- A. The Contractor shall submit a written report of his preliminary field inspection listing all potential block design problems in the areas included in this Contract within 21 days of receipt of Notice to Proceed.
- B. The Contractor shall submit detailed flow charts of his block design simulation programs for the designated Resident Engineer's approval within 60 days of receipt of Notice to Proceed.
- C. The Contractor shall submit copies of his final block design ATP Speed Command Control Line Diagrams for both traffic directions on all route segments included in this Contract, together with calculations and computerized simulation runs used to evaluate this block design within 120 days of receipt of Notice to Proceed. The calculations and simulation runs shall be suitably identified.

## **PART 2 - PRODUCTS**

### **2.01 PROGRAMS AND DOCUMENTATION**

- A. The Contractor shall furnish all safe-braking distance programs, simulation programs, computer time and time by properly qualified train control engineers to create, examine, evaluate and document a block design of the type specified for the route segment included in this Contract.

## **PART 3 - EXECUTION**

### **3.01 PRELIMINARY INSPECTION**

- A. Fixed facility locations shown on the Contract Drawings are based upon the latest design information available at the time this Contract was prepared.
- B. The Contractor shall conduct a field inspection to determine the actual as-built locations of substation-return conduit, crossbonding conduit, station platforms, special trackwork, Train Control Rooms, and all other special facilities which will affect his block design, prior to commencing his block design effort.

### **3.02 DESIGN**

- A. The Contractor shall use the actual locations of station platform ends, insulated rail joints, special trackwork, crossbonding conduit stub-ups and substation return conduit stub-ups as the initial fixed points in determining his block design.
- B. The remainder of the Contractor's block design shall conform to the requirements set forth in this Section, and to other special requirements set forth in these Specifications. (See Part 1.06, BASIC CRITERIA.)
- C. Intermediate block boundaries shown on the Contract Drawings are for illustrative purposes only, and represent the format to be used by the Contractor when submitting his Double Line Track Plans and Panel Layouts for approval. The Contractor's approved block design shall establish the actual number and location of intermediate block boundaries.
- D. The block design effort shall include the determination of the four "Performance Level" speed limits for trains traveling in both directions on each mainline track from all passenger stations included in this Contract. These performance level speed limits shall be determined as follows:

1. The PL1 ("MAXIMUM" PL) speed limit shall allow the train to run at the maximum safe interstation speed (MAS), resulting in the minimum safe interstation run time.
  2. The PL2 ("NORMAL" PL) speed limit shall limit the train speed to approximately 90 percent of the maximum safe interstation speed. (Normal scheduled run times will be based upon this performance level.)
  3. The PL3 ("REDUCED" PL) speed limit shall limit the train speed to approximately 90 percent of the PL2 speed.
  4. The PL4 ("RETARDED" PL) speed limit shall limit the train speed to approximately 80 percent of the PL2 speed.
- E. The Block Design shall include all intermediate block boundaries and intermediate speed commands necessary to fully implement all Performance Level speed limits in both the Normal and Reverse traffic directions.
- F. The Train Control stationing for all block boundaries shall be included in the Contractor's block design submittal. (This may or may not coincide with the civil stationing for block boundaries.)

### **3.03 IMPLEMENTATION**

- A. Block Boundaries
1. The Contractor shall install block boundaries of the type specified in the approved block design at the locations specified herein and as indicated on the approved block design drawings. Impedance bonds shall be installed within the specified tolerance distances from all crossbonding and substation return conduits unless otherwise authorized by the designated Resident Engineer. The use of terminating receivers or other similar devices (in lieu of impedance bonds) to establish block boundaries will not be permitted except as previously approved by the designated Resident Engineer in writing on an individual location basis.
- B. Control Codes
1. The Contractor shall install all hardware and circuitry required to provide the control codes specified in the approved block design.

### **3.04 FIELD TESTING**

- A. The Contractor shall conduct safe-braking-distance and all applicable headway tests as part of the system testing of all trackage included under this Contract to verify that the braking distances and headways specified can be met under actual operating conditions. See Section 16980, ATC Tests, Inspections and Quality Assurance.

### **3.05 MEASUREMENT FOR PAYMENT**

- A. No separate payment will be made for the design, simulation and implementation of the block design. The block design's acceptability will be determined based upon its conformance to the Specifications.

**END OF SECTION**

**SECTION 16914**

**ATC - ENVIRONMENTAL REQUIREMENTS**

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

A. DESCRIPTION

1. This Section describes the environmental conditions under which the ATC equipment and systems furnished and installed under this Contract shall function and specifies certain measures which the Contractor shall take to prevent environmental interference with the ATC System.

**1.02 PHYSICAL ENVIRONMENT**

- A. All ATC equipment housed in Train Control Rooms shall function in accordance with the Specifications over a room temperature range of -22 degrees F to +158 degrees F at relative humidities of 5 percent non-condensing to 95 percent, inclusive.
- B. All wayside ATC equipment not housed in Train Control Rooms shall function in accordance with the Specifications over a temperature range of -40 degrees F to +158 degrees F at relative humidities of 5 percent non-condensing to 95 percent, inclusive.
- C. Wayside ATC equipment not housed in Train Control Rooms shall operate in accordance with the Specifications when subject to the climatic conditions indigenous to the Washington, D.C. metropolitan area within the extreme limits of precipitation and wind force recorded in data published by the United States Government, Department of Commerce, National Oceanic & Atmospheric Administration, Environmental Data Service.
- D. All ATC equipment housed in Train Control Rooms shall be so constructed and installed that it will remain fully operational while being vibrated, with simple harmonic motion having an amplitude, acceleration and frequency as listed below, for a minimum period of 15 minutes in each of three mutually perpendicular planes.

<u>Sweep Frequencies</u>	<u>Peak to Peak Displacement</u>	<u>Acceleration</u>
5-12 Hz	0.02 inches	--
12-1000 Hz	--	0.14g peak or 0.10g rms

- E. Wayside ATC equipment not housed in Train Control Rooms shall be so constructed and installed that it will remain fully operational while being vibrated, with simple harmonic motion having an amplitude, acceleration, and frequency as listed below, for a minimum period of 15 minutes in each of three mutually perpendicular planes.

<u>Sweep Frequencies</u>	<u>Peak to Peak Displacement</u>	<u>Acceleration</u>
5-20 Hz	0.2 inches	--
20-1000 Hz	--	4.2g peak or 3.0g rms

- F. All electrical contacts on ATC equipment (including relay contacts, jack contacts and switch contacts) shall be protected from dust and moisture.

### **1.03 ELECTRICAL ENVIRONMENT**

- A. Each system and subsystem element will generally be operated in the unfavorable electrical environment of a Rail Rapid Transit System characterized by heavy direct-current propulsion equipment which will cause electrostatic, electromagnetic, inductive, conductive, and radiated interference.
- B. Some of the possible sources of electrical interference are:
  - 1. Alternating current 60 Hz systems
  - 2. Direct current traction power systems
  - 3. Propulsion power contact shoe and third-rail arcing
  - 4. Rotating machinery
  - 5. Lightning discharges
  - 6. Public and private communications systems
  - 7. Wayside and carborne ATC equipment
  - 8. Highway traffic and traffic control systems.

### **1.04 RELATED SECTIONS**

- A. All 16900-series Sections.

### **1.05 REFERENCES**

- A. ANSI/IEEE C37.90.2
- B. AREMA Signal Manual, Part 2.4.25
- C. Listed in individual Related Sections, where applicable.

## **PART 2 - PRODUCTS**

### **2.01 PRODUCTS AND MATERIAL**

- A. Provide all products and materials necessary for the protection of the ATC System against interference by the physical or electrical environment. The products and materials so used shall not themselves constitute a threat to human health or safety, or interfere with the operation of equipment or systems furnished or installed by other disciplines.

### **2.02 EQUIPMENT**

- A. Provide all wayside ATC equipment which has enclosed, internal air-filled cavities, with appropriate moisture control devices as follows:
  - 1. Where possible, follow the recommendations of Part 2.4.25 of the AREMA Signal Manual to minimize condensation and frost buildup in the wayside ATC equipment.
  - 2. In small items of wayside ATC equipment where the screened, shielded vents and drains or heaters of the AREMA recommendation do not appear to be a practical solution to controlling condensation, exclude moisture-laden air by other means such as true hermetic sealing or displacement of the air by an approved potting compound.
  - 3. Where wires enter a sealed unit, approved heavy-duty plug couplers with minimal internal air spaces and hermetic headers shall be utilized. Cable connections to such plug couplers shall be potted with an approved, flexible, rubber-like compound.

## **PART 3 - EXECUTION**

### **3.01 PHYSICAL INTERFERENCE**

- A. Include in the design, fabrication, and installation, all equipment, systems, and procedures required by these specifications to prevent external or internal physical interference with the proper operation of the ATC System.
- B. Include in the design, fabrication, and installation, all additional equipment, systems, and procedures which may prove necessary to prevent external or internal physical interference with the proper operation of the ATC System.

### **3.02 ELECTRICAL INTERFERENCE**

- A. Ascertain (using ANSI/IEEE C37.90.2 as a standard) the specific electrical environment to which the various elements of the ATC System equipment will be exposed in all areas covered by this Contract.
- B. Incorporate such design techniques and installation practices as are necessary to protect the ATC System furnished under this Contract from any electrostatic, electromagnetic, radiated, or direct electrical interference.
- C. Provide adequate lightning protection equipment on power lines and on line wires that run between equipment in two or more locations which are served by independent grounding systems.

**END OF SECTION**

## SECTION 16915

### BASIC ATC EQUIPMENT REQUIREMENTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies certain basic requirements for the design and fabrication of ATC systems and equipment, the methods which the Contractor shall use to mount and wire various types of equipment, and the manner in which equipment components, modules and racks shall be arranged.
- B. All ATC metallic cases, junction boxes, support hardware, and fastening hardware furnished and installed by the Contractor inside tunnels or other exposed underground locations shall be made of stainless steel, ASTM A276, Type 304, or approved equal, unless otherwise directed by the designated Resident Engineer. This requirement shall supersede requirements for hot-dip galvanizing, cadmium plating, epoxy coating, or other protective measures for such equipment, unless otherwise directed by the designated Resident Engineer (Engineer).

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16916 Basic ATC Circuit Requirements
  - 2. Section 16922 Lightning/Surge Protection and Grounding Systems
  - 3. Section 16940 ATC Electrical and Electronic Components and Material
  - 4. Section 16970 ATC Mechanical Components

##### 1.03 SUBMITTALS

- A. Prior to the installation of Train Control Room equipment, the Contractor shall submit for the Engineer's approval, drawings showing the proposed layout of equipment racks, cable trays, and wire chases for each TCR.
- B. Submit a tabulation of equipment to be mounted on each rack. Each item of this tabulation shall include a cross-reference to the number of a particular drawing of the subject equipment, which has been previously submitted for approval.
- C. Any finished material or prefabricated apparatus delivered to the site, stored or installed, which is not covered by an approved product submittal, layout drawing or other applicable document, shall be subject, at the discretion of the Authority, to removal from the site by the Contractor at no additional cost to the Authority, whether it has been installed or not.

#### PART 2 - PRODUCTS

##### 2.01 FAIL-SAFE DESIGN CRITERIA

- A. Vital Equipment and Systems
  - 1. Vital equipment and systems proposed for this Contract must be proven fail-safe by in-service experience or be made available for type-acceptance testing. Type-acceptance testing of components shall consist of bench tests on breadboard or prototype units as directed by the Engineer. Type-acceptance testing of systems or subsystems shall consist of bench testing of operational systems or subsystems

and/or field testing of same at the discretion of, and as directed by the Engineer. All expenses incurred during type-acceptance testing shall be borne by the Contractor.

- B. Component or System Failures
  - 1. Self-detecting component or system failures shall cause the train(s) to stop or run at a safe, more restrictive speed than that permitted with no failure.
  - 2. Component or system failures which are not self-detecting shall not cause unsafe conditions, even if added to other failures.
  - 3. Any number of simultaneous components or system failures attributable to the same cause or related causes shall not cause unsafe conditions.
  - 4. Any component or wire becoming grounded or any combination of such grounds shall not cause unsafe conditions.
  - 5. Any amplifier breaking into spurious oscillations shall not result in an unsafe condition.
  - 6. Filters used in fail-safe circuits shall be designed to prevent undesired signals from passing through the filter at a level which could cause unsafe conditions, even in the event of component failures within the filter.
  
- C. Alternative Equipment
  - 1. Should an alternative be proposed for a specified system or components thereof, the function of which affects the safety of train operation and because of its magnitude and integration parameters precludes absolute fail-safe engineering analysis, the Authority will require definitive factory and field tests and documentation of proposer's research and development tests, prior to completing the technical proposal evaluation. The acceptance of such an alternate system or subsystem at the time of technical proposal evaluation does not preclude further factory tests and field tests to determine that the alternate system or subsystem in actual operation, complies with the fail-safe criteria. Should the alternate system or subsystem fail to meet the fail-safe criteria, the Contractor shall furnish the originally specified system or component at no additional cost to the Authority.

## **2.02 PACKAGING OF EQUIPMENT**

- A. Modular design oriented to maintenance efficiency shall be used throughout the ATC System. Electrical and mechanical components shall be organized in plug-in assemblies and shall be rack mounted. The mixing of equipment associated with two subsystems in one plug-in assembly will not be acceptable unless expressly specified or specifically authorized in writing by the Engineer.

## **2.03 COMPONENT PROTECTION**

- A. Components shall be protected from damage in the event a plug-in unit is removed while the equipment is energized.

## **2.04 ADJUSTMENTS**

- A. Adjustable components shall be avoided wherever possible, by the use of appropriate circuitry, stable components, and high-tolerance circuits. Adjustable components, useful during design development to determine experimentally the correct operational settings, shall be eliminated in the final design. Adjustable components, where required, shall have locking devices or shall be self-locking to prevent inadvertent operation and/or drift.
  
- B. Whenever practical, two or more points of adjustment which are required during the same tune-up operation shall be located within 12 inches of each other and in such a way that they can be operated by one man. Interacting adjustments shall be avoided.

- C. The replacement of a component or PC card with a spare shall not require compensating adjustments to the associated components or modules. If compensating adjustments are required, they shall be limited to the device to be replaced or repaired.

## **2.05 TEST POINTS**

- A. Test points for checking essential voltages and wave forms and for injecting test signals shall be provided for trouble-shooting and routine maintenance.
- B. Test points shall be provided to detect defective PC boards and equipment modules without the disconnection of wires.
- C. All test points shall be readily accessible when the equipment is in the normal operating position and shall be clearly labeled.
- D. Test points shall be capable of accepting probes and connectors used with standard test equipment such as voltmeters and oscilloscopes, except where only special test equipment and connectors supplied by the Contractor will serve.

## **2.06 VISUAL INDICATIONS**

- A. Built-in indicators or meters shall be provided when frequent observation or adjustments are necessary, or when portable test equipment would not provide the necessary information or accuracy. Go/No-Go type indicators shall be used as substitutes where feasible.
- B. When built-in indicators or meters are associated with adjustments, the adjustment point shall be sufficiently close to the associated indicator so that both may be manipulated and observed simultaneously by one man.
- C. Visual indicators shall not require removal of covers to view. Exceptions are microprocessors with hinged doors which do not require tools to open.

## **2.07 ELECTRONIC EQUIPMENT**

- A. All electronic equipment used on this Contract shall be semiconductor except as otherwise approved by the Engineer in writing.

## **PART3 - EXECUTION**

### **3.01 RACK ARRANGEMENT IN ROOMS**

- A. Install the equipment racks in the Train Control Rooms and in conformance with the requirements specified in Section 16971, Racks and Cable Trays; as indicated on the Contract Drawings, and; as shown on the Contractor's previously approved TCR arrangement plan drawings. This shall include all mounting and fastening materials necessary to mount the racks in the specified manner.

### **3.02 EQUIPMENT ARRANGEMENT ON RACKS**

- A. Unless otherwise approved by the Engineer, relays and equipment panels shall not be mounted at a height exceeding 6 feet from the floor. The Contractor shall provide a minimum of 10 percent spare space, terminals, and plug connector points on each rack or group of racks serving a common function.
- B. Equipment arrangements within equipment racks shall present a neat and orderly appearance. Equipment serving similar functions shall be in the same relative location on

all racks. Similar types of racks shall be arranged to present an orderly and uniform appearance from Train Control Room to Train Control Room, to the extent possible.

### **3.03 COMPONENT MOUNTING ARRANGEMENT**

- A. Basic electrical and electronic components shall be mounted on and soldered to printed circuit (PC) cards except as permitted herein. Where size and weight prohibit PC card mounting, circuit components shall be mounted on plugboards or rack-mounted equipment chassis or panels.

### **3.04 PANELS**

- A. Equipment panels shall be used to rack-mount circuit components such as transformers, meters, relays, fuse holders, and resistors which cannot be mounted on PC cards.
- B. Input-output terminal and connector panels shall be furnished and installed at the top and to the rear of each equipment rack to be used to terminate cables and wires entering or leaving the rack.
- C. One power-distribution panel shall be located immediately below the terminal and connector panel and shall mount the power connectors, fuses and filters for the equipment rack power.
- D. The terminal and connector panel and the power-distribution panel shall not require more than 18 inches of combined rack space and shall be above all other apparatus mounted on the rack.

### **3.05 EQUIPMENT ACCESSIBILITY**

- A. All equipment and components on racks and on PC cards shall be accessible for testing or replacement without removal of other components wherever possible. Components or subassemblies which must be removable shall be of the plug-in type.

### **3.06 WIRING AND TERMINATION REQUIREMENTS**

- A. Power Rack Wiring
  - 1. Main power feeders shall have segregated facilities for entering and leaving each Train Control Room and shall be terminated on the power rack. Wires distributing ac and dc power within each Train Control Room shall originate from the power rack and terminate on the power distribution panels of the individual racks.
- B. Entrance Rack Wiring
  - 1. All wiring other than main power feeders and track circuit wires entering or leaving each Train Control Room shall be connected to terminals located on the entrance rack. All connections on these terminals shall be solderless.
  - 2. Entrance rack terminations shall be constructed and arranged to permit the room wiring to be isolated from the field wiring, on an individual wire basis, without removing the wires from their terminals.
  - 3. Terminations on the entrance rack for wiring between the entrance rack and the substations, dc tie-breaker stations, and other support facilities shall be of the miniature, pressure-clamp type unless otherwise approved in writing by the Engineer. All wiring shall be supported near terminal points to minimize mechanical stresses caused by vibration or by normal cable movement. The mechanical strength of each connection shall be at least 85 percent of the mechanical strength of the wire. The electrical conductivity of each connection shall be at least 95 percent of the electrical conductivity of the wire.

- C. Wire Terminations
  - 1. All wire termination hardware shall be sized for the wire being used. The use of wire terminal lugs which are one or more sizes larger than the terminal posts to which the connection is to be made will not be permitted. Where large wire must be terminated on relatively small terminals, special adaptor hardware approved by the Engineer shall be provided by the Contractor.
  - 2. Where high voltages (35 volts or more) are present on exposed terminals insulating nuts or protective covers shall be provided.
  - 3. A minimum of 20 percent spare terminals shall be provided on each terminal block. Terminals used for the termination of spare wires shall be considered spare terminals.

### **3.07 EQUIPMENT MOUNTING**

- A. All equipment shall be mounted plumb and level.
- B. The Contractor shall provide special facilities for required protection and grounding of non-rack-mounted equipment, e.g., wall mounted equipment, at no additional cost to the Authority. The methods and materials used to provide such protection shall be as previously approved by the Engineer. See Section 16922.
- C. Unless otherwise specified herein, equipment shall be anchored to concrete walls, floors, or ceilings by machine-bolt type expansion shields and 1/2 inch minimum diameter bolts. Sufficient bolts shall be used to provide a rigid and safe support, subject to the Engineer's approval. Where necessary, concrete bases or pedestals shall be provided by the Contractor, with anchor bolts cast in place for the mounting of equipment.

### **3.08 MEASUREMENT FOR PAYMENT**

- A. No separate payment will be made for the implementation of basic equipment requirements. The cost of work required to meet these requirements shall be included in the cost of the various items of equipment to which the requirements apply.

**END OF SECTION**

## SECTION 16916

### BASIC CIRCUIT REQUIREMENTS

#### PART 1- GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies basic requirements for the various types of vital and non-vital circuits required in the Automatic Train Control System.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16915 Basic ATC Equipment Requirements
  - 2. Section 16917 Basic Interlocking Requirements
  - 3. Section 16940 ATC Electrical and Electronic Component Requirements
  - 4. Section 16980 ATC Tests, Inspections and Quality Assurance
  - 5. Section 16991 ATC Drawings and Tracings

##### 1.03 FAIL-SAFE CIRCUIT DESIGN CRITERIA

- A. Vital Circuitry
  - 1. Vital circuits shall be based on closed-loop principles; i.e, broken wires, damaged or dirty contacts, a relay failing to respond when energized, or a loss of power supply energy shall not result in unsafe conditions. Fail-safe circuit design for vital circuits shall be achieved by conforming to the fail-safe design criteria specified in Section 16915, Basic ATC Equipment Requirements, in addition to arranging the circuitry in conformance with the principles specified above.
- B. Electronic Circuitry
  - 1. Electronic fail-safe circuit design shall provide protection against the following types of component failures:
    - a. Two terminal devices: open, short, partial open, or partial short
    - b. Multi-terminal devices: any combination of opens, shorts, partial opens, or partial shorts

##### 1.04 VITAL CIRCUITS

- A. The following types of circuits are considered vital to the safety of the ATC system:
  - 1. Track Circuit
  - 2. Loop Energy Stick Circuits
  - 3. ATP Speed Command Circuits
  - 4. Switch Operating Circuits
  - 5. Overload Stick Circuits
  - 6. Switch Repeater Circuits
  - 7. Switch Correspondence Circuits
  - 8. Switch Locking Circuit
  - 9. Approach Locking Circuits
  - 10. Time Locking Circuits
  - 11. Route Locking Circuits
  - 12. Detector Locking Circuits
  - 13. Traffic Locking Circuits
  - 14. Signal Control Circuits
  - 15. Speed Command portion of Intrusion Detection Warning Circuits (where applicable).

- B. Regardless of how they are implemented, vital circuits shall be of fail-safe design.
- C. Except when specified otherwise, all circuits which energize a vital relay located outside of a Train Control Room and all circuits which energize a vital relay located inside a Train Control Room but which contain contacts located outside of the Train Control Room in which the relay is located, shall be two-wire, double-break circuits and shall be energized from an ungrounded dc power supply.
- D. In addition to these requirements, if non-vital relays are used in vital circuits, it shall be assumed that these relays can fail so that front contacts weld, back contacts weld, or any combination of these events may occur. It shall be assumed that the welding of a front contact will not prevent back contacts from conducting when the relay is deenergized, and that the welding of a back contact will not prevent front contacts of the relay from conducting when the relay is energized. It shall also be assumed that an armature may stick in any position. None of the above events, when they occur, shall cause unsafe conditions.
- E. Switch Operation circuits and Switch Repeater circuits shall be two-wire, polar, double-break circuits. Overload Stick Relays shall be circuited to meet the operating requirements established in Section 16943. The remaining vital circuits shall be positive-energy, single-break circuits. All of the relays used in these circuits shall have one side of each relay, or each individually controlled relay coil, connected directly to negative energy (common).
- F. When the number of contacts required in vital circuits demand the use of repeater relays, minor circuits shall be operated by contacts of the repeater relays. Minor circuits are defined as those involved in panel illumination, pushbutton box indication illumination, DTS indications, and other similar circuits. The circuits controlled by the prime relay and its repeaters shall be coordinated so that unsafe or undesirable conditions cannot occur if a repeater relay fails to pick up.

#### **1.05 NON-VITAL CIRCUITS**

- A. The following types of circuits are not considered vital to the safety of the ATC System:
  1. Route Initiation Circuits
  2. Route Selection Circuits except specified Pushbutton Stick Circuits
  3. Level Repeater Circuits
  4. Switch Indication Circuits
  5. Alarm Circuits
  6. Blown Fuse Circuits
  7. Transfer Control Circuits
  8. Mode Selection Control Circuits
- B. Certain circuits are considered non-vital and shall meet the non-vital circuit requirements specified herein, but shall energize vital relays which meet the requirements contained in Section 16943, Vitals Relays. These circuits are as follows:
  1. Switch Control Circuits
  2. Route Check Circuits
  3. Specified Pushbutton Stick Circuits in Route Selection Networks
- C. All non-vital electrical circuits shall be positive energy, single break circuits of the switching type and shall not depend upon timing or precise voltage control for their proper operation. All non-vital relays shall have one side of each relay, or each individually controlled relay coil, connected directly to negative energy (common).

- D. When the number of non-vital relay contacts required demands the use of repeater relays, minor circuits shall be operated by the contacts on the repeater relays. Minor circuits are defined as those involving panel illumination, pushbutton box indication illumination, DTS indications, and other similar circuits.

#### **1.06 ELECTRONIC CIRCUITS**

- A. Electronic circuits interfaced with, or operating in conjunction with ATC relay circuits shall be designed to perform as required by these Specifications.
- B. When electronic circuits are used, either positive one or negative zero logic shall be employed with ground being the other potential.

#### **1.07 OVERLOAD PROTECTION**

- A. The Contractor shall incorporate appropriately sized fuses, circuit breakers or resistors into the positive side of all grounded Train Control circuits for overcurrent protection.
- B. The Contractor shall incorporate appropriately sized fuses, circuit breakers or resistors into both the positive and negative sides of all un-grounded Train Control circuits for overcurrent protection, unless otherwise specified or specifically authorized by the Engineer. Circuit breakers used for such service shall be of the single-unit, dual-breaker type.
- C. The Contractor shall, to the greatest extent practicable, provide sufficient protection devices and shall group the ATC circuits in such a manner that the tripping of a circuit breaker or the blowing of a fuse will affect service on only one track or one portion of an interlocking.

#### **1.08 MULTIPLE-FEED PROTECTION**

- A. The Contractor shall ensure that no circuit is fed from more than one energy bus or from more than one overload protective device on a single energy bus.

#### **1.09 RELAY COIL SNUBBING**

- A. Wherever a capacitor is used in parallel with one or more relay coils for snubbing purposes, a resistor shall be used in series with the capacitor to prevent shorting the circuit in case of capacitor failure.

#### **1.10 QUALITY ASSURANCE**

- A. Check all circuits shown on the Contract Drawings and notify the Engineer in writing of any circuit which the Contractor feels is unsafe or not in conformance with the operational requirements specified in the text of the Specifications.
- B. All ATC System circuits shall be tested as specified in Section 16980, ATC Tests, Inspections and Quality Assurance.

#### **1.11 SUBMITTALS**

- A. The Contractor shall submit his ATC circuits to the Engineer for approval at least 30 days before wiring of the circuits is to begin. The circuits for these submittals shall be drawn as specified in Section 16991; shall produce the type of operation specified for the ATC

system, and; shall have the characteristics specified in this Section and on the Contract Drawings.

## **PART 2 - PRODUCTS**

### **2.01 COMPONENTS FOR VITAL CIRCUITS**

- A. Vital circuits shall be implemented with:
  - 1. Relays specified in Section 16943, Vital Relays
  - 2. Electrical and electronic components specified in Section 16941, Basic ATC Electrical and Electronic Component Requirements
  - 3. Vital signal wire and cable as specified in Section 16949, Signal Wire and Cable
  - 4. Combinations of the above devices

### **2.02 COMPONENTS FOR NON-VITAL CIRCUITS**

- A. Non-vital circuits shall be implemented with:
  - 1. Relays and timer equipment specified in Section 16944, Non-Vital Relays and Timers
  - 2. Electrical and electronic components specified in Section 16941, Basic ATC Electrical and Electronic Component Requirements
  - 3. Printed Circuit Cards specified in Section 16942, Printed Circuit Cards
  - 4. Combinations of the above devices
- B. Vital relays specified in Section 16943 may also be used in non-vital circuits.

## **PART 3 - EXECUTION**

### **3.01 NUMBER OF RELAYS**

- A. When the number of relays to perform a function is specified herein, the number specified is meant to establish standards for the required performance and circuit design and as such the number specified shall be the minimum number of relays required to meet the specified basic performance requirements. Repeater relays, parallel relays, and other necessary relays shall be supplied in addition to the number of relays specified so that all of the system performance requirements and spare contact requirements are met.

### **3.02 ADJUSTABLE CIRCUIT COMPONENTS**

- A. Potentiometers, adjustable resistors, and other adjustable circuit components shall be electrically sized and inserted in the circuits in such a manner that acceptable test results can be achieved by the related circuits when the device is adjusted to no less than 25 percent of its range and to no more than 75 percent of its range. The only exception to this requirement will be when compliance would result in a potentially unsafe condition in a vital circuit.

### **3.03 WIRES PER TERMINAL**

- A. No more than two wires shall be connected to a single terminal or contact pin other than an AAR terminal unless specifically authorized in writing by the Engineer. No more than three wires shall be connected to a single AAR terminal.

### **3.04 TRACK CIRCUIT INDICATION**

- A. The failure of any track circuit shall result in a "track occupied" indication.

- B. For platform-track track relays driven by a terminating receiver, this indication shall be achieved by double-breaking contacts of this intermediate track circuit track relay into the positive leads for the two coils of the associated full track relay in the manner shown on the Contract Drawings.

### **3.05 ENERGY LOOPS**

- A. Wherever energy is fed from a bus to more than one equipment point in succession, the energy feed wire shall be looped back to the same bus terminal or another terminal on the same bus. Where the energy feed is through an overload-protective device, both sides of the loop shall originate at the same protective device.
- B. Energy loops shall be subject to the following limitations unless specifically authorized by the Engineer in writing:
  - 1. No more than 30 equipment points or circuits shall be fed from a given energy loop.
  - 2. No more than four rows of equipment shall be fed from a given energy loop.
  - 3. Each energy loop wire shall be sized to carry the maximum normal load which could be imposed by the equipment and/or circuits fed by that loop.

### **3.06 MEASUREMENT FOR PAYMENT**

- A. No separate payment will be made for the implementation of basic circuit requirements. The cost of work required to meet these requirements shall be included in the cost of the various items of equipment included in the circuits to which the requirements apply.

**END OF SECTION**

**SECTION 16917  
BASIC INTERLOCKING REQUIREMENTS**

**PART 1        GENERAL**

**1.01    SECTION INCLUDES**

- A.     This Section specifies the basic requirements for interlockings which the Contractor shall furnish, install and test, or partially modify and test under this Contract. The interlockings to be provided or activated fall into three basic categories as follows:
  - 1.     Automatic Terminal Crossover (Mainline)
  - 2.     Emergency Crossovers (Mainline)
  - 3.     Tail Track Half Pocket
  
- B.     Each interlocking shall be provided with a full complement of safety facilities. These facilities shall meet the requirements of all applicable FRA regulations.
  
- C.     All ATC circuitry for the interlockings shall be as specified in Section 16916, Basic ATC Circuit Requirements, and as shown on the Contract Drawings.
  
- D.     Although relay type interlocking circuits are shown on the drawings, the Contractor shall implement certain interlocking functions with microprocessors as specified in Sections 16926 and 16928.

**1.02    RELATED SECTIONS**

- A.     Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1.     Section 16904            Current Automatic Train Control System
  - 2.     Section 16913            ATC Block Design
  - 3.     Section 16916            Basic ATC Circuit Requirements
  - 4.     Section 16918            Special ATC Requirements for Specific Locations
  - 5.     Section 16926            Microprocessor Systems for Non-Vital Interlocking Functions
  - 6.     Section 16928            Interlocking Vital Processor Systems
  - 7.     Section 16940            ATC Electrical and Electronic Components and Material
  - 8.     Section 16970            ATC Mechanical Components
  - 9.     Section 16980            ATC Tests, Inspections and Quality Assurance

**1.03    INTERLOCKING LIMITS**

- A.     Interlocking limits shall be defined by special track circuit boundaries and controlled wayside signals as indicated on the Contract Drawings. These track circuit boundaries will include insulated joints furnished by other disciplines.
  
- B.     The signal aspects, names and indications to be used by the controlled wayside signals shall be as follows:
 

<u>ASPECT</u>	<u>NAME</u>	<u>INDICATION</u>
1.     RED over RED	STOP	Stop
2.     LUNAR WHITE (STEADY)	NORMAL ROUTE CLEAR	Normal Interlocking Route locked and clear. Proceed according to cab speed indicator.
3.     LUNAR WHITE (FLASHING)	DIVERGING ROUTE CLEAR	Diverging Interlocking Route locked and clear. Proceed according to  cab speed indicator.

- C. Wayside route selection pushbutton layouts shall be installed in conjunction with certain interlocking home signals as specified in Section 16966, and as shown on the Contract Drawings.

#### **1.04 INTERLOCKING TRACK CIRCUITS**

- A. Mainline "through" (main) track routes within interlocking limits shall be equipped with two-rail Audio Frequency (AF) track circuits for both train detection and speed command transmission. These circuits shall be basically the same as those used for main line track circuits and shall meet all of the requirements specified for such circuits in Section 16961, Audio Frequency Track and Loop Circuit Layouts.
- B. Certain AF track circuit connections to the running rails within interlockings shall be made by means of inductive loops rather than by impedance bonds. See Section 16961 and the Contract Drawings. The shunting characteristics of AF track circuits installed within interlockings shall be such that their track relays shall not be down if the specified train shunt resistance is further than **twenty** feet beyond an impedance bond or loop defining the end of the track circuit **or if the shunt is beyond the interlocking limits**. Each interlocking AF track circuit relay shall be down while the specified train shunt resistance is located between the bonds, insulated joints or loops defining the track circuit.
- C. Mainline crossover tracks shall be equipped with power frequency track circuits and superimposed ATP speed command loops as indicated on the Contract Drawings and as specified in Sections 16961 and 16963. The number of insulated joints within each interlocking will be kept to a minimum required to provide for proper operation of the power frequency track circuits.
- D. Loss of shunt protection shall be provided for switch detector tracks involved in automatic switch operation. This protection shall consist of a delay in the track relay restoration and shall be provided by a vital timer circuit as shown on the Contract Drawings.
- E. The number, type and boundaries of track circuits to be used within interlockings shall be as shown on the Contract Drawings.

#### **1.05 TRACK SWITCHES**

- A. Interlocking track turnouts and crossovers will be fabricated with 115 lb. RE rail by other disciplines.
- B. The Contractor shall furnish and install track switch operating layouts for all newly installed interlocking turnouts and crossovers as specified in Section 16964, and as shown on the Contract Drawings.

#### **1.06 SPEED COMMANDS**

- A. Transmission of speed commands shall be prevented within interlocking limits until a properly aligned route is available and electrically locked.
- B. Speed commands shall not be transmitted in the track circuit upstream of an interlocking home signal until that signal has cleared.
- C. Unless otherwise specified, circuits shall be arranged in such a manner that, should a train pass a wayside signal at STOP, the transmission of speed commands to all trains within the interlocking shall be turned off when the STOP signal is passed. See Section 16916, Basic ATC Circuit Requirements, and the Contract Drawings.

#### **1.07 LOCKING REQUIREMENTS**

- A. Electric locking shall be provided to prevent unsafe switch operation and to prevent the clearing of signals for opposing or conflicting routes. The Contractor shall provide the following types of locking:
1. Approach Locking-Approach Locking shall be provided to lock switches within a route governed by a cleared wayside signal and to prevent clearing signals for opposing or conflicting routes when a cleared wayside signal is set to STOP and a train is closer than safe braking distance from that signal. Approach Locking shall also prevent simultaneous clearing of opposing signals at a given interlocking. One Approach Locking Relay shall be provided for each wayside signal as shown on the Contract Drawings.
  2. Time Locking-Time Locking shall be provided to lock switches within a route governed by a cleared wayside signal and to prevent clearing wayside signals for opposing or conflicting routes when a cleared wayside signal is set to stop. Time Locking shall also prevent simultaneous clearing of opposing signals within an interlocking. One Time Locking relay shall be provided for each wayside signal as shown on the Contract Drawings.
  3. Route Locking-Route Locking shall be provided to lock switches within a route after a train has accepted the wayside signal governing the entrance to the route and to prevent the clearing of opposing signals within the interlockings. Two Route Locking Relays, one for each direction of traffic, shall be provided for each section of track between opposing interlocking signals. Additional Route Locking Relays shall be provided to permit sectional release of Route Locking as required by the Contract Drawings.
  4. Switch Locking (Detector Locking)-Switch Locking shall be provided to prevent operation of a track switch when the track in which the switch is located is occupied, i.e., the track relay is down, or it is otherwise unsafe or undesirable to throw the switch. One Switch Locking Relay shall be provided for each single turnout, for each single crossover, and for each half of a double crossover, all as shown on the Contract Drawings.
  5. Traffic Locking-Traffic Locking shall prevent clearing opposing signals into a section of track between two interlockings or intermediate signals, or combinations thereof. Individual Traffic Locking circuits shall be provided for each mainline track between each pair of interlockings, (or intermediate signals) as shown on the Contract Drawings. A signal governing movement into a section of track for which traffic locking is effective shall not clear until traffic direction has been established and locked in the direction of movement for which the signal governs. Traffic Locking shall also prevent the established direction of traffic in a traffic block from being reversed so long as the traffic block is occupied.

#### **1.08 NEGATIVE TRACTION RETURN**

- A. See Section 16968 and the Contract Drawings for negative return bonding requirements in the interlocking areas.
- B. The Contract Drawings establish the basic guidelines for the Contractor's design of the negative traction return system at interlockings.

#### **1.09 ROUTE CONTROL**

- A. At end-of-line terminal interlockings (temporary or permanent) having the terminal crossovers located at the inbound end of the terminal station, the Contractor shall provide control of route selection by four selectable methods:
1. Central Control shall be able to control the route initiation network to select a route through the interlocking.
  2. Local equipment shall be provided to automatically establish routes to the station platform tracks for trains approaching the terminal on the outbound track. The local route selection circuitry shall automatically route the train to an unoccupied terminal

track in accordance with the position of a three position mode selector switch as follows:

- a. Mode 1: A train approaching the interlocking on the outbound track shall be automatically routed to the station platform on track 1 as soon as that track is available, and upon leaving the terminal in the inbound direction shall automatically be routed to the inbound track.
  - b. Mode 2: A train approaching the interlocking on the outbound track shall be automatically routed to the station platform on track 2 as soon as that track is available, and upon leaving the terminal in the inbound direction shall automatically be routed to the inbound track.
  - c. Mode 3: A train approaching the interlocking on the outbound track shall be automatically routed to the platform on either track 1 or track 2, depending upon which is first available, and if neither platform track is occupied or otherwise unavailable, the train shall be automatically routed through the crossover to the platform on the "inbound" track. Upon leaving the terminal in the inbound direction, the train shall automatically be routed to the inbound track.
3. If, due to equipment malfunction, the route cannot be selected in accordance with 1. or 2. above, the train operator shall be provided with the means to set the route manually. This will require that the operator place the train in a manual mode of operation, having been stopped by the ATP System, and move the train to a preselected location at which a trackside interlocking control pushbutton panel (wayside pushbutton layout) shall be located. Once the route is manually requested by the train operator and set and locked, the operator will return the train to an automatic control mode and the ATC System shall cause the train to proceed under automatic control, providing all other conditions allow safe movement of the train.
  4. Two local Interlocking Control Panels, one mounted in the Dispatcher's Room and one mounted in the Train Control Room shall provide the capability for manually initiating or canceling routes through the terminal interlocking as specified in Section 16956. The control panels shall be designed for operation by pushbuttons.
- B. At emergency crossovers, the Contractor shall provide for control of route selection by two methods:
1. From Central Control
  2. By manual operation of a local Interlocking Control Panel
- C. At interlockings located outbound of a terminal station on Yard Lead tracks or Tail Tracks, the Contractor shall provide for control of route selection as follows:
1. From Central Control, or (with Central's permission) from either the Dispatcher's Control Panel or the Local (TCR) Interlocking Control Panel.
  2. By Emergency Release from either the Dispatcher's Control Panel or the Local (TCR) Interlocking Control Panel, with the Local Interlocking Control Panel Emergency Release having the highest priority.
- D. Coordination and priority shall be provided between the methods of route initiation to achieve the operation described in Sections 16904, 16913, 16916, 16918, and 16956, and as indicated on the Contract Drawings.

#### **1.10 QUALITY ASSURANCE**

- A. The quality of the Contractor's final interlocking design and the conformance of his design to the requirements specified herein shall be verified by an employee of the Contractor who is well versed in AREMA recommended practices for interlocking safety design requirements and is familiar with established principles in interlocking signaling. This employee shall have had a minimum of 15 years experience in railway signaling design including at least five years experience in rapid transit signaling design.

- B. It shall be the Contractor's responsibility to check the location of insulated joints shown on the Contract Drawings for conformance with all interlocking safety requirements and for conformance with specified civil stationing. It shall also be the Contractor's responsibility to verify by field inspection and testing that the insulated joints (provided by other disciplines) have been located correctly and are functioning properly.
- C. All interlocking components and systems shall be tested as specified in Section 16980 and in the Sections describing specific components and systems.

#### **1.11 SUBMITTALS**

- A. The Contractor shall submit three copies of his final interlocking circuit design for each interlocking included under this Contract to the designated Resident Engineer for approval within 180 days of receipt of Notice To Proceed. These drawings will not be considered for approval by the designated Resident Engineer until they have been signed by the Contractor's designated, qualified signal engineer to indicate that they have been checked and approved by the Contractor.
- B. The Contractor shall submit three copies of a complete written description of any portion of his final interlocking design which does not conform with the requirements specified herein. This description shall include:
  - 1. An explanation of each change and how it will affect operation of the interlocking.
  - 2. The reason for proposing each change.
  - 3. A statement of benefits accruing to the Authority as a result of each change.
  - 4. Verification that the changes will not require changes in the existing METRO carborne or wayside ATC systems.

### **PART 2 PRODUCTS**

#### **2.01 ELECTRICAL AND MECHANICAL EQUIPMENT**

- A. All electrical equipment for audio frequency (AF) track circuits, power frequency track circuits, speed-command loops, track switch operating layouts, signal layouts, pushbutton layouts, negative return bonding, signal rail bonding, interlocking control panels, and vital and non-vital interlocking circuitry furnished under this Contract shall be as specified in Section 16960 of these Specifications and as shown on the Contract Drawings.
- B. All mechanical ATC equipment for interlockings furnished and installed under this Contract shall be as specified in Section 16960 and Section 16970 of these Specifications and as shown on the Contract Drawings.

### **PART 3 EXECUTION**

#### **3.01 INSTALLATION**

- A. The various electrical and mechanical devices composing each interlocking control system shall be installed as specified in the Sections describing those devices and as shown on the Contract Drawings.

#### **3.02 OPERATION**

- A. The final operation of interlockings furnished and installed or modified under this Contract shall conform to the operation of similar types of interlockings described in Section 16904, Current Automatic Train Control System, unless otherwise specified.
- B. Local manual control by means of Interlocking Control Panels and Dispatcher Control Panel shall be as specified in Sections 16918 and 16956.

- C. Where applicable, when diverging (or turnback) route selection is initiated automatically by detection of Train Identity, the transfer of the detected train destination information to Central shall be coordinated with the occupancy of the designated ADVANCE APPROACH area by the train, and with route availability.

**3.03 MEASUREMENT FOR PAYMENT**

- A. Interlockings will not be measured for payment as such.
- B. The Contractor will be reimbursed for the various components and systems comprising an interlocking on the basis of measurement specifications for the components of the interlockings and for the acceptance testing of those components and systems.

**END OF SECTION**

## SECTION 16918

### SPECIAL ATC REQUIREMENTS FOR SPECIFIC LOCATIONS

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies special ATC equipment, work, and operating requirements for certain locations involved in this Contract in addition to the basic ATC requirements specified elsewhere.
- B. Wherever the term "...at the appropriate time..." appears in these ATC Specifications or on the ATC Contract Drawings, it shall be interpreted to mean, "... at the appropriate time as determined by the designated Resident Engineer (Engineer)."

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16901 Definition of ATC Terms
  - 2. Section 16904 Current Automatic Train Control System
  - 3. Section 16911 Scope of ATC Work
  - 4. Section 16913 ATC Block Design
  - 5. Section 16916 Basic ATC Circuit Requirements
  - 6. Section 16917 Basic Interlocking Requirements
  - 7. Section 16920 Wayside ATC Systems
  - 8. Section 16930 ATC Facilities and Spare Equipment
  - 9. Section 16940 ATC Electrical and Electronic Components and Material
  - 10. Section 16950 Train Control Equipment Modules
  - 11. Section 16980 ATC Tests, Inspections and Quality Assurance
  - 12. Section 16997 RTU Scan Sheets

##### 1.03 (EXAMPLE LOCATION SPECIFICATIONS SHOWN) ANACOSTIA (F06) TIE-IN WORK

- A. The Contractor shall provide all equipment, circuitry and logic, and perform all work necessary, to convert the Anacostia interlocking and station from its temporary terminal configuration to an emergency crossover/inline station configuration in the manner specified herein and as shown on the Contract Drawings. This shall include, but not be limited to, the following activities at the appropriate times:
  - 1. Removal of Train Control Room DTS/RTU wiring for:
    - a. Possible future Tiebreaker Station
    - b. Existing Chiller Plant
    - c. Future Station Destination Signs.
    - d. See the RTU Scan Sheets and the Contract Drawings.
  - 2. Installation, testing, and placing in service the necessary number of new Audio-Frequency track circuits for the Anacostia TCR area of control, and all speed commands in the Anacostia TCR control area outbound of the station platform.
  - 3. Activation of the number 20 and 24 turnback "signals" for the inbound end of the Anacostia interlocking, and the number 10 and 14 turnback "signals" for the outbound end of that interlocking. The Contractor shall furnish and install new wayside "TURNBACK" signs at the appropriate locations.
  - 4. Activation and testing of the inbound programmed-stop marker coil layouts on the outbound end of the station. The Contractor shall furnish and install STATION STOP signs for the inbound approaches to Anacostia Station.

5. Removal of all "terminal algorithm" circuits, logic and equipment, and performance of all necessary reprogramming. (WMATA will maintain the existing algorithm for daily normal terminal revenue operation until the final cutover of the system.)
  6. Removal of wayside signal pushbutton layouts and START ATC and END ATC signs.
  7. Removal of Route Cancel pushbutton layouts and any existing Flyby-Transmitters.
  8. Replacement of terminal station transceivers with inline type transceivers, and performance of all necessary reprogramming for same.
  9. Modifications to the existing Interlocking Control Panel in the TCR, or replacement of the existing faceplate.
  10. All necessary revisions and additions to the RTU wiring for both ATC and ancillary functions, e.g., addition of new track circuit indications in prescribed sequence, and removal of Automatic Terminal Mode controls and indications, all as indicated on the RTU Scan Sheets and as shown on the Contract Drawings. This work shall be done in close cooperation and coordination with Authority personnel at times designated by the designated Resident Engineer.
  11. Provision/activation of the Anacostia TCR area portion of all necessary Anacostia/Congress Heights vital traffic and vital and non-vital repeater circuits.
  12. Performance of a complete examination of all existing, new, and revised circuits and logic in the Anacostia Station area, and completion of all remedial work necessary to ensure that no unsafe conditions exist. This shall include, but not be limited to, examination and remedial action to ensure that no unsafe speed commands can be issued to normal or reverse-running trains in the area due to:
    - a. omission of necessary circuitry, and/or;
    - b. omission of appropriate "traffic" or other necessary contacts in existing or necessary new speed control circuits.
- B. The Contractor shall, at the appropriate times, provide temporary, base-of-rail clamped 1000 KCMIL negative return bonding around the insulated rail joints (by others) at first O.B. Sta. F203+85 and first I.B. Sta. F203+85 in the vicinity of the existing bumping posts at Sta. F203+97 on the existing F-Route tracks.
- C. The Contractor shall, at the appropriate times, replace the temporary negative return rail bonding at first O.B. Sta. F203+85 and first I.B. Sta. F203+85, with permanent compression-bolted rail-web bonding of the normally specified type, all as indicated on the Contract Drawings.
- D. The Contractor shall disconnect and tag & tape the existing external 25-Pair DTS-4 cable at the TCR entrance rack and at the RTU entrance rack. (The originally proposed new Tiebreaker Station has been eliminated. See Dwg. ATCF06-G-004 and the RTU Scan Sheets.)
- E. The Contractor shall disconnect and tag & tape the existing 50-Pair DTS-5 cable at the TCR entrance rack and at the RTU entrance rack. (The DTS is no longer used to control and indicate Chiller Plants. See Dwg. ATCF06-G-004 and the RTU Scan Sheets.)
- F. The Contractor shall extend the existing 1R and 2N Speed Restriction Zones to include all new track circuits added to the Anacostia TCR area of control. See the Contract Drawings and the RTU Scan Sheets (Section 16997).
- G. The ATC testing at Anacostia shall include:
1. All new or revised circuitry, equipment and logic
  2. All static and dynamic testing which could not be completed in the normal manner in the past.

3. The Contractor shall furnish new AS-BUILT tracings, prints, magnetic media and aperture cards for all new ATC drawings created and for all existing ATC drawings revised as part of the work in the Anacosita RTU area of control.

**1.04 (EXAMPLE LOCATION) CONGRESS HEIGHTS (F07)**

- A. The Contractor shall provide the DTS/RTU connection from the Congress Heights TC/Comm Interface Cabinet for the Fire and Intrusion indications for Emergency Exit F2, which is physically located in the Anacostia TCR Area of Control. See Contract Drawings ATCF07-G-004 and G-019.

**1.05 (EXAMPLE LOCATION) SOUTHERN AVENUE (F08)**

- A. The Contractor shall take special note of the large gap in stationing on the I.B. Track inbound of the emergency crossover, and the considerable overlap in stationing on both tracks outbound of the emergency crossover. (See Dwg. ATCF08-G-007).
- B. The Contractor shall provide an Inclement Weather (RETARDED PERFORMANCE LEVEL) TWC Fly-By Transmitter System for the inbound approach to this Station. See Section 16924, the RTU Scan Sheets and the Contract Drawings.

**1.06 (EXAMPLE LOCATION) NAYLOR ROAD (F09)**

- A. The Contractor shall provide special overhead protection for the power disconnect switch (by other disciplines), and for any Train control racks or other equipment mounted below the area where cable ducts enter through the ceiling of the Train Control Room. See Dwg. ATCF09-G-003. This protection shall divert any liquids entering the room in this area in a manner satisfactory to the designated Resident Engineer.
- B. The Contractor shall provide an Inclement Weather (RETARDED PERFORMANCE LEVEL) TWC Fly-By Transmitter System for both approaches to this Station. See Section 16924, the RTU Scan Sheets and the Contract Drawings.
- C. The Contractor shall provide Snowmelter Layouts for the Naylor Road Interlocking. See Section 16969 and the Contract Drawings.

**1.07 (EXAMPLE LOCATION) SUITLAND (F10)**

- A. The Contractor shall provide one, or possibly two, fly-by transmitters on the outbound track (for control of the approach to Branch Avenue Terminal) in the Suitland TCR area of control. See the double line track plans.
- B. The Contractor shall provide Inclement Weather (RETARDED PERFORMANCE LEVEL) Fly-By Transmitter Systems for both normal approaches to this location. See Section 16924, the RTU Scan Sheets and the Contract Drawings.

**1.08 (EXAMPLE LOCATION) BRANCH AVENUE TERMINAL (F11)**

- A. The Contractor shall provide "END ATC" signs at the southeast (outbound) end of the station platform, and "START ATC" signs at the northwest (inbound) end of the station platform, as indicated on the Contract Drawings.
- B. The Contractor shall provide a complete complement of automatic terminal equipment, circuitry and logic for the Branch Avenue terminal interlocking and station. This shall provide three modes of automatic terminal operation as follows:

1. Mode 1 - Use platform track 1 only
  2. Mode 2 - Use platform track 2 only
  3. Mode 3 - Use first available unoccupied, unrestricted station platform track, with preference given to track 1, the inbound track.
  4. The mode selection shall be appropriately limited before a move is permitted from either of the yard lead tail tracks to an unoccupied Station platform track.
- C. Request for an inbound route from either of the station platform tracks shall be initiated by a TRAIN READY signal from the train rather than by any automatic "First In/First Out" feature.
- D. The Contractor shall provide complete equipment, circuitry and logic for the control and monitoring of the East (yard lead/storage track) interlocking. In addition to the normal safety circuits for this interlocking, the Contractor shall provide interfacing circuitry and logic which will make it possible for a "train" to safely move from the yard lead tail tracks to an occupied station platform track, once train motion on the platform track has ceased. (Such moves will be required to allow cars to be added to existing train consists at the station platform). Part of this special circuitry and logic shall include, but not be limited, to the following features:
1. No outbound speed commands shall be transmitted to a train on either platform track upon completion of the station dwell time for that train.
  2. Upon completion of the dwell time and time unlocks, provision shall be included to override the platform track "traffic" circuit if a route request is received from one of the storage tracks to the platform track.
- E. Additional interfacing shall be provided for safe and logical interaction between the East (temporary storage track) interlocking and the automatic terminal logic on a first-come, first served basis. As an example, with the terminal interlocking functioning in "automatic" mode and no outbound train approaching the station, a route request from storage track 1 or 2 to unoccupied platform track 1 would be granted only after the terminal interlocking crossover 1 was aligned and locked Normal, and the terminal mode selection was limited to platform 2. The Contractor shall prepare and submit complete operating plans for the coordinated operation of the two interlockings, and receive the Engineer's written approval of same, before proceeding with the final circuit and logic design to implement the agreed upon and approved operating plans.
- F. The Contractor shall provide three Terminal Algorithm Fly-by Transmitters for the Branch Avenue terminal; two on the outbound track upstream from the Branch Avenue terminal interlocking, and one on the inbound track downstream from the terminal interlocking as indicated on the Contract Drawings. (The first, and possibly the second, of these Fly-by Transmitters on the outbound track may have to be installed within the Suitland TCR area of control.) These Fly-by Transmitters shall be circuited to implement the terminal algorithm, i.e., to enable Central Control to reduce congestion at the Branch Avenue terminal interlocking by controlling train performance levels at these locations. The Contractor shall determine the exact locations for these Fly-by Transmitters, subject to the approval of the designated Resident Engineer.
- G. The Contractor shall provide two Interlocking Control Panels (I.C.P.s) at Branch Avenue - one in the main TCR and one in the Dispatcher's Room. Each of these panels shall be capable of controlling and monitoring both the West (automatic terminal) and East (yard lead track) interlockings. (If necessary due to space limitations, or operational necessity, or as directed by the Engineer, the Dispatcher's I.C.P. shall be provided on two separate cabinets, but with both faceplates showing the station platform area, at no additional cost to the Authority.) See the Contract Drawings and Section 16956.
- H. The Contractor shall provide complete, constantly energized automatic and manual

control circuitry for the control of the illuminating energy (furnished by others) for the NEXT TRAIN signs furnished and installed by others in the Branch Avenue Station. The "automatic" logic for this control circuitry shall be based on "First In/First Out" principals, but provision for manual override control from the Dispatcher's Interlocking Control Panel shall also be included. This logic shall not be included in the STAP. The Contractor shall install control wiring and any necessary suppression devices for the heavy duty control relays (by others) in the existing NEXT TRAIN Sign interface cabinet (by others) in the AC Service Room. See Section 16949 and Contract Drawing ATCF-C-011.

- I. The Contractor shall provide logically located extra rack space and spare terminals in the TCR to accommodate possible future Branch Avenue track circuit equipment for mainline track circuits and speed commands which might be installed southeast (outbound) of the Branch Avenue Station location in the future. This shall include sufficient extra rack space to mount 50 US&S PN-150 or GRS B1 vital relays in addition to the 20 percent spare space normally required.
- J. A Train Control Equipment Room (TCER F98) has been furnished by others at the Branch Avenue Tiebreaker Station. The Contractor shall provide Automatic Transfer and Bypass-Isolation equipment and internal power distribution and lightning/surge protection and grounding systems for all Train Control equipment and circuits installed in this TCER. The Contractor shall provide all power supplies for the necessary ATC equipment and circuitry in this TCER and for the East (Yard Lead) Interlocking Switch Machines, all yard lead signal lighting, and for the yard lead 60 Hz Track Circuits. The Contractor shall provide all vital and non-vital interfacing circuitry between this TCER and the main TCR at Branch Avenue Station.
- K. The Contractor shall (if possible) coordinate with the contractor providing the Branch Avenue Train Control Room and Branch Avenue Yard TCER lighting to ensure that rack lighting arrangements meet the requirements of these Specifications. If the lighting has already been installed, it shall be the Contractor's responsibility to make any necessary revisions and/or additions to these lighting arrangements to meet the Specifications of this Contract, at no additional cost to the Authority.
- L. The Contractor shall provide an Inclement Weather (RETARDED PERFORMANCE LEVEL) Fly-By Transmitter System for the normal outbound approach to Branch Avenue Station. See Section 16924, the RTU Scan Sheets and the Contract Drawings.
- M. The Contractor shall provide Snowmeter Layouts for both interlockings at this location. See Section 16969 and the Contract Drawings.

#### **1.09 QUALITY ASSURANCE**

- A. The Contractor shall perform in the field at the Tie-In location (Example-Anacostia), all tests required to ensure that the ATC system he has furnished or modified is safe and compatible with the existing ATC system and that the complete system operates as described and required by these Specifications.
- B. The Contractor shall review the work to be done at the tie-in location and produce a list of all the tests necessary to verify the safe and proper operation of all affected equipment at the tie-in location. This list shall include, but not be limited to, all tests included in Section 16980 which pertain to new equipment and circuitry installed, existing equipment and circuitry reworked, and areas where the revisions allow testing which was not previously possible.
- C. The Contractor shall perform in the field at the Tie-In location (Example-Anacostia) all

static and dynamic tests and retesting necessary due to wiring changes and track changes involved in the conversion of the area to its final, emergency crossover configuration. This shall include all testing which was not previously possible in the normal manner due to the temporary terminal track configuration.

- D. Testing by the Contractor at the Tie-In location (Example-Anacostia) shall be in close cooperation and coordination with the Authority's ATC operation and maintenance personnel.
- E. All testing at the Tie-In location (Example-Anacostia) shall be performed in accordance with procedures and schedules previously approved by the Engineer and at the appropriate times specified by the Engineer.

#### **1.10 SPECIAL SUBMITTALS**

- A. Unless otherwise specified, the Contractor shall submit drawings of all proposed new circuits and revisions to existing circuits, and descriptions and equivalent circuits for all proposed microprocessor reprogramming for Anacostia at least 120 calendar days prior to planned start of installation of such circuits or revisions.
- B. The Contractor shall submit plans and schedules for conducting the revisions and tie-in work at Anacostia. These plans and schedules shall be submitted to the Engineer at least 120 calendar days before the planned commencement of such work. The Contractor's method of placing the new or revised circuitry, programming, and/or equipment in service, and the method of disconnecting, revising and/or removing existing circuitry and/or equipment, shall be described in a written proposal of a procedure which shall have minimum effect on existing revenue service.
- C. At least 120 calendar days prior to commencing testing at Anacostia, the Contractor shall submit to the Engineer for approval a written description of the scope of testing required for that location. Copies of detailed test procedures and data sheets for these tests shall be included with this submittal. The submittal shall describe in detail all necessary tests and partial tests, identifying those tests which require complete retesting and those for which partial testing is sufficient. Any partial testing shall be properly identified and all items to be tested shall be documented in the submittal. No testing will be permitted until the Contractor has received approval of the test plan and schedule for the location involved.
- D. (EXAMPLE LOCATIONS ANACOSTIA, SOUTHERN AVENUE, AND NAYLOR ROAD SPECIFICATIONS SHOWN) The Contractor shall, within 180 calendar days of receipt of Notice-to-Proceed, submit to the Authority for approval complete operational descriptions of the following:
  - 1. The final Anacostia, Southern Avenue, and Naylor Road emergency crossover interlockings, complete with all of their applicable turnback and DTS operational features.
  - 2. The final Branch Avenue automatic terminal crossover interlocking area, complete with its final automatic route selection and all applicable TWC, Fly-by Receiver, Fly-by Transmitter and DTS control facilities, and special facilities to allow additional transit cars to be added to trains at the Branch Avenue Station platforms in a safe manner.
  - 3. The initial operation of controls and indications for the Branch Avenue East Yard Lead universal crossover interlocking and tail tracks.
  - 4. The special provisions for the future operation of the East (Yard Lead) interlocking with Branch Avenue Yard in service.

- E. These documents shall not only describe the "normal" operations envisioned, but also how the systems will operate under abnormal and unusual conditions, and what actions will take place or be prevented by the systems proposed in order to ensure safe and efficient operation. These documents shall serve two purposes;
  - 1. They shall ensure that there is a "meeting of the minds" between the Contractor and the Authority with regard to the movements to be provided and the movements to be prevented by the Contractor's ATC equipment and circuitry in the applicable TCR control areas, and;
  - 2. They shall, in their approved form, serve as the basis for the Contractor's submittals of Operations Manuals for these areas.
- F. The Contractor shall, at least 60 days prior to commencement of such work, submit detailed plans for the proposed bonding methods and equipment to be used to provide 1000 kcmil negative-return isolation bonding from shunt bars and impedance bonds to the negative-return moles (by others) in the Branch Avenue TBS area. These plans shall also show the exact location and number of cables for each such bond.
- G. The Contractor shall, at least 60 days prior to commencement of such work, submit detailed plans for the installation of any impedance bonds or marker coils which cannot be installed in the normally specified manner or location due to the presence of guard rail or restraining rail mounting hardware, or to the location of closure rails in turnout areas. These plans shall include details of the proposed cutting of guard rails and modifications or relocation of supports for impedance bonds, marker coils, guard rails and/or restraining rails (as applicable) at each specific location.

## **PART 2 - PRODUCTS**

### **2.01 THE PRODUCTS AND MATERIALS REQUIRED BY THIS SECTION SHALL BE AS DESCRIBED ELSEWHERE IN THESE SPECIFICATIONS.**

## **PART 3 - EXECUTION**

### **3.01 EXAMPLE LOCATIONS ANACOSTIA, SOUTHERN AVENUE, AND NAYLOR ROAD SPECIFICATIONS SHOWN)**

### **3.02 REQUIRED OPERATION AT ANACOSTIA INTERLOCKING**

- A. The Contractor shall, at the appropriate time, modify this interlocking to eliminate automatic terminal operation and to provide emergency crossover operation with automatic turnback capability as indicated on the Contract Drawings and as specified herein.

### **3.03 REQUIRED OPERATION OF THE NAYLOR ROAD AND SOUTHERN AVENUE INTERLOCKINGS**

- A. The Contractor shall provide emergency crossover operation with automatic turnback capability for these interlockings as indicated on the Contract Drawings and as specified herein.

### **3.04 REQUIRED OPERATION OF BRANCH AVENUE INTERLOCKINGS**

- A. The Contractor shall design and install these terminal and yard lead crossover interlocking systems:
  - 1. to provide safe automatic terminal operation;
  - 2. to safely allow additional cars (from the yard lead storage tracks) to be added to

- 3. existing train consists at the Branch Avenue Station platform;  
to allow Central to control both the east (Yard Lead) interlocking and the west (Terminal) interlocking;
  - 4. to allow control of the West (Terminal) interlocking to be transferred by normal means, to either the Branch Avenue TCR I.C.P., or the Branch Avenue Dispatcher's I.C.P., by Central;
  - 5. to allow control of the East (Yard Lead) interlocking to be transferred by normal means, to either the Branch Avenue TCR I.C.P., or to the Branch Avenue Dispatcher's I.C.P., or to the (future) Branch Avenue Yard Control Machine, by Central, and;
  - 6. to allow authorized personnel at the Branch Avenue TCR I.C.P. or the Dispatcher's I.C.P. to seize control of the West (Terminal) interlocking or the East (yard lead) interlocking by operating the applicable EMERGENCY RELEASE pushbutton for that interlocking, with the TCR I.C.P. having priority and the capability to override the Dispatcher's EMERGENCY RELEASE capability.
- B. all as indicated on the Contract Drawings and as specified herein. See Section 16956, Interlocking Control Panels, and the Contract Drawings.

### **3.05 TUNNEL CLEANING (Where Applicable)(Example Specifications)**

- A. The Contractor shall, at the appropriate time after all other installation work in the (Location "A" Name and Location "B" Name) TCR areas of control has been completed, and prior to dynamic train testing, perform the following tunnel cleaning work in the two tunnels, including all cross-adits and shaft access points, outbound of Sta. X000+00:
- 1. Cover all drain openings with adequate filter media to prevent entry of wash down debris into the drainage system. Filter media shall be monitored and maintained during the wash down.
  - 2. Clean all tunnel and covered surface structure surfaces using a method adequate to remove dust and debris which may become airborne during dynamic train testing.
- B. Cleaning shall include, but not be limited to:
- 1. The surfaces of junction boxes, cables, fire lines, running rails, third rail, third rail cover boards, track fasteners, conduits, safety walks, cross adits, the area under the running rails and under shafts.
  - 2. Removal of all debris resulting from the tunnel cleaning.
  - 3. Removal of filter media from the drain openings once all cleaning operations have been completed.
- C. The Contractor shall, upon completion of the cleaning operation, inspect each of the drain openings for debris. The Contractor shall remove all debris and prove the drainage system using an adequately sized mandrel.
- D. The Contractor shall be responsible for damage to any equipment resulting from the cleaning operation. Appropriate measures shall be taken by the Contractor to protect all equipment installed in the area being cleaned.
- E. The Contractor shall furnish, through agreement with the local jurisdiction, any water needed for the cleaning operations.
- F. The Contractor shall remain responsible for the prevention of airborne dust in the tunnels for the duration of all dynamic train testing including dynamic systems testing.

### **3.06 MEASUREMENT FOR PARTIAL PAYMENTS FOR ATC TIE-IN WORK**

- A. Converting the (interface location name) interlocking and station operation from a Temporary Terminal configuration to an Emergency Crossover configuration, except testing, will be considered to be ATC Tie-In Work.
- B. Measurement for partial payments for ATC Tie-In Work will be based upon:
  - 1. Timely and acceptable submittal of all required special reports, descriptions, procedures and schedules for conducting the required tie-in work.
  - 2. Approval of the ATC Tie-In Work actually completed.
  - 3. Final Acceptance of the Tie-In Location
- C. The cost of "Tunnel Cleaning" work specified in this Section will not be paid for separately, but will be included in the payments for the installation work. All other work specified in this Section, except ATC Tie-In Work, will be measured for payment as described in the Sections under which the applicable type of work is specified.

**END OF SECTION**

## SECTION 16919

### ATC SYSTEM SAFETY PROGRAM

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the establishment and maintenance of an ATC System Safety Program which shall be developed by the Contractor and integrated into the ATC phase of this Contract. The ATC System Safety Program shall provide a disciplined approach to methodically evaluate the ATC system's design in regard to safety and to identify hazards and prescribe corrective action in a timely, cost effective manner.

##### 1.02 DESCRIPTION

- A. The ATC System Safety Program shall prescribe a formal approach to the elimination of hazards through engineering, design, education, management policy, and supervisory control of conditions and practices.
- B. The Contractor's ATC System Safety Program shall constitute a portion of the overall WMATA System Safety Program. The ATC System Safety Program shall supplement the fail-safe design requirements of these Specifications, but shall not relieve the Contractor of fail-safe design responsibility in any way.

##### 1.03 REQUIREMENTS

- A. The Contractor shall be responsible for the management and operation of the ATC System Safety Program. The responsibilities and functions of those directly associated with system safety policies and implementation of the program shall be clearly defined. The authority delegated to this organization and the relationship between line, staff, and interdepartmental, project, functional, and general management organizations shall be identified. It is not the intent of this article to prescribe or imply organizational structure, management methodology, implementation procedures, or internal documentation.
- B. The Contractor shall identify system safety interface links between the ATC system and other WMATA systems. These links shall include machine/machine interfaces, man/machine interfaces, training, maintenance, rules and procedures.
- C. The Contractor shall conduct a hazard mode and effect analysis for the entire ATC System covered by this Contract and for the following subsystems and potential hazard areas:
  - 1. Automatic train protection
    - a. Train separation
    - b. Route protection
  - 2. Automatic train operation
  - 3. Automatic train supervision
  - 4. Data transmission system
  - 5. Miscellaneous subsystems
    - a. TC Maintenance Telephone System
  - 6. Interface between train control system and operating personnel
  - 7. Interface between ATC system and non-ATC systems such as the Train Propulsion System.

##### 1.04 HAZARD CATEGORIES

- A. Hazards identified shall be classified and assigned a relative qualitative measure in accordance with the following categories:
  - 1. Category I - Catastrophic
    - a. Hazardous conditions such that human error, environment, design deficiencies, subsystem or component failure, or procedural deficiencies will cause death or serious injury to human beings or major system loss.
  - 2. Category II - Critical
    - a. Hazardous conditions such that human error, environment, design deficiencies, subsystem or component failure, or procedural deficiencies will cause personal injury or major system damage.
  - 3. Category III - Marginal
    - a. Hazardous conditions such that human error, environment, design deficiencies, subsystem or component failure, or procedural deficiencies can be counteracted or controlled without personal injury or major system damage.
  - 4. Category IV - Negligible
    - a. Hazardous conditions such that human error, environment, design deficiencies, subsystem or component failure, or procedural deficiencies will not result in personal injury or system damage.

#### **1.05 TASKS AND PROCEDURES**

- A. The ATC System Safety Program shall specifically describe the procedures which the Contractor shall follow in order to accomplish certain safety oriented tasks. These tasks shall include, but not be limited to, the following:
  - 1. Correct safety irregularities in the ATC design phase as early as possible.
  - 2. Eliminate from the system the evoking of any false proceed commands or false proceed signal aspects.
  - 3. Minimize the number of false restrictive or stop commands and false stop signal aspects.
  - 4. Evaluate design changes and the impact these changes will have on the safety of the complete ATC System.

#### **1.06 OBJECTIVES**

- A. The Contractor's objectives shall be in consonance with WMATA system safety objectives.
- B. The primary objective of the System Safety Program shall be to eliminate hazards of a vital nature, whether actual or potential, from the ATC System. These are hazards which could result in personal injury, unrefurbishable property damage, or loss of a portion of the Train Control System. This applies both directly and indirectly, i.e., whether the injury, damage, or loss were to be caused directly by Train Control System malfunction or indirectly by the resultant unsafe operation of one or more trains.
- C. The secondary objective of the System Safety Program shall be to minimize the seriousness of injury to patrons or personnel and the extent of damage to equipment and property due to any malfunction of the Train Control System or the trains themselves.

#### **1.07 SUBMITTALS**

- A. The Contractor shall submit a detailed description of his proposed ATC System Safety Program for the applicable route segment within 60 calendar days of receipt of the applicable Notice to Proceed. This description shall include, but not be limited to, all of the items required by this article. It shall also detail the methods to be used to achieve the specified objectives of the program and delineate how the ATC System Safety Program is to be implemented and documented.

- B. The Contractor shall submit an initial System Safety Report within 90 calendar days of receipt of the applicable Notice to Proceed. Supplementary System Safety Reports shall be submitted as necessary. These reports shall include, but not be limited to, descriptions of hazards detected and progress in implementing corrective measures to eliminate or reduce the seriousness of hazards within the ATC System. The discussion of hazards in this section of the report is intended to be limited to hazards, or safety-related design problems, of an unexpected or unusual nature. It is not intended that the monthly safety report contain a comprehensive discussion of all hazards related to rapid transit operation (or ATC operation) in general. The ATC System Safety reports shall include an interface section which identifies hazards to the ATC System which are best corrected external to the ATC System such as by changes in rules, procedures, training or maintenance. The interface section shall also identify external hazards which shall be corrected in the ATC System, such as protection against mismanipulation of controls or failure of incoming power.
- C. The Contractor shall submit separate reports evaluating the impact of design changes on the safety of the ATC System.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS AND EQUIPMENT**

- A. The Contractor shall supply all the materials, tools, equipment, computer time, reference literature and other items which are necessary to meet the requirements of the ATC System Safety Program.

## **PART 3 - EXECUTION**

### **3.01 ATC SYSTEM SAFETY COORDINATION**

- A. The Contractor shall designate one of his employees as ATC System Safety Coordinator. The ATC System Safety Coordinator shall have the following responsibilities:
  1. Direct the activities of the ATC System Safety Program personnel.
  2. Coordinate the activities of the ATC System Safety Program with the overall WMATA System Safety Program.
  3. Supervise the Contractor's Hazard Mode and Effect Analysis of the ATC System and its individual subsystems and interface areas.
  4. Keep records of all time charged to the ATC System Safety Program. These records shall be available to the designated Resident Engineer on 48 hours notice.
  5. Take immediate appropriate action to prevent personal injury or system damage when a category I or category II hazard is identified.
  6. Determine what changes could be made in the ATC System, operating rules, training procedures, equipment, maintenance procedures, physical structure, or other systems to permanently reduce category I and category II hazard conditions to a category III or category IV status and recommend these changes to the designated Resident Engineer.
  7. Determine which category III hazard conditions should be reduced to a category IV status and how this could best be accomplished. Recommend these changes to the designated Resident Engineer.
  8. Implement those safety changes approved or required by the designated Resident Engineer, which fall within the Contractor's area of responsibility.
  9. Submit the supplementary ATC System Safety Reports to the designated Resident Engineer.

### **3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. The ATC System Safety Program will be measured for partial payments based upon:
1. The designated Resident Engineer's approval of the ATC System Safety Program submitted by the Contractor
  2. The Contractor's implementation and continuing management and operation of this program, as reflected in the supplementary ATC System Safety Reports
  3. The designated Resident Engineer's approval of the final documentation of the ATC System Safety Program.

**END OF SECTION**

## **SECTION 16920**

### **WAYSIDE ATC SYSTEMS**

(Table of Contents)

#### **PART 1 - GENERAL**

##### **1.01 SECTION INCLUDES**

A. This SECTION lists the various 16920-series Wayside ATC Systems Specification Sections:

- |    |   |                 |
|----|---|-----------------|
| 1. | ATC Power Distribution System                                 | (Section 16921) |
| 2. | Lightning/Surge Protection and Grounding Systems              | (Section 16922) |
| 3. | TC Maintenance Telephone System                               | (Section 16923) |
| 4. | Non-Vital ATO and ATS Processor Systems                       | (Section 16924) |
| 5. | Data Transmission System                                      | (Section 16925) |
| 6. | Microprocessor System for<br>Non-Vital Interlocking Functions | (Section 16926) |
| 7. | ATC Microprocessor Support Systems                            | (Section 16927) |
| 8. | Interlocking Vital Processor Systems                          | (Section 16928) |

**END OF SECTION**

## SECTION 16921

### ATC POWER DISTRIBUTION SYSTEMS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of a complete Power Distribution System inside each of the new Train Control Rooms included in this Contract. Each of the Power Distribution Systems shall include all power supplies, transformers, transfer and bypass equipment, buses, feeders, and mains required to accept electrical energy from the two 3-phase power sources in the Train Control Room, modify this energy as required, and distribute it at the proper voltages to the various pieces of ATC equipment.
- B. Design each Power Distribution System to achieve the best load balance practicable.
- C. Each Power Distribution System shall include a power failure and overcurrent alarm system circuited as shown on the Contract Drawings. If a Remote Terminal Unit (RTU) is located in the Train Control Room, this alarm system shall include a check of the 5 volt internal power supply of the RTU.
- D. Certain monitoring, isolation, and protection devices shall also be included, as indicated on the Contract Drawings and as specified herein.
- E. All power supply distribution systems, regardless of rated system voltage, current or frequency, shall deliver the system voltage to the module, device or appliance connected to that system at not less than 95 percent, nor more than 105 percent of the nominal voltage rating of the module, device or appliance.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16916 Basic ATC Circuit Requirements
  - 2. Section 16917 Basic Interlocking Requirements
  - 3. Section 16918 Special ATC Requirements for Specific Locations
  - 4. Section 16922 Lightning/Surge Protection and Grounding Systems
  - 5. Section 16925 Data Transmission System (DTS)
  - 6. Section 16941 Basic Electrical and Electronic Components
  - 7. Section 16946 Transformers
  - 8. Section 16947 Ground Detectors
  - 9. Section 16949 Signal Wire and Cable
  - 10. Section 16951 Transfer and Bypass Equipment
  - 11. Section 16952 DC Power Supplies
  - 12. Section 16971 Racks and Cable Trays
  - 13. Section 16977 Tagging and Marking
  - 14. Section 16978 Miscellaneous Train Control Components and Material
  - 15. Section 16980 ATC Tests, Inspections and Quality Assurance

##### 1.03 POWER SOURCE

- A. A "Normal" 208Y/120V, 60-Hz, 3-phase, grounded neutral service and a "Reserve" 208Y/120V, 60-Hz, 3-phase, grounded neutral service, each with its own grounded neutral

conductor, will be terminated by other disciplines on overcurrent-protected disconnect switches in power junction boxes located in each TCR. The overcurrent protection in these boxes will be sized to protect the feeders and service transformers only. At stations, the Normal (Essential) service will be served by the inverter of the Station Uninterruptible Power Supply System. The rating of both the Normal (Essential) and the Reserve (Emergency) services will be 9 KVA. These services have been sized with a demand factor of 70 percent. These two services, the disconnect switches and power junction boxes complete with terminals and the overcurrent protection devices for the on-site source equipment, will be provided by other disciplines at each TCR.

- B. Examine the equipment described in the preceding paragraph and the on-site transformers and feeders for these two services to determine whether they are of sufficient size to carry the required ATC loads in the manner specified herein. If the Contractor finds that any of the AC source equipment furnished by other disciplines has not been properly installed or connected or is insufficient to handle the required loads in the manner specified, he shall notify the Engineer in writing.

#### **1.04 BASIC TCR POWER DISTRIBUTION REQUIREMENTS**

- A. The Power Distribution System for each TCR which does not service one or more interlockings shall be equipped with the following:
1. A Normal 208Y/120V, 60-Hz, 3-phase, 4-wire, grounded neutral bus supplied by the Normal service
  2. A Reserve 208Y/120V, 60-Hz, 3-phase, 4-wire, grounded neutral bus supplied by the Reserve service
  3. An uninterruptible 120V, 60-Hz, single-phase bus energized through an automatic transfer switch by the third phases of the Normal or Reserve 208Y/120V, 60-Hz, 3-phase buses, but isolated from the transfer switch by an isolation transformer and monitored by an AC ground detector. This bus (UBX120-UCX120) shall supply all ATC loads requiring uninterruptible 60-Hz energy. These loads include power frequency track circuits, signal lighting circuits and power supplies for traffic circuits and for miscellaneous loads such as station dwell timers. A suitably interlocked bypass-isolation switch shall be provided in combination with the automatic transfer switch.
  4. A grounded 28V DC local energy bus (B28G-N28G) used to supply the DTS Remote Terminal Unit (RTU), all vital DC circuits which are totally confined to that TCR, and all non-vital 28V DC circuits.
    - a. The ends of this bus shall be energized by two identical sets of regulated power supplies. One set of these power supplies shall be fed from the Normal 208Y/120V, 60-Hz bus, and the other set shall be fed from the Reserve 208Y/120V, 60-Hz bus. Each of these power supply sets shall consist of an even number of individual power supplies divided equally between two of the three phases of each 3-phase power bus, as shown on the Contract Drawings. Each half of each of these power supply sets shall be capable of continuously providing at least 50 percent of the normal MAXIMUM load for the B28G-N28G bus.
    - b. As an option, the Contractor shall furnish and install two identical sets of 3-phase-input regulated power supplies to feed the ends of the B28G bus. Each of these power supply sets, one fed from the Normal 208Y/120V AC, 3-phase bus and the other fed from the Reserve 208Y/120V AC, 3-phase bus, shall be capable of continuously providing at least 100 percent of the normal MAXIMUM load for the B28G-N28G bus.
    - c. The negative terminals of these 28V DC local power supplies shall not be

connected directly to the negative side of the local 28V DC bus. Instead, both the N28G bus and the negative terminals of the 28V DC local power supplies shall be connected directly to the TCR prime ground bus, as shown on the Contract Drawings.

5. An ungrounded 28V DC line energy bus (LB-LC) used to supply all vital 28V DC circuits that extend outside of the TCR. The ends of this bus shall be energized by two identical regulated 28V DC power supplies. Each of these power supplies shall have a continuous output current rating of at least 100 percent of the normal maximum load for the LB-LC bus. One of these power supplies shall be fed from the third phase of the Normal 208Y/120V, 60-Hz bus, and the other shall be fed from the third phase of the Reserve 208Y/120V, 60-Hz bus. The LB-LC bus shall be monitored by a DC ground detector.
6. A grounded 5V DC bus (B5G-N5G) used for electronic station control and energy distribution failure alarm circuits inside the TCR.
  - a. The ends of this bus shall be energized by two identical regulated 5V DC power supplies. Each of these power supplies shall have a continuous output current rating of at least 125 percent of the normal maximum load for the B5G-N5G bus. One of these power supplies shall be fed from the third phase of the Normal 208Y/120V, 60-Hz bus, and the other shall be fed from the third phase of the Reserve 208Y/120V, 60-Hz bus.
  - b. The negative terminals of these 5V DC power supplies shall not be connected directly to the negative side of the 5V DC bus. Instead, both the N5G bus and the negative terminals of the 5V DC power supplies shall be connected directly to the TCR prime ground bus as shown on the Contract Drawings.
7. While these Specifications call for a DC system potential of 28 volts, nominal, the Contractor may request the Authority to consider, and if approved, supply equipment utilizing a different nominal voltage, provided that the equipment supplied is adequately engineered for safety, reliability and efficiency and provided that the equipment complies with the following conditions:
  - a. The nominal system potential utilized shall not be greater than 28 volts DC.
  - b. Voltage tolerances stated in these Specifications shall, when converted to a percentage basis, apply to the alternate system potential.
  - c. The separation and differentiation between grounded and ungrounded DC power buses shall be retained.
  - d. All equipment supplied to operate on the alternate supply potential shall be properly designed to operate at that potential.
  - e. Contact ratings and wire, conduit, terminal, and junction box sizes stated in these Specifications shall be increased where necessary to accommodate the increased current necessitated by a lower system potential, and as required to hold voltage losses to the levels specified elsewhere in this Section.
  - f. At all interface locations, equipment provided shall be capable of operating with the equipment of existing adjacent locations and at existing voltages without modification to the existing locations, except as required by other sections of these Specifications.
  - g. The alternate system potential shall not result in a system which requires significantly more rack space than that allotted in these Specifications.
  - h. Equipment supplied at locations equipped, or partially equipped, on a previous contract for purposes of tie-in, or revision of configuration, shall be of the same type and function at the same voltage as the equipment already installed.

## 1.05 ALTERNATE VOLTAGE RELATED SECTIONS

- A. Areas of these Specifications in which the effects of an alternate DC system potential must be considered shall include, but not be limited to, the following:
1. Section 16916 Basic ATC Circuit Requirements
  2. Section 16921 ATC Power Distribution Systems
  3. Section 16922 Lightning/Surge Protection and Grounding Systems
  4. Section 16924 Non-Vital ATO & ATS Processor Systems
  5. Section 16925 Data Transmission System (DTS)
  6. Section 16926 Microprocessor Systems for Non-Vital Interlocking Functions
  7. Section 16931 ATC Maintenance and Test Facilities
  8. Section 16943 Vital Relays
  9. Section 16944 Non-Vital Relays and Timers
  10. Section 16949 Signal Wire and Cable
  11. Section 16952 DC Power Supplies
  12. Section 16953 ATP Track Modules
  13. Section 16955 Track and Alarm Indication Panels
  14. Section 16956 Interlocking Control Panels
  15. Section 16980 ATC Tests, Inspections and Quality Assurance
  16. Section 16997 RTU Scan Sheets

## 1.06 POWER DISTRIBUTION FOR TCRs SERVICING INTERLOCKINGS

- A. For Power Distribution Systems in TCRs servicing one or more interlockings, the Contractor shall provide all of the basic power distribution equipment and buses specified for non-interlocking TCRs, plus the following:
1. An ungrounded WHB DC bus to supply switch-and-lock movement loads and, where applicable, snowmelter control circuit loads.
    - a. The ends of this bus shall be fed by two identical sets of 3-phase-input regulated power supplies. One of these power supply sets shall be fed by the 208Y/120V, 60 Hz, 3-phase Normal bus, and the other set shall be fed by the 208Y/120V, 60 Hz, 3-phase Reserve bus.
    - b. As an option, each end of the WHB-WHC bus shall be fed by a set of three identical single-phase-input regulated power supplies, one set fed from the three phases of the 208Y/120V, 60 Hz, Normal bus, and the other set fed from the three phases of the 208Y/120V, 60 Hz, Reserve bus.
    - c. In either case, each of these sets of power supplies shall be capable of supplying enough current to operate five switch-and-lock movements simultaneously, and the WHB bus shall be of sufficient capacity to carry this current without voltage drop at the movement which exceeds the limits stated in these Specifications.
  2. Two 120V, 60 Hz buses for signal lighting, each fed from the uninterruptible 120V bus through separate overcurrent protection devices.
  3. A single 120V, 60-Hz "flashing" energy bus for signal lighting. This energy bus shall be provided by breaking energy from the first signal lighting bus over the heavy duty contacts of a vital flasher relay having a "flashing" rate of 56 to 64 flashes per minute. This relay shall be energized only when one or more track switches within the interlocking are aligned in their "diverging" position.
  4. As many separately protected track transformers and local track relay coil taps as are required to supply the 60-Hz, AC track circuits used in the interlockings.

## 1.07 QUALITY ASSURANCE

- A. Inspect each Power Distribution System installed and shall promptly correct any deficiencies noted at no additional cost to the Authority. Each inspection shall be conducted in accordance with the requirements of the Contractor's Installation Inspection Procedure for Power Distribution Systems, as approved by the designated Resident Engineer.
- B. Test each new Power Distribution System and promptly correct any deficiencies noted, at no additional cost to the Authority. The testing shall be conducted in accordance with the requirements of the Contractor's Test Procedure for Power Distribution Systems, as approved by the designated Resident Engineer.

## 1.08 SUBMITTALS

- A. Submit the following to the designated Resident Engineer for approval at least 60 calendar days prior to the fabrication or procurement of the power distribution apparatus:
  - 1. Power Computations
    - a. Compute the power requirements for each bus and each type of train control load for the Power Distribution System of each newly equipped TCR included in this Contract. These computations shall include provisions for adequate wire sizing, taking into account the specifications concerning the requirements for the various overload capacities, the maximum and minimum applied voltage, and the maximum voltage loss.
    - b. When computing power requirements for a TCR and determining the proposed arrangement and capacity of its Power Distribution System, include the capacity for all ATC circuits and equipment which would logically be energized and controlled from that room, whether or not the wayside circuits and equipment can all be installed under this Contract. This shall include capacity for circuits and equipment for planned future track circuits, interlockings, and wayside ATC support functions for future stations which are delineated in Section 16918, Special ATC Requirements for Specific Locations.
    - c. Based upon these computations, the extra capacity and maximum voltage loss requirements of these Specifications and the requirements of the National Electrical Code (NEC) and applicable local electrical codes, determine and list the sizes and ratings of all buses and other power distribution equipment which he proposes to use in each Power Distribution System.
    - d. Submit complete computations for internal TCR power circuits which show the maximum voltage drop from room power source to each appliance, and the minimum working voltage which will be applied at each appliance.
    - e. Submit complete computations for all TC power circuits which leave the TCRs which show the maximum line voltage drop from the TCR to the apparatus or remote field location, and which show the line wire size(s) necessary to provide acceptable minimum working voltage and current at the remote device or location.
    - f. The Contractor shall include power equipment size lists with the complete power computations.
  - 2. Technical Data
    - a. Submit ratings, performance data, and mechanical and electrical drawings for the items of equipment which are proposed to be used as part of the Power Distribution Systems under this Contract. Equipment which does not conform with these Specifications shall not be used as part of any Power Distribution System or addition unless specifically approved by the designated Resident Engineer in writing.

- B. Submit the following to the designated Resident Engineer for approval at least 60 calendar days prior to the commencement of installation work on Power Distribution Systems:
  - 1. A complete power distribution layout for each TCR. Each of these layouts shall include the number, physical size, and electrical rating for all buses and other electrical apparatus comprising the layout, and drawings showing the physical location of the various Power Distribution System components in the TCR and showing complete circuits and details of the manner in which the various components are to be interconnected electrically. Each layout shall include provisions for power failure and overcurrent alarms, monitoring equipment, equipment grounding, and ground detection where required. Each layout shall also include provisions for isolating major components of the ATC Power Distribution System without interfering with the primary supply of ATC power, as indicated on the Contract Drawings and as specified herein.
  - 2. A Field Inspection Procedure for the Power Distribution Systems, which shall be used to check the installation of each TCR Power Distribution System or addition. This procedure shall be in accordance with the requirements specified for inspection procedures in Section 16980, ATC Tests, Inspections and Quality Assurance.
  - 3. A complete Field Test Procedure for the Power Distribution Systems which shall be in accordance with the requirements specified for field test procedures in Section 16980.
- C. For each TCR Power Distribution System installed, the Contractor shall submit a complete field inspection report within 15 calendar days of the completion of that installation.
- D. For each TCR Power Distribution System installed, the Contractor shall submit a complete field test report within 60 calendar days of the completion of that installation.

## **PART 2 - PRODUCTS**

### **2.01 MAJOR COMPONENTS**

- A. Power racks, cable trays, conduit, cable, power supplies, power transformers, automatic transfer switches, bypass-isolation switches, and ground detectors shall be as specified in other Sections of these Specifications.

### **2.02 FEEDERS AND MAINS**

- A. Feeders and mains shall be of sufficient size to carry the rated load, with voltage variation of not more than plus-or-minus 5 percent of the rated voltage of the appliance, measured at the appliance under full load and no load conditions. The continuous load rating for ATC feeders and mains shall be at least 125 percent of the total load that could reasonably be imposed by the part of the ATC system fed therefrom.

### **2.03 PROTECTIVE DEVICES**

- A. Circuit breakers and fuses shall be as specified in Section 16941, Basic Electrical and Electronic Components, and shall be of appropriate continuous current ratings for the loads to be supplied. In addition, circuit breakers and fuses protecting power supply equipment and buses shall be of the electrical indicating type. The protective devices of the ATC Power Distribution System shall be properly coordinated to provide selective tripping protection of the system against overloads and short circuits with a minimum of disruption

to the functioning of the ATC system. Protective devices for the automatic transfer switch shall be such that the contacts of the transfer switch are protected from welding.

#### **2.04 MISCELLANEOUS POWER DISTRIBUTION EQUIPMENT**

- A. Furnish and install all mounting and fastening hardware, insulating nuts or covers, cable lugs, conduit, and other miscellaneous components required to provide complete Power Distribution Systems or additions.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION**

- A. Install all TCR Power Distribution Systems as indicated on the power distribution layouts approved by the Engineer. These systems shall be in compliance with the requirements of the NEC, all applicable local electrical codes, these Specifications, and the Contract Drawings. The Contractor shall not proceed with the installation of any TCR Power Distribution System until he has obtained the designated Resident Engineer's written approval for the proposed layout of that ATC Power Distribution System and all components thereof.
- B. Arrange grounded or ungrounded power buses so that ground loops do not exist in the bus or its connecting wiring. That is, only one path for current shall exist between the current source and the point of current application.
- C. Make the connections between the power buses on the power racks and the point of application with a twisted-pair of wires of the correctly calculated wire gauge. No parallel path shall exist between the source and the point of application. The current flow in both conductors of the twisted pair connections shall be, at all locations, equal in magnitude and opposite in direction.
- D. One twisted-pair may supply more than one appliance only if the conditions in B and C above are met and if irregularities of current draw of any one appliance will not effect the operation of any other appliances obtaining power from the same pair.

#### **3.02 IDENTIFICATION**

- A. Tag and label the equipment, cables, and buses comprising each ATC Power Distribution System as specified in Section 16977, Tagging and Marking, and as shown on the Contract Drawings.

#### **3.03 POWER TRANSFER SENSIVITY**

- A. The ATC Power Distribution System shall be so configured that normal inrush current during a power transfer by the Automatic Transfer Switch shall not trip any input or output fuses or breakers.

#### **3.04 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. For measurement purposes, ATC Power Distribution Systems for TCRs newly equipped under this Contract shall consist of:
  - 1. Buses, feeders and mains used for power distribution
  - 2. Disconnect and overcurrent protection devices

3. Isolation transformers
  4. Power failure and overcurrent alarm system
  5. Transfer and bypass equipment
  6. DC power supplies
  7. Ground detectors
  8. TCR equipment for power frequency track circuits (as applicable)
  9. All associated mounting and identifying hardware
  10. All associated wiring and terminations
- B. For purposes of payment, the transfer and bypass equipment, DC power supplies, ground detectors and power frequency track circuit equipment will not be included, but will be measured for payment separately as specified elsewhere.
- C. Power Distribution Systems will be measured for payment based upon:
1. Approval of all the preliminary submittals required
  2. Installation of the system by the Contractor and approval of the installation by the designated Resident Engineer

**END OF SECTION**

## SECTION 16922

### ATC - LIGHTNING/SURGE PROTECTION AND GROUNDING SYSTEMS

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing, installation, and testing of lightning protection, surge protection and grounding systems for Train Control Rooms, and the grounding of signals, Train Control equipment cases, junction boxes, and other Train Control equipment or apparatus hereinafter specified or shown on the Contract Drawings to require grounding. It is the intent of these Specifications that the Contractor shall perform all work and furnish and install all equipment necessary to provide complete, operating lightning protection, surge protection and grounding systems which are effective in protecting all Train Control systems from damage and operational malfunction.
- B. Ground connection to the track rails or use of the neutral conductors of the power company or any signal power supply system will not be permitted.
- C. The Contractor's design shall preclude any "closed loops" in the Train Control Room lightning protection and grounding systems. A "closed loop" in these systems is a condition which may occur due to multiple contact points between two or more sections of cable tray, or between any combination of cable tray, cable shielding, ground wire, and ground bus bar. Where shielded cable is used, the cable shield shall be grounded, but no electrically contiguous segment of the cable shielding shall be grounded at more than one point.
- D. Provide a complete system of devices to protect the Train Control circuits and equipment from lightning and other electrical surges. This shall be accomplished by providing as many applicable types and stages of protection as necessary to protect each type of circuit and equipment involved. The protection system designed by the Contractor shall comply with the requirements specified herein and shall be subject to Type Acceptance Testing.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16918 Special Requirements for Specific Locations
  - 2. Section 16923 TC Maintenance Telephone System
  - 3. Section 16924 Non-Vital ATO & ATS Processor System
  - 4. Section 16925 Data Transmission System (DTS)
  - 5. Section 16926 Microprocessor Systems for Non-Vital Interlocking Functions
  - 6. Section 16927 ATC Microprocessor Support System
  - 7. Section 16928 Interlocking Vital Processor Systems
  - 8. Section 16947 Ground Detectors
  - 9. Section 16952 DC Power Supplies
  - 10. Section 16955 Track and Alarm Indication Panels
  - 11. Section 16956 Interlocking Control Panels
  - 12. Section 16965 Signal Layouts
  - 13. Section 16966 Wayside Pushbutton Layouts
  - 14. Section 16969 Snowmelter Layouts
  - 15. Section 16971 Racks and Cable Trays
  - 16. Section 16980 ATC Tests, Inspections and Quality Assurance
  - 17. Section 16996 ATC Technical Appendix

### 1.03 QUALITY ASSURANCE

- A. Inspect the lightning, surge protection and grounding systems for the Train Control Rooms and the grounding of wayside signals, equipment cases, pushbutton layouts, and other Train Control equipment which requires grounding, and correct any deficiencies noted. The inspection shall be conducted in conformance with the requirements of the Contractor's Installation Inspection Procedure as approved by the Designated Resident Engineer.
- B. The final tests of the TCR lightning, surge protection and grounding systems and the grounding of wayside signals, pushbutton layouts, equipment cases, and other grounded Train Control equipment shall be in conformance with the requirements of Section 16980, ATC Tests and Inspections, and shall be conducted in compliance with the approved Field Test Procedure for TCR and TC equipment lightning, surge protection and grounding systems.
- C. If, after the installation of any outside ground, it is found that the ohmic resistance between equipment and earth exceeds 15 ohms, furnish and install additional ground rods and any associated material required to connect them to the first ground rod driven, to meet the resistance requirement of 15 ohms or less. The Contractor shall retest the first ground rod after the multiple ground rods have been installed and connected, and record the results in accordance with Section 16980. Any additional ground rods installed to meet the 15-ohms-or-less requirement shall be either multiple ground rods or sectional ground rods. Rods connected in multiple shall be spaced a minimum distance of six feet apart.
- D. Within Train Control Rooms provided by others, if ground tests disclose that the resistance between earth ground and the room prime ground bus exceeds 15 ohms, the Contractor shall notify the Designated Resident Engineer.

### 1.04 SUBMITTALS

- A. Submit circuit, schematic and detail drawings showing design and details of each Train Control Room lightning, surge protection and grounding system for approval of the Designated Resident Engineer. These, drawings shall form a part of the Contractor's overall Train Control Room drawing submittal for equipment racks, entrance racks and cable trays as required by these Specifications.
- B. The Contractor's design and details of the lightning, surge protection and grounding systems for each Train Control Room shall be shown on one or more separate drawings dedicated to those systems. The combination of the lightning, surge protection and grounding system drawings with the cable tray layout or any other drawing will not be permitted, but details of the bonding of cable tray joints shall be shown on the Contractor's grounding system design drawings.
- C. Submit an Installation Inspection Procedure for lightning/surge protection and grounding equipment.
- D. Submit a Field Test Procedure for lightning/surge protection and grounding systems for Train Control Rooms and Train Control equipment.
- E. Submit an Inspection Report for the installation of lightning/surge protection and grounding equipment in each TCR and its area of control.
- F. Submit a Test Report for the lightning/surge protection and grounding systems in each

TCR and its area of control.

## **PART - 2 PRODUCTS**

### **2.01 OUTSIDE GROUNDING EQUIPMENT**

- A. When grounding rods are required, the rod and clamp shall be in accordance with requirements for grounding material as specified in Section 16978, Miscellaneous Train Control Components and Material. The connection between the ground rod and the apparatus shall be No. 6 AWG soft drawn, extra-flexible copper wire, or 4/0 wire if more than one ground rod is necessary.

### **2.02 INSIDE GROUNDING EQUIPMENT**

- A. Grounding bus bars furnished under this Contract shall have a minimum cross section of one and one-half by one-quarter inches, and shall be made of hard drawn pure copper having a minimum conductivity of 98 percent per ASTM B187-73. Each bar shall be straight and of rectangular cross section. All surfaces shall be true and free of imperfections. Train Control Room "prime" ground bus bars shall be at least two feet in length.
- B. Miscellaneous hardware, including but not limited to such items as lugs, washers, studs, and bolts used for ground connections, shall be bronze.

### **2.03 GROUND DETECTORS**

- A. Ground detectors shall be as specified in Section 16947.

### **2.04 LIGHTNING AND SURGE PROTECTION EQUIPMENT**

- A. Primary surge arresters shall have the ability to shunt relatively high current surges to ground with relatively little overshoot.
- B. Secondary surge suppressors shall have the ability to shunt-to-ground any surge overshoot from the primary arrester devices.
- C. The intermediate impedance devices shall have characteristics which will allow them to assist the initiation of operation of the primary arresters and protect the secondary surge suppressors, and yet not interfere with the normal operation of the Train Control circuits and equipment they are assisting to protect.
- D. Appropriately sized and rated metal oxide varistors (MOVs) shall be provided as a third stage of lightning protection for micro-processor circuits which exit the TCR. The rating for these devices shall be 50 percent greater than the working voltage of the protected circuit.

## **PART 3 - EXECUTION**

### **3.01 GROUNDING OF OUTSIDE EQUIPMENT**

- A. The following items of wayside equipment at locations external to Train Control Rooms shall each be grounded in the manner specified:
  - 1. All controlled signals and marker signals shown on the Contract Drawings or required by the final design.
  - 2. All metallic Train Control equipment cases and cable junction boxes shown on the Contract Drawings or required by the final design.

- B. The grounding of each piece of outdoor equipment shall be provided by the Contractor by means of an individual connection to a driven copper ground rod, or rods driven in series, i.e., one on top of the other. Where ground rods must be driven in parallel, the minimum distance between rods shall be six feet. The resistance of the connection from each piece of equipment to earth ground shall not exceed 15 ohms.
- C. The connection between the equipment and the ground rod shall consist of No. 6 AWG stranded copper wire, or 4/0 wire as necessary for proper protection.
- D. No more than three pieces of equipment to be grounded shall be connected to each driven ground.
- E. The ground connection wire from each piece of equipment to its associated ground rod shall be run in as direct a path as practicable. No looping or cascading of ground connection wires will be permitted.
- F. All ground rods shall have the grounding wire attached to the ground rod four inches above grade in order to facilitate maintenance inspection. The ground rod shall be driven in such a location that it does not create a tripping hazard.
- G. The Contractor shall take care to avoid previously buried cable when driving ground rods. The Contractor shall furnish all labor and material required to repair or replace any underground equipment damaged by his ground-rod-driving operations. This repair and/or replacement work shall be done to the satisfaction of the Designated Resident Engineer, and at no additional cost to the Authority.

### **3.02 GROUNDING OF INSIDE EQUIPMENT**

- A. Train Control equipment located in TCRs (or Dispatcher Rooms) provided by others shall be grounded as follows:
  - 1. Each equipment rack and entrance rack shall be grounded via a single point ground to overhead grounding bus bars which shall be installed continuously along each row of racks. Each grounding bus bar shall be properly sized and supported at sufficient intervals to prevent sagging. The grounding bus bars shall be mechanically attached via stand-off insulators to the cable tray support system. Joints in the cable tray shall be bonded and each cable tray, consisting of one, two or more sections so bonded, shall be single-point connected to the adjacent ground bus bar. All ground connections to racks, trays and other equipment shall be arranged to facilitate easy removal to allow the testing of the electrical isolation between each item of equipment and the ground bus. Surfaces of equipment shall be cleaned of paint, rust, corrosion, oil, or other possible insulating material, before ground connections are made. Joints in ground bus bar shall be kept to a minimum. When joints are necessary, they shall be shown in detail on the Contractor's design drawings for the grounding system, as approved by the Designated Resident Engineer.
  - 2. Wall mounted and desk mounted Interlocking Control Panel cabinets (where applicable) shall be grounded with a separate, insulated No. 6 AWG, extra-flexible soft drawn copper wire (or greater wire size as necessary to meet specified resistivity requirements) from the cabinet frame to the Train Control Room prime ground bus, unless otherwise directed by the Designated Resident Engineer. This connection shall be arranged to be removable to allow testing of the electrical insulation between the control machine and ground.
  - 3. The Contractor shall make all ground connections in each Train Control Room to a prime ground bus bar furnished and installed by others. This prime ground bus bar will be a minimum of two feet in length and will be of sufficient length to accommodate all Train Control system related connections required. It will be

mounted on insulating stand-offs on a wall of the Train Control Room, approximately four feet above the floor. This prime ground bus bar will be connected to a number 4/0, six foot pigtail (provided by others) which is the lead to the main ground connection for the applicable room. Each ground wire connected to the room prime ground bus bar shall be identified by an embossed metal tag indicating the wire's origin.

4. Ground bus bars as installed shall be free from sharp edges. All joints shall be assembled with a uniform pressure of 200 pounds per square inch.
5. Items of Train Control equipment such as power supplies, which contain an external ground post, shall be grounded to their respective rack and not directly to the room prime ground. Train Control equipment which contains an internal connection to the ac distribution system neutral, shall not be grounded. All other individual apparatus not located on racks and shown on the Contract Drawings or herein specified to be grounded shall be connected to the room prime ground bus with individual insulated No. 6 AWG (or larger as necessary) extra-flexible soft drawn copper wire. These connections shall be designed to be of the shortest possible length consistent with good workmanship and the layout of the room.
6. If shielded cable is used as part of the Contractor's Train Control System, each electrically continuous segment of cable shielding shall be grounded at only one point.
7. The Contractor shall provide all labor and material for any special grounding which is required or necessary for his equipment over and above that specified herein, at no additional cost to the Authority.

### **3.03 LIGHTNING AND SURGE PROTECTION**

- A. Conform to all wiring and equipment installation methods and procedures known, and provide all types and levels of lightning arresters and surge protectors necessary, to protect the Train Control equipment from damage or operational interference. This coordinated protective system shall include, but not be limited to the following:
  1. Segregation of high voltage wiring from low voltage wiring;
  2. Segregation of TC control wiring from power/ operating wiring and communications wiring;
  3. Provision of short, direct, low resistance conductor paths, using a minimum number of long-radius bends in the grounding cable, for the grounding of equipment and protective devices;
  4. Provision of initial lightning protection and surge protection by means of low resistance (15 ohms, max.) earth grounds for outside Train Control equipment, and at the point where TC cables and wiring first enter the buildings housing the Train Control Rooms;
  5. Provision of primary, high-current-capacity, properly grounded arresters of characteristics and type(s) appropriate to the application(s);
  6. Provision of three-stage secondary surge protection, which shall consist of:
    - a. Stage 1 - Dual overvoltage devices, each containing a gas-filled surge arrester, a varistor-type overvoltage protection module, and zener-type suppression diodes;
    - b. Stage 2 - Fast-blow fuses rated at the maximum current capable of being delivered by the device(s) being protected, and;
    - c. Stage 3 - A duplication of Stage 1, all circuited as shown on the applicable page in the ATC Technical Appendix (Section 16996).

### **3.04 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. With the exception of ground rods, there will be no separate measurement for partial payments for lightning, surge protection or grounding of equipment specified herein. All costs

of furnishing, delivery, storage and proper installation of grounding and lightning protection equipment other than ground rods specified within this Section will be measured for payment as part of the cost of the work for which it is a part.

- B. Factors which will be considered when determining partial payments for ground rods will include, but not be limited to:
1. Delivery of the ground rods:
  2. Installation of the ground rods and approval of the installation by the Designated Resident Engineer.
  3. Testing of the ground resistance and satisfactory correction of all grounding installation and test discrepancies by the Contractor.
  4. Final approval of the grounding test results by the Designated Resident Engineer.

**END OF SECTION**

## SECTION 16923

### ATC MAINTENANCE TELEPHONE SYSTEM

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of telephone equipment to extend the existing METRO Train Control (TC) Maintenance Telephone System to certain equipment provided under this Contract and to certain equipment provided by others.
- B. Provide all telephone jacks and plugs, terminals, jack boxes, rotary selector switches, interconnecting twisted pair wiring and speaker phones to form a complete system compatible with the existing system. No instrument ringing shall be provided.
- C. Provide TC Maintenance Telephone jacks in or on each of the following pieces of equipment as applicable under this Contract:
  - 1. Power, Entrance, and Equipment Racks (2 per rack; front and back)
  - 2. Track and Alarm Indication Panels
  - 3. Large Junction Boxes (to include TC/COMM Interface Cabinets and DTS interface boxes or cabinets furnished by other disciplines, and Wayside Interface or Distribution Junction Boxes furnished by the Contractor)
  - 4. Signal Junction Boxes
  - 5. Wall Mounted Interlocking Control Panels
  - 6. Switch-and-Lock Movements
- D. TC Maintenance Telephone circuits shall conform to the requirements specified in Section 16916, Basic Circuit Requirements, and be as indicated on the Contract Drawings.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:

1.	Section 16916	Basic Circuit Requirements
2.	Section 16941	Basic Electrical and Electronic Component Requirements
3.	Section 16949	Signal Wire and Cable
4.	Section 16965	Signal Layouts
5.	Section 16955	Track and Alarm Indication Panels
6.	Section 16956	Interlocking Control Panels
7.	Section 16969	Snowmelter Layouts
8.	Section 16971	Racks and Cable Trays
9.	Section 16972	Junction Boxes
10.	Section 16980	ATC Tests, Inspections and Quality Assurance

##### 1.03 QUALITY ASSURANCE

- A. Ten randomly selected telephone jacks and plugs out of every hundred of each furnished, shall pass a 1000-volt insulation breakdown test and a low voltage continuity test before shipment from the point of manufacture. The results of these tests shall be recorded by the Contractor and submitted to the designated Resident Engineer on a test form previously approved by the Engineer.
- B. Each speaker phone and its adaptor cord shall be factory tested. The factory test for speaker phones shall be the manufacturer's standard. Only those speaker phones and cords which have passed their factory test shall be shipped to the Authority.

- C. The rotary selector switches for the TC Maintenance Telephone System shall be factory tested prior to installation in the racks.

#### **1.04 SUBMITTALS**

- A. Prior to Purchase or Fabrication
  - 1. The Contractor shall not proceed with the purchase or fabrication of TC Maintenance Telephone equipment until he has received the designated Resident Engineer's written approval of the proposed equipment. The Contractor shall submit the following drawings and data for approval prior to the purchase or fabrication of TC Maintenance Telephone equipment:
    - a. Mechanical drawings for each type of plug and jack lay-out to be used, including mounting and fastening details. The drawings for telephone jacks shall show the details of mounting on the front and back of all entrance, power and equipment racks, on all types of control and indication panels and internal junction boxes, and the details of the proposed external weatherproof jack box for external housing and junction boxes.
    - b. Complete mechanical and electrical drawings and performance data for the proposed speaker phones.
    - c. Complete mechanical and electrical drawings including contact ratings for the proposed rotary selector switches.
- B. Prior to Shipment or Installation
  - 1. Submit properly filled out factory test report forms to the designated Resident Engineer prior to the shipment of speaker phones or the installation of rotary selector switches or TC Maintenance Telephone jacks.
- C. Prior to Acceptance
  - 1. Submit properly filled out field installation inspection report forms and field test reports to the designated Resident Engineer for approval before the TC Maintenance Telephone System will be considered for approval.

#### **1.05 DELIVERY, STORAGE AND HANDLING**

- A. Deliver the speaker phones and adaptor cords furnished under this Contract directly to the Authority at a location on WMATA property designated by the designated Resident Engineer.

### **PART 2 - PRODUCTS**

#### **2.01 TELEPHONE JACKS**

- A. Telephone jacks for the TC Maintenance Telephone System shall be Type NL-112B as manufactured by Switchcraft, Inc., or approved equal, except that Type N-112B may be used on racks in the TCRs or on thin sheet metal boxes. Springs shall be silver-plated, nickel silver. A nylon bushing shall be provided to insulate jack sleeves from mounting surfaces. Terminals at all telephone jack locations shall be arranged to accommodate at least two pairs of No. 16 AWG wires.

#### **2.02 EXTERNAL JACKS**

- A. All telephone jacks mounted on junction boxes or equipment housings outside of Train Control Rooms shall be enclosed in wired entrance boxes or weatherproof housings and shall be equipped with spring-loaded jack-covers, Switchcraft No. 520, or approved equal.

### 2.03 TELEPHONE PLUGS

- A. All telephone plugs shall be Type 267 as manufactured by Switchcraft Inc. or approved equal. Plugs shall have solder terminals with built-in strain-relief clamp.

### 2.04 SPEAKER PHONES

- A. Furnish six speaker phones for each of the TCRs newly equipped under this Contract. Each speaker phone shall operate from either an internal power supply fed by external 120V ac, or a self-contained battery pack using conventional penlite batteries which shall be easily replaceable. Each speaker phone shall be equipped with a call button switch and a push-to-talk button switch.
- B. The speaker phones shall meet or exceed the following specifications:
  - 1. Receive Mode
    - a. Sensitivity: -30dBm
    - b. Impedance: 600 ohms, 300 Hz to 3kHz
    - c. Frequency Response:  $\pm 3$ dB from 300 Hz to 3kHz
    - d. Audio Power: 200mw
  - 2. Transmit Mode
    - a. Output:  $\pm 5$ dBm
    - b. Impedance: 600 ohms, 300 Hz to 3kHz
    - c. Frequency Response:  $\pm 3$ dB from 300 Hz to 3kHz
  - 3. Physical
    - a. Size: (Maximum) 8 inches x 5 inches x 4 inches
    - b. Weight: (Maximum) 24 oz. (including batteries)
  - 4. Battery
    - a. Type: Dry - Alkaline
    - b. Cell Size: AA (1.5V penlite)
    - c. Life: 125 hours minimum
  - 5. Protection
    - a. No damage to the speaker phone shall result from connection across 120V ac or 150V dc.
  - 6. Leads
    - a. Leads shall be six feet long and equipped with type 267 plugs; lead insulation breakdown voltage shall be 600V ac.
- C. An adaptor cable shall be provided with each speaker phone. The adaptor cable shall consist of a six foot length of extra flexible single-pair cable, with an insulated jack to accept the type 267 plug at one end and a pair of insulated alligator clips at the opposite end.
- D. Speaker Phones shall be "Nobelphone Portable Telephone Model P-11" as manufactured by Nobel Co., Ltd., Tokyo, Japan, or approved equal, modified to meet additional requirements specified above.

### 2.05 SELECTOR SWITCH UNITS

- A. A rotary, six-pole, six position wafer switch, wired as shown on the Contract Drawings, shall be furnished to select various combinations of TC Maintenance Telephone connections at each Train Control Room. This switch and a terminal strip of pressure-clamp type communications terminals shall be mounted on a metal plate suitable for installation in a standard size space on the entrance rack. The mounting plate shall be steel with a black or gray enamel finish, or anodized aluminum. The front of the plate shall be clearly and permanently marked to indicate the various connection combinations available for the various positions of the rotary switch, all as shown on the Contract Drawings. The back of the plate shall be marked to indicate the terminal coordinates for the switch plate wiring.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. External Jacks
  - 1. The weatherproof external jacks shall be so mounted on external cases, housings and junction boxes that the jacks may be used without opening the junction box, case or housing. The two wires from the telephone jack shall be terminated on terminals mounted inside the associated case, housing or junction box. The Contractor shall make twisted pair connections to other locations from these terminals.
  
- B. External Wiring
  - 1. The Contractor shall use No. 16 AWG twisted pair cable, as specified in the non-vital wire portion of Section 16949, Signal Cable and Wire, to connect all the external TC Maintenance Telephone jacks mounted on ATC equipment within the control limits of each TCR to the selector switch in that TCR as shown on the Contract Drawings. The Contractor shall install a separate twisted pair cable for each track in each direction from the TCR. Each cable shall connect all the TC Maintenance Telephone jacks mounted on ATC and support system equipment located along that particular track within the TCR area limits. The twisted pair installed along each track shall be extended to connect with the corresponding TC Maintenance Telephone pair from each adjacent TCR as shown on the Contract Drawings.
  - 2. The Contractor shall use one No. 19 AWG twisted pair out of each special control and indication cable to connect the TC Maintenance Telephone jack in each DTS Interface junction box to the TC Maintenance Telephone System in the Train Control Room as shown on the Contract Drawings.
  
- C. Internal Wiring
  - 1. The Contractor shall use No. 16 AWG twisted pair cable, unless otherwise directed on the Contract Drawings, to connect all of the TC Maintenance telephone jacks on panels, racks and junction boxes located within each TCR, to the selector switch in that TCR. Two individual single-conductor wires twisted together will not be acceptable.
  
- D. Jack and Plug Wiring
  - 1. All jacks and plugs shall be wired with white insulated wire on the tip side and black insulated wire on the ring side.
  
- E. In all instances, the TC Maintenance Telephone jacks shall be installed in such a manner that they are easily seen and easily accessible for use. A room-temperature vulcanizing adhesive sealant shall be applied to the threads of phone jacks to prevent them from loosening due to vibration and use.

### **3.02 FIELD TESTING**

- A. Test each TC Maintenance Telephone jack after the system has been installed in the field to assure a minimum resistance of one megohm between each jack and the equipment on which it is mounted.
  
- B. The TC Maintenance Telephone System provided under this Contract shall be tested to ensure that voice communications with a minimum signal-to-noise ratio of 15dB can be maintained through the extreme ends of all possible TC Maintenance Telephone circuits:
  - 1. Between TCRs located within the new route segment,

2. Between these TCRs and external wayside equipment jacks along each track within the new route segment,
  3. Between all the TCRs and wayside equipment jacks located within the route segment provided under this Contract and the nearest adjacent TCR originally equipped under previous contracts,
  4. Between all TCRs and DTS junction boxes newly connected under this Contract.
- C. The minimum resistance and minimum signal-to-noise ratio characteristics specified above shall be regarded as part of the criteria for acceptance of the TC Maintenance Telephone System. The Contractor shall provide whatever effort and material is required to meet these criteria at no additional cost to the Authority.
- D. Record the results of the above described field tests for submittal to the designated Resident Engineer.

### **3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. There will be no separate payment for telephone jacks, jack boxes, plugs and the associated switching and wiring facilities. The cost of furnishing, installing and wiring all TC Maintenance Telephone jacks, jack boxes and selector switches will be included in the costs for the junction boxes, panels, housings, or racks on which these items are mounted.
- B. The cost of furnishing and installing external twisted pair cable for the TC Maintenance Telephone System will be measured for partial payments as indicated in Section 16949, Signal Wire and Cable.
- C. Speaker phones, complete with specified power supplies or batteries, leads and adaptor cords, will be measured for partial payments based upon the number of required units delivered to the Authority and accepted by the Authority.

**END OF SECTION**

## SECTION 16924

### ATC - NON-VITAL ATO & ATS PROCESSOR SYSTEMS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the requirements for providing a system of one or more equipment modules which constitute a microprocessor-based controller with the capability of operating certain non-vital ATO and ATS functions for each passenger station equipped for ATC under this Contract. This controller, or group of controllers, for each new passenger station location, shall be referred to herein as a Non-Vital Station Processor or, more simply, a Station Processor (STAP). This Section also specifies the requirements for certain interfacing equipment and circuitry to be provided along with the Station Processor, and for certain non-vital function logic to be provided by discrete components external to the Station Processor.
- B. Unless otherwise specified, the requirements of this Section shall supersede the Contract Drawings where the various passenger station functions are shown to be executed by relay and discrete electronic component types of equipment. The "discrete component" drawings are included to indicate how these non-vital ATO & ATS functions are achieved on other portions of the **current** METRORAIL SYSTEM, and are still correct insofar as the logic and results are concerned.
- C. The area of the WMATA right-of-way controlled or affected by the STAP shall be limited to the station platforms and the approaches thereto.

##### 1.02 BASIC STAP SYSTEM REQUIREMENTS

- A. It is recognized that a manufacturer of the STAP may supply more than one processor to properly accommodate the various station functions specified herein. This is acceptable under these Specifications. For the purposes of these Specifications, one or more non-vital processors will be referred to as a single entity, or as sections of a single entity. The STAP shall be completely separate from any processor specified in these Specifications for any other purpose. Functions or equipment of the STAP shall not interfere with the operation of other systems. The basic modular unit(s) of all STAPs provided under this Contract shall be interchangeable. The overall configuration for each STAP shall be determined by its internal programming and by its external wiring.
- B. The Contractor shall provide:
  - 1. One complete Station Processor for each passenger station newly equipped for ATO and ATS under this Contract,
  - 2. One complete Station Processor for use during training, which is to be delivered to the Authority upon completion of training.
- C. In the design of the logic for the STAP the Contractor shall comply with the requirements of this Article and to the logic design inherent in the descriptions of electronic equipment and relay-type circuits contained on the applicable related Contract Drawings of these Specifications. In the construction of the STAP, the Contractor shall comply with the requirements of all other related Articles included in these Specifications.
- D. The Contractor shall provide a parallel-data interface between the STAP and the DTS Remote Terminal Unit.

- E. The Station Processor shall be capable of performing the following subsystem tasks as specified:
1. Control of Programmed Station Stopping
    - a. The Program Stop subsystem to be provided shall be the wayside portion of a system which shall cause the trains of transit vehicles to decelerate smoothly to a stop at the desired location along each passenger station platform included under this Contract. This subsystem shall be fully compatible with the carborne program stop equipment currently in use.
    - b. The wayside Program Stop subsystem shall transmit codes from the TCR to appropriate track-mounted marker coils to cause two-car and four-car trains to stop with their front ends aligned with the platform centerline (Type A Stop); or with their front ends aligned with the leaving end of the platform (Type B Stop); or with their centerline aligned with the platform centerline (Type C Stop), all as determined by the presence or absence of special jumpers in the control circuitry. Six-car and eight-car trains shall always be caused to stop with their centerline aligned with the platform centerline. The codes required are specified in Section 16967, Marker Coil Layouts.
    - c. The wayside Program Stop subsystem shall also have the capability of transmitting to the wayside marker layouts the proper code to cause the trains to skip the station stop when so commanded by Central Control via the DTS. When Central Control sends a skip-stop control, this control signal will be present at the output interface relay of the DTS until the skip-stop command is transferred to the intended train. In the absence of a skip-stop signal from Central Control, the Program Stop subsystem shall send to the appropriate marker coils the three-wire code for the programmed train/platform alignment.
    - d. The wayside Program Stop subsystem shall provide inputs to the Platform Edgelight Control subsystem, specified herein, for use in controlling the flashing of the proper segments of the platform edgelights.
  2. Train-to-Wayside Communications (TWC)
    - a. The TWC subsystem to be provided shall expand the wayside portion of the current METRORAIL TWC System as described herein. The operation of the TWC subsystem specified herein shall be functionally compatible with the current TWC System installed under previous WMATA contracts or by the Authority. The TWC subsystem shall be interfaced in such a way that any frequency ranges of electrical noise from the surrounding environment shall not interfere with the normal operation of the TWC System. TWC signal input circuits shall be provided with security check circuitry or software which shall not allow electrical noise to be interpreted as a valid message.
    - b. The current TWC System is the digital communications link between trains and wayside for exchange of data. The following functional data is exchanged between the trains and the wayside equipment.
 

<u>Train-to-Wayside</u>	<u>Wayside-to-Train</u>

3. Platform Edgelight Control

a. The Platform Edgelight Control subsystem shall provide the logic necessary to illuminate the platform edgelights in such a manner that the lighted sections indicate the stopping alignment and length of the next train to stop in the station. The Platform Edgelight Control subsystem shall make use of traffic direction, track occupancy, and the Program Stop subsystem circuits to provide this logic. Output from the Platform Edgelight Control subsystem shall consist of a control for each 75-ft. section of platform edgelights as shown on the Contract Drawings. The Contractor shall extend the outputs to the appropriate locations in AC service rooms.

b. The Platform Edgelight Control Subsystem shall operate as follows:

- 1) Four types of input information are required for the Platform Edgelight Control System to determine the proper platform segment output controls:
  - a) Traffic Direction on the applicable track - supplied by the appropriate traffic relays;
  - b) Length of the approaching train - supplied by the Program Stop Control subsystem;
  - c) Skip Stop (Yes or No) - determined by Central Control, and;
  - d) "Type of Stop" (for 2 and 4 car trains) if the stop is to be other than centerline-of-train to centerline-of-station. Jumpers shall be provided by the Contractor in the TCR to call for Type A (Short) Stop, or Type B (Long) Stop as instructed by Designated Resident the Engineer. Absence of jumpers shall result in a call for a Type C (Center) Stop.
- 2) The Platform Edgelight Control System shall include two methods of triggering the outputs. One method shall be by means of inputs from the RTU via the Program Stop Control subsystem. The alternate method of triggering the Platform Edgelight Control subsystem outputs shall be by track occupancy in approach to the station as shown on the Contract Drawings.
- 3) The Platform Edgelights shall be caused to cease flashing upon departure of a train from the platform track.

4. Train Door Operation and Dwell Time Control

a. The Door and Dwell Control subsystem shall provide independent door and dwell control for each platform.

- b. The Door and Dwell Control subsystem shall:
  - 1) Provide the controls necessary to hold a train in the station.
  - 2) Provide automatic door control commands.
  - 3) Control the length of time a train remains at a station platform with its doors either opened or closed.
  - 4) Control the removal and restoration of ATP speed commands for trains at the station platforms.
  - 5) Control the transmission and removal of open door commands to the platform impedance bonds.
  - 6) Provide the interface between the RTU, the dwell timing and the station ATP track modules.
- c. The Door and Dwell Control subsystem shall operate as follows:
  - 1) The Door and Dwell Control subsystem shall receive the TRAIN BERTHED signal from a train in the station via the TWC System. Upon receiving the TRAIN BERTHED signal the Door and Dwell Control subsystem shall simultaneously:
    - a) Start the operation of the appropriate dwell timer.
    - b) Inhibit the transmission of an ATP speed to the platform impedance bond and the next downstream bond.
  - 2) The Door and Dwell Control subsystem shall subsequently replace the ATO speed command with an OPEN DOOR command.
  - 3) The speed command selection circuits shall:
    - a) Determine on which side the doors are to open.
    - b) Apply the appropriate OPEN DOOR command to both platform impedance bonds in such a manner that all doors of the train must be within the platform limits in order for the train to be able to process the command.
  - 4) Under normal operating conditions, when the dwell timer has timed-out the Door and Dwell Control subsystem shall:
    - a) Remove the OPEN DOOR command from the platform impedance bonds.
    - b) Allow the restoration of ATP speed commands to the platform impedance bonds and the next downstream impedance bond.
  - 5) The removal of the OPEN DOOR command causes the train to send a TRAIN-NOT-BERTHED signal via the TWC station receiver. Reception of the TRAIN-NOT-BERTHED signal by the Door and Dwell Control subsystem shall simultaneously:
    - a) Cause a DWELL COMPLETE signal to be transmitted to the Program Stop subsystem which shall cancel the train length information stored there.
    - b) Cancel the TRAIN BERTHED signal which is stored in the Door and Dwell Control subsystem.
  - 6) The Door and Dwell Control subsystem shall receive and process inputs from the RTU which will permit Central Control to influence dwell times.
    - a) These controls are as follows:
      - (1) HOLD WITH DOORS OPEN
      - (2) HOLD WITH DOORS CLOSED
      - (3) TERMINATE DWELL
    - b) Receipt of a HOLD WITH DOORS OPEN command from the RTU shall cause the Door and Dwell Control subsystem to maintain an OPEN DOOR command as long as the HOLD WITH DOORS OPEN command is present, even after the dwell timer has timed-out.
    - c) Receipt of a HOLD WITH DOORS CLOSED command

- from the RTU shall cause the Door and Dwell subsystem to:
- (1) Remove the OPEN DOOR command
  - (2) Transmit a zero mph speed command to the train as long as the HOLD WITH DOORS CLOSED command is present, even after the dwell timer has timed out.
- d) Transmission of a TERMINATE DWELL command shall simultaneously:
- (1) Cancel the TRAIN BERTHED signal stored in the Door and Dwell Control circuits.
  - (2) Transmit a DWELL COMPLETE signal to the Program Stop subsystem.
  - (3) Remove the OPEN DOOR command from the platform impedance bond.
  - (4) Allow the restoration of ATP speed commands to the platform impedance bond and the next downstream bond.
- 7) The Door and Dwell Control subsystem shall be provided with wiring for a possible future local control switch for the following commands:
- a) HOLD WITH DOORS OPEN
  - b) HOLD WITH DOORS CLOSED
- 8) The effect of the possible future locally initiated "Hold With Doors ..." commands shall be the same as previously described.
5. Train Approach Warning Light Control(for TRAIN ARRIVAL INDICATION LIGHT SYSTEM) ("TAILS")
- a. Provide the circuitry/logic to initiate a "TRAIN APPROACH WARNING LIGHT" (TAWL) when an outbound train is in approach to, and within approximately 60 seconds of arriving at the station platform.
  - b. Provide an adjustable timing function output to maintain this "TAWL" indication for a certain period of time after the train first arrives at the station platform track. The "timer" shall initially be set for 120 seconds.
  - c. The Contractor shall also provide the necessary circuitry to carry this "TAWL" indication to a 28-volt, non-vital relay (by others) in the DTS Box (by others) in the applicable station AC Service Room, as indicated on the Contract Drawings.
- F. The Station Processor shall include all non-vital internal timing functions necessary for the subsystems which it is executing.
- G. The Station Processor shall include the "Performance Level Translator" logic necessary to convert the two-bit performance level control received from Central Control into a four-bit binary code which identifies the ATS speed limit required to achieve the desired performance level. (See Section 16904, Current ATC System.) The two bit Performance Level Translator shall be programmable from external hardwire program plug couplers. Modifications of Software to change performance levels will not be allowed.
- H. The Contractor shall provide training courses for personnel maintaining the STAP. The training courses shall be in accordance with the requirements of this Section and Section 16993, ATC Training Courses.
- I. The Contractor shall provide circuitry for the control of "NEXT TRAIN SIGN" lights furnished by others at terminal locations, as shown on the Contract Drawings. The "automatic" logic for this control circuitry shall be based on "First In/First Out" principals, but provision for manual override control from the Dispatcher's Interlocking Control Panel shall also be included. This logic shall not be included in the STAP.

