foot five inches center-to-center transversely. The loaded cart will weigh approximately 1,260 pounds.
  - f. The entrance of the cart into the elevator car will produce eccentric forces which, acting through the guide rails, will result in additional deflections and deformation on the hoistway. These deflections and deformations shall not exceed 1/16 inch and shall not be permanent.
  - g. The top enclosure shall be reinforced to support two men and capable of sustaining, without damage or permanent deformation, a load of 300 hundred pounds on any area one feet square and 100 pounds applied at any point. An emergency exit shall be installed in the car top in conformance with the Code.
  - h. In-ground (Holed) hydraulic elevator travel shall not exceed 36 feet.
- B. Performance Requirements
1. The elevators shall be designed for continuous operation seven days per week, 24 hours per day.
  2. Elevators shall be designed to be capable of operating with full specified performance capability while exposed to the climatic and environmental conditions described in the following paragraphs. In addition, during installation and until the beginning of scheduled maintenance service, the elevators will be subject to more extreme environmental conditions. The elevator shall be furnished the amount of protection necessary to prevent any damage to or deterioration of the elevators during this period.

- a. Elevators shall be designed to operate in dry bulb temperature range of  $-10^{\circ}\text{F}$  to  $140^{\circ}\text{F}$  and operate while exposed to the natural elements of weather, including sunlight, rain, snow, slush, salt; all condition of relative humidity, de-icing chemicals, debris, airborne dust, and corrosive elements.
  - b. The elevators shall have a special winter operation. The elevators shall be designed to operate in the event the outside temperature falls below a pre-established minimum value. The elevator contractor shall furnish and install the necessary timers and thermostat to accommodate the desired function
3. Sound Level: No elevator car or elevator power unit shall generate noise in excess of NC45 sound level. Measurement of noise shall be made at a point 3 feet from the hoistway, machine room entrances, and ventilation openings, either free running or under load. For multiple elevator installation, the noise measurements shall be made with only one (1) elevator unit in operation, but with the entire installation complete and in operating condition. An ambient level not to exceed forty-nine (49) decibels shall be maintained prior to units being turned on.
4. Hoistway Movement:
- Elevators shall be designed to sustain the load and operate with the following lateral movements of the hoistway structures:
- a. In any individual glazed area: 1/4 inch.
  - b. In total height of hoistway structure:
    1. Aerial and surface structures: 5/8 inch
    2. Underground structures: 1/2 inch
5. The elevator assembly shall be designed in a manner to avoid corrosion and galvanic action due to physical contact between dissimilar metals or due to other causes.
6. Reliability:
1. Each elevator shall be capable of operating at full load under any of the normal modes of operation at a level of availability of not less than 98 percent over a period of 365 days.
  2. Availability (A) is defined as the portion of normal operational time during which the equipment is available for use. Or

$$A = \frac{MTBF}{MTBF + MTTR}$$

Where:

$MTBF$  = Mean time between failure in days

= Operating time,  $t$  (in days) /Number of failures in time  $t$

*MTTR* = The average time in days required to restore an elevator to operation after a report of a failure.

B. Seismic Loads

1. In accordance with VA-USBC 2003, all structures shall be designed to resist the effects of earthquake motions.
2. The elevator shall be designed to comply with the seismic zone 2 requirements of ASME A17.1.

C. Make provision for and provide a closed circuit television camera (CCTV), in the elevator car(s) with the ability to monitor the CCTV from the Kiosk annunciator panel. Submit drawings for approval before fabrication.

- a. Provide electrical connections, through shielded traveling cables, between camera and the communications terminal block in machine room or pit.

D. Painting: The pit, pit walls and machine room floor shall be painted. All machine room equipment shall be given two coats of approved machinery paint. All new iron work shall be given one coat of rust- inhibiting paint.

E. Workmanship:

1. Joints shall be welded their full length and dressed smooth and flush on exposed surfaces. Spot welding shall be used where practicable in preference to screw or rivet fasteners.
2. Sheet metal materials shall be accurately rolled and leveled, and have smooth finish and uniform color. Joints shall be formed to a tight fit, with abutting edges flush, and shall be securely welded or riveted together in such a manner as to give strength equivalent to the solid sheet. Riveted construction shall have heavy reinforcement on the back, and no rivets shall show on exposed surfaces, Welds shall be solid and dressed flush, and holes for screws or bolts shall be drilled and countersunk.
3. Wrought work shall have joints milled to a tight even fit and, where possible, shall be made without screws. Square turns and comers shall be sharp, Curves and loops shall be true and without visible joints. Abutting members shall be welded, riveted or both. Similar bars shall be halved at intersections and wide bars shall be punched for the small bars to pass through.
4. The finished work shall be strong, rigid and neat, painted in appearance. Plane surfaces shall be smooth and free from warp or buckle. Molded members shall be clean cut, straight, and true. Miters shall be well formed and in true alignment. Fastenings shall be concealed from face side of the material.

G. Corrosion Protection: The contractor shall design the elevator assembly in such a manner to avoid corrosion and galvanic action due to physical contact between dissimilar metals or due to other causes.

## 1.05 PROJECT SITE CONDITIONS

- A. The project site premises shall be visited by the Contractor to thoroughly familiarize with all details of work and working conditions. All dimensions shall be verified in the field and by comparison with the station structural and finish (information) drawings and the Authority shall be informed of any discrepancy before ordering equipment or performing work. Coordination and proper relation of this work to the structure and to the work of all trades shall be performed.
- B. The elevator installer shall install all elevator wiring in the embedded conduit provided by other trades including that to the kiosk. Other trades will bring wiring for their services to either the elevator machine room or the elevator pit, terminated on a terminal block. The elevator installer shall extend wires from the terminal blocks to the appropriate location or device within the elevator enclosure or hoistway. Some of these circuits shall require shielded wires or separate isolated circuits.

### 1.06 WARRANTY

Warranty: Two (2) year warranty of construction shall start at Final Contract completion.

- A. The OEM shall warrant in writing that all equipment manufactured and installed under this specification, for a period of twenty four (24) months from the date of Final Acceptance by the Authority, be free of defects in design, materials, and workmanship, under normal use and service. Defective work shall be repaired or replaced at no additional cost to the Owner.
- B. The warranty shall include materials and labor necessary to correct defects.
- C. The warranty does not begin until all of the following requirements have been met.
  - 1. The Operations and Maintenance Manuals are accepted by WMATA.
  - 2. The required training has been completed to the satisfaction of WMATA.
  - 3. All field tests have been successfully completed.
  - 4. The acceptance testing has been successfully completed.
  - 5. The elevators are in service for passenger/public use.
  - 6. The State and local jurisdictions have inspected the elevators and issued the respective certificates of Operation.
  - 7. All spare parts have been delivered and received by WMATA.
  - 8. Any discrepancy identified by the ELES representative shall be repaired or replaced by the Contractor at no additional cost to the Authority.

### 1.07 OPERATION AND MAINTENANCE TRAINING

- A. Training: The Contractor shall develop and provide operation, troubleshooting and maintenance training in accordance with the General Requirements  
The following training requirements shall be met:
  - 1. Three days of classroom plus two days hands on training on the field shall be provided for 10 students per class. Six training session for a total of 60 students is required.
  - 2. Time and place of training will be determined by the Authority, but

must be completed no later than 30 days prior to the Final Completion.

3. Training shall be organized to make optimum use of the required maintenance and operation manuals including training for replacement of all parts contained in the Parts Inventory list.
4. At the completion of the first training session, a narrated and properly edited training video shall be submitted for the authority on DVD or flash drive. The video shall be taken by the professional camera operator with quality image and sound track and will be used for the future trainings. The video shall cover operation of the elevator, function of the devices, maintenance, adjustment procedures and troubleshooting. The following items shall be included as minimum requirements:
  - 1) Step by step adjustment procedure on the followings:
    - 1.1 Door operators, DCL, DOL, full door opening, and so on...
    - 1.2 Valve adjustment
    - 1.3 Car Leveling and adjustment of leveling sensors and vans
    - 1.4 Door: door interlock, proper pressure, restrictors ...
    - 1.5 Pump motor: belt tension and alignment
  - 2) General overview of major items:
    - 2.1 Packing:
    - 2.2 Piston:
    - 2.3 shut of valve
    - 2.4 Controller:
    - 2.5 Controller display:
    - 2.6 Hydraulic pump
    - 2.7 Hydraulic tank
    - 2.8 Door sills
    - 2.9 Guide rails
  - 3) Daily operation and sequence of operation
  - 4) Replacement and Installation of components:
    - 4.1 hydraulic packing
    - 4.2 door photo eye
    - 4.3 Hydraulic valve
    - 4.4 Door clutch
    - 4.5 Door pickup rollers
  - 5) Proper guide roller adjustment
  - 6) Verification of safety circuit
  - 7) Maintenance procedure and Frequency of maintenance
  - 8) Proper access of pit and top of car for inspection
  - 9) Proper test of fire service operation
  - 10) Proper lubrication of components
  - 11) Troubleshooting techniques
  - 12) How to use proper communication device, machine room, car top, and kiosk

5. Provide one additional copy of all required submittals to the ELES Engineer for Authority use.
  6. Provide two copies in DVD format of training materials along with visuals and handouts to the Engineer for the Authority use.
    - a. Video shall be narrative.
    - b. Video shall be separated by major components Sections
    - c. Equipment Identification shall be as a part of the section title.
  7. Separate training manual shall be submitted for approval prior the scheduling of the training. The O&M manual shall not be used as a training manual.
- B. Scope of Work
1. All training, as described below, shall take place prior to Final Acceptance of equipment or materials by the Authority. Operations and maintenance training may take place as a combined class by agreement of the Office of Elevators and Escalators (ELES). The minimum number of ELES employees to be trained will be no fewer than 60 total with a maximum of 10 per class. Those persons will be identified by WMATA. The contractor shall video tape all training sessions and provide WMATA/ELES with edited copy of the recording as stated above.
  2. Operations training shall be tailored specifically to the furnished and installed equipment, and designed to teach the day-to-day operation of all equipment. The training shall be sufficient to bring personnel to a level of operating proficiency such that routine vendor support is not needed.
  3. Maintenance Training shall be tailored specifically to the furnished and installed equipment, and designed to develop the knowledge and skills required to maintain all item(s) delivered.
  4. Maintenance training shall be subdivided into two major levels as follows:
    - a. System Level Maintenance Training, covering:
      1. Theory of operation of the system and its major components.
      2. System configuration.
      3. Preventative maintenance, consisting of written procedures and schedules for the periodic maintenance of all equipment.
      4. Written and validated inspection procedures and a system-level trouble-shooting guide (to the lowest field-replaceable unit).
    - b. Shop Level Maintenance Training, covering
      1. Detailed theory of operation to module, board, and/or device level.
      2. Component level troubleshooting and component replacement and adjustment.
      3. Testing and alignment procedures of repaired units.

C. Deliverables

1. The following course materials shall be delivered by the Contractor, according to the following specifications:
  - a. An Instructor's Guide containing all the information and direction necessary for the instructor to make an effective presentation. It shall include adequate guidelines to conduct a comprehensive training program. Individual lessons within the course shall be organized as separable blocks (or modules) which may be taught as a unit. The Instructor's Guide shall contain, as a minimum:
    1. Discussion of student prerequisites (if any).
    2. Program overview.
    3. A statement of overall program goals.
    4. Lesson plans (a session-by-session outline containing the following):
      - a. Student learning objectives, stated in measurable term
      - b. Overview of each lesson.
  - b. A Student Manual including all materials for the student to interact in the learning situation. It shall contain, as a minimum:
    1. Program overview and introduction.
    2. Statement of overall program goals.
    3. Learning objectives, stated in measurable terms that specifically describe desired behaviors or knowledge to be gained.
    4. A fully developed prose treatment (not outline format) of content presentation, developed in the same modular format as the Instructor's Guide.
    5. Illustrations, charts, photos and other graphics of actual system components as needed to enhance content presentation.
    6. The training manuals shall be prepared and submitted for approval to WMATA/ELES prior to training. The training manuals shall include procedures for adjustment and replacement of all electrical and mechanical components, and a troubleshooting guide.
  - c. Audio-visual Aids consisting of a narrated video of not less than 90 minutes duration to include, but not limited to, the following:
    1. General overview of major features.
    2. Daily operations.
    3. Maintenance procedures such as lubrication, adjustments, critical measurements, etc.

4. Frequency of maintenance procedures.
  5. Parts replacement such as safety devices, lighting, etc.
  6. Verification of safety circuits, methods of accessing and preserving computerized functional data if required.
  7. Step by step adjustment procedures and installation of components.
  8. Handouts, transparencies and/or slides as necessary to ensure clear and comprehensive presentations.
  9. The training video shall be taken from actual equipment installed under this contract by the professional camera operator
- D. Supplemental Materials consisting of a functional mock-up or a functional representation is required of any equipment that requires theoretical discussion. This may be in the form of an animated schematic, a model of the equipment, an actual device, an interactive video training device, or an Authority approved substitute. All mock-ups shall become the property of the Authority for eventual turn over to WMATA/ELES.
- E. The final copies shall be delivered to the Authority as follows:
1. One complete set of training materials that is completely camera-ready. Camera-ready copy is defined as typewritten or typeset originals or high-quality copies such that further copies can be made from them with no noticeable decrease in copy quality.
  2. Five copies of all student and instructor materials, to be used for archival purposes, in the WMATA ELES Technical Library.
  3. A set of complete student materials including training manuals for each participant enrolled in training classes. The O&M manual, training manuals and special tools shall be approved by the Engineer and delivered to the Authority for eventual turn over to WMATA ELES.
  4. The contractor shall video record all training sessions and provide WMATA/ELES with edited DVD copy of the recording to be used as training guide for other WMATA ELES employees.
- F. The following specifications shall be met in instructional delivery:
1. Instructor Qualifications. A description of instructor qualifications, a resume, curriculum vitae, or other description of instruction qualifications must be submitted at least 60 days prior to the presentation of training. The description shall document a thorough knowledge of the equipment being taught, an understanding of the adult learning process, and demonstrated experience in vocational instructional. The ELES Engineering Office will review and approve the Instructor candidacy.
  2. Course length - The length of the course shall be 5 working days with 3 days in the classroom and 2 days hands-on training.

3. Student qualifications - For the purposes of course development and presentation, vendors shall assume all WMATA students are high school graduates (or equivalent), and that maintenance personnel will possess the ability to use basic hand tools and electronic test equipment.
4. Testing. Instructors must give written and/or practical tests as a measuring device to determine knowledge transference. Tests shall use a multiple-choice or short answer format, and have been validated in a pilot course or by some other means agreed to by the Authority and Contractor. Whenever possible, a practical hands-on test shall be developed to demonstrate the transference of operational/ mechanical skills.

**1.08 SPARE PARTS AND SERVICE FACILITY**

**A. Spare Parts**

At the expiration of the warranty requirements of the General Provisions, the Contractor is responsible to provide a source for spare parts and service facility in the United States which can be obtained for an additional five years. If product source is another vendor, Contractor shall include name and address of other vendor.

1. The Contractor shall propose and provide a spare parts inventory to be approved by the Engineer and provided to the Authority not less than 90 days prior to scheduled completion, equal in value to seven percent of the cost of each elevator.
2. This provision requires the furnishing of a Recommended Spare Parts and Special Tools List based on manufacturer's recommendations, defines criteria to be used by the Contractor in developing spare parts recommendations; defines the manner of identifying spare parts on the list and the labeling and identification of spare parts upon delivery; and the timing of delivery of spare parts.
3. Elevator parts list, grouped by system and subsystem for stocking identification and the list shall contain the following information for each item listed:
  - a. Component name and Part number(s)
  - b. Manufacturer's name
  - c. Model number(s)
  - d. A blank column for WMATA's part number
  - e. Manufacturer's recommended quantity (see Section 1.08A.4 below)
  - f. Anticipated annual usage
  - g. Unit price
  - h. Special storage and handling requirements
4. The manufacturer's recommended quantities shall be based upon the following reliability, usage and lead time considerations:

- a. Wear: Components which may be expected to require replacement under normal maintenance schedule and operations, such as mechanical parts subject to continuous operation within projected mean time between failure levels.
  - b. Consumables or Expendables: Components which are consumed, used up, destroyed, or upon failure, are otherwise made usable for their intended purpose and are economically unrecoverable except for inherent scrap value.
  - c. Recoverable or Repairable: Components which, upon failure, are capable of being repaired or remanufactured to a serviceable, operational condition and maintained available for use within their initial intended purpose.
  - d. Long Lead: Components that are not available from commercial distributors or within 48 hours from the manufacturers such as specifically made or selected components.
5. Cross referencing: Where replacement components are common to more than one system or subsystem, include a cross reference and indexing system in the replacement components list:
  6. Non-Unique parts: In all components lists, items that are not unique to the system and have been manufactured by others shall be identified by the manufacturer's name and part number.
  7. WMATA will provide the Elevator Contractor with shipping instructions, with WMATA part numbers for each item the Elevator Contractor is required to furnish.
  8. The parts shall be shipped to the locations as directed by the Authority. Shipping documents shall identify the Contract number, manufacturer's part number, quantity, unit price and WMATA part number.
  9. Spare parts shall be properly packaged or crated so as to prevent damage during shipment and long-term storage. An individual packing slip shall be included inside the package or crate.
  10. Spare parts shall be the same in all respects as their counterparts furnished as a part of the assembled equipment to be delivered.
  11. Parts furnished in accordance with this provision are WMATA spares, separate and distinct from any Contractor obligation to replace parts, components or assemblies under any warranty provision.
  12. Parts lists contained in Operations and Maintenance Manuals provided under the Contract shall include assigned WMATA part numbers.
  13. A Manufacturer's Recommended Spare Parts List shall be provided. Parts to be provided shall be based on the criteria described herein and require Authority approval and shall be provided prior to Final Acceptance.
  14. Any Special Tool(s) used including, but not limited to, troubleshooting, maintaining the elevator, software and/or hardware shall be provided as part of the spare parts to the Authority. Any tools provided shall be the

same as those issued to the Adjuster and equivalent members of the subcontractor's staff.

- B. The finished elevator installations shall be completely barricaded and enclosed to preclude their use without permission of the Contractor until Final Acceptance and release by the Contractor for general use. The enclosure shall be fabricated to allow easy access for maintenance, testing and adjustment.
- C. The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room, and ensure that it shall remain secure at all times until the completion of the Contractor's interim maintenance obligation.

#### **1.09 SPECIAL TOOLS**

- A. A complete set of special tools and instruments necessary for troubleshooting, maintenance, repair and making all adjustments on every part of the elevator installation, including software and hardware shall be furnished for each elevator and delivered to the Engineer as part of the spare parts inventory. Tools that are designed specifically for tasks associated with elevator inspection, maintenance and repair or that are required for these tasks, and are not readily available through normal purchasing channels are defined as special tools.
- B. Any "Special Tool/ equipment" that is required to troubleshoot, maintain, adjust, and test the system; the tool/equipment shall remain operational for the life of the equipment.
  - a. Provide all special tools and equipment necessary for making all system adjustments to the signal and speed controller and door equipment. A programming unit, approved by equipment manufacturer (OEM) such as a new laptop with 4GB memory, 15-inch display and DVD drive, with all software packages required to setup and program all equipment in the elevator system shall be provided, one per station or location. Software shall be provided for the display unit, DeviceNet, hoist motor drive, if applicable, and any other programmable devices, as well as for the controller PLC. Any hardware or software required for configuring, programming and or communicating to controller or any parts of the elevator shall be submitted to ELES engineering. Using the provided laptop, the contractor shall demonstrate loading, downloading (programming) any and all software that is required for the elevator for all operating needs. This includes display, PLC and any I/O controls. All special tools shall be new and to be provide with casing. No special tools with decaying circuits or clocks are permitted.
- C. Keys: Provide ten (10) sets of keys per elevator to operate all keyed switches and locks prior to completion of the first unit.

#### **1.10 AUTHORITY COORDINATION:**

The elevators shall not be in service for passenger/public use until all of the following requirements have been met.

1. The Operations and Maintenance Manuals have been approved and received by WMATA.
2. The Training and Student Manuals as well as video record of all training sessions have been approved and received by WMATA
3. The required training has been completed in accordance with this specification.
4. All field tests have been successfully completed.
5. The acceptance testing has been successfully completed.
6. All spare parts have been delivered and received by WMATA.
7. All Special Tools/Equipment and Software have been delivered and received by WMATA.
8. All discrepancies identified by the WMATA's CEI (Certified Elevator Inspector) representative shall be completed.

## **PART 2 – PRODUCTS**

### **2.01 MANUFACTURERS**

The major elevator components shall be the products of one of the three manufacturers of established reputation, except they may be the products, either wholly or in part, of another manufacturer of established reputation provided such items are capably engineered and produced under coordinated specifications to ensure a high grade, safe, and smooth operating system. Also, the major components to be furnished for this project shall be of a make or makes that have performed satisfactorily together under conditions of normal use for not less than one year in at least two other elevator installations of equal or greater capacity and speed.

### **2.02 MATERIALS**

#### **A. Stainless Steel**

1. Shapes and Bars:
  - a. ASTM A276, Type 304 or 301 for non-exposed components, and Type 316, all finish panels and exposed components.
2. Plate, Sheet, and Strip
  - a. Over 1/8 inch, ASTM A264 with ASTM A240, Type 316 on ASTM A36 base;
  - b. Under 1/8 inch, ASTM A167, Type 304, Type 316, for all finish panels and exposed components.
3. Stainless steel finish shall be NAAMM NO.4 with vertical grain.
4. Stainless steel screws, bolts and nuts shall be used for fastening and shall be AISI Alloy 303.

#### **B. Steel Sheet and Steel Fabrications**

1. Steel sheet for top enclosure shall be minimum 12-gauge.

2. Steel sheet for hoistway door frame shall be minimum 12-gauge.
3. Steel sheet for corrugated floor decking shall be minimum 10-gauge.
4. Steel sheet for subfloor shall be minimum 3/8-inch thick.
5. Galvanized steel material shall comply with ASTM A123, ASTM A153, and ASTM A653 (G90 Coating) as applicable. All steel sheet and steel fabrications, except lubricated machinery parts, which are not shown or specified to have other applied finishes, shall be galvanized.

C. Steel Finishes

1. Where visible to the public, steel surfaces shall have a baked enamel finish unless otherwise shown.
  - a. Color shall meet the requirements as shown in the finish schedule on the contract drawings.
  - b. Baked enamel finish shall consist of a thorough hot chemical cleaning process, a six-step zinc-phosphate process, two prime coats, and one finish coat of sprayed acrylic enamel (1.25 mils thickness minimum), baked at 350°F for a minimum of 30 minutes.
2. Fasteners

Fasteners securing removable sheet metal materials shall be operable with the aid of simple tools and concealed wherever possible. When the framework to which the metal is fastened is less than 1/4-inch thick, steel backup plates 1/4-inch thick shall be added with tapped holes and clearance holes where necessary. Exposed fasteners shall match the color and finish of the material being fastened, and shall be tamperproof flat-head machine screws of a captive screw fastener design.

- a. Fasteners shall be compatible with materials being fastened.
- b. Fasteners shall be furnished with self-locking nuts or retaining rings (spring washers, toothed disks).
- b. Fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened.

**2.03 EQUIPMENT AND COMPONENTS**

- A. The hydraulic elevator drive shall be of the oil-electric type with direct-acting plunger, power unit, oil storage tank, and control equipment. The power unit, storage tank, and associated control equipment shall be mounted in the machine room.
  - 1. Cylinder and Plunger:
    - a. The cylinder and plunger unit shall be designed and constructed in accordance with the applicable requirements of the ASME Code and other applicable codes. It shall be of sufficient size to lift the gross load to the height specified and shall be factory-tested at a pressure of 400 psi. Gray cast iron or other brittle materials shall not be used in the construction of the cylinder and plunger unit. The cylinder shall be coated on the outside to prevent rust and corrosion. The bottom of the cylinder shall be closed and the top provided with an internal guide bearing and a cylinder head. The cylinder head shall be equipped with an adjustable packing gland designed to effectively prevent leakage of oil. A scavenger pump shall be provided to return oil to the system. It shall be located so as not to obstruct the path between the pit entrance and the cylinder.
    - b. The packing gland shall be constructed to permit easy repacking.
    - c. The cylinder shall be provided with a means to release air or other gas and shall have a drip ring below the packing gland to collect all oil leakage.
    - d. The cylinder shall be secured to a support, provided by the Contractor, which will transfer and distribute the load to the floor of the hoistway pit.
    - e. Plunger of built-up construction shall be secured to the car platform by means of a suitable platen.
    - f. Plunger shall be designed to prevent its leaving the cylinder.
    - g. The cylinder shall be isolated from soil, ground water, pit channel, building structure and other sources of possible corrosive or galvanic damage by being installed in a PVC casing with the area between the cylinder and the casing left empty and free of water and oil.
    - h. The cylinder shall be coated with corrosion-rust resistant primer and painted with a dark gray industrial epoxy or other approved paint.
    - i. The top of the cylinder shall be jointed to the PVC liner by a victaulic coupling forming a sealed unit.
  - 2. Well Hole and Casing
    - a. Well Hole and Well Hole Casing

1. The well hole shall be plumb enough to provide a plumb installation of the PVC inner casing and pressure cylinder.
  2. The well hole outer casing shall be installed to retain the well hole for installation of the PVC casing and pressure cylinder.
  3. The well hole casing shall be 3/8" thick welded steel pipe.
- b. PVC Casing:
1. The PVC casing inside the well casing shall be ½-inch thick minimum, water tight and free of any liquid or debris after being installed plumb in the well hole.
  2. Exterior surface of casing shall be cleaned prior to application of solvent welding material to ensure watertight connections.
  3. The PVC casing shall be capped with PVC to prevent liquid and debris from getting in the area between the PVC casing and the cylinder.
  4. The PVC casing shall be capped at the bottom.
  5. Provide top of PVC with a PVC pipe coupling connecting with cylinder victaulic coupling.
  6. A PVC pipe shall be installed in the PVC casing to allow installing hydraulic piping to the cylinder. The PVC casing shall be secured at its base relative to the outer casing. Gaps between the PVC and outer casing may be filled using clean, dry backfill or other approved material.
  7. An electronic monitoring device shall be installed to detect the presence of oil or water in the PVC casing. A "Liquid in Casing" alarm signal shall be provided to the elevator controller for display on the fault display and transmitting to the remote monitoring system.
  8. An evacuation tube with an evacuation port shall be provided between the PVC liner and the cylinder.
3. Cathodic Protection
- a. The cathodic protection shall be provided for cylinders and piping and shall be provided by dielectrically isolating the cylinder and piston from the car platen, pit support structure, and pressure piping.
  - b. Gaskets and pads for dielectric insulation shall be neoprene or approved alternative. Insulating sleeves, washers, and oil line coupling shall be provided where specified or shown.

4. Power Unit
  - a. The power unit shall consist of a screw-type or gear-type oil pump driven by an electric induction motor with oil control valves, combined in a self-contained unit fabricated of structural steel. Power unit drive motor is specified under Electrical Work (See Section. Submersible units will not be accepted.
  - b. The oil pump shall be especially designed and manufactured for hydraulic elevator service. It shall be designed for a steady discharge with minimum pulsation to give smooth and quiet operation. The pump shall be of proper size and shall deliver oil into the cylinder in sufficient quantity and pressure to lift the elevator car with specified load at specified speed. During downward trip of elevator, the oil shall be returned to the tank by gravity.
  - c. Geared pumps, when used, shall be provided with accurately cut herringbone or helical gears. The gears shall operate under flooded suction in an accurately machined case with close clearances to assure maximum efficiency. An effective strainer shall be provided in the suction line to the pump. The power unit shall be equipped with a vibration isolation device suitable for use with and approved by the power unit manufacturer. The vibration isolation shall effectively prevent the transmission of power unit vibration to the machine room structure.
5. Piping, Fittings, and Couplings
  - a. Piping, fittings, and couplings shall be furnished and installed between the storage tank, pump, muffler, valves, and cylinder complete with necessary supports.
  - b. All connections between the discharge side of the pump, check valve, muffler, cylinder, and lowering valves shall be of rigid steel with screw, flanged, welded, or approved mechanical couplings.
  - c. Pipe supports shall be provided within 12-inches of every change of direction in piping.
    1. Supports shall not be more than 10-feet apart.
    2. Secure vertical runs properly with iron clamps at sufficiently close intervals to carry weight of pipe and contents and provide supports under pipe to floor.
    3. Furnish and install all piping from remote machine room to hoist way, including necessary supports and/or hangers.
  - d. Size of pipe and couplings between cylinder and pumping unit shall be such that fluid pressure loss is limited to 10 pounds.
  - e. Mechanical couplings, when used, shall be of a self-centering type that provide for some degree of deflection, contraction, and expansion.

1. Couplings that provide for partial or full separation of the two sections of piping being connected are acceptable, provided all other specified requirements are met.
  2. Couplings shall be rated for a pressure at least three times the working pressure of the elevator and shall be so designed that failure of the flexible sealing element or gasket shall not permit the separation of the parts connected.
  3. Flexible sealing elements or gaskets shall be of a type and material suitable for use with the hydraulic fluid furnished.
- f. Where piping, fittings, and couplings supplied by the Contractor are contained within sleeves, conduit, trenches, troughs, or other passage means provided by others to allow for the connection of the power unit with the cylinder and plunger, the Contractor shall provide appropriate devices which shall effectively prevent the transmission of vibration to the surrounding structure.
- g. The Contractor shall install all piping, fittings, and couplings used to connect the power drive to the cylinder and plunger in such a way that these may be removed and replaced at a future date. When Victaulic is used, there shall be access for inspection and maintenance. Destruction of portions of these items in the process of removal is acceptable but efforts shall be made in the designs to minimize the necessity to destroy items.
6. Valves
- a. Valves shall be of the unitized manifold type with no more than four solenoids and arranged so that all adjustments are individually adjustable without the need for sequential readjustment. Valve shall be designed to ensure that oil flow will be controlled in a positive and gradual manner, thereby ensuring smooth starts, operation, and stops of the elevator car.
  - b. Valves shall be designed for quiet operation and shall be mounted above the storage tank in a manner that allows leakage to drain back to the tank.
  - c. A safety check valve shall be provided which will function to hold the elevator car with rated load at any point when the pump stops or the maintained pressure drops below the minimum operating pressure required holding the car in place.

- d. A manually operated lowering valve shall be provided, which shall permit the manual lowering of the elevator car in the event of power failure. The location of the lowering valve and access to it shall be described in white stenciled lettering on the front panel of the pump unit. The lowering valve operating means shall be easily and readily accessible and unobstructed by the valve wiring, conduits or other equipment. A tank shut-off valve shall be provided to permit isolating the oil in the tank during maintenance operations. The location and orientation of the valve shall allow for safe operation of the handle throughout its range of travel.
  - e. All additional pump relief valves and other auxiliary valves required by the ASME Code or necessary to provide smooth, safe and satisfactory operation of the elevator shall be furnished and installed.
  - f. Any relief valves having exposed pressure adjustment shall have their adjustment sealed after being set to the correct pressure.
  - g. Manual shut-off valves shall be provided in the hydraulic oil line in the elevator pit and in the elevator machine room. In any portion of its travel, the machine room shutoff valve handle shall not intrude in the walk space or work space or obstruct access to other equipment.
7. Storage Tank
- a. The storage tank shall be constructed of steel and shall be provided with a steel cover, protected vent opening, overflow connection and a valve drain connection. Tank shall act as a storage tank only. Suitable gauge glasses shall be provided if the top of the tank is over 4 feet above the floor. An initial supply of oil sufficient for proper operation of the elevator shall be provided. The tank shall have a capacity equal to the volume of oil required to lift the elevator to the top terminal plus a reserve of not less than 10 gallons.
  - b. The oil storage tank cover shall be arranged for easy unobstructed access. Clearance of 24 inches vertical and 18 inches horizontal from tank cover shall be maintained for ease of service.
  - c. The permissible minimum liquid level shall be clearly indicated. The manufacturer's recommendation of type of oil to be used shall be included in the written instruction for the care, adjustment, and maintenance of the equipment. The flash point of oil used shall be not less than 400 degrees F.
  - d. Provide an oil filtering system that removes contaminants that can clog valves and settle in the bottom of the tank.
8. Blowout-proof foil-hydraulic muffler of an approved make shall be furnished and installed in the oil line near the power unit to reduce noise to a minimum.

9. Oil Temperature Control/Tank Heater: Hydraulic oil viscosity/temperature control shall be provided by the application of an internally mounted, thermostatically controlled, tank heater. The oil temperature shall be maintained at a maximum 110 degrees Fahrenheit with the use of a 120 VAC powered tank heater. Unit shall be permanently mounted, integral with oil reservoir, and with a lighted switch/indicator to visually confirm unit is powered. Tank heater shall include the switch for disconnection of power during maintenance/repair operations. Unit shall be hard wired to electrical source per ASME A17.1.
  10. Elevator Car Buffers: Heavy-duty spring buffers shall be provided, mounted on the supporting channel or block on the pit floor. The buffers shall comply with the requirements of the ASME Code. Buffer anchorage at pit floor shall be arranged to avoid damaging the waterproofing.
  11. Car guides consist of a guide rail and guide-rollers. Guide rails for the elevator cars shall be of planed steel standard T-section. Guide rails shall be erected plumb and parallel with a maximum deviation of 1/8 inch and shall be securely fastened to the bracket or other supports by approved heavy rail clamps.
  12. Car Roller Guides:
    - a. The elevator car shall be provided with roller guides.
    - b. Roller guides shall be spring-loaded and allow rail-to-rail and front-back adjustment of the rollers.
    - c. Three or more rollers per guide and shall have 4-inch minimum sound-deadening wheels.
- B. Operation:
1. Operation shall be automatic. Automatic operation by means of car and landing buttons. Stops registered by momentary actuation of car buttons to be made irrespective of number of buttons actuated or of sequence in which buttons are actuated.
  2. Operating station in car containing bank of buttons numbered to correspond to landing served position indicators. EMERGENCY CALL button, keyed EMERGENCY STOP button, DOOR OPEN/DOOR CLOSE buttons, independent maintenance key switch, and key-operated light and fan switches, with legends as specified. Identification as specified for emergency telephone. Emergency call button connected to bell that serves as emergency signal. Panel finish: Stainless Steel.
  3. Landing: Single push-button fixture at each terminal landing. Button fixture having push buttons with UP and DOWN legends at intermediate landing. Button identification as specified for Person with disabilities per latest ADA regulation (ADA rule 4.10.3).
  4. Momentary pressure on car button or landing button illuminates that button, which remains illuminated until call is answered. Illuminated buttons serve as visual indication that call has been registered and that car will stop at that landing. The Push Buttons shall be flush, round, have a Metalized Halo and center jewel. The metalized halo shall be from different color and approved by ELES Engineer.

5. Stops, registered by momentary actuation of landing buttons. All stops subject to respective car or landing button being actuated sufficiently in advance of arrival of car at that landing to enable stop to be made. Direction of travel for idle car established by first car or landing button actuated.
6. UP landing calls answered while car is traveling in up direction and DOWN landing calls answered while car is traveling down, car reversing after uppermost or lowermost car or landing call has been answered and proceed to answer car calls and landing calls registered in opposite direction of travel.
7. Elevators to park at the secure landing level selected by the Engineer.
8. Push-button units to be Dupar US85 or approved equal with button identification as specified by latest ADA regulation.
9. Emergency-stop shall be key operated rather than push-pull arrangement with key removal only in off position.
10. All elevator car control panel operating devices shall be designated by Braille and by raised standard alphabet characters for letters, Arabic characters for numerals, and standard symbols as required by the Code and ADAAG.
11. Lettering shall have a highly visible coloring, such as white, that is permanently affixed.
12. Independent Service: Provide a key switch in the car operating panel which, when actuated, shall cancel previously registered car calls, disconnect the elevator from the hall buttons and allow operation from the car buttons only. Car door shall remain open unless closed fully by the door close button.
13. Two-Stop Collective Simplex Automatic Operation:  
The two-stop collective simplex automatic operation shall be used and checked for the following:
  - a. System shall be designed so that when the car is standing at either terminal landing, pressure on car button for the other terminal shall automatically dispatch car to that landing. Pressure of landing button at either terminal landing shall call car automatically to that landing. If a landing call is registered while the car is making its trip, that call shall remain registered until the car responds to that call. If no car calls are registered car shall start automatically and respond to hall calls. Provide time limit relay arranged to hold car at landing at which it has stopped for predetermined time after car stops. After all car landing calls have been answered, car shall remain parked at landing where last used with car and hoistway doors closed until another call is registered. Pressing the landing button at floor at which car is parked shall automatically open car and hoistway doors. In all normal operations, the starting of the car shall be contingent upon establishment of hoistway door interlock and car door circuits.

- b. Automatic dispatching operation: all two stop elevators shall include "Step-in-and-Go" feature. Calls for the opposite landing will be automatically set when the elevator opens its doors for a hall call. This feature shall be provided for all elevators that have public access for two stops (i.e., any elevators with key operated service landings will be included).

C Position Indicators:

1. Car indicator: In accordance with ADA requirements. Mounted in vertical row in car-operating panel to show position of car in hoistway by illumination of indicators corresponding to landing at which the car is stopped or passing. Finish for exposed-to-view metal components: Stainless Steel.
2. Landing indicator: In accordance with ADA requirements. Two-element direction-of-travel indicator mounted above call station or hoistway entrance as shown, including one red and one white indicator. Direction of car's operation shown by illumination of red indicator for DOWN and white indicator for UP.
3. In-car signals: Audible signal indicating car's direction of travel, signal sounding once for UP direction and twice for DOWN direction.
4. Landing signals: Audible signal at each hoistway entrance indicating car's direction of travel, signal sounding once for UP direction and twice for DOWN direction.

D. Lighting:

1. Machine Room Emergency Lighting: Emergency lighting shall be provided in each elevator machine room.
  - a. There shall be a minimum of one lighting fixture.
2. Car interior: LED fixture, 120-volt operation, with clear prismatic glass diffuser, flush mounted in ceiling, cool white bulbs. Illumination level shall be 15-foot candles minimum at car operating panel.
3. Car top and underside of car floor: Medium-base porcelain lamp receptacles, with wire lamp guards.
4. Car Emergency Lighting:
  - a. Fixture: Recess mounted, with stainless steel frame, location as shown.
  - b. Diffuser: Prismatic polycarbonate plastic.
  - c. Lamps: Two, size 16-51
  - d. Remote power supply:
    - 1) Power pack: Sealed gel cell battery with integral regulating charger and an alarm bell.

- 2) Capable of operating bell for one-hour minimum and light at car-operating panel at 0.2 low candles minimum for four hours minimum.
  - 3) Location: in top of car or COP with easy access provided.
- E. Inspection Operation: Key switch in car to nullify car and landing buttons permitting operation of elevator from top of car for inspection purposes:
1. Top of Car Inspection Station: The Inspection Station contains continuous pressure UP and DOWN buttons, emergency stop button and toggle switch to activate inspection devices. The device shall also have an 110v ac outlet for extension cord and provided with a light and guard.
- F. Leveling: Automatic leveling device to stop car within 1/8 inch of landing level regardless of load or direction of travel. Landing level maintained within leveling zone irrespective of hoistway doors being open or closed.
- G. Emergency Service:
1. Controls to return elevator to designated floor by means of key-operated switch outside street or ground floor hoistway entrance in compliance with ANSI/ASME A17.1.
  2. In-car control during emergency operation by means of key switch in compliance with ANSI/ASME A17.1.
  3. Terminals on elevators controllers for connection of circuit from heat and smoke sensing devices, with wiring from sensing devices to elevator controller.
- H. Telephone Facilities:
1. Provide all audio/visual communication, signaling, and monitoring in accordance with ADA and ANSI. "Hands-free" phone integral with control panel, mounted in accordance with ADA requirements; having inscription EMERGENCY TELEPHONE as specified for Person with disabilities; finish exposed-to-view components to match stainless steel control panel; color of letters to contrast with panel.
    - a. Provide emergency communicators in accordance with ADA requirements to include auxiliary push button to summon help and visual feedback indicating that the call has been responded to.
  2. Provide wiring and jacks for a portable self-contained battery-powered maintenance telephone system. Jacks shall be located on car top, inside car, and in machine room. Furnish three telephone instruments for use of maintenance personnel.
- I. Electrical Equipment:
1. Electric equipment for elevator shall be designed, selected, and fabricated in accordance with NEC, NEMA, IEEE, ANSI Standards, applicable jurisdictional codes, and additional specified requirements. All equipment including motors, controllers, service cabinets, circuit breakers, switches, panelboards, indicators, lighting, wiring, conduit, boxes and other appurtenances for proper installation and operation of the elevator shall be furnished and installed by the Contractor.

2. Cable and wire for external circuits between the various items of elevator equipment, exclusive of the traveling cable, shall comply with the requirements specified below. The talk pair of the voice communications intercom system shall be shielded with 0.008-inch, minimum, copper shield.
  - a. General Requirements for Single-Conductor and Multiple-Conductor Cable:
    1. Type and size: As shown or as required by code.
    2. Rated voltage: 600 volts.
    3. Conductors:
      - a. ASTM B3 or ASTM B8 annealed copper
      - b. Size 10 AWG and smaller: Solid or Class B or Class C stranded.
      - c. Size 8 AWG and larger: Class B stranded.
      - d. Other constructions as specified.
    4. Standards: Except as modified, wires and cable complying with the following:
      - a. Cross-linked polyethylene (XLPE) insulated cable: NEMA WC 70.
      - b. Other cable: NEMA WC 70.
    5. Nonmetallic jacket for single-conductor cable and individual conductors of multiple-conductor cable and as overall covering on multiple-conductor cable:
      - a. Chlorosulfonated polyethylene, or cross-linked polyolefin.
      - b. Cross-linked polyolefin complying with the following physical requirements.
    6. Properties tested in accordance with NEMA WC 70 if ethylene-propylene-rubber (EPR) insulation is used, or with NEMA WC 70 if cross-linked polyethylene insulation is used. Jacket material free of PVC and PVC-based compounds.
      - a. Tensile strength, minimum pounds per square inch: 1,800.
      - b. Elongation at rupture, minimum percent: 150.
      - c. Aging requirement: After 168 hours in air oven test at 100EC, plus or minus one degree C:
        - a) Tensile strength, minimum percentage of unaged value: 100.
        - b) Elongation at rupture, minimum percentage of unaged value: 80.

- d. Oil immersion: 18 hours at 121EC, plus or minus one degree C, ASTM D471, Table 1, No. 2 oil:
    - a) Tensile strength, minimum percentage of unaged value: 80.
    - b) Elongation at rupture, minimum percentage of unaged value: 80.
    - c) Jacket materials other than cross-linked polyolefin complying with NEMA WC 70. Jacket material free of PVC and PVC-based compounds.
  - e. Flame retardancy: Single-conductor and multiple-conductor cable demonstrating flame retardancy in accordance with the following:
    - a) Single-conductor cable and individual conductors of multiple-conductor cable passing vertical flame test in accordance with UL 1591 or NEMA WC 70. Cable size for testing: 14 AWG.
    - b) Single-conductor and individual conductors of multiple-conductor cable passing vertical tray flame test using ribbon gas burner in accordance with IEEE 1202.
    - c) Multiple-conductor cable passing vertical tray flame test, using ribbon gas burner in accordance with IEEE 1202.
  - f. Applied voltage testing:
    - a) Single-conductor cable and individual conductors of multiple-conductor cable to be given applied ac voltage dielectric strength test, i.e., six-hour water-immersion test.
    - b) For single conductors of multiple-conductor cable, conduct tests prior to assembly as multiple-conductor cable.
    - c) Test procedures:
      - (a) Polyethylene insulated conductors: In accordance with NEMA WC 70
      - (b) Other conductors: In accordance with NEMA WC 70.
- b. Single-Conductor Cable:
- 1. Insulated with ethylene-propylene-rubber with non-metallic jacket or unjacketed filled cross-linked polyethylene. UL-labeled Type RHW or XHHW.

2. Color coding: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
- c. Multiple-Conductor Cable:
1. Individual conductors:
    - a. Number of conductors: As shown or as required by code.
    - b. Construction: Complying with one of the following:
      - a) Insulated with ethylene-propylene-rubber, with or without nonmetallic jacket as specified.
      - b) Insulated with composite compound of ethylene-propylene-rubber and polyethylene, UL Class EPCV, without outer jacket.
      - c) Insulated with filled cross-linked polyethylene without jacket.
    - c. Phase and neutral conductors: Individually insulated.
    - d. Neutral conductors: Same size as phase conductors.
    - e. Bare ground conductors: Sized in accordance with the NEC, unless otherwise shown.
    - f. UL-listed as Type RHW or XHHW.
  2. Conductors assembled with non-wicking, flame-retardant filler to form cable of circular cross section.
  3. Metallic-sheath: Provide one of the following
    - a. Continuous smooth aluminum sheath in accordance with NEMA WC 70.
    - b. Continuous corrugated aluminum sheath in accordance with NEMA WC 70.
    - c. Interlocked aluminum tape armor.
    - d. Multiple-conductor cable provided with overall nonmetallic jacket as specified.
    - e. Cable UL-listed as follows: Metallic-sheathed cable: Type MC, suitable for wet and dry locations.
  4. Color coding:
    - a. Power cables: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
    - b. Control cables: In accordance with NEMA WC 70
- d. Fixture Wire: UL 62, with the following additional requirements:

1. Type: Suit temperature rating of lighting fixture, minimum 194EF.
  2. Conductor: Stranded copper conductor 16 AWG or larger as shown.
- e. Bare Conductor: ASTM B3 or B8, annealed copper conductor; 8 AWG and larger, class B stranded.
3. Traveling Cable
  - a. The elevator car traveling cable shall be type ETT conforming with the requirements of the NEC with minimum conductor sizes as specified in the NEC. Individual conductors in the cable shall have a distinctive color code for identification. Each traveling cable shall have one two-conductor stranded 18 AWG, twisted shielded pair for elevator intercom and a minimum of ten spare conductors. Traveling cable exceeding 100 feet in length shall have steel supporting fillers. Traveling cable 100 feet or less in length shall have steel or non-metallic fillers.
  - b. For surface elevators only, the traveling cable shall be provided in addition to the above requirements, with one RG-6u coaxial cable, and one two-conductor, twisted shielded pair, stranded 18 AWG power cable for CCTV camera.
4. Connector, Terminal Lugs and Fittings
  - a. In accordance with UL 486.
  - b. For 10 AWG and smaller conductor cable: Tin-plated copper pressure connectors with nonflammable, self-extinguishing insulation grip with temperature rating equal to that of conductor insulation.
  - c. For 8 AWG to 4/0 AWG conductor cable: Tin-plated copper compression connectors and terminal lugs with insulating sleeve or heat shrinkable insulator for insulation grip.
  - d. For multiple-conductor cable: Watertight aluminum fittings with stainless steel pressure ring and set screws or compression cone for grounding of aluminum sheath of Type MC cable.
  - e. Terminal lugs used for bonding connections to metallic structures shall be installed on bare/uncoated metallic surfaces to assure minimum contact resistance.
  - f. All wires shall run inside conduits. Wires and cables shall not be spliced inside or outside of conduit. Wire and cable shall only be connected at terminal strips or devices inside boxes, controller or approved enclosures.
5. Self-extinguishing nylon bundling straps having a temperature range of minus 65EF to plus 250EF shall be used for bundling or cabling of conductors where required. Strap shall have a hub complete with stainless steel locking barb on one end and a taper on the other.

6. Conduits and Fittings:
  - a. Rigid conduit and fittings shall be UL-Listed rigid galvanized steel conforming to the requirements of UL 6 and ANSI C80.1. The minimum diameter shall be 3/4 inch for power circuits, one inch for fire and intrusion circuits, and two inches for audio and control circuits.
  - b. Liquid-tight flexible conduit shall conform to the requirements of UL 360 and consist of a flexible galvanized steel core containing a copper bonding conductor spiral-wound between convolutions and a neoprene or PVC jacket overall. Fittings for liquid-tight flexible conduit shall be watertight and shall conform to the requirements of UL 514.
  - c. All conduits (rigid steel and liquid tight flexible) should be permanently secured with metallic clamps. Zip ties are not acceptable to use as permanent use.
7. Auxiliary gutters, wireways, and raceways shall be constructed of galvanized sheet steel conforming to the requirements of the NEC and shall be UL-listed. Raceway, conduit and wireways within the hoistway exposed to public view shall be concealed within steel cladding.
8. Electrical Boxes:
  - a. Outlet, junction and pull boxes shall be galvanized sheet steel or galvanized malleable iron, cast iron or ductile iron conforming to the requirements of UL 50, UL 514 and NEC paragraph 370-C. Pull boxes shall have screw cover with a liquid-tight gasket.
  - b. Junction boxes on car bottom and hoistway connecting the traveling cable shall contain approved terminal blocks for connection of traveling cable conductors. Terminal blocks shall have indelible identification numbers for each terminal connection.
  - c. All wire connection terminal blocks shall have the same identification number as labeled on the associated electrical wiring. All electrical wires shall use a labeling tube and heat shrink and match the terminal numbers.
  - d. During field installation of junction boxes or control boxes, the contractor/subcontractor shall not drill or cut into the top sides of the box for wiring.
  - e. All boxes shall be accessible without removal of other components.
  - f. All boxes in machine room or pit shall be mounted on strut channels in order to prevent future corrosion and water damage. The strut channels shall be mounted on the wall and has a minimum of 1-1/2 inches thickness and 18 inches above the floor.
  - g. All solid state and electrical components located on top of the car enclosure or in the hoistway shall be installed within NEMA 4X enclosures.

9. Disconnect Switches for Car Lights and Mainline Power
  - a. Disconnect switches shall be the following: UL 98, NEMA KS 1, heavy-duty, quick-make/quick-break switching mechanism with operating handle external to enclosure, with positions labeled ON and OFF, defeatable interlock to prevent opening of enclosure door when switch is ON. Enclosures shall be NEMA 250 Type 4x. Label disconnect switches in accordance with the NEC.
  - b. Mainline power disconnect switch shall be located in close proximity to the machine room entrance and shall be easily identifiable from other disconnect.
10. Circuit Breakers and Panelboards
  - a. Circuit breakers shall be the following: NEMA AB 1, UL 489, molded-case, bolt-on quick-make/quick-break, mechanically trip-free switching mechanism, with thermal trip for inverse time delay overcurrent protection and magnetic trip for instantaneous short-circuit protection. Designed to carry continuous rating in ambient temperature of 40°C.
  - b. Panelboards shall be the following: UL 50, NEMA PB 1, latch and handle in accordance with UL 50, minimum side gutter size of four inches, bus bar of 98-percent-conductivity copper with contact surfaces silver-plated or tin-plated, rating of neutral and ground buses equal to phase bus rating, neutral bus mounted on insulated block, neutral and ground buses equipped with integral mechanical connectors, one-inch high engraved plastic nameplate with 2-inch high letters on black and attached with stainless steel fasteners. Enclosures shall be NEMA 250 Type 12.
11. Pit Receptacles and Lights
  - a. Electrical power receptacles shall be furnished and installed in the elevator hoistway, pit, and top of car as shown or required by code. Each receptacle shall be duplex, ground fault interrupter type, resettable at the receptacle; waterproof; grounded; rated for 120 volts at 20 amperes.
  - b. Maintenance lighting shall be furnished and installed in the elevator hoistway as shown or required by code. Lighting shall be vapor-tight service lights with quick start type PL compact fluorescent lamp. Furnish and install light switches; waterproof; grounded. The light switches shall be so located as to be accessible from the pit access door.
12. Drive Unit Motor
  - a. Motor shall be designed specifically for elevator service. The drive motor shall be of the alternating current, intermittent duty, 120 starts per hour, 1.15 service factor, squirrel cage induction type design adapted to the severe requirements of elevator service. Elevator drive motor shall be single-speed. The motor shall be suitable for operation on a 480-volt, three-phase, 60-Hertz supply and capable of developing the required starting torque.

- b. The motor shall be rated in accordance with NEMA Standard MG 1 for 60-minute rating motors and shall have sufficient capacity to operate the elevator with specified rated load at specified rated speed without overheating. The insulation and the starting and running torque of the motor shall be capable of permitting operation in accordance with NEMA MG 1. Standard factory motor test data and motor dimensions shall be submitted to the Contractor for approval. Each motor nameplate shall include the motor hp rating, voltage, full-load amperes, locked rotor amperes, full-load speed, design temperature rise, and NEMA design rating of the motor. Each motor shall be provided with ring or other suitable lifting means. The motor frame shall be tapped and drilled for a copper cable grounding connection.
  - c. Insulation of windings shall be NEMA Class B, fully impregnated and baked to prevent the absorption of moisture and oil. The insulation resistance between motor frame and windings shall be greater than one megohm.
  - d. Motor bearings shall be of the ball or roller type arranged for grease lubrication and fitted with grease gun connections and drain plugs or fitted with sealed-for-life bearings. The bearings shall incorporate dust-tight lubricant seals.
  - e. Motor shall be provided with an electronic soft start feature and thermal overload protection for each phase.
  - f. Connect motor and pump with multiple V-belt.
    - 1. Belts and sheaves shall be sized for duty involved and designed to prevent any metallic contact between motor and pump shaft.
    - 2. Furnish and install isolation units of rubber in shear to prevent transmission of pump and motor vibration to building.
    - 3. Furnish and install expanded metal sheave guard that can be easily removed for servicing and inspection.
13. Elevator Controller:
- 1. An Allen Bradley (or ELES Engineering approved equal) PLC-based controller shall be provided, governing starting and stopping as well as preventing damage to the motor from overload or excessive current. It shall automatically cut off the motor current and bring the car to rest in the event any of the safety devices are activated.
    - a. System shall coordinate the functioning of elevator drive unit relative to actual location and status of elevator. It shall interface with door control and all required safety circuits, switches and devices. The controller shall be mounted in a NEMA 4X stainless steel air-conditioned cabinet within the controller room.

- b. The diagnostic system shall be an integral part of the controller and provide user-friendly interaction between the service person and the controller system.
  - c. The supervisory logic shall be performed by a main controller or coordinated between the elevator controllers which will interface directly into the Allen Bradley DH485 (or ELES Engineering approved equal) protocol Remote Monitoring network, transmitting data from the elevator controller through a data concentrator to the Authority's AEMS RTU computer control and data system. The supervisory logic will coordinate dispatching assignments, interfacing operational demand data accumulated from car and corridor operating fixtures, selector and door control functions.
  - d. Controller shall be capable of operating with an operating temperature range of 32<sup>0</sup> F to 140<sup>0</sup> F with non-drip environment and no more than 90 percent relative humidity. However the air conditioner on controller cabinet shall maintain the operating temperature in range of 50<sup>0</sup> F to 90<sup>0</sup> F.
2. An Allen Bradley CompactLogix 1769-L32E (or ELES Engineering approved equal) based PLC control system shall be provided. (take to #1)
- 1) The exclusive Allen Bradley DH485 protocol data port will transmit data from the elevator controller to the station or facility data concentrator. The contractor shall provide a controller data interface to a DH 485 network. Contractor shall provide Data cables to connect from the PLC controller to data concentrator in the station and available for connection to the controller DH485 interface. The contractor shall pull Belden 9842, or ELES Engineering approved equal, cables to connect the controller into the monitoring DH485 network. The DH 485 controller interface shall be programmable for data rates up to 115 Kbps. The interface shall allow other nodes such as other elevators and escalators to be readily incorporated into the DH 485 network.
  - 2) A data concentrator PLC shall be installed using an Allen Bradley MicroLogix 1400 or SLC5/05 PLC per station to function as data concentrated or to consolidate data from all controllers in the station. The software for the data concentrator shall receive controller data over the local monitoring DH 485 network and provide formatted data to the AEMS RTU through an RS232 link. The data concentrator shall provide an Ethernet port for interfacing with the WMATA wide area network. A data concentrator connection to the WMATA wide area network shall be provided.
4. The PLC shall accommodate the following Signal List, as Applicable, and provide data to the data concentrator as specified in specification.

5. The PLC CPU module shall store the last 99 faults, accessible via laptop connection, controller fault/status display and remote communications. The contractor shall provide WMATA with a programming and monitoring unit, such as a laptop computer with the newest version of Allen Bradley RS-Logix and any other software required to setup and program all electronic items in the control system, for each elevator, for the purpose of troubleshooting and remote monitoring modifications. The laptop should allow uploading, editing, and downloading any software that is being used on this elevator for any operation.
6. An Allen Bradley PanelView Plus 6, EZAutomation or ELES Engineering approved equal, fault/status display/interface shall be provided in the controller cabinet. Control system timers and other setup criteria shall be programmable through this unit. All fault, status and setup data shall be stored in the controller CPU module.
7. In cases where the programming is done by the supplier, the supplier shall provide a copy of all working programs, including labels for all inputs and outputs, data tables and internal logic points, on Flash Drives/CD-R disks as well as a printed program listing. The programs and setup data shall require a password for access and modification. The password shall be provided to ELES Engineering as part of the Submittal.
8. The main control of an elevator shall contain at least the following devices or electronic sensing: phase failure line voltage monitor, motor current and ground fault monitor.
9. The controller cabinet shall contain a permanently mounted fault indicator panel with LED indicator lights. Tripped safety devices, door position, door reversal, car running status, and control system status shall be indicated.
10. All terminals shall have identification markings and all wires, including field wires, shall be provided with permanent heat shrink sleeve cable markers. These wiring identifications shall be provided in the wiring diagram at each end of the circuit connections.
11. The controller shall be equipped with the AC vector drive installed in-line before the motor contactor and the motor.
12. The AC vector drive shall be capable of accelerating and decelerating the motor smoothly and gradually.
13. Adjustable settings for acceleration and deceleration ramps shall be provided.
14. The controller shall have, at least, one dedicated serial port for interface to the DH485 monitoring network and programming access without disconnecting any other port.
15. The Programmable Controller shall have, at least, one dedicated port to support the controller fault/status display.
16. The controller PLC shall provide the following Remote Monitoring and diagnostic network support:
  - a) All applicable faults, statuses and data listed in Table 1 shall be provided

- b) Fault indications shall remain until reset in the controller.
  - c) Status and analog data shall be provided for the duration of the condition.
  - d) Software in the controller PLC shall format monitoring data responses to data concentrator polling as specified in the specification.
  - e) The monitoring data port in the controller shall be setup for DH485 protocol with the port network identification number programmed for the particular elevator identification. For instance, identification number 11 applies to elevator 1, 12 to elevator 2, etc.
  - f) All faults, statuses and data shall be held by the controller CPU and sent from the CPU when polled by the data concentrator.
17. Provide sufficient non-volatile CPU memory, for non-volatile retention of program memory, system status and operating parameters.
18. Diagnostics
- a) The processor shall have built-in diagnostics and self-test, such that each time power is cycled, the processor does a complete CPU and RAM memory test. Additionally the power-up test will momentarily light up all diagnostic LEDs to be sure they are working. A power up test will not be performed if the internal flag (bit) for Firemans Service Phase I is latched. The processor shall be capable of reporting major and minor fault codes and processor status information back to the data concentrator, provided the fault is not a catastrophic hardware failure where the processor is unable to power up.
  - b) The processor shall have a built-in watchdog timer to ensure that all processor program scans occur within the time limit set by the watchdog timer.
  - c) The processor shall have individual LED indicators that are clearly visible and labeled for easy identification. At a minimum the following indicators must be provided:
    - (1) CPU is in RUN mode
    - (2) CPU is FAULTED
    - (3) CPU battery is LOW
    - (4) I/O points are FORCED and are not under program control  
COMMUNICATION channels are active.
19. Input/Output Modules
- a) The Input/Output modules shall be compatible with the PLC processor I/O structure. Each module shall be provided with a detachable terminal strip to connect wiring to the module. Each wire on the terminals shall be identified by the module terminal.
  - b) Discrete Input Modules: Suitable for the input voltage and compatible with the Allen Bradley system
  - c) Discrete Output Modules: Suitable for the voltage and load and

- compatible with the Allen Bradley system.
- d) Analog Input Modules: Converts analog signals to proportional twelve-bit binary values. The module shall accept 4 to 20 mA signals. Provide modules compatible with the Allen-Bradley system.
20. I/O Chassis and Power Supply
- a) The controller chassis shall have an additional three spare modules.
- b) Power supplies shall provide power to the PLC processors, I/O and other function modules. The power supply shall be suitable for operation of 120 VAC, single phase power. Power supply capacity shall be a minimum of 150% of the connected load.
21. Air Conditioning
- Provide an independent air conditioning unit for each controller to maintain manufacturers' recommended operating temperatures. Condensate from the air conditioning unit must be piped to a suitable drain.
22. Selective Collective Operating: As defined by ASME A17.1 and shall be the pressure upon one or more car buttons to correspond to landings in the order in which the landings are reached by the car, irrespective of the sequence in which the buttons are pressed, provided the hoistway door interlock and car door switch circuits are completed. During this operation, the car shall also answer calls from the landings, which are in the prevailing direction of travel. Each landing call shall be canceled when answered
- a. Momentary pressure on car button or landing button illuminates that button, which remains illuminated until call is answered. Illuminated buttons serve as visual indication that call has been registered and that car will stop at that landing.
- b. Operation shall be automatic by means of the car and landing buttons. Stops registered by the momentary actuation of the car or landing buttons shall be made in the order in which the landings are reached in each direction of travel after the buttons have been actuated.
- c. UP landing calls answered while car is traveling in up direction and DOWN landing calls answered while car is traveling down, car reversing after uppermost or lowermost car or landing call has been answered and proceed to answer car calls and landing calls registered in opposite direction of travel.
- d. Should both an up and a down call be registered at an intermediate landing, only the call responding to the direction in which the car is traveling shall be canceled upon the stopping of the car at the landing.

23. Supervisory Control: A processor based system to coordinate dispatching assignments, interfacing operational demand data accumulated from car and corridor operating fixtures and other special feature commands issuing from computer processing, selector and door control functions. Incorporate in the system specific operational features as herein described.
- a. Allocate service to demand, make decisions to prevent crowding, save energy, and provide efficient coverage throughout the building. Respond in real time to prevailing traffic conditions as well as historical traffic patterns.
  - b. Constantly compare passenger demand, car load, anticipated demand, car motion status, machine status and other prevailing conditions and evaluate this information in the context of the following dispatching approaches:
    - 1) Give priority to contiguous calls, assigning calls on adjacent floor to the same car if other criteria is satisfied.
    - 2) Give priority to coincident calls, having the same car let a riding passenger off and a waiting passenger on at the same floor.
    - 3) Anticipate demand based on hall calls and car calls already registered and floors with a high possibility of demand.
    - 4) Evaluate relative system response time for each car in the group, weighing all of the above factors.
    - 5) Allocate calls and position cars to minimize waiting time, response time and travel time. The other elevator shall respond for hall calls without any delay after the first elevator left the door zone.
    - 6) When there is a hall call registered and an elevator left the landing, the other elevator shall run toward opposite landing.
  - c. Provide the capability to make both car to call or call to car assignments.
  - d. During light traffic conditions, assign cars without demand to specific parking areas until requested for a hall call. Continuously evaluate dispatching assignment and immediately release a car from its assigned area to meet heavy demand elsewhere in the building.
  - e. In determining relative system response time for a car to answer a hall call, factor in round-trip calculations for each car as well as other system parameters before deciding which car shall respond to a hall call.

24. Other Features:
- a. Independent Operation: Provide TWO-position keyed switch (ChicagoLock 7500) marked Independent Service, OFF and ON in the lower portion of the car operating panel of all cars. The switch shall be spring loaded type. When placed in ON position, car will be removed from the automatic operating system and will not respond to demands registered at the hall push buttons. It will respond only to floor with doors open until another demand is registered in the car. Demands registered at the landing will remain registered until answered by another elevator. The car only responds to car calls and that the doors remain open after a stop until closed by continuous pressure on the door close button.
  - b. The controller shall be designed to operate automatically on standby power.
25. Control Room Two Way Communication Device: Provide within each controller/machine room a two way communication device that will interface with any type of ADA compliant telephone. The device shall be mounted directly on or within hands distance proximity to the elevator controller.
26. Any junction boxes installed in the machine room or hoistway shall be accessible for Maintenance.
- a. Drilling or opening top end of enclosure is not acceptable
  - b. Wire nuts or splicing without terminal strips is prohibited.
  - c. All openings shall be properly sized for the conduits.
- J. Emergency Lowering
1. Provide a separate battery powered unit that senses loss of power and which shall operate as follows:
    - a. Elevator automatically descends to bottom landing.
    - b. Doors open automatically when car arrives at bottom landing and remain open until power is restored.
    - c. Elevator shall remain inoperative until normal power is restored.
  2. The system shall differentiate between actual power failure and manual operation of disconnect switch.
  3. Failure protection (operational/power) battery shall be a 12 volt minimum, sealed, lead-acid, or approved alternative. The separate box shall be used for battery and not stored within the main controller.
    - a. Unit shall be connected to a power source
    - b. Unit shall automatically maintain the battery at its proper charge.
  4. Provide a manual lowering valve to allow the car to return to the lowest landing. The manual lowering shall be easily accessible and reachable.
  5. Provide all wiring, sensors and associated connections to the main line power and disconnect.
- K. Elevator Hoistway Entrances and Doors

1. Doors of elevators shall be of the horizontal sliding type, single-speed, center-opening. All elevator door openings shall be a minimum of 42-inches wide per the Americans with Disabilities Act.
2. Entrance frames shall be of welded or bolted construction for complete one-piece unit assembly. All frames shall be securely fastened to fixing angles mounted in the hoistway and shall be type 316 stainless steel. Provide an additional type 316 stainless steel sill angle support. The landing sills shall be extruded stainless steel with a mill finish.
3. All materials and finished surfaces exposed to public view shall be stainless steel with embossed finish and/or glass panels as indicated on Contract drawings. Glass panels (if provided) to be completely flush with door assembly. In a glass hoistway the struts or any brackets should not be visible to public.
4. Fascia and Dust Cover in the hoistway shall be galvanized or type 316 stainless steel and extend at least the full width of door opening on each side. Toe guard shall be fastened to the sill at the lowest landing.
5. Hoistway doors are to be stainless steel and provided with keyways as required for operating mechanisms and door hangers. Provide glass panels that are completely flush with door, as indicated in A17.1. Each door panel shall have stainless steel bottom guides that run in landing sill slots. Guides shall be replaceable without removing door panels. All doors shall have fixed fire gibs.
6. Interlocks and Contacts:
  - a. The doors at each hoistway entrance shall be equipped with approved hoistway door interlocks of the hoistway unit system type tested as required by the Code. Interlock shall prevent operation of the car away from a landing until doors are locked in the closed position. Interlock shall prevent doors from opening at any landing from the corridor side unless car is at rest at that landing, or is in the leveling zone and stopping at that landing.
  - b. Provide key-operated hoistway door unlocking devices. A device shall conform to the requirements of the Code and shall permit authorized persons to open the hoistway doors from the landing when car is away from landing. The key for emergency use shall be mounted in a receptacle with a breakable transparent cover clearly marked in letter at least 1/8 inch high ELEVATOR DOOR KEY FOR FIRE DEPARTMENT AND EMERGENCY USE ONLY. The location of the receptacle shall be as directed by the Engineer.
7. Provide raised floor/level designations in characters and Braille on each jamb at 60 inches from floor to centerline. Characters shall be two inches high and in accordance with ADA requirements.

- a. Sills shall be stainless steel and shall be supported on and attached to galvanized steel anchors securely fastened to the sill plate support. The sill and its assembly shall be capable of supporting 1260-pound service load for the transfer cart used by WMATA. Grooves for the door guides shall be machined with minimum clearance for the guides. The Contractor shall provide sill plates. Sill plates and all other sill support structure including shims and jack bolts shall be hot-dipped galvanized.
  - b. Struts and closer angles shall be hot-dipped galvanized structural steel angles of sufficient size to accommodate and support the hoistway door header plate. Angles shall be continuous and securely bolted to the sills and building beams or structure above.
8. Hanger supports shall be 1/8-inch minimum thickness formed sections securely bolted to the strut angles.
  9. Fascia Plates: Galvanized Steel cladding reinforced to ensure a flat, even surface throughout, and shall be securely fastened to hanger supports and sills above.
  10. Dust Covers: Galvanized or Stainless Steel cladding which shall extend over the hanger support the width of the jamb opening plus the jamb flanges, at the top landing for which fascia plates are not supplied.
  11. Hanger cover plate sections above the door openings shall be arranged for opening or removal from within the car.
  12. Sill guards: Sill guards (galvanized steel cladding) shall be supplied for the lowest landing. On glass hoistways, they shall extend the full width of the hoistway and to bottom of pit.
  13. Door hangers and tracks shall be provided for each hoistway, sliding door sheave type, two-point suspension hangers and tracks, complete. Sheaves shall not be less than 2-1/4 inch diameter with ball bearings properly sealed to retain grease lubrication and shall be mounted on stands arranged for attaching to the doors by two capscrews. Hangers shall be equipped with adjustable ball bearing rollers to take the up--thrust of the doors.
  14. The tracks shall be high-carbon steel or formed steel with nylon inserts, shaped to permit free movement of the sheaves.
  15. All inside surfaces of doors shall have baked-enamel finish as shown on the finish schedule.
- L. Elevator Components
1. The elevator car and car components shall conform to the requirements of the Code, and shall operate without squeaks or metallic sounds.  
  
Entire car assembly, including car frame and platform, shall be free from warps, buckles, and squeaks and rattles. Joints shall be lightproof.

2. Frame and Platform
  - a. The car frame shall be constructed of structural steel members. The platform shall consist of a steel frame with necessary steel stringers all welded together. The frame and platform shall be braced and reinforced to prevent the transmission of strain to the elevator car. Steel framing shall conform to the requirements of ASTM A500, Grade B, modified to minimum yield strength if required. The variation in straightness of individual members and the frame as a whole shall not exceed 1/8 inch. Secondary straightening may be performed if necessary. The car enclosure shall be securely fastened to the car platform and so supported that it cannot loosen or become displaced during ordinary service, on the application of the car safety or on buffer engagement.
  - b. Platform shall be provided with a steel floor designed for specified loading and sealed watertight. The platform shall be isolated from the cylinder by suitable rubber pads or other equally effective platen isolation.
  - c. All structural steel in the frame and platform shall be hot-dipped galvanized.
3. Car enclosure walls shall be structural steel tubing with stainless steel cladding, in-filled with aluminum framed laminated fully tempered safety glass. Stainless steel cladding shall be #4 satin finish.
4. Railings and Handrails: Car handrails shall be 1/2 inch by 6 inch stainless steel #4 satin finished tube suitably mounted.
5. Car threshold shall be stainless steel with a non-slip surface.
6. Toe Guard Aprons:
  - a. The toe guard apron (cladding) at entrance side of elevator cab shall be not less than 16 U.S. Standard Gauge (USSG) galvanized steel or stainless steel, and shall extend at least three inches beyond entrance jambs at each side. Toe guard shall have a straight vertical face, extending below the level of finished car floor, of not less than the depth of leveling zone plus three inches. The bottom of guard shall extend three inches below vertical face and be beveled at a 15-degree angle from the vertical. The toe guard shall be secured to car platform construction and be reinforced and braced to withstand a constant force of 150 pounds on its face without permanent deformation or deflection exceeding 1/4 inch.
  - b. On glass elevators, the toe guard shall extend full width of cab.
7. Suspended Ceiling:
  - a. The suspended ceiling shall be faced and edged with solid stainless steel panels, 0.075-inch thick with a fully adhered 3/4-inch thick core of noncombustible, sound-absorbent material and backed with galvanized sheet steel. ASTM A653M, G90 coating or better.

- b. Mounting brackets and any necessary holes for the CCTV camera shall be provided on the top of the ceiling, as further specified in Section A. Coordinate bracket configuration and location with the CCTV subcontractor.
    - c. Mounting brackets and any necessary holes for the smoke and fire detection sensors shall be provided on the top of the ceiling, as further specified. Coordinate bracket configuration and location with the fire and intrusion system subcontractor
8. Glass shall be laminated fully tempered safety glass conforming to ANSI Z97.1 and the requirements of Specification Section 08\_81\_00.
  - a. Glass shall be laminated. Heat-strengthened, safety glass conforming to requirements of ASTM C 1048 and ANSI Standard Z97.1 and shall consist of two pieces of ¼ inch thick glass and a 0.060 inch thick polyvinyl butyryl interlayer, laminated together.
  - b. Color: Tint by Globe-Amerada Co., used as a standard of quality, or comparable and approved equal.
  - c. Weatherproof tape for field installation of final edge seating shall be compatible with the interlayer.
9. Dry Pressure Glazing Materials:
  - a. The setting blocks, edge blocks, and face gaskets shall be ozone-resistant, virgin neoprene.
  - b. Setting blocks for installation at each quarter point of the sill shall be 90 durometer, shore A hardness, approximately full channel width, four inches long, and high enough to afford correct cover and 3/8-inch edge clearance for the glass.
  - c. Edge blocks, for vertical installation at the bottom of each joint channel, shall be 50 durometer, shore. hardness approximately full channel width, three inches long, and provide 3/8-inch edge clearance for the glass.
  - d. Face gaskets shall be continuous, 50 durometer hardness, and provide 3/16-inch face clearance both inside and outside.
10. Sub floor material to be nominal ¼" stainless steel to prevent water infiltration between finished floor, cab and platform base.

Floor covering: Poured Acrylic Epoxy, polymer system or approved equal, color selection and samples to be submitted to the Authority for approval by the Engineer, with slip-resistant surface, ¼ inch thickness, covering elevator car floor area. Flooring shall be non-shrinking, manufactured of prime quality compound, free of calendaring and curing defects, resistant to grease, oil, chemicals, aging, and ozone. Flooring shall be poured incorporating a full membrane system for the entire cab floor width and depth.
11. Emergency exit: Car shall have a top emergency exit conforming to the requirement of the ASME Code, and the applicable jurisdictional requirements. The door shall open toward the top of elevator and shall have a latching mechanism to keep it in place.

12. Ventilation: A 350-cfm two-speed exhaust fan for continuous car ventilation shall be provided and located above the car ceiling or outside the enclosure.
  - a. Ventilating fans shall be securely mounted in place.
  - b. Ventilation openings shall comply with the ASME and local codes, and shall be suitably sized and distributed to provide uniform airflow within the car.
  - c. Connect continuous ventilation fan to emergency power system. Provide battery backup for fan operation of at least 1 hour in the event of power loss.
  - d. The exhaust fan shall be controlled from the car operating panel with Chicago Lock 7500 (similar to existing WMATA Elevators keys).
13. Cab air conditioning (if applicable), in addition to the exhaust fan, shall be installed as specified in the contract and shall be a self-contained, packaged design for easy mounting, maintenance, and replacement.
  - a. Packaged air conditioners shall be installed on the top of the elevator car.
    1. If not installed in original scope, space provisions shall be made for future installation of packaged air conditioning units.
    2. Installation area shall be coordinated with electrical, structural, and other trades to ensure no interferences with current or future installation.
    3. Electrical power of the proper voltage and capacity shall be available for the air conditioning unit installation current or future.
14. Lighting Fixtures and Plug Receptacles:
  - a. Car lighting shall provide a minimum of 15-foot candles measured at any point on the cab floor and shall be of the LED type. Car lighting shall be provided with emergency battery backup upon failure or interruption of normal car lighting. Emergency lighting unit shall provide required lighting for a minimum of four (4) hours. Battery charger shall be capable of restoring battery to full charge within sixteen (16) hours after resumption of normal power.
  - b. Exterior car lighting shall be as specified. On glass-enclosed elevators they shall be concealed under access panels flush with cab top or bottom surfaces, respectively. A duplex plug receptacle shall be provided in the pit and on top and bottom of each car. The lighting fixtures and receptacles on exterior of car shall be controlled by a switch adjacent to each fixture.

- c. Provide 115 volt ac plug receptacle (GFCI) within 12 inches of CCTV camera location. Coordinate the installation of CCTV equipment within the design of the elevator cab as the elevator contractor is responsible for the installation of the camera and wiring to the control room.
15. Car Doors and Door Equipment:
- a. Car doors and door frames shall be suitably reinforced and provided with a laminated stainless steel #4 finish on cab side and baked enamel finish on hoistway side. Doors shall protect the full width and height of car entrance opening when in the fully closed position. Car door frame shall be integral with front wall of cab.
  - b. Hanger cover plate sections above the door opening shall be removable from the hoistway. Doors shall be guided at the bottom by composition gibs engaging threshold grooves with minimum clearance.
  - c. Car/Hoistway Door Operator: Car and hoistway doors at each landing shall be opened and closed quietly and smoothly by a direct current electric operator.
  - d. Door operation automatic at each landing with door opening being initiated as car arrives at landing and closing taking place after expiration of specified time interval, with electric contact to prevent starting elevator away from landing unless car door is in its fully closed position.
    - 1. Time door closing to start 5 seconds minimum from notification that car is answering landing call.
    - 2. Time doors to remain open five seconds minimum.
    - 3. Time shall be adjustable to 20 seconds.
    - 4. The interval of time that the doors remain open at intermediate landings shall be less for a stop made in response to a landing call. Door open time at a dispatching terminal shall be longer than the time for a stop in response to an intermediate landing call.
    - 5. All door timers shall be adjustable from the controller display panel.
16. Capacity Plate:
- a. The car capacity plate shall be of plain stainless steel and, in addition to data required by the ASME Code, but shall not bear the name of elevator manufacturer.
17. Door Operator Equipment:
- a. Provide a water resistant heavy-duty GAL MOVFR or ELES Engineering approved equal door operator with encoderless VVVF drive. Closed loop door operator designed to operate car and hoistway doors simultaneously at the speed specified. Door shall open automatically when car stops at landing to discharge

passengers or to answer valid calls and close automatically after predetermined time interval has elapsed. The doors shall be capable of smooth and quiet operation without slam or shock. Door operator to have the following features::

1. ½ hp motor and heavy-duty sprocket, chain, belt, and sheaves.
  2. Closed loop regulated speed performance.
  3. Hand-held keypad programming.
  4. Adjustments can be stored in the keypad and downloaded to another operator.
  5. Adjustable door obstruction reversal.
  6. Optical cams with LED indicators.
  7. Test switches for open, close, nudging and speed zone set up.
  8. Universal inputs for open, close, and nudging.
  9. Reversing switch to back up the door reversal device.
  10. Designed for interior and exterior applications.
- b. Provide a non-contact door reversal device with light immunity: The Door Reopening Device shall cause both the car and hoistway doors to reverse, should they detect an obstruction in the elevator entrance. The device electrical wiring shall be supplied with quick disconnects terminals to facilitate replacement. The infrared curtain detector shall include the following:
- a. A protective infrared detector field extending from 1 1/2" above the car sill to a height of 68".
  - b. A fail-safe control system to prevent the doors from closing in case of power loss to the detector.
  - c. A one-piece full door height protective lens cover designed to be completely waterproof and to withstand impact, abrasion and vandalism.
- M. Normal and final terminal stopping devices shall be provided for elevator conforming to the ASME Code requirements.
1. Final terminal stopping devices, located in hoistway or on the car and operated by cams, shall be fitted with rollers having a rubber or other approved composition tread to provide silent operation when actuated by the cam.
  2. Normal terminal stopping device may be mounted in hoistway, on top of the car, or in the machine room.
- N. Signal Devices and Fixtures:
- 1) Car Operating Station:

- a. Provide one (1) main station in the front and one (1) auxiliary station. The COP shall be a vertical type.
- b. General: Provide signal fixtures and control devices for each elevator. Buttons and signals shall be tamper resistant of the illuminated type that light-up when activated and remain lit until call or other function has been fulfilled. All signal fixture and control device faceplates shall be of Type 316L, nominal 0.135 inch thick stainless steel with No. 4 finish, unless otherwise shown on the Contract Drawings.
- c. Car operating stations shall contain Braille plates adjacent to each call button. Contractor to coordinate proper landing call outs based on maximum characters as indicated on Contract drawings. Buttons for DOOR-OPEN, DOOR-CLOSE, ALARM, EMERGENCY PHONE call functions are to be supplied. Buttons are to be vandal resistant and of the positive stop type.
- d. Station shall have a locked service cabinet for keyed switches of the car light; exhaust fan, independent operation, GFI duplex outlet as indicated on the Contract drawings.
- e. Provide Emergency Communication: "Hands-free" ADA compliant telephone/intercom.
  - 2) Hall Station: Riser of hall stations of the push-button, call acknowledging, stainless steel, tamper resistant type shall be mounted at all elevator landings. Highest landing shall have a single DOWN button. Lowest landing shall have a single UP button. Incorporate ADA compliant telephone with each hall station. Braille Indicator Plate shall be provided. Faceplate finish shall be Type 316L stainless steel #4 finish. The Hall Station shall be flush to the surface and shall not be projected out.
  - 3) Hall Lanterns:
    - a. Tamper resistant hall lanterns shall be equipped with illuminated (LED type) UP and DOWN signal arrows, but provide single arrow where only one direction is possible. Provided units projecting from faceplate for ease of angular viewing. Match materials, finishes and mounting method with hall stations.
    - b. In conjunction with each hall lantern, provide an adjustable electronic chime signal to indicate that a car is arriving in response to a hall call and to indicate direction of car travel. Signal shall sound one for up direction of travel and twice for down direction.
  - 4) Bell Alarm System: Bell alarm system for each elevator shall be properly located within building and audible outside hoistway when activated by the EMERGENCY ALARM call button on each car control building/station. When emergency stop switch is activated inside fire service box, the bell alarm system should not be activated.

- 5) Firefighters' Service System: Firefighters' service system shall be provided in compliance with code requirements.
- O. Drip pans constructed of 26 USSG galvanized sheet steel shall be provided below all bearings to catch lubricant drippings, except for bearings that are fitted with effective approved grease seals.
- P. Metal parts visible to the public shall be field painted.
- Q. A metal cabinet of suitable size shall be provided in each machine room for the storage of special tools and necessary spare parts. The cabinet shall be mounted on legs or a pedestal, a minimum of 4 inches off the floor. A Mobile Tool Storage Cabinet with wheels is not allowed.
- R. A complete set of special tools or wrenches that are designed specifically for tasks associated with elevator inspection, maintenance and repair shall be provided with a case or suitably mounted in the storage cabinet.
- S. At the expiration of the warranty requirements, the Contractor shall provide a spare parts and service facility in the United States at no additional cost to the Authority from which all manufactured parts and components of the equipment furnished and installed can be obtained for an additional three years.

#### **2.04 KIOSK SURVEILLANCE CONTROL AND COMMUNICATION:**

- A. Surveillance Camera Provisions (Surface Elevators). All requirements for CCTV shall comply with the WMATA SMNT Department.
  1. Space provisions and mounting holes shall be provided for closed-circuit television (CCTV) cameras to be furnished and install by CCTV subcontractor.
    - a. The Contractor shall coordinate with the CCTV subcontractor and install wiring from the CCTV location within the elevator cab to an interface terminal and video transmitter located on the elevator car. Final equipment selection has not been performed and is subject to change. Coordinate model, configuration, and location with the CCTV subcontractor.
      - 1) Power will be required by the video transmitter and CCTV camera and shall be provided.
      - 2) Equipment: Fiber Optic Video Transmitters (Elevator Cameras)
    - b. The Contractor shall work with the CCTV subcontractor to install CCTV subcontractor-provided fiber-optic cable and transmitter to a terminal location specified by the CCTV subcontractor. The Contractor shall tag the cables appropriately, indicating that they are for future use by others.

B. Supply the following status indication, control, and communication functions for each elevator car and landing at an annunciator panel in the kiosk: indication, control, and communication functions in each elevator and landing; and all interconnecting wiring required to provide a complete and operable system. Systems to be provided and installed include the following:

1. Kiosk annunciator panel: Panel shall be a single panel approximately 7-½ by 19 inches. Coordinate design to ensure that the panel is compatible with the mounting provisions, previous designs, and human factors. The panels shall contain:
  - a. Indicators:
    - 1) Visual display of elevator car status, to include landing stopped at or being approached and direction of travel:
      - a) Designate elevator by functional name, e.g., Garage 1.
      - b) For garage elevators designate landing by garage floor level.
    - 2) Out of service because of malfunction.
    - 3) In-Car stop switch is actuated.
    - 4) Continuous audible alarm activated when emergency alarm switch in car is initiated.
    - 5) Indicator lamps shall be LEDs, with life expectancy of 50,000 average rated hours.
  - b. Controls:
    - 1) Out of service.
    - 2) Override control.
    - 3) Door open.
    - 4) Landing selection.
    - 5) Push button switches shall have limited over-travel to prevent damage due to abuse and shall be equipped with lift-up covers to avoid inadvertent operation, have mechanical and electrical life of 25,000 cycles, with integral or isolated illumination circuit and be normally open with momentary action or alternate action circuitry.
    - 6) When the override control switch is OFF, the kiosk controls shall function in parallel with the car and landing controls, i.e., the selective/collective control system shall respond to a kiosk-initiated landing selection with the normal priority afforded the remaining system landing selection and call buttons.
    - 7) When the override control switch is ON, the following actions shall take place:
      - a) If the car is stationary at a landing, it shall remain at the landing and the doors, if open, shall close and remain closed.

- b) If the car is in motion, it shall stop at the first landing reached and the doors shall remain closed.
  - c) The elevator control system shall then respond only to the kiosk controls and car station.
  - d) The car shall park at the designate landing.
- 8) When the OUT OF SERVICE switch is actuated, the elevator shall return to the lowest landing before shutting off.
2. Elevator fire detection sensor: Provide space and mounting holes for smoke and fire detection sensors to be furnished and installed as required by building, electrical, elevator and local codes. Install wiring from the sensor location in the car to interface terminal cabinet in the machine room, for connection from the sensors to the smoke and fire detection system. Coordinate with installers to allow installation of sensors and operational checkout of the system.
3. Passenger - Kiosk communications (VIOP) system:
- a. Communications signal button in elevator car momentary contact to illuminate back-lighted signal button in car and latch on a continuous audible signal and illuminated indicator in the kiosk.
  - b. Communications buttons at landings, momentary contact, to illuminate back lighted signal button at the landing and latch on a continuous audible signal and illuminated indicator in the kiosk.
  - c. Push button in kiosk to activate intercom system and reset indicator lamps and audible alarm.
  - d. Each passenger operated device shall have identification markings as specified for car operating devices.
  - e. The voice communication intercom system shall function as a master remote network. The master station shall be located in the kiosk annunciator panel and shall include a speaker-microphone, audio amplifier, on-off indicator lamp, audible signal device control and push button lamp for the operations. A remote station shall include a speaker-microphone and a communications signal button shall light the signal button and cause a continuous audible signal at the master station and light indicator lamp corresponding to the calling remote station. Communications between master and remote station shall be established upon the actuation of the master station push-button control corresponding to the calling remote station with the master station push to talk control determining the direction of transmission.
  - f. If successive calls are received from other remote stations while communication is in progress with one remote station, the audible signal shall sound the indicator lamps corresponding to the calling remote stations shall light and both shall remain on the indicate waiting calls.

- g. Means shall be provided to clear the indicating lamps independently. Communication initiated from the master station shall be established upon actuation of the push button control corresponding to the called remote station, with the master station push-to-talk control determining the direction of transmission.
- h. The audio amplifier at the master station shall be all solid state in construction and shall control incoming and outgoing volumes for all of the remote stations. The volume levels shall be preset during installation and shall be adjustable to provide a maximum of five watts rms at the speaker-microphones.
- i. The power supply shall supply all ac and dc voltages necessary for all circuitry associated with the voice communications intercom system, and shall operate from the 120-volt ac, 60 Hertz emergency power supply located in the elevator machine room.
- j. The audio amplifier and the speaker-microphones shall have a frequency response of plus or minus three Db from 300 Hertz to 5,000 Hertz. Power consumption shall be 5 watts maximum in standby and 50 watts maximum under load.
- k. The Contractor shall be responsible for shielding, grounding and other measures necessary to protect the voice communications intercom system from interference from other electrical systems.
- l. Speaker grilles shall have a minimum of 35 percent open area over the entire surface of the speaker cone.
- m. Switches and relays used with this system shall have an operating life exceeding 5,000,000 cycles. Documentation shall be provided by the Contractor to the Engineer, for his approval, to substantiate this life cycle level.
- n. The system shall perform adequately, as approved by the Engineer, with both the remote and the master station test personnel speaking from three feet away from the speaker-microphones.
- o. Communication in the car shall also rollover to a 24-hour manned site (Rail Operations Control Center) in the event that the kiosk does not respond to the call.
- p. Each passenger-operated device shall be identified in accordance with ADA/ADAAG requirements.
  - 1. ADA requirement for providing emergency two-way communications between an elevator and a point outside the hoist way (the Kiosk).
  - 2. Device mounting heights shall comply with:
    - a. ADAAG requirements.
    - b. ASME A17.1-2007. The highest operable part of the two-way communication system shall be a maximum of 48 inches from the floor.

3. A Braille Instruction Plate shall be permanently affixed on each remote intercom unit.
  - a. ADA Standards: Raised symbol and lettering (Signage) located adjacent to the device.

## **PART 3 – EXECUTION**

### **3.01 EXAMINATION**

- A. Prior to beginning installation of elevator equipment, examine the following and verify that no irregularities exist that would affect quality or execution of work as specified.
  1. Hoistway size and plumbness.
  2. Sill pockets.
  3. Anchor brackets
  4. Sill supports.
  5. Spreader/Divided beams.
  6. Machine beams and any other supplied by others.
  7. Pit Depth
  8. Overhead clearance
- B. Do not proceed with installation until previous work conforms to project requirements.

### **3.02 INSTALLATION**

- A. Electrical Installation:
  1. The Contractor shall install all raceways and wiring necessary for the proper connection and operation of all equipment. The installation shall comply with the applicable requirements of the NEC and local codes.
  2. Raceway:
    - a. Rigid conduit connecting the various items of elevator equipment and electrical boxes in the machine room and hoistway shall be run parallel to the ceilings and walls. Metal wireway and auxiliary gutters in the machine room shall run exposed in readily accessible locations and shall not protrude into the working space around equipment.
    - b. Liquid-tight flexible conduit shall be used for connections to motor, limit switch, interlock push-button box, door operator motor, and similar devices. A length of liquid-tight flexible conduit 18 to 24 inches long shall be used for connection to the elevator drive motor.
    - c. Raceway terminal fittings shall be free from burrs, shoulders, or other projections that will reduce internal passage area or cause abrasion of conductors.
    - d. Electrical boxes shall be installed in accordance with the requirements of NEC paragraph 370.

3. Wiring:
  - a. All wiring shall be run in conduit, metal wireway, or auxiliary gutter, with the following exceptions:
    1. Flexible hard-service cord, type SO, used between fixed car wiring and switches on car doors.
    2. The traveling cable connection to the elevator car.
  - b. Wire and cable shall be sized for their respective duty so that the maximum current carried shall not exceed limits prescribed by the NEC and local codes. The minimum sizes of conductor shall be 12 AWG for lighting and receptacle circuits and 16 AWG for operating, control and signal circuits, except for traveling cable, where 14 AWG shall be the minimum size for elevator lighting circuit conductors.
  - c. In glass hoistways, wiring shall be installed only in the locations shown with the requirement that wiring and conduit be hidden from public view.
  - d. The traveling cable shall run from a junction box on the bottom of car to a junction box approximately midway in the hoistway. The cable shall be anchored and suspended to minimize any strain on individual cable conductors. The cable shall be free from contact with the hoistway construction, car, or other equipment. The overall covering of cable shall remain intact between junction boxes. The Contractor shall ensure that the cable shall not bend to a radius less than 12 times the outer diameter at any position of elevator travel.
  - e. Traveling cable shall be suspended by the wire rope center or self-gripping devices where cable weight will not cause excessive crushing forces.
4. Splices and terminations of conductors shall be made only in outlet, junction. Splices in conduit or raceways will not be permitted. Splices and terminal connections shall be made only by means of solderless connectors and terminal lugs as specified. Splices shall be covered with electrical insulating tape to an insulation level equivalent to that of the conductors. Terminal lugs used for bonding connections to metallic structures shall be installed on bare/uncoated metallic surfaces to assure minimum contact resistance.
5. Grounding:
  - a. The Contractor shall be responsible for grounding and bonding all parts of the elevator metallic structure, equipment and raceway in accordance with the applicable requirements of the NEC and the codes and regulations of the jurisdictional authorities. An equipment grounding conductor will be furnished and installed by other trades in each feeder to the elevator machine room and terminated in a disconnect device or junction box.

8. Provide Mats of insulating rubber or other suitable floor insulation in the front of the Controllers.
  - a. The Resistance range shall be  $1 \times 10^4 < 1 \times 10^6$  and shall meet ANSI/ESD requirements.
  - b. The rubber mat shall be the width of the controller plus 12".
  - c. The length of rubber mat shall be a minimum of 24".
  - d. The rubber mat shall be a 1/4" thickness and beveled at each end.
- C. Hydraulic Elevator Cylinder
  1. The Contractor shall set the hydraulic elevator cylinders true and plumb
    - a. Dielectric Insulation Installation
      1. Each cylinder shall be electrically isolated from the building steel and other earth ground sources
      2. The following are minimum requirements:
        - a. Install an insulating gasket between the platen plate and floor of the elevator cab. Use insulating sleeves and washers on the bolts.
        - b. Use insulating pads to insulate the cylinder support members (channels) from the guide rails and other structures at ground potential.
        - c. Use insulating sleeves and washers on the bolts that connect the cylinder to the support channels.
        - d. Install an insulating coupling on the oil supply line between the pump and cylinder, located as close to the cylinder as possible.
  2. Insulating gaskets shall be installed in the same manner as a normal gasket.
    - a. Sleeves shall not be forced through misaligned bolt holes. Where misalignment occurs, the holes shall be reamed true, and all metal, chips shall be carefully removed.
    - b. The sleeves shall extend into the plastic washer on both sides of the flange. Any sleeves or washer cracked during installation shall be replaced immediately.
    - c. After making up the flange, the resistance of each bolt to the flange shall be tested using a 500-volt megohmmeter. If the resistance of any bolt is less than 50 megohms, the sleeve and washer shall be checked and changed, if necessary, to provide the required resistance.

### 3.03 DEMONSTRATION

- A. Acceptance Tests:

1. The Contractor shall submit an operational test plan to the Authority for approval. When each elevator, furnished, installed, and tested, is ready to be placed in interim service, the Contractor, at no additional cost to the Authority, shall perform operational tests described below. The Authority shall be notified at least 48 hours prior to each scheduled test so that arrangements can be made for the presence of appropriate personnel to witness the tests. Acceptance Tests and inspections will be based upon the elevator meeting the requirements of the Specification and as evidenced by the operational test shall be witnessed by WMATA representative.

**B. Elevator Tests**

1. When the elevator work is fully completed, the Contractor shall demonstrate to the satisfaction of the Authority and Authorities Having Jurisdiction that the proper operation of every part of the equipment complies with all applicable requirements including the ASME Code.
  - a. The inspection procedure outlined in the ASME A17.2 will form a part of the final inspection.
  - b. No shop test of elevator motor and no certified test sheets will be required.
  - c. The heating, insulation and resistance of the motors will be determined under actual conditions after installation.
2. The Elevator Contractor shall furnish all test instruments and materials, required at the time of final inspection, to determine compliance of the work with the Contract requirements. Materials and instruments furnished shall include standard 50-pound test weights, megohmmeter, voltmeter and ammeter, Centigrade calibrated thermometers, spirit level, and stop watch. At the time of final inspection, tests shall include, but not be limited to, the following:
  - a. After installation, each elevator shall be tested without load by the Contractor. The elevator shall be subjected to a test for a period of eight-hours continuous run. During the test run, the car shall be stopped at top and bottom levels, in both directions of travel with a standing period of 10 seconds at each landing.
  - b. Full-Load Run Test
    1. The elevator shall be subjected to a test for a period of one-hours continuous run, with full specified rated load in the car. During the test run, the car shall be stopped at top and bottom levels, in both directions of travel with a standing period of 10 seconds at each landing.
  - c. Speed Test
    1. The actual speed of the elevator car shall be determined in both directions of travel, with full specified rated load and with no load in the elevator car.

2. Speed tests shall be made before and after the full-load run test.
  3. For hydraulic elevators, speed shall be determined with a temporarily mounted tachometer on the guide rail or stop.
  4. Car speed when ascending shall be not more than 10 percent above not more than 10 percent below the specified car speed.
  5. Car speed when descending shall be not more than 25 percent above not more than 10 percent below the specified car speed.
- d. Temperature Rise Test
1. The temperature rise of the drive unit motor shall be determined during the full-load test run. Temperatures shall be measured as specified in NEMA and IEEE Standards. Under these conditions the temperature rise of the motor shall not exceed NEMA and IEEE specified temperature rise. Test shall be started only when all parts of equipment are within 9 degrees Fahrenheit of the ambient temperature at time of starting test.
- e. Car Leveling Test
1. Elevator car leveling devices shall be tested for ¼-inch accuracy of landing at all floors with no load in car and with full load in car, in both directions of travel.
  2. One re-level operation is permitted when full load is in the car.
  3. Accuracy of floor leveling shall be determined both before and after the full-load run test.
- f. Insulation Resistance Test
1. The complete wiring system of elevator shall be free from short circuits and accidental grounds. The insulation resistance of the system shall be more than one megohm when tested by using a 500-volt megohmmeter. The elevator structure, equipment, and raceway shall be tested for continuity to ground.

### 3.04 ELEVATOR PROTECTION

1. The finished elevator installations shall be completely barricaded and enclosed to preclude their use without permission of the Contractor until Final Acceptance and release by the Contractor for general use. The enclosure shall be fabricated to allow easy access for maintenance, testing and adjustment.

2. The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room, and ensure that it shall remain secure at all times until the completion of the Contractor's interim maintenance obligation.
3. Protection: During installation and until all elevator systems are fully operational and accepted by WMATA, make all necessary provisions to protect all elevator components from damage, deterioration, and adverse environmental conditions. Do not use or allow the use of the elevator for construction purposes such as hauling materials or worker transport during construction.
4. Security Of Machine Rooms: The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room and ensure it shall remain locked and secure at all times.
5. Field Painting:
  - A. The pit, pit walls and machine room floor shall be painted. All machine room equipment shall be given two coats of approved machinery paint. All new iron work shall be given one coat of rust-inhibiting paint.
  - B. Metal parts visible to the public shall be field painted where specifically shown or authorized by the Authority.

**3.05 MAINTENANCE**

The Contractor shall perform full maintenance service for a period of two years on each elevator in accordance with the manufacturer's maintenance manual and WMATA ELES maintenance program prior to WMATA providing permanent maintenance. The period of maintenance shall begin after test(s) and Provisional Acceptance of each elevator and shall extend to the scheduled date of Final Acceptance for all units in the same facility plus a period of two years. In no case shall the interval between inspections and testing be greater than one month. The maintenance service during the warranty period shall be provided by fully trained elevator mechanics. The maintenance tasks shall include, but not be limited to, the following:

- a. Inspection of completed installation and periodic testing to maintain the elevators in completely operable condition.
- b. Contractor shall provide support for periodic, accident and incident, PM compliance inspections.
- c. Lubrication of parts, and the protection of the equipment.
- d. Replacement of defective parts at no additional cost to the Authority.
- e. Annual clean down of the elevator and hoistway enclosure is required. Make necessary arrangements with Authority in order to minimize any inconvenience.
- f. Contractors performing maintenance are responsible for all service, repair work and emergency call. The contractors shall provide unlimited service during revenue hours and twenty-four (24) hour

(including Holidays) emergency call back service at no additional cost.

- 1) Provide twenty (24) hour (including Holidays) emergency service during the maintenance period consisting of a prompt response (within 1 hour) to emergency request by telephone or otherwise from Authority or designated representative if an elevator is inoperable or in case of injury, entrapment, or potential injury to persons.
  - 2) Unlimited service callbacks are included with a required response time of one (1) hour (including Holidays).
- g. Periodic maintenance (based on WMATA schedule) shall be performed off peak hours to minimize service interruption as long as the other elevator serving the same platform is operational.
  - h. Reporting: Detailed monthly records of tasks performed including names of individuals performing the tasks, date and time performed, and other pertinent data. In addition, the reports are to be provided in an electronic format acceptable to WMATA's needs.
  - i. Contractor performed maintenance shall follow the WMATA Office of Elevator and Escalator Operations procedures, schedules and check charts.

Within three (3) months prior to the termination of this contract, the Authority or his designated representative(s) shall make a thorough maintenance inspection of all equipment covered under this contract. The contractor shall provide personnel to remove, test, and operate equipment as necessary. All deficiencies found as a result of this inspection shall be corrected by the Contractor as required in this agreement with no additional cost for the Authority.

### **3.06 REMOTE MONITORING SPECIFICATIONS:**

- A. Allen Bradley DF1 or ELES Engineering approved equal or industry standard Modbus protocol shall be provided to transmit data from the Elevator/Escalator controller to the Authority's AEMS RTU computer control and data system. The Design-Builder shall provide a controller data interface to a DH-485 network located in the Elevator /Escalator machine room. The DH-485 controller interface shall be programmable for data rates up to 115Kbps. The interface shall allow other nodes such as other Elevator or Escalators to be readily incorporated into the DH-485 network. The controller data interface shall include one Allen Bradley SLC PLC per station to function as a data concentrator to consolidate data from all the controllers in the station. The software for the data concentrator shall be as specified by the Authority. The data concentrator shall receive controller data over the DH-485 data network and provide formatted data to the AEMS RTU through a RS 232 link. This data transmission may be accomplished by a separate PLC controller integrated into the control system.

- B. The Elevator /Escalator control system shall automatically initiate the transmittal of data when data is requested by the Authority's AEMS system and continue until all data is received by the AEMS RTU in the station AC switchboard room. The Authority will perform final integration of the data in the AEMS system.
- C. The Contractor shall also provide the required hardware to download data from any fault finding annunciator panel to a supplied laptop PC being utilized at the Elevator/Escalator location. The provided software shall permit the downloading and storage of data on the supplied laptop PC from multiple fault finding annunciator panels.
- D. The Contractor shall install an Allen Bradley network interface module, (model 1761-NET-AIC, or approved alternative) beside the PLC in the controller and provide 24 VDC power to the module. The Allen Bradley PLC will be used for remote monitoring capabilities into WMATA established engineering monitoring network.
  - a) The Contractor shall provide all wiring and programming of the PLC to communicate with station data concentrators on the DH-485 network. Coordinate work with WMATA ELES Engineering.
  - b) The Contractor shall pull all remote monitoring cables to the interface in the elevator controller from the remote monitoring network going back to WMATA's Automated Energy Management System (AEMS) remote terminal unit (RTU).
  - c) Provide Ethernet communication between the elevator machine room and WMATA's communication room. The communication port shall be located less than 6' from the controller and shall have minimum of two ports for data communication.

E. Terms and Definitions

- 1. Boolean - A single bit data type.
- 2. DF1 - A Rockwell Automation Company proprietary communications protocol.
- 3. DH485 - An industrial communications network used by Allen Bradley programmable controllers.
- 4. Integer - A data type 16 bit signed (range -32768 to 32767).
- 5. PLC - Programmable Logic Controller.
- 6. QEI - QEI Inc. Springfield NJ
- 7. RTU - Remote Terminal Unit

F. Elevator Remote Monitoring Data Specification

1. Overview

The design of the WMATA escalator & elevator monitoring system shall include a data concentrator PLC to gather data from the elevator control PLC's over an Allen Bradley DH 485 network or ELES Engineering approved equal. The QEI RTU shall read data from the WMATA data concentrator PLC via an RS 232 serial connection to a 1746-BAST (or ELES Engineering approved equal) module using Allen Bradley DF1 (or ELES Engineering approved equal) protocol. See figure 1.1 for reference. This specification defines data to be presented by the

WMATA data concentrator PLC to the QEI RTU. The WMATA data concentrator PLC station shall poll the escalator & elevator controller(s) periodically for data and format the data into blocks within the WMATA data concentrator. An Ethernet TCP/IP connection is available at the Data concentrator PLC. The data concentrator PLC has been designed to collect data from up to (10) escalators and/or elevators. The data concentrator PLC is to be mounted into the existing QEI RTU enclosures and powered by a 120 VAC source from within the RTU. For Metro stations where more than (10) escalators and elevators are present additional data concentrator PLC's will be required.

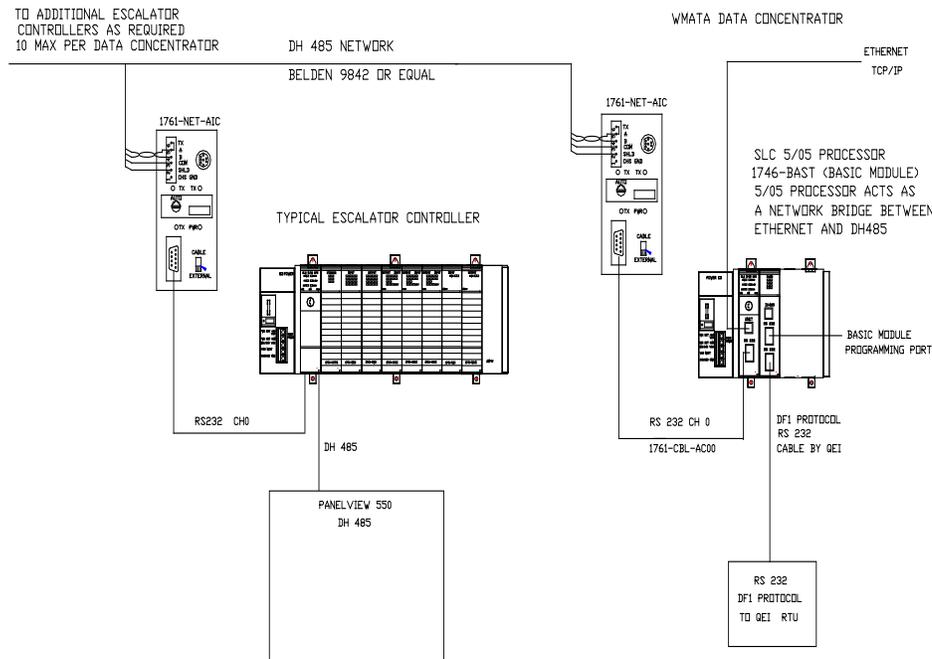

Figure 1.1

2. Data Concentrator PLC Data File Assignments.

The WMATA data concentrator PLC shall store data for up to (10) escalators and/or elevators in any combination as defined in table 2.1.

Concentrator PLC (DC)	25	N80	N79		
--------------------------	----	-----	-----	--	--

Each data file shall begin with word 1 (example: escalator #1 status bits begin with N20:1 and end at N20:20)

The data concentrator PLC communication ports shall be configured as follows.

**Channel 1**

Driver: Ethernet  
 IP Address: TBD  
 Subnet Mask: TBD  
 Gateway Address: TBD

**Channel 2**

Driver: DH485  
 Baud Rate: 19.2K  
 Node Address: 25

1756-BAST basic module communication ports shall be configured as follows.

**Port 1:** Programming port

Settings -- 19,200 Baud, No parity, 8 bits, 1 stop bit, No handshaking

**Port 2:** DF1 port

Settings -- 19,200 Baud, No parity, 8 bits, 1 stop bit, No handshaking

DF1 – Op Code 19 (Full Duplex, NHS, ER, Enable DPD, CRC error checking,

Timeout = 50

Retries = 3

RTS on delay = 20 msec

RTS off delay = 20 msec

Module address = 10

**DH485 Port** – Not Available

**3. Data Format**

Data Concentrator status in File N80 per table 3.0

**Table 3.0 Data Concentrator Status Bits**

19	INTEGER					
20	INTEGER					

Note: All analog values are multiplied by 16 in the data concentrator to bit shift left 4 bits to align with QEI's 12 bit analog data types.

A note on communication loss

A 60 second watchdog timer is coded into each escalator file. If communications are lost between the data concentrator and the escalator controller for more than 60 seconds the watchdog timer will timeout. When the timer has timed out the communications loss bit will be reset (0) to indicate the communications loss condition.

**3. Time and date sync**

The QEI RTU shall provide clock synchronization to the WMATA data concentrator PLC every 5 minutes. Table 4.1 defines the address and data format of the clock registers in the WMATA data concentrator PLC. The data concentrator PLC shall set the escalator controller date and time every day at 3 AM.

**Table 4.1**

FUNCTION	ADDRESS	FORMAT
YEAR	N13:10	4 DIGITS
MONTH	N13:11	2 DIGITS
DAY	N13:12	2 DIGITS
HOUR	N13:13	2 DIGITS 24 HOUR
MINUTE	N13:14	2 DIGITS
SECOND	N13:15	2 DIGITS

**4. Data Concentrator PLC Program**

The data concentrator PLC includes code to monitor up to 10 escalators and 5 elevators. Each escalators and elevators has an independent code file and a configuration bit. If an elevator is to be monitored the configuration bit must be set corresponding to the DH485 station address of the elevator controller. If the configuration bit is reset (0), the status and analog data table values for the elevator or escalator will be set to 0.

The configuration bits are as follows.

Escalator Configuration Bit	DH485 Address of Escalator Controller	Elevator Configuration Bit	DH485 Address of Elevator Controller
B9:0/1	1	B9:1/1	11
B9:0/2	2	B9:1/2	12
B9:0/3	3	B9:1/3	13
B9:0/4	4	B9:1/4	14
B9:0/5	5	B9:1/5	15
B9:0/6	6	B9:1/6	16
B9:0/7	7	B9:1/7	17
B9:0/8	8	B9:1/8	18
B9:0/9	9	B9:1/9	19
B9:0/10	10	B9:1/10	20

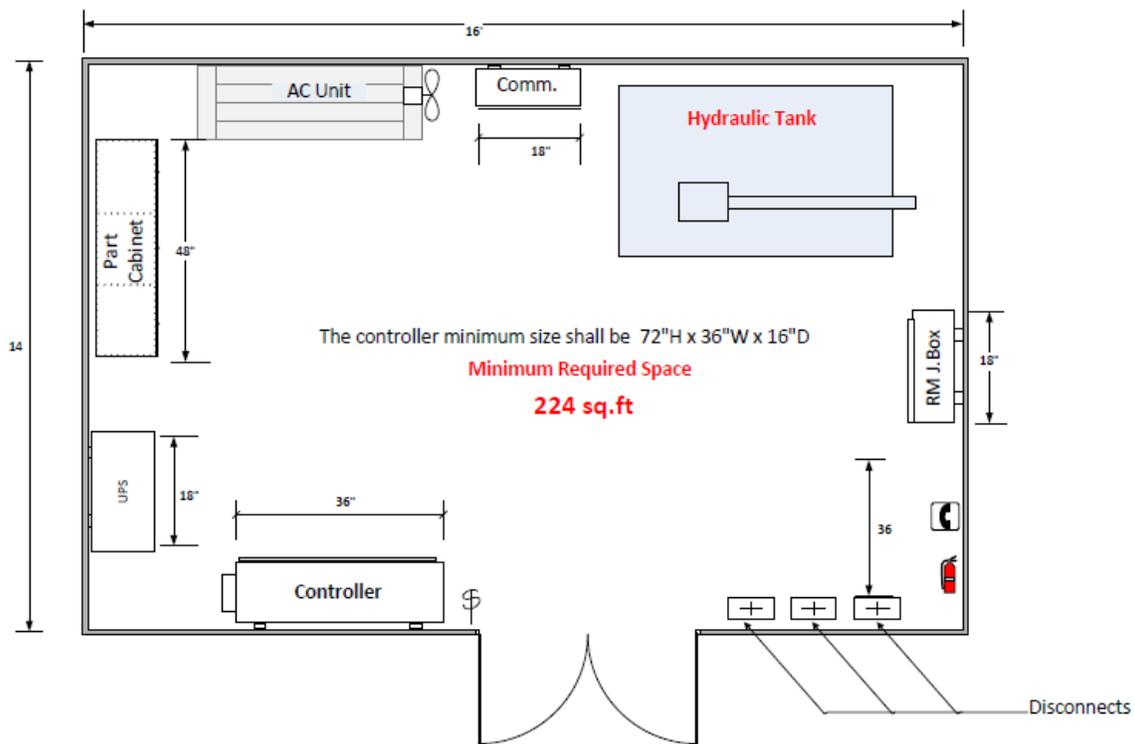

### 3. Data Concentrator Gateway IP addresses.

The Data concentrator PLC acts as a gateway between the Ethernet and DH485 networks. The PLC contains a list of IP addresses, known as the routing table which will be allowed access to the DH485 network. The routing table will contain 20 addresses.

**3.07 EXHIBIT 1. Hydraulic Single Elevator Machine Room**

**END OF SECTION**

**SECTION 14210  
HOLELESS HYDRAULIC**

**PART 3 – GENERAL**

**3.01 DESCRIPTION**

- A. This section specifies work pertaining to heavy-duty hydraulic passenger elevator systems including elevator cars, hoistway equipment, hydraulic piping, valves, cylinders, machinery, control systems, indicators, signs, elevator pit ladders and finish work in the vicinity of the hoistway doors as shown on the Contract Drawings and as specified..
- B. The following sections include related requirements and are performed by other trades:
  - 1. Specifications Section 02000 – Site Construction
  - 2. Specifications Section 05000 – Metal Fabrication
  - 3. Specifications Section 08800 – Glass and Glazing
  - 4. Specifications Section 09920 – Painting
  - 5. Division 7 Section “Waterproofing” for water proofing of elevator pit
  - 6. Division 15 Sections for heating, ventilating and/or air conditioning of elevator machine room.
  - 7. Division 16 Sections for electrical service to elevator equipment, fire alarm systems and communications systems.
- C. Definitions:

All terms in this specification have the meaning as defined in the ASME code.

  - 1. Heavy duty elevator: An elevator designed specifically for the harsh environment and duty load cycles common to transportation system usage.
  - 2. Elevator - a hoisting and lowering mechanism, equipped with a car or platform, which moves in guide rails or racks and serves two or more landings
  - 3. Elevator, passenger - an elevator used primarily to carry persons other than the operator and persons necessary for loading and unloading.
  - 4. Elevator, hydraulic - a power elevator in which the energy applied, by means of a liquid under pressure, in a hydraulic jack.
  - 5. Contractor: The General Contractor.
  - 6. Installer: The responsible party who installs the elevator.
  - 7. OEM: Original Equipment Manufacturer.

8. Dwell time: The period of time the elevator is at a landing while the doors open, passengers transfer and doors close.
9. Substantial completion: The point at which the elevator is ready for use, whether the site is finished or not. This is where the jurisdictional inspection usually takes place.
10. Final Acceptance: The point at which the owner accepts the elevator project as being complete including all submittal requirements. This may be a different point in time than substantial completion.
11. Interim Maintenance: Maintenance from the point of substantial completion, but prior to Revenue Service.
12. Beneficial Use: When the elevator is placed into service, may be prior to the site being ready for public use.
13. Revenue Service: The station or facility opening date.
14. Notice to Proceed (NTP): within this document shall mean the date which the elevator installer is notified to proceed with the project.
15. Override Switch – A switch located in a kiosk panel, which disables the Hall Call Buttons.
16. MSDS - Material Safety Data Sheet.
17. BOM - Bill of Material
18. SMNT - Systems Maintenance (WMATA)
19. WMATA: Washington Metropolitan Area Transit Authority.

### 3.02 REFERENCES AND QUALITY ASSURANCE

- B. Codes, Regulations, Reference Standards and Specifications.
  6. Comply with codes and regulations of the Authority Having Jurisdiction.
  7. American Society of Mechanical Engineers (ASME) A17.1 Safety Code for Elevators & Escalators and A17.2 Guide for Inspection of Elevators, Escalators and Moving Walks.
  8. WMATA Design Criteria requirements indicated in Section VI-Mechanical.
  9. American Institute of Steel Construction (AISC).
  10. American Iron and Steel Institute (AISI).
  11. American National Standards Institute (ANSI): C80.1
  12. American Society for Testing and Materials (ASTM): A36, A123, A153, A167, A240, A264, A276, A500, A653, B3, B8, D471.
  13. American Wire Gauge (AWG).
  14. Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG).

15. American Welding Society (AWS): D1.1.
16. Environmental Protection Agency (EPA).
17. Federal Transit Administration (FTA).
18. Institute of Electrical and Electronic Engineers (IEEE): 1202.
19. International Code Council (ICC) – International Building Code (IBC).
20. National Association of Architectural Metal Manufacturers. (NAAMM): C54, C55.
21. National Institute of Standards and Technology (NIST).
22. National Electrical Code (NEC).
23. National Electrical Manufacturers' Association (NEMA): WC 70, KS 1, AB 1, 250, PB 1, MG 1.
24. National Electrical Safety Code (NESC)
25. National Elevator Industry, Inc. (NEII)
26. National Fire Protection Association (NFPA): NFPA-130-2003.
27. Occupational Safety and Health Act (OSHA).
28. Society of the Plastics Industry (SPI).
29. Underwriters' Laboratories, Inc. (UL), UL-94HB, 6, 50, 62, 98, 360, 486, 489, 514, 1591.
30. United States Department of Transportation (DOT).
26. Any additional requirements imposed by local agencies and/or codes having jurisdiction shall be incorporated into elevator installation.
27. In the event of a conflict between codes, regulations, these specifications or standards, the most stringent requirement as determined by the Contractor and approved by the Authority shall take precedence unless specifically addressed herein.

**B. Elevator Manufacturer and/or Installer's Qualification:**

1. **Manufacturer Qualification:** : Shall provide documents stating that their firm has successfully produced elevators for transit system applications for a minimum of ten (10) years and regularly engaged for the past five (5) years in the manufacture of major components for hydraulic passenger elevators. As a standard of quality the elevator equipment design and installation shall comply with the Code.
2. **Installer's Qualifications:** Shall be the original manufacturer of elevator equipment or manufacturer's authorized agent who is trained and approved for installation of units required for this Project.
3. The Contractor shall obtain and pay for all permits and licenses and perform all required inspections.

**C. Quality Assurance:**

1. The elevator contractor shall guarantee the materials and workmanship of the apparatus furnished under these specifications and will correct any defects not due to ordinary wear and tear within two (2) years from date of completion of each elevator, inclusive of labor and traveling expenses. Defective work shall be repaired or replaced at no additional cost to the Authority.
2. Welding: Welding shall be performed in accordance with the requirements of AWS or CWB Welders shall produce evidence of current certification by AWS or CWB.
3. Labeling Requirements: Every elevator shall be clearly marked with rated load and speed, manufacture serial number and the designated Authority identification.
  - a. All elevators shall be permanently numbered with number designations corresponding to the indications on the kiosk annunciator panel. A station sketch showing the elevator numbers shall be submitted for WMATA ELES Engineering. The elevators shall be numbered in sequence, starting at the north entrance left to right facing to the elevator at each station and proceeding clockwise around the station. The numbering shall proceed into the station toward the end of the platform. Corresponding numerical identification shall be affixed to the equipment in the machine rooms. The elevator numbering shall be approved by the ELES Engineer.

**3.03 SUBMITTALS**

Submit the following for approval in accordance with the Contract Documents and with the additional requirements as specified.

A. Product Data

1. The summation of product information shall be submitted, in tabular form, of all parts incorporated in the entire group of elevators supplied under this Contract.. Hard copies and electronic copies on the Flash Drive/Compact Discs (CDs) shall be submitted.
  - a. Manufacturer's design data, material specifications, drawings, installation and maintenance instructions including preventive, predictive and general maintenance, and other data pertinent to the components used in the elevator systems, including, but not limited to, detailed repair data for all components, including disassembly, inspection/gauging/torque requirements, reassembly, testing and other related information. Submittals shall cover all mechanical components, operating panels and indicators and electronic equipment to control and monitor elevator control functions. Exploded view drawings shall be included to facilitate repair and maintenance functions.
  - b. Lubricants, sealers, paints and any other potentially hazardous substances are subject to review and approval by the Authority. The Contractor shall submit the necessary Material Safety Data Sheets.
2. The following information shall be provided:

- a. Nomenclature of part.
  - b. Elevator Contractor's part number
  - c. Nomenclature of next higher assembly in which used.
  - d. Manufacturer and part number.
  - e. Model number(s) of elevator(s) on which used.
  - f. Total quantity in entire group of elevators.
  - g. Current unit price to the Authority.
  - h. Recommended spare parts list showing parts with prices for each part. The parts listing shall be provided on or before 90 days prior to scheduled completion
3. Loads on supporting members, reaction points, and deflections under varying loads.
- a. Loads imposed on the structure shall be coordinated with the Authority and not exceed agreed limits. This requirement shall be verified, documented, and stamped by a registered Professional Engineer Supporting calculations shall be provided for record file.

B. Shop Drawings

The contractor to provide detailed drawings that shows the dimensions and tolerance, specification that may include the material specification, hardness or electrical rating for each component that is being used. In regards to assemblies they must provide a top level drawing with BOM and quantities with detailed material specifications and drawings with dimensional tolerances. The contractor also to provide as-built CAD models of all elevator components.

The name of the manufacturer and type or style designation shall be listed on the each page of the equipment shop drawings. Drawings submitted shall include, but not be limited to, the following.

- a. Fully dimensioned layout in plan and elevation, showing the arrangement of equipment and all pertinent details of each specified elevator unit, including as appropriate
  - 1. All equipment located in machine rooms.
  - 2. Location of circuit breaker, switchboard panel or disconnect switch, light switch, and feeder extension points in machine room. These electrical components shall not be blocked by anything.
  - 3. Location in hoistway of outlets for connection of traveling cables for car light, fire detectors, communication, and control system.
  - 4. Car, hydraulic cylinder and plunger, supporting beams, guide rails, buffers, and other components located in the hoistways.

5. Maximum guide rail bracket spacing. Guide rail brackets shall be provided at every horizontal structural member and shall be of sufficient strength to meet the ASME Code.
  6. Reactions at points of supports.
  7. Weight of principal parts.
  8. Top and bottom clearance and over-travel of car.
  9. Complete wiring diagram of the elevator system and subsystems. Complete data regarding electrical characteristics and connection requirements.
  10. Refuge space on top of car and pit.
  11. Cab design, dimensions and layout.
  12. Color/material schedule and selection chart for cab and entrance features.
  13. Hoistway Ventilation - Thermostatically Controlled, positive mechanical ventilation system.
  14. Hydraulic Jack Details
  15. Machine/Pump Room area, pit and hoistway layout.
  16. Hydraulic piping layout indicating layout, type, size, and schedule of piping from machine room to elevator pit(s) indicating orientation of valve(s), and location of shut-off valve(s), and shall include calculations of working pressures.
- b. Drawings of the hoistway entrances and doors showing their method of operation, details of construction, and fastenings to the structural members of the station structure.
  - c. Drawings of the car for each design specified, showing dimensions, details of construction, fastenings to platform, car-lighting, ventilation, air conditioning (if applicable), communication, and location of equipment.
  - d. Cuts or drawings showing details of all signal and operating devices, identifying graphics, and detailed design with diagram and schematic of kiosk annunciator panel.
  - e. Hydraulic drive:
    1. Cylinders and plunger.
    2. Power unit, including volume, rate of flow, working pressure, rpm of pump, and horsepower, voltage, frequency, service factor and rpm of the motor.
    3. Piping, fittings, and couplings.
    4. Valves.
    5. Storage tank.
    6. Muffler.

- 7) Hydraulic Jack Details Drawings
  - 8. Fluid flow diagram showing all valves, operating devices, and controls.
  - 9) Complete assembly detail of machine/pump, hydraulic tank mounting, with all load calculations.
- f. Elevator controller, including manufacturer's technical data and catalog cuts, and interface hardware and software requirements.
  - g. Power door operator.
  - h. Door interlocks and electrical contacts including test reports showing that hoistway door interlocks, car door contacts, and car top emergency contacts meet the requirements of the ASME Code and certification by the NIST or other approved laboratory.
  - i. Car ventilation fan.
  - j. Car Air Conditioning (if applicable)
  - k. Car lighting.
  - l. Cabling.
  - m. Buffer, including stroke and certified maximum striking speed for car.
  - n. Communication and intrusion system design details covering electrical, mechanical, and architectural aspects.
  - o. Design and architectural details, including light ray unit locations, of the electrical protective device for car doors.
  - p. Where the use of adjoining dissimilar metals is required, descriptions of protective measures to be employed to avoid corrosive damage.
  - q. Certification from independent testing laboratory that glazing gaskets meet the specified requirements.
  - r. Hall and car fixtures at each landing including the car operating panel (COP).
  - s. Interface wiring diagrams with other systems showing terminal board location and identification.
  - t. Expected heat dissipation of elevator equipment in machine room and control areas (i.e. BTU's/hr.) based on 240 round cycles per hour.
  - u. Complete wiring diagram of the elevator system and subsystems. Complete data regarding electrical characteristics and connection requirements.
  - v. Complete assembly detail of machine/pump, hydraulic tank mounting, with all load calculations.
  - w. Lubricants, sealers, paints and any other potentially hazardous substances are subject to review and approval by the Authority.

The Elevator Contractor shall submit the necessary Material Safety Data Sheets.

C. Samples

6. Three of each of the following samples shall be submitted for approval:

- a. Steel cladding: Baked-enamel finish, six inches square. The sample shall show the rust-protected surface of the base metal on one side and the prime and finish coats (stepped) of enamel on the other side, although both sides of actual panels are to be enameled as specified.
- b. Sheet metal: Six inches square of thickness and finish specified.
- c. Stainless steel cladding: 12 inches square of thickness and finish specified.
- d. Glass: 12 inches square.
- e. Floor covering: 12 inches square in the color and finish to be supplied.
- f. Neoprene gasket: Each type.
- g. Landing selector button mounted in cover plate with identity marking alongside button.
- h. Signs: One of each type.
- i. Ceiling material.

D. Certification:

- 1. Certificates of inspection and acceptance issued by Jurisdictional Authority.
- 2. The Acceptance Inspection (Specifications and Code) by the Elevator and Escalator (ELES) Department shall take place prior to the Final Acceptance Inspection by the Jurisdictional Authority, and the elevators and associated equipment shall be free of defective material, imperfect work and faulty operation.

All defective work identified by ELES representatives shall be repaired or replaced at no additional cost to the Authority prior to the Final Acceptance Inspection by the Jurisdictional Authority.

E. Operation & Maintenance Manuals.

Six sets of the approved manuals, elevator installation, operation instructions, troubleshooting techniques and related equipment drawings and software (all publication must be in English) – two copies of which to be delivered to the WMATA/ELES Engineer representing the Authority prior to installation. Each binder shall have the Binder Cover and Spine Insert which contain the Station Name and Unit ID.

Submit an additional electronic copy on Flash Drive(s)/CD(s). The Information shall be saved/presented as follows:

- a. Graphic images in “.dwg” AutoCad and “.pdf” formats. All revisions shall be made by

using computer software. Hand written changes are not acceptable.

b. Text in Microsoft Word .doc, “.pdf” or approved equal format.

The manuals shall include the following:

1. Complete operation and maintenance Instructions of the elevator equipment included complete illustrated, exploded views of all assemblies and a complete illustrated, exploded view for identification all system parts.
2. Complete nomenclature of replaceable parts, part numbers, current cost, and warehouse location. If product source is another vendor, Contractor shall include name and address of other vendor.
3. Furnish a summation, in tabular form, of all parts incorporated in the elevators supplied under the Contract. Include but not be limited to the following:
  - a. Nomenclature of part.
  - b. Contractor's part number.
  - c. Nomenclature of next higher assembly in which used.
  - d. Manufacturer and part number.
  - e. Model number of elevator on which used.
  - f. Total quantity.
  - g. Current unit price to the Authority.
  - h. Serial numbers of all serialized assemblies, subassemblies, motors, and other major components supplied and installed.
4. Control and schematic electrical wiring diagrams of controller including wiring of safety devices.
  - a. Wiring Diagrams shall be full size (11x17), ladder type, complete "as-built" wiring and single line diagrams showing the electrical connections, functions and sequence of operation of apparatus connected with each elevator, using standard symbols or proprietary symbols defined on the diagram, both in the machine room and in the hoistway, shall be furnished in duplicate for each elevator.
  - b. Wiring diagrams shall incorporate the wiring identification labeling to identify the controller and field wiring used for each circuit. Wiring diagrams shall have sheets numbered with an indication of the total number of sheets in the diagram set. Each page should include unit number where the diagram belongs to.
  - c. After approval, a copy of each print (11x17) shall be laminated and mounted with non-metallic holder in each elevator machine room. A reproducible .003 mil Mylar set of wiring diagrams for each elevator shall be delivered to ELES Engineering Office.
  - d. Coded diagrams are not acceptable.

5. Complete detailed drawings and wiring diagram of elevator system.
6. Lubricants, sealers, paints and any other potentially hazardous substances are subject to review and approval by the Authority.
  - a. Provide MSDS for all the lubricants/chemicals.
  - b. Provide manufacturer part number.
  - c. Provide name of the manufacturer.
7. Detailed lubrication and cleaning schedule.
8. Procedures for adjusting all elevator components.
9. Complete set of contract software including operating control software.
10. Detailed, record and as-built layout drawings.
11. The entire manual, all software upgrades and service tools for elevators shall be provided in an electronic format on Flash Drive/CD-ROM that is acceptable to the WMATA Engineering and Maintenance Department.
12. All hard copy publications shall be in loose-leaf form, on 30-pound paper and with punch holes reinforced with plastic, cloth or metallic material.
  - a. The O&M manual shall only contain information related to equipment installed under this contract. Generic information that does not pertain to the equipment installed shall not be included. Scanned documents are not allowed. The fonts should be standard format.
  - b. All covers shall be resistant to oil, moisture, and wear commensurate with their intended use. Diagrams and illustrations shall not be loose or in pockets. All printed material shall be capable of being reproduced on dry copying machines.
13. Each elevator shall be treated as a whole and not as a grouping of disassociated parts. The material in the Wiring Diagram Manual shall be organized and indexed by the elevator classifications included in this Specification. All manual sections shall be sub-divided, to the extent required by the subject matter, and shall include, but not necessarily limited to the following topics:
  - a. General system or sub-system description and operation.
  - b. Sequence of operation.
  - c. Replacement and step by step adjustment procedure for all components and systems.
  - d. Block diagrams.
  - e. Functional schematics.
  - f. Functional as-built wiring diagram.
  - g. Lubrication and cleaning, including frequency, methods, and trade identifications of recommended materials.
  - h. Component location and description.

- i. Inspection and maintenance standards including wear limits, settings, and tolerances.
  - j. Installation and removal sequence.
  - k. Test and evaluation procedures.
  - l. Spare parts lists and special tools.
14. The contractor shall provide all information: manuals, drawings, design changes, modifications, techniques, procedures and any other documents related to maintenance, safety, operations which relate to any part, component, system, subsystem or material and applicable to the elevator equipment. All operating, programming, control software and licensing keys (if applicable) to the PLC control system for the installation.
15. All of the above referenced shall be provided as it pertains to the original installation and for a period of ten (10) years after final acceptance of the elevator. During a ten (10) years period, In case of any items are obsolete or no longer available from the manufacturer the Elevator Contractor shall provide the alternative products.

**3.04 SYSTEM DESCRIPTION AND PERFORMANCE REQUIREMENTS**

A. Design Requirements:

1. General:

- a. Elevators furnished under this Contract shall be of the heavy duty automatic, hydraulic-type with direct-acting plunger.
- b. All parts shall be built to standard dimensions, tolerances, and clearances so that similar machines and devices supplied under contract are completely interchangeable. Elevators shall be designed with provision for thermal expansion and contraction of complete elevator assemblies and for any movement of the facility.
- c. Fasteners: Fasteners shall be compatible with materials being fastened. Fasteners shall be furnished with self-locking nuts or retaining rings (spring washers, toothed disks). Fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened. The mechanical fastening used throughout the equipment on parts subject to wear and requiring replacement shall be key and seat, nut, screw, or other removable and replaceable type not requiring physical deformation or field positioning. The use of rivets or similar devices will not be acceptable as mechanical fastenings for such parts.
- d. Doors of elevators shall be of the horizontal sliding type, single speed, center-opening. The doors shall be arranged for low-speed electric power operation.

2. Capacity, Speed, Travel, Platform Size

- a. All parts of the elevator equipment shall be of such design, size, and material as to satisfactorily function under all conditions of loading and operation within its rated load and speed, all with a proper factor of safety, maximum mechanical and electrical efficiency, and a minimum wear on parts.
  - b. Hydraulic elevators shall have sufficient capacity to lift the rated load at 150 feet per minute, with a tolerance of plus or minus 8.0 percent.
  - c. The rated load shall be exclusive of the weight of the complete car and shall be determined in accordance with ASME Code requirements for passenger-elevators required to carry freight, Class C3 (ASME A17.1 Section 2.16) or 4500 lbs, whichever is greater.
  - d. The travel, location, terminal floors, number of stops and openings, and the overall car platform size shall be as shown on the Contract Drawings.
  - e. The anticipated freight load (cart) will be approximately 4 feet-1 inch by 2 feet in plan, supported on four 8-inch wheels with 2-inch wide treads spaced approximately 2 feet-4 inches center-to-center longitudinally and one foot five inches center-to-center transversely. The loaded cart will weigh approximately 1,260 pounds.
  - f. The entrance of the cart into the elevator car will produce eccentric forces which, acting through the guide rails, will result in additional deflections and deformation on the hoistway. These deflections and deformations shall not exceed 1/16 inch and shall not be permanent.
  - g. The top enclosure shall be reinforced to support two men and capable of sustaining, without damage or permanent deformation, a load of 300 hundred pounds on any area one feet square and 100 pounds applied at any point. An emergency exit shall be installed in the car top in conformance with the Code.
  - h. Car travel shall not exceed 15 feet with Holeless type hydraulic elevator.
- B. Performance Requirements
- 1. The elevators shall be designed for continuous operation seven days per week, 24 hours per day.
  - 2. Elevators shall be designed to be capable of operating with full specified performance capability while exposed to the climatic and environmental conditions described in the following paragraphs. In addition, during installation and until the beginning of scheduled maintenance service, the elevators will be subject to more extreme environmental conditions. The elevator shall be furnished the amount of protection necessary to prevent any damage to or deterioration of the elevators during this period.