### 1.03 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
1. Section 16998 Correction of ATC Deficiencies
  2. Section 16904 Current Automatic Train Control System
  3. Section 16911 Scope of ATC Work
  4. Section 16914 Environmental Requirements

### 1.04 QUALITY ASSURANCE

- A. The Contractor shall provide "Type Acceptance Testing" for the Station Processor if its design differs in any respect from a STAP previously accepted for regular use on the WMATA METRORAIL SYSTEM. This Type Acceptance Testing shall be performed at the manufacturer's factory. The testing may be under the surveillance of the designated Resident Engineer and shall be thoroughly documented.
- B. The Type Acceptance Testing shall including, but not be limited to, the following tests:
1. For the STAP, complete with its I-O Interface:
    - a. Full Temperature Sequence
    - b. Full Humidity Sequence
    - c. Full Vibratory Sequence
    - d. Full Power Voltage Variation
    - e. Electrical Transient Withstand (all external connections)
    - f. Proof of Correct Software Operation
    - g. Broad-band Radio Frequency Interference-Output Limits and Withstand Capability
    - h. Proof of Diagnostic Operation.

- C. All of the STAP modules and the software programs which are to be installed under this Contract shall be factory tested as a complete system in accordance with a factory test procedure. This procedure shall be generated by the Contractor in accordance with the guidelines set forth in another part of this Section. The procedure shall be approved by the Designated Resident Engineer before the start of factory testing.
- D. The factory test for the system complete with all TCR equipment shall include:
  - 1. All field tests which can be performed in the factory;
  - 2. Simulation of train movements at, and in approach to, the station platforms.
- E. The Contractor shall record the results of these tests on the specified Factory Test Report forms. Items for which Factory Test Reports have not been approved by the Designated Resident Engineer may be shipped to the job site only at the Contractor's risk.
- F. Each item of equipment shall be inspected by the Contractor immediately prior to installation. Only those items which have suffered no damage during shipment and subsequent handling shall be installed.
- G. All of the STAP modules and their software program which have been installed under this Contract shall be field tested after installation in accordance with a field test procedure. This procedure shall be generated by the Contractor in accordance with the guidelines set forth in another part of this Article. Field testing of the STAP shall not start until this procedure has been approved by the Designated Resident Engineer.
- H. The Contractor shall provide and maintain up-to-date, a Station Processor Diary or Log containing a detailed write-up of any and all changes made to the system hardware and software from the time of their approval by the Engineer until final acceptance by the Authority, at which time the Log shall be delivered to the Designated Resident Engineer. This record shall conform to the requirements more fully described in the documentation section of Part 3 of this Article.
- I. The STAP system shall be capable of meeting the Mean-Time-To-Restore requirements shown in the ATC Technical Appendix (Section 16996) of these Specifications.
- J. The Contractor shall provide Operation and Maintenance Manuals for the STAP. These manuals shall be prepared during the initial phases of the Contract so that they may be approved and delivered to the Authority before field testing commences. These manuals shall be prepared according to guidelines set forth in another part of this Article and in Section 16992, ATC Instruction Manuals.

#### **1.05 SUBMITTALS**

- A. The Contractor shall furnish within 60 calendar days of receipt of Notice to Proceed a submittal consisting of the following four explanatory items. These explanations shall be fully detailed and written in plain English. Simple diagrams may be used for clarity. All such diagrams shall be fully explained. A glossary of definitions shall be included to thoroughly define any absolutely necessary technical or unusual words, otherwise, such words shall not be used. Buzzwords, slang, computer jargon and telegraphic writing style not be used. The explanatory items are:
  - 1. The Contractor shall explain the method by which he obtains reliability in the system which he intends to provide for this Contract. With this explanation, he shall explain his understanding of the word reliability and his method of quantifying the reliability of the system.
  - 2. The Contractor shall provide a detailed explanation of the method by which he intends to implement the diagnostic requirements of this Section. This explanation

- shall describe the techniques of schemes to be utilized to verify the correct operation of every step of every process included in the information processing.
3. The Contractor shall provide a general explanation of the method by which he intends to implement the maintenance requirements of this Section. This explanation shall describe the features of the proposed maintenance program and the test equipment to be supplied for use with the maintenance procedures.
  4. The Contractor shall describe in detail the provisions he has made for repairing the printed circuit boards which are part of the STAP. This description shall address the following items:
    - a. Confirm that the Contractor will provide PC board service for at least 24 months as specified in Section 16998, Correction of ATC Deficiencies.
    - b. The procedure the Contractor plans to follow to allow continued Authority servicing when the 24 months have expired.
    - c. Which boards or devices will be kept in stock at the Contractor's factory, and for how many years.
    - d. The guaranteed maximum factory turn-around time from the receipt of a request for a new board or device to the shipment of its replacement.
    - e. The Contractor's board replacement policy.
    - f. Whether replacement boards are new or repaired.
    - g. Whether replacement boards would be from Authority returned boards or a general stock.
    - h. The present cost of replacement for each board type.
    - i. The present cost of repair for each board type.
- B. The Contractor shall furnish, within 60 calendar days of receipt of Notice to Proceed, any Type Acceptance Testing documentation which may be required for the STAP systems. This documentation shall include, but not be limited to, the details of the simulations for the functions to be executed by the STAP, the diagnostic routines and equipment, and the tests to be utilized in proving to the satisfaction of the Engineer that the STAP and the related system to be supplied will meet all of the applicable requirements of these Specifications.
- C. The Designated Resident Engineer will review the documentation for all equipment to be furnished under this Article before the equipment is delivered. The Designated Resident Engineer recommends that the Contractor not manufacture equipment for this Contract which has not been approved. Therefore, prior to component purchase, or fabrication of the equipment to be supplied under this Section, the Contractor shall deliver to the Designated Resident Engineer for approval, the following:
  1. Drawings of the proposed equipment modules, and test and diagnostic fixtures, including schematic diagrams, arrangement plans, assembly drawings, complete parts lists keyed to the drawings, ordering information, mounting details, internal and external wiring circuits and details, and mechanical and electrical component descriptions to the component level.
  2. The complete field test procedures for the installed and programmed STAP system.
  3. An outline of the course to be provided for Authority class instruction on the STAP.
  4. An outline of the organization of the system documentation for the STAP which the Contractor plans to supply according to these Specifications.
- D. The Factory Test Procedures for the assembled and programmed equipment modules for the applicable TCR locations shall be in conformance with the requirements specified in Section 16980, ATC Tests, Inspections and Quality Assurance. Approval of the procedures shall be obtained prior to manufacture of the modules. Manufacture without this approval shall be at the Contractor's risk. These test procedures shall include the testing of all operational aspects of each proposed system. The procedures shall show that the factory tests will be made on the complete system with all of the racks interconnected and with a complete simulation of the field inputs and outputs.

- E. Factory Test Reports as stipulated by the approved Factory Test Procedures shall be submitted to the Designated Resident Engineer for approval as quickly as possible after the factory tests. These test reports shall bear the signature of the Designated Resident Engineer's representative attesting to the witnessing of the test and its successful conclusion. There shall be a test report for each of the boards (including spares) comprising the STAP furnished under this Contract for initial Type Acceptance Testing.
- F. For the Design Review of the equipment to be supplied under this Section, the Contractor shall submit to the Designated Resident Engineer, for approval, the following:
  - 1. A listing of all inputs and outputs for each system with easily understood designations of their functions.
  - 2. A complete and detailed program printout of all software, including equivalent circuit drawings, for each STAP. The program shall be easily related to its associated equivalent circuits and modularized in a logical and easily understood manner. Each module of the program shall be fully documented with plain-English explanations of its purpose and the method by which it accomplishes that task, the modules to which it is related, and the module(s) of which it is a part.
  - 3. A description of the program functions and details with flow charts, a programming manual and a key sheet which lists and defines all symbols, abbreviations and other aspects of the program. This shall be one of the first items submitted for review.
  - 4. A description of, and documentation for, the compiler.
  - 5. Full documentation for the class of instruction including a course outline, course instruction manual, list of course training aids, list of class facility requirements, and class schedule.
- G. The Contractor shall revise the circuits of the Contract Drawings as necessary to show the circuitry external to the STAP and accomplish the functions described by the Drawings and Specifications with the equipment he plans to provide under this Contract. These revised circuits shall be submitted as part of the Design Review. These circuits shall be complete and continuous from the point of origin to the point of destination. They shall show all interface terminal connections between the various pieces of equipment. No conductor shall be ended or terminated without some note or reference as to its physical location or continuation at some other place. Twisted pair and/or shielded wiring shall be shown and noted wherever it is used.

## **PART 2 - PRODUCTS**

### **2.01 BASIC STAP EQUIPMENT REQUIREMENTS**

- A. The STAP equipment furnished by the Contractor under this Contract shall perform all of the functions listed in Part 1.02 E.
- B. The STAP equipment shall meet the physical and environmental requirements listed in these Specifications.

### **2.02 MECHANICAL REQUIREMENTS**

- A. The STAP shall make use of plug-in circuit boards. Each board shall be labeled with its function, a means of application identification, a serial number, and a model or drawing number.
- B. The program of the STAP shall reside in Erasable Programmable Read Only Memory (E-PROM) located on the processor board, or on a separate "memory" board. The memory devices shall be erasable and reprogrammable. The Contractor shall provide sockets on the boards for the memory devices. The memory devices shall be removable, and each memory

device shall have a complete and unique identification marking.

- C. Electro-mechanical memories such as magnetic-media tape and disk drives shall not be used in the STAP, except as may be necessary for programming and testing purposes.
- D. The printed circuit boards of the STAP shall be housed in rigid frames containing a motherboard for the mounting of the printed circuit board receptacles. This motherboard may be either a printed circuit board or a hard-wired plane. The frame shall contain full-length board guides to assure that the plug-in contacts of each plug-in board correctly mate with their motherboard receptacle.
- E. Each plug-in location of the STAP shall be labeled with the identity of the board type intended for that location.
- F. The Contractor shall provide some form of interlocking device to ensure that plug-in boards of the STAP cannot be mechanically or electrically damaged by plugging them into an incorrect location.
- G. The board frame of the STAP shall be constructed and mounted in a manner which allows the free movement of air over the equipment by convection to prevent local hot-spots which would degrade the life and operation of the assembled and mounted equipment and prevent it from meeting the physical and electrical environmental requirements of this Section and Section 16914. No fans or blowers will be approved for these purposes.
- H. The printed circuit boards or the printed circuit board frame which houses the STAP shall be provided with electromagnetic shielding if necessary for the system to meet the electrical environmental requirements of these Specifications.
- I. The Contractor shall provide a dust-resistant cabinet to house the STAP. This cabinet shall have dust-resistant doors or removable covers on both the front and back. The front shall be supplied with a safety glass or fire-resistant plastic panel which allows observation of the operation indicators which may be located on the front of the boards. The equipment shall be immune to the ambient dust accumulation. TCR dust consists mostly of residues of the train brake wear.
- J. This cabinet shall be of sufficient volume to allow the removal of heat from the boards by internal convection and the removal of heat from the cabinet by radiation and external convection. Fans shall not be employed in the heat removal process.
- K. The board frame shall be located within a zone which does not allow the bottom of the frame to be any closer to the floor than 2 feet or the top of the frame to be any higher than 6 feet from the floor. This requirement is for ease of viewing indicators or working on the STAP modules. Items of support equipment such as power supplies may be mounted in rack locations outside of this zone.
- L. At the time of the qualification test of the STAP, the printed circuit board frame shall be installed in this cabinet and the door or cover shall be in place.
- M. The Contractor shall provide compiler software maintenance for a period of 5 years.

## **2.03 ELECTRICAL REQUIREMENTS**

- A. The STAP and its associated equipment shall be powered by conservatively rated power supplies or inverters provided as part of its support equipment. These supplies or inverters shall meet the electrical, mechanical and environmental requirements of these Specifications.

These supplies or inverters shall operate either from the 120 Vac line or the 28 Vdc local power system specified elsewhere in these Specifications. In either case, these supplies or inverters shall be equipped with sufficient transient protection to provide immunity from power line transients as high as six kilovolts (1.5/40 microsecond standard wave).

- B. The input and output signal connections of the STAP shall be fully isolated from the power supply of the processor. This isolation shall be adequate to provide protection from the transient levels encountered in the installation. The Contractor shall be cognizant of the various sources of transient interference that may be encountered in the TCR such as those listed in Section 16914. It shall be the Contractor's responsibility to assess and provide protection from this interference.
- C. The output signal potential shall be 28 Vdc nominal and the outputs shall have an adequate and conservatively rated power capability suitable for each application.
- D. The impedance of the input channel shall be low enough to draw sufficient current for the circuitry to ignore false high resistance voltage applications at the input terminal. This low input impedance shall also serve to reduce "noise" interference. The input circuit shall be read as permissive only when sufficient current is present.
- E. All inputs shall be provided with de-bounce circuitry so that momentary voltage changes at the time of initial external contact closure will be ignored.
- F. One or more ports shall be provided for the transfer of coded input and output information. These ports shall make maximum use of industry standard communications standards and protocol except as necessary to promote reliability and security. These ports shall be for the purpose of system expansion, connection of test equipment and other such uses.
- G. All input and output boards utilized in the STAP system shall be constructed with a minimum of 1/8 inch creepage distance between all conductors exposed to the external electrical environmental, and shall be capable of withstanding a 1500 volt dc breakdown test. The voltage shall be applied between adjacent isolated circuits as well as from the isolated circuits to ground.
- H. All printed circuit boards utilized in the STAP shall have a properly applied conformal coating to minimize the effects of moisture.
- I. All printed circuit boards utilized for inputs or outputs in the STAP shall be designed so that there is minimal capacitive coupling between the circuitry on either side of the isolation devices. Consideration shall be given by the Contractor to the use of a grounded copper track between circuitry on either side of the isolation devices to further decrease the capacitive coupling which bypasses the isolation device.
- J. Visual indicators, such as LEDs, shall be provided on each input and output board to indicate when each of the associated inputs or outputs is active. A Key chart which identifies the function which each LED represents, shall be mounted inside the cover of the STAP module.
- K. All appropriate, relatively short timing functions shall be field adjustable without software modification, via jumpers on printed circuit boards in the processor or by some other means approved by the Designated Resident Engineer. The adjustable range of the timers shall be at least 0.1 to 30 minutes. The timers shall have a timing error of not more than plus or minus 5 percent of the setting.

## **2.04 ENVIRONMENTAL REQUIREMENTS**

- A. The following requirements shall take precedence over any other applicable environmental requirements:
1. Physical
    - a. The STAP assembly shall function in accordance with the Specifications in the physical environmental conditions described for the TCRs in Section 16914.1.02.
    - b. The various STAP system modules shall be shock mounted to provide the required vibration suppression.
    - c. Cooling of the STAP modules shall be accomplished by radiant plus natural convection means only. (No fans shall be used for this purpose.)
  2. Electrical
    - a. The STAP assembly shall work in the electrical environment of the TCR. The Contractor shall assess this environment, considering the factors stated in Section 16914.1.03 of these Specifications, and the characteristics of the equipment he is providing under this Contract. All inputs, outputs, power connections and communications lines, if any, shall be immune to the effects of lightning (except in the case of a direct stroke to the building which houses the STAP) and to surges or transients to which they may be subjected.
    - b. The Contractor shall pay special attention to the design and implementation of adequate protection for both ends of all input, output and metallic communications lines which are connected at their far end to equipment referenced to an independent ground.
    - c. The equipment to be provided under the terms of this Section shall conform to the following requirements:
      - 1) Conducted and radiated radio frequency energy at all frequencies shall be attenuated to a level which will not interfere with the operation of an adjacent radio transceiver with a self-contained antenna operating at any of the usual communications frequencies.
      - 2) The operation of a radio transceiver, transmitting radio frequency energy at any of the usual communications frequencies with ten (10) watts of power into an attached antenna, shall not cause malfunction of the microprocessor or the I/O devices. This and the previous requirement shall be met when the end of the transmitting antenna is within three inches of any external part of the STAP equipment.
      - 3) The STAP, if operating from an AC supply, shall be capable of operating without loss of continuity during power outages of up to three times the transfer time of the transfer switch provided by the Contractor.
      - 4) The STAP shall be immune to electrostatic discharges to all devices and surfaces exposed to human touch during operation or adjustment. This requirement does not apply to repair procedures to the printed circuit boards.

## **2.05 PROGRAMMING HARDWARE AND SOFTWARE**

- A. The Contractor shall exercise special care in the design of the program for the STAP to select an order of processing which does not cause any unwanted results.
- B. The Contractor shall provide a means of programming the STAP system, initially and as any subsequent changes, improvements, and replacements may require. This means of programming shall take the form of test and program fixtures and, if necessary to operate a fixture, a test program. See Section 16927, ATC Microprocessor Support Systems. The application software shall be written in Boolean expression, i.e., \*, +, etc.

- C. The Contractor shall provide a user-friendly software program to generate equivalent relay logic circuits for the STAP logic systems. This program may be combined with a program to create equivalent circuits for the NVIP systems. See Section 16926, Microprocessor System for Non-Vital Interlocking Functions.

## **2.06 PROGRAM STOP SUBSYSTEM EQUIPMENT AND LOGIC**

- A. The wayside Program Stop subsystem shall consist of the following equipment and logic:
  - 1. Equipment and logic located in the TCR which shall interface properly with the DTS and with the other passenger station subsystems, and which shall translate Skip-Stop commands and train/platform alignment data into a three-wire, 28 volt polarity code for transmission to track-mounted marker coils. This code shall be as shown on the Contact Drawings.
  - 2. Track-mounted marker assemblies to house the marker coils, tuning units, and related hardware required to transfer program stop data to the carborne recognition equipment. These marker assemblies shall meet the requirements specified in Section 16967, Marker Coil Layouts.
  - 3. All necessary interconnecting cable and wire for the equipment specified above.

## **2.07 TWC SUBSYSTEM EQUIPMENT AND LOGIC**

- A. The wayside TWC subsystem shall consist of the following basic equipment and logic:
  - 1. Equipment and logic located in the TCR which shall interface properly with the DTS and with ATP track modules and the TCR circuitry as specified, for each station platform and for each TWC flyby transmitter, flyby receiver and dispatch receiver location indicated on the Contract Drawings.
  - 2. Circuitry necessary to provide LED system status maintenance indications as specified. The LED indicators shall be mounted and identified on the system module such that they will be visible at all times without the need to remove covers or open the module.
  - 3. All interconnecting cable, wires and miscellaneous hardware and software required to provide the operating system specified herein.
- B. TWC Transmitters
  - 1. The equipment and logic for each TWC transmitter shall consist of:
    - a. Logic circuitry necessary to convert parallel ATS codes received from the RTU to serial binary codes for use by the Carborne TWC System.
    - b. Circuitry necessary to generate the required timing pulses.
    - c. An FSK oscillator which operates in a sine wave mode and is capable of generating three output frequencies (center 9800 Hz; mark 9950 Hz; space 9650 Hz) when digitally keyed by the logic circuitry.
    - d. A line driver (linear amplifier) which shall interface the oscillator and a power amplifier which is shared with the ATP System. The output of the power amplifier is connected to the track-mounted impedance bonds.
    - e. Circuitry necessary to provide LED maintenance indicators. The system status signals to be indicated shall include, but not be limited to, the following:
      - 1) For Station TWC Transmitters:
        - a) DTS Operational
        - b) DTS Strobe Pulse Present
        - c) Memory Load Pulse
        - d) Receiver Inhibit
        - e) Parity Check
        - f) Key On Transmitter

- 2) For Flyby Transmitters:
  - a) DTS Operational
  - b) DTS Strobe Pulse Present
  - c) Receive Carrier Detected
  - d) ATS Speed Bit 1
  - e) ATS Speed Bit 2
  - f) Key On Transmitter
- f. An externally mounted programmable plug coupler which shall translate ATS speed bits from the RTU into the ATS speed required for each location.
- 2. The TWC transmitter shall have the following characteristics:
  - a. Frequency: 9800 Hz carrier frequency
  - b. Modulation: frequency shift keying ( $\pm 150$  Hz)(mark 9950 Hz; Space 9650 Hz)
  - c. Signal to Noise Ratio: 20 d
  - d. Output Impedance: 600 ohms
  - e. Bit Rate: 100 bps
  - f. Range: 450 feet
  - g. Output Power: 20 watts (Transmitter output shall be connected to the power amplifier shared with the ATP System. Output of the power amplifier is 60 watts; the TWC output is limited to 20 watts.)

C. TWC Receivers

- 1. Each TWC receiver shall consist of:
  - a. A receiver input network which limits the level of the receiver signals.
  - b. Logic necessary to decode serial data received from the Carborne TWC System for transmission to the RTU as parallel data.
  - c. A band pass filter to eliminate noise and harmonics. The Contractor shall provide a passive network band pass filter. No other type will be acceptable to the Authority.
  - d. A limiter amplifier.
  - e. A carrier detector and squelch circuit which provides the squelch feature to inhibit the receiver during transmitter operation.
  - f. A receiver which detects the mark and space signals.
  - g. Circuitry necessary to equalize and square signals before transmitting them to the RTU.
  - h. Circuitry necessary to provide LED maintenance indicators. The system status signals to be indicated shall include, but not be limited to, the following:
    - 1) For Station TWC Receivers:
      - a) Receive Carrier Detected
      - b) Data Strobe
      - c) Word 1
      - d) Word 2
      - e) Word 4
      - f) Word 5
    - 2) For Flyby TWC Receivers:
      - a) Receiver Carrier Detected
      - b) Data Strobe
      - c) Receive Mark Bit
      - d) Word 1 Parity Check
      - e) 1.6 K Hz Clock
      - f) Shift Register Clock
- 2. The TWC receiver shall have the following characteristic:
  - a. Receiver Band: Passive network; 9800 Hz
  - b. Pass Filter: center frequency; bandwidth  $\pm 250$  Hz at

- c. Receiver Limiter Amplifier: 3dB down.  
Full limiting with input signal of .016V rms.  
Dynamic limiting range of 54 dB minimum.
- d. Carrier Detector Amplifier: Gain 42 dB. Adjustable 0-42 dB.
- e. Squelch: Carrier operated; adjustable threshold.
- f. Receiver Detector: 2 parallel tuned circuits: f1 is 9650 Hz, f2 is 9950 Hz, each with bandwidth of  $\pm 70$  Hz.
- g. Receiver Sensitivity: Adjustable without using a train.
- h. Size: No larger than 15x18x6 inches.
- i. Weight: Maximum: 15 pounds.

D. TWC Monitor

1. The Contractor shall provide for each TWC installation, wired card connectors in the STAP cabinet for the temporary installation of a TWC monitor.
2. The TWC monitor shall consist of one or more plug-in printed circuit boards in the STAP cabinet for the temporary installation of a TWC monitor.
3. The TWC monitor shall provide an indication for each of the functions listed in Part 1.02-E.2.b. Train length, train destination and train number shall be displayed on multi-segment numerical indicators.
4. The Contractor shall provide one TWC monitor for each route segment in the Contract.
5. The TWC monitor shall not interfere with the operation of the system, nor require movement or replacement of any part of the installed system.
6. The Contractor shall provide a complete instruction manual covering the installation and use of the TWC monitor.

E. TWC Data Logging Device

1. The Contractor shall provide, for each TWC installation location, a notebook-size data logging device.
2. The data logging device shall interface with the STAP by means of a portable, plug-in/out, serial-connected communications cable.
3. The data logging device shall enable a Signal Maintainer to retrieve recorded data from the STAP, or to observe real-time operation of the STAP on an integral CRT.
4. The data logging device shall not interfere in any way with the normal operation of the STAP.
5. This device can be used to satisfy certain requirements of Part 2.09-B of this Section.

## 2.08 PASSENGER STATION SUBSYSTEMS EQUIPMENT AND LOGIC

A. Platform Edgelight Control Subsystem

1. The Platform Edgelight Control subsystem shall consist of equipment and logic necessary to interface properly with the Program Stop subsystem and to control the platform edgelights in the manner specified in Part 1.02-E.3., and as shown on the Contract Drawings.

B. Door and Dwell Control Subsystem

1. The Door and Dwell Control subsystem shall consist of the following equipment and logic:
  - a. Equipment and logic necessary to interface properly with the DTS, ATP track circuit modules, the TWC and Program Stop subsystems, and dwell timer equipment, or, as an alternative, to generate electronically the adjustable timing intervals necessary for the control of dwell time for each station platform.
  - b. An equipment panel, suitable for mounting on a standard 19-inch EIA

- c. equipment rack, on which the local dwell timers shall be mounted.  
All interconnecting cables, wires, and miscellaneous hardware necessary to provide the operating system specified herein.

## 2.09 DIAGNOSTICS

### A. Internal

- 1. The Contractor shall provide the STAP system with one or more Diagnostic Routines as outlined herein. The degree or refinement of such routines is at the discretion of the Contractor who is reminded that the diagnostics he furnished will be instrumental in meeting the time-to-restore requirements shown in the Technical Appendix of these Specifications. The minimum requirements follow, but the Contractor shall be alert for ways to extend these requirements in any way practicable to make the system more reliable and easier to maintain. The minimum diagnostic requirements are:
  - a. The Contractor shall provide one or more Diagnostic Routines which shall continuously monitor the operation of the STAP and shall "remember" and indicate both on-going and intermittent failures until manually reset in the field. The diagnostic Routine(s) may be implemented in any way the Contractor selects, providing that the results meet the requirements of these Specifications and providing that the methodology meets with the approval of the Designated Resident Engineer.
  - b. One output of the STAP shall operate a slow-release relay, named the Station Passenger Check relay (STAPCHK), by means of recurring pulses which indicate that the processor is correctly meeting the requirements of all of the internal diagnostic tests. These tests shall be designed to require the proper operation of as many of the STAP facilities as possible. (The Contractor may employ some other means of obtaining the operation of this relay, but it must have the prior approval of the Designated Resident Engineer.) In the de-energized position, the opening of the front contacts of the relay shall open a circuit to the RTU. The opening of this circuit shall cause an indication to be received at Central Control called PROCESSOR FOR STATION PROBLEM.
  - c. The Contractor shall provide diagnostic indicator lights (LEDs) on the visible edge of the printed circuit boards. One of these lights shall be provided to indicate a failure for each individual diagnostic routine, and one additional light shall be provided which shall be illuminated whenever energy is not being provided to the Station Processor Check Relay.

### B. External

- 1. In addition to the internal diagnostic capability of the STAP, the Contractor shall provide an external plug-in diagnostic device and associated software. This external device shall have some form of data memory capability and a CRT display. The software for this device shall be user friendly and menu driven. See Part 2.07-E of this Section.

- C. The Diagnostic Routines (both Internal and External) shall be thoroughly documented in the maintenance manual provided by the Contractor and described elsewhere in this Section.

## 2.10 SPARE EQUIPMENT

- A. See Section 16932, Spare ATC Equipment and Selectable Items.

## 2.11 TEST FIXTURES

- A. Board Test Fixtures
1. The Contractor shall provide one complete set of printed circuit board test fixtures for each of the following:
    - a. The route segment equipped under this Contract;
    - b. The Central Maintenance Facility, and;
    - c. The Training Courses (combined).
  2. Each of these board test fixture sets shall include all individual test fixtures necessary to (collectively) test every printed circuit board in all parts of the working STAP system. Included with each of these complete test fixture sets shall be any test device which is necessary or desirable to set-up, inspect, monitor, maintain or facilitate the restoration of the STAP system.
  3. The Contractor shall not include as part of the equipment furnished for this requirement any instrument or test device duplicated in response to the requirements of another Section of these Specifications. Equipment for maintenance or actual repair of printed circuit boards shall not be considered part of this requirement.
- B. System Test Fixture
1. In addition to the PC board test fixtures required in the preceding paragraphs, the Contractor shall furnish two STAP System (Shop) Test Fixtures, one for training and one for maintenance purposes. Each of these fixtures shall consist of a board frame (or frames) complete with power supplies, printed circuit boards, diagnostic routines, and any other equipment or programs needed to simulate a complete and operable wayside system. Each of these STAP System test fixtures shall be equipped with a 120 Vac line cord and simulated input and output facilities consisting of a minimum of 10 input switches and 10 output indicators located on a suitable Indication Panel. The System (Shop) Test Fixtures shall be designed to allow electronic technicians access to working boards in a working system through the use of extender boards. The STAP System (Shop) Test Fixtures shall also be designed for use as a training aid in the training course described in Part 3.05 of this Section.
  2. Each STAP System Test Fixture shall be installed in a dust-resistant cabinet of the same type as specified in Part 2.02 I of this Section. Suitable supports shall be provided to floor-mount the cabinet on casters. Two complete sets of extender boards shall be provided for use with these STAP System (Shop) Test fixtures.
  3. The two STAP System (Shop) Test Fixtures shall be considered to be Specific ATC Test Devices, as specified in Section 16931.1.01 H., Item 10.

## **2.12 SUPPLY MATERIALS**

- A. The Contractor shall provide, if necessary for the operation of equipment supplied under this Article, paper, ribbon and any other consumable supplies sufficient for one year of operation. Unless the supplies are readily available, the name and address of the source of further supplies shall be furnished to the Designated Resident Engineer as a separate document.

## **2.13 INSTRUCTION MANUALS**

- A. The Contractor shall provide Maintenance and Programming Manuals for the STAP. Together, these manuals shall include a complete description, to the board level, of the setup, programming, operation, maintenance and trouble-shooting of the STAP system and all items of hardware and software included therein. These manuals shall be prepared according to guidelines set forth in this Section and in Section 16992, ATC Instruction Manuals. Manuals which do not meet these requirements will not be approved.
- B. The first type of manual which the Contractor shall provide shall be the Engineer's STAP Programming Manual. It shall consist of detailed instruction in the use of all the documentation for the STAP System software. This manual shall also provide all information

on the use of the equipment and software provided with the Microprocessor Support Systems to program and re-program the STAP System. (See Section 16927.) This documentation is meant for engineers with experience in the design of signal systems.

- C. Documentation describing the programming of the STAP System shall be provided 45 days prior to the Type Acceptance Testing. Six copies of this manual shall be provided.
- D. The second type of manual which the Contractor shall provide shall be a Field Maintainer's STAP Manual, intended for the signal maintainer. It shall be written for instruction of Authority personnel with an educational equivalent of 12th grade plus two years in a general electrical technical school. The Contractor shall not consider the technical school training as being two years in a computer programming school. The Field Maintainer's STAP Manual shall be clearly organized into two maintenance levels. They are:
  - 1. Level 1 - This level shall cover the detection of problems occurring in the field, TCR wiring, equipment modules and the input and output boards of the processor. This level is intended for the use of general maintenance personnel, and the manual shall so state.
  - 2. Level 2 - This level shall cover the detection and replacement of a malfunctioning board other than the input and output boards. It shall describe how this can be accomplishing using the facilities of the Board Test Fixtures which the Contractor has furnished as well as simple devices such as voltmeters and ohmmeters. This level is intended for specially trained maintenance personnel and their supervisors and the manual shall so state.
- E. The Field Maintainer's STAP Manuals shall be prepared during the initial phases of the Contract so that they may be approved and delivered to the Authority before field testing commences.

### **PART 3 - EXECUTION**

#### **3.01 DELIVERY, STORAGE AND HANDLING**

- A. The Contractor shall take whatever measures may be necessary to protect the STAP module from damage or marring during shipment, installation and testing and until the Authority accepts the system. If the equipment suffers any damage, from whatever cause, during this period, the Contractor shall replace or repair it to a like-new condition, to the satisfaction of the Designated Resident Engineer at no additional cost to the Authority.

#### **3.02 INSTALLATION**

- A. The Contractor shall install the STAPs in TCRs provided by the Authority for this purpose. The equipment shall be installed on equipment racks as required in these Specifications and as shown on the Contract Drawings.
- B. The Contractor shall install each STAP, complete with its program and all appliances necessary to provide a complete, local wayside ATO and ATS system which operates as required by these Specifications and is readily maintained.
- C. The STAP subsystems shall be interconnected with each other and with their applicable external equipment as specified herein and as shown on the Contract Drawings.
  - 1. STAP passenger station TWC transmitter and receiver circuitry and logic shall be connected to impedance bonds equipped with TWC coils, installed at both ends of each passenger station platform on each passenger station track.
  - 2. STAP TWC Dispatch Receiver circuitry and logic shall be connected to impedance bonds equipped with TWC coils, installed at certain train dispatching points other

than passenger station platforms as indicated on the Contract Drawings. (May not be used in some Contracts.)

3. STAP Program Stop subsystem circuitry and logic shall be connected to the appropriate track-mounted Middle (No. 2) and Inner (No. 3) program stop marker coil layouts, and to the TCR entrance rack. The Contractor shall provide all necessary jumpers on the TCR entrance rack to call for the desired train/platform alignment at the station unless otherwise instructed by the Designated Resident Engineer.
4. Track mounted equipment for the Program Stop subsystem shall be installed as specified in Section 16967, Marker Coil Layouts, and as shown on the Contract Drawings.
5. TWC flyby transmitter and receiver circuitry and logic shall be connected to impedance bonds equipped with TWC coils, installed at the "Flyby Transmitter" and "Flyby Receiver" locations indicated on the Contract Drawings.
6. An "Inclement Weather" Flyby Transmitter (Type 5 for Track 1, or Type 4 for Track 2) shall be installed at the first impedance bond more than 1000 feet upstream from the station platform centerline, on each normal direction (right-hand-running) station approach track which is exposed to the weather. The Type 4 and/or Type 5 Flyby Transmitter(s) for applicable locations shall be activated by the receipt of an ENABLE RETARDED PERFORMANCE LEVEL "Command" from Central. See the Contract Drawings and the RTU Scan Sheets.

### **3.03 TESTING**

- A. The Contractor shall perform a Type Acceptance Test on the first complete STAP furnished if its design differs in any respect from a STAP previously accepted for regular use on the WMATA METRORAIL SYSTEM. This test may be witnessed by the Engineer. The Contractor shall notify the Engineer in writing at least two weeks prior to the time this test is to take place.
- B. The Contractor shall factory test each completed STAP according to a test procedure which has been prepared in accordance with Section 16980 of these Specifications and previously approved by the designated Resident Engineer. Field conditions shall be simulated for this test. This test may be witnessed by the designated Resident Engineer. This test shall be successfully completed and the results approved by the designated Resident Engineer before the equipment is shipped from the factory.
- C. The Contractor shall field-test the installed STAP according to a series of field tests described in these Specifications, prepared by the Contractor and approved by the designated Resident Engineer.
- D. The Contractor shall notify the designated Resident Engineer at least one week before the commencement of each of the specified factory and field tests unless otherwise directed by the designated Resident Engineer.
- E. At the conclusion of the factory testing of the STAP, the Contractor shall deliver to the Authority three copies of the complete program documentation. The program documentation shall bear revision numbers to reflect any necessary changes in the program.
- F. The final revised program shall be entered into the memories of the spare equipment and the spare equipment shall be installed in the working system. When approval of the test has been received, the Contractor shall install the regular equipment in the system and repeat the tests. This equipment shall then be left in the system.
- G. If, once the final field testing has been approved, any change in the program is deemed necessary by the Contractor, the designated Resident Engineer shall be informed, and with his approval, the change shall be made. When the change has been completed and the log

filled out, the Contractor shall repeat the cycle of testing described in the previous paragraph.

### **3.04 DOCUMENTATION**

- A. The Contractor shall produce the required tracings, program listings, drawings and aperture cards at the times required by these Specifications and keep them up-to-date during installation.
- B. The Contractor shall produce the required maintenance manuals and training course submittals at the times required by these Specifications.
- C. The Contractor shall provide a Station Processor Software Configuration Logbook which shall be utilized commencing with the approval of the design submittal and continuing until Final Acceptance of the installation. This book shall be used (only for the STAP) to register dated entries describing every change made to the STAP program or equipment and the reason the change was made. It shall be written in a detailed, step-by-step narrative, and shall include cross-references to all program changes. Failure to provide and utilize this logbook will delay and may prevent, the approval of all the test reports associated with the field testing of the processor. At final acceptance, this logbook shall become the property of, and be delivered to, the Authority.

### **3.05 TRAINING**

- A. The Contractor shall provide two training courses, described in B. and C. below. One shall be called the Field Maintainer's STAP Training Course and the other shall be called the Engineer's STAP Training Course. Training aides shall be liberally employed in these courses where helpful to illustrate the devices and principles being described. Firmware such as flip charts, transparencies and slides shall become the property of the Authority at the conclusion of the final presentation of each course. The Contractor's instructor shall cooperate with the Authority in the videotaping of the course presentations.
- B. Field Maintainer's STAP Training Course
  - 1. The Contractor shall provide on the Authority's premises, for its signal maintenance personnel, four presentations of a course of classroom and hands-on instruction in the operation and maintenance of the STAP System. Each course shall be not less than 3 days nor more than 5 days in length. Each presentation of the course shall accommodate 12 persons designated by the Authority.
    - a. The first two presentations of this course shall occur consecutively during the final installation stages of the STAP. The third and fourth presentations shall be at later dates within one year from the date of the first two; the exact dates to be determined at the mutual consent of the Authority and the Contractor. These instruction courses shall be at no additional cost to the Authority.
    - b. This instruction shall be based on the second Instruction Manual described in Part 2.13-D.
    - c. This instruction shall cover all aspects of operation and maintenance of the wayside and TCR equipment pertaining to the STAP. It shall include but not be limited to the following:
      - 1) All Station Facilities operated by the STAP
      - 2) All Modules of the STAP and its programsProcessors
      - 3) Trouble shooting
      - 4) Diagnostic routines
      - 5) Maintenance procedures
      - 6) Preventive maintenance
    - d. This course shall be designed for an educational level of 12th grade plus 2 years in a technical school.

- e. This course shall include "hands-on" instruction for each participant in identifying and replacing defective boards through the use of the Board Test Fixtures provided by the Contractor. The Contractor shall supply, at no additional cost to the Authority, a set of printed circuit boards with various defects for use in this test. There shall be enough boards and variations in defective components so that successive course participants are not bored by locating the same defective board.
- C. Engineer's Station Processor Training Course
- 1. The Contractor shall provide on the Authority's premises, for certain engineering personnel, one presentation of a course of classroom and hands-on instruction in the programming, maintenance, and reprogramming of the STAP system to the board level. The course shall be not less than 5 days nor more than 10 days in length. The presentation of the course shall accommodate up to 5 persons designated by the Authority; 3 from Operations, and 2 from Engineering.
    - a. The presentation of this course shall occur during the final installation stages of the STAP and shall be made at no additional cost to the Authority.
    - b. This instruction shall be based on the first Instruction Manual described in Part 2.13-B.
    - c. This instruction shall cover all aspects of setup, programming, operation and maintenance of the STAP equipment. It shall include, but not be limited to the following:
      - 1) Programming Techniques
      - 2) Compiling
      - 3) Setting and Erasing Memory Devices
      - 4) Locating Defective Board Components
      - 5) System Operation
      - 6) Reliability Considerations
      - 7) Trouble Shooting
      - 8) Diagnostic Routines
      - 9) Maintenance Procedures
    - d. This course shall be designed for an educational level of 12th grade plus a Bachelor's Degree in Engineering or its equivalent.
    - e. This course shall include "hands-on" instruction for each participant in programming, reprogramming and identifying and replacing defective board components through the use of the Contractor's test fixtures (made available by the Contractor at no additional cost to the Authority), and the STAP unit provided to the Authority by the Contractor for training purposes. The Contractor shall supply, at no additional cost to the Authority, a set of boards with various defective components for use in this test.
- D. These training courses shall be organized in accordance with the requirements of this Section and Section 16993, ATC Training Courses.

### **3.06 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. No separate payment will be made for Non-Vital Station Processors (and their PC Board Test Fixtures) as such. The cost of the STAPs shall be included in the Design Engineering, Material and Fabrication and Installation costs for this Contract. The STAPs will be measured for partial payments based upon the number of complete required systems installed and accepted, relative to the total number required.
- B. For purposes of measurement for partial payments, Non-Vital Station Processor Systems shall include all mounting hardware, interconnecting wiring and STAP PC Board Test Fixtures.

- C. The following conditions will be considered when measuring the STAPs for partial payments:
1. Delivery by the Contractor of the STAPs, provided approval has been given of their Factory Test Reports.
  2. Installation of the STAPs and all interconnecting wiring by the Contractor, provided approval of the installation has been given by the designated Resident Engineer.
  3. Level "C" partial system acceptance of the location involved.
  4. Completion by the Contractor of Level "F" testing of the location involved, approval of the Level "F" testing and test reports by the designated Resident Engineer, and delivery of the TWC Monitor(s) to the Authority.
  5. Delivery by the Contractor of the approved as-built drawings, aperture cards and program listings.
  6. Approval by the designated Resident Engineer, and receipt by the Authority of the applicable Maintenance Manuals.
  7. Approval by the designated Resident Engineer of the documentation of the applicable classes of instruction and the satisfactory completion of each presentation.
  8. Delivery of the board test fixtures and system test fixtures, and final acceptance of these devices by the Authority.
- D. System (Shop) Test Fixtures for the Non-Vital Station Processor Systems will be measured for payment as specified in Section 16931.3.02 C.

**END OF SECTION**

## SECTION 16925

### ATC - DATA TRANSMISSION SYSTEM (DTS)

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION

- A. This Section specifies the furnishing and installation of additions and modifications to the current WMATA Data Transmission System (DTS). (The DTS transfers control information, status indications, and other information relating to train control, electrification, and support facility functions, between the Central Control Computer and all Train Control Rooms, passenger stations and other specified remote locations via the communications Carrier Transmission System (CTS) which is provided by other disciplines.)
- B. It is the intent of this Section that the Contractor shall provide all required, complete, and fully compatible operational DTS additions and modification work for the WMATA (**Project Name**). This work shall include, but not be limited to, the following:
1. Provision of new Remote Terminal Units (RTUs) and final, As-Built RTU Scan Sheets for the new Train Control Room(s).
  2. Provision of all interface wiring and equipment to connect the new RTUs to the ATC and ancillary devices and functions to be controlled and monitored, and to the Carrier Transmission System (CTS), provided by other disciplines.
  3. Provision of Computerized Analyzer Units (CAUs) for the new and currently used RTU(s).
  4. Provision of additions and modifications to the interface wiring of the current RTU(s) at the tie-in location(s), and updated Scan Sheets for same. (Where applicable). As an alternative, the Contractor shall provide a complete, new RTU and associated wiring, interfacing, and scan sheets for the tie-in location(s). This alternative shall be at the discretion of the designated Resident Engineer.
  5. Furnishing and installation of final AS-BUILT Wiring Diagrams for all new or revised DTS junction boxes (cabinets) furnished and installed by other disciplines, or by the Contractor.
- C. This Section specifies the requirements for the Remote Terminal Unit(s) (RTUs) to be provided by the Contractor. A cardinal requirement is that the new RTUs be completely and interchangeably compatible with the data message format generated by the existing equipment (channel processor) at the Operations Central Control. The equipment supplied for the RTU functions shall be capable of operating with the same inputs and outputs as the equipment currently in use on the WMATA Metrorail Data Transmission System. The original Model 9600 RTUs (as manufactured by TRW Controls of Houston, Texas) are no longer commercially available. The Contractor shall therefore provide RTUs of the "Outpost" Model 409 type (as manufactured by ABB Network Management of Sugar Land, Texas), or RTUs approved as equal by the designated Resident Engineer. See Part 2.02 of this Section.
- D. The new RTU(s) shall be microprocessor based, but shall be completely and interchangeably compatible in all respects with the existing Data Transmission System and its message format, bit structure, and functionality. They shall also meet the requirements of this Section, and be acceptable to the designated Resident Engineer. The Contractor shall determine the type(s) of PC cards and appropriate energization wiring to be used for certain applications for these new units, as noted on the RTU Scan Sheets. The energization and card type(s) actually used shall be fully documented in the RTU circuits and Scan Sheets submitted by the Contractor. The types of Control PC cards and their energization requirements shall be as follows:

<u>Control Card Type</u>	<u>Energization Required</u>
Electronic	Strobe
Relay Pair	Strobe
Relay Single	Strobe and Common B28G

- E. This Section specifies the requirements for Computerized Analyzer Units (CAUs) to be furnished by the Contractor.
- F. This Section specifies the requirements for DTS junction box wiring diagrams to be furnished and installed by the Contractor.

## 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  1. Section 16904 Current Automatic Train Control System
  2. Section 16914 Environmental Requirements
  3. Section 16918 Special ATC Requirements for Specific Locations
  4. Section 16921 ATC Power Distribution Systems
  5. Section 16923 TC Maintenance Telephone System
  6. Section 16928 Interlocking Vital Processor Systems
  7. Section 16930 ATC Facilities And Spare Equipment
  8. Section 16944 Non-Vital Relays and Timers
  9. Section 16948 Plug Connectors
  10. Section 16949 Signal Wire and Cable
  11. Section 16971 Racks and Cable Trays
  12. Section 16980 ATC Tests, Inspections and Quality Assurance
  13. Section 16992 ATC Instruction Manuals
  14. Section 16993 ATC Training Courses
  15. Section 16997 RTU Scan Sheets

## 1.03 QUALITY ASSURANCE

- A. The Contractor shall, within 90 days of issuance of N.T.P., successfully complete Type Acceptance Testing which proves, to the satisfaction of the designated Resident Engineer, that the proposed Data Transmission System equipment meets all of the operational, functional, environmental (physical and electrical) and configurational requirements of these Specifications. This testing shall be done in the Contractor's facilities under the surveillance of the designated Resident Engineer's representative. This testing shall include, but not be limited to, a full-range temperature and humidity test of an operational prototype of the completely configured system, housed in its dust-proof cabinet. Temperature sensors shall be mounted inside to determine when the temperature of the internal equipment has reached and maintained its stabilized value for at least twenty minutes. The equipment shall be in continuous operation during this test and means shall be provided for determining that the operation is within the specified tolerances. During this test the temperature shall be stabilized at increments of not more than thirty degrees. Readings of several critical temperature-dependent values shall be taken at each stabilized increment. The Contractor shall provide to the designated Resident Engineer a two-week minimum advance notice of the date of testing. If the Contractor-proposed RTU equipment fails to meet the specified requirements during Type Acceptance Testing, the Contractor shall provide "Outpost" 409 Units of the required configuration as specified.
- B. In addition to proving that the proposed Data Transmission System equipment meets all of the operational, functional, environmental (physical and electrical) and configuration requirements of these Specifications, a System Performance Test shall be successfully completed, to the satisfaction of the designated Resident Engineer, within 120 days of

issuance of N.T.P., to prove that the equipment functions properly when connected to the WMATA Central Control equipment and to either the existing TRW Model 9600 Portable Analyzer Unit (PAU), the CAU provided for Outpost Model 409 RTUs, or the computerized analyzer unit (CAU) provided under the requirements of this Section. At the Contractor's option, through arrangement with the designated Resident Engineer, and at no additional cost to the Authority, the System Performance Test shall either be conducted on the WMATA premises or it shall be conducted by means of Contractor-furnished telephone lines. If the Contractor-proposed RTU equipment fails to meet the specified requirements during the Systems Performance Testing, the Contractor shall provide "Outpost" 409 Units of the required configuration as specified.

- C. Each RTU provided under this Contract shall be factory tested in accordance with a factory test procedure provided by the Contractor and approved by the designated Resident Engineer. The Factory Test shall be a subset of the Type Acceptance Test, providing proof, through the testing of key operational factors, that each RTU is operating as well as the prototype. Each module may be tested separately, but the test shall prove that the module has operated a minimum of 100 hours without failure at the usual ambient temperature of the factory. One hundred percent of the RTU modules shall be so tested.
- D. Following installation, the Data Transmission System for each Train Control Room area of control shall be field-tested according to the basic test and inspection requirements specified in Section 16981, Basic ATC Test & Inspection Requirements, and the specific requirements specified in Section 16985 for DTS Interface Testing.

#### **1.04 SUBMITTALS**

- A. The Contractor shall submit the following to the designated Resident Engineer for approval within 60 calendar days of receipt of Notice-to-Proceed, and prior to purchase or fabrication of Remote Terminal Units:
  - 1. Complete internal circuits and wiring diagrams for the proposed RTUs.
  - 2. Drawings showing the physical dimensions and characteristics of the proposed RTUs.
  - 3. Complete performance data for the proposed RTUs.
  - 4. Complete logic diagrams and software for the proposed RTUs.
  - 5. Complete parts listing for all major components of the proposed RTUs.
  - 6. Complete installation, wiring and maintenance requirements and instructions for the proposed RTUs.
  - 7. A complete testing procedure for the Type Acceptance Test which proves that the proposed equipment meets all of the operational, functional, environmental (physical and electrical) and configurational requirements of these Specifications.
  - 8. A complete testing procedure for the System Performance Test which will prove that the proposed equipment is in every way compatible with the WMATA DTS system and with the PAU. Specifically, the tests shall include, but not be limited to, procedures concerning the message carrier frequency, carrier amplitude, format, bit structure and functioning, and timing.
- B. The Contractor shall give the designated Resident Engineer two weeks advance notice of when he expects to be ready to perform the Type Acceptance Testing on a prototype unit so that the designated Resident Engineer may witness the testing.
- C. Upon approval of the RTU design and prototype unit(s) by the designated Resident Engineer, the Contractor shall, within 30 calendar days, submit a System Performance Test procedure and a factory test procedure for the new Remote Terminal Units.
- D. The Contractor shall submit, and obtain approval of, factory test reports for each RTU prior to shipment of the unit.

- E. Upon approval of the RTU design, but prior to proceeding with the DTS interface wiring, the Contractor shall submit, and obtain approval from the designated Resident Engineer for, the following items, as applicable:
  - 1. Complete, updated RTU Scan Sheets showing terminal and board assignments for all RTUs to be provided under this Contract.
  - 2. Complete, updated RTU Scan Sheets showing terminal and board assignments for all existing RTUs to be modified under this Contract.
- F. Upon approval of the Contractor's RTU Scan Sheets by the designated Resident Engineer, the Contractor shall commence interface wiring and submit complete interfacing circuits and wiring diagrams for the proposed new RTU(s) (and for the revised portions of the current RTU(s) to be modified, where applicable).
- G. The Contractor shall submit, and obtain approval by the designated Resident Engineer for, an Installation Inspection Procedure for Remote Terminal Units at least 120 calendar days prior to the scheduled installation of the first new RTU. This procedure shall be in conformance with the requirements specified in Section 16981.
- H. The Contractor shall submit a complete RTU Installation Inspection Report within the 30 calendar day period following the installation of each new RTU.
- I. The Contractor shall submit the schedules and documents required for the associated training courses (as listed in Section 16993, Training Courses) for the new RTU and CAU equipment within 45 calendar days after approval of such equipment by the Authority.

## **PART 2 - PRODUCTS**

### **2.01 BASIC COMPONENTS**

- A. The additions to the wayside Data Transmission System shall consist primarily of the following basic components:
  - 1. One or more Remote Terminal Units.
  - 2. Interfacing equipment and wiring between the RTU(s) and the Train Control equipment, support system DTS interface junction boxes, and communications system equipment.
  - 3. Wiring diagrams for the DTS interface junction boxes.
  - 4. Computerized Analyzer Units (CAUs).

### **2.02 REMOTE TERMINAL UNITS**

- A. Each Remote Terminal Unit (RTU) shall consist of the following basic sections and components:
  - 1. Communications Line Interface.
  - 2. Receiving, Processing and Transmitting Logic.
  - 3. Control Output Interface.
  - 4. Status Input Interface, (to include converting analog 4-to-20 milliamp signals to digital signals, where applicable).
  - 5. Power Supply and Interface.Rack or Cabinet for Equipment Modules.
  - 6. Monitoring Interface for the internal 5 volt energy supply bus.
- B. Communications Line Interface Requirements
  - 1. The communications line interface shall contain a modem which provides all facilities necessary for reliable two-way communications between Central Control and the RTU. The interface shall also include surge protection and other features designed to protect the RTU from the hostile electrical environment of the communications line. The interface shall be accomplished by means of optical isolators. The modem shall be equipped with indicator lights for all critical functions. For a modem of the

204, 205 or 207 type to be considered by the designated Resident Engineer for "approved equal" status to the 201B type currently in use, the Contractor shall provide both ends of the modem at no additional cost to the Authority.

2. This interface shall perform properly under the following conditions and conform to the following requirements:

- |    |                                  |  |
|----|----------------------------------|--|
| a. | Line signal to noise ratio:      | 18 dB  |
| b. | Data interchange mode:           | Serial, Binary, Full Duplex  |
| c. | Interface Protocol:              | EIA Standard RS232C  |
| d. | Communications Channel:          | Voice grade  |
| e. | Modem Compatibility:             | AT&T (Bell) 201B Data Set  |
| f. | Modem Configuration:             | Synchronous  |
| g. | Modem Sensitivity Adjustment:    | Automatic  |
| h. | Modem Receive Level:             | 0 dBm to -40 dBm   |
| i. | Modem Transmit Level:            | -10 dBm to 0 dBm   |
| j. | Modem input impedance:           | 600 ohms, transformer isolation  |
| k. | Modem frequency response:        | 900 to 2700 Hz @ -2 to +6 dB   |
| l. | Modem transmit delay:            | Switchable, delay-for-quiet-line or immediate-transmit                 |
| m. | Error Rate (maximum) @ 2400 BPS: | 1x10E-09 @ 18dB S/N ratio (1x10E-08 @ 15 dB)                           |
| n. | Scan Mode:                       | Continuous   |
| o. | Scan Rate - All locations:       | Once per Second  |
| p. | RTU locations per line (max.):   | Seven (0,0,0 is "All Location Call")                                   |
| q. | Baud Rate:                       | 2400 bits per second   |
| r. | Clock Frequency:                 | 384 kHz  |
| s. | Distortion - max. time delay:    | ±50 nanoseconds  |
| t. | Delay correction (maximum):      | 3 nanoseconds  |
| u. | Delay of envelope (nanoseconds): | 1800 @ 700 to 2700 Hz  |
| v. | Distortion - Amplitude:          | ±1 dB  |
| w. | Line input protection:           | Adequate for ±10,000 v o l t p e a k 8 / 2 0 microsecond standard wave |

C. Receiving Processing & Transmitting Logic Requirements

1. The Receiving Processing and Transmitting Logic section of the RTU shall contain the necessary logic and circuitry for detection of a proper incoming data message from the central control computer including preamble address, data synchronization, and bit security as specified herein. The Receiving Processing and Transmitting Logic shall convert the serial data received from the Central Control Office to parallel form for use by the control output interface. It shall also convert the parallel data from the status input interface to a serial form for use in generating the outgoing message to the Central Control Office. The requirements for the organization of the equipment are as follows:

- |    |  |   |
|----|--|---|
| a. | Control capability (min.) per location:    | 836 controls                                      |
| b. | Indication capability (min.) per location: | 892 indications                                   |
| c. | Dataframe count:                           | 31 (total of 15 control and 16 indication frames) |
| d. | Words per dataframe:                       | 4   |
| e. | Bits per dataframe, Total:                 | 76  |
| f. | Assignable bits per dataframe:             | 52 (first frame), 56 (successive frames)          |
| g. | Bits per word:                             | 16  |

h. Bits per word - assignable:

14

D. Data Format Requirements

1. The data format of the incoming message received by the RTU and the outgoing message generated by the RTU shall be as follows:

a. Incoming Message (to RTU):

1) CONTROL FRAME ONE:

- a) Bits 1 to 9 - PREAMBLE Nine 1s (1,1,1,1,1,1,1,1,1)
- b) Bits 10 and 11 - SYNC PATTERN Fixed (0,1)
- c) NOTE 1 - The above 11 bits are checked for validity. If not valid, the incoming message is locked out. If only seven 1s are received before the 0, the message being received is from another RTU and is also locked out.
- d) Bits 12 to 67 (56 bits) - FIRST CONTROL DATA FRAME - Consists of:
- e) Bits 12 to 14 (3 bits) Code 0,0,0 is used as RTU ADDRESS "All Location Call"
- f) Bits 15 (1 bit) NO RESPONSE BIT Inhibits the return of the status message if 1; allows the return if 0
- g) Bits 16 to 67 (52 bits) CONTROL DATA Assignable; 1 for "Control On" 0 for "Control Off"
- h) Bits 68 to 74 (7 bits) SECURITY CHECKWORD BCH Encoded, transmitted inverted
- i) NOTE 2 - The received checkword is compared to a locally generated checkword which is developed using the same BCH (Bose-Chaudhuri-Hocquenghem) coding method as was used in the office to generate the transmitted checkword. If the received and locally generated checkwords are the same, the first frame of data is accepted and a strobe pulse is generated to execute the controls. If they are not the same, the frame control message is aborted and the scan continues on to the next frame. The BCH code consists of the 7-bit remainder from a sequential division calculation utilizing the polynomial  $x^7+x^6+x^2+1$ .
- j) Bits 75 to 76 (2 bits) FRAME SYNC Binary code (0,1) - MORE DATA (advances frame counter); (0,0) - END OF DATA (initiates status transmission); (1,0) or (1,1) - ERROR (locks out control changes)
- k) NOTE 3 - Code (0,0) indicates the last frame being transmitted. It resets the error latches and initiates the status transmission. If codes (1,0) or (1,1) occur in the first frame, they lock out changes in the RTU controls. If they occur after the first valid frame, they lock out further control changes and immediately initiate a status transmission with its ERROR bit set to (1).

2) CONTROL FRAME TWO (and succeeding frames):

- a) Bit 77 (and successive 75 bits) Message bits for frame 2
- b) NOTE 4 - The succeeding frames are the same as the first, EXCEPT they lack the three ADDRESS bits and the NO

RESPONSE bit. This allows 4 more bits to be used for controls, bringing the number of assignable control data bits in the succeeding frames to 56, while keeping the total number of bits at 76.

- 3) LAST CONTROL FRAME:
  - a) The FRAME SYNC code of (0,0) in the last control frame being transmitted signals the end of the control message and initiates the indication (status) transmission from the RTU to the Office.
  - b. Outgoing Message (from RTU):
    - 1) The outgoing message is identical to the incoming message described above EXCEPT that:
    - 2) the PREAMBLE contains only seven "ones" (1,1,1,1,1,1,1) instead of nine, and:
    - 3) the NO RESPONSE bit is replaced by an ERROR bit which is described in NOTE 3 above.
    - 4) The assignable data bits are utilized for transmitting field status information to Central Control.

E. Other Requirements for incoming data:

1. Loss of the modem carrier, malfunction of the modem, or malfunction of the RTU shall cause all control output registers to be reset to zero.
2. If no valid data is received from the central control computer for a period of five seconds, all control output registers shall be reset to zero.
3. No data shall be acted upon unless preceded by a valid preamble word.
4. Updating of the outgoing data points (controls) shall not take place if the BCH checkword is invalid.
5. The receiver shall return to its quiescent state after the receipt of sync bits indicating end of message.

F. Other Requirements for outgoing data:

1. Under no condition shall a malfunction of the Remote Terminal Unit place any constraints on the external data point circuits, or interfere in any way with the normal conditions on the communication line.

G. Control Output Interface Requirements

1. The Control Output Interface shall provide bi-stable (latching) relays or electronic outputs to accept data from the incoming message and control the external equipment as listed in the control section of the Contractor's RTU Scan Sheets. Each individual output interface shall be equipped with a light emitting diode indicator which shall be lighted when the output is energized. This interface shall protect the RTU from the hostile electrical environment of the external equipment and the accidental application of external voltages. This interface shall conform to the following requirements:
  - a. Output type: Relay and transistor
  - b. Relay configuration: Form A, bistable (latching)
  - c. Relay type: Dry contact reed
  - d. Relay operating time (max.): 3 milliseconds
  - e. Contact capacity: 15 volt-amps, @ 28 Vdc
  - f. Contact surge capacity: 15 volt-amps, @ < 400 Vdc
  - g. Contact current rating: 1 amp dc maximum, supplied by external circuit
  - h. Contact open resistance (min.): 100 megohms
  - i. Contact closed resistance (max.): 100 milliohms

j.	Contact common return:	One only, and two contacts
k.	Transistor type. (electronic):	Open collector, latching
l.	Transistor current:	100 milliamp sink, limited self-protecting, supplied by external circuit
m.	Transistor common:	Negative 28 volts, dc grounded
n.	Read-status window-pulse output:	For quieting external device for reading by strobe
o.	External strobe pulse output:	Initiates external device status reading
p.	Contact surge suppression:	±2000V. peak, 8/20 micro-second standard wave

#### H. Status Input Interface Requirements

1. The Status Input Interface shall accept data from the external equipment listed in the Scan Sheets and organize it for use by the RTU in generating the outgoing message. This interface shall protect the RTU from the hostile electrical environment of the external equipment and the accidental application of external voltages in excess of the normal operating voltage. Each individual input interface shall be equipped with a light emitting diode which shall be lighted when the input is energized. Each individual input interface shall be equipped with a pushbutton or switch which is circuited to simulate an input, but which does not energize the external input circuit. Each individual input interface shall be capable of connection to a mechanical contact or an electronic output. This interface shall conform to the following requirements:
  - a. External (driving) Circuit:
    - 1) Contact closure, isolated
  - b. External voltage for contact indications:
    - 1) 30 Vdc maximum, 10 Vdc minimum
  - c. External circuit indicating current:
    - 1) Maximum Steady Application: 20 milliamps, from RTU Supply
    - 2) Noise Rejection Threshold: 5 milliamps
  - d. External contact bound immunity:
    - 1) 12 to 20 milliseconds
  - e. Input circuit configuration Optional:
    - 1) latching and
    - 2) non-latching
  - f. External contact operation (non-latching):
    - 1) Bit transmitted if contact closed during RTU scan
  - g. External contact operation (latching):
    - 1) Bit transmitted subsequent to 20 millisecond contact closure
    - 2) External suppression surge limit:
      - a) 15 volt-amps, @ < 400 Vdc
2. The Status Input Interface shall also accept data from external equipment in the form of a 4 to 20 milliamp current loop. This analog data shall be converted to digital 7-bit status and placed in the appropriate frame/word of the RTU response message. The accuracy of the Analog to Digital Converter shall be +/- 0.15% full scale.
3. Each RTU that is required to accept 4 to 20 milliamp analog current loop inputs shall have the capacity to handle a minimum of 16 analog inputs. This may be done by multiplexing.

#### I. Spare Point Requirements

1. Remote Terminal Units shall be provided with more points (spares) than the maximum number of points required for outputs (controls) and inputs (status). The arrangement and number of spare points shall be determined by the RTU Scan Sheets as shown in Section 16997 for each specific RTU location.

- J. Power Supply Interface Requirements
1. The Power Supply Interface contained within the RTU cabinet shall take its power from the 28 Vdc supply in the TCR. One or more power supplies shall convert this power to the voltages and currents required by the devices with which the RTU is implemented. The capacities of these internal power supplies shall be adequate for a full complement of input and output equipment. This interface shall protect the RTU from the hostile environment and normal variation of the external power source. This interface shall conform to the following requirements:
    - a. External supply voltage: Local System Vdc  $\pm$  8% or 120 Vac  $\pm$  15%
    - b. External supply load: Less than 500 volt-amperes
    - c. Ripple tolerance (dc supply):  $\pm$  7%
    - d. Power transient immunity:  $\pm$  2000V peak, 8/20 micro-second standard wave
    - e. Power failure or interruption: Cancels ongoing cycle, does not affect control memory
  2. Adequate power and ground buses shall be provided to transfer the power from the supply to the modules without loss and without introducing electrical interference.
  3. Surge protection shall be provided as part of the RTU's internal power supply input interface.
- K. Power Panel
1. A panel on the RTU shall be arranged to hold equipment which will serve the following functions:
    - a. Provide facilities for monitoring (on pin jacks or the equivalent) the power supply input and output voltages from the front of the panel.
    - b. Provide space for mounting power supply indicators and fuses, both of which shall be of the style that allows replacement from the front of the panel without rack or panel disassembly.
- L. I/O Interface Requirements
1. Control outputs and status inputs shall be interfaced from the external equipment to the RTU through plug connectors and optical isolators. The optical isolators shall protect the RTU internal circuitry and equipment from the application of ac or dc voltages up to 150 volts.
  2. All connections to the RTU shall be through the top of the rack or cabinet where it is mounted unless otherwise authorized by the designated Resident Engineer.
- M. Internal Circuitry Requirements
1. All active internal circuitry shall be comprised of solid state silicon devices. The circuitry shall be configured utilizing CMOS technology with board layout and component selection arranged for minimum heat generation, maximum heat dissipation and maximum immunity from interference. The copper layout of interface boards shall minimize (through adequate spacing and intervening grounded conductors) the electrical coupling between the internal and the external circuitry. The wiring harness of the interface boards shall provide for a separation of the wires of the internal and external circuits. The power wiring and the external circuits shall be wired with either twisted pair or twisted triple. The internal RTU circuitry shall withstand without damage or false operation, the interfering effects of induced lightning surges in the external interface wiring and the operation of the external interface relays at their maximum ratings.
  2. Proper grounding procedures shall be utilized throughout the system to ensure that ground loops are not established and EMI is not propagated or conducted to sensitive internal circuits.
  3. Circuitry shall be included which shall check and validate each requested output before it is activated, i.e., prevent the execution of false "commands."

- N. Rack Requirements
1. The RTU shall be composed of one or more dust-resistant modules mounted on a single, standard 19" rack, not exceeding 7 feet in height. The depth of the equipment modules and rack shall not exceed 33 inches.
  2. Modules containing indicators or controls shall be located as close to eye-level as practicable.
- O. Dust-Resistant Module Requirements
1. The individual modules of which the RTU is composed shall be gasketed and dust-resistant. They shall also meet the temperature requirements of these Specifications. This shall be accomplished without the use of fans or outside air by making the module enclosure large enough to dissipate its internally generated heat by internal convection and external radiation. The modules shall be immune to the predominant type of dust present in the TCR which results from train brake wear.
- P. Cabinet Requirements
1. If necessary to meet the temperature and dust-resistant requirements, the Contractor may elect to enclose the entire rack in a steel cabinet of approved construction, rather than to enclose each module. The interior of the cabinet shall be accessible from both front and rear by means of removable panels, or doors and shall be large enough to allow easy expansion of the inputs and outputs to the full specified capacity. The doors and their mountings shall allow the removal of the modules without restriction.
- Q. Cabinet Equipment Arrangement
1. The equipment within the cabinet shall be arranged (with ducting where necessary) to encourage air movement within the cabinet by natural convection. The air movement shall remove heat from the heat-producing components in the modules and transfer it to the exterior of the cabinet where it can be dissipated by radiation. The air movement shall be largely unimpeded in an upward flow, through all of the various modules mounted on the 19-inch rack to the top of the cabinet; then downward along the outside sheet metal housing (where the heat is removed by radiation) to the bottom of the cabinet, where it is ducted inward, to return upward again, to cool the modules. The "chimney" formed by the stack of uniformly sized module housings shall be continuous from the bottom of the module stack to the top. This "chimney" shall be free of gaps or openings larger than 1/8-inch where heated air currents rising inside the stack can escape and interfere with cooling air currents falling outside the stack, thus reducing circulation. Baffles shall be utilized as necessary to prevent the rising air currents from entering non-heat-producing sections of the modules and bypassing the critical components. The modules shall be designed so that the baffle of one module does not interfere with the air movement through the critical areas of an adjacent module.
- R. Environmental Requirements
1. Physical
    - a. The RTU assembly shall work in the physical environment of the TCR. These environmental requirements are:
      - 1) Operating temperature range -22 to +158 degrees F. (-30 to +70 degrees C.)
      - 2) Operating humidity range 5 to 95 percent R.H., non-condensing
      - 3) Vibration suppression Shock mounted
      - 4) Cooling system Radiant plug natural convection (no fans)
  2. Electrical

- a. The RTU assembly shall work satisfactorily in the electrical environment of the TCR. The Contractor shall assess this environment considering the factors stated in Section 16914.1.03 of these Specifications and the characteristics of the equipment the Contractor is providing under this Contract.
  - b. Conducted and radiated radio frequency energy in the bands 150-160 MHz, 460-500 MHz and 850-950 MHz shall be attenuated to a level which will not interfere with the operation of a radio transceiver with a self-contained antenna. Further, the operation of a radio transceiver, transmitting radio frequency energy at any frequency with ten (10) watts of power into a self-contained antenna, shall not cause malfunction of the microprocessor, its related equipment, or the I/O devices. These requirements shall be met when said antenna is within three inches of any external part of the RTU assembly.
- S. Maintainability
  - 1. The RTU and its mounting shall be designed to possess a high degree of maintainability, facilitated by the use of modular construction to allow easy removal and replacement of modules, subassemblies and components. Modules shall be removable without tilting them. Modules shall have sufficient cable slack to facilitate their removal without having to open additional covers.
- T. Operational Accuracy
  - 1. The RTU shall operate accurately, i.e., without generating erroneous controls or indications, over the entire range of operating voltage tolerances specified by its manufacturer.
- U. Fabrication or Procurement
  - 1. The RTUs provided under this Contract shall be of the "Outpost" type, similar to Model 409 (as manufactured by ABB Network Management, Inc., 1601 Industrial Blvd., Sugar Land, Texas 77478) except for the additional rack dimensional requirements, optical isolator interface requirements, and internal 5 volt power supply monitoring and interface requirements specified herein. These additional features shall be provided by the Contractor. The Contractor shall also provide, at no additional cost to the Authority, all necessary new-type(s) of printed circuit boards, plus 20 percent spares, which may be required at the WMATA Operations Control Center (OCC) location and the new wayside TCR locations if a different type of RTU, which accurately emulates the WMATA protocol, is approved.

## **2.03 INTERFACE JUNCTION BOX WIRING DIAGRAMS**

- A. DTS interface junction box (cabinet) wiring diagrams shall show the box designation, the final configuration for all wires and terminals in the box and the nomenclature for each wire terminated in the box. Where the nomenclature of external wires by other disciplines differs from the Contractor's nomenclature, the Contractor shall show both wire designations. The Contractor shall reduce these wiring diagrams in size (as necessary), laminate them (when approved) between sheets of clear moisture-proof material, and mount them inside the junction box covers. The lettering of these diagrams shall still be legible when so mounted. A copy of the approved arrangement (as-built) drawing shall be maintained in each DTS Junction Box until the laminated drawing is installed.

## **2.04 RTU EXTERNAL CONNECTIONS**

- A. Control outputs to all equipment or systems external to the ATC system shall be at the local system dc voltage (independently fused by function) switched over the contacts of the output interface relays, as specified in Section 16944, Non-Vital Relays and Timers. Suppression

for inductive loads shall be provided in the external equipment or system such that the instantaneous volt-amp load on the interface relays shall never exceed 15 volt-amperes and the voltage shall never exceed 400 Vdc.

- B. Inputs (Status Indications)
  - 1. On/off indication inputs from equipment or systems external to the ATC system shall be provided by dry contacts meeting the contact requirements of non-vital general purpose interfacing relays as specified in Section 16944.
  - 2. Analog indication inputs from systems external to the ATC system will be provided by 4 to 20 milliamp current loops. The RTU field Interface shall include 250 ohm radial lead, 0.01 percent tolerance, 2ppm/Degree C temperature coefficient or better, resistors.
- C. The wiring of the external circuits as they approach the RTU Input or Output interface device shall be twisted pair of appropriate gauge (twisted triple shall be used for relay outputs with one common per relay pair). This wiring shall be kept physically separate from the internal circuitry of the RTU. Mutual inductance and capacitance between the internal and the external wiring shall be minimized throughout; printed circuit layout of the interface shall conform to this requirement.
- D. Wire and cable for DTS wiring shall be as specified in Section 16949, Signal Wire and Cable.

## **2.05 COMPUTERIZED ANALYZER UNIT**

- A. The Contractor shall furnish (*number*) Computerized Analyzer Units (CAUs) for the route segment included in this Contract (i.e., one for each new station TCR), plus two CAUs for the Engineer Systems Engineering (ENSE) and one CAU for Operations (OPER) training. (A total of (*number*) CAUs).
- B. Each CAU shall be complete with all the equipment, manuals and supplies necessary to connect it to the system, perform the required tests, and to service all of the RTUs previously installed by others and the RTUs provided under this Contract.
- C. The CAU shall be a notebook style, pentium MMX™ microcomputer and visual display for monitoring all RTU functions. It shall include a minimum of 16 MB RAM, Active Matrix SVGA Monitor, 1.44" floppy drive, 28.8 baud modem and an external modem to interface with the RTU modem, internal 4X CD-R Drive with sound card, 2 type II PCMCVI slots, one parallel port and one serial port, an additional battery and battery charger, latest Windows software including latest Procomm Plus (pre-loaded with backup floppies) and a carrying case. It shall be useful in both the initial setup of RTUs and in the field and shop maintenance of RTUs. It shall have the capability of serving as a Local Storage Monitor for data messages. The microcomputer shall have an internal battery allowing at least three hours of operation without connection to any external power source. The display shall be active matrix color. If space limitations prohibit the installation of the necessary RTU interface equipment, a piggy-back type enclosure shall be provided which conforms to the physical characteristics of the microprocessor. If an external enclosure is provided, it shall be equipped with a suitcase style carrying handle.
- D. The CAU shall include, as a minimum, all of the facilities of the TRW Model 9600 Portable Analyzer Unit (PAU). These facilities shall provide the CAU operator with information which will enable him to successfully analyze the performance of the existing RTUs, the new RTUs furnished under this article, and the existing SIMPACT Boards. The CAU shall provide for the analysis of each of these units on a bit-by-bit basis to readily recognize and isolate trouble to a specific section.
- E. The CAU shall be capable of simulating for the RTU, the functions normally performed by the

SIMPACT Boards in the Front End processors located at Central Control.

- F. The CAU shall be connectable, either directly to the transmitter and receiver of the RTU or the SIMPACT Boards, or indirectly to these units via its internally provided modem. The CAU shall be capable of testing through its internal modem.
- G. Means shall be provided on the CAU for manually setting the transmitted bits of the data message described in this article and utilized in the existing and future system.
- H. The CAUs furnished for the Central Maintenance Facility shall be additionally equipped with plug couplers, cables, manuals, programs and other devices necessary to service the other CAUs. Alternatively, each CAU shall have the capability of a self-diagnostic program or test.
- I. The CAU, when acting as a simulator, shall adapt its data format depending upon whether it is simulating an RTU or a SIMPACT Board.
- J. Indicators or Flags on the visual display screen shall display the status of data message being processed. These indications shall include, but not be limited to, the following:
  - 1. Receive
  - 2. Transmit
  - 3. Frame Bits
  - 4. Address Bits
  - 5. Security CheckwordError
  - 6. Frame Sync.
  - 7. Carrier Level
- K. The CAU shall have a menu driven capability to store the control and status data bit information of an average RTU configured for a diamond interlocking location for not less than a 48 hours on a circular (write-over) basis. The menu shall provide the capability of selecting the required information bits to be stored. The stored memory shall be retrievable on the CRT and a typical laser jet printer. A program shall be included to highlight changes in the data. The data shall be transferable to a floppy diskette in ASCII (DOS) Text format.
- L. The CAU shall have a self-contained power supply operating from 120V ac. The power supply and the internal modem shall contain adequate transient protection.
- M. Each CAU shall be furnished with a durable, light- weight carrying case with provision to carry the CAU and all cables, adapters and external devices except the external modem.

## **2.06 SPARE REQUIREMENTS**

- A. See Section 16932, Spare ATC Equipment and Selectable Items.

## **2.07 INSTRUCTION MANUALS**

- A. For the RTU the Contractor shall submit, in accordance with the provisions of Section 16992, ATC Instruction Manuals, the specified documentation for the following manuals:
  - 1. Field Maintenance Manual
    - a. For maintenance of the RTU in the field to the board level.
  - 2. Shop Maintenance Manual
    - a. For maintenance of the RTU boards in the shop to the component level.
- B. For each CAU provided, the Contractor shall submit, in accordance with Section 16992, ATC Instruction Manuals, the specified documentation for the following manuals:
  - 1. Operator Training Manual
    - a. The "operator" will be a field maintainer or a shop maintainer.

2. Field Maintenance Manual
    - a. For maintenance of the CAU in the field to the board level.
  3. Shop Maintenance Manual
    - a. For maintenance of the CAU in the shop to the component level.
- C. The Contractor shall provide necessary field maintenance, shop maintenance, and operator training instruction manuals for the A/D Converter and Multiplexer equipment.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. The Contractor shall mount the Remote Terminal Unit for each TCR at the location shown on the approved TCR arrangement plan for that room in a manner similar to that used to mount the ATC racks. Signs displaying the RTU system voltage followed by the word "ONLY", all in 2-inch high letters, shall be affixed to the outside of each exposed side of the Remote Terminal Unit modules, and to the sides and cover of each DTS Interface Junction Box.
- B. RTU interfacing circuitry shall be installed in conformance with the typical RTU control and indication circuits shown on the Contract Drawings and connected to the RTU as indicated on the RTU Scan Sheets submitted by the Contractor and approved by the Engineer. (See Section 16997, RTU Scan Sheets.)
- C. Ancillary Location Interface
1. The Contractor shall provide the interface connections between the RTUs and all ancillary facilities in their respective areas. These facilities shall include, but not be limited to, the following, as applicable:
    - a. AC Service Rooms (AC)
    - b. Substations (SS)
    - c. Tiebreaker Stations (TBS)
    - d. Drainage Pumping Stations (DPS)
    - e. Vent Shafts (VS)
    - f. Fan Shafts (FS)
    - g. Sewage Ejectors (SEJ)
    - h. Communications Equipment Rooms (COMM)
    - i. Special Sump Pumps (SP) (where applicable)
    - j. Jet Fan Control Rooms (JFC) (where applicable)
  2. This interfacing shall be accomplished by furnishing, installing and terminating sufficient Special Control and Indication cables, of the type and at least the minimum capacity specified in Section 16949, between the TCR and the standard DTS junction boxes (cabinets) provided by others at certain wayside, non-ATC facilities external to the Train Control Rooms, as indicated on the Contract Drawings.
  3. As an alternative to direct conductor RTU interface for each ancillary data bit, and subject to the prior approval of the designated Resident Engineer, the Contractor shall provide small, satellite RTUs at selected ancillary locations. These satellite RTUs shall be connected to the local DTS interface junction boxes in the standard, specified manner, but shall be connected to the main RTU by one or more twisted-pair cables of appropriate size(s). The satellite RTUs shall be subject to the same limitations as specified for the primary RTUs, and the whole satellite RTU subsystem shall be subject to Type Acceptance Testing. If satellite RTUs are used, the CAU shall be equipped to interface with the satellite RTUs.
- D. The Contractor shall furnish, install and terminate a special control and indication cable, of the minimum size and type required as specified for external cable in Section 16949,

Signal Wire and Cable, between the RTU in each TCR and its associated TC/COMM Interface Cabinet (furnished by other disciplines in the Communications Room) to pick up, among other things, Fire and Intrusion indications for the various rooms and buildings specified. The Contractor shall tag and terminate this cable in the TC/COMM interface cabinet as indicated on the Contract Drawings, and make the appropriate corresponding terminations on the RTU.

- E. The Contractor shall provide a reed relay, energized by the internal 5 volt power supply of the RTU, and the necessary interface to use a contact of this relay in the applicable TCR power failure alarm system to indicate failure of the RTU internal 5 volt power supply.
- F. The Contractor shall furnish and install a two-pair telephone-type cable between the RTU in each TCR and the associated Main Distribution Frame (MDF) (furnished by other disciplines in the Communications Room) leaving sufficient wire at the MDF end for proper termination by other disciplines. Each pair in this cable shall be individually shielded. This cable shall be tagged "DTS". The shielded pair carrying information from Central Control shall be tagged "REC" and another shielded pair carrying the return information to Central Control shall be tagged "TRANS". The shields of these shielded pairs shall be grounded at one end only, to prevent interference from ground currents of the ac power. The Contractor shall terminate this cable on the appropriate terminals in the RTU and advise the appropriate other disciplines when this has been accomplished. Other disciplines will terminate this cable in the MDF cabinet and perform tests on the DTS channel from the MDF as part of the CTS System test. The other disciplines will advise the Contractor when the DTS channel has been tested and is operational and when the cable between the MDF and the RTU has been terminated in the MDF.
- G. The Contractor shall exercise the DTS channel from the RTU to ensure proper operation. It shall be the responsibility of the Contractor to coordinate with the appropriate other disciplines to locate and correct faults identified as carrier transmission faults within the Data Transmission System. The other disciplines will cooperate fully with the Contractor in accomplishing this interface.
- H. The Contractor shall inform the designated Resident Engineer when the RTU and all of its field connections are complete. The Authority will then, within a two-week period, make the appropriate connections at Central Control.
- I. Unless otherwise specified, the Contractor shall design and install the data point wiring as follows:
  - 1. The RTU wiring shall be installed in a manner and configuration having the prior approval of the designated Resident Engineer.
  - 2. The Contractor shall provide wiring from all active and spare data points to terminals or plug connectors located on an appropriate equipment or entrance rack in the Train Control Room.
  - 3. The Contractor shall provide no printed circuit card for the locations designated as "NO CARD" on the RTU Scan Sheets. Positions which are indicated by a "NO CARD" within the CONTROL FRAMES shall be wired to accept either a "RELAY PAIR CARD" or a "RELAY SINGLE CARD," as indicated on the approved Scan Sheets. (A "RELAY PAIR CARD" has one common brought out for every two control points and a "RELAY SINGLE CARD" has a common brought out for every control point.) Positions which are indicated by a "NO CARD" within the STATUS FRAMES shall be wired to accept any status input card and the wiring shall extend to plug couplers or terminals on an appropriate equipment or entrance rack.
  - 4. Where a card cage position is indicated as "VACANT SLOT" on the RTU Scan Sheet, no internal wiring shall be provided for that cage position, and no PC card shall be provided.

- J. The Contractor shall prepare and install Interface Junction Box Wiring Diagrams for all interface junction boxes (cabinets) in which ATC or DTS wiring provided under this Contract is terminated. This shall include a wiring diagram for each TC/COMM Interface Cabinet located in Communications Rooms. One copy of each box wiring diagram shall be inserted in each "Room Book of Plans" for the associated TCR, and another copy shall be laminated between layers of clear, moisture-proof material and mounted inside the applicable box.

### 3.02 SCAN SHEET DATA FORMAT

- A. The RTU Scan Sheets included in these Specifications are listings, as determined by information available at the time these Specifications were prepared, of the input (status), output (control), and spare data points to be provided or modified by the Contractor at each RTU location affected by this Contract. Modifications to the Scan Sheets must be approved before implementation. The Contractor shall provide RTU Scan Sheets which have the same format as those included in the Contract Documents, but which also contain additional columns showing RTU termination points.
- B. The Scan Sheets for each control and status "frame" contain four "words" (WD 0 through WD 3). Each word contains 16 bits, of which 14 are assignable as data bits (Bits 0 through Bit 13). The proposed arrangement of frames, words, and bits for each RTU location is shown in the RTU Scan Sheet section of these Specifications.
- C. Where an equipment function may be added or activated in the future, the notation "(FUTU)" in the Scan Sheet following the function name has the following meaning:
1. (FUTU) = Inactive now, but all DTS hardware and wiring shall be provided by the Contractor under this Contract at "New" locations to facilitate possible future use.
- D. Revised functions, PC card types, or energy feeds for the existing Tie-In location RTUs are indicated by an alphabetical character in the Scan Sheet column preceding the function names. The characters used, and their meanings, are as follows:
1. The old (**current**) names for the functions, PC cards and energy feeds at the point location revised are shown in brackets following the new names.
    - a. A = ADD
    - b. C = CHANGE
    - c. D = DELETE
    - d. E = ENERGIZE (a pre-wired point)
    - e. R = RESERVE or REMOVE
    - f. M = MOVED (point or card) (May include a CHANGE)
- E. The Contractor shall check the RTU Scan Sheets included in these Specifications and make any additions, corrections or revisions necessary to provide complete control and indication coverage of all Train Control and support facilities within the respective RTU control areas, based on the latest information available. For example, the Contractor shall modify the name and number of track occupancy indication data points as necessary to reflect the final, approved block design.
- F. The Contractor's RTU Scan Sheets shall also indicate the types of printed circuit cards actually used, together with appropriate common signal or energy bus wiring, and the arrangement for those printed circuit cards within the card cages of each RTU.
- G. The Contractor shall wire all RTUs affected by this Contract in conformance with the arrangement specified in the Contractor's RTU Scan Sheets which have been approved in writing by the designated Resident Engineer. The Contractor shall include

documentation of all termination points for data point wiring of the RTUs in the Scan Sheets he furnishes.

### **3.03 DELIVERY, STORAGE AND HANDLING**

- A. The Contractor shall take whatever measures may be necessary to protect the RTU, CAU, and A/D Converter equipment from damage or marring during shipment, installation and testing and until the Authority accepts the system. If the equipment suffers any damage, from whatever cause, during this period, the Contractor shall replace or repair it to a like-new condition, to the satisfaction of the Engineer and at no additional cost to the Authority.

### **3.04 TRAINING REQUIREMENTS**

- A. The Contractor shall provide three types of DTS training courses, for different groups of Authority employees. One course, (described in 1. below) shall be called the DTS Field Maintainer's Training Course. The second course, (2. below) shall be called the DTS Shop Maintainer's Training Course. The third course, (3. below) shall be called the Engineers' DTS Training Course. Training aids shall be liberally employed where helpful to illustrate the devices and principles being described. Firmware such as flip charts, transparencies and slides shall become the property of the Authority at the conclusion of the presentation of each course by the Contractor. The Contractor's instructor shall cooperate with the Authority in the videotaping of the course presentations.
  - 1. DTS Field Maintainer's Training Course
    - a. The Contractor shall provide on the Authority's premises, for its signal maintenance personnel, four identical presentations, each a minimum of five days duration. Each presentation shall be a complete course of classroom and hands-on instruction in the operation and maintenance of the RTU, CAU, and, where applicable, the A/D Converter and Multiplexer equipment and circuitry. Each presentation shall accommodate 12 persons designated by the Authority.
      - 1) The first two presentations of this course shall occur successively during the final installation stages of the RTU. The second two presentations shall be at later dates within one year from the date of the first two; the exact dates to be determined by the mutual consent of the Authority and the Contractor. All of these instruction courses shall be at no further cost to the Authority.
      - 2) This instruction shall be based on the Field Maintenance Manuals described above in Section 16992.2.07.
      - 3) This instruction shall cover all aspects of operation and maintenance of the RTU and CAU equipment, and, where applicable, the A/D Converter and Multiplexer equipment.
  - 2. DTS Shop Maintainer's Training Course
    - a. The Contractor shall provide two complete and identical presentations of a five-day course of instruction for the Authority's electronic technicians. This course shall provide hands-on training to enable these technicians to locate defective board components in the RTU and CAU systems, and defective A/D Converter and Multiplexer equipment. Each presentation of this course shall be held for eight Authority-designated persons. This course shall be based on the Shop Maintenance Manuals described in Section 16992.2.07.
    - b. The first presentation of this course shall be held on the Authority's premises at a mutually acceptable date during the installation phases of the Contract. The Authority will be responsible for the personal expenses of the participants during the time of course presentation.
    - c. The second presentation of this course shall be held on the Authority's

premises on a date mutually acceptable within one year of the date of the first presentation.

d. The Contractor shall provide at no further cost to the Authority, the copies of required manuals and all materials for these courses. These materials shall include but not be limited to defective boards for comparison with properly-operating boards. The Contractor shall be responsible for the repair or replacement of all boards inadvertently damaged during these courses.

3. Engineers' Data Transmission System Training Course

a. The Contractor shall provide on the Authority's premises, for certain engineering personnel, one presentation of a course of classroom and hands-on instruction in the operation of the DTS, the programming and reprogramming of the Remote Terminal Units, and the maintenance of the RTUs and other DTS equipment to the board level. The course shall be three days in length. The presentation of the course shall accommodate up to 12 persons designated by the Authority.

1) The presentation of this course shall occur during the final installation states of the DTS and shall be made at no additional cost the Authority.

2) This instruction shall be based on the Instruction Manuals described in Section 16992.2.07.

3) This instruction shall cover all aspects of setup, programming, operating and maintenance of the DTS equipment. It shall include, but not be limited to the following:

a) Programming Techniques

b) Compiling

c) Setting and Erasing Memory Devices

d) Locating Defective Board Components

e) System Operation

f) Reliability Considerations

g) Trouble Shooting

h) Diagnostic Routines

i) Maintenance Procedures.

4) This course shall be designed for an educational level of 12th grade plus a Bachelor's Degree in Engineering or its equivalent.

5) This course shall include "hands-on" instruction for each participant in programming, reprogramming and identifying and replacing defective board components through the use of the Contractor's test fixtures (made available by the Contractor at no additional cost to the Authority), and the Remote Terminal Unit provided to the Authority by the Contractor for training purposes. The Contractor shall supply, at no additional cost to the Authority, a set of boards with various defective components for use in this test.

B. These training courses shall be organized in accordance with the requirements of this Section and Section 16992, ATC Training Courses.

### 3.05 MEASUREMENT FOR PARTIAL PAYMENTS

A. The Data Transmission System additions provided under this Contract will be measured for partial payments based upon:

1. Approval by the designated Resident Engineer of the Type Acceptance and System Performance testing;
2. The number of required Remote Terminal Units furnished, installed and accepted
3. The number of required DTS junction box wiring diagrams properly furnished and

- installed;
4. (Where applicable): The number of A/D Converters and Multiplexers furnished, installed and accepted.
  5. (Where applicable): The number of Satellite Remote Terminal Units (SRTUs) furnished, installed and accepted.
- B. The Computerized Analyzer Units (CAU) will be measured for payment under Section 16931, ATC Maintenance and Test Facilities.

**END OF SECTION**

## SECTION 16926

### ATC - MICROPROCESSOR SYSTEMS FOR NON-VITAL INTERLOCKING FUNCTIONS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of systems of one or more equipment modules, which constitute a microprocessor-based controller with the capability of supervising the non-vital functions of interlockings, and monitoring both the vital and non-vital interlocking functions. The requirements of this Section shall supersede those shown on the Contract Drawings or given in other Sections of these Specifications where the non-vital interlocking functions are shown or described as being performed by "discrete component" and relay-type equipment.

##### 1.02 DESCRIPTION

- A. This controller shall be referred to herein as a Non-Vital Interlocking Processor System, or more simply, as an NVIP.
- B. The area of the WMATA right-of-way supervised and monitored by each NVIP shall be limited to interlockings and to the adjacent mainline area, but only to the distance that a "stop" aspect of an interlocking signal has an effect.
- C. It is recognized that a manufacturer of a non-vital interlocking processor controller system may supply separate modules, each possibly consisting of more than one processor, for "non-vital" interlocking processing. This is acceptable under these Specifications. Alternatively, a manufacturer may utilize only one processor module for the combined processing of all the interlocking non-vital tasks. For the purposes of these Specifications, the non-vital processors will be referred to as a single entity, or as sections of a single entity. Functions or equipment of the non-vital processor (or portions of a processor) shall not interfere with the safe operation of the vital logic system controlling and operating the interlocking.
- D. The basic modular units of all NVIPs provided by the Contractor under this Contract shall be interchangeable. The overall configuration of each NVIP shall be determined by its internal programming and by its external wiring.
- E. In the design of the logic for the NVIPs the Contractor shall comply with the applicable requirements of Section 16917, (Basic Interlocking Requirements) of these Specifications, and to the logic design inherent in the relay-type Circuit Drawings accompanying these Specifications. In the construction of the NVIPs, the Contractor shall comply with the requirements of all applicable articles included in these Specifications except as necessary to accommodate the vital relay logic controlling and operating the interlockings.
- F. The Contractor shall provide non-vital microprocessor logic to the greatest extent practicable to perform the functions of all the interlocking circuits classified as "Non-Vital" in Section 16916, Basic ATC Circuit Requirements. In addition, the Contractor shall provide non-vital processor logic to monitor both vital and non-vital interlocking functions as specified herein.

- G. The Contractor shall interface the processor to the Local Interlocking Control Panel, the TCR Track and Alarm Indication Panel, and the Remote Terminal Unit, providing non-vital inputs and outputs for interconnection to the indicators and manual controls thereon.
- H. The processor shall be capable of performing the following non-vital interlocking tasks and functions within the interlocking area specified in 1.02 B. above:
  - 1. Replace all non-vital relays and non-vital timers utilized in performing the interlocking non-vital supervisory and indication tasks set forth in these Specifications wherever possible and practical.
  - 2. Drive a non-vital relay referred to in these Specifications, as the NVIP Check Relay (NVIPCHK). Control of this relay is specified in PART 2 of this Section.
- I. The Contractor shall supply one complete Non-Vital Interlocking Processor System for each of the new Interlocking Train Control Room locations included in the area of this Contract as delineated in Section 16911, Scope of ATC Work, and Section 16918, Special ATC Requirements for Specific Locations of these Specifications, and one complete NVIP System for use during training, which is to be delivered to the Authority upon completion of training. See Section 16932.
- J. The Contractor shall provide a training program for personnel maintaining the NVIPs. The program shall be in accordance with the requirements of this Section and Section 16993.

### **1.03 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16904 Current Automatic Train Control System
  - 2. Section 16911 Scope of ATC Work
  - 3. Section 16914 Environmental Requirements
  - 4. Section 16916 Basic ATC Circuit Requirements
  - 5. Section 16917 Basic Interlocking Requirements
  - 6. Section 16918 Special ATC Requirements for Specific Locations
  - 7. Section 16924 Non-Vital ATO & ATS Processor Systems
  - 8. Section 16925 Data Transmission System (DTS)
  - 9. Section 16927 ATC Microprocessor Support Systems
  - 10. Section 16928 Interlocking Vital Processor Systems
  - 11. Section 16931 ATC Maintenance and Test Facilities
  - 12. Section 16932 Spare ATC Equipment and Selectable Items
  - 13. Section 16941 Basic ATC Electrical and Electronic Component Requirements
  - 14. Section 16942 Printed Circuit Cards
  - 15. Section 16945 Plugboards and Cabinets
  - 16. Section 16948 Plug Connectors
  - 17. Section 16949 Signal Wire and Cable
  - 18. Section 16955 Track and Alarm Indication Panels
  - 19. Section 16956 Interlocking Control Panels
  - 20. Section 16961 Audio Frequency Track and Loop Circuit Layouts
  - 21. Section 16971 Racks and Cable Trays
  - 22. Section 16977 Tagging and Marking
  - 23. Section 16980 ATC Tests, Inspections and Quality Assurance
  - 24. Section 16992 ATC Instruction Manuals
  - 25. Section 16993 ATC Training Courses

### **1.04 QUALITY ASSURANCE**

- A. All of the NVIP modules and the software programs which are to be installed under this

Contract shall be factory tested as a complete system in accordance with a factory test procedure. This procedure shall be generated by the Contractor in accordance with the guidelines set forth in another part of this article. The procedure must have the approval of the designated Resident Engineer before factory testing is started.

- B. The Contractor shall record the results of these tests on the specified Factory Test Report forms. Items for which Factory Test Reports have not been approved by the designated Resident Engineer, may be shipped to the job site only at the Contractor's risk.
- C. NVIP equipment modules shall be inspected by the Contractor prior to installation and only those items which have suffered no damage during shipment and subsequent handling shall be installed.
- D. All of the NVIP modules and their software program which have been installed under this Contract shall be field tested after installation in accordance with a field test procedure. This procedure shall be generated by the Contractor in accordance with the guidelines set forth in Part 1.05 (Submittals) of this Section. The Contractor shall submit this procedure for approval by the designated Resident Engineer, and must receive such approval before the start of field testing.
- E. The Contractor shall provide and maintain up-to-date, a diary or log containing a detailed write-up of any and all changes made to the NVIP system hardware and software from the time of their approval by the designated Resident Engineer until final acceptance by the Authority, at which time the log shall be delivered to the designated Resident Engineer. This record shall conform to the requirements more fully described in the documentation section of Part 3 of this Section.
- F. The Contractor shall provide Operation and Maintenance Manuals for the NVIPs. These manuals shall be prepared during the initial phases of the Contract so that they may be approved and delivered to the Authority before field testing commences. These manuals shall be prepared according to guidelines set elsewhere in this Section and in Section 16992 of these Specifications.
- G. The factory test for the NVIP system complete with all TCR equipment shall include:
  - 1. All field tests which can be performed in the factory
  - 2. Train movement simulations (all routes)

#### 1.05 SUBMITTALS

- A. The Contractor shall furnish within 60 calendar days of receipt of Notice to Proceed a submittal consisting of the following three explanatory items. These explanations shall be fully detailed and in plain English. Simple diagrams may be used for clarity. All such diagrams shall be fully explained. A glossary of definitions shall be included to thoroughly define any absolutely necessary technical or unusual words, otherwise, such words shall not be used. Buzzwords, slang, computer jargon and telegraphic writing style shall not be used. The Contractor shall explain the following:
  - 1. The Contractor shall present a detailed explanation of the method by which he intends to implement the diagnostic requirements specified in this Article. This explanation shall describe the techniques of schemes to be utilized to verify the correct operation of every step of every process included in the NVIP information processing.
  - 2. The Contractor shall present a general explanation of the method by which he

intends to implement the maintenance requirements specified in this Article. This explanation shall describe the features of the proposed maintenance program and the test equipment to be supplied for use with the maintenance procedures.

3. The Contractor shall describe in detail the provisions he has made for repairing the printed circuit boards which are part of the NVIP. This description shall address the following items:
  - a. The period of time for which the Contractor will provide PC board service for the NVIPs.
  - b. How and where the Authority may continue to receive NVIP PC board service when this time period expires.
  - c. Which boards or devices will be kept in stock at the Contractor's factory, and for how long.
  - d. The guaranteed maximum factory turn-around time from receipt of request for new board or device to shipment of its replacement.
  - e. The Contractor's replacement policy.
  - f. Whether replacement boards are new or repaired.
  - g. Whether replacement boards would be from Authority returned boards or a general stock.
  - h. The present cost of replacement for each board type.

B. The preceding three sections of the Contractor's submittal shall provide all of the information necessary to enable the designated Resident Engineer to make a reliability assessment. The Contractor shall assume that the designated Resident Engineer is familiar with basic computer terminology, but that he is not a programmer. The designated Resident Engineer will determine whether or not the equipment which the Contractor intends to supply for the NVIP system appears to be capable of performing the interlocking non-vital supervisory, monitoring and diagnostic functions in the desired manner. The results of the designated Resident Engineer's evaluation will be used as part of the design review. The outcome of this review shall be in no way construed as lessening the successful bidder's responsibility to provide a workable system.

- C. The Authority will review documentation for all equipment to be furnished under this Section before the equipment is delivered. The Authority also recommends that the Contractor not manufacture equipment which may not be approved for this Contract. Therefore, prior to component purchase, or fabrication of the equipment to be supplied under this Section, the Contractor shall deliver to the designated Resident Engineer for approval, the following:
1. Drawings of the proposed equipment modules and test fixtures, including schematic diagrams, arrangement plans, assembly drawings, complete parts lists keyed to the drawings, ordering information, mounting details, internal and external wiring circuits and details, and mechanical and electrical component descriptions to the component level.
  2. The complete field test procedures for the installed and programmed system.
  3. An outline of the course to be provided for Authority class instruction.
  4. An outline of the organization of the system documentation which the Contractor plans to supply according to these Specifications.
  5. A Critical Path Diagram which lists all of the major milestones set forth in these Specifications and any additional milestones which the Contractor deems appropriate. The diagram shall show as a minimum, the number of elapsed working days from Notice-to-Proceed to the listed milestone. All required submittals shall be listed as milestones.

- D. The NVIP Testing documentation shall include, but not be limited to, the details of the interlocking to be simulated, test durations, test equipment and test procedures for the tests to be utilized in proving to the satisfaction of the designated Resident Engineer that the NVIP system to be supplied will meet all of the requirements of these Specifications.
- E. The factory test procedures for the assembled and programmed equipment modules for the applicable TCR locations shall be in conformance with the requirements specified in Section 16980, ATC Tests, Inspections and Quality Assurance. Approval of the procedures shall be obtained prior to manufacture of the modules. Manufacture without this approval shall be at the Contractor's risk. These test procedures include the testing of all operational aspects of each proposed system, including the Interlocking Control Panels specified in Section 16956. The procedures shall show that the factory tests will be made on the complete system with all of the racks interconnected and with a complete simulation of the field inputs and outputs.
- F. Factory Test Reports shall be as stipulated by the approved Factory Test Procedures. These reports shall be submitted to the designated Resident Engineer for approval as quickly as possible after the completion of the factory tests. These test reports shall bear the signature of the designated Resident Engineer's representative attesting to the witnessing of the test and its successful conclusion. There shall be a test report for each of the PC boards (including spares) comprising the first NVIP furnished under this Contract.
- G. For the Design Review of the equipment to be supplied under this Section, the Contractor shall submit to the designated Resident Engineer, for approval, the following
1. A listing of all inputs and outputs for each system with easily understood designations of their functions.
  2. A complete and detailed program printout of all software, including equivalent circuit drawings, for each NVIP. The program shall be modularized in a logical and easily understood manner. Programming shall be easily related to circuit equivalents. Each module of the program shall be easily related to the associated equivalent circuits and be fully documented with plain-English explanations of its purpose and the method by which it accomplished that task, the modules to which it is related, and the modules of which it is a part.
  3. A description of the program functions and details with flow charts, a programming manual and a key sheet which lists and defines all symbols, abbreviations and other aspects of the program. This shall be one of the first items submitted for review.
  4. A description of, and documentation for, the compiler.
  5. Full documentation for the class of instruction including a revised course outline, course instruction manual, list of course training aids, list of class facility requirements, and class schedule.
- H. The Contractor shall provide drawings of all internal equivalent circuits, and circuits external to the NVIP, which are necessary to accomplish the functions described by the Drawings and Specifications with the equipment he plans to provide under this Contract. These circuits shall be submitted as part of the Design Review. These circuits shall be complete and continuous from the point of origin to the point of destination. They shall show all interface terminal connections between the portions at various locations and between the various pieces of equipment. No conductor shall be ended or terminated without some note or reference as to its physical location or continuation at some other place. All buses (including ground buses) shall be fully detailed. Twisted pair wiring shall be shown where utilized.

## **PART 2 - PRODUCTS**

### **2.01 BASIC REQUIREMENTS**

- A. The NVIP equipment, circuitry and software logic furnished by the Contractor under this Contract shall perform all of the functions designated in paragraph 1.01 and the paragraphs of PART 2 of this Section.
- B. The NVIP equipment shall meet the physical and environmental requirements listed in these Specifications.

### **2.02 MECHANICAL REQUIREMENTS**

- A. The NVIP shall make use of plug-in circuit boards. Each board shall be labeled with its function, a means of application identification, a serial number, and a model or drawing number.
- B. The program of the NVIP shall reside in a Programmable Read Only Memory located on the processor board, or a separate "memory" board. The memory devices shall be erasable and reprogrammable. A separate plugcoupler dedicated to this function may be provided on the board at a readily accessible location. This plugcoupler shall provide for the connection of suitable programming test fixtures which shall be provided by the Contractor. As an alternative, the Contractor may provide sockets on the boards for the memory devices. In this case, each memory device shall have a complete and unique identification marking. The placement of the wrong memory device on a board shall be detected by the system and power shall be removed from the outputs.
- C. Electro-mechanical memories such as magnetic-media tape and disk drives shall not be used in the NVIP, except for programming and testing purposes.
- D. The printed circuit boards of the NVIP shall be housed in rigid frames containing a motherboard for the mounting of the printed circuit board receptacles. This motherboard may be either a printed circuit board or a hard-wired plane. The frame shall contain full-length board guides to assure that the plug-in contacts of each plug-in board correctly mate with the motherboard receptacle.
- E. Each plug-in location of the NVIP shall be labeled with the identity of the board type intended for that location.
- F. The Contractor shall provide some form of interlocking device to ensure that plug-in boards of the NVIP cannot be mechanically or electrically damaged by plugging them into an incorrect location.
- G. The board frame of the NVIP shall be constructed and mounted in a manner that allows the free movement of air over the equipment by convection to prevent local hot-spots which could degrade the assembled and mounted equipment and prevent it from meeting the physical environmental and reliability requirements in Section 16914.1.02. No fans or blowers will be permitted for these purposes.
- H. The printed circuit boards or the printed circuit board frame which houses the NVIP shall be provided with electromagnetic shielding, if necessary to allow the system to meet the electrical environmental requirements of these Specifications.

- I. The Contractor shall provide a dust-resistant cabinet to house the NVIP. This cabinet shall have dust-resistant doors or removable covers on both the front and back. The front shall be supplied with a safety glass or fire-resistant plastic panel which allows observation of the indicators which may be located on the front of the boards. This equipment shall be immune to the ambient dust accumulation. TCR dust consists mostly of residues of the train brake wear.
- J. This cabinet shall be of sufficient volume to allow the removal of heat from the boards by internal convection and the removal of heat from the cabinet by radiation and external convection. Fans shall not be employed in the heat removal process.
- K. At the time of the initial factory test of the NVIP, the printed circuit board frame shall be installed in this cabinet and the door or cover shall be in place.
- L. The Contractor shall provide compiler software maintenance for a period of 5 years.

### **2.03 ELECTRICAL REQUIREMENTS**

- A. The NVIP and its associated equipment shall be powered by conservatively rated power supplies or inverters provided as part of its support equipment. These supplies or inverters shall meet the electrical and environmental requirements of these Specifications. At the Contractor's option these supplies or inverters shall operate either from the 120 Vac line or the 28 Vdc local power system specified elsewhere in these Specifications. In either case, these supplies or inverters shall be equipped with sufficient transient protection to provide immunity from power line transients as high as six kilovolts (1.5/40 microsecond standard wave), i.e., six kilovolts maximum voltage rise in 1.5 microseconds and decay in 40 microseconds.
- B. The input and output signal connections of the NVIP shall be fully isolated from the power supply of the processor. This isolation shall be adequate to provide protection from the transient levels encountered in the installation. The Contractor shall be cognizant of the various sources of transient interference that may be encountered in the TCR such as those listed in Section 16914. It is the Contractor's responsibility to assess and provide protection from this interference.
- C. The NVIP output signal potential shall be 28 Vdc nominal and the outputs shall have an adequate and conservatively rated power capability suitable for each application.
- D. All NVIP inputs shall be provided with de-bounce circuitry so that momentary voltage changes at the time of initial external contact closure will be ignored.
- E. One or more ports shall be provided for the transfer of coded input and output information. These ports shall make maximum use of industry standard communications standards and protocol except as necessary to promote safety and security. These ports shall be for the purpose of system expansion, connection of test equipment and other such uses.
- F. All components of the NVIP shall be conservatively rated so that the system is capable of meeting the Microprocessor Mean Time-To-Restore requirements shown in the Technical Appendix of these Specifications.
- G. All printed circuit boards utilized in the NVIP shall have a properly applied conformal

coating to minimize the effects of moisture.

- H. All printed circuit boards utilized for inputs or outputs in the NVIP shall be designed so that there is minimal capacitive coupling between the circuitry on either side of the isolation devices. Consideration shall be given by the Contractor to the use of a grounded copper track between circuitry on either side of the isolation devices to further decrease the capacitive coupling which bypasses the isolation device.

## **2.04 ENVIRONMENTAL REQUIREMENTS**

- A. Physical
  - 1. The NVIP assembly shall work in the physical environment of the TCR. These environmental requirements are:
  - 2. Operating temperature range: -22 to +158 degrees F. (30 to +70 degrees C.)
  - 3. Operating humidity range: 5 to 95 R.H., non-condensing
  - 4. Vibration suppression: Shock mounted
  - 5. Cooling system: Radiant plus natural convection (no fans)
- B. Electrical
  - 1. The NVIP assembly shall work in the electrical environment of the TCR. The Contractor shall assess this environment, considering the factors stated in Section 16914.1.03 of these Specifications, and the characteristics of the equipment he is providing under this Contract. All inputs, outputs, power connections and communications lines, if any, shall be immune to the effects of lightning (except in the case of a direct stroke to the building which houses the NVIP) and to surges or transients to which they may be subjected. In addition, the equipment to be provided under the requirements of this Section shall conform to the following requirements:
    - a. Conducted and radiated radio frequency energy at all frequencies shall be attenuated to a level which will not interfere with the operation of a radio transceiver with a self-contained antenna operating at any normal communications frequency.
    - b. The operation of a radio transceiver, transmitting radio frequency energy at any normal communications frequency with ten (10) watts of power into an attached antenna, shall not cause malfunction of the microprocessor or the I/O devices. This and the previous requirement shall be met when the end of the antenna is within three inches of any external part of the NVIP equipment.
    - c. The NVIP shall operate without loss of continuity during power outages lasting as long as three times the transfer time of the automatic transfer switch approved and provided for this Contract.
    - d. The NVIP shall be immune to electrostatic discharges to all devices and surfaces exposed to human touch during operation or servicing.

## **2.05 PROGRAMMING REQUIREMENTS**

- A. The Contractor shall provide a means of programming and testing the NVIP system, initially and as any subsequent changes, improvements, and replacements may be required. This means shall take the form of a test fixture and, if necessary to operate a fixture, a program. Both the fixture and the program shall become the property of the Authority when the installation is accepted. See Section 16927, ATC Microprocessor Support Systems. The application software shall be written in Boolean expression (i.e.; \*, +, etc.).

- B. The Contractor shall exercise special care in the design of the program to select an order of processing which does not cause any unwanted or unsafe results.
- C. The Contractor shall provide a user-friendly software program to generate equivalent relay logic circuits for the NVIP logic systems. This program may be combined with a program to create equivalent circuits for the STAP Systems. See Section 16924, Non-Vital ATO & ATS Processor Systems.

## 2.06 DIAGNOSTICS

- A. Internal
  - 1. The Contractor shall provide the NVIP system with one or more Diagnostic Routines as outlined herein. The degree or refinement of such routines is at the discretion of the Contractor who is reminded that the diagnostics he furnished will be instrumental in meeting the time-to-restore requirements shown in the Technical Appendix (Section 16996). The minimum requirements follow, but the Contractor shall be alert for ways to extend these requirements in any way practicable to make the system more reliable and easier to maintain. The minimum diagnostic requirements are:
    - a. The Contractor shall provide one or more Diagnostic Routines which shall continuously monitor the operation of the NVIP and shall "remember" and indicate both on-going and intermittent failures until manually reset in the field. The diagnostic Routine(s) may be implemented in any way the Contractor selects, providing that the results meet the requirements of these Specifications and providing that the methodology meets with the approval of the designated Resident Engineer.
    - b. One output of each NVIP module shall operate a uniquely identified, slow-release relay, named (X) Non-Vital Interlocking Processor Check relay ((X) NVIPCHK), by means of recurring pulses which indicate that the processor module is correctly meeting the requirements of all of the internal diagnostic tests. These tests shall be designed to require the proper operation of as many of the NVIP facilities as possible. (The Contractor may employ some other means of obtaining the operation of this relay, but it must have the prior approval of the designated Resident Engineer.) The opening of the front contacts of any applicable NVIPCHK relay shall energize an associated red LED alarm light on the Track and Alarm Panel and open a circuit to the RTU. This RTU circuit shall also include series front contacts of the Interlocking Vital Processor AVPCHKR and BVPCHKR vital relays. (See Section 16928 and the Contract Drawings.) The opening of this circuit shall cause an indication to be received at Central Control called PROCESSOR FOR INTLKG PROBLEM. For an example see drawing G4b-ATC-I-051.
    - c. The Contractor shall provide diagnostic indicator lights (LEDs) on the visible edge of the printed circuit boards. One of these lights shall be provided to indicate a failure for each individual diagnostic routine, and one additional light shall be provided which shall be illuminated whenever energy is not being provided to the NVIP Check Relay.
  - 2. External
    - a. In addition to the internal diagnostic capability of the NVIP, the Contractor shall provide an external plug-in diagnostic device and associated software. This external device shall have some form of data

memory capability and a CRT display. The software for this device shall be user friendly and menu driven. The diagnostic result(s) shall be displayed on the CRT in English language; no special code or number will be allowed.

- B. The Diagnostic Routines (both Internal and External) shall be thoroughly documented in the maintenance manual provided by the Contractor and described elsewhere in this Section.

**2.07 SPARE REQUIREMENTS**

- A. See Section 16932, Spare ATC Equipment and Selectable Items.

**2.08 TEST FIXTURE REQUIREMENTS**

- B. The Contractor shall provide a complete Shop Test Station to test and maintain all PC boards of the NVIP System to the component level.
  - 1. This NVIP Shop Test Station shall include all VXI based computer controlled test equipment, interfacing devices for all of the various NVIP units to be tested, and associated test programs capable of providing stimulus and measurement facilities necessary to fully test and diagnose faults in the various NVIP units. Self test programs shall be included to diagnose faults in the interface devices.
  - 2. The Shop Test Station shall be capable of providing fault isolation in the NVIP printed circuit boards to the following Ambiguity Levels:
    - a. For Active Element Groups (AEGs)

<u>No. of AEGs</u>	<u>Percent of the Time</u>
One (1)	80
Three (3) or less	90
Five (5) or less	100

- b. For Components Not Part of an AEG

<u>No. of Components</u>	<u>Percent of the Time</u>
One (1)	80
Three (3) or less	90
Five (5) or less	100

- 3. The NVIP Shop Test Station shall consist of a VXI Test Set, Part No. 9803-10000 as manufactured by RJO Enterprises, Inc., Hunt Valley, MD, and associated test programs and interfacing devices for the units to be tested, unless otherwise directed by the designated Resident Engineer. See Specific ATC Test Device Item 13 in Section 16931.1.01 H.
- 4. Equipment for repair of printed circuit boards shall not be considered part of this requirement. See Section 16927.
- C. The Shop Test Station for NVIP PC boards shall include one of each type of working PCBs (e.g., CPU, I/O) used in the NVIP, and shall have the capability necessary to test all NVIP PCBs, including the NVIP CPU provided under this Contract.
- D. In addition to the Shop Test Station for NVIP PC Boards specified in Part 2.08 A., the Contractor shall provide two Non-Vital Interlocking System (Shop) Test Fixtures. Each of these test fixtures shall include all devices necessary or desirable to set-up, inspect, monitor, maintain or facilitate the repair of the NVIP System. This shall include test devices

capable of troubleshooting the NVIP System by means of step-by-step sequential diagnostic operation. These two NVIP System (Shop) Test Fixtures shall be considered to be Specific ATC Test Devices, as specified in Section 16931.1.01 H., Item 11.

- E. The Contractor shall provide a complete set of Test EPROMs for the NVIP functions.
- F. The Contractor shall not include as part of the equipment furnished for this requirement any instrument or test device duplicated in response to the requirements of other Sections of these ATC Specifications.

## **2.09 SUPPLY MATERIAL REQUIREMENTS**

- A. The Contractor shall provide, if necessary for the operation of Train Control equipment supplied under this Contract, paper, ribbon and any other consumable supplies sufficient for one year of operation. Unless the supplies are readily available, the name and address of the source of further supplies shall be furnished to the designated Resident Engineer as a separate document.

## **2.10 INSTRUCTION MANUAL REQUIREMENTS**

- A. The Contractor shall provide three types of Maintenance Manuals which cover, to the board level, all items of hardware and software included as part of the working system and the maintenance system of the NVIP.
- B. These manuals shall comply with the special requirements of this section and the general requirements of Section 16992, ATC Instruction Manuals.
- C. The first manual which the Contractor shall provide shall be an Operator's Training Manual which covers the operation of the emergency control panel. It shall be written for an educational level limited to the 12th grade only.
- D. The second manual which the Contractor shall provide shall be a Field Maintainer's Manual intended for the signal maintainer. This manual shall contain basic information about the applicable computer processor systems as follows:
  - 1. Complete Memory Map and I/O Map. Table of addresses and data necessary to access all parts of the system.
  - 2. Complete theory of circuit operation for both the operational systems and the test devices.
  - 3. Complete description of a method of trouble-shooting the processor system kernel (microprocessor, address decoding, ram, DMA, etc.,) to be used when the system kernel fails.
  - 4. A listing of waveforms frequencies, voltages and other appropriate measured conditions when taken with PC board(s) in reset at major outputs of circuits. (With all signal lines labeled.)
  - 5. Complete System parts list with IC data sheets for both the operational equipment and the test device(s).
  - 6. Description of a power-on, self test which will display error code(s) indicating which "part" has failed, e.g., rom check sum, DMA, timer, serial, PPI, etc.
  - 7. Description of a diagnostic test either burnt into the operational EPROM or accessible by exchanging the operational EPROMs with diagnostic EPROMs.
  - 8. A complete listing of the code for the operational EPROMs.
  - 9. A complete listing of the code for the test and diagnostic EPROMs.
- E. The Field Maintainer's Manual shall be written for instruction of Authority personnel with an

educational equivalent of 12th grade plus two years in a general electrical technical school. (The Contractor shall not consider two years in a computer programming school as being equivalent to two years of electrical technical school training).

- F. The Field Maintainer's Manual shall be clearly organized into two maintenance levels. They are:
  - 1. Level 1 - This level shall cover the detection of problems occurring in the field, TCR wiring, equipment modules and the input and output boards of the processor. This level is intended for the use of general maintenance personnel, and the manual shall so state.
  - 2. Level 2 - This level shall cover the detection and replacement of a malfunctioning board other than the input and output boards. It shall describe how this can be accomplished using the facilities of the Alarm Panel and the diagnostic routines. This level is intended for specially trained maintenance personnel and their supervisors and the manual shall so state.
- G. The third type of manual which the Contractor shall provide shall be the Engineer's Programming Manual. It shall consist of all the documentation provided by the programming system manufacturer and shall provide all information on the use of the equipment and the software provided with the system. This documentation is meant for engineers with experience in the design of signal and interlocking systems. Documentation describing the programming of the NVIP system shall be submitted to the Engineer for approval at least 45 days prior to the factory testing of the first NVIP system. Six copies of this manual shall be provided.
- H. Manuals which do not meet these requirements will not be approved.

## **PART 3 - EXECUTION**

### **3.01 DELIVERY, STORAGE AND HANDLING**

- A. The Contractor shall take whatever measures may be necessary to protect the NVIP modules from damage or marring during shipment, installation and testing and until the Authority accepts the system. If the equipment suffers any damage, from whatever cause, during this period, the Contractor shall replace or repair it to a like-new condition, to the satisfaction of the designated Resident Engineer at no additional cost to the Authority.

### **3.02 INSTALLATION**

- A. The Contractor shall install the NVIPs along with their associated vital relay interlocking circuitry, in appropriate TCRs or TCERs provided by the Authority for this purpose. The equipment shall be installed on equipment racks as required in these Specifications and as shown on the Contract Drawings.
- B. Each NVIP installed shall be complete with its program and all appliances necessary to provide the non-vital portion of a complete interlocking system which operates as required by these Specifications and is readily maintained.
- C. The NVIP shall be interconnected and tested with its DTS interface equipment and associated vital relay interlocking circuitry as required elsewhere in these Specifications and as shown on the Contract Drawings.

### **3.03 TESTING**

- A. The Contractor shall factory test each completed NVIP according to a test procedure which has been prepared in accordance with Section 16980 of these Specifications and approved by the designated Resident Engineer. Field conditions shall be simulated for this test. This test may be witnessed by the designated Resident Engineer. This test shall be successfully completed and the results approved by the designated Resident Engineer before the equipment is shipped from the factory to the job site.
- B. The Contractor shall field-test the installed NVIP according to a series of field tests described in these Specifications, prepared by the Contractor and approved by the designated Resident Engineer.
- C. The Contractor shall notify the designated Resident Engineer at least one week before the commencement of each of the specified factory and field tests unless otherwise directed by the designated Resident Engineer.
- D. At the conclusion of the testing of the NVIP, the Contractor shall deliver to the Authority three copies of the complete program documentation. The program shall be labeled at this time as Revision 1. Subsequent changes, if necessary, shall bear subsequent revision numbers.
- E. The final revised program shall be entered into the memories of the spare equipment installed in the working system. When approval of the test has been received, the Contractor shall install the regular equipment in the system and repeat the tests. This equipment shall then be left in the system.
- F. If, upon completion of the final field testing, any change in the program is deemed necessary by the Contractor, the designated Resident Engineer shall be informed, and with his approval, the change shall be made. When the change has been completed and the log book filled out, the Contractor shall repeat the cycle of testing described in the previous paragraph.

### **3.04 DOCUMENTATION**

- A. The Contractor shall produce the required test procedures, program listings, test reports, drawings and aperture cards at the times required by these Specifications, and keep the drawings up-to-date during installation.
- B. The Contractor shall produce the required maintenance manuals and training course submittals at the times required by these Specifications.
- C. The Contractor shall provide a Software Configuration Log-book which shall be utilized commencing with the approval of the design submittal and continuing until Final Acceptance of the installation. This book shall be used to register dated entries describing every change made to the program or equipment and the reason the change was made. It shall be written in a detailed, step-by-step narrative, and shall include cross-references to all program changes. Failure to provide and utilize this logbook will delay, and may prevent, the approval of all the test reports associated with the field testing of the processor. At final acceptance, this logbook shall become the property of and be delivered to the Authority.

### **3.05 TRAINING REQUIREMENTS**

- A. The Contractor shall provide two training courses, (described in B. and C. below) which shall be called, respectively, the Maintainer's Training Course for Interlockings, and the Engineer's Training Course for Interlockings. Training aids shall be liberally employed

where helpful to illustrate the devices and principles being described. Firmware such as flip charts, transparencies and slides shall become the property of the Authority at the conclusion of the section presentation of each course. The Contractor's instructor(s) shall cooperate with the Authority in the videotaping of the course presentations.

B. Maintainer's Training Course for Interlockings

1. The Contractor shall provide on the Authority's premises, for its signal maintenance personnel, four presentations of a course of classroom and hands-on instruction in the operation and maintenance of complete interlocking signal systems. This course shall include special emphasis on the NVIP system. The course shall be not less than 5 days nor more than 10 days in length. Each presentation of the course shall accommodate 12 persons designated by the Authority.
  - a. The first two presentations of this course shall occur consecutively during the final installation stages of the NVIPs. The third and fourth presentations shall be at later dates within one year from the date of the first two; the exact dates to be determined at the mutual consent of the Authority and the Contractor. These instruction courses shall be at no additional cost to the Authority.
  - b. This instruction shall be based on the Field Maintainer's Manual, described in Section 16992.2.10, paragraphs D., E., & F.
  - c. This instruction shall cover all aspects of operation and maintenance of the wayside and TCR equipment related to the NVIPs. It shall include but not be limited to the following:
    - 1) Vital and Non-Vital Functions of Interlockings
    - 2) Track Circuits
    - 3) AF Track Modules
    - 4) Microprocessors
    - 5) Microprocessor programming and changes
    - 6) Trouble shooting
    - 7) Diagnostic routines
    - 8) Maintenance procedures
    - 9) Preventative maintenance
    - 10) Interlocking Control Panel Operation
    - 11) NVIP Alarm Panel Operation
  - d. This course shall be designed for an educational level of 12th grade plus 2 years in a technical school.
  - e. This course shall include "hands-on" instruction for each participant in identifying and replacing defective boards through the use of the test fixtures provided by the Contractor. The Contractor shall supply, at no further cost to the Authority, a set of defective boards for use in this test. There shall be enough boards so that successive course participants are not bored by locating the same defective board.
  - f. This course may be combined with a similar course for the Interlocking Vital Processor Systems. See Section 16928.

C. Engineer's Training Course for Interlockings

1. The Contractor shall provide on the Authority's premises, for certain engineering personnel, one presentation of a course of classroom and hands-on instruction in the programming, maintenance, and reprogramming of the NVIP system to the board level. The course shall be not less than five days nor more than 10 days in length. The presentation of the course shall accommodate up to 12 persons designated by the Authority.
  - a. The presentation of this course shall occur during the final installation stages of the NVIPs and shall be made at no additional cost to the

- Authority.
- b. This instruction shall be based on the Engineer's Programming Manual described in Part 2.10 G.
  - c. This instruction shall cover all aspects of setup, programming, operation and maintenance of the NVIP equipment. It shall include, but not be limited to the following:
    - 1) Programming Techniques
    - 2) Compiling
    - 3) Setting and Erasing Memory Devices
    - 4) Locating Defective Board Components
    - 5) System Operation
    - 6) Reliability Consideration
    - 7) Trouble Shooting
    - 8) Diagnostic Routines
    - 9) Maintenance Procedures
  - 2. This course shall be designed for an educational level of 12th grade plus a Bachelor's Degree in Engineering or its equivalent.
  - 3. This course shall include "hands-on" instruction for each participant in programming, reprogramming and identifying and replacing defective board components through the use of the Contractor's test fixtures (made available by the Contractor at no additional cost to the Authority), and the NVIP unit(s) provided to the Authority by the Contractor for training purposes. The Contractor shall supply, at no additional cost to the Authority, a set of boards with various defective components for use in this test.
- D. These training courses shall be organized in accordance with the requirements of this Section and Section 16993, ATC Training Courses.

### **3.06 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. No separate payment will be made for NVIPs as such. The cost of the NVIPs shall be included in the ATC Design Engineering, Material & Fabrication, and Installation costs for this Contract. The NVIPs will be measured for partial payments based upon the number of complete NVIP systems required by these Specifications which are delivered, installed, field tested, documented and approved.
- B. For purposes of measurement for partial payments, the NVIP systems shall include all mounting hardware inter-connecting wiring, and NVIP Test Fixtures.
- C. The following conditions will be considered when measuring the NVIPs for partial payments:
  - 1. Delivery by the Contractor of the NVIPs, provided approval has been given of their Factory Test Reports.
  - 2. Installation of the NVIPs and all interconnecting wiring by the Contractor, provided approval of the installation has been given by the designated Resident Engineer.
  - 3. Level "A" or Level "B" partial system acceptance of the location involved.
  - 4. Delivery by the Contractor of the approved NVIP as-built drawings, aperture cards and program listings.
  - 5. Approval by the designated Resident Engineer and receipt by the Authority of the Maintenance Manuals.
  - 6. Approval by the designated Resident Engineer of the documentation for: the NVIPs; the NVIP Test Fixtures; the various NVIP-related Training courses; and for the satisfactory completion of the various NVIP Training Course presentations.
  - 7. Delivery of the NVIP test fixtures and final acceptance of these devices by the Authority.

- D. The Shop Test Station for NVIP PCBs and the System (Shop) Test Fixtures for the Non-Vital Interlocking Processor Systems will be measured for payment as specified in Section 16931.3.02 C.

**END OF SECTION**

## SECTION 16927

### ATC MICROPROCESSOR SUPPORT SYSTEMS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing, installation, testing and documentation of microprocessor-based service systems to support the programming, maintenance and modifications for all ATC microprocessor systems provided by the Contractor under this Contract. These service systems are referred to as Microprocessor Support Systems (or more simply as MPS Systems), and Drawing Editor Systems.

##### 1.02 DESCRIPTION

- A. The MPS Systems shall be designed to be used with the required Training Courses to develop the Authority's engineering familiarity with the operating microprocessor system(s) provided under this Contract.
- B. Each of the MPS Systems shall include all of the equipment, fixtures, software and instructional information necessary to program, reprogram and maintain all of the microprocessor systems provided under this Contract.
- C. Provide six complete desktop type Microprocessor Support Systems: three for WMATA Design Engineering and three for WMATA Operations Engineering.
- D. Provide two portable Microprocessor Support Systems: one for WMATA Design Engineering, and one for WMATA Operations Engineering. Each of these portable MPSs shall be of the highest speed and maximum RAM commercially available, and shall include a 1.44 MB 3-1/2" internal Read/Write Floppy Drive, CD ROM drive with communication printer and USB port, modem, PROM Burner, an additional battery, and a carrying case.
- E. The Contractor shall provide two complete Drawing Editor Systems, one for WMATA Design Engineering, and one for WMATA Operations Engineering.

##### 1.03 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16911 Scope of ATC Work
  - 2. Section 16918 Special ATC Requirements for Specific Locations
  - 3. Section 16924 Non-Vital ATO & ATS Processor Systems
  - 4. Section 16926 Microprocessor Systems for Non-Vital Interlocking Functions
  - 5. Section 16928 Interlocking Vital Processor Systems
  - 6. Section 16992 ATC Instruction Manuals
  - 7. Section 16993 ATC Training Courses

##### 1.04 MPS SYSTEM DESIGN

- A. Each desktop MPS system shall consist of an IBM-type microprocessor complete with the programs and all necessary peripherals to analyze, program and reprogram the memory devices used with all the various microprocessor systems furnished as part of the ATC systems provided under this Contract. With the MPS System it shall be possible to program the various microprocessor systems from their relay circuits or from the Boolean equivalents

thereof. The process shall be "user friendly" and easily understood from reading the Instruction Manuals furnished by the Contractor with the respective operating microprocessor systems. (See Sections 16924, 16926, and 16928.)

- B. The Contractor shall provide, as part of each MPS System, a simulator program for each type of operating microprocessor-based system to be provided under this Contract. The simulator program(s) shall check the results of the individual system programming effort. These simulators shall be adequate to locate and identify logic errors in the "circuit" designs entered into the individual operating microprocessor system programs. The simulator program(s) shall also be "user friendly" and easily understood from reading the Instruction Manual for the applicable associated operating microprocessor system.
- C. The Contractor shall provide, as part of each MPS System, software programs that can generate equivalent, relay-style circuits represented by applicable WMATA nomenclature, from program logic provided under this Contract.
- D. Each MPS System shall be a complete system in itself, but the Contractor shall include all cables, connections and interface facilities necessary to allow the MPS System to be used in conjunction with the System Test Fixtures for all the related operating microprocessor systems provided under this Contract, at no additional cost to the Authority.

## **PART 2 - PRODUCTS**

### **2.01 EQUIPMENT AND SOFTWARE**

- A. The Microprocessor Support Systems shall be COMPAQ or DELL, with Intel processor, unless otherwise specified. All MPS equipment shall be of the latest generation, highest speed, and maximum capacity commercially available, at the time of delivery, unless otherwise directed by the designated Resident Engineer.
- B. Equipment for each MPS System shall include Universal EPROM burners with all available accessories to reprogram the various microprocessor systems provided under this Contract as well as the Authority's existing microprocessor systems.
- C. Each of the six MPS Systems to be provided shall include, in addition to items previously specified, the following new equipment and software or approved equal:
  - 1. Hardware
    - a. Latest generation with highest available clock cycle Intel Processor, minimum 2-level Cache of maximum size, minimum 100 Hz I/O Bus, and appropriate Power Supply in full Tower Case, with:
      - 1) Maximum RAM Memory offered by the manufacturer.
      - 2) Maximum capacity available Hard Drive with integrated PCI ULTRA-Fast-SCSI-2 or latest generation state-of-the-art Controller. (8 ms or better access time and 160 MB/sec minimum transfer rate). Mandatory partitioning of the disk will be indicated to the Contractor for implementation prior to delivery.
      - 3) Latest generation Video Graphics Card with maximum size WRAM with Graphic Accelerator.
      - 4) 17.3" diagonal, Low Emissions, 1600x1024 pixels at 60 Hz. 110 dpi (minimum resolution) Non-Interlaced, thin film transistor (TFT) active-matrix liquid crystal display (AMCLD) flat panel, digitally controlled, minimum 75 MHz refresh rate, 0.23 mm Dot Pitch Color Multiple Scan, Non-glare and Anti-Static screen monitor, for local bus system.
      - 5) 1.44 MB 3-1/2" internal Read/Write Floppy Drive with 720 MB

- Capability.
- 6) Latest generation with highest speed and transfer rate internal minimum 650 MB SCSI Read/Write CD Drive (with not to exceed 195 ms access time) capable of reading standard CD formats and read/write 650 MB re-writeable disc
  - 7) Latest generation internal DVD Drive.
  - 8) Latest generation with highest speed and transfer rate with minimum available access time, read only minimum 3 CD changer drive.
  - 9) Latest generation internal digital video disk player.
  - 10) 3-Button Mouse, Microsoft or compatible.
  - 11) Latest generation Windows compatible Keyboard.
  - 12) Latest generation business digital Audio Card (Sound Blaster or compatible) with necessary number of high quality, 55 watt, Base, Treble and Volume individually controllable, with surround sound speakers.
  - 13) Latest generation AWE 32 w/ASP chip set Internal SCSI, minimum 25 percent of Hard Drive capacity Tape Backup.
  - 14) Latest generation with highest speed V.42bis Internal Voice/Data/Fax Modem.
  - 15) Digital Video Camera port and additional two parallel and minimum four Comm. serial ports, four USB ports, fully equipped for Plotter, Scanner and PROM Burner connections.
  - 16) IBM Token Ring 16 mbps PCI Network Card.
  - 17) Latest generation HP Laser Jet Printer with minimum 600x600 DPI resolution, maximum internal memory, and applicable drivers, and optional accessories, such as software selectable dual paper trays, envelope feeder and straight through paper paths with complete mechanism.
  - 18) DOS/WINDOWS/OS2 Software Drivers for above mentioned equipments.
  - 19) Electronic A/B/C/D Switch and applicable equipment to connect furnished PROM burners.
  - 20) Latest generation HP ScanJet Scanner with paper feeder and optional accessories, such as OMNI Page Pro software and other drivers, or compatible full page, with complete mechanism.
  - 21) Latest generation 3½" Laser Stereo Diskette Drive with 720 KB, 1.44 MB and 120 MB Read/Write capability.
  - 22) Highest capacity, Min. 200MB Zip Drive.
  - 23) Latest generation Digitab with interface cursor and ACAD template compatible with AUTOCAD supplied.

2. Software:

- a. Software, with complete set of Manuals, for each Microprocessor Support System as follows:
  - 1) Latest version of MS-DOS (Minimum 6.2).
  - 2) Latest version of MS Windows for the desktops and portables.
  - 3) Latest version of MS Windows for the servers.
  - 4) Latest version of MS Windows compatible Sound System, with voice recognition and microphone.
  - 5) Latest version of PROCOMM PLUS for Windows.
  - 6) Latest version of Norton SYSTEMS WORKS.
  - 7) Latest version of DELRINA WINFAX Pro for Windows.
  - 8) Latest version of AUTOCAD and AUTOCAD Support software and Libraries for Electrical and Electronic design.
  - 9) AUTOCAD Lite software which is compatible with above AUTOCAD and other generic CAD systems.

- 10) Language Compiler compatible with Contractor's development software and Block Design software.
  - 11) Latest version of Corel Office Professional.
  - 12) Latest version of Corel Draw.
  - 13) Latest version of MS Office Pro for Windows.
  - 14) Latest version of MS Project Manager.
  - 15) Software Drivers for Drawing Editor Systems to be provided under this Contract.
  - 16) A state-of-the-art Boot Manager (e.g., "System Commander") capable of running multiple operating systems, selectable during boot time.
  - 17) All software shall be installed on site and debugged by the Contractor, with proper Hard Drive partitioning appropriate for DOS, Windows, OS/2 Boot Manager, OS/2, and DATA. All software shall be delivered in both diskette and CD ROM media, when available.
3. Magnetic Media
- a. The following items shall be furnished for each micro-processor system (8 sets total):
    - 1) 12 Back-up tape cassettes compatible with supplied tape back-up units.
    - 2) 50 Re-writeable disks for above CD Drive.
    - 3) 12 LS-120 Diskettes.
    - 4) 12 Zip Disks
- D. Drawing Editor Systems
1. The Contractor shall provide two complete ATC Drawing Editor Systems (Cadcam Computer Systems).
  2. Each Drawing Editor System shall include all items specified for an MPS system, with the following exception:
    - a. The monitor for the Drawing Editor System shall be 21 inch instead of 19 inch.
  3. Each Drawing Editor System shall also include the following:
    - a. Latest generation HP Color Design Jet Plotter (complete with paper roll holder stand and automatic paper cutter), with automatic switch and necessary cabling to provide remote access from up to six MPS Systems in addition to access from the Drawing Editor System.
  4. Latest generation HP Laser Color Printer with all optional accessories including , but not limited to, software selectable multiple paper trays (letter, legal, and 11"x17"), straight through paper paths and applicable drivers.
  5. One complete set of high quality computer furniture to house and store the equipment of the Drawing Editor System, and a swivel chair for the operator.

## **PART 3 - EXECUTION**

### **3.01 DELIVERY, STORAGE AND HANDLING**

- A. The Contractor shall deliver the equipment and software for the desktop and portable Microprocessor Support Systems, and the equipment, software and furniture for the Drawing Editor Systems, to the locations designated by the designated Resident Engineer approximately 30 calendar days prior to the ORD.
- B. The Contractor shall take whatever measures may be necessary to protect the MPS System equipment and furniture from damage or marring during shipment, installation and testing, and until the Authority accepts the systems. If the equipment or furniture suffers any damage, from whatever cause, during this period, the Contractor shall replace or repair it to

a like-new condition, to the satisfaction of the designated Resident Engineer, at no additional cost to the Authority.

### **3.02 INSTALLATION**

- A. The Contractor shall unpack all MPS and Drawing Editor System hardware and software, and set up and properly interconnect the various pieces of equipment comprising the MPS Systems and Drawing Editor Systems, and install all applicable software at the location(s) designated by the designated Resident Engineer.
- B. The Contractor shall arrange the System equipment and furniture in accordance with layouts previously approved by the designated Resident Engineer.

### **3.03 TESTING**

- A. The Contractor shall perform all initial testing of the various components of the MPS Systems and Drawing Editor Systems as recommended by the equipment manufacturers.
- B. The Contractor shall design, document and perform all other tests of the MPS Systems and Drawing Editor Systems which may be necessary to ensure proper operation of the Systems.

### **3.04 MAINTENANCE**

- A. Maintenance of the Microprocessor Support Systems and the Drawing Editor Systems shall be provided by the Contractor for the duration of the Contract, and for three years following formal acceptance of the Systems by the Authority.

### **3.05 INSTRUCTION AND TRAINING**

- A. The Contractor shall include training and instruction for the operation of the Microprocessor Support Systems and the Drawing Editor Systems in the training and instruction manuals and Training Courses required for the microprocessor-based systems included in this Contract. See Section 16924, Non-Vital ATO & ATS Processor Systems; Section 16926, Microprocessor Systems for Non-Vital Interlocking Functions, and; Section 16928, Interlocking Vital Processor Systems.

### **3.06 ACCEPTANCE**

- A. The MPS Systems and Drawing Editor Systems will not be formally accepted by the Authority until all of the following have been completed by the Contractor in a manner acceptable to the designated Resident Engineer:
  - 1. Delivery by the Contractor of all of the System hardware (and any applicable furniture) to the site designated by the designated Resident Engineer.
  - 2. Complete installation of the System and all interconnecting wiring by the Contractor, provided prior approval of the proposed installation layout has been given by the designated Resident Engineer.
  - 3. Delivery and on-site installation by the Contractor of the approved software and program listings for the System, and successful on-site testing of all required programs by the Contractor.
  - 4. Receipt by the Authority and approval by the designated Resident Engineer of the Instruction Manuals specified for the applicable type of System provided under this Contract.
  - 5. Approval by the designated Resident Engineer of the documentation for the applicable related classes of instruction and the satisfactory presentation of the applicable classes.

### **3.07 MEASUREMENT AND PARTIAL PAYMENTS**

- A. Payment for desktop and portable Microprocessor Support Systems, and Drawing Editor Systems will be based upon a unit price for each as specified in the CPM Price Schedule.
- B. The factors which will be considered when measuring an MPS System or Drawing Editor System for partial payments are those listed in Part 3.06, ACCEPTANCE.
- C. Partial Payments for desktop and portable Microprocessor Support Systems, and Drawing Editor Systems will be made as follows:
  - 1. Upon delivery of all individual System hardware and (if applicable) furniture to the designated site 15% of CPM Unit Price
  - 2. Upon installation and interconnection of each individual system by the Contractor 15% of CPM Unit Price
  - 3. Upon delivery, installation and satisfactory testing of all required software programs for the individual System 40% of CPM Unit Price
  - 4. Upon receipt by the Authority and approval by the designated Resident Engineer of the applicable related Instruction Manuals or the individual System 10% of CPM Unit Price
  - 5. Upon receipt by the Authority and approval by the designated Resident Engineer of the Documentation for the applicable related classes of instruction and the satisfactory presentation of the applicable classes 10% of CPM Unit Price
  - 6. Upon approval and formal acceptance of each individual System by the Authority 10% of CPM Unit Price

### **3.08 DISPOSITION**

- A. The equipment and software of the Microprocessor Support Systems and Drawing Editor Systems shall become the property of the Authority upon delivery to the Authority and formal acceptance of the Systems by the designated Resident Engineer.

**END OF SECTION**

## SECTION 16928

### ATC - INTERLOCKING VITAL PROCESSOR SYSTEMS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of systems of equipment modules, each of which constitutes a fail-safe, microprocessor-based, redundant controller with the capability of performing safely certain vital functions involved in the control of a vital interlocking. This controller system shall be referred to herein as an Interlocking Vital Processor (IVP) system, and shall contain two complete Vital Processor-I/O Systems configured as specified in Part 2 of this Section.

##### 1.02 DESCRIPTION

- A. Vital interlocking functions shall be performed electronically by the IVP Systems using logic equivalent to that shown on the Contract Drawings unless otherwise specified in this Section.
- B. The area of the WMATA right-of-way controlled by each IVP System shall be limited to one interlocking. The area influenced by the performance of the IVP shall be limited to an interlocking and the adjacent mainline area, but only to the distance that a "stop" aspect of that interlocking signal has an effect.
- C. It is recognized that a manufacturer of an Interlocking Vital Processor System may supply separate subsystems (each possibly consisting of more than one processor module) for "vital" and "non-vital" processing. This is acceptable under these Specifications. Alternatively a manufacturer may utilize two or more processors for the combined processing of both the "vital" and "non-vital" tasks. The non-vital functions shall be as specified in Section 16926, Microprocessor Systems for Non-Vital Interlocking Functions. Functions or equipment of the non-vital processor (or portions of a processor) shall not interfere with the safe operation of the Interlocking Vital Processor System (or portions of such a system).
- D. It is the intent of this Section that the Contractor shall provide one complete, safe, fully operational Interlocking Vital Processor System for each of the (*how many*) new interlockings included in the area of this Contract (as delineated in Section 16911, Scope of ATC Work, and Section 16918, Special ATC Requirements for Specific Locations, and one additional IVP system for use at the WMATA training facility.
- E. In the design of the logic for the IVP the Contractor shall comply with the requirements of Section 16917, Basic Interlocking Requirements, and to the logic design inherent in the relay-type Circuit Drawings included in these Specifications. In the design and fabrication of the IVP Systems, the Contractor shall comply with the requirements of all applicable Sections included in these Specifications except as necessary to accommodate the IVP Systems in a manner approved by the Designated Resident Engineer.
- F. The Contractor shall provide separate vital I/Os for the redundant vital, fail-safe processor units comprising each Interlocking Vital Processor System for all of the applicable circuits classified as "Vital" in Section 16916, Basic ATC Circuit Requirements. Non-vital processing, and non-vital inputs and outputs may be utilized for those circuits classified as "Non-vital" in Section 16916.
- G. The Contractor shall implement the circuits which are listed in Section 16916.1.05.B as being composed of both "Vital" and "Non-Vital" circuit components in a manner approved by the designated Resident Engineer.

- H. The Contractor shall interface the IVP System processors to the local Interlocking Control Panel (or Panels), Remote Terminal Unit and, where applicable, to the Wayside Pushbuttons, providing non-vital inputs and outputs for interconnection to the indicators and manual controls thereon.
- I. The Interlocking Vital Processor System shall be capable of performing non-vital interlocking tasks and functions within the geographical interlocking area specified in Part 1.02 C. above, and may replace non-vital relays and timers utilized in performing those interlocking tasks. See Section 16926.
- J. Each Interlocking Vital Processor System shall be configured, and function, as specified in Part 2.01, General Requirements, and as indicated on the Contract Drawings.
- K. The Contractor shall provide training courses for personnel maintaining the IVPs. The courses shall be in accordance with the requirements of this Section and Section 16993, ATC Training Courses.
- L. The intent of this Section is that the Contractor shall provide complete, fail-safe, redundant, vital processor systems, configured as specified herein, which operate to control interlocking areas of the WMATA METRO RAIL System in complete harmony with the current WMATA ATC System and all of its sub-systems.

**1.03 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to:
  - 1. Section 16904 Current Automatic Train Control System
  - 2. Section 16911 Scope of ATC Work
  - 3. Section 16914 Environmental Requirements
  - 4. Section 16915 Basic ATC Equipment Requirements
  - 5. Section 16916 Basic ATC Circuit Requirements
  - 6. Section 16917 Basic Interlocking Requirements
  - 7. Section 16918 Special ATC Requirements for Specific Locations
  - 8. Section 16926 Microprocessor Systems for Non-Vital Interlocking Functions
  - 9. Section 16927 ATC Microprocessor Support Systems
  - 10. Section 16941 Basic ATC Electrical and Electronic Component Requirements
  - 11. Section 16942 Printed Circuit Cards
  - 12. Section 16945 Plugboards and Cabinets for Relays and PC Cards
  - 13. Section 16948 Plug Connectors
  - 14. Section 16949 Signal Wire and Cable
  - 15. Section 16955 Track and Alarm Indication Panels
  - 16. Section 16956 Interlocking Control Panels
  - 17. Section 16961 Audio Frequency Track and Loop Circuit Layouts
  - 18. Section 16971 Racks and Cable Trays
  - 19. Section 16977 Tagging and Marking
  - 20. Section 16980 ATC Tests, Inspections and Quality Assurance
  - 21. Section 16992 ATC Instruction Manuals
  - 22. Section 16993 ATC Training Courses

**1.03 QUALITY ASSURANCE**

- A. All of the IVP modules and the software programs which are to be installed under this Contract shall be factory tested as a complete system in accordance with a factory test procedure which has been furnished by the Contractor and approved by the designated

Resident Engineer. This procedure shall be generated by the Contractor in accordance with the guidelines set forth in another part of this Section. Factory testing shall not commence until this procedure has been approved by the designated Resident Engineer.

- B. The Contractor shall record the results of these tests on the specified Factory Test Report forms. Items for which Factory Test Reports have not been approved by the designated Resident Engineer, may be shipped to the job site only at the Contractor's risk.
- C. Each item of equipment shall be inspected by the Contractor immediately prior to installation and only those items which have suffered no damage during shipment and subsequent handling shall be installed.
- D. All of the IVP modules and their software programs which have been installed under this Contract shall be field tested after installation in accordance with a field test procedure. This procedure shall be generated by the Contractor in accordance with the guidelines set forth in another part of this Section. Field testing shall not commence until this procedure has been approved by the designated Resident Engineer.
- E. The Contractor shall provide and maintain up-to-date, a diary or log containing a detailed write-up of any and all changes made to the system hardware and software from the time of their approval by the designated Resident Engineer until final acceptance by the Authority, at which time the log shall be delivered to the designated Resident Engineer. This record shall conform to the requirements more fully described in the documentation section of Part 3 of this Section.
- F. The Contractor shall provide Operation and Maintenance Manuals for the IVP Systems. These manuals shall be prepared during the initial phases of the Contract so that they may be approved and delivered to the Authority before field testing commences. These manuals shall be prepared according to guidelines set forth in another part of this Section and in Section 16992 of these Specifications.
- G. The Contractor shall provide "Type Acceptance Testing" for the IVP Vital Processor modules. This Type Acceptance Testing shall be performed at the manufacturer's factory. The testing may be under the surveillance of the designated Resident Engineer and shall be thoroughly documented.
- H. The Type Acceptance Testing shall include, but not be limited to, the following tests:
  - 1. For the VP, complete with I-O Interface
    - a. Full temperature sequence
    - b. Full humidity sequence
    - c. Full vibratory sequence
    - d. Full power voltage variation
    - e. Electrical transient withstand (all external connections)
    - f. Proof of validity and accuracy of the executive or control software, and proof of the vitality of its execution
    - g. Artificial fault simulation of hardware and software (glitch) failures
    - h. Intentional clock frequency variation (plus and minus)
    - i. Broad-band radio frequency interference-output and withstand
    - j. Proof of diagnostic operation.
- I. The factory test for the system, complete with all TCR equipment shall include:
  - 1. All field tests which can be performed in the factory.
  - 2. Train movement simulations (all routes).

#### **1.04 SUBMITTALS**

- A. Furnish within 60 calendar days of receipt of Notice-to-Proceed a submittal consisting of the following four explanatory items. These explanations shall be fully detailed and in plain English. Simple diagrams may be used for clarity. All such diagrams shall be fully explained. A glossary of definitions shall be included to thoroughly define any absolutely necessary technical or unusual words; otherwise, such words shall not be used. Buzzwords, slang, computer jargon and telegraphic writing style shall not be used. The explanatory items are:
1. Explain the method by which vital interlocking safety is ensured in the system which he intends to provide for this Contract. With this explanation, the Contractor shall explain his understanding of the word "vital," and his method of quantifying the hazard rate.
  2. Present a detailed explanation of the method by which he intends to implement the diagnostic requirements of these Specifications. This explanation shall describe the techniques or schemes to be utilized to verify the correct operation of every step of every process included in the information processing.
  3. Present a general explanation of the method by which the maintenance requirements of these Specifications are to be implemented. This explanation shall describe the features of the proposed maintenance program and the test equipment to be supplied for use with the maintenance procedures.
  4. Describe in detail the provisions he has made for repairing the printed circuit boards which are part of the VP modules. This description shall address the following items:
    - a. The period of time for which the Contractor will provide board service.
    - b. What the Contractor plans to do with respect to board services when this time period expires.
    - c. Which boards or devices will be kept in stock at the Contractor's factory and for how long.
    - d. The guaranteed maximum factory turn-around time from receipt of request for new or replacement board or device to shipment of same.
    - e. The Contractor's board replacement policy.
    - f. Whether replacement boards are new or repaired.
    - g. Whether replacement boards would be from Authority returned boards or a general stock.
    - h. The present cost of replacement for each board type.
- B. The preceding four sub-sections of the Contractor's submittal shall provide all of the information necessary to enable the designated Resident Engineer to make a safety and reliability assessment. The Contractor shall assume that the designated Resident Engineer is familiar with basic computer terminology, but that he is not a programmer. The designated Resident Engineer will determine whether or not the equipment which the Contractor intends to supply for the Interlocking Vital Processor System appears to be capable of failing only in a safe mode and whether the diagnostics appear to be capable of detecting these failures. The results of the designated Resident Engineer's evaluation will be used as part of the design review. The outcome of this review shall be in no way construed as lessening the successful bidder's responsibility to provide a safe system.
- C. Submit to the Authority for review documentation for all equipment to be furnished under this Section. The Contractor shall not ship any IVP [TCVP] equipment, except at his own risk, until the review has been completed and the equipment approved. The Authority also recommends that the Contractor not manufacture equipment for this Contract which may not be approved. Therefore, prior to component purchase, or fabrication of the equipment to be supplied under this Section, the Contractor shall deliver to the designated Resident Engineer for approval, the following:
1. Drawings of the proposed equipment modules and test fixtures, including schematic diagrams, arrangement plans, assembly drawings, complete parts lists keyed to the drawings, ordering information, mounting details, internal and external wiring circuits and details, and mechanical and electrical component descriptions to the component level.

2. A detailed fault-tree analysis of the IVP system and its equipment.
  3. The complete field test procedures for the installed and programmed system.
  4. An outline of the course(s) to be provided for Authority class instruction.
  5. An outline of the organization of the system documentation which the Contractor plans to supply according to these Specifications.
  6. A Critical Path Diagram, as required in Section 2 of these Specifications, which lists all of the major milestones set forth in this Section and any additional milestones which the Contractor deems appropriate. The diagram shall show, as a minimum, the number of elapsed working days from Notice-to-Proceed to the listed milestone. All required submittals shall be listed as milestones.
- D. The Type Acceptance Testing documentation shall include, but not be limited to, the details of the interlocking to be simulated, test duration, test equipment and test procedures for the tests to be utilized in proving, to the satisfaction of the designated Resident Engineer, that the Vital Processor and the related system to be supplied will meet all of the requirements of these Specifications.
- E. The Factory Test Procedures for the assembled and programmed equipment modules for the applicable TCR locations shall be in conformance with the requirements specified in Section 16980, ATC Tests, Inspections and Quality Assurance. Approval of the procedures shall be obtained prior to manufacture of the modules. Manufacture without this approval shall be at the Contractor's risk. These test procedures include the testing of all operational aspects of each proposed system, including the emergency Interlocking Control Panels specified in Section 16956. The procedures shall show that the factory tests will be made on the complete system with all of the racks interconnected and with a complete simulation of the field inputs and outputs.
- F. The Factory Test Reports shall be as stipulated by the approved Factory Test Procedures. These reports shall be submitted to the designated Resident Engineer for approval as quickly as possible after the completion of the factory tests. These test reports shall bear the signature of the designated Resident Engineer's representative attesting to the witnessing of the test and its successful conclusion. There shall be a test report for each of the boards (including spares) comprising the VP furnished under this Contract for initial type acceptance testing.
- G. For the Design Review of the equipment to be supplied under this Section, the Contractor shall submit to the designated Resident Engineer, for approval, the following:
1. A listing of all inputs and outputs for each system with easily understood designations of their functions.
  2. A complete and detailed program printout of all software for each IVP System. The program shall be modularized in a logical and easily understood manner. Each module of the program shall be fully documented with plain-English explanations of its purpose and the method by which it accomplishes that task, the modules to which it is related, and the modules of which it is a part.
  3. A description of the program functions and details with flow charts, a programming manual and a key sheet which lists and defines all symbols, abbreviations and other aspects of the program. This shall be one of the first items submitted for review.
  4. A description of, and documentation for, the compiler.
  5. Full documentation for the class of instruction including a revised course outline, course instruction manual, list of course training aids, list of class facility requirements, and class schedule.
- H. Revise the circuits of the Contract Drawings as necessary to show the circuitry external to the VP necessary to accomplish the functions described by the Drawings and Specifications with the VP equipment he plans to provide under this Contract. These revised circuits shall be submitted as part of the Design Review. These circuits shall be complete and continuous

from the point of origin to the point of destination. They shall show all interface terminal connections between the portions at various locations and between the various pieces of equipment. No conductor shall be ended or terminated without some note or reference as to its physical location and specific continuation at some other place. All buses (including ground buses) shall be fully detailed. Twisted pair and shielded wiring shall be identified where utilized.

## PART 2 - PRODUCTS

### 2.01 GENERAL REQUIREMENTS

- A. The IVP System equipment shall meet all of the basic, special and environmental requirements listed in these Specifications.
- B. All application software programs shall be the equivalent of the existing WMATA relay logic.
- C. All application software source code shall be delineated in Boolean expressions.
- D. Each Interlocking Vital Processor System shall consist of two independent, virtually identical Vital Processor - I/O Systems, "A" and "B." Each of the two VP-I/O Systems composing an IVP System shall be capable of performing all of the specified vital interlocking functions for the interlocking controlled by that IVP. One of the VP-I/O Systems shall be "on-line," i.e., its outputs shall be connected (interfaced) to the Automatic Train Protection (ATP) system equipment, while the other VP-I/O System shall be running in "hot-standby" mode, i.e., with its outputs isolated from the ATP System, but ready to go "on-line" immediately and automatically if the other VP-I/O System fails or is removed. The VP-I/O System which is "on-line" shall drive a vital indication relay ("AVPOLR" or "BVPOLR") which shall in turn generate an applicable "PROCESSOR A FOR **INTLKG** ONLINE" or "PROCESSOR B FOR **INTLKG** ONLINE" indication to Central and to the local Track and Alarm Panel. (See the Contract Drawings.)
- E. Each VP-I/O System shall have an Executive (Diagnostic) Routine to monitor its own inputs, outputs and internal operations. Each of these Executive Routines ("A" and "B") shall drive its own Vital Check relay (AVPCHKR and BVPCHKR respectively), so long as no I/O errors or internal failures are detected. Each of these interfacing relays shall generate its applicable local "FAILURE" indication when deenergized. When the "on-line" VP System recognizes a problem, a failure, the IVP System shall immediately (if possible) transfer control to the other (hot-standby) VP System and remove the "problem" VP System from on-line status in such a manner that no problem is caused for the new on-line VP System or for the ATP System.
- F. If the "standby" VP-I/O System is also in a failure mode, or has been removed from service when the operating VP-I/O System experiences an internal failure, the IVP System shall immediately cancel all cleared routes and signals through its applicable interlocking.
- G. Each independent Vital Processor - I/O system in the Interlocking Vital Processor System shall be capable of being isolated and physically removed from its normal mounting in the TCR (for troubleshooting and maintenance purposes), without disturbing the continued normal operation of the other VP-I/O System, i.e., the on-line processor. When both VP-I/O Systems are in place and operating properly, it shall be possible to manually cause the IVP System to switch from one "on-line" VP System to the other.
- H. Each VP-I/O System shall include diagnostic systems as specified in part 2.05 of this Section.
- I. Track circuits shall not be operated or disabled by the IVP systems.

- J. The speed selection circuits for the applicable area of trackage shall be included in the IVP systems, but no speed commands shall be generated by the IVP System.
- K. Vital relays shall be used to interface vital control and indication circuits between the Train Control Room and the trackside equipment.
- L. All internally generated vital variables developed by the vital application logic shall be made available as output bits for future troubleshooting aids. Their status and identity shall be made distinguishable by specially identified LED indicators mounted on the applicable VP logic modules.

## **2.02 MECHANICAL REQUIREMENTS**

- A. Each VP-I/O System shall make use of plug-in circuit boards. Each board shall be labeled with its function, a means of application identification, a serial number, and a model or drawing number.
- B. The program of each VP-I/O System shall reside in a Programmable Read Only Memory located on the processor board, or a separate "memory" board. The memory devices shall be erasable and reprogrammable. A separate plugcoupler dedicated to this function may be provided on the board at a readily accessible location. This plugcoupler shall provide for the connection of suitable programming test fixtures which shall be provided by the Contractor. As an alternative, the Contractor may provide sockets on the boards for the memory devices. In this case, each memory device shall have a complete and unique identification marking. The placement of the wrong memory device on a board shall be detected by the system and power shall be removed from the outputs.
- C. Electro-mechanical memories such as magnetic-media tape and disk drives shall not be used in the VP Systems, except for programming and testing purposes.
- D. The printed circuit boards of the VP modules shall be housed in rigid frames containing a motherboard for the mounting of the printed circuit board receptacles. This motherboard may be either a printed circuit board or a hard-wired plane. The frame shall contain full-length board guides to assure that the plug-in contacts of each plug-in board correctly mate with the motherboard receptacle.
- E. Each plug-in location of the VP modules shall be labeled with the identity of the board type intended for that location.
- F. The Contractor shall provide some form of interlocking device to ensure that plug-in boards of the VP modules cannot be plugged into an incorrect location.
- G. The board frame of the VP shall be constructed and mounted in a manner which allows the free movement of air over the equipment by convection to prevent local hot-spots which could degrade the assembled and mounted equipment and prevent it from meeting the environmental and reliability requirements of these Specifications. No fans or blowers will be permitted for these purposes.
- H. The printed circuit boards or the printed circuit board frame which houses the VP shall be provided with electromagnetic shielding, if necessary to allow the system to meet the electrical environmental requirements of these Specifications.
- I. The Contractor shall provide a dust-resistant cabinet to house the VP. This cabinet shall have dust-resistant doors or removable covers on both the front and back. The front shall be supplied with a safety glass or fire-resistant plastic panel which allows observation of the indicators which may be located on the front of the boards. The equipment shall be immune

to the ambient dust accumulation. TCR dust consists mostly of residues of the train brake wear.

- J. This cabinet shall be of sufficient volume to allow the removal of heat from the boards by internal convection and the removal of heat from the cabinet by radiation and external convection. Fans shall not be employed in the heat removal process.
- K. The board frame shall be located within a zone which does not allow the bottom of the frame to be any closer to the floor than two feet or the top of the frame to be any higher than six feet from the floor. This requirement is for ease of viewing indicators or working on the VP modules.
- L. At the time of the type acceptance test of the IVP System, the printed circuit board frames shall be installed in these cabinets and the doors or covers shall be in place.
- M. The Contractor shall provide as part of the IVP Systems, three sets of all of the equipment and fixtures necessary to program, reprogram and maintain the systems. These fixtures shall include, but not be limited to, a microprocessor-oriented program system. This support system shall be IBM or IBM compatible and shall, as a minimum, include all the features of the computer system described in Section 16927, ATC Microprocessor Support Systems. The system shall include an EPROM burner to reprogram IVP system software.
- N. The Contractor shall provide compiler software maintenance for a period of five years.

## **2.03 ELECTRICAL REQUIREMENTS**

- A. Each VP-I/O System and its associated equipment shall be powered by conservatively rated power supplies or inverters provided as part of its support equipment. These supplies or inverters shall meet the electrical and environmental requirements of these Specifications. At the Contractor's option these supplies or inverters shall operate either from the 120V ac line or the 28V dc (or 12V dc) local power system specified elsewhere in these Specifications. In either case, these supplies or inverters shall be equipped with sufficient transient protection to provide immunity from power line transients as high as six kilovolts (1.5/40 microsecond standard wave).
- B. The input and output signal connections of the VP-I/O Systems shall be fully isolated from the power supply of the processor. This isolation shall be adequate to provide protection from the transient levels encountered in the installation. The Contractor shall be cognizant of the various sources of transient interference that may be encountered in the TCR such as those listed in Section 16914 of these Specifications. The Contractor shall assess and provide protection from this interference.
- C. The output signal potential shall be 28V dc (or 12V dc) nominal and the outputs shall have an adequate and conservatively rated power capability suitable for each application.
- D. Each vital output shall include provision for monitoring the current which flows in the external output circuit. This shall allow the program to check the output circuit to detect unexpected current when the output is supposed to be deenergized. The program shall produce an alarm and fail-safe response when this condition is detected.
- E. Input Monitoring
  - 1. Each vital input shall include provision for monitoring the current which flows into the input channel from the external circuit. The impedance of the input channel shall be low enough to draw sufficient current for the circuitry to ignore false high resistance voltage applications at the input terminal. This low input impedance shall also serve to reduce "noise" interference. The input circuit shall be read as permissive only

- when sufficient current is present.
2. As an alternative, each input shall be monitored in a vital manner.
- F. Outputs shall be provided by the VP-I/O Systems for the control of vital interfacing relays which shall control the illumination of the wayside signals. This circuitry shall be capable of withstanding without damage, the shorting of the output to ground or the opposite ac polarity. Such a short shall register an alarm.
  - G. Provide local system voltage dc output from the VP-I/O Systems for the vital relays which shall be provided for controlling the switch-and-lock movements. These relays shall minimize the amount of equipment to be maintained on the wayside. This shall also allow the use of the same types of switch-and-lock movements that are currently in use on the WMATA Metrorail System.
  - H. All vital inputs and outputs of the VP-I/O Systems shall be capable of being equipped or connected, and programmed in either a unipolar or bipolar mode.
  - I. All vital and non-vital inputs to the IVP Systems shall be provided with de-bounce circuitry so that momentary voltage changes at the time of initial external contact closure, will be ignored.
  - J. One or more ports shall be provided for the transfer of coded input and output information. These ports shall make maximum use of industry standard communications standards and protocol except as necessary to promote safety and security. These ports shall be for the purpose of system expansion, connection of test equipment and other such uses.
  - K. All components of the IVP Systems shall be conservatively rated so that the system is capable of meeting the Mean-Time-To-Restore requirements shown in the Technical Appendix (Section 16996) of these Specifications.
  - L. All vital inputs and outputs utilized in the VP-I/O Systems shall be constructed with a minimum of 1/4 inch creepage distance between all exposed conductors and shall be capable of withstanding a 3000 volt dc breakdown test. The voltage shall be applied between isolated circuits as well as from isolated circuit to ground.
  - M. All printed circuit boards utilized in the VP-I/O Systems shall have a properly applied conformal coating to minimize the effects of moisture.
  - N. All printed circuit boards utilized for inputs or outputs in the VP-I/O Systems shall be designed so that there is minimal capacitive coupling between the circuitry on either side of the isolation devices. Consideration shall be given by the Contractor to the use of a grounded copper track between circuitry on either side of the isolation devices to further decrease the capacitive coupling which bypasses the isolation device.
  - O. A visual indicator, such as a LED, shall be provided on each input and output board to indicate when each applicable input or output for that board is active.
  - P. All vital timing functions shall be field adjustable without software modification, but via jumpers on printed circuit boards in the processor, or jumpers on vital outputs. Means shall be provided for sealing the time setting. The adjustable range of the timers shall be 0 to 300 seconds.

## **2.04 ADDITIONAL ENVIRONMENTAL REQUIREMENTS**

- A. Physical
  1. The VP assembly shall work in the physical environment of the TCR. These environmental requirements are:

- a. Operating temperature range 22 to +158° F. (-30 to +70° C.)
- b. Operating humidity range 5 to 95 R.H., non-condensing
- c. Vibration suppression Shock mounting
- d. Cooling system Radiant plus natural convection (no fans)

B. Electrical

- 1. The VP-I/O assemblies shall work in the electrical environment of the TCR. The Contractor shall assess this environment, considering the factors stated in Section 16914.1.03 of these Specifications, and the characteristics of the equipment he is providing under this Contract. All inputs, outputs, power connections and communications lines, if any, shall be immune to the effects of lightning (except in the case of a direct stroke to the building which houses the VP) and to surges or transients to which they may be subjected. In addition, the equipment to be provided under the requirements of this Article shall conform to the following requirements:
  - a. Conducted and radiated radio frequency energy at all frequencies shall be attenuated to a level which will not interfere with the operation of a radio transceiver with a self-contained antenna operating at any normal communications frequency.
  - b. The operation of a radio transceiver, transmitting radio frequency energy at any normal communications frequency with ten watts of power into an attached antenna, shall not cause malfunction of the microprocessor or the I/O devices. This and the previous requirement shall be met when the end of the antenna is within three inches of any external part of the VP equipment.
  - c. The IVP Systems shall be capable of operating without loss of continuity and with complete safety, during power outages of up to three times the transfer time of the transfer switch provided by the Contractor.
  - d. The IVPs shall be immune to electrostatic discharges to all devices and surfaces exposed to human touch during operation or servicing.

**2.05 PROGRAMMING REQUIREMENTS**

- A. Provide a means of programming the IVP Systems, initially and as any subsequent changes, improvements, and replacements may require. This means shall take the form of test fixtures and, if necessary to operate a fixture, a program. Both the fixtures and the program shall become the property of the Authority when the installation is accepted.
- B. The Contractor shall exercise special care in the design of the VP programs to select an order of processing which does not cause any unwanted or unsafe results.
- C. Provide each VP-I/O System with three forms of diagnostic systems as outlined herein. The degree of refinement in each of these systems is at the discretion of the Contractor who is reminded that the diagnostics he furnishes will be instrumental in meeting the time-to-restore requirement described elsewhere in these Specifications. The three forms of diagnostics are; (1) Executive Routine, (2) Maintainer's Diagnostic System, (MDS) and (3) Engineer's Monitoring System (EMS). The minimum requirements for these systems follow, but the Contractor shall be alert for ways to extend these requirements in any way practicable to make the VP-I/O systems safer, more reliable and easier to maintain. The minimum requirements for these diagnostic systems are:
  - 1. Executive Routine
    - a. Provide an Executive Routine to continuously monitor the operation of each VP-I/O System, and to the greatest extent possible, its peripheral devices. This may be implemented in any way the Contractor selects, providing that the solution includes provisions to meet the requirements of these Specifications and providing that the solution meets with the approval of the designated Resident Engineer.

- b. As part of the Executive Routine, provide a method of verifying the integrity of the input and output circuits.
  - c. In the event that any part of the Executive Routine indicates that an unsafe condition exists within its VP-I/O System, vital provisions within that VP-I/O System shall:
    - 1) Cause the VP-I/O System to attempt to transfer control to the other VP-I/O System (if the troubled VP-I/O System was "on-line" at the time);
    - 2) Disconnect and/or remove energy from the VP-I/O System's vital outputs to the ATP System, and;
    - 3) Remove energy from the applicable Vital Processor Check Relay (VPCHKR).
  - d. The removal of energy from the VP Check Relay of one or both of the VP-I/O Systems shall result in the energization of an "NVIP PROBLEM" alarm LED on the Track and Alarm Panel in the TCR. (See the Contract Drawings.)
  - e. The removal of energy from the VP Check Relay of a VP-I/O System shall result in the energization of the applicable VP FAILURE alarm LED on the local Track and Alarm Panel, to alert the supervisor to call maintenance personnel. (See the Contract Drawings.)
  - f. Some examples of the type of events that shall cause the deenergization of a vital processor check relay are:
    - 1) Failure of the equipment to properly execute an internal diagnostic routine that checks the VP System clock and other normal routines or facilities.
    - 2) Failure of the equipment to properly execute an internal diagnostic routine checking wayside equipment.
  - g. The dropping of a VP ON-LINE relay or a VP CHECK relay shall be monitored by, and a descriptive alarm indication (identity, time and date of de-energization) entered into the memory of the Maintainer's Diagnostic System described below.
2. Maintainer's Diagnostic System (MDS)
- a. This system shall contain all of the information, processes and equipment necessary to enable the maintainer to audit the operation of the VP-I/O System equipment modules, and to determine the location of a problem so that he can make effective repairs as quickly as possible and within the time allotted by the requirements of these Specifications.
  - b. The MDS provided shall be capable of diagnosing VP-I/O System failures or intermittent conditions. Its equipment and software shall not affect the safety of the IVP System. If necessary to ensure safe operation, the MDS shall prevent energization of the applicable ("A" or "B") VPCHK Relay while the MDS is operative.
  - c. The MDS provided shall be designed to be activated at the TCR by maintenance personnel, and shall be capable of locating the source of problems such as those caused by defective printed circuit boards.
  - d. The MDS shall include an easily understood, hand-held display and test device having the ability to implement the test procedure, and to use built-in hand-step controls if necessary. The diagnostic displays on this unit shall be in simple text form and shall be unambiguous to the reader.
  - e. The MDS shall be thoroughly documented in the Maintenance Manuals provided by the Contractor. See Part 2.09 of this Section.
3. Engineer's Monitoring System (EMS)
- a. This system shall contain all of the individual TCR location wiring and logic, and all of the special, plug-in, notebook computers needed to monitor the operation of the IVP local application software in real time, or for up to 48 hours of such data in a store/playback mode, in the manner specified

- herein.
- b. Plugging in or unplugging an EMS monitor shall have no affect on the safety of IVP operation.
  - c. Data shall be displayed on the EMS monitor in English text form for the location being monitored.
  - d. The Contractor shall provide:
    - 1) All necessary local TCR EMS wiring and logic at each new TCR equipped with Vital Processor interlocking logic under this Contract.
    - 2) Two special EMS Monitor Units (plug-in notebook computers) complete with all necessary programming.
    - 3) Two complete extra sets of EMS software in the media format required by the designated Resident Engineer.
- D. FRA Test Facilities
- 1. The Contractor shall provide special programming and equipment necessary to allow maintainer's or other authorized personnel to conduct all applicable FRA Tests involving the IVP Systems in a safe and efficient manner which will not require other re-testing of the IVP Systems. The special FRA Test equipment must be easily applied and easily removed.
  - 2. The special software and hardware proposed for this purpose are subject to pre-approval by the designated Resident Engineer. The proposed designs must be submitted to the Engineer for approval at least 60 days prior to the start of construction/programming.

## **2.06 SPECIAL EQUIPMENT REQUIREMENTS**

- A. Provide, in addition to the equipment supplied for the working system of this Contract, two card frames with motherboards and two sets of printed circuit boards to be used as replacements for defective units. Each set shall contain one printed circuit board for every different board utilized to meet the requirements of the working systems supplied. Where many boards of the same type are utilized in the working systems, the Contractor shall provide either one board, or twenty percent of the total number of boards used in all of the working systems (rounded to the next higher whole number), whichever is greater.
- B. The replacement boards shall be identical to, and interchangeable with, the boards of the working system. This shall be demonstrated during field testing of the system by making a replacement of the working boards with the maximum number of replacement boards and repeating the tests.
- C. Rugged and portable carrying cases with hinged and latched covers and with a handle on top shall be provided to house and protect each set of replacement boards and memory devices. Guides shall be fitted to the interior of these cases to hold each board and prevent contact between the components of any two boards. The bottom of the inside of each case shall be fitted with a one inch thick foam pad (closed cell Neoprene) to protect the boards from impact during transit and storage. The maximum weight of any case with a full complement of boards installed shall be twenty-five pounds. If one case capable of holding a complete set of replacement boards exceeds this weight limit, more than one case shall be provided. Provide a means of safely storing spare replacement memory devices within these cases, possible in a compartment built into the case lid.

## **2.07 SHOP TEST FIXTURE REQUIREMENTS**

- A. The Contractor shall provide two each of every test fixture necessary to test and maintain all IVP PC boards of the IVP System to the component level. Equipment for actual repair of printed circuit boards shall not be considered part of this requirement.

- B. Each IVP PC board test fixture shall include one of each type of working PCBs (e.g., CPU, I/O) used in the IVP and shall have the capability necessary to test all IVP PCBs, including the IVP CPU provided under this Contract.
- C. In addition to the IVP PC board test fixtures required in the preceding paragraph, the Contractor shall provide two IVP System (Shop) Test Fixtures, each of which shall consist of a board frame complete with power supplies, printed circuit boards, diagnostic systems, and any other equipment or programs needed to simulate complete and operable wayside systems. Each of these test fixtures shall include all devices necessary or desirable to set-up, inspect, monitor, maintain or facilitate the repair of the IVP System. Each of these test fixtures shall be equipped with simulated input and output facilities interfaced to a minimum of 10 input switches, 10 output indicators (five for the 28v dc outputs and five for the 120v ac outputs), and a 120v ac line cord. The System Test Fixtures shall be designed to allow electronic technicians access to working boards in a working system through the use of extender boards. The system shall be installed in a dust-resistant rack or cabinet of the same type as specified in Part 2.02 I. of this Section. Suitable supports shall be provided to floor-mount the rack or cabinet on casters. A complete set of extender boards shall be provided for use with each of these test fixtures.
- D. The Contractor shall provide two complete sets of IVP Test EPROMS for the IVP functions.
- E. The two IVP System (Shop) Test Fixtures shall be considered to be Specific ATC Test Devices, as specified in Section 16931.1.01 H., Item 12.
- F. The Contractor shall not include as part of the equipment furnished for these requirements any instrument or test device duplicated in response to the requirements of another Section of these Specifications.

## **2.08 SUPPLY MATERIAL REQUIREMENTS**

- A. The Contractor shall provide, if necessary for the operation of equipment supplied under this Contract, paper, ribbon and any other consumable supplies sufficient for one year of operation. Unless the supplies are readily available, the name and address of the source of further supplies shall be furnished to the designated Resident Engineer as a separate document.

## **2.09 INSTRUCTION MANUAL REQUIREMENTS**

- A. The Contractor shall provide three types of Maintenance Manuals which cover, to the board level, all items of hardware and software included as part of the working system and the maintenance system of the VP.
- B. These manuals shall comply with the Special Requirements of Part 2.06 of this Section, and the general requirements of Section 16992, ATC Instruction Manuals.
- C. The first manual which the Contractor shall provide shall be an Operator's Training Manual which covers the operation of the Emergency Control Panel. It shall be written for an educational level limited to the 12th grade only.
- D. The second manual which the Contractor shall provide shall be a Field Maintainer's Manual intended for the signal maintainer. It shall be written for instruction of Authority personnel with an educational equivalent of 12th grade plus two year in a general electrical technical school. (Two years in a computer programming school will not meet this requirement). Manuals which do not meet these requirements will not be approved.
- E. The Field Maintainer's Manual shall be clearly organized into two maintenance levels. They

are:

1. Level 1 - This level shall cover the detection of problems occurring in the field, TCR wiring, equipment modules and the input and output boards of the processor. This level is intended for the use of general maintenance personnel, and the manual shall so state.
  2. Level 2 - This level shall cover the detection and replacement of a malfunctioning board other than the input and output boards. It shall describe how this can be accomplished using the facilities of the Alarm Panel and the diagnostic routines. This level is intended for specially trained maintenance personnel and their supervisors and the manual shall so state.
- F. The third type of manual which the Contractor shall provide shall be the Engineer's Programming Manual. It shall consist of all the documentation provided by the programming system manufacturer and shall provide all information on the use of the equipment and the software provided with the system. This documentation is meant for engineers with experience in the design of signal and interlocking systems. Documentation describing the programming of the VP System shall be provided 45 days prior to the type acceptance testing. Six copies of this manual shall be provided.

### **PART 3 - EXECUTION**

#### **3.01 DELIVERY, STORAGE AND HANDLING**

- A. The Contractor shall take whatever measures may be necessary to protect the VP modules from internal or external damage during shipment, installation and testing and until the Authority accepts the system. If the equipment suffers any damage, from whatever cause, during this period, the Contractor shall replace or repair it to a like-new condition, to the satisfaction of the designated Resident Engineer at no additional cost to the Authority.

#### **3.02 INSTALLATION**

- A. The Contractor shall install the IVPs in TCRs which have one or more interlockings located within their area of control. The equipment shall be installed on equipment racks as required in these Specifications and as shown on the drawings prepared by the Contractor and approved by the designated Resident Engineer.
- B. The Contractor shall install the VP-I/O modules, complete with their programs and all appliances necessary to provide a complete IVP System which operates as required by these Specifications and is readily maintained.
- C. The IVP Systems shall be interconnected and tested with their interface equipment as required elsewhere in these Specifications and as shown on the Contract Drawings.

#### **3.03 TESTING**

- A. The Contractor shall perform a Type Acceptance Test on the first complete IVP System available, according to the requirements of these Specifications.
- B. The Contractor shall factory test each completed VP-I/O module and each complete IVP System according to a test procedure which the Contractor has prepared in accordance with Section 16981 of these Specifications and which has been approved by the designated Resident Engineer. Field conditions shall be simulated for this test. This test may be witnessed by the designated Resident Engineer. This test shall be successfully completed and the results approved by the designated Resident Engineer before the equipment is shipped from the factory.

- C. The Contractor shall field-test each installed IVP System according to a series of field tests described in these Specifications, prepared by the Contractor and approved by the designated Resident Engineer.
- D. The Contractor shall notify the designated Resident Engineer at least one week before the commencement of each of the specified factory and field tests unless otherwise directed by the designated Resident Engineer.
- E. The final revised program shall be entered into the memories of the spare equipment and the spare equipment shall be installed in the working system for testing. When approval of the test results has been received from the designated Resident Engineer, the Contractor shall install the regular equipment in the system and repeat the tests. Upon approval by the designated Resident Engineer of the results of this second test, the regular equipment shall be left in the system.
- F. At the conclusion of the testing of each IVP System, the Contractor shall deliver to the Authority three copies of the complete program documentation. The program shall be labeled at this time as Revision 1. Subsequent changes if necessary shall bear subsequent revision numbers.
- G. If, upon completion of the final field testing, any change in the program is deemed necessary by the Contractor, the designated Resident Engineer shall be informed, and with the designated Resident Engineer's approval, the Contractor shall make the change. When the change has been completed and the log book filled out, the Contractor shall repeat the cycle of testing described in Part 3.03 E of this Section.

#### **3.04 DOCUMENTATION**

- A. The Contractor shall deliver the required tracings, program listings, drawings and aperture cards at the times required by these Specifications and keep them up-to-date during installation.
- B. The Contractor shall deliver the required maintenance manual and training course submittals at the times required by these Specifications.
- C. The Contractor shall provide a Software Configuration Logbook which shall be utilized commencing with the approval of the design submittal and continuing until Final Acceptance of the installation. This book shall be used to register dated entries describing every change made to the VP program and equipment, and the reason the change was made. It shall be written in a detailed, step-by-step narrative, and shall include cross-references to all program changes. Failure to provide and utilize this logbook will delay, and may prevent, the approval of all the test reports associated with the field testing of the processor. At final acceptance, this logbook shall become the property of and be delivered to the Authority.

#### **3.05 TRAINING REQUIREMENTS**

- A. The Contractor shall provide one training course, (described in B. below) which shall be called the Field Maintainer's ATC/IVP Training Course and one training course, (described in C below) which shall be called the Engineer's ATC/IVP Training Course. Training aids shall be liberally employed where helpful to illustrate the devices and principles being described. Applicable firmware, such as flip charts, transparencies and slides, shall become the property of the Authority at the conclusion of the first presentation of the courses. The Contractor's instructor(s) shall cooperate with the Authority in the videotaping of the course presentations.
- B. Field Maintainer's ATC/IVP Training Course

1. The Contractor shall provide on the Authority's premises, for its signal maintenance personnel, four presentations of a course of classroom and hands-on instruction in the operation and maintenance of the complete ATC system. This course shall include special emphasis on the IVP System. The course shall be not less than five days nor more than ten days in length. Each presentation of the course shall accommodate 12 persons designated by the Authority.
  2. The first two presentations of this course shall occur consecutively during the final installation stages of the VP. The third and fourth presentations shall be at later dates within one year from the date of the first two; the exact dates to be determined with the mutual consent of the Authority and the Contractor. These instruction courses shall be at no additional cost to the Authority.
  3. This instruction shall be based on the second Maintenance Manual described in Part 2.09.E. of this Section.
  4. This instruction shall cover all aspects of operation and maintenance of the wayside and TCR equipment including the VP. It shall include, but not be limited to the following:
    - a. Track Circuits
    - b. Interlockings
    - c. Passenger Facilities
    - d. TCR Modules
    - e. Processors
    - f. Processor programming and changes
    - g. Trouble shooting
    - h. Diagnostic routines
    - i. Maintenance procedures
    - j. Preventive maintenance
    - k. Emergency Interlocking Control Panel Operation
  5. This course shall be designed for an educational level of 12th grade plus two years in a technical school.
  6. This course shall include "hands-on" instruction for each participant in identifying and replacing defective boards through the use of the test fixtures provided by the Contractor. The Contractor shall supply, at no further cost to the Authority, a set of defective boards for use in this test. There shall be enough boards to that successive course participants are not bored by locating the same defective board.
  7. This course may be combined with a similar course for the Non-Vital Processor Interlocking Systems. See Section 16926.
- C. Engineer's Training Course for Interlocking Vital Processor Systems
1. The Contractor shall provide on the Authority's premises, for certain engineering personnel, one presentation of a course of classroom and hands-on instruction in the programming, maintenance, and reprogramming of the IVP Systems to the board level. The course shall not be less than three days nor more five days in length. The presentation of the course shall accommodate up to 12 persons designated by the Authority.
  2. The presentation of this course shall occur during the final installation stages of the IVPs and shall be made at no additional cost to the Authority.
  3. This instruction shall be based on the third Instruction Manual described in Part 2.09 F. of this Section.
  4. This instruction shall cover all aspects of setup, programming, operation and maintenance of the IVP equipment. It shall include, but not be limited to the following:
    - a. Programming Techniques
    - b. Compiling
    - c. Setting and Erasing Memory Devices
    - d. Locating Defective Boards
    - e. System Operation

- f. Reliability Considerations
  - g. Trouble Shooting
  - h. Diagnostic Routines
  - i. Maintenance Procedures
5. This course shall be designed for an educational level of 12th grade plus a Bachelor's Degree in Engineering or its equivalent.
  6. This course shall include "hands-on" instruction for each participant in programming, reprogramming and identifying and replacing defective boards through the use of the Contractor's test fixtures (made available by the Contractor at no additional cost to the Authority), and the IVP unit(s) provided to the Authority by the Contractor for training purposes. The Contractor shall supply, at no additional cost to the Authority, a set of boards with various defective components for this purpose.
- D. These training course presentations shall be organized in accordance with the requirements of this Section and Section 16993, Training Courses.

### **3.06 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. The Interlocking Vital Processor Systems will be measured for partial payments based upon the number of such required, complete systems which are designed, furnished installed and successfully tested by the Contractor.
- B. For purposes of measurement and payment, these systems shall include all mounting hardware, interconnecting wiring, and IVP PC Board Test Fixtures.
- C. The following conditions will be considered when measuring the IVPs for partial payments:
  1. Completion by the Contractor, and approval by the designated Resident Engineer, of the Interlocking Vital Processor System design.
  2. Delivery by the Contractor of the IVP systems, provided approval of their Factory Test Reports has been received from the designated Resident Engineer.
  3. Installation of the IVP system and all interconnecting wiring by the Contractor, provided approval of the installation has been received from the designated Resident Engineer.
  4. Level "A" or Level "B" partial system acceptance of the location involved.
  5. Delivery by the Contractor of the approved as-built drawings, aperture cards and program listings.
  6. Approval by the designated Resident Engineer and receipt by the Authority of the applicable Maintenance Manuals.
  7. Approval by the designated Resident Engineer of the documentation for the classes of instruction and the satisfactory completion of these presentations.
- D. System (Shop) Test Fixtures for the Interlocking Vital Processor Systems will be measured for payment as specified in Section 16931.3.03 C., and in the ATC Unit Price Schedule.

**END OF SECTION**

**SECTION 16930**

**ATC FACILITIES AND SPARE EQUIPMENT**

(Table of Contents)

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

- A. This SECTION lists the various 16930-series ATC Facilities and Spare Equipment Specification Sections:
1. ATC Maintenance and Test Facilities (Section 16931)
  2. Spare ATC Equipment and Selectable Items (Section 16932)

**PART 2 - PRODUCTS**

NOT USED

**PART 3 - EXECUTION**

NOT USED

**END OF SECTION**

**SECTION 16931**

**ATC MAINTENANCE AND TEST FACILITIES**

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section specifies the furnishing and installation by the Contractor of certain storage and maintenance facilities and equipment at Train Control Rooms, TCERs and Interlockings, and the furnishing of basic and specific ATC Test Equipment.
- B. Provide the following at each Train Control Room and TCER newly equipped under this Contract:
  - 1. A workbench and stool for reading plans.
  - 2. A wall-mounted storage cabinet for spare parts.
  - 3. A 6-foot fiberglass stepladder.
- C. At new Train Control Rooms and TCERs controlling interlockings, the Contractor shall also provide a floor-mounted steel locker.
- D. Furnish and install a "Gang Box" (storage bin) at each interlocking newly equipped under this Contract.
- E. Furnish maintenance tools and materials to enable Authority maintenance personnel to perform compression bolted negative return bonding.
- F. Furnish, in the quantity shown, the following Basic ATC Test Equipment. Each item shall be portable and furnished complete with all necessary cables, adapters and ancillary devices needed to perform the functions or tests for which it is designed. Each item shall be of the manufacturer indicated or equal.

<u>ITEM</u>	<u>QUANTITY</u>	<u>BASIC ATC TEST DEVICE</u>
1	2	Megger (BIDDLE No. 212159CL)
2	2	Digital Frequency Counter (FLUKE No. PM6669)
3	2	Function/Arbitrary Wave Form Generator (HEWLETT PACKARD No. HP-33120A) with Accessory Pouch (HEWLETT PACKARD No. HP 34161A)
4	5**	Inductive Ammeter (AMPROBE No. ACDC-1000)
5	3**	Digital Voltmeter (FLUKE No. 8060A)
6	2	Oscilloscope (TEKTRONIX Model TDS-340A w/Option 14: Interfaces and Printing)
7	2	Oscilloscope, Battery-Powered, hand-held (TEKTRONIX Model THS-720Aw/THS7CHG Battery Charger)
8	4	Shunt strap, .06 ohm with T-Handle Clamping (Safetran Model TS1)
9	2	AC Ammeter, Clamp-on (FLUKE No. 80I-600A)
10	2	DC Ammeter (FLUKE No. Y8100)
11	2	Volt-Ohmmeter with leads and case (SIMPSON Model No. 260-6XLPM)

ITEM    QUANTITY    BASIC ATC TEST DEVICE (Continued)

12	1	Digital Micro-ohmeter (ALBERENGINEERING No. RT-10)
13	2	RMS Voltmeter (DB)(HEWLETT-PACKARD No. 3400B)
14	1	TWC Receiver/Transmitter Test Set*#
15	2	ATP Track Module Test Set
17	2	Power Level Adjustment Unit for ATP module*
18	8	RTU Computerized Analyzer Unit (CAU)*
19	6	ATP Logic Card Extender*
20	10	Rail Audio Frequency Test Set (RAFTS)which can detect and individually identify each of the 14 ATC operating frequency signals in the running rails (RJO Part No. 9802-10000)
21	2	Marker Coil Test Unit*###
22	7	Data Logging Device*####
23	1	Insulated Joint Tester which can determine insulated joint resistance over a range from zero to 10,000 ohms. (RJO Part No. 9801-10000)
24	2	Complete Sets, Test and Adjustment equipment for all the Microprocessors furnished under this Contract*
25	1	Safe Braking Distance (SBD) Test Fixture as used in WTP 2.21 testing under this Contract. If this unit is computerized, all associated hardware and soft-ware (including source code) shall be included.
26	1	TWC Train Simulator*##
27	1	Complete set of card extenders for shop extender boards

\*NOTE: Unit shall be applicable to the manufacturer's equipment furnished under this Contract and shall be subject to approval by the designated Resident Engineer.

\*\*NOTE: One of these units shall be delivered directly to the designated Resident Engineer's Office no later than 30 days prior to the start of any ATC field testing.

#NOTE: See Part 2 of this Section.

##NOTE: See Part 2.06

###NOTE: See Part 2.07 A.

####NOTE: See Part 2.04

G. The Contractor shall evaluate all of his test procedures relative to test equipment requirements, and shall augment the BASIC ATC TEST DEVICE list (in Part 1.01-F.) to include one of every additional item of test equipment used. This shall include PCs, laptop computers, and special PC boards.

H. Furnish the following items of Specific ATC Test Equipment. Each item shall be portable unless otherwise indicated, and furnished complete with all necessary cables, adapters and ancillary devices needed to perform the function or tests for which it is designed. The items to be included are:

<u>ITEM</u>	<u>QUANTITY</u>	<u>SPECIFIC ATC TEST DEVICE</u>
-------------	-----------------	---------------------------------

1	1	TWC Transmitter Test Unit for TWC transmitters furnished
2	1	TWC Receiver Adjustment Test Unit for TWC receivers furnished
3	1	Portable Test Fixture for the Vital DC Relays furnished
4	1	Portable Test Fixture for the Vital AC Relays furnished
5	1	Portable Test Fixture for the Non-Vital DC Relays furnished
6	1	Shop Test Fixture for Impedance Bonds furnished
7	1	Marker Coil Dynamic Test Unit**
8	1	Shop Test Fixture for the RTUs furnished
9	1	Shop Test Fixture for the ATP Modules furnished
10	2	Shop Test Fixture for the Non-Vital Station Processors furnished*#
11	2	Shop Test Fixture for the Non-Vital Interlocking Processors furnished*##
12	2	Shop Test Fixture for the Interlocking Vital Processors furnished*###
13	1	Shop Test Station for NVIP PCBs##

- \*NOTE: One for Maintenance and one for Training.
- \*\*NOTE: See Part 2.07 B.
- #NOTE: See Section 16924.2.11 B.3.
- ##NOTE: See Section 16926.2.08
- ###NOTE: See Section 16928.2.07 E.

I. Special Test Equipment Required

1. Each piece of special test equipment required by the Contractor to inspect, test, adjust, tune or otherwise modify the equipment to be provided under this Contract shall, at the conclusion of all field tests which make use of it, become the property of, and be delivered to, the Authority. Unless otherwise specified, this requirement shall be limited to a quantity of one piece of equipment of each type, regardless of the quantity the Contractor requires to expedite his testing program. This requirement shall not be construed to increase the quantity of test equipment listed in Part 1.01, paragraphs F, G, and H. See also Section 16981, Basic ATC Test and Inspection Requirements.

**PART 2 - PRODUCTS**

**2.01 TCR MAINTENANCE EQUIPMENT**

A. Workbench

1. The workbench shall be 42 inches high, 60 inches wide, and 30 inches deep. The framework for the bench shall be 14-gauge cold rolled steel. Side panels shall be 14-gauge cold rolled steel, and the under panels shall be 16-gauge steel. The bench top shall be formica bonded to three-quarter inch thick plywood. The bench shall have a heavy-duty drawer, supported by the bench frame and capable of storing a Room Book of Plans under the bench top. The drawer shall be steel as specified above and shall have the following minimum dimensions: 4 inches high, 40 inches wide, and 25 inches deep.

B. Stool

1. The stool shall have a 14 inch diameter seat with tubular steel adjusting leg extensions that lock securely at one inch intervals. The legs shall be adjustable from 18 inches to 27 inches.

C. Cabinet

1. The storage cabinet shall be made of steel. It shall be 36 inches high, 60 inches wide, and 16 inches deep, with one shelf. Shelf height shall be adjustable. The shelf shall be supported every 15 inches. The cabinet shall have 4 doors for access.
- D. Stepladder
1. The stepladder shall be a heavy-duty, type 1A, 6-foot, self-supporting, fiberglass, folding ladder.
- E. Locker
1. The locker shall be made of steel. The locker shall be 72 inches high, 15 inches wide, and 18 inches deep, and shall have one shelf mounted near the top. The locker shall have a full-height hinge, and a lockable door.

## **2.02 WAYSIDE MAINTENANCE EQUIPMENT**

- A. Gang Boxes shall be 60 x 30 x 48 inches in size, made of 16 gauge steel. Each box shall have two shelves and a continuously welded piano hinge for the lid. Gang Boxes shall be Delta #DEL-6841, or approved equal.
- B. Compression Bolted Bonding Equipment
1. The following new maintenance equipment shall be furnished to the Authority for performing compression bolted negative-return bonding:
    - a. One complete hydraulic installation tool, complete with appropriate nose assembly, for 5/8 inch diameter compression fasteners. (No. 586 tool with No. 99-709 Nose Assembly, as manufactured by Huck International, or approved equal.)
    - b. One 115 volt AC electrically-powered hydraulic unit, complete with 20 foot hydraulic hose kit, for operating hydraulic installation tools. This unit shall be Model 940 Powerig Hydraulic Unit, complete with hose kit, as manufactured by Huck International, or approved equal.
    - c. One dozen 5/8 inch diameter compression fasteners, No. C50LR-BR20-12, as manufactured by Huck International, or approved equal.
    - d. One dozen 5/8 inch diameter compression fasteners, No. C50LR-BR20-16, as manufactured by Huck International, or approved equal.
    - e. Two dozen terminal lugs, Burndy Type YA34-L, or approved equal.
- C. This equipment and material shall be in addition to that necessary for compression bonding required to be performed under this Contract.

## **2.03 ATC TEST EQUIPMENT**

- A. Furnish Basic Test and Maintenance devices in the quantities listed in Part 1.01 paragraphs F, and G, and Specific ATC Test devices as specified in Part 1.01 H.
- B. Each item of special purpose ATC test equipment shall be designed to fully test and align the device or function for which it is intended and shall have as a minimum, features to perform the tests specified for it in Section 16980, ATC Tests, Inspections and Quality Assurance.

## **2.04 DATA LOGGING DEVICES**

- A. Provide a notebook size, portable Data Logging Device for each station TCR installation. These devices shall be delivered to the designated Resident Engineer prior to commencement of wayside testing.
1. The Data Logging Device shall include a portable plug in/out serial communications cable for interfacing with the local STAP and NVIP systems.

2. The Data Logging Device shall include a Display Panel so that a signal maintainer can retrieve the recorded data and/or observe real time operation of the STAP or NVIP.
  3. The Data Logging Device shall not interfere with the normal operation of the STAP or NVIP.
- B. Provide two additional Data Logging Devices; one to be delivered to WMATA Design Engineering and one to be delivered to WMATA Operations Engineering prior to the commencement of wayside testing.

## **2.05 TWC RECEIVER/TRANSMITTER TEST SET**

- A. The TWC Receiver/Transmitter Test Set shall be a dedicated microprocessor-controlled device no larger than a notebook computer, and shall contain an FSK interface which is compatible with the Metrorail TWC equipment. As an alternative, this and other test equipment may be furnished in a combined unit, provided that operation does not exceed a normal Technician's understanding or cause the unit to exceed 15 pounds weight, and 15x18x6 inches in size.
- B. The microprocessor device shall be a ruggedized unit with 16 Mb memory and an IPCMCIA-144 modem. The test unit shall have an active matrix TFT color, 800x600 64,000 color LCD display.
- C. The test set shall be programmed in a Windows type environment to receive all commands from a screen menu. The test set shall display all test functions and indications in a Windows menu driven display.
- D. This device shall display the status of all bits in the TWC message: prefix and suffix bits; all bits relating to train status and control, and; all spare bits. The device shall be capable of testing all of the following:
1. TWC station receiver,
  2. Station transmitter,
  3. Fly-by receiver,
  4. Fly-by transmitter,
  5. TWC input and output of the ATP module,
  6. TWC signal quality and amplitude in the running rails.
- E. The test set shall contain a program which can analyze and display (in spectrum analyzer format) the incoming TWC signal on its display screens in comparison with the individual TWC status/control bits from the RTU scan sheets.
- F. The transmitter output shall be variable, from the screen menu, from 30 millivolts to four (4) volts, peak to peak.
- G. The unit shall be capable of operating from either a 120V ac source or from internal batteries. The internal batteries shall be capable of powering the unit for at least six (6) hours.
- H. The unit shall come complete with battery charger, all interface cabling, signal pick-up devices and interface circuitry.
- I. All associated hardware and software (including source code) shall be included.

## **2.06 TWC TRAIN SIMULATOR**

- A. The physical configuration of the TWC Train Simulator unit shall be identical to the physical

configuration of the TWC Receiver/Transmitter Test Set specified in Part 2.05 of this Section.

- B. The TWC Train Simulator shall provide the capability of testing the train TWC transmitter and receiver as a system to simulate a train communicating to the wayside TWC system. The unit shall have the capabilities to simulate all the bits (including spares) the train can transmit and receive, and display them on the screen in a Windows type environment.
- C. The unit shall be able to simulate the train communicating to:
  - 1. A fly-by transmitter
  - 2. A fly-by receiver.
- D. All associated hardware and software (including source code) shall be included.

## **2.07 MARKER COIL TEST UNITS**

- A. Marker Coil Test Unit
  - 1. The Marker Coil Test Unit shall be capable of automatically, or with minimum intervention, determining: the frequency, and, by means of a meter connected to its amplifier, the relative signal strength, which would be generated when passing over any marker coil on the Metrorail System. This unit shall be portable, light weight, and shall be bolted into a rugged carrying case which shall also serve to center the test unit at the same height as the carborne loops above the marker coil to be tested.
- B. Marker Coil Dynamic Test Unit
  - 1. The Marker Coil Dynamic Test Unit shall be capable of automatically, or with minimum intervention, determining the frequency and signal strength generated, and the location (+/- 10 feet) of any marker coil on the Metrorail System. This unit shall be portable, light weight and shall be bolted into a rugged carrying case. If this unit is computerized, all associated hardware and software (including source code) shall be included.

## **2.08 COMBINED TEST UNITS**

- A. As an alternative to individual computerized test units specified herein, the Contractor may provide computerized test units which combine the specified test capability of two or more of the individual units if the operation of these combined test units does not exceed a normal technician's understanding, or cause the unit to exceed 15 pounds weight and 15x18x6 inches in size.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Install the TCR maintenance equipment in each new Train Control Room at the locations shown on the Contract Drawings, as specified herein, or as otherwise approved by the designated Resident Engineer.
- B. Mount the storage cabinet on the wall above the workbench. The bottom of the storage cabinet shall be no less than 15 inches above the top of the workbench.
- C. Mount a Gang Box at each interlocking in a manner and location approved by the designated Resident Engineer.
- D. Deliver the compression bolted bonding equipment and fasteners to the site(s) designated by the designated Resident Engineer.

### 3.02 MEASUREMENT AND PAYMENT

- A. ATC Maintenance Equipment
  - 1. Factors which will be considered when determining partial payments for ATC Maintenance Equipment will include:
    - a. Installation of the equipment in all of the new TCRs and at each new interlocking, as applicable.
    - b. Final acceptance of the ATC System by the Authority.
  - 2. ATC Maintenance Equipment shall be included in the cost of Material and Fabrication for the route segment included in this Contract.
  
- B. Basic ATC Test Equipment
  - 1. Factors which will be considered when determining partial payments for Basic ATC Test Equipment will include:
    - a. Safe delivery to the Authority of all Basic ATC Test Equipment in good working order.
    - b. Formal acceptance of the equipment by the Authority.
  - 2. The sum of payments for Basic ATC Test Equipment will equal the Lump Sum Price determined by the Cost-Loaded CPM, under:
    - a. BASIC ATC TEST AND MAINTENANCE EQUIPMENT
  
- C. Specific ATC Test Equipment
  - 1. The sum of payments for each item of Specific ATC Test Equipment will equal the applicable Unit Price determined by the Cost-Loaded CPM, under:
    - a. TWC TRANSMITTER TEST FIXTUR
    - b. TWC RECEIVER ADJUSTMENT TEST FIXTURE
    - c. PORTABLE TEST FIXTURE FOR VITAL DC RELAYS
    - d. PORTABLE TEST FIXTURE FOR VITAL AC RELAYS
    - e. PORTABLE TEST FIXTURE FOR NON-VITAL DC RELAYS
    - f. SHOP TEST FIXTURE FOR IMPEDANCE BONDS
    - g. MARKER COIL DYNAMIC TEST UNIT
    - h. SHOP TEST FIXTURE FOR RTUs
    - i. SHOP TEST FIXTURE FOR ATP MODULES
    - j. SHOP TEST FIXTURE FOR NON-VITAL STATION PROCESSORS
    - k. SHOP TEST FIXTURE FOR NON-VITAL INTERLOCKING PROCESSORS
    - l. SHOP TEST FIXTURE FOR INTERLOCKING VITAL PROCESSORS
    - m. SHOP TEST STATION FOR NVIP PCBs
  - 2. Payments for Specific ATC Test Equipment will be made as stipulated below. Upon safe delivery to the Authority, in good working order, of each item of Specific ATC Test Equipment selected by the Authority:
    - a. 100%ofapplicable CPM Unit Price

**END OF SECTION**

## SECTION 16932

### SPARE ATC EQUIPMENT AND SELECTABLE ITEMS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies:
  - 1. The furnishing of spare ATC equipment for this Contract.
  - 2. The furnishing of a price list of recommended ATC-related tools and equipment components from which the Authority may select quantities of individual items at the quoted prices up to a dollar amount equal to 3% of the CPM Price for ATC Material and Fabrication.
  - 3. The method to be used to determine prices to be charged to the Authority for items of Spare ATC Equipment, and for items of Selectable ATC Tools and Equipment Components.
- B. The Contractor shall furnish and deliver to the Authority the quantities of spare ATC equipment specified, and the quantities of selectable ATC tools and equipment components chosen by the Authority from the approved price list submitted by the Contractor.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Division 1 Article IX Commencement, Prosecution and Completion of Work
  - 2. Section 16924 Non-Vital ATO & ATS Processor Systems
  - 3. Section 16925 Data Transmission System (DTS)
  - 4. Section 16926 Microprocessor Systems for Non-Vital Interlocking Functions
  - 5. Section 16928 Interlocking Vital Processor Systems
  - 6. Section 16953 ATP Track Modules
  - 7. Section 16964 Track Switch Operating Layouts
  - 8. Section 16965 Signal Layouts
  - 9. Section 16969 Snowmelter Layouts

##### 1.03 QUALITY ASSURANCE

- A. The ATC spare equipment and the ATC selectable tools and equipment components shall be of the same quality as specified within applicable Sections of these Specifications for their working counterparts.
- B. Factory Tests, as called for by the Contractor's approved quality assurance program, are applicable to the ATC spare equipment, selectable tools, and equipment components to be provided on this Contract.

##### 1.04 SUBMITTALS

- A. Submit, for the approval of the designated Resident Engineer, no later than 90 days prior to the ORD, a price list of recommended ATC tools and equipment components, showing the individual item prices and the quantities recommended. The designated Resident Engineer will make the final determination of items and quantities of ATC selectable tools and equipment components to be furnished.

## PART 2 - PRODUCTS AND MATERIALS

### 2.01 SPARE EQUIPMENT

- A. Furnish the following complete items and modules of spare equipment:
1. Two complete track switch operating layouts for each size and type of track switch included in this Contract, as indicated on the Contract Drawings. Each of these layouts shall include:
    - a. All items specified for a track switch operating layout in Section 16964, Track Switch Operating Layouts.
    - b. One complete set of special adjusting tools for switch-and-lock movements, and, if required by the manufacturer's switch machine layout, a switch circuit controller.
  2. Two complete signal layouts; one equipped for wall mounting, to include all wall-mounting brackets, and one equipped for ground mounting, to include mast, base, foundation and ladder or steps.
  3. One set of all special tools required for removing plugboard contacts, for removing plug-in relays, and for making any other special changes or adjustments to TCR equipment.
  4. One impedance bond of each of the eight frequency combination types (Part Numbers) normally used.
  5. One **WMATA Mini-Loop** inductive track loop and one 4-foot inductive track loop.
  6. Four ATP Track Modules as follows: two configured as Transmit/Receive Modules; one configured as an ATP Slave Transmitter Module, and; one configured as an ATP Receiver Module, all as described in Section 16953, ATP Track Modules.
  7. One complete and tested RTU System for training purposes. This unit shall have control, status, spare, and vacant capacities which are equivalent to the capacities of the largest, most complex working RTU delivered under this Contract. (The percentages of board slots which are equipped with control or status boards, active or spare, or that are left vacant, shall be the same as for the working unit, and the percentage of control and status points dedicated to train control or non-train control functions shall be the same as for the working unit.) The Contractor shall consult with the Authority and provide final details for this spare RTU System as specified by the Authority.
  8. One set of complete vital and non-vital processor modules, consisting of one of each type of processor used under this Contract to (collectively) perform all necessary Local and Remote functions of Station (STAP - Programmed Station Stopping and Train-to-Wayside Communications (TWC)), and Interlocking (NVIP and IVP) operations as described in Sections 16924, 16926, and 16928, respectively. The individual processors shall be of exactly the same type, and of the largest size, as their functional counterparts used in this Contract, complete with all PC boards. If different Train Control functions are performed by the same "type" of processor, i.e., by processors which are identical internally, except for the software, the Contractor shall provide only one of that type of processor.
  9. A recommended assortment of wire stripping and crimping tools and AAR nut wrenches. This assortment shall include a minimum of one of each tool required:
    - a. to crimp, insert, strip or extract any wire or cable used in this Contract, including 1000 KCMIL lugs and any other specialized connection.
    - b. for the removal and replacement of the jack-screws on plug coupler units.
  10. Two tubular electric snowmelter heating elements and two switch rod heater units for each type and size of switch layout equipped with snowmelters under this Contract.

### 2.02 SELECTABLE ATC TOOLS AND EQUIPMENT COMPONENTS

- A. The price list of recommended ATC tools and equipment components, from which the Authority may choose any quantity of any item or items, shall include, but not be limited to:
1. All major components of complete track switch operating layouts provided under this Contract, to include:
    - a. All items specified in Section 16964, Track Switch Operating Layouts.
    - b. A complete set of special adjusting tools for switch-and-lock movements, and, if required by the manufacturer's switch machine layout, a switch circuit controller.
  2. All components of signal layouts provided under this Contract.
  3. A complete set of all special tools required for removing plugboard contacts, for removing plug-in relays, and for making any other special changes or adjustments to TCR equipment.
  4. A recommended assortment of components such as relays, rectifiers, pushbuttons, transformers, ground detectors, fuses, circuit breakers, resistors, capacitors, reactors, control machine and PCB indicator LEDs, track and alarm indication panel LEDs, signal lamps, diodes and other solid state devices.
  5. A recommended assortment of telephone jacks, plugs and weatherproof covers for the TC Maintenance Telephone System.
  6. Individual impedance bonds of each of the eight frequency combination type (Part Number) normally used. Each of these eight impedance bonds shall be of the TWC type.
  7. A **WMATA Mini-Loop** inductive track loop and a 4-foot inductive track loop.
  8. Component parts, to the complete PC board level (including card cage and connectors), for each type of ATP Track Module provided under this Contract.
  9. Component parts, to the complete PC board level (including card cage and connectors), for each type of RTU PC Board provided under this Contract.
  10. Component Parts, to the complete PC board level (including card cages and connectors), for each unique type of PC Board for all processors provided under this Contract. (A CPU or memory card with unique EPROMs shall be considered to be a unique board.) These replacement boards shall be identical to, and interchangeable with, the boards of the working system.
  11. Rugged and portable carrying cases with hinged and latched covers and with a handle on top, to house and protect sets of replacement PC Boards and memory devices. Guides shall be fitted to the interior of these cases to hold each board and prevent contact between the components of any two boards. The bottom of the inside of each case shall be fitted with a one inch thick foam pad (closed cell neoprene) to protect the boards from impact during transit and storage. The resilience of this pad shall be selected to allow a reduction in pad thickness of about 25 percent due to the static weight of a board. The maximum weight of any case with a full complement of boards installed shall be twenty-five pounds. Provide a means of safely storing spare replacement memory devices within these cases, possibly in a compartment built into the case lid
  12. A recommended assortment of wire stripping and crimping tools and AAR nut wrenches.

## **PART 3 - EXECUTION**

### **3.01 DETERMINATION OF PRICES**

- A. Prices for items of Spare ATC Equipment (Part 2.01) and for items of Selectable ATC Tools and Equipment Components (Part 2.02) which are manufactured by the Contractor shall not exceed 85% of the Contractor's published catalog prices in effect at the time of ordering such equipment.
- B. Prices for items of Spare ATC Equipment (Part 2.01) and Selectable ATC Tools and

Equipment Components (Part 2.02) which are not manufactured by the Contractor shall not exceed 85% of the published catalog prices in effect at the time of ordering such equipment.

### **3.02 SELECTION**

- A. The designated Resident Engineer will select, from the approved price list of recommended ATC tools and equipment components, the quantities of individually selectable items of tools and equipment components to be furnished by the Contractor at the stated prices.

### **3.03 PREPARATION**

- A. All spare equipment and selectable tools and equipment components provided under this Section shall be packaged or treated to preclude deterioration of the product due to environmental conditions.
- B. All spare equipment, tools and equipment component items shall be properly packaged or crated by the Contractor to prevent damage to the items during shipment and storage.

### **3.04 DELIVERY**

- A. Upon notification by the Contractor of the delivery schedule, the designated Resident Engineer will furnish WMATA part numbers for all spare ATC equipment, tools and equipment components to be delivered. Each tool, equipment component and piece of spare equipment shall be identified by the Contractor with a WMATA identification number prior to delivery to the Authority.
- B. The Contractor shall deliver the spare ATC equipment items and the ATC tool and component items selected by the Authority to the address or addresses designated by the Authority no later than the Contract completion date specified in Division 1, Article IX, Commencement, Prosecution and Completion of Work.

### **3.05 MEASUREMENT FOR PAYMENT**

- A. Spare ATC equipment items will be measured for payment based upon the amount of specified spare equipment actually delivered and accepted.
- B. ATC selectable tool items and equipment component items will be measured for payment based upon the price list prices of the Authority-selected items actually delivered and accepted.

### **3.06 PAYMENT**

- A. The Contractor shall certify that the prices for the various items of ATC spare equipment and selectable ATC tools and equipment components which he manufactures do not exceed 85% of the Contractor's Catalog prices in effect at the time/date of bid opening and do not exceed 85% of the published prices for non-Contractor manufactured items as specified in Part 3.01, DETERMINATION OF PRICES.
- B. The Contractor agrees that if the cost of ATC Selectable Tools and Equipment Components ordered by the Authority is less than 3% (three percent) of the CPM price for ATC Material and Fabrication, a credit for the remaining amount will be taken by the Authority.
- C. The Sum of Payments for ATC Spare Equipment, will equal the CPM Lump Sum Price listed in the CPM prices under:
  - 1. ATC SPARE EQUIPMENT

- D. Payments for ATC Spare Equipment will be made as stipulated below:
  - 1. Upon delivery to and acceptance by the Authority of all items of ATC Spare Equipment required by the Authority
    - a. 100 Percent of the applicable CPM Price
  
- E. The Sum of Payments for the ATC Selectable Tool and Equipment Component Items will be determined by multiplying the number (quantity) of each Item selected times its applicable Price List Price, and totaling the results of these multiplications.
  
- F. Payments for ATC Selectable Tool and Equipment Component Items will be made as stipulated below:
  - 1. Upon delivery to the Authority and acceptance by the Authority of each Item of selectable ATC tools and components selected by the Authority
    - a. 100 Percent of the applicable Selectable Price List Item price

**END OF SECTION**

## **SECTION 16940**

### **ATC ELECTRICAL AND ELECTRONIC COMPONENTS AND MATERIAL** (Table of Contents)

#### **PART 1 GENERAL**

##### **1.01 SECTION INCLUDES**

- A. This SECTION lists the various 16940-series ATC Electrical and Electronic Component and Material Specification Sections:
1. Basic ATC Electrical and Electronic Component Requirements (Section 16941)
  2. Printed Circuit Cards (Section 16942)
  3. Vital Relays (Section 16943)
  4. Non-Vital relays and Timers (Section 16944)
  5. Plugboards and Cabinets for Relays and PC Cards (Section 16945)
  6. ATC Transformers (Section 16946)
  7. Ground Detectors (Section 16947)
  8. Plug Connectors (Section 16948)
  9. ATC Signal Wire and Cable (Section 16949)

**PART 2 - PRODUCTS**  
NOT USED

**PART 3 - EXECUTION**  
NOT USED

**END OF SECTION**

## SECTION 16941

### BASIC ATC ELECTRICAL AND ELECTRONIC COMPONENT REQUIREMENTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies basic electrical requirements for ATC work, and the characteristics of certain basic electrical components which shall be furnished and installed by the Contractor.
- B. This Section specifies basic electronic requirements for ATC work, and the characteristics of certain basic electronic components which shall be furnished and installed by the Contractor.

##### 1.02 BASIC ELECTRICAL COMPONENT REQUIREMENTS

- A. All electrical components provided under this Contract shall be:
  - 1. New and free of manufacturing defects,
  - 2. Free of storage and handling damage,
  - 3. Clearly and permanently labeled with value and type identification
  - 4. Rated to operate at power, voltage, current and temperature levels at least 20 percent in excess of those to which the components will be subjected in service,
  - 5. Available from the manufacturer within 90 days of order, with a guaranteed supply for 20 years, and
  - 6. Capable of operating as required in the environmental conditions specified in Section 16914, Environmental Requirements.
- B. Any ATC module, device or appliance, furnished or provided under this Contract, which requires power to be supplied from a power supply system, regardless of system voltage, current, or frequency, shall be capable of operating satisfactorily and continuously at any voltage throughout the range of plus or minus 8 percent of the rated system voltage. The Contractor shall demonstrate conformance with this requirement in either the type acceptance test or the factory test.

##### 1.03 BASIC ELECTRONIC COMPONENT REQUIREMENTS

- A. All electronic components provided under this Contract shall be:
  - 1. New and free of manufacturing defects,
  - 2. Free of storage and handling damage,
  - 3. Clearly and permanently labeled with value and type identification,
  - 4. Rated to operate at power, voltage, current and temperature levels at least 20 percent in excess of those to which the components will be subjected to in service,
  - 5. Commercially available in the Washington, D.C. area unless otherwise approved by the designated Resident Engineer,
  - 6. Capable of operating as required in the environmental conditions specified in Section 16914, Environmental Requirements.

##### 1.04 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16914 Environmental Requirements
  - 2. Section 16921 ATC Power Distribution Systems
  - 3. Section 16931 ATC Maintenance and Test Facilities
  - 4. Section 16942 Printed Circuit Cards
  - 5. Section 16978 Miscellaneous Train Control Components and Materials

## **1.05 QUALITY ASSURANCE**

- A. Basic electrical components specified herein shall be factory tested by the Contractor. The Contractor shall see that factory tests are sufficiently rigorous to provide components which shall not prevent devices, circuits and systems in which the components are used from meeting the operating and reliability requirements specified herein.
- B. The basic electronic components specified herein shall be factory tested by the manufacturer. The Contractor shall select electronic components of sufficient quality to provide electronic modules which shall meet all of the operational requirements specified.
- C. Field testing of basic electrical and electronic components by the Contractor shall be accomplished as part of the field testing of the devices, circuits, electronic modules and systems in which these components are used.

## **1.06 ELECTRICAL COMPONENT SUBMITTALS**

- A. Submit scale drawings of each subtype of each basic electrical component specified herein.
- B. Submit technical data for each type of basic electrical component specified herein.
- C. Submit factory test reports for the basic electrical component specified herein.
- D. Samples of all solderless lugs and other terminals shall be submitted to the designated Resident Engineer for approval. Samples of the application of these solderless lugs and terminals to the wire the Contractor intends to use under this Contract shall be submitted for approval. The terminals and solderless lugs shall not be used until the Contractor has received approval for their use in writing from the designated Resident Engineer.

## **1.07 ELECTRONIC COMPONENT SUBMITTALS**

- A. Submit lists of the basic electronic components to be used in each type of electronic module provided under this Contract. These lists shall include:
  - 1. Name of module
  - 2. Name of component and quantity used
  - 3. Ratings and tolerances of component
  - 4. Manufacturer and model number of component
  - 5. Reliability (MTBF) data for component.
- B. Submit technical data for the compounds proposed to be used to impregnate transformers and inductors for use in ATC electronic modules. As an option, the Contractor shall submit technical data for the insulation and/or other materials he proposes for use in transformers and/or inductors instead of an impregnating compound.

## **PART 2 - PRODUCTS**

### **2.01 RESISTORS**

- A. All resistors, other than those required for electronic circuits;
  - 1. Shall be suitable for railway signaling circuits;
  - 2. Shall conform to all applicable recommendations of Part 14.2.15 (Recommended Design Criteria for Resistors) of the AREMA Signal Manual, and;
  - 3. Shall be subject to the approval of the designated Resident Engineer.
- B. Resistors used in electronic modules furnished under this Contract shall have a maximum tolerance of plus-or-minus 5 percent and shall be rated to dissipate a minimum of 1.5 times the maximum power they will be required to dissipate in operation.

## **2.02 CAPACITORS**

- A. Capacitors provided for power factor improvement of ATC power distribution systems shall be subject to the approval of the designated Resident Engineer.
- B. All other capacitors furnished under this Contract, except those of 10 mfd or less used in electronic modules, shall have a maximum tolerance of +75 percent, -50 percent and shall be rated for at least 1.5 times the maximum peak voltage to which they will be subjected in operation.
- C. Capacitors 10 mfd or less in value used in electronic modules furnished under this Contract shall have a maximum tolerance of plus-or-minus 10 percent except board-mounted power supply filter capacitors which may be plus-or-minus 20 percent. These capacitors shall be rated for at least 1.5 times the maximum peak voltage they will be subjected to in operation.

## **2.03 REACTORS AND INDUCTORS**

- A. All reactors, other than those required for electronic circuits;
  - 1. Shall conform to all applicable recommendations of Part 14.2.20 (Recommended Design Criteria for Air-Cooled Reactor) of the AREMA Signal Manual, and,
  - 2. Shall be subject to the approval of the designated Resident Engineer.
- B. All coils and chokes or other inductors used in electronic modules furnished under this Contract shall have windings impregnated with a compound approved by the designated Resident Engineer unless non-impregnated windings are approved by the designated Resident Engineer in writing.
- C. Inductors for use in electronic modules shall be rated to withstand a minimum of twice the maximum peak-to-peak voltage to which they will be subjected to in operation.

## **2.04 FUSES**

- A. Fuses shall be of the non-renewable, fibre-case, time-lag, fusion type unless otherwise authorized by the designated Resident Engineer.
- B. Fuses for installation on equipment racks and all fuses associated with power supplies shall be of the indicating type. This does not apply to AC track circuit fuses.
- C. Fuses shall be rated for a minimum of 125 percent of the maximum connected load and derated for an ambient operating temperature of 120 degrees F.

## **2.05 CIRCUIT BREAKERS**

- A. Provide circuit breakers which meet the following requirements:
  - 1. Each breaker shall have a short-circuit current interrupting rating in excess of the short-circuit current capability of the power supply to which it is connected.
  - 2. Each breaker shall have a nominal trip current rating of not less than 125 percent of the maximum steady current required by its load, derated for an ambient operating temperature of 120 degrees F., and in no case less than two times the current rating of the largest connected branch circuit current limiting device.
  - 3. When the breaker is utilized to supply power to loads with inrush current ratings higher than their steady current ratings, the selected breaker shall have a time-delay characteristic curve suitable for that load, according to the breaker manufacturer's recommendations.
  - 4. The voltage rating of the breaker shall not be less than the nominal voltage applied to the breaker.
  - 5. The breaker shall have endurance ratings equal to or greater than 5000 operations

- at rated voltage and current.
- 6. The voltage, current and current inrush ratings of the auxiliary trip-indicating contact of breakers so equipped (as specified on the Contract Drawings), shall be adequate for the trip-indicating device employed by the Contractor.
- 7. The breaker shall have mechanical characteristic ratings adequate for the service to which it is assigned. The Contractor shall select a breaker with characteristics designed to meet environmental conditions encountered in TCRs as stated in Section 16914, Environmental Conditions. The Contractor shall pay special attention to such factors as humidity, operating temperature, shock and vibration.
- 8. Circuit breakers shall be UL-listed.

**2.06 TERMINAL BLOCKS**

A. Basic Characteristics

- 1. Terminal blocks shall be modular, with solderless connections of the pressure clamp or wire wrap type. Connection resistance shall not exceed 0.0002 ohms. Terminals of the pressure clamp type shall be suitable for solid or stranded wire. Individual modular blocks shall have the following features:
  - 2. Built-in facility for affixing tags for identification.
  - 3. Terminals cross-connectable by shunt straps or sliding links as applicable.
  - 4. All metal parts, except wire wrap posts, recessed below the surface of the insulating material.

B. Insulation

- 1. Terminal blocks shall be rated for service at 600 volts minimum. Terminal block insulating material shall meet the requirements of ASTM Specification D-704, Type 6, where such specifications do not conflict with the following minimum requirements, which shall take precedence:
  - a. Material Pressure molded melamine or equal (non-carbonizing)
  - b. Water absorption Less than 0.75 percent after 24 hours immersion ASTM D-570
  - c. Impact strength 0.25 ft. lbs/in ASTM D-256
  - d. Tensile strength 4500 psi ASTM D-638
  - e. Compression strength 32 psi ASTM D-695
  - f. Dielectric strength 250 volts/mil at 100 degrees C ASTM D-48
  - g. Dielectric loss 0.10 at 1000 Hz ASTM D-48
  - h. Volume resistivity 10E11 ohms/cm ASTM D-48
  - i. Surface resistivity 0.3 x 10E12 ohms ASTM D-257
  - j. Heat distortion point 195 degrees F ASTM D-648
  - k. Creepage distance 0.5 inch  
(metal of one module to metal of adjacent module or to ground)

**2.07 TERMINALS FOR WIRES AND CABLES**

- A. All stranded signal wires of size 6 AWG or smaller to be terminated on terminal posts under this Contract shall be fitted with the approved crimp-on type terminal lugs furnished by the Contractor. These pre-insulated solderless lugs shall be of the following types as manufactured by Amp Inc. or approved equal.

<u>WIRE SIZE</u>	<u>INSULATION DIA.</u>	<u>CATALOG NO.</u>
18-22	.125	320554
14-16	.230	35349
10-12	.250	34855
8	.360	52041-1

- B. The Contractor shall make his own determination as to the adequacy of these terminals for the stud sizes and insulation diameters he intends to use under this Contract.
- C. Lugs for wires larger than No. 6 AWG shall be insulated with heat shrink tubing, subject to the approval of the designated Resident Engineer.

## **2.08 TRANSFORMERS**

- A. All transformers used in ATC electronic modules furnished under this Contract shall have windings impregnated with a compound approved by the designated Resident Engineer, unless non-impregnated windings are approved by the designated Resident Engineer in writing.
- B. Transformers used in ATC electronic modules shall not emit audible noise in excess of 40 dB referenced to 0.0002 dynes per sq. cm. at a distance of two feet while operating at rated voltage and load.

## **2.09 SEMICONDUCTOR DEVICES**

- A. All transistors, diodes, zener diodes or other semi-conductors furnished under this Contract shall carry a Joint Electron Device Engineering Council (JEDEC) number and shall be used within the published specifications for that number.
- B. All semiconductors furnished under this Contract shall be of the silicon type, unless otherwise approved by the designated Resident Engineer in writing.
- C. As an option to semiconductors carrying JEDEC numbers, the Contractor shall provide semiconductors approved by the designated Resident Engineer which are available from more than one manufacturer.
- D. Zener diodes used for voltage regulation or reference levels shall be of such rating that they will not be damaged if the entire load is removed abruptly, and shall have a zener voltage tolerance of plus-or-minus 5 percent or better.
- E. Zener diodes used for transient protection shall be of such rating that they will not be damaged in performing their function within all actual conditions encountered in the operating system.

## **2.10 INTEGRATED CIRCUITS**

- A. Integrated circuits shall not be damaged by the failure or partial failure of any one or any combination of the various supply voltages.
- B. Integrated circuits shall not be damaged by an overvoltage applied to the module of 1.4 times the normal supply voltage or by short circuits on the module inputs and/or outputs.
- C. Integrated circuits shall be immune to improper operation due to noise levels of up to 0.8 volts peak-to-peak on any module lead.

# **PART 3 - EXECUTION**

## **3.01 ELECTRICAL INSTALLATION**

- A. Install all basic electrical components of the correct type, size and rating required to provide the specified operation of the ATC system. This shall include replacement of basic electrical

components damaged or burned out in the course of installation and testing.

- B. Install fuses or circuit breakers of the correct type, size and rating to:
  - 1. Protect the electrical equipment and circuits from short-term and long-term overloads,
  - 2. Function properly as part of the ATC power distribution system protection, and,
  - 3. Function properly as part of the ATC failure alarm system (when so required by the Contract Drawings).
- C. Fuses shall be installed and removed using a suitable tool designed for such use. Provide a properly sized fuse puller within reach of every fuse in every rack containing fuses. The fuse pullers shall be attached to the racks at intervals not exceeding every third rack by means of non-conductive lanyards of the shortest length sufficient to reach all fuses in the three adjacent racks. These pullers shall be installed prior to commencement of any electrical test activities.
- D. Attach lugs to the ends of conductors in such a manner that the flexibility of the conductor will not be destroyed and the possibility of wire breakage at the terminal will be reduced to a minimum. Lugs shall be attached to the conductor with a tool made by the same manufacturer as the lug and/or terminal being used. The tool shall be equipped with a ratchet device which ensures proper application of the lug and which will not release until proper compression is attained. Tools which are excessively worn, damaged, abused, or show evidence of missing parts shall not be used. A minimum of one of each type of crimping tool shall be furnished as part of the requirements of Section 16931, Maintenance and Test Facilities.
- E. The Contractor shall use removable type contacts on plugboards for plug-in relays. The method of attaching the wires to the removable contacts shall be a solderless connection, except on plugboards for vital relays which may be solderless or soldered, and which shall be subject to the approval of the designated Resident Engineer.
- F. The method proposed for the application of solderless type terminals to wires of 1000 volt class shall be fully described and submitted to the designated Resident Engineer for approval.

### **3.02 ELECTRONIC INSTALLATION**

- A. Install all basic electronic components of the correct type, size and rating necessary to provide the specified operation of ATC electronic modules. This shall include replacement of basic electronic modules damaged or burned out in the course of installation and testing.

### **3.03 MEASUREMENT FOR PAYMENT**

- A. Basic electrical components will not be paid for separately. The cost of basic electrical components shall be included in the cost of the devices or circuits in which the components are used.
- B. Basic electronic components will not be paid for separately. The cost of basic electronic components shall be included in the cost of the electronic modules or circuits in which the components are used.

**END OF SECTION**

## SECTION 16942

### ATC - PRINTED CIRCUIT CARDS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the characteristics of printed circuit (PC) cards which shall be furnished and installed by the Contractor.
- B. The design and construction of PC cards of the same subsystem shall be of the same design. Cards of different subsystems shall be of the same design and construction wherever practicable.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16926 Microprocessor Systems for Non-Vital Interlocking Functions
  - 2. Section 16941 Basic ATC Electrical and Electronic Component Requirements
  - 3. Section 16945 Plugboards and Cabinets for Relays and PC Cards

##### 1.03 QUALITY ASSURANCE

- A. All printed circuit cards shall be factory tested by the Contractor to determine their compliance with the Specifications for:
  - 1. Mechanical construction
  - 2. Electrical fabrication
  - 3. Circuit Logic
  - 4. Operation
- B. Each printed circuit card which meets all specified requirements shall be permanently marked with the Contractor's inspector's stamp
- C. The Contractor shall install only those PC cards which have passed the factory test and bear the inspector's stamp.

##### 1.04 SUBMITTALS

- A. The Contractor shall submit drawings showing the dimensions and layout of each basic type and size of printed circuit card he proposes to furnish.
- B. The Contractor shall submit factory test reports for all printed circuit cards furnished under this Contract for vital functions.

#### PART 2 - PRODUCTS

##### 2.01 BASIC DESIGN

- A. To the greatest extent possible and without causing an incompatibility with existing PC cards, the Contractor shall arrange the PC card circuitry in such a manner that terminals assigned to a given power supply, common, or ground shall be the same on each PC card in each subsystem.

- B. Where practical, the Contractor shall arrange the remaining PC card circuitry in such a manner that terminals assigned to a given function shall be the same on all PC cards in each subsystem.
- C. PC cards containing circuits performing logic functions which affect passenger safety or train routing shall be designed and circuited in such a way that removal or insertion of a PC card shall not create an unsafe condition.
- D. Printed circuit cards (boards) for use in non-vital interlocking processors shall be specially designed for "testability," i.e., they shall include test points and other testability facilities which shall enable fault isolation to the ambiguity levels specified in Section 16926.

## **2.02 CONSTRUCTION**

- A. Printed circuit cards shall be constructed of glass epoxy material meeting the requirements of NEMA Type FR-4.
- B. PC cards shall be of sufficient thickness to permit easy insertion and removal without buckling or breaking.
- C. PC cards shall be mechanically keyed to prevent incorrect interchange, or electrically interlocked to prevent operation in the event of incorrect interchange. They may also be interlocked through software programming.
- D. Conductor material shall be copper and shall be protected from exposure to air.
- E. Circuits shall be formed by etching. The etched circuits of vital PC cards shall conform exactly to the logic of the corresponding vital circuits contained in the Specifications. No external jumpers shall be used on vital PC cards provided under this Contract, either initially, or on replacement cards.
- F. PC cards shall be coated with an approved moisture-proofing compound.

## **2.03 COMPONENT MOUNTING**

- A. PC card-mounted-components which weigh more than one-half ounce or have a displacement of more than one-half cubic inch shall have a structural attachment to the card which is separate from the electrical attachment.

## **2.04 IDENTIFICATION**

- A. Each type of PC card shall be permanently and legibly marked with a unique number identifying that type of PC card.
- B. Each PC card shall be permanently and legibly marked with a unique serial number.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Printed circuit cards shall be installed in 19-inch card file cabinets of the type specified in Section 16945, Plugboards and Cabinets for Relays and PC Cards, or in other special hardware approved by the designated Resident Engineer.

**3.02 MEASUREMENT FOR PAYMENT**

- A. Printed circuit cards will not be paid for separately. The cost of printed circuit cards shall be included in the cost of the various devices in which they are used.

**END OF SECTION**

## SECTION 16943

### ATC - VITAL RELAYS

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of all relays to be used in circuits which are vital to the safety of train control or operation. This shall include biased neutral relays, switch operating relays, switch overload relays, vital dc timer relays, vane type ac track relays and special purpose dc neutral relays.
- B. The Contractor shall furnish and install all such vital relays required to provide a complete working ATC system as specified herein.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16916 Basic ATC Circuit Requirements.
  - 2. Section 16945 Plugboards and Cabinets for Relays and PC Cards
  - 3. Section 16955 Track and Alarm Indication Panels
  - 4. Section 16971 Racks and Cable Trays
  - 5. Section 16977 Tagging and Marking
  - 6. Section 16980 ATC Tests, Inspections and Quality Assurance

##### 1.03 QUALITY ASSURANCE

- A. Each vital relay shall be factory tested and the results legibly recorded on an applicable AAR "Office Record of Test" form, in conformance with the recommendations of the AREMA Signal Manual, Part 6.4.5 (Alternating Current Relays), and Part 6.4.1 (Direct Current Relays).
- B. The Contractor shall make a visual inspection of all vital relays and their plugboards at the time the relays are installed in the field to detect any obvious mechanical damage. The Contractor shall promptly replace any vital relays or plugboards which have sustained mechanical damage.
- C. Upon installation of the relays, the Contractor shall conduct field and breakdown tests in accordance with a test procedure approved by the designated Resident Engineer. Results of the field and breakdown tests shall be legibly recorded on approved Field and Breakdown Test Report forms.
- D. Operational tests shall be conducted as prescribed in the applicable Sections of Section 16980, ATC TESTS, INSPECTIONS AND QUALITY ASSURANCE.
- E. Type acceptance testing will be required for any solid state vital dc timer relay proposed for use under this Contract.

##### 1.04 SUBMITTALS

- A. The Contractor shall submit a detailed description of each type of vital relay he proposes to furnish on this Contract. He shall also indicate the circuits in which each type of relay is to be used. The Contractor shall obtain the designated Resident Engineer's written approval for each type of vital relay and its proposed application before proceeding with the

manufacture or procurement of the relays.

- B. The Contractor shall submit a Breakdown Test Procedure for field testing vital relays and a Breakdown Test Report form for recording the results thereof.
- C. Factory test reports for the associated wired plugboards shall accompany the relay test forms. These documents shall be required for "delivery approval" by the Engineer. See Part 3.03, Measurement for Partial Payments.
- D. Properly completed Field Test Report forms and Breakdown Test Reports shall be submitted to the Engineer within seven days of performance of the tests. These reports shall be required for "installation approval" by the designated Resident Engineer. See Part 3.03, Measurement for Partial Payments.
- E. The Contractor shall provide the Authority with 50 Relay Manuals. Each manual shall contain comprehensive descriptions and illustrations of each type of vital relay (and plugboard) provided under this Contract, to include such items as relay operation, adjustment, contact insertion and removal, testing and internal wiring diagrams.

#### **1.05 DELIVERY, STORAGE AND HANDLING**

- A. Vital relays shall be shipped separately from the racks in which they are to be mounted.

### **PART 2 - PRODUCTS**

#### **2.01 BASIC REQUIREMENTS**

- A. All vital relays supplied under this Contract shall be of the plug-in type furnished with transparent covers which are fire resistant and do not emit toxic gasses when exposed to fire.
- B. Provisions shall be included for mounting a typed or printed relay name tag on the front of this cover. The name tags shall be easily replaceable, but shall not come off due to vibration.
- C. Arc suppression for all vital dc relay coils shall be built into the relay or its plugboard, or shall be mounted to the back of the plugboard in a manner acceptable to the designated Resident Engineer. This arc suppression shall be of the capacitor-resistor type and shall prevent the load presented to a contact controlling that relay from exceeding the following values during steady state or switching conditions:

1.	Maximum volt-ampere load	15VA
2.	Maximum load current	1 ampere
3.	Maximum switched voltage	250 volts
- D. When three vital dc relays, suppressed as specified herein, are connected in parallel and operated from 28 volts, any vital relay front or back contact which breaks this load shall be capable of at least five million operations at this load without the contact resistance, measured with a 10 ma current, exceeding five ohms.
- E. All vital dc relays furnished shall conform to the applicable recommendations established by the AREMA Signal Manual, Part 6.2.1 (Tractive Armature DC Neutral Plug-in Relay) and Part 6.4.1 (DC Relays).
- F. All vital dc timer relays shall conform to the recommendations established by the applicable sections of Part 6.1.20 (Time Element Relay) of the AREMA Signal Manual.
- G. All ac track relays shall conform to the recommendations established by Part 6.4.5 (AC

Relays) and Part 6.1.35 (AC Induction Type Relay) of the AREMA Signal Manual.

- H. All vital relays shall be of the US&S PN-150 type or the GRS (Alstom Signaling Inc.) "B" type, or an approved equal.
- I. All vital relays and their plugboards shall be equipped with mechanical registration devices to prevent relays of the wrong style, contact arrangement, or operating characteristics from being mounted on any given plugboard. These registration devices shall be applied to the vital relays and their plugboards prior to mounting the relays on the plugboards for factory testing of rack wiring. See Section 16954.

## **2.02 BIASED NEUTRAL RELAYS**

- A. Biased neutral relays shall have a nominal operating voltage of 28 volts and shall be capable of operating continuously and successfully without resultant damage when voltages in a range from 18 to 35 volts inclusive are applied to their operating circuits.
- B. Biased neutral relays shall be so designed that their armature will not pick up when their permanent magnet is demagnetized. These relays shall also be designed so that a fault causing an interruption to the normal magnetic circuit of the relay shall not cause the relay armature to pick up while no current is being applied to the relay coils.
- C. Biased neutral relays shall be so designed that up to at least 50 times working energization applied for two seconds at both normal and reverse polarity will not affect their operating characteristics by more than two percent, and will not pick up their armature, i.e., "break" their back contacts and "make" their front contacts, on reverse polarity.
- D. Each biased neutral vital relay shall have a minimum of either:
  - 1. Four independent front contacts, two dependent front-back contacts, and two independent back contacts, or;
  - 2. Six dependent front-back contacts.
    - a. If option 2 is selected, the Contractor shall certify that any required circuit changes result in circuits which are at least as safe as those specified.
- E. All front contacts shall be silver-to-metalized carbon which conform to the recommendations of Part 6.2.1, paragraph 12, of the AREMA Signal Manual. Each biased neutral relay shall have a minimum of two silver-to-metalized carbon back contacts which conform to the same recommendations unless otherwise approved by the Engineer. In reviewing any proposed alternate back contact composition, the designated Resident Engineer will evaluate the composition, the overall relay characteristics, and the circuit applications of the contacts. It shall be the Contractor's responsibility to perform any tests required by the designated Resident Engineer and to provide all data requested by the designated Resident Engineer to prove that the alternate contact composition is at least as safe as the composition specified. Should an alternate back contact composition be approved and later be found to be unacceptable due to relay characteristics and/or circuit application, the Contractor shall provide relays as specified at no additional cost to the Authority.
- F. All biased neutral relays furnished under this Contract shall be identical.

## **2.03 SWITCH OPERATING RELAYS**

- A. Relays used to control the polarity of the operating current for switch-and-lock movements shall meet the following requirements in addition to the basic requirements specified above:
  - 1. The operating voltage range shall be from 22 to 35 volts inclusive, unless otherwise approved by the designated Resident Engineer.

2. A minimum of two front-back dependent contacts or two independent front contacts and two independent back contacts shall be provided.
  3. Each contact shall be equipped with a magnetic blow-out feature to effectively interrupt high currents and minimize contact wear. Each contact shall be capable of interrupting the normal switch-and-lock movement operating current 10,000 times without its resistance exceeding ten ohms measured at five amps.
- B. All switch operating relays furnished under this Contract shall be identical.

#### **2.04 SWITCH OVERLOAD RELAYS**

- A. Switch overload (stick) relays, used to detect an over-current condition during operation of a switch-and-lock movement, shall meet the following requirements in addition to the basic requirements specified above.
1. Relays shall be equipped with two separately wired, non-biased coils; one to be series connected in the switch operating circuit to detect over-current conditions, the other coil to be operated from nominal 28 Vdc and used as a holding coil in the overload stick circuit.
  2. Relays shall be furnished with a sufficient number of make-before-break contacts to perform the functions described in these Specifications. See Section 16916, Basic ATC Circuit Requirements.

#### **2.05 VITAL DC TIMER RELAYS**

- A. The timing elements of vital dc timer relays shall be electronically controlled. These relays shall be for nominal 28 volt dc operation, and shall operate successfully and without resulting damage with 26.5 volts to 31.5 volts applied to their operating circuits.
- B. Each vital dc timer relay shall be equipped with a timing adjustment device, external to its cover, which can be sealed. When sealed, it shall be impossible to adjust the timing interval. When the device is unsealed, the timing interval shall be adjustable from less than five seconds to more than 15 minutes. The adjustment shall be in increments of one second or less. Once adjusted, the timing interval shall repeat with an error of no more than  $\pm 5$  percent while the relay is operated at rated voltage  $\pm 5$  percent, and at  $\pm 50$  degrees F about the ambient temperature at which the interval was set. Alternately, once adjusted, the timing interval shall repeat with an error of no more than  $\pm 7$  percent when the ambient temperature is between -40 degrees C and +71 degrees C and while the relay is operated at nominal rated voltage  $\pm 5$  percent. For any voltage variation greater than  $\pm 5$  percent (but within the voltage limits of the bus) under the above temperature conditions, the timing interval shall repeat with an error which shall not exceed 15 percent.
- C. Each vital dc timer relay shall have a minimum of two dependent front-back contacts and two independent back contacts. All of the front contacts, and the independent back contacts shall be silver-to-metalized carbon contacts which conform to the recommendations of the AREMA Signal Manual, Part 6.2.1, paragraph 12.
- D. The vital timer relays shall begin their preset timing interval when energy is applied. All of the back contacts shall remain closed until the completion of the timing interval, at which time the back contacts shall open and the front contacts shall close. The front contacts shall then remain closed until energy is removed from the relay. When energy is removed from the relay, the front contacts shall open and the back contacts shall close. The relay shall be so designed and constructed that once energy has been removed from its input terminals, the full preset pick-up time interval shall elapse (when power is reapplied) before the relay can pick-up.
- E. All vital dc timer relays furnished under this Contract shall be identical and shall be

Microchron Timer Relays, Drawing No. 50800-100, GR.2, as manufactured by Alstom Signaling Inc. (formerly General Railway Signal Company) of Rochester, New York, or an approved equal.

- F. The Contractor shall furnish and install any timer repeater relays required by these Specifications, or necessary to meet the demands of the circuits, at no additional cost to the Authority.

## **2.06 AC TRACK RELAYS**

- A. Requirements For All AC Track Relays
  1. AC track relays shall be plug-in, two element, 60 Hz, vane type induction relays. They shall be capable of operating continuously and successfully without resultant damage with 100 to 135 volts, inclusive, applied to the local winding, and with 0.75 to 5.0 volts, inclusive, applied to the control winding.
  2. Each ac track relay shall have a minimum of two dependent front-back contacts. Each front contact shall be of the silver-to-metalized carbon type.
  3. These relays shall not be equipped with breathers.
  4. AC track relays shall conform to the recommendations established by Part 6.1.35 (AC Induction Relay) of the AREMA Signal Manual. These relays shall also conform to the recommendations established in Part 6.2.1 (Tractive Armature DC Plug-in Relay) of the AREMA Signal Manual insofar as base plate, plugboard and mounting are concerned.
  5. All ac track relays furnished under this Contract shall be identical.

## **2.07 SLOW RELEASE RELAYS**

- A. Vital slow release relays shall be of the direct current, neutral, tractive armature type and shall meet the following requirements in addition to the basic requirements specified above:
  1. Slow release relays shall have a nominal operating voltage of 28 volts dc and shall be capable of operating continuously and successfully without resultant damage when voltages in a range from 14 to 35 volts inclusive are applied to their operating circuits.
  2. Slow release relays shall have a minimum release time of 2.00 seconds at 28 volts dc input.
  3. Each slow release relay shall have a minimum of four independent front contacts, two independent back contacts, and two dependent front-back contacts.
  4. All contacts shall be silver-to-metalized carbon which conform to the recommendations of Part 6.2.1 (Tractive Armature DC Plug-in Relay), of the AREMA Signal Manual.
- B. All vital slow release relays furnished under this Contract shall be identical.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. All vital relays shall be rack mounted.
- B. Vital relays shall be arranged in racks as shown on approved rack arrangement plans. Relays shall be mounted at their preassigned locations on the racks only after the racks have been permanently mounted in the Train Control Room. The full complement of required mounting hardware to mount each relay.

### **3.02 SPECIAL REQUIREMENTS**

- A. Each biased neutral relay and each track relay, or their relay-repeater combinations, shall have at least one spare dependent front-back contact or one spare independent front and one spare independent back contact. This requirement shall be met throughout the installation and test period and at the conclusion of all field corrections.
- B. One Normal and one Reverse Switch Operating Relay shall be provided for each switch-and-lock movement.
- C. One Switch Overload Relay shall be provided for each switch-and-lock movement.
- D. Each track relay or track relay-repeater combination shall have one back contact wired out to a plug coupler for use by a track indication panel, as specified in Section 16956, Interlocking Control Panels. If the vital track relay is repeated by a non-vital logic relay, a contact on the non-vital repeater relay may be used for this purpose.
- E. No more than 90 percent of the available relay space in each relay rack shall be filled at the time of installation, and no more than 95 percent of the available relay space in each relay rack shall be filled upon completion of all field corrections and testing.
- F. Where vital relays are added to existing Train Control Room racks, the new relays shall be mounted in conformance with the existing relays, i.e., in such a manner that the fronts of all relays in the rack are in the same vertical plane.

### **3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Vital relays will be measured for partial payments on a unit basis. The "unit" shall include the relay, a completely wired and mounted plugboard of the proper type as specified in Section 16945, all the hardware required to register and mount the relay onto the plugboard, and the correct relay name tag.
- B. Factors which will be considered when measuring vital relays for partial payments will include:
  - 1. Delivery of the relays and their associated wired plugboards, and submission and approval of the required plugboard Factory Test Reports by the designated Resident Engineer.
  - 2. Installation of the relays, submission of the required Field Test Record forms and Breakdown Test Reports, and approval of the installation by the designated Resident Engineer.

**END OF SECTION**

## SECTION 16944

### ATC - NON-VITAL RELAYS AND TIMERS

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of relays and timers used in circuitry not considered vital to the safety of train control or operation. The Contractor shall furnish and install all such non-vital relays and timer equipment necessary to provide a complete working system under this Contract.

##### 1.02 DESCRIPTION

- A. Non-Vital Relays
  - 1. Non-vital relays are specified in three categories as follows:
    - a. Non-vital logic relays
    - b. Non-vital general purpose interfacing relays
    - c. Non-vital heavy duty interfacing relays
- B. Non-Vital Timers
  - 1. Non-vital timers shall be furnished for platform dwell time applications.

##### 1.03 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, work specified in the following Sections and documents:
  - 1. Section 16916 Basic ATC Circuit Requirements
  - 2. Section 16918 Special ATC Requirements for Specific Locations
  - 3. Section 16942 Printed Circuit Cards
  - 4. Section 16943 Vital Relays
  - 5. Section 16945 Plugboards and Cabinets for Relays and PC Cards
  - 6. Section 16971 Racks and Cable Trays
  - 7. Section 16980 ATC Tests, Inspections and Quality Assurance
  - 8. Factory Test Procedures approved by the designated Resident Engineer.

##### 1.04 QUALITY ASSURANCE

- A. The Contractor shall factory test non-vital relays and timers in accordance with the requirements of the applicable Factory Test Procedures approved by the designated Resident Engineer.
- B. The Contractor shall inspect the installation of non-vital relays and dwell timers in accordance with the requirements of the applicable Installation Inspection Procedure approved by the designated Resident Engineer

##### 1.05 SUBMITTALS

- A. The Contractor shall submit complete drawings and performance data for the non-vital dwell timers and for each type of non-vital relay he proposes to furnish under this Contract. The Contractor shall obtain the designated Resident Engineer's written approval for each type of required equipment before proceeding with the manufacture or procurement of that type of equipment.

- B. The Contractor shall submit a proposed Factory Test Procedure for each type of non-vital relay and timer approved for use under this Contract. These procedures shall be in conformance with the requirements specified in Section 16980, ATC Tests, Inspections and Quality Assurance.
- C. The Contractor shall submit an Installation Inspection Procedure for each type of non-vital relay and timer approved for use under this Contract. These procedures shall be in conformance with the requirements specified in Section 16980.
- D. The Contractor shall submit Factory Test Reports required by the Factory Test Procedure for non-vital relays and timers prior to the shipment of this material.

## **1.06 DELIVERY, STORAGE AND HANDLING**

- A. Non-vital logic relays, non-vital heavy duty interfacing relays, and non-vital timers, may be mounted and shipped in the racks or cabinets in which they are to be used. (See Sections 16945 and 16971.)
- B. Non-vital, general purpose interfacing relays shall be mounted and shipped on the printed circuit cards on which they are to be used. (See Section 16942.)

## **PART 2 - PRODUCTS**

### **2.01 BASIC NON-VITAL RELAY REQUIREMENTS**

- A. Covers and Name Tags
  - 1. Non-vital logic relays and non-vital heavy duty interfacing relays shall be of the plug-in type. Unless these relays are mounted in metal cabinets having non-combustible, transparent front plates, they shall be furnished with individual transparent covers which will not support combustion.
  - 2. Facilities shall be included for mounting a typed or printed relay name tag for each relay, either on the relay cover or on the relay cabinet front plate, as applicable. The name tag shall be easily replaceable, but shall not come off during normal service.
  - 3. The design of the individual relay covers and of the cabinet in which several relays are mounted shall permit viewing the relays without disassembly or other mechanical manipulation to determine whether each relay is picked up or dropped out.
- B. Arc Suppression
  - 1. Arc suppression for non-vital logic and heavy duty interfacing relay coils shall be built into the relays or into their plugboards. Arc suppression for non-vital, general purpose interfacing relay coils shall be built into the printed circuit cards on which the relays are mounted. (See Section 16916.)

### **2.02 NON-VITAL LOGIC RELAYS**

- A. Non-vital logic relays shall be plug-in, dc, neutral relays with a nominal operating voltage of 28 volts. These relays shall pick up with 18 volts, or more, applied to their operating circuit. These relays shall be capable of operating continuously with as much as 32 volts applied to their operating circuit.
- B. The typical pick up time for non-vital logic relays shall be less than 75 ms when energized with 18 volts. The typical drop out time for these relays shall be less than 100 ms when de-energized from 28 volts. These times shall be measured from the instant the switch applying the voltage closes until a front contact closes and from the instant the switch removing the voltage opens until a front contact opens.

- C. Each non-vital logic relay shall be equipped with a minimum of four front-back contacts. Each front-back contact shall be metal-to-metal and shall be capable of carrying one ampere continuously without the contact resistance, measured at this current level, exceeding 5 ohms. Each contact shall also be capable of breaking a 0.5 ampere dc resistive load at least 50 million times, at no less than 120 cycles per minute, without the contact resistance, as measured with a 10 ma current, exceeding 5 ohms. Non-vital logic relays shall be capable of electrical operation specified above after 100 million mechanical cycles without electrical load on the contacts.
- D. Arc suppression on the coils of each non-vital logic relay shall prevent the load presented to a contact controlling that relay from exceeding the following values during steady state or switching conditions:
 

1.	Maximum volt-ampere load	4.2VA
2.	Maximum load current	.15 ampere
3.	Maximum switched voltage	250 volts
- E. When three non-vital logic relays, suppressed as required by these Specifications, are connected in parallel and operated from 28 volts, a non-vital logic relay front or back contact which breaks this load shall be capable of at least 10 million operations at this load, at no less than 120 cycles per minute, without the contact resistance, as measured with a 10 ma current, exceeding 5 ohms.
- F. Non-vital logic relays shall conform to the recommendations established by the AREMA Signal Manual, Part 6.3.5 (Detachable DC Non-vital Relay), where the recommendations of the AREMA Signal Manual do not conflict with requirements specified herein.
- G. Non-vital logic relays shall be type "J," as manufactured by the Alstom Signaling, Inc., or type LP-100, as manufactured by the Union Switch & Signal Company, or an approved equal.
- H. All non-vital logic relays furnished under this Contract shall be identical.

**2.03 NON-VITAL GENERAL PURPOSE INTERFACING RELAYS**

- A. Non-vital general purpose interfacing relays shall be reed relays or crystal can relays, either type with hermetically sealed contacts and epoxy encapsulated coils. These relays shall be mounted on printed circuit cards described in Section 16942.
- B. Non-vital general purpose interfacing relays shall be dc relays with a nominal operating voltage of 28 volts. They shall pick up with 18 volts or more applied to their operating circuit, and must drop out when this voltage decreases below two volts at 20 degrees C.
- C. These relays shall be capable of operating continuously with as much as 32 volts applied to their operating circuit.
- D. The typical pick up time for non-vital general purpose interfacing relays shall be less than 25 ms when energized with 18 volts. The typical drop out time for these relays shall be less than 50 ms when de-energized from 28 volts. These times shall be measured from the instant the switch applying the voltage closes until a front contact closes and from the instant the switch removing the voltage opens until a front contact opens.
- E. All non-vital general purpose interfacing relays except those used for input and output interfacing of the RTU, shall be equipped with a minimum of two front contacts, one of which shall be used for an indication light circuit. Each contact shall be metal-to-metal and shall be capable of carrying and breaking a load with the following characteristics:

- |    |                          |              |
|----|--------------------------|--------------|
| 1. | Maximum volt-amp load    | 15VA         |
| 2. | Maximum load current     | 1 ampere     |
| 3. | Maximum switched voltage | 250 volts dc |
- F. Each contact shall be capable of breaking a resistive load with the above characteristics, or an inductive load suppressed so that at no time during steady state or switching conditions does the load exceed the above characteristics, at least 1.5 million times, at no less than 120 cycles per minute, without the contact resistance, measured at 10 ma, exceeding 3.0 ohms.
- G. Non-vital general purpose interfacing relays shall be capable of the electrical operation specified above after 10 million mechanical cycles without an electrical load on their contacts. Under all conditions, the minimum open contact resistance shall be 50 megohms at 400 volts dc and the maximum duration of contact bounce shall be 5.0 ms.
- H. Arc suppression on the coils of general purpose interfacing relays shall prevent the load presented to a contact controlling each relay from exceeding the following values during steady state or switching conditions:
- |    |                          |           |
|----|--------------------------|-----------|
| 1. | Maximum volt-ampere load | 15VA      |
| 2. | Maximum load current     | 1 ampere  |
| 3. | Maximum switched voltage | 250 volts |
- I. All non-vital general purpose interfacing relays used for non-RTU interfacing under this Contract shall be identical. Likewise, all non-vital general purpose interfacing relays used for RTU interfacing under this Contract shall be identical. All printed circuit card assemblies containing non-vital general purpose interfacing relays shall be identical.

#### 2.04 NON-VITAL HEAVY-DUTY INTERFACING RELAYS

- A. Non-vital heavy interfacing relays shall be plug-in, dc neutral relays with a nominal operating voltage of 28 volts. These relays shall pick up with 22 volts or more applied to their operating circuit, and must drop out when this voltage decreases below one volt. These relays shall be capable of operating continuously with as much as 32 volts applied to their operating circuit.
- B. The typical pick up time for non-vital heavy-duty interfacing relays shall be less than 35 ms when energized with 28 volts. The typical drop out time for these relays shall be less than 60 ms when de-energized from 28 volts. These times shall be measured from the instant the switch applying the voltage closes until a front contact closes and from the instant the switch removing the voltage opens until a front contact opens.
- C. Each non-vital heavy-duty interfacing relay shall be equipped with a minimum of two front-back contacts. Each contact shall be metal-to-metal and shall be capable of carrying and breaking a resistive or an inductive load which does not exceed the following characteristics one million times, at no less than 120 cycles per minute without the contact resistance, measured at 5 amps, exceeding one ohm:
- |    |   |              |
|----|---|--------------|
| 1. | Maximum continuous volt-amp load  | 200VA        |
| 2. | Maximum volt-amp load while relay contact is opening (transient due to inductive surge) | 350VA        |
| 3. | Maximum instantaneous load current  | 5 amps       |
| 4. | Maximum continuous load current   | 5 amps       |
| 5. | Maximum instantaneous switch voltage  | 100 volts dc |
- D. Each contact shall also be capable of carrying and breaking a resistive load or an inductive load which does not exceed the following characteristics five million times, at no less than

120 cycles per minute, without the contact resistance, measured at 0.5 amps, exceeding one ohm:

- |    |   |              |
|----|---|--------------|
| 1. | Maximum continuous volt-amp load  | 50VA         |
| 2. | Maximum volt-amp load while relay contact is opening (transient due to inductive surge) | 90VA         |
| 3. | Maximum instantaneous load current  | 1.25 amps    |
| 4. | Maximum continuous load current   | 1.25 amps    |
| 5. | Maximum instantaneous switch voltage  | 100 volts dc |

E. Arc suppression on the coils of each non-vital heavy interfacing relay shall prevent the load presented to a contact controlling that relay from exceeding the following values during steady state or switching conditions:

- |    |                          |           |
|----|--------------------------|-----------|
| 1. | Maximum volt-ampere load | 15VA      |
| 2. | Maximum load current     | 1 ampere  |
| 3. | Maximum switched voltage | 250 volts |

F. All non-vital heavy interfacing relays furnished under this Contract shall be identical.

## 2.05 DWELL TIMERS

A. Non-vital timers to control the dwell time of trains at station platforms shall be Series GP-60S, plug-in, automatic reset, delay/interval timers as manufactured by the Industrial Timer Division of the Esterline Corporation, or an approved equal.