- a. Elevators shall be designed to operate in dry bulb temperature range of  $-10^{\circ}\text{F}$  to  $140^{\circ}\text{F}$  and operate while exposed to the natural elements of weather, including sunlight, rain, snow, slush, salt; all condition of relative humidity, de-icing chemicals, debris, airborne dust, and corrosive elements.
  - b. The elevators shall have a special winter operation. The elevators shall be designed to operate in the event the outside temperature falls below a pre-established minimum value. The elevator contractor shall furnish and install the necessary timers and thermostat to accommodate the desired function
3. Sound Level: No elevator car or elevator power unit shall generate noise in excess of NC45 sound level. Measurement of noise shall be made at a point 3 feet from the hoistway, machine room entrances, and ventilation openings, either free running or under load. For multiple elevator installation, the noise measurements shall be made with only one (1) elevator unit in operation, but with the entire installation complete and in operating condition. An ambient level not to exceed forty-nine (49) decibels shall be maintained prior to units being turned on.
  4. Hoistway Movement:  
Elevators shall be designed to sustain the load and operate with the following lateral movements of the hoistway structures:
    - a. In any individual glazed area: 1/4 inch.
    - b. In total height of hoistway structure:
      1. Aerial and surface structures: 5/8 inch
      2. Underground structures: 1/2 inch
  5. The elevator assembly shall be designed in a manner to avoid corrosion and galvanic action due to physical contact between dissimilar metals or due to other causes.
  6. Reliability:
    1. Each elevator shall be capable of operating at full load under any of the normal modes of operation at a level of availability of not less than 98 percent over a period of 365 days.
    2. Availability (A) is defined as the portion of normal operational time during which the equipment is available for use. Or

$$A = \frac{MTBF}{MTBF + MTTR}$$

Where:

*MTBF* = Mean time between failure in days

= Operating time,  $t$  (in days) /Number of failures in time  $t$

*MTTR* = The average time in days required to restore an elevator to operation after a report of a failure.

B. Seismic Loads

6. In accordance with VA-USBC 2003, all structures shall be designed to resist the effects of earthquake motions.
7. The elevator shall be designed to comply with the seismic zone 2 requirements of ASME A17.1.

C. Make provision for and provide a closed circuit television camera (CCTV), in the elevator car(s) with the ability to monitor the CCTV from the Kiosk annunciator panel. Submit drawings for approval before fabrication.

- a. Provide electrical connections, through shielded traveling cables, between camera and the communications terminal block in machine room or pit.

D. Painting: The pit, pit walls and machine room floor shall be painted. All machine room equipment shall be given two coats of approved machinery paint. All new iron work shall be given one coat of rust- inhibiting paint.

E. Workmanship:

1. Joints shall be welded their full length and dressed smooth and flush on exposed surfaces. Spot welding shall be used where practicable in preference to screw or rivet fasteners.
2. Sheet metal materials shall be accurately rolled and leveled, and have smooth finish and uniform color. Joints shall be formed to a tight fit, with abutting edges flush, and shall be securely welded or riveted together in such a manner as to give strength equivalent to the solid sheet. Riveted construction shall have heavy reinforcement on the back, and no rivets shall show on exposed surfaces, Welds shall be solid and dressed flush, and holes for screws or bolts shall be drilled and countersunk.
3. Wrought work shall have joints milled to a tight even fit and, where possible, shall be made without screws. Square turns and comers shall be sharp, Curves and loops shall be true and without visible joints. Abutting members shall be welded, riveted or both. Similar bars shall be halved at intersections and wide bars shall be punched for the small bars to pass through.
4. The finished work shall be strong, rigid and neat, painted in appearance. Plane surfaces shall be smooth and free from warp or buckle. Molded members shall be clean cut, straight, and true. Miters shall be well formed and in true alignment. Fastenings shall be concealed from face side of the material.

G. Corrosion Protection: The contractor shall design the elevator assembly in such a manner to avoid corrosion and galvanic action due to physical contact between dissimilar metals or due to other causes.

### 3.05 PROJECT SITE CONDITIONS

- A. The project site premises shall be visited by the Contractor to thoroughly familiarize with all details of work and working conditions. All dimensions shall be verified in the field and by comparison with the station structural and finish (information) drawings and the Authority shall be informed of any discrepancy before ordering equipment or performing work. Coordination and proper relation of this work to the structure and to the work of all trades shall be performed.
- B. The elevator installer shall install all elevator wiring in the embedded conduit provided by other trades including that to the kiosk. Other trades will bring wiring for their services to either the elevator machine room or the elevator pit, terminated on a terminal block. The elevator installer shall extend wires from the terminal blocks to the appropriate location or device within the elevator enclosure or hoistway. Some of these circuits shall require shielded wires or separate isolated circuits.

### 3.06 WARRANTY

Warranty: Two (2) year warranty of construction shall start at Final Contract completion.

- A. The OEM shall warrant in writing that all equipment manufactured and installed under this specification, for a period of twenty four (24) months from the date of Final Acceptance by the Authority, be free of defects in design, materials, and workmanship, under normal use and service. Defective work shall be repaired or replaced at no additional cost to the Owner.
- B. The warranty shall include materials and labor necessary to correct defects.
- C. The warranty does not begin until all of the following requirements have been met.
  - 1) The Operations and Maintenance Manuals are accepted by WMATA.
  - 2) The required training has been completed to the satisfaction of WMATA.
  - 3) All field tests have been successfully completed.
  - 4) The acceptance testing has been successfully completed.
  - 5) The elevators are in service for passenger/public use.
  - 6) The State and local jurisdictions have inspected the elevators and issued the respective certificates of Operation.
  - 7) All spare parts have been delivered and received by WMATA.
  - 8) Any discrepancy identified by the ELES representative shall be repaired or replaced by the Contractor at no additional cost to the Authority.

### 3.07 OPERATION AND MAINTENANCE TRAINING

- A. Training: The Contractor shall develop and provide operation, troubleshooting and maintenance training in accordance with the General Requirements  
The following training requirements shall be met:
  - 1. Three days of classroom plus two days hands on training on the field shall be provided for 10 students per class. Six training session for a total of 60 students is required.
  - 2. Time and place of training will be determined by the Authority, but

- must be completed no later than 30 days prior to the Final Completion.
3. Training shall be organized to make optimum use of the required maintenance and operation manuals including training for replacement of all parts contained in the Parts Inventory list.
  4. At the completion of the first training session, a narrated and properly edited training video shall be submitted for the authority on DVD or flash drive. The video shall be taken by the professional camera operator with quality image and sound track and will be used for the future trainings. The video shall cover operation of the elevator, function of the devices, maintenance, adjustment procedures and troubleshooting. The following items shall be included as minimum requirements:
    1. Step by step adjustment procedure on the followings:
      - 1.1 Door operators, DCL, DOL, full door opening, and so on...
      - 1.2 Valve adjustment
      - 1.3 Car Leveling and adjustment of leveling sensors and vans
      - 1.4 Door: door interlock, proper pressure, restrictors ...
      - 1.5 Pump motor: belt tension and alignment
    2. General overview of major items:
      - 2.1 Packing:
      - 2.2 Piston:
      - 2.3 shut of valve
      - 2.4 Controller:
      - 2.5 Controller display:
      - 2.6 Hydraulic pump
      - 2.7 Hydraulic tank
      - 2.8 Door sills
      - 2.9 Guide rails
    3. Daily operation and sequence of operation
    4. Replacement and Installation of components:
      - 4.1 hydraulic packing
      - 4.2 door photo eye
      - 4.3 Hydraulic valve
      - 4.4 Door clutch
      - 4.5 Door pickup rollers
    5. Proper guide roller adjustment
    6. Verification of safety circuit
    7. Maintenance procedure and Frequency of maintenance
    8. Proper access of pit and top of car for inspection
    9. Proper test of fire service operation
    10. Proper lubrication of components
    11. Troubleshooting techniques
    12. How to use proper communication device, machine room, car top, and kiosk

5. Provide one additional copy of all required submittals to the ELES Engineer for Authority use.
  6. Provide two copies in DVD format of training materials along with visuals and handouts to the Engineer for the Authority use.
    - a. Video shall be narrative.
    - b. Video shall be separated by major components Sections
    - c. Equipment Identification shall be as a part of the section title.
  7. Separate training manual shall be submitted for approval prior the scheduling of the training. The O&M manual shall not be used as a training manual.
- B. Scope of Work
6. All training, as described below, shall take place prior to Final Acceptance of equipment or materials by the Authority. Operations and maintenance training may take place as a combined class by agreement of the Office of Elevators and Escalators (ELES). The minimum number of ELES employees to be trained will be no fewer than 60 total with a maximum of 10 per class. Those persons will be identified by WMATA. The contractor shall video tape all training sessions and provide WMATA/ELES with edited copy of the recording as stated above.
  7. Operations training shall be tailored specifically to the furnished and installed equipment, and designed to teach the day-to-day operation of all equipment. The training shall be sufficient to bring personnel to a level of operating proficiency such that routine vendor support is not needed.
  8. Maintenance Training shall be tailored specifically to the furnished and installed equipment, and designed to develop the knowledge and skills required to maintain all item(s) delivered.
  9. Maintenance training shall be subdivided into two major levels as follows:
    - a. System Level Maintenance Training, covering:
      1. Theory of operation of the system and its major components.
      2. System configuration.
      3. Preventative maintenance, consisting of written procedures and schedules for the periodic maintenance of all equipment.
      4. Written and validated inspection procedures and a system-level trouble-shooting guide (to the lowest field-replaceable unit).
    - b. Shop Level Maintenance Training, covering
      1. Detailed theory of operation to module, board, and/or device level.
      2. Component level troubleshooting and component replacement and adjustment.

3. Testing and alignment procedures of repaired units.
- C. Deliverables
6. The following course materials shall be delivered by the Contractor, according to the following specifications:
    - a. An Instructor's Guide containing all the information and direction necessary for the instructor to make an effective presentation. It shall include adequate guidelines to conduct a comprehensive training program. Individual lessons within the course shall be organized as separable blocks (or modules) which may be taught as a unit. The Instructor's Guide shall contain, as a minimum:
      1. Discussion of student prerequisites (if any).
      2. Program overview.
      3. A statement of overall program goals.
      4. Lesson plans (a session-by-session outline containing the following):
        - a) Student learning objectives, stated in measurable term
        - b) Overview of each lesson.
    - b. A Student Manual including all materials for the student to interact in the learning situation. It shall contain, as a minimum:
      1. Program overview and introduction.
      2. Statement of overall program goals.
      3. Learning objectives, stated in measurable terms that specifically describe desired behaviors or knowledge to be gained.
      4. A fully developed prose treatment (not outline format) of content presentation, developed in the same modular format as the Instructor's Guide.
      5. Illustrations, charts, photos and other graphics of actual system components as needed to enhance content presentation.
      6. The training manuals shall be prepared and submitted for approval to WMATA/ELES prior to training. The training manuals shall include procedures for adjustment and replacement of all electrical and mechanical components, and a troubleshooting guide.
    - c. Audio-visual Aids consisting of a narrated video of not less than 90 minutes duration to include, but not limited to, the following:
      1. General overview of major features.
      2. Daily operations.

3. Maintenance procedures (lubrication, adjustments, critical measurements, etc.).
  4. Frequency of maintenance procedures.
  5. Parts replacement safety devices, lighting, etc.
  6. Verification of safety circuits, methods of accessing and preserving computerized functional data if required.
  7. Step by step adjustment procedures and installation of components.
  8. Handouts, transparencies and/or slides as necessary to ensure clear and comprehensive presentations.
  9. The training video shall be taken from actual equipment installed under this contract by the professional camera operator.
- D. Supplemental Materials consisting of a functional mock-up or a functional representation is required of any equipment that requires theoretical discussion. This may be in the form of an animated schematic, a model of the equipment, an actual device, an interactive video training device, or an Authority approved substitute. All mock-ups shall become the property of the Authority for eventual turn over to WMATA/ELES.
- E. The final copies shall be delivered to the Authority as follows:
6. One complete set of training materials that is completely camera-ready. Camera-ready copy is defined as typewritten or typeset originals or high-quality copies such that further copies can be made from them with no noticeable decrease in copy quality.
  7. Five copies of all student and instructor materials, to be used for archival purposes, in the WMATA ELES Technical Library.
  8. A set of complete student materials including training manuals for each participant enrolled in training classes. The O&M manual, training manuals and special tools shall be approved by the Engineer and delivered to the Authority for eventual turn over to WMATA ELES.
  9. The contractor shall video record all training sessions and provide WMATA/ELES with edited DVD copy of the recording to be used as training guide for other WMATA ELES employees.
- F. The following specifications shall be met in instructional delivery:
6. Instructor Qualifications. A description of instructor qualifications, a resume, curriculum vitae, or other description of instruction qualifications must be submitted at least 60 days prior to the presentation of training. The description shall document a thorough knowledge of the equipment being taught, an understanding of the adult learning process, and demonstrated experience in vocational instructional. The ELES Engineering Office will review and approve the Instructor candidacy.
  7. Course length - The length of the course shall be 5 working days with 3 days in the classroom and 2 days hands-on training.

8. Student qualifications - For the purposes of course development and presentation, vendors shall assume all WMATA students are high school graduates (or equivalent), and that maintenance personnel will possess the ability to use basic hand tools and electronic test equipment.
9. Testing. Instructors must give written and/or practical tests as a measuring device to determine knowledge transference. Tests shall use a multiple-choice or short answer format, and have been validated in a pilot course or by some other means agreed to by the Authority and Contractor. Whenever possible, a practical hands-on test shall be developed to demonstrate the transference of operational/ mechanical skills.

### **3.08 SPARE PARTS AND SERVICE FACILITY**

#### **A. Spare Parts**

At the expiration of the warranty requirements of the General Provisions, the Contractor is responsible to provide a source for spare parts and service facility in the United States which can be obtained for an additional five years. If product source is another vendor, Contractor shall include name and address of other vendor.

1. The Contractor shall propose and provide a spare parts inventory to be approved by the Engineer and provided to the Authority not less than 90 days prior to scheduled completion, equal in value to seven percent of the cost of each elevator.
2. This provision requires the furnishing of a Recommended Spare Parts and Special Tools List based on manufacturer's recommendations, defines criteria to be used by the Contractor in developing spare parts recommendations; defines the manner of identifying spare parts on the list and the labeling and identification of spare parts upon delivery; and the timing of delivery of spare parts.
3. Elevator parts list, grouped by system and subsystem for stocking identification and the list shall contain the following information for each item listed:
  - a. Component name and Part number(s)
  - b. Manufacturer's name
  - c. Model number(s)
  - d. A blank column for WMATA's part number
  - e. Manufacturer's recommended quantity (see Section 1.08A.4 below)
  - f. Anticipated annual usage
  - g. Unit price
  - h. Special storage and handling requirements
4. The manufacturer's recommended quantities shall be based upon the following reliability, usage and lead time considerations:

- a. Wear: Components which may be expected to require replacement under normal maintenance schedule and operations, such as mechanical parts subject to continuous operation within projected mean time between failure levels.
  - b. Consumables or Expendables: Components which are consumed, used up, destroyed, or upon failure, are otherwise made usable for their intended purpose and are economically unrecoverable except for inherent scrap value.
  - c. Recoverable or Repairable: Components which, upon failure, are capable of being repaired or remanufactured to a serviceable, operational condition and maintained available for use within their initial intended purpose.
  - d. Long Lead: Components that are not available from commercial distributors or within 48 hours from the manufacturers such as specifically made or selected components.
5. Cross referencing: Where replacement components are common to more than one system or subsystem, include a cross reference and indexing system in the replacement components list:
  6. Non-Unique parts: In all components lists, items that are not unique to the system and have been manufactured by others shall be identified by the manufacturer's name and part number.
  7. WMATA will provide the Elevator Contractor with shipping instructions, with WMATA part numbers for each item the Elevator Contractor is required to furnish.
  8. The parts shall be shipped to the locations as directed by the Authority. Shipping documents shall identify the Contract number, manufacturer's part number, quantity, unit price and WMATA part number.
  9. Spare parts shall be properly packaged or crated so as to prevent damage during shipment and long-term storage. An individual packing slip shall be included inside the package or crate.
  10. Spare parts shall be the same in all respects as their counterparts furnished as a part of the assembled equipment to be delivered.
  11. Parts furnished in accordance with this provision are WMATA spares, separate and distinct from any Contractor obligation to replace parts, components or assemblies under any warranty provision.
  12. Parts lists contained in Operations and Maintenance Manuals provided under the Contract shall include assigned WMATA part numbers.
  13. A Manufacturer's Recommended Spare Parts List shall be provided. Parts to be provided shall be based on the criteria described herein and require Authority approval and shall be provided prior to Final Acceptance.
  14. Any Special Tool(s) used including, but not limited to, troubleshooting, maintaining the elevator, software and/or hardware shall be provided as part of the spare parts to the Authority. Any tools provided shall be the

same as those issued to the Adjuster and equivalent members of the subcontractor's staff.

- B. The finished elevator installations shall be completely barricaded and enclosed to preclude their use without permission of the Contractor until Final Acceptance and release by the Contractor for general use. The enclosure shall be fabricated to allow easy access for maintenance, testing and adjustment.
- C. The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room, and ensure that it shall remain secure at all times until the completion of the Contractor's interim maintenance obligation.

#### **1.09 SPECIAL TOOLS**

- A. A complete set of special tools and instruments necessary for troubleshooting, maintenance, repair and making all adjustments on every part of the elevator installation, including software and hardware shall be furnished for each elevator and delivered to the Engineer as part of the spare parts inventory. Tools that are designed specifically for tasks associated with elevator inspection, maintenance and repair or that are required for these tasks, and are not readily available through normal purchasing channels are defined as special tools.
- B. Any "Special Tool equipment" that is required to troubleshoot, maintain, adjust, and test the system; the tool/equipment shall remain operational for the life of the equipment.
  - a. Provide all special tools and equipment necessary for making all system adjustments to the signal and speed controller and door equipment. A programming unit, approved by equipment manufacturer (OEM) such as a laptop with 4GB memory, 15-inch display and DVD drive, with all software packages required to setup and program all equipment in the elevator system shall be provided, one per station or location. Software shall be provided for the display unit, DeviceNet, motor drive, if applicable, and any other programmable devices, as well as for the controller PLC. Any hardware or software required for configuring, programming and or communicating to controller or any parts of the elevator shall be submitted to ELES engineering. Using the provided laptop, the contractor shall demonstrate loading, downloading (programming) any and all software that is required for the elevator for all operating needs. This includes display, PLC and any I/O controls. All special tools shall be new and to be provide with casing. No special tools with decaying circuits or clocks are permitted.
- C. Keys: Provide ten (10) sets of keys per elevator to operate all keyed switches and locks prior to completion of the first unit.

#### **1.10 AUTHORITY COORDINATION:**

The elevators shall not be in service for passenger/public use until all of the following requirements have been met.

1. The Operations and Maintenance Manuals have been approved and received by WMATA.
2. The Training and Student Manuals as well as video record of all training sessions have been approved and received by WMATA
3. The required training has been completed in accordance with this specification.
4. All field tests have been successfully completed.
5. The acceptance testing has been successfully completed.
6. All spare parts have been delivered and received by WMATA.
7. All Special Tools/Equipment and Software have been delivered and received by WMATA.
8. All discrepancies identified by the WMATA's CEI (Certified Elevator Inspector) representative shall be completed.

## **PART 4 – PRODUCTS**

### **4.01 MANUFACTURERS**

- D. The major elevator components shall be the products of one of the three manufacturers of established reputation, except they may be the products, either wholly or in part, of another manufacturer of established reputation provided such items are capably engineered and produced under coordinated specifications to ensure a high grade, safe, and smooth operating system. Also, the major components to be furnished for this project shall be of a make or makes that have performed satisfactorily together under conditions of normal use for not less than one year in at least two other elevator installations of equal or greater capacity and speed.

### **4.02 MATERIALS**

- A. Stainless Steel
  1. Shapes and Bars:
    - a. ASTM A276, Type 304 or 301 for non-exposed components, and Type 316, all finish panels and exposed components.
  2. Plate, Sheet, and Strip
    - a. Over 1/8 inch, ASTM A264 with ASTM A240, Type 316 on ASTM A36 base;
    - b. Under 1/8 inch, ASTM A167, Type 304, Type 316, for all finish panels and exposed components.
  3. Stainless steel finish shall be NAAMM NO.4 with vertical grain.
  4. Stainless steel screws, bolts and nuts shall be used for fastening and shall be AISI Alloy 303.
- B. Steel Sheet and Steel Fabrications
  6. Steel sheet for top enclosure shall be minimum 12-gauge.

7. Steel sheet for hoistway door frame shall be minimum 12-gauge.
8. Steel sheet for corrugated floor decking shall be minimum 10-gauge.
9. Steel sheet for subfloor shall be minimum 3/8-inch thick.
10. Galvanized steel material shall comply with ASTM A123, ASTM A153, and ASTM A653 (G90 Coating) as applicable. All steel sheet and steel fabrications, except lubricated machinery parts, which are not shown or specified to have other applied finishes, shall be galvanized.

C. Steel Finishes

6. Where visible to the public, steel surfaces shall have a baked enamel finish unless otherwise shown.
  - a. Color shall meet the requirements as shown in the finish schedule on the contract drawings.
  - b. Baked enamel finish shall consist of a thorough hot chemical cleaning process, a six-step zinc-phosphate process, two prime coats, and one finish coat of sprayed acrylic enamel (1.25 mils thickness minimum), baked at 350°F for a minimum of 30 minutes.
7. Fasteners

Fasteners securing removable sheet metal materials shall be operable with the aid of simple tools and concealed wherever possible. When the framework to which the metal is fastened is less than 1/4-inch thick, steel backup plates 1/4-inch thick shall be added with tapped holes and clearance holes where necessary. Exposed fasteners shall match the color and finish of the material being fastened, and shall be tamperproof flat-head machine screws of a captive screw fastener design.

- a. Fasteners shall be compatible with materials being fastened.
- b. Fasteners shall be furnished with self-locking nuts or retaining rings (spring washers, toothed disks).
- b. Fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened.

#### 4.03 EQUIPMENT AND COMPONENTS

- A. The hydraulic elevator drive shall be of the oil-electric type with direct-acting plunger, power unit, oil storage tank, and control equipment. The power unit, storage tank, and associated control equipment shall be mounted in the machine room.
1. Cylinder and Plunger:
    - a. The cylinder and plunger unit shall be designed and constructed in accordance with the applicable requirements of the ASME Code and other applicable codes. It shall be of sufficient size to lift the gross load to the height specified and shall be factory-tested at a pressure of 400 psi. Gray cast iron or other brittle materials shall not be used in the construction of the cylinder and plunger unit. The cylinder shall be coated on the outside to prevent rust and corrosion. The bottom of the cylinder shall be closed and the top provided with an internal guide bearing and a cylinder head. The cylinder head shall be equipped with an adjustable packing gland designed to effectively prevent leakage of oil. A scavenger pump shall be provided to return oil to the system. It shall be located so as not to obstruct the path between the pit entrance and the cylinder.
    - b. The packing gland shall be constructed to permit easy repacking.
    - c. The cylinder shall be provided with a means to release air or other gas and shall have a drip ring below the packing gland to collect all oil leakage.
    - d. The cylinder shall be secured to a support, provided by the Contractor, which will transfer and distribute the load to the floor of the hoistway pit.
    - e. Plunger of built-up construction shall be secured to the car platform by means of a suitable platen.
    - f. Plunger shall be designed to prevent its leaving the cylinder.
    - g. The cylinder shall be isolated from rails, pit channel, building structure and other sources of possible corrosive or galvanic damage by dielectric insulation of the cylinders.
    - h. The cylinder shall be coated with corrosion-rust resistant primer and painted with a dark gray industrial epoxy or other approved paint.
  2. Cathodic Protection
    - a. The cathodic protection shall be provided for cylinders and piping and shall be provided by dielectrically isolating the cylinder and piston from the car platen, pit support structure, and pressure piping.
    - b. Gaskets and pads for dielectric insulation shall be neoprene or approved alternative. Insulating sleeves, washers, and oil line coupling shall be provided where specified or shown.

### 3. Power Unit

- a. The power unit shall consist of a screw-type or gear-type oil pump driven by an electric induction motor with oil control valves, combined in a self-contained unit fabricated of structural steel. Power unit drive motor is specified under Electrical Work (See Section. Submersible units will not be accepted.
- b. The oil pump shall be especially designed and manufactured for hydraulic elevator service. It shall be designed for a steady discharge with minimum pulsation to give smooth and quiet operation. The pump shall be of proper size and shall deliver oil into the cylinder in sufficient quantity and pressure to lift the elevator car with specified load at specified speed. During downward trip of elevator, the oil shall be returned to the tank by gravity.
- c. Geared pumps, when used, shall be provided with accurately cut herringbone or helical gears. The gears shall operate under flooded suction in an accurately machined case with close clearances to assure maximum efficiency. An effective strainer shall be provided in the suction line to the pump. The power unit shall be equipped with a vibration isolation device suitable for use with and approved by the power unit manufacturer. The vibration isolation shall effectively prevent the transmission of power unit vibration to the machine room structure.

### 4. Piping, Fittings, and Couplings

- a. Piping, fittings, and couplings shall be furnished and installed between the storage tank, pump, muffler, valves, and cylinder complete with necessary supports.
- b. All connections between the discharge side of the pump, check valve, muffler, cylinder, and lowering valves shall be of rigid steel with screw, flanged, welded, or approved mechanical couplings.
- c. Pipe supports shall be provided within 12-inches of every change of direction in piping.
  1. Supports shall not be more than 10-feet apart.
  2. Secure vertical runs properly with iron clamps at sufficiently close intervals to carry weight of pipe and contents and provide supports under pipe to floor.
  3. Furnish and install all piping from remote machine room to hoistway, including necessary supports and/or hangers.
- d. Size of pipe and couplings between cylinder and pumping unit shall be such that fluid pressure loss is limited to 10 pounds.
- e. Mechanical couplings, when used, shall be of a self-centering type that provide for some degree of deflection, contraction, and expansion.

1. Couplings that provide for partial or full separation of the two sections of piping being connected are acceptable, provided all other specified requirements are met.
  2. Couplings shall be rated for a pressure at least three times the working pressure of the elevator and shall be so designed that failure of the flexible sealing element or gasket shall not permit the separation of the parts connected.
  3. Flexible sealing elements or gaskets shall be of a type and material suitable for use with the hydraulic fluid furnished.
- f. Where piping, fittings, and couplings supplied by the Contractor are contained within sleeves, conduit, trenches, troughs, or other passage means provided by others to allow for the connection of the power unit with the cylinder and plunger, the Contractor shall provide appropriate devices which shall effectively prevent the transmission of vibration to the surrounding structure.
  - g. The Contractor shall install all piping, fittings, and couplings used to connect the power drive to the cylinder and plunger in such a way that these may be removed and replaced at a future date. When Victaulic is used, there shall be access for inspection and maintenance. Destruction of portions of these items in the process of removal is acceptable but efforts shall be made in the designs to minimize the necessity to destroy items.
5. Valves
- a. Valves shall be of the unitized manifold type with no more than four solenoids and arranged so that all adjustments are individually adjustable without the need for sequential readjustment. Valve shall be designed to ensure that oil flow will be controlled in a positive and gradual manner, thereby ensuring smooth starts, operation, and stops of the elevator car.
  - b. Valves shall be designed for quiet operation and shall be mounted above the storage tank in a manner that allows leakage to drain back to the tank.
  - c. A safety check valve shall be provided which will function to hold the elevator car with rated load at any point when the pump stops or the maintained pressure drops below the minimum operating pressure required holding the car in place.

- d. A manually operated lowering valve shall be provided, which shall permit the manual lowering of the elevator car in the event of power failure. The location of the lowering valve and access to it shall be described in white stenciled lettering on the front panel of the pump unit. The lowering valve operating means shall be easily and readily accessible and unobstructed by the valve wiring, conduits or other equipment. A tank shut-off valve shall be provided to permit isolating the oil in the tank during maintenance operations. The location and orientation of the valve shall allow for safe operation of the handle throughout its range of travel.
  - e. All additional pump relief valves and other auxiliary valves required by the ASME Code or necessary to provide smooth, safe and satisfactory operation of the elevator shall be furnished and installed.
  - f. Any relief valves having exposed pressure adjustment shall have their adjustment sealed after being set to the correct pressure.
  - g. Manual shut-off valves shall be provided in the hydraulic oil line in the elevator pit and in the elevator machine room. In any portion of its travel, the machine room shutoff valve handle shall not intrude in the walk space or work space or obstruct access to other equipment.
6. Storage Tank
- a. The storage tank shall be constructed of steel and shall be provided with a steel cover, protected vent opening, overflow connection and a valved drain connection. Tank shall act as a storage tank only. Suitable gauge glasses shall be provided if the top of the tank is over 4 feet above the floor. An initial supply of oil sufficient for proper operation of the elevator shall be provided. The tank shall have a capacity equal to the volume of oil required to lift the elevator to the top terminal plus a reserve of not less than 10 gallons.
  - b. The oil storage tank cover shall be arranged for easy unobstructed access. Clearance of 24 inches vertical and 18 inches horizontal from tank cover shall be maintained for ease of service.
  - c. The permissible minimum liquid level shall be clearly indicated. The manufacturer's recommendation of type of oil to be used shall be included in the written instruction for the care, adjustment, and maintenance of the equipment. The flash point of oil used shall be not less than 400 degrees F.
  - d. Provide an oil filtering system that removes contaminants that can clog valves and settle in the bottom of the tank.
7. Blowout-proof foil-hydraulic muffler of an approved make shall be furnished and installed in the oil line near the power unit to reduce noise to a minimum.

8. Oil Temperature Control/Tank Heater: Hydraulic oil viscosity/temperature control shall be provided by the application of an internally mounted, thermostatically controlled, tank heater. The oil temperature shall be maintained at a maximum 110 degrees Fahrenheit with the use of a 120 VAC powered tank heater. Unit shall be permanently mounted, integral with oil reservoir, and with a lighted switch/indicator to visually confirm unit is powered. Tank heater shall include the switch for disconnection of power during maintenance/repair operations. Unit shall be hard wired to electrical source per ASME A17.1.
9. Elevator Car Buffers: Heavy-duty spring buffers shall be provided, mounted on the supporting channel or block on the pit floor. The buffers shall comply with the requirements of the ASME Code. Buffer anchorage at pit floor shall be arranged to avoid damaging the waterproofing.
10. Car guides consist of a guide rail and guide-rollers. Guide rails for the elevator cars shall be of planed steel standard T-section. Guide rails shall be erected plumb and parallel with a maximum deviation of 1/8 inch and shall be securely fastened to the bracket or other supports by approved heavy rail clamps.
11. Car Roller Guides:
  - a. The elevator car shall be provided with roller guides.
  - b. Roller guides shall be spring-loaded and allow rail-to-rail and front-back adjustment of the rollers.
  - c. Three or more rollers per guide and shall have 4-inch minimum sound-deadening wheels.

B. Operation:

1. Operation shall be automatic. Automatic operation by means of car and landing buttons. Stops registered by momentary actuation of car buttons to be made irrespective of number of buttons actuated or of sequence in which buttons are actuated.
2. Operating station in car containing bank of buttons numbered to correspond to landing served position indicators. EMERGENCY CALL button, keyed EMERGENCY STOP button, DOOR OPEN/DOOR CLOSE buttons, independent maintenance key switch, and key-operated light and fan switches, with legends as specified. Identification as specified for emergency telephone. Emergency call button connected to bell that serves as emergency signal. Panel finish: Stainless Steel.
3. Landing: Single push-button fixture at each terminal landing. Button fixture having push buttons with UP and DOWN legends at intermediate landing. Button identification as specified for Person with disabilities per latest ADA regulation (ADA rule 4.10.3).
4. Momentary pressure on car button or landing button illuminates that button, which remains illuminated until call is answered. Illuminated buttons serve as visual indication that call has been registered and that car will stop at that landing. The Push Buttons shall be flush, round, have a Metalized Halo and center jewel. The metalized halo shall be from different color and approved by ELES Engineer.

5. Stops, registered by momentary actuation of landing buttons. All stops subject to respective car or landing button being actuated sufficiently in advance of arrival of car at that landing to enable stop to be made. Direction of travel for idle car established by first car or landing button actuated.
6. UP landing calls answered while car is traveling in up direction and DOWN landing calls answered while car is traveling down, car reversing after uppermost or lowermost car or landing call has been answered and proceed to answer car calls and landing calls registered in opposite direction of travel.
7. Elevators to park at the secure landing level selected by the Engineer.
8. Push-button units to be Dupar US85 or approved equal with button identification as specified by latest ADA regulation.
9. Emergency-stop shall be key operated rather than push-pull arrangement with key removal only in off position.
10. All elevator car control panel operating devices shall be designated by Braille and by raised standard alphabet characters for letters, Arabic characters for numerals, and standard symbols as required by the Code and ADAAG.
11. Lettering shall have a highly visible coloring, such as white, that is permanently affixed.
12. Independent Service: Provide a key switch in the car operating panel which, when actuated, shall cancel previously registered car calls, disconnect the elevator from the hall buttons and allow operation from the car buttons only. Car door shall remain open unless closed fully by the door close button.
13. Two-Stop Collective Simplex Automatic Operation:  
The two-stop collective simplex automatic operation shall be used and checked for the following:
  - a. System shall be designed so that when the car is standing at either terminal landing, pressure on car button for the other terminal shall automatically dispatch car to that landing. Pressure of landing button at either terminal landing shall call car automatically to that landing. If a landing call is registered while the car is making its trip, that call shall remain registered until the car responds to that call. If no car calls are registered car shall start automatically and respond to hall calls. Provide time limit relay arranged to hold car at landing at which it has stopped for predetermined time after car stops. After all car landing calls have been answered, car shall remain parked at landing where last used with car and hoistway doors closed until another call is registered. Pressing the landing button at floor at which car is parked shall automatically open car and hoistway doors. In all normal operations, the starting of the car shall be contingent upon establishment of hoistway door interlock and car door circuits.

- b. Automatic dispatching operation: all two stop elevators shall include "Step-in-and-Go" feature. Calls for the opposite landing will be automatically set when the elevator opens its doors for a hall call. This feature shall be provided for all elevators that have public access for two stops (i.e., any elevators with key operated service landings will be included).

C Position Indicators:

1. Car indicator: In accordance with ADA requirements. Mounted in vertical row in car-operating panel to show position of car in hoistway by illumination of indicators corresponding to landing at which the car is stopped or passing. Finish for exposed-to-view metal components: Stainless Steel.
2. Landing indicator: In accordance with ADA requirements. Two-element direction-of-travel indicator mounted above call station or hoistway entrance as shown, including one red and one white indicator. Direction of car's operation shown by illumination of red indicator for DOWN and white indicator for UP.
3. In-car signals: Audible signal indicating car's direction of travel, signal sounding once for UP direction and twice for DOWN direction.
4. Landing signals: Audible signal at each hoistway entrance indicating car's direction of travel, signal sounding once for UP direction and twice for DOWN direction.

D. Lighting:

1. Machine Room Emergency Lighting: Emergency lighting shall be provided in each elevator machine room.
  - a) There shall be a minimum of one lighting fixture.
2. Car interior: LED fixture, 120-volt operation, with clear prismatic glass diffuser, flush mounted in ceiling, cool white bulbs. Illumination level shall be 15-foot candles minimum at car operating panel.
3. Car top and underside of car floor: Medium-base porcelain lamp receptacles, with wire lamp guards.
4. Car Emergency Lighting:
  - a. Fixture: Recess mounted, with stainless steel frame, location as shown.
  - b. Diffuser: Prismatic polycarbonate plastic.
  - c. Lamps: Two, size 16-51
  - d. Remote power supply:
    - 1) Power pack: Sealed gel cell battery with integral regulating charger and an alarm bell.
    - 2) Capable of operating bell for one-hour minimum and light at car-operating panel at 0.2 low candles minimum for four hours minimum.

- 3) Location: in top of car or COP with easy access provided.
- E. Inspection Operation: Key switch in car to nullify car and landing buttons permitting operation of elevator from top of car for inspection purposes:
1. Top of Car Inspection Station: The Inspection Station contains continuous pressure UP and DOWN buttons, emergency stop button and toggle switch to activate inspection devices. The device shall also have an 110v ac outlet for extension cord and provided with a light and guard.
- F. Leveling: Automatic leveling device to stop car within 1/8 inch of landing level regardless of load or direction of travel. Landing level maintained within leveling zone irrespective of hoistway doors being open or closed.
- G. Emergency Service:
1. Controls to return elevator to designated floor by means of key-operated switch outside street or ground floor hoistway entrance in compliance with ANSI/ASME A17.1.
  2. In-car control during emergency operation by means of key switch in compliance with ANSI/ASME A17.1.
  3. Terminals on elevators controllers for connection of circuit from heat and smoke sensing devices, with wiring from sensing devices to elevator controller.
- H. Telephone Facilities:
1. Provide all audio/visual communication, signaling, and monitoring in accordance with ADA and ANSI. "Hands-free" phone integral with control panel, mounted in accordance with ADA requirements; having inscription EMERGENCY TELEPHONE as specified for Person with disabilities; finish exposed-to-view components to match stainless steel control panel; color of letters to contrast with panel.
    - a. Provide emergency communicators in accordance with ADA requirements to include auxiliary push button to summon help and visual feedback indicating that the call has been responded to.
  2. Provide wiring and jacks for a portable self-contained battery-powered maintenance telephone system. Jacks shall be located on car top, inside car, and in machine room. Furnish three telephone instruments for use of maintenance personnel.
- I. Electrical Equipment:
1. Electric equipment for elevator shall be designed, selected, and fabricated in accordance with NEC, NEMA, IEEE, ANSI Standards, applicable jurisdictional codes, and additional specified requirements. All equipment including motors, controllers, service cabinets, circuit breakers, switches, panelboards, indicators, lighting, wiring, conduit, boxes and other appurtenances for proper installation and operation of the elevator shall be furnished and installed by the Contractor.

2. Cable and wire for external circuits between the various items of elevator equipment, exclusive of the traveling cable, shall comply with the requirements specified below. The talk pair of the voice communications intercom system shall be shielded with 0.008-inch, minimum, copper shield.
  - a. General Requirements for Single-Conductor and Multiple-Conductor Cable:
    1. Type and size: As shown or as required by code.
    2. Rated voltage: 600 volts.
    3. Conductors:
      - a) ASTM B3 or ASTM B8 annealed copper
      - b) Size 10 AWG and smaller: Solid or Class B or Class C stranded.
      - c) Size 8 AWG and larger: Class B stranded.
      - d) Other constructions as specified.
    4. Standards: Except as modified, wires and cable complying with the following:
      - a) Cross-linked polyethylene (XLPE) insulated cable: NEMA WC 70.
      - b) Other cable: NEMA WC 70.
    5. Nonmetallic jacket for single-conductor cable and individual conductors of multiple-conductor cable and as overall covering on multiple-conductor cable:
      - a) Chlorosulfonated polyethylene, or cross-linked polyolefin.
      - b) Cross-linked polyolefin complying with the following physical requirements.
    6. Properties tested in accordance with NEMA WC 70 if ethylene-propylene-rubber (EPR) insulation is used, or with NEMA WC 70 if cross-linked polyethylene insulation is used. Jacket material free of PVC and PVC-based compounds.
      - a) Tensile strength, minimum pounds per square inch: 1,800.
      - b) Elongation at rupture, minimum percent: 150.
      - c) Aging requirement: After 168 hours in air oven test at 100EC, plus or minus one degree C:
        - a) Tensile strength, minimum percentage of unaged value: 100.
        - b) Elongation at rupture, minimum percentage of unaged value: 80.

- d) Oil immersion: 18 hours at 121EC, plus or minus one degree C, ASTM D471, Table 1, No. 2 oil:
    - a) Tensile strength, minimum percentage of unaged value: 80.
    - b) Elongation at rupture, minimum percentage of unaged value: 80.
    - c) Jacket materials other than cross-linked polyolefin complying with NEMA WC 70. Jacket material free of PVC and PVC-based compounds.
  - e) Flame retardancy: Single-conductor and multiple-conductor cable demonstrating flame retardancy in accordance with the following:
    - a) Single-conductor cable and individual conductors of multiple-conductor cable passing vertical flame test in accordance with UL 1591 or NEMA WC 70. Cable size for testing: 14 AWG.
    - b) Single-conductor and individual conductors of multiple-conductor cable passing vertical tray flame test using ribbon gas burner in accordance with IEEE 1202.
    - c) Multiple-conductor cable passing vertical tray flame test, using ribbon gas burner in accordance with IEEE 1202.
  - f) Applied voltage testing:
    - a) Single-conductor cable and individual conductors of multiple-conductor cable to be given applied ac voltage dielectric strength test, i.e., six-hour water-immersion test.
    - b) For single conductors of multiple-conductor cable, conduct tests prior to assembly as multiple-conductor cable.
    - c) Test procedures:
      - (a) Polyethylene insulated conductors: In accordance with NEMA WC 70
      - (b) Other conductors: In accordance with NEMA WC 70.
- b. Single-Conductor Cable:
- 1. Insulated with ethylene-propylene-rubber with non-metallic jacket or unjacketed filled cross-linked polyethylene. UL-labeled Type RHW or XHHW.

2. Color coding: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
- c. Multiple-Conductor Cable:
1. Individual conductors:
    - a) Number of conductors: As shown or as required by code.
    - b) Construction: Complying with one of the following:
      - a) Insulated with ethylene-propylene-rubber, with or without nonmetallic jacket as specified.
      - b) Insulated with composite compound of ethylene-propylene-rubber and polyethylene, UL Class EPCV, without outer jacket.
      - c) Insulated with filled cross-linked polyethylene without jacket.
    - c) Phase and neutral conductors: Individually insulated.
    - d) Neutral conductors: Same size as phase conductors.
    - e) Bare ground conductors: Sized in accordance with the NEC, unless otherwise shown.
    - f) UL-listed as Type RHW or XHHW.
  2. Conductors assembled with nonwicking, flame-retardant filler to form cable of circular cross section.
  3. Metallic-sheath: Provide one of the following
    - a) Continuous smooth aluminum sheath in accordance with NEMA WC 70.
    - b) Continuous corrugated aluminum sheath in accordance with NEMA WC 70.
    - c) Interlocked aluminum tape armor.
    - d) Multiple-conductor cable provided with overall nonmetallic jacket as specified.
    - e) Cable UL-listed as follows: Metallic-sheathed cable: Type MC, suitable for wet and dry locations.
  4. Color coding:
    - a) Power cables: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
    - b) Control cables: In accordance with NEMA WC 70
- d. Fixture Wire: UL 62, with the following additional requirements:

1. Type: Suit temperature rating of lighting fixture, minimum 194EF.
  2. Conductor: Stranded copper conductor 16 AWG or larger as shown.
- e. Bare Conductor: ASTM B3 or B8, annealed copper conductor; 8 AWG and larger, class B stranded.
3. Traveling Cable
  - a. The elevator car traveling cable shall be type ETT conforming with the requirements of the NEC with minimum conductor sizes as specified in the NEC. Individual conductors in the cable shall have a distinctive color code for identification. Each traveling cable shall have one two-conductor stranded 18 AWG, twisted shielded pair for elevator intercom and a minimum of ten spare conductors. Traveling cable exceeding 100 feet in length shall have steel supporting fillers. Traveling cable 100 feet or less in length shall have steel or non-metallic fillers.
  - b. For surface elevators only, the traveling cable shall be provided in addition to the above requirements, with one RG-6u coaxial cable, and one two-conductor, twisted shielded pair, stranded 18 AWG power cable for CCTV camera.
4. Connector, Terminal Lugs and Fittings
  - a. In accordance with UL 486.
  - b. For 10 AWG and smaller conductor cable: Tin-plated copper pressure connectors with nonflammable, self-extinguishing insulation grip with temperature rating equal to that of conductor insulation.
  - c. For 8 AWG to 4/0 AWG conductor cable: Tin-plated copper compression connectors and terminal lugs with insulating sleeve or heat shrinkable insulator for insulation grip.
  - d. For multiple-conductor cable: Watertight aluminum fittings with stainless steel pressure ring and set screws or compression cone for grounding of aluminum sheath of Type MC cable.
  - e. Terminal lugs used for bonding connections to metallic structures shall be installed on bare/uncoated metallic surfaces to assure minimum contact resistance.
  - f. All wires shall run inside conduits. Wires and cables shall not be spliced inside or outside of conduit. Wire and cable shall only be connected at terminal strips or devices inside boxes, controller or approved enclosures.
5. Self-extinguishing nylon bundling straps having a temperature range of minus 65EF to plus 250EF shall be used for bundling or cabling of conductors where required. Strap shall have a hub complete with stainless steel locking barb on one end and a taper on the other.

6. Conduits and Fittings:
  - a. Rigid conduit and fittings shall be UL-Listed rigid galvanized steel conforming to the requirements of UL 6 and ANSI C80.1. The minimum diameter shall be 3/4 inch for power circuits, one inch for fire and intrusion circuits, and two inches for audio and control circuits.
  - b. Liquid-tight flexible conduit shall conform to the requirements of UL 360 and consist of a flexible galvanized steel core containing a copper bonding conductor spiral-wound between convolutions and a neoprene or PVC jacket overall. Fittings for liquid-tight flexible conduit shall be watertight and shall conform to the requirements of UL 514.
  - c. All conduits (rigid steel and liquid tight flexible) should be permanently secured with metallic clamps. Zip ties are not acceptable to use as permanent use.
7. Auxiliary gutters, wireways, and raceways shall be constructed of galvanized sheet steel conforming to the requirements of the NEC and shall be UL-listed. Raceway, conduit and wireways within the hoistway exposed to public view shall be concealed within steel cladding.
8. Electrical Boxes:
  - a. Outlet, junction and pull boxes shall be galvanized sheet steel or galvanized malleable iron, cast iron or ductile iron conforming to the requirements of UL 50, UL 514 and NEC paragraph 370-C. Pull boxes shall have screw cover with a liquid-tight gasket.
  - b. Junction boxes on car bottom and hoistway connecting the traveling cable shall contain approved terminal blocks for connection of traveling cable conductors. Terminal blocks shall have indelible identification numbers for each terminal connection.
  - c. All wire connection terminal blocks shall have the same identification number as labeled on the associated electrical wiring. All electrical wires shall use a labeling tube and heat shrink and match the terminal numbers.
  - d. During field installation of junction boxes or control boxes, the contractor/subcontractor shall not drill or cut into the top sides of the box for wiring.
  - e. All boxes shall be accessible without removal of other components.
  - f. All boxes in machine room or pit shall be mounted on strut channels in order to prevent future corrosion and water damage. The strut channels shall be mounted on the wall and has a minimum of 1-1/2 inches thickness and 18 inches above the floor.
  - g. All solid state and electrical components located on top of the car enclosure or in the hoistway shall be installed within NEMA 4X enclosures.

9. Disconnect Switches for Car Lights and Mainline Power
  - a. Disconnect switches shall be the following: UL 98, NEMA KS 1, heavy-duty, quick-make/quick-break switching mechanism with operating handle external to enclosure, with positions labeled ON and OFF, defeatable interlock to prevent opening of enclosure door when switch is ON. Enclosures shall be NEMA 250 Type 4x. Label disconnect switches in accordance with the NEC.
  - b. Mainline power disconnect switch shall be located in close proximity to the machine room entrance and shall be easily identifiable from other disconnect.
10. Circuit Breakers and Panelboards
  - a. Circuit breakers shall be the following: NEMA AB 1, UL 489, molded-case, bolt-on quick-make/quick-break, mechanically trip-free switching mechanism, with thermal trip for inverse time delay overcurrent protection and magnetic trip for instantaneous short-circuit protection. Designed to carry continuous rating in ambient temperature of 40°C.
  - b. Panelboards shall be the following: UL 50, NEMA PB 1, latch and handle in accordance with UL 50, minimum side gutter size of four inches, bus bar of 98-percent-conductivity copper with contact surfaces silver-plated or tin-plated, rating of neutral and ground buses equal to phase bus rating, neutral bus mounted on insulated block, neutral and ground buses equipped with integral mechanical connectors, one-inch high engraved plastic nameplate with 2-inch high letters on black and attached with stainless steel fasteners. Enclosures shall be NEMA 4.
11. Pit Receptacles and Lights
  - a. Electrical power receptacles shall be furnished and installed in the elevator hoistway, pit, and top of car as shown or required by code. Each receptacle shall be duplex, ground fault interrupter type, resettable at the receptacle; waterproof; grounded; rated for 120 volts at 20 amperes.
  - b. Maintenance lighting shall be furnished and installed in the elevator hoistway as shown or required by code. Lighting shall be vapor-tight service lights with quick start type PL compact fluorescent lamp. Furnish and install light switches; waterproof; grounded. The light switches shall be so located as to be accessible from the pit access door.
12. Drive Unit Motor
  - a. Motor shall be designed specifically for elevator service. The drive motor shall be of the alternating current, intermittent duty, 120 starts per hour, 1.15 service factor, squirrel cage induction type design adapted to the severe requirements of elevator service. Elevator drive motor shall be single-speed. The motor shall be suitable for operation on a 480-volt, three-phase, 60-Hertz supply and capable of developing the required starting torque.

- b. The motor shall be rated in accordance with NEMA Standard MG 1 for 60-minute rating motors and shall have sufficient capacity to operate the elevator with specified rated load at specified rated speed without overheating. The insulation and the starting and running torque of the motor shall be capable of permitting operation in accordance with NEMA MG 1. Standard factory motor test data and motor dimensions shall be submitted to the Contractor for approval. Each motor nameplate shall include the motor hp rating, voltage, full-load amperes, locked rotor amperes, full-load speed, design temperature rise, and NEMA design rating of the motor. Each motor shall be provided with ring or other suitable lifting means. The motor frame shall be tapped and drilled for a copper cable grounding connection.
- c. Insulation of windings shall be NEMA Class B, fully impregnated and baked to prevent the absorption of moisture and oil. The insulation resistance between motor frame and windings shall be greater than one megohm.
- d. Motor bearings shall be of the ball or roller type arranged for grease lubrication and fitted with grease gun connections and drain plugs or fitted with sealed-for-life bearings. The bearings shall incorporate dust-tight lubricant seals.
- e. Motor shall be provided with an electronic soft start feature and thermal overload protection for each phase.
- f. Connect motor and pump with multiple V-belt.
  - 1. Belts and sheaves shall be sized for duty involved and designed to prevent any metallic contact between motor and pump shaft.
  - 2. Furnish and install isolation units of rubber in shear to prevent transmission of pump and motor vibration to building.
  - 3. Furnish and install expanded metal sheave guard that can be easily removed for servicing and inspection.

13. Elevator Controller:

- 1. An Allen Bradley (or ELES Engineering approved equal) PLC-based controller shall be provided, governing starting and stopping as well as preventing damage to the motor from overload or excessive current. It shall automatically cut off the motor current and bring the car to rest in the event any of the safety devices are activated.
  - a. System shall coordinate the functioning of elevator drive unit relative to actual location and status of elevator. It shall interface with door control and all required safety circuits, switches and devices. The controller shall be mounted in a NEMA 4X stainless steel air-conditioned cabinet within the controller room.

- b. The diagnostic system shall be an integral part of the controller and provide user-friendly interaction between the service person and the controller system.
    - c. The supervisory logic shall be performed by a main controller or coordinated between the elevator controllers which will interface directly into the Allen Bradley DH485 protocol Remote Monitoring network, transmitting data from the elevator controller through a data concentrator to the Authority's AEMS RTU computer control and data system. The supervisory logic will coordinate dispatching assignments, interfacing operational demand data accumulated from car and corridor operating fixtures, selector and door control functions.
    - d. Controller shall be capable of operating with an operating temperature range of 32<sup>0</sup> F to 140<sup>0</sup> F with non-drip environment and no more than 90 percent relative humidity. However the air conditioner on controller cabinet shall maintain the operating temperature in range of 50<sup>0</sup> F to 90<sup>0</sup> F.
2. An Allen Bradley CompactLogix 1769-L32E (or ELES Engineering approved equal) based PLC control system shall be provided.
  - 1) The exclusive Allen Bradley DH485 protocol data port will transmit data from the elevator controller to the station or facility data concentrator. The contractor shall provide a controller data interface to a DH 485 network. Contractor shall provide Data cables to connect from the PLC controller to data concentrator in the station and available for connection to the controller DH485 interface. The contractor shall pull Belden 9842, or ELES Engineering approved equal, cables to connect the controller into the monitoring DH485 network. The DH 485 controller interface shall be programmable for data rates up to 115 Kbps. The interface shall allow other nodes such as other elevators and escalators to be readily incorporated into the DH 485 network.
  - 2) A data concentrator PLC shall be installed using an Allen Bradley MicroLogix 1400 or SLC5/05 per station to function as data concentrated or to consolidate data from all controllers in the station. The software for the data concentrator shall receive controller data over the local monitoring DH 485 network and provide formatted data to the AEMS RTU through an RS232 link. The data concentrator shall provide an Ethernet port for interfacing with the WMATA wide area network. A data concentrator connection to the WMATA wide area network shall be provided.
3. The PLC shall accommodate the following Signal List, as Applicable, and provide data to the data concentrator as specified in specification.

4. The PLC CPU module shall store the last 99 faults, accessible via laptop connection, controller fault/status display and remote communications. The contractor shall provide WMATA with a programming and monitoring unit, such as a laptop computer with the newest version of Allen Bradley RS-Logix and any other software required to setup and program all electronic items in the control system, for each elevator, for the purpose of troubleshooting and remote monitoring modifications. The laptop should allow uploading, editing, and downloading any software that is being used on this elevator for any operation
5. An Allen Bradley PanelView Plus 6, EZAutomation or ELES Engineering approved equal, fault/status display/interface shall be provided in the controller cabinet. Control system timers and other setup criteria shall be programmable through this unit. All fault, status and setup data shall be stored in the controller CPU module.
6. In cases where the programming is done by the supplier, the supplier shall provide a copy of all working programs, including labels for all inputs and outputs, data tables and internal logic points, on Flash Drives/CD-R disks as well as a printed program listing. The programs and setup data shall require a password for access and modification. The password shall be provided to ELES Engineering as part of the Submittal.
7. The main control of an elevator shall contain at least the following devices or electronic sensing: phase failure line voltage monitor, motor current and ground fault monitor.
8. The controller cabinet shall contain a permanently mounted fault indicator panel with LED indicator lights. Tripped safety devices, door position, door reversal, car running status, and control system status shall be indicated.
9. All terminals shall have identification markings and all wires, including field wires, shall be provided with permanent heat shrink sleeve cable markers. These wiring identifications shall be provided in the wiring diagram at each end of the circuit connections.
10. The controller shall be equipped with the AC vector drive installed in-line before the motor contactor and the motor.
11. The AC vector drive shall be capable of accelerating and decelerating the motor smoothly and gradually.
12. Adjustable settings for acceleration and deceleration ramps shall be provided.
13. The controller shall have, at least, one dedicated serial port for interface to the DH485 monitoring network and programming access without disconnecting any other port.
14. The Programmable Controller shall have, at least, one dedicated port to support the controller fault/status display.
15. The controller PLC shall provide the following Remote Monitoring and diagnostic network support:
  - a) All applicable faults, statuses and data listed in Table 1 shall be provided

- b) Fault indications shall remain until reset in the controller.
  - c) Status and analog data shall be provided for the duration of the condition.
  - d) Software in the controller PLC shall format monitoring data responses to data concentrator polling as specified in the specification.
  - e) The monitoring data port in the controller shall be setup for DH485 protocol with the port network identification number programmed for the particular elevator identification. For instance, identification number 11 applies to elevator 1, 12 to elevator 2, etc.
  - f) All faults, statuses and data shall be held by the controller CPU and sent from the CPU when polled by the data concentrator.
16. Provide sufficient non-volatile CPU memory, for non-volatile retention of program memory, system status and operating parameters.
17. Diagnostics
- a) The processor shall have built-in diagnostics and self-test, such that each time power is cycled, the processor does a complete CPU and RAM memory test. Additionally the power-up test will momentarily light up all diagnostic LEDs to be sure they are working. A power up test will not be performed if the internal flag (bit) for Firemans Service Phase I is latched. The processor shall be capable of reporting major and minor fault codes and processor status information back to the data concentrator, provided the fault is not a catastrophic hardware failure where the processor is unable to power up.
  - b) The processor shall have a built-in watchdog timer to ensure that all processor program scans occur within the time limit set by the watchdog timer.
  - c) The processor shall have individual LED indicators that are clearly visible and labeled for easy identification. At a minimum the following indicators must be provided:
    - (1) CPU is in RUN mode
    - (2) CPU is FAULTED
    - (3) CPU battery is LOW
    - (4) I/O points are FORCED and are not under program control  
COMMUNICATION channels are active.
18. Input/Output Modules
- a) The Input/Output modules shall be compatible with the PLC processor I/O structure. Each module shall be provided with a detachable terminal strip to connect wiring to the module. Each wire on the terminals shall be identified by the module terminal.
  - b) Discrete Input Modules: Suitable for the input voltage and compatible with the Allen Bradley system.
  - c) Discrete Output Modules: Suitable for the voltage and load and

compatible with the Allen Bradley system.

- d) Analog Input Modules: Converts analog signals to proportional twelve-bit binary values. The module shall accept 4 to 20 mA signals. Provide modules compatible with the Allen-Bradley system.

19. I/O Chassis and Power Supply

- a) The controller chassis shall have an additional three spare modules
- b) Power supplies shall provide power to the PLC processors, I/O and other function modules. The power supply shall be suitable for operation of 120 VAC, single phase power. Power supply capacity shall be a minimum of 150% of the connected load.

20. Air Conditioning

Provide an independent air conditioning unit for each controller to maintain manufacturers' recommended operating temperatures. Condensate from the air conditioning unit must be piped to a suitable drain.

21. Selective Collective Operating: As defined by ASME A17.1 and shall be the pressure upon one or more car buttons to correspond to landings in the order in which the landings are reached by the car, irrespective of the sequence in which the buttons are pressed, provided the hoistway door interlock and car door switch circuits are completed. During this operation, the car shall also answer calls from the landings, which are in the prevailing direction of travel. Each landing call shall be canceled when answered
- a. Momentary pressure on car button or landing button illuminates that button, which remains illuminated until call is answered. Illuminated buttons serve as visual indication that call has been registered and that car will stop at that landing.
  - b. Operation shall be automatic by means of the car and landing buttons. Stops registered by the momentary actuation of the car or landing buttons shall be made in the order in which the landings are reached in each direction of travel after the buttons have been actuated.
  - c. UP landing calls answered while car is traveling in up direction and DOWN landing calls answered while car is traveling down, car reversing after uppermost or lowermost car or landing call has been answered and proceed to answer car calls and landing calls registered in opposite direction of travel.
  - d. Should both an up and a down call be registered at an intermediate landing, only the call responding to the direction in which the car is traveling shall be canceled upon the stopping of the car at the landing.

22. Supervisory Control: A processor based system to coordinate dispatching assignments, interfacing operational demand data accumulated from car and corridor operating fixtures and other special feature commands issuing from computer processing, selector and door control functions. Incorporate in the system specific operational features as herein described.
- a. Allocate service to demand, make decisions to prevent crowding, save energy, and provide efficient coverage throughout the building. Respond in real time to prevailing traffic conditions as well as historical traffic patterns.
  - b. Constantly compare passenger demand, car load, anticipated demand, car motion status, machine status and other prevailing conditions and evaluate this information in the context of the following dispatching approaches:
    - 1) Give priority to contiguous calls, assigning calls on adjacent floor to the same car if other criteria is satisfied.
    - 2) Give priority to coincident calls, having the same car let a riding passenger off and a waiting passenger on at the same floor.
    - 3) Anticipate demand based on hall calls and car calls already registered and floors with a high possibility of demand.
    - 4) Evaluate relative system response time for each car in the group, weighing all of the above factors.
    - 5) Allocate calls and position cars to minimize waiting time, response time and travel time. The other elevator shall respond for hall calls without any delay after the first elevator leaved the door zone.
    - 6) When there is a hall call registered and an elevator left the landing, the other elevator shall run toward opposite landing.
  - c. Provide the capability to make both car to call or call to car assignments.
  - d. During light traffic conditions, assign cars without demand to specific parking areas until requested for a hall call. Continuously evaluate dispatching assignment and immediately release a car from its assigned area to meet heavy demand elsewhere in the building.
  - e. In determining relative system response time for a car to answer a hall call, factor in round-trip calculations for each car as well as other system parameters before deciding which car shall respond to a hall call.

23. Other Features:
    - a. Independent Operation: Provide TWO-position keyed switch (ChicagoLock 7500) marked Independent Service, OFF and ON in the lower portion of the car operating panel of all cars. The switch shall be spring loaded type. When placed in ON position, car will be removed from the automatic operating system and will not respond to demands registered at the hall push buttons. It will respond only to floor with doors open until another demand is registered in the car. Demands registered at the landing will remain registered until answered by another elevator. The car only responds to car calls and that the doors remain open after a stop until closed by continuous pressure on the door close button.
    - b. The controller shall be designed to operate automatically on standby power.
  24. Control Room Two Way Communication Device: Provide within each controller/machine room a two way communication device that will interface with any type of ADA compliant telephone. The device shall be mounted directly on or within hands distance proximity to the elevator controller.
  25. Any junction boxes installed in the machine room or hoistway shall be accessible for Maintenance.
    - a. Drilling or opening top end of enclosure is not acceptable
    - b. Wire nuts or splicing without terminal strips is prohibited.
    - c. All openings shall be properly sized for the conduits.
- J. Emergency Lowering
6. Provide a separate battery powered unit that senses loss of power and which shall operate as follows:
    - a. Elevator automatically descends to bottom landing.
    - b. Doors open automatically when car arrives at bottom landing and remain open until power is restored.
    - c. Elevator shall remain inoperative until normal power is restored.
  7. The system shall differentiate between actual power failure and manual operation of disconnect switch.
  8. Failure protection (operational/power) battery shall be a 12 volt minimum, sealed, lead-acid, or approved alternative. The separate box shall be used for battery and not stored within the main controller.
    - a. Unit shall be connected to a power source
    - b. Unit shall automatically maintain the battery at its proper charge.
  9. Provide a manual lowering valve to allow the car to return to the lowest landing. The manual lowering shall be easily accessible and reachable.
  10. Provide all wiring, sensors and associated connections to the main line power and disconnect.
- K. Elevator Hoistway Entrances and Doors

1. Doors of elevators shall be of the horizontal sliding type, single-speed, center-opening. All elevator door openings shall be a minimum of 42-inches wide per the Americans with Disabilities Act.
2. Entrance frames shall be of welded or bolted construction for complete one-piece unit assembly. All frames shall be securely fastened to fixing angles mounted in the hoistway and shall be type 316 stainless steel. Provide an additional type 316 stainless steel sill angle support. The landing sills shall be extruded stainless steel with a mill finish.
3. All materials and finished surfaces exposed to public view shall be stainless steel with embossed finish and/or glass panels as indicated on Contract drawings. Glass panels (if provided) to be completely flush with door assembly. In a glass hoistway the struts or any brackets should not be visible to public.
4. Fascia and Dust Cover in the hoistway shall be galvanized or type 316 stainless steel and extend at least the full width of door opening on each side. Toe guard shall be fastened to the sill at the lowest landing.
5. Hoistway doors are to be stainless steel and provided with keyways as required for operating mechanisms and door hangers. Provide glass panels that are completely flush with door, as indicated in A17.1. Each door panel shall have stainless steel bottom guides that run in landing sill slots. Guides shall be replaceable without removing door panels. All doors shall have fixed fire gibs.
6. Interlocks and Contacts:
  - a. The doors at each hoistway entrance shall be equipped with approved hoistway door interlocks of the hoistway unit system type tested as required by the Code. Interlock shall prevent operation of the car away from a landing until doors are locked in the closed position. Interlock shall prevent doors from opening at any landing from the corridor side unless car is at rest at that landing, or is in the leveling zone and stopping at that landing.
  - b. Provide key-operated hoistway door unlocking devices. A device shall conform to the requirements of the Code and shall permit authorized persons to open the hoistway doors from the landing when car is away from landing. The key for emergency use shall be mounted in a receptacle with a breakable transparent cover clearly marked in letter at least 1/8 inch high ELEVATOR DOOR KEY FOR FIRE DEPARTMENT AND EMERGENCY USE ONLY. The location of the receptacle shall be as directed by the Engineer.
7. Provide raised floor/level designations in characters and Braille on each jamb at 60 inches from floor to centerline. Characters shall be two inches high and in accordance with ADA requirements.

- a. Sills shall be stainless steel and shall be supported on and attached to galvanized steel anchors securely fastened to the sill plate support. The sill and its assembly shall be capable of supporting 1260-pound service load for the transfer cart used by WMATA. Grooves for the door guides shall be machined with minimum clearance for the guides. The Contractor shall provide sill plates. Sill plates and all other sill support structure including shims and jack bolts shall be hot-dipped galvanized.
  - b. Struts and closer angles shall be hot-dipped galvanized structural steel angles of sufficient size to accommodate and support the hoistway door header plate. Angles shall be continuous and securely bolted to the sills and building beams or structure above.
8. Hanger supports shall be 1/8-inch minimum thickness formed sections securely bolted to the strut angles.
  9. Fascia Plates: Galvanized Steel cladding reinforced to ensure a flat, even surface throughout, and shall be securely fastened to hanger supports and sills above.
  10. Dust Covers: galvanized or stainless steel cladding which shall extend over the hanger support the width of the jamb opening plus the jamb flanges, at the top landing for which fascia plates are not supplied.
  11. Hanger cover plate sections above the door openings shall be arranged for opening or removal from within the car.
  12. Sill guards: Sill guards (galvanized steel cladding) shall be supplied for the lowest landing. On glass hoistways, they shall extend the full width of the hoistway and to bottom of pit.
  13. Door hangers and tracks shall be provided for each hoistway, sliding door sheave type, two-point suspension hangers and tracks, complete. Sheaves shall not be less than 2-1/4 inch diameter with ball bearings properly sealed to retain grease lubrication and shall be mounted on stands arranged for attaching to the doors by two capscrews. Hangers shall be equipped with adjustable ball bearing rollers to take the up-thrust of the doors.
  14. The tracks shall be high-carbon steel or formed steel with nylon inserts, shaped to permit free movement of the sheaves.
  15. All inside surfaces of doors shall have baked-enamel finish as shown on the finish schedule.
- L. Elevator Components
1. The elevator car and car components shall conform to the requirements of the Code, and shall operate without squeaks or metallic sounds.  
  
Entire car assembly, including car frame and platform, shall be free from warps, buckles, and squeaks and rattles. Joints shall be lightproof.

2. Frame and Platform
  - a. The car frame shall be constructed of structural steel members. The platform shall consist of a steel frame with necessary steel stringers all welded together. The frame and platform shall be braced and reinforced to prevent the transmission of strain to the elevator car. Steel framing shall conform to the requirements of ASTM A500, Grade B, modified to minimum yield strength if required. The variation in straightness of individual members and the frame as a whole shall not exceed 1/8 inch. Secondary straightening may be performed if necessary. The car enclosure shall be securely fastened to the car platform and so supported that it cannot loosen or become displaced during ordinary service, on the application of the car safety or on buffer engagement.
  - b. Platform shall be provided with a steel floor designed for specified loading and sealed watertight. The platform shall be isolated from the cylinder by suitable rubber pads or other equally effective platen isolation.
  - c. All structural steel in the frame and platform shall be hot-dipped galvanized.
3. Car enclosure walls shall be structural steel tubing with stainless steel cladding, in-filled with aluminum framed laminated fully tempered safety glass. Stainless steel cladding shall be #4 satin finish.
4. Railings and Handrails: Car handrails shall be 1/2 inch by 6 inch stainless steel #4 satin finished tube suitably mounted.
5. Car threshold shall be stainless steel with a non-slip surface.
6. Toe Guard Aprons:
  - a. The toe guard apron (cladding) at entrance side of elevator cab shall be not less than 16 U.S. Standard Gauge (USSG) galvanized steel or stainless steel, and shall extend at least three inches beyond entrance jambs at each side. Toe guard shall have a straight vertical face, extending below the level of finished car floor, of not less than the depth of leveling zone plus three inches. The bottom of guard shall extend three inches below vertical face and be beveled at a 15-degree angle from the vertical. The toe guard shall be secured to car platform construction and be reinforced and braced to withstand a constant force of 150 pounds on its face without permanent deformation or deflection exceeding 1/4 inch.
  - b. On glass elevators, the toe guard shall extend full width of cab.
7. Suspended Ceiling:
  - a. The suspended ceiling shall be faced and edged with solid stainless steel panels, 0.075-inch thick with a fully adhered 3/4-inch thick core of noncombustible, sound-absorbent material and backed with galvanized sheet steel. ASTM A653M, G90 coating or better.

- b. Mounting brackets and any necessary holes for the CCTV camera shall be provided on the top of the ceiling, as further specified. Coordinate bracket configuration and location with the CCTV subcontractor.
  - c. Mounting brackets and any necessary holes for the smoke and fire detection sensors shall be provided on the top of the ceiling, as further specified. Coordinate bracket configuration and location with the fire and intrusion system subcontractor
8. Glass shall be laminated fully tempered safety glass conforming to ANSI Z97.1 and the requirements of Specification Section 08\_81\_00.
- a. Glass shall be laminated. Heat-strengthened, safety glass conforming to requirements of ASTM C 1048 and ANSI Standard Z97.1 and shall consist of two pieces of ¼ inch thick glass and a 0.060 inch thick polyvinyl butyryl interlayer, laminated together.
  - b. Color: Tint by Globe-Amerada Co., used as a standard of quality, or comparable and approved equal.
  - c. Weatherproof tape for field installation of final edge seating shall be compatible with the interlayer.
9. Dry Pressure Glazing Materials:
- a. The setting blocks, edge blocks, and face gaskets shall be ozone-resistant, virgin neoprene.
  - b. Setting blocks for installation at each quarter point of the sill shall be 90 durometer, shore A hardness, approximately full channel width, four inches long, and high enough to afford correct cover and 3/8-inch edge clearance for the glass.
  - c. Edge blocks, for vertical installation at the bottom of each joint channel, shall be 50 durometer, shore. hardness approximately full channel width, three inches long, and provide 3/8-inch edge clearance for the glass.
  - d. Face gaskets shall be continuous, 50 durometer hardness, and provide 3/16-inch face clearance both inside and outside.
10. Sub floor material to be nominal ¼" stainless steel to prevent water infiltration between finished floor, cab and platform base.
- Floor covering: Poured Acrylic Epoxy, polymer system or approved equal, color selection and samples to be submitted to the Authority for approval by the Engineer, with slip-resistant surface, ¼ inch thickness, covering elevator car floor area. Flooring shall be non-shrinking, manufactured of prime quality compound, free of calendaring and curing defects, resistant to grease, oil, chemicals, aging, and ozone. Flooring shall be poured incorporating a full membrane system for the entire cab floor width and depth.
11. Emergency exit: Car shall have a top emergency exit conforming to the requirement of the ASME Code, and the applicable jurisdictional requirements. The door shall open toward the top of elevator and shall have a latching mechanism to keep it in place.

12. Ventilation: A 350-cfm two-speed exhaust fan for continuous car ventilation shall be provided and located above the car ceiling or outside the enclosure.
  - a. Ventilating fans shall be securely mounted in place.
  - b. Ventilation openings shall comply with the ASME and local codes, and shall be suitably sized and distributed to provide uniform airflow within the car.
  - c. Connect continuous ventilation fan to emergency power system. Provide battery backup for fan operation of at least 1 hour in the event of power loss.
  - d. The exhaust fan shall be controlled from the car operating panel with Chicago Lock 7500 (similar to existing WMATA Elevators keys).
13. Cab air conditioning (if applicable), in addition to the exhaust fan, shall be installed as specified in the contract and shall be a self-contained, packaged design for easy mounting, maintenance, and replacement.
  - a. Packaged air conditioners shall be installed on the top of the elevator car.
    1. If not installed in original scope, space provisions shall be made for future installation of packaged air conditioning units.
    2. Installation area shall be coordinated with electrical, structural, and other trades to ensure no interferences with current or future installation.
    3. Electrical power of the proper voltage and capacity shall be available for the air conditioning unit installation current or future.
14. Lighting Fixtures and Plug Receptacles:
  - a. Car lighting shall provide a minimum of 15-foot candles measured at any point on the cab floor and shall be of the LED type. Car lighting shall be provided with emergency battery backup upon failure or interruption of normal car lighting. Emergency lighting unit shall provide required lighting for a minimum of four (4) hours. Battery charger shall be capable of restoring battery to full charge within sixteen (16) hours after resumption of normal power.
  - b. Exterior car lighting shall be as specified. On glass-enclosed elevators they shall be concealed under access panels flush with cab top or bottom surfaces, respectively. A duplex plug receptacle shall be provided in the pit and on top and bottom of each car. The lighting fixtures and receptacles on exterior of car shall be controlled by a switch adjacent to each fixture.

- c. Provide 115 volt ac plug receptacle (GFCI) within 12 inches of CCTV camera location. Coordinate the installation of CCTV equipment within the design of the elevator cab as the elevator contractor is responsible for the installation of the camera and wiring to the control room.
15. Car Doors and Door Equipment:
- a. Car doors and door frames shall be suitably reinforced and provided with a laminated stainless steel #4 finish on cab side and baked enamel finish on hoistway side. Doors shall protect the full width and height of car entrance opening when in the fully closed position. Car door frame shall be integral with front wall of cab.
  - b. Hanger cover plate sections above the door opening shall be removable from the hoistway. Doors shall be guided at the bottom by composition gibs engaging threshold grooves with minimum clearance.
  - c. Car/Hoistway Door Operator: Car and hoistway doors at each landing shall be opened and closed quietly and smoothly by a direct current electric operator.
  - d. Door operation automatic at each landing with door opening being initiated as car arrives at landing and closing taking place after expiration of specified time interval, with electric contact to prevent starting elevator away from landing unless car door is in its fully closed position.
    - 1. Time door closing to start 5 seconds minimum from notification that car is answering landing call.
    - 2. Time doors to remain open five seconds minimum.
    - 3. Time shall be adjustable to 20 seconds.
    - 4. The interval of time that the doors remain open at intermediate landings shall be less for a stop made in response to a landing call. Door open time at a dispatching terminal shall be longer than the time for a stop in response to an intermediate landing call.
    - 5. All door timers shall be adjustable from the controller display panel.
16. Capacity Plate:
- a. The car capacity plate shall be of plain stainless steel and, in addition to data required by the ASME Code, but shall not bear the name of elevator manufacturer.
17. Door Operator Equipment:
- a. Provide a water resistant heavy-duty GAL MOVFR- or ELES Engineering approved equal door operator with encoderless VVVF drive. Closed loop door operator designed to operate car and hoistway doors simultaneously at the speed specified. Door shall open automatically when car stops at landing to discharge

passengers or to answer valid calls and close automatically after predetermined time interval has elapsed. The doors shall be capable of smooth and quiet operation without slam or shock. Door operator to have the following features:

1. ½ hp motor and heavy-duty sprocket, chain, belt, and sheaves.
  2. Closed loop regulated speed performance.
  3. Hand-held keypad programming.
  4. Adjustments can be stored in the keypad and downloaded to another operator.
  5. Adjustable door obstruction reversal.
  6. Optical cams with LED indicators.
  7. Test switches for open, close, nudging and speed zone set up.
  8. Universal inputs for open, close, and nudging.
  9. Reversing switch to back up the door reversal device.
  10. Designed for interior and exterior applications.
- b. Provide a non-contact door reversal device with light immunity: The Door Reopening Device shall cause both the car and hoistway doors to reverse, should they detect an obstruction in the elevator entrance. The device electrical wiring shall be supplied with quick disconnects terminals to facilitate replacement. The infrared curtain detector shall include the following:
- a. A protective infrared detector field extending from 1 1/2" above the car sill to a height of 68".
  - b. A fail-safe control system to prevent the doors from closing in case of power loss to the detector.
  - c. A one-piece full door height protective lens cover designed to be completely waterproof and to withstand impact, abrasion and vandalism.
- M. Normal and final terminal stopping devices shall be provided for elevator conforming to the ASME Code requirements.
6. Final terminal stopping devices, located in hoistway or on the car and operated by cams, shall be fitted with rollers having a rubber or other approved composition tread to provide silent operation when actuated by the cam.
  7. Normal terminal stopping device may be mounted in hoistway, on top of the car, or in the machine room.
- N. Signal Devices and Fixtures:
- 1) Car Operating Station:

- a. Provide one (1) main station in the front and one (1) auxiliary station. The COP shall be a vertical type.
- b. General: Provide signal fixtures and control devices for each elevator. Buttons and signals shall be tamper resistant of the illuminated type that light-up when activated and remain lit until call or other function has been fulfilled. All signal fixture and control device faceplates shall be of Type 316L, nominal 0.135 inch thick stainless steel with No. 4 finish, unless otherwise shown on the Contract Drawings.
- c. Car operating stations shall contain Braille plates adjacent to each call button. Contractor to coordinate proper landing call outs based on maximum characters as indicated on Contract drawings. Buttons for DOOR-OPEN, DOOR-CLOSE, ALARM, EMERGENCY PHONE call functions are to be supplied. Buttons are to be vandal resistant and of the positive stop type.
- d. Station shall have a locked service cabinet for keyed switches of the car light; exhaust fan, independent operation, GFI duplex outlet as indicated on the Contract drawings.
- e. Provide Emergency Communication: "Hands-free" ADA compliant telephone/intercom.
  - 2) Hall Station: Riser of hall stations of the push-button, call acknowledging, stainless steel, tamper resistant type shall be mounted at all elevator landings. Highest landing shall have a single DOWN button. Lowest landing shall have a single UP button. Incorporate ADA compliant telephone with each hall station. Braille Indicator Plate shall be provided. Faceplate finish shall be Type 316L stainless steel #4 finish. The Hall Station shall be flush to the surface and shall not be projected out.
  - 3) Hall Lanterns:
    - a. Tamper resistant hall lanterns shall be equipped with illuminated (LED type) UP and DOWN signal arrows, but provide single arrow where only one direction is possible. Provided units projecting from faceplate for ease of angular viewing. Match materials, finishes and mounting method with hall stations.
    - b. In conjunction with each hall lantern, provide an adjustable electronic chime signal to indicate that a car is arriving in response to a hall call and to indicate direction of car travel. Signal shall sound one for up direction of travel and twice for down direction.
  - 4) Bell Alarm System: Bell alarm system for each elevator shall be properly located within building and audible outside hoistway when activated by the EMERGENCY ALARM call button on each car control building/station. When emergency stop switch is activated inside fire service box, the bell alarm system should not be activated.

- 5) Firefighters' Service System: Firefighters' service system shall be provided in compliance with code requirements.
- O. Drip pans constructed of 26 USSG galvanized sheet steel shall be provided below all bearings to catch lubricant drippings, except for bearings that are fitted with effective approved grease seals.
- P. Metal parts visible to the public shall be field painted.
- Q. A metal cabinet of suitable size shall be provided in each machine room for the storage of special tools and necessary spare parts. The cabinet shall be mounted on legs or a pedestal, a minimum of 4 inches off the floor. A Mobile Tool Storage Cabinet with wheels is not allowed.
- R. A complete set of special tools or wrenches that are designed specifically for tasks associated with elevator inspection, maintenance and repair shall be provided with a case or suitably mounted in the storage cabinet.
- S. At the expiration of the warranty requirements, the Contractor shall provide a spare parts and service facility in the United States at no additional cost to the Authority from which all manufactured parts and components of the equipment furnished and installed can be obtained for an additional three years.

#### **2.04 KIOSK SURVEILLANCE CONTROL AND COMMUNICATION:**

- A. Surveillance Camera Provisions (Surface Elevators). All requirements for CCTV shall comply with the WMATA SMNT Department.
  1. Space provisions and mounting holes shall be provided for closed-circuit television (CCTV) cameras to be furnished and install by CCTV subcontractor.
    - a. The Contractor shall coordinate with the CCTV subcontractor and install wiring from the CCTV location within the elevator cab to an interface terminal and video transmitter located on the elevator car. Final equipment selection has not been performed and is subject to change. Coordinate model, configuration, and location with the CCTV subcontractor.
      - 1) Power will be required by the video transmitter and CCTV camera and shall be provided.
      - 2) Equipment: Fiber Optic Video Transmitters (Elevator Cameras)
    - b. The Contractor shall work with the CCTV subcontractor to install CCTV subcontractor-provided fiber-optic cable and transmitter to a terminal location specified by the CCTV subcontractor. The Contractor shall tag the cables appropriately, indicating that they are for future use by others.

B. Supply the following status indication, control, and communication functions for each elevator car and landing at an annunciator panel in the kiosk: indication, control, and communication functions in each elevator and landing; and all interconnecting wiring required to provide a complete and operable system. Systems to be provided and installed include the following:

1. Kiosk annunciator panel: Panel shall be a single panel approximately 7-½ by 19 inches. Coordinate design to ensure that the panel is compatible with the mounting provisions, previous designs, and human factors. The panels shall contain:
  - a. Indicators:
    - 1) Visual display of elevator car status, to include landing stopped at or being approached and direction of travel:
      - a) Designate elevator by functional name, e.g., Garage 1.
      - b) For garage elevators designate landing by garage floor level.
    - 2) Out of service because of malfunction.
    - 3) In-Car stop switch is actuated.
    - 4) Continuous audible alarm activated when emergency alarm switch in car is initiated.
    - 5) Indicator lamps shall be LEDs, with life expectancy of 50,000 average rated hours.
  - b. Controls:
    - 1) Out of service.
    - 2) Override control.
    - 3) Door open.
    - 4) Landing selection.
    - 5) Push button switches shall have limited over-travel to prevent damage due to abuse and shall be equipped with lift-up covers to avoid inadvertent operation, have mechanical and electrical life of 25,000 cycles, with integral or isolated illumination circuit and be normally open with momentary action or alternate action circuitry.
    - 6) When the override control switch is OFF, the kiosk controls shall function in parallel with the car and landing controls, i.e., the selective/collective control system shall respond to a kiosk-initiated landing selection with the normal priority afforded the remaining system landing selection and call buttons.
    - 7) When the override control switch is ON, the following actions shall take place:
      - a) If the car is stationary at a landing, it shall remain at the landing and the doors, if open, shall close and remain closed.

- b) If the car is in motion, it shall stop at the first landing reached and the doors shall remain closed.
  - c) The elevator control system shall then respond only to the kiosk controls and car station.
  - d) The car shall park at the designate landing.
- 8) When the OUT OF SERVICE switch is actuated, the elevator shall return to the lowest landing before shutting off.
2. Elevator fire detection sensor: Provide space and mounting holes for smoke and fire detection sensors to be furnished and installed as required by building, electrical, elevator and local codes. Install wiring from the sensor location in the car to interface terminal cabinet in the machine room, for connection from the sensors to the smoke and fire detection system. Coordinate with installers to allow installation of sensors and operational checkout of the system.
3. Passenger - Kiosk communications (VIOP) system:
- a. Communications signal button in elevator car momentary contact to illuminate back-lighted signal button in car and latch on a continuous audible signal and illuminated indicator in the kiosk.
  - b. Communications buttons at landings, momentary contact, to illuminate back lighted signal button at the landing and latch on a continuous audible signal and illuminated indicator in the kiosk.
  - c. Push button in kiosk to activate intercom system and reset indicator lamps and audible alarm.
  - d. Each passenger operated device shall have identification markings as specified for car operating devices.
  - e. The voice communication intercom system shall function as a master remote network. The master station shall be located in the kiosk annunciator panel and shall include a speaker-microphone, audio amplifier, on-off indicator lamp, audible signal device control and push button lamp for the operations. A remote station shall include a speaker-microphone and a communications signal button shall light the signal button and cause a continuous audible signal at the master station and light indicator lamp corresponding to the calling remote station. Communications between master and remote station shall be established upon the actuation of the master station push-button control corresponding to the calling remote station with the master station push to talk control determining the direction of transmission.
  - f. If successive calls are received from other remote stations while communication is in progress with one remote station, the audible signal shall sound the indicator lamps corresponding to the calling remote stations shall light and both shall remain on the indicate waiting calls.

- g. Means shall be provided to clear the indicating lamps independently. Communication initiated from the master station shall be established upon actuation of the push button control corresponding to the called remote station, with the master station push-to-talk control determining the direction of transmission.
- h. The audio amplifier at the master station shall be all solid state in construction and shall control incoming and outgoing volumes for all of the remote stations. The volume levels shall be preset during installation and shall be adjustable to provide a maximum of five watts rms at the speaker-microphones.
- i. The power supply shall supply all ac and dc voltages necessary for all circuitry associated with the voice communications intercom system, and shall operate from the 120-volt ac, 60 Hertz emergency power supply located in the elevator machine room.
- j. The audio amplifier and the speaker-microphones shall have a frequency response of plus or minus three Db from 300 Hertz to 5,000 Hertz. Power consumption shall be 5 watts maximum in standby and 50 watts maximum under load.
- k. The Contractor shall be responsible for shielding, grounding and other measures necessary to protect the voice communications intercom system from interference from other electrical systems.
- l. Speaker grilles shall have a minimum of 35 percent open area over the entire surface of the speaker cone.
- m. Switches and relays used with this system shall have an operating life exceeding 5,000,000 cycles. Documentation shall be provided by the Contractor to the Engineer, for his approval, to substantiate this life cycle level.
- n. The system shall perform adequately, as approved by the Engineer, with both the remote and the master station test personnel speaking from three feet away from the speaker-microphones.
- o. Communication in the car shall also rollover to a 24-hour manned site (Rail Operations Control Center) in the event that the kiosk does not respond to the call.
- p. Each passenger-operated device shall be identified in accordance with ADA/ADAAG requirements.
  - 1. ADA requirement for providing emergency two-way communications between an elevator and a point outside the hoistway (the Kiosk).
  - 2. Device mounting heights shall comply with:
    - a) ADAAG requirements.
    - b) ASME A17.1-2007. The highest operable part of the two-way communication system shall be a maximum of 48 inches from the floor.

- 3. A Braille Instruction Plate shall be permanently affixed on each remote intercom unit.
  - a) ADA Standards: Raised symbol and lettering (Signage) located adjacent to the device.

**PART 3 – EXECUTION**

**3.01 EXAMINATION**

- A. Prior to beginning installation of elevator equipment, examine the following and verify that no irregularities exist that would affect quality or execution of work as specified.
  - 1. Hoistway size and plumbness.
  - 2. Sill pockets.
  - 3. Anchor brackets
  - 4. Sill supports.
  - 5. Spreader/Divided beams.
  - 6. Machine beams and any other supplied by others.
  - 7. Pit Depth
  - 8. Overhead clearance
- B. Do not proceed with installation until previous work conforms to project requirements.

**3.02 INSTALLATION**

- A. Electrical Installation:
  - 6. The Contractor shall install all raceways and wiring necessary for the proper connection and operation of all equipment. The installation shall comply with the applicable requirements of the NEC and local codes.
  - 7. Raceway:
    - a. Rigid conduit connecting the various items of elevator equipment and electrical boxes in the machine room and hoistway shall be run parallel to the ceilings and walls. Metal wireway and auxiliary gutters in the machine room shall run exposed in readily accessible locations and shall not protrude into the working space around equipment.
    - b. Liquid-tight flexible conduit shall be used for connections to motor, limit switch, interlock push-button box, door operator motor, and similar devices. A length of liquid-tight flexible conduit 18 to 24 inches long shall be used for connection to the elevator drive motor.
    - c. Raceway terminal fittings shall be free from burrs, shoulders, or other projections that will reduce internal passage area or cause abrasion of conductors.
    - d. Electrical boxes shall be installed in accordance with the requirements of NEC paragraph 370.

8. Wiring:
  - a. All wiring shall be run in conduit, metal wireway, or auxiliary gutter, with the following exceptions:
    1. Flexible hard-service cord, type SO, used between fixed car wiring and switches on car doors.
    2. The traveling cable connection to the elevator car.
  - b. Wire and cable shall be sized for their respective duty so that the maximum current carried shall not exceed limits prescribed by the NEC and local codes. The minimum sizes of conductor shall be 12 AWG for lighting and receptacle circuits and 16 AWG for operating, control and signal circuits, except for traveling cable, where 14 AWG shall be the minimum size for elevator lighting circuit conductors.
  - c. In glass hoistways, wiring shall be installed only in the locations shown with the requirement that wiring and conduit be hidden from public view.
  - d. The traveling cable shall run from a junction box on the bottom of car to a junction box approximately midway in the hoistway. The cable shall be anchored and suspended to minimize any strain on individual cable conductors. The cable shall be free from contact with the hoistway construction, car, or other equipment. The overall covering of cable shall remain intact between junction boxes. The Contractor shall ensure that the cable shall not bend to a radius less than 12 times the outer diameter at any position of elevator travel.
  - e. Traveling cable shall be suspended by the wire rope center or self-gripping devices where cable weight will not cause excessive crushing forces.
9. Splices and terminations of conductors shall be made only in outlet, junction. Splices in conduit or raceways will not be permitted. Splices and terminal connections shall be made only by means of solderless connectors and terminal lugs as specified. Splices shall be covered with electrical insulating tape to an insulation level equivalent to that of the conductors. Terminal lugs used for bonding connections to metallic structures shall be installed on bare/uncoated metallic surfaces to assure minimum contact resistance.
10. Grounding:
  - a. The Contractor shall be responsible for grounding and bonding all parts of the elevator metallic structure, equipment and raceway in accordance with the applicable requirements of the NEC and the codes and regulations of the jurisdictional authorities. An equipment grounding conductor will be furnished and installed by other trades in each feeder to the elevator machine room and terminated in a disconnect device or junction box.

- b. The Contractor shall provide equipment grounding conductors from the disconnect devices or junction boxes for all feeders and branch circuits as shown and required. Electrical equipment shall be provided with a minimum of two ground paths. One path shall be a green insulated equipment grounding conductor. The second path shall be a connection to grounded metallic structure using metallic fasteners, metallic conduit and/or bonding jumper. In elevator car, bond exposed metallic structures, ac equipment enclosures and lighting fixtures to grounded elevator metallic structure with metallic fasteners as shown.
  - 11. Each device, each terminal, and each wire on the controller panels shall be properly identified by name, letter, or standard symbol in an approved indelible manner, on the device, panel, or wire. The identification markings shall be identical to markings used on the wiring diagrams.
- B. Machine Room Equipment:
- Machine room shall be 168 sq.ft minimum.
- 1. Machine Room Emergency Lighting: Maintained Emergency lighting fittings shall be provided in each elevator machine room.
    - a. There shall be a minimum of one maintained lighting fixture.
  - 2. Clearance around equipment in each machine room shall comply with provisions of all applicable codes. Clear distance for the maintenance purposes shall be at least 18". In no case shall this clearance supersede minimum Code requirements.
  - 3. Equipment in elevator machine room shall be so arranged that replaceable items can be removed for repair or replacement either by overhead hoist and dolly, or other conventional means, without dismantling or removing other equipment components in the same machine room.
  - 4. Machine rooms must be air conditioned and heated to maintain an ambient temperature of 50<sup>0</sup> F to 90<sup>0</sup> F degrees and a relative humidity between 35% and 50%. The Air Conditioner shall be Split System. The heating system for the machine room is also a built in system. A forced removal should be done by moving the air from the room to the outside of the building to another part of the building to keep an air exchange through the equipment room. Intake and exhaust vent should not be located close to each other.
  - 5. Any component attached to the controller shall have a minimum clearance of 18 inches from the side(s) of the component requiring access for maintenance and free air circulation.
  - 6. One set of approved electrical and hydraulic diagrams of elevator shall be mounted in an aluminum channel frame with lucite cover and waterproof fiberglass backing and installed adjacent to the appropriate drive machine.

7. Provide Mats of insulating rubber or other suitable floor insulation in the front of the Controllers.
  - a. The Resistance range shall be  $1 \times 10^4 < 1 \times 10^6$  and shall meet ANSI/ESD requirements.
  - b. The rubber mat shall be the width of the controller plus 12".
  - c. The length of rubber mat shall be a minimum of 24".
  - d. The rubber mat shall be a 1/4" thickness and beveled at each end.
- C. Hydraulic Elevator Cylinder
  6. The Contractor shall set the hydraulic elevator cylinders true and plumb
    - a. Dielectric Insulation Installation
      1. Each cylinder shall be electrically isolated from the building steel and other earth ground sources
      2. The following are minimum requirements:
        - a) Install an insulating gasket between the platen plate and floor of the elevator cab. Use insulating sleeves and washers on the bolts.
        - b) Use insulating pads to insulate the cylinder support members (channels) from the guide rails and other structures at ground potential.
        - c) Use insulating sleeves and washers on the bolts that connect the cylinder to the support channels.
        - d) Install an insulating coupling on the oil supply line between the pump and cylinder, located as close to the cylinder as possible.
  7. Insulating gaskets shall be installed in the same manner as a normal gasket.
    - a. Sleeves shall not be forced through misaligned bolt holes. Where misalignment occurs, the holes shall be reamed true, and all metal, chips shall be carefully removed.
    - b. The sleeves shall extend into the plastic washer on both sides of the flange. Any sleeves or washer cracked during installation shall be replaced immediately.
    - c. After making up the flange, the resistance of each bolt to the flange shall be tested using a 500-volt megohmmeter. If the resistance of any bolt is less than 50 megohms, the sleeve and washer shall be checked and changed, if necessary, to provide the required resistance.

### 3.03 DEMONSTRATION

- A. Acceptance Tests:

1. The Contractor shall submit an operational test plan to the Authority for approval. When each elevator, furnished, installed, and tested, is ready to be placed in interim service, the Contractor, at no additional cost to the Authority, shall perform operational tests described below. The Authority shall be notified at least 48 hours prior to each scheduled test so that arrangements can be made for the presence of appropriate personnel to witness the tests. Acceptance Tests and inspections will be based upon the elevator meeting the requirements of the Specification and as evidenced by the operational test shall be witnessed by WMATA representative.

B. Elevator Tests

6. When the elevator work is fully completed, the Contractor shall demonstrate to the satisfaction of the Authority and Authorities Having Jurisdiction that the proper operation of every part of the equipment complies with all applicable requirements including the ASME Code.
  - a. The inspection procedure outlined in the ASME A17.2 will form a part of the final inspection.
  - b. No shop test of elevator motor and no certified test sheets will be required.
  - c. The heating, insulation and resistance of the motors will be determined under actual conditions after installation.
7. The Elevator Contractor shall furnish all test instruments and materials, required at the time of final inspection, to determine compliance of the work with the Contract requirements. Materials and instruments furnished shall include standard 50-pound test weights, megohmmeter, voltmeter and ammeter, Centigrade calibrated thermometers, spirit level, and stop watch. At the time of final inspection, tests shall include, but not be limited to, the following:
  - a. After installation, each elevator shall be tested without load by the Contractor. The elevator shall be subjected to a test for a period of eight-hours continuous run. During the test run, the car shall be stopped at top and bottom levels, in both directions of travel with a standing period of 10 seconds at each landing.
  - b. Full-Load Run Test
    1. The elevator shall be subjected to a test for a period of one-hours continuous run, with full specified rated load in the car. During the test run, the car shall be stopped at top and bottom levels, in both directions of travel with a standing period of 10 seconds at each landing.
  - c. Speed Test
    1. The actual speed of the elevator car shall be determined in both directions of travel, with full specified rated load and with no load in the elevator car.

2. Speed tests shall be made before and after the full-load run test.
  3. For hydraulic elevators, speed shall be determined with a temporarily mounted tachometer on the guide rail or stop.
  4. Car speed when ascending shall be not more than 10 percent above not more than 10 percent below the specified car speed.
  5. Car speed when descending shall be not more than 25 percent above not more than 10 percent below the specified car speed.
- d. Temperature Rise Test
1. The temperature rise of the drive unit motor shall be determined during the full-load test run. Temperatures shall be measured as specified in NEMA and IEEE Standards. Under these conditions the temperature rise of the motor shall not exceed NEMA and IEEE specified temperature rise. Test shall be started only when all parts of equipment are within 9 degrees Fahrenheit of the ambient temperature at time of starting test.
- e. Car Leveling Test
1. Elevator car leveling devices shall be tested for ¼-inch accuracy of landing at all floors with no load in car and with full load in car, in both directions of travel.
  2. One re-level operation is permitted when full load is in the car.
  3. Accuracy of floor leveling shall be determined both before and after the full-load run test.
- f. Insulation Resistance Test
1. The complete wiring system of elevator shall be free from short circuits and accidental grounds. The insulation resistance of the system shall be more than one megohm when tested by using a 500-volt megohmmeter. The elevator structure, equipment, and raceway shall be tested for continuity to ground.

### 3.04 ELEVATOR PROTECTION

1. The finished elevator installations shall be completely barricaded and enclosed to preclude their use without permission of the Contractor until Final Acceptance and release by the Contractor for general use. The enclosure shall be fabricated to allow easy access for maintenance, testing and adjustment.

2. The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room, and ensure that it shall remain secure at all times until the completion of the Contractor's interim maintenance obligation.
3. Protection: During installation and until all elevator systems are fully operational and accepted by WMATA, make all necessary provisions to protect all elevator components from damage, deterioration, and adverse environmental conditions. Do not use or allow the use of the elevator for construction purposes such as hauling materials or worker transport during construction.
4. Security Of Machine Rooms: The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room and ensure it shall remain locked and secure at all times.
5. Field Painting:
  - A. The pit, pit walls and machine room floor shall be painted. All machine room equipment shall be given two coats of approved machinery paint. All new iron work shall be given one coat of rust-inhibiting paint.
  - B. Metal parts visible to the public may be field painted where specifically shown or authorized by the Authority.

### 3.05 MAINTENANCE

The Contractor shall perform full maintenance service for a period of two years on each elevator in accordance with the manufacturer's maintenance manual and WMATA ELES maintenance program prior to WMATA providing permanent maintenance. The period of maintenance shall begin after test(s) and Provisional Acceptance of each elevator and shall extend to the scheduled date of Final Acceptance for all units in the same facility plus a period of two years. In no case shall the interval between inspections and testing be greater than one month. The maintenance service during the warranty period shall be provided by fully trained elevator mechanics. The maintenance tasks shall include, but not be limited to, the following:

- a. Inspection of completed installation and periodic testing to maintain the elevators in completely operable condition.
- b. Contractor shall provide support for periodic, accident and incident, PM compliance inspections.
- c. Lubrication of parts, and the protection of the equipment.
- d. Replacement of defective parts at no additional cost to the Authority.
- e. Annual clean down of the elevator and hoistway enclosure is required. Make necessary arrangements with Authority in order to minimize any inconvenience.
- f. Contractors performing maintenance are responsible for all service, repair work and emergency call. The contractors shall provide

unlimited service during revenue hours and twenty-four (24) hour emergency call back service at no additional cost.

- 1) Provide twenty (24) hour emergency service during the maintenance period consisting of a prompt response (within 1 hour) to emergency request by telephone or otherwise from Authority or designated representative if an elevator is inoperable or in case of injury, entrapment, or potential injury to persons.
  - 2) Unlimited service callbacks are included with a required response time of one (1) hour (including Holidays).
- g. Periodic maintenance (based on WMATA schedule) shall be performed off peak hours to minimize service interruption as long as the other elevator serving the same platform is operational.
  - h. Reporting: Detailed monthly records of tasks performed including names of individuals performing the tasks, date and time performed, and other pertinent data. In addition, the reports are to be provided in an electronic format acceptable to WMATA's needs.
  - i. Contractor performed maintenance shall follow the WMATA Office of Elevator and Escalator Operations procedures, schedules and check charts.

Within three (3) months prior to the termination of this contract, the Authority or his designated representative(s) shall make a thorough maintenance inspection of all equipment covered under this contract. The contractor shall provide personnel to remove, test, and operate equipment as necessary. All deficiencies found as a result of this inspection shall be corrected by the Contractor as required in this agreement with no additional cost for the Authority.

### **3.06 REMOTE MONITORING SPECIFICATIONS:**

- A. Allen Bradley DF1 or ELES Engineering approved equal industry standard Modbus protocol shall be provided to transmit data from the Elevator/Escalator controller to the Authority's AEMS RTU computer control and data system. The Design-Builder shall provide a controller data interface to a DH-485 network located in the Elevator /Escalator machine room. The DH-485 controller interface shall be programmable for data rates up to 115Kbps. The interface shall allow other nodes such as other Elevator or Escalators to be readily incorporated into the DH-485 network. The controller data interface shall include one Allen Bradley SLC PLC per station to function as a data concentrator to consolidate data from all the controllers in the station. The software for the data concentrator shall be as specified by the Authority. The data concentrator shall receive controller data over the DH-485 data network and provide formatted data to the AEMS RTU through a RS 232 link. This data transmission may be accomplished by a separate PLC controller integrated into the control system.

- B. The Elevator /Escalator control system shall automatically initiate the transmittal of data when data is requested by the Authority's AEMS system and continue until all data is received by the AEMS RTU in the station AC switchboard room. The Authority will perform final integration of the data in the AEMS system.
- C. The Contractor shall also provide the required hardware to download data from any fault finding annunciator panel to a supplied laptop PC being utilized at the Elevator/Escalator location. The provided software shall permit the downloading and storage of data on the supplied laptop PC from multiple fault finding annunciator panels.
- D. The Contractor shall install an Allen Bradley network interface module, (model 1761-NET-AIC, or approved alternative) beside the PLC in the controller and provide 24 VDC power to the module. The Allen Bradley PLC will be used for remote monitoring capabilities into WMATA established engineering monitoring network.
  - a) The Contractor shall provide all wiring and programming of the PLC to communicate with station data concentrators on the DH-485 network. Coordinate work with WMATA ELES Engineering.
  - b) The Contractor shall pull all remote monitoring cables to the interface in the elevator controller from the remote monitoring network going back to WMATA's Automated Energy Management System (AEMS) remote terminal unit (RTU).
  - c) Provide Ethernet communication between the elevator machine room and WMATA's communication room. The communication port shall be located less than 6' from the controller and shall have minimum of two ports for data communication.
- E. Terms and Definitions
  - 1. Boolean - A single bit data type.
  - 2. DF1 - A Rockwell Automation Company proprietary communications protocol.
  - 3. DH485 - An industrial communications network used by Allen Bradley programmable controllers.
  - 4. Integer - A data type 16 bit signed (range -32768 to 32767).
  - 5. PLC - Programmable Logic Controller.
  - 6. QEI - QEI Inc. Springfield NJ
  - 7. RTU - Remote Terminal Unit
- F. Elevator Remote Monitoring Data Specification
  - 1. Overview

The design of the WMATA escalator & elevator monitoring system shall include a data concentrator PLC to gather data from the elevator control PLC's over an Allen Bradley DH 485 network or ELES Engineering approved equal. The QEI RTU shall read data from the WMATA data concentrator PLC via an RS 232 serial connection to a 1746-BAST (or ELES Engineering approved equal) module

using Allen Bradley DF1 (or ELES Engineering approved equal) protocol. See figure 1.1 for reference. This specification defines data to be presented by the WMATA data concentrator PLC to the QEI RTU. The WMATA data concentrator PLC station shall pole the escalator & elevator controller(s) periodically for data and format the data into blocks within the WMATA data concentrator. An Ethernet TCP/IP connection is available at the Data concentrator PLC. The data concentrator PLC has been designed to collect data from up to (10) escalators and/or elevators. The data concentrator PLC is to be mounted into the existing QEI RTU enclosures and powered by a 120 VAC source from within the RTU. For Metro stations where more than (10) escalators and elevators are present additional data concentrator PLC's will be required.

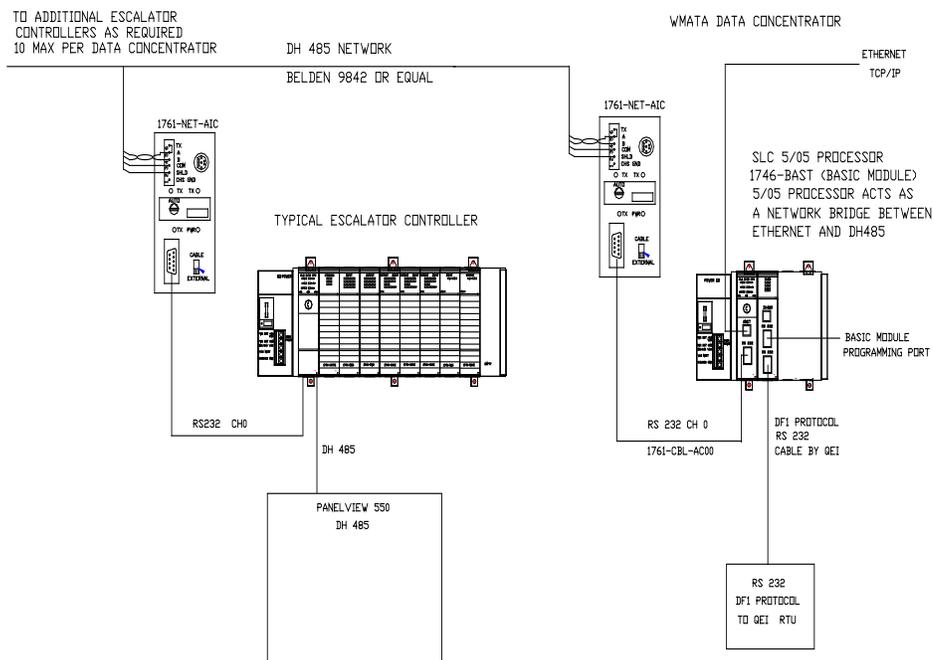

Figure 1.1

2. Data Concentrator PLC Data File Assignments.

The WMATA data concentrator PLC shall store data for up to (10) escalators and/or elevators in any combination as defined in table 2.1.

Concentrator PLC (DC)	25	N80	N79		

Each data file shall begin with word 1 (example: escalator #1 status bits begin with N20:1 and end at N20:20)

The data concentrator PLC communication ports shall be configured as follows.

**Channel 1**

Driver: Ethernet  
IP Address: TBD  
Subnet Mask: TBD  
Gateway Address: TBD

**Channel 2**

Driver: DH485  
Baud Rate: 19.2K  
Node Address: 25

1756-BAST basic module communication ports shall be configured as follows.

**Port 1:** Programming port

Settings -- 19,200 Baud, No parity, 8 bits, 1 stop bit, No handshaking

**Port 2:** DF1 port

Settings -- 19,200 Baud, No parity, 8 bits, 1 stop bit, No handshaking

DF1 – Op Code 19 (Full Duplex, NHS, ER, Enable DPD, CRC error checking,

Timeout = 50

Retries = 3

RTS on delay = 20 msec

RTS off delay = 20 msec

Module address = 10

**DH485 Port** – Not Available

Note: All analog values are multiplied by 16 in the data concentrator to bit shift left 4 bits to align with QEI's 12 bit analog data types.

A note on communication loss

A 60 second watchdog timer is coded into each escalator file. If communications are lost between the data concentrator and the escalator controller for more than 60 seconds the watchdog timer will timeout. When the timer has timed out the communications loss bit will be reset (0) to indicate the communications loss condition.

**3. Time and date sync**

The QEI RTU shall provide clock synchronization to the WMATA data concentrator PLC every 5 minutes. Table 4.1 defines the address and data format of the clock registers in the WMATA data concentrator PLC. The data concentrator PLC shall set the escalator controller date and time every day at 3 AM.

**Table 4.1**

FUNCTION	ADDRESS	FORMAT
YEAR	N13:10	4 DIGITS
MONTH	N13:11	2 DIGITS
DAY	N13:12	2 DIGITS
HOUR	N13:13	2 DIGITS 24 HOUR

MINUTE	N13:14	2 DIGITS
SECOND	N13:15	2 DIGITS

#### 4. Data Concentrator PLC Program

The data concentrator PLC includes code to monitor up to 10 escalators and 5 elevators. Each escalators and elevators has an independent code file and a configuration bit. If an elevator is to be monitored the configuration bit must be set corresponding to the DH485 station address of the elevator controller. If the configuration bit is reset (0), the status and analog data table values for the elevator or escalator will be set to 0.

The configuration bits are as follows.

Escalator Configuration Bit	DH485 Address of Escalator Controller	Elevator Configuration Bit	DH485 Address of Elevator Controller
B9:0/1	1	B9:1/1	11
B9:0/2	2	B9:1/2	12
B9:0/3	3	B9:1/3	13
B9:0/4	4	B9:1/4	14
B9:0/5	5	B9:1/5	15
B9:0/6	6	B9:1/6	16
B9:0/7	7	B9:1/7	17
B9:0/8	8	B9:1/8	18

B9:0/9	9	B9:1/9	19
B9:0/10	10	B9:1/10	20

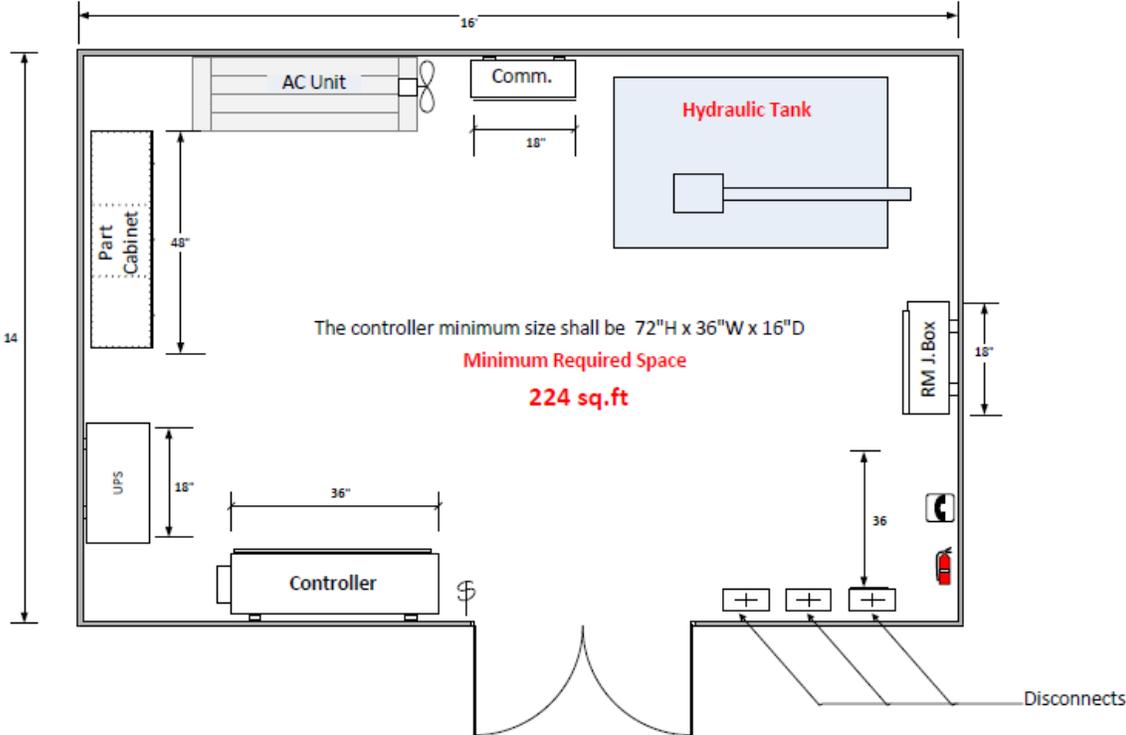

**3. Data Concentrator Gateway IP addresses.**

The Data concentrator PLC acts as a gateway between the Ethernet and DH485 networks. The PLC contains a list of IP addresses, known as the routing table which will be allowed access to the DH485 network. The routing table will contain 20 addresses.

3.07 EXHIBIT 1. Hydraulic Single Elevator Macine Room

END OF SECTION

**SECTION 14240  
GEARLESS TRACTION PASSENGER ELEVATORS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION**

- A. This provides guidelines for the fabrication, installation and testing of the heavy-duty gearless traction passenger elevators, signs and Kiosk information system.
- B. The following sections include related requirements and are performed by other trades:
  - 1. Specifications Section 02000 – Site Construction
  - 2. Specifications Section 05000 – Metal Fabrication
  - 3. Specifications Section 08800 – Glass and Glazing
  - 4. Specifications Section 09920 – Painting
  - 5. Division 7 Section “Waterproofing” for water proofing of elevator pit
  - 6. Division 15 Sections for heating, ventilating and/or air conditioning of elevator machine room.
  - 7. Division 16 Sections for electrical service to elevator equipment, fire alarm systems and communications systems.
- C. Definitions:
  - 1. Heavy duty elevator: An elevator designed specifically for the harsh environment and duty load cycles common to transportation system usage.
  - 2. Elevator - a hoisting and lowering mechanism, equipped with a car or platform, which moves in guide rails or racks and serves two or more landings
  - 3. Elevator, passenger - an elevator used primarily to carry persons other than the operator and persons necessary for loading and unloading.
  - 4. Gearless: a traction machine, without intermediate gearing, that has the traction sheave and the brake drum mounted directly on the motor shaft.
  - 5. Contractor: The General Contractor.
  - 6. Installer: The responsible party who installs the elevator.
  - 7. OEM: Original Equipment Manufacturer.
  - 8. Dwell time: The period of time the elevator is at a landing while the doors open, passengers transfer and doors close.

9. Substantial completion: The point at which the elevator is ready for use, whether the site is finished or not. This is where the jurisdictional inspection usually takes place.
10. Final Acceptance: The point at which the owner accepts the elevator project as being complete including all submittal requirements. This may be a different point in time than substantial completion.
11. Interim Maintenance: Maintenance from the point of substantial completion, but prior to Revenue Service.
12. Beneficial Use: When the elevator is placed into service, may be prior to the site being ready for public use.
13. Revenue Service: The station or facility opening date.
14. Notice to Proceed (NTP): within this document shall mean the date which the elevator installer is notified to proceed with the project.
15. Override Switch – A switch located in a kiosk panel, which disables the Hall Call Buttons.
16. MSDS - Material Safety Data Sheet.
17. BOM - Bill of Material
18. SMNT - Systems Maintenance (WMATA)
19. WMATA: Washington Metropolitan Area Transit Authority.

## **1.02 REFERENCES AND QUALITY ASSURANCE**

### **A. Codes, Regulations, Reference Standards and Specifications:**

1. Codes and regulations. of the jurisdictional authorities.
2. ANSI/ME: A17.1, A17.1a, A17.1b, A117.1.
3. ASTM: A123, A153, A525, A568, C1048.
4. Uniform Federal Accessibility Standard,
5. Americans with Disabilities Act.
6. FS: RR-W-410.
7. American Institute of Steel Construction (AISC).
8. American Iron and Steel Institute (AISI).
9. American National Standards Institute (ANSI): C80.1
10. American Welding Society (AWS): D1.1.
11. Environmental Protection Agency (EPA).
12. Federal Transit Administration (FTA).

13. Institute of Electrical and Electronic Engineers (IEEE): 1202.
  14. International Code Council (ICC) – International Building Code (IBC).
  15. National Association of Architectural Metal Manufacturers. (NAAMM): C54, C55.
  16. National Institute of Standards and Technology (NIST).
  17. National Electrical Code (NEC).
  18. National Electrical Manufacturers' Association (NEMA): WC 70, KS 1, AB 1, 250, PB 1, MG 1.
  19. National Electrical Safety Code (NESC)
  20. National Elevator Industry, Inc. (NEII)
  21. National Fire Protection Association (NFPA): NFPA-130-2003.
  22. Occupational Safety and Health Act (OSHA).
  23. Society of the Plastics Industry (SPI).
  24. Underwriters' Laboratories, Inc. (UL), UL-94HB, 6, 50, 62, 98, 360, 486, 489, 514, 1591.
  25. United States Department of Transportation (DOT).
  26. Any additional requirements imposed by local agencies and/or codes having jurisdiction shall be incorporated into elevator installation.
  27. In the event of a conflict between codes, regulations or standards, the most stringent requirement as determined by the Contractor and approved by the Authority shall take precedence unless specifically addressed herein.
- B. Elevator Manufacturer and/or Installer's Qualification:
1. Manufacturer Qualification: : Shall provide documents stating that their firm has successfully produced elevators for transit system applications for a minimum of ten (10) years and regularly engaged for the past five (5) years in the manufacture of major components for gearless traction passenger elevators. As a standard of quality the elevator equipment design and installation shall comply with the Code.
  2. Installer's Qualifications: Shall be the original manufacturer of elevator equipment or manufacturer's authorized agent who is trained and approved for installation of units required for this Project.
  3. The Contractor shall obtain and pay for all permits and licenses and perform all required inspections.
- C. Quality Assurance:
1. The elevator contractor shall guarantee the materials and workmanship of the apparatus furnished under these specifications and will make good any defects not due to ordinary wear and tear or improper use or carelessness, which may develop within two (2) years from date of completion of each elevator, inclusive of labor and

- traveling expenses. Defective work shall be repaired or replaced at no additional cost to the Authority.
2. Welding: Welding shall be performed in accordance with the requirements of AWS or CWB Welders shall produce evidence of current certification by AWS or CWB.
  3. Labeling Requirements: Every elevator shall be clearly marked with rated load and speed, manufacture serial number and the designated Authority identification.
    - a. All elevators shall be permanently numbered with number designations corresponding to the indications on the kiosk annunciator panel. A station sketch showing the elevator numbers shall be submitted for WMATA ELES Engineering. The elevators shall be numbered in sequence, starting at the north entrance left to right facing to the elevator at each station and proceeding clockwise around the station. The numbering shall proceed into the station toward the end of the platform. Corresponding numerical identification shall be affixed to the equipment in the machine rooms. The elevator numbering shall be approved by the ELES Engineer.

### **1.03 SUBMITTALS**

Submit the following for approval in accordance with the General Requirements and the additional requirements as specified for each to WMATA/ELES.

A. Shop Drawings:

The contractor to provide detailed drawings that shows the dimensions, tolerance and specification that may include the material specification, hardness or electrical rating for each component that is being used. In regards to assemblies, they must provide a top level drawing with BOM and quantities with detailed material specifications and drawings with dimensional tolerances. The contractor also to provide as-built CAD models of all elevator components.

The name of the manufacturer and type or style designation shall be listed on the equipment shop drawings. Drawings submitted shall include, but not be limited to, the following. Submit six sets include the following:

1. Fully dimensioned layout in plan and elevation, showing the arrangement of equipment and all pertinent details of each specified elevator unit, including as appropriate:
  - a. All equipment located in machine rooms.
  - b. Location of circuit breaker, switchboard panel, disconnect switches, light switch, and feeder extension points in machine rooms,
  - c. Location in hoistway of outlets for connection of traveling cables for car light, fire detectors, communication, and control systems.
  - d. Car, drive and motors, safeties governors, supporting beams, guide rails, buffers, and other components located in the hoistways for each elevator.

- e. Maximum Rail bracket spacing and maximum horizontal forces on guide rails in accordance with Part 2.23 of the ANSI/ASME Code.
  - f. Reactions at points of supports.
  - g. Weight of principal parts.
  - h. Loads on hoist beams.
  - i. Loads imposed on racks requiring transfer to building structure.
  - j. Top and bottom clearance and travel of car and counterweight runby.
  - k. Refuge space on top of car and pit.
  - l. Cab design, dimensions and layout.
  - m. Color/material schedule and selection chart for cab and entrance features.
2. Complete wiring diagram of the elevator system and subsystems. Complete data regarding electrical characteristics and connection requirements.
  3. Drawings of the hoistway entrances and doors showing their method of operation, details of construction, and fastenings to the structural members of the station structure.
  4. Drawings of the car for each design specified, showing details of construction, and fastenings to platform car floor covering, car-lighting, ventilation, communication, provision for closed circuit television monitor, and location of equipment.
  5. Cuts or drawings showing details of all signal and operating devices, identifying graphics and kiosk interface where applicable.
  6. Electrical characteristics and connection requirements.
  7. Complete assembly detail of machine, machine mounting, machine beam assembly, dead end hitch and beam assemblies.
  8. Machine performance data sheets.
  9. Elevator controller, including manufacturer's technical data and catalog cuts, and interface hardware and software requirements.
  10. Power door operator.
  11. Door interlocks and electrical contacts including test reports showing that hoistway door interlocks, car door contacts, and car top emergency contacts meet the requirements of the ANSI/ASME Code and certification by the NBS or other approved laboratory.
  12. Car ventilation.
  13. Car lighting.
  14. Cabling.

15. Hall and car fixtures at each landing including the car operating panel (COP).
16. Buffer, including stroke and certified maximum striking speed for car.
17. Mechanical, electrical, and architectural design details of communication systems and intrusion systems for both elevator and kiosk systems. Provide diagram and schematic of kiosk annunciator panel.
18. Design and architectural details of electrical protective device for car doors.
19. Where use of adjoining dissimilar metals is required, descriptions of protective measures to be employed to avoid corrosive damage.
20. Certification from independent testing laboratory that glazing gaskets meet the specified requirements.
21. Conduit and wireway cladding configuration configuration from the point of origin to the final destination. .
22. Interface wiring diagrams with other systems showing terminal board location and identification.
23. Expected heat dissipation of elevator equipment in machine room and control areas (i.e. BTU's/hr.) based on 240 round cycles per hour.

**B. Samples:**

Three of each of the following samples shall be submitted for approval.

1. Stainless Steel: One of stainless steel sheet of thickness and finish specified, 6 inches square.
2. Glass: One, 12 inches square.
3. Floor covering: One, 12 inches square in the color and finish to be supplied.
4. Neoprene gasket: One of each type.
5. Landing selector button mounted in cover plate with identity marking along side button.
6. Ceiling material.
7. Signs: One of each type.

**C. Certification:**

1. Certificates of inspection and acceptance issued by jurisdictional authority.
2. The Acceptance Inspection (Specifications and Code) by Office of Elevator and Escalator (ELES) shall take place prior to the Final Acceptance Inspection by the Jurisdictional Authority, and the elevators and associated equipment shall be free of defective material, imperfect work and faulty operation.

All defective work identified by ELES representatives shall be repaired or replaced at no additional cost to the Authority prior to the Final Acceptance Inspection by the Jurisdictional Authority.

D. Operation and Maintenance Manuals:

Six sets of the approved manuals, elevator installation, operation instructions, troubleshooting techniques and related equipment drawings and software (all publication must be in English) – two copies of which to be delivered to the WMATA/ELES Engineer representing of the Authority prior to installation. Each binder shall has the Binder Cover and Spine Insert which contain the Station Name and Unit ID.

Submit an additional electronic copy on Flash Drive(s)/CD(s). The Information shall be saved/presented as follows:

- a. Graphic images in “.dwg” AutoCad and “.pdf” formats. All revisions shall be made by using computer software. Hand written changes are not acceptable.
- b. Text in Microsoft Word .doc, “.pdf” or approved equal format.

The manuals shall include the following:

- 1. Complete operation and maintenance Instructions of the elevator equipment included complete illustrated, exploded views of all assemblies and a complete illustrated, exploded view for identification all system parts.
- 2. Complete nomenclature of replaceable parts, part numbers, current cost, and warehouse location. If product source is another vendor, Contractor shall include name and address of other vendor.
- 3. Furnish a summation, in tabular form, of all parts incorporated in the elevators supplied under the Contract. Include but not be limited to the following:
  - a. Nomenclature of part.
  - b. Contractor's part number.
  - c. Nomenclature of next higher assembly in which used.
  - d. Manufacturer and part number.
  - e. Model number of elevator on which used.
  - f. Total quantity.
  - g. Current unit price to the Authority.
  - h. Serial numbers of all serialized assemblies, subassemblies, motors, and other major components supplied and installed.
- 4. Control and schematic electrical wiring diagrams of controller including wiring of safety devices.

- a. Wiring Diagrams shall be full size, ladder type, complete "as-built" wiring and single line diagrams showing the electrical connections, functions and sequence of operation of apparatus connected with each elevator, using standard symbols or proprietary symbols defined on the diagram, both in the machine room and in the hoistway, shall be furnished in duplicate for each elevator.
  - b. Wiring diagrams shall incorporate the wiring identification labeling to identify the controller and field wiring used for each circuit. Wiring diagrams shall have sheets numbered with an indication of the total number of sheets in the diagram set. Each page should include unit number where the diagram belongs to.
  - c. After approval, a copy of each print shall be laminated and mounted in each elevator machine room. A reproducible .003 mil Mylar set of wiring diagrams for each elevator shall be delivered to ELES Engineering.
  - d. Coded diagrams are not acceptable.
5. Complete detailed drawings and wiring diagram of elevator system.
  6. Lubricants, sealers, paints and any other potentially hazardous substances are subject to review and approval by the Authority.
  7. Detailed lubrication and cleaning schedule.
  8. Procedures for adjusting all elevator components.
  9. Complete set of contract software including operating control software.
  10. Detailed, record and as-built layout drawings.
  11. The entire manual, all software upgrades and service tools for elevators shall be provided in an electronic format on CD-ROM that is acceptable to the WMATA Engineering and Maintenance Department.
  12. All hard copy publications shall be in loose-leaf form, on 30-pound paper and with punch holes reinforced with plastic, cloth or metallic material.
- a. The O&M manual shall only contain information related to equipment installed under this contract. Generic information that does not pertain to the equipment installed shall not be included. Scanned documents are not allowed. The fonts should be standard format.
  - b. All covers shall be resistant to oil, moisture, and wear commensurate with their intended use. Diagrams and illustrations shall not be loose or in pockets. All printed material shall be capable of being reproduced on dry copying machines.

13. Each elevator shall be treated as a whole and not as a grouping of disassociated parts. The material in the Wiring Diagram Manual shall be organized and indexed by the elevator classifications included in this Specification. All manual sections shall be sub-divided, to the extent required by the subject matter, and shall include, but not necessarily limited to the following topics:
  - a. General system or sub-system description and operation.
  - b. Sequence of operation.
  - c. Replacement and step by step adjustment procedure for all components and systems.
  - d. Block diagrams.
  - e. Functional schematics.
  - f. Functional as-built wiring diagram.
  - g. Lubrication and cleaning, including frequency, methods, and trade identifications of recommended materials.
  - h. Component location and description.
  - i. Inspection and maintenance standards including wear limits, settings, and tolerances.
  - j. Installation and removal sequence.
  - k. Test and evaluation procedures.
  - l. Spare parts lists and special tools.
14. The contractor shall provide all information: manuals, drawings, design changes, modifications, techniques, procedures and any other documents related to maintenance, safety, operations which relate to any part, component, system, subsystem or material and applicable to the elevator equipment. All operating, programming, control software and licensing keys (if applicable) to the PLC control system for the installation.
15. All of the above referenced shall be provided as it pertains to the original installation and for a period of ten (10) years after final acceptance of the elevator. During a ten (10) years period, In case of any items are obsolete or no longer available from the manufacturer the Elevator Contractor shall provide the alternative products.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING**

- A. Ship equipment and accessories securely packaged and labeled for safe handling and to prevent damage.
- B. Protect equipment exposed finishes during transportation storage and erection against damage and stains.

- C. Deliver components with factory-installed wooden skids and lifting lugs; pack components in factory-fabricated protective containers.
- D. Store in clean, dry and secure areas and protect them from weather and damage.

**1.05 WORK BY OTHER TRADES**

The following will be provided in accordance with other sections of the Contract Specifications or by separate contracts; coordination is the Contractor's responsibility:

- A. Hoistway conforming to code and specified requirements, plumb to within ¼ inch, including machine beams, pit, and pit ladders.
- B. Intermediate rail bracket supports.
- C. Grouting around hoistway entrances and sills.
- D. Temporary and Permanent Electrical Power Services:  
Contractor shall provide and coordinate the following:
  - 1. For the elevator drive systems: 480 (460) volts, 3 phase, 3 wire, 60 Hertz terminating in a disconnect switch within sight of the controller. The disconnect shall be free on any obstruction for a total of 36" from any part of the disconnect.
  - 2. For lighting and GFCI receptacles: 120 volts, 1 phase, 3 wire, 60 Hertz terminating at the elevator controller location.
  - 3. Separate disconnect for cab lighting and wiring to cab. This disconnect shall be located close to the main line disconnect.
  - 4. Separate service for sill heaters where required.
- E. Cutouts in hoistway walls for fixtures.
- F. Smoke and/or heat sensors in machine room, in car and above each hoistway entrance.
- G. Closed circuit television camera (CCTV) in elevator car.
- H. Intrusion detectors on machine room doors.
- I. Space in kiosk for elevator annunciator panels.
- J. All embedded electrical conduit between elevator hoistway, machine room and kiosk.
- K. Pit Drainage means to prevent water from accumulating in the pit for outdoor and indoor elevators. If pumps are used, they shall have a backup power source.
- L. Lock and Key Requirements: Contractor shall coordinate with WMATA. The keys for all elevators except of Code requirements shall be keyed the same. Each station shall have a key and a master key shall be furnished which will operate all elevator locks in the Metro System, including previously installed elevators.

- M. Contractor shall coordinate any alterations required to accommodate elevators with the Authority.
- N. Contractor shall attend appropriate safety training programs provided by WMATA at no extra cost.
- O. As-Built Drawings: Contractor is responsible to provide revised Contract Drawings to reflect the actual as built condition including all structural, architectural, electrical, mechanical and plumbing connections to the elevators.

**1.06 COORDINATION WITH OTHERS**

- A. The elevator installer shall install all elevator wiring in the embedded conduit provided by other trades including that to the kiosk. Other trades will bring wiring for their services to either the elevator machine room or the elevator pit, terminated on a terminal block. The elevator installer shall extend wires from the terminal blocks to the appropriate location or device within the elevator enclosure or hoistway. Some of these circuits shall require shielded wires or separate isolated circuits.

**1.07 OPERATION AND MAINTENANCE TRAINING**

- A. Training: The Contractor shall develop and provide operation, troubleshooting and maintenance training in accordance with the General Requirements and as follows:
  - 1. Three days of classroom plus two days hands on training on the field shall be provided for 10 students per class. Six training session for a total of 60 students is required.
  - 2. Time and place of training will be determined by the Authority, but must be completed no later than 30 days prior to the Final Completion.
  - 3. Training shall be organized to make optimum use of the required maintenance and operation manuals including training for replacement of all parts contained in the Parts Inventory list.
  - 4. At the completion of the first training session, a narrated and properly edited training video shall be submitted for the authority on DVD or flash drive. The video shall be taken by the professional camera operator with quality image and sound track and will be used for the future trainings. The video shall cover operation of the elevator, function of the devices, maintenance, adjustment procedures and troubleshooting. The following items shall be included as minimum requirements:
    - 1) Step by step adjustment procedure on the followings:
      - 1.1 Door operators, DCL, DOL, full door opening, and so on...

- 1.2 Car Leveling and adjustment of leveling sensors and vans
  - 1.3 Door: door interlock, proper pressure, restrictors ...
  - 2) General overview of major items:
    - 2.1 Controller:
    - 2.2 Controller display:
    - 2.3 Door sills
    - 2.4 Guide rails
  - 3) Daily operation and sequence of operation
  - 4) Replacement and Installation of components:
    - 4.1 door photo eye
    - 4.2 Door clutch
    - 4.3 Door pickup rollers
  - 5) Proper guide roller adjustment
  - 6) Verification of safety circuit
  - 7) Maintenance procedure and Frequency of maintenance
  - 8) Proper access of pit and top of car for inspection
  - 9) Proper test of fire service operation
  - 10) Proper lubrication of components
  - 11) Troubleshooting techniques
  - 12) How to use proper communication device, machine room, car top, and kiosk
  - 13) Proper adjustment of shaft and drive encoders
  - 14) Proper run learn adjustment
  - 15) Operation of Governor and adjustment procedure
  - 16) How to perform governor tripping test
  - 17) Function of Rope gripper
  - 18) Lubricate rope and check for wear
  - 19) Maintenance and inspection of buffer
  - 20) Test and inspection of safety plunk
  - 21) Overview of car and counterweight run-by
  - 22) Operation of brake and proper adjustment procedure.
  - 23) Check Gear box for wear and oil check
  - 24) Inspect Sheave for wear and bearings lubrication
- 5. Provide one additional copy of all required submittals to the Engineer for Authority use.
  - 6. Provide two copies in DVD format of training materials along with visuals and handouts to the Engineer for Authority use.
    - a. Video shall be narrative.
    - b. Video shall be separated by major components Sections

- c. Equipment Identification shall be as a part of the section title.
- 7. Separate training manual shall be submitted for approval prior the scheduling of the training. The O&M manual shall not be used as a training manual.

**B. Scope of Work**

- 1. All training, as described below, shall take place prior to Final Acceptance of equipment or materials by the Authority. The contractor shall video tape all training sessions and provide WMATA/ELES with edited copy of the recording.
- 2. The training shall be tailored specifically to the furnished and installed equipment, and designed to teach the day-to-day operation of all equipment. The training shall be sufficient to bring personnel to a level of operating proficiency such that routine vendor support is not needed.
- 3. Maintenance Training shall be tailored specifically to the furnished and installed equipment, and designed to develop the knowledge and skills required to maintain all item(s) delivered.
- 4. The training shall be subdivided into two major levels as follows:
  - a. System Level Maintenance Training, covering:
    - i. Theory of operation of the system and its major components.
    - ii. System configuration.
    - iii. Preventative maintenance, consisting of written procedures and schedules for the periodic maintenance of all equipment.
    - iv. Written and validated inspection procedures and a system-level trouble-shooting guide (to the lowest field-replaceable unit).
  - b. Shop Level Maintenance Training, covering
    - i. Detailed theory of operation to module, board, and/or device level.
    - ii. Component level troubleshooting and component replacement and adjustment.
    - iii. Testing and alignment procedures of repaired units.

**C. Deliverables**

- 1. The following course materials shall be delivered by the Contractor, according to the following specifications:

- a. An Instructor's Guide containing all the information and direction necessary for the instructor to make an effective presentation. It shall include adequate guidelines to conduct a comprehensive training program. Individual lessons within the course shall be organized as separable blocks (or modules) which may be taught as a unit. The Instructor's Guide shall contain, as a minimum:
  1. Discussion of student prerequisites (if any).
  2. Program overview.
  3. A statement of overall program goals.
  4. Lesson plans (a session-by-session outline containing the following):
    - a. Student learning objectives, stated in measurable term
    - b. Overview of each lesson.
- b. A Student Manual including all materials for the student to interact in the learning situation. It shall contain, as a minimum:
  1. Program overview and introduction.
  2. Statement of overall program goals.
  3. Learning objectives, stated in measurable terms that specifically describe desired behaviors or knowledge to be gained.
  4. A fully developed prose treatment (not outline format) of content presentation, developed in the same modular format as the Instructor's Guide.
  5. Illustrations, charts, photos or other graphics of actual system components as needed to enhance content presentation.
  6. The training manuals shall be prepared and submitted for approval to WMATA/ELES prior to training. The training manuals shall include procedures for adjustment and replacement of all electrical and mechanical components, and a troubleshooting guide.
- c. Audio-visual Aids consisting of a narrated video of not less than 90 minutes duration to include, but not limited to, the following:
  1. General overview of major features.
  2. Daily operations.
  3. Maintenance procedures (lubrication, adjustments, critical measurements, etc.).
  4. Frequency of maintenance procedures.
  5. Parts replacement safety devices, lighting, etc.

6. Verification of safety circuits, methods of accessing and preserving computerized functional data if required.
  7. Step by step adjustment procedures and installation of components.
  8. Handouts, transparencies and/or slides as necessary to ensure clear and comprehensive presentations.
  9. The training video shall be taken from actual equipment installed under this contract.
- D. Supplemental Materials consisting of a functional mock-up or a functional representation is required of any equipment that requires theoretical discussion. This may be in the form of an animated schematic, a model of the equipment, an actual device, an interactive video training device, or an approved substitute. All mock-ups shall become the property of the Authority for eventual turn over to WMATA/ELES.
- E. The final copies shall be delivered to the Authority as follows:
1. One complete set of training materials that is completely camera-ready. Camera-ready copy is defined as typewritten or typeset originals or high-quality copies such that further copies can be made from them with no noticeable decrease in copy quality.
  2. Five copies of all student and instructor materials, to be used for archival purposes, in the WMATA ELES Technical Library.
  3. A set of complete student materials including training manuals for each participant enrolled in training classes. The O&M manual, training manuals and special tools shall be approved by WMATA prior to the training.
  4. The contractor shall video record all training sessions and provide WMATA/ELES with edited DVD copy of the recording to be used as training guide for other WMATA ELES employees.
- F. The following specifications shall be met in instructional delivery:
1. Instructor Qualifications. A description of instructor qualifications, a resume, curriculum vitae, or other description of instruction qualifications must be submitted at least 60 days prior to the presentation of training. The description shall document a thorough knowledge of the equipment being taught, an understanding of the adult learning process, and demonstrated experience in vocational instructional. The ELES Engineering Office will review and approve the Instructor candidacy.
  2. Course length. The length of the course shall be 5 working days with 3 days in the classroom and 2 days hands-on training.
  3. Student qualifications. For the purposes of course development and presentation, vendors shall assume all students are high school graduates (or equivalent), and that maintenance personnel will possess the ability to use basic hand tools and electronic test equipment.

4. Testing. Instructors must give written and/or practical tests as a measuring device to determine knowledge transference. Tests shall use a multiple-choice or short answer format, and have been validated in a pilot course or by some other means agreed to by the Authority and Contractor. Whenever possible, a practical hands-on test shall be developed to demonstrate the transference of operational/mechanical skills.

**1.08 SPARE PARTS AND SERVICE FACILITY**

- A. At the expiration of the warranty requirements of the General Provisions, the Contractor is responsible to provide a source for spare parts and service facility in the United States which can be obtained for an additional five years. If product source is another vendor, Contractor shall include name and address of other vendor.
- B. The Contractor shall propose and provide a spare parts inventory, to be approved by the Engineer and provided to the Authority not less than 90 days prior to scheduled completion, equal in value to seven percent of the cost of the each elevator.
- C. This provision requires the furnishing of a Recommended Spare Parts and Special Tools List based on manufacturer's recommendations, defines criteria to be used by the Contractor in developing spare parts recommendations; defines the manner of identifying spare parts on the list and the labeling and identification of spare parts upon delivery; and the timing of delivery of spare parts.

Elevator parts list, grouped by system and subsystem for stocking identification and the list shall contain the following information for each item listed:

- a. Component name and Part number(s)
  - b. Manufacturer's name
  - c. Model number(s)
  - d. A blank column for WMATA's part number
  - e. Manufacturer's recommended quantity
  - f. Anticipated annual usage
  - g. Unit price
  - h. Special storage and handling requirements
- D. The manufacturer's recommended quantities shall be based upon the following reliability, usage and lead time considerations:
    - a. Wear: Components which may be expected to require replacement under normal maintenance schedule and operations, such as mechanical parts subject to continuous operation within projected mean time between failure levels.

- b. Consumables or Expendables: Components which are consumed, used up, destroyed, or upon failure, are otherwise made usable for their intended purpose and are economically unrecoverable except for inherent scrap value.
- c. Recoverable or Repairable: Components which, upon failure, are capable of being repaired or remanufactured to a serviceable, operational condition and maintained available for use within their initial intended purpose.
- d. Long Lead: Components that are not available from commercial distributors or within 48 hours from the manufacturers such as specifically made or selected components.
- E. Cross referencing: Where replacement components are common to more than one system or subsystem, include a cross reference and indexing system in the replacement components list:
- F. Non-Unique parts: In all components lists, items that are not unique to the system and have been manufactured by others shall be identified by the manufacturer's name and part number.
- G. WMATA will provide the Elevator Contractor with shipping instructions, with WMATA part numbers for each item the Elevator Contractor is required to furnish.
- H. The parts shall be shipped to the locations as directed by the Authority, at the same time as the counterpart equipment delivery or acceptance by the Authority of installed equipment. Shipping documents shall identify the Contract number, manufacturer's part number, quantity, unit price and WMATA part number.
- I. Spare parts shall be properly packaged or crated so as to prevent damage during shipment and long-term storage.
- J. Spare parts shall be the same in all respects as their counterparts furnished as a part of the assembled equipment to be delivered.
- K. Parts furnished in accordance with this provision are WMATA spares, separate and distinct from any Contractor obligation to replace parts, components or assemblies under any warranty provision.
- L. Parts lists contained in Operations and Maintenance Manuals provided under the Contract shall include assigned WMATA part numbers.
- M. A Manufacturer's Recommended Spare Parts List shall be provided. Parts to be provided shall be based on the criteria described herein and require the Authority approval and shall be provided prior to Final Acceptance.
- N. Any Special Tool(s) used including, but not limited to, troubleshooting, maintaining the elevator, software and/or hardware shall be provided as part of the spare parts to ELES Engineering Office. Any tools provided shall be the same as those issued to the Adjuster and equivalent members of the subcontractor's staff.

**1.09 STORAGE CABINET**

- A. The contractor shall install a lockable metal cabinet of suitable size with a key specified by the WMATA Engineering and Maintenance Dept. in each elevator machine room for the storage of special tools and necessary spare parts. The cabinet shall be mounted on legs or a pedestal, a minimum of 4 inches off the floor.

**1.10 SPECIAL TOOLS**

- A. A complete set of special tools and instruments necessary for troubleshooting and making all adjustments on every part of the elevator installation, including software and hardware shall be furnished for each elevator machine room and delivered to the Engineer as part of the spare parts inventory. Tools that are designed specifically for tasks associated with elevator inspection, maintenance and repair or that are required for these tasks, and are not readily available through normal purchasing channels are defined as special tools.
- B. Any "Special Tool/ equipment" that is required to troubleshoot, maintain, adjust, and test the system; the tool/equipment shall remain operational for the life of the equipment.
  - a. Provide all special tools and equipment necessary for making all system adjustments to the signal and speed controller and door equipment. A programming unit, approved by the Original Equipment Manufacturer (OEM) such as a laptop with 4GB memory, 15-inch display and DVD drive, with all software packages required to setup and program all equipment in the elevator system shall be provided, one per station or location. Software shall be provided for the display unit, DeviceNet, hoist motor drive, if applicable, and any other programmable devices, as well as for the controller PLC. Any hardware or software required for configuring, programming and or communicating to controller or any parts of the elevator shall be submitted to ELES engineering. Using the provided laptop, the contractor shall demonstrate loading, downloading (programming) any and all software that is required for the elevator for all operating needs. This includes display, PLC and any I/O controls. No special tools with decaying circuits or clocks are permitted.
- C. Keys: Provide ten (10) sets of keys to operate all keyed switches and locks prior to completion of the first unit.

**1.11 AUTHORITY COORDINATION:**

The elevators shall not be in service for passenger/public use until all of the following requirements have been met.

- 1. The Operations and Maintenance Manuals have been approved and received by WMATA.

2. The Training and Student Manuals as well as video record of all training sessions have been approved and received by WMATA
3. The required training has been completed in accordance with this specification.
4. All field tests have been successfully completed.
5. The acceptance testing has been successfully completed.
6. All spare parts have been delivered and received by WMATA.
7. All Special Tools/Equipment and Software have been delivered and received by WMATA.
8. All discrepancies identified by the WMATA's CEI (Certified Elevator Inspector) representative shall be completed.

**PART 2 - PRODUCTS**

**2.01 DESIGN REQUIREMENTS**

A. General:

1. Elevators furnished under the Contract shall be Gearless Traction elevators type elevators as shown. All parts shall be built to standard dimensions, tolerances, and clearances so that similar machines and devices supplied under contract are completely interchangeable. The mechanical fastening used throughout the equipment on parts subject to wear and requiring replacement shall be key and seat, nut, screw, or other removable and replaceable type not requiring physical deformation or field positioning. The use of rivets or similar devices will not be acceptable as mechanical fastenings for such parts.
2. Hours of Operation: Elevator shall be designed for continuous operation seven (7) days per week, 24 hours per day.
3. Elevators shall be designed, installed, and tested to operate with full-specified performance while exposed to the climatic and environmental conditions specified. In addition, during installation and until the beginning of scheduled maintenance service, the elevators will be subject to more extreme environmental conditions. The Contractor shall furnish protection necessary to prevent damage to or deterioration of the elevators during this period.
  - a. Elevators shall be designed to operate in dry bulb temperature range of -10<sup>0</sup>F to 140<sup>0</sup>F and operate while exposed to the natural elements of weather, including sunlight, rain, snow, slush, salt; all condition of relative humidity, de-icing chemicals, debris, airborne dust, and corrosive elements.

- b. The elevators shall have a special winter operation. The elevators shall be designed to operate in the event the outside temperature falls below a pre-established minimum value. The elevator contractor shall furnish and install the necessary timers and thermostat to accommodate the desired function
  - 4. Make provision for and provide a closed circuit television camera (CCTV), in the elevator car(s) with the ability to monitor the CCTV from the Kiosk annunciator panel. Submit drawings for approval before fabrication.
    - a. Provide electrical connections, through shielded traveling cables, between camera and the communications terminal block in machine room or pit.
  - 5. Painting: The pit, pit walls and machine room floor shall be painted. All machine room equipment shall be given two coats of approved machinery paint. All new iron work shall be given one coat of rust- inhibiting paint.
- B. Fasteners
  - 1. Fasteners shall be compatible with materials being fastened.
  - 2. Fasteners shall be furnished with self-locking nuts or retaining rings (spring washers, toothed disks).
  - 3. Fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened.
  - 4. Fasteners securing removable sheet metal materials shall be operable with the aid of simple tools and concealed wherever possible. When the framework to which the metal is fastened is less than ¼ inch thick, steel backup plates ¼ inch thick shall be added with tapped holes and clearance holes where necessary.
- C. Capacity, Speed, Travel, Platform Size
  - 1. All parts of the elevator equipment shall be of such design, size, and material as to satisfactorily function under all conditions of loading and operation within its rated load and speed, all with a proper factor of safety, maximum mechanical and electrical efficiency, and minimum wear on parts. The elevators shall have sufficient capacity to lift the rated load at 350 feet per minute, minimum.
  - 2. Elevator shall be of size, arrangement, capacity and shall comply with design criteria and as shown on the Contract Drawings, and in accordance with the requirements of the ANSI/ASME A17.1
  - 3. The top enclosure shall be reinforced to support two men and be capable of sustaining, without damage or permanent deformation, a load of three hundred pounds on any area two feet square and 100 pounds applied at any point. An emergency exit shall be installed in the car top in conformance with the Code.

- 4. Travel, location terminal floors, number of stops and openings, and overall car platform size shall be as shown on the Contract Drawings.

D. General Environmental Operation Conditions:

- a. Operation Under Fire or Other Emergency Conditions: Elevator shall be equipped to function in accordance with the requirements of ANSI/ASME A 17.1 and applicable local codes.
- b. Sound Level: No elevator car or elevator power unit shall generate noise in excess of NC45 sound level. Measurement of noise shall be made at a point 36 inches from the hoistway, machine room entrances, and ventilation openings.

E.. Hoistway Movement:

- 1. Elevators shall be designed to sustain the load and operate with the following lateral movements of the hoistway structures:
  - a. In any individual glazed area. ¼ inch.
  - b. In total height of hoistway structure for aerial and surface structures: 5/8 inch.

F.. Reliability:

- 1. Each elevator shall be capable of operating at full load under any of the normal modes of operation at a level of availability of not less than 98 percent over a period of 365 days.
- 2. Availability (A) is defined as the percent of normal operational time during which the equipment is available for use. Or

$$A = \frac{MTBF}{MTBF + MTTR}$$

Where:

- MTBF* = Mean time between failure in days
- = Operating time, *t* (in days) /Number of failures in time *t*
- MTTR* = The average time in days required to restore an elevator to operation after a report of a failure.

G. Workmanship:

- 1. Joints shall be welded their full length and dressed smooth and flush on exposed surfaces. Spot welding shall be sued where practicable in preference to screw or rivet fasteners.

2. Sheet metal materials shall be accurately rolled and leveled, and have smooth finish and uniform color. Joints shall be formed to a tight fit, with abutting edges flush, and shall be securely welded or riveted together in such a manner as to give strength equivalent to the solid sheet. Riveted construction shall have heavy reinforcement on the back, and no rivets shall show on exposed surfaces, Welds shall be solid and dressed flush, and holes for screws or bolts shall be drilled and countersunk.
  3. Wrought work shall have joints milled to a tight even fit and, where possible, shall be made without screws. Square turns and comers shall be sharp, Curves and loops shall be true and without visible joints. Abutting members shall be welded, riveted or both. Similar bars shall be halved at intersections and wide bars shall be punched for the small bars to pass through.
  4. The finished work shall be strong, rigid and neat in appearance. Plane surfaces shall be smooth and free from warp or buckle. Molded members shall be clean cut, straight, and true. Miters shall be well formed and in true alignment. Fastenings shall be concealed from face side of the material.
- H. Corrosion Protection: The contractor shall design the elevator assembly in such a manner to avoid corrosion and galvanic action due to physical contact between dissimilar metals or due to other causes.

**2.02 MANUFACTURERS**

- A. The major elevator components shall be the products of one of the three manufacturers of established reputation, except they may be the products, either wholly or in part, of another manufacturer of established reputation provided such items are capably engineered and produced under coordinated specifications to ensure a high grade, safe reliable, and smooth operating system.
- B. Major components to be furnished for this project shall be of a make or makes that have performed satisfactorily together under conditions of normal use for not less than one year in at least two other elevator installations of equal or greater capacity and speed.

**2.03 PRODUCTS AND MATERIALS**

- A. Elevator Car Characteristics:
  1. Rated load. Minimum rated load for the car will be as determined by the inside net platform area per ANSI/ASME A17.1 formula rules-rule 1300.1.
  2. Rated speed: as per Contract Drawings
  3. Inside dimensions: As shown.
  4. Landings served: As shown.
  5. Number of openings: As shown.
  6. Travel: As shown.

7. Operation: Selective/Collective. Drive Type: AC – VVVF
  8. Car and landing operating buttons: Illuminated type, vandal resistant, in accordance with ADA requirements.
  9. Car door and hoistway entrances: High-Speed, Heavy-Duty Master Door Operator GAL – MOVFR. Door Type: per Contract Drawings. Door Size: per Contract Drawings
- B. Operation:
1. Operation shall be automatic. Automatic operation by means of car and landing buttons. Stops registered by momentary actuation of car buttons to be made irrespective of number of buttons actuated or of sequence in which buttons are actuated.
  2. Operating station in car containing bank of buttons numbered to correspond to landing served position indicators. EMERGENCY CALL button, keyed EMERGENCY STOP button, DOOR OPEN/DOOR CLOSE buttons, independent maintenance key switch, and key-operated light and fan switches, with legends as specified. Identification as specified for emergency telephone. Emergency call button connected to bell that serves as emergency signal. Panel finish: Stainless Steel.
  3. Landing: Single push-button fixture at each terminal landing. Button fixture having push buttons with UP and DOWN legends at intermediate landing. Button identification as specified for Person with disabilities per latest ADA regulation (ADA rule 4.10.3).
  4. Momentary pressure on car button or landing button illuminates that button, which remains illuminated until call is answered. Illuminated buttons serve as visual indication that call has been registered and that car will stop at that landing. The Push Buttons shall be flush, round, have a Metalized Halo and center jewel. The metalized halo shall be from different color and approved by ELES Engineer.
  5. Stops, registered by momentary actuation of landing buttons. All stops subject to respective car or landing button being actuated sufficiently in advance of arrival of car at that landing to enable stop to be made. Direction of travel for idle car established by first car or landing button actuated.
  6. UP landing calls answered while car is traveling in up direction and DOWN landing calls answered while car is traveling down, car reversing after uppermost or lowermost car or landing call has been answered and proceed to answer car calls and landing calls registered in opposite direction of travel.
  7. Elevators to park at the secure landing level selected by the Engineer.
  8. Push-button units to be Dupar US85 or approved equal with button identification as specified by latest ADA regulation.

9. Emergency-stop button shall be key operated rather than push-pull arrangement with key removal only in off position.
10. All elevator car control panel operating devices shall be designated by Braille and by raised standard alphabet characters for letters, Arabic characters for numerals, and standard symbols as required by the Code and ADAAG.
11. Lettering shall have a highly visible coloring, such as white, that is permanently affixed.
12. Independent Service: Provide a key switch in the car operating panel which, when actuated, shall cancel previously registered car calls, disconnect the elevator from the hall buttons and allow operation from the car buttons only. Car door shall remain open unless closed fully by the door close button.
13. Two-Stop Collective Simplex Automatic Operation:  
The existing two-stop collective simplex automatic operation shall be reused and checked for the following:
  1. System shall be designed so that when the car is standing at either terminal landing, pressure on car button for the other terminal shall automatically dispatch car to that landing. Pressure of landing button at either terminal landing shall call car automatically to that landing. If a landing call is registered while the car is making its trip, that call shall remain registered until the car responds to that call. If no car calls are registered car shall start automatically and respond to hall calls. Provide time limit relay arranged to hold car at landing at which it has stopped for predetermined time after car stops. After all car landing calls have been answered, car shall remain parked at landing where last used with car and hoistway doors closed until another call is registered. Pressing the landing button at floor at which car is parked shall automatically open car and hoistway doors. In all normal operations, the starting of the car shall be contingent upon establishment of hoistway door interlock and car door circuits.
  2. Automatic dispatching operation: all two stop elevators shall include "Step-in-and-Go" feature. Calls for the opposite landing will be automatically set when the elevator opens its doors for a hall call. This feature shall be provided for all elevators that have public access for two stops (i.e., any elevators with key operated service landings will be included).

C Position Indicators:

1. Car indicator: In accordance with ADA requirements. Mounted in vertical row in car-operating panel to show position of car in hoistway by illumination of indicators corresponding to landing at which the car is stopped or passing. Finish for exposed-to-view metal components: Stainless Steel.
  2. Landing indicator: In accordance with ADA requirements. Two-element direction-of-travel indicator mounted above call station or hoistway entrance as shown, including one red and one white indicator. Direction of car's operation shown by illumination of red indicator for DOWN and white indicator for UP.
  3. In-car signals: Audible signal indicating car's direction of travel, signal sounding once for UP direction and twice for DOWN direction.
  4. Landing signals: Audible signal at each hoistway entrance indicating car's direction of travel, signal sounding once for UP direction and twice for DOWN direction.
- D. Lighting:
1. Machine Room Emergency Lighting: Maintained Emergency lighting fittings shall be provided in each elevator machine room.
    - a) There shall be a minimum of one maintained lighting fixture.
  2. Car interior: LED fixture, 120-volt operation, with clear prismatic glass diffuser, flush mounted in ceiling, cool white bulbs. Illumination level shall be 15-foot candles minimum at car operating panel.
  3. Car top and underside of car floor: Medium-base porcelain lamp receptacles, with wire lamp guards.
  4. Car emergency lighting:
    - a. Fixture: Recess mounted, with stainless steel frame, location as shown.
    - b. Diffuser: Prismatic polycarbonate plastic.
    - c. Lamps: Two, size 16-51
    - d. Remote power supply:
      - 1) Power pack: Sealed gel cell battery with integral regulating charger and an alarm bell.
      - 2) Capable of operating bell for one-hour minimum and light at car-operating panel at 0.2 low candles minimum for four hours minimum.
      - 3) Location: on top of car or in COP with easy access provided.
- E. Inspection Operation: Key switch in car to nullify car and landing buttons permitting operation of elevator from top of car for inspection purposes:

1. Top of Car Inspection Station: controls on roof of car containing continuous pressure UP and DOWN buttons, emergency stop button and toggle switch to activate inspection devices. The device shall also have an 110v ac outlet for extension cord and provided with a light and guard.
- F. Leveling: Automatic leveling device to stop car within 1/8 inch of landing level regardless of load or direction of travel. Landing level maintained within leveling zone irrespective of hoistway doors being open or closed.
- G. Emergency Service:
  1. Controls to return elevator to designated floor by means of key-operated switch outside street or ground floor hoistway entrance in compliance with ANSI/ASME A17.1.
  2. In-car control during emergency operation by means of key switch in compliance with ANSI/ASME A17.1.
  3. Terminals on elevators controllers for connection of circuit from heat and smoke sensing devices, with wiring from sensing devices to elevator controller.
- H. Telephone Facilities:
  1. Provide all audio/visual communication, signaling, and monitoring in accordance with ADA and ANSI. "Hands-free" phone integral with control panel, mounted in accordance with ADA requirements; having inscription EMERGENCY TELEPHONE as specified for Person with disabilities; finish exposed-to-view components to match stainless steel control panel; color of letters to contrast with panel.
    - a. Provide emergency communicators in accordance with ADA requirements to include auxiliary push button to summon help and visual feedback indicating that the call has been responded to.
  2. Provide wiring and jacks for a portable self-contained battery-powered maintenance telephone system. Jacks shall be located on car top, inside car, and in machine room. Furnish three telephone instruments for use of maintenance personnel.
- I. Elevator Components:

Provide and install, Gearless Traction elevators with machine unit, roping, governors, safeties, counterweight, and related equipment. Provide for locating and installing the machine units and associated control equipment in the machine rooms. Provide and install any and all necessary auxiliary beams, structural members or other such devices needed to assure proper and safe operation of all elevator equipment. Vibration isolating machine foundation shall be of approved type which shall effectively prevent transmission of machine vibration to the building structure.

1. Guide Rails:
  - a. Guides shall be steel T-section rails. Rail surfaces shall be machined smooth to insure proper operation of guides. Rail ends shall be accurately machined with tongue and matching groove centrally located on web. Non wearing rail surfaces are to be painted at the completion of the elevator in color selected by the Engineer.
  - b. Guides shall be joined and installed in accordance with Section 2.23 of the Code.
  - c. Rail bracket spacing and maximum horizontal forces and guide rails in accordance with ASME A17.1.
2. Roller Guides: Roller guides shall be mounted on top and bottom of the car and counterweight frames to engage the guide rails and provide a smooth ride.
3. Machine: Provide AC gearless machine, with permanent magnet synchronous motor, direct current electro-mechanical disc brakes and integral traction drive sheave.
  - a. The motors shall be of the alternating current reversible asynchronous or synchronous type of a design adapted to the severe requirements of elevator service. Motor shall be capable of developing the torque required to meet or exceed an acceleration rate of 2 ft/sec<sup>2</sup> for the elevator car.
  - b. A means to protect the windings and bearings from airborne dust shall be provided.
  - c. Insulation of all windings shall be impregnated and baked to prevent absorption of moisture and oil. The insulation resistance between motor frame and windings shall not be less than one megohm. The motor windings shall stand a dielectric test of twice the normal voltage plus 1000 RMS volts of 60 Hertz, alternating current for one minute.
  - d. Motor leads in the conduit box shall have the same insulation class as the windings. Motor lead wire shall be rated 125 C and shall be sized for 105 C at the motor nameplate amperes at 1.0 Power Factor per Electrical Apparatus Service Association (EASA) recommendations. Leads are to be numbered for clockwise rotation when facing opposite the shaft end.
  - e. The motor shall be designed to stand the severe loads encountered in elevator service and the windings shall have a minimum insulation temperature rating two ratings higher than the actual temperature rise of the motor, with a minimum rating of NEMA class F.
  - f. The motor shall be designed to the ASME A17.1 rated load requirements.
4. Brake: The brake(s) shall be of the self-adjusting fail-safe (spring

applied and electrically released) type provided with an external manual brake release and designed to meet the service factor demand of its intended use. Dual brakes shall operate independent of each other for ascending car over speed and unintended car movement. Disc type brake shall be securely mounted to the shaft and shall run concentric to the shaft. Disc shall be machined to obtain a smooth and accurate face. The brake shall be spring actuated, direct current, electrically released, heavy construction with proper braking area for the load and speed specified. The brake shall be provided with sufficient power to stop and hold the car with full contract load.

5. Elevator Drive System: Variable Voltage Variable Frequency (VVVF) Drive: The drive shall be microprocessor and IGBT based using vector control algorithms. The algorithms shall incorporate a motor model to determine the electromagnetic state of the motor. The motor model shall also encompass a temperature compensation algorithm which is essential for speed accuracy.
  - a. Velocity shall be controlled by a feedback loop to within +/- 2% of contract speed and speed shall be independently supervised.
  - b. Position of floors in the building shall be learned during a slow speed setup run. Once learned, floor locations shall be stored in non-volatile memory. Power loss shall not require the floors to be re-learned. Stopping accuracy shall be +/- 5 mm or less. Re-leveling shall be automatic.
  - c. Resistors shall be provided to absorb the power regenerated by the motor. They shall dissipate power only when the motor is regenerating. Control shall be by IGBT.
  - d. Maximum total harmonic distortion shall not exceed IEEE Std. 519 to be measured at the elevator disconnect.
  - e. For hoist motors 50Hp and above, the drive shall be regenerative feeding the three-phase power supply of the controller.
6. Hoistway Operating Devices: Normal terminal stopping devices. Emergency terminal stopping device as required, controller switches and circuitry arranged in accordance with ANSI/ASME requirements. All switches to be compatible with control system.
7. Stop Switch: Emergency stop switch mounted in the pit of each elevator in accordance with Section 2.2.6 of the Code, shall prevent operation of elevator when switch is activated. Switch shall be of the type described in Section 2.2.6 of the Code.
8. Automatic Terminal Stopping Device: Terminal stopping devices shall be provided at the top and bottom of the elevator hoistway and shall be operated by a fixed cam attached to the elevator. The switches shall be

- independent of any other stopping device and shall cut off power from the driving machine motor and brake.
9. MOUNTING: Anti-vibration Mounts: For machines that are support beam mounted, an anti-vibration mounting pad is to be provided.
  10. Car Safety. The car safety shall be Type B, as specified in the ANSI/ASME Code, mounted under the car platform and securely bolted to the car sling. It shall be sized for the capacity and speed noted on the Contract Drawings. The car safety shall be actuated by the speed governor upon a predetermined overspeed downward. When tripped, the safety mechanism shall engage the rails with sufficient force to stop a fully loaded car with an average rate of retardation within the limits given by the ASME A17.1 Code for the capacity. The safety shall stop the elevator whenever excessive descending speed is experienced and means shall be provided to cut off power from the motor and apply brake prior to application of the safety. The safety shall be modified and adjusted as necessary so that its operation complies with Code requirements and requirement of all authorities having jurisdiction.
  11. Governor: Friction type over-speed governor rated for the duty of the elevator specified and to operate the car safety. The governors shall be located where the car or the counterweight in case of overtravel cannot strike it, and where there is adequate space for full movement of governor parts and driven by a governor rope suitably connected to the governor rope-releasing carrier.
    - a. An electrical governor overspeed protective switch that, where operated, shall remove from the driving machine motor and brake before or at the time of application of the safety.
    - b. The governor shall be sealed and tagged with the running speed, tripping speed, and date last tested as required by Code.
  12. Tension Sheave: A tension sheave shall be provided in accordance with governor and car safety loading requirements.
  13. Life Safety Provisions: Provide Life safety hooks and/or other life safety devices for fall protection in accordance with OSHA standards/guidelines. Life safety hooks and/or other life safety devices locations to be coordinated and installed by the Installer.
  14. Counterweight: A counterweight shall be provided for the elevator equal to the weight of the complete car and 40 percent of the rated car. Tie rods shall pass through holes in each subweight and through holes in frame members above and below subweights in such a manner as to securely hold subweights in place. The bottom of the counterweight shall have a buffer striking plate and means to attach knock-off blocks during rope stretch. Roller guides shall be mounted on top and bottom of the counterweight frames to engage the guide rails. Submit paint finish of counterweights for approval.

- a. Idler Sheave: To be located directly above the counterweight frame and integral with counterweight frame. The sheave material shall be accurately machined as per manufacturers requirements.
  - b. Counterweight guides shall be of the roller type; each guide shall consist of a set of at least three (3) large diameter polyurethane rollers equipped with sealed preloaded ball bearings. Each roller shall automatically adjust itself to guide rail misalignment and prevent excessive lateral car movement.
15. Compensation for the weight of hoisting ropes and unbalanced portion of traveling cables shall be provided where required to produce proper operation of elevator for car travel of 50 to 100 feet. All elevators requiring compensation shall have rope compensation.
- a. Rope compensation shall consist of an appropriate number and size of iron steel wire ropes attached to the underside of car frame and counterweight frame and passing under a weighted idler sheave in pit. A metal data tag giving the number, diameter, type, month and year installed, and names of manufacturer and installer of compensating ropes shall be securely attached to one of the compensating rope fastenings.
  - b. The weighted idler shall be provided to equalize tension in the compensating rope. The idler sheave shall be provided with bearing of anti-friction bearing metal, ball or roller-type similar to those specified for hoisting machine. Suitable metal guards shall be provided for, or be incorporated in, the design of the equipment, to prevent rope jumping off sheave.
16. Buffers: Provide and install car and counterweight buffers of the oil type as indicated by Code with blocking and support, mounted on the supporting channel or block on the pit floor. Buffers shall comply with all applicable codes. Buffer anchorage at pit floor to be designed and installed without damage to pit floor.
17. Car Frame: A suitable car frame shall be provided with adequate bracing to support the platform and car enclosure. Provide welded or bolted type 316 stainless steel channel uprights affixed to crosshead and plank channels with welded or bolted bracing members and gusset plates which will remove strain from car enclosure.
18. Platform: Havy Loading Type. The car platform shall be designed to accommodate one-piece loads weighing up to 25% of the APTA rated load, such as wheeled food carts, hand trucks, etc. The platform shall be type 316 stainless steel.

19. Provide and install all necessary accessory beams, auxiliary beams or other devices needed for safe and normal operation and installation of all elevator equipment and devices. It is the elevators installer's responsibility to ensure provided elevator equipment will function as designed in the available space and with the steel beams, steel members or other such equipment in the machine rooms and hoistways in place at the time of installation.

J. Controller-System:

1. An Allen Bradley PLC-based controller shall be provided, governing starting and stopping as well as preventing damage to the motor from overload or excessive current. It shall automatically cut off the motor current and bring the car to rest in the event any of the safety devices are activated.
  - a. System shall coordinate the functioning of elevator drive unit relative to actual location and status of elevator. It shall interface with door control and all required safety circuits, switches and devices. The controller shall be mounted in a NEMA 4X stainless steel air-conditioned cabinet within the controller room.
  - b. The diagnostic system shall be an integral part of the controller and provide user-friendly interaction between the service person and the controller system.
  - c. The supervisory logic shall be performed by a main controller or coordinated between the elevator controllers which will interface directly into the Allen Bradley DH485 protocol Remote Monitoring network, transmitting data from the elevator controller through a data concentrator to the Authority's AEMS RTU computer control and data system. The supervisory logic will coordinate dispatching assignments, interfacing operational demand data accumulated from car and corridor operating fixtures, selector and door control functions.
  - d. Controller shall be capable of operating with an operating temperature range of 320F to 140F with non-drip environment and no more than 90 percent relative humidity. However the air conditioner on controller cabinet shall maintain the operating temperature in range of 50<sup>0</sup> F to 90<sup>0</sup> F.
2. An Allen Bradley CompactLogix 1769-L32E based PLC control system shall be provided.
  - 1) The exclusive Allen Bradley DH485 protocol data port will transmit data from the elevator controller to the station or facility data concentrator. The contractor shall provide a controller data interface to a DH 485 network. Contractor

shall provide Data cables to connect from the PLC controller to data concentrator in the station and available for connection to the controller DH485 interface. The contractor shall pull Belden 9842, or ELES Engineering approved equal, cables to connect the controller into the monitoring DH485 network. The DH 485 controller interface shall be programmable for data rates up to 115 Kbps. The interface shall allow other nodes such as other elevators and escalators to be readily incorporated into the DH 485 network.

- 2) A data concentrator PLC shall be installed using an Allen Bradley MicroLogix 1400 or SLC5/05 PLC per station to function as data concentrated or to consolidate data from all controllers in the station. The software for the data concentrator shall receive controller data over the local monitoring DH 485 network and provide formatted data to the AEMS RTU through an RS232 link. The data concentrator shall provide an Ethernet port for interfacing with the WMATA wide area network. A data concentrator connection to the WMATA wide area network shall be provided.
3. The PLC power shall come from 120VAC provided by the car lighting supply in the elevator controller.
4. The PLC shall accommodate the following Signal List, as Applicable, and provide data to the data concentrator as specified in specification.

5. The PLC CPU module shall store the last 99 faults, accessible via laptop connection, controller fault/status display and remote communications. The contractor shall provide WMATA with a programming and monitoring unit, such as a laptop computer with the newest version of Allen Bradley RS-Logix and any other software required to setup and program all electronic items in the control system, for each elevator that this system is installed, for the purpose of troubleshooting and remote monitoring modifications. The laptop should allow uploading, editing, and downloading any software that is being used on this elevator for any operation.
6. An Allen Bradley PanelView Plus 6, EZAutomation or ELES Engineering approved equal, fault/status display/interface shall be provided in the controller cabinet. Control system timers and other setup criteria shall be programmable through this unit. All fault, status and setup data shall be stored in the controller CPU module.
7. In cases where the programming is done by the supplier, the supplier shall provide a copy of all working programs, including labels for all inputs and outputs, data tables and internal logic points, on Flash Drives/CD-R disks as well as a printed program listing. The programs and setup data shall require a password for access and modification. The password shall be provided to ELES Engineering as part of the Submittal.
8. The main control of an elevator shall contain at least the following devices or electronic sensing: phase failure line voltage monitor, motor current and ground fault monitor.
9. The controller cabinet shall contain a permanently mounted fault indicator panel with LED indicator lights. Tripped safety devices, door position, door reversal, car running status, and control system status shall be indicated.
10. All terminals shall have identification markings and all wires, including field wires, shall be provided with permanent heat shrink sleeve cable markers. These wiring identifications shall be provided in the wiring diagram at each end of the circuit connections.
11. The controller shall be equipped with the AC vector drive installed in-line before the hoist motor contactor and the hoist motor.
12. The AC vector drive shall be capable of accelerating and decelerating the hoist motor smoothly and gradually.
13. Adjustable settings for acceleration and deceleration ramps shall be provided.
14. The controller shall have, at least, one dedicated serial port for interface to the DH485 monitoring network and programming access without disconnecting any other port.

15. The Programmable Controller shall have, at least, one dedicated port to support the controller fault/status display.
16. The controller PLC shall provide the following Remote Monitoring and diagnostic network support:
  - a) All applicable faults, statuses and data listed in Table 1 shall be provided
  - b) Fault indications shall remain until reset in the controller.
  - c) Status and analog data shall be provided for the duration of the condition.
  - d) Software in the controller PLC shall format monitoring data responses to data concentrator polling as specified in the specification.
  - e) The monitoring data port in the controller shall be setup for DH485 protocol with the port network identification number programmed for the particular elevator identification. For instance, identification number 11 applies to elevator 1, 12 to elevator 2, etc.
  - f) All faults, statuses and data shall be held by the controller CPU and sent from the CPU when polled by the data concentrator.
17. Provide sufficient non-volatile CPU memory, for non-volatile retention of program memory, system status and operating parameters.
18. Diagnostics
  - a) The processor shall have built-in diagnostics and self-test, such that each time power is cycled, the processor does a complete CPU and RAM memory test. Additionally the power-up test will momentarily light up all diagnostic LED's to be sure they are working. A power up test will not reset fire-service status signals if the internal flag (bit) for Firemans Service Phase I is latched. The processor shall be capable of reporting major and minor fault codes and processor status information back to the data concentrator provided the fault is not a catastrophic hardware failure where the processor is unable to power up.
  - b) The processor shall have a built-in watchdog timer to ensure that all processor program scans occur within the time limit set by the watchdog timer.
  - c) The processor shall have individual LED indicators that are clearly visible and labeled for easy identification. At a minimum the following indicators must be provided:
    - (1) CPU is in RUN mode
    - (2) CPU is FAULTED
    - (3) CPU battery is LOW
    - (4) I/O points are FORCED and are not under program control  
COMMUNICATION channels are active.

19. Input/Output Modules
- a. The Input/Output Modules shall be compatible with the PLC processor I/O structure. Each module shall be provided with a detachable terminal strip to connect wiring to the module. Each wire on the terminals shall be identified by the module terminal.
  - b. Discrete Input Modules: Suitable for the input voltage and compatible with the Allen Bradley system.
  - c. Discrete Output Modules: Suitable for the voltage and load and compatible with the Allen Bradley system.
  - d. Analog Input Modules: Converts analog signals to optional twelve-bit binary values. The module shall accept ~~4~~ four 20 Ma signals. Provide modules compatible with the Allen-Bradley system.
20. I/O Mounting and Power Supply
- a) The controller chassis shall have an additional three spare modules.
  - b) Power supplies shall provide power to the PLC processors, I/O and other function modules. The power supply shall be suitable for operation of 120 VAC, single phase power. Power supply capacity shall be a minimum of 150% of the connected load.
21. Air Conditioning:
- Provide an independent air conditioning unit for each new controller to maintain manufacturers recommended operating temperatures. Condensate from the air conditioning unit must be piped to a suitable drain.
22. Selective Collective Operating: As defined by ASME A17.1 and shall be the pressure upon one or more car buttons to correspond to landings in the order in which the landings are reached by the car, irrespective of the sequence in which the buttons are pressed, provided the hoistway door interlock and car door switch circuits are completed. During this operation, the car shall also answer calls from the landings, which are in the prevailing direction of travel. Each landing call shall be canceled when answered
- a. Momentary pressure on car button or landing button illuminates that button, which remains illuminated until call is answered. Illuminated buttons serve as visual indication that call has been registered and that car will stop at that landing.
  - b. Operation shall be automatic by means of the car and landing buttons. Stops registered by the momentary actuation of the car or landing buttons shall be made in the order in which the landings are reached in each direction of travel after the buttons have been actuated.
  - c. UP landing calls answered while car is traveling in up direction and DOWN landing calls answered while car is traveling down, car reversing after uppermost or lowermost car or landing call has

- been answered and proceed to answer car calls and landing calls registered in opposite direction of travel.
- d. Should both an up and a down call be registered at an intermediate landing, only the call responding to the direction in which the car is traveling shall be canceled upon the stopping of the car at the landing.
23. Supervisory Control: A processor based system to coordinate dispatching assignments, interfacing operational demand data accumulated from car and corridor operating fixtures and other special feature commands issuing from computer processing, selector and door control functions. Incorporate in the system specific operational features as herein described.
- a. Allocate service to demand, make decisions to prevent crowding, save energy, and provide efficient coverage throughout the building. Respond in real time to prevailing traffic conditions as well as historical traffic patterns.
  - b. Constantly compare passenger demand, car load, anticipated demand, car motion status, machine status and other prevailing conditions and evaluate this information in the context of the following dispatching approaches:
    - 1) Give priority to contiguous calls, assigning calls on adjacent floor to the same car if other criteria is satisfied.
    - 2) Give priority to coincident calls, having the same car let a riding passenger off and a waiting passenger on at the same floor.
    - 3) Anticipate demand based on hall calls and car calls already registered and floors with a high possibility of demand.
    - 4) Evaluate relative system response time for each car in the group, weighing all of the above factors.
    - 5) Allocate calls and position cars to minimize waiting time, response time and travel time. The other elevator shall respond for hall calls without any delay after the first elevator leaved the door zone.
    - 6) When there is a hall call registered and an elevator left the landing, the other elevator shall run toward opposite landing.
  - c. Provide the capability to make both car to call or call to car assignments.
  - d. During light traffic conditions, assign cars without demand to specific parking areas until requested for a hall call. Continuously evaluate dispatching assignment and immediately release a car from its assigned area to meet heavy demand elsewhere in the building.

- e. In determining relative system response time for a car to answer a hall call, factor in round-trip calculations for each car as well as other system parameters before deciding which car shall respond to a hall call.
24. Other Features:
- a. Independent Operation: Provide TWO-position keyed switch (ChicagoLock 7500) marked Independent Service, OFF and ON in the lower portion of the car operating panel of all cars. The switch shall be spring loaded type. When placed in ON position, car will be removed from the automatic operating system and will not respond to demands registered at the hall push buttons. It will respond only to floor with doors open until another demand is registered in the car. Demands registered at the landing will remain registered until answered by another elevator. The car only responds to car calls and that the doors remain open after a stop until closed by continuous pressure on the door close button.
  - b. The controller shall be designed to operate automatically on standby power.
25. Machine Room Two Way Communication Device: Provide within each controller/machine room a two way communication device that will interface with any type of ADA compliant telephone. The device shall be mounted directly on or within hands distance proximity to the elevator controller.
26. Any junction boxes installed in the machine room or hoistway shall be accessible for Maintenance.
- a. Drilling or opening top end of enclosure is not acceptable
  - b. Wire nuts or splicing without terminal strips is prohibited.
  - c. All openings shall be properly sized for the conduits.
- K. Door Operator Equipment:
- 1. Provide a water resistant heavy-duty GAL MOVFR or ELES Engineering approved equal door operator with encoderless VVVF drive. Closed loop door operator designed to operate car and hoistway doors simultaneously at the speed specified. Door shall open automatically when car stops at landing to discharge passengers or to answer valid calls and close automatically after predetermined time interval has elapsed. The doors shall be capable of smooth and quiet operation without slam or shock. Door operator to have the following features:
    - a) ½ hp motor and heavy duty sprocket, chain, belt, and sheaves.
    - b) Closed loop regulated speed performance.
    - c) Hand-held keypad programming.
    - d) Adjustments can be stored in the keypad and downloaded to another operator.
    - e) Adjustable door obstruction reversal.

- f) Optical cams with LED indicators.
  - g) Test switches for open, close, nudging and speed zone set up.
  - h) Universal inputs for open, close, and nudging.
  - i) Reversing switch to back up the door reversal device.
  - j) Designed for interior and exterior applications.
2. Provide a non-contact door reversal device with light immunity: The Door Reopening Device shall cause both the car and hoistway doors to reverse, should they detect an obstruction in the elevator entrance. The device electrical wiring shall be supplied with quick disconnects terminals to facilitate replacement. The infrared curtain detector shall include the following:
- a. A protective infrared detector field extending from 1 1/2" above the car sill to a height of 68".
  - b. A fail-safe control system to prevent the doors from closing in case of power loss to the detector.
  - c. A one-piece full door height protective lens cover designed to be completely waterproof and to withstand impact, abrasion and vandalism.
- L. Hoistway Entrances:
- 1. Doors of elevators shall be of the horizontal sliding type, single-speed, center-opening. All elevator door openings shall be a minimum of 42-inches wide per the Americans with Disabilities Act.
  - 2. Entrance frames shall be of welded or bolted construction for complete one-piece unit assembly. All frames shall be securely fastened to fixing angles mounted in the hoistway and shall be type 316 stainless steel. Provide an additional type 316 stainless steel sill angle support. The landing sills shall be extruded stainless steel with a mill finish.
  - 3. All materials and finished surfaces exposed to public view shall be stainless steel with embossed finish and/or glass panels as indicated on Contract drawings. Glass panels (if provided) to be completely flush with door assembly. In a glass hoistway the struts or any brackets should not be visible to public.
  - 4. Fascia and Dust Cover in the hoistway shall be galvanized or type 316 stainless steel and extend at least the full width of door opening on each side. Toe guard shall be fastened to the sill at the lowest landing.
  - 5. Hoistway doors are to be stainless steel and provided with keyways as required for operating mechanisms and door hangers. Provide glass panels that are completely flush with door, as indicated. Each door panel shall have stainless steel bottom guides that run in landing sill slots. Guides shall be replaceable without removing door panels. All doors shall have fixed fire gibs.
  - 6. Interlocks and Contacts:

- a. The doors at each hoistway entrance shall be equipped with approved hoistway door interlocks of the hoistway unit system type tested as required by the Code. Interlock shall prevent operation of the car away from a landing until doors are locked in the closed position. Interlock shall prevent doors from opening at any landing from the corridor side unless car is at rest at that landing, or is in the leveling zone and stopping at that landing.
  - b. Provide key-operated hoistway door unlocking devices. A device shall conform to the requirements of the Code and shall permit authorized persons to open the hoistway doors from the landing when car is away from landing. The key for emergency use shall be mounted in a receptacle with a breakable transparent cover clearly marked in letter at least 1/8 inch high ELEVATOR DOOR KEY FOR FIRE DEPARTMENT AND EMERGENCY USE ONLY. The location of the receptacle shall be as directed by the Engineer.
7. Provide raised floor/level designations in characters and Braille on each jamb at 60 inches from floor to centerline. Characters shall be two inches high and in accordance with ADA requirements.
- M. Wiring and Cable: Division 16, except elevator traveling cable.
1. Elevator Traveling Cable.
    - a. NEC Type ETT, size and number of conductors to suit service, 14AWG minimum, each conductor with different color insulation.
    - b. Cable exceeding 100 feet in length to have steel supporting fillers, cable 100 feet or less with steel or nonmetallic fillers.
    - c. Conductors for electrical, signal, control telephone and sensing devices.
    - d. Ten feet of additional telephone, communications and sensing-device conductors in elevator machine room for connection to future interface panel by others.
    - e. Each traveling cable shall have a minimum of 10 percent spare conductors, but not less than 6 spare conductors in each traveling cable.
    - f. A separate coax cable or a shielded twisted pair should be added to accommodate the security video cameras inside the elevator.
    - g. Provide separate traveling cables for car lighting and fan control circuits and 14 AWG minimum size for elevator lighting circuit.
    - h. All insulated wiring, control wiring and wiring in traveling cables shall be tag coded at their terminals in the motor/controller room, and hoistway junction box, elevator cab junction box, and push-button stations within the cab, and shall agree with the approved wiring diagrams.

- i. Cables shall be free from any possible contact with hoistway structure, car or other equipment. Furnish and install shields or pads to protect the cables.

**N. Conduit Raceways and Boxes: Division 16.**

- 1. Rigid conduit and fittings shall be UL-Listed rigid galvanized steel conforming to the requirements of UL 6 and ANSII C80.1. Minimum diameter shall be  $\frac{3}{4}$  inch for power circuits, one inch for fire and intrusion circuits, and two inches for audio and control circuits. Liquid-tight flexible conduit shall conform to the requirements of UL 360 and consist of a flexible galvanized steel core containing a copper bonding conductor spiral-wound between convolutions and a neoprene or outer jacket overall. Fittings for liquid-tight flexible conduit shall be watertight and shall conform to the requirements of UL 514.
  - a. All conduit terminating in steel cabinets, junction boxes, wireways, switch boxes, outlet boxes and similar locations shall have approved insulation bushings. If the bushings are constructed completely of insulation material, a steel locknut shall be installed under the bushing. At ends of conduits not terminating in steel cabinets or boxes, the conductors shall be protected by terminal fittings having an insulated opening for the conductors.
  - b. The Contractor shall furnish all materials and completely wire all parts of the electrical equipment of the elevators including electrical devices on hatch doors.
- 2. Auxiliary gutters, wireways, and raceways shall be constructed of galvanized sheet steel conforming to the requirement of the NEC and shall be UL listed. Raceway, conduit and wireways within the hoistway exposed to public view shall be concealed within steel cladding.
- 3. Electrical boxes:
  - a. Outlet, junction and pull boxes shall be galvanized sheet steel or galvanized malleable iron, cast iron or ductile iron conforming to the requirement of UL 50, UL 514, and NEC 370-C. Pull boxes shall have screw cover with a liquid-tight gasket.
  - b. Junction boxes on car bottom and hoistway connecting the traveling cable shall contain approved terminal blocks for connection of traveling cable conductors. Terminal blocks shall have indelible identification numbers for each terminal connection.
  - c. All wire connection terminal blocks shall have the same identification number as labeled on the associated electrical wiring. All electrical wires shall use a labeling tube and heat shrink and match the terminal numbers.
  - d. During field installation of junction boxes or control boxes, the contractor/subcontractor shall not drill or cut into the top sides of the box for wiring.

- e. All boxes in machine room or pit shall be mounted on strut channels in order to prevent future corrosion and water damage. The strut channels shall be mounted to the wall and has a minimum of 1-1/2 inches thickness and a minimum of 18 inches above the floor.
  - f. All solid state and electrical components located on top of the car enclosure or in the hoistway shall be installed within NEMA 4X enclosures.
4. Disconnect Switches for Car Lights and Mainline Power
- a. Disconnect switches shall be the following: UL 98, NEMA KS 1, heavy-duty, quick-make/quick-break switching mechanism with operating handle external to enclosure, with positions labeled ON and OFF, defeatable interlock to prevent opening of enclosure door when switch is ON. Enclosures shall be NEMA 250 Type 4x. Label disconnect switches in accordance with the NEC.
  - b. Mainline power disconnect switch shall be located in close proximity to the machine room entrance and shall be easily identifiable from other disconnect.
- O. Metal Work:
- 1. Steel sheet and steel fabrications:
    - a. Stainless steel sheet for cladding shall be minimum 16-gauge, best grade cold-rolled furniture steel. Stainless steel sheet for top enclosure shall be minimum 12-gauge. Stainless steel sheet for hoistway door frame shall be minimum 12-gauge.
    - b. Steel sheet for corrugated floor decking shall be minimum 10-gauge.
    - c. Steel shed for subfloor shall be minimum 3/8-inch thick.
    - d. Stainless steel for screws, bolts and nuts shall be AISI Alloy 303.
    - e. Galvanized steel material shall comply with ASTM A123, ASTM A153, ASTM A525 (G90 coating) and ASTM A568, as applicable. Steel sheet and steel fabrications, except stainless and lubricated machinery parts, which are not shown or specified to have other applied finishes, shall be galvanized.
  - 2. Steel Finishes:

Provide protection for all metal parts, fittings, and accessories by painting or galvanizing, except for stainless steel or anodized aluminum.

    - a. Where visible to the public, cladding and related steel surfaces shall be 316 stainless steel satin finish.
    - b. Paint finish, where shown, shall be aliphatic polyester polyurethane as follows:
      - 1) Primer shall be high-build epoxy-polyamide type, Tnemec Series 66-1211 or equal.

- 2) Finish coat shall be aliphatic polyester polyurethane, Tnemec 71 Endura-shield or equal.
  - 3) Total dry film thickness shall be not less than six mils.
- P. Cab Enclosure:
1. The elevator car and car components shall conform to the requirements of the Code, and shall operate without squeaks or metallic sounds.
  2. Entire car assembly, including car frame and platform, shall be free from warps, buckles, and squeaks and rattles. Joints shall be lightproof.
  3. Handrails: Handrails shall be ½ inch by 6 inch stainless steel #4 satin finished tube suitably mounted.
  4. Car threshold: Car threshold shall be stainless steel with non-slip surface.
  5. Toe guard aprons:
    - a. The toe guard aprons (cladding) at entrance side of elevator car shall be not less than 16 U.S. Standard Gauge (USSG), galvanized or stainless steel and shall extend at least three inches beyond entrance jambs at each side. Toe guard shall have a straight vertical face, extending below the level of finished car floor, of not less than the depth of leveling zone plus three inches. The bottom of guard shall extend 3 inches below vertical face and be beveled at a 15-degree angle from the vertical. The toe guard shall be secured to car platform construction and be reinforced and braced to withstand a constant force of 150 pounds on its face without permanent deformation or deflection exceeding ¼ inch.
    - b. On glass elevators, the toe guard shall extend full width of cab.
  6. Suspended Ceiling:
    - b. The suspended ceiling shall be faced and edged with solid stainless steel panels, 0.075-inch thick with a fully adhered ¾-inch thick core of noncombustible, sound-absorbent material and backed with galvanized sheet steel. ASTM A653M, G90 coating or better.
    - c. Mounting brackets and any necessary holes for the CCTV camera shall be provided on the top of the ceiling. The CCTV 360 degree camera shall be provided that will cover the entire car area. Coordinate bracket configuration and location with the CCTV subcontractor.
    - d. Mounting brackets and any necessary holes for the smoke and fire detection sensors shall be provided on the top of the ceiling, as further specified. Coordinate bracket configuration and location with the fire and intrusion system subcontractor.
  7. Laminated tempered safety glass: Glass shall be laminated fully tempered safety glass conforming to ANSI Z97.1 and the requirements of Specification Section 088000.

- a. Glass shall be laminated. Heat-strengthened, safety glass conforming to requirements of ASTM C 1048 and ANSI Standard Z97.1 and shall consist of two pieces of ¼ inch thick glass and a 0.060 inch thick polyvinyl butyryl interlayer, laminated together.
  - b. Color: Tint by Globe-Amerada Co., used as a standard of quality, or comparable and approved equal.
  - c. Weatherproof tape for field installation of final edge seating shall be compatible with the interlayer.
8. Dry pressure glazing materials:
- a. The setting blocks, edge blocks, and face gaskets shall be ozone resistant, virgin neoprene.
  - b. Setting blocks for installation at each quarter point of the sill shall be 90 durometer, shore A hardness approximately full channel width, 4 inches long, and high enough to afford correct cover and provide 3/8 inch edge clearance for the glass.
  - c. Edge blocks, for vertical insulation at the bottom of each joint channel, shall be 50 durometer, shore A hardness approximately full channel width, three inches long, and provide 3/8 inch edge clearance for the glass.
  - d. Face gaskets shall be continuous, 50 durometer hardness, and provide 3/16 inch face clearance both inside and outside.
9. Sub floor material to be nominal ¼" stainless steel to prevent water infiltration between finished floor, cab and platform base.
- Floor covering: Poured Acrylic Epoxy, polymer system or approved equal color selection and samples to be submitted to the Authority for approval by the Engineer, with slip-resistant surface, ¼ inch thickness, covering elevator car floor area. Flooring shall be non-shrinking, manufactured of prime quality compound, free of calendaring and curing defects, resistant to grease, oil, chemicals, aging, and ozone. Flooring shall be poured incorporating a full membrane system for the entire cab floor width and depth.
10. Emergency exit: Car shall have a top emergency exit conforming to requirements of the ANSI/ASME Code, the applicable jurisdictional requirements. The door shall open toward the top of elevator and shall have a latching mechanism to keep it in place.
11. Ventilation: A 350 cfm exhaust fan for continuous car ventilation shall be provided. Connect continuous ventilation fan to emergency power system. The exhaust fan shall be controlled from the car operating panel with Chicago Lock 7500. Provide sixty (60) minute backup battery power for fan.
12. Lighting fixtures and plug receptacles:

- a. Car lighting shall provide a minimum of 15-foot candles measured at any point on the cab floor and shall be of the LED type. Car lighting shall be provided with emergency battery backup upon failure or interruption of normal car lighting. Emergency lighting unit shall provide required lighting for a minimum of four (4) hours. Battery charger shall be capable of restoring battery to full charge within sixteen (16) hours after resumption of normal power.
  - b. Exterior car lighting shall be as specified. On glass-enclosed elevators they shall be concealed under access panels flush with cab top or bottom surfaces, respectively. A duplex plug receptacle shall be provided in the pit and on top and bottom of each car. The lighting fixtures and receptacles on exterior of car shall be controlled by a switch adjacent to each fixture.
  - c. Provide 115 volt ac plug receptacle (GFCI) within 12 inches of CCTV camera location. Coordinate the installation of CCTV equipment within the design of the elevator cab as the elevator contractor is responsible for the installation of the camera and wiring to the control room.
13. Car Doors and Door Equipment:
- a. Car doors and door frames shall be suitably reinforced and provided with a laminated stainless steel #4 finish on cab side and baked enamel finish on hoistway side. Doors shall protect the full width and height of car entrance opening when in the fully closed position. Car door frame shall be integral with front wall of cab.
  - b. Hanger cover plate sections above the door opening shall be removable from the hoistway. Doors shall be guided at the bottom by composition gibs engaging threshold grooves with minimum clearance.
  - c. Car/Hoistway Door Operator: Car and hoistway doors at each landing shall be opened and closed quietly and smoothly by a direct current electric operator.
  - d. Door operation automatic at each landing with door opening being initiated as car arrives at landing and closing taking place after expiration of specified time interval, with electric contact to prevent starting elevator away from landing unless car door is in its fully closed position.
    - a. Time door closing to start 5 seconds minimum from notification that car is answering landing call.
    - b. Time doors to remain open five seconds minimum.
    - c. Time shall be adjustable to 20 seconds.
    - d. The interval of time that the doors remain open at intermediate landings shall be less for a stop made in response to a landing call. Door open time at a dispatching terminal shall be longer than the time for a stop in response to an intermediate landing call.

- e. All door timers shall be adjustable from the controller display panel.
- 14. Capacity plate: The car capacity plate shall be of plain stainless steel and contain the data required by the ANSI/ASME Code but shall not bear the name of the elevator manufacturer.
- 15. Signal Devices and Fixtures:
  - 1) Car Operating Station:
    - a. Provide one (1) main station in the front and one (1) auxiliary station. The COP shall be a vertical type.
    - b. General: Provide signal fixtures and control devices for each elevator. Buttons and signals shall be tamper resistant of the illuminated type that light-up when activated and remain lit until call or other function has been fulfilled. All signal fixture and control device faceplates shall be of Type 316L, nominal 0.135 inch thick stainless steel with No. 4 finish, unless otherwise shown on the Contract Drawings.
    - c. Car operating stations shall contain Braille plates adjacent to each call button. Contractor to coordinate proper landing call outs based on maximum characters as indicated on Contract drawings. Buttons for DOOR-OPEN, DOOR-CLOSE, ALARM, EMERGENCY PHONE call functions are to be supplied. Buttons are to be vandal resistant and of the positive stop type.
    - d. Station shall have a locked service cabinet for keyed switches of the car light; exhaust fan, independent operation, GFI duplex outlet as indicated on the Contract drawings.
    - e. Provide Emergency Communication: "Hands-free" ADA compliant telephone/intercom.
  - 2) Hall Station: Riser of hall stations of the push-button, call acknowledging, stainless steel, tamper resistant type shall be mounted at all elevator landings. Highest landing shall have a single DOWN button. Lowest landing shall have a single UP button. Incorporate ADA compliant telephone with each hall station. Braille Indicator Plate shall be provided. Faceplate finish shall be Type 316L stainless steel #4 finish. The Hall Station shall be flush to the surface and shall not be projected out.
  - 3) Hall Lanterns:
    - a. Tamper resistant hall lanterns shall be equipped with illuminated (LED type) UP and DOWN signal arrows, but provide single arrow where only one direction is possible. Provided units projecting from faceplate for ease of angular viewing. Match materials, finishes and mounting method with hall stations.
    - b. In conjunction with each hall lantern, provide an adjustable electronic chime signal to indicate that a car is arriving in response to a hall call and to indicate direction of car

travel. Signal shall sound one for up direction of travel and twice for down direction.

- 4) Bell Alarm System: Bell alarm system for each elevator shall be properly located within building and audible outside hoistway when activated by the EMERGENCY ALARM call button on each car control building/station. When emergency stop switch is activated inside fire service box, the bell alarm system should not be activated.
- 5) Firefighters' Service System: Firefighters' service system shall be provided in compliance with code requirements.

R. Machine Room Equipment:

1. Machine Room Emergency Lighting:  
Emergency lighting fittings shall be provided in each elevator machine room.
  - a. There shall be a minimum of one maintained lighting fixture.
2. Clearance around equipment in each machine room shall comply with provisions of all applicable codes. Clear distance for the maintenance purposes shall be at least 18". In no case shall this clearance supersede minimum Code requirements.
3. Equipment in the elevator machine room and hoistway sheaves area shall be so arranged that replaceable items can be removed for repair or replacement either by overhead hoist and dolly, or other conventional means, without dismantling or removing other equipment components in the same machine room.
4. Machine rooms must be air conditioned and heated to maintain an ambient temperature of 50F to 90 degrees F and a relative humidity between 35% to 50%. The Air Conditioner shall be Split System. The heating system for the machine room is also a built in system. A forced removal should be done by moving the air from the room to the outside of the building to another part of the building to keep an air exchange through the equipment room. Intake and exhaust vent should not be located close to each other.
5. Any component attached to the controller shall have a minimum clearance of 18 inches from the side(s) of the component requiring access for maintenance and free air circulation.
6. Provide Mats of insulating rubber or other suitable floor insulation in the front of the Controllers.
  - a. The Resistance range shall be  $1 \times 10^4 < 1 \times 10^6$  and shall meet ANSI/ESD requirements.
  - b. The rubber mat shall be the width of the controller plus 12".
  - c. The length of rubber mat shall be a minimum of 24".
  - d. The rubber mat shall be a ¼" thickness and beveled at each end.

**2.04 KIOSK SURVEILLANCE CONTROL AND COMMUNICATION:**

A. Surveillance Camera Provisions (Surface Elevators). All requirements for CCTV shall comply with the WMATA SMNT Department.

1. Space provisions and mounting holes shall be provided for closed-circuit television (CCTV) cameras to be furnished and install by CCTV subcontractor.

1. The Contractor shall coordinate with the CCTV subcontractor and install wiring from the CCTV location within the elevator cab to an interface terminal and video transmitter located on the elevator car. Final equipment selection has not been performed and is subject to change. Coordinate model, configuration, and location with the CCTV subcontractor.

1) Power will be required by the video transmitter and CCTV camera and shall be provided.

2) Equipment: Fiber Optic Video Transmitters (Elevator Cameras)

2. The Contractor shall work with the CCTV subcontractor to install CCTV subcontractor-provided fiber-optic cable and transmitter to a terminal location specified by the CCTV subcontractor. The Contractor shall tag the cables appropriately, indicating that they are for future use by others.

B. Supply the following status indication, control, and communication functions for each elevator car and landing at an annunciator panel in the kiosk: indication, control, and communication functions in each elevator and landing; and all interconnecting wiring required to provide a complete and operable system. Systems to be provided and installed include the following:

1. Kiosk annunciator panel: Panel shall be a single panel approximately 7-½ by 19 inches. Coordinate design to ensure that the panel is compatible with the mounting provisions, previous designs, and human factors. The panels shall contain:

a. Indicators:

1) Visual display of elevator car status, to include landing stopped at or being approached and direction of travel:

a) Designate elevator by functional name, e.g., Garage 1.

b) For garage elevators designate landing by garage floor level.

2) Out of service because of malfunction.

3) In-Car stop switch is actuated.

4) Continuous audible alarm activated when emergency alarm switch in car is anitiated.

5) Indicator lamps shall be LEDs, with life expectancy of 50,000 average rated hours.

- b. Controls:
  - 1) Out of service.
  - 2) Override control.
  - 3) Door open.
  - 4) Landing selection.
  - 5) Push button switches shall have limited over-travel to prevent damage due to abuse and shall be equipped with lift-up covers to avoid inadvertent operation, have mechanical and electrical life of 25,000 cycles, with integral or isolated illumination circuit and be normally open with momentary action or alternate action circuitry.
  - 6) When the override control switch is OFF, the kiosk controls shall function in parallel with the car and landing controls, i.e., the selective/collective control system shall respond to a kiosk-initiated landing selection with the normal priority afforded the remaining system landing selection and call buttons.
  - 7) When the override control switch is ON, the following actions shall take place:
    - a) If the car is stationary at a landing, it shall remain at the landing and the doors, if open, shall close and remain closed.
    - b) If the car is in motion, it shall stop at the first landing reached and the doors shall remain closed.
    - c) The elevator control system shall then respond only to the kiosk controls and car station.
    - d) The car shall park at the designate landing.
  - 8) When the OUT OF SERVICE switch is actuated, the elevator shall return to the lowest landing before shutting off.
- 2. Elevator fire detection sensor: Provide space and mounting holes for smoke and fire detection sensors to be furnished and installed as required by building, electrical, elevator and local codes. Install wiring from the sensor location in the car to interface terminal cabinet in the machine room, for connection from the sensors to the smoke and fire detection system. Coordinate with installers to allow installation of sensors and operational checkout of the system.
- 3. Passenger - Kiosk communications (VIOP) system:
  - a. Communications signal button in elevator car momentary contact to illuminate back-lighted signal button in car and latch on a continuous audible signal and illuminated indicator in the kiosk.
  - b. Communications buttons at landings, momentary contact, to illuminate back lighted signal button at the landing and latch on a continuous audible signal and illuminated indicator in the kiosk.

- c. Push button in kiosk to activate intercom system and reset indicator lamps and audible alarm.
- d. Each passenger operated device shall have identification markings as specified for car operating devices.
- e. The voice communication intercom system shall function as a master remote network. The master station shall be located in the kiosk annunciator panel and shall include a speaker-microphone, audio amplifier, on-off indicator lamp, audible signal device control and push button lamp for the operations. A remote station shall include a speaker-microphone and a communications signal button shall light the signal button and cause a continuous audible signal at the master station and light indicator lamp corresponding to the calling remote station. Communications between master and remote station shall be established upon the actuation of the master station push-button control corresponding to the calling remote station with the master station push to talk control determining the direction of transmission.
- f. If successive calls are received from other remote stations while communication is in progress with one remote station, the audible signal shall sound the indicator lamps corresponding to the calling remote stations shall light and both shall remain on the indicate waiting calls.
- g. Means shall be provided to clear the indicating lamps independently. Communication initiated from the master station shall be established upon actuation of the push button control corresponding to the called remote station, with the master station push-to-talk control determining the direction of transmission.
- h. The audio amplifier at the master station shall be all solid state in construction and shall control incoming and outgoing volumes for all of the remote stations. The volume levels shall be preset during installation and shall be adjustable to provide a maximum of five watts rms at the speaker-microphones.
- i. The power supply shall supply all ac and dc voltages necessary for all circuitry associated with the voice communications intercom system, and shall operate from the 120-volt ac, 60 Hertz emergency power supply located in the elevator machine room.
- j. The audio amplifier and the speaker-microphones shall have a frequency response of plus or minus three Db from 300 Hertz to 5,000 Hertz. Power consumption shall be 5 watts maximum in standby and 50 watts maximum under load.
- k. The Contractor shall be responsible for shielding, grounding and other measures necessary to protect the voice communications intercom system from interference from other electrical systems.
- l. Speaker grilles shall have a minimum of 35 percent open area over the entire surface of the speaker cone.

- m. Switches and relays used with this system shall have an operating life exceeding 5,000,000 cycles. Documentation shall be provided by the Contractor to the Engineer, for his approval, to substantiate this life cycle level.
- n. The system shall perform adequately, as approved by the Engineer, with both the remote and the master station test personnel speaking from three feet away from the speaker-microphones.
- o. Communication in the car shall also rollover to a 24-hour manned site (Rail Operations Control Center) in the event that the kiosk does not respond to the call.
- p. Each passenger-operated device shall be identified in accordance with ADA/ADAAG requirements.
  - 1) ADA requirement for providing emergency two-way communications between an elevator and a point outside the hoist way (the Kiosk).
  - 2) Device mounting heights shall comply with:
    - a) ADAAG requirements.
    - b) ASME A17.1-2007. The highest operable part of the two-way communication system shall be a maximum of 48 inches from the floor.
  - 3) A Braille Instruction Plate shall be permanently affixed on each remote intercom unit.
    - a) ADA Standards: Raised symbol and lettering (Signage) located adjacent to the device.

**2.05 EMERGENCY POWER OPERATION**

- A. Provide control equipment and interlocks sufficient to operate at least one elevator for group of three at a time in the event of failure of normal building power supply.
- B. Provide for sequential operation to return elevators to the main entrance floor. Upon transfer to generator power source as evidenced by signal generated by contact closure at elevator automatic transfer switch, start one elevator at a time and return that elevator to the main floor and park with the door open before starting next elevator.
- C. Provide selector switch for automatic and manual selection of the elevator that is to operate on generator power source. Locate selector switch adjacent to elevator door key or as directed by the Engineer.
- D. When normal building power is restored, as evidenced by signal generated by contact closure at elevator automatic transfer switch, return elevators to normal operation without disruption to normal operating circuits or electrical systems.
- E. The key lock shall be ChicagoLock 7500.
- F. The minimum requirements of the Code shall be met.

**PART 3 – EXECUTION**

**3.01 EXAMINATION**

- A. Prior to beginning installation of elevator equipment, examine the following and verify that no irregularities exist that would affect quality or execution of work as specified.
  - 1. Hoistway size and plumbness.
  - 2. Sill pockets.
  - 3. Anchor brackets
  - 4. Sill supports.
  - 5. Spreader/Divided beams.
  - 6. Machine beams and any other supplied by others.
  - 7. Pit Depth
  - 8. Overhead clearance
- B. Do not proceed with installation until previous work conforms to project requirements.

**3.02 INSTALLATION**

- A. Coordinate work in this section with all trades to ensure that the installation of the elevators is not in conflict with the work performed of other trades.
- B. Make necessary wiring connections.
- C. Paint metal surfaces in accordance with Section 09\_91\_99.
- D. Install elevator equipment, materials and accessories in accordance with the OEM's installation procedures and approved Shop Drawings to make elevator fully operational.
- E. Erect guides plumb and securely fasten to building structure.
- F. Provide protective coverings for finished surfaces.
- G. Upon completion, touch up and restore/ replace damaged or defaced factory finished surfaces. Touch up any marred finishes and replace as directed by the Authority.
- H. Remove protective coverings and clean exposed surfaces after completion.

**3.03 FIELD TESTING:**

- A. Operating Adjustments and tests: At all times, until issued final acceptance by ELES representative, adjust equipment to operate satisfactorily, conduct performance tests and make necessary readjustments.
  - 1. Provide test instruments, materials, other necessary facilities, and all labor required for acceptance tests specified.
  - 2. All faults recorded during performance period will be turned over to the

Authority for review. The review period should be not less than 20 working days. A fault such as, but not limited to:

- a. Door lock or car gate switch malfunction.
  - b. Emergency stop switches and safety circuit malfunction.
  - c. Door protection timer.
  - d. Motor overload circuits
  - e. Stuck button protection features.
  - f. Low oil and oil pressure devices.
  - g. Test emergency telephone in car
- B. Any deficiencies found during the performance period will be repaired by the contractor at no charge to the Authority.  
The warranty shall include materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, noisy, rough, or substandard operation; loose, damaged, missing parts and fluid leaks.
- D. Arrange for tests and inspection by jurisdictional authorities to obtain certificate of acceptance.
- E. Coordinate with the Engineer to have the Authority personnel witness acceptance tests.
- F. When the elevator work included in this Contract is fully completed, demonstrate to the satisfaction of ELES representative that the proper operation of every part of the equipment complies with Contract requirements including compliance with all applicable requirements of ANSI/ASME A17.1. The inspection procedure outlined in ANSI/ASME A17.2 will form a part of the final inspection.
- G. Shop test of elevator motor and certified test sheets will be required. The heating, insulation and resistance of the motors will also be determined under actual conditions after installation.

**3.04 ACCEPTANCE TESTS:**

Notification Requirements: Notify the Project Manager and the Engineer a minimum of five (5) working days prior to each scheduled test.

- A. Furnish all test instruments and materials, required at the time of final inspection, to determine compliance of the work with Contract requirements. Materials and instruments furnished shall include standard 50-pound test weights, megohmmeter, alternating current voltmeter and ammeter, centigrade calibrated thermometers, spirit level, and stop watch. At the time of final inspection, tests shall include the following:
- 1. After installation, each elevator shall be tested without load by the Contractor. The elevator shall be subjected to a test for a period of eight—hours continuous run. During the test run, the car shall be stopped at top and bottom levels, in both directions of travel with a standing period of 10 seconds at each landing.

2. Full-load run test: The elevator shall be subjected to a test for a period of one-hour continuous run, with full specified rated load in the car. During the test run, the car shall be stopped at top and bottom levels in both direction of travel with a standing period of 10 seconds at each landing.
3. Car Leveling Test: Determine accuracy of floor landing tests both before and after full load run tests. Minimum of 1/4 inch leveling must be maintained. Test accuracy of landing at all floors with full load and no load in car, in both directions of travel.
4. Speed test: The actual speed of the elevator car shall be determined in both directions of travel, with full specified rated load and with no load in the elevator car. Speed tests shall be made before and after the full load run test. Speed shall be determined with a Tachometer. Car speed when ascending shall be not more than 10 percent above not more than 10 percent below the specified car speed.
5. Temperature rise test: The temperature rise of the drive unit motor shall be determined during the full load test run. Temperatures shall be measured by the use of thermometers inserted into the windings and shielded by cotton waste. Under these conditions, the temperature rise of the motor shall not exceed NEMA specified temperature rise. Test shall be started only when all parts of equipment are within 5<sup>0</sup> C of the ambient temperature at the time of starting test.
6. Insulation resistance test:
  - a. The complete wiring system of elevator shall be free from short circuits and accidental grounds. The insulation resistance of the system shall be more than one megohm when tested by using a 500-volt megohmmeter.
  - b. The elevator structure, equipment, and raceway shall be tested for continuity to ground.

### 3.05 ELEVATOR PROTECTION:

1. The finished elevator installations shall be completely barricaded and enclosed to preclude their use without permission of the Contractor until Final Acceptance and release by the Contractor for general use. The enclosure shall be fabricated to allow easy access for maintenance, testing and adjustment.
2. The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room, and ensure that it shall remain secure at all times until the completion of the Contractor's interim maintenance obligation.
3. Protection: During installation and until all elevator systems are fully operational and accepted by WMATA, make all necessary provisions to protect all elevator components from damage, deterioration, and adverse environmental conditions. Do not use or allow the use of the elevator for construction purposes such as hauling materials or worker transport during construction.
4. Security Of Machine Rooms: The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room and ensure it shall remain locked and secure at all times.
5. Field Painting: Metal parts visible to the public shall be field painted.

**3.06 WARRANTY**

Warranty: Two-year warranty of construction shall start at Final Contract completion.

- A. The OEM shall warrant in writing that all equipment manufactured and installed under this specification, for a period of twenty four (24) months from the date of Final Acceptance by the Authority, be free of defects in design, materials, and workmanship, under normal use and service. Defective work shall be repaired or replaced at no additional cost to the Owner.
- B. The warranty shall include materials and labor necessary to correct defects.
- C. The warranty does not begin until all of the following requirements have been met.
  - 1) The Operations and Maintenance Manuals are accepted by WMATA.
  - 2) The required training has been completed to the satisfaction of WMATA.
  - 3) All field tests have been successfully completed.
  - 4) The acceptance testing has been successfully completed.
  - 5) The elevators are in service for passenger/public use.
  - 6) The State and local jurisdictions have inspected the elevators and issued the respective certificates of Operation.
  - 7) All spare parts have been delivered and received by WMATA.
  - 8) Any discrepancy identified by the ELES representative shall be repaired or replaced by the Contractor at no additional cost to the Authority.

**3.07 MAINTENANCE:**

3. Maintenance Service

The Contractor shall perform full maintenance service for a period of two years on each elevator in accordance with the manufacturer's maintenance manual and WMATA ELES maintenance program prior to WMATA providing permanent maintenance. The period of maintenance shall begin after test(s) and Provisional Acceptance of each elevator and shall extend to the scheduled date of Final Acceptance for all units in the same facility plus a period of two years. In no case shall the interval between inspections and testing be greater than one month. The maintenance service during the warranty period shall be provided by fully trained elevator mechanics. The maintenance tasks shall include, but not be limited to, the following:

- a. Inspection of completed installation and periodic testing to maintain the elevators in completely operable condition.
- b. Contractor shall provide support for periodic, accident and incident, PM compliance inspections.

- c. Lubrication of parts, and the protection of the equipment.
- d. Replacement of defective parts at no additional cost to the Authority.
- e. Annual clean down of the elevator and hoistway enclosure is required. Make necessary arrangements with Authority in order to minimize any inconvenience.
- f. Contractors performing maintenance are responsible for all service, repair work and emergency call. The contractors shall provide unlimited service during regular time and twenty-four (24) hour (including Holidays) emergency call back service at no additional cost.
  - A. Provide twenty (24) hour (including Holidays) emergency service during the maintenance period consisting of a prompt response (within 1 hour) to emergency request by telephone or otherwise from Authority or designated representative if an elevator is inoperable or in case of injury, entrapment, or potential injury to persons.
  - B. Unlimited service callbacks are included with a required response time of one (1) hour (including Holidays).
- g. Periodic maintenance (based on WMATA schedule) shall be performed off peak hours to minimize service interruption as long as the other elevator serving the same platform is operational.
- h. Reporting: Detailed monthly records of tasks performed including names of individuals performing the tasks, date and time performed, and other pertinent data. In addition, the reports are to be provided in an electronic format acceptable to WMATA's needs.
- i. Contractor performed maintenance shall follow the WMATA Office of Elevator and Escalator Operations procedures, schedules and check charts.

Within three (3) months prior to the termination of this contract, the Authority or his designated representative(s) shall make a thorough maintenance inspection of all equipment covered under this contract. The contractor shall provide personnel to remove, test, and operate equipment as necessary. All deficiencies found as a result of this inspection shall be corrected by the Contractor as required in this agreement with no additional cost to the Authority.

**3.08 REMOTE MONITORING SPECIFICATIONS:**

- A. Allen Bradley DF1 or industry standard Modbus protocol shall be provided to transmit data from the Elevator/Escalator controller to the Authority's AEMS RTU computer control and data system. The Design-Builder shall provide a controller data interface to a DH-485 network located in the Elevator /Escalator machine room. The DH-485 controller interface shall be programmable for data rates up to 115Kbps. The interface shall allow other nodes such as other Elevator or Escalators to be readily incorporated into the DH-485 network. The controller data interface shall include one Allen Bradley SLC PLC per station to function as a data concentrator to consolidate data from all the controllers in the station. The software for the data concentrator shall be as specified by the Authority. The data concentrator shall receive controller data over the DH-485 data network and provide formatted data to the AEMS RTU through a RS 232 link. This data transmission may be accomplished by a separate PLC controller integrated into the control system.
- B. The Elevator /Escalator control system shall automatically initiate the transmittal of data when data is requested by the Authority's AEMS system and continue until all data is received by the AEMS RTU in the station AC switchboard room. The Authority will perform final integration of the data in the AEMS system.
- C. The Contractor shall also provide the required hardware to download data from any fault finding annunciator panel to a supplied laptop PC being utilized at the Elevator/Escalator location. The provided software shall permit the downloading and storage of data on the supplied laptop PC from multiple fault finding annunciator panels.
- D. The Contractor shall install an Allen Bradley network interface module, (model 1761-NET-AIC, or approved alternative) beside the PLC in the controller and provide 24 VDC power to the module. The Allen Bradley PLC will be used for remote monitoring capabilities into WMATA established engineering monitoring network.
- a) The Contractor shall provide all wiring and programming of the PLC to communicate with station data concentrators on the DH-485 network. Coordinate work with WMATA ELES Engineering.
  - b) The Contractor shall pull all remote monitoring cables to the interface in the elevator controller from the remote monitoring network going back to WMATA's Automated Energy Management System (AEMS) remote terminal unit (RTU).
  - c) Provide Ethernet communication between the elevator machine room and WMATA's communication room. The communication port shall be located less than 6' from the controller and shall have minimum of two ports for data communication.
- E. Terms and Definitions
- 1. Boolean - A single bit data type.
  - 2. DF1 - A Rockwell Automation Company proprietary communications protocol.
  - 3. DH485 - An industrial communications network used by Allen Bradley programmable controllers.

4. Integer - A data type 16 bit signed (range -32768 to 32767).
5. PLC - Programmable Logic Controller.
6. QEI - QEI Inc. Springfield NJ
7. RTU - Remote Terminal Unit

F. Elevator Remote Monitoring Data Specification

1. Overview

The design of the WMATA escalator & elevator monitoring system shall include a data concentrator PLC to gather data from the elevator control PLC's over an Allen Bradley DH 485 network. The QEI RTU shall read data from the WMATA data concentrator PLC via an RS 232 serial connection to a 1746-BAST module using Allen Bradley DF1 protocol. See figure 1.1 for reference. This specification defines data to be presented by the WMATA data concentrator PLC to the QEI RTU. The WMATA data concentrator PLC station shall poll the escalator & elevator controller(s) periodically for data and format the data into blocks within the WMATA data concentrator. An Ethernet TCP/IP connection is available at the Data concentrator PLC. The data concentrator PLC has been designed to collect data from up to (10) escalators and/or elevators. The data concentrator PLC is to be mounted into the existing QEI RTU enclosures and powered by a 120 VAC source from within the RTU. For Metro stations where more than (10) escalators and elevators are present additional data concentrator PLC's will be required.

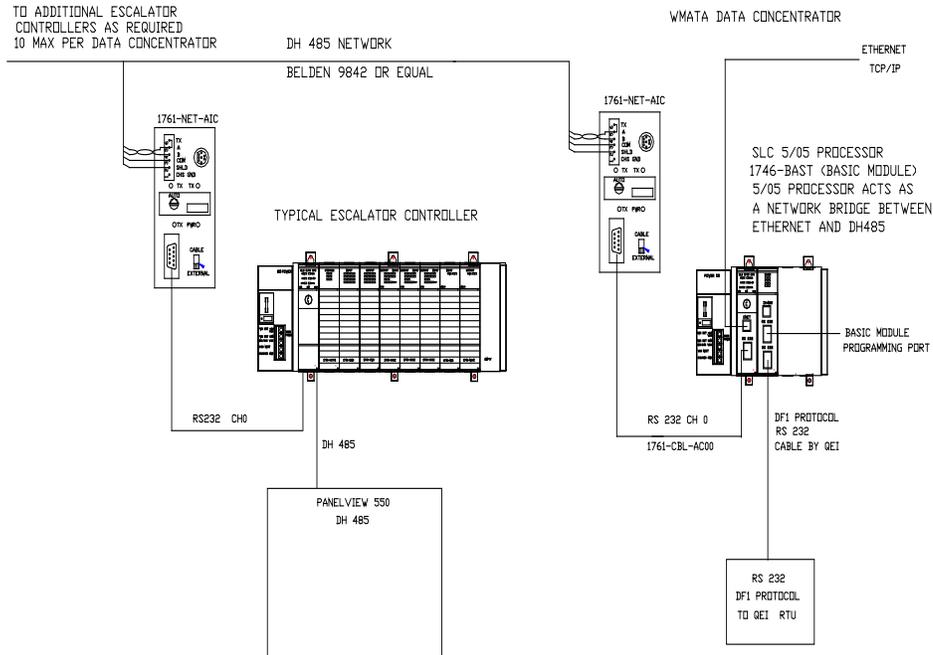

Figure 1.1

## 2. Data Concentrator PLC Data File Assignments.

The WMATA data concentrator PLC shall store data for up to (10) escalators and/or elevators in any combination as defined in table 2.1.

**Table 1**

Escalator DH485 node #	Elevator H485 node #	Status bits File	Analog Data File	DC PLC MSG file#	DC PLC MSG buffer file#
1		N20	N21	N81	N101

Concentrator PLC (DC)	25	N80	N79		

Each data file shall begin with word 1 (example: escalator #1 status bits begin with N20:1 and end at N20:20)

The data concentrator PLC communication ports shall be configured as follows.

**Channel 1**

Driver: Ethernet  
 IP Address: TBD  
 Subnet Mask: TBD  
 Gateway Address: TBD

**Channel 2**

Driver: DH485  
 Baud Rate: 19.2K  
 Node Address: 25

1756-BAST basic module communication ports shall be configured as follows.

**Port 1:** Programming port

Settings -- 19,200 Baud, No parity, 8 bits, 1 stop bit, No handshaking

**Port 2:** DF1 port

Settings -- 19,200 Baud, No parity, 8 bits, 1 stop bit, No handshaking

DF1 – Op Code 19 (Full Duplex, NHS, ER, Enable DPD, CRC error checking,

Timeout = 50

Retries = 3

RTS on delay = 20 msec

RTS off delay = 20 msec

Module address = 10

DH485 Port – Not Available

**3. Data Format**

Data Concentrator status in File N80 per table 3.0

**Table 3.0 Data Concentrator Status Bits**

Note: All analog values are multiplied by 16 in the data concentrator to bit shift left 4 bits to align with QEI's 12 bit analog data types.

A note on communication loss

A 60 second watchdog timer is coded into each escalator file. If communications are lost between the data concentrator and the escalator controller for more than 60 seconds the watchdog timer will timeout. When the timer has timed out the communications loss bit will be reset (0) to indicate the communications loss condition.

**3. Time and date sync**

The QEI RTU shall provide clock synchronization to the WMATA data concentrator PLC every 5 minutes. Table 4.1 defines the address and data format of the clock registers in the WMATA data concentrator PLC. The data concentrator PLC shall set the escalator controller date and time every day at 3 AM.

**Table 4.1**

FUNCTION	ADDRESS	FORMAT
YEAR	N13:10	4 DIGITS

MONTH	N13:11	2 DIGITS
DAY	N13:12	2 DIGITS
HOUR	N13:13	2 DIGITS 24 HOUR
MINUTE	N13:14	2 DIGITS
SECOND	N13:15	2 DIGITS

#### 4. Data Concentrator PLC Program

The data concentrator PLC includes code to monitor up to 10 escalators and 5 elevators. Each escalator and elevator has an independent code file and a configuration bit. If an elevator is to be monitored the configuration bit must be set corresponding to the DH485 station address of the elevator controller. If the configuration bit is reset (0), the status and analog data table values for the elevator or escalator will be set to 0.

The configuration bits are as follows.

Escalator Configuration Bit	DH485 Address of Escalator Controller	Elevator Configuration Bit	DH485 Address of Elevator Controller
B9:0/1	1	B9:1/1	11
B9:0/2	2	B9:1/2	12
B9:0/3	3	B9:1/3	13
B9:0/4	4	B9:1/4	14
B9:0/5	5	B9:1/5	15

B9:0/6	6	B9:1/6	16
B9:0/7	7	B9:1/7	17
B9:0/8	8	B9:1/8	18
B9:0/9	9	B9:1/9	19
B9:0/10	10	B9:1/10	20

**3. Data Concentrator Gateway IP addresses.**

The Data concentrator PLC acts as a gateway between the Ethernet and DH485 networks. The PLC contains a list of IP addresses, known as the routing table which will be allowed access to the DH485 network. The routing table will contain 20 addresses.

END OF SECTION

**SECTION 14245  
GEARED TRACTION PASSENGER ELEVATORS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION**

- A. This provides guidelines for the fabrication, installation and testing of the heavy-duty Traction Passenger Elevators, Signs and Kiosk information system.
- B. The following sections include related requirements and are performed by other trades:
  - 1. Specifications Section 02000 – Site Construction
  - 2. Specifications Section 05000 – Metal Fabrication
  - 3. Specifications Section 08800 – Glass and Glazing
  - 4. Specifications Section 09920 – Painting
  - 5. Division 7 Section “Waterproofing” for water proofing of elevator pit
  - 6. Division 15 Sections for heating, ventilating and/or air conditioning of elevator machine room.
  - 7. Division 16 Sections for electrical service to elevator equipment, fire alarm systems and communications systems.
- C. Definitions:
  - 1. Heavy duty elevator: An elevator designed specifically for the harsh environment and duty load cycles common to transportation system usage.
  - 2. Elevator - a hoisting and lowering mechanism, equipped with a car or platform, which moves in guide rails or racks and serves two or more landings
  - 3. Elevator, passenger - an elevator used primarily to carry persons other than the operator and persons necessary for loading and unloading.
  - 4. Elevator, Geared: A traction machine-type elevator in which the energy from the motor is transmitted to the drive sheave through worm gearing. The motion of the car is obtained through friction between the suspension ropes and a traction sheave.
  - 5. Contractor: The General Contractor.
  - 6. Installer: The responsible party who installs the elevator.

7. OEM: Original Equipment Manufacturer.
8. Dwell time: The period of time the elevator is at a landing while the doors open, passengers transfer and doors close.
9. Substantial completion: The point at which the elevator is ready for use, whether the site is finished or not. This is where the jurisdictional inspection usually takes place.
10. Final Acceptance: The point at which the owner accepts the elevator project as being complete including all submittal requirements. This may be a different point in time than substantial completion.
11. Interim Maintenance: Maintenance from the point of substantial completion, but prior to Revenue Service.
12. Beneficial Use: When the elevator is placed into service, may be prior to the site being ready for public use.
13. Revenue Service: The station or facility opening date.
14. Notice to Proceed (NTP): within this document shall mean the date which the elevator installer is notified to proceed with the project.
15. Override Switch – A switch located in a kiosk panel, which disables the Hall Call Buttons.
16. MSDS - Material Safety Data Sheet.
17. BOM - Bill of Material
18. SMNT - Systems Maintenance (WMATA)
19. WMATA: Washington Metropolitan Area Transit Authority.

## **1.02 REFERENCES AND QUALITY ASSURANCE**

### **A. Codes, Regulations, Reference Standards and Specifications:**

1. Codes and regulations. of the jurisdictional authorities.
2. ANSI/ME: A17.1, A17.1a, A17.1b, A117.1.
3. ASTM: A123, A153, A525, A568, C1048.
4. Uniform Federal Accessibility Standard,
5. Americans with Disabilities Act.
6. FS: RR-W-410.
7. American Institute of Steel Construction (AISC).
8. American Iron and Steel Institute (AISI).

9. American National Standards Institute (ANSI): C80.1
  10. American Welding Society (AWS): D1.1.
  11. Environmental Protection Agency (EPA).
  12. Federal Transit Administration (FTA).
  13. Institute of Electrical and Electronic Engineers (IEEE): 1202.
  14. International Code Council (ICC) – International Building Code (IBC).
  15. National Association of Architectural Metal Manufacturers. (NAAMM): C54, C55.
  16. National Institute of Standards and Technology (NIST).
  17. National Electrical Code (NEC).
  18. National Electrical Manufacturers' Association (NEMA): WC 70, KS 1, AB 1, 250, PB 1, MG 1.
  19. National Electrical Safety Code (NESC)
  20. National Elevator Industry, Inc. (NEII)
  21. National Fire Protection Association (NFPA): NFPA-130-2003.
  22. Occupational Safety and Health Act (OSHA).
  23. Society of the Plastics Industry (SPI).
  24. Underwriters' Laboratories, Inc. (UL), UL-94HB, 6, 50, 62, 98, 360, 486, 489, 514, 1591.
  25. United States Department of Transportation (DOT).
  31. Any additional requirements imposed by local agencies and/or codes having jurisdiction shall be incorporated into elevator installation.
  32. In the event of a conflict between codes, regulations or standards, the most stringent requirement as determined by the Contractor and approved by the Authority shall take precedence unless specifically addressed herein.
- B. Elevator Manufacturer and/or Installer's Qualification:
1. Manufacturer Qualification: : Shall provide documents stating that their firm has successfully produced elevators for transit system applications for a minimum of ten (10) years and regularly engaged for the past five (5) years in the manufacture of major components for traction passenger elevators. As a standard of quality the elevator equipment design and installation shall comply with the Code.
  2. Installer's Qualifications: Shall be the original manufacturer of elevator equipment or manufacturer's authorized agent who is trained and approved for installation of units required for this Project.
  3. The Contractor shall obtain and pay for all permits and licenses and perform all required inspections.

C. Quality Assurance:

1. The elevator contractor shall guarantee the materials and workmanship of the apparatus furnished under these specifications and will make good any defects not due to ordinary wear and tear or improper use or carelessness, which may develop within two (2) years from date of completion of each elevator, inclusive of labor and traveling expenses. Defective work shall be repaired or replaced at no additional cost to the Authority.
2. Welding: Welding shall be performed in accordance with the requirements of AWS or CWB Welders shall produce evidence of current certification by AWS or CWB.
3. Labeling Requirements: Every elevator shall be clearly marked with rated load and speed, manufacture serial number and the designated Authority identification.
  - a. All elevators shall be permanently numbered with number designations corresponding to the indications on the kiosk annunciator panel. A station sketch showing the elevator numbers shall be submitted for WMATA ELES Engineering. The elevators shall be numbered in sequence, starting at the north entrance left to right facing to the elevator at each station and proceeding clockwise around the station. The numbering shall proceed into the station toward the end of the platform. Corresponding numerical identification shall be affixed to the equipment in the machine rooms. The elevator numbering shall be approved by the ELES Engineer.

**1.03 SUBMITTALS**

Submit the following for approval in accordance with the General Requirements and the additional requirements as specified for each to WMATA/ELES.

A. Shop Drawings:

The contractor to provide detailed drawings that shows the dimensions, tolerance and specification that may include the material specification, hardness or electrical rating for each component that is being used. In regards to assemblies, they must provide a top level drawing with BOM and quantities with detailed material specifications and drawings with dimensional tolerances. The contractor also to provide as-built CAD models of all elevator components.

The name of the manufacturer and type or style designation shall be listed on the equipment shop drawings. Drawings submitted shall include, but not be limited to, the following. Submit three sets include the following:

1. Fully dimensioned layout in plan and elevation, showing the arrangement of equipment and all pertinent details of each specified elevator unit, including as appropriate:
  - a. All equipment located in machine rooms.
  - b. Location of circuit breaker, switchboard panel, disconnect switches, light switch, and feeder extension points in machine rooms,

- c. Location in hoistway of outlets for connection of traveling cables for car light, fire detectors, communication, and control systems.
  - d. Car, drive and motors, safeties governors, supporting beams, guide rails, buffers, and other components located in the hoistways for each elevator.
  - e. Maximum Rail bracket spacing and maximum horizontal forces on guide rails in accordance with Part 2.23 of the ANSI/ASME Code.
  - f. Reactions at points of supports.
  - g. Weight of principal parts.
  - h. Loads on hoist beams.
  - i. Loads imposed on racks requiring transfer to building structure.
  - j. Top and bottom clearance and travel of car and counterweight runby.
  - k. Refuge space on top of car and pit.
  - l. Cab design, dimensions and layout.
  - m. Color/material schedule and selection chart for cab and entrance features.
2. Complete wiring diagram of the elevator system and subsystems. Complete data regarding electrical characteristics and connection requirements.
  3. Drawings of the hoistway entrances and doors showing their method of operation, details of construction, and fastenings to the structural members of the station structure.
  4. Drawings of the car for each design specified, showing details of construction, and fastenings to platform car floor covering, car-lighting, ventilation, communication, provision for closed circuit television monitor, and location of equipment.
  5. Cuts or drawings showing details of all signal and operating devices, identifying graphics and kiosk interface where applicable.
  6. Electrical characteristics and connection requirements.
  7. Complete assembly detail of machine, machine mounting, machine beam assembly, dead end hitch and beam assemblies.
  8. Machine performance data sheets.
  9. Elevator controller, including manufacturer's technical data and catalog cuts, and interface hardware and software requirements.
  10. Power door operator.

11. Door interlocks and electrical contacts including test reports showing that hoistway door interlocks, car door contacts, and car top emergency contacts meet the requirements of the ANSI/ASME Code and certification by the NBS or other approved laboratory.
12. Car ventilation.
13. Car lighting.
14. Cabling.
15. Hall and car fixtures at each landing including the car operating panel (COP).
16. Buffer, including stroke and certified maximum striking speed for car.
17. Mechanical, electrical, and architectural design details of communication systems and intrusion systems for both elevator and kiosk systems. Provide diagram and schematic of kiosk annunciator panel.
18. Design and architectural details of electrical protective device for car doors.
19. Where use of adjoining dissimilar metals is required, descriptions of protective measures to be employed to avoid corrosive damage.
20. Certification from independent testing laboratory that glazing gaskets meet the specified requirements.
21. Conduit and wireway cladding configuration from the point of origin to the final destination.
22. Interface wiring diagrams with other systems showing terminal board location and identification.
23. Expected heat dissipation of elevator equipment in machine room and control areas (i.e. BTU's/hr.) based on 240 round cycles per hour.

**B. Samples:**

Three of each of the following samples shall be submitted for approval.

1. Stainless Steel: One of stainless steel sheet of thickness and finish specified, 6 inches square.
2. Glass: One, 12 inches square.
3. Floor covering: One, 12 inches square in the color and finish to be supplied.
4. Neoprene gasket: One of each type.
5. Landing selector button mounted in cover plate with identity

marking along side button.

6. Ceiling material.
7. Signs: One of each type.

C. Certification:

1. Certificates of inspection and acceptance issued by jurisdictional authority.
2. The Acceptance Inspection (Specifications and Code) by the Elevator and Escalator (ELES) Department shall take place prior to the Final Acceptance Inspection by the Jurisdictional Authority, and the elevators and associated equipment shall be free of defective material, imperfect work and faulty operation.

All defective work identified by ELES representatives shall be repaired or replaced at no additional cost to the Authority prior to the Final Acceptance Inspection by the Jurisdictional Authority.

D. Operation and Maintenance Manuals:

Six sets of the approved manuals, elevator installation, operation instructions, troubleshooting techniques and related equipment drawings and software (all publication must be in English) – two copies of which to be delivered to the WMATA/ELES Engineer representing of the Authority prior to installation. Each binder shall have the Binder Cover and Spine Insert which contain the Station Name and Unit ID.

Submit an additional electronic copy on Flash Drive(s)/CD(s). The Information shall be saved/presented as follows:

- a. Graphic images in “.dwg” AutoCad and “.pdf” formats. All revisions shall be made by using computer software. Hand written changes are not acceptable.
- b. Text in Microsoft Word .doc, “.pdf” or approved equal format.

The manuals shall include the following:

1. Complete operation and maintenance Instructions of the elevator equipment included complete illustrated, exploded views of all assemblies and a complete illustrated, exploded view for identification all system parts.
2. Complete nomenclature of replaceable parts, part numbers, current cost, and warehouse location. If product source is another vendor, Contractor shall include name and address of other vendor.
3. Furnish a summation, in tabular form, of all parts incorporated in the elevators supplied under the Contract. Include but not be limited to the following:

- a. Nomenclature of part.
  - b. Contractor's part number.
  - c. Nomenclature of next higher assembly in which used.
  - d. Manufacturer and part number.
  - e. Model number of elevator on which used.
  - f. Total quantity.
  - g. Current unit price to the Authority.
  - h. Serial numbers of all serialized assemblies, subassemblies, motors, and other major components supplied and installed.
4. Control and schematic electrical wiring diagrams of controller including wiring of safety devices.
- a. Wiring Diagrams shall be full size (11x17), ladder type, complete "as-built" wiring and single line diagrams showing the electrical connections, functions and sequence of operation of apparatus connected with each elevator, using standard symbols or proprietary symbols defined on the diagram, both in the machine room and in the hoistway, shall be furnished in duplicate for each elevator.
  - b. Wiring diagrams shall incorporate the wiring identification labeling to identify the controller and field wiring used for each circuit. Wiring diagrams shall have sheets numbered with an indication of the total number of sheets in the diagram set. Each page should include unit number where the diagram belongs to.
  - c. After approval, a copy of each print (11x17) shall be laminated and mounted with non-metallic holder in each elevator machine room. A reproducible .003 mil Mylar set of wiring diagrams for each elevator shall be delivered to ELES Engineering Office.
  - d. Coded diagrams are not acceptable.
5. Complete detailed drawings and wiring diagram of elevator system.
6. Lubricants, sealers, paints and any other potentially hazardous substances are subject to review and approval by the Authority.
- a. Provide MSDS for all the lubricants/chemicals.
  - b. Provide manufacturer part number.
  - c. Provide name of the manufacturer.
7. Detailed lubrication and cleaning schedule.
8. Procedures for adjusting all elevator components.

9. Complete set of contract software including operating control software.
10. Detailed, record and as-built layout drawings.
11. The entire manual, all software upgrades and service tools for elevators shall be provided in an electronic format on Flash Drive/CD-ROM that is acceptable to the WMATA Engineering and Maintenance Department.
12. All hard copy publications shall be in loose-leaf form, on 30-pound paper and with punch holes reinforced with plastic, cloth or metallic material.
  - a. The O&M manual shall only contain information related to equipment installed under this contract. Generic information that does not pertain to the equipment installed shall not be included. Scanned documents are not allowed. The fonts should be standard format.
  - b. All covers shall be resistant to oil, moisture, and wear commensurate with their intended use. Diagrams and illustrations shall not be loose or in pockets. All printed material shall be capable of being reproduced on dry copying machines.
13. Each elevator shall be treated as a whole and not as a grouping of disassociated parts. The material in the Wiring Diagram Manual shall be organized and indexed by the elevator classifications included in this Specification. All manual sections shall be sub-divided, to the extent required by the subject matter, and shall include, but not necessarily limited to the following topics:
  - a. General system or sub-system description and operation.
  - b. Sequence of operation.
  - c. Replacement and step by step adjustment procedure for all components and systems.
  - d. Block diagrams.
  - e. Functional schematics.
  - f. Functional as-built wiring diagram.
  - g. Lubrication and cleaning, including frequency, methods, and trade identifications of recommended materials.
  - h. Component location and description.
  - i. Inspection and maintenance standards including wear limits, settings, and tolerances.
  - j. Installation and removal sequence.
  - k. Test and evaluation procedures.
  - l. Spare parts lists and special tools.

14. The contractor shall provide all information: manuals, drawings, design changes, modifications, techniques, procedures and any other documents related to maintenance, safety, operations which relate to any part, component, system, subsystem or material and applicable to the elevator equipment. All operating, programming, control software and licensing keys (if applicable) to the PLC control system for the installation.
15. All of the above referenced shall be provided as it pertains to the original installation and for a period of ten (10) years after final acceptance of the elevator. During a ten (10) years period, In case of any items are obsolete or no longer available from the manufacturer the Elevator Contractor shall provide the alternative products.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING**

- A. Ship equipment and accessories securely packaged and labeled for safe handling and to prevent damage.
- B. Protect equipment exposed finishes during transportation storage and erection against damage and stains.
- C. Deliver components with factory-installed wooden skids and lifting lugs; pack components in factory-fabricated protective containers.
- D. Store in in clean, dry and secure areas and protect them from weather and damage.

**1.05 WORK BY OTHER TRADES**

The following will be provided in accordance with other sections of the Contract Specifications or by separate contracts; coordination is the Contractor's responsibility:

- A. Hoistway conforming to code and specified requirements, plumb to within ¼ inch, including machine beams, pit, and pit ladders.
- B. Intermediate rail bracket supports.
- C. Grouting around hoistway entrances and sills.
- D. Temporary and Permanent Electrical Power Services:  
Contractor shall provide and coordinate the following:
  1. For the elevator drive systems: 480 (460) volts, 3 phase, 3 wire, 60 Hertz terminating in a disconnect switch within sight of the controller. The disconnect shall be free on any obstruction for a total of 36" from any part of the disconnect.
  2. For lighting and GFCI receptacles: 120 volts, 1 phase, 3 wire, 60 Hertz terminating at the elevator controller location.

- 3. Separate disconnect for cab lighting and wiring to cab. This disconnect shall be located close to the mainline disconnect.
- 4. Separate service for sill heaters where required.
- E. Cutouts in hoistway walls for fixtures.
- F. Smoke and/or heat sensors in machine room, in car and above each hoistway entrance.
- G. Closed circuit television camera (CCTV) in elevator car.
- H. Intrusion detectors on machine room doors.
- I. Space in kiosk for elevator annunciator panels.
- J. All embedded electrical conduit between elevator hoistway, machine room and kiosk.
- K. Pit Drainage means to prevent water from accumulating in the pit for outdoor and indoor elevators. If pumps are used, they shall have a backup power source.
- L. Lock and Key Requirements: Contractor shall coordinate with WMATA. The keys for all elevators except of Code requirements shall be keyed the same. Each station shall have a key and a master key shall be furnished which will operate all elevator locks in the Metro System, including previously installed elevators.
- M. Contractor shall coordinate any alterations required to accommodate elevators with the Authority.
- N. Contractor shall attend appropriate safety training programs provided by WMATA at no extra cost.
- O. As-Built Drawings: Contractor is responsible to provide revised Contract Drawings to reflect the actual as built condition including all structural, architectural, electrical, mechanical and plumbing connections to the elevators.

**1.06 COORDINATION WITH OTHERS**

The elevator installer shall install all elevator wiring in the embedded conduit provided by other trades including that to the kiosk. Other trades will bring wiring for their services to either the elevator machine room or the elevator pit, terminated on a terminal block. The elevator installer shall extend wires from the terminal blocks to the appropriate location or device within the elevator enclosure or hoistway. Some of these circuits shall require shielded wires or separate isolated circuits.

**1.07 OPERATION AND MAINTENANCE TRAINING**

- A. Training: The Contractor shall develop and provide operation, troubleshooting and maintenance training in accordance with the General Requirements and as follows:
1. Three days of classroom plus two days hands on training on the field shall be provided for 10 students per class. Six training session for a total of 60 students is required.
  2. Time and place of training will be determined by the Authority, but must be completed no later than 30 days prior to the Final Completion.
  3. Training shall be organized to make optimum use of the required maintenance and operation manuals including training for replacement of all parts contained in the Parts Inventory list.
  4. At the completion of the first training session, a narrated and properly edited training video shall be submitted for the authority on DVD or flash drive. The video shall be taken by the professional camera operator with quality image and sound track and will be used for the future trainings. The video shall cover operation of the elevator, function of the devices, maintenance, adjustment procedures and troubleshooting. The following items shall be included as minimum requirements:
    - 1) Step by step adjustment procedure on the followings:
      - 1.1 Door operators, DCL, DOL, full door opening, and so on...
      - 1.2 Car Leveling and adjustment of leveling sensors and vans
      - 1.3 Door: door interlock, proper pressure, restrictors ...
    - 2) General overview of major items:
      - 2.1 Controller:
      - 2.2 Controller display:
      - 2.3 Door sills
      - 2.4 Guide rails
    - 3) Daily operation and sequence of operation
    - 4) Replacement and Installation of components:
      - 4.1 door photo eye
      - 4.2 Door clutch
      - 4.3 Door pickup rollers
    - 5) Proper guide roller adjustment
    - 6) Verification of safety circuit
    - 7) Maintenance procedure and Frequency of maintenance
    - 8) Proper access of pit and top of car for inspection
    - 9) Proper test of fire service operation
    - 10) Proper lubrication of components

- 11) Troubleshooting techniques
  - 12) How to use proper communication device, machine room, car top, and kiosk
  - 13) Proper adjustment of shaft and drive encoders
  - 14) Proper run learn adjustment
  - 15) Operation of Governor and adjustment procedure
  - 16) How to perform governor tripping test
  - 17) Function of Rope gripper
  - 18) Lubricate rope and check for wear
  - 19) Maintenance and inspection of buffer
  - 20) Test and inspection of safety plunk
  - 21) Overview of car and counterweight run-by
  - 22) Operation of brake and proper adjustment procedure.
  - 23) Check Gear box for wear and oil check
  - 24) Inspect Sheave for wear and bearings lubrication
5. Provide one additional copy of all required submittals to the ELES Engineer for Authority use.
  6. Provide two copies in DVD format of training materials along with visuals and handouts to the Engineer for the Authority use.
    - a. Video shall be narrative.
    - b. Video shall be separated by major components Sections
    - c. Equipment Identification shall be as a part of the section title.
  7. Separate training manual shall be submitted for approval prior the scheduling of the training. The O&M manual shall not be used as a training manual.

**B. Scope of Work**

1. All training, as described below, shall take place prior to Final Acceptance of equipment or materials by the Authority. The contractor shall video tape all training sessions and provide WMATA/ELES with edited copy of the recording.
2. The Training shall be tailored specifically to the furnished and installed equipment, and designed to teach the day-to-day operation of all equipment. The training shall be sufficient to bring personnel to a level of operating proficiency such that routine vendor support is not needed.
3. The Training shall be tailored specifically to the furnished and installed equipment, and designed to develop the knowledge and skills required to maintain all item(s) delivered.
4. The training shall be subdivided into two major levels as follows:

- a. System Level Maintenance Training, covering:
  - i. Theory of operation of the system and its major components.
  - ii. System configuration.
  - iii. Preventative maintenance, consisting of written procedures and schedules for the periodic maintenance of all equipment.
  - iv. Written and validated inspection procedures and a system-level trouble-shooting guide (to the lowest field-replaceable unit).
- b. Shop Level Maintenance Training, covering
  - i. Detailed theory of operation to module, board, and/or device level.
  - ii. Component level troubleshooting and component replacement.
  - iii. Testing and alignment procedures of repaired units.

**C. Deliverables**

1. The following course materials shall be delivered by the Contractor, according to the following specifications:
  - a. An Instructor's Guide containing all the information and direction necessary for the instructor to make an effective presentation. It shall include adequate guidelines to conduct a comprehensive training program. Individual lessons within the course shall be organized as separable blocks (or modules) which may be taught as a unit. The Instructor's Guide shall contain, as a minimum:
    1. Discussion of student prerequisites (if any).
    2. Program overview.
    3. A statement of overall program goals.
    4. Lesson plans (a session-by-session outline containing the following):
      - a. Student learning objectives, stated in measurable term
      - b. Overview of each lesson.
  - b. A Student Manual including all materials for the student to interact in the learning situation. It shall contain, as a minimum:
    1. Program overview and introduction.

2. Statement of overall program goals.
  3. Learning objectives, stated in measurable terms that specifically describe desired behaviors or knowledge to be gained.
  4. A fully developed prose treatment (not outline format) of content presentation, developed in the same modular format as the Instructor's Guide.
  5. Illustrations, charts, photos or other graphics of actual system components as needed to enhance content presentation.
  6. The training manuals shall be prepared and submitted for approval to WMATA/ELES prior to training. The training manuals shall include procedures for adjustment and replacement of all electrical and mechanical components, and a troubleshooting guide.
- c. Audio-visual Aids consisting of a narrated video of not less than 90 minutes duration to include, but not limited to, the following:
1. General overview of major features.
  2. Daily operations.
  3. Maintenance procedures (lubrication, adjustments, critical measurements, etc.).
  4. Frequency of maintenance procedures.
  5. Parts replacement safety devices, lighting, etc.
  6. Verification of safety circuits, methods of accessing and preserving computerized functional data if required.
  7. Step by step adjustment procedures and installation of components.
  8. Handouts, transparencies and/or slides as necessary to ensure clear and comprehensive presentations.
  9. The training video shall be taken from actual equipment installed under this contract.
- D. Supplemental Materials consisting of a functional mock-up or a functional representation is required of any equipment that requires theoretical discussion. This may be in the form of an animated schematic, a model of the equipment, an actual device, an interactive video training device, or an approved substitute. All mock-ups shall become the property of the Authority for eventual turn over to WMATA/ELES.
- E. The final copies shall be delivered to the Authority as follows:

1. One complete set of training materials that is completely camera-ready. Camera-ready copy is defined as typewritten or typeset originals or high-quality copies such that further copies can be made from them with no noticeable decrease in copy quality.
  2. Five copies of all student and instructor materials, to be used for archival purposes, in the WMATA ELES Technical Library.
  3. A set of complete student materials including training manuals for each participant enrolled in training classes. The O&M manual, training manuals and special tools shall be approved by WMATA prior to the training.
  4. The contractor shall video record all training sessions and provide WMATA/ELES with edited DVD copy of the recording to be used as training guide for other WMATA ELES employees.
- F. The following specifications shall be meet in instructional delivery:
1. Instructor Qualifications. A description of instructor qualifications, a resume, curriculum vitae, or other description of instruction qualifications must be submitted at least 60 days prior to the presentation of training. The description shall document a thorough knowledge of the equipment being taught, an understanding of the adult learning process, and demonstrated experience in vocational instructional. The ELES Engineering Office will review and approve the Instructor candidacy.
  2. Course length. The length of the course shall be 5 working days with 3 days in the classroom and 2 days hands-on training.
  3. Student qualifications. For the purposes of course development and presentation, vendors shall assume all students are high school graduates (or equivalent), and that maintenance personnel will possess the ability to use basic hand tools and electronic test equipment.
  4. Testing. Instructors must give written and/or practical tests as a measuring device to determine knowledge transference. Tests shall use a multiple-choice or short answer format, and have been validated in a pilot course or by some other means agreed to by the Authority and Contractor. Whenever possible, a practical hands-on test shall be developed to demonstrate the transference of operational/mechanical skills.

**1.08 SPARE PARTS AND SERVICE FACILITY**

- A. At the expiration of the warranty requirements of the General Provisions, the Contractor is responsible to provide a source for spare parts and service facility in the United States which can be obtained for an additional five years. If product source is another vendor, Contractor shall include name and address of other vendor.
- B. The Contractor shall propose and provide a spare parts inventory to be approved by the Engineer and provided to the Authority not less than 90 days prior to scheduled completion, equal in value to seven percent of the cost of each elevator.
- C. This provision requires the furnishing of a Recommended Spare Parts and Special Tools List based on manufacturer's recommendations, defines criteria to be used by the Contractor in developing spare parts recommendations; defines the manner of identifying spare parts on the list and the labeling and identification of spare parts upon delivery; and the timing of delivery of spare parts.

Elevator parts list, grouped by system and subsystem for stocking identification and the list shall contain the following information for each item listed:

- a. Component name and Part number(s)
  - b. Manufacturer's name
  - c. Model number(s)
  - d. A blank column for WMATA's part number
  - e. Manufacturer's recommended quantity
  - f. Anticipated annual usage
  - g. Unit price
  - h. Special storage and handling requirements
- D. The manufacturer's recommended quantities shall be based upon the following reliability, usage and lead time considerations:
    - a. Wear: Components which may be expected to require replacement under normal maintenance schedule and operations, such as mechanical parts subject to continuous operation within projected mean time between failure levels.
    - b. Consumables or Expendables: Components which are consumed, used up, destroyed, or upon failure, are otherwise made usable for their intended purpose and are economically unrecoverable except for inherent scrap value.
    - c. Recoverable or Repairable: Components which, upon failure, are capable of being repaired or remanufactured to a serviceable, operational condition and maintained available for use within their initial intended purpose.

- d. Long Lead: Components that are not available from commercial distributors or within 48 hours from the manufacturers such as specifically made or selected components.
- E. Cross referencing: Where replacement components are common to more than one system or subsystem, include a cross reference and indexing system in the replacement components list:
- F. Non-Unique parts: In all components lists, items that are not unique to the system and have been manufactured by others shall be identified by the manufacturer's name and part number.
- G. WMATA will provide the Elevator Contractor with shipping instructions, with WMATA part numbers for each item the Elevator Contractor is required to furnish.
- H. The parts shall be shipped to the locations as directed by the Authority. Shipping documents shall identify the Contract number, manufacturer's part number, quantity, unit price and WMATA part number.
- I. Spare parts shall be properly packaged or crated so as to prevent damage during shipment and long-term storage. An individual packing slip shall be included inside the package or crate.
- J. Spare parts shall be the same in all respects as their counterparts furnished as a part of the assembled equipment to be delivered.
- K. Parts furnished in accordance with this provision are WMATA spares, separate and distinct from any Contractor obligation to replace parts, components or assemblies under any warranty provision.
- L. Parts lists contained in Operations and Maintenance Manuals provided under the Contract shall include assigned WMATA part numbers.
- M. A Manufacturer's Recommended Spare Parts List shall be provided. Parts to be provided shall be based on the criteria described herein and require the Authority approval and shall be provided prior to Final Acceptance.
- N. Any Special Tool(s) used including, but not limited to, troubleshooting, maintaining the elevator, software and/or hardware shall be provided as part of the spare parts to ELES Engineering Office. Any tools provided shall be the same as those issued to the Adjuster and equivalent members of the subcontractor's staff.

**1.09 STORAGE CABINET**

The contractor shall install a lockable metal cabinet of suitable size with a key specifies by the WMATA Engineering and Maintenance Dept. in each elevator machine room for the storage of special tools and necessary spare parts, The cabinet shall be mounted on legs or a pedestal, a minimum of 4 inches off the floor. A Mobile Tool Storage Cabinet with wheels is not allowed.

**1.10 SPECIAL TOOLS**

- A. A complete set of special tools and instruments necessary for troubleshooting, inspection, maintenance, repair and making all adjustments on every part of the elevator installation, including software and hardware shall be furnished for each elevator machine room and delivered to the Engineer as part of the spare parts inventory. Tools that are designed specifically for tasks associated with elevator inspection, maintenance and repair or that are required for these tasks, and are not readily available through normal purchasing channels are defined as special tools.
- B. Any "Special Tool/ equipment" that is required to troubleshoot, maintain, adjust, and test the system; the tool/equipment shall remain operational for the life of the equipment.
  - a. Provide all special tools and equipment necessary for making all system adjustments to the signal and speed controller and door equipment. A programming unit, approved by the Original Equipment Manufacturer (OEM) such as a laptop with 4GB memory, 15-inch display and DVD drive, with all software packages required to setup and program all equipment in the elevator system shall be provided, one per station or location. Software shall be provided for the display unit, DeviceNet, hoist motor drive, if applicable, and any other programmable devices, as well as for the controller PLC. Any hardware or software required for configuring, programming and or communicating to controller or any parts of the elevator shall be submitted to ELES engineering. Using the provided laptop, the contractor shall demonstrate loading, downloading (programming) any and all software that is required for the elevator for all operating needs. This includes display, PLC and any I/O controls. No special tools with decaying circuits or clocks are permitted.
- C. Keys: Provide ten (10) sets of keys to operate all keyed switches and locks prior to completion of the first unit.

**1.11 AUTHORITY COORDINATION:**

The elevators shall not be in service for passenger/public use until all of the following requirements have been met.

- 1. The Operations and Maintenance Manuals have been approved and received by WMATA.
- 2. The Training and Student Manuals as well as a complete training video have been approved and received by WMATA
- 3. The required training has been completed in accordance with this specification.

4. All field tests have been successfully completed.
5. The acceptance testing has been successfully completed.
6. All spare parts have been delivered and received by WMATA.
7. All Special Tools/Equipment and Software have been delivered and received by WMATA.
8. All discrepancies identified by the WMATA's CEI (Certified Elevator Inspector) representative shall be completed.

**PART 2 - PRODUCTS**

**2.01 DESIGN REQUIREMENTS**

A. General:

1. Elevators furnished under the Contract shall be Passenger Traction elevators type. All parts shall be built to standard dimensions, tolerances, and clearances so that similar machines and devices supplied under contract are completely interchangeable. The mechanical fastening used throughout the equipment on parts subject to wear and requiring replacement shall be key and seat, nut, screw, or other removable and replaceable type not requiring physical deformation or field positioning. The use of rivets or similar devices will not be acceptable as mechanical fastenings for such parts.
2. Hours of Operation: Elevator shall be designed for continuous operation seven days per week, 24 hours per day.
3. Elevators shall be designed, installed, and tested to operate with full-specified performance while exposed to the climatic and environmental conditions specified. In addition, during installation and until the beginning of scheduled maintenance service, the elevators will be subject to more extreme environmental conditions. The Contractor shall furnish protection necessary to prevent damage to or deterioration of the elevators during this period.
  - a. Elevators shall be designed to operate in dry bulb temperature range of -10<sup>0</sup>F to 140<sup>0</sup>F and operate while exposed to the natural elements of weather, including sunlight, rain, snow, slush, salt; all condition of relative humidity, de-icing chemicals, debris, airborne dust, and corrosive elements.
  - b. The elevators shall have a special winter operation. The elevators shall be designed to operate in the event the outside temperature falls below a pre-established minimum value. The elevator contractor shall furnish and install the necessary timers and thermostat to accommodate the desired function

4. Make provision for and provide a closed circuit television camera (CCTV), in the elevator car(s) with the ability to monitor the CCTV from the Kiosk annunciator panel. Submit drawings for approval before fabrication.
  - a. Provide electrical connections, through shielded traveling cables, between camera and the communications terminal block in machine room or pit.
5. Painting: The pit, pit walls and machine room floor shall be painted. All machine room equipment shall be given two coats of approved machinery paint. All new iron work shall be given one coat of rust- inhibiting paint.

**B. Fasteners**

1. Fasteners shall be compatible with materials being fastened.
2. Fasteners shall be furnished with self-locking nuts or retaining rings (spring washers, toothed disks).
3. Fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened.
4. Fasteners securing removable sheet metal materials shall be operable with the aid of simple tools and concealed wherever possible. When the framework to which the metal is fastened is less than ¼ inch thick, steel backup plates ¼ inch thick shall be added with tapped holes and clearance holes where necessary.

**C. Capacity, Speed, Travel, Platform Size**

1. All parts of the elevator equipment shall be of such design, size, and material as to satisfactorily function under all conditions of loading and operation within its rated load and speed, all with a proper factor of safety, maximum mechanical and electrical efficiency, and minimum wear on parts. Traction elevators shall have sufficient capacity to lift the rated load at 300 feet per minute, minimum and 400 feet per minute, maximum.
2. Elevator shall be of size, arrangement, capacity and shall comply with design criteria and as shown on the Contract Drawings, and in accordance with the requirements of the ANSI/ASME A17.1
3. The top enclosure shall be reinforced to support two men and be capable of sustaining, without damage or permanent deformation, a load of three hundred pounds on any area two feet square and 100 pounds applied at any point. An emergency exit shall be installed in the car top in conformance with the Code.
4. Travel, location terminal floors, number of stops and openings, and overall car platform size shall be as shown on the Contract Drawings.

**D. General Environmental Operation Conditions:**

- a. Operation Under Fire or Other Emergency Conditions: Elevator shall be equipped to function in accordance with the requirements of ANSI/ASME A 17.1 and applicable local codes.
  - b. Sound Level: No elevator car or elevator power unit shall generate noise in excess of NC45 sound level. Measurement of noise shall be made at a point 36 inches from the hoistway, machine room entrances, and ventilation openings.
- E. Hoistway Movement:
- 1. Elevators shall be designed to sustain the load and operate with the following lateral movements of the hoistway structures:
    - a. In any individual glazed area. ¼ inch.
    - b. In total height of hoistway structure for aerial and surface structures: 5/8 inch.
- F. Reliability:
- 1. Each elevator shall be capable of operating at full load under any of the normal modes of operation at a level of availability of not less than 98 percent over a period of 365 days.
  - 2. Availability (A) is defined as the percent of normal operational time during which the equipment is available for use. Or

$$A = \frac{MTBF}{MTBF + MTTR}$$

Where:

- MTBF* = Mean time between failure in days
- = Operating time, *t* (in days) /Number of failures in time *t*
- MTTR* = The average time in days required to restore an elevator to operation after a report of a failure.

- G. Workmanship:
- 1. Joints shall be welded their full length and dressed smooth and flush on exposed surfaces. Spot welding shall be used where practicable in preference to screw or rivet fasteners.

2. Sheet metal materials shall be accurately rolled and leveled, and have smooth finish and uniform color. Joints shall be formed to a tight fit, with abutting edges flush, and shall be securely welded or riveted together in such a manner as to give strength equivalent to the solid sheet. Riveted construction shall have heavy reinforcement on the back, and no rivets shall show on exposed surfaces, Welds shall be solid and dressed flush, and holes for screws or bolts shall be drilled and countersunk.
  3. Wrought work shall have joints milled to a tight even fit and, where possible, shall be made without screws. Square turns and comers shall be sharp, Curves and loops shall be true and without visible joints. Abutting members shall be welded, riveted or both. Similar bars shall be halved at intersections and wide bars shall be punched for the small bars to pass through.
  4. The finished work shall be strong, rigid and neat in appearance. Plane surfaces shall be smooth and free from warp or buckle. Molded members shall be clean cut, straight, and true. Miters shall be well formed and in true alignment. Fastenings shall be concealed from face side of the material.
- H. Corrosion Protection: The contractor shall design the elevator assembly in such a manner to avoid corrosion and galvanic action due to physical contact between dissimilar metals or due to other causes.

**2.02 MANUFACTURERS**

- A. The major elevator components shall be the products of one of the three manufacturers of established reputation, except they may be the products, either wholly or in part, of another manufacturer of established reputation provided such items are capably engineered and produced under coordinated specifications to ensure a high grade, safe reliable, and smooth operating system.
- B. Major components to be furnished for this project shall be of a make or makes that have performed satisfactorily together for transit system applications for not less than five years and at least ten other elevator installations of equal or greater capacity and speed.

**2.03 PRODUCTS AND MATERIALS**

- A. Elevator Car Characteristics:
  1. Rated load. Minimum rated load for the car will be as determined by the inside net platform area per ANSI/ASME A17.1.
  2. Rated speed: as per Contract Drawings
  3. Inside dimensions: As shown.
  4. Landings served: As shown.

5. Number of openings: As shown.
  6. Travel: As shown.
  7. Operation: Selective/Collective. Drive Type: AC – VVVF
  8. Car and landing operating buttons: Illuminated type, vandal resistant, in accordance with ADA requirements.
  9. Car door and hoistway entrances: High-Speed, Heavy-Duty Master Door Operator GAL – MOVFR. Door Type: per Contract Drawings. Door Size: per Contract Drawings
- B. Operation:
1. Operation shall be automatic. Automatic operation by means of car and landing buttons. Stops registered by momentary actuation of car buttons to be made irrespective of number of buttons actuated or of sequence in which buttons are actuated.
  2. Operating station in car containing bank of buttons numbered to correspond to landing served position indicators. EMERGENCY CALL button, keyed EMERGENCY STOP button, DOOR OPEN/DOOR CLOSE buttons, independent maintenance key switch, and key-operated light and fan switches, with legends as specified. Identification as specified for emergency telephone. Emergency call button connected to bell that serves as emergency signal. Panel finish: Stainless Steel.
  3. Landing: Single push-button fixture at each terminal landing. Button fixture having push buttons with UP and DOWN legends at intermediate landing. Button identification as specified for Person with disabilities per latest ADA regulation (ADA rule 4.10.3).
  4. Momentary pressure on car button or landing button illuminates that button, which remains illuminated until call is answered. Illuminated buttons serve as visual indication that call has been registered and that car will stop at that landing. The Push Buttons shall be flush, round, have a Metalized Halo and center jewel. The metalized halo shall be from different color and approved by ELES Engineer.
  5. Stops, registered by momentary actuation of landing buttons. All stops subject to respective car or landing button being actuated sufficiently in advance of arrival of car at that landing to enable stop to be made. Direction of travel for idle car established by first car or landing button actuated.
  6. UP landing calls answered while car is traveling in up direction and DOWN landing calls answered while car is traveling down, car reversing after uppermost or lowermost car or landing call has been answered and proceed to answer car calls and landing calls registered in opposite direction of travel.

7. Elevators to park at the secure landing level selected by the Engineer.
8. Push-button units to be Dupar US85 or approved equal with button identification as specified by latest ADA regulation.
9. Emergency-stop button shall be key operated rather than push-pull arrangement with key removal only in off position.
10. All elevator car control panel operating devices shall be designated by Braille and by raised standard alphabet characters for letters, Arabic characters for numerals, and standard symbols as required by the Code and ADAAG.
11. Lettering shall have a highly visible coloring, such as white, that is permanently affixed.
12. Independent Service: Provide a key switch in the car operating panel which, when actuated, shall cancel previously registered car calls, disconnect the elevator from the hall buttons and allow operation from the car buttons only. Car door shall remain open unless closed fully by the door close button.
13. Two-Stop Collective Simplex Automatic Operation:  
The two-stop collective simplex automatic operation shall be used and checked for the following:
  - a. System shall be designed so that when the car is standing at either terminal landing, pressure on car button for the other terminal shall automatically dispatch car to that landing. Pressure of landing button at either terminal landing shall call car automatically to that landing. If a landing call is registered while the car is making its trip, that call shall remain registered until the car responds to that call. If no car calls are registered car shall start automatically and respond to hall calls. Provide time limit relay arranged to hold car at landing at which it has stopped for predetermined time after car stops. After all car landing calls have been answered, car shall remain parked at landing where last used with car and hoistway doors closed until another call is registered. Pressing the landing button at floor at which car is parked shall automatically open car and hoistway doors. In all normal operations, the starting of the car shall be contingent upon establishment of hoistway door interlock and car door circuits.
  - b. Automatic dispatching operation: all two stop elevators shall include "Step-in-and-Go" feature. Calls for the opposite landing will be automatically set when the elevator opens its doors for a hall call. This feature shall be provided for all elevators that have public access for two stops (i.e., any elevators with key operated service landings

will be included).

**C Position Indicators:**

1. Car indicator: In accordance with ADA requirements. Mounted in vertical row in car-operating panel to show position of car in hoistway by illumination of indicators corresponding to landing at which the car is stopped or passing. Finish for exposed-to-view metal components: Stainless Steel.
2. Landing indicator: In accordance with ADA requirements. Two-element direction-of-travel indicator mounted above call station or hoistway entrance as shown, including one red and one white indicator. Direction of car's operation shown by illumination of red indicator for DOWN and white indicator for UP.
3. In-car signals: Audible signal indicating car's direction of travel, signal sounding once for UP direction and twice for DOWN direction.
4. Landing signals: Audible signal at each hoistway entrance indicating car's direction of travel, signal sounding once for UP direction and twice for DOWN direction.

**D. Lighting:**

1. Machine Room Emergency Lighting: Emergency lighting shall be provided in each elevator machine room.
  - a) There shall be a minimum of one lighting fixture.
2. Car interior: LED fixture, 120-volt operation, with clear prismatic glass diffuser, flush mounted in ceiling, cool white bulbs. Illumination level shall be 15-foot candles minimum at car operating panel.
3. Car top and underside of car floor: Medium-base porcelain lamp receptacles, with wire lamp guards.
4. Car Emergency Lighting:
  - a. Fixture: Recess mounted, with stainless steel frame, location as shown.
  - b. Diffuser: Prismatic polycarbonate plastic.
  - c. Lamps: Two, size 16-51
  - d. Remote power supply:
    - 1) Power pack: Sealed gel cell battery with integral regulating charger and an alarm bell.

- 2) Capable of operating bell for one-hour minimum and light at car-operating panel at 0.2 low candles minimum for four hours minimum.
- 3) Location: in top of car or COP with easy access provided.
- E. Inspection Operation: Key switch in car to nullify car and landing buttons permitting operation of elevator from top of car for inspection purposes:
  - 1. Top of Car Inspection Station: The Inspection Station contains continuous pressure UP and DOWN buttons, emergency stop button and toggle switch to activate inspection devices. The device shall also have an 110v ac outlet for extension cord and provided with a light and guard.
- F. Leveling: Automatic leveling device to stop car within 1/8 inch of landing level regardless of load or direction of travel. Landing level maintained within leveling zone irrespective of hoistway doors being open or closed.
- G. Emergency Service:
  - 1. Controls to return elevator to designated floor by means of key-operated switch outside street or ground floor hoistway entrance in compliance with ANSI/ASME A17.1.
  - 2. In-car control during emergency operation by means of key switch in compliance with ANSI/ASME A17.1.
  - 3. Terminals on elevators controllers for connection of circuit from heat and smoke sensing devices, with wiring from sensing devices to elevator controller.
- H. Telephone Facilities:
  - 1. Provide all audio/visual communication, signaling, and monitoring in accordance with ADA and ANSI. "Hands-free" phone integral with control panel, mounted in accordance with ADA requirements; having inscription EMERGENCY TELEPHONE as specified for Person with disabilities; finish exposed-to-view components to match stainless steel control panel; color of letters to contrast with panel.
    - a. Provide emergency communicators in accordance with ADA requirements to include auxiliary push button to summon help and visual feedback indicating that the call has been responded to.
  - 2. Provide wiring and jacks for a portable self-contained battery-powered maintenance telephone system. Jacks shall be located on car top, inside car, and in machine room. Furnish three telephone instruments for use of maintenance personnel.
- I. Elevator Components:

Provide and install, Passenger Traction elevators with machine unit, roping, governors, safeties, rope gripper, counterweight, and related equipment. Provide for locating and installing the machine units and associated control equipment in the controller rooms. Provide and install any and all necessary auxiliary beams, structural members or other such devices needed to assure proper and safe operation of all elevator equipment. Vibration isolating machine foundation shall be of approved type which shall effectively prevent transmission of machine vibration to the building structure.

1. Guide Rails:
  - a. Guides shall be steel T-section rails. Rail surfaces shall be machined smooth to insure proper operation of guides. Rail ends shall be accurately machined with tongue and matching groove centrally located on web. Non wearing rail surfaces are to be painted at the completion of the elevator in color selected by the Engineer.
  - b. Guides shall be joined and installed in accordance with Section 2.23 of the Code.
  - c. Rail bracket spacing and maximum horizontal forces and guide rails in accordance with ASME A17.1.
2. Roller Guides: Roller guides shall be mounted on top and bottom of the car and counterweight frames to engage the guide rails and provide a smooth ride.
3. Machine: Provide AC geared machine. The hoisting motor shall drive a grooved sheave through a worm and gear. The hoisting machine shall be of the worm-gear traction-type with induction motor, brake, worm gearing, and sheave mounted on a common bedplate. Induction motor is specified under Electrical Work Machine.
  - a. The motors shall be of the alternating current reversible asynchronous or synchronous type of a design adapted to the severe requirements of elevator service. Motor shall be capable of developing the torque required to meet or exceed an acceleration rate of 2 ft/sec<sup>2</sup> for the elevator car.
  - b. A means to protect the windings and bearings from airborne dust shall be provided.
  - c. Insulation of all windings shall be impregnated and baked to prevent absorption of moisture and oil. The insulation resistance between motor frame and windings shall not be less than one megohm. The motor windings shall stand a dielectric test of twice the normal voltage plus 1000 RMS volts of 60 Hertz, alternating current for one minute.
  - d. Motor leads in the conduit box shall have the same insulation class as the windings. Motor lead wire shall be rated 125 C and shall be sized

- for 105 C at the motor nameplate amperes at 1.0 Power Factor per Electrical Apparatus Service Association (EASA) recommendations. Leads are to be numbered for clockwise rotation when facing opposite the shaft end.
- e. The motor shall be designed to stand the severe loads encountered in elevator service and the windings shall have a minimum insulation temperature rating two ratings higher than the actual temperature rise of the motor, with a minimum rating of NEMA class F.
  - f. The motor shall be designed to the ASME A17.1 rated load requirements.
4. Brake: Disc type brake shall be securely mounted to the shaft and shall run concentric to the shaft. Disc shall be machined to obtain a smooth and accurate face. The brake shall be spring actuated, direct current, electrically released, heavy construction with proper braking area for the load and speed specified. The brake shall be provided with sufficient power to stop and hold the car with 25% overload. Disc brakes shall be of caliper or multiple disc design. Provide operation to prevent the elevator from striking the hoistway overhead or unintended car movement per the requirements of code.
  5. Gear Housing: The gear housing shall be divided horizontally at the centerline of the shaft to provide access to the worm gear. Suitable drain plugs and overflow pipes shall be provided.
  6. Bed plate shall be of structural steel, either separate or integral with the machine frame. Bed plate shall be heavily ribbed or reinforced to provide the rigidity required to maintain accurate alignment of parts. Accurately machined surfaces shall be provided to seat all parts secured to the bed plate or machine frame. Use of brackets or other extensions bolted to the bed plate as supports for principal parts will not be permitted. All parts shall be bolted in place with finished bolts or cap screws. All protruding edges of machine beams shall be rounded off to a 1/2" radius.
  7. Bearings: Bearing shall be rigidly fastened to, or be integral with the main structure of bed plate or machine frame. Bearing mounting and method of machining and assembly must be such as to insure accurate bearing alignment. Bearings shall be of the anti-friction ball or roller bearing type. Bearings and lubricant reservoirs shall be virtually dust-tight, and shall incorporate effective lubricant seals or other means to prevent lubricant leakage. Outer ends of bearings shall be closed with a removable oil-tight plate or cap. Roller and ball bearings shall be either immersed in oil, or subject to oil flood lubrication, or shall be arranged for grease lubrication and be fitted with grease gun connection and drain plugs. Machine shall have highest grade, double-acting thrust bearing of the ball or roller type. Bearing shall have two sets of balls or rollers arranged to eliminate backlash. Thrust bearing shall be removable without dismantling machine.