B. Technical Specifications:

- |    |                   |   |
|----|-------------------|---|
| 1. | Operating Voltage | 120 Vac 60 Hz   |
| 2. | Timing Range      | 2 seconds to 60 seconds adjustable in one-second increments |
| 3. | Resetting Time    | Less than one second\                                       |
| 4. | Repeat Accuracy   | ±0.25 second  |
| 5. | Operating Life    | 5 x 10E6 operations minimum at rated load                   |

C. All dwell timers furnished under this Contract shall be identical.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

A. Logic Relays and Heavy-Duty Interfacing Relays

1. Non-vital logic relays and non-vital heavy interfacing relays shall be mounted in racks or metal cabinets as shown on approved plans. No more than 90 percent of the available relay space in each rack or cabinet shall be filled at the time of installation, and no more than 95 percent of the available relay space in each rack or cabinet shall be filled upon completion of all field corrections and testing.
2. Cabinets used to mount these relays shall have transparent front plates which do not support combustion. These cabinets shall be mounted in racks as specified in Section 16971.

B. General Purpose Interface Relays

1. Non-vital general purpose interfacing relays shall be mounted on printed circuit cards described in Section 16942.
2. Each printed circuit card on which non-vital general purpose interfacing relays are mounted shall have one indicator light mounted along the front edge of the card for

each relay in such a manner that the lights can be readily viewed for trouble shooting. The indicating light shall be operated by a contact on the relay so that it will be illuminated whenever the relay is picked up. Each indicating light shall be identified, both on the printed circuit card and on the transparent front plate of the card cabinet, with the name of the relay it indicates.

3. Groups of printed circuit cards on which non-vital general purpose interfacing relays are mounted shall be installed in metal cabinets that have transparent front plates or covers which do not support combustion. The design of the cabinets shall permit viewing the cards without disassembly or other mechanical manipulation to determine whether each relay indicator light is lighted.

C. Dwell Timers

1. The non-vital dwell timers shall be rack mounted.

### 3.02 SPECIAL REQUIREMENTS

- A. Each non-vital logic relay or logic relay-repeater combination shall have at least one spare dependent front-back contact. This requirement shall be met throughout the installation period and at the conclusion of field corrections and testing.
- B. When one or more non-vital logic relays are used as front contact repeaters for a vital track relay (or a vital track repeater relay), and none of the vital relay back contacts are wired to a plug coupler for use by a portable pen graph unit, one of the non-vital logic relay back contacts shall be wired for this purpose. See Section 16943, Vital Relays, paragraph 3.02, Special Requirements.

### 3.03 MEASUREMENT FOR PAYMENT

- A. Non-vital Logic Relays and Non-vital Heavy-Duty Interfacing Relays will be measured for payment on a unit basis. The unit shall include the relay, a completely wired and mounted plugboard of the proper type as specified in Section 16945, all the hardware required to mount the relay to the plugboard, and the correct relay name tag.
- B. Non-vital General Purpose Interfacing Relays will not be measured for payment separately, but will be considered to be part of the printed circuit cards on which they are mounted. See Section 16942.
- C. Dwell Timer Units will be measured for payment on a unit basis. The unit shall include the timer and all required wiring and mounting hardware.
- D. The following factors will be considered when measuring these items for partial payments:
  1. Delivery of the items by the Contractor and approval of their Factory Test Reports by the designated Resident Engineer.
  2. Installation of the items by the Contractor and approval of the installation by the designated Resident Engineer.

**END OF SECTION**

## SECTION 16945

### ATC - PLUGBOARDS AND CABINETS FOR RELAYS AND PC CARDS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing, installation, and wiring of various mounting devices for vital and non-vital relays and printed circuit cards.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be lifted to, the following Sections:
  - 1. Section 16915 Basic ATC Equipment Requirements
  - 2. Section 16916 Basic ATC Circuit Requirements
  - 3. Section 16942 Printed Circuit Cards
  - 4. Section 16943 Vital Relays
  - 5. Section 16944 Non-Vital Relays and Timers
  - 6. Section 16949 Signal Wire and Cable
  - 7. Section 16948 Plug Connectors
  - 8. Section 16953 ATP Track Modules
  - 9. Section 16977 Tagging and Marking
  - 10. Section 16978 Miscellaneous Train Control Components and Materials

##### 1.03 QUALITY ASSURANCE

- A. The Contractor shall factory test all relay plugboards, all PC card connectors, and all cabinets for relays or printed circuit cards in the manner prescribed by factory test procedures previously approved by the designated Resident Engineer.
- B. The Contractor shall record the results of all such factory tests on the prescribed factory test report forms for submittal to the designated Resident Engineer.

##### 1.04 SUBMITTALS

- A. The Contractor shall submit the following for approval:
  - 1. Drawings and mechanical and electrical characteristics of each type of vital relay plugboard he proposes to furnish;
  - 2. Drawings and mechanical and electrical characteristics of each type of non-vital relay plugboard and cabinet he proposes to furnish;
  - 3. Drawings of each type of PC card connector and associated terminals he proposes to furnish;
  - 4. Drawings of the hardware and/or cabinets he proposes to use to mount PC cards;
  - 5. Drawings showing the proposed method of mounting each type of relay plugboard and relay or PC card cabinet to be used.
- B. The Contractor shall submit a factory test procedure for each type of relay plugboard, cabinet, or PC card connector he proposes to furnish.
- C. The Contractor shall submit properly filled out factory test reports for all plugboards and cabinets for relays and PC cards.

#### PART 2 - PRODUCTS

## **2.01 BASIC RELAY PLUGBOARD REQUIREMENTS**

- A. Plugboards for vital relays, non-vital logic relays, and non-vital heavy-duty interfacing relays shall have the following characteristics:
  - 1. The plugboard shall be designed for vertical mounting.
  - 2. The method of fastening the relay to the plugboard shall be designed to hold the relay securely in place and yet allow the relay to be easily removed.
  - 3. The plugboards shall be designed for the insertion of removable contacts attached to the external wiring.
  - 4. The plugboards shall be designed in such a manner that the removable contacts shall make direct contact with the relay coil leads and the relay contact springs.
  - 5. Arc suppression when required, shall be built into the relay plugboards or shall be mounted on the back of the plugboards in a manner acceptable to the designated Resident Engineer if it is not built into the relays themselves. (See Section 16916.)
  - 6. The back of each vital relay plugboard shall be equipped with a tag to indicate the nomenclature of the relay for which it is wired.
  - 7. Plugboards shall be identical for each type of plug-in relay.
  - 8. Plugboards for plug-in relays shall be designed for the insertion of removable contacts. The removable contacts shall be designed for connection to the wires by means of solder less connections. As an option for plugboards for vital relays only, the contacts shall be designed for soldered connections.
  
- B. Plugboards for vital relays shall have the following features in addition to those specified above:
  - 1. Plugboards for vital relays shall be equipped with a mechanical registration device to prevent relays of the wrong style, contact arrangement, or operating characteristic from being inserted.
  - 2. Vital relay plugboards shall be equipped with one voltage test post and one combination voltage-and-current test post unless otherwise specified. Vital relay plugboards for biased-neutral frequency-selection (QR) relays shall be equipped with one voltage test post and one combination voltage-and-current test post for the coil leads of each coil. Each current test post shall be so designed that ammeter leads can be attached and the test post opened to check the current without interrupting current flow to the relay coil involved.

## **2.02 PRINTED CIRCUIT CARD CONNECTORS**

- A. The types of printed circuit card connectors and their associated terminals shall be fully described in the Contractor's submittals to the designated Resident Engineer.
  
- B. PC card connector contacts shall have gold plating .000050 inch thick unless otherwise approved by the designated Resident Engineer.
  
- C. PC card connectors used as "mother board" connections shall be secured to the cabinet in such a manner that PC cards can be readily removed and inserted.

## **2.03 CABINETS**

- A. Cabinets used to house non-vital relays and printed circuit cards, shall be of rigid metal construction and shall be designed for mounting on standard 19-inch equipment racks.
  
- B. Cabinets shall be constructed of a non-corroding metal or shall be painted to the manufacturer's standard to match the finish of the equipment racks in which they are to be mounted.

- C. Each cabinet shall have a transparent front dust cover which will permit easy viewing of relay name tags and indication lights. This dust cover shall be made of a shatter-proof material which will not support combustion or emit poisonous or corrosive gases, even when exposed to flame or extreme heat. The covers shall be hinged or otherwise attached for easy removal from the cabinets. Fasteners for the front dust cover shall be of the rugged, metal, half-turn, twist-lock design. Light duty fasteners such as a plastic plunger and grommet design shall not be used. The rear cover shall either be hinged or secured with screws or fasteners of the half-turn, twist-lock design. The screws for fastening the rear cover shall have slotted heads with knurled finger grips and captive lockwashers for ease of assembly into a captive nut on the module. All fasteners shall be approved by the designated Resident Engineer.
- D. Relay and printed circuit board cabinets shall be equipped with plug connectors of the type specified in Section 16948, Plug Connectors. These plug connectors shall be mounted on the back panel of the cabinet. Internal wiring between these plug connectors and the relay plugboards or the PC card connectors shall be as specified for module wiring in Section 16949, Signal Wire and Cable. Sufficient slack shall be provided in this wiring to permit easy access to the relay plugboards and/or printed circuit card connectors mounted inside the cabinet when the cabinet back panels are open.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION OF RELAY PLUGBOARDS**

- A. Relay plugboards shall be factory installed and wired. A full complement of non-corroding fasteners shall be used to mount the plugboards on equipment racks or in relay cabinets.
- B. Wires shall be connected to the removable contacts in the manner specified by the manufacture of the contacts. Stripping and crimping tools recommended by the manufacturer of the contacts shall be used to make all wire-to-contact connections. A minimum of one of each type of crimping tool shall be furnished as specified in Section 16978.
- C. Each contact wire shall be of sufficient length to permit the contact to which it is connected to be moved to any contact position on the same relay plugboard. The wiring to each removable contact shall carry an approved tag indicating the relay contact number assigned to the wire.

#### **3.02 INSTALLATION OF RELAY AND PC CARD CABINETS**

- A. Cabinets for non-vital relays or printed circuit cards shall either be rack mounted prior to shipment or installed on the racks in the field. In either case a full complement of non-corroding mounting hardware shall be used to attach these modules to the rack in the manner previously approved by the designated Resident Engineer.
- B. Cabinets shall be marked with their identifying geometric coordinates as specified in Section 16977, Tagging and Marking.

#### **3.03 MEASUREMENT FOR PAYMENT**

- A. Relay plugboards and wiring will not be measured for payment separately, but will be included in the cost of the relays for which they are installed and wired. (See Sections 16943 and 16944.)

- B. Cabinets (if used) and/or hardware for mounting non-vital relay plugboards will not be measured for payment separately, but will be included in the cost of the relays which they support. (See Section 16944.)
- C. Cabinets and/or hardware for mounting printed circuit cards will not be measured for payment separately, but will be included in the cost of the devices in which the associated printed circuit cards are used.

**END OF SECTION**

**SECTION 16946  
ATC TRANSFORMERS**

**PART 1        GENERAL**

**1.01    SECTION INCLUDES**

- A.     This Section specifies the furnishing and installation of all transformers for ATC power distribution and isolation purposes, and for such other purposes as may be required to accomplish the functions specified herein.

**1.02    GENERAL REQUIREMENTS**

- A.     All ATC transformers provided under this Contract shall be of the air-cooled, dry type unless otherwise approved by the designated Resident Engineer.
- B.     The Contractor shall compute the sizes of all power and isolation transformers required to supply the loads imposed by other equipment he installs under this Contract. These computations shall be based upon a continuous duty cycle at maximum load, unless otherwise specified.
- C.     The Contractor shall furnish transformers having nameplate ratings at least 25 percent in excess of the maximum computed loads they are to supply.
- D.     Transformers shall be in accordance with the recommendations of Part 14.2.10 (Transformer, Dry Type) of the AREMA Signal Manual.

**1.03    RELATED SECTIONS**

- A.     Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1.     Section 16921             ATC Power Distribution Systems
  - 2.     Section 16952             DC Power Supplies
  - 3.     Section 16961             Audio Frequency Track and Loop Circuit Layouts
  - 4.     Section 16963             Power Frequency Track Circuit Layouts
  - 5.     Section 16965             Signal Layouts
  - 6.     Section 16980             ATC Tests, Inspections and Quality Assurance

**1.04    QUALITY ASSURANCE**

- A.     The Contractor shall factory test all ATC transformers furnished under this Contract.
- B.     The factory tests shall be made in accordance with the recommendations of Part 14.2.10 (Transformer Dry Type) of the AREMA Signal Manual and the provisions of Section 16980 of these Specifications.
- C.     Transformers shall be field tested as part of the overall testing of power distribution systems or of the other systems or devices in which the transformers are used.

**1.05    SUBMITTALS**

- A.     Submit the following to the designated Resident Engineer for approval prior to purchase or fabrication of the transformers:
  - 1.     Detailed copies of the computations used to determine the size of each transformer to be provided.
  - 2.     Scale drawings showing the physical characteristics of the proposed transformers and details of the method of mounting each type.

3. Internal wiring diagrams and performance data for each type and size of transformer proposed.
4. Technical data describing the basic materials proposed for transformer cores, coils, insulation, impregnating compound, and housings.

## **PART 2 PRODUCTS**

### **2.01 BASIC TRANSFORMER REQUIREMENTS**

- A. Cores
  1. Core laminations shall be grain oriented silicon steel.
  2. Maximum flux densities shall be substantially below saturation level.
  3. The core volume shall allow efficient transformer operation at 10 percent above the highest tap voltage.
  4. All laminations must be core plated or annealed, free of burrs and firmly butted.
  5. The core laminations shall be tightly clamped and compressed to provide quiet operation.
  6. Transformers shall not emit audible noise in excess of 50 dB (referenced to .0002 dynes per sq. cm.) at a distance of three feet while operating at rated voltage and load.
- B. Coils
  1. Coil conductors shall be continuous with terminations brazed or welded without auxiliary flux material.
  2. The entire core and coil assembly shall be predried by heat, impregnated with varnish or other approved compound, and cured at a minimum of 350 degrees F to reduce hot spots and seal out moisture.
  3. Coils shall be protected with an outer layer of glass tape or similar quality insulation.
- C. Insulation
  1. All ATC transformers furnished under this Contract, except those used in electronic modules, shall have insulation capable of withstanding 3000 volts DC between windings or from winding to core.
  2. The insulating material shall be subject to the approval of the designated Resident Engineer.
- D. Terminals
  1. All ATC transformers furnished under this Contract, except those used in electronic modules, shall be equipped with suitably insulated screw terminals or standard AAR binding posts for all primary and secondary lead wires.

### **2.02 TRACK TRANSFORMERS**

- A. The 60-Hz track circuit transformers required to supply power to track circuits at certain specified locations shall meet the following requirements in addition to those specified above:
  1. Track transformers shall have a nominal primary voltage of 120 volts, but shall also have primary winding taps and terminals for 110 and 115 volts.
  2. The secondary windings shall be provided with taps and terminals to supply voltages in one-volt increments up to a maximum of 15 volts.
  3. Track transformers shall be capable of carrying the track circuit load plus 25 percent, but in no case shall they be rated less than 300 VA.

### **2.03 SIGNAL HEAD TRANSFORMERS**

- A. Signal head transformers shall meet the requirements specified in Section 16965, Signal Layouts, in addition to the Basic Transformer Requirements specified above.

## **PART 3 EXECUTION**

### **3.01 INSTALLATION**

- A. Power and isolation transformers shall be rack mounted unless otherwise specified or approved by the designated Resident Engineer.
- B. Use a full complement of non-corroding hardware to mount each transformer in the manner previously submitted by the Contractor and approved by the designated Resident Engineer. Mounting panels or brackets shall be rigidly designed so that they do not sag under the weight of the transformer.

### **3.02 MEASUREMENT FOR PAYMENT**

- A. Transformers will not be measured and paid for separately.
- B. The cost of track transformers shall be included in the cost of power frequency track circuit layouts (Section 16963).
- C. The cost of signal head transformers shall be included in the cost of signal layouts (Section 16965).
- D. The cost of transformers used in electronic devices shall be included in the costs of the associated electronic devices.
- E. The cost of transformers used in DC power supplies shall be included in the costs of the associated DC power supplies (Section 16952).
- F. The cost of power and isolation transformers used in power distribution systems shall be included in the cost of the associated power distribution systems (Section 16921).

**END OF SECTION**

## SECTION 16947

### ATC - GROUND DETECTORS

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of Ground Detectors for the uninterruptible, ungrounded, 120 Vac, and the ungrounded 28 Vdc energy buses in each Train Control Room.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16922 Lightning/Surge Protection and Grounding Systems
  - 2. Section 16980 ATC Tests, Inspections and Quality Assurance

##### 1.03 QUALITY ASSURANCE

- A. Both the ac and dc ground detectors shall be subject to type-acceptance testing.
- B. The Contractor shall factory test all ground detectors for conformance with the requirements of these Specifications. Only those ground detectors meeting these requirements shall be shipped or installed.
- C. The Contractor shall field test all ground detectors as part of the respective TCR grounding systems. See Section 16922, Lightning/Surge Protection and Grounding Systems.

##### 1.04 SUBMITTALS

- A. The Contractor shall submit the following within 90 days of NTP for each type of ground detector he proposes to furnish:
  - 1. Mechanical drawings of all major components of the unit and the method of mounting the unit
  - 2. Electrical circuits
  - 3. Operating description
  - 4. Performance and sensitivity data
  - 5. Maintenance requirements
  - 6. Parts list
  - 7. Prototype unit for type-acceptance testing
  - 8. The Contractor shall submit a factory test report for each ground detector furnished under this Contract.

#### PART 2 - PRODUCTS

##### 2.01 BASIC DESIGN REQUIREMENTS

- A. The dc ground detector shall be sensitive enough to detect leakage currents from either terminal of the floating supply to ground through leakage paths having resistances throughout the range of zero to 10,000 ohms.
- B. The ac ground detector shall be at least sensitive enough to detect currents to ground (from either terminal of the floating supply) which would flow through an impedance of 2000 ohms.

- C. The ground detection schemes utilized shall allow the detectors to be immune to transient current flows that may be the result of charging distributed supply-to-ground capacitances. The detectors shall also be immune to induced power line ripple which may exist between the supply leads and ground.
- D. The ground detectors shall have a memory capability to provide an indication of a momentary or intermittent supply to ground leakage condition.
- E. The operation of the ground detectors shall not interfere with the operation of power, communication or ATC circuits or equipment.
- F. The ground detector circuits shall meet the fail-safe design criteria with respect to open circuits. Furthermore, the shorting or opening of any component part of the ground detector circuits shall be detectable.
- G. The "made" ground in the ground detecting part of the circuits shall be checked to validate its presence. This check shall be continuously made in a fail-safe manner.
- H. The ground detector repeater relays shall be vital relays and shall be energized when no ground is being or has been detected.
- I. The ground detector circuits shall operate stably over the specified temperature range and over a voltage range of from zero volts to 10 percent above the rated voltage of the power supply with which they are associated.

## **2.02 OPERATION AND INDICATIONS**

- A. It shall be necessary to manually reset either ground detector to its normal operating condition after a ground has been detected. The ground detector shall not remain in its normal indication position upon reset if the ground condition has not been eliminated.
- B. Each ground detector shall be equipped with two indicator lights:
  1. A white indicator to indicate that both buses are clear of grounds.
  2. A red indicator to indicate that a ground has occurred.
- C. Each ground detector shall be equipped with an electrically isolated contact to provide remote indication of a detected ground.
- D. Each ground detector shall be equipped with a three-position, center-off, momentary-contact test switch to check the operation of that detector by providing momentary leakage paths from ground to the buses being monitored. The impedance of these paths shall be 10,000 ohms for dc ground detectors and 2000 ohms for ac ground detectors.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. The Contractor shall install the ground detectors in the power racks in each TCR.
- B. Installation shall include all materials, labor and wiring required:
  1. to connect the ground detector ground references to the TCR ground system as shown on the Contract Drawings.
  2. to connect the ground detection indication contacts to the local RTU as shown on the Contract Drawings.
  3. to connect the ground detectors to the energy sources required to operate the

detectors and their local indication lights.

**3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. The cost of Ground Detectors shall be included in the costs of Lightning/Surge Protection and Grounding Systems.
- B. Ground detectors will be measured for partial payments on a unit basis, based upon the number and type of such approved units actually furnished, installed, tested and accepted.

**END OF SECTION**

## SECTION 16948

### ATC - PLUG CONNECTORS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of multiple position plug connector assemblies required to connect multiconductor cables and/or individual wires to the internal wiring of racks, control panels or equipment modules.

##### 1.02 DESCRIPTION

- A. These assemblies shall hold and insulate individually mated, extractable pin-and-socket contacts which shall be mechanically crimped to individual wires or wire wrap pins.
- B. The connector assemblies shall be easily connected and disconnected by hand and shall be provided with mechanical locking and keying devices.
- C. Two basic types of connectors shall be furnished; a 28 contact, vital circuit type, and a 50 contact, non-vital circuit type.

##### 1.03 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16949 ATC Signal Wire and Cable
  - 2. Section 16978 Miscellaneous Train Control Components and Materials

##### 1.04 QUALITY ASSURANCE

- A. The following tests shall be made on six or more randomly selected plug connector assemblies at the start of the production run for this contract. The same tests shall be repeated on additional samples selected at intervals of no more than 500 plug connector assemblies as the production run continues.
  - 1. Each half of the plug connector assembly shall withstand for one minute, a dielectric strength test of 900 volts ac (RMS) applied between adjacent contacts and between the contacts and the other metallic parts of the connector assembly.
  - 2. A minimum of six randomly selected contacts shall have not less than ten pounds of retention after each contact has been inserted and extracted ten times using the applicable extraction tool. The force to dislodge the aged contacts from their cavities shall be measured and recorded after the eleventh insertion.
  - 3. The durability of the connector assemblies shall be measured by subjecting fully wired assemblies having a full complement of contacts to 500 cycles of mating and unmating, with the connectors being fully locked and unlocked during each cycle. After cycling as described above, the connector assemblies shall show no evidence of mechanical damage or missing parts.
  - 4. The mated connectors shall be vibrated in accordance with Method 204, Condition A of MIL-STD-202 with arrangements to monitor a test circuit with 100 ma flowing through the contacts. When tested as above, the connector assemblies shall show no evidence of cracking or breaking and there shall be no loss of continuity of any circuit greater than one microsecond.
  - 5. The mated connectors shall show no evidence of mechanical damage after being subjected to a shock test in accordance with Method 205, Condition C of MIL-STD-202, repeated three times, for a total of 18 drops.

6. The mated connectors shall show no evidence of mechanical damage after being subjected to temperature cycling in accordance with Method 107, Test Condition B of MIL-STE-202 with a minimum operating temperature of -55 degrees C and a maximum operating temperature of +150 degrees C.
  7. The unmated connectors shall show no evidence of corrosion and shall be capable of being mated and unmated after being subjected to a moisture environment in accordance with Method 106 of MIL-STD-202, except that 7b is not required.
- B. The Contractor shall provide a complete test report for each of the plug connector tests prescribed. These reports shall include the date, location, number and origin of specimens, type of test, test conditions, and results of the test.

## **1.05 SUBMITTALS**

- A. Complete drawings for each type of plug connector to be used shall be submitted to the designated Resident Engineer for approval prior to manufacture or procurement of the plug connectors. These drawings shall include complete parts lists and information required to order replacement parts. Drawings shall be required for the following components:
1. Molded plug connector blocks
  2. Protective shells for blocks
  3. All locking and keying devices
  4. Strain-relief clamping devices
  5. Extractable pin and socket contacts
- B. Three copies of all plug connector test reports shall be submitted to the designated Resident Engineer within seven days of the test performance.

## **PART 2 - PRODUCTS**

### **2.01 PLUG CONNECTOR ASSEMBLY**

- A. Each plug connector assembly shall consist of the following:
1. A two-part molded plastic connector block equipped to hold an appropriate number of solderless, pin-and-socket contacts.
  2. Devices for the mechanical locking and keying of the connector block halves.
  3. Protective shells for both connector block halves.
  4. A strain relief device for the external wiring portion of the connector assembly.
  5. Solderless, extractable pin-and-socket contacts.
  6. Where required, embedded wire wrap terminals for the internal wiring portion of the connector block.

### **2.02 CONNECTOR BLOCKS**

- A. The connector blocks shall consist of molded dielectric plastic shaped to accept the required number and types of contact pins, contact sockets and locking, keying and mounting devices. The dielectric material shall exhibit a minimum insulation resistance of 100 megohms as measured between adjacent pairs of contacts and between the accessory hardware and the closest contacts in each connector assembly half immediately after being exposed to 100 percent relative humidity at 120 degrees F for a period of at least 48 hours.
- B. The contact cavities shall be arranged in a rectangular grid configuration. The opening for each contact shall be uniquely identified by a coordinate molded into both the mating and wiring faces of each part of the connector block.
- C. The 28 contact, vital plug connector blocks shall provide a surface leakage distance of not

less than 1/4 inch between contacts and between the contacts and any other metallic part of the connector assembly.

### 2.03 LOCKING AND KEYING

- A. Each plug connector assembly shall include a device for mechanically locking the two mated parts together.
- B. Mechanical devices and facilities shall also be provided to allow the mating parts of connector assemblies to be keyed in such a manner that they cannot be coupled except when in the correct position relative to each other and cannot be coupled to the mating parts of other coupler assemblies keyed in a different pattern.

### 2.04 PROTECTION AND STRAIN RELIEF

- A. Each half of the plug connector block shall be protected by a metal shield which shall extend beyond the mating surface. These two shields shall overlap when the connector halves are coupled.
- B. The external wiring portion of each plug connector assembly shall be equipped with a device to grip the external wiring firmly in order to prevent strain on the plug connector contacts.

### 2.05 PIN AND SOCKET CONTACTS

- A. The pin and socket contacts shall be fabricated from commercial bronze or brass and plated with gold over nickel underplate. The retention springs of the pin and socket contacts shall be fabricated from stainless steel.
- B. The contacts shall be fabricated and classified in the required selection of sizes to accept wire sizes 16 through 22, AWG.
- C. Contact current rating and termination resistance shall meet the requirements of the following table with properly sized contacts applied to the wire sizes specified.

<u>WIRE SIZE (AWG)</u>	<u>16</u>	<u>18</u>	<u>20</u>	<u>22</u>
Minimum Current Rating (Amperes)	13.0	10.0	7.5	5.0
Maximum Termination Resistance (Milliohms) at rated current	1.7	2.0	2.7	4.0

- D. Contact termination resistance shall be measured in accordance with Method 307 of MIL-STD-202 at the rated current specified for each wire size.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

- A. The 28 way, vital plug connector assembly shall be required where any vital circuits are to be interconnected and the 50 way, non-vital plug connector assembly shall be used where no vital circuits are to be interconnected.
- B. A plug connector may be dedicated to a single 50 or 30 conductor cable or it may be shared

by several cables or types of wire. When plug connectors are dedicated to single multiconductor cables, 20 percent of the wires and connector contacts shall be reserved for future working circuits.

- C. When a plug connector is assembled to a multiconductor cable, the strain relief device shall grip the cable outer sheath.
- D. When a vital plug connector is dedicated to a 30 conductor cable, all but two of the cable wires shall be terminated on connector contacts. The two extra wires shall be properly terminated and inserted into any contact cavity of the connector block. These wire ends shall be folded, taped, and stored under the strain-relief clamp for possible future service.
- E. When a non-vital plug connector is dedicated to a 50 conductor cable, each wire shall be terminated properly on a connector contact.
- F. In each case, a uniform scheme shall be followed in assigning specific cable wires to specific connector contacts.
- G. Where a full hand grasp is required to connect or disconnect a plug connector, a minimum of two inches of clear space shall be provided around the connector. A minimum of three-quarters of an inch of clear space shall be provided around connectors which can be connected or disconnected with thumb and fingertips only.
- H. Plug connectors shall be located and installed in such a manner that no part of the plug connector or its cable will extend beyond the wire routing as defined by the wire supports and in no circumstances shall the connector or its cable be permitted to protrude into an aisleway.
- I. Each plug connector assembly, as finally installed, shall be marked in such a manner that its mating halves shall be distinctly identified as being related to each other, but to no other plug connector assembly within the immediate area. These identification markings shall be applied in such a manner that they will not be obscured or worn off in normal use.
- J. Tools used to apply plug connector contacts to wire and tools used to extract contacts from the plug connector blocks shall be the size and type recommended by the manufacturer of the plug connector assemblies. A minimum of one of each type of these tools, to include one of each type of tool which may be necessary for the removal and/or replacement of the jack-screws shall be furnished under Section 16978.
- K. The Contractor shall furnish and install a mating blank plug coupler, complete with all accessory hardware, for each rack or module plug coupler installed as "future" or "spare."

### **3.02 MEASUREMENT FOR PAYMENT**

- A. Plug connectors will not be measured for payment separately. The costs thereof, at each TCR, shall be included in the costs for Plug Connected Cable Assemblies as specified in Section 16949, ATC Signal Wire and Cable.

**END OF SECTION**

## SECTION 16949

### ATC SIGNAL WIRE AND CABLE

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section includes specifications for the internal and external wire and cable to be used for the wayside ATC systems.

##### 1.02. INTERNAL SIGNAL WIRE AND CABLE

- A. This Section and the latest version of industry standard Wire and Cable Specification 940801, Interior Wire and Cable, specify the: furnishing; minimum design, manufacturing, performance and testing requirements, and; installation, of wire and cable for use in Train Control Rooms and inside train control equipment modules and housings. All internal wiring of ATC equipment and all intra-rack and inter-rack wire and cable in the TCRs shall conform to the requirements of this Section. The wire, cable, and insulation specified herein shall meet all requirements of the industry standard Wire and Cable Specification 940801 (W.&C.S. 940801). In addition, all internal wire and cable furnished by the Contractor shall be termite proof.
- B. Internal plug connected cable assemblies shall be as specified in this Section and in Section 16948, Plug Connectors.

##### 1.03 EXTERNAL SIGNAL WIRE AND CABLE

- A. This Section specifies the furnishing and installation of the three basic groups of cable required for ATC system wiring external to the Train Control Rooms and signal equipment housings. The basic external cable groups are:
  - 1. Signal Cables
  - 2. Special Control and Indication Cables
  - 3. Negative Propulsion Return Cables
- B. The intent of these Specifications is that the Contractor shall provide properly designed, well made and thoroughly tested external cable for vital and non-vital signal circuit, and negative propulsion return applications, which will render long service life to the Authority. External cable furnished by the Contractor shall be of rugged construction and shall have insulating and jacketing materials capable of a 40 year average service life. These cables shall be suitable for use in the environment to be encountered in the WMATA Rail Rapid Transit System and shall be certified for continuous operation at 90 degrees C in wet or dry locations, whether in trays, troughs, duct bank or conduits, above or below ground, or installed directly in the ground. All external cable furnished by the Contractor shall be termite proof.
- C. External signal cables supplied shall meet or exceed the requirements of the applicable standards of ICEA, NEMA, UL, ASTM, and the recommendations of Part 10.3.19 of the AREMA Signal Manual, with modifications and/or additions as detailed herein. Individual conductor insulation shall be Ethylene Propylene Rubber (EPR) as described in ICEA S-68-516.
- D. Multiconductor external signal cables permitted under this Contract shall have 2, 5, 7, 9, 12, 14, 19, 27, or 37 conductors. Multiconductor Special Control and Indication cables permitted under this Contract shall have 2, 6, 18, 25 or 50 twisted pairs.

- E. Multiconductor external signal cables containing more than two conductors shall contain 20-percent spare conductors or two spare conductors, whichever is greater. Local distribution cable shall contain ten percent spare conductors or one spare conductor, whichever is greater, except that two conductor local distribution cables (such as track circuit leads) will not require spare conductors.
- F. The requirements of these Specifications shall apply when there is a difference between the requirements of these Specifications and other specifications referenced herein.
- G. All insulation and jacketing compounds offered on this Contract by the cable manufacturer shall be formulated, applied, and, where applicable, vulcanized by the cable manufacturer in his own facilities, except as specified in Part 1.02.H. of this Section.
- H. If the cable manufacturer does not normally compound and otherwise prepare insulating materials in its own plant, it is acceptable for the cable manufacturer to have its proprietary formulations compounded and prepared at another, non-owned facility which complies with the manufacturing and end-product quality requirements specified herein.
- I. The Contractor may request the option, on an individual case basis, of providing, at no additional cost to the Authority, conduit, sleeves, pipe, core-boring or other special cable installation facilities approved by the designated Resident Engineer, which will either reduce the amount of cable required by providing more direct cable runs, or will provide access where no direct access was provided by others. (The Contractor shall inform the designated Resident Engineer at least two weeks in advance, and shall obtain approval at least one week in advance, of any core-boring work.)

#### 1.04 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16915 Basic ATC Equipment Requirements
  - 2. Section 16921 ATC Power Distribution Systems
  - 3. Section 16922 Lightning/Surge Protection and Grounding Systems
  - 4. Section 16923 TC Maintenance Telephone System
  - 5. Section 16925 Data Transmission System
  - 6. Section 16948 Plug Connectors
  - 7. Section 16955 Track and Alarm Indication Panels
  - 8. Section 16956 Interlocking Control Panels
  - 9. Section 16961 Audio Frequency Track and Loop Circuit Layouts
  - 10. Section 16962 Impedance Bond Layouts
  - 11. Section 16963 Power Frequency Track Circuit Layouts
  - 12. Section 16964 Track Switch Operating Layouts
  - 13. Section 16965 Signal Layouts
  - 14. Section 16967 Marker Coil Layouts
  - 15. Section 16968 Track Bonding Layouts
  - 16. Section 16969 Snowmelter Layouts
  - 17. Section 16971 Racks and Cable Trays
  - 18. Section 16973 Conduit
  - 19. Section 16977 Tagging and Marking
  - 20. Section 16978 Miscellaneous Train Control Components and Material
  - 21. Section 16980 ATC Tests, Inspections and Quality Assurance
  - 22. Section 16996 ATC Technical Appendix
  - 23. Section 16997 RTU SCAN SHEETS

**1.05 DOCUMENTS AND REFERENCES FOR INTERNAL SIGNAL WIRE**

- A. Applicable documents and references for internal signal wire shall be as specified in Section 3.0 of the industry standard Wire and Cable Specification 940801 (W.&C.S. 940801).

**1.06 INTERNAL SIGNAL WIRE DEFINITIONS**

- A. Internal Wire Definitions used in this Section shall be as specified in Section 4.0 of the industry standard Wire and Cable Specification 940801.

**1.07 QUALIFICATION AND CERTIFICATION SAMPLES FOR INTERNAL SIGNAL WIRE AND CABLE**

- A. In addition to meeting the Qualification and Certification requirements specified in Section 5.0 of the industry standard Wire and Cable Specification 940801, the cable manufacturer shall submit samples of each type of wire and cable to the Contractor.
- B. One-half of each qualification sample shall be retained for the Contractor's evaluation and the remaining one-half shall be forwarded to the designated Resident Engineer for final approval.

**1.08 SUBMITTALS FOR INTERNAL SIGNAL WIRE AND CABLE**

- A. Submit the following for the designated Resident Engineer's approval:
  - 1. Complete technical data describing the internal wire and cable which the Contractor proposes to finish in compliance with the requirements of this Section and W.&C.S. 940801.
  - 2. Qualification samples per Part 1.05 of this Section.
  - 3. Certified test reports of all breakdown tests conducted on finished internal cable as specified herein and W.&C.S. 940801.
  - 4. Certified test reports of all flame tests conducted on finished internal cable as specified herein and W.&C.S. 940801.

**1.09 QUALITY ASSURANCE FOR EXTERNAL SIGNAL WIRE AND CABLE**

- A. All cable manufacturers supplying external cable for this Contract must be approved by the designated Resident Engineer. The Contractor shall provide all of the data necessary for the demonstrations and tests required by the designated Resident Engineer. Approval will be based on the following criteria:
  - 1. Past Performance and Experience
    - a. The cable manufacturer must have had at least ten years of successful experience in supplying external cable to the railway/rapid transit industry for use as vital circuit signal control cable. A certified list of such installations spanning the past ten years shall be provided by each cable manufacturer desiring to be considered
  - 2. Quality Assurance Program
    - a. The manufacture of external cables in accordance with the requirements of these Specifications shall be accomplished in compliance with a Quality Assurance Program which meets the intent of the ASQC Standard C1-1985 corrected 1987, General Requirements for a Quality Program. Such compliance shall promote the production of properly designed, well made, and thoroughly tested cable which will render long service life to the user. Efficient methods of production, test, and product evaluation shall be used, but prime concern shall be focused on the necessary formal quality requirements to ensure that cable failure cannot

water tank tested after a minimum immersion time of six hours. For these tests, which shall be conducted per ICEA S-68-516, Section 6.27, test voltages shall be applied for a period of five minutes. While still immersed, the insulated conductors shall be subjected to the applicable test voltages as follows:

- 1) Minimum AC Test Voltage = 120 volts per mil of insulation thickness
- 2) Minimum DC Test Voltage = 375 volts per mil of insulation thickness

i. Voltage tests required for each reel of finished wire or cable after application to the shipping reel shall be either the AC Voltage test or the DC Voltage test. For these tests, which shall be conducted per ICEA S-68-516, Section 6.27, test voltages shall be applied for a period of five minutes. The appropriate minimum test voltages shall be as follows:

- 1) Minimum AC Test Voltage = 120 volts per mil of insulation thickness
- 2) Minimum DC Test Voltage = 375 volts per mil of insulation thickness

- C. The Authority reserves the right to witness any or all of the above tests and shall be notified two weeks in advance of each of the above tests.
- D. The Contractor shall prepare and certify a report for each of the above tests, to include all pertinent facts concerning the conditions and results of that test, plus the backup information required.

#### 1.10 SUBMITTALS FOR EXTERNAL WIRE

- A. The Contractor shall submit two certified copies of the following to the designated Resident Engineer for approval:
  1. A certified list of each cable manufacturer's railway/rapid transit signal installations for the past ten years and proof of same.
  2. Each cable manufacturer's (and, where applicable, each insulation and/or jacket material manufacturer's) Quality Assurance Program and proof of tenure.
  3. Full technical data for each type of cable which each cable manufacturer intends to supply.
  4. Qualification test reports for all qualification tests required by these Specifications.
  5. Monitoring procedures for the manufacture of cable and cable insulating material.
  6. Test procedures for cable and cable insulating material.
  7. Test reports for all qualification tests required by the designated Resident Engineer.
  8. Cable test and inspection reports for tests and inspections required and described by these Specifications.
  9. Test reports of cable tests conducted in the field in accordance with approved testing procedures.
- B. Information to be supplied by certified cable test reports for external cable shall include, but not be limited to, the following:
  1. Report number
  2. Date and location of test
  3. Description of test and test conditions
  4. Complete cable or wire description
  5. Lot, batch, and/or reel identification number
  6. Quantitative test results
  7. Summary of the test results
  8. Information on the components of the cable tested to include batch numbers and

- physical and electrical properties.
9. Traceability data.
- C. Submit the following completed, signed and notarized standard documents along with each Certified Test Report:
1. An Inspection Sheet for Wire and Cable
  2. A Physical Test Report.
- D. Submit detailed drawings showing the method and materials he intends to use to support cables in manholes, pull chambers, and on tunnel walls, as applicable.
- E. Submit to the designated Resident Engineer a program for maintaining and assuring the mechanical and electrical integrity of cable during cable pulls into pipe or conduit, as recommended by the cable manufacturer.
- F. Submit the manufacturer's recommended pulling tension for each type of cable to be used, for both cable grip and core hitch methods. The formula(s) for determining multi-cable pull calculations shall also be included. This information shall be submitted prior to any cable pull.
- G. Two copies of a "Pull Sheet" for each planned cable pull shall be submitted by the Contractor to the designated Resident Engineer at least one week prior to each actual cable pull. This "Pull Sheet" shall include the following information:
1. Date of proposed pull
  2. Cable nomenclature(s)
  3. Cable type(s)
  4. Cable routing
  5. Recommended pulling method
  6. Maximum recommended tension (as determined by the type of cable and pulling method, or, for multi-cable pulls, by calculation using the applicable formula(s).
  7. Room for recording the date of the actual pull, the maximum pull tension experienced during the pull, and any other pertinent information concerning the pull.
- H. Approved Pull Sheets will be returned to the Contractor prior to the proposed pull. The Contractor shall record the date of the actual pull, the actual method used, the maximum tension experienced during the pull, and other pertinent information, and resubmit the Pull Sheet(s) to the designated Resident Engineer.

#### **1.11 DELIVERY, STORAGE AND HANDLING FOR EXTERNAL CABLE**

- A. Shipping, storage and handling of external wire and cable shall be in accordance with the recommendations contained in Part 10.4.1 of the AREMA Signal Manual, the applicable cable manufacturer's recommendations, and as further specified herein.
- B. Cables shall be reeled in such a manner that both ends are accessible for testing on the reel. The Contractor shall ship each unit securely packaged and labeled for safe handling and shipment.
- C. Mark each single-conductor cable and each multiple-conductor cable to show UL label, size, voltage, manufacturer and number of conductors in accordance with NEC requirements.
- D. Store the cables in a dry and secure facility.
- E. During storage and handling prior to final conductor termination, cable ends shall be

sealed to prevent the entrance of moisture.

## **PART 2 - PRODUCTS**

### **2.01 INTERNAL WIRE CONDUCTORS**

- A. Stranded Internal Wire Conductors shall meet the requirements specified in Section 6.1 of the industry standard Wire and Cable Specification 940801.
- B. Solid Internal Wire Conductors shall meet the requirements specified in Section 6.2 of the industry standard Wire and Cable Specification 940801.

### **2.02 INTERNAL WIRE INSULATION**

- A. Material
  - 1. The insulation material for stranded and solid conductor internal wires shall be as specified in Section 7.1 of the industry standard Wire and Cable Specification 940801.
- B. Internal Wire Constructions
  - 1. Applicable internal wire constructions shall be as specified in Section 7.2 of the industry standard Wire and Cable Specification 940801.
- C. Insulation Thickness - Stranded and Solid Internal Wire
  - 1. Insulation thickness for stranded and solid wire shall be as specified in Section 7.3 of the industry standard Wire and Cable Specification 940801.
- D. Identification
  - 1. Internal Wire identification shall be as specified in Section 7.4 of the industry standard Wire and Cable Specification 940801.
- E. Internal Wire Performance Requirements
  - 1. Internal Wire performance requirements shall be as specified in Section 7.5 of the industry standard Wire and Cable Specification 940801.
- F. Color Coding of Internal Wires
  - 1. Color coding of internal wires shall be as specified in Section 7.6 of the industry standard Wire and Cable Specification 940801.

### **2.03 MULTICONDUCTOR INTERNAL CABLES**

- A. Multiconductor internal cable shall meet all requirements specified in Sections 8.0 through 8.9 (inclusive) of the industry standard Wire and Cable Specification 940801.

### **1.01 2.04 PACKAGING OF INTERNAL WIRE AND CABLE**

- A. Stranded internal wire and cable shall be packaged as specified in Sections 9.1 through 9.5, inclusive, of the industry standard Wire and Cable Specification 940801.

### **2.05 INDIVIDUAL EXTERNAL WIRE CONDUCTORS**

- A. General Requirements
  - 1. All conductors of external wire and cable, including the individual conductors of multi-conductor signal cables, shall be rated for continuous operation at 90

- degrees C in wet or dry locations, whether in trays, troughs or conduits above or below ground, exposed runs, or direct buried. The rated life shall be 40 years.
2. The insulation of external signal cables shall be either Type I or Type II ethylene propylene rubber. Individual conductors shall be insulated with either Type I EPR insulation per Part 2.05.C.1., or Type II EPR Insulation per Part 2.05.D. of this Section. All single conductor external signal cable shall have a jacket which meets the requirements of Part 2.05.D. of this Section.
  3. The insulation of negative propulsion return cables shall be Type II ethylene propylene rubber. Negative propulsion return cable shall have a jacket which meets the requirements of Part 2.05.E.2. of this Section.
  4. The insulation or insulation system of external wire and cable shall fit tightly to the conductor and shall be free-stripping. Insulation or insulation system thickness shall be in accordance with the following :

0 to 600V Service

Conductor Size(AWG)	Average Wall Thickness (mils)* (as determined by ICEA S-68-516 Section 6.4)
16 to 8	78
7 to 2	94
1 to 0000	109

601 to 2500V Service

Conductor Size (AWG)	Average Wall Thickness (mils)* (as determined by ICEA S-68-516 Section 6.4)
14 to 000 AWG	156
225 to 1000 KCMIL	190

\*The minimum wall thickness shall be not less than 90 percent of the average wall thickness.

- B. Conductor Requirements
1. Signal Conductors:
    - a. Material - soft annealed copper ASTM B-33
    - b. Construction - stranded ASTM B-8
    - c. Coating - continuous tin alloy(vital signal cable only) ASTM B-33
    - d. Resistance - ICEA S-68-516(NEMAWC 8) Section 2.5
    - e. Stranding:
      - 1) smaller than 14 AWG ASTM B-8  
Class B
      - 2) 14 AWG to 00 AWG ASTM B-8  
Class C
  2. Negative Propulsion Return Conductors:
    - a. Material - soft annealed copper ASTM B-33
    - b. Construction - stranded ASTM B-8

c.	Resistance -	ICEA S-68-516 (NEMA WC 8)Section 2.5
d.	Stranding:	
	1) Extra-flexible, 1000 KCMIL cable,	Class G stranded (427 Strands)
	2) Standard 1000 KCMIL cable,	Class D stranded. (127 Strands)
	3) 500 KCMIL	Ropelay

C. Type I Insulation & Insulation System Requirements

1.	Primary insulation:	
a.	Material - rubber-like:	
	1) vulcanized during construction	ICEA S-68-516(NEMA WC 8)
b.	Chlorine content, maximum % by weight	Zero
c.	Physical properties, original:	
	1) Tensile strength, minimum psi	1000
	2) Elongation at rupture, minimum %	25
	3) Tensile stress, minimum psi at 200% elongation	600
d.	Physical properties after:	
	aging 168 hours, air oven, at 121 degrees C:	
	1) Tensile strength, minimum % of original	8
	2) Elongation at rupture, minimum % of original	75
	3) Mechanical water absorption:	
	a) Maximum (mg/sq.in.) after 7 days immersion at 70 degrees C	8
2.	Jacket:	
a.	Material - rubber-like,	
	1) vulcanized during construction	ICEA S-68-516(NEMA WC 8)
b.	Chlorine content maximum % by weight	15
c.	Physical properties, original:	
	1) Tensile strength, minimum psi	1800
	2) Elongation at rupture, minimum %	300
	3) Tensile Stress, Minimum psi at 200% elongation	800
d.	Physical properties after	
	aging for 168 hours, air oven,at 121 degrees C:	
	1) Tensile strength ,minimum % of original	85
	2) Elongation at rupture ,minimum % of original	45
e.	Oil immersion, 18 hours,121 degrees C, ASTM No. 2 oil:	
	1) Tensile strength, minimum % of original	70
	2) Elongation at rupture minimum % of original	70
f.	Mechanical water absorption;	
	1) Maximum (mg/sq.in.)after 7 days immersion in 70 degrees C, water;	20
g.	Oxygen index min. (ASTM D2863)	30
h.	Smoke Density Rating, as per ASTM E662-83 using a 100 mil slab thickness:	
	1) Flaming Mode,	
	a) 4 minute	325 (max.)
	b) 20 minute peak	400 (max.)

- 2) Non-Flaming Mode
  - a) 4 minute 325 (max.)
  - b) 20 minute peak 480 (max.)
- 3. Primary Insulation and Jacket Combined:
  - a. Flame Resistance, as per ICEA S-19-81 Section 6.19.6 Pass
  - b. Cold Bend after -35 degrees C, for 3 hours:
    - 1) Mandrel diameter = 10 x O.D. No cracks
  - c. Insulation resistance constant (K)
    - 1) minimum at 15.6 degrees C 10,000
  - d. Surface resistivity,
    - 1) minimum 200,000 mega-ohms
- 4. Electrical stability in water as per ICEA S-68-516(NEMA WC 8) Section 6.21 Dielectric constant, SIC:
  - 1) Maximum after
    - a) 24 hours immersion 3.5 SIC
  - 2) Maximum increase between:
    - a) 1 and 14 days 2.0%
    - b) 7 and 14 days 1.5%
  - 3) Maximum Dielectric constant, SIC
    - a) between 1 and 90 days(with no failure) 3.6 SIC
- 5. Ozone resistance ICEA S-19-81, Part 6.8
  - a. After three hours exposure to an ozone concentration of not less than 0.025% nor more than 0.030% by volume No cracks

D. Type II Insulation Requirements

- 1. Material - rubber-like,
  - a. vulcanized during construction ICEA S-68-516(NEMA WC 8)
- 2. Chlorine content,
  - a. maximum % by weight Zero
- 3. Physical properties, original:
  - a. Tensile strength, minimum psi 1500
  - b. Elongation at rupture, minimum % of original 250
  - c. Tensile Stress, minimum psi at 200% elongation 800
- 4. Physical properties after aging 168 hours 80 degrees C, oxygen pressure, 300 psi:
  - a. Tensile strength, minimum % of original 85
  - b. Elongation at rupture, minimum % of original 75
- 5. After 20 hours, at 128 degrees C, Air pressure 80 psi:
  - a. Tensile strength, minimum % of original 75
  - b. Elongation at rupture, minimum % of original 50
- 6. Oil immersion ASTM No. 2 oil, 18 hours, 121 degrees
  - a. Tensile strength, minimum % of original 50
  - b. Elongation at rupture, minimum % of original 50
- 7. Mechanical water absorption
  - a. Maximum (mg/sq.in.) after 7 days immersion in 70 degrees C, water 15
- 8. Flame Resistance, as per ICEA S-19-81 Section 6.19.6 Pass
- 9. Smoke Density Rating, as per ASTM E-662-83, using a 100 mil slab thickness:
  - a. Flaming Mode,
    - 1) 4 minute 325 (max.)
    - 2) 20 minute peak 400 (max.)

- b. Non-Flaming Mode,
  - 1) 4 minute 325 (max.)
  - 2) 20 minute peak 480 (max.)
- 10. Cold Bend, -35 degrees C, for 3 hours:
  - a. Mandrell diameter = 10 x O.D. No cracks
- 11. Insulation resistance constant (K)
  - a. Minimum at 15.6 degrees C 25,000
- 12. Surface resistivity, minimum 200,000 mega-ohms
- 13. Electrical stability in water, as per ICEA S-68-516 (NEMA WC 8)  
Section 6.21: Dielectric constant, SIC:
  - a. Maximum
    - 1) after 24 hours immersion 3.5 SIC
    - 2) Maximum increase between:
      - a) 1 and 14 days 2.0%
      - b) 7 and 14 days 1.5%
    - 3) Maximum Dielectric constant, SIC
    - 4) between 1 and 90 days (with no failure) 3.6 SIC
- 14. Ozone resistance ICEA S-19-81, Part 6.8
  - a. After three hours exposure to an ozone concentration of not less than 0.025% nor more than 0.030% by volume No cracks

E. Requirements for Negative Propulsion Return Cables

- 1. Insulation:
  - a. Ethylene-propylene rubber, ICEA Type II, 90°C, suitable for dry and wet locations.
- 2. Jacket:
  - a. Overall nonmetallic jacket of chloro-sulfonated polyethylene, or cross-linked polyolefin.
  - b. Cross-linked polyolefin jacket shall comply with the following physical requirements. Properties tested in accordance with Part 6 of ICEA S-68-516 (NEMA WC8) where ethylene-propylene-rubber (EPR) insulation is used. Jacket material shall be free of PVC and PVC-based compounds.
    - 1) Physical Properties, original: (ASTM D-412)
    - 2) Tensile strength, minimum
      - a) pounds per square inch: 1800
    - 3) Elongation at rupture, minimum percent: 150
    - 4) Physical Properties after aging (ASTM D-573)  
168 hours, air oven test at 100 degrees C, +/-1 degree C:
      - a) Tensile strength, minimum
        - (1) percentage of unaged value: 100
      - b) Elongation at rupture, minimum
        - (1) percentage of unaged value: 80
  - c. Oil immersion: (ASTM D-471)
    - 1) 18 hours at 121 degrees C, +/-1 degree C, Table 1, No. 2 oil:
      - a) Tensile strength, minimum
        - (1) Percentage of unaged value: 80
      - b) Elongation at rupture, minimum
        - (1) Percentage of unaged value 80
  - d. Jacket materials other than cross-linked polyolefin shall comply with ICEA S-68-516 (NEMA WC8). Jacket material shall be free of PVC and PVC-based compounds.
  - e. Additional Requirements:
  - 1) Insulation Power Factor: Twopercent maximum.
  - f. Bond jacket to insulation to prevent moisture pockets.

- g. Minimum peel strength of the jacket from insulation: Four pounds per inch width.
- h. UL labeling: Type RHW-2.
- i. Flame Retardancy:
  - 1) Negative propulsion return cable shall demonstrate flame retardancy in accordance with vertical tray flame test, UL44.
- j. Applied Voltage Testing:
  - 1) Negative Propulsion Return Cables shall pass applied ac voltage dielectric strength test, i.e., six-hour water-immersion test, in accordance with paragraphs 3.5.2, and 6.27.1 of ICEA S-68-516.

**2.06 MULTICONDUCTOR SIGNAL CABLE**

**A. General**

- 1. Where used in this Section, the term "multiconductor signal cable" shall be interpreted as meaning any multiconductor cable applied in circuits, either vital or non-vital, the function of which has a direct effect upon the operation of trains or the ability of the system or subsystems to implement control upon the trains.
- 2. All multiconductor external signal cable shall be assembled from conductors which meet the requirements of Part 2.05, Individual External Wire Conductors.

**B. External Cable Assembly**

- 1. External Cable Assembly shall be per ICEA S-68-516 (NEMA WC 8), Part 5, unless otherwise specified herein.
- 2. Multiconductor external cable shall be made by assembling individual or twisted pairs of insulated conductors into a tight cylindrical form. Individual or twisted pairs in a cable having more than two wires shall be assembled helically and with adjacent layers wound in opposite directions.
- 3. Twisted pairs shall consist of two individually insulated conductors cabled with a length of lay as short as good construction will permit, but not longer than ten inches. Where more than one twisted pair is included, the length of lay of adjacent pairs shall differ by at least one-half inch.
- 4. Twisted pairs shall not be provided in combination with individual wires in the same cable.
- 5. Interstices shall be filled with moisture-resistant fillers.
- 6. A marker tape printed with sequential footages at one foot intervals shall be placed with the core. In addition to the footages this marker tape shall display, at intervals of no more than 30 inches, the name of the cable manufacturer and the year in which the cable was manufactured. The complete core assembly shall be wrapped with flame-retardant core tape or tapes with a 12.5-percent minimum lap. As an option, the core assembly shall be encased in an extruded, flame-retardant, moisture resistant, elastomeric cushion layer of the following thickness:

Core Diameter (inches)	Thickness (mils)
0 - 1.5	47
1.501 & larger	62

- 7. When an extruded rubber cushion layer is used, a pull cord shall be included beneath the cushion layer to provide for efficient stripping of this layer. This cord shall be compatible with all other components of the cable.
- 8. The taped cable core shall be covered with suitable bedding tape(s) when flat metal armor tape is used or with an inner jacket when corrugated metal armor tape is used.
- 9. Multiconductor external cables of 8 or more conductors shall have a 0.005-inch thick bronze (or an 0.008-inch thick zinc) corrugated or flat tape armor which shall be helically applied and overlapped approximately 12 percent. An overall separator tape shall be applied over the armor tape to protect the armor from attack by the overall jacket material.

10. The core, with or without armor, shall be covered with an outer jacket having a nominal thickness in accordance with ICEA S-68-516, Table 4-5. The inner jacket, when corrugated tape armor is used, shall be of sufficient thickness and so formulated to completely fill the voids on the underside of the corrugated metal tape. Cable jacketing material shall conform to the cable jacket specification contained herein.

C. Cable Identification and Conductor Markings

1. In addition to the internal sequential marker tape, the cables shall have the following information imprinted on the surface of the outer jacket at intervals of not more than three feet:
  - a. Manufacturer's name
  - b. Number of conductors
  - c. Size of conductors
  - d. Voltage rating
2. Individual conductors of multiconductor signal cables shall be imprinted at intervals of not more than six inches with the conductor identification. The identification shall be in the form of a number printed in both numeral form and English.
3. The cable and conductor markings shall be of a color which contrasts with the material on which it is imprinted and shall be of sufficient size to be easily recognized. The markings shall be permanent.

D. Cable Jacket Specification

- |    |   |                          |
|----|---|--------------------------|
| 1. | Material - rubber-like,<br>vulcanized during construction:                    | ICEA S-68-516(NEMA WC 8) |
| 2. | Chlorine content,   |                          |
|    | a. Maximum % by weight  | 15                       |

|    | b. Non-Flaming Mode,  |                          |
|    | 1) 4 minute   | 325 (max.)               |
|    | 2) 20 minute peak   | 480 (max.)               |
| 8. | Cold bend, -35 degrees C, for 3 hours   |                          |
|    | a. Mandrel diameter = 10 x O.D.   | No cracks                |
| 9. | Surface resistivity, minimum  | 200,000 mega-ohms        |

E. Finished Cables

1. Finished cables having 7 or fewer conductors shall be capable of passing the IEEE Vertical Tray Flame Propagation Test, IEEE Standard 383-1974, or the UL-44 Vertical Tray Flame Test. The test sample shall have 7 or fewer conductors.
2. Finished cables having 8 or more conductors shall be capable of passing the following horizontal flame test. The test sample shall have 8 or more conductors.
  - a. Support a four-foot length of the multi-conductor cable specimen horizontally over a ribbon gas burner. The cable shall be supported parallel to the burner length in a manner which will maintain a spacing of 3/4 inch to two inches between the burner and the cable throughout the test.
  - b. The cable specimen shall be connected to a 3-wire, 120-240 volt circuit such that conductor-to-conductor and conductor-to-metal-armor-tape shorts will be indicated.
  - c. The flame temperature shall be monitored by a thermocouple and the flame temperature output regulated at 1400-1500 degrees F. The thermocouple shall be located in the flame close to, but not touching, the surface of the cable.
  - d. Readings of the thermocouple output shall be recorded each minute during the test.
  - e. The cable will be acceptable if no shorts are detected within six minutes after the flame is ignited.

**2.07 SPECIAL CONTROL AND INDICATION CABLE**

- A. Multiconductor cable applied in non-vital signal circuits, i.e., signal circuits the functions of which do not control or affect the ability to control operation of trains, shall conform to the following requirements:
 

1.	Minimum conductor size	19 AWG
2.	Chlorine content of insulation, maximum percent by weight	22
3.	Inner jacket	PE or PVC
4.	Metal tape armor, helically applied, bronze or zinc:	
a.	Minimum thickness	
1)	Bronze:	5 mils
2)	Zinc:	8 mils
5.	Minimum overlap	12%
6.	Outer jacket	PVC or XLPVC
7.	Chlorine content of jacketing materials,	
a.	maximum percent by weight	22
- B. Finished cables shall be capable of passing the IEEE Vertical Tray Flame Propagation Test set forth in IEEE Standard 383-1974, or the Vertical Tray Flame Test in UL 44. In all other respects, cable shall conform to ICEA Pub. No. S-61-402 (NEMA WC 5), Part 7.4, Type B.

**2.08 DISTRIBUTED COMPUTER INTERCONNECTION CABLE**

- A. Cable to be used to interconnect distributed computers of the computerized Automatic Train Control System shall be shielded twisted pair or shielded multiple twisted pair and shall meet the same conductor and insulation requirements as specified in Part 2.07 for Special Control and Indication Cable.

**PART 3 - EXECUTION**

**3.01 CONDUCTOR SIZING**

- A. All conductors shall be sized per the National Electrical Code, but shall not be smaller than the minimum conductor sizes specified herein.

- B. Conductors shall be sized in such a manner that voltage drop at the farthest load does not exceed 3 percent during peak load conditions.

### **3.02 INSTALLATION OF INTERNAL WIRE AND CABLE**

- A. Wires and cables shall be installed in a neat, workmanlike manner. Cables in trays or in troughs shall be laid therein and pulled into same. Cables shall be installed with a minimum amount of cross-over in the trays and troughs and shall not be pulled tightly around bends. All exposed wires and cables entering or leaving equipment racks or housings shall be protected from abrasion.
- B. Nylon straps shall be provided and installed for bundling and cabling of conductors where two or more single conductors of the same circuit are exposed in cable trays or cable troughs. Straps shall be installed approximately every five feet along the cable run. Wires of multiconductor cables exposed by the stripping of the cable jacket for terminations shall be trained in a neat, workmanlike manner and tied approximately every three inches with nylon straps.
- C. There shall be no point-to-point redundancy of wires for increased current capacity.
- D. Single conductor No. 14 wire shall be used for interconnecting switch machines and junction boxes, signal junction boxes and lamp compartments, and interconnecting other miscellaneous internal equipment.
- E. The smallest size wire the Contractor shall use for power cross termination and power wiring shall be No. 14 AWG. If No. 14 does not satisfy the load current requirements, the wire shall be increased in size according to the load requirements, at no additional cost to the Authority.

### **3.03 MODULE WIRING**

- A. Unless otherwise approved by the Engineer in writing, all module wiring shall be accomplished with solderless connections using solid wire for wire wrap connections, and stranded wire for crimped connections, as specified herein. Minimum wire size shall be No. 22 AWG for stranded wire and No. 24 AWG for solid wire.

### **3.04 RACK WIRING**

- A. Unless otherwise approved by the Engineer in writing, all rack wiring shall be accomplished with solderless connections. Wire used for rack wiring shall be stranded wire, minimum size No. 20 AWG, or multiconductor cables as specified herein. Where wires of a multiconductor cable are used for intra-rack wiring, any unused conductors shall be folded back and taped.
- B. Rack wiring shall be neatly tied into compact bundles. The main bundles and branches shall be secured to the racks in a manner which shall preclude physical damage due to pressure or abrasion and prevent the wire weight from being supported by the wire terminations, connections, or plug connectors. The arrangement of the wire bundles and cables shall be such that they do not interfere with visual inspection, troubleshooting, or repair of the rack mounted equipment.

### **3.05 RACK-TO-RACK WIRING**

- A. Rack-to-rack wiring shall be accomplished with solderless connections using multiconductor cables as specified herein, or single conductors tied into bundles to form unjacketed multiconductor cables. Unjacketed multiconductor cables shall consist of individual

conductors of size 14 AWG or larger wire and shall have a maximum tie spacing of six inches.

- B. All rack-to-rack wiring shall be routed via the overhead cable trays, with one foot of slack between the cable tray and each rack to which the cable is connected.
- C. Cables shall not be pulled into the cable trays, but shall be laid loosely and neatly in the trays with a minimum of crosses.
- D. Cable connections to all racks except the entrance racks shall be via plug connections. Cable connections to the entrance racks may be made in the same manner as field wiring.

### 3.06 HIGH VOLTAGE WIRING

- A. Internal wire used in circuits directly connected to the rails and internal wire used in circuits which operate at voltages in excess of 600 volts shall meet the requirements of this Section for 601 to 2500 volt service.

### 3.07 EXTERNAL CABLE APPLICATION

- A. The Contractor shall be responsible for the sizing of all conductors greater than the minimum size specified, due to the application of his design or due to voltage losses caused by long cable runs. Where special cable configurations and/or conductor sizes larger than the minimum sizes specified herein are necessary to meet the specified operating conditions of the system, the Contractor shall provide same at no additional cost to the Authority. Increases in required conductor size shall be in accordance with the National Electrical Code.
- B. If the Contractor's Train Control System requires the use of shielded cable, the Contractor shall provide the required shielded cables, and all additional related terminating required to provide single-point grounding of the shield at no additional cost to the Authority. The shielded cable supplied shall meet all requirements of these cable specifications and the shield shall be grounded as specified in Section 16922, Lightning/Surge Protection and Grounding Systems. Armor tape shall not be considered as a substitute for a shield. Each electrically contiguous segment of armor tape shall be grounded at only one point.
- C. The Contractor shall furnish and install the amounts of specified types of external cable necessary to provide a complete ATC System. The various types of cable and their applications shall include, but not be limited to, the following:
  - 1. GROUP I - SIGNAL CABLES
    - a. Audio Frequency Track Circuits
      - 1) An individual twisted pair cable, minimum size 16 AWG, shall be furnished and installed between the terminating point in the TCR and the associated trackside junction box for each impedance bond, track circuit bridging receiver unit, speed command transmission loop, or other inductive track loop device. When these devices are located more than 4000 feet from the TCR, the minimum wire size shall be No. 14 AWG. This twisted pair **shall not** be part of a multiple twisted-pair cable between the TCR and a wayside distribution box. **Individual twisted pairs for audio frequency track detection signals of the same track circuit (i.e. transmitter and receiver bond lines) shall be separated by at least two inches for any parallel length exceeding 700 feet. A grounded metal separator may be substituted for the two inch separation in cable troughs.**
      - 2) Track cable leads for impedance bonds and speed command devices shall always terminate in an adjacent wayside junction box and then continue as specified to the track circuit or speed

- transmission device.
- 3) In direct fixation construction, where the cable is installed in conduit between the junction box and impedance bond or speed command device, a continuation of twisted pair No. 14 or No. 16 AWG shall be used.
  - 4) In ballast construction, the cable between junction box and impedance bond and/or speed command device shall consist of No. 14 or No. 16 twisted pair cable (as applicable), installed inside rubber hose of the type specified in Section 16961, Audio Frequency Track and Loop Circuit Layouts, or in conduit along the edge of the crosstie.
  - 5) The individual cables between a terminating receiver wayside junction box and the running rails shall be 1000-volt class cable, minimum size No. 6 AWG.
  - 6) The Contractor shall also furnish and install one spare twisted pair cable, identical to that specified for AF track circuit devices, along each main track between successive Train Control Rooms. The spare cable for each track between consecutive TCRs shall be terminated in both TCRs and shall be intermediately terminated in wayside junction boxes associated with AF track and speed command devices for that track. **Wherever feasible, the spare cable shall be provided a service loop at each intermediate junction box without actually entering the junction box. At locations where the service loop is not feasible the spare cable shall be terminated in the junction box and the slider straps left in the open position.**
- b. Speed Command Loops
- 1) A single conductor, size 10 AWG cable shall be installed adjacent to the running rails in a loop configuration, as shown on the Contract Drawings, to provide for the transmission of speed commands through interlockings, as required. The loops so formed shall be transposed, as required, to minimize coupling to the rails.
  - 2) The No. 10 AWG cable used for speed command loops in interlockings shall have 600 volt insulation and be encased in hose. See Section 16961, Audio Frequency Track and Loop Circuit Layouts.
  - 3) Where the No. 10 AWG loop wires serve as leads between the track loop itself, and;
    - a) an adjacent wayside junction box; or
    - b) an impedance-matching transformer they shall be twisted to minimize induction radiation and interference.
  - 4) Speed Command Loop control wires from the Train Control Room to a wayside junction box shall be twisted pair, minimum size 14 AWG. See also Part 3.07.C.(GROUP I),9., Interlocking Control Distribution, of this Section.
- c. TC Maintenance Telephone
- 1) Size No.16 AWG twisted pair cable, identical to that used for AF track circuits, shall be furnished and installed to connect all telephone jacks of the TC Maintenance Telephone System along the wayside. A separate cable of this type shall be installed along each main track to connect the telephone jacks mounted in train control equipment along that track. See Section 16923, TC Maintenance Telephone System, and the Contract Drawings.
- d. Power Frequency Track Circuits
- 1) One-thousand-volt-class single conductor cable shall be furnished and installed for 60-Hz track circuits. The only exception is that, in areas of high concentration of 60-Hz track leads, these circuits may

- be accumulated into a dedicated 1000-volt-class multiconductor cable between the TCR and the wayside distribution junction box.
- 2) Cable for the feed end of each 60-Hz track circuit shall be minimum size No. 10 AWG. Cable for the relay end of such track circuits shall be minimum size No. 14 AWG from the TCR to the wayside junction box.
  - 3) Feed end track circuit leads extending more than 400 feet and relay end track circuit leads extending more than 1000 feet shall be increased in conductor size to compensate for the additional cable length resistance losses.
  - 4) The cables between the wayside junction box and the running rail connections shall be single conductor, size 10 AWG, 1000 volt class, for both direct fixation and ballast construction.
  - 5) Cable used for 60-Hz track circuit signal rail jumpers in crossovers shall be single conductor size 6 AWG, 1000-volt class, as shown on the Contract Drawings. The long signal-rail jumper used to connect the two "halves" of the signal rail in a diamond or universal crossover 60-Hz track circuit shall be installed in schedule 80 F.R.E. conduit.
- e. Line Circuit Cable
- 1) The Contractor shall furnish and install one or more 27 conductor, minimum size 14 AWG cables, as required, for line circuits between consecutive TCRs for the route segment included in this Contract, and between the first TCR for the route segment included in this Contract and the TCRs at the tie-in locations with the existing ATC System.
- f. Station Stop Markers
- 1) A five conductor, size 14 AWG cable shall be furnished and installed between the TCR and each variable frequency marker coil junction box. A three-conductor, size 16 AWG twisted cable shall be furnished and installed between each variable frequency marker coil tuner unit and its associated junction box. See Section 16967, Marker Coil Layouts.
- g. Controlled Signals
- 1) A seven conductor, size 14 AWG cable shall be furnished and installed between each controlled signal and its associated Train Control Room or wayside distribution box. See Section 16965, Signal Layouts.
- h. Switch-and-Lock Movements
- 1) The cables to be furnished and installed between each switch junction box and the TCR (or an interlocking distribution junction box) shall be a single seven conductor (minimum size 14 AWG) for control and indication and a single five conductor (minimum size 10 AWG) for operation, or one composite cable (made up of two or more minimum size 10 AWG conductors) for operation, plus ten or more (minimum size 14 AWG) conductors for control, indication and spares. The minimum size of the two conductors for operation shall be increased to size 8 AWG if the distance from the switch junction box (or interlocking distribution junction box) to the TCR is more than 400 ft., and shall be increased to size 6 AWG if this distance exceeds 1000 ft. See Section 16964, Track Switch Operating Layouts.
- i. Interlocking Control Distribution
- 1) As an alternative, the Contractor shall furnish and install one or more multiconductor signal cables, each consisting of six twisted pairs, size 14 AWG, assembled as described in Part 2.02.B, between a distribution junction box for each interlocking, and its associated

- TCR. These cables shall be used for the various speed command inductive track loops required by the interlocking.
- 2) As an alternative, the Contractor shall furnish and install one or more of the following multiconductor signal cables between each interlocking distribution junction box and its associated TCR to consolidate control, operation, and indication wiring:
    - a) 12c No. 14
    - b) 19c No. 14
    - c) 5c No. 10
    - d) 7c No. 1
- j. Marker Signals
    - 1) A five conductor, size 14 AWG cable shall be furnished and installed between each marker signal and its associated Train Control Room or wayside distribution box. See Section 16965, Signal Layouts.
  - k. Route Selection Pushbuttons
    - 1) A seven or twelve conductor, size 14 AWG cable, as required, shall be furnished and installed between each route selection pushbutton and its associated wayside junction box or distribution box, or the TCR. See Section 16966, Wayside Pushbutton Layouts.
  - l. Snowmelter Control and Indication
    - 1) A nine conductor, size 14 AWG cable shall be furnished and installed between the TCR and each snowmelter control case for control and indication purposes, and for energization of the SM case heaters. See Section 16969, Snowmelter Layouts.
  - m. Snowmelter Energy Supply
    - 1) The Contractor shall furnish and install a single conductor, No. 1 AWG (minimum size), 1000-volt-class underground cable between the propulsion power contact rail and the snowmelter control case via the contact rail Fuse Box.
  - n. Snowmelter Heating Elements
    - 1) The Contractor shall furnish and install:
      - a) A single conductor, size 6 AWG, 1000-volt-class underground cable between the snowmelter control housing and each running-rail snowmelter heating element controlled from that housing, and;
      - b) A single conductor, size 10 AWG, 1000-volt-class underground cable between the snowmelter control housing and each switch rod heater unit controlled from that housing.
    - 2) Maximum length for each of these cables shall be 75 feet unless otherwise authorized in writing by the Engineer. See Section 16969, Snowmelter Layouts, and the Contract Drawings.
  - o. Next Train Sign Control Cable
    - 1) The Contractor shall furnish and install a five conductor, minimum size 14 AWG cable from the TCR to the applicable AC Service Room in each Terminal Station. The routing for each of these cables shall be as previously approved by the designated Resident Engineer.
2. GROUP II - SPECIAL CONTROL AND INDICATION CABLE
    - a. Multiconductor Special Control and Indication Cable, minimum size 19 AWG, for use by the Data Transmission System, shall be furnished and installed from TCRs to DTS junction boxes (cabinets) furnished by other disciplines at certain locations(As Applicable) to meet the minimum twisted pair requirements shown below.
      - 1) Traction Power Substation (SS) 100 Twisted-Pair
      - 2) AC Service Room (Near) (or Single) 75 Twisted-Pair

- |     |   |                  |
|-----|---|------------------|
| 3)  | AC Service Room (Far)   | 50 Twisted-Pair  |
| 4)  | Tie Breaker Station (TBS)   | 31 Twisted-Pair* |
| 5)  | Jet Fan Control Room (JFC)  | 31 Twisted-Pair* |
| 6)  | Fan Shaft (FS)  | 25 Twisted-Pair  |
| 7)  | Vent Shaft (VS)   | 6 Twisted-Pair   |
| 8)  | Sewage Ejector (SEJ)  | 6 Twisted-Pair   |
| 9)  | Drainage Pumping Station (DPS)  | 6 Twisted-Pair   |
| 10) | Sump Pump (Special Locations only)                                      | 6 Twisted-Pair   |
| 11) | *The cables used shall be limited to 2, 6, 18, 25 and 50 Twisted Pairs. |                  |
- b. The Contractor shall install a 25 twisted-pair, Special Control and Indication cable between the TCR entrance rack and the associated TC/COMM Interface Cabinet (by others) at each TCR newly equipped with an RTU under this Contract. See Section 16925, Data Transmission System (DTS).
  - c. The ATC Subcontractor shall furnish and install a two-pair, solid-conductor, telephone-type cable between the RTU in each new TCR and the associated Main Distribution Frame (MDF) (furnished by others in the Communications Equipment Room), leaving sufficient wire at the MDF end for proper termination by the Communications subcontractor. Each pair in this cable shall be individually shielded, size 22 AWG wire. Larger wire will not be acceptable. See Section 16925.
  - d. Unless otherwise specified, the Contractor shall size the conductors of all special control and indication cables in such a manner that the working voltage drop for any circuit in the cable does not exceed ten percent with a working load of one-half ampere on the circuit.
3. **GROUP III - NEGATIVE PROPULSION RETURN CABLE**
- a. All Negative Propulsion Return Cable shall be rated for 2000 Volts. The insulation shall be Ethylene-propylene rubber, ICEA Type II, 90°C, suitable for dry and wet locations.
  - b. The cable shall have an overall nonmetallic jacket of chlorosulfonated polyethylene or cross-linked polyolefin. The jacket shall be bonded to the insulation to prevent moisture pockets. The minimum peel strength of the jacket from the insulation shall be four pounds per inch width for either type of jacketing used.
  - c. The insulation power factor shall not exceed two percent.
  - d. The cable shall carry UL labeling, Type RHW-2.
  - e. Cable furnished and installed for the connection between impedance bond center taps (or shunt-bar center taps) and substation return or tiebreaker station return bus bars or moles shall be single conductor, 1000 KCMIL Class D (127 strand). See Section 16968, Track Bonding Layouts. Cable furnished and installed for negative return cross bonding and switch bonding, and for connection between the impedance bonds and the running rails, shall be single conductor, extra-flexible, 1000 KCMIL, Class G (427 strand).
  - f. Cable furnished and installed for negative-return, compression-bolted rail-web bonding shall be single conductor, 500 KCMIL, Ropelay with 2000-volt-class insulation. See Section 16968, Track Bonding Layouts.

### 3.08 CABLE INSTALLATION

- A. General
  1. The installation of wire and cable shall conform to Part 10.4.40 (Wiring) and Part 10.4.1 (Wires & Cables) of the AREMA Signal Manual except as modified herein.
  2. The Contractor shall notify the designated Resident Engineer at least 24 hours prior to installing cables.
  3. The Contractor shall provide sufficient slack in cable conductors at all terminating posts to enable three reterminations of the conductor due to broken eyelets without

reservicing or repositioning the cable. In types of installation where the cable cannot be constrained, sufficient cable slack shall be provided to prevent damage to the cable due to vibration.

4. Signal cable shall not be bent to a radius less than 20 times the diameter of the cable during installation or as finally installed, except as permitted in writing by the designated Resident Engineer.
5. Cable splices will not be allowed as a normal installation practice for non-vital circuits, and will not be permitted for cables carrying vital circuits. Cables carrying vital circuits over long distances, such as the wayside TCR-to-TCR cables, shall be terminated in wayside junction boxes in lieu of being spliced. Intermediate junction boxes shall not be installed prior to approval of their construction, configuration and location by the Engineer. Upon written request, and only under extreme circumstances and because of installation hardship, will the use of cable splicing in certain non-vital cable runs be considered, all subject to the designated Resident Engineer's prior approval.
6. Cable splices, where permitted in non-vital circuit cables, shall be of the cable manufacturer's recommendation or the 3M (Minnesota Mining and Manufacturing Co.) type, all subject to the designated Resident Engineer's approval. Further, all splices other than the 3M type shall have a layer of fireproof tape applied over the splice and for six inches beyond each end of the splice. All cable splices shall be waterproof and shall have the same or greater service life as the cable to which they are applied.
7. All cable entrance openings in equipment enclosures, manholes and junction boxes shall be sealed with either a compression type fitting or pliable sealing compound after the cable is in place. Sealing compound shall be used to seal the area around cable where the cable emerges from the end of a conduit, pipe or duct bank. The Contractor shall install conduit sealing bushings in the ends of all unused Train Control conduits to prevent fluids or gases in the conduits from entering the enclosure. These bushings shall be Type CSBI as manufactured by O-Z/Gedney, or approved equal.
8. A suitable lubricating medium (Cable Pulling Lubricant), as specified in Section 16978.2.09, shall be used when pulling cables into conduit, pipe, or duct bank.
9. Where cable transfers from trays or troughs to conduit the ends of the conduit shall, for guidance, be fitted
10. with plastic end bells to prevent damage to the cable.
11. Wherever multiple conductor cables are terminated the outer sheath of the cable shall be carefully removed to the point of cable entrance. At the end of the cable sheath or covering, two layers of plastic electrical tape shall be applied. This tape shall be Reference No. 88, as manufactured by the 3M Company, or an approved equal. As an alternative, the Contractor shall apply a heat shrink sleeve to the end of the cable sheath.
12. The Contractor shall be responsible for the dewatering and removal of all dirt and trash from trenches, pipe, manholes, pull chambers, cable trough, surface trench, conduit and duct bank prior to and during the installation of cable, at no additional cost to the Authority.

**B. Buried Installation**

1. Horizontal runs of buried cable greater than 15 feet shall be installed in PVC conduit per the requirements of this Section.
  - a. Cable shall be buried to a uniform depth of not less than 30 inches. A bed of sand at least four inches thick shall be provided in the bottom of the trench. The cable shall be laid neatly, but loosely on this sand bed, with a minimum of cable crossings. The cable shall then be covered with a minimum of four inches of sand before backfilling. Loam or clay, free of lumps, stones or other debris, may be substituted for sand only with the prior written approval of the Engineer. Backfill shall be compacted to not less than 95 percent of the maximum dry density of the respective materials as determined by AASHTO Test Designation T-99.

- b. Cable passing under tracks or under ballast, or within track right-of-way shall normally be installed in conduit provided by others. Track right-of-way is defined as an area encompassing the ties and rail and extending two feet beyond the ends of each tie. When no conduit has been provided in such an area, the Contractor shall furnish Schedule 80 PVC conduit for this purpose and shall bury this conduit not less than 30 inches below the ties. See Section 16973, Conduit.
- c. In all areas beyond the right-of-way area where cables cannot be buried to a uniform depth of 30 inches, the Contractor shall, at no additional cost to the Authority, either install surface trench or install the cable in concrete encased Schedule 80 PVC to the maximum uniform depth allowable by field conditions. At transition areas between buried and non-buried installation, the cable shall be protected by Schedule 80 PVC. Horizontal runs of PVC buried at or greater than a depth of 30 inches will not require concrete encasement.
- d. Where cable leaves the ground at other than buildings, or in foundations or pedestal mounted junction boxes, it shall be protected by heavy duty, two-ply, fiber reinforced rubber hose or Schedule 80 PVC conduit. The top end of each hose or conduit shall be filled with sealing compound where the cable emerges.
- e. The cables used as track leads between the rail connections and the wayside junction box shall be protected by vertical bootlegs of heavy duty, two-ply, fiber reinforced, one-inch I.D. neoprene hose where they pass through the ballast and the subgrade. Cable not extending beyond the far rail shall be placed in heavy duty, two-ply, fiber reinforced, one-half inch I.D. neoprene hose or Schedule 80 PVC conduit which shall be clamped to the side of the crosstie as shown on the Contract Drawings.
- f. Cable shall be installed in a steel or wrought iron pipe wherever the cable passes under pavement or roadway. This pipe shall extend two feet beyond the edges of the pavement.
- g. The Contractor shall be responsible for all shoring required to prevent undermining and cave-ins during cable burying operations and shall also be responsible for any damages or lost time resulting from inadequate shoring. Any trench over 3 feet deep shall be shored.
- h. Where a buried cable enters a conduit, pipe, pedestal, or concrete foundation, for an equipment case, junction box, or other piece of Train Control equipment in which the cable is to be terminated, or bootlegs for track circuit or snowmelter connections, a five foot slack coil of that cable shall be installed in a trench below the point of entrance.
- i. Cable required to carry current at 600 volts or more shall not be installed in the same trench as signal or other low voltage cable without prior written consent of the Engineer.
- j. If signal, communication or track circuit cables, due to installation hardship, must be installed in the same trench as, or are required to cross cable carrying current at 600 or more volts, these low voltage cables shall be installed so that the distance between them and the high voltage cables shall not be less than 30 inches for all the cables. Where the high and low voltage cable cross or diverge, the area between the two types of cable shall be filled with sand to a distance of two feet along each type of cable from the point of their nearest proximity.
- k. Locate, dig and backfill the cable trench with a minimum of disturbance to the right-of-way. The Contractor shall reestablish and/or repair any portion of the right-of-way and/or drainage system that may be disturbed by the cable burying operations. Excess spoils shall be evenly distributed along the right-of-way if digging operations are at the subgrade level and ballast has not yet been installed. If ballast has been installed, care shall be taken to cover the

ballast during digging operations in order to keep the ballast clear of spoils. In the latter case, excess spoils shall be removed from the property and disposed of at no additional cost to the Authority.

- I. Install mylar cable marking tape at a depth of six inches while backfilling each cable trench.

C. Non-Buried Installation

1. Direct Fixation in Tunnel Areas

- a. Train control cables shall be installed along the tunnel walls in an organized fashion within the area allotted to them. Cable crosses shall be kept to a minimum. The topmost cable(s) shall be assigned for through runs with local cable(s) below them to facilitate cable branching into the wayside equipment in an orderly manner. Where the Contractor has more cable than will fit in the allocated area, the Contractor shall furnish and install additional approved cable mounting devices at no additional cost to the Authority. Cable runs along tunnel walls shall not interfere with access to grab bars located on the tunnel walls at access points to the safety walk.
- b. Channel inserts will have been provided by others for the Contractor's use, mounted on approximately four foot centers in the tunnel walls. The Contractor shall furnish and install fastenings or mounting devices to secure the cables to the channel inserts. These fasteners shall be properly sized to the cable, or shall be adjustable to the proper size to support the cable without undue compression. Prior to cable installation the Contractor shall clear and remove any foreign material from the channel inserts where necessary. Where channel inserts are missing, the Contractor shall provide a substitute device which performs the same function and is acceptable to the Engineer. Any additional work and materials involved with the installation of the substitute device shall be provided at no additional cost to the Authority.
- c. Sufficient slack shall be provided in the cable between fasteners to allow for expansion and contraction of the cable without damage to the cable or the fasteners.

2. Installation in Trays, Troughs or Surface Trench

- a. Cable installed in trays, troughs or surface trench shall be laid therein and not pulled into place. Cables installed in trays, troughs and surface trench shall have a minimum amount of crossover and shall not be pulled tightly around bends.

3. Installation in Conduit or Pipe

- a. Remove any foreign material from conduits by using an appropriate mandrel. The Contractor shall then clear or swab dry each conduit or pipe before installing cable therein. It shall be the Contractor's responsibility to prove existing conduits prior to use. The Contractor shall maintain the conduits and/or pipe in a clean and dry condition during the installation process up to and including the time each conduit or pipe is sealed as specified, at no additional cost to the Authority.
- b. The Contractor shall have an approved Pull Sheet in his possession for each cable pull executed, and shall record thereon the date of the pull, the method used, the maximum pull tension experienced for each applicable pull, and other pertinent data. The Contractor shall resubmit a copy of each completed Pull Sheet to the designated Resident Engineer within one week of the pull. See Part 1.08 G of this Section.
- c. Conduct cable pulls in accordance with the cable manufacturer's recommendations. In the absence of any such specific recommendations, the Contractor shall use an approved wire cable grip extending not less than 18 inches back from the end of the cable when pulling cable. The clutch on the pulling device shall be set to slip at 50 percent of the weight per 1000 feet

of the cable to be pulled or at the manufacturer's maximum force rating, whichever is less. The equipment used for pulling cable shall be equipped with a dynamometer which shall indicate the pulling force in pounds. An approved cable pulling lubricant, as specified in Section 16978, shall be applied to the cable when installing cable in conduit or pipe.

- d. Cables shall not cross one another when they are pulled into a conduit or pipe and care shall be taken not to have the conductors pulled tight or kinked in conduit fittings or boxes. All cables to be installed in a given conduit or pipe shall be pulled and installed simultaneously.
  - e. Furnish and install potheads and filling compound where cables enter or leave conduit or pipe. The potheads and filling compounds shall be as specified in Section 16978, Miscellaneous Train Control Components and Materials, and shall be applied in conformance with the manufacturer's instructions.
  - f. Local cable runs from wayside equipment in direct fixation to the trackside junction boxes shall be installed in embedded conduit which has been provided by others. Where embedded conduit is not provided by others for this purpose, the Contractor shall chip and grout the required conduit in place below the structure surface. In doing this work, the Contractor shall not cut any concrete reinforcing bars without the prior written approval of the designated Resident Engineer.
4. Installation in Manholes and Pull Chambers
- a. Furnish and install clamps or other cable restraining hardware in manholes or other areas where support is needed for cables entering or leaving conduit or pipe or passing through the manhole. Apply an identification tag to each TC cable in every manhole.
  - b. Sufficient slack shall be provided in each cable so that the bending radius of each cable shall not be less than 20 times the diameter of the cable. Where the specified minimum bending radii of cables do not allow strapping or clamping to channel inserts, the Contractor shall furnish and install approved manhole racks with insulators to support the cables.
  - c. All mounting and fastening materials used for this application by the Contractor shall be stainless steel, as specified in Section 16915, Basic Equipment Requirements. Use of anodized channel is unacceptable in manholes and pull chambers.
  - d. Cables shall be installed in a manner which will prevent their injury by persons and equipment entering and exiting the manholes via ladders or other climbing devices.
  - e. Install and support cable in manholes and pull chambers in accordance with the approved version of drawings he has submitted for this work.
5. Special Installation Requirements
- a. Provide sufficient slack in all cable installation runs to prevent damage to the cable or its terminations due to expansion or contraction.
  - b. Provide appropriate special protection for cables in areas where the cables are unavoidably exposed to hazardous conditions such as vibration or sharp corners on equipment. The Contractor shall be responsible for replacing, at no additional cost to the Authority, any cable he has installed which is subsequently damaged as a result of his failure to provide such special protection.

**PART 3 - EXECUTION**

NOT USED

**END OF SECTION**

**SECTION 16951**  
**ATC - TRANSFER AND BYPASS EQUIPMENT**

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section specifies the furnishing and installation of Automatic Transfer and Bypass-Isolation equipment as part of each new TCR Power Distribution system provided under this Contract. For each TCR, this equipment shall include:
1. A high speed, single phase Automatic Transfer Switch to supply an uninterruptible 120 volt, 60 Hz bus.
  2. A one-way, bypass-to-normal Bypass-Isolation Switch to provide a safe and convenient means of bypassing and isolating the Automatic Transfer Switch for test and maintenance purposes without interrupting ATC functions.
  3. All devices and wiring required to cause the Transfer and Bypass equipment to function as specified herein.

**1.02 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
1. Section 16916 Basic ATC Circuit Requirements
  2. Section 16921 ATC Power Distribution Systems
  3. Section 16922 Lightning/Surge Protection and Grounding Systems
  4. Section 16941 Basic ATC Electrical and Electronic Component Requirements
  5. Section 16980 ATC Tests, Inspections and Quality Assurance

**1.03 SWITCHING**

- A. The Automatic Transfer Switch shall immediately throw from the Normal to the Reserve service whenever the Normal 120 volt, 60 Hz bus falls below 85 percent of its nominal voltage and the Reserve voltage is 85 percent of nominal or higher.
- B. Once the switch has thrown to the Reserve 120 volt, 60 Hz service, it shall remain in that position until the Normal service voltage returns to at least 95 percent of its nominal value and remains in that range for a time period adjustable from 15 seconds to five minutes, whereupon the switch shall retransfer the load to the Normal service. This "return-delay time" feature shall be nullified and the switch shall immediately retransfer to the NORMAL position if the Reserve service falls below 85 percent of its nominal value and the Normal service voltage is at least 85 percent of its nominal value.

**1.04 BYPASS AND ISOLATION**

- A. The Bypass-Isolation Switch shall perform two functions:
1. Connect the load directly to the Normal service without interrupting service to the load.
  2. Electrically isolate the Automatic Transfer Switch from the load and both services.
- B. Interlocks shall be provided to prevent:
1. Moving the bypass switch handle from the AUTOMATIC to the BYPASS-TO-NORMAL position unless the Automatic Transfer Switch is in its NORMAL position and the Normal service is at least 85 percent of its nominal value.
  2. Isolation of the Transfer Switch prior to bypassing the load to the Normal service.
  3. Removal of the load bypass connection prior to reconnection of the Automatic Transfer Switch to the load and both services.
  4. Moving the bypass switch handle from the BYPASS-TO-NORMAL to the

AUTOMATIC position unless the Automatic Transfer Switch is in its NORMAL position.

#### **1.05 QUALITY ASSURANCE**

- A. The factory tests for Transfer and Bypass Equipment shall meet the requirements of Underwriters Laboratories Standard UL 1008 and the requirements specified herein. The overload and endurance tests specified in UL 1008, Sections 21 and 23, respectively, shall be conducted prior to the temperature rise tests specified in UL 1008, Section 22. The factory tests shall also include a test to determine the transfer time of each Transfer Switch in each direction.
- B. Field installation inspections and operational tests of automatic transfer switches and bypass-isolation switches shall be conducted as specified in the approved inspection and test procedures submitted by the Contractor.

#### **1.06 SUBMITTALS**

- A. Prior to purchase or fabrication of Transfer or Bypass Equipment, the Contractor shall submit:
  - 1. A copy of the calculations used to determine the size of the Automatic Transfer Switch and Bypass-Isolation Switch he proposes to use in each TCR. The calculations shall reflect:
    - a. Proper coordination of the transfer and bypass equipment with the size of the load to be supplied and the characteristics of protective devices to be provided.
    - b. The relative electrical capabilities of the Automatic Transfer and Bypass-Isolation Switches proposed.
  - 2. Complete drawings, operational explanations, performance data and sizes for the Transfer and Bypass equipment he proposes to furnish and install. The drawings shall include control, interlocking, and indication circuits and hardware, transfer times, mounting details, wiring diagrams and a complete parts list.
- B. Prior to installation of Transfer and Bypass Equipment, the Contractor shall submit:
  - 1. A Train Control Room arrangement plan for each TCR which identifies the Transfer and Bypass Equipment and indicates where it is to be mounted in the room. This does not have to be a separate submittal if such a plan has previously been submitted for other purposes.
  - 2. Copies of the factory test reports for the Transfer and Bypass Equipment. These shall include plotted traces of the output voltage showing the actual transfer time of each transfer switch in each direction, i.e., from Normal to Reserve, and from Reserve to Normal when activated by the removal of the applicable initial voltage source.
  - 3. Proposed procedures for installation inspection and field testing of the Transfer and Bypass Equipment.
- C. Upon installation and field testing of the Transfer and Bypass Equipment, the Contractor shall submit a complete field test report.

### **PART 2 - PRODUCTS**

#### **2.01 AUTOMATIC TRANSFER SWITCH**

- A. The Automatic Transfer Switch shall be of the electrically operated, mechanically held type, rated for continuous duty in an unventilated sheet metal enclosure. All accessory control and indication devices shall be removable from the front of the Transfer Switch without removal of the switch panels from the enclosure and without disconnection of drive linkages or power

conductors. The Transfer Switches provided shall meet the requirements of Underwriters Laboratories Standard UL 1008 for Automatic Transfer Switches and other requirements specified herein.

- B. The switching mechanism shall have only two positions, NORMAL and RESERVE, inherently interlocked mechanically and with main contacts mechanically attached to a common shaft. The switching mechanism shall cause the main contacts to transfer the load from one service to another with an output power interruption period of sufficient brevity not to cause any track relays or traffic sticks to drop, and not to cause any other failure in the ATC System.
- C. The main contacts shall be of the brush, segmented, or silver alloy, wiping action type and shall be protected by arcing contacts in sizes above 40 amperes. The "constant current" rating for the main contacts and associated arc-quenching apparatus shall be at least 20 percent higher than the maximum working load computed for the transfer switch by the Contractor and approved by the designated Resident Engineer. The contact configuration shall utilize magnetic forces to keep main contacts closed when subject to high fault currents.
- D. The transfer switch shall have the thermal capacity to carry its withstand rating without contact welding or electrical or mechanical damage.
- E. Sensing and control relays shall be continuous duty industrial control type with minimum contact rating of 10 amperes. The voltage sensitive relays shall be of the close differential type, factory adjusted for 95 percent pickup and 85 percent drop-out. The return-delay time relay shall be adjustable from 15 seconds to five minutes in at least eight steps.
- F. Each Automatic Transfer Switch shall be equipped with the following test and adjustment features:
  - 1. A spring-return test pushbutton or equivalent which shall, when operated, cause the switch to transfer from the NORMAL to the RESERVE position. The transfer switch shall then remain in the RESERVE position until the test button has been released and the preset return-delay time period has run out. The test pushbutton shall be clearly identified by a metal or phenolic label or approved equal.
  - 2. Facilities for testing and adjusting the undervoltage sensitivity for both the Normal and Reserve services.
  - 3. Facilities for testing and adjusting the return-delay time mechanism.
- G. The Automatic Transfer Switch shall be equipped with the following indication features:
  - 1. At least five independent auxiliary contacts shall be provided for transfer switch position indicating use. Three of these contacts shall close when the transfer switch is in the NORMAL position and the other two shall close when the switch is in the RESERVE position. All of these auxiliary contacts shall have 10 ampere minimum continuous contact rating and shall be activated by the switching mechanism. One of these contacts shall be used to energize a remote relay indication of the transfer switch position as shown on the Contract Drawings.
  - 2. The Transfer Switch shall include four LED indicating light units:
    - a. One amber LED unit to indicate the availability of Normal service energy of the proper voltage (Normal voltage sensing relay energized)
    - b. A second amber LED unit to indicate the availability of Reserve service energy of the proper voltage (Reserve voltage sensing relay energized)
    - c. A green LED unit to indicate when the transfer switch is in the NORMAL position
    - d. A red LED unit to indicate when the transfer switch is in the RESERVE position
- H. The indications provided by these LED indicators shall be visible from the outside of the Transfer Panel. The LED units shall be, as applicable:

1. SP940112-R (RED)
  2. SP940224 (GREEN)
  3. SP940112-A (AMBER)
  4. as manufactured by Data Display Products of El Segundo, California, or approved equal.
- I. The Automatic Transfer Switch, complete with all its control, test and indication equipment, shall be housed in a non-ventilated NEMA-12 type enclosure constructed of 11 gauge sheet metal. Provision shall be made for locking the doors of this enclosure. When the metal used is not inherently non-corrosive, the enclosure shall be finished in grey ANSI-61, or approved equal. The switch position and power indicating lights shall be mounted on the front of this enclosure. This assembly of power transfer equipment shall be known as the Transfer Panel.
- J. Each control, test or indicating device mounted on the front of the Transfer Panel shall be clearly identified by a metal or phenolic label firmly attached to the panel.

## **2.02 BYPASS-ISOLATION SWITCH**

- A. Each Bypass-Isolation Switch shall be compatible with its associated Automatic Transfer Switch and shall be designed to the same standards as the Automatic Transfer Switch. The Bypass-Isolation Switch shall have "withstand current" abilities equal to or greater than the associated Automatic Transfer Switch.
- B. The Bypass-Isolation Switch shall be arranged so that one person can perform the bypass and isolation functions through the operation of a maximum of two handles at a common deadfront panel:
1. A handle labeled BYPASS CONTACTS which shall connect the load to the Automatic Transfer Switch when in the AUTOMATIC position, and which shall transfer the load from the transfer switch to the Normal service by means of make-before-break contacts when rotated to the NORMAL position.
  2. A handle labeled ISOLATION CONTACTS which shall disconnect the Automatic Transfer Switch from both the Normal and Reserve service leads when moved from the CLOSED to the OPEN position. Provision shall be made for padlocking this handle in the OPEN position.
- C. The Bypass-Isolation Switch shall be equipped with the following indication features:
1. A red indicating LED light (of the same type as used on the Transfer Switch) on the faceplate of the Bypass-Isolation Switch which shall be illuminated when the BYPASS CONTACTS handle is in the BYPASS-TO-NORMAL position.
  2. Sufficient auxiliary contacts to provide remote ac power and bypass indications as shown on the Contract Drawings. One of these contacts shall close only when the BYPASS CONTACTS handle is in the AUTOMATIC position and another contact shall close only when the BYPASS CONTACTS handle is in the BYPASS-TO-NORMAL position. These contacts shall have a 10 ampere minimum continuous contact rating and shall be activated by the bypass mechanism.
- D. The Bypass-Isolation Switch shall either be housed in a NEMA-12 type sheet metal enclosure of its own, or shall be housed in an isolated compartment of the Transfer Panel enclosure. In either case, the Bypass-Isolation Switch shall have a metal faceplate of its own. The operating handles and the BYPASS indication light shall be mounted on this faceplate. Housing and faceplate metal which is not inherently non-corrosive shall be finished in grey ANSI-61 or approved equal.
- E. The two operating handles, the two positions for each handle, and the BYPASS indication LED light unit shall all be clearly identified by metal or phenolic labels firmly attached to the faceplate of the Bypass-Isolation Switch.

- F. A fail-safe solenoid lock or similar device shall be included in the Bypass-Isolation Switch to prevent movement of the BYPASS CONTACTS handle except when the Transfer Switch is in the NORMAL position and Normal service energy of the proper voltage is available.

### **2.03 TERMINALS AND WIRING**

- A. The Bypass-Isolation Switch, and the Automatic Transfer Switch together with its accessory control and indication devices, shall be completely factory wired internally. If the Bypass-Isolation Switch is mounted in the Transfer Panel, the interlocking control circuits shall also be factory wired. Auxiliary contacts for external indication of interlocking control purposes shall be wired to external solderless terminals of the pressure clamp type. All external power, load, control, and indication terminals shall be clearly identified by permanent tags or markings.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. The Contractor shall wall mount the Transfer Switch and the Bypass-Isolation Switch as shown on the approved drawings. Electrical connections to the power distribution system of the Train Control Room shall be made as shown on the Contract Drawings.
- B. The Transfer and Bypass Equipment shall be wired utilizing single conductor, stranded wire and jumpers, neatly bundled and shaped. The size and type of wire and the wiring diagram shall be as shown on the approved drawings.

### **3.02 FIELD INSPECTION AND TESTING**

- A. The Contractor shall conduct a complete field inspection of the Transfer and Bypass equipment installation and correct any discrepancies noted.
- B. The Contractor shall field test the automatic transfer and bypass-isolation equipment as part of the respective TCR Power Distribution Systems. See Section 16921.

### **3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Transfer and Bypass Equipment will be measured for partial payments on a unit basis. For purposes of payment, this equipment group "unit" shall include:
  - 1. An Automatic Transfer Switch with all its associated control, indication and test devices and enclosure;
  - 2. A complete Bypass-Isolation Switch, and;
  - 3. The equipment required to provide interlocking between the Automatic Transfer Switch and the Bypass-Isolation Switch, all as specified above.
- B. Factors which will be considered before partial payments are made will include, but not be limited to:
  - 1. Delivery of each complete Transfer and Bypass Equipment Group and approval of factory test reports for each major component by the designated Resident Engineer;
  - 2. Complete installation of each Transfer and Bypass Equipment Group, to include all required wiring, and;
  - 3. Approval by the designated Resident Engineer of the installation and operation of the Transfer and Bypass Equipment Group.

**END OF SECTION**

## SECTION 16952

### ATC - DC POWER SUPPLIES

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of direct current power supplies of various voltages and capacities to supply power to all wayside direct current ATC equipment furnished or installed under this Contract.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
- |    |               |  |
|----|---------------|--|
| 1. | Section 16914 | Environmental Requirements                                 |
| 2. | Section 16915 | Basic ATC Equipment Requirements                           |
| 3. | Section 16916 | Basic ATC Circuit Requirements                             |
| 4. | Section 16921 | ATC Power Distribution Systems                             |
| 5. | Section 16922 | Lightning/Surge Protection and Grounding Systems           |
| 6. | Section 16941 | Basic ATC Electrical and Electronic Component Requirements |
| 7. | Section 16949 | Signal Wire and Cable                                      |
| 8. | Section 16955 | Track and Alarm Indication Panels                          |
| 9. | Section 16980 | ATC Tests, Inspections and Quality Assurance               |

##### 1.03 QUALITY ASSURANCE

- A. All DC power supplies furnished under this Contract shall be factory tested by the Contractor in the manner prescribed in a factory test procedure prepared by the Contractor and approved by the designated Resident Engineer. Only those power supplies passing this factory test and receiving approval of the test from the designated Resident Engineer, shall be shipped to the project site.
- B. Field testing of all DC power supplies furnished under this Contract shall be performed by the Contractor in the manner specified in Section 16980, ATC Tests, Inspections and Quality Assurance.

##### 1.04 SUBMITTALS

- A. The Contractor shall submit the following for approval by the designated Resident Engineer prior to procurement or fabrication of the DC power supplies, and within 90 days of NTP:
1. Complete mechanical and electrical drawings for each type and size of DC power supply to be furnished. These drawings shall include details of the internal protection and alarm indication components and any required filtering and regulation components.
  2. Complete physical characteristics and performance data for each type and size of DC power supply to be furnished. This information shall include the amount of heat, noise and electromagnetic emissions generated by the power supplies over an output power range of 10 to 130 percent of rated output in steps of 10 percent.
  3. Proposed location and method of mounting the various DC power supplies on the rack.
  4. A detailed Factory Test Procedure and Factory Test Report Form for each type of DC power supply to be furnished.

- B. The Contractor shall submit for approval, a completed Factory Test Report, in the approved format, for each DC power supply.

## **PART 2 - PRODUCTS**

### **2.01 BASIC DC POWER SUPPLY REQUIREMENTS**

- A. All DC power supplies furnished under this Contract shall be immune to external RF energy from portable 2-way radios and personal communications devices such as cellular telephones, and shall meet the following basic requirements:
1. Transformers
    - a. Transformers used in DC power supplies shall not emit audible noise in excess of 50 dB (referenced to 0.0002 dynes per square cm.) at a distance of three feet when operated anywhere within the range of input and output voltages and currents specified.
  2. Filters
    - a. The power supplies requiring filter capacitors shall be so designed that their filter capacitors can be replaced without removing the power supply from the rack on which it is mounted.
  3. Electrical Insulation
    - a. The power supplies shall have sufficient insulation to be cable of withstanding, for one minute, 600 volts, 60 Hz applied between the input leads (connected together) and the output leads (connected together).
  4. Cooling
    - a. The power supplies shall be designed for natural convection cooling. No supplementary fans or other cooling devices will be allowed.
    - b. The Contractor shall bear in mind that a power supply may be mounted on a rack with other power supplies and shall accordingly be certain that convection area and other components are sized and have dissipation ratings, for such installations.
  5. Duty Cycle
    - a. The power supplies shall be designed for a continuous duty cycle with the exception of the WHB which shall be designed for an average five percent duty cycle.
  6. Failure Alarm
    - a. Each DC power supply shall be equipped with a failure alarm device which shall detect any internal failure which would impair the ability of the power supply to deliver its full rated load. This device shall be normally energized by a small percentage of the rated load current of the power supply and shall cause two separately wired internal contacts to open when a failure is detected. One of these contacts shall be independently wired to binding posts for an external alarm indication circuit. The second contact shall be used to light an indication lamp or LED indicator mounted on the power supply. (See Section 16955, Track and Alarm Indication Panels, and the Contract Drawings.) This circuit shall function even if the output voltage is maintained by a tandem power supply. The power supply shall be so designed that the internal failure indication lamp or LED can be replaced without removing the power supply or any adjacent equipment from the rack.
  7. Input Voltage
    - a. The power supplies shall not be damaged by a sustained input voltage varying from 0 to 150 percent of the rated input voltage. Nominal supplied input voltages may range from 110V to 125V per leg at the incoming

- feeder disconnect.
8. Current Rating
    - a. The power supplies shall be sized in such a manner that no individual power supply operates at less than 20 percent of its rated current output during normal operation of the power bus fed therefrom.
  9. Output Current
    - a. The power supplies shall self-limit their output current to no more than 200 percent of their rated load unless otherwise specified herein. Reverse output current protection shall be provided to prevent shorting or sagging of tandem supplies in the event of filter capacitor failure.
  10. Identification
    - a. Each power supply shall be clearly and permanently labeled with the following:
      - 1) Manufacturer's name
      - 2) Part or model number
      - 3) Serial number
      - 4) Input rating
      - 5) Output rating (Continuous or intermittent)
  11. Components and Wiring
    - a. Electrical and electronic components used in DC power supplies shall be as specified in Section 16941. Internal wire shall meet the requirements of Section 16949. Power supplies which are designed to be repaired in the rack shall have all components in modular assemblies which do not require soldering to replace.

## 2.02 POWER SUPPLIES FOR MAJOR DC BUSES

- A. All power supplies used to feed the four major DC buses (B28G, LB, B5G and WHB) shall meet the following requirements in addition to the basic requirements specified in Part 2.01 of this Section:
  1. Housing
    - a. Each power supply shall be housed in a metal panel-chassis combination with no exposed electrical connections or wires. A perforated protective cover shall be used to provide for convective heat transfer. Metal used in this housing and cover which is subject to corrosion shall be protected by zinc plating or an approved equivalent finish applied after forming.
  2. Front Panel
    - a. The front panel shall be designed for use in mounting the power supply in a standard 19-inch rack with EIA hole spacing. All panel mounted indicating, adjusting or protective devices, or openings for such devices, shall be legibly and permanently labeled.
  3. Electrical Insulation
    - a. The power supplies shall be electrically insulated so that they will be capable of withstanding, for one minute, 600 volts, 60 Hz applied between:
      - 1) The input leads (connected together) and the chassis.
      - 2) The output leads (connected together) and the chassis.
  4. Panel Mounted Indicators
    - a. Each power supply shall have an output voltmeter, an output ammeter and a normally illuminated power failure light (lamp or LED) mounted on its front panel. As an option, the Contractor shall provide this metering on a separate panel in the same rack as the power supplies. Meter accuracy shall be  $\pm 2$  percent with nominal readings at center scale.
  5. Terminals
    - a. The power supplies shall be equipped with standard AAR type binding

posts (No. 14-24 studs) within the chassis, for the connection of all external input and output power leads. Terminals for external connections to the internal failure alarm contacts shall be of the 8-32 barrier strip type or standard AAR type binding posts. Each terminal shall be permanently labeled. No terminal shall protrude outside the chassis.

- b. Where 120-volt input terminals are in close proximity to failure indication terminals, a grounded metal barrier shall be provided to prevent accidental application of 120V to the other terminals.
- 6. Protection
  - a. Internal circuit breakers or fuses shall be easily reset or replaced from outside the power supply.
- 7. Adjustment
  - a. Output voltage adjustment over the specified range shall be easily made and locked from outside the power supply.

## 2.03 LOCAL POWER SUPPLY

- A. Application
  - 1. These power supplies shall be provided to feed the grounded 28 VDC bus (B28G-N28G or B12G-N12G) for operating ATC logic circuits entirely contained within the Train Control Rooms and non-vital circuits which extend outside the TCRs.
- B. Additional Requirements
  - 1. These power supplies shall meet the following requirements in addition to the requirements specified in Parts 2.01 and 2.02 of this Section.
  - 2. Output Current
    - a. Rated Output Current
      - 1) These power supplies shall be furnished in no more than three maximum continuous current ratings selected as required by the application.
    - b. Overload Current Rating
      - 1) Each power supply shall have a short-time overload rating stamped on the nameplate. The overload rating shall be at least 125 percent of rated load sustained for one minute out of any ten consecutive minutes.
    - c. Overload Current Limiting under Short-Circuit Conditions
      - 1) Output current shall be limited to 250 percent of maximum continuous rating. If this short circuit current is sustained for 30  $\pm$ 10 seconds, an internal hand-resettable protective device shall operate to disconnect input power, without harm to power supply components. If this short circuit current is sustained for less than the 30 seconds, recovery of normal output voltage shall be automatic upon removal of the short circuit condition.
    - d. Reverse Current Prevention
      - 1) Reverse output current shall be prevented by circuitry contained within the power supply. This circuitry shall isolate all of the active components within the power supply (including filter capacitors) from the output terminals of the supply. If a circuit other than a blocking diode is used for control of reverse current, a small amount of reverse current will be allowed; however, this shall not exceed 2 percent of the rated current.
  - 3. Output Voltage (During Warm-Up Period)
    - a. Time and Voltage
      - 1) The power supply output shall stabilize within a period of 20

- minutes after rated input voltage is applied to the supply. During this period, the output voltage shall not be greater than 120 percent of rated DC voltage, regardless of load.
- 2) Output Voltage Ripple and Noise
    - a) During the warm-up period, ripple shall not exceed 3 percent of the rated voltage (as measured peak-to-peak), and noise shall be limited to 7 percent of the rated voltage (as measured peak-to-peak) at any frequency.
4. Output Voltage (After Warm-Up Period)
- a. Rated Output Voltage
    - 1) The output voltage shall be adjustable to plus or minus 0.1 percent of the system voltage, at rated input voltage, with an ambient temperature of 25 degrees C, when operating at 50 percent of rated output current.
  - b. Regulation of Output Voltage
    - 1) Versus Input Voltage
      - a) The output voltage at 50 percent load current, shall not vary more than  $\pm 2$  percent for input voltage variations of  $\pm 15$  percent of rated voltage at constant ambient temperature.
    - 2) Versus Ambient Temperature
      - a) The output voltage at 50 percent load current and constant rated input voltage shall not vary more than  $\pm 2$  percent over a temperature range of -30 degrees C to +70 degrees C at constant rated line voltage.
    - 3) Versus Load Current
      - a) The output voltage, from no load to full rated load current, at constant rated input voltage and constant ambient temperature, shall not vary from the output voltage at 50 percent load current by more than plus or minus one half of one percent.
    - 4) Versus Time (Long Term)
      - a) After the warm-up period and once adjusted to a rated voltage with given constant input and load conditions, the output voltage shall not vary more than  $\pm 0.5$  percent in a 72 hour period.
    - 5) Versus Line Voltage, Load Current and Ambient Temperature
      - a) With the worst combination of load current and line voltage, and with temperature variation ranging from -30 degrees C to +70 degrees C, the output voltage shall never vary more than  $\pm 12$  percent of rated voltage.
  - c. Output Voltage Transients
    - 1) Variation in output voltage due to load changes of up to 50 percent of maximum load and for a 10 millisecond interruption of input power shall be limited to  $\pm 1.0$  percent of rated output voltage, peak. Recovery to the point where the waveform stays within the ripple tolerance shall occur within 80 milliseconds of the initiation of the load change.
  - d. Ripple and Noise on Output Voltage Once the power supply output voltage has stabilized:
    - 1) Output ripple, related to the power frequency, shall not exceed one half of one percent of rated voltage.
    - 2) Noise, unrelated to the power frequency, shall be limited to one half of one percent of rated voltage peak-to-peak at any frequency.

- e. Overvoltage Protection
  - 1) If the circuitry of the power supply is such that failure of one or more components within the supply could cause an output voltage greater than that allowed in the requirements of this article, an overvoltage circuit shall be added which senses this overvoltage condition and shuts the power supply down. Such circuitry may be of the "crowbar" type which causes an overcurrent protection condition resulting in the operation of the unit's overcurrent feature in consequent (manually resettable) shutdown. This circuit shall be designed to limit peak overvoltage conditions to a maximum of 125 percent of the rated continuous voltage.
- 5. Input Voltage
  - a. These power supplies shall be designed and rated to operate on 120 volts RMS (Nominal), derived from one phase of a 208Y/120V, 60 Hz, 3-phase, 4-wire grounded neutral service bus, with the input voltage varying by as much as  $\pm 15$  percent and the frequency varying by as much as 0.5 Hz. At the Contractor's option, these supplies may be designed to operate at 208 volts RMS derived from one or all three phases of the 3-phase, 4-wire grounded neutral service. See Section 16921, ATC Power Distribution Systems, and the Contract Drawings.
- 6. Parallel Operation
  - a. Circuitry shall be provided within the power supply for control of the output voltage in a manner which shall cause the power supply to share the total bus load equally with all other parallel connected (tandem) power supplies feeding a given bus. This circuitry may require an additional terminal on the power supply which can be interconnected with its counterpart on the paralleled power supplies to properly control the load sharing as specified in Part 3 of Section 16921, ATC Power Distribution Systems.
- 7. Reliability
  - a. The 100-ampere power supply units shall have a minimum individual MTBF of 100,000 hours. Supply units of 50 amperes rating and less shall have a minimum individual MTBF of 150,000 hours. MTBF shall be calculated at 50 percent load. The maximum MTTR for any individual local power supply unit shall be one hour.

#### **2.04 LINE POWER SUPPLY (LB-LC)**

- A. Application
  - 1. These power supplies shall be provided to feed the non-grounded DC bus (LB-LC) for operating the 28 Vdc ATC vital logic circuits which extend outside the Train Control Rooms.
- B. Requirements
  - 1. These power supplies shall meet all the requirements specified in Parts 2.01 and 2.02 of this Section. These supplies shall also meet all the requirements specified in Part 2.03, except for paragraphs A, and B.2.a.
- C. Output Current
  - 1. The output current of the LB-LC supplies shall be suitable and adequate for the load supplied.

#### **2.05 LOGIC BUS POWER SUPPLIES**

- A. Application

1. These power supplies shall be provided to feed the grounded logic bus (B5G-N5G) for operating low voltage ATC logic circuits entirely contained within the Train Control Rooms.
- B. Requirements
1. These power supplies shall meet all the requirements specified in Parts 2.01 and 2.02 of this Section. In addition, these power supplies shall meet all the requirements specified in Part 2.03, except for paragraphs A, B.2a, and B.4.a.
- C. Rated Output Current
1. These power supplies shall have an output rating suitable and adequate for the load supplied.
- D. Rated Output Voltage
1. These power supplies shall have a rated voltage (after the warm-up period) adjustable to within 0.1 percent of the nominal logic bus voltage, at rated input voltage, and ambient temperature of 25 degrees C, and a load of 50 percent of the rated continuous output current.

## **2.06 WHB POWER SUPPLIES (WHB-WHC)**

- A. Application
1. These power supplies shall be provided to feed the non-grounded WHB DC bus (WHB-WHC) for switch-and-lock movement and snowmelter control circuits at TCRs controlling interlockings.
- B. Requirements
1. These power supplies shall meet the requirements specified in Part 2.01 of this Section, (with the exception of paragraphs A.2, A.8, and A.9) and Part 2.02 of this Section.
- C. Rated Output Current
1. These power supplies shall be rated at a current value sufficient to simultaneously operate five of the switch-and-lock movements supplied by the Contractor.
- D. Rated Output Voltage
1. These power supplies shall deliver to the switch-and-lock movements, at any load, or temperature between 0 degrees C and +70 degrees C, their rated voltage (110 Vdc on the specified machines) plus or minus 5 percent, at rated input voltage, and an ambient temperature of 25 degrees C. The output voltage may vary somewhat from its rating during warm-up, but it shall not exceed 120 percent of rated voltage and the warm-up period shall not be greater than 20 minutes.
- E. Ripple and Noise
1. The ripple and noise of these power supplies shall not interfere with any electrical or electronic system furnished by the Contractor or with the Communications Systems.
- F. Output Voltage Transients
1. Output voltage transients may appear on these power supplies for internal or external reasons; however, the circuitry of the power supply shall contain devices to protect the rectifiers utilized in the supply.
- G. Input Voltage
1. These power supplies shall be designed and rated to operate on 208 volts RMS,

3 phase, derived from a 208Y/120V, 60 Hz, 3 phase, 4 wire grounded neutral, source. The input voltage may vary as much as  $\pm 15$  percent, and the frequency may vary  $\pm 0.5$  Hz.

- H. Terminals (Quantity)
  - 1. A minimum of three bussed terminals shall be provided for each power supply polarity. Four terminals shall be provided for the output of the two contacts of the failure circuit.

## **2.07 VITAL TRAFFIC CIRCUIT POWER SUPPLIES**

- I. The individual power supplies provided by the Contractor for Traffic Circuits shall have enough capacitance to be unaffected by operation of the TCR Automatic Transfer Switch.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. DC Power supplies shall be rack mounted unless otherwise specified or approved by the designated Resident Engineer.
- B. The Contractor shall use a full complement of non-corroding hardware to mount each DC Power Supply in the manner previously submitted by the Contractor and approved by the designated Resident Engineer. Mounting panels or brackets shall be rigidly designed so that they do not sag under the weight of the power supply.

### **3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. DC Power Supplies will be measured for partial payments based upon the number and type of required groups of such approved supplies furnished, installed and accepted.
- B. Each "group" shall include all hardware required to mount all the DC power supplies included therein.
- C. Factors which will be considered when determining partial payments for the DC power supply groups will include:
  - 1. Delivery of all DC power supplies required for a given group and approval of their Factory Test Reports.
  - 2. Installation of the entire DC power supply group by the Contractor and approval of the installation by the designated Resident Engineer.

**END OF SECTION**

## SECTION 16953

### ATC - ATP TRACK MODULES

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of equipment modules required to perform the following basic ATP functions:
1. Generate train detection frequency signals.
  2. Generate coded speed command and door command signals.
  3. Receive train detection frequency signals.
  4. Drive vital track relays when the proper train detection frequency signals are being received.
  5. Allow adjustment of the track detection sensitivity from the receiver end of the module. (The ATP module shall allow for a 20-foot preshunt adjustment of the longest track circuit within 75 percent of the limit of the overall adjustment capability of the module).

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
1. Section 16904 Current Automatic Train Control System
  2. Section 16949 Signal Wire and Cable
  3. Section 16961 Audio Frequency Track and Loop Circuit Layouts
  4. Section 16962 Impedance Bond Layouts
  5. Section 16963 Power Frequency Track Circuit Layouts
  6. Section 16971 Racks and Cable Trays
  7. Section 16980 ATC Tests, Inspections and Quality Assurance

##### 1.03 QUALITY ASSURANCE

- A. All ATP modules shall be factory tested in accordance with the factory test procedure approved by the designated Resident Engineer.
- B. All ATP modules installed under this Contract shall be field tested after installation, both prior to connection of field wayside equipment and after connection of field wayside equipment, as specified in Section 16980, ATC Tests and Inspections.

##### 1.04 SUBMITTALS

- A. The Contractor shall submit the following to the designated Resident Engineer for approval prior to purchase or fabrication of ATP track modules, and within 90 days of NTP:
1. Drawings of the proposed modules including complete parts lists, ordering information, mounting details, internal and external wiring details, and mechanical and electrical component descriptions.
  2. Internal circuit plans for the modules.
  3. A complete factory test procedure for the modules.
- B. The Contractor shall submit all required factory test reports to the designated Resident Engineer for approval prior to shipment of the modules to the work site.

#### PART 2 - PRODUCTS

## 2.01 TRANSMITTER

- A. Train detection and speed command frequency transmitters and associated input equipment shall consist of:
  - 1. Oscillators
  - 2. Code rate generator
  - 3. Power amplifier
  - 4. Coupling units
  - 5. Isolating transformer
- B. This equipment shall operate from 28 Vdc.
- C. Train detection and ATP speed command signals shall be generated by separate oscillators. The output frequency of either oscillator shall not drift by more than 0.5 percent of nominal.
- D. The code rate generator outputs shall not vary from their assigned rates by more than 0.5 percent.
- E. The power amplifier shall produce sufficient signal to operate at least two 2000-foot track circuits. A plug coupler with programmable level settings determined by jumpers shall be provided to enable a selection of varying signal strengths. A minimum power level setting of five (5) percent shall be provided for use on minimum length track circuits. If the five percent setting is not sufficiently low for proper operation of certain track circuits, the Contractor shall provide one or more supplementary devices to lower the power level to the extent necessary for proper operation of the track circuit(s) involved. A common electronic code rate generator shall be provided to modulate both the train detection and speed command signals in a given track circuit.
- F. Transmitting coupling units shall be capable of transmitting all ATP speed commands and one train detection signal, and shall be capable of receiving one train detection signal.
- G. The coupling unit output shall be connected through an isolating transformer, if required, to the impedance bond located at wayside by twisted-pair, copper-wire cable of a suitable conductor size. Shielded cable shall not be used unless approved by the designated Resident Engineer. Refer to Section 16949 for cable data.
- H. The signal strength of the ATP transmitter shall be capable of driving the cab level of the longest bond-to-bond **track circuit or WMATA Mini-Loop or** four foot loop track **transmitters** to a maximum of 210 milliamps **rail current** (signal strength measured with the WMATA Cab Level Adjustment Test Fixture). The required cab level output for each track circuit shall be attainable at no more than 85 percent of the maximum output level of the transmitter.

## 2.02 RECEIVER

- A. The equipment receiving the train detection signal from the track coupling device shall produce a dc voltage of the required polarity to drive a biased neutral vital relay only when the received signal is within the specified range of the nominal frequency and input signal coding is detected. The frequency ranges at 3db down shall be as follows:
  - 1. F1: 2100 Hz  $\pm$  20 Hz
  - 2. F2: 2320 Hz  $\pm$  20 Hz
  - 3. F3: 2580 Hz  $\pm$  20 Hz
  - 4. F4: 2820 Hz  $\pm$  20 Hz
  - 5. F5: 3100 Hz  $\pm$  20 H
  - 6. F6: 3370 Hz  $\pm$  20 Hz
  - 7. F7: 3660 Hz  $\pm$  20 Hz

8. F8: 3900 Hz ± 20 Hz

- B. The frequency tolerances in the preceding paragraph necessitate a filter with a narrow bandwidth. The Contractor shall design the filter to minimize ringing (fill-in) between track frequency pulses. The Contractor shall also design the receiver detection circuitry to minimize the detrimental effect of the residual amount of the ringing that remains. The signal-to-noise ratio shall be greater than ten to one.
- C. The connection from the impedance bond or bridging receiver to the coupling unit of the receiving equipment shall be through an isolation transformer, if necessitated by equipment design.

### **2.03 CONFIGURATION**

- A. The standard ATP track module shall contain both train detection transmitting and receiving equipment and speed and door command transmitting equipment. These modules shall also include speed restriction plugs which shall use internal jumpers to cause reduced speed commands to be generated when the plug positions in the module are reversed. Test points and a toggle switch to cause the track relay to drop shall be mounted on the front of the ATP track modules in such a manner that they are not accessible without unsealing and removing the transparent front cover of the modules.
- B. The Contractor may provide "receive only" ATP modules to drive track relays upon receipt of train detection signals.
- C. The Contractor may provide ATP "slave" transmit-only modules for use in conjunction with standard ATP transmitter/receiver modules to transmit train detection and train command signals within interlockings.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. The Contractor shall install all ATP modules for use on this Contract in the TCR on equipment racks specified in Section 16971.
- B. The ATP modules shall be interconnected with associated AF track circuit equipment described elsewhere in these Specifications and as shown on the Contract Drawings.

### **3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. ATP Track Modules, Slave Modules and Receiver Modules will not be measured separately for partial payments, but will be measured as part of the racks on which they are mounted.

**END OF SECTION**

## SECTION 16954

### ATC - SWITCH-AND-LOCK MOVEMENTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of switch-and-lock movements at the locations indicated on the Contract Drawings.

##### 1.02 DESCRIPTION

- A. Each switch-and-lock movement shall be designed to perform the throwing, locking and point detection functions of the Track Switch Operating Layout, using separate rods for each function. See Section 16964.
- B. These switch-and-lock movements shall be electrically controlled and operated and shall consist of the following components:
  - 1. Motor
  - 2. Cranking Arrangement
  - 3. Clutch
  - 4. Mechanical Locking Mechanism
  - 5. Circuit Controller
  - 6. Point Detector
  - 7. Housing and Cover

##### 1.03 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16949 Signal Wire and Cable
  - 2. Section 16964 Track Switch Operating Layouts
  - 3. Section 16969 Snowmelter Layouts
  - 4. Section 16974 Locks & Keys
  - 5. Section 16980 ATC Tests, Inspections and Quality Assurance
  - 6. Section 16996 ATC Technical Appendix

##### 1.04 QUALITY ASSURANCE

- A. Test each switch-and-lock movement before shipping it to the job site. This factory testing shall be conducted in accordance with the Contractor's Factory Test Procedure for switch-and-lock movements as approved by the designated Resident Engineer.
- B. The Contractor shall inspect each switch-and-lock movement after it has been installed and correct any deficiencies noted. This inspection shall be conducted in conformance with the requirements of the Contractor's Installation Inspection Procedure as approved by the designated Resident Engineer.
- C. The final operational tests of the switch-and-lock movements shall be conducted as described in Section 16982, Preliminary and Interlocking Tests (Level A).

##### 1.05 SUBMITTALS

- A. The Contractor shall, within 90 days of receipt of Notice-to-Proceed, submit performance data and mechanical and electrical drawings for the switch-and-lock movements he proposes to

furnish under this Contract. The drawings shall include complete installation details and shall show how the hand crank is to be locked to the switch-and-lock movement. The Contractor shall obtain the designated Resident Engineer's written approval for the proposed switch-and-lock movements before proceeding with the manufacture or procurement of this equipment.