8. Worm: Worm shall be accurately cut from a solid steel forging or heat treated steel bar stock integral with worm shaft. Worm gear shall have an accurately machined bronze rim of such composition that the gear will not show appreciable wear after five years' service. Worm gear shall be of such diameter relative to that of sheave so that the maximum pressure between worm gear and worm will not exceed a safe value. Worm gear shall operate without appreciable noise, and shall cause no appreciable vibration in the car. Worm gear rim shall be shrunk or pressed on a cast iron or cast steel center or spider, and shall be bolted thereto by means of tightly fitted turn bolts in reamed holes, with bolt nuts positively secured in an approved manner. Boltholes through outer peripheral joints of center and the rim will not be permitted. Worm gear center may either be integral with the traction sheave center, or may be pressed on and keyed to sheave shaft. Integral traction sheave and worm gear centers shall either be pressed on the sheave shaft, or be fitted to bearings on sheave shaft. Use of worm gear and shave centers on the sheave shafts will not be permitted.
9. Dynamic Balance: The worm and its shaft, and the sheave, gear and gear spider shall be dynamically balanced as required to eliminate any source of noise or harshness.
10. Elevator Drive System: Variable Voltage Variable Frequency (VVVF) Drive: The drive shall be microprocessor and IGBT based using vector control algorithms. The algorithms shall incorporate a motor model to determine the electromagnetic state of the motor. The motor model shall also encompass a temperature compensation algorithm which is essential for speed accuracy.
  - a. Velocity shall be controlled by a feedback loop to within +/- 2% of contract speed and speed shall be independently supervised.
  - b. Position of floors in the building shall be learned during a slow speed setup run. Once learned, floor locations shall be stored in non-volatile memory. Power loss shall not require the floors to be re-learned. Stopping accuracy shall be +/- 5 mm or less. Re-leveling shall be automatic.
  - c. Resistors shall be provided to absorb the power regenerated by the motor. They shall dissipate power only when the motor is regenerating. Control shall be by IGBT.
  - d. Maximum total harmonic distortion shall not exceed IEEE Std. 519 to be measured at the elevator disconnect.
  - e. For hoist motors 50Hp and above, the drive shall be regenerative feeding the three-phase power supply of the controller.

11. Hoistway Operating Devices: Normal terminal stopping devices. Emergency terminal stopping device as required, controller switches and circuitry arranged in accordance with ANSI/ASME requirements. All switches to be compatible with control system.
12. Stop Switch: Emergency stop switch mounted in the pit of each elevator in accordance with Section 2.2.6 of the Code, shall prevent operation of elevator when switch is activated.
13. Car Safety. The car safety shall be Type B. as specified in the ANSI/ASME Code, mounted under the car platform and securely bolted to the car sling. It shall be sized for the capacity and speed noted on the Contract Drawings. The car safety shall be actuated by the speed governor upon a predetermined overspeed downward. When tripped, the safety mechanism shall engage the rails with sufficient force to stop a fully loaded car with an average rate of retardation within the limits given by the ASME A17.1 Code for the capacity. The safety shall stop the elevator whenever excessive descending speed is experienced and means shall be provided to cut off power from the motor and apply brake prior to application of the safety. The safety shall be modified and adjusted as necessary so that its operation complies with Code requirements and requirement of all authorities having jurisdiction.
14. Governor: Friction type over-speed governor rated for the duty of the elevator specified and to operate the car safety. The governors shall be located where the car or the counterweight cannot strike it in case of over travel, and where there is adequate space for full movement of governor parts and driven by a governor rope suitably connected to the governor rope-releasing carrier.
  - a. An electrical governor over speed protective switch that, when operated, shall remove power from the driving machine motor and brake before or at the time of application of the safety.
  - b. The governor shall be sealed and tagged with the running speed, tripping speed, and date last tested as required by Code.
15. Rope Gripper: Rope Gripper shall stop the elevator in the event of a mechanical or electrical failure and during overspeed in the up direction or if the elevator leaves the floor with the doors opened. The rope gripper shall be provided with grip pad made of soft and metal particles to provide powerful grip but gentle on the rope. The action of the Rope Gripper shall not cause any undue wear of the hoist ropes. The moving jaw plate of the rope gripper shall spring loaded. The hydraulic piston shall hold the Rope Gripper in unclamped position during normal operation.
16. Terminal Limits: The limit switches shall slowdown and stop the car at the terminals if the primary automatic stopping system fails.
17. Tension Sheave: A tension sheave shall be provided in accordance with governor and car safety loading requirements.

18. Life Safety Provisions: Provide Life safety hooks and/or other life safety devices for fall protection in accordance with OSHA standards/guidelines. Life safety hooks and/or other life safety devices locations to be coordinated and installed by the Installer.
19. Counterweight: A counterweight shall be provided for the elevator equal to the weight of the complete car and 40 percent of the rated car. Tie rods shall pass through holes in each subweight and through holes in frame members above and below subweights in such a manner as to securely hold subweights in place. The bottom of the counterweight shall have a buffer striking plate and means to attach knock-off blocks during rope stretch. Roller guides shall be mounted on top and bottom of the counterweight frames to engage the guide rails. Each counterweight shall be painted. Submit paint finish of counterweights for approval.
  - a. Idler Sheave: To be located directly above the counterweight frame and integral with counterweight frame. The sheave material shall be accurately machined as per manufacturers requirements.
  - b. Counterweight guides shall be of the roller type; each guide shall consist of a set of at least three (3) large diameter polyurethane rollers equipped with sealed preloaded ball bearings. Each roller shall automatically adjust itself to guide rail misalignment and prevent excessive lateral car movement.
20. Compensation for the weight of hoisting ropes and unbalanced portion of traveling cables shall be provided where required to produce proper operation of elevator for car travel of 50 to 100 feet. All elevators requiring compensation shall have rope compensation.
  - a. Rope compensation shall consist of an appropriate number and size of iron steel wire ropes attached to the underside of car frame and counterweight frame and passing under a weighted idler sheave in pit. A metal data tag giving the number, diameter, type, month and year installed, and names of manufacturer and installer of compensating ropes shall be securely attached to one of the compensating rope fastenings.
  - b. The weighted idler shall be provided to equalize tension in the compensating rope. The idler sheave shall be provided with bearing of anti-friction bearing metal, ball or roller-type similar to those specified for hoisting machine. Suitable metal guards shall be provided for, or be incorporated in, the design of the equipment, to prevent rope jumping off sheave.

21. Buffers: Provide and install car and counterweight buffers of the oil type as indicated by Code with blocking and support, mounted on the supporting channel or block on the pit floor. Buffers shall comply with all applicable codes. Buffer anchorage at pit floor to be designed and installed without damage to pit floor.
  22. Car Frame: A suitable car frame shall be provided with adequate bracing to support the platform and car enclosure. Provide welded or bolted or type 316 stainless steel channel uprights affixed to crosshead and plank channels with welded or bolted bracing members and gusset plates which will remove strain from car enclosure.
  23. Platform: Havy Loading Type. The car platform shall be designed to accommodate one-piece loads weighing up to 25% of the APTA rated load, such as wheeled food carts, hand trucks, etc. The platform shall be type 316 stainless steel.
  24. Provide and install all necessary accessory beams, auxiliary beams or other devices needed for safe and normal operation and installation of all elevator equipment and devices. It is the elevators installer's responsibility to ensure provided elevator equipment will function as designed in the available space and with the steel beams, steel members or other such equipment in the machine rooms and hoistways in place at the time of installation.
- J. Controller-System:
1. An Allen Bradley PLC-based controller shall be provided, governing starting and stopping as well as preventing damage to the motor from overload or excessive current. It shall automatically cut off the motor current and bring the car to rest in the event any of the safety devices are activated.
    - a. System shall coordinate the functioning of elevator drive unit relative to actual location and status of elevator. It shall interface with door control and all required safety circuits, switches and devices. The controller shall be mounted in a NEMA 4X stainless steel air-conditioned cabinet within the controller room.
    - b. The diagnostic system shall be an integral part of the controller and provide user-friendly interaction between the service person and the controller system.
    - c. The supervisory logic shall be performed by a main controller or coordinated between the elevator controllers which will interface directly into the Allen Bradley DH485 protocol Remote Monitoring network, transmitting data from the elevator controller through a data concentrator to the Authority's AEMS RTU computer control and data system. The supervisory logic will coordinate dispatching assignments, interfacing operational demand data

- accumulated from car and corridor operating fixtures, selector and door control functions.
- d. Controller shall be capable of operating with an operating temperature range of 320F to 140F with non-drip environment and no more than 90 percent relative humidity. However the air conditioner on controller cabinet shall maintain the operating temperature in range of 50<sup>0</sup> F to 90<sup>0</sup> F.
2. An Allen Bradley CompactLogix 1769-L32E (or ELES Engineering approved equal) based PLC control system shall be provided.
- 1) The exclusive Allen Bradley DH485 protocol data port will transmit data from the elevator controller to the station or facility data concentrator. The contractor shall provide a controller data interface to a DH 485 network. Contractor shall provide Data cables to connect from the PLC controller to data concentrator in the station and available for connection to the controller DH485 interface. The contractor shall pull Belden 9842, or ELES Engineering approved equal, cables to connect the controller into the monitoring DH485 network. The DH 485 controller interface shall be programmable for data rates up to 115 Kbps. The interface shall allow other nodes such as other elevators and escalators to be readily incorporated into the DH 485 network.
  - 2) A data concentrator PLC shall be installed using an Allen Bradley MicroLogix 1400 or SLC5/05 PLC per station to function as data concentrated or to consolidate data from all controllers in the station. The software for the data concentrator shall receive controller data over the local monitoring DH 485 network and provide formatted data to the AEMS RTU through an RS232 link. The data concentrator shall provide an Ethernet port for interfacing with the WMATA wide area network. A data concentrator connection to the WMATA wide area network shall be provided.
4. The PLC shall accommodate the following Signal List, as Applicable, and provide data to the data concentrator as specified in specification.

5. The PLC CPU module shall store the last 99 faults, accessible via laptop connection, controller fault/status display and remote communications. The contractor shall provide WMATA with a programming and monitoring unit, such as a laptop computer with the newest version of Allen Bradley RS-Logix and any other software required to setup and program all electronic items in the control system, for each elevator that this system is installed, for the purpose of troubleshooting and remote monitoring modifications. The laptop should allow uploading, editing, and downloading any software that is being used on this elevator for any operation.
6. An Allen Bradley PanelView Plus 6, EZAutomation or ELES Engineering approved equal, fault/status display/interface shall be provided in the controller cabinet. Control system timers and other setup criteria shall be programmable through this unit. All fault, status and setup data shall be stored in the controller CPU module.
7. In cases where the programming is done by the supplier, the supplier shall provide a copy of all working programs, including labels for all inputs and outputs, data tables and internal logic points, on Flash Drives/CD-R disks as well as a printed program listing. The programs and setup data shall require a password for access and modification. The password shall be provided to ELES Engineering as part of the Submittal.
8. The main control of an elevator shall contain at least the following devices or electronic sensing: phase failure line voltage monitor, motor current and ground fault monitor.
9. The controller cabinet shall contain a permanently mounted fault indicator panel with LED indicator lights. Tripped safety devices, door position, door reversal, car running status, and control system status shall be indicated.
10. All terminals shall have identification markings and all wires, including field wires, shall be provided with permanent heat shrink sleeve cable markers. These wiring identifications shall be provided in the wiring diagram at each end of the circuit connections.
11. The controller shall be equipped with the AC vector drive installed in-line before the hoist motor contactor and the hoist motor.
12. The AC vector drive shall be capable of accelerating and decelerating the hoist motor smoothly and gradually.
13. Adjustable settings for acceleration and deceleration ramps shall be provided.
14. The controller shall have, at least, one dedicated serial port for interface to the DH485 monitoring network and programming access without disconnecting any other ports.
15. The Programmable Controller shall have, at least, one dedicated port to support the controller fault/status display.

16. The controller PLC shall provide the following Remote Monitoring and diagnostic network support:
- a) All applicable faults, statuses and data listed in Table 1 shall be provided
  - b) Fault indications shall remain until reset in the controller.
  - c) Status and analog data shall be provided for the duration of the condition.
  - d) Software in the controller PLC shall format monitoring data responses to data concentrator polling as specified in the specification.
  - e) The monitoring data port in the controller shall be setup for DH485 protocol with the port network identification number programmed for the particular elevator identification. For instance, identification number 11 applies to elevator 1, 12 to elevator 2, etc.
  - f) All faults, statuses and data shall be held by the controller CPU and sent from the CPU when polled by the data concentrator.
17. Provide sufficient non-volatile CPU memory, for non-volatile retention of program memory, system status and operating parameters.
18. Diagnostics
- a) The processor shall have built-in diagnostics and self-test, such that each time power is cycled, the processor does a complete CPU and RAM memory test. Additionally the power-up test will momentarily light up all diagnostic LED's to be sure they are working. A power up test will not reset fire-service status signals if the internal flag (bit) for Fireman's Service Phase I is latched. The processor shall be capable of reporting major and minor fault codes and processor status information back to the data concentrator provided the fault is not a catastrophic hardware failure where the processor is unable to power up.
  - b) The processor shall have a built-in watchdog timer to ensure that all processor program scans occur within the time limit set by the watchdog timer.
  - c) The processor shall have individual LED indicators that are clearly visible and labeled for easy identification. At a minimum the following indicators must be provided:
    - (1) CPU is in RUN mode
    - (2) CPU is FAULTED
    - (3) CPU battery is LOW
    - (4) I/O points are FORCED and are not under program control  
COMMUNICATION channels are active.
19. Input/Output Modules
- a. The Input/Output Modules shall be compatible with the PLC processor I/O structure. Each module shall be provided with a detachable terminal strip to connect wiring to the module. Each wire on the terminals shall be identified by the module terminal.

- b. Discrete Input Modules: Suitable for the input voltage and compatible with the Allen Bradley system.
  - c. Discrete Output Modules: Suitable for the voltage and load and compatible with the Allen Bradley system.
  - d. Analog Input Modules: Converts analog signals to optional twelve-bit binary values. The module shall accept 4 to 20 mA signals. Provide modules compatible with the Allen-Bradley system.
20. I/O Mounting and Power Supply
- a) The controller chassis shall have an additional three spare modules.
  - b) Power supplies shall provide power to the PLC processors, I/O and other function modules. The power supply shall be suitable for operation of 120 VAC, single phase power. Power supply capacity shall be a minimum of 150% of the connected load
21. Air Conditioning:
- Provide an independent air conditioning unit for each controller to maintain specified recommended operating temperatures. Condensate from the air conditioning unit must be piped to a suitable drain.
22. Selective Collective Operating: As defined by ASME A17.1 and shall be the pressure upon one or more car buttons to correspond to landings in the order in which the landings are reached by the car, irrespective of the sequence in which the buttons are pressed, provided the hoistway door interlock and car door switch circuits are completed. During this operation, the car shall also answer calls from the landings, which are in the prevailing direction of travel. Each landing call shall be canceled when answered
- a. Momentary pressure on car button or landing button illuminates that button, which remains illuminated until call is answered. Illuminated buttons serve as visual indication that call has been registered and that car will stop at that landing.
  - b. Operation shall be automatic by means of the car and landing buttons. Stops registered by the momentary actuation of the car or landing buttons shall be made in the order in which the landings are reached in each direction of travel after the buttons have been actuated.
  - c. UP landing calls answered while car is traveling in up direction and DOWN landing calls answered while car is traveling down, car reversing after uppermost or lowermost car or landing call has been answered and proceed to answer car calls and landing calls registered in opposite direction of travel.
  - d. Should both an up and a down call be registered at an intermediate landing, only the call responding to the direction in which the car is traveling shall be canceled upon the stopping of the car at the landing.

23. Supervisory Control: A processor based system to coordinate dispatching assignments, interfacing operational demand data accumulated from car and corridor operating fixtures and other special feature commands issuing from computer processing, selector and door control functions. Incorporate in the system specific operational features as herein described.
- a. Allocate service to demand, make decisions to prevent crowding, save energy, and provide efficient coverage throughout the building. Respond in real time to prevailing traffic conditions as well as historical traffic patterns.
  - b. Constantly compare passenger demand, car load, anticipated demand, car motion status, machine status and other prevailing conditions and evaluate this information in the context of the following dispatching approaches:
    - 1) Give priority to contiguous calls, assigning calls on adjacent floor to the same car if other criteria is satisfied.
    - 2) Give priority to coincident calls, having the same car let a riding passenger off and a waiting passenger on at the same floor.
    - 3) Anticipate demand based on hall calls and car calls already registered and floors with a high possibility of demand.
    - 4) Evaluate relative system response time for each car in the group, weighing all of the above factors.
    - 5) Allocate calls and position cars to minimize waiting time, response time and travel time. The other elevator shall respond for hall calls without any delay after the first elevator left the door zone.
    - 6) When there is a hall call registered and an elevator left the landing, the other elevator shall run toward opposite landing.
  - c. Provide the capability to make both car to call or call to car assignments.
  - d. During light traffic conditions, assign cars without demand to specific parking areas until requested for a hall call. Continuously evaluate dispatching assignment and immediately release a car from its assigned area to meet heavy demand elsewhere in the building.
  - e. In determining relative system response time for a car to answer a hall call, factor in round-trip calculations for each car as well as other system parameters before deciding which car shall respond to a hall call.

24. Other Features:
- a. Independent Operation: Provide TWO-position keyed switch (ChicagoLock 7500) marked Independent Service, OFF and ON in the lower portion of the car operating panel of all cars. The switch shall be spring loaded type. When placed in ON position, car will be removed from the automatic operating system and will not respond to demands registered at the hall push buttons. It will respond only to floor with doors open until another demand is registered in the car. Demands registered at the landing will remain registered until answered by another elevator. The car only responds to car calls and that the doors remain open after a stop until closed by continuous pressure on the door close button.
  - b. The controller shall be designed to operate automatically on standby power.
25. Controller Room Two Way Communication Device: Provide within each controller/machine room a two way communication device that will interface with any type of ADA compliant telephone. The device shall be mounted directly on or within hands distance proximity to the elevator controller.
26. Any junction boxes installed in the machine room or hoistway shall be accessible for Maintenance.
- a. Drilling or opening top end of enclosure is not acceptable
  - b. Wire nuts or splicing without terminal strips is prohibited.
  - c. All openings shall be properly sized for the conduits.
- K. Door Operator Equipment:
1. Provide a water resistant heavy-duty GAL MOVFR or ELES Engineering approved equal door operator with encoderless VVVF drive. Closed loop door operator designed to operate car and hoistway doors simultaneously at the speed specified. Door shall open automatically when car stops at landing to discharge passengers or to answer valid calls and close automatically after predetermined time interval has elapsed. The doors shall be capable of smooth and quiet operation without slam or shock. Door operator to have the following features:
    - a) ½ hp motor and heavy duty sprocket, chain, belt, and sheaves.
    - b) Closed loop regulated speed performance.
    - c) Hand-held keypad programming.
    - d) Adjustments can be stored in the keypad and downloaded to another operator.
    - e) Adjustable door obstruction reversal.
    - f) Optical cams with LED indicators.
    - g) Test switches for open, close, nudging and speed zone set up.
    - h) Universal inputs for open, close, and nudging.

- i) Reversing switch to back up the door reversal device.
  - j) Designed for interior and exterior applications.
2. Provide a non-contact door reversal device with light immunity: The Door Reopening Device shall cause both the car and hoistway doors to reverse, should they detect an obstruction in the elevator entrance. The device electrical wiring shall be supplied with quick disconnects terminals to facilitate replacement. The infrared curtain detector shall include the following:
- a. A protective infrared detector field extending from 1 1/2" above the car sill to a height of 68".
  - b. A fail-safe control system to prevent the doors from closing in case of power loss to the detector.
  - c. A one-piece full door height protective lens cover designed to be completely waterproof and to withstand impact, abrasion and vandalism.
- L. Hoistway Entrances:
- 1. Doors of elevators shall be of the horizontal sliding type, single-speed, center-opening. All elevator door openings shall be a minimum of 42-inches wide per the Americans with Disabilities Act.
  - 2. Entrance frames shall be of welded or bolted construction for complete one-piece unit assembly. All frames shall be securely fastened to fixing angles mounted in the hoistway and shall be type 316 stainless steel. Provide an additional type 316 stainless steel sill angle support. The landing sills shall be extruded stainless steel with a mill finish.
  - 3. All materials and finished surfaces exposed to public view shall be stainless steel with embossed finish and/or glass panels as indicated on Contract drawings. Glass panels (if provided) to be completely flush with door assembly. In a glass hoistway the struts or any brackets should not be visible to public.
  - 4. Fascia and Dust Cover in the hoistway shall be galvanized or type 316 stainless steel and extend at least the full width of door opening on each side. Toe guard shall be fastened to the sill at the lowest landing.
  - 5. Hoistway doors are to be stainless steel and provided with keyways as required for operating mechanisms and door hangers. Provide glass panels that are completely flush with door, as indicated in A17.1. Each door panel shall have stainless steel bottom guides that run in landing sill slots. Guides shall be replaceable without removing door panels. All doors shall have fixed fire gibs.
  - 6. Interlocks and Contacts:

- a. The doors at each hoistway entrance shall be equipped with approved hoistway door interlocks of the hoistway unit system type tested as required by the Code. Interlock shall prevent operation of the car away from a landing until doors are locked in the closed position. Interlock shall prevent doors from opening at any landing from the corridor side unless car is at rest at that landing, or is in the leveling zone and stopping at that landing.
  - b. Provide key-operated hoistway door unlocking devices. A device shall conform to the requirements of the Code and shall permit authorized persons to open the hoistway doors from the landing when car is away from landing. The key for emergency use shall be mounted in a receptacle with a breakable transparent cover clearly marked in letter at least 1/8 inch high ELEVATOR DOOR KEY FOR FIRE DEPARTMENT AND EMERGENCY USE ONLY. The location of the receptacle shall be as directed by the Engineer.
7. Provide raised floor/level designations in characters and Braille on each jamb at 60 inches from floor to centerline. Characters shall be two inches high and in accordance with ADA requirements.
- M. Wiring and Cable: Division 16, except elevator traveling cable.
- 1. Elevator Traveling Cable.
    - a. NEC Type ETT, size and number of conductors to suit service, 16AWG minimum, each conductor with different numbered insulation.
    - b. Cable exceeding 100 feet in length to have steel supporting fillers, cable 100 feet or less with steel or nonmetallic fillers.
    - c. Conductors for electrical, signal, control telephone and sensing devices.
    - d. Ten feet of additional telephone, communications and sensing-device conductors in elevator machine room for connection to future interface panel by others.
    - e. Each traveling cable shall have a minimum of 10 percent spare conductors, but not less than 6 spare conductors in each traveling cable.
    - f. A separate coax cable or a shielded twisted pair should be added to accommodate the security video cameras inside the elevator.
    - g. Provide separate traveling cables for car lighting and fan control circuits and 14 AWG minimum size for elevator lighting circuit.
    - h. All insulated wiring, control wiring and wiring in traveling cables shall be tag coded at their terminals in the motor/controller room, and hoistway junction box, elevator cab junction box, and push-button stations within the cab, and shall agree with the approved wiring diagrams.

- i. Cables shall be free from any possible contact with hoistway structure, car or other equipment. Furnish and install shields or pads to protect the cables.

**N. Conduit Raceways and Boxes: Division 16.**

- 1. Rigid conduit and fittings shall be UL-Listed rigid galvanized steel conforming to the requirements of UL 6 and ANSII C80.1. Minimum diameter shall be 3/4 inch for power circuits, one inch for fire and intrusion circuits, and 3/4 inch for audio and control circuits. Liquid-tight flexible conduit shall conform to the requirements of UL 360 and consist of a flexible galvanized steel core containing a copper bonding conductor spiral-wound between convolutions and a neoprene or outer jacket overall. Fittings for liquid-tight flexible conduit shall be watertight and shall conform to the requirements of UL 514.
  - a. All conduit terminating in steel cabinets, junction boxes, wireways, switch boxes, outlet boxes and similar locations shall have approved insulation bushings. If the bushings are constructed completely of insulation material, a steel locknut shall be installed under the bushing. At ends of conduits not terminating in steel cabinets or boxes, the conductors shall be protected by terminal fittings having an insulated opening for the conductors.
  - b. The Contractor shall furnish all materials and completely wire all parts of the electrical equipment of the elevators including electrical devices on hatch doors.
- 2. Auxiliary gutters, wireways, and raceways shall be constructed of galvanized sheet steel conforming to the requirement of the NEC and shall be UL listed. Raceway, conduit and wireways within the hoistway exposed to public view shall be concealed within steel cladding.
- 3. Electrical boxes:
  - a. Outlet, junction and pull boxes shall be galvanized sheet steel or galvanized malleable iron, cast iron or ductile iron conforming to the requirement of UL 50, UL 514, and NEC 370-C. Pull boxes shall have screw cover with a liquid-tight gasket.
  - b. Junction boxes on car top, bottom and hoistway connecting the traveling cable shall contain approved terminal blocks for connection of traveling cable conductors. Terminal blocks shall have indelible identification numbers for each terminal connection.
  - c. All wire connection terminal blocks shall have the same identification number as labeled on the associated electrical wiring. All electrical wires shall use a labeling tube and heat shrink and match the terminal numbers.
  - d. During field installation of junction boxes or control boxes, the contractor/subcontractor shall not drill or cut into the top sides of the box for wiring.

- e. All boxes in machine room or pit shall be mounted on strut channels in order to prevent future corrosion and water damage. The strut channels shall be mounted to the wall and a minimum of 18 inches above the floor.
  - f. All solid state and electrical components located on top of the car enclosure or in the hoistway shall be installed within NEMA 4X enclosures.
4. Disconnect Switches for Car Lights and Mainline Power
- a. Disconnect switches shall be the following: UL 98, NEMA KS 1, heavy-duty, quick-make/quick-break switching mechanism with operating handle external to enclosure, with positions labeled ON and OFF, defeatable interlock to prevent opening of enclosure door when switch is ON. Enclosures shall be NEMA 250 Type 4x. Label disconnect switches in accordance with the NEC.
  - b. Mainline power disconnect switch shall be located in close proximity to the machine room entrance and shall be easily identifiable from other disconnect.
- O. Metal Work:
- 1. Steel sheet and steel fabrications:
    - a. Stainless steel sheet for cladding shall be minimum 16-gauge, best grade cold-rolled furniture steel. Stainless steel sheet for top enclosure shall be minimum 12-gauge. Stainless steel sheet for hoistway door frame shall be minimum 12-gauge.
    - b. Steel sheet for corrugated floor decking shall be minimum 10-gauge.
    - c. Steel shed for subfloor shall be minimum 3/8-inch thick.
    - d. Stainless steel for screws, bolts and nuts shall be AISI Alloy 303.
    - e. Galvanized steel material shall comply with ASTM A123, ASTM A153, ASTM A525 (G90 coating) and ASTM A568, as applicable. Steel sheet and steel fabrications, except stainless and lubricated machinery parts, which are not shown or specified to have other applied finishes, shall be galvanized.
  - 2. Steel Finishes:

Provide protection for all metal parts, fittings, and accessories by painting or galvanizing, except for stainless steel or anodized aluminum.

    - a. Where visible to the public, cladding and related steel surfaces shall be 316 stainless steel satin finish.
    - b. Paint finish, where shown, shall be aliphatic polyester polyurethane as follows:
      - 1) Primer shall be high-build epoxy-polyamide type, Tnemec Series 66-1211 or equal.

- 2) Finish coat shall be aliphatic polyester polyurethane, Tnemec 71 Endura-shield or equal.
- 3) Total dry film thickness shall be not less than six mils.

**P. Cab Enclosure:**

1. The elevator car and car components shall conform to the requirements of the Code, and shall operate without squeaks or metallic sounds.
2. Entire car assembly, including car frame and platform, shall be free from warps, buckles, and squeaks and rattles. Joints shall be lightproof.
3. Handrails: Handrails shall be ½ inch by 6 inch stainless steel #4 satin finished tube suitably mounted.
4. Car threshold: Car threshold shall be stainless steel with non-slip surface.
5. Toe guard aprons:
  - a. The toe guard aprons (cladding) at entrance side of elevator car shall be not less than 16 USSG sheet steel, galvanized and shall extend at least three inches beyond entrance jambs at each side. Toe guard shall have a straight vertical face, extending below the level of finished car floor, of not less than the depth of leveling zone plus three inches. The bottom of guard shall extend 3 inches below vertical face and be beveled at a 15-degree angle from the vertical. The toe guard shall be secured to car platform construction and be reinforced and braced to withstand a constant force of 150 pounds on its face without permanent deformation or deflection exceeding ¼ inch.
  - b. On glass elevators, the toe guard shall extend full width of cab.
6. Suspended Ceiling:
  - b. The suspended ceiling shall be faced and edged with solid stainless steel panels, 0.075-inch thick with a fully adhered ¾-inch thick core of noncombustible, sound-absorbent material and backed with galvanized sheet steel. ASTM A653M, G90 coating or better.
  - c. Mounting brackets and any necessary holes for the CCTV camera shall be provided on the top of the ceiling. The CCTV 360 degree camera shall be provided that will cover the entire car area. Coordinate bracket configuration and location with the CCTV subcontractor.
  - d. Mounting brackets and any necessary holes for the smoke and fire detection sensors shall be provided on the top of the ceiling, as further specified. Coordinate bracket configuration and location with the fire and intrusion system subcontractor
7. Laminated tempered safety glass:

- a. Glass shall be laminated. Heat-strengthened, safety glass conforming to requirements of ASTM C 1048 and ANSI Standard Z97.1 and shall consist of two pieces of ¼ inch thick glass and a 0.060 inch thick polyvinyl butyryl interlayer, laminated together.
  - b. Color: Tint by Globe-Amerada Co., used as a standard of quality, or comparable and approved equal.
  - c. Weatherproof tape for field installation of final edge seating shall be compatible with the interlayer.
8. Dry pressure glazing materials:
- a. The setting blocks, edge blocks, and face gaskets shall be ozone resistant, virgin neoprene.
  - b. Setting blocks for installation at each quarter point of the sill shall be 90 durometer, shore A hardness approximately full channel width, 4 inches long, and high enough to afford correct cover and provide 3/8 inch edge clearance for the glass.
  - c. Edge blocks, for vertical insulation at the bottom of each joint channel, shall be 50 durometer, shore A hardness approximately full channel width, three inches long, and provide 3/8 inch edge clearance for the glass.
  - d. Face gaskets shall be continuous, 50 durometer hardness, and provide 3/16 inch face clearance both inside and outside.
9. Sub floor material to be nominal ¼” stainless steel to prevent water infiltration between finished floor, cab and platform base.
- Floor covering: Poured Acrylic Epoxy, polymer system or approved equal, color selection and samples to be submitted to the Authority for approval by the Engineer, with slip-resistant surface, ¼ inch thickness, covering elevator car floor area. Flooring shall be non-shrinking, manufactured of prime quality compound, free of calendaring and curing defects, resistant to grease, oil, chemicals, aging, and ozone. Flooring shall be poured incorporating a full membrane system for the entire cab floor width and depth.
10. Emergency exit: Car shall have a top emergency exit conforming to requirements of the ANSI/ASME Code, the applicable jurisdictional requirements. The door shall open toward the top of elevator and shall have a latching mechanism to keep it in place.
11. Ventilation: A 350 cfm exhaust fan for continuous car ventilation shall be provided. Connect continuous ventilation fan to emergency power system. The exhaust fan shall be controlled from the car operating panel with Chicago Lock 7500. Provide sixty (60) minute backup battery power for fan.
12. Lighting fixtures and plug receptacles:

- a. Car lighting shall provide a minimum of 15-foot candles measured at any point on the cab floor and shall of the LED type. Car lighting shall be provided with emergency battery backup upon failure or interruption of normal car lighting. Emergency lighting unit shall provide required lighting for a minimum of four (4) hours. Battery charger shall be capable of restoring battery to full charge within sixteen (16) hours after resumption of normal power.
  - b. Exterior car lighting shall be as specified. On glass-enclosed elevators they shall be concealed under access panels flush with cab top or bottom surfaces, respectively. A duplex plug receptacle shall be provided in the pit and on top and bottom of each car. The lighting fixtures and receptacles on exterior of car shall be controlled by a switch adjacent to each fixture.
  - c. Provide 115 volt ac plug receptacle (GFCI) within 12 inches of CCTV camera location. Coordinate the installation of CCTV equipment within the design of the elevator cab as the elevator contractor is responsible for the installation of the camera and wiring to the control room.
13. Car Doors and Door Equipment:
- a. Car doors and door frames shall be suitably reinforced and provided with a laminated stainless steel #4 finish on cab side and baked enamel finish on hoistway side. Doors shall protect the full width and height of car entrance opening when in the fully closed position. Car door frame shall be integral with front wall of cab.
  - b. Hanger cover plate sections above the door opening shall be removable from the hoistway. Doors shall be guided at the bottom by composition gibs engaging threshold grooves with minimum clearance.
  - c. Car/Hoistway Door Operator: Car and hoistway doors at each landing shall be opened and closed quietly and smoothly by a direct current electric operator.
  - d. Door operation automatic at each landing with door opening being initiated as car arrives at landing and closing taking place after expiration of specified time interval, with electric contact to prevent starting elevator away from landing unless car door is in its fully closed position.
    - a. Time door closing to start 5 seconds minimum from notification that car is answering landing call.
    - b. Time doors to remain open five seconds minimum.
    - c. Time shall be adjustable to 20 seconds.
    - d. The interval of time that the doors remain open at intermediate landings shall be less for a stop made in response to a landing call. Door open time at a dispatching terminal shall be longer than the time for a stop in response to an intermediate landing call.

- e. All door timers shall be adjustable from the controller display panel.
- 14. Capacity plate: The car capacity plate shall be of plain stainless steel and contain the data required by the ANSI/ASME Code but shall not bear the name of the elevator manufacturer.
- 15. Signal Devices and Fixtures:
  - 1) Car Operating Station:
    - a. Provide one (1) main station in the front and one (1) auxiliary station. The COP shall be a vertical type.
    - b. General: Provide signal fixtures and control devices for each elevator. Buttons and signals shall be tamper resistant of the illuminated type that light-up when activated and remain lit until call or other function has been fulfilled. All signal fixture and control device faceplates shall be of Type 316L, nominal 0.135 inch thick stainless steel with No. 4 finish, unless otherwise shown on the Contract Drawings.
    - c. Car operating stations shall contain Braille plates adjacent to each call button. Contractor to coordinate proper landing call outs based on maximum characters as indicated on Contract drawings. Buttons for DOOR-OPEN, DOOR-CLOSE, ALARM, EMERGENCY PHONE call functions are to be supplied. Buttons are to be vandal resistant and of the positive stop type.
    - d. Station shall have a locked service cabinet for keyed switches of the car light; exhaust fan, independent operation, GFI duplex outlet as indicated on the Contract drawings.
    - e. Provide Emergency Communication: "Hands-free" ADA compliant telephone/intercom.
  - 2) Hall Station: Riser of hall stations of the push-button, call acknowledging, stainless steel, tamper resistant type shall be mounted at all elevator landings. Highest landing shall have a single DOWN button. Lowest landing shall have a single UP button. Incorporate ADA compliant telephone with each hall station. Braille Indicator Plate shall be provided. Faceplate finish shall be Type 316L stainless steel #4 finish. The Hall Station shall be flush to the surface and shall not be projected out.
  - 3) Hall Lanterns:
    - a. Tamper resistant hall lanterns shall be equipped with illuminated (LED type) UP and DOWN signal arrows, but provide single arrow where only one direction is possible. Provided units projecting from faceplate for ease of angular viewing. Match materials, finishes and mounting method with hall stations.
    - b. In conjunction with each hall lantern, provide an adjustable electronic chime signal to indicate that a car is arriving in

response to a hall call and to indicate direction of car travel. Signal shall sound one for up direction of travel and twice for down direction.

- 4) Bell Alarm System: Bell alarm system for each elevator shall be properly located within building and audible outside hoistway when activated by the EMERGENCY ALARM call button on each car control building/station. When emergency stop switch is activated inside fire service box, the bell alarm system should not be activated.
- 5) Firefighters' Service System: Firefighters' service system shall be provided in compliance with code requirements.

**R. Machine Room Equipment:**

Machine room for the single elevator shall be 224 sq.ft minimum.

1. Machine Room Emergency Lighting: Emergency lighting shall be provided in each elevator machine room.
  - a. There shall be a minimum of one lighting fixture.
2. Clearance around equipment in each machine room shall comply with provisions of all applicable codes. Clear distance for the maintenance purposes shall be at least 18". In no case shall this clearance supersede minimum Code requirements.
3. Equipment in the elevator machine room and hoistway sheaves area shall be so arranged that replaceable items can be removed for repair or replacement either by overhead hoist and dolly, or other conventional means, without dismantling or removing other equipment components in the same machine room. The overhead hoist and dollies shall be part of the construction.
4. Machine rooms must be air conditioned and heated to maintain an ambient temperature of 50F to 90 degrees F and a relative humidity between 35% to 50%. The Air Conditioner shall be Split System. The heating system for the machine room is also a built in system. A forced removal should be done by moving the air from the room to the outside of the building to another part of the building to keep an air exchange through the equipment room. Intake and exhaust vent should not be located close to each other.
5. Any component attached to the controller shall have a minimum clearance of 18 inches from the side(s) of the component requiring access for maintenance and free air circulation.
6. Provide Mats of insulating rubber or other suitable floor insulation in the front of the Controllers.
  - a. The Resistance range shall be  $1 \times 10^4 < 1 \times 10^6$  and shall meet ANSI/ESD requirements.
  - b. The rubber mat shall be the width of the controller plus 12".
  - c. The length of rubber mat shall be a minimum of 24".
  - d. The rubber mat shall be a ¼" thickness and beveled at

each end.

**2.04 KIOSK SURVEILLANCE CONTROL AND COMMUNICATION:**

A. Surveillance Camera Provisions (Surface Elevators). All requirements for CCTV shall comply with the WMATA SMNT Department.

1. Space provisions and mounting holes shall be provided for closed-circuit television (CCTV) cameras to be furnished and install by CCTV subcontractor.

a. The Contractor shall coordinate with the CCTV subcontractor and install wiring from the CCTV location within the elevator cab to an interface terminal and video transmitter located on the elevator car. Final equipment selection has not been performed and is subject to change. Coordinate model, configuration, and location with the CCTV subcontractor.

1) Power will be required by the video transmitter and CCTV camera and shall be provided.

2) Equipment: Fiber Optic Video Transmitters (Elevator Cameras)

b. The Contractor shall work with the CCTV subcontractor to install CCTV subcontractor-provided fiber-optic cable and transmitter to a terminal location specified by the CCTV subcontractor. The Contractor shall tag the cables appropriately, indicating that they are for future use by others.

B. Supply the following status indication, control, and communication functions for each elevator car and landing at an annunciator panel in the kiosk: indication, control, and communication functions in each elevator and landing; and all interconnecting wiring required to provide a complete and operable system. Systems to be provided and installed include the following:

1. Kiosk annunciator panel: Panel shall be a single panel approximately 7-½ by 19 inches. Coordinate design to ensure that the panel is compatible with the mounting provisions, previous designs, and human factors. The panels shall contain:

a. Indicators:

1) Visual display of elevator car status, to include landing stopped at or being approached and direction of travel:

a) Designate elevator by functional name, e.g., Garage 1.

b) For garage elevators designate landing by garage floor level.

2) Out of service because of malfunction.

3) In-Car stop switch is actuated.

- 4) Continuous audible alarm activated when emergency alarm switch in car is initiated.
- 5) Indicator lamps shall be LEDs, with life expectancy of 50,000 average rated hours.
- b. Controls:
  - 1) Out of service.
  - 2) Override control.
  - 3) Door open.
  - 4) Landing selection.
  - 5) Push button switches shall have limited over-travel to prevent damage due to abuse and shall be equipped with lift-up covers to avoid inadvertent operation, have mechanical and electrical life of 25,000 cycles, with integral or isolated illumination circuit and be normally open with momentary action or alternate action circuitry.
  - 6) When the override control switch is OFF, the kiosk controls shall function in parallel with the car and landing controls, i.e., the selective/collective control system shall respond to a kiosk-initiated landing selection with the normal priority afforded the remaining system landing selection and call buttons.
  - 7) When the override control switch is ON, the following actions shall take place:
    - a) If the car is stationary at a landing, it shall remain at the landing and the doors, if open, shall close and remain closed.
    - b) If the car is in motion, it shall stop at the first landing reached and the doors shall remain closed.
    - c) The elevator control system shall then respond only to the kiosk controls and car station.
    - d) The car shall park at the designate landing.
  - 8) When the OUT OF SERVICE switch is actuated, the elevator shall return to the lowest landing before shutting off.
2. Elevator fire detection sensor: Provide space and mounting holes for smoke and fire detection sensors to be furnished and installed as required by building, electrical, elevator and local codes. Install wiring from the sensor location in the car to interface terminal cabinet in the machine room, for connection from the sensors to the smoke and fire detection system. Coordinate with installers to allow installation of sensors and operational checkout of the system.

3. Passenger - Kiosk communications (VIOP) system:
  - a. Communications signal button in elevator car momentary contact to illuminate back-lighted signal button in car and latch on a continuous audible signal and illuminated indicator in the kiosk.
  - b. Communications buttons at landings, momentary contact, to illuminate back lighted signal button at the landing and latch on a continuous audible signal and illuminated indicator in the kiosk.
  - c. Push button in kiosk to activate intercom system and reset indicator lamps and audible alarm.
  - d. Each passenger operated device shall have identification markings as specified for car operating devices.
  - e. The voice communication intercom system shall function as a master remote network. The master station shall be located in the kiosk annunciator panel and shall include a speaker-microphone, audio amplifier, on-off indicator lamp, audible signal device control and push button lamp for the operations. A remote station shall include a speaker-microphone and a communications signal button shall light the signal button and cause a continuous audible signal at the master station and light indicator lamp corresponding to the calling remote station. Communications between master and remote station shall be established upon the actuation of the master station push-button control corresponding to the calling remote station with the master station push to talk control determining the direction of transmission.
  - f. If successive calls are received from other remote stations while communication is in progress with one remote station, the audible signal shall sound the indicator lamps corresponding to the calling remote stations shall light and both shall remain on the indicate waiting calls.
  - g. Means shall be provided to clear the indicating lamps independently. Communication initiated from the master station shall be established upon actuation of the push button control corresponding to the called remote station, with the master station push-to-talk control determining the direction of transmission.
  - h. The audio amplifier at the master station shall be all solid state in construction and shall control incoming and outgoing volumes for all of the remote stations. The volume levels shall be preset during installation and shall be adjustable to provide a maximum of five watts rms at the speaker-microphones.
  - i. The power supply shall supply all ac and dc voltages necessary for all circuitry associated with the voice communications intercom system, and shall operate from the 120-volt ac, 60 Hertz emergency power supply located in the elevator machine room.

- j. The audio amplifier and the speaker-microphones shall have a frequency response of plus or minus three Db from 300 Hertz to 5,000 Hertz. Power consumption shall be 5 watts maximum in standby and 50 watts maximum under load.
- k. The Contractor shall be responsible for shielding, grounding and other measures necessary to protect the voice communications intercom system from interference from other electrical systems.
- l. Speaker grilles shall have a minimum of 35 percent open area over the entire surface of the speaker cone.
- m. Switches and relays used with this system shall have an operating life exceeding 5,000,000 cycles. Documentation shall be provided by the Contractor to the Engineer, for his approval, to substantiate this life cycle level.
- n. The system shall perform adequately, as approved by the Engineer, with both the remote and the master station test personnel speaking from three feet away from the speaker-microphones.
- o. Communication in the car shall also rollover to a 24-hour manned site (Rail Operations Control Center) in the event that the kiosk does not respond to the call.
- p. Each passenger-operated device shall be identified in accordance with ADA/ADAAG requirements.
  - 1) ADA requirement for providing emergency two-way communications between an elevator and a point outside the hoist way (the Kiosk).
  - 2) Device mounting heights shall comply with:
    - a) ADAAG requirements.
    - b) ASME A17.1-2007. The highest operable part of the two-way communication system shall be a maximum of 48 inches from the floor.
  - 3) A Braille Instruction Plate shall be permanently affixed on each remote intercom unit.
    - a) ADA Standards: Raised symbol and lettering (Signage) located adjacent to the device.

**2.05 EMERGENCY POWER OPERATION**

- A. Provide control equipment and interlocks sufficient to operate at least one elevator for group of three at a time in the event of failure of normal building power supply.

- B. Provide for sequential operation to return elevators to the main entrance floor. Upon transfer to generator power source as evidenced by signal generated by contact closure at elevator automatic transfer switch, start one elevator at a time and return that elevator to the main floor and park with the door open before starting next elevator.
- C. Provide selector switch for automatic and manual selection of the elevator that is to operate on generator power source. Locate selector switch adjacent to elevator door key or as directed by the Engineer.
- D. When normal building power is restored, as evidenced by signal generated by contact closure at elevator automatic transfer switch, return elevators to normal operation without disruption to normal operating circuits or electrical systems.
- E. The key lock shall be ChicagoLock 7500.
- F. The minimum requirements of the Code shall be met.

**PART 3 – EXECUTION****3.01 EXAMINATION**

- A. Prior to beginning installation of elevator equipment, examine the following and verify that no irregularities exist that would affect quality or execution of work as specified. Notify the Authority if there is any non-conformances.
  - 1. Hoistway size and plumbness.
  - 2. Sill pockets.
  - 3. Anchor brackets
  - 4. Sill supports.
  - 5. Spreader/Divided beams.
  - 6. Machine beams and any other supplied by others.
  - 7. Pit Depth
  - 8. Overhead clearance
- B. Do not proceed with installation until previous work conforms to project requirements.

**3.02 INSTALLATION**

- A. Coordinate work in this section with all trades to ensure that the installation of the elevators is not in conflict with the work performed of other trades.
- B. Make necessary wiring connections.
- C. Paint metal surfaces in accordance with Section 09\_91\_99.
- D. Install elevator equipment, materials and accessories in accordance with the OEM's installation procedures and approved Shop Drawings to make elevator fully operational.
- E. Erect guides plumb and securely fasten to building structure.
- F. Provide protective coverings for finished surfaces.

- G. Upon completion, touch up and restore/ replace damaged or defaced factory finished surfaces. Touch up any marred finishes and replace as directed by the Authority.
- H. Remove protective coverings and clean exposed surfaces after completion.

**3.03 FIELD TESTING:**

- A. Operating Adjustments and tests: At all times, until issued final acceptance by ELES representative, adjust equipment to operate satisfactorily, conduct performance tests and make necessary readjustments.
  - 1. Provide test instruments, materials, other necessary facilities, and all labor required for acceptance tests specified.
  - 2. All faults recorded during performance period will be turned over to the Authority for review. The review period should be not less than 20 working days. A fault such as, but not limited to:
    - a. Door lock or car gate switch malfunction.
    - b. Emergency stop switches and safety circuit malfunction.
    - c. Door protection timer.
    - d. Motor overload circuits
    - e. Stuck button protection features.
    - f. Low oil and oil pressure devices.
    - g. Test emergency telephone in car
- B. Any deficiencies found during the performance period will be repaired by the contractor at no charge to the Authority.  
The warranty shall include materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to, noisy, rough, or substandard operation; loose, damaged, missing parts and fluid leaks.
- D. Arrange for tests and inspection by jurisdictional authorities to obtain certificate of acceptance.
- E. Coordinate with ELES Engineer to have the Authority personnel witness acceptance tests.
- F. When the elevator work included in this Contract is fully completed, demonstrate to the satisfaction of ELES representative that the proper operation of every part of the equipment complies with Contract requirements including compliance with all applicable requirements of ANSI/ASME A17.1. The inspection procedure outlined in ANSI/ASME A17.2 will form a part of the final inspection.
- G. Shop test of elevator motor and certified test sheets will be required. The heating, insulation and resistance of the motors will also be determined under actual conditions after installation.

**3.04 ACCEPTANCE TESTS:**

Notification Requirements: Notify the Project Manager and ELES Engineer a minimum of five (5) working days prior to each scheduled test.

- A. Furnish all test instruments and materials, required at the time of final inspection, to determine compliance of the work with Contract requirements. Materials and instruments furnished shall include standard 50-pound test weights, megohmmeter, alternating current voltmeter and ammeter, centigrade calibrated thermometers, spirit level, and stop watch. At the time of final inspection, tests shall include the following:
1. After installation, each elevator shall be tested without load by the Contractor. The elevator shall be subjected to a test for a period of eight—hours continuous run. During the test run, the car shall be stopped at top and bottom levels, in both directions of travel with a standing period of 10 seconds at each landing.
  2. Full-load run test: The elevator shall be subjected to a test for a period of one-hour continuous run, with full specified rated load in the car. During the test run, the car shall be stopped at top and bottom levels in both direction of travel with a standing period of 10 seconds at each landing.
  3. Car Leveling Test: Determine accuracy of floor landing tests both before and after full load run tests. Minimum of 1/4 inch leveling must be maintained. Test accuracy of landing at all floors with full load and no load in car, in both directions of travel.
  4. Speed test: The actual speed of the elevator car shall be determined in both directions of travel, with full specified rated load and with no load in the elevator car. Speed tests shall be made before and after the full load run test. Speed shall be determined with a Tachometer. Car speed when ascending shall be not more than 10 percent above not more than 10 percent below the specified car speed.
  5. Temperature rise test: The temperature rise of the drive unit motor shall be determined during the full load test run. Temperatures shall be measured by the use of thermometers inserted into the windings and shielded by cotton waste. Under these conditions, the temperature rise of the motor shall not exceed NEMA specified temperature rise. Test shall be started only when all parts of equipment are within 5<sup>0</sup> C of the ambient temperature at the time of starting test.
  6. Insulation resistance test:
    - a. The complete wiring system of elevator shall be free from short circuits and accidental grounds. The insulation resistance of the system shall be more than one megohm when tested by using a 500-volt megohmmeter.
    - b. The elevator structure, equipment, and raceway shall be tested for continuity to ground.

**3.05 ELEVATOR PROTECTION:**

1. The finished elevator installations shall be completely barricaded and enclosed to preclude their use without permission of the Contractor until Final Acceptance and release by the Contractor for general use. The enclosure shall be fabricated to allow easy access for maintenance, testing and adjustment.

2. The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room, and ensure that it shall remain secure at all times until the completion of the Contractor's interim maintenance obligation.
3. Protection: During installation and until all elevator systems are fully operational and accepted by WMATA, make all necessary provisions to protect all elevator components from damage, deterioration, and adverse environmental conditions. Do not use or allow the use of the elevator for construction purposes such as hauling materials or worker transport during construction.
4. Security Of Machine Rooms: The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room and ensure it shall remain locked and secure at all times.
5. Field Painting: Metal parts visible to the public shall be field painted.

**3.06 WARRANTY**

Warranty: Two-year warranty of construction shall start at Final Contract completion.

- A. The OEM shall warrant in writing that all equipment manufactured and installed under this specification, for a period of twenty four (24) months from the date of Final Acceptance by the Authority, be free of defects in design, materials, and workmanship, under normal use and service. Defective work shall be repaired or replaced at no additional cost to the Owner.
- B. The warranty shall include materials and labor necessary to correct defects.
- C. The warranty does not begin until all of the following requirements have been met.
  - 1) The Operations and Maintenance Manuals are accepted by WMATA.
  - 2) The required training has been completed to the satisfaction of WMATA.
  - 3) All field tests have been successfully completed.
  - 4) The acceptance testing has been successfully completed.
  - 5) The elevators are in service for passenger/public use.
  - 6) The State and local jurisdictions have inspected the elevators and issued the respective certificates of Operation.
  - 7) All spare parts have been delivered and received by WMATA.
  - 8) Any discrepancy identified by the ELES representative shall be repaired or replaced by the Contractor at no additional cost to the Authority.

**3.07 MAINTENANCE:**

- a. Maintenance Service

The Contractor shall perform full maintenance service for a period of two years on each elevator in accordance with the manufacturer's maintenance manual and WMATA ELES maintenance program prior to WMATA providing permanent maintenance. The period of maintenance shall begin after test(s) and Provisional Acceptance of each elevator and shall extend to the scheduled date of Final Acceptance for all units in the same facility plus a period of two years. In no case shall the interval between inspections and testing be greater than one month. The maintenance service during the warranty period shall be provided by fully trained elevator mechanics. The maintenance tasks shall include, but not be limited to, the following:

- a. Inspection of completed installation and periodic testing to maintain the elevators in completely operable condition.
- b. Contractor shall provide support for periodic, accident and incident, PM compliance inspections.
- c. Lubrication of parts, and the protection of the equipment.
- d. Replacement of defective parts at no additional cost to the Authority.
- e. Annual clean down of the elevator and hoistway enclosure is required. Make necessary arrangements with Authority in order to minimize any inconvenience.
- f. Contractors performing maintenance are responsible for all service, repair work and emergency call. The contractors shall provide unlimited service during regular time and twenty-four (24) hour (including Holidays) emergency call back service at no additional cost.
  - 1) Provide twenty (24) hour (including Holidays) emergency service during the maintenance period consisting of a prompt response (within 1 hour) to emergency request by telephone or otherwise from Authority or designated representative if an elevator is inoperable or in case of injury, entrapment, or potential injury to persons.
  - 2) Unlimited service callbacks are included with a required response time of one (1) hour (including Holidays).
- g. Periodic maintenance (based on WMATA schedule) shall be performed off peak hours to minimize service interruption as long as the other elevator serving the same platform is operational.
- h. Reporting: Detailed monthly records of tasks performed including names of individuals performing the tasks, date and time performed, and other pertinent data. In addition, the reports are to be provided in an electronic format acceptable to WMATA's needs.
- i. Contractor performed maintenance shall follow the WMATA Office of Elevator and Escalator Operations procedures, schedules and check charts.

Within three (3) months prior to the termination of this contract, the Authority or his designated representative(s) shall make a thorough

maintenance inspection of all equipment covered under this contract. The contractor shall provide personnel to remove, test, and operate equipment as necessary. All deficiencies found as a result of this inspection shall be corrected by the Contractor as required in this agreement with no additional cost to the Authority.

### 3.08 REMOTE MONITORING SPECIFICATIONS:

- A. Allen Bradley DF1 or industry standard Modbus protocol shall be provided to transmit data from the Elevator/Escalator controller to the Authority's AEMS RTU computer control and data system. The Design-Builder shall provide a controller data interface to a DH-485 network located in the Elevator /Escalator machine room. The DH-485 controller interface shall be programmable for data rates up to 115Kbps. The interface shall allow other nodes such as other Elevator or Escalators to be readily incorporated into the DH-485 network. The controller data interface shall include one Allen Bradley SLC PLC per station to function as a data concentrator to consolidate data from all the controllers in the station. The software for the data concentrator shall be as specified by the Authority. The data concentrator shall receive controller data over the DH-485 data network and provide formatted data to the AEMS RTU through a RS 232 link. This data transmission may be accomplished by a separate PLC controller integrated into the control system.
- B. The Elevator /Escalator control system shall automatically initiate the transmittal of data when data is requested by the Authority's AEMS system and continue until all data is received by the AEMS RTU in the station AC switchboard room. The Authority will perform final integration of the data in the AEMS system.
- C. The Contractor shall also provide the required hardware to download data from any fault finding annunciator panel to a supplied laptop PC being utilized at the Elevator/Escalator location. The provided software shall permit the downloading and storage of data on the supplied laptop PC from multiple fault finding annunciator panels.
- D. The Contractor shall install an Allen Bradley network interface module, (model 1761-NET-AIC, or approved alternative) beside the PLC in the controller and provide 24 VDC power to the module. The Allen Bradley PLC will be used for remote monitoring capabilities into WMATA established engineering monitoring network.
  - a) The Contractor shall provide all wiring and programming of the PLC to communicate with station data concentrators on the DH-485 network. Coordinate work with WMATA ELES Engineering.
  - b) The Contractor shall pull all remote monitoring cables to the interface in the elevator controller from the remote monitoring network going back to WMATA's Automated Energy Management System (AEMS) remote terminal unit (RTU).
  - c) Provide Ethernet communication between the elevator machine room and WMATA's communication room. The communication port shall be located less than 6' from the controller and shall have minimum of two ports for data communication.
- E. Terms and Definitions

1. Boolean - A single bit data type.
2. DF1 - A Rockwell Automation Company proprietary communications protocol.
3. DH485 - An industrial communications network used by Allen Bradley programmable controllers.
4. Integer - A data type 16 bit signed (range -32768 to 32767).
5. PLC - Programmable Logic Controller.
6. QEI - QEI Inc. Springfield NJ
7. RTU - Remote Terminal Unit

#### F. Elevator Remote Monitoring Data Specification

##### 1. Overview

The design of the WMATA escalator & elevator monitoring system shall include a data concentrator PLC to gather data from the elevator control PLC's over an Allen Bradley DH 485 network. The QEI RTU shall read data from the WMATA data concentrator PLC via an RS 232 serial connection to a 1746-BAST module using Allen Bradley DF1 protocol. See figure 1.1 for reference. This specification defines data to be presented by the WMATA data concentrator PLC to the QEI RTU. The WMATA data concentrator PLC station shall poll the escalator & elevator controller(s) periodically for data and format the data into blocks within the WMATA data concentrator. An Ethernet TCP/IP connection is available at the Data concentrator PLC. The data concentrator PLC has been designed to collect data from up to (10) escalators and/or elevators. The data concentrator PLC is to be mounted into the existing QEI RTU enclosures and powered by a 120 VAC source from within the RTU. For Metro stations where more than (10) escalators and elevators are present additional data concentrator PLC's will be required.

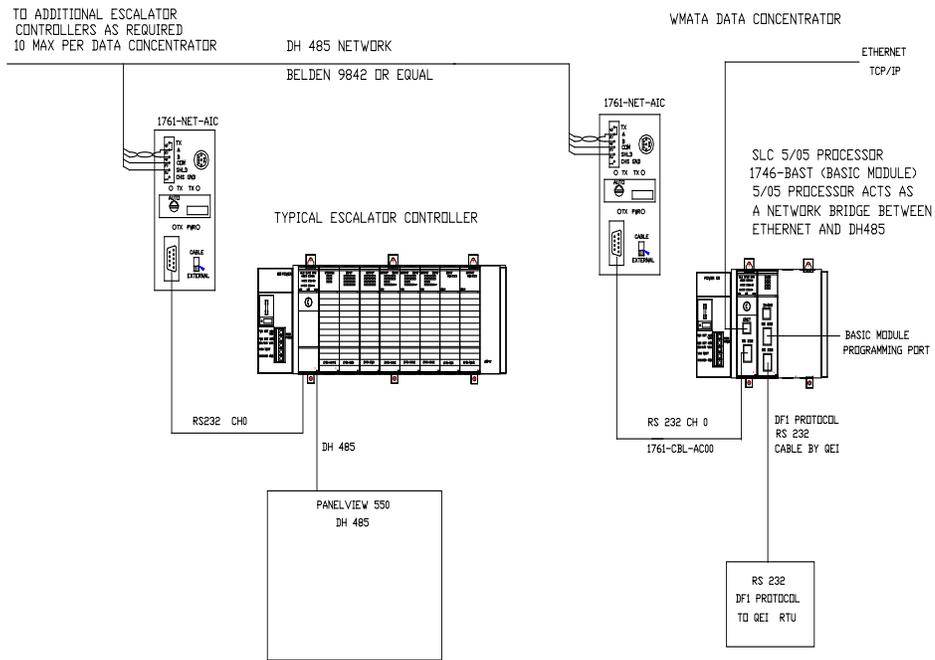

Figure 1.1

2. Data Concentrator PLC Data File Assignments.

The WMATA data concentrator PLC shall store data for up to (10) escalators and/or elevators in any combination as defined in table 2.1.

Table 1

Escalator DH485 node #	Elevator H485 node #	Status bits File	Analog Data File	DC PLC MSG file#	DC PLC MSG buffer file#
1		N20	N21	N81	N101
2		N22	N23	N82	N102
3		N24	N25	N83	N103

4		N26	N27	N84	N104
5		N28	N29	N85	N105
6		N30	N31	N86	N106
7		N32	N33	N87	N107
8		N34	N35	N88	N108
9		N36	N37	N89	N109
10		N38	N39	N90	N110
	11	N40	N41	N121	N141
	12	N42	N43	N122	N142
	13	N44	N45	N123	N143
	14	N46	N47	N124	N144
	15	N48	N49	N125	N145
	16	N50	N51	N126	N146
17		N52	N53	N127	N147
18		N54	N55	N128	N148

Note: All analog values are multiplied by 16 in the data concentrator to bit shift left 4 bits to align with QEI's 12 bit analog data types.

A note on communication loss

A 60 second watchdog timer is coded into each escalator file. If communications are lost between the data concentrator and the escalator controller for more than 60 seconds the watchdog timer will timeout. When the timer has timed out the communications loss bit will be reset (0) to indicate the communications loss condition.

**3. Time and date sync**

The QEI RTU shall provide clock synchronization to the WMATA data concentrator PLC every 5 minutes. Table 4.1 defines the address and data format of the clock registers in the WMATA data concentrator PLC. The data concentrator PLC shall set the escalator controller date and time every day at 3 AM.

**Table 4.1**

FUNCTION	ADDRESS	FORMAT
YEAR	N13:10	4 DIGITS
MONTH	N13:11	2 DIGITS
DAY	N13:12	2 DIGITS
HOUR	N13:13	2 DIGITS 24 HOUR
MINUTE	N13:14	2 DIGITS
SECOND	N13:15	2 DIGITS

#### 4. Data Concentrator PLC Program

The data concentrator PLC includes code to monitor up to 10 escalators and 5 elevators. Each escalators and elevators has an independent code file and a configuration bit. If an elevator is to be monitored the configuration bit must be set corresponding to the DH485 station address of the elevator controller. If the configuration bit is reset (0), the status and analog data table values for the elevator or escalator will be set to 0.

The configuration bits are as follows.

Escalator Configuration Bit	DH485 Address of Escalator Controller	Elevator Configuration Bit	DH485 Address of Elevator Controller
B9:0/1	1	B9:1/1	11
B9:0/2	2	B9:1/2	12
B9:0/3	3	B9:1/3	13
B9:0/4	4	B9:1/4	14
B9:0/5	5	B9:1/5	15
B9:0/6	6	B9:1/6	16
B9:0/7	7	B9:1/7	17
B9:0/8	8	B9:1/8	18
B9:0/9	9	B9:1/9	19
B9:0/10	10	B9:1/10	20

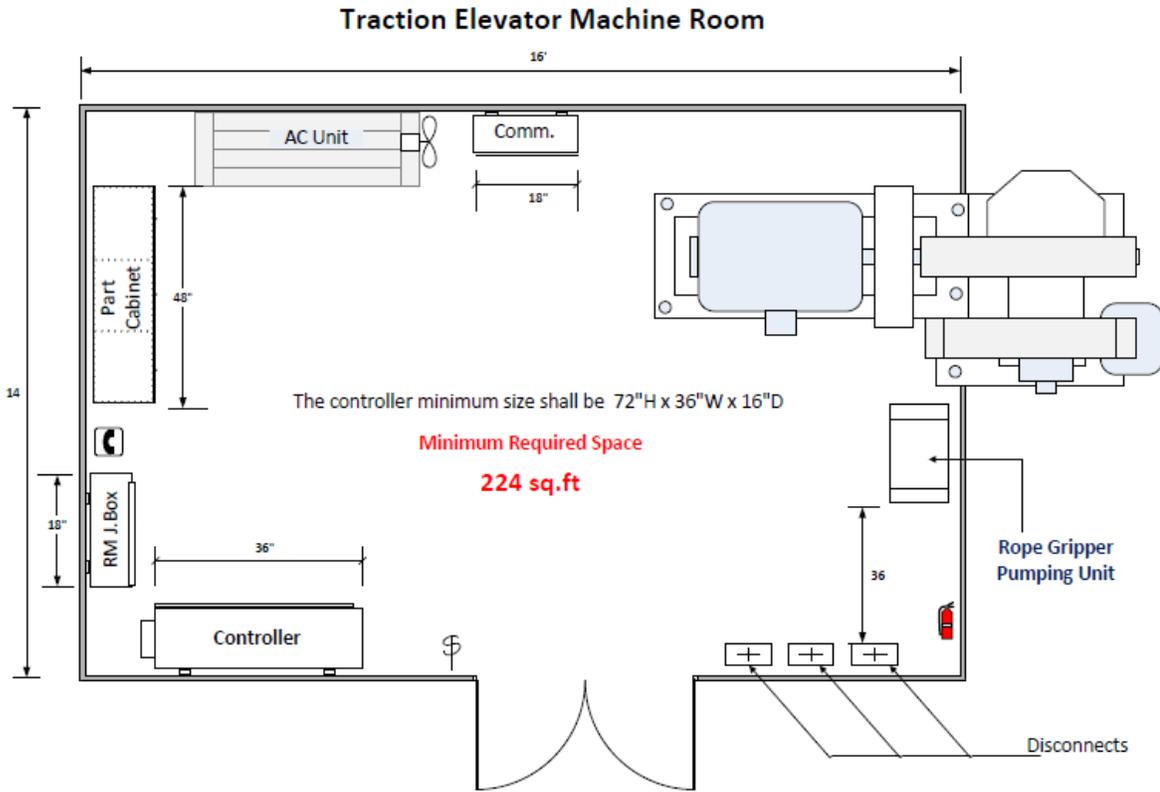

**3. Data Concentrator Gateway IP addresses.**

The Data concentrator PLC acts as a gateway between the Ethernet and DH485 networks. The PLC contains a list of IP addresses, known as the routing table which will be allowed access to the DH485 network. The routing table will contain 20 addresses.

3.09 EXHIBIT 1. Traction (Basement or Side) Elevator Machine Room

END OF SECTION

**SECTION 14300  
HEAVY-DUTY ESCALATORS**

**PART 1 – GENERAL**

**1.01 DESCRIPTION**

- A. This section specifies work pertaining to the design, fabrication, and installation of heavy-duty escalators, designed specifically for heavy rail transit system use.
  
- B. The following sections include related requirements and are performed by other trades:
  - 1. Specifications Section 02000 – Site Construction
  - 2. Specifications Section 05000 – Metal Fabrication
  - 3. Specifications Section 08800 – Glass and Glazing
  - 4. Specifications Section 09920 – Painting
  - 5. Division 7 Section “Waterproofing” for water proofing of escalator pit
  - 1. Division 15 Sections for heating, ventilating and/or air conditioning of escalator controller room.
  - 2. Division 16 Sections for electrical service to escalator equipment, fire alarm systems and communications systems.
  
- C. Definitions
  - 1. The WMATA escalators included in this Specification are classified as "Class A" or "Class B" which corresponds to the designations applied to the wellway structures. These are WMATA classifications, chosen for convenience to define machine installations having similar operating characteristics and ranges of vertical rise. The various classes and designation number of escalators are shown on the drawings.
    - a. Class A escalators shall have a vertical rise up to 24 feet nominal, three flat steps at the upper and lower landings, and rated speed of 90 to 100 feet per minute.  
A1: Not exceeding 20 ft. vertical rise  
A2: Over 20 to 24 feet vertical rise
    - b. Class B escalators shall have a vertical rise above 24 feet through 30 feet, and shall have four flat steps and a rated speed of 90 feet per minute.  
B1: Over 24 to 30 feet vertical rise

B2: Over 30 to 40 feet vertical rise

B3 escalators shall have a vertical rise above 40 feet through 60 feet, and shall have four flat steps and a rated speed of 90 feet per minute.

2. Heavy-Duty Escalators are defined as escalators designed specifically for heavily traveled, heavy rail transit system usage according to the structural and operational parameters defined herein and substantially more robust and superior to commercial units in the design of truss, machine, steps, step chain, and step chain tensioning device. Minimum design life shall be 30 years based on maximum loading conditions of (320 pounds per exposed step) for 75% of the operational hours.
3. The Working Point is the point of intersection of the step nosing line and the horizontal projection of the top of the landing plates. The landing plates shall be horizontal and shall be at the same elevation as the finish floor at the point of intersection with face of the truss bearing plate. This should not be confused with a working point internal to the escalator that is used by escalator installers to align the components, which is different from the previous building reference point.
4. Flat steps: The number of flat steps specified shall be measured from the point where the comb teeth join the comb plate in a horizontal direction to the first exposure of the riser of an adjacent step at the upper and lower landings.
5. Step width: The horizontal distance between skirt panels.
6. Escalator support: These are the upper, lower, and intermediate supports needed to support the total loads of the escalator.
7. Noncombustible materials are those materials that meet the requirements of the National Fire Protection Association (NFPA), Fire Protection Handbook, and for applicable plastics, Underwriters Laboratories (UL)-94HB.
8. Final Acceptance: The point at which the owner accepts the escalator project as being complete including all submittal requirements. This may be a different point in time than substantial completion.
9. Interim Maintenance: Maintenance from the point of substantial completion, but prior to Revenue Service.

10. Beneficial Use: When the escalator is placed into service, may be prior to the site being ready for public use.
11. Revenue Service: The station or facility opening date.
12. Notice to Proceed (NTP): within this document shall mean the date which the escalator installer is notified to proceed with the project.
13. MSDS - Material Safety Data Sheet.
14. BOM - Bill of Material
15. SMNT - Systems Maintenance (WMATA)
16. WMATA: Washington Metropolitan Area Transit Authority.

## **1.02 QUALITY ASSURANCE**

- A. Codes, Regulations, Reference Standards and Specifications.
  1. Comply with codes and regulations of the Authority Having Jurisdiction. The American Public Transportation Association (APTA): Heavy Duty Transportation System Escalator Design Guidelines.
  2. American Society of Mechanical Engineers (ASME) A17.1 Safety Code for Elevators & Escalators and A17.2 Guide for Inspection of Elevators, Escalators and Moving Walks.
  3. WMATA Design Criteria requirements indicated in Section VI-Mechanical.
  4. American Institute of Steel Construction (AISC).
  5. American Iron and Steel Institute (AISI).
  6. American National Standards Institute (ANSI): C80.1
  7. American Society for Testing and Materials (ASTM): A36, A123, A167, A240, A276, A312, A325, A385, A490, A500, A501, A525, A653, B3, B8, B108, B221, D471, D635, D1056, D2628, E84, E136.
  8. American Wire Gauge (AWG).
  9. Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG).
  10. American Welding Society (AWS): D1.1.
  11. Environmental Protection Agency (EPA).
  12. Federal Transit Administration (FTA)

13. International Code Council (ICC) – International Building Code (IBC).
14. Institute of Electrical and Electronic Engineers (IEEE): 1202.
15. National Association of Architectural Metal Manufacturers (NAAMM): C54, C55.
16. National Institute of Standards and Technology (NIST).
17. National Electrical Code (NEC).
18. National Electrical Manufacturers' Association (NEMA): WC 70, KS 1, AB 1, 250, PB 1, MG 1.
19. National Electrical Safety Code (NESC)
20. National Fire Protection Association (NFPA): NFPA-130-2003.
21. Occupational Safety and Health Act (OSHA).
22. Society of the Plastics Industry (SPI).
23. Underwriters' Laboratories, Inc. (UL), UL-94HB, 6, 50, 62, 98, 360, 486, 489, 514, 1591.
24. United States Department of Transportation (DOT).

These specifications are not to be construed as supplanting any code requirements.

Any additional requirements imposed by local agencies and/or codes having jurisdiction shall be incorporated into escalator installation.

In the event of a conflict between codes, regulations, these specifications or standards, the most stringent requirement as determined by the Contractor and approved by the Authority shall take precedence unless specifically addressed herein.

- B. In addition to the Design Submittal Requirements, the Contractor shall comply with the following:
  1. Escalators shall be installed by the manufacturer.
  2. The Escalator Contractor shall obtain all permits and licenses and perform all required inspections.
  
- C. Quality Assurance:
  1. The escalator contractor shall guarantee the materials and workmanship of the apparatus furnished under these specifications and will make good any defects not due to ordinary wear and tear or improper use or carelessness, which may develop within two (2) years from date of completion of each escalator, inclusive of labor and traveling expenses. Defective work shall be repaired or replaced at no additional cost to the Authority.

2. Welding: Welding shall be performed in accordance with the requirements of AWS or CWB Welders shall produce evidence of current certification by AWS or CWB.
  3. Labeling Requirements: Every escalator shall be clearly marked with rated load and speed, manufacture serial number and the designated Authority identification.
    - a. All escalators shall be permanently numbered with number designations corresponding to the indications on the kiosk annunciator panel. A station sketch showing the escalator numbers shall be submitted for WMATA ELES Engineering. The escalators shall be numbered in sequence, starting at the north entrance left to right facing to the escalator at each station and proceeding clockwise around the station. The numbering shall proceed into the station toward the end of the platform. Corresponding numerical identification shall be affixed to the equipment in the machine rooms. The escalator numbering shall be approved by the ELES Engineer.
- D. Certification:
1. Certificates of inspection and acceptance issued by jurisdictional authority.
  2. The Acceptance Inspection (Specifications and Code) by the Office of Elevator and Escalator (ELES) Services shall take place prior to the Final Acceptance Inspection by the Jurisdictional Authority, and the escalators and associated equipment shall be free of defective material, imperfect work and faulty operation. All defective work shall be repaired or replaced at no additional cost to the Authority prior to the Final Acceptance Inspection by the Jurisdictional Authority.

### **1.03 SUBMITTALS**

Submit the following for approval in accordance with the Contract Documents and with the additional requirements as specified.

- A. Product information shall be submitted in both hard copy and electronic copy (compact disc) format, and shall include the following:
  - 1. Manufacturer's design data, material specifications, drawings, installation and maintenance instructions, and other data pertinent to the components used in the escalator systems, including, but not limited to, detailed repair data for all components, including disassembly, inspection/gauging/torque requirements, reassembly, testing and other related information. Submittals shall cover all mechanical components, operating panels and indicators and electronic equipment to control and monitor escalator control functions. Exploded view drawings shall be included to facilitate repair and maintenance functions. Calculations for sizing motors, brakes, chains, etc. shall be included to document the designs conformance with the criteria.
  - 2. Loads on supporting members, reaction points, and deflections under varying loads.
    - a. Loads imposed on the structure shall be coordinated by the Contractor and not exceed limits established by the final structural design. This requirement shall be verified, documented, and stamped by a registered Professional Engineer in the Commonwealth of Virginia in accordance with the regulations of the Virginia Department of Professional and Occupational Regulation's Board for Architects, Professional Engineers, Land Surveyors, Certified Interior Designers and Landscape Architects (APELSCIDLA Board). Supporting calculations shall be provided for record file.
  - 3. Step chain details for material, configuration, arrangement, and lubrication requirements.
  - 4. Lubricants, sealers, paints and any other potentially hazardous substances are subject to review and approval by the Authority. All necessary Material Safety Data Sheets shall be submitted.
  - 5. Truss split detail drawings, associated design calculations and split torque settings.
  - 6. Dimension of the truss including the top and bottom pit area.
- B. The contractor to provide detailed drawings that shows the dimensions, tolerance and specification that may include the material specification, hardness or electrical rating for each component that is being used. In

regards to assemblies they must provide a top level drawing with BOM and quantities with detailed material specifications and drawings with dimensional tolerances. The contractor also to provide as-built CAD models of all escalator components.

Shop drawings and samples shall be submitted in both hard copy and electronic copy (Flash Drive/CD) format, and shall include but not be limited to the following:

1. Drawings required to interface the escalator installation with other work.
2. Fully dimensioned layout in plan and elevation indicating component locations, structural supports, access spaces, and points of entry.
3. Drawings and cut sheets covering drive motor, controller, and safety devices and switches including brakes.
4. Complete layout of electrical system including motor; control panel; disconnect switches; panel boards, truss lighting, light fixtures and light switches; receptacles; and safety, surveillance, and control devices. Schematic diagrams including single line power diagram of the escalator system, control wiring diagram and sequence of operation, interface connections with remote surveillance and control system.
5. Truss reaction loads with design calculations: Signed and sealed by a structural engineer licensed in the Commonwealth of Virginia.
6. Dimension of the truss including top and bottom pit area.
7. Other drawings, reports, and samples are specified in appropriate articles of this specification section.

C. Reports:

1. Five copies of a reliability and maintainability demonstration report. This report will document compliance with reliability and maintainability requirements specified herein by means of
  - a. Inspection
  - b. Verifiable engineering analysis,
  - c. By static and dynamic testing, and
  - d. By analysis of field operational data.

The Contractor has the option to conduct test as a part of the factory "type" testing if certification of equivalent performance of the completed installation is provided by the Contractor. Prior notice shall be provided (two weeks minimum) to allow Authority representatives to witness testing and demonstrations. Submit the report no later than 90 calendar days prior to Final Acceptance. All reliability and maintainability documentation is subject to approval by the Authority.

2. Results from tests specified in Section 3.04.
3. Failure Mode and Effects Analysis: Provide five copies of a Failure Mode and Effects Analysis for all escalator safety circuits and components, including but not limited to steps, axles, brakes and step and axle rollers and any other components which could affect rider safety.

**D. Samples**

1. Three of each of the following samples shall be submitted for approval in accordance with the Design Submittal Requirements.
  - a. Stainless steel cladding: 12 inches square of thickness and finish specified.
  - b. Landing Plate: 12 inches square in the color and finish to be supplied.
  - c. Handrails: 12 inches long exposing non-separating stainless steel mesh core laminated within the handrail structure.
  - d. Comb Plate: 42 inches long.
2. One of the following samples shall be submitted for approval in accordance with the Design Submittal Requirements.
  - a. Step: Sample size adequate to show tread, riser, cleats, nosing, and black powder based baked on enamel paint.

**E. Operation & Maintenance (O&M) Manuals.**

**Manuals and Catalogs:**

The O&M Manual shall be submitted to the WMATA/ELES Engineer for the approval.

1. The maintenance and repair manuals, hardbound and indexed, shall be furnished, in a minimum of four volumes as follows:
  - a. Wiring Diagram Manual with page size of 11 inches by 17 inches.
  - b. Maintenance and Renewal Parts Catalog with page size of 8-1/2 inches by 11 inches.

Six sets of the approved manuals, escalator installation, operation instructions, troubleshooting techniques and related equipment drawings and software (all publication must be in English) – two copies of which to be delivered to the WMATA/ELES Engineer representing of the Authority prior to installation. Each binder shall has the Binder Cover and Spine Insert which contain the Station Name and Unit ID.

Submit an additional electronic copy on Flash Drive(s)/CD(s). The Information shall be saved/presented as follows:

- c. Text in Microsoft Word “.doc”, “.pdf”, or approved alternative formats.
  - d. Graphic images in ".tif" or ".dwg" AutoCAD formats.
2. All publications shall be in loose-leaf form, on 30-pound paper and with punch holes reinforced with plastic, cloth or metallic material.
  3. All covers shall be resistant to oil, moisture, and wear commensurate with their intended use. Diagrams and illustrations shall not be loose or in pockets. All printed material shall be capable of being reproduced on dry copying machines.
  4. Each escalator shall be treated as a whole and not as a grouping of disassociated parts. The material in the Wiring Diagram Manual shall be organized and indexed by the escalator classifications included in this Specification. All manual sections shall be subdivided, to the extent required by the subject matter, and shall include, but not necessarily limited to the following topics:
    - a. General system or sub-system description and operation.
    - b. Block diagrams.
    - c. Functional schematics.
    - d. Replacement and step by step adjustment procedure for all components and systems.
    - e. Recommended measurement values such as torque and pressure.
    - f. Functional wiring diagram.
    - g. Lubrication and cleaning, including frequency, methods, and trade identifications of recommended materials.
    - h. Component location and description.
    - i. Inspection and maintenance standards including wear limits, settings, and tolerances.
    - j. Installation and removal sequence.
    - k. Test and evaluation procedures.

- I. Spare parts lists and special tools.
5. The O&M manual shall only contain information related to equipment installed under this contract. Generic information that does not pertain to the equipment installed shall not be included. Scanned documents are not allowed. The fonts should be standard format. The manuals shall be prepared to help WMATA/ELES personnel who perform maintenance, service and repair on the equipment's installed under this contract.
6. The detailed contents of sealed assemblies need not be displayed but their functions must be explained and the appropriate operational specification characteristics listed as well as procedures for test and replacement.
  - a. Maintenance and Renewal Catalog and Wiring Diagram Manual shall contain all the information needed to sustain optimum operation. It shall include general familiarization material; location, function, and operation of all controls, gauges, indicators, and switches; emergency procedures; and trouble diagnosis methods.
  - b. The manual shall be logically organized with systems and elements considered in descending order of importance.
  - c. The Catalog and Manual shall provide, in convenient form, all the information needed for servicing, including lubrication, inspection, running, maintenance and adjustment, and on-line trouble diagnosis.
7. Repair and Maintenance Section shall contain a complete functional description of each component of the escalator likely to require repair and complete procedures and step-by-step guide for the repair and overhaul of the escalator and all components.
  - a. The manuals shall include all measurements for clearance, gap, and torque readings.
8. Four copies of the complete draft copy of each publication shall be submitted for approval at least 60 days prior to the date of acceptance testing of the first escalator.
9. Each year, for a period of five years, on the anniversary of the Final Acceptance date, the Authority shall be provided with the revised catalog and manual pages encompassing all changes to the appropriate escalator models, including modifications of all parts. If no changes occur, the Authority shall be informed in writing on each date the pages are due for submittal.
10. Manuals shall include the following data:
  - a. Table of Contents.

- b. Contractor's name, address and telephone number with similar data for his 24-hour service organization.
  - c. Manufacturer's name, address and telephone number, with similar data for his local representative, distributor and service agency.
  - d. Catalog, model and serial number of equipment installed. Include WMATA unit numbers where applicable.
  - e. Description of equipment.
  - f. Statement of warranty as specified.
  - g. Description of modification, service and repairs performed prior to start of warranty.
  - h. Dates warranty begins and expires
  - i. Standard starting, stopping and operating procedures for escalator sequence of operation.
  - j. Emergency and special operating procedures.
  - k. Routine maintenance procedures.
  - l. Servicing and lubrication schedule.
  - m. Manufacturer's printed operating and maintenance instructions, manufacturer's parts list, illustrations and diagrams.
  - n. One copy of each wiring diagram.
  - o. List of spare parts, prices and recommended stock quantities for routine maintenance of the equipment for one year and list of spare parts that are considered critical and for which extended time frames for acquisition would create undesirable down-time for the equipment.
  - p. List of special tools required to perform inspection, adjustment, maintenance and repair. Special tools are those developed to perform a unique function related to the particular equipment and are not available from commercial sources. One set of all special tools shall be provided for each escalator. No special tools with decaying circuits or disabling clocks are permitted.
  - q. Copy of each approved shop drawing of the equipment and system. Include drawings which show outline dimensions, weights and assembly data: do not include drawings which show manufacturing details.
11. Four sets of full-size laminated electrical wiring drawings shall be provided for each escalator.

All of the above referenced shall be provided as it pertains to the original installation and for a period of ten (10) years after final acceptance of the escalator. During a ten (10) years period, In case of any items are obsolete or no longer available from the manufacturer the Escalator Contractor shall provide the alternative products.

- F. Manufacturers recommended spare parts list.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING**

- A. Deliver materials to site in original unopened moisture proof containers clearly labeled with manufacturer's name, type, grade and color.
- B. Provide setting compound and sealant materials with labels certifying compliance with specifications and that they are of the types recommended by manufacturer for this application.
- C. Store materials on pallets so as to prevent damage and moisture penetration. Materials shall be stored in a clean, dry area.
- D. Handle materials so as to prevent breakage of containers and damage to materials.
- E. Do not work with flammable materials such as polyurethane adhesive components or keep such materials on the WMATA property during revenue hours. Deliver quantities of such materials as are needed for the day's work, and remove any excess from the WMATA property before revenue hours begin. Acquire permits for the use of flammable materials as required by jurisdictional Fire Marshal.
- F. Protect setting compound and sealants from freezing or excessive heat. If necessary, provide heated, dry storage facility.

#### **1.05 SYSTEM DESCRIPTION AND PERFORMANCE REQUIREMENTS**

- A. Design Requirements:
  - 1. Escalators shall be heavy-duty type, designed specifically for the operating; loading and environmental conditions encountered in extensively used, heavy-rail transit systems and shall have a minimum design life as previously defined.
  - 2. Each escalator shall be of a 48-inch nominal width (40-inch step width) and be designed for an incline of 30 degrees from the horizontal.
  - 3. In all design, fabrication, and purchasing, the interchangeability of equipment shall be given maximum consideration.

4. The drive mechanism, step drive unit assembly, motor, steps, step chains, comb plates, handrails, handrail drive units, and any parts subjected to wear or frequent removal shall be readily and easily removable and replaceable without requiring any rigging, modification or alteration of escalator structure, station structure, or equipment.
    - a. Access for all maintenance actions must be available from the step area between the balustrade panels, from the machine room and through the landing plates.
    - b. Standard items such as, but not limited to, steps, comb plates, axles, safety devices, controllers, locks and keys, rollers, handrails shall be interchangeable within each class and may be interchangeable between classes within a single manufacturer to the greatest extent possible.
  5. On parts of equipment subject to wear and requiring periodic replacement, provide key and seat, nut, screws, or other removable and replaceable type mechanical fasteners.
    - a. Such replacements shall not diminish original structural integrity.
    - b. Use of rivets or similar type fasteners requiring physical deformation during field positioning will not be permitted.
    - c. All gaps and running openings within structural design tolerances where the escalator structure meets the surface of the finished openings shall be properly closed by the use of polyurethane sealant as specified or other approved means installed in accordance with the manufacturers' instructions.
  6. Components and materials, except for handrails and step wheels, shall be noncombustible and shall meet the requirements UL-94HB. The equipment shall be quiet and smooth running and be capable of withstanding the operating conditions hereinafter described.
  7. Surface irregularities, sharp edges, or protrusions in public and maintenance areas will not be permitted.
  8. There shall be a work area on top and bottom landing pit. This area should be a minimum of 42" X 30" starting from end of the steps.
- B. Structure Dimensions:
1. Escalators design shall be coordinated with the final architectural and structural design, and escalators shall be fabricated to fit within the structures as dimensioned on the drawings.

NOTE: That the dimensions given on the drawings are designed dimensions. The contractor shall verify all dimensional after construction of decks prior to final shop drawings, fabrication, delivery and installation of trusses.

- a. All field-verified structural dimensions which do not conform to the drawings shall be identified to the Authority so that contractor's corrective action can be reviewed and approved.
  - b. If the wellways are not available at this time for dimensional survey, the escalators shall be designed and fabricated in accordance with approved structural shop drawings.
2. Refer to the drawings showing the location of the working point placement. Note, the station construction drawings have placed the working point of all the escalators on the finished floor line, thus causing the upper and lower landing areas to slope away from the escalators.
  3. The escalators shall be installed under canopies. The Escalator Contractor shall verify the size and location of each canopy prior to the delivery of truss to insure that the fabricated escalator can be installed and also removed for future maintenance or replacement.
  4. In the event of a discrepancy, Contractor shall notify the Authority immediately, and shall not proceed with installation in the areas of discrepancy, until the discrepancy has been fully resolved, and the Authority has instructed Contractor to proceed. Failure of Contractor to report discrepancies shall constitute an acceptance of existing work as fit and proper for the execution and completion of Contractor's work.
- C. Truss Supports:
1. The station structures shall have supports of adequate strength for the truss installation at the upper and lower landings of the wellway. The supports are to be provided with I-beams or bearing plates of steel eight inches wide for the full length of the support surface, for attachment of escalator truss mounting angles by the Contractor. All angles or support bearing plates shall be galvanized paint.
  2. The loads shown on the drawings were computed for heavy-duty, transit system type escalators as specified. The escalators will have the drive motor assembly mounted within the truss or truss width dimension in the flat step and pit area, cage or wellway.

3. The total live and dead load reactions imposed by the escalator assembly, the remote machine loads, and the drive assembly reactions shown on the drawings shall be verified by the Contractor. The Contractor shall prepare calculations for the escalators and submit to the Authority for approval.
- D. Truss:
1. Verify field dimensions when possible of wellways prior to fabricating trusses. Structural trusses shall be designed and fabricated in accordance with the requirements of the most stringent applicable code, and as specified. The width of trusses shall be sufficient to afford a width of the finished escalator of not less than a nominal 40 inches between the skirt panels as defined in ASME A17.1. Deflection under full load, including 320 pounds live load per exposed step, shall not exceed 1/1000 of the intersupport distance.
  2. The truss shall be of sufficient total length to allow for the track radii between the 30 degree angle and the horizontal portion of the truss and the minimum number of flat steps. Provisions shall be made for the thermal expansion and contraction of the complete escalator assembly due to changing ambient conditions. The truss shall be fabricated by welding.
  3. Field splices, where necessary, shall be made with drive fit bolts in reamed holes. Punched holes of proper size shall be provided for attaching the balustrade securing brackets. Field modification of these holes by burning will not be permitted.
  4. The truss shall rest on the top and bottom support beams and the intermediate support recesses provided in the wellway structure.
    - a. Trusses shall be of ample strength to rigidly maintain the alignment of tracks and moving parts and shall be so designed that they will safely retain the steps and running gear, and in case of failure of the track system, retain the step mechanism within the guides and envelope of the individual truss.
    - b. Intermediate supports shall be of the stub column and beam type bolted or welded to the wellway structure. The stub columns may be welded to the truss. All intermediate supports shall be galvanized paint.
    - c. The trusses shall be supported using these supports, to suit the installation. No other attachments to the structure will be allowed.
    - d. All truss mounts, including bolts, angles, shims, bearing pads, and spring supports shall be provided and installed to properly install and align the escalator.

- e. All support points shall be shop coated with galvanized paint prior to truss installation and touched up, if required, after the truss installation.

**E. Drip Pans:**

1. Galvanized steel, welded, oil tight drip pans shall be provided in the truss, for the entire length and width and shall be of sufficient strength to support a concentrated load of 500 pounds on any portion of the drip pan. Material of pan shall be 0.125 inch minimum thickness.
2. Drip pans shall be of a sufficient size to collect and maintain, within the truss area, all oil, water and grease droppings from the step chain and all forms of loose debris that may be deposited in the drip pans from the steps at the turn-around point at the upper and lower portions of the truss.
3. An access shall be provided to the drip pans at the lower landings of all escalators for cleaning the drain catch basin.
4. The drip pans in the upper landings of escalator wellways shall be removable for cleaning, or be otherwise accessible for easy cleaning.
5. Drip pans on exterior escalators shall be designed to collect and drain off all water which may enter through the exposed portions of the escalator, including landing and floor plates. The drip pan in the upper truss section shall be sloped to drain water down the sloping portion of the drip pan to the lower pit. The upper portion of the drip pan shall not be provided with a drain outlet.
6. No transverse bracing shall be placed on the interior surface of the drip pan. Supporting elements impeding drip flow and clean down shall not be permitted.
7. A manual or mechanical method for clearing/cleaning the drip pan shall be provided. Cleaning requirements also apply to longitudinal drains pans (if used).
8. At truss splits, appropriate sealing of drip pans shall be performed.
9. Any screws at splices that protrude below the pan shall be cut flush if the area below is accessible.

**F. Tracks:**

1. Tracks shall be designed and fabricated to safely support, and retain the steps, step rollers and running gear under the maximum load requirements at the highest design speeds specified and under any lateral movement. Sections of track shall be assembled and secured together in a manner that permits easy removal and replacement of defective sections. The design shall permit easy installation and removal of mechanical components without dismantling any part of the truss or building structure.
2. The rolling surface of the track shall be a minimum of 0.12 inch (3mm) thick or of a thickness to provide equivalent strength, safety and rigidity relative to the complete track assembly.
3. Tracks shall be properly supported on trusses to provide correct alignment and smooth, even operation of the running gear. Track shall be fitted with guides to insure proper alignment of steps through the turn around.
4. The radius of the upper transitional tracks shall be determined in conformance with the following constraints:
  - a. A minimum radius of 8 feet- 6 inches for vertical rise less than 10 meters, and a minimum radius of 8 feet-10 inches for vertical rise greater than 10 meters.
  - b. The requirement for the number of flat steps is met in all cases.
  - c. Verify that track loading and wheel size is such that interaction force between each wheel and track shall permit escalator to meet the reliability and maintainability requirements specified herein.
5. The radius of the lower transitional tracks shall be a minimum of 6 feet-6 3/4 inches for Class B units and 4 feet-11 inches for Class A units.
6. It is the intent of these provisions to limit the maximum effect of acceleration on passengers due to radius of curvature of track, consistent with a design for good longevity of wheels and tracks.
7. The step roller/wheel tracks shall be sectional elements of structural steel throughout the truss, incline and transition curves at the upper and lower landings in order to restrain the lateral displacement of the steps, ensure rollers/wheels are retained in their proper position on the track and to provide a smooth ride without discernible vibration.

8. The tracks shall be constructed of drawn steel or other alloy of proper rigidity and strengths and shall be installed and supported to ensure correct alignment and smooth operation of the running gear. All tracks shall have a smooth finished track surface. Means shall be provided to positively ensure the forming of steps before the 30 degree run and flattening of the steps. The unit design shall be such that vibration levels are less than 0.4 inches per second as measured by Bruel and Kjaer model 2516 integrating vibration meter. Readings shall be taken throughout the exposed travel of steps.
- G. Escalator Enclosure:
1. On completion of all work, the finished escalator installations shall be completely barricaded and enclosed to preclude their use without permission until Final Acceptance and release for general use by the jurisdictional inspector and the Authority inspector. The enclosure shall be fabricated in a manner to allow easy access by authorized persons for maintenance, testing, and adjustment, and shall be removed when directed by the Engineer.
- H. Step Chains:
1. Two-step chains of the endless type shall be used, one on each side of the steps.
  2. Each pair of step chains shall be exactly the same length. Only precision roller fish plate chains of high grade, heat treated steel shall be used as step chains. The pins, axles, bushings and rollers shall be hardened and ground.
  3. The breaking factor of safety of a step chain defined as a ratio of chain breaking load to chain traction force, must be a minimum factor of safety of six based on a load of 320 pounds per step.
  4. Pins:
    - a. Pin diameter shall be 5/8 inches (15.875 millimeters) minimum.
    - b. Pin shall be case hardened, with tensile strength suitable for the application.
    - c. Pin pressure shall not exceed 4351 psi (30 N/mm<sup>2</sup>) for standard escalator step chain bushings or 2320 psi (16 N/mm<sup>2</sup>) for polymer non-lube bushings.
  5. Each lot/load of step chain shall be certified by the manufacturer that the step chain meets the requirements of this Contract by design, function and materials.

6. Provisions shall be made to prevent sagging or buckling of the step chains, to prevent steps from coming in physical contact with one another, and to maintain a constant distance between the step axles.
  - a. Automatic tension devices shall be provided to maintain tension under load and to compensate for wear.
  - b. Each step chain shall have a provision for individual fine adjustment of tension.
  - c. The step chains shall be designed and constructed in a manner that permits the removal of a segment, as may be required for replacement purposes.
  - d. Step chains shall be positively guided at the lower and upper landing turnarounds to prevent chordal action and resultant vibration and wear.
  - e. Material, configuration, arrangement, and lubrication requirements shall be submitted for approval.
  - f. Support wheels shall be spaced to distribute the load and to guide the step chain throughout the run, and shall be constructed of a polyurethane material, or equivalent, with a diameter sufficient to provide the reliability, maintainability, and smoothness of motion and noise level specifications contained herein.
    - 1) 4 inch nominal (100 mm) diameter wheels shall be affixed in a manner that ensures positive wheel retention but allows for replacement without dismantling chain link assemblies.
    - 2) Wheel foot print width shall equal wheel width at the hub.
- I. Steps:
  1. Step assemblies shall be cast aluminum. .
  2. The design of the steps and their various attachments shall be such as to permit ready removal of the steps at the upper and lower landings without disturbing the balustrades or dismantling any part of the step drive system.
  3. The design shall permit running the drive without steps or with a minimum of number of steps for convenience in cleaning and inspection.
  4. Color:

- a. Steps shall be aluminum color on the tread and riser surfaces on both raised and recessed portion of the surface; black riser surfaces are acceptable if approved.
  - b. On the step nose, a strip 2 inches wide on the tread and one inch wide on the riser shall be black powder based baked on enamel paint on the recessed portions only of the surfaces.
  - c. Per ASME A 17.1, there shall be demarcation lines on the step tread along the back of the step to delineate the division between steps. These lines shall be marked by a yellow strip a minimum of 1.5 in. and a maximum of 2 in. in width.
  - d. Per ASME A 17.1, there shall be demarcation lines on the step tread along the sides of the step. These side lines shall be marked by a yellow strip a minimum of 0.5 in. and a maximum of 2 inches in width.
5. Steps shall be constructed to be driven by step chains in a manner that will not transmit any of the strain in the step chain to the step.
  6. Lock washers shall be used on all tap bolts, and lock washers and lock nuts or an approved alternative shall be on all through bolts.
  7. Step guides and skirt panels shall be designed to be sufficiently adjustable to meet and hold maintenance adjustment requirements for the life of the unit. The design goal for skirt panel adjustment shall be 3/32-inch clearance between either side of step and its adjacent skirt, with a maximum allowable not to exceed 3/16-inch.
- J. Risers:
1. Risers shall be slotted and designed to interlock and mesh with adjacent step treads to minimize seizure of articles between the riser of one step and the tread of the following step.
- K. Treads:
1. Step treads shall be die-cast aluminum, cleat type, with sound deadening coating at the underside of tread, designed to assure a secure foothold and a comfortable tread surface and shall be an integral part of the step assembly.
  2. Step treads shall have 1/8 inch wide cleats on 3/8 inch centers, not less than 3/8 inch in-depth and shall be designed to mesh with the comb plates.
  3. Step treads shall have a chamfered or radius nosing of 1/8 inch at the riser edge of the tread.
  4. Casting drafts shall be eliminated by machining, grinding or other mechanical means.

L. Wheels:

1. Step wheels shall have 100 percent pure virgin polyurethane tires on a sealed hub and bearing. Step wheel bearings shall be of the ball or roller-type, factory-sealed and self-aligning. Bearings shall be rated for severe heavy-duty service, be of the best quality available, and shall be subject to the Authority approval. Four-inch nominal (100mm) diameter wheels shall be located and arranged so as to prevent tilting and rocking of the steps.

M. Comb Plate Assembly:

1. The comb teeth assemblies of the comb plate shall be of a highly wear-resistant, noncorrosive material, with an anti-slip surface.
2. Comb teeth assemblies of the comb plate shall be bright yellow in color and shall clearly contrast with any step demarcations required by code. Finish shall be baked enamel. No plastic comb plates shall be permitted.
3. Comb teeth shall be designed as removable sections, to permit easy replacement without the aid of special tools or equipment. Each assembly shall have a minimum of three and no more than seven comb teeth sections.
4. A method of fine lateral and vertical adjustment of the comb teeth sections shall be provided so that the cleats of the step treads will pass between the comb teeth with minimum clearance. The teeth shall be designed to engage the treads on the escalator steps in such a manner as to reduce to a minimum the dangers of injury to passengers, and prevent breakage and wear of comb teeth caused by interference with step treads.
5. The comb teeth shall be adjusted according to ASME A17.1, but in no case shall the penetration be less than 3/16- inch into the step tread.
6. Two individual safety switches shall be employed for comb impact device assembly on each side of the comb plate landing. One switch and a spring are for vertical force activating device adjustment and the other switch for horizontal force activating device adjustment. These two switches should have a separate spring for adjustment. The vertical tripping force and the horizontal tripping force should be able to adjust independently to maximum allowable force.

**N. Landing Plates:**

1. Landing and floor plates shall be furnished and installed by the Contractor to cover the entire areas of the upper and lower landings. A frame around the floor openings shall be provided to receive the landing and floor plates. The upper edge of the frame shall enclose the open pit space, be at the elevation of the finish floor and be contiguous with the finish floor.
2. Landing and floor plates shall be reinforced to be rigid. Exposed portions of the landing and floor plates shall be of a material and finish to harmonize with the steps and comb plates. All landing plates shall be sufficiently lightweight and removable, or hinged, for easy access to the machinery and maintenance areas below, and designed in sections of a size and weight capable of being handled by an average person. Landing plate fasteners shall be readily removable by maintenance personnel.
3. The landing plates and floor plates shall be of a wear-resistant, noncorrosive material with an anti-slip surface. The anti-slip surface shall be American Safety Technologies Inc. AS-250 or equivalent and shall be designed for a live load of 250 pounds per square foot. The landing plate shall be installed flush with the adjacent floor area. Deflection with maximum load shall not exceed applicable code. The landing and floor plates of all escalators shall be coated with AS-250, applied per written manufacturer's recommendation, black in color stopping 2 inches from the combplate.
4. Upper and lower landing plates of each escalator installed in Class A escalator shall have access provided as an integral part of the plate. The supplier shall demonstrate the adequacy of the proposed access to the satisfaction of the Authority.
5. In cases where two or more escalators are installed side-by-side, landing plates shall be designed to allow adjacent escalators to remain operational while work is being performed on an escalator.

**O. Metal Balustrades, Newel Panels, Skirt Panels and Decking:**

1. Surface panels shall be type 316 stainless steel and at least 0.075-inch (2 mm) thick. The panels shall be reinforced to withstand the specified loads/forces as specified in ASME 17.1. Skirt panels shall match the balustrade panels.
2. Decking shall be reinforced metal with material and finish to match the balustrade and skirt panels. The finish of the face side shall be as specified in the escalator materials legend.
3. Moldings, trim, baggage stops and other miscellaneous metal items shall match the surface to which they are attached.

4. Edges of the balustrade and newel panels shall be sealed against moisture and shall then be framed within a welded aluminum "U" channel except for the facing section. Sections shall be made in equal lengths for interchangeability where practical.
5. The panels shall be designed and fabricated to permit easy removal for inspection, lubrication, and adjustment of safety devices located behind the panels. Panels shall be designed to be individually removable, without the need to remove any other panel.
6. Panels shall be fully engaged and seated in place properly. The top and bottom of each panel shall be covered a minimum of ½ inch to secure the panels and shall be free of rattles.
7. Removal or replacement of the panels shall not affect the escalator mechanical operation in any way. The panels shall be removable without the use of special handling equipment, and by not more than two persons. All panels shall be securely fastened to their respective supports or mating portions to ensure a secure installation resulting in flush surface.
8. Removal of the fasteners shall be with the aid of simple tools. When the framework to which the panels are fastened is less than 1/4-inch (6.35 mm) thick, steel backup plates 1/4-inch (6.35 mm) thick shall be added with tapped holes and clearance holes where necessary.
9. All paneling, decking, and other enclosures shall be supported on the steel framework. Wood or wood products will not be permitted for use in any part of the escalator.
10. The decking between escalators and deck extensions shall be free draining and shall be designed to support a live load of 100 pounds per square foot (489.3 kilograms per square meter), without "oil canning" of the surface or a deflection of greater than 1/200 of the span.
11. Details for the fabrication and application of baggage stops shall be as shown on the drawings and shall match current system design.
  - a. Baggage stops are used only at Double Escalator applications.
  - b. The baggage stop is a stainless steel disk, 2 inches in diameter and 2 inches high, fastened to the stainless cladding between escalators by machine screws.
  - c. Baggage stops are placed every 24 inches along the plate.
12. The balustrades and decking shall be designed and installed so that the interface to the adjacent wellway surfaces does not leave openings which would be in violation of applicable codes, or offer areas of potential entrapment or infiltration of foreign substances.

13. Shear guards of material matching the decking or clear lexan shall be provided in the intersecting angle of the outside balustrades and the ceiling or soffit where required in order to comply with applicable codes.
  14. Provisions for mounting information signs at the upper and lower landings of all escalators shall be made.
- P. Neoprene Joint Filler:
1. Lubricant-adhesive: One-part polyurethane, non-staining to adjacent surfaces, as recommended by joint filler manufacturer.
  2. Joint filler: Preformed polychloroprene or neoprene joint filler, sized for joint as required; ASTM D2628.
  3. Application: Prime and lubricate both sides of joint for adhesion of filler as recommended by manufacturer. Fill joint continuously with joint filler bonded together to form continuous strip.
- Q. Cladding and Base Plates:
1. Stainless steel cladding shall be solid as specified in Section 1.05 O, with a fully adhered 3/4-inch thick core of noncombustible, sound-absorbent material and backed with galvanized sheet steel, ASTM A525M, G90 coating or better.
  2. Base plates shall be finished to match the cladding and shall be laminated to reinforced, galvanized sheet steel backing 16-gauge minimum. Where sufficient rigidity is achieved and sound decibels are met, design may omit core of sound insulation and backing.
  3. Finish panels shall be as specified on the escalator materials legend.
  4. All panels shall be secured with concealed screws and shall be of such size and weight (less than 30 pound) that one mechanic can easily remove or replace a panel with the aid of simple tools.
  5. All sections shall be made in equal length for interchangeability where practical and for removal independently of the adjacent panels.
  6. All necessary steel framework and attachments shall be included for a complete installation.
    - a. All openings shall be provided in the above panels as shown on the Contract Drawings and coordinated with the trades.
    - b. The cladding shall be designed and installed so that the interface to the adjacent wellway surfaces does not leave any openings that would be in violation of applicable codes.

R. Sealant and Accessories:

1. Primer: As recommended by sealant manufacturer; tested for non-staining and durability characteristics on samples of actual surfaces to be sealed.
2. Solvents, cleaning agents and similar materials: As recommended by sealant manufacturer.
3. Backup material: Non-staining, compatible with sealant and primer; and resilient, closed-cell foam sponge rubber, tube or rod stock, ASTM D1056, Class SC-E, Grade SCE 41 for general use, Grade SCE 44 where sealant is subject to traffic.
4. Sealant: Polyurethane; single-component, FS TT-S-227, or two-component, FS TT-S-230; Type I, self-leveling for joints in horizontal surfaces; Type II, non-sag for joints in overhead and vertical surfaces. Color shall match color of surfaces being sealed.
5. Application: Apply products in accordance with manufacturer's printed instructions.

S. Handrails:

1. Handrails shall be of the traction-drive type, and have a return of 180 degrees minimum around the newel. Handrails shall receive their motion from the main escalator drive through direct gearing and drive shaft, auxiliary drive or drive chains designed so that the handrail and steps operate at substantially the same speed in either direction of travel. Handrail speeds shall be synchronized with step speed so that there is no more than plus or minus 4-inch displacement of the handrail with respect to the step in a full run in either direction. Separate or independent handrail drives are acceptable so long as the function specified and the applicable code requirements are met. Handrail lead or trail speed shall not exceed the tolerance defined in ASME A17.1.
2. Provide methods within escalator and approved by the engineer (1) to adjust the slack and tension in the handrail and (2) for releasing tension for repair or removal of handrails. Pre-tensioning of handrail to create traction on drive is not acceptable. Driving and guiding wheels shall be compatible with the design of the underside of the handrail.
3. The handrail drive mechanism shall be designed to operate without slippage under full load condition and, at minimum, maintain no less than 30 square inches of contact with the underside of the handrails at any time.

4. The surface of the newel base adjacent to where the handrail enters or leaves shall be at an angle of 90 degrees with the surface of the handrail. The newel shall be of an extended type designed and constructed in such a manner that the handrail will enter the newel end at a point inconspicuous and difficult for the passengers to reach.
5. Handrails, handrail drive systems and guides shall be so designed and installed that the handrail cannot be physically thrown off or disengaged while running, and special design attention shall be given to the area where the handrail passes from the drive system to the guides.
6. Handrail wheels, where used, shall have a bearing material or bearings that have provision for retention of lubricant to insure satisfactory lubrication and operation.
7. Friction drive wheels and idlers, where used, shall be designed and positioned in such a manner that lubricant cannot reach the surface of the handrail. Marking and spotting of the handrail by the drive equipment will not be permitted.
8. The handrails shall be constructed with non-separating stainless steel mesh core laminated with the handrail structure so as to be resistant to the environmental conditions set forth herein and the materials vulcanized into an integral, non-separating, seamless, smooth handrail.
  - a. A specially coated finish to minimize the frictional wear to the underside of the handrail shall be provided.
  - b. Hand rails shall contain no cotton and shall comply with Fire Protection guidelines specified in Section 1.05 W. 4.
9. The handrail guides shall be continuous on the exposed portion of handrail and shall be constructed of 316 stainless steel which shall not subject to corrosion or pitting, and shall have a polished or specially coated permanent finish to minimize the frictional wear to the under surface of the handrail.
10. Anti-static rollers to prevent static electricity shocks shall be provided at both top and bottom of the escalator. The color of the handrail material shall be black. The material selected for the handrail shall not be subject to swelling or other deformation when exposed to the environmental conditions given in Section 1.05 W. 7.

- T. Drive Units:
1. Mount motors and drive mechanisms within truss envelope and/or truss width if positioned below on the floor of the upper machine room. Use single-stage worm gear or planetary gear type drive machine designed especially for moving stair service, with means for determining oil level inside the case and for draining oil, driven by an electric motor, the speed of which shall not exceed 1800 rpm.
    - a. The drive machine shall be readily accessible without use of special tools.
    - b. The design of movable carriages shall be such that freedom of movement is maintained over the life of the escalator with proper maintenance.
    - c. Provisions to access the drive motor and gear boxes individually and also to replace them individually for maintenance and repair without any special equipment are required. The motor should have a bed plate or equivalent method for easy removal during maintenance.
  2. Design shafts, where possible, for ease of assembly or disassembly, without use of keyways.
  3. If chain drive is used between motors, reduction gears, or other drive mechanism:
    - a. Design shall have provisions for tensioning chain.
    - b. Drive chain must run in a safety housing.
    - c. Manual tensioning with automatic lubrication shall be provided.
    - d. Chain drive systems, where used, shall use double or triple strand roller chains for transmitting power from the step chain sprockets.
    - e. Step chains shall be driven by sprockets connected to the drive machine with a double- or triple-strand roller chain.
  4. Drive sprockets shall directly engage the step chain. Intermediate linkages or belt drives are not permitted in the power transmission members.
  5. If carriages are required for step chain tensioning, they shall be designed for continued free movement of the carriage under varying chain tensions and with a guide system which prevents skewing or crabbing as the step chain tension is modified. Provide mechanical adjustment and spring-operated device to aid in adjustment of tension. Provide carriages with scale and pointer on accessible section of carriage frame to indicate movement and amount of adjustment available.

6. Position scale and pointer to indicate zero for initial position of carriage, prior to placing in service.
7. The use of timing belts is prohibited.
8. Provide rotating parts with means for lubrication and retention of lubricants. Use sealed bearings in those environmental conditions where entry of water or dust may adversely affect bearing performance. Bearings shall be rated for severe heavy-duty service, shall be the best quality available and shall be subject to the Authority's approval. Protect exposed moving drive elements by removable sheet metal or wire mesh guard or shield assemblies designed to allow for free air circulation.
9. Means shall be install to detect excessive movement/worn on bearings for main drive shaft and carriage. The signals to controller should not affect the operation of the escalator, but just for alarm purpose.

U. Brakes and Sequence of Operations:

1. Each drive motor shall be equipped with one motor shaft brake, which is sufficient to dynamically stop (320 pounds per exposed step) and statically hold a fully loaded escalator (674 pounds per exposed step). This load shall not include any loads imposed by an operating escalator.
  - a. The deceleration rate shall be no greater than 3 feet per second squared in accordance with the ASME A17.1 code requirement.
  - b. Deceleration rate shall be adjustable to the maximum allowed by the Code.
  - c. The stopping distance shall be at least four inches less than the distance between the first skirt panel safety switch and the comb plate.
  - d. Under no load conditions, the escalator shall stop in a nominal 10-20 inches with a unit-to-unit variation of no more than 4 inches.
  - e. Brakes shall comply with the requirements of ASME A17.1.
2. Each escalator shall have the following brakes for the stopping and locking of the moveable drive components:
  - a. A motor brake shall be provided on the motor shaft for shutting down and holding the escalator with the full specified loads upon activation of either
    - 1) Normal stop control,

- 2) Emergency stop button,
  - 3) Any safety device switch or
  - 4) Loss of power.
- b. An emergency brake shall be provided on the main drive shaft to stop and hold the fully loaded escalator if the drive chain parts.
- 1) The emergency brake shall be electrically interlocked so that when actuated it shall disconnect the motor from the line.
  - 2) When actuated, the emergency brake shall be reset by means of a separate key actuated switch.
- c. If the main drive unit is directly connected by gearing to the main drive shaft, without a chain or other means of transmitting power that is susceptible to breakage, the emergency brake will not be required. The gearing shall maintain at least 2 teeth in contact at all times.
- d. An apparatus shall be provided to mechanically lock the step chains and prevent movement at such times as repair work is performed within the truss or upon the other brakes.
- 1) This apparatus shall be a positive mechanical device that shall be manually engaged to prevent movement of the step chains.
  - 2) An electrical interlock shall prevent the escalator drive motors from starting while the apparatus is engaged.
- e. Both the motor brake and the emergency brake shall be mechanically or magnetically applied and electrically released. Brakes shall be of a fail-safe design. The Hydraulic brake is not recommended due to the hydraulic fluid entering to friction surface may affect the escalator stopping and holding capability.
- f. The design of the brakes shall provide for easy access to the brake equipment for inspection and maintenance.
- 1) The operating temperatures of the brakes shall not exceed 195 degrees Fahrenheit (90 degrees Celsius) above ambient.

- 2) Brake torque requirements shall be permanently marked on the brake. The procedure for measuring torque shall be included in the O&M manual.
- 3) The brake assembly shall be designed to provide an audible warning indication of brake pad wear (at the 80-percent level of wear) and to prevent restart of the escalator unit on the brake pad reaching an unacceptable wear level as identified by the manufacturer. (Refer to Section 1.05 V. 6. d)
- 4) The manufacturer shall provide written instructions describing field testing and field measurement of brake torque.
- 5) Friction surfaces shall be protected from oil, grease, dirt and other substances which would reduce brake friction.

V. Safety Devices:

1. Specific switches and safety devices are required to insure safety during maintenance and to shut down the escalator in an emergency.
2. A disconnect switch capable of being locked in the OFF position shall be provided in the upper pit of each escalator to prevent the starting of the escalator from any other location.
3. All safety devices shall be clearly identified and accessible for maintenance within the escalator. These devices shall be designed for easy adjustment or reset without dismantling the escalator.
4. If an escalator stops because of a malfunction or actuation of a safety device, it shall be impossible to operate the escalator until the safety hazard or malfunction has been corrected. A manual start shall be necessary if the escalator stops for any reason.
5. An EMERGENCY STOP button shall be located according to ASME A17.1 and the Code.
  - a. The emergency button shall be a momentary contact-type push button.
  - b. This emergency button shall be housed under a clear, high impact-resistant plastic cover, which shall be self-closing by means of a gravity/positive closure cover.

- c. The cover shall have clearly printed upon it, EMERGENCY STOP, in white Helvetica medium-typeface letters, 3/8-inch minimum height.
  - d. The cover shall be hinged at the top and lift from the bottom.
  - e. The emergency button shall be red in color and visible through the cover.
  - f. The cover shall be provided with a switch to set off an alarm when lifted, but it shall be necessary to press the STOP button to stop the escalator. The cover alarm switch shall be a proximity device not requiring mechanical contact to operate.
  - g. The alarm shall be continuous for five minutes while the cover is lifted or until manually silenced by the key on/off switch at the operating controls.
6. Each escalator shall be equipped with safety devices in accordance with the Code, any other safety devices appropriate to the specific design; and shall include but not be limited to the following:
- a. Over/Under Speed Device - A device which detects operating speeds of less than 80 percent or more than 110 percent of the rated speed. The device shall operate in both directions.
  - b. Step Sag Device - A device that can detect a 0.2 inch (5 mm) out-of-level condition on any step. This step sag device or a separate device shall detect step or axle/chain rollers with diameter reduced 0.2 inch (5mm) or more before steps enter a turnaround or comb plate area.
  - c. Skirt Obstruction Device
    - 1) These devices shall be installed behind the skirt panels at the upper and lower landings and intermittently along the 30 incline at distances not to exceed 20 feet.
    - 2) At both the upper and lower landings, these devices shall be located such that the escalator will stop in a distance at least four inches less than the distance between the first skirt panel safety switch and the comb plate.
  - d. Brake Lining Wear Device - A device which detects a condition when degree of brake wear is such that the brake function cannot meet the requirements of this specification. Activation of this device shall prevent escalator start until the brake has been serviced.

- e. Motor Over-Temperature Device – A PTC shall be embedded in the motor windings to detect a motor over temperature condition.
    - 1) When the PTC detects a motor over temperature, the escalator shall shut down and not be able to be restarted until the temperature of the motor has cooled to within design specifications of the motor.
    - 2) Motor Over-Temperature device shall be manually reset type to facilitate investigation of over temperature condition.
  - f. Motor Temperature Monitor - A device which shall indicate on fault-finding annunciator panel the date and time operational parameters for the motor were exceeded.
  - g. Provide a monitor/alarm to ensure notification of a disengaged brake during maintenance.
  - h. A manual locking mechanism shall be provided to secure the step chain during maintenance. This device shall be interlocked such to prevent escalator operation while engaged and may be an integral part of 1.05.V.6.
  - i. Step Upthrust – A device which detects a condition in which an article becomes wedged between the step tread of one step and the riser of another step while forming a landing. This device shall be provided at both landings.
  - j. Install skirt deflector devices using threaded steel inserts in the skirt to allow repeated removal and reinstallation.
    - 1) The length shall be the same as skirt panel sections for the straight segments to allow the skirt panel to be removed without disassembling the entire brush.
    - 2) Top and bottom radial segments with end caps and all fittings for a complete installation shall be provided.
    - 3) Fasteners for attaching the strips to the skirt panels shall be selected to be appropriate for the skirt panel construction.
7. Upon activation, devices as defined in Sections 1.05 V. 6. a through e., inclusive, shall interrupt electric power to the individual escalator motor, automatically apply the brakes and bring the escalator to a stop.

W. Operating Controls:

1. Each escalator shall have a control station (operating controls) at each landing. The control stations shall be mounted on the newels.
  2. Interlock shall be provided to require that the escalator be brought to a stop before a direction change is made.
  3. Escalators shall have key operated switches, accessible at both upper and lower landings, located on the exterior deck above the newel base. (A separate switch must be provided for direction (UP and DOWN) and stop switch; the stop key switch should be below the direction switch). Alternate locations may be used subject to approval by the Authority. The key shall be an Allen-Bradley #D018, Cylinder Model #800T-J631KC1, with 30mm switches. Each keyed switch shall be clearly and permanently labeled, including starting, stopping and direction selection.
    - a. Cylinder locks having not less than five disc combinations may be used provided keyway, tumblers, and springs are of stainless steel.
    - b. Five (5) keys shall be provided for each station.
    - c. Locks and keys shall be provided.
  4. Provided no safety devices are activated, manual escalator start from a key switch shall be possible from both landings upon restoration of power following an outage or after the emergency stop button has been inadvertently activated. In the event of escalator shut-down resulting from activation of a safety switch, a start shall be possible from either landing only upon completion of the appropriate corrective action and a manual reset at the controller.
- X. Performance Requirements:
1. Escalators shall not generate noise levels in excess of 65 dBA measured five feet above the floor or stair level at the entrance comb at either end and along the incline with escalator operating under rated load and no load.
    - a. Background noise without the escalator operating shall not exceed 49 dBA at the measurement point at the time test measurements are taken.
    - b. For multiple escalator installations the noise measurements at each installation shall be made with only the escalator under evaluation operating.
  2. All escalators shall be designed using tamper proof fastenings to the maximum degree practicable.
  3. Corrosion Protection

- a. The escalator assembly shall be designed and enveloped in a manner to avoid corrosion and galvanic action due to physical contact between metals or other causes. Trusses shall be hot dipped galvanized.
  - b. Where the use of adjoining dissimilar metals is required, the descriptions of protective measures to be employed shall be provided to avoid corrosive damage.
4. Materials of construction shall be noncombustible (as defined in ASTM E136) and the design shall produce a fire-resistant installation. Handrails shall have a flame spread rating of 76 to 200 when tested in accordance with ASTM E84. Lubricants shall be selected to obtain the highest practicable flashpoint, consistent with other requirements. Fire control means shall be non-hazardous to human life and shall be approved by the Authority.
5. In addition to the minimum requirements given in the Codes, the Contractor shall design the steps for a minimum load of 320 pounds load with an ultimate strength safety factor of eight. The steps shall carry the load under maximum, concentric and eccentric loading conditions without distortion.
6. Step Testing
  - a. Step assemblies shall be tested in accordance with ASME A17.1 STEP FATIGUE TEST requirements, Sections 8.3.11.1 through 8.3.11.6, as a minimum. The Contractor shall furnish a certification by a Professional Engineer an actual copy of the test report. The step assemblies shall be a sample test for each lot so that the manufacturer guarantees compliance with the fatigue requirements. Step castings will be permanently marked to identify casting source, casting date, assembly and installation.
  - b. Perform dynamic testing, witnessed by the WMATA representatives and, to verify the structural strength and serviceability requirements and submit certified test results. Testing shall include the tests necessary to verify the structural capacity of the step.
7. All escalators shall be designed to operate at full specified performance in temperature ranging from minus 10 degrees Fahrenheit to 140 degrees Fahrenheit dry bulb while exposed to sunlight, rain, snow, slush, debris, airborne dust, tracked on deicing substances, and maximum patron loading.
8. Controllers shall be designed to operate in a temperature range of 32 degrees Fahrenheit to 140 degrees Fahrenheit dry bulb.
9. Unintentional abuse by patrons and vandalism shall be a consideration in the design of the escalator.

## **1.06 SITE CONDITIONS**

### **A. General:**

1. During installation and until the Final Acceptance, the escalators may be subjected to more extreme environmental conditions. Furnish the amount of protection necessary, and to the satisfaction of the WMATA to prevent any damage or deterioration to the escalators during this period.

## **1.07 WARRANTY**

Warranty: Two (2) year warranty of construction shall start at Final Contract completion.

- A. The OEM shall warrant in writing that all equipment manufactured and installed under this specification, for a period of twenty four (24) months from the date of Final Acceptance by the Authority, be free of defects in design, materials, and workmanship, under normal use and service. Defective work shall be repaired or replaced at no additional cost to the Owner.
- B. The warranty shall include materials and labor necessary to correct defects.
- C. The warranty does not begin until all of the following requirements have been met.
  1. The Operations and Maintenance Manuals are accepted by WMATA.
  2. The required training has been completed to the satisfaction of WMATA.
  3. All field tests have been successfully completed.
  4. The acceptance testing has been successfully completed.
  5. The escalators are in service for passenger/public use.
  6. The State and local jurisdictions have inspected the escalators and issued the respective certificates of Operation.
  7. All spare parts have been delivered and received by WMATA.
  8. Any discrepancy identified by the ELES representative shall be repaired or replaced by the Contractor at no additional cost to the Authority.

## **1.08 OPERATION AND MAINTENANCE TRAINING**

A classroom training program shall be developed to instruct WMATA Operations and Maintenance personnel in the operation and maintenance of escalator equipment.

- A. The following training requirements shall be met:
  1. Three days of classroom plus two days hands on training on the field shall be provided for 10 students per class. Six training session for a total of 60 students is required.

2. Time and place of training will be determined by the Authority, but must be completed no later than 30 days prior to the Final Completion.
3. Training shall be organized to make optimum use of the required maintenance and operation manuals including training for replacement of all parts contained in the Parts Inventory list.
4. Training materials reflecting the final installed equipment configuration shall be submitted to support continued in-house WMATA training. Photos of actual equipment shall be included to support training materials.
5. On-site training may be included and/or supplemented with mock-up equipment, as appropriate.

**B. Scope of Work:**

1. All training, as described below, shall take place prior to Final Acceptance of equipment or materials. Operations and maintenance training may take place as a combined class by agreement of the Office of Elevators and Escalators (ELES). The minimum number of ELES employees to be trained will be 60 total with a maximum of 10 in each class. Those persons will be identified by WMATA. The contractor shall video tape all training sessions and provide WMATA/ELES with edited copy of the recording. The video shall be edited for the purpose to be used as a training guide for other WMATA/ELES mechanics.
2. At the completion of the first training session, a narrated and properly edited training video shall be submitted for the Authority on DVD or flash drive. The video shall be taken by the professional camera operator with quality image and sound track and will be used for the future trainings. The video shall cover operation of the elevator, function of the devices, maintenance, adjustment procedures and troubleshooting. The following items shall be included as minimum requirements:
  - 1) Step by step adjustment procedure on the followings:
    - 1.1 Handrail system including drive chain
    - 1.2 Comb Impact device
    - 1.3 Escalator Brake
    - 1.4 Bottom Carriage ...
    - 1.5 Drive and motor alignment
    - 1.6 Safety switch adjustment and clearance
  - 2) General overview of major items:
    - 2.1 Motor:
    - 2.2 Gearbox:

- 2.3 Bull gear and Carriage system
  - 2.4 Controller:
  - 2.5 Controller display:
  - 2.6 Brake mechanism
  - 2.7 Escalator pit
  - 2.8 Handrail system
  - 2.9 Guide rails
  - 2.10 Automatic oiler
  - 3) Daily operation and sequence of operation
  - 4) Replacement and Installation of components:
    - 4.1 Brake
    - 4.2 Balustrade panels
    - 4.3 Escalator steps
    - 4.4 Handrail Drive chain
    - 4.5 sensors
  - 5) Proper step and chain guide adjustment
  - 6) Verification of safety circuit
  - 7) Maintenance procedure and Frequency of maintenance
  - 8) Proper access of pit and step band
  - 9) Proper test of over/under speed operation
  - 10) Proper lubrication of components
  - 11) Troubleshooting techniques
  - 12) Proper clearance check between the skirt and balustrade panels.
3. Operations training shall be tailored specifically to the furnished and installed equipment, and designed to teach the day-to-day operation of all equipment. The training shall be sufficient to bring personnel to a level of operating proficiency such that routine vendor support is not needed.
4. Maintenance Training shall be tailored specifically to the furnished and installed equipment, and designed to develop the knowledge and skills required to maintain all item(s) delivered. Maintenance training shall be subdivided into two major levels as follows:
- a. System Level Maintenance Training, covering:
    - 1) Theory of operation of the system and its major components.
    - 2) System configuration.
    - 3) Preventative maintenance, consisting of written procedures and schedules for the periodic maintenance of all equipment.

- 4) Written and validated inspection procedures and a system-level trouble-shooting guide (to the lowest field-replaceable unit).
  - b. Shop Level Maintenance Training, covering:
    - 1) Detailed theory of operation to module, board, and/or device level.
    - 2) Component level troubleshooting and component replacement.
    - 3) Testing and alignment procedures of repaired units.
- C. Deliverables:
  1. The following course materials shall be delivered by the Contractor, according to the following specifications:
    - a. An Instructor's Guide containing all the information and direction necessary for the instructor to make an effective presentation. It shall include adequate guidelines to conduct a comprehensive training program. Individual lessons within the course shall be organized as separable blocks (or modules) which may be taught as a unit. In some instances, the same module may be used in more than one course. The Instructor's Guide shall contain, as a minimum:
      - 1) Discussion of student prerequisites (if any).
      - 2) Program overview.
      - 3) A statement of overall program goals.
      - 4) Lesson plans (a session-by-session outline containing the following):
        - a) Student learning objectives, stated in measurable terms.
        - b) Overview of each lesson.
        - c) Suggested instructional methods/learning activities.
        - d) Required equipment and resources. Special training equipment, test equipment or special tools required for maintenance training shall be supplied by the Contractor and delivered to the Authority's representative after completion of the course.

- e) Evaluation Device(s), (written and/or practical tests) designed to measure the extent to which students have met the learning objectives with an answer key for each of the tests developed.
- b. A Student Manual including all materials for the student to interact in the learning situation. It shall contain, as a minimum:
  - 1) Program overview and introduction.
  - 2) Statement of overall program goals.
  - 3) Learning objectives, stated in measurable terms, that specifically describe desired behaviors or knowledge to be gained.
  - 4) A fully developed prose treatment (not outline format) of content presentation, developed in the same modular format as the Instructor's Guide.
  - 5) Illustrations, charts, photos or other graphics of actual system components, as needed to enhance content presentation.
  - 6) The training manuals shall be prepared and submitted for approval prior to training. The training manuals shall include procedures for adjustment and replacement of all electrical and mechanical components, and a troubleshooting guide.
- c. Audio-visual Aids consisting of:
  - 1) A narrated video of not less than 90 minutes duration to include, but not limited, to the following:
    - a) General overview of major features.
    - b) Daily operations.
    - c) Maintenance procedures (lubrication, adjustments, critical measurements, etc.).
    - d) Frequency of maintenance procedures.
    - e) Parts replacement, safety device, lighting, etc.
    - f) Verification of safety circuits methods of accessing and preserving computerized functional data if required.

5. Testing. Instructors must give written and/or practical tests as a measuring device to determine knowledge transference. Tests shall use a multiple-choice or short answer format, and have been validated in a pilot course or by some other means agreed to by the Authority. Whenever possible, a practical hands-on test shall be developed to demonstrate the transference of operational/mechanical skills.

## **1.09 SPARE PARTS AND SERVICE FACILITY**

At the expiration of the warranty requirements of the General Provisions, the Contractor shall provide a spare parts and service facility in the United States at no additional cost to the Authority from which all manufactured parts and components of the equipment furnished and installed under this Contract can be obtained for an additional five years. If product source is another vendor, Contractor shall include name and address of other vendor.

- A. Spare Parts and Special Tools:
  1. This provision requires the furnishing of a Recommended Spare Parts and Special Tools List based on manufacturer's recommendations; defines criteria to be used in developing spare parts recommendations; defines the manner of identifying spare parts on the list and the labeling and identification of spare parts upon delivery; and the timing of delivery of spare parts.
  2. Escalator parts list shall be grouped by system and subsystem for stocking identification and the list shall contain the following information for each item listed:
    - a. Component name and Part number(s)
    - b. Manufacturer's name
    - c. Model number(s)
    - d. A blank column for WMATA's part number
    - e. Manufacturer's recommended quantity (see Section 1.09 A. 3, below)
    - f. Anticipated annual usage
    - g. Unit price
    - h. Available packaging
    - i. Special storage and handling requirements
  3. The manufacturer's recommended quantities shall be based upon the following reliability, usage and lead time considerations:

- a. Wear: Components which may be expected to require replacement under normal maintenance schedule and operations, such as mechanical parts subject to continuous operation within the projected mean time between failure levels.
  - b. Consumables or Expendables: Components which are consumed, used up, destroyed, or upon failure, are otherwise made unusable for their intended purpose and are economically unrecoverable except for inherent scrap value.
  - c. Recoverable or Repairable: Components which, upon failure, are capable of being repaired or remanufactured to a serviceable, operational condition and maintained available for use within their initial intended purpose.
  - d. Long Lead: Components which are not available at short notice from commercial distributors or within 48 hours from the manufacturers, such as specifically made or selected components.
4. Cross referencing: Where replacement components are common to more than one system or subsystem, include a cross reference and indexing system in the replacement components list:
  5. Non-Unique parts: In all components lists, items which are not unique to the system and have been manufactured by others shall be identified by the manufacturer's name and part number.
  6. The Contractor shall propose and provide a spare parts inventory to be approved by the Engineer and provided to the Authority not less than 90 days prior to scheduled completion, equal in value to seven percent of the cost of each elevator.
- B. The Authority will provide shipping instructions, with WMATA part numbers for each item. The parts shall be shipped to the locations as directed by the Authority. Shipping documents shall identify the Contract number, manufacturer's part number, quantity, unit price and WMATA part number.
1. Spare parts shall be properly packaged or crated so as to prevent damage during shipment and long-term storage. An individual packing slip shall be included inside the package or crate.
  2. Spare parts shall be the same in all respects as their counterparts furnished as a part of the assembled equipment to be delivered.
  3. Parts furnished in accordance with this provision are WMATA spares, separate and distinct from any Contractor obligation to replace parts, components or assemblies under any warranty provision.

4. Parts lists contained in Operations and Maintenance Manuals provided under the Contract shall include assigned WMATA part numbers.
  5. A Manufacturer's Recommended Spare Parts List shall be provided. Parts to be provided shall be based on the criteria described herein and require Authority approval and shall be provided prior to Final Acceptance.
  6. Any Special Tool(s) used including, but not limited to, troubleshooting, maintaining the elevator, software and/or hardware shall be provided as part of the spare parts to the Authority. Any tools provided shall be the same as those issued to the Adjuster and equivalent members of the subcontractor's staff.
- C. Security of Machine Rooms:
1. The Contractor shall be responsible for the security of the contents of each machine room. The Contractor shall control access to that room, and ensure that it shall remain secure at all times until the completion of the Contractor's interim maintenance obligation.

#### **1.10 SPECIAL TOOLS**

- A. A complete set of special tools and instruments necessary for troubleshooting, maintenance, repair and making all adjustments on every part of the elevator installation, including software and hardware shall be furnished for each escalator and delivered to the Engineer as part of the spare parts inventory. Tools that are designed specifically for tasks associated with elevator inspection, maintenance and repair or that are required for these tasks, and are not readily available through normal purchasing channels are defined as special tools.
- B. Any "Special Tool/ equipment" that is required to troubleshoot, maintain, adjust, and test the system; the tool/equipment shall remain operational for the life of the equipment.
  - a. Provide all special tools and equipment necessary for making all system adjustments to the controller and other equipment. A programming unit, approved by equipment manufacturer (OEM) such as a new laptop with 4GB memory, 15-inch display and DVD drive, with all software packages required to setup and program all equipment in the elevator system shall be provided, one per station or location. Software shall be provided for the display unit, DeviceNet, motor drive, if applicable, and any other programmable devices, as well as for the controller PLC. Any hardware or software required for configuring, programming and or communicating to controller or any parts of the escalator shall be submitted to ELES engineering. Using the provided laptop, the contractor shall demonstrate loading, downloading (programming)

any and all software that is required for the escalator for all operating needs. This includes display, PLC and any I/O controls. All special tools shall be new and to be provide with casing. No special tools with decaying circuits or clocks are permitted.

- C. Keys: Provide ten (10) sets of keys per escalator to operate all keyed switches and locks prior to completion of the first unit.

### **1.11 AUTHORITY COORDINATION:**

The escalators shall not be in service for passenger/public use until all of the following requirements have been met.

- 1) The Operations and Maintenance Manuals have been approved and received by WMATA.
- 2) The Training and Student Manuals as well as video record of all training sessions have been approved and received by WMATA
- 3) The required training has been completed in accordance with this specification.
- 4) All field tests have been successfully completed.
- 5) The acceptance testing has been successfully completed.
- 6) All spare parts have been delivered and received by WMATA.
- 7) All Special Tools/Equipment and Software have been delivered and received by WMATA.
- 8) All discrepancies identified by the WMATA's CEI (Certified Elevator Inspector) representative shall be completed.

## **PART 2 – PRODUCTS**

### **2.01 MANUFACTURERS**

- A. All escalators shall be the product of a single of three manufacturers.
  1. KONE TransitMaster 180
  2. Schindler (9700 series at Dulles Airport Station)
  3. ThyssenKrupp 'Victoria'
  4. Approved Equal

### **2.02 MATERIALS**

- A. Except where product conformance to specific standards is indicated, and in ASME A17.1, manufacturer's standard materials and equipment may be used in escalator construction, subject to approval by the Authority. Materials cited below are intended to establish the standard of quality for comparable materials if used by the manufacturer. Noncombustible materials shall meet the requirements of the National Fire Protection Association (NFPA), Fire Protection Handbook.
- B. Structural Steel:

1. Rolled Steel Sections, Shapes, and Rods: ASTM A36.
  2. Tubing:
    - a. Cold formed: ASTM A500.
    - b. Hot formed: ASTM A501.
  3. Sheet Steel: ASTM A653, Grade B, zinc coated.
- C. Stainless Steel:
1. Shapes and Bars:
    - a. ASTM A276, Type 304 or 301 for non-exposed components, and Type 316 for all finish panels and exposed components.
  2. Plate, Sheet, and Strip:
    - a. Over 1/8 inch, ASTM A264 with ASTM A240, Type 316 on ASTM A36 base
    - b. Under 1/8 inch, ASTM A167, Type 304, or Type 316 for all finish panels and exposed components.
  3. Pipes and Tubes: ASTM A312, Type 304, in accordance with the following:
    - a. Welded connections: Schedule 10 minimum.
    - b. Screwed connections: Schedule 40S minimum.
    - c. Press fits: Schedule 5S minimum.
- D. Cast Aluminum: ASTM B108, Alloy ANSI 356.0, T6 or comparable materials meeting the strength and performance requirements specified.
- E. Extruded Aluminum: ASTM B221, Alloy 6061, T6.
- F. Fasteners:
1. Provide bolts, nuts, washers, screws, rivets, and other fastenings necessary for proper erection and assembly of work in accordance with ASTM A325 or ASTM A490. Fasteners shall be compatible with materials being fastened, comply with buy America requirements, and shall be tested and certified based on appropriate sampling.
  2. For exposed fasteners, ensure that fasteners match adjacent material in appearance, finish, and color, and are countersunk to achieve a smooth, uniform surface, unless otherwise indicated. In any case, surfaces exposed to passengers shall be snag free. If screws are used in an exposed location, use tamperproof screws to the maximum extent possible, otherwise use Phillips flathead type.
    - a. Fasteners shall be compatible with materials being fastened.

- b. Fasteners shall be furnished with self-locking nuts or retaining rings (spring washers, toothed disks).
  - b. Fasteners shall be equal to or of greater corrosion resistance than the most corrosion resistant metals being fastened.
- G. Welding Material: AWS D1.1, type required for structural steel materials being welded.
- H. Welder's qualifications shall be certified in accordance with AWS D1.1 or equivalent, internationally recognized standard.
- I. Neoprene joint filler: As specified in paragraph 1.05.P.
- J. Handrail material: As specified in paragraph 1.05.S.
- K. Sealers, Paints, Coatings, Lubricants and Other Similar Materials:
  - 1. The least hazardous material or substance that will effectively perform the required function shall be selected. Submit MSDS information for all potentially hazardous materials, for approval.
- L. Balustrade shall be made of the following materials:
  - 1. All locations shall be used Stainless Steel
- M. Decking, Newel and Skirt Panels:
  - 1. Stainless Steel
- N. Outer Cladding Panels:
  - 1. All locations shall be use Stainless Steel

## **2.03 EQUIPMENT**

- A. Electrical:
  - 1. Electric equipment for all escalators shall be designed, selected, and fabricated in accordance with NEC, NEMA, IEEE, and ANSI standards as applicable, and as specified herein. All equipment including motors, controllers, switches, indicators, circuit breakers, panelboards, lighting, heating, wiring, conduit, boxes and other appurtenances for proper installation and operation of the escalators shall be furnished and installed.
    - a. One 480/277-volt, 3-phase, 4-wire, or 480-volt, 3-phase, 3-wire, 60-Hertz power feeder will be provided in each wellway by others, and terminated in a junction box in the upper pit. Power feeder will be sized to include the total load of combined escalator drive systems, controls, and heating. The Contractor shall provide necessary power distribution from the junction box to the individual escalators, including all disconnect switches, wiring, and electrical equipment necessary to make complete and operable escalator systems.

- b. One auxiliary 208/120-volt, 3-phase, 4-wire, or 120-volt, 1-phase, 2-wire 60-Hertz feeder for lighting and receptacles will be provided in each wellway by others, and terminated in a junction box in the upper pit. The feeder is used for escalator balustrade lights except as noted below for the emergency feeder.
- c. One 120-volt, single-phase 2-wire, or 208/120-volt, 3-phase, 4-wire, or 208/120-volt, 1-phase, 3-wire 60-Hertz emergency feeder will be provided by others, and terminated in a junction box in the upper pit. Emergency feeder shall be used as necessary for maintenance service lights, comb lights, and step demarcation lights, and 20 percent of the other escalator lights.
- d. Equipment grounding conductors with each of the three escalator feeders will be provided by others and terminated in the junction box. The equipment grounding conductors shall be provided from the junction boxes for all feeders and branch circuits as shown and required. Electrical equipment shall be provided with a minimum of two ground paths. One path shall be a green, insulated equipment-grounding conductor. The second path shall be a connection, to grounded metallic items using metallic fasteners, metallic conduit and/or bonding jumper. Provide a #6 AWG insulated grounding conductor attached to each truss and running back to the main feeder junction or tap box and spliced to the equipment grounding conductor run with the feeder wires. On escalator, bond exposed metallic items, ac equipment enclosures and lighting fixtures to grounded escalator metallic structure with metallic fasteners as shown. Only escalator parts shall be used the ground bond or ground bar located inside the escalator truss.
- e. All necessary steps shall be taken to ensure the flow to ground of accumulated static electricity, by means of metallic rollers or other appropriate means installed at appropriate locations to prevent potential at all times at all points along the handrails.
- f. Grounding and bonding all parts of the escalator metallic structure, truss, equipment and raceway shall be in accordance with the applicable requirements of the NEC and the codes and regulations of the jurisdictional authorities.
- g. All wires in controller or junction boxes shall be identified and a permanent label shall be placed to match with

terminals number. The terminals shall have permanent labels. Wires to relays or connected any other devices must be marked and identified. Wires shall have insert labeling and heat shrank.

2. Temporary Power Supply
  - a. The Contractor will provide temporary power for Contractor's use.
3. Conduit Boxes and Fittings:
  - a. All wiring for escalator equipment and control devices is in GRS conduit or liquid-tight flexible conduit.
  - b. Rigid conduit and fittings shall be UL-approved galvanized steel conforming to the requirements of UL 6 and ANSI C80.1. The minimum size shall be 3/4-inch for power circuits and one-inch for control circuits. Power and control circuits shall be in separate conduits.
  - c. Liquid-tight flexible conduit shall conform to the requirements of UL 360 and consist of a flexible hot dip galvanized steel core spiral wound with continuous copper ground built in the core for sizes up to 1-1/4 inch and a neoprene jacket overall. Sizes 1-1/2 inches and above shall be installed using a separate ground wire. Fittings for flexible conduit shall be watertight and shall conform to the requirements of UL 514B.
  - d. Outlet boxes shall be watertight, stainless steel for exterior units and galvanized malleable iron, cast iron or ductile iron for interior units conforming to the requirements of UL 514A. Wiring device cover plates shall have weatherproof construction. Junction and pull boxes shall be non-metallic NEMA 250 Type 4X conforming to the requirements of UL 50 and UL 514A and having screw covers with liquid-tight gaskets.
  - e. Provide NEMA 250 Type 4X waterproof fittings, watertight hubs and appurtenances as required by the installation to preclude the entry of water or moisture into the system.
  - f. Junction Boxes with electrical circuit boards and/or terminal blocks shall not be installed inside the step band. All junction boxes shall be NEMA 4X and shall have easy access for maintenance.
  - g. All boxes shall be accessible without removal of steps and installed behind removable balustrade panels as recommended.

- d) Chlorosulfonated polyethylene, or cross-linked polyolefin.
  - i) Tensile strength, minimum pounds per square inch: 1,800. Tensile strength, minimum percentage of unaged value: 100.
  - ii) Elongation at rupture, minimum percent: 150. Elongation at rupture, minimum percentage of unaged value: 80.
  - iii) Aging requirements: After 168 hours in air oven test at 100C, plus or minus one degree Celsius.
  - iv) Oil immersion: 18 hours at 121C, plus or minus one degree Celsius, ASTM D471, Table 1, No. 2 oil:
    - (a) Tensile strength, minimum percentage of unaged value: 80.
    - (b) Elongation at rupture, minimum percentage of unaged value: 80.
- e) Jacket materials other than cross-linked polyolefin complying with NEMA WC 70. Jacket material free of PVC and PVC-based compounds.
- 6) Flame retardancy: Single-conductor and multiple-conductor cable demonstrating flame retardancy in accordance with the following:
  - i) Single-conductor cable and individual conductors of multiple-conductor cable passing vertical flame test in accordance with UL 1581 and/or NEMA WC 70. Cable size for testing: 14 AWG.
  - ii) Single-conductor cable and individual conductors of multiple-conductor cable, passing vertical tray flame test, using ribbon gas burner in accordance with IEEE 1202. Multiple-conductor cable passing vertical tray flame test using ribbon gas burner in accordance with IEEE 1202.

- 7) Applied voltage testing:
  - a) Single-conductor cable and individual conductors of multiple-conductor cable to be given applied ac voltage dielectric strength test, after six-hour water-immersion test.
  - b) For single-conductors of multiple-conductor cable, conduct tests prior to assembly as multiple-conductor cable.
  - c) Test procedures:
    - i) Polyethylene insulated conductors: In accordance with NEMA WC 70.
    - ii) Other conductors: In accordance with NEMA WC 70.
- d. Single-Conductor Cable:
  - 1) Insulated with ethylene-propylene-rubber with non-metallic jacket orunjacketed filled cross-linked polyethylene. UL-labeled Type RHW or XHHW.
  - 2) Color coding: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
- e. Multiple-Conductor Cable:
  - 1) Individual conductors:
    - a) Number of conductors: As required.
    - b) Construction: Complying with one of the following:
      - i) Insulated with ethylene-propylene-rubber, with or without nonmetallic jacket.
      - ii) Insulated with composite compound of ethylene-propylene-rubber and polyethylene, UL Class EPCV, without outer jacket.
      - iii) Insulated with filled cross-linked polyethylene without jacket.
  - c) Phase and neutral conductors: Individually insulated.
  - d) Neutral conductors: Same size as phase conductors.

- e) Bare ground conductors: Sized in accordance with the NEC, unless otherwise shown.
- f) UL-listed as Type RHW or XHHW.
- 2) Conductors assembled with nonwicking, flame-retardant filler to form cable of circular cross section.
- 3) Metallic-sheath: Provide one of the following:
  - a) Size 1AWG and larger:
    - i) Interlocked aluminum tape armor.
    - ii) Continuous corrugated aluminum sheath conforming to NEMA WC 70.
  - b) Size 2AWG and smaller: As specified for 1AWG and larger or continuous smooth aluminum sheath conforming to NEMA WC 70.
- f. Multiple-conductor cable provided with overall nonmetallic jacket as specified.
- g. Cable UL-listed as follows: Metallic-sheathed cable: Type MC, suitable for wet and dry locations.
- h. Color coding:
  - 1) Power cables: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
  - 2) Control cables: In accordance with NEMA WC 70.
- 5. Fixture Wire: UL 62, with the following additional requirements:
  - a. Type: To suit temperature rating of lighting fixture, minimum 90C
  - b. Conductor: Stranded copper conductor 16AWG or larger.
- 6. Bare Conductor: ASTM B3 or B8 annealed copper conductor; 8AWG and larger, Class B stranded.
- 7. Connectors, Terminal Lugs and Fittings:
  - a. In accordance with UL 486A.
  - b. For 10 AWG and smaller conductor cable: Tin-plated copper pressure connectors with nonflammable, self-extinguishing insulation grip with temperature rating equal to that of conductor insulation.
  - c. For 8 AWG to 4/0 AWG conductor cable: Tin-plated copper compression connectors and terminal lugs with insulating sleeve or heat shrinkable insulator for insulation grip.

- d. For 250 KCMIL and larger conductor cable: Long barrel double-compression tin-plated copper connectors and terminal lugs with two-hole pad.
  - e. For multiple-conductor cable: Watertight aluminum fittings with stainless steel pressure ring and set screws or compression cone for grounding of aluminum sheath of Type MC cable.
  - f. Terminal lugs used for bonding connections to metallic structures shall be installed on bare/uncoated metallic surfaces to assure minimum contact resistance.
8. AC Drive Motors: Motors shall have TEFC enclosures and be rated for inverter use on 480 VAC, three-phase, 60-Hertz power. The follow characteristics shall also be provided:
- a. Insulation of all windings shall be impregnated and baked to prevent absorption of moisture and oil. The insulation resistance between motor frame and windings shall not be less than one megohm. The motor windings shall stand a dielectric test of twice the normal voltage plus 1000 RMS volts of 60 Hertz, alternating current for one minute. Insulation shall be Class F.
  - b. Motor characteristics shall include: heavy gauge steel and cast iron frames, ball bearings, inverter spike resistant windings, low-loss electrical grade lamination steel, dynamic balancing for vibration no greater than half the NEMA vibration standard, continuous duty rating, service factor of 1.15 and have a rated efficiency at full load of greater than 91%.
  - c. Motor leads in the conduit box shall have the same insulation class as the windings. Motor lead wire shall be rated 125 C and shall be sized for 105 C at the motor nameplate amperes at 1.0 Sf per EASA recommendations. Leads shall be securely labeled.
  - d. The motor shall be provided with a ring or other suitable lifting means. A sliding base shall be provided for motors other than direct coupled.
  - e. Motors shall be provided with a compression type grounding lug, the same size as motor leads, mounted in the conduit box by drilling and tapping into the motor frame or by a double ended silicon bronze cap.
9. Controller:
- The controller shall utilize an Allen Bradley PLC incorporating the CompactLogix 1769 L32E based PLC module , or approved equal.

The controller, the variable-voltage variable frequency (VVVF) motor drive as well as any brake controller shall be located in a readily accessible Escalator machine room. The controller shall be mounted in a NEMA 4X stainless steel air-conditioned cabinet within the controller room, and include all surfaces being painted, drip-proof venting, and lockable doors. The door of the cabinet shall have a sealed window placed over the fault indicator board within. Controllers shall include the PLC components, control relays, fault indicator, and all other functions of escalator controls.

- a. Variable-Voltage Variable-Frequency Drive: The escalator shall be started and continue to run with drive motor power provided by an appropriately sized variable voltage, variable frequency AC motor drive with regenerative drive. Motor contactors shall be installed to meet code requirements when running off a solid state drive. Accommodation shall be made to set a second maintenance-operation speed in the solid state drive. The VVVF drive and drive motor shall be capable of over speeding the escalators by 40% for test purposes. There shall be no bypassing of the solid state motor drive for normal operation or maintenance operation. The drive and associated components can be housed in a separate NEMA 4 enclosure.
- b. PLC Escalator Control: The Allen Bradley CompactLogix 1769 L32E controller shall provide logic for all required operation of the escalator including control of the VVVF drive, braking control, safety device responses, maintenance operation and control inputs from key switches.
- c. All controller enclosures shall be NEMA 4X rated. All enclosures shall be provided with strip heaters controlled by a humidistat mounted within the enclosure.
- d. The top side of the controller enclosure shall not be drilled for any reason, liquid tight and any other connectors to the controller shall be installed half way below the controller or at the bottom side of the controller.
- e. The controller space shall have adequate lighting.
- f. Specific capabilities shall include:
  1. The CPU module must provide DH-485 and/or RS-232 communication ports. In addition, the contractor shall install an Allen Bradley network interface module, (model 1761-NET-AIC, or

approved equal) beside the PLC in the controller and provide 24 VDC power to the module. The Allen Bradley PLC will be used for remote monitoring capabilities into WMATA established engineering monitoring network. All required coordination for wiring and programming on the PLC and the DH-485 network shall be made with WMATA ELES Engineering. Contractor shall pull all Remote Monitoring cables to the interface in the escalator controller from the pull box in the upper or lower pit area.

2. The Programmable Controller shall have one serial port open to support accessibility to ladder logic and provide data to the remote monitoring network.
3. The exclusive Allen Bradley DH485 protocol data port will transmit data from the escalator controller to the station or facility data concentrator. The contractor shall provide a controller data interface to a DH 485 network located in the escalator controller room. Data cables in an existing controller or in the escalator controller room shall be retained and connected into the new controller and available for connection to the controller DH485 interface. If DH485 cabling is not available, the contractor shall run Belden 9842 cable or approved equal, to connect the controller into the monitoring DH485 network as directed by WMATA. The DH 485 controller interface shall be programmable for data rates up to 115 Kbps. The interface shall allow other nodes such as other elevator and escalator to be readily incorporated into the DH 485 network.

If not already installed in the station or facility, a data concentrator PLC shall be installed using an Allen Bradley MicroLogix 1400 or SLC5/05 PLC per station to function as data concentrator to consolidate data from all controllers in the station. The software for the data concentrator shall receive controller data over the local monitoring DH 485 network and provide formatted data to the AEMS RTU through an RS232 link. The data concentrator shall provide an Ethernet port for interfacing with the WMATA wide area network. A data concentrator connection to the WMATA wide area network shall be provided.

4. The signals shall be active when the listed status is present as it is in the escalator control computer. The signals shall be 24 Vdc from an independent power supply provided in the escalator controller cabinet or external enclosure by the manufacturer or the installer. Analog signals shall be connected in a 20 mA current loop configuration to analog inputs on the added PLC. An area of 18 inches by 10 inches shall be available inside the controller or in an external enclosure - on the side is acceptable - that allows a unit 10 inches deep to be mounted. An Allen Bradley type MicroLogix 1400 PLC with 24-volt input modules for 32 inputs shall be supplied by the manufacturer or the installer. The CPU module must provide DH-485 and Ethernet communications ports. In addition, the contractor shall install an Allen Bradley network interface module, (model 1761-NET-AIC, or equal) for interfacing into the local remote monitoring DH485 network beside the PLC in the controller and provide 24 vdc power to the module. The output signals from the MCE or equivalent shall be wired from the terminal strip to the PLC inputs indicated in the Signal List table. PLC power and signal returns shall be wired into the PLC. The PLC power shall come from 120VAC provided by the car lighting supply in the escalator controller.

- 1) The controller PLC shall use integrated programming, error checking, communications setup, ladder-type software package that shall be supplied by the Contractor.
  - a) Five copies of the annotated ladder listing with flowchart of the PLC software shall be provided in electronic format and in hardcopy.
  - b) One programming/monitoring device, such as an appropriately setup laptop, with necessary software and cables shall be provided for each station.
- 2) Provide battery backup – 2 year minimum.

- a) PLC memory and programs shall be retained in non-volatile memory such as an Allen Bradley 1747-M13 module or approved alternative.
- 3) Modules, such as input, output, communication and analog, shall be slot type and compatible with the PLC processor I/O structure.
  - a) Each module shall be provided with a removable wiring terminal strip so that modules may be changed without removing associated wiring.
- 4) The power supply shall be suitable for operation on 120 VAC, single phase power.
  - a) Power supply capacity shall be a minimum of 150 percent of the connected load.
- 5) As a minimum, status, faults and analog data as listed in the tables for the remote monitoring interface shall be available from the serial port. Some of this data may be available in the tables of data for the two fault displays.
- 6) When on Inspection, the control system, variable frequency drive and drive components shall be capable of being set to various running speeds including over speeding the escalator by 40%.
- 7) No circuit boards, other than those incorporated in the lower balustrade display or in transducers for speed monitoring, shall be located in the truss or balustrade areas of the escalator.
  - a) All circuit boards and terminals for escalator safety, indicator and control devices shall be located in the controller area.
- 8) Screw type compression terminal blocks rated for 20 amperes minimum shall be used for all power circuits and 10 Amp minimum terminal blocks for control and indicating lights.
  - a) All wiring shall be stranded conductors of sufficient current carrying rating, color coded and permanently identified at all terminations.
  - b) A maximum of three wires shall be terminated at any terminal.

- c) All wiring jumpers, taps or multiple wire connections shall be located on a terminal; tee taps, wire nuts or conductor splices shall not be utilized.
- d) All controls shall operate at 120 volts or lower, AC or DC.
- e) Control power shall be obtained from integral dry type control transformers.
- 9) All wiring internal or external to the controller shall be stranded copper, matching existing AWG size or size 18 AWG minimum, moisture resistant, flameproof, and oil resistant insulated conductors.
  - a) All terminations at devices and terminals shall utilize insulated type crimp connectors, terminal strip, phoenix or similar devices.
  - b) All terminals shall be identified with wire numbers which correspond to wiring diagrams.
  - c) Wiring shall be laced and tied or contained in wiring trough at terminal blocks.
  - d) All conductors shall be identified with embossed tubing sleeves at each terminal and heat shrink.
  - e) All terminations shall be made within boxes at terminal strips.
- 10. Air Conditioning:

Provide an independent air conditioning unit for each new controller to maintain manufacturers recommended operating temperatures. Condensate from the air conditioning unit must be piped to a suitable drain.
- 11. Fault and Status Display:
  - a. One fault and status displays shall be provided for each escalator to visually indicate the activation of specified safety devices.
    - 1) The panel shall be constantly active.
    - 2) The panel should be located in the controller enclosure visible with controller door closed.
    - 3) The controller display shall indicate operating status when no fault is displayed.
    - 4) An Allen Bradley PanelView Plus 6,

EZAutomation or ELES Engineering approved equal, fault/status display/interface shall be provided in the controller cabinet. Control system timers and other setup criteria shall be programmable through this unit. All fault, status and setup data shall be stored in the controller CPU module.

- b. The fault and status display shall provide the capability to store:
  - 1) 99 activations of any and all safety devices
  - 2) 99 events of a minimum of 125 different error or event codes
  - 3) 99 entries of the escalator travel distances in inches or millimeters after application of the brake(s)
  - 4) 99 entries of motor current draw in five minute increments.
  - 5) The display shall have the capability to download faults to a flash drive and upload the program from a flash drive or other memory device without the need for a laptop.

All data points shall be date and time stamped.

- c. Stack memory shall be used so that, when full, the oldest data point is overwritten as new data is accumulated.
  - d. Events to be stored include, but are not limited to, internally detected error codes, operational mode selection, start up, power down, and run direction including items listed in the table above.
    - 1) The fault displays shall use definitive word descriptions at the controller panel.
    - 2) The display shall only display the root cause of the shutdown when it occurs.
  - e. The Contractor shall provide test plans for approval and shall satisfactorily demonstrate all local and remote functions of the fault and status displays and the remote monitoring data retrieval system prior to Final Acceptance.
12. Disconnect switches shall be provided and installed in the space where the controller is located as required by code.
- a. Disconnect switches shall be the following: UL 98, NEMA KS 1, heavy-duty, quick-make/quick-break switching

mechanism with operating handle external to enclosure, with positions labeled ON and OFF, defeatable interlock to prevent opening of enclosure door when switch is ON. The disconnect and any other boxes shall have a permanent label to identify specific unit.

- b. Enclosures shall be NEMA 250 Type 4X stainless steel for all escalators.
- c. Controllers shall be interlocked so that all drives shall be disconnected in the off position and cannot be inadvertently started.
- d. A disconnect switch shall be provided to disconnect all ungrounded power feeders for each motor in accordance with NEC paragraphs 620-51 and 620-91.
- e. Label disconnect switches in accordance with the NEC.
- f. The main line disconnect shall be located inside the machine room near the machine room access door and easily reachable.

**13. Circuit Breakers and Panel Boards**

- a. Circuit breakers shall be the following: NEMA AB 1, UL 489, molded-case, bolt-on quick-make/quick-break, mechanically trip-free switching mechanism, with thermal trip for inverse time delay overcurrent protection and magnetic trip for instantaneous short-circuit protection. Designed to carry continuous rating in ambient temperature of 40 degrees Celsius.
- b. Panelboards shall be the following: UL 50, NEMA PB 1, latch and handle in accordance with UL 50, minimum side gutter size of four inches, bus bar of 98-percent-conductivity copper with contact surfaces silver-plated or tin-plated, rating of neutral and ground buses equal to phase bus rating, neutral bus mounted on insulated block, neutral and ground buses equipped with integral mechanical connectors, one-inch high engraved plastic nameplate with 1/2-inch high letters on black and attached with stainless steel fasteners.
- c. Enclosures shall be NEMA 250 Type 3R for mezzanine to platform escalators in underground stations and panelboard in NEMA 250 Type 4X box for all other escalators.

14. Switches, Indicators and Controls
  - a. All switches, indicators, and controls and their respective housings and fittings shall be suited for the operations and environmental conditions specified in Section 1.05 of these Specifications. Those components and fittings that may come in contact with water or dust environment, and in other ways are not protected, shall be in NEMA 250 Type 4X enclosures.
  - b. Indicator lights, two with red lenses, two-inch diameter Plexiglas 2423 or approved alternative, and two with two-inch diameter green lenses, Plexiglas 2092 or approved alternative, shall be provided at the upper and lower landings of each escalator to indicate to approaching passengers the direction of travel of the escalators.
  - c. One red and one green light shall be located on the right hand side of each escalator landing. A green light shall indicate that the escalator is moving away from the landing being approached. A red light shall indicate that the escalator is moving toward the landing being approached. Each green and red pair may be a single fixture with dual lamps. Red light lens shall be equipped with the international no entry symbol silhouetted over the red lens.
  - d. Indicator lights shall be vandal-resistant with easily replaceable long-life LED lamps. Lens shall be held secure and resist external pressure.
  - e. Shop drawings showing complete details shall be submitted to the Authority for approval.
15. A protective rubber mat shall be installed for the main and AC drive controller cabinets.
  - a. Floor mat of solid construction, ¼ inch thick with beveled edges shall be placed in front of the permanently mounted electric equipment in escalator machine room/control spaces and escalator pits. Rubber mats shall be noncombustible.
16. Electric power receptacles shall be furnished and installed in the upper and lower pits and along the escalator trusses as well as escalator machine room. .
  - a. Each receptacle shall be duplex, of specification grade, ground fault circuit interrupter type, resettable at the receptacle; waterproof; grounded; and rated for 120 volts at 20 amperes.

- b. The receptacles in the pits shall be surface-mounted on the walls, not less than 30 inches from the floor.
  - c. The receptacles mounted along the escalators shall be mounted directly on a truss member at the location at minimum 15-foot intervals.
  - d. A receptacle shall be mounted near the remote control panel.
17. All maintenance lighting shall be furnished and installed with quick start type PL LED type and LED strip lighting as required for complete illumination of working spaces and specified areas within the escalator machine room, the interior of the escalator and its immediate surroundings.
- a. The escalator machine room shall have illumination of 19-foot candles minimum. The light switch shall be on the lock-jamb side of the access door.
  - b. Upper and lower pits shall have internal lighting of 15-foot candles minimum.
  - c. Separate panel circuits shall be provided for pit lights and stair and truss lights.
  - d. A separate vapor-tight service light with quick start type PL LED compact fluorescent lamp shall be furnished, installed, and connected to the emergency lighting circuit to illuminate the entry.
  - e. A main light switch of specification grade shall be located at the entry to the pit.
  - f. Provide maintenance lighting for the remote control panel.
18. Electric Heating
- a. Electric heaters shall be provided where required to permit sustained performance and maintenance of all escalators exposed to the outside environment.
  - b. Wellways shall be equipped with thermostatically controlled heaters to maintain a wellway temperature of 50F.
  - c. Heaters shall be provided to maintain the handrail steps, comb plates, landing plates and floor plates free of ice and snow while the escalators are running or idle. Heaters and mounting devices shall be of corrosion resistant materials.
  - d. Boxes associated with the heater shall be installed so that their covers are easily accessible and unobstructed by other components. No boxes shall be installed inside the

step band. Boxes may be installed behind the removable balustrade panels.

19. Escalator Lighting Fixtures

- a. The built-in escalator lighting fixtures shall be furnished and installed complete with all conduit, wiring, and accessories.
- b. Fixtures/light box assemblies shall be UL-listed and labeled and shall be as shown and specified. LEDs lightings and associated parts shall be replaceable without a requirement to disassemble the balustrade or other parts of the escalator.
- c. Type CST, Continuous Strip balustrade and cladding lighting fixture shall be enclosed and recessed and shall deliver a minimum of five foot candles on any portion of the step treads.
  - a) The fixtures shall be suitable for wet locations.
  - b) Individual lighting fixtures along the length of the balustrade may be acceptable so long as specified foot candles are provided on the steps.
  - c) Lamps/ LED stripe shall be compatible with the fixtures.
  - 2) The housings shall be fabricated of steel, welded all around.
    - a) The housings shall have a lens opening width of 4 inches.
    - b) The housings in the balustrade must slip over the skirt, be mounted securely to the escalator truss and provide structural reinforcing of the skirt.
    - c) The interior finish shall be baked aluminum enamel (BAE) with curved, interior reflectors for maximum light distribution.
    - d) The bezel plate trim shall be attached to the escalator with tamper proof screws, and designed to fit securely against the balustrade and cladding with suitable gasketing to prevent light leakages and the intrusion of dust or moisture into the fixture.
    - e) Bezel trim finish plates shall match the adjacent material and finish.

- 3) The lenses shall be white polycarbonate.
- 4) LED strip light shall be enclosed, the lights shall be UL listed and waterproof. Contractor shall submit the manufacture of the light and detail information to WMATA-ELES engineering for approval. The lighting shall have minimum life of 50,000 hours.
  - a) The ballast shall be electronic, instant start, high frequency type rated 0 to 300EF and shall be installed under/within the housing, under the lamp, for easy removal and installation, and to maintain the continuity of the lighting strip.
  - b) All fixtures shall be hardwired to the branch circuits, protected by GFCI in the panel.
  - c) Wiring outside of the light boxes shall be in galvanized rigid conduit or liquid-tight flexible metallic conduit.
  - d) Wiring inside shall be in rigid pipe or liquid-tight flexible metallic conduit.
  - e) Each light box shall be electrically grounded by means of the equipment grounding conductor from the branch circuit. Additionally, each light box is to be electrically bonded to adjacent light boxes by means of a green jumper wire sized per overcurrent protection.
  - f) Light box assemblies shall be grounded and personal protected against shock hazard by means of a ground fault circuit interrupter which has a sensitivity of not more than 5 mA.
  - g) The fixtures shall be configured with gasketed hand holes at each end.
  - h) The balustrade lighting must be electrically independent of the operation of the escalator.
- 5) Wiring shall be configured to insure that each step has lighting from at least one side at all times. Ground escalator lighting fixtures to equipment grounding bar associated with ac power feeder by using separate insulated annealed copper grounding conductor, size governed by NEC paragraph 250-95.
  - d. Step demarcation lights (located below the steps at both landings) shall be in accordance with ASME A17.1.

- e. No joints or splices shall be permitted in wiring except at outlets. Tap connectors may not be used. All terminations shall be made within boxes at terminal strips or devices. All wiring shall be run in conduit.
20. Fixtures, Bodies, Reflector Plates, Channels. End Caps and Castings.
- a. Except as shown otherwise, materials for fixture bodies, reflector plates, channels, end caps, and castings shall be as follows:
    - 1) Steel for Type CST fixtures shall be precision die-formed of not less than 16-gauge prime cold-rolled steel with anti-rust primer and baked enamel finish all over or painted surface of equivalent durability.
    - 2) Fixture bodies, reflectors, channels, end caps, and castings shall be so formed as to prevent buckling or distortion. Reflector plates shall conceal all wiring and be easily removable by one man without special tools. Reflector plate fastening device shall be of rugged construction and provided with an approved grounding bond to the fixture. At least two wire clips shall be provided in the wiring channel for support of wiring. Wiring channel shall be UL-listed.
    - 3) All construction seams and joints shall be continuous-welded and ground smooth before finishing. Fixtures shall have mechanically self-retaining neoprene gaskets where shown or specified.
    - 4) Dissimilar metals shall be jointed in a manner to preclude electrolytic corrosion.
21. Ballasts shall be hybrid electronic, high frequency or electronic, instant start, high frequency type rated 0E to 300EF.
22. The lamps shall be furnished and installed by the Contractor as specified.
- a. All lamps shall be guaranteed for 90 days after Final Acceptance and the Contractor shall replace those lamps which fail during this guarantee period within eight hours after request by the Authority.
23. Lenses and Diffusers:

- a. All lenses and diffusers shall be of one-piece construction made of polycarbonate plastic, 0.125-inch minimum thickness.
    - 1) The plastic shall be non-flammable as determined by ASTM D635, "Flammability of Self-Supporting Plastics".
    - 2) The plastic shall not change color materially when lighted by 4500 degree Kelvin fluorescent lamps.
    - 3) The plastic shall show no yellowing apparent to the naked eye after 500 hour exposure to lamp source under conditions identical with those existing in the fixture in which it is to be used.
  - b. The light transmission range for the clear polycarbonate sheet shall be from 82 to 89 percent.
  - c. The plastic shall be non-electrostatic or the finished parts shall be treated with an anti-static wax. The wax shall not affect or alter the optical properties of the fixture.
24. All lampholders shall have a glazed porcelain body-type with nonferrous metal components and be of heavy-duty design. Incandescent lamp holders shall have a mechanical self-retaining neoprene jacket to provide a dustproof seal between bulb and socket.
25. Latch and release mechanism, hinges, pins and other operating parts of the fixtures, screws, or other assembly and mounting parts shall be manufactured of stainless steel, precision quality, positive in operation and rugged in construction.
- a. All exposed hardware to be same material and finish as adjacent balustrades or cladding.
  - b. All springs shall be heavy-duty stainless steel.
  - c. All operating hardware shall be self-retaining.
26. Seismic Loads
- In accordance with VA-USBC 2006, all structures shall be designed to resist the effects of earthquake motions.

## **2.04 ACCESSORIES**

- A. Smoke Detection

1. Fire and smoke detection devices which will shut off all entering escalators will be furnished and installed by other trades. An interface terminal box shall be furnished and installed. A 4-inch by 4-inch electrical box and flex conduit into the control panel shall be furnished and installed. The ¾-inch conduit into the 4-inch by 4-inch electrical box will be provided by other trades.
2. Location of terminal box to be coordinated with applicable trades. Interconnecting wiring between the fire and smoke alarm panel and terminal box will be furnished and installed by other trades.
3. Coordination shall be done with all applicable trades to allow installation of the equipment as required and make operational checkout within the wellway.
4. The fire and smoke alarm system shall be interfaced with the escalator controller in such a way that upon activation of the fire or smoke alarm, only entering escalators shall be stopped. Once stopped, escalators shall be capable of being reversed and started in an exiting direction only. Non-running escalators shall be capable of being started only in the exiting mode.

**B. Smoke Detection Control Relays**

1. Relays energized from the fire detection system shall be ordinary acting relays enclosed in polycarbonate dust covers. The relays will be provided by other trades.
2. Contacts interfacing the escalator control equipment shall be electrically compatible with the equipment they are serving.

**C. Kiosk Escalator Remote Surveillance and Control**

1. The kiosk contains an annunciator panel provided by trade communications which displays escalator status. An interface terminal box shall be furnished and installed by the Contractor in the upper or lower pit. Location of terminal box to be coordinated with the appropriate trades. Interconnecting wiring between the kiosk annunciator panel and terminal box will be furnished and installed by other trades. Coordination by the Contractor among trades is required to ensure the kiosk panel reports escalator functions correctly.
2. The following status indications and control functions shall be furnished for inclusion on the annunciator panel:
  - a. Indication of direction of travel (two modes).
  - b. "Out of Service" indication.
  - c. A provision for flashing the "Out of Service" indication to indicate that the escalator has stopped due to the activation of any safety device.

3. Coordination of design shall be done with the Contractor, and the specified devices necessary to provide a complete electrical installation shall be furnished and installed. All necessary wire and conduit runs from the escalator control circuits to the interface box shall be furnished and installed, and final connection to the appropriately identified terminals shall be made. All work shall be in accordance with all applicable codes and regulations.
- D. Kiosk Status Interface Contacts: All contacts wired to the interface terminal box shall be metal-to-metal dry contacts and shall be capable of carrying and breaking a maximum resistive load of one ampere at 24 volts DC. Contacts shall be hermetically sealed or otherwise protected from deleterious effects from the environment in which they are installed.
- E. Comb Plate Lighting Fixture
1. Each escalator shall be equipped with LEDs light fixture.
  2. Fixture housings may be constructed of die cast aluminum alloy and be equipped with two cable entries to facilitate through wiring. Fixtures shall be UL listed as suitable for wet locations. A polycarbonate high density, UV stabilized, impact resistant diffuser shall be sealed to the housing with extruded closed cell ethylene propylene diene terpolymer (EPDM) gasketing and held in position by the housing frame. The housing frame shall be secured by tamper proof set screws. A full opal lens shall be provided. An electrically applied baked enamel finish shall be provided on aluminum surfaces. Finish shall meet or exceed all AAMA requirements for 5,000-hour salt exposure. The interior of the housing body shall be white enameled.
  3. Fixture shall be "Quality Lighting" ST-9-0 or approved alternative. Each fixture shall be hardwired to the branch circuit. Separate aluminum from dissimilar metals and ground fixtures.
- F. Signs and Illuminated Indicators
1. The signs, including escalator cautions signs at the upper and lower landings, both illuminated and unilluminated, which attach to the escalator, as required for the proper and safe unattended operation of the escalators, shall be furnished and installed.
  2. One portable sign shall be provided for each landing for all escalators. The signs shall be reversible with both sides finished in brown porcelain conforming to Federal Standard 595A, Color 20040.
  3. Camera-ready artwork will be furnished by others for application in porcelain; one side of each sign shall bear the words PLEASE USE OTHER ESCALATOR in white letters. Signs shall be durable, easily stored, and designed for attachment to support means provided in all escalator balustrades.

4. Signs and illuminated indicators shall conform to all applicable ADAAG requirements.
  5. All escalators shall be permanently numbered at the top and bottom right hand newels with number designations corresponding to the indications on the kiosk annunciator panel. A station sketch showing the escalator numbers shall be submitted for WMATA ELES Engineering. Number escalators in sequence, starting at the north entrance (left to right, looking UP from bottom) of each station and proceeding clockwise around the station. The numbering shall proceed into the station toward the end of the plate form. Corresponding numerical identification shall be affixed to the equipment in the machine spaces. Markers for newels shall be constructed of 15 MIL, transparent, non-glare General Electric Lexan or approved alternative. Adhesive shall be 3M hi-performance #468 double thick adhesive or approved alternative, heat-laminated to the marker. Numbers shall be sub-surface screen printed and vandal resistant. Markers shall be laser die cut with rounded corners for increased durability and vandal resistance.
- G. Locks and Keys:
1. All key switches shall be of the tumbler or cylinder type.
  2. An Allen Bradley 30 mm key switch with D018 key, Cylinder Model #800T-J631KC1 shall be used.
  3. Keys shall be stamped with the inscription "TRANSIT AUTHORITY - DO NOT DUPLICATE" and with visual key control data.
  4. Five keys shall be supplied with each escalator.
- H. Drain System
1. Floor type drains will be provided in all outside entrance escalator machine rooms and/or pits or both by other trades. Drain pans to the floor drains shall be connected and suitable grease traps provided per applicable EPA regulations. Access for cleaning grease traps and floor drains shall be provided.

2. Provisions shall be made for the capture and containment of oil/grease from the escalator. The oil/grease shall be captured either by a longitudinal drain pan under the length of each escalator drive chain or by the escalator drain pan itself. A method of cleaning both the longitudinal drain pan (if used) and the escalator drain pan itself shall be provided. A method of accessing and emptying the interceptor(s) shall be provided. The interceptor(s) shall be constructed of stainless steel equal to the gauge and strength of the escalator drain pan. The interceptor(s) shall consist of a 2 inch elevated drain, outer container, and internal gate(s). The oil/grease storage capacity of the interceptor shall be 2 fluid quarts per escalator drive chain handled. The interceptor(s) shall fit into the escalator pit without modification to the pit.
3. Retractable or non-retractable ladder shall be installed in the pit of each escalator, where the pit extends more than 35 in. below the sill.
  - I. Electrical Interlock
    1. Where indicated on the contract drawings, the Contractor shall provide gate limit switches and the necessary wiring to prevent escalator operation in the direction leading toward the gate if the gates are not fully open. The interlock shall not preclude escalator operation in a direction moving away from the gate. The required connections to the escalator circuits shall be made.

## **2.05 FINISHES**

- A. Stainless steel: For cladding finish exposed to view, use manufacturer's Standard No. 4 satin polished finish. Stainless steel shall be finished to match adjacent escalator surface.
- B. Aluminum castings and extrusions: Manufacturer's standard commercial mill finish.
- C. Galvanized: For sheet steel, use ASTM A653 as applicable with coating designation of G185. For other galvanizing, use ASTM A385 and ASTM A123. For touch-up galvanizing, use zinc dust coating conforming to MIL PRF 26915. Galvanizing process shall not result in a loss of metal ductility.

## **PART 3 – EXECUTION**

### **3.01 PREPARATION**

- A. General

1. The Contractor shall become thoroughly familiar with the related work and shall coordinate and schedule escalator delivery and installation with the work of others and the site availability schedule. The Authority shall be notified of intended delivery dates no less than 30 days prior to the dates. No deliveries shall be made without prior approval of the WMATA.
2. The dimensional survey of wellways shall be conducted prior to fabrication, delivery and installation of trusses. The Authority shall be notified immediately of all field-verified structural dimensions which do not conform to the drawings so that the Contractor can take corrective action. If the wellways are not available at this time for dimensional survey, the escalators shall be designed and fabricated in accordance with approved structural shop drawings.

**B. Structure**

1. The structural elements required to support the escalators and to withstand the forces and loads resulting from use of the escalators will be provided in accordance with the requirements shown on the drawings. The escalators shall be designed, fabricated, and installed to be compatible with the structures and equipment room spaces as designed, and in accordance with the current version of ASME A17.1 except as modified by these specifications.

**C. Alterations**

1. Alterations of any structures or systems necessary to accommodate the escalator installation and maintenance such as cutting of walls, floors, and repairs as required, shall be submitted to the Authority for approval and such work performed at no additional cost to the Authority.

### **3.02 INSTALLATION**

**A. General**

1. Entrance escalators shall be installed under canopies. The size and location of each canopy shall be verified prior to the delivery of truss to insure that the fabricated escalator can be installed.
2. The station construction drawings have placed the working point of all the escalators on the finished floor line, thus causing the upper and lower landing areas to slope away from the escalators. The drawings shall be referred to showing the location of the working point placement.

**B. Controller Room Equipment:**

Escalator controller room shall be 168 sq.ft. minimum.

1. Clearance around equipment in each machine room shall comply with provisions of all applicable codes. The ASME A17.1 code requirements for the machine room clearances shall be applied in addition to the code specified clearances for escalator machine room/control room.
2. Equipment in escalator machine room shall be arranged so that replaceable items can be removed for repair or replacement without the need to dismantle or remove other equipment components in the same machine room.
3. Drive controller and main controller enclosures shall be right-or left-hand as required to provide necessary work space around the equipment in machine room.
4. Any component attached to the controller shall have a minimum clearance of 18 inches from the side(s) of the component requiring access for maintenance and free air circulation.
5. Layout shall be designed to allow safe access to controllers and minimize piping bends and provide ease of access for service and repair.
6. Upon approval, one set of plastic or laminated electrical diagrams of each escalator shall be provided. The diagrams shall be mounted in an aluminum channel frame with Lucite cover and waterproof fiberglass backing and installed adjacent to the appropriate controller.
7. A permanent rubber floor mat of solid construction, 1/4-inch thick, shall be provided with beveled edges in front of the permanently mounted electric equipment in escalator machine room/control spaces and escalator pits. Rubber mats shall be noncombustible as defined in 1.01 B. 5. Rubber mats shall be inches wider than the controller on all sides
  - a. The Resistance range shall be  $1 \times 10^4 < 1 \times 10^6$  and shall meet ANSI/ESD requirements.
  - b. The rubber mat shall be the width of the controller plus 12".
  - c. The length of rubber mat shall be a minimum of 24".
  - d. The rubber mat shall be a 1/4" thickness and beveled at each end.
8. Controller rooms must be air conditioned and heated to maintain an ambient temperature of 50<sup>0</sup>F to 90<sup>0</sup>F degrees and a relative humidity between 35% to 50%. The Air Conditioner shall be Split System. The heating system for the machine room is also a built in system. A forced removal should be done by moving the air from the room to the outside of the building to keep an air exchange through the

equipment room. Intake and exhaust vent should not be located close to each other.

9. Machine room lighting shall provide an illumination level of 19fc minimum at the floor when measured at any location in the room.
  10. Machine Room Emergency Lighting: Maintained Emergency lighting fittings shall be provided in each elevator machine room.
    - a. There shall be a minimum of one maintained lighting fixture.
- C. Install controllers and electrical panels outside the pit or truss area in environmentally protected areas such as a machine room or a purpose built control space which meets the requirements, and ensure that these components are protected from water and de-icing salts.
1. All controllers and electrical panels shall be mounted on strut channels to hold the enclosures away from the wall. The strut legs should be at least 1 ¼" deep.
- D. A metal cabinet of suitable size shall be provided in each machine room for the storage of special tools and necessary spare parts. The cabinet shall be mounted on legs or a pedestal, a minimum of 4 inches off the floor. A Mobile Tool Storage Cabinet with wheels is not allowed.
- E. Miscellaneous Work by Other Trades
1. The furnishing and installing of electrical and non-electrical signs for escalators, which are not a part of the escalator.

### **3.03 FIELD QUALITY CONTROL**

- A. Provide a quality control program for approval by the Authority.

### **3.04 DEMONSTRATION**

#### **A. General**

1. Before an escalator is put into interim service, that escalator, or one of the same rated load and type shall be tested with full design load in accordance with ASME A17.1 and ASME A17.2. These design loads shall include all above rated loads including, but not limited to, a static load of 674 pounds per exposed step, a live load of 320 pounds per exposed step in the downward direction and 300 pounds live load in the upward direction. The tests shall be conducted either in the Contractor's plant or after installation in the presence of the Authority or their designated representative after the installation is completed. The tests shall demonstrate to the satisfaction of the Authority that all the requirements of this Contract have been complied with. Applicable provisions of the Code Practices for Inspections of Escalators, ASME A17.2, Part III (and supplements) shall apply. Additional testing shall not be required if the supplier has previously provided WMATA with an escalator of the same rated load and type, and successfully passed the required testing.
2. The testing shall satisfy the requirements of the local jurisdiction and this specification.
3. Every escalator shall be marked with the rated load and speed for which that size and type has been tested and approved. Such markings will be accepted in lieu of actual tests at the installation.
4. After installation, each escalator shall be tested without load by the Contractor in the presence of the WMATA shall include tests as follows:
  - a. The over speed protection device shall be tested by operating the escalator at the speed which trips the overspeed device. Verify compliance with Code requirements.
  - b. The handrail tension malfunction device shall be tested manually.
  - c. The broken chain protection shall be tested by operating the escalator at rated speed and tripping the broken chain device by hand.
  - d. The device providing against sudden and unusual strains on the step chains shall be tested by operating the device by hand.

- e. All push buttons, starting switches, relays, interlocks, and controls required in connection with the work shall be inspected and tested to prove that the complete escalator functions properly under any and all conditions of operation within the limits specified.
  - f. Brakes and driving machinery shall be tested for operating efficiency, ease of adjustment and temperature limits. Test and record brake torque.
  - g. The device which removes power and stops the escalator in the event an article becomes wedged between the comb plate and a step tread.
  - h. The device which removes power and stops the escalator in the event an object is carried into the handrail entries.
  - i. The device which removes power and stops the escalator in the event either handrail breaks, stops, fails to travel on escalator start-up or the handrail tensioning device fails.
  - j. The devices installed behind the upper and lower landing skirt panels which remove power and stop the escalator in the event the skirt panels are forced away from the steps.
  - k. All AC conductors before being connected shall withstand a 1,000 volt D.C. megger test, the voltage being applied between each conductor and ground for a minimum of 1 minute. Each conductor shall show an insulation resistance to ground of not less than 2 megohms.
  - l. Instruments, electric power, other necessary facilities and all labor required for the tests specified herein shall be furnished by the Contractor at no additional expense to the Authority. All test data shall be certified.
  - m. Noise level as specified in paragraph 1.05.
  - n. Vibration level as specified in paragraph 1.05.
- 5. Inspections: A Final Acceptance inspection shall be conducted by WMATA Representatives prior to acceptance inspection by the AHJ.
  - 6. All malfunctions and deficiencies revealed by the tests shall be immediately corrected by the Contractor at no additional cost to the Authority.
  - 7. Performance Guarantee: Should any of these tests identify any defects or evidence of poor workmanship, any variance or noncompliance with the requirements of the specified codes, ordinances or these specifications, the following work and or repairs shall be complete at no expense to the Authority.

- a) Replace equipment that does not meet code or specified requirements.
- b) Perform work and furnish labor, materials and equipment necessary to meet specified operation and performance.
- c) Perform and assume cost for re-testing required by Governing Code Authority and the Authority to verify specified operation and performance.

8.

### **3.05 PROTECTION**

- A. The Contractor shall be responsible for the security of the contents of each machine/controller room. The Contractor shall control access to that room, and ensure that it shall remain secure at all times until the completion of the Contractor's interim maintenance obligation.
- B. Do not proceed with remainder of the work until the demonstration, installation, procedures and personnel are approved.

### **3.06 MAINTENANCE:**

The Contractor shall perform full maintenance service for a period of two years on each escalator in accordance with the manufacturer's maintenance manual and WMATA ELES maintenance program prior to WMATA providing permanent maintenance. The period of maintenance shall begin after test(s) and Provisional Acceptance of each escalator and shall extend to the scheduled date of Final Acceptance for all units in the same facility plus a period of two years. In no case shall the interval between inspections and testing be greater than one month. The maintenance service during the warranty period shall be provided by fully trained escalator mechanics. The maintenance tasks shall include, but not limited to, the following:

- a. Inspection of completed installation and periodic testing to maintain the escalators in completely operable condition.
- b. Contractor shall provide support for periodic, accident and incident, PM compliance inspections.
- c. Lubrication of parts, and the protection of the equipment.
- d. Replacement of defective parts at no additional cost to the Authority.
- e. Annual clean down of the escalator and wellway enclosure is required. Make necessary arrangements with Authority in order to minimize any inconvenience.
- f. Contractors performing maintenance are responsible for all service, repair work and emergency call. The contractors shall provide unlimited service during revenue hours and twenty-four (24) hour (including Holidays) emergency call back service at no additional cost.

- 1) Provide twenty (24) hour (including Holidays) emergency service during the maintenance period consisting of a prompt response (within 1 hour) to emergency request by phone or otherwise from Authority or designated representative if an escalator is inoperable or in case of injury or potential injury to persons.
  - 2) Unlimited service callbacks are included with a required response time of one (1) hour (included Holidays).
- g. Periodic maintenance (based on WMATA schedule) shall be performed off peak hours to minimize service interruption.
- h. Reporting: Detailed monthly records of tasks performed including names of individuals performing the tasks, date and time performed, and other pertinent data. In addition, the reports are to be provided in an electronic format acceptable to WMATA's needs.
- i. Contractor performed maintenance shall follow the WMATA Office of Elevator and Escalator Operations procedures, schedules and check charts.
- j. Within three (3) months prior to the termination of this contract, the Authority or his designated representative(s) shall make a thorough maintenance inspection of all equipment covered under this contract. The contractor shall provide personnel to remove, test, and operate equipment as necessary. All deficiencies found as a result of this inspection shall be corrected by the Contractor as required in this agreement with no additional cost to the Authority.

### **3.07 REMOTE MONITORING SPECIFICATIONS:**

- A. Allen Bradley DF1 or industry standard Modbus protocol shall be provided to transmit data from the Elevator/Escalator controller to the Authority's AEMS RTU computer control and data system. The Design-Builder shall provide a controller data interface to a DH-485 network located in the Elevator /Escalator machine room. The DH-485 controller interface shall be programmable for data rates up to 115Kbps. The interface shall allow other nodes such as other Elevator or Escalators to be readily incorporated into the DH-485 network. The controller data interface shall include one Allen Bradley SLC PLC per station to function as a data concentrator to consolidate data from all the controllers in the station. The software for the data concentrator shall be as specified by the Authority. The data concentrator shall receive controller data over the DH-485 data network and provide formatted data to the AEMS RTU through a RS 232 link. This data transmission may be accomplished by a separate PLC controller integrated into the control system.
- B. The Elevator /Escalator control system shall automatically initiate the transmittal of data when data is requested by the Authority's AEMS system and continue until all data is received by the AEMS RTU in the station AC switchboard room. The Authority will perform final integration of the data in the AEMS system.

- C. The Contractor shall also provide the required hardware to download data from any fault finding annunciator panel to a supplied laptop PC being utilized at the Elevator/Escalator location. The provided software shall permit the downloading and storage of data on the supplied laptop PC from multiple fault finding annunciator panels.
- D. The Contractor shall install an Allen Bradley network interface module, (model 1761-NET-AIC, or approved alternative) beside the PLC in the controller and provide 24 VDC power to the module. The Allen Bradley PLC will be used for remote monitoring capabilities into WMATA established engineering monitoring network.
  - 1. Contractors shall provide all the wiring and program the PLC to communicate with station data concentrators on the DH-485 network. Coordination can be made with WMATA ELES Engineering.
  - 2. The Contractor shall pull all remote monitoring cables to the interface in the escalator controller from the remote monitoring network going back to WMATA's Automated Energy Management System (AEMS) remote terminal unit (RTU).
  - 3. Provide Ethernet communication between the elevator machine room and WMATA's communication room. The communication port shall be located less than 6' from the controller and shall have minimum of two ports for data communication.

## **1. ESCALATOR REMOTE MONITORING DATA SPECIFICATION**

### **Overview**

The design of the WMATA escalator & elevator monitoring system shall include a data concentrator PLC to gather data from the escalator control PLC's over an Allen Bradley DH 485 network. The QEI RTU shall read data from the WMATA data concentrator PLC via an RS 232 serial connection to a 1746-BAST module using Allen Bradley DF1 protocol. See figure 1.1 for reference. This specification defines data to be presented by the WMATA data concentrator PLC to the QEI RTU. The WMATA data concentrator PLC station shall poll the escalator & elevator controller(s) periodically for data and format the data into blocks within the WMATA data concentrator. An Ethernet TCP/IP connection is available at the Data concentrator PLC for future connection. The data concentrator PLC has been designed to collect data from up to (10) escalators and/or elevators. The data concentrator PLC is to be mounted into the existing QEI RTU enclosures and powered by a 120 VAC source from within the RTU. For Metro stations where more than (10) escalators and elevators are present additional data concentrator PLC's will be required.

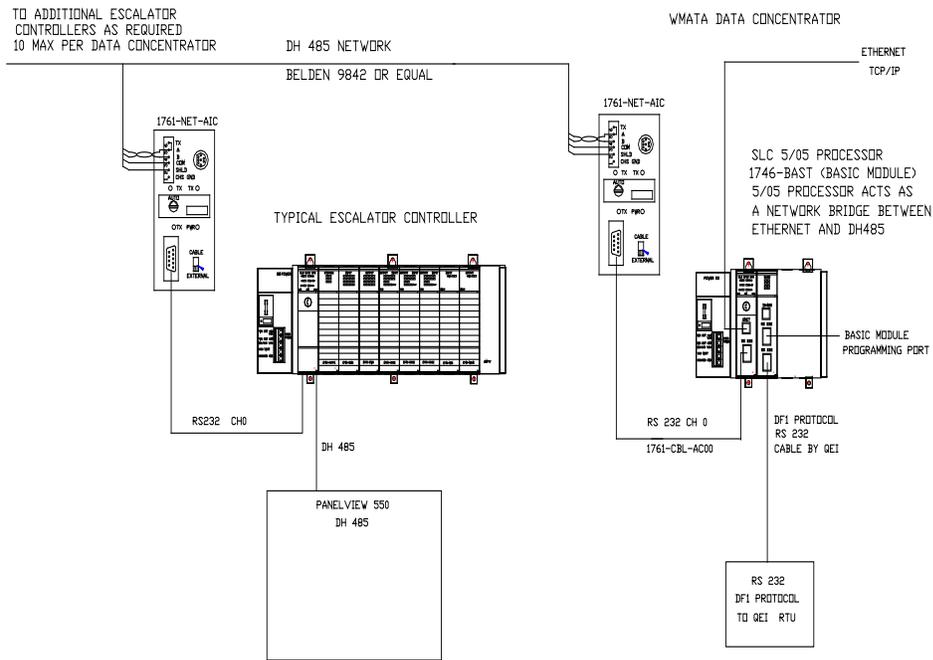

Figure 1.1

**2. Data Concentrator PLC Data File Assignments.**

The WMATA data concentrator PLC shall store data for up to (10) escalators and/or elevators in any combination as defined in table 2.1.

Note: All analog values are multiplied by 16 in the data concentrator to bit shift left 4 bits to align with QEI's 12 bit analog data types.

A note on communication loss

A 60 second watchdog timer is coded into each escalator file. If communications are lost between the data concentrator and the escalator controller for more than 60 seconds the watchdog timer will timeout. When the timer has timed out the communications loss bit will be reset (0) to indicate the communications loss condition.

#### **4. Time and date sync**

The QEI RTU shall provide clock synchronization to the WMATA data concentrator PLC every 5 minutes. Table 4.1 defines the address and data format of the clock registers in the WMATA data concentrator PLC. The data concentrator PLC shall set the escalator controller date and time every day at 3 AM.

**Table 4.1**

FUNCTION	ADDRESS	FORMAT
YEAR	N13:10	4 DIGITS
MONTH	N13:11	2 DIGITS
DAY	N13:12	2 DIGITS

HOUR	N13:13	2 DIGITS 24 HOUR
MINUTE	N13:14	2 DIGITS
SECOND	N13:15	2 DIGITS

#### **4. Data Concentrator PLC Program**

The data concentrator PLC includes code to monitor up to 10 escalators. Each escalator has an independent code file and a configuration bit. If an escalator is to be monitored the configuration bit must be set corresponding to the DH485 station address of the escalator controller. If the configuration bit is reset (0), the status and analog data table values for the escalator or elevator will be set to 0.

The configuration bits are as follows.

Escalator Configuration Bit	DH485 Address of Escalator Controller	Elevator Configuration Bit	DH485 Address of Elevator Controller
B9:0/1	1	B9:1/1	11
B9:0/2	2	B9:1/2	12
B9:0/3	3	B9:1/3	13
B9:0/4	4	B9:1/4	14
B9:0/5	5	B9:1/5	15

B9:0/6	6	B9:1/6	16
B9:0/7	7	B9:1/7	17
B9:0/8	8	B9:1/8	18
B9:0/9	9	B9:1/9	19
B9:0/10	10	B9:1/10	20

- 5. Data Concentrator Gateway IP addresses.  
The Data concentrator PLC acts as a gateway between the Ethernet and DH485 networks. The PLC contains a list of IP addresses, known as the routing table which will be allowed access to the DH485 network. The routing table will contain 20 addresses.

## SECTION 15070

### VIBRATION ISOLATION

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing vibration isolation for mechanical equipment and piping.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities
  - 2. ASTM: A123.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Design for concrete inertia block and structural-steel bases. Include tabulation of design data on isolators including actual deflection; outside diameter; free, operating and solid heights of isolators; method of attachment; bolt sizes; and type and sizes of anchor plates.
- B. Certification.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. Vibration isolators selected to produce uniform loading and deflection even when equipment weight is not evenly distributed; steel components hot-dip galvanized after fabrication in accordance with ASTM A123.
    - a. Types of vibration isolators:
    - b. For equipment and piping:
      - 1) Floor-mounted: Spring isolators.
      - 2) Ceiling-suspended: Suspension-type isolators.
  - 2. Spring isolators for floor-mounted equipment:
    - a. Free-standing, laterally stable without housing, complete with minimum 1/4-inch thick neoprene, acoustical friction pad in series with spring element.
    - b. Leveling bolts and adequate facilities for bolting to equipment and supporting structure using isolation washers.
    - c. Coil outside diameter: Not less than 0.8 of operating height of spring.
    - d. Horizontal stiffness: Not less than 0.8 of vertical stiffness.
    - e. Springs designed to have additional 50-percent capacity beyond rated load.
    - f. Springs designed so that ends remain parallel during and after spring deflection to operating height.
    - g. Vibration isolators selected for lowest operating speed of equipment.
    - h. Built-in adjustable limit stops with isolators provided for equipment of operating weight different from installed weights, to prevent rising of equipment when weight is removed and for equipment exposed to wind. Limit stops not to be in contact during normal operating conditions.

- i. Welding of springs to load-plate assembly for vibration isolators with capacities of 6,000 pounds or less is prohibited.
    - j. Vibration isolators with capacities of 6,000 pounds or less are permitted use of cups or other positive means for restraining springs.
  - 3. Suspension-type isolation hangers for ceiling-suspended equipment:
    - a. Combination of spring and neoprene in series.
    - b. Spring made of stable steel.
    - c. Encased in structurally stable steel bracket.
    - d. Spring diameter large enough to permit 15-degree angular misalignment of rod connecting hanger to equipment without rubbing on box
    - e. Designed to provide complete support for suspended units upon failure or rupture of isolator.
  - 4. Inertia bases:
    - a. Furnished by vibration-isolator manufacturer.
    - b. Complete with steel-reinforced concrete cast into welded structural-steel channel frame, mounting templates and brackets for vibration isolators with thickness equal to eight-percent minimum of longest base dimension.
    - c. Structural-steel work: Section 05500.
  - 5. Concrete equipment subbases (housekeeping pads)
    - a. Concrete: Sections 03100, 03200 and 03300.
    - b. Concrete subbases not less than four inches high provided for floor-mounted equipment. Subbases resting on structural floor and reinforced with steel rods interconnected with reinforcing bars of floor by means of tie bars hooked at both ends.
    - c. Clearance between subbases and inertia bases: Two inches minimum.
    - d. Subbase concrete: Class 2500, Finish No. 4.
  - 6. Snubbers:
    - a. As recommended by manufacturer of vibration isolator.
    - b. Compatible with vibration isolators provided.
- B. Isolation-Unit Types and Deflection:
  - 1. Fans, ventilating units, evaporation units and air-conditioning units: Floor-mounted and ceiling-suspended.
    - a. Spring isolators designed for a minimum of 1.5 inches deflection.
    - b. Snubbers: Where shown.
  - 2. Pumps:
    - a. Base-mounted pumps on inertia bases.
    - b. Inertia bases shaped to include base elbow supports for connected piping and at least 1-1/2 times weight of supported equipment or a minimum base thickness of eight percent of longest base dimension, whichever results in greater weight.
    - c. Springs with minimum deflection of 1.5 inches under imposed static load.
  - 3. Chillers:
    - a. Vertically restrained spring isolators designed for 1.5 inches minimum deflection. Inertia bases if recommended by chiller manufacturer.
  - 4. Self-contained air-conditioning units:
    - a. Spring-isolators designed for a minimum of one-inch deflection except through-wall units.
  - 5. Remote air-cooled condensing or condenser units:
    - a. Isolators: As specified for self-contained units.
  - 6. Cooling towers:
    - a. Steel beams mounted on vertically restrained spring isolators designed for 1.5 inches minimum deflection.
    - b. Rails: Acceptable, if performance requirements for spring isolators specified for cooling towers are met.

- c. Height of steel beams designed to support loads and eight-percent minimum of longest span between isolators.
- 7. Air compressors:
  - a. Temperature-control compressors: Spring isolators designed for 1.5 inches minimum deflection.
- 8. Piping:
  - a. Ceiling-suspended piping: Combination spring and neoprene in shear element hangers as specified for ceiling-suspended equipment. Springs designed for 1.5-inch minimum deflection. First two isolation hangers of each pipe connected to equipment to have deflection equal to equipment isolation-support deflection.
  - b. Floor-mounted piping isolated by spring isolators with one-inch minimum static deflection. First two spring isolators of each pipe connected to equipment to have deflection equal to equipment isolation-support deflection.
- 9. Grout: Section 03300, premixed shrinkage-compensating grout.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Install vibration isolators where shown as recommended by the equipment manufacturer.
- B. Mount mechanical equipment on vibration isolators to isolate equipment from structure.
- C. Jack bases and equipment into position and wedge or block before vibration isolators are loaded.
- D. Use isolator leveling bolts for final leveling of equipment after equipment is in operation.
- E. Springs installed so that ends remain parallel during and after deflection to operating height.
- F. Mount snubbers as close to vibration isolators as practicable.
- G. Grout void between pump bases and inertia-base concrete.
- H. Piping connected to equipment isolated from structures as follows:
  - 1. Condenser-water piping in its entirety.
  - 2. Chilled-water piping: Piping connected to equipment, mounted on vibration isolators or suspended with vibration hangers, isolated for a distance of 50 feet from equipment. Piping with installed length less than 50 feet isolated in its entirety only when connected to equipment provided with vibration isolators.
  - 3. Compressed-air piping: Connected to compressors for a distance of 50 feet from compressor. Piping with installed length less than 50 feet isolated in its entirety.

**END OF SECTION**

## SECTION 15075

### IDENTIFICATION OF MECHANICAL EQUIPMENT AND PIPING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing nameplates and tags on mechanical equipment and apparatus.
- B. Related Work Specified Elsewhere:
  - 1. Field painting: Section 09920.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples:
    - a. Labels and tags in each size.
  - 2. Documentation:
    - a. Charts for valves; include valve identification number, location and purpose.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. Nameplates: Laminated plastic.
- B. Tags: 18-gauge stainless steel.
- C. Identification Plates: Bronze, Authority-furnished.

#### PART 3 - EXECUTION

##### 3.01 IDENTIFICATION:

- A. Equipment and Apparatus:
  - 1. Label equipment and apparatus with one-inch high white letters engraved on 1-1/2 inch high, black, laminated-plastic nameplates securely fastened to metal panels, showing function and unit number of item.
  - 2. Identify devices including transducers, controls and switches by means of 1/2-inch high white letters engraved on one-inch high, black, laminated plastic nameplates identifying manufacturer and function of equipment.
    - a. Provide same type nameplates on front cover for each pilot light and for mode-of-operation selector switches. Label positions of mode-selector switches AUTOMATIC/OFF/EMERGENCY EXHAUST/EMERGENCY SUPPLY for subway-ventilation fans, and LOCAL/TRACK 1/LOCAL TRACK OFF/REMOTE for jet fans..
  - 3. Nameplates for components located in fan-control cabinets to show symbol used on schematic diagram to represent component. Label fan-control cabinet terminals using same symbols and identification corresponding to that shown on schematic diagram.
- B. Piping:

1. Stencil legends and bands on piping showing service and direction of flow as specified in Section 09920.
  2. Color coding of exposed piping and terminatings of piping is specified in Section 09920.
- C. Valves:
1. Identify valves with 1-1/2 inch diameter, 18-gauge stainless-steel tags.
  2. Designate appropriate service on each tag with 1/4-inch stamped black-filled letters and valve number with 1/2-inch stamped black-filled numbers.
- D. Orifice Flange and Venturi Tube:
1. Identify each orifice or venturi tube with integral tab or stainless-steel tag.
  2. Stamp on tag differential multiplier, orifice bore, rate of flow and equipment served.

### **3.02 INSTALLATION:**

- A. Cement nameplates with permanent adhesive on equipment and apparatus.
- B. Affix labels to surface of control and switch boxes by means of sheet-metal rivets. Cement labels to surface with permanent adhesive when rivets cannot be used.
- C. Fasten tags securely to valves, orifice flange, venturi tube with brass jack chain, so as to permit easy reading.
- D. Mount valve charts in aluminum frames with clear Lucite front cover in locations as directed.
- E. Fire-Protection and Suppression System:
1. Stencil legends on piping as shown to identify service and direction of flow.
  2. Stencil vent-shaft and fan-shaft identification as shown on piping adjacent to angle hose valves in tunnels.
  3. Stamp information on Authority-furnished identification plates as shown and fasten to sleeve on siamese fire-department connections for tunnel systems as shown.

**END OF SECTION**

## SECTION 15080

### INSULATION

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing insulation.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NFPA: 90A.
  - 3. ASTM: C240, C534, C552, C1071, E84.
  - 4. FS: HH-I-558.
  - 5. MS: MIL-A-3316, MIL-B-19564, MIL-C-19565, MIL-C-20079.
  - 6. SMACNA: HVAC Duct Construction Standards – Metal and Flexible
- B. Each item listed in UL Building Materials Directory.
- C. Fire-Hazard Ratings:
  - 1. Determine fire-hazard ratings in accordance with ASTM E84.
    - a. Insulation, fastener, and jacketing materials, except flexible cellular plastic for expansion joints: Not exceeding 25 for flame spread, 50 for fuel contributed and 50 for smoke developed.
    - b. Use of flameproofing and fireproofing treatments for the purpose of achieving specified fire-hazard ratings for insulation not meeting specified requirements is prohibited.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Label each item with manufacturer's name and brand designation, referenced specification number, type, class and thermal and acoustical rating as applicable.
- B. Ship each type of insulation and accessory materials securely packaged and labeled for safe handling in shipment and to avoid damage.
- C. Store materials in secure and dry storage facility.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. External Ductwork Insulation with Vapor-Barrier Facing:
  - 1. Insulation:
    - a. Rigid board for exposed ductwork:
      - 1) Thickness: One inch.

- 2) Density: Three pounds per cubic foot.
- 3) Vapor-barrier facing: As specified, factory-applied.
- 4) FS HH-I-558, Form A, Class 2.
- b. Flexible duct wrap for concealed ductwork:
  - 1) Thickness: Two inches.
  - 2) Density: 1.5 pounds per cubic foot.
  - 3) Vapor-barrier facing: As specified, factory-applied.
  - 4) FS HH-I-558, Form B, Type I, Class 6.
- 2. Vapor-barrier facing: foil-reinforced kraft paper.

B. Internal Ductwork Insulation:

- 1. Optional materials:
  - a. Flexible insulation:
    - 1) Thickness: One inch.
    - 2) Density: Three pounds per cubic foot.
    - 3) Smooth coating on inside.
    - 4) ASTM C1071 and NFPA 90A.
  - b. Fibrous-glass insulation:
    - 1) Thickness: One inch.
    - 2) Density: Three pounds per cubic foot.
    - 3) Perforated, galvanized-sheet metal inner lining, lining as specified.
- 2. Minimum normal incidence sound absorption coefficients based on insulation thickness of one inch:

Cycles per second	125	250	500	1000	2000	4000
Coefficient	0.11	0.22	0.60	0.85	0.82	0.91

- 3. Maximum increase in friction loss of air due to duct insulation: 15 percent at 2,000 feet per minute velocity.

C. Piping Insulation:

- 1. General:
  - a. Vapor-permeance resistance:
    - 1) Maximum vapor permeance: 0.5 percent by volume.
    - 2) Vapor-permeance ratings for piping insulation determined in accordance with ASTM C240.
- 2. Chilled-water piping insulation:
  - a. Rigid premolded cellular glass: Covered with aluminum jacket 0.016-inch thick; ASTM C552.
  - b. Rigid premolded insulation sleeving: Thermal-pipe and tube covering, mineral fiber, industrial-type covered with aluminum jacket 0.016-inch thick; ASTM C552, all-service jacket.
  - c. Insulation for buried or embedded pipe: As specified or rigid polyurethane, one-inch thick, ASTM C552.
- 3. Insulation for pump discharge lines, force sewer mains and hot/cold potable-water piping:
  - a. Pipe, valves, flanges and fittings: As specified for chilled-water piping except insulation to consist of one layer, one-inch thick.
  - b. Insulation not required on embedded or buried pipe.
- 4. Refrigerant-piping insulation:
  - a. As specified for chilled-water piping except insulation to consist of one layer, one-inch thick.

D. Chilled-Water Pump Insulation:

- 1. Rigid premolded cellular glass: Two inches thick, ASTM C552.

- E. Chiller Insulation:
  - 1. Insulation:
    - a. Semi-rigid fibrous-glass board: 1-1/2 inches thick; FS HH-I-558, Form A, Class 1.
    - b. Cellular glass, rigid blocks or boards: Two inches thick; ASTM C552.
  - 2. Vapor-barrier coating: Resistant to fire and water; MS MIL-C-19565, Type 1.
  - 3. Fire-resistant lagging adhesive: MS MIL-A-3316, Class 1.
  - 4. Metal bands for securing insulation in place: Type 316, stainless steel, minimum thickness 0.016 inches, minimum width 1/2 inch.
  - 5. Glass cloth: MS MIL-C-20079, Type I, Class 2.
- F. Air-Separator Insulation:
  - 1. As specified for chilled-water pump.
- G. Compression-Tank Insulation:
  - 1. As specified for chiller.
- H. Expansion-Joint Insulation: Flexible unicellular, ASTM C534, one-inch thickness, two layers.
- I. Wire Mesh: Galvanized wire, 22-gauge, one-inch mesh welded.
- J. Corner Beads: Galvanized steel, 26-gauge, 2 1/2-inch wings.
- K. Rigid-Insulation Adhesive and Sealer: Cold-applied, nonhardening asphaltic-type, in accordance with MS MIL-B-19564.
- L. Vinyl-Emulsion Mastic: As recommended by manufacturer of rigid insulation.
- M. Bore Coating: Anti-abrasive vinyl-base type as recommended by manufacturer of rigid insulation.
- N. Sheet Metal Duct Lining: Galvanized sheet metal, 22 gauge, perforated with 3/32-inch holes on 3/16-inch centers, with 22-percent open area.
- O. Fabric Pipe Jacket: Prefabricated laminate containing 10-by-10 asphalt-impregnated glass fabric and aluminum foil one-mil thick, sandwiched between three layers of bituminous mastic, for use on embedded or inaccessible piping.
- P. Metal Pipe Jacket:
  - 1. Galvanized sheet steel, 24 gauge (U.S.S.) having Z-type longitudinal joint seam.
  - 2. Aluminum alloy, 0.016-inch thick, mill-finish, having Z-type longitudinal joint seam.
- Q. Insulation-Hanger Shields: Aluminum alloy, minimum 0.050-inch thick, mill-finish, covering bottom 180 degrees of pipe insulation, lengths as follows:

Pipe Sizes/Inclusive	Shield Length
1/2 inch to 2 inches	6 inches
2-1/2 inches to 6 inches	9 inches
6 inches to 12 inches	12 inches

**PART 3 - EXECUTION**

**3.01 APPLICATION OF INSULATION:**

- A. General:
1. Do not apply insulation until all surfaces to be covered are clean, dry and free of foreign materials, such as oil, grease, rust, scale and dirt.
  2. Apply only clean and dry insulation.
  3. Install insulation in accordance with manufacturer's recommendations as a minimum requirement.
  4. Provide complete moisture and vapor seal wherever insulation terminates against metal hangers, anchors and other projections through insulation on cold surfaces.
  5. Provide continuous insulation through sleeves and openings except pipe sleeves piercing exterior walls, floors and ceilings below ground level.
  6. Stagger joints with respect to adjacent butt joints.
  7. Unless otherwise shown, insulate the following:
    - a. Platform and mezzanine air-conditioning supply ductwork.
    - b. Ancillary-area air-conditioning ductwork, supply and return, except ductwork within air-conditioned space.
    - c. Ancillary-area heating ductwork, ventilating ductwork and combined heating and ventilating ductwork, supply and return except ductwork within heated space.
    - d. Outside-air intake ductwork.
    - e. Exhaust-air ductwork between automatic damper on discharge side of fan and louver, except underplatform and dome exhaust-air ductwork where insulation is not required.
  8. The Contractor has the option of applying insulation internally or externally, except for the following required internal applications:
    - a. Where shown.
    - b. Insulated ductwork exposed to weather.
    - c. Air-conditioning pylons.
    - d. Air-conditioning ductwork under platform.
- B. External Ductwork Insulation:
1. Install insulation continuously through openings provided for passage of ductwork and unbroken over seams, angles, hangers and other accessories.
  2. Do not use scrap pieces of insulation to make up full-length sections. Eliminate voids by refitting or replacing insulation.
  3. Rigid board for exposed ductwork:
    - a. Fasten to duct with mechanical fasteners spaced 12 inches to 18 inches on center, with minimum of two rows on each side of duct.
    - b. Secure with washers firmly embedded in insulation.
    - c. Seal joints, breaks and punctures with fire-resistant vapor-barrier coating reinforced with a three-inch wide vapor-barrier strip.
  4. Flexible duct wrap for concealed ductwork:
    - a. Adhere to duct with fire-resistant adhesive in sufficient quantities to prevent sagging.
    - b. Secure insulation tightly to the ducts with Type 316 stainless-steel insulation bands spaced 12 inches maximum center-to-center.
    - c. For duct widths over 30 inches, secure on underside of duct with mechanical fasteners on 18-inch centers.
    - d. Butt insulation, overlap joints with vapor-barrier facing two inches minimum; seal with fire-resistant vapor-barrier adhesive.
    - e. Seal breaks and punctures with vapor-barrier strip and coating.
- C. Internal Ductwork Insulation:
1. Install insulation in accordance with manufacturer's recommendations based on velocity and duct dimensions and SMACNA HVAC Duct Construction Standards -- Metal and Flexible.

2. Where insulation has perforated galvanized-sheet-metal inner lining, fill space between liner and outer duct, leaving no void spaces or unlined sections.
  3. Do not use scrap pieces of insulation to make up full-length sections. Eliminate voids by retrofitting or replacing insulation.
  4. Apply adhesives, where required, in accordance with manufacturer's recommendations.
  5. Increase both width and height dimensions of duct by two inches from dimensions shown.
- D. Chilled-Water Pump Insulation:
1. Rigid premolded cellular glass: Two inches thick, ASTM C552.
- E. Piping Insulation:
1. Chilled-water piping:
    - a. Insulation thickness:
      - 1) Rigid premolded cellular glass:
        - a) Pipe sizes four inches and smaller: Install two layers of one-inch thick insulation on supply and return piping, valves and fittings.
        - b) Pipe size five inches and larger: Install one layer of two-inch thick insulation on supply and return piping, valves and fittings.
      - 2) Rigid premolded insulation sleeving: Install one layer of two-inch thick on supply and return piping, valves and fittings as follows:
        - a) IPS sizes: 1/2 inch through 30 inches.
        - b) Copper tubing: 1/2 inch through 6-1/8 inches.
  2. Pump discharge lines, force sewer mains and potable-water piping:
    - a. Install insulation on pump discharge lines, force sewer mains, hot and cold potable-water piping, valves, flanges and fittings conforming to insulation installation specified for chilled-water piping except that insulation consists of one one-inch thick layer.
    - b. Asphalt-paper inner jacket not required.
  3. Refrigerant-piping insulation:
    - a. Install insulation consisting of one layer, one-inch thick and finished as specified for chilled-water piping.
  4. Embedded or inaccessible-piping insulation:
    - a. Install insulation consisting of layers or thickness specified for usage specified.
    - b. Provide inner jacket of prefabricated-fabric pipe jacket.
    - c. Coat exposed surface of fabric pipe jacket with protective plastic film and inner surface with special-release paper.
    - d. Apply jacket of galvanized steel over inner jacket.
    - e. For flanges, valves and other fittings, apply aluminum jacket with paper backing or asphalt adhesive over galvanized-steel jacket. Secure by means of straps as specified.
    - f. Over elbows provide mitered insulation covered with aluminum jacket material.
- F. Application of Insulation on Pipe Saddles:
1. Cut two-inch thick piece of premolded pipe insulation of same material as used on piping, slightly larger than void formed by outer pipe circumference and pipe saddle.
  2. Press insulation into void by hand pressure, so that both ends project slightly beyond each end of saddle.
  3. Cut ends of insulation flush with saddle ends.
  4. Use of filler, adhesive or other material to fill voids or imperfections in insulation is prohibited.

- G. Expansion Joints for Piping Insulation:
1. Install expansion joints in both horizontal insulation and vertical runs of piping on centers not to exceed 50 feet.
  2. Install joints one-half inch wide and fill with cushioning material in accordance with insulation manufacturer's recommendations.
- H. Insulation for Anchors:
1. Insulate anchors which are secured directly to cold piping as specified for a minimum distance of eight inches from surface of pipe insulation and sufficient to prevent sweating.
- I. Application of Chilled-Water Pump Insulation:
1. Install two-inch thick insulation as complete unit or in sections, constructed so that insulation can be removed and replaced without damage.
  2. Fit insulation snugly against pump without voids.
  3. Bevel curved surface edges to provide tight joint.
  4. Provide metal insulation covers with metal fasteners, supports, frames and membranes.
- J. Application of Chiller Insulation:
1. Insulate water-cooler shell, water boxes of water cooler, exposed suction piping and cold gas-inlet connection to hermetic-unit motors.
  2. Exposed suction piping: As specified for chiller-water piping
  3. Cooler shell:
    - a. Cut and miter insulation to fit contour of surface. Secure in place with bands not over 12 inches on center. Stagger and seal joints with vapor-barrier mastic.
    - b. Apply tack coat of adhesive conforming to MS MIL-A-3316, Class 1, at 60 to 70 square feet per gallon by spray or brush. Embed glass cloth into wet coating, smoothing to remove wrinkles. Overlap seams at least two inches. By spray or brush apply finish coat of lagging adhesive to entire fabric surface at rate of 60 to 70 square feet per gallon. Apply finish coat not later than one hour after tack coat.
  4. Removable heads and water boxes:
    - a. Cover removable heads and water boxes with galvanized-steel box, 22-gauge minimum, constructed as complete unit or in sections. Construction to permit removal and replacement of covers without damage to insulation.
    - b. Line metal covers with insulation of type and thickness used for cooler shell. Impale insulation on weld pins and secure with speed washers.
    - c. Seal voids and joints with vapor-barrier mastic to prevent infiltration of moisture in space between insulation and metal cover.
- K. Application of Air Separator Insulation:
1. As specified for chilled-water pump.
- L. Application of Compression-Tank Insulation:
1. As specified for chiller.

**END OF SECTION**

**SECTION 15120**  
**COMPRESSION TANKS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing compression tanks complete with fittings and appurtenances.

**1.02 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
  2. ASME: Boiler and Pressure Vessel Code.

**1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings:
    - a. Complete catalog information and shop drawings including piping diagrams.

**PART 2 - PRODUCTS**

**2.01 PRODUCTS AND MATERIALS:**

- A. Compression Tank:
1. Compression tank diaphragm type.
  2. Black-steel, welded plate with rustproof coating on exterior, capacity as shown.
  3. Designed for working pressure of 125-psig minimum; meeting ASME Boiler and Pressure Vessel Code.
  4. Diaphragm made of butyl, replaceable.
  5. System connection forged steel.
  6. Factory precharged to 12 psig.
  7. Provided with charging valve and drain plug.
- B. Nameplates:
1. Securely attached plate on each tank showing manufacturer's name, model number and serial number.

**PART 3 - EXECUTION**

**3.01 INSTALLATION:**

- A. Install equipment and appurtenances within space provided and locate for easy servicing.
- B. Provide concrete pad, bracket supports, saddles and hangers for tanks.

**END OF SECTION**

## SECTION 15125

### PIPING CONDUIT

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing complete factory-fabricated piping conduit and control-air piping conduit.
- B. Related Work Specified Elsewhere:
  - 1. Piping systems: Section 15205.
  - 2. Insulation: Section 15080.
  - 3. Raceways, boxes and cabinets: Section 16130.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ANSI/ASME: B31.1.0.
- B. Source Quality Control:
  - 1. Prior to shipment, test carrier pipes at 800 psi until found leak-free.
  - 2. Test prefabricated-conduit sections and fittings at 15-psi air at the factory to ensure compliance with specified requirements and to prove weldtight.
- C. Inspection:
  - 1. Upon delivery to job site, visually inspect each section of prefabricated conduit to determine shipping damage, thickness of coating, necessary air space, bond of coating to conduit and conformance to specified requirements. Reject material not in conformance with special requirements or which displays shipping damage beyond that permitted by these Specifications.
  - 2. Coating test:
    - a. After visual examination and prior to installation, perform coating dielectric-integrity test in accordance with manufacturer's instructions for test equipment.
    - b. Test equipment:
      - 1) Silicone-rubber, electric wire-brush or coil-probe type providing 10,000 peak volts plus-or-minus five percent.
      - 2) Audible alarm or buzzer to sound upon detection of holiday or void in coating.
      - 3) Sealed case to avoid tampering or adjustment in the field.
      - 4) Calibration by manufacturer at six-month intervals or at such times as peak voltage is questionable.
      - 5) Furnish manufacturer's certification of date of calibration and peak-voltage setting.
      - 6) Indication of state of battery charge.
  - 3. Repair of voids:
    - a. If voids detected by the above methods were caused by improper handling, and are such that the areas of patches extending a minimum of two inches from the outer periphery of the void total less than 100 square inches for sections of conduit up to 20 feet in length, or less than 200 square inches for sections up to 40 feet in length, the section may be repaired.
      - 1) Perform repairs using specified coating; repeat testing procedure.

- b. Remove from job site sections requiring patches larger than specified and replace with new conduit sections.
- 4. Perform inspections in the presence of the Engineer. Provide samples of coating and coating material for laboratory analysis when directed.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification:
    - a. Manufacturer's certification that installation has been made in accordance with manufacturer's recommendations and published instructions and meets specified requirements.

## PART 2 - PRODUCTS

### 2.01 PRODUCTS AND MATERIALS:

- A. Prefabricated-Piping Conduit:
  - 1. Welded-piping conduit, factory-insulated armored piping, welded as specified for steel piping in Section 15205.
  - 2. Outer conduit: Steel, four-gauge minimum.
  - 3. Insulation consisting of two one-inch layers of cellular glass as specified in Section 15080 except insulation jacket consisting of outer wrap of asphalt-impregnated, fibrous-glass reinforced, asbestos pipeline felt, spirally wound under tension.
  - 4. Adequate air space between outer conduit and pipe insulation permitting expansion and contraction of piping without resulting damage.
  - 5. Outer conduit coated on inside with six mils minimum unmodified catalytic polyamide or versamid-cured epoxy.
  - 6. Outer conduit coated on outside with minimum 20-mil epoxy reinforced with two layers of fibrous-glass cloth. Outer coating consisting of iron-oxide zinc-chromate catalyzed primer, chromium-oxide catalyzed finish coat and asphaltic bituminous-mastic final coating.
    - a. Coating cured at 180F for one-hour minimum.
    - b. Final asphaltic coating: Machine-coated high-melting-point asphalt, 3/16-inch minimum, with interposed layer of fibrous-glass screen, plus one final outer wrap of asphalt-impregnated, fibrous-glass reinforced, asbestos pipeline felt, applied under tension.
  - 7. Iron-oxide zinc-chromate catalyzed primer as follows:
    - a. Primer containing 60-percent minimum solids after mixing two components but before reduction.
    - b. Solids: Iron-oxide pigment 1.50 to 2.00 pounds per gallon, containing minimum of 75-percent ferric oxide.
    - c. Zinc chromate: 0.50 pound per gallon minimum and magnesium silicate 1.5 to 2.0 pounds per gallon.
    - d. Vehicle portion of primer consisting of 65-percent epoxy resin (450 - 525 epoxide equivalent) and 35-percent resinous nitrogen containing curing agent with not more than five percent of vehicle as stabilizers and flow-control agents. Finish coat to contain not less than 60-percent solids after mixing two components but before reduction.
    - e. Use pigment which consists of two pounds per gallon of chromium oxide with the addition of not more than three percent of pigment as dispersant and suspending agents.

8. Finished-coat vehicle of 65-percent epoxy resin (450 - 525 epoxide equivalent) and 35-percent resinous-nitrogen curing agent with not more than five percent of vehicle as stabilizers and flow-control agents.
  9. Conduits incorporating the following features:
    - a. Pipe-support guides.
    - b. Watersheds, welded pipe only.
    - c. Leak plates:
      - 1) Equip conduits with steel leak plates of type and size shown.
    - d. Anchors: As shown.
    - e. End and gland seals:
      - 1) Equip terminal ends of conduit with seals of type and size shown.
      - 2) Equip seals with drain and vent openings located diametrically opposite on vertical centerline of mounting plate. During fabrication install plugs for drain and vent openings. Plugs to remain in place during shipment and installation.
    - f. Expansion loops:
      - 1) Factory-fabricated of casing, couplings, insulation and piping identical to that specified for straight runs.
      - 2) Designed and installed to ensure complete drainage.
      - 3) Designed with allowable-stress limits in accordance with in ANSI/ASME B31.1.0, for type of pipe used.
      - 4) Shipped to job site in maximum size sections feasible in order to minimize number of field joints.
    - g. Loop casing:
      - 1) Sized to contain pipe movement without crushing insulation or causing other damage.
      - 2) Eccentric reducers and increasers, or welding collars serving same purpose, used to allow drainage through loop.
      - 3) Welding collars not lighter than conduit casing and not less than 10 gauge.
- B. Control-Air Piping Conduit:
1. PVC: Section 16130.
- C. Conduit Monitoring System:
1. Control unit: Provided only in cases where conduit is buried or when approved.
    - a. Wall-mounted, liquid-tight, hinged cover.
    - b. Leak warning light, allowing reset by depressing, mounted on front cover.
    - c. Pressure gauge, mounted on front cover, indicating conduit internal pressure, covering conduit internal-pressure range of five to eight psi.
    - d. Compression fittings for gas inlet and gas outlet: 3/8-inch copper tubing.
    - e. Gas regulator capable of adjustment from zero psig to 20 psig.
  2. Copper tubing: 3/8-inch as specified by manufacturer of monitoring system.
  3. Source of dry nitrogen gas not to exceed 100 psi.
  4. Relief valves capable of being set for 15-psig maximum, blowoff piping, conduit vents, conduit drains: As specified by the manufacturer.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Excavation:
1. Remove rock encountered during excavation for installation of prefabricated-piping conduit to minimum overdepth of four inches.

2. Backfill overdepth with aggregate for subgrade foundation as specified in Section 02535.
- B. Installation:
1. Install prefabricated piping conduit, including expansion loops and conduit monitoring system, in accordance with manufacturer's recommendations and under personal supervision of manufacturer's representative.
    - a. Locate monitoring unit in refrigeration-equipment room.
  2. Fabricate field joints to match factory fabrication and perform testing as specified.
  3. Clean and sandblast steel surfaces prior to coating.
  4. Apply coating to match factory-applied coating and perform testing as specified.
- C. Backfill:
1. Backfill after installation and testing in accordance with Section 02320, with the exception that 1/4 inch used as maximum particle size.
  2. Backfill with specified material in six-inch layers, rammed, to one-foot minimum cover.

### **3.02 FIELD QUALITY CONTROL:**

- A. Install prefabricated-piping conduit under personal supervision of manufacturer's qualified field-service representative.
- B. Field Testing:
1. Prior to application of coating and before backfilling, test conduit sections and joints for leaks by application of 15 psig for one-hour minimum.
  2. Repair leaks in accordance with manufacturer's recommendations and retest until approved.
  3. After application of coating and prior to backfill, perform coating tests as specified on exterior surfaces including field joints.
  4. Repair coating voids to restore full dielectric integrity to system or replace conduit section and repeat testing procedures.
  5. After backfilling, test conduit system by application of 15 psig for eight hours minimum
  6. Locate and repair leaks detected by loss of gas pressure and retest until approved.
  7. Ventilate air space in conduit with heated air at rate of two cfm. Continue until cool mirror located at exit port exhibits no fogging.
  8. Charge to five psig and close off plugs.
  9. Set monitoring system according to manufacturer's instructions for unattended surveillance.
  10. Submit copy of installation and inspection report.

**END OF SECTION**

## SECTION 15135

### MISCELLANEOUS PUMPS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing pumps, complete with motor drives and controls, except drainage pumping systems, chilled-water pumps and condenser-water pumps.
- B. Related Work Specified Elsewhere:
  - 1. Piping systems: Section 15205.
  - 2. Raceways, boxes and cabinets: Section 16130.
  - 3. Wire, cable and busways: Section 16120.
  - 4. Motors: Section 16225.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. UL, NEMA 250.
- B. Source Quality Control:
  - 1. Select pumps based on capacity, total dynamic head and electrical characteristics shown.
  - 2. Test pumps at 1-1/2 times working pressure.
  - 3. Balance impeller statically, dynamically and hydraulically.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements specified for each:
  - 1. Shop Drawings.
  - 2. Certification.
  - 3. Operation and Maintenance Manuals:
  - 4. Submit for each pump.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIAL:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of subassemblies, parts, motors, starters and relays.
- B. Hot-Water Circulating Pump:
  - 1. Type: Centrifugal, single-stage, single-suction, in-line, hydraulically balanced and electric-motor-driven.
  - 2. Minimum capacity: As shown.
  - 3. Operating speed: 1,750 rpm.
  - 4. Designed in accordance with the following:
    - a. Standards of Hydraulic Institute.
    - b. Pump supported by piping system.

- c. To permit complete servicing without severing pipe connection.
    - 5. Construction: Bronze, with stainless-steel or heat-treated steel shafts, with the following additional requirements:
      - a. Bearings: One of the following:
        - 1) Ball bearings, frictionless with permanent grease lubrication.
        - 2) Sleeve bearings, oil-lubricated.
      - b. Roller bearings, with oil reservoir.
    - 6. Casing: Suitable for working pressure of 125 psig.
    - 7. Seals: Mechanical, designed and guaranteed for long life in hot-water systems operating at 250F.
    - 8. Motors: As specified in Section 16225.
- C. Submersible Sump Pump:
  - 1. Type: Automatic, electric-motor-driven, centrifugal, wet-pit, close-coupled.
  - 2. To include single-phase, hermetically sealed, capacitor-start motor with built-in overload protection, upper and lower bearing factory-sealed, grease-lubricated ball-type, common shaft of stainless steel, Type 316, and sealed pump cable with neoprene cover and flexible armor. Motors to have cooling characteristics permitting continuous operation in totally submerged, partially submerged and non-submerged condition.
  - 3. Casing: Close-grain cast iron, volute-type.
  - 4. Impeller: Cast bronze, enclosed or semi-open, with vanes and back shroud, dynamically balanced.
  - 5. Intake protected with slotted cast-iron or perforated steel intake strainer with effective free area sufficient to prevent cavitation and poor efficiency.
- D. Liquid-Level Control:
  - 1. Simplex submersible, single-phase unit, one of the following:
    - a. Integral with pump, designed for direct switching of single-phase pumps, complete with ON/OFF, adjustable-level float switches.
    - b. Completely independent, designed for direct switching of single-phase pumps and consisting of control box, contactor and ON/OFF level float switches.
      - 1) Control box of heavy-duty plastic having three-prong male plug for plugging into standard three-wire grounded power-supply outlet; grounded female socket into which cable from pump motor is plugged and heavy-duty contactor with 90-ampere lock-rotor rating for direct switching of motor load.
      - 2) Float switches for ON and OFF level switching connected to control box with extra-flexible, neoprene-jacketed electrical cable. Float switches UL-listed. Floats strapped to discharge pipe at required ON and OFF levels. Mercury switch with molybdenum contacts sealed in each double-walled float enclosure. Float enclosure of heavy-duty rigid plastic, resistant to attack by inorganic salt solutions, alkalis and mineral acids.
  - 2. Duplex submersible, single-phase unit. Completely independent, designed for direct switching of two single-phase pumps and consisting of duplex control box, contactors, alternator, and ON/OFF and emergency-level float switches.
    - a. Weatherproof, UL-listed, steel control box with gasketed removable cover containing contactor with 90-ampere lock-rotor rating for each pump, electric-alternator circuit and control-circuit fuse. Pump starting alternated at ON level on successive cycles. Second pump starts at EMERGENCY level if inflow exceeds capacity of first pump or is inoperative.
    - b. Float switches for ON, OFF and EMERGENCY level switching, connected to control box with extra-flexible, neoprene-jacketed electrical cable. Float switches UL-listed. Floats strapped to discharge pipes at required ON, OFF

and EMERGENCY levels. Mercury switch with molybdenum contacts sealed in each double-walled enclosure. Float enclosure of heavy-duty rigid plastic, resistant to attack by inorganic salt solutions and mineral acids.

- c. Alternator:
  - 1) Electric, automatic.
  - 2) Designed to alternate pumps on each successive cycle of operation and to operate both pumps automatically when one pump is unable to handle flow.
  - 3) Enclosure for electrical components: NEMA 250, Type 1.
- E. Wiring:
  - 1. Control panel: Completely wired at the factory prior to shipment.
  - 2. Wiring and conduit: Sections 16130 and 16120.
- F. Nameplates:
  - 1. Securely attached to each major item of equipment. In each case, show manufacturer's name, model number, serial number, electrical and operating characteristics.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide hangers and anchor bolts required for proper installation of equipment as recommended by manufacturer.
- C. Install in accordance with manufacturer's instructions.

#### **3.02 FIELD QUALITY CONTROL:**

- A. Ensure that connections are secure and watertight.
- B. Test system through five complete operating cycles.
- C. Ensure that pump and motor operate without noticeable vibration.

**END OF SECTION**

## SECTION 15185

### CHILLED WATER PUMPS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION

- A. This section specifies providing chilled-water and condenser-water pumps, complete with motor drives.
- B. Related Work Specified Elsewhere:
  - 1. Insulation: Section 15080.
  - 2. Vibration isolation: Section 15070.
  - 3. Motors: Section 16225.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NEC.
- B. Design Criteria:
  - 1. Select pumps based on capacity and total dynamic head shown.
- C. Source Quality Control:
  - 1. Test pumps at 1-1/2 times working pressure.
  - 2. Balance impeller statically, dynamically and hydraulically.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.
  - 3. Operation and Maintenance Manuals.

##### 1.04 JOB CONDITIONS:

- A. Safety Requirements:
  - 1. Properly guard belts, pulleys, chains, gears and other rotating parts to prevent danger to personnel.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
- B. Casings:
  - 1. Close-grained cast iron, volute-type.
  - 2. Horizontal or vertical split case with flanged suction and discharge, designed for optimum-velocity change and hydraulic balance.

3. Openings tapped for suction and discharge gauges, suction chamber, discharge-volute venting and casing drainage.
  4. Sections of casings bolted and doweled to permit access to impeller without removal of piping and to provide exact positioning at assembly, after inspection or replacement of parts.
  5. Split bearing brackets bolted and doweled for perfect alignment of rotor, wearing rings and bearings.
- C. Impeller:
1. Enclosed, double suction, cast bronze, one-piece.
  2. Secured to shaft by key and locking collars for exact alignment.
  3. Exterior surfaces machined.
  4. Interior surfaces and water passages deburred and hand-finished.
- D. Casing Wearing Rings:
1. Bronze, renewable-type, locked to prevent rotation.
- E. Shafts:
1. Solid, Alloy S30300 stainless steel.
  2. Sized to provide maximum 0.002-inch deflection at face of stuffing box.
- F. Mechanical Seals:
1. Single, inside-mounted, selection based on pressure, temperature, speed and shaft diameter.
  2. Seal parts:
    - a. 150 psi with shaft diameter to three inches:
      - 1) Temperature range: 40F to 225F.
      - 2) Shaft sealing member: Buna rubber.
      - 3) Rotating sealing member: Carbon.
      - 4) Metal parts of seal: Brass.
      - 5) Stationary sealing member: Nickel-alloy iron.
      - 6) Spring: Stainless steel.
    - b. Above 150 psi: As specified for 150 psi with shaft diameter to three inches, except stationary sealing member fabricated of tungsten carbide.
- G. Glands:
1. Mechanical seal, flush-type, drilled and tapped to provide clear, filtered liquid flush to seal face with separate stainless cyclone separator.
  2. Fabricated of stainless steel, factory-mounted and piped for each seal.
- H. Bearings:
1. Grease or oil lubricated, designed for 150,000 hours average life.
  2. Bearing housings enclosed and protected from dirt and water.
- I. Coupling:
1. Flexible, nonlubricated, pin and bushing.
- J. Coupling Guard:
1. Fabricated steel-housing enclosure bolted to base plate.
- K. Bedplate:
1. Structural steel, ribbed for rigidity and with minimum five-inch diameter grout holes.
  2. Drip collection chamber provided with ½-inch IPS connection at low point of bedplate.
  3. Drilled and tapped to accommodate pump, motor and coupling guard.
- L. Motors: Section 16225 with the following additional requirements:

1. Sized for nonoverloading operation under all conditions on pump curve.
  2. Four-pole, squirrel-cage induction, dripproof and fully guarded.
- M. Flexible Connection:
1. Reinforced-rubber-type or contour-molded reinforced-Teflon-type with flanged ends at inlet and outlet of pump.
  2. Reinforcement: Monel or stainless-steel rings.
  3. Designed for 150 percent of maximum working pressure.
- N. Vibration Isolators: Section 15070.
- O. Nameplates:
1. Securely attached on each pump showing manufacturer's name, model number and serial number.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide foundation for proper installation of equipment.
- C. Construct subbases for equipment in accordance with Section 15070.
- D. Insulate pumps as specified in Section 15080.
- E. Make final alignment on pump and motor coupling prior to operation.
- F. Mount pumps on vibration isolators where shown.
- G. Ensure that pump and motor operate without noticeable vibration after installation.

**END OF SECTION**

## SECTION 15186

### WATER TREATMENT SYSTEM

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing complete and operable water-treatment systems for chilled-water and condenser-water systems.
- B. Related Work Specified Elsewhere:
  - 1. Piping systems: Section 15205.
  - 2. Insulation: Section 15080.
  - 3. Vibration isolation: Section 15070.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NEMA: 250
- B. Design Criteria:
  - 1. Design automatic water-treatment systems to minimize corrosion and prevent fouling of components.
    - a. Chilled water: Select chemicals for control of corrosion, scale and algae that are not toxic to humans in concentrations found in operating system.
    - b. Condenser water: Design a non-chemical water treatment system to minimize scale and reduce biological growth in the circulating chiller condenser -cooling tower water system. The system shall use permanent magnetic technology and copper silver electrode assembly to reduce scale and biological growth respectively.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
    - a. Complete catalog information and shop drawings for material and equipment including wiring and control diagram.
  - 2. Certification.
    - a. Manufacturer's certified test reports.
  - 3. Documentation:
    - a. Water analysis:
      - 1) Water-sample analysis. Submit prior to introducing chemicals into systems.
    - b. Chemical-quantity requirements:
      - 1) Submit calculations showing total quantities of various chemicals required for two years operation of water-treatment systems
      - 2) Base quantity of chemicals for 2,000 full-load operating hours per annum for designed tonnage and average of five cycles concentration of condenser water.
    - c. Chemical-quality requirements:
    - d. Submit chemical formulae and descriptions or generic names of materials used.

- e. Prior to acceptance, submit toxicity data of water treatment complying with applicable codes and regulations of jurisdictional authorities.
- f. If required by the jurisdiction, submit their approval of chemicals proposed for use
- 4. MSDS approval by WMATA SAFE:
  - a. Submit Manufacturers' Safety Data Sheets (MSDS) for approval by WMATA's Safety Office (SAFE) for use by WMATA personnel and for use in the WMATA system.
- 5. Operation and Maintenance Manuals.

**1.04 JOB CONDITIONS:**

- A. Safety Requirements:
  - 1. Store and handle chemicals so as to prevent danger to personnel.

**1.05 FIELD SERVICE:**

- A. Engage services of specialist for two years from day air-conditioning system is first put into normal and continuous operation to supervise and train plant-operating personnel in correct water treatment. Specialist to be certified by water-treatment system manufacturer as qualified in operation of system provided.
- B. Specialist's services to include the following:
  - 1. Supervision of pretreatment, startup and adjustment of automatic water-treatment systems.
  - 2. Minimum of six inspections, at startup and during cooling season for water analysis and to analyze and recommend changes in treatment as operating conditions vary during adjustment period.
  - 3. Inspections at not greater than five-week intervals and additional inspections upon request from the Authority.

**1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Ship products securely packaged and labeled for safe handling in shipment and to avoid damage and distortion.
- B. Label each item with manufacturer's name, brand, reference specification, type, class and other pertinent information as applicable.
- C. Supply dry chemicals in waterproof bag or containers weighing maximum of 100 pounds.
- D. Supply liquid chemicals in thirty-gallon polyethylene-lined steel drums or five-gallon plastic pails.
- E. Ship chemicals which are not used for initial startup to Authority-designated storage facility.
- F. Store products in a secure, dry storage facility.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
- B. Condenser-Water Treatment:

- C. HydroPlex as manufactured by Quantum Magnetic System (QMS), Inc., Cleveland, Ohio. Equipment shall include, but not limited to the following
1. Electrode:
    - a. Copper Silver Alloy Type.
      - 1) Low voltage direct current, max. 60 watts per electrode assembly.
      - 2) Quick disconnect electrical connection.
      - 3) Adjustable duty cycles.
      - 4) Minimum 1 month before cleaning and 1 year before replacement.
      - 5) A quick disconnect designed for removal without using special tools.
    - b. Solid removal:
      - 1) Cyclone type separator, capable of removing particles larger than 200 microns.
      - 2) Equipped with automatic purge valve capable of removing all solids from the system during purging cycle.
      - 3) Provide a manually adjusted throttling valve between the centrifugal device and the automatic purge valve. This valve shall be a gate valve or approved equivalent of the same pipe diameter as the automatic purge valve.
      - 4) Union fittings shall be supplied on both sides of the automatic purge valve and also and also both sides of the manual throttling valve for ease of valve removal.
    - c. Magnets for scale removal:
      - 1) An integral part of the piping system. Clamp-on type will not be acceptable.
      - 2) Effective operating life 50 years minimum.
    - d. Pump:
      - 1) Single stage, end suction, centrifugal type, capable of delivering minimum of 200 gpm at the designed pressure discharge.
      - 2) Pump and motor mounted on common steel base.
      - 3) Pump fitted with ball bearings and double mechanical shaft seal.
      - 4) Pump motor: Manufacturer's standard motor suitable for intended use.
      - 5) One spare part/repair kit provided with pump.
    - e. Valves, pipe and fittings:
      - 1) Valves shall be bronze construction, solder or threaded ends type, rising stem and rated at minimum 150 psi.
      - 2) Pipe, ASTM B88 Type K, Hard drawn; Fittings, ANSI B16.22.
    - f. System cabinet:
      - 1) Size to contain electrode assembly, Cyclone separator, Magnets, Flow meter, Pressure gauges and all associated plumbing, electrical wiring and controls.
      - 2) Cabinet shall be NEMA 4 rating, suitable for indoor and outdoor installations.
      - 3) Cabinet shall be provided with openings for electrical conduit and piping.
      - 4) Provide cabinet with one-inch drain at the bottom to be piped to the nearest floor drain.
    - g. Other equipment:
      - 1) A 30-gallon surge tank of corrosion-resistant construction.
      - 2) Copper test kit as manufactured by Hach Pocket Colorimeter (Catalog No. 46700-19) or approved equal.
      - 3) Conductivity meter as manufactured by Orion Quikcheck Pocket meter (Catalog No. OR914026, Model 116) or approved equal.

- D. Chilled-Water Treatment:
  - 1. Pot-type chemical feeder:
    - a. Designed and constructed for 150-psig water working pressure.
    - b. Chemical feeder: Minimum capacity, 12 gallons.
    - c. In accordance with applicable codes and regulations for unfired pressure vessels.
  - 2. Chemicals: Furnish chemicals supplied for chilled-water system treatment in accordance with the following performance standards:
    - a. Corrosion inhibition:
      - 1) Carbon steel: Less than or equal to 1.0 mil per year.
      - 2) Copper and copper alloys: Less than or equal to 0.10 mil per year; chemical mixture to contain copper-corrosion inhibitor and buffering agents to maintain system pH at 7.0 to 8.5.
    - b. Scale inhibition: Maintain system free of scale deposit.
    - c. Inhibitor to be compatible with permanent glycol-based water solutions.
    - d. Containing no chromates or acids; providing colorless solution when mixed with water.
- E. Name Plates: Securely attached to each major item of equipment showing manufacturer's name, model number and serial number.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances to space provided and make readily serviceable.
- B. Provide foundations, platforms and hangers for proper installation of equipment.
- C. Provide concrete subbases for equipment conforming to the requirements of Section 15070.
- D. Provide waste connections for water-treatment equipment as specified in Section 15205.
- E. Insulate piping and equipment in accordance with Section 15080
- F. Install condenser water treatment as per manufacturer's recommendation.

#### **3.02 APPLICATION AND PERFORMANCE:**

- A. Control chemical feed automatically in direct proportion to makeup-water flow as measured by water meter.
- B. Control bleed-off flow rate automatically by timer.
- C. Adjust composition of recirculated water chemically to control scale and corrosion without use of chromates or acids.
- D. Condenser water treatment capable of operating as high as 10 standard units.
- E. Capable of operation in the system with total dissolved solids ranging from 150mg/l to 10,000 mg/l.

#### **3.03 FIELD QUALITY CONTROL:**

- A. Chemical Tests:

1. Perform chemical analysis of condensing and chilled-water system at startup of cooling tower.
2. Determine chemical status of water in accordance with specified requirements.
3. Upon approval of treatment, add chemicals and operate systems for 48 hours.
4. Analyze solution at end of 48-hour operation and submit complete report.
5. Report deficiencies in treatment to the Engineer.
6. Perform total of six tests for condensing and chilled-water system during each operating year at intervals of not less than five weeks.

**3.04 ADJUSTING AND CLEANING:**

- A. Prior to testing equipment, flush piping systems with chemically treated water to remove scale, slag, dirt, oil, grease and foreign material.
- B. Remove and hand-clean low points and strainers.
- C. Install fine cloth around strainers during initial circulation to remove silt finer than normal strainer mesh.

**3.05 CHEMICAL SUPPLY:**

- A. Supply quantity of chemicals required for two years' operation, based upon 2,000 full-load operating hours per year for designed tonnage of refrigeration plant.

**END OF SECTION**

## SECTION 15205

### PIPING SYSTEMS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing piping, fittings, valves, drains, specialties and supporting devices.
- B. Related Work Specified Elsewhere:
  - 1. Water distribution system: Section 02515.
  - 2. Sanitary sewer: Section 02535.
  - 3. Firestopping: Section 07841.
  - 4. Field painting: Section 09920.
  - 5. Stray current and cathodic protection: Section 13110
  - 6. Corrosion control testing system: Section 13115.
  - 7. Fire protection, suppression and alarm: Section 13905.
  - 8. Identification of mechanical equipment and piping: Section 15075.
  - 9. Insulation: Section 15080.
  - 10. Grounding and bonding: Section 16060.

##### 1.02 QUALITY ASSURANCE:

- A. Qualifications of Welder: Section 05120.
- B. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. The Model Plumbing Code.
  - 3. ASSE Standards.
  - 4. AWWA Standards.
  - 5. ASME Code for Unfired Pressure Vessels.
  - 6. ANSI/ASME: A21.15/C115, B16.1, B16.3, B16.5, B16.9, B16.11, B16.18, B16.22, B16.39, B31.1, Z21.22.
  - 7. ANSI/AWS: A5.8, E8016, E8018.
  - 8. CISPI: HSN 85.
  - 9. FS: A-A-1192, SS-C-153C, WW-P-51F, WW-P-460D, WW-P-501, WW-U-516B, WW-U-531, WW-V-51F.
  - 10. MSS: SP-58, SP-67, SP-70, SP-80.
  - 11. PDI: WH-201.
  - 12. ASTM: A53, A74, A105, A126, A234, A276, A395, A536, B32, B61, B62, B88, B150, B280, B306, F709.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Complete catalog information and shop drawings for material and equipment.
    - b. Submittals include, but are not limited to, the following:
      - 1) Pipes and piping layout, including locations of hangers and supports.
      - 2) Pipe hangers and supports.
      - 3) Valves.

- 4) Cleanout deck plates and wall plates.
  - 5) Escutcheons.
  - 6) Gauges.
  - 7) Expansion joints, guides and anchors.
  - 8) Air eliminators.
  - 9) Pipe sleeves.
  - 10) Drains.
2. Certification:
- a. Certificates from manufacturers verifying the following:
    - 1) That pipe-joint gaskets and lubricants are satisfactory for use with pipe and fittings specified.
    - 2) That expansion joints are designed and tested as specified.

**1.04 JOB CONDITIONS:**

- A. Do not perform welding when the temperature of base metal is less than zero degree F.
- B. Do not perform welding when surfaces are wet from rain, snow, ice or during periods of high wind unless operator and work are properly protected.

**PART 2 - PRODUCTS**

**2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies and parts.
- B. Piping:
  - 1. Cast-iron soil pipe and fittings:
    - a. Inside of or embedded within structures: ASTM A74, Class SV, uncoated.
    - b. Passing through underground structural elements or buried below or outside structures: ASTM A74, Class XH, uncoated.
    - c. Pipes, including embedded pipe crossing structural contraction joints, provided with modified bell and spigot joints with molded-neoprene elastic compression gaskets.
    - d. Gaskets: CISPI HSN 85.
    - e. Pipe and fittings manufactured with spigot ends plain and beveled.
    - f. Bells modified to receive gaskets.
  - 2. Steel pipe and fittings:
    - a. Seamless piping: ASTM A53, Types Grade B, hot-dip galvanized, Schedule 40, provided for the following applications:
      - 1) Waste and drainage piping and fitting, 2-1/2 inches and smaller where embedded or otherwise inaccessible.
      - 2) Dry vents where embedded or otherwise inaccessible.
      - 3) Chilled-water and condenser-water supply and return embedded or otherwise inaccessible.
    - b. Fittings for chilled water, condenser water: ASTM A234 and ANSI/ASME B16.9 for dimensions and tolerances but not chemical properties.
    - c. Flanges: ASTM A105 and ANSI/ASME B16.5 for dimensions and tolerances.
    - d. Fittings and flanges furnished with properties equal to or greater than that of adjacent pipe.
  - 3. Ductile-iron pipe and fittings:
    - a. Embedded or otherwise inaccessible piping: ANSI/ASME A21.15/C115, 250-pound pressure class.

- b. Piping for sewage-ejector discharge, drainage-pump discharge, interim pumps and for water service from point of connection to inside of structure: ANSI/ASME A21.15/C115, 250-pound pressure class, flanged.
    - 1) Flanges: ANSI/ASME B16.1.
  - c. Pipe coated on outside with bituminous coating and lined with cement mortar of twice standard thickness specified for pipe size used.
    - 1) Cement-mortar lining having a seal coat of nontoxic, taste and odor-free bituminous material.
  - d. Neoprene gaskets furnished for joints.
4. Copper tubing and fittings:
- a. Copper tubing for potable water and for control air where embedded or otherwise inaccessible: ASTM B88, Type K, hard-drawn.
  - b. Provide copper tubing for potable water, control air and pneumatic sewage-ejector compressed air where accessible: ASTM B88.
    - 1) Potable water and control air: Type M.
    - 2) Potable water and control air installed in conduit: Type K, annealed and lengths of piping 100 feet or less continuous without joints.
    - 3) Pneumatic sewage-ejector compressed air: Type K, hard-drawn.
  - c. Fittings for potable-water piping: ANSI/ASME B16.22.
    - 1) Fitting wall thickness after forming not less than that of adjacent piping.
  - d. Fittings for control-air piping: Wrought copper, solder joint except at apparatus connections where brass compression fittings furnished.
  - e. Maximum pressure drop for high-pressure control-air mains: Five psi per 1,000 feet, with minimum 1-1/2 cubic feet per minute of 75-psi air flowing for each single station served and one cubic foot per minute for chilled-water plant.
    - 1) Minimum size for high-pressure control-air mains connecting chiller plants and underground stations: One-half inch ID, 5/8-inch OD.
  - f. Control-air piping graded to low points and each low point provided with 3/8-inch drain cock.
  - g. Solder joints: Lead-free 95.5-percent tin, 4.0-percent copper and 0.5-percent silver with non-corrosive flux; ASTM B32.
5. Copper drainage tube (DWV) and fittings:
- a. Seamless tubing: ASTM B306, No. 122 for drainage, waste, and vent piping and fittings.
6. Copper tubing for refrigerant service:
- a. Seamless copper tubing: ASTM B280 for refrigeration service.
  - b. Fittings: Pure wrought copper, recessed solder joint, ANSI/ASME B16.18.
  - c. Solder joints: Brazing filler metal in accordance with ANSI/AWS A5.8 and the following:
    - 1) Copper to Copper - 12-percent Sil-Foss (no flux 1300F).
    - 2) Copper to Copper - 6-percent Dyna-Flow (no flux 1350F).
    - 3) Copper to Steel - 45 silver solder (white flux 1150F)
7. Condensate-drain pipes:
- a. Hard-drawn copper: ASTM B88, Type L.
8. Unpolished stainless-steel drip pans:
- a. Provided under water, waste or condensate-drain piping which run over transformer vaults or electric motor starters.
  - b. Each drip pan provided with one-inch drain.
9. Black-steel seamless pipe and fittings:
- a. Exposed chilled water, condenser-water supply and return piping: ASTM A53, Standard Weight Schedule 40.
  - b. Pipes 1-1/2 inch and smaller connected with socket-weld fittings or screwed fittings.
  - c. Pipes two inches and larger connected with welded fittings.

- d. Pipes larger than 12 inches in diameter: Minimum 3/8-inch wall.
  - e. Threaded-pipe fittings: FS WW-P-501, Type I, Class B.
  - f. Welding fittings made of same schedule or weight classification as the pipe.
    - 1) Factory-made welding fittings.
    - 2) Mitered joint elbows and field-made reducers will not be permitted.
  - g. Butt-welded fittings larger than 1-1/2 inches: ANSI/ASME B16.9.
  - h. Socket-welding fittings: ANSI/ASME B16.11.
  - i. Flanges for welded piping system: ANSI/ASME B16.5, forged steel, welded-neck type, 150-pressure class.
  - j. Black-steel pipe and fittings for drainage in aboveground structures as specified in a., except Weight B piping furnished.
10. Unions:
- a. 1-1/2 inch and smaller: Threaded, ASME B16.39, Type A or B to match piping.
  - b. Two inch and larger unions: ASTM A126, Class B, flanged.
    - 1) Two, 2-1/2 and three-inch union flanges: Steel, FS WW-U-531 or of cast iron, ANSI/ASME B16.1, 125-pound class.
  - c. Four inch and larger union: Forged steel, 150-pound class, slip-on weld-neck flanges, ANSI/ASME B16.5.
  - d. Nonferrous-piping unions: Brass, FS WW-U-516B.
11. Cleanouts:
- a. For cast-iron bell-and-spigot pipe: SVCI, ferrule caulked into cast-iron fittings and extra-heavy brass tapered screw plug with recessed head.
  - b. For wrought-iron pipe: Extra-heavy brass plug in drainage fitting.
  - c. Floor cleanouts: Cleanouts turning up through architecturally finished floors made by means of a long-sweep ell or Y and adjustable ABS housing with secured, scoriated, round satin-brass cover.
  - d. Wall cleanouts: Cleanout plugs furnished with solid head tapped for 1/4-inch brass machine screw to secure coverplate. Coverplate to be polished-brass round access plate secured to plug with countersunk screw.
  - e. For threaded pipes: Bronze, FS WW-P-460D, Class A.
  - f. Furnished with adjustable recessed head in floor and where shown.
  - g. Except for test openings, cleanout plugs for pipes up to four inches to be same size as pipe.
  - h. On pipe sizes five inches and larger, cleanout plugs to be of four inches and pipe reduced to plug size with bushing.

C. Valves:

- 1. Gate valves two inches or smaller:
  - a. MSS SP-80, Type 2, Class 150.
  - b. Bronze with threaded ends, rough bodies and finished trim.
  - c. Materials except handwheels: ASTM B61.
  - d. Furnished with malleable-iron hand wheels.
- 2. Gate valves 2-1/2 inches and three inches:
  - a. MSS SP-70, Type 3, Class 125, OS&Y flanged end, Type I, Class 2, cast-iron bodies and bonnets.
  - b. Seat rings, disc, disc guide and stem furnished in bronze.
  - c. Outside stem and yoke (OS&Y), flanged-end connections and malleable-iron hand wheels.
- 3. Gate valves four inches and larger:
  - a. MSS SP-70, Type 2, Class 125, OS&Y, flanged end, cast-iron bodies and bonnets.
  - b. Seat rings, disc, disc guide and stem furnished in bronze.
  - c. Outside stem-and-yoke type and cast-iron hand wheels.
- 4. Globe, angle and check valves:
  - a. Two inches and smaller:

- 1) WW-V-51F, Class B.
  - 2) Bronze with threaded ends, rough bodies and finished trim.
  - 3) Materials except hand wheels: ASTM B61.
  - 4) Globe and angle valves furnished with malleable-iron hand wheels.
  - 5) Check valves four inches and larger:
    - a) Swing-type valve seat, with iron or steel body and cap and flanged-end connections.
    - b) 150-pound class, renewable arm, disc assembly and seat ring with bronze trim.
    - c) Outside arm and weight for pump discharge check valves.
5. Valves for copper piping:
- a. Gate valves with solder ends: MSS SP-80, Type 2, Class 150, Bronze, Type 1, Class B.
  - b. Gate valves with flanged ends: MSS SP-80, Type 2, Class 150, Bronze.
  - c. Globe, angle and check valves with solder or flanged ends: FS WW-V-51F, Bronze, Class B.
6. Pressure-reducing valves:
- a. Direct-acting type in which diaphragm and spring act directly on valve stem.
  - b. Constructed to ensure that delivered pressure does not vary more than one psi for each ten-psi variation in inlet pressure.
  - c. Wearing parts readily renewable.
  - d. Valves two inches and smaller designed for working pressure of 250 psi, brass construction except yoke connecting valve body to separate diaphragm chamber having brass cover and assembled with brass bolts.
  - e. Valves larger than two inches designed for minimum 125 psi, iron bodies and bronze trim.
  - f. Adjustable to any outlet pressure.
  - g. Gate valve and union on both inlet and outlet connections.
  - h. Provided with bypass one pipe-size smaller than main water line.
  - i. Stem-mounted pressure-reducing valve gauges, 3-1/2 inch dial, solid brass or stainless steel case and connections with T-handle stops.
  - j. Pressure-reducing valve strainer: Brass, removable without disconnecting piping.
    - 1) Strainers two inches and smaller: Brass, bodies designed for minimum working pressure of 250 psi.
    - 2) Strainers 2-1/2 inch and larger: Iron bodies designed for minimum working pressure of 125 psi
7. Pressure-temperature relief valves:
- a. Temperature-and-pressure-actuated type, adjustable, bronze, single disc with bottom guide to ensure proper seating.
  - b. Body, disc and base: Bronze, ASTM B62.
  - c. Spring and stem: Steel.
  - d. Lever: Malleable iron.
  - e. Pressure range from three psi to 250 psi rated and tested under ANSI/ASME Z21.22.
  - f. Temperature range: To 400F.
8. Automatic flow-control valve:
- a. Individually selected by manufacturer to automatically limit rate of flow to design capacity, regardless of system fluctuations.
  - b. Selected to regulate flow within five percent of nameplate rating of system in which installed. Maximum operating differential between body tappings necessary for control not to exceed two psi.
  - c. Self-cleaning, cartridge-piston type with stainless-steel variable-area orifices.
  - d. Designed for minimum of 125 psi or 150 percent of system working pressure, whichever is greater.

- e. Tamperproof with body tapplings for connecting instruments for verifying flow-control performance.
  - f. Threaded or flanged connections as required for pipe fittings.
  - g. Furnished with valve kit consisting of 1/8-inch by two-inch minimum size nipples, shutoff valves located outside of insulation and hose fittings for use with measuring instruments.
9. Refrigerant valves: UL listed.
10. Balancing cocks:
- a. Resilient-faced, eccentric-plug type designed for minimum of 125 psi or 150 percent of system working pressure, whichever is greater.
  - b. Six inches and under, wrench-operated; eight inches and over, operated by worm or spur gear.
11. Line Strainers:
- a. Water strainers, Y or basket-type, 1-1/2 inches and smaller: ASTM A126, Grade B, iron bodies with screwed connections.
  - b. Two inches and larger: ASTM A126, Grade B, iron bodies with flanged-end connections.
  - c. Designed for minimum of 125 psi or 150 percent of system working pressure, whichever is greater.
  - d. Stainless-steel or Monel screens as follows:
    - 1) Perforations:

Strainer size	Perforation size
3/4-inch to two-inch inclusive	1/32 inch
2-1/2 inch to six-inch inclusive	1/16 inch
Eight-inch to 12-inch inclusive	1/8 inch
Over 12 inches	5/32 inch

- 2) Free area of screen minimum three times area of strainer inlet pipe.
- e. Strainer provided with 3/4-inch drain valve.
12. Backflow preventer:
- a. Reduced-pressure type with two check valves and automatically operated pressure-differential relief valve located between two check valves.
  - b. Relief valve and discharge port to drain intermediate chamber to level below supply-line inlet.
  - c. Moving parts and trim constructed of corrosion-resistant material.
  - d. Equipped with test cocks.
  - e. Conform to applicable section of ASSE and AWWA Standards.
13. Butterfly valves:
- a. MSS SP-67, sizes as shown.
  - b. Provide extended necks or neck extenders to accommodate two inches of insulation.
  - c. Provide 10-position latch-lock handles.

- d. Provide enclosed work screw operators, sizes eight inches and larger.
- e. Provide chainwheels when above normal reaching area.
- f. Provide adjustable balance-return stops for balancing service.
- g. Meeting MSS SP-67.
- h. Test shell at 225 psi.
- i. Body:
  - 1) Wafer-type, cast iron, ASTM A126, Class B, or lug-type, ductile iron, ASTM A536 grade 60-40-18, or ASTM A395.
  - 2) To fit between ANSI/ASME B16.5 flanges.
  - 3) Bodies with integral flanges or full lugs drilled.
- j. Seat:
  - 1) Provide ethylene-propylene-terpolymer (EPT) bonded to rigid ring providing noncollapsible and replaceable seat.
  - 2) Provide bubble-tight shutoff of 150 psi at temperatures between 25F and 225F.
  - 3) Provide O-ring as secondary seal between seat and stem.
- k. Disc:
  - 1) Aluminum-bronze: ASTM B150.
- l. Stem:
- m. Stainless steel: AISI Type 304, 316, 410 or 416.
  - 1) Isolate from contact with piped material.

D. Portable Flow Meters:

- 1. Factory-fabricated case, carrying handle and fitted to hold meter securely to accommodate the following accessories:
  - a. Two 10-foot lengths of connecting hose with female connectors for venturi-tube pressure-tap nipples.
    - 1) Hose designed for minimum of 125 psi or 150 percent of system working pressure, whichever is greater.
    - 2) Completely assembled three-valve manifold with two block valves and vent and drain valves piped and mounted on base.
  - b. Set of curves showing flow versus pressure differential for each orifice or venturi tube.
  - c. Metal instruction plate, secured inside cover, illustrating use of meter.

E. Orifices and Venturis:

- 1. Stainless steel, square-edge type, mounted between pipe flanges with factory-made pressure taps.
- 2. Taps with shut-off valves and with quick-connection hose fittings for portable meters.
- 3. Orifice-throat diameter at specified flow and differential pressure in inches water gauge as follows:
  - a. Fall in 60 to 80 percent of full scale reading for square-root meters.
  - b. Twelve to 40 inches for linear-scale meters.
- 4. Venturi size selected with design flow rate between 10 and 40 inches of water-pressure differential.
  - a. Permanent pressure loss: 25-percent maximum of indicated flow-rate differential pressure.
- 5. Flow-metering equipment: Supplied by same manufacturer.

F. Thermometers:

- 1. Dial-type, chromium-plated case, remote or direct-type bulb with accuracy of plus-or-minus one degree.
  - a. Three-inch minimum dial with white face and black digits, graduated in two-degree increments.
- 2. Liquid-in-glass thermometers.

3. Thermometer ranges suitable for service at not less than 20 degrees above controlled temperature settings.
- G. Thermometer Wells:
1. Stainless steel with portions surrounding bulbs not over 1/16-inch thick, designed to hold engraved-stem thermometer.
  2. Six inches projecting two inches into pipe with dust-excluding caps with gaskets and chains.
  3. Pipe smaller than 2-1/2 inches enlarged where wells are located.
  4. Set vertical or at angle to retain oil.
- H. Gauges:
1. ASTM F709, Class 1, 2 or 3, Style A, Type I or III with metal case.
- I. Shock Absorbers:
1. Constructed of stainless steel, precharged with nitrogen, argon or pneumatic pure glycerine and permanently sealed.
  2. Provided on cold-water supply piping to flush-valve water closets and urinals.
  3. Provided on hot and cold supply piping to lavatories and mop service basins.
  4. Certified to meet requirements of PDI WH-201.
- J. Expansion Joints:
1. General:
    - a. Designed for 150 psi and 200F for systems operating at 100 psi or less.
    - b. Provide expansion joint traverse with 150 percent of pipe expansion resulting from temperature variation of 80F.
    - c. Provide corrugated-bellows expansion joints for pipe expansion of 1-1/2 inches or less, minimum of 200 percent of expansion.
    - d. 1-1/2 inches and smaller, threaded ends; two inches and larger, flanged ends.
  2. Flexible ball joints:
    - a. Carbon steel, providing 360 degrees rotation plus 15 degrees minimum angular-flexing movement, furnished with asbestos-composition gaskets, steam-molded in steam-heat presses.
  3. Corrugated-bellows expansion joints:
    - a. Bellows constructed of single-ply or multiple-ply, formed, corrugated stainless steel for pipe sizes smaller than three inches.
    - b. Self-equalizing type with equalizing or reinforcing rings, internal-telescoping stainless-steel or Monel sleeves, removable steel housing to protect bellows and support insulation.
    - c. Corrugated element: Seamless tubing or of single sheet of metal rolled into cylinder having one longitudinal seam for sizes up to 16 inches.
    - d. Joints 2-1/2 inches and smaller: Internal guides and limit stops.
    - e. Designed for a minimum life of 5,000 full-rated traverse cycles when tested at specified pressures and temperatures.
- K. Supporting Devices:
1. Pipe hangers and supports:
    - a. Provide adjustable steel pipe hangers and supports as follows:
      - 1) Clevis and clamp, cadmium-plated or zinc-plated: MSS SP-58, Type 1 and Type 8 for steel and cast-iron piping.
      - 2) With cast-iron roller and sockets: MSS SP-58, Type 41 for chilled-water piping.
      - 3) Space not greater than six feet for pipe sizes up to and including 1-1/2 inches; 10 feet for pipe sizes two inches through six inches; 16 feet for pipe sizes eight inches and larger

- b. Pipe hangers for copper tubing: Steel, copper-plated, clevis-type, spaced at maximum five feet for tubing sizes through 1-1/2 inches and maximum eight feet for sizes two inches and larger.
  - c. Hanger rods minimum diameter 3/8 inch, constructed of steel, cadmium-plated, threaded full-length and diameter required by pipe size and load imposed.
  - d. Hanger rod nuts and washers: Steel, cadmium-plated.
  - e. Supported from malleable-iron, hot-dip galvanized inserts in concrete slab: MSS SP-58, Type 18.
  - f. Pipe hangers and supports in tunnels and shafts: MSS-SP-58, stainless steel, ASTM A276, Type 304.
2. Pipe rolls, plates and stands:
- a. Cast iron: MSS SP-58, Types 44, 45, and 46.
    - 1) Adjustable types selected for piping require grading after setting in place.
  - b. Protection saddles for support piping: MSS SP-58, Type 39, welded to pipe.
3. Pipe anchors:
- a. Designed to withstand five times anchor load minimum.
  - b. Vertical pipes anchored by means of clamps welded around pipes and secured to wall or floor construction.
4. Pipe guides:
- a. Factory-made cast semi-steel or heavy fabricated galvanized steel, consisting of bolted two-section outer cylinder and base with two-section guiding spider bolted or welded tight to pipe.
  - b. Designed to clear pipe insulation and to prevent overtravel of spider and cylinder.
  - c. Guides not less than 12 inches long and spiders not less than the following:

Pipe size/ inches	Spider length/ inches
1-1/2 and smaller	2
2 to 3	2-1/2
4	3
5 and larger	3-1/2

- 5. Expansion bolt anchors:
  - a. Consisting of bolt, expander, star lock washer and nut.
  - b. Fabricated of stainless steel, Type 303, including expander and star lock washer.
  - c. Anchor assemblies: FS: A-A-1992, Group II, Type 4, Class 1.
- 6. Self-drilling anchors:

- a. Self-drilling expansion anchors, with self-cutting annular broaching grooves.
  - b. Anchor and expander plug: FS: A-A-1992, Group III, Type 1, double-plated.
7. Pipe sleeves:
- a. Through interior masonry-unit walls: As shown. Sleeve to be large enough to accommodate pipe and covering but not less than two sizes larger than pipe size.
  - b. Through poured-concrete interior walls, floors and ceiling: As shown.
    - 1) Sleeves minimum two sizes larger than pipe. At floors, sleeves to project four inches above finish floor.
  - c. Through exterior structural elements: Minimum two sizes larger than pipe and as shown.
  - d. Sleeves designed to allow expansion/contraction movement of pipe.
8. Escutcheon plates:
- a. Polished brass or stainless steel, screw-fastened to wall or ceiling.
  - b. Plate collars caulked watertight with mastic.
  - c. Mastic: FS SS-C-153C, Type I.
- L. Drains:
- 1. Area drains:
    - a. Cast iron with flashing flange and flat grate for entrance areas.
    - b. Outlets designed for connection to cast-iron soil pipe.
    - c. Drain sizes and types as shown.
    - d. Clamping devices: For securing membrane or flashing for drains installed in membrane-waterproofed floors and in floors not laid on ground.
  - 2. Floor drains:
    - a. Cast iron with flashing flanges and bottom or side outlet as required and designed for connection to cast-iron soil pipe.
    - b. Clamping devices: For securing membranes or flashing, for drains installed in membrane-waterproofed floors and in floors not laid on ground.
    - c. Reinforced-neoprene flashing: For drains installed in floors that are not membrane-waterproofed and are not laid on ground.
    - d. Flashing of reinforced sheet neoprene, secured to drain by clamping device and extending 12 inches minimum from drain to ensure watertight connection.
    - e. Area, yard and floor drains in public spaces having finished brass grates.
    - f. Floor-drain sizes and types as shown.
  - 3. Roof drains:
    - a. Cast iron having integral flange and a clamping device for securing the roof covering to make a watertight connection.
    - b. Drains for promenade roofs with removable, loose-set, round flat grate in square frame secured to nonpuncturing flashing clamp collar with weep holes and for two inch or more roof fill.
    - c. Other roof drains furnished with cast-iron beehive or dome-shaped strainer.
    - d. Openings in each strainer having a combined-area minimum twice the area of drain outlet.
    - e. Each drain outlet having same size as downspout and with parts to make watertight connection to threaded pipe or cast-iron pipe as required.
    - f. Meeting requirements shown.
  - 4. Canopy drains (Roof Drain - Type 5):
    - a. Ductile iron: ASTM A536, Grade 65-45-12.
    - b. 30 square inches minimum grate free area.
    - c. Removable gratings, contoured to match opening in concrete rib and as shown.
- M. Air Separators:
- 1. Provide in-the-pipeline air separators with tangential openings for water in and out.