- B. The Contractor shall submit a Factory Test Procedure for the approved switch-and-lock movements. This procedure shall be in conformance with the requirements of Section 16980, Tests and Inspections.
- C. The Contractor shall submit an Installation Inspection Procedure for switch-and-lock movements. This procedure shall be in conformance with the requirements of Section 16980, ATC Tests and Inspections.
- D. The Contractor shall submit Factory Test Reports of switch-and-lock movements to the designated Resident Engineer prior to shipment of the movements.
- E. The Contractor shall submit for the Engineer's approval, five copies of manuals describing the installation, operation and maintenance of the approved switch-and-lock movements to be furnished under this Contract.
- F. The Contractor shall furnish a minimum of two copies of the approved installation, operation and maintenance manuals for each switch-and-lock movement provided under this Contract, but no fewer than 20 copies total.

#### **1.06 DELIVERY, STORAGE AND HANDLING**

- A. Prior to shipment, all unpainted metal parts of the switch-and-lock movements shall be given a thorough coating of a protective substance approved by the designated Resident Engineer in order to prevent corrosion. All unused threaded outlets shall be suitably plugged or capped.
- B. During storage and after installation, switch-and-lock movements shall be properly lubricated and maintained by the Contractor on a regular timed program until accepted by the Authority. The designated Resident Engineer will have the right to monitor the Contractor's compliance with this maintenance requirement from time to time as he deems necessary.
- C. The **two** hand cranks and a set of adjusting wrenches & **tools** for each switch-and-lock movement shall be delivered to the Authority at the time of Level A partial system acceptance of the interlocking involved.

### **PART 2 PRODUCTS**

#### **2.01 BASIC DESIGN CRITERIA**

- A. The switch-and-lock movements shall be designed for electric operation and shall not be equipped with a hand-throw mechanism. They shall however, be equipped to permit emergency manual operation by means of a hand crank. **Hand crank operation of the Switch-and-Lock Movement shall be so designed that it is operational with the friction clutch and/or the motor removed from the machine.**
- B. Insertion of the hand crank into the switch-and-lock movement **shall be prevented until, or** shall cause the opening of electrical contacts before the crank mechanically engages with the switch-throwing mechanism. The opening of these contacts shall disconnect the switch-and-lock movement motor and the switch repeater relays. **However, the opening of these cut-out contacts shall not open a repeater relay shunt circuit otherwise applied by the circuit**

controller of the Switch-and-Lock Movement. Once opened, these cut-out contacts shall latch in the open position until manually reset. Removal of the hand crank and closing of the hand crank cover shall not cause restoration of this latch.

- C. Switch-and-lock movement motors shall be suitable for repeated successful operation at their rated dc voltage, plus or minus eight percent without undue damage to their contacts which shall have a useful life in excess of 150,000 switch operations over two years.
- D. The cranking arrangement shall mechanically convert the rotational torque supplied by the motor or the hand crank into a longitudinal force to move the switch points.
- E. The clutch shall protect the motor from the mechanical shocks which may be encountered at end of stroke or during abnormal track switch operation such as obstructed points or rods. The friction clutch shall be adjustable to slip reliably and consistently within the range of 12 to 14 amperes of motor current. Once adjusted, the clutch shall not slip at motor currents below this range..
- F. The mechanical locking mechanism shall prevent point movement by vibration or otherwise after the points have reached the Normal or Reverse position and the switch-and-lock movement has been de-energized.
- G. The circuit controller shall indicate that the points are moved to and locked in the Normal or Reverse position and shall also control the connections to the motor.
- H. The circuit controller point detector shall provide an indication when mechanical locking is in effect that the points are in the Normal or Reverse position. The circuit controller point detector shall incorporate a latch-out feature that may be enabled or disabled by the user. When enabled, this latch-out feature shall prevent restoration of the point detector indications until a maintainer manually resets the latch-out whenever the points have been detected moving ¼ inch from the stock rail without first mechanically unlocking the Switch-and-Lock Movement (e.g. a trailed or forced switch point.) This feature shall be disabled at the time of commissioning and shall be easily enabled by WMATA without additional parts.
- I. The case shall serve as a mounting bed for the various other components of the switch-and-lock movement. The cover(s) shall protect these components from the environment. Each hinged cover on the machine shall have brass or stainless steel hinge pins. The case and cover(s) shall conform to Part 12.1.1 of the AREMA Communications & Signals Manual.
- J. Each switch-and-lock movement shall conform to the recommendations contained in Part 12.2.1 of the AREMA Signal Manual, where the recommendations of the AREMA Signal Manual do not conflict with other requirements established herein.
- K. All switch-and-lock movements supplied shall be identical unless otherwise specified. Switch-and-Lock Movements shall be of the type, Model M-3, as manufactured by Union Switch & Signal, Inc. of Pittsburgh, Pennsylvania, or approved equal.
- L. Each Switch-and-Lock Movement shall be permanently identified by a serial number that encodes the date of manufacture to the nearest month or week. The serial number shall be prominently displayed on the case of the Switch-and-Lock Movement near the motor.
- M. Removable covers or other parts of the Switch-and-Lock Movement, which appear to be nearly symmetrical but require a specific orientation for proper operation of the machine shall have mechanical keying or asymmetrical fastener pattern to prevent incorrect orientation

when being assembled.

- N. Slip-on electrical connections shall not be used in the Switch-and-Lock Movement.
- O. The motor circuit shall be terminated to an accessible single test-nut binding post or similar device designed for repeated ease of opening and closing of the circuit for periodic maintenance. An ammeter connected across the opened circuit shall be used to measure motor current for either direction of operation during WMATA's periodic testing.
- P. The hand crank operation of the machine shall be designed to avoid tight clearances of less than 3 inches between fixed equipment or structures and any part of the hand crank handle without modification to equipment or structures not furnished with the Switch-and-Lock Movement.
- Q. Electrical contact spring fingers of the circuit controller shall be operated by cam action. To prevent metal fatigue, each electrical contact spring finger, when moved from its at-rest position shall be displaced no more than 2 degrees of angular deflection per linear inch of spring finger length. All electrical contacts of the circuit controller shall wipe on make and break. Contacts that break motor current shall wipe a minimum of 1/32 inch on make and break.

## 2.02 OPERATING CHARACTERISTICS

- A. Each switch-and-lock movement shall be capable of repeated successful operation without damage at voltages from 90 to 150 volts dc at the machine. Reliability will be based upon operation at 90 to 130 volts dc at the machine.
- B. Switch-and-lock movement operating time shall be measured from the closure of a front contact on the switch operating relay (WR) to the closure of a front contact on the switch repeater relay (WPR) when the switch-and-lock movement is driving a load, the characteristics of which are shown in Part 12.2.5 of the AREMA **Communications & Signals** Manual.
- C. When the switch-and-lock movement operating voltage, as measured at the switch-and-lock movement, is between 90 volts and 130 volts, switch operating time shall be less than the time indicated by the SWITCH OPERATING TIME vs. VOLTAGE curve shown in the Technical Appendix of these Specifications.
- D. The operating voltage used to determine the limit on switch operating time shall be measured at the switch-and-lock movement while the switch is in transit, with the operating supply voltage being **110** volts dc nominal in the Train Control Room.
- E. Under manual operation, once the hand crank has been inserted, it shall take no longer than 20 seconds to hand crank a switch from the Normal locked position to the Reverse locked position, or vice versa.
- F. The hand crank shall be of sufficient size and appropriate configuration for ease of use, as approved by the designated Resident Engineer.
- G. **Motor control contacts of the circuit controller shall open the motor circuit, by opening two contacts (double-break) of the motor energy circuit at the completion of switch operation. However, they shall not remove motor current before completion of switch locking action unless sufficient kinetic energy is stored to complete the locking action.**

- H. When the Switch-and-Lock Movement is unlocked (e.g. lock dog is less than ½ inch engaged within the lock rod) the repeater relay circuit shall be shunted by the circuit controller and the motor control contacts of the circuit controller shall be closed to permit motor operation in either direction.

### 2.03 IDENTIFICATION

- A. All wire and cable terminals of the switch-and-lock movements shall be tagged or numbered to designate the terminals and contacts in conformance with the Contractor's wiring diagrams.
- B. A number corresponding to the number of its controlling pushbutton shall be securely fastened to the cover of each switch-and-lock movement. This number shall be not less than three inches high, made of cast metal, and painted white. Where two movements are to be repeated by one WP relay, the number of each switch-and-lock movement shall be supplemented by the letter "A" or "B," made as specified above, and centered directly under the number.

### 2.04 PAINTING

- A. Switch-and-lock movements shall be painted in accordance with the recommendations contained in Part 1.5.10 of the AREMA Communications & Signals Manual. The finish color shall be black, except as noted above.

### 2.05 SECURITY

- A. Provisions shall be made for the use of a padlock of the type specified in Section 16974 on each hinged or removable cover or special opening on the machine. This shall include, but not be limited to the following:
  1. A padlock to restrict entry to the inside of the switch-and-lock movement
  2. A padlock to restrict entry to the opening into which the hand crank is inserted to hand crank the movement
  3. A padlock to secure the hand crank to the movement in its storage position.

### 2.06 INTERNAL HEATERS

- A. Switch-and-lock movements shall be provided with internal heating devices to prevent condensation or frost accumulation on contacts and the motor armature. The Contractor shall provide a separate control switch on the power rack in the Train Control Room for all the internal switch-and-lock movement heating devices required at any given interlocking.

### 2.07 HAND CRANKS AND ADJUSTING WRENCHES & TOOLS

- A. Two hand cranks and one set of adjusting wrenches & tools shall be provided for each switch-and-lock movement furnished under this Contract.
  1. Hand cranks shall be equipped with swivel handles.
  2. Adjusting wrenches & tools shall include the minimum number of each tool required to perform all the adjusting and testing required during either initial installation and set-up or for maintenance of the switch-and-lock layout. Tools and gauges required to periodically verify conformance to 49CFR Part 236 FRA standards shall be included in this set.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

- A. The Contractor shall install switch-and-lock movements in accordance with the requirements of his own installation drawings, as previously approved by the designated Resident Engineer, and as shown on the Contract Drawings, with particular attention to maintaining specified clearances in all directions. The distances from centerline of track to centerline of switch-and-lock movement shall be maintained at 4 feet 9 inches as shown on the Contract Drawings unless otherwise authorized in writing by the designated Resident Engineer. **All fixed and moving parts of the functional Switch-and-Lock Layout outside the gage lines of the track (excluding the removable hand-crank handle) shall be at least ½ inch below the top of the running rail without cutting switch ties to a depth of more than 3¾ inches.**
- B. In areas of direct fixation trackwork, the Contractor shall weld four switch machine anchor bolts to the gauge plate extensions (furnished by others) for each switch-and-lock movement. Each anchor bolt shall be a 3/4 inch diameter, 3-1/2 inch long threaded stud (such as a Nelson stud, type CPL, or approved equal) with a yield strength of 50,000 PSI. The Contractor shall determine the proper locations on the gauge plate extensions for these anchor bolts. The welding procedure for the anchor bolts shall be in accordance with ANSI/AWS D1.1-98, Structural Welding Code - Steel. Details of this procedure shall be submitted to the designated Resident Engineer for approval prior to commencement of work. Attachment shall be made by resistance welding. As an option, the Contractor shall drill and chamfer the plate extensions to allow anchor bolts to be attached by downhand fillet welds on the bottom of the gauge plate extensions. Prior to beginning the work, two anchor bolts shall be installed in a piece of 3/4 inch thick A-36 steel plate using an approved method, and tested in accordance with the applicable paragraph(s) of ANSI/AWS D1.1-98. In addition, the two installed studs shall be torque tested by the Contractor in accordance with the applicable paragraph(s) of ANSI/AWS D1.1-98.
- C. Where, due to the height of the switch machine or some other cause, the standard gauge plate extensions (provided by others) cannot be used, it shall be the Contractor's responsibility to provide modified gauge plate extensions, of a design and material previously approved by the designated Resident Engineer, at no additional cost to the Authority. It shall also be the Contractor's responsibility to perform any additional work, e.g., chipping and grouting, which may be necessary to permit such special gauge plate extensions to be installed in a manner satisfactory to the designated Resident Engineer, all at no additional cost to the Authority. Where chipping is necessary, due to insufficient depth for normal installation of the switch operating layout, the Contractor shall also provide proper drainage for the switch-and-lock movement at no additional cost to the Authority.
- D. Further installation criteria and final adjustment shall be as described in Section 16964, Track Switch Operating Layouts.

### 3.02 MEASUREMENT FOR PARTIAL PAYMENTS

- A. Switch-and-lock movements will be measured for partial payments based upon the number of movements delivered, installed, and accepted.
- B. For measurement purposes, each switch-and-lock movement shall include the hand operating crank, the set of switch adjusting wrenches, and all required mounting hardware. It shall not include the padlocks supplied with the switch-and-lock movement. See Section 16974.

**END OF SECTION**

## SECTION 16955

### ATC - TRACK AND ALARM INDICATION PANELS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of Track and Alarm Indication Panels which shall be supplied in varying quantities (the quantity depends primarily upon the number of track circuits to be indicated) in each Train Control Room. The visual indications shall be implemented with Light Emitting Diode (LED) indicator units.

##### 1.02 DESCRIPTION

- A. These Track and Alarm Indication Panels shall accomplish the following functions:
1. Provide a suitably identified red LED indicator of track occupancy for each track circuit within the limits of the control room.
  2. Provide a suitably identified red LED indicator of track occupancy for the track circuit immediately adjacent to the limits of the control room in each direction on each track.
  3. Provide a pair of suitably identified LED indicators to show the direction of traffic for each track within the control limits of the TCR. At TCRs with interlockings, additional traffic direction indicator pairs shall be provided, one pair for each traffic block emanating from the interlocking. A white indicator shall indicate normal traffic direction, and a red indicator shall indicate reverse traffic direction.
  4. Provide a suitably identified red LED Blown Fuse indicator for each indicating fuse bus in the TCR.
  5. Provide a suitably identified red LED indicator for abnormal conditions for each individual device in the following categories:
    - a. Ground Detectors
    - b. Automatic Transfer Panel
  6. Where applicable, provide suitably identified red LED Non-Vital Interlocking Processor Problem indicator(s).
  7. Where applicable, provide a suitably identified red LED Snowmeter Problem indicator, and individual red LED Snowmelter Failure indicators for each snowmelter-equipped track switch. Where applicable, provide two suitably identified white LED VP On-Line indicators, and two suitably identified red LED VP Failure indicators for each local IVP System.
  8. Provide an audible alarm device and an associated control switch mounted on the front panel as described in Part 2 of this Section.
  9. Provide an output for the connection of an event recorder (local positive grounded energy-switched) at a "test plug coupler" (female receptacle) located on the front panel for each of the indications specified in paragraphs 1 through 8 above as well as a signal return (local negative grounded energy).
- B. All inputs to the Track and Alarm Indication Panels shall be taken from dry contacts provided specifically for them on the devices and circuits specified above. Where necessary, suitable relays shall be provided for this purpose.

##### 1.03 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
1. Section 16921 ATC Power Distribution Systems
  2. Section 16922 Lightning/Surge Protection and Grounding Systems
  3. Section 16928 Interlocking Vital Processor Systems

4. Section 16931 ATC Maintenance and Test Facilities
5. Section 16948 Plug Connectors
6. Section 16949 Signal Wire and Cable
7. Section 16952 D.C. Power Supplies
8. Section 16982 Preliminary and Interlocking Tests

#### **1.04 QUALITY ASSURANCE**

- A. The Contractor shall factory test each Track and Alarm Indication Panel in accordance with a test procedure previously approved by the Engineer, to ensure mechanical, electrical and operational conformance with the requirements of these Specifications. The Contractor shall record the results of these tests on the prescribed Factory Test Report forms for submittal to the Engineer. Only those panels for which Factory Test Reports have been approved shall be shipped to the job site.
- B. Inspect each Track and Alarm Indication Panel after it has been delivered to the job site. Only those panels which have sustained neither external or internal damage during shipment and handling shall be installed.
- C. The final operational test for the Track and Alarm Indication Panel shall be conducted, after the programming jumpers and the indicator designation cards (in their final typed form) have been installed, as part of the preliminary field testing of the location wherein the panel is installed. This test shall include verification of correct outputs at the "test plug coupler," correct indicator operation and correct audible alarm operation per selection.

#### **1.05 SUBMITTALS**

- A. Prior to purchase or fabrication of the Track and Alarm Indication Panels, the Contractor shall submit the following to the Engineer for approval:
  1. Mechanical and assembly drawings of the proposed panel and all components housed therein, including the internal arrangement plan and mounting hardware.
  2. Catalog cuts and complete performance data for the proposed arrangement plan and mounting hardware.
  3. Circuit drawings and wiring diagrams for all internal wiring of the proposed panels.
  4. Samples of all LED indicator units proposed for the panels.
  5. Factory Test Procedure for the proposed panels.
- B. Submit factory test reports for all Track and Alarm Indication Panels before shipping these panels to the job site.

### **PART 2 - PRODUCTS**

#### **2.01 BASIC PANEL REQUIREMENTS**

- A. The unit shall be constructed as a standard 19 inch rack panel of suitable height and 1/8 inch wall thickness. It shall be of dust-tight construction and shall have no ventilation holes in the top and bottom cover plates, unless the inside temperature reached in an ambient of 100 degrees F exceeds 150 degrees F. If ventilation is thus required, the dust-tight requirement will be waived, but only by written approval of the designated Resident Engineer. The front panel (faceplate) shall be as shown on the Contract Drawings, or shall be of an approved mosaic design.
- B. All indications, controls and the test plug coupler shall be front panel mounted. The program input plug couplers shall be mounted on the rear of the unit. An input plug coupler shall be used for external power and input wiring to the unit. This plug coupler shall be a male, flush

mounted receptacle, which shall mate with a female plug clamped to a flexible multiconductor cable as described in Section 16949, Signal Wire and Cable

- C. The indicators shall be Light Emitting Diodes (LEDs) types approved by the designated Resident Engineer. The LEDs shall be front panel, push-in type. Threaded retaining rings shall be used to secure the LEDs in their sockets. As an alternative, integral unit LED indicators may be used, mounted on a supporting mosaic grid. The indicators shall be provided in the colors previously specified, as approved by the designated Resident Engineer. One complete set of spare indicators shall be furnished with each panel. This indicator set shall be separately packaged and taped to the designated panel. LEDs shall be subject to type acceptance testing.
- D. A solid-state annunciator (mounted in a nominal one-inch hole) which emits a moderately loud, but not painful tone at approximately 1000-2000 Hz shall be provided in the front panel. It shall be controlled by a four-position, three-pole switch as shown on the Contract Drawings. The positions for the three-pole switch shall be labeled:
  - 1. OFF;
  - 2. SILENCE (annunciator only off);
  - 3. NORMAL (indicators, recorder, and annunciator operable), and;
  - 4. TEST (all indicators, all recorder outputs, and annunciator on).
- E. Two program jumper plug couplers shall be provided on the rear panel. They shall consist of female receptacles of 50 pins each. For each indication on the front panel there shall be an output at these plug couplers which may be connected to a mating plug with a jumper (to be provided) to either of two adjacent or nearby pins. The first of these pins shall connect the indicator energy (through appropriate circuitry) to the audible alarm bus so that when the indicator is illuminated by a controlling contact in the control room, an alarm will sound. The second pin shall be connected to the same alarm bus except that it shall include in its circuitry an inverter which allows the monitoring of a normally energized contact in the control room and sounds the alarm when this contact opens and the associated indicator is extinguished. These jumpers shall be movable by use of a simple tool such as a contact extractor which shall be supplied with each panel.
- F. Each Track and Alarm Indication Panel shall be complete in all respects and shall provide operational characteristics as described in these Specifications.
- G. Solid state equipment used in the circuitry of the unit shall be designed to utilize semiconductors which are either inherently self-protecting from transients or are protected by devices approved by the designated Resident Engineer. Some conditions which might present problems are the back-EMF generated by event recorder pen motors or casual transients inductively coupled to the power supply or input leads of the unit.
- H. Fifteen pins on the test plug coupler shall be wired to the input plug coupler. When two or more units are installed in a location, these pins shall be connected in parallel at the input plug coupler terminals to allow the recorder outputs of one unit to be jumpered to another unit where the recorder is connected.
- I. The front panel shall be arranged in the manner shown on the Contract Drawings or in an alternate manner previously approved by the Engineer.
- J. The unit shall be circuited as indicated on the Contract Drawings or in an alternate manner previously approved by the designated Resident Engineer which provides equivalent operation as specified herein.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. The Track and Alarm Indication Panels shall be installed at eye level plus or minus one foot as approved by the designated Resident Engineer.
- B. The panels shall be connected to contacts of relays which reflect the operations specified herein through the plug couplers and cable specified herein.

### **3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Track and Alarm Indication Panels will be measured for partial payments based upon the number of such required panels delivered, installed and accepted.
- B. The following factors will be considered when measuring Track and Alarm Indication Panels for partial payments:
  - 1. Delivery of the specified Track and Alarm Indication Panels and all accessory items by the Contractor and approval of the applicable factory test reports by the designated Resident Engineer.
  - 2. Proper installation of the Track and Alarm Indication Panels by the Contractor.
  - 3. Approval of the installation and operation of the panels by the designated Resident Engineer.

**END OF SECTION**

**SECTION 16956**

**ATC - INTERLOCKING CONTROL PANEL**

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

- A. This Section specifies the furnishing and installation of rack-mounted or wall-mounted Interlocking Control Panels (I.C.P.s) and their mounting enclosures in Train Control Rooms which have one or more interlockings within their control limits, and for the furnishing and installation of table-mounted Interlocking Control Panels in Dispatcher's Rooms at terminal and temporary terminal locations. All of these panels shall be designed to permit convenient local monitoring of track occupancy, switch position, signal aspects, and traffic direction established for all tracks in the vicinity of the interlocking, and for local auxiliary switch control and local manual "entrance-exit" control of route selection through the interlockings. These panels shall also include facilities for controlling and monitoring terminal operation and/or snowmelter layouts, where applicable.
- B. The Contractor shall design each of the Interlocking Control Panels in accordance with the style established by the Contract Drawings. The appearance of the face of the Interlocking Control Panel shall be aesthetically pleasing.
- C. Interlocking Control Panels for TCRs at end-of-route terminal locations shall also include facilities for the local control and indication of Terminal Mode Selection, and, where applicable, for hold-out signals. In addition to the Interlocking Control Panel provided in the terminal TCR, the Contractor shall provide one or more table-mounted, plug connected Interlocking Control Panel Assemblies in the Dispatcher's Room at each terminal location. These panels shall also include facilities for controlling and monitoring the NEXT TRAIN Signs, where applicable.
- D. **(Where a Terminal Interlocking is included in the Project, include specific requirements for the I.C.P.s to be provided for that location.)** Example: At the (Station Name) Terminal location, the Contractor shall include facilities in both of the Interlocking Control Panels (TCR and Dispatcher's Room) to control and monitor the terminal interlocking, the automatic terminal mode selection/operation of the terminal interlocking, and the operation of (other possible interlockings in the area). The I.C.P.s. for the Train Control Room and the Dispatcher's Room shall both be equipped to take emergency control of these interlockings, with the Local I.C.P. in the TCR having priority, all as specified herein and in Section 16918, and on the Contract Drawings. The I.C.P. in the Dispatcher's Room shall control and monitor the NEXT TRAIN Signs for the **(terminal name)** Station at all times.
- E. **(Where a Tie-In location Interlocking is included in the Project, include requirements for the revision or replacement of the I.C.P. at that previously existing location.)**Example: The Contractor shall, at the appropriate time, provide a complete new Interlocking Control Panel, or a new face plate and revised/updated wiring for the existing I.C.P. in the Train Control Room at the (Name) Tie-In location, in a manner previously approved by the designated Resident Engineer.
- F. (Include a tabulation of the Type, Capability, and Location for all new I.C.P.s to be provided as part of the Project Contract.Example: The Contractor shall provide Interlocking Control Panels for the following new interlocking locations:

<u>TYPE</u>	<u>CONTROL CAPABILITY</u>	<u>PANEL LOCATION</u>
Wall	Far End Station	Far End Station

	Terminal Crossovers with Automatic Terminal Mode Operation, and the Half Pocket Storage Track Interlocking. Emergency control of same area.	Train Control Room
Table Top (2)	Far End Station Terminal Crossovers with Automatic Terminal Mode Operation, "NEXT TRAIN" Signs, and (2 <sup>nd</sup> Cabinet); Far End Half Pocket Storage Track Interlocking. Emergency control of same area.	Far End Station Dispatcher's Room
Rack	Hooterville Emergency Crossover Interlocking. Emergency Control of same.	Hooterville Station Train Control Room

**1.02 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
1. Section 16913 ATC Block Design
  2. Section 16915 Basic ATC Equipment Requirements
  3. Section 16916 Basic ATC Circuit Requirements
  4. Section 16917 Basic Interlocking Requirements
  5. Section 16918 Special ATC Requirements for Specific Locations
  6. Section 16923 TC Maintenance Telephone System
  7. Section 16924 Non-Vital AT0 & ATS Processor Systems
  8. Section 16925 Data Transmission System (DTS)
  9. Section 16928 Interlocking Vital Processor Systems (if applicable)
  10. Section 16948 Plug Connectors
  11. Section 16949 Signal Wire and Cable
  12. Section 16969 Snowmelter Layouts
  13. Section 16971 Racks and Cable Trays
  14. Section 16974 Locks and Keys
  15. Section 16980 ATC Tests, Inspections and Quality Assurance

**1.03 QUALITY ASSURANCE**

- A. The Contractor shall test each Interlocking Control Panel Assembly prior to shipment. This test shall conform to the Contractor's Factory Test Procedure as approved by the designated Resident Engineer. The results shall be recorded on the approved Factory Test Report Form.
- B. The Contractor shall inspect each Interlocking Control Panel Assembly as finally installed in the field. This inspection shall conform to the Contractor's Installation Inspection Procedure as approved by the designated Resident Engineer.
- C. The final operating tests to determine the acceptability of each Interlocking Control Panel Assembly shall be performed as described in Section 16980, and in the Sections describing the specific interlockings involved.

**1.04 SUBMITTALS**

- A. The Contractor shall submit the following Interlocking Control Panel drawings for approval within 120 days of NTP. These I.C.P. arrangement plans and assembly drawings shall include keyed parts lists.
  - 1. Drawings required for each individual Interlocking Control Panel Assembly:
    - a. Drawings showing the arrangement of the engraved track diagram, symbols and lettering, and the location of all the required control and indication hardware to be mounted thereon.
    - b. Complete circuit drawings for all the control and indication functions to be performed by each Interlocking Control Panel Assembly.
    - c. Complete control, indication and common-return energy wiring diagrams for each Interlocking Control Panel Assembly.
  - 2. Drawings common to all Interlocking Control Panel Assemblies:
    - a. Drawings showing the details of all the various items of control and indication hardware required for the Interlocking Control Panels and the method of mounting these devices on the panel or in the enclosure.
    - b. Drawings showing the details of material and construction for the panel enclosures and the location and method of mounting plug connectors in the enclosures.
    - c. Drawings showing the details for mounting the enclosures in a rack or on the wall.
    - d. Drawings showing the methods of harnessing and supporting the control panel wiring.
- B. The Contractor shall not proceed with fabrication or procurement of any Interlocking Control Panel Assembly until he has obtained the designated Resident Engineer's approval of all the drawings applicable to that particular assembly.
- C. The Contractor shall submit a Factory Test Procedure for Interlocking Control Panel Assemblies. This test procedure shall be in conformance with the requirements specified in Section 16980, ATC Tests, Inspections and Quality Assurance.
- D. The Contractor shall submit an Installation Inspection Procedure for Interlocking Control Panel Assemblies. This inspection procedure shall be in conformance with the requirements specified in Section 16980, ATC Tests, Inspections and Quality Assurance.
- E. The Contractor shall submit Factory Test Reports as required by his approved Factory Test Procedure. These reports shall be submitted to the designated Resident Engineer for approval at least two weeks prior to shipment of the panels from the point of fabrication.
- F. The Contractor shall submit a Field Inspection Report for each new Interlocking Control Panel installed.

## **1.05 DELIVERY, STORAGE AND HANDLING**

- A. The Contractor shall take whatever measures may be necessary to protect Interlocking Control Panels from damage or marring during shipment, storage, installation, and testing. Panels which are marred or otherwise damaged prior to acceptance by the Authority shall be replaced by the Contractor at no additional cost to the Authority.

## **PART 2 - PRODUCTS**

### **2.01 BASIC PANEL REQUIREMENTS**

- A. Basic Controls and Indications

1. Every new Interlocking Control Panel Assembly shall have the following control and indication hardware and all wiring and logic to support the applicable function:
  - a. A MASTER LEVER key switch
  - b. A TRANSFER pushbutton (SR)
  - c. An EMERGENCY RELEASE pushbutton (sealable SR)
  - d. A Single stroke bell
  - e. An INDICATION TEST pushbutton (SR)
  - f. LED indicator units for LOCAL (W) and CENTRAL (G) Control indications
  - g. A YIELD TO CENTRAL (A) indicator LED unit
  - h. ON and OFF pushbuttons (SR) to control the PANEL LIGHTS
  - i. A SWITCH POSITION pushbutton (SR)
  - j. AUXILIARY SWITCH CONTROL pushbuttons (PPT) and switch lock indicator (R) LED units
  - k. Pushbuttons (PPT) for route entrance/exit signals, and turnback signals
  - l. LED indicator units for signals (R/W) and signal fleeting (G/G) indications
  - m. LED indicator units (R/W) for "available route exit" points
  - n. LED indicator units (R/W) for switch position indications (in track diagram)
  - o. LED indicator units (R/W) for route locked/track occupancy indications
  - p. LED indicator units (R) for track occupancy only indications
  - q. LED indicator units (W) for "traffic" indications
  
- B. Special Controls and Indications (where applicable)
  1. Additional control and indication hardware which may be required for certain Interlocking Control Panels shall be as follows:
    - a. SNOWMELTER ON and OFF pushbuttons (SR), and SNOWMELTER ON (R), and SNOWMELTER
    - b. FAILURE (A) LED indicator units
    - c. TERMINAL MODE pushbuttons (SR) and LED (W) indicator units
    - d. AUTOMATIC SIGNAL OPERATION pushbuttons (PPT) and LED indicator units (W)
    - e. LED indicator units (R) for Signal LOCKOUT
    - f. LED indicator units (A or W) for DISPATCHER control
    - g. LED Indicator units (W) for the NEXT TRAIN destination stored in the Train Destination Storage Registers
    - h. CLEAR REGISTER pushbuttons (SR)
    - i. Special control function pushbuttons and special indication function LED units as applicable, as specified in Section 16918, and as shown on the Contract Drawings.
  
- C. Panel Construction and Arrangement
  1. All Interlocking Control Panel face plates shall be constructed of black/white/black laminated phenolic at least 1/4 inch thick, supported at suitable intervals. As an alternative, the face plates shall be composed of an assembly of small, individually engraved, 1/8-inch-thick black/white/black phenolic plates, supported on a three dimensional metal grid carrier structure, which shall also support the alternative control and indication hardware as further specified herein. The engraved phenolic face plates shall be as shown on the Contract Drawings and as manufactured by Mauell Corporation, Dillsburg, PA, or approved equal.
  2. Each panel face plate shall be engraved with a track diagram of the interlocking and its approaches and with symbols for the interlocking signals and passenger station platforms. The track diagram for each panel shall be oriented with track 2 located above track 1. An arrow pointing in the relative direction of Metro Center Station (or Gallery Place Station for the "E", "F" and "J" Routes), and the word "INBOUND" shall be engraved at the top of each panel face plate above the location code and the name of the location.
  3. Lettering shall be engraved into the white core of the phenolic to identify the name

and number of the interlocking, switch numbers, signal numbers, track circuit numbers, the functions of the various controls and indications included, and all other information necessary for effective use of the control panel. See the Contract Drawings.

- D. Control and Indication Requirements
1. Pushbuttons for route entrance and exit points (wayside signal locations), and turnback "signals", shall be located in the track diagram at points representing the location of wayside signals and turnback-point signs.
  2. Two "PANEL LIGHTS" pushbuttons, one labeled "ON", and the other labeled "OFF", shall be provided on the lower portion of each Interlocking Control Panel to control the panel indication lights.
  3. An INDICATION TEST pushbutton shall be located near the PANEL LIGHTS pushbuttons to initiate a brief, computer controlled energization of all LED indicators on the applicable panel(s).
  4. TRANSFER, AUXILIARY SWITCH OPERATION, and EMERGENCY RELEASE pushbuttons, the MASTER LEVER key switch, and, where applicable, SNOWMELTER (ON-OFF) pushbuttons and the NEXT TRAIN SIGN control switch, shall be located on the control panel below the track plan unless otherwise indicated. For terminal locations, TERMINAL MODE pushbuttons and indicators, AUTOMATIC SIGNAL OPERATION pushbuttons, and signal LOCKOUT indicators shall be located above the track diagram unless otherwise indicated. All these controls and indications shall be identified by suitable panel engraving as shown on the Contract Drawings.
  5. Track circuit occupancy indications shall, as a minimum, be provided on the Interlocking Control Panel for all track circuits within Approach Locking Limits as well as for all track circuits within interlocking limits and all track circuits within the limits established by turnback points. In addition, track circuit occupancy indications shall be provided for each Advance Approach section in approach to the interlocking and for at least one track circuit beyond each turnback point.
  6. Track circuit indications shall be provided by LED line-of-light bar indicators mounted in the track diagram. These units shall be mounted close to one another so that, when illuminated, they will give a nearly continuous line-of-light through the track circuit they represent. At least three LED line-of-light indicators shall be provided for each switch. One indicator shall be used to indicate the Normal, and one the Reverse position of the switch, while the third indicator shall be located in the diverging approach to the switch.
  7. Signal indications shall be provided by round spotlight LED indicator units located in each interlocking signal symbol and adjacent to each turnback point pushbutton. Another round spotlight LED indicator shall be located in the immediate vicinity of each signal or turnback point light to indicate fleeting of the associated signal.
  8. Arrow-shaped LED traffic indicators shall be located adjacent to their associated track line.
  9. Round spotlight LED indicators shall be provided for other indications, such as switch locked, snowmelter control, snowmelter failure, signal lockout, and stored route destinations.
  10. The shapes for the respective LED indicator lights shall be as shown on the Contract Drawings. The colors for all LED indicator lights shall be as close as possible to the colors indicated on the Contract Drawings, as approved by the designated Resident Engineer prior to installation.
  11. The Contractor shall use the Contract Drawings as a guide for the arrangement of the Interlocking Control Panels. Each panel shall contain all of the equipment required to provide the functions specified.

## 2.02 CONTROL HARDWARE

- A. Basic Types
  - 1. Four basic types of control devices shall be used on the Interlocking Control Panels:
    - a. Key switches
    - b. Pushbuttons (push/pull/turn type) (PPT)
    - c. Pushbuttons (spring-return type) (SR)
    - d. Rotary switches
- B. Key Switch
  - 1. One two-position, key operated, electrical switch shall be mounted on each Interlocking Control Panel to serve as a MASTER LEVER to activate and deactivate the panel. This electrical switch shall be as specified in Section 16974, Locks and Keys.
- C. Pushbuttons
  - 1. Pushbuttons used for AUXILIARY SWITCH OPERATION, route entrance and exit designation (signals), turnback signal control and AUTOMATIC SIGNAL OPERATION shall be of the push-pull, turn-right, turn-left, center-return type (PPT). Simple spring-return (SR) pushbuttons of uniform contact arrangement shall be used for the remaining control functions specified.
  - 2. The external appearance of all the various pushbuttons shall be identical except for the color of the discs attached to their operating knobs. The colors of the identifying discs shall be as indicated on the Contract Drawings. The knobs of pushbuttons shall be shaped to facilitate rotary manipulation.
  - 3. A male plug connector shall be an integral part of each pushbutton assembly. All contacts on each type of pushbutton shall be wired or directly connected to this plug connector. Electrical connections between the pushbutton and other equipment shall be made via a female plug connector. Each pushbutton contact assembly shall be protected by a dust cover. The pushbutton assembly and its cover shall be made of noncombustible materials.
- D. Rotary Switches
  - 1. A three-position rotary switch shall be provided to control the NEXT TRAIN signs at certain terminal locations. The arc between successive position detents shall be 90 degrees. The control knob on the switch shall have an engraved arrow indicator.
- E. Alternative Control Hardware
  - 1. Specialized multi-function control switches shall be mounted securely in the grid carrier.
  - 2. Each control switch shall be mounted individually through the use of a rear mounting plate, front mounting disc and threaded bushing nut.
  - 3. When assembled, a disc and nut shall clamp the switch body (with mounted rear plate) to the rear plane of the grid carrier in an indexed position.
  - 4. Each switch bushing nut shall be tightened to 20 foot pounds of torque in order to mount the switch in the grid carrier.
  - 5. The switch shall be able to be mounted in any open unit in the grid carrier.
  - 6. Switches shall be able to be mounted in adjacent grid openings without interference from other devices.
  - 7. The shaft and bushing when installed shall protrude through the face of the phenolic surface, having sufficient clearance to use a standard blocking pin and mount the operator knob.
  - 8. This alternative control hardware shall be as manufactured by Mauell Corporation, Dillsburg, PA, or approved equal.

## 2.03 INDICATION HARDWARE

- A. Light Unit Indicators
1. All illuminated indications on the Interlocking Control Panels shall be provided by means of identical individual unit, dual-LED type indicators. These indicators shall have the capability to produce two different colored indications where necessary. The indications shall be produced by means of LEDs and colored filters, or by means of appropriately colored LEDs without filters. In either case, the variously colored indications produced shall be of approximately the same intensity.
  2. The LEDs used shall be of the low-voltage, low-wattage, long-life type. LEDs shall be replaceable from the rear of the panel only. Replacement of an individual LED shall require the loosening of no more than two screws. LEDs shall be SP940112-R (red), -A (amber or, with lens, white), or -G (green), as applicable, as manufactured by Data Display products of E1 Segundo, California, or approved equal.
  3. Indicator housings shall be made of a material which is suited to housing LEDs of the rated wattage and which will not exhibit signs of overheating (discoloration or melting) after an extended period of time. The LED housings shall be so designed and mounted that LEDs may be replaced without loosening or disturbing other parts of the indicator or adjacent equipment on the panel. LED replacement shall not require the use of special extractor tools.
  4. Shaped, translucent, non-colored panel inserts shall be provided between the indicators and the panel face. Individual shapes shall be provided for various types of indications as shown on the Contract Drawings. The exposed face of the panel inserts shall be flush with the front of the panel with no space between the edges of the inserts and the cutouts provided for them in the panel.
- B. Bell
1. A 28 volt, single-stroke bell shall be mounted within the panel enclosure and wired to serve as an annunciator for the YIELD TO CENTRAL indicator.
- C. Alternative Indication Hardware
1. All status indications shall be illuminated by discrete solid state high intensity light emitting diodes (LEDs) mounted in special LED holder units.
  2. The LEDs, voltage dropping resistors, diodes, jumpers and connectors shall be mounted to a LED holder designed to snap into any opening of the grid carrier system.
  3. The discrete LED devices shall be directly connected (no plug-in sockets) to the electronic components which provide the proper voltage and current for each LED.
  4. LED holders shall be non-conductive, held firmly in place without any separate mounting hardware (i.e., clips, screws, springs) and shall be easily removable without requiring the use of any tools.
  5. Each unit shall have a 3x3 matrix of mounting holes which allows a 5mm discrete LED to be mounted in any of nine positions in a 24mm square.
  6. The LEDs shall be rated for 100,000 life hours and shall be available in colors of red, green, yellow and white (light yellow).
  7. The LEDs shall have a maximum current consumption of 50 milliamps at 24 VDC.
  8. The LEDs, when installed in the panel, shall not protrude above the phenolic surface.
  9. All track occupancy and "traffic" LEDs shall be mounted behind shaped, water clear lenses.
  10. The alternative indication hardware shall be as manufactured by Mauell Corporation, Dillsburg, PA, or approved equal.

## 2.04 MISCELLANEOUS HARDWARE

- A. One TC Maintenance Telephone Jack, as specified in Section 16923, shall be mounted in one end of the enclosure for each wall-mounted and table-mounted Interlocking Control Panel enclosure. This jack shall be so located that it shall be easily accessible by any person

operating the panel.

- B. The back or end panel of each table-mounted Interlocking Control Panel enclosure shall be equipped with one or more plug couplers to interface the internal wiring with a plug-coupled cable from the Train Control Room.
- C. Grid Carrier Requirements for Alternative Hardware
  - 1. The grid carrier system shall consist of stamped steel shapes assembled using grid screws to form an assembly of incremental units, each 24mm square. When assembled, the grid carrier system shall be rigid, providing a three-dimensional module for mounting the 1/8 inch engraved phenolic panel faceplate, and also providing mounting and support for special control and indication devices.
  - 2. Components of the grid carrier shall be as follows:
    - a. Cross Sections
    - b. "T" Sections
    - c. Corner Sections
    - d. Grid Standoffs
    - e. Grid Screws
    - f. Grid Spacers
  - 3. Cross, "T," and corner sections shall be 1.5mm thick fabricated from cold rolled steel, electrogalvanized zinc plated with a bi-chromate zinc coating according to ASTM Specification B633-85.
  - 4. Grid screws shall be fabricated from cold rolled steel round stock with a tensile strength of 470 to 720 N/mm<sup>2</sup>, and shall be electroplated with a bi-chromate plating according to ASTM Specification B633-85.
  - 5. Grid spacers and standoffs shall be fabricated from MS-58 Brass alloy with a tensile strength of 390 to 670 N/mm<sup>2</sup>.
  - 6. The finished grid assembly shall be mounted in a frame which is part of the panel cabinet. The frame shall be finished in the manufacturer's standard finish and shall provide strength and support to the outer perimeter of the phenolic faceplate.
  - 7. The grid carrier system shall be as manufactured by Mauell Corporation, Dillsburg, PA, or approved equal.

## 2.05 INTERLOCKING CONTROL PANEL ENCLOSURES

- A. Basic Construction
  - 1. Interlocking Control Panel Enclosures shall be of dust-tight design and rigid metal construction.
  - 2. The enclosures for Interlocking Control Panels to be mounted on racks or tables shall have a removable or hinged metal back panel.
  - 3. The enclosures for wall mounted Interlocking Control Panels shall include a metal angle perimeter frame to support and stiffen each individual phenolic panel making up the total display. Each of these support frames shall be hinged continuously along the bottom edge. The front panel(s) shall be prevented from lowering beyond a horizontal position by folding brackets attached to the inside of the enclosure. The top corners of each wall mounted panel shall be equipped with captive thumb screws or other approved devices to secure the panel(s) at the top edge of the enclosure.
- B. Locking
  - 1. A key-operated cabinet lock shall be mounted on each wall-mounted or table-top I.C.P. in such a manner that access to the interior of each Interlocking Control Panel enclosure can be achieved only after the lock has been unlocked. The lock shall be as specified in Section 16974.
- C. Wiring

1. Plug connectors of the solderless crimp type shall be mounted in the back or sides of the enclosure to permit connecting rack wiring to the panel mounted electrical equipment. Plug connectors shall be as specified in Section 16948. Wiring from the pushbuttons, indicators and other equipment mounted on the control panel shall be terminated on the internal portions of the plug connector blocks. Wiring shall be harnessed in such a manner that it does not bind or interfere with the opening or closing of the access panel or interfere with the replacement of pushbuttons, lamps or other panel components. The Contractor shall use single conductor, 19 strand wire, as specified in Section 16949, no smaller than No. 22 AWG, for all internal panel wiring other than telephone jacks. The TC Maintenance Telephone jacks installed in wall-mounted and table-mounted panel enclosures shall be wired as specified in Section 16923.
- D. Finish
1. The finish for Interlocking Control Panel Enclosures shall be a non-chipping, hard gloss gray enamel.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION**

- A. The I.C.P.s in TCRs shall be located where their faceplate can be seen by technicians working on the Remote Terminal Unit. Where practicable, the I.C.P.s shall be mounted in geographical alignment with the trackage they control.
- B. Small Interlocking Control Panel enclosures for Train Control Rooms shall be mounted in relay racks. The location of the rack selected and the location of the panel enclosure in the rack shall permit convenient use of the control panel by an operator standing in front of it.
- C. Interlocking Control Panel enclosures too large for rack mounting shall be mounted on a wall of the TCR in a position permitting convenient use of the panel without interfering with other equipment or access to the room.
- D. Table Top Interlocking Control Panel enclosures (for use primarily in Dispatcher's Rooms at terminal locations) shall support the control panel at an angle of 75 degrees from horizontal when standing on top of a table or desk.

#### **3.02 OPERATION**

- A. The Interlocking Control Panel indications and controls shall operate as specified herein and as indicated by the circuitry shown on the Contract Drawings and described in Section 16916, Basic ATC Circuit Requirements. It shall not be necessary for the MASTER LEVER KEY Switch to be turned on in order to have the Panel Lights turned on, or to test the visual indicators, or to check switch position.
- B. Indications
  1. The following indications, as applicable, shall occur whether the Panel Lights are turned on or not:
    - a. When pushed, the SWITCH POSITION pushbutton shall cause line-of-light track indicators associated with all unoccupied switches or crossovers shown on the panel to become illuminated in such a way that the position of the switches or crossovers is indicated.
    - b. The SNOWMELTER ON indicator light shall display a steady red when all applicable snowmelters are on in correspondence with a control request. The SNOWMELTER ON indicator shall display a flashing red when

- snowmelters are not all on in correspondence with a control request. When this occurs, one or more SNOWMELTER FAILURE indicators (located adjacent to the individual switches on the track panel) should illuminate to indicate which snowmelter layout is not functioning properly.
- c. When pushed and held in, the INDICATION TEST pushbutton shall cause the interlocking processor to attempt to alternately energize for 2-second intervals:
    - 1) One of the green LEDs in each dual-green fleeting indicator, together with all "white" LEDs on the I.C.P. and;
    - 2) The other green LED in each dual-green fleeting indicator, together with all other ("non-white") colored LEDs on the I.C.P.
2. The following indications shall appear on the panel only when the Panel Lights are turned on:
- a. The green CENTRAL indicator shall be illuminated when Central has control of the interlocking.
  - b. The white LOCAL indicator (and the amber TCR indicator on the I.C.P. in the Dispatcher's Room at terminal locations) shall be illuminated when the Interlocking Control Panel in the TCR has control of the interlocking.
  - c. At terminal locations, the white DISPATCHER indicator on the Dispatcher's Interlocking Control Panel (and the amber DISPATCHER indicator on the I.C.P. in the TCR) shall be illuminated when the Dispatcher's I.C.P. has control of the interlocking.
  - d. When a route entrance is requested, the line-of-light units at all available-exit buttons shall be illuminated white. The illuminated units shall be the ones adjacent to the exit buttons in the direction toward the originating entrance button. When an available-exit point is selected, the line-of-light indicator for that exit shall remain illuminated white and any other available-exit indicators illuminated by the entrance request shall be extinguished.
  - e. The signal indicator adjacent to an entrance/ exit pushbutton shall be illuminated red after a route has been requested at that entrance point, but before the signal has cleared. It shall also be illuminated red after the signal has been set to STOP, but while Approach Locking or Time Locking is still in effect. This indicator shall be illuminated white whenever the associated signal is CLEAR.
  - f. Fleeted signal indicators shall be illuminated green when their associated signals are fleeted.
  - g. The line-of-light indicator units located in the track diagram shall be illuminated red whenever their associated track circuits are occupied. The line-of-light indicators representing tracks located within interlocking limits shall also be capable of producing a white indication. Whenever an entrance/exit route between two opposing interlocking signals is established, but not occupied, the line-of-light indicators for the tracks between those signals shall be illuminated white. When such a route is canceled without being occupied, these units shall remain illuminated white until Approach Locking or Time Locking is released. When the positions of one or more switches (or crossovers) of a requested route are out of correspondence with the called positions, the indicator units representing the called positions of the out-of-correspondence switches shall display flashing red indications as long as the switches remain out of correspondence. When the positions of switches (or crossovers) are in correspondence with the called positions, these same indicator units shall be illuminated white. These flashing red and steady white indications shall be displayed whether the switch call is originated by the Route Selection circuits or by the AUXILIARY SWITCH OPERATION buttons.
  - h. The arrow-shaped traffic indicators shall be illuminated white pointing in the direction of traffic only when the applicable traffic is established and locked.

- i. The round spotlight indicator adjacent to an AUTO SIGNAL OPERATION button shall be illuminated white when automatic route initiation is enabled for that signal.
- j. Signal LOCKOUT indicators for certain signals shall be illuminated red when a route which prevents any other route from being initiated through the area governed by these signals, has been lined and locked.
- k. Each appropriate switch lock indicator, located below the AUXILIARY SWITCH OPERATION pushbuttons, shall be illuminated red whenever its respective switch or crossover is locked.
- l. At terminal locations, the appropriate TERMINAL MODE indicator shall be illuminated white to indicate the terminal mode currently selected.
- m. At terminal stations located on tail tracks, the appropriate Next Train Sign TRACK indicator on the DISPATCHER'S CONTROL PANEL shall be illuminated white to indicate which track is currently designated to have the next revenue train departure.
- n. Where applicable, the appropriate indicator in a NEXT TRAIN Destination Register shall be illuminated white when a train is approaching its respective diverging route signal.
- o. Where applicable, PLATFORM TRACK LOCKOUT indicators shall be illuminated red when a terminal station platform track is not available as a destination for an outbound route due to the establishment of an opposing inbound route from a storage track to the applicable platform track.

C. Control Transfer

- 1. To transfer interlocking control to LOCAL (or to DISPATCHER in the case of a Dispatcher's (I.C.P.) in the normal manner, it is first necessary to turn the (appropriate) MASTER LEVER Key Switch clockwise. The TRANSFER button on the (applicable) Interlocking Control Panel shall then be pressed and held in. This action shall transmit the REQUEST LOCAL CONTROL indication to Central. When Central approves the transfer, it will transmit a TRANSFER TO LOCAL CONTROL control back to the interlocking. When the TRANSFER button is still being pressed at the time this control is received, control shall be transferred to LOCAL (or to DISPATCHER, as applicable). When the TRANSFER button is not being pressed at the time this control is received, no transfer shall take place. When the MASTERLEVER Key Switch for a location which is in LOCAL control is returned to the position designated to deactivate the local I.C.P., control shall automatically transfer back to Central
- 2. When a location is in Local Control and Central desires transfer of control to CENTRAL, Central will transmit a REQUEST CENTRAL CONTROL control to the location currently in control. With the MASTER LEVER Key Switch in the position designated to activate the Interlocking Control Panel, the single-stroke bell on the local panel shall sound and the YIELD TO CENTRAL indication on the control panel shall be illuminated to show that a request to transfer control to CENTRAL has been received. When the MASTER LEVER Key Switch on the applicable Interlocking Control Panel is returned to the position designated to deactivate the panel, control shall automatically be transferred to CENTRAL.
- 3. The EMERGENCY RELEASE pushbutton(s) on an Interlocking Control Panel shall be sealed. When the seal is broken and the button is pushed, control of the applicable interlocking shall be immediately transferred from CENTRAL to the requesting I.C.P. Restoration of control to CENTRAL shall be accomplished by the means described above.
- 4. Operation of the TRANSFER and EMERGENCY RELEASE pushbuttons shall be effective only if the applicable MASTER LEVER Key Switch is in the position designated to activate the Interlocking Control Panel.
- 5. The LOCAL CONTROL indication shall be transmitted from the interlocking to Central Control when local control of the interlocking is in effect; the CENTRAL

CONTROL indication shall be transmitted when local control of the interlocking is not in effect.

6. The same indications which appear on the Interlocking Control Panel shall continue to be transmitted to Central Control when control has been transferred to a local Interlocking Control Panel.
7. ***(Include all special, site-specific requirements for I.C.P. operation.)*****Example:** At the (***Far End Station***) TCR I.C.P. (and the Dispatcher's Room I.C.P.), the Control Transfer specified in paragraphs 1 through 6 above shall apply to control of both the Terminal Interlocking, and the Pocket/Storage Track Interlocking.

D. Route Initiation and Auxiliary Switch Control

1. Operation of the local manual controls described below shall be effective only if the MASTER LEVER Key Switch on the Interlocking Control Panel is in the position designated to activate the control panel and control has been transferred to the local Interlocking Control Panel from Central. At terminal locations, control from the Interlocking Control Panel in the TCR, or from the Interlocking Control Panel in the Dispatcher's Room, shall be mutually exclusive, as indicated on the Contract Drawings. The local control circuits at terminal locations shall be arranged in such a manner as to give priority to the Interlocking Control Panel in the Train Control Room rather than to the Interlocking Control Panel in the Dispatcher's Room. See the Contract Drawings for the interfacing circuits between these two panels.
2. An entrance-exit type manipulation scheme shall be incorporated into each Interlocking Control Panel to provide route initiation by local manual control.
3. Route initiation shall be performed by pushing the button corresponding to the signal at the entrance point of the desired route and then pushing the button corresponding to the desired available exit point. For those entrance points from which a choice of route never exists, it shall not be necessary to push an exit pushbutton. Cancellation of a route or an entrance point designation shall be performed by pulling the button used as the entrance button.
4. Fleeting of a route shall be performed by pushing the entrance button and then, while it is still in, turning it in a direction so that the top of the button moves in the same direction that a train would move as it passes the signal represented by the button. Fleeting shall be performed either at the time that the entrance of the route is defined or after the route has been selected. Fleeting shall be canceled by pulling the entrance button. This operation shall also cancel the route which was fled. Fleeting shall also be canceled by pushing the entrance button and then, while it is pushed, turning it in the direction opposite to that for fleeting. This operation shall cancel the fleeting but shall not cancel the route.
5. The AUXILIARY SWITCH OPERATION buttons shall be wired for auxiliary control of individual switches or crossovers. Turning one of these buttons clockwise or counterclockwise shall control the operation of the associated switch or crossover to the Normal or Reverse position, respectively, unless a route is already locked over that switch. Such auxiliary operation shall remove control of the switch or crossover from the Route Initiation and Route Selection circuits, and shall cause the illumination of the line-of-light units denoting the position of the switch or crossover. Pulling this button shall restore control of the switch or crossover to the Route Selection circuits.
6. For those wayside signals at terminal or diverging route interlockings from which a route can be chosen automatically (by train destination, or by track circuit occupancy), the initiation of routes by these means from a given signal shall be enabled by pushing the AUTO SIGNAL OPERATION button representing that signal, and then, while it is pushed, turning it in the direction of traffic (as indicated by the engraved arrow on the panel). Performing this operation shall not cancel a route that was previously established from the signal.
7. The initiation of routes by automatic means from a given signal shall be inhibited by

pulling the AUTO SIGNAL OPERATION button representing that signal.

- E. Snowmelter Control
  - 1. Local control of the snowmelter layouts in the interlocking area shall be achieved any time the MASTER LEVER Key Switch is turned clockwise, whether the panel is in LOCAL control or not.
- F. Terminal Mode Selection
  - 1. Pushing one of the applicable three TERMINAL MODE pushbuttons when either of the local I.C.P.s (TCR or Dispatcher) is in control shall cause the applicable mode of terminal operation to take effect if it is safely possible to do so.
- G. NEXT TRAIN Sign Control
  - 1. The three-position NEXT TRAIN SIGN rotary control switch (provided on the Dispatcher's Control Panel at locations where the terminal interlocking is on the revenue service end of the passenger platform) shall be wired in such a manner that the center (upward) position results in automatic control of the NEXT TRAIN signs, while the left (counterclockwise) position results in a TRACK 1 indication, and the right (clockwise) position results in a TRACK 2 indication. This switch shall be energized to give the Dispatcher control of the NEXT TRAIN signs at all times, i.e., whether the Dispatcher has control of the terminal interlocking or not.

### **3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Interlocking Control Panels, complete with their mounting enclosures, will be measured for partial payments as units, based upon the number and type of such required units which have been delivered, installed and accepted.
- B. Factors which will be considered when determining partial payments will include the following:
  - 1. Delivery of the control panel assemblies and associated Factory Test Reports by the Contractor and approval of the Factory Test Reports by the designated Resident Engineer;
  - 2. Installation of the control panel assemblies by the Contractor and approval of the installation by the designated Resident Engineer.
  - 3. Approval by the designated Resident Engineer of the final system level testing of the applicable location.

**ATC - EQUIPMENT LAYOUTS**  
(Table of Contents)

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

- A. This SECTION lists the various 16960-series Train Control Equipment Layout
1. Specification Sections:
    - a. Audio Frequency Track and Loop Circuit Layouts (Section 16961)
    - b. Impedance Bond Layouts (Section 16962)
    - c. Track Circuit Layouts (Section 16963)
    - d. Track Switch Operating Layouts (Section 16964)
    - e. Signal Layouts (Section 16965)
    - f. Wayside Pushbutton Layouts (Section 16966)
    - g. Marker Coil Layouts (Section 16967)
    - h. Track Bonding Layouts (Section 16968)
    - i. Snowmelter Layouts (Section 16969)

**END OF SECTION**

## SECTION 16961

### ATC - AUDIO FREQUENCY TRACK AND LOOP CIRCUIT LAYOUTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. Specifications for the design, furnishing and installation of Audio-Frequency (AF) Track and Loop Circuits to perform the two basic ATP functions of train detection and speed command transmission, and to meet certain other requirements.
1. Design AF track circuit equipment in such a manner that normal track circuit maintenance activity shall not require adjustment of the AF track transmitter, i.e., AF track circuits shall normally be adjusted at the receiver end rather than at the transmitter end.
  2. Provide Audio-Frequency (AF) Track Circuits for train detection in all areas except crossover tracks in interlockings. The minimum contiguous length of track in each of these circuits shall be 50 feet.
  3. Provide Audio-Frequency Loop Circuits to transmit speed commands through wire loops installed in conjunction with power-frequency train-detection track circuits at crossover tracks in interlockings. When AF circuits are used in this manner, ensure that the circuits and loops are designed, installed and controlled in such a manner that no speed command can be transmitted (within the interlocking) behind a train which still occupies a portion of the interlocking.
- B. Specifications for the two basic types of inductive track loops and their subtypes, as follows:
1. Prefabricated, multiple-turn loops encased in epoxy filled molded fiberglass channel, and used to transmit speed command signals to the running rails at turnout locations:
    - a. A WMATA Mini-Loop 32 inch by 24 inch D-shaped configuration for use in conjunction with a shunt bar between the running rails.
    - b. A four-foot by fifty - seven inches rectangular configuration for use in pairs, in conjunction with an untuned, receive-only impedance bond
  2. Single-turn loops of heavy wire encased in rubber hose; used in conjunction with single- rail, power frequency track circuits at interlockings to transmit speed commands directly to the transit vehicles.
- C. All wayside AF track and loop devices that contain enclosed, internal air-filled cavities shall conform to the requirements of Section 16914, Environmental Requirements.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
- |     |               |  |
|-----|---------------|--|
| 1.  | Section 16905 | Current Automatic Train Control System       |
| 2.  | Section 16914 | Environmental Requirements                   |
| 3.  | Section 16943 | Vital Relays                                 |
| 4.  | Section 16946 | Transformers                                 |
| 5.  | Section 16949 | Signal Wire and Cable                        |
| 6.  | Section 16953 | ATP Track Modules                            |
| 7.  | Section 16962 | Impedance Bond Layouts                       |
| 8.  | Section 16963 | Power Frequency Track Circuit Layouts        |
| 9.  | Section 16972 | Junction Boxes                               |
| 10. | Section 16973 | Conduit                                      |
| 11. | Section 16980 | ATC Tests, Inspections and Quality Assurance |

##### 1.03 QUALITY ASSURANCE

- A. All AF track and loop circuit equipment shall be factory tested in conformance with the applicable approved factory test procedure.
- B. All AF track and loop circuits shall be field tested after installation as specified in Section 16980, ATC Tests, Inspections and Quality Assurance.

#### **1.04 SUBMITTALS**

- A. Submit to the designated Resident Engineer for approval, 120 days prior to purchase or fabrication of any AF track or loop circuit equipment, and within 90 days of NTP; schematic representations, operating descriptions, and inter-connection diagrams of the AF track and loop circuit equipment and methods proposed to be used to install and operate this equipment. Include also:
  - 1. Drawings showing the physical characteristics of the proposed inductive loops with their moisture control devices, junction boxes, and impedance matching transformers.
  - 2. Drawings and descriptions of the proposed cable, plug connectors, and splicing materials to be used to wire the loops.
  - 3. Drawings showing the details of the methods and equipment to be used to mount the loops in the trackway.
- B. Submit factory test reports for the prefabricated inductive track loops prior to their shipment to the work site. Only those loops that pass the factory test shall be shipped.
- C. Submit a complete description of the physical properties of the hose to be used to protect single-turn inductive track loops.
- D. Submit drawings and descriptions of the operating characteristics of the impedance-matching transformers for the loops and details of the transformer mounting.
- E. Submit detailed drawings for the installation of each single-wire inductive track loop.

### **PART 2 - PRODUCTS**

#### **2.01 BASIC COMPONENTS**

- A. Each AF track circuit shall consist of the following basic components:
  - 1. A device for generating the proper train detection frequency and coded speed command signals. (ATP Track Module or Slave Module.)
  - 2. A device (ATP Track Module or Receiver Module) for receiving the proper train detection frequency and driving a vital, biased neutral track relay when this frequency is received.
  - 3. A device (Impedance Bond or Inductive Track Loop) for injecting train detection and speed command signals into the running rails.
  - 4. A device (Impedance Bond or Terminating Receiver) for receiving train detection signals from the running rails.
  - 5. Twisted pair interconnecting cable between the track side equipment and the equipment located in the Train Control Rooms.
- B. Each AF loop circuit used for transmitting speed commands only, (in conjunction with power-frequency train-detection track circuits) shall consist of a device for generating the proper coded speed command signals (ATP Track Module or Slave Module) and a single-turn inductive track loop.
- C. ATP Track Modules, Slave Modules, and Receiver Modules shall be as specified in Section

16953, ATP Track Modules, and as shown on the Contract Drawings.

- D. Impedance Bonds shall be as specified in Section 16962, Impedance Bond Layouts, and as shown on the Contract Drawings.
- E. Inductive Track Loops shall be as specified herein, and as shown on the Contract Drawings.
- F. Interconnecting cable shall be as specified in the External Cable portion of Section 16949, Signal Wire and Cable, and as shown on the Contract Drawings.

## **2.02 MULTIPLE-TURN INDUCTIVE TRACK LOOPS**

- A. Each multiple-turn inductive track loop shall consist of a single length of 30 turns of insulated conductor no smaller than 19 AWG and no greater than 16 AWG encased in a one-piece molded fiberglass reinforced, epoxy U-channel. This cable shall meet the requirements of internal cable as specified in Section 16949, Signal Wire and Cable.
- B. The channel shall be formed in a rectangular ("four-foot loop") or a "D" shaped ("WMATA Mini-Loop") configuration and dimensioned as shown on the Contract Drawings. Minimum channel wall thickness shall be 0.155 inch. Minimum channel height and width shall be 1.5 inches. Maximum channel height and width shall be 2.0 inches. Minimum inside radius on corners shall be 2.0 inches.
- C. The two leads for the multi-turn loop thus formed shall be terminated to a weatherproof, quick-disconnect, two-pin, male plug connector mounted near the center of one transverse leg of the loop and facing into the center of the loop as shown on the Contract Drawings. The track loop connector shall mate to the same style threaded field connector used to connect control wires to impedance bonds under this contract.
- D. The formed channel with the 30 turns shall be completed by a hardened epoxy resin fill to strengthen the loop and displace all air cavities.
- E. The finished loop shall include a permanently attached metal embossed manufacturer's part number and serial number name plate near the connector.

## **2.03 SINGLE-TURN INDUCTIVE TRACK LOOPS**

- A. Each single-turn inductive track loop layout shall consist of a single conductor size 10 AWG flex cable loop encased in 1/2 inch I.D. hose hardware for attaching the hose-encased loop to the track structure in the required configuration, and a wayside junction box.
- B. Hose construction shall be molded lead-press process, vertically braided, oil resistant, non-porous, resistant to the effect of aging with braided lay-on yarn and a cover of oil, abrasion, and age resistant red neoprene, as manufactured by American Biltrite Rubber Co., or approved equal.
- C. Cable for the single-turn loop layouts shall be as specified in the External Cable portion of Section 16949, Signal Wire and Cable.

## **2.04 LOOP JUNCTION BOXES**

- A. Wayside junction boxes for all inductive track loop layouts shall be as specified in Section 16972, Junction Boxes.

## **2.05 IMPEDANCE MATCHING TRANSFORMERS**

- A. Impedance matching transformers for the inductive track loop layouts shall meet the basic transformer requirements specified in Section 16946, Transformers.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Train detection and AF speed command generating apparatus shall be rack-mounted in the Train Control Rooms. Only equipment such as impedance bonds, cables, junction boxes and inductive loops shall be installed at trackside.
- B. Install all AF track circuit equipment as required by the section in which the equipment is specified.
- C. Install inductive track loop layouts of the required type at the locations shown on the Contract Drawings.
- D. Install prefabricated, multi-turn loops in conformance with the approved installation drawings.
- E. Install single turn Speed Command loops in loop configurations as indicated on the Contract Drawings, and in conformance with the approved installation drawings. The loops so formed shall be transposed, as required, to minimize coupling to the rails. Where the No. 10 AWG loop wires serve as leads between the track loop itself and an adjacent wayside junction box or the TCR, they shall be hand twisted to minimize induction radiation.
- F. Interconnect all AF track circuit equipment as shown on the Contract Drawings and on the approved circuit drawings.

### **3.02 ADJUSTMENT**

- A. Final train detection sensitivity adjustment shall be made at the receiver end of the track circuit, i.e., at the receiver portion of the ATP track module.
- B. Set cab power levels according to WMATA approved standards.
- C. At the time of acceptance by the Authority, no AF track transmitter shall be set higher than 85 percent of maximum output level.

### **3.03 MEASUREMENT FOR PAYMENT**

- A. Audio-Frequency Track and Loop Circuits will not be measured for payment as such. The cost of Audio-Frequency Track and Loop Circuits shall be included in the cost of the various ATC components used to provide them.

**END OF SECTION**

## SECTION 16962

### ATC - IMPEDANCE BOND LAYOUTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section includes Specifications for the furnishing and installation of the various types of impedance bond layouts that are required under this Contract.
- B. Impedance bond layouts shall perform one or more of the following basic functions:
  - 1. Inject train detection, speed command, door command, and/or TWC signals into the running rails.
  - 2. Receive train detection or TWC signals from the running rails.
  - 3. Carry negative propulsion return current from the running rails to track cross-bonding cables or substation return connections via center tap connections on the bonds.
  - 4. Carry negative propulsion return current around insulated joints in the running rails via center-tap connections on the bonds.

##### 1.02 RELATED SECTIONS:

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16914 Environmental Requirements
  - 2. Section 16924 Non-Vital ATO and ATS Processor Systems
  - 3. Section 16949 Signal Wire and Cable
  - 4. Section 16961 Audio-Frequency Track and Loop Circuit Layouts
  - 5. Section 16968 Track Bonding Layouts
  - 6. Section 16978 Miscellaneous ATC Components and Material
  - 7. Section 16980 ATC Tests, Inspections and Quality Assurance

##### 1.03 QUALITY ASSURANCE

- A. Factory test each impedance bond for conformance with the requirements of these Specifications. Where an ancillary trackside device is required for the proper operation of the bond, this device shall be factory tested along with the bond and shall be shipped and installed with the same bond after passing the factory test. Record the results of these factory tests on forms previously approved by the designated Resident Engineer.
- B. Conduct installation and operational tests of each impedance bond layout as required by test procedures previously approved by the Engineer and record the results of these tests for submittal to the designated Resident Engineer. The field test procedures shall meet the requirements specified in Section 16980, ATC Tests, Inspections and Quality Assurance.

##### 1.04 SUBMITTALS

- A. Submit the following to the designated Resident Engineer for approval prior to fabrication or procurement of the impedance bonds, and within 90 days of NTP:
  - 1. Scale drawings of the proposed impedance bonds and any ancillary trackside devices required, to include all mounting details for both direct-fixation and ballasted track mounting.
  - 2. Schematic circuits and detailed wiring diagrams of the proposed impedance bonds and any ancillary trackside devices required.
  - 3. Physical and operating characteristics of the proposed impedance bonds and any

- ancillary trackside devices required.
  - 4. A factory test procedure for the proposed impedance bonds and ancillary devices.
  - 5. A detailed listing of the chemical, mechanical and environmental characteristics of the encapsulating, bonding, and corrosion preventive materials to be used in the fabrication of the impedance bonds.
- B. Submit completed factory test reports of the approved type prior to shipment of the impedance bonds and ancillary devices.
  - C. Submit field test procedures and reports for the impedance bond layouts in accordance with the applicable requirements specified in Section 16980, ATC Tests, Inspections and Quality Assurance.

**PART 2 - PRODUCTS**

**2.01 IMPEDANCE BOND LAYOUT COMPONENTS**

- A. Each impedance bond layout shall consist of the following basic components:
  - 1. An impedance bond of the required type as specified herein and as indicated on the Contract Drawings.
  - 2. Any ancillary trackside device required, such as a tuning unit for the impedance bond.
  - 3. Cables of the required type, number, size and length for rail connections to the impedance bond, and bond center-tap connections where required.
  - 4. Terminating lugs, compression eye fittings, bolts, nuts and other hardware required to connect the cables to the impedance bond.
  - 5. Rail clamps, terminating lugs and welding lugs required to connect the cables to the running rails and/or to negative return moles.

**2.02 IMPEDANCE BONDS**

- A. Each impedance bond shall consist basically of a center-tapped, single turn track coil (composed of two heavy copper "J" bars) around which the applicable coils for train detection, speed command, and TWC signals are wound. The signal coils and signal coupling devices for external cable connections shall be contained in an epoxy- encapsulated assembly on the track coil. The "J" bars of the impedance bond shall be bonded to the body of the impedance bond. This bonding shall prevent rotation of the "J" bars, and shall prevent moisture and dirt from penetrating between the "J" bars and the body of the bond. The exposed portions of the two "J" bars forming the single-turn copper coil shall be thoroughly cleaned, treated and coated at the factory to prevent corrosion. The corrosion preventive coating shall be as approved by the designated Resident Engineer.
  - 1. **At Substation Return locations a configuration of two married impedance bonds may be used to increase the DC return current capacity. No insulated joints shall be used between impedance bonds in this configuration. Track circuit shunting sensitivity shall not be diminished by the configuration. The married bonds may share a track-side mounted coupling unit to separate and couple track and train frequencies to and from the correct impedance bond.**
- B. The impedance bonds shall be sized such that they can be mounted between the running rails on all types of road-bed construction included under this Contract without any part of the impedance bond extending above the top of rail.

- C. The impedance bonds shall weigh less than 80 pounds each.
- D. Track coil terminal lugs shall be provided to connect the required number of rail connection cables to the ends of the track coil, and center tap terminal lugs shall be provided to connect the required number of 1000 KCMIL cables from the center-tap for negative propulsion return feeders and cross-bonding. The Contractor shall provide all material including the protective lugs for connection to moles installed by others.
- E. The track coil shall be rated for 3,000 amperes DC from each rail to center tap (6,000 amperes total) continuously for no less than 3 hours. At Substation Return installations the impedance bond configuration current capacity shall be increased to 4,000 amperes per rail
- F. The bond and associated track circuit shall function properly with an imbalance of 12 percent in the negative return current in the running rails. The imbalance shall be equivalent to 360 amperes DC passing through the track winding from one rail to the other.
- G. The DC resistance of the track coil of the bond shall not exceed 30 micro-ohms.
- H. The impedance bonds shall operate in conformance with all specified requirements when subjected to the extremes of environmental conditions described in Section 16914, Environmental Requirements.
- I. DC Current capacities dependent on temperature rise of copper j-bars shall be based on ambient temperatures of 50 degrees Celsius in direct sun and based on 30 degrees Celsius for tunnel applications.

### 2.03 BOND ANCILLARY DEVICE

- A. The size, weight, and environmental requirements for any trackside impedance bond ancillary device shall be the same as for the impedance bond. All components of such a device shall be appropriate for dependable operation of the unit in the applicable environment.

### 2.04 BOND CONNECTION CABLES

- A. All cables connecting impedance-bond end taps to the rails at a given bond location shall be the same length, as specified in the Negative Return Bonding portion of Section 16968, Track Bonding Layouts.
- B. The type and size of cable used for track and center-tap connections shall be as specified in the External Cable portion of Section 16949, Signal Cable and Wire.
- C. The number of cables used for track and center-tap connections shall be as specified herein and in the Negative Return Bonding portion of Section 16968, Track Bonding Layouts, and as indicated on the Contract Drawings.

### 2.05 BOND CONNECTING HARDWARE

- A. Rail clamps, compression eye fittings, and other hardware required to make track and center-tap connections shall be as specified in Section 16978, Miscellaneous ATC Components and Material, as shown on the Contract Drawings.
- B. Terminals for control cable connection to the impedance bond and any ancillary device required shall be of the pressure-clamp or locking plug connector type, and shall readily accept the appropriate cable specified.

- C. Any exposed fastening hardware such as cover bolts and name tag screws shall be stainless steel, brass or monel.

## **2.06 BOND MOUNTING HARDWARE**

- A. Bond mounting studs and nuts shall be stainless steel or brass.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Install impedance bond layouts of the required configuration at the following specified types of locations as shown on the Contractor's approved double-line track plans:
  - 1. Negative propulsion return locations near traction power substations (indicated on the Contract Drawings by the letters SSR).
  - 2. Locations where negative propulsion return crossbonding is required between tracks.
  - 3. Boundaries of the audio-frequency (AF) track circuits required by:
    - a. Interlocking limits and end-of-track locations;
    - b. Logic codes established by the block design;
    - c. Passenger station platforms (both ends);
    - d. Automatic routing and train supervisory control considerations, and;
    - e. Mainline/Yard negative return propulsion power isolation requirements.
- B. Mount the impedance bonds and any required ancillary devices on the track structure in the manner previously approved by the designated Resident Engineer. All bolted surfaces that are to carry negative return currents, including those on J-bars, T-bars and lugs, shall be polished to a bright finish and a conductive coating (Kopr-Shield Coat or equivalent) applied prior to assembly.
- C. Install appropriate protection for any exposed connectors on the impedance bonds to prevent damage from being inflicted by dragging equipment.
- D. Rail-To-Bond Connections
  - 1. Install the electrical connections between all impedance bond side taps and the running rails. At impedance bonds which are used to provide a connection between a substation (or tiebreaker station) negative propulsion return bus and the rails, two 1000 kcmil cables (or their equivalent) shall be used to connect each side tap terminal ear of the impedance bond track winding to its adjacent running rail. Unless otherwise specified, one 1000 kcmil cable (or its equivalent) shall be used to connect each rail to the impedance bond track winding at all other impedance bonds. See Section 16968, Track Bonding Layouts, and the Contract Drawings.
  - 2. One end of each of these cables shall be clamped to the running rail with a base-of-rail clamp. The other end of each of these cables shall be equipped with a compression eye terminal lug and shall be securely bolted to one of the side tap terminal ears on the impedance bond. See Section 16968, Track Bonding Layouts, and the Contract Drawings.
  - 3. All terminals and electrical connection taps on impedance bonds and negative-return cables shall be thoroughly cleaned immediately before being connected.
  - 4. Once track connections are installed, the resistance between the impedance bond track winding and the rail, including contact resistance at the impedance bond and at the rail, shall be less than 120 percent of the combined resistance of the installed cable or cables, when measured using the following criteria:
    - a. Resistance of 24 inches of conductor containing a connection shall not exceed the resistance of 30 inches of plain conductor.

- b. Tests shall be made by the ammeter, milli-voltmeter or Kelvin Bridge method of low-resistance ohmmeter. Tests shall be made with direct current at a value not exceeding 100 amperes. All test values shall be corrected to 68 degrees F for comparative purposes with tables of cable resistance.
- E. **Bond Center Tap Connections**
  - 1. Install all electrical connections to impedance bond center taps. Where more than two cables must be attached to a single impedance bond center tap, provide a copper adapter plate having one hole for bolting to the bond center tap and four holes for bolting cables or pairs of cables to be connected. This plate shall be rated for twice the current-carrying capacity of the bond track winding. All of the center-tap connection cables at a given location shall be the same length.
- F. For cross-bonding purposes, install two cables of the required size in conduit furnished by other disciplines, as indicated on the Contract Drawings. These cables shall be equipped with compression-eye terminal lugs on both ends.
- G. For substation return or yard isolation purposes, furnish and install a minimum of four Class D (127 strand) 1000 kcmil cables between the bond center tap adapter plate ("T" connector) and the appropriate negative propulsion return energy mole furnished by others, all as indicated on the Contract Drawings. Where no mole is furnished by other disciplines, connect all of the substation return cables (by other disciplines) directly to the bond center tap adapter plate in the specified manner.
- H. The installed resistance of center-tap connections, including the resistance of all cable end connections and any adapter plates required, shall be less than 120 percent of the combined resistance of the installed cables, when measured using the criteria specified in Part 3.01-D.4. above.

### **3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Impedance bond layouts will be measured for partial payments based upon the number and type of such required layouts which are delivered, installed, and accepted.
- B. Factors that will be considered before partial payments for impedance bond layouts are made will include, but not be limited to the following:
  - 1. Delivery of the impedance bonds and all required ancillary devices, and approval of the impedance bond Factory Test Reports by the designated Resident Engineer;
  - 2. Installation of the layouts and Level A partial system acceptance of the location involved, and;
  - 3. Level C partial system acceptance of the location involved.

**END OF SECTION**

## SECTION 16963

### ATC - POWER FREQUENCY TRACK CIRCUIT LAYOUTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of balancing impedance type, single-rail track circuit layouts, utilizing 60 Hz energy, for train detection in crossover tracks within interlockings.
- B. These circuit layouts shall be as specified herein, and as shown on the Contract Drawings.
- C. Minimum track circuit length, per operating track, shall be 50 feet.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16914 Environmental Requirements
  - 2. Section 16917 Basic Interlocking Requirements
  - 3. Section 16941 Basic Component Requirements
  - 4. Section 16943 Vital Relays
  - 5. Section 16946 Transformers
  - 6. Section 16949 Signal Wire and Cable
  - 7. Section 16968 Track Bonding Layouts
  - 8. Section 16980 ATC Tests, Inspections and Quality Assurance

##### 1.03 QUALITY ASSURANCE

- A. Components of the power frequency track circuits furnished by the Contractor shall be factory tested in accordance with procedures previously submitted by the Contractor and approved by the designated Resident Engineer.
- B. Test insulated rail joints (provided by other disciplines) which define the limits of power frequency track circuits, and promptly notify the designated Resident Engineer of any such joints not functioning properly.
- C. Field test power frequency track circuits as specified in Section 16980, ATC Tests, Inspections and Quality Assurance.

##### 1.04 SUBMITTALS

- A. Submit, 120 days prior to fabrication or procurement of the following items, drawings showing the physical characteristics, ratings and operating characteristics for the proposed track feed transformers, adjustable resistors, balancing impedances and track fuses.
- B. Submit factory test procedures for the above items 90 days prior to fabrication or procurement of the items.
- C. Submit factory test reports for the above items prior to shipment of the items to the job site.

#### PART 2 - PRODUCTS

## **2.01 TRACK TRANSFORMERS**

- A. Track transformers shall be as specified in Section 16946, Transformers.

## **2.02 BALANCING IMPEDANCE**

- A. The balancing impedance shall consist of a three-terminal device containing an inductor and a resistor in series, with the center, connecting point brought to a terminal. The inductor shall be of the laminated iron type having an impedance of 24.0 ohms at 60 Hz plus-or-minus 10 percent. The resistor shall have a value equal to the dc resistance of the inductor within plus-or-minus 2 percent (approximately 0.67 ohms).

## **2.03 ADJUSTABLE RESISTORS**

- A. Adjustable resistors shall meet the requirements specified in Section 16941, Basic Component Requirements, and be as described below:
  - 1. The resistor in the feed end shall be 3.0 ohms with a continuous capacity of 200 watts. It shall be capable of a current of 10 amperes and shall have taps allowing the selection of 0.5, 1.0, and 1.5 ohms.
  - 2. The resistor at the relay end shall be 25 ohms with a continuous capacity of 100 watts. It shall be capable of a current of 3 amperes and have taps allowing the selection of 12, 8 and 4 ohms.

## **2.04 TRACK FUSES**

- A. Fuses shall be as specified in Section 16941, Basic Component Requirements, and as described below:
  - 1. The fuse in the feed end of the track circuit shall be 600 volt, 8 amperes.
  - 2. The fuse in the relay end of the track circuit shall be 600 volt, 2 amperes.

## **2.05 TRACK RELAY**

- A. The ac track relay shall be as specified in Section 16943, Vital Relays.

## **2.06 WIRING**

- A. Wiring for power frequency track circuits shall be in accordance with Section 16949, Signal Cable and Wire.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Power frequency track circuits shall be arranged to provide continuous train detection.
- B. All power frequency track circuit equipment shall be located in the local Train Control Room, with the exception of wayside junction boxes and cabling.
- C. The track feed transformer and the local coil of the track relay for each power frequency track circuit shall be fed from the same energy source and phase.
- D. Power frequency track circuits shall be installed as shown on the Contract Drawings.

### **3.02 OPERATION**

- A. Shunting sensitivity of power frequency track circuits shall be .06 ohms or more under dry weather conditions.
- B. Power Frequency track circuits shall operate in a satisfactory manner under the environmental conditions described in Section 16914, Environmental Requirements.

### **3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. For purposes of measurement for partial payments, each power frequency track circuit will be considered to include:
  - 1. Track feed transformer
  - 2. Feed and relay end adjustable resistors
  - 3. Balancing impedance
  - 4. Track fuses
  - 5. Vital ac track relay
  - 6. Cables and wayside junction boxes
  - 7. Track connection hardware and signal rail bonding
  - 8. Insulated rail joints (provided by other disciplines)
- B. Power frequency track circuits will be measured for partial payments based upon the number of such required circuits installed and accepted.

**END OF SECTION**

## SECTION 16964

### ATC - TRACK SWITCH OPERATING LAYOUTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of Track Switch Operating Layouts at the various locations indicated on the Contract Drawing track plans.
- B. Each Switch-and-Lock Layout shall be designed to perform the specified functions for WMATA switch point throws of either 5 inches or 3¾ inches, plus or minus ¼ inch in conformance with applicable parts of AREMA Communications & Signals Manual, Sections 12, 13, and 16.
- C. Each Track Switch Operating Layout shall consist of:
1. A Switch-and-Lock Movement
  2. All the necessary arrangement of rods, insulators and hardware to connect the Switch-and-Lock Movement to the switch points for throwing, locking, and detecting purposes, including but not limited to the following separate rods and associated equipment:
    - a. Hinged or swivel front (#0) rod lug,
    - b. Operating ("throw") rod and lost motion device ("basket"),
    - c. Lock rod,
    - d. Detector rod,
    - e. Front (#0) insulated switch rod to connect switch points to the lock rod.
  3. All the necessary cable, wire, junction boxes and electrical fittings required to connect the Switch-and-Lock Movement electrically to the TCR for operation and indication purposes.
  4. All the necessary arrangement of tie straps and fastening hardware to stabilize the switch ties for reliable operation of the Switch-and-Lock Layout for ballasted track installations.
  5. All necessary hardware to secure the Switch-and-Lock Movement to the switch ties for ballasted installations or to the gage plate extensions for direct fixation installations.
  6. Two cast metal letters, "N" and "R", at least three inches high, painted white, and affixed to the #0 cross-tie or corresponding direct fixation location to denote the Normal and Reverse open switch point positions.
- D. All Track Switch Operating Layouts shall have all similar parts interchangeable insofar as possible and practical.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
- |    |               |  |
|----|---------------|--|
| 1. | Section 16923 | TC Maintenance Telephone System              |
| 2. | Section 16949 | Signal Cable and Wire                        |
| 3. | Section 16954 | Switch-and-Lock Movement                     |
| 4. | Section 16972 | Junction Boxes                               |
| 5. | Section 16980 | ATC Tests, Inspections and Quality Assurance |

### 1.03 QUALITY ASSURANCE

- A. Quality assurance for Switch-and-Lock Movements, external signal cable, and junction boxes included in Track Switch Operating Layouts shall consist of the quality assurance requirements specified for those components in Sections 16954, 16949 and 16972, respectively.
- B. Factory inspect all rods, connecting hardware and electrical fittings in accordance with the inspection procedures approved by the designated Resident Engineer.
- C. Upon installation of each Track Switch Operating Layout, conduct a mechanical inspection and perform a circuit breakdown test in conformance with the installation inspection procedures approved by the designated Resident Engineer. This inspection shall also ensure that the switch-and-lock movement is electrically isolated from both running rails.
- D. The final operating tests and inspections for Track Switch Operating Layouts shall be performed as specified in Section 16982, Preliminary and Interlocking Tests (Level A).
- E. Establish and execute a monthly maintenance schedule per the O&M Manual until such time as the equipment has been accepted by the Authority at the time of SCI.
- F. All supplied Switch-and-Lock Layout components and systems are Class A type equipment and shall conform to all environmental requirements as identified in AREMA Communications & Signals Manual, Part 11.5.1. for such equipment.

### 1.04 SUBMITTALS

- A. Submit mechanical and electrical drawings for each type of Track Switch Operating Layout proposed for this Contract. The mechanical drawings shall include keyed material lists complete with part numbers. The drawings to be submitted shall include, but not be limited to:
  - 1. Overall mechanical layouts showing relative location of major components
  - 2. Detailed drawings of the various rods, connecting hardware and electrical fittings
  - 3. Control, operating, indicating and internal heating circuits
  - 4. Detailed wiring diagrams for the Switch-and-Lock Movement mechanism and its associated wayside junction box.
- B. The Contractor shall not proceed with the manufacture or procurement of this equipment, except at his own risk, before obtaining the designated Resident Engineer's written approval of the equipment proposed.
- C. Submit factory inspection procedures for the various rods, connecting hardware and electrical fittings included in the layout. These procedures shall be in conformance with the requirements of Section 16981, Basic ATC Test and Inspection Requirements.
- D. Submit an installation inspection procedure which shall include a breakdown test of all field wiring included in the Track Switch Operating Layout. This procedure shall be in conformance with the requirements of Section 16981, Basic ATC Test and Inspection Requirements.
- E. Submit the required factory inspection reports prior to shipment of the junction box, electrical fittings, rods and connecting hardware for Track Switch Operating Layouts.

- F. Prior to the installation of any track switch operating layout, submit a maintenance procedure which outlines the monthly and any other periodic maintenance which shall be performed by the Contractor until such time as the Authority takes possession of the Train Control System. This procedure shall include maintenance as specified in Section 16954, Switch and Lock Movements, and the applicable O&M Manual.
- G. Submit a breakdown test report for each Track Switch Operating Layout installed.
- H. Submit a monthly report certifying that monthly maintenance has been performed per the O&M Manual.

## 1.05 DELIVERY, STORAGE AND HANDLING

- A. All unpainted ferrous metal surfaces of Track Switch Operating Layout equipment shall be coated with NO-OX-ID "E" grease, petroleum jelly or an approved equivalent, before the equipment is shipped from point of manufacture. Parts constructed of a non-ferrous material or having a painted finish will not require this protective coating.

## PART 2 - PRODUCTS

### 2.01 - SWITCH-AND-LOCK MOVEMENT

- A. A Switch-and-Lock Movement shall be provided as part of each Track Switch Operating Layout. See Section 16954.

### 2.02 RODS

- A. Provide the following separate, insulated rods and associated equipment as part of each Track Switch Operating Layout:
  1. Hinged or swivel front rod
  2. Throw rod and throw rod basket
  3. Lock rod and lock rod lug
  4. Detector rod and point detector lug
- B. No welded components will be allowed. All rods and lugs shall be forged unless otherwise directed in writing by the designated Resident Engineer.
- C. When offsets are required in the rods, the rods shall be offset during manufacture. At least 15 inches of threaded area shall be supplied on each rod to accommodate a wide latitude of operating adjustments.
- D. The circuit controller point detector shall be connected to the point detector lug attached to the near side switch point.
- E. The lock rod shall be connected to the middle of the insulated front rod.
- F. Insulation shall be provided in the Number Zero switch Rod to electrically isolate the switch points from one another. Insulation required for the above rods and equipment shall be of the type recommended in Part 8.5.3. of the AREMA Communications & Signals Manual.
- G. The rods shall be of appropriate length to provide the specified distance from centerline of track to centerline of switch-and-lock movement. Any modifications necessary to meet this

requirement shall be performed by the Contractor in a manner satisfactory to the Engineer at no additional cost to the Authority. (See Section 16954, Switch and Lock Movements.)

### **2.03 JUNCTION BOX**

- A. Each Track Switch Operating Layout shall include a junction box suitable for terminating the interconnecting wire and cable adjacent to the Switch-and-Lock Movement.
- B. A cast iron, pedestal mounted junction box shall be furnished for layouts to be situated in ballasted construction areas. A NEMA 4X cast metal or 14 gauge stainless steel junction box shall be furnished for use in direct fixation areas, except that a fiberglass junction box shall be furnished for installation on tunnel walls. See Section 16972, Junction Boxes.
- C. A TC Maintenance Telephone jack shall be installed in the junction box. See Sections 16972 and 16923.
- D. If the switch machine junction box or WJ is located on the opposite side of the track from the switch machine, or if the WJ is located at a distance greater than 12 feet from the switch machine, an additional TCM phone jack (which is accessible without removing any covers) shall be installed at or near the switch machine.

### **2.06 PULL BOX AND ELECTRICAL FITTINGS**

- A. Where embedded conduit stubs up on the side or end of the switch-and-lock machine opposite to the entrance opening to the machine, provide a stainless steel pull box and liquidtight flexible conduit at no additional cost to the Authority.
- B. Each Track Switch Operating Layout shall include all the conduit, connectors, terminal blocks and other electrical fittings required for the switch control, operation and indicating wiring between the Switch-and-Lock Movement and the TCR.

### **2.07 MISCELLANEOUS HARDWARE**

- A. Two cast metal letters, "N" and "R", at least three inches high, painted white, and drilled to provide a means of attaching them, shall be furnished to denote the Normal and Reverse positions of the switch points.
- B. Furnish all screws, bolts, nuts, washers, pins, cotter keys, shims, plates and other hardware required to connect the rods to the Switch-and-Lock Movement and to the switch points. In ballasted track areas the Contractor shall also furnish tie straps as shown on the Contract Drawings.

### **2.08 PAINTING**

- A. All equipment described in this Section shall be painted in accordance with the recommendations of Part 1.5.10 of the AREMA **Communications & Signals** Manual. The finish color shall be black.

### **2.09 EQUIPMENT PROVIDED BY OTHER DISCIPLINES**

- A. The Number One and Number Two insulated vertical switch rods of each track switch will be furnished by other disciplines.

- B. Two switch ties will be furnished by other disciplines for each Track Switch Operating Layout in ballasted track areas.
- C. Two gauge-plate extension bars will be furnished by other disciplines for each Track Switch Operating Layout in direct fixation track areas.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION**

- A. Track Switch Operating Layouts shall be installed as per approved installation drawings and as shown on the Contract Drawings. The Switch-and-Lock Movements shall be installed as specified in Section 16954.
- B. In ballasted construction areas, the Contractor shall be responsible for any ballast removal required to install the switch operating layouts. Excess ballast shall be spread evenly between ties in the vicinity of the track switch. Likewise, the Contractor shall be responsible for all drilling, dapping, shifting, relocating or replacement of ties that may be necessary to meet the requirements indicated on the approved drawings. Whenever ties are shifted, relocated or replaced, the Contractor shall re-tamp them to a fully stable condition. The Contractor shall be responsible for restoring the track to proper alignment and profile at no additional cost to the Authority.
- C. In direct fixation construction areas, the Contractor shall be responsible for mounting the switch-and-lock movements (switch machines) at the proper location and height on the gauge plate extension bars furnished by others. **All fixed and moving parts of the functional Switch-and-Lock Layout shall be within 3 feet 10½ inches from the gauge line (within 6 feet 2¾ inches of the centerline) of the track.**

#### **3.02 IDENTIFICATION**

- A. The two cast metal letters "N" and "R" shall be securely mounted inside the running rails, attached to the first tie adjacent to, but not supporting, the switch points (or in a similar position on the concrete in direct fixation areas) to denote the Normal and Reverse positions of the switch points. The letter "N" shall be mounted on the normally open point side as shown on the Contract Drawings.

#### **3.03 LUBRICATION**

- A. Lubricate all moving parts and bearing points of the switch machine upon switch machine installation, with lubricants approved by the designated Resident Engineer. Any moving parts of the switch layout which are frozen shall be freed prior to being lubricated.
- B. Upon installation of the layout, grease the various rod fittings, thoroughly clean, and apply an Authority approved graphite lubricant to the tie plates under the switch points, and to the inside of the joint bars holding the heels of the switch-point rails. Rusted plates shall be wire brushed to remove any scale prior to being lubricated.
- C. Apply a supplemental coating of NO-OX-ID "E" grease, or approved equivalent, to exposed threaded surfaces to prevent corrosion.

#### **3.04 ADJUSTMENT**

- A. Adjust the rods and Switch-and-Lock Movement in such a manner that the proper point detector contacts indicate switch closure when **the switch is mechanically locked and** a point is within 1/8 inch of its stock rail and no point detector contacts are closed when **the switch is mechanically locked and** both switch points are 1/4 inch or more from their respective stock rails, and **adjust the lock rods in such a manner that the Switch-and-Lock Movement cannot mechanically lock when both switch points are 1/4 inch or more from their respective stock rails** with the specified obstruction measurements being made 6 inches back from the switch points.
- B. The adjustment shall result in the switch points being at least 4-3/4 inches, and not more than 5-1/8 inches from the stock rails when in their "Open" position. For guarded-point switches, the adjustments shall result in switch points being at least 3-3/4 inches, and no more than 4 inches from the stock rails when open.
- C. Final adjustment shall result in a complete "tuck" of the point rail under the machined portion of the stock rail, with point-to-stock rail contact.
- D. These adjustments shall be maintained by the Contractor from the time of installation until acceptance by the Authority. All of these adjustments shall be verified (and corrected if necessary) by the Contractor, not more than 30 days prior to acceptance by the Authority.

### **3.05 MAINTENANCE**

- A. Track Switch Operating Layouts shall be properly lubricated, adjusted, and maintained by the Contractor on a regular timed basis until use and possession of the switches is taken by Authority Rail Systems Maintenance at the time of acceptance by the Authority. The Authority will assume responsibility for switch adjustment and maintenance at that time.

### **3.06 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Track Switch Operating Layouts will be measured for partial payments as units, based upon the number of complete sets of properly inspected layout components delivered, installed, and properly adjusted by the Contractor, and accepted by the Authority.
- B. For measurement purposes for partial payments, the switch-and-lock movements will not be considered to be included in the switch operating layouts, but will be measured separately.

**END OF SECTION**

## SECTION 16965

### ATC - SIGNAL LAYOUTS

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of Signal Layouts at the various locations indicated on the Contract Drawings, and the final design by the Contractor of modifications to standard signal layouts where necessary.
- B. Each Signal Layout shall consist of:
  - 1. A complete color light signal unit
  - 2. All required mounting devices and related hardware
  - 3. All electrical fittings and cable required to provide the specified signal control and/or lighting circuitry for the wayside signal unit.
- C. Two basic types of Signals shall be used:
  - 1. Controlled Signals (Three Lenses - R/LW/R)
  - 2. Marker Signals (Two Lenses - R/R) (End of Track locations)
- D. All signals of a given type shall be identical, unless otherwise specified.
- E. Controlled signals shall be used to govern the movement of trains:
  - 1. Through interlocking plants (Interlocking Signals) (or as "Repeater Signals" for Interlocking Signals where sighting problems or other special situations are encountered.);
  - 2. For entrance to segments of "running tracks" between interlockings (Intermediate Signals), or;
  - 3. From tail track storage areas (Holdout Signals).
- F. Marker signals shall be used to present a permanent "STOP" aspect at end-of-track locations.
- G. Based upon the Contract Documents and on-site inspection, the Contractor shall determine, for every required signal location, if there is a potential sighting, clearance or interference problem for signals installed in the normally specified manner. For every signal location where such a potential problem exists, the Contractor shall design and submit thorough documentation for whatever alterations and/or additions to the normal installation layout are necessary to overcome the potential problem.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16914 Environmental Requirements
  - 2. Section 16915 Basic ATC Equipment Requirements
  - 3. Section 16916 Basic ATC Circuit Requirements
  - 4. Section 16923 TC Maintenance Telephone System
  - 5. Section 16949 Signal Wire and Cable
  - 6. Section 16972 Junction Boxes
  - 7. Section 16974 Locks and Keys
  - 8. Section 16975 Foundations
  - 9. Section 16978 Miscellaneous Train Control Components and Materials

**1.03 QUALITY ASSURANCE**

- A. The Contractor shall inspect each signal unit prior to shipment. This inspection shall conform to the Contractor's Factory Inspection Procedure as approved by the designated Resident Engineer. Signal units shall be in compliance with the Specifications prior to delivery to the Authority.
- B. The Contractor shall inspect each signal layout after it has been installed in the field. This inspection shall conform to the Contractor's Installation Inspection Procedure as approved by the designated Resident Engineer. Installation will not be considered complete until the Contractor has corrected all installation defects to the satisfaction of the designated Resident Engineer.
- C. The final operating tests to determine the acceptability of each complete signal layout shall be performed as described in Section 16982, Preliminary and Interlocking Tests (Level A).

**1.04 SUBMITTALS**

- A. The Contractor shall submit complete drawings for each type of signal unit and each type of signal layout he proposes to use, to include all mounting and wiring details. A key-numbered parts list and complete material ordering reference numbers shall be included for each type of signal and layout.
- B. The Contractor shall submit complete documentation for each signal layout which has to be modified to overcome potential sighting or interference problems. This documentation shall include an explanation of how the problem is eliminated by the proposed modifications.
- C. The Contractor shall obtain written approval from the designated Resident Engineer for each type of Signal Layout prior to manufacture or procurement of the signal layout equipment.
- D. The Contractor shall submit a Factory Test and Inspection Procedure for checking complete signal units. This procedure shall be in conformance with the requirements of Section 16981, Basic Test and Inspection Requirements.
- E. The Contractor shall submit an Installation Inspection Procedure for checking the installation of signal layouts. This procedure shall be in compliance with the requirements established by Section 16981, Basic Test and Inspection Requirements.

**1.05 DELIVERY, STORAGE AND HANDLING**

- A. Signal lamps shall be shipped separately from the signals.

**PART 2 - PRODUCTS**

**2.01 SIGNAL UNITS**

- A. Each color light signal unit shall consist of the following components, all as described herein and as shown on the Contract Drawings:
  - 1. Housing
  - 2. Lenses
  - 3. Lamps and lamp receptacles
  - 4. Adjustable transformers
  - 5. Backlights

6. Terminal boards and wiring
  7. Number plate
  8. Mounting device
  9. Lens hoods - where required
  10. Mast and base or wall mounting bracket, as applicable.
  11. Ladder or pole steps, as applicable
- B. Signal units shall be similar to those depicted on Alstom Signaling Inc. (GRS) Drawing No. 45906-358, Union Switch & Signal Inc. (US&S) Part No. N451357, or an equivalent approved in writing by the designated Resident Engineer. Approval of an equivalent signal unit will be based upon:
1. Submittal of proof of the ability of the unit to meet the requirements specified in this Section;
  2. Such additional evidence and tests as the designated Resident Engineer may require to be provided or conducted, all at no additional cost to the Authority.

## **2.02 HOUSINGS**

- A. The housing for Controlled and Marker Signals shall be made of cast iron or cast aluminum and shall have three lamp compartments. The lamp compartments shall be separated from each other by partitions which shall allow the necessary wiring to pass between compartments, but which shall prevent the passage of light between the compartments.
- B. Each lamp compartment shall be of adequate size to provide ample space for the lamps, lamp receptacles, transformer, terminal blocks and other necessary apparatus. The inside of each lamp compartment shall be painted to the manufacturer's standard.
- C. Each signal housing shall have a cast aluminum or cast iron, hinged, removable door. The hinge pins shall be made of brass or stainless steel. This door shall be equipped with a gasket as recommended in Part 15.2.10 of the AREMA Signal Manual. The door shall also be provided with two ventilating openings, top and bottom, which shall be covered with fine mesh stainless steel, copper or brass screen on the inside and protected with hoods to keep precipitation out. A stop shall be provided to prevent the door from opening to an angle greater than ninety degrees. Facility shall be provided for locking the door with a standard WMATA padlock as specified in Section 16974, Locks and Keys. Each door shall be provided with a latching arrangement of such design that the door cannot be latched or locked until it is fully closed.

## **2.03 LENSES AND HOODS**

- A. Signal lenses shall be of the doublet type, 6-3/8 inches in diameter, mounted in gasket material and secured to the lamp compartments in such a manner that their removal will not affect the adjustments of the lamp receptacles. The lenses for these signals shall meet all applicable recommendations of Part 7.1.10 of the AREMA Signal Manual which do not conflict with the requirements of these Specifications.
- B. Controlled signals shall have three lenses, while Marker Signals shall have only two. For standard, three-lens Controlled Signals, red lenses shall be installed on the top and bottom lamp compartments and the middle lens shall be lunar white. For Marker Signals, the top and bottom lenses shall be red and blank plate shall be installed in place of a lens on the middle compartment.
- C. Mount a nine-inch-long sheet metal hood of copper-bearing steel to shield each lens of all signals not located in tunnels.
- D. No backgrounds shall be furnished.

- E. Provide special lenses and other devices as necessary to prevent phantom aspects and to meet the requirements specified in Section 16965 3.2.

#### **2.04 LAMPS AND RECEPTACLES**

- A. Mount two lamps in receptacles behind each lens. Signal lamps shall be manufacturer's designation RLS, 25-watt, 10-volt, S-11 bulb, SC-base, CC-6 shape lamps with a light center length of 1-1/4 inches and a tolerance of 1/64 inch. Lamps shall have a rated life of at least 2000 hours when operated at rated voltage.
- B. The lamp receptacles shall be so designed and located that proper relation of lamps to lens can be readily made and maintained. Receptacles shall be designed so that they will prevent the lamps from coming loose because of vibration.

#### **2.05 SIGNAL HEAD TRANSFORMERS**

- A. Install an individual transformer in each lamp compartment having a lens and lamps. This transformer shall supply current to the lamps in that compartment.
- B. These transformers shall have a nominal primary voltage of 120 volts, a nominal secondary voltage of 10 volts and power rating of 60 watts, all at 60 Hz. They shall have input voltage taps for 110 to 125 volts in five-volt steps, and output voltage taps for five to 12 volts in one-volt steps unless otherwise approved by the designated Resident Engineer.

#### **2.06 BACK LIGHTS**

- A. Equip controlled and marker signals with back lights approximately one-quarter inch in diameter.
- B. Place the back lights in the signal housing opposite each respective lens. The back light for a lunar white lens shall be frosted white, and the back light for a red lens shall be red.
- C. Back lights shall be made of glass, plastic or similar material.

#### **2.07 NUMBER PLATES**

- A. Equip each Controlled Signal and Marker Signal with a sheet steel number plate as shown on the Contract Drawings. These number plates shall have white reflex-reflecting lettering on a black synthetic enamel background.
- B. The number plate for each Controlled Signal shall have two lines of 2-inch high lettering. The top line shall be the route initial and location designation number, and the bottom line shall be the signal number.
- C. The number plates for Marker Signals shall be similar to those for Controlled Signals except that they shall have a white letter "X" followed by the two-digit track number in place of the lettering specified for the bottom line of Controlled Signal number plates.
- D. Number plates shall meet the applicable recommendations established by Part 14.6.1 of the AREMA Signal Manual, where the recommendations of the AREMA Signal Manual do not conflict with the requirements established in this Section.

#### **2.08 MOUNTING DEVICES**

- A. Equip each signal head with a mounting device suitable for the method of mounting required for the particular signal. An adjusting mechanism for aligning the signal shall be included in this device.

## **2.09 MAST AND BASE**

- A. The mast for each mast-mounted signal shall consist of an approved pipe pole four inches in diameter supported by an approved split cast-iron base of the appropriate type (with or without a junction box) as shown on the Contract Drawings.
- B. A suitable adapter shall be provided when the four-inch pole is used to support a signal sized for a three-inch pole. As an option, the mast for each mast-mounted signal shall consist of an approved pipe pole three inches in diameter supported by an approved split cast iron base.
- C. The mast shall be of suitable length to support the signal head at the height required by its approved layout design.
- D. For installation in ballasted-track areas, the cast-iron base shall be of the junction box type. The junction box base shall be equipped with at least six pairs of AAR terminals for the signal lamp wiring and a weatherproof telephone jack for the TC Maintenance Telephone System. The AAR terminals shall be accessible by a cover or door, equipped with provisions for padlocking. Opening this cover or door shall not require the removal of any other part of the signal assembly.
- E. Each type of base shall have four mounting holes suitable for 3/4-inch diameter foundation bolts arranged on 9-1/2 by 9-1/2 inch centers.
- F. Wherever a non-junction-box base is used, or the signal is wall mounted, the Contractor shall provide a separate junction box for installation in close proximity to the signal at no additional cost to the Authority. This junction box shall be equipped with at least six pairs of AAR terminals for the signal lamp wiring and a weatherproof telephone jack for the TC Maintenance Telephone System. The junction box and the telephone jack shall be as specified in Section 16972, Junction Boxes, and Section 16923, TC Maintenance Telephone System, respectively.
- G. Platform-Mounted Signals
  - 1. A leveling plate and a No. 60 Duro Neoprene pad, or approved equal, shall be furnished and installed beneath the base of each platform-mounted signal. The Contractor shall furnish and install 4 1-inch galvanized bolts and star masonry anchors, or approved equal, to secure the signal base to the platform.

## **2.10 LADDER OR STEPS**

- A. Provide ladders or pole steps for all signals where the upper signal lamp compartment is more than six feet from the ground or from a walkway from which convenient signal lamp replacement can be made.
- B. All prefabricated ladders shall be furnished complete with all stays, fastenings, bolts, strap-iron extensions, where required, and any other necessary mounting and fastening equipment. Side rails of ladders shall not be factory bent or drilled at the bottom but shall be furnished straight so that they can be bent and drilled in the field for best accommodation to local conditions.
- C. Ladders with a series of punched holes in the side rails will not be acceptable.

- D. Sloping ladders for mast-mounted signals shall be furnished complete with top and intermediate stays.
- E. Pole steps may be furnished in lieu of ladders for mast-mounted signals. When pole steps are used, they shall be of the double-sided type, mounted as follows:
  - 1. The top step shall not be lower than 5 feet below the top of the signal.
  - 2. The bottom step shall be 1 foot above the pole base.
  - 3. The maximum distance between steps shall not exceed 12 inches.
  - 4. Steps shall be uniformly spaced.

## **2.11 WIRING**

- A. Signal units shall be internally wired at the factory insofar as practical and possible.
- B. Signal layout wiring shall conform to the requirements of Section 16949, Signal Wire and Cable, and Section 16915, Basic Equipment Requirements, and shall be located as indicated on the Contract Drawings.

## **2.12 PAINTING**

- A. Paint the metal components of each signal layout in accordance with the recommendations of Part 2.4.30 of the AREMA Signal Manual. The finish coat of paint shall be dull black.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Install Signal Layouts per approved drawings and as shown on the Contract Drawings. No part, either fixed or movable, of any signal layout shall project into the clearance envelope for the transit vehicles. This shall include, but not be limited to, the opened covers or doors of the signal housing and signal junction box.
- B. The signal number plate shall be placed under the lowest signal lens in the assembly, bracket-mounted to the signal housing, and shall be fastened by four brass screws, with lead and brass washers under the screw heads and under the enameled plate. The lead washers shall be installed adjacent to the enamel.
- C. Attach the base for each mast-mounted signal to the concrete invert or to a concrete foundation by means of anchor bolts cast into the concrete. See Section 16978, Miscellaneous Train Control Components and Material, and Section 16975, Foundations.
- D. Wall mounted signals shall be bolted to solid strap steel brackets which shall in turn be bolted to machine-bolt type expansion anchors driven into the concrete wall. Where the distance from the wall to the signal head exceeds four inches, a bracket having a diagonal component shall be used to provide additional vertical support for the signal head as indicated on the Contract Drawings. The diagonal component shall be attached to the wall at the top and to the signal at the bottom as shown on the Contract Drawings. The use of sheet metal channel for wall mounting brackets will not be permitted.
- E. Where ladders or steps are required in conjunction with wall-mounted signals, they shall be designed and field modified to fit each particular location in a manner approved by the designated Resident Engineer.
- F. Where local conditions beyond the control of the Contractor make it impossible or unsafe to use the standard specified methods for mounting a wayside signal, or where the standard

specified mounting would result in sighting problems for the signal, the Contractor shall, at no additional cost to the Authority, design and furnish an alternate means for mounting the signal which is acceptable to the designated Resident Engineer. Upon receiving the designated Resident Engineer's approval for the design, proceed with the fabrication of any necessary special mounting device(s) and installation of the signal in compliance with the approved design.

### **3.02 LOCATION AND HEIGHT**

- A. Install signals on the right side of the right-of-way (for the direction in which their aspects govern) wherever clearance and sighting conditions permit. Controlled signals shall be located 9 ft. 7 inches (plus or minus 1 foot 10 inches) downstream from the effective Insulated Joint (IJ), unless otherwise directed by the designated Resident Engineer. Marker signals (where applicable) shall be located at the effective IJ, which is normally located 16'-6" from the outer end of the associated service platform
- B. Where a signal cannot be installed on the right side due to clearance or sighting restrictions, the Contractor shall prepare plans for mounting the signal on the left side of the right of way, and submit these plans to the designated Resident Engineer for approval. Final installation of such signals shall be in accordance with the approved plans.
- C. Install Marker signals with their top lens 8'-6" above top-of-rail as indicated on the Contract Drawings.
- D. Mast-mounted Controlled signals shall normally be installed with their bottom lens 7'-4" above top-of-rail as indicated on the Contract Drawings.
- E. Wall-mounted Controlled signals shall normally be installed with their top lens 8'-6" above top of rail as indicated on the Contract Drawings.
- F. At locations where wayside pushbuttons are required in conjunction with wayside signals, and at all other locations where mounting signals in the normally prescribed manner causes sighting or interference problems, the Contractor shall, at no additional cost to the Authority, mount the signal(s) in accordance with an approved alternative layout which will safely eliminate the problem.

### **3.03 ALIGNMENT AND FOCUSING**

- A. Signals shall be aligned and focused, both horizontally and vertically, in such a manner that the aspects displayed, when viewed from a position seven feet above the top of the right-hand running rail, shall be distinct, unmistakable and continuously visible over a distance of 500 feet upstream from the signals, day or night, under the most adverse environmental conditions indigenous to the Washington, D.C. metropolitan area. See Section 16914, Environmental Requirements.
- B. Where track or tunnel curvature, grade change, or other conditions make sighting impossible at 500 feet, the signal shall be mounted, aligned and focused to provide continuous sighting over the greatest distance possible, but under no circumstances shall this continuous sighting distance be less than 300 feet, unless otherwise authorized by the designated Resident Engineer.
- C. Where continuous sighting from 300 feet cannot be provided, the Contractor shall provide a repeater signal as approved by the designated Resident Engineer, at no additional cost to the Authority.

### **3.04 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Signal Layouts will be measured for partial payments based upon the number of such complete units delivered, installed, and accepted.
- B. External cable used to connect the signal unit to the TCR will not be paid for as part of the Signal Layout, but will be measured for payment separately.

**END OF SECTION**

## SECTION 16966

### ATC - WAYSIDE PUSHBUTTON LAYOUTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of wayside pushbutton layouts at the locations indicated on the Contract Drawings, to allow train operators to select routes through interlockings.
- B. Each wayside pushbutton layout shall consist of the following:
  - 1. A pushbutton box, complete with all applicable pushbuttons, indicator lights, and identification plates;
  - 2. Brackets, or pole and base, as necessary, to mount the pushbutton box at the location indicated on the Contract Drawings,
  - 3. All fittings necessary to mount the pushbutton box, and to connect its control cable to the Train Control Room. This shall include, but not be limited to, such items as junction boxes, terminals, conduit, flexible hosing and clamps.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16917 Basic Interlocking Requirements
  - 2. Section 16949 Signal Wire and Cable
  - 3. Section 16965 Signal Layouts
  - 4. Section 16972 Junction Boxes
  - 5. Section 16980 ATC Tests, Inspections and Quality Assurance

##### 1.03 QUALITY ASSURANCE

- A. All wayside pushbutton box assemblies shall be factory tested in conformance with the approved factory test procedure.
- B. Inspect each wayside pushbutton layout after it has been installed in the field. This inspection shall conform to the Contractor's Installation Inspection Procedure as approved by the designated Resident Engineer. Installation will not be considered complete until the Contractor has corrected all installation defects to the satisfaction of the designated Resident Engineer.
- C. Wayside pushbutton layouts shall be field tested as specified in Section 16980.

##### 1.04 SUBMITTALS

- A. Prior to purchase or fabrication of pushbutton box assemblies:
  - 1. The Contractor shall submit scale drawings of the Route Selection and Route Cancel pushbutton boxes he proposes to furnish. These drawings shall include, but not be limited to:
    - a. Enclosure details, including corrosion protection and painting,
    - b. Mounting details,
    - c. Complete, key-numbered parts list including ordering information for all components used for each type of wayside pushbutton layout to be used.
  - 2. The Contractor shall submit drawings and performance data for the pushbuttons and indicating lights he proposes to furnish.

3. The Contractor shall submit a complete Factory Test and Inspection Procedure for each type of pushbutton box assembly.
- B. Prior to shipment of pushbutton box assemblies, the Contractor shall submit Factory Test Reports of the units.
- C. Prior to installation of wayside pushbutton layouts, the Contractor shall submit detailed installation drawings for each pushbutton box and an Installation Inspection Procedure for checking the installation of the Wayside Pushbutton Layouts. The inspection procedure shall be in compliance with the requirements established by Section 16981, Basic ATC Test and Inspection Requirements.

## **PART 2 - PRODUCTS**

### **2.01 ROUTE SELECTION PUSHBUTTON LAYOUT EQUIPMENT**

- A. The route selection pushbutton layouts shall consist of:
  1. A pushbutton box enclosure,
  2. The quantity of pushbuttons and indicators shown on the Contract Drawings,
  3. Identification plates as shown on the Contract Drawings,
  4. Mounting equipment and hardware suitable for each location.

### **2.02 PUSHBUTTON BOX**

- A. Each pushbutton box shall consist of the following:
  1. An oil-tight, weatherproof enclosure,
  2. A quantity of oil-tight industrial pushbuttons and indicator lights, arranged as shown on the Contract Drawings,
  3. Identification plates for the pushbuttons and indicator lights.
- B. Pushbutton boxes shall be adaptable for mounting on columns, concrete walls, pipe masts, or special mounting brackets, as necessary.

### **2.03 ENCLOSURE**

- A. Each pushbutton box shall be a NEMA 4X stainless steel or fiberglass enclosure with a hinged or removable front panel on which the pushbuttons and indication lights shall be mounted.
- B. All enclosures used for route selection pushbutton boxes shall be of the same type.

### **2.04 PUSHBUTTONS**

- A. The pushbuttons for use in the pushbutton box layouts shall:
  1. Be equipped with a red mushroom-shaped actuator,
  2. Have contacts which shall be capable of breaking a load consisting of three vital or non-vital dc relay coils, suppressed as specified elsewhere, connected in parallel and operated at the local DC system voltage, one million times without the contact resistance exceeding 10 ohms as measured at 10 ma,
  3. Have contacts which shall have a mechanical life of at least five million operations,
  4. Be oil-tight and weatherproof,
  5. All be identical.

### **2.05 INDICATOR LIGHTS**

- A. The indicator lights for use on the route selection pushbutton box layouts shall:
  - 1. Be complete with socket, lamp, and plastic color cap,
  - 2. Be transformerless,
  - 3. All be identical.
  
- B. B. The lamps shall:
  - 1. Be clear, type 6S6/dc,
  - 2. Be rated for 120 volt, 6 watt operation,
  - 3. Have bayonet base 11 or approved equal.
  
- C. Color caps shall be white plastic.

## **2.06 IDENTIFICATION PLATES**

- A. Identification plates shall be provided for each pushbutton and each indicator light, as shown on the Contract Drawings.
  
- B. The identification plates shall be:
  - 1. Black with white lettering,
  - 2. Permanently attached,
  - 3. Suitable for use outdoors.

## **2.07 MISCELLANEOUS EQUIPMENT**

- A. Additional equipment required to complete the pushbutton box layout shall be as follows:
  - 1. At locations where any pushbutton or indicator light is more than six feet from the ground or walkway, the Contractor shall provide ladders or polesteps.
  - 2. The ladders or polesteps shall be as specified in Section 16965, Signal Layouts.
  
- B. Where field conditions dictate pole mounting, equipment shall be as follows:
  - 1. A steel pipe post with a cap and all hardware necessary to attach the pushbutton box.
  - 2. A split base. Base can be a split junction box base, as specified in Section 16965, Signal Layouts, or a plain split base. Where a split junction box base is not used, a separate junction box, as specified in Section 16972, is required.
  
- C. Where field conditions dictate wall mounting, the equipment shall be as follows:
  - 1. Brackets suitable for mounting on concrete or cinderblock walls and any extensions necessary to bring the pushbutton box layouts within easy reach of the train operator while seated in the train operator's cab.
  - 2. Suitable bolts, anchors and hardware necessary for a complete installation.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Install pushbutton layouts at the locations shown on the Contract Drawings.
  
- B. The route selection pushbuttons shall be:
  - 1. Right hand mounted with respect to train direction for the signal with which it is associated, unless otherwise specified,
  - 2. Located 10 feet upstream of the signal with which it is associated, unless otherwise specified or specifically authorized by the designated Resident Engineer.
  - 3. Mounted as shown on previously submitted detailed drawings approved by the designated Resident Engineer.

- C. Where local conditions beyond the control of the Contractor make it impossible or unsafe to use the standard specified methods for mounting a wayside pushbutton unit, or where the standard specified mounting would result in sighting problems for the associated signal, the Contractor shall, at no additional cost to the Authority, design an alternate means for mounting the pushbutton unit which is acceptable to the designated Resident Engineer.
- D. Upon receiving the designated Resident Engineer's approval for the design, proceed with the installation of the pushbutton unit in compliance with the approved design.

### **3.02 OPERATION**

- A. The route selection pushbuttons shall operate as specified in Section 16917, Basic Interlocking Requirements, and as shown on the Contract Drawings.

### **3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Wayside pushbutton layouts will be measured for partial payments based upon the number of required pushbutton layouts furnished, installed and accepted.
- B. For measurement purposes, each pushbutton layout shall include all hardware necessary to mount the pushbutton box in an approved manner. External cable used to connect the pushbutton box to the TCR will not be paid for as part of the Wayside Pushbutton Layout, but will be measured for payment separately.
- C. Factors which will be considered when measuring pushbutton layouts for partial payments will include:
  - 1. Delivery of the pushbutton layout material and approval of its factory test reports,
  - 2. Installation of the pushbutton layout by the Contractor, to include all associated circuitry, and approval of the installation and operation by the designated Resident Engineer.

**END OF SECTION**

## SECTION 16967

### ATC - MARKER COIL LAYOUTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of the various types of wayside Marker Coil Layouts required to transfer program station stop data to passing trains at required locations for all mainline tracks in both directions of traffic.
- B. Marker Coil Layouts under this Contract shall be designed, fabricated, located and installed in such a manner that their method of transferring information to the WMATA transit vehicles will be compatible with the method used on previous contracts without requiring any changes in the design or installation of the transit vehicle ATO equipment.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16918 Special ATC Requirements for Specific Locations
  - 2. Section 16924 Non-Vital ATO & ATS Processor Systems
  - 3. Section 16949 Signal Wire and Cable
  - 4. Section 16972 Junction Boxes
  - 5. Section 16976 Wayside Signs
  - 6. Section 16980 ATC Tests, Inspections and Quality Assurance
  - 7. Section 16996 ATC Technical Appendix

##### 1.03 QUALITY ASSURANCE

- A. Factory test Marker Coil assemblies in accordance with his approved Factory Test Procedure for this equipment.
- B. Inspect fully installed Marker Coil Layouts in conformance with the requirements of his approved Installation Inspection Procedure for this equipment.
- C. Conduct operational tests of the Marker Coil Layouts in the manner prescribed in Section 16980.

##### 1.04 SUBMITTALS

- A. Submit, within 120 days of NTP, complete drawings and material ordering information for each component of the Marker Coil assembly equipment proposed to be furnished and installed under this Contract. Details for mounting and wiring this equipment shall be included. The Contractor shall obtain the designated Resident Engineer's approval for this equipment before proceeding with its manufacture or procurement.
- B. Submit, within 120 days of NTP, drawings for each type of Marker Coil Layout required under this Contract. These drawings shall show the type of track construction, the location and mounting details for the coil assemblies, and shall indicate how guard rail (and/or restraining rail) must be cut, where necessary. The Contractor shall also submit a complete listing of all Marker Coil Layouts to be provided, showing the track number, type of layout, the stationing and frequency of each coil assembly, and indicating the amount of offset required, if any.

- C. Submit, within 120 days of NTP, a Factory Test Procedure for the approved Marker Coil assembly equipment. This procedure shall be in conformance with the requirements of Section 16981, Basic ATC Test and Inspection Requirements.
- D. Submit, within 120 days of NTP, an Installation Inspection Procedure for checking the installation of Marker Coil Layouts. This procedure shall be in accordance with the requirements of Section 16981, Basic ATC Test and Inspection Requirements.
- E. Factory Test Reports for Marker Coil assemblies shall be submitted to the designated Resident Engineer prior to shipment of the equipment.

## **PART 2 - PRODUCTS**

### **2.01 COMPONENTS**

- A. Each Marker Coil Layout shall consist of one or two Marker Coil assemblies to include housings, coils, fixed tuning units, mounting hardware, and, where required, a variable tuning unit and the electrical cable and fittings needed to connect this tuning unit to one of the Marker Coils and to the applicable control circuitry in the TCR.
- B. The No. 1 (2700-foot) Marker Coil Layout shall have two fixed-frequency Marker Coil assemblies; the No. 2 (1200-foot) and No. 3 (484-foot) Marker Coil Layouts shall have one fixed and one variable Marker Coil assemblies, and; the No. 4 (160-foot) Marker Coil Layout shall consist of a single Marker Coil assembly having a fixed tuning coil. The frequencies of the various marker coil assemblies shall be as specified herein and as shown on the Contract Drawings.

### **2.02 MARKER COIL ASSEMBLIES**

- A. Each Marker Coil assembly shall consist of a Marker Coil unit mounted in a nonmetallic housing and, when required, a tuning unit for variable tuning of the coil unit. See the Contract Drawings.

### **2.03 MARKER COILS**

- A. Each wayside Marker Coil shall be constructed and wired in such a manner that, when properly installed, its coupling characteristics and the quality factor (Q) of its tuning circuit are adequate to interact correctly with the existing carborne Marker Coil detection equipment.

### **2.04 MARKER COIL HOUSINGS**

- A. The Marker Coil housings shall be constructed of a non-metallic, noncombustible, fiberglass reinforced plastic material, impervious to the effects of sunlight or extremes of temperatures or humidity. The housings shall support a load of 400 pounds and shall withstand, without damage, the impact of a 20-pound lead ball dropped from a height of four feet. The outer surface of the housing shall be skid-resistant. The ends of the Marker Coil housings shall be sloped as indicated on the Contract Drawings.

### **2.05 STATION OVERSPEED MARKER SIGNS**

- A. A Station Overspeed Marker Sign shall be affixed to the housing for each 160-foot platform Marker Coil assembly as specified in Section 16976, Wayside Signs, and as indicated on the Contract Drawings.

### **2.06 COIL TUNING**

A. Marker Coils shall either be tuned to one of eight fixed frequencies or shall be capable of being variably tuned to one of four of these eight fixed frequencies. Each of the wayside Marker Coils shall be identified by a code number which indicates the frequency at which it will cause the carborne Marker Coil detector to oscillate. This code number shall be marked on the exterior of the marker coil housing by means of stenciling or self-adhesive lettering applied on the side nearest the tuning unit. Letter size shall be one-half inch.

B. Fixed Tuning

1. A small capacitor unit shall be attached directly to each of the "fixed frequency" Marker Coils to create a tuned circuit for one of the eight frequencies to be received on board the transit cars within the tolerances indicated as follows:

FREQUENCY CODE NO.		CYCLES	TOLERANCE Plus or Minus
1	=	110KHz	+ 400 Hz-700 Hz
2	=	100KHz	+ 400 Hz-600 Hz
3	=	92KHz	+ 400 Hz-600 Hz
4	=	170KHz	+ 600 Hz-1100 Hz
5	(No longer used)		
6	=	130KHz	+ 500 Hz-850 Hz
7	=	140KHz	+ 500 Hz-900 Hz
8	=	160KHz	+1000 Hz-1050 Hz
9	=	180KHz	+1200 Hz-900 Hz
10	(No longer used)		

C. Variable Tuning

1. Variable tuning of a Marker Coil shall be accomplished by using a tuning unit which shall be controlled by a direct current polarity code transmitted over a three-wire circuit from the TCR. This tuning unit shall be mounted in the marker coil assembly housing and shall tune the marker coil to one of four frequencies based on the received polarity code. The three-wire dc polarity code and the resultant tuning shall be as follows:

POLARITY CODE			CODE	TUNING FREQUENCIES	
Wire Number			NO.	Cycles	Tolerance
<u>1</u>	<u>2</u>	<u>3</u>			Plus or Minus
+	+	common	6	130KHz	650 Hz
-	+	common	7	140KHz	650 Hz
+	-	common	8	160KHz	650 Hz
-	-	common	9	180KHz	650 Hz
Open circuit			9	180KHz	650 Hz

## 2.07 MARKER COMBINATIONS

A. The first or outer coil of each Marker Coil pair shall have fixed tuning and shall convey to the carborne Marker Detection System the following:

Fixed Tuning  
of First Coil

Information Conveyed

Frequency 1	2700 ft. Station Stop Marker
Frequency 2	1200 ft. Station Stop Marker
Frequency 3	484 ft. Station Stop Marker
Frequency 4	160 ft. Platform Marker (single Marker Coil)
Frequency 5	Not Used (formerly a Grade Change annunciator)

B. Where the outer coil is tuned to frequency 2 or 3, as shown above, the second or inner coil of the Marker Coil pair shall have variable tuning and shall be able to convey to the carborne

Marker Detection System the following:

Variable Tuning  
of Second Coil

Information Conveyed

Frequency 6	Skip Stop
Frequency 7	Make Type A stop
Frequency 8	Make Type B stop
Frequency 9	Make Type C stop

- C. Where the outer coil is tuned to frequency 1, the inner coil of the Marker coil pair shall have fixed tuning (frequency 8) and shall, by its location, convey to the carborne Marker Detection System the direction of movement for which the marker layout applies.

**PART 3 - EXECUTION**

**3.01 INSTALLATION**

A. Basic Requirements

- All Marker Coil assemblies shall be installed with the coils centered between the running rails, except that on curves with a radius of less than 8500 feet the coils shall be offset toward the outside of the curve by the appropriate distance indicated by the "Marker Coil Offset vs. Curve Radius" drawing in the Technical Appendix and as shown on the Contract Drawings. All Marker Coil assemblies shall be installed with their tops at least 1/4 inch and no more than 3/4 inch below the top of the running rails. The centers of the coils of a Marker Coil pair shall be located not less than 4 feet nor more than 8 feet apart. Between sets of adjacent Marker Coil pairs, the centers of the closest coils shall be no closer than 12 feet from each other.

B. Station Stop Markers

- In order to achieve the specified accuracy of station stops, the location of the distance-to-centerline coil of the three station stopping Marker Coil pairs and the two single-coil platform Marker Coils (located 160 feet on either side of the station centerline) is critical. The distance-to-centerline coil of each station stopping Marker Coil pair is the outermost, i.e., "upstream" coil of the pair, in relation to the centerline of the station platform.
- The center of the distance-to-centerline coil of each station stopping Marker shall be located at follows:

Marker Designation	<u>Distance From Platform</u>		<u>Tolerance</u>
	<u>Centerline</u>		<u>Plus or Minus</u>
"Platform" (No. 4)	160 feet		½ foot
"484 foot" (No. 3)	484 feet		½ foot (see note)
"1200 foot" (No. 2)	1200 feet		1 foot (see note)
"2700 foot" (No. 1)	2700 feet		1 foot (see note)

NOTE: All efforts shall be made to maintain the above tolerances in order to achieve the desired stopping accuracy. However, upon written permission from the Designated Resident Engineer, a tolerance of up to +20 feet for No. 1 and No. 2 Markers, and -20 feet for No. 3 Markers, will be acceptable when switches or other obstructions prevent exact location of these approach Marker Coils.

- The second or inner coil of each No. 3 (484-foot) Marker Coil pair, and of each No. 2 (1200-foot) Marker Coil pair, shall have variable tuning. The Contractor shall install a cable between each of these Marker Coil assembly tuner units and the TCR via an adjacent wayside junction box. See Sections 16949, Signal Wire and Cable, and

16972, Junction Boxes.

- C. Installation Restrictions and Variations
1. Marker Coils shall not be installed over drains or cable stub-ups.
  2. Where Marker Coil Layouts must be offset from the track center-line in track having guard rails, either the Marker Coil mounting or the guard rail, or both may have to be modified. This modification shall be performed by the Contractor, subject to the prior approval of the designated Resident Engineer. The Contractor shall design specific modifications for each situation involved, and submit the proposed modifications to the designated Resident Engineer for approval. The installation shall be performed by the Contractor in the manner finally approved.
  3. Where Marker Coil Layouts must be installed in track having restraining rail, either the Marker Coil assembly mounting or the restraining rail support mounting, or both, may have to be modified. This modification shall be performed by the Contractor, subject to the prior approval of the designated Resident Engineer. The Contractor shall design specific modifications for each situation involved, and submit the proposed modifications to the designated Resident Engineer for approval. The installation shall be performed by the Contractor in the manner finally approved.
  4. Wherever a turnout closure rail and/or its fastening hardware interferes with the normally specified placement of a No. 3 marker coil layout, the Contractor shall install the marker layout on the centerline of the through (main) track at the first location less than 484 feet from the centerline of the applicable passenger station platform track where it is possible to do so without interfering with the operation of the turnout. No attempt shall be made to provide a separate No. 3 marker layout for trains approaching the passenger station by way of the crossover track.

### **3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Marker Coil Layouts will be measured for partial payments based upon the number and type of complete, individual coil assemblies delivered, installed, and accepted. For purposes of measurement, Marker Coil assemblies of the variable tuning type will not be considered installed until all their controlling circuitry and interconnecting cables have been installed as well.
- B. Factors which will be considered when measuring Marker Coil Layouts for partial payments will include:
1. Delivery of the appropriate Marker Coil assemblies and approval of their Factory Test Reports
  2. Installation of the appropriate Marker Coil Layouts by the Contractor and approval of the installation by the designated Resident Engineer
  3. The number and type (fixed or variable tuned frequency) of individual marker coil assemblies included in the Marker Coil Layouts accepted.

**END OF SECTION**

## SECTION 16968

### ATC - TRACK BONDING LAYOUTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. Negative Return Bonding
  - 1. This Section specifies the furnishing and installation of all negative return bonding required to complete the negative propulsion return system.
- B. Signal Rail Bonding
  - 1. This Section specifies the furnishing and installation of "signal rail" joint, switch jumper, and transposition bonding for power frequency track circuits.

##### 1.02 NEGATIVE RETURN BONDING

- A. Negative Return Bonding is required as follows:
  - 1. Around all negative-return-rail bolted or "glued," non-insulated rail joints in special trackwork areas;
  - 2. To and around trackwork frogs in the negative-return rail, and to isolated pieces of running rail in the frog assemblies;
  - 3. To the heels of negative-return-rail track switch points;
  - 4. As a signal transposition and current-equalizing bond between the stock rails of the diverging tracks at individual main line turnouts using audio frequency track circuits;
  - 5. As a transposition bond in the middle of single crossovers using power frequency track circuits and wherever else the location of negative-return rails must be transposed;
  - 6. As cross bonding between parallel main line track impedance bonds, and between through-track and diverging-track impedance bonds at junction switches;
  - 7. Between impedance bonds and running rails;
  - 8. Between track-mounted negative return device (mole) (usually by others) and impedance bond center tap at substation locations and yard isolation locations;
  - 9. From both ends of segments of restraining rail to their associated running rail;
  - 10. In Audio Frequency Track Circuit territory, from segments of restraining rail to their associated running rail at locations where impedance bonds are connected to the running rails. (Current "balancing" cable (by others) shall also be bonded to its running rail at impedance bond locations);
  - 11. Around all extraneous or abandoned insulated joints in negative-return running rails, whether these joints are indicated on the Contract Drawings or the trackwork drawings or not, and;
  - 12. Between the two closure rails of each turnout adjacent to the turnout frog.
  - 13. At such other locations as necessary to provide an electrically bonded path of adequate capacity for the negative propulsion current around non-insulated, bolted connections in the negative return running rails.

##### 1.03 SIGNAL RAIL BONDING

- A. All signal rail within the limits of power frequency track circuits to be provided under this Contract shall be properly bonded to provide complete power frequency track circuits having the greatest degree of broken-rail protection and shunt detection practicable. This bonding, which is shown on the Contract Drawings, shall meet the following criteria:
  - 1. Provide all signal rail bonding necessary to provide a series path for the track circuit current through the greatest length of signal rail practicable.

2. Do not bond around frogs in the signal rail, but provide signal rail bonding to the ends of the frog castings where necessary, or to frog-flangeway/signal-rails which are continuous through the frog.
  3. Provide signal rail bonds between the extremities of the two legs of the track circuit signal rail which extend to insulated joints beyond each signal frog of a diamond crossover.
  4. Provide all signal rail bonds and transpositions necessary, whether specifically shown on the typical Contract Drawings or not, to produce a single, continuously bonded, maximum-length path through the signal rail and around all bolted or "glued" non-insulated joints in the signal rail.
  5. Where restraining rail is used in conjunction with a signal running rail, bond each end of each individual rail segment of restraining rail to its associated running rail.
- B. Typical signal-rail bonding details are shown on the Contract Drawings. Signal rail bonding connections shall be made as close to the rail joints as practicable to ensure maximum broken rail detection.

#### **1.04 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
- |    |               |  |
|----|---------------|--|
| 1. | Section 16917 | Basic Interlocking Requirements                      |
| 2. | Section 16949 | Signal Wire and Cable                                |
| 3. | Section 16962 | Impedance Bond Layouts                               |
| 4. | Section 16963 | Power Frequency Track Circuit Layouts                |
| 5. | Section 16978 | Miscellaneous Train Control Components and Materials |
| 6. | Section 16980 | ATC Tests, Inspections and Quality Assurance         |

#### **1.05 QUALITY ASSURANCE - NEGATIVE RETURN BONDING**

- A. Upon completion of the installation of Negative Return Bonding at each location, the Contractor shall conduct field inspections of the installation in accordance with pre-approved procedures and furnish documentation of the inspection results, all as specified in Section 16981, Basic ATC Test and Inspection Requirements.
- B. Test each clamped bond, each bolted bond and each welded bond in accordance with the requirements of Section 16980, ATC Tests and Inspections.

#### **1.06 QUALITY ASSURANCE - SIGNAL RAIL BONDING**

- A. Upon completion of the Signal Rail Bonding installation at each location, the Contractor shall conduct field inspections of the installation in accordance with pre-approved procedures and furnish documentation of the inspection results, all as specified in Section 16981, Basic ATC Test and Inspection Requirements.
- B. The Contractor shall demonstrate that the signal rail bonding is in accordance with the requirements specified herein, as shown on the approved installation drawings, and as recommended in Part 8.1.20 of the AREMA Signal Manual.

#### **1.07 SUBMITTALS - NEGATIVE RETURN BONDING**

- A. Prepare and submit detailed installation drawings showing the configuration of negative return bonding for each type of layout encountered. Wherever special, non-standard layout conditions exist, a drawing shall be submitted for each special condition. A list of materials with ordering reference numbers shall be included with each of the submitted drawings.

- B. Submit documentation of resistance tests performed by the Contractor in compliance with Section 16980 to the Designated Resident Engineer within ten days of performance of the required tests.

#### **1.08 SUBMITTALS - SIGNAL RAIL BONDING**

- A. Prepare and submit detailed installation drawings showing the configuration of signal rail bonding for each type of layout encountered. Wherever special, non-standard layout conditions exist, a drawing shall be submitted for each special condition. A list of materials with ordering reference numbers shall be included with each of the submitted drawings.
- B. Submit samples and data for at least two types of protector clips for restraining signal rail joint bonds.

### **PART 2 - PRODUCTS**

#### **2.01 NEGATIVE-RETURN-RAIL JOINT BONDS**

- A. Negative-return-rail joint bonds shall be fabricated for compression bolting to the web of the rails. They shall consist of 500 kcmil size, insulated, ropelay cable, 48 inches long with Burndy type YA34-L terminal lugs on each end, two for each location, except only one for switch point rail heels.

#### **2.02 1000 KCMIL CABLE BONDS**

- A. Each negative return bond used for impedance bond-center-tap-to-running-rail bonding, substation-return bonding, cross-bonding or switch bonding (to include running-rail-transposition bonding at single switches), shall consist of a 1000 kcmil cable which meets the requirements of Section 16949, with an appropriate connector which meets the requirements of these Specifications, on each end, unless otherwise specified herein.
- B. As an alternative to each single 1000 kcmil base-of-rail clamped bond specified for impedance bond-to-running-rail connections, the Contractor may use a prefabricated, dual-500 kcmil bond with an integral connecting lug on one end for attachment to the impedance bond and individual Burndy type YA34-L terminal lugs on the other ends of the two 500 kcmil cables. These two 500 kcmil bond leads shall be separately compression-bolted to the web of the running rail using 5/8-inch diameter fasteners of the appropriate length.

#### **2.03 CABLE-TO-RAIL CLAMPS**

- A. Base-of-Rail clamps for connecting impedance bond leads and other negative propulsion return cables to the running rails shall be sized to accommodate 115 RE rail and 1000 kcmil cable, as shown on the Contract Drawings. Rail clamps shall be Part Number 115-1000, as manufactured by Connector Products, Inc., Camden/Pennsauken, New Jersey, or approved equal.

#### **2.04 COMPRESSION EYE FITTINGS**

- A. Compression-eye type terminal fittings shall be used to attach 1000 kcmil cable to impedance bonds and certain other terminating devices. The compression terminal shall be made of drop-forged copper and formed for compression onto the strands of the cable in accordance with approved methods used by manufacturers experienced in this class of manufacture. Terminals shall be of soft ductile copper, drilled for bolting onto the ears of the impedance bonds or other terminating devices without cracking. Care shall be taken in compressing terminals to strands so as not to reduce the cross section of the conductor or to injure any of the individual strands. The strands, at the point where they leave the terminal, shall be

sufficiently soft to permit being bent to an angle of 90 degrees with the axis of the cable and back to their normal position without breaking. Auxiliary sleeves of the terminal shall be so arranged as not to pinch the wires entering the sleeves. Samples of the terminals shall be submitted for the approval of the designated Resident Engineer before installation.

## **2.05 "T" CONNECTORS**

- A. Copper adapter plates ("T" connectors) for multiple-cable connections to impedance bond center taps shall be fabricated as shown on the Contract Drawings, from 3/4-inch copper bus bar stock of 98 percent conductivity.

## **2.06 WELDED RAIL HEAD NEGATIVE RETURN BONDS**

- A. Prefabricated rail head bonds for welding around joints between consecutive rails shall be 250 kcmil size, 13 inches long, two for each location; as manufactured by Erico Products, Inc., Cadweld Type C bond, or approved equal.
- B. Negative return rail head bonds for welding between adjacent, non-consecutive rails or to frog wing rails shall be 250 kcmil size, of appropriate length for each individual location, with appropriate components as manufactured by Erico Products, Inc., or approved equal.
- C. The welding material shall consist of a copper exothermic mixture appropriate for the types of rail to which the bonds are to be welded.

## **2.07 MISCELLANEOUS NEGATIVE RETURN BONDING HARDWARE**

- A. Bolts, nuts and washers used to connect compression eye fittings to the end and center taps of impedance bonds and to "T" connectors, shall be made of Naval Bronze or Silicon Bronze.
- B. Fasteners for compression-bolted bond connections shall be 5/8-inch diameter compression fasteners, Huck MFG. Co. C50LR-BR20-16 (for two bonds) or C50LR-BR20-12 (for one bond).

## **2.08 SIGNAL RAIL JOINT BONDS**

- A. Non-insulated signal rail joint bonds shall be commercial bonds as manufactured by Erico Rail Transportation Producers Type SBPAJB-"A" or approved equal, consisting of sixteen extra-galvanized steel wires and three copper wires.
- B. Insulated signal rail joint bonds shall be assembled by the Contractor and shall consist of two commercially available track connectors and the required length of insulated cable. The track connectors and cable shall be as close as practicable to the same size/gauge and composition as the non-insulated signal rail joint bonds.
- C. Signal bond wires shall be as recommended in Part 8.1.25 of the AREMA Signal Manual except as otherwise specified herein.
- D. Signal rail switch jumper and transposition bonds shall be as shown on the Contract Drawings.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION OF NEGATIVE RETURN BONDING**

- A. Negative return bond cables shall be connected to the end and center taps of impedance bonds as specified in Section 16962, Impedance Bond Layouts, but only after certain

specified tests (Section 16980) have been made. Each negative return bond shall be installed with a sufficient amount of slack to accommodate rail movement due to expansion and contraction.

- B. Unless otherwise specified, one 1000 kcmil negative return bond (or one dual-500 kcmil bond) shall be installed between each impedance bond end tap and its adjacent running rail. The bond cables for the two ends of each individual impedance bond shall always be of the same size and type and shall be of equal length.
- C. At substation return locations and yard isolation locations, two 1000 kcmil negative return bonds (or two dual-500 kcmil bonds) shall be installed between the impedance bond and each running rail. All four of these bonds shall be of the same size and type and shall be of equal length.
- D. Install a minimum of four 1000 kcmil negative-return bond cables of appropriate length between each substation negative-propulsion-return junction device ("mole" - by others) and a center-tap "T" connector on its adjacent impedance bond. (The mole will be arranged to accept at least eight connections.) The Contractor shall provide and install all necessary connectors, lugs, cables and hardware to make the installation complete between each impedance bond and its appropriate junction device for each return to the substation. The length of each substation negative-return connection shall be kept to the minimum required to reach between the two points without undue strain.
- E. No cross bond shall be provided at a substation return location.
- F. Two 1000 kcmil negative-return bonds (cables) shall be installed in parallel at each cross bond location between main line parallel tracks. One 1000 kcmil negative-return bond (or two 500 kcmil bonds) shall be installed between the center taps of the first impedance bonds of the two diverging tracks of each junction switch. Where applicable, one 1000 kcmil negative-return, base-of-rail clamped bond (or two 500 kcmil compression-bolted rail-web bonds) shall be installed (as a transposition for both signal and negative return purposes) between the "through" running rail and the "isolated" running rail of individual turnouts having AF track circuits throughout.
- G. Provide negative-return bonding around all non-insulated negative-return rail joints and around all extraneous or abandoned insulated joints, both in running tracks and within interlocking limits. Two 500 kcmil insulated cable, compression-bolted rail web bonds (one on each side of the web of the rail) shall be used for this purpose wherever possible. These bonds shall be properly bolted to the center of the web of the rails in the positions indicated on the Contract Drawings. The Contractor shall drill and de-bur 21/32-inch holes at the center-line of the web of rails for the 5/8-inch fasteners.
- H. Should conditions be encountered where it is not practicable to install either compression-bolted bonds or clamped, base-of-rail bonds, appropriate bond connections of the expansion pin type or the welded rail-head type shall be used if specifically pre-approved by the Engineer for that location.
- I. Install all negative return rail joint bonds, rail transposition bonds, and switch, frog, and cross bonds as specified herein. Joint bonds shall be installed close to the ends of the rail joint bars in order to maximize broken rail detection. All 500 kcmil rail bonds shall be compression-bolted to the rail at the centerline of the web of the rail.
- J. For all rail-head and rail-web bonding, the bond terminal lugs and the surfaces of the rails which are to come in contact with the molten metal or the terminal lugs shall be ground clean with a vitrified grinding wheel. The rail brand shall also be ground off in areas where rail-web bolted bonds are to be applied. After grinding, terminal lugs and rails shall be cleaned with Inhibisol, or other approved, non-toxic solvent, to remove all traces of grease and dirt. The

applicator brush shall be kept free of dirt and debris during cleaning operations.

- K. Welded rail-head bonds shall be attached to the rail by an approved exothermic process in such a manner as to ensure the necessary mechanical and electrical connection. The welding mixture shall be appropriate for the type(s) of rail to which the bonds are to be welded.
- L. After thoroughly cleaning the applicable surfaces of the rail and the connector hardware for compression-bolted bonds and base-of-rail clamped bonds, the Contractor shall liberally coat the surface of the copper conductor, and the mating surfaces of the rail and the connector hardware with an anti-oxidation compound before assembly. This compound shall be "Kopr-Shield" Part No. CP128, as manufactured by Thomas & Betts or approved equal. The bond shall then be attached to the rail in such a manner as to ensure the necessary mechanical and electrical connection.
- M. Base-of-rail cable clamps, as shown on the Contract Drawings, shall be installed as per manufacturer's instructions. The torque recommended by the manufacturer shall be applied by torque wrench to ensure the necessary mechanical and electrical connection.
- N. Compression-bolted rail web bonds shall be installed as per the manufacturers instructions, using the recommended equipment to attach properly sized terminating devices to the center of the web of the rail.
- O. Where impedance bond locations do not align properly with substation return layouts; the Contractor shall adjust the bond layout(s) or provide additional equipment and cable as necessary to accomplish the required substation return connections at no additional cost to the Authority.

### **3.02 INSTALLATION OF SIGNAL RAIL BONDING**

- A. Install all signal rail joint bonds, jumpers and transposition bonds as specified herein, in accordance with the manufacturer's instructions, and as shown on the detailed installation drawings submitted by the Contractor and approved by the designated Resident Engineer.
- B. For all signal rail bonding, no hole shall be drilled through the rail brand. Holes shall be drilled perpendicular to the rail by an approved rail drilling machine within plus or minus three-sixteenths inch of the neutral axis of the rail. Holes shall be a maximum of three-eighths inch in diameter. All holes shall be cleaned and deburred before the bonds are installed. Bond wires shall be installed the same day as the hole is drilled. In the event bond wires cannot be installed the same day, the bond hole shall be protected with a suitable plug for protection against the elements. Plugs shall be driven with a hammer approximately three pounds in weight and when in place shall be tight to provide the best possible contact with the drilled surface in the web of the rail. The bond pin shall not be driven to the pin's shoulder. Where a pin is driven to the shoulder, a new hole shall be drilled and a new bond shall be provided. After the bond pin has been driven, a coating of no-oxide grease shall be applied to the surface of the bond where it contacts the rail. Under no circumstances shall any lubricant be applied before the bond has been driven.
- C. Where space does not permit the drilling of the hole into the web of the rail for installation of switch bonds, the hole shall be drilled into the base of the rail as directed and approved by the designated Resident Engineer.
- D. It shall be the Contractor's responsibility to ensure that signal bonding for each given track circuit does not cause the signal rail to become grounded or to contact some extraneous energy source or the signal rail of another track circuit. Where such a possibility exists, the

Contractor shall use insulated signal bonds, or shall take such other approved action as may be necessary to prevent such contact, at no additional cost to the Authority.

- E. Any signal bond which is found to be defective, shall be removed and a new bond shall be installed at no additional cost to the Authority.
- F. Signal rail joint bonds shall be held in place by a protector clip of a type which has been approved by the designated Resident Engineer.

### **3.03 MEASUREMENT FOR TRACK BONDING PARTIAL PAYMENTS**

- A. For measurement purposes only, negative return bonding and signal rail bonding will include all electrical fittings, bonds, and cable used for this purpose, and all labor and miscellaneous material and equipment required to make the required connections as specified.

### **3.04 PARTIAL PAYMENTS**

- A. Factors which will be considered when measuring track bonding for partial payments will include:
  - 1. The proportional amounts of the required types of bonding shown in the Contract Drawings which has been properly installed and accepted.
  - 2. Proper installation of negative return bonding for all extraneous unbonded or improperly bonded rail joints not shown in the Contract Drawings, if any.

**END OF SECTION**

## SECTION 16969

### ATC - SNOWMELTER LAYOUTS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of snowmelter layouts for all track switches within the limits of this Contract which are located out-of-doors or have their switch points located within 100 feet of a tunnel portal. These locations are indicated on the Contract Drawings.
- B. Each snowmelter layout shall consist of:
  - 1. a contact rail fuse box;
  - 2. two tubular electric heating elements (switch point snowmelters) for attachment to the stock rails of turnouts in the switch point area
  - 3. two power-limiting (auto-therming) switch rod heater units for installation under the throw rod and lock rods;
  - 4. a snowmelter control unit (case) for the wayside control and indication of the snowmelters and switch rod heaters, and;
  - 5. all external signal cable, conduit, rail connections and other miscellaneous hardware required to mount this equipment and to interconnect it with the TCR as specified herein and as shown on the Contract Drawings.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16916 Basic ATC Circuit Requirements
  - 2. Section 16918 Special ATC Requirements for Specific Locations
  - 3. Section 16923 TC Maintenance Telephone System
  - 4. Section 16932 Spare ATC Equipment and Selectable Items
  - 5. Section 16941 Basic ATC Electrical and Electronic Components
  - 6. Section 16949 Signal Wire and Cable
  - 7. Section 16956 Interlocking Control Panels
  - 8. Section 16964 Track Switch Operating Layouts
  - 9. Section 16973 Conduit
  - 10. Section 16974 Locks and Keys
  - 11. Section 16975 Foundations
  - 12. Section 16977 Tagging and Marking
  - 13. Section 16978 Miscellaneous Train Control Components and Materials
  - 14. Section 16980 ATC Tests, Inspections and Quality Assurance

##### 1.03 QUALITY ASSURANCE

- A. Each snowmelter heating element, switch rod heater unit, snowmelter control case, and contact rail fuse box shall be factory tested. The factory tests for these items shall be conducted in accordance with procedures previously submitted by the Contractor and approved by the designated Resident Engineer.
- B. As part of its factory test, each switch point snowmelter heating element shall meet the following requirements:
  - 1. Each element must withstand a potential of 900 volts DC, applied between conductor and sheath, for 30 seconds, at an ambient temperature of 75 degrees Fahrenheit,

- without breakdown of, or mechanical or electrical injury to the heater element or its terminal connections.
2. Each element shall provide uniform heating of 400 watts ( $\pm 3\%$ ) per foot of active length when energized at 750 volts DC.
  3. Before shipment, each switch point heating element shall be completely submerged in water under hydrostatic pressure of 100 psi for 1/2 hour. Immediately upon removal from the water, the heating element must have insulation resistance of at least 1,000 megohms.
- C. As part of its factory test, each switch rod heater unit shall meet the following requirements:
1. Power Output
    - a. The heaters shall provide a minimum power output of 90 watts per square foot of top surface (100 watts nominal) when powered at 785 volts  $\pm 5$  percent when horizontally immersed in a 32 degrees F water-ice bath.
  2. Dielectric Withstanding Voltage
    - a. When tested as specified in MIL-STD-202, Method 301, the heater element shall withstand 5000 VDC for not less than one minute when immersed in tap water containing 0.1 to 0.5 percent wetting agent. The test voltage shall be applied between the heater power leads (connected together) and a ground electrode placed in the tap water bath. This test may be performed on the heater element either before or after assembly in the steel case.
  3. Self-Limiting Test
    - a. The heater shall be powered at rated voltage for a period of not less than one hour surrounded by not less than the equivalent of one inch of fiberglass insulation. Following the test, the heater shall continue to meet the previously described power output and dielectric withstanding requirements, unless otherwise specified. There shall be no burning, charring, or other permanent damage.
  4. Maximum Surface Temperature
    - a. During the Self-Limiting test (specified in Part 1.03- C.3. above), the maximum temperature indicated by a thermocouple attached to the top surface of the heater shall not exceed 212 degrees F, unless otherwise specified.
  5. Terminal Strength
    - a. The heater lead wires shall withstand a lead pull test of not less than 50 pounds.
  6. Insulation Resistance
    - a. Before shipment, each switch point heater submerged in water under hydrostatic pressure of 100 psi for one-half hour. Immediately upon removal from the water, the heater must have insulation resistance of at least 1,000 megohms.
- D. Record the results of these tests on the prescribed Factory Test Report forms for submittal to the designated Resident Engineer. Only those heating elements, fuse boxes, and control cases for which Factory Test Reports have been approved by the designated Resident Engineer shall be shipped to the job site.
- E. Each snowmelter heating element, switch rod heater unit and contact rail fuse box shall be inspected immediately prior to installation of the snowmelter layouts. Only those heating elements, rod heater units, control cases, and fuse boxes which have suffered no damage due to shipment and handling shall be installed.
- F. Quality assurance for snowmelter control case units shall be conducted as follows:
1. Factory Test

- a. The Contractor shall factory test each snowmelter control case as prescribed in a test procedure previously approved by the designated Resident Engineer, to assure mechanical, electrical and operational conformance with the requirements of these Specifications. The Contractor shall record the results of these tests on the prescribed Factory Test Report forms for submittal to the designated Resident Engineer. Only those cases for which Factory Test Reports have been approved shall be shipped to the job site.
  - b. Field Inspection
    - 1) Inspect each snowmelter control case after it has been delivered to the job site. Only those cases which have sustained neither external nor internal damage during shipment and handling shall be installed.
  - c. Final Operational Test
    - 1) The final operational test for snowmelter control cases shall be conducted as part of the field testing of snowmelter layouts. See Section 16980, ATC Tests, Inspections and Quality Assurance.
- G. Each completely installed Snowmelter Layout shall be field tested in conjunction with the snowmelter control and indication equipment located in the Train Control Rooms. See Section 16956, Interlocking Control Panels.
- H. Conduct the field test for Snowmelter Layouts in accordance with a field test procedure previously submitted by the Contractor and approved by the Engineer.
- I. The field test shall include, but not be limited to, verification of the following:
- 1. All components of the snowmelter layouts are wired and terminated properly.
  - 2. The snowmelter control contactors function properly in response to the control devices in the Train Control Rooms.
  - 3. The snowmelter heating elements and switch rod heater units function properly in response to the closing and opening of the contactor contacts.
  - 4. The snowmelter current monitors and indication relays function properly in response to energization of the snowmelter heater elements and switch rod heater units.
  - 5. The snowmelter case heater units and their control circuits function properly.
  - 6. All safety devices included in the snowmelter layouts, such as fuses and the door interlock, function properly.
  - 7. Each Snowmelter Malfunction indication circuit functions properly.

#### **1.04 SUBMITTALS**

- A. Submit the following for approval by the designated Resident Engineer prior to purchase or fabrication of the items described and within 120 days of NTP:
  - 1. Performance data for the proposed switch point snowmelter heating elements and switch rod heater units.
  - 2. Drawings showing the physical characteristics of the proposed switch point snowmelter heating elements and switch rod heater units, and the details of proposed mounting and wiring of these devices.
  - 3. Drawings showing the physical characteristics of the proposed Contact Rail Fuse Box.
  - 4. Mechanical and assembly drawings of the proposed control case housing and all major components housed therein, to include the internal arrangement plan and mounting hardware.
  - 5. Catalog cuts and complete performance data for the proposed snowmelter control contactors and current monitoring devices.

6. Circuit drawings, arrangement plans, and wiring diagrams for all internal wiring of the proposed cases.
  7. A Factory Test Procedure for the proposed cases.
- B. Submit factory test procedures for switch point snowmelter heating elements, switch rod heater units, snowmelter control cases and contact rail fuse boxes to the designated Resident Engineer for approval prior to factory testing of these devices.
  - C. Submit factory test reports for switch point snowmelter heating elements, switch rod heater units, snowmelter control cases and contact rail fuse boxes to the designated Resident Engineer for approval within two weeks of the date such tests are performed. These devices shall not be shipped from the factory until the designated Resident Engineer's approval of their respective factory test reports has been received by the Contractor.
  - D. Submit complete circuit and installation drawings for the control, operation, and indication of the snowmelter layouts prior to the installation of these layouts. These circuits and installation layouts shall be as indicated on the Contract Drawings unless otherwise approved by the designated Resident Engineer.
  - E. Submit calculations used to determine the amperage ratings for the current monitors to be used in the Snowmelter Control cases.
  - F. Submit a complete field test procedure for snowmelter layouts to the designated Resident Engineer for approval prior to installation of the layouts.
  - G. Submit a field test report for each snowmelter layout installed.

#### **1.05 SHIPPING AND HANDLING**

- A. All snowmelter heating elements furnished under this Contract shall be packed, shipped and handled in such a manor that they are delivered to the Authority work site and installed without bends, kinks or any other damage.
- B. All snowmelter layout parts furnished by the Contractor which are damaged in the course of shipment, handling or installation, shall be replaced by the Contractor at no additional cost to the Authority.

### **PART 2 - PRODUCTS AND MATERIALS**

#### **2.01 SWITCH POINT SNOWMELTER HEATING ELEMENTS**

- A. The snowmelter heating elements shall be of the incoloy sheathed tubular element type designed to operate at 750 volts DC  $\pm 20$  percent with a uniform heat dissipation rating of 400 watts per foot of active length.
- B. Each heating element shall be 0.475 inch in outside diameter,  $\pm 0.005$  inch, with the sheath to be incoloy 800 with a wall thickness of 0.030 inch,  $\pm 0.005$  inch.
- C. Each heating element for a No. 10 switch layout shall have two anti-creep collars, each 2 inches long and 5/8 inch  $\pm 1/16$  inch in diameter. One collar shall be located with its center 11 inches from the midpoint of the active length of the heating element and the other collar shall be located at the midpoint of the active length of the heating element. Each heating element for a No. 8 switch layout shall have one anti-creep collar located at the midpoint of the active length of the heating element.

- D. Each heating element shall be equipped with terminal connectors of the neoprene quick disconnect type with positive locking action. Each terminal connector shall be 7/8 inch in diameter and have an overall length of 8-1/4 inches. Terminals on heating element ends shall be male probe (female sheath), Chromalox Part #070-055910-001. These terminals shall be waterproof and shatterproof (as per MIL specification MIL S-TD-202, Method 107, Condition B), mate with Chromalox connector #070-055909-001 and be able to withstand the following test: Immersion in water for 240 hours while vibrating at 70 CPS to 80 CPS and while maintaining a minimum insulation resistance of 17 megohms.
- E. Two 8-foot, #6 AWG, flexible, rubber-insulated, neoprene sheathed connection cables shall be provided with each snowmelter heating element. The cable insulation shall be of heat-resistant rubber compound 3/32 inch thick covered with a 1/32 inch thick jacket of oil-resistant, neoprene based compound. The cable shall be Type DEL 018-2000V, as manufactured by the Okonite Company. Each connection cable shall be equipped with a mating female connector (male sheath), Chromalox Part #070-055909-001.
- F. Both the male and female mating Chromalox connectors on the switch point heaters and connecting cables shall have "DANGER 750 VOLTS" laser-etched into the connector in 3/4 inch high letters. The letters shall be painted with a non-oxidizing red paint. The type (size) of switch layout each calrod is designed for shall also be indicated in an identical manner (laser-etched in 3/4 inch high letters, painted red) on one of the rod's Chromalox connectors, e.g., "10" for a number 10 turnout.
- G. The active length of snowmelter heating elements shall be approximately one foot less than the length of the switch points for which they apply, as shown on the Contract Drawings.
- H. Snowmelter Heating Elements provided under this Contract shall be Chromalox switch point heaters designed specifically for WMATA applications, Chromalox Drawing "Track Switch Heater for WMATA".

## **2.02 SWITCH ROD HEATER UNITS**

- A. Each Switch Rod Heater Unit shall consist of an autotherming polymeric resistive element on top of a layer of foam insulation, all enclosed in a thin sheet metal case which shall provide heat conducting and radiating surfaces. The case shall be made of 16 gauge, zinc plated, bonderized steel and painted with bright, safety-yellow epoxy paint. The self-regulating conductive polymer heating element shall have a non-linear positive temperature coefficient of resistance which shall limit the heater power output and the maximum heater temperature attained.
- B. The Switch Rod Heater Unit case shall be no more than one inch thick nor seven inches wide. Cases for Switch Rod Heater Units to be installed in ballasted track areas shall be six feet long. Cases for Switch Rod Heater Units to be installed in direct fixation track areas, i.e., on concrete slab, shall be 4.5 feet long.
- C. The Switch Rod Heater Units shall be rated for operation at 750 volts dc  $\pm$ 20 percent, and shall not be damaged when subject to operation at voltages up to 900 volts dc.
- D. All terminations and connections shall be water tight, and the leads shall be secured to the case with strain reliefs.
- E. Each Switch Rod Heater Unit shall have two six-foot, 1000-volt, flexible leads of No. 10 AWG copper cable of the type specified in Section 16949, Signal Wire and Cable. Each lead shall terminate in the male portion (female sheath) of an insulated quick-disconnect plug and socket connector, Chromalox Part #070-055910-001. The female portion of each of the two

quick-disconnect connectors (Chromalox Part #070-055909-001) shall be provided with a 15-foot pigtail of flexible No. 10 AWG, 1000 volt class copper cable, one to be used as the permanent negative return connection, and the other to be spliced to the power feed wire emanating from the snowmelter control case, all as shown on the Contract Drawings.

- F. The switch rod heater units shall provide a minimum power output of 80 watts per square foot of top surface (100 watts normal) when powered at 750 +/-10 volts dc with the top surface exposed to an ambient temperature of 32 degrees Fahrenheit.
- G. Each heater unit case shall bear the following legend on its top surface in three-inch high red letters:
  - 1. DANGER - HIGH VOLTAGE - THIS SIDE UP
- H. The manufacturer's name and part number shall be painted on the top surface of the case in one-inch high letters.
- I. Switch Rod Heater Units provided under this Contract shall be type GPR-SL-PL72C (for ballasted track), or GPR-PL54C (for direct fixation track), as manufactured by Thermon Manufacturing Company of San Marcos, Texas, or an approved equal.

## **2.03 SNOWMELTER CONTROL UNITS**

- A. Each Snowmelter Control Unit shall consist of a fiberglass case containing all the components specified herein to control and indicate the operation of the snowmelter heating elements and switch rod heater units for a maximum of two track switches.
- B. Case Housing
  - 1. The housing for all snowmelter control cases shall be of weatherproof design and single-door, fiberglass construction not exceeding 28 inches in width. The thickness of the housing walls shall be one-eighth (1/8) inch minimum, with the door and back being one-quarter (1/4) inch thick. The finish of the housings shall be Pleogen 2907 ISO Gel-Coat, or similar polyester base material, in a thickness of 15 to 20 mils. The outside color shall be light gray. The inside color shall be white.
    - a. Door and Hinge
      - 1) Each snowmelter control housing door shall be fastened to its housing with a minimum 16 gauge stainless steel hinge continuous over the full height of the door. The hinge shall be concealed when the door is closed. A print pocket shall be mounted on the inside of the door. The door shall swing through an angle of 90 degrees. A latching device shall be provided to hold the door in its fully open position.
    - b. Door Latch and Interlock
      - 1) The door for each snowmelter control housing shall be equipped with a latching mechanism of a three-point lock design. The handle for this mechanism shall be designed for the use of a standard WMATA padlock. The housing shall be equipped with an interlock device which shall, whenever the door of the control case is opened, disconnect both sides of the circuit which remotely controls the snowmelter contactors. The plunger of the door interlock device shall bear against and be depressed by a solid surface on the housing door when the door is closed.
    - c. Ventilators
      - 1) Each housing shall be equipped with at least two ventilators. Each of the ventilator openings shall be hooded or protected by a rain guard on the outside and shall be covered with a fine mesh

screening of stainless steel, copper or brass on the inside. These ventilators shall be so designed and located that an object cannot be inserted through the vent and make straight line contact with energized components inside the housing.

d. Backboard

- 1) A non-metallic, fire-resistant backboard panel shall be mounted on fiberglass channels inside the housing to support the snowmelter control and indication equipment.

2. Uniformity

- a. All snowmelter control housings provided under this Contract shall be of the same size and external appearance.

3. Type

- a. Snowmelter control case housings shall be of a type approved by the designated Resident Engineer, as manufactured by Robroy Industries of Belding, Michigan, or approved equal

C. Contactors

1. Each snowmelter control case shall be equipped with two 2-pole contactors having normally open contacts. The contactors shall be so designed that arcing between their contacts shall be suppressed and voltage breakdown between their coils and contacts is precluded. All snowmelter contactors installed shall be identical in size and rating. The two contactors in each housing shall be wired in parallel as shown on the Contract Drawings.

2. The snowmelter control contactors shall have coils suitable for operation from a 120 Vdc source, but shall be capable of successful continuous operation without resultant damage at voltages of 140 volts plus-or-minus 15 percent. The contactor coil shall have a nominal resistance of 750 ohms. The coil of each contactor shall be equipped with arc suppression which shall prevent the load presented to a relay contact controlling that contactor from exceeding the following values during steady state or switching conditions:

- |                             |             |
|-----------------------------|-------------|
| a. Maximum volt-ampere load | 100 VA      |
| b. Maximum load current     | 2.25 amps   |
| c. Maximum switched voltage | 75 volts DC |

3. Contacts

- a. Each contactor contact shall be able to control 8,000 watts of heater element load continuously without resultant damage at 550 to 900 volts DC, and shall be rated for operation at 1000 volts DC maximum.
- b. Snowmelter contactors shall be 60 Amp. 750 Vdc, Part No. LTHS60, as manufactured by *Microelettrica Scientifica*, or approved equal.

D. Snowmelter Current Monitoring Devices

1. One current monitoring device shall be provided for each snowmelter heating element/switch rod heater unit combination controlled from each snowmelter control case.
2. Each of these monitoring devices shall have a normally open contact which shall be used in a low voltage indication circuit.
3. Each of these units shall monitor the current flow in the snowmelter heating element/switch rod heater unit combination it is to indicate. Its contact shall be closed only when its snowmelter/rod heater combination is drawing at least its normal working current.
4. Each current monitoring device shall be insulated for 1000 volts between its operating and indicating components.
5. Snowmelter current monitoring devices shall be DC Current Monitors, Series 930400 of appropriate amperage as manufactured by Gort Electronics Company, or approved equal.

- E. Case Heaters
  - 1. Each snowmelter control case shall be equipped with two 100 watt, 500 ohm, 120 volt insulated strip heaters, wired in parallel and mounted as shown on the Contract Drawings to control moisture condensation within the housing.
- F. Local Disconnects
  - 1. Provide a manual knife switch (rated at 1000 volts DC, 100 amps) in an insulated enclosure to enable maintenance personnel to control all high voltage energy to the case, as indicated on the Contract Drawings.
  - 2. Provide an enclosed 250 volt manual breaker switch disconnect for the case heaters, mounted in the case as indicated on the Contract Drawings.
- G. Fuses
  - 1. All fuses used in snowmelter control cases shall be of the non-renewable, fiber or fiberglass case, time-lag, fusion type, rated for 1000 volt operation.
  - 2. The snowmelter contactors and current monitors shall be protected by 1,0 amp, 1000 volt fuses as shown on the Contract Drawings.
  - 3. One 10 amp, 1000 volt fuse shall be provided for each No. 8 switch point/switch rod heater element combination controlled from the case, and one 15 amp, 1000 volt fuse shall be provided for each No. 10 switch point/switch rod heating element combination.
  - 4. Fuses shall be Gould-Shawmut A100X form 101 type 4, as manufactured by the Gould-Shawmut Company, of Newburyport, Massachusetts.
- H. Wire
  - 1. All snowmelter control case internal wiring shall be insulated for 1000 volts and shall meet the applicable requirements specified in Section 16949, Signal Wire and Cable.
  - 2. Low voltage control, indication and communication wiring shall be run separately from all the 750 volt heater element wiring.
- I. Terminals
  - 1. Solderless screw type terminals of the appropriate size shall be provided at the bottom or on the hinge side of the control case backboard for the 750 volt wiring terminations.
  - 2. Standard AAR binding post terminals shall be provided at the top of the latch side of the control case backboard for the low voltage control, indication, case heater, and communication wiring terminations.
- J. Telephone Jack
  - 1. A Train Control Maintenance telephone jack with a weatherproof external jack cover shall be mounted in the latch side of each snowmelter control case as specified in Section 16923, TC Maintenance Telephone System, and as shown on the Contract Drawings.
  - 2. This telephone jack shall be of the type specified in Section 16923, and shall be wired as shown on the Contract Drawings.

#### **2.04 CONTACT RAIL FUSE BOX**

- A. One contact rail fuse box shall be provided to feed each snowmelter control case required.
- B. Each contact rail fuse box shall be constructed of one-half inch minimum thickness of GPO-3 grade fiberglass laminate, or material of equal strength and insulating quality, rated for maximum service voltage of 1200 volts.

- C. The fuse box shall be equipped with fuse clips for an appropriately sized, 1000 volt Gould-Shawmut Type 4 fuse.
- D. The fuse box shall be so constructed that the lifting of the cover shall open the circuit by removing the fuse.
- E. The openings for cable entering and leaving the box shall be equipped with water-tight seals and strain-relief devices for the cables.
- F. Both sides of the contact rail fuse box shall be permanently and prominently labeled, "DANGER - 750 VOLTS". In addition, an embossed metal tag which identifies which track switch(es) snowmelters the fuse box serves shall be fastened securely to one side of the box.
- G. Contact Rail Fuse Boxes to be provided under this Contract shall be Fused Disconnect, Part No. 350000-8X (up to 60 Amp fuse) or Part No. 350000-9X (60-150 Amp fuse), as manufactured by UniTrac Systems Inc., 100 Impulse Way, P.O. Box 889, Mount Olive, NC 28635, or approved equal.

## **2.05 WIRE AND CABLE**

- A. Wire and cable for snowmelter layouts shall be as specified in Section 16949, Signal Wire and Cable, and as shown on the Contract Drawings unless otherwise specified. All heater element and switch rod heater unit wiring shall be insulated for 1000 volts.

## **2.06 CONDUIT**

- A. Conduit used to protect snowmelter wire and cable surface runs in direct-fixation areas, and for entrance to the snowmelter control cases, shall be schedule 80 PVC or fiberglass reinforced epoxy (FRE), as specified in Section 16973, Conduit, and as shown on the Contract Drawings.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION OF SNOWMELTERS**

- A. Install all snowmelter heating elements on the field side of the stock rails in a manner which meets the following requirements:
  - 1. The heater shall be located on the stock rail with the active part extending from two feet ahead of point-of-switch to the vicinity of the heel block.
  - 2. The heater shall be secured to the lower half of the web of the rail by means of supports spaced 18 inches to 24 inches apart (except at the anti-creep collar). One support shall be located on the rail ahead of the switch point. Special support clamps shall be provided for securing the heater half of the separable connectors to the rail in such a manner that the alignment rib on the connector is visible.
  - 3. A heater support shall be placed against each end of the anti-creep collar on the heater to prevent longitudinal movement. All other supports shall be arranged to allow longitudinal movement of the heater as a result of expansion and contraction.
  - 4. All supports shall be secured by means of 3/8 inch corrosion-resistant bolts.
  - 5. Drill 13/32 inch holes in the web of the stock rails (at the neutral axis) for the 3/8 inch bolts used to secure the heater support clamps and terminal housing support clamps. The bolts shall be inserted from the gauge side of the rail with the washers and nuts installed on the field side of the rail.

6. Leads between the heating elements and the control case shall be so located as to minimize possible damage. Where necessary, mechanical protection shall be provided.
- B. The Contractor shall be responsible for the removal and replacement of rail wedges where necessary. This shall include returning the rail and wedges to their initial adjustments.

### **3.02 INSTALLATION OF SWITCH ROD HEATER UNITS**

- A. Install Switch Rod Heater Units and all associated control, operation and indication wiring as specified herein and as indicated on the Contract Drawings.
- B. Two Switch Rod Heater Units shall be provided as part of each Snowmelter Layout. One unit shall be installed under the switch throw rod and the other unit shall be installed under the switch lock rod.
- C. In ballasted track areas, the Contractor shall remove the ballast to the level of the bottom of the ties in the two cribs under the switch rods, and in a direct line beyond these cribs to provide a drainage path for the crib.
- D. The heater units shall be centered in each crib, with the energy leads located on the end away from the switch machine, as indicated on the Contract Drawings. The distance from the bottom of the switch rod to the top of the heater unit shall not exceed two inches.
- E. Plug-connect the heater units to their appropriate energy and negative-return leads and secure the leads and plug connectors to the ties, or to the surface of the concrete slab, as applicable, to prevent the leads from catching on carborne equipment or presenting a tripping hazard to maintenance personnel, all as indicated on the Contract Drawings. There is no "polarity" requirement for the individual switch rod heater units, but each unit must be connected in parallel with a snowmelter heating element. See paragraph 3.06-C.
- F. Install tie straps or brackets of a design approved by the designated Resident Engineer above each crib containing a Switch Rod Heater Unit to prevent the heater unit from being drawn upward out of the crib by suction created by passing transit cars.
- G. Each Switch Rod Heater Unit for a given switch shall be wired in parallel with one of the Snowmelter Heating Elements for that switch, all as indicated on the Contract Drawings.

### **3.03 INSTALLATION OF SNOWMELTER CONTROL UNIT**

- A. Each snowmelter control unit shall be located more than ten feet from other signal and electrical equipment, if practicable, but no closer than six feet from other signal and electrical equipment, and no more than 75 feet from the snowmelter heating elements and switch rod heater units it controls.
- B. Snowmelter control cases shall be mounted on foundations of the type specified in Section 16975, Foundations.
- C. The snowmelter control cases shall be mounted with the front, back and sides vertical and the top and bottom horizontal, all within a tolerance of 1/8 inch.
- D. The cases shall be installed in such a manner that their doors shall open, close, seal and lock properly without binding.

- E. Upon installation, each snowmelter control case shall be locked with a padlock of the type specified in Section 16974, Locks and Keys.
- F. Snowmelter control cases shall be so located that no part of the case including its open door, can intrude upon the clearance envelope of the transit vehicles.

### **3.04 SNOWMELTER CONTROL CASE CONNECTIONS**

- A. Make two openings in the bottom of each snowmelter control case and install vertical conduit to protect external wiring as shown on the Contract Drawings. Install all high voltage wiring in the conduit near the hinge side of the case and all low voltage control, indication and communication wiring in the conduit near the latch side of the case.

### **3.05 INSTALLATION OF FUSE BOX**

- A. The contact rail fuse box shall be installed as indicated on the Contract Drawings.

### **3.06 RAIL CONNECTIONS**

- A. The snowmelter energy supply cable to the contact rail fuse box shall be connected to the power third rail by means of an exothermic weld as shown on the Contract Drawings.
- B. The negative return lead for each snowmelter heating element shall be connected to the neutral axis of the nearest negative propulsion return rail by means of an exothermic weld as shown on the Contract Drawings.
- C. The negative return lead for each switch rod heater unit shall be connected to the neutral axis of the same negative propulsion running rail as the negative return lead of its parallel-connected snowmelter heating element, or to the nearest impedance bond center tap in the applicable track. Under no circumstances shall the negative return lead for a switch rod heater unit be connected to the opposite running rail from the negative return lead of its parallel-connected snowmelter heating element.

### **3.07 IDENTIFICATION**

- A. The identification letters "SM" and the number(s) for each snowmelter layout controlled from that case shall be stenciled on both the inside and outside of the case door. (The identification number(s) shall correspond to the number(s) of the track switch(es) for which snowmelters are controlled from that case.) The lettering shall be at least two inches high. This stenciling shall be in addition to the embossed metal name tag required on the outside of the case door.
- B. The positive and negative leads of each snowmelter heating element, switch rod heater unit, and both high voltage cables emerging from the contact rail fuse box shall be provided with brass tags engraved with the legend "DANGER - 750 VOLTS".
- C. The brass tags shall be securely attached to the power cable or wire with No. 14 AWG stainless steel wire in such a manner that the insulation on the power leads is not damaged.
- D. Each contact rail fuse box shall have an approved type of label or stencil applied to an outside end of the box, designating the number(s) of the applicable track switch snowmelter layout(s) energized from that box.

### **3.08 SURFACE MOUNTED CONDUIT**

- A. When Snowmelter Layouts are installed in direct-fixation track construction areas, in tunnels or outdoors, the Contractor shall install heavy duty fiberglass reinforced epoxy (FRE) conduit on the surface of the concrete slab in a manner approved by the designated Resident Engineer to protect the external snowmelter cable runs.
- B. Dedicated conduit runs shall be provided for high-voltage snowmelter energy cables.

### **3.09 DOCUMENTATION**

- A. Place a complete, AS-BUILT set of drawings for the applicable snowmelter layout(s) in the print pocket on the door of each snowmelter control case.

### **3.10 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. For measurement purposes only, each Snowmelter Layout will be considered to consist of a contact rail fuse box, a snowmelter control unit complete with foundation, all the switch rod heater units and tubular electric rail heating elements controlled from that snowmelter control case, and all cable, conduit, rail connections and miscellaneous hardware and labor required to mount and interconnect the above items with the TCR and the snowmelter control case as specified. Snowmelter Layouts will not be measured for payment as such.
- B. For measurement and payment purposes, each Snowmelter Control Unit will be considered to include the furnishing and installation of a housing containing all field components and internal wiring necessary for the control and indication of up to four snowmelter heating element/switch rod heater unit combinations (as required) in the manner specified herein. Snowmelter control units will be measured for partial payments based upon the number and type of such units delivered and properly installed, and upon approval by the designated Resident Engineer of the installation and testing.
- C. For measurement and payment purposes, each contact rail fuse box will be considered to consist of the unit described in Part 2.04 of this Section installed as shown on the Contract Drawings. Contact rail fuse boxes will be measured for partial payments based upon the number of such units delivered and properly installed, and upon the approval by the designated Resident Engineer of the installation and testing.
- D. External cable, foundations, conduit and padlocks used as part of Snowmelter Layouts, and final field testing of Snowmelter Layouts will be measured for partial payments separately as described in the Specification Sections describing those items.
- E. Factors which will be considered when determining partial payments for Contact Rail Fuse Boxes, Snowmelter Control Units, Snowmelter Heating Elements and Switch Rod Heater Units will include the following:
  - 1. Delivery of each approved item by the Contractor and approval of its Factory Test Report by the designated Resident Engineer.
  - 2. Complete installation of the respective items by the Contractor in the manner specified, and approval of the installation by the designated Resident Engineer.
  - 3. Level E partial system acceptance by the Authority of the interlocking involved.

**END OF SECTION**

## **SECTION 16970**

### **ATC MECHANICAL COMPONENTS** (Table of Contents)

#### **PART 1 - GENERAL**

##### **1.01 SECTION INCLUDES**

- A. This SECTION lists the various 16970-series ATC Mechanical Components Specification Sections:
- |    |  |                 |
|----|--|-----------------|
| 1. | Racks and Cable Trays                                | (Section 16971) |
| 2. | Junction Boxes                                       | (Section 16972) |
| 3. | Conduit  | (Section 16973) |
| 4. | Locks and Keys                                       | (Section 16974) |
| 5. | Foundations  | (Section 16975) |
| 6. | Wayside Signs  | (Section 16976) |
| 7. | Tagging and Marking                                  | (Section 16977) |
| 8. | Miscellaneous Train Control Components and Materials | (Section 16978) |
| 9. | Surface Trench                                       | (Section 16979) |

#### **PART 2 - PRODUCTS** NOT USED

#### **PART 3 - EXECUTION** NOT USED

**END OF SECTION**

## SECTION 16971

### ATC - RACKS AND CABLE TRAYS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. Racks:
  - 1. This Section specifies the furnishing and installation of free standing, shock mounted metal racks in the Train Control Rooms to support various types of ATC equipment. Three basic types of racks shall be provided as follows:
    - a. Entrance racks
    - b. Power Racks
    - c. Equipment Racks
  - 2. Cable Trays:
- B. This Section specifies the design, furnishing, installation and inspection of cable tray systems above and adjacent to racks in and about the Train Control Rooms and at such other locations as they may be required.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16911 Scope of ATC Work
  - 2. Section 16915 Basic Equipment Requirements
  - 3. Section 16921 ATC Power Distribution Systems
  - 4. Section 16922 Lightning/Surge Protection and Grounding Systems
  - 5. Section 16923 TC Maintenance Telephone System
  - 6. Section 16945 Plugboards and Cabinets for Relays and PC Cards
  - 7. Section 16948 Plug Connectors
  - 8. Section 16949 Signal Wire and Cable
  - 9. Section 16977 Tagging and Marking
  - 10. Section 16980 ATC Tests, Inspections And Quality Assurance

##### 1.03 QUALITY ASSURANCE

- A. Factory test all racks as prescribed by the factory test procedure previously approved by the designated Resident Engineer.
- B. Conduct a field inspection of all racks after they have been installed in the field. This inspection shall be conducted in conformance with the Installation Inspection Procedure approved by the designated Resident Engineer.
- C. Inspect each completed cable tray layout after it has been installed. This inspection shall be conducted in conformance with the requirements of the Contractor's Installation Inspection Procedure as approved by the designated Resident Engineer.

##### 1.03 SUBMITTALS

- A. Prior to Fabrication or Procurement of Racks
  - 1. Submit complete drawings and parts lists for the basic shock-mounted rack shell and bases and for all accessory mounting bars, rods, brackets and other equipment-mounting devices which will constitute part of the various rack

- configurations required.
2. Obtain the designated Resident Engineer's written approval of rack components and assembly before proceeding with fabrication or procurement of racks.
- B. Prior to Installation of ATC Equipment on Racks
1. Submit plans showing the proposed arrangement of terminals, power supplies, relay plugboards, fuses, and other ATC equipment on each rack to be provided.
  2. Submit drawings showing mounting details for each type of equipment to be mounted on the racks.
  3. Obtain the designated Resident Engineer's written approval of rack arrangement plans and mounting details before mounting equipment on the racks.
- C. Prior to Shipment of Racks
1. Submit a Factory Test Procedure for Wired Racks for approval by the designated Resident Engineer.
  2. Submit factory test reports for the wired racks.
- D. Prior to Installation of Racks
1. Submit rack arrangement plans showing the proposed arrangement of racks in each Train Control Room to be equipped under this Contract. These arrangements shall be compatible with the actual physical characteristics of the TCRs as determined by on-site inspection by the Contractor and shall conform to the requirements specified herein.
  2. Coordinate the proposed rack arrangement with the lighting arrangement in each TCR in such a manner that:
    - a. Racks are not installed under light fixtures;
    - b. The front and back of each rack is well illuminated, and;
    - c. The rack arrangement and spacing complies with the requirements specified in Part 3 of this Section.
  3. Submit an Installation Inspection Procedure for racks. The purpose of the prescribed inspection shall be to ensure that:
    - a. The racks have been positioned, secured, insulated and grounded as specified.
    - b. All required equipment has been mounted on the racks as specified.
- E. Upon completion of installation of racks in each applicable TCR, submit a written report listing all discrepancies noted and remedial action taken.
- F. Prior to Fabrication or Procurement of Cable Trays:
1. Submit drawings showing designs and details of the entire tray layout for each Train Control Room and special cable tray location for approval by the designated Resident Engineer.
  2. Submit documentation to the designated Resident Engineer for approval, to substantiate that ceilings, walls, racks, and any other surface or structure used for cable tray support will safely support the load which the fully loaded cable tray will impose on these surfaces or structures. The Contractor shall base his cable weight and space calculations on the Contractor cable requirement plus 100 percent for possible future load.
- G. Prior to Installation of Cable Trays
1. Submit a cable tray "fill" tabulation with the tray system layout for the designated Resident Engineer's determination that the 100 percent additional space requirement has been met throughout the system.
  2. Submit an Installation Inspection Procedure for cable trays within 120 days of NTP.

- H. Upon completion of the installation and inspection of the cable tray system and cables in a given TCR, submit a written report listing all discrepancies noted and remedial action taken.

#### **1.04 DELIVERY, STORAGE AND HANDLING**

- A. Cable trays shall be disassembled prior to shipment and packed in cartons to prevent damage.
- B. Any cable tray sections damaged during shipment, storage, or handling shall be replaced by the Contractor at no additional cost to the Authority.

### **PART 2 - PRODUCTS**

#### **2.01 BASIC RACK CONSTRUCTION**

- A. All racks shall have frame weldments constructed of 14-gauge cold-rolled steel and designed to mount standard 19-inch equipment panels. Neither the width nor the depth of the frame unit shall exceed 24 inches. The frame weldment shall be designed to accept universally adjustable panel mounting hardware. The panel mounting angles shall be constructed with standard EIA hole spacing.
- B. The racks shall be mounted on and secured to 12-gauge cold-rolled steel bases, floor-supported to make free-standing units. These bases shall be 24 inches deep (front to back) and the same width as the rack, and shall be 3-1/2 inches high. These bases shall provide an insulation resistance between the rack frame and ground of at least 100,000 ohms.
- C. Chassis supports or guides shall be provided for auxiliary support of heavy equipment such as power supplies. The chassis supports shall be made of 11-gauge cold rolled steel. They shall be capable of being mounted directly to the panel-mounting angles and shall permit side-to-side guide adjustment.
- D. Each rack shall be equipped with a ground connector of the bolted type to permit removal of the ground connection for testing insulation between racks. See Section 16922.
- E. The overall height of each rack shall not exceed 7-1/2 feet.
- F. Each rack shall be equipped with two TC Maintenance Telephone Jacks of the type specified in Section 16923, and as shown on the Contract Drawings.
- G. All racks shall be painted gray.
- H. Each rack shall be identified by its manufacturer's standard nameplate, as specified in Section 16977, Tagging and Marking. This nameplate shall not extend beyond the edge of the supporting metal to which it is attached.
- I. Each rack shall be further identified, front and back, with its identifying type and location number by means of a painted stencil. (See Section 16977, Tagging and Marking). The "type" and "location" letters and numbers shall be at least 1 inch in height. The various rack types shall be designated as follows:
  - 1. "E" - Entrance Racks
  - 2. "P" - Power Racks
  - 3. "C" - Station Support Racks

- 4. "T" - Speed Command Logic Racks
- 5. "TM" - ATP Track Module Racks
- 6. "B" - Vital Interlocking Support Racks
- 7. "J" - Non-Vital Interlocking Support Racks

J. Rack location stenciling shall be on the racks and not on modules in the racks.

## **2.02 POWER RACKS**

- A. The rear of the panel shall be open for ventilation but all live, metal parts shall be completely shielded from contact with any external object by small plastic covers, mounted in place over each part, or group of parts. These covers shall be made of 1/4 inch thick shatter-proof plastic material which will not support combustion or emit poisonous or corrosive gases when exposed to flame or extreme heat. Other approved material may be utilized. These covers shall be easily removed and replaced, but the fastenings shall be secure.
- B. The front of each power rack shall have an 1/8-inch cold-rolled steel sheet for mounting the voltmeters, ammeters, switches, test jacks, circuit breakers, and other equipment necessary to control and monitor the TCR power distribution system. See Section 16921, ATC Power Distribution Systems.
- C. The Contractor shall permanently mount high-voltage warning signs on the back, front and exposed sides of each power rack.

## **2.03 EQUIPMENT RACKS AND ENTRANCE RACKS**

- A. Equipment racks and Entrance racks shall be enclosed with formed 16-gauge cold-rolled sheet metal on the top, bottom and on both ends of each row of adjacent racks.
- B. Entrance racks shall be equipped with molded terminal blocks which conform to the recommendations of Part 14.1.5 of the AREMA Signal Manual and such other terminal blocks and plug connectors as may be required by these Specifications.

## **2.04 EQUIPMENT ARRANGEMENT AND MOUNTING**

- A. The arrangement of equipment on the racks shall present a neat and orderly appearance. Equipment serving similar functions shall be in the same relative location on all racks.
- B. Unless otherwise approved by the designated Resident Engineer in writing, relays and equipment modules shall not be mounted at a height exceeding 6 feet from the floor.
- C. Provide a minimum of 10 percent spare module, component and relay spaces, spare terminals, and spare plug-connector points on each rack or group of racks serving a common function. This 10 percent spare equipment space, terminals and plug-connector points shall be in addition to any space, terminals and plug-connector points reserved for specifically designated possible future additions to the TCR, such as additional track relays and modules which will be required when revenue service is extended beyond a temporary terminal location, or when an anticipated future junction is added to a location being equipped under this Contract.
- D. ATP track modules and track relays for a given track shall be so located on the racks that they reflect the geographical sequence of the actual track circuits they represent wherever practicable.

- E. Track repeater relays shall be located adjacent to the track or repeater relays they repeat or parallel unless there is some compelling reason for locating them elsewhere.
- F. Repeater relays for other than track relays shall be located wherever their contacts are most needed in order to keep wire runs to minimum length.
- G. Terminal blocks and plug connectors for inter-rack and external wiring connections shall be located in the top row of each equipment rack. Where terminal blocks or plug connectors are mounted on swing-out "doors," the Contractor shall provide a means to prevent accidental contact between such terminals or plug couplers and adjacent equipment. This shall be accomplished either by providing insulated protective covers on the "door" equipment, or by limiting the opening arc of the "door," or both.
- H. Terminal boards, plug connectors, power supplies, fuse buses, relay plugboards and cabinets, and all other ATC equipment modules shall be mounted on the racks in conformance with the arrangement plans and mounting methods previously approved by the designated Resident Engineer.

## **2.05 RACK WIRING**

- A. Racks shall be pre-wired, insofar as possible, prior to installation in the Train Control Rooms.
- B. Intra-rack wiring shall be accomplished as specified in Section 16949, Signal Wire and Cable.

## **2.06 CABLE TRAYS**

- A. Cable trays shall be of the "ladder" type, constructed of aluminum or other suitable material commercially available and approved by the designated Resident Engineer. Where applicable a cantilevered single "wall-support" type of tray shall be provided.
- B. Cable trays shall be P-W Industries Cable Tray System 064D02, as manufactured by P-W Industries, Inc. (Cornwell Heights, PA 19020), or approved equal, with the following requirements:
  - 1. Rung spacing shall be six inches maximum where rack-to-rack wiring consists of individual conductors of size 14 AWG or larger wire tied into bundles to form unjacketed multiconductor cable routed via the cable trays. Rung spacing shall be six inches minimum where cable tray is used exclusively for jacketed multiconductor cables.
  - 2. Minimum tray width shall be 6 inches.
  - 3. All fittings, supports and accessories shall be furnished in accordance with the manufacturer's recommendations.
  - 4. There shall be no sharp edges or corners on the cable trays which could damage the cables or present a safety hazard to humans.
- C. Cable trays shall not be purchased or fabricated by the Contractor until wiring plans for the applicable Train Control Room(s) are complete and tray layout drawings are approved by the designated Resident Engineer.

## **2.07 FIBERGLASS SUPPORTS FOR CABLE TRAYS**

- A. Where the Contractor's cable tray layout includes any support mounting to the equipment

and entrance racks, such mounting shall be by means of approved fiberglass arms or stand-offs in order to insulate the cable tray assembly from the equipment and entrance racks.

- B. Fiberglass support arms, where required to insulate the cable tray from the equipment racks, shall be flame retardant, reinforced polyester laminate Class "B", 130 degrees C electrical sheet, meeting NEMA GPO-2 requirements, ASTM Specification D1532-67T, as manufactured by Hayside Division of Alco Standard Co., or approved equal.

## **PART 3 - EXECUTION**

### **3.01 RACK INSTALLATION**

- A. Arrange the racks in the Train Control Rooms in a manner previously approved by the designated Resident Engineer.
- B. The Contractor shall install the racks in rows with a spacing of 5 feet between centerlines of rows and from wall to row centerline wherever possible. Where 5 foot spacing cannot be obtained, the Contractor shall attempt to maintain 4.5 foot minimum spacing for front-to-front oriented rows and 3.5 foot minimum spacing for back-to-back oriented rows. Under no circumstances shall rack row spacing be less than 3.5 feet unless otherwise authorized by the designated Resident Engineer.
- C. Rows of racks shall be oriented to have adjacent rows either front-to-front or back-to-back wherever possible.
- D. A minimum 2-foot aisle shall be provided between the walls of the TCR and the ends of the rack rows unless otherwise authorized by the designated Resident Engineer.
- E. The row of racks nearest the wall, if closer than five feet to the wall, shall not face the wall.
- F. The Contractor shall shim rack bases as necessary to maintain level rack height within each row.
- G. The Contractor shall ground each individual rack to a room ground bus provided and installed by the Contractor. See Section 16922. The racks shall be insulated from each other and from any supporting framework and shall only be electrically connected via the common ground connection. The value of the insulating resistance shall be at least one megohm.
- H. Rack-to-rack wiring shall be accomplished as specified in Section 16949.

### **3.02 CABLE TRAY DESIGN**

- A. The Contractor shall design and provide a complete ATC cable tray system for each Train Control Room newly equipped under this Contract.
- B. The Contractor shall design and provide all modifications necessary to the cable tray systems in TCRs at tie-in locations to adapt them to new requirements imposed by this Contract.
- C. The Contractor shall design special cable tray systems as required for certain other locations where ATC cables cannot be supported in the normal manner. See Section 16911, Scope of ATC Work.

- D. Based upon field inspections and inspection of the Authority's structural drawings, determine the extent to which it will be necessary to relocate existing conduit, lighting fixtures and/or other facilities in order to permit proper installation of the cable tray systems. Include all such relocation of existing facilities in the design of the cable tray systems and include the cost of all such work in the bid price.
- E. Each cable tray system shall be designed to support (and allow usable spare space for) a load of 100 percent in addition to the cable requirement for this Contract. The usable spare space is defined as that unobstructed area in the cable tray measured from the top of the Contract cable requirement to the top of the tray side rails.
- F. The design of each tray system shall be based on the manufacturer's recommendations unless otherwise specified herein.
- G. The tray supports shall be a maximum of 4 feet on centers.
- H. Make a load analysis to ensure that only those ceilings, walls, racks or other surfaces or structures are used for cable tray support which will safely support the load which the fully loaded cable tray will impose on these surfaces or structures.
- I. Each cable tray system shall be so designed that continuous runs without gaps may be installed using a minimum number of sections in accordance with the manufacturer's standards.

### **3.03 CABLE TRAY INSTALLATION**

- A. Perform all work required to relocate existing conduit, lighting fixtures, and other facilities to permit proper installation of the cable trays, at no additional cost to the Authority.
- B. Perform all special concrete or metal work necessary in connection with the installation of the cable trays. To avoid spalling, aluminum shall be installed so that it does not come in contact with concrete.
- C. The cable trays shall be assembled at the site of the work in accordance with the manufacturer's instructions and the approved installation drawings.
- D. Sufficient support shall be provided to keep the loaded cable tray deflection to one-quarter inch maximum at midspan. Tray supports and trays shall be mounted plumb and level.
- E. Tray supports shall be anchored to ceilings or walls by machine-bolt type expansion anchors and one-half inch minimum diameter bolts.
- F. Cable trays shall be bolted to support members. The Contractor shall not use any method of connecting or supporting cable trays which would reduce the rated load carrying capacity of the trays or could possibly result in damage to cables placed in the trays.
- G. Where cable tray splice joints occur in a run, trays shall be supported immediately adjacent to and on both sides of the splice fitting.
- H. All metal cable trays shall be bonded and grounded as described in Section 16922.
- I. All metal cable trays shall be insulated from all walls, ceilings, racks and conduit runs. The value of the insulating resistance shall be at least 1000 ohms.

- J. To the extent practicable, the final position of cable on the trays shall result in minimal loading eccentricity.
- K. Maximum deflection of the runs shall not exceed 0.25 inches when fully loaded. A fully loaded cable tray is defined as a load consisting of the Contract cable requirement plus the 100 percent for the possible future load.

#### **3.04 MEASUREMENT FOR PARTIAL PAYMENTS FOR RACKS**

- A. For purposes of measurement only, each power rack and equipment rack will be considered to consist only of the open frame weldment, complete with shock-mounting base and all sheathing, telephone jacks, support brackets and other hardware required to mount the terminal boards, power-supply modules, relay plugboards or other types of ATC equipment modules it is designed to support.
- B. For purposes of measurement only, each entrance rack will be considered to consist of the basic components defined above for power and equipment racks plus all the molded terminal blocks and other terminating and support hardware required to constitute a complete entrance rack.
- C. Racks will be measured for partial payments based upon the number of such required units furnished, installed and accepted.
- D. The following factors will be considered when measuring racks for partial payments:
  - 1. Delivery of the specified racks by the Contractor and approval of the rack Factory Test Reports by the designated Resident Engineer.
  - 2. Proper installation of the racks by the Contractor and approval of the installation by the designated Resident Engineer.

#### **3.05 MEASUREMENT FOR PARTIAL PAYMENTS FOR CABLE TRAYS**

- A. Cable trays will be measured for partial payments based upon the linear footage of required tray furnished, installed and accepted.
- B. Factors which will be considered when determining partial payments for cable trays will include, but not be limited to:
  - 1. Furnishing and installation of approved cable trays and all appurtenances by the Contractor in the manner specified herein;
  - 2. Correction of all installation discrepancies by the Contractor and final approval of the installation by the designated Resident Engineer.

**END OF SECTION**

## SECTION 16972

### ATC - JUNCTION BOXES

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of track-side junction boxes associated with track switch layouts, signal layouts, program stop marker coil layouts, power frequency and audio frequency track circuit layouts, terminating receivers, inductive track loop layouts, pushbutton layouts, interlocking cable distribution, and other necessary wayside ATC equipment.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16923 TC Maintenance Telephone System
  - 2. Section 16925 Data Transmission System (DTS)
  - 3. Section 16961 Audio Frequency Track and Loop Circuit Layouts
  - 4. Section 16962 Impedance Bond Layouts
  - 5. Section 16963 Power Frequency Track Circuit Layouts
  - 6. Section 16964 Track Switch Operating Layouts
  - 7. Section 16965 Signal Layouts
  - 8. Section 16967 Marker Coil Layouts
  - 9. Section 16974 Locks and Keys
  - 10. Section 16977 Tagging and Marking

##### 1.03 QUALITY ASSURANCE

- A. Each junction box shall be factory tested to ensure conformance with the requirements specified herein and shown on the Contract Drawings.
- B. The Contractor shall inspect each junction box after it has been installed and wired. This inspection shall be conducted in conformance with the requirements of the Contractor's installation inspection procedure as approved by the designated Resident Engineer.

##### 1.04 SUBMITTALS

- A. Submit drawings for each type of junction box he proposes to provide. These drawings shall include terminal boards, wiring and mounting details and all other components as required by the circuits or indicated on the applicable Contract Drawings. The designated Resident Engineer's approval of each type of junction box is required prior to manufacture or procurement of this equipment by the Contractor.
- B. The Contractor shall submit typical scale installation drawings for each type of junction box he proposes to provide. These drawings shall show hinged doors or covers in their open position and distances to related trackwork in such a manner that specified clearances can be determined. In each instance where a junction box cannot be installed in the typical manner, a separate, specific scale installation drawing shall be submitted for that situation.
- C. Submit an Installation Inspection Procedure for each type of junction box to be provided under this Contract within 120 days of receipt of NTP.
- D. Submit installation inspection documentation for each junction box installed.

## **PART 2 - PRODUCTS**

### **2.01 BASIC REQUIREMENTS**

- A. All junction boxes shall conform to NEMA-4X and U.L. requirements. Junction boxes shall be constructed of cast iron, sheet metal, or fiberglass material approved by the Engineer. Cast iron junction boxes shall have stainless steel or brass cover hardware.
- B. Sheet metal junction boxes shall be constructed of stainless steel, all seams welded.
- C. Covers shall be hinged and gasketed with a neoprene gasket to provide a dustproof and weatherproof enclosure. Covers shall be equipped with a three-point latching arrangement, complete with handle and facilities for accepting the shackle of a padlock of the type specified in Section 16974.
- D. Junction boxes shall be of sufficient size to provide ample space for the specified minimum bending radii of cables and wires.
- E. Junction boxes shall be provided complete with all necessary terminals and a weatherproof Telephone Jack as specified in Section 16923.
- F. Sheet metal and fiberglass junction boxes shall be provided complete with print pockets, sized as per manufacturer's standard, and located on the inside of the junction box cover or door.
- G. Junction boxes shall be equipped with drain plugs.
- H. Cast-iron junction boxes shall be furnished complete with appropriate pedestals.

### **2.02 SWITCH LAYOUT JUNCTION BOXES**

- A. One or more junction boxes of the appropriate type, as necessary, shall be provided as part of each Track Switch Operating Layout provided under this Contract, as shown on the Contract Drawings and as described herein.
- B. The junction boxes for direct fixation Track Switch Operating Layouts shall be made of stainless steel as specified in Part 2.01 B. of this Section, and shall be provided with all necessary mounting hardware.
- C. If the Contractor's switch layout requires an additional junction box, or pull box, for the switch circuit controller, the Contractor shall furnish this box, complete with all mounting hardware, as part of his switch layout, at no additional cost to the Authority.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Provide junction boxes of appropriate size for the terminals and equipment required.
- B. Junction boxes shall be installed in conformance with the approved installation drawings.
- C. Install junction boxes in such a manner that no part of the junction box, including the open door or cover, can intrude into the dynamic clearance envelope of the transit cars.

- D. In those instances where it is impossible to keep the junction box door from opening into the dynamic clearance envelope of the transit cars, or where there is no room for a person between the box and the dynamic clearance envelope of the transit cars, the Contractor shall apply moisture-proof warning labels of an Authority-approved design and size to the inside and outside of the covers of the junction boxes. These labels shall consist of a background of black and luminescent yellow diagonal stripes, and shall bear the legend "NO CLEARANCE" in black letters on a white horizontal stripe.

### **3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Junction boxes will be measured for partial payments based upon the number and type delivered, installed, and accepted.
- B. The following factors will be considered when junction boxes are measured for partial payments:
  1. Delivery of the specified junction boxes by the Contractor and approval of the applicable Factory Test Reports by the designated Resident Engineer.
  2. Proper installation of the junction boxes by the Contractor and approval of the installation by the designated Resident Engineer.

**END OF SECTION**

## **SECTION 16973**

### **ATC - CONDUIT**

#### **PART 1 - GENERAL**

##### **1.01 SECTION INCLUDES**

- A. This Section specifies the furnishing and installation of conduit and associated fittings.

##### **1.02 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
- |     |               |  |
|-----|---------------|--|
| 1.  | Section 16949 | Signal Wire and Cable                                |
| 2.  | Section 16961 | Audio Frequency Track and Loop Circuit Layouts       |
| 3.  | Section 16962 | Impedance Bond Layouts                               |
| 4.  | Section 16963 | Power Frequency Track Circuit Layouts                |
| 5.  | Section 16964 | Track Switch Operating Layouts                       |
| 6.  | Section 16965 | Signal Layouts                                       |
| 7.  | Section 16966 | Wayside Pushbutton Layouts                           |
| 8.  | Section 16967 | Marker Coil Layouts                                  |
| 9.  | Section 16972 | Junction Boxes                                       |
| 10. | Section 16977 | Tagging and Marking                                  |
| 11. | Section 16978 | Miscellaneous Train Control Components and Materials |
| 12. | Section 16981 | Basic ATC Test and Inspection Requirements           |

##### **1.03 QUALITY ASSURANCE**

- A. The Contractor shall inspect conduit and fittings upon delivery and shall inspect conduit after installation. The field inspection shall be conducted in conformance with the requirements of the Contractor's installation inspection procedure as approved by the designated Resident Engineer.

##### **1.04 SUBMITTALS**

- A. Submit a detailed conduit layout for all proposed buried conduit runs, including the calculated fill and size of each run. No conduit shall be installed until the applicable plan has been approved by the designated Resident Engineer.
- B. Submit a field installation inspection procedure for each type of conduit he proposes to install under this Contract. The inspections prescribed shall determine whether conduit has been installed in conformance with the Specifications. These installation inspection procedures shall be submitted by the Contractor within 120 days of receipt of Notice to Proceed.
- C. Submit a conduit installation inspection report for all conduit installed within the area controlled from each TCR involved in this Contract.

#### **PART 2 - PRODUCTS**

##### **2.01 RIGID STEEL CONDUIT AND FITTINGS**

- A. All rigid steel conduit and fittings required by these Specifications shall be galvanized. Galvanized steel, rigid conduit shall be used at locations in passenger stations, equipment rooms, beneath paved roadways, and as hereinafter specified. This conduit shall be consistent with ANSI C80.1.

- B. Fittings for rigid steel conduit shall be of malleable iron, threaded, and shall be protected by hot-dip galvanizing. Conduit fittings designed for removable covers shall be complete with gaskets and blank covers.

## **2.02 POLYVINYL CHLORIDE CONDUIT AND FITTINGS**

- A. At outdoor or embedded locations where conduit is required, but has not been provided by other disciplines, or where it is specifically required by these Specifications and Drawings, the Contractor shall furnish and install thick-wall, Schedule 80, polyvinyl-chloride (PVC) conduit, unless otherwise specified. PVC conduit shall not be installed on concrete surfaces exposed to sunlight.
- B. Where conduit elbows are used, they shall be Schedule 80 and of the long radius type.

## **2.03 FIBERGLASS REINFORCED EPOXY (FRE) CONDUIT**

- A. In all confined areas such as tunnels where exposed conduit runs are required, the Contractor shall furnish and install appropriately sized fiberglass reinforced epoxy (FRE) conduit unless otherwise specified or directed by the designated Resident Engineer.
- B. FRE conduit installed by the Contractor shall have a minimum dielectric strength of 500 volts per mil, tensile strength (axial) of 11,000 psi, and an "HB" flammability rating.
- C. FRE conduit installed by the Contractor shall have a minimum compressive load withstand rating of 3500 pounds per foot of conduit, and a minimum average impact resistance value of 25 foot-pounds.
- D. FRE conduit and fittings installed by the Contractor shall bear nationally accepted testing laboratory approval from U.L. and C.S.A.
- E. Conduit combustion by-products shall not contain chlorine gas in excess of trace levels and always less than safe OSHA limits.
- F. Fiberglass reinforced epoxy conduit shall be FRE Rigid Non-Metallic Fiberglass Conduit as manufactured by FRE Conduit Inc., 1885 Swarthmore Ave., Lakewood, NJ 08701, or approved equal.

## **2.04 FLEXIBLE CONDUIT AND FITTINGS**

- A. Flexible conduit shall be provided only where specifically required by these Specifications or the Contract Drawings or where, at the request of the Contractor, its use has been approved by the Engineer. It shall be constructed of interlocking spiral strip steel of the best quality. The steel strips used in the construction of flexible conduit shall be thoroughly annealed, fully coated with metallic zinc, and shall have an extruded liquid-tight neoprene or PVC jacket overall. The flexible conduit shall conform to the applicable requirements of UL 360. It shall contain, in addition to the galvanized steel core, a continuous copper bonding conductor spiral wound between the convolutions of the core.
- B. Construction of the spiral steel strip shall be such as to permit bending of the conduit to a radius of 4 times its internal diameter; without spreading the strips to such extent that they will open on the outside of the bend, without compressing them to such extent that rough edges will result on the inside of the bend, and without distorting or reducing the internal diameter of the flexible conduit at the bend.

- C. The Contractor shall utilize conduit fittings supplied or recommended by the manufacturer of the brand of liquid-tight flexible metal conduit he provides.

## **2.05 CORDURA HOSE CONDUIT AND FITTINGS**

- A. Flexible hose utilized as conduit shall be furnished and installed by the Contractor where required by the Contract Drawings or Specifications. It shall be vari-purpose, internal tube hose with braided CORDURA rayon reinforcement and a "HYCAR" neoprene cover as made by the ACME-Hamilton Mfg. Corp., or approved equal. Where so required, the hose ends shall be pushed over suitable fittings which provide a snug fit, and fastened with stainless steel clamps as manufactured by the W.D. Allen Mfg. Co., or approved equal.

## **2.06 TRACK LOOP CONDUIT**

- A. Conduit for prefabricated inductive track loop layouts shall be as specified in Section 16961.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION OF CONDUIT**

- A. Conduit provided by the Contractor shall be installed as specified in the National Electrical Code or as specified herein, whichever is more restrictive. All wiring in passenger stations, external to equipment enclosures, shall be installed in rigid steel conduit.
- B. At wayside train control electrical equipment locations, the Contractor shall install lengths of the appropriate type of conduit (Schedule 80 PVC or fiberglass reinforced) to extend the embedded conduit installed by others to the proper location.
- C. In tunnels or other enclosed areas, wiring in the trackway areas shall be installed in fiberglass reinforced conduit. (It shall be understood that in tunnels the word "trackway" refers to the area between the outermost rails and includes a linear zone approximately six feet wide outside of each of the outermost running rails. The depth of the trackway area shall be understood to extend downward from the top of the highest piece of equipment mounted in the trackway area to the surface of the concrete slab in areas of direct fixation. Wiring on tunnel walls, retaining walls, or in cable troughs shall not be considered to be in the trackway.) Conduit shall not be used on the cable runs along the walls of tunnels. Where the Contractor utilizes steel conduit embedded in the floor of the tunnel by others, he shall provide, as a minimum, protective bushings for the ends.
- D. Wiring in horizontal runs in the trackway in ballasted areas, shall be in Schedule 80 PVC conduit buried at a uniform depth of 30 inches, (42 inches from the top of the rail).
- E. Unless otherwise shown on the Contract Drawings, wiring in vertical runs in the track in ballasted areas shall be in CORDURA Hose Conduit where it runs to a device on the ties or rails, and in Schedule 80 PVC in all other places.
- F. Wiring in runs attached to the sides of ties shall be in Schedule 80 PVC conduit unless otherwise shown on the Contract Drawings.
- G. Except in the trackway, or where enclosed in a cable trough, wiring on aerial structures shall be in rigid steel conduit.
- H. In general, all exposed conduit runs shall be installed parallel to walls, floors and ceilings. Conduits shall be supported at intervals not to exceed eight feet for rigid steel conduit and four feet for flexible conduit. PVC conduit (and fiberglass reinforced conduit) shall be

supported at intervals dependent upon its diameter as required in Table 347-8 of the National Electrical Code. Cast, single-hole, malleable iron, galvanized pipe straps of the proper size shall be used for the support of individual conduit runs on concrete surfaces. Where conduit is supported on concrete surfaces, rust-proof stud anchors as specified in Section 16978 shall be used. Galvanized conduit spacers (back straps) shall be used with the conduit clamps to space the conduit away from the mounting surface.

- I. Conduit shall be of sufficient size to leave, as a minimum after installation of wire, the percentage of free space specified in the National Electrical Code.
- J. All bends and offsets in rigid conduit shall be made on a forming tool to prevent damage to the conduit. Rigid conduit bends made in the field shall be in accordance with the manufacturer's recommended procedure. Care shall be taken not to overheat rigid conduit during the bending process.
- K. Steel conduit threads shall be painted with anti-seize, anti-corrosion surface treatment compound, such as Thomas & Betts KOPR-SHIELD, or an approved equal to ease assembly, make them watertight, prevent rust and enhance conductivity.
- L. Rigid or flexible steel conduit shall not be clamped or connected to equipment racks or trays in equipment rooms in any manner which results in an electrically conductive path between the conduit and the rack or tray.
- M. Fittings with removable side plates (pull boxes) shall be installed on long conduit runs at intervals of no more than 75 feet. In the less-than-75-foot conduit segments thus formed, an additional fitting of the same type shall be added each time the total number of degrees in bends exceeds 180. All such fittings shall be of sufficient length to allow the installation of wire or cable without exceeding its minimum bending radius, either as installed or during installation. The minimum bending radius shall be as specified by the manufacturer, or as specified in Articles 370-18 or 370-51 (as applicable) of the National Electrical Code, or as necessary to comply with the applicable minimum cable bending radii specified herein, whichever is more restrictive.
- N. Radii of conduit bends shall meet the requirements of the National Electrical Code.
- O. Conduit shall be connected to equipment enclosures and junction boxes in accordance with the approved installation drawings. Proper fittings with appropriate gasketing and protective bushings shall be utilized.
- P. All conduit which the Contractor utilizes, whether provided by the Contractor or others, shall be properly cleaned (before pulling wires or cables) by either blowing compressed air through the run or by swabbing.
- Q. All conduit installed by the Contractor shall be identified as described in Section 16977, Tagging and Marking.
- R. PVC fittings shall be attached to PVC conduit utilizing both pre-conditioner and cement which have been approved by the designated Resident Engineer.
- S. On long runs of PVC conduit, expansion joints shall be installed at intervals not to exceed 75 feet.
- T. A short (1 to 3 feet) section of liquid-tight flexible metal or CORDURA hose conduit shall be provided where rigid conduit is to be connected to a device which consist of, or contains, a rotating or vibrating mass.

- U. All conduits provided in the TCR for train control, but not used, shall be grounded and closed with a watertight fitting.
- V. Install metallic raceway, fittings, boxes and cabinets, free from contact with reinforcing steel.
- W. To prevent corrosion where aluminum is placed in contact with dissimilar metal or with concrete, separate contact surfaces by means of a gasket, non-absorptive tape or special coating.

### **3.02 CONDUIT PROVIDED BY OTHER DISCIPLINES**

- A. Conduit to be furnished and installed by other disciplines will be approximately as shown on the applicable drawings. It shall be the responsibility of the Contractor to verify the actual location and placement of all conduit provided by others. If it is determined that conduits which should have been provided by other disciplines are missing, defective, or cannot be located, the Contractor shall notify the designated Resident Engineer in writing. The Contractor shall not proceed with any corrective work which may be considered extra work until such work has been approved by the designated Resident Engineer. The Engineer will instruct the Contractor as to the reporting method for the corrective work at the time of approval for such. Any corrective work not brought to the designated Resident Engineer's attention in writing prior to the commencement of such work will not be considered for payment.
- B. The Contractor shall furnish and install any conduit which is necessary according to his approved design (but which was not installed by others) at no additional cost to the Authority.
- C. In the event the Contractor cannot locate conduit installed by other disciplines, the Contractor shall furnish and install the necessary conduit at no additional cost to the Authority.

### **3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. The cost of all connections, fittings and fastening devices shall be included in the cost for each applicable type of conduit.
- B. Rigid steel, fiberglass reinforced, and polyvinyl chloride conduit will be measured for partial payments based upon the linear footage of each type of such approved conduit delivered, installed, and accepted at each TCR area.
- C. Flexible or CORDURA hose conduit will be measured for partial payments based upon the linear footage installed and accepted.
- D. Factors which will be considered when determining partial payments for applicable footage of rigid conduit (including associated fittings) will include the following:
  - 1. Installation of the conduit by the Contractor and approval of the installation by the designated Resident Engineer.
  - 2. Correction of all conduit installation discrepancies by the Contractor to the satisfaction of the designated Resident Engineer.

**END OF SECTION**

## SECTION 16974

### ATC - LOCKS AND KEYS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of the various types of locks, keys and key switches required to secure ATC equipment and apparatus housings furnished under this Contract.
- B. The proprietary "rights" to all locks, keys, key switches and keying combinations furnished under this Contract shall be assigned to the Authority.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16914 Environmental Requirements
  - 2. Section 16954 Switch-and-Lock Movements
  - 3. Section 16956 Interlocking Control Panels
  - 4. Section 16965 Signal Layouts
  - 5. Section 16972 Junction Boxes

##### 1.02 QUALITY ASSURANCE

- A. Factory Test
  - 1. The Factory test for all locks, key switches and keys shall be the manufacturer's standard.

##### 1.03 SUBMITTALS

- A. Submit one key switch and one lock of each type specified herein for acceptance testing.
- B. Submit one key of each type specified herein for acceptance testing.

#### PART 2 - PRODUCTS

##### 2.01 BASIC REQUIREMENTS

- A. The locking mechanism for all locks and key switches furnished under this Contract shall be of the 7-pin cylinder type.
- B. All lock rotation shall be 90 degrees clockwise from locked position at 12 o'clock to unlocked position at 3 o'clock.
- C. The coding of the various types of locks and keys furnished under this Contract shall be identical to the coding presently in use on the WMATA Rail Rapid Transit System.
- D. All locks furnished under this Contract shall be keyed to one of two combinations and to a single master combination:
  - 1. The first combination and the master combination shall be provided to key the following locks:
    - a. Padlocks
    - b. Cabinet Locks

- c. Cam Locks
  - 2. The second combination and the master combination shall be provided to key the following locks:
    - a. Key Switch
- E. The keys supplied under the terms of this article shall not be reproducible commercially.

## **2.02 PADLOCKS**

- A. Padlocks shall be solid blocks of extruded brass or stainless steel, bored to receive the locking mechanism. The shackle shall be made of case hardened steel. The locking mechanism shall be operable from its own key and the master key, and shall be designed in such a manner that keys can be removed from the padlock in both the locked and unlocked positions.
- B. The lock shackle shall lock at both heel and toe. The steel shackle pull strength shall exceed 2500 lbs.
- C. The length and width of shackle opening shall be sufficient to allow the padlocks to be installed on all pieces of ATC equipment for which they are required.
- D. Padlocks shall be of a type and quality normally associated with railroad type outdoor services and shall be designed to operate satisfactorily in all weather conditions indigenous to the Washington, D.C. metropolitan area, as described in Section 16914, Environmental Requirements.
- E. Padlocks shall be type 21B722 with AR-3 cylinder as manufactured by Best Lock Corp., or equal.
- F. Padlocks shall be furnished without chains.

## **2.03 CABINET AND CAM LOCKS**

- A. Cabinet and cam locks furnished shall be suitable for mounting on 14 gauge sheet steel, and/or 1/4 inch phenolic panels.
- B. The locking mechanism for cabinet and cam locks shall be so designed that keys can be removed from the locks in both the locked and unlocked positions.
- C. Cabinet locks shall be type BT1004AD as manufactured by Fort Lock Corp., or equal.
- D. Cam locks shall be type N1058AD-186421-1906-49 and/or type N1058AD-186425-2508-49 as manufactured for Fort Lock Corp., or equal.

## **2.04 KEY SWITCHES**

- A. Key switches furnished shall be suitable for flush mounting on 14 gauge steel or 1/4 inch phenolic panels. Each switch shall be supplied with a special two-flange washer to prevent rotation in phenolic panels.
- B. Insertion of the proper key into the tumbler and rotation of the key in a clockwise direction shall cause an internal electrical switch to close. When the key is rotated to this clockwise position, it shall be impossible to remove the key from the tumbler.
- C. Returning the key to the normal position by counter-clockwise rotation shall cause the internal electrical switch to open. When in this position, it shall be possible to remove the key.

- D. The internal electrical switch shall have sufficient current carrying capacity to control a 28 volt (nominal) signal type relay without damage to the switch contacts.
- E. Key switch locks shall be type SW21138AXMKX2KXSC as manufactured for Fort Lock Corp., or equal, and keyed to WMATA Y1A master and appropriate Y001 or Y002 key codes.

## **2.05 KEYS**

- A. The Contractor shall furnish three types of keys as follows:
  - 1. Master keys to unlock all types of locks and key switches specified herein.
  - 2. Keys to unlock only the key switches specified herein.
  - 3. Keys to unlock only the padlocks, cabinet locks and cam locks specified herein.
- B. Each type of key shall be distinctly marked for the use intended, but in such a manner that the marking system employed cannot be used for commercial duplication.
- C. Each type of key shall be identical to the corresponding type presently in use on the WMATA rail system.
- D. Keys shall be made of brass or stainless steel.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Padlocks
  - 1. Padlocks shall be installed at the locations specified on all signals, junction boxes, switch-and-lock movements, snowmelter control cases and other wayside ATC equipment housings not equipped with integral cabinet or cam locks.
- B. Key Switches and Cam Locks
  - 1. Key Switches and suitable cabinet or cam locks shall be installed on Interlocking Control Panels as shown on the Contract Drawings.

### **3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Padlocks will be measured for partial payments based upon delivery to the Authority of suitable padlocks and their keys as specified. The cost of padlocks shall include the cost of the associated keys.
- B. Cabinet locks, cam locks, and key switches and their keys will not be measured separately. The cost of these items shall be included in the cost of the devices they secure.

**END OF SECTION**

## SECTION 16975

### ATC - FOUNDATIONS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of foundations for ATC sign, signal, junction box and pushbutton masts, and, where applicable, for snowmelter control cases.

##### 1.02 DESCRIPTION

- A. Foundations for ATC sign, signal, junction box and pushbutton masts shall be precast, reinforced concrete and shall be of either monolithic or sectional construction.
- B. Foundations for snowmelter control cases shall each consist of two identical units, one to support each end of the snowmelter control case, or a single fabricated unit. These units shall be at least four feet high, and shall be constructed of cast iron, hot-dip galvanized steel, reinforced concrete, or some approved combination thereof.
- C. As an alternative to the materials previously specified, foundations for junction boxes and small control cases may be constructed of fiberglass if pre-approved by the designated Resident Engineer.
- D. Foundations shall not be procured or constructed by the Contractor, except at his own risk, until drawings of the proposed foundations have been approved by the designated Resident Engineer.

##### 1.03 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections
  1. Section 16965 Signal Layouts
  2. Section 16966 Wayside Pushbutton Layouts
  3. Section 16969 Snowmelter Layouts
  4. Section 16972 Junction Boxes
  5. Section 16976 Wayside Signs
  6. Section 16978 Miscellaneous Train Control Components and Materials
  7. Section 16981 Basic ATC Test and Inspection Requirements

##### 1.04 QUALITY ASSURANCE

- A. A permanent record shall be kept by the fabricator of the date and conditions of casting of each precast concrete unit.
- B. Representative test specimens of the concrete poured during the fabrication of the foundation units shall be tested according to test procedure ASTM C94 to determine the compressive strength of the concrete. These tests shall be conducted by an "Accredited Authoritative Structural Testing Laboratory" at no additional cost to the Authority.
- C. Proper control of water-cement ratio, vibration frequency, protection and curing processes shall be monitored to ensure that the concrete provided meets the minimum strength requirements specified in this Section.

- D. The Contractor shall inspect each foundation after it has been installed. This inspection shall be conducted in conformance with the requirements of the Contractor's installation inspection procedure as approved by the designated Resident Engineer.

#### **1.05 SUBMITTALS**

- A. If the Contractor proposes to furnish and install precast concrete foundations different from those shown on the Contract Drawings or specified herein, he shall submit drawings for each type of foundation, including size and details of the galvanized anchor bolts, nuts, and washers to be provided.
- B. Submit two copies of the fabricator's records showing the date and conditions relating to the manufacture of each precast unit, which shall include type of fabricator's building or enclosure, form material used, curing procedures (steam or water), temperature ranges, air entrainment content, water-cement ratio, method of finishing the units, and all other pertinent information.
- C. Submit complete mechanical drawings showing the dimensions, composition and mounting details for each type of fabricated metal foundation unit he proposes to provide.
- D. Submit installation drawings for each type of fabricated metal foundation he proposes to provide.
- E. Submit an Installation Inspection Procedure for each type of foundation provided under this Contract within 120 days of NTP.
- F. Submit a field installation inspection report for each foundation installed under this Contract.

#### **1.06 DELIVERY, STORAGE AND HANDLING**

- A. Precast concrete foundation units shall be handled with care to avoid damage in transit and at storage locations. They shall be adequately supported, cushioned and stacked to protect all edges of the units. Any chipping, cracks or other damaged caused by mis-handling of the units shall be the Contractor's responsibility. Defective foundations shall be repaired or replaced as directed by the designated Resident Engineer at no additional cost to the Authority.

### **PART 2 - PRODUCTS**

#### **2.01 BASIC COMPONENTS**

- A. Cement, aggregates, mixing water and reinforcement used for precast foundation units and cast-in-place foundation structures shall conform to the applicable requirements specified in the current edition of the AREMA Manual for Railway Engineering.
- B. Metal used for Snowmelter Control Case foundation units shall be as recommended in the applicable portions of Part 15.1 of the AREMA Signal Manual.

#### **2.02 CONCRETE FOUNDATIONS**

- A. Foundations shall be provided complete with anchor bolts, nuts and washers, all in accordance with the applicable portion of Part 14.4 of the AREMA Signal Manual and Section 16978 of these Specifications.

- B. Spacing of anchor bolts shall be as required to properly support the equipment to be mounted.
- C. Precast concrete foundations shall be made of concrete of average compressive strength of 4000 p.s.i., air-entrained for exterior locations.
- D. The concrete used in cast-in-place foundations shall have an average compressive strength of 3000 p.s.i.

### **2.03 SNOWMELTER CONTROL CASE FOUNDATIONS**

- A. Snowmelter control case foundations shall be fabricated in accordance with the detailed drawings submitted by the Contractor and approved by the designated Resident Engineer for that purpose.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION**

- A. Provide properly compacted crushed stone bases for all train control equipment foundations installed in ballasted track areas under this Contract.

### **3.02 INSTALLATION**

- A. Train control equipment foundations shall be installed in accordance with the installation drawings approved by the designated Resident Engineer for that purpose. All foundations for ATC equipment shall be vertical and level as installed.
- B. When placing these foundations, exercise due care to ensure that anchor bolts are not bent or threads damaged. All anchor bolt thread, washers, and nuts shall be protected by applying friction tape, or by some other method satisfactory to the designated Resident Engineer, until such time as the train control equipment is installed.

### **3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Foundations will be measured for partial payments based upon the number of required foundations furnished, installed, and accepted. These foundations shall include all required foundation bolts, nuts and washers as indicated on the Contract Drawings and as specified herein.

**END OF SECTION**

## SECTION 16976

### ATC - WAYSIDE SIGNS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of various sheet-metal and reflective film wayside signs and markers at locations indicated on the Contract Drawings.
- B. The types of signs and markers shall include, but not be limited to:
  - 1. Wayside ATC Signs:
    - a. "S" signs (Start programmed Station Stop)
    - b. "TB" signs (Turnback points)
    - c. "START ATC" (Begin Automatic Train Control)
    - d. "END ATC" (End of Automatic Train Control)
  - 2. Berthing Markers (Numerals "2", "4", "6" and "8", or combinations thereof).
  - 3. Station Overspeed Marker Signs.
- C. The Contractor shall design any special mounting brackets necessary for the mounting of the Wayside signs in the specified manner at the locations approved by the designated Resident Engineer. These mounting brackets shall be subject to pre-approval by the designated Resident Engineer.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16918 Special ATC Requirements for Specific Locations
  - 2. Section 16967 Marker Coil Layouts
  - 3. Section 16977 Tagging and Marking

##### 1.03 QUALITY ASSURANCE

- A. The Contractor shall inspect each sign and marker at its point of manufacture. Only those signs and markers which conform to the Specifications shall be shipped and installed.
- B. The Contractor shall inspect each wayside ATC sign and marker sign installation in conformance with the approved installation inspection procedure.

##### 1.04 SUBMITTALS

- A. Complete drawings shall be submitted for each type of sign and marker, and for each type of mounting to be used, showing all mounting and installation details.
- B. Submit a field installation inspection procedure for wayside ATC signs, berthing markers, and station overspeed marker signs within 120 days of NTP.
- C. Submit field installation inspection reports for wayside ATC signs, berthing markers, and station overspeed marker signs.

##### 1.05 DELIVERY, STORAGE AND HANDLING

- A. Signs and markers shall be protected during shipping, storage and handling, and throughout installation, from damage or marring of the painted or reflecting surface.

## **PART 2 - PRODUCTS**

### **2.01 BASIC REQUIREMENTS**

- A. Wayside ATC signs shall be made of 16 gauge sheet steel. They shall display white, reflecting lettering on a green, reflecting background. These signs shall be fabricated in accordance with the applicable recommendations of Part 14.6.1 of the AREMA Signal Manual and as shown on the Contract Drawings.
- B. Train "Berthing Marker" signs shall be made of 20-gauge sheet aluminum. They shall display silver, reflecting numerals on a green, reflecting background. The reflective material used for Wayside ATC signs and Berthing Marker signs shall be 3M Scotchlite High Intensity Grade Pressure Sensitive Reflective Sheeting, or approved equal. Lettering and numerals shall be cut from appropriately colored Series 3860 sheeting. Backgrounds shall be green Series 3800 sheeting. The sheeting shall be applied in conformance with the manufacturer's instructions.
- C. Wayside ATC signs shall be suitable for mounting on masts, or on brackets on walls, as applicable. Berthing markers shall be designed for mounting under station platforms. All ATC signs or markers of a given type shall be identical.
- D. Station Overspeed Marker signs shall consist of 10-inch wide by 8-inch high adhesive-backed, green, reflex-reflecting film background material with the number "20" in silver reflex-reflecting film displayed thereon. (See the Contract Drawing for Typical Marker Coil Layouts). The reflective film shall be 3M Scotchlite High Intensity pressure sensitive sheeting (SCOTCHLITE 510), or approved equal.
- E. The size, shape and lettering for the various types of signs shall be as indicated on the Contract Drawings. The ATC signs, Station Overspeed Marker Signs and Berthing Markers shall be readable at a distance of at least 500 feet when illuminated by a METRO car's headlights.

### **2.02 MAST AND BASE**

- A. The masts for mast-mounted signs shall consist of steel pipe poles, two inches in diameter, supported by cast iron bases. The poles shall be approximately four feet high and fitted with a threaded steel cap at the top.
- B. The cast iron bases shall have four mounting holes suitable for 5/8-inch diameter foundation bolts arranged on 6-3/4 x 6-3/4 inch centers.
- C. Masts and bases shall be painted in accordance with the recommendations of Part 2.4.30 of the AREMA Signal Manual.

### **2.03 BERTHING MARKER LAYOUTS**

- A. Each "Berthing Marker" layout shall consist of the following:
  - 1. One or more Berthing Marker signs
  - 2. A resilient neoprene backing
  - 3. A galvanized steel mounting angle
  - 4. Appropriate assembly and mounting hardware.

- B. The appropriate berthing marker sign (or signs) shall be attached to a quarter-inch neoprene backing pad with pop-rivets and reinforcing washers as shown on the Contract Drawings.
- C. The neoprene backing pad shall be attached to the galvanized mounting angle with quarter-inch bolts, nuts, washers and lock washers as shown on the Contract Drawings. A one-inch-wide reinforcing strip of 20-gauge sheet aluminum shall be used on the front of the neoprene support pad.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. Wayside ATC signs shall be installed on masts, or on brackets on walls, as indicated on the Contract Drawings and as shown specifically on the Contractor's approved drawings.
- B. Train Berthing Marker sign layouts shall normally be mounted under the edge of passenger station platforms at locations and in the manner shown on the Contract Drawings.
- C. The pole base for mast-mounted signs shall be attached to the concrete invert by means of four 5/8-inch anchor bolts.
- D. Wall mounted signs shall be attached to metal brackets bolted to the concrete wall as shown on the Contract Drawings.
- E. Provide all the masts, brackets, bolts, washers, tie wires and other mounting hardware required to mount the signs and markers as specified.
- F. The Station Overspeed Marker signs shall be affixed to the sloping face of the housings of the four 160-foot station stop marker coils facing the center of each passenger station. The sloping face of the marker coil cover shall be thoroughly cleaned and dried before the sign is applied. The film shall be applied in conformance with the manufacturer's instructions.

### **3.02 TYPE AND LOCATION**

- A. Program Station Stop Signs shall be located at the marker coil locations of the markers that normally initiate program station stops. These signs shall be provided for both directions of traffic when program station stop markers are so provided. (See Section 16967 and the Contract Drawings.) Each of these signs shall be positioned so that it can be read by the train operator on a train making the program station stop initiated by the marker at which the sign is located.
- B. Turnback signs shall be located at turnback points and shall be visible to the operators of trains to be turned back before passing that location.
- C. "START ATC" signs shall normally be located at the inbound ends of Terminal passenger station platforms to indicate to the train operators that their trains are entering Automatic Train Control territory.
- D. "END ATC" signs shall normally be located at the outbound ends of Terminal passenger stations to indicate to the train operators that their trains must be operated in a manual mode if they proceed beyond the applicable sign, i.e., that Automatic Train Control territory ends at that point.

- E. Berthing Marker sign layouts shall be located underneath the station platforms at the positions indicated on the Contract Drawings unless otherwise directed by the designated Resident Engineer.

**3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Signs and markers will be measured for partial payments based upon the number and type of required signs and markers delivered, installed and accepted.

**END OF SECTION**

## SECTION 16977

### ATC - TAGGING AND MARKING

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of identifying markings on ATC items furnished under this Contract, either directly on the item or through the use of suitable marking tags properly applied to the item.
- B. These markings shall be of the following types which are described in Part 2 of this Section.
- |     |         |                                      |
|-----|---------|--------------------------------------|
| 1.  | Type 1  | Cast Metal                           |
| 2.  | Type 2  | Sheet Steel - Reflective Coated      |
| 3.  | Type 3  | Embossed Metal                       |
| 4.  | Type 4  | Die-Stamped Nameplate                |
| 5.  | Type 5  | Printed Plastic                      |
| 6.  | Type 6  | Painted Stencil                      |
| 7.  | Type 7  | Ink Stamped                          |
| 8.  | Type 8  | Etched Copper                        |
| 9.  | Type 9  | Engraved Phenolic                    |
| 10. | Type 10 | Wire Tags Exposed to Direct Sunlight |
| 11. | Type 11 | Temporary Tags                       |
- C. Tagging and marking shall be further in accordance with specific considerations specified in the following listed Related Sections. Also listed are the marking types that generally apply to the equipment specified in each Section

##### 1.02 RELATED SECTIONS

### 1.03 QUALITY ASSURANCE

- A. The Contractor shall check during factory test that all tags, labels, stamping and/or stenciling specified herein are present, correct and properly applied, and in the case of adhesive type tags, applied according to step-by-step instructions approved by the designated Resident Engineer.

- B. Tags and labels shall be of the same type as approved by the designated Resident Engineer.
- C. The Contractor shall, during routine field inspection, check to see that all field installed labels are present, correct and properly applied. Work will not be considered complete until all tags and markings are correct and in place.

#### **1.04 SUBMITTALS**

- A. Prior to the tagging or marking of any device or piece of apparatus requiring tagging or marking, the Contractor shall:
  - 1. Submit a sample of each type of tag or marking required by these Specifications to the designated Resident Engineer for approval. The samples shall show typical nomenclature and lettering arrangement for each device, cable, wire, or piece of apparatus requiring tagging or marking. Sufficient nomenclature shall be present on each sample tag to indicate to the designated Resident Engineer that tags supplied with the equipment will not be ambiguous.
  - 2. Submit technical information on the composition and applicable wear characteristics for each type of tag or marker to be utilized.
  - 3. Obtain written approval from the designated Resident Engineer for each type of tag and marker to be utilized.
- B. The Contractor shall submit plans, diagrams, and/or photographs showing how and where each marking will be applied to each device or piece of apparatus.
- C. The Contractor shall submit a step-by-step procedure for the application of each tag or marking requiring special techniques.
- D. When tags are to be applied by methods employing an adhesive, the Contractor shall submit evidence of having included the adhesive manufacturer's recommendations for solvent cleaning and adhesive activation in the step-by-step procedures for application and shall further certify that these steps are followed during application.
- E. When tags are to be applied by heat shrink methods, the Contractor shall submit evidence of having included the manufacturer's recommendation for printing and shrinking the tubing in a step-by-step procedure for the factory personnel.

### **PART 2 - PRODUCTS**

#### **2.01 MARKER TYPE 1 - CAST METAL**

- A. This marker (used for switch-and-lock movement layouts) shall be at least three inches high and of a thickness to ensure ruggedness. It shall be made of cast metal and shall be painted white. All edges shall be slightly rounded and free of burrs. The casting shall be free of cracks or voids.

#### **2.02 MARKER TYPE 2 - SHEET METAL REFLECTIVE COATED**

- A. This marker (used for signal number plates and wayside signs) shall be of a minimum 1/8 inch thickness and a size to allow visibility as specified elsewhere in these Specifications. The reflectorized coatings or appliques shall be applied per the manufacturer's specifications and shall be free of air pockets, cuts, tears, loose edges and blemishes of any kind.
- B. If a ferrous sheet metal is selected, the marker must be fully protected from rusting according to the Contractor's standard painting procedures as approved by the designated Resident

Engineer. This procedure must include complete corrosion proofing surface preparation before paint application.

- C. If aluminum is selected as the marker material, it must be of sufficient thickness and hardness to remain stiff and straight under field conditions.

### **2.03 MARKER TYPE 3 - EMBOSSED METAL**

- A. This type of marker shall consist of a sheet metal strip approximately one inch wide and of sufficient thickness for ruggedness and durability. It shall be embossed by a stamping machine capable of producing crisp letters approximately one half inch high. The metal shall be lead bearing, galvanized or non-ferrous so that it will not be subject to deterioration by rust.
- B. Care shall be taken to ensure that the marker is flat and straight and that it is free from sharp edges.

### **2.04 MARKER TYPE 4 - DIE-STAMPED NAMEPLATE**

- A. This marker shall be the manufacturer's standard nameplate which shall contain pertinent data such as:
  - 1. Manufacturer's name
  - 2. Serial number
  - 3. Model number
  - 4. Date of manufacture (where required)
  - 5. Drawing number
  - 6. Identifying type and location number (as applicable)
- B. The nameplate shall be made of a non-corroding material. The dies and stamping process shall provide good legibility and permanence.

### **2.05 MARKER TYPE 5 - PRINTED PLASTIC**

- A. This type of marker shall be applied to each conductor and cable not exposed to direct sunlight, and to devices not otherwise identified. (TYPE 10 Markers shall be used for wires and cables exposed to direct sunlight.)
- B. TYPE 5 Markers shall be available in two forms, sleeve and flat:
  - 1. Sleeve Tags
    - a. The sleeve form shall be of the heat shrinkable type and shall be sized from 3/32-inch through 1/2-inch diameter to properly fit the wire for which it is intended. The sleeve shall be made from radiation crosslinked polyolefin (for service to 125 degrees C) or modified fluorocarbon (for service to 200 degrees C) tubing which is white in color. The printing shall be done in black and shall be permanently set through the use of a suitable infrared heater. These sleeve tags shall be of the "TMS" type as manufactured by Raychem Corporation, or approved equal. Material submitted to the designated Resident Engineer for alternate approval will be subjected to indelibility tests and must perform at least as well as that herein specified.
    - b. The legend on the sleeve tag shall always read from left to right, with the first nomenclature indicating the "from/at" location and the second nomenclature indicating the "to" location.
  - 2. Flat Tags
    - a. The flat form shall be made of flat, white, sheet stock with slots for application to large conductors, cables, and conduits (not subject to

painting) with nylon tie-wrap fasteners. These tags shall also be used for identifying indicators, relays, and other devices where slide-in holders are provided.

- b. These tags shall be one and one-half inches long by three-quarter inches wide with one, five sixteenth inch hole located in the center of the width. The distance from the edge of tag to the hole shall be approximately nine thirty-seconds of an inch. The untreated tag shall be milk white "vinylite," or approved equal, approximately seven hundredths of an inch thick.
- c. The identifying nomenclature space shall allow for three rows of lettering. The tag material shall be capable of receiving typed-on characters by conventional means. The height of the lettering shall be not less than one-eighth inch.
- d. After lettering, the face side of the tag shall be covered with a clear plastic coating, "vinylite," or approved equal, of at least one hundredth of an inch thickness. The back of the tag shall be covered with a milk white coating "vinylite," or approved equal, of at least one hundredth of an inch thickness.
- e. The nomenclature applied to tags to go on terminal racks and boards shall show the terminal post identification on the top line. The functional nomenclature shall appear on the bottom line, or, if required, on the middle and bottom lines. The terminal posts shall be identified by geometry coordinates, such as rack, row and post number.

#### **2.06 MARKER TYPE 6 - PAINTED STENCIL**

- A. This type of marking may be utilized for identification of large objects such as racks or enclosures providing they are not subject to field painting (use type 3 in this case) and providing the mark is clearly and neatly applied. The marking paint shall provide a definite contrast with the surface on which it is applied, e.g., black paint on a gray surface would not be acceptable.

#### **2.07 MARKER TYPE 7 - INK STAMPED**

- A. This type of marking shall be utilized for the identification of components not otherwise identified. All electronic components on printed circuit cards shall be so identified. The printed circuit cards themselves shall be so identified as well as their location if not identified by another type marking. The color of the ink shall be either black or white, whichever provides the greatest contrast with the background color.

#### **2.08 MARKER TYPE 8 - ETCHED COPPER**

- A. This marker type is an alternate to type 7 which may be utilized on printed circuit cards for identification of card or components.

#### **2.09 MARKER TYPE 9 - ENGRAVED PHENOLIC**

- A. This marker type shall be utilized for all special purpose panels specified elsewhere in these Specifications. The material shall be white phenolic sheet with thin layers of black phenolic laminated to both sides. Panels shall contain no detectable filled areas resulting from errors, mistakes or changes. The panel shall be free from chips or scratches. Where the edges of the panel are visible, they shall be carefully finished with a durable matte black paint. The surface of the panel shall be buffed with a fine abrasive to remove any shininess and produce a matte finish.

#### **2.10 MARKER TYPE 10 - WIRE TAGS EXPOSED TO DIRECT SUNLIGHT**

- A. This marker type shall be utilized in lieu of Marker Type 5 to identify wires and cables exposed to direct sunlight. The identifying lettering shall be as specified for MARKER TYPE 5 for similar application, but these markers shall be made of material approved by the designated Resident Engineer which will not corrode, rot, melt, or otherwise decay or lose their legibility due to moisture or the effects of sunlight. These markers will be subject to Type-Acceptance Testing.
- B. As an alternative, the Contractor may use embossed metal markers as specified for MARKER TYPE 3 for the purpose of identifying wires and cables exposed to direct sunlight.

## **2.11 MARKER TYPE 11 - TEMPORARY TAGS**

- A. This marker type shall be utilized to identify circuit changes, apparatus or any other device when, in the course of testing, an error in the permanent tag or label is noted. These tags shall be of a size and quality to readily identify the wire or apparatus until such time as the permanent tag is available. Temporary tags shall be of the size, type, material, and color(s) previously approved by the designated Resident Engineer.

## **PART 3 - EXECUTION**

### **3.01 APPLICATION**

- A. The tags and markings shall be applied during manufacture wherever possible or in the field where necessary. The markings shall be applied in a careful, thorough and skillful manner.
- B. The following special precautions shall be observed when applying tagging and marking per above mentioned type:
  - 1. Marker Type 1
    - a. The cast metal marker shall be suitably applied with rivets or flat head screws. If the fasteners penetrate the surface to which they are applied, suitable sealant shall be utilized to ensure watertight integrity of the unit. When flat head screws are used with nuts and washers, they must be secured in such a manner as to prevent loosening due to vibration with consequent entry, into and fouling of the internal operation of the switch-and-lock mechanism.
  - 2. Marker Type 2
    - a. The sheet metal, reflective coated marker shall be securely fastened in place utilizing stainless steel hex bolts, lockwashers and nuts, of diameter appropriate for marker size. A large stainless steel washer shall be used on the front surface of the sign with a neoprene gasket between it and the reflective surface to prevent tearing or gouging of the reflectorized surface. Alternately, the sign may be fastened with a suitable bracket welded or otherwise fastened to the back surface and presenting no discontinuity of the front surface.
  - 3. Marker Type 3
    - a. The embossed metal marker shall be applied by rivets, screws, stainless steel wire, or an adhesive method, to all field equipment subject to periodic painting or obscuring accumulations of dirt or grime. Examples of this equipment are:
      - 1) Conduits
      - 2) Junction Boxes
      - 3) Impedance Bonds
      - 4) Track Loops
      - 5) Station Stopping Distance Markers
  - 4. Marker Type 4

- a. The Die-stamped Nameplate shall be applied by an approved adhesive method or rivets. This marker shall be applied to racks and all equipment or apparatus which requires a test procedure as specified in other Sections. A sample of this marker affixed to a 6-inch x 6-inch finished metal plate shall be submitted to the designated Resident Engineer for testing and approval.
5. Marker Type 5
  - a. The printed plastic marker shall be properly installed so that the printed legend indicates the proper identification of the wire terminal adjacent to the sleeve. The sleeve form shall be located at the termination of the wire and may be used as insulation over an uninsulated pressure-applied terminal. The sleeve shall be oriented on the wire so that the printed legend will start at the terminal, before the heat is applied to shrink the sleeve onto the wire. The sleeve shall be used on wires of sizes up to and including No. 0 AWG. The sleeve shall also be used to identify multiple conductor cables up to 1/2-inch in diameter where specified or appropriate. The tag form shall be securely fastened to the intended object with nylon tie-wrap fasteners inserted in the slots in a manner that does not obscure the legend, and the tag shall be positioned so that it is right side up and readable when installed. The tie-wrap shall be tight enough to prevent the tag from moving from its desired position.
6. Marker Type 6
  - a. The Painted Stencil marking shall be applied with a procedure that produces clear, legible letters without voids and without paint running between the stencil and the surface being marked. No paint shall be allowed to reach the surface being marked around the outside edge of the stencil.
7. Marker Type 7
  - a. The Ink Stamped markings shall be neatly and uniformly applied. Stamped markings that are not complete as a result of improper positioning of the stamp or that are blurred or smeared will not be acceptable.
8. Marker Type 8
  - a. The Etched Copper marking utilized on printed circuit cards, shall be legible and shall not be obscured by any component mounted on the card. Letters or numerals shall be large enough so that solder fill-in will not render them illegible.
9. Marker Type 9
  - a. The Engraved Phenolic markings on control panels shall be applied with letters, numerals and lines engraved through the black layer and well into the white base to provide clean edges and distinct letters. Panels shall be fastened in place without damage from nicking or chipping. If it is not practicable to install the panels without screwheads through the panel, the screwheads shall be flat or oval and shall have a black matte (or black anodized) finish. Screwheads that are burred with a screwdriver shall be replaced.
10. Marker Type 10
  - a. Tags which will be exposed to direct sunlight shall be attached with material which will not corrode or rot due to moisture, or decompose due to ultraviolet light.
11. Marker Type 11
  - a. Temporary tags shall be attached with string, generally in the same location as required for the permanent tag. Temporary tags shall be replaced with permanent tags before each of the Authority acceptance levels listed elsewhere in these Specifications.

### 3.02 MEASUREMENT FOR PAYMENT

- A. Tagging and marking will not be paid for separately. The cost of tagging and marking shall be included in the costs of the materials and equipment being identified.

**END OF SECTION**

## SECTION 16978

### ATC - MISCELLANEOUS COMPONENTS AND MATERIALS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of miscellaneous components and materials which form part of Train Control equipment or systems which are specified in other Sections of these Specifications.

##### 1.02 RELATED SECTIONS

- A. Related Work specified elsewhere shall include, but not be limited to, the following Sections:

1.	Section 16915	Basic ATC Equipment Requirements
2.	Section 16922	Lightning/Surge Protection and Grounding Systems
3.	Section 16940	ATC Electrical and Electronic Components and Material
4.	Section 16971	Racks and Cable Trays
5.	Section 16972	Junction Boxes
6.	Section 16973	Conduit

##### 1.03 QUALITY ASSURANCE

- A. Certify that the miscellaneous components and materials used are in accordance with the Specifications and the Contract Drawings.

#### PART 2 - PRODUCTS

##### 2.01 BOLTS, NUTS AND WASHERS FOR TRAIN CONTROL WORK

- A. All nuts and bolts furnished by the Contractor for Train Control work shall have "cut" threads and shall be purchased from an approved nut and bolt manufacturer.
- B. Nuts and threads shall be in accordance with the AREMA Signal Manual, Part 14.6.20, Recommended Design Criteria for Bolts, Nuts and Threads. Plain washers shall be in accordance with the AREMA Signal Manual, Part 14.6.21, Recommended Design Criteria for Plain and Spring Lock Washers. Steel shall be in accordance with the AREMA Signal Manual, Part 15.1.4, Section 1, Recommended Developmental Criteria for Various Types of Steel.
- C. Bolts, nuts and washers shall be hot-dip galvanized, or they shall be made of brass or stainless steel. Cold galvanizing, plating and anodizing will not be acceptable. Where regular maintenance requires periodic removal of bolts, the bolts, nuts and washers shall be stainless steel.

##### 2.02 ANCHORS

- A. Stainless steel stud anchors shall be used for mounting Train Control equipment to concrete and masonry structures.

##### 2.03 POTHEADS AND FILLING COMPOUND

- A. Potheads for multiconductor Train Control cable shall be neoprene end seals similar to those manufactured by the Okonite Co., or approved equal.
- B. The filling material shall be "encapsulating resin" as manufactured by Preformed Line Products Company, FX-70 Polymetric Joint Sealant as manufactured by Fox Industries of Baltimore, Maryland, or approved equal, and shall be applied in accordance with the manufacturer's instructions.
- C. At locations where the outdoor end of a conduit entering a TCR or other structure is at a higher elevation than the indoor end, so that water entry is a problem, the Contractor shall provide conduit sealing bushings on both ends of the conduit after removing all water and moisture from the conduit. The fitting shall be as manufactured by O-Z/GEDNEY Co., type CSBG or approved equal product. At locations known to have a problem with infiltration of water under pressure, the Contractor shall install an additional seal 10 inches inside the end of the conduit. This seal shall be the O-Z type CSBI or approved equal product. Apply Dow Corning No. 96081 RTV to the cables at the locations of the seals. Fill space between the O-Z fittings with Dow-Corning No. 3-6548 Silicone RTV Foam under pressure. O-Z seal screws shall be torqued per the manufacturer's specifications.

#### **2.04 SWITCH PLATE LUBRICANT**

- A. A suitable graphite lubricant approved by the designated Resident Engineer, shall be furnished and applied by the Contractor to lubricate switch point tie plates and the inside of the joint bars holding the heels of the switch point rails. This lubricant shall be Dylon Grade SP-MS All Weather Switch Plate Lubricant, as manufactured by Dylon Industries, Inc., Cleveland, OH 44144, or equal.

#### **2.05 CORROSION PROTECTION**

- A. Protection for machined/finished surfaces, threaded rods and nuts and other parts which are susceptible to rusting, shall be a corrosion-preventive compound, NO-OX-ID "A Special", as manufactured by Sanchem, Inc., or approved equal. The compound must have sufficient body to resist weather and rusting for at least six months.

#### **2.06 GROUNDING EQUIPMENT**

- A. Driven ground rods shall be copper-clad steel, or the non-rusting type as manufactured by Copperweld Corporation, or approved equal. Each rod shall be at least eight feet in length and at least five-eighths inch diameter.
- B. Ground rod clamps shall be bronze with tamper-proof safety set screws, as approved by the Engineer.
- C. Connections to ground rods and ground buses shall be made with No. 6 bare copper wire, No. 6 insulated copper wire, No. 4/0 copper wire, or one-eight inch by one and one-half inch flat, hard drawn, bare copper strip, as applicable to the equipment to be grounded.

#### **2.07 SEALING COMPOUND**

- A. Sealing compound shall be "Duxseal" as manufactured by the Manville Company, or an approved equal.

#### **2.08 PAINT AND FINISH**

- A. All paint and painting procedures shall be in accordance with the applicable recommendations of Part 2.4.30 of the AREMA Signal Manual, where the recommendations of the AREMA Signal Manual do not conflict with the requirements of these Specifications.
- B. The surface of equipment and material not accessible after mounting shall have the final finish coat applied prior to installation.

#### **2.09 CABLE PULLING LUBRICANT**

- A. The cable pulling lubricant shall be compatible with all cable jackets and noninjurious to cable insulation.
- B. The lubricant shall be UL (or CSA) listed.
- C. The lubricant shall contain no waxes, greases, silicones, or polyalkylene glycol oils or waxes.
- D. A 200-gram sample of the lubricant, when placed in a one-foot, split metal conduit and fully dried for 25 hours at 105°C, shall not spread a flame more than three inches beyond a point of ignition at a continued heat flux of 40 KW/m<sup>2</sup>. Total time of test shall be one-half hour.
- E. The cable pulling lubricant shall be POLYWATER® J, available from American Polywater Corporation, Stillwater, MN 55082, or approved equal.

#### **2.10 UNDERGROUND EQUIPMENT**

- A. All ATC metallic cases, junction boxes, support hardware, and fastening hardware furnished and installed by the Contractor inside tunnels or other exposed underground locations shall be made of stainless steel, ASTM A276, Type 304, or approved equal, unless otherwise directed by the designated Resident Engineer. This requirement supersedes requirements for hot-dip galvanizing, cadmium plating, epoxy coating, or other protective measures for equipment so installed, unless otherwise directed by the designated Resident Engineer.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION AND/OR UTILIZATION**

- A. Miscellaneous components, products and processes shall be installed, utilized or performed as required by these Specifications, and as indicated on approved submittal drawings.

#### **3.02 MEASUREMENT AND PAYMENT**

- A. The costs of Miscellaneous Components and Material will not be measured or paid for separately, but will be included in the prices for the devices to which they are related.

**END OF SECTION**

## SECTION 16979

### ATC - SURFACE TRENCH

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the furnishing, installation and use of surface trench as an alternative to the use of ductbank or conventional direct-burial cable trenching in certain areas of the work included in this Contract.

##### 1.02 DESCRIPTION

- A. The surface trench shall consist basically of channel sections with covers, installed in such a manner that the covers are approximately two inches above the surface of the ground.
- B. Cables shall enter and exit the surface trench runs from the bottom.

##### 1.03 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16911 Scope of ATC Work.
  - 2. Section 16918 Special ATC Requirements for Specific Locations
  - 3. Section 16949 Signal Wire and Cable

##### 1.04 QUALITY ASSURANCE

- A. All surface trench components installed by the Contractor shall be new and free of defects.
- B. The Contractor shall replace all train control surface trench components which are damaged during the time this Contract is in effect, at no additional cost to the Authority.

##### 1.05 SUBMITTALS

- A. Submit complete mechanical drawings and manufacturer's documentation for the type of surface trenching he proposes to furnish. This documentation shall include, but not be limited to, the size, shape, weight, strength and composition for each type of component required for the complete system, and the methods and hardware required to assemble these components into a working surface cable trenching system.
- B. The Contractor shall submit to the designated Resident Engineer, along with the trenching plans, three sets of plans showing all locations where he proposes to install surface trench. These plans shall designate the size, length and cable consist for each proposed surface trench cable run segment.
- C. Submit complete mechanical drawings showing installation details for each type of situation to be encountered by the proposed surface trench runs.
- D. Submit a Cable Trench Installation Inspection Procedure and a Cable Trench Installation Inspection Report form.
- E. The Contractor shall not proceed with the procurement or installation of surface cable trench until these submittals have been approved by the designated Resident Engineer.

## **PART 2 - PRODUCTS**

### **2.01 TRENCH SECTIONS**

- A. Surface trench sections shall be channel shaped and constructed of precast, high density polymer concrete, steel-reinforced concrete, or cement mortar reinforced by alkali-resistant glass fiber and high-tensile welded wire.
- B. Channel sections shall be of prefabricated, one-piece construction, or shall be fabricated on site from prefabricated support brackets and sidewall sections.
- C. Channel sections shall be open on the bottom, or shall have large drainage holes and cable-access openings in the bottom.
- D. Channel sections shall have an integral means of alignment, or shall be aligned by means of external clips, plates or brackets.

### **2.02 COVERS, END PLATES AND DIVIDERS**

- A. Trench covers, end plates and, where required, internal dividers, shall be constructed of high density polymer concrete reinforced with glass fiber; fiberglass-and-steel reinforced concrete, or; cement mortar reinforced by alkali-resistant glass fiber and high-tensile welded wire.
- B. Trench covers shall be capable of supporting a load of 500 lbs/sq. ft. when properly installed on the appropriate trench sections.

### **2.03 ASSOCIATED PARTS AND MATERIALS**

- A. Furnish and install all special channel sections, alignment hardware, brackets, corner posts, lintels, or other fastening hardware needed to provide complete surface trench runs in accordance with the manufacturer's instructions and the requirements of these Specifications.
- B. Furnish and install all material and special support structure needed to provide proper support and drainage for the surface trench runs installed under this Contract.
- C. Furnish and install all sand backfill required for cable installation in the surface trench runs.

### **2.04 MANUFACTURER**

- A. Surface trench shall be: "Plastibeton Channel System" as manufactured by Synertech Moulded Products Inc., 332 South Michigan Avenue, Chicago, Illinois 60604; "Fibercrete" as manufactured by Concast, Incorporated, 15325 Babcock Avenue, Rosemont, Minnesota 55068; "Trenwa Precast Concrete Trench System" as manufactured by Trenwa Inc., 1419 Alexandria Pike, Fort Thomas, Kentucky 41075, or approved equal.

## **PART 3 - EXECUTION**

### **3.01 DESIGN**

- A. Determine the final location of surface trenching runs based upon field inspections and subject to the criteria set forth herein and the approval of the designated Resident Engineer.
- B. The Contractor shall take the following factors into consideration when determining the proposed location of surface trenching runs:

1. Relative location of natural and man-made drainage facilities and final gradients;
  2. Relative location of trackwork, conduit, duct-banks, and manholes;
  3. Relative location of train control cases, junction boxes, signals, switch machines, snowmelter control cases, and other train control and communications equipment;
  4. Relative location of third-rail power stub-ups, building foundations, walls, fences, light posts, approach slabs and other civil, electrical, and mechanical fixed facilities.
  5. Relative location of existing, direct-buried cable.
- C. The Contractor shall size and locate surface trench cable runs to provide the most efficient and economical routing for train control cables in conjunction with the conduit, ductbank and manholes provided by others.

### **3.02 INSTALLATION**

- A. Surface trench units shall be installed in such a manner that the top surface of their covers generally follows the ground contour and is approximately two inches above the final ground level, unless otherwise directed by the designated Resident Engineer.
- B. Surface trench runs shall be installed in accordance with the manufacturer's instructions and as approved by the designated Resident Engineer. The Contractor shall take care not to disturb existing direct-buried cable while installing surface trench or installing cable therein.
- C. Where surface trench runs cannot avoid crossing over natural or man-made drainage facilities, the Contractor shall provide adequate structure to support the surface trench runs plus an additional load of 500 lbs/sq.-ft. without interfering with the function and capacity of the drainage facilities.
- D. Where surface trench runs must run parallel to natural or man-made drainage facilities, the Contractor shall provide adequate structure to prevent undermining, displacement, or other damage to the surface trench runs, and to prevent the surface trench runs from becoming part of the drainage system. This shall be accomplished by providing sufficient drainage for the surface trench runs and by installing the runs in such a manner that surface running water is prevented from entering the runs. Any gaps between the ends of the trench cover sections shall not exceed one-quarter inch.
- E. Install a bed of sand at least three inches deep in the bottom of each surface trench run before installing cable in the run.
- F. Cable shall be installed in surface trench runs in a manner similar to the installation of cable in cable trays, i.e., the cables shall be laid loosely and neatly in the trench with a minimum of crosses. Cable, during installation and as finally installed, shall not be bent to a radius less than 20 times its diameter, and shall not be pulled tightly around corners. Sufficient slack shall be provided in each cable in each cable trench segment to prevent damage to the cable.
- G. Provide longitudinal dividers in surface trench runs which will contain both high-voltage (greater than 200V) and low-voltage cables, and separate the cables accordingly.
- H. Each cable installed in a surface trench run shall be identified by a weatherproof tag at each end of its run in the surface trench and at intervals not to exceed 100 feet.
- I. Unless otherwise directed by the designated Resident Engineer, the Contractor shall not install the surface trench cover sections until the installation of the trench itself and the installation of all required cables therein has been approved by the designated Resident Engineer.

- J. Remove all trash and ballast from the surface trench before installing the trench covers.

**3.03 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Surface trench will be measured for partial payments based upon the amount and size of such required trench which has been approved, furnished and properly installed.
- B. For measurement purposes only, surface trench will not be considered to be completely installed until the required cables have been installed therein, and the cover sections installed.
- C. Factors which will be considered when determining partial payments for surface trench will include, but not be limited to, the following:
  - 1. Delivery of the surface trench components to the work site;
  - 2. Proper installation of the surface trench base sections;
  - 3. Installation of all applicable cable in the surface trench in the specified manner;
  - 4. Installation of the trench cover sections;
  - 5. Approval of the installation by the designated Resident Engineer and correction of all applicable punch list items by the Contractor.

**END OF SECTION**

## SECTION 16980

### TESTS, INSPECTIONS AND QUALITY ASSURANCE

(Table of Contents)

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

A. This section lists the various 16980-series ATC Test, Inspection, and ATC Quality Assurance specification Sections

- |    |  |                           |
|----|--|---------------------------|
| 1. | Basic ATC Test and Inspection Requirements | (Section 16981)           |
| 2. | Preliminary and Interlocking Tests         | (Level A) (Section 16982) |
| 3. | Train Separation Tests                     | (Level B) (Section 16983) |
| 4. | ATO and Local ATS Tests                    | (Level C) (Section 16984) |
| 5. | DTS Interface Tests                        | (Level D) (Section 16985) |
| 6. | Miscellaneous Tests                        | (Level E) (Section 16986) |
| 7. | System Level Tests                         | (Level F) (Section 16987) |
| 8. | ATC Quality Assurance                      | (Section 16988)           |

END OF SECTION

## **SECTION 16981**

### **BASIC ATC TEST AND INSPECTION REQUIREMENTS**

#### **PART 1 - GENERAL**

##### **1.01 SECTION INCLUDES**

- A. This Section specifies the basic criteria for factory and field tests and field installation inspections which the Contractor shall devise, perform and document on the various Automatic Train Control systems, subsystems, assemblies, subassemblies, and components provided under this Contract, to demonstrate that each is in compliance with these Specifications.

##### **1.02 DESCRIPTION OF BASIC TRAIN CONTROL TEST AND INSPECTION WORK REQUIRED**

- A. The Contractor shall review the Wayside Test Procedure (WTP) requirements described in Sections 16982 through 16987, inclusive, for applicability to the ATC system(s) and equipment he proposes to furnish under this Contract. The described test procedures or any additional wayside (field) test procedures necessary for applicability to the system(s) or equipment the Contractor proposes to furnish shall be prepared, submitted for approval, and, when approved, executed by the Contractor at no additional cost to the Authority. Wayside Test Procedures approved for previous WMATA contracts, if any, upon resubmittal, will not receive automatic approval, but will be thoroughly reviewed for conformance with the current requirements of these Specifications.
- B. The Contractor shall be responsible for the costs of his personnel and any special equipment and assistance required to conduct all required tests and field installation inspections, and complete the required documentation. When a device or system does not meet the specification requirements initially, the Contractor shall make the necessary corrections and shall be responsible for the total cost of additional tests and/or inspections required to prove compliance. The Contractor will not be responsible for the cost of train operation; these costs will be borne by the Authority to the extent agreed upon by approval of the Contractor's requirements in the test procedure.
- C. No test which requires that a potentiometer, adjustable resistor or other adjustable component be adjusted to within 25 percent of its maximum or minimum value in order to achieve the required test results will be considered satisfactorily completed except in those instances where non-compliance has been specifically approved by the Engineer. (See Section 16916, Basic Circuit Requirements.) When a component adjustment is within 25 percent of its limits, the Contractor shall notify the designated Resident Engineer, commence corrective action and schedule a retest to take place after the condition is corrected.
- D. The WTP number designations used in these Specifications are based upon numbers used for tests of the ATC system to date. The Contractor may elect, subject to the designated Resident Engineer's approval, to alter these designations in his proposed test procedures. The Contractor shall provide a detailed description in writing of the relationship between the existing and any proposed new test procedures. The proposed testing scheme shall, as a minimum, address all of the requirements of this article as well as the specific article describing the test and may include additional tests deemed necessary by the Contractor in order to meet his responsibilities of providing a complete, safe and workable system. Any such additions shall be brought to the attention of the designated Resident Engineer. Each WTP number shall be used as a file name for that test procedure.

- E. The Contractor may elect to conduct two or more of the required tests at the same time, to reduce train movements and time requirements. When two or more of the required tests are conducted at the same time, the Contractor shall provide a single test procedure with clearly designated, consecutive steps covering the combined tests and a single series of Data Sheets shall be provided, with consecutive numbering. The Contractor shall exercise care to assure that the combined tests do not require more time than the tests performed separately. In the event that they do, any additional time required will be at no additional cost to the Authority.
- F. The Contractor shall submit to the designated Resident Engineer for approval, a list of all the test equipment required for the tests. Such pieces of equipment shall be adequate for the test to be made and shall meet with the designated Resident Engineer's approval. If special test fixtures are required, sufficient documentation shall be submitted with the list to enable the designated Resident Engineer to make a judgment regarding their suitability. The special test equipment shall become the property of the Authority at the conclusion of the test requiring it. Wherever possible the test equipment shall be of the multipurpose type, thus minimizing the number of different pieces of test equipment required.
- G. A minimum of one of each item of test equipment required for testing shall be delivered to the Authority by the Contractor prior to the start of testing. Any associated or required software or special licenses shall be included with this equipment. Upon request the Contractor may utilize specialized test equipment which has been delivered under this Contract. The Contractor shall be responsible for the calibration of such equipment and shall return the equipment in like-new condition. The Contractor shall replace any equipment damaged while in the Contractor's custody.
- H. The Contractor shall give the designated Resident Engineer sufficient advance notice of all field installation inspections and field tests to enable the designated Resident Engineer to witness such inspections and tests. Field installation inspections and tests shall not proceed without prior notification to the designated Resident Engineer. The Contractor shall make any provisions necessary for the designated Resident Engineer to witness such inspections and tests. Should the designated Resident Engineer decline to witness any such inspection or test, the Contractor shall keep the designated Resident Engineer apprised of the progress and results of the inspection or test.
- I. The Contractor shall keep a master log of all field testing, with a special emphasis on all problems encountered and readjustments or revisions necessary to correct the problems. As an alternative, the Contractor shall require each individual tester to maintain individual testing logs. In either case, the log(s), or a legible copy of the log(s) shall be delivered to the Authority on a monthly basis. The original log(s) shall be available for inspection by the Authority at any time during the applicable testing period(s). Upon conclusion of all testing by the Contractor, the final logs shall be delivered to the Authority.

**1.03 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Division 1 General Requirements
  - 2. (Article IX) Commencement, Prosecution and Completion of Work
  - 3. (Article VI.A) Progress Schedules Quality Assurance
  - 4. Section 16901 Definition of ATC Terms
  - 5. Section 16904 Current Automatic Train Control System
  - 6. Section 16916 Basic ATC Circuit Requirements
  - 7. Section 16917 Basic Interlocking Requirements
  - 8. Section 16918 Special Requirements for Specific Locations
  - 9. Section 16931 ATC Maintenance and Test Facilities

10.	Section 16949	Signal Wire And Cable
11.	Section 16977	Tagging and Marking
12.	Section 16982	Preliminary and Interlocking Tests (Level A)
13.	Section 16983	Train Separation Tests (Level B)
14.	Section 16984	ATO and Local ATS Tests (Level C)
15.	Section 16985	DTS Interface Tests (Level D)
16.	Section 16986	Miscellaneous Tests (Level E)
17.	Section 16987	System Level Tests (Level F)

#### 1.04 QUALITY ASSURANCE

- A. The quality of materials, fabrication and finish of all ATC components, and their compliance with these Specifications, shall be assured by the factory tests and inspections which the Contractor shall devise and perform as specified in the various ATC Sections of these Specifications.
- B. The quality of the wayside ATC System installation shall be assured through the performance by the Contractor of tests and inspections made during the progress of this Contract and after completing the installation of equipment. These tests and inspections shall consist of, but not be limited to, factory tests, field installation inspections, circuit breakdown tests, wiring verification tests, continuity tests, resistance tests, voltage and current tests, time tests, flame tests, operating tests, simulation tests, and other electrical and mechanical tests and inspections required by the Engineer to prove that every system and device in the installation meets these Specification and design requirements.
- C. The Contractor shall devise, perform and document such factory tests as are necessary to ensure the appropriate degree of quality for items manufactured or fabricated for use on the ATC system specified herein.
- D. The Contractor shall devise, perform and document field installation inspections to ensure that all Train Control equipment furnished in association with this Contract is installed, connected and adjusted in compliance with these Specifications.
- E. The Contractor shall devise, perform and document such field tests as are required by the various Sections in Section 16980 to ensure that all wayside ATC systems, subsystems, and operating equipment, provided under this Contract, function in a safe and proper manner and as required by these Specifications.
- F. The validity of each field test shall be demonstrated to the designated Resident Engineer, either at the factory with simulated equipment or in the field on newly installed equipment. (Simulated tests at the factory for vital equipment such as track circuits will not be acceptable.) The designated Resident Engineer must be satisfied that the test procedure adequately determines that the equipment is working properly, in a safe manner, and that it meets or exceeds the requirements of the Specifications. The designated Resident Engineer will signify his satisfaction with the test procedure by placing his signature on the first page of the document. No test procedure which has not been signed by the designated Resident Engineer (as well as the Contractor) will be considered valid.
- G. Any ATC module, device or appliance, furnished or provided under this Contract, which requires power to be supplied from a power supply system, regardless of system voltage, current or frequency, shall operate satisfactorily throughout the range of plus or minus 8 percent of the rated system voltage. The Contractor shall demonstrate conformance with this requirement in either the type acceptance test or the factory test.

- H. The Contractor's Quality Assurance Manager shall ensure that the approved test procedures are on site and being executed per the requirements of the approved procedure. This information shall be conveyed to the designated Resident Engineer. The QA Manager shall initial and date any portion of the test data sheets witnessed during spot checks. The QA Manager shall stop testing activities if an approved copy of the test procedure is not on site and being utilized. Testing shall not resume until a stamped approved copy of the test procedure is on site.

## 1.05 SUBMITTALS

- A. The Contractor shall, within 90 calendar days of Notice to Proceed, submit for approval of the designated Resident Engineer, three copies of the following:
1. A list called "Master List of Factory Tests" which lists and briefly describes the inspections to be performed on each piece of equipment furnished under this Contract.
  2. A list called "Master List of Installation Inspections" which lists and briefly describes the inspections to be performed in the field upon installation of Train Control equipment. This list shall include, but not be limited to, inspections for the following items and associated components:
    - a. Wall mounted power distribution equipment:
      - 1) Circuit breaker cabinets
      - 2) Transfer and bypass equipment
      - 3) Transformers
    - b. Equipment racks to include all equipment mounted thereon:
      - 1) Rack mounted interlocking control panels
      - 2) Track and alarm indication panels
      - 3) Vital relays
      - 4) Non-vital relays and timers
      - 5) Modules and cabinets
      - 6) Power supplies
      - 7) Transformers
      - 8) Ground detectors
    - c. Cable trays
    - d. Grounding systems (all components)
    - e. External and internal cable
    - f. Negative return bonding
    - g. Signal rail bonding
    - h. Impedance bond layouts
    - i. Marker coil layouts
    - j. Inductive track loop layouts
    - k. Power frequency track circuits
    - l. Audio frequency track circuits
    - m. Signal layouts
    - n. Track switch operating layouts
    - o. Equipment and interface cases and junction boxes
    - p. Wayside signs and markers
  3. A list called "Master List of Field Tests" which lists by number and describes the various field tests that the Contractor plans to perform in the field. This list may be all-inclusive providing references to tests not to be performed at certain locations or on the current Contract. The tests to be performed at each location shall, in some manner, be delineated.
  4. Progress Schedules
    - a. The Contractor shall include in the Progress Schedules specified in Article VI.A., of Division 1 of these Specifications a complete description of the testing to be provided under this Contract. The Progress Schedule shall

delineate the order in which the various required field installation inspections and field tests are to be made and their durations. The Progress Schedules shall show how the Contractor plans to meet the installation and testing dates required by the Contract.

- b. The Progress Schedule provided by the Contractor shall conform to the following requirements:
  - 1) Supplementary data to be included with the schedule shall include an estimate of the test and train requirements, number of man-days required for each test, and the number of men the Contractor plans to utilize for testing.
  - 2) The Critical Path Installation Inspection and Testing Schedule shall take into account the number of locations included in the Contract and the fact that there will be a three week period after all Level A testing has been completed, and a three week period after Level B, C and D testing has been completed before Level F testing can be started. During these two periods, the wayside will not be available to the Contractor.
  - 3) The Contractor shall construct this schedule to allow each test to have its prerequisite testing complete before the test is started. If the resulting approved order of testing is not followed, the Contractor may be required by the designated Resident Engineer to repeat some tests, and such repeat testing will be at no cost to the Authority.
5. A list of all field tests to be performed at each location affected by this Contract.
  - a. This list shall include the following items for each field test listed:
    - 1) List issue number
    - 2) Test procedure
    - 3) Current revision number of the test procedure
    - 4) Descriptive title of test
    - 5) Partial acceptance level of test
    - 6) Prerequisite tests and/or installation inspections required
    - 7) Remarks
    - 8) Date on which list was revised and reason.
  - b. This list shall have an Authority and designated Resident Engineer approved distribution list which may contain the names of as many as twenty persons.
  - c. This list shall be reissued following every list revision.
- B. The Contractor shall, within 120 calendar days of Notice to Proceed, submit a Field Installation Inspection Procedure for each of the field installation inspections to be performed. (See Section 18981.1.05-A.2.) These field installation inspection procedures shall include, but not be limited to the following items:
  1. Title sheet
  2. Revision log
  3. Table of Contents
  4. Introduction
  5. Responsibilities
  6. List of applicable documents
  7. List of items to be inspected
  8. Quality assurance flow diagram
  9. Field installation inspection check list
  10. Discrepancy List
  11. Discrepancy Resolution Sheet
  12. Designated spaces for signatures of inspection personnel and Contractor's project manager
  13. Designated space for signature of Authority's witnessing inspector.

- C. The Contractor shall, within 120 calendar days of Notice to Proceed, submit three copies of a basic "Test Report" document (on 8-1/2 inch by 11 inch paper) for every field and factory test required in these Specifications. This document shall include titled lines for the following information where possible:
1. Prerequisite installation inspections and tests, and all other prerequisite installation documents or information necessary
  2. Name and number of test
  3. Date and time of start and conclusion of test
  4. Names of personnel performing test
  5. Name of Test Supervisor
  6. Time Test Supervisor was present during test
  7. Names, model numbers, calibration dates and serial numbers of all instruments used in test
  8. Results of test
  9. List of difficulties or discrepancies encountered in test
  10. Recommendations and authorization for remedial action and retest
  11. Signatures of test personnel and Test Supervisor
  12. Authority approvals
  13. List of circuit pages, drawings, and/or arrangement plans used during test
  14. List of circuit pages, arrangement plans or other documents revised due to corrections or modifications
  15. Miscellaneous comments
  16. Train car numbers and current train validation date.
- D. The Contractor shall endeavor to minimize the amount of paper required for the Test Report forms by providing self explanatory boxes to check, in lieu of long written descriptions made during the test.
- E. The Contractor shall, at least 30 calendar days prior to the commencement of manufacture, submit for approval of the designated Resident Engineer, detailed factory test documents as described herein. These test documents shall conform to the following requirements:
1. The Contractor's factory test documents shall consist of a test procedure and pre-printed data sheets and/or inspection sheets for each test.
  2. When completed by the factory test personnel and checked for accuracy and completeness, the data sheets shall be submitted as the factory test report.
  3. The Contractor shall submit these data sheets to the Engineer and receive formal approval thereof before the equipment thereby tested is shipped.
  4. When factory tests require specific meter or test instrument readings, the pre-printed data sheet shall show the allowable range of values, and each part of the test. The test report shall also contain a checkoff system for each action and a blank space adjacent to the expected range of values in which to record the test readings. When tests include observations of pertinent responses which do not require instrument readings, each response shall have its own checkmark. No single checkmark shall be used for groups of responses.
  5. If, during the factory test, a discrepancy is found, it shall be corrected and any affected portion of the test shall be repeated. No piece of equipment with an uncorrected discrepancy shall be shipped.
  6. If, during the factory test, a discrepancy is found which cannot be corrected, testing shall be discontinued and the Engineer shall be notified and furnished with the test results and all particulars.
  7. Each device requiring factory test shall be given a model number to which the test documents are keyed. Any change in the organization or construction of the device shall result in a new model number or alternatively, the same model number, but a new series number. Each device requiring factory test shall have a serial number which shall be unique for any given model number. These numbers shall appear on the device.

- F. For each field installation inspection the Contractor shall submit, at least two weeks prior to the inspection, a Field Installation Inspection Report which shall include, but not be limited to, the following:
1. Title sheet showing specific equipment inspected
  2. Check list
  3. Discrepancy list
  4. Discrepancy resolution sheet
  5. Signatures of Contractor's inspection personnel and Project Manager
  6. Signature of Authority's witnessing inspector.
- G. For each field test the Contractor shall submit a detailed test procedure, as described herein, at least 60 calendar days prior to the scheduled performance of the test for approval of the designated Resident Engineer. These test procedures shall meet, as a minimum, the following requirements:
1. The Contractor's field test documents shall consist of applicable, approved pre-printed data sheets for recording data for each test. When preprinted data sheets are used for more than one set of conditions, the Contractor shall identify each set of conditions on separate data sheets. For all tests, if a check mark is required to indicate proper performance, the data sheet shall have a box for indicating the nomenclature of the applicable device, and the desired condition, e.g., XXX relay energized (or deenergized), YYY light indication on (or off), or color, etc. When completed by the field test personnel and checked for accuracy and completeness, the sheets shall be submitted to the designated Resident Engineer as the test report.
  2. When field tests require specific meter or test instrument readings, the pre-printed data sheet shall show the allowable range of values, for each part of the test by providing on the data sheet, the maximum and minimum values for each value measured. The test report shall also contain a checkoff system for each action and a blank space adjacent to the expected value in which to record the test readings. When tests include observations of pertinent responses which do not require instrument readings, each response shall have its own checkmark. No single checkmark shall be used for groups of responses.
  3. If, during the field test, a discrepancy is found, it shall be corrected and any affected portion of the test shall be repeated. No piece of equipment or test with an uncorrected discrepancy will be approved.
  4. If, during the field test, a discrepancy is found which cannot be corrected, testing shall be discontinued and the Engineer shall be notified and furnished with the test results and all particulars. Corrective action by the Contractor shall be started immediately.
  5. The field test report shall also contain a final description sheet on which the Contractor shall record discrepancies found and action taken. This documentation shall be furnished to the designated Resident Engineer. All test reports shall be dated and signed by the responsible employee of the Contractor, or subcontractor, on the day the test is performed. Space shall also be provided for the signature of the witnessing inspector.
  6. Each step of the test procedure shall be clearly written in a manner which describes the action to be performed and also the purpose of the step.
  7. Test procedures shall be clearly worded. A Glossary of Technical Terms shall be provided with each group of test procedures submitted. No technical words shall be used which are not in the Glossary. No words may be used in the test procedures which are not either in the Glossary or in common usage as defined by their inclusion in a commonly used "desk" or "college" edition dictionary. Words shall have their common meaning or a meaning in general use in the Signal Industry.
  8. A Glossary of Abbreviations shall be provided with each group of test procedures submitted. No abbreviation may be used in the test procedure which is not included in the Glossary of Abbreviations.

9. Test procedures shall not be written for specific locations, but shall be general, and apply to all locations of the same general type. Where a particular location has a special feature not usually found in locations of the same general type, the Contractor shall add a special section to the general procedure, clearly designated for that special feature. The Contractor shall provide entry spaces in the Data Sheets for the entry of the data which makes the general test procedure specific for specific locations. Examples of such data are:
    - a. Location designations
    - b. Adjacent location designations
    - c. Track circuit numbers
    - d. Signal numbers
    - e. Train numbers
  10. The Contractor shall record the results of each factory or field test as specified herein. The Contractor shall submit properly executed test documents for each prescribed test within not more than two weeks of completion of the individual tests. All test reports shall be checked and approved by the Contractor prior to submittal to the designated Resident Engineer. Partially completed test documents shall not be submitted without permission of the designated Resident Engineer. The test report shall be all-inclusive, that is it shall contain all required data, reference drawings, explanations, and other information necessary to permit evaluation without the necessity of securing this information from other sources by those responsible for evaluating the test report. All superfluous data shall be so marked or eliminated from the test report prior to submittal. The test report shall be legible in its entirety. Test reports which do not meet the requirements as outlined in these paragraphs will be rejected.
- H. The Contractor shall organize each test procedure into the following sections:
1. Title Sheet - containing the test procedure title, number, acceptance level, issue date and revision date. This sheet shall also present a concise, but complete statement of the purpose of the test described. Finally, blanks shall be provided for the signatures (and dates of signatures) of the Contractor's responsible personnel and the designated Resident Engineer.
  2. Table of Contents
  3. List of test and installation inspection prerequisites
  4. List of abbreviations used in test
  5. List of test equipment required
  6. Preliminary information (background information further clarifying the purpose of the test)
  7. Test description
  8. Data sheets for recording results. These sheets shall include maximum and minimum values for expected results and shall include boxes to be checked for each adjustable circuit component to indicate that the adjustment is within the acceptable mid-50 percent range.
- I. Prior to the commencement of any test, the Contractor shall present a copy of the approved test procedure to the inspector who is to witness the test.

## **PART 2 - PRODUCTS**

### **2.01 TEST INSTRUMENTS**

- A. The Contractor shall use only test and inspection instruments which are of the proper type and capacity for the task required.

- B. The Contractor shall use only test and inspection instruments which are properly calibrated and in good working order.
- C. The Contractor shall obtain approval of test and inspection instruments in accordance with the provisions of Sections 16982, 16983, 16984, 16985, 16986 and 16987 of these Specifications.

## **PART 3 - EXECUTION**

### **3.01 FACTORY TESTS AND INSPECTIONS**

- A. The Contractor and/or his subcontractors shall perform all necessary factory tests and inspections of systems, subsystems, assemblies, subassemblies, and components supplies under this Contract to ensure compliance with these Specifications. These tests shall verify design and nameplate ratings, and shall ensure adequate and proper performance, safety and reliability.
- B. All systems, subsystems, and components forming an integral part of a fail-safe circuit and all electronic devices shall be 100 percent inspected and tested. All components, other than those related to fail-safe circuits shall be tested on a sampling basis. An approved number of randomly selected components or units from the manufacturing process shall be tested to ensure the adequacy and acceptability of all components and units produced. Bidders shall indicate in their proposals:
  - 1. The tests to be performed on each type of component or unit, and;
  - 2. The numbers of each type of component or unit to be tested to demonstrate the adequacy of design and quality control.
- C. When test results are not recorded on a test-data plate affixed to the component or unit, the Contractor shall furnish certified test reports for each item at the time of delivery.
- D. Each component and unit shall be inspected at its point of manufacture and evidence of this inspection and acceptability shall be indicated on the item where practicable.
- E. The Authority and the designated Resident Engineer reserve the right to witness any or all tests and inspections in the Contractor's and/or subcontractors' plants. The Contractor shall advise the designated Resident Engineer a minimum of two weeks in advance of each test. When tests are to be conducted continuously as a production-line routine, the Contractor shall advise the designated Resident Engineer two weeks in advance of the start of such tests and shall indicate the duration of the period over which such tests will be conducted.
- F. All test and inspection procedures shall be subject to the approval of the designated Resident Engineer.

### **3.02 FIELD INSTALLATION INSPECTIONS**

- A. The Contractor shall perform in the field all installation inspections necessary to ensure the proper installation of all Train Control equipment installed under this Contract. These inspections shall verify that all equipment to be provided is present, properly installed, tagged and marked according to Section 16977, Tagging and Marking. These inspections shall be performed in the manner described in the Contractor's Field Installation Inspection Procedures as approved by the designated Resident Engineer.
- B. The Contractor shall record the results of each field installation inspection and submit the completed report to the designated Resident Engineer for approval. The designated Resident Engineer will review the installation inspection reports in conjunction with any on-

site inspections he considers necessary, and inform the Contractor as to whether the inspected area is acceptable for field testing. The designated Resident Engineer reserves the right to decide whether installation inspection discrepancies, either noted in the Contractor's reports or noted by the designated Resident Engineer during his on-site inspection, must be corrected prior to commencement of field tests.

- C. It is the intent of these Specifications that the Field Installation Inspections ensure that proper installation of equipment has been accomplished prior to the commencement of field testing. Approval of the installation does not constitute final or partial acceptance of the equipment by the Authority.

### **3.03 FIELD TESTS**

- A. The Contractor shall perform in the field all tests required to ensure the proper and safe operation of all equipment, systems and subsystems and to prove the adequacy and acceptability of the total installation. The tests to be performed shall cause each system and subsystem to be sequenced through its required operations, including the imposition of simulated conditions to prove that the installation complies with all specified fail-safe requirements.
- B. Contractor Responsibility
  1. The Contractor shall develop computerized spread sheets or data bases to track all field tests and test results. Copies of all software used which is not already in use by the designated Resident Engineer shall be delivered to the designated Resident Engineer along with the computerized data sheets prior to commencement of testing.
  2. The Contractor shall provide equipment and apparatus required for the tests and shall disconnect and reconnect any connections necessary in performing the tests.
  3. For each test crew, the Contractor shall loan to the designated Resident Engineer a notebook-style computer capable of running the programs used for test result tracking. These computers will remain in the possession of the designated Resident Engineer until the review of test data is complete.
  4. Wherever practicable, Test Data sheets shall be computer-generated printouts by the Contractor. The Data Sheets will be checked and, if acceptable, signed by the designated Resident Engineer's representative. Copies of the completed test data shall be submitted by the Contractor on magnetic disk along with the signed hard copy.
- C. Only those field tests which are conducted and documented by the Contractor after the designated Resident Engineer has notified the Contractor that the installations are acceptable will be considered valid tests and be accepted for review by the designated Resident Engineer.
- D. The Contractor's field testing shall be divided into six "Levels," (A, B, C, D, E and F) as specified in Sections 16982, 16983, 16984, 16985, 16986 and 16987 respectively. The tests shall be performed in sequence and conducted in compliance with the requirements of Division 1, Article IX, Commencement, Prosecution and Completion of Work, and as specified herein.
- E. There will be a period of time after Level B Test WTP 2.7 and all Level A testing has been completed, which will be reserved for the Authority to certify the system for train operations, energize the wayside (Propulsion Power) system and condition the rails for the remaining Level B testing. The wayside will not be available to the Contractor during this energization period. All Level A testing and Level B test WTP 2.7 must be complete prior to energization. See Section 16995, Appendix L, for this time period.

- F. There will be a period after all Level B, C, D and E testing has been completed which shall be reserved for the Authority to conduct its own testing and evaluation. At the conclusion of this period, the Contractor shall commence the Level F testing if so authorized by the designated Resident Engineer. The Authority will inspect each TCR to determine if the TCR is ready for Level F testing. The Contractor shall endeavor to minimize all installation and testing discrepancies prior to this period. The designated Resident Engineer will not authorize the start of Level F testing if discrepancies are found that constitute a lack of confidence in the Contractor's performance. Discrepancies in circuits, and data sheets containing data that do not meet the Contract requirements are examples of situations which will create such lack of confidence.
- G. After (Propulsion Power) energization, the Contractor's testing activities and access to the energized test areas will be controlled by WMATA Start-Up. Only Authority-authorized Contractor personnel with escort, will be allowed in the track bed in an energized area, and only for tasks in support of the test program which can safely be performed in the energized environment. For other activities, the Contractor will be required to make arrangements in advance with the designated Resident Engineer for removal of power before occupying the track bed. The Contractor shall provide, in writing to the designated Resident Engineer, his planned duration of testing including the holidays he plans to observe during the test period.
- H. The Authority publication "Start-Up Rules for Conducting Test Operations," as amended for the current Contract's track configuration, will be in effect and will govern the movement of trains and the Contractor's access and activities. The latest revision of R-SMNT Red Tag SOP 200-22 and all other applicable Authority RAPs shall be followed by the Contractor. Revenue operating rules and safety procedures will be in effect, and failure to comply with these rules will result in disciplinary action against the Contractor. These documents will be available to the Contractor at the WMATA Systems Maintenance Facility, located at 195 Telegraph Road, Alexandria, Virginia 22314.
- I. After energization the Contractor shall not move any switch points, or operate any switch-and-lock movements, without first requesting (and securing) permission from Start-Up Control.
- J. When it is necessary for the Contractor to utilize one or more trains for conducting tests according to these Specifications, the Authority will furnish the proper number of "valid trains," as long as the total number of trains does not exceed the number of trains specified in Part 1.05-C.16 of this Section. Each train will be available according to the following conditions:
1. A "valid train" will be considered to be a train on which all electrical facilities, controls, motive power equipment and brake gear is in good operating order and a train which responds correctly to the Daily Safety Test at an existing location. In addition to the requirements specified above, a "valid train" for safe braking distance (SBD) purposes shall meet the requirements specified in Section 16905, Part 1.03, Acceleration and Brake Rates.
  2. The necessary number of 2-car "valid trains" will normally be available to the Contractor for not more than two (2) shifts (15 hours) per day and not more than five (5) days per week, subject to the following conditions:
    - a. The Authority will normally furnish up to two (2) 2-car "valid trains" as required, with one (1) operator per valid train. When a particular test requires a 4-car train, the two 2-car trains furnished shall be coupled. When a 6-car or 8-car train is needed, the Authority, after two weeks advance notice, will provide one or two additional married pairs of cars as necessary for the 2 to 3 hours required for the test.

- b. For WTP 2.20, Part III, Control Line Tests, the Authority will provide two (2) two-car "valid trains" with one (1) operator for each "valid train" in addition to the two (2) 2-car trains normally furnished.
    - c. The Contractor shall, as a minimum, have one qualified, experienced technician per test train, and one qualified, experienced test supervisor for dynamic testing, who shall be full time salaried employees of the Contractor.
  - 3. This equipment will be available as long as the Contractor keeps it in current use and does not let it stand idle for more than three consecutive working days.
  - 4. If equipment on the valid train becomes inoperative as a result of an action taken by the Contractor, the Contractor shall bear the cost of restoring the equipment to proper working order.
  - 5. It shall be the responsibility of the Contractor to keep a log of any changes or readjustments made on the "valid train" while it is being used by the Contractor. This log shall be turned over to the Authority with the train at the end of the testing period for which the train is required.
  - 6. No changes, replacements or readjustments shall be made to any connections, wiring or equipment aboard the "valid train" without the knowledge and express consent of the designated Resident Engineer and the Authority. The Authority's Rail Car Maintenance Department (R-CMNT) will make all modifications and equipment changes to the test train as approved by the designated Resident Engineer.
  - 7. Interface testing must be scheduled two weeks in advance of the test start date and shall be conducted only during the hours listed below:
    - a. 1:30 am - 3:30 am Monday through Friday
    - b. 2:30 am - 4:30 am Saturday
    - c. 2:30 am - 5:30 am Sunday
    - d. All preparatory work such as equipment set-up, data sheet preparation and boarding of the train shall have been completed by the Contractor in advance of the hours stated above.
  - 8. Track inspection will be performed by the Authority prior to the start of each working day in non-revenue areas. The trackway will not be available for testing during these inspection periods. The productive test time percentage shall be calculated by multiplying the number of trains available by the number of hours scheduled for each shift which gives the total number of hours available and then dividing the number of test hours recorded, by the total number of hours available. The productive test time applies to all phases of Dynamic Testing including system tests (Level F). The Contractor can expect, on the average, between 35 and 45 percent productive test time during the above working-day and non-revenue periods.
- K. All field tests and procedures will be subject to the approval of the designated Resident Engineer. The designated Resident Engineer will have the right to witness any or all field tests conducted. The Contractor shall notify the designated Resident Engineer in writing at least 48 hours prior to each test.
- L. Following the completion of each field test, the test results, data sheets and other required records shall be furnished to the designated Resident Engineer. Where the installation did not comply with the Specifications, the remedial action taken by the Contractor shall be recorded and included with the test results.
- M. The Contractor shall resolve all field test discrepancies in accordance with applicable sections of the following procedure:
- 1. Upon discovery of each discrepancy, the Contractor shall describe the discrepancy on the data sheet form which he has provided for that purpose.
  - 2. If the discrepancy is due to an error in field wiring and connections which do not agree with the approved circuit plans, the Contractor may correct such errors without prior approval of the designated Resident Engineer.

3. If the test discrepancy is due to an error in the approved circuit, the Contractor shall not make any changes which affect safety of operation of the approved circuits, as designed, without prior approval of the designated Resident Engineer.
  4. The Contractor shall retest the affected portions of each discrepancy he has corrected.
  5. The retest shall be documented by the Contractor in the manner prescribed in Part 1.05.G of this Section.
  6. Whenever a resolution to the discrepancy is not available at the conclusion of the test, the Contractor shall describe the follow-on action required and list responsibility for such action in the initial field test report.
- N. The designated Resident Engineer will make all final determinations as to whether only a part, or the whole test, shall be re-run when any specific field test does not meet the requirements specified for the test.

### **3.04 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Testing of the wayside ATC System and equipment for each TCR area of control will be divided into the following categories for measurement purposes for partial payments:
1. Factory Test Documentation
  2. Level A Tests
  3. Level B Tests
  4. Level C Tests
  5. Level D Tests
  6. Level E Tests
  7. Level F Tests
    - a. The six test "Levels" (A, B, C, D, E and F) are defined in Sections 16982, 16983, 16984, 16985, 16986, and 16987, respectively, and in SECTION 101, Article IX, Commencement, Prosecution and Completion of Work.
  8. Test Report Discrepancy Correction
  9. Field Wire and Cable (F.W. & C.) Test Documentation
  10. F.W. & C. Test Report Discrepancy Correction
- B. In addition to the items listed above, the following items will be measured for partial payments as part of the testing for the first TCR area of control to be tested:
1. Master List of all ATC Factory Tests required under this Contract, and Factory Test Procedures for all such required tests.
  2. Master List of all ATC Field Tests required under this Contract, and ATC Field Test Procedures for all such required tests.

### **3.05 PAYMENT**

- A. The sum of payments for ATC Testing at each TCR area of control will equal the Lump Sum Price listed in the Unit Price Schedule for the applicable area under:
1. (NAME OF FIRST TCR LOCATION) ATC TESTING
  2. (NAME OF SECOND TCR LOCATION) ATC TESTING (As Applicable)
  3. (NAME OF THIRD TCR LOCATION) ATC TESTING (As Applicable)
  4. (Etc. as Applicable)

**END OF SECTION**

## SECTION 16982

### ATC - PRELIMINARY AND INTERLOCKING TESTS (LEVEL A)

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the criteria for the field tests and inspections which the Contractor shall develop and conduct in order to prove that the ATC system at individual TCR locations is ready for system testing and to verify that interlockings at such locations are acceptable for manual train operation.
- B. The preliminary tests and inspections to be performed throughout the area of control of each Train Control Room shall cover, as a minimum, the following functions:
  - 1. Train Control (TC) Maintenance Telephone System
  - 2. Power distribution and alarms
  - 3. Grounding system
  - 4. Negative propulsion return system
  - 5. Proper wiring, both vital and non-vital
  - 6. Proper insulation for cable, running rails and equipment
  - 7. Track circuit equipment modules, both track-mounted and rack-mounted
  - 8. Track circuit adjustment, both audio frequency and power frequency
  - 9. Traffic and line circuits
- C. At locations where there is no interlocking equipment, Level A acceptance shall, as a minimum, consist of the preliminary tests only. The preliminary tests are:
  - 1. 1.1 Power Racks, Energy Distribution and Failure Alarm Circuits
  - 2. 1.2 Breakdown Test of Vital Circuits and (where applicable) Interlocking Control Circuits
  - 3. 1.3 Breakdown Test of Non-Vital Circuits
  - 4. 1.5 ATP Track Module Test
  - 5. 1.11 Checkout of Impedance Bonds
  - 6. 1.14 Inspection and Test of Cable
  - 7. 1.15 Inspection and Test of Equipment Grounds
  - 8. 1.18 Test of Track Circuit Terminating Receivers (where applicable)
  - 9. 1.21 Test and Inspection of Negative Return Bonding
  - 10. 1.22 Tests of TC Maintenance Telephone System
  - 11. 1.33 Test of Track and Alarm Indication Panels
  - 12. 2.1 Adjustment of ATP Track Modules
  - 13. 2.15 Operating Test of Line Circuits between Consecutive TC Rooms
- D. Where an interlocking is included within the area controlled by a Train Control Room, tests of the following functions shall, as a minimum, be conducted in addition to the tests listed previously:
  - 1. Track switch control and indication
  - 2. Signal control and indication
  - 3. Detector locking
  - 4. Approach and/or time locking
  - 5. Route locking
  - 6. Derail operation (where applicable)
  - 7. Wayside pushbutton box operation (where applicable)
  - 8. Loop operation
  - 9. Entrance-Exit control operation.

10. Slave module operation

- E. At locations where there is an interlocking, Level A acceptance testing shall, as a minimum, include, in addition to the preliminary tests listed above, certain interlocking tests. These interlocking tests are:
1. 1.6 ATP Slave Module Checkout
  2. 1.12 Lamp Circuitry and Signal Performance
  3. 1.13 Wiring and Adjustments to Switch-and-Lock Movements
  4. 1.16 NOT USED (Wiring and Adjustments to Derail Layouts)
  5. 1.19 Checkout of Wayside Pushbutton Layouts (where applicable)
  6. 2.10 Interlocking Plant Vital Circuit Test
  7. 2.12 Inductive Track Loop Tests
  8. 2.13 Interlocking Plant Tests
  9. 2.24 Tests of 60-Hz, Single-Rail, AC Track Circuits
- F. The area covered by these additional interlocking tests shall be the tracks within the interlocking limits and all tracks approaching the interlocking to and including the approach limits for each interlocking signal.

**1.02 RELATED SECTIONS**

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
- |     |                         |  |
|-----|-------------------------|--|
| 1.  | DIVISION 1 (Article IX) | Commencement, Prosecution and Completion of Work       |
| 2.  | Section 16904           | Current Automatic Train Control System                 |
| 3.  | Section 16916           | Basic ATC Circuit Requirements                         |
| 4.  | Section 16917           | Basic Interlocking Requirements                        |
| 5.  | Section 16918           | Special Requirements for Specific Locations            |
| 6.  | Section 16928           | Interlocking Vital Processor System                    |
| 7.  | Section 16940           | ATC Electrical And Electronic Components and Materials |
| 8.  | Section 16977           | Tagging and Marking                                    |
| 9.  | Section 16981           | Basic ATC Test and Inspection Requirements             |
| 10. | Section 16986           | Miscellaneous Tests (Level E)                          |
| 11. | Section 16997           | RTU Scan Sheets  |

**1.03 SUBMITTALS**

- A. The Contractor shall, at least 60 calendar days prior to the scheduled performance of each test described herein, submit a detailed test procedure for that test:
1. Test 1.1 - Power Racks, Energy Distribution and Failure Alarm Circuits
    - a. The purpose of this test is to determine whether energy at all required levels is available in the control room, and properly distributed to equipment requiring it, both in the field and in the control room.
    - b. This test shall be made with all loads connected and shall prove that the voltage supplied to any module, device or appliance is within plus or minus 5 per-cent of its rated voltage when the module, device or appliance is operating at its maximum current and at its minimum current.
    - c. This test shall be made after test 1.15 is completed and according to the Critical Path Testing Schedule.
    - d. This test shall check that no grounds, shorts, open circuits, crosses or misplaced wiring exist in the power distribution system.

- e. All standby or reserve power circuitry and the Automatic Transfer Switch shall be checked both for completeness and specified operation.
  - f. All alarm circuits shall be tested by simulating power or equipment failure.
  - g. This test shall also include the following:
    - 1) Check AC Power sources for correct voltage levels, and, where necessary, for correct phasing.
    - 2) Check DC power supplies for correct voltage levels and correct polarity.
    - 3) Check transformer taps and adjust as necessary.
    - 4) Check and make operational all ground detectors.
  - h. Any malfunctions, lack of power, or blown fuses shall be reported for later correction and retesting.
2. Test 1.2 - Breakdown Test of Vital Circuits and (where applicable) Interlocking Control Circuits
- a. All vital circuits shall be tested in their entirety for the correct operation of, and response to, each contact on each circuit element, such as relays and contractors. Where parallel paths exist, the tests shall validate each path, and circuits shall be opened to ensure the proper test.
  - b. Where parallel paths exist in a relay circuit, the circuit shall be checked to ensure that all such paths are energized from the same fuse.
  - c. Each circuit shall be tested by simulating all operating conditions to ensure that the relay is energized and that the circuit operates in accordance with the requirements of these Specifications and that it is implemented according to an up-to-date and approved copy of the circuit plans. This shall be done by removing contact terminals from plugboards starting at the positive (+) energy bus and henceforth, at each succeeding contact, checking to see that the energized relay drops.
  - d. These tests shall also include the verification of correct current where resistors are used to reduce current.
  - e. These tests shall also include the checking of all tags and markings for their presence, legibility, and accuracy. Any discrepancy shall be tagged with a red tag fastened to the wire or device with string.
  - f. Wires used for temporary connections for these tests shall be of vividly contrasting color to the rack wire, or alternatively, these wires shall be identified by a green paper tag fastened to the wire with string. These wires shall be removed at the end of the tests.
  - g. Both ends of each wire shall be checked during these tests to be certain that their terminations are solidly applied and that they are properly held in their correct place. The corresponding line on an up-to-date set of approved plans shall be marked with green pencil to indicate the presence of continuity in each wire and that each wire is in its proper position and properly terminated.
  - h. This test shall be performed after tests 1.1 and 1.15 have been completed, and in accordance with the Critical Path Testing Schedule.
  - i. All circuit elements shall be checked in the breakdown test. This shall include, but not be limited to, relay test posts, pushbutton contacts, and switch machine control, energization and indication contacts in the Train Control Room. All terminations shall be checked to ensure that no extraneous connections exist.
  - j. A contrasting colored pencil (brown) shall be used to checkmark each circuit element connected by the circuit (on the set of plans included with the test submittal) to indicate that each circuit element has been

checked and that it is correct and in place as shown on the Contract Drawings. All coordinates for identifying apparatus locations shall be checked during this test.

- k. Where applicable, these tests shall include the portions of the Vital Processor circuitry which are external to that unit.
3. Test 1.3 - Breakdown Test of Non-Vital Circuits
- a. When all relay rack connections have been completed and all equipment is in place, the Contractor shall energize and test each non-vital circuit to determine that it meets the requirements of these Specifications and that it is implemented according to an up-to-date and approved copy of the circuit plans. The Blown Fuse Circuit shall be the first circuit to be tested.
  - b. As each circuit is checked for continuity, by first energizing the relay and then opening the circuit, contact by contact, from energy plus to energy minus, the corresponding circuit in the circuit plans shall be delineated with green pencil so that no wire, contact, coil, device or connection is overlooked.
  - c. On relays with exposed contacts, circuits may be checked by placing a thin strip of plastic between the appropriate pair of contacts and checking to see that this break de-energizes the relay of the circuit being checked. These plastic strips shall be configured so that they cannot be inadvertently left in place after the test. These plastic strips can be utilized to separate multiple circuit paths so that each contact in the remaining single circuit path may be checked. As each circuit element is checked out, its corresponding symbol on the plans shall be marked with a brown pencil.
  - d. Where the device being controlled is remote from the equipment being tested, a lamp, buzzer, or voltmeter shall be connected at the final terminal leading to that device. NOTE: If a buzzer or other vibrating contact device is used, its coil shall be properly suppressed to prevent transient damage to the equipment.
  - e. Paragraphs b, e, f and j of Test 1.2 shall also apply to this test.
  - f. This test shall be performed after Tests 1.1 and 1.15 have been successfully completed and in accordance with the Critical Path Testing Schedule.
4. Test 1.5 - ATP Track Module Test(See Section 16953, ATP Track Modules) The Contractor shall test each ATP (Automatic Train Protection) module in accordance with an approved test procedure consistent with the following Specifications:
- a. This test shall be made at a time consistent with the Critical Path Testing Schedule after Tests 1.1, 1.2 and 1.15 have been successfully performed. This test shall be made with all field wiring disconnected, according to an up-to-date set of circuit plans and following an approved step-by-step test procedure.
  - b. The following items shall be checked, and the Contractor shall determine that:
    - 1) Filters of the proper frequency are in place.
    - 2) The unit has a track carrier generator of the proper frequency in place for the location.
    - 3) Code rate generators with the proper coding rate are in place for the location.
    - 4) The module for TWC (Train-To-Wayside Communications) is in place if required at the location.
    - 5) All other components of the module are in place and properly positioned.

- 6) A suitable test fixture is connected to the output.
  - 7) Power is present at the module, device or appliance and it is within plus or minus 5 percent of its nominal voltage rating with all loads connected, during operation.
  - 8) The unit does not overheat when power is applied.
  - 9) The proper current is being drawn from the power supply.
  - 10) The proper carrier frequency is being generated and that it is within the tolerance designated by the manufacturer and approved by the designated Resident Engineer.
  - 11) The proper code rates are being generated and that they are within the tolerance designated by the manufacturer and approved by the designated Resident Engineer.
  - 12) A suitable test fixture is connected to the input and that the receiver gain is properly adjusted.
  - 13) With the module connected to the test fixture, the track relay is energized.
  - 14) With the module connected to the test fixture and track shunting simulated, the relay is de-energized.
5. Test 1.6 ATP Slave Module Checkout (See also also Section 16953, ATP Track Modules).The Contractor shall test each ATP Slave Module in accordance with an approved test procedure consistent with the following Specifications:
- a. This test shall be made at a time consistent with the Critical Path Testing Schedule after tests 1.1, 1.2, 1.5 and 1.15 have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) The module does not overheat.
    - 2) Transmitted output has correct frequency for the location and is within the tolerance designated by the manufacturer and approved by the designated Resident Engineer.
    - 3) Transmitter output responds to changes in code rate supplied from ATP transmitter or test fixture.
    - 4) Receiver input can be adjusted to be within the specified tolerance.
    - 5) Track relay connections are complete, free from shorts and grounds, and the relay responds to simulated shunting of the track.
6. Test 1.11 - Checkout of Impedance Bonds(See also Section 16962, Impedance Bond Layouts).The Contractor shall test all impedance bonds in accordance with a test procedure which he has prepared and which the designated Resident Engineer has approved. Each test shall produce a printed trace from a spectrum analyzer using a signal generator connected to the track terminals in the TCR. The test shall be consistent with the following requirements:
- a. This test shall be made at a time consistent with the Critical Path Testing Schedule and after tests 1.1, 1.2, 1.5, 1.6, 1.14, 1.15 and 1.21 have been successfully completed at that location.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) A frequency sweep test verifies that voltage peaks are present for all frequencies assigned to this location and that these peaks are within tolerance according to the manufacturer's approved specifications.
    - 2) The impedance bond is connected to the correct ATP module.

- 3) With untuned bonds, (for which frequency sweep tests cannot be made) amplitude tests prove the correct connections are made and the bond is operable.
7. Test 1.12 - Lamp Circuitry and Signal Performance(See also Section 16965, Signal Layouts).The Contractor shall test all signal layouts in accordance with a test procedure which he has prepared and which the designated Resident Engineer has approved. The test shall be consistent with the following requirements:
- a. This test shall be made at a time consistent with the Critical Path Schedule and after tests 1.1, 1.2, 1.14, 1.15 and 1.22 have been successfully completed at the location involved.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) The signal layout is wired according to the approved circuit design plans.
    - 2) The signal is located according to the approved plans.
    - 3) The signal displays the proper aspect for the signal control relay positions and has the correct lamp installed.
    - 4) The signal is energized with the proper voltage, which is 9 volts, and that this voltage does not vary beyond the range of +1 percent and -5 percent during normal power supply and load fluctuations. This voltage shall be recorded on the test data sheet.
    - 5) The signal connections are checked for tightness, clearness and integrity.
    - 6) The signal layout and all its components are tagged and marked according to Section 16977, Tagging and Marking.
    - 7) The TC maintenance telephone line and jack are properly installed and in operating order.
    - 8) The performance of the signal beam is visually checked for intensity, alignment and sufficient beam width, to allow continuous viewing from an approaching train over the required upstream distance.
8. Test 1.13 - Wiring and Adjustments to Switch-and- Lock Movements(See also Section 16954,Switch-and-Lock Movements)The Contractor shall test all Switch-and-Lock Movements in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
- a. This test shall be made at a time consistent with the Critical Path Testing Schedule and after tests 1.1, 1.2, 1.3, 1.14, 1.15 and 1.22 have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) The Switch-and-Lock Movement is properly placed, installed, lubricated, free of abnormal mechanical resistance, and wired according to the approved plans.
    - 2) The Switch-and-Lock Movement is energized with the proper voltage, and that the voltage remains within a tolerance of plus or minus 5 percent of its nominal rating during operation of the movement.
    - 3) That all internal and external mechanisms are in adjustment according to the manufacturer's instructions **and meet all requirements of Sections 16954 and 16964.**
    - 4) The movement responds to a blocked point in the manner specified.

- 5) The movement draws the correct current at the voltage supplied as specified by the manufacturer.
  - 6) The movement responds in the correct direction according to the control relays and the appropriate repeater relays are energized.
  - 7) The movement can be hand-cranked to both extreme positions and cannot be operated electrically with the crank in place.
  - 8) The movement heater(s) are in place and are at the correct temperature.
9. Test 1.14 - Inspection and Test of Cable (See also Section 16949, Signal Wire and Cable).The Contractor shall test all cable in accordance with a test procedure he has prepared and which the designated Resident Engineer has approved. The test shall be consistent with the following requirements:
- a. Appropriate tests shall be made before installation and after installation is complete, at times consistent with the Critical Path Test Schedule.
  - b. The following items shall be checked BEFORE INSTALLATION. The Contractor shall determine that, with the cable on the reel:
    - 1) A visual inspection shows exterior of cable to be free from nicks, gouges, or any obvious damage insofar as the cable can be inspected.
    - 2) Insulation resistance between all conductors and all conductors and shield, if any, meet the specified values.
    - 3) The cable is of the type and configuration specified and shown on the plans and drawings.
    - 4) Continuity for each conductor is satisfactory.
  - c. The following items shall be checked AFTER INSTALLATION is complete. The Contractor shall determine that:
    - 1) A visual inspection of the exposed portion of the cable shows the exterior to be free of nicks, gouges or any obvious damage.
    - 2) The cable is properly installed and supported in the correct location, and adequate slack has been provided to prevent strain on the terminations or abrasion to the cable.
    - 3) The cable shows adequate insulation resistance (at least one megohm for 600V-class cable and at least 100 megohms for 1000V-class cable) to ground and between each conductor and all other conductors. (The cables shall be disconnected by opening terminal links, or by other means, for these tests). A megger of the type specified in Section 16931.1.01 F., or approved equal, shall be used to conduct this test.
    - 4) Cable of the proper size, voltage rating and type has been installed. (If substitution was necessary and was authorized and made, the plans shall show these changes.)
    - 5) A proper tag has been installed on both cable wire, and the wires have been properly terminated and landed. (All drawings showing cable terminations shall be verified as to completeness and correctness of the cable terminations, and shall be submitted with the Test Report.)
10. Test 1.15 - Inspection and Test of Equipment Grounds(See also Section 16922, Lightning/Surge Protection and Grounding Systems)The Contractor shall inspect and test all equipment grounds in accordance with a test procedure which he has prepared and which the designated Resident Engineer has approved. The test shall be consistent with the following requirements:
- a. This test shall be made as soon as the grounding system has been established, before testing of electronic equipment is started and according to the Critical Path Testing Schedule.

- b. The following items shall be checked and the Contractor shall determine that:
  - 1) The grounding systems called for in these Specifications or shown on the Contract Drawings are in place and correctly installed.
  - 2) A visual inspection shows all ground connections tight, free of paint and suitably protected from physical damage and corrosion.
  - 3) A visual inspection shows all ground leads to be properly sized (per Specifications), short, direct and free of bend radii less than six inches.
  - 4) The dc resistance from TCR Prime Ground Bus has been tested and recorded by the use of an approved testing device, and it has been determined that the ground resistance between the bus and true ground is less than 15 ohms.
  - 5) The dc resistance from each equipment ground connection to the TCR Prime Ground Bus has been checked and recorded, and it has been determined that the dc resistance is less than 0.01 ohms.
  - 6) One path and only one path exists between the TCR Prime ground bus bar and ground. (Disconnecting the leads from the bar to ground shall show a DC resistance from the bar to ground of over 100,000 ohms.)
  - 7) The dc resistance between racks, cable trays or other pieces of equipment which are required to be insulated from each other and/or insulated from supporting framework is at least 100,000 ohms.
  - 8) All ground wires are properly attached to the TCR Prime Ground Bus and properly labeled as to their origin.
- 11. Test 1.18 - Test of Track Circuit Terminating Receivers (Where applicable)(See also Section 16953, ATP Track Modules)The Contractor shall test all Track Circuit Terminating Receivers which may be included in the ATC system, in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
  - a. The test shall be made at a time consistent with the Critical Path Testing Schedule and after tests 1.1, 1.2, 1.5, 1.14 and 1.15 have been successfully completed at that location.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) The Terminating Receiver is located and installed according to the approved plans.
    - 2) The associated track module transmitter is operating and adjusted according to test procedure 1.5.
    - 3) The correct bandpass filter for the location is installed.
    - 4) The gain is properly adjusted according to the approved test procedure, utilizing a special test fixture if necessary to obtain adjustment.
    - 5) If the location requires a second parallel connected receiver, the test procedure nevertheless still allows proper gain adjustment of both units.
    - 6) The approved test data sheets, properly filled in, have been submitted. (A separate special data sheet shall be prepared for each module configuration, and it shall show the limits of acceptance performance for each reading.)

- 7) The applicable track relay operates properly according to whether its track is shunted or unshunted, as specified elsewhere in these Specifications.
12. Test 1.19 - Checkout of Wayside Pushbutton Boxes(Where applicable) (See also Section 16966, Wayside Pushbutton Layouts)The Contractor shall test all wayside pushbutton boxes in accordance with a test procedure which he has prepared and which the designated Resident Engineer has approved. The test shall be consistent with the following requirements:
    - a. The test shall be made at a time consistent with the Critical Path Testing Schedule and after tests 1.1, 1.2, 1.3, 1.14 and 1.15 have been successfully completed at that location.
    - b. The following items shall be checked and the Contractor shall determine that:
      - 1) The pushbutton layout is located and installed according to the approved plans.
      - 2) Where indicating lamps are included in the pushbutton box, each lamp lights only when the appropriate circuit is energized in the Train Control Room.
      - 3) Each pushbutton control circuit in the TCR becomes energized (or for some circuits, deenergized) only when its corresponding pushbutton is pushed.
  13. Test 1.21 - Test and Inspection of Negative Return Bonding(See also Section 16968, Track Bonding Layouts).The Contractor shall test each Negative Return Bond (including impedance bond, shunt bar and crossbonding connections) in accordance with test procedures which he has prepared and which the designated Resident Engineer has approved. The tests shall be consistent with the following requirements:
    - a. Before any bonding has been installed, the Contractor shall verify that all insulated joints have been correctly located, correctly installed and that their resistance when tested by the Authority's approved method is above 5000 ohms. If any discrepancy is found in the insulated joint, the Authority shall be notified and the bonding of that section shall be postponed.
    - b. The remaining tests shall be made after all the bonds and negative return equipment have been installed at a particular location, and according to the Critical Path Testing Schedule.
    - c. The following items shall be checked and the Contractor shall determine that:
      - 1) Each bond has been installed in the correct location according to these Specifications and that all bonds necessary to ensure an uninterrupted low resistance path for the negative return current are in place.
      - 2) The cap screw of each negative return cable clamp has been tightened with the proper torque according to the approved procedure.
      - 3) Each bond has been tested by the Null Balance method utilizing a four terminal configuration of a Kelvin Bridge.
      - 4) The resistance of each bond has been measured and does not exceed the maximum acceptable ohmic value (for its configuration and bond length) which has been approved by the designated Resident Engineer.
  14. Test 1.22 - Tests of TC Maintenance Telephone System(See also Section 16923, TC Maintenance Telephone System).The Contractor shall test each train control maintenance telephone, telephone jack and selector switch both at the factory and after installation in the field in accordance with a testing procedure

which he has prepared and which the designated Resident Engineer has approved. The tests shall be consistent with the following requirements:

- a. The tests shall be made at a time consistent with the Critical Path Testing Schedule and after test 1.14 has been successfully completed at that location.
  - b. The field tests shall be made after all interconnecting wiring has been installed, after the test procedure 1.15 has been successfully completed, and in accordance with the Critical Path Testing Schedule.
  - c. The field tests shall be made according to the approved test procedures. The Contractor shall determine that:
    - 1) Each TC Maintenance Telephone is operating properly, and conforms to the manufacturer's specifications. Proper operation will be judged according to the following qualities:
      - a) Clarity of tone (distinctness and freedom from distortion) at all normal working levels.
      - b) Uniform volume level among units at midpoint on the control with a good range of adjustability of the control.
    - 2) Voice communications can be maintained through the extreme ends of TC Maintenance Telephone circuits for this route segment with a signal-to-noise ratio which meets the specified minimum requirements.
    - 3) Each phone jack and selector switch is installed, properly placed, and wired correctly according to these Specifications, and is not a source of hum, noise or static as determined by an actual listening test.
    - 4) The system functions as intended and herein specified.
15. Test 1.33 - Test of Track and Alarm Indication Panels(See also Section 16955, Track and Alarm Indication Panels).The Contractor shall test all Track and Alarm Indication Panels in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
- a. This test shall be made only after all of the installation work in the TCR is essentially complete. It shall be made at a time consistent with the Critical Path Testing Schedule and after tests 1.1, 1.2 and 1.3 have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determined that:
    - 1) The programming jumpers are correctly installed.
    - 2) Typed track circuit occupancy and alarm indication designation labels are correct and inserted at the appropriate locations.
    - 3) Each visual Track Occupancy indication is activated by manually dropping the associated track relay.
    - 4) All NORMAL and REVERSE Traffic indications function properly and display the specified indication color.
    - 5) All Blown-Fuse indications function properly for every fuse.
    - 6) All Ground Detector and Transfer Panel indications function properly.
    - 7) All Power Failure and Power Off indications function properly.
    - 8) Where applicable, all Snowmelter Problem and Snowmelter Failure indications function properly.
    - 9) Where applicable, the Non-Vital Interlocking Problem indication(s) function properly.
    - 10) Where applicable, all Vital Processor On-Line indications function properly.

- 11) Where applicable, all Vital Processor Failure indications function properly.
  - 12) All spare and unused alarm indication inputs are capable of correct operation.
  - 13) The audible alarm functions as specified for each alarm tested.
  - 14) An output for the pen recorder functions for each alarm indication and "test" position of the alarm control switch.
  - 15) If two or more alarm panels are installed in the same room, their fifteen interpanel input plug coupler pins have continuity between panels.
16. Test 2.1 - Adjustment of ATP Track Modules(See also Section 16953, ATP Track Modules).The Contractor shall test and adjust each ATP track module, both at the factory and after installation in the field, in accordance with a testing procedure which he has prepared and which the designated Resident Engineer has approved. The tests shall be consistent with the following requirements:
- a. The field tests shall be made after all the necessary equipment has been correctly installed; after the successful completion of test 1.11 and, if applicable, test 1.18, and all of their prerequisite tests, and; in accordance with the Critical Path Testing Schedule.
  - b. The field tests shall be made according to the approved test procedures and shall determine that:
    - 1) The track module is complete and properly installed according to the Specifications.
    - 2) The track module is drawing the correct current from the power supply. This current shall be read and recorded during track and train transmission, after track and train power levels have been set.
    - 3) The output power level is properly adjusted according to the manufacturer's approved instructions.
    - 4) The proper output to the track relay is present and the relay is picked up on the correct current and polarity.
    - 5) When an 0.06 ohm shunt is placed across the track **at the middle of the track circuit** the corresponding track relay drops. The track relay also drops **when an 0.06 ohm shunt is placed across** the track transmitting bond or Mini-Loop and when an 0.06 ohm shunt is placed across the receiving bond of the track circuit being tested. At interlockings, verification of the appropriate track relay dropping with an 0.06 ohm shunt placed across the switch points is also required.
    - 6) The input sensitivity of the receiver amplifier is correctly adjusted according to the manufacturer's approved procedure for the configuration of the track installation being tested. (A separate set of instructions shall be available for every configuration.)
    - 7) Each receiver filter shall be checked during field testing to determine that the ringing (fill-in), during the "off time" of the track frequency cycle is less than the maximum level established during the type acceptance testing. Filters which do not meet this requirement shall be rejected and shall not be furnished or installed under this Contract.
    - 8) The train frequency is correct and its voltage is adjusted according to the manufacturer's approved procedure.
    - 9) The coupling transformer or series resistor (if any) is properly adjusted according to the manufacturer's procedure.

- 10) The signal-to-noise ratio on any pair of leads is not less than 10:1.
  - 11) Data taken in this test has been recorded as part of a permanent log located in each Train Control Room. (This log shall be kept for use by the Authority for ongoing maintenance.)
  - 12) The cross-talk on any pair of leads is below a level corresponding to a signal-to-noise ratio of 10:1. (This test shall be made with all transmitters in operation except the one under test.)
17. Test 2.10 - Interlocking Plant Vital Circuit Test(See also Sections 16928, 16943, 16953, 16954, 16961, 16963, and 16965).The Contractor shall perform a dynamic test of each of the vital interlocking circuits at each location. This test shall prove by actual visual observation of all interlocking relays, switches, and signals, that the vital circuits enforce the rules of safe interlocking of signals, track switches, and track occupancy.
- a. The Contractor shall delineate in his test procedure the intended purpose of each circuit contact break or program routine as it is listed. This test procedure shall be prepared by the Contractor and approved by the Engineer before testing may begin.
  - b. The test shall be conducted in conformance with the approved test procedure and shall check that each and every circuit contact break or program routine performs the function intended, and does not perform or allow any function which could result in an unsafe situation.
  - c. This test shall be made only after all of the vital equipment at a location has been installed, after tests 1.6, 1.12, 1.13, 1.18, 1.21 and 2.24 have been successfully completed, and in accordance with the Critical Path Testing Schedule.
  - d. The vital circuit test procedure shall be complete and shall be consistent with all of the following considerations. The Contractor shall determine for every possible route in the interlocking, that:
    - 1) When a signal is cleared for a given route, all track switches along that route and all potentially conflicting routes are properly positioned and locked, and no signals governing conflicting routes can be cleared.
    - 2) When any track circuit within the interlocking is occupied, all switches previously locked by a cleared signal remain locked, and no signal can be cleared over that or conflicting routes.
    - 3) No switch can be operated if its track circuit is occupied.
    - 4) With a train occupying the approach to a given signal, once that signal is cleared, no other signal can be cleared over a conflicting route until the first signal is put to stop and a suitable time period expires.
    - 5) With a train occupying the approach to a given signal, once that signal is cleared, no switch along that or conflicting routes can be moved until the signal is put to stop and a suitable time period expires.
    - 6) No signal can be cleared over a locked route, a route conflicting with a locked route, a route with an occupied track circuit or a route with an unexpired time period.
    - 7) No subsequent call for a signal or switch movement over any part of a locked route can be stored so long as the route remains locked.
  - e. **WARNING:** The Contractor shall take every precaution to see that no vital interlocking circuit is compromised as a result of these tests. All temporary test jumpers, programs or devices of any kind shall be

removed at the conclusion of the testing and all wiring, programs and equipment shall be restored to their proper operating condition. The use of high visibility tagging on any such wire or device, or where any wire is removed, is mandatory.

18. Test 2.12 - Inductive Track Loop Tests(See also Section 16961, Audio Frequency Track and Loop Circuit Layouts)The Contractor shall test all Inductive Track Loops in accordance with a test procedure which he has prepared and which the Engineer has approved. The test shall be consistent with the following requirements:
- a. This test shall be made after all the loops, bridging receivers, shunt bars and impedance bonds at a given location are in place according to the plans, and the installation, insofar as the loops may be affected, is complete. It shall also be made at a time consistent with the Critical Path Testing Schedule, and after test 2.1 and all its prerequisite tests have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) The transmitter power level adjustments for all the loop and track transmitters at the location under test (made in the 2.1 test procedure) are still correct.
    - 2) For progressive placements of a shorted shunt strap, the track and loop currents of the route selected are present and within tolerance. (The Contractor shall describe in the test procedure the correct locations for shunt strap and current measurements for all track circuits and loops along every legitimate route.)
    - 3) When tests are made with shorted shunt straps, correct sequencing of the strap application and removal is observed.
    - 4) For any given strap placement, only the correct loops are active and the remainder are de-energized. The values of the measured current in both the energized (active) and the nominally de-energized track circuits shall be recorded on the test data sheet where the acceptable range of values is shown.
19. Test 2.13 - Interlocking Plant Tests(See also Section 16961, Audio Frequency Track and Loop Circuit Layouts)The Contractor shall test the interlocking plant equipment in accordance with a procedure which he has prepared and the designated Resident Engineer has approved. The procedure shall cover field testing and final operating tests. The test procedure shall be consistent with the following requirements:
- a. The field test shall be made after all the associated equipment at the location of the test is completely installed and in apparent working order. It shall be made at a time consistent with the Critical Path Testing Schedule and after tests 1.19, 2.10, 2.12, 2.24 and all their prerequisite tests have been successfully completed. Note that for certain locations where approach locking extends beyond the limits of the room under test, the portion of test procedure 2.15 dealing with these approach locking circuits shall also be considered a prerequisite.
  - b. The test procedures shall be designed to prove safe and proper operation of the interlockings. The test sequence shall be designed to test each function for correct performance in accordance with the Contract Specifications. Furthermore, the test sequence shall include simulated unusual conditions to determine that the interlocking circuits will respond to these in a safe and desirable way. The functions to be tested shall include, but not be limited to, the following:
    - 1) Signal indication locking
    - 2) Approach locking

- 3) Traffic locking
- 4) Route locking
- 5) Time locking
- 6) Switch indications
- 7) Signal indications
- 8) Locking indications
- 9) Occupancy indications
- 10) Route indications

c. The operational test shall be designed to offer PROOF that the system will perform as specified to provide fail-safe operation of trains. During this test, each and every possible route shall be tested to determine that, at the appropriate time in the interlocking operation sequence:

- 1) The route is effectively secured.
- 2) Control panel indicators are correct and present a true picture of locking, switch position, signal aspect and track occupancy conditions at the interlocking.
- 3) All switches are locked in position and cannot be moved electrically by any controls.
- 4) All conflicting signals are locked in their stop aspect and cannot be cleared by any controls.
- 5) The route is released correctly, and sectionally where required, by occupancy (followed by unoccupancy in some cases) of the specified track circuits, and no conflicting switch movement or signal clearing is possible until passage of the train.
- 6) "Preconditioning" can not be set up by any panel manipulation, train movement or combination thereof. "Preconditioning" shall be understood to be the storage of a control or panel manipulation which will cause the clearing of a route or movement of a switch at some later time as the result of a timer operation or train movement.
- 7) Time locking is operating properly and timers are set to correct times.
- 8) Coded speed commands are correct.
- 9) All coded speed commands from the interlocking are cut off in the event a train passes a stop aspect signal, and any cleared signal at that interlocking is put to stop.
- 10) That wayside pushbuttons and associated indications (at locations so equipped) work properly and conflicting or erroneous routes cannot be set up.
- 11) That Fleeting and Automatic Route Selection (at locations so equipped) operate safely and according to the Specifications.

20. Test 2.15 - Operating Test of Line Circuits between Successive Train Control Rooms. The Contractor shall make an operating test of the line circuits between all consecutive Train Control Rooms, and between Train Control Rooms for consecutive interlocking locations. This test shall be performed in accordance with a test procedure which he has prepared and which has been approved by the Engineer. The test shall be consistent with the following requirements:

- a. This test shall be made: after all equipment installations at the applicable consecutive interlockings have been completed; after test 2.13 and all its prerequisite tests have been successfully completed at both interlocking locations; after all preliminary tests have been successfully completed at all intermediate locations, and; in accordance with the Critical Path Testing Schedule.
- b. The following items shall be checked and the Contractor shall determine that, for the successive interlocking involved:

- 1) A route can be established on each track between successive interlocking locations, but for only one direction at a time, not both directions simultaneously.
  - 2) When a route is established on a track between two successive interlockings: the correct indications at both interlocking locations are energized; the correct relays, properly tagged, are energized; no conflicting route from either location can be established, and; no opposing signals can be cleared.
  - 3) Attempts to clear all opposing signals have no effect on a previously cleared signal.
  - 4) Route locking for each route releases in the manner specified after canceling a cleared signal or acceptance of the route.
  - 5) All track circuits between the interlockings are effective in their operation on the traffic circuitry.
  - 6) When intermediate locations exist on the track section between interlockings, the traffic circuitry is properly selected and affected by the track circuits at these locations.
  - 7) Loss-of-shunt timers (where required) are adjusted to correct time settings, and are operating properly.
  - 8) The control of "AR" relays has not been selected over traffic relay contacts which would cause unnecessary timer operations.
21. Test 2.24 - Testing 60 Hz, Single Rail, AC Track Circuits(See also Section 16963, Power Frequency Track Circuit Layouts).The Contractor shall test each 60 Hz Single Rail AC Track Circuit in accordance with a test procedure which he has prepared and which the designated Resident Engineer has approved. The test shall be consistent with the following requirements:
- a. This test shall be made after the installation is complete, after tests 1.1, 1.2, 1.14, 1.15 and 1.21 have been successfully completed, and in accordance with the Critical Path Testing Schedule.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) The feed-end resistor has been adjusted to its correct value.
    - 2) The track voltage has been adjusted to the proper level according to the track circuit length.
    - 3) The relay-end resistor has been adjusted to its correct value.
    - 4) When a .06 ohm shunt is placed across the track, the corresponding relay drops.
    - 5) The relay drops whether the .06 ohm shunt is placed at feed end, relay end, or, in turnouts, across insulated joints.

PART 2 - NOT USED

PART 3 - NOT USED

**END OF SECTION**

## SECTION 16983

### ATC - TRAIN SEPARATION TESTS (LEVEL B)

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the criteria for the field tests and inspections which the Contractor shall develop and conduct in order to prove that the wayside ATC system is capable of providing safe automatic train operation within the areas controlled by TCRs included under this Contract.
- B. The basic functions which shall be tested include:
  - 1. Speed command logic
  - 2. Wayside/car detection, protection and speed commands
  - 3. Track shunting
  - 4. Block design control line verification
  - 5. Safe braking distances enforcement
  - 6. Programmed stop and platform edgelight control
- C. Level B acceptance shall, as a minimum, consist of the following train separation tests:
  - 1. Test 1.23 - Verification of Speed Command Logic
  - 2. Test 2.4 - Testing of Program Stop and Platform Edgelight Control
  - 3. Test 2.17 - Wayside/Car Interface Checkout (Level B)
  - 4. Test 2.20 - Wayside Train Detection and Protection Tests
  - 5. Test 2.21 - Safe Braking Distance Tests
- D. The Contractor shall provide sufficient test equipment to perform simultaneous testing on at least two trains for the time consuming test procedures: WTP 2.20 (Part I), WTP 2.21 and 2.18 (in Level C).
- E. The area covered by these tests shall be all tracks within the control limits of each TCR included under this Contract.

##### 1.02 RELATED SECTIONS:

- A. Related work specified elsewhere shall include, but not be limited to. The following Sections:
  - 1. Division 1 General Requirements
  - 2. (Article IX) Commencement, Prosecution and Completion of Work
  - 3. Section 16904 Current Automatic Train Control System
  - 4. Section 16928 Interlocking Vital Processor Systems
  - 5. Section 16940 ATC Electrical and Electronic Components and Materials
  - 6. Section 16960 Train Control Equipment Layouts
  - 7. Section 16981 Basic ATC Test and Inspection Requirements
  - 8. Section 16982 Preliminary and Interlocking Tests(Level A)
  - 9. Section 16984 ATO and Local ATS Tests (Level C)

##### 1.03 SUBMITTALS

- A. The Contractor shall, at least 60 calendar days prior to the scheduled performance of each test described herein, submit a detailed test procedure for that test:
  - 1. Test 1.23 - Verification of Speed Command LogicThe Contractor shall test the speed command logic circuits in accordance with a test procedure which he has prepared

and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:

- a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Level A Preliminary Test 2.1, 2.24 (when applicable), 1.18 (when applicable) and all of their prerequisite tests have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) With test equipment (fixtures) set up, all possible routes exhibit the proper speed commands for all possible occupancies (or combinations of occupancies).
    - 2) Track frequencies and code rates correspond to the values shown on the Contract Drawings and the values are duly recorded on the test data sheets or checked off on the control line diagram in the Contract Drawings.
    - 3) Each of the above measured values is within tolerance as compared to maximum and minimum values given in the test procedure.
    - 4) The speed commands are affected properly as the temporary speed restriction plug couplers are manipulated to all of their positions for each module.
    - 5) The presence of the temporary speed restriction plug couplers in the ATP modules is properly expressed in the RTU unit and has been checked and duly recorded on the test documents.
    - 6) Relay contacts have been wired in accordance with WMATA relay contact assignment rules wherever such rules are applicable.
2. Test 2.4 - Testing of Program Stop and Edgelight Control .The Contractor shall test the Program Stop and Platform Edgelight Control logic and circuitry in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
- a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.4 and 1.7, and all their prerequisite tests have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) Utilizing the proper test equipment connected to the RTU rack, the SKSS, NSKS, PTP, PTPS relays can be manually sequenced to verify these circuits.
    - 2) Utilizing the test fixture, the correct relays operate for the various train lengths.
    - 3) All wiring for the possible future control of stop location from the Kiosk operates correctly.
    - 4) The controls to the variable markers are operating correctly.
    - 5) The edgelight relays and circuitry extending to the interface point are operating correctly.
3. Test 2.17 - Wayside/Car Interface Checkout.The Contractor shall verify the proper operation of the Wayside/Car Interface with a dynamic train test which is in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. Radio communication links between the train and wayside shall be operational for this test. The test shall verify the communication links and the operation of the ATP and TWC systems. The test shall be consistent with the following requirements:
- a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Level B Tests 2.4 and 1.23, and all their prerequisite

tests have been successfully completed, but before Test 2.20 has been performed. The transit cars used in this test must constitute a Contractually "Valid" train with all carborne ATC systems operating properly.

- b. The following items shall be checked and the Contractor shall verify that:
  - 1) For every possible route, in both normal and reverse running directions, the speed command information is received aboard the train from every track circuit and loop with no dropouts.
  - 2) The TWC system is operating correctly and according to the requirements of these Specifications.
  - 3) For every possible route, in both normal and reverse running directions, valid communication occurs with respect to each applicable Flyby Receiver and Flyby Transmitter.
  - 4) As the above specified information is verified, the data sheets are properly filled out.
- 4. Test 2.20 - Wayside Train Detection and Protection Tests. The Contractor shall verify the performance of the equipment tested under the four parts of this test procedure. These four parts are; Part I - ATP Signal Level Test ; Part II - Post-Shunt and Pre-Shunt Tests; Part III - Control Line Verification Tests and Part IV - Signal Sighting, Slotting and Clearing Tests .The test of these four parts shall be consistent with the following requirements:
  - a. The test of each part shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.23 and 2.15, and all their prerequisite tests have been successfully completed. The transit cars used in this test must constitute a Contractually "Valid" train with all carborne ATC systems operating properly.
  - b. The following items shall be checked and the Contractor shall determine that for every track circuit in both directions:
    - 1) In Part I: (Utilizing one train)
      - a) The level of both carriers of the ATP signal received aboard the car is measured and recorded, and is within the maximum and minimum tolerance values shown on the data sheet
      - b) A recording of both carrier levels (where existent) is made for each ATP circuit.
    - 2) In Part II - (Utilizing one train)
      - a) The distance of the front wheels of the train from each track circuit boundary which the train is approaching at the time the track relay drops, has been measured and recorded on the data sheet under "pre-shunt" and that distance is within the specified tolerance zone of 20 to 40 feet. (50 to 70 feet when transmitter and receiver are in different TCRs.)
      - b) The distance of the rear wheels of the train from each track circuit boundary which the train is leaving at the time the track relay picks up, is measured and recorded on the test data sheet under "post-shunt," and that distance is within the specified tolerance zone of 20 to 40 feet. (50 to 70 feet when transmitter and receiver are in different TCRs.)
    - 3) In Part III: (Utilizing two trains) With train A stationary and "keyed up" facing train B, and with train B moving in the appropriate direction of traffic in approach to train A:
      - a) No speed commands are received by train A, as observed and noted based upon continuous observation of the display readout on train A.
      - b) Successive speed commands (for each track circuit occupied) are checked and noted based upon continuous

distance (determined from the block design), then removes power and brakes to a stop with a minimum of 10 feet remaining to the overrun bond at the end of the test section. (The test shall include a remaining distance allowance to accommodate 8 car trains if they require more stopping distance as determined by the block design.) If the train is unable to reach the desired test speed, three runs shall be made and the data sheet so marked.

- 2) The distance from the actual stopping point (front end of train) to the end of block (overrun bond) has been measured and recorded on the data sheet and is within limits.
- 3) The test has been conducted in the required direction for every target bond within the area under test.
- 4) The data sheet shows the maximum speed within the block, the stopping distance and time, and the distance to the overrun bond for every test.
- 5) The data sheet shows that each run complies with (or does not comply with) the block design for distance readings, overrun distance, speed and brake rate.

- B. The Contractor shall submit Safe Braking Distance (Test 2.21) data as per Drawing G-026, on 3-1/2 inch floppy disk in "EXCEL" format. The Contractor shall also submit a printed copy of the Test form as a pre-printed data sheet, for each route track segment to be tested.

**PART 2**

**PART 3**  
NOT USED

**END OF SECTION**

## SECTION 16984

### ATC - ATO AND LOCAL ATS TESTS (LEVEL C)

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the criteria for the types of field tests which the Contractor shall develop and conduct in order to ensure that the wayside ATC system is performing the following functions properly over the area controlled from a given Train Control Room:
1. Programmed station stopping
  2. Train-to-wayside communications (TWC)
  3. Door, dwell and destination control
  4. Automatic route initiation (where applicable)
  5. Marker coil installation
  6. Station stopping distance data transmission
  7. Interlocking Control Panel operation (where applicable)
  8. NEXT TRAIN Sign energy control (where applicable)
- B. Level C acceptance shall, as a minimum, consist of the following ATO and local ATS tests: 1.7, 1.8, 1.9, 1.10, 1.24, 1.26, 2.2, 2.3, 2.7, 2.18, 2.19, 2.31, and 2.32, as applicable.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
- |    |               |  |
|----|---------------|--|
| 1. | Division 1    | Contract Record Drawings                               |
| 2. | Section 16904 | Current Automatic Train Control System                 |
| 3. | Section 16918 | Special Requirements for Specific Locations            |

| 8. | Section 16982 | Preliminary and Interlocking Tests (Level A)           |

##### 1.03 SUBMITTALS

- A. The Contractor shall, at least 60 days prior to the scheduled performance of each test described herein, submit a detailed test procedure for that test:
1. Test 1.7 - TWC Receiver Test  
The Contractor shall perform a test to verify the correct operation of all TWC Station and Dispatch receivers in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
    - a. The test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.1, 1.2, 1.3, 1.14 and 1.15 have been successfully completed.
    - b. The following items shall be checked and the Contractor shall determine that:
      - 1) With the receiver properly connected to a test fixture, all receiver adjustments have been properly made, are correct and have been recorded on the data sheet.
      - 2) The connections to the RTU are correct and that the information flow through them corresponds to the makeup of the pulse train.

2. Test 1.8 - TWC Transmitter Test  
The Contractor shall perform a test to verify the correct operation of all TWC transmitters in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
  - a. The test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.1, 1.2, 1.3, 1.14 and 1.15 have been successfully completed. The following items shall be checked and the Contractor shall determine that:
    - 1) With the transmitter properly connected to a test fixture, all transmitter adjustments have been properly made, are correct and have been recorded on the data sheet.
    - 2) The connections to the RTU are correct and that the information flow through them corresponds to the makeup of the pulse train.
3. Test 1.9 - TWC Flyby Receiver Test  
The Contractor shall test all Flyby Receiver equipment, circuitry and logic in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
  - a. The test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.1, 1.2, 1.3, 1.14 and 1.15 have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) With the receiver properly connected to a suitable test fixture, all input and/or output frequency and amplitude adjustments for Carrier, Mark and Space have been properly made, are correct and have been recorded on the data sheet. (Maximum and minimum values, approved by the designated Resident Engineer, shall also appear on the data sheet.)
    - 2) The Flyby Receiver has a valid message with correct parity as specified in Section 16924, Non-Vital ATO & ATS Processor Systems.
    - 3) Bit control connections are properly made and function as specified elsewhere in these Specifications.
4. Test 1.10 - TWC Flyby Transmitter Test  
The Contractor shall test all Flyby Transmitter equipment, circuitry and logic in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
  - a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.1, 1.2, 1.3, 1.14 and 1.15 have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) With the transmitter properly connected to a suitable test fixture, all input and/or output frequency and amplitude adjustments for Carrier, Mark and Space have been properly made, are correct and have been recorded on the data sheet. (Maximum and minimum values, approved by the designated Resident Engineer, shall also appear on the data sheet.)
    - 2) The Flyby Transmitter has a valid message with correct parity as specified in another section of these Specifications.
    - 3) Bit control connections are properly made and function as specified elsewhere in these Specifications.
5. Test 1.24 - Route Decoder Test (where applicable)  
The Contractor shall test all Route Decoder equipment, circuitry and logic in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:

- a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Test 1.9 and all its prerequisite tests have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) All programming jumpers and printed circuit boards are installed in the correct position for the location in which the unit is installed.
    - 2) With a suitable test fixture in place, the unit properly decodes the train destination when presented with applicable train identity information per the plans for that location.
    - 3) The various associated track repeater relays initiate the results indicated in these Specifications.
    - 4) An incorrect train identity decodes only as an "unidentified route."
    - 5) All connections to the flyby equipment are installed and in working order.
6. Test 1.26 - Destination Storage Register Test (where applicable).The Contractor shall test all destination storage register equipment, circuitry and logic in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
- a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.1, 1.2, 1.3, 1.14 and 1.15 have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) All printed circuit boards are installed in the correct positions.
    - 2) With a suitable test fixture in place, the unit properly responds when presented with applicable storage information derived from manipulation of the test fixture.
    - 3) The unit responds properly to applicable controls from the local control panel.
7. Test 2.2 - Door and Dwell Control Subsystem TestThe Contractor shall test the Door and Dwell Control subsystem in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
- a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.4, 1.7, 2.1 and all their prerequisite tests have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) With TWC receiver test fixture connected, the "train berthed" relays operate according to specification when the "train berthed" signal is turned on and off at the test fixture.
    - 2) The dwell timers operate correctly and within  $\pm$  one second of their assigned times.
    - 3) Code rate and train frequency are correct and platform speed command relays operate properly during all applicable dwell-timer time out periods.
    - 4) The door control equipment responds properly to manual control from Central as tested utilizing the local RTU and its portable analyzer.
8. Test 2.3 - Destination Decoder Subsystem Test.The Contractor shall test all destination decoder modules in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:

- a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.4, 1.5, 1.6, 1.7, 1.8, 1.9, 1.10 and all their prerequisite tests have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) With a suitable test fixture in place, verify that valid destination codes for the location under test are received by the decoder when simulated codes are transmitted by the test unit and when track occupancy and train berthed signals are simulated.
    - 2) With a suitable test fixture in place, verify that valid destination codes for the location under test are received by the decoder via the RTU when the signals from central are simulated by the test fixture.
9. Test 2.7 - Station Stopping Distance Markers - Installation Checkout. The Contractor shall test the Station Stopping Distance Markers in accordance with a test procedure which he has prepared and which the designated Resident Engineer has approved. The test shall be consistent with the following requirements:
- a. The test shall be made at a time consistent with the Critical Path Test Schedule and after Test 1.14 and Test 2.4 and all their prerequisite tests have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) The fixed frequency units are properly tuned to provide frequencies to the trains which are within the specified tolerance ranges.
    - 2) The variable frequency tuning units are properly tuned to provide frequencies to the trains which are within the specified tolerance ranges, and which are properly controlled by the frequency selector circuit in the TCR.
    - 3) All marker coils on both tracks of the location under test have been checked.
10. Test 2.18 - Marker Coil Validation Test. The Contractor shall verify the performance of the Station Stopping Distance Markers in accordance with a test procedure which he has prepared and which the designated Resident Engineer has approved. Proper implementation of the approved procedure shall fully test the dynamic wayside-to-car interface and be consistent with the following requirements:
- a. The test shall be made at a time consistent with the Critical Path Test Schedule and after Test 2.7 and all its prerequisite tests have been successfully completed.
  - b. The test shall measure the carborne marker receiver coil output produced as the receiver aboard the moving train passes over the track-mounted marker layout, utilizing a test fixture (Marker Coil Validation Test Fixture) consisting of a digital computer and the necessary signal acquisition equipment.
  - c. The test shall measure, and compare to a standard, the following aspects of the received signal:
    - 1) Duration of received signal-This is the time in milliseconds during which the received signal is above an adjustable, preselected signal threshold which is nominally 10 percent higher than the background noise signal.
    - 2) Frequency of received signal-This is the frequency of the waveform received from the marker coil during the time that the amplitude is higher than the signal threshold described in the previous paragraph.
    - 3) Frequency classification of the received signal.-This is the nominal marker coil classification of the received marker signal as perceived by either the normal train carried equipment or by test equipment

- based on the identical circuitry. (Frequencies 1 through 4 and 6 through 9 as defined in Section 16967, Marker Coil Layouts.)
- 4) Amplitude of the received signal-This is the maximum amplitude observed as the train crosses the marker coil. In correctly operating markers, this signal should be well above the signal threshold mentioned in the preceding paragraphs.
- d. The information derived from the received signal shall be recorded by the test equipment on a paper printout. In addition to recording the values of the four received signal characteristics, the test equipment shall also record for every marker, the following:
- 1) Speed of train-This is the speed of the train in miles per hour at the instant it passes over the marker. This speed shall be derived from the signal of the wheel tachometer.
  - 2) The distance to the marker-This is the distance in feet which the train has traveled from its starting point. This distance shall be derived from the wheel tachometer.
  - 3) The distance from the previous marker-This is the difference in feet obtained by subtracting from the value of the current marker distance, the value of the preceding marker distance. This is useful in obtaining correspondence between the test data and the track plans in case of a missed marker.
  - 4) The observed frequency-This is the resonant frequency of the marker coil which was observed aboard the train.
  - 5) The observed frequency error-This is the error expressed in percent between the observed frequency and the nominal center frequency of the marker coil which was classified by the train or test equipment. Negative errors shall be indicated with a minus sign. This frequency of the marker coil will be acceptable if it is within 2 kilohertz of the nominal center frequency and readings in excess of this limit shall be flagged on the printout.
- e. In order to make the test data complete and unambiguous, certain additional data shall be recorded on the printout by entering it into the computer before the start of the run. This data is:
- 1) Date of test
  - 2) Time of test
  - 3) Name of nearest TCR
  - 4) Train number
  - 5) Track number
  - 6) Train direction
  - 7) Chaining of start location
  - 8) Number of markers anticipated
  - 9) Run number
  - 10) Value of the signal threshold level.
- f. Date which shall appear on the printout as a result of the data recorded during the run shall be:
- 1) Number of signals received from the pick-up coil which were classified as markers.
  - 2) Chaining of the stop location (obtained by adding or subtracting the total distance traveled to or from the chaining of the start location).
- g. The test shall consist of a minimum of two successful runs in each direction on each track, wherein every marker coil is received and classified properly. Where an interlocking is located in the test section, two additional short runs shall be made in each direction over each crossover or other interlocked track, to test any markers located therein. These crossover runs shall then be repeated after the train has been turned end-for-end. One of the two runs shall be made at a maximum speed of 15 miles per hour and the other

at the maximum control-line speeds (in automatic operation). The readings for every marker shall be within the standard limits listed in the test procedure prepared by the Contractor and approved by the Engineer. All markers shall be successfully recorded. No extraneous "markers" shall be recorded. Discrepancy sheets shall be filled out for any variation from these standards.

- h. The Contractor shall connect the test equipment with properly grounded twisted-pair, shielded cable, organized without ground loops so as to minimize noise pickup from the car-carried equipment and the propulsion power.
  - i. The Contractor shall evaluate the data printouts at the end of each run and, as proof that the requirements for marker coils, delineated in these Specifications, have been met, submit to the designated Resident Engineer evidence of successful marker validations signed by his representative and the designated Resident Engineer's inspector.
11. Test 2.19 - Station Control Tests The Contractor shall test all station control equipment, circuitry and logic in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The transit cars used in this test must constitute a contractually "valid" train, with all carborne ATC systems operating properly. The test shall be consistent with the following requirements:
- a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.23, 2.2, 2.3, and 2.18 and all their prerequisite tests have been successfully completed.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) With the train stationary at the station, and with suitable test equipment (CAU) connected to the RTU, the proper information (bits-carrier) is received for each of the following functions when the train key is in the OFF as well as the ON positions:
      - a) Train Destination
      - b) Train Number
      - c) Manual Pushbutton Right
      - d) Manual Pushbutton Left
      - e) Doors Closed Right
      - f) Doors Closed Left
      - g) PSS Active
      - h) ATP in Effect
      - i) Train in ATO
      - j) Passenger Station Check
      - k) Train Ready
      - l) All Doors Closed
      - m) Train Berthed
      - n) Train Motion
      - o) Train Length
    - 2) With the train standing in the station, and the various functions simulated aboard the train (pushing buttons or relays) that the RTU receives the proper information for the following functions:
      - a) traction power status
      - b) train length description
      - c) "door mode" selector
      - d) "train ready" (ATO start pushbutton)
      - e) "train berthed" pushbutton
    - 3) With the train standing in the station, and entering codes on the CAU, that the following train equipment is operable:
      - a) dwell termination

- b) "limiting speed" display
  - c) door and dwell operation
  - d) destination sign
  - e) train identification display
  - f) door close warning
- 4) With the train positioned outside the first station marker (2700-ft. or 1200-ft.) and the controls properly set, the "Limiting Speed" display indicates the maximum authorized speed for that block. Where an interlocking is involved, more than one speed may have to be checked.
  - 5) With train positioned as in 4), the "ATO Start" button is capable of causing the train to move to a correct stop in the station, indicators operate properly, and the doors open.
  - 6) Test made in 5) operates for all station stopping points (short, center and long stop) in both directions.
  - 7) Skip Stop feature operates in both directions.
  - 8) Tests described in 4), 5), 6), & 7) shall be performed with both two-car and eight-car trains.
  - 9) At locations equipped for automatic route selection, the operation of the following items is as specified:
    - a) The proper route is cleared for the destination code transmitted by the train.
    - b) All valid routes can be cleared.
  - 10) At locations equipped with TWC flyby transmitters, the operation is as specified.
  - 11) At locations equipped with dispatch receivers, the operation is as specified.
12. Test 2.31 - Interlocking Control Panel Operation - Local Train Control Room and/or Dispatcher's Room  
The Contractor shall test the complete operation of every control and indication device on the I.C.P. in accordance with a test procedure which he has prepared and which the designated Resident Engineer has approved. The test shall be consistent with the following requirements:
- a. The test shall be made at a time consistent with the Critical Path Test Schedule and after all applicable track circuits, signal layouts, traffic circuits, switch-and-lock movement layouts, interlocking circuits, and, where applicable, snowmelter layouts, terminal mode selection circuits, and/or automatic routing circuits, have been installed and connected.
  - b. The following items shall be checked:
    - 1) Master Lever Key Switch(es)
    - 2) PANEL LIGHTS pushbutton(s)
    - 3) INDICATION TEST pushbutton (and illumination of all panel indicators)
    - 4) SWITCH POSITION pushbutton(s) and appropriate indicators
    - 5) AUXILIARY SWITCH OPERATION pushbuttons and indicators
    - 6) Route Entrance, Exit, and Turnback Signal Pushbuttons and associated indicators
    - 7) Track Indicators (all route locking and track occupancy)
    - 8) All traffic and switch lock indicators
    - 9) AUTO SIGNAL OPERATION pushbuttons and indicators
    - 10) All control transfer pushbuttons and indicators
    - 11) EMERGENCY RELEASE pushbutton(s)
    - 12) SNOWMELTER control pushbuttons and indicators
    - 13) Terminal MODE SELECTION pushbuttons and indicators
    - 14) NEXT TRAIN Sign rotary switch and indicators
13. Test 2.32 - NEXT TRAIN Sign Energy Control Test (where applicable).  
The Contractor shall test the operation of the control circuitry and relays provided by the

Contractor to control illuminating energy (furnished by others) for NEXT TRAIN signs (furnished by others) at Terminal Stations, in accordance with a test procedure which he has prepared and which the designated Resident Engineer has approved. The test shall be consistent with the following requirements:

- a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.23, 2.2, 2.3, 2.18, and 2.19 and all their prerequisite tests have been successfully completed.
- b. The following items shall be checked and the Contractor shall determine that:
  - 1) With the NEXT TRAIN sign control set for TRACK 1 (Manual Override), the appropriate sign control relay in the AC Service Room is energized, and the other sign control relay is deenergized.
  - 2) With the NEXT TRAIN sign control set for TRACK 2 (Manual Override), the appropriate sign control relay in the AC Service Room is energized, and the other sign control relay is deenergized.
  - 3) With the NEXT TRAIN sign control set for the Automatic Mode, the two sign energy control relays in the AC Service Room function in the specified manner, i.e., they close their respective contacts to reflect a "First-In, First-Out" sequence of Next Trains, regardless of which platform tracks become occupied from either end.

## SECTION 16985

### ATC - DTS INTERFACE TESTS (LEVEL D)

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the criteria for the types of tests which the Contractor shall develop and conduct in order to ensure that the Data Transmission System (DTS) provided under this Contract is functioning properly.
- B. The basic functions which shall be tested include:
  - 1. The internal functioning of the Remote Terminal Units (RTUs)
  - 2. The interface between the RTUs and wayside ATC and ancillary equipment
  - 3. The interface between Central Control and wayside ATC and ancillary equipment via the RTU and the DTS.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16904 Current Automatic Train Control System
  - 2. Section 16925 Data Transmission System (DTS)
  - 3. Section 16981 Basic ATC Test and Inspection Requirements
  - 4. Section 16982 Preliminary and Interlocking Tests (Level A)

##### 1.03 SUBMITTALS

- A. The Contractor shall, at least 60 calendar days prior to the scheduled performance of each test described herein, submit a detailed test procedure for that test:
  - 1. Test 1.4 - RTU Local Test. The Contractor shall verify the proper operation of the DTS Interface in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
    - a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.1, 1.2 and 1.3 have been successfully completed. With a Contractor-supplied analyzer connected to the unit, the Contractor shall determine that:
      - 1) The input pulse train, when constructed according to the approved scan sheet, results in an output at the correct output connection where application relays are connected, or will be connected.
      - 2) The RTU rejects all incorrect addresses and responds to the address of the location where it is installed.
      - 3) All tests specified by the manufacturer of the unit have been successfully completed.
  - 2. Test 2.14 - RTU to Wayside Interface. The Contractor shall test the RTU to wayside interface connections in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
    - a. This test shall be made at a time consistent with the Critical Path Test Schedule and after Tests 1.4 and 1.22, and all of their prerequisite tests have been successfully completed.
    - b. The following items shall be checked and the Contractor shall determine that:

- c. All connections between the RTU and its controlled or monitored device connection have been made and are in working order. The test shall be made as follows:
  - 1) When contact closures are simulated at the terminals in each DTS and TC/COMM interface cabinet, the proper indication is received at the CAU and agrees with the approved bit assignment.
  - 2) When each control is transmitted from Central, the proper control voltage can be measured on the proper terminal in the proper DTS or TC/COMM interface cabinet, and is not measurable on the two adjacent terminals. This shall be in accordance with the approved bit assignment.
  - 3) All spare bits (commands or status) are operable at the terminal terminating their connections.
  - 4) Where used, all 4 to 20 milliamp current loop inputs shall be tested for proper operation of the multiplex input, digital conversion accuracy, and appropriate frame/word assignment.
- 3. Test 6.0 - Central to Wayside Interface. The Contractor shall test the Control to Wayside Interface in accordance with a test procedure which he has prepared and which has been approved by the designated Resident Engineer. Wherever possible, wayside equipment shall be used to verify RTU commands. If it is impossible to use the wayside equipment, a simulator shall be connected to the most distant point in the circuit from the RTU in the TCR. The local Interlocking Control Panel (at TCRs so equipped) shall not be used for obtaining data unless that panel is the most distant point on the circuit from the RTU. The test shall be consistent with the following requirements:
  - a. This test shall be made separately at each TCR at a time consistent with the Critical Path Test Schedule, and;
    - 1) after all A, B and C Level tests (except train tests), and D Level Tests 1.4 and 2.14 have been successfully completed,
    - 2) after the Authority has made the necessary changes at central control to accept the new line locations,
    - 3) after the RTU has been on line with central continuously for at least one week, and,
    - 4) after the modem supplied with the RTU system has been tested.
  - b. The following items shall be checked and the Contractor shall determine that:
    - 1) Utilizing suitable test fixtures and temporary expedients (such as deenergizing relays by hand) every control (listed in the "Control Data Sheet" or required by these Specifications) from the Central Console, results in the appropriate operation at the wayside or on the train (simulated).
    - 2) As in (1), every operation of the train and wayside equipment (listed on the "Status Data Sheet" or required by these Specifications) results in the appropriate indication at the Central Console.
    - 3) Proper "Strobe Pulse" operation is verified.
    - 4) Proper "Read Status Signal" operation is verified.

**END OF SECTION**

## SECTION 16986

### ATC - MISCELLANEOUS TESTS (LEVEL E)

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the criteria for the field tests and inspections which the Contractor shall develop and conduct in order to prove that the devices listed in this category are capable of safe and proper operation as required by these Specifications.
- B. The basic functions and devices which shall be tested include:
  - 1. Fuse Sizing, Circuit Breaker Sizing, Load Sharing and Load Transfer Sensing and Timing
  - 2. Ground Detectors
  - 3. Snowmelter Layouts (Where Applicable)
  - 4. Wayside Coding System (Where Applicable)
- C. The facilities covered by these tests shall be all of the special ATC equipment, systems and configurations within the control limits of each TCR included under this Contract which are not covered by other Levels of ATC testing specified in this Contract.

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Division 1 General Requirements
  - 2. (Article IX) Commencement, Prosecution, and Completion of Work
  - 3. Section 16904 Current Automatic Train Control System
  - 4. Section 16918 Special ATC Requirements for Specific Locations
  - 5. Section 16921 ATC Power Distribution Systems
  - 6. Section 16941 Basic ATC Electrical and Electronic Component Requirements
  - 7. Section 16947 Ground Detectors
  - 8. Section 16951 Transfer and Bypass Equipment
  - 9. Section 16969 Snowmelter Layouts
  - 10. Section 16981 Basic ATC Test and Inspection Requirements
  - 11. Section 16982 Preliminary & Interlocking Tests (Level A)
  - 12. Section 16983 Train Separation Tests (Level B)
  - 13. Section 16985 DTS Interface Tests (Level D)

##### 1.03 SUBMITTALS

- A. The Contractor shall, at least 60 calendar days prior to the scheduled performance of each of the following tests, submit a detailed test procedure for that test:
  - 1. Test 2.28 - Fuse Size and Load Sharing
  - 2. Test 2.29 - Ground Detector Functional Tests
  - 3. Test 1.20 - Snowmelter Layouts and Controls
  - 4. Test 2.25 - Snowmelter Control Units
  - 5. Test 2.6 - Wayside Coding System (Where Applicable)
- B. These test procedures shall prescribe tests which meet the following criteria:
  - 1. Test 2.28 - Fuse Size, Circuit Breaker Size, Load Sharing, and Automatic Transfer Switch This test shall be conducted to determine whether fuses and circuit breakers are properly sized with respect to measured maximum load (as

specified in Sections 16911, Scope of ATC Work, and 16941, Basic Electrical and Electronic Components), to determine whether TCR power supplies are sharing the electrical load equally (as specified in Section 16911); to determine whether the total AC power load is within the capability of the services, and; to determine whether the Automatic Transfer Switch is functioning properly (as specified in Section 16951). The test shall be conducted in accordance with a test procedure previously prepared by the Contractor and approved by the designated Resident Engineer. The test shall be consistent with the following requirements:

- a. The test shall be conducted after all ATC power-consuming equipment has been installed in the TCR and its area of control; after all Level A, B, C and D tests have been successfully completed, and; at a time consistent with the Critical Path Testing Schedule.
- b. Any fuse wire used temporarily shall be removed and replaced with appropriately sized fuses at this time. The nominal as well as temperature derated ratings of all power distribution fuses shall be recorded.
- c. The Contractor shall simulate train occupancy, train movements and, where applicable, set routes and operate such other equipment as required to cause maximum operating load to be drawn from the fuses, circuit breakers and power supplies being examined for proper sizing and load sharing. These maximum operating current values and the total bus load current(s) shall be recorded on pen recorders and the peak values shall be transferred to the test data sheets along with columns for the ratings of the applicable fuses, derated for an operating temperature of 120 degrees F. The derated value must be at least 125 percent of the measured maximum load. A load equal to 125 percent of the measured maximum load on the power supplies shall be within their rating, as required in Section 16921.1.03.
- d. In a similar manner, the load on the two AC power services shall be measured and the results shall be recorded on a data sheet and forwarded to the designated Resident Engineer. This test shall be made twice; once with the "normal" service disconnected and once with the "reserve" service disconnected.
- e. For buses which are normally fed by both NORMAL service power supplies and RESERVE service power supplies, load sharing shall be tested under three conditions as follows:
  - 1) With the bus fed from the NORMAL service power supplies only,
  - 2) With the bus fed from the RESERVE service power supplies only,
  - 3) With the bus fed in the usual manner from both the NORMAL and the RESERVE power supplies.
- f. The Contractor shall measure the load current and check that the fuses and breakers installed are of the proper size, relative to the maximum current measured.
- g. The Contractor shall calculate the expected load current and check that each applicable power supply module is contributing to the total bus load equally within the prescribed tolerances.
- h. The Contractor shall temporarily install any additional control and monitoring equipment on the Normal and Reserve power sources, and on the Transfer Panel, necessary to determine whether the Transfer and Bypass equipment is:
  - 1) Sensing low voltage in each source properly;
  - 2) Sensing return to acceptable voltage levels in each source properly;

- 3) Transferring the load properly (in each direction) without causing vital relays to drop or causing loss or malfunction of the ATC system in any other way.
2. Test 2.29 - Ground Detector Functional Tests This test shall be conducted to determine whether the ground detectors remain functional after the completion of all the tests specified in Levels A, B, C, and D. The test shall be conducted in accordance with a test procedure prepared by the Contractor and approved by the designated Resident Engineer. The cause of any abnormal response shall be determined, documented, and repaired by the Contractor, and the affected function retested as specified in Section 16981. The test shall be consistent with the following requirements:
    - a. The test shall be conducted after all ATC equipment has been installed in the TCR and its area of control; after all Level A, B, C, and D tests have been successfully completed, and; at a time consistent with the Critical Path Testing Schedule.
    - b. The Contractor has ascertained, during the Level A, B, C, and D testing, that any ground, either intermittent or continuous, which may have appeared on any of the ungrounded energy buses being monitored by the ground detectors, has been cleared. Any ground still remaining shall be cleared at this time.
    - c. The three-position manual test switch shall be operated to each of its test positions and the indicators shall be monitored to ensure that the ground detector response is correct when each of the momentary leakage paths from ground to the buses being tested has been made.
    - d. After each operation of the three-position test switch, the reset button shall be operated to check that the manual reset functions and that the indicators display the proper response.
  3. Test 1.20 - Snowmelter Layouts and Controls - Checkout This test shall verify that the Snowmelter Layouts and their Controls and Indications are wired and operate properly. The test shall be made with no electrical connection to the third rail and shall be consistent with the following requirements:
    - a. The test shall be made at a time consistent with the Critical Path Testing Schedule and after tests 1.1, 1.2, 1.3, and 1.14 have been successfully completed.
    - b. The following items shall be checked and the Contractor shall determine that:
      - 1) With all the fuses removed, verification is made of the fact that all Snowmelter Layout wiring is installed and terminated properly.
      - 2) Continuity is made through contacts to fuse receptacles of snowmelter loads.
      - 3) Contactor coil circuits are wired and operate correctly.
      - 4) Door interlock circuits are wired and operate correctly.
      - 5) Control pushbuttons and indications in the TCR are wired and operate properly.
      - 6) When this test has been completed, the Contractor shall check to be sure that there are no tools, test jumpers or foreign materials of any kind in the Snowmelter Control case, and that the high voltage (propulsion power voltage) cables are obviously physically separated from all other case wiring.
  4. Test 2.25 - Snowmelter Control Units - High Voltage This test shall verify that the Snowmelter Control Units operate properly. The test shall be made under strict supervision as third rail propulsion voltages are involved. The test shall be consistent with the following requirements:

- a. The test shall be made at a time consistent with the Critical Path Testing Schedule and after Tests 1.20, 6.0 and all of their prerequisite tests have been successfully completed.
- b. The following items shall be checked and the Contractor shall determine that:
  - 1) With all the fuses removed, verification has been made of the fact that all Snowmelter Layout wiring has been terminated properly.
  - 2) With the applicable Interlocking Control Panel in the local control mode, power applied to the snowmelter control circuit, and the contactor fuses in the Snowmelter Control Unit in place, the Snowmelter Contactor(s) (both) pick up when the "SNOWMELTERS ON" pushbutton is pushed, and drop when the "SNOWMELTERS OFF" button is pushed.
  - 3) With the Snowmelter Control Contactor(s) de-energized, the fuses for all the individual snowmelter heater elements and switch rod heater units in place, the third rail power on, and the 1000 volt fuse in the contact rail fuse box in place, none of the snowmelter heater elements or switch rod heater units is energized.
  - 4) With a SNOWMELTERS ON command in effect (SMZ and SMZP up) and the Snowmelter Contactor(s) energized, the following items are correct:
    - a) Each snowmelter heating element and switch rod heater unit is energized from the proper fuse and is drawing a proper amount of current, as indicated by the energization of its current-sensing (K) relay.
    - b) Each Snowmelter Indication Relay (SMK) is energized and indicating the proper heating elements.
    - c) The "SNOWMELTERS ON" indication light on the Local Manual Control Panel in the Train Control Room is on and remains on only when all of the snowmelters at the interlocking are actually energized. (SMYPK energized). Under these conditions, a SNOWMELTER ON indication shall be transmitted to Central.
    - d) When one or more of the individual series current sensing relays (K1, K2, K3, K4) is down, its associated SMK relay shall drop, causing its associated Snowmelter Failure (SMF) indicator on the I.C.P. to illuminate, and the SNOWMELTER ON indicator to flash. This situation shall also cause the "SNOWMELTER PROBLEM" indication to be transmitted to Central.
  - 5) With the Snowmelter Control Contactor(s) deenergized in combination with a SNOWMELTERS OFF command, the following items are correct:
    - a) All snowmelter heating elements and switch rod heater units are deenergized.
    - b) The "SNOWMELTERS ON" indication light on the local Interlocking Control Panel is extinguished.
  - 6) With control remaining in the Local control mode, the following items are correct:
    - a) Central Control cannot turn the snowmelters on or off. Central Control receives the correct indication of the snowmelters being on or off.
  - 7) With control in the Central Control mode, the following items are correct:

- a) Central Control can turn the snowmelters on and off.
  - b) The snowmelters cannot be turned on or off from the local Interlocking Control Panel.
  - c) The correct indication for the snowmelters is received by both Central Control and the local Interlocking Control Panel.
  - d) Interruption of the DTS communication causes no change in the status of the snowmelters.
- 8) With the snowmelter control relay (SMZ) up and the snowmelter indication relay (SMK) down, the "SNOWMELTERS ON" light on the Interlocking Control Panel displays a flashing red indication.
  - 9) With the fuse for the case heaters in the Snowmelter Control Housing in place, the case heaters and their controlling breaker-switch work properly.
5. Test 2.6 - Wayside Coding System Test (Fiber Optic Interface System Test) This test shall be conducted (where applicable) to determine whether the Fiber Optic Interface System (FOIS) modems and their interconnecting fiber optic cable and local interfacing wiring are functioning properly. The test shall be conducted in accordance with a test procedure prepared by the Contractor and approved by the designated Resident Engineer. The Contractor shall pattern this test procedure according to the requirements of Section 16981. The test shall be consistent with the following requirements:
- a. The test shall be conducted at a time consistent with the Critical Path Testing Schedule, and after the required equipment and wiring have been completely installed in the applicable Train Control Rooms.
  - b. The test shall determine whether all energy levels, frequencies and timing functions in the FOIS modems are correct and performing properly.
  - c. The test shall determine whether the messages generated by the FOIS modems are properly formatted and accurately represent the input information.
  - d. The test shall determine whether the external information presented to the FOIS modems is properly translated into appropriate internal messages of the type and format specified.
  - e. The test shall determine whether the internal FSK messages are properly interpreted and transferred by the FOIS interfacing logic and cable.
  - f. The test shall determine whether the FOIS modem LED maintenance indications are functioning properly.

**END OF SECTION**

## SECTION 16987

### ATC - SYSTEM LEVEL TESTS (LEVEL F)

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the criteria for the types of tests which the Contractor shall develop and perform in order to ensure that the entire ATC system furnished under this Contract is functioning properly, and can be controlled from Central by both the operator and the computer as required in these Specifications.
- B. The basic functions to be tested shall include, but not be limited to:
  - 1. Interlocking Functions
  - 2. Passenger Station Functions
  - 3. TWC Functions
  - 4. Central Display Equipment Functions
  - 5. Central Computer Operation Functions
  - 6. DTS Functions
  - 7. Miscellaneous Functions

##### 1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Section 16904 Current Automatic Train Control System
  - 2. Section 16912 ATC Submittal Requirements
  - 3. Section 16913 ATC Block Design
  - 4. Section 16917 Basic Interlocking Requirements
  - 5. Section 16918 Special ATC Requirements for Specific Locations
  - 6. Section 16924 Non-Vital ATO & ATS Processor Systems
  - 7. Section 16925 Data Transmission System (DTS)
  - 8. Section 16926 Microprocessor Systems for Non-Vital Interlocking Functions
  - 9. Section 16928 Interlocking Vital Processor Systems
  - 10. Section 16956 Interlocking Control Panels
  - 11. Section 16969 Snowmelter Layouts
  - 12. Section 16981 Basic ATC Test and Inspection Requirements
  - 13. Section 16982 Preliminary and Interlocking Tests (Level A)
  - 14. Section 16983 Train Separation Tests (Level B)
  - 15. Section 16984 ATO and Local ATS Tests (Level C)
  - 16. Section 16985 DTS Interface Tests (Level D)
  - 17. Section 16986 Miscellaneous Tests (Level E)

##### 1.03 SPECIAL REQUIREMENTS FOR LEVEL F TESTING

- A. The Contractor shall conduct the Level F testing in conformance with the Critical Path Test Schedule described in Section 16981.
- B. The Contractor shall not perform any Level F testing until the Authority has performed all of the following:

1. Taken use and possession of the Train Control equipment following approval of all Level A, B, C, D and E testing.
  2. Performed to their satisfaction, all tests which they deem as necessary, prior to permitting the Contractor to perform his Level F tests.
  3. Granted, through the designated Resident Engineer, permission for the Contractor to proceed with the Level F testing.
- C. Other tests, to be developed by the Contractor and assigned numbers higher than 20.6, may be necessary to meet the requirements of these Specifications in proving that all Central Control functions have been implemented. Some of these tests may be performed in conjunction with each other if approved by the designated Resident Engineer.
- D. Train requirements and usage as defined in Section 16981.3.03, Field Tests, apply to System Level Tests (Level F).
- E. Access to the Central console is subject to the same productive time efficiencies as the trains and is further limited by permitting access only at non-revenue times, unless otherwise authorized by the Authority.

#### **1.04 SUBMITTALS**

- A. Submit to the designated Resident Engineer for approval a list of all the test equipment required for each of the tests in Level F. If special test fixtures are required, sufficient documentation shall be submitted with the list to enable the designated Resident Engineer to make a judgment regarding its suitability.
- B. The Contractor shall, at least 60 calendar days prior to the scheduled performance of the tests, submit detailed test procedures for the following tests:
1. Test 20.1 - CONSOLE/STATION/INTERLOCKING TESTThe Contractor shall perform a system test without a train to verify the correct operation of all interlocking functions when under control from Central. This test shall be conducted in conformance with a procedure which the Contractor has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
    - a. The test shall be made at a time consistent with the Critical Path Test Schedule and after all Level A, B, C, D and E tests have been completed.
    - b. The Contractor shall determine that the following preparatory steps have been accomplished, and each item checked off on the data sheet.
      - 1) Central Control and wayside systems are all operational.
      - 2) The test is scheduled for non-revenue service hours, unless otherwise authorized by the Authority.
      - 3) All necessary test personnel, test equipment, plans, procedures and documentation are available and on-site.
      - 4) The Contractor's test conductor, the designated Resident Engineer's representa-tives, and the Authority's designated representative for the test are available at Central Control.
      - 5) The Central Control computer is on-line in the test area and the console display is correct for the conditions at the wayside.
      - 6) Alarm status has been verified and recorded before conducting the test. (To be included in the test documentation.)

- c. The Contractor's test procedure shall, as a minimum, contain a step for each of the following items. Each item shall be checked and the results entered at the assigned location on the data sheet. Verify that:
- 1) The third rail can be "electrified" in the test area and the console display properly responds to this process.
  - 2) An alarm print-out has been made and preserved as a test document following the "electrification" and a record made of all alarms displayed on the console.
  - 3) It is possible to institute and verify that Central Control is actually in control and verify removal of control from the interlocking under test. These requirements shall also apply to the two adjacent interlockings.
  - 4) It is possible to transmit the "Cancel All Routes" command to the test interlockings and verify that all signals are at "STOP" within 5 seconds, and no "traffic" arrows are displayed at Central.
  - 5) All required routes can be established, their signals "cleared," route canceled, the signals observed at "STOP" and that conflicting routes cannot be established, while required non-conflicting routes can.
  - 6) All required fleeting routes, including turnbacks, can be established, signals "cleared" and routes canceled.
  - 7) Traffic arrows on the display are correct during route clearings.
  - 8) Automatic routing at automatic signal locations can be established, properly displayed, and canceled.
  - 9) Auxiliary switch commands can be transmitted to operate the switches "NORMAL" and "REVERSE" and that this action is properly displayed.
  - 10) Where applicable, Snowmelter commands and indications function properly.
  - 11) Where applicable, Third Rail Heater commands and indications function properly.
  - 12) Where applicable, Intrusion Detection Warning (IDW) commands and indications function properly.
2. Test 20.2 - CONSOLE/STATION/TRAIN TEST. The Contractor shall perform a system test with a train to verify the correct interaction of a train with all station control functions when under control from Central. This test shall be conducted in conformance with a procedure which the Contractor has prepared and which has been approved by the designated Resident Engineer. The test shall be consistent with the following requirements:
- a. The test shall be made at a time consistent with the Critical Path Test Schedule and after all Level A, B, C, D and E tests and Test 20.1 have been completed, and all outstanding discrepancies resolved.
  - b. The Contractor shall determine that the following preparatory steps have been accomplished, and each item checked off on the data sheet:
    - 1) Central Control and wayside systems are all operational.
    - 2) The test is scheduled for non-revenue service hours, unless otherwise authorized by the Authority.
    - 3) All necessary test personnel, test equipment, plans, procedures and documentation are available and on-site.
    - 4) The Contractor's test conductor, the designated Resident Engineer's representatives, and the Authority's designated representative for the test are available at Central.

- 5) The computer is on-line in the test area and the console display is correct for the conditions at the wayside.
  - 6) Alarm status has been verified and recorded before conducting the test. (To be included in the test documentation.)
- c. The Contractor's test procedure shall, as a minimum, contain a step for each of the following items. Each item shall be checked and the results entered at the assigned location on the data sheet. Verify that:
- 1) The third rail can be "electrified" in the test area and the console display properly responds to this process.
  - 2) An alarm print-out has been made and preserved as a test document following the "electrification" and a record has been made of any alarm displayed on the console.
  - 3) It is possible to institute and verify that Central Control is actually in control and verify removal of control from the interlockings under test. These requirements shall also apply to the two adjacent interlockings.
  - 4) It is possible to transmit the "Cancel All Routes" command to the associated interlockings and verify that all signals are at "STOP" within 5 seconds, and no "traffic" arrows are displayed at Central.
  - 5) When the test train is moved into the test area, the proper display is observed at Central Control and this fact is recorded in the test documents.
  - 6) With the train's identity set upstream from the test location platform, and where the track layout allows, the symbols on the display change from unidentified to identified when the train arrives at the test location platform.
  - 7) The following commands operate and are displayed properly:
    - a) "PLATFORM ID"
    - b) "HOLD WITH DOORS OPEN"
    - c) "DISPLAY TRAIN NUMBER"
    - d) "HOLD WITH DOORS CLOSED"
    - e) "TERMINATE DWELL" (with subsequent departure of train from test location)
  - 8) These commands function properly for all station tracks, during both Normal and Reverse Running.
  - 9) All the ATS Performance/Acceleration commands are received and properly decoded aboard the test train standing at each station platform and that the command most recently given is retained by the train as it leaves each platform.
  - 10) All the ATO commands function as intended, including SKIP STOP for each station platform track in each direction, and TRAIN READY for each put-in location.
  - 11) All flyby transmitters function properly, and that changed performance levels are received and retained aboard the train as it traverses each flyby location.
  - 12) Where provisions have been made for "short turn" operation, (i.e., the pocket-track turn-back of certain revenue-service trains at an intermediate terminal station) the equipment functions properly, allowing the train to return in the direction from which it came, in the specified manner of automatic operation, with the correct stopping point, and that the proper indications of this move are observable at Central.

3. Test 20.3 - CONSOLE/TERMINAL INTERLOCKING TEST (Terminal Modes 1, 2, 3) The Contractor shall perform a system test with three trains to verify the correct interaction of the trains with Central Control, and with all interlocking functions at a terminal, including the Interlocking Control Panel and the Dispatcher's Control Panel, when not under control from Central Control. This test shall be conducted in conformance with a procedure which the Contractor has prepared and which has been approved by the designated Resident Engineer. The test procedure shall be modified as necessary to provide a distinctive test document for each of the various terminal and track configurations at automatic terminal interlockings. The terminal configurations include "normal" terminals (located at the outbound end of the route segment) and "reverse" terminals (located at the inbound end of the route segment). The track configurations at automatic terminal interlockings include, but are not limited to, such layouts as: Interlocking on the inbound end of the station; interlocking on the outbound end of the station, with or without a pocket track, and; interlockings at both ends of the station platform. The test shall be consistent with the following requirements:
- a. The test shall be made at a time consistent with the Critical Path Test Schedule and after all Level A, B, C, D and E tests and System Test 20.1 have been completed, and all outstanding discrepancies resolved.
  - b. The Contractor shall determine that the following preparatory steps have been accomplished and each item checked off on the data sheet.
    - 1) Central Control and wayside systems are all operational.
    - 2) The tests are scheduled for non-revenue service hours, unless otherwise authorized by the Authority.
    - 3) All necessary test personnel, test equipment, plans, procedures and documentation are available and on-site.
    - 4) The Contractor's test conductor, the designated Resident Engineer's representative and the Authority's designated representatives for the test are available at Central.
    - 5) The computer is on-line in the test area and the console display is correct for the conditions at the wayside.
    - 6) Alarm status has been verified and recorded before conducting the test. (To be included in test documentation)
  - c. The Contractor's test procedure shall, as a minimum, contain a step for each of the following items. Each item shall be checked and the results entered at the assigned location on the data sheet. The Contractor shall verify that:
    - 1) The third rail can be "electrified" in the test area and the console display properly responds to this process.
    - 2) An alarm print-out has been made and preserved as a test document following the "electrification" and a record made of any alarms displayed on the console.
    - 3) It is possible to institute and verify "Operation by Central Control" and removal of "local control" at the interlocking under test, and at the adjacent interlocking(s).
    - 4) It is possible to transmit the "Cancel All Routes" command to the test interlocking and verify that all signals are at "STOP" within 5 seconds, and no "traffic" arrows are displayed at Central Control.
    - 5) When the test trains are moved into the test area, the proper display is observed and recorded in the test documents.
    - 6) The operation of each and every specified operation of the interlocking is possible.

- 7) No operation other than those specified or approved by the Engineer is possible.
  - 8) When each of the operations described in these Specifications occurs:
    - a) no conflicting or opposing routes are, or can be, established;
    - b) all conflicting signals are checked at "STOP";
    - c) proper spacing is provided, and;
    - d) proper indications for these operations are observable at Central Control.
4. Test 20.4 - OPERATION OF MAINLINE INTERLOCKINGS BY CENTRAL COMPUTER WITH ONE OR MORE TRAINS
- a. The Contractor shall prepare and submit for approval a test procedure for use with one or more test trains, as necessary, to verify the correct operation of each interlocking when under supervision by the Central Computer. The test shall address each aspect of Central Computer supervision of the interlockings, and shall ascertain whether the test train(s) interact properly with Central Control, and whether the mainline interlocking operates as required by other Sections of these Specifications. The test procedure shall contain easily identified special sections for the testing of the different types of interlockings (Junctions, Emergency Crossovers, Terminals, Turnback Pocket Tracks or Special Combinations, as applicable) which are included in this Contract.
  - b. The test procedure shall include the following preparatory steps:
    - 1) Central Control and wayside systems are all operational;
    - 2) The tests are scheduled for non-revenue service hours, unless otherwise authorized by The Authority;
    - 3) All necessary test personnel, test equipment, plans, procedures, and documentation are available and on-site;
    - 4) The Contractor's test conductor, the designated Resident Engineer's representative and the Authority's designated representatives for the test are available at Central Control;
    - 5) The computer is on-line in the test area and the console display properly responds to the process;
    - 6) The third rail can be "electrified" in the test area and the console display properly responds to the process;
    - 7) Alarm status has been verified following the "electrification" and a record made of any alarms displayed on the console (to be included in test documentation);
    - 8) It is possible to institute and verify operation by Central Control and removal of local control at the interlocking under test, and at the adjacent interlocking(s);
    - 9) It is possible to transmit the "Cancel All Routes" command to the test interlocking and verify that all signals are at "STOP" within 5 seconds, and no traffic arrows are displayed at Central Control;
    - 10) It is possible to reinstitute and verify operation by local control and removal of operation by Central Control, at the interlocking under test and at the adjacent interlockings.
  - c. The test procedure shall include, but not be limited to, sections to test all significant aspects of the following characteristics which are applicable:
    - 1) Train identity
    - 2) Unidentified Train Alarms

- 3) Automatic Routing
  - 4) Train Direction and Location Reporting and Alarms
  - 5) Train Destination
  - 6) Train Ready
  - 7) Platform Information
  - 8) Central Console
  - 9) Data Logger
  - 10) Train Separation
  - 11) ATS Speed Control
  - 12) Intrusion Detection Warning
- d. The Contractor shall pattern this test procedure according to the requirements of Section 16981. Provision shall be made for testing the equipment for any operation which is unique to a given location by providing specific sections of this test which relate to the unique feature. The test procedure shall include checks of the operations which are desired as well as checks of the prevention of operations which need to be precluded, or which interfere in any way with the safe or normal operation of the interlocking.
- e. Features of any applicable automatic-route interlockings to be tested shall include, but not be limited to, those listed below:
- 1) Route Decoder
  - 2) Train Identification
  - 3) Automatic Signal Clearing
  - 4) Proper Interaction between Central and the Wayside Interlocking Control Panel
  - 5) Central Route Initiation
- f. The Contractor shall perform the applicable tests of the centrally supervised interlockings in conformance with the approved test procedure at a time consistent with the Critical Path Test Schedule after all Level A, B, C, D and E Tests, and Test 20.1 have been satisfactorily completed.
- g. When making this test, any associated passenger station areas shall be set for the "Skip Stop" mode of operation.

**PART 2**  
NOT USED

**PART 3**  
NOT USED

**END OF SECTION**

## SECTION 16988

### ATC QUALITY ASSURANCE

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section includes specifications for the design, implementation and maintenance by the Contractor, of a Quality Assurance Program, a Quality Assurance Plan, and an Inspection Plan covering the ATC equipment, systems, and services required by this Contract.
- B. The ATC Quality Assurance Program, Quality Assurance Plan, and Inspection Plan, including related directives, procedures, processes, instructions, and schedules, shall be submitted to the Authority for approval. Basis for approval will be a description of how the ATC Quality Assurance Program Requirements set forth in Part 1.04 of this Section shall be met. The approved program and plans will be used by the Authority in the performance of any inspection in determining the acceptability of the ATC equipment, systems and services being furnished. If the program/plan is returned as unacceptable, the Contractor shall revise and resubmit the Quality Assurance Program or plans to the designated Resident Engineer within 30 calendar days.

##### 1.02 DEFINITION OF QA TERMS

- A. Audit: An examination of the conduct of the (ATC) Quality Assurance Program for the purpose of determining compliance with and conformance to the (ATC) Quality Assurance Plan.
- B. Corrective Action Report : A part of the corrective action process which documents actions taken to correct nonconforming conditions or products.
- C. Inspection : The physical act of verifying by measurement and examination that the supplies and workmanship conform to approved documents and established quality requirements.
- D. (ATC) Inspection Plan : A description of the specific work areas and the extent to which these areas will be inspected by the Contractor.
- E. (ATC) Quality Assurance Plan: An identification of how the Contractor shall comply with or otherwise implement the ATC Quality Assurance Program for the time period or authorized phase of the Contract
- F. (ATC) Quality Assurance Program : An identification and correlation of a Contractor's quality-related policies, practices, procedures and methods which are required to assure compliance with Contract requirements.

##### 1.03 RELATED SECTIONS

- A. All Sections in the 16900 series.

## 1.04 QUALITY ASSURANCE PROGRAM

- A. The submitted Quality Assurance Program shall be organized as follows:
1. Name of Contractor and Contract
  2. Revision Dates
  3. Index
  4. Contents
    - a. Scope - provide a statement which identifies the work areas (or disciplines) essential to Contract performance. The (ATC) Quality Assurance Program shall apply to all ATC equipment, systems, and services included in the Specifications, except as otherwise stated. The work areas (or disciplines) shall include, but shall not be limited to: management, design, procurement, manufacture, installation, and inspection.
    - b. Program Requirements:
      - 1) Quality Management
        - a) Identify and describe the organizational units having responsibility and authority for development, implementation, and management of the (ATC) Quality Assurance Program. Achievement of quality objectives shall be verified by individuals and organizations who are responsible for checking, inspecting, auditing, or otherwise verifying that the work has been performed satisfactorily.
        - b) Identify the program for assuring that sufficient records are maintained to provide documentary evidence of the performance of activities affecting quality and for use in managing the Contract. Typical records shall include Quality Assurance Program, Quality Assurance Plans, procedures, instructions, non-conformance or defect reports, corrective action reports, and such other quality-related documents as are specified in the Contract specifications.
        - c) Identify the program for verifying and determining the cause of unsatisfactory product or workmanship quality and for initiating necessary improvements and corrections to preclude repetition. The Contractor's program should extend, when necessary, to the performance of subcontractors and suppliers.
      - 2) Design (and Development), where applicable:
        - a) Prepare and maintain a plan for inspecting the quality of design, development, testing and documentation activities. Identify the procedures, practices, tables, charts, and diagrams applicable to the effort.
        - b) Document the design criteria applicable to the ATC equipment, systems, subsystems, and software being supplied. Include performance objectives, operating ranges and conditions, interfacing protocols, requirements for safety, reliability, and availability, the requirements (codes, standards, and practices) for materials, fabrication, construction, testing, operation, maintenance, and quality assurance.
        - c) Engineering studies, to be conducted in support of the design (or development) activity, shall be identified. They shall include analysis of allowable "trade offs" and alternatives, identification of potential weaknesses, and the

- appropriate preventative design features, operating and maintenance practices, and safety precautions.
- d) Identify the program for assuring that specifications, drawings, and other engineering documents will delineate, as applicable:
    - (1) materials and methods, including fabrication, construction, installation, inspection, maintenance, cleaning, packaging, shipping, handling, and storage.
    - (2) traceability of materials, parts, components and processes through appropriate lot, piece part, serial, or other appropriate numbers.
    - (3) product or workmanship acceptance criteria and the checkpoints during the work process for verifying compliance with the criteria.
    - (4) appropriate functionality and operational protocol of all ATC software.
  - e) Identify the methods and procedures for defining and controlling design interfaces among other project participants and design organizations. The procedures shall cover the exchange of required design data, analysis, and resolution of design interface problems.
  - f) Identify procedures for controlling the release of documents for authorized use.
  - g) Identify procedures for documenting the reporting, verifying, analyzing, and correcting of troubles that occur during development.
- 3) Procurement:
- a) Identify the procedures for controlling the receipt, inspection, tests, handling, storage, and distribution of received equipment and its protection from damage, deterioration, loss or substitution. Inspection instructions and test procedures shall provide for verification of characteristics required by Contract Drawings and Specifications, and documentation of results.
  - b) Identify the procedures for controlling purchased items that do not conform to the Specifications. The procedures shall provide for prompt identification, documentation, segregation, technical review, and disposition of non-conforming items.
- 4) Manufacturing, Fabrication, and Assembly:
- a) Identify the procedures and instructions which will be used to assure that fabrication, processing, and assembly operations are being satisfactorily performed.
  - b) Identify the inspection and test plans which will be applied to all manufacturing activities for the purpose of verifying conformance to procedures and instructions.
  - c) Identify the method employed for tracing the identity of materials and items throughout fabrication, processing, or assembly operations.
  - d) Identify the procedures, instructions, and checklists for the control of fabrication and assembly processes. Include such items as shop orders, process sheets, travelers, and inspection instructions, covering all mechanical, electrical, and metallurgical processes. Inspection instructions shall

- identify the non-destructive examination processes employed.
  - e) Identify the methodology of the program including record maintenance.
  - f) Identify the procedures for prompt identification, documentation, segregation, technical review, and disposition of non-conforming items.
  - g) Identify the procedures and instructions for handling, preserving, packing, packaging, storing, and shipping items shipped to the construction site.
  - h) Identify the inspections and tests that will be performed upon completed parts, materials, components, assemblies or systems before they are delivered or installed.
- 5) Installation:
- a) Identify the procedures, checkoff lists, and instructions governing receipt inspection of equipment on arrival at the installation site. Include in the procedures the control of non-conforming items.
  - b) Identify the procedures for controlling configuration. This shall include the control of drawings, specifications, work instructions, quality-control procedures, inspection instructions, and testing procedures, used in connection with installation.
  - c) Identify the procedures and work instructions which apply to installation methods, tests, repairs and rework, cleaning, and protection.
  - d) Identify the inspections and tests to be performed to verify installation suitability.
  - e) Identify the procedures for controlling the identification, documentation, segregation, technical review, and disposition of non-conforming supplies or workmanship.
  - f) Inspection:
    - (1) Identify the inspection plan which will be used to perform the various types of inspections for supporting the Quality Assurance Program.
    - (2) Identify in the inspection plan the types of inspection (e.g., source, receiving, in process, installation) which will be performed by the Contractor.

## 1.05 SUBMITTAL

- A. The ATC Quality Assurance documents shall be submitted within 30 calendar days after Notice to Proceed. The submitted ATC Quality Assurance Program shall be complete with the exception of detailed processes and procedures governing the fabrication, test and inspection of equipment and systems that require development. Detailed test and inspection procedures required by the technical provisions shall be added to the approved ATC Quality Assurance Program after they are submitted and approved as required by the individual technical articles. Fabrication processes for equipment and systems which require development shall be added to the approved ATC Quality Assurance Program as the development work progresses.

## PART 2 PRODUCTS NOT USED

## PART 3 EXECUTION

### **3.01 QUALITY ASSURANCE COMPLIANCE**

- A. The prime Contractor shall employ and assign continuously, from the time any field installation of Train Control equipment commences until all Train Control field installation and testing is completed and approved, a qualified, full-time ATC Quality Assurance (Q.A.) Inspector who shall monitor all Train Control field installation work performed by the Contractor and report to the designated Resident Engineer every work day. The Q.A. Inspector shall have specialized training and experience in vital signal and train control systems design and installation work and have a working knowledge of applicable FRA regulations. The ATC Quality Assurance Inspector shall be employed exclusively for the purpose of overseeing and ensuring the quality of the ATC work performed on this Contract.
  
- B. To assure the Contractor's compliance with and conformance to an approved ATC Quality Assurance Program, such program will be subject to quality audits. ATC QA Audits will be scheduled by the designated Resident Engineer as required. Within 30 days of receiving the Audit Report, the Contractor shall provide in writing to the designated Resident Engineer a description of actions taken to correct deficiencies cited.

### **3.02 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. Factors which will be considered when determining Partial Payments for the ATC Quality Assurance Program will include the following:
  - 1. Approval of the Contractor's ATC Quality Assurance Program by the designated Resident Engineer.
  - 2. Continued satisfactory compliance with the requirements of the approved ATC Quality Assurance Program.
  - 3. Final acceptance of all Contract TCR areas by the Authority.

**END OF SECTION**

## SECTION 16990

### ATC DOCUMENTATION AND TRAINING and SPECIAL ATC APPENDICES (Table of Contents)

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This SECTION lists the various 16990-series ATC Documentation, Training, and Special ATC Appendices Sections:
1. ATC Drawings and Tracings (Section 16991)
  2. ATC Instruction Manuals (Section 16992)
  3. ATC Training Courses (Section 16993)
  4. ATC Appendix "C" - Index of ATC Drawings Section 16994)
  5. ATC Appendix "L" - ATC Design, Submittal  
Access, Energization and Completion Schedule (Section 16995)
  6. ATC Appendix "TA" - ATC Technical Appendix (Section 16996)
  7. ATC Appendix "SS" - RTU Scan Sheets (Section 16997)
  8. ATC Appendix "CD" -  
Correction of ATC Deficiencies (Section 16998)

#### PART 2- PRODUCTS

NOT USED

#### PART 3 - EXECUTION

NOT USED

END OF SECTION

## SECTION 16991

### ATC DRAWINGS AND TRACINGS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section contains Specifications for the production and furnishing of Train Control tracings, drawings, CD-ROMs, optical media, and microfilm aperture cards, and describes the general format of ATC drawings, types of ATC drawings, and the manner in which ATC information shall be displayed on these drawings.

##### 1.02 BASIC DESCRIPTION

- A. ATC drawings shall be divided into two basic types. Each type shall be furnished in a separate book. The typical drawings common to all TCR locations shall be contained in a "Book of Typical Plans." Drawings specific to a particular TCR location shall be contained in a "Room Book-of-Plans" for that particular room.
- B. ATC drawings for the existing Train Control systems are on file at the Authority's offices. The Contractor may refer to these drawings and may obtain prints, at no additional cost to the Authority, of any of these drawings required for completion of work under this Contract.
- C. When the work requires alteration or additions to existing ATC drawings, the Authority will furnish the original mylars of the Record Drawings which require revisions. From these the Contractor shall produce new tracings, drawings, CD-ROM's, optical media, and aperture cards to replace or supplement the existing drawings, all as specified herein.
- D. The effective date and identification number, to be inscribed on the final tracings, will be furnished by the designated Resident Engineer prior to the time the tracings reach As-Built condition and are ready for the Contractor's final processing.
- E. With the exception of certain relay type circuit drawings being replaced by microprocessor system drawings, the Contractor shall draw the various types of drawings required by these Specifications in a manner similar to that depicted on the corresponding typical drawings or example location drawings included in the Contract Drawings. Example location drawings included in this Contract are for Cleveland Park and Van Ness-UDC.

##### 1.03 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:
  - 1. Division 1 Contract Record Drawings
  - 2. Section 01250 Contract Modification Procedures
  - 3. Section 16904 Current Metrorail Rapid Transit System
  - 4. Section 16911 Scope of ATC Work
  - 5. Section 16912 ATC Submittal Requirement
  - 6. Section 16916 Basic ATC Circuit Requirement
  - 7. Section 16927 ATC Microprocessor Support Systems
  - 8. Section 16931 ATC Maintenance and Test Facilities
  - 9. Section 16932 Spare ATC Equipment and Selectable Items

## 1.04 TYPES OF DRAWINGS

- A. The types of ATC drawings to be provided shall include, but not be limited to, the following as applicable:
1. Drawings indicating the track configuration including curvature and grade profile and showing the location of pertinent items of Train Control related facilities such as impedance bonds, signals, switch-and-lock movements, junction boxes, pushbuttons, signs, snowmelter control housings, TCRs, stations, marker coils and other wayside Train Control equipment and ancillary facilities. These drawings shall be drawn to a horizontal scale of 1 inch equals 100 feet, or 1 inch equals 50 feet and shall be known as Double Line Track Plans.
  2. Drawings showing ATP speed commands transmitted for each track section or block, for both the normal and reverse directions of traffic, depending upon track occupancy and, where applicable, upon the status of wayside IDW fence. These drawings shall also define and indicate the limits of approach locking. These drawings shall be known as ATP Speed Command Control Line Diagrams.
  3. Drawings showing the arrangement of equipment, facilities, or components in a room, rack, junction box, housing, cabinet or module shall be known as Arrangement Plans.
  4. Drawings showing the dimensions and internal mechanical and electrical details of particular pieces of equipment or assemblies shall be known as Product Drawings, but shall bear the title of the particular piece or type of equipment shown.
  5. Drawings on which detailed information is shown for the mechanical installation of Train Control equipment, such as signals, impedance bonds and switch-and-lock movements. These drawings shall be known as Installation Drawings.
  6. Drawings which indicate the point-to-point cable runs and identify cable make-up and conductor wire size. These drawings shall be known as Cable Plans.
  7. Drawings showing the exact location of direct burial and surface cable trench runs, as applicable, shall be known as Trenching Plans.
  8. Drawings showing the various types of control, operating and indication circuits required. These drawings shall bear the title of the particular function(s) performed by the circuits illustrated, but shall all be classified as Circuit Drawings.
  9. Schematic drawings of various energy distribution systems or subsystems. These drawings shall be known as Energy Distribution Schematics.
  10. Drawings showing the details of electrical connections for various pieces of train control equipment. These drawings shall bear the title of the particular piece of equipment, but shall all be classified as Wiring Diagrams. This category shall include "Back Panel Wiring Diagrams" for all control and indication panels provided under this Contract.
  11. Drawings showing the wiring and connection diagrams for individual systems and subsystems supplied on this Contract. Complete logic diagrams shall be included for all microprocessor-based systems and modules. These drawings shall bear the title of the applicable system or subsystem. For example, the separate drawings showing the TC Maintenance Telephone lines emanating from each TCR and showing all terminations of these lines within the Contract limits shall be known as TC Maintenance Telephone System Drawings. Wiring diagrams of the connections between the various parts of a system shall be fully detailed with all terminals and wire numbers. They shall be complete and all on one page if possible. No connections shall be omitted. All interface connections shall show destinations, preferably graphically, but if not practical, through the use of adequate nomenclature. Reference may be made to drawings in the "Room Book-of-Plans," or the "Book of Typical Plans."

12. Drawings showing complete Material Lists for all assemblies, subassemblies and components supplied on this Contract. These Material Lists shall include all information necessary for preparing an order to the supplier for replacement of such equipment. As an option, these Material Lists may be provided on 8.5 x 11 inch paper, or may be included as part of related drawings. All items shown on these material lists shall be completely described, to include identifying sources, size, configuration, mating and attaching characteristics, functional characteristics and performance requirements, and "form, fit and function" data contained on specification control drawings, catalog sheets, and outline drawings. Items such as resistors, capacitors, nuts, bolts, and other general hardware, shall be described only once for this Contract provided they are adequately cross-referenced.
13. Drawings entitled "List of Spare Parts" for all assemblies, subassemblies and components supplied on this Contract. These lists of spare parts shall include the recommended stock quantities for routine maintenance of the equipment for one year and shall include a sub-list of spare parts that are considered critical and for which extended amounts of time required for acquisition would create undesirable down-time for the equipment. See Section 16932, Spare ATC Equipment and Selectable Items.
14. Drawings entitled "List of Tools" for all assemblies, subassemblies and components requiring the use of tools. These drawings shall list all common and special tools required to perform inspection, adjustment, maintenance and repair. Special tools are those developed to perform a unique function related to a particular piece of equipment which are not available from common commercial sources. Special tools shall be so identified on the list. See Section 16931, ATC Maintenance and Test Facilities.
15. Drawings showing complete circuits which, with minor modifications and details added, will be used repetitively throughout the Contract work shall be known as Typical Circuit Drawings and shall have the word "Typical" included in the title along with the circuit or function name shown.
16. Index sheets for each room book of plans.
17. Drawings showing the logic coding for microprocessor logic modules together with their equivalent discrete- component circuits shall be identified as Equivalent Circuit Drawings, and shall include a separate drawing which lists (alphabetically and numerically) clear and concise definitions for every term and abbreviation used on these drawings.

#### **1.05 QUALITY ASSURANCE**

- A. The Contractor shall check drawings and final tracings for both form and content prior to submittal. Points to be checked shall include, but not be limited to, the following:
  1. Safety and operability of the circuits, devices and systems represented
  2. Conformance to the Specifications
  3. Logical grouping and arrangement of subject matter
  4. Accuracy
  5. Legibility
  6. Neatness
  7. Line Quality
  8. Lettering Quality
  9. Reproduction Quality
  10. Inclusion of proper interfaces internal to the ATC System
  11. Inclusion of Contract specified interfaces with related systems and contracts.

- B. Approval of drawings and tracings will be at the discretion of the designated Resident Engineer. The designated Resident Engineer will consider the same points enumerated above, with the basic criteria for obtaining approval being that drawings are accurate and easy to read, understand and use.

## 1.06 SUBMITTALS

- A. The Contractor shall submit drawings to the designated Resident Engineer for approval of ATC products, circuits, programming logic, subsystems, methods of installation, location arrangements, cut-in procedures, and such other items or functions as may be required by these Specifications. When submitting such drawings for approval, the Contractor shall submit all drawings germane to the subject at one time. This logical grouping of drawings, sufficient to completely cover the subject concerned, shall be known as a Submittal Package.
- B. The Contractor shall, unless otherwise directed, submit one reproducible, three magnetic or optical media, and three legible copies of all Train Control drawings to the designated Resident Engineer for approval. These drawings shall be complete and detailed. Train Control drawings shall include, but not be limited to, the following:
  - 1. Title Sheets
  - 2. Index Sheets
  - 3. Nomenclature Description Sheets
  - 4. Relay/Contact Location Charts
  - 5. Cable Plans
  - 6. Double Line Track Plans
  - 7. Arrangement Plans
  - 8. Product Drawings
  - 9. Equipment Installation Drawings
  - 10. Circuit Drawings
  - 11. Typical Drawings (circuits and/or equipment layouts)
  - 12. Energy Distribution Schematic
  - 13. Wiring Diagrams
  - 14. System Drawings
  - 15. Control Panel Drawings (to include Back Panel Wiring)
  - 16. Tie-in Drawings
  - 17. Interface Drawings
  - 18. Cut-In Drawings (as applicable)
  - 19. TC Maintenance Telephone System Drawings
  - 20. Trenching Plans (both direct burial and surface trench, as applicable)
  - 21. ATP Speed Command Control Line Diagrams
- C. The drawings shall be submitted using standard transmittal forms in accordance with detailed instructions furnished by the designated Resident Engineer. A supply of these forms will be furnished without cost to the Contractor. The Contractor shall provide the services of a local reproduction service to prepare three copies of all ATC submittals. Reproduction time shall be less than two business days.
- D. Before submitting Train Control drawings to the designated Resident Engineer for approval, the Contractor shall ascertain that:
  - 1. The drawings represent the coordinated efforts of all Train Control subcontractors involved;

2. The equipment, circuits, or subsystems represented are compatible with the directly related equipment, circuits and subsystems provided by other disciplines, based upon the most up-to-date information available, and;
  3. The equipment, circuits, or subsystems represented, and the manner in which they are represented, are in conformance with the requirements of these Specifications.
- E. Train Control drawings submitted for the approval of the designated Resident Engineer shall bear the Contractor's stamp of approval as evidence of such checking, coordination, and compatibility. Drawings submitted without this stamp of approval will be returned to the Contractor for resubmission.
- F. The form and content of Train Control drawings and tracings shall comply with the requirements set forth herein.
- G. If ATC drawings show variations from the Contract requirements because of standard shop practice or for other reasons, the Contractor shall describe such variations in his letter of transmittal. If acceptable, the designated Resident Engineer may approve any or all such variations, subject to a proper adjustment in the Contract. If the Contractor fails to describe such variations, he shall not be relieved of the responsibility for executing the work in accordance with the Contract, even though such drawings have been approved.
- H. If the drawings as submitted describe variations per paragraph **G.** above, and show a departure from the Contract requirements which the designated Resident Engineer finds to be in the interest of the Authority and to be so minor as not to involve a change in the Contract price or time for performance, the designated Resident Engineer may approve the drawings.
- I. If approved by the designated Resident Engineer, each copy of the Train Control drawings will be identified as having received such approval by being so stamped and dated. Train Control drawings stamped "Not Approved" and with required corrections shown will be returned to the Contractor for correction and resubmittal by the Contractor within two weeks. Resubmittals will be handled in the same manner as first submittals. When resubmitting drawings, the Contractor shall direct specific attention, either in the transmittal letter or on the resubmitted Train Control drawings, to revisions other than the corrections requested by the designated Resident Engineer on previous submissions. The Contractor shall make any corrections required by the designated Resident Engineer. If the Contractor considers any correction indicated on the ATC drawings to constitute a change to the Contract Drawings or Specifications, notice as required under Section 01250 Contract Modification Procedures, shall be given to the Contracting Officer. One reproducible set of Train Control drawings will be returned to the Contractor. The Contractor shall return 2 sets of prints to the Authority's designated Resident Engineer within 15 calendar days.
- J. When the Train Control drawings have been completed to the satisfaction of the designated Resident Engineer, the Contractor shall carry out the installation in accordance therewith and shall make no further changes therein except upon written instruction from the designated Resident Engineer.
- K. When drawings are approved by the designated Resident Engineer subject to certain revisions, the Contractor shall supply the designated Resident Engineer with four suitably revised prints of the approved drawings prior to installation of equipment.

- L. Before any payment is made for Train Control drawings, the Contractor shall furnish to the designated Resident Engineer three sets of record Train Control drawings, all clearly revised and completed and brought up to date, showing the permanent installation as actually made. Upon written approval of the final ATC As-Built tracings and drawings by the designated Resident Engineer, the Contractor shall reproduce the tracings on three sets of microfilm aperture cards of the type and size specified in Division 1, Contract Record Drawings, and deliver these tracings and aperture cards to the designated Resident Engineer.
- M. The Contractor shall submit three sets of prints and three sets of magnetic or optical media of As-Built drawings for review and approval not later than 10 days after final acceptance of the work. Additions and corrections shall be incorporated as required and originals with five copies of prints shall be delivered (one copy to the Train Control Rooms and four copies to the designated Resident Engineer) not later than 20 days after final acceptance of the work, and prior to the Operational Readiness Date. The final sets of As-Built drawings for the Train Control Rooms ("Book of Typical Plans" and "Room Book of Plans"), shall be legibly and permanently printed on special heavy duty, long lasting media of a type previously approved by the designated Resident Engineer, and bound using a method previously approved by the designated Resident Engineer.
- N. Final payment will not be made until the Contractor has submitted both CD-ROM and microfilmed record versions of each of the As-Built drawings for the completed work.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS FOR TRACINGS**

- A. The tracings for the final As-Built drawings shall be printed on four-mil-thick mylar in AutoCAD 20 format by automated techniques approved by the designated Resident Engineer.
- B. The materials and methods used to produce these tracings shall result in tracings which are durable, easily readable, and non-fading.

### **2.02 MICROFILM APERTURE CARDS**

- A. The aperture card reproductions of the final As-Built drawings shall be provided in accordance with the requirements stated in Division 1, Contract Record Drawings, of these Specifications.

### **2.03 BOOKS OF DRAWINGS**

- A. The Contractor shall supply books of specific ATC drawings for submittal packages and plan books as required elsewhere in these Specifications. These books of drawings shall consist of the following components:
  - 1. A group of drawings assembled in a logical order.
  - 2. An index sheet of the same size as the drawings.
  - 3. Protective cover and backing sheets. The name of the submittal package or name and location of the plan book shall be printed on the cover sheet in two-inch-high letters.
  - 4. A device for binding the left-hand edges of the drawings firmly, but in such a manner that drawings may be easily added, removed, or replaced without damage to the drawings or the binding.

## **PART 3 - EXECUTION**

### **3.01 BASIC FORMAT REQUIREMENTS FOR ATC DRAWINGS**

- A. Each ATC drawing (maximum size of sheet, 22 inches by 36 inches) shall have a blank area 3-1/2 inches by 3-1/2 inches, located adjacent to the title block in the lower right hand corner.
- B. The title block shall display the following:
  - 1. Number and type of drawing
  - 2. Date of drawing and all revisions
  - 3. Name of Route and, where applicable, specific Train Control Room area
  - 4. Name of Contractor and Subcontractor submitting drawing
  - 5. Clear identification of contents and location of the work
  - 6. Specification title and Contract number
- C. Drawings shall not be crowded or cluttered, but shall be arranged to be easily readable.
- D. All lettering or printing shall be at least 0.10 inches high and shall be produced by automated means. Freehand printing or lettering will not be acceptable.
- E. Wherever practical to do so, notes shall be located as far toward the right border of the drawing as possible.

### **3.02 SPECIAL REQUIREMENTS FOR ATC CIRCUIT DRAWINGS**

- A. Circuitry shall be presented on the drawing with a minimum of crossed or offset lines.
- B. Circuits shall not be drawn as schematics, but shall be drawn to reflect the actual wiring of the circuits. A uniform method shall be used to indicate the actual location of double wire connections when it is not desirable to show both wires at the point of termination. If the final circuit is not wired as shown on the Contractor's drawing, the Contractor shall revise his tracings to indicate the actual wiring before final, As-Built prints are made.
- C. The circuit drawings included in these Specifications do not dictate the location of double wire connections, but shall guide the Contractor insofar as circuitry, symbols, lettering, drawing size and layout are concerned.
- D. No more than two wires shall be shown connected to a single terminal or contact pin other than an AAR terminal unless specifically authorized by the designated Resident Engineer. No more than three wires shall be shown connected to a single AAR terminal.
- E. Complete circuits shall be shown on each drawing insofar as possible. A minimum of continuations shall be used. When continuations must be used, they shall be clear and specific and shall include the identity of the continuation sheet and the unique identity of the specific continuation. Wherever practicable, these "continuations" shall "line up" from drawing to drawing.
- F. Circuits shall be drawn with relay coils, timers, motors or other operated devices shown near the right or left border of the drawing wherever practical. Where there is a choice, the right border shall be favored.

- G. Track relay contacts in ATC circuits shall be inserted successively in conformance with the geographical succession of the track circuits themselves insofar as possible and practical.

### **3.03 PLAN BOOKS**

- A. The Contractor shall maintain two sets of plan books in each TCR in which ATC equipment is installed under this Contract. Each of these sets shall consist of two books of ATC drawings:
  - 1. One book shall consist of all the ATC drawings for the area controlled from that particular TCR and shall include applicable prints from adjacent TCRs to show the non-local portions of traffic circuits and other line circuits appearing in the local TCR. This book shall also include:
    - a. A copy of the wiring diagram for each DTS interface junction box served from the local TCR. See the Data Transmission System (DTS) portion of Section 16927, Microprocessor Support Systems.
    - b. A copy of the wiring diagram for each wayside Train Control junction box and control case located within the area controlled from that TCR.
    - c. Complete Train Control cable plans for the entire area controlled from that TCR.
  - 2. The second book shall consist of typical circuits and typical arrangement or internal layout plans and wiring diagrams for the various pieces of ATC equipment common to the various TCRs.
- B. Both sets of these books shall be updated immediately to reflect any changes made in the ATC circuits or equipment. Work shall not proceed within a TCR area of control until such updates are made. One set of these updated plan books for each TCR shall never leave the TCR, and shall be left in the TCR when the TCR is transferred to Authority control.
- C. In lieu of keeping stamped copies of drawings signed by the Authority's designated R.E. in each TCR, the Contractor shall maintain a log of drawing approval status indicating drawing revision number, any changes, dates of approval and approval status. Approved "as-corrected" drawings shall have corrections transferred to the Room Books of Plans and so noted on both the drawings and in the log.
- D. The Contractor shall maintain a complete set of up-to-date plan books for all TCR locations included in this Contract at his on-site headquarters.
- E. Three additional copies of the typical books and three additional copies of each TCR book of drawings shall be furnished to the Authority at the time the Contractor begins work in the TCR.

### **3.04 AS-BUILT DRAWINGS**

- A. The completed As-Built drawings shall bear the signature of an officer of the Contractor's organization, certifying compliance with as-built conditions, using a rubber stamp as follows

<p>AS-BUILT</p> <p>(Date)</p> <p>-----</p> <p>I certify that this drawing accurately depicts the work as installed.</p> <p><i>(An Officer of the Contractor)</i></p> <p>_____</p> <p>Signature Title</p> <p>CONTRACTOR'S NAME</p>
---

**3.05 MICROFILMED RECORD DRAWINGS**

- A. The Contractor shall prepare Microfilmed Record Drawings following acceptance of the As-Built Drawings by the designated Resident Engineer.
- B. The Contractor shall maintain the original camera master film in roll form, in a covered metal container labeled with project identification and contents information.
- C. The Contractor shall furnish a typewritten index of the contents of the master film rolls.
- D. The Contractor shall deliver the master film, aperture cards and index to the designated Resident Engineer no later than 30 days after approval of the As-Built drawings.

**3.06 CD-ROMs**

- A. The individual formats required for the various CD-ROMs to be furnished by the Contractor shall be as directed by the designated Resident Engineer.

**3.07 MEASUREMENT FOR PARTIAL PAYMENTS**

- A. ATC drawings, tracings, CD-ROMs, plan books and aperture cards will be measured for payment based upon the delivery of the required As-Built drawings, tracings, CD-ROMs and aperture cards to the Train Control Rooms and to the designated Resident Engineer, and upon the approval of these items by the Authority.

**END OF SECTION**

## SECTION 16992

### ATC INSTRUCTION MANUALS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the production and furnishing of ATC Instruction Manuals, prescribes their contents, and describes the materials and general format to be used in their production.

##### 1.02 DESCRIPTION

- A. Assign a minimum of two experienced full-time personnel to the preparation of the required ATC Instruction Manuals. The preparation of the manuals shall commence immediately after the award of Contract. All required manuals shall be delivered during the field testing phase of this Contract as specified herein.
- B. All ATC Instruction Manuals shall be supplied in both printed text version and software version. Software format shall be standard, commercially available, with specific name brand to be determined, subject to the designated Resident Engineer's approval, during development of the Instruction Manuals.

##### 1.03 TYPES OF INSTRUCTION MANUALS REQUIRED

- A. Unless otherwise instructed in the section specifying the equipment, the Contractor shall provide three separate types of Instruction Manuals for the Automatic Train Control System and all items of equipment in the systems and subsystems therein:
  - 1. Operator's Instruction Manual
  - 2. Field Maintainer's Instruction Manual
  - 3. Shop Maintainer's Instruction Manual
- B. In the event the quantity of material for each type would make the manual too bulky or inconvenient to use, more than one binder may be used, but closely related subsystems shall be grouped under the same cover.
- C. The Contractor shall provide separate ATC Instruction Manuals for particular items of equipment if so specified in one or more other Sections of these Specifications.

##### 1.04 QUALITY ASSURANCE

- A. **Reproduction Quality:** The text of the ATC Instruction Manuals shall be cleanly defined and legible. It shall have the quality of line produced by a photo typesetter or laser printer.
  - 1. If a Computer-Aided Publishing System (CAP) is used (which is recommended for legibility and uniformity), the resolution shall be a minimum of 300 dots per inch, and it shall be capable of printing mixed text and graphics. Regardless of the reproduction system used, the Contractor shall submit to the designated Resident Engineer, within 30 working days of NTP, a sample of the final output for approval of the type form and legibility.
  - 2. If a computer-operated printer is used, it shall produce fully-formed letters or letters that are nearly fully-formed. Print output from printers that do not produce "lower case descenders" will not be approved. The Contractor shall use only letter quality (LQ) printers for this work.
  - 3. Printed text which obviously suffers from the effects of multiple copying will not be approved.

- B. The Contractor shall check the ATC Instruction Manuals for both form and content before submittal. Points to be checked shall include, but not be limited to, the following:
  - 1. Conformance to the Specifications
  - 2. Logical grouping and arrangement of subject matter
  - 3. Accuracy
  - 4. Legibility
  - 5. Neatness
  - 6. Line and lettering quality of figures
  - 7. Reproduction quality
  - 8. Recognition and inclusion of interfaces with other subsystems
  - 9. Binder material, labeling and adequacy of ring size

## **1.05 SUBMITTALS**

- A. Master ATC Instruction Manual List: Prior to the preparation of any ATC Instruction Manual, the Contractor shall submit, and obtain the designated Resident Engineer's approval of, a master list of all the ATC Instruction Manuals which he plans to furnish. This list shall show the separation of the manuals (for the entire Automatic Train Control System included in this Contract) into sections covering the system as a whole, and the individual subsystems, modules, and logical parts of subsystems. This list shall be entitled "Master ATC Instruction Manual List."
- B. ATC Instruction Manual Submittal Schedule: Prior to the submittal of any ATC Instruction Manual, the Contractor shall submit, and obtain the designated Resident Engineer's approval of, an ATC Instruction Manual Submittal Schedule which lists the Contractor's target dates for the submittal of all ATC instruction manuals in the first draft form. This schedule shall correspond on a one-for-one basis with the Master ATC Instruction Manual List.
- C. Manual Outline: Submit for approval, within 120 days of receipt of Notice to Proceed, a Preliminary Submittal consisting of an outline of the material to be included in each manual.
- D. First Draft Approval: Following the approval of the manual outline, submit to the designated Resident Engineer for approval, six copies of each ATC instruction manual in "first draft" form. This submittal shall take place during the construction phase of the Contract, as shown on the ATC Instruction Manual Submittal Schedule. The Contractor shall have submitted all of these manuals no later than 30 working days after field testing has begun. This will allow the review of the manuals at a time when all of the related drawings and information are available, and the approval of the manuals before use and possession of the train control equipment by the Authority.
- E. Approved ATC Instruction Manuals: When the Contractor has received written approval of his first draft submittal from the designated Resident Engineer, he shall, within 30 days, furnish 50 bound copies of each manual complete with corrections as approved. The Contractor shall also furnish at this time one unbound, unpunched master copy of each manual in an envelope, suitably marked with its contents, the number of pages in the complete manual, and the Contract number. The purpose of the master copy is to allow the Authority to produce additional copies of the manual. If the manual is to be used in a course of instruction by the Contractor as required by these Specifications, the quantity of manuals required for the course is in addition to the 50 copies required in the preceding paragraph.
- F. Previously Approved Manuals: Because of the revised requirements in this Contract, manuals approved on a previous Contract may not meet the requirements of this Section. Such manuals will not automatically be approved. The Contractor may submit, within 30 working days of NTP, a list of previously approved manuals or sections of manuals which he feels

meet the revised requirements and for which he desires approval under this Contract.

- G. Revisions :Revisions shall be made to ATC Instruction Manuals to accommodate any changes which are made in the equipment before, during or after its installation. ATC Instruction Manuals shall be up-to-date at the time revenue service begins and shall be kept up-to-date until Contract completion. Requirements for revisions to ATC Instruction Manuals are as follows:
1. Furnish with each revision submittal a replacement title page for the affected manual or manual section, with the current revision date in place.
  2. Six copies of the revision submittal shall be furnished by the Contractor and when he receives approval of the revision, he shall furnish 50 collated copies of the revisions with all pages punched. The 50 copies shall be furnished in an envelope or package marked with the Contract number, and the name and all other designations of the manual to be revised. An unbound, unpunched master copy of each revised page shall be submitted by the Contractor for the Authority's use in updating its master copy of the manual.
  3. Submit these revisions in groups which are not so small as to present a continual nuisance to the Authority and not so large that they overload review and approval personnel or delay getting needed revisions to the field.
- H. Personnel Qualifications :Submit to the Authority the names and proof of the qualifications of the personnel selected for preparing the ATC Instruction Manuals.
1. At least one person shall have demonstrated ability in the procedures of preparing manuals and shall be proficient in all of the following:
    - a. Technical Writing
    - b. Graphic Arts
    - c. Ability to read, understand and write the English Language clearly and accurately
    - d. Educational Training
  2. At least one person shall have demonstrated ability in comprehensive knowledge of the ATC system supplied by the Contractor under this Contract. Proof of this knowledge shall take the form of the following:
    - a. Specific information documenting prior experience with the design, installation and/or testing of a similar system
    - b. An engineering degree or equivalent work experience
    - c. Ability to read, understand and write the English Language clearly and accurately
    - d. Previous instruction manual experience.
  3. Proof of these qualifications may be one or more of the following items, but the submittal shall be adequate to provide that the candidate is qualified.
    - a. A resume
    - b. A certificate or diploma
    - c. A curriculum vitae
    - d. Documentary evidence of qualifications

## **PART 2 PRODUCTS**

### **2.01 BASIC REQUIREMENTS**

- A. Binder: Each ATC Instruction Manual furnished by the Contractor shall be bound in a high quality three-ring (minimum), lever operated, loose-leaf binder with the following characteristics:
1. The ring shall be sized so that all of the material in the book may be accommodated on one half of the ring when the rings are open. When the material occupies less than two thirds of a half-ring, a smaller ring size shall be selected. The maximum size of the rings shall be two and one quarter inches. When more material needs

to be bound than will fit in a two and one quarter inch ring binder, two or more binders shall be furnished with the material divided among them in a logical manner. The number of binders in a complete set of a divided manual shall be obvious from the title of each binder. If a three ring binder is used, the rings shall have the standard four and one quarter inch spacing.

2. The cover of the binder shall be constructed from rigid, heavy cardboard stock covered with cloth, or a high quality vinyl which will not become sticky or adhere to adjacent materials under conditions of heat and humidity. The color of each individual binder shall be uniform, but the colors of the various binders may vary, allowing one logical division of the material to have one color and other divisions to have their own uniform colors.
  3. A legend bearing the title of the manual shall be affixed to the outside of the binder in a manner which will last the life of the binder. The legend shall be located on the spine of the binder except that if the flat surface available on the spine is less than one inch, the legend may be located on the top half of the front cover. The legend shall contain the title of the manual and the name of the subdivision of which it is a part. Other markings such as the Contractor's name will be acceptable only if they do not interfere with, or detract from, the required legend. Such markings shall be as approved by the designated Resident Engineer.
  4. Each ATC Instruction Manual shall be equipped with a paper control device on each side of the loose leaf material to prevent punch-out of the paper margins at the holes.
- B. Dividers: Each ATC Instruction Manual shall be divided into logical sections by the use of clearly labeled tab dividers. Each divider shall bear a legend which identifies the contents of the section and is shown in the Table of Contents. The holes of the dividers shall be reinforced.
- C. Title Page: Each ATC Instruction Manual and manual section shall have a title page which explains in detail the content of the manual or manual section, its limits, and the system or subsystem of which it is a part. The title page shall also bear the name of the Contractor and the signature and title of the person designated by the Contractor as responsible for the content of the manual. The title page shall bear a numerical designation, such as a volume and part number, by which it may be uniquely identified and keyed to the Master ATC Instruction Manual List. The title page shall bear the date of the original issue (after approval) as well as the latest revision date, if any.
- D. Table of Contents:
1. Each ATC Instruction Manual shall have a Table of Contents located immediately after the title page. This table shall list all the articles that are contained within the manual and their page numbers. The articles shall be grouped into sections which correspond to the dividers. The page numbering shall list the numbers of the first and last page of each article.
  2. The text of articles which are long or cover various aspects of a subject, shall be further divided into paragraphs which are identified by headings. These headings shall be included in the Table of Contents with their page numbers.
  3. When the Table of Contents consists of more than one page, its pages shall be numbered consecutively.
  4. The Table of Contents shall account for each and every page in the manual, in a manner which will allow detection of a missing page.
- E. Composition of Each Section: Each section of an ATC Instruction Manual shall include:
1. The section title as listed in the Table of Contents;
  2. An Introduction, giving an overall view of the material covered by the section, and listing, in general terms, the equipment described;
  3. A General Description of the function of the equipment with an explanation of any

4. interfaces the equipment may have with other equipment, systems or subsystems;  
The balance of the detailed, explanatory content of the section, as required in these Specifications.
- F. Figures:
1. The manual shall utilize figures consisting of graphs, charts, drawings, diagrams and any other illustrative material in black and white, that can be reproduced by an office copier. Complicated half-tones, photographs, and colored printing may only be included by special request to, and approval of, the Engineer. The figures shall be located within the section of which they are a part and where possible, within, or following, the paragraph describing them. Figures shall be liberally utilized where they can contribute to the grasp and understanding of the subject. Each figure shall be titled. Figures shall be identified with a designation consisting of the word "Figure" (or "Fig."); the section number; a hyphen and a sequential number, starting with one at the beginning of each section. The use of drawings from the Room Book of Plans must be reproduced and included in the manual as a figure.
  2. Large size drawings may be reduced slightly for inclusion as figures in the manuals, but caution shall be exercised because the figure will not be acceptable if the information or printing becomes illegible because of excessive reduction. If large size drawings are included as figures, the drawing number, title block and border shall be removed and a figure number and proper title added. Large drawings, if used as figures, because of their size, shall be grouped together at the back of the book or in one section. These drawings shall be folded so that the page title and page number will be visible without unfolding the page.
- G. Page Size: The manual shall be composed of loose leaf pages of 60 pound paper, which are 8-1/2 inches wide by 11 inches high. To accommodate large drawings such as circuits, fold-out pages of the same weight or heavier paper may be utilized. These fold-out pages shall be a uniform size of 11 inches high by 17 inches wide. With the exception of large drawings, pages larger than 11 by 17 inches shall not be utilized and will not be approved.
- H. Page Margins:
1. Each page shall have an adequate margin at the left side for accommodating the ring holes. This margin shall not be less than one inch.
  2. Each page shall have a margin at the remaining three sides of not less than one-half inch.
  3. Page number and dates if any, shall be placed just above the bottom margin and within the side margin.
- I. Page Numbering: The pages of the section shall be identified at the bottom with a designation consisting of the section number, a hyphen, and a consecutive page number starting with one. At his option, the Contractor may precede this designation with a number or letter identifying the manner of which it is a part and a hyphen. This would provide each page with a unique number.
- J. Difficulty of Material:
1. Operator's Instruction Manuals and Field Maintainer's Instruction Manuals: The Contractor shall assume that a person reading an Operator's Instruction Manual has had the benefit of no more than a twelfth grade education, and a person reading a Field Maintainer's Instruction Manual, no more than that received through the twelfth grade plus two years in a technical school. Long and difficult words shall be avoided. Technical words may be used only where common words are inadequate, provided that words not likely to have been encountered with the education mentioned in this paragraph, are fully explained. Under no circumstances shall any form of slang, or jargon, applicable to a specific industry, be used unless it is thoroughly defined in common terms. Proper English shall be used throughout the text. All sentences shall be complete. Telegraphic or abbreviated sentences, leaving out words, such

- as "of" and "the" will not be acceptable.
2. Shop Maintainer's Instruction Manuals: The Contractor shall assume that a person reading a Shop Maintainer's Instruction Manual has received education through the twelfth grade, has had the benefit of sufficient additional education to comprehend the technical words common to the particular technology being discussed, is skilled in the use of electronic test equipment and is competent in the repair of electronic equipment. This does not however relieve the Contractor of the responsibility of explaining any technical words or procedures specific to the equipment being described. Slang or jargon shall not be used and will not be approved.

## **PART 3 - EXECUTION**

### **3.01 ORGANIZATION OF ATC INSTRUCTION MANUALS**

- A. Types of ATC Instruction Manuals: There shall be three types of manuals:
  1. Operator's Instruction Manual
    - a. This manual shall be used to describe the operation of the system and its various parts. One section of the operator's manual shall be furnished which covers the Automatic Train Control System as a whole. Other sections shall be furnished which explain the operation of each subsystem without getting into technical details of the actual functioning of the equipment. This manual shall contain, in addition to the general operation description, special operating instructions, block diagrams of the organization of the system, and information describing the relation of the system to other interface systems not covered by the manual or Contract. This manual shall be useful for training non-technical personnel in the operation of the equipment, and for purposes of overview by the Maintainers.
    - b. Sections of the Operator's Instruction Manual for separate facilities shall be kept separate. The operator of any facility shall only require a single comprehensive manual and shall not be required to refer to any other manual section.
  2. Field Maintainer's Instruction Manual:
    - a. The purpose of the Field Maintainer's Manual is to instruct the signal system maintainer in the field maintenance of all the equipment furnished by the Contractor in order to allow restoration of operation in the shortest possible time. The manual shall detail procedures for isolating trouble to the "smallest field replaceable device." The Field Maintainer's Manual shall contain complete technical descriptions of the operation of each and every item of equipment.
    - b. One manual section shall be supplied for each piece of equipment, or family of equipment in the Automatic Train Control System.
    - c. These manual sections shall include where applicable, but not be limited to, the following:
      - 1) Equipment Arrangement Drawings
      - 2) Module Arrangement Drawings
      - 3) Connection Wiring Diagrams
      - 4) Test Procedure Descriptions
      - 5) Routine Maintenance Procedures
      - 6) Special Maintenance Procedures
      - 7) Methods and Description of Repairs
      - 8) Trouble-Shooting Guide
      - 9) Trouble-Shooting Procedure Description
      - 10) List of Recommended Trouble-Shooting Test Equipment
      - 11) List of Spare Parts, to the board module level, with recommended

quantities

12) List of Special Tools

3. Shop Maintainer's Instruction Manuals:

- a. The Contractor shall furnish Shop Maintainer's Manuals for each piece of equipment which cannot be fully maintained in the field. This equipment will usually be of the type where the "smallest field replaceable device" is a printed circuit board or an electrical or mechanical subassembly.
- b. The Shop Maintainer's Manual shall provide all the information necessary for the trouble isolation and repair of the "smallest field replaceable device."
- c. When other sections of these Specifications require the Contractor to furnish special test equipment or test fixtures, the Shop Maintainer's Manual shall contain procedures which will instruct the Authority's maintenance personnel in the use and maintenance of this test equipment. These manuals shall provide all the necessary information for the shop maintenance of the equipment to the component level.
- d. These manuals shall contain, but not be limited to, the following:
  - 1) A technical operational description and schematics with full technical detail
  - 2) Maintenance Procedures for the unit
  - 3) Methods and Description of Repair and Calibration
  - 4) Point by point voltage charts
  - 5) A waveform analysis
  - 6) List of Spare Parts, to the component level, with recommended quantities. This shall include all items not included in the Field Maintenance Manual.

- B. Manual Organization: The Contractor shall key each ATC Instruction Manual and manual section to a submitted and approved Master ATC Instruction Manual List with a suitable numbering and titling system.

### 3.02 MEASUREMENT FOR PARTIAL PAYMENTS

- A. ATC Instruction Manuals will be measured for partial payments based upon the delivery of the required number of manuals to the Authority for preliminary approval, upon delivery of the required number of up-to-date manuals, and upon final approval of the updated manuals by the Authority.

**END OF SECTION**

## SECTION 16993

### ATC TRAINING COURSES

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies the basic requirements for training courses and associated training material which shall be provided by the Contractor in relation to certain items of ATC equipment or systems included in this Contract. These training courses shall be provided by the Contractor for those items of ATC equipment or systems which are to be used for the first time on the WMATA Metrorail System, and for certain other ATC equipment and systems specifically designated in other Sections of these Specifications. Further requirements for ATC training courses shall be as specified in the articles of these Specifications which describe the requirements for those items of equipment or systems.

##### 1.02 DESCRIPTION

- A. The ATC training courses shall include, but not be limited to, classroom courses of instruction for Authority-designated training instructors and maintenance personnel. The presentations shall include reference manuals, guides and, when required in other Sections of these Specifications, "hands-on" instruction for each participant. The presentations shall enable the participant to fully understand the use, servicing and maintenance of the equipment or system for which training is required. The training courses shall conform to the requirements of this Section and the other Sections of these Specifications which require them. The training courses shall be complete in all respects and shall be subject to the approval of the designated Resident Engineer who will be responsive to the needs of the WMATA Office of Quality Assurance and Training.
- B. The Contractor shall provide training courses for certain items of ATC equipment or systems as designated by the Section of these Specifications which describes the requirements of those items or systems. In addition, that Section will specify the following characteristics of the training program which shall be provided by the Contractor:
  - 1. The category of Authority personnel for whom the course is intended.
  - 2. The educational level for which the training program shall be written.
  - 3. Any "hands-on" training which the Contractor shall provide.
  - 4. Any special training equipment which the Contractor shall provide.
  - 5. The number of classes which the Contractor shall provide.
  - 6. The size of the classes for which the Contractor shall provide training.
  - 7. The number of days of instruction which the Contractor shall assign to each course of training.
  - 8. Whether a refresher course will be required and the duration and number of participants of the refresher course.
- C. The documents and the presentation for the training courses shall be written or presented in good English, utilizing all of the usual verbs and articles and they shall utilize a vocabulary consistent with the educational level of the course participant as specified in the article of these Specifications which requires the training course. This instructional material shall not be written in outline or "telegraphic" format. Highly technical or seldom used words shall be avoided. All necessary technical words shall be defined and explained, both in the written documents and in the verbal presentation.
- D. The Authority reserves the right to videotape or otherwise record any or all training performed by the Contractor. The Contractor shall cooperate with the designated Resident Engineer in facilitating any such recording effort by the Authority.

### 1.03 QUALITY ASSURANCE

- A. All printed materials necessary or required as an adjunct to the educational program shall be first quality and shall meet the following requirements:
1. The text of the material shall be cleanly defined and legible. It shall have the quality of line produced by a photo typesetter or laser printer.
  2. If a computer-aided publishing system (CAP) is used (which is recommended for legibility and uniformity) the CAP shall have a minimum resolution of 300 dots per inch. If a CAP is used, the Contractor shall submit to the designated Resident Engineer within 30 working days of Notice-To-Proceed, a sample of the final output for approval of the type form and legibility.
  3. If any form of computer based word processor is used, it shall be capable of printing mixed text and graphics.
  4. If a computer-operated printer is used, it shall produce fully formed letters or letters that are nearly fully formed. Print output from printers that do not produce "lower case descenders" will not be approved. The Contractor shall use near letter quality (NLQ) printers, or better, for this work.
  5. Printed text or graphic figures which obviously suffer from the effects of multiple copying will not be approved.
  6. All written courseware deliverables shall include complete camera-ready copy.
- B. All verbal training program instructions shall be clearly presented in a logical form which follows the outline closely. They shall be presented by a person who fully understands the system and who has received formal training in the delivery of such presentations.
- C. The Contractor shall check the presentation for both form and content before submittal or presentation. Points to be checked shall include, but not be limited to, the following:
1. Conformance to the requirements of these Specifications.
  2. Logical grouping and arrangement of subject matter.
  3. Accuracy.
  4. Correspondence between printed material, graphic material and the verbal presentation.
  5. Legibility.
  6. Intelligibility.
  7. Neatness.
  8. Line and lettering quality.
  9. Reproduction quality
  10. Inclusion of material describing the interfaces with other systems.

## PART 2 - PRODUCTS

### 2.01 BASIC REQUIREMENTS

- A. Provide the following four types of training courses in the manner specified. Each course shall be tailored to the specific equipment as supplied by the Contractor to WMATA.
1. Operator's Training Course: This course shall be designed to teach, to the course participant, the day-to-day operation of the equipment. This training shall be sufficient to bring the course participant to a level of operating proficiency such that routine vendor support is not needed.
  2. Field Maintainer's Training Course: This course shall be designed to teach, to the course participant, the knowledge and skills necessary for the field maintenance of the items of equipment or systems for which the training course is required. Field maintenance shall be understood to be that level of maintenance necessary to allow maintenance personnel to isolate troubles to the printed circuit board level and restore service by board replacement (and readjustment if necessary).

3. Shop Maintainer's Training Course: This course shall be designed to teach, to the course participant, the knowledge and skills necessary for the shop maintenance of all of the items of equipment or systems for which the training course is required. Shop maintenance shall be understood to be that level of maintenance necessary to allow maintenance shop personnel to isolate troubles to the component level and restore the printed circuit boards to operational status. The Contractor shall assume that the personnel performing these maintenance procedures are proficient in the skills necessary for the repair of printed circuit boards. This training shall include instruction in the following items:
    - a. The theory of operation, detailed to the system, module, board and board component level.
    - b. Component level troubleshooting and component replacement information.
    - c. Testing and alignment (adjustment) procedures of the repaired units.
  4. Refresher Course: This course, if required by an equipment specification Section, shall be designed to refresh the memories and job-related skills of former course participants. It shall be held on the Authority's premises for the specified number of participants and days, at a mutually acceptable date within one year of completion of the Contract. This refresher course shall be provided at no additional cost to the Authority.
- B. Unless otherwise specified, the course shall be presented before the completion of installation of the equipment for which the training course is intended.
  - C. If changes are made to the equipment during the course of the Contract, the Contractor shall update the training course material immediately. If the changes are the result of errors or miscalculations on the part of the Contractor, all costs for the change shall be borne by the Contractor at no additional cost to the Authority.
  - D. Unless otherwise specified in the article specifying the equipment, the Contractor shall assume for purposes of course development and presentation, that all WMATA students are high school graduates (or equivalent), and that maintenance personnel will already possess the ability to use basic hand tools and simple electronic test equipment.
  - E. The Contractor shall prepare and present to each course participant one or more written and/or practical tests to determine the knowledge transference resulting from the course presentation. The results of this testing shall be tabulated and presented to the designated Resident Engineer to be forwarded to the Rail Training branch. Satisfactory results will serve as evidence of the satisfactory fulfillment of the requirements for the course presentations.
  - F. Course material shall be provided for each course and shall consist of the following items:
    1. Instructor's Guide
      - a. This guide shall contain all the information and directions necessary for the instructor to make an effective presentation. It shall include the guidelines necessary to conduct a comprehensive training program.
      - b. The instructor's guide shall be complete enough and sufficiently detailed enough to allow a WMATA staff instructor to hold additional courses from time to time.
      - c. Individual lessons within the course shall be organized as separate modules (blocks) which may be taught as a unit. Each module shall cover completely one or more subjects or aspects of a subject. In some instances the same module may be used in more than one course. An example of this would be a section on the basic fundamentals of the operation of a microprocessor which could be used in both the field and shop level courses.
      - d. The guide shall be organized with each page divided into two columns. (The page width shall be 11 inches and the height 8-1/2 inches less a

- binding edge of 1-1/2 inches.) The left column shall be the instructional text and the right column the Instructor's directions for conducting the course.
- e. The Instructor's guide shall contain as a minimum, the following items:
    - 1) A statement of the overall program goals and course objectives.
    - 2) A lesson plan containing the following:
      - a) Student learning objectives, stated in measurable terms.
      - b) An overview of each lesson.
      - c) Suggested instructional methods.
      - d) Suggested learning activities.
      - e) Instructions for use of the required equipment.
      - f) A listing of references and resources.
      - g) A listing of where in the course, the audio-visual aids and mock-ups are to be used.
    - 3) An evaluation module, which contains instructions for presenting written or practical tests designed to measure the extent to which the course participants have attained the course objectives. An answer key shall be included for each of the tests.
  - f. At the conclusion of the course presentation, the Contractor shall revise the Instructor's guide with all changes resulting from the presentation, class questions and Authority comments. When approved by the designated Resident Engineer, the Contractor shall provide one camera-ready document and five copies of the revised Instructor's Guide for the Authority's Training Facility.
2. Student's Guide
- a. The Student's Guide shall include all materials necessary for the student to interact in the learning situation. The Student's Guide shall be similar to the Instructor's Guide except the portions of the Instructor's Guide devoted to directions for the instructor shall be left blank as a space for the students' notes. It shall contain as a minimum, the following items:
    - 1) A program overview.
    - 2) An introduction or preface.
    - 3) A statement of overall program goals.
    - 4) A statement of learning objectives, stated in measurable terms, that specifically describes desired behavior, procedures or knowledge to be gained by the student.
    - 5) A fully developed written presentation of the course content which is developed in the same modular organization as the Instructor's Guide.
    - 6) Illustrations, graphs, charts or tables as necessary to enhance the presentation and increase student understanding.
  - b. When the Student's Guide has been approved by the designated Resident Engineer, the Contractor shall provide one copy for each class participant. Five approved copies of the guide shall be provided, through the designated Resident Engineer, for the training facility Rail Technical Library. One camera-ready copy of the approved Student's Guide shall be provided, through the Engineer, for the training facility.
3. Audio-Visual Aids
- a. Audio-visual aids shall be used to enhance the course presentation wherever they will be helpful in increasing the student's comprehension of the subject. The Contractor shall consider and use, where appropriate, the following items:
    - 1) Handouts
    - 2) Transparencies
    - 3) Slides
    - 4) Films and/or Video Tapes
    - 5) Mock-ups

4. Supplemental Materials:
  - a. Applicable supplemental materials such as equipment setups, test fixtures, special tools, regulatory manuals or books shall be furnished by the Contractor and integrated into the various training courses required.
  - b. Interactive Video: Interactive video tapes may be utilized by the Contractor, with the Authority's permission, in lieu of, or in addition to, one or more sections of the live course presentation as required by the article of these Specifications which requires the training course. The Contractor shall submit the tape, or a detailed description of its contents and the depth of its instruction, to the designated Resident Engineer at least 60 days before the course is to be presented. The designated Resident Engineer will forward the tape or description to the WMATA Office of Quality Assurance and Training for approval. The Contractor will not be permitted to use such tapes as part of the course presentation(s) unless approval has been obtained from the designated Resident Engineer prior to the scheduled presentation date.

### **PART 3 - EXECUTION**

#### **3.01 COMMENCEMENT OF TRAINING PROGRAM WORK**

- A. The Contractor shall commence work on the ATC training program as soon as he is given the Notice-To-Proceed. Work on the training courses required in these Specifications shall be performed by a person whose primary responsibility is the production of the training courses required by these Specifications. The person charged with this responsibility shall not only be familiar with the production of training courses, but also must have a comprehensive understanding of the adult learning process and be familiar with the equipment for which the students are being trained.

#### **3.02 SUBMITTALS**

- A. The following documents shall be submitted to the designated Resident Engineer for approval at the time required. These submittals will also serve as proof that the training course is on schedule. (Payments for certain equipment will be linked to successful course completion as specified in Part 3.04 of this Section.) The documents to be submitted are:
  1. Training Course Schedule: The Contractor shall submit, within 45 calendar days of the Notice-To-Proceed, a training course schedule which provides the dates when all of the events required in this article will take place. This schedule shall include, but not be limited to:
    - a. The dates when the submittals will be received by the designated Resident Engineer.
    - b. The dates when training materials will be shipped.
    - c. The dates when the courses will be held.
  2. Instructor's Guides: The Contractor shall submit preliminary versions of the required Instructor's Guides within 60 calendar days of the Notice-To-Proceed.
  3. Student's Guides: The Contractor shall submit preliminary versions of the required Student's Guides according to the approved Instructor's Guide submittal. These manuals shall be in the designated Resident Engineer's hands at least 45 calendar days before the course is to be presented. Unless otherwise specified, the course shall be presented before the completion of installation of the equipment for which the training course is intended.
  4. Documents and Materials: All training documents, materials and supplemental materials required by these Specifications shall be delivered to the designated Resident Engineer at least 10 working days before the date of the course presentation. The designated Resident Engineer will forward all approved training

documents and materials directly to the WMATA Office of Quality Assurance and Training.

### 3.03 INSTRUCTOR QUALIFICATIONS

- A. The Contractor shall submit to the designated Resident Engineer for approval by the WMATA Office of Quality Assurance and Training at least 60 calendar days prior to the presentation of the training course, a description of the instructor's teaching qualifications. This description shall document a thorough knowledge of the functioning of the equipment for which the course is intended, an understanding of the adult learning process, and demonstrated experience in vocational instruction.
- B. Proof of these qualifications may be one or more of the following items, but the submittal shall be adequate to prove that the candidate meets the above requirements and is a qualified instructor:
  - 1. A resume
  - 2. A copy of a certificate or diploma
  - 3. A curriculum vitae
  - 4. Documentary evidence of technical and instructional qualifications

### 3.04 MEASUREMENT FOR PARTIAL PAYMENTS

- A. Training Courses will be measured for partial payments based upon:
  - 1. Timely delivery by the Contractor and approval by the designated Resident Engineer of the Training Course Schedule
  - 2. Timely delivery by the Contractor and approval by the designated Resident Engineer of all course materials
  - 3. Timely delivery by the Contractor of special training equipment which has been approved by the designated Resident Engineer
  - 4. Completion of the approved course presentation(s) in a manner satisfactory to the designated Resident Engineer.

### 3.05 PAYMENT

- A. The sum of payments for ATC Training Courses included under this Contract, will equal the Lump Sum Price listed in the Unit Price Schedule for:ATC TRAINING COURSES
- B. The Lump Sum Price for the ATC Training Courses listed in the Contract shall be divided by the number of courses required by the Contract, to produce the total payment per course. Payments for each course will be made as specified below:
  - 1. Upon delivery of the ATC Training Course Schedule 25% of Course Total
  - 2. Upon delivery of all ATC course materials and special training equipment 25% of Course Total
  - 3. Upon the successful completion of all of the course presentations as approved by the designated Resident Engineer 50% of Course Total

DTS FUNCTIONS - TABLE I TRAIN OPERATION CONTROLS	23 - 32
DTS FUNCTIONS - TABLE II ELECTRICAL & SUPPORT EQUIPMENT CONTROLS	33 - 35
DTS FUNCTIONS - TABLE III TRAIN OPERATION INDICATIONS	36 - 46
DTS FUNCTIONS - TABLE IV ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS (2 Bits)	47 - 60
DTS FUNCTIONS - TABLE V ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS (1 Bit)	61- 65

SWITCH OPERATING TIME vs. VOLTAGE

WHEN SWITCH-AND-LOCK MOVEMENT OPERATING VOLTAGE IS BETWEEN 90 VOLTS AND 130 VOLTS, SWITCH OPERATING TIME SHALL BE LESS THAN THE MAXIMUM THROW TIME INDICATED ABOVE.

$$\text{FOR } V=90-100, \quad T= 8.75 - .05 \times V$$

$$\text{FOR } V=100-130, \quad T= 6.25 - .025 \times V$$

TABLE OF DWELL TIMES

**EXAMPLE:**

<u>STATION NAME</u>	DWELL TIMES IN SECONDS			
	<u>Min. Dwell</u>	<u>Norm. Dwell</u>	<u>Max. Dwell</u>	<u>Actual Setting</u>
<b>"G" Route - Outbound - Addison Road to Largo Town Center</b>				
Addison Road	20	25	30	25
Summerfield	20	25	30	25
Largo Town Center	30	35	40	35
<b>"G" Route - Inbound - Largo Town Center to Addison Road</b>				
Largo Town Center	30	35	40	35
Summerfield	20	25	30	25
Addison Road	20	25	30	25

TRAINING CLASSES --- GENERAL REQUIREMENTS

<u>EQUIPMENT/SYSTEM &amp; CLASS NAME</u>	<u>PRESENTATIONS &amp; DESCRIPTION</u>	<u>CLASS TIME &amp; TRAINEES</u>
Non-Vital Station Processor Maintainer's STAP Training Course	4 Presentations Operation and Maintenance of the STAP System	3 to 5 Days Each 12 Trainees Each See <b>Section 16924</b>
Non-Vital Station Processor Engineer's Station Processor Training Course	1 Presentation Programming, Reprogramming, and Maintenance of the STAP System to the board level	5 to 10 Days 12 Trainees See <b>Section 16924</b>
Data Transmission Sys.(DTS) DTS Field Maintainer's Training Course	4 Presentations - Operation and Maintenance of the RTU, CAU, A/D Converter and Multiplexer Equipment and Circuitry	5 Days Min., Each 12 Trainees Each See <b>Section 16925</b>
Data Transmission Sys.(DTS) DTS Shop Maintainer's Training Course	2 Presentations Troubleshooting to the Component Level	5 Days Each 8 Trainees Each See <b>Section 16925</b>
Data Transmission Sys.(DTS) Engineer's DTS Training Course	1 Presentation Program, Reprogram and Maintenance of DTS	5 Days Minimum 12 Trainees See <b>Section 16925</b>
Non-Vital Interlocking Processor (NVIP) Systems Field Maintainer's Training Course for NVIP Systems	1 Presentation Operation, Maintenance and Troubleshooting of Non-Vital portion of Interlocking Control System	5 to 10 Days 12 Trainees See <b>Section 16926</b>
Non-Vital Interlocking Processor (NVIP) Systems Engineer's Training Course for NVIP Systems	1 Presentation Operation, Maintenance and Troubleshooting of Non-Vital portion of Interlocking Control System	5 to 10 Days 12 Trainees See <b>Section 16926</b>
ATC System and IVP Systems Maintainer's ATC/IVP Training Course	4 Presentations Operation, Maintenance and Troubleshooting of the complete ATC System with Special emphasis on the Interlocking Vital Processor Systems	5 to 10 Days Each 12 Trainees See <b>Section 16928</b>
Interlocking Vital Processor Systems (IVP) Engineer's Training Course for IVP Systems	1 Presentation Programming, Maintenance and Re-Programming of the IVP Systems to the Board Level	5 to 10 Days 12 Trainees See <b>Section 16928</b>
Train Control Room (TCR) Equipment and Systems  TCR Maintenance Training Course	4 Presentations Operation, Maintenance and Troubleshooting of Vital Control Systems, Power Supply Systems, Grounding & Surge Protection Systems, and Non-Vital Systems	10 Days Each 12 Trainees Each
Wayside Equipment & Systems  Wayside Maintenance Training Course	4 Presentations Operation, Troubleshooting & Field Maintenance of Switch Machines, Signals, Impedance Bonds, Marker Coil Layouts, Signal & Negative-Return Bonding, Snowmelter Layouts, Vital & Non-Vital Relays, Test Equipment	10 Days Each 12 Trainees Each

TC/COMM INTERFACE CABINET LAYOUT

**TC/COMM INTERFACE CABINET LAYOUT**

USUALLY LOCATED IN COMMUNICATIONS EQUIPMENT ROOM  
(BY OTHER DISCIPLINES)

## TC/COMM INTERFACE CABINET WIRING

The TC/COMM INTERFACE CABINET located in the Communications Room at each Passenger Station included in this Contract, shall be wired or modified as indicated on the site-specific Interface Cabinet Wiring Diagram for that location, unless otherwise directed by the Designated Resident Engineer.

DTS FUNCTIONS - TABLE I  
TRAIN OPERATION CONTROLS

<u>NO.</u> 1A	<u>GROUP</u> Train/ Station	<u>NAME</u> Set Train Identification RUN NUMBER, PLATFORM DESTINATION, PLATFORM
------------------	-----------------------------------	--

FUNCTION

Assign Identification to a train; 3 BCD digits of RUN NUMBER (12 bits); 2 BCD digits of DESTINATION CODE (8 bits).

SIGNAL HIGH

Upon OCC command, or when an unupdated (with commanded identification) train reports CXR-ON at next downstream station (a retry feature up to 2 downstream stations) transmitted every DTS cycle.

SIGNAL LOW

Upon loss of TWC signal.

<u>NO.</u> 1B	<u>GROUP</u> Train/ Station	<u>NAME</u> HOLD WITH DOORS CLOSED
------------------	-----------------------------------	---------------------------------------

FUNCTION

Commands a train to remain at the station with doors closed after its doors have closed at end of dwell cycle.

SIGNAL HIGH

Upon OCC Command. Transmitted every DTS cycle.

SIGNAL LOW

Upon loss of TWC signal or issuance of either HOLD WITH DOORS OPEN or TERMINATE DWELL command by OCC.

<u>NO.</u> 1C	<u>GROUP</u> Train/ Station	<u>NAME</u> HOLD WITH DOORS OPEN
------------------	-----------------------------------	-------------------------------------

FUNCTION

Commands a train to remain at the station with doors open even after end of dwell cycle.

SIGNAL HIGH

Upon OCC command. Transmitted every DTS cycle.

SIGNAL LOW

Upon loss of TWC signal or issuance of either HOLD WITH DOORS CLOSED or TERMINATE DWELL command by OCC.

TABLE I - TRAIN OPERATION CONTROLS (Continued)

<u>NO.</u> 1D	<u>GROUP</u> Train/ Station	<u>NAME</u> TERMINATE DWELL
------------------	-----------------------------------	--------------------------------

FUNCTION

Commands a train to close doors and depart. Overrides local or OCC hold commands.

SIGNAL HIGH

Upon issuance of command by OCC. Transmitted for two DTS cycles.

SIGNAL LOW

Two DTS cycles from issuance of command.

<u>NO.</u> 1E	<u>GROUP</u> Train/ Station	<u>NAME</u> ATS PERFORMANCE, PLATFORM (Station Platform Number)
------------------	-----------------------------------	---

FUNCTION

Two bit performance level code. Cause the train not to exceed a certain ATS performance level speed until changed by next station or fly-by transmitter. MAXIMUM = 00 (PL1); NORMAL = 01 (PL2); REDUCED = 10 (PL3); RETARDED = 11 (PL4).

SIGNAL HIGH

Upon issuance of command.

SIGNAL LOW

Upon loss of CXR signal except when broadcast by OCC. If broadcast by OCC, then upon issuance of terminate/stop broadcast command by OCC.

<u>NO.</u> 1F	<u>GROUP</u> Train/ Station	<u>NAME</u> ATS-PERFORMANCE, FLY-BY (Fly-by transmitter No.)
------------------	-----------------------------------	--

FUNCTION

Two bit performance level code. Cause the train not to exceed a certain ATS performance level speed until changed by next station or fly-by transmitter. MAXIMUM = 00 (PL1); NORMAL = 01 (PL2); REDUCED = 10 (PL3); RETARDED = 11 (PL4).

SIGNAL HIGH

Triggered by software internally at OCC upon occupancy of trigger block by tracked block train.

SIGNAL LOW

Triggered by software internally at OCC upon vacancy of trigger block (different trigger block than signal high trigger block).

TABLE I - TRAIN OPERATION CONTROLS (Continued)

NO.GROUPNAME  
1GTrain/ATS-ACCELERATION,  
StationPLATFORM (Station  
Platform Number)

FUNCTION  
Sets half acceleration on train.

SIGNAL HIGHSIGNAL LOW  
Upon issuance of command for Same as 1E and/or  
half acceleration. issuance of full  
acceleration command.

NO.GROUPNAME  
1HTrain/StationSKIP-STOP (Marker  
Number)

FUNCTION  
Cancel station stop sent to Markers located at 500 ft. & 1200 ft. from center of station platform in both  
normal and reverse directions.

SIGNAL HIGHSIGNAL LOW  
Upon issuance of command to all Upon issuance of 'STOP'  
markers if command is for all skip-stop command to all  
trains. If command is for a markers if the command is  
specific train then when the for all trains. If the  
trigger block immediately command is for a specific  
upstream from the marker block train, then when the  
prior to the station, depending train occupies trigger  
on the direction of travel. block immediately  
downstream from the  
marker, depending on  
direction of travel.

NO.GROUPNAME  
1ITrain/StationDOOR CLOSE WARNING  
PLATFORM (Number)

FUNCTION  
Alert the train operator to close the train doors.

SIGNAL HIGHSIGNAL LOW  
Upon issuance of command Upon removal of command  
by OCC. by OCC.

TABLE I - TRAIN OPERATION CONTROLS (Continued)

<u>NO.</u> 1J	<u>GROUP</u> Track	<u>NAME</u> RESET IDW SYSTEM
------------------	-----------------------	---------------------------------

FUNCTION  
Resets IDW alarm if alarm is false.

SIGNAL HIGH  
Upon issuance of command by OCC. Transmitted for two DTS cycles.

SIGNAL LOW  
Two DTS cycles from issuance of command.

<u>NO.</u> 2A	<u>GROUP</u> Interlocking	<u>NAME</u> SET LOCAL CONTROL
------------------	------------------------------	----------------------------------

FUNCTION  
Transfers control of an interlocking from OCC to local.

SIGNAL HIGH  
Upon issuance of command.

SIGNAL LOW  
When LOCAL CONTROL indication is received or 60 seconds, whichever is earlier.

<u>NO.</u> 2B	<u>GROUP</u> Interlocking	<u>NAME</u> SET CENTRAL CONTROL
------------------	------------------------------	------------------------------------

FUNCTION  
Requesting transfer of control of an interlocking from local to OCC.

SIGNAL HIGH  
Upon issuance of command.

SIGNAL LOW  
When CENTRAL IN CONTROL indication is received or 60 seconds, whichever is earlier.

<u>NO.</u> 2C	<u>GROUP</u> Interlocking	<u>NAME</u> SET NORMAL SWITCH (No.)
------------------	------------------------------	--

FUNCTION  
Requests wayside to put normal call on a specific switch.

SIGNAL HIGH  
Upon issuance of command.

SIGNAL LOW  
When SWITCH (No.) CALLED NORMAL indication is received, or 10 seconds, whichever is earlier.

TABLE I - TRAIN OPERATION CONTROLS (Continued)

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
2D	Interlocking	SET REVERSE SWITCH (No.)

FUNCTION

Requests wayside to put reverse call on a specific switch.

SIGNAL HIGH

Upon issuance of command.

SIGNAL LOW

When SWITCH (No.) CALLED REVERSE indication is received, or 10 seconds, whichever is earlier.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
2E	Interlocking	CANCEL SWITCH (Number)

FUNCTION

Requests wayside to remove all calls from a specific switch.

SIGNAL HIGH

Upon issuance of command.

SIGNAL LOW

When call indication is lost or 10 seconds, whichever is earlier.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
2F	Interlocking	ROUTE REQUEST SIG (No.)

FUNCTION

Requests establishment of a route from a given entrance signal. The request may include a designated exit signal.

SIGNAL HIGH

Upon issuance of command to entrance signal and upon receipt of ENT RECV SIG (No.) indication (must be within 5 seconds from entrance request) from entrance signal. Or upon issuance of FLEET SIG (No.) or CANCEL FLEET SIG (No.) Command.

SIGNAL LOW

When ENT RECV SIG (No.) (Entrance Received) indication is received, or 5 seconds, whichever is earlier for entrance signal. When SIG CLEAR SIG (No.) indication for entrance signal is received or 10 seconds, whichever is earlier. When cancelling fleet, upon loss of fleet indication or 10 seconds, whichever is earlier. When requesting fleet, upon receipt of ENT RECV SIG (No.) indication or 5 seconds, whichever is earlier for a non-established route, and upon receipt of FLEETED TK (No.) SIG (No.) indication, or 10 seconds, whichever is earlier, for an established route.

TABLE I - TRAIN OPERATION CONTROLS (Continued)

<u>NO.</u> 2G	<u>GROUP</u> Interlocking	<u>NAME</u> CANCEL ROUTE
------------------	------------------------------	--------------------------------

FUNCTION

Requests cancellation of the established route from a given entrance signal.

SIGNAL HIGH

Upon issuance of command.

SIGNAL LOW

Upon loss of SIG CLEAR SIG (No.) indication or 10 seconds, whichever is earlier.

<u>NO.</u> 2H	<u>GROUP</u> Interlocking	<u>NAME</u> FLEET SIG (Number)
------------------	------------------------------	-----------------------------------

FUNCTION

Requests fleetting of an established route or establishment of a fleetted route from a given entrance signal.

SIGNAL HIGH

Upon issuance of command.

SIGNAL LOW

Upon receipt of FLEETED TK (No.) SIG (No.) indication or 10 seconds, whichever is earlier for an established route. Upon receipt of ENT RECV (entrance received) TK (No.) SIG (No.) indication from entrance signal or 5 seconds, whichever is earlier for a non-established route.

<u>NO.</u> 2I	<u>GROUP</u> Interlocking	<u>NAME</u> CANCEL FLEET SIG (No.)
------------------	------------------------------	---------------------------------------

FUNCTION

Requests fleetting to be cancelled but keeps the established route from the designated entrance signal.

SIGNAL HIGH

Upon issuance of command.

SIGNAL LOW

When FLEETED TK (No.) SIG (No.) indication is lost or 10 seconds whichever is earlier.

<u>NO.</u> 2J	<u>GROUP</u> Interlocking	<u>NAME</u> SET AUTO ROUTE SIG (No.)
------------------	------------------------------	---

FUNCTION

Request that a signal be put in the automatic mode of operation so that wayside can establish automatic routing.

SIGNAL HIGH

Upon issuance of command.

SIGNAL LOW

When AUTO ROUTE IN EFFECT SIG (No.) indication for the signal is received or 10 seconds, whichever is earlier.

TABLE I - TRAIN OPERATION CONTROLS (Continued)

<u>NO.</u> 2K	<u>GROUP</u> Interlocking	<u>NAME</u> CANCEL AUTO ROUTE SIG (Number)
<u>FUNCTION</u> Take a signal out of automatic mode of operation.		
<u>SIGNAL HIGH</u> Upon issuance of command.		<u>SIGNAL LOW</u> When AUTO ROUTE IN EFFECT SIG (No.) indication for the signal is lost or 10 seconds, whichever is earlier.
<hr/>		
<u>NO.</u> 2L	<u>GROUP</u> Interlocking	<u>NAME</u> INHIBIT AUTO OPER SIG (Number)
<u>FUNCTION</u> Prevents the wayside from establishing an automatic routing from the designated entrance signal at a divergent or terminal interlocking even if the signal is in automatic operation mode.		
<u>SIGNAL HIGH</u> At start of the computer system. Transmitted every DTS cycle except when software removes this signal, or when commanded by OCC post OCC command to stay low.		<u>SIGNAL LOW</u> When software removes the signal to allow wayside automatic routing until signal is clear, or 60 seconds from removal of signal, whichever is earlier, or when any block within the advance approach area is under dark (DTS down) area, or when commanded by OCC to stay low.
<hr/>		
<u>NO.</u> 2M	<u>GROUP</u> Interlocking	<u>NAME</u> CLEAR DEST REG SIG (No.) (Clear Destination Register for Signal__)
<u>FUNCTION</u> Clears all stored destinations from destination register for designated wayside destination controlled automatic signal.		
<u>SIGNAL HIGH</u> Upon issuance of command.		<u>SIGNAL LOW</u> Upon loss of destination indication or 10 seconds, whichever is earlier.
<hr/>		

TABLE I - TRAIN OPERATION CONTROLS (Continued)

NO.GROUPNAME  
 2NInterlockingTERMINAL MODE (Number)  
 FUNCTION  
 Set terminal in one of three operations modes.

SIGNAL HIGHSIGNAL LOW  
 Upon issuance of command.  
 When commanded Terminal Mode indication  
 (AUTO OPER MODE [No.]) is received,  
 or 10 seconds, whichever is earlier.

NO.GROUPNAME  
 2OInterlockingSET SNOWMELTER ON

FUNCTION  
 Turn wayside running rail and  
 switch rod heaters on to keep switches free of ice.

SIGNAL HIGHSIGNAL LOW  
 Upon issuance of command.10 DTS cycles from start,  
 or upon receipt of SNOWMELTER ON status,whichever is earlier.

NO.GROUPNAME  
 2PInterlockingSET SNOWMELTER OFF

FUNCTION  
 Turn wayside running rail and switch rod  
 heaters off when weather conditions are favorable.

SIGNAL HIGHSIGNAL LOW  
 Upon issuance of command.10 DTS cycles from start,  
 or loss of SNOWMELTER ON  
 status, whichever is earlier.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
3A	Misc.	DESTINATION, PLATFORM (Number)

FUNCTION  
 Send information (2 BCD Digits) to station sign for the designated platform.

SIGNAL HIGH  
 60 seconds prior to estimated  
 arrival time of a train (for  
 less than 60 second runtime  
 upon departure, from previous  
 station), or after previous  
 train departure whichever  
 is later.

SIGNAL LOW  
 Upon train departure,  
 or 2 DTS cycles from  
 start.

TABLE I - TRAIN OPERATION CONTROLS (Continued)

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
3B	Misc.	TRAIN LENGTH, PLATFORM (Number)

FUNCTION  
1 BCD digit to control the platform edge lights.

SIGNAL HIGH  
60 seconds prior to estimated arrival time of a train (for less than 60 second runtime upon departure from previous station), or after previous train departure, whichever is later.

SIGNAL LOW  
Upon train departure, or 2 DTS cycles from start.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
3C	Misc.	TIME PULSE-MIN

FUNCTION  
To keep the station clock in sync. with the OCC computer clock minutes.

SIGNAL HIGH  
At start of minute period (00 seconds) transmitted to all stations.

SIGNAL LOW  
1 second after start.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
3D	Misc.	TIME PULSE-HRS/24 HRS

FUNCTION  
To keep the station clocks in sync with the OCC computer clock hour/day.

SIGNAL HIGH  
At 57:54 (mm:ss) each hour. Transmitted to all stations.

SIGNAL LOW  
8 seconds 58:02 (mm:ss) except 14 seconds at 2 a.m. until 2:58:08.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
4A	Train Dispatch	TRAIN NEEDED, PLATFORM (Number)

FUNCTION  
Rings bell and turns Train Needed indicator light on in yard tower.

SIGNAL HIGH  
Start of train needed window.

SIGNAL LOW  
Start of dispatch/putin window.

TABLE I - TRAIN OPERATION CONTROLS (Continued)

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
4B	Train Dispatch	DISPATCH WARNING

FUNCTION

Turns dispatch warning lights on.

SIGNAL HIGH

Start of dispatch/putin window.

SIGNAL LOW

Expiration of dispatch window.

.....

DTS FUNCTIONS - TABLE II  
ELECTRICAL & SUPPORT EQUIPMENT CONTROLS

<u>NO.</u> 1A	<u>GROUP</u> Traction power (DCPWR)	<u>NAME</u> AC INC LINE BRK (Number) CLOSED (AC incoming line breaker).
------------------	--	--

FUNCTION  
Request breaker to close.

SIGNAL HIGH  
Upon execution of close command  
by OCC.

SIGNAL LOW  
2 seconds after execution  
of command.

<u>NO.</u> 1B	<u>GROUP</u> Traction power (DCPWR)
------------------	--

NAME  
AC INC LINE BRK (Number)  
TRIP (AC incoming line  
breaker).

FUNCTION  
Request breaker to trip.

SIGNAL HIGH  
Same as 1A except for trip  
command

SIGNAL LOW  
Same as for 1A

<u>NO.</u> 1C	<u>GROUP</u> Traction power (DCPWR)
------------------	--

NAME  
AC RECT TRANS FDR BRK  
(Number) CLOSED (AC rectifier  
transformer feeder breaker)

FUNCTION  
Request breaker to close.

SIGNAL HIGH  
Same as for 1A

SIGNAL LOW  
Same as for 1A

---

<u>NO.</u> 1D	<u>GROUP</u> Traction power (DCPWR)
------------------	--

NAME  
AC RECT TRANS FDR BRK (Number) TRIP (AC  
Rectifier Transformer Feeder Breaker).

FUNCTION  
Request breaker to trip.

SIGNAL HIGH  
Same as for 1B

SIGNAL LOW  
Same as for 1A

---

TABLE II - ELECTRICAL & SUPPORT EQUIPMENT CONTROLS (Continued)

<u>NO.</u> 1E	<u>GROUP</u> Traction power (DCPWR)	<u>NAME</u> DC FDR TIE BRK (Number) CLOSED (DC Feeder Tie Breaker)
------------------	--	---

FUNCTION  
Request breaker to close.

SIGNAL HIGH  
Same as for 1A

SIGNAL LOW  
Same as for 1A

---

<u>NO.</u> 1F	<u>GROUP</u> Traction power (DCPWR)	<u>NAME</u> DC FDR TIE BRK (Number) TRIP (DC Feeder Tie Breaker)
------------------	--	---

FUNCTION  
Request breaker to trip.

SIGNAL HIGH  
Same as for 1B

SIGNAL LOW  
Same as for 1A

---

<u>NO.</u> 2A	<u>GROUP</u> Ventilation	<u>NAME</u> FANS (No.) EMERGENCY OFF
------------------	-----------------------------	---

FUNCTION  
Request fans to stop immediately.

SIGNAL HIGH  
Upon execution of EMERGENCY OFF command by OCC

SIGNAL LOW  
Same as for 1A

---

<u>NO.</u> 2B	<u>GROUP</u> Ventilation	<u>NAME</u> FANS (No.) EMERGENCY ON
------------------	-----------------------------	--

FUNCTION  
Request fans to start immediately.

SIGNAL HIGH  
Same as for 1A except for EMERGENCY ON command by OCC.

SIGNAL LOW  
Same as for 1A

---

TABLE II - ELECTRICAL & SUPPORT EQUIPMENT CONTROLS (Continued)

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
2C	Ventilation	FANS (No.) AUTOMATIC ON

FUNCTION  
Request fans to go into automatic mode.

<u>SIGNAL HIGH</u>	<u>SIGNAL LOW</u>
Same as for 1A except for AUTOMATIC ON command by OCC	Same as for 1A

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
2D	Ventilation	FANS (No.) SUPPLY

FUNCTION  
Command along with either EMERGENCY ON or AUTOMATIC ON command to request air supply mode of operation.

<u>SIGNAL HIGH</u>	<u>SIGNAL LOW</u>
Upon execution of FANS SUPPLY command along with either EMERGENCY ON or AUTOMATIC ON command by OCC.	Same as for 1A

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
2E	Ventilation	FANS (No.) EXHAUST

FUNCTION  
Same as for 2D except request air exhaust mode.

<u>SIGNAL HIGH</u>	<u>SIGNAL LOW</u>
Same as for 2D except FANS EXHAUST command by OCC	Same as for 1A

---

DTS FUNCTIONS - TABLE III  
TRAIN OPERATION INDICATIONS

<u>NO.</u> 1A	<u>GROUP</u> Train to Wayside Communications (TWC)	<u>NAME</u> RUN NUMBER, PLATFORM (No.)
------------------	--	--

FUNCTION  
Indicates 3 BCD Digits run-number; 12-bits.

SIGNAL HIGH  
When front of the train is  
within the platform-limits and  
transmitting a "long" message.

SIGNAL LOW  
When front of the train  
is outside of the  
platform limits and/or  
not transmitting a "long"  
message.

<u>NO.</u> 1B	<u>GROUP</u> Train to Wayside Communications (TWC)	<u>NAME</u> DESTINATION, PLATFORM (No.)
------------------	--	---

FUNCTION  
Indicates 2 BCD Digits destination code;  
8-bits.

SIGNAL HIGH  
Same as for 1A.

SIGNAL LOW  
Same as for 1A.

<u>NO.</u> 1C	<u>GROUP</u> Train to Wayside Communications (TWC)	<u>NAME</u> TRAIN LENGTH, PLATFORM (No.)
------------------	--	--

FUNCTION  
Indicates 1 BCD digit of train length 4 bits.

SIGNAL HIGH  
Same as for 1A and/or when the  
train is at a put-in location  
(at yard or tail track)  
and train attendant presses  
ATO-Start button on board  
train.

SIGNAL LOW  
Same as for 1A and/or  
3 seconds duration  
maintained by wayside  
from put-in locations.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

<u>NO.</u> 1D	<u>GROUP</u> Train to Wayside Communications (TWC)	<u>NAME</u> DOOR OPEN MANUAL TK (number)
------------------	--	--

FUNCTION

Indicates whether train door opening is being controlled manually.

SIGNAL HIGH

Same as for 1A and doors are being opened under manual control.

SIGNAL LOW

Same as for 1A and doors are not being opened under manual control.

<u>NO.</u> 1E	<u>GROUP</u> Train to Wayside Communications (TWC)	<u>NAME</u> TRAIN READY TRACK (Number)
------------------	--	--

FUNCTION

Indicates whether train is ready for automatic operation.

SIGNAL HIGH

When the train is at "put in" location or at a platform and train attendant presses ATO Start button onboard train.

SIGNAL LOW

3 seconds duration maintained by wayside & carborne ATC.

<u>NO.</u> 1F	<u>GROUP</u> Train to Wayside Communications (TWC)	<u>NAME</u> TRAIN BERTHED TRACK (Number)
------------------	--	--

FUNCTION

Indicates whether train is berthed at a station.

SIGNAL HIGH

Wayside equipment receives this from train when train reaches 7 MPH speed during it's programmed stop.

SIGNAL LOW

When the dwell time is complete.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

<u>NO.</u> 1G	<u>GROUP</u> Train to Wayside Communications (TWC)	<u>NAME</u> TRAIN MOTION TRACK (Number)
------------------	--	---

FUNCTION  
Indicates whether train is moving.

SIGNAL HIGH  
Same as for 1A and the train is moving 3 MPH or higher speed within platform area.

SIGNAL LOW  
Same as for 1A and/or train is stopped or moving below 3MPH speed.

<u>NO.</u> 1H	<u>GROUP</u> TWC	<u>NAME</u> DOOR CLOSE (RIGHT OR LEFT) Track (Number)
------------------	---------------------	--

FUNCTION  
Indicates whether applicable (side) train doors are closed.

SIGNAL HIGH  
Same as for 1A and applicable (side) train doors are closed.

SIGNAL LOW  
Same as for 1A and applicable (side) train doors are not closed.

<u>NO.</u> 1I	<u>GROUP</u> TWC	<u>NAME</u> PSS ACTIVE TK (Number)
------------------	---------------------	---------------------------------------

FUNCTION  
Indicates whether Program Station Stop feature is active.

SIGNAL HIGH  
Same as for 1A and PSS feature is active.

SIGNAL LOW  
Same as for 1A and PSS feature is not active.

<u>NO.</u> 1J	<u>GROUP</u> TWC	<u>NAME</u> ATP CUTOUT TK (Number)
------------------	---------------------	---------------------------------------

FUNCTION  
Indicates status of ATP System on Train.

SIGNAL HIGH  
Same as for 1A and ATP System is cut in.

SIGNAL LOW  
Same as for 1A and ATP System is cut out.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

<u>NO.</u> 1K	<u>GROUP</u> TWC	<u>NAME</u> TRAIN IN ATO TK (Number)
------------------	---------------------	--

FUNCTION  
Indicates whether train is in automatic mode.

SIGNAL HIGH  
Same as for 1A and train is in Automatic Operation mode.

SIGNAL LOW  
Same as for 1A and train is not in Automatic Operation mode.

<u>NO.</u> 2A	<u>GROUP</u> Track	<u>NAME</u> BLK OCCP TK (No.) (Block Occupancy)
------------------	-----------------------	---

FUNCTION  
Indicates track block occupied/unoccupied.

SIGNAL HIGH  
When a track block is occupied.

SIGNAL LOW  
When a track block is unoccupied.

<u>NO.</u> 2B	<u>GROUP</u> Track	<u>NAME</u> TEMP SPEED RESTRICTION TK (No. - Direction)
------------------	-----------------------	---

FUNCTION  
Indicates whether restricted speed has been set manually. (Locally)

SIGNAL HIGH  
When no manual/local restriction in speed is in effect.

SIGNAL LOW  
When manual/local restriction in speed is in effect.

<u>NO.</u> 2C	<u>GROUP</u> Track	<u>NAME</u> RIGHT OF WAY HAZARD (No.) TK (Number)
------------------	-----------------------	---

FUNCTION  
Indicates whether METRO system's r/w (adjacent to other r/w) has been violated.

SIGNAL HIGH  
When METRO r/w has been violated.

SIGNAL LOW  
When METRO r/w has not been violated.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

<u>NO.</u> 2D	<u>GROUP</u> Track	<u>NAME</u> DRAGGING EQUIPMENT DETECTED FOR (RR) TK (Number)
------------------	-----------------------	--

FUNCTION

Indicates detection of derailment or equipment dragging from train on adjacent railroad.

SIGNAL HIGH

When derailed/dragging equipment is detected.

SIGNAL LOW

When detector is quiescent.

<u>NO.</u> 3A	<u>GROUP</u> Interlocking	<u>NAME</u> LOCAL IN CONTROL
------------------	------------------------------	---------------------------------

FUNCTION

Indicates whether interlocking is under field control.

SIGNAL HIGH

When interlocking is under field control.

SIGNAL LOW

When interlocking is not under field control.

<u>NO.</u> 3B	<u>GROUP</u> Interlocking	<u>NAME</u> CENTRAL IN CONTROL
------------------	------------------------------	-----------------------------------

FUNCTION

Indicates whether interlocking under OCC control.

SIGNAL HIGH

When interlocking is under OCC control.

SIGNAL LOW

When interlocking is not under OCC control.

<u>NO.</u> 3C	<u>GROUP</u> Interlocking	<u>NAME</u> LOCAL CONTROL REQUEST
------------------	------------------------------	--------------------------------------

FUNCTION

Indicates whether field is requesting OCC to transfer control of the interlocking to the field.

SIGNAL HIGH

When REQUEST push button is pressed at the field location.

SIGNAL LOW

When REQUEST push button is released or OCC-to-field transfer of control is completed.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

<u>NO.</u> 3D	<u>GROUP</u> Interlocking	<u>NAME</u> SWITCH (No.) CALLED NORMAL
------------------	------------------------------	--

FUNCTION  
Indicates whether a specific switch has normal call.

SIGNAL HIGH  
When the specific switch has normal call as a result of routing or call normal control.

SIGNAL LOW  
when the specific switch does not have normal call.

<u>NO.</u> 3E	<u>GROUP</u> Interlocking	<u>NAME</u> SWITCH (No.) CALLED REVERSE
------------------	------------------------------	---

FUNCTION  
Indicates whether a specific switch has reverse call.

SIGNAL HIGH  
Same as for 3D except for reverse call.

SIGNAL LOW  
Same as for 3D except for reverse call.

<u>NO.</u> 3F	<u>GROUP</u> Interlocking	<u>NAME</u> SWITCH (No.) NORMAL
------------------	------------------------------	------------------------------------

FUNCTION  
Indicates normal correspondence of a switch.

SIGNAL HIGH  
When switch is reporting normal correspondence.

SIGNAL LOW  
When switch is not reporting correspondence.

<u>NO.</u> 3G	<u>GROUP</u> Interlocking	<u>NAME</u> SWITCH (No.) REVERSE
------------------	------------------------------	-------------------------------------

FUNCTION  
Same as 3F for except for reverse correspondence.

SIGNAL HIGH  
Same as for 3F except for reverse correspondence.

SIGNAL LOW  
Same as for 3F except for reverse correspondence.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

<u>NO.</u> 3H	<u>GROUP</u> Interlocking	<u>NAME</u> SIG CLEAR TK (No.) SIG (Number) (Signal Clear)
------------------	------------------------------	---

FUNCTION

Indicates whether specific signal is clear with established route.

SIGNAL HIGH

When a specific signal is clear.

SIGNAL LOW

When a specific signal is red.

<u>NO.</u> 3I	<u>GROUP</u> Interlocking	<u>NAME</u> ENT RECV TK (No.) SIG (Number) (Entrance Received)
------------------	------------------------------	---

FUNCTION

Request for a route is acknowledged by specific signal as entrance or exit signal.

SIGNAL HIGH

Signal is ready to accept a route request as entrance or exit or when route is established for a home signal. Signal is not ready to accept a route request for a turnback signal.

SIGNAL LOW

Home signal is not ready to accept a route request as entrance or exit i.e., when a routing is in progress. Turnback signal is ready to accept a route request.

<u>NO.</u> 3J	<u>GROUP</u> Interlocking	<u>NAME</u> FLEETED TK (No.) SIG (No.)
------------------	------------------------------	--

FUNCTION

Indicates whether specific signal is fleeted to an established route.

SIGNAL HIGH

When a specific signal is fleeted.

SIGNAL LOW

When a specific signal is not fleeted.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

NO.GROUPNAME  
3KInterlockingAUTO ROUTE IN EFFECT  
SIG (Number)  
FUNCTION

Indicates whether automatic routing mode is in effect in the field for the specified signal.

SIGNAL HIGHSIGNAL LOW  
When a specific signal is in a When a specific signal is  
condition to establish automaticnot in a condition to  
routing.establish automatic  
routing.

NO.GROUPNAME  
3LInterlockingAPPR LKD TK (No.) SIG  
(No.) (Approach Locked)  
FUNCTION

Approach locking indication for the specified signal.

SIGNAL HIGHSIGNAL LOW  
When approach locking is inWhen approach locking is  
locked state.in released state.

NO.GROUPNAME  
3MInterlockingRTE LKD TK (Number)  
(Route Locked over  
Track No.)  
FUNCTION

Route locked indication for a given track.

SIGNAL HIGHSIGNAL LOW  
When a designated When the designated track  
track is locked due tois not locked, due to  
an established route.the absence of an  
established route over.  
that track.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

NO.GROUPNAME  
3NInterlockingAUTO OPER MODE (No.)  
(Automatic Operation Mode)

FUNCTION

Indicates one of three modes of operation at a terminal interlocking.

SIGNAL HIGHSIGNAL LOW

Individual bit indicates particular (one of three) operation mode in effect. Individual bit indicates not in that particular mode of operation.

NO.GROUPNAME  
3OInterlockingCENTRAL LOCKED OUT  
SIG (No., No., No.)

FUNCTION

Indicates wayside routing is in progress for an automatic signal group.

SIGNAL HIGHSIGNAL LOW

When wayside automatic routing is in progress. Locks out OCC initiated routing involving the signal group. When wayside automatic routing is not in progress. Allows OCC to initiate routes or switch movements.

NO.GROUPNAME  
3PInterlockingDEST SIG (No.)  
(Destination Signal)

FUNCTION

Indicates destination of first upstream train within the advance approach area of a destination controlled automatic signal at a divergent interlocking.

SIGNAL HIGHSIGNAL LOW

When wayside equipment releases the decoded destination readin storage for the from a train and stored on a designated signal first-in/first-out basis for or when train accepts the designated signal. When no destination is in storage for the designated signal and passes the signal.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

NO.GROUPNAME  
3QInterlockingTRAFFIC DIRECTION  
NORMAL (or REVERSE)  
TK (No. & Direction of Traffic Zone)  
FUNCTION  
Indicates specific direction of traffic in specific traffic zone on designated track.

SIGNAL HIGHSIGNAL LOW  
When in a specific traffic zoneWhen in a specific zone and  
in specific direction trafficno traffic is locked in  
is locked due to block occupancythe specific direction.  
or set route.

NO.GROUPNAME  
3RInterlockingSNOWMELTER ON

FUNCTION  
Indicates switch heater status.

SIGNAL HIGHSIGNAL LOW  
When heaters are on.When heaters are off.

NO.GROUPNAME  
3SInterlockingPROCESSOR FOR INTLKG  
FAILURE  
FUNCTION

Indicates processor shutdown.

SIGNAL HIGHSIGNAL LOW  
When processor is not shutdown.When processor is shutdown.

TABLE III - TRAIN OPERATION INDICATIONS (Continued)

<u>NO.</u> 3T	<u>GROUP</u> Interlocking	<u>NAME</u> PROCESSOR FOR INTLK PROBLEM or; PROCESSOR FOR STATION PROBLEM
------------------	------------------------------	---

FUNCTION

Indicates detection of trouble in processor but system is operational.

SIGNAL HIGH

When processor is not in warning state.

SIGNAL LOW

When processor is in warning state.

<u>NO.</u> 4A	<u>GROUP</u> Misc. Train Control Room	<u>NAME</u> CIRCUIT POWER FAILURE
------------------	--	--------------------------------------

FUNCTION

Indicates loss of power in Train Control Room electrical circuit(s).

SIGNAL HIGH

When all Train Control Room power voltages are available and no ground fault is detected.

SIGNAL LOW

When power in Train Control Room fails in one or more electrical circuits, or when ground fault is detected.

<u>NO.</u> 4B	<u>GROUP</u> Misc. Train Control Room	<u>NAME</u> POWER TRANSFER
------------------	--	-------------------------------

FUNCTION

Indicates failure of transfer switch or when the transfer switch is thrown to secondary source of power.

SIGNAL HIGH

When transfer switch is thrown to secondary source of power or failure of transfer switch.

SIGNAL LOW

When transfer switch is in normal position (primary power source).

DTS FUNCTIONS - TABLE IV  
ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS (2 BITS)

<u>NO.</u> 1Ai	<u>GROUP</u> Traction Power (DCPWR)	<u>NAME</u> AC INC LINE BRK (No.) CLOSED (AC Incoming Line Breaker)
-------------------	--	---

FUNCTION  
Indicates whether designated breaker is closed or not.

SIGNAL HIGH  
Indicates breaker in closed status.

SIGNAL LOW  
Indicates breaker not in closed status.

---

<u>NO.</u> 1Aii	<u>GROUP</u> Traction Power (DCPWR)	<u>NAME</u> AC INC LINE BRK (No.) TRIP.
--------------------	--	---

FUNCTION  
Indicates whether designated breaker is tripped or not.

SIGNAL HIGH  
Indicates breaker is in tripped status

SIGNAL LOW  
Indicates breaker not in tripped status.

---

<u>NO.</u> 1Bi	<u>GROUP</u> Traction Power (DCPWR)	<u>NAME</u> AC SEC TIE BRK (No.) CLOSED (AC Section Tie Breaker).
-------------------	--	---

FUNCTION  
Same as for 1Ai.

SIGNAL HIGH  
Same as for 1Ai. Alarm state.

SIGNAL LOW  
Same as for 1Ai. No alarm state.

TABLE IV - ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS  
(2 BITS) (Continued)

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1Ii	Traction Power (DCPWR)	RECT TRANS LOCKOUT (No.) NOR/OFF (Rectifier Transformer Lockout)

FUNCTION

Indicates whether the equipment is in locked out state or not.

SIGNAL HIGH  
Indicates normal status  
and no alarm state.

SIGNAL LOW  
Indicates not normal  
and alarm state

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1Iii	Traction Power (DCPWR)	RECT TRANS LOCKOUT (No.) ABN/ON (Rectifier Transformer Lockout)

FUNCTION

Indicates whether the equipment is in lockout condition or not.

SIGNAL HIGH  
Indicates locked out status  
and alarm state.

SIGNAL LOW  
Indicates not locked out  
and not in alarm state.

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1Ji	Traction Power (DCPWR)	AC INC LINE VOLTS (No.) NOR/OFF (AC Incoming Line Voltage)

FUNCTION

Indicates whether line voltage condition is within limit or not.

SIGNAL HIGH  
Indicates line voltage within  
limits and no alarm condition.

SIGNAL LOW  
Indicates line voltage  
not within limits and  
alarm state.

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1Jii	Traction Power (DCPWR)	AC INC LINE VOLTS (No.) ABN/ON (AC Incoming Line Voltage)

FUNCTION

Indicates whether line voltage condition out of limits or not.

SIGNAL HIGH  
Indicates line voltage out of  
limits and alarm state.

SIGNAL LOW  
Indicates line voltage  
not out of limits and no alarm state.

TABLE IV - ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS  
(2 BITS) (Continued)

<u>NO.</u> 1Ki	<u>GROUP</u> Traction Power (DCPWR)	<u>NAME</u> AC SUPPLY (No.) TO SWGR FAIL NOR/OFF (AC supply to switch gear control circuit failure)
-------------------	--	---

FUNCTION  
Indicates whether the ac voltage is present or not.

SIGNAL HIGH  
Indicates voltage present  
condition and no alarm state.

SIGNAL LOW  
Indicates voltage not  
present and alarm state.

---

<u>NO.</u> 1Kii	<u>GROUP</u> Traction Power (DCPWR)	<u>NAME</u> AC SUPPLY (No.) TO SWGR FAIL ABN/ON (AC supply to switch gear control circuit failure)
--------------------	--	--

FUNCTION  
Indicates whether the ac voltage has failed or not.

SIGNAL HIGH  
Indicates voltage failure and  
alarm state.

SIGNAL LOW  
Indicates not a voltage  
failure and no alarm state.

---

<u>NO.</u> 1Li	<u>GROUP</u> Traction Power (DCPWR)	<u>NAME</u> AUX PWR TRANSFER SW (No.) NOR/OFF (Auxiliary power transfer switch)
-------------------	--	--

FUNCTION  
Indicates whether the switch is in normal position or not.

SIGNAL HIGH  
Indicates the switch is in normal  
(primary source of power)  
position and not in alarm state.

SIGNAL LOW  
Indicates the switch is  
not in normal position  
and in alarm state.

---

<u>NO.</u> 1Lii	<u>GROUP</u> Traction Power (DCPWR)	<u>NAME</u> AUX PWR TRANSFER SW (No.) ABN/ON (Auxiliary power transfer switch)
--------------------	--	---

FUNCTION  
Indicates whether the switch is in abnormal position or not.

SIGNAL HIGH  
Indicates switch is in abnormal  
(secondary source of power)  
position and in alarm state.

SIGNAL LOW  
Indicates the switch is  
not in abnormal position  
and not in alarm state.

---

TABLE IV - ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS  
(2 BITS) (Continued)

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1Mi	Traction Power (DCPWR)	BAT CHARGE RLY (No.) NOR/OFF (Battery Charge Relay)

FUNCTION

Indicates whether the Relay is in charging position or not.

SIGNAL HIGH

Indicates the relay is in charging position and no alarm state.

SIGNAL LOW

Indicates the Relay is not in charging position and in alarm state.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1Mii	Traction Power (DCPWR)	BAT CHARGE RLY (No.) ABN/ON (Battery Charge Relay)

FUNCTION

Indicates whether the relay is in not charging position or not.

SIGNAL HIGH

Indicates the relay is in not charging position and in alarm state.

SIGNAL LOW

Indicates the relay is not in the not charging position and not in alarm state.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1Ni	Traction Power (DCPWR)	AC FDR BRK, AUX PWR TRANS TEMP NOR/OFF (AC Feeder Breaker Auxiliary power transformer temperature)

Same as for 1Lii.

SIGNAL LOW  
Same as for 1Lii.

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
2Gi	AC Service Room (ACPWR)	AC BAT CHARGE RELAY (No.) NOR/OFF (AC Battery Charge Relay).

FUNCTION  
Same as for 1Mi.

SIGNAL HIGH  
Same as for 1Mi.

SIGNAL LOW  
Same as for 1Mi.

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
2Gii	AC Service Room (ACPWR)	AC BAT CHARGE RELAY (No.) ABN/ON (AC Battery Charge Relay).

FUNCTION  
Same as for 1Mii.

SIGNAL HIGH  
Same as for 1Mii.

SIGNAL LOW  
Same as for 1Mii.

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
3Ai	Misc.	INVERTER OUTPUT (No.) NOR/OFF

FUNCTION  
Indicates whether output is normal or not.

SIGNAL HIGH  
Indicates output is normal.  
No alarm state.

SIGNAL LOW  
Indicates output is not  
normal. Alarm state.

---

TABLE IV - ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS  
(2 BITS) (Continued)

<u>NO.</u> 3Aii	<u>GROUP</u> Misc.	<u>NAME</u> INVERTER OUTPUT (No.) ABN/ON
--------------------	-----------------------	--

FUNCTION  
Indicates whether output is abnormal or not.

SIGNAL HIGH  
Indicates output is abnormal.  
Alarm state.

SIGNAL LOW  
Indicates output is not  
abnormal. No alarm state.

---

<u>NO.</u> 3Bi	<u>GROUP</u> Misc.	<u>NAME</u> FANS (No.) EMERGENCY OFF
-------------------	-----------------------	---

FUNCTION  
Indicates whether equipment is in emergency off status or not.

SIGNAL HIGH  
Indicates fan is in emergency  
off status.

SIGNAL LOW  
Indicates fan is not in  
emergency off status.

---

<u>NO.</u> 3Bii	<u>GROUP</u> Misc.	<u>NAME</u> FANS (No.) EMERGENCY ON
--------------------	-----------------------	--

FUNCTION  
Indicates whether equipment is in emergency on status or not.

SIGNAL HIGH  
Indicates fan is in  
emergency on status.

SIGNAL LOW  
Indicates fan is not in  
emergency on status.

---

<u>NO.</u> 3Di	<u>GROUP</u> Misc.	<u>NAME</u> THIRD RAIL HEATER (No.) ON
-------------------	-----------------------	--

FUNCTION  
Indicates heater is on.

SIGNAL HIGH  
Heater is on.

SIGNAL LOW  
Heater is not on.

---

TABLE IV - ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS  
(2 BITS) (Continued)

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
3Dii	Misc.	THIRD RAIL HEATER (No.) OFF

FUNCTION  
Indicates heater is off.

SIGNAL HIGH  
Heater is off.

SIGNAL LOW  
Heater is not off.

- NOTE 1: When alarm states are not mentioned, equipment is controllable from OCC. Commanded state is non-alarm state. All other states are alarmable including two-bit status High-High or Low-Low, except Low-Low status for fan indicates AUTO mode, and Low-Low for pump indicates ON status. When status for these two are received and commanded, it is not an alarm state.
- NOTE 2: When alarm state is indicated, equipment is not controllable from OCC. Two-bit status of High-High and Low-Low are alarm states.
- NOTE 3: "00" state for FANS is considered to be AUTO state, and is not a "PROBLEM 00" state. "00" state for PUMP is ON state and not "PROBLEM 00" state.

DTS FUNCTIONS - TABLE V  
ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS (1 BIT)

<u>NO.</u> 1A	<u>GROUP</u> Tunnel	<u>NAME</u> FANS (No.) SUPPLY
------------------	------------------------	----------------------------------

FUNCTION

Indicates whether the mode of operation is in supply or exhaust.

SIGNAL HIGH  
Indicates supply.

SIGNAL LOW  
Indicates exhaust.

<u>NO.</u> 1B	<u>GROUP</u> Tunnel	<u>NAME</u> FAN SHAFT DAMPER (No.) ABN/ON
------------------	------------------------	---

FUNCTION

Indicates whether damper (open or close) position is matching with fans operational state.

SIGNAL HIGH  
Indicates unmatched position.  
Alarm state.

SIGNAL LOW  
Indicates matching  
position. Non-alarm state.

<u>NO.</u> 1C	<u>GROUP</u> Tunnel	<u>NAME</u> VENT SHAFT DAMPER (No.) ABN/ON
------------------	------------------------	--

FUNCTION

Same as for 1B.

SIGNAL HIGH  
Same as for 1B.

SIGNAL LOW  
Same as for 1B.

<u>NO.</u> 1D	<u>GROUP</u> Tunnel	<u>NAME</u> FANS (No.) OPERATION ABN/ON
------------------	------------------------	---

FUNCTION

Indicates whether the fan is operating as commanded or not.

SIGNAL HIGH  
Indicates Fan is not operating  
as commanded. Alarm state.

SIGNAL LOW  
Indicates Fan is  
operating as commanded.  
Non-alarm state.

TABLE V - ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS  
(1 BIT) (Continued)

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1E	Tunnel	FANS (No.) REMOTE CONTROL ABN/ON

FUNCTION

Indicates whether remote control circuitry is operational or not.

SIGNAL HIGH

Indicates remote control circuitry is not operational. Alarm state.

SIGNAL LOW

Indicates remote control circuitry is operational. Non-alarm state.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1F	Tunnel	TUNNEL TEMP (No.) HIGH ABN/ON

FUNCTION

Indicates whether temperature is above high limit or not.

SIGNAL HIGH

Indicates temperature above high limit. Alarm state.

SIGNAL LOW

Indicates temperature not above high limit. Non-alarm state.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
1G	Tunnel	TUNNEL TEMP (No.) LOW ABN/ON

FUNCTION

Indicates whether temperature is below low limit or not.

SIGNAL HIGH

Indicates temperature below low limit. Alarm state.

SIGNAL LOW

Indicates temperature not below low limit. Non-alarm state.

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
2A	Station	STATION AMBIENT TEMPERATURE ABN/ON

FUNCTION

Indicates whether station temperature is within limits or not.

SIGNAL HIGH

Indicates temperature is above high or below low limit. state.

SIGNAL LOW

Indicates temperature is within limits. Non-alarm Alarm state.

TABLE V - ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS  
(1 BIT) (Continued)

<u>NO.</u> 2B	<u>GROUP</u> Station	<u>NAME</u> ACU FAN (No.) ABN/ON (Air Conditioning Unit Fan)
<u>FUNCTION</u> Indicates whether ACU fan is in proper operation or not.		
<u>SIGNAL HIGH</u> Indicates improper operation. Alarm state.		<u>SIGNAL LOW</u> Indicates proper operation. Non-alarm state.
<u>NO.</u> 2C	<u>GROUP</u> Station	<u>NAME</u> FRESH AIR AHU FAN (No.) ABN/ON. (Fresh Air Air Handling Unit Fan)
<u>FUNCTION</u> Indicates whether AHU Fan is in proper operation or not.		
<u>SIGNAL HIGH</u> Same as for 2B.		<u>SIGNAL LOW</u> Same as for 2B.
<u>NO.</u> 4A	<u>GROUP</u> Misc.	<u>NAME</u> Subway DPS (No.) ABN/ON (Subway Drainage Pumping Station).
<u>FUNCTION</u> Indicates whether water level is above normal or not.		
<u>SIGNAL HIGH</u> Indicates water level is above normal. Alarm state.		<u>SIGNAL LOW</u> Indicates water level is not above normal. Non-alarm state.

TABLE V - ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS  
(1 BIT) (Continued)

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
4B	Misc.	SEWAGE PUMP (No.) AIR ABN/ON

FUNCTION

Indicates whether air pressure is below operational level or not.

SIGNAL HIGH

Indicates pressure below  
operational level.  
Alarm state.

SIGNAL LOW

Indicates pressure not  
below operational level.  
Non-Alarm state.

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
4C	Misc.	FVD WARNING ACTIVE/ON (Flammable Vapor)

FUNCTION

Indicates whether FVD system at warning level or not.

SIGNAL HIGH

Indicates warning level.  
Alarm state.

SIGNAL LOW

Indicates not at warning  
level. Non-Alarm state.

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
4D	Misc.	FVD ALARM ACTIVE/ON

FUNCTION

Indicates whether FVD System at danger level or not.

SIGNAL HIGH

Indicates danger level.  
Alarm state.

SIGNAL LOW

Indicates not danger  
level. Non-Alarm state.

---

<u>NO.</u>	<u>GROUP</u>	<u>NAME</u>
4E	Misc.	FIRE ALARM (No.) ACTIVE/ON

FUNCTION

Indicates whether fire alarm system is active or not.

SIGNAL HIGH

Indicates active state.  
Alarm state.

SIGNAL LOW

Indicates non-active.  
Non-Alarm state.

---

TABLE V - ELECTRICAL & SUPPORT EQUIPMENT INDICATIONS  
(1 BIT) (Continued)

<u>NO.</u> 4F	<u>GROUP</u> Misc.	<u>NAME</u> UNAUTHORIZED ENTRANCE (No.) ACTIVE/ON
------------------	-----------------------	---

FUNCTION  
Indicates whether intrusion detected or not.

SIGNAL HIGH  
Indicates intrusion detected.  
Alarm state.

SIGNAL LOW  
Indicates intrusion not  
detected. Non-Alarm  
state.

<u>NO.</u> 4G	<u>GROUP</u> Misc.	<u>NAME</u> BLDG AMBIENT TEMP ABN/ON
------------------	-----------------------	---

FUNCTION  
Indicates whether building ambient temperature is normal or not.

SIGNAL HIGH  
Indicates abnormal temperature.  
Alarm state.

SIGNAL LOW  
Indicates normal temperature.  
Non-Alarm state.

<u>NO.</u> 4H	<u>GROUP</u> Misc.	<u>NAME</u> SUMP PUMP (No.) ABN/ON
------------------	-----------------------	---------------------------------------

FUNCTION  
Indicates whether sump pump is operating properly or not.

SIGNAL HIGH  
Indicates improper operation.  
Alarm state.

SIGNAL LOW  
Indicates proper operation.  
Non-Alarm state.

<u>NO.</u> 4I	<u>GROUP</u> Misc.	<u>NAME</u> GARAGE EXH FAN (No.) ABN/ON
------------------	-----------------------	---

FUNCTION  
Indicates whether garage exhaust fan is operating properly or not.

SIGNAL HIGH  
Indicates improper operation.  
Alarm state.

SIGNAL LOW  
Indicates proper operation.  
Non-Alarm state.

NOTE: When alarm state is not mentioned, equipment is controllable from OCC. Commanded state is non-alarm state and other state is alarm state.

END OF SECTION

**SECTION 16997**

**ATC APPENDIX "SS"**

**RTU SCAN SHEETS**

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

- A. TABLE OF CONTENTS of wayside TCR locations involved.
- B. Explanation of notations used to define modifications to Scan Sheets at location(s) currently in service.

Example TABLE OF CONTENTS

<u>Location</u>	<u>Type</u>	<u>Code</u>	<u>Frame Type</u>	<u>Sheets</u>
Tie-In Loc.	Rev.	X03	Control Status	X03-C1-C12* X03-S1-S16*
Hooterville	New	X04	Control Status	X04-C1-C10* X04-S1-S16*
End-of-Line Terminal	New	X05	Control Status	X05-C1-C12* X05-S1-S18*

NOTES:

1. Where an equipment function may be added or activated in the future, the notation "(FUTU)" in the Scan Sheet following the function name has the following meaning:
  - a. (FUTU) = Inactive now, but all DTS hardware and wiring shall be provided by the Contractor under this Contract at "New" locations to facilitate possible future use.
2. Revised functions, PC card types, or energy feeds for the existing Tie-In location RTU are indicated by an alphabetical character in the Scan Sheet column preceding the function names. The characters used, and their meanings, are as follows:
  - a. A = ADD
  - b. C = CHANGE
  - c. D = DELETE
  - d. E = ENERGIZE/ACTIVATE (a pre-wired point)
  - e. M = MOVED HERE (point or card) (May include a CHANGE)
  - f. R = RESERVE (for specific future use)  
or  
1) REMOVE (existing wired point to be removed at the appropriate time)
  - g. V = VERIFY (that the indicated change has been made)
3. The old (previously assigned) names for the functions at the point locations revised are shown in brackets following the new names.
4. All deleted DTS function wiring shall be tagged and taped by the Contractor.
5. Control card types (and associated energization) for new Remote Terminal Units are shown for illustrative purposes only. The Contractor may use Relay-Single, Relay-Pair, or Electronic PC Control cards, or any combination thereof, for these

new units, along with appropriate wiring. The energization and card type(s) shall be fully documented in the RTU circuits and Scan Sheets submitted by the Contractor. (See Section 16925, Data Transmission System.)

- C. RTU Control and Status Scan Sheets for new mainline locations.
- D. RTU Control and Status Scan Sheets required to reflect necessary changes at pre-existing mainline Tie-In locations.

**1.02 RTU SCAN SHEETS BY LOCATION**

- E. Location Name (Location Code) Control Frames
- F. Location Name (Location Code) Status Frames
- G. The above to be added by the Authority for the applicable New and/or Tie-In mainline locations. Example Location follows.

## SECTION 16998

### ATC APPENDIX "CD" CORRECTION OF ATC DEFICIENCIES

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. Definitions: As used in this Section
- B. General Conditions
- C. Deficiencies of Tested ATC Materials, Equipment, Systems or Subsystems
- D. Pre-Acceptance Recognition of Deficiencies in ATC Materials, Equipment, Systems or Subsystems
- E. Time for Performance, Contract Price
- F. Transportation Charges
- G. Failure to Correct
- H. Correction of Deficient Replacements and Reperformances
- I. Disassembly/Reassembly Expense
- J. Warranties

##### 1.02 RELATED SECTIONS

- A. All 16900-Series Sections

##### 1.03 DEFINITIONS: AS USED IN THIS SECTION

- A. Deficiency:
  - 1. ATC materials and equipment, will be regarded as having a deficiency if a type of material or equipment, in like service accumulates a failure rate greater than five percent during a period starting with initial Factory Testing of the applicable material and/or, equipment, and ending 24 months following final acceptance by the Authority.
  - 2. ATC systems or subsystems will be regarded as having a deficiency if they exhibit any condition or characteristics which are not in compliance with the requirements and intent of this Contract anytime during a period starting with initial Factory Testing of the applicable system and/or subsystem, and extending for 24 months following final acceptance by the Authority.
- B. Correction
  - 1. Correction of ATC materials or equipment exhibiting a failure rate greater than five percent means taking of any and all actions necessary to correct the deficiencies, including removal and replacement of all pieces of material or equipment in like service in a manner satisfactory to the designated Resident Engineer.
  - 2. Correction of ATC systems or subsystems exhibiting one or more deficiencies means taking any and all actions to eliminate any and all deficiencies in a manner satisfactory to the designated Resident Engineer.

#### **1.04 GENERAL CONDITIONS**

- A. The rights and remedies of the Authority provided in this Section: Shall not be affected in any way by any other provisions under this Contract concerning the conclusiveness of inspections and acceptance, and;
  - 1. Are in addition to and do not limit any rights afforded to the Authority by any other Section of this Contract.
  - 2. This Section shall apply only to those deficiencies discovered by either the Authority or the Contractor within a period commencing with the initial Factory Testing of the applicable material, equipment, system and/or subsystem and extending for 24 months after acceptance by the Authority.
- B. The Contractor shall not be responsible under this Section for the correction of deficiencies in Authority-furnished property, except for deficiencies in installation, unless the Contractor performs or is obligated to perform any modifications or other work on such property. In that event, the Contractor shall be responsible for correction of deficiencies to the extent of such modifications or other work.
- C. The Contractor will not be responsible under this Section for the correction of deficiencies caused by the Authority.

#### **1.05 DEFICIENCIES IN ATC MATERIALS, EQUIPMENT, SYSTEMS AND/OR SUBSYSTEMS**

- A. Notice of Deficiency to Contractor: If the Contracting Officer determines that a deficiency exists in any of the ATC materials, equipment, systems or subsystems provided to the Authority under this Contract, he will promptly (within 30 days) notify the Contractor of the deficiency, in writing,.
- B. Recommendation for Correction: Upon timely notification of the existence of such a deficiency, or if the Contractor independently discovers a deficiency in Factory Tested ATC materials, equipment, systems or subsystems, the Contractor shall promptly submit to the Contracting Officer his recommendation for corrective actions, together with supporting information in sufficient detail for the Contracting Officer to determine what corrective action, if any, shall be taken. The recommendation shall be submitted to the Contracting Officer within 15 working days of notice of the deficiency.
- C. Direction to Contractor Concerning Correction of ATC Deficiencies : Within 30 days after receipt of the Contractor's recommendations for corrective action and adequate supporting information, the Contracting Officer, at his sole discretion, will give the Contractor written notice not to correct the subject deficiency, or to correct or partially correct the subject deficiency within a reasonable time and at a specified location.
- D. Correction of ATC Deficiencies by Contractor: The Contractor shall promptly comply with any timely direction by the Contracting Officer to correct or partially correct an ATC deficiency, at no increase in the Contract price. The Contractor shall also prepare and furnish to the Authority data and reports applicable to any correction required under this Section (including revision and updating of all other affected data called for under this Contract) at no increase in the Contract price.
- E. Schedule of Deficiency Corrections: The Contractor shall prepare a Schedule of Deficiency Corrections and deliver it to the Authority for approval within 15 working days of discovery of an ATC deficiency by the Authority or the Contractor.
- F. Modification of Contract with respect to Uncorrected ATC Deficiencies: In the event of timely notice of a decision not to correct, or only to partially correct an ATC deficiency, the Contractor shall submit within 15 working days, a technical and cost proposal to amend the

Contract to permit acceptance of the affected materials, equipment, systems or subsystems in accordance with the revised requirements, and an equitable reduction in Contract price shall promptly be negotiated by the parties and stated in a modification to this Contract.

**1.06 PRE-ACCEPTANCE RECOGNITION OF DEFICIENCIES IN ATC MATERIALS, EQUIPMENT, SYSTEMS OR SUBSYSTEMS**

- A. The Contractor shall maintain a log of all ATC material, equipment, system and subsystem failures starting at the time of initial Factory Testing of each type of item, and make this log available to the Designated Resident Engineer. If the Contractor becomes aware at any time before acceptance by the Authority (whether before or after tender to the Authority) that a deficiency exists in any ATC materials, equipment, system or subsystems, he shall promptly correct the deficiency, or, if he elects to invoke the procedures specified in Part 1.05, he shall promptly communicate information concerning the deficiency to the Contracting Officer in writing, together with his detailed recommendation for corrective action.

**1.07 TIME FOR PERFORMANCE; CONTRACT PRICE**

- A. In no event will the Authority be responsible for extension or delays in the scheduled deliveries or periods of performance under this Contract as a result of the Contractor's obligations to correct ATC deficiencies, nor shall there be any adjustment of the delivery schedule or period of performance as a result of such correction of deficiencies, except as may be agreed to by the Authority in a supplemental agreement with adequate consideration.
- B. It is hereby specifically recognized and agreed by the parties hereto that this Section shall not be construed as obligating the Authority to increase the Contract price of this Contract.

**1.08 TRANSPORTATION CHARGES**

- A. When the Authority returns supplies to the Contractor for correction or replacement pursuant to this Section, the Contractor shall be liable for transportation charges up to an amount equal to the cost of transportation by the usual commercial method of shipment from the designated destination point under this Contract to the Contractor's plant, in addition to any charges specified in Part 1.08.B. The Contractor shall also bear the responsibility for the supplies while in transit.
- B. When compliance with the terms of this Section by the Contractor involves shipment of corrected or replacement supplies from the Contractor to the Authority, the Contractor shall be liable for transportation charges up to an amount equal to the cost of transportation by the usual commercial method of shipment from the Contractor's plant to the designated destination point under this Contract, in addition to any charges specified in Part 1.08.A. The Contractor shall also bear the responsibility for the supplies while in transit.

**1.09 FAILURE TO CORRECT**

- A. If the Contractor fails or refuses to present a detailed recommendation for corrective action in accordance with Part 1.05, correct deficiencies in accordance with Part 1.05 C. or, prepare and furnish data reports in accordance with Part 1.05 D.,
  - 1. The Contracting Officer will give the Contractor written notice specifying the failure or refusal and setting a period after receipt of the notice within which it must be corrected.
- B. If the failure or refusal is not corrected within the specified period, the Contracting Officer may, by contract or otherwise, as required:
  - 1. Obtain detailed recommendations for corrective action;

2. Correct the materials, equipment, systems or subsystems, or;
3. Replace the materials, equipment, systems or subsystems, and if the Contractor fails to furnish timely disposition instructions, the Contracting Officer may dispose of non-conforming materials, equipment, systems or subsystems for the Contractor's account in a reasonable manner, in which the Authority is entitled to reimbursement from the Contractor or from the proceeds for the reasonable expense of care and disposition, as well as for excess costs incurred or to be incurred, and;
4. Obtain applicable data and reports; and charge to the Contractor the cost occasioned to the Authority thereby.

#### **1.10 CORRECTION OF DEFICIENT REPLACEMENTS AND REPERFORMANCES**

- A. Any ATC materials or equipment corrected or furnished in replacement, and any ATC systems or subsystems revised pursuant to this Section shall also be subject to all the provisions of the Contract to the same extent as ATC materials, equipment, systems or subsystems previously tested, and/or initially accepted, i.e., for a new 24-month period.

#### **1.11 DISASSEMBLY/REASSEMBLY EXPENSE**

- A. The Contractor shall be liable for reasonable cost of disassembly/reassembly of larger items necessary to remove the materials or equipment to be inspected and/or returned for correction or replacement.

#### **1.12 WARRANTIES**

- A. All ATC materials and equipment provided under this Contract shall be warranted for proper operation for a period of 24 months beginning with final acceptance by the Authority.
- B. All subcontractors', manufactures', and suppliers' warranties and guarantees, expressed or implied, respecting any part of the ATC work, and any materials or equipment used therein shall be deemed obtained and shall be enforced by the Contractor as the agent and for the benefit of the Authority without the necessity of separate transfer or assignment thereof. Furthermore, if directed by the Contracting Officer, the Contractor shall require such subcontractors, manufacturers and suppliers to execute such warranties and guarantees in writing to the Authority.