2. Design to create low-velocity vortex for internal separation of free air from water stream.
  3. Size according to size of connecting pipeline as shown.
  4. Equip with two-inch blowdown connection located at bottom of separator.
  5. Equip with 1-1/4 inch minimum compression tank connection located at top of tank.
  6. Tank:
    - a. Size as shown and rated at 125-psi working pressure.
    - b. Construct of carbon steel and in accordance with ASME Code for Unfired Pressure Vessels and so certified and stamped.
  7. Strainer:
    - a. Stainless steel with perforations sized for water flow.
    - b. Install in location to assist in separation of air.
    - c. Removable from bottom of separator.
  8. Insulation: Section 15080.
- N. Coal-Tar Epoxy Coating: Section 02535.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Welding Procedure:
1. Perform welding by manual metallic arc-process except for pipe sizes four inches and smaller where gas welding (oxyacetylene) may be used.
    - a. Use electrodes and rods of composition recommended for pipe by AWS.
    - b. Heat surface within three inches from point where weld will start to temperature warm to the hand before welding.
  2. Weld corrosion-resistant nickel-copper alloy steel pipe by arc-process utilizing low-hydrogen electrodes of AWS E8016 or E8018 types.
  3. Leave joint surfaces smooth, uniform, free from fins, tears and other defects which adversely affect proper welding.
  4. After each pass of weld on multiple-pass welding, clean weld free of slag and other deposits before applying next pass.
  5. Peen with light blows of blunt-nosed peening hammer.
    - a. Do not peen surface layers or first pass in groove welds.
  6. For groove welds, have surface pass substantially centered on the seam, smooth and free from depressions.
  7. Perform fillet-welds with minimum cutting back of outside pipe.
    - a. Leave throat of full fillet-weld not less than 0.707 of thickness of pipe.
    - b. Repair excess cutting back and undercutting of base metal in pipe adjoining weld.
    - c. Fill up craters to full cross section of weld.
  8. Align and position accurately joints to be welded, so that pipe will not project beyond its adjoining pipe by more than 20 percent of pipe wall thickness or 1/8-inch maximum.
  9. Install welded pipe in accordance with ANSI/ASME B31.1.
- B. Soil, Waste, Vent and Drainage-Piping Installation:
1. Grade piping to 1/4 inch per foot and not less than that of main drain to which it is connected.
  2. Use reducers to change pipe sizes on vent and drain lines.
  3. Use long-sweep bends, Y-fittings, 1/8 or 1/16-bends, or combination Y and 1/8-bends to make changes in direction.
  4. Join service-weight soil pipe and fittings with service-weight gaskets and extra-heavy soil pipe and fittings with extra-heavy gaskets.
    - a. Designate and clearly identify service-weight and extra-heavy gaskets.

- b. Use lubricant for making joints.
  - c. Make tight seal between external face of pipe and internal face of bell.
  - d. Use gaskets capable of making and maintaining tight seal with deflection not exceeding five degrees.
  - e. Assemble joints by use of tools recommended by pipe, fittings and gasket manufacturers.
  - f. Employ trained workmen experienced in installation of gasket system to install entire gasket system.
5. Install embedded cast-iron piping at angle of 90 degrees to contraction joints with end of pipe bell coinciding precisely with centerline of contraction joint.
  6. Cut ends of screw-jointed pipes squarely to seat in bottom of recess of fittings and ream after cutting so waterway is not reduced in size.
  7. Apply thread dope or compound to male thread only.
- C. Buried Ductile-Iron Pipe:
1. Install pipe with mechanical joints and neoprene gaskets and stabilize by use of thrust blocks.
  2. Thrust blocks: Section 02515.
- D. Potable-Water System Installation:
1. Connect and install service water piping, sizes as shown, to fixtures, equipment and outlets.
  2. Install water meter in accordance with requirements of local water authority and provide the following valves:
    - a. Main shut-off gate valve inside service room ahead of water meter.
    - b. Drain with globe valve and hose nipple for 3/4-inch hose installed on house side of meter.
  3. Pipe or tubing free from cuts, dents and other surface damage. Remove damaged pipe and replace with new pipe or tubing.
  4. Cut square and ream ends of copper tubing.
  5. Tubing ends to extend full depth of fitting recesses without binding.
  6. Use lead-free 95.5-percent tin, four-percent copper and 0.5-percent silver solder with non-corrosive flux; ASTM B32.
  7. Ream and clean ends of threaded pipes before assembling with fittings and apply approved joint compound to pipe thread only.
  8. Make connections to equipment and fixtures without undue strain.
  9. Run horizontal piping with minimum pitch of one inch in 40 feet and arrange for drains at low points.
    - a. Install drain valves and hose nipples not smaller than 3/4 inch at low points.
  10. Connect nonferrous piping to ferrous piping with dielectric couplings.
  11. Install pressure-reducing valves where main water pressure exceeds 60 psi to maintain pressure of 15 psi at most remote fixture.
- E. Control-Air Piping Installation:
1. Do not run piping concealed under duct insulation, inside of ducts or in direct contact with surfaces colder than normal room temperature.
- F. Steel-Pipe Installation:
1. Weld embedded pipe and install so that pipe will not penetrate construction joints or structural contraction joints.
  2. Install horizontal piping with minimum pitch of one inch in 40 feet and arrange for drains at low points.
    - a. Install drain valves and hose nipples not smaller than 3/4 inch at low points.
  3. Install high-capacity automatic air vents at high points, designed for 125 psi and suitable for operation on pressures under 125 psi.
    - a. Pipe air-vent outlet to floor drains.
  4. Pipe drip pan to discharge as shown; if not shown, discharge to nearest open drain.

5. Provide flexible connections to coils, pumps and other equipment so as to eliminate undue strains in piping and equipment.
  6. Install condensate-drain lines for each air-handling unit with pitch of 1/4 inch per foot in the direction of flow.
    - a. Run drain lines to nearest open drain.
    - b. Do not exceed 400 feet maximum length of pipe between anchor and expansion joint or 90-degree offset.
  7. Do not support embedded pipe from reinforcing bars with metallic means.
- G. Expansion-Joint Installation:
1. Field set expansion joints for position corresponding to ambient temperature at time of installation.
  2. Setting based on manufacturer's calibration data furnished with expansion joints.
  3. Do not use corrugated-bellows expansion joints where exposed in train tunnels.
  4. Install ball joints in accordance with approved published recommendations of manufacturer.
  5. Do not use shims or steel spacers.
- H. Pipe Anchors:
1. Securely anchor piping where shown and where necessary for proper installation to force pipe expansion in proper direction.
- I. Expansion-Bolt Anchors:
1. Drill holes and install expansion-bolt anchors as recommended by anchor-bolt manufacturer. Do not locate less than eight inches from concrete edge.
- J. Pipe Sleeves:
1. Exterior walls:
    - a. Install as shown.
    - b. For cathodically protected pipe, test in accordance with Section 13115.
  2. Interior walls:
    - a. Install as shown. Seal to maintain integrity of walls.
- K. Plumbing-Fixture and Equipment Connections:
1. Make connections to wall-hung water closets and urinals with adjustable flanged nipples secured to chair supports, wax rings and rubber or impregnated-felt gaskets.
  2. Face plate of carrier not more than six inches from back of finish wall.
- L. Drains:
1. Install floor drains with traps.
- M. Air-Separator Installation:
1. Install air separator on suction side of chilled-water pump and as near to pump as practicable.
  2. Install dead-level in both directions and support from structure so that pipe can be removed without moving air separator.
  3. Install two-inch drain line, equipped with gate valve and union, from blowdown connection to nearest drain.
- N. Attachments to Prestressed-Concrete Girders:
1. Attach pipes and similar items to prestressed girders by welding to embedded plates or bolting to embedded fittings. Drilling into prestressed girders is prohibited, except as shown.
- O. Refrigeration Copper Tubing Installation:
1. Before heating joints, force nitrogen or carbon dioxide into the system.

2. Sweat each copper tubing installation joint in accordance with standard accepted practice.
- P. Bonding: In accordance with Section 16060, and with the following additional requirements:
1. Bond mechanical joints and fittings , including valves, by exothermic-welding method.
  2. Make welds in accordance with recommendations of the manufacturer. Clean and coat with coal tar epoxy.
  3. Bond pipe using bonding strap welded to each side of joint not less than six inches from joint. Allow sufficient slack in conductor for expansion of pipe.
- Q. Firestopping: Section 07841.
1. Pipe penetration through fire rated partitions to be sealed with approved fireproof sealant.

### **3.02 PROTECTION OF PIPING AND EQUIPMENT:**

- A. Protect pipe, openings, valves and fixtures from dirt, foreign objects and damage during construction.
- B. Replace damaged piping, valves, fixtures and appurtenances.
- C. Prior to testing, flush piping with chemically treated water until systems are clean and free of scale, slag, dirt, oil, grease and other foreign material.
- D. Hand-clean expansion joints and strainers.
- E. Coal-Tar Epoxy Coating for Protection of Ferrous Piping: Apply as specified in Section 02535 and test as specified in Section 13115.

### **3.03 FIELD QUALITY CONTROL:**

- A. Water-Pressure Testing:
  1. Prior to burial or concealment, test affected piping in presence of the Engineer using specified procedures.
  2. Test entire piping systems and test until found leak-free in presence of and to satisfaction of the Engineer.
  3. Notify the Authority at least 36 hours in advance of making tests.
  4. Test piping at following pressures:
    - a. Soil, waste and vent piping: Requirements of local plumbing code but not less than equivalent to ten feet of water.
    - b. Chilled-water and condenser-water piping embedded or otherwise inaccessible: 400-psi minimum.
    - c. Ductile-iron pipe: 150 psi or 1-1/2 times maximum working pressure, whichever is greater, at lowest point in system.
    - d. Potable-water piping: 1-1/2 times operating pressure but not less than 100 psi at topmost outlet.
    - e. Chilled-water and condenser-water piping, exposed and accessible: 150 psi or 1-1/2 times maximum working pressure, whichever is greater, at lowest point in system.
- B. Test Procedures:
  1. Soil, waste and vent piping:
    - a. Water test to include entire system from lowest point to highest point.
    - b. After filling system, shut off water supply and allow it to stand two hours without loss or leakage.

- c. Conduct final test by smoke test or peppermint test as prescribed by jurisdictional authority.
  - 2. Chilled-water and condenser-water piping embedded or otherwise inaccessible:
    - a. Avoid excessive pressure on safety devices and mechanical seals.
    - b. Fill entire system with water and vent air from system at least 24 hours before test pressure is applied.
    - c. Apply test pressure when water and average ambient temperatures are approximately equal and constant.
    - d. Maintain test pressure for minimum of six hours without drop after force pump has been disconnected.
    - e. Visually inspect joints while pipe is under test pressure.
  - 3. Ductile-iron pipe and black-steel piping:
    - a. Use procedure specified for chilled-water and condenser-water piping embedded or otherwise inaccessible.
  - 4. Potable-water piping:
    - a. Use procedure specified for chilled-water and condenser-water piping embedded or otherwise inaccessible, except tests may be conducted in sections as long as no pipes or joints are left untested.
- C. Control-air piping:
  - 1. Test main air piping at minimum of 150 psi and maintain pressure for one hour without pumping.
    - a. Test low-pressure air piping at minimum of 30 psi and maintain pressure for one hour without pumping.
    - b. Correct leaks by remaking joints.
- D. Pressure Testing:
  - 1. Refrigerant piping: Test at 300 psi on high side and 150 psi on low side.
    - a. Maintain pressure for minimum of 12 hours.
    - b. Use electronic leak detector to check leaks, after soap-bubble test.
- E. Repair of Leaks:
  - 1. Do not repair by mechanical caulking leaks in threads or welds occurring while pipeline is under test or in service.
  - 2. Introduction into piping system of material intended to stop leakage is prohibited.
  - 3. Repair leaks in threaded piping by breaking joint, cutting new threads on pipe and installing new pipe fitting.
  - 4. Remove defective welds by chipping or gas gouging from one or both sides of joint.
    - a. Reweld chipped-out places.
    - b. When base metals of fillet-weld are cut back or throat of weld is less than specified, repair defect by adding additional weld metal.

### 3.04 DISINFECTION:

- A. Adjust and Clean:
  - 1. Flush entire hot and cold-water piping and other piping and equipment connected downstream from the domestic-water inlet main shutoff valve with water to remove sediment after completion of tests, replacements or repairs.
    - a. Use chlorine for disinfection in form of hypochlorite solution or in form of compressed gas applied through approved chlorinator.
    - b. Operate valves and equipment during chlorination to ensure that chlorine reaches entire system.
    - c. Feed water and chlorination agent into system at rate providing for 50 ppm of chlorine and allow to stand 24 hours before flushing.
    - d. Residual chlorine at end of 24-hour retention period: Two-ppm minimum.
  - 2. Flush treated water from system completely after disinfection.

3. Continue flushing until samples show that quality of water delivered is comparable with public water supply and satisfactory to jurisdictional public-health authority.
4. Do not take samples from hydrants or through unsterilized hose.

**3.05 FIELD PAINTING:**

- A. Paint exposed soil and waste pipe lines in accordance with Section 09920.

**END OF SECTION**

## SECTION 15410

### PLUMBING FIXTURES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing plumbing fixtures, including emergency-eyewash and body-spray facilities.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. FS: WW-P-541/GEN, A-A-1154.
  - 3. ASMEA112.19.2M
  - 4. ADA.
  - 5. ANSI: Z358.1.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings
  - 2. Certification.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship products securely packaged and labeled for safe handling in shipment and to avoid damage and distortion.
- B. Mark each item permanently and legibly with manufacturer's name, brand, reference specification, type, class and other pertinent information as applicable.
- C. Store products in a secure, dry storage facility.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. Plumbing Fixtures:
  - 1. General requirements:
    - a. Fixtures manufactured of twice-fired vitreous chinaware of best quality, nonabsorbent and burned so that whole mass is thoroughly fused and vitrified producing material white in color, which when fractured will show homogenous mass, close-grained and free from pores.
    - b. Brass fittings, faucets, traps and exposed piping, chrome-plated over nickel plate, with polished finish.
    - c. Brass pipe, chrome-plated over nickel plate and provided with heavy cast-brass escutcheons and set screw plated to match pipe at fixtures passing into floors, walls or partitions.
  - 2. Water closet:
    - a. Wall-hung, flush valve, siphon jet, vitreous china: ASMEA112.19.2M.
  - 3. Urinal:
    - a. Wall-hung, flush valve, washout-type, vitreous china: ASMEA112.19.2M

4. Lavatory:
  - a. Vitreous china: FS WW-P-541/GEN.
  
- B. Fixture Supports:
  1. Supports for wall-hung water closets, urinals and lavatories: FS WW-P-541/GEN.
  2. Supports of metal, concealed in building construction. Fixtures rigidly supported from floor by means of one or more heavy extensions or feet built into floor.
  
- C. Mop Service Basin:
  1. One-piece precast terrazzo, approximate size 36 inches by 24 inches by six inches high.
  2. Terrazzo made of marble chips, cast in grey portland cement to produce minimum seven-day compressive strength of 3,000 psi.
    - a. Terrazzo surfaces ground with holes and pits grouted.
    - b. Excess grout removed and surfaces polished
  3. Stainless-steel bumpers furnished for exposed sides of basin.
  4. Drain body of chrome-plated brass, cast integral with basin and provided for inside neoprene joint connection two inches minimum depth to three-inch pipe.
  5. Chrome-plated service faucet with vacuum breaker, integral stops, adjustable wall brace, pail hook and 3/4-inch hose thread on spout.
  
- D. Vacuum Breakers:
  1. Chrome-plated brass sized to provide minimum air area equal to piping served and approved by local jurisdictional authorities
  
- E. Traps:
  1. Plain-pattern type having seal minimum of 2-1/2 inches and maximum four inches.
  2. 1-1/2 inch and two-inch traps: Heavy cast brass.
  3. All other size traps: Same material as specified for piping system to which they are connected.
  4. Fixture traps: As specified under plumbing fixtures, and insulated in accordance with ADA guidelines..
  
- F. Emergency Eyewash Fountain and Body Spray:
  1. In accordance with ANSI Z358.1.
    - a. Permanent type:
      - 1) Equipped with automatic pressure and volume-control devices to ensure safe and steady water flow under varying pressures.
      - 2) Wall-mounted, with functional parts constructed of corrosion-resistant materials and as follows:
        - a) Eyewash fountain: Twin chrome-plated brass eyewash heads, angled to direct flow of water into eyes and ocular area of face and mounted in stainless-steel bowl.
        - b) Body spray: Chrome-plated brass spray head and wall bracket. Spray head mounted on heavy-duty rubber hose.
      - 3) Operated by valves of the following types:
        - a) Eyewash fountain: Push-flag operating handle on stay-open valve.
        - b) Body spray: Quick-opening, chrome-plated, hand-squeeze level valve.
      - 4) Eyewash fountain and body spray equipped with pedal-operated and self-draining freeze proof valve where shown.
      - 5) Water filter:
        - a) Made of FDA-approved polypropylene with disposable FDA-approved viscose-fiber filter media capable of removing particles larger than 20 microns.

- b) Capable of withstanding rate of flow of seven gpm and working pressure of 200 psi at 100F.
    - 6) Shield: Fabricated as specified for toilet partition: Section 10155.
  - b. Portable type
    - 1) ASME rated 5-gallon stainless steel pressure tank.
    - 2) Equipped with built-in carrying handles, resilient bottom, pressure relief valve, tire filler valve and air pressure gauge.
    - 3) Furnished with twin chrome plated brass eye wash heads with automatic flow control and stay-open valve, with eight foot hose with hand held squeeze type valve and full size spray nozzle.
    - 4) Flow: 7-1/2 minutes from eye wash and 2-1/2 minutes from hose spray.
    - 5) Size: 25 inches tall and 26 inches circumference.
    - 6) Weight: 12 pounds empty and 42 pounds full.
    - 7) Chrome plate all metal parts.
- G. Electric Water Cooler: FS A-A-1154, minimum capacity 4.75 gallons per hour, Type 1 or Type 2 dispenser, temperature not more than 60F at 15 minute period, bubbler-style, air cooled, wall-hung, System T, for operation on 120-volt ac, 60-Hertz power. Dispenser not exceeding 18 inches in depth, with up-front spouts and controls; and complying with the ADA.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Protection of Fixtures:
  - 1. Protect plumbing fixtures from dirt, foreign objects and damage during construction period.
  - 2. Do not use warped or otherwise imperfect fixtures.
  - 3. Do not use installed fixtures for any purpose, except testing, prior to final acceptance by the Authority.
  - 4. Replace damaged and defective fixtures.
  - 5. Install vacuum breakers on water supply-piping connections to fixtures and equipment in accordance with requirements of jurisdictional authorities.
- B. Chair supports adjusted so that heights of fixtures above finished floor are as follows:
  - 1. Water closet: 18 inches to top of earthenware.
  - 2. Urinal: 17 inches to top surface of lowest part of lip.
  - 3. Lavatory: 31 inches to top of rim.
  - 4. Handicapped lavatory: 29-1/2 inches clear under apron.
- C. Emergency-Eyewash and Body-Spray Facilities:
  - 1. Install in locations shown and as follows:
    - a. Install water-supply line connecting facilities to water service.
    - b. Install filter on water-supply line at readily serviceable location.
    - c. Install drain line connecting facilities to drainage system as shown.
    - d. Install freeze-proof valve a minimum of 42 inches below grade.
    - e. Install portable type where shown.
- D. Electric Water Cooler:
  - 1. Install in locations shown and with top of spout 36 inches above floor.

**END OF SECTION**

## SECTION 15444

### DRAINAGE PUMPING SYSTEM

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing complete drainage pumping system consisting of factory-assembled submersible pumping facilities.
- B. Related Work Specified Elsewhere:
  - 1. Subway drainage system: Section 02625.
  - 2. Piping systems: Section 15205.
  - 3. Control equipment: Section 15900.
  - 4. Raceways, boxes and cabinets Section 16130.
  - 5. Wire, cable and busways: Section 16120.
  - 6. Motors: Section 16225.
  - 7. Motor starters and control centers: Section 16425.
  - 8. Wiring and control devices: Section 16145.
  - 9. Grounding and bonding: Section 16060.
  - 10. Circuit breakers panelboards and load centers: Section 16440.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: A276, A312.
  - 3. NEMA: 250.
  - 4. P-MSHA: Permissible - Mining Safety and Health Association.
- B. Source Quality Control:
  - 1. Submersible: Perform the following in the order given:
    - a. Check impeller, motor rating and electrical connections.
    - b. Perform motor and cable-insulation tests.
    - c. Run dry to establish rotation and mechanical integrity.
    - d. Run for 30 minutes, a minimum of six feet underwater. Test head and capacity.
    - e. Repeat motor and cable-insulation tests.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Submit complete catalog information and shop drawings for material and equipment including wiring and control diagrams.
  - 2. Certification:
    - a. Manufacturer's certified test reports.
  - 3. Operation and Maintenance Manuals:
    - a. Submit for each drainage pumping system.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of subassemblies, parts, motors, starters and relays.
  
- B. Submersible Pumping System:
  - 1. Pumps:
    - a. Heavy-duty, non-clog, fully submersible drainage-water pumps and motors as shown on pump schedule.
    - b. Casings and impeller fabricated of gray cast iron with stainless-steel wear rings and external nuts and bolts.
    - c. Impeller: Fully enclosed, vane-type, non-clog design capable of passing minimum two-inch diameter solids.
    - d. Seals: Tandem double mechanical seals running in oil reservoir; lower seal composed of two separate carbon or ceramic lapped face rings. Protect lower compression spring against exposure to pumped liquid.
    - e. Pump units capable of automatic connection to discharge piping by single linear downward motion of pump pressing tightly against discharge connection.
    - f. Discharge connection: Automatic discharge connection permanently bolted level to bottom slab with four 3/4-inch heavy-duty, stainless-steel threaded anchor bolts ASTM A276, Type 304, and at exact location required relative to respective access cover.
    - g. Guide bars, permanently attached to discharge connection or sole plate and to the access cover, for automatic hookup and dismount of pump units.
      - 1) Guide bars for pumps: Stainless-steel pipe, ASTM A312, Grade TP 304.
    - h. Pump units with integral sliding guide bracket easily removable from upper room equipment hatches, without requiring personnel to enter pump well to remove bolts, nuts or other fastenings.
    - i. Lifting handle and chain provided for service work. Lifting chain permanently attached to lifting handle and to safety hook on access cover. Galvanized steel design using safety factor of four.
  - 2. Pump motors: Section 16225, with the following additional requirements:
    - a. 1,750 rpm maximum; 460-volt; tolerance, plus 10 percent, minus 10-percent nameplate-value voltage; nonoverloading at all points of pump curve with cooling characteristics for continuous operation and with thermal-overload protection.
    - b. Air-filled, watertight, Class B insulation system with Class F materials, insulated windings and watertight terminal board. Dry, shell-type, squirrel-cage induction-type design. Provide watertight cable entry with power-cable strain-relief mechanism.
      - 1) Cable entry: Designed to preclude specific torque requirements to ensure watertight submersible seal.
      - 2) Cable entry, junction chamber and motor separated by terminal board isolating motor interior from foreign matter entering through pump top.
  - 3. Controls: Control-system components to be supplied by pump manufacturer.
    - a. Liquid-level controllers of direct-acting float, mercury switch sensors for pump control and HIGH/LOW level indicators. Pump control-point elevations and fully automatic operational sequence for each pump as shown. HIGH/LOW level alarm-indication system to be independent from pump control.
    - b. Panel: Duplex pump-control panel, in NEMA 250, Type 4 wall-mounted enclosure as shown. Provide surveillance for malfunction. Provide space for each pump motor starter.

- c. Motor starter: In accordance with Section 16425, with HAND/OFF/AUTO selector switch.
  - d. Provide automatic electric alternator with duplex pump-control panel.
    - 1) Solid state, plug-in type.
    - 2) Independent ON, common OFF operation.
    - 3) Relay rating: Heavy-duty, 10 amperes, 250 volts.
  - e. HIGH/LOW level-indication relays.
  - f. Float switches: Direct automatic float switches with Type 316 stainless-steel, 5-1/2 inch diameter housings; mounting clamps and attached cables. Capable of detecting level changes of one inch from rest position and suitable for mounting to one-inch, stainless-steel vertical pipe.
  - g. Provide local high-motor-temperature indicator light.
4. Wiring:
- a. Wiring and conduit: Sections 16130 and 16120. Cable racking in upper room and below floor slab.
  - b. Wiring for controls and motors by pump-system equipment manufacturer.
  - c. Autotransformer, pump-starter control panel wired from transfer switch as shown.
  - d. Pump-motor cables: Suitable for submersible-pump application with P-MSHA (Permissible-Mining Safety and Health Association) approval demonstrated by code or legend permanently embossed on cable, 25 feet per pump, strain-relieved within pump junction chamber.
  - e. Float switches: Flexible three-conductor, 14AWG cable, stranded conductor with synthetic-rubber submersible jacket and attached mercury switch. Each float furnished with 25 feet of cable grounded internally to float housing.
5. Piping, valves and fittings: Section 15205.
6. Thrust restraints: Provide on discharge lines as shown in accordance with Section 02515.
7. Pump hatches: Lightweight modularized design, fabricated of structural aluminum, stainless-steel hardware, recessed tilt-up access handle and hasp, torsion bar, changeable hinge side, lateral sliding nuts for station-hardware attachment. Each pump cover furnished with stainless-steel upper guide-bar brackets and lifting-chain hook.
8. Trolley and hoist: Single-chain hoist and trolley, 3,000-pound capacity, with 3.33-inch operating flange track, traversing centerline of pumps and installed as shown to permit installation and removal of units with station's internal equipment.
- a. Wheels: Special alloy iron with chilled and ground tread. Double row, prelubricated and permanently sealed precision bearings, with the following additional requirements:
    - 1) Overall diameter: Five inches.
    - 2) Tread diameter: Four inches.
    - 3) Axle diameter: 3/4 inch.
  - b. Yokes and load bar: Formed steel.
  - c. Fitting: Two-piece malleable-iron swivel clevis.
- C. Flowmeter: As approved by WASA, Controlotron, including the following components or approved equivalent system:
- 1. Flow Computers:
    - a. Model 1010 ANI,-JBLV Single Ultrasonic Transit Time Clamp On Flow Computer System with Full Graphical Digital Display, incorporating phase based detection, phase marker correlation, multipulse transmission and 4~20 mA outputs. Flow Computers having amplitude based detection are not acceptable due to EMI/RFI potentially generated by electric driven trains.
- D. Miscellaneous Equipment: Provide the following:

1. 120-volt, duplex, polarized convenience outlet furnished in side of control panel.
  2. 120-volt accessory controls provided with 15-ampere single-phase circuit breaker for each item.
  3. Ground-fault protection in each combination starter to trip breaker. Field-adjustable device with range to 50 amperes and factory-set at five amperes pick-up fault current.
  4. Automatic transfer switch in accordance with Section 16145.
  5. Ground bus bar in accordance with Section 16060.
  6. Circuit breaker in accordance with Section 16440.
  7. Surveillance in accordance with Section 15900:
    - a. Indicating malfunction when water level falls below or rises above predetermined range.
    - b. Indicating loss of power.
  8. DTS cabinet in accordance with Section 16130.
- E. Nameplates:
1. Securely attached to each major item of equipment showing manufacturer's name, model number and serial number.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Install complete pumping system including provision for hoisting in accordance with manufacturer's recommendations and place into operation. Prior to such operation, maintain drainage system specified in Section 02625 and as shown.
- B. Fit equipment and appurtenances within space provided and make readily serviceable
- C. Install remote totalizer where shown.
- D. Where shown, install flowmeter in accordance with manufacturer's instructions. Engage services of manufacturer of flowmeter for start-up services and instruction of personnel with a minimum of four hours on site.

#### **3.02 FIELD QUALITY CONTROL:**

- A. Tests and Inspections:
  1. Verify performance of drainage pumping station in accordance with items indicated on Exhibit 15444-1.
  2. Make arrangements for water needed for testing.

#### **3.03 TEMPORARY PUMPING SYSTEM:**

- A. The Contractor may at his option elect one of the following courses of action:
  1. Install a temporary drainage pump for his use during construction and replace it prior to final acceptance with the specified permanent system.
  2. Install specified permanent drainage pump for use during construction and prior to final acceptance have it rehabilitated by the manufacturer as necessary to restore it to a new condition.

**EXHIBIT 15444-1**

**CONTRACTOR VERIFICATION OF DRAINAGE PUMPING**

**STATION PERFORMANCE**

I. Instruments Required:

	<u>Instrument</u>	<u>Date of Calibration</u>
A.	Amprobe	_____
B.	Tachometer or Strobe	_____
C.	Stop Watch	_____ N/A _____
D.	Measuring Stick	_____ N/A _____
E.	Pressure Gauge	_____

II. Hand Operation: The purpose of this test is to establish operating characteristics of pumps and motors.

- A. Fill wet well with enough water to start pump.
- B. Pump No. 1 selected as lead pump:
  - 1. Set for hand operation with HAND/OFF/AUTOMATIC (HOA) switch on H.
  - 2. Start pump.
  - 3. Record:
    - Motor voltage \_\_\_\_\_ volts.
    - Motor current \_\_\_\_\_ amperes.
    - Pump speed \_\_\_\_\_ rpm.
    - Discharge pressure \_\_\_\_\_ psi.
  - 4. Stop pump.
- C. Fill wet well with enough water to start pump.
- D. Pump No. 2 selected as lead pump:

**EXHIBIT 15444-1 (CONT.)**

1. Set for hand operation (HOA on H).
2. Start pump.
3. Record:
  - Motor voltage \_\_\_\_\_ volt.
  - Motor current \_\_\_\_\_ amperes.
  - Pump speed \_\_\_\_\_ rpm.
  - Discharge pressure \_\_\_\_\_ psi.
4. Stop pump.

E. Record size of wet well: \_\_\_\_\_

III. Automatic Operation: The purpose of this test is to check alternator and automatic pump operation.

A. Set both pumps for automatic operation (HOA on A).

B. Add water to wet well. As soon as water reaches invert of influent pipe level (datum), one pump should start. Record data for four continuous cycles.

Cycle	Pump Running #1 or #2	Water level from datum $\pm$ at start	Time of Start	Water level from datum $\pm$ at stop	Time of stop	Calc. Flow Rate
1.						
2.						
3.						
4.						

IV. Alarm Operation: The purpose of this test is to check operation of lag-pump starting and high-level alarm.

A. Set both pumps for automatic operation (HOA on A).

B. Add water to wet well. As soon as water reaches the invert of influent pipe level (datum), one pump should start.

**EXHIBIT 15444-1 (CONT.)**

C. When lead pump starts, shut it off (HOA on O).

D. When lag pump starts, record water level and return lead-pump control to automatic (HOA on A) and record water level when pumps stop. Repeat for a total of four cycles with each pump being lead pump twice.

Cycle	Alarm Yes/No	Lead pump #1 or #2	Water level when lag pump starts, datum $\pm$	Water level when pumps stop, datum $\pm$
1.				
2.				
3.				
4.				

E. Repeat steps A, B, and C above.

F. When lag pump starts, shut it off (HOA on O). Allow water to continue to rise in wet well until high alarm sounds. Then record level and turn both pumps on automatic (HOA on A). Repeat for two cycles.

Cycle	Alarm for Lag Pump Yes/No	Alarm for high- water level Yes/No	Water level, datum $\pm$ when high- water level alarm sounds
1.			
2.

**END OF SECTION**

**SECTION 15445**  
**SEWAGE EJECTORS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing complete triplex dry pit submersible vertical electric sewage ejector.
  
- B. Related Work Specified Elsewhere:
  - 1. Piping systems: Section 15205.
  - 2. Control equipment: Section 15900.
  - 3. Miscellaneous pumps: Section 15135.
  - 4. Grounding and bonding: Section 16060.
  - 5. Wire, cable and busways: Section 16120.
  - 6. Conduit, raceway and boxes: Section 16130.
  - 7. Wiring and control devices : Section 16145.
  - 8. Motors: Section 16225.
  - 9. Motor starters and control centers: Section 16425.
  - 10. Circuit breakers panelboards and load centers. Section 16440.

**1.02 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications.
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASME code.
  - 3. ASTM: A48, E527.
  - 4. NEMA.
  - 5. P-MSHA.
  - 6. UL.

**1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Submit complete catalog information and shop drawings for material and equipment including wiring and control diagrams.
  - 2. Certification.
    - a. Manufacturer's certified test reports.
  - 3. Operation and Maintenance Manuals.
    - a. Submit for each drainage pumping system.

**PART 2 - PRODUCTS**

**2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of piping subassemblies, parts, motors, starters and relays.
  
- B. Dry Pit Pumping System:
  - 1. Pumps:

- a. Vertical dry-pit, non-clog sewage water pumps and motors as shown on pump schedule.
  - b. Castings fabricated of gray cast iron with stainless steel wear rings and external nuts and bolts, conforming to ASTM A48 Class 30.
  - c. Impeller: One piece, single suction, fully enclosed, vane-type, conforming to an ASTM A48 Class 30, non-clog design capable of passing minimum three-inch diameter solids statically, balanced and secured directly and straight motor shaft.
  - d. Seals: Tandem double mechanical seals running in oil reservoir; lower seal composed of two separate carbon or ceramic lapped face rings. Protect lower compression spring against exposure to pumped liquid.
  - e. Provide a pump which rotates on a minimum of two bearings permanently lubricated but capable of being regreased, suitable for a minimum L10 bearing life of 40,000 hours.
  - f. Provide a heavy duty fabricated steel base with openings for access to the suction elbow and cleanout bolted directly to the volute. Provide a base which supports the assembled weight of the pump and driver. Furnish a cast iron elbow with 1/4-inch gauge connection, contoured hand hole clean out, and a 125-pound flat faced flange conforming to ANSI drilling.
  - g. Provide a volute of one piece circular design with smooth fluid passages large enough to pass any solid that can pass through the impeller, made of close-grained cast iron conforming to ASTM A48 Class 30. The volute is to be side flagged tangential discharge, and capable of rotation in 45 increments to accommodate piping orientation. The volute is to have large cleanout openings located at the impeller centerline. Provide volute priming drain and 1/4-inch minimum gauge connections. Provide 125-pound flat faced flanges in accordance with ANSI drilling. Provide for removal of the rotating assembly without disturbing the suction or discharge piping. Hydrostatically test the casing to 1.5 times the design head or 1.25 times the shutoff head, whichever is greater.
2. Pump Motors: Section 16225, with the following additional requirements:
- a. 1,750 rpm maximum; 460-volt tolerance; plus or minus 10 percent nameplate-value voltage; non-overloading at all points of pump curve with cooling characteristics for continuous operation and with thermal-overload protection.
  - b. Submersible as defined by the air-filled cast iron watertight enclosure.
  - c. Shaft: Alloy S41600 stainless steel in accordance with ASTM E527; the rotor dynamically balanced to meet NEMA vibration limits; hardware stainless steel.
3. Controls: Control system components to be supplied by the pump manufacturer.
- a. Liquid-level controllers of direct acting float, mercury switch sensors for pump control and HIGH level indicators. Pump controls pint elevations and fully automatic operational sequence to reach pump as shown. HIGH level alarm indication system to be independent from pump control.
  - b. Panel: Triplex pump control panel, in NEMA I, wall-mounted enclosure as shown. Provide surveillance for malfunction. Provide space for each pump motor starter.
  - c. Motor starter: In accordance with Section 16425, with HAND/OFF/AUTO selector switch.
  - d. Provide automatic electric alternator with triplex pump control panel.
    - 1) Solid state, plug-in type.
    - 2) Independent ON, common OFF operation.
    - 3) Relay rating: Heavy-duty, 10 amperes, 250 volts.
  - e. HIGH level indication relays.
  - f. Float switches: Direct automatic float switches with Alloy S31600 stainless steel in accordance with ASTM E527, 5-1/2-inch diameter housing;

mounting clamps and attached cables. Capable of detecting level changes of one inch from reset position, and suitable for mounting to one-inch stainless steel vertical pipe.

- g. Provide local high-motor-temperature indicator light.
  - 4. Sequence of operation:
    - a. As the liquid level rises in the wet well have SE-1 energize as the lead pump float switch rises, and deenergize at the off level/lowering of the float switch.
    - b. On the next cycle, have SE-2 energize and proceed as described for SE-1.
    - c. On the following cycle, have SE-3 proceed the same as described above.
    - d. Program SE-1, SE-2 and SE-3 to alternate each cycle and program the other pumps to be first lag pump on and second lag pump on. The sequence is as follows:
      - 1st Cycle SE-1, SE-2, SE-3
      - 2nd Cycle SE-2, SE-3, SE-1
      - 3rd Cycle SE-3, SE-1, SE-2Normal operation = one pump per load only.
    - e. If the water level continues to rise after the first pump has energized and due to clog or mechanical failure, have SE-2 energize and trigger alarm at the first lag pump input; and if the water continues to rise due to second pump failure, then have SE-3 energize and activate alarm at the second lag pump input.
    - f. Program two more alarm inputs for indication functions.
    - g. Make low-level and high-level alarms independent of pump control and activated as required.
  - 5. Wiring:
    - a. Wiring and conduit: Sections 16130 and 16120. Cable racking in upper room and below floor slab.
    - b. Wiring for controls and motors by pump system equipment manufacturer.
    - c. Auto transformer, pump starter control panel wired from transfer switch, as shown.
    - d. Pump-motor cables: Suitable for submersible-pump application with P-MSHA approval demonstrated by code or legend permanently embossed on cable, 25 feet per pump, strain-relieved within pump junction chamber.
  - 6. Piping, valves and fittings: Section 15205, except check valves to be swing type with outside lever and spring or outside lever and weight; steel or iron body and cap and flanged end connection.
  - 7. Thrust restraints and anchors: Provide on discharge lines as shown or in accordance with Section 02515 for buried pipe or Section 15205 for exposed pipe.
  - 8. Pump access gratings and ladders: In accordance with Section 05500, and as shown.
- C. Miscellaneous Equipment: Provide the following:
- 1. Furnish 120-volt, duplex, polarized convenience outlet inside of control panel.
  - 2. Provide 120-volt accessory controls with 15-ampere single-phase circuit breaker for each item.
  - 3. Provide ground-fault protection in each combination starter or trip breaker. Field adjustable device with range to 50-amperes and factory set at 5-amperes pickup fault current.
  - 4. Automatic transfer switch in accordance with Section 16145.
  - 5. Ground bus bar in accordance with Section 16060.
  - 6. Circuit breaker in accordance with Section 16440.
  - 7. Surveillance in accordance with Section 15900.
  - 8. Indication loss of power.
- D. Hand propelled carrier: Provide monorail and hand propelled carrier as shown.

- E. Sump pump: Provide sump pump as specified in Section 15135 and as shown.
- F. Nameplates: Securely attach to each major item of equipment showing manufacturer's name, model number and serial number.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Install complete pumping system including provision for hoisting in accordance with manufacturer's recommendation and place into operation. Follow manufacturer's recommendation for minimum separation between sensor and maximum expected material level.
- B. Fit equipment and appurtenances within space provided and make readily serviceable.

#### **3.02 FIELD QUALITY CONTROL:**

- A. Tests and inspections:
  - 1. Pump chamber: Test shop and field joints for water tightness by pressurizing with compressed air to a minimum of five inches of water gauge and applying water and soap solution to the joints. Seal leaks and retest joints until leak free.
  - 2. Make arrangements for water needed for testing.

#### **3.03 MANUFACTURER'S ASSISTANCE AND WARRANTY:**

- A. Have the manufacturer guarantee equipment and controllers for two years of operation or 30 months from date of shipment, whichever comes first, so that the equipment is free from defects in design, workmanship or materials.
- B. In the event that a component fails to perform as specified or is proven defective in service during the guarantee period, have the manufacturer promptly replace the defective part at no additional cost to the Authority.
- C. Provide support beams, concrete pads, platforms, hangars and anchor bolts necessary for proper installation of equipment as recommended by manufacturer.

**END OF SECTION**

## SECTION 15480

### DOMESTIC WATER HEATERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing domestic electric water heaters.
- B. Related Work Specified Elsewhere:
  - 1. Concrete Pads: Sections 03100 and 03300.
  - 2. Miscellaneous Pumps : Section 15135.
  - 3. Piping Systems: Section 15205.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASME Boiler and Pressure Vessel Code.
  - 3. UL listed.
  - 4. ASHRAE: 90.1b, Standard for Energy Efficiency.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.
  - 3. Operations and Maintenance Manuals.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of equipment, subassemblies, parts, relays and other items
- B. Water-Heater Equipment; UL listed and as follows:
  - 1. Capacity of storage-type water heaters and accessories: As shown.
  - 2. Water heaters fabricated of steel in accordance with the following additional requirements:
    - a. 120-gallon capacity or more: ASME Boiler and Pressure Vessel Code and applicable local plumbing code.
    - b. Less than 120-gallon capacity: Applicable local plumbing code.
  - 3. Minimum storage capacity: As shown.
  - 4. Water heaters designed for heat-recovery capacity as shown.
  - 5. Glass-lined tanks insulated with minimum 1-1/2 inch fibrous-glass blanket, or manufacturer's standard insulation with metal jacket over insulation.
  - 6. ASME rated temperature-pressure relief valve on tank, piped to indirect waste.
  - 7. Heating elements of double Incoloy rod-type for operation at voltage shown.
    - a. Water heaters with capacity of 20 gallons or less equipped with single heating element.

- b. Water heaters with capacity of more than 20 gallons equipped with two or more heating elements.
  - 8. Furnished with complete automatic controls including temperature protector designed to shut-off power supply if water temperature in tank rises to 205F.
  - 9. Low-water cutoff to protect system from operating when water level drops below electrical probe.
  - 10. Immersion-type thermostats and dial-indicating temperature gauge.
  - 11. In-line hot-water recirculating pump: Section 15135.
  - 12. Meets ASHRAE 90.1b, Standard for Energy Efficiency.
- C. Nameplates:
- 1. Securely attached plate on each water heater showing manufacturer's name, model number and serial number.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide supports, concrete pads, hangers and anchor bolts necessary for proper installation of equipment as recommended by manufacturer.
- C. Install complete potable make-up water system as shown and in accordance with Section 15205.

**END OF SECTION**

## SECTION 15625

### CHILLERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing complete factory-assembled packaged water-chilling units.
- B. Related Work Specified Elsewhere:
  - 1. Concrete pads: Sections 03100 and 03300.
  - 2. Water Treatment System: Section 15186.
  - 3. Piping systems: Section 15205.
  - 4. Insulation: Section 15080.
  - 5. Vibration isolation: Section 15070.
  - 6. Control equipment: Section 15900.
  - 7. Conduit, raceways and cabinets: Section 16130.
  - 8. Wire, cable and busways: Section 16120.
  - 9. Motors: Section 16225.
  - 10. Motor starters and control center: Section 16425.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASME Code.
  - 3. ARI: 550.
  - 4. ANSI: B9.1.
  - 5. ASHRAE Standards.
- B. Design Criteria:
  - 1. For single-chiller chiller plant: Select each water-chilling unit in accordance with the following criteria:
    - a. Water on evaporator: 55F.
    - b. Water off evaporator: 42F.
    - c. Water on condenser: 85F.
    - d. Water off condenser: 95F.
    - e. Net refrigeration effect, chilled-water flow rate and condenser water-flow rate: as shown on the Contract Drawings.
    - f. Control system compatible with AEMS system.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Capacity curves for evaporator/compressor and compressor/condenser plotted on charts to ensure properly balanced refrigeration equipment under design conditions.
  - 2. Certification:
    - a. Record of packaged water chillers in field operation for minimum of 12,000 operating hours for not less than ten individual units prior to shipment. Types that have already shown satisfactory operation for this period may

- have modifications , provided modifications will not increase maintenance and operating costs or decrease life of machine and complies with ARI 550.
- b. Verification of successful use of material used for impeller wheel for centrifugal compressors, if other than aluminum alloy.
- 3. Operation and Maintenance Manuals.

#### **1.04 JOB CONDITIONS:**

- A. Safety Requirements:
  - 1. Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, key and other rotating parts to prevent danger to personnel.

#### **1.05 OPERATION AND MAINTENANCE TRAINING:**

- A. In accordance with the General Requirements.

### **PART 2 – PRODUCTS**

#### **2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements:
  - 1. Supply chiller with full operating charge of HFC-134a Refrigerant and oil. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
- B. Centrifugal Compressors:
  - 1. Single-stage, statically and dynamically balanced impeller.
  - 2. Driven by drive motor directly or by means of gears.
  - 3. Casing fabricated of cast iron, aluminum or steel plate with split sections gasketed and bolted.
  - 4. Impeller wheel constructed of aluminum alloy or other material that has been demonstrably successful in use.
  - 5. Impeller shaft fabricated of heat-treated alloy steel with sufficient rigidity for proposed operation at specified operating speeds.
  - 6. Shaft main bearings: Journal with bronze or babbitted liners or one-piece aluminum alloy inset.
  - 7. Lubrication: Forced feed to lubrication points.
  - 8. Differential oil-pressure cutout interlocked with compressor starter to allow compressor to operate only when recommended oil pressure is provided to bearings.
  - 9. Capacity reduction designed to provide automatic capacity modulation from 100 percent capacity to 10-percent capacity without cycling.
  - 10. Capacity-control system actuated by temperature of water leaving evaporator.
  - 11. Transducers for remote surveillance and control by AEMS system as shown and in accordance with Section 15900.
- C. Water Cooler:
  - 1. Removable bundle-type copper tube, constructed of seamless copper tubing minimum 0.035-inch wall thickness, plain or with integral fins individually replaceable and rolled or brazed into copper or steel-tube sheets, with baffles and tube supports of copper or steel.
  - 2. Complete refrigerant-feed control, designed to control feed to evaporator at each level of load range from 100 percent to 10 percent of package water-chilling capacity without use of hot-gas bypass.
  - 3. Performance based on water velocity of minimum three fps and maximum ten fps throughout full length of tubes and fouling factor of 0.00025 for individual machine.

4. Water spaces in coolers designed for minimum 150-psi working pressure; tested in accordance with ASME Code.
  5. Water spaces not subject to the ASME Code due to size or other limitations, tested at pressure of not less than 1-1/2 times working pressure.
- D. Insulation:
1. Each water-chilling unit provided with insulation as specified in Section 15080.
- E. Condenser:
1. Shell-and-tube type permitting tubes to be cleaned from each end by removing water-box cover plates or head.
  2. Tubes fabricated of seamless copper tubing, minimum 0.035-inch wall thickness, with integral fins individually replaceable and rolled or brazed into copper or steel-tubed sheets.
  3. Performance based on rate of water flow specified and water velocity of 3-fps minimum and 10-fps maximum throughout full length of tubes and fouling factor of 0.0075.
  4. Water spaces in condenser designed for minimum 150-psi working pressure; tested in accordance with requirements of ASME Code.
  5. Refrigerant side of shell tested at 1-1/2 times refrigerant saturation pressure.
- F. Compressor Drive Motor, Hermetic Units:
1. Squirrel-cage induction, refrigerant gas-cooled, rated at 460 volts, three-phase and 60 Hertz and in accordance with Section 16225.
  2. Bearings: Sleeve-type.
  3. Pressure lubrication with pump and cooler.
  4. Gear cases oiltight.
  5. Motor starter conforming to recommendations of water-chiller manufacturer and as specified in Section 16425.
  6. Wiring as recommended by compressor manufacturer to provide complete automatic operation of centrifugal refrigeration system.
  7. Each centrifugal machine, driven through speed-increasing gears designed to ensure self-alignment, lubrication and minimum of unbalanced forces.
- G. Compressor Drive Motor, Open-Drive Units:
1. Drip-proof, fully guarded, squirrel-cage induction and as specified in Section 16225.
- H. Controls, Control Panel and Gauges: Provide refrigerant monitors suitable for refrigerant R-134a per ASHRAE Standards.
1. Provide a microprocessor control panel which can monitor and display various chiller parameters and alarms. As a minimum, monitor the following points:
    - a. Analog points:
 

1)	Chilled water enter temperature	DEG F
2)	Chilled water return temperature	DEG F
3)	Condenser water enter temperature	DEG F
4)	Condenser water return temperature	DEG F
5)	Condenser water pressure	PSI
6)	Chilled water pressure	PSI
7)	Condenser refrigerant pressure	PSI
8)	Evaporator refrigerant pressure	PSI
9)	Chiller oil pressure	PSI
10)	Chiller KW demand	KW
11)	Chiller efficiency	KW/TON
    - b. Alarm points:
      - 1) Chiller oil temperature
      - 2) Chiller bearing temperature

- c. In addition, for future interface with an Energy Management System, provide a 4-20 mA signal output for each analog point and a dry contact closure for each alarm point.
  2. Each water-chilling unit provided with electronic or pneumatic controls as specified in Section 15900.
  3. Capacity-control mechanism to be integral part of packaged water chiller maintaining leaving water temperature within 0.75 degrees F of setting temperature from 100 percent to 10 percent of chiller capacity.
  4. Control mechanism: Compressor stopped when chiller output drops below 10 percent and automatically restarted when leaving water rises to preset temperature.
  5. Timing device: Restarting unit limited to four starts per hour, minimum 15 minutes apart.
  6. Modulating chilled-water operating control having adjustable throttling range, with means of calibration by adjusting chilled-water temperature control point. Pneumatic or solid-state electronic control.
  7. Control panel provided on each unit with compressor-operating control, START/STOP switch and the following gauges and protective devices:
    - a. Suction-pressure gauge.
    - b. Condensing-pressure gauge.
    - c. Oil-pressure gauge.
    - d. Low-refrigerant-pressure cutout.
    - e. High-pressure cutout, manual reset only.
    - f. Low-oil-pressure cutout, manual reset only.
    - g. Low-water-temperature cutout, manual or automatic reset.
    - h. Motor-winding high-temperature cutout, manual reset only.
    - i. Running-time meter.
  8. Signal lights for protective devices.
  9. Alarm-circuit terminals in basic chiller-package control panel designed to actuate alarm device in event of machine cutout of protective devices.
- I. Evacuation System:
  1. Manually started and stopped evacuation system when positive-pressure refrigerant is used and chiller package is not designed to permit pumpdown storage and isolation of entire charge in condenser.
  2. Motor-driven, air-cooled or water-cooled reciprocating condensing unit and receiver of sufficient capacity to store entire refrigerant charge of largest water-chilling system.
  3. Receiver in accordance with ASME Code, mounted on floor brackets and provided with rupture members and dual relief valves in series.
  4. Entire system completed with valves, piping and controls so that evacuation system may be utilized for pumpout, without temporary piping or wiring.
- J. Receiver, Refrigerant:
  1. Horizontal liquid receiver designed, fitted and rated in accordance with ASME Code.
  2. Each receiver having storage capacity 25 percent minimum in excess of that required for fully charged system.
  3. Inner surfaces thoroughly cleaned by sandblasting.
  4. Each receiver equipped with inlet, outlet drip pipe, drain plug, purging valve, relief valves of capacity and setting in accordance with ANSI B9.1 and two bulls-eye liquid sight glasses.
  5. Sight glasses installed in same vertical plane, 90 degrees apart, perpendicular to the axis of the receiver and not over 3-inches horizontally from drip pipe measured along axis of receiver.
  6. Receiver constructed and tested in accordance with ASME Code.
- K. Starter:

1. Motor starters: Section 16425.
- L. Tools:
  1. One complete set of special tools as recommended by manufacturer for field maintenance of system.
- M. Factory Wiring:
  1. In accordance with manufacturer's standard practice.
- N. Nameplates:
- O. Securely attached to each chiller showing manufacturer's name, model number and serial number.

### **PART 3 – EXECUTION**

#### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide concrete pads, platforms and hangars necessary for proper installation of equipment.
- C. Install chillers on concrete pads 4-inches minimum height in accordance with Sections 03100 and 03300.
- D. Install chillers on vibration Isolators in accordance with Section 15070.
- E. Coordinate work with other trades.
- F. Mount tools on tool board in equipment room, as directed.
- G. For piping system installation, see Section 15205.
- H. For water treatment installation, see Section 15186.
- I. For conduit, raceways and cabinets installation, see Section 16130.
- J. For wire cable, and busways, installation, see Section 16120.

#### **3.02 FIELD SERVICES:**

- A. Hermetic Units: Obtain on-site services for two man-days of manufacturer's engineering representative to advise on the following:
  1. Pressure test on hermetic water-chilling unit for leaks.
  2. Evacuation and dehydration of machine to minus 12F wet bulb or to absolute pressure of not over 0.204-inch of mercury for 24 hours minimum.
  3. Charging machine with refrigerant.
  4. Starting machine and instructing representative of the Authority as to its proper care and operation.
- B. Open Units: Obtain on-site services for two man-days of manufacturer's engineering representative to advise on the following:
  1. Erection, alignment, testing and dehydrating.
  2. Charging machine with refrigerant.

3. Starting machine and instructing Authority personnel in proper care and operation of machine.

**END OF SECTION**

**SECTION 15640**

**COOLING TOWERS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing factory-assembled, counterflow, vertical-discharge, blow-through, cooling towers.
- B. Related Work Specified Elsewhere:
  - 1. Piping systems: Section 15205.
  - 2. Vibration isolation: Section 15070.
  - 3. Sound attenuators: Section 15825.
  - 4. Control equipment: Section 15900.
  - 5. Motors: Section 16225.

**1.02 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NFPA: 214.
  - 3. CTI: Bulletin ATP-105.
  - 4. ASME: Performance Test Code PTC-23.
  - 5. ASTM: A653, B117.

**1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification:
    - a. Certificates stating that the sound power level of cooling tower based on 10<sup>12</sup> watts does not exceed following decibel ratings, without attenuators:

Octave Band Center Frequency/Hertz	Sound Power Level/dB
63	97
125	95
250	92
500	90
1000	86
2000	85
4000	82
8000	78

- b. Certified field test reports as specified and as directed.

3. Operation and Maintenance Manuals.

#### **1.04 JOB CONDITIONS:**

- A. Safety Requirements:
  1. Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, keys and other rotating parts to prevent danger to personnel.

#### **1.05 OPERATION AND MAINTENANCE TRAINING:**

- A. Upon completion of installation, furnish on-site services of manufacturer's engineering representative with specialized experience in components of system for minimum of 1/2 man-day to instruct Authority personnel in proper operation and maintenance of each system.

### **PART 2 - PRODUCTS**

#### **2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements:
  1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motor starters and relays.
  2. Galvanized-steel sheets: ASTM A653; coating designation G90 with raw edges coated with a zinc-rich compound.
  3. Galvanized surfaces finished with zinc-chromate primer and aluminum-paint finish coat or finished with manufacturer's standard coating, with the following additional requirements:
    - a. Coating permitting no corrosion on steel when exposed to 20-percent salt spray at 95F for a minimum of 400 consecutive hours.
    - b. Coating tested in accordance with ASTM B117.
- B. Cooling Towers:
  1. Each cooling tower designed to meet the following performance criteria:
    - a. Water-flow rate: As shown.
    - b. Cooling: From 95F to 85F minimum.
    - c. Ambient temperature: 78F wet bulb.
    - d. Water-pressure drop: Not exceeding value shown.
  2. Sump sections:
    - a. Galvanized steel, heavy-gauge.
    - b. Provided with outlet connection, overflow, valved drain and electric water-level control consisting of magnetic-type electric float switch in moisture proof housing and control solenoid valve in makeup water line.
    - c. Outlet connections with large-area lift-out strainer with perforated openings sized smaller than spray-nozzle orifices, mounted in assembly and baffled to prevent cavitation.
    - d. Pipe drain and overflow connections as shown or to nearest drain leading to sewer.
  3. Fan sections:
    - a. Hot-dip galvanized steel.
    - b. Fans forward-curved, centrifugal, with one or more wheels, statically and dynamically balanced.
    - c. Designed to overcome resistance of tower, its enclosure, connecting ductwork and sound attenuators, if any, and quiet in operation.
    - d. Air inlets designed for smooth air entry.
    - e. Hot-dip galvanized bird screen at fan air inlets.
  4. Fan bearings:

- a. Heavy-duty ball bearings, precision-grade, incorporating cast-iron pillow blocks and self-aligning with wide inner rings for greater load capacity.
  - b. Slip-fit bearings equipped with eccentric locking collars to provide for positive means of securing bearings to shaft.
  - c. Prelubricated bearings, ready for immediate service.
  - d. Grease-fitting for relubrication.
  - e. Lithium-base grease, waterproof, containing inhibitor and effective for temperature range of minus 65F to plus 250F.
5. Fan drives:
- a. Fan driven by electric motors through V-belt drives.
  - b. Belt guard of expanded metal, wire mesh or solid side panels.
  - c. Adjustable motor brackets.
  - d. Entire fan drive, including sheaves, belts, keys and other items manufacturer-rated for minimum of 1.5 times maximum horsepower required to drive fan.
  - e. Rating taken from manufacturer's standard catalog data.
  - f. Fan-shaft sheave-pitch diameter minimum 35 percent of fan wheel outside diameter.
6. Fan motors: Section 16225, with the following additional requirements:
- a. Four-pole, totally enclosed, fan-cooled and guarded.
7. Casings:
- a. Fabricated of heavy-gauge hot-dip galvanized steel using channel-type sheets.
  - b. Gasketed access doors for strainer.
  - c. Towers designed for live load of 40 pounds per square foot on horizontal deck surfaces and wind load of minimum 100 miles per hour for vertical surfaces.
  - d. Ladder: Aluminum or hot-dip galvanized steel for towers having water-distribution section more than eight feet above roof or grade.
8. Tower fill and drift eliminators:
- a. Tower fill (wet deck) fabricated in modular layers consisting of hot-dip galvanized, wave-formed, 26-gauge surface sheets or manufacturer's equivalent standard product.
  - b. Drift eliminators fabricated of materials specified for fill but located at top of tower and assembled in easily handled removable sections to provide access to spray tree and nozzles.
9. Water distribution:
- a. Water evenly distributed over tower fill area through spray tree consisting of hot-dip galvanized steel header and removable hot-dip galvanized steel branches.
  - b. Branches and spray nozzles retained in place by means of snap-in rubber grommets to provide for ease of removal for cleaning and replacement of spray nozzles.
  - c. Plastic nozzles provided.
  - d. Spray tree and spray nozzles designed for total flow rate for each tower as specified.
  - e. Spray header with plugged tap for measurement of pressure.
  - f. Separate regulating and stop valves for complete balancing and complete shutoff for each tower.
10. Makeup-water solenoid valve:
- a. 120-volt, 60-Hertz solenoid valve installed in makeup-water line.
  - b. Maximum operating pressure-drop across valve: 10 psi.
  - c. Solenoid valve controlled by electric float switch.

C. Nameplates:

1. Securely attached plate on each cooling tower showing manufacturer's name, model number and serial number.
- D. Sound Attenuators: Section 15825.
- E. Controls: Section 15900.
- F. Vibration Isolators: Section 15070.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Start ladders at roof or grade level.
- B. Provide support beams, concrete pads, platforms, hangers and anchor bolts for proper installation of equipment as recommended by the manufacturer.
- C. Install complete potable makeup-water system as shown and as specified in Section 15205.
- D. Mount units on vibration isolators in accordance with Section 15070.
- E. Provide sound attenuators where shown.

#### **3.02 FIELD QUALITY CONTROL:**

- A. Field Tests:
  1. Test cooling towers in accordance with ASME Performance Test Code PTC-23 or CTI Bulletin ATP-105, using services of independent testing agency.
  2. Prior to commencing tests, submit name of testing agency for approval.
  3. Tests will be observed by the Authority and calculations performed immediately following tests. Have tests and calculations signed by observers.
  4. Submit computations to the Engineer together with six complete sets of test results.
  5. Compute and test in accordance with particular test procedure employed by testing agency.
  6. When the Engineer considers the performance of cooling towers unsatisfactory, the Engineer will direct that cooling towers be retested.
  7. Should tests show that cooling towers are deficient, modify or replace towers to provide specified capacities.
  8. If cooling tower performance is proven satisfactory, cost of tests will be borne by the Authority. If cooling tower performance is proven unsatisfactory, cost of tests will be borne by the Contractor.

**END OF SECTION**

**SECTION 15725**  
**VENTILATING UNITS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing ventilating units.
- B. Related Work Specified Elsewhere:
  - 1. Concrete pads: Sections 03100, 03200 and 03300.
  - 2. Vibration isolation: Section 15070.
  - 3. Air conditioning units: 15733.
  - 4. Heating equipment: Section 15765.
  - 5. Control equipment: Section 15900.
  - 6. Electrical connections: Sections 16120 and 16130.

**1.02 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.

**1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Operation and Maintenance Manuals.

**PART 2 - PRODUCTS**

**2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of equipment, subassemblies, parts, motors, starters and relays.
- B. Ventilating Units:
  - 1. Ventilating units furnished in accordance with Section 15733, but without cooling-coil section in ventilating units.
  - 2. Provide heating when required as per Section 15765.

**PART 3 - EXECUTION**

**3.01 INSTALLATION:**

- A. Fit equipment and appurtenances to space provided and make readily serviceable.
- B. Mount ventilating units on concrete pads and vibration isolators in accordance with Sections 03100, 03200, 03300, and 15070.
- C. Provide supports, hangers and anchor bolts necessary for proper installation of equipment as recommended by manufacturer.

D. Wire, cable and boxes: Sections 16120 and 16130.

**END OF SECTION**

## SECTION 15733

### AIR CONDITIONING UNITS - CHILLED WATER COOLED

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing factory-built air-conditioning units with cabinet-type fan sections and coil sections.
- B. Related Work Specified Elsewhere:
  - 1. Equipment foundations: Sections 03100, 03200 and 03300.
  - 2. Water coils: Section 15734.
  - 3. Filters: Section 15865.
  - 4. Ductwork: Section 15810.
  - 5. Piping systems: Section 15205.
  - 6. Vibration isolation: Section 15070.
  - 7. Control equipment: Section 15900.
  - 8. Raceways, boxes and cabinets: Section 16130.
  - 9. Wire, cable and busways: Section 16120.
  - 10. Motors: Section 16225.
  - 11. Motor starters and control centers: Section 16425.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NFPA: 90A.
  - 3. ARI: 430.
- B. Qualifications of Manufacturer:
  - 1. Furnish air-conditioning units which are the products of a manufacturer who is a member of AMCA.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification:
    - a. Each air-conditioning unit fan.
  - 3. Operation and Maintenance Manuals.

##### 1.04 JOB CONDITIONS:

- A. Safety Requirements:
  - 1. Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, keys and other rotating parts to prevent danger to personnel.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:

1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
- B. Fans:
1. Class I or II: Double width, double inlet, centrifugal, meeting ARI 430 and bearing ARI seal.
  2. Blades backward inclined airfoil sections, with the following additional requirements:
    - a. Forward curved blades may be furnished for fan wheel diameter 24 inches or less.
  3. Inlets with smooth, rounded edges.
  4. Fan housing fabricated of zinc-coated steel sheets, heavy-gauge consistent with size and use of unit.
  5. Fan wheels having heavy-gauge rims, blades of heavy-gauge steel consistent with blade size and for capacity, with matching heavy-gauge backplates. Steel, painted with zinc-oxide primer or corrosion-proof plastic coating.
  6. Fan wheels and sheaves: Splined or keyed, fastened to shafts with set screws.
  7. Shafts of steel, solid or hollow, ground to tolerance on working surfaces.
  8. Nonworking surfaces of shafts coated with factory-applied corrosion proof plastic coating.
- C. Fan Bearings:
1. Self-aligning, antifriction type, designed to prevent leakage of lubricant and entrance of dirt.
  2. Design life: 200,000 hours minimum.
  3. Extended grease fittings when bearings are located internally.
- D. Fan Operating Characteristics:
1. Brake horsepower necessary to drive fan at air volume and static pressure shown.
  2. Fans which do not approach 25 percent of first critical speed of shaft during normal operation or while attaining speed.
  3. Prior to shipment, statically and dynamically balance fans on their own shafts in their own units at design speed.
- E. Fan Drives:
1. Fan driven by electric motor through high-capacity, V-belt drive.
  2. Drives protected with belt guard of expanded-metal wire mesh or solid-metal side panels with tachometer opening.
  3. Adjustable motor brackets and sheaves with nominal rating at midpoint.
  4. Gasketed, hinged access doors with quick-opening latches or removable access panels.
  5. Entire fan drive, including sheaves, belts, keys and other items rated by manufacturer at minimum 1.5 times maximum horsepower required to drive fan.
  6. Ratings in accordance with manufacturer's standard catalog data.
  7. Fan-shaft sheave-pitch diameter: 30-percent minimum outside diameter of fan wheel.
  8. Metal label riveted to unit stating size of replacement belt .
- F. Fan Motors: Section 16225, with the following additional requirements:
1. Four-pole, dripproof, fully guarded.
- G. Motor Starters and Control Centers: Section 16425.
- H. Unit Casings:
1. In sections to facilitate handling.
  2. Fabricated of steel sheets, manufacturer's standard heavy-gauge.

3. Steel sheets, angles and other structural shapes used in construction of casings: Zinc-coated steel or chemically pretreated and painted with enamel primer and exterior surface finished with factory-applied enamel coating.
  4. Panels removable for access.
  5. Cadmium-plated steel bolts, screws and washers.
  6. Structural frame fabricated with members rigidly braced to hold parts in line and to prevent distortion when operating.
  7. Structural frame of welded construction; slag and splatter removed after welding.
  8. Welds painted with two coats of approved primer and one finish coat of aluminum epoxy paint.
  9. Fan sections and coil sections factory-insulated.
    - a. Insulation: Minimum one-inch thick neoprene-coated fibrous glass, 1-1/2 pounds per cubic foot density, securely adhered to panel inner surface with adhesive and weld pins on minimum two-foot centers.
    - b. Exposed edges coated with adhesive.
    - c. Insulation and adhesive: NFPA 90A.
  10. Fan section or fan-coil section connected by flexible connections as specified in Section 15810.
  11. Filters: Section 15865.
  12. Drain pan:
    - a. Drain pan under fan and coil section where cooling coil used.
    - b. Drainage connection: As shown.
    - c. Insulate entire drain pan with 1/2-inch cellular foam.
  13. Coil: Section 15734.
- I. Nameplates:
1. Securely attached plate to each air-conditioning unit showing manufacturer's name, model number and serial number.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide foundations, platforms and hangers necessary for proper installation of equipment.
- C. Construct equipment foundations four inches minimum height in accordance with Sections 03100, 03200 and 03300.
- D. Install units on vibration isolators where shown as specified in Section 15070.
- E. Electrical connections: Sections 16130 and 16120.
- F. Condensate piping: Section 15205.
- G. After installation, adjust fans to operate without noticeable vibration.
- H. Arrange belt guards to permit oiling, testing and using tachometer with guards in place.

**END OF SECTION**

## SECTION 15734

### WATER COILS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing chilled water-coils in factory-built air-conditioning units.
- B. Related Work Specified Elsewhere:
  - 1. Air Conditioning Units: Section 15733.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. ARI: 410.
- B. Qualifications of Manufacturer:
  - 1. Furnish water coils which are the products of a manufacturer who is a member of ARI.
- C. Source Quality Control:
  - 1. Factory test water coils at 350-psi air pressure underwater.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.
  - 3. Operation and Maintenance Manuals.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies and parts.
  - 2. Coil section to interface directly with sections on sides without use of transition sections.
  - 3. Meet ARI 410.
- B. Water Coil:
  - 1. Seamless deoxidized-copper tubes, minimum 0.025-inch thick wall with aluminum fins.
  - 2. Coil casings of zinc-coated, rust-resistant steel.
  - 3. End panels: Heavy-gauge steel.
  - 4. Side panels: 16 gauge for tube lengths up to 90 inches; 14 gauge for tube lengths of 91 to 120 inches.
  - 5. Top and bottom casing flanges formed into box shape for strength and durability with flat surface for coil stacking.
  - 6. Coils with 48 to 84-inch tube lengths provided with one center tube support; for longer coils, up to 120-inch tube lengths, provided with two intermediate supports.

7. Maximum fin spacing: 12 per inch of tube.
  8. Water velocity: Minimum two fps and maximum six fps throughout tube length.
  9. Maximum water-pressure drop through coils: 35 feet water gauge.
  10. Maximum air velocity through coil face: 550 fpm.
  11. Designed with continuous circuits from inlet header to outlet header.
  12. Drainable, pitched 3/16 inch per foot toward return header for complete drainage.
  13. Self-venting with supply connection at bottom of supply header and return connection at top of return header.
  14. Vent connection provided in supply header and drain connection in return header.
- C. Nameplates:
1. Securely attached to each coil showing manufacturer's name, model number and serial number.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Support coils on rails and make readily removable.
- B. Make supply connection to header giving counter flow as shown.
- C. Use of coils to support piping is prohibited.

**END OF SECTION**

## SECTION 15735

### AIR CONDITIONING UNITS - PACKAGED

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing factory-packaged self-contained air-conditioning units with direct expansion coil, electric heating coils, air-cooled condensers and automatic controls.
- B. Related Work Specified Elsewhere:
  - 1. Filters: Section 15865.
  - 2. Conduit, raceways and cabinets: Section 16130.
  - 3. Wire, cable and busways: Section 16120.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ARI: 210.
  - 3. UL listed.
- B. Design Criteria:
  - 1. Select units in accordance with requirements shown.
- C. Factory wiring:
  - 1. In accordance with manufacturer's standard practice.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.
  - 3. Operation and Maintenance Manuals.

##### 1.04 JOB CONDITIONS:

- A. Safety Requirements:
  - 1. Properly guard belts, pulleys, chains, gears and other rotating parts to prevent danger to personnel.

#### PART 2- PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for the interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
  - 2. Each unit completely piped, wired, charged and factory-tested as a package and designed for through-wall installation.
  - 3. Meet ARI 210.
  - 4. UL listed

- B. Cabinet:
1. Welded cabinet constructed of heavy-gauge steel, zinc-coated or chemically pretreated, painted with enamel primer and exterior surface finished with factory-applied enamel coating.
  2. Containing junction boxes, polarized sockets and plugs for chassis electrical connection.
  3. Discharge grilles, front panels and return air grilles assembled to be removable for cleaning and access.
  4. Interior casing lined with sound-absorbing insulation material resistant to moisture, vermin and rot.
  5. Discharge grille with adjustable louver blades, fabricated of extruded aluminum.
- C. Compressor:
1. Hermetically and semi-hermetically sealed, refrigerant-cooled, suitable for operation with refrigerant R-22.
  2. High-pressure cutout with manual reset and low-pressure cutout with automatic reset.
  3. Compressor motor protected by means of overload relays and internal-winding thermostat.
  4. Mounted on rubber-isolated spring mountings.
- D. Evaporator Coil:
1. Direct expansion, fabricated of seamless copper tubing with aluminum fins, tightly bonded to tubing.
  2. Cooling-capacity selection based on space conditions and the following as shown:
    - a. Entering wet-bulb temperature at evaporator.
    - b. Entering ambient temperature at condenser coil.
  3. Single thermal-expansion valve for refrigerant control or capillary tube.
  4. Tested at minimum 300 psig.
- E. Condenser Coil:
1. Air-cooled type, fabricated of seamless copper tubing with aluminum fins, tightly bonded to tubing.
  2. Capable of a total heat rejection based on condensing and ambient temperatures as shown.
  3. Tested at minimum 425 psig.
- F. Electric Heating Coil:
1. Consisting of finned, metal-sheathed elements, anchored to ensure noiseless expansion and contraction.
  2. Fins furnace-brazed to steel sheath.
  3. Sheath and fins coated with heavily-fired ceramic capable of resisting spalling under operating conditions.
  4. Automatic-reset, snap-action, thermal-overheat switch.
  5. Voltage: As shown.
- G. Evaporator Fan and Motor:
1. Centrifugal fan of corrosion-resistant construction.
  2. Fan wheels dynamically and statically balanced.
  3. Motors: Air-conditioning unit manufacturer's standard for intended use and location.
  4. Brake horsepower selected to drive fan at air volume and static pressure shown.
- H. Condenser Fan and Motor:
1. Propeller fan of corrosion-resistant construction.
  2. Fan dynamically and statically balanced.

3. Motors: Air-conditioning unit manufacturer's standard for intended use and location.
  4. Brake horsepower selected to drive fan at air volume and static pressure as shown.
- I. Filters:
1. Replaceable (throwaway)-type: Section 15865.
- J. Ventilation-Control Damper:
1. Ventilation-control damper furnished in one piece, rotating on oilless bearings and capable of air-tight closure.
  2. Damper fabricated from heavy-gauge galvanized steel.
- K. Chassis:
1. Complete factory-wired, packaged heating and cooling-unit chassis consisting of the following:
    - a. Electric heating bank.
    - b. Hermetically sealed compressor.
    - c. Condenser coil and fan.
    - d. Evaporator coil and fan.
    - e. Self-contained temperature controls.
    - f. Protective devices.
- L. Condensate Pan:
1. Condensate pan provided with opening for drain connection or provision for condensate drains into condenser-coil pans to be evaporated by condenser heat.
- M. Wall Sleeves:
1. Watertight, connection provided between cabinet and wall louver.
  2. Constructed from corrosion-resistant material.
  3. Baffles provided to separate flow paths of ventilating and condenser inlet and outlet air.
- N. Wall Louver:
1. Wall louver fabricated from extruded aluminum with 16-gauge enclosing frame.
  2. Louver blades fabricated from heavy-gauge aluminum.
  3. Removable louver for access.
- O. Automatic-Control Kit:
1. Automatic-control package for both cooling and heating consisting of the following:
    - a. Manual changeover-selector switch for cooling or heating.
    - b. Multiple-position thermostat for desired temperature setting.
    - c. Fresh-air control for filtered outside air.
    - d. Heating control relays for staging heating elements.
    - e. Head-pressure control to maintain proper condensing pressure at low outdoor temperature.
    - f. Compressor motor to start after evaporator fan motor starts operating.
- P. Self-Contained Unit Controls:
1. Controls capable of maintaining mechanical cooling and heating operation, factory-mounted and wired to terminal blocks in unit-control compartment.
  2. Room-air thermostat.
  3. Thermostat-setting dial.
  4. Damper operators.
  5. Heating and compressor contacts.
  6. Condenser and evaporator fan contactors.
  7. Interlock switch to de-energize entire unit when front panel is removed.
  8. Push-button selector switch for OFF/FAN/COOLING/HEATING operations.

9. Control sequence: Room-air thermostat cycles condenser fan and compressor or heater to maintain room at thermostat setting.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Interlock heating coil with evaporator fan motor, so that heating coil will not operate when evaporator fan motor is operating.
- B. Fit equipment and appurtenances within space provided and make readily serviceable.
- C. Provide supports and hangers required for proper installation of equipment.
- D. Ensure that fans operate without noticeable vibration after installation
- E. Electrical connections: Sections 16120 and 16130.

**END OF SECTION**

## SECTION 15736

### KIOSK MECHANICAL WORK

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing air-cooled split-system air-conditioning unit and wall heater for Station kiosks.
- B. Related Work Specified Elsewhere:
  - 1. Vibration isolators: 15070.
  - 2. Insulation: Section 15080.
  - 3. Piping systems: Section 15205.
  - 4. Ductwork: Section 15810.
  - 5. Filters: Section 15865.
  - 6. Wire, cable and busways: Section 16120.
  - 7. Conduit, raceways and cabinets: Section 16130.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. UL 181.
  - 3. FS: 595 B, F-F 310.
  - 4. SMACNA:
    - a. HVAC Duct Construction Standard: Metal and Flexible.
    - b. HVAC System: Testing, Adjusting and Balancing.
  - 5. ASTM: A36, B280, B 486 C534, C1071, E84.
  - 6. NFPA: 90A, 90B.
  - 7. AWS: A5.8.
- B. Design Criteria:
  - 1. Select units in accordance with requirements shown.
  - 2. Provide completely matched combination between evaporator unit and condensing unit.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.
  - 3. Operation and Maintenance Manuals.

##### 1.04 JOB CONDITIONS:

- A. Safety Requirements:
  - 1. Properly guard belts, pulleys, chains, gears and other rotating parts to prevent danger to personnel.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for the interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
- B. Air-Conditioning Unit:
  - 1. Fan coil unit:
    - a. Horizontal unit with front discharge and back return connections.
    - b. Unit casing galvanized steel with ½-inch fiberglass insulation, bonderized and finished with baked enamel. Access to the entire unit provided through bottom swing down panel attached to casing with removable locking lugs.
    - c. Fan forwardly curved, centrifugal type, direct drive, and quiet in operation. Fan wheel statically and dynamically balanced at the factory.
    - d. Motor: Standard with the manufacturer, two speed, frequency 60 Hertz, voltage RPM and HP as shown. Make provisions for grounding motor.
    - e. Drain pan fabricated of continuous galvanized steel, insulated with closed-cell insulation, sealed with mastic and pitched toward the drain connection.
    - f. Coil: Direct-expansion type, seamless non-ferrous tubing with aluminum fins mechanically bonded to the tubing. Tested at 300 psi.
    - g. Unit-mounted controls, out of air stream and accessible from the inside of the kiosk.
    - h. Filters: Two-inch glass fiber throwaway type, replaceable from inside of kiosk.
    - i. Vibration isolators: Rubber-in-shear type isolation hangers.
  - 2. Condensing unit:
    - a. Unit casing galvanized steel, heavy gauge, bonderized and finished with baked-on enamel paint.
    - b. Brass service valves with refrigerant line fittings to permit mechanical connections.
    - c. Compressor:
      - 1) Hermetic or semi-hermetic, refrigerant-cooled, designed for operation with refrigerant 134a. If 134a is unavailable for this application, submit an alternate to the Engineer for approval.
      - 2) Mounted on internal spring isolator with rubber-in-shear mounting pad.
      - 3) Crankcase heater.
    - d. Fan, forwardly curved centrifugal type, direct drive, quiet in operation. Fan wheel statically and dynamically balanced at the factory.
    - e. Motor: Standard with the manufacturer, frequency 60 Hertz, phase, voltage and RPM as shown.
    - f. Coils: Seamless, non-ferrous tubing with aluminum plate fins, mechanically bonded to the tubes. Tested at 425 psi.
    - g. Unit- mounted controls, out of the air stream.
    - h. Unit-mounted on vibration isolator pads
    - i. Noise level ratings as shown.
  - 3. Controls for fan coil unit and condensing unit:
    - a. Thermostat and manual two-speed fan controller labeled LOW/HIGH. Provide 24-volt control circuit with control transformer 208/24 volts, 60 Hertz and VA ratings as required.
    - b. Thermostat equipped with switch for manual and automatic operation fan.
    - c. Interlocked compressor and evaporator fan. Differential pressure switch on evaporator fan to keep compressor from energizing if evaporator fan is not running.
    - d. Time delay provided on compressor to prevent short cycling of compressor
  - 4. Other components
    - a. Liquid line refrigerant drier.
    - b. Moisture- ndicating sight glass on the liquid line.
    - c. Relief valve.

- d. Charging valve.
  - e. Pre-charged refrigerant aluminum tubing and fittings acceptable in lieu of specified field-fabricated copper tubing, if system is provided by manufacturer of unit.
- C. Wall Heater:
- 1. Heater cabinet: Designed for surface mounting, minimum 20-gauge sheet metal, finished with baked-on enamel. Front panel 16-gauge, ribbed, with downflow louver.
  - 2. Heating element: Cast-aluminum grid with nickel-chromium resistance wire, metal-sheathed, with automatically resetting thermal cutouts.
  - 3. Fan: Precision balanced, and fan and motor assembly mounted for vibration-free performance.
  - 4. Motor: Standard with the manufacturer, frequency, phase and voltage as shown.
  - 5. Built-in fan delay switch.
  - 6. UL-listed.
- D. Filter: Section 15865.
- E. Outlets and Grilles: Section 15850 with the following additional requirements:
- 1. Exhaust and return grilles:
    - a. Fan coil unit return grille: Surface mounted, extruded aluminum, Anemostat RC3HD-81 or approved equal.
    - b. Condensing unit return and exhaust grille: Penn Ventilator, Airstream Model D1 or approved equal. Finish: Spatter surface texture FS 595B, Color No. 20040. Deflection as shown.
  - 2. Linear air diffusers:
    - a. Finish: Baked enamel FS 595B, Color No. 36586.
- F. Ductwork: Section 15810, with the following additional requirements
- 1. Flexible Ductwork:
    - a. Factory-fabricated, insulated flexible round air duct with reinforced metalized mylar outer jacket enclosing a 1-1/2-inch thick fiberglass insulation wrapped around a continuous inner air barrier of double-layer polyester reinforced with encapsulated steel wire helix. UL-181, Class 1, meeting NFPA standards 90A and 90B. Certaflex 25, Certainteed Corporation, or approved equal.
- G. Piping: Section 15205.
- H. Insulation: Section 15080, with the following additional requirements:
- 1. Condensate drain line insulation:
  - 2. 3/8-inch thick closed-cell, foamed plastic, tubular pipe insulation complying with ASTM C1071, Type 1 and NFPA 90A.
- I. Vibration Isolation: Section 15070, with the following additional requirements:
- 1. Isolation materials/isolation pads:
    - a. Non-adhesive neoprene type provided in accordance with manufacturer's recommendations and selected to eliminate transmission of vibration to kiosk structure. Minimum one-inch thick.
- J. Hanger Rods and Angles: ASTM A36, hot-dip galvanized or shop painted, with sufficient rigidity to prevent visible deflection.

### **PART 3 - EXECUTION:**

### **3.01 INSTALLATION:**

- A. Install equipment and appurtenances where shown, securely anchored.
- B. Adjust all items to function as shown and specified.
- C. Install air conditioning unit and wall heater as shown, to be easily removable.
- D. Install remote control for air conditioning unit at location shown.
- E. Install thermostat and speed controller for fan coil unit and condensing unit as shown.
- F. Ductwork Installation:
  - 1. Install dampers so as to permit adjustment after completion of the work.
  - 2. Install dampers without strain or distortion of any part of dampers.
  - 3. Adjust moving parts to move freely without binding.
  - 4. Caulk dampers airtight around frames.
  - 5. Adjust damper to operate freely between open and closed positions.
  - 6. Secure flexible ducts with metal clamps and sealer tape for air tightness, using short and straight segments, and stretched to smooth out internal corrugations with long radius bends. Install flexible ducts in accordance with UL-181.
  - 7. Line ductwork where shown with internal duct insulation as specified.
- G. Install vibration isolators where shown as recommended by the manufacturer.
- H. Mount mechanical equipment on vibration isolators to isolate equipment from structure.
- I. Electrical Connections: Sections 16120 and 16130.

### **3.02 FIELD QUALITY CONTROL:**

- A. Operational Test:
  - 1. Test unit after installation to demonstrate that all components are functioning properly, that noise level meets criteria as shown, and that the required heating and cooling capacities are achieved.
- B. Furnish necessary equipment, perform required tests and submit certified reports. Test the following:
  - 1. Air conditioning unit and wall heater
    - a. Circuit for connections in accordance with wiring diagrams.
    - b. Equipment enclosures for continuity to the grounding system.
    - c. Insulation resistance of motor windings using a 500-volt dc megohmmeter to ensure that the ground is not less than two megohms.
    - d. Insulation resistance of each ungrounded conductor with respect to ground and adjacent conductors and of each grounded conductors with respect to adjacent ungrounded conductors to ensure that resistance is not less than one megohm when test is performed using a 500-volt megometer.
    - e. Operations of circuits, operating each control ten times minimum.

2. Air leak test for accessible ductwork..
  - a. Perform air leak tests in accordance with SMACNA Manual for the Balancing and Adjustment of Air Distribution System.
3. Pressure testing:
  - a. Refrigerant piping: Test at 300 psi on high side and 150 psi on low side.
    - 1) Maintain pressure for minimum of 12 hours.
    - 2) Use electronic leak detector to check leaks after soap-bubble test.

**3.03 CLEANING OF AIR SYSTEM:**

- A. Before fan or filter is operated, clean inside of air system, including casing, plenums, and ductwork used for air supply or return.
- B. Clean by means of industrial vacuum cleaners which will effectively remove dust and foreign material from surfaces swept by air stream.
- C. Clean exposed ductwork and leave in satisfactory condition, free from grease, oil, and finish painting.

**END OF SECTION**

## SECTION 15737

### AIR CONDITIONING UNITS - AIR-COOLED SPLIT SYSTEM

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing air-cooled split-system air-conditioning units.
- B. Related Work Specified Elsewhere:
  - 1. Concrete pads: Sections 03100, 03200 and 03300.
  - 2. Insulation: Section 15080.
  - 3. Piping systems: Section 15205.
  - 4. Filters: Section 15865.
  - 5. Wire, cable and busways: Section 16120.
  - 6. Conduit, raceways and cabinets: Section 16130.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ARI: 210.
  - 3. UL listed.
- B. Design Criteria:
  - 1. Select units in accordance with requirements shown.
  - 2. Provide completely matched combination between evaporator unit and condensing unit.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.
  - 3. Operation and Maintenance Manuals.

##### 1.04 JOB CONDITIONS:

- A. Safety Requirements:
  - 1. Properly guard belts, pulleys, chains, gears and other rotating parts to prevent danger to personnel.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for the interchangeability of items of piping equipment, subassemblies, parts, motors, starters and relays.
  - 2. UL listed.
  - 3. Meet ARI 210.
- B. Evaporator Unit:
  - 1. Cabinet:

- a. Welded, constructed of heavy-gauge steel, zinc-coated or chemically pretreated, painted with enamel primer and exterior surface finished with factory-applied enamel coating.
  - b. Interior of cabinet completely lined with sound-absorbing thermal insulation resistant to moisture, vermin and rot.
  - c. Casing provided with insulated condensate-drain pan.
  - 2. Evaporator coil:
    - a. Direct expansion, fabricated of seamless copper tubing with aluminum fins tightly bonded to tubing.
    - b. Selection of cooling capacity of coils based on space conditions and the following as shown:
      - 1) Entering wet-bulb temperature at evaporator coil.
      - 2) Entering ambient temperatures at condenser coil.
    - c. Factory-mounted thermal-expansion valve:
      - 1) For units of 10 tons or more: Coils double-circuited and provided with two expansion valves.
    - d. Tested at minimum 300 psig.
  - 3. Evaporator fan and motor:
    - a. Centrifugal fans of corrosion-resistant construction.
    - b. Fan wheels dynamically and statically balanced.
    - c. Fan belt drives designed for 150 percent of required fan-motor brake horsepower.
    - d. Motor mounted on adjustable base.
    - e. Brake horsepower selected to drive fan at air volume and static pressure shown.
    - f. Fan motors: Air-conditioning unit manufacturer's standard for intended use and location.
  - 4. Filters:
    - a. Replaceable (throwaway)-type: Section 15865.
- C. Air-Cooled Condensing Unit:
- 1. Casing:
    - a. Weatherproof suitable for outdoor installation.
    - b. Fabricated of heavy-gauge steel, zinc-coated or chemically pretreated, painted with enamel primer and exterior surface finished with factory-applied enamel coating.
    - c. Removable panels provided for access to accessories
  - 2. Condenser coils:
    - a. Air-cooled, fabricated of seamless copper tubing with aluminum fins tightly bonded to tubing.
    - b. Condenser coil capable of total heat rejection based on condensing and ambient temperature shown.
    - c. Tested at minimum 425 psig.
  - 3. Condenser fan and motor:
    - a. Fan of corrosion-resistant construction.
    - b. Fans dynamically and statically balanced.
    - c. Fans protected with heavy-gauge welded-wire fan guards.
    - d. Motors: Air-conditioning unit manufacturer's standard for intended use and location.
  - 4. Compressor:
    - a. Hermetically semi-hermetic sealed, refrigerant-cooled, suitable for operation with refrigerant R-22.
    - b. Capacity control provided for compressor of 10 tons and more to permit partial operation at low-load conditions.
    - c. High and low-pressure cutouts.
    - d. Compressor motor protected by means of overload relays and internal-winding thermostat.

- e. Compressor mounted on internal spring isolator or on rubber-in-shear mounting pads.
- f. Number of compressors:
  - 1) For units rated up to and including 7-1/2 tons: One compressor.
  - 2) For units rated at 10 or more tons: Two compressors with two separate refrigerant circuits.
- 5. Refrigerant piping: Section 15205.
- 6. Refrigerant-piping insulation: Section 15080.
- 7. Refrigeration circuits:
  - a. Provide the following components in refrigeration circuits:
    - 1) Back-seating service valves in liquid and hot-gas lines.
    - 2) Filter drier on liquid line.
    - 3) Moisture-indicating sight glass on liquid line.
    - 4) Charging valves on suction side.
    - 5) Hot-gas muffler on discharge side.
- D. Air-Cooled Split-System Air-Conditioning Unit Controls:
  - 1. Factory-wired in separate control cabinet mounted on exterior of condenser casing.
  - 2. Heating and compressor contactors.
  - 3. Condenser and evaporator-fan contactors.
  - 4. High-pressure cutout with automatic reset.
  - 5. Low-pressure cutout with manual reset.
  - 6. Reset relay to prevent unit from cycling on automatic resetting of safety controls.
  - 7. Noncycling pumpdown control.
  - 8. Controls provided near evaporator unit:
    - a. Room-air thermostat heating/cooling control for systems incorporating electric-duct heaters.
    - b. Damper operators.
  - 9. Pushbutton selector switch for OFF/FAN/COOLING/HEATING operations, mounted on evaporator unit.
  - 10. Control sequence:
    - a. Room-air thermostat cycles condenser fan and compressor heater to maintain room temperature at thermostat setting.
    - b. Low-ambient control to permit condensing-unit operation down to ambient temperature of 30F.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances within space provided and make readily serviceable.
- B. Provide foundation, platforms and hangers necessary for proper installation of equipment.
- C. Install equipment on concrete pads minimum of four inches in height in accordance with Section 03100, 03200 and 03300.
- D. Ensure that fans operate without noticeable vibration after installation.
- E. Arrange belt guards to permit use of tachometer, oiling and testing with guards in place.
- F. Charge refrigerant in accordance with manufacturer's recommendations.
- G. Electrical connections: Sections 16120 and 16130.

**END OF SECTION**

## SECTION 15765

### HEATING EQUIPMENT

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing heating equipment and electric heat tracing for piping.
- B. Related Work Specified Elsewhere:
  - 1. Vibration isolators: Section 15070.
  - 2. Ventilating Units: Section 15725.
  - 3. Control equipment: Section 15900.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. UL: 1025.
- B. Source Quality Control:
  - 1. Test electric heating coils dielectrically at 2,000 volts before shipment.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification:
    - a. Successful dielectric testing of electric heating coil at 2,000 volts.
  - 3. Operation and Maintenance Manuals.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of equipment, subassemblies, parts, motors, starters and relays.
- B. Electric Heating Coils:
  - 1. Casings:
    - a. Frame members, casings, terminal box, terminal-box cover and similar sheet metal parts fabricated of minimum 18-gauge, die-formed steel with integral corrosion-resistant coating.
    - b. Casing assembled into rigid structure by means of welding or threaded fastenings.
    - c. Flanged in-line heater for inclusion in duct or ventilating unit.
    - d. Coil-section panels factory-insulated.
  - 2. Heating element:
    - a. Heating elements composed of individual flange-mounted, finned-tube heating elements with highest grade nickel-chromium alloy resistor wire centered within tubes and embedded in compacted insulating material.
    - b. Flanges and fins permanently furnace-brazed to elements for rigid support and rapid heat transfer.
    - c. Finned tubes of copper-plated or ceramic-coated steel.

- 1) Ceramic coating fired at minimum of 1,500F and capable of continuous resistance to corrosion without cracking, checking or spalling under operating conditions.
3. Controls:
- a. In accordance with Section 15900, with the following additional requirements:
    - 1) Heaters provided with built-in step controllers.
    - 2) Heaters of 30 kw or less with manufacturer's standard steps.
    - 3) Heaters larger than 30 kw having six equal steps.
    - 4) An automatic-reset, snap-action, thermal-overheat switch provided to instantly de-energize heating coil when safe operating temperatures are exceeded.
    - 5) Heating coil interlocked with fan to prevent energization of heating coil while fan is not running.
- C. Electric Unit Heaters:
1. Factory-assembled unit heaters consisting of heating element, fan, fan motor, housing and outlet diffuser.
    - a. Casings:
      - 1) Fabricated of galvanized steel or bonderized steel, factory-primed and finished with baked enamel.
      - 2) Parts rigidly stiffened to prevent vibration and to hold working parts in line.
      - 3) Casings for suspended-type units designed for direct attachment to hangers.
      - 4) Ceiling or wall-mounted, spring-type brackets furnished as necessary to support unit.
      - 5) Casings readily removable for access to interior parts.
      - 6) Adjustable horizontal vanes, arranged to give uniform air distribution without objectionable drafts.
    - b. Fan and fan motor:
      - 1) Propeller fan directly connected to fan motor.
      - 2) Fan air throw: As shown.
      - 3) Fan factory-balanced dynamically and designed for quiet operation.
      - 4) Unit heater/fan motor: As standard with manufacturer.
      - 5) Each unit equipped with combination fan guard/motor support resiliently mounted to absorb motor vibration.
      - 6) Motor speed: 1,750-rpm maximum.
      - 7) Integral transformer where fan-motor voltage differs from line voltage.
    - c. Heating element:
      - 1) Resistance wire of corrosion-resistant metal surrounded by finned metal sheath, interspace filled with ceramic material or magnesium oxide.
      - 2) Each heating element wired to built-in, line-voltage, automatic-reset, thermal-overheat protection.
      - 3) Complete controls, contactors, control-circuit transformers factory-assembled and factory-wired.
      - 4) Unit heaters tested and listed under UL 1025.
      - 5) Thermostats: Built-in, unless otherwise shown.
      - 6) Disconnect switch near unit heater.
    - d. Unit heaters with capacities of 10 kW or higher equipped with H.O.A. switches.
- D. Electric Wall Convectors:
1. Factory-assembled consisting of heating element, connection boxes, controls, surface-mounted steel cabinet and wall-mounted thermostat.
  2. Convector cabinet: Fabricated of heavy-gauge reinforced steel with inlet and outlet grilles.

3. Surface-mounted cabinet, chemically treated to resist corrosion and finished in baked prime coat.
  4. Cabinets equipped with disconnect switch and automatic-reset thermal-overload protection.
  5. Heating elements of steel-sheath or aluminum-sheath enclosed construction, nonhumming, with fins permanently brazed to tube for quick and efficient heat transfer.
  6. Heating elements having a nonoxidizing heat-resistant finish.
  7. Completely factory-wired, tested and UL-listed.
  8. Capacity and operating characteristics: As shown.
- E. Electric Heat Tracing for Piping:
1. Heat-traced pipe insulated after installation of heating tape in accordance with Section 15080.
  2. Heating tape with single or twin heating elements embedded in impact-resistant, high-dielectric refractory material, UL-listed and with stainless-steel exterior protective sheath acting as electrical ground in case heating element touches sheath.
  3. Heating tape rated for voltage shown and capable of producing wattage shown.
  4. Heating tape flexible with minimum bending radius of not more than six times diameter of tape.
  5. Heating tape compatible with pipe temperature-sensing thermostat: Section 15900.
  6. Heating tape connected to power source and controls through nonheating leads minimum seven feet in length.
- F. Nameplates:
1. Securely attached to each major item of equipment showing manufacturer's name, model number and serial number.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances to space provided and make readily serviceable.
- B. Mount electric unit heaters on vibration isolators in accordance with Section 15070.
- C. Provide supports, hangers and anchor bolts necessary for proper installation of equipment as recommended by manufacturer
- D. Provide heat tracing on piping where shown.
- E. Install electric heating coil where shown.
- F. Apply insulation on heat-traced piping in accordance with manufacturer's recommendations.
  1. Where heating tape is spiralled, ensure that adjacent turns do not touch so as to avoid overheating and damaging sheath material.
  2. Allow minimum of one inch between spirals.
  3. Do not flex wire when ambient temperature is less than 32F, unless tape is warmed.
  4. Connect unheated cold end to power source.
  5. Secure heating tape in contact with pipe with banding or strapping.
  6. Provide automatic temperature control by thermostat designed and set to energize at 40F.
  7. Upon completion of installation and testing of pipe, install and test heating tape in accordance with manufacturer's recommendations.

**END OF SECTION**

## SECTION 15806

### AIR CONDITIONING PYLONS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing air-conditioning pylons.
- B. Related Work Specified Elsewhere:
  - 1. Ductwork: Section 15810.
  - 2. Insulation: Section 15080.
  - 3. System balancing and testing: Section 15950.
  - 4. Raceways, boxes and cabinets: Section 16130.
  - 5. Lighting fixtures: Section 16525.
- C. Work by Others:
  - 1. Graphic panels.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. ANSI: C80.3.
  - 2. FED STD: 595.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. Air Control Damper:
  - 1. Each pylon body equipped with air control damper containing low leakage opposed blades of aluminum airfoil shape and 16-gauge galvanized steel frame.
  - 2. Single-shaft damper control provided with air control damper. Damper shaft end which projects to pylon exterior fitted with high-pressure damper regulator with neoprene gaskets and acorn nut.
- B. Supply Grille:
  - 1. Each pylon furnished with square supply grille. Frames, vanes and fins fabricated of steel (Tuttle and Bailey/Hart and Cooley G-series, GOS Core with Style A, or approved equal).
  - 2. Diffusion grille fabricated of 22-gauge galvanized steel, perforated with 3/32-inch diameter holes on 3/16-inch centers, 33-percent free area. Fixed horizontal vanes (square grille) fabricated of steel oriented to deflect supply air at 15-degree angle from horizontal plane. Vanes spaced maximum 1/4-inch apart. Grille finished in flat black, FED STD 595, Color No. 37038..
  - 3. Fixed vertical fins (masking plates), spaced as shown, welded to top and bottom finish plates, finished in baked enamel.

- C. Electrical Items:
  - 1. Zinc-coated, thin-wall steel conduit in accordance with ANSI C80.3.
  - 2. Junction box and flexible conduit: As specified in Section 16130.
  - 3. Lighting fixture as shown. Steel-cone housing for lamp and reflector insert: Black baked-enamel finish.
  - 4. Aluminum-reflector insert: Seamless aluminum with clear specular alzak finish on interior of cylindrical surface and clear semi-specular alzak finish on interior of conical surface.
  - 5. Lampholder and lamp: As specified in Section 16525 and as shown on Dwg ST-A-PY.-2.
    - a. Lamp for Type L-1 Fixture: 1000-watt, BT-56 mercury-vapor lamp, ANSI Code H36GW-1000/WDX; General Electric warm deluxe white No. H1000 WDX 36-15 or equal.
    - b. Lamp for Type L-1a Fixture: 400-watt, E-37 mercury-vapor lamp, ANSI Code H33GL-400/WDX; General Electric warm deluxe white, H400WDX 33-1 or equal.
- D. Pylon Body: Constructed as shown.
- E. Pylon-body insulation and innerliner: As specified in Section 15080.
- F. Wire Pylon Cover: Stainless-steel mesh wire cloth with steel frame as shown.
- G. Louver Pylon Cover: Steel louvers and frame as shown.
- H. Finish: Unless otherwise shown, factory-finish, FED STD 595, Color No. 20040, provided on items exposed to public view.

### **PART 3 - EXECUTION:**

#### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances into space provided. No portion of pylon to extend into space in which graphics panels will be installed by others.
- B. Mercury-vapor lamp ballast as specified in Section 16525 and installed in space between reflector cone and square grille.

#### **3.02 FIELD QUALITY CONTROL:**

- A. Pressure Test:
  - 1. Include pylon in ductwork pressure test as specified in Section 15810.
- B. Balancing and Testing:
  - 1. Include balancing of pylons in balancing and testing of system specified in Section 15950.

**END OF SECTION**

## SECTION 15810

### DUCTWORK

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing ductwork and accessories.
- B. Related Work Specified Elsewhere:
  - 1. Firestopping; Section 07841.
  - 2. Insulation: Section 15080.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. SMACNA:
    - a. HVAC Duct Construction Standards - Metal and Flexible.
    - b. Fire, Smoke and Radiation Damper Installation Guide for HVAC Systems.
    - c. HVAC Systems - Testing, Adjusting and Balancing.
    - d. HVAC Air Duct Leakage Test Manual.
  - 3. ASTM: A36, A53, A653.
  - 4. NFPA: 90A
  - 5. AASHTO: M81.
  - 6. UL: Building Materials Directory, 181, 555.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Scale: 1/4-inch minimum
  - 2. Certification.

#### PART 2 - PRODUCTS

##### 2.01 MATERIALS:

- A. Galvanized Sheet Steel: ASTM A653.
- B. Steel Plate: ASTM A36, Grade A.
- C. Steel Pipe: ASTM A53, Grade A.
- D. Flexible Material:
  - 1. Fibrous-glass cloth, 32 ounces per square yard, UL-listed.
  - 2. Tensile strength: 450-psi minimum.
  - 3. Coated on both sides with fire-resistant neoprene.
  - 4. Suitable for operating temperature of 200F and meeting requirements of NFPA 90A.
- E. Paint:
  - 1. Zinc-rich gray, No. 721, Detroit Graphite or equal.
  - 2. Bituminous, AASHTO M81, Grade RC-250.

## 2.02 FABRICATION:

- A. Duct Construction:
  - 1. Fabrication in accordance with HVAC Duct Construction Standards-Metal and Flexible.
- B. Access Doors in Ducts:
  - 1. Provide access doors as shown to gain access to resistance heaters, fans, fan motors, dampers, filters, coils and controls.
  - 2. Doors: Of same metal thickness as ducts.
  - 3. Gasketed doors: Secured to duct.
- C. Plenums:
  - 1. Field-fabricated and reinforced consistent with class of ductwork in which used.
  - 2. Outward-opening access doors to plenums provided where necessary for equipment access and as shown.
- D. Embedded Ductwork:
  - 1. Fabricated of welded steel plate or round steel pipe. Minimum thickness for steel plate 1/4 inch. Minimum wall thickness for pipe 1/4 inch. For galvanizing, mask joint areas at ends of sections after fabrication.
  - 2. Hot-dip galvanized after fabrication, with minimum coating weight of two ounces per square foot. Where shown, inside of sections insulated as specified in Section 15080. Apply one coat of specified paint to exterior surfaces.
- E. Expansion Joints in Embedded Ducts:
  - 1. Where ductwork crosses structural contraction joints at 90 degrees to plane of joint, provided slip-type expansion joints in ductwork at structural contraction-joint crossings.
  - 2. Provide expansion joints designed to accommodate linear movement at contraction joint.
  - 3. Provide slip-type expansion joint in perforated-metal duct liner
- F. Dampers:
  - 1. Splitter or butterfly damper provided in duct leading to air terminal as shown.
  - 2. Butterfly dampers:
    - a. Balanced-type with flat blades.
    - b. Rigid blades fabricated with close-fitting hemmed edges.
    - c. Damper rods minimum 3/8-inch square at one end passing directly through ducts.
    - d. Square end of each rod held in self-locking lever device.
    - e. Where installed in furred ceilings, damper-locking device may be provided with short lever and concealed in box with flush cover in lieu of access panel.
  - 3. Opposed-blade dampers:
    - a. Gang-operated multiple blades provided in ducts over 12 inches in dimension.
    - b. Multiple blades fabricated maximum six inches wide.
    - c. Fabricated with nonmetallic edges or coating in low-pressure, medium-pressure or high-pressure ducts.
    - d. Ends of damper rods sealed to prevent leakage of air.
  - 4. Splitter dampers:
    - a. Single blade with hemmed edges, provided at branch duct connections.
    - b. Each blade hinged at one end with sheet metal straps.

- c. Free end of each blade connected to 1/4-inch adjusting rod secured to side of duct in flanged bushing with set screws.
    - d. Rods adjusted to operate freely between open and closed positions.
  - 5. Damper material:
    - a. Splitter and damper blades fabricated of same metal and two gauges heavier than ductwork and casings.
    - b. Fastening details and other items fabricated of metal specified for ductwork and casing bracing.
  - 6. Damper regulators:
    - a. Self-locking, damper and splitter regulators furnished, labeled SHUT and OPEN.
    - b. Factory-fabricated damper and splitter hardware furnished with zinc or cadmium protective coating.
  - 7. Fire dampers:
    - a. Fabricated to meet requirements of codes and regulations of jurisdictional authorities.
    - b. Constructed so that, during normal operation, folded blade assembly does not interrupt air stream.
    - c. Access provided for replacement of links.
    - d. Sleeve provided for fire damper, 14-gauge hot-rolled steel.
    - e. Fire dampers remote from fire partitions; connecting ductwork provided between fire damper and fire partition, fabricated of 11-gauge, zinc-coated sheet steel and supported by 1/2-inch diameter rods.
    - f. Fire dampers constructed to meet requirements of NFPA 90A and UL 555.
- G. Flexible-Duct Connections:
  - 1. Flexible-duct connections provided between air-handling unit fan and related ductwork and wherever necessary to prevent transmission of vibration to adjacent elements.
  - 2. Factory-assembled flexible material bordered each side with three-inch wide galvanized-steel edging mechanically attached.
  - 3. Width of flexible portion: Three to nine inches as necessary for installation conditions and to allow freedom of movement without unnecessary slack.
  - 4. Fabric parts of flexible connections: Unpainted.
- H. Instrument Test Holes:
  - 1. Factory-fabricated, airtight, non-corrosive instrument test hole with screw cap and gasket.
  - 2. Instrument test holes provided where required by balancing and testing agency.
  - 3. Cap extended up through insulation.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Ductwork Installation:
  - 1. Install dampers and splitters so as to permit adjustment after completion of the work.
  - 2. Install dampers without strain or distortion of any part of dampers.
  - 3. Adjust moving parts to move freely without binding.
  - 4. Caulk dampers airtight around frames.
  - 5. Adjust damper and splitter adjusting rods to operate freely between open and closed positions.
    - a. Cut off projecting ends of rods after adjustment and bend over two inches from bushings.
    - b. Leave cut ends smooth and free from burrs.

6. Where diffuser is located at end of rectangular duct, extend duct minimum of one-neck diameter beyond center line of neck.
  7. Fire dampers:
    - a. Install fire dampers in ducts which penetrate walls or floors separating areas normally used by the public from ancillary areas. Patron-used areas include, but are not limited to, the following:
      - 1) Station train rooms.
      - 2) Train tunnels.
      - 3) Passageways ordinarily used by patrons.
    - b. Install fire dampers in ducts which penetrate walls and floors of elevator machinery rooms.
    - c. Install fire dampers to conform with fire, smoke and radiation damper installation guide for HVAC system
  8. Embedded Ductwork:
    - a. Join sections by continuous weld to achieve watertightness.
  9. Duct penetration through fire-rated partitions to be sealed with approved fireproof sealant in accordance with Section 07841.
  10. At in-line fans, provide flanged removable transition to permit access to and removal of fan motor
- B. Flexible Connections:
1. Install flexible connections in accordance with HVAC Duct Construction Standards – Metal and Flexible.
- C. Protection of Ductwork:
1. Protect ductwork, appurtenances and openings from dirt, foreign objects and damage during construction.
  2. Replace damaged ductwork and appurtenances.
  3. Provide sheet metal caps on duct ends that are to be connected to future ductwork.
- D. Painting of Embedded Ductwork:
1. After pressure test, clean joint areas.
  2. Coat outside of duct joints with zinc-rich paint measuring not less than five mils dry-film thickness or with two coats of bituminous paint over compatible primer.

### **3.02 FIELD QUALITY CONTROL:**

- A. Air-Leak Tests for Accessible Ductwork: Perform air-leak tests in accordance with SMACNA HVAC Air Duct Leakage Test Manual.
- B. Air-Leak Test for Embedded Ductwork: Test ductwork with internal air pressure of six inches wg. In accordance with SMACNA.

### **3.03 CLEANING OF AIR SYSTEM:**

- A. Before fans or filters are operated, clean inside of air system, including casing, plenums, ductwork and concrete tunnels used for air supply or return.
- B. Accomplish cleaning by means of industrial vacuum cleaners which will effectively remove dust and foreign material from surfaces swept by air stream.
- C. Clean exposed ductwork and leave in satisfactory condition, free from grease, oil and foreign material prior to application of insulation or finish painting.
- D. Clean ducts after the system has been used for adjusting, testing or temporary ventilation.

**END OF SECTION**

**SECTION 15825**

**SOUND ATTENUATORS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing factory-fabricated sound attenuators.

**1.02 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AMCA Standards.
  - 3. SMACNA HVAC Duct Construction Standards.
  - 4. UL: 723.
  - 5. NFPA: 130, 255.
  - 6. ASTM: E84.
- B. Source Quality Control:
  - 1. Run tests for subway ventilation-fan attenuators on dynamic insertion-loss performance by duct-to-reverberation-room method with air flowing through sound attenuator at rated capacity.
  - 2. Test methods to eliminate effects due to end reflection, vibration, flanking transmission and standing waves in reverberant room.
  - 3. Take air flow and pressure loss data in accordance with AMCA Standards.

**1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.
    - a. Certify that values for sound-pressure levels, i.e., decibels, Re 0.0002 microbar, of cooling tower with attenuators do not exceed those scheduled below measured at 50 feet in free field in any direction

Octave Band Center Frequency/Hertz	Sound Pressure Level/dB at 50 Feet with Inlet and Outlet Attenuators
63	66
125	61
250	54
500	45
1000	42
2000	41
4000	39
8000	39

## PART 2 - PRODUCTS

### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of equipment, subassemblies and parts.
  
- B. Subway Ventilation-Fan and Jet-Fan Attenuators:
  - 1. Factory-fabricated with nominal rectangular cross section and length as shown.
  - 2. Outer casing constructed of minimum 22-USSG, galvanized sheet steel in accordance with SMACNA HVAC Duct Construction Standards.
  - 3. Interior partitions minimum 24-USSG, galvanized, perforated steel sheet.
  - 4. Factory-banded with 1-1/2 inch square by 1/8-inch steel angle flanges and two-inch bar straps.
  - 5. Airtight when operated at two inches water-gauge static pressure and rated capacity.
  - 6. Acoustic filler material:
    - a. Inorganic fibrous glass, permanently odorless.
    - b. Minimum five-percent compression to eliminate voids and setting.
    - c. Combustion rating when tested in accordance with ASTM E84, NFPA 255, or UL 723, maximum 20 for flame spread, 20 for smoke developed and 15 for fuel contributed.
  - 7. Designed for maximum pressure drop as specified for 100-percent forward flow and 70-percent reverse flow for air flow volume as shown.
  - 8. Minimum dynamic insertion loss (dB) under operating conditions shown in accordance with Table 15825-1.
  - 9. Comply with high temperature requirements given in NFPA 130.
  
- C. Cooling-Tower Sound Attenuators:
  - 1. Factory-fabricated, packaged-type, furnished by tower manufacturer.
  - 2. Outer casing constructed of minimum 22-USSG, hot-dip galvanized sheet steel in accordance with SMACNA HVAC Duct Construction Standards.
  - 3. Panels lines:
    - a. With weatherproof, inorganic, permanently odorless, fibrous-glass acoustic material.
    - b. Combination rating when tested in accordance with ASTM E84, NFPA 255, or UL 723, maximum 25 for flame spread, 20 for smoke developed and 20 for fuel contributed.
  - 4. Lining secured in place with galvanized-steel screening.
  - 5. Removable panels: For access to the eliminator sections and upper interior of tower.
  - 6. Exposed metal surfaces finished with zinc-chromate aluminum paint or manufacturer's standard finish providing equal or greater corrosion protection.
  - 7. Intake attenuators designed to bolt directly to the cooling tower, having removable access doors at ends for entry to moving parts of unit.
  - 8. Discharge attenuators designed to mount directly to top of tower and requiring no additional structural support.
  - 9. Galvanized-sheet-metal hooded inlet provided for protection from weather.
  
- D. Nameplates:
  - 1. Securely attached to each attenuator showing manufacturer's name, model number and serial number.

## PART 3 - EXECUTION

### 3.01 INSTALLATION:

- A. Fit sound attenuators within space available without restricting air flow.
- B. Install attenuators in accordance with manufacturer's recommendations and printed instructions.
- C. Provide sheet metal transitions, supports and concrete pads for fan attenuators.
- D. Provide self-supported cooling tower attenuators which can be readily attached.

**TABLE 15825-1 MINIMUM DYNAMIC INSERTION LOSS**

**END OF SECTION**

## SECTION 15830

### FANS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing fans.
- B. Related Work Specified Elsewhere:
  - 1. Vibration isolation: Section 15070.
  - 2. Ductwork: 15810.
  - 3. Control equipment: Section 15900.
  - 4. Motors: Section 16225.
  - 5. Motor starters and control centers: Section 16425.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AISI Standards.
  - 3. AMCA: 210, 99-2408.
  - 4. NFPA: 130.
  - 5. SAE: 1035,1040.
- B. Factory Wiring:
  - 1. In accordance with manufacturer's standard practice.
- C. Source Quality Control:
  - 1. Notify the Engineer 14 days prior to each test.
  - 2. Tunnel ventilation-fan testing:
    - a. Whirl tests:
      - 1) Perform tests on each fan at factory prior to shipment.
      - 2) Three tests total, each two minutes in duration, each performed at 125 percent of the operating rpm minimum.
    - b. Fan-reversal tests:
      - 1) Operate fan in primary direction at rated rpm for five minutes minimum.
      - 2) Disconnect power for 20 seconds; start fan in reverse direction.
      - 3) Operate fan in reverse direction for five minutes minimum, disconnect power for 20 seconds and restart fan in primary direction.
      - 4) Operate fan in primary direction for five minutes minimum, disconnect power and allow fan to stop gradually.
      - 5) Record following data and submit with shop drawings:
        - a) Motor-winding temperature and motor current, recorded continuously during test.
        - b) Motor-winding electrical resistance, recorded immediately prior to and following test.
      - 6) After completion of testing, inspect hub and blades for surface defects with approved penetrant dye. Submit certification of visual acceptability of fan hub and blades.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Performance tests certified by AMCA or performed either in accordance with AMCA 210 or in a laboratory approved by AMCA, for capacities shown.
    - b. Performance curves for each fan showing brake horsepower, static pressure and static efficiency plotted against air volume and noise level. For reversible fans, submit curves for both forward and reverse modes.
  - 2. Certification:
    - a. For under-platform-exhaust fans, dome-exhaust fans and subway-ventilation fans, certify that fans are rated and tested in accordance with AMCA 210.
    - b. For subway-ventilation fans, certify that sound power level based on  $10^{-12}$  watts does not exceed decibel ratings, without attenuators as specified.
  - 3. Operation and Maintenance Manuals.

#### 1.04 JOB CONDITIONS:

- A. Safety Requirements:
  - 1. Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, keys and other rotating parts to prevent danger to personnel.

## PART 2 - PRODUCTS

### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design and purchase of equipment, provide for interchangeability of items of equipment, subassemblies, parts, motors starters and relays.
  - 2. Requirements of this section apply to fans which are not a component part of air-handling units designed as complete units by the manufacturer.
  - 3. Fan rating based on tests performed in accordance with AMCA 210.
  - 4. Fans statically and dynamically balanced and quiet in operation.
  - 5. Fans designed to ensure that resonance frequency of blade assembly is not within 15 percent of harmonics of rotational frequency.
  - 6. Finished parts of fans, such as shafts and bearings, protected from rust prior to operation by means of wrappings or protective grease or plastic coatings.
  - 7. Exhaust fans, except subway-ventilation fans, under-platform-exhaust fans and dome-exhaust fans, provided with firestats to stop fan when temperature of air being handled reaches 125F.
    - a. Firestat having adjustable range from 100F to 200F and manual reset.
  - 8. Fans with wheels less than 12 inches in diameter, and utility fans operating at less than 0.75 inches WG may have forward-curved blades.
  - 9. Fan construction suitable for operating conditions defined in AMCA 99-2408.
- B. Centrifugal Fans:
  - 1. Class I or II, nonoverloading.
  - 2. Fan blades:
    - a. Fan wheels larger than 30 inches: Backward-inclined air-foil section.
    - b. Fan wheels 30 inches or less: Backward-inclined plate-type blades.
  - 3. Air entering fan uniformly over inlet area.
  - 4. Fan housing: Fabricated of steel sheets, manufacturer's standard heavy-gauge construction, except for those of low-pressure fans of less than 5,000-cfm capacity which may be fabricated of aluminum, 0.080-inch thick or heavier.

5. Fan wheel rims and blades: Fabricated of steel, manufacturer's standard heavy-gauge construction, with back plates of steel, 3/16 inch, except for those of low-pressure fans of less than 5,000 cfm which maybe fabricated of aluminum, 0.080-inch thick or heavier.
  6. Fan wheels: Aluminum or steel provided with manufacturer's standard corrosion-resistant coating.
  7. Fan scroll attached to the side plates by means of continuous lock-seam or welded-seam construction.
  8. Fan wheels and sheaves splined or keyed and fastened to the shafts with set screws.
  9. Shaft constructed solid or hollow of SAE 1035 or SAE 1040 ground and polished steel.
  10. One layer of corrosion-resistant coating on nonworking surfaces of shafts, factory-applied.
  11. Inspection openings provided for fan housing having wheels larger than 22 inches in diameter.
    - a. Cover plate having pressure latches on fan housing on scroll sheets located opposite outlets.
  12. Large fan housings provided in sections to permit installation or removal through openings available in structure.
  13. Field joints: Flanged and bolted.
  14. Fans designed to provide self-limiting, nonoverloading power characteristics.
  15. Two bearings for double-inlet and single-inlet fans having wheels larger than 36 inches in diameter, one on each side of wheel, with overhung sheaves.
  16. Inside and outside of fan housings factory-painted with baked-enamel primer; exterior surfaces given additional factory finish-coat of enamel.
  17. Fan driven by V-belt rated at 150 percent of driving-motor brake horsepower.
    - a. Adjustable sheaves furnished on motor, capable of 20-percent adjustment in fan speed, with design fan-capacity setting at approximately midpoint of adjustment.
    - b. Drives provided with belt guard of expanded-metal wire mesh or belt guards with solid-metal side panels with tachometer opening.
  18. Motors:
    - a. One-half horse power and above: Totally enclosed, fan-cooled and guarded in accordance with Section 16225.
    - b. Less than 1/2 horsepower: Manufacturer's standard for intended use.
  19. Vibration isolators: In accordance with Section 15070.
- C. Tubular Centrifugal Fans:
1. Class I or II, belt-driven, nonoverloading, designed for straight through airflow.
  2. Housing: Manufacturer's standard heavy-gauge steel construction.
    - a. Flanged inlet and outlet for connection to ductwork, with inlet and outlet identical in size.
    - b. Welded, cylindrical construction, braced to prevent vibration.
    - c. Fan bearings and drive enclosed and isolated from air stream.
  3. Fan wheels:
    - a. Welded construction, centrifugal wheel, with backward-inclined blades.
    - b. Fan wheels 27 inches in diameter or larger supplied with double thickness, air-foil blades.
    - c. Fan wheels less than 27 inches in diameter supplied with plate-type blades.
    - d. Fan wheels statically and dynamically balanced.
  4. Fans supplied with stationary conversion vanes on discharge side of wheel designed to reduce turbulence.
  5. Fan bearings:
    - a. Heavy-duty, self-aligning ball bearings.

- b. Lubrication fittings extended to fan casing and provided with covers to effectively exclude water and dirt.
  - 6. Fan shaft accurately machined and ground for proper fit to wheel hub and bearing and designed to operate well below first critical speed.
  - 7. Inside and outside of fan housing factory-painted with baked-enamel primer. Exterior surfaces given an additional factory-coat of corrosion-resistant finish enamel.
  - 8. One coat of corrosion-resistant coating on nonworking surfaces of shafts, factory-applied.
  - 9. Fan driven by V-belt rated at 150 percent of driving-motor brake horsepower.
    - a. Adjustable sheaves furnished on motor allowing 20-percent adjustment in fan speed, with design-capacity setting at approximately midpoint of adjustment.
  - 10. Fan wheels and sheaves splined or keyed and fastened to the shaft with set screws.
  - 11. Internal and external belt guards as necessary for complete protection.
  - 12. Motors:
    - a. One-half horsepower and above: Totally enclosed, fan-cooled and guarded in accordance with Section 16225.
    - b. Less than 1/2 horsepower: Manufacturer's standard for intended use.
- D. Axial Fans:
  - 1. Direct-driven or belt-driven as shown.
  - 2. Welded tubular-steel casings, except for low-pressure fans of less than 5,000-cfm capacity, which may have aluminum casings.
  - 3. Equipped with stationary discharge conversion blades and adjustable motor mounts.
  - 4. Air-foil blades: High-strength cast aluminum or steel.
  - 5. Blade pitch:
    - a. Fans with wheels 18 inches or larger: Blades field-adjustable without removing wheel from casing.
    - b. Fans with wheels less than 18 inches in diameter: May be equipped with stationary blades.
  - 6. Flanged-type for fan-casing connections to ductwork.
  - 7. Internal and external belt guards, as appropriate.
  - 8. Inlets with smooth, rounded edges.
  - 9. Air entering and leaving fan axially.
  - 10. Belt-driven fans:
    - a. Provide with high-grade, open-hearth steel fan shaft accurately machined and ground for proper fit to wheel hub and bearings.
    - b. Fan bearings and drive shafts enclosed and isolated from the air stream.
    - c. Bearings sealed mechanically against dust and dirt, self-aligning and grease-lubricated.
    - d. Fan driven by V-belt rated at 150 percent of driving-motor brake horsepower.
  - 11. Motors:
    - a. 1/2 horsepower and above:
      - 1) Belt-driven fans: Totally enclosed, fan-cooled and guarded in accordance with Section 16225.
      - 2) Direct-driven fans: Totally enclosed, air-over, fully guarded in accordance with Section 16225.
    - b. Less than 1/2 horsepower: Manufacturer's standard for intended use.
- E. Power Roof Ventilators:
  - 1. Direct-driven or belt-driven as shown.
  - 2. Consisting of fan with housing and weatherproof hood mounted on factory-supplied acoustical-thermal curb.

3. Fan housing constructed of spun aluminum and arranged to facilitate access for servicing from roof.
    - a. Discharge openings with 1/2-inch wire-mesh bird screen of aluminum or provided with corrosion-resistant coating.
    - b. Acoustical-thermal curb: Product of power roof-ventilator manufacturer.
    - c. Aluminum-blade back-draft dampers sized to fit curb opening.
    - d. Power roof-ventilator housing secured to curb to resist winds of 100 MPH.
  4. Motor: Totally enclosed weatherproof housing located outside of air stream and as specified in Section 16225.
    - a. Motor having unfused power-disconnect switch, mounted under fan housing adjacent to motor.
    - b. Permanently sealed, grease-lubricated, ball bearings or roller bearings.
  5. Belt-driven unit and belt drivers rated for 150 percent of motor-nameplate horsepower.
    - a. Adjustable sheaves to permit 20-percent adjustment in fan speed, with design fan capacity at approximately midpoint of adjustment.
  6. Wheel and drive assembly isolated from base section by means of rubber-in-shear isolators.
- F. Propeller Fans:
1. Direct-connected or belt-connected, motor-driven.
  2. Wheels having steel or aluminum blades; statically and dynamically balanced at the factory.
  3. Cast or die-formed mounting rings or plates.
    - a. Mounting plates designed to prevent distortion.
    - b. Mounting plates turned up at edges or braced with steel angles.
  4. Wire-mesh guard completely surrounding fan blades.
  5. Steel shafts for fans which are not mounted directly on motor shafts.
    - a. Shafts accurately finished on working surfaces.
  6. Self-aligning sleeve bearings or ball bearings:
    - a. Sleeve bearings:
      - 1) Ring oiled sleeve bearings or wool-packed and provided with oil reservoirs.
      - 2) Oiling device arranged in manner so that oil can be added while fan is running without danger of over-oiling.
    - b. Ball bearings:
      - 1) Prelubricated sealed bearings.
      - 2) Factory-installed grease fittings to permit external bearing relubrication.
  7. Motors:
    - a. Up to and including 1/2 HP: Manufacturer's standard.
    - b. Above 1/2 HP: Section 16225.
- G. Under-Platform-Exhaust Fans and Dome-Exhaust Fans:
1. Tube axial, direct-driven, reversible.
  2. Air volume in reverse: Minimum of 70 percent of that in forward direction.
  3. Minimum efficiency: 75 percent at specified forward direction and operating conditions.
  4. Brake horsepower: Not exceeding 100 percent of associated motor-nameplate rating at any point on fan power curve.
  5. Construction:
    - a. Fan housing constructed of minimum 1/4-inch welded steel plate, reinforced as necessary and flanged for connection to system ductwork or for mounting as otherwise shown.
    - b. Wheel and motor entirely enclosed within fan housing.

- c. Stationary curved guide vanes integrally welded with housing and located on discharge side of wheel to straighten motion of air leaving blades.
  - d. Fan wheels: Fabricated of high-strength cast aluminum or steel with air-foil shaped, adjustable blades.
  - e. Blades adjustable without removing wheel. Index and stops at hub to prevent overload of motor.
  - f. Positive-locking device installed for attaching rotor to motor shaft.
  - g. Drain fittings located in low parts of fan housing.
  - h. Fan fabricated of corrosion-resistant materials.
6. Fan motors: Section 16225, with the following additional requirements:
- a. Totally enclosed, air-over, squirrel cage, induction, reversible, fully guarded.
  - b. Adequate cooling in both directions at 50 percent of flow.
  - c. Motor bearings precision-grade anti-friction type, packed at the factory with special lubricant designed for maximum radial and thrust loads to be encountered in both directions of air flow.
  - d. Double-shielded bearings, minimum 200,000-hour life, regreasable with readily accessible inlet grease fittings and outlet grease plug to allow for in-service greasing, and metering the amount of grease which actually enters the bearings to protect against over-lubrication.
  - e. Grease fittings brought to outside of fan housing and provided with covers which effectively exclude water and dirt between lubrications.
  - f. Each motor with a drain plug at bottom of shell.
  - g. Motor speed not to exceed 1,200 rpm.
7. High temperature: Fans and motors capable of meeting high temperature requirements specified in NFPA 130.
- H. Subway-Ventilation Fans:
- 1. Tube axial, direct-driven, reversible, corrosion-resistant, designed for mounting in any position without modification.
  - 2. Capacity:
    - a. Each subway-ventilation fan having forward direction and reverse direction capacity as shown when operating at total pressures shown.
    - b. Minimum efficiency: 75 percent at specified forward direction and operating conditions.
    - c. Brake horsepower: Not exceeding 100 percent of associated motor-nameplate rating at any point on fan power curve.
  - 3. Construction:
    - a. Fan housing constructed of minimum 1/4-inch welded steel plate, reinforced as required and flanged for connection to inlet bells, outlet cones and outlet transitions provided by fan manufacturer.
    - b. Inside diameter of housing: 60 inches.
    - c. Wheel and motor totally enclosed within fan housing and not protruding at either end of housing exclusive of attached bells and cones.
    - d. Stationary curved guide vanes, integrally welded with housing and located on discharge side of wheel to straighten motion of air leaving blades.
    - e. Drain fittings located in low part of fan housing.
    - f. Inlet bell, outlet cone and outlet transition constructed of heavy-gauge, welded steel, flanged for connection to fan housing.
      - 1) Outlet transition having not more than ten degrees divergence all around.
    - g. Fan wheels fabricated of high-strength cast aluminum or steel with air-foil shaped, adjustable blades.
    - h. Blades adjustable without removing wheel.
    - i. Positive-locking device installed in attaching rotor to motor shaft.
    - j. 3/4-inch square woven-mesh, galvanized-steel screen on inlet side of each fan.

4. Fan motors: Section 16225, with the following additional requirements:
  - a. Totally enclosed, air-over.
  - b. 900-rpm maximum.
  - c. Motor bearings precision-grade, anti-friction bearings, factory-packed with special lubricant designed for maximum radial and thrust loads encountered in both directions of air flow.
  - d. Double-shielded bearings, regreasable with readily accessible inlet grease fittings and outlet grease plug to allow for in-service greasing and metering amount of grease which actually enters bearings to protect against over-lubrication. In normal ambient conditions the bearings shall be designed for 200,000 hours operation services (L-50 life rating).
  - e. Grease fittings brought to outside of fan housing and provided with covers to effectively exclude water and dirt.
  - f. Each motor with drain plug at bottom of shell.
  - g. Factory-installed resistance heater within motor enclosure.
    - 1) Resistance heater: Single-phase, 460 volt, 60 Hertz.
    - 2) Heater energized by means of NC auxiliary contact located in magnetic motor starter.
    - 3) Control sequence: Section 15900.

5. Sound ratings:
  - a. Maximum permissible sound levels, based on 10-12 watts:

Octave Band Center Frequency/Hertz	Sound Power Level/dB
63	87
125	96
250	98
500	99
1000	99
2000	94
4000	91
8000	90

- b. If sound exceeds permissible levels, provide sound attenuators as specified in Section 15825.
6. High temperature: Fans and motors capable of meeting high temperature requirements specified in NFPA 130.

- I. Jet Fans:
  1. Constructed of corrosion-resistant materials and finishes.
  2. Fan components and assemblies supplied by a single manufacturer. Parts interchangeable to the extent possible.
  3. Capable of delivering same volume of air in both forward and reverse directions of airflow. Capable of reversing airflow a minimum of three times during any one-hour period.
  4. Maximum vibrations are not to exceed a peak-to-peak amplitude of 2.0 mm for a normal operating speed of 1800 rpm or less.

5. Blade pitch manually adjustable without removing impeller. The maximum blade setting is to permit a minimum 15-percent increase in capacity above the design operating blade setting without motor overload or use of motor service factor.
  6. Conforming to NFPA 130 and applicable ANSI, AISI, AMCA and ASHRAE standards.
  7. Provided with fan support and suspension system designed per AISI Allowable Stress Design Method and which permits removal or replacement or both within a two-hour maintenance period.
  8. Housing, motor mounts and supports fabricated of hot-rolled steel and of continuous-welded construction; minimum eight-gauge USSG thickness and capable of withstanding penetration forces from blade failure and rotating forces due to loss-of-blade imbalance.
  9. Equipped with serviceable assemblies, including access doors of adequate size in the fan housing for inspection of blade locking devices and vibration devices and vibration test instrumentation. Doors of steel construction with AISI Type 316 stainless steel hardware and gasket material for the operating conditions as required.
  10. Capable of starting and continuously operating at full capacity in ambient air temperature range of zero to 40 degrees Celsius.
  11. Fan assemblies capable of operating at elevated temperatures as defined in NFPA 130.
  12. Impeller designed to withstand the stresses and loads created by overspeed testing of 125-percent of the nominal operating speed.
  13. Provided with adequate clearance between blade tips and housing at all points to allow for expansion and contraction over the operating and emergency temperature ranges.
  14. Motors and motor assemblies are to conform to the following:
    - a. NEMA Design B.
    - b. Capable of accelerating the fan impeller from stand still to the rated rotational speed in less than 15 seconds when connected to the terminal voltage of 75-percent of the nominal supply voltage.
    - c. Applicable ANSI, IEEE and NEMA or approved equivalent ISO standards.
    - d. Minimum Class H insulation and Class F rating for temperature rise when tested at the service factor load.
    - e. Totally enclosed, high efficiency, air-over, all cast iron or high grade silicone steel frame, induction type, wound for 480-volt, three-phase, 60-hertz alternating current.
    - f. Bearings designed and constructed for maximum radial thrust loads anticipated during starting, operating and reversing conditions. Bearings are to have a minimum L-10 life rating equal to 40,000 hours as defined by the AFBMA.
    - g. Equipped with 120-volt, single-phase heaters to prevent condensation in the motor windings.
    - h. Bearing lubrication lines extending to the exterior of the fan housing and terminating in straight lubrication fittings; fittings provided with covers to exclude water and dust
- J. Nameplates:
1. Fans: Securely attached on each fan showing manufacturer's name, model number and serial number.
  2. Motors: As specified in Section 16225.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Fit fans and appurtenances within space provided and make readily serviceable.
- B. Provide support beams, concrete pads, support legs, platforms, hangers and anchor bolts required for proper installation of equipment as recommended by manufacturer.
- C. Vibration isolation for fans: As specified in Section 15070.
- D. Concrete pads: As specified in Section 15070.
- E. Axial and tubular centrifugal fans: Provide service access in accordance with Section 15810
- F. Motor starters and control centers: As specified in Section 16425.

**END OF SECTION**

## SECTION 15850

### OUTLETS AND GRILLES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing outlets and grilles.
- B. Related Work Specified Elsewhere:
  - 1. Air conditioning pylons: Section 15806.
  - 2. System balancing and testing: Section 15950.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Samples:
    - a. One full-size sample of each outlet and grille in each finish specified.
  - 3. Certification.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. Supply Grilles:
  - 1. Type: Removable core, adjustable, two-way directional.
  - 2. Horizontal adjustment: By means of individually adjustable vertical bars or vanes spaced one-inch apart maximum.
  - 3. Vertical adjustment: By means of individually adjustable horizontal bars or vanes placed in front of vertical bars or by means of fixed fins which can be removed as a unit from frame and inserted in four positions.
  - 4. Horizontal bars or vanes spaced one-inch apart maximum.
  - 5. Fixed fins spaced 1/4-inch apart maximum.
  - 6. Frames constructed of stamped-steel or rolled-steel sections.
    - a. Prior to priming and finishing, steel parts of grilles treated with zinc-phosphate or zinc-chromate, dipped after fabrication.
  - 7. Supply grilles provided with airtight felt, neoprene or plastic sealing strips at edges, designed to prevent leakage.
  - 8. Corner joints finished to provide neat, trim appearance.
  - 9. Each grille provided with factory-fabricated volume-control damper furnished by grille manufacturer.
    - a. Volume dampers: Group-operated, opposed-blade, key adjustable.
    - b. Volume adjustment: By inserting key through face of grille.
    - c. Operating mechanism not projecting through grille face.
  - 10. Factory-fabricated multiple-blade extractors, furnished by grille manufacturer where shown.

- a. Multiple-blade extractors: Air-deflecting and air-straightening type with blades spaced two inches apart maximum.
- B. Exhaust and Return Grilles:
1. Exhaust and return grilles constructed as specified for supply grilles except with single set of nonadjustable face bars or vanes having same appearance as supply grilles.
  2. Volume-control dampers where shown.
- C. Ceiling Diffusers:
1. Types: Circular, square, rectangular or linear as shown.
  2. Diffuser ring or frame: Compatible with ceiling construction in which they are installed.
  3. Diffusers fabricated to meet sizes and capacities shown.
  4. Transitions provided where necessary to connect ducts to diffusers.
  5. Diffusers equipped with baffles or other devices necessary to achieve air-distribution pattern shown.
  6. Turning vanes factory-fabricated, furnished by diffuser manufacturer, at each diffuser or takeoff except where flexible ductwork is used.
  7. Single-key, opposed-blade volume damper factory-fabricated for each diffuser, furnished by diffuser manufacturer.
  8. Diffuser constructed of steel or aluminum with edges exposed to view rolled or otherwise stiffened and rounded:
    - a. Internal parts removable as unit to permit cleaning of diffuser and provide access to ducts.
    - b. Removable parts constructed to prevent reassembly so as to produce incorrect air-distribution pattern.
    - c. Internal assembly fastened to permit removal and reassembly without special tools.
  9. Air-pattern control omitted from diffusers used for return air or exhaust air.
  10. Air-duct or plenum connections secured to diffusers in accordance with manufacturer's recommendations.
  11. Circular ceiling diffusers provided with two or more concentric circular elements designed to deliver air radially, in a generally horizontal direction.
  12. Square and rectangular ceiling diffusers provided similar to circular diffusers, except that outer elements to be square or rectangular.
  13. Where diffuser is located at end of rectangular duct, duct extended minimum one-neck diameter beyond centerline of neck.
- D. Linear Air Diffusers:
1. Size and capacity: As shown.
  2. Diffusers and components parts constructed of extruded aluminum and finished as specified.
  3. Where diffuser length necessitates sectional installation, alignment slots provided for insertion of key strips or with other concealed means to align exposed butt edges of diffuser:
    - a. Joints between diffuser sections to appear as hairline.
    - b. Corner joints of frames and flanges exposed below ceiling or side wall to appear as hairline cracks with unexposed sides or corner joints welded or secured with alignment keys.
  4. Air-delivery patterns: Manually adjustable from face of diffuser after installation.
    - a. Full 180-degree air pattern, from horizontal left or right, vertical or intermediate pattern from each slot independent of other slots.
  5. Damper blades:
    - a. Independent of pattern blades.
    - b. Damper designed for manual adjustment from face of diffuser.

6. Screws or bolts prohibited in exposed face of diffuser frames or flanges.

**2.02 FINISHES:**

- A. Items exposed to public view in stations: Unless otherwise shown, factory-finished in baked enamel, colors as directed.
- B. Items not exposed to public view: Factory-finished in light-gray baked enamel.

**PART 3 - EXECUTION**

**3.01 INSTALLATION:**

- A. Install grilles and diffusers to permit key adjustment from face without other special tools.
- B. Install vanes and volume-control dampers to permit removal through diffuser for access to duct.

**END OF SECTION**

## SECTION 15865

### FILTERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing air filters.
- B. Related Work Specified Elsewhere:
  - 1. Remote-surveillance devices: Sections 13810 and 15900.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. UL 900 Class 1.
  - 2. ASHRAE: 52.1.
- B. Source Quality Control:
  - 1. Factory-tested or tested by an independent laboratory experienced in testing filters; certify compliance with requirements of ASHRAE Standard 52 for arrestance, efficiency, dust-holding capacity and pressure drop.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
  - 1. In design of equipment, provide for interchangeability of items of equipment, subassemblies, and parts.
- B. Throwaway (Replaceable) Prefilters:
  - 1. Flat-panel filter units designed and fabricated for disposal when dust-load limit is reached.
  - 2. Dry or adhesive-coated filter media, as standard with the manufacturer.
  - 3. Maximum air flow through filters: Not exceeding manufacturer's published rated capacity but not exceeding 500 feet per minute at 0.10-inch w.g.
  - 4. Designed to fit within space available and constructed so as to prevent passage of unfiltered air.
  - 5. Filter frames constructed of 18-gauge galvanized steel with air-tight access panels for filter inspection, cleaning and replacement.
  - 6. Filters are UL 900 Class I listed.
- C. Bag Filters:
  - 1. Horizontal air-flow filters of the high-density glass microfibers-type.
  - 2. Capacity based on air-handling capacity of unit to which it is applied with velocity limited to maximum of 500 feet per minute through filter based on net filter area.
  - 3. Provide high-density glass-microfiber filter media, reinforced with a backing to form a lofted filter blanket. Provide filter media with an average efficiency of 80 to 85

percent when tested by ASHRAE 52.1, and with an average arrestance of not less than 98 percent on that standard. Provide UL 900 Class 1 listed filters.

- a. Remote-surveillance devices: In accordance with Section 13810 and Section 15900.
4. Pocket construction: Pockets to consist of glass microfibers chemically bonded to a reinforced UL Class 1 backing. Sew pockets with a tapered stitch which forms a V or wedge-shaped pocket resulting in uniform velocity in the passages of the air-entering and air-exiting sides of the filter. Equip the pockets with a minimum of 40 support points per square foot of filter media:
  - a. Completely seal all stitching points with foam-seal or equivalent. Chemically adhere the pockets around the periphery of the galvanized-steel retainers. Provide retainers with rolled edges to reduce possible cuts to media, or lacerations to installers.
5. Enclosing frame: Construct enclosing frame of a J return channel of 16-gauge galvanized steel. The channel may be 7/8 inch or 1-1/8 inch.
6. Glide/Packs - for side-access applications: Factory fabricate and assemble filter housings. Construct the units of not less than 16-gauge galvanized steel, incorporating two access doors, extruded-aluminum tracks and individual universal holding frames designed to accommodate a wide range of standard size filters in varying efficiency ranges.
7. Leakage at rated airflow, upstream to downstream of filter, holding frame and slide mechanism to be less than one percent at 3-inch w.g. differential.
8. Leakage into housing from ambient atmosphere at rated airflow to be less than 0.5 percent at 3-inch w.g. negative. Manufacturer to submit substantiating test reports.
9. Construct access doors of 16-gauge galvanized steel and position them to facilitate removal and replacement of filters from either side of the housing. Equip each door with adjustable and replaceable post.
10. Provide factory installed 16-gauge galvanized steel transition plates on air-inlet and/or air-exit side to match air-handling unit.

D. Controls:

1. Control panels factory wired.
  - a. Adjustable pressure-differential sensing device and wiring for remote surveillance.
  - b. Pressure range of 0.02-inch w.g. to 1.0-inch w.g. Accuracy of plus-or-minus 0.03-inch w.g.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances within the space provided and make readily serviceable.
- B. Install bag filters with capacities as shown.
- C. Examine each bag filter's media before installation for seepage and adhesive to surface of container.
- D. Replace bag filters showing evidence of seepage.
- E. After final testing and cleaning of fans and ductwork, replace prefilters and final filter media with new, clean media.

**END OF SECTION**

## SECTION 15900

### CONTROL EQUIPMENT

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing automatic temperature controls, remote surveillance and control and local control systems.

##### 1.02 QUALITY ASSURANCE:

- A. Qualifications of Manufacturer:
1. Select manufacturer who maintains full-time organization for installation and service in the Washington, D.C. metropolitan area.
  2. Have instruments, piping and wiring installed by representative of temperature control-equipment manufacturer.
- B. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
  2. ASTM: A153.
  3. ASME: Boiler and Pressure Vessel Codes.
  4. NEMA: 250, ICS 2-1993
  5. UL: Electrical Construction Materials Directory.
- C. Design Criteria:
1. Automatic temperature-control systems:
    - a. Design systems to perform functions and operate in sequence as shown or specified for air conditioning and ventilation of station platforms, mezzanines, station ancillary rooms, tie-breaker stations, traction-power substations and chilled-water plants.
    - b. Maintain conditions shown or specified.
    - c. Operate and control motor-operated dampers.
    - d. Design duplex air compressor to have sufficient capacity to supply entire system, under normal conditions, while running less than 50 percent of the time.
    - e. Design dessicant dryer system to maintain maximum pressure dew point of -10F at main air pressure and delivery volume necessary.
    - f. Design control system to interface with fire and smoke-detection system by others to shut off the following fans on activation of fire and smoke-detection system.
      - 1) Battery-room fans:
      - 2) Air-conditioning and ancillary area fans in excess of 2,000 cfm, except the following:
        - a) Underplatform-exhaust fans.
        - b) Subway-ventilation fans.
        - c) Dome-exhaust fans.
        - d) Jet fans.
  2. Remote surveillance and control systems:
    - a. Continuously measure parameters as shown including pressure, temperature and flow. Convert analog values of sensing transducer into seven-bit binary code and transfer to designated interface DTS terminals by relays.
    - b. Monitor abnormal operations, such as high and low limits on pressure, temperature, water level, water flow, damper position, mode-selector switch

position and air flow as shown; provide contact closure to designated DTS terminals.

- c. Design system to compensate for electrical losses in wiring. Design dc-power supplies and signal amplifiers, as necessary

D. Source Quality Control:

- 1. Test and stamp air storage tank in accordance with ASME Boiler and Pressure Vessel Code, Section VIII, Div. I.
- 2. Identify each transducer according to type, sensitivity, accuracy and operating range.
- 3. Each remote-indication system installed to have accuracy shown.

### 1.03 SUBMITTALS:

A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- 1. Shop Drawings:
  - a. Complete catalog information and shop drawings for material and equipment including wiring and control diagrams.
  - b. Submittals include, but are not limited, to the following:
    - 1) Air compressors, with motors and controls.
    - 2) Compressed-air storage tanks.
    - 3) Dessicant air drier system including prefilters, after each if provided, after filter.
    - 4) Thermostats.
    - 5) Controllers.
    - 6) Damper operators, electric or pneumatic as applicable.
    - 7) Automatic valves and operators.
    - 8) Dampers.
    - 9) Control panels and cabinets.
    - 10) Gauges and indicators.
    - 11) Transducers.
    - 12) Data-transmission system-interface relays.
    - 13) Sensing devices.
    - 14) Wiring diagrams, control diagrams and layouts for each system.
    - 15) Pneumatic controls.
    - 16) Control, indication and time-delay relays.
    - 17) Damper limit switches.
  - c. Complete set of floor plans of rooms showing by means of graphic coding actual location and mounting heights of thermostats and zone served by each thermostat.
- 2. Operation and Maintenance Manuals:
  - a. Complete electrical schematic of each system showing and identifying each internal and external component and internal and external wiring.
  - b. Detailed piping and wiring diagrams showing graphic coding.
  - c. Terminal numbers for wire or pipe connections.
  - d. Complete parts list of internal and external components.

### 1.04 OPERATION AND MAINTENANCE TRAINING:

A. Upon completion of installation, furnish services of competent field engineer with specialized experience in temperature control and remote surveillance and control system to train Authority personnel in accordance with the General Requirements and as follows:

- 1. Instructional period: Three consecutive man-days minimum. A minimum of one day to be devoted to hands-on demonstration of the equipment operation, trouble analysis, repair, adjustment and maintenance.

2. Train operators in preventive maintenance of systems and to recognize malfunctions.
3. Provide complete printed operating instructions in manual or handbook form, completely and clearly indexed for ready reference during actual operation and for use as text during instruction of operating personnel.
  - a. Include descriptions of systems, background information and complete procedures for adjustment, calibration, replacement and repair of components in system.

## **PART 2 - PRODUCTS**

### **2.01 PRODUCTS AND MATERIALS:**

- A. General Requirements:
  1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters, relays and transducers.
- B. Automatic Temperature-Control System:
  1. Air compressors:
    - a. Duplex-type, with intake air cleaners of cleanable, impingement type, designed for heavy-duty service.
    - b. Relief valve located between compressor and discharge shutoff valve, set for pressure 10-psi greater than that of control-switch cutout.
    - c. Cast-iron or steel base for each compressor and motor for mounting on air tank or on separate concrete foundation.
    - d. Controls:
      - 1) Enclosed, adjustable, pressure-operated pilot switches connected to motor starter and mounted on unloading device.
      - 2) To start lead compressor when air storage-tank pressure falls to 85 psig and stop it when pressure rises to 100 psig.
      - 3) To start lag compressor when air storage-tank pressure falls to 75 psig and stop it when pressure rises to 90 psig.
      - 4) Automatic alternator to change sequence of operation of compressors on completion of each cycle.
    - e. Motors: Four-pole, dripproof and fully guarded: Section 16225.
  2. Air storage tank:
    - a. Construction: Welded steel plate designed for minimum of 125 psi in accordance with ASME Boiler and Pressure Vessel Codes.
    - b. Finish: Zinc-coated after fabrication.
    - c. Relief valve and automatic drain with drain piping extended to nearest drain.
    - d. Tanks mounted with compressors: Horizontal or vertical.
      - 1) Tanks mounted separately: Vertical.
    - e. Capacity: Such that idle time between compressor running periods is 10 minutes minimum.
  3. Aftercooler:
    - a. Air-cooled.
    - b. Designed to reduce compressed-air temperature to a maximum of 100F.
    - c. Operating pressure and temperature compatible with air compressor.
    - d. Fabricated in accordance with ASME Boiler and Pressure Vessel Codes.
    - e. Equipped with ASME PTC 25-3 safety valve.
    - f. Built-in moisture separator with automatic drain valve.
  4. Air dryer:
    - a. Heatless/heaterless regenerative desiccant-type.
    - b. Designed to supply air with a maximum pressure dew point of -10F at 80 psi and in sufficient quantity to operate controls as determined by controls contractor.

- c. Two-tower design constructed in accordance with ASME Boiler and Pressure Vessel Codes.
  - d. Designed for a working pressure of 150-psi minimum.
  - e. Towers equipped with safety relief valves and pressure gauges.
  - f. Supplied as a complete package unit, operable on 115V, single-phase, 60-Hz power.
  - g. Rated in accordance with Compressed Air and Gas Institute (CAGI) Standard for Rating and Testing Compressed Air Dryers and National Fluid Power Association Recommended Standards.
  - h. Muffler on purge air discharge.
  - i. Fully automatic operation with cycle controlled by timer.
  - j. Electrical components including:
    - 1) ON/OFF switch.
    - 2) POWER ON light.
5. Prefilter:
- a. Compatible with air dryer.
  - b. Automatic drain.
  - c. Coalescent-type.
6. Afterfilter:
- a. Compatible with air dryer and designed to prevent desiccant carryover into compressed-air supply line.
7. Automatic valves:
- a. Bodies, discs, stems and stuffing boxes designed for minimum working pressure of 125 psi.
  - b. Provide valves of type specified for each of the following body sizes:
    - 1) 1-1/2 inches or smaller: Brass or bronze with screwed or union ends.
    - 2) Four inches and larger: Iron bodies with brass or bronze trimmings and flanged ends.
    - 3) Two inches to three inches: Brass or bronze with screwed or union ends or iron bodies with brass or bronze trimmings and flanged ends.
  - c. Visible position indicators and renewable discs.
8. Automatic dampers, except fan shaft, vent shaft and dome relief dampers:
- a. Provided by automatic temperature-control manufacturer.
  - b. Factory-fabricated, opposed blade, balanced-type with factory-assembled linkages, mounted in galvanized-steel frames.
  - c. Blades: Flat or formed galvanized steel with interlocking edges or with compressible seals at point of contact.
    - 1) Air-temperature range of seals: Suitable for operation from minus 20F to plus 200F.
    - 2) Supported by thrust bearings for vertically mounted blades.
    - 3) Length of blades between bearings: 48 inches maximum.
    - 4) Width of blades: Eight inches maximum.
  - d. Leakage when closed: Maximum 20 cfm per square foot at static pressure of four inches water gauge.
  - e. Frames: Bar or channel, with corner bracing for rectangular dampers larger than four square feet in area.
  - f. Damper-operating linkage:
    - 1) Adjustable-length galvanized-steel rods capable of withstanding load of at least twice maximum operating force of damper operator without deflection.
    - 2) Joints: Brass pins and clevises or brass ball-and-socket joints.
  - g. Steel parts: Hot-dip galvanized after fabrication.
9. Automatic dampers for subway-ventilation fan discharge and bypass, vent shaft, underplatform-exhaust fan and dome-exhaust fan:

- a. Automatic dampers factory-fabricated, constructed of galvanized sheet metal or extruded aluminum. Frames constructed of minimum 13-gauge galvanized sheet steel or extruded aluminum.
  - b. Dampers designed for control by pneumatic or electric motor operators. Mounting provisions for motor operators included in damper assembly.
  - c. Damper blades designed for air velocities to be encountered in system.
  - d. Blades: Maximum width eight inches and 24 inches maximum between bearings, fabricated of galvanized sheet steel, 16-gauge or double 22-gauge minimum.
  - e. Seals designed to withstand air temperatures ranging from minus 20F to plus 200F.
  - f. Damper-operating linkage:
    - 1) Adjustable-length galvanized-steel rods capable of withstanding without deflection load of at least twice maximum operating force of damper operator.
    - 2) Joints: Brass pins and clevises or brass ball-and-socket joints.
    - 3) Damper operators attached to operating linkage so as to ensure positive operation without lost motion.
  - g. Motor mounting supported so that operator will not deflect from its normal path when operating under load.
  - h. Steel parts: Hot-dip galvanized after fabrication. Galvanizing: 1.25 ounces, in accordance with ASTM A153.
  - i. Conforming to NFPA 130 high temperature requirements.
10. Pneumatic valve and damper operators:
- a. Spring-return type with nonferrous-metal bellows or reinforced-neoprene diaphragms.
  - b. Bellows or diaphragm: Sized for operating pressure necessary to start valve or damper operator.
  - c. Spring to return valve or damper to fail-safe position in event of power failure, in normally open or normally closed position as shown.
  - d. Adjustment provisions: Adjustable stops to control open and closed positions of damper operators.
  - e. Damper operators for vent-shaft dampers and fan-shaft dampers to include pilot or positive positioners.
11. Space thermostats:
- a. Supplied with subbase for mounting and guards as shown.
  - b. Adjustment devices on controllers locked or concealed.
  - c. Operating points: Minimum range 10 degrees above and 10-percent below operating points shown.
  - d. Provide external thermometer with knob or lever-adjusting devices where shown.
  - e. Thermostat throttling range: 2F maximum.
  - f. Controllers, submaster controllers, lagged sensing elements and space thermostats provided with means for field adjustment of throttling range.
12. Duct thermostats:
- a. Remote sensing-element type, with controller mounted on apparatus control panel.
  - b. Enclosure for operating and adjusting mechanism: Metal or phenolic-resin case.
  - c. Thermostats used for freeze protection: Sensing element 20 feet minimum in length.
    - 1) Thermostat capable of operating when freezing condition exists at one-foot increments anywhere along sensing element.
  - d. Remote transmitter provided when distance from bulb to panel exceeds manufacturer's recommended capillary length.
13. Pipe thermostats:

- a. Immersion-type with liquid-filled separable sockets.
  - b. Remote sensing-element type, used where socket is located minimum five feet above floor.
  - c. Remote transmitter provided when distance from bulb to panel exceeds manufacturer's recommended capillary length.
  - d. Separable sockets: Stainless steel, heavy enough to withstand pulsations and turbulences in fluid controlled.
  - e. Pipe-sensing thermostat for electric heat tracing:
    - 1) Remote bulb suitable for attachment to outside of pipe as shown.
    - 2) Thermostat with DPST contacts, range of zero degree F to 100F and control differential of not more than 8F.
    - 3) Thermostat in NEMA 250, Type 4 enclosure, except NEMA 250, Type 12 enclosure for train tunnels, vent shafts or track-drainage pumping station.
    - 4) Contactor, as necessary, when total amperes of heating tape exceeds rated capacity of thermostat.
14. Pressure gauges:
- a. For individual-mounted controllers: Stem-mounted, two inches diameter minimum.
  - b. For panel-mounted controllers, individual gauges: Two inches minimum diameter.
  - c. For panel-mounted controllers, multiple-indication gauges: 3-1/2 inches minimum diameter.
15. Apparatus control panels, except for subway-ventilation fans and dome-exhaust fans:
- a. Separate apparatus control panel or metal cabinet for each air-handling and air-conditioning unit.
  - b. Control instruments located on panel, except fire and freeze-protection instruments.
  - c. Panel constructed of fire-resistant material with nonglare surfaces.
16. Electric damper operators:
- a. Spring-return type.
  - b. Two-position motor operation.
  - c. Spring returns damper to fail-safe position as shown in event of power failure or termination.
  - d. Opening time: 60 seconds maximum.
  - e. Adjustable stops to control open and closed positions.
17. Time clock:
- a. Suitable for automatic weekly switching operations of electrical equipment.
  - b. Seven-day cycle with ten-hour spring reserve to maintain programmed switching in event of power failure.
  - c. Capable of being programmed as desired.
  - d. Manual trip mechanism for overriding timer.
  - e. Mechanism powered by single-phase synchronous motor from available internal control power of 120 volts, 60 Hertz.
  - f. Motor capable of operating at temperatures ranging from zero degrees F to 120F.
  - g. Contacts of cadmium alloy, rated for 40-ampere, noninductive service at 120, 208/240, or 277 volts.
  - h. Enclosure: NEMA 250, Type 1, surface-mounted.
18. Selector switch, except for subway-ventilation fan, underplatform-exhaust fan and dome-exhaust fan:
- a. Positions labeled HAND/OFF/AUTOMATIC.
  - b. Maintained contact.
  - c. Oil-tight.

- d. Contact-rating designation: NEMA ICS 2-1993, with the following additional requirements:
  - 1) Continuous current rating: 10 amperes.
  - 2) Voltage rating: 120 volts, 60 Hertz
- 19. Damper limit switch:
  - a. Contacts: Single-pole; one NO, one NC; snap-action.
  - b. Enclosure: NEMA 250, Type 1.
  - c. Actuator: Level-operated, rotary-type, adjustable, with spring return.
  - d. Mounting: Plug-in type with receptacle tapped for conduit size as shown.
  - e. Contact-rating designation: NEMA A600, with the following additional requirements:
    - 1) Continuous-current rating: 10 amperes.
    - 2) Voltage rating: 120 volts, 60 Hertz.
- 20. Automatic alternator:
  - a. Equipped with ratchet mechanism to alternate opening and closing of two contacts after each ventilating-unit cycle.
  - b. Electrical requirements:
    - 1) Continuous-current rating: 10 amperes.
    - 2) Voltage rating: 120 volts, 60 Hertz.
    - 3) Enclosure: NEMA 250, Type 1.
- C. Remote Surveillance and Control:
  - 1. DTS Relays:
    - a. Energized from command-center control via DTS.
    - b. Momentary-pulse type requiring no sustained power consumption.
    - c. Maximum coil load: 15 volt-amperes, resistive or suppressed inductive.
    - d. Coil voltage: 28 volts dc.
    - e. Contacts: Compatible with equipment controlled.
  - 2. General relays:
    - a. Control and indication relays:
      - 1) Functional designations and schematic connections as shown.
      - 2) Number and configuration of contacts as shown.
      - 3) Contact ratings:
        - a) Maximum switched voltage: 600 volts ac
        - b) Maximum continuous current: 10 amperes.
        - c) Capable of making load of 720 volt-amperes ac.
        - d) Capable of breaking load of 720 volt-amperes ac.
        - e) Minimum open-contact resistance: 50 megohms, 400 volts dc.
        - f) Maximum duration of bounce: 50 milliseconds.
      - 4) Modular convertible contacts enclosed in plastic.
    - b. Time-delay relays:
      - 1) Functional designations and schematic connections as shown.
      - 2) Number and configuration of contacts as shown.
      - 3) Capable of operating from minus 20F to plus 165F.
      - 4) Externally adjustable time delay.
      - 5) Contact rating:
        - a) Current capacity of 20 amperes resistive at 120 volts ac for 100,000 operations.
      - 6) Insulation resistance: 50 megohms at 500 volts dc.
      - 7) Auxiliary contacts for instantaneous transfer or two-step timing as scheduled.
  - 3. Transducers:
    - a. Rise time: One-second maximum.
    - b. Sensitivity: Constant over operating range shown.

- c. Adjustment for high and low operating ranges: Manual, calibrated and clearly identified.
  - d. Output: Accommodate three wires, marked with PLUS, MINUS and GROUND SHIELD symbols.
  - e. Transducers requiring external electric power to operate at 120 volts, single-phase, 60 Hertz.
  - f. Transducers requiring external air supply to operate from 20-psi source.
  - g. Housings: Moisture proof and disproof enclosure suitable for environment in which each transducer is located. Transducer nameplate attached to housing.
4. Drainage pumping-station surveillance:
- a. Indicating malfunction upon loss of electric power from both sources.
  - b. Indicating malfunction when both pumps are running.
  - c. Indicating malfunction when water level is above or below preset range.
5. Fan control cabinets:
- a. For subway ventilation-fan controls: NEMA 250, Type 4 steel enclosure with epoxy powdered-resin-coated finish.
  - b. For underplatform exhaust-fan and dome exhaust-fan controls: NEMA 250, Type 1 enclosure.
  - c. Mode-selector switch mounted in front cover:
    - 1) Maintained contact.
    - 2) Oil-tight.
    - 3) Contacts conforming to NEMA ICS 2-1993 rated for 10 amperes continuous current at 120 volts, 60 Hertz.
  - d. Positions of mode-selector switch: Labeled on nameplate as follows: REMOTE/OFF/LOCAL EXHAUST/LOCAL SUPPLY.
  - e. Complete electrical schematic diagram of control cabinet affixed permanently to inner surface of front cover and protected by clear Lucite.
    - 1) Include on schematic diagram parts list for all components of panel and contents, showing complete manufacturer's name, nomenclature and parts number
  - f. Pilot lights mounted in front cover.
    - 1) Polycarbonate lens.
    - 2) Push to test.
    - 3) Legend plate with mode indicated.
    - 4) 20,000-hour 6.3-volt lamp.
  - g. Control panel surface, except for underplatform-exhaust fans and dome-exhaust fans, lighted by fixture permanently mounted on panel.
    - 1) Fixture to include fireproof lampshade extending width of panel.
    - 2) Average lighting level: 40 foot-candles over entire surface of panel.
  - h. Panel constructed of fire-resistant material with nonglare surface
6. Flow sensor:
- a. Diaphragm differential sensor.
  - b. Single-pole, double-throw, snap-acting switch, 10-ampere rating.
  - c. NC contacts.
  - d. Adjustable set point.
  - e. Operating range of zero degree F to 180F.
7. Electric heat tracing: Section 15725.
- D. Traction-Power Substation Ventilating-Unit Controls:
- 1. Two-stage thermostat and automatic alternator.
  - 2. Control sequence:
    - a. When room temperature rises to 80F: Open lead-fan dampers and start lead fan.
    - b. When room temperature rises to 90F: Open lag-fan dampers and start lag fan.

- c. Reverse control process on falling temperature.
    - d. Automatic alternator reverses lead-lag sequence after each lead-fan operating cycle.
  - 3. Selector switch.
- E. AC Switchboard Room Ventilating-Fan Controls:
  - 1. Thermostat, flow switches, time-delay relay, selector switch, automatic alternator and limit switches.
  - 2. During each operating cycle, one fan to serve as primary fan and second fan as standby.
  - 3. Control sequence:
    - a. Dampers on intake and discharge side to remain open when fans are not in operation.
    - b. When room temperature rises to 90F, relief damper(s) open, standby-fan intake damper closes and primary fan starts.
    - c. Control sequence to reverse when room temperature falls.
    - d. After each operating cycle, automatic alternator to reverse functions of automatic and standby fans.
  - 4. Abnormal operation: If primary fan fails to operate, primary-fan intake damper closes, standby-fan intake damper opens and standby fan starts. Relief dampers to remain open during standby-fan operation.
- F. DC Breaker Room and Tie-Breaker Station Ventilating-Fan Controls:
  - 1. Single-stage space thermostat.
  - 2. HAND/OFF/AUTOMATIC switch.
  - 3. Operation:
    - a. Hand: Fan running, dampers open.
    - b. Off: Fan off, dampers closed.
    - c. Automatic:
      - 1) When room temperature rises to 90F, open dampers and start fan.
      - 2) Reverse control process on falling temperature.
- G. Battery Room Fan Controls:
  - 1. Battery room exhaust fan to operate continuously.
  - 2. Magnetic starter.
- H. Fire Alarm for Shutdown Interface Box: Data transmission system (DTS) cabinet specified in Section 16130, with the following additional requirements:
  - 1. Cabinet: Hoffman A161206LP.
  - 2. Terminal strip: Terminal as required mounted in upper right-hand quadrant of cabinet.
  - 3. Exterior finish color: Sherwin-Williams Fire Protection Red.
    - a. Yellow letters, one-inch high on cover: FA-FAN SHUTDOWN.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Fit equipment and appurtenances within space provided and make readily serviceable. All gauges and indicators to be installed so they can be readily read without use of ladder or other means to reach installed items.
- B. Foundations, platforms, or hangers for apparatus in accordance with Sections 03200 and 03300.

- C. Unless specifically shown otherwise on drawings, provide a complete compressed-air system as required for pneumatic-control system being provided, including air compressor, storage tank, pressure-reducing valves, aftercooler, air dryer complete with prefilter and afterfilter, and all control-air piping from air compressor to controls and operating units. Piping is to be in accordance with Section 15205.
  
- D. Install 18AWG minimum control wiring, as shown and in accordance with Sections 16120 and 16125.
  - 1. Identify each wire at interface cabinet locations.
  - 2. When communication fan-shutdown interface cabinets are installed by others, complete wiring to designated terminals.
  
- E. Automatic Temperature-Control Systems:
  - 1. Install entire automatic temperature-control system, including piping and wiring under supervision of automatic temperature-control equipment manufacturer.
  - 2. Mount damper operators outside of duct or casing with support plates that are completely outside insulation or covering.
    - a. Install support plates so as to prevent condensation on damper operator or on supports.
  - 3. Support valves and damper-operator motor mountings so that operator does not deflect from its normal path when operating under load.
  - 4. Locate sensing elements of duct thermostats where they will respond to representative temperature within duct or casing.
  - 5. Duct thermostats and remote transmitters:
    - a. Install outside of ducts and casings.
    - b. Where ducts or casing are insulated, mount thermostats flush with outside insulation, so that moisture will not condense on thermostats or on supports.
  - 6. Duct thermal capillary tubes and wires:
    - a. Install to pierce thermal insulation at least practicable number of points.
    - b. Seal insulation properly where capillaries and wiring pass through.
  - 7. Capillary tubes:
    - a. Protect by conduit, molding or flexible armor.
    - b. Coil capillary tube neatly and fasten excess lengths out of the way.
  - 8. Apparatus control panel:
    - a. Mount bottom of each panel 30 inches above floor.
    - b. Provide 30 inches clearance between rear of panel and wall where conduit or wiring enters panel from rear.
    - c. Mount controls, instrument gauges, thermostats and relays flush on front of panel.
    - d. Install wiring and tubing connections for accessibility in servicing.
  - 9. Apparatus control cabinets:
    - a. Make wiring and tubing connections to control instruments, indicating instruments and communication equipment inside cabinet.
    - b. Install pilot lights, manual switches, and pushbutton controllers in cabinet door, so they are visible and operable with door closed.
  - 10. Mount framed schematic temperature-control diagram adjacent to each apparatus control panel or cabinet.
  - 11. Mount time clock on control panel in accordance with manufacturer's recommendations.
  - 12. Mount selector switch in motor-starter enclosure of ventilating units in ac-switchboard rooms, traction-power substations and tie-breaker stations.
  - 13. Mount pushbutton station in motor-starter enclosure of exhaust fan in battery rooms.
  - 14. Limit switch:
    - a. Mount on automatic damper blades in ac-switchboard rooms, traction-power substations, tie-breaker stations, vent shafts, fan shafts, underplatform-exhaust fans and dome-exhaust fans.

- b. Set switch contacts to close when damper opens.
  15. Install automatic alternator in ac-switchboard rooms and traction-power substations which have two ventilating units.
  16. Pipe-sensing thermostat for electric tracing:
    - a. Firmly attach remote bulb against pipe at location in which bulb does not touch heating tape.
    - b. Mount thermostat securely on wall at conveniently accessible location.
  17. Install pneumatic-control systems for the following:
    - a. Chilled-water plant.
    - b. Underplatform-exhaust fans.
    - c. Subway-ventilation fans and vent shafts where control air is available.
    - d. Mezzanine and platform air-conditioning units with chilled-water coils.
    - e. Dome-exhaust fans.
  18. Install electric-control systems or functionally equivalent pneumatic-control systems for the following:
    - a. Station ancillary-room heating, ventilating and air-conditioning systems.
    - b. Traction-power substation and tie-breaker station ventilation systems.
    - c. Subway-ventilation fans where control air is not available.
  19. Install flow sensor in designated fans as shown and adjust to open or close contacts as shown at full flow in respective directions.
- F. Remote Surveillance and Control:
1. Coordinate design with the Engineer and provide necessary interface for complete compatibility with DTS system.
  2. Coordinate with the Engineer installation of fire-alarm sensors in air units.
  3. Locate temperature-sensing transducer supervising space temperature in chilled-water plant adjacent to space thermostat.
  4. Locate passenger-station temperature-sensing transducers adjacent to platform thermostat. Coordinate locations with the Engineer.
  5. Provide shielding for sensing and signaling systems to prevent electrical interference.
  6. Install flow sensor in designated fan as shown and adjust to close contacts at full flow in respective directions.
- G. Fire-Detection Controls:
1. Coordinate enclosure interface terminal block with the Engineer.
- H. Post diagrams under Lucite with aluminum-channel frames, waterproof glass-fiber backing adjacent to apparatus control panels.

### **3.02 FIELD QUALITY CONTROL:**

- A. Acceptance Testing:
1. Furnish equipment required to perform tests.
  2. Submit test procedure for approval.
  3. Perform approved tests to verify that control surveillance systems comply with requirements shown and specified.

**END OF SECTION**

## SECTION 15950

### SYSTEM BALANCING AND TESTING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies balancing, adjusting and performance-testing of heating, exhaust, air-conditioning and ventilating systems with ductwork. Water-balancing required only for chilled-water systems.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. NEBB: Procedural Standards for Testing, Adjusting and Balancing of Environmental Systems.
  - 2. ASHRAE III: Practices for Measurement, Testing, Adjusting and Balancing of Building HVACR Systems.
- B. Instrument Calibration:
  - 1. Calibrate instruments required for air and water balance within six months prior to use on this project.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Test and instrument location plans.
    - b. After initial balancing measurements, submit shop drawings for additional equipment such as balancing dampers, pressure taps and balancing cocks necessary to effect proper air and water balance.
  - 2. Certification:
    - a. Complete air and water-balance report certified by professional engineer licensed in the jurisdiction where the work is to be performed. Water balancing and testing includes entire system served by chiller plant in this project.
    - b. Collect data in accordance with referenced standards.
    - c. Submit complete data on standard NEBB testing and balancing report forms without omissions or on approved report forms bearing identical data. Data to include types, serial numbers and calibration dates of instruments and to cover the following:
      - 1) Air-conditioning units: Sections 15733, 15735 and 15737.
      - 2) Ventilating units: Section 15725.
      - 3) Fans: Section 15830.
      - 4) Electric heating coil: Section 15725.
      - 5) Ductwork including transverse and pilot tube test: Section 15810.
      - 6) Air outlets: Sections 15850 and 15806.
    - d. In addition, provide the following data:
      - 1) Air-conditioning supply registers for side platform stations: Three temperature and velocity traverse perpendicular to coffer wall. Traverse consists of simultaneous readings at the following locations:
        - a) Three readings five feet above platform, one each at three feet, five feet and nine feet from train edge of platform.
        - b) One reading at face of register.

- c) One reading twelve feet above edge of platform.
  - 2) Air-conditioning pylons: One temperature and velocity traverse at each air-conditioning pylon. Traverse consists of simultaneous readings at the following locations:
    - a) Twenty readings five feet above platform or mezzanine, one each at three feet, six feet, nine feet, twelve feet and fifteen feet from pylon, at each of four quadrant points around pylon.
    - b) Four readings at supply register one at each of four quadrant points.
    - c) One reading twelve feet above platform or mezzanine, three feet from pylon.
  - 3) Air-conditioning supply registers for mezzanines: One temperature and velocity traverse at centerline of each coffer mezzanine supply register. Traverse consists of simultaneous readings at the following locations:
    - a) Five readings five feet above mezzanine or escalator, one each at three feet, six feet, nine feet, twelve feet and eighteen feet from parapet or on escalator centerline.
    - b) One reading at face of register.
    - c) One reading twelve feet above mezzanine parapet at centerline of station.
- e. Water-balance test reports to include data covering the following:
  - 1) Chilled-water coils: Section 15734.
  - 2) Chillers: Section 15625.
  - 3) Cooling towers: Section 15640.
  - 4) Pumps: Section 15185.
  - 5) Control valves: Section 15900.

## **PART 2 - PRODUCTS**

- 2.01** Provide, as specified in Sections 15810 and 15205, additional equipment, such as balancing dampers, pressure taps and balancing cocks necessary to effect proper air and water balance.
- 2.02** Design, construct and install necessary blanking baffles for air-conditioning pylons.

## **PART 3 - EXECUTION**

### **3.01 BALANCING AND PERFORMANCE TESTING:**

- A. After completion of installation of heating, exhaust and air-conditioning systems, and prior to acceptance by the Engineer, adjust and balance air-handling systems, water systems and appurtenances applicable to those systems to deliver the air and water quantities as specified and as shown. Make final tests after modifications are completed. Seal instrument test holes upon completion of balancing operation.
- B. Air and Water Balance:
  - 1. Perform testing in accordance with referenced NEBB Standard, ASHRAE 111 or other approved standard.
  - 2. Perform tests, adjust and balance when outside conditions approximate design conditions as shown for heating and cooling functions.
  - 3. Balancing cock: Provide reference mark to permit reset after shutoff.

**END OF SECTION**

**DIVISION 16 - ELECTRICAL, TRACTION POWER, COMMUNICATIONS,  
& AUTOMATIC TRAIN CONTROL**

- 16051 SCOPE OF WORK FOR TRACTION POWER
- 16052 BASIC MATERIALS AND METHODS FOR TRACTION POWER
- 16053 OPERATIONS AND MAINTENANCE TRAINING FOR TRACTION POWER
- 16060 GROUNDING AND BONDING
- 16120 WIRE, CABLE AND BUSWAYS
- 16122 CONTACT RAIL CABLE CONNECTOR ASSEMBLIES FOR TRACTION POWER
- 16123 CONTACT RAIL INSULATOR ASSEMBLY FOR TRACTION POWER
- 16124 CONTACT RAIL PROTECTION COVER ASSEMBLIES FOR TRACTION POWER
- 16125 WIRE CONNECTION ACCESSORIES
- 16126 CONTACT RAIL ANCHOR ASSEMBLY FOR TRACTION POWER
- 16127 CONTACT RAIL SYSTEM INSTALLATION FOR TRACTION POWER
- 16128 WIRE AND CABLE FOR TRACTION POWER
- 16130 RACEWAYS, BOXES AND CABINETS
- 16145 WIRING AND CONTROL DEVICES
- 16220 EMERGENCY STANDBY GENERATOR SYSTEM
- 16225 MOTORS
- 16260 UNINTERRUPTIBLE POWER SYSTEM
- 16261 TRANSFORMER-RECTIFIER UNITS FOR TRACTION POWER
- 16270 TRANSFORMERS
- 16291 LOCAL ANNUNCIATOR PANEL FOR TRACTION POWER
- 16292 **DELETED** - REMOTE TERMINAL UNIT (AEMS RTU) FOR TRACTION POWER -  
Replaced by 16601(08/01)
- 16293 MIMIC PANEL FOR TRACTION POWER-STORAGE YARD
- 16294 CONTACT RAIL HEATING SYSTEM FOR TRACTION POWER
- 16320 HIGH-VOLTAGE SWITCHGEAR
- 16321 HIGH VOLTAGE A.C. SWITCHGEAR (13.8 kV) FOR TRACTION POWER

**DIVISION 16 - ELECTRICAL, TRACTION POWER, COMMUNICATIONS,  
& AUTOMATIC TRAIN CONTROL(Cont.)**

16322	HIGH VOLTAGE A.C. SWITCHGEAR (34. 5KV) FOR TRACTION POWER
16341	METAL ENCLOSED D.C. SWITCHGEAR FOR TRACTION POWER
16360	UNIT SUBSTATIONS
16425	MOTOR STARTERS AND CONTROL CENTERS
16435	LOW-VOLTAGE SWITCHGEAR AND SWITCHBOARD
16440	CIRCUIT BREAKERS, PANELBOARDS AND LOAD CENTERS

## SECTION 16051

### SCOPE OF WORK FOR TRACTION POWER

#### PART 1. GENERAL

##### 1.01 SUMMARY

- A. The scope includes all work required to furnish, install, connect, test and energize traction power equipment and appurtenances to ensure safe, complete, workable and operational traction power substation and tie breaker station in facilities of the WMATA Metro Rail System, including furnishing and installation of ancillary material as required.
- B. The work shall include furnishing, installing, connecting, energizing and testing of all materials, equipment, labor, transportation and handling, construction equipment, tools and all other incidentals necessary for the execution, testing, connection, interconnection and energizing of the following
  - 1. Equipment:
    - a. General: The Contractor shall install all required equipment. The work shall be in accordance with the drawings and specifications included in this contract and comply with the "Information Drawings" and equipment vendor drawings.
    - b. When permanent power has not been provided in the traction power substations and tie breaker stations, the Contractor shall provide the necessary temporary power for his work. The Contractor shall protect the equipment. In equipment such as switchgear and bus ducts in which there are internal space heaters, the space heaters shall be kept energized. If permanent power for the space heaters is not available, the Contractor shall provide the necessary temporary power.
  - 2. Equipment, Material and Work Included in this Contract Specification:
    - a. The Contractor shall furnish, install and test all material specified elsewhere in this specification including, but not limited to, the following:
      - 1) High voltage A.C. switchgear 13.8kv, or 34.5kv.
      - 2) Transformer-Rectifier units.
      - 3) Metal-Enclosed DC Switchgear.
      - 4) Drainage and negative switchboard.
      - 5) Substation busways.
      - 6) Local annunciator panel.
      - 7) Wire and Cable.
      - 8) Uninterruptible Power System (UPS).
      - 9) Contact-rail heating system.
      - 10) Remote terminal unit (AEMS RTU) including connection from AC and DC switchgear transducers and AEMS interface panels as shown.
      - 11) Miscellaneous materials including conduit, cable tray, support hardware, DTS and ETS cabinet, ETS lights, ETS enclosures, and wiring system, subfloor pouring/finishing, floor finishing and insulating topping, panelboards, grounding, etc., as shown and specified in Section 16052.
      - 12) Grounding and bonding as shown and specified.
      - 13) Cutting, patching and core drilling: The Contractor shall provide wall and floor openings or enlarge openings as required to accommodate bus duct, cable tray or conduit furnished. All unused conduit, sleeves, openings around bus ducts, cable trays etc. shall be sealed using fireproof material to meet occupancy jurisdictional codes for the room.

- 14) Fabrication of plastic sheets to close sections around bus duct passing through floor opening.
- 15) Assembly of equipment: switchgear shipping sections shall be assembled for proper alignment, leveling, and bonding of adjacent sections. Electrical connections between shipping breaks shall be made according to manufacturer's shop drawings.
- 16) Training program as specified in section 16053.
- 17) Removal of temporary 480v service (if used) including disposal of miscellaneous material such as pole, wire, meter, etc. connection of auxiliary transformer secondary to switchboard and other miscellaneous work shown.
- 18) Removal and disposal of all excess material from jobsite as directed by the Engineer.
- 19) Mimic Panel: storage Yard.
- 20) Power Company interface: Incoming cable, cable terminators, metering CTs/PTs and metering panels are furnished by the power company. The Contractor shall install this equipment as specified or directed by the power company at no additional cost to the Authority. When required by the power company, the Contractor shall fabricate and install a galvanized steel sheet enclosure to protect the incoming high voltage service cables at no cost to the Authority. The enclosure shall be fabricated from 12-gauge galvanized steel sheet with adequate structuring bracing and installed around the stubout up to a height of 6 feet. A detail shall be prepared and submitted through the Engineer for approval.

2. Section 16053 - Operation and Maintenance Training.
3. Section 16128 - Wire and Cable For Traction Power.
4. Section 16261 - Transformer-Rectifier Units For Traction Power.
5. Section 16262 - Uninterruptible Power System For Traction Power.
6. Section 16291 - Local Annunciator Panel For Traction Power.
7. Section 16292 - Remote Terminal Unit (AEMS RTU) For Traction Power.
8. Section 16293 - Mimic Panel For Storage Yard.
9. Section 16294 - Contact Rail Heating System For Traction Power.
10. Section 16321 - High Voltage AC Switchgear (13.8kv) For Traction Power.
11. Section 16322 - High Voltage AC Switchgear (34.5kV) For Traction Power.
12. Section 16441 - Drainage and Negative Switchboard
13. Section 16451 - Substation Busways For Traction Power.

D. Payment and Measurement Basis

1. Compensation for work specified in this section will be made in accordance with the Unit Price Schedule.
  - a. Material and Equipment furnished/installed in this contract: As specified in appropriate sections of this specification.
  - b. Installation, testing and energizing : Included in the Lump Sum installation cost for each traction power substation and tie-breaker station.
  - c. Support during testing.
    - 1) Material: Lump-sum
    - 2) Labor: Lump-sum

### 1.03 SYSTEM DESCRIPTION

- A. The work to be performed under this Contract includes the furnishing and delivering to the job site of 13.8 KV and 34.5 KV ac switchgear, 700 Volt dc output transformer-rectifier units, metal-enclosed dc switchgear assemblies, dc negative switchboards, ac and dc busducts, annunciators and other auxiliary equipment for the traction substations and tie breaker stations on the WMATA system. The equipment shall be delivered as completely engineered, fabricated, assembled units, inspected and tested ready for installation and connection to external circuits.
- B. The equipment shall be designed and fabricated for connection per general arrangement shown on the Contract Drawings. The arrangements shall result in minimum space requirements for the substations and tie breaker stations, adequate clearances and accessibility and suitability of arrangement with other equipment. Components, design and construction shall be chosen to provide a pleasing and homogeneous appearance. Units shall be as low in profile as possible. Units of the same type and rating shall be identical and interchangeable
- C. The Contractor shall be responsible for providing all required support from equipment manufacturers during field-assembly, installation, testing and start-up of each traction power facility. This effort will include, but not be limited to, the following:
  1. Provide shop-drawings and test-plans.
  2. Provide manufacturer's field-engineering assistance during installation, field-testing and initial energizing. The services of qualified manufacturer's engineering representative shall be made available in phases, during the entire life of the installation contract.
  3. Provide services of manufacturer's engineering representative during initial energization for verification of all equipment functions during train operation.
  4. Make all changes on the equipment which may result from manufacturing discrepancies noted during equipment installation at no additional cost to the Authority.
  5. Manufacturer's engineering representative shall be provided during Operation and Maintenance Training specified in Section 16053. The exact schedule and location shall be coordinated with the Authority and the Contractor.

### 1.04 SUBMITTALS

- A. Submit the following for approval in accordance with Special Conditions and with the additional requirements as specified for each:
  1. Shop drawings:
    - a. Arrangement Drawings: The contractor shall submit equipment arrangement drawings within 25 days after Notice-to-Proceed for all substations and tie breaker stations. Contractor's equipment shall be designed to fit within the building dimensions and with the minimum clearances shown on the Contract Drawings. The Authority reserves the right to require different arrangements than proposed, provided such changes do not add material or equipment in excess of that covered by the Contract.
    - b. Within 40 days after receipt of NTP, submit a schedule of all shop drawing submittal. Include in the schedule, as a minimum, all items listed in Table 16051-II.
    - c. For equipment furnished in this contract, provide complete shop drawings and documentation as specified elsewhere in this specification.
    - d. Update equipment interconnection wiring diagrams provided by equipment

- manufacturers to include panelboard circuit designations for control power, connections to ETS and DTS cabinets, connections to annunciator from UPS, battery, control and interlock wiring between equipment, etc. Develop and submit composite interconnection diagrams showing terminal blocks, cable type, size and routing, appropriate cross-reference at both ends of cable termination, to the Engineer for approval.
- e. Submit a complete drawing index for each substation and tie-breaker station.
  - f. Submit five (5) sets of shop drawings and relay settings for [13.8 kV], [34.5 KV] ac Switchgear including elementary and interconnection wiring diagrams to the Engineer for Power Company coordination and approval.
  - g. In addition submit to the Engineer five (5) sets of shop drawings for complete substation and Tie Breaker Station equipment, including bus duct, control cable tray, elementary wiring and interconnection diagrams for approval.
2. Documentation:
    - a. Submit short circuit calculations and protective relay coordination study for system protection and selective overcurrent tripping within 150 days of NTP. Submit relay coordination study to the engineer for power company approval.
      - 1) In accordance with IEEE 141 and IEEE 242 for fault calculations and coordinated system protection.
      - 2) Include high-voltage source, relays on high voltage switchgear, transformer-rectifier units and dc switchgear.
      - 3) Available short-circuit currents based on power company contribution 750 MVA for 13.8 KV service and 1500 MVA for 34.5 KV service.
      - 4) Recommended settings and adjustment of protective devices
    - b. Field test plan and documentation:
      - 1) Submit field test plan 60 days prior to testing of equipment, with accompanying documentation in the form of test data recording sheets and list of proposed test equipment for approval by the Engineer.
      - 2) The approved test plan will be used for field-testing after installation is completed.
      - 3) Indicate in scope of test plan how equipment will be tested to ensure safe and orderly transition from installation, through initial energizing, to specified field testing.
      - 4) Accompanying documentation to include standard data recording sheets as used in manufacturer's in-plant testing of equipment and devices or as used by major utilities or large industrial users of specified equipment.
      - 5) Submit certified copies of test data, indexed by facility within ten days after completion of testing.
        - a) Include oscillograph recordings of currents with dc switchgear protective device characteristics superimposed in the test reports.
        - b) Verify schematic diagrams for interconnecting wiring, device labeling and proper operation.
        - c) Submit one complete set of certified schematics at time of initial energizing of equipment.
  3. Operation and Maintenance Manuals: In accordance with Special Conditions; include final relay and trip device settings.

## 1.05 QUALITY ASSURANCE

- A. Qualifications: Select manufacturer (s) /contractor (s) who are regular engaged in

production/ installation of similar equipment and have demonstrated a successful record of providing/installing equipment of equal type and rating for extra heavy duty traction service for at least five similar projects.

- B. For codes, regulations, reference, standards and specifications, refer to article 1.02 above.

## **1.06 DELIVERY, STORAGE, AND HANDLING**

- A. Deliver and handle equipment as specified on contract documents.
- B. Store all equipment in secure and dry storage facility before installation at no additional cost to the Authority.

## **PART 2 PRODUCTS**

### **2.01 EQUIPMENT**

- A. As specified in other sections of these specifications.

## **PART 3 EXECUTION**

### **3.01 INSTALLATION**

- A. Provide oversight and supervision to ensure that all equipment are installed in accordance with manufacturers' recommendation and approved shop drawings.
- B. Install equipment as shown and specified in other sections of this specification.
- C. Manufacturer's Engineering Representative:
  - 1. Arrange for assistance of manufacturer's engineering representative during field assembly, installation and adjustment/calibration of equipment being furnished under this contract.
  - 2. Initial energizing of the tracks and each station to be under guidance of manufacturer's engineering representative who will advise Authority personnel on step-by-step procedure.
  - 3. Energizing of each station shall be the Contractor's responsibility with guidance from equipment manufacturer's engineering representative.

### **3.02 FIELD QUALITY CONTROL**

- A. Field Testing and Inspection:
  - 1. General requirements:
    - a. Conduct field testing and inspection at each station to ensure proper operation of equipment provided.
    - b. Correct any deficiencies found during field testing and retest at no additional cost to the Authority.
    - c. Relays and trip device setting: Set protective relays and trip devices in accordance with approved coordination study and their calibration for proper operation during field testing.
      - 1) Initial operation is expected to be six-car trains at two-minute headway; vehicles are being designed so that each six-car train when accelerating will draw a peak current of 9,675 amperes for approximately 17 seconds. Future operation is expected to be eight-car trains at two-minute headway; each eight-car train, when accelerating will draw a peak current of 12,900 amperes for

approximately 17 seconds.

2. Field Inspection

- a. Prior to field testing, check equipment installation in accordance with manufacturer's recommendations and IEEE 141 as applicable including, but not limited to, verification of the following:
- 1) Integrity of bus insulation.
  - 2) Tightness of connections.
  - 3) Adequate support of bus bars.
  - 4) Correct grounding, anchoring and alignment of switchgear in accordance with manufacturer's drawings. Correct insulation of rectifier and dc switchgear from ground.
  - 5) Ease of racking draw out breakers in and out of cubicle
  - 6) Physical interchangeability of similar circuit breakers.
  - 7) Adjustment of circuit breaker main and secondary contacts.
  - 8) Functioning of interlock and closing of safety shutter with breaker in disconnect or withdrawn position.
  - 9) Verify mechanical clearances and proper operation of disconnecting and grounding devices associated with potential transformers.
  - 10) Tightness of bolted bus joints by calibrated-torque-wrench method, based on manufacturer's recommended values.
  - 11) Verify proper mounting and capacitive coupling of neon glow tube in A.C. switchgear for proper indication upon energization, make adjustment as required.

3. Field Testing:

- a. The Contractor shall coordinate with the Engineer to establish the specific testing schedule for each facility. Notify the Engineer one week in advance of each test. Conduct test in presence of engineer.
- b. Furnish test equipment, labor and services of manufacturers' engineering representative to perform specified tests.
- c. Submit certified test reports within ten days of substantial completion inspection. For each item, submit for approval and perform approved tests but not limited to those specified.
- d. Perform insulation resistance test of 60-second duration on all equipment in accordance with the following requirements:.
- e. Test voltage:
- |    |                       |                     |
|----|-----------------------|---------------------|
| 1) | <u>Voltage Rating</u> | <u>Test Voltage</u> |
| a) | 150-600V              | 1,000V, dc          |
| b) | 601-5,000V            | 2,500V, dc          |
| c) | Above 5,000V          | 5,000V, dc          |
- 2) Insulation resistance: kV rating plus one megohm but not less than minimum value recommended by manufacturer.
- 3) Ensure insulation resistance is equal to or greater than minimum value specified before performing dielectric withstand test.
- f. Perform functional and set-up tests on metering, control, interlocking, blocking and supervisory circuits, including verification of interconnections between equipment and interface points. Verification of these tests to be substantiated by lined-in schematics, signed by the Contractor and the Engineer.
- g. For high-voltage ac switchgear:
- 1) Perform insulation resistance test between phase-to-phase and phase-to-ground.
  - 2) Test grounding conductors and enclosures for continuity to station ground bus.
  - 3) Test protective relays and trip devices in accordance with IEEE 141 procedures, modified as necessary, for compliance with approved coordination study.

- 4) Test operation of each circuit and control in accordance with approved sequence.
  - 5) Test interlock system as follows:
    - a) Make closure attempt on locked open devices.
    - b) Make opening attempt on locked closed devices.
  - 6) Dielectric withstand tests: Perform dielectric withstand test of 60-second duration on entire assembled and erected switchgear lineup using 60 Hertz voltage level as specified. During this test, electronic equipment may be isolated from the circuit. Perform tests in accordance with reference standards as follows:
    - a) 13.8 KV switchgear: 27,000 volts rms.
    - b) 34.5 KV switchgear: 60,000 volts rms.
    - c) Control wiring: 1,500 volts rms.
  - 7) Test current transformer circuits for polarity, ratio and protective device operation by primary injection method.
  - 8) Test potential transformer ratio and polarity.
- h. Rectifier Transformer:
- 1) Perform insulation resistance test between winding-to-winding and winding-to-ground. Correct resistance value to temperature.
  - 2) Perform ac high-voltage test between high-voltage winding and ground and low-voltage winding and ground. Perform test at 75 percent of factory test voltage for 60-second duration.
  - 3) Test voltage ratio for full winding and taps. Test result not to deviate more than 0.5 percent from calculated ratio. Set transformer tap as necessary.
  - 4) Check polarity or phase relation.
  - 5) Check contacts of dial-type thermometer for indicating normal and over temperature condition of transformers at remote location and to initiate tripping of associated rectifier-transformer feeder breaker under abnormal temperature conditions. Set thermometer contacts as recommended by manufacturer.
  - 6) Test all alarm indications and protective devices for proper operation.
  - 7) Transformer for outdoor use (oil-filled type) :
    - a) Inspect transformer for oil leaks.
    - b) Test samples of insulating liquid from top and bottom of tank.
    - c) Test dielectric strength in accordance with ANSI C57.12 to verify the minimum breakdown voltage is not less than 34kV for 13.8kV service and 70 kV for 34.5kV service.
- i. Silicon Rectifier
- 1) Perform insulation resistance test between phase to phase and phase to ground.
  - 2) Check contacts of 1st stage rectifier overtemperature device to initiate alarm upon excessive temperature increase. Make temperature settings as recommended by the manufacturer.
  - 3) Check contacts of 2nd stage rectifier overtemperature condition (higher than the 1st stage), to initiate alarm and tripping of rectifier transformer ac circuit breaker and the rectifier cathode breaker via lock-out relay. Make temperature settings as recommended by the manufacturer.
  - 4) Check contacts of diode failure device for alarm initiation with the loss of one diode and tripping of ac rectifier-transformer feeder circuit breaker and rectifier cathode breaker via lock-out relay with second diode failure.
  - 5) Check the operation of enclosure ground detection system to initiate alarm for grounding of the metal enclosure and to initiate

- alarm and tripping of cathode circuit breaker, rectifier-transformer feeder ac circuit breaker and rectifier transformer lockout relay under structure energized condition.
- 6) Check the operation of door interlock to trip and prevent closing of the rectifier-transformer feeder breaker and cathode breaker when the enclosure door is open.
  - 7) Test rectifier enclosure insulation to demonstrate proper enclosure insulation from ground. Test at 2500 volts, 60 Hertz from enclosure to ground for a duration of one minute, with the enclosure ground detection relaying disconnected.
- j. Substation busways: AC busducts, positive dc busducts and negative dc busducts.
- 1) Test resistance of all busway connections. Resistance not to exceed value recommended by manufacturer.
  - 2) Test insulation resistance from bus bars to ground and between insulated busbar.
  - 3) Perform dielectric withstand test of one minute duration at 75 percent of specified factory test value.
  - 4) Test cathode bus duct enclosure insulation to demonstrate proper enclosure insulation from rectifier, dc switchgear and ground. Test at 2500 volts, 60 Hertz from enclosure to ground for a duration of one minute. Remove bonding jumper between bus duct enclosure and rectifier or switchgear during test.
- k. Metal-enclosed dc switchgear:
- 1) Test protective devices/relays in accordance with IEEE 141 procedures, modified as necessary, for compliance with approved coordination study.
  - 2) Test operation of each circuit and control in accordance with approved sequence.
  - 3) Test interlock system as follows:
    - a) Make closure attempt on locked-open devices.
    - b) make opening attempt on locked-closed devices.
  - 4) Perform dielectric withstand test of one minute duration on entire assembled and erected switchgear. Test at a voltage of 2775 volts, rms, 60 Hertz or 3900 volts dc on live parts and 1500 volts, rms, 60 Hertz on control wiring. Isolate all electronic timers and devices during the test.
- l. Test switchgear enclosure insulation to demonstrate proper enclosure insulation from ground. Test at 2500 volts, 60 Hertz from enclosure to ground for a duration of one minute. Disconnect enclosure ground detection relaying during the test.
- m. Short-Circuit Test on DC Bus: At each substation, perform a short-circuit test to insure capability of transformer-rectifier units to withstand a bolted fault at the dc switchgear bus and to verify coordination of cathode circuit breaker and ac circuit breakers in ac switchgear. Test with all ac circuit breakers closed except ac bus tie breaker, all dc cathode circuit breakers closed and all dc feeder circuit breakers connected and open. Apply a bolted fault to the dc switchgear at the line terminals of one dc feeder circuit breaker. Record current at each affected breaker with an oscillograph.
- n. Short-Circuit on DC Feeder:
- 1) Perform short-circuit tests in the vicinity of [location - TBD] substations to ensure capability of dc feeder breaker to trip and interrupt a close-in fault under maximum short-circuit conditions and to coordinate with cathode breaker forward trip. Apply a bolted fault at the tracks in the immediate vicinity of the substation between inbound contact rail and a running rail. Demonstrate that the instantaneous trip element of the feeder breaker nearest to the

fault in the substation initiate breaker tripping and rate of rise relay associated with the remote feeder breaker in the tie breaker station initiate breaker tripping and the cathode breaker and AC breakers and the other DC feeder breaker does not trip improperly. Test with all rectifiers in operation and all interconnecting dc feeder breakers closed. As part of the test, record the trip device which operates affected dc feeder breakers. Record current at each affected breaker with an oscillograph.

- a) Provide any additional relays, other than those shown on the one line diagram, which are considered to be necessary to achieve the above protective relaying coordination.
  - 2) Remote Short-Circuit on Feeder: Perform a remote short-circuit test on the remote end of the same section of inbound contact rail midway between Substations, but located as specified. Demonstrate capability to detect and clear a remote fault with settings made on the protective relays, that only the two feeder breakers (one in the substation and one in the tie breaker station) nearest to the faulted section of contact rail trip and that the cathode breaker, and ac breakers and other dc feeder breakers do not trip. Demonstrate that the feeder breakers at the adjacent substations or tie breakers stations do not trip. As part of the test, record the trip device which operates affected dc feeder breakers. Record current at each affected breaker with an oscillograph.
  - 3) Automatic Recloser Field Tests: Test the automatic recloser system for both the near short-circuit test for the remote short-circuit test for on dc feeder and for proper operation under both short-circuit conditions and normal operating conditions.
  - 4) station prior to short-circuit test on dc feeder, remote short-circuit test on dc feeder and automatic recloser field test. Test with two twelve-car trains, without passengers one inbound and one outbound, starting at the passenger station simultaneously. Demonstrate relays and trip devices, as set, do not respond improperly to train starting. Demonstrate that the relay and trip settings required to meet the required short circuit test will not respond improperly when starting a twelve-car train at a passenger station close to a substation. Record current at each affected feeder breaker with an oscillograph.
  - o. Reverse Current Test on Cathode Breaker: Perform a primary current injection test on a cathode breaker to verify proper operation of reverse current protection.
  - p. Test ETS system for proper operation in conjunction with Installation Contractor.
  - q. Graph/record harmonic noise and content of harmonic current on feeder cables and on surrounding ATC equipment. Meet utility and manufacturer standards.
- B. Field Testing Personnel:
1. Provide services of qualified engineering representatives of the equipment manufacturers to conduct specified field testing program.
  2. When more than one representative is involved, the Contractor is responsible for coordination of testing effort.
- C. The short circuit tests shall be planned for minimum interference with Authority's train testing or other track use, and shall be totally accomplished, including all instrumentation and removal, in a total period of three (3) days or less per facility. The actual period shall be coordinated with and established by the Authority.

- D. Authority Tests:
  - 1. The Authority reserves the right to require the Contractor to conduct acceptance tests of voltage regulation and sound level on each transformer-rectifier unit at each substation and a train start test at each passenger station within one year after installation.
  - 2. In order to perform sound level test, the Contractor may recreate test conditions of applicable standards to the extent possible without disturbing existing structure or installed equipment and materials.
- E. Submit five (5) copies of certified test reports within 10 days of Substantial Completion (SCI) for each station.

TABLE 16051-I

SCHEDULE OF SHOP DRAWING REQUIREMENTS

<u>Item</u>	<u>Description</u>	<u>To Be Furnished Within Calendar Days</u>
A	Outline dimensions, including weights and foundation requirements for all equipment furnished	60 after Award
B	Front views, floor plans, and mounting details for all equipment furnished	60 after Award
C	One line diagrams	90 after Award
D	List of standard symbols and nomenclature	90 after Award
E	Elementary and control schematic diagrams and description of operation	90 after Award
F	Interconnection wiring diagrams	120 after Award
G	Wiring diagrams, showing internal wiring of all equipment furnished	120 after Award
H	Wiring diagram, showing interconnection between shipping breaks	120 after Award
I	Cross sections showing internal construction of equipment	60 after Award
J	Physical details of 13.8kV or 34.5 kV connections to transformers	90 after Award
K	Physical details of all ac and both dc positive and negative busducts and bus connections	60 after Award
L	Certified Design and Field Test Reports	10 after Test Completion
M	Rectifier Transformer Data, including: 1. Excitation Current 2. Impedance, percent based on rated kVA 3. Reactance, percent based on rated kVA 4. Resistance, percent based on rated kVA 5. Weights: Core and coils Tank and fittings Insulating oil Total	60 after Award
N	Rectifier Data, including: 1. Diode Ratings: Voltage, Peak Reverse Voltage, Current, Temperature Limit 2. Arrangement of Components	45 after Award

TABLE 16051-I (Continued)

SCHEDULE OF SHOP DRAWING REQUIREMENTS

<u>Item</u>	<u>Description</u>	<u>To Be Furnished Within Calendar Days</u>
O	Dc Switchgear Data, including: 1. Duty cycles before required maintenance: No-load Full-load Rated fault current interruptions 2. Weight of circuit breaker only 3. Certified Design Test Reports	45 after Award
P	AC Switchgear Data, including: 1. Duty cycles before required maintenance: No-load Full-load Rated fault current interruptions 2. Weight of circuit breaker only 3. Certified Design Test Reports	45 after Award
Q	Annunciator Panel	45 after Award
R	Control Power Data for each substation including: 1. Continuous 125-Volt dc load 2. Continuous 115-Volt ac load 3. Closing and Tripping loads of: a. 700-Volt dc circuit breakers, for each rating b. 13.8kV or 34.5 kV circuit breakers	60 after Award
S	Technical Description of Equipment Operation, Control and Protective Functions	90 after Award
T	Bill of Material, with reference to all components indicating part numbers and manufacturer name	90 after Award
U	Equipment Arrangement Drawing; Plan and Elevation for each substation and tie breaker station including busduct sizes and elevation and cable tray plan and elevation for space coordination purposes.	30 after Award
AA	Wire and Cable.	45 after NTP.
BB	Uninterruptible power system.	In accordance with table 16261-1.
CC	Basic materials and methods: Cable trays and mounting details, DTS	45 after NTP.

TABLE 16051-I (Continued)

<u>Item</u>	<u>SCHEDULE OF SHOP DRAWING REQUIREMENTS</u> <u>Description</u>	<u>To Be Furnished</u> <u>Within Calendar Days</u>
	cabinet, ETS enclosures, ETS relay cabinet, ETS system schematic diagram, ETS light fixture and remote ballast, Panelboard, steel panels, glastic barrier/firestop.	
DD	Remote terminal unit, including schematic diagram, connection diagram, layout drawing of control wiring and Internal component, enclosure details.	60 after NTP.
EE	Certified factory test reports.	30 after test completion.
FF	Certificates from manufacturers verifying that products conform to specified requirements.	45 after NTP.
GG	Manufacturers' catalog cuts and literature.	45 after NTP.

SPECIFIER'S NOTE:      NUMBER OF CALENDAR DAYS IS FOR INFORMATION ONLY. SPECIFIER TO COORDINATE NUMBER OF DAYS WITH SPECIAL CONDITIONS.

## SECTION 16052

### BASIC MATERIALS AND METHODS FOR TRACTION POWER

#### PART 1. GENERAL

##### 1.01 SUMMARY

- A. The scope includes furnishing and installing basic materials.
- B. Related Sections:
  - 1. Section 16051 - Scope of Work For Traction Power
  - 2. Section 16128 - Wire and Cable For Traction Power
  - 3. Section 16260 - Uninterruptible Power System (Static)
  - 4. Section 16261 - Transformer-Rectifier Units For Traction Power
  - 5. Section 16291 - Local Annunciator Panel For Traction Power
  - 6. Section 16292 - Remote Terminal Unit (AEMS RTU) For Traction Power
  - 7. Section 16293 - Mimic Panel-Storage Yard
  - 8. Section 16294 - Contact Rail Heating System For Traction Power
  - 9. Section 16321 - High Voltage AC Switchgear (13.8KV) For Traction Power
  - 10. Section 16322 - High Voltage AC Switchgear (34.5KV) For Traction Power
  - 11. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power
  - 12. Section 16441 - Drainage and Negative Switchboard
  - 13. Section 16451 - Substation Busway For Traction Power
- C. Compensation for work specified in this section will be made in the following manner:
  - 1. Basic Materials: Lump Sum.
  - 2. Installation: Lump Sum.

##### 1.02 REFERENCES

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of jurisdictional authorities
  - 2. NEC
  - 3. UL: 6, 50, 67, 94, 198D, 224, 360, 486, 489, 496, 508, 514, 651, 870, 1029, 1572
  - 4. ASTM: A36, A47, A123, A153, A325, A386, A500, A507, A523, A525, A532, A536, B138, B187, B633, D149, D150, D257, D412, D495, D570, D638, D648, D696, D790, D792, D1000, D1056, D1518, D1682, D1784, D2240, D2583, E84, F593, F594, G21, G235
  - 5. ANSI: C80.1, C80.5, Z55.1, A14.1, B18.21.1, C119.1
  - 6. NEMA: VE1, AB1, PB1, CC1, ST-20, FG-1, 250
  - 7. FS: TT-S-227, FF-S-760, FF-S-325,
  - 8. ACI: 318
  - 9. MS: MIL-I-23053/15

##### 1.03 SUBMITTALS

- A. Submit the following for review in accordance with the instructions elsewhere in this Specification and with the additional requirements as specified for each:
  - 1. Shop Drawings: Shop drawings for cable trays and mounting details, DTS Cabinet, complete ETS Enclosure including all devices and components, ETS light fixture and remote ballast, ETS relay cabinet, panelboards, fiberglass panels, glastic material and through floor barrier/firestop.

2. Submit shop drawings for incoming service cable tray to the Engineer for approval by PEPCO and Virginia Power.
3. Certification: Certificates from manufacturers verifying that equipment furnished conforms to the specified requirements.
4. Product Data: Manufacturer's product data for all materials.
5. Samples: ETS enclosure and light fixture, one of each size nameplate, tags, wire labels, contact rail cable connector assembly, glastic material and danger markers.

#### **1.04 QUALITY ASSURANCE**

- A. Qualifications: Select manufacturers who are regularly engaged in production of specified materials. Select installation contractors who are regularly engaged in the installation of specified materials.
- B. For Codes, Regulations, Reference Standards and Specifications, refer to Article 1.02 above.

#### **1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage.
- C. Store products in secure and dry storage facility.

### **PART 2 PRODUCTS**

#### **2.01 MATERIALS**

- A. Floor Sealant:
  1. Floor sealant: Water-epoxy concrete floor protective coating providing good resistance to wear, abrasion, soiling and chemical attack.
    - a. Product: Tennant ECO-LTS (405) coating system mixed with Tennant 413SF solvent-free bonding additive (for first coat only) as manufactured by Tennant Company, Minneapolis, or equal.
    - b. Tennant 409 Pre-Kote cleaner or equal, for floor preparation and better adhesion of the coating.
- B. Insulated Floor Topping:
  1. Description: Insulated floor topping consisting of epoxy resin with filler where indicated. Gray color.
  2. Epoxy resistivity: Minimum  $10^{12}$  ohm-cm.
  3. Epoxy manufacturers: Hallemite Grey Amazite by Hallemite, 25 Holden Street, Providence, R.I., 02908, or FX-70-6EE by Fox Industries, 3100 Falls Cliff Road, Baltimore, MD, 21211, or equal.
  4. Filler: Manufacturer's standard for this service.
- C. Furniture:
  1. Workbench: Heavy duty, 2-5/8 inch laminated maple top, 35 inch high by 60 inches wide by 30 inches deep with steel base which can be bolted to the floor. Provided with three 14-inch wide by 22-inch deep by 6-inch high drawers, one 20-inch deep by 50-inch wide by 20-inch high cabinet with center shelves and two steel doors. Provided with four inch toe clearance.

2. Stool: 14-inch diameter seat with tubular steel adjusting leg extensions that lock securely at one-inch intervals, adjustable from 18 inches to 27 inches.
3. Storage Cabinet: Steel, 36 inches high, 60 inches long and 16 inches deep with one, adjustable height shelf supported every 15 inches. Provided with four doors.
4. Stepladder: Wood, heavy duty, eight-foot. ANSI A14.1, Type 1, industrial.
5. Finish for metallic surfaces: Cleaned, degreased, primed with zinc primer and finished with one coat of light gray enamel, ANSI Z55.1, color 61, minimum dry film thickness: one mil.

## 2.02 EQUIPMENTS

- A. Conduit, Cable Tray, Boxes, Cabinets and Fittings.
  1. General Requirements:
    - a. Size: As shown, minimum conduit size 3/4 inch.
    - b. Materials:
      - 1) Steel sheet: ASTM A507.
      - 2) Zinc-coated steel sheet: ASTM A653, coating G235.
      - 3) Malleable iron: ASTM A47
      - 4) Cast iron: ASTM A532
      - 5) Ductile iron: ASTM A536
      - 6) Fiberglass Reinforced Polyester (FRE): NEMA FG-1
      - 7) Bronze Extrusion: ASTM B455, Alloy C38500
      - 8) Bronze Casting: ASTM B584, Alloy C38600
    - c. Zinc coating:
      - 1) Hot Dip Galvanizing: ASTM A123 and ASTM A386
      - 2) Electro galvanizing: ASTM B633
  2. Galvanized Steel Rigid Conduit and Fittings: UL 6 and ANSI C80.1, zinc coating tested in accordance with reference test in appendix.
  3. Aluminum Rigid Conduit and Fittings:
    - a. ANSI C80.5 and UL6.
  4. Liquid-tight Flexible Conduit and Fittings: (for use with galvanized steel rigid conduit)
    - a. Applicable requirements of UL 360.
    - b. Flexible galvanized steel core with extruded liquid-tight neoprene or PVC jacket overall.
    - c. Sizes up to 1-1/4 inch provided with continuous copper bonding conductor, spiral wound between convolutions.
    - d. Sizes 1-1/2 inch and above provided with separate grounding conductor.
  5. Rigid fiberglass reinforced epoxy conduits and fittings:
    - a. Rigid fiberglass reinforced epoxy conduit, UL 1684, IPS (Iron Pipe Size) based conduit.
    - b. Conduit shall be manufactured by using filament winding process with minimum fiberglass content of 65 percent by weight and no fillers.
    - c. IPS based conduit shall have nominal wall thickness of 0.09 inch for five-inch nominal conduit size.
    - d. Conduits, elbows and fittings manufactured from the same material and using the same manufacturing process.
    - e. Conduit sections formed with integral bell-and-spigot type couplings shall use adhesive epoxy compound to make the joints watertight. Rubber sealing gasket at bell end is prohibited.
    - f. Adhesive epoxy compound as recommended by conduit manufacturer.
    - g. Conduits, elbows and fittings are specified for use throughout a temperature range of -40F to 230F, and they are to be protected from exposure to sunlight by pigmentation uniformly dispersed through the resin material.
    - h. Conduits, elbows and fittings shall be suitable for encasement in concrete below grade and conform to UL 1684, and listed and labeled by UL meeting the requirements of NEC Article 347 for Rigid Nonmetallic Conduit and its

- use.
6. Conduit Expansion Fittings: Weatherproof, fabricated from material compatible with conduit with which fittings are to be used. Metallic fittings equipped with bonding jumper cable to provide electrical continuity.
  7. Conduit Connector Fittings:
    - a. UL 514, material and finish similar to that of conduit with which they are to be used.
    - b. Indoor Locations: For enclosures, cabinets, boxes and gutters: Nylon-insulated bushing and locknut.
    - c. Outdoor Locations: Watertight nylon-insulated bushing and locknut for termination of galvanized rigid steel conduit. Watertight PVC threaded adapter with O-ring and locknut or bushings for termination of PVC conduit.
  8. Conduit seal:
    - a. To provide watertight seal between concrete and conduit where it penetrates wall, floor or ceiling.
    - b. Size as shown or necessary.
    - c. Materials: Body and pressure clamp of malleable or cast iron with a neoprene sealing grommet and PVC-coated or galvanized-steel pressure rings, oversized sleeve of PVC or galvanized.
    - d. Seal between conduit and concrete to withstand pressure from 50-foot head of water without leakage.
  9. Cable and Seal Fittings:
    - a. To provide watertight seal between cable and conduit for use with single-conductor or multiple-conductor cable as necessary.
    - b. Size as necessary, drilled to accommodate cable.
    - c. Pressure discs of PVC-coated steel and sealing ring of neoprene.
    - d. Seal between cable and conduit to withstand water pressure of 50 psi without leakage.
    - e. O-Z type CSBI, CSBE or equal as shown on drawings.
    - f. Seal all unused conduits for traction power and auxiliary power using blank seals.
  10. Seal Compound:
    - a. FS TT-S-227, two-component, fast-setting, polymeric sealing compound to provide watertight seal between cable and conduit.
    - b. Pour-type for horizontal and gun-grade for vertical or overhead application.
    - c. When cured, sealant to have rubber-like flexibility allowing minimum movement of conduit and cable in temperature range of minus 10F to plus 150F without loss of watertight seal.
    - d. Pot life: 15 minutes.
    - e. Minimum ambient temperature for application: 35F.
    - f. Initial cure: 15 minutes.
    - g. Final cure: Seven days.
    - h. Hardness, Durometer A: 20-35.
    - i. Seal between conduit and single-conductor or multiple-conductor cable to withstand water pressure of 50 psi without leakage.
    - j. Fox Industries, Type FX-571G or equal.
  11. Conduit, Cable Tray and Cable Supports:
    - a. Retaining straps and fasteners: FS FF-S-760, with the following additional requirements:
      - 1) Type, style and size: As necessary.
      - 2) Material and finish: Steel or malleable iron, hot-dip galvanized after fabrication, fiberglass reinforced polyester.
      - 3) For separating conduit from masonry surface: Galvanized malleable iron spacer assembled with Style A strap.
      - 4) For vertical run of metallic sheath cable: Basket weave cable support.

- 5) For fastening conduit or cable to channel inserts: Galvanized steel fasteners.
- b. Trapeze type hangers: Consisting of two or more hanger rods, horizontal member, U-bolt clamp and other attachment necessary for securing hanger rods and conduit, with the following additional requirements:
- 1) Material and finish: Steel, hot-dip galvanized after fabrication or Fiberglass Reinforced Polyester conforming to the requirements specified for fiberglass channel struts.
  - 2) Hanger rod: Not smaller than 5/8-inch diameter, threaded for sufficient distance at each end to permit at least 1-1/2 inches of adjustment.
  - 3) Horizontal member: Channel, 1-5/8 inches square by 12 gauge or heavier. Weld two or more channels together for greater strength if necessary.
  - 4) Design: Capable of supporting load equal to sum of weights of conduit, cable and hanger plus 200 pounds. At design load, stress at root of thread on hanger rod 9,500 psi maximum; stress in horizontal member 12,500 psi maximum.
- c. Steel Channel Struts:
- 1) Size and shape as shown, 12-gauge or heavier hot-dip galvanized, with 7/8 inch wide continuous slot, 9/16 inch base slot, two inches on center or solid base with field drilled holes as required with minimum pull out load rating of 1,000 pounds per linear foot.
  - 2) Fittings and accessories compatible with associated steel channel struts and having same material and finish.
- d. Stainless Steel Channel Struts:
- 1) Size and shape as shown, 12-gauge or heavier stainless steel, type 304, with 7/8 inch wide continuous slot, 9/16 inch base slot, two inches on center or solid base with field drilled holes as required with minimum pull out load rating of 1,000 pounds per linear foot.
  - 2) Fittings and accessories compatible with associated channel struts and having same material and finish.
- e. Fiberglass Channel Struts:
- 1) Fiberglass reinforced polyester, self extinguishing, with 7/8" wide continuous slot, 13/32" pre-drilled holes in base on 1-5/8" centers, or solid base with field drilled holes as required with the following additional requirements

<u>Physical Properties</u>	<u>Value</u>	<u>Method</u>
Tensile Strength	30,000 PSI	ASTM D638
Flexural Strength	30,000 PSI	ASTM D790
Barcol Hardness	50	ASTM D2583
Dielectric Constant	200 VPM	ASTM D150
Coefficient of Thermal Expansion	$5 \times 10^{-6}$ in/in/°F	ASTM D696
Specific Gravity	1.7	ASTM D792
Flammability Rating	15	ASTM E84
Moisture Absorption	1% (24 hrs. at 72°F)	ASTM D570

- 2) Fittings and accessories compatible with associated fiberglass channel struts and having same material or approved similar material.
  - f. Cinch anchors: One-piece wedge type, galvanized with threaded stud.
  - g. Cable support brackets: Size and type as shown, 12-gauge or heavier, hot-dip galvanized.
  - h. Cable insulators: Saddle type, high glazed porcelain, designed for use with the brackets provided.
12. Boxes
- a. Outlet boxes:
    - 1) UL 514, capable of accommodating conduit as shown.
    - 2) Material and finish:
      - a) Steel, cast iron, ductile iron or malleable iron.
      - b) Hot-dip galvanized or electrogalvanized after fabrication.
  - b. Junction and pull boxes:
    - 1) Internal volume up to 100 cubic inches, UL 514; internal volume above 100 cubic inches, UL 50.
    - 2) Flush-mounted or surface-mounted as shown.
    - 3) Size: Suitable to accommodate conduit, raceways, ducts, number of cables and splices shown.
    - 4) Material:
      - a) Stainless Steel, Type 316.
      - b) Hot-dipped galvanized or electrogalvanized after fabrication.
13. Cable Trays
- a. General:
    - 1) Dimensions: Minimum four inches inside depth; nine inches rung spacing unless otherwise shown.
    - 2) Maximum load rating: 50 pounds per linear foot with safety factor of 2.0 at 12-foot support span for steel trays. 200 pounds per linear foot with safety factor of 1.5 at 12 foot support span for fiberglass reinforced polyester trays. Support additional concentrated load of 200 pounds at any point without permanent deflection.
    - 3) Bend Radius:
      - a) For incoming service cable: 36 inches or as approved by the utility.
      - b) For all other cable: 24 inches or as shown.
  - b. Fiberglass Cable Tray
    - 1) NEMA FG-1, fiberglass ladder type.
    - 2) Allowed for carrying all dc positive and negative cable except as otherwise noted. Fiberglass material shall be used for all fittings and accessories associated with the installation of fiberglass trays.
    - 3) Fiberglass Reinforced Polyester in accordance with the following:

Physical Properties	Value	Method
Tensile Strength	40,000 PSI	ASTM D638
Flexural Strength	45,000 PSI	ASTM D790
Barcol Hardness	95	ASTM D2583
Dielectric Strength	200 VPM	ASTM D149
Specific Gravity	1.7	ASTM D792
Coefficient of Thermal Expansion (Longitudinal)	5x10 <sup>-6</sup> in./in./°F	ASTM D696
ASTM D696	1% (24hrs. at 72°F)	ASTM D570
Flammability Classification	V-O	UL 94
Flammability Rating	15	ASTM E84

14. Expansion Bolt Anchors: FS FF-S-325C Group II, Stainless Steel-316, type and class as approved, galvanized.
15. Wireways and auxiliary gutters:
- a. Galvanized steel with formed flanges on both body and cover, screw on covers, in accordance with UL870, complete with all necessary fittings, couplings and end pieces.
  - b. Size as shown.
  - c. Electrogalvanized and finished with light gray enamel, ANSI Z55.1, Color 61.
16. DTS Cabinet/Remote Control and Monitoring Cabinet:
- a. Wall-mounted, single-door, NEMA 250, Type 12, with panel, similar to Hoffman Engineering Company or equal, as shown.
  - b. Enclosure: Formed of minimum 14-gauge steel, seams continuously welded and ground, without openings or knockouts, with threaded conduit entrance hubs, lugs for mounting enclosure and collar studs for mounting panel. Rolled lip formed on all sides of door opening. Enclosure and door reinforced when size exceeds 30 inches square. Size as shown. (Note: The Remote Control & Monitoring Cabinet shall be identical to the DTS Cabinet for Tie Breaker Station, except that the nameplate shall be modified to suit.)
  - c. Door: Formed of minimum 14-gauge steel, with rolled lip along top and sides to mate with enclosure. Fitted with removable print pocket. Closed-cell neoprene gasket attached with oil-resistant adhesive and steel retaining clips.
  - d. Hardware: Corrosion-resistant steel continuous piano hinge with removable pin. Hasp and staple for padlocking.
  - e. Panel: Formed of 12-gauge steel.
  - f. Finish: Galvanized enclosure, door, panel and latch mechanism. Painting by manufacturer's standard method in accordance with the following:
    - 1) Outside: Phosphatized, primed and finished with two coats of light gray enamel or epoxy coating, ANSI Z55.1, Color 61; minimum dry film thickness, two mils.
    - 2) Inside including panel: Two coats of white enamel or epoxy coating.
  - g. Breather drain: One 1/2 inch diameter, Crouse-Hinds Catalog No. ECD11 or equal.

- h. Grounding stud: Manganese bronze, ASTM B138, Alloy No. 675 hard, 3/8 inch high; Evedur GSI, American Brass Company or equal.
  - i. Terminations: Assembly rail and modular terminals, Weidmuller Terminations, Incorporated or equal.
    - 1) Terminal: Modular test terminal, Melamine plastic, screw clamp connections, with socket screws; type SAKC4, Catalog No. 3406.2, with the following additional requirements:
      - a) Amperes: 25.
      - b) Volts: 300.
      - c) Wire gauge range: 22 AWG to 12 AWG.
      - d) Thickness: 0.256 inch.
      - e) UL-listed.
      - f) Standard accessories: compatible with terminal, with the following additional requirements:
        - (1) End section: Type AP, No. 1179.2.
        - (2) End bracket: Type EWK1, No. 2061.6.
        - (3) Test plug: Type PS, No. 1804.0
        - (4) Jumpering Combination: Type QB, No. 91455.0.
        - (5) Disconnect plug for SAKC4 terminal: Type TST, No. 413074.
        - (6) Locking pin: Type SST3, No. 1527.0.
    - 2) Assembly rail: Type TS 32 steel standard section compatible with terminals, with fixing slots, Catalog No. 1228.0 and standard rail mounting screws.
    - 3) Marking tags: Horizontal in sequence, Type FW, No. 4681.6 white thermoplastic. Consecutive numbering conforming to that of DTS box.
    - 4) Group marking carrier with paper marking strip and transparent cover.
      - a) Type SCHAT5, Catalog No. 2924.6.
      - b) Type ES05, Catalog No. 2937.0.
      - c) SST5, Catalog No. 2940.0
17. ETS Enclosures:
- a. Enclosure: Nonventilated, single-door fiberglass enclosure NEMA 250, Type 3R, with mounting brackets as shown, complying with applicable requirements of UL 508.
    - 1) Molded fiberglass reinforced polyester material 1/8 inch thickness, minimum, and in accordance with the following:

Physical Properties	Value	Method
Flexural Strength	17,000 PSI	ASTM D790
Deflection Temp	400F	ASTM D648
Water Absorption (24 hours)	0.5%	ASTM D570
Tensile Strength	6,500 PSI	ASTM D638
Specific Gravity	1.8	ASTM D792
Flammability	V-O	UL94
Dielectric Strength	400 Volts/Mil	ASTM D149
Arc Resistance	180 Sec	ASTM D495

- 2) Gasket: Oil-resistant 100 percent neoprene by polymer content, ASTM-D1056 grade SCE-42 with oil-resistant adhesive.
  - 3) Piano hinges: Stainless Steel, one inch wide by 1-3/4 inches high with model pins and fasteners, two per enclosure.
  - 4) Door handle: T-handle, One half turn, Vise Action Type, die cast zinc, matte black, polyester powder finish with stainless steel hardware, SOUTHCO catalog No. E3-10-105-50 or equal.
  - 5) Panels, back plates, barriers and brackets: 10 gauge stainless steel as shown.
  - 6) Hardware: Stainless steel bolts, nuts and screws; ASTM F593, size as shown.
  - 7) For ultra-violet protection of fiberglass box, the material shall contain ultra-violet inhibitor on inside and outside surfaces coated with polyurethane paint, 1.5 mils minimum dry film thickness.
  - 8) Color: Fiberglass material, gray inside and out.
  - 9) Open/Close Decal: Pressure sensitive weatherproof, vinyl tape with 1/4" high red on a white background. "OPEN" shall have red letters, "CLOSE" shall have green letters.
  - 10) Nameplates: Each ETS Enclosure provided with three-ply laminated plastic, multi-layered nameplates inscribed with 1-inch lettering identifying the ETS Box Number, Supervisory Control Identification Nos. of the dc breakers being tripped. A typical example of engraving is as follows:
    - a) EMERGENCY TRIP SWITCH NO.
    - b) E-F07-31
    - c) E-F08-41
- b. Emergency pushbutton: Provide on the backplate, mushroom head trip switch with 4 NC poles similar to Square-D Cat. No. 9001-4-KA-3 with head No. 9001-KR-5R.
- c. Terminal block: Provide on the backplate one 12-point terminal board similar to GE Cat. No. CR151B2 or equal.
18. ETS Relay Cabinets:
- a. Wall mounted, single door, NEMA 250, type 12, with enclosure and back panel similar to Hoffman Engineering Company or equal, as shown.
  - b. Enclosure formed of minimum 14-gauge steel with sufficient structural reinforcements to ensure a plane surface, to limit vibration and to provide

sufficient rigidity during shipment, installation and operation. A print pocket shall be attached to the inside of the door of enclosure.

- c. Door formed of minimum 14 gauge steel with rolled lip formed along top and sides to mate with enclosure. Provided with hasp and staple for padlocking.
- d. Back panel formed of minimum 12 gauge steel.
- e. Relays and Terminal Blocks: The cabinet shall have mounted on its back panel auxiliary relays of hinged armature construction, 125V dc rated coil and electrically held, self reset type with 2 NO and 4 NC contacts similar to GE Catalog No. 12HFA51A42H code No. 24 contact arrangement or equal. Terminal blocks with cover similar to GE Type EB shall be mounted on back panel. Quantity of relays and points on terminal blocks as shown.
- f. Name Plates and Wire Labels: In accordance with Article 2.02.C.

B. Circuit Breakers & Panelboards:

- 1. General Requirements:
  - a. Interchangeability: Components of the same type, size, rating, functional characteristics and make are to be interchangeable.
  - b. Finish for enclosures for panelboards.
    - 1) Clean and degrease metallic surfaces.
    - 2) Prime with zinc primer.
    - 3) Finish with one coat of light gray enamel, ANSI Z55.1, Color 61; two mils minimum DFT.
- 2. Circuit Breaker: NEMA AB1, UL489, molded-case, bolt-on, quick-make/quick-break, mechanically trip-free, switching mechanism, with thermal trip for inverse time delay overcurrent protection and magnetic trip for instantaneous short-circuit protection. Frame size 225 amperes and above equipped with interchangeable thermal trip and adjustable magnetic trip unit. Designed to carry continuous rating in ambient temperature of 40C with the following parameters as shown:
  - a. Number of poles.
  - b. Rated voltage, ac or dc
  - c. Rated interrupting current.
  - d. Trip setting.
  - e. Frame size.
- 3. Enclosed Circuit Breaker:
  - a. NEMA AB1.
  - b. Circuit breaker: As shown and specified. Overcurrent trip device coordinated to provide selective tripping under overload conditions.
  - c. Enclosure:
    - 1) Galvanized steel, surface-mounted, unless otherwise shown.
  - d. Type:
    - 1) Above-ground indoor locations and electrical rooms: NEMA 1.
    - 2) Tunnel areas and underground locations, except electrical rooms: NEMA 12.
    - 3) Outdoor locations: NEMA 3R.
- 4. Panelboard:
  - a. NEMA PB1, UL 67.
  - b. Enclosure:
    - 1) UL 50.
    - 2) Galvanized steel, surface mounted unless otherwise shown.
    - 3) NEMA 250, Type 1
    - 4) Gutter size

Main Bus Rating Amperes	Minimum Top and Bottom Gutter Size in Inches	Minimum Side Gutter in Inches
100 and below	4	4
225	6	4

- 5) Interior components mounted on backplate of reinforced steel for rigid support and accurate alignment.
  - 6) One piece sheet steel front panels with hinged door and lock so constructed that when panelboard door is locked front cannot be removed.
  - 7) Provide latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.
  - 8) Provision for enclosure grounding.
- c. Busbars:
- 1) ASTM B187.
  - 2) 98 percent conductivity copper.
  - 3) Contact surface silver-plated or tin-plated.
  - 4) Rating of neutral and ground bus: Equal to that of phase bus.
  - 5) Neutral bus mounted on insulating block.
  - 6) Neutral and ground bus equipped with integral mechanical connectors.
- d. Circuit Directory:
- 1) Neatly typed to identify the load fed by each circuit by number.
  - 2) Mounted on a metal frame with clear plastic cover inside cabinet door.
- e. DC Panelboard: 125 volt dc, 2-wire. Main and branch circuits with 2-pole breakers, quantity and ratings as shown. AIC-10,000 amps minimum.
- C. Nameplates, Tags and Wire Labels:
1. Nameplates:
    - a. Three-ply, laminated phenolic plates, engraved through black face to white core, attached by stainless steel rivets or screws.
    - b. Lettering: Vertical gothic using round or square cutter. V-shape groove is prohibited.
    - c. Size: One-inch high with 1/2-inch high lettering.
  2. Conduit and Cable Tags: Stainless steel, round, punched with cable or conduit number as shown.
  3. Wire labels: Sleeve-type, heat shrinkable, flame retardant Raychem TMS product line, Type XPE or equal and conforming to UL224. Wire identification same as corresponding terminal block identification unless otherwise shown. The labels on 1000 KCMIL cable shall be clear, heat shrinkable with 1/2" height yellow lettering stamped on inside. The labels shall have reference of substation or tie-breaker station breaker Supervisory Control ID number and cable sequence in the branch of the feeder (e.g. BRK. 32-A) at both ends.
- D. Emergency Trip Station Light Fixture Type 9.
1. Lighting Fixture: Enclosed and gasketed mercury-vapor fixture suitable for outdoor locations conforming to UL-1572 and as shown. Hubbell Catalog No. VMWX-50C-R or equal.
    - a. Lamp: Mercury-vapor, 40 watt B-17, medium base, 24,000 hours rated average life, and conforming to applicable ANSI Standards.
    - b. Lampholder: In accordance with UL 496, glazed porcelain base and body, rated 660 watts, 600 volts, medium screw base, and self-retaining neoprene

- c. gasket for dust and moisture-proof seal between lamp and lampholder.  
Housing: Copper free heavy-duty die cast aluminum with 90-degree arm for wall mounting, natural color, threaded to provided a secure fit for the globe and guard.
- d. Globe: Thermal shock and impact resistant blue tempered glass, threaded to ensure secure fit to housing.
- e. Guard: Copper free die cast aluminum to provide protection to the globe and lamp, threaded and provided with a flush mounted set screw for a positive and secure fit to housing.
- f. Ballast: UL 1029, high power factor, H45 type, Class H insulated, capable of starting a 40 watt mercury vapor lamp at an ambient temperature of minus 20F and above, 277 volt, 60 Hertz, suitable for mounting in an enclosure for remote mounting.
- g. Remote ballast enclosure: Fiberglass or aluminum with polyester powder paint finish, front access and weathertight construction with 3/4" conduit entry and exit knockouts, with mounting lugs suitable for mounting on channel inserts or inside interface box as shown.

E. Danger Markers:

1. Danger markers for conduit and cable installed in track areas:
  - a. Danger plate for use on timber ties supporting conduit and cable.
    - 1) Three-ply, laminated phenolic plates, engraved through red face to white core, attached by stainless steel lag screws.
    - 2) Lettering: Vertical Gothic using round or square cutter. V-shape groove is prohibited.
    - 3) Size: Four-inch high with one-inch high lettering as below and applicable.  

DANGER 750 VOLTS
    - 4) Ultra-Violet Protection: coated with polyurethane paint 1.5 mils minimum dry film thickness on all surfaces.
  - b. Danger label for use on conduit:
    - 1) 2-1/2-inch wide pressure sensitive vinyl with red background and white lettering 1-1/4 inch high, Gothic Capital Style as follows and applicable.  

"DANGER 750 VOLTS"

"DANGER 480 VOLTS"
    - 2) Lettering printed with weather resistant ink and shall be durable and scuff resistant.
    - 3) Marker provided with permanent type back adhesive for long term outdoor use.

## 2.03 ACCESSORIES

A. Wire Connection Accessories:

1. Connectors, terminal lugs and fittings.
  - a. In accordance with UL486, and NEMA CC1.
  - b. For 10 AWG and smaller conductors: Compression type, high conductivity copper, tin-plated ring tongues, with nylon self-extinguishing insulating grip with temperature rating equal to that of conductor insulation. Thomas and Betts STA-KON type or equal.
  - c. For 8 AWG to 4/0 AWG conductor cable: Tin-plated copper compression connectors and terminal lugs with nylon insulating sleeve for insulation grip.
  - d. For 250 KCMIL and larger conductor cable: Long barrel double-compression tin-plated copper connectors and terminal lugs with two-hole

- pad.
  - e. For multiple conductor cable: Watertight aluminum fittings with stainless steel pressure ring and set screws or compression cone for grounding of aluminum sheath of MC cable.
  - f. Hardware: High strength silicon bronze, corrosion resistant, non-magnetic, and electrolytic action free when in contact with copper.
  - g. Ground connector:
    - 1) O-Z, Type KG or equal.
    - 2) Two-piece, designed for connecting grounding conductor to bus bar.
    - 3) Copper-alloy bolt and silicon-bronze bolt, nut and lock washer with interlocking clamp.
  - h. Contact rail terminal lugs: Compression type, 98-percent-pure copper, hot-dip tin-coated to 0.3 mils minimum thickness. Tongues not less than two inches square by 1/2-inch thick and drilled for 5/8-inch diameter fastener. Compatible with 1000 KCMIL, extra flexible cable.
2. Bundling Straps:
- a. Self-locking steel barb on one end, with tapered strap of self-extinguishing nylon, temperature rating minus 65F to 250F.
  - b. For outdoor use: Ultraviolet-resistant.
3. Insulating Tape:
- a. Plastic tape: Vinyl plastic tape with rubber-based pressure-sensitive adhesive, pliable at zero degrees F with the following minimum properties when tested in accordance with ASTM D1000:
    - 1) Thickness: 8.5 mils.
    - 2) Breaking strength: 20 pounds per inch width.
    - 3) Elongation: 200 percent.
    - 4) Dielectric breakdown: 10,000 volts.
    - 5) Insulation resistance, indirect method of electrolytic corrosion: 1,000,000 megohms.
  - b. Rubber tape: Silicone rubber tape with silicone pressure-sensitive adhesive, with the following minimum properties when tested in accordance with ASTM D1000:
    - 1) Thickness: 12 mils.
    - 2) Breaking strength: 13 pounds per inch width.
    - 3) Elongation: 525 percent.
    - 4) Dielectric breakdown: 13,000 volts.
    - 5) Insulation resistance, indirect method of electrolytic corrosion: 1,000,000 megohms.
  - c. Arc-proof tape: Flexible and conformable organic fabric tape, coated one side with flame-retardant flexible elastomer, self-extinguishing, non-combustible, with the following minimum properties:
    - 1) Thickness, ASTM D1000: 30 mils.
    - 2) Tensile strength, ASTM D1000: 1500 pounds per square inch @ 23C.
    - 3) Elongation, ASTM D1000: 150 percent @ 23C.
    - 4) Thermal conductivity, ASTM D1518: 0.078 BTU per hour per square foot per degree F.
    - 5) Electrical arc resistance: one half-lap layer capable of withstanding a high current fault arc temperature of 13,000K for 75 cycles.
  - d. Glass tape: Woven glass fabric tape with pressure-sensitive thermosetting adhesive, with the following minimum properties when tested in accordance with ASTM D1000:
    - 1) Nominal width: 3/4 inch.
    - 2) Thickness: Seven mils.
    - 3) Breaking strength: 170 pounds per inch width.

- 4) Elongation: Five percent.
  - 5) Dielectric breakdown: 2,500 volts.
  - 6) Insulation resistance, indirect method of electrolytic corrosion: 5,000 megohms.
4. Epoxy Resin: Suitable for insulating and moisture sealing cable splices, with the following minimum properties:
    - a. Dielectric strength, ASTM D149: 400 volts per mil.
    - b. Volume resistance, ASTM D257:  $2.8 \times 10^9$  ohm per centimeter cube at 30C.
    - c. Water absorption, ASTM D570:
      - 1) 0.193 percent in 24 hours at 23C.
      - 2) 0.62 percent in 24 hours at 53C.
    - d. Tensile strength, ASTM D638: 8,000 psi.
    - e. Elongation, ASTM D638: 2.4 percent.
    - f. Coefficient of expansion, ASTM D696:  $6.8 \times 10^{-5}$  inch per inch per degree C.
  5. Contact rail cable connector assemblies:
    - a. Cable connectors: Compression type, MAC Products, Inc., No. B-9180 or equal, 98 percent pure copper with four hole tongues and necessary silicon-bronze flat washers, lockwashers, nuts and bolts. Tongues not less than 9/16 inch thick and drilled for 1/2 inch bolts on 1 3/4 inch centers.
    - b. Insulating covers and accessories: Two-piece, glass reinforced polyester, orange colored, not less than 0.125 inch thick. Equipped with neoprene gaskets, sealing collars and captive screw fasteners.
    - c. Heat shrinkable tubing: T & B Cat. No. HSB400-225-1 or equal.
    - d. Completed assembly to be watertight and readily disassembled.
  6. Terminal blocks:
    - a. Barrired, screw type equipped with washer head binding screws, white marking strips for terminal identifications and hinged covers; unless otherwise shown or specified.
    - b. Rated 600 volts, 30 amperes per point and designed to accommodate wire sizes 19 AWG through 10 AWG inclusive.
- B. Exothermic mold kit, consisting of mold and handle and Exothermic Weld Cartridge:
1. Exothermic weld mold for making #4 AWG cable connections to the base of the composite contact rail. Erico part No. PB10QITL84C or equal.
  2. Exothermic weld mold for making #4 cable connections to the neutral axis of the running rail, Erico part No. PB13STIL or equal.
  3. Mold handle for holding the exothermic mold to the composite contact rail and the running rail. Erico part No. PBL160 or equal.
  4. Exothermic Weld Cartridge: Consisting of welding powder, steel discs and packing material required to make an exothermic weld of #4 AWG cable to the composite contact rail and running rail. Erico part No. PB65 or equal.
- C. Heat-shrinkable tubing: UL-approved, flame retardant, corrosion resistant thick wall tubing with factory-applied sealant for field insulation on inline splices and taps or wraparound type sleeve for retrofit installation on existing splices and taps to provide a watertight seal and insulating encapsulation, with the following additional properties:
1. Material: Cross-linked polyolefin.
  2. Shrink ratio: 3 to 1 (min.)
  3. Physical properties:

Ultimate tensile strength	2350 psi	ASTM D412
Hardness, Shore D	42	ASTM 2240
Water absorption Method 6.1	0.05%	ASTM D570
Specific gravity	1.28	ASTM D792

4. Electrical properties:
    - a. Dielectric strength 450 volts ASTMD149 per mil
    - b. Volume resistivity  $1 \times 10^{14}$  ASTMD 257 ohm cm
  5. Thermal properties:
    - a. Continuous operating temp. -55C to +135C
    - b. Air oven aging (7 days @ 175C):
      - 1) Tensile strength 2680 psi
      - 2) Elongation 375 %
      - 3) Low temp. flexibility No cracking  
(4 hours @ -55C) when flexed
      - 4) Heat shock (4 hours No cracking,  
@ 225C) flowing or dripping
  6. Chemical properties:
    - a. Corrosivity Non-corrosive MIL-I-23053/15
    - b. Fungus resistance Non-nutrient ASTM G21
- D. Nuts, Bolts, U-Bolts and Miscellaneous Hardware.
1. Material
    - a. All nuts, bolts, u-bolts and washers for outdoor locations including tunnels shall be Type 316 stainless steel in accordance with ASTM F593 and F594.
    - b. All nuts, bolts, and flat washers for indoor locations in TBS and TPS shall be galvanized steel in accordance with ASTM A325.
    - c. The dimensional data and type hardware for all nuts, bolts and miscellaneous parts shall be shown and specified; where not shown as recommended by the manufacturer.
  2. Galvanizing
    - a. All parts to be galvanized shall be galvanized after manufacture. Unless otherwise specified, parts to be galvanized shall be coated in accordance with the requirements of ASTM A123. Bolts and miscellaneous hardware shown or specified to be galvanized shall be coated in accordance with ASTM A153 or alternate method in accordance with ASTM B633
- E. Structural Steel Shapes:
1. Shapes, plates and bars: ASTM A36.
  2. Structural tube: ASTM A500, Grade A, hot-dip galvanized. Galvanizing: Hot-dip galvanized after fabrication in accordance with ASTM A123, zinc coating weight two ounces per square foot, minimum.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

- A. Install generally as shown and in accordance with approved shop drawings, the NEC and jurisdictional agencies.
- B. Conduit, Cable Tray, Boxes, Cabinets and Fittings:
  1. General:

- a. Use size, type, general routing, location of conduit, raceways, boxes and cabinets as shown and specified.
  - b. Install metallic raceway, fittings, boxes and cabinets free from contact with reinforcing steel.
  - c. Where aluminum is placed in contact with dissimilar metal or with concrete, separate contact surfaces by means of gasket, non-absorptive tape or coating to prevent corrosion.
  - d. Unless specified or shown otherwise, make metallic conduit, raceways, and cable trays, electrically and mechanically continuous, and grounded in accordance with NEC and as shown.
2. Conduit:
- a. Run exposed conduit parallel to building lines.
  - b. Install exposed conduit to avoid interference with other work.
    - 1) Where shown and as necessary, install cable seal in accordance with the manufacturer's recommendation.
    - 2) Use sealing compound where approved and in accordance with manufacturer's recommendations, with the following additional requirements:
      - a) Before applying sealing compound, prime conduit and cable surface using primer recommended by the manufacturer.
      - (b) Pour or inject compound to prevent voids inside seal and to keep cable centered in conduit.
    - 3) In empty conduit installed for future use, install blank cable seal inside conduit to prevent seepage of water.
    - 4) Ensure conduits are free of water before conduit seals are installed.
  - c. Apply lead-free conductive anti-seize compound to threaded conduit joints.
  - d. For outdoor locations use threaded conduit hub to attach conduit to equipment enclosure. Use watertight conduit fitting for attachment of conduit to enclosure having punched or formed knockout.
  - e. For indoor locations use locknut and nylon-insulated bushing to attach conduit to enclosure.
  - f. Install suitable caps or plugs in empty conduit for future extension.
  - g. Thread and ream ends of field-cut conduit to remove rough edges. Use bushing at conduit entrance to boxes, cabinets and equipment enclosures.
  - h. Bends:
    - 1) Unless otherwise shown or specified, install conduit bends in accordance with reference codes.
    - 2) Bend conduit so that field made bend is free from cuts, dents and other surface damage and does not reduce cross-sectional area of conduit.
  - i. Support horizontal conduit 1-1/2 inches and smaller with one-hole pipe straps or individual pipe hangers.
  - j. Support horizontal conduit larger than 1-1/2 inches with individual pipe hangers.
  - k. Spring steel fasteners, clips or clamps specifically designed for supporting exposed single conduits may be used in lieu of pipe straps or pipe hangers. Use 1/4 inch minimum diameter galvanized steel rods for hanger rods with spring steel fasteners, clips and clamps.
  - l. Secure conduit supported on multi-hangers (trapeze) or channel inserts by fasteners suitable for such purpose.
  - m. Where conduit is attached to masonry surface, use malleable iron spacers with Style A pipe straps.
  - n. Support and secure vertical conduit spanning open areas at intervals not exceeding 10 feet.

- o. Install conduit so as to drain moisture to nearest outlet or pull box.
  - p. Use only metallic conduit in exposed locations in tunnels and buildings.
  - q. Ensure waterproof conduit connection where conduit is installed in outdoor locations.
  - r. Use Schedule 80 PVC conduit for cable which is buried directly in ballast or at trackside locations for contact rail heater segment jumper cables.
  - s. Install expansion fittings in exposed conduit runs longer than 300 feet.
  - t. Use metallic conduit routed between control cable trays and equipment enclosures.
3. Channel Inserts and Spot Inserts:
    - a. Mount outlet boxes.
    - b. Keep number of knock-outs to minimum.
    - c. Clean boxes thoroughly after installation and correct damage to boxes and to finish.
    - d. Install covers on boxes mounted on walls and ceilings.
    - e. Install junction and pull boxes so that covers are readily accessible.
  4. Cabinets:
    - a. Fasten cabinets using expansion bolts, toggle bolts or mounting ears.
    - b. Touch-up damaged painted finish.
  5. Cable Trays:
    - a. For incoming service cable from power company, coordinate with the power company, and install cable tray with covers as approved by the power company.
    - b. Support cable tray straight sections, elbows, tees and crosses at the locations specified in NEMA FG-1 for fiberglass tray. Provide supports on 10 foot centers for horizontal positive and negative cable tray and not more than 12 feet on center for all other cable trays.
  6. Fasteners:
    - a. Fasten equipment and devices to concrete surfaces with lag screw shields, cinch anchors, expansion bolt anchors or lead jacketed tamp-in inserts. Use bolt sizes providing a safety factor of 2.5.
    - b. Fasten equipment and devices to concrete masonry units with toggle bolts.
    - c. Fasten equipment, devices and supports to structural steel with beam clamps, welded studs or drilled and tapped holes no greater than 1/4 inch diameter.
  7. DTS Cabinet and ETS Relay Cabinet:
    - a. Install as shown. Wall-mounted and fixed by expansion bolt anchors or toggle-bolts.
    - b. Terminate all wires as shown, including spares.
    - c. Ground DTS and ETS relay cabinets.
  8. ETS Enclosures:
    - a. Install as shown.
  9. ETS lighting fixtures:
    - a. Install as shown.
  10. Filling of openings:
    - a. Where conduit and raceway (including cable tray and bus duct) pass through fire-rated walls, ceilings or floors, provide approved firestops to prevent passage of fire and fumes and to maintain integrity of fire-rated structure.
    - b. Close unused openings or spaces in floors, walls and ceilings. Plug or cap unused conduit and sleeves.
    - c. Seal unused traction power conduits in ductbank at both ends using OZ Gedney CSBE seals or equal.
  11. Cleaning of raceways:
    - a. Rod and swab raceways and ducts through which cables are to be installed. Use a mandrel with an outside diameter 3/8-inch less than the

inside diameter of the duct and remove all obstructions. Install a non-metallic pull line fish wire, as approved by the Engineer in each raceway or duct immediately after rodding and swabbing and, unless cables are pulled immediately.

- b. The Contractor shall be responsible for the dewatering and removal of all dirt, rocks, track ballasts and trash from trenches, pipe, manholes, pull chambers, cable trough, surface trench, conduit and ductbank prior to and during the installation of cable, at no additional cost to the Authority.
12. Cable Troughs (Track Right-of-Way):
- a. Remove the trough covers, install wire and cables and reinstall the trough covers.
  - b. The Contractor is specifically warned of the following conditions and potential problems with the track right-of-way cable troughs:
    - 1) The covers for these troughs are not of uniform length and locations of drill holes, i.e., each cover section must be replaced on the trough section from where it was removed.
13. Apply anti-corrosion joint compound to connectors, terminal lugs and bolting pads before installation. Install lockwasher under each bolt head and nut.
14. Install terminal fittings on multiple-conductor cable in accordance with manufacturer's recommendation. Completely seal cable from moisture.
15. Attach contact rail cable connector assembly compression connectors to the cable with manufacturer's recommended tooling. Install a lockwasher under the head of each bolt and under each nut when bolting tongues together. Tighten bolted connections to a uniform torque of 450 inch-pounds.
16. Prior to assembly of contact rail cable terminal lugs to composite contact rail, coat mating services with oxide-inhibiting paste, NO-OX-ID, Dearborn Chemical, or equal. Coat all interfaces of the compression fasteners. Fasten terminal lugs to the composite compact rail using methods and equipment recommended by the rail manufacturer.
17. Exothermic Welded Connections: Make connections using exothermic mold kit and cartridge in accordance with the manufacturer's recommendations. Remove all extraneous weld metal and test connection for mechanical strength by striking twice with a two-pound hammer.
18. The splicing of power and control cables is not permitted in manholes, ductbanks and cable troughs. However, if permitted by the Engineer, make water tight splices as approved.
- C. Panelboards:
- 1. Install panelboards at locations shown.
  - 2. Mound panelboards with front straight and plumb.
  - 3. Connect branch circuit wires as shown. Connect neutral wire of branch circuit to neutral bar in panelboard.
  - 4. Make power cable connections to circuit breakers, neutral and ground bus bars in panelboard by means of integral mechanical connectors. If such items are not furnished with integral mechanical connectors, make connections using compression connectors.
  - 5. Ground panelboards.
  - 6. Apply matching touch-up paint where necessary.
  - 7. Provide directory for each panelboard.
- D. Furniture:
- 1. Provide one workbench, two stools, one storage cabinet and one stepladder for each traction power substation. Provide one storage cabinet and one stepladder for each tie breaker station. Place furniture inside each location where directed by the Engineer.

- E. Insulated Floor Topping:
1. Job Conditions:
    - a. Maintain substrate temperature within limits recommended by the flooring materials manufacturer.
    - b. Provide adequate ventilation during installation and curing.
  2. Inspection: Examine substrate and conditions under which flooring materials are to be prepared and installed. Do not proceed with the installation until all unsatisfactory conditions have been corrected.
  3. Surface Preparation:
    - a. Inspect all surfaces to determine that entire area to receive insulating floor topping is structurally sound. Remove loose sections down to the substrate.
    - b. Remove grease, oil, asphalt, mastics, and other contaminants that may prevent adhesion, by scrubbing with degreasers, detergents, or solvents. Grinding, scarifying, or sandblasting are other acceptable methods.
    - c. Repair cracks, holes, eroded and damaged areas with patching materials recommended by the insulating flooring manufacturer.
    - d. Prepare concrete surface by acid etching, grinding, sandblasting, scarifying, or other approved method.
    - e. Saw cut at all termination points.
    - f. Prior to applying base coats and top coats, apply marking tape at all termination points and adjacent surfaces not to be coated.
    - g. Remove tape immediately after broadcasting and after top coating.
  4. Materials Protection: Mix and prepare materials in accordance with manufacturer's written instructions.
  5. Application: Mix and apply each component of the insulating flooring system in accordance with the manufacturer's written instructions and as indicated to provide an uninterrupted, uniformly thick, seamless, and monolithic surface.
  6. Contraction Joints: When floor insulating topping material crosses contraction joints in the floor slab, a contraction joint shall be provided in the topping. Provide a vee shaped groove, 1/2 inch wide at the base of the groove, but not less than the width of the contraction joint, and insure the groove is 1/2 inch wider at the top than at the bottom. A bond breaker shall be provided to top of the concrete. An epoxy shall be used to seal damp surfaces before application of the primer and polysulfide. The groove shall then be filled with two component, self-leveling, gray polysulfide. Epoxy primer and polysulfide material shall be as recommended by the floor topping manufacturer. Surface preparation, and mixing and installation of materials shall be in accordance with manufacturer's instructions. Sheets of Haysite, not less than 1/16 inch thick, and 1/4 inch narrower than the groove at the top, shall be placed on top of the polysulfide and flush with the top of the insulated floor topping.
  7. Cleaning: After completion of insulating flooring installation, clean free of residue those surfaces not required to receive insulating flooring materials.
  8. Protection: Close to all traffic for 24 hours, minimum, completed insulating flooring installation. Protect it for 3 days from acid, alkali, or solvent which may spill on the flooring.
- F. Install appropriate power company furnished metering panel as shown and in accordance with power company instructions. Ground metering panel to substation ground bus. Connect to 120V, AC, 1-phase circuit in emergency panel as shown.
- G. Nameplates, Tags and Wire Labels:
1. Nameplates: Attach nameplates to all panelboards, DTS cabinets, remove control and monitoring cabinet, ETS enclosures and ETS relay cabinets.
  2. Cable Tags: Attach cable tags to each cable at all pull boxes, manholes and terminations.
  3. Wire labels: Attach wire labels at all control, annunciation and supervisory wiring at each terminal point. Attach label to a clean, dry section of wire as close as possible

to the terminal point.

- H. Danger Marker:
  - 1. Attach danger marker plate on top of timber ties on both ties where contact rail heater conduit transition occurs.
  - 2. Attach conduit danger label on each exposed conduit carrying contact rail heater control and power cable installed in track area at a maximum interval of five feet as noted below:
  - 3. Conduit carrying DC power cables: DANGER 750 VOLTS.
  - 4. Conduit carrying AC power and control cables: DANGER 480 VOLTS.
- I. Arc-Proofing:
  - 1. Cover all cables installed in manholes and pits with arc-proof tape, applied in a single layer, half-lapped with the coated side next to the cable and held in place with random wrap of glass cloth electrical insulating tape.
- J. Floor Sealant:
  - 1. Apply to finished floor surfaces in all traction power substations and tie breaker stations excluding areas with insulating floor topping.
  - 2. Prepare floor by removing compacted dirt.
  - 3. Treat with 409 Pre-Kote cleaner, mixed in ration one part 409 to nine parts water. Apply mix solution to the floor liberally (100 square fee per gallon) with a spray. Allow to soak for 10 minutes but do not allow it to dry. Scrub floor clean and vacuum using a wet vacuum. Scrub and rinse with clear water and repeat the scribe/rinse/vacuum process to ensure removal of all residue. The texture of floor should feel like sand paper before applying sealant.
  - 4. Let the floor dry completely.
  - 5. Mix Tennant ECO-LTS Parts A and B and Bond Additive (for the first coat) as recommended.
  - 6. Applicator or airless sprayer. Ensure ambient temperature is 65°F or higher during application. Apply two additional coats of the mix with four hours drying time in between.
  - 7. Allow to cure for 16 hours at 75°F before opening up the floor to traffic.

### 3.04 FIELD QUALITY CONTROL

- A. Submit test procedure for approval and perform approved tests. Do not perform tests without approved test procedure. Schedule tests through the Engineer with minimum of 14 days prior notice. Furnish the necessary equipment and perform the following tests:
  - 1. Test metallic conduit and boxes for electrical continuity.
  - 2. Panelboards: Perform insulation resistance tests of each bust section phase-to-phase and phase-to-ground for one minute using 1,000 volt megger. Insulation resistance not less than manufacturer's recommended value, two megohms minimum. Test enclosure for continuity to substation ground bus. Test circuit connections in accordance with wiring diagrams.
  - 3. Molded case circuit breakers: Perform pole-to-pole and pole-to-ground insulation resistance tests with a 1,000 volt megger. Insulation resistance: 50 megohms minimum.
  - 4. Prior to installation, test two contact rail cable connector assembly compression connections, prepared under the direction of foremen who will supervise the installation, as follows:
    - a. Measure the electrical resistance between distal end of the cable and the connector tongue. Resistance shall not be greater than that of an equivalent length of uncut cable.
    - b. Subject the test connections to a sustained tension of 5000 psi for three hours. At the end of three hours, verify that there has been no slipping of

- the cable in the connector, deforming or loosening of the connection or increase in the electrical resistance beyond that specified.
- c. Should any sample fail to meet the specified test requirements, the qualification of the foreman and the equipment shall be disapproved.
5. Test contact rail, DC switchgear and negative switchboard 1,000 KCMIL cable terminal lugs as specified for contact rail cable connector assembly compression connectors.
  6. Testing of Exothermic Connections of Composite Contact Rail and Steel Running Rail:
    - a. All exothermic connections shall be tested for mechanical strength using a two-pound hammer. A minimum of three sharp blows fifteen inches in stroke shall be directed to the weld nugget. The weld shall sustain the blows without cracking weld metal or at the interface with the steel contact rail. Defective welds shall be removed and the rail and cable thoroughly cleaned before rewelding.
    - b. Electrical Resistance: Using a megohmmeter, measure and record the insulated flooring electrical resistance to ground at four points designated by the Engineer. Resistance not less than 100 megohms for a 12-inch by 12-inch floor area.
- B. Submit Certified test reports within 10 days of completion of tests.

**END OF SECTION**

## SECTION 16053

### OPERATION AND MAINTENANCE TRAINING FOR TRACTION POWER

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This section specifies requirements for training of Authority personnel.
- B. Training shall be conducted according to the following classes:
  - 1. Operations and maintenance ("O&M") training, to include preventive and corrective maintenance, adjustment of all equipment in its anticipated installed environment and relay coordination study..
  - 2. Engineering and technician training, for performing reliability-oriented inspection, maintenance, diagnostic tests, calibration, trouble-shooting and repair of the traction power substation equipment classes in accordance with applicable IEEE, ANSI, ASTM standards and applicable INETA test procedures.  
Engineering and technician training shall include training in utilization of diagnostic test equipment, Software Applications in conjunction with appropriate test, function/signal generation, measurement hardware to calibrate and test the operation of traction power substation equipment as well as the setting of Power Digital Meter for monitoring purpose.
  - 3. Engineering training shall include a complete Traction Power Substation short circuit and coordination study.
- C. Payment and Measurement Basis(if scheduled) or included in the lump sum installation cost of each facility: Compensation for work specified in this section will be made in accordance with the Unit Price Schedule.

##### 1.02 SUBMITTALS

- A. O&M training: Submit five copies of all training material and resume(s) of instructor(s) for approval prior to commencement of training. Each resume shall outline the instructor's qualifications, skills, and experience in training.
- B. Engineering and Technician training:
  - 1. Submit five copies of training course descriptions and syllabus, training plan, instructor's guide, recommended class size, course provider's qualifications and instructors' resumes prior to commencement of training.
  - 2. Submit plans, equipment lists and software-generated signals and wave forms necessary for a training mock-up of laptop PC based relay testing and calibration system for approval.
  - 3. Provide a copy of the short circuit and coordination study software with a minimum of two licences. For initial training, provide 30 days temporary licence for 10 power engineers.

##### 1.03 QUALITY ASSURANCE

- A. Standards: applicable industry standards of IEEE, ANSI, ASTM, and INETA (InterNational Electrical Testing Association).

- B. O&M Training Instructor Qualifications: Instructors shall:
  - 1. Have in-depth knowledge of the design, packaging, operations, maintenance and trouble-shooting of the systems to be taught.
  - 2. Have schooling in adult education teaching methods or previous satisfactory experience in teaching with emphasis on the subject matter to be covered in the course of instruction.
  
- C. Engineering and Technician Training, Course Provider and Instructor Qualifications:
  - 1. The course instructors shall have schooling in adult education methods or previous satisfactory experience in adult education with a minimum of 2 years in-depth and professional experience in the following components of utility, industrial or traction power systems as they apply to the selected course:
    - 1. software applications for signal and waveform design procedures as applicable to the DC relay testing procedures, and Power quality meters.
    - 2. Theory of protective relay design, operation and calibration procedures as applied to DC power systems
  - 2. Preferred providers are National Technology Transfer, Inc., AVO Training Institute or approved equal.
  
- D. Engineering Short Circuit and Protective Relay Coordination Training Course Provider and Instructor Qualifications:
  - 1. The course instructors shall be a professional engineer with extensive experience in traction power substation system protective relay study. Preferred provider is the equipment manufacturer's consultant providing the short circuit and coordination study for the current contract.

## **PART 2 PRODUCTS**

### **2.01 MATERIALS**

- A. O&M Concept of Training:
  - 1. Classroom and field instruction shall be designed to cover, in detail, the functions of each item of equipment. Fault isolation and trouble-shooting techniques will be covered to the extent necessary to permit a technician to diagnose and repair faulty modules. Instruction shall be designed to provide Authority maintenance personnel with practical experience in the performance of preventive and corrective maintenance. Trouble-shooting and fault isolation of simulated faults shall be provided for each type of equipment in the traction power substation and tie breaker station, including all AC and DC switchgear, rectifiers, and transformers.
  - 2. The Contractor shall develop and provide all operation and maintenance training necessary for Authority-designated personnel to support the power equipment. Classroom instruction shall include not only the anatomy and functioning of the parts under discussion, but the essentials of their routine care including lubrication schedules, adjustments, limits, test frequency, inspection frequency, trouble-shooting, identification by manufacturer's part number, removal and replacement. Instruction shall cover theory of operation of the power systems, individual modules and special protective circuits. Flow diagrams must be used to show sequence of events and time required to complete each event.
  - 3. The course shall include performance of preventive maintenance operations on the equipment and hands-on trouble-shooting of all subsystems.
  - 4. The Contractor shall assume that the Authority's employees have no knowledge of the features of the new equipment. For the purpose of course development and presentation, the Contractor shall assume all Authority students are high

school graduates (or equivalent), and that maintenance personnel will possess the ability to use basic hand tools and electronic test equipment.

5. The Authority shall be permitted to videotape all class presentations.
6. Instruction shall include an evaluation device(s) (written and/or practical tests) designed to measure the extent to which students have met the learning objectives, with an answer key for each of the tests developed. Tests should use a multiple choice format, and have been validated in a pilot course or by some other means agreed to by the Authority (OPER TRNG). Whenever possible, a practical hands-on test shall be developed to demonstrate the transference of operational/mechanical skills.

B. O&M Training Materials

1. First generation reproducible training material shall be developed as specified herein. Training should be conducted using final manuals approved by the Authority and certified by the Contractor as being correct and conforming to as-manufactured (and where appropriate, as-built and as-adjusted) conditions. Manuals shall become the property of the Authority at the end of program. The following training materials for the course shall be developed:
  - a. Instructor material: Instructor material shall be provided for the course.
  - b. Course outline: A course outline with measurable learning objectives shall be provided. The course outline shall provide a topic outline for each item of equipment. Maintenance training shall include a section devoted to system fault analysis and trouble-shooting. The learning objectives shall be stated for each topic.
  - c. Lesson plans: A set of lesson plans shall be developed for each item of equipment corresponding to the topic outline and shall contain the following information: Lesson title, instruction time, objectives, training aids required, instructing sequence (outline), tests, and summary.
  - d. Training aids: Optimum use of visual aids, including 8-inch by 10-inch transparencies, 35-millimeter slides, videos, mockups, and functional representations are required for any equipment which requires theoretical discussion. This may be in the form of an animated schematic, a model of the equipment, an actual device, an interactive video training device or an Authority-approved (TRNG) substitute. All mock-ups become the property of the Authority. Training aids which can be conveyed in electronic file format are preferred, and for any such items, the electronic files shall be provided to the Authority. Any drawings which are not available in electronic file format but which are needed for the course of instruction shall be provided to the Authority in transparency.
  - e. Instructional material: The primary source of instructional material shall be the applicable equipment operation and maintenance manuals, as-built equipment drawings and as-built power and control circuit schematic drawings. In addition, the Contractor shall develop notebooks containing such additional drawings, descriptive information and procedures necessary to ensure that all learning objectives are met in an orderly and timely manner. Workbook material shall be arranged by item of equipment and according to the topic outline.
  - f. Course topic outlines and schedules: The topic outline and schedule for the course shall include the following:
    - 1) Description of course including course objectives and training program level.
    - 2) Course length and recommended number of students per course.
    - 3) List of training materials required including documentation and equipment.

- 4) Objective for each topic and the time allotted for each topic.
  - 5) Schedules listing the major topics and sub-topics with a time allocation for each topic and sub-topic.
- g. Instructor guides and training aids: The instructor guide for the course shall include:
- 1) Table of contents listing each topic and the time allotted.
  - 2) List of applicable documents.
  - 3) List of training materials.
  - 4) Course learning objectives including course length and recommended number of students.
  - 5) Each topic with a cover sheet listing topic, objective, time allotted, and training aids required.
  - 6) Training aids.
- h. Student workbook: Copies of operations and maintenance procedures, as-built diagrams, drawings and schematics shall be reproduced from engineering data and manuals by the Contractor for inclusion in a student workbook.
- C. Engineering and Technician Training Concept of Training:
1. Classroom instruction shall be designed to cover, in detail, the following procedures and design criteria:
    - a. AC / DC Protective Relay Calibration Procedures
    - b. The theory and application of AC/ DC traction power system protective device coordination studies including the interpretation and application of AC and DC protective device timing curves to equipment protection within transit authorities
    - c. The design, operation, testing, trouble-shooting, repair and calibration of AC/DC over-current and rate of rise protective relays, recloser relays and energized/grounded structure relays. The provided mockup is to be used for instructional purposes to demonstrate the process of troubleshooting and calibrating the AC and DC relays
    - d. The methods for performing tests on installed and operational AC/ DC Switchgear with particular emphasis on electrical isolation equipment and techniques to perform multiple measurements concurrently without causing ground loops
  2. At the conclusion of the course the students should be able to recognize and correct relay operating problems, calibrate AC/DC relays and obtain test measurements on operating AC/DC switchgear using laptop PC based measurement software and associated hardware, setup the provided power quality meter, retrieve store data in the power quality meter using laptop PC based provided software.
  3. Instruction shall include an evaluation device(s) (written and/or practical tests) designed to measure the extent to which students have met the learning objectives, with an answer key for each of the tests developed. Tests should use a multiple choice format, and have been validated in a pilot course or by some other means agreed to by OPER TRNG. Whenever possible, a practical hands-on test shall be developed to demonstrate the transference of operational/mechanical skills.
  4. For the purpose of course development and presentation, the Contractor shall assume all Authority students are high school graduates (or equivalent), and that maintenance personnel will possess the ability to use basic hand tools and electronic test equipment.
  5. Training courses shall be conducted on Authority property. Necessary training material, mockups, AC/DC protective relays and contractor-supplied test equipment may be shipped to and stored at the training facility in coordination with the Authority (OPER-TRNG).

D. Engineering and Technician Training- Training Materials

1. Course Outline: A course outline with measurable learning objectives shall be provided. The course outline shall provide a description of the course and duration, recommended class size, instructor qualifications, list of training materials including documentation and equipment, topic outline for each item of equipment and time allotted for each topic.
2. Instructor's Guide: An instructor's guide for the course shall include a table of contents for each topic and the time allotted; a list of applicable documents and training materials; course learning objectives; course length and recommended number of students; training aids.
3. Student Manual / Workbook shall include all materials necessary for student interaction in the learning process and may serve as a field reference at the conclusion of the course. A copy of the Student manual / Workbook will be provided to each participant enrolled in training classes and one copy shall be provided to OPER TRNG for archival purposes. It shall contain, at a minimum:
  - 1) Program Overview / Introduction
  - 2) Statement of overall course goals
  - 3) Learning Objectives, stated in measurable terms, that describe desired skills or knowledge to be obtained
  - 4) Prose treatment, not outline format, of a fully developed content presentation, developed in the same modular format as the instructor's guide.
  - 5) Illustrations, charts, graphics and duplication of visual aids used during the course presentation in order to enhance content presentation and provide a course reference during later field use.
  - 6) A Problems or Frequently Asked Questions section related to lesson content, as appropriate.
4. Visual Aids: Handouts, transparencies, slides, films or computer presentations are required for each circuit or wiring diagram and all activities not demonstrable in lecture or hands-on instruction.
5. Supplemental Materials: A functional mockup of the installed switchgear containing the subject relays. Auxiliary relays and indicating lights may be used to simulate circuit breaker operation within the mockup. Theoretical discussion of the operation of the system should be supplemented with an animated schematic or an interactive video training device or a TRNG-approved substitute.
6. In addition to the training mockup, a sufficient number of each type of relay should be supplied so as to allow students to acquire hands-on familiarization while at their desks/tables during training lecture and discussion periods.

E. Engineering Training: Concept of Training and Material

1. Training shall be scheduled through the Traction Power Assistant Chief Engineer's office.

2. Training shall be conducted using the final short circuit and protective devices coordination study approved by the Authority and certified by the Contractor as being correct and conforming to as-manufactured (and where appropriate, as-built and as-adjusted) conditions.
3. Manual / Workbook shall include all materials necessary to present in a step-by-step, simplified, yet comprehensive work fashion, the principles of system protection and the proper application and coordination of those components that may be required to protect traction power substation systems. A copy of the manual / Workbook will be provided to each participant enrolled in training classes and one copy shall be provided to the assistant chief engineer's office for archival purposes. It shall contain, at a minimum:
  - 1) Program Overview / Introduction
  - 2) Statement of overall course goals
  - 3) The theory and application of AC/ DC traction power system protective device coordination studies including the interpretation and application of AC and DC protective device timing curves to equipment protection within extra heavy transit traction power substation.
  - 4) AC and DC short circuit calculation.
  - 5) AC and DC protective device coordination.
  - 6) Application of commercial software for power system analysis.

## **2.02 O&M COURSE OF INSTRUCTION:**

- A. The course of instruction shall be developed and conducted by the Contractor and given by the Contractor to those individuals designated by the Authority. It shall consist of in-depth instruction on the fundamentals involved in the design of the complete system combined with practical aspects of operation and maintenance. It shall also include the following:
  1. Practical exercises that require the trainees to make use of the operation and maintenance manuals and parts identifiers.
  2. Familiarization with the assembly, subassembly and components that make up a total system. This part of the course shall include instruction and practical exercises in trouble-shooting at a level higher than that performed by equipment operators.
  3. Use and replacement of original assemblies, subassemblies and components with compatible assemblies, subassemblies and components manufactured by others where applicable.
  4. Handouts to all trainees that include information drawings, shop drawings, catalog cuts, manufacturers literature, equipment maintenance check lists and other literature describing the total system.
  5. Video and color slide presentations showing system installation, operation, trouble-shooting, maintenance, module removal and replacement.
  6. Tools and test equipment necessary to conduct operation and equipment maintenance trouble-shooting.

- B. Supplemental Training: In the event the Contractor changes or performs modifications to the equipment subsequent to the training that impact form, fit and/or function, the Contractor shall provide supplementary training to the Authority's training instructor on a one-time basis.

### **2.03 ENGINEERING AND TECHNICIAN COURSE OF INSTRUCTION**

- 1. The course of instruction shall be developed and conducted by the contractor or the contractor's approved representative to those individuals designated by the Authority. It shall consist of in-depth instruction of the fundamentals involved in the design of the complete system combined with practical aspects of operation, maintenance, testing and calibration. It shall also include the following:
  - a. practical exercises that require the trainees to make use of software to develop and apply wave forms, operation and maintenance manuals, parts identifiers, schematics, time curves, published industry standards and procedures and other applicable reference materials
  - b. familiarization with the assembly, subassembly and components that make up a total system
  - c. use and replacement of original assemblies, subassemblies and components with compatible assemblies, subassemblies and components manufactured by others where applicable
  - d. handouts to all trainees that include information drawings, shop drawings, catalog cuts, manufacturer's literature, equipment maintenance and calibration check lists, parts lists and other literature describing the total system
  - e. video and color slide presentation showing system installation, operation, trouble-shooting, maintenance, module removal and replacement
  - f. recommended tools and test equipment necessary to conduct operation and equipment maintenance trouble-shooting both in the field and at the bench.

### **2.04 O&M TRAINING EQUIPMENT**

- A. Installed equipment shall be used in the course of instruction.
- B. Training shall include practical exercises that permit the trainees to perform hands-on work using installed equipment under normal operating conditions.
- C. Training equipment: Any special tools required for maintenance training shall be supplied by the Contractor and delivered to the Authority after completion of the course.
- D. Test equipment: Test equipment required for maintenance training shall be supplied by the Contractor and delivered to the Authority after completion of the course.

### **2.05 ENGINEERING AND TECHNICIAN TRAINING EQUIPMENT**

- A. Necessary training equipment, mockups, contractor-provided relays and contractor-supplied test equipment may be shipped to and stored at the training facility in

coordination with OPER-TRNG. Installed Authority-owned typical protective relays may be provided in coordination with and conditionally based on the approval of OPER-TRNG.

- B. Installed Authority-owned equipment may be used in coordination with and conditionally based on the approval of OPER- TRNG.
- C. Training shall include practical exercises that permit the trainees to perform hands-on work using contractor-supplied equipment or Authority-owned installed equipment conditional to OPER-TRNG approval.
- D. Training equipment: Any specialized tools, other than basic hand tools, laptop/notebook computers, application software, connection and interface devices required for training shall be supplied by the contractor.
- E. Test Equipment: Specialized test equipment, other than standard VOMs, laptop/notebook computers, application software, connection and interface devices required for training shall required for maintenance training shall be supplied by the contractor.
- F. All computers received and owned by WMATA shall be procured and processed per Authority Published P/I (Policy and Instruction).

**PART 3 EXECUTION**

**3.01 TRAINING APPLICATION**

- A. The training program shall consist of the following:

Course Title	Course Length	Class size in persons	Number of Courses	Total number of course hours per person per class
Operation and Maintenance Training	80 hours	25	2	80
Engineering and Technician Training	32 hours	10	1	32
Engineering	24 hours	10	1	24

- B. Practical training on equipment shall be not less than 60% of the course duration.
  - 1. Location: The contractor shall provide training facility with disclaimer allowing WMATA to select and provide a facility for certain selected courses at the engineers discretion.
  - 2. Times: Class times will be at the convenience of the Authority.

**END OF SECTION**

## SECTION 16060

### GROUNDING AND BONDING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing complete grounding and bonding system.
- B. Related Work Specified Elsewhere:
  - 1. Fencing: Section 02820.
  - 2. Earth tunneling: Section 02415.
  - 3. Fabricated gray iron and ductile iron segmental tunnel lining: Section 02416.
  - 4. Fabricated steel segmental tunnel lining Section 02417.
  - 5. Concrete reinforcement: Section 03200.
  - 6. Piping systems: 15205
  - 7. Wire, cable and busways: Section 16120.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. National Electrical Code (NEC)
  - 3. ANSI/IEEE 80-2000, IEEE Guide for Safety in AC Substation Grounding.
  - 4. UL 467, Grounding and Bonding Equipment..
  - 5. American Standards of Testing and Materials (ASTM) B187-00, Standard Specification for Copper Bar, Bus Bar, Rod and Shapes.
  - 6. ITS: Directory of ITS Listed Products.
- B. Source Quality Control:
  - 1. Each item, except for exothermic-welded electrical connections, listed per referenced UL or ITS directory.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.
    - a. Certified test reports verifying that ground resistance of each ground grid when installed and each ground bus when connected to ground grid does not exceed specified values.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling and to avoid damage.
- C. Store equipment in secure and dry storage facility.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. Grounding and Bonding Equipment:
1. General Requirements:
    - a. UL 467.
  2. Ground rods: Solid steel, with stainless steel or copper jacket, one-inch or 5/8-inch diameter as shown, by 10 feet long or of necessary length in 10-foot sections.
  3. Grounding conductor:
    - a. Grounding electrode conductors:
      - 1) Insulated or bare conductor, as shown, in accordance with the following:
        - a) Insulated conductor: As specified in Section 16120 for single-conductor cable.
        - b) Bare conductor: Section 16120.
      - 2) Size:
        - a) For use in ground grid and for connecting of ground grid to ground bus: 4/0 AWG.
        - b) For connection of ground bus in train-control, communications, electrical, dispatcher, Bell system and mechanical rooms to main ground bus in ac-switchboard rooms: 2/0 AWG.
        - c) For other grounding electrode conductors: In accordance with NEC Table 250-66.
    - b. Equipment grounding conductor:
      - 1) Sized in accordance with NEC Article 250-122 unless otherwise shown.
      - 2) Insulated equipment grounding conductor: Single-conductor cable as specified in Section 16120.
      - 3) Bare equipment grounding conductor integral with multiple-conductor cable: Section 16120.
    - c. Bonding conductor for stray current and cathodic protection and electrical continuity:
      - 1) Insulated or bare conductors, as shown, in accordance with the following:
        - a) Insulated conductors: As specified in Section 16120 for single-conductor cable.
        - b) Bare conductor: Section 16120.
      - 2) Size: As shown or as specified.
  4. Bus bar: ASTM B187-00, 98-percent-conductivity copper bus bar, size two inches wide by 1/4-inch thick, length as necessary.
  5. Terminal lugs:
    - a. For 4/0 AWG and smaller conductors: Copper compression terminal lugs.
    - b. For 250 MCM and larger: Long-barrel, copper, double-compression terminal lugs.
  6. Ground connector:
    - a. O-Z, Type KG or equal.
    - b. Two-piece, designed for connecting grounding conductor to bus bar.
    - c. Copper-alloy body and silicon-bronze bolt, nut and lock washer with interlocking clamp.
  7. Jumpers: Copper braided or leaf-type flexible jumper, size as necessary.
  8. Bus-bar insulators: Fiberglass reinforced-polyester insulator with 1/2-inch diameter threaded holes at both ends for bus-bar installation.
  9. Exothermic welded electrical connections:
    - a. Exothermic process using powdered metals contained in a mold to form a molecular bond between materials to be connected without application of an external source of heat or power in accordance with ANSI/IEEE 80-2000.

- b. Molds, weld metal and associated accessories designed for making electrical connections between copper and copper, copper and steel, copper and cast iron and copper and ductile iron as required.
- c. Welding system designed for making connections suitable for the application as follows:
  - 1) Connections made outdoors for grounding using the standard process and not containing phosphorous or any caustic, toxic or explosive materials.
  - 2) Connections made indoors or in confined spaces for grounding using a low-smoke, low-emission process.
  - 3) Connections made specifically for cathodic protection applications using the standard process.
- d. Molds made of graphite with permanent marking indicating name of manufacturer, model, conductor size, and type and size of welding mixture compatible with the welding process. Mold connection type suitable for making connections between various configurations of items as shown or specified.
- e. Weld metal consisting of copper oxide and aluminum contained in a moisture-resistant container along with other necessary materials required for the specific application as determined by the manufacturer. Container for applications other than low-smoke, low-emission process to also include suitable starting material.
- f. Container for weld metal identified with part number, type of metals to be connected and application such as standard outdoor, low emission or cathodic application.

### **PART 3 - EXECUTION**

#### **3.01 GROUNDING:**

- A. Ground Connections:
  - 1. Weld buried ground connections exothermically, in accordance with manufacturer's recommendations. Clean and coat with coal-tar epoxy before backfilling. Encapsulate with epoxy resin buried ground connection of grounding electrode conductors running to ground bus.
  - 2. Use terminal lug to connect grounding conductor to equipment enclosure. Use ground connector to connect grounding conductor to ground bus. Secure connector or terminal lug to the conductor so as to engage all strands equally. Install terminal lug using tools and pressure recommended by the manufacturer. Indent mark terminal lug with the number of die used for installation.
  - 3. Exothermically weld connections to ground rods in handholes, junction boxes and manholes, frame columns of bus passenger and bus supervisor shelters and station entrance pylon (type B) and light poles.
  - 4. Splices in grounding conductor are prohibited.
  - 5. For making ground connections located indoors and in confined spaces located outdoors such as manholes, use exothermic welds with low-smoke, low-emission process.
- B. Ground Grid:
  - 1. Install ground grid consisting of ground-grid conductors and ground rods buried in earth in pattern and at locations shown.
  - 2. Use ground rod one-inch in diameter by 10 feet long or of greater length in 10-foot sections as shown.
  - 3. Bury top of ground rod 24 inches minimum below unfinished surfaces.

4. Ensure 24-inch minimum separation between ground rods or bare grounding conductors and concrete structures or soldier piles bonded for stray current and cathodic protection.
5. Interconnect ground rods using 4/0 AWG insulated or bare grounding conductor as shown.
6. For connecting ground grid to ground bus in associated traction-power substation and ac-switchboard room, provide minimum of four 4/0 AWG insulated grounding electrode conductors as shown.
7. For connecting ground grid to ground bus in dc tie-breaker station, chiller plant, fan shaft and drainage-pumping station, provide two 4/0 AWG insulated grounding electrode connections.
8. For additional grounding of service transformer in outdoor location, provide one grounding electrode conductor from nearest ground grid to transformer pad.
9. Unless otherwise shown, leave pigtail, three-feet six-inches minimum length, above finished floor for connection to ground bus or service-entrance equipment.
10. When ground grid is provided for electrical room, connect ground grid to ground bus in electrical room with two 4/0 AWG insulated grounding electrode conductors.

C. Ground Bus:

1. Install ground bus bar, two inches wide by 1/4-inch thick, around the inside periphery of traction-power substation, dc tie-breaker station, ac-switchboard room and electrical rooms; on full length of wall adjacent to service equipment such as switchboard and motor controls in chiller plants and mechanical rooms.
2. Install ground bus bar, two inches by 1/4 inch by 24 inches long in train-control, communications, dispatcher, Bell system and mechanical rooms, kiosk, fan shafts, drainage-pumping stations, escalator pits, elevator rooms, battery rooms and where shown.
3. Mount ground bus bar on insulators two feet above finished floor, unless otherwise shown, using cap screws and expandable threaded anchor.
4. Provide insulator support at each end of ground bus and at three-foot intervals.
5. In traction-power substation, dc tie-breaker station, ac-switchboard room, chiller plants, fan shafts, and drainage-pumping station, connect the ground bus to 4/0 AWG grounding electrode conductor running from associated ground grid.
6. In train-control, communications, electrical, dispatcher, Bell system and mechanical rooms, escalator pits, elevator rooms, battery rooms and other locations shown, connect ground bus to main ground bus in associated ac-switchboard room, traction-power substation or dc tie-breaker station, using 2/0 AWG insulated conductor.
7. Install 4/0 AWG insulated ground conductor, sub-ground bus, with one end connected to ground bus in ac-switchboard room, at following locations:
  - a. In each tunnel for mainline track, support grounding conductor on channel inserts in tunnel wall.
  - b. In each cable trough and ductbank along mainline track, install grounding conductor in cable-trough area and conduit reserved for ac power.
  - c. In each cable space under station platform, install grounding conductor on channel inserts on wall.
8. Installing grounding connections in train-control and communication rooms:
  - a. The only ground connection on the bus bar provided for train control and communication equipment grounding is the cable leading to the A. C. Switchboard room.
  - b. Do not bond equipment or metallic structure to the ground bus provided for train control equipment.
  - c. For items requiring bonding, have the bonding conductors go to the nearest ground bus beyond the ground bus provided for train control equipment.
  - d. Grounding transformers to the dedicated train control and communication room ground bus bars is not permitted.

- D. Equipment Grounding Conductor: Provide insulated equipment grounding conductor for following services and as shown:
1. Feeders.
  2. Branch circuits.
- E. Grounding of Service Equipment:
1. Ground in accordance with NEC.
  2. Ground enclosure and ground bus in switchgear, switchboard, motor-control center or panelboard to ground bus provided in substation or room using insulated grounding electrode conductor.
  3. Install copper bonding jumper between neutral and ground bus as shown.
- F. Grounding of Separately Derived AC System:
1. Ground in accordance with NEC.
  2. Ground secondary neutral and enclosure of transformers to nearest ground bus or sub-bus using insulated grounding electrode conductor.
  3. For transformer located outside of building, install additional grounding connector between transformer secondary neutral/enclosure and ground bus or grid using insulated grounding electrode conductor.
- G. Grounding for Personnel Safety:
1. In substation, electrical and mechanical rooms, tie-breaker stations, chiller plants, fan shaft and pumping stations, bond exposed metallic structure, motor frame, ac-equipment enclosure, ductwork and metallic piping to local ground bus, using minimum of 6AWG insulated grounding conductor as follows:
    - a. Ground multiple items of exposed metallic structure to local ground bus using a separate grounding conductor for each item or by using series-connected grounding conductors to connect two or more items.
    - b. Ground each ac equipment enclosure to local ground bus using a separate grounding conductor.
    - c. Connection of grounding conductor for ac equipment enclosure in series with grounding conductor for exposed metal structure is prohibited.
  2. Bond escalator's and elevator's motor frames, ac-equipment enclosures and metallic structures to equipment grounding conductor in ac-power feeder and to local ground bus bar. Provide a second ground path, connecting trusses and guide rails, using a #1/0 AWG insulated ground conductor connected to ground bus bar in A. C. Switchboard room. Leave 20-foot length of conductor coiled up in pits or wellway for making the grounding connections to trusses and guide rails by the escalator stage contractor.
  3. Bond metallic ladders and stairs in fan shafts, vent shafts and other locations to local ground bus, using insulated grounding conductor, 6AWG minimum.
  4. Bond and ground exposed metallic structures in open areas to separate grounding electrode in accordance with the following requirements:
    - a. Metal pole for mounting light fixtures: Bond and ground each metal pole to separate 5/8-inch diameter by 10-foot long ground rod, buried with top two feet below grade with two-foot separation from footing, using 6AWG insulated grounding conductor.
    - b. Cable troughs alongside track: Bond and ground metal cable troughs to 5/8-inch diameter by 10-foot long ground rod, buried with top two feet below grade, at approximate 50-foot intervals and at each end with two-foot separation from reinforced or buried metallic structures, using 4AWG insulated grounding conductor. At expansion and contraction joints, install 4AWG insulated grounding conductor for electrical continuity.
    - c. Metallic railings and fences alongside track: Bond and ground railings and posts for galvanized steel fence to 5/8-inch diameter by 10-foot long ground rod, buried with top two feet below grade, at approximate 50-foot intervals

and at each end, with two-foot separation from railing and fence-post footing and other reinforced structure, using 4AWG insulated grounding conductor. For electrical continuity, where necessary, install flexible copper braided or leaf-type jumper or 4 AWG insulated grounding conductor. In addition to the above requirements for grounding galvanized steel fences, provide the following for grounding PVC-coated steel fences:

- 1) Bond and ground each fence post to bottom tension wire using 6AWG bare grounding conductor, O-Z Type CG, Burndy Type GAR or equal connector at fence post, and Burndy Type KS or equal tap connector at tension wire.
  - 2) At connections of grounding conductors to posts and tension wires, remove vinyl coating at contact surfaces before making connections and apply vinyl coating over finished connections to match original coating.
- d. Railing, cable trough and metallic-deck structure at aerial track:
- 1) In each abutment and pier, install 4/0 AWG insulated grounding conductor with one end connected to pile or one-inch diameter by 10-foot long ground rod, buried with top two feet below grade, with two-foot separation from concrete structure and three-foot pigtail on the top of pier or abutment for bonding and grounding of deck structure.
  - 2) Bond and ground deck structure, cable trough and hand railing to 4/0 AWG insulated grounding conductor installed at each abutment and pier using 4AWG insulated grounding conductor. For providing electrical continuity, where necessary, install flexible copper braided or leaf-type jumper or 4AWG insulated grounding conductor.
5. In underground locations, bond and ground hand railing and metallic safety walk grating at each end and at approximate 50-foot intervals to nearest ground bus or sub-bus, using 6AWG insulated grounding conductor. For electrical continuity, where necessary, install flexible copper braided or leaf-type jumper or 6AWG insulated grounding conductor.
6. Bus passenger and supervisor shelters equipped with light fixtures: Provide multiple ground paths as follows:
- a. Bond and ground two separate frame columns of each single or double bus passenger shelter or supervisor shelter to two separate ground rods using 6AWG insulated grounding conductor. Drive 5/8-inch diameter by 10-foot long ground rod with top of rod six inches below finished grade.
  - b. Bond and ground each shelter to equipment grounding conductor in branch circuit.
7. Passenger shelter equipped with illuminated diorama and receptacle at station platform: Provide multiple ground paths as follows:
- a. Bond and ground two separate frame columns of each shelter to nearest ground bus in electrical room or sub-bus or to 5/8-inch diameter by 10-foot long ground rod driven so that the top of rod is three inches above finished floor of under platform space using 6AWG insulated grounding conductor unless otherwise shown.
  - b. Bond and ground each shelter to equipment grounding conductor in branch circuit.
8. Illuminated diorama, station pylon equipped with light fixtures, map case and telephone enclosure: Provide multiple ground paths as follows:
- a. Bond and ground illuminated diorama frame, column of station pylon equipped with light fixtures, map case and telephone enclosure to nearest ground bus in electrical room or sub-bus or to 5/8-inch diameter by 10-foot long ground rod driven so that the top of rod is three inches above finished floor of under platform space using 6AWG insulated grounding conductor unless otherwise shown.

- b. Bond and ground frame of each illuminated diorama, pylon equipped with light fixture, map case and telephone enclosure to equipment grounding conductor in branch circuit.
- 9. Station entrance pylon (Type B): Provide multiple ground paths as follows:
  - a. Bond and ground the pylon frame using 6AWG insulated grounding conductor to 5/8-inch diameter by 10-foot long ground rod driven so that top of rod is six inches below finished grade.
  - b. Bond and ground the pylon frame to equipment grounding conductor in branch circuit.
- 10. Handhole, manhole and junction box metallic body, cover frame and cover: Provide a minimum of two ground paths as follows:
  - a. Bond and ground handhole, manhole and junction box metallic cover frame and metallic body to 5/8-inch diameter by 10-foot long ground rod driven with top of rod three inches above bottom of manhole, handhole and junction box using 6AWG insulated grounding conductor.
  - b. Provide a minimum of 6AWG insulated grounding conductor and a bronze or brass chain with 210-pound breaking strength in a 1/2-inch or 5/8-inch rubber hose to bond metallic cover to metallic cover frame. Length of cable, chain and hose as required to allow removal of cover adjacent to and clear of handhole and/or manhole opening.
  - c. When cable is spliced in handhole, manhole or junction box, bond metallic cover frame and body to equipment grounding conductor.
- 11. Exothermically weld or gas torch braze grounding and bonding connection to exposed metallic structure, metallic cable trough, galvanized steel fence, hand railing, metallic safety walk grating, map case and telephone enclosure, frame columns of shelter, pylon and diorama, and metallic cover, metallic cover frame and metallic body of handhole, manhole and junction box. Repair damaged galvanized coating in accordance with Section 02820. Repair finish of shelter, map case and telephone enclosure and diorama frame to match existing finish.

### **3.02 BONDING FOR STRAY CURRENT AND CATHODIC PROTECTION:**

- A. Reinforcing Steel in Tunnel, At-Grade and Aerial Sections:
  - 1. Bond reinforcing steel using 250 MCM, Class G, stranded bare conductor exothermically welded to steel straps as shown, in accordance with Section 03200.
- B. Floating-Slab Expansion Joints:
  - 1. Bond floating-slab expansion joints, using 1/0 AWG, Class G, stranded bare conductor exothermic welded to longitudinal bar.
- C. Fabricated Gray-Iron or Ductile-Iron Tunnel-Lining Segments:
  - 1. Bond gray-iron or ductile-iron segments as shown in accordance with Sections 02415 and 02416.
- D. Fabricated Steel Tunnel-Lining Segments:
  - 1. Bond steel segments as shown in accordance with Sections 02415 and 02417.
- E. Metallic Pipe:
  - 1. Bond across joint for the following pipe, pipe fittings and pipe appurtenances, except those welded or soldered joints, using 2AWG insulated conductor as shown and in accordance with Section 15205.
    - a. Buried pipe, except soil pipe unless shown bonded.
    - b. Pressure pipe.
    - c. Pipe parallel to and within 20 feet of centerline of track.

2. Do not bond District of Columbia, Department of Public Works (DCDPW), buried piping systems
- F. Permanent Metal Piles:
1. Interconnect permanent metal piles, except those used in ground grid, using 4/0 AWG insulated conductor exothermically welded to piles. At each end of line of bonded piles, connect 4/0 AWG insulated conductor and terminate it in box inside line structure. Identify conductor termination using non-metallic tags or plastic labels attached to conductor with slip-free plastic lacing or nylon bundling strap.
- G. Drainage Cables in Tunnel, At-Grade and Aerial Sections:
1. Between bonded reinforcing steel and negative switchboard in traction-power substation, install stray-current discharge cable in accordance with the following requirements:
    - a. Adjacent to each traction-power substation, install two 250 kcmil, Class G, stranded bare conductors, one end of each conductor welded to the reinforcing steel which has been bonded as specified herein, and the other end terminated in 12-inch by 18-inch by 4-inch junction box.
    - b. From the junction box, install two 250 kcmil insulated cables in FRE conduit to dc negative switchboard area of the traction-power substation for future connection by others.
- H. Separate reinforcing steel and other buried metallic structures, bonded for stray current and cathodic protection, from ground grid, grounding electrode, or exposed metallic structures grounded for personnel safety. Metallic contact or electrical bonding between two systems is prohibited.

### **3.03 FIELD QUALITY CONTROL:**

- A. Test ground resistance of each ground grid after installation and each ground bus when connected to ground grid, using approved test procedure.
- B. Ground resistance not to exceed the following:
1. Ground grid/bus in ac-switchboard rooms, chiller plants, and traction-power substations: Two ohms.
  2. Ground grid/bus in fan shafts, drainage-pumping stations, electrical rooms, dispatcher rooms, Bell system rooms, mechanical rooms and dc tie-breaker stations: Five ohms.
- C. To meet resistance requirements, install additional ground rods or use permanent metal piles as ground rods.
- D. Isolate permanent metal piles used for grounding from those bonded for stray-current and cathodic protection.
- E. Test metallic conduits and raceways, metallic enclosures for equipment, metallic cable troughs, fences, metallic hand railings, metallic safety walk gratings, metallic structures, metallic covers, cover frames and bodies of manholes, handholes and junction boxes, frames of shelters, pylons and dioramas, map case and telephone enclosures, and poles for mounting lighting fixtures for continuity to grounding system.
- F. Test resistance of connection between ground bus in train-control rooms/communications rooms and ground bus in associated ac-switchboard rooms, traction-power substations or dc tie-breaker stations for resistance not to exceed one ohm.

- G. Conduct tests in presence of Engineer.
- H. Inspect and test exothermic welds as follows:
  - 1. Inspect finished exothermic welds for visual characteristics that are consistent with a properly made connection in accordance with the manufacturer's instructions and recommendations. Remove welds that do not meet minimum visual requirements as acknowledged by the Engineer, and reweld after cleaning the area to be welded.
  - 2. Test mechanical strength of exothermic weld by applying three sharp blows to the weld with a two-pound hammer using 15-inch strokes. Acceptable welds to sustain the blows without cracking the weld metal or the bond between the two connecting materials. Remove defective welds and reweld after cleaning the area to be welded.

**END OF SECTION**

## SECTION 16120

### WIRE, CABLE AND BUSWAYS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing wire, cable and busways.
- B. Definitions:
  - 1. Cable: Cable having low smoke generating characteristics.
- C. Requirements for single-conductor cable and for multiple-conductor cable as stated except as otherwise specified.
- D. Related Work Specified Elsewhere:
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Wire connection accessories: Section 16125.
  - 3. Raceways, boxes and cabinets: Section 16130.

##### 1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is engaged in production of similar wire, cable and busways.
- B. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. National Electrical Code (NEC).
  - 3. Insulated Cable Engineers Association (ICEA): S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692, S-81-570.
  - 4. IEEE: 1202-1991 IEEE Standard for Flame Testing of Cables for Use in Cable Tray in Industrial and Commercial Occupancies, 383-1974 IEEE Standard for Type Test of Class 1E Electrical Cables, Field Splices, and Connections for Nuclear Power Generating Stations.
  - 5. National Electrical Manufacturers Association (NEMA): BU1, WC70, WC71, WC74.
  - 6. American National Standards Institute (ANSI): *C37.20.1, Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear; C37.20.2, Metal-Clad and Station-Type Cubicle Switchgear; C37.20.3, Metal-Enclosed Interrupter Switchgear; Z55.1, Gray Finishes for Industrial Apparatus and Equipment.*
  - 7. UL: 44, Rubber-Insulated Wires and Cables Thermoset-Insulated Wires and Cables; 62, Flexible Cord and Fixture Wire; 857, Electric Busways and Associated Fittings; and 1581, Standard for Electrical Wires, Cables, and Flexible Cords.
  - 8. American Standards of Testing and Materials (ASTM): B3-95, Standard Specification for Soft or Annealed Copper Wire; B8-99, Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft; D471-98e1, Standard Test Method for Rubber Property-Effect of Liquids, E662-97, Standard Test Method for Specific Optical Density of Smoke Generated by Solid Materials.
  - 9. ITS: Directory of ITS Listed Products
- C. Source Quality Control:
  - 1. Cable and busways: Listed or labeled per UL or ITS directory.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Samples:
    - a. Smoke-density test sample for jacket material: Specified sample will become property of the Authority.
  - 3. Certification:
    - a. Certified flame-retardancy test reports (VW-1, IEEE 383, and IEEE 1202, Article 18) and data for tests performed not more than 12 months prior to submittal, for materials which are identical to those of cable furnished. Include test reports with submittal of shop drawings.
    - b. Submit smoke-density test reports and data for tests performed on the jacket material not more than 12 months prior to the submittal, for materials which are identical to those of the furnished cable. Include test reports with submittal of shop drawings.
    - c. Certified test reports demonstrating that cable complies with specified requirements and those of referenced ICEA Standards. Submit test reports prior to cable shipments.
    - d. Certificates from manufacturers verifying that products conform to specified requirements. Include certificate with submittal of shop drawings and with each cable shipment.

### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each single-conductor cable, each multiple-conductor cable and each busway to show label per referenced UL or ITS directory, size, voltage, manufacturer and number of conductors or phases in accordance with NEC requirements.
- B. Ship each unit securely packaged and labeled for safe handling and shipment.
- C. Store products in a dry and secure facility.

## PART 2 - PRODUCTS

### 2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Single-Conductor and Multiple-Conductor Cable:
  - 1. Type and size: As shown.
  - 2. Rated voltage: 600 volts.
  - 3. Conductors:
    - a. ASTM B3 or B8 annealed copper.
    - b. Size 10 AWG and smaller: Solid or Class B or Class C stranded.
    - c. Size 8 AWG and larger: Class B stranded.
  - 4. Standards: Except as modified, wires and cable complying with the following standards:
    - a. Cross-linked polyethylene (XLPE) insulated cable: ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692, S-81-570.
    - b. Other cable: ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692, S-81-570.
  - 5. Non-metallic jacket for single-conductor cable and an overall covering on multiple-conductor cable:
    - a. Chlorosulfonated polyethylene or cross-linked polyolefin.

- b. Cross-linked polyolefin complying with the following physical requirements. Properties tested in accordance with ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692, and S-81-570 if ethylene-propylene-rubber (EPR) insulation is used, or with ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, and S-105-692 if cross-linked polyethylene insulation is used. Jacket material free of PVC and PVC-based compounds.
    - 1) Tensile strength, minimum pounds per square inch: 1,800.
    - 2) Elongation at rupture, minimum percent: 150.
    - 3) Aging requirement: After 168 hours in air oven test at 100C, plus-or-minus one degree C:
      - a) Tensile strength, minimum percentage of unaged value: 100.
      - b) Elongation at rupture, minimum percentage of unaged value: 80.
    - 4) Oil immersion: 18 hours at 121C, plus-or-minus one degree C, ASTM D471, Table 1, No. 2 oil:
      - a) Tensile strength, minimum percentage of unaged value: 80.
      - b) Elongation at rupture, minimum percentage of unaged value: 80.
  - c. Jacket materials other than cross-linked polyolefin complying with ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692. Jacket material free of PVC and PVC-based compounds.
6. Flame retardancy: Single-conductor and multiple-conductor cable tested by independent agency demonstrating flame retardancy in accordance with the following:
- a. Single-conductor cable and individual conductors of multiple-conductor cable passing vertical wire (VW-1) flame test in accordance with UL1581 or ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692. Cable size for testing: 14AWG.
  - b. Single-conductor cable, size 1/0 AWG and larger, passing vertical tray flame test, using ribbon gas burner in accordance with IEEE 1202 or IEEE 383. Cable size for testing: 1/0 AWG.
  - c. Multiple conductor cable passing vertical tray flame test using ribbon gas burner in accordance with IEEE 383 or IEEE 1202. Cable size for testing: 7/C or 9/C with No. 12 AWG or No. 14 AWG conductors.
7. Smoke generation: Single and multiple-conductor cable jacket materials demonstrating low-smoke generation when tested in accordance with ASTM E662 by independent, nationally recognized testing agency.
- a. Conduct tests on specimens of overall jacket material for multiple-conductor cable and of jacket material for single-conductor cable.
  - b. Prepare slab specimens for each material .100 inch, plus-or-minus .005-inch thick, identical to those of finished cables and meeting minimum physical requirements specified.
    - 1) Prior to testing, submit six-inch square portion of each specimen. Tag sample with manufacturer's jacket or insulation identification code or number.
  - c. Test values for chlorosulfonated polyethylene not to exceed the following:
    - 1) Flaming mode:
      - a) Uncorrected maximum specific optical density during first four minutes of test: 325.
      - b) Uncorrected maximum specific optical density for entire 20-minute test: 400.
    - 2) Nonflaming mode:
      - a) Uncorrected maximum specific optical density during first four minutes of test: 325.

- b) Uncorrected maximum specific optical density for entire 20-minute test: 480.
      - d. Test values for cross-linked polyolefin not to exceed the following:
        - 1) Flaming mode:
          - a) Uncorrected maximum specific optical density during first four minutes of test: 150.
          - b) Uncorrected maximum specific optical density for entire 20-minute test: 300.
        - 2) Nonflaming mode:
          - a) Uncorrected maximum specific optical density during first four minutes of test: 150.
          - b) Uncorrected maximum specific optical density for entire 20-minute test: 300.
8. Applied voltage testing:
  - a. Single-conductor cable and individual conductors of multiple-conductor cable to be given applied ac voltage dielectric-strength test, i.e., six-hour water-immersion test.
  - b. For single conductors of multiple-conductor cable, conduct tests prior to assembly as multiple-conductor cable.
  - c. Test procedures:
    - 1) Polyethylene-insulated conductors: In accordance with ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, and S-105-692.
    - 2) Other conductors: In accordance with ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692, and S-81-570.
- B. Single-Conductor Cable:
- 1. Insulated with ethylene-propylene-rubber with non-metallic jacket as specified. UL-Labeled as Type RHW-2.
  - 2. Color coding: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
- C. Multiple-Conductor Cable:
- 1. Individual conductors:
    - a. Number of conductors: As shown.
    - b. Construction: Complying with one of the following:
      - 1) Insulated with ethylene-propylene-rubber, with or without non-metallic jacket.
      - 2) Insulated with composite compound of ethylene-propylene-rubber and polyethylene, without outer jacket.
      - 3) Insulated with filled cross-linked polyethylene without jacket.
    - c. Phase and neutral conductors: Individually insulated.
    - d. Neutral conductors: Same size as phase conductors.
    - e. Bare ground conductors: Sized in accordance with the NEC, unless otherwise shown.
    - f. UL Listed as Type RHW-2 or XHHW-2.
  - 2. Conductors assembled with nonwicking, flame-retardant filler to form cable of circular cross section.
  - 3. Metallic sheath:
    - a. Provide one of the following:
      - 1) Size 1 AWG and larger:
        - a) Interlocked aluminum-tape armor.
        - b) Continuous corrugated aluminum sheath conforming to ICEA S-19-81, Table 4-26A.
      - 2) Size 2 AWG and smaller: As specified for 1 AWG and larger or continuous smooth aluminum sheath conforming to ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, and S-105-692.

- b. Metallic covering not required for multiple-conductor TC cable with overall non-metallic jacket when installed in cable tray.
  - 4. Multiple-conductor cable provided with overall non-metallic jacket as specified.
  - 5. Cable UL-listed as follows:
    - a. Non-metallic-sheathed cable: Type TC, suitable for wet and dry locations.
    - b. Metallic-sheathed cable: Type MC, suitable for wet and dry locations.
  - 6. Color coding:
    - a. Power cables: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
    - b. Control cables: In accordance with ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, and S-105-692.
- D. Fixture Wire: UL 62, with the following additional requirements:
  - 1. Type: SF-2 silicone-rubber insulated or as necessary to suit temperature rating of lighting fixture, minimum 90C.
  - 2. Conductor: Stranded copper conductor 16AWG or larger as shown.
- E. Bare Conductors: ASTM B3 or B8, annealed copper conductor; 8AWG and larger, Class B stranded, unless otherwise shown or specified.
- F. Busway (Busduct) and Fittings:
  - 1. UL 857, NEMA BU1.
  - 2. Totally enclosed, three-phase, four-wire feeder busway system, as shown, with necessary fittings, hanging devices, accessories and provision for flange bolting over circuit breaker.
  - 3. Continuous current rating:
    - a. Secondary tie duct for use in combined substation: Sized in accordance with ANSI C37.20.1, C37.20.2, C37.20.3, and NEC.
  - 4. Voltage rating: 480/277 volts.
  - 5. Busway system braced to withstand minimum short-circuit current of 75,000 amperes symmetrical, unless otherwise shown.
  - 6. Maximum allowable temperature rise in busway at continuous full load above maximum ambient temperature of 40C: 55C.
  - 7. Housing: Nonventilated, fabricated from galvanized sheet steel. Removable gasketed cover provided at transformer connection for maintenance and test. Hardware galvanized or cadmium-plated.
  - 8. Joints:
    - a. Single-bolt pressure joint designed for optimum electrical contact and mechanical strength.
    - b. To permit safe testing of its tightness without de-energizing systems.
    - c. To permit removal of duct sections without disturbing adjacent pieces.
    - d. To permit making up joint from one side when busway is installed against wall or ceiling.
  - 9. Busbars: Fabricated from 98-percent-conductivity copper and insulated over entire length except at joints and contact surface. Joints and contact surfaces tin-plated or silver-plated. Neutral bar same size as phase bar. Ground bar half size of phase bar.
  - 10. Entire busway system polarized.
  - 11. Expansion fittings provided where necessary.
  - 12. Flexible connections, braided or laminated, provided for connecting bus conductor to transformer terminals.
  - 13. Finish: Light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.

### PART 3 - EXECUTION

### **3.01 INSTALLATION:**

- A. Install type cable as specified.
- B. Install single-conductor cable in conduit, underfloor duct or wireway. Install UL Type TC multiple-conductor cable in cable trays only. Install UL Type MC multiple-conductor cable and ground cable on channel inserts, cable trays, racks, trench or trough using straps and fasteners as specified in Section 16130. Install UL Type MC multiple-conductor cable in conduit where shown or required. On walls or ceilings, fasten cable and bus duct directly to channel inserts, or use expansion-bolt anchors to attach to concrete and toggle bolts to attach to concrete masonry unit walls. Splice cable only when unavoidable.
- C. Install motor feeders, service connections and extensions in accordance with reference codes. Install motor feeder in 18-inch minimum length liquid-tight flexible conduit at motor conduit box.
- D. Use nylon straps to bundle and secure wire and cable located in panelboards, cabinets, switchboards, motor control centers and switchgear.
- E. Minimum bending radius 12 times outer diameter of cable. Where shown, use shorter bending radius as permitted by NEC, ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, and S-105-692, and cable manufacturer.
- F. To facilitate pulling cable, use listed per UL or ITS directory lubricant recommended by cable manufacturer.
- G. Use direct-burial cable only for stray current and cathodic protection.
- H. To install direct-burial cable, prepare trench of uniform width and free of sharp projections and rocks and place three-inch bed of sand. Do not pull cable directly into trench from stationary reel; unreel cable beside trench. Place cable on sand bed and backfill with three-inch deep sand cover. Fill remainder of trench with approved fill material and compact in accordance with Section 02320. Provide temporary supports in trench as necessary to prevent damage to insulation or jacket during installation.
- I. In damp and dusty indoor locations, tunnel areas, manholes and outdoor locations, seal cable at conduit termination using duct-sealing compound.
- J. Where shown or necessary, install cable-seal fitting specified in Section 16130 to prevent entry of water into electrical facilities. Where approved, use seal compound specified in Section 16130.

### **3.02 IDENTIFICATION:**

- A. Identify cable terminations, feeders and power circuits using non-metallic fiberboard tags or plastic labels. Attach tags to cable with slip-free plastic lacing or nylon bundling straps. Use designation shown.

### **3.03 FIELD QUALITY CONTROL:**

- A. Furnish equipment required to perform tests. Prior to insulation and high-potential tests, disconnect instruments and equipment which might be damaged during such tests. Conduct tests in presence of the Engineer.
- B. Submit test procedure for approval and perform approved tests including, but not limited to, the following:

1. Single-conductor cable and multiple-conductor cable:
    - a. Test continuity of cable conductors using ohmmeter.
    - b. Proof-test insulation resistance to ground and between insulated conductors for minimum of one minute using 1,000-volt megger. Insulation resistance: 200,000 ohms minimum.
    - c. When cable shows unsteady insulation resistance of less than 200,000 ohms, perform high-potential test at 80 percent of factory ac test voltage or as recommended by cable manufacturer.
  2. Busway:
    - a. Clean contact surfaces before making connections. For bolted connections, apply torque recommended by manufacturer.
    - b. Test resistance of busway connections. Resistance not to exceed value recommended by manufacturer.
    - c. Test insulation resistance to ground and between insulated busbars for minimum of one minute using 1,000-volt megger. Insulation resistance: One-megohm minimum. When busway shows insulation resistance of less than one-megohm minimum, perform high-potential test.
- C. Submit certified test reports.

**END OF SECTION**

## SECTION 16121

### DC SWITCHBOARD, STINGER SYSTEM AND CONTROLS, DC PEDESTAL AND WALL MOUNTED CONTACTOR SYSTEMS FOR S&I SHOP

#### PART 1 - GENERAL

##### 1.1 DESCRIPTION:

- A. This Section covers specifications for furnishing all labor, materials, equipment, services, and tools necessary and required for electrical construction of the following S&I shop traction power systems.
  - 1. 750VDC Switchboard
  - 2. 750 VDC Stinger system for traction power to married pairs for movement inside the shop.
  - 3. 750 VDC Pedestal and wall mounted contactor system

##### 1.2 RELATED SECTIONS

- 1. 16128 - Wire and Cable for Traction Power
- 2. 16130 - Raceways, Boxes and Cabinets
- 3. 16341 - Metal Enclosed DC Switchgear
- 4. 16051 - Scope of Work for Traction Power

##### 1.3 QUALITY ASSURANCE

- A. Qualification: Select a manufacturer how is regularly engaged in the production of "DC switchboard, Stinger system and controls and DC pedestal and wall mounted contactor systems" equipment of the types and ratings described in these specifications using the latest technology and who has proven record of successful manufacturing and testing of same or similar type equipment for the last five (5) years. The equipment manufacturer shall have and maintain ISO9001 or ISO9002 certification.
- B. The work of this Section, including the products, shall satisfy the applicable requirements of the following standards and regulations of Jurisdictional Authorities:
  - 1. National Electrical Code (NFPA 70)
  - 2. ANSI/IEEE
  - 3. OSHA
  - 4. NEMA including WC8
  - 5. UL
  - 6. NESC C2 (Safety Code)
  - 7. IP code ( Ingress protection)

- C. Inspections and Tests:
1. The Engineer and his representatives reserve the right to witness all tests and manufacturer inspections that the Engineer deems necessary.
  2. The Contractor and his supplier shall grant the Engineer, or the Engineer's representative, free entry at all times while work under this Specification is being performed.
  3. The Contractor shall provide, free of cost, reasonable facilities to satisfy that materials and equipment are being furnished in accordance with these Specifications.

#### 1.4 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of Section 16051 of these specifications.
- B. In addition to the requirements set-forth in other section of the contract and section 16051 of these specifications, the Contractor shall submit to the Engineer, prior to final acceptance of work, a drawing(s) showing the complete layout of the 750 VDC switchboard, stinger system, DC pedestals and wall mounted contactors as well as all UL listings.
- C. The Contractor shall include shop drawings, manufacturer's descriptive literature and published details with performance and capacity rating schedules on chart, for all product specified in Part 2 of this Section. Product shop drawings shall indicate fabrication detail and proposed layouts for shop or field fabrication. Include electrical wiring diagrams, details and all necessary dimensions from assembly and from installation.
- D. Operation and Maintenance Manuals
1. The Contractor shall include the following element in each manual; however not necessarily in the order listed:
    - a. Table of Contents.
    - b. Erection or installation instructions.
    - c. Start-up procedures.
    - d. Schedule of preventive maintenance requirements.
    - e. Detailed maintenance procedures and schedule for any routine periodic maintenance.
    - f. Detailed trouble shooting procedures.
    - g. Corrected and approved control and wiring diagrams.
    - h. Data sheet listing pertinent equipment or system information.
    - i. Color photographs (4"x6") of the constructed and functional stinger system in detail. The photographs shall be bound in a suitable loose-leaf photograph album having individual transparent pages for insertion of the photographs.

j Name, address, and telephone number for each major supplier/manufacturer of the equipment, where spare parts may be obtained for the equipment.

2. The Contractor shall submit the final operation and maintenance manuals to the Engineer or authorized representative. These manuals shall be technically accurate and complete and shall represent the "As-Built" system, piece of equipment, or material. All illustrations, text, and tabular material shall be in final form; copies of all Shop Drawings shall be included for each major piece of equipment.
3. The contractor shall provide six copies of the complete operation, maintenance and repair instruction manuals in paper copies as well as in electronic file media on CDROM. Manuals shall include complete equipment layout drawings, one-line diagrams, elementary diagrams, control schematics, interconnection wiring diagrams, inventory part list with component number, part nomenclature, manufacturer's part number and any third party's part number. Maintenance instructions shall include full descriptive and pictorial literature and all parts of the equipments.
4. The electronic file media shall be in the following formats:
  - a. Drawing in editable AUTOCAD format.
  - b. Text in Word
  - c. Image in Tiff

E. Spare Parts Lists:

1. A list of suggested spare parts for each section to include all items given part number, model number, component name, manufacturer's name, price, phone numbers and suggested quantities.
2. Parts numbers by others shall be identified.

F. Certification:

1. The Contractor shall furnish to the Engineer, the certified copies of the results of all tests and measurements made to determine the quality and serviceability of the manufactured equipment listed in this Specification Section, at no additional cost to WMATA.
2. Certification shall include, as a minimum, the following items:
  - a. DC Stinger System and control - system integration, to include operation with the wheel truing and car progression systems if Provided.
  - b. DC switchboard
  - c. DC Pedestal and wall mounted contactor system

## PART 2 - PRODUCTS

### 2.1 DC SWITCHBOARD:

#### A. DC Switchboard:

1. The shop dc switchboard shall be a dead front, free-standing, metal enclosed assembly, suitable for indoor service. Ambient temperature will not exceed 40°C. The switchboard shall contain dc positive bus and bus connections, a minimum six (6) combination fusible branch circuit switches and magnetic contactors to supply power to a minimum six (6) individual stingers as required, and a minimum twenty (20) fusible branch circuit switches for receptacles at 750 V, dc. The switchboard shall contain terminal connectors and other auxiliary equipment and devices required. Shipping sections including shipping skids shall not be longer than 11'-0".
2. Except as otherwise noted herein, the switchboard shall be designed constructed and tested in accordance with the applicable provisions of ANSI Standard C37.20 and its supplements a, b and c (IEEE Standard No. 27) "Switchgear Assemblies Including Metal Enclosed Bus".
3. The switchboard shall have the following ratings from ANSI C37.20.
  - a. Rating Nominal Voltage 750 volts dc
  - b. Rating Maximum Voltage 800 Volts dc
  - c. Insulated Test Level 2,775 volts dc
  - d. Withstand 3, 900 volts dc
  - e. Short Circuit Rating
    - a. Peak 75,000 amperes
    2. Steady-State 75,000 amperes
    3. Rate-of-rise 2,000,000 amperes per second
    4. Continuous Current Ratings
- F. The switchboard assembly, including all components, shall be designed to safely withstand the available short circuit currents without damage and to limit the available short circuit currents without damage to the dc contactors specified.
4. Description and Materials
  - a. Metal enclosed switchboard structure shall be rigid, self supporting, self contained steel, constructed in accordance with ANSI C37.20 "Standards for switchgear assemblies including metal-enclosed bus". Each branch combination feeder switch and magnetic contactor and each branch feeder switch shall be fully compartmentalized so that they permit isolated access while serving load and confine faults to a single compartment. All switches shall be externally operable. The nominal height of the switchboard shall not exceed 90 inches. The enclosure shall be insulated from and anchored to a concrete floor which will be covered by an insulating topping(Leveling channels will be required). The supplier shall provide the means for insulated anchoring to the finish floor. Wherever the switchboard enclosure is less than three feet from any vertical building surfaces such as a wall or column, the Contractor shall form sheet insulation of a non-hygroscopic type required to insulate the vertical building surfaces to a height of nine feet above the

floor. A 2500 volt 60 Hz high-potential insulation test will be given to the insulation between enclosure and ground and also between the surface of the wall insulation and ground, upon completion of installation.

#### 5. Design

- a. The switchboard shall be designed and arranged to provide convenient access to all components for normal operation and maintenance. The switches, fuses and contactors shall be accessible from the front of the switchboard, but they shall be enclosed behind full height front doors. The front doors shall be full height, not more than 36 inches wide, with viewing windows so that the positions of the switches will be visible without opening the doors. All compartments shall have a hinged doors interlocked with the handle so the door cannot be opened while the switch is in the "ON" position. The front doors shall be key-interlocked with the dc main circuit breaker so that the doors cannot be opened without the insertion of a key, which shall be available from the circuit breaker only when the breaker is open. The key shall be retained in the front door until the door is closed and locked to prevent closing of the circuit breaker with the door open. The front doors shall be designed so that they can be closed and locked when the switches are either open or closed. The bus work and cable connections shall be accessible from the rear of the switchboard. The rear of the switchboard shall be provided with removable covers.

#### 6. Branch Circuit Switches

- a. Each branch switch shall be single pole, Bolted pressure (BPS), non-load break with current limiting fuse. The fuse compartment shall have a hinged door interlocked with the handle so the door cannot be opened while the switch is in the "ON" position. Provisions shall be provided to padlock the switch in the "Off" position.
- b. Branch Circuit switches and fuses supplying power to the stingers shall be rated at 600 amperes at 750V dc. Branch circuit switches supplying power to receptacles shall be rated at 150 amperes at 750V dc.

#### 7. Terminal Connectors

- a. The combination switches, contactors and switches shall be provided with solderless terminal connectors for outgoing cables. Connectors shall be of the long barrel, double indentation, compression type. The connectors shall be of one piece tubular construction formed of pure electrolytic copper and tin-plated to resist corrosion. Each contactor shall be provided with two (2) 250 MCM connectors; each 150 ampere switch with one (1) No. 1/0 connector.

#### 8. Nameplates

- a. Each switch shall be provided with a circuit identifying nameplate attached to the equipment with bolts, screws or rivets. Nameplates shall consist of three-ply laminated phenolic plates (2 1/2"x 6 1/2") engraved through black face to white core. Lettering shall be 1/2" high condensed vertical gothic using a rounded or square cutter. V-shaped grooves are not acceptable. Nameplate legends shall be as follows:
  1. DC STINGER NO. 1 (etc. through No. 6)
  2. DC RECEPTACLE POWER - NO. 1 (etc. through No. 20)

#### 9. DC Bus Section

- a. DC switchboard isolated from the DC switchgear( e.g. separate rooms) shall be provided with a DC bus section which shall include provisions for the connections of a total of six (6) 1000 MCM copper cables to the switchboard bus, entering from the top. Connectors shall be of the long barrel, double-indentation, compression type. The connectors shall be of one piece tubular construction formed of pure electrolytic copper and tin-plated to resist corrosion. Connectors shall be NEMA standard. The switchboard enclosure shall not be insulated from ground.
- b. The switchboard shall be provided with a bus connection to the DC switchgear when both switchboard and switchgear enclosures are in the same room and bonded. The switchboard enclosure shall then be insulated from ground. The enclosure will be bonded to the dc switchgear, to that the switchgear-mounted ground relay shall monitor and protect the switchboard, as well as the switchgear, from accidental grounding and accidental energizing of the enclosures.

#### 10. Description of Contactors

- a. Switchboard-mounted dc contactors shall be normally open, magnetically held, single pole, load break with 8-hour enclosed rating of 600 amperes inductive load at 750 volts dc and shall be NEMA size 6. The contactor shall be used to control the dc current to the stinger systems. Each contactor shall be provided with silver alloy, adjustable and readily replaceable contacts. The contactor shall have a minimum life under full load conditions of 100,000 cycles. Each pole shall be equipped with a current coil type magnetic blow-out which will provide directed control of the arc away from the current carrying contact surfaces. Each of the contactors shall be supplied with two (2) N.O. and (2) N.C. auxiliary contacts rated at 10 amperes. The short-circuit withstand capability shall be coordinated with the available peak-through current of the dc distribution switchboard and shall be sufficiently large so that no damage to the contactor or its enclosure is done during the time it takes the feeder circuit fuse to clear the fault. The contactor shall be controlled with a 120V ac rated coil capable of remote control operation. An internally-mounted 120 volt ac toggle switch which shall disconnect the control power shall be provided. Each contactor shall be designed to control the dc current to a single stinger system only.

#### 11. Testing

- a. The dc distribution switchboard shall be tested with fuses in place and shall withstand for one minute, without breakdown, a 60 cycle alternating potential of 3.7 times the maximum rated voltage. The switchboard shall also withstand for one minute, without breakdown, a direct current test voltage of 5.2 times the maximum rated voltage. The test potential is to be increased gradually from zero until the required test value is reached and is to be held at the value for one minute.

#### B. Receptacle Contactors

- 1. Provide 750 volt dc contactors in accordance with the following specifications.
  - a. DC contractors shall be normally open, magnetically held, single pole , load break rated as listed below at 750 volts dc. The contractor shall be used to control the DC current to the receptacle circuits. Each contractor shall be provided with silver alloy, adjustable and readily replaceable contacts. The contactor shall have a minimum life under full load conditions of 100,000 cycles. Each pole shall be equipped with a current coil type magnetic blow-out which will provide directed control of the arc away from the current carrying contact surfaces.
  - b. Contactors supplying power to receptacle circuits shall have 8 hour enclosed ratings of at least 150 amperes inductive load at 750 volts dc and shall be NEMA size 4. The

short-circuit withstand capability shall be coordinated with the available peak-through current of the dc distribution switchboard and shall be sufficiently large so that no damage to the contactor or its enclosure is done during the time it takes the feeder circuit fuse to clear the fault. The contactor shall have a 120 volt ac coil operation.

c. Enclosure

1. Each contactor shall be enclosed in a NEMA type 12 ventilated self supporting fiberglass enclosure suitable for wall mounting. Each 150 ampere rated contactor enclosure shall be provided with one key operated momentary contact switch to energize the control coil and one mushroom head stop pushbutton. The switch and pushbutton shall be located on the front cover and shall be accessible with the enclosure door closed. The door shall be suitable for padlocking. An internally-mounted 120 volt ac toggle switch which shall disconnect the control power shall be provided. Enclosure shall be manufactured of glass-reinforced polyester and shall have the following minimum strength.
  - a. Tensile strength 13,000 psi
  - b. Flexural strength 23,000 psi
  - c. Compression strength 17,000 psi
  - d. Impact strength 15 ft. lbs. Per inch
2. Enclosures shall be provided with a gasket hinged front door, suitable for padlocking. Enclosures shall be as manufactured by the Vynco Division of the English Electric Corporation, Crouse-Hinds, or Hoffman, or an approved equal.

## 2.2 DC STINGER (CONDUCTOR/COLLECTOR) SYSTEM

A. General:

1. The conductor/collector system components shall be UL listed, and shall meet or exceed UL-94 for Combustibility (self-extinguishing characteristics).
2. The conductor/collector system shall be protected against direct contact in accordance with "finger-safe standard" (UL-E99342, and/or D1N57470).
3. The conductor/collector system shall consist of standardized interchangeable units - track section, coupling sets, dead end caps, track hangers and power takeoff and control trolleys (including cables and cable support/relief assemblies)
4. This application requires a system of sturdy mechanical design, able to withstand the everyday operating environment common to transit maintenance facilities and as found in areas of vehicle maintenance lifts.
5. The conductor/collector system shall be of sufficient size to conduct all intermittent peak current requirements and a conductor of a cross sectional area of sufficient size for required mechanical strength.
6. No special tools should be required for installation.
7. The conductor system shall consist of all necessary conductor sections, hanger supports, insulators, anchor supports, feeder assemblies, expansion joint assemblies, collector (trolley) assemblies and/or special components.

8. The Contractor shall submit to the Engineer and the Car Maintenance Department(CMNT) plan and details of the Stinger System for review and approval, prior to procurement and installation.

B. Acceptable Manufacturers

1. The following manufacturers are approved for manufacture of the DC Stinger power and control system:
  - a. MAC Products, Inc. or approved equal
  - b. WAMPFLER Products, Inc. or approved equal

C. Construction:

1. Internal air clearance or solid dielectrics sufficient to withstand 4500 volt transient potentials on the DC power bus.
2. Electrical rating of 600 Amperes, 800 VDC nominal.
3. Design shall maintain pressure tolerances between bus bars and collector trolley pickups without frequent adjustment.
4. Construction shall allow for longitudinal thermal expansion movement between bus structure and other assembly supporting components or housings. The design shall provide a continuous track giving the control trolley and the power take-off trolley complete freedom of travel over the entire length without any binding.
5. The design shall maintain the full current carrying capacity throughout the system structure.

D. Power Conductor:

1. The conductor rail shall be a one piece copper trolley trough with a self "V" groove contact surface for the trolley collector assembly, and shall be suitable for the voltage rating.
2. The conductor rail shall have an intermittent current carrying capacity of 1250 amperes, with a DC resistance of 16.6 micro-ohms/ft, having sufficient thermal capacity to withstand 300% overload for intermittent duty cycles. Expansion joints shall not be required for lengths up to 660 feet. Each rail section shall be 16.4 feet in length in order to reduce the number of connection joints. All rail connectors shall be a bolted design. Rail shall be rated IP23 for indoor or outdoor use.
3. Designed utilizing collectors having sufficient mechanical strength to support and electrically feed a 100 amp (nominal) rated trolley/collector assembly.
4. The conductor bar hangers material shall be macrolon with galvanized hardware. The hanger shall swivel to self align with the rail and allow for the rail to snap in to the clamp during installation. The hanger will support the rail without "pinching" the rail side. Hanger design must provide free conductor movement to accommodate the thermal expansion or contraction of the conductor.
5. No drilling or welding of the conductor rail at time of erection shall be necessary, only bolted connections. Splice joint, anchors, expansion joints and all other required appurtenances shall be provided and shall be manufactured from the same material as the conductor rail.
6. The electrical efficiency of the components, e.g. splice joints, feeders and expansion joints shall not be less than an equal length of conductor.

7. The internal and external supporting insulators of fiberglass reinforced polyester compound shall have a flash over strength of four times nominal system voltage when tested per ANSI C29.1 (1988) Electrical Power Insulators, Test methods.
  8. The roof truss-supported Stinger system shall have the conductor rail supported at 7.5 ft. intervals (maximum) between support members center to center.
- E. Stinger Power Collector Trolley:
1. Rated 1000 Volt DC, 600 amperes capacity and compatible with the DC power conductor.
  2. The collector or trolley shall be of a captive type design in that the complete assembly shall be supported by and guided by sets of roller wheels within pair of "C" channel mounted in tandem with the power conductor.
  3. The trolley housing shall be of NEMA type 4 /IEC 1 P65 enclosure construction.
  4. Contact with the power bus shall be by pairs of contact shoes that are spring-loaded with minimum contact pressure of 6 pounds and shall be adjusted to permit free longitudinal movement of the complete trolley assembly along the power conductor.
  5. Provide horizontal and vertical guide wheels with sealed ball bearings, as an integral part of the trolley assembly. Supply support wheels designed to carry the dead and come-along dynamic weight of trolley, power cable, and stinger assembly, including pull-off force of stinger from the traveling vehicle shoe. Design shall prevent a 20 degree angle side pull-along force from creating abnormal pressure and shall maintain contact shoe alignment.
  6. Collector assembly to accommodate one power conductor. Provide solderless type pressure cable connectors and insulate connections using heat-shrinkable sleeves as manufactured by Raychem, 3M products, or Engineer approved equal.
  7. The complete trolley assembly will consist of two auxiliary support and movement rollers mounted to a common bracket held in alignment by the captive trolley.
  8. The cable connection between the trolley assembly and the stinger cable will be such that the force required to move the trolley assembly longitudinally along the conductor will not be fully placed on the connection itself. Provide strain-relief Kellems grip connectors to support the power cable at the trolley.
  9. Collector shoes shall be simple to replace without the use of tools.
- F. Control Conductor:
1. The conductor rail shall be a one piece copper trolley trough with a self "V" groove contact surface for the trolley collector assembly, and shall be suitable for the voltage rating.
  2. A current carrying capacity of 100 amperes, with impedance rating of  $1.1 \times 10^{-4}$  ohms/ft. The assembled conductor shall be enclosed in a safety orange, extruded PVC cover.
  3. Designed utilizing collectors having sufficient mechanical strength to support and electrically feed a 100 amp (nominal) rated trolley/collector assembly.
  4. The conductor bar hangers material shall be macrolon with galvanized hardware. The hanger shall swivel to self align with the rail and allow for the rail to snap in to the clamp during installation. The hanger will support the rail without "pinching" the rail side. Hanger design

must provide free conductor movement to accommodate thermal expansion or contraction of the conductor.

5. No drilling or welding of the conductor rail at time of erection shall be necessary, only bolted connections. Splice joint, anchors, expansion joints and all other required appurtenances shall be provided and shall be manufactured from the same material as the conductor rail.
6. The cable connection between the trolley assembly and the stinger cable will be such that the force required to move the trolley assembly longitudinally along the conductor will not be fully placed on the connection itself. Provide strain-relief Kellems grip connectors to support the power cable at the trolley.
7. Collector shoes shall be simple to replace without the use of tools.

G. Stinger Control Station Collector Trolley:

1. The control of the DC power stinger shall be provided by a separate 3-pole AC collector assembly, control trolley take-off system that shall be constructed in tandem with the DC power stinger assembly as shown on the Drawings.
2. (3) conductors rated 600VAC with a UL rated current capacity of 250 amperes at 100% duty cycle and at 35 degree C. All bar must be copper. with resistance greater than  $2.78 \times 10^{-4} \Omega/m$  at 20°C. Expansion joints shall not be required for lengths up to 660 feet. Each rail section shall be 13 feet in length in order to reduce the number of connection joints and shall be compatible with the AC multi-conductor control cable. All rail connectors shall be a bolted design. Rail shall be rated IP23 for indoor or outdoor use.
3. The collector or trolley shall be of a captive type design in that the complete assembly shall be supported by and guided by sets of roller wheels within pairs of "C" channel mounted in tandem with the power conductor.
4. The trolley housing shall be of NEMA type 4 /IEC IP65 enclosure construction.
5. Contact with the AC control bus shall be by pairs of contact shoes that are spring-loaded with a minimum of contact pressure of 4 pounds and shall be adjusted to permit free longitudinal movement of the complete trolley assembly along the control conductors.

Provide horizontal and vertical guide wheels with sealed ball bearings, as an integral part of the trolley assembly. Supply support wheels designed to carry the dead and come-along dynamic weight of trolley, power cable, and stinger assembly, including pull-off force of stinger from the traveling vehicle shoe. Design shall prevent a 20 degree angle side pull-along force from creating abnormal pressure and shall maintain contact shoe alignment.

Collector assembly to accommodate three (3) control conductors. Provide solderless type pressure cable connectors or terminal strip.

6. The complete control trolley assembly will consist of two auxiliary support and movement rollers mounted to a common bracket held in alignment by the captive trolley.
7. Collector assembly to accommodate three (3) control conductors as indicated on the drawings. Collector shoe lead wire shall be bolted direct to collector shoe to eliminate any potential of hot spots or thermal overloads. Provide solderless type pressure cable connectors and insulate connection using heat shrinkable sleeves as manufactured by Raychem, 3M Products or engineer approved equal.

8. The cable connection between the trolley assembly and the control cable will be such that the force required to move the trolley assembly longitudinally along the conductor will not be fully placed on the connection itself. Provide strain-relief Kellems grip connectors to support the control cable at the trolley.

#### H. Stinger Assembly

1. The DC power stinger assembly shall be provided with power cable, and service power tip. The control of the DC power stinger shall be provided by a separate 3-pole AC collector assembly, control trolley take-off system that shall be constructed in tandem with the DC power stinger assembly as shown on the Drawings.
2. The design shall meet space restrictions of vehicle lifts and vehicle clearances for safe working procedures for transit vehicle in the elevated and at floor positions on the car hoists.
3. Connection of the power and control cables to the stinger power cable and to the control pushbutton station and collector trolleys shall be via strain relief Kellems grip connectors.
4. Stinger assembly shall be furnished with an extra flexible, rope lay, stranded (class K in accordance with ASTM B 172) #4/0 AWG, coated, annealed copper power cable, having low smoke and low toxic silicon rubber insulation thickness rated for 2kV in accordance with ICEA NEMA WC8. Provide low smoke, zero halogen cross linked modified polyolefin jacket.
5. Provide hook on stinger and cable-mounted hanger for storage to facilitate operator to return trolley to starting position for next vehicle movement.
6. Provide end-of-run shock absorber assembly for both the stinger power trolley and the stinger control trolley.
7. Provide one (1) stinger assembly for each mobile collector trolley assembly and one (1) control station assembly for each mobile collector trolley assembly. The stinger assemblies and control station assemblies shall be furnished by the manufacturer of the collector busway and trolley assembly. Each stinger assembly shall have an independent 600A DC contactor. A single DC contactor shall not supply two stinger assemblies.
8. Provide all required means to permit passage of overhead crane loads between adjacent shop tracks.

#### I. Control Station Assembly

1. The control station assembly shall be provided with control cable, and pendant-mounted single pushbutton control station.
2. The design shall meet space restrictions of vehicle lifts and vehicle clearances for safe working procedures.
3. Connection of the power and control cables to the stinger power cable and to the control pushbutton station and collector trolleys shall be via strain relief Kellems grip connectors.

#### J. Supporting Insulators:

1. The mechanical and electrical properties of the DC conductor supporting insulator and the external mounting insulators shall meet the following requirements:

a. tensile strength	5000 lbs.
b. cantilever strength	9000 inch lbs.
c. compression strength	65000 lbs.
d. torsional strength	150 (+) ft.-lbs.
e. arc resistance	190 seconds - ASTM D495
f. tracking resistance	1200 min. - ASTM D2302
g. flame resistance	ASTM D635 Self-Extinguishing Federal LP406b - 164/31
h. creep distance	plate to plate - 4.75 inches (min) insert to insert 6.25 inches (min)
i. dielectric strength	(a) dry - 40 kV minimum (b) wet - 19 kV minimum
j. impulse	80 kV minimum - (1.5 x 40 wave)

K. Additional System Parameters

1. Operational safety of the stinger system shall require any personnel to be remote from the vehicle movement. It also requires that disengagement of the vehicle shoe clamp be accomplished as a NON-LOAD BREAK operation.
2. Trolley end stop bumper will permit "pull-off" of the stinger from the vehicle collector shoe and will stop trolley traveling at a speed of 5 mph without damage to trolley or overhead busway system (power and control conductors).

L. System Operation:

1. All stinger cable assemblies, control station cable assemblies, power and control system wiring, and auxiliary devices shall permit the following sequence of operation.
  - a. 750 DC voltage to the service power tip is off.
  - b. To make a move, the operator places the stinger service power tip on the vehicle shoe.
  - c. The operator then presses the control station momentary pushbutton and continues to press it. Immediately the green lights switch off, alarm will sound, rotating red lights will start flashing. After a preset time delay (15 seconds), DC traction power is available at the service tip and the vehicle will begin to move.
  - d. Movement is permitted to continue as long as the momentary pushbutton is pressed.
  - e. The control circuit "power on" function is disabled if any of the three (3) emergency (maintained) pushbutton stations are pressed.
  - f. Only one (1) stinger systems can be operated at any given time.

- g. After the move is made, the stinger control station momentary pushbutton is released red lights stop flashing and the green lights come on. The stinger is stored on its cable hanger.
- h. Alarm/horn activation is maintained when the 750V DC contactor malfunction and fail to de-energize the stinger system .

#### M. Control Stations

- 1. Cord-mounted pendant-type single pushbutton control stations shall have NEMA 4/4X stainless steel enclosure.
- 2. Flush head momentary pushbutton with 10 ampere rated contacts in accordance with NEMA A600.
- 3. Acceptable manufacturers shall be Allen-Bradley or Engineer approved equal.

#### N. Relays and Timers

- 1. All control relays and timers for the operation of the stinger system shall be of the heavy duty industrial type having screw type wire terminals or plug-in sockets. Provide sockets and all mounting hardware for the complete control system. Cube relays are not acceptable.
- 2. Acceptable Manufacturers
  - a. Agastat
  - b. Square D Co.
  - c. ASCO
  - d. Potter Brumfield
  - e. Allen Bradley
  - f. GE
  - g. Approved equal.

#### O. Stinger Control Panel

Provide Stinger Control Panel (SCP) as described herein. The SCP shall be manufactured by the same manufacturer as the DC Stinger System and Controls.

- 1. SCP - Provide a completely engineered assembly that is arranged in a manner that affords safety for the maintenance personnel and operators. The components and wiring are to be well identified and shall reflect the exact configuration as the control ladder diagrams, wiring diagrams and assembly diagrams.

- a. The minimum wire size for control wiring within the SCP shall be #14 AWG rated 2000 VAC.
  - b. Control wiring shall be EPR insulated, stranded copper wire.
- 2. Multi-Conductor Control Cable (SCP - DC Switchboard).
  - a. Provide an 8-conductor #10 AWG
- P. Warning Devices
  - 1. Provide warning devices to indicate presence of 750 VDC in areas having controlled DC stinger power. Maintain activation of the alarm/horn where stinger system is energized even when hand-held momentary push button switch is released, where contactors in DC Switchboard malfunction.
  - 2. All stinger areas shall be provided with rotating red lights for visual indication and warning horns for audible indication.
- Q.. Spare Parts
  - 1. The Contractor shall furnish spare components, parts and service tools as follows:
    - a. (1) - Stinger Power Trolley assembly, complete.
    - b. (1) - Stinger Control Trolley assembly, complete.
    - c. (2) - DC Stinger power cable assemblies, complete (service power tip furnished by WMATA).
    - d. (2) - DC Stinger control cable assemblies, complete with control station.
  - 2. All spare parts shall be packaged in manufacturer's standard cartons, properly labeled and delivered to a location designated by the Engineer that is within 20 miles of the Project's location.

## **2.3 DC PEDESTAL AND WALL MOUNTED CONTACTOR SYSTEM**

### **A. DC CONTACTOR ASSEMBLY**

- 1. 150 Amp, 800 Volts, DC, electrically operated contactor, 120 Volts AC operated solenoid. Provide 120 VAC from external source for control circuit operation as shown on the Contract Drawings. Control relays shall be as manufactured by General Electric Company, Allen-Bradley, ASCO, or approved equal.
- 2. Internal air clearances or solid dielectrics sufficient to withstand 4500 volt transient potentials on the circuit.
- 3. Acceptable Manufacturer's:
  - a. Microelectrica Scientifica; Model LTC-250-M-ADA.

- b. General Electric Company
- c. Cutler Hammer
- d. Approved Equal

**B. POWER CABLE**

- 1. 1/C # 1/0 extra flexible Class K copper stranded conductor with low smoke, zero halogen silicon rubber insulation, rated 2 kV.
- 2. Power cable shall be 30 feet long. Power cable shall be equipped with a spring-loaded clamp and protective 2 kV insulated boot over clip.

**C. ENCLOSURE - DC CONTACTOR**

- 1. Provide a Fiberglass, NEMA Type 4X wall-mounted enclosure having the following minimum dimensional characteristics: 20.19" high, 16.25" wide, and 12.00" deep. (Provide internal mounting panel, (17"high x 13" wide)). Provide a larger enclosure if required by the contactor manufacturer for its equipment and circuit arrangement.
- 2. Provide wire way to guide 1/0 AWG conductors within the enclosure.
- 3. Acceptable Manufacturer's:
  - a. Hoffman Engineering Co. A-20H1612GQRLP with A-20P16 Panel.
  - b. Approved Equal.

**D. CONTROL AND INDICATION**

- 1. Key Operated "ON" Pushbutton
- 2. Position, cylinder lock momentary (oil tight) pushbutton with key removable in "LOCK" position only.  
  
Allen Bradley 800T-E11A or equal, with extra large legend plate.
- 3. "OFF" non-illuminated extended head oil tight pushbutton, red color, Form B contact block.  
Allen Bradley 800MR-N26 or equal, with extra large legend plate.
- 4. "ON" Pilot Light, oil tight, red lens, push-to-test, full voltage 120 Volt LED, with extra large legend plate.  
Allen Bradley 800T-QTH10R or equal.

**PART 3 - EXECUTION**

**3.1 INSTALLATION**

- A. Refer to wire and cable sizes or single line diagrams and control ladder diagrams for size and quantity of wires required for the installation.

- B. Clean installed PRODUCTS of this Specification Section where deposits of oil, grease, dirt, dust, mud or debris is present after installation.
- C. Follow the recommendations of the stinger equipment manufacturer that pertain to the start-up and operation of the DC stinger systems.

**3.2 FIELD TEST FOR EQUIPMENT OPERATION**

- A. Perform the following tests and submit certified test reports to the Engineer. Furnish, at no cost to WMATA, all test equipment, materials, and labor required to perform the tests.
- B. Test performance and operation of the DC stinger system and DC contactor systems and operating procedures, to the satisfaction of the Engineer.
  - 1. Testing of controls shall consist of operating each control not fewer than five times.
  - 2. Testing of power circuits and operational procedure shall consist of energizing each stinger bus and provide actual traction power to a married-pair.
- C. The Contractor shall provide final testing under power subsequent to completion. The Contractor shall coordinate the interconnection between the DC Stinger System and the DC Switchboard power and control circuits. The contractor shall be responsible for final connections to the DC Switchboard power and associated commissioning, and final acceptance of the DC Stinger System by WMATA.

\* \* \*

## SECTION 16122

### CONTACT RAIL CABLE CONNECTOR ASSEMBLIES FOR TRACTION POWER

#### PART 1. GENERAL

##### 1.01 SUMMARY

- A. This section specified fabricating, testing and furnishing contact rail cable connector assemblies as shown and specified.
- B. Related Sections
  - 1. Section 16123 - Contact Rail Insulator Assembly For Traction Power
  - 2. Section 16124 - Contact Rail Protection Cover For Traction Power
  - 3. Section 16126 - Contact Rail Anchor Assembly For Traction Power
  - 4. Section 16127 - Contact Rail System Installation For Traction Power
  - 5. Section 16128 - Wire and Cable For Traction Power
- C. Payment and Measurement:
  - 1. Cable Connector Assembly: Lump sum, no separate measurement.

##### 1.02 REFERENCES

- A. Codes, regulations, references, standards and specifications:
  - 1. Does not apply.

##### 1.03 QUALITY ASSURANCE

- A. Testing: Conduct specified testing at no additional cost to the Authority.
  - 1. Compression connectors:
    - a. Prototype testing:
      - 1) Prior to production, assemble three compression connectors on 1,000-KCMIL 2,000-volt cable for use as test connections.
      - 2) Electrical resistance test:
        - a) Procedure:
          - (1) Remove insulation from cable portion of test connectors.
          - (2) Measure resistance between the cable and connector tongue with digital low resistance ohmmeter.
          - (3) With a 10 amp test current, digital low resistance ohmmeter (Kelvin Bridge Type) measure resistance of equivalent length of 1,000-KCMIL 2,000-volt cable.
        - b) Acceptance criteria:
          - (1) Electrical resistance for connection equal to or less than that of equivalent length of 1,000-KCMIL 2,000-volt cable.
    - 3) Tension test:
      - a) Procedure:
        - (1) Subject test connections to sustained tension of 5,000 psi of the nominal conductor cross-sectional area for three hours.
        - (2) Retest for electrical resistance after three hours.
      - b) Acceptance criteria:

- (1) No slipping of cable in connector.
- (2) No deformation.
- (3) No increase of electrical resistance beyond that specified.
- 4) Production Testing:
  - a) After successful prototype testing, production may commence.
    - (1) Prior to delivery, randomly select one percent of each production lot and subject to specified electrical resistance and tension tests.
- 5) Insulating covers:
  - a) Production testing:
    - (1) Procedure:
      - (a) Prior to delivery, randomly select one percent of each production lot of insulating covers and test insulation resistance at thinnest portion with 1,000-volt dc megohmmeter.
    - (2) Acceptance criteria:
      - (a) Insulation resistance: 1,000,000 ohms minimum.
      - (b) If one insulator cover of a lot fails insulation resistance test, entire lot will be rejected.

#### 1.04 SUBMITTALS

- A. Submit the following in accordance with the Division 1 and with the additional requirements specified for each.
  - 1. Shop Drawings:
    - a. Fabrication of cable connector assemblies.
    - b. Use of drawings for manufacture or fabrication prior to approval is not permitted.
  - 2. Certification:
    - a. Certifications that all cable connector assemblies meet or exceed specified requirements.
    - b. Test procedures.
    - c. Certified test reports.
    - d. Method of packaging: Submit prior to packaging and shipping.

#### PART 2: PRODUCT

##### 2.01 MANUFACTURERS

- A. Cable Connector Assembly
  - 1. MAC Products, Inc. No. B-9180 or equal.
  - 2. SELCO Manufacturing Corp., No. 2610 or equal.

##### 2.02 COMPONENTS

- A. Furnish cable connector assemblies in accordance with the following requirements:
  - 1. Lug: Compression type.
  - 2. Material: 98-percent pure copper. Tongue:
  - 3. Not less than 9/16-inch thick, with fourholes and drilled for 1/2-inch bolts on 1-3/4

4. inch centers.  
Complete with silicon-bronze flat washers, lock washers, nuts and bolts.

### **2.03 INSULATING COVER AND ACCESSORIES**

- A. Furnish insulating cover and accessories in accordance with the following requirements:
  1. Type: Two-piece.
  2. Material: Glass-reinforced polyester.
  3. Thickness: Not less than 0.125-inch.
  4. Color: Orange.
  5. Watertight.
  6. Complete with neoprene gaskets, sealing collars and captive screw fasteners.
  7. Each assembly, except sealing collar, capable of easy disassembly.

### **2.04 FABRICATION**

- A. Procedures and tooling to be recommended by the manufacturer and strictly complied with by the installer.

### **PART 3: EXECUTION - Not Used**

**END OF SETION**

## SECTION 16123

### CONTACT RAIL INSULATOR ASSEMBLY FOR TRACTION POWER

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This section specifies fabricating, testing and furnishing plastic and porcelain contact rail insulator assemblies as shown and specified.
- B. Related Sections:
  - 1. Section 16122 - Contact Rail Cable Connector Assemblies For Traction Power
  - 2. Section 16124 - Contact Rail Protection Cover Assemblies For Traction Power
  - 3. Section 16126 - Contact Rail Anchor Assembly For Traction Power
  - 4. Section 16127 - Contact Rail System Installation For Traction Power
  - 5. Section 16128 - Wire and Cable For Traction Power
- C. Payment and measurement:
  - 1. Compensation for work specified in this section will be made in the following manner:
    - a. Materials: Lump sum, no separate measurement.

##### 1.02 REFERENCES

- A. Codes, regulations, references, standards and specifications.
  - 1. ASTM A47.
  - 2. ASTM A153.
  - 3. ASTM A164.
  - 4. ASTM D149.
  - 5. ASTM D229.
  - 6. ASTM D256.
  - 7. ASTM D495.
  - 8. ASTM D570.
  - 9. ASTM D638.
  - 10. ASTM D648.
  - 11. ASTM D695.
  - 12. ASTM D790.
  - 13. ASTM D2000.
  - 14. ASTM D2303.
  - 15. ANSI B4.1.
  - 16. ANSI B18.2.1.
  - 17. ANSI B18.2.2.
  - 18. ANSI C29.1.
  - 19. ANSI C29.5.
  - 20. UL 94

##### 1.03 QUALITY ASSURANCE

- A. Testing
  - 1. Perform specified testing by a nationally recognized independent testing laboratory at no additional cost to the Authority.
  - 2. The Contractor shall notify the engineer fourteen (14) days in advance of the commencement of testing, including preparation of the test equipment for testing. Testing shall be performed in the presence of the Engineer unless otherwise approved by the Engineer in writing.

B. General testing

1. Randomly select a minimum of one percent of each production lot of 500 insulators of each type as test specimens.
2. Subject specimens to the following tests:
  - a. Electrical resistance test:
    - 1) Procedure:
      - a) Immerse each specimen in water at room temperature.
      - b) After 70 hours, remove and dry thoroughly.
      - c) Provide complete contact by use of wet clay pads on top and bottom of specimen.
      - d) Measure resistance to each specimen with 1,000-volt dc megohm meter or other approved device.
    - 2) Acceptance criteria:
      - a) Electrical resistance: Not less than eight megohms.
      - b) If one insulator of a lot fails, entire lot will be rejected.
  - b. Impulse withstand voltage test.
    - 1) Procedure: In accordance with ANSI C29.1.
    - 2) Acceptance criteria:
      - a) Dry withstand voltage: 30 kV at 60 Hertz for one minute.
      - b) Wet withstand voltage: 20 kV at 60 Hertz for ten seconds.
      - c) If one insulator of a lot fails, the entire lot will be rejected.
3. Insulators used as test specimens prohibited as part of quantity furnished.

C. Plastic Insulators

1. Material testing

<u>TEST ITEM</u>	<u>PROCEDURE</u>	<u>ACCEPTANCE CRITERIA</u>
Arc resistance	ASTM D495	180 seconds
Dielectric strength	ASTM D149, short-time test	100 volts per mil
Water absorption	ASTM D570, 24 hours at 23C	Weight increase: 0.3 percent maximum
Flammability	UL 94	Class 94V-O
Flame resistance	ASTM D229, Method II	Ignition time: 80 seconds minimum Burning time: 60 seconds maximum
Heat distortion	ASTM D648	Deflection temperature 390F at 264 psi
Izod Impact	ASTM D256, Method A	Average impact strength: 16 foot-pounds per inch width of specimen
Flexural strength	ASTM D790	24,000 psi
<u>TEST ITEM</u>	<u>PROCEDURE</u>	<u>ACCEPTANCE CRITERIA</u>
Tensile strength	ASTM D638	12,000 psi
Compressive strength	ASTM D695	20,000 psi

Tracking resistance      ASTM D2303

Time to track: at 2,500  
volts ac 600 minutes

\* Minimum unless otherwise specified.

2. Production testing:

a. General Requirements:

- 1) Production testing specified constitutes minimum requirements.
- 2) All insulators subject to full or partial testing at the discretion of the Engineer.
- 3) Insulators used for testing are not to be included in quantities furnished.
- 4) All facets of production testing, particularly location of facility and repair, capacity and calibration of test equipment, subject to approval.
- 5) Notify Engineer fourteen calendar days prior to scheduled testing dates.
- 6) If one insulator of a lot fails, the entire lot will be rejected.

b. Randomly select a minimum of one percent of each lot of 500 insulators as test specimens.

c. Load test:

1) Procedure:

- a) Mount 50% of the specimens on a rigid vertical support with centerline of holes on a horizontal plane.
- b) Mount 50% of the specimens on a rigid vertical support with centerline of holes on a vertical plane.
- c) Vertically apply a steady, even, downward pressure on the insulator head until it fails.
- d) Record pressure being exerted when first crack occurs in specimen.
- e) Record pressure being exerted when specimen fails.

2) Acceptance criteria:

a) Withstand:

- (1) To first crack: 1,200 pounds minimum.
- (2) To failure: 2,400 pounds minimum.

d. Compressive load test:

1) Procedure:

- a) Mount insulator on flat horizontal surface.
- b) Mount steel plate one-inch thick by 4-1/2 inches diameter on top of insulator.
- c) Conduct test in accordance with ASTM D695.

2) Acceptance criteria:

a) Withstand:

- (1) To first crack: 10,000 pounds minimum.
- (2) To failure: 20,000 pounds minimum.

e. Dielectric strength test:

1) Procedure:

- a) ASTM D149, Short-time Test.

2) Acceptance criteria:

a) Dielectric strength:

- (1) Perpendicular chair 100 volts per mil.
- (2) Perpendicular cap: 100 volts per mil.

f. Insulators used for testing are not to be included in quantities furnished.

D. Porcelain insulators:

1. Impulse flash-over voltage test:

- a. Subject all insulators to routine flash-over test.
  - b. Procedure: In accordance with ANSI C29.1.
  - c. Acceptance criteria:
    - 1) Insulator and glazing to remain intact.
    - 2) If an insulator fails the flash-over test, it will be rejected.
2. Mechanical test:
- a. Randomly select a minimum of one percent of each lot of 500 insulators as test specimens.
  - b. Procedure:
    - 1) Attach each insulator and mounting base to oak block.
    - 2) Mount each assembly on rigid foundation simulating service conditions.
    - 3) Place on top of each insulator one of the following type pads:
      - a) Lead: 1/4 inch thick
      - b) Canvas: 1/16 inch thick
    - 4) Attach to malleable iron cap a hardened steel disc ½ inch thick and equal in diameter to cap. Place both atop each insulator pad.
    - 5) Subject each test specimen to 10 blows of 15-pound spherical iron weight dropped from height of 36 inches.
  - c. Acceptance criteria:
    - 1) No cracks or fractures.
    - 2) If 50 percent or more of specimens fail, entire kiln-lot represented by specimens tested will be rejected.
3. Porosity test:
- a. From insulators destroyed in other tests, randomly select ten specimens.
  - b. Procedure: In accordance with ANSI C29.1.
  - c. Acceptance criteria:
    - 1) No evidence of penetration of dye into test specimen to an extent visible to the unaided eye.
    - 2) If one insulator of a lot fails, entire lot will be rejected.
4. Insulators used as test specimens prohibited as part of quantity furnished.
5. Verification:
- a. Compatibility of components of porcelain insulator assemblies:
    - 1) Prior to shipment, randomly select a minimum of one percent of each production lot of 500 of each component.
    - 2) Assemble to ensure that components mate properly.
    - 3) If one assembly fails to meet compatibility requirements, entire lot will be rejected.

#### 1.04 SUBMITTALS

- A. Shop Drawings:
  - 1. The Contractor shall submit for approval shop drawings for fabrication of the component and assemblies of the contact rail insulators, showing tolerances for all dimensions. No fabrication or manufacture shall be performed prior to drawing approval.
- B. Samples:
  - 1. One complete insulator assembly for each type.
- C. Documentation:
  - 1. Certification that all insulator assemblies furnished meet or exceed specified requirements.
  - 2. Detailed engineering data on materials used in the manufacture of insulator assemblies.
  - 3. Fabrication details.

4. Name of proposed independent testing laboratory.
5. Detailed description of quality control program. Work performed prior to approval is undertaken at the Contractor's risk.
6. Calibration certificates for quality control testing equipment.
7. Certified test reports. Submit no later than seven days after completion of tests.
8. Method of packaging. Submit prior to packaging and shipping.

## **PART 2 - PRODUCT**

### **2.01 MATERIALS**

- A. Furnish contact rail insulator assembly in accordance with the following requirements:
1. General Requirements
    - a. New and undamaged.
    - b. Symmetrical
    - c. Free of cracks, voids, air pockets, lamination, metallic substances or other defects rendering them unsuitable for intended service.
    - d. Meeting or exceeding acceptance criteria of specified tests.
    - e. Indelibly marked on underside with model number and identification of manufacturer.
    - f. Rated for a nominal voltage of 750 volts dc.
    - g. Minimum creepage distance over external surface of insulator from energized metal components to ground or to insulator fasteners: Eight inches minimum.
    - h. Resistant to weathering and sudden changes in atmospheric temperature from plus 150F to minus 20F.
    - i. Impervious to moisture, acid and alkali.
    - j. Suitable for use on wood ties and for direct fixation to concrete invert.
    - k. Color: Uniform gray matching sample available from the Engineer.
    - l. Designed for composite rail specified in Section 05661 with free-end-to-anchor distance of 500 feet and temperature range of plus 150F to minus 20F.
    - m. Compatible with protection cover assemblies specified in Section 16124, contact Rail Protection Cover Assembly.
  2. Plastic Insulators
    - a. Polyester resin reinforced with fibrous glass and inert fillers.
    - b. Compression-molded.
    - c. Appearance: Smooth and uniform.
    - d. Dimensions: As shown.
    - e. Tolerance: Plus-or-minus 1/32-inch.
  3. Porcelain Insulators
    - a. Design porcelain insulator assemblies as a system.
    - b. Manufacture components to tolerances ensuring that each component is compatible with all other components.
    - c. Insulators:
      - 1) Material:
        - a) Wet process porcelain, ANSI C29.5.
        - b) Close grained, homogenous and non-absorbent.
      - 2) Dimensions: As shown.
      - 3) Tolerances:
        - a) Variation of maximum dimension between top and bottom face: Plus or minus one percent.
        - b) Variation of diameter of holes from that shown: Plus or minus 1/8 inch.
        - c) Variation of other dimensions: Plus or minus one percent.

- 4) Glazing:
  - a) Smooth, hard, firmly adherent coating of uniform thickness.
  - b) Continuous over entire surface except as shown.
  - c) Free of checks and bubbles which extend completely through glaze.
  - d) Thermal expansion properties equal to porcelain material used.
- d. Other components:
  - 1) Malleable iron castings:
    - a) ASTM A47, Grade 32510.
    - b) Free from imperfections.
    - c) Finished surface: Smooth. Grinding to ensure accurate fit with adjoining parts is permitted.
    - d) Galvanized.
  - 2) Tolerances: ANSI B4.1.
  - 3) Hardware:
    - a) Dimensions and type: As shown.
    - b) Bolts: Steel, chemical and mechanical requirements in accordance with ANSI B18.2.1, galvanized.
    - c) Nuts: Steel, ANSI B18.2.2, galvanized.
    - d) Neoprene cushions, rings and pads: ASTM D2000, 1BC415.
  - 4) Galvanizing:
    - a) ASTM A153 or ASTM A164, Type GS.
    - b) Prior to coating perform the following:
      - (1) Shot blast finished parts in accordance with SSPC-SP-6, except maximum grit size to be SAE G-18, or pickle finished parts in diluted sulfuric acid.
      - (2) Thoroughly remove scale.
      - (3) Thoroughly clean with cold running water.
    - c) Immerse parts in solution of zinc chloride or hydrochloric acid.
    - d) Dry thoroughly.
    - e) Subject parts to zinc bath.

**PART 3 - EXECUTION Not Used**

**END OF SECTION**

## SECTION 16124

### CONTACT RAIL PROTECTION COVER ASSEMBLIES FOR TRACTION POWER

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This section specifies designing, fabricating, testing and furnishing contact rail protection cover assemblies, including expansion joint protection cover assemblies, as shown and specified.
- B. Related Sections
  - 1. Section 05661 - Contact Rail and Appurtenances For Traction Power
  - 2. Section 16123 - Contact Rail Insulator Assembly For Traction Power
  - 3. Section 16126 - Contact Rail Anchor Assembly For Traction Power
  - 4. Section 16127 - Contact Rail System Installation For Traction Power
  - 5. Section 16128 - Wire and Cable For Traction Power
  - 6. Section 16294 - Contact Rail Heating System For Traction Power
- C. Payment and measurement:
  - 1. Compensation for work specified in this section will be made in the following manner:
    - a. Material - Lump sum, no separate measurement.

##### 1.02 REFERENCES

- A. Codes, regulations, references, standards and specifications:
  - 1. ASTM - A123
  - 2. ASTM - A153
  - 3. ASTM - A313
  - 4. ASTM - A325
  - 5. ASTM - B633
  - 6. ASTM - D149
  - 7. ASTM - D229
  - 8. ASTM - D256
  - 9. ASTM - D570
  - 10. ASTM - D1499
  - 11. ASTM - E84
  - 12. ASTM - G23

##### 1.03 SYSTEM DESCRIPTION

- A. Type A: is full protection cover for installation in underground locations.
- B. Type B: is a top protection cover for installation in at-grade locations to accommodate the contact rail heating system.

##### 1.04 SUBMITTALS

- A. Submit the following for review in accordance with the Division 1 and with the additional requirements as specified for each.
  - 1. Shop Drawings:
    - a. The Contractor shall in accordance with Division 1 submit for approval shop drawings showing the design and fabrication of contact rail protection cover

- assembly.
2. Documentation:
    - a. Certification that protection cover assemblies furnished meet or exceed specified requirements.
    - b. Detailed engineering data on materials used in manufacture of protection covers.
    - c. Fabrication details.
    - d. Name of proposed testing laboratory.
    - e. Detailed description of quality control Program. Work performed prior to approval is undertaken at the Contractor's risk.
    - f. Calibration certificates for quality control testing equipment.
    - g. Certified test reports. Submit no later than seven days after completion of tests.
    - h. Method of packaging. Submit prior to packaging and shipping.

## 1.05 QUALITY ASSURANCE

- A. Testing: Have specified testing performed by a nationally recognized testing laboratory at no additional cost to the Authority. The Contractor shall notify the Engineer fourteen (14) days in advance of the commencement of testing, including preparation of the test equipment for testing. Testing shall be performed in the presence of the Engineer unless otherwise approved by the Engineer in writing.
  1. Material testing: Prior to fabrication, furnish one test specimen for performance of the following tests:
    - a. Water absorption test:
      - 1) Procedure: Test in accordance with ASTM D570.
      - 2) Acceptance criteria: Maximum absorption rate not exceeding 0.50 percent in 24 hours.
    - b. Flammability tests:
      - 1) Flame resistance:
        - a) Procedure: Test in accordance with ASTM D229.
        - b) Acceptance criteria: Maximum burning time: ten seconds.
      - 2) Flame spread:
        - a) Procedure: Test in accordance with ASTM E84.
        - b) Acceptance criteria:
          - (1) Flame spread: UL-listed, Class A Incombustible with classification not exceeding 25.
          - (2) Chlorine content: Not exceeding that which will emit more than 10 ppm.
    - c. Dielectric test:
      - 1) Procedure: Test in accordance with ASTM D149, Short Time Method.
      - 2) Acceptance criteria: Not less than 250 volts per mil.
  2. Type testing: Prior to fabrication, furnish five rail protection cover assemblies of each type and five expansion joint Type A protection cover assemblies with brackets set at widest spacing shown, as test specimens for performance of all specified tests on contact rail protection cover assemblies and specified mechanical load tests on expansion joint protection cover assemblies.
    - a. Mechanical load test:
      - 1) Procedure: Perform the following in the order given:
        - a) Mount protection cover assembly on length or contact rail or approved equivalent.
        - b) Static load test:
          - (1) Use 250-pound weight with bottom measuring six inches by twelve inches.

- (2) Place weight on protection cover at point selected by Engineer.
      - (3) One cycle consists of applying weight to assembly for 30 seconds, removing it, and reapplying it 60 seconds later.
      - (4) Test duration: Fifty cycles.
    - c) Impact resistance test:
      - (1) Use 250-pound weight with bottom measuring 18 inches square.
      - (2) Drop weight from height of 18 inches onto portion of protection cover directly above centerline of rail and directly above bracket.
      - (3) Subsequently, drop weight from height of 18 inches onto point on protection cover midway between two adjacent support brackets.
  - 2) Acceptance criteria:
    - a) Maximum permissible deflection at centerline of rail: 1-½ inches, at all times.
    - b) No splits, cracks or breaks.
    - c) Permanent deformation: Not exceeding 1/8 inch.
    - d) No violation of clearance envelope shown.
- b. Insulation resistance test:
  - 1) Procedure:
    - a) Conduct after mechanical load test.
    - b) Measure resistance between a point in contact with rail and a point on surface of protection cover assembly with 1,000-volt dc megohm meter.
  - 2) Acceptance criteria:
    - a) Resistance: 1,000,000 ohms minimum.
- c. Longevity test:
  - 1) Procedure:
    - a) Expose test specimens to light and water in accordance with ASTM G23 and ASTM D1499.
    - b) Total exposure time: 3,600 hours.
    - c) With 1,000-volt dc megohm meter, test insulation resistance through thinnest portion of protection cover.
  - 2) Acceptance criteria:
    - a) No visible evidence of deterioration.
    - b) Resistance: 1,000,000 ohms minimum.
- d. Izod impact strength test:
  - 1) Procedure:
    - a) Perform after longevity test in accordance with ASTM D256, Method A.
  - 2) Acceptance criteria:
    - a) Average izod impact strength: Four foot-pounds per inch of width.
- e. Production testing:
  - 1) General requirements:
    - a) Production testing specified constitutes minimum requirements.
    - b) All components subject to full or partial testing at the discretion of the Engineer.
    - c) Items used for testing not to be included in quantities furnished.
    - d) All facets of production testing, particularly location of facility and repair, capacity and calibration of test

- e) equipment, subject a approval.
- e) Notify Engineer 14 calendar days prior to scheduled testing dates.
- 2) Procedure:
  - a) Select one percent of protection covers produced in such a way that each group of five specimens represents identifiable lots of 500 lengths of protection cover and 1500 support brackets.
  - b) Subject test specimens to specified mechanical load and resistance rests specified under type testing.
- 3) Acceptance criteria:
  - a) As specified for type testing for mechanical load and resistance.
  - b) If one protection cover assembly of a lot fails to meet requirements, test additional 10 specimens from same lot. If one assembly of additional specimens fails to meet specified requirements, entire lot will be rejected.

## PART 2 -PRODUCTS

- A. Design: Design protection cover assembly to meet the following requirements:
  - 1. Prevention of accidental contact with energized rail components.
  - 2. Assurance of unimpeded passage of current collector mounted on transit vehicle.
  - 3. Resistance to sagging produced by intrinsic weight or external loads and forces.
  - 4. Ease of dismounting and remounting without disassembly of support bracket. Fasteners to be easily removable and reusable.
  - 5. Configuration:
    - a. Similar to configuration shown.
    - b. Cover not to be integral part of support bracket.
    - c. Basic geometry of cover, curved or chorded.
    - d. Fabricated in 10-foot lengths.
    - e. Continuous and uniform. Gaps at support brackets not exceeding 1/16 inch.
    - f. Support brackets at three-foot four-inch intervals, for Type B protection cover and at five-foot intervals for Type A protection cover, and as shown.
    - g. Arrangement of brackets at expansion joints as shown.
    - h. Assembly to lie within clearance envelope shown.
  - 6. Compatible with the composite contact rail specified in Section 05661.
- B. Material: Fabricate protection covers of material meeting the following requirements
  - 1. Glass-reinforced plastic.
  - 2. No separation or warpage under service conditions during 30-year life expectancy.
  - 3. Flame spread, flame resistance, chlorine content, water absorption and dielectric strength: In accordance with specified testing.
  - 4. Outer surface coated with polyurethane paint, 1.5 mils minimum dry film thickness.
  - 5. Color: Gray, to match specimen available from the Engineer.
- C. Support Brackets: Furnish support brackets meeting the following requirements:
  - 1. Design: Two-piece consisting of bracket and clamp as shown.
    - a. Configuration: Compatible with protection cover and with composite contact rail specified in Section 05661.
  - 2. Material: Same as that of protection cover.
- D. Nuts, Bolts, and Miscellaneous Hardware:
  - 1. Material
    - a. All nuts, bolts, and flat washers shall be manufactured in accordance with ASTM A325.

- b. The dimensional data and type hardware for all nuts, bolts and miscellaneous parts shall be recommended by the manufacturer. All steel bolts, nuts, screws and washers shall be galvanized as specified.
  - c. Spring washers shall be manufactured in accordance with the requirements of ANSI B18.21.1.
  - d. Hair pin cotter pins shall conform to the requirements of ASTM A313, Stainless Steel 304.
2. Galvanizing:
- a. All parts to be galvanized shall be galvanized after manufacture. Unless otherwise specified, parts to be galvanized shall be coated in accordance with the requirements of ASTM A123.
  - b. Bolts and miscellaneous hardware shown or specified to be galvanized shall be coated in accordance with ASTM A153 or alternate method in accordance with ASTM B633 Type I SC-2 for threaded items and SC-3 without threads.
  - c. Before galvanizing, the finished parts shall be pickled or sandblasted and the scale and adhering impurities removed. The pickling shall be done in properly diluted sulfuric acid, after which the parts shall be thoroughly cleaned in running cold water. Sandblasting shall meet or exceed Steel Structures Painting Council SSPC-SP-6, except that the maximum grit size shall be SAE No. G-18. The parts shall then be immersed in a solution of zinc chloride or hydrochloric acid. Immediately following thorough drying, the parts shall be dipped into the zinc bath before corrosion starts again.

**PART 3: EXECUTION- Not Used**

**END OF SECTION**

## SECTION 16125

### WIRE CONNECTION ACCESSORIES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing wire-connection accessories, such as connectors, terminal lugs and fittings, bundling straps, insulating tape and resin.

##### 1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is engaged in production of similar wire connection accessories.
- B. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. National Electrical Code (NEC).
  - 3. UL: 486A, Wire Connectors and Soldering Lugs for Use With Copper Conductors.
  - 4. American Standards of Testing and Materials (ASTM): D149-97a, Standard Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies; D257-99, Standard Test Methods for DC Resistance or Conductance of Insulating Materials; D412-98a, Standard Test Methods for Vulcanized Rubber and Thermoplastic Rubbers and Thermoplastic Elastomers-Tension; D570-98, Standard Test Method for Water Absorption of Plastics; D638-00, Standard Test Method for Tensile Properties of Plastic; D696-98, Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between -30°C and 30°C with a Vitreous Silica Dilatometer; D792-00, Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement; D1000-99, Standard Test Method for Pressure-Sensitive Adhesive-Coated Tapes Used for Electrical and Electronic Applications; D1518-85(1998)e1, Standard Test Method for Thermal Transmittance of Textile Materials; D5034-95, Standard Test Method for Breaking Strength and Elongation of Textile Fabrics (Grab Test); D5035-95, Standard Test Method for Breaking Force and Elongation of Textile Fabrics (Strip Method); D2240-00, Standard Test Method for Rubber Property-Durometer Hardness; and G21-96, Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi.
  - 5. American National Standards Institute (ANSI): C119.1, Sealed Insulated Underground Connector System 600V
  - 6. ITS: Directory of ITS Listed Products.
- C. Source Quality Control:
  - 1. Connectors, terminal lugs and fittings listed, per referenced UL or ITS directory.
  - 2. Factory testing: Submit certified copies of test report for cable splice and tap-insulation/sealing kits as specified.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings.
  - 2. Certification.

#### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage.
- C. Store products in secure and dry storage facility.

### PART 2 - PRODUCTS

#### 2.01 PRODUCTS AND MATERIALS:

- A. Connectors, Terminal Lugs and Fittings:
  - 1. In accordance with UL 486A.
  - 2. For 10AWG and smaller conductor cable: Tin-plated copper pressure connectors with nonflammable, self-extinguishing insulation grip with temperature rating equal to that of conductor insulation.
  - 3. For 8AWG to 4/0 AWG conductor cable: Tin-plated copper compression connectors and terminal lugs with nylon insulating sleeve for insulation grip.
  - 4. For 250 Kcmil and larger conductor cable: Long-barrel, double-compression tin-plated copper connectors and terminal lugs with two-hole pad.
  - 5. For multiple-conductor cable: Watertight aluminum fittings with stainless-steel pressure ring and set screws or compression cone for grounding of aluminum sheath of MC cable.
- B. Bundling Straps:
  - 1. Self-locking steel barb on one end, with tapered strap of self-extinguishing nylon, temperature rating minus 40F to plus 185F.
  - 2. For outdoor use: Ultraviolet-resistant.
- C. Insulating Tape:
  - 1. Plastic tape: Vinyl plastic tape with rubber-based pressure-sensitive adhesive, pliable at zero degree F with the following minimum properties when tested in accordance with ASTM D1000-99:
    - a. Thickness: 8.5 mils.
    - b. Breaking strength: 20 pounds per inch width.
    - c. Elongation: 200 percent.
    - d. Dielectric breakdown: 10,000 volts.
    - e. Insulation resistance, indirect method of electrolytic corrosion: 1,000,000 megohms.
  - 2. Rubber tape: Silicone-rubber tape with silicone pressure-sensitive adhesive, with the following minimum properties when tested in accordance with ASTM D1000-99:
    - a. Thickness: 12 mils.
    - b. Breaking strength: 13 pounds per inch width.
    - c. Elongation: 525 percent.
    - d. Dielectric breakdown: 13,000 volts.
    - e. Insulation resistance, indirect method of electrolytic corrosion: 1,000,000 megohms.
  - 3. Arcproof tape: Flexible, coated one side with flame-retardant flexible elastomer, self-extinguishing, non-combustible, with the following minimum properties:
    - a. Thickness, ASTM D1000: 30 mils.
    - b. Breaking strength, ASTM D5034-95 and D5035-95: 50 pounds per inch width.

- c. Thermal conductivity, ASTM D1518-85: 0.0478 BTU per hour per square foot per degree F.
    - d. Electrical arc resistance: Withstand 200 amperes arc for 30 seconds.
  - 4. Glass tape: Woven-glass fabric tape with pressure-sensitive thermosetting adhesive, with the following minimum properties when tested in accordance with ASTM D1000-99:
    - a. Nominal width: 3/4 inch.
    - b. Thickness: Seven mils.
    - c. Breaking strength: 170 pounds per inch width.
    - d. Elongation: Five percent.
    - e. Dielectric breakdown: 2,500 volts.
    - f. Insulation resistance, indirect method of electrolytic corrosion: 5,000 megohms.
- D. Epoxy Resin: Suitable for insulating and moisture sealing cable splices, with the following minimum properties:
  - 1. Dielectric strength, ASTM D149-97a: 400 volts per mil.
  - 2. Volume resistance, ASTM D257-99:  $2.8 \times 10^{15}$  ohm per centimeter cube at 30C.
  - 3. Water absorption, ASTM D570-98:
    - a. 0.193 percent in 24 hours at 23C.
    - b. 0.62 percent in 24 hours at 53C.
  - 4. Tensile strength, ASTM D638-00: 8,000 psi.
  - 5. Elongation, ASTM D638-00: 2.4 percent.
  - 6. Coefficient of expansion, ASTM D696-98:  $6.8 \times 10^{-5}$  inch per inch per degree C.
- E. Cable splice and tap-insulation/sealing kit: Suitable for use on 600-volt, 90C cables, material compatible with cable insulation and jacket, meeting the seal test requirements of ANSI C119.1.
  - 1. Heat-shrinkable tubing or wraparound heat-shrinkable sleeve: approved per referenced UL or ITS directory, flame-retardant, corrosion-resistant thick-wall tubing with factory-applied sealant for field insulation on in-line splices and taps or wraparound-type sleeve for retrofit installation on existing splices and taps to provide a watertight seal and insulating encapsulation, with the following additional requirements:
    - a. Material: Cross-linked polyolefin.
    - b. Shrink ratio: 3 to 1 minimum.
    - c. Physical properties:
      - 1) Ultimate tensile strength: 2,350 psi, ASTM D412-98a.
      - 2) Ultimate elongation: 350 percent, ASTM D412-98a.
      - 3) Hardness, Shore D: 42, ASTM D2240-00.
      - 4) Water absorption: 0.050 percent, ASTM D570-98, Method 6.1.
      - 5) Specific gravity: 1.28, ASTM D792-00.
    - d. Electrical properties:
      - 1) Dielectric strength: 450 volts per mil, ASTM D412-98a.
      - 2) Volume resistivity:  $1 \times 10^{14}$  ohm cm, ASTM D257-99.
    - e. Thermal properties:
      - 1) Continuous operating temp.: -55C to +135C.
      - 2) Air oven aging (14 days at 175C):
        - a) Tensile strength: 2,680 psi.
        - b) Elongation: 375 percent.
      - 3) Low temp. flexibility (4 hours at -55C): No cracking when flexed.
      - 4) Heat shock (4 hours at 250C): No cracking, flowing or dripping.
    - f. Chemical properties:
      - 1) Corrosivity: Non-corrosive.
      - 2) Fungus resistance: Non-nutrient, ASTM G21-96.
      - 3) Flammability: Self-extinguishing.

## **PART 3 - EXECUTION**

### **3.01 SPLICES AND TERMINATIONS:**

- A. Make wire and cable splices in outlet, junction or pull boxes, in cable troughs or in equipment cabinets. Splices in conduit are prohibited.
- B. Secure connectors or terminal lugs to conductor so as to engage all strands equally.
- C. Do not rupture insulation nor expose bare conductors.
- D. Install compression connectors and terminal lugs using tools and pressure recommended by manufacturer. Indent mark connectors and terminal lugs with number of die used for installation.
- E. Apply anti-corrosion joint compound to connectors, terminal lugs and bolting pads before installation.
- F. Wrap ½-lapped layer of arcproof tape, glass tape overall on cable splices installed in air tunnels, ducts and shafts.
- G. Install terminal fittings on multiple-conductor cable in accordance with manufacturer's recommendation. Completely seal cable from moisture.
- H. On cable splices, taps and terminations in manhole handhole and outdoor junction and pull boxes, cover connectors with electrical putty, wrapped with three layers of plastic tape or final layer of rubber tape and then install watertight encapsulation as follows and under the supervision of kit manufacturer's representative or using a factory-certified installation technician, proficient in field installation of heat-shrinkable sealing kits.
  - 1. Use heat-shrinkable tubing for encapsulation of new splices, taps and terminations.
  - 2. Use wraparound-type heat-shrinkable sleeve for encapsulation of existing splices, taps and terminations.

### **3.02 CATHODIC PROTECTION SPLICES AND TERMINATIONS:**

- A. For splices made in aboveground cable, use compression connectors covered with electrical putty, wrapped with three layers of plastic tape and final layer of rubber tape.
- B. Install compression terminal lugs using tools and pressure recommended by manufacturer. Indent mark terminal lugs with number of die used for installation.
- C. For splices made in direct-burial cable, use thermit weld sealed with cast epoxy-resin encapsulation.

### **3.03 INSPECTION:**

- A. Have splices in direct-burial cable for stray current and cathodic protection inspected by the Engineer before backfilling.
- B. Have splices and taps in manholes, handholes and outdoor junction and pull boxes inspected by the Engineer or the manufacturer's representative, when available.

**END OF SECTION**

## SECTION 16126

### CONTACT RAIL ANCHOR ASSEMBLY FOR TRACTION POWER

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This section specified fabricating, testing and furnishing contact rail cable connector assemblies as shown and specified.
- B. Related Sections:
  - 1. Section 16122 - Contact Rail Cable Connector Assemblies For Traction Power
  - 2. Section 16123 - Contact Rail Insulator Assembly For Traction Power
  - 3. Section 16124 - Contact Rail Protection Cover Assembly For Traction Power
  - 4. Section 16126 - Contact Rail System Installation For Traction Power
  - 5. Section 16128 - Wire and Cable For Traction Power
- C. Payment and Measurement Basis:
  - 1. Compensation for work specified in this section
    - a. Contact Rail Anchor Assemblies, Furnish, Fabricate and Deliver: Lump Sum.

##### 1.02 REFERENCES

- A. Codes, Regulations, Standards and Specifications:
  - 1. Society of Automotive Engineers (SAE):
    - a. SAE G18.
  - 2. American Society for Testing and Materials (ASTM):
    - a. ASTM A27.
    - b. ASTM A36.
    - c. ASTM A47.
    - d. ASTM A48.
    - e. ASTM A123.
    - f. ASTM A153.
    - g. ASTM A283.
    - h. ASTM A325.
    - i. ASTM A489.
    - j. ASTM A681.
    - k. ASTM B134.
    - l. ASTM B633.
    - m. ASTM D570.
    - n. ASTM D638.
  - 3. American National Standards Institutes (ANSI):
    - a. ANSI B4.1.
    - b. ANSI B46.1.
    - c. ANSI B18.8.1.
    - d. ANSI B18.21.1.
  - 4. Steel Structures Painting Council (SSPC):
    - a. SSPC-SP-6.

##### 1.03 SUBMITTALS

- A. Submit the following for approval in accordance with the Division 1 and with additional requirements as specified for each:

1. Shop Drawings
  - a. The Contractor shall submit shop drawings to be used for fabrication of the components and assemblies of the contact rail anchors.
2. Certification
  - a. Certification that contact rail anchor assemblies furnished meet or exceed specified requirements and are compatible with the contact rail.
  - b. Certified test reports for specified factory testing.

#### 1.04 QUALITY ASSURANCE

- A. Testing
  1. Production Testing
    - a. Prior to delivery two anchor assemblies of each production lot shall be randomly selected to be used as test specimens.
    - b. Perform the tests in the following sequence in accordance with the referenced codes and standards.
      - 1) Tension test:
        - a) Tension test shall be in accordance with ASTM D638 using a temperature range of plus 40C to minus 17C.
        - b) The minimum acceptable tensile strength shall be 60,000 psi.
      - 2) The impact-resistance test:
        - a) The impact-resistance test shall be conducted within the temperature range of plus 21C to minus 17C.
        - b) The strain insulator rod shall be mounted as a simple beam with 21 inches between supports.
        - c) A 50-pound weight shall be dropped from a height of 12 inches so that it impacts at a midpoint on the rod. Repeat the test three times. No fractures shall occur on the rod.
      - 3) Water-absorption test:
        - a) Water-absorption test shall be performed in accordance with ASTM D570 over a 48-hour period using a temperature range of 20C to 40C.
        - b) Weight gain shall not exceed 0.15 percent of the original weight.
      - 4) DC-resistance test:
        - a) Following the specified water-absorption test, one eight-inch length of 5/8-inch diameter strain insulator rod shall undergo a dc-resistance test. The rod shall show a resistance of not less than eight megohms measured between the end surfaces of the rod.
      - 5) Dielectric test:
        - a) A dielectric test shall be performed on the same rod used in the resistance test.
        - b) The strain insulator rod shall be capable of withstanding an ac potential of 15,000 volts, 60 Hertz applied to the rod surface for three minutes without insulation breakdown or damage.
        - c) If one test specimen of a lot fails to meet specified test requirements, the entire production lot shall be rejected.
      - 6) Strain Insulator Rod Testing
        - a) After the rods are assembled to the clevis ends using a resin compound or similar approved adhesive and allowed to cure for 24 hours, proof load test each assembly to 15,000 pounds. No physical damage shall be allowed at the conclusion of testing.

- B. For Codes, Regulation, References, Standards and Specifications, refer to Article 1.02.

## **PART 2 - PRODUCTS**

### **2.01 COMPONENTS**

- A. Contact Rail Anchors
1. Cast Parts
    - a. The contact rail anchor cast parts shall be free of cracks, blemishes, scale, machining flaws, excessive shrinkage or other defects rendering them unsuitable for their intended service. They shall be finished to a true and homogeneous surface and if necessary ground to ensure accurate fit with contiguous parts.
    - b. Steel used in the fabrication shall be medium steel manufactured by the open-hearth, basic-oxygen or electric furnace process, ASTM A27, Grade 65-35, fully annealed and tempered. Malleable iron shall be ASTM-A47, Grade 32510 and gray iron shall be ASTM A48 Class 40C.
  2. Rolled Steel Parts
    - a. Rolled steel parts shall be manufactured by the open-hearth, basic-oxygen or electric-furnace process and shall be in accordance with ASTM A36, ASTM A681 and ASTM A283, Grade C.
    - b. Parts shall be free from cracks, flaws, seams, blisters, imperfect edges and other defects rendering them unsuitable for their intended service. The surface roughness shall not exceed 125 micro inches as prescribed by ANSI B46.1
  3. Tolerances
    - a. All tolerances shall be in accordance with ANSI B4.1.
  4. Galvanizing
    - a. Parts to be galvanized shall be prepared by first pickeling in diluted sulfuric acid and cleaning in cold running water. The parts shall then be shot blasted in accordance with SSPC - SP6, maximum grit size SAE G18, followed by immersion in a solution of zinc chloride or hydrochloric acid. After drying, hot-dip galvanize the parts in accordance with ASTM A123, unless otherwise specified. Nuts, bolts, washers, clevis pins and eye bolts shall be galvanized in accordance with ASTM A153 or ASTM B633 Type I SC-2.
  5. Strain Insulator Rods
    - a. The strain insulator rods shall be fabricated from 5/8-inch diameter reinforced plastic consisting of 60 to 65-percent glass fiber uniformly impregnated with 35 to 40-percent thermosetting p
  6. Miscellaneous Hardware
    - a. Nuts, bolts and miscellaneous hardware shall be of the type, material and dimensions as shown. The parts shall be galvanized as specified and manufactured as follow:
    - b. Nuts, bolts and flat washers: ASTM A325.
      - 1) Spring washers: ANSI B18.21.1.
      - 2) Cotter pins: ASTM B134 and ANSI B18.8.1.
      - 3) Eye bolts: ASTM A489.

## **PART 3 - EXECUTION - Not Used.**

**END OF SECTION**

## SECTION 16127

### CONTACT RAIL SYSTEM INSTALLATION FOR TRACTION POWER

#### PART 1: GENERAL

##### 1.01 SUMMARY

- A. This section specifies the requirements for installation of an operable contact rail system consisting of composite contact rail and all appurtenances including protection equipment and furnishing of ancillary material as specified.
- B. Related Sections:
1. Section 05661 - Contact Rail and Appurtenances For Traction Power
  2. Section 16122 - Contact Rail Cable Connector Assemblies For Traction Power
  3. Section 16123 - Contact Rail Insulator Assemblies For Traction Power
  4. Section 16124 - Contact Rail Protection Cover Assemblies For Traction Power
  5. Section 16126 - Contact Rail Anchor Assemblies For Traction Power
  6. Section 16128 - Wire and Cable For Traction Power
  7. Section 16294 - Contact Rail Heating System For Traction Power
- C. Payment and Measurement
1. Compensation for work specified in this section will be made in the following manner and in accordance with the unit price schedule:
    - a. Contact rail system, install: linear foot.
  2. Measurement of work specified in this section will be made in the following manner:
    - a. Contact rail system, install: linear foot measured to nearest 0.5 foot along center line of contact rail including end approaches, excluding gaps to include:
      - 1) Insulators, ballasted, install: includes furnishing and installing insulators, shims and drive spikes.
      - 2) Insulators, direct fixation, install: includes furnishing and installing insulators, shims, anchor bolts and group pads.
      - 3) Composite contact rail, install: includes furnishing and installing of composite contact rail, bending rail, attachment of splice joints and installation of anchors, expansion joints and end approaches.
      - 4) Cable connector assembly, install: includes preparation and installation of 1,000 KCMIL power cable as required and installation of compression connectors and insulating covers.
      - 5) Composite contact rail terminal lugs, install: includes preparation and installation of extra-flexible, 427-strand, power cable as required and installation of the terminal lugs on the composite contact rail.
      - 6) Protection cover, install: includes furnishing and installation of protection cover, support brackets, expansion joint protection cover assemblies and hardware.

##### 1.02 REFERENCES

- A. Code, regulations, references standards and specifications
1. ASTM - D1248
  2. UL
  3. AREMA

### 1.03 SUBMITTALS

- A. Submit the following for approval in accordance with the Division 1 and with additional requirements specified for each:
  - 1. Shop drawings: shims for contact rail height adjustment.
  - 2. Documentation:
    - a. The method of bending and tolerances to be allowed for contact rail.
    - b. The method of brushing, cleaning, and grinding for removing local surface irregularities
  - 3. Certification:
    - a. Wire pulling lubricants to be non-injurious to insulation of wire.

### 1.04 QUALITY ASSURANCE

- A. Testing
  - 1. Electrical resistance of the installed composite rail not to be greater than 0.002 ohms per 1,000 feet at 20 degree centigrade.
  - 2. Sample compression cable connector assemblies will be tested to sustain tension of 5,000 psi for three hours. At the end of three hours, there shall be no slipping of the cable in the connector, deforming or loosening of the connection or increase in the electrical resistance beyond that is specified.
  - 3. Terminal lugs for composite contact rail shall be tested as specified for cable connector assembly compression connections.
- B. For codes, regulations, reference standards and specifications, refer to Article 1.02 above.

## PART 2: PRODUCTS

- A. The components furnished under this section shall be as follows:
  - 1. The top surface of each insulator rail clip shall be thoroughly coated with a non-conductive lubricant, Dow-Corning 44 (heavy) grease, or equal, to reduce strain on the insulators caused by the movement of the contact rail.
  - 2. Timber drive spikes to secure insulator to contact rail for ballasted track installment shall be ½ inch in diameter and 6-1/2 inches long. Two spikes will be required for each insulator. Timber drive spikes shall be in accordance with Area Plan.
  - 3. Anchor bolts for securing insulators to contact rail for direct fixation installation shall be galvanized threaded studs ½ inch in diameter.
  - 4. Group pads each 12 inches wide and 12 inches long shall be as specified for Direct Fixation Track Construction (DFTC). Grout pads of varying thickness will be required for adjusting required relative height of contact rail with respect to the top of running rail.
  - 5. Shims as required, up to 1/4 inch shall be used under the insulator for further height adjustment. Shims shall be supplied by the Contractor at no additional cost to the Authority.
  - 6. Shims for contact rail height adjustment shall be 1/8 inches thick high density polyethylene, ASTM D1248, Type III, Class C, Cat. 5, and shall provide full bearing of the insulator on the grout pad in all positions of adjustment. Shims shall be designed to stay in place even if bolts are loose.
  - 7. Shim material may be manufactured without carbon black but shall meet all other requirements.
  - 8. The contact rail anchors installed as shown shall be secured to the trackbed with 3/4 inch diameter by 7-3/4-inch long threaded studs in direct fixation track, and with 11/16-inch by 6-inch washer-head drive spikes in ballasted track. Drive spikes shall be in accordance with AREMA Plan.
  - 9. Expansion joint jumper cable shall be extra flexible, 427-strand, power cable. Its

- length and points of connection to the contact rail shall be as shown.
10. All jumper cable installed in conduit at crossovers, transitions and other special track work shall be standard duty, 127-strand, or extra flexible 427-strand power cable.
  11. Contact rail connection cable shall be extra flexible 427-strand, power cable. Its length and points of connection to the contact rail shall be as shown, in accordance with expansion and contraction requirements of the contact rail.

### 3.0 EXECUTION

#### A. Insulator Assemblies

1. Insulators shall be installed as shown and specified.
  - a. The insulators shall be centered and secured in place and shimmed if necessary.
  - b. Insulators shall be installed on the direct fixation invert or on contact rail ties and shown. The distance between insulators shall not exceed ten feet.
  - c. All injurious substances falling on the insulators shall be immediately removed to prevent damage. Upon completion of the work, all insulators shall be inspected and thoroughly cleaned. All insulators chipped, broken or otherwise defective after installation shall be replaced before final acceptance at no additional cost to the Authority.
2. Ballasted Track Installation
  - a. The insulator shall be located to permit positioning the contact rail with respect to the gauge line of the near running rail within the specified tolerances.
  - b. The insulators shall be secured to the contact rail ties by two 1/2-inch diameter by 6-1/2-inch long timber drive spikes per insulator. The ends of ties under insulators shall be adzed or shimmed as necessary to compensate for warped ties. Contact rail ties shall be bored in the field to receive the drive spikes. Position holes to ensure that each insulator is centered across width of tie. The holes shall be 3/8-inch in diameter and six inches deep and treated with pentachlorophenol oil or creosote immediately after boring. The drive spikes shall be started vertically and driven straight. Drive spikes bent during installation shall be withdrawn and new drive spikes driven. Drive spikes shall be driven firmly to the top of the insulator base. Uneven tightening of spikes to adjust rail locating is prohibited
3. Direct Fixation Installation
  - a. The insulators shall be located to permit positioning the contact rail with respect to the gauge line of the near running rail within the specified tolerances. Anchor bolts shall be 1/2-inch diameter galvanized threaded studs. Anchor bolt holes for the insulators shall be located as shown and drilled as specified for DFTC. The diameter of the holes shall be as recommended by the manufacturer of the anchoring device, to a maximum of 1-3/4 inches.
  - b. Anchor bolts shall be installed in accordance with the approved procedure as specified for DFTC, the minimum upward vertical load shall be 6,000 pounds tension.

#### B. Contact Rail:

1. The centerline of the contact rail shall be located as shown on drawings. The contact rail shall be installed to rest evenly and uniformly on all insulator assemblies.
2. No length of contact rail less than 25 feet in length shall be used, except at locations shown, unless otherwise approved. Cuts shall be made only as required to ensure that the end of a run of contact rail falls within the specified tolerances. Cuts shall be made straight and perpendicular to the longitudinal axis of the contact rail. Contact rail for curve radii of less than 400 feet shall be bent to the appropriate curve

prior to installation. Contact rail for curve radii greater than 400 feet may also be bent prior to installation to facilitate handling. The method of bending and tolerances to be allowed shall be submitted for approval.

- a. Ballasted Track Installation: The required relative height of contact rail with respect to the top of running rail for timber ties shall be obtained by using shims under the insulator if necessary. Shims necessary for height adjustment shall be supplied by the Contractor at no additional cost to the Authority.
  - b. Direct Fixation Installation: The required relative height of contact rail with respect to the top of running rail shall be obtained by varying the thickness of grout pads which will support the insulators as shown. The grout pads shall be as specified for DFTC, except that the dimensions shall be 12 inches wide and 12 inches long.
  - c. If further height adjustment is required, additional shims as required up to 1/4 inch shall be used under the insulator.
  - d. Shims shall be installed with tabs facing the direction of train traffic and a 3 inch finish nail tacked into the timber tie directly adjacent to the insulator base to prevent shims from vibrating out.
3. End Approaches: The end of contact rail sections shall be terminated with end approaches, installed as shown on drawings. They shall be assembled to the contact rail to ensure a smooth running surface. The allowable longitudinal location tolerance shall be plus or minus six inches except at special track work locations where the distance measured from the nearest point of switch shall be as calculated from dimensions shown with a tolerance of minus zero and plus one foot. An 11-foot long end approach shall be used for all main track unless otherwise shown.
  4. Splice Joints for Composite Contact Rail: Composite contact rail splice joint shall be installed as specified by the manufacturer of the composite contact rail and approved. Splice joints shall be installed to provide one foot clearance from contact rail insulators. The contractor shall demonstrate that the installed composite rail has an electrical resistance not greater than 0.002 ohms per 1,000 feet at 20 degrees C.
  5. Splice joints may be installed over insulators if the manufacturer demonstrates to the satisfaction of the Engineer that designed and furnished joint bars will not come in contact with insulator ears.
- C. Contact Rail Surface Preparation: After installation of the contact rail to the specified tolerances, but prior to its final acceptance, the Contact rail shall be brushed or otherwise cleaned to remove rust and scale from the head of the contact rail. Such brushing or cleaning shall not remove in excess of 0.002 inch from any surface of the rails, except that additional brushing, cleaning or grinding shall be performed as necessary to remove local surface irregularities. The method of brushing, cleaning and grinding shall be submitted for approval prior to use.
- D. Expansion Joints: Expansion joints shall be installed in the contact rails as specified at the locations shown with an allowable tolerance of plus or minus five feet centered between insulators. The expansion joint shall be installed to provide a flat surface uniform with the rails, ensuring that the top surfaces of the two sections are in line within 1/32 inch for a distance of three feet in either direction. Expansion joint gaps shall be established depending on the rail temperature at the time of installation as shown on the Expansion Data Table. After installation the top surfaces of the expansion joint bars shall be ground so that they are flat and do not project above the top surface of the contact rail.
- E. Protection Cover Assembly: The protection cover assembly shall be installed entirely within the clearance envelope shown and in accordance with the manufacturer's recommendations:
1. At end approaches the protection cover shall be maintained at the uniform height above the top of the contact rail and shall not drop with the end approach.
  2. On curve radii under 500 feet, the protection cover may be cut into lengths a

minimum of five feet long to conform as closely as possible to the arc of the curve. The protection cover shall lie within the clearance envelope at all times.

3. For underground installation, protection cover support brackets shall be installed at five-foot intervals maximum; one bracket joining ends of protection cover sections and one at the midpoint of each 10-foot section.
4. For at-grade installation, protection cover support brackets shall be installed at three foot, four inch intervals maximum; one bracket joining ends of protection cover sections and one at each third point of a 10-foot section.
5. Additional protection cover brackets shall be installed where necessary. The maximum middle ordinate of a length shall be  $\frac{1}{2}$  inch. At contact rail expansion joints, an expansion joint protection cover assembly shall be installed as shown. Contractor shall fabricate expansion joint protection covers from the protection covers as shown. Contractor shall install protection cover support brackets so as to avoid compression fasteners and splice joints in the composite contact rail.

F. Electric Cabling and Connections

1. Feeder cables from substations and tie breaker stations will be furnished and installed by the Contractor, including the cable connector assemblies, extra-flex 1,000 KCMIL, cables and connections to the contact rail.
  - a. All other contact rail cabling and connections shall be installed by the Contractor. All cabling shall be continuous without splices between terminations.
  - b. Cables shall not be bent, either permanently or during installation, to radii less than 10 times the outer diameters, except where shorter radii are approved for conditions making the specified radius impractical. The Contractor shall provide suitable installation equipment to prevent cutting and abrasions of conduit and cable during installation. Any conduit stub-ups broken or damaged shall be repaired as shown. Rod and swab conduits so as to remove water, cement and other foreign matter. Wire pulling lubricants, if used, shall conform to applicable UL requirements. The lubricant shall be certified by the manufacturer to be non-injurious to such insulation. Pull-lines shall be made of nylon, polyester, polyethylene or other suitable nonmetallic material. Pull-lines shall be attached to cables by means of either woven basket grips or pulling eyes attached directly to the conductors. Only one cable shall be installed per conduit. Pulling tensions on both the conductors and their insulations and jackets shall not exceed the maximum tensions recommended by the cable manufacturer
2. Cable Installed in Conduit: All jumper cable installed in conduit at crossovers, transitions and other special track work shall be standard duty, 127-strand, or extra flexible 427-strand power cable. After installation, all cables shall be tested in accordance with Section 16128. Conduit ends shall be sealed using existing conduit sealing bushings, OZ Gedney Type CSBE-400p-1 or equal, as shown.

G. Cable Connector Assemblies

1. Qualifications for Performing Compression Connections: Prior to installation, the Contractor shall have prepared, under the direction of each foreman who will supervise a crew performing compression connections, two compression assemblies. The test compression assemblies shall be made using the methods and equipment the Contractor proposes to use for the installation. The electrical resistance of the completed connection, when measured between the distal end of cable and the connector tongue, shall not be greater than the resistance of an equivalent length of uncut cable.
2. Installation of Compression Connectors: Compression connectors shall be attached to the cable with the manufacturer's recommended tooling. When bolting tongues together, a lockwasher shall be installed under the head of each bolt and under each nut. All bolted connections shall be tightened with torque wrenches to a uniform

- torque of 450 inch pounds.
3. Installation of Terminal Lugs for Composite Contact Rail: Cable connections to the composite contact rail shall be one-hole, tin-plated, copper compression connectors. Prior to assembly of the terminal lugs to the composite contact rail, mating surfaces shall receive a liberal coating of oxide-inhibiting paste, NO-OX-ID, Dearborn Chemical, or equal. The oxide-inhibiting paste shall also be applied to all interfaces of the compression fasteners. The methods and equipment used to fasten the terminal lugs to the composite contact rail shall be as recommended by the manufacturer of the rail. Compression fasteners bent or improperly installed shall be replaced. Compression fasteners shall be installed in existing compression fastener holes used to hold the aluminum extrusion in place. Existing steel compression fasteners shall be removed and new fasteners installed to hold the terminal lugs.

**END OF SECTION**

## SECTION 16128

### WIRE AND CABLE FOR TRACTION POWER

#### PART 1. GENERAL

##### 1.01 SUMMARY

- A. This section specifies furnishing, installing and testing wire and cable.
- B. Compensation for work specified in this section will be made in the following manner and in accordance with the Unit Price Schedule:
  - 1. Wire and Cable Materials: Lump Sum.
  - 2. Installation: Lump Sum.
- C. Related sections include:
  - 1. Section 16051 - Scope of Work For Traction Power
  - 2. Section 16052 - Basic Materials and Methods For Traction Power
  - 3. Section 16260 - Uninterruptible Power System (Static)
  - 4. Section 16261 - Transformer-Rectifier Units For Traction Power
  - 5. Section 16291 - Local Annunciator Panel For Traction Power
  - 6. Section 16292 - Remote Terminal Unites (AEMS RTU) For Traction Power
  - 7. Section 16294 - Contact Rail Heating System For Traction Power
  - 8. Section 16321 - High Voltage AC Switchgear (13.8kV) For Traction Power
  - 9. Section 16322 - High Voltage AC Switchgear (34.5kV) For Traction Power
  - 10. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power
  - 11. Section 16441 - Drainage and Negative Switchboard For Traction Power
  - 12. Section 16451 - Substation Busways For Traction Power

##### 1.02 REFERENCES

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of the jurisdictional authorities.
  - 2. NEC.
  - 3. ICEA: S-66-524, S-68-516, S-19-81, T-33 - 655.
  - 4. IEEE: 383.
  - 5. NEMA: WC7, WC8.
  - 6. ASTM: B3, B8, D471, B173, E662.
  - 7. UL: 44, 224, 1581, 1569, 1685

##### 1.03 SUBMITTALS

- A. Submit the following for approval in accordance with the Special Conditions and with the additional requirements as specified for each:
  - 1. Shop Drawings: Submit shop drawings for each type of cable in accordance with Section 16051.
  - 2. Samples: Specified smoke-density test sample will become property of the Authority.
  - 3. Certification:

- a. Certified flame retardancy test reports and data for tests performed not more than 12 months prior to submittal, for materials which are identical to those of cable furnished.
- b. Submit smoke-density test reports and data from tests performed not more than 12 months prior to the submittal for materials which are identical to those of the furnished cable.
- c. Certified test reports demonstrating that cable complies with specified requirements and those of referenced ICEA and NEMA Standards.
- d. Certificates from manufacturers verifying that products conform to specified requirements. Include certificate with submittal of shop drawings and with each cable shipment.

#### **1.04 QUALITY ASSURANCE**

- A. Qualifications: Select a manufacturer who is regularly engaged in production of similar wire and cable, particularly to Railway or Transit industry in USA.
- B. For Codes, Regulations, Reference Standards and Specifications, refer to Article 1.02.

#### **1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Mark each single-conductor cable and each multiple-conductor cable to show UL label, size, voltage, manufacturer and number of conductors or phases in accordance with NEC requirements.
- B. Ship each unit securely packaged and labeled for safe handling and shipment.
- C. Store products in a dry and secure facility.

### **PART 2 PRODUCTS**

#### **2.01 MATERIALS**

- A. General Requirements for Single-Conductor and Multiple-Conductor Cable:
  1. Type and size: Type I cable having low smoke - generating characteristics as shown on contract drawings.
  2. Conductors: Type I cable having low smoke generating characteristics.
    - a. ASTM B3 or ASTM B8 annealed copper.
    - b. Size 10 AWG and smaller: Solid or Class B or Class C stranded.
    - c. Size 8 AWG and larger: Class B stranded, unless otherwise specified.
    - d. Other constructions as specified.
  3. Standards: Except as modified, wires and cable complying with the following standards:
    - a. Cross-linked polyethylene (XLPE) insulated cable: ICEA S-66-524, NEMA WC7.
    - b. Other cable: ICEA S-68-516, NEMA WC8.

4. Conductor insulation: Low smoke, halogen free, low toxicity Ethylene-Propylene Rubber (EPR), ICEA Type II, and have the following properties:
  - a. The low smoke, halogen free, low toxicity EPR insulation shall be capable of withstanding operating copper conductor temperature of 90 degrees C continuous, 130 degrees C emergency overload for standard prescribed periods and 250 degrees C for short circuits. The insulation shall be highly moisture resistant, shall be free-stripping and leave the surface of the conductor clean. An opaque mylar separator may be used between the conductor and the insulation to ease stripping. Any additional tapes (e.g., flame-retardant fiberglass over the tinned copper tape, etc.) deemed necessary by the manufacturer shall be clearly noted.
  - b. Insulation thickness:
    - 1) Minimum average thickness of the EPR insulation wall over the conductor: 90 mils (0.090 inches).
    - 2) Minimum average thickness of the supplemental EPR insulation wall over the shield: 80 mils (0.080 inches).

The minimum point thickness for both layers of insulation shall not be less than 90% of the minimum average thickness.
  - c. The EPR insulation will have the following physical and electrical characteristics when tested in strict accordance with Article 1.02 standards:
    - 1) Tensile strength (minimum): 1200 PSI .
    - 2) Elongation (minimum): 150 percent.
    - 3) Tensile stress at 100 percent elongation (minimum): 500 PSI.
    - 4) When air oven tested for 168 hours at 121 degrees C  $\pm$  1 degree C:
      - a) Tensile strength: 75 percent
      - b) Elongation: 75 percent.
    - 5) When Hot Creep tested after conditioning at 150 degrees C  $\pm$  2 degrees C:
      - a) Elongation (maximum): 50 percent
      - b) Set (maximum): 5 percent.
    - 6) Electrical properties after water immersion at 75 degrees C  $\pm$  1 degree C:
      - a) Permittivity after 24 hours (maximum): 6.0
      - b) One to 14 days immersion (maximum increase in capacitance): 5 percent
      - c) Seven to 14 days immersion (maximum increase in capacitance): 3 percent
      - d) Stability factor after 4 days (maximum): 1.0,  
- OR -  
Stability factor difference (maximum) 1 - 14 days: 0.5
    - 7) Insulation resistance constant at 15.6 degrees C (minimum): 10,000 meg/1000 feet.
5. Nonmetallic jacket for single-conductor cable and individual conductors of multiple-conductor cable and as overall covering on multiple-conductor cable:
  - a. Cross-linked polyethylene (XPLE) or cross-linked polyolefin unless otherwise specified.
6. Cross-linked polyolefin complying with the following physical requirements. Properties tested in accordance with Part 6 of ICEA S-68-516, NEMA WC8 if

ethylene-propylene-rubber (EPR) insulation is used, or with Part 6 of ICEA S-66-524, NEMA WC7 if cross-linked polyethylene insulation is used. Jacket material free of PVC and PVC-based compounds.

- 1) Tensile strength, minimum pounds per square inch: 1,800.
  - 2) Elongation at rupture, minimum percent: 150.
  - 3) Aging requirement: After 168 hours in air oven test at 100C, plus or minus 1 degree C:
