## SECTION 02205

### REMOVAL AND RESTORATION OF EXISTING FACILITIES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies removing, restoring and reinstalling miscellaneous facilities on public and private property which are removed during construction.
- B. Related Work Specified Elsewhere:
  - 1. Demolition: Section 02220.
  - 2. Grading, excavating and backfilling: Section 02320.
  - 3. Base for pavements: Section 02725.
  - 4. Bituminous pavement: Section 02740.
  - 5. Concrete pavement: Section 02750.
  - 6. Curbs, gutters and walks: Section 02772.
  - 7. Fencing: Section 02820.
  - 8. Topsoil, seeding and sodding: Section 02920.
  - 9. Landscaping: Section 02930.
  - 10. Concrete formwork: Section 03100.
  - 11. Concrete reinforcement: Section 03200.
  - 12. Cast-in-place structural concrete: Section 03300.
- C. Definitions:
  - 1. Miscellaneous facilities include, but are not limited to, the following: Store fronts, alarm and sprinkler systems, bay windows, cornices, signs, fire escapes, canopies, awnings, security grilles, heating, cooling and electrical facilities, vaults, entrance walkways, steps, sidewalks, curbs, walls, railings, fences, planter boxes, shrubs, lawns and trees.
  - 2. Definitions pertaining to trees, shrubs and other plants: ANSI Z60.1.
  - 3. .Salvage: To remove and store material and equipment for reuse in this or other Authority contracts.
- D. Salvage:
  - 1. Clean salvaged items of foreign material and store in accordance with the General Requirements at accessible points within right-of-way unless otherwise shown, approved or directed.
  - 2. Repair or replace salvaged items which are damaged or destroyed.
  - 3. Unless otherwise specified items removed but not to be salvaged will become the property of the Contractor.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Working Drawings:
    - a. Complete details of proposed reconstruction of store fronts and shop windows.
    - b. Complete details of temporary signs including method of reinstalling existing permanent signs. Submit prior to removing signs.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ANSI: Z60.1.
  - 3. ASTM: C4.
  - 4. ICNCP (International Commission for the Nomenclature of Cultivated Plants): International Code of Nomenclature for Cultivated Plants.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Materials for Restoration: New materials, unless otherwise approved, conforming to existing undisturbed materials in quality, color and finish.
- B. Topsoil: Section 02920.
- C. Seeding and Sodding: Section 02920.
- D. Trees, Shrubs and Other Plants: Same species as that removed, unless otherwise specified, and identified in accordance with the International Code of Nomenclature for Cultivated Plants.
- E. Clay Drain Tile: ASTM C4.

## **PART 3 - EXECUTION**

### **3.01 REMOVALS:**

- A. Remove work to extent shown minimizing damage to work which is to remain in place.

### **3.02 STORE FRONTS, BAY WINDOWS AND CORNICES:**

- A. Store Fronts:
  - 1. Rebuild store fronts at or behind building line to match existing fronts insofar as practicable.
  - 2. Complete restoration in accordance with approved working drawings.
- B. Bay Windows:
  - 1. Rebuild bay windows at or behind building line as window walls.
- C. Cornices:
  - 1. Do not replace cornices which have been removed.
  - 2. Parge areas disturbed by removal with cement plaster.

### **3.03 ALARM AND SPRINKLER SYSTEMS AND FIRE ESCAPES:**

- A. Alarm Systems:
  - 1. Maintain existing alarm systems in operating condition. On completion of construction, reinstall components to provide same degree of protection as original system.

- B. Sprinkler Systems:
  - 1. Maintain existing sprinkler systems fully operative in areas temporarily occupied for construction purposes.
  - 2. Protect system from freezing where exposed to open-air conditions.
  - 3. Restore sprinkler system to provide same degree of protection as original system.
- C. Fire Escapes:
  - 1. Relocate fire escapes temporarily and maintain safe egress.
  - 2. Replace fire escapes in original location as soon as practicable.

**3.04 CANOPIES, AWNINGS AND GRILLES:**

- A. Canopies and Awnings:
  - 1. Store canopies and awnings during construction.
  - 2. Reinstall as soon as construction permits.
- B. Grilles:
  - 1. Remove and reinstall security grilles concurrently with building modifications.

**3.05 VAULTS:**

- A. Perform work on vaults as specified in Section 02320.

**3.06 HEATING, COOLING AND ELECTRICAL FACILITIES:**

- A. Heating and Cooling Facilities:
  - 1. Remove and rebuild heating and air-conditioning facilities as necessary to provide service.
- B. Electrical Facilities:
  - 1. Remove and reconstruct electrical facilities to extent necessary to provide electrical service inside building line.

**3.07 SIGNS, FLAGPOLES, RAILINGS AND FENCES:**

- A. Salvage signs, flagpoles, railings and fences where shown.
- B. Provide temporary sign for each permanent sign removed in accordance with approved working drawings. Remove on completion of construction.
- C. Reinstall items in their original locations or in other locations shown. Reinstall or replace chain-link fences in accordance with Section 02820.
- D. Repair existing surfaces, damaged during the work, by cleaning and restoration to match existing.

**3.08 STEPS, WALLS AND COPINGS:**

- A. Salvage steps and copings of wall components where shown and rebuild them to match existing.
- B. Where new reinforcing steel and concrete construction is necessary, provide such items in accordance with Sections 03100, 03200 and 03300 so as to maintain continuity of quality and appearance between existing and new construction.

### **3.09 SIDEWALKS AND CURBS:**

- A. Salvage components of sidewalks and curbs where shown. Dispose of six-inch granite curb. It will not be reused.
- B. Restore sidewalks and curbs to line and grades which existed originally or new lines and grades shown.
- C. Restore asphalt and concrete sidewalks and curbs using new asphalt and concrete of equal quality to existing and to match lines, grades, thickness and construction existing prior to removal. Perform work in accordance with Sections 02725, 02740, 02750 and 02772.

### **3.10 PARKING AREAS AND DRIVEWAY PAVEMENTS:**

- A. Restore parking area and driveway pavements to lines, grades, thickness and construction existing prior to removal. Perform work in accordance with Section 02725, 02740 and 02750.

### **3.11 LANDSCAPING:**

- A. Tree Preservation:
  - 1. Repair injuries, abrasions or other damage to planting by cleanly removing broken members, loose or torn bark and shape edges in order to permit drainage of rain water from wounds. Perform pruning in accordance with Section 02930.
    - a. Where depth of soil over root system of existing plantings is to be modified by final grading, provide the following:
      - 1) Where increase of one foot or more in elevation is shown, spread continuous layer of rock aggregate, graded 1/4 inch to two inches, six inches deep from trunk to drip line of branches prior to installation of fill.
      - 2) Provide proper aeration by installing, within perimeter of spread, system of four-inch clay drain tile, vertically from soil surface into aggregate fill.
      - 3) Construct stone wells around trunks as shown, detailed or as approved. Extend stone work from rock fill layer to final grade, allowing sufficient space for trunk growth.
      - 4) Protect trees, shrubs, groundcovers and features such as landforms, walls, wells, coping and similar items that are to remain. Exercise special precautions and provide treatment for retention and protection of such landscape items in preference to removal.
- B. Tree Removal and Replacement:
  - 1. Where existing trees are to be removed and replaced by others at present locations, use replacement trees of comparable species and size up to four inches maximum caliper, except that the jurisdictional authorities have the right to specify alternate tree species or varieties of comparable size and cost, if such are readily available. Do not replant or relocate trees over 12 inches in caliper, except in cases of historical significance, rarity of type, excellence of form or other special considerations.
  - 2. Replace trees of minimum three-inch caliper, removed by construction, on the basis of diameter inch for diameter inch, up to four-inch maximum caliper, and on total diameter inches removed, so that planting can be complete and uniform throughout.
  - 3. Use replacement trees of prime specimen quality, field selected and seal-tagged. Measure, grade, install and maintain plants in accordance with ANSI Z60.1, except for National Park Service lands where trees are to be measured for diameter by taking the average of two trunk caliper measurements at right angles, six inches

- above the root crown.
4. Replace shrubs removed with same species and varieties and of same size in height or width or substitute at locations designated by the Engineer a number of plants of same species and variety whose total measurements equal measurement of plant or plants to be replaced
- C. Plant maintenance and replacements:
1. For 18 months after completion of plant installation, maintain planting and incidental work by replacing plants, watering, weeding, cultivating, fertilizing, remulching, pruning, controlling insects and diseases, reguying, rewrapping and by performing other maintenance operations for promotion of root growth and plant life so that work is in satisfactory condition at completion of Contract and throughout maintenance period.
  2. Water and weed root system of plants at regular intervals and keep surrounding soil in condition for promotion of root growth and plant life.
  3. Provide planting and planting materials that will be in a condition acceptable to the Engineer at end of maintenance period.
  4. During next planting season, replace trees, ground cover, vines and shrubs which are discovered during and at end of maintenance period to be dead or in unhealthy, unsightly or badly impaired condition. Replace with healthy plants of same kinds and sizes as originally specified.
  5. The Contractor will not be held responsible or liable for damages to plants and planting materials by animals, malicious or careless damage by human agencies over which he has no control, or by fire and storm damage following completion and acceptance of original planting.
- D. Topsoil:
1. Provide and place topsoil in tree spaces and areas to be seeded in accordance with Section 02920.
- E. Grassed Areas:
1. Unless otherwise shown, provide seed in accordance with Section 02920. If sodding is required, provide in accordance with Section 02920.
- F. Replace landscaping, trees and grassed areas, inside and outside limits of work, if removed or damaged.

### **3.12 JOINTS BETWEEN EXISTING AND RESTORED WORK:**

- A. Make joints between existing and restored work as inconspicuous as practicable.
- B. Use saw to cut straight line at joint between existing and new concrete surfaces.
- C. Make joints between existing and restored work at least equal structurally to original undisturbed items.

**END OF SECTION**

## SECTION 02220

### DEMOLITION

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies demolition work.
  - 1. Related Work Specified Elsewhere:
  - 2. Clearing, grubbing, removal and protection of trees and shrubs: Section 02230.
  - 3. Removal of concrete and masonry walls and foundations 12 inches below existing grade: Section 02320.
  - 4. Removal and restoration of miscellaneous facilities: Section 02205.
- B. Definitions:
  - 1. Demolition: Complete removal and disposal of existing facilities from areas to be cleared and grubbed and from other areas shown.
  - 2. Existing facilities include, but are not restricted to, buildings, sheds, streetcar tracks, pavements, sidewalks, curbs and gutters, signs, posts, fences, drainage, sewage and other utility facilities located in the area to be cleared and grubbed.
  - 3. Salvage: Section 02205.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Certification:
    - a. Submit copy of request to utility companies owning or agency controlling services and appurtenances affected by demolition work for discontinuance of services along with certificates of severance.
  - 2. Documentation:
    - a. Demolition permit from the jurisdictional agency or owner.
    - b. Permits and releases from each owner of property where demolition debris will be deposited absolving the Authority of responsibility in connection with such disposal.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.

##### 1.04 JOB CONDITIONS:

- A. Buildings:
  - 1. Demolish buildings in place.
- B. Street and Road Closures:
  - 1. Make arrangements with appropriate jurisdictional agency for temporary closing of public streets or highways to traffic as necessary.
  - 2. Arrange with the appropriate agency for the rerouting of traffic and comply with its regulations.
  - 3. Furnish and maintain temporary signs, barricades, flashing lights and flag persons necessitated by the work and remove same upon completion of work.

- C. Maintenance of Traffic:
  - 1. Construct, maintain and remove on completion of work, temporary canopies and other structures for protection of the public in accordance with applicable codes to ensure continuous safety of traffic.
  - 2. Bridge cuts in traffic areas with steel plates or by other approved means.
  - 3. Keep traffic areas free from debris and spillage of materials.
  - 4. When demolition work interferes with bus loading facilities, provide and maintain surfaced areas at alternative locations or arrange rerouting with appropriate authorities for duration of work.
  
- D. Protection and Restoration:
  - 1. Prevent damage to pipes, conduits, wires, cables and structures above and below ground which are not designated for removal. Repair or replace damaged items.

## **PART 2 - PRODUCTS**

Not Used.

## **PART 3 - EXECUTION**

### **3.01 PRESERVATION OF REFERENCES:**

- A. Prior to removal, record location and designation of survey markers and monuments located within demolition area. Store markers and monuments during period of work. Restore survey markers and monuments upon completion of work.

### **3.02 BUILDING DEMOLITION:**

- A. Undertake rodent control and extermination program in demolition areas.
- B. Take possession of building materials, fixtures and equipment in, attached to or belonging to, buildings and structures.
- C. Proceed with demolition of building or structure and appurtenances.
- D. Party Walls:
  - 1. Where building wall being demolished is a party wall with another building not to be demolished, prevent damage to other building and avoid interference with its occupants.
  - 2. Restore and waterproof exposed party walls in accordance with applicable building code for exterior walls of particular type of construction involved.
  - 3. Should party wall become unsafe or dangerous because of demolition, effect remedial measures for anchoring, bracing or buttressing. If such work does not correct unsafe or dangerous conditions, remove and replace wall and perform necessary work to properly enclose structure that is to remain standing, at no cost to the owner of such property.
- E. Cellars and Foundation Walls:
  - 1. Break concrete and masonry cellar floors into pieces not exceeding four cubic feet in volume or, where approved, punch holes of not less than one-square-foot area through full thickness of floor approximately at 10-foot centers.
  - 2. Remove wooden cellar floors.
  - 3. Remove foundation and cellar walls 12 inches minimum below final grade.

4. After breaking or removing cellar floors, fill cellar spaces with durable free-draining fill material, consisting of particles no one of which exceeds eight inches in its greatest dimension. Use masonry rubble obtained from demolition work if it meets this requirement. Place fill material in layers each of 12-inch maximum thickness, compact each layer and fill voids in each lift with approved coarse sand.
5. Correct subsidence in filled areas by placing and compacting additional fill.
6. The Engineer may waive the requirement to fill cellar voids where cellar structures will be subsequently excavated for construction.

### **3.03 REMOVAL OF STREETCAR TRACKS, PAVEMENTS, SIDEWALK, CURBS AND GUTTERS:**

- A. Removal of Streetcar Tracks:
  1. Regardless of depth, totally remove and dispose of rails, slot rails, yokes, switches, turnouts, ties, manholes, concrete and masonry encasements, cables, insulators and other related parts and accessories of track installation located within boundaries drawn two feet outside outer rails. Remove materials within such boundaries horizontally and from existing street grade to yoke encasement subgrade, vertically. In double track installations, remove materials in intervening space between inner rails of each track.
  2. Known locations of streetcar tracks are shown.
  3. Remove streetcar tracks as necessitated by the work and as directed, whether tracks are shown or encountered during excavation.
  4. Transport from the site removed or excavated track accessories or parts thereof which will become the property of the Contractor.
  5. Methods of removal and disposal will be at the Contractor's option, subject to approval and meeting the requirements of the Construction Sequence and Maintenance of Traffic Schedule.
- B. Demolish pavement, sidewalks, curbs and gutters within demolition area shown to underside of pavement and dispose of resulting debris. Remove and salvage stone curbing where shown. Dispose of six-inch granite curb.
- C. Fill resulting excavations, holes and depressions to existing grade or alternative grade as shown, using fill material conforming to requirements of Section 02320.
- D. Adequately drain resulting surfaces.

### **3.04 DISPOSAL:**

- A. Remove debris resulting from demolition work to locations outside Authority's right-of-way.
- B. Dispose of debris off site only with permission of property owner where such debris is to be deposited and in accordance with codes and regulations of the jurisdictional authorities.
- C. Do not burn debris at demolition site.

**END OF SECTION**

## SECTION 02230

### SITE CLEARING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This Section includes the following:
  - 1. Protecting existing trees and vegetation to remain.
  - 2. Removing trees and other vegetation.
  - 3. Clearing and grubbing.
  - 4. Topsoil stripping.
  - 5. Removing above-grade site improvements.
  - 6. Disconnecting, capping or sealing, and abandoning site facilities in place.
  - 7. Disconnecting, capping or sealing, and removing site facilities.
  
- B. Related Sections include the following:
  - 1. Demolition: Section 02220.
  - 2. Topsoil, seeding and sodding: Section 02920.
  - 3. Landscaping: Section 02930.
  - 4. Construction Facilities and Temporary Controls- Div 1
  
- C. Definitions
  - 1. Topsoil: Natural or cultivated surface-soil layer containing organic matter and sand, silt, and clay particles; friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects more than 2 *inches* in diameter; and free of weeds, roots, and other deleterious materials.
  - 2. Facility: Utility structures and system components belonging to utility company including service lines which are used to provide service to utility's customers and product which these facilities convey.
  - 3. Utility: Company, agency, owner or operator of facility concerned.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Documentation:
    - a. Permits and releases from each owner of property where debris will be deposited absolving the Authority of responsibility in connection with such disposal.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.

#### PART 2 - PRODUCTS

##### 2.01 MATERIALS:

- A. Requirements for satisfactory soil materials are specified in Division 2 Section "Earthwork."

1. Obtain approved borrow soil materials off-site when satisfactory soil materials are not available on-site.
- B. Standard Wood Tree Guards: As shown on W.M.A.T.A. Standard Drawing ST-C-16, consisting of the following:
  1. Wood posts: Two inches square.
  2. Wood stringers: Two inches by four inches.
- C. Standard Chain-Link Tree Guards: As shown on W.M.A.T.A. Standard Drawing ST-C-16, consisting of the following:
  1. Chain-link fencing: Nine gauge, two-inch mesh.
  2. Posts: 2.7 lbs. per foot "H" or 1-1/2 inches inside diameter.
  3. Brace rails: 1-5/8 inches outside diameter.
  4. Stretcher bars: 1/4-inch by 3/4-inch.
- D. Temporary Enclosures and Wrapping: Contractor's option.
- E. Tree Wound Paint: Standard bituminous product.

### **PART 3 - EXECUTION**

#### **3.01 PREPARATION**

- A. Protect and maintain benchmarks and survey control points from disturbance during construction.
- B. Provide erosion-control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways
- C. Locate and clearly flag trees and vegetation to remain or to be relocated.
- D. Protect existing site improvements to remain from damage during construction.
  1. Restore damaged improvements to their original condition, as acceptable to Owner.

#### **3.02 TREE PROTECTION**

- A. Erect and maintain temporary enclosures or wrappings around drip line of individual trees or around perimeter drip line of groups of trees to remain. Remove enclosures or wrapping when construction is complete.
  1. Do not store construction materials, debris, or excavated material within drip line of remaining trees.
  2. Do not permit vehicles, equipment, or foot traffic within drip line of remaining trees.
- B. Protect trees shown on the drawing with standard wood or chain link tree guards.
- C. Nurture protected and replaced trees, shrubs and plants during the period of this Contract.
- D. Do not excavate within drip line of trees, unless otherwise indicated.

- E. Where excavation for new construction is required within drip line of trees, hand clear and excavate to minimize damage to root systems. Use narrow-tine spading forks, comb soil to expose roots, and cleanly cut roots as close to excavation as possible.
  - 1. Cover exposed roots with burlap and water regularly.
  - 2. Temporarily support and protect roots from damage until they are permanently relocated and covered with soil.
  - 3. Coat cut faces of roots more than 1-1/2 inches in diameter with an emulsified asphalt or other approved coating formulated for use on damaged plant tissues.
  - 4. Cover exposed roots with wet burlap to prevent roots from drying out. Backfill with soil as soon as possible.
- F. Repair or replace trees and vegetation indicated to remain that are damaged by construction operations, in a manner approved by Architect.
  - 1. Employ a qualified arborist, licensed in jurisdiction where Project is located, to submit details of proposed repairs and to repair damage to trees and shrubs.
  - 2. Replace trees that cannot be repaired and restored to full-growth status, as determined by the qualified arborist.

### **3.03 UTILITY FACILITIES**

- A. Locate, identify, disconnect, and seal or cap off facilities indicated to be removed.
  - 1. Owner will arrange to shut off indicated facilities when requested by Contractor.
- B. Existing Facilities: Do not interrupt facility service to building connections occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:
  - 1. Notify Engineer not less than two days in advance of proposed facility interruptions.
  - 2. Do not proceed with facilities interruptions without Engineer's written permission.
- C. Excavate for and remove underground facilities indicated to be removed.

### **3.04 CLEARING AND GRUBBING**

- A. Remove obstructions, trees, shrubs, grass, and other vegetation to permit installation of new construction. Removal includes digging out stumps and obstructions and grubbing roots.
  - 1. Do not remove trees, shrubs, and other vegetation indicated to remain or to be relocated.
  - 2. Cut minor roots and branches of trees indicated to remain in a clean and careful manner where such roots and branches obstruct installation of new construction.
  - 3. Completely remove stumps, roots, obstructions, and debris extending to a depth of 18 inches below exposed subgrade.
  - 4. Use only hand methods for grubbing within drip line of remaining trees.
- B. Fill depressions caused by clearing and grubbing operations with satisfactory soil material, unless further excavation or earthwork is indicated
  - 1. Place fill material in horizontal layers not exceeding 8-inch loose depth, and compact each layer to a density equal to adjacent original ground.

### **3.05 TOPSOIL STRIPPING**

- A. Remove sod and grass before stripping topsoil.

- B. Strip topsoil to whatever depths are encountered in a manner to prevent intermingling with underlying subsoil or other waste materials.
  - 1. Strip surface soil of unsuitable topsoil, including trash, debris, weeds, roots, and other waste materials.
- C. Stockpile topsoil materials away from edge of excavations without intermixing with subsoil. Grade and shape stockpiles to drain surface water. Cover to prevent windblown dust.
  - 1. Limit height of topsoil stockpiles to 72 inches.
  - 2. Do not stockpile topsoil within drip line of remaining trees.
  - 3. Stockpile surplus topsoil and allow for respreading deeper topsoil.

**3.06 REMOVAL OF TREE BRANCHES:**

- A. Remove tree branches which extend over structure neat lines and are less than 20 feet above top of rail or existing surface whichever is higher.
- B. Remove tree branches which create a hazardous condition.
- C. Remove branches so as to present balanced appearance of tree.
- D. Treat scars resulting from removal of tree branches with heavy coat of tree wound paint

**3.07 SITE IMPROVEMENTS**

- A. Remove existing above- and below-grade improvements as indicated and as necessary to facilitate new construction.
- B. Remove slabs, paving, curbs, gutters, and aggregate base as indicated.
  - 1. Unless existing full-depth joints coincide with line of demolition, neatly saw-cut length of existing pavement to remain before removing existing pavement. Saw-cut faces vertically.

**3.08 DISPOSAL**

- A. Disposal: Remove surplus soil material, unsuitable topsoil, obstructions, demolished materials, and waste materials, including trash and debris, and legally dispose of them off Owner's property.
- B. Dispose of debris off site only with permission of property owner where such debris is to be deposited and in accordance with codes and regulations of the jurisdictional authorities.
- C. Burning and burying debris on site is prohibited.

**END OF SECTION**

## SECTION 02240

### DEWATERING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies general dewatering systems for control of groundwater and removal of surface water during construction.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM:
    - a. D2466 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40
    - b. D1785 - Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120
    - c. D2564 - Standard Specification for Solvent Cements for Poly(Vinyl Chloride) (PVC) Plastic Piping Systems
    - d.
- B. Qualifications:
  - 1. For mined earth tunnels, have the design, implementation, evaluation, and maintenance of the dewatering system under the supervision of a specialist with a minimum of five years experience in responsible control of work similar to that proposed.
- C. Design Criteria:
  - 1. Provide dewatering system which will reduce hydrostatic pressure and lower groundwater levels below excavation levels excluding mined tunnels, as necessary for safe and proper prosecution of the work and which will result in obtaining stable, substantially dry subgrade for prosecution of subsequent operations.
  - 2. For mined earth tunnels, provide dewatering system which will reduce hydrostatic pressure and control groundwater in soil surrounding each tunnel to prevent the following:
    - a. Heaving of the invert, hazardous seepage, and flow of soil in tunnel face.
    - b. Loss of ground and surface subsidence.
  - 3. For mined earth tunnels in pervious soils, lower groundwater to two feet below invert or reduce hydrostatic pressure to a point where tunneling proceeds without groundwater related delay and loss of ground.
  - 4. For mined earth tunnels where impervious soils extend above invert, lower groundwater level to two feet above top of lowest impervious soil layer or reduce hydrostatic pressure to a point where tunneling proceeds without groundwater related delay and loss of ground.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Working Drawings:
    - a. Type of dewatering system proposed, showing arrangement, location and depths of proposed system, complete description of equipment and materials to be used, installation procedure, well and piezometer

development procedures, maintenance plan for dewatering system and piezometers, standby equipment and standby power supply (if required), and proposed location of points of discharge of water and settlement measuring procedure.

- b. Obtain approval of jurisdictional agencies prior to installation of system.
2. Documentation:
- a. Observe and record average flow rate and time of operation of each pump used in dewatering system. Provide appropriate devices, such as totalizing flow meters for observing flow rates. Provide interior dewatering well drop tube and exterior filter piezometer to observe and record operating levels and filter levels. Submit data on approved form and in approved format during period dewatering system is in operation.
  - b. Observe and record elevation of groundwater in the piezometers, including those previously installed, on approved form and in approved format, during the period that dewatering system is in operation. Sound depth to bottom of each piezometer monthly to ensure that soil particles are not building up in standpipe. Submit observation records promptly, regularly and as directed.
  - c. During dewatering, make observations daily. After dewatering levels have stabilized, observations frequency may be reduced as approved.
  - d. Submit maintenance schedule for piezometers and dewatering system. Record and submit maintenance records for each piezometer and dewatering well or dewatering system component weekly or as approved
  - e. Provide drill logs and installation details of all dewatering system components, and piezometers, 24-hours after installation.

### **1.03 JOB CONDITIONS:**

- A. Subsurface Conditions:
  1. Reports of subsurface investigations are available as listed in the General Requirements.
- B. Permits:
  1. Prior to discharging water, obtain permit from jurisdictional agency.
  2. Control discharge of water in accordance with the General Requirements, if specified.
- C. Responsibilities:
  1. Design and install dewatering system to accomplish groundwater control as specified.
  2. Monitor, and report as required, discharge from dewatering system to determine if water quality meets the requirements of jurisdictional agency. Modify dewatering system as necessary to meet the requirements of jurisdictional agency.
  3. Measure to determine if movement occurs in adjacent areas by dewatering operations; take approved measures to minimize movement and prevent damage to affected properties, buildings, structures, utilities or facilities. Establish criteria for acceptable tolerances.
  4. Take measures to prevent damage to properties, buildings, structures, utilities and facilities resulting from groundwater pumping.
  5. Modify system if it causes, or threatens to cause, damage to properties, buildings, structures, utilities or facilities.
  6. Repair as approved, damage, disruption or interference to properties, buildings, structures, utilities or facilities resulting from dewatering operations.
  7. Contract Drawings may designate locations where lowering of groundwater will not be permitted.

8. Locations of dewatering system elements and piezometers may be adjusted in field to suit job conditions, as approved.
  9. Operate dewatering system without interruption until directed otherwise.
- D. Coordination with Other Contractors:
1. The Contract Specifications govern requirements for access to areas outside Contract limits.
  2. Coordinate installation and operation of dewatering system and piezometers with others concerned and with other Authority contractors if applicable.
  3. If an adjoining Authority contract requires installation of portions of the adjoining contract dewatering system or piezometers within Contract limits, allow access for installation.

## **PART 2- PRODUCTS**

### **2.01 PIEZOMETERS:**

- A. See Soil & Geological Standard Drawing Piezometer Details as shown.
- B. Piezometer construction shall use ASTM-specified materials and procedures (D2466, D1785, and D2564) .

## **PART 3 - EXECUTION**

### **3.01 SURFACE DRAINAGE:**

- A. Intercept and divert surface drainage away from excavations, piezometers and dewatering wells by use of dikes, curb walls, ditches, pipes, sumps or other means.
- B. Design surface drainage systems to prevent erosion.
- C. Remove surface drainage system when no longer required.
- D. Remove debris and restore site to original conditions.

### **3.02 DRAINAGE OF EXCAVATED AREAS:**

- A. Provide and maintain ditches of adequate size to collect surface and subsurface water and divert it into sump for draining or pumping into channels or storm sewers, as approved.
- B. Install settling basins, tanks or other approved apparatus as necessary to bring the discharge into compliance with permit requirements.
- C. When no longer necessary, backfill and seal drainage ditches, sumps and settling basins with approved material.

### **3.03 DEWATERING:**

- A. Coordinate dewatering installation to prevent conflict with other construction activities.
- B. Install dewatering system in accordance with approved drawings and procedures. If site conditions require modification of the dewatering system, implement modifications to achieve specified design criteria prior to excavation.

- C. Demonstrate by approved methods that discharged sand content from each well meets the design criteria specified above under Quality Assurance.
- D. Discharge subsurface water clear of the work area.
- E. Maintain continuous and complete effectiveness of the installation through regularly scheduled maintenance of well screens, pumps, piezometers, electrical and piping systems.
- F. Maintain water level so that no damage to structure can occur.
- G. During backfill operations, the extent of dewatering may be reduced when approved, provided water level does not result in uplift pressure in excess of 80 percent of downward pressure produced by weight of structure and backfill in place.
- H. At locations of piezometers in mined earth tunnel sections, reduce water level to specified criteria at least 48 hours in advance of tunnel excavation.
- I. Maintain dewatering operations until permanent tunnel lining has been installed.

**3.04 PIEZOMETERS:**

- A. Prior to dewatering operations, install piezometers at locations shown or as approved and to the depths shown or approved.
- B. Verify installed piezometer tip elevation. Reinstall piezometers which do not comply with requirements at no additional cost to the Authority.
- C. 48 hours after completion of each piezometer installation, prove proper functioning of piezometer by performing Falling Head Tests. Submit test records within 24 hours of test completion.
- D. While dewatering system is in operation, prove continued proper functioning of each piezometer by performing rising head tests. Submit test records within 24 hours of test completion.
- E. Take static water level readings prior to energizing dewatering system. Submit water level readings within 24 hours of observation.
- F. Operate dewatering system so that groundwater level in piezometers is maintained continuously within prescribed limits.
- G. Protect and maintain piezometers in good operating condition until completion of Contract.
- H. Replace promptly any piezometer or dewatering well that is damaged or destroyed.
- I. Terminate piezometer readings when approved.

**3.05 PORTIONS OF SYSTEM TO BE LEFT IN PLACE:**

- A. When specified, leave portions of dewatering system in place.

**3.06 PORTIONS OF SYSTEM TO BE REMOVED:**

- A. Upon completion of Contract, remove piezometers and well casings, unless otherwise specified, to a depth of two feet minimum below ground surface.

- B. Backfill voids, well and piezometer casings with bentonite-cement grout.
- C. Backfill remaining space with compacted earth and restore ground surface to its original condition.

**END OF SECTION**

## SECTION 02255

### UNDERPINNING, SUPPORT AND RESTORATION OF STRUCTURES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies underpinning, supporting and restoring of structures.
- B. Definitions:
  - 1. Underpinning: Permanent supporting structure designed to transmit foundation loads to lower bearing levels necessary to securely maintain structure being underpinned. Also includes temporary support necessary to safely perform underpinning work and restoration of structure upon completion of work.
    - a. Temporary support: Construction required and designed to support structures during underpinning or other construction work.
    - b. Restoration: Correction by repair or replacement of structure which is damaged, removed or altered by the Contractor in furtherance of his operation equivalent to condition existing prior to start of Contract work unless otherwise shown or specified.
  - 2. Structure categories:
    - a. Category 1 structures: Structures for which underpinning is necessary and has been designed.
    - b. Category 2 structures: Structures which, because they are likely to be affected by construction operations, the Contractor has the option of supporting temporarily, underpinning or both. The decision rests solely with the Contractor who is entirely responsible for results.
- C. Related Work Specified Elsewhere:
  - 1. Grading, excavation and backfilling: Section 02320.
  - 2. Dewatering: Section 02240.
  - 3. Support of excavation: Section 02260.
  - 4. Decking: Section 01530.
  - 5. Piles: Section 02460.
  - 6. Concrete work: Sections 03100, 03200 and 03300.
  - 7. Structural steel: Section 05120.
  - 8. Geotechnical instrumentation: Section 02291.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: D1056, D1149, D1692.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Working Drawings:
    - a. Verify by field investigation foundation loads, locations, sizes and conditions of existing structures and footings requiring underpinning and temporary protection.

- b. Prepare working drawings showing method, staging and necessary details, including computations for construction of underpinning and temporary support of each structure on which work is to be accomplished as well as method of transferring structural load to piles.
  - c. Have drawings and computations certified by a registered professional engineer who is licensed to practice in the jurisdiction where the work is to be performed and who is qualified to substantiate extent and design of underpinning work.
2. Documentation:
    - a. Submit written understandings with each structure owner with owner's signature signifying his agreement.

#### **1.04 JOB CONDITIONS:**

- A. Consents, Permits and Approvals:
  1. The Authority will obtain necessary rights from owner for Contractor to occupy construction areas for Category 1 Structures as shown.
  2. The Contractor is responsible for obtaining in his own name, other agreements, rights, permits and consents necessary to effect underpinning work, which are to provide for and constitute agreement as to interdependent unitized system of underpinning support, when such system is feasible in the Contractors' opinion. Obtain permits required by jurisdictional agencies. Permits to name property owner and the Authority as co-applicants, when applicable, and the Contractor as their agent. Transmit copies of these instruments to the Engineer before starting work on each affected structure.
  3. Additional requirements for permits, consents and approvals are contained in the General Provisions. Where plans for existing structures are available, they may be reviewed as specified in the General Requirements.
- B. Responsibilities:
  1. Maintain safety, stability and integrity of structures of whatever nature regardless of location which may be affected by the work.
  2. Repair damage to structures caused by work necessary to restore structures to condition existing prior to start of work.
  3. Perform underpinning operations in accordance with applicable codes and regulations of the jurisdictional agencies.
  4. Perform underpinning operations with qualified personnel under continuous supervision of a registered professional engineer experienced in such work.
- C. Coordination with Structure Owners:
  1. Prior to starting work on structure, confer with owner or his authorized representative and obtain concurrence with underpinning procedures and sequence of operations including:
    - a. Means of access to the construction area.
    - b. Permitted areas of operations.
    - c. Time restrictions for performance of work which may disturb occupants.
    - d. Scheduling of time and durations of outages of utilities and other services to premises as well as of operation of systems within premises.
  2. Notify the Engineer three days prior to intended conferences with owner.

## **PART 2 - PRODUCTS**

### **2.01 PRODUCTS AND MATERIALS:**

- A. Piling: Section 02460.
- B. Concrete: Section 03300, Class 3500 or better.
- C. Reinforcement: Section 03200.
- D. Structural Steel: Section 05120.
- E. Vibration-Isolation Materials:
  - 1. Closed-cell neoprene isolation board conforming to ASTM D1056, Grade 2C5.
  - 2. Self-extinguishing when tested in accordance with ASTM D1692.
  - 3. No cracks after exposure to air containing 100 ppm of ozone for 100 hours at 104F with samples under 20 percent strain tested in accordance with ASTM D1149.
  - 4. Water absorption: Not exceeding one percent by weight.
- F. Bonding Adhesive: As recommended by the vibration-isolation material manufacturer.

## **PART 3 - EXECUTION**

### **3.01 DETECTION OF MOVEMENT:**

- A. In accordance with the General Requirements, provide, install and maintain monitoring equipment to detect horizontal or vertical movement of structures as specified in Section 02291.
- B. Inscribe or firmly affix on each column, pile cap, or wall to be underpinned or supported and at additional locations directed by the Engineer, visual methods of determining movements. Method used is optional but to be capable of being read to within 0.005 foot.
- C. Take readings daily or more often if necessary during progress of underpinning or support operations and for a period of four weeks after completion of such operations. Frequency of readings may be reduced at specific location(s) with prior approval.

### **3.02 TEMPORARY PARTITIONS AND CLOSURES:**

- A. Build where shown and as required by property owner, closed, dustproof, weatherproof and burglarproof temporary partitions and closures of suitable materials to isolate work site from remainder of the structure. Comply with local building code requirements.
- B. Provide emergency exits, with appropriate hardware.
- C. Provide temporary protection against dust and damage from underpinning operations.
- D. Remove temporary protective installations upon completion of work and restore area to original condition.

### **3.03 INSTALLATION:**

- A. Excavation:
  - 1. Excavate underpinning pits in accordance with Section 02320.
  - 2. Support excavated surfaces in accordance with Section 02260.
  - 3. Provide and maintain protective fencing and decking in accordance with Section 01530.
  - 4. Dewatering: In accordance with Section 02240.
- B. Underpinning:

1. Perform needling, shoring, cribbing and posting as necessary to ensure that movements damaging to the structure do not occur prior to and during underpinning operations.
  2. Place dry pack mortar, concrete and reinforcing steel in accordance with Sections 03100, 03200 and 03300.
  3. Install structural steel shapes in accordance with Section 05120.
  4. Install piling where shown in accordance with Section 02460.
  5. When jacking piles, establish adequate controls to detect movement of structure being underpinned. Maintain suitable equipment and methods continuously available to contain movement should it occur.
  6. Remove obstructions encountered when installing steel shell piling by drilling or spudding. Blasting is prohibited.
  7. Test installed piling where shown and take remedial action necessary to obtain loading.
  8. Use underpinning piles for underpinning purposes only, unless approved.
  9. Transfer structural load to piles in accordance with approved procedures.
  10. When transfer of loading has been completed and approved, clean pits of foreign matter.
- C. Vibration Isolation:
1. Place vibration-isolation material where shown using boards supplied in lengths sufficient for one-piece installation. Apply bonding adhesive at rate recommended by manufacturer of board.
- D. Backfill:
1. Place concrete backfill to limits shown.
  2. Place and compact earth backfill in accordance with Section 02320.
- E. Restore ground and building surfaces to their original condition.
- F. Remove debris and construction materials. Leave site in a neat presentable condition.

**END OF SECTION**

## SECTION 02260

### SUPPORT OF EXCAVATION

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies support for cut-and-cover, open-cut excavation, trench excavation and shafts.
- B. Related Work Specified Elsewhere:
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Maintenance, support and restoration of utility facilities: Section 02270.
  - 3. Decking: Section 01530.
  - 4. Rock reinforcement: Section 02420.
  - 5. Drilling: Section 02431.
  - 6. Concrete reinforcement: Section 03200.
  - 7. Cast-in-place structural concrete: Section 03300.
  - 8. Steel bars, steel strand, anchorages, couplings for ground anchors, grout: Section 03415.
  - 9. Structural steel: Section 05120.
  - 10. Grounding and bonding of soldier piles: Section 16060.
  - 11. Geotechnical instrumentation: Section 02291.
- C. Contractor's Options:
  - 1. System of support to consist of soldier piles and lagging, sheet-piling or slurry-trench concrete walls, secured in place by means of bracing members such as wales, struts, shores and ground anchors. Other methods of support permitted only when approved.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standard and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. API: 13A, 13B-1.
  - 3. ASTM: A36, A709, A722.
  - 4. EPA.
- B. Design Criteria:
  - 1. Design support of excavation in accordance with design criteria shown and specified. Criteria are the minimum acceptable.
  - 2. Design component members of system to support temporary decking system, earth and rock pressures, unrelieved hydrostatic pressures, utility loads, applicable traffic and construction loads and other surcharge loads. Use loading combinations shown. Prepare design for staged removal of bracing to suit sequence of concrete placement.
  - 3. Design support system for nonpenetration of station and entrance surfaces visible to public. Temporary penetration permitted only where location of penetration is eventually to be hidden by elements such as acoustical panels or similar items

4. Design sheeting and bracing for sides of excavations for underground structures in a manner permitting safe and expeditious construction of permanent structures, minimizing movement or settlement of the ground and preventing damage to adjacent buildings, structures and utility facilities. Locate and design the bracing system such that it will not interfere with the reinforcement and construction of the permanent structure.
5. For support systems in which struts are installed between opposite sides of the excavation, design and construct support of both sides to obtain comparable rigidity.
6. Choose location of soldier piles to allow for expected deviations from true line during driving procedure without encroaching on future permanent structures.
7. Approval of Contractor's plans and methods of construction does not relieve the Contractor of the responsibility for adequacy of support.

## 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  1. Working Drawings:
    - a. Details, arrangement and method of assembly of proposed system, including construction sequence.
    - b. Method of preloading and bracing.
    - c. Elevations and sections showing full excavation depth from top grade to bottom of soldier piles or subgrade, whichever is deeper.
    - d. Loads for various stages of bracing removal and concrete placement.
    - e. Anticipated equipment load.
    - f. Maximum design load to be carried by various members of support system and preloads.
    - g. Depths below main excavation to which support system will be installed.
    - h. Methods of resolving difficulties arising from misalignment of soldier piles exposed during excavation and criteria for implementation of those procedures.
    - i. Methods of controlling and monitoring vibrations caused by driving of soldier piles to prevent damage to structures and utility facilities.
    - j. If proposed support system includes tieback anchors, show geologic profile or section for which each anchor is intended, design load for full depth of the excavation, maximum design and proof load and criteria proposed for deformations under proof loads.
    - k. Ground anchors and rock bolts:
      - 1) Prior to starting work, submit support system tieback and rock bolt details including design calculations, installation and load test procedures, grouting materials, grouting methods and detailed working drawings of the proposed rock bolt system.
      - 2) Show geologic profile or section for which each ground anchor or rock bolt is intended and design load of ground anchor and rock bolt for full excavation condition.
    - l. Include design calculations and maximum theoretical deflections of support members.
      - 1) The maximum allowable deflections of support members are as follows:
 

Soldier beams	1/2-inch
Walers	1/4-inch

This does not include the movement of support due to creep in tieback.
    - m. Include existing utility facilities. After checking their locations by field investigations, revise drawings to show actual locations of facilities, location of excavation supports, interference with proposed work and measures proposed to overcome such interferences.

2. Documentation:
  - a. Where proposed system of tieback anchors or rock bolts projects beyond vertical projection of property lines shown onto adjoining property, obtain permission of owner in writing.
  - b. Submit copies of permits with drawings.
  - c. Calculations:
    - 1) Design calculations as applicable.
    - 2) Do not proceed with work prior to approval.

#### **1.04 JOB CONDITIONS:**

- A. Provision for Contingencies:
  1. Monitor performance of components of support system, both vertical and horizontal movement in accordance with Section 02291, at regular intervals not to exceed three days.
  2. Provide contingency plan or alternative procedures to be implemented if unfavorable performance is evidenced.
  3. Keep on hand materials and equipment necessary to implement contingency plan.
- B. Proceed with caution in areas of utility facilities; expose them by hand excavation or other methods acceptable to utility owner.
- C. If existing utility facilities interfere with proposed method of support, modify or relocate such facilities with the approval of the appropriate utility owner. If relocation of the utility is not possible, obtain Engineer's approval for field changes to the approved support scheme of the excavation.
- D. Do not splice elements of support system unless approved.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Steel Sheet Piles: Continuous interlocking type with cross section selected for intended use.
- B. Cast-In-Place Structural Concrete: Section 03300, Class 3500 unless otherwise shown.
- C. Timber Lagging: Structural grade, minimum allowable flexural stress of 1,100 psi.
- D. Concrete Reinforcement: Section 03200.
- E. Structural Steel: Section 05120; ASTM A36 or ASTM A709, Grade 36, minimum.
- F. Rock Bolts: Section 02420.
- G. Ground Anchors:
  1. Steel bars: ASTM A722 and Section 03415.
  2. Steel strand: Section 03415.
- H. Anchorages and Couplings for Ground Anchors: Section 03415.
- I. Grout: Section 03415.
- J. Bentonite Powder: API 13A.

- K. Other Materials: Those best suited for intended use, and as approved.

## **2.02 MIXES:**

- A. Lean Concrete: Portland cement and mineral or soil aggregate proportioned so that concrete retains its shape during excavation operations.
- B. Concrete for Slurry Trench Walls:
1. Tremie concrete of 3500 psi strength or higher if necessitated by design, with the following additional requirements:
    - a. Minimum cement factor: Seven bags per cubic yard.
    - b. Water-cement ratio: As necessary for strength and durability.
    - c. Sand proportion: As necessary to produce optimum results.
    - d. Rounded gravel aggregate: 1-1/2 inch maximum.
    - e. Slump: Six inches plus-or-minus one inch.
    - f. With water-reducing or fluidizing agents as necessary.
  2. Submit mix design for approval.
- C. Bentonite Slurry:
1. Stable suspension of powdered bentonite, or equal, and natural silts and clays in water.
  2. Density: 64 pcf minimum, 85 pcf maximum.
  3. Marsh funnel flow rate: 40 seconds minimum, 80 seconds maximum viscosity.
  4. Fluid loss: 25-cc maximum in 30 minutes.
  5. pH: 7.0 to 11.0
  6. Shear strength:
    - a. By shearometer: 1.4 to 10 N/M.
    - b. By fan viscometer: 4.0 to 400 N/M.

## **PART 3 - EXECUTION**

### **3.01 SHEETING, SHORING AND PILING:**

- A. Install soldier piles by driving, preboring or other pre-excavation methods. Drive soldier piles only in those areas where shown or approved. Install piles vertically within tolerance of one foot per each 100 feet for full depth of each pile.
- B. Where piles are installed by preboring or other pre-excavation methods, take appropriate measures to stabilize excavation to preclude loss of ground.
- C. Provide prebored holes for soldier piles adequate to accommodate pile section shown on approved working drawings. Extend hole to necessary depth below top of subgrade.
- D. Carry bottom of support system to depth below main excavation, adequate to prevent lateral movement. In areas where additional excavation is required below main excavation subgrade, make provisions to prevent movement of main excavation supports.
- E. Multiple-Layered Horizontal Bracing:
1. At locations where top of weathered bedrock is above the subgrade of main excavation, install soldier piles so that tips are at least two feet below top of subgrade.
  2. At locations where top of weathered bedrock is five feet or more below subgrade of main excavation, install soldier piles so that lower tip is at least five feet below bottom of excavation.

3. If weathered bedrock is encountered at elevation between subgrade elevation and five feet below subgrade, install soldier piles so that lower tip is five feet below subgrade or two feet into rock, whichever is higher.
- F. After seating soldier piles in pre-excavated holes, encase piles with Class 3500 concrete up to lowest point of excavation adjacent to pile location. Fill remainder of hole with lean concrete, completely encasing pile.
  - G. Use timber lagging, steel sheeting or precast reinforced concrete members secured in place for sheeting of excavations.
  - H. Follow excavation closely with placement of sheeting and lagging. Do not allow maximum height of unsheeted or unlagged face of excavation to exceed five feet in rock or predominantly clayey soils and three feet in sandy soils.
  - I. Do not permit height of unlagged face to exceed 15 inches if water flows from face of excavation or if soil in face moves toward excavation area.
  - J. Carefully perform excavation for installation of sheeting to minimize formation of voids. Separate sheeting members only to extent necessary to permit packing behind them.
  - K. Pack behind sheeting as installation progresses to establish tight contact between excavation face and sheeting. Pack openings between sheeting members with straw or other suitable material to allow free drainage of water without loss of soil or sand packing.
  - L. If unstable material is encountered during excavation, take suitable measures to contain it in place and prevent ground displacement which may cause damage.
  - M. Maintain sufficient quantity of material on hand for sheeting, shoring, bracing and other operations for protection of work and for use in case of accident or emergency.
  - N. Support System For Vertical Shafts Which Penetrate Soil/Rock Interface:
    1. Soldier piles:
      - a. If shaft excavation is supported by soldier piles, locate piling at least five feet in a horizontal direction from outer face of shaft wall. Install lower tip of piling at least ten feet below top of unweathered bedrock.
      - b. Procedure for establishing tip elevations:
        - 1) Make three pilot core borings at equal spacing along soldier pile line. Borings may be washed through overburden, but must be cored through bedrock to a depth of 20 feet into unweathered rock as determined by the Engineer. Advance holes in rock by rotary drilling methods and recover 2-1/8 inch diameter (NX) size rock cores using Series M double-tube core barrel. Drill in conformance to applicable portions of Section 02431. Place cores in wooden boxes as specified in Section 02431 and deliver to storage site as directed.
        - 2) Install soldier piles to obtain tip elevations established by the Engineer's examination of coring results.
        - 3) For shafts where pilot core borings indicate top of unweathered bedrock varies by more than three feet in elevation, set tips of soldier piles at least ten feet below lowest point of top of unweathered bedrock.
        - 4) In drilling soldier pile holes, use equipment capable of penetrating hard igneous and metamorphic rock that has an average unconfined compressive strength of six to eight kips per square inch and that may reach even greater values in some locations.

2. Ring beams and lagging or liner plate:
  - a. If shaft excavation is supported by ring beams or liner plates, install rings or liner plate to at least ten feet below average elevation of top of unweathered bedrock, which will be determined by the Engineer from examination of the rock in the advancing excavation.

### **3.02 SLURRY WALLS:**

- A. Slurry Trench Equipment:
  1. Use equipment capable of removing from trench foreign materials embedded in soil as well as natural materials, including boulders, where necessary. Arrange equipment to permit free vertical passage of slurry within trench and to prevent development of suction or pressure.
  2. Furnish trench inspection tools adequate to ensure that trench has been excavated to dimensions shown on approved working drawings and that cuttings and foreign material have been removed.
  3. Use slurry mixing equipment capable of producing, with mechanical agitation, a stable suspension of bentonite and water. Transport slurry to panels by temporary pipe line or other approved methods.
  4. Furnish slurry circulation equipment to provide circulation and agitation of the slurry throughout full depth of excavated panels. Do not agitate slurry by air
  5. Use slurry reclaiming equipment which will remove detrimental quantities of excavated material from slurry to ensure use of clean slurry in trenches. Recirculate reclaimed slurry to trenches in a continuous operation regardless of slurry density. Monitor slurry and control its capability of retaining solid particles in suspension.
- B. Field Quality Control:
  1. Make tests on samples of in-place slurry to determine density, viscosity, filtration and sand content in accordance with API 13B-1.
  2. Maintain quality of bentonite slurry compatible with soil characteristics of trench walls.
- C. Construction:
  1. Perform preparatory work to discover, protect, maintain, relocate and restore utility facilities and other obstructions in vicinity of slurry walls.
  2. Construct slurry trench walls by displacement of bentonite slurry with tremie concrete.
  3. Construct walls of reinforced concrete or plain concrete embedded with structural steel. Where soldier piles are used in construction of walls, it is permissible to consider piles as reinforcement.
  4. Provide sufficient embedment of walls below subgrade of excavation to prevent loss of ground due to piping under wall or lateral movement of wall.
  5. Use construction methods ensuring that slurry materials employed during trench excavation and placing of tremie concrete are contained and controlled to prevent leakage and spillage of slurry and excavated materials into basements, vaults, utilities and other facilities.
  6. Excavate slurry wall trenches in panels of width and depth shown on approved working drawings with maximum panel length of 18 feet. Reduce panel length when excavating adjacent to facilities sensitive to settlement.
  7. Maintain level of slurry in panels no more than five feet below top of trench during excavation operations and until tremie placement is essentially completed.
  8. Progress construction with no less than one unexcavated panel and one tremie-filled panel with concrete cured at least 72 hours, between two slurry panels under active excavation.
  9. Keep slurry circulated or agitated during drilling and excavating and immediately prior to concreting. Continuously maintain slurry requirements even during

nonworking periods and stoppages. If stoppage occurs in the operation causing slurry in panel to remain uncirculated and unagitated for more than 24 hours, backfill panel until operation can be resumed.

10. Place concrete by tremie methods either by gravity flow or by pumping. As soon as possible after placement of concrete is commenced, position bottom of pipe not less than five feet below upper surface of concrete being placed and maintain it in this position throughout operation. Equip tremie pipe with bottom valve or other device to prevent mixing of slurry with concrete inside tremie pipe. Aluminum pipe is prohibited.
11. Inspect trenching in the presence of the Engineer prior to concreting. Ensure that settled cuttings and excavated material have been removed.
12. Start placement of concrete in panels within 12 hours after completion of panel excavation and proceed continuously until concreting is completed.
13. When wales are used, obtain tight bearing between wales and wall and ample bearing area with wedges and dry pack for load transfer.
14. Preload braces at each level to computed maximum compressive force to be encountered at that level. Base calculations of this computed force upon pressure diagrams shown. Take into consideration increased strut loads that may develop because of removal of bracing as structure is built.
15. Accomplish preloading by approved procedures. Transfer load by jacking applied symmetrically to braces without introducing eccentricity.
16. Introduce jacking load into braces immediately after each tier of braces has been installed and before excavation has progressed more than two feet below bottom of bracing tier. Make provision to fix preload into each brace by shim plates, wedges, blocking or other approved device.
17. After concrete invert slab has been placed and attains sufficient strength to receive loads from slurry walls, remove tiers of bracing above invert level, provided the following conditions exist:
  - a. Remaining tiers are capable of resisting total load calculated from trapezoidal pressure diagrams shown.
  - b. Calculated deflection of the walls between tiers of bracing, assuming forces indicated by the trapezoidal pressure diagrams, does not exceed 1/2 inch.
18. Construct tight joints between adjacent pours of concrete in slurry wall to minimize loss of fines from retained earth. Take necessary care to accomplish this in terms of properly excavating trench and cleaning abutting face of hardened concrete or surfaces of structural members if used. Provide approved method of water stopping.
19. Seal leaks encountered in walls as excavation progresses, if leaks are of sufficient size to permit penetration of fines and loss of ground. Procedures may include grouting outside or through wall.
20. Dispose of unsuitable excavated material and debris in accordance with Section 02320.
21. Dispose of slurry waste offsite by means of sealed tanks and in accordance with EPA regulations.

### **3.03 PRIMARY SUPPORT:**

- A. Use wales, struts, tieback anchors and rock anchors as necessary to provide primary support of excavation faces retained by soldier piles, sheeting, sheet piles or concrete slurry walls. For excavation depths greater than eight feet, primary support or supports are required.
- B. Provide struts with intermediate bracing as needed to enable them to carry maximum design load without distortion or buckling.
- C. Provide diagonal bracing as needed to maintain stability of system.

- D. Include web stiffeners, plates or angles as needed to prevent rotation, crippling or buckling of connections and points of bearing between structural steel members. Allow for eccentricities caused by field fabrication and assembly.
- E. Install and maintain primary support members in tight contact with each other and with surface being supported.
- F. Design primary support members to support maximum loads occurring during excavation or removal stages.
- G. Preloading:
  1. Except for ground anchors and slurry wall bracing, preload primary bracing members including struts, shores, wales carrying axial load, and similar members at installation to 50 percent of design load, which for this purpose is maximum load that bracing member will have to carry. Preload tiebacks and slurry walls as specified for those installations.
  2. Use procedures that produce uniform loading of bracing member without appreciable eccentricities or overstressing and distortion of members of wall system.
  3. Make provisions for permanently fixing load in each member using steel shims or wedges welded into place.
  4. Accomplish preloading by jacking support in place against soldier piles or wales.
  5. Do not use wooden wedges to preload bracing member.
  6. Include in preloading system means to determine within five percent amount of preload induced into bracing members.
- H. If decking beams are not required or if decking beams are not designed for support of excavation loads, install uppermost tier of bracing at vertical distance of not more than six feet below top of excavation.
- I. Install tiers of primary support with no greater vertical distance between them than 16 feet
- J. Reduce maximum vertical distance to 12 feet at locations where ground movement and settlement must be minimized to prevent damage, where shown and as directed.
- K. Excavate to no more than two feet below point of support about to be placed. Install support and preload immediately after installation and prior to continuing excavation.

#### **3.04 SUPPORT SYSTEM WITH TIEBACKS:**

- A. Install tieback system in accordance with approved working drawings. Install anchorage in soil no closer than a plane extending upward at an angle of 45 degrees to the horizontal from outer limit of lowest depth of excavation.
- B. Stress tiebacks to proof loads equal to 140 percent of maximum design load and maintain proof load for 30 minutes prior to reducing to design load. Reject tiebacks which lose more than five percent of proof load during 30-minute period.
- C. Apply proof loads in increments of five tons at one-minute intervals and provide means to measure load application within accuracy of plus-or-minus five percent.
- D. After reducing tieback load to design load, encase anchors in grout maintaining design load until anchors are fixed in place.
- E. In transfer of loads from jacks to support system, use fixation method which will limit load loss to no more than five percent of design load.

- F. Provide and maintain convenient access and appropriate means to accomplish these observations.
- G. Preliminary And Creep Tests On Tiebacks:
  - 1. Reapply proof loads equal to 140 percent of design load at each level of support in excavation on first installation on each side of excavation at horizontal intervals not exceeding 500 feet and wherever there is significant difference in soil in which tiebacks are installed.
  - 2. As specified for proof loading, apply proof loads in increments of five tons at one-minute intervals. Provide means to measure load applications with an accuracy of plus-or-minus five percent of design load. Maintain proof load for 24 hours prior to reducing it to design load.
  - 3. Make records of axial movement with incremental applications of load as well as amount and time of load fall-off with no pumping of jack or axial movement during 24-hour period that proof load on tieback is maintained. If during 24-hour period axial deformation of tieback system exceeds 0.02 inch or decrease in jack pressure without pumping is more than five percent after correcting for temperature changes during the test period, redesign tieback system to satisfy requirements.
- H. Rock Bolts:
  - 1. Tension rock bolts to their design load as approved to permit checking of each loading by the Engineer.
  - 2. If grouted rock bolts are used, after loading has been approved, pressure-grout each permanent rock bolt in place using methods and equipment which will ensure elimination of air from bolt hole.
  - 3. If fully resin-encapsulated bolts are used, use slow-setting resin to allow Engineer sufficient time to approve loading prior to gelation.
- I. Vertical Support System With Tiebacks:
  - 1. Install piles or other vertical support system members incorporated in a system utilizing tiebacks so that they are capable of resisting vertical components of tieback loads without significant settlement during excavation and construction.
  - 2. Install vertical support members so that settlements will not be caused by construction. In general, install members to be end bearing in stratum below maximum depth of excavation and capable of carrying total vertical loads without assistance of skin friction at depth of excavation.

### **3.05 LAGGING:**

- A. Unless otherwise shown or specified, provide timber lagging of three inches minimum thickness where it spans soldier piles placed at distances five to seven feet on centers and for excavation depths up to 25 feet. Increase minimum lagging thickness to four inches for excavation below 25 feet in depth.
- B. For other conditions and types of lagging, submit design details for approval.

### **3.06 TRENCH EXCAVATION:**

- A. Perform sheeting, shoring and bracing for trench excavation for utility facilities and other purposes in accordance with specified safety requirements.
- B. Provide sheeting, shoring and bracing for trench excavation in subgrade of subway excavation to prevent movement of main excavation support system.

### **3.07 SUPPORT OF EXCAVATION AT INTERFACES:**

- A. Design, construct, maintain and remove all or parts of support system at limits of the Contract at interface with the Authority's adjacent contracts, as may be necessitated by construction schedules and sequence of operations of respective contracts.
- B. In the event excavation is commenced at an interface prior to the commencement of excavation on adjacent contract, design, construct and maintain end support system making provisions as follows:
  - 1. Install near face of cofferdam on line separating contracts. Allow no part of support system to project into the next contract except thickness of supporting wall, e.g. soldier piles and lagging, and tiebacks if approved.
  - 2. Provide support system adequate to support backfill and restoration loads with installation of a reasonable bracing system by adjacent contractor during excavation for his contract.
  - 3. Design and construct support system so that it will be supported against vertical settlement when adjacent contractor removes lower portion of the cofferdam to effect connection of structures at juncture of two contracts.
- C. If excavation has commenced on adjacent contract at interface prior to excavation on this Contract, make provisions as follows:
  - 1. Coordinate removal of such portions of cofferdam which have been installed in adjacent contract and support and maintain remainder as necessary to effect juncture of contracts.

**3.08 FIELD QUALITY CONTROL:**

- A. Tests:
  - 1. Where system of tiebacks or rock bolts is proposed in conjunction with or in lieu of struts, bracing and shores, undertake approved number of on-site tests to demonstrate adequacy of tiebacks or rock bolts for typical subsurface conditions.
  - 2. Conduct tests and obtain approval prior to use of tieback system for excavation support.
  - 3. The Engineer may furnish and install certain instruments to monitor performance of tieback or rock-bolt system.
- B. Remove components of support system which inadvertently penetrate or encroach on permanent structure without endangering stability of support.
- C. Welding: In accordance with Section 05120.

**3.09 REMOVAL OF SUPPORTING SYSTEM:**

- A. When removing support of excavation system, wholly or in part, do not disturb or damage adjacent buildings, structures, construction or utility facilities. Fill voids immediately with lean concrete or with approved backfill compacted to density specified in Section 02320.
- B. During strut removal stages, design soldier piles or slurry walls for increased vertical spacing of supports. For the removal of the first level support immediately above the invert slab, the slab can be considered a support for the soldier piles or slurry walls if it is poured directly against the sheeting and shoring and the invert slab is in place for at least 48 hours and is adequate to safely support the support of excavation, adjacent structures and the works. Leave support immediately above top of intermediate structure element, such as walls, slabs, or other horizontal members, until they are placed and are in place for at least seven days and are adequate to carry the loads from the support of excavation and other loads imposed on them. Leave support immediately above top of roof slabs of structure in place for at least seven days after placement of roof slab concrete.

- C. Remove other supports above roof structure only after backfill has been placed and compacted to required density to within three feet of bottom of support.
- D. Except as specified below, remove supporting system to a depth of six feet below surface. Remove supporting systems of intersections of streets and at temporary access ramps to a depth of eight feet.
- E. Where top of Authority structure extends into six-foot or eight-foot limit, remove adjacent supporting systems to a depth flush with top of the Authority structure or one-foot below surface, whichever is greater. Increase removal depths where necessary to accomplish work in this Contract.
- F. Remove material of supporting system from site immediately.

**END OF SECTION**

## SECTION 02270

### MAINTENANCE, SUPPORT AND RESTORATION OF UTILITY FACILITIES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies protecting, supporting, maintaining and reconstructing existing utility facilities affected by construction, including but not limited to the following:
1. Storm, sanitary and combined sewer facilities.
  2. Water distribution and service
  3. Gas distribution and services.
  4. Electric light and power facilities and services.
  5. Telephone, telegraph and GSA communication facilities and services.
  6. Police and fire alarm systems.
  7. Traffic signals and street lighting, temporary and permanent.
  8. Steam distribution facilities.
  9. Parking meter installations.
- B. Related Work Specified Elsewhere:
- |  |                           |
|--|---------------------------|
| 1. Selective Demolition:                           | Section 02220.            |
| 2. Grading, excavating and backfilling:            | Section 02320.            |
| 3. Dewatering:                                     | Section 02240.            |
| 4. Support of excavation:                          | Section 02260.            |
| 5. Sanitary Sewer:                                 | Section 02535.            |
| 6. Storm Sewer:                                    | Section 02635             |
| 7. Water distribution system:                      | Section 02515.            |
| 8. Ducts, manholes and handholes:                  | Section 02585.            |
| 9. Removal and restoration of existing facilities: | Section 02205.            |
| 10. Concrete reinforcement:                        | Section 03200.            |
| 11. Concrete:                                      | Sections 03100 and 03300. |
| 12. Decking:                                       | Section 01530.            |
- C. Work by Others:
1. Gas distribution and services: Gas company will do its own work.
- D. Definitions:
1. Facility: Utility structures and system components belonging to utility company including service lines which are used to provide service to utility's customers and product which these facilities convey.
  2. Utility: Company, agency, owner or operator of facility concerned.
  3. Abandoned: Use of facilities shown as existing has been discontinued by the owners and operators. Demolish or remove such facilities to extent they conflict with proposed work.
  4. To be abandoned: Particular facility will be removed from operation and/ or replaced by other facilities after written notice has been received that service is no longer required. Maintain service for as long as required, including temporary support, rerouting, substitution of temporary facility or other measures, as directed by the Engineer. Demolish or remove such facilities to extent they conflict with proposed work.
  5. Maintenance: Ensuring continuous and satisfactory service during construction.
  6. Proposed facility:
    - a. New facility constructed and, if necessary, temporarily supported in place, by the Contractor.
    - b. Temporary facility constructed, supported in place and ultimately removed and new facility constructed, by the Contractor.
    - c. New facility constructed as part of rapid transit construction.

7. Temporary facility: Facility provided by the Contractor in lieu of existing or proposed facility, to ensure continuity of service.
8. Maintain complete-in-place: Support and maintenance in serviceable condition, of existing facilities during construction, which may include constructing permanent support, temporary support or other measures necessary to maintain continuous service of existing facility.
9. Expose and maintain existing cables and replace ducts and manholes: Remove existing duct and manhole structures, construct temporary manholes, place existing cables in split conduits and replace spare ducts with whole conduit. Maintain this system during construction. Reconstruct permanent concrete manholes and encase conduits in concrete as specified. Cables for electric power and telephone facilities shall be exposed, separated and supported under supervision of electric power and telephone companies.
10. Maintain service and replace:
  - a. Construct new facility in same location and support it in place.
  - b. Provide temporary facility and ultimately remove it, and construct permanent replacement facility in its original location.
  - c. Temporarily support original facility and ultimately replace it with new facility.
11. Remove and replace: Remove existing facility without providing temporary replacement and reconstruct new facility in same location during execution of contract.
12. Local Jurisdictional Authority: Agency responsible for acceptance and approval of work on storm, sanitary and water distribution facilities.
13. Salvage: Remove and store material and equipment for reuse in this or other Authority contracts.

## **1.02 SUBMITTALS**

- A. Schedule of Work on Utility Facilities:
  1. Submit to the Utilities and the Engineer a detailed sequence of work, with starting and ending dates for each interruption of utility services, and method of coordination for shutoff, capping and continuation of utility services.
  2. Give notice at least two weeks prior to date of intended commencement of operations to parties having surface, subsurface or overhead structures in the construction area. Provide copies of notices to the Engineer.
  3. Do not commence work until written approval has been received from the Utility and the Engineer.
- B. Record Documents:
  1. Show actual location of existing facilities, interference which these facilities present to new work, proposed method of proceeding with actual construction and details of proposed support systems.
  2. Show actual location of settlement measurement points for facilities as indicated on the drawings. Submit copies of readings and measurements within 24 hours after such readings are taken.
  3. Prior to construction, submit two copies of records of inspection of sewers, one copy to local jurisdictional authority and one copy to the Engineer. On completion of tunneling and cut-and-cover and prior to paving or other construction over sewers, submit to local jurisdictional authority and the Engineer one copy each of the inspection records of sewers, including video-tape records of television inspections and coordinated logs, photographs and other records as specified by local jurisdictional authority for visual walk-through inspections. Obtain and submit a written approval and acceptance from local jurisdictional authority of the inspection records of preconstruction and post-construction conditions of affected storm and sanitary sewers.

## **1.03 QUALITY ASSURANCE:**

- A. Codes, Regulations, and Standards: Comply with codes and regulations of the jurisdictional authorities, published standards of owning utility agency, and ASTM: C136.

- B. Inspection Of Sewers:
  - 1. Employ a sewer inspection company which has been regularly engaged in television sewer inspections and which is acceptable to local jurisdictional authority to perform preconstruction and post-construction inspections of sewers 36 inches and smaller in diameter. Submit to Local jurisdictional authority for prior approval one sample of the cassettes to be used.
  - 2. Conduct preconstruction and post-construction inspections under conditions as nearly identical as practical and using the same company.

#### **1.04 DELIVERY, STORAGE, AND HANDLING**

- A. Coordinate with utilities who are furnishing materials for the work to determine availability, locations and required methods of storage and care of materials prior to incorporation into the work.
- B. Transport store and handle materials in accordance with the requirements of the utilities.

#### **1.05 PROJECT CONDITIONS:**

- A. Existing Facilities:
  - 1. Locations of existing facilities shown are plotted from available records; however, these locations are not guaranteed.
  - 2. Verify by field investigation and "Miss Utility" utility locating service, locations of facilities within and adjacent to limits of project which may be affected by construction operations. Avoid damage or disruption of facilities during operation.
  - 3. Upon encountering existing facility which is not shown or upon ascertaining that facility differs from that shown, determine ownership, use and disposition of such facility and proceed as follows:
    - a. If facility is abandoned or is to be abandoned, perform necessary work for either condition as specified.
    - b. If facility is to remain in service, perform support and restoration work in accordance with these Specifications and the CHANGES article of the General Provisions.
- B. Temporary Service:
  - 1. Do not interrupt facility service to building connections unless permitted in writing by Engineer, and then only after arranging to provide temporary service as required..
  - 2. Notify the Engineer and the Utility of damage to facilities caused by construction operations. Repair such damage, except that damaged cables will be repaired or replaced only by the Utility.
  - 3. Provide access for inspection of facilities and for emergencies involving utility services as specified in Section 01530.
  - 4. Permit free and clear access to utility personnel for purposes of inspection, maintenance, providing additional service and construction of new facilities.
  - 5. When approved working or shop drawings show temporary facility provided for the Contractor's benefit, supply necessary materials and perform necessary work.
  - 6. Pay utility directly if, as an aid to the Contractor's construction, the utility performs work not shown.
  - 7. Items supplied by the utility companies are as listed and as shown.

#### **1.06 Coordination:**

- A. Establish through the Engineer direct and continuous contact with respective utilities and cooperate with them in all phases of the work.
- B. Contact utility early enough to allow them sufficient time to accomplish the work. Give special consideration to lead times required for cable work. Provide schedule of utility relocation to the utility to permit coordination with Authority's construction sequence.

- C. To locate buried telephone cables, call the local telephone company's Buried Cable Location Service at least 48 hours prior to starting excavation.
- D. Comply with printed standards and practices of utilities available from the Engineer.
- E. Aerial facilities shown to be relocated by others will be relocated by facility owner. The Contractor is responsible for coordinating relocation work with utility owner as far as possible in advance of required time of relocation. A minimum three-month lead time is required by utility owner when facility serves only one utility. When facility to be relocated is shared by more than one utility agency or when a street light is included in the relocation, a minimum four-month lead time is required

**PART - PRODUCTS**

**2.01 MATERIALS:**

- A. Refer to individual Division 2 Storm, Combined And Sanitary Sewer, Water Distribution and Services, Ducts and Manholes Sections for pipe, tubing, fittings and appurtenances, and for joining and installation methods.
- B. Refer to individual Division 3 Concrete and Reinforcement Sections for materials and installation methods.
- C. Sand Backfill Around High Voltage Conduits And Pipes:
  - 1. Thermal Resistivity Value (RHO) of not more than 70 and the following sieve analysis when tested in accordance with ASTM C136:

Sieve Size	Percent Passing
4	94 - 100
8	80 - 90
16	60 - 80
30	35 - 60
50	31 - 35
100	3 - 13
200	1 - 5

- 2. The power company, through the Engineer, will inform the Contractor of approved sources for this material.

**PART 3 - EXECUTION**

**3.01 Salvage:**

- A. Salvage and clean material shown to be salvaged.
- B. Maintain adequate records and storage facilities for salvaged items as specified in the General Requirements. Make available for inspection a detailed record including signed vouchers and receipts.
- C. Reuse salvaged items after inspection and approval for reuse has been given by the Utility
- D. Return salvaged materials which are not reused to the Utility.

### **3.02 SETTLEMENT OR MOVEMENT:**

- A. Where settlement or movement monitoring system is shown, comply with the following:
  - 1. Provide series of settlement measurement points along each facility and make regular readings to detect movements.
  - 2. Use approved painted marks, metal marker plugs or pins as settlement measurement points.
  - 3. Prior to subsurface work, make initial survey to establish elevations of installed settlement measurement points utilizing permanent, established bench marks outside 100-foot line.
  - 4. Take readings weekly on settlement points until completion of this Contract. Take readings daily during work which may affect facilities.
  - 5. Make readings to an accuracy of 0.01 foot.
  - 6. Take immediate remedial measures to correct conditions causing settlement or other movement and to repair damages thus caused.

### **3.03 EXCAVATION AND BACKFILLING OF UTILITY TRENCHES:**

- A. Excavate and backfill utility facility trenches in accordance with Sections 02320, 02240 and 02260.
- B. Proceed with caution in areas of utility facilities; expose them by hand excavation or other methods acceptable to facility owner.

### **3.04 SURFACE RESTORATION:**

- A. Remove pavements, sidewalks, lawns, landscaping, curbs and gutters where necessitated by utility trenches in accordance with Section 02220.
- B. Replace pavements, sidewalks, curbs and gutters in accordance with Section 02205.
- C. Place temporary pavements where necessitated by sequence of operations.
- D. Replace lawns and landscaping in accordance with Sections 02920 and 02930.
- E. Provide erosion control measures to prevent erosion or displacement of soils and discharge of sediment bearing water or airborne dust from the site.

### **3.05 UNSAFE AND UNSUITABLE UTILITY STRUCTURES:**

- A. General Requirements:
  - 1. If upon exposure, condition or location of facility to be supported in place is found to be unsafe for maintenance or support, replace or reconstruct facility as required after receiving prior approval of the Engineer and Utility Owner.
  - 2. Maintain continuity of existing utility facilities. Protect, support, relocate and reconstruct such facilities, regardless of jurisdictional control.
- B. Electric, Communication and Similar Type Facilities:
  - 1. If structures containing electrical, communication and similar types of cables shown to be maintained complete in place are found upon exposure to be incapable of being maintained in place because of condition, location or both, replace such structures with timber enclosures or split ducts after prior approval of the Engineer and the utility owner.
  - 2. When service box, manhole or conduit structure containing electrical or communication cables is broken away, replace it immediately with temporary structure having facilities for racking and supporting cables equivalent to existing facilities.

3. Exercise care when working in vicinity of telephone structures containing coaxial cable which cannot withstand movement.
  4. Give timber enclosures one interior and one exterior coat of fire-retardant paint of type specified by owners and operators.
  5. Replace temporary timber enclosures with permanent structures in accordance with details shown and restore facilities to the satisfaction of the Engineer and utilities prior to completion of work. Remove materials of temporary nature after completion of permanent installation.
- C. Procedures for payment of costs of work on unsafe and unsuitable utility structures are governed by the CHANGES article of the General Provisions.

**END OF SECTION**

## SECTION 02291

### GEOTECHNICAL INSTRUMENTATION

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies the design, installation, maintenance, and removal of geotechnical instrumentation to monitor soil, rock, and structure movements during construction. This section also includes specifications for reading, analyzing, and reporting instrumentation monitoring results.
- B. Design Criteria:
  - 1. Provide a system of geotechnical instrumentation which will allow monitoring of soil, rock, and excavation support elements, as well as adjacent structures and utilities to ensure safety and stability, confirm design assumptions, and provide a basis for establishing compliance with Contract requirements.
- C. Definitions:
  - 1. Geotechnical Instrumentation - Any device designed to determine change in the position or state of stress of soil, rock, and structures.
  - 2. Instrument Monitoring - The procurement of data obtained from the repeated optical, mechanical, or electronic observations of geotechnical instruments.
  - 3. Frequency of Monitoring - The number of readings obtained from a geotechnical instrument with respect to time.
  - 4. Initial reading- The first stable reading set obtained after instrument installation, but prior to excavation, to which all subsequent readings will be compared.
  - 5. Threshold Limit Values Level 1 and Level 2 - Designer-specified limits for geotechnical instrumentation which if exceeded require (1) notification of the Authority and increased monitoring frequency and (2) implementation of the contingency plan.

##### 1.02 QUALITY ASSURANCE:

- A. Comply with codes and regulations of the jurisdictional authorities.
- B. Permits - Prior to instrumentation installation obtain any permits from the responsible jurisdiction and pay permit costs and any associated fees at no additional cost to the Authority.
- C. Qualifications of Personnel:
  - 1. Instrumentation Selection, Design, Layout, and Data Analysis shall be performed by a registered Professional Engineer specializing in geotechnical engineering with 5 years experience in soil stability and geotechnical design
  - 2. Instrumentation installation shall be performed under the supervision of qualified technicians with at least one year experience in the installation of instruments of the type specified.
  - 3. Instrumentation monitoring shall be performed by qualified technicians with at least one year experience in the reading of instruments of the type specified.
- D. Continuously maintain all geotechnical instrumentation in proper working condition and within manufacturer's specifications. Immediately repair or replace malfunctioning equipment. All instrumentation readout devices to be periodically tested and recalibrated within schedule as recommended by the instrument manufacturer or as approved by the Authority..

### 1.03 SUBMITTALS:

- A. Submit the following for approval prior to proceeding with work:
  - 1. Type of instrumentation system proposed, showing arrangement, location and depths of proposed system.
  - 2. Manufacturer's literature including descriptions and installation recommendations for all instruments, software, and read-out devices proposed for use.
  - 3. Instrumentation installation schedule and monitoring schedule.
  - 4. Resumes listing the qualifications of the Professional Engineer and Technicians specified in 1.02.C.
  
- B. Instrument Installation Data:
  - 1. Record of installation details including date and time of installation, general soil condition at instrument site, adjacent construction activities, and remarks of unusual conditions observed during installation.
  - 2. As-built location and elevation of installed instruments including coordinates and distance referenced to Outbound track centerline. Supply location data within 48 hours of instrument installation.
  
- C. Instrumentation Monitoring Data:
  - 1. Analyzed data to be submitted on forms approved by the Authority within 48 hours after instrument monitoring. Supply copies of field notes if requested.
  - 2. Immediately report to the Authority movements exceeding Level 1 limits.
  - 3. Shift Reports of Construction Activities:
    - a. For each shift in which work is taking place, submit a report within 24 hours containing the following:
      - 1) Detailed excavation and tunneling status at time of instrument reading.
      - 2) Excavation subgrade elevation and tunnel face station at time of instrument reading.
      - 3) Incidents of ground loss, groundwater flow, excavation support instability, or any other unusual event.
      - 4) General construction activity in the vicinity of the instruments.
      - 5) Duration and cause of delays to construction activities.
      - 6) Weather conditions.
  
- D. Contingency Plans:
  - 1. Submit contingency plans to stabilize soil, rock, and structures affected by adverse movements detected by instrumentation. Submit contingency plans at least one month prior to start of excavation or tunneling. At a minimum, include the following:
    - a. Names, telephone numbers, and locations of persons responsible for implementation of contingency plans.
    - b. Materials and equipment required to implement contingency plans.
    - c. Location onsite of all required materials and equipment to implement contingency plans.
    - d. Step-by-step procedure for performing work involved in implementation of the contingency plans.
    - e. Threshold limit Level 1 and Level 2 values for all instruments.
    - f. Clear identification of objectives of contingency plans and methods to measure plan success.

### 1.04 JOB CONDITIONS:

- A. Do not disclose to third parties or publish monitoring data without the approval of the Authority.

- B. The Authority may monitor any geotechnical instrument at any time. Provide and facilitate access to instruments for the Authority.
- C. The instrumentation monitoring data shall be continuously reviewed and interpreted by the responsible instrumentation specialist.
- D. During construction, additional instrumentation may be required beyond that proposed in the initial design. Modifications to the instrumentation plan, including proposed instrument locations, may be required due to site conditions and instrumentation results.
- E. Ensure that all instrumentation installations are continuously protected and are not damaged by construction activities, including blasting. Replace or repair as necessary any instrument damaged by construction activities or adverse soil, rock, or structure movement.

## **PART 2- PRODUCTS**

### **2.01 INSTRUMENT TYPES:**

- A. Specify instrument types and locations in accordance with design criteria indicated in Section 1.01 B.1. and as approved by the Authority.

## **PART 3 - EXECUTION**

### **3.01 INSTRUMENT INSTALLATION SCHEDULE:**

- A. Install and obtain initial readings for all surface instrumentation prior to excavation, chemical grout operations, or dewatering activities, in accordance with approved schedule. In areas to receive chemical grout, delay installation of instruments which might be damaged by chemical grout until completion of this activity.
- B. For all instrumentation located within excavated areas, install and obtain initial reading as soon as practical after excavation or passage of tunnel heading in accordance with approved schedule.

### **3.02 INSTRUMENT LOCATIONS:**

- A. Install instruments as close as practical to locations submitted and approved. Actual conditions in field may require location adjustment. Obtain Authority approval for location adjustments.
- B. After instrument installation, submit reports showing location and installation details of each instrument as specified in Section 1.03.B.
- C. Ensure that all proposed instrument locations will not result in damage to utilities or other structures. Coordinate proposed instrument locations with Miss Utility and any other affected owners prior to instrument installation.

### **3.03 INSTRUMENTATION MONITORING:**

- A. Initial Reading:
  - 1. At time of initial reading, verify that instrument is functioning and has been installed in accordance with contract specifications and manufacturer's recommendations.
  - 2. Replace at no additional cost to the Authority any instrument which does not meet specification requirements.

3. Obtain at least three separate and complete sets of initial readings on each instrument which yield consistent results.
  4. Should inconsistent initial readings be obtained on any instrument, reread until correct and repeatable readings are obtained.
- B. Monitoring Frequency:
1. Monitoring frequency to be in accordance with schedule submitted and approved as specified in Section 1.3 A.3.
  2. Instrument readings which show significant change from previous readings shall be reread immediately.
- C. Instrumentation Monitoring Threshold Values:
1. Instrumentation system design shall establish threshold limit values for each instrument.
    - a. Level 1 Limit values if exceeded require notification of the Authority within 24 hours and notification of individuals listed within the contingency plan. Monitoring frequency of affected instruments which exceed Level 1 limit will be increased to frequency as approved within the contingency plan.
    - b. Level 2 limit values if exceeded require immediate notification of the Authority and implementation of the contingency plan. Instruments which exceed Level II limits will be monitored continuously until stability is achieved.

#### **3.04 INSTRUMENT PROTECTION, MAINTENANCE, AND REPLACEMENT:**

- A. Protect and maintain instruments. Divert surface water from instrument covers. Flush debris from instrument installations. Maintain access to all instruments.
- B. Provide barriers as required to protect instrument.
- C. Install and maintain instruments and instrument access covers in a manner which protects workers and ensures public safety.
- D. Repair or replace damaged instruments within 5 days at no additional cost to the Authority.

#### **3.05 REMOVAL OF INSTRUMENTS:**

- A. Prior to final acceptance of work and subject to Authority approval, remove and dispose of all instrumentation.
  1. Remove surface instrument installations to 2 feet below ground surface. Backfill voids and casing with cement grout.
  2. Restore ground surface to original condition.
- B. Fill holes in masonry with portland cement mortar. Restore structure surfaces to original condition.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY THE DESIGNER.**

#### **ENDNOTES:**

1. The Designer must specify the level 1 and 2 threshold values before finalizing the contract-specific specifications.

**END OF SECTION**

## SECTION 02320

### GRADING, EXCAVATING AND BACKFILLING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies grading, excavating and backfilling for structures and utility facilities.
- B. Related Work Specified Elsewhere:
  - 1. Removal of existing construction and facilities: Section 02220.
  - 2. Clearing and grubbing: Section 02230.
  - 3. Dewatering: Section 02240.
  - 4. Support of excavation: Section 02260.
  - 5. Underpinning, support and restoration of structures: Section 02255.
  - 6. Maintenance, support and restoration of utility facilities: Section 02270.
  - 7. Rock tunneling: Section 02410.
  - 8. Earth tunneling: Section 02415.
  - 9. Rock reinforcement: Section 02420.
- C. Definitions:
  - 1. Grading: Shaping earth and rock through the removal or filling of earth and rock materials.
  - 2. Earth Excavation: Excavation of materials of whatever nature, except rock as defined below.
  - 3. Rock Excavation: Excavation of material in place which cannot be loosened or broken down by ripping using earth excavating equipment and which requires blasting or rock excavating equipment for its removal.
  - 4. Approved Material: Earth which meets specified measurable requirements for use as embankment, fill or backfill.
  - 5. Surplus Excavated Material: Approved excavated material which is not used in embankments or as fill on site.
  - 6. Unsuitable Material: Material which does not meet specified requirements for use in situ or as embankment, fill or backfill and is prohibited for use in the work.
  - 7. Authorized Excavation: Excavating to neat lines and limits shown and specified; excavating unsuitable material.
  - 8. Unauthorized Excavation: Excavating materials which would otherwise be left in place; excavation which is not specified as authorized excavation, such as excavation beyond neat lines and bottoms of footings as shown.
  - 9. Excess Excavation: Excavating materials beyond or below cross section shown, as well as unavoidable over breakage in rock.
  - 10. Controlled Low Strength Materials (CLSM): Fill.
- B. Salvage:
  - 1. Materials shown to be salvaged in accordance with Section 02205 and the General Requirements.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and the additional requirements as specified for each:
  - 1. Samples:
    - a. Submit sample 21 days in advance of desired date of approval. Two one-cubic-foot samples are required of each material proposed for fill, backfill and embankments.

- b. Obtain, identify and ship soil and aggregate samples in accordance with ASTM D75.
  - 2. Documentation:
    - a. Permits for disposal of excavated material:
      - 1) Obtain written permits and releases from owners of property where material will be deposited.
      - 2) Each permit and release from each property owner will absolve the Authority from responsibility in connection with such disposal of the material.
    - b. Blasting plan:
      - 1) Submit a blasting plan in accordance with Section 02410.
    - c. Plan for tunneling or jacking of utility facilities:
      - 1) Prior to tunneling, submit a tunneling plan.
        - (a) Include in the plan the location of the facility, the method of construction, the types of equipment and the procedures proposed.
        - (b) Procedure for field determination of soil bearing capacity, including description of the equipment to be used, and any calibration curves for the various soil types to be encountered, details of field test procedures, forms for reporting of test data/results and details of minimum number of tests required for each footing/base area
  - 3. Certification:
    - a. With samples of materials proposed for fill, backfill and embankment, submit certified test reports of tests performed by an approved Independent Testing Agency for all tests required to demonstrate compliance with specified requirements.

### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: M147.
  - 3. ASTM: C33, D75 , D698, D2487, D2922, D3017, D4318.

### 1.04 JOB CONDITIONS:

- B. Existing Drainage:
  - 1. Preserve, protect and maintain existing operable drains and sewers during grading operations.
  - 2. Keep excavations dry.
- C. Blasting:
  - 1. Control blasting in accordance with Section 02410.
  - 2. Exercise care in drilling and blasting operations so that the remaining rock remains stable and overbreak is minimized. Use controlled blasting in areas where concrete for walls and arches of structures is to be placed against rock.
- D. Accident Prevention and Safety:
  - 1. Perform work in accordance with specified safety requirements and PROTECTIVE DEVICES article of the General Requirements.
- E. Location of Underground Facilities and Structures:
  - 1. Locations shown for utility facilities are approximate.
  - 2. Utility facility locations and site investigations are listed in the General Requirements.
  - 3. Contact Miss Utility to have utilities located before beginning excavation.

- F. Toxic and Combustible Substances:
1. During excavation, provide detection and testing equipment and carry out necessary tests to detect the presence of toxic and combustible substances.
  2. Take action to safeguard persons and property in accordance with the rules and regulations of the jurisdictional agencies and utility owners.
  3. Promptly notify utility owners when problems concerning their facilities become apparent.
- G. Ramps:
1. Construct temporary ramps as necessary to provide access to work area.
  2. Locate such access ramps in Contractor's storage, operations and access areas or within excavation for subway structure and maintain traffic as specified.
  3. Support ramp excavation in accordance with Section 02260.
  4. When ramps are in use, station flag persons equipped with red flags at ramp entrances to keep unauthorized vehicles or persons from entering work area.
  5. When work necessitating entrance or exit of vehicles via ramps is not being performed, protect entrances and exits of ramps by warning signs, barricades and fences in accordance with the General Requirements.
  6. Upon completion of the work needing ramps, remove the ramps in accordance with Section 02260; backfill excavated ramp areas, if necessary.
- H. Excavation Near Buildings:
1. Control excavation in areas near buildings or structures to maintain stability of buildings or structures. If underpinning is necessary, perform excavation work in accordance with Section 02255, so that condition of surrounding area remains unimpaired.

## **PART 2 - PRODUCTS:**

### **2.01 MATERIALS:**

- A. Embankment, Fill or Backfill Materials:
1. Composition:
    - a. Well-graded soil-aggregate mixture, as defined by ASTM D2487, comprised of stone, gravel, sand, silt, clay or combinations of such materials.
    - b. Prohibited material: Organic matter, debris, cinders and frozen material.
  2. Additional requirements:
    - a. Particle size: Four inches maximum, but not exceeding one inch within one foot of finished grade.
    - b. Liquid limit: Forty maximum, determined in accordance with ASTM D4318.
    - c. Plasticity index: Ten maximum, determined in accordance with ASTM D4318.
    - d. Maximum dry density: Not less than 100 pounds per cubic foot.
- B. Select Material: AASHTO M147, with the following gradation requirements:

THIS SPACE NOT USED.

Sieve Designation	Percentage Passing By Weight
Two inch	100
One inch	70 - 95
3/8 inch	35 - 75
Size 4	25 - 60
Size 10	15 - 45
Size 40	10 - 30
Size 200	0 - 15

- C. Pervious Material:
1. Natural, clean, free draining sand conforming to the requirements of ASTM C33 except the following:
    - a. Material passing Size 100 sieve not to exceed eight percent.
    - b. Material passing Size 200 sieve not to exceed five percent.
  2. Drainage Material: Clean, crushed, rock, gravel, with 1-1/2 inch maximum particle size and maximum two percent by weight passing Size 4 sieve.
  3. Below concrete walks and slabs: ASTM C33, Size No. 67, except maximum two percent by weight passing Size 4 sieve.
- D. Impervious Material:
1. Silt-clay material minimum 35 percent by weight passing Size 200 sieve.
  2. Plasticity index: 11 minimum, determined in accordance with ASTM D4318

## 2.02 SOURCE OF MATERIALS:

- A. Use materials for embankment, fill or backfill from this Contract if they meet specified requirements. If sufficient material meeting these requirements is not available from this Contract, obtain material meeting specified requirements.
- B. Use only material whose quality, source and zone of placement in the fill have been approved.
- C. Dress and shape borrow areas provided by the Authority to ensure positive drainage when borrow operations are completed.

## PART 3 - EXECUTION

### 3.01 EQUIPMENT:

- A. Use appropriate equipment in sufficient quantity and sizes to perform the work as specified and shown.

### 3.02 EARTH EXCAVATION:

- A. Excavate in sequences and stages as specified, and in a manner which will not impair permanent or temporary structures, installations or surfaces.
- B. Excavate to neat lines or set back lines for mixed face conditions and grades shown. If approved, slopes may be flattened as a matter of expediency.

- C. Support sides of excavation as specified in Section 02260.
- D. Protect, support and maintain utility facilities as specified in Section 02270.
- E. Proceed with caution in areas of utility facilities; expose them by hand excavation or other methods acceptable to the facility owner.
- F. Control runoff so that water does not run through excavation area. Keep excavation free of water.
- G. Remove excavated materials to fill, embankment, stockpile or disposal locations. Keep haul routes clean in accordance with the General Requirements.
- H. Fill excess excavations with approved materials and compact as specified.
- I. Unauthorized excavation for the purpose of obtaining materials for resale or for use at another job site is prohibited unless otherwise approved by the Engineer.

### **3.03 ROCK EXCAVATION:**

- A. Perform rock excavation to neat lines shown and so as to produce surfaces free of loose rock.
- B. Install rock reinforcement in accordance with Section 02420.
- C. Remove loose, semi-detached and unsound fragments from blasted surfaces. Remove standing water, debris, oil and other objectionable coatings from surfaces of rock upon or against which concrete or porous fill material is to be placed.
- D. Repair shattered or loosened rock surfaces outside neat lines shown, which in the opinion of the Engineer would be detrimental to subway structure or would adversely affect subway drainage system.
- E. Where directed, grout rock surfaces which have not been shattered but are naturally permeable.
- F. Remove excavated rock to approved fill locations or disposal locations.
- G. Fill excess excavation with concrete or other approved material.
- H. If flowing or seeping water is encountered during excavation, install approved drainage system in accordance with Section 02240.

### **3.04 REMOVAL OF SUBSURFACE OBSTRUCTIONS:**

- A. Permanent Closure walls:
- B. Prior to removal of parts of vaults or areaways which extend into Contract limits, build permanent closure walls where shown in such vaults or areaways to separate areas to be left intact from areas to be removed.
  - 1. Obtain the Engineer's approval of permanent closure wall design prior to its installation.
- C. Remove vaults, areaways and foundation walls as shown.

### **3.05 EMBANKMENT, FILL AND BACKFILL:**

- A. Place embankment, fill and backfill in eight-inch loose layers, unless otherwise shown, for entire width so that each layer can be uniformly and properly compacted.
- B. Avoid accumulation of large pieces of material at one location. Fill voids and interstices with finer materials.
- C. In confined areas, use approved power-actuated compactors to achieve required density.
- D. Prior to compaction, adjust moisture content of material within required limits by drying or watering either at material source or on fill.
- E. Leave struts, braces, lagging and timber sheathing in place as long as needed to support excavation and adjacent facilities and structures.
- F. Where utility facilities and structures are supported in place, use special equipment and techniques as required to achieve specified compaction under and around them.
- G. Do not place backfill on subway structures until requirements for curing and waterproofing have been complied with and, if required, until test cylinders for particular structure indicate that concrete has attained specified compressive strength.
- H. When backfilling against structures, place material approximately simultaneously on both sides of structures to equalize opposing horizontal pressures.
- I. When backfilling on tops of structures, place material in six-inch lifts over full area.
- J. Under concrete floor and other slabs on grade, place drainage material directly on prepared subgrade which meets density and elevation requirements. Compact with hand-operated plate-type vibratory compactor.
- K. Prior to placing embankment against slope greater than one vertical to four horizontal, cut benches into existing slope. Height of bench not to exceed two feet unless otherwise approved.
- L. Maintain embankment, fill and backfill in stable, well-drained condition.
- M. Where approved, dispose of surplus excavated material by widening embankments and flattening slopes.
- N. Where pervious material will be exposed to erosion, cover it with 12-inch layer of approved impervious material compacted in place.

**3.06 COMPACTION ADJACENT TO STRUCTURES:**

- A. Compact embankment, fill or backfill materials within five feet of retaining walls, abutments or other structures using lightweight compactors.
- B. Do not overstress structures.
- C. Backfilling against new structures without approval is prohibited.

**3.07 EXCAVATION OF UNSUITABLE MATERIALS:**

- A. Remove unsuitable materials from the site.
- B. Replace unsuitable material with approved material and compact as specified.

### **3.08 PREPARATION OF GROUND AS SUBGRADE:**

- A. Where the subgrade is on original ground or in cut or where embankment or fill is less than one foot, fulfill compaction requirement for 12 inches minimum below final subgrade.
- B. If necessary, scarify original ground and adjust moisture content prior to compacting.

### **3.09 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  - 1. Construct finished subgrade to vary not more than 0.05-foot above or 0.10-foot below elevation shown.
  - 2. Complete embankment slopes to plus-or-minus 0.5 foot of slope line shown.
  - 3. Maintain moisture content of embankment, fill or backfill material within plus-or-minus three percent of optimum moisture content of material.
  - 4. Compact each layer of embankment, fill or backfill to 95 percent of maximum dry density as determined in accordance with ASTM D698, at moisture content within tolerance specified, except the following:
    - a. From upper surface of fill or backfill to a plane 12 inches below subbase level of vehicular pavement, sidewalks, trackbeds and structural foundations to 100 percent of maximum dry density at moisture content within tolerance specified.
    - b. In areas of 95-percent compaction where utility facilities are located in fill and are not supported on concrete cradles, compact material for a depth of one foot directly below bottom of facility to 100 percent of maximum dry density at moisture content within tolerance specified.
- B. Test Method:
  - 1. Determine the maximum dry density and the optimum moisture content in accordance with ASTM D698.
  - 2. Determine in-place density and moisture content in accordance with ASTM D2922 and ASTM D3017 respectively, or other test methods acceptable to the Engineer.

### **3.10 TUNNELING FOR OR JACKING OF UTILITY FACILITIES:**

- A. Location of facility, method of construction, type of equipment and procedures: As approved.

### **3.11 FINISHING:**

- A. On completion of work, clean ditches and channels.
- B. Slope and shape borrow areas to provide positive drainage.
- C. Remove unsuitable and surplus excavated materials to locations outside the Authority's right-of-way.
- D. Leave site in neat, presentable condition.

**END OF SECTION**

## SECTION 02410

### ROCK TUNNELING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies the following:
1. Rock tunneling for running sections, stations, pilot drifts through stations, side drifts, crossover and transition sections, vaults, adits, auxiliary tunnels, escalator ways and cross-passages.
  2. Tunnel linings.
- B. Related Work Specified Elsewhere:
1. Grading, excavating and backfilling: Section 02320.
  2. Dewatering: Section 02240.
  3. Subway drainage system: Section 02625.
  4. Earth tunneling: Section 02415.
  5. Rock reinforcement: Section 02420.
  6. Drilling and pressure grouting for rock tunnels: Section 02431.
  7. NATM excavation (rock): Section 02411.
  8. Concrete work: Sections 03100, 03200 and 03300.
  9. Shotcrete: Section 03370.
  10. Structural steel: Section 05120.
  11. Epoxy injection: Section 07125.
  12. Bentonite slurry: Section 07170.
  13. Piping systems: Section 15205. \*1
- C. Definitions:
1. Rock tunneling: Excavation of natural rock, which requires use of rock excavation methods, such as drilling and blasting, channeling, wedging or barring, or rock tunneling machines.
  2. Controlled blasting: Excavation of rock in which the various elements of the blast, i.e., hole size, depth, spacing, burden, charge size, distribution, delay sequence, are carefully balanced and controlled to provide a distribution of charge which will excavate rock to required contours with smooth surface to minimize overbreak, stressing and fracturing of the rock beyond the contour line. Smooth-wall blasting, presplitting, cushion blasting and line drilling are examples of operations included in the term controlled blasting.
  3. Initial support:
    - a. Elements designed, furnished and installed by the Contractor for stability and safety during construction and not shown.
    - b. To the extent elements of permanent lining shown are effective in providing initial support, such elements may be utilized to provide initial support. If permanent lining must be augmented by initial support to ensure stability and safety during construction, provide elements of such initial support.
    - c. Elements of initial support may be in the form of additional rock bolts, shotcrete, plain concrete, reinforced concrete, timber or steel members which may be temporary or permanent if compatible with permanent lining shown. Plain or reinforced concrete may consist of elements such as wall girders, carrier beams or supplementary foot blocks for temporary posting. Timber may consist of elements such as posts, struts and cross beams. Steel members may consist of such elements as steel sets, straps, spiling,

crown bars, carrier beams, girders, brackets, posts, struts, shores or needle beams. Design and provide these or other alternative elements, singly or in combination, to ensure stability and safety during construction. Install initial support to transfer loads to rock so as to ensure stability and safety during construction.

4. Permanent lining: Tunnel lining elements and support as shown.

## 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of the jurisdictional authorities.
  2. Appendix G of the General Requirements: Geotechnical Design Report.
  3. MS: MIL-P-26915 (USAF).
  4. ASTM: C171, D638, D1304. \*<sup>2</sup>
  5. ASTM: C171, D638, D1304, D1785, D2464, D2564. \*<sup>3</sup>
- B. Blasting Consultant:
  1. Engage the services of approved, qualified independent, professional blasting consultant to design, review, evaluate and modify blasting operations.
- C. Allowable Tolerances:
  1. Steel rib bending tolerance:
    - a. Conformance to true template:
      - 1) Wide-flange sections up to 14 inches deep weighing 150 pounds per foot: Rib segments to conform to true template at butt plates; intermediate points may depart from true template up to 3/8 inch, providing no point departs more than 1/8 inch from three-foot template section.
      - 2) Wide flange sections heavier than 150 pounds per foot: Intermediate departure not exceeding 5/8 inch from true template; deviation from three-foot template section not exceeding 3/16 inch.
    - b. Bending curvature uniform.
    - c. After bending:
      - 1) Outer flange will be permitted to droop 1/8-inch maximum toward inner flange for radii of bend equal to or greater than 14 times rib depth; 1/4-inch maximum droop will be permitted for radii of bend which are less than 14 times rib depth.
      - 2) Rib depth at not less than theoretical depth minus 1/4 inch.
  2. Steel rib fabrication tolerances:
    - a. Chord, out-to-out of butt, foot plates or both measured on centerline of rib: Theoretical length plus-or-minus 1/16 inch.
    - b. Face of butt or foot plates: Within plus-or-minus 1/16 inch of theoretical plane.
    - c. Gap between ends of ribs and butt or foot plates prior to welding not exceeding 1/16 inch for at least 75 percent of cross sectional area of rib. Where gaps are in excess of 1/16 inch, fill by additional steel-shim welding.
    - d. Tie rod holes in rib webs: Within plus-or-minus 3/8 inch of locations shown on approved shop drawings.
    - e. Width or length of sheared plates: Within theoretical dimension plus-or-minus 1/8 inch.
    - f. Center-to-center of bolt hole dimensions on butt or splice plates: Theoretical dimension plus-or-minus 3/64 inch.

- g. Bolt hole groups in butt or splice plates after fabrication: Within plus-or-minus 1/16 inch of theoretical location regardless of variations in rib resulting from other tolerances.
- h. Holes in butt plates welded to ribs: Within plus-or-minus 1/16 inch of theoretical location.
- 3. Precast-concrete segment tolerances: As shown.
- 4. Watertightness criteria: Section 03300.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Working Drawings:
    - a. Prior to using tunneling machines, submit drawings showing design, specification, method of operation and other pertinent data.
      - 1) Drawings and pertinent data for shielded tunnel-boring machine (TBM). Show dust-suppression system. If precast-concrete tunnel-lining segments are used, show the following:
        - (a) That machine can develop forward thrust independently of installed precast-concrete tunnel lining, if this lining is to be used.
        - (b) That machine is equipped to handle and erect precast-concrete segments behind cutter head within tail shield, including auxiliary equipment necessary for erection.
        - (c) Descriptions, data or calculations of proposed facilities, equipment to be utilized and method of construction. Items include, but are not limited to, the following: Hoisting plant, tunnel ventilation, lighting and drainage; groundwater-control methods; temporary shafts, cuts, ramps and tunnels; breakouts; cross passages; bulkheads; details of initial support; details of placing concrete and erection procedures for the installation of precast-concrete tunnel lining.
    - b. For excavation of tunnels and stations, submit drawings, calculations, descriptions and specifications for the following:
      - 1) Number, size, location, orientation and direction of excavation of drifts and benches including those excavated previously and temporary drifts.
      - 2) Sequence and timing of excavating drifts and benches including stagger of advance of heading in adjacent drifts or benches and anticipated rate of advance.
      - 3) Blasting program including length of round and charge distribution for each drift.
      - 4) Initial support elements, including when and where they will be installed in relation to excavation plan and sequence and design calculation and assumptions.
      - 5) Permanent lining elements relationship to initial support elements and to the plan and sequence of excavation and support.
      - 6) Construction equipment and capacities.
      - 7) Assumptions used in arriving at above items, including:
        - (a) Thickness and condition of various zones of rock, decomposed rock and overburden.
        - (b) Incidence, orientation and extent of rock discontinuities including foliation, joints, shears, fractures, faulting, folding,

- depth and degree of weathering, condition of discontinuities (open, tightly closed, gouge-filled).
    - (c) Relationship of excavation and initial support to rock discontinuities.
    - (d) Design load conditions and design mechanical properties of rock and discontinuities used for determining initial support requirements.
    - (e) Stability of sidewall and vertical rock faces with respect to excavation dimensions, sequence and rock discontinuities.
    - (f) Groundwater.
- 2. Certification:
  - a. Certified test report of properties of electrical insulative coating.
- 3. Documentation:
  - a. Blasting plan:
    - 1) Not less than 30 days prior to starting a new phase of work, submit the following data concerning proposed blasting operations:
    - 2) Location, depth, area, anticipated neat lines and relationship to adjacent excavations and structures.
    - 3) Diameter, spacing, burden, depth, pattern and inclination of blast holes.
    - 4) Type, strength, amount in terms of weight and cartridges of explosives to be used in each hole, on each delay and total for each blast.
    - 5) Distribution of charge in each hole and priming of each hole.
    - 6) Type, sequence and number of delays, delay pattern; wiring diagram for blast; size and type of hookup lines, and lead lines; type and capacity of firing source; type, size and location of safety switches, lightning gaps.
    - 7) Scaled range or distance used to calculate scaled range if blast will exceed vibration limits.
    - 8) Stemming of holes and matting or covering of blast area.
    - 9) Qualifications of person directly responsible for supervising loading of shot and for firing it.
    - 10) Complete, maintain and submit permanent blast reports including logs of each blast. Complete reports after each blast to include the following:
      - (a) Date, time and limits of blast by station.
      - (b) Amount of explosives used by weight and number of cartridges.
      - (c) Total number of delays used and number of holes used for each delay period.
      - (d) On a diagram of approved blast pattern indicate each hole not drilled, drilled but not loaded, changes in spacing or in pattern of delays or in loading of holes.
      - (e) Total number of holes, maximum charge per hole and corresponding delay number.
      - (f) Evaluation of blast indicating tight spots, areas of significant overbreak and recommended adjustments for next blast.
  - b. Permits for disposal of excavated material:
    - 1) Arrange for disposal of excavated materials at locations outside the Authority's right-of-way, and obtain written permits from owners of property where excavated material will be deposited.

- 2) Submit each permit and release from each property owner absolving the Authority from responsibility in connection with disposal of such material.
- 3) Details of temporary ventilation:
- 4) In the event it is planned to use equipment not covered by the SAFETY REQUIREMENTS article of the General Requirements, submit details of such equipment.
- 5) Approval of the use of alternative equipment will depend on submitted research information concerning performance in accordance with applicable standards in common use.
  - a. Air-quality reports:
  - b. Daily reports of tests for dust, toxic and hazardous gases and other atmospheric impurities in the working environment during construction.
  - c. Leak repair work plan:
    - 1) Include proposed application methods, equipment details and schedule, as well as complete manufacturer's literature, data, instructions and recommendations.
    - 2) Submit prior to beginning leak repair work.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Formwork: Section 03100.
- B. Reinforcing Steel: Section 03200.
- C. Concrete: Section 03300, Class 3500; Class 2500 concrete backfill where specified for rock trench for track drain.
- D. Contact Grouting: Section 02431.
- E. Structural Steel, Ribs, Beams, Channels and Plates: Section 05120.
- F. Bolts: ASTM A325, unless otherwise shown or specified.
- G. Timber for Blocking, Lagging, Foot Blocks and Cribbing: Sound, well-seasoned, hardwood timber of rectangular cross section.
- H. Track Drainage: Section 02625.
- I. Porous Subgrade Material: Section 02625.
- J. Pea Gravel: Smooth, rounded pieces of gravel, clean and free from objectionable materials such as soft particles, coal and lignite particles or friable particles, graded from 1/4 to 3/8 inch in size.
- K. Sand: Section 03300, fine aggregate, except 100-percent passing U.S. Standard Sieve Size 16.
- L. Precast Concrete Tunnel Lining Segments: Section 02425.
- M. Impervious Membrane: Polyethylene, ASTM C171, clear or opaque, 0.006-inch thickness.

- N. Epoxy Injection Material: Section 07125.
- O. Bentonite Slurry for Repair of Leaks: Section 07170.
- P. Epoxy Mortar:
  - 1. Two-component, solventless epoxy-resin system, with 100-percent solids, workable in temperature range of 50F to 60F when mixed with sand in specified proportions.
  - 2. Epoxy-resin system: FX-775, Fox Industries, Incorporated; Sikadur 31, Hi-Mod Gel, Sika Chemical Corporation or approved equal.
  - 3. Sand for use with epoxy resin: Three parts No. 16 sand to one part No. 90 sand. High-silica type, dry and bagged.
  - 4. Add sand to epoxy paste as necessary to provide best workability characteristics up to one part sand per one part epoxy.
- Q. Electrical Insulative Coating: Approved moisture-insensitive coating, 100-percent solids, containing no solvents for use on dry or damp concrete or steel surfaces, with the following additional requirements:
  - 1. Properties:
    - a. Minimum tensile strength: ASTM D638, 5,000 psi in 14 days.
    - b. Dielectric strength: ASTM D1304, 440-465 volts per mil.
    - c. Dielectric constant: ASTM D1304 as follows:
      - 1) 60 Hertz: 3.4-3.5.
      - 2) 1,000 Hertz: 3.3-3.4.
    - d. Power factor: ASTM D1304 as follows:
      - 1) 60 Hertz: 0.006-0.007.
      - 2) 1,000 Hertz: 0.03-0.04.
    - e. Viscosity: 6,000 centipoises plus-or-minus 1,000 centipoises, as determined by Brookfield Viscometer using No. 6 spindle at 50 rpm.
  - 2. Primer: Zinc-rich primer, MS MIL-P-26915 (USAF) Type 1, Class B.
- R. Hydrostatic-Pressure Relief System: \*4
  - 1. Plastic pipe: PVC, Schedule 40, ASTM D1785.
  - 2. Plastic fittings: PVC, Schedule 40, ASTM D2464.
  - 3. Solvent cement: ASTM D2564.
  - 4. Galvanized steel pipe and fittings: Section 15205.

## 2.02 FABRICATION:

- A. Fabricate steel supports in accordance with Section 05120.
- B. The following operations are not required:
  - 1. Portions of bearing members such as butt and foot plates, straightened, planed and connected after fabrication.
  - 2. Grinding to remove nicks resulting from flame-cutting.
  - 3. Planing and facing of sheared edges or bearing surfaces.
  - 4. Subpunching or subdrilling of bolt holes.
  - 5. Inspection of groove and fillet welds by other than visual inspection.

## PART 3 - EXECUTION

### 3.01 TEMPORARY VENTILATION:

- A. Provide, operate and maintain for duration of project temporary ventilation system which conforms to specified safety requirements and those of jurisdictional authorities. Remove system from site when work is completed.

### **3.02 SAFETY REQUIREMENTS:**

- A. Perform work so as to minimize safety hazards and exposure of men and equipment to hazardous and potentially hazardous conditions in accordance with specified safety requirements.
- B. In case of emergency or work stoppage likely to endanger excavation or adjacent structures, continuously maintain full work force 24 hours per day including weekends and holidays until emergency or hazardous conditions no longer jeopardize stability and safety of the work.

### **3.03 DISTANCE BETWEEN HEADINGS:**

- A. Maintain longitudinal distance of no less than 150 feet between two adjacent tunnel faces being simultaneously excavated unless otherwise shown or approved in writing.
- B. Where tunnel heading is being advanced adjacent to previously excavated tunnel, ensure that initial support in first tunnel is completely installed and is adequate to withstand construction of second tunnel.

### **3.04 DETECTION OF MOVEMENT:**

- A. In accordance with the General Requirements and as shown, install, maintain and make observations of a system of detection of vertical and horizontal movement of ground, tunnel support, permanent lining and utilities adjacent to the work.
- B. Special Instruments:
  - 1. Provide instrumentation as specified and where shown.
  - 2. Provide such facilities as directed for monitoring these instruments and take appropriate action to arrest movement revealed by resulting observations.

### **3.05 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  - 1. Excavate to accommodate tunnel cross section and minimum thickness of lining selected to within one inch of alignment and grade shown.
  - 2. When steel ribs are used for initial support, do not permit any portion of lagging except clips or bolts used to attach lagging to ribs to extend into tunnel within concrete design line as shown nor any portion of steel rib including bracing to extend further than three inches into concrete design line.
  - 3. Place cast-in-place tunnel concrete to the following tolerances:
    - a. Tunnel lining:
      - 1) Departure of tunnel from line or grade shown as measured from working point of tunnel: One inch.
      - 2) Variation in thickness of lining at any point: Minus zero inch.
      - 3) Variation in internal diameter at any point: One inch.
    - b. Invert: As specified in Section 03300.
    - c. Safety walk: As specified in Section 03300.
  - 4. Install precast concrete segment lining to tolerances shown.

### **3.06 EXCAVATION:**

- A. Excavate to lines, grades, dimensions and tolerances as shown and specified to accommodate initial support and permanent lining.

- B. Tunneling Machine:
1. When excavating with tunneling machine, use equipment which includes dust-control system with spray system and dust shroud. Keep intake end of fan suction line as close to machine as possible without interfering with other operations.
  2. Use equipment which permits installation of initial support no further than ten feet from tail. Use hood if necessary. Install initial support in accordance with approved working drawings.
  3. In order to exercise option for using circular permanent lining comprised of precast segments, excavate tunnel and erect the segments by means of TBM. If, during machine boring, material is encountered in reaches of tunnel that cannot be excavated satisfactorily by TBM, excavate such reaches by other approved methods. Provide necessary initial support and cast-in-place concrete permanent lining as shown for such conditions.
- C. Air Quality:
1. Perform drilling and tunneling operations by methods and with equipment which will positively control dust, fumes, vapors, gases, fibers, fogs, mists or other atmospheric impurities in accordance with specified safety requirements.
  2. Provide approved instruments for testing quality of tunnel atmosphere; take samples under working conditions at prescribed intervals. Submit results of the quality tests.
- D. Drilling and Blasting:
1. Perform blasting in accordance with the General Requirements and approved blasting plan.
  2. Have the blasting consultant design initial blasts as well as supervise and conduct test blasts, if required, until regular production controlled blast patterns are developed that produce desired rate of excavation while meeting requirements for vibration and air-blast control. Have consultant periodically, or when requested by the Engineer, review blasting operations and direct such changes in blasting operations as necessary to produce a controlled blasting operation meeting specified requirements.
    - a. Before blasting within 50 feet of cured concrete, except shotcrete, submit and obtain approval of plan showing relative positions of concrete, area to be blasted and blasting technique to be employed.
    - b. Protect concrete work and structures in vicinity of blasting by limiting size of blasts, by covering blasts and by other means until it is certain that there is no danger of damage by shock waves or flying rock.
    - c. Use controlled blasting techniques. Modify blasting round as necessary to achieve best obtainable results and to keep vibrations and noise within limits specified.
    - d. As excavation proceeds and immediately after each blast, test the roofs and walls; scale loose and shattered rock which is likely to fall. Carry out similar checks on previously excavated sections at least every 48 hours; recheck support system and tighten, lagging, blocking and rock bolts as necessary.
    - e. When so directed, drill feeler or pilot holes no less than 1-1/2 inch diameter ahead of excavation to predetermine nature and condition of materials to be excavated. Number of holes, location, direction and length, minimum 15 feet and maximum 30 feet: As directed.
    - f. Install initial support in accordance with approved working drawings.
- E. Vibration and Air-Blast Control:
1. Control operations in accordance with the following:
    - a. Peak particle velocity:

- 1) Not to exceed two inches per second (ips) measured in or at any adjacent existing structure outside limits of construction site.
- 2) Peak particle velocity at structural concrete not to exceed the following limits dependent on age of freshly-placed concrete and powder charge per delay:

Concrete Age	Maximum Peak Particle Velocity (ips)
Less than three days	0.2
Between three and seven days	2.0
Over seven days	4.0

- 3) Calculate values of maximum powder charge per delay permissible at specified intervals of distance between point of detonation and critical structure and submit for approval.
  - 4) exceed 140-dB peak sound-pressure level measured at edges of shafts or portals of tunnels.
2. Peak particle velocity is defined as maximum of three velocity components of a vibration measured at any point in three mutually perpendicular directions by an appropriate instrument.
  3. Peak sound-pressure level is the peak level measured on the A-scale of a standard sound-level meter at slow response.
  4. The Engineer may make measurements to determine if the Contractor's operations are exceeding such requirements. This data will be available to the Contractor.
  5. If data indicates that specified requirements are not being met, take necessary measures including reducing size of charge, covering or matting blasts to reduce noise and vibrations to acceptable levels.
- F. Dispose of excavated materials as specified.
- G. Drain excavated areas as necessary in accordance with requirements of Section 02240.
- H. If initial support is necessary, keep its installation within three feet of excavated face; do not leave tunnel unsupported without full initial support for longer than three hours after excavation. Stabilize face if necessary.

**3.07 STRUCTURAL STEEL SUPPORT FOR PERMANENT LINING:**

- A. Install structural steel supports true to lines and grades, blocked, braced and wedged against rock surface or against initial layers of shotcrete placed on rock surface.
- B. Install supports as soon as possible after initial layers of shotcrete are placed or as soon as possible after exposing rock by excavation and as close to headings as work will permit.
- C. For support at base of steel ribs, use steel foot plates resting on smooth bearing surface formed by precast concrete or low slump, dry-packed concrete.

- D. Position joints to facilitate steel-rib installation as necessary and as approved.
- E. Wedge and brace blocking and cribbing solidly between rock surface or initial shotcrete layer and steel supports. Check blocking and cribbing and retighten after every blast or more frequently as necessary to maintain it in a secure condition.
- F. Use no greater amount of wedging, blocking, timber lagging and cribbing than necessary to support ground safely and to distribute load to structural-steel supports.
- G. Do not cover more than 25 percent of rock surface above spring line with wedging, blocking, timber lagging and cribbing nor more than 25 percent of projected rock surface of walls below spring line. 25-percent criterion applies along any 10 feet of horizontal underground excavation and between any two adjacent steel ribs placed less than 10 feet on center.
- H. Limit spacing of blocking and wedging points on outside flange of steel set to 48 inches maximum, unless otherwise shown.
- I. Steel lagging may be used in any amount in any underground excavation providing it permits ready placement of shotcrete and flow of concrete around it.
- J. Place wedging, blocking, lagging and cribbing in an open arrangement to permit ready placement of shotcrete and flow of concrete through and around them.
- K. Repair or replace structural steel supports placed improperly or damaged.

**3.08 PERMANENT LINING:**

- A. Cast-In-Place Concrete:
  - 1. Invert:
    - a. Prior to installing drainage system and constructing invert slab, clean off loose material.
    - b. Install drainage pipes and place porous subgrade material as shown and in accordance with Section 02625.
    - c. Place impervious membrane over subgrade layer and extend it continuously up sides of invert and above top of expansion-joint material, taking care to prevent puncturing and tearing it. Tape laps and repair tears or punctures in membrane with material recommended by membrane manufacturer.
  - 2. Permanent lining: In accordance with Sections 03100, 03200 and 03300 and as follows:
    - a. Prior to placement of concrete, remove timber blocks or wedges extending into concrete design line by such means as to not endanger stability of surrounding ground.
    - b. Place concrete for lining upper portion of tunnel by mechanical or pneumatic methods through pipes which discharge as nearly as practicable to highest point of structure. Do not use pneumatic equipment with high-velocity delivery, unless it has velocity-discharge control and unless its discharge line is continuously embedded at least four feet in fresh concrete
    - c. Fill spaces around posts, ribs and lagging beyond limits of concrete lining. Use concrete, grout or mortar as best suited to conditions at particular locations.
    - d. Fill enlargements of tunnel excavation beyond dimensions shown with concrete or grouted prepacking.
    - e. Force concrete into contact with lagging and ribs

- f. After concrete has attained its design strength, perform contact grouting to fill voids in accordance with Section 02431.
- g. For sections in which permanent lining includes steel ribs, comply with sequence of operations and details shown.
- h. Starter walls:
  - 1) Construction of starter walls, 18 inches minimum height, permitted as separate pour after supporting concrete has attained strength to support starter wall forms.
- i. Tolerances for cast-in-place permanent tunnel lining are based on design alignment, not on actual alignment. Locate initial support with sufficient allowance for permanent lining without violating clearance requirements.

B. Precast-Concrete Tunnel Lining:

1. Install tunnel lining so as to prevent damage to lining and coating. Use taper rings on curves.
2. When installing segments ensure that edges are clean and free from materials that could interfere with proper bearing of segments.
3. Place invert segment over properly shaped bed of pea gravel providing full and even bearing.
4. Alternate erection of side segments to prevent shifting of invert segment.
5. Erect precast-concrete segments immediately behind tunneling-machine cutter head and inside tail shield of TBM.
6. Complete ring of precast-concrete segments, without dislodging or damaging gasket. Lubricate gasket of last segment of each ring prior to its installation.
7. Backpack solidly each completed ring of precast-concrete segments with pea gravel and grout. Place pea gravel so as to ensure complete filling of space between lining and excavated surface of tunnel. Do not install more than two completed rings without filling space between lining and excavated surface of tunnel. Proceed with backfill grouting from bottom holes to top holes of completed rings. Use bulkheads as necessary to complete filling of space behind segments. Grouting pressure: 20-psi minimum, 30-psi maximum.
8. Continuously hold last six completed rings from heading by sufficient force to prevent separation of rings. Gap between adjacent rings not to exceed 1/8 inch.
9. Perform necessary remedial work. Damaged precast-concrete segments may be removed, repaired and reinstalled if approved.
10. Fill grout holes with portland-cement grout after backfill grouting is completed for each ring.

C. Hydrostatic-Pressure Relief System. \*5

1. Install hydrostatic-pressure relief system as shown.

**3.09 INSTALLATION OF ELECTRICAL INSULATIVE COATING:**

- A. Apply coating prior to placement of invert and safety-walk concrete on precast segmented lining. Do not apply in tunnels where full circumference water proofing membrane is shown or specified.
- B. Surface Preparation:
  1. Remove dirt, grease and heavy laitance by wet sandblasting, water blasting or wire brushing.
- C. Application:
  1. Apply in two coats of equal thickness totaling 20 mils minimum dry-film thickness (DFT) in accordance with recommendations of coating manufacturer.

### **3.10 TUNNEL CONNECTIONS AND TERMINATIONS AND TEMPORARY BULKHEADS:**

- A. Connect new tunnels to existing structures by removing existing bulkheads and constructing junction as shown.
- B. By means of temporary bulkheads, seal terminations of tunnels which are not connected to existing structures.
- C. Design temporary waterproof bulkheads where and when necessary, capable of resisting lateral pressures and capable of removal without damaging permanent lining. Obtain approval of design prior to construction.

### **3.11 TEMPORARY WORKSHAFTS AND OTHER OPENINGS:**

- A. Excavate and support temporary workshafts and other openings in accordance with Sections 02320 and 02260.
- B. Seal such openings when no longer necessary.
- C. Form and place Class 2500 concrete, two feet thick, in shafts over tunnels to prevent damage to tunnel shape. When concrete has attained design strength, backfill remaining void in accordance with Section 02320.

### **3.12 DEFECTIVE LINING:**

- A. Precast concrete segmented tunnel lining will be considered defective unless it is watertight, properly finished and within specified tolerances and has undamaged edges and joints.
- B. Watertightness Criteria: Section 03300.

### **3.13 CORRECTIVE WORK:**

- A. Repair of Concrete Segments: Repair segments which have minor chipping of edges and corners, using epoxy mortar having surface color and texture closely matching adjacent concrete surfaces. As directed, repair or replace with new segments those cracked segments which the Engineer determines will impair structural integrity of tunnel lining.
  - 1. Ensure that surfaces to be repaired are clean, dry, free from dirt, dust, oil, water and other contaminants.
  - 2. Mix and place epoxy mortar as recommended by manufacturer of epoxy resin. Grind rough or raised projections smooth and flush with adjacent surfaces.

### **3.14 LEAK REMEDIATION:**

- A. If water leakage into tunnel exceeds specified allowable limit, undertake remedial measures such as injection of epoxy, bentonite slurry, chemical grout, cement or a combination thereof in accordance with Sections 07125 and 07170.
- B. Prior to beginning work, submit leak-remediation plan.
- C. If possible, use existing grout holes for injecting material.
- D. Establish injection pressure by means of on-site demonstration; do not exceed structural capacity of lining.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

- \*1. Add Article 1.1 B.13. for contracts where hydrostatic-pressure relief system work is directed to be performed.
- \*2. For contracts where hydrostatic-pressure relief systems work is not directed to be performed.
- \*3. Modification for contracts where hydrostatic-pressure relief systems work is directed to be performed.
- \*4. Add 2.1 R. including 1.-4. for contracts where hydrostatic-pressure relief system work is directed to be performed.
- \*5. Add 3.8 C. including 1. for contracts where hydrostatic-pressure relief system work is directed to be performed.

**END OF SECTION**

## SECTION 02415

### EARTH TUNNELING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies the following:
1. Earth tunneling for running sections, side drifts, adits and auxiliary tunnels.
  2. Installing tunnel linings.
  3. Concrete filled voids.
  4. The references in this section to steel ribs and lagging are restricted to the following:
    - a. Misalignment correction.
    - b. Stabilizing excessive deformations occurring in the precast segments.
- B. Related Work Specified Elsewhere:
1. Grading, excavating and backfilling: Section 02320.
  2. Dewatering: Section 02240.
  3. Support of excavation: Section 02260.
  4. Underpinning, support and restoration of structures: Section 02255.
  5. Subway drainage system: Section 02625.
  6. Rock tunneling: Section 02410.
  7. Earth (EPBM) tunneling: Section 02416.
  8. Precast-concrete tunnel-lining: Section 02425.
  9. Concrete work: Sections 03100, 03200 and 03300.
  10. Membrane waterproofing: Section 07125.
  11. Bentonite waterproofing: Section 07170.
  12. Tunnel waterproofing (two-pass system): Section 07137.
- C. Definitions:
1. Earth tunneling: Mined excavation in earth. The following, among others, are classified as excavation in earth: Mixed-face, filled ground including rock fill, boulders, concrete or stone masonry, buried trees, timbers or plankings, conduits, pipes or drains, wood, concrete or steel piles and sheeting and soft decomposed or disintegrated rock.
  2. Mixed-face tunneling: Mined excavation of earth and rock materials both in the same heading at the same time.
  3. Initial support: Elements designed, furnished and installed by the Contractor for stability and safety during construction preparatory to the construction of permanent lining.
  4. Permanent lining:
    - a. For single-pass system precast concrete tunnel lining elements as shown.
    - b. For the two-pass system there are two layers of linings, the initial and the final. The initial lining consists of precast concrete segments which are either jacked in place and retained by dutchmen and filled with concrete or grout to form the ring, or gasketed and bolted segments to form the ring. Final liner is a cast-in-place concrete liner.
      - 1) Concrete filled voids: Voids or chimneys which develop as the result of run-in of soil into the tunnel and which extend entirely or partially to the surface. These voids are then filled with lean concrete.

## 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications.
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. Geotechnical Design Summary Report (GDSR) included as Appendix G to the General Requirements.
  - 3. AASHTO: M33, SDMS.
  - 4. MS: MIL-P-26915.
  - 5. FS: TT-S-230, TT-W-261.
  - 6. ASTM: A36, A325, A709, C109, C144, C150, D638, D1056, D1304, D2240.
  - 7. FGCC: Standards and Specifications for Geodetic Control Networks.
  - 8. OSHA: Standard 1926.800(k)(2) AND (3), CFR 1910720, CFR 1926.800.
  
- B. Watertightness Criteria: Section 03300.
  - 1. Survey Control:
    - a. Provide qualified survey personnel in accordance with the General Requirements pertaining to Layout of Work.
  - 2. Establish a secondary survey control system consisting of horizontal and vertical reference points for driving the tunnels and placing concrete lining. Install horizontal control points either as a brass disc or lead and tack. Install vertical control points either as a brass disc or a 1/2-inch diameter by minimum three-inch long anchor bolt with nut and washer.
    - a. Employ survey procedures and equipment in accordance with FGCC Standards and Specifications for Geodetic Control Networks, using Second Order, Class 1 specifications for horizontal control work and Second Order, Class 1 specifications for vertical control work.
    - b. Make tunnel horizontal transverses closed loops and adjusted by the least squares method. Make tunnel vertical traverses closed loops and adjusted by distributing the error of closure equally through the turning points. Provide the Engineer with traverse adjustment results within 24 hours.
    - c. Advance and verify underground tunnel control after each 500 feet of tunnel lining placement.
    - d. Install vertical control points maximum 300 feet on center throughout tunnel.
    - e. Install inter-visible theodolite instrument platform mounting brackets in the shotcrete lining, at or below the springline, at maximum intervals of 500 feet on center throughout the tunnel, for the purpose of maintaining the secondary horizontal control system. Install additional platform mounting brackets where tunnel alignment curvature does not allow for intervisibility between instrument locations.
    - f. See Part 2 - Products for bracket and surveyor platform specifications.
    - g. Survey Data Collection:
      - 1) Provide and maintain equipment and software necessary to record secondary survey control measurement observations. Assemble measurement observations in digital data collection files and provide data to the Engineer in a format that is compatible and in accordance with the AASHTO Survey Data Management System (SDMS) technical specification for survey data.
      - 2) Survey data collection files transmitted to the Engineer are to contain a time and date stamp for each observation, original field measurements, and the correctly computed coordinates/elevations in addition to the survey data tags necessary to recompute the file if required.
      - 3) Preserve original unedited data collection files and provide one copy of each file to the Engineer.

- h. Survey Equipment Adjustment and Calibration:
- 1) Adjust instrument for collimation error every six months or whenever difference between direct and reverse readings of theodolite depart from 180 degrees by more than 15 seconds. Readjust cross hairs and level bubble whenever their misalignments affect instrument reading by amount of least count.
  - 2) The National Geodetic Survey (NGS) has established specific calibration baselines for the purpose of comparing survey equipment to known monumentation to verify correct instrument operation and verification of compliance with manufacturer's specifications. Service every six months and check frequently the electronic distance measuring instruments (EDMI's) and retroreflectors over lines of known distance at an approved NGS baseline. Recalibrate an EDM I if physical damage is incurred.
  - 3) Compute calibration results using procedures in NOS NGS-10 Use of Calibration Base Lines. Record actual measurements, apply atmospheric corrections and then adjust by least squares to compute a constant, as well as a relative correction factor (scale correction). Calibrate prisms at the same facility.
  - 4) Forward results of this calibration to the Engineer. Post correction factors in Contractor's office for computing area and apply them as required to maintain specified accuracy.
  - 5) Immediately remove and repair, or replace instruments found to be in disrepair or misalignment.
  - 6) Provide a certification of adjustment to the Engineer for instruments to be utilized before commencement of survey work.
  - 7) Provide and maintain the ability in-house to check and adjust tribrachs for eccentricity. Perform adjustment checks at least once a week. Keep a record of adjustments to tribrachs current and made available to the Engineer monthly or upon request. Number and tag each tribrach with date of last adjustment.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings:
    - a. Design, specifications, method of operation and other data pertaining to tunnel shields and tunnel machine.
    - b. Manufacturers' printed literature for the products, equipment and instrumentation proposed for use in the work, annotated clearly to indicate exact items to be used
  2. Working Drawings:
    - 1) Detailed description, data or calculations of proposed facilities, equipment to be utilized and method of construction, including but not limited to, the following: Method of operation and other data pertaining to tunnel shields and tunnel machine, hoisting plant, tunnel ventilation, lighting and drainage; ground water control methods; pre-support (chemical) grouting methods; temporary shafts, cuts, ramps and tunnels; breakouts; cross passages; bulkheads; initial support; method of construction including details of installation of initial support and permanent lining; method of controlling line and grade of shield and lining; details of rib and segment ring movement measurement; details of method and procedure for the expansion of initial lining including jack pressures

- and test for completion of expansion; details of method and procedure for preventing the expansion jacks and dutchmen from dropping out from construction induced loads or vibrations; details of method procedure for filling expansion gaps with concrete and grout behind the initial tunnel support system.
- b. Have drawings and computations certified by a professional engineer experienced in earth tunneling and registered in the jurisdiction in which the work is to be performed.
  - c. Details of temporary ventilation:
    - 1) In the event it is planned to use equipment not covered by Section 101, Article VII.A., Safety Requirements, submit details of such equipment.
    - 2) Approval of the use of alternative equipment will depend on submitted research information concerning performance in accordance with applicable standards in common use.
  - d. Leak-remediation plan:
    - 1) Include proposed application method, equipment details and schedule, as well as complete manufacturer's literature, data, instructions and recommendations.
    - 2) Submit prior to beginning leak-remediation work.
  - e. Tunnel shield guidance system: Equipment and software details and operation. Include specific information concerning the method of controlling line and grade of Tunnel Boring Machine.
  - f. Contingency expansion or installation plans for initial lining: Submit in anticipation of the possibility that initial lining expansion or installation procedure is not successful.
  - g. Survey Control:
    - 1) Type and location of horizontal and vertical control monuments to be set.
    - 2) Survey procedures and equipment.
    - 3) Design and location of theodolite instrument platform mounting bracket, bracing support hardware, method of attachment to initial liner, brass mounting screw and standing platform underneath instrument mounting bracket.
    - 4) Survey data collection equipment and software; and traverse reduction and adjustment software.
    - 5) Survey equipment certification of adjustment; and calibration results of electronic distance measuring instruments (EDMI's) and prisms.
    - 6) Tribrach adjustment method and equipment.
3. Certification: Certified test report from the independent testing agency verifying that properties of concrete or non-shrink cement grout are as specified.
  4. Documentation:
    - a. Permits for disposal of excavated material: Each permit and release from each property owner where excavated materials will be deposited absolving the Authority from responsibility in connection with the disposal of such materials.
    - b. Air quality reports: Reports of tests for dust, toxic and hazardous gases and other atmospheric impurities in working environment.
    - c. Qualifications of the following:
      - 1) Survey personnel.
      - 2) Specialists in responsible charge of groundwater control.

- 3) Operators in responsible charge of operating the shield or the tunnel machine.
  - 4) Specialists in responsible charge of pre-support (chemical) grouting program.
  - 5) Independent testing agency.
5. Samples:
- a. Premolded circumferential filler: Two, each two feet square.
  - b. Asphalt-saturated felt filler: Two, each two feet square.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Maintain an adequate supply of straight and tapered precast concrete segments for tunnel lining on site.
- B. Avoid damage to surfaces and undue strain on segments during handling.
- C. Chemical Grout: Transport, store and handle chemical grout, catalysts, inhibitors, additives and buffers in accordance with manufacturer's instructions.

**1.05 JOB CONDITIONS:**

- A. Groundwater Control:
  - 1. Control groundwater along the tunnel alignment and within the tunnel heading to prevent the following:
    - a. Heaving of invert, boiling conditions, hazardous seepage and sudden inflow of soil at the tunnel face and at the tail of the tunnel shield.
    - b. Loss of ground and surface subsidence.
  - 2. Accomplish groundwater control by, but not limited to, the following:
    - a. Lower the water table in accordance with Section 02240.
    - b. Underpin and support structures in accordance with Section 02255.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Precast-Concrete Tunnel Lining Segments: Section 02425.
- B. Reinforcing Steel: Section 03200.
- C. Concrete: Section 03300.
- D. Track Drainage: Section 02625.
- E. Grout: Ingredients that are compatible, noncorrosive to steel and free from calcium chloride.
  - 1. Cement: ASTM C150, Type I.
  - 2. Sand: ASTM C144.
  - 3. Water: Potable.
  - 4. Admixtures and additives: Fly ash or other pozzolanic materials; fluidifiers; accelerating, retarding, and water-reducing agents; and bentonite may be used if approved.
- F. Non-Shrink Cement Grout:
- G. Chemical Grout: Gel-type as follows:

1. Self-supporting gel grout using a soluble polyacrylamide, producing no toxic hazard and which can be mixed in such proportions that dilute aqueous solutions, when properly catalyzed, will form stiff gels and yield true solutions at concentrations sufficiently high to accomplish soil solidification.
  2. Polymer solution mixed using formulations and procedures to provide variable gel times in accordance with the manufacturer's recommendations.
  3. Source: Chem G-9 by Polymer Chemicals, Incorporated or equal.
- H. Ribs, Beams, Channels, Plates and Retainers: ASTM A36.
- I. Timber for Blocking, Lagging, Foot Blocks and Cribbing: Sound, well-seasoned hardwood timber of rectangular cross section.
- J. Pea Gravel: Smooth, rounded pieces of gravel, clean and free from objectionable material, such as soft particles, coal and lignite particles or friable particles, graded from 1/4 to 3/8 inch in size.
- K. Sand: Section 03300, fine aggregate, except with 100-percent passing U.S. Standard Size 16 sieve.
- L. Sealant and Back-Up Rod:
  1. Siloxane-polymer sealant: FS TT-S-230.
  2. Back-up rod: 5/8-inch diameter polyethylene.
- M. White Lead (for Coating Grout-Plug Threads): FS TT-W-261.
- N. Bentonite Slurry: Stable suspension of powdered bentonite in water.
- O. Epoxy Mortar: Two-component, epoxy-resin and sand system without solvents; containing 100-percent solids, workable from 50F to 60F.
  1. Sand grading: Three parts No. 16 sand to one part No. 90 sieve sand, high-silica content, dry and bagged.
  2. Mortar mix: One part epoxy to maximum of one part sand.
- P. Premolded Circumferential Filler:
  1. Closed-cell neoprene, ASTM D1056, Grade SCE-45.
  2. Water absorption: No increase in weight in excess of two percent when tested in accordance with ASTM D1056 and completely immersed in water for 70 hours at 65F to 95F.
  3. Hardness: 50 plus-or-minus five on the Shore A durometer as measured by procedures given in ASTM D2240.
  4. Size: One-inch thick, width and length as shown.
- Q. Asphalt-Saturated Felt Filler: AASHTO M33.
- R. Electrical Insulative Coating:
  1. Properties: Moisture-insensitive coating, 100-percent solids, containing no solvents, for use on dry or damp concrete or steel surfaces, with the following additional requirements:
    - a. Minimum tensile strength: ASTM D638, 5,000 psi in 14 days.
    - b. Dielectric strength: ASTM D1304, 440-465 volts per mil.
    - c. Dielectric constant: ASTM D1304 as follows:
      - 1) 60 Hertz: 3.4-3.5.
      - 2) 1,000 Hertz: 3.3-3.4.

- d. Power factor: ASTM D1304 as follows:
  - 1) 60 Hertz: 0.006-0.007.
  - 2) 1,000 Hertz: 0.03-0.04.
- e. Viscosity: 6,000 centipoises plus-or-minus 1,000 centipoises, as determined by Brookfield Viscometer using No. 6 spindle at 50 rpm.
- 2. Primer: Zinc-rich, MS MIL-P-26915 (USAF) Type 1, Class B.

## **2.02 GROUT MIX DESIGN:**

- A. Stage I Mix: To develop compressive strength of 100 to 120 psi at 24 hours.
  - 1. Mix sand and cement dry.
  - 2. Add minimum water to achieve water-cement ratio compatible with pumping and placing requirements.
  - 3. Mix in high-speed mixer for minimum of three minutes.
  - 4. Prepare batches so that standing time does not exceed 45 minutes.
  - 5. Prepare trial mixes for laboratory testing.
  - 6. Perform tests of compressive strength in accordance with ASTM C109.
- B. Stage II Mix: Neat cement and water.

## **2.03 INSTRUMENT PLATFORM MOUNTING BRACKETS:**

- A. Construction: Steel, minimum 1/8-inch thick, having a smooth finish where instrument attaches. Make bracket rigid enough to resist deflection or movement when a theodolite is mounted and operated on top of it. If deflection or movement is apparent, add bracing supports as directed by the Engineer.
- B. Bracket Supports: Attach bracket supports to the underside of platform mounting bracket to provide a clear and unobstructed working area at and above platform.
- C. Size: Sufficient length and width to allow efficient set-up and operation of various theodolite and electronic distance measuring instruments (EDMI).
  - 1. Minimum width: Nine inches.
  - 2. Minimum length: Sufficient to allow a mounted instrument a at least one foot clearance from tunnel lining.
- D. Install platform mounting brackets to a level plane within the adjustment limits of a standard tribrach.
- E. Forced Centering Hole: Provide each platform mounting bracket with a forced centering hole to accept a brass instrument mounting screw (standard 5/8-inch by 11-inch thread) for securing a standard tribrach.
  - 1. Provide a brass mounting screw that is hollowed and of sufficient diameter to allow the instrument operator to site below platform mounting bracket with a nadir optical plummet.
  - 2. Mill force centering hole and brass mounting screw to match each other within 0.001 inch tolerance.
  - 3. Provide the Engineer with three mounting screws for duration of the Contract.
- F. Surveyor Platform: Provide a platform underneath each instrument mounting bracket for the purpose of supporting a surveyor during measurement observation process from wither side of instrument.

## **PART 3 - EXECUTION**

### **3.01 TEMPORARY VENTILATION:**

- A. Provide, operate and maintain for duration of project a temporary ventilation system which conforms to specified safety requirements and those of jurisdictional authorities, and is capable of providing twice the required volume and velocity of air flow as specified in OSHA Standard 1926.800(k)(2) AND (3). Assume that other conditions likely to produce harmful vapors or gases may be present at portions of the alignment. Remove system from site when work is completed.
- B. Use equipment which is adequate to maintain sufficient supply of fresh air in underground work areas.

### **3.02 SAFETY REQUIREMENTS:**

- A. Perform work so as to maximize safety and reduce exposure of men and equipment to hazardous and potentially hazardous conditions in accordance with specified safety requirements.
- B. Emergencies:
  - 1. In case of emergency or work stoppage likely to endanger excavation or adjacent structures, continuously maintain full work force 24 hours per day including weekends and holidays until emergency or hazardous conditions no longer jeopardize stability and safety of the work.
  - 2. For emergency purposes, have always on-site and ready for use a minimum of 12 steel rib rings and lagging sufficient to support 25 feet of tunnel.
- C. Perform tunnel construction so as to minimize ground movement in front of and surrounding tunnel and prevent subsidence of surface, structures and utilities above and in vicinity of tunnel.
- D. Support ground continuously so as to prevent loss of ground and keep perimeters and maintain stability of tunnel faces, passages and bottoms of shafts.
- E. If the Environmental Property Assessment Reports required in Section 101, indicate the potential for encountering contaminated groundwater or contaminated soil along the alignment, have electrical equipment in the tunnel and shafts comply with OSHA regulations CFR 1910720 and CFR 1926.800. Provide toxic and explosive gas sensors in the shafts, running tunnels and on the shield at the tunnel face to monitor the presence of potentially toxic or combustible materials.

### **3.03 BLASTING:**

- A. Whenever material requiring blasting is encountered, perform the work in accordance with Section 02410 and Section 101.

### **3.04 DISTANCE BETWEEN HEADINGS:**

- A. Maintain longitudinal distance of no less than 150 feet between adjacent tunnel headings being simultaneously excavated.
- B. Where tunnel heading is being advanced adjacent to previously excavated tunnel, ensure that initial support in first tunnel is completely installed and that voids behind lining are filled and tendency of lining to distort is minimized before commencing work on second tunnel.

- C. Where two adjacent tunnels are to be installed at different levels, complete and support lower level tunnel first as specified for previously excavated adjacent tunnel.

**3.05 SURVEILLANCE OF HEADINGS:**

- A. If tunnel invert is below groundwater level, maintain qualified personnel on duty to monitor conditions that might threaten stability of heading whenever tunnel excavation is suspended or shut down.
- B. Use of monitoring devices, such as closed-circuit television, which permit continuous monitoring of conditions at face by qualified observers from outside tunnel is permitted subject to approval.

**3.06 AIR QUALITY:**

- A. Conduct drilling and tunneling operations by methods and with equipment which ensure control of dust, fumes, vapors, gases, fibers, fogs, mists or other atmospheric impurities in accordance with specified safety requirements.
- B. Provide instrumentation for testing quality of tunnel atmosphere and obtain samples under working conditions at prescribed intervals. Submit results of quality tests.

**3.07 DISPOSAL OF EXCAVATED MATERIAL:**

- A. Dispose of excavated materials at locations outside the Authority's right-of-way.

**3.08 DETECTION OF MOVEMENT:**

- A. Rib and Segment Ring Movement:
  - 1. Monitor dimensions and elevations of ribs and segmental rings as follows:
    - a. Measure width of each rib and segmented ring at spring line to within plus-or-minus 0.01 foot.
    - b. Measure height of each rib and segmented ring from crown to invert or foot block to within plus-or-minus 0.01 foot.
    - c. Measure crown elevation of each rib and segmented ring and elevation of each footblock to within plus-or-minus 0.01 foot.
  - 2. Take measurements of width and height of each rib and crown elevation of each rib and each segmented ring within one hour after each rib or segmented ring is expanded or emerges from tail of machine.
  - 3. Take measurement of width and crown elevation of each segmented ring within 12 hours after each segmented ring is expanded or emerges from tail of machine.
  - 4. Following such initial readings, the Engineer will select one segmented ring in each 12-foot section of tunnel for additional measurements. Take measurements of width, height and crown elevation of each segmented ring on selected sets of ribs or rings three days after selected ring erected, and at monthly intervals thereafter until they are concreted in.
  - 5. If impracticable to obtain these measurements because of design of tunneling equipment or method of construction, use alternative methods of measurement as approved.
  - 6. If measurements indicate excessive deformations are occurring, take corrective measures, such as installation of ribs, and additional measurements on selected elements and on additional elements as directed.

- B. Ground Movement: Install, maintain and make observations of instrumentation shown..

### **3.09 CONCRETE FILLED VOID:**

- A. Should run-in of the soil produce a concrete filled void as defined above, stop tunneling operations immediately and notify the Engineer. Secure the tunnel and construct a temporary bulkhead to prevent further run-ins. Provide a bulkhead which is capable of resisting lateral earth and hydrostatic pressure, waterproof and capable of removal without damage to the tunnel liner.
- B. Fill the void from the surface with lean concrete.
- C. Resume tunneling operations after a minimum of 48 hours has passed after filling the voids with lean concrete and after approval of the Engineer.

### **3.10 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  - 1. Cast-in-place tunnel concrete: Place cast-in-place tunnel concrete to the following tolerances:
    - a. Tunnel lining:
      - 1) Departure of tunnel from line or grade shown as measured from working point of tunnel: One inch.
      - 2) Variation in thickness of lining at any point: Minus zero inch.
      - 3) Variation in internal diameter at any point: Plus-or-minus one inch.
      - 4) For two-pass system where final cast-in-place liner is less than 12 inches but equal to or greater than nine inches, provide additional reinforcing as shown on the Contingency Reinforcement Drawing, at no additional cost to the Authority.
      - 5) No final liner wall thickness less than nine inches will be accepted. Tunnel remaining necessary to maintain the allowable final liner thickness is at no additional cost to the Authority.
    - b. Invert: Section 03300.
    - c. Safety walk: Section 03300.
  - 2. Precast concrete segmented tunnel lining: Install precast concrete segmented tunnel lining to tolerances shown.

### **3.11 EQUIPMENT:**

- A. General: Use shields and machines which can be controlled to desired line and grade and minimize over excavation and loss of ground and provide for erection of specified tunnel linings.
- B. Tunnel Shields:
  - 1. Use tunnel shields suitable for work conforming to shape of tunnel and having uniform exterior surface from leading edge of head or poling plates to rear edge of tail and free of projections. Horseshoe-shaped shield may have closed or open bottom; circular shield to have closed bottom. Permanent poling plates incorporated in the hood of the shield are prohibited.
  - 2. On shield, provide substantially proportioned hood, which projects not less than two feet, nor more than two feet six inches, beyond shield bottom and rear overhang or tail long enough to provide at least 12 inches of overlap beyond last installed element of lining when shield has been pushed forward to fullest extent possible. Ensure that

annular space between tail and lining is in accordance with current practice but in no case greater than 1-1/2 inches.

3. Provide a shield with either a suitably designed hydraulically operated breasting system with tight breast boards, with breast-jacks or breast-tables or both, and such other means necessary to accomplish the same results. Hinged or "orange peel plates" as the sole means of face support will not be approved. In addition, provide such means as necessary to continuously support the face of the tunnel without loss of ground through a continuous grouting operation where necessary.
4. Make the pattern of breast-jacks and soldier beams to fully support the upper 50 percent of the tunnel face in order to provide direct face support. Provide the forward bulkhead with reaction points for trench jacks to support the upper half moon breast boards.
5. Mechanical excavators may be used provided that they can be retracted and do not interfere with the capability of breasting. Do not allow excavation to extend beyond the leading edge of the hood.
6. Design breasting system to do the following:
  - a. Permit drilling and soil sampling from the exploratory holes for grouting from the face of the shield.
  - b. Provide space and facilities for grouting for ground stabilization.
  - c. Provide capability to install probes ahead of the excavation face.
7. Include propulsion system on shield capable of moving shield in forward direction, while maintaining construction tolerances with respect to line, grade and direction. Design propulsion system so that in event of failure of propulsion-system elements there is no over stressing and distortion of lining, and there is no movement backward.
8. Jack loads: For precast-concrete tunnel lining, use shields and machines in which each jack load is applied uniformly at centerline of longitudinal rib of segment and over area equivalent to cross section of longitudinal rib. Use a minimum of 18 jacks each of 150-ton capacity, or 24 jacks each of 125-ton capacity, located at centerline of each longitudinal rib of lining.
9. Incorporate seal in tail of each shield to prevent leakage of grout into tunnel space between shield and lining.
10. Erection system: Equip shield with erector arm or erection system capable of handling largest sizes of lining and of erecting sections of lining to tolerances shown without damage to lining.
  - a. Use erection system that allows for prompt expansion of the segment against the soil when segment emerges from tail of the shield.
  - b. Use erection system that is fully integrated with the tunnel machine and capable of erecting the pre-cast liners in a smooth operation.
  - c. Have previously installed segments in a ring supported prior to installation of ring expansion jacks.
  - d. Have the erector arm equipped with a hydraulic system which prevents sudden movement of the liner during erection and which provides a fail-safe system should hydraulic pressure be lost in order to prevent accidental segment droppage.
11. Provide an adequate expansion system to include the following:
  - a. Capability to start expansion as soon as clearances permit.
  - b. Reaction for expansion jacks independent of shield and shield movement.
  - c. Expansion system expanding outward and upward.
  - d. A minimum capacity expansion of two 100-ton hydraulic jacks.
  - e. If required because of insufficient expansion, ability to modify the system by increasing the jack capacity, adding more jacks and points of expansion, or by other means in accordance with a plan subject to the Engineer's approval.

12. Tunnel guidance: Provide a tunnel shield guidance system for automatic computation of curved axis coordinates to maintain proper tunnel line and grade within specified tolerances.
    - a. Use guidance system capable of calculating and displaying the position and attitude of the tunnel shield or boring machine (TBM) relative to the designed tunnel axis at each point, including predicted points at the face of the shield or some specified distance ahead of the shield.
    - b. Include in the tunnel shield guidance the following features:
      - 1) The parts and equipment necessary to continually and automatically measure horizontal, vertical, and axial displacement as well as horizontal, vertical, and main axis rotation.
      - 2) A control unit capable of storing the design tunnel alignment using a three-dimensional coordinate system and displaying the present position and attitude of the shield or the TBM and its predicted deviation from the design axis of the tunnel.
      - 3) Motorized electronic theodolite with electronic distance measuring instrument (EDMI) and laser. Have the laser directed through the eyepiece of the theodolite, used to automatically update laser beam directional information. Use the EDM to automatically update the shield or TBM drive distance.
      - 4) An above-ground computer which enables entry, modification and verification of the designed tunnel axis coordinates.
        - a) Have the above-ground computer display, print and digitally store the information available at the control unit and to document the position and progress of the tunnel drive without leaving the office. Make this information available to the Engineer upon request or at the end of each shift.
        - b) Have the above-ground computer electronically connected to the equipment underground via cable or modem.
    - c. Source for guidance system: Subject to the requirements, use ZED-260 or equal.
  13. Equip shield with permissible electrical systems equipped with toxic gas and combustible gas sensors. Have toxic gas and combustible gas sensors linked to the machine operation to automatically shut the machine down should measured gaseous concentrations exceed established safety threshold values.
- C. Tunnel Machines: Use tunnel machines which minimize loss of ground ahead of and around machine and provide for erection of specified tunnel linings within machine. Use machines which have same features as shields except for face-support requirement. For tunneling with Earth Pressure Balance Machines (EPBM) see Section 02416.
- D. Grouting Equipment:
1. For pumping grout, use pump capable of developing specified uniform pressure at grout hole connection and hoses with minimum inside diameter of 1-1/2 inches. Provide automatic recording of volumes and pressures during grouting operations.
  2. Provide mixing equipment with capacity to fill voids outside last ring after each advancement of tunnel shield.
  3. Provide automatic shutoff control to prevent grouting pressure from exceeding that specified
  4. Keep equipment lines clean by constant circulation of grout and by periodic flushing with water.
  5. Use equipment that allows flushing with grout-intake valve closed, water-supply valve open and grout pump running at full speed.

6. Provide two pressure gauges, one at the pump and other on manifold hookup at collar of hole being grouted. Use pressure-gauge ranges as necessary for each part of grouting program.
7. Provide suitable stop valves at collar of hole to maintain necessary pressure until grout has set.
8. Provide grouting equipment with means of accurately determining amount of grout injected.
9. Furnish accurately calibrated, high-precision pressure gauge to periodically check accuracy of pressure gauges.

### **3.12 OPERATIONS BY TUNNEL SHIELDS AND MACHINES:**

- A. On initial setup, properly support tunnel shields or tunneling machines on concrete cradle at lines and grades which permit correct installation of tunnel lining. Based on design or existing soil conditions or both, pre-support grouting or dewatering or both may be required.
- B. During forward movement of shield, provide sufficient support at excavation face to prevent movement of materials, except such materials as are physically displaced by elements of shield itself.
- C. Control face efficiently using appropriate support procedures and methods, such as breasting, poling, face jacks, slide tables, singly or in combination.
  1. No tunnel advance will be permitted until the crown has been grouted, and it has been determined by the Engineer that additional pre-support grouting is not required, to provide a stable soil mass into which to tunnel.
  2. Perform pre-support grouting from existing ground surface locations shown. Extend the grouted arch at least two tunnel diameters in front of the shield when grouting from the surface and one tunnel diameter in front of the shield when grouting from within the tunnel prior to an advance of the tunnel face. The minimum required thickness of the grouted arch is five feet.
  3. Additional pre-support (chemical) grouting will be required if, in the judgement of the Engineer, the ground conditions in advance of the excavation require it.
  4. During probing, identify substantially cohesive deposits (such as T1, P1/P3 soils – See Appendix G, Geotechnical Design Report, of the General Requirements) which are continuous and occupy essentially the upper 50 percent of the face. Additionally, the observed performance of the excavation with respect to surface settlement and lateral deformation determined from the geotechnical instrumentation monitoring program will be evaluated in conjunction with the probe data.
  5. More extensive pre-support ground control other than grouting may be required depending on the effectiveness of the dewatering system, the pre-support grouting and the data obtained from the geotechnical instrumentation program.
- D. Dispose of excavated materials as required.
- E. During shutdown periods, support face of excavation by positive means such as breasting of face. Do not rely solely on support by hydraulic pressure. Provide surveillance as specified above.

### **3.13 INSTALLATION OF TUNNEL LININGS:**

- A. Lining of One-Pass System or Bolted Initial Liner of Two-Pass System:
  1. Install tunnel lining so as not to damage lining or coating. Use taper rings on curves. Develop and submit the details of taper rings not shown.

2. When installing segments, ensure that edges are clean and free from material that could interfere with proper bearing.
  3. Install bolted connections consisting of one bolt, one nut, two grommets and two washers arranged and conforming to sizes as shown. Tighten bolts in accordance with AISC requirements for structural joints. After each advance of shield or tunneling machine, check tension of bolts on last two rings and retighten or replace if necessary those bolts which do not meet requirements.
  4. Replace grommets at bolts which show signs of leakage.
  5. Staggering Longitudinal Joints:
    - a. For metallic lining, stagger longitudinal joints in adjacent rings by one half of segment length, but in no case by less than 25 percent of segment length.
    - b. For precast concrete segmented lining, stagger joints in adjacent rings by one third of segment length. One joint between adjacent rings may be continuous.
  6. After approval of bolted connections, clean out caulking recesses.
  7. Insert metallic lead caulking in metallic lining or sealant with backup rod in precast-concrete lining so that it completely fills recess and forms tight and continuous plug providing watertight joint.
  8. Recaulk joints which are leaking.
  9. After each advance of shield or tunneling machine, fill voids between lining and excavated surfaces with grout. Where approved, pea gravel followed by neat portland-cement grout or one-to-one sand-cement grout may be used to fill voids in lieu of two-stage grouting. For special purposes, finer sand may be used. Do not exceed 30 psi at grout hole.
  10. Perform grouting in two stages as follows:
    - a. First stage: Perform immediately after each forward thrust of equipment, at nozzle pressure which will not cause movement of soil or lining nor damage to lining, but not exceeding pressure specified. Keep topmost hole in liner open as air vent. Assist Engineer in checking adequacy of first stage grouting.
    - b. Prior to performing Stage II grouting, completely drill out previously filled grout holes and prepare for regrouting. When grouting of ring is completed and grout has set, clean threads of holes and plugs, coat plug threads with white lead, and screw plugs completely and tightly into holes.
    - c. Second stage: Fill soft spots or voids which may be detected, no later than 24 hours nor more than 50 feet behind first stage grouting. Use nozzle pressures specified.
  11. Avoid spillage or leakage of grout into tunnel. Clean up spillage promptly and remove it from tunnel.
  12. Complete electrical bonding of segments as shown.
  13. Install corrosion test rods through grout holes where shown, ensuring full contact with surrounding earth. Use insulating bushing in grout holes.
  14. Support trailing edge of last installed ring by means of horizontal tie rod or vertical strut inserted before shield or tunneling machine is advanced. Keep support in place until grouting around lining has been completed and the tendency of lining to distort or surrounding ground to move has been overcome.
  15. Repair or replace as directed damaged segments in previously placed ring.
  16. Completely seal area of tunnel roof described by arch of approximately 45 degrees each side of tunnel's vertical centerline to at least one-foot beyond outside face of contact rail and on opposite side of track to one-foot beyond outside face of running rail. Perform such work in accordance with manufacturer's recommendations.
- B. Expanded (Jacked) Initial Liner of the Two-Pass System:
1. Install tunnel lining so as not to cause damage to lining or coating. Use taper rings on curves as necessary. Develop and submit the details of taper ring not shown.

2. When installing segments, ensure that edges are clean and free from material that could interfere with proper bearing.
3. Ensure that each ring is positioned properly and that each segment is supported in a secure position during erection within the shield, allowing for the shield expansion of the ring. Expand the rings with the use of jacking rings (or other approved equivalent measures). However, to provide proper bearing at the joints of the segments, use two 100-ton capacity hydraulic jacks in the circumferential "gap" in the segmented precast concrete ring and maintain pressure in these jacks. Install a plywood board on the outside of the initial liner at the "gap" to prevent ground loss during further expansion and installation of the liner ring.
4. Immediately after leaving the shield, expand initial liner segments outwards and radially using hydraulic jacks with jacking rings (or other approved equivalent measures) and hydraulic jacks in the "gap" so that the segments are in good contact with the ground. After the initial liner segments are fully expanded, install the steel dutchmen in the "gap" of the segmented ring and ensure proper bearing with the use of shims if necessary, and secure these dutchmen to prevent movement or loss of support.
5. First Stage Contact Grout (cement-sand grout):
  - a. Perform the First Stage Contact Grout on the outside of the initial tunnel liner to fill the annular space between the initial liner and the excavated surface within 16 hours after initial tunnel support ring installation, but not more than the installation of four rings, or when directed by the Engineer. Use nozzle pressure that will not cause movement of soil or lining nor damage to the lining, and not exceeding 30 psi at the grout hole.
  - b. Subject to the Engineer's approval, perform the First Stage Contact Grout on the outside of the initial tunnel liner to fill the annular space between the initial liner and the excavated surface after each advance of the tunnel machine. Use nozzle pressure that will not cause movement of soil or lining nor damage to the lining, and not exceeding 30 psi at the grout hole.
6. After the installation of the dutchmen in the "gap" and the removal of the jacks from the "gap", dry pack the "gap" with non-shrink grout after the heading has advanced no further than 150 feet past the ring, or within 48 hours from the time of the initial ring expansion.
7. After expansion and initial deformation of initial liner ring has occurred, if measurements indicate excessive deformations or indicate additional "squat" of more than one inch at the crown, install internal bracing to arrest additional deformation. Place contact grout behind the initial precast liner.
8. Seal leaking joints.
9. Avoid spillage or leakage of grout into tunnel. Clean up spillage promptly and remove from tunnel.
10. Support last installed ring by means of an erection arm, expansion system, horizontal tie rod or vertical strut inserted before shield or tunneling machine is advanced. Keep support in place until the tendency of lining to distort, or surrounding ground to move, has been overcome.
11. Repair or replace as directed damaged segments in previously installed rings

### **3.14 INSTALLATION OF ELECTRICAL INSULATIVE COATING:**

- A. Apply coating prior to placement of invert and safety-walk concrete on precast segmented lining.
- B. Surface Preparation: Remove dirt, grease and heavy laitance by wet sandblasting, water blasting or wire brushing.

- C. Application: Apply in two coats of equal thickness totaling 20 mils minimum dry-film thickness in accordance with recommendations of coating manufacturer.

### **3.15 CONCRETE CONSTRUCTION:**

- A. Prior to construction of the permanent liner, install the tunnel waterproofing with water barriers as shown. See Section 07137.
- B. Complete electrical bonding of lining and invert shown. Electrically bond the invert of the final lining at each end of each unit.
- C. Install corrosion test rods where shown, ensuring full contact with surrounding earth. Use bushing in grout holes.
- D. Perform cast-in-place concrete work in accordance with Sections 03100, 03200 and 03300.
- E. Place concrete for lining upper portion of tunnel by mechanical or pneumatic methods through pipes which discharge as nearly as practicable to highest point of structure.
- F. Prior to placement of concrete, remove timber blocks or wedges extending within concrete design line so as to avoid compromising stability of initial support and surrounding ground.
- G. Fill enlargements of tunnel excavation beyond dimensions shown with concrete or grouted prepacking as approved.
- H. Schedule erection of concrete tunnel lining so that no concrete is placed closer than 500 feet from tunnel excavation heading, unless otherwise approved.
- I. Perform contact grouting through grout nipples, in such quantity and at sufficient pressure to fill voids. Use grouting pressure shown.

### **3.16 TUNNEL CONNECTIONS AND TERMINATIONS AND TEMPORARY BULKHEADS:**

- A. Connect new tunnels to existing structures by removing existing bulkheads if necessary and sealing junction as shown.
- B. Provide temporary bulkheads to seal terminations of tunnels which are not connected to permanent structures.
- C. Design temporary bulkheads where and when necessary. Obtain approval of design prior to construction. Provide bulkhead which is capable of resisting lateral earth and hydrostatic pressures, waterproof and capable of removal without damage to permanent liner.
- D. Provide portal transitions as shown.

### **3.17 TEMPORARY WORKSHAFTS AND OTHER OPENINGS:**

- A. Excavate and support temporary workshafts and other openings in accordance with Sections 02320, 02240 and 02260.
- B. Seal such openings when no longer necessary.
- C. Form and place Class 2500 concrete, two feet thick, in shafts over tunnels to prevent damage to tunnel shape. When concrete has achieved design strength, backfill remaining void in accordance with Section 02320.

### **3.18 DEFECTIVE LINING:**

- A. Precast concrete segmented bolted tunnel lining will be considered defective unless it is watertight, properly finished, within specified tolerances and has undamaged edges and joints.
- B. Watertightness Criteria: Section 03300.
- C. Precast concrete expanded or jacked tunnel initial liner is considered defective unless it is properly finished, within specified tolerances and has undamaged edges and joints.
- D. Defective concrete criteria for cast-in-place final liner for the two-pass system: Section 03300.

### **3.19 CORRECTIVE WORK:**

- A. Repair of Precast Concrete Segments: Repair segments which have minor chipping of edges and corners, using epoxy mortar having surface color and texture closely matching adjacent concrete surfaces. As directed, repair or replace with new segments those cracked segments which impair structural integrity of tunnel lining as determined by the Engineer.
  - 1. Ensure that surfaces to be repaired are clean, dry, free from dirt, dust, oil, water and other contaminants.
  - 2. Mix and place epoxy mortar as recommended by manufacturer. Grind rough or raised projections smooth and flush with adjacent surfaces.
- B. Contingency Reinforcement: When tunneling misalignment results in a final liner thickness of less than 12 inches but greater than or equal to nine inches, install contingency reinforcement as shown. Furnish and install contingency reinforcement when required at no additional cost to the Authority.
- C. Correction of Misalignment: In the case of misalignment which will result in a final thickness of less than nine inches, enlarge the tunnel excavation by re-mining or as otherwise approved. Provide additional materials and redesign required due to misalignment at no additional cost to the Authority.

### **3.20 LEAK REMEDIATION:**

- A. If water leakage into tunnel exceeds specified allowable limit, undertake remedial measures such as injection of bentonite slurry, cement, chemical grout or combination thereof in accordance with Section 07125 and 07170.
- B. Prior to beginning work, submit leak-remediation plan.
- C. If possible, use existing grout holes for injecting material.
- D. Establish injection pressure by means of on-site demonstration. Do not exceed structural capacity of lining.

**END OF SECTION**

## SECTION 02416

### EARTH (EPBM) TUNNELING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies the following:
  - 1. Earth tunneling for running sections, side drifts, adits and auxiliary tunnels.
  - 2. Installing tunnel linings.
  
- B. Related Work Specified Elsewhere:
  - 1. Excavation and backfilling: Section 02320.
  - 2. Dewatering: Section 02240.
  - 3. Support of excavation: Section 02260.
  - 4. Maintenance, support and restoration of utility facilities: Section 02270.
  - 5. Underpinning, support and restoration structures: Section 02255.
  - 6. Subway drainage system: Section 02625.
  - 7. Pre-cast concrete tunnel lining: Section 02425.
  - 8. Concrete formwork: Section 03100.
  - 9. Concrete reinforcement: Section 03200.
  - 10. Cast-in-place structural concrete: Section 03300.
  - 11. Structural steel: Section 05120.
  - 12. Tunnel waterproofing: Section 07137.
  - 13. Geotechnical instrumentation: Section 02291.
  
- C. Definitions:
  - 1. Earth tunneling: Mined excavation in earth, including but not limited to filled ground, rock fill, boulders, concrete or stone masonry, buried trees, timbers or plankings, conduits, pipes or drains, wood, concrete or steel pipes and sheeting, soft decomposed or disintegrated rock, concretionary rock-like material in lenses or layers, cemented sands, unconsolidated lignitized wood deposits, and naturally occurring gravel, cobbles and boulders.
  - 2. Mixed-face tunneling: Mind excavation of soil strata with a face exposing more than one type of soil or material including rock and hard rock in the same heading at the same time.
  - 3. Initial lining: Precast concrete elements furnished and installed by the Contractor for stability and safety during construction preparatory to the construction of final lining.
  - 4. Final lining: Cast-in-place concrete lining and waterproofing membrane placed after installation of initial lining.
  - 5. Precast concrete lining: For single pass system precast elements, per Contract Drawings to carry both short term and long term loads and adequate provision to exclude water into tunnel by use of gaskets.
  - 6. EPBM: Earth pressure balance machine.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. Geotechnical Design Summary Report (GDSR), included as Appendix G to the General Requirements.
  - 3. ASTM: C109, C144, C150.
  - 4. FGCC: Standards and Specifications for Geodetic Control Networks.

- B. Watertightness Criteria: Section 03300.
- C. Personnel qualifications: Have the Earth Pressure Balance Machine (EPBM) operated only by personnel who have had successful experience in similar work.
- D. Survey control: Provide qualified survey personnel in accordance with General Requirements Article titled Layout of Work.

**1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the following additional requirements as specified for each:
  - 1. Working Drawings:
    - a. General: Detailed descriptions, design, specifications, data and calculations of proposed facilities, equipment to be used and, method of construction, including, but not limited to, the following:
      - 1) Method of operation and other data pertaining to the EPBM.
      - 2) Hoisting plant tunnel ventilation, lighting and drainage, groundwater control methods, temporary shafts, cuts, ramps and tunnels, breakouts, cross passages, bulkheads; initial support, methods of construction including details of installation of initial support; final lining and waterproofing membrane, method of controlling line and grade of shield and lining and, details for segment ring movement measurement.
      - 3) Have drawings and computations certified by a professional engineer experienced in earth tunneling and registered in the jurisdiction in which the work is to be performed.
    - b. Details of temporary ventilation: Details of equipment not covered by the Safety Requirements article of the General Requirements. Approval of the use of alternative equipment depends on submitted research information concerning performance in accordance with applicable standards in common use.
    - c. Water inflow control, initial lining:
      - 1) Submit proposed method, equipment details and schedule, as well as complete manufacturer's literature, data, instructions and recommendations.
      - 2) Submit prior to beginning tunnel excavation.
    - d. Leak remediation plan, final lining: Include proposed application method, equipment details and schedule, as well as complete manufacturer's literature, data, instructions and recommendations.
    - e. Contact grouting:
      - 1) Grouting procedure: Detailed description of proposed grouting equipment and layout, and the proposed order of grouting.
      - 2) Grout mix: Details for materials, grout mix proportions, and the results of trial mixes and test specimens for sand-cement grout.
      - 3) Records:
        - a) Maintain and submit weekly a record of drill holes, the time of each change of grouting operations, pressures, rates of pumping, amount of cement for each change in water-cement ratio, admixtures, and other such data required by the Engineer.

- b) Maintain and submit daily records of grout take for each liner ring and the time performed. Have records available the following day for on-site review by the Engineer.
- f. Earth pressure balance machine (EPBM):
  - 1) Provide a complete technical description of the EPBM and backup equipment, including the cutters and cutterhead, thrust and steering systems, drive system, muck system, machine and tail seals, segment erector, machine-liner interface, guidance system, grout hole drilling system, ventilation system, and muck transport system. Make the level of detail in the submittal sufficient to clearly demonstrate that aspects of the specification requirements are met, including design for the maximum hydrostatic pressure specified. Have the technical description include drawings from the EPBM manufacturer showing details of the EPBM and backup equipment, the cutterhead assembly, muck system, thrust and steering system, drive system, machine and tail seals, grout hole drilling system, segment erector and the interface of the EPBM with the precast segmental lining system elements. Have the drawings show the relation between the excavated tunnel size, the ground support system and the tolerances specified. Submit equipment, software and operation details for the EPBM guidance system and include specific information on the method of controlling and correcting line and grade of the EPBM.
  - 2) Have the proposed EPBM manufacturer certify in writing that the EPBM and backup equipment meet the requirements of this section.
  - 3) Written certification from the EPBM manufacturer of design coordination between the EPBM manufacturer and the liner manufacturer. Include in the certification a statement of compatibility between the EPBM and liner system.
  - 4) Description of EPBM spare parts required in paragraph 2.3.B.4.d giving storage location and condition.
  - 5) A method statement covering the intended machine parameters to achieve earth pressure balance mode at the tunnel face for each of the expected ground conditions described in the Geotechnical Design Summary Report (GDSR) as Appendix G to the General Requirements. Have this include, but not be limited to, cutterhead rotation speed and torque, EPBM thrust, screw conveyor rotation speed and torque, discharger rate, rate of EPBM advance, muck conditioning materials and methods, and mix quantities and volumetric control of the screw conveyor discharge.
  - 6) A method statement covering the start-up of the EPBM and the launch of the EPBM into the ground through the portal and shaft structure.
  - 7) A method statement covering the disassembly and removal of the EPBM and back-up equipment.
- 2. Documentation:
  - a. Permits for disposal of excavated material: Each permit and release form from each property owner where excavated materials will be deposited, absolving the Authority from responsibility in connection with the disposal of such materials.
  - b. Air quality reports: Reports of tests for dust, toxic and hazardous gases and other atmospheric impurities in working environment.
  - c. Qualifications of personnel operating the EPBM.
  - d. Description of Contractor's experience with an EPBM similar to that specified for this work, operated in similar tunneling conditions. The

experience record si to demonstrate a successful completion of at least one project using a similar EPBMi in similar conditions. Include descriptions of the following in the information:

- 1) Features of EPBM used.
  - 2) Lengths and diameters of tunnels, geologic conditions, and ground support systems installed.
  - 3) EPBM performance, including average daily advance, average EPBM penetration or excavation rate, utilization, and description of any major machine-related delays.
3. Schedule Information:
    - a. Contractor's estimated average daily advance for tunnel excavation in feet per day, average EPBM penetration or excavation rate in feet per hour, linear erection rate in minutes per ring and utilization, and average muck system and cutter wear in either parts, cost per cubic yards excavated per change.
    - b. Schedule for the design, manufacturing or rebuilding of EPBM, shop testing, dismantling and shipment to site.
  4. EPBM Quality Assurance Submittals: Submit continuous monitoring data of EPBM performance on a weekly basis for the duration of the EPBM excavation. Accomplish data collection by either automatic recording systems or manually. Include the following in the data to be collected:
    - a. For every shove or stroke of the EPBM, the date, time and tunnel station at start of shove; duration and length of shove; average drive motor current and thrust and propel cylinder pressure; number of operating motors; mode of operation and cutterhead chamber pressure.
    - b. Description of delays longer than 15 minutes, water inflow, incidence of ground loss or other unusual events.
    - c. Cutter and muck system components changes, including time and date of replacement, cutter position and number.
  5. Survey Quality Assurance Submittals:
    - a. Survey personnel qualifications.
    - b. Type and location of horizontal and vertical control monuments to be set.
    - c. Survey procedures and equipment.
    - d. Design and location of theodolite instrument platform mounting bracket, bracing support hardware, method of attachment to initial liner, brass mounting screw and standing platform underneath instrument mounting bracket.
    - e. Survey data collection equipment and software; and traverse reduction and adjustment software.
    - f. Survey equipment certification of adjustment; and calibration results of electronic distance measuring instruments (EDMI's) and prisms.
    - g. Tribrach adjustment method and equipment.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Maintain adequate supply of straight and tapered precast initial lining segments on site.
- B. Avoid damage to surfaces and undue strain on segments during handling. The Engineer retains the right to reject damaged segments resulting from improper fabrication, handling, storing, transporting or erection.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Track drainage: Section 02625.
- B. Precast concrete tunnel lining: Section 02425.
- C. Reinforcing steel: Section 03200.
- D. Final lining, working slab, invert slab and safety walk concrete: Section 03300, Class 4000.
- E. Grout: Ingredients that are compatible, noncorrosive to steel, and free from calcium chloride.
  - 1. Cement: ASTM C150, Type II.
  - 2. Sand: ASTM C144.
  - 3. Water: Potable.
  - 4. Admixture and additives: Fly ash or other pozzolanic materials; fluidifiers; accelerating, retarding, and water-reducing agents; and bentonite may be used if approved.
- F. Sand: Section 03300, fine aggregate, except that 100 percent passes US Standard Size 16 sieve.
- G. Epoxy mortar: Two-component, solventless, epoxy-resin system, containing 100 percent solids, workable from 50 degrees F to 60 degrees F when one part epoxy is mixed with maximum of one part sand graded as follows:
  - 1. Three parts No. 16 sieve sand to one part No. 90 sieve sand, high-silica content, dry and bagged.
- H. Shrinkage-compensating grout: Section 03300.
- I. Gasket lubricant: As recommended by gasket manufacturer.
- J. Gasket: Section 02425.

**2.02 GROUT MIX DESIGN:**

- A. Contact Grouting Stage One Mix: To develop compressive strength of 100 to 120 psi at 24 hours.
  - 1. Mix sand and cement dry.
  - 2. Add minimum water to achieve water-cement ratio compatible with pumping and pacing requirements.
  - 3. Mix in high speed mixer for minimum of three minutes.
  - 4. Prepare batches so that standing time does not exceed 45 minutes.
  - 5. Prepare trial mixes for laboratory testing.
  - 6. Perform tests of compressive strength in accordance with ASTM C109.
- B. Contact grouting stage Two mix: Neat cement and water.

**2.03 EQUIPMENT:**

- A. General Requirements:
  - 1. Use an excavation machine that can be controlled to desired line and grade, minimize over excavation and loss of ground and provide for erection of specified tunnel linings.
- B. Earth pressure balance machine (EPBM):
  - 1. General:

- a. The EPBM is to be a full face earth pressure balance machine designed for the excavation of saturated soils under maximum hydrostatic pressure described in the GDSR.
  - b. Soil type, density, gradation, strength and abrasivity, and the maximum hydrostatic pressure for the various tunnel reaches, as well as the ground conditions expected, are presented in the GDSR. Design the EPBM to operate in all the ground conditions, including running or flowing sands and clay, and combination thereof indicated in the GDSR.
  - c. The EPBM shall be designed to operate in either open (unpressurized) or closed (pressurized) mode using a muck disposal system fitted with a pressure lock out system. Accomplish switching from open to close mode within one minute or less.
  - d. The average width of the annular space between outside surface of the tunnel liner segments and excavated soil surface is not to exceed 2.5 inches.
  - e. Equip the EPBM with overcutters not more than 3/4-inch thick.
  - f. Equip the EPBM with a grouting system to allow soil grouting ahead of face of excavation.
  - g. Design the EPBM to maintain heading (face) stability at all times under all conditions described in the GSDR during excavation and periods of EPBM shutdown.
  - h. The EPBM is to have provisions for removal of boulders 12 inches in diameter and larger, and other obstructions as described in the GDSR.
2. Cutters and Cutterhead:
    - a. The EPBM shall be Design the EPBM to pass up to 12-inch size cobbles through the head without special procedures.
    - b. Design the EPBM with the capacity to use other techniques such as grouting, slurry, or foam injection to control the tunnel face, maintain tunnel integrity and mucking operations.
    - c. Make cutters serviceable and replaceable from behind the cutterhead of the EPBM.
  3. Thrust System and Steering:
    - a. Designed the EPBM to provide forward thrust by thrust cylinders reacting against the installed segmental liner for the full range and combination of ground conditions described in the GSDR.
    - b. Thrust system capacity is to exceed the combined reaction from maximum hydrostatic pressure, shield friction and face stabilization load.
    - c. Provide symmetrically arranged thrust cylinders which have individual actuation, synchronized actuation for cylinders or for groups of cylinders as necessary for EPBM steering, and individual maximum thrust control. Thrust cylinders are not to exert forces when idle, but are to resist displacements.
    - d. The shield is to be articulated if the total length exceeds 90 percent of the tunnel outside diameter. Shield length is measured from the last gauge cutter to the back of the tail.
  4. Drive System:
    - a. The EPBM is to have sufficient drive motor power, such that the machine is not torque limited when operating in earth pressure balance mode for the full range and combination of ground conditions described in the GDSR.
    - b. The EPBM is to have the ability to start the cutterhead with at least rated full load torque. Provide clutches or hydraulic assist with an electric drive, or a variable speed hydraulic drive system may be used.
    - c. The EPBM design shall permit the replacement of the main bearings and cutterhead seals from within the tunnel.
    - d. One spare main bearing assembly and seals, and one spare main drive gear are be available for replacement of the corresponding parts, and

- provided with the EPBM in the event that those parts fail. Make the spare parts available for the duration of the EPBM excavation and make them deliverable to the site within 36 hours notice. The spare parts may be used, provided they are in like-new condition, as certified in writing by the EPBM manufacturer.
- e. Make the EPBM drive system operate the cutterhead such that it is fully operational in either direction or rotation.
  - f. Make the EPBM configured to provide access to the head of the machine for maintenance, repair or obstacle removal.
5. Muck System:
- a. Fit the EPBM with a screw conveyor for controlled muck removal from the cutterhead chamber. Design the screw conveyor for operation in the soils described in the GDSR and for efficient replacement from within the tunnel.
  - b. Design the screw conveyor to be closed and sealed against maximum hydrostatic pressure at both the front and rear.
  - c. Fit the EPBM with a pressure lock out system, such as a piston discharger, rotary discharger or equivalent, to separate the high pressure groundwater and muck within the screw conveyor from the atmospheric pressure at the muck discharge point of the tunnel.
  - d. Design the discharge for the controlled release of muck under maximum hydrostatic pressure and readily maintained or replaced. Make the discharger operate in ground conditions described in the GDSR.
  - e. Design the muck systems for operation in either an open mode (unpressurized cutterhead chamber) or a closed mode (pressurized chamber).
  - f. For operations in the open mode, design the muck system capacity for continuous operation. Design the muck system such that changing from closed to open mode, or open mode to closed mode, takes less than four 12-hour shifts.
  - g. Muck transport in the tunnel may be by conveyor, rail or slurry system. Design the system selected for abrasive fines and high water content muck.
  - h. Design the EPBM for water, polymer, or slurry foam injections to facilitate mucking operations through the control of muck consistency.
6. Seals:
- a. Provide high pressure seals designed for maximum hydrostatic pressure, as indicated in the GDSR, at the cutterhead drive and main bearings, the articulation joint, the tail shield, and probe and injection grout drill hole points.
  - b. Design and equip the EPBM with a suitable tail seal capable of handling the anticipated ground conditions and hydrostatic pressures. Also consider the influence of liner grouting in seal design.
  - c. Make tail seals replaceable from within the tunnel.
  - d. Employ a grout deal located at the rear of the tail shield to limit grout migration along the shield toward the cutterhead.
7. Segment Erector and Erection Ring:
- a. Make the segment erector and erection ring compatible with the machine and the liner system and gasket selected to ensure safe and efficient segment installation and closing the ring.
  - b. Actuate the erector in the axial, radial, and circumferential directions and in the three articulation angles corresponding to the six degrees of freedom of the liner segments to grip and erect the segments properly such that they are positioned accurately, gaskets are aligned within the required tolerances, and no damage or distortion of the segments or gaskets occur and that the gasket is fully compressed when the ring is closed.
  - c. Once gripped by the erector, make it not possible for the segment to relocate with the erector under external loads or under the dead load of the

- segment, in the axial direction as well as in the direction of the articulation angles, when corresponding actuators are idle.
- d. Have the erector include a suitable gripping device for gripping the segments. Make segment design consistent with the chosen method of gripping.
  - e. For smooth and continuous operation, proportional valves are required on hydraulic actuators, or variable speed motors are required on electric actuators.
  - f. Equip the EPBM with measurement devices to indicate correct radial and circumferential positioning of the segments.
8. Machine-liner interface:
- a. Do not exceed 1800 psi maximum bearing pressure at any point and at any time on the liner segment unless otherwise submitted and reviewed by the Engineer.
  - b. Equip the thrust cylinder with a jacking ring or shoes and pads to equally distribute the jacking forces to the liner. Make the design of thrust cylinder jacking ring or shoes and pads consistent with segment and segment joint design.
  - c. Do not bear jacking ring, shoes and pads on gaskets at any time.
  - d. Start contact grouting as soon as the grout holes are clear of the last tail seal. Do not install the next ring of segments in the tail shield until grouting is complete.
  - e. Coordinate the tail seal and the liner system to ensure a competent seal.
  - f. For tail seals requiring grease or other liquid sealants, make the sealant compatible with the liner system gaskets. Use inert materials which will not contaminate the surrounding ground or cause the long term deterioration of the liner concrete, the joint connector, the gaskets or joint packers.
9. Guidance System and Alignment Control:
- a. Provide the DYWIDAG-Leica, ZED-260 or approved equivalent tunneling machine guidance system for automatic computation of curved axis coordinates to maintain proper tunnel line and grade within specified tolerances.
  - b. Make the guidance system capable of calculating and displaying the position and attitude of the EPBM relative to the designed tunnel axis at all points, including predicted points at the face of the shield or some specified distance ahead of the shield.
  - c. Have the EPBM guidance system include the following salient features:
    - 1) The parts and equipment necessary to continually and automatically measure horizontal, vertical, and axial displacement as well as horizontal, vertical and main axis rotation
    - 2) A control unit that is capable of storing the design tunnel alignment using a three-dimensional coordinate system and displaying the present position and the attitude of the EPBM and its predicted deviation from the design of the tunnel.
    - 3) Motorized electronic theodolite with electronic distance measuring instrument (EDMI) and laser. Direct the laser through the eyepiece of the theodolite that is used to automatically update laser beam directional information. Use the EDM to automatically update the EPBM drive distance.
    - 4) An above-ground computer which enables entry, modification and verification of the designed tunnel axis coordinates.
      - a) Have the above-ground computer display, print and digitally store the information available at the control unit to document the position and progress of the tunnel drive without leaving the office. Make the information available to the Engineer upon request, or at the end of each shift.

- b) Electronically connect the above-ground computer to the equipment underground via cable or modem.
    - 5) Design the EPBM and backup equipment to negotiate curves in the alignment with minimum radius as shown, and meet the specified alignment tolerances.
  - 10. Other Features:
    - a. Equip the EPBM with a fire suppression system and hand operated fire extinguishers.
    - b. Design the EPBM to control the ground at the heading and flow of ground water through the tail seal by grouting during abnormal conditions, construction removal or EPBM maintenance. Store at the site equipment and materials necessary to control the excavation during conditions described above, tested and ready to use when needed.
    - c. Provide and maintain a stock of spare parts and consumables on site.
    - d. Use fire resistant hydraulic fluids throughout the EPBM.
  - C. Contact Grouting Equipment:
    - 1. For pumping grout, use approved pump capable of developing specified uniform pressure at grout hole connection and hoses with minimum inside diameter of 1-1/2 inches.
    - 2. Provide mixing equipment with capacity to fill voids and annular space, outside last ring after each advancement of the EPBM.
    - 3. Provide automatic shutoff control to prevent grouting pressure from exceeding that specified.
    - 4. Use equipment that allows flushing with grout intake valve closed, water-supply valve open and grout pump running at full speed.
    - 5. Provide two pressure gauges, one at the pump and a second on the manifold hookup at the collar of hole being grouted. Use pressure-gauge ranges as necessary for each part of grouting program.
    - 6. Provide suitable stop valves at collar of hole to maintain necessary pressure until grout has set.
    - 7. Provide grouting equipment with means of accurately determining amount of grout injected.
    - 8. Furnish accurately calibrated, high-precision pressure gauge to periodically check accuracy of pressure gauges.

## **PART 3 - EXECUTION**

### **3.01 TEMPORARY VENTILATION AND AIR QUALITY:**

- A. For the duration of the project, provide, operate and maintain a temporary ventilation system which conforms to specified safety requirements and those of jurisdictional authorities. Remove system from site when work is completed.
- B. Use equipment which is adequate to maintain sufficient supply of fresh air in underground work areas.
- C. Conduct drilling and tunneling operations by methods, and with equipment, which ensure control of dust, fumes, vapors, gases, fibers, fogs, mists or other atmospheric impurities, in accordance with specified safety requirements.
- D. Provide approved instrumentation for testing quality of tunnel atmosphere and obtain samples under working conditions at prescribed intervals. Submit results of quality tests.

### **3.02 TEMPORARY WORKSHAFTS AND OTHER OPENINGS:**

- A. Excavate and support temporary workshafts and other openings in accordance with Sections 02320 and 02260.
- B. Seal such openings when no longer necessary.
- C. Form and place Class 2500 concrete, two-feet-thick, in shafts over tunnels to prevent damage to tunnel shape. When concrete has achieved design strength, backfill remaining void in accordance with Section 02320.

### **3.03 SAFETY REQUIREMENTS:**

- A. Perform work to maximize safety and reduce exposure of personnel and equipment to hazardous and potentially hazardous conditions in accordance with specified safety requirements.
- B. In case of emergency or work stoppage likely to endanger excavation or adjacent structures, continuously maintain full work force 24 hours per day, including weekends and holidays, until emergency or hazardous conditions no longer jeopardize the stability and safety of the work. In addition to rib rings and lagging needed for planned work and shown on Contract Drawings, have on site and ready for use in emergencies a minimum of 12 steel rib rings (W8 x 40 or larger) and lagging sufficient to support 25 feet of tunnel.
- C. Perform tunnel construction to minimize ground movement in front of, and surrounding, tunnel and minimize subsidence if surface, structures and utilities above and in vicinity of tunnel for the ground conditions encountered.
- D. Support ground continuously at the excavation face and surrounding tunnel perimeter to prevent loss of ground and to maintain stability of tunnel faces, passages and bottoms of shafts.

### **3.04 DISTANCE BETWEEN HEADINGS:**

- A. Maintain longitudinal distance of no less than 150 feet between adjacent tunnel headings being simultaneously excavated.
- B. Where a tunnel heading is being advanced adjacent to a previously excavated tunnel, ensure initial support in first tunnel is completely installed, that voids behind linings are completely filled, and that the tendency of the lining to distort is minimized before commencing work on the second tunnel.

### **3.05 SURVEILLANCE OF HEADINGS:**

- A. If tunnel invert is below groundwater level, maintain qualified personnel on duty to monitor conditions that might threaten stability of heading whenever tunnel excavation is suspended or shut down.
- B. Use of approved monitoring devices, such as closed-circuit television, which permit continuous monitoring of conditions at the face by qualified observers from outside the tunnel is permitted.
- C. At the first indication of misalignment exceeding the bull's eye limit in the tunnel heading, stop the work and notify the Engineer immediately.

### 3.06 DETECTION OF MOVEMENT:

- A. Segment Ring Movement:
  - 1. Monitor dimensions and elevations of segmental rings as follows:
    - a. Measure width of each segmented ring to within plus-or-minus 0.01 foot.
    - b. Measure height of each segmented ring from crown to invert to within plus-or-minus 0.01 foot.
    - c. Measure crown elevation of each segmented ring to within plus-or-minus 0.01 foot.
  - 2. Take measurements of width and height of each segmented ring within one hour after each segmented ring emerges from the tail of the machine.
  - 3. Take measurement of width and crown elevation of each segmented ring within 12 hours after each segmented ring emerges from the tail of the machine.
  - 4. Following such initial readings, Engineer will select one segmented ring in each 25-foot section of tunnel for additional measurements. Take measurements of width, height and crown elevation of each segmented ring on selected sets of rings daily after each selected ring erected and within 250 feet of the trailing gear; monitor tunneling weekly between 250 feet and 1,000 feet, and at monthly intervals thereafter until the cast-in-place liner is installed.
  - 5. If measurements indicate excessive deformations are occurring, take corrective measures and additional measurements on selected elements and on additional elements as directed by the Engineer.
- B. Ground Movement:
  - 1. Install, maintain and make observations as specified of instrumentation shown on the Contract Drawings and/or as specified in Section 02291.

### 3.07 FIELD QUALITY CONTROL:

- A. Place cast-in-place tunnel concrete to the following tolerances:
  - 1. Tunnel lining:
    - a. Departure of tunnel from line or grade shown as measured from working point of tunnel: one inch.
    - b. Variation in internal diameter at any point: plus-or-minus one inch.
    - c. Where thickness of cast-in-place tunnel lining is less than 12 inches but greater or equal to nine inches, provide additional reinforcing as shown, at no additional cost to the Authority.
    - d. No final lining thickness below nine inches will be accepted. Tunnel remaining necessary to maintain the allowable final lining thickness is at no additional cost to the Authority.
  - 2. Invert: Section 03300.
  - 3. Safety walk: Section 03300.
- B. Install initial precast concrete segmental tunnel lining to tolerances shown on the Contract Drawings.
- C. Contact Grouting:
  - 1. Keep workers aware that tunnel grouting is one of a series of linked tunneling processes, each one depending for its proper performance on the proper performance of the others; adverse consequences are likely to result for inadequate performance of tunnel grouting.
  - 2. Provide facilities and assistance necessary for the Engineer to inspect the grouted initial lining to ensure complete filling of voids, including assistance in drilling, probing, or sounding through the grout hole.

3. An inspection will be made by the Engineer not later than 24 hours after, nor more than 60 feet behind, the initial injection. Have voids, as determined by the Engineer, completely grouted by an additional injection performed immediately after this inspection.
4. From time to time, the Engineer may require the drilling through grout holes in precast segments, and up to one foot into surrounding ground, not to exceed one every 100 feet of tunnel on the average. If regrouting is required, drill additional check holes. Fill check holes flush with surface using epoxy mortar.

### **3.08 FIELD SURVEY CONTROL:**

- A. Secondary Survey Control System:
  1. Establish a secondary survey control system consisting of horizontal and vertical reference points for driving the EPBM and placing final liner concrete. Install horizontal control points either as a brass disc or lead and tack. Install vertical control points either as a brass disc or 1/2-inch diameter by a minimum three-inch-long anchor bolt with nut and washer.
  2. Employ survey procedures and equipment in accordance with FGCC Standards and Specifications for Geodetic Control Networks using Second Order, Class 1 specifications for horizontal control work and Second Order, Class 1 specifications for vertical control work.
  3. Construct tunnel horizontal traverses as closed loops adjusted by the least squares method. Tunnel vertical traverses are to be closed loops and adjusted by distributing the error of closure equally through the turning points. Furnish the Engineer with traverse adjustment results within 24 hours.
  4. Advance and verify underground tunnel control after every 300 feet maximum of tunnel lining placement.
  5. Install vertical control points maximum 300 feet on center throughout tunnel.
  6. Platform mounting brackets:
    - a. Install inter-visible theodolite instrument platform mounting brackets in the tunnel initial liner, at or below springline, at maximum intervals of 500 feet on center throughout the tunnel, for the purpose of maintaining the secondary horizontal control system. Install additional platform mounting brackets where tunnel alignment curvature does not allow for intervisibility between instrument locations. Fabricate platform mounting bracket from steel, having a smooth finish where the instrument attaches. Make brackets rigid enough to resist deflection or movement when a theodolite is mounted and operated on top of it. If deflection or movement is apparent then add bracing supports to sufficiently stabilize the platform mounting bracket and install additional bracing supports as directed by the Engineer. Use minimum 1/8-inch-thick steel for brackets. Attach bracket supports to the underside of platform, mounting bracket to provide a clear and unobstructed working area at and above platform. The platform mounting bracket shall be of sufficient length and width to allow efficient set-up and operation of theodolite and electronic distance measuring instrument (EDMI). Minimum width of platform mounting bracket is nine inches; minimum length of platform mounting bracket is equal to a distance sufficient to allow a mounted instrument a minimum one foot of clearance from tunnel lining. Install platform mounting brackets to a level plane within the adjustment limits of a standard tribrach.
    - b. Provide each platform mounting bracket with a forced centering hole that can accept a brass instrument mounting screw (standard 5/8-inch by 11-inch thread) for securing a standard tribrach. Mill force centering hole and brass mounting screw to match each other within 0.001 inch. Make the brass mounting screw hollow and of sufficient diameter to allow the instrument operator to site below platform mounting bracket with a nadir

optical plummet. Provide the Engineer with three mounting screws for the duration of the Contract. Construct and install a platform underneath the instrument mounting bracket for the purpose of supporting a surveyor during measurement observation process from either side of instrument.

- B. Survey Data Collection:
1. Provide and maintain equipment and software necessary to record secondary survey control measurement observations. Assemble measurement observations in digital data collection files and provide data to the Engineer in a format that is compatible and in accordance with the AASHTO Survey Data Management System (SDMS) technical specification for survey data.
  2. Have the survey data collection files transmitted to the Engineer contain: a time and date stamp for each observation, original field measurements, and the correctly computed coordinates and elevations in addition to the survey data tags necessary to recompute the file if required.
  3. Preserve original unedited data collection files and provide one copy of each file to the Engineer.
- C. Survey Equipment Adjustment and Calibration:
1. Adjust instrument for collimation error every six months, or whenever difference between reverse and direct readings of theodolite depart from 180 degrees by more than 15 seconds. Readjust cross hairs and level bubble whenever their misalignments affect instrument readings by amount of least count.
  2. The National Geodetic Survey (NGS) has established specific calibration baselines for the purpose of comparing survey equipment to known monumentation to verify correct instrument operation and verification of compliance with manufacturer's specifications. Service every six months and check frequently the electronic distance measuring instruments (EDMI's) and retroreflectors over lines of known distances at an approved NGS baseline. Recalibrate EDM if physical damage is incurred.
  3. Compute calibration results using procedures in NOS NGS-10, Use of Calibration Base Lines. Record actual measurements, apply atmospheric corrections and then adjust by least squares to compute a constant, as well as a relative correction factor (scale correction). Calibrate prisms at the same facility.
  4. Forward results of this calibration to the Engineer. Post correction factors in Contractor's office for computing area and apply them as required to maintain specific accuracy.
  5. Immediately remove and repair, or replace instruments found to be in disrepair or misalignment.
  6. Provide a certification of adjustment to the Engineer for instruments to be utilized before commencement of survey work.
  7. Provide and maintain the ability in-house to check and adjust tribrachs for eccentricity. Perform adjustment checks at least once a week. Keep a record of adjustments to tribrachs current and made available to the Engineer monthly, or upon request. Number and tag each tribrach with date of last adjustment.

### **3.09 OPERATION BY THE EPBM:**

- A. On initial setup, support the EPBM on concrete cradle properly at lines and grades which will permit correct installation of tunnel lining.
- B. During forward movement of the EPBM, provide sufficient support at excavation face to prevent movement of materials, except such materials as are physically displaced by elements of shield itself.
- C. Control face efficiently using appropriate support procedures and methods.

- D. Dispose of excavated materials as specified.
- E. During shutdown periods, due to abnormal conditions, obstruction removal, EPBM maintenance or other reasons, ensure stability of the tunnel with appropriate support measures. In areas where the tunnel face stability cannot be maintained directly by the EPBM, support face of excavation by other means, such as grouting.
- F. In the event of EPBM stoppage for more than 12 hours, inject bentonite slurry into gap between tail of shield and foil to facilitate resuming of EPBM advancement.

### **3.10 INSTALLATION OF INITIAL LINING:**

- A. Support segments as necessary to prevent damage or undue strain. During handling of segments, wire ropes, keep chains or hooks from direct contact with concrete or gaskets. Ship tapered segments in units of complete rings, properly identified.
- B. Inspect segments with gaskets before taking them underground and just prior to erection. Damaged segments shall not be installed in the tunnel. Damaged segments shall be repaired or replaced as directed, at no additional cost to the Authority.
- C. Install the segmented tunnel lining system to the specified dimensions and tolerances for line and grade, within the design tolerances for joint and structural performance. Projection or lipping (abrupt surface irregularity) of a segment with respect to the adjoining segment will is not allowed in excess of that shown on the Contact Drawings under Tolerances.
- D. Assemble and mechanically connect each ring of segments inside the tunneling shield. Keep the invert of the EPBM free of excavated material prior to erection of each ring. Hose clean the joint surfaces of each segment with clean water immediately prior to erection. At time of erection, make joint and gasket surfaces free of material that could interfere with proper bearing and watertightness. Lubricate gasket along cross joints of key segments prior to key segment installation.
- E. Prior to jacking the EPBM have mechanical connectors across joints in place ahead of the segment ring and tightened sufficiently to provide joint closure pressure as specified in Section 02425. Maintain the design tolerances on joint closure during erection of subsequent rings. If necessary, retighten the mechanical connectors of the last circumferential joint prior to retracting jacking rings or shoes.
- F. Do not apply loads or eccentricities to the segments that are detrimental to the lining system as a result of the erection sequence. Do not permit jacking rings or shoes and pads to bear on the circumferential joint gaskets.
- G. Use tapered rings on curves and elsewhere as necessary to maintain line and grade tolerances. In no case is compression packing to be added to or removed from the circumferential joints to adjust line and grade.
- H. Stagger longitudinal joints in adjacent rings.
- I. Perform contact grouting behind each ring and shall begin as soon as segment grout holes are clear of the tail seal.

- J. Hangars for utility lines necessary for construction of the tunnel may be connected to concrete segments, but may not interfere with proper erection of each ring. Cast or drilled holes or embedded anchorages may be used for this purpose, if approved by the Engineer.
- K. Support trailing edge of last installed ring by means of horizontal tie rod or vertical strut inserted before EPBM is advanced. Keep support in place until grouting around lining has been completed and tendency of lining to distort, or surrounding ground to move, has been overcome.
- L. Repair or replace, as directed, damaged segments in previously placed ring.

### **3.11 WATERTIGHTNESS:**

- A. Watertightness of Initial Lining (of Two-Pass System):
  1. Provide clean, dewatered conditions during waterproofing membrane placement and installation of final lining.
  2. Prior to beginning work, submit plan for control of water entering tunnel through the initial lining. Include capacity of proposed water pumps.
  3. If water leakage into tunnel exceeds capacity of the proposed water pumps, undertake remedial measures, such as injection of bentonite slurry, cement, chemical grout or combination thereof.
  4. Repair visible leaks.
  5. If possible, use existing grout holes for injecting materials.
  6. Establish injection pressure by means of on-site demonstration. Do not exceed structural capacity of the lining, or combined hydrostatic and soil overburden pressure as determined for construction conditions.
- B. Watertightness of Precast Concrete Lining (of Single-Pass System):
  1. Comply with Leak Remediation, specified above.

### **3.12 CONCRETE CONSTRUCTION:**

- A. For Two-Pass System:
  1. Perform concrete work in accordance with Sections 03100, 03200 and 03300.
  2. Clean and roughen working slab surface to expose aggregates prior to placing invert slab concrete.
  3. Place concrete for lining upper portion of tunnel by mechanical or pneumatic methods through pipes which discharge as nearly as practicable to highest point of structure.
  4. Do not perform concreting of final lining of the first tunnel excavated until excavation of the second tunnel has progressed at least 100 feet beyond the limits of active concreting, unless otherwise approved.
  5. Schedule erection of concrete lining of the second tunnel so that no concrete is placed closer than 500 feet from tunnel excavation heading, unless otherwise approved.
  6. Perform contact grouting through grout nipples, in such quantity and at sufficient pressure to completely fill voids. Use grouting pressure as specified.
  7. Drill and grout safety walk reinforcement into final lining using shrinkage-compensating grout. Exercise care during drilling operation not to impair waterproofing membrane.
  8. Install remaining reinforcing steel in the safety wells and pour concrete.
- B. For Single-Pass System:
  1. Perform concrete work in accordance with Sections 03100, 03200 and 03300.
  2. Place invert slab concrete on the cleared liner or over the insulative coating, if used.

3. Do not place the invert in the first tunnel excavated until excavation of the second tunnel has progressed at least 100 feet beyond the limits of active concreting, unless otherwise approved.
4. Schedule placement of the invert of the second tunnel so that no concrete is placed closer than 400 feet from tunnel excavation heading unless otherwise approved.
5. Install safety walk dowels per Contract Drawings, provide remaining reinforcing steel and place concrete in the safety walks.

### **3.13 CONTACT GROUTING:**

- A. First Stage-Precast Concrete Initial Lining (for Two-Pass System) and Precast Concrete Lining (for One-Pass System):
  1. Perform cement-sand grouting behind initial tunnel support to fill the annular space between the initial support system and the excavated surface. Use nozzle pressure that will not cause movement of soil or lining nor damage to lining, and not exceed 30 psi at the grout hole. Keep topmost hole in liner open as air vent. Assist Engineer in checking adequacy of first stage grouting.
  2. Consider grouting of a hole complete when the hole refuses grout for 60 seconds at 90 percent of highest pressure stipulated for conditions at that hole location. After the grouting of a hole is completed, maintain pressure by means of a stop cock or other suitable device until the grout has set sufficiently to be retained in the hole.
  3. After grout has set, remove valves and fittings. Fill grout holes with epoxy mortar at completion of the grouting operations to have a smooth finished surface acceptable to the Engineer.
- B. Second Stage-Cast-in-Place Concrete Final Lining (for Two-Pass System Only):
  1. Place grout pipes or connections in the concrete lining or concrete pipe shown on the Drawings and as specified herein. Place grout pipes in the lining at a nominal 25 foot spacing. Place pipes behind the concrete forms and held securely in position. Suitably plug grout pipe perforations to prevent the entrance of concrete. Drilled holes may not be used in lieu of cast-in-place grout pipes
  2. Ensure that concrete lining has reached 28-day strength prior to commencement of grouting operations.
  3. Use nozzle pressure which will not puncture or otherwise injure waterproofing membrane.
  4. Make connections by threaded fittings of ample strength and tightness to prevent leakage or with approved packers, and provide each with a straightway cock or valve. Remove plugs on ends of adjacent ungrouted pipes to ensure escape of air and water and filling of spaces with grout. Replace plugs as required to prevent loss of grout. The general direction of advance is to be from lower elevations to higher elevations.
  5. Prior to injection of grout, inspect each grout pipe to ensure that the pipe is clear and open. Hook-up and pump grout at each grout pipe.
  6. Operate and control grout pumps so that the grout is delivered uniformly and steadily. Inject grout in a sequential side-to-side progression along the tunnel to fill voids with grout.
  7. Grouting at each grout pipe connection will be considered complete when no more grout of the required mix and consistency can be injected at the specified pressure or when clean grout appears at the next hole.
  8. Exercise care to prevent the setting of escaped grout on exposed surfaces. Remove such grout and restore surfaces to their original conditions.
  9. Upon completion of the grouting at each connection, close the valve and leave it in place until the grout has set, after which remove the valves and fitting. Remove grout supply connections from the embedded grout pipe to a minimum depth of two inches, and fill the hole with epoxy mortar to give a smooth finished surface.

- C. Keep equipment lines clean by constant circulation of grout and by periodic flushing with water.

**3.14 DEFECTIVE LINING:**

- A. Precast concrete segmented tunnel lining will be considered defective unless it is properly finished, and within specified tolerances and has undamaged edges and joints.

**3.15 CORRECTIVE WORK:**

- A. Repair of Concrete Segments: Repair segments which have chips, spaces, or formed depressions meeting the conditions set forth in Section 07137, Tunnel Waterproofing. As directed, repair or replace with new segments those cracked segments which impair structural integrity of tunnel lining as determined by the Engineer.
  1. Ensure that surfaces to be repaired are clean, dry, free from dirt, dust, oils, water and other contaminants.
  2. Mix and place epoxy mortar as recommended by manufacturer. Grind rough or raised projections smooth and flush with adjacent surfaces.

**3.16 LEAK REMEDIATION:**

- A. For Two-Pass System:
  1. If water leakage into tunnel after placement of final cast-in-place concrete lining exceeds specified allowable limit, undertake remedial measures such as injection of bentonite slurry, cement, chemical grout or combination thereof.
  2. Prior to beginning work, submit leak-remediation plan.
  3. If possible, use existing grout holes for injecting material.
  4. Establish injection pressure by means of on-site demonstrations. Do not exceed structural capacity of lining.
- B. For Single-Pass System:
  1. If water leakage into tunnel exceeds specified allowable limits, undertake remedial measures such as injection of bentonite slurry, cement, chemical grout, or combination thereof.
  2. Prior to beginning work, submit leak-remediation plan.
  3. If possible, use existing grout holes for injecting material.
  4. Establish injection pressure by means of on-site demonstration. Do not exceed structural capacity of lining.

**3.17 DISPOSAL OF EXCAVATED MATERIAL:**

- A. Dispose of excavated materials at locations outside of the Authority's right-of-way.

**END OF SECTION**

## SECTION 02417

### NATM EXCAVATION ( SOFT GROUND )

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies the excavation and support of the NATM tunnels (center drift, middle drifts, side drifts, shafts and station, as applicable) in accordance with the construction sequences and limits of excavation shown for the NATM.<sup>1</sup>
1. Stations indicating limits of typical excavation and support types, pre-support types, and of concrete lining are approximate only and may vary due to geological and hydrological conditions actually encountered in the field.
  2. Stations are outbound stations; apply inbound stations accordingly.
- B. Related Work Specified Elsewhere:
1. Grading, excavating and backfilling: Section 02320.
  2. Dewatering: Section 02240.
  3. Support of excavation: Section 02260.
  4. Subway drainage system: Section 02625.
  5. NATM shotcrete lining: Section 02426.
  6. Concrete work: Sections 03100, 03200, and 03300.
  7. NATM concrete lining: Section 02427.
  8. Shotcrete: Section 03370.
  9. Tunnel waterproofing (NATM system): Section 07138.
  10. Geotechnical instrumentation: Section 02291.
- C. Definitions:
1. Excavation Line: Theoretical line of excavation inside of which no earth or surrounding ground may protrude.
  2. NATM Excavation in Soft Ground: Mined excavation in earth by the New Austrian Tunneling Method (NATM). The following, among others, are classified as excavation in earth: Filled ground including rock fill, boulders, concrete or stone masonry, buried trees, timbers or plankings, conduits, pipes or drains, wood, concrete or steel piles and sheeting, and shotcrete applied for protecting heading or as support for previously excavated drift, and soil pretreated by grouting.
  3. Mixed-face Excavation: Mined excavation of soil strata with a face exposing more than one type of soil or material, including rock and hard rock, in the same heading at the same time.
  4. NATM Portal Wall: A temporary, rigid structure that supports a mass of soil and from which NATM excavation can begin.
  5. Support: Support for NATM construction includes those measures necessary to maintain the inherent strength of the ground surrounding the tunnel openings while preventing unnecessary loosening and enhancing the stress redistribution process. This function of support is enhanced by installation of pre-support and local support where required by ground conditions.
  6. Pre-support: Systematic measures including chemical grout arch installed by directional drilling, grouted pipe spiling and rebar spiling installed as shown prior to or during NATM tunnel excavation.

7. Local Support: Grouted pipe spiling and rebar spiling installed in a non-systematic manner, dowels, face shotcrete, and face stabilization wedge installed individually or otherwise in addition to specified pre-support, for local stabilization and safety during tunneling.
8. Rebar Spiling: Rebars without end hardware installed at the tunnel heading ahead of excavation as a means to pre-support the ground.
9. Grouted Pipe Spiling: Perforated steel pipes installed at the tunnel heading ahead of excavation and grouted as a means to pre-support the ground.
10. Shotcrete of Initial Lining: Shotcrete layer of a minimum seven inches thickness reinforced with welded wire fabric, lattice girders, splice bars and splice clip.
11. Concrete or Final Lining: Cast-in-place concrete placed after installation of shotcrete lining and waterproofing.
12. Excavation and Support Type: Prescribed excavation sequence, support and local support based on the type of host material in both top heading and bench/invert encountered as well as by the anticipated response and behavior of the host material during excavation.<sup>\*2</sup>
13. Break-Out: Support installed at support of excavation walls prior to and during the start-up of NATM tunneling including reinforced shotcrete collar, dowels, and thickened shotcrete lining.
14. Chemical Grout Arch: Zone of soil improved by chemical grouting above the tunnel roof and reinforced longitudinally by minimum two-inch ID tube-a-manchette steel pipes through which grout has been injected. Steel pipes installed in drill holes drilled by means of directional drilling.
15. Directional Drilling: Soil stabilization, for sandy and other running soil, chemical grouting by installing continuous horizontal grouting pipes. Directional drilling is also used for horizontal dewatering pipes. If it is necessary to use horizontal directional drilling for additional geologic investigation, have adequate records and logs maintained during the entire drilling operation.<sup>\*3</sup>
16. Dowels: Injection bore anchors with end hardware installed at break-outs as shown to tie the shotcrete collar to the ground and pre-support the loosened ground where required.
17. Length of Round: Length of the unsupported span of exposed ground opened up during one round of excavation. Excavation to be immediately followed by the installation of support as shown.
18. Flash-crete: Minimum one-inch thick layer of unreinforced shotcrete placed immediately after excavation on exposed surface to seal and protect the material from deterioration and initial loosening. It is not part of the structural shotcrete lining as shown and specified.
19. Face Stabilization Wedge: Unexcavated portion of the heading temporarily left in place to enhance face stability.
20. Vacuum Lances: Slotted PVC or other approved temporary pipes with filter fabric inserted into the ground from within the tunnel for the purpose of performing local dewatering and removing perched water using vacuum pressure during excavation.
21. Drain Pipes: Slotted PVC pipes, or other pipes approved by the Engineer, with filter fabric inserted into the ground from within the tunnel to drain water and perched water by gravity during excavation.
22. Water Sheet and Drain Hose: PVC-sheet and PVC-hose or similar materials as approved by the Engineer. Use watersheet and drain hose to collect and drain off ground water from areas at either the excavated ground surface before applying shotcrete lining to prevent hydrostatic pressure build-up behind the shotcrete lining and/or for dewatering of seepage through the shotcrete lining. Use drain hose individually applied to drain off water ingress at localized spots behind the shotcrete lining.

23. Geologic Overbreak: The amount of ground dislocated beyond the theoretical excavation line primarily due to running or flowing in materials, like P2 material, and falling out of blocks along fissures in materials, like P1 material..

## 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of the jurisdictional authorities.
  2. Geotechnical Design Summary Report (GDSR) in the Appendix G of the General Requirements.
  3. AASHTO: Survey Data Management System
  4. ASTM: A36, A53, A325, A615, C109, C144, C150, D638, D1304, D2240.
  5. MS: MIL-P-26915
  6. FGCC: Standards and Specifications for Geodetic Control Networks.
- B. NATM Engineer: Have field staff include a civil engineer (NATM engineer) meeting the following requirements:
  1. Education: Graduate civil engineer from an accredited college or university, foreign or domestic.
  2. Experience: Field and design experience in soft ground NATM tunnel engineering.
  3. Proficient in spoken and written English.
  4. Do not commence field work until NATM engineer has been approved in writing by the Authority.
  5. Have approved engineer report for work at the site at least six weeks prior to commencement of NATM excavation-related work, including installation of chemical grout arch, and remain at the site for four weeks after completion of the excavation work.
  6. Duties include the following:
    - a. Supervising excavation to ensure safety of construction.
    - b. Coordinating preventative and remedial measures when ground loss at tunnel heading or instability of tunnel occurs, or when they appear likely.
    - c. Preparing daily written interpretation of instrumentation measurement readings during excavation.
    - d. Holding daily discussion with the Engineer at the tunnel face regarding ground conditions and corresponding Excavation and Support Type and other supports and keeping written records thereof.
    - e. Submitting a weekly report on geologic conditions as encountered during excavation for the Engineer's use including record of daily discussion. Have the geologic report include geologic mapping of the face for a frequency recommended for various Excavation and Support types.<sup>\*4</sup>
    - f. Participating in pertinent coordination meetings with the Engineer, and providing minutes of each meeting to the Authority within one week. Preparing final reports on geologic conditions encountered, ground control measures taken, problems encountered and geometrical measurements.
  7. Be always available to report to the site.
- C. Survey Control:
  1. Provide qualified survey personnel in accordance with the General Requirements pertaining to Layout of Work.
  2. Establish a secondary survey control system consisting of horizontal and vertical reference points for driving the tunnels and placing concrete lining. Install horizontal control points either as a brass disc or lead and tack. Install vertical control points

either as a brass disk or a 1/2-inch diameter by minimum three-inch long anchor bolt with nut and washer.

- a. Employ survey procedures and equipment in accordance with FGCC Standards and Specifications for Geodetic Control Networks, using Second Order, Class 1 specifications for horizontal control work and Second Order, Class 1 specifications for vertical control work.
- b. Make tunnel horizontal transverses closed loops and adjusted by the least squares method. Make tunnel vertical traverses closed loops and adjusted by distributing the error of closure equally through the turning points. Provide the Engineer with traverse adjustment results within 24 hours.
- c. Advance and verify underground tunnel control after each 500 feet of tunnel lining placement.
- d. Install vertical control points maximum 300 feet on center throughout tunnel.
- e. Install inter-visible theodolite instrument platform mounting brackets in the shotcrete lining, at or below the springline, at maximum intervals of 500 feet on center throughout the tunnel, for the purpose of maintaining the secondary horizontal control system. Install additional platform mounting brackets where tunnel alignment curvature does not allow for intervisibility between instrument locations.
- f. See Part 2 - Products for bracket and surveyor platform specifications.
- g. Survey Data Collection:
  - 1) Provide and maintain equipment and software necessary to record secondary survey control measurement observations. Assemble measurement observations in digital data collection files and provide data to the Engineer in a format that is compatible and in accordance with the AASHTO Survey Data Management System (SDMS) technical specification for survey data.
  - 2) Survey data collection files transmitted to the Engineer are to contain a time and date stamp for each observation, original field measurements, and the correctly computed coordinates/elevations in addition to the survey data tags necessary to recompute the file if required.
  - 3) Preserve original unedited data collection files and provide one copy of each file to the Engineer.
- h. Survey Equipment Adjustment and Calibration:
  - 1) Adjust instrument for collimation error every six months or whenever difference between direct and reverse readings of theodolite depart from 180 degrees by more than 15 seconds. Readjust cross hairs and level bubble whenever their misalignments affect instrument reading by amount of least count.
  - 2) The National Geodetic Survey (NGS) has established specific calibration baselines for the purpose of comparing survey equipment to known monumentation to verify correct instrument operation and verification of compliance with manufacturer's specifications. Service every six months and check frequently the electronic distance measuring instruments (EDMI's) and retroreflectors over lines of known distance at an approved NGS baseline. Recalibrate an EDM I if physical damage is incurred.
  - 3) Compute calibration results using procedures in NOS NGS-10 Use of Calibration Base Lines. Record actual measurements, apply atmospheric corrections and then adjust by least squares to compute a constant, as well as a relative correction factor (scale correction). Calibrate prisms at the same facility.

- 4) Forward results of this calibration to the Engineer. Post correction factors in Contractor's office for computing area and apply them as required to maintain specified accuracy.
  - 5) Immediately remove and repair, or replace instruments found to be in disrepair or misalignment.
  - 6) Provide a certification of adjustment to the Engineer for instruments to be utilized before commencement of survey work.
  - 7) Provide and maintain the ability in-house to check and adjust tribrachs for eccentricity. Perform adjustment checks at least once a week. Keep a record of adjustments to tribrachs current and made available to the Engineer monthly or upon request. Number and tag each tribrach with date of last adjustment.
- D. NATM Tunnel Heading Inspector: Contractor's field staff to include inspector for each shift of work.
1. Qualifications of such persons to include inspection experience in soft ground NATM tunnel construction, proficiency in the English language, and capability to assume duties of NATM engineer.
  2. By the Engineer approved inspector to report for work at the site prior to commencement of NATM excavation.
  3. In the event that ground loss at the tunnel heading or instability of tunnel heading occurs or appears likely, and NATM engineer is not physically present at the tunnel heading, duties of inspectors to include the following:
    - a. Directing modifications in tunneling techniques.
    - b. Notifying the Engineer of ground losses at tunnel heading.
    - c. Notifying personnel responsible for performing preventative and/or remedial measures to report immediately at tunnel heading.
    - d. Coordinating preventative and remedial measures.
    - e. Notifying personnel responsible for monitoring instruments to increase frequency of monitoring as specified.
- E. Have qualified firm or specialist, and necessary equipment in working order and always present at the site, for performing directional drilling, chemical grouting, probe drilling, installation of pre-support and local support, and other approved measures.
- F. Have qualified firm or specialist responsible for groundwater control measures and knowledgeable in dewatering methods for use in this type of soils, preferably with adequate experience within the project areas.
- G. \*<sup>5</sup>
- H. NATM Portal Wall:\*<sup>6</sup>

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings: Design, specifications, method of operation and other data pertaining to the following:
    - a. Grouted pipe spiling pipes and rebars.
    - b. Casings, packers, rubber sleeve pipes and drill rods to be used for chemical grouting, grout pipe spiling, probe drilling and installation of drain pipes and vacuum lances.

2. Working Drawings:
  - a. Detailed descriptions, data or calculations of proposed facilities, equipment to be utilized and method of construction including, but not limited to, the following:
    - 1) Groundwater control system including the installation of vacuum lances and drain pipes, temporary sumps, construction drains, pumps, procedures to be followed and standby power supply.
    - 2) Number, location, direction and timing of headings including temporary drifts.
    - 3) Temporary tunnels, widenings, shafts, cuts and ramps.
    - 4) Batching plants, hoisting plant, tunnel ventilation, lighting and drainage.
    - 5) Methods of construction including details of installation of shotcrete lining, support elements (including lattice girder, welded wire fabric, forepoling bars and sheets, as necessary) and concrete lining.
    - 6) Method of controlling line and grade of lining; directional drilling and chemical grout arch.
  - b. Reinforcement design for cast-in-place lining wherever thickness of cast-in-place concrete is less than 12 inches but greater than nine.
  - c. Have drawings and computations certified by a professional engineer experienced in NATM tunneling and registered in the jurisdiction in which the work is to be performed.
  - d. For excavation of tunnels, submit drawings, calculations, descriptions and specifications for the following:
    - 1) Sequence and timing of excavation of top heading and bench/invert including excavation sequencing for individual excavation and support types, key excavation plan including sequence of installation of chemical grout arch, grouted pipe spiling and anticipated rate of advance.
    - 2) Concrete lining elements, support elements and their relationship to the plan and sequence of excavation and support, and waterproofing installation.
    - 3) Excavation equipment details including make and model numbers, specifications, and complete manufacturer's literature including copies of owner's manual and maintenance records.
3. Documentation:
  - a. Permits for disposal of excavated material:
    - 1) Arrange for disposal of excavated materials at locations outside the Authority's right-of-way, and obtain written permits from owners of property where excavated materials will be disposed.
    - 2) Submit permits and releases from each property owner absolving the Authority from responsibility in connection with disposal of such material.
  - b. Details of temporary ventilation:
    - 1) In the event it is planned to use equipment not covered by the SAFETY REQUIREMENTS Article of the General Requirements, submit details of such equipment for approval by the Engineer.
    - 2) Approval of the use of alternative equipment will depend on submitted research information concerning performance in accordance with applicable standards in common use.
  - c. Air quality reports: Daily reports of test for dust, toxic and hazardous gases and other atmospheric impurities in the working environment during construction.
  - d. Leak remediation plan:

- e. Include proposed application method equipment details and schedule, as well as complete manufacturer's literature, data, instructions and recommendations.
  - 1) Submit plans prior to beginning leak remediation work.
  - 2) Establish injection pressure by means of on-site demonstration; do not exceed structural capacity of lining.
- 4. Survey Control:
  - a. Survey personnel qualifications.
  - b. Type and location of horizontal and vertical control monuments to be set.
  - c. Survey procedures and equipment.
  - d. Design and location of theodolite instrument platform mounting bracket, bracing support hardware, method of attachment to shotcrete lining, brass mounting screw and standing platform underneath instrument mounting bracket.
  - e. Survey data collection equipment and software; and traverse reduction and adjustment software.
  - f. Survey equipment certification of adjustment; and calibration results of electronic distance measuring instruments (EDMI's) and prisms.
  - g. Tribrach adjustment method and equipment.
- 5. Samples:
  - a. One-foot long sections of vacuum lances, and drain pipes that show full cross section and type to be used. Submit three samples for each.
  - b. Two-foot long section of pipe to be used for grouted pipe spiling and rebar spiling that show full cross section and configuration of tip to be used. Minimum three-foot long tube-a-machette pipe.
- 6. Contingency Measures: At least 30 days prior to starting NATM excavation, submit the following for the Engineer's approval:
  - a. Name and qualification of personnel responsible for implementing contingency measures.
  - b. Plans outlining measures to be undertaken in the event of ground loss or instability at tunnel heading.
  - c. Plans outlining surveillance during longer stoppages such as weekends and holidays.
- 7. Submit to the Engineer for approval the qualifications and experience of the NATM engineer within 10 days of Notice to Proceed. Do not commence field work until approval in writing of the Engineer has been received by the Authority.
- 8. Submit to the Engineer for approval the qualifications and experience of NATM tunnel heading inspectors within 30 days of Notice to Proceed.
- 9. Submit to the Engineer for approval the qualifications of the firm or specialist responsible for groundwater control, and directional drilling within 10 days of Notice to Proceed.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Have adequate supply of required materials for performing chemical grouting, grouted pipe spiling, rebar spiling, vacuum lances, drain pipes, water sheets and drain hoses, and other approved materials for measures always present at the site.

**PART 2 - PRODUCTS**

**2.01 NATM SHOTCRETE LINING:**

- A. See Section 02426.

**2.02 SHOTCRETE:**

- A. See Section 03370.

**2.03 CHEMICAL GROUTING AND DIRECTIONAL DRILLING:**

- A. As shown.\*7

**2.04 VACUUM LANCES AND DRAIN PIPES:**

- A. Two-inch diameter, rigid PVC pipe with filter fabric, slotted, length as required.

**2.05 WATERSHEETS AND DRAIN HOSES:**

- A. PVC sheet for application at exposed ground surfaces: System AKWA DRAIN, or equal.
- B. Flexible PVC hose with end couplings as required.

**2.06 WATERPROOFING:**

- A. See Section 07137.

**2.07 GROUTED PIPE SPILING:**

- A. General:
  - 1. 1- 1/2-inch diameter pipe, length 15 feet.
  - 2. Steel, black: ASTM A53.
  - 3. Perforated as shown and approved by the Engineer.
- B. Grout Mix Design: Ingredients that are compatible, noncorrosive to steel and free from calcium chloride.
  - 1. Cement: ASTM C150, Type 1.
  - 2. Sand: ASTM C144, except maximum particle size limited to Size 8 sieve. Water: Potable.
  - 3. Admixtures and additives: Fly ash or other pozzolanic materials; fluidifiers; accelerating, retarding and water reducing agents; and bentonite may be used if approved.

**2.08 REBAR SPILING:**

- A. No. 8 standard deformed reinforcing steel bars, length eight feet as shown on the Contract Drawings, conforming to ASTM A615, Grade 60.\*8

**2.09 DOWELS:**

- A. Injection Bore Anchors:
  - 1. Assembly: Length 10 feet, O.D. 30 mm, bearing plate washer and nut.
  - 2. Bearing plate 3/8-inch thick, with bearing area not less than 36 inches, conforming to ASTM A36.
  - 3. Washer and nut: ASTM A325.
  - 4. Source: Subject to meeting requirements of dowels, as manufactured by G. D. Chance Company, or equal.
- B. Grout Mix Design: According to manufacturer's recommendations.

## **2.10 GROUT MIX FOR CONTACT GROUTING:**

- A. Grout for Contact Grouting: One part portland cement, one part fine aggregate and approved admixture, or as approved otherwise by the Engineer.
- B. Minimum Compressive Strength: 100 psi within 24 hours. Perform and submit tests of comprehensive strength in accordance with C109.
- C. Water: Minimum water as needed to achieve water-cement ratio compatible with pumping and placing requirements.

## **2.11 ELECTRICAL INSULATIVE COATING:**

- A. Electrical Insulative Coating: Approved moisture-insensitive coating, 100 percent solids, containing no solvents for use on dry or damp concrete of steel surfaces, with the following additional requirements:
  - 1. Properties:
    - a. Minimum tensile strength: ASTM D638, 5,000 psi in 14 days
    - b. Dielectric strength: ASTM D1304, 440-465 volts per mil.
    - c. Dielectric constant: ASTM D1304 as follows:
      - 1) 60 Hertz: 3.4 - 3.5.
      - 2) 1,000 Hertz 3.3 - 3.4.
    - d. Power factor: ASTM D1304 as follows:
      - 1) 60 Hertz: 0.006 - 0.007.
      - 2) 1,000 Hertz 0.03 - 0.04.
    - e. Viscosity: 6,000 centipoises plus-or-us 1,000 centipoises, as determined by Brookfield Viscometer using No. 6 spindle at 50 rpm.
  - 2. Primer: Zinc-rich, MS MIL-P-26915 (USAF) Type 1, Class B.

## **2.12 INSTRUMENT PLATFORM MOUNTING BRACKETS:**

- A. Construction: Steel, minimum 1/8-inch thick, having a smooth finish where instrument attaches. Make bracket rigid enough to resist deflection or movement when a theodolite is mounted and operated on top of it. If deflection or movement is apparent, add bracing supports as directed by the Engineer.
- B. Bracket Supports: Attach bracket supports to the underside of platform mounting bracket to provide a clear and unobstructed working area at and above platform.
- C. Size: Sufficient length and width to allow efficient set-up and operation of various theodolite and electronic distance measuring instruments (EDMI).
  - 1. Minimum width: Nine inches.
  - 2. Minimum length: Sufficient to allow a mounted instrument a at least one foot clearance from tunnel lining.
- D. Install platform mounting brackets to a level plane within the adjustment limits of a standard tribrach.
- E. Forced Centering Hole: Provide each platform mounting bracket with a forced centering hole to accept a brass instrument mounting screw (standard 5/8-inch by 11-inch thread) for securing a standard tribrach.

1. Provide a brass mounting screw that is hollowed and of sufficient diameter to allow the instrument operator to site below platform mounting bracket with a nadir optical plummet
  2. Mill force centering hole and brass mounting screw to match each other within 0.001 inch tolerance.
  3. Provide the Engineer with three mounting screws for duration of the Contract.
- F. Surveyor Platform: Provide a platform underneath each instrument mounting bracket for the purpose of supporting a surveyor during measurement observation process from wither side of instrument.

### **PART 3 - EXECUTION**

#### **3.01 TEMPORARY VENTILATION:**

- A. Provide, operate and maintain for the duration of the project a temporary ventilation system which will conform to specified safety requirements and those of jurisdictional authorities. Remove the system from the site when work is completed.
- B. Use equipment which is adequate to maintain a sufficient supply of fresh air in underground work areas.

#### **3.02 SAFETY REQUIREMENTS:**

- A. Perform work so as to minimize safety hazards and exposure of men and equipment to hazardous and potentially hazardous conditions in accordance with specified safety requirements.
- B. In case of an emergency or work stoppage likely to endanger excavation or adjacent structures, continuously maintain full work force 24 hours per day including weekends and holidays until emergency or hazardous conditions no longer jeopardize stability and safety of the work.
- C. Perform tunnel construction so as to minimize ground movement in front of and surrounding the tunnel and prevent subsidence of surface, structures and utilities above and in the vicinity of the tunnel. Perform specified pre-support measures.
- D. Support ground continuously so as to prevent loss of ground and keep perimeters and maintain stability of tunnel faces, passages and bottom of shafts.

#### **3.03 DISTANCE BETWEEN HEADINGS:**

- A. Maintain longitudinal distance of a minimum of 150 feet between adjacent active tunnel faces being simultaneously excavated.
- B. Where tunnel heading is being advanced adjacent to previously excavated tunnel, ensure that shotcrete lining in the first tunnel is completely installed and stable.
- C. Where two tunnel headings of the same tunnel tube are being excavated toward each other, stop excavation at one face and install at this face elements of shotcrete lining and pre-support as specified and a minimum seven-inch thick one layer welded wire fabric reinforced shotcrete face support. Place these support measures at a minimum distance of 100 feet between the headings.

- D. Where tunnel heading is being advanced toward previously excavated tunnel, ensure that shotcrete lining and face support as specified in the stopped tunnel are completely installed and stable.

**3.04 SURVEILLANCE OF HEADINGS:**

- A. Maintain qualified personnel on duty to monitor conditions that might threaten stability of heading whenever tunnel excavation is suspended or shut down.
- B. Have one qualified inspector always on duty to monitor stability of face and roof during tunneling operations. Use of approved monitoring devices, such as closed circuit television, which permit continuous monitoring of conditions at the face by qualified observers from outside of the tunnel is permitted.

**3.05 DETECTION OF MOVEMENT:**

- A. Install instruments shown and monitor the horizontal and vertical movements of the tunnels and the station as applicable as specified in Section 02291. If movements are observed, take appropriate action to arrest these movements.
- B. Displacement Limits of Initial Lining:
  - 1. NATM tunnels:
    - a. Horizontal: 0.30 inch.
    - b. Vertical: 0.30 inch.
  - 2. NATM station:
    - a. Center drift:
      - 1) Horizontal: 0.50 inch.
      - 2) Vertical: 0.40 inch.
    - b. Side drifts:
      - 1) Horizontal: 0.20 inch.
      - 2) Vertical: 0.25 inch.
    - c. Center drift during excavation of side drifts in addition to 2.a. above:
      - 1) Horizontal: 0.50 inch.
      - 2) Vertical: 0.05 inch.
    - d. Middle drift:
      - 1) Horizontal: 0.30 inch.
      - 2) Vertical roof: 0.50 inch.
      - 3) Vertical invert: 0.60 inch.
  - 3. NATM shafts:
    - a. Shallow shafts:
      - 1) Horizontal: 1.0 inch.
      - 2) Vertical: 0.5 inch.
    - b. Deep shafts:
      - 1) Horizontal: 0.5 inch.
      - 2) Vertical: 0.5 inch.

**3.06 FIELD QUALITY CONTROL:**

- A. Do not encroach on NATM lining clearance line with shotcrete lining. Consider inaccuracy of construction, material tolerances, and shotcrete lining deflection to determine dimensions of actual excavation and support and pre-support elements.
  - 1. Install lattice girders as close as possible to the line of excavation but not closer than one inch (unless otherwise shown on the Contract Drawings), from the defined inside face of the initial lining.

2. Submit survey protocols and plotted profiles with a maximum spacing of 20 feet not later than 90 days after excavation.
- B. Document stability of the tunnel support system by monitoring as specified. Demonstrate the absence of continuing and significant deflection or increase of stress before installing the waterproofing system and the concrete tunnel lining.
1. Submit monitoring protocols and plotted information.
- C. Allowable Tolerances: Place cast-in-place concrete to the following tolerances:
1. Departure of tunnel, shaft and station from line or grade shown as measured from working point of tunnel, shaft and station: One inch.
  2. Variation in thickness of lining: Minus zero inch.
  3. Variation in internal diametrical distance between two points: Plus-or-minus one inch.

### **3.07 EQUIPMENT:**

- A. General:
1. Use equipment that can be controlled to desired line grade, minimize over excavation and loss of ground, capable of excavating the ground materials and grouted soils. Provide specified tunnels, shaft and station lining.
  2. Use equipment and methods that satisfy the requirements of this section while preserving and protecting the inherent strength of the material surrounding the tunnel, shafts and station.
- B. Grouting Equipment for Contact Grouting:
1. For pumping grout, use approved pump capable of developing specified uniform pressure at grout hole connection.
  2. Provide automatic shutoff control to prevent grouting pressure from exceeding that specified.
  3. Keep equipment lines clean by constant circulation of grout and by periodic flushing with water.
  4. Use equipment that allows flushing with grout-intake valve closed, water-supply valve open and grout pump running at full speed.
  5. Provide two pressure gauges, one at the pump and other on manifold hookup at collar of hole being grouted. Use pressure-gauge ranges as necessary for each part of the grouting program.
  6. Provide suitable stop valves at collar of hole to maintain necessary pressure until grout has set.
  7. Provide grouting equipment with means of accurately determining amount of grout injected.
  8. Furnish accurately calibrated, high-precision gauge to periodically check accuracy of pressure gauges.

### **3.08 INSTALLATION OF NATM SHOTCRETE LINING:**

- A. NATM Shotcrete Lining: Section 02426.

### **3.09 TUNNEL WATERPROOFING:**

- A. Install in accordance with Section 07138.

### 3.10 EXCAVATION:

- A. General:
1. Excavate to lines, grades, dimensions and tolerances, as shown and specified to accommodate shotcrete lining and concrete linings including waterproofing.
  2. Install support, pre-support systems and shotcrete lining as shown. Allow neither the shotcrete lining nor other support or pre-support systems to intrude into clearances required for the placement of the final concrete lining.
  3. Unless otherwise noted or approved by the Engineer, open up a new round of excavation only following the complete installation of the support elements of the previous round and for a length not exceeding the maximum length of unsupported excavation shown for the respective support and excavation type and specified herein. However, reduce the spacing of the lattice girders and the length of round if ground conditions and the actual stand-up time encountered or achieved by pre-support means so dictate.
  4. For station, remove shotcrete installed to support previously excavated tunnel or drift within the station interior as shown.<sup>9</sup>
  5. Apply additional subdivision of excavation areas, and face stabilization by means of a face stabilization wedge and/or shotcrete wherever ground conditions require to do so. The selected method is subject to approval by the Engineer.
  6. Apply a flash-crete layer immediately after excavation to seal and protect material from deterioration and initial loosening. Install shotcrete lining in a timely manner so as to maintain the inherent strength of the ground.
  7. Full face support with a minimum of two inches of shotcrete is mandatory for stoppages longer than 24 hours but not exceeding 72 hours. For stoppages beyond 72 hours full face support by a minimum seven inches thick shotcrete layer reinforced with one layer welded wire fabric is mandatory.
- B. General Excavation Sequences:
1. Top Heading: Apply pre-support in advance of excavation wherever required by ground conditions or specified hereafter.
  2. Bench/Invert: Excavate bench/invert alternating with advance of the top heading, with a remaining separation as shown.<sup>10</sup>
- C. Excavation and Support Types:
1. Generally, make the determination of excavation and support type in the top heading, and under consideration of the anticipated subsurface conditions immediately ahead of the face and in the following bench and invert area.
  2. Make evaluation of the ground conditions and of the appropriate excavation and support type in the top heading, and under consideration of the anticipated subsurface conditions immediately ahead of the face and in the following bench and invert areas.
  3. The approval of the proposed excavation and support type by the Engineer or his failure to call attention upon improper or inadequate application of the related excavation sequence and/or tunnel support and/or pre-support, or to require respective chance will not relieve the Contractor of his responsibility for the integrity of the tunnel support or the proper excavation of the work.
  4. Excavation and Support Type 1:
    - a. Top heading and bench/invert excavation, top heading two rounds ahead of bench/invert excavation as shown.
    - b. Tunnel support requirements include:
      - 1) Shotcrete lining: minimum seven-inch thick shotcrete, reinforced with one layer of welded wire fabric type 6 x 6 - w4.0 x w4.0, lattice

- girders, splice bards, and splice clip as shown on the Contract Drawings.
  - 2) Grouted pipe spiling: 1.5-inch I.D. perforated steel pipe. Where no systematic grouted pipe spiling pre-support measures have been installed as specified herein, install grouted pipe spiling at length and at locations as required. Where installed for more than one section overlap, make spiling minimum three feet.
  - c. Face stabilization:
    - 1) Shotcrete minimum two inch thickness as required.
    - 2) Face stabilization wedge in top heading or bench/invert as required.
  - d. Maximum length of unsupported excavation (excluding length for wwf reinforcement overlap as shown): Install support elements within a distance to the face of 3'-4" in the top heading, and 6'-8" in the bench/invert.
  - e. Maximum distance between top heading face and shotcrete closure in the invert: 16'-8" (excluding lengths for welded wire fabric overlap as shown).
  - f. In case of stoppages and in addition to other requirements, provide invert closure at a maximum distance of 11'-10" for stoppages exceeding 72 hours.
5. Excavation and Support Type 2:
- a. Top heading and bench/invert excavation, top heading one round ahead of bench/invert excavation as shown.
  - b. Tunnel support requirements include:
    - 1) Shotcrete lining: minimum seven-inch thick shotcrete, reinforced with one layer of welded wire fabric type 6 x 6 - w4.0 x w4.0, lattice girders, splice bards, and splice clip as shown.
  - c. Rebar Spiling: No. 8 rebar, eight feet long, installed as required individually or up to around tunnel roof perimeter as shown.
  - d. Face stabilization:
    - 1) Shotcrete minimum two-inch thickness.
    - 2) Face stabilization wedge in top heading or bench-invert as required.
  - e. Maximum length of unsupported excavation (excluding length for wwf reinforcement overlap as shown on the Contract Drawings): Install support elements within a distance to the face of three feet four inches in the top heading, and six feet eight inches in the bench-invert.
  - f. Maximum distance between top heading face and shotcrete closure in the invert: 13'-4" (excluding lengths for welded wire fabric overlap as shown).
  - g. In case of stoppages and in addition to other requirements, provide invert closure at a maximum distance of 8'-6" for stoppages exceeding 24 hours.<sup>\*\*11</sup>

D. Pre-Support:<sup>\*\*12</sup>

- 1. Three types of tunnel roof pre-support are specified:
  - a. Chemical grouting.
  - b. Grouted pipe spiling.
  - c. Rebar spiling.
- 2. Do not perform NATM tunnel excavation without the aid of specified pre-support measures
- 3. Install chemical grout arch above both inbound and outbound tunnels as shown. Install grouting pipes for the chemical grouting canopy by means of directional drilling and perform chemical grouting as specified.
- 4. Perform grouted pipe spiling in a systematic manner as shown and as specified for both the inbound and outbound tunnels
  - a. Exact extent of grouted pipe spiling to be determined in the field in accordance with the following requirements:

- 1) Grouted pipe spiling to overlap with chemical grout arch for a length of a minimum of five feet.
  - 2) Grouted pipe spiling to be installed as long as cover of P1 material above tunnel crown is five feet or less.
  - b. Install pipes for grouted pipe spiling in four-inch diameter pre-drilled holes. Use distancers to center pipes in boreholes.
  - c. Inject cement grout through perforated pipes with low pressure until entire predrilled hole is grouted.
  5. Rebar spiling: Install rebars without end hardware by jacking.
  6. As required by geologic conditions encountered, substitute specified roof pre-support with another specified measure after obtaining written approval from the Engineer.
  7. Provide additional pre-support measures as required by geological conditions encountered or as directed by the Engineer.
- E. Sequence and Direction of Tunneling:
1. Install chemical grout arch as shown.
  2. For limitations and direction of tunneling conform to **Section \_\_\_\_\_**.
- F. Probe Drilling:
1. During excavation in accordance with Excavation and Support Type 1 drill two-inch minimum diameter probe holes to determine soil and groundwater conditions ahead of tunneling.
  2. Drill a minimum of three probe holes in the top heading; one located at approximately the tunnel center line and two feet below the tunnel roof, one each to both sides of the tunnel approximately two feet above the top heading invert and three feet distant from the tunnel wall. Alter location of probe holes as approved or as directed by the Engineer.
  3. Add more probe holes as required and as directed by the Engineer.
  4. Drill probe holes to minimum distance of 50 feet ahead of the excavation face.
  5. Drill 50 feet probe holes after every 40 feet of tunneling so that soil and groundwater conditions are always known for a minimum 10 feet ahead of tunneling.
  6. Drill probe holes only in the presence of the Engineer.<sup>\*13</sup>
- G. Groundwater Control:
1. Control groundwater in soil surrounding each tunnel to prevent the following:
    - a. Heaving of invert, blow-ups, hazardous seepage, and sudden flow of soil in the tunnel face.
    - b. Loss of ground and surface subsidence.
  2. Perform free-air tunneling when groundwater levels, as observed in piezometers are:
    - a. Lowered to the top of P1 material or lower four weeks prior to tunneling. Use at a minimum piezometers CP-1, CP-2 and CP-3 as shown on the Contract Drawings to verify groundwater levels.
    - b. Dewatering requirements are provided in accordance with Section 02240.
  3. Maintain groundwater levels as specified herein and in Section 02240 during tunneling and until minimum four weeks after cast-in-place concrete lining is installed and approved.
  4. Collect infiltrating groundwater and pump or drain it out of the tunnel.
  5. Where a probe hole indicates water inflow apply further investigation by drilling an additional probe hole approximately two feet below the water bearing probe hole. Repeat this procedure until invert level is reached.
    - a. Use vacuum lances and/or drain pipes installed along the tunnel perimeter or otherwise as required to provide relief from water.

- b. Commence tunneling after sufficient results of dewatering could be verified, or as directed by the Engineer.
  6. Upon approaching saturated strata during tunneling, seal entire excavation face with a minimum four inches of shotcrete, reinforced with one layer welded wire fabric, and apply drain pipes and/or vacuum lances as dewatering measures. Excavation may continue after sufficient results of the additional dewatering measures could be verified, or as directed by the Engineer.
  7. Prior to application of shotcrete lining, collect seeping groundwater or local groundwater inflow by means of drain hoses or water sheets or both to prevent build up of hydrostatic pressure behind the shotcrete lining and to prevent deterioration or reduction of the strength properties of the fresh shotcrete. Use water sheet to collect water seepage through shotcrete and drain away by means of drain hoses.
  8. Install and always maintain temporary drainage sumps at minimum one foot below tunnel invert and locations as required, and construction drains at tunnel sidewalls of sufficient capacity to pump out water collected from within the tunnel.
  9. Maintain drainage and pumping systems free of hardness build-up caused by calcification and/or corrosive characteristics of the groundwater, treat systems to prevent or kill bacterial clogging of screens, piping and sumps.
  10. Use approaching previously drilled exploratory or other borings which intersect the tunneling cross section, ensure that procedures and materials are in place to immediately seal off and stabilize the borehole as required to prevent water inrush and/or associated groundloss.
- H. Break-Out:
1. Install shotcrete reinforced collars around the proposed break-outs from the support of excavation as shown on Contract Drawings. Submit for approval by the Engineer collar arrangement and break-out construction procedures as adjusted to actual support of excavation.
  2. Excavate and support tunnels in the start-up section as shown.
  3. Prior to break-out construction, install horizontal drain pipes and/or vacuum lances as required two feet below the tunnel invert for the local dewatering.
    - a. Utilize knowledge of geologic conditions based on shaft excavation.
    - b. As required to promote invert stability, limit length of round in bench/invert to three feet and four inches.
  4. Construct break-out prior to "hole through" at support of excavation.
  5. Construct break-out following installation of chemical grout arch.
- I. Air Quality:
1. Conduct drilling and tunneling operations by methods and with equipment that will positively control dust, fumes, vapors, gases, fibers, fogs, mists or other atmospheric impurities in accordance with specified safety requirements.
  2. Provide approved instruments for testing quality of tunnel atmosphere, take samples under working conditions at prescribed intervals. Submit results of the quality tests on a daily basis.
- J. Dispose of excavated material at locations outside the Authority's right-of-way. If contaminated soil is unexpectedly encountered, inform the Engineer immediately for a resolution.
- K. Dispose of groundwater and wastewater from the operation as quickly as possible without causing damage. Maintain ditches and sump pumps. Dispose of groundwater in an environmentally approved manner to meet or exceed the code requirements.

- L. Temporary Backfill: Protect the invert area of tunnel tubes from construction equipment traffic until placing of the final invert concrete by means of a work slab, gravel bed, or other suitable material approved by the Engineer. Have the temporary backfill protect the shotcrete lining from being damaged. This invert protection road to have a height in the centerline of the tunnel of at least three feet unless otherwise approved.
- M. NATM Portal Wall:
  - 1. The Contractor may choose slurry wall or other equivalent methods to construct the NATM portal wall.
  - 2. The Contractor is not allowed methods such as soldier piles and lagging method to construct the NATM portal wall.
  - 3. Have methods of excavation and portal wall construction approved by the Engineer before starting excavation and construction of the portal wall.

### **3.11 TEMPORARY TUNNEL WIDENINGS, WORKSHAFTS AND OTHER OPENINGS:**

- A. Design, excavate, support and backfill temporary tunnel widenings, workshafts and other openings conforming to this section, and in accordance with Sections 02320 and 02260.
- B. Seal such openings when no longer necessary.
- C. Form and place Class 2500 concrete, two feet thick, in shafts over tunnels to prevent damage to tunnel shape. When concrete has achieved design strength, backfill remaining void in accordance with Section 02320.

### **3.12 TUNNEL CONNECTION AND TERMINATIONS AND TEMPORARY BULKHEADS:**

- A. Connect new tunnels to existing structures by removing existing bulkheads if necessary and sealing junctions.
- B. Provide temporary bulkheads to seal terminations of tunnels which are not connected to permanent structures.
- C. Design temporary bulkheads where and when necessary. Obtain approval of the design prior to construction. Provide bulkhead which is capable of resisting lateral earth and hydrostatic pressures, waterproof and capable of removal without damage to concrete lining.

### **3.13 CONCRETE CONSTRUCTION:**

- A. Fill enlargements of tunnel excavation beyond dimensions shown with concrete, to provide a proper surface for installing waterproofing.
- B. Install waterproofing and perform concrete work in accordance with Sections 03100, 03200, and 03300.
- C. Place concrete for lining upper portion of tunnel by mechanical or pneumatic methods through pipes which discharge as nearly as practicable to highest point of structure.
- D. Protect waterproofing during installation of reinforcement and forms for placing cast-in-place concrete lining.
- E. Schedule erection of concrete tunnel lining so that the concrete is placed after decline of shotcrete lining deflection.

- F. Perform contact grouting through grout pipes in the roof.

**3.14 DEFECTIVE LINING:**

- A. Watertightness Criteria: Section 03300.
- B. Cast-in-place concrete lining will be considered defective if thickness of cast-in-place concrete at any point is less than 12 inches.

**3.15 CORRECTIVE WORK:**

- A. Provide reinforcement in cast-in-place lining wherever thickness of cast-in-place concrete at is less than 12 inches but greater than nine, at no additional cost to the Authority.
- B. Cast-in-place lining less than nine inches thick:
  - 1. Wherever cast-in-place concrete lining is less than nine inches thick, enlarge the excavation cross section by remining, so that the specified minimum thickness is achieved.
  - 2. Support the tunnel shotcrete lining during remining.
  - 3. Submit method of support during remining, including design calculation signed by a professional engineer registered in the jurisdiction where the work is being performed, description of material, and sequence of operation for the Engineer's approval.
  - 4. Maintain qualified personnel, equipment and adequate supply of materials on-site to perform emergency support measures during remining. Submit emergency action plan for the Engineer's approval prior to starting remining operations.

**3.16 INSTALLATION OF ELECTRICAL INSULATIVE COATING:**

- A. Electric insulative coating installation may be omitted if the geomembrane meets the dielectric strength of 440-465 volts per mil as specified for electric insulative coating. If electric insulative coating will be installed, install as follows:
- B. Apply coating prior to placement of invert and safety walk concrete on shotcrete lining.
- C. Surface Preparation: Remove dirt, grease and heavy laitance by wet sandblasting, water blasting or wire brushing.
- D. Application: Apply in two coats of equal thicknesses totaling 20 mils minimum dry film thickness in accordance with recommendations of coating manufacturer

**PART 4 - MEASUREMENT AND PAYMENT**

**4.01 MEASUREMENT:**

- A. Placement of perforated steel pipes in predrilled holes: Lineal feet.
- B. Placement of steel bars: Lineal feet.
- C. Placement of lances and drain pipes (slotted PVC pipes): Lineal feet.
- D. Measurement for payment will not be made for the following items:
  - 1. Drilled holes, grouted pipe spiling, rebar spiling, vacuum lances or drain pipes lost or damaged due to Contractor's negligence.

2. Grout loss due to improper anchorage of grout pipes, injections, and failure of Contractor to seal leaks.
  3. Loss of grout when work is not being performed in accordance with specifications and is interrupted by the Engineer, or when work is stopped to implement specified contingency measures.
- E. Except as defined below, no separate measurement or payment will be made for work specified in this section, such work being considered incidental to and part of other pay items.

#### **4.02 PAYMENT:**

- A. Compensation for the following will be made on unit price basis.
1. Furnishing and installing Grouted Pipe Spiling for NATM Tunnels: Payment will be made for total length of pipes incorporated in work. Cost of pipes, drilling holes, grouting, fittings, manifolds, pumps, hoses, connections, and other incidentals required to perform work will be included in cost for placing pipes.
  2. Furnishing and installing rebar spiling for NATM Tunnels: Payment will be made for total length of steel bars incorporated in work. Cost of steel bars and other incidentals required to perform work will be included in cost of placing rebar spiling.
  3. Furnishing and Installing Vacuum Lances and Drain Pipes for NATM Tunnels: Payment will be made for total length of slotted PVC pipes incorporated in work. Cost of lances and pipes, hoses, connections, fittings, filter fabric, collection pipes, pumps, operating costs and other incidentals required to perform work will be included in cost for placing lances and drain pipes.
  4. Cost of work includes cost of materials, labor and equipment required to perform work.
  5. Compensation for work specified in this section will be made in the following manner:
    - a. Grouted Pipe Spiling in NATM Tunnels: Lineal feet.
    - b. Rebar Spiling in NATM Tunnels: Lineal feet.
    - c. Vacuum Lances and Drain Pipes: Lineal feet
    - d. Work not included in above is included in Lump Sum Pay Item No. 1.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

#### **ENDNOTES:**

- \*1. Include the limits of NATM excavation and construction sequence on structural Contract Drawing.
- \*2. Include "Excavation and Support Types" based on the material anticipated being encountered during the proposed excavation. These types should also be shown and clarified on the structural Contract Drawings.
- \*3. On a case-by-case basis, if directional drilling is to be used, write a new specification section on directional drilling.
- \*4. Establish the frequency of mapping.
- \*5. List additional Quality Assurance (QA) requirements, including requiring other specialists as necessary on the Contractor's field staff, depending on the soil encountered and the procedures proposed. As an example, a proposal for jet grouting should be included in the definitions and QA sections and a jet grouting specialist should be required on the Contractor's staff.

- \*6. If an NATM Portal Wall is proposed at the beginning of excavation, include requirements such as the maximum lateral movement of soil behind the wall, the vertical movement of the wall, provisions for grouting for pre-support and chemical grout arch etc.. Otherwise delete this paragraph.
- \*7. If directional drilling is to be used, write a new specification section on directional drilling.
- \*8. If rebar spiling is used, show it on the Structural Contract Drawings. The size and the length of spiling rebar may be changed by the Section Designer if warranted by subsoil conditions.
- \*9. Show these on the Contract Drawings.
- \*10. Show the scheme of excavation sequence indicating heading, bench/invert, center drift, side drifts, middle drift, etc.
- \*11. Revise these support Types 1 and 2, if necessary, to suite the subsurface conditions anticipated, based on the subsoil exploration.
- \*12. Show types and extent of such support on Contract Drawings.
- \*13. Show the arrangement of probe holes on Contract Drawings

**END OF SECTION**

## SECTION 02420

### ROCK REINFORCEMENT

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing and testing rock bolts, accessories, welded-wire fabric and miscellaneous steel for reinforcement of rock.
- B. Related Work Specified Elsewhere:
  - 1. Rock tunneling: Section 02410.
  - 2. Drilling and pressure grouting: Section 02431.
- C. Definitions:
  - 1. Initial support: Section 02410.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: A185, A615, C144, C150, C579, F432.
- B. Demonstration:
  - 1. Prior to installation of rock bolts, arrange demonstration to show that specified test requirements have been met.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Prior to beginning work, submit the following:
      - 1) Locations, installation procedures and layouts of rock bolt installations.
      - 2) Pattern covering crown, sidewalls and face.
      - 3) Spacing, type, size and length of rock bolts, together with type of bolt accessories and surface covering.
      - 4) Relationship to rock discontinuities and execution sequence as well as time and distance from face for installation.
  - 2. Samples:
    - a. Bolts:
      - 1) At least 30 days prior to purchase of rock bolts, obtain samples of various sizes and types to be used from normal stock of manufacturer. Submit three such sample bolts of each type for testing by an independent testing agency designated by the Engineer.
      - 2) In the event of failure, provide additional samples until it can be demonstrated that bolts scheduled for delivery meet specified requirements.
    - b. Grout additive:
      - 1) One two-ounce sample of pure, unpolished metallic aluminum powder or similar additive proposed for use in grout mixture.

- c. Resin cartridges:
  - 1) Three samples of each type of resin cartridge.
- 3. Certification:
  - a. Prior to installation of rock bolts, arrange demonstration to show that specified test requirements have been met.
  - b. Certificates verifying that samples for testing are from normal stock.
  - c. Certified mill reports of the bolts.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Rock Bolts and Accessories:
  - 1. General requirements:
    - a. In accordance with ASTM F432.
    - b. Rock-bolt assembly: Bolt, bearing plate, washer and nut as specified.
    - c. At least 5-1/2 inches of rolled thread on outer end.
    - d. Fabricated from deformed bars.
  - 2. Type 1, with resin end anchors and fully resin-encapsulated:
    - a. ASTM A615, Grade 60.
    - b. Approved method of resin anchorage to take specified tension.
  - 3. Type 2, with mechanical end anchors and fully grouted:
    - a. ASTM F432, Grade 55, hollow core.
    - b. Approved expansion-shell anchorage on inner end.
  - 4. Protective grease: Type used for bilge protection, containing rust-inhibiting compounds, factory-applied to threads of rock bolts and entire surface of nuts and washers.
  - 5. Steel bearing plates: Square, not less than 3/8-inch thick, having bearing area of at least 36 square inches unless otherwise shown, with holes for injection of grout, for effective air release and for bolt. Hole in steel bearing plate of sufficient size to eliminate binding of bolt.
  - 6. Nuts: Hexagonal head
  - 7. Steel washers: Quenched and tempered. Hard-steel washers to be two inches in diameter and 1/8-inch thick unless otherwise shown. Center hole to be 1/8-inch larger in diameter than bolt with which it is to be used.
- B. Miscellaneous Steel: Products of recognized manufacturer, comprising rock-bolt mats, mine roof ties, mine roof channels or similar members which are attached to roof surface by means of rock bolts.
- C. Wire Fabric: ASTM A185, hot-dip galvanized.
- D. Expansion Shells: As approved, capable of developing guaranteed minimum yield strength of rock bolt.
- E. Grout and Mortar:
  - 1. Cement: ASTM C150, Type I.
  - 2. Water: Section 03300.
  - 3. Additive: Pure, unpolished metallic aluminum powder or other approved additive.
  - 4. Sand: ASTM C144, except maximum particle size limited to Size 8 sieve.
- F. Lubricant for Threads and Washers: Molybdenum-disulfide base, Molykote G, Alpha Molykote Corporation or equal.
- G. Resin Cartridges:

1. Two components as follows:
  - a. Resin: High-strength unsaturated polyester with predominance of nonreactive inorganic filler.
  - b. Catalyst: Containing peroxide with nonreactive inorganic filler.
2. Strength of mixed and cured resin when tested in accordance with ASTM C579:
  - a. Compressive strength: 17,000 psi.
  - b. Tensile strength: 7,500 psi.
  - c. Shear strength: 4,800 psi.
3. Gel time:
  - a. Gel and cure time of fast-set resin: Sufficient to permit bolt tensioning within 10 minutes or as recommended by manufacturer for the particular application.
  - b. Gel time of slow-set resin: 15 to 30 minutes.
4. Materials to have thixotropic and viscous properties to permit adequate mixing of materials by manipulating bolt and to prevent mixture from running out of hole after mixing.
5. Shelf life: Six months, minimum.
6. Casing constructed of saturated polyester providing optimum resistance to moisture but easily fractured to enable complete mixing during installation.

## **2.02 MIXES:**

- A. Grout:
  1. Mix cement and sand dry.
  2. Add water to obtain water-cement ratio of approximately 0.4 by weight.
  3. Mix in high-speed mixer for three minutes minimum.
  4. Prepare batches so that time before use does not exceed 45 minutes.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION - GENERAL:**

- A. For underground excavation in rock on which bolts are used, install rock bolts within three feet of heading and within eight hours after blasting and prior to next shot.
- B. When excavating with tunneling machine which provides direct ground support over machine such as a shield, install rock bolts within three feet of trailing edge of such support.
- C. After each exposure of final rock surface, examine surface and confirm that rock bolt pattern to be installed will be adequate. Provide rock reinforcement that is adequate at all times to ensure safety of personnel and construction operations.
- D. Drill holes in rock of depth and diameter necessary to accommodate bolt and to give anchorage consistent with type and length shown on Contract Drawings and approved shop drawings. Clean holes of drill cuttings, sludge and debris.
- E. Avoid damaging threads on projecting end of bolt during installation.
- F. Remove protective grease from threads and nuts.
- G. Apply lubricant to threads. Use lubricant between washers and nuts.
- H. Between bearing plate and steel washer, set bearing surface of nut perpendicular to bolt by use of bevel washers as necessary.

### **3.02 INSTALLATION OF RESIN-ANCHORED (TYPE 1) ROCK BOLTS:**

- A. For installation of resin-anchored rock bolts, have qualified representative of manufacturer supervise installation of initial 50 rock bolts. Have representative periodically reinspect installation procedures.
- B. After drilling of rock bolt holes has been completed, insert resin cartridges in accordance with manufacturer's recommendations for anchorage conditions. Avoid rupture of cartridge skin.
- C. To rupture cartridge and mix resin, insert bolt in hole rotating it at penetration rate of two inches per second through cartridge. Rotate bolt by mechanical means for five to ten seconds after bolt reaches bottom of hole or for 20 seconds minimum, whichever is least.
- D. Apply tension as specified after recommended cure time for fast-set resin has elapsed, but before gel time for slow-set resin has elapsed.

### **3.03 INSTALLATION OF MECHANICALLY ANCHORED (TYPE 2) ROCK BOLTS:**

- A. Insert bolt in hole and set anchorage at necessary depth.
- B. Tension bolt as specified.
- C. Grout bolt as specified.

### **3.04 GROUTING OF ROCK BOLTS:**

- A. Pack or seal holes in bearing plate and between bearing plate and rock or shotcrete surface so that grout will be retained in hole.
- B. Inject grout into hole at pressure not greater than that necessary to fill hole adequately.
- C. Continue injecting grout until there is full return of grout through air vent.
- D. If, during grouting of bolt, grout is found to flow from points in adjacent rock surface, plug or caulk leaks until leakage is stopped.
- E. Grout only rock bolts located further than 50 feet behind working face as heading advances.

### **3.05 TENSIONING OF ROCK BOLTS:**

- A. Type 1 - Resin Anchored: Nominal tension to ensure proper nut tightening, not to exceed 20 percent of bolt guaranteed minimum yield strength.
- B. Type 2 - Mechanically Anchored: Tension rock bolts by direct pull using approved hydraulic jacks and accurate calibrating techniques to between 60 and 80 percent of bolt guaranteed minimum yield strength; tighten nut.
- C. If specified tension is not achieved for tensioned rock bolts, submit modified procedure for approval.

### **3.06 PULL TESTS ON INSTALLED BOLTS:**

- A. Equipment:
  - 1. Provide equipment consisting of suitably sized hollow ram jack, adjustable bearing truss for aligning direction of pull with centerline of bolt, extension bar for attaching

jack to bolt, hydraulic pump with gauge calibrated to read directly in pounds for ram being used, dial gauge which reads in increments of 0.001-inch over a range of two inches, magnetic or independent dial gauge mounting and other necessary accessories.

2. Calibrate pump gauge while connected to jack by testing machine before performing pull tests and at subsequent times as directed during construction period.
3. Maintain ready access to spare parts for testing equipment, especially gauges and pump seals, so that work will not be delayed.
4. Maintain pull test equipment in good working condition.
5. Ensure that equipment is used exclusively for pull tests. Store as directed.

B. Testing:

1. Conduct pull tests on installed rock bolts as directed.
2. Perform testing to:
  - a. Measure head movement.
  - b. Verify that specified tension can be sustained by bolt and anchorage without yield of steel or rock or slip of anchor.
  - c. Check grouting procedure and prove grout strength.
3. Test rock bolts as follows:
  - a. As selected at random by the Engineer according to the following schedule:

For Each Rock Bolt Type Installed	Required Testing
First 100 bolts	10
Remaining bolts	1 per 100

- b. No earlier than 24 hours and no later than three days after installation.
  - c. To at least 80 percent of minimum specified yield strength.
4. Correction of defective work:
  - a. For test purposes, bolt will be considered to have failed if outward movement of bolt anchorage in excess of 0.001-inch occurs and continues to occur at sustained loading below tension specified.
  - b. Replace bolts that fail or pull out with bolts that meet specified testing requirements.
  - c. Perform further testing, up to a minimum of five rock bolts in vicinity of failed bolt as directed. Replace as directed bolts that fail or pull out.

**3.07 ROCK SURFACE REINFORCEMENT:**

- A. Install where shown, where directed and where approved when conditions at the site dictate, rock surface reinforcement consisting of wire fabric, miscellaneous steel or a combination of both. Rock conditions which may require surface reinforcement include, but are not limited to, places where the rock is weathered, excessively jointed or fractured or where it has a tendency to spall.
- B. For installation of surface reinforcement and rock bolts simultaneously, place reinforcing materials over rock bolts between rock surface and steel bearing plate; tension bolt to draw reinforcing materials up tightly to the rock surface. Where wire fabric is used, overlap 1-1/2 times mesh dimension.
- C. Where surface covering or reinforcement is placed after installation of rock bolts, attach materials to previously installed bolts by use of additional steel plate and nut by welding or

by supporting with additional rock bolts. Check existing rock bolts to which extra steel plate and nut are added.

- D. Replace installed bolts which become loose after attachment of surface reinforcement.
- E. Firmly attach surface covering or reinforcement so that it closely follows approximate contour of rock.

**END OF SECTION**

## SECTION 02425

### PRECAST-CONCRETE TUNNEL LINING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing precast-concrete segments for use as lining rings in one-pass tunnels with waterproofing gaskets and bolts, and as the initial lining of the two-pass system tunnels. Precast concrete lining segments for the two-pass system may be either gasketed and bolted when the initial liner needs to exclude water from tunnels being driven; or the segments may be jacked in place and retained by steel dutchmen and then grouted
- B. Related Work Specified Elsewhere:
  - 1. Installation of the linings: Section 02415.
  - 2. Concrete formwork: Section 03100.
  - 3. Concrete reinforcement: Section 03200.
  - 4. Cast-in-place structural concrete: Section 03300.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. MS: MIL-23241 (Ships), MIL-P-26915 (USAF).
  - 3. FS: QQ-L-201, TT-S-230.
  - 4. ACI: 318.
  - 5. ASTM: A36, A123, A126, A153, A185, A325, A615, A706, C143, C309, C509, D395, D412, D471, D2240, D2628, F436.
  - 6. AWS: D1.4.
- B. Dimensional Tolerances:
  - 1. Fabricate segments to dimensions and tolerances shown. Contractor may use closer tolerances if necessary for erection, watertightness or both.
  - 2. Maintain tolerances at mean temperature of 68F. Measure tolerances prior to installation of gasket and elastomeric compression packing. Replace or correct segments which do not comply with tolerances shown.
  - 3. Determine the necessary taper of rings to cope with horizontal and vertical curves or to correct misalignment, and submit details for approval.
  - 4. Provide labor, tools, templates and facilities necessary for inspection of manufactured segments.
  - 5.
- C. Demonstration Lining:
  - 1. Before starting production of precast-concrete segments, furnish five-ring long section of complete precast-concrete segment lining, including gasket, compression packing, exterior coating, nuts, bolts and accessories to demonstrate construction of completed precast-concrete segment lining within tolerances shown. Include in demonstration lining two rings using tapered segments. For segments to be installed in earth tunnels include water-repellant treatment.
  - 2. Assemble entire demonstration lining at job site, above ground, with longitudinal axis of rings horizontal. Provide temporary support structures such as base cradle and lateral bracing for such demonstration. Place rings in longitudinal compression using identical type of holding devices proposed for use in tunnel erection.
  - 3. Notify the Engineer 15 days prior to installation of demonstration lining.

4. Maintain demonstration lining until tolerances of completed lining are verified and removal is approved. Dismantled segments may be used for permanent tunnel lining, if approved.
  5. If approval is withheld, dismantle demonstration lining as directed, adjust forms, cast new segments, if necessary, and erect new demonstration lining for approval.
- D. Production Units:
1. Commence production of segments only after written approval of demonstration lining has been obtained.
- E. Recorders: If casting is done at off-site plants, recorders described in Section 03300 are not required.
- F. Tunnel Demonstration Lining:
1. Construct one additional demonstration lining in initial 20 feet of tunnel. Erect the lining within the tail of the shield utilizing the erection methods for this project. The purpose of this additional demonstration lining is to ensure that the tunneling and erection procedures are capable of erecting the complete tunnel lining to the specified tolerances.
  2. Stop tunneling after installation of the 20 feet (five rings) of demonstration lining until tolerances are verified and approved.
  3. If approval is withheld, submit proposed measures to rectify the 20-foot demonstration lining as well as proposed modification of procedures to ensure satisfactory installation of the tunnel lining.
  4. Do not resume tunneling until corrective measures are approved and implemented.
  5. After approval of corrective measures, construct an additional lining if required by the Engineer.
- G. Quality-Assurance Program for Gaskets: Before starting production of gaskets, provide quality-assurance program to ensure that manufactured gaskets meet the same specifications and quality as originally approved.
- H. Rebar-Coating Applicator: Company approved by the Engineer specializing in hot-dip galvanizing after fabrication.
- I. Qualifications of Fabricator: Have precast-concrete segments fabricated by a firm with recent continuous successful experience in the fabrication of precast-concrete structural units with tolerances equivalent to those specified in this section.
- J. Adjust, if necessary, the gasket and gasket-groove dimensions to satisfy gasket testing requirements specified in Article 3.3.B, with the approval of the Engineer.

### **1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings:
    - a. Include complete details of formwork, reinforcement, inserts and accessories necessary for manufacturing, transportation and erection.
      - 1) Have drawings and design certified by a professional engineer licensed to practice in the jurisdiction where the work is to be performed.
      - 2) Detailed design for segment lifting devices, providing for complete removal of lifting device if device intrudes into tunnel space
    - b. Plant layout: Detailed flow diagram showing stages in manufacture of segments.

- c. Procedures:
  - 1) Detailed description of procedures for fabricating, handling, transporting, storing and erecting segments, including calculations of stresses during handling.
  - 2) If the reinforcement shown on the Contract Drawings is inadequate for the handling, storage, stacking and erection forces, including jacking, provide additional reinforcement to compensate for the anticipated stresses at no additional cost to the Authority.
- 2. Samples
  - a. Exterior coal-tar epoxy coating: One quart.
  - b. Gasket: One complete ring for each type.
  - c. Compression packing: Two square feet.
  - d. Adhesive: One pint of each kind used.
  - e. Bolt, with washer, nut and grommet in sets: Two of each set.
  - f. Sealant: Two tubes.
  - g. Back-up rod: Three feet.
  - h. Grout plugs: Two.
  - i. Water-repellant treatment: One-quart container and one concrete panel, 12 inches square, treated on one side.
  - j. Bolt sleeves, if required: Two.
- 3. Certification:
  - a. Certified reports of successful testing by an independent testing agency verifying that elastomeric joint-seal materials conform to the requirements of ASTM D2628 for earth-tunnel segments and with ASTM C509 for rock-tunnel segments.
  - b. Certification that fabricator of segments has demonstrable experience in the fabrication of precast-concrete structural units similar to specified units as a predominant portion of its production.
  - c. Certification for concrete as specified in Section 03300.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Precast Concrete Segments:
  - 1. Store and handle materials in accordance with Section 03300, with the following additional requirements:
    - a. Transport, store and handle segment units so as to prevent damage to surfaces, edges and corners and to prevent development of stresses within units.
  - 2. Keep units under cover and protected prior to installation.
  - 3. Protect mating surfaces of segments and gaskets from detrimental conditions during transportation.
  - 4. The Authority retains the right to reject any segments structurally damaged as a result of improper fabrication, handling, storing, stacking or transporting of the segments.
  - 5. Ship tapered units of complete rings, properly identified, when the segments are to be bolted for erection.
  - 6. Provide a positive means of identifying each segment, acceptable to the Authority. Identification markings must be cast in or stenciled on the interior face of the segments.
- B. Water-Repellant Treatment:
  - 1. Deliver products to the job site in their original unopened containers clearly labeled with the manufacturer's name and brand designation, the referenced specification number, and the quantity or net weight of contents.
  - 2. Store products in an approved dry area and protect from contact with soil and from exposure to the elements. Keep products from freezing.

3. Handle products in a manner that will prevent breakage of container and damage to contents.
- C. Markings, including logos, trademarks and proprietary information, but excluding panel-identification markings, are prohibited on surfaces of tunnel-lining segments.

#### 1.05 JOB CONDITIONS:

- A. Environmental Requirements:
1. Do not apply water-repellant treatment to unprotected surfaces in wet weather or to surfaces on which ice, frost, or water is present.
  2. Do not apply water-repellant treatment unless the ambient temperature is at least 50F and rising unless approved in writing.
  3. Provide ventilation in accordance with specified safety requirements.

#### PART 2 - MATERIALS:

##### 2.01 MATERIALS:

- A. Concrete:
1. Section 03300, with not less than seven bags of cement per cubic yard of concrete, with the following additional requirements as determined by ASTM C143:
    - a. Rock-tunnel segments: Class 5000.
    - b. Earth-tunnel segments: Class 8000.
    - c. Initial liner segment for two-pass tunnel: Class 6000.
    - d. Use mix of portland cement and ground-iron blast-furnace slag. Blast-furnace slag amount not to exceed 50 percent of the cement weight.
  2. Admixtures, if used, to contain no chlorides, fluorides or nitrates.
  3. Maximum size of aggregate: 3/4 inch.
- B. Reinforcement: Section 03200, with the following additional requirements:
1. Rock-tunnel segments: Welded-wire fabric, ASTM A185.
  2. Earth tunnel segments: ASTM A706, Grade 60 and ASTM A615, Grade 60. When welding of the reinforcing bars is required, use ASTM A706, Grade 60 bars. Conform to the Structural Welding Code—Reinforcing Steel, AWS D1.4 for the welding of reinforcing bars.
    - a. Liner rebar cage: Hot-dip galvanized, Section 05120. Coat reinforcing cages after assembly and welding.
- C. Inserts, Anchors, Dowels and Accessories: Steel, ASTM A36 or equal; zinc-coated in accordance with ASTM A123. \*1
- D. Gasket:
1. Elastomeric seal: ASTM D2628.
  2. Manufactured as continuous ring sized to fit panels snugly, formed to shape and size shown, with gasket corners molded, mitered and vulcanized to provide uniform thickness along entire length of mating surfaces.
  3. Hardness: ASTM D2240, Shore A Durometer, as follows:
    - a. Rock-tunnel segments: 40, plus-or-minus five
    - b. Earth-tunnel segments: 55, plus-or-minus five.
  4. Tensile strength: ASTM D412, 2,250-psi minimum, minus 10 percent.
  5. Elongation: ASTM D412, 300-percent minimum, minus 25 percent.
  6. Water absorption: ASTM D471, 24 hours at 212F, 10-percent maximum by weight.
  7. Compression set: ASTM D395, Method B, 70 hours at 212F, 25-percent maximum.
  8. Fire rating: Self extinguishing.

9. Dimensional tolerances: Plus-or-minus three percent.
  10. Stress relaxations: 25 percent.
  11. Contact pressure: Between 200 psi and 400 psi, as determined by specified compression test. \*2
- E. Compression Packing:
1. Neoprene sheet: 30 mils thick.
  2. Hardness: ASTM D2240, Type A Durometer, 65, plus-or-minus five.
- F. Adhesive:
1. As recommended by manufacturer of compression packing and gasket and compatible for conditions of application, including areas of applied waterproofing.
  2. Use solution recommended by manufacturer for cleaning elastomers at time of segment installation.
- G. Exterior Coating:
1. Coal-tar epoxy, MS MIL-P-23241 (Ships), Type 1, Class 2.
  2. Thinner: As recommended by coating manufacturer.
- H. Bond Breaker: Section 03100, non-staining.
- I. Grout Plugs:
1. ASTM A126, Class B, 1-1/2 inch NSPM external threads, galvanized in accordance with ASTM A153, threads coated with thread sealing compound SEAL UNYTE or T-UTYPE 555 manufactured by J.C. Whitman Manufacturing Company, Wadsworth, Ohio, or approved equal.
  2. Lead washer: FS QQ-L-201.
- J. Fasteners:
1. Bolts and nuts: ASTM A325, Type I, galvanized. Bolts to have rolled threads.
  2. Washers: ASTM F436, galvanized.
  3. Grommets: Low-density polyethylene, hardness Shore D Durometer 45 to 55, ASTM D2240, configuration to seal bolt holes under conditions of maximum misalignment.
- K. Water-Repellant Treatment: Acrylic, water-emulsion, ASTM C309.
- L. Grout: Section 02415.
- M. Sealant: Siloxane polymer and fillers, FS TT-S-230.
1. Backup rod: Polyethylene rod, closed cell, 5/8-inch diameter.
- N. Primer: Zinc-rich primer, MS MIL-P-26915 (USAF), Type 1, Class
- O. Bolt Sleeves: Low-density polyethylene, ribbed, hardness Shore D Durometer 45 to 55, ASTM D2240, minimum 1/8-inch wall thickness plus ribs, configuration as shown.

## **PART 3 - EXECUTION**

### **3.01 FABRICATION:**

- A. Formwork:
1. Fabricated of steel.
  2. Special sizes and cross sections as shown, with metal thickness, reinforcement, stiffness and surface finish as necessary to form concrete surfaces that are smooth, free of irregularities, welding blemishes and concrete stain.

3. Machine form surfaces for contact faces of segments to tolerance of plus-or-minus 0.016 inch.
4. Clean and coat forms with bond breaker prior to each reuse.
5. Ensure smooth surfaces for application of adhesive.
6. Accurately place reinforcing steel with tolerances in accordance with ACI 318.
7. Securely anchor form inserts and embedded items to formwork.
8. Mix and place concrete in accordance with Section 03300.

### **3.02 CURING:**

- A. Cure by steam in accordance with the following requirements:
  1. Immediately after segments have been cast, enclose forms in an enclosure capable of vapor tight sealing to prevent escape of moisture and heat, and which is large enough to allow complete circulation of steam.
  2. Introduce saturated steam into enclosure and maintain atmosphere in a saturated condition until compressive strength of 4,000 psi is attained, as determined by test cylinders. Do not attempt removal of segments from forms until 4,000 psi compressive strength is attained. The Engineer reserves the right to require compressive strength up to 0.75f<sub>c</sub>, if there is evidence of distortion, cracking, spalling or similar damage which could occur during handling and storage of segments.
  3. Enclosure ambient temperature: Not to exceed 100F for first two hours of curing. Thereafter, maintain temperature within 95F to 150F until specified curing strength is achieved.
  4. Do not allow rate of change of temperature to exceed 30F per hour.
  5. When specified strength is attained, allow segments to cool slowly but not exceeding rate of change specified in subparagraph 4. above.

### **3.03 TESTING:**

- A. Test in accordance with Section 03300, with the following additional requirements:
  1. Mix design and curing strength test:
    - a. Prior to manufacture establish concrete mix that will produce concrete of specified compressive strengths and submit data for approval.
    - b. After approval of initial mix design has been obtained, make six cylinders from each single batch of concrete.
    - c. Obtain prior approval of changes in mix design during segment manufacture.
    - d. Prepare, cure and test cylinders in accordance with procedures specified for segment manufacture.
    - e. For cylinders prepared prior to manufacture:
      - 1) Remove in pairs at appropriate time intervals during curing and test immediately upon removal to establish correct curing duration and compressive strength.
    - f. For cylinders prepared as result of change in mix design and as directed:
      - 1) Follow procedures specified for cylinders prepared prior to manufacture.
      - 2) Obtain approval of test results prior to manufacture of segments using new mix design. Inclusion or exclusion of any additives or admixtures to be treated as a change in mix design.
- B. Production test cylinders:
  1. Prepare three cylinders and cure as specified for each work shift or each 100 cubic yards of concrete used, whichever is more frequent.
    - a. Test cylinders in accordance with Section 03300.

- b. 28-day compressive strength: 85 percent of cylinders to meet specified compressive strength.

C. Gasket Testing:

1. Compression test:

a. Testing device:

- 1) Hydraulic equipment capable of applying 20,000-pound force with load-scale capable of reading up to 20,000 pounds in 20-pound increments.
- 2) Two steel plates 16 inches by five inches by 1-1/2 inches thick, each plate with machined groove having dimensions and geometry of gasket groove in precast-concrete segments on one side.
- 3) Minimum 3/4-inch diameter rod by which upper steel plate is attached to hydraulic equipment.

b. Test preparation:

- 1) Attach compression packing to high side of groove on each plate.
- 2) Cut two pieces of gasket 16 inches long and attach one to each plate with contact cement. Center gasket in groove.
- 3) Attach steel end plates on both sides of bottom plate to prevent longitudinal deformation of both top and bottom gaskets.
- 4) Prepare bed of grout underneath bottom plate. Bring upper plate in contact with lower plate. Apply pressure until grout squeezes out from below bottom plate. Ensure that gaskets are properly aligned by placing 1/8-inch spacer between low sides of grooves while grout is setting. Leave in position until grout sets.

c. Test:

- 1) Apply pressure at rate of 400 lb/min. until closure is completed.
- 2) Calculate closure pressure based on two-inch width of gasket.
- 3) Record, calculate and submit closure load (lb.), gasket thickness (inches), length of gasket (inches), load rate (lb/min) and closure pressure (psi).

d. Test supervision: Have all phases of mechanical test supervised by test engineer with experience in similar test procedures.

2. Leakage test:

a. Testing device:

- 1) Two steel plates 16 inches by 16 inches by two inches thick with machined groove running along perimeter of plates and having geometry and dimensions of gaskets grooves in precast-concrete segments. Centerline of groove 2-1/2 inches from plate edge. Low side of groove to center of plate. Plates shall have 5/8-inch diameter holes evenly spaced around perimeter of plate between groove and edge. Both plates identical and symmetrical about centerline.
- 2) Eight 1/2-inch bolts capable of resisting 5,000-pound force.
- 3) Steel water tank, filled with water.
- 4) Nitrogen tank under 2,200-psi pressure with regulator.
- 5) Gasket material having passed mechanical test.

b. Test preparation:

- 1) Place gasket in groove by cutting 45-degree angles in ends of four equal pieces and gluing them together in a square with Super Glue or equal. Lengths of four pieces of gasket selected so as to fit squarely in groove of each steel plate. Attach gasket to each plate by means of contact cement.
- 2) Attach compression packing to high side of groove on each plate with contact cement.

- 3) Provide vent hole for escaping air pressure, and inlet hole for water, in center of top plate.
  - 4) Bolt both plates together, tightening bolts until plates just close.
  - c. Test:
    - 1) Attach water tank to plates. Add water to vent out air. Plug vent hole.
    - 2) Apply 200-psi pressure to water tank with nitrogen tank. Record pressure through gauge in nitrogen to water-tank line.
    - 3) Record pressure and inspect for leakage daily during period of one month. Submit result to the Engineer.
    - 4) Gasket will be accepted if no leakage is observed during entire duration of test.
  - d. Have all phases of mechanical test supervised by test engineer with experience in similar test procedures.
3. Frequency of tests: Perform both compression and leakage tests on gasket before production begins and at 25-percent, 50-percent and 75-percent production levels.

#### **3.04 INSTALLATION OF GASKET:**

- A. Prior to installation of gasket, apply water-repellant treatment to surface as shown.
- B. Use gasket adhesive as recommended by manufacturer of gasket at intervals of approximately 15 inches.
- C. Fit gasket snugly into groove provided around segments.

#### **3.05 INSTALLATION OF COMPRESSION PACKING:**

- A. Clean surface as necessary. Apply adhesive in accordance with manufacturer's recommendations.
- B. Cut elastomeric compression packing to proper dimensions and affix as shown.

#### **3.06 EXTERIOR-COATING APPLICATION:**

- A. Apply coating to exterior surfaces of segments. Do not coat mating surfaces or sealant grooves.
- B. Apply coating in two coats of equal thickness totaling 20-mil minimum dry-film thickness and in strict accordance with recommendations of manufacturer of protective coating, including pretreatment of first coat prior to application of second coat.
- C. Apply second coat before first coat has dried tack-free and not later than 24 hours after application of first coat, unless otherwise specified by coating manufacturer.

#### **3.07 APPLICATION OF WATER-REPELLANT TREATMENT:**

- A. Preparation:
  1. Apply water-repellant treatment only after concrete has cured as specified in Section 03300.
  2. Remove from surface to be treated dust, dirt, debris, oil, grease and other foreign matter. Prepare surfaces to be treated in accordance with treatment manufacturer's recommendations.
- B. Installation

1. Apply one base coat of water-repellant treatment to segment surfaces as shown and in accordance with manufacturer's recommendations.
2. Allow a minimum of 24 hours elapsed time between treatment-coating applications.

### **3.08 TUNNEL BREAKOUT**

- A. Provide special liner segments and special lining rings, complete with steel frame and temporary bracing, where shown.
- B. Upon completion of the tunnel breakout, remove and dispose of the special liner segments and special lining rings.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

#### **ENDNOTES:**

- \*1. Other joint connection systems, eg. coil inserts, tylags, plastic washers, etc., to be included in specifications by the Section Designer.
- \*2. To be specified by the Section Designer.

**END OF SECTION**

## SECTION 02426

### NATM SHOTCRETE LINING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies the shotcrete lining applied following NATM excavation.
- B. Related Work Specified Elsewhere:
  - 1. NATM excavation: Section 02417.
  - 2. Shotcrete: Section 03370.
  - 3. NATM concrete lining: Section 02427.
  - 4. Tunnel waterproofing (NATM system): Section 07138.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: A36, A185, A325, A615, A706, C144, C150, C579.
- B. Installer with a minimum of two years experience.
- C. Lattice girder tolerances as certified by engineer's calculations.

##### 1.03 DEFINITIONS:

- A. Shotcrete: Section 03370.
- B. Lattice Girder: A lightweight, three-dimensional steel frame made to act as a unit by connecting components with lacing bars used in conjunction with shotcrete for shotcrete lining reinforcement.
- C. Splice Bar: Rebar installed to provide inherent connection of shotcrete in circumferential direction between top heading and bench shotcrete and at break-outs from cut-and-cover structures.
- D. Splice Clip: Rebar installed at arch lines as means of longitudinal reinforcement of the shotcrete lining.
- E. Local Support: See Section 02417.
- F. Pre-support: See Section 02417.
- G. Girder Brace: Rebar installed between two adjacent lattice girders for lateral support of lattice girders.
- H. Soil Anchor: Steel bar installed in borehole on the tunnel shotcrete lining and fully encapsulated in cement mortar grout with accelerator cartridge when and where shown on drawings.
- I. Forepoling or Spiling Bar: Steel bar without end hardware installed at the tunnel heading by jacking or other mechanical equipment.

- J. Forepoling Sheets: Steel plate installed at the tunnel heading by jacking using mechanical equipment to provide earth support during excavation.
- K. Grouting: Methods used for pre-support of tunnel excavation and ground stabilization by pressure injecting chemical grout or cement grout.

#### **1.04 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Shotcrete lining indicating structural construction details.
    - b. Show relationship of waterproofing and concrete lining elements to shotcrete lining elements and to the plan and sequence of excavation and lining installation.
    - c. Show relationship of shotcrete lining to intermediate excavation and support stages at break-out of tunnel and at interfaces.
    - d. Design, specifications, method of operation and other data pertaining to the following:
      - 1) Fabrication details for lattice girders.
      - 2) Welded wire fabric, splice bars, and splice clips.
      - 3) Rebar spiles and perforated steel pipes.
  - 2. Documentation:
    - a. Calculations for lattice girder connection details. Have these calculations certified by a professional engineer registered in the jurisdiction where the work is being performed.
    - b. Tolerances: Include engineer's statement of acceptable tolerances in the certified calculations.
  - 3. Samples:
    - a. Lattice Girders: Submit a two foot long sample of lattice girder with its accessories which shows full cross section and type to be used. Submit three such samples of lattice girder.
    - b. Soil Anchors: Anchor bolts and accessories: Three samples of each.
    - c. Accelerator Cartridge: Three samples.
    - d. Forepoling Sheets and Bars: Three sample sections one foot long showing full cross section and type to be used.
  - 4. Testing:
    - a. Prior to installation of soil anchor, arrange demonstration to show that specified pull out strength requirements can be met.

#### **1.05 JOB CONDITIONS:**

- A. Maintain a minimum of a five-day supply of lattice girders and shotcrete on site to prevent delays to the work. Maintain constant and adequate supply of shotcrete at tunnel heading during excavation, such that shotcrete may be applied at any time.

#### **1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. General:
  - 1. Load, transport, unload and store structural materials to keep them clean and free from damage.

2. Store material on platforms, skids or other supports above ground and ensure proper drainage and protection from corrosion.
- B. Lattice Girders:
1. When handling and shipping lattice girders prevent bending, scraping or overstressing members.
  2. Block projecting parts likely to be bent or damaged during handling with wood or other approved material.
  3. Replace pieces bent or damaged unless repair is approved.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Shotcrete: Section 03370.
- B. Welded Wire Fabric: ASTM A185, Size 6 x 6 - W4.0 x W4.0.
- C. Splice Bar: Fabricated from No. 4 standard reinforcing steel conforming to ASTM A615 Grade 60 as shown.
- D. Splice Clips: Fabricated from No. 5 standard reinforcing steel conforming to ASTM A615 Grade 60 as shown.
- E. Lattice Girder:
1. General:
    - a. Fabricate lattice girders to consist of three primary retaining bars, dimensioned and arranged as shown and connected by stiffening elements of the manufacturer's design or as shown and from rebars conforming to ASTM A706 Grade 60.
      - 1) Facilitate shotcrete penetration into and behind the girder, thereby minimizing the creation of injection shadows.
      - 2) Provide optimum bonding between the steel and shotcrete in order to form a composite, continuous, reinforced shotcrete lining structure.
    - b. Provide lattice girders with moment properties about the neutral axes in a section perpendicular to the longitudinal axis of the border, as shown. Have the stiffening elements provide a minimum five percent of the total moments of inertia. This percentage is calculated as an average value along repeatable lengths of the lattice girder.
    - c. Ensure stability against buckling. Maintain the maximum spacing between stiffening elements at less than three times the cross sectional height of the girder.
  2. Dimensions:
    - a. As shown.
    - b. Fabricate the lattice girders to meet minimum clearances shown under consideration of inaccuracy of placement during construction, material tolerances, and of lining deflection following installation.
  3. Testing:
    - a. Test lattice girder segments of typical length randomly selected by the Engineer from the standard stock. The Engineer will observe the testing.
    - b. Test segments in single point flexure with loading and constrains representative of the in-situ conditions of the girder. Record measurements of the gradually applied load and deflection of the girder at the point of

application until failure occurs to verify that the girder satisfies the minimum structural requirements.

- c. Replace faulty lattice girders at no additional cost to the Authority.
- F. Soil Anchors: Anchor Bolts and Accessories:
  - 1. General Requirements:
    - a. Soil anchor assembly: Anchor bolt, anchor plate, washer and nut.
    - b. Fabricated from No. 6 standard deformed reinforcing steel bar suitably threaded conforming to ASTM A615 Grade 60.
    - c. Approved method of anchorage to take specified tension.
    - d. Anchor plate: Plate 3/8-inch thick conforming to ASTM A36 having bearing area of at least 64 square inches.
    - e. Nuts: Hexagonal head, ASTM A325.
    - f. Steel washers: Center hole to be 1/8-inch larger in diameter than bolt with which it is to be used. Flat or conical shape conforming to ASTM A325.
    - g. Grout and mortar:
      - 1) Cement: ASTM C150 Type 1.
      - 2) Water: Section 03300.
      - 3) Sand: ASTM C144.
      - 4) Accelerator cartridge: Accelerator cartridge to be such that pull out strength of 5,000 pounds is achieved within 20 minutes.
- G. Forepoling or Spiling Bars: Fabricated from No. 8 standard reinforcing steel conforming to ASTM A615 Grade 60 as shown.
- H. Forepoling Sheets: Steel ASTM A36.
- I. Girder Brace: Fabricated from No. 6 standard reinforcing steel conforming to ASTM A615 Grade 60 as shown.

## **2.02 FABRICATION:**

- A. Provide each of the primary retaining bars of lattice girder segment in one piece, that is without splice, of high strength steel having a yield strength of 60 ksi.
- B. Construct the connection elements at the end of the lattice girder segments of structural steel angles having a yield strength of 36 ksi or stronger, or of welded flat steel ensuring similar strength characteristics.
- C. Fabricate steel supports in accordance with Section 05120, except as follows
  - 1. Inspection of groove and fillet welds by visual inspection only.
  - 2. Grinding to remove nicks resulting from flame cutting is not required.
  - 3. Planing and facing of sheared edges or bearing surfaces is not required.
  - 4. Subpunching or subdrilling of bolt holes is not required.
  - 5. Portions of bearing members such as butt and foot plates need not be straightened, planed and connected after fabrication.

## **PART 3 - EXECUTION**

### **3.01 GENERAL:**

- A. Install shotcrete lining as shown and specified herein, and in accordance with applicable requirements of Section 02417.

- B. Verify that the ground types encountered in the tunnels or station excavation are the same as were considered in the design. If not, make the necessary changes to the excavation sequence with the prior approval of the Engineer.
- C. Excavation sequences of headings as shown for Excavation and Support Type 1 and Type 2.

**3.02 FLASH-CRETE:**

- A. Install as shown and as specified in Section 02417.

**3.03 LATTICE GIRDERS:**

- A. Install to conform to excavated shape as shown. Consider inaccuracy of construction, tolerances of materials, and initial lining deflection to determine actual dimensions. Provide minimum embedment as shown.
- B. Secure lattice girder segments by use of girder braces, temporary wood blocking and other appropriate means to maintain position during shocreting.
- C. Provide butt plates of lattice girder segments and expansion unit in invert as shown or otherwise approved by Engineer. Ensure tight connection of elements.

**3.04 WELDED WIRE FABRIC:**

- A. Install as shown. Provide minimum overlap of 12 inches in each direction or use splice bars as shown.

**3.05 SPLICE BARS AND SPLICE CLIPS:**

- A. Install splice bars and splice clips for additional reinforcement as shown.

**3.06 SHOTCRETE:**

- A. Install shotcrete lining to provide required shotcrete lining thickness as shown.

**3.07 SMOOTHNESS CRITERIA:**

- A. General Smoothness Criteria: Provide shotcrete with a surface meeting the following tolerance:
  - 1. Shotcrete lining: Depth-to-wavelength ratio as measured with a 10-foot straightedge in random direction to be 1/5 or less.

**3.08 DETECTION OF MOVEMENT:**

- A. As specified in Section 02417.

**3.09 FIELD QUALITY CONTROL:**

- A. As specified in Sections 02417 and 03370.

**END OF SECTION**

## SECTION 02427

### NATM CONCRETE LINING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies cast-in-place concrete lining installation in NATM tunnels.
- B. Related Work Specified Elsewhere:
  - 1. NATM shotcrete lining: Section 02426.
  - 2. Concrete formwork: Section 03100.
  - 3. Concrete reinforcement: Section 03200.
  - 4. Cast-in-place structural concrete: Section 03300.
  - 5. Shotcrete: Section 03370.
  - 6. Tunnel waterproofing (NATM system): Section 07138.
  - 7. Drilling and pressure grouting for rock tunnels: Section 02431.
  - 8. NATM excavation (soft ground): Section 02417.
- C. Definitions:
  - 1. NATM: New Austrian Tunneling Method.

##### 1.02 QUALITY ASSURANCE:

- A. Comply with the requirements of Sections 03100, 03200 and 03300.

##### 1.03 SUBMITTALS

- A. Comply with the requirements of Sections 03100, 03200 and 03300.

#### PART 2 - PRODUCTS

##### 2.01 MATERIALS:

- A. Comply with the requirements of Sections 03100, 03200 and 03300.

#### PART 3 - EXECUTION

##### 3.01 INSTALLATION OF CONCRETE LINING:

- A. Perform concrete work in accordance with Sections 03100, 03200 and 03300.
- B. Place concrete for lining upper portion of tunnel by mechanical or pneumatic methods through pipes which discharge as nearly as practicable to highest point of structure.
- C. Prior to placement of concrete, remove materials within concrete design lines so as to avoid compromising stability of shotcrete lining and surrounding ground.
- D. Fill enlargement of tunnel excavation beyond theoretical outer limit of concrete lining shown with concrete.

- E. Force concrete into contact with waterproofing.
- F. Schedule erection of concrete tunnel lining so that no concrete is placed closer than 500 feet from tunnel excavation heading, unless otherwise approved.
- G. Contact Grouting: Perform contact grout as specified in Section 02431 and 02417 and as follows:
  - 1. Perform contact grouting through grout pipes in roof, in such quantity and at sufficient pressure to fill all voids. Maximum allowable grouting pressure for contract grouting is not to exceed 20 psi.
  - 2. Pump grout until grout comes through adjacent grout pipes in the roof.
  - 3. Perform contact grouting behind concrete lining when concrete is more than 28 days old.

### **3.02 DEFECTIVE LINING:**

- A. Concrete tunnel lining is considered defective unless it is watertight, properly finished, is within specified tolerances and has undamaged surfaces and joints.
- B. Watertightness criteria: Section 03300.
- C. Cast-in-place concrete lining is considered defective if misalignments cause tunnel wall to be less than 12 inches thick.

### **3.03 CORRECTIVE WORK:**

- A. Repair of concrete: Repair concrete having minor chipping of surfaces using epoxy mortar having surface color and texture closely matching adjacent concrete surfaces. As directed, repair or replace with new concrete those cracked portions which impair structural integrity of tunnel lining as determined by the Engineer.
  - 1. Ensure that surfaces to be repaired are clean, dry, free from dirt, dust, oil, water and other contaminants.
  - 2. Mix and place epoxy mortar as recommended by the manufacturer. Grind rough or raised projections smooth and flush with adjacent surfaces.
- B. If cast-in-place concrete lining thickness falls below nine inches, to maintain line and grade, remine tunnel so that concrete lining thickness is at specified minimum thickness.
  - 1. Remine as specified in Section 02417.

### **3.04 LEAK REMEDIATION:**

- A. Leak remediation: Section 07138.

**END OF SECTION**

## SECTION 02431

### DRILLING AND PRESSURE GROUTING FOR ROCK TUNNELS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies drilling feeler, exploratory, drainage and other holes, furnishing and injecting grout and patching finished grout holes in rock tunnels
- B. Definitions:
  - 1. Contact grouting: Injection of grouting material at crown areas of tunnels to fill voids between tunnel lining and surrounding rock.
  - 2. Consolidation grouting: Injection of grouting material through holes drilled up to 25 feet long at appropriate intervals around periphery of rock tunnel prior to installation of lining.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: A53, C109, D1785, D2466.
- B. Qualifications:
  - 1. When taking rock cores, employ only experienced rock core-drilling personnel.
- C. Tests:
  - 1. Determine strength of cementitious grout from test specimens made and tested in accordance with ASTM C109.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Working Drawings:
    - a. Details of grout mix composition. Submit prior to grouting.
  - 2. Documentation:
    - a. Rock core logs prepared as approved. Submit daily.
      - 1) Include descriptions as follows:
        - a) Materials of whatever character encountered in drilling and their locations in the holes.
        - b) Length of each run with percentage of core recovery.
        - c) Location of special features such as mud seams, open cracks and soft or broken ground.
        - d) Points where abnormal loss or gain of drill water has occurred.
        - e) Groundwater levels or other items of interest in connection with grouting in exploratory drilling.
        - f) Significant actions of bit and reasons for loss of core.
  - 3. Rock Cores:
    - a. Place entire rock cores in boxes in same order they are recovered from each hole. Use wooden blocks to show lengths of core not recovered.

- b. Mark core boxes with number of boring and depths from which cores are recovered.
- c. Include the following information:
  - 1) Percentage of core recovered compared with actual depth of drilling necessary to obtain sample.
  - 2) Rock quality designation (RQD) for each core run.
- d. Deliver cores to Engineer as directed.

**1.04 JOB CONDITIONS:**

- A. Grouting Records:
  - 1. Cooperate with and assist the Engineer in keeping records of grouting operations including time of each change in grouting pressure, rate of pumping, amount of cement for each change in water-cement ratio and other necessary data.
- B. Start Date:
  - 1. Notify the Engineer at least one week prior to beginning grouting operations

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Cement: Section 03300, Type II.
- B. Water: Potable.
- C. Admixture: For plasticizing or retarding as approved.
- D. Fine Aggregate:
  - 1. As specified in Section 03300, with the following additional requirements:
    - a. 100-percent passing U.S. Standard sieve Number 16.
    - b. Graded as follows for contact grouting:

U.S. Standard Sieve Size	Percent Passing
16	100
30	65 - 90
50	20 - 60
100	5 - 15
200	0 - 15

- E. Grout Pipe and Fittings: ASTM A53, standard weight, Schedule 40, black.
- F. Plastic Drain Pipe: PVC, ASTM D1785 and ASTM D2466, Schedule 40.
- G. Core Boxes:
  - 1. Wood fabrication, sufficiently strong to withstand handling and transportation.
  - 2. Size: Forty-eight inches by nine inches by three inches.
  - 3. With solid-wood dividing strips, not plywood, to separate cores.

**2.02 GROUT MIXES:**

- A. Grout for Contact Grouting:
  - 1. Consisting of one part portland cement, one part fine aggregate and approved admixture or as otherwise approved.
  - 2. Minimum compressive strength: 100 psi within 24 hours.
  - 3. Fluid enough to be injected to fill voids.
  - 4. Comprising ingredients not corrosive to steel.

### **PART 3 - EXECUTION**

#### **3.01 EQUIPMENT:**

- A. For exploratory core drilling, use approved drilling equipment with double-tube core barrel to obtain continuous NX, minimum size cores, 2-1/8 inches diameter.
- B. For feeler, grout and drain holes, use rotary or percussion-drilling equipment.
- C. For pumping grout, use approved pump capable of developing appropriate, approved, uniform pressure at grout hole connection and hoses with inside diameter of 1-1/2 inches minimum.
- D. Use horizontal shaft paddle or colloidal pump mixer with minimum capacity of 20 cubic feet and with accurate meter which reads to nearest 1/10-cubic foot for measuring amount of mixing water added to grout.
- E. Provide approved pressure gauges at grout pump and on manifold hookup at collar of hole being grouted.

#### **3.02 FEELER HOLES:**

- A. Drill feeler holes as directed ahead of excavation to determine in advance nature and condition of materials to be excavated.
- B. Drill each hole to diameter of 1-1/2 inches minimum and length of 15 feet minimum and 30 feet maximum.
- C. While drilling feeler holes, suspend or modify other operations as necessary to permit such drilling. Drill holes only in the presence of the Engineer.
- D. Obtain approval for location, direction, length and number of holes.

#### **3.03 EXPLORATORY HOLES:**

- A. Drill exploratory holes in order to determine type and quality of rock.
- B. Depending on nature of rock, select length of drill run to ensure maximum core recovery, but in no case to exceed five feet.
- C. Package cores as specified and deliver to the Engineer as directed.
- D. Unless otherwise directed, pressure grout exploratory holes after removal of core.

#### **3.04 DRAIN HOLES:**

- A. Locate and drill holes where shown or as directed. Keep holes clear of obstructions.

- B. Use plastic pipe for weep holes where shown. Fasten fittings with adhesive or threads.

### 3.05 GROUTING:

- A. General Requirements:
1. Grout holes:
    - a. Drill grout holes in rock or lining to diameter of two inches minimum and as shown or as directed or use existing grout holes.
    - b. Avoid cutting embedded steel. If steel is encountered, cease cutting and patch hole.
    - c. Clean obstructed holes for entire depth prior to grouting.
    - d. Thoroughly wash grout holes immediately before starting pressure grouting.
  2. Pipes and fittings:
    - a. Place pipes to be embedded in tunnel lining for contact-grout connections and air vents as shown.
    - b. Set inner end of pipes not less than two inches back from finished inside surface and provide recesses from there to surfaces of lining. Fill recesses with concrete or mortar after grouting operations have been completed.
    - c. Set grout pipes so that grout flows freely to voids behind lining.
    - d. Hold pipes to be embedded firmly in position and protect from damage while concrete is being placed. Provide and attach caps or other devices to ends of pipe to prevent entry of concrete or other foreign materials prior to grouting and to facilitate location of grout pipe after forms are removed.
    - e. Avoid clogging or obstructing pipes before grout hookups are made. Clean clogged or obstructed pipes.
  3. Connections:
    - a. Make connections so as to prevent leakage.
    - b. Remove plugs on ends of grout holes or pipes to permit escape of air and water and filling of spaces with grout.
    - c. Provide straightway cock or valve at each connection.
  4. Grouting operations:
    - a. Perform grouting operations in the presence of the Engineer.
    - b. Use grout of consistency to suit the characteristics of the hole being grouted or the type of grouting being performed.
    - c. Use approved pressure at hole.
    - d. Consider grouting hole to be complete when hole refuses grout at 90 percent of highest pressure approved.
    - e. Upon completion of grouting at each connection, close valve and leave it in place until grout has set.
    - f. After grout has set remove valves and fittings and metal connections to depth of 1-1/2 inches minimum from face of concrete.
    - g. Fill grout holes with thick grout or dry pack at completion of grouting operations to leave smooth finished surface.
    - h. Do not block drains or drain lines during grouting operations.
    - i. Clean drains after each grouting operation.
- B. Consolidation Grouting:
1. Perform consolidation grouting as necessary.
  2. If consolidation grouting has to be performed after contact grouting, allow at least seven days to elapse between completion of contact grouting and beginning of consolidation grouting.
  3. Perform consolidation grouting within radius of 50 feet of cast-in-place concrete tunnel lining only when lining is more than 14 days old.
- C. Contact Grouting:

1. Perform contact grouting through holes drilled or placed in tunnel lining where shown.
2. Obtain approval of grouting pattern and order of grouting prior to start of contact grouting.
3. Provide vent pipes to suit conditions encountered.
4. Perform contact grouting behind concrete liner when concrete is more than 14 days old.
5. Use maximum pressure for contact grouting as approved.
6. Continue grouting until clear grout stream emerges from vent pipe.
7. Allow at least seven days after completion of contact grouting, before beginning further grouting.

**END OF SECTION**

## SECTION 02460

### PILES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies furnishing and installing bearing piles, performance of Static Pile Load Tests and Dynamic Pile Testing.
1. Sequence of Work:
    - a. Conduct initial wave equation analysis, prepare Indicator Pile Order List and submit information to Engineer for review.
    - b. Piles shall not be driven until embankments or excavations shown have been completed to the specified grade.
    - c. Obtain and drive the indicator piles where shown on the drawings. During initial driving perform Dynamic Pile Testing and the refined wave equation analysis on each indicator pile to confirm the length, and control blow count. Determine pile driving criteria on the basis of the pile driving analysis (PDA) during the initial driving and the static load test. Incorporate results into driving of subsequent indicator piles.
    - d. Perform Static Pile Load Tests per Article 3.2.B.2 on indicator piles designated by the Engineer after all indicator piles have been installed. After Static Load Test is complete immediately restrike all indicator piles with Dynamic Testing Apparatus installed and functioning.
    - e. Analyze Static Pile Load Tests and evaluate data collected from Dynamic Pile Testing and refined wave equation analyses to determine pile driving criteria as indicated in item c.. Develop and submit the proposed "Order List" for production piles to the Engineer for approval.
    - f. Order and procure production piles based on the approved "Order List".
    - g. Drive each production pile to twice the pile design load and "production maximum tip elevation", and report all data as specified to evaluate the adequacy of the foundation system.
- B. Definitions:
1. Pile Group: All piles to support a foundation element or column within a specified area, or all piles to support a linear unit of retaining wall. Pile groups are shown on the Contract Drawings.
  2. Production Piles: All piles that are driven after the installation of required test piles in accordance with the contract documents and which upon approval by the Engineer, become part of the permanent structure.
  3. Indicator Pile: Indicator piles are shown on the Contract Drawings. These piles shall be tested with the Dynamic Testing Apparatus. Static load tests shall be conducted on the indicator piles shown on the Contract Drawings or as directed by the Engineer. The Engineer may direct that additional indicator piles be driven and that dynamic or static testing be conducted on them to verify the load capacity.
  4. Reaction Piles: Piles driven by the Contractor to provide reaction for Static Pile Load Tests.
  5. Predicted Maximum Tip Elevation: The elevation below which indicator pile tips must penetrate by at least one foot.

6. Production Maximum Tip Elevation: The elevation below which production pile tips must penetrate by at least one foot, based on the indicator pile test program.
  7. Pile Design Load: The load each pile is designed to carry.
  8. Ultimate Bearing Capacity: The maximum bearing capacity that the pile can sustain without rapid progressive settlement of the pile under constant load.
- C. Pile Type:
1. Prestressed precast concrete piles, driven.
- D. Related Information:
1. Grading, Excavating, and Backfilling: Section 02320.
  2. Support of Excavation: Section 02260.
  3. Concrete Formwork: Section 03100.
  4. Concrete Reinforcement: Section 03200.
  5. Cast-in-Place Structural Concrete: Section 03300.
  6. Structural Precast Concrete: Section 03400.
  7. Prestressed Concrete: Section 03415.

## 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Codes and regulations of the jurisdictional authorities.
  2. ASTM Standards:
    - a. D1143 - Test Method for Piles Under Static Axial Compressive Load.
    - b. D4945 - Test Method for High Strain Dynamic Testing of Piles.

## 1.03 SUBMITTALS:

- A. Submit the following for the Engineer's approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings:
    - a. For Static Pile Load Tests, provide drawings that show load test apparatus setup including the method of applying the load. Drawings must show devices to be used to measure pile top movement.
    - b. For Dynamic Pile Testing, provide manufacturer's or vendor's data on transducers, computer, wiring, and schematic drawings for testing specified piles.
    - c. For Static Pile Load Test and Dynamic Pile Testing programs, provide detailed sequence of testing, evaluation of results and planned reports.
    - d. Pile splicing is not desired and shall be avoided. In the event that concrete piles are driven below the elevation of bottom of cap, build-ups, precast or cast-in-place splicing may be used when approved by the Engineer. The pile submittal shall include splice details, build-up details and any other details necessary to satisfy the requirements of these specifications.
    - e. The pile submittal shall show prestressing methods, tendon arrangement, working stresses, and methods for pick-up and handling of piles.
    - f. Submit certification of accuracy for all gauges and test equipment.
  2. Documentation:
    - a. Driving Equipment/Accessories List:
      - 1) Submit details of proposed driving equipment to include cranes, leads, hammer, compressors, powerpacks, driving caps, hammer cushions and pile cushions. Data on hammer shall include as a minimum the manufacturer's model number, estimate of efficiency,

- energy ratings and ram details, including operation certification performed within the last 90 days.
- 2) Submit details of accessory equipment to be used including service cranes, hoses, throttles, and pile handling rigging.
- b. Submit procedures and details for installation of reinforcement and prestressing.
  - c. Submit materials certifications and concrete mix designs for all concrete products to be used during the pile installation.
  - d. Indicator Pile Order List:
    - 1) Submit a list of piles to be installed as part of the indicator pile test program. List shall show type, size, number, location, indicator pile order length, predicted maximum tip elevation, allowable driving stress related to hammer blows, and blow count needed to attain twice the pile design load. If locations for indicator piles differ from those shown on the drawings, provide reasons for change. The proposed revised location will be reviewed and, if appropriate, approved by the Engineer.
    - 2) Submit list prior to ordering indicator piles.
  - e. Test Documentation and Reports:
    - 1) The Contractor shall retain an experienced Engineer employed by a Dynamic Testing Consultant. The Dynamic Testing Consultant's Engineer shall be an integral part of the Contractor's Quality Control Program. Submit the qualifications of the Dynamic Testing Consultant's Registered Maryland Professional Engineer responsible for monitoring Static and Dynamic Pile Testing. The Dynamic Testing Consultant's Engineer shall have a minimum of five (5) years experience in similar work, of which two (2) years shall be field experience with the monitoring of pile driving operations. The Dynamic Testing Consultant shall provide the following:
      - a) Results of all Wave Equation Analyses using the GRLWEAP program, Dynamic tests, Static tests and the Case Pile Wave Analysis Program (CAPWAP). The GRLWEAP and CAPWAP program is a product of Globe Rausche Likins and Associates, Inc., 4535 Renaissance Parkway, Cleveland, OH 44128. Telephone (216)831-6131.
    - 2) Sample pile driving record/report and sample sketch proposed to show any necessary deviations from planned locations.
    - 3) An annotated sample of the dynamic testing apparatus output. Output shall include recorded input, reduced data and analysis.
    - 4) After completion of each Static and/or Dynamic Pile Test, submit a test report for review and approval by the Engineer. The test report shall include reporting information specified in ASTM D1143 and D4945, results of the refined wave equation analyses, and recommendations for the Production Pile Order List.
    - 5) Prepare a summary report of all the wave equation analyses, CAPWAP, and results of the dynamic and static pile tests. The report shall include test details, hammer and driving system details, soil conditions, instrumentation, test sequence and observations, discussions of test results (including hammer performance, driving stresses, pile integrity and pile capacity), and conclusions and recommendations for the Production Pile Order List.
  - f. Production Pile Order List:

- 1) After review and approval of the results of the Static Pile Load Test and Dynamic Pile Testing, submit an "Order List" of production piles proposed to be installed in each pile group. The list shall show type, size, number, location, sequence of installation, length, production maximum tip elevation, allowable driving stress related to hammer blows and blow count needed based on end of initial driving results to attain twice the pile design load for all piles in each pile group.
- g. Pile Driving Record:
- 1) Maintain a record throughout the indicator pile test program and production pile driving operations and submit to the Engineer upon completion of each pile group. The record shall show the applicable established driving criteria developed by the Static Load Test, as modified by Dynamic Testing, for each pile. As a minimum include the following information:
    - a) Sequence in which piles were driven.
    - b) Equipment: type, model, serial number.
    - c) Required blow count per approved driving criteria, allowable driving stress related to hammer blows, production maximum tip elevation and final pile tip elevation.
    - d) Blow count for each foot of driven length.
    - e) For all piles, the number of blows per inch of penetration for last 12 inches.
    - f) Unusual conditions encountered during driving of each pile.
    - g) Immediately after final pile driving, record top elevation of pile to nearest 0.01 inch. Provide as built pile information after all piles in a pile group have been driven.

#### **1.04 PRODUCT DELIVERY AND HANDLING:**

- A. Lifting loops shall be used as provided by the precaster. Lifting loops shall not be tied in any way to the pile reinforcement. Loops may remain in place during driving. When handling and delivering precast piles, avoid bending and breaking or chipping of piles.

#### **PART 2 - PRODUCTS**

##### **2.01 MATERIALS:**

- A. Precast concrete piles:
  1. Prestressed precast concrete piles in accordance with Sections 03100, 03200, 03300, 03400, and 03415 of these specifications as applicable, shaped as shown.
- B. Miscellaneous Driving Accessories: Including driving heads, collars, bands, shoes, and other driving devices in accordance with pile manufacturer's recommendations.
- C. Lean concrete: Section 02260.

## **PART 3 - EXECUTION**

### **3.01 DRIVING EQUIPMENT:**

- A. The Engineer will review submitted data on driving equipment, accessories and methods for adequacy in conditions expected.
- B. Adequacy of equipment and accessories remains the responsibility of the Contractor.
- C. Should the equipment used by the Contractor prove inadequate to drive scheduled types of piles at the locations shown, or should progress schedule not be maintained, the Engineer may require replacement of equipment or different expendable accessories or additional equipment.
- D. If the hammer, driving block, cushion or any other part of the driving system is changed for any reason, the system must be calibrated by conducting Dynamic Pile Testing to prove the new system is equal to the original system. This work shall be made at no additional time to the Contract and at no cost to the Authority.

### **3.02 INDICATOR PILE TEST PROGRAM:**

- A. Installation:
  - 1. No later than twenty-one (21) days prior to driving indicator piles, conduct initial wave equation analysis that represents the subsurface conditions on this project, the pile properties and driving equipment provided. This analysis shall be submitted along with the required pile and driving equipment data to the Engineer.
  - 2. Provide and install indicator piles where shown, to determine lengths of production piles to be furnished to achieve twice the pile design load in the scheduled pile groups. If twice the design load is not attained when the top of the pile is one-foot above planned cut off, discontinue driving for a period of 24 hours or as directed by the Engineer. After the specified period, restrike pile in accordance with Article 3.2.B.1.b. If twice the design load is not attained after restrike, splice the pile, if necessary, and drive it until the specified bearing value is obtained.
  - 3. Locate piles at contract pile locations so they can become part of the completed structure provided they are approved as conforming to requirements specified for production piles. Install indicator piles to achieve pile tips below the predicted maximum tip elevation, in the presence of the Engineer. Assist the Engineer in verifying measurements and driving characteristics as necessary to evaluate the adequacy of the foundation system.
  - 4. The indicator piles scheduled for Static Pile Load Tests are shown on the Contract Drawings. The Engineer may designate alternate or additional indicator piles that exhibit the weakest bearing capacity for Static Pile Load Tests.
  - 5. Piles which are subjected to Static Pile Load Tests which do not pass the acceptance requirements shall be restruck, per 3.2. B.1.b with Dynamic Testing Apparatus installed and functioning, within 48 hours after completion of the Static Pile Load Test to reestablish the minimum required pile length and blow counts.
  - 6. Additional piles may be driven, at the Contractor's option, in the area of the Static Load Test Piles to be used as reaction piles. All piles driven as indicator piles or reaction piles for load tests in accordance with the plans and specifications and meeting specified requirements for production piles can, upon approval, be cut off and become a part of the permanent structure.
  - 7. Install all indicator piles that are intended to become part of the permanent structure with the same type and model of equipment and methods to be used to install production piles. Perform work in the presence of the Engineer.

8. Remove piles which are not incorporated into the completed structure or which do not satisfy test requirements. Alternatively, if rejected piles are not removed then cut off at least three (3) feet below finished grade and backfill resulting hole with lean concrete.

B. Pile Testing:

1. Dynamic Pile Testing:

- a. Perform Dynamic Pile Testing in accordance with ASTM D4945.
- b. Install indicator piles where shown with the Dynamic Testing Apparatus installed and functioning to measure performance of the driving system and the bearing capacity. Begin dynamic testing during initial driving when the pile tip achieves the predicted maximum tip elevation. Drive indicator piles to a bearing capacity of at least twice the pile design load based on initial driving. Restrike all indicator piles, with Dynamic Testing Apparatus installed and functioning to verify results from initial driving of these piles. Restrike indicator piles with the hammer at normal operating temperature for a maximum penetration of twelve inches, a maximum of 60 hammer blows, or to less than the driving stress limits established by Article 3.3.B, whichever occurs first. Pile driving shall resume as if it was the initial strike conditions per Article 1.1.A.1.c to obtain the correct pile driving criteria
- c. Perform CAPWAP analyses using the Dynamic Pile Testing data from the end of initial driving and the beginning of restrike of all indicator piles.
- d. Perform refined wave equation analyses using the dynamic test results of each indicator pile. Incorporate the results of the refined wave equation analyses in driving of subsequent indicator piles. Refined wave equation analyses shall be based upon the variations in the subsurface conditions and/or drive system performance measured by the dynamic testing apparatus.

2. Static Pile Load Tests:

- a. Static Pile Load Test equipment and testing procedures shall be in accordance with ASTM D1143, Quick Load Test Method, except as modified herein.
- b. Provide test equipment with capacity greater than three times the pile design load and having means of determining applied load to within five (5) percent of test load. Provide test equipment capable of measuring total settlement at the top of the pile to nearest 0.001 inch.
- c. Perform Static Pile Load Tests. Commence loading the pile no sooner than 72 hours after installation of the pile. The maximum test load shall be equal to three times the pile design load or the ultimate bearing capacity, whichever occurs first.
- d. The ultimate bearing capacity under axial comprehensive load is that load which produces a settlement of the pile head equal to:  
$$S_u = S + (0.15 + 0.008D)$$
Where:  
 $S_u$  = Settlement at ultimate bearing capacity in inches  
S = Elastic deformation of total unsupported pile length in inches  
D = Pile diameter or width in inches
- e. The safe bearing capacity is defined as 50 percent of the maximum test load. Static load test results will be acceptable when the safe bearing capacity equals or exceeds the design bearing capacity.

- f. Restrike piles for monitoring with Dynamic Testing Apparatus in accordance with Articles 3.2.A.5 and 3.2.B.1.

### 3.03 PRODUCTION PILE DRIVING:

#### A. Bearing Value, Length and Penetration:

1. Provide production piles of length necessary to attain production maximum tip elevation, twice the pile design load, and to extend into cap or footing block as shown.
2. Determine lengths of production piles by analysis of data obtained from Static Pile Load Tests, Dynamic Pile Testing and refined wave equation analyses.
3. Any pile that does not reach twice the pile design load by approved blow count or attain the minimum penetration will be rejected. Rejected piles will be restruck after 48 hours in accordance with Article 3.2.B.1 and ,if necessary tested using Dynamic Pile Testing equipment as directed by the Engineer to prove attained capacity at no additional cost to the Authority.
4. The Contractor may install additional test piles, make borings or make such other investigations as he may desire at no additional time to the Contract and no cost to the Authority.

#### B. Pile Driving Stresses:

1. Indicator and production piles shall not be driven above the hammer energy and blow count shown by the wave equation analyses to produce stresses above the point of impending damage. For concrete piles limit the tensile (TS) and compressive (CS) driving stresses to:

$$TS \leq 3\sigma' f'_c + EPV$$

$$CS \leq 0.85 f'_c - EP$$

Where:

$f'_c$  = The 28-day design compressive strength of the concrete

EPV = The effective prestress value

2. Cut off grade: At the Contractor's option, production piles reaching design bearing capacity and production maximum tip elevation with tops above the cut off grade may be driven to the cut off grade providing the required bearing capacity is maintained, allowable driving stresses within the pile have not been exceeded and no damage to the pile occurs. Piles damaged or suspected of damage due to driving to achieve a cut off grade shall be pulled and/or replaced at the Contractor's expense.

#### C. General Requirements:

1. Drive piles only after completion of required excavation or construction of indicated embankments.
2. Stage driving within supported excavation areas so as not to damage internal bracing.
3. For production piles in permanent embankments, pre-drill through fill or embankment to natural ground or bottom of embankment.
4. Drive each pile in a continuous operation until required penetration and twice the pile design load have been attained. If driving is stopped before required blow count and penetration have been reached, drive the pile one foot upon resumption of driving before resuming blow count for bearing value determination.
5. Redrive each pile which is lifted 1/4 inch or more by ground heave during driving of adjacent piles to at least the original tip elevation or as directed.

6. Remove loose and displaced material forced up around piles during driving.
7. In Terrace deposits and directly above the Monmouth Formation, cobbles, boulders and cemented sand/silt deposits were found. Penetrate into and through these deposits as necessary to attain twice the pile design load and required maximum tip elevation.
8. Achieve pile penetration through miscellaneous fill, rubble concrete, tires, hardpan, cemented sands/silts, and any other obstruction, natural or man-made, by means of pre-drilling or other approved excavation methods.
9. Hold pile tops in position with steel driving block or anvil.
10. Do not drive piles with free swinging hammer.
11. Pull and replace piles which are not within specified tolerances or, if approved, redesign pile cap as specified. Costs associated with the redesign and construction of modified pile caps will be borne by the Contractor and no additional time to the Contract will be allowed.

D. Pre-drilled Holes:

1. Where shown on the Contract Drawings, drill holes to diameter of greatest cross section dimension of the pile to be installed in accordance with the notes and schedules on the drawings and with Section 204.
2. Set pile in pre-drilled hole and drive to predicted or production maximum tip elevation and twice the pile design load, but in all cases to a minimum depth of five (5) feet below bottom of pre-drilled hole.
3. Fill voids between pre-drilled hole and pile with lean concrete immediately upon completion of the driving sequence, as approved.
4. Dispose of material resulting from drilling holes in accordance with the requirements of Section 204.
5. Fill rejected pre-drilled holes with lean concrete and redrill at approved location.

E. Concrete Piles:

1. Cut off piles at such elevation that they will extend into cap or footing as shown. Saw cut piles with equipment capable of providing a flat smooth surface without spalling or damaging pile below cutoff. Replace or repair piles that are damaged when cut off.
2. Where reinforcing steel dowels are shown, dowels may be anchored in cast or drilled holes in concrete pile. If holes are drilled, drill by methods that will not damage concrete, reinforcing steel or prestressing steel. Drill minimum diameter consistent with placing approved epoxy adhesive and dowel. Leave holes free of dust, moisture or other deleterious material. Place sufficient epoxy in holes before inserting dowels leaving no voids afterwards. Leave dowels undisturbed until epoxy has developed 100 percent of its strength capacity.

### 3.04 FIELD QUALITY CONTROL:

A. Concrete Pile Allowable Tolerances:

1. Ensure straightness and cross-sectional dimensions of precast piles so that a line stretched from butt to tip on any face is not more than one inch from face of pile at any point.
2. Install piles within the following tolerances:
  - a. Axis of pile within six inches of design location at cutoff elevation.
  - b. Axis of pile not out of plumb or batter by more than one percent of its driven length.
  - c. No encroachment of piles upon neat lines of Authority structures.

## **PART 4 - MEASUREMENT AND PAYMENT**

### **4.01 BASIS:**

- A. Compensation for work specified in this section will be made in the following manner:
1. Furnishing and installing piles: Linear foot in place in the completed work measured from the tip of the pile to the plane of the cut off (top of pile). This price shall include conducting and reporting the initial wave equation analysis, furnishing piles; driving piles; splices; concreting; achieving specified load and tip elevations.
  2. Static Pile Load Test: This work will be measured and paid for at the Contract unit price per each static pile load test performed. The payment will be full compensation for furnishing and setup of test equipment, providing reaction piles, conducting test, reporting and incidentals necessary to complete the work. If load test is terminated by the Engineer because of insufficient bearing capacity, test will be measured for payment. If the test is terminated because of malfunction of Contractor's equipment or other reasons that are the fault of the Contractor, the test will not be measured for payment.
  3. Dynamic Pile Testing: This work will be measured and paid for at the Contract unit price per dynamic test performed. The payment will be full compensation for furnishing and setup of dynamic testing equipment and conducting test during initial and restrrike driving of each indicator pile, performing CAPWAP analyses, performing the refined Wave Equation Analysis, reporting and incidentals necessary to complete the work. Incomplete tests and terminations treated in accordance with Article 4.A.2.
  4. Pile restrrike: This work will be measured and paid for at the Contract unit price, per each restrrike performed. The payment will be full compensation for furnishing and setup of pile driving equipment required for restrriking piles with dynamic equipment installed and functioning in accordance with Article 3.2. If test is terminated by Engineer because of insufficient bearing capacity pile restrrike will be measured for payment. If the test is terminated because of malfunction of Contractor's equipment or other reasons that are the fault of the Contractor, pile restrrike will not be measured for payment.
  5. Pre-drilled holes shown and specified in Article 3.3 will be paid for at the Contract unit price per linear foot measured from the plane of the cut off (top of pile) to the level of the pre-drilled elevation specified. This price shall include providing the equipment, material and labor necessary to drill holes to the scheduled elevation, disposal of materials, placing lean concrete and incidentals necessary to complete the work.

**END OF SECTION**

## SECTION 02515

### WATER DISTRIBUTION SYSTEM

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing water mains.
- B. Related Work Specified Elsewhere
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Maintenance, support and restoration of utility facilities: Section 02270.
  - 3. Grounding and bonding: Section 16060.

##### 1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Certification:
  - 1. Proof that the water sampling and testing laboratory satisfies the requirements of the American Council of Independent Laboratories' Recommended Requirements for Independent Laboratory Qualification. Laboratory need not be a member of the American Council of Independent Laboratories
  - 2. Proof that the independent laboratory is approved by the EPA or jurisdictional health authority.
  - 3. Certified results of the specified Post-Sterilization Water Test.
- B. Documentation:
  - 1. Bill of materials for material which will be supplied by operating agency. <sup>\*1</sup>
- C. Working Drawings: <sup>\*2</sup>
  - 1. Complete detailed working drawings of the proposed fire hydrants. Approval of drawings submitted does not constitute a waiver of the requirements of the Contract, nor is the Authority compelled to accept hydrants unless they pass specified tests and requirements.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: M36, M153. <sup>\*3</sup>
  - 3. AASHTO: M153. <sup>\*4</sup>
  - 4. ANSI/AWWA: C104/A21.4, C110/A21.10, C111/A21.11, C151/A21.11, C151/A21.51.
  - 5. ASTM: A36, A48, A53, B88, C33.
  - 6. ASTM: A36, A48, C33, C76. <sup>\*5</sup>
  - 7. ASTM: A36, A48, C33. <sup>\*6</sup>
  - 8. ANSI/AWWA: C108, C151, C500, C502. <sup>\*7</sup>

9. ANSI/AWWA: C151, C200. <sup>\*8</sup>
10. EPA: National Primary Drinking Water Standards.
11. WSSC: General Conditions and Standard Specifications, Standard Fire Hydrant Drawings. <sup>\*9</sup>

B. Allowable Tolerances:

1. Leakage not to exceed figures given in Table 02515-1.
2. Lead concentration in specified water samples less than 15 micrograms per liter of water, and water quality meets the requirements of EPA National Primary Drinking Water Standards.

C. Testing Laboratory:

1. Furnish services of an EPA-certified or jurisdictional health agency-certified independent laboratory for sampling and testing water quality. Employment of an independent laboratory does not relieve Contractor of the obligation to perform work in accordance with Contract requirements.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Upon approval of bill of materials, pick up material at designated storage facility and transport to job site. <sup>\*9</sup>
- B. To reduce handling to a minimum, coordinate pipe delivery with installation.
- C. Distribute pipe along line of work and outside trench as near as practicable to point of placement. Do not deposit material on or against pipe.
- D. Arrange and install skids and wedges to prevent damage to pipe. Do not roll or drag pipe.
- E. Avoid damage to coating and lining; use handling equipment designed for the purpose. Where approved, pipe may be handled by hand.
- F. When pipe installation is not actually in progress, place watertight caps or plugs on open pipe ends.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Aggregate for Subgrade Foundation: ASTM C33, coarse aggregate No. 4 or where directed No. 4 and No. 67 in combination and proportions to suit field conditions.
- B. Aggregate for Fire Hydrant Dry Wells: ASTM C33, coarse aggregate, No. 67.
- C. Ductile Iron Pipe:
  1. ANSI/AWWA C151/A21.51. With standard cement-mortar lining with bituminous seal coat conforming to ANSI/AWWA C104/A21.4.
  2. Furnished in uniform standard lengths. Short pipe lengths and fittings are permitted where line, grade and closure requirements necessitate.

- D. Joints:
1. ANSI/AWWA C151/A21.11.
  2. Where shown as DILM, use mechanical joint ductile iron pipe. Where shown as DILS, use push-on joint. Unless otherwise shown, ductile iron pipe joints may be either mechanical joints or push-on joints.
- E. Fittings:
1. ANSI/AWWA C110/A21.10 as modified.
  2. Suitable for use with ductile-iron pipe; designed for 250 psi working pressure.
  3. Furnished with coating and lining as for ductile iron pipe, with mechanical joint, except that offsets will have one plain spigot end.
- F. Gasket Lubricant: For mechanical joints: Approved vegetable oil soap. For push-on joints: Approved gasket lubricant supplied by the pipe manufacturer and conforming to ANSI/AWWA C111/A21.11.
- G. Concrete: Section 03300, Class 3500.
- H. Mortar: Section 02535.
- I. Brick: Section 02535.
- J. Reinforcing Steel and Welded Steel Wire Fabric: Section 03200.
- K. Precast Concrete Elements: Section 03400, Class 4000, air-entrained concrete.
- L. Steps: ASTM A48, Class 30.
- M. Manhole Frame and Cover; And Other Castings For Service With Utility Systems:
1. Authority manhole: Cast-iron, ASTM A48, Class 30, with METRO logo.
  2. Utility company manhole: Manhole frame and cover furnished as part of the Contract or furnished by the utility as shown on the drawings.
  3. Rust-resistant cast iron or rust-resistant malleable cast iron.
  4. True to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blowholes and defects affecting strength.
  5. Fillets at angles in casting with arises sharp and perfect.
  6. Sandblasted to effectively remove scale and sand, presenting smooth, clean and uniform surfaces. Coated with bituminous coating.
  7. Metro logo: For utility components which will remain METRO property and are not within boundaries of utility easements as shown: Cast METRO logo as shown.
  8. Covers that receive paver tile:
    - a. Omit bituminous coating.
    - b. Provide positioning lug and lug receptor as a permanent part of the cover and frame rim so that the cover can only be installed (flush) in one position
- N. Piling for Thrust Blocks and Steel for Structural Use: ASTM A36.

- O. Resilient Material at Pipe Penetrations: AASHTO M153, Type II. See Section 02320.
- P. Vitrified Clay Pipe: Section 02535.
- Q. Backfill: Section 02320.
- R. Valves: Built and tested in accordance with ANSI/AWWA C500.
1. Cast-iron body, bronze-mounted, parallel-seat, double-disc gate valves with nonrising stems, nut-operated to open counterclockwise to withstand and operate under a working pressure of 150 pounds per square inch.
  2. Mechanical joint or flanged ends as shown and manufactured by American Darling Valve and Manufacturing Company, Ludlow-Rensselaer Valve Company or equal.
  3. No gearing or bypass will be required on valves smaller than 16 inches.
  4. Valves 16 inches and larger equipped with a bypass and bevel gearing for horizontal installations or spur gearing for vertical installations.
- S. Valves: In accordance with requirements of the operating agency. <sup>\*10 and \*9</sup>
- T. Materials Supplied by the Operating Agency: <sup>\*11 and \*9</sup> 1.
1. Except for those items which bear the METRO logo, the WSSC furnishes the following:
    - a. Water meter, meter frame and cover, meter housing, copper and brass pipe and fittings for meter settings, and adjustable valve box.
- U. Materials Supplied by Operating Agency: As specified. <sup>\*12 and \*9</sup>
- V. Yard Hydrant: Cast-iron box with lid, freeze proof valve with removable handle and threaded hose connection, hose bib size 2-1/2 inches, service pipe size as shown, Josam Series 71600 or equal.  
Coal-tar epoxy: Section 02535.
- W. Bituminous Coating: ANSI/AWWA C151. <sup>\*13</sup>
- X. Steel Pipe Casing: ASTM A53, Grade B, ungalvanized. <sup>\*14</sup>
- Y. Casing pipe: <sup>\*15</sup>
1. Reinforced concrete: ASTM C76, Class IV.
  2. Corrugated metal: AASHTO M36, 8-gauge, galvanized, asphalt coated.
  3. Seamless steel: Black, welded, mill type, ANSI/AWWA C200.
- Z. Fire Hydrants: Conforming to ANSI/AWWA C502, and WSSC's Standard Fire Hydrant Drawings with the following additional requirements: <sup>\*16</sup>
1. Interchangeable with existing WSSC fire hydrant. A sample fire hydrant similar to those now in use will be available at the Warehouse at 3500 Kenilworth Avenue, Bladensburg, Maryland, for inspection and comparison.
  2. Manufactured by Kennedy Valve Mfg. Company, Elmira, N.Y. or equal, including name of manufacturer and year of manufacture cast in raised letters.

3. Barrel sections:
  - a. Two cast-iron sections, with hollow or breakable flange at least two inches above finished grade line, cast iron conforming to ANSI/AWWA A21.8/C108).
  - b. Lower section of barrel: Static casting with an integral tapered top flange seat. Nozzle section attached to lower barrel section by means of a tapered flange ring held in place by six hydrant-head bolts and nuts.
  - c. Flange and flange rings: Top or nozzle section, including bonnet and operating nut, revolving 360 degrees for facing without disturbing bottom section of barrel. The use of split bronze insert ring is prohibited.
  - d. Hydrant: Barrel, complete with the working parts, including main and drain valve seats, removable for inspection or repair and replaceable without disturbing the ground.
  - e. Depth of bury of the hydrant indicated in raised figures on barrel, showing depth in feet. Figure on barrel just below the swivel flange and above protective case, visible when installed. Figure raised at least 1/8-inch above barrel surface and height of the figure at least one inch, integrally cast with barrel.
4. Frost case:
  - a. Cast-iron, two-piece lower section may be centrifugally cast and 12 inches shorter than depth of bury.
  - b. The upper section of frost casing normally furnished in lengths of nine inches, but sections both 15 and 21 inches long furnished as required to be used for maintenance purposes where longer hydrant barrels have to be replaced on existing installations.
5. Main valve:
  - a. Main valve seat: Compression type, opening against pressure.
  - b. Valve: Faced with Balata.
6. Discharge nozzles:
  - a. One 4-1/2 inch pumper and two 2-1/2 inch hose nozzles, both pumper and hose nozzle threads conforming to the requirements of ANSI specifications for National (American) Standard fire hose coupling screw thread.
  - b. Nozzle caps: For outlets, attached to the fire hydrant by means of suitable chains.
  - c. Hose nozzles of bronze and leaded into the barrel.
7. Elbow or inlet connections:
  - a. Cast-iron hydrant barrel to screw into the elbow. Elbow fitted with removable or replaceable threaded bronze ring to receive hydrant barrel.
  - b. Inlet connection: Six inches, Class 350, mechanical joint bell, meeting the general requirement for Standard Mechanical Joint Cast-Iron Pipe and Fittings with the necessary accessories for each such mechanical joint.
  - c. Bolts: Low-alloy steel, Corten, Usaloy or equal.
  - d. Gaskets: Rubber.
  - e. Glands: High-strength cast iron consistent in design with elbows with which they are to be used.

AA Copper Tubing: ASTM B88, Class I, Type K, hard-drawn. \*17

- BB Metro Logo: For utility components which remain property of the Authority and are not within the boundaries of utilities' easements indicated in the Right-of-Way drawings, use cast METRO logo as shown. <sup>\*18</sup>
- CC Oak Chock: Undressed, clear, four inches wide by 18 inches long, height variable, with recessed groove, 1-1/16 inches by 1/4-inch deep, centered across four-inch dimension. <sup>\*19</sup>
- DD Metal Band: Steel, one inch by 0.035 inch. <sup>\*20</sup>

### **PART 3 - EXECUTION**

#### **3.01 MAINTAINING WATER SERVICES:**

- A. Maintain water service in accordance with Section 02270. In furtherance of this requirement, conduct operations at times selected to minimize duration and inconvenience of service interruption.
- B. At least 24 hours prior to cutting or abandoning an existing water main, notify the Engineer and operations division of operating agency and obtain approval of schedule for performance of work. <sup>\*9</sup>
- C. Keep existing water mains parallel to new water mains in service until new water mains are ready for service.
- D. Where existing water main must be cut for connection to new water main, provide necessary facilities and prosecute work on 24-hour basis.
- E. Water valves in service will only be operated by personnel of the agency owning main. <sup>\*9</sup>

#### **3.02 EXCAVATION:**

- A. Perform excavation to line and grade in accordance with Section 02320 with the following additional requirements:
  - 1. Excavate test pits sufficiently in advance of construction so that reasonable changes in line and grade can be made where the location of existing structures varies from that shown.
  - 2. Excavate below horizontal plane extending two feet above top of water main structure to such width that construction may be properly performed, but not less than six inches nor more than nine inches from outside of proposed structure.
  - 3. Excavation above such plane may exceed specified dimensions where approved.
  - 4. If excavation exceeds permissible dimensions, install pipe of higher strength as directed.
  - 5. Unless otherwise shown, install pipe in excavated trenches. Trench to have such depth that there will be at least two feet of trench of required width above top of pipe.
  - 6. Where necessary to place backfill or embankment so that trench can be excavated, extend and compact backfill or embankment to full depth and laterally at least 2-1/2 times diameter of pipe on each side measured from centerline of pipe.

#### **3.03 SUBGRADE:**

- A. Prepare subgrade so that pipe will rest solidly throughout its length. Excavate recesses to accommodate joints and fittings.

**3.04 BACKFILL:**

- A. Backfill excavation upon completion of construction in accordance with Section 02320.
- B. Perform backfilling after inspection and approval of pipe laying.

**3.05 LAYING PIPES:**

- A. Take proper measures to keep pipe clean. Immediately prior to placing, clean inside and ends of outside surfaces of pipe. Keep interior surfaces clean throughout construction.
- B. Prior to placing pipe in trench, have interior and exterior inspected. Where there is damage that the Engineer determines repairable, make repairs as directed. Replace pipe damaged beyond acceptable repair.
- C. Complete excavation and placing of subgrade before pipe is placed. Place pipe solidly true to line and grade shown. Do not subject pipe to blows or shocks to achieve solid bedding or proper line and grade.
- D. Make change in line with fittings. Do not spring joints to effect change of direction.
- E. Do not field cut pipe unless necessary. Make such necessary cuts by means of equipment designed for purpose, ensuring smooth square end.
- F. For connection to existing pipe, provide pipe with suitable ends or adaptors, after verification of size and type of existing pipe.
- G. For railroad and highway crossings, lay casing and water mains as shown. <sup>\*21</sup>
- H. Place oak chocks as shown, fasten metal band to chocks as approved. Space chock arrangements on water mains at six feet zero inches on center. <sup>\*22</sup>
- I. After water main is in place, fill void between main and casing with sand. <sup>\*23</sup>
- J. Close ends of casing pipe with brick masonry enclosure as approved. <sup>\*24</sup>

**3.06 ASSEMBLING MECHANICAL JOINTS:**

- A. Assemble mechanical joints to provide tight, flexible joints that safely permit expansion, contraction and ground movement.
- B. Prior to assembling mechanical joints, wire brush surfaces of pipe sections in contact with gasket so that surfaces are clean, smooth and free of rust and other foreign substances. Clean and lubricate contact surfaces with vegetable oil.
- C. Assemble mechanical joints in accordance with ANSI/AWWA C111/ A21.11.

- D. Furnish to the Engineer calibrated torque wrenches in sufficient number to permit complete inspection of work. Provide satisfactory means of recalibration.
- E. If satisfactory seating of joint is not obtained at maximum permissible torque, disassemble joint, reclean and reassemble with new gasket.

**3.07 ASSEMBLING PUSH-ON JOINTS:**

- A. Assemble push-on joints to provide tight, flexible joints that safely permit expansion, contraction and ground movement.
- B. Assemble joints using lubricant in accordance with recommendations by pipe manufacturer.
- C. File or grind spigot of field-cut pipe lengths to resemble manufactured pipe so that spigot end will slip into socket without hindrance or gasket damage.
- D. Place identifying mark on pipe not bearing depth mark on spigot to show depth of socket.

**3.08 VALVES:**

- A. Install valves in accordance with recommendations of the valve manufacturer.
- B. Where valves are provided by operating agency, provide suitable access for performance of work. <sup>9</sup>
- C. Where necessary, alter typical valve manhole to suit actual conditions.

**3.09 SUCTION OUTLETS:**

- A. Construct suction outlets where shown.
- B. Provide necessary materials not furnished by operating agency to complete installation. <sup>9</sup>

**3.10 DEAD-END BLOWOFFS:**

- A. Provide tapped and drilled caps for dead-end blowoffs where shown.
- B. Complete construction of dead-end blowoffs. Provide materials not furnished by operating agency but necessary to complete installation. <sup>9</sup>

**3.11 FIRE HYDRANTS:**

- A. Construct fire hydrant installations as shown.
- B. Provide necessary materials not furnished by operating agency to complete installation. <sup>9</sup>
- C. Shop Painting: <sup>25</sup>
  - 1. Clean outside of hydrant above finished ground line and give two coats of paint as manufactured by Grow Chemical Coating Corp., Tropical Paint Division, 1250 West 70th Street, Cleveland, Ohio 44102, or equal. The bonnet of the hydrant painted with Rhinamel Forest Green No. 202-97-I.F. or equal and the body and outside of the top section frost casing painted with Rhinamel Gray No. 202-21-00 or equal

2. Bituminous Coating: Paint the barrel below the ground line, the bottom section of the frost casing and the cast-iron elbow, inside and outside. Paint only the inside of the top section of frost casing.
  - a. The bituminous coating to be smooth, tough and tenacious coating, neither so soft as to flow when exposed to sun nor so brittle as to crack and scale off when exposed to temperature below freezing, and not deleterious to potable water.
  - b. Apply the bituminous coating hot or cold either by brushing, dipping or spraying. The coating material to be subjected to chemical and physical tests by the Engineer to confirm its uniformity and quality.
  - c. Examine surfaces for peeling or scaling. Repair damage to the coating because of rough handling or rubbing in shipping and restore coating to its original condition.

**3.12 THRUST BLOCKS AND HARNESSING:**

- A. Make provision for counteracting thrust caused by static and dynamic forces including water hammer at bends, tees, reducers, valves and dead-ends by installing ductile iron retainer glands with mechanical joints. For other methods submit details for approval prior to use.
- B. Install concrete thrust blocks as shown where harnessing is not practicable.
- C. Where shown provide piles and reinforcing steel in concrete thrust blocks. Install piles for thrust blocks to bearing of 15 tons.

**3.13 CAST-IN-PLACE CONCRETE CONSTRUCTION:**

- A. Conform to applicable requirements of Sections 03100, 03200 and 03300.

**3.14 PRECAST CONCRETE CONSTRUCTION:**

- A. When installing precast sections, prevent damage to seals and sealants.

**3.15 BRICK CONSTRUCTION:**

- A. Conform to applicable requirements of Section 04215.

**3.16 WATER SERVICE CONNECTIONS:**

- A. Construct water mains and water service connections in accordance with the codes and regulations of the jurisdictional agency. <sup>\*26</sup>
- B. Make water service connections, where necessary, in accordance with applicable plumbing code. <sup>\*27</sup>
- C. Pay the required by the jurisdictional agency, except the water availability charge, which will be paid by the Authority. <sup>\*28</sup>
- D. Pay the water consumption charges until the time of final substantial completion for this Contract. <sup>\*29</sup>

- E. Do not connect water service to WSSC system until application for the connection has been approved by the WSSC. <sup>\*30</sup>
- F. Pay the water consumption charges until the time of final substantial completion for this Contract. <sup>\*31</sup>

**3.17 TUNNELING AND JACKING:**

- A. Perform tunneling and jacking as approved.
- B. Where open cut is specified and the Engineer permits work to be done by tunneling or jacking, perform such work as specified and as approved.
- C. Make horizontal borings for laying pipe lines true to line and grade.
- D. Where pipes are laid in borings, completely fill void between pipe and the boring with sand, using water pressure to ensure that voids are filled.
- E. Methods of boring and filling of voids between pipe and boring and subject to approval.

**3.18 BONDING AND CATHODIC PROTECTION:**

- A. Bond ferrous pipe in accordance with Section 16060.
- B. Where cathodic protection of piping system is shown, apply coal-tar epoxy coating as specified in Section 02535 and test as specified in Section 13115.

**3.19 FIELD QUALITY CONTROL:**

- A. Notice of Testing:
  - 1. Coordinate with and assist the WSSC in testing water mains. Provide equipment necessary for and adequate to maintain required pressures for the required period. Do the work, such as making connections, operating pump, providing piping, valves and other materials necessary for making tests. Pressure recorder, charts and water meter for testing will be furnished by the WSSC. <sup>\*32</sup>
  - 2. Give two days notice of intention of testing to operating agency which will furnish, install and operate pumps, gauges, meters and individual pipe connections to test openings. <sup>\*33 and \*9</sup>
  - 3. Designate largest sections feasible for testing and sterilizing. One testing and sterilizing operation will be performed at no expense to the Contractor; the cost of subsequent testing and sterilizing, if necessary, will be borne by the Contractor. <sup>\*9</sup>
- B. Tests:
  - 1. General requirements:
    - a. Prior to coating and backfilling, isolate system by use of approved valves, caps and plugs or other means.
    - b. Maintain such isolation throughout performance of leakage and pressure testing.

- c. Where valves are used for isolation, eliminate leakage through such valves if it occurs. Maintain new work isolated from existing water mains, except for test connections, until testing and sterilization have been completed.
- 2. Leakage test:
  - a. For leakage tests, provide approved caps and plugs in sections to be tested and remove them after testing.
  - b. Prevent leakage in pipes and fittings at openings.
  - c. Block temporarily plugged and capped ends to prevent displacement.
  - d. Install water source connection for testing isolated section; the Engineer may permit the use of tap which will be furnished and installed by operating agency. <sup>9</sup>
  - e. Perform work and furnish materials incidental to leakage testing, including excavation for installation and removal of pumps, gauges, meters and water source connections. Operating agency will apply 125-psig test-pressure section under test for 24 hours minimum. <sup>9</sup>
  - f. Where leakage exceeds the amount specified in Table 02515-1, perform necessary corrective measures.
  - g. Pressure test:
    - 1) After completion of leakage test, remove temporary caps and plugs and connect new water main into system. With new work valved off or otherwise isolated from system by approved means, assist with pressure test.
    - 2) Operating agency will apply 175-psig test-pressure to section under test for one-hour minimum. <sup>9</sup>
    - 3) Take corrective measures necessary to provide system free of leaks. Remove and replace defective pipes, jointings, fittings, valves and other appurtenances. Reset such items, if displaced.

**3.20 STERILIZING:**

- A. Operating agency will sterilize work during leakage test. <sup>9</sup>
- B. Provide access to opening used for sterilizing.
- C. Provide Post-Sterilization Water Sampling and Testing Services: Have EPA-approved or jurisdictional health authority-certified laboratory sample and test water, and submit certified test results that water quality and lead concentration in samples meet EPA standards.

**3.21 COMPLETION:**

- A. Upon completion of leakage testing and sterilizing remove temporary construction and complete connection of new work to system.
- B. Bond ferrous pipe in accordance with Section 16060.
- C. Have EPA-approved or jurisdictional health authority-certified laboratory sample and final proof-test water, and submit certified test results that water quality and lead concentration in samples meet EPA standards.

THIS SPACE NOT USED.

TABLE 02515-1												
MAXIMUM ALLOWABLE LEAKAGE IN CUBIC FEET PER 24 HOURS PER JOINT												
Test Pressure	Pipe Size											
	Nominal											
psi	6"	8"	12"	16"	20"	24"	30"	36"	48"	60"	66"	72"

psi	6"	8"	12"	16"	20"	24"	30"	36"	48"	60"	66"	72"
Above tabulation is based on leakage at maximum rate of 23.3 gallons per inch of pipe diameter per mile per 24 hours at 150 psi for pipe in 18-foot lengths.												

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

**ENDNOTES:**

- \*1. Delete or modify this paragraph as appropriate when project does not involve an operating agency.
- \*2. Add 1.2 C. including 1. for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*3. Use first version of 1.3 A.2. modification for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*4. Use second version of 1.3 A.2. for contracts where water distribution work is performed in all other jurisdictions.
- \*5. Use second version of 1.3 A.4. modification for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*6. Use third version of 1.3 A.4. modification for contracts where water distribution work is performed in all other jurisdictions.

- \*7. Add first version of 1.3 A.5. for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*8. Add second version of 1.3 A.5. for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*9. Add 1.3 A.7. for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*10. Use second version of 2.1 R. for contracts where water distribution work is performed outside the jurisdiction of WSSC.
- \*11. Use first version of 2.1 S. including 1.a. modification for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*12. Use second version of 2.1 S. for contracts where water distribution work is performed outside the jurisdiction of WSSC.
- \*13. Add 2.1 V. for contracts where water distribution work is performed within the jurisdiction of WSSC and where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*14. Add first version of 2.1 W. for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*15. Add second version of 2.1 W. for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*16. Add first version of 2.1 X. including 1.-7.e. for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*17. Add second version of 2.1 X. including 1.-3. for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*18. Add first version of 2.1 Y. for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*19. Add second version of 2.1 Y. for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*20. Add 2.1 Z. for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*21. Add 3.5 G. for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*22. Add 3.5 H. for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*23. Add 3.5 I. for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.

- \*24. Add 3.5 J. for contracts where water distribution work is performed within the jurisdiction of Fairfax County, Virginia.
- \*25. Add 3.11 C. including 1.-2.c. for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*26. Use first version of 3.16 A. modification for contracts where water distribution work is performed within the jurisdiction of WSSC and where water distribution work is performed within the jurisdiction of Fairfax County, Virginia and Falls Church, Virginia.
- \*27. Use second version of 3.16 A. modification for contracts where water distribution work is performed in all other jurisdictions.
- \*28. Add 3.16 B. for contracts where water distribution work is performed within the jurisdiction of WSSC and where water distribution work is performed within the jurisdiction of Fairfax County, Virginia and Falls Church, Virginia.
- \*29. Add first version of 3.16 C. where water distribution work is performed within the jurisdiction of Fairfax County, Virginia and Falls Church, Virginia.
- \*30. Add second version of 3.16 C. for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*31. Add 3.16 D. for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*32. Use first version of 3.19 A.1. modification for contracts where water distribution work is performed within the jurisdiction of WSSC.
- \*33. Use second version of 3.19 A.1. modification for all other contracts where water distribution work is performed.

**END OF SECTION**

## SECTION 02535

### SANITARY SEWER

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies installing sanitary sewers.
- B. Related Work Specified Elsewhere:
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Maintenance, support and restoration of utility facilities: Section 02270.
  - 3. Stray current and cathodic protection: Section 13110 and 13115.
- C. Material Furnished By Others: <sup>\*1</sup>
  - 1. Except for those items which bear the METRO logo, WSSC furnishes the following:
    - a. Manhole frames and covers: 22-inch diameter.
    - b. Manhole steps, except where precast manholes are used.
- D. Definitions: <sup>\*2</sup>
  - 1. Granular bedding required by WSSC is equivalent to aggregate for pipe cradle as specified.
  - 2. WSSC: Washington Suburban Sanitary Commission.
  - 3. WASA: Water and Sewer Authority.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Drawings for each size and configuration of precast manhole with details of accessories and joints.
    - b. Diagrams showing dimensioned locations for openings in precast concrete manhole walls.
  - 2. Documentation:
    - a. Submit calculations for modified or special designs to demonstrate compliance with required load-bearing capacity, certified by a professional engineer registered in the jurisdiction where the work is to be installed.
  - 3. Samples:
    - a. Sewer brick: Ten.
    - b. Manhole brick: Ten.
  - 4. Certification.
  - 5. Documentation: <sup>\*3</sup>
    - a. Submit two copies of records of inspection of new and relocated sewers, one copy to WSSC and one copy to the Engineer. Include video-tape cassette of television inspections and logs, photographs and other records specified by WASA for visual walk-through inspections.
    - b. Obtain and submit a written approval and acceptance from WASA.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
  2. Building Stone Institute: Stone Catalog
  3. CISPI: HSN 85.
  4. AASHTO: M33, M153, T85, T96, T104. <sup>\*4</sup>
  5. AASHTO: H20, M33, M36, M153, M175, M176, M190, M252, M288, T85, T96, T104. <sup>\*5</sup>
  6. ANSI/ASME: B16.1. <sup>\*6</sup>
  7. ACI: 318.
  8. ASTM: A36, A48, A53, A74, A167, C14, C32, C33, C76, C144, C150, C207, C361, C425, C443, C478, C700, D698, D1682, D3034. <sup>\*7</sup>
  9. ASTM: A36, A48, A53, A74, A167, C14, C32, C33, C76, C144, C150, C207, C361, C425, C443, C478, C700, D698, D3034, D5034. D5035. <sup>\*8</sup>
  10. MS: MIL-P-23236.
  11. SSPC: SP-6.
  12. WSSC: General Conditions and Standard Specifications. <sup>\*9</sup>
- B. Allowable Tolerances:
1. Rate of infiltration into sanitary sewer lines not to exceed 100 gallons per inch diameter per 24 hours per mile of sewer.
  2. Subgrade: Plus-or-minus 1/2 inch of elevation shown.
- C. Inspection: <sup>\*10</sup>
1. Prior to paving or other construction over new or relocated sewers, conduct visual walk-through inspection of sewers larger than 36 inches in diameter and of associated structures and internal television inspection of sewers 36 inches and smaller in diameter.
  2. Employ the services of a sewer inspection company which has been regularly engaged in television sewer inspections and which is acceptable to WASA to perform preconstruction and post-construction inspections of sewers 36 inches and smaller in diameter.
    - a. Submit to WASA for prior approval one sample of the cassettes to be used.

## PART 2 - PRODUCTS

### 2.01 MATERIALS:

- A. Formwork: Section 03100.
- B. Reinforcing Steel: Section 03200.
- C. Portland Cement Concrete: Section 03300, Class 3500, unless otherwise shown.
- D. Aggregate for Subgrade Foundation: ASTM C33, coarse aggregate, No. 4. Where shown use layers of No. 4 and No. 67 in combinations and proportions determined by field conditions and as approved.
- E. Aggregate for Pipe Cradle: ASTM C33, coarse aggregate No. 67.
- F. Concrete Pipe:
1. 10-inch diameter and smaller:
    - a. STM C14, Class 2, nonreinforced concrete pipe.
    - b. Bell-and-spigot type.

- c. Joints fabricated in accordance with ASTM C361. Physical characteristics for rubber gaskets in accordance with ASTM C443.
    - 2. 12-inch diameter and larger:
      - a. ASTM C76, bell-and-spigot or tongue-and-groove, Class IV, unless otherwise shown.
      - b. Radius (bevel) pipe, with drop between two pipe sections not exceeding the common wall thickness.
      - c. Rubber gasket joints, when required, fabricated in accordance with ASTM C361. Physical characteristics for rubber gaskets in accordance with ASTM C443.
      - d. Acceptance tests as specified in ASTM C76 form basis of acceptance for concrete pipe in accordance with the following:
        - 1) 72-inch diameter and smaller: Acceptance on the Basis of Plant Load Bearing Test, Material Tests and Inspection of Manufactured Pipe for Visual Defects and Imperfections.
        - 2) Larger than 72 inches in diameter: Acceptance on the Basis of Material Tests and Inspection of Manufactured Pipe for Defects and Imperfections.
        - 3) Minimum laying lengths:
          - (a) Sanitary sewer and combined system construction:
          - (b) 72-inch diameter and smaller: Eight feet.
          - (c) Larger than 72-inch diameter: Six feet.
      - e. Rubber gaskets: ASTM C361. <sup>\*11</sup>
      - f. Rubber gaskets: ASTM C443. <sup>\*12</sup>
      - g. Jointing mastic: Elastic, water-resistant, formulation of plastic bituminous materials, nonflammable solvent and inert fillers so combined that:
        - 1) When applied to a vertical metal surface and heated to 120F, jointing mastic will neither slump nor lose plasticity.
        - 2) When applied directly from container without further fixing, jointing mastic can be applied in even, adherent coat within temperature range of 20F to 100F.
- G. Plastic Pipe:
  - 1. Polyvinyl chloride (PVC) pipe: ASTM D3034, SDR-35.
- H. Vitrified Clay Pipe: ASTM C700; Joints, ASTM C425, using plastic materials.
- I. Cast-Iron Soil Pipe and Fittings: ASTM A74, extra-heavy (XH), with hub and spigot ends so constructed that joints may be made with gaskets conforming to CISPI Designation HSN 85 and the requirements of the relevant plumbing codes.
- J. Lubricant for Rubber Gasket Pipe Joints: Vegetable oil soap.
- K. Mortar Materials:
  - 1. Portland cement: ASTM C150, Type I.
  - 2. Sand: ASTM C144, natural sand.
  - 3. Lime: Pressure-hydrated, ASTM C207, Type S.
  - 4. Water: Potable.
  - 5. Pigment: As approved.
- L. Brick: ASTM C32; solid brick; Grade MS for manhole brick, Grade SS for sewer brick; 2-1/4 inches by 3-3/4 inches by eight inches.
- M. Precast Concrete Manhole Sections: <sup>\*13</sup>
  - 1. ASTM C478.
  - 2. Joint entry seal gasket: A-LOK as manufactured by Atlantic Precast Concrete, Inc.; A-LOCK gaskets, manufactured by A-LOK Products Corporation, Trenton,

N.J.; DURAC-SEAL gaskets, manufactured by DURA-CRETE, Inc., Dayton, Ohio; or equal.

- N. Precast Concrete Manholes: \*14
  - 1. Cylindrical, eccentric and conical: ASTM C478.
  - 2. Other configurations: ACI 318, AASHTO H20.
- O. Manhole Steps:
  - 1. Cast iron: ASTM A48 Class 30 A.
  - 2. Rebar: No. 4 reinforcing bar with molded polypropylene or rubber encasement.
- P. Manhole Frame and Cover; And Other Castings For Service With Utility Systems:
  - 1. Authority manhole: Cast-iron, ASTM A48, Class 30, with METRO logo.
  - 2. Utility company manhole: Manhole frame and cover furnished as part of the Contract or furnished by the utility as shown on the drawings.
  - 3. Rust-resistant cast iron or rust-resistant malleable cast iron.
  - 4. True to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blowholes and defects affecting strength.
  - 5. Fillets at angles in casting with arises sharp and perfect.
  - 6. Sandblasted to effectively remove scale and sand, presenting smooth, clean and uniform surfaces. Coated with bituminous coating.
  - 7. Metro logo: For utility components which will remain METRO property and are not within boundaries of utility easements as shown: Cast METRO logo as shown.
  - 8. Covers that receive paver tile:
    - a. Omit bituminous coating.
    - b. Provide positioning lug and lug receptor as a permanent part of the cover and frame rim so that the cover can only be installed (flush) in one position.
- Q. Metal Water Seals for Basin Connections: Neenah Foundry Model No. R-3707 or equal.
- R. Structural Steel Members: ASTM A36.
- S. Steel Pipe: ASTM A53, black finish, extra strong wall class.
- T. Stainless Steel Angle: ASTM A167, Type 304.
- U. Jute for Caulking: Good quality jute, free from tar, oil, or grease and dry when installed.
- V. Preformed Expansion Joint Fillers: AASHTO M153, Type I, Type II or Type III.
- W. Bituminous Expansion Joint Filler: AASHTO M33.
- X. Galvanizing: Section 05120.
- Y. Miscellaneous Metal: Section 05500.
- Z. Coal-Tar Epoxy Coating:
  - 1. Two-component.
  - 2. Chemically cured.
  - 3. Conforming to MS MIL-P-23236 (Ships), Type I, Class 2.
  - 4. Thinner: As recommended by manufacturer of coating and as approved.
- AA. Pipe Supports: \*15
  - 1. Pipe: Three-inch diameter, ASTM A53, Weight B, Class 1.

2. Flanges: ANSI/ASME B16.1, 125-pound Class, galvanized after fabrication.

## **2.02 MORTAR AND GROUT MIXES:**

- A. General Requirements:
  1. Mix dry in specified proportions by volume. Control and maintain accurate measurement throughout progress of work.
  2. Add sufficient water as specified to produce approved consistency.
  3. Do not mix in amount exceeding that which can be used within one hour after introduction of water.
  4. Do not retemper mix that has begun to set nor use such mix in the work.
  5. Where shown, specified or directed, mix pigment into dry mix to attain color selected by the Engineer. Pigment not to exceed 10 percent of dry batch weight of cement.
- B. Proportions:
  1. Mortar: One part portland cement, 2-1/2 parts sand and water sufficient to produce stiff workable mix.
  2. Grout: One part portland cement, 2-1/2 parts sand and water sufficient to produce plastic flowable mix.
  3. Mortar for setting and pointing granite: One part portland cement, four to five parts sand, one part lime and water sufficient to produce approved consistency.
  4. Mortar for setting granite paving and grouted granite blocks: One part portland cement, four parts sand, with water sufficient to produce approved consistency.

## **PART 3 - EXECUTION**

### **3.01 EXCAVATION FOR SEWER:**

- A. Perform excavation for sewers line and grade shown in accordance with Section 02320 and the following additional requirements:
  1. Excavate test pits sufficiently in advance of construction of sewers so that reasonable changes in line and grade can be made where location of existing structures varies from that shown.
  2. Excavate below horizontal plane extending two feet above top of sewer to maximum width of trench pay width shown. Where dimensions are not shown, make maximum horizontal width of excavation 18 inches from outside of sewer and minimum six inches. Where approved, excavation above such plane may exceed specified dimensions.
  3. If excavation exceeds permissible dimensions, encase pipe or install pipe of higher strength.
  4. Where necessary to place backfill or embankment so that trench can be excavated, extend backfill or embankment full depth laterally at least 2-1/2 times diameter of pipe on each side measured from centerline of pipe.

### **3.02 PIPE CRADLE:**

- A. Place pipes on cradle of aggregate or concrete where shown.
- B. Place aggregate so as to avoid segregation; compact to maximum practicable density so that pipe can be laid to required tolerances.

### **3.03 LAYING PIPE:**

- A. General Requirements:

1. Excavate to lines and grades shown in accordance with Sections 02320 and herein. Excavate depressions for bells.
  2. Protect pipe and fittings during handling to prevent damage.
  3. Place, shape and compact bedding material to receive barrel of pipe. Type and thickness of bedding material as shown.
  4. Start laying pipe at lowest point; lay true to line and grade shown.
  5. Install pipe to bear on bedding material along entire length. Shape bedding material to fit bells and flanges.
  6. Install pipe so that bells and grooves are on upstream end.
  7. Align each section of pipe with adjoining section with uniform annular space between bell and spigot and so as to prevent sudden offsets in flow line.
  8. As each section of pipe is laid, place sufficient backfill to hold it firmly in place.
  9. Keep interior of sewer clean as work progresses. Where small pipe size makes cleaning difficult, keep suitable swab or drag in pipe and pull through each joint immediately after jointing is completed.
  10. Keep trenches and excavations free of water during construction and until backfilled. Each day, excavate only as much trench as needed to lay pipe.
  11. When work is not in progress, securely plug ends of pipe and fittings to prevent trench water or other substances from entering pipes and fittings.
  12. Where length of stub is not shown, install four-foot length and seal free end with brick masonry bulkhead or approved stopper.
  13. Have work approved prior to covering pipe.
  14. Where shown, place additional aggregate filter around and over pipe in lifts not exceeding six inches loose. Compact each lift before placement of next lift.
  15. Backfill in accordance with Section 02320.
  16. Accomplish compaction by method that will avoid damage to pipe and will not disturb its alignment and grade. The use of vibratory rollers is prohibited until compacted cover over pipe has reached three feet or half the pipe diameter, whichever is greater.
  17. Where cathodic protection is shown, apply coal-tar epoxy coating.
- B. Vitrified Clay Pipe:
1. Nonperforated pipe:
    - a. Use pipe hoist, crane or other approved device when laying pipe greater than 18 inches diameter.
    - b. Prevent damage to premolded joint rings or attached couplings.
    - c. Clean joint contact surfaces immediately prior to jointing. To complete joint, use lubricants, primers or adhesives as recommended by pipe or joint manufacturer.
- C. Concrete Pipe:
- a. Bell-and-spigot joints:
    - b. Lay bell-and-spigot joint pipe as specified for vitrified clay pipe.
  1. Tongue-and-groove joints:
    - a. Clean groove end of preceding pipe with wet brush and apply soft mortar to lower 1/4 of groove. Clean tongue end of succeeding pipe with wet brush and position it. Remove mortar from interior surface if squeezed out of joint.
    - b. Complete mortaring interior and exterior portions of joint for entire circumference, extending from previously placed mortar. Perform final exterior mortaring of joints three lengths of pipe behind laying.
- D. Plastic Pipe:
1. Nonperforated pipe:
  2. Join sections of pipe with couplings recommended by pipe manufacturer.

- E. Inspections Of Sewers: <sup>\*16</sup>
1. Perform all work in accordance with current requirements of WASA.
  2. Perform inspections on new or relocated storm, sanitary and combined sewers within or adjacent to the zone of influence, as defined by the limits of a theoretical slope of 1:1 from the bottom edges of tunneling and cut-and-cover excavations, as follows:
    - a. Make inspections upon completion of tunneling and cut-and-cover operations, but prior to paving.
    - b. Obtain video-tape television inspection records of sewers 36 inches and smaller in diameter.
    - c. By means of visual walk-through inspection, obtain coordinated logs, photographs and other records specified by WASA sewers larger than 36 inches in diameter and of associated structures.
  3. Coordinate all television and walk-through inspection field operations with WASA. All such work to be performed in the presence of a WASA representative.

**3.02 BACKFILL:**

- A. Perform backfilling only after inspection and approval of pipe laying.
- B. On completion of construction, backfill excavation in accordance with Section 02320.

**3.03 JOINTS FOR COMBINED SEWER SYSTEM CONCRETE PIPE:**

- A. Use rubber gasket and bell-and-spigot pipe as specified.
- B. Prior to jointing pipe, liberally coat pipe joints with lubricant.
- C. Fit bell or spigot with gasket in accordance with manufacturer's instructions.
- D. Joint pipes with equipment designed for purpose.
- E. Before joint is completely home, check position of gasket using suitable gauge. If gasket is found to be dislocated, repeat entire joining process using new gasket.

**3.04 JOINTS FOR VITRIFIED CLAY PIPE:**

- A. Immediately before joining vitrified pipe, liberally coat bell with lubricant and fit spigot with gasket.
- B. Join pipes using equipment designed for purpose.

**3.05 JOINTS FOR CAST-IRON SOIL PIPE AND FITTINGS:**

- A. Immediately before joining cast-iron soil pipe and fittings, liberally coat hub with lubricant and fit spigot with pipes using equipment designed for purpose.

**3.06 CONNECTIONS WITH EXISTING SEWERS:**

- A. Make connections with existing public sewers in accordance with requirements of the jurisdictional authority.
- B. Connect house sewers in accordance with local plumbing code.

- C. Connect house sewers by means of Y-branches. Approved cast-iron thimble may be used, provided it is bonded into sewer pipe wall with approved epoxy at manufacturer's plant.
- D. Do not connect existing sewer to sewer under construction unless approved.
- E. Do not connect sanitary sewers to the WSSC system until application for such connections has been approved by WSSC. <sup>\*17</sup>

**3.07 TUNNELING AND JACKING:**

- A. Perform tunneling and jacking by approved methods.
- B. Where open cut is specified and the Engineer permits the work to be done by tunneling or jacking, perform such work as specified and as approved.
- C. Cost of material substitutions required by change of methods will be borne by the Contractor.
- D. Make horizontal borings necessary to lay pipe lines true to line and grade.
- E. When sewers are laid in borings, completely fill void between outside barrel of pipe and boring with cement grout pumped into place.
- F. When drainage pipes are laid in borings, completely fill void between pipe and boring with sand, using water pressure to ensure that voids are filled.
- G. Methods of boring and filling of voids between pipe and boring are subject to approval.

**3.08 CAST-IN-PLACE CONCRETE CONSTRUCTION:**

- A. Conform to applicable requirements of Sections 03100, 03200 and 03300. Section designer to specify the type of cement to be used. The type of cement will vary depending upon the jurisdiction where the work is performed.
  - 1. Cement. <sup>\*18</sup>
- B. Construct concrete support systems where shown. Section designer to specify the type of mortar to be used. Mortar type will vary depending upon jurisdiction in which the work is performed.
  - 1. Mortar and cement. <sup>\*19</sup>

**3.09 BRICK CONSTRUCTION:**

- A. Perform brick construction as specified in Section 04215, with the following additional requirements:
  - 1. Use sewer brick wherever brick construction is exposed to flow; otherwise, use manhole brick.
  - 2. Lay sewer brick on edge so that 2-1/4 by 8-inch side is exposed to flow.
  - 3. Lay manhole brick so that every sixth course is a header course.
  - 4. Where practicable, lay each course with a line. For curved courses or those in nonparallel planes, use bonded-and-keyed construction.
  - 5. Do not exceed joint thickness of 3/8 inch in straight courses in parallel planes; for courses curved or in nonparallel planes, make thickest part of joint as thin as practicable.

6. Rack or tooth uncompleted brick construction and parge unexposed surfaces with 1/2 inch of mortar.

### **3.10 MANHOLES:**

- A. Construct manholes of precast sections, cast-in-place concrete or brick as shown.
- B. Provide base of precast or cast-in-place construction. Make watertight connection between base and risers.
- C. Unless otherwise shown, place axes of manholes directly over centerlines of pipes.
- D. Construct appropriate flow channels in bottom of manholes.
- E. Where necessary, build connections for public and residential sewers into manholes. Cut pipe flush with inside wall of structure. Do not build pipe into wall; provide mortar joint between pipe and structure.
- F. Install manhole steps and cast iron frame and cover for each manhole; adjust frame and cover to proper grade by brick construction.
- G. Install joint entry seal gaskets in openings in the walls of 48-inch precast manholes with O-ring joint. <sup>\*20</sup>
- H.

### **3.11 COATING APPLICATION AND REPAIR:**

- A. Preparation of surface: Perform the following in order given:
  1. Clean surfaces contaminated with oil or grease using naphtha or xylol.
  2. Remove rust and mill scale from surfaces by dry abrasive blasting to commercial finish in accordance with SSPC SP-6.
  3. Coat surfaces within 24 hours and before dew point is reached.
  4. Apply coating only to surfaces which are dry and free of contaminants. Whip blast surfaces not coated within specified time limit.
- B. Application of coating:
  1. Mix coating in quantity which can be applied within its pot life if in accordance with manufacturer's recommendation. Thin only with approval.
  2. Apply coating to exterior surfaces of pipes and fittings in accordance with recommendations of coating manufacturer and as follows:
    - a. Two coats of equal thickness.
    - b. Total dry film thickness: 20 mils.
    - c. Pretreat first coat as required prior to application of second coat.
    - d. Apply second coat before first coat has dried tack-free but not later than 24 hours after application of first coat, unless otherwise recommended by coating manufacturer.
    - e. Inspect coating prior to burial. Repair damages in accordance with recommendations for field corrections by coating manufacturer.
  3. Test cathodic protection as specified in Section 13115.

### **3.12 FIELD QUALITY CONTROL:**

- A. Maximum Surface Variation Tolerances:
  1. Grouted riprap: 1-1/4 inches in four feet from true plane.
  2. Bituminous concrete: Plus-or-minus 1/4 inch from specified grade in 25 feet.

3. Cast-in-place concrete: Plus-or-minus 1/4 inch from specified grade in 15 feet.
  4. Precast concrete block: Plus-or-minus 1/2 inch from specified grade in 25 feet.
  5. Paving brick: Plus-or-minus 1/2 inch from specified grade in 25 feet.
- B. Leakage Tests:
1. Perform leakage tests on sanitary sewer lines to verify compliance with allowable tolerances specified.
- C. Obstruction Tests:
1. Perform field tests to verify that installed storm and sanitary systems are free from obstructions.
  2. Remove obstructions by excavating at the apparent obstruction and repairing or replacing the defective pipe as directed by the Engineer.
- D. Low-Pressure Air Testing Of Sanitary Sewers. \*21
1. Test sanitary sewers with air under low pressure in accordance with WSSC procedures. The tests will not be accepted by the WSSC until the sewers meet the criteria enumerated. Pressure gauges, stop watches and test supervision will be provided by the WSSC. Provide air compressor, hose, plugs, labor and such materials, equipment and assistance required to perform the tests. Conduct tests in the presence of representatives of the WSSC. Do not place air under pressure in any sewer under any condition except those specified by WSSC.
  2. Inspect sanitary sewers, including manholes, prior to air testing. Prior to undertaking the low-pressure air tests, correct and eliminate any water leakage into the system sufficient to constitute a noticeable trickle or dribble.
  3. Wherever underdrains have been constructed or gravel placed under pipelines to dewater the trench during construction of the sewers, do not make air test until pumps used in the dewatering process have been removed from the site.
  4. Before air tests are scheduled, complete backfill operations and compaction tests. Have compaction test approved before air tests are scheduled.
  5. Schedule air tests with the WSSC at least 48 hours in advance. Test each section of completed sewers. Test sewers from manhole to manhole, or from manhole to terminus of the sewer if there is not a manhole at the other extremity. Do not exclude any sewers or sewer connections from this testing procedure.

### **3.13 TRANSPORTATION AND INSTALLATION OF MATERIALS FURNISHED BY OTHERS: \*22**

- A. Transport and install materials furnished at the WSSC's storeyard at Bladensburg or other delivery points designated by the WSSC.
- B. Use only suitable equipment, tools, and appliances for the safe and convenient handling and hauling of materials.
- C. Check that all materials furnished by the WSSC are in satisfactory condition.
- D. Materials damaged, lost or wasted after acceptance will be replaced by the WSSC at the expense of the Contractor.
- E. Material showing inherent defects will be replaced by the WSSC without charge.

### **SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

**\*1.** Add 1.1 C. including 1.a.-b. for contracts where sanitary systems work is performed within the jurisdiction of WSSC.

- \*2.** Add 1.1 D. including 1. for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*3.** Add 1.2 E. including 1.-2. for contracts where sanitary systems work is performed within the jurisdiction of WASA.
- \*4.** Use first version of 1.3 A.4. modification for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*5.** Use second version of 1.3 A.4. for contracts where sanitary systems work is performed outside the jurisdiction of WSSC.
- \*6.** Use first version of 1.3 A.5. modification for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*7.** Use first version of 1.3 A.6. modification for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*8.** Use second version of 1.3 A.6. for contracts where sanitary systems work is performed outside the jurisdiction of WSSC.
- \*9.** Add 1.3 A.9. for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*10.** Add 1.3 C. including 1.-2.a. for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*11.** Use first version of 2.1 F.2.f. modification for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*12.** Use second version of 2.1 F.2.f. for contracts where sanitary systems work is performed outside the jurisdiction of WSSC.
- \*13.** Use first version of 2.1 N. including 1.-2. modification for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*14.** Use second version of 2.1 N. including 1.-2. for contracts where sanitary systems work is performed outside the jurisdiction of WSSC.
- \*15.** Add 2.1 DD. including 1.-2. for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*16.** Add 3.4 E. including 1.-3. for contracts where sanitary systems work is performed within the jurisdiction of WASA.
- \*17.** Add 3.11 E. for contracts where sanitary systems work is performed within the jurisdiction of WSSC.
- \*18.** Specify the type of cement to be used. The type of cement will vary depending on the jurisdiction and the use of the sanitary system.
- \*19.** Specify the type of mortar and cement to be used. They will vary depending on the jurisdiction and the use of the sanitary system.
- \*20.** Add 3.15 G. for contracts where work is performed within the jurisdiction of WSSC.

- \*21. Add 3.21 D. including 1.-5. for contracts where work is performed within the jurisdiction of WSSC.
- \*22. Add 3.22 including A.-E. for contracts where work is performed within the jurisdiction of WSSC.

**END OF SECTION**

## SECTION 02585

### UNDERGROUND ELECTRICAL AND COMMUNICATIONS DISTRIBUTION SYSTEMS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

This section specifies providing new ducts, manholes and handholes for electrical and communications facilities.

- A. Related Work Specified Elsewhere:
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Support of excavation: Section 02260.
  - 3. Maintenance, support and restoration of utility facilities: Section 02270.
  - 4. Grounding and bonding: Section 16060.
  - 5. Concrete formwork: Section 03100.
  - 6. Concrete reinforcement: Section 03200.
  - 7. Cast-in-place structural concrete: Section 03300.
  - 8. Structural precast concrete: Section 03400.
  
- B. Definitions:
  - 1. Conduit: Individual raceway.
  - 2. Ductbank: Assembly of conduits in configurations shown, with concrete encasement, with or without reinforcement.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Drawings for each cast-in-place manhole and handhole.
    - b. Drawings for each size and configuration of precast manhole and handhole with details of accessories and joints.
    - c. Diagrams showing dimensioned locations for openings and knockout panels for ductbank penetrations of manhole and handhole walls.
  - 2. Documentation:
    - a. Submit calculations to demonstrate compliance with required load-bearing capacity, certified by a professional engineer registered in the jurisdiction where the work is to be installed.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: H15-44, H20-44.
  - 3. ANSI: C80.1.
  - 4. ASTM: A36, A48, A123, A185, A615, C33, C109, C173, C231, D570, D638, D790, F512.
  - 5. NEMA: TC-14.
  - 6. UL: 6.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Transport those materials supplied by utility companies from companies' storage facilities to construction site.
- B. Protect materials stored on site from damage prior to incorporation into work and during handling.

**1.05 JOB CONDITIONS:**

- A. Coordination with Utility Companies:
  - 1. Arrange with the Engineer to contact utility companies early enough to allow sufficient time for them to accomplish work they are required to perform, giving special consideration to lead times required for cable work.
  - 2. Establish liaison with utility companies furnishing materials for the work in order to determine availability, locations, methods of storage and care of materials prior to incorporation into work.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Concrete Formwork: Section 03100.
- B. Reinforcing Steel: Section 03200.
- C. Concrete:
  - 1. Cast-in-place: Section 03300, Class 3500 or as required by the power company for its facilities.
  - 2. Precast: Section 03400, Class 5000, unless otherwise shown on the drawings.
- D. Materials Supplied by Utility Company: As listed.
- E. Conduit and Fittings:
  - 1. PVC conduit and fittings: ASTM F512; modulus of elasticity, 500,000 psi.
  - 2. Concrete encased: Schedule 40.
    - a. Direct burial: Schedule 80 heavy wall.
    - b. Solvent cement: As recommended by conduit manufacturer.
  - 3. Galvanized rigid steel conduit and fittings: UL 6 and ANSI C80.1.
  - 4. Fiberglass conduit and fittings:
    - a. Rigid fiberglass reinforced epoxy conduit, UL 1684, IPS (Iron Pipe Size) based conduit.
    - b. Rigid fiberglass-reinforced epoxy, filament wound with minimum fiberglass content of 65 percent by weight and no fillers.
    - c. Type SW (Standard Wall) of IPS based standard conduit with nominal wall thickness of .09 inch for five-inch nominal conduit size, and nominal wall thickness of 0.07 inch for two through four-inch nominal conduit size.
    - d. Conduits, elbows and fittings manufactured from the same material and using the same manufacturing process.
    - e. Conduit sections formed with integral bell-and-spigot type couplings. Rubber sealing gasket at bell end is prohibited.
    - f. Conduits, elbows and fittings shall be specified for use throughout a temperature range of -40°F to 230°F and protected from exposure to sunlight by pigmentation uniformly dispersed through resin material.
    - g. Adhesive as recommended by conduit manufacturer.
    - h. Conduit, elbows and fittings shall be suitable for encasement in concrete below grade and conform to UL 1684, and listed and labeled by UL, meeting

- the requirement of NEC Article 347 for Rigid Nonmetallic Conduit and its use.
- i. Conduit for above ground surface mounted duct systems shall pass the UL1684 mandatory flame test (UL 1684, Section 5.12.1) and be certified by the manufacturer as such.
  - j. Each piece of the straight length conduit and each piece of the elbow and other bend made from and for use with such conduit is to be labeled with the following information, marked clearly legible and durably every 10 feet or as recommended by the manufacturer:
    - a. "Reinforced Thermosetting Resin Conduit", "RTRC", or equivalent wording such as "FRE" (Fiberglass Reinforced Epoxy) conduit.
    - b. Nominal size: (IPS)
    - c. Manufacturer's name and trademark.
    - d. Temperature range for conduit application.
    - e. "Above ground", "AG", "Below ground", "BG", or equivalent wording.
    - f. "FT4" when flame test is required for above ground conduit.
5. Conduit seal fittings:
- a. To provide watertight seal between concrete and conduit where it penetrates wall, floor or ceiling.
  - b. Size as shown or necessary.
  - c. Materials: Body and pressure clamp of malleable or cast iron with a neoprene sealing grommet and PVC-coated or galvanized-steel pressure rings, oversized sleeve of PVC or galvanized steel.
  - d. Seal between conduit and concrete to withstand pressure from 50-foot head of water without leakage.
- F. Channel Inserts: Stainless steel, size and shape as shown, 12-gauge minimum thickness, with 7/8-inch slot; surface-mounted; slotted-base channel with 9/16-inch by 3/16-inch nominal mounting slots on eight-inch centers.
- G. Cable Pulling Eye: Fabricated of plain steel reinforcement bar, ASTM A615, Grade 60; welded; size as shown. Hot-dip galvanized after fabrication, ASTM A123. Pulling tension: 5,000 pounds.
- H. Manhole Frame and Cover:
- 1. Authority manhole: Cast-iron, ASTM A48, Class 30, with METRO logo.
  - 2. Utility company manhole: Manhole frame and cover furnished as part of the Contract or furnished by the utility as shown on the drawings.
  - 3. Rust-resistant cast iron or rust-resistant malleable cast iron.
  - 4. True to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blowholes and defects affecting strength.
  - 5. Fillets at angles in casting with arises sharp and perfect.
  - 6. Sandblasted to effectively remove scale and sand, presenting smooth, clean and uniform surfaces. Coated with bituminous coating.
  - 7. Covers to receive paver tile:
    - a. Omit bituminous coating.
    - b. Provide positioning lug and lug receptor as a permanent part of the cover and frame rim so that the cover can only be installed (flush) in one position.
- I. Manhole Steps:
- 1. ASTM A48, cast-iron, Class 30A.
  - 2. Molded rubber or plastic on cast-iron or reinforcing steel core.
- J. Handhole and Manhole: Option of cast-in-place or precast.
- 1. Cast-in-place concrete handhole and manhole: As shown and specified.
  - 2. Precast concrete:

- a. Shape shown. If precast manholes are selected and size shown is not standard, use nearest larger standard precast unit; where added size will conflict with other utilities or structures, use cast-in-place unit.
  - b. Designed for AASHTO H20-44 truck loading.
  - c. Manhole: Include lifting rings, manhole steps, pulling eyes, sump, hole through floor for ground rod, and seal or sealant for sealing joints between sections, precast extensions included where required by utility.
3. Precast concrete handhole: Compressive strength 3,500 psi, air entrainment six-percent minimum, ASTM C173 or ASTM C231; Section 03300 and Section 03400 and in accordance with the following:
- a. Box: Concrete formed with closed bottom and sides and recess at top of box or at edge of cover to provide mating surfaces to prevent lateral movement of flush-mounted cover. Knockouts provided to accommodate conduits as shown on the drawings..
  - b. Cover:
    - a. Material same as for box. Use of metallic cover and cover frame prohibited.
    - b. Metro Type "B" logo with 3-1/8 inch by 4-inch envelope and service designation recessed in center of cover.
    - c. Non-protruding provisions provided for lifting.
  - c. Reinforcement:
    - a. Sidewalk and landscape locations: Welded-wire fabric, ASTM A185.
    - b. Areas subject to vehicular traffic: Deformed steel bars, ASTM A615.
  - d. Loading:
    - a. Sidewalk and landscape locations: AASHTO H15-44.
    - b. Areas subject to vehicular traffic: AASHTO H20-44.
  - e. Hardware: Stainless steel.
  - f. Size: As shown or next available larger size.

K. Precast composite material handhole: Sand and gravel bound together with a polymer and reinforced with continuous woven glass strands and in accordance with the following:

Physical Properties	Values	Methods
Compressive strength	11,000 psi	ASTM C109
Tensile strength	1,700 psi	ASTM D638
Flexural strength	7,500 psi	ASTM D790
Water absorption (24 hours)	0.5 percent	ASTM D570

- 1. Box: Gray-color material formed with closed bottom and sides and flange with recess at top of box to accommodate flush-mounted cover.
- 2. Cover:
  - a. Material same as for box.
  - b. Skid-resistant top surface with minimum 0.5 coefficient of friction.
  - c. Metro Type "B" logo with 3-1/8 inch by 4-inch envelope and service designation recessed in center of cover.
  - d. Secured to box with bolts.
  - e. Non-protruding provisions provided for lifting.
  - f. Loading:
    - g. Sidewalk and landscape locations: AASHTO H15-44.
    - h. Areas subject to vehicular traffic: AASHTO H20-44.

- i. Hardware: Stainless steel.
- j. Size: As shown or next available larger size.
- L. Aggregate for Subgrade Foundation: ASTM C33, coarse aggregate No. 4 and No. 67.
- M. Spacer: As shown or recommended by conduit manufacturer.
- N. End Bells: Flared, smooth-surfaced fittings of same material as conduit; if of different material, include adaptor for connection to conduit.
- O. Grounding: Section 16060.
- P. Brick: Section 04215.
- Q. Mortar: Section 04050.

### **PART 3 - EXECUTION**

#### **3.01 EXCAVATING AND BACKFILLING:**

- A. Excavating and backfilling: In accordance with Section 02320.
- B. If ducts and manholes are to be installed on backfill over subway structure, place and compact backfill up to grade shown for ductbanks, conduits, manholes and handholes; compact as specified in Section 02320; ensure the manhole sets level. Schedule completion of backfilling to allow sufficient time for installation of ductbanks, conduits, manholes and handholes.
- C. Where shown for subgrade foundation, use layers of coarse aggregate No. 4 and No. 67 in combinations and proportions determined by field conditions.

#### **3.02 PAVEMENTS, SIDEWALKS, CURBS AND GUTTERS:**

- A. Remove pavements, sidewalks, curbs and gutters where necessitated by construction of ductbanks, manholes and handholes in accordance with Section 02220.
- B. Place temporary bituminous pavement in accordance with Section 02740, when necessary because of sequence of operations.
- C. On completion of construction, replace pavements, sidewalks, curbs and gutters in accordance with Section 02205.

#### **3.03 INSTALLATION:**

- A. General:
  - 1. Use size, type, general routing and locations of ductbanks, conduits, manholes and handholes as shown and specified.
- B. Ductbanks:
  - 1. Place conduits in ductbanks on spacers or construct concrete base prior to placing bottom row of conduits.
  - 2. Use spacers to provide conduit spacing and support as recommended by conduit manufacturer.
  - 3. Make conduit joints watertight by complying with recommendations of conduit manufacturers and as follows:

- a. PVC conduit: Use solvent cement to join conduits, elbows and fittings.
  - b. Galvanized steel rigid conduit: Use lead-free conductive anti-seize compound on threaded conduit joints.
  - c. Fiberglass conduit: Use adhesive to join conduits, elbows and fittings for water tightness and pull out strength. Follow instructions of conduit manufacturer for using adhesive during periods below the recommended temperature range. Use of rubber sealing gaskets and interference type joints is prohibited.
4. Use Schedule 40 PVC conduit for underground ductbanks except as follows:
- a. Use galvanized steel rigid conduit only in specific locations as shown.
  - b. Use fiberglass conduit only for providing utility company's 13.8 kv electric services.
5. Place and compact concrete around conduits in accordance with Section 03300.
6. Where shown, install reinforcing steel in concrete encasement in accordance with Section 03200.
7. Bends:
- a. Unless otherwise shown or specified, install conduit bends in accordance with reference codes.
  - b. Install bends in buried conduit in accordance with the following:

Size of conduit in inches	Minimum radius of factory-bend in inches	Minimum radius of field-bend in inches
3	18	24
4	24	30
5	48	48
6	48	48

- c. Total bends in each conduit run for traction-power cable: 225 degrees maximum.
  - d. Bend conduit so that field-made bend is free from cuts, dents and other surface damage.
  - e. Field-made bends in fiberglass conduits are prohibited.
8. Support conduit during construction using compatible conduit supports and spacers to maintain positions of conduit during placement of concrete and to ensure independent support.
9. Install conduit so that it drains to adjacent manhole or handhole.
10. Prevent concrete and other foreign materials from entering, obstructing or deflecting conduit. Cap or plug conduit ends prior to pouring concrete.
11. Remove burrs from conduit ends, clean and dry before applying solvent cement to PVC conduit joints or adhesive to fiberglass conduit joints.
12. Pull approved test mandrel and swab through each conduit after installation. Cap or plug conduit ends. If mandrel cannot be pulled through conduit, replace conduit.
13. Leave approved nylon or polyester pull-line in each conduit.
14. At the ends of each conduit, use corrosion-resistant metallic tags with stamped markings to establish identification in accordance with designations shown. Install tags securely to permanent structure near each conduit as approved by the Engineer.
15. Install caps at empty conduit ends for future use.

C. Conduits Without Concrete Encasement:

- 1. Use Schedule 80 for direct-buried train control conduit.

2. Install caps on ends of empty train control conduits and identify locations of conduit ends with stakes.

### **3.04 CONSTRUCTION OF MANHOLES AND HANDHOLES:**

- A. Provide drainage facilities for manholes and handholes where shown. If connection is made to existing sewer line, install connection in accordance with applicable local regulations
- B. Erect formwork in accordance with Section 03100.
- C. Place reinforcing in accordance with approved shop drawings.
- D. Provide for location of ductbank entrances and inserts in walls as shown.
- E. Place concrete as specified in Section 03300.
- F. Install conduits of material shown.
- G. Install end bells on conduits where ductbanks terminate in manholes and handholes.
- H. Build ductbank formation into walls of manholes and handholes and seal around opening.
- I. If location of manholes and handholes openings will be obstructed, so inform the Engineer.
- J. Install frame and cover, adjusting to finished grade, building brick chimney as specified in Section 02535.
- K. Seal conduit openings with approved conduit plugs.
- L. Install cable pulling eyes and steps as shown. Test pulling eye for compliance with specified pullout load rating.
- M. Install ground rods, 2-inch by 1/4-inch by 12-inch long ground bus bar and insulated grounding conductors where shown. If soil conditions prevent driving rod to required depth, install alternative grounding system as approved. Provide grounding for personnel protection as specified in Section 16060.
- N. When installing sections of precast manholes and handholes, prevent damage to joints seals.
- O. Provide full-height stainless steel channel inserts approximately two feet on center along interior walls, spaced to clear ductbank entrances and steps. Use expansion bolt anchors to secure channel inserts to walls. Install and test channel inserts in accordance with Section 16130.

### **3.05 INSTALLATION OF HANDHOLES:**

- A. Bury precast concrete or composite material handholes with cover mounted flush with finish grade or pavement. Comply with installation procedures furnished by manufacturer.

### **3.06 CLEAN UP:**

- A. Remove debris from manholes and handholes and ensure complete installation is left in neat and finished condition.

**3.07 FIELD QUALITY CONTROL:**

- A. Arrange with the Engineer for inspection and approval of conduits in ductbank and cast-in-place manholes and handholes prior to concrete placement.
- B. Arrange with the Engineer for a representative of the utility company to inspect and approve service conduits for Authority facilities, relocated utility conduits, manholes and handholes prior to concrete placement.
- C. Arrange with the Engineer for inspection and approval of direct-buried conduits for future train control circuits, prior to backfilling.

**END OF SECTION**

## SECTION 02625

### SUBWAY DRAINAGE SYSTEM

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing subway drainage system except drainage pumping system.
- B. Related Work Specified Elsewhere:
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Concrete work: Sections 03100, 03200 and 03300.
  - 3. Drainage pumping station: Section 15444.
  - 4. Piping systems: Section 15205.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples:
    - a. Submit proposed materials not less than ten days prior to date of expected first shipment.
  - 2. Shop Drawings:
    - a. Include complete catalog information and shop drawings for material and equipment.
  - 3. Certification.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: M352.
  - 3. ASTM: A48, B271, B584, C33, C131, C654, C700, D1785, D2729.

#### PART 2 - PRODUCTS

##### 2.01 PRODUCTS AND MATERIALS:

- A. Porous Concrete Pipe:
  - 1. Extra strength: ASTM C654.
  - 2. Tongue-and-groove joints formed of solid concrete.
- B. Vitrified Clay Pipe: ASTM C700, standard strength, extra strength, as shown.
- C. Plastic Pipe and Fittings:
  - 1. PVC pipe: ASTM D2729 or ASTM D1785.
  - 2. Polyethylene corrugated pipe: AASHTO M352. Individual lengths not less than 10 feet. Coil pipe not permitted for pipe eight inches in diameter or larger.
  - 3. Fittings:
    - a. Polyvinyl chloride: ASTM D2729 or ASTM D1785.
    - b. Polyethylene, corrugated: AASHTO M352.
- D. Manholes:

1. Formwork: Section 03100.
  2. Concrete reinforcement: Section 03200.
  3. Concrete: Section 03300, Class 3500. Manhole frames and covers, inlet frames and grates:
    - a. Authority manhole: Cast-iron, ASTM A48, Class 30, with METRO logo. Size as shown.
    - b. Rust-resistant cast iron or rust-resistant malleable cast iron, fabricated as shown.
    - c. True to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blowholes and defects affecting strength.
    - d. *Fillets at angles in casting with arises sharp and perfect.*
    - e. Sandblasted to effectively remove scale and sand, presenting smooth, clean and uniform surfaces. Coated with bituminous coating.
    - f. Covers to receive paver tile.
      - 1) Omit bituminous coating.
      - 2) Provide positioning lug and receptor permanently part of cover and frame rim so that cover can only be installed (flush) in one position.
- E. Drainage Castings:
1. Drain inlets, cleanouts, floor and scupper drains fabricated from cast iron: ASTM A48, Class 25 with brass parts, Alloy Number 844.
  2. Copper alloy sand castings: ASTM B584.
  3. Copper base alloy centrifugal castings: ASTM B271.
- F. Drainage Casting Covers:
1. Cast iron: ASTM A48, Class 30.
  2. Copper alloy: ASTM 584.
- G. Wire Mesh Screen:
1. Bronze or stainless steel wire, minimum .047-inch diameter, 1/4-inch mesh.
- H. Porous Subgrade Material:
1. Coarse aggregate: ASTM C33, Size No. 67.
  2. Maximum percentage of wear: 45 percent when tested in accordance with ASTM C131.
- I. Drainage Pumping Station: Section 15444.

## **PART 3 - EXECUTION**

### **3.01 EXCAVATION:**

- A. Excavate to lines and grades shown in accordance with Section 02320.

### **3.02 POROUS MATERIAL PLACEMENT:**

- A. Place porous material for subgrade around main track drain and drain pipes and for trench backfill as shown.
- B. In rock excavation, do not place porous subgrade material on excavated rock surface until surface has been flushed with water to remove fine dust and sludge.
- C. Place material only on stable rock surfaces.

### **3.03 VITRIFIED CLAY PIPE:**

- A. Place vitrified clay pipe to lines and grades shown.
- B. Make joints in accordance with manufacturer's instructions.
- C. Place concrete encasement where shown in accordance with Section 03300. Secure pipe to avoid displacement during concrete placement.

**3.04 POROUS CONCRETE PIPE:**

- A. Lay pipe on porous subgrade material so as to provide full bearing and grades shown.
- B. Install joints in accordance with the manufacturer's instructions.
- C. Place porous material over and around the pipe as shown.
- D. Place perforated pipe as specified with the perforations downward.
- E. Place concrete for encasement in accordance with Section 03300.
- F. Place and brace pipe for encasing to prevent displacement during placing of concrete.

**3.05 PLASTIC PIPE:**

- A. Lay plastic pipe as specified for porous concrete pipe.
- B. Use nonpressure pipe for drainage.
- C. Use cast iron, concrete or vitrified clay pipe for last two feet at exposed termination points. Provide standard adaptor fittings for connections between differing pipe materials.
- D. Plastic pipe may be used only if buried or encased in concrete. Its use is prohibited in exposed locations.

**3.06 MANHOLES:**

- A. Construct cast-in-place concrete manholes as shown.
- B. Construct flow channel in manhole where shown.
- C. Place axis of manholes directly over centerlines of pipes unless otherwise shown.
- D. Set manhole frame and cover or grate to required elevation. Set ballast screen where shown.

**3.07 INSTALLATION OF PIPE AND CASTINGS:**

- A. Install cast-iron, ductile-iron, nickel-copper alloy steel pipe and fittings meeting the requirements of Section 15205.
- B. Install drainage piping to the lines and grades shown.
- C. Locate drainage castings and set to the finished floor elevation, slabs or inverts.
- D. Install cleanouts at the locations shown.

**3.08 PROTECTION OF DRAINAGE SYSTEM:**

- A. During the course of construction, maintain drainage lines free of debris and in undamaged condition.
- B. Plug or close ends of completed runs of piping until the Engineer approves their use.
- C. Cover the inlet end of drainage piping used to convey water to wet wells at the existing drainage pumping stations with wire mesh screen.

**3.09 FIELD QUALITY CONTROL:**

- A. Where drainage piping is located below invert slabs, conduct a ball, shuttlecock, or mandrel test to ensure that the line is free of obstructions subsequent to the placing of porous subgrade material over the line and prior to the placement of the concrete invert slab.
- B. Upon completion of the test and determination that the line is free of obstructions, plug, cap or otherwise close the open end or ends of the installed piping to prevent the entrance of debris into the lines.
- C. Immediately prior to final inspection of the work, remove debris from manholes, drain inlets, and floor scupper drains. In the presence of the Engineer, prove by one of the methods specified above that the piping is free of obstructions.

**END OF SECTION**

## SECTION 02635

### STORM SEWER

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies installing storm sewers, roadway drains, roadway underdrains, ditch lining and slope protection.
- B. Related Work Specified Elsewhere:
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Maintenance, support and restoration of utility facilities: Section 02270.
  - 3. Stray current and cathodic protection: Section 13110 and 13115.
- C. Material Furnished By Others: \*1
  - 1. Except for those items which bear the METRO logo, WSSC furnishes the following:
    - a. Manhole frames and covers: 22-inch diameter.
    - b. Manhole steps, except where precast manholes are used.
- D. Definitions: \*2
  - 1. Granular bedding required by WSSC is equivalent to aggregate for pipe cradle as specified.
  - 2. WSSC: Washington Suburban Sanitary Commission.
  - 3. WASA: Water and Sewer Authority.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Drawings for each size and configuration of precast manhole with details of accessories and joints.
    - b. Diagrams showing dimensioned locations for openings in precast concrete manhole walls.
  - 2. Documentation:
    - a. Submit calculations for modified or special designs to demonstrate compliance with required load-bearing capacity, certified by a professional engineer registered in the jurisdiction where the work is to be installed.
  - 3. Samples:
    - a. Sewer brick: Ten.
    - b. Manhole brick: Ten.
    - c. Slope protection materials:
      - 1) Concrete blocks: Ten each.
      - 2) Paving bricks: Ten each.
      - 3) Riprap: 1.5 cubic yards.
      - 4) Gabions: Two each, complete.
    - d. Geotextile filter fabric: Two, 12 inches long by 12 inches wide, minimum.
  - 4. Certification.
  - 5. Documentation: \*3
    - a. Submit two copies of records of inspection of new and relocated sewers, one copy to WSSC and one copy to the Engineer. Include video-tape

- cassette of television inspections and logs, photographs and other records specified by WASA for visual walk-through inspections.
- b. Obtain and submit a written approval and acceptance from WASA.

### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of the jurisdictional authorities.
  2. Building Stone Institute: Stone Catalog.
  3. CISPI: HSN 85.
  4. AASHTO: M33, M36, M153, M175, M176, M190, M252, M288, T85, T96, T104. <sup>\*4</sup>
  5. AASHTO: H20, M33, M36, M153, M175, M176, M190, M252, M288, T85, T96, T104. <sup>\*5</sup>
  6. ANSI/ASME: B16.1. <sup>\*6</sup>
  7. ACI: 318. <sup>\*7</sup>
  8. ASTM: A36, A48, A53, A74, A167, C14, C32, C33, C76, C144, C150, C207, C361, C425, C443, C478, C507, C700, D698, D1682, D3034, D5034, D5035. <sup>\*8</sup>
  9. ASTM: A36, A48, A53, A74, A167, C14, C32, C33, C76, C144, C150, C207, C361, C425, C443, C478, C700, D698, D1682, D3034, D5034, D5035. <sup>\*9</sup>
  10. MS: MIL-P-23236.
  11. SSPC: SP-6.
  12. WSSC: General Conditions and Standard Specifications. <sup>\*10</sup>
- B. Source Quality Control:
  1. Ditch lining and slope protection materials:
    - a. After approval, do not change source.
    - b. Replace defective material.
- C. Allowable Tolerances:
  1. Subgrade: Plus-or-minus 1/2 inch of elevation shown.
- D. Inspection: <sup>\*11</sup>
  1. Prior to paving or other construction over new or relocated sewers, conduct visual walk-through inspection of sewers larger than 36 inches in diameter and of associated structures and internal television inspection of sewers 36 inches and smaller in diameter.
  2. Employ the services of a sewer inspection company which has been regularly engaged in television sewer inspections and which is acceptable to WASA to perform preconstruction and post-construction inspections of sewers 36 inches and smaller in diameter.
    - a. Submit to WASA for prior approval one sample of the cassettes to be used.

## PART 2 - PRODUCTS

### 2.01 MATERIALS:

- A. Formwork: Section 03100.
- B. Reinforcing Steel: Section 03200.
- C. Portland Cement Concrete: Section 03300, Class 3500, unless otherwise shown.
- D. Aggregate for Subgrade Foundation: ASTM C33, coarse aggregate, No. 4. Where shown use layers of No. 4 and No. 67 in combinations and proportions determined by field conditions and as approved.

- E. Aggregate for Pipe Cradle: ASTM C33, coarse aggregate No. 67.
- F. Concrete Pipe:
  - 1. 10-inch diameter and smaller:
    - a. ASTM C14, Class 2, nonreinforced concrete pipe.
    - b. Bell-and-spigot type.
    - c. Joints fabricated in accordance with ASTM C361. Physical characteristics for rubber gaskets in accordance with ASTM C443.
  - 2. 12-inch diameter and larger:
    - a. ASTM C76, bell-and-spigot or tongue-and-groove, Class IV, unless otherwise shown.
    - b. Radius (bevel) pipe, with drop between two pipe sections not exceeding the common wall thickness.
    - c. Rubber gasket joints, when required, fabricated in accordance with ASTM C361. Physical characteristics for rubber gaskets in accordance with ASTM C443.
    - d. Acceptance tests as specified in ASTM C76 form basis of acceptance for concrete pipe in accordance with the following:
      - 1) 72-inch diameter and smaller: Acceptance on the Basis of Plant Load Bearing Test, Material Tests and Inspection of Manufactured Pipe for Visual Defects and Imperfections.
      - 2) Larger than 72 inches in diameter: Acceptance on the Basis of Material Tests and Inspection of Manufactured Pipe for Defects and Imperfections.
    - e. Minimum laying lengths: Four feet.
    - f. Rubber gaskets: ASTM C361. <sup>\*12</sup>
    - g. Rubber gaskets: ASTM C443. <sup>\*13</sup>
    - h. Jointing mastic: Elastic, water-resistant, formulation of plastic bituminous materials, nonflammable solvent and inert fillers so combined that:
      - 1) When applied to a vertical metal surface and heated to 120F, jointing mastic will neither slump nor lose plasticity.
      - 2) When applied directly from container without further fixing, jointing mastic can be applied in even, adherent coat within temperature range of 20F to 100F.
    - i. Reinforced concrete elliptical pipe: ASTM C507. <sup>\*14</sup>
  - 3. Perforated nonreinforced concrete pipe: AASHTO M175, Type 1 or 2, bell-and-spigot or tongue-and-groove type.
  - 4. Porous concrete pipe: AASHTO M176, tongue-and-groove.
- G. Plastic Pipe:
  - 1. Polyvinyl chloride (PVC) pipe: ASTM D3034, SDR-35.
  - 2. Polyethylene corrugated pipe: AASHTO M252.
- H. Bituminous-Coated Corrugated Metal Pipe: AASHTO M190, Type A or C, with connecting bands, AASHTO M36.
- I. Vitrified Clay Pipe: ASTM C700; Joints, ASTM C425, using plastic materials.
- J. Cast-Iron Soil Pipe and Fittings: ASTM A74, extra-heavy (XH), with hub and spigot ends so constructed that joints may be made with gaskets conforming to CISPI Designation HSN 85 and the requirements of the relevant plumbing codes.
- K. Lubricant for Rubber Gasket Pipe Joints: Vegetable oil soap.
- L. Mortar Materials:

1. Portland cement: ASTM C150, Type I.
  2. Sand: ASTM C144, natural sand.
  3. Lime: Pressure-hydrated, ASTM C207, Type S.
  4. Water: Potable.
  5. Pigment: As approved.
- M. Brick: ASTM C32; solid brick; Grade MS for manhole brick, Grade SS for sewer brick; 2-1/4 inches by 3-3/4 inches by eight inches.
- N. Precast Concrete Manhole Sections: <sup>\*15</sup>
1. ASTM C478.
  2. Joint entry seal gasket: A-LOK as manufactured by Atlantic Precast Concrete, Inc.; A-LOCK gaskets, manufactured by A-LOK Products Corporation, Trenton, N.J.; DURAC-SEAL gaskets, manufactured by DURA-CRETE, Inc., Dayton, Ohio; or equal.
- O. Precast Concrete Manholes: <sup>\*16</sup>
1. Cylindrical, eccentric and conical: ASTM C478.
  2. Other configurations: ACI 318, AASHTO H20.
- P. Manhole Steps:
1. Cast iron: ASTM A48 Class 30 A.
  2. Rebar: No. 4 reinforcing bar with molded polypropylene or rubber encasement.
- Q. Manhole Frame and Cover; Inlet Frame and Grate; and Ballast Screen;
1. Authority manhole: Cast-iron, ASTM A48, Class 30, with METRO logo.
  2. *Rust-resistant cast iron or rust-resistant malleable cast iron.*
  3. *True to pattern in form and dimensions, free from pouring faults, sponginess, cracks, blowholes and defects affecting strength.*
  4. *Fillets at angles in casting with arises sharp and perfect.*
  5. *Sandblasted to effectively remove scale and sand, presenting smooth, clean and uniform surfaces. Coated with bituminous coating.*
  6. *Covers that receive paver tile:*
    - a. *Omit bituminous coating.*
    - b. *Provide positioning lug and lug receptor as a permanent part of the cover and frame rim so that the cover can only be installed (flush) in one position.*
- R. Metal Water Seals for Basin Connections: Neenah Foundry Model No. R-3707 or equal.
- S. Structural Steel Members: ASTM A36.
- T. Steel Pipe: ASTM A53, black finish, extra strong wall class.
- U. Stainless Steel Angle: ASTM A167, Type 304.
- V. Jute for Caulking: Good quality jute, free from tar, oil, or grease and dry when installed.
- W. Preformed Expansion Joint Fillers: AASHTO M153, Type I, Type II or Type III.
- X. Bituminous Expansion Joint Filler: AASHTO M33.
- Y. Galvanizing: Section 05120.
- Z. Ditch Lining and Slope Protection:
1. Riprap: Material meeting the following requirements:

- a. Hard, durable and free of fractures; angular in shape; weather-resistant; and free from overburden, spoil, shale and organic material.
  - b. Size: Weight distribution of pieces provided in accordance with the following:
    - 1) Class I: From 50 to 150 pounds with 60-percent minimum weighing 100 pounds or more; approximately 10 percent may weigh 50 pounds or less.
    - 2) Class II: From 150 to 500 pounds with 50-percent minimum weighing more than 300 pounds; approximately 10 percent may weigh 150 pounds or less.
  - c. Quality:
    - 1) Water absorption: 3.0-percent maximum when tested in accordance with AASHTO T85.
    - 2) Specific gravity: 2.5 minimum when tested in accordance with AASHTO T85.
    - 3) Resistance to abrasion: Grade B maximum when tested in accordance with AASHTO T96.
    - 4) Soundness: Loss 20-percent maximum when tested in accordance with AASHTO T104.
  - 2. Aggregate filter:
    - a. Coarse aggregate, ASTM C33, Size 357.
    - b. Use only tough, durable materials free of thin, flat, elongated or soft friable particles and free of organic matter.
  - 3. Granite block facing: Type 4, quarry split finish on face and edges.
  - 4. Sand cushion for concrete block: Section 03300, fine aggregate.
- AA. Geotextile Filter Fabric: AASHTO M288 and the following additional requirements:
- 1. Woven or non-woven pervious filter fabric weighing approximately 0.03 to 0.05 pounds per square foot; free of defects.
  - 2. Fabric: Long chain synthetic polymer composed of at least 85 percent by weight of propylene, ethylene, ester, amide or vinyl-chloride and with stabilizers or inhibitors to make fabric resistant to deterioration due to ultraviolet and heat exposure.
  - 3. Fabric formed or treated so that filaments retain their positions relative to each other.
  - 4. Edges selvaged.
  - 5. Physical strength:
    - a. Tensile strength: 200-pound minimum in each direction, ASTM D1682.
    - b. Elongation at failure: 10 to 30 percent, ASTM D5034 and D5035.
    - c. Puncture strength: 70-pound minimum, ASTM D5034 and D5035.
  - 6. Percent of open area: Not less than five percent nor more than six percent.
  - 7. Equivalent opening size (E.O.S.): 70-100 US Standard Sieve, CW-02215-77.
  - 8. Securing Pins: As recommended by manufacturer of filter fabric.
- BB. Gabions:
- 1. Wire mesh: Galvanized steel wire 0.105 minimum diameter, 60,000 pounds per square inch tensile strength, galvanized at rate of 0.80 ounces per square foot. Wires twisted to form nonraveling hexagonal openings of uniform size, not to exceed 4-1/2 inches in length nor eight square inches in area of mesh opening. Horizontal dimension uniform, not to exceed 36 inches. Gabion dimensions not to vary more than three percent from manufacturer's stated size.
  - 2. Tie devices: Malleable iron or steel, producing frictional force of 160 pounds per foot of spacing. Sized to conform to requirements of jurisdictional agency.
  - 3. Stone: Durable, free from cracks and seams, unweathered, weighing between four pounds (four-inch average diameter) and 30 pounds (eight-inch average diameter) except five percent may vary more or less and 50 percent to exceed 10 pounds.
    - a. Stone size:

Basket Thickness (Inches)	Size of Stones (Inches)
6	3 to 5
9, 12, 18	4 to 7
36	4 to 12

- CC. Coal-Tar Epoxy Coating:
1. Two-component.
  2. Chemically cured.
  3. Conforming to MS MIL-P-23236 (Ships), Type I, Class 2.
  4. Thinner: As recommended by manufacturer of coating and as approved.
- DD. Pipe Supports: <sup>\*17</sup>
1. Pipe: Three-inch diameter, ASTM A53, Weight B, Class 1.
  2. Flanges: ANSI/ASME B16.1, 125-pound Class, galvanized after fabrication.
- EE. Underdrain Filter Material: ASTM C33, Size 57. <sup>\*18</sup>

**2.02 MORTAR AND GROUT MIXES:**

- A. General Requirements:
1. Mix dry in specified proportions by volume. Control and maintain accurate measurement throughout progress of work.
  2. Add sufficient water as specified to produce approved consistency.
  3. Do not mix in amount exceeding that which can be used within one hour after introduction of water.
  4. Do not retemper mix that has begun to set nor use such mix in the work.
  5. Where shown, specified or directed, mix pigment into dry mix to attain color selected by the Engineer. Pigment not to exceed 10 percent of dry batch weight of cement.
- B. Proportions:
1. Mortar: One part portland cement, 2-1/2 parts sand and water sufficient to produce stiff workable mix.
  2. Grout: One part portland cement, 2-1/2 parts sand and water sufficient to produce plastic flowable mix.
  3. Mortar for setting and pointing granite: One part portland cement, four to five parts sand, one part lime and water sufficient to produce approved consistency.
  4. Mortar for setting granite paving and grouted granite blocks: One part portland cement, four parts sand, with water sufficient to produce approved consistency.

**PART 3 - EXECUTION**

**3.01 EXCAVATION FOR SEWER AND DRAINAGE STRUCTURES:**

- A. Perform excavation for sewers and drainage structures to line and grade shown in accordance with Section 02320 and the following additional requirements:
1. Excavate test pits sufficiently in advance of construction of sewers and drainage structures so that reasonable changes in line and grade can be made where location of existing structures varies from that shown.
  2. Excavate below horizontal plane extending two feet above top of sewer or drainage structures to maximum width of trench pay width shown. Where dimensions are not shown, make maximum horizontal width of excavation 18 inches from outside of

sewer or drainage structure and minimum six inches. Where approved, excavation above such plane may exceed specified dimensions.

3. If excavation exceeds permissible dimensions, encase pipe or install pipe of higher strength.
4. Where necessary to place backfill or embankment so that trench can be excavated, extend backfill or embankment full depth laterally at least 2-1/2 times diameter of pipe on each side measured from centerline of pipe.

### **3.02 GEOTEXTILE FILTER FABRIC:**

- A. Prepare surface to receive fabric to relatively smooth condition free of obstructions, depressions, debris and soft or low density pockets of material.
  1. Place fabric with long dimension parallel to centerline of trench and lay smooth and free of tension, stress, folds, wrinkles or creases with sufficient excess to allow for minimum overlap of 12 inches.
  2. Place strips in trench to provide minimum width of 12 inches of overlap for each joint.
  3. Insert securing pins with washers through both strips of overlapped fabric at not greater than 3-foot intervals along a line through the midpoint of overlap at joints.
  4. Where this method of placement conflicts with manufacturer's instructions, the manufacturer's instructions prevail.
- B. At time of installation fabric to be rejected if it has defects, rips, holes, flaws, deterioration or damage incurred during manufacture, transportation, storage or handling.
- C. Place fabric in manner and at location shown.

### **3.03 PIPE CRADLE:**

- A. Place pipes on cradle of aggregate or concrete where shown.
- B. Place aggregate so as to avoid segregation; compact to maximum practicable density so that pipe can be laid to required tolerances.

### **3.04 LAYING PIPE:**

- A. General Requirements:
  1. Excavate to lines and grades shown in accordance with Sections 02320 and herein. Excavate depressions for bells.
  2. Protect pipe and fittings during handling to prevent damage.
  3. Place, shape and compact bedding material to receive barrel of pipe. Type and thickness of bedding material as shown.
  4. Start laying pipe at lowest point; lay true to line and grade shown.
  5. Install pipe to bear on bedding material along entire length. Shape bedding material to fit bells and flanges.
  6. Install perforated pipe with perforations downward.
  7. Install pipe so that bells and grooves are on upstream end.
  8. Align each section of pipe with adjoining section with uniform annular space between bell and spigot and so as to prevent sudden offsets in flow line.
  9. As each section of pipe is laid, place sufficient backfill to hold it firmly in place.
  10. Keep interior of sewer clean as work progresses. Where small pipe size makes cleaning difficult, keep suitable swab or drag in pipe and pull through each joint immediately after jointing is completed.
  11. Keep trenches and excavations free of water during construction and until backfilled. Each day, excavate only as much trench as needed to lay pipe.

12. When work is not in progress, securely plug ends of pipe and fittings to prevent trench water or other substances from entering pipes and fittings.
  13. Where length of stub is not shown, install four-foot length and seal free end with brick masonry bulkhead or approved stopper.
  14. Have work approved prior to covering pipe.
  15. Where shown, place additional aggregate filter around and over pipe in lifts not exceeding six inches loose. Compact each lift before placement of next lift.
  16. Backfill in accordance with Section 02320.
  17. Accomplish compaction by method that will avoid damage to pipe and will not disturb its alignment and grade. The use of vibratory rollers is prohibited until compacted cover over pipe has reached three feet or half the pipe diameter, whichever is greater.
  18. Where cathodic protection is shown, apply coal-tar epoxy coating.
- B. Vitrified Clay Pipe:
1. Nonperforated pipe:
    - a. Use pipe hoist, crane or other approved device when laying pipe greater than 18 inches diameter.
    - b. Prevent damage to premolded joint rings or attached couplings.
    - c. Clean joint contact surfaces immediately prior to jointing. To complete joint, use lubricants, primers or adhesives as recommended by pipe or joint manufacturer
  2. Perforated pipe:
    - a. Firmly position spigot in bell of preceding pipe. Saturate jute gasket in cement grout and caulk into annular space. Ensure that jute is long enough to reach entirely around pipe and is of such thickness to bring pipe sections to same grade.
    - b. After pipe sections have been caulked and centered, fill annual space with cement mortar.
    - c. After mortar joints have set, place additional aggregate filter material as specified.
- C. Concrete Pipe:
1. Bell-and-spigot joints:
    - a. Lay bell-and-spigot joint pipe as specified for vitrified clay pipe.
  2. Tongue-and-groove joints:
    - a. Clean groove end of preceding pipe with wet brush and apply soft mortar to lower 1/4 of groove. Clean tongue end of succeeding pipe with wet brush and position it. Remove mortar from interior surface if squeezed out of joint.
    - b. Complete mortaring interior and exterior portions of joint for entire circumference, extending from previously placed mortar. Perform final exterior mortaring of joints three lengths of pipe behind laying.
- D. Plastic Pipe:
1. Perforated pipe:
    - a. Use sleeve couplings designed to hold pipe in alignment without use of sealing compound or gaskets.
    - b. Place additional aggregate filter material as specified.
    - c. Cap open ends of underdrains.
  2. Nonperforated pipe:
    - a. Join sections of pipe with couplings recommended by pipe manufacturer.
- E. Corrugated Metal Pipe:
1. Perforated pipe:
    - a. Place additional aggregate filter material as specified
  2. Nonperforated pipe:

- a. When pipe is shown to be bituminous paved, place paved area on bottom.
  - 3. Connections for corrugated metal pipe:
    - a. Join sections of pipe with coupling bands arranged to fit corrugations accurately.
    - b. Do not damage protective coating when tightening bolts.
    - c. After final tightening of connection bolts, apply brush coat of bituminous paint to bands and bolts.
- F. Porous Concrete Pipe:
  - 1. Fill joints with mortar as specified for tongue-and-groove joints of concrete pipe.
  - 2. After pipe joints have been made, place additional filter material as specified.
- G. Inspections Of Sewers: <sup>\*19</sup>
  - 1. Perform all work in accordance with current requirements of WASA.
  - 2. Perform inspections on new or relocated storm sewers within or adjacent to the zone of influence, as defined by the limits of a theoretical slope of 1:1 from the bottom edges of tunneling and cut-and-cover excavations, as follows:
    - a. Make inspections upon completion of tunneling and cut-and-cover operations, but prior to paving.
    - b. Obtain video-tape television inspection records of sewers 36 inches and smaller in diameter.
    - c. By means of visual walk-through inspection, obtain coordinated logs, photographs and other records specified by WASA of sewers larger than 36 inches in diameter and of associated structures.
  - 3. Coordinate all television and walk-through inspection field operations with WASA. All such work to be performed in the presence of a WASA representative.

**3.05 BACKFILL:**

- A. Perform backfilling only after inspection and approval of pipe laying.
- B. On completion of construction, backfill excavation in accordance with Section 02320.

**3.06 JOINTS FOR CONCRETE STORM SEWER: <sup>\*20</sup>**

- A. Use cold-applied jointing mastic for joints of storm sewer.
- B. Bell-and-Spigot Joints:
  - 1. Clean interior surface of bell and fill lower portion with mastic of sufficient thickness to make inner surfaces of abutting sections flush.
  - 2. Install spigot end of adjoining pipe into bell so that sections are closely fitted and aligned.
  - 3. Apply sufficient jointing mastic to fill remaining void in joint.
  - 4. Remove excess mastic from interior of pipe.
- C. Tongue-and-Groove Joints:
  - 1. Clean groove. Apply mastic to lower half of groove.
  - 2. Clean tongue of next pipe and apply layer of mastic to upper half.
  - 3. Fit tongue into groove until pipes are closely fitted and aligned and mastic covers inner and outer surfaces.
  - 4. Remove excess mastic from interior of pipe.

**3.06 JOINTS FOR CONCRETE STORM SEWER 12 INCHES TO 33 INCHES: <sup>\*21</sup>**

- A. Use cold applied jointing mastic for joints of storm sewer 12 inches to 33 inches in diameter.

- B. Bell-and-Spigot Joints:
  1. Clean interior surface of bell and fill lower portion with mastic of sufficient thickness to make inner surfaces of abutting sections flush.
  2. Install spigot end of adjoining pipe into bell so that sections are closely fitted and aligned.
  3. Apply sufficient jointing mastic to fill remaining void in joint.
  4. Remove excess mastic from interior of pipe.
- C. Tongue-and-Groove Joints:
  1. Clean groove. Apply mastic to lower half of groove.
  2. Clean tongue of next pipe and apply layer of mastic to upper half.
  3. Fit tongue into groove until pipes are closely fitted and aligned and mastic covers inner and outer surfaces.
  4. Remove excess mastic from interior of pipe.

### **3.06 JOINTS FOR CONCRETE STORM SEWER 36 INCHES AND LARGER. \*22**

- A. Where not prohibited by jurisdictional agencies, Use mortar for joints of storm sewers 36 inches diameter and larger.
- B. Bell-and-Spigot Joints:
  1. Where pipe cradle is aggregate, place shallow bed of mortar under joint.
  2. Thoroughly wet bell and fill lower half with mortar.
  3. Thoroughly wet spigot and uniformly fit into bell so that sections are closely fitted and aligned.
  4. Fill remaining annular space in bell with mortar sufficient to form bead around outside of spigot end of pipe.
  5. Remove excess mortar from interior of pipe and finish exterior and interior to smooth surfaces.
- C. Tongue-and-Groove Joints:
  1. Thoroughly wet groove; apply mortar to lower half of groove.
  2. Thoroughly wet tongue of next pipe and apply a layer of mortar to top half.
  3. Fit tongue into groove until pipes are closely fitted and aligned and mortar covers inner and outer surfaces of the joint.
  4. Clean inner surface of pipes at joint and point up outside with bead of mortar.

### **3.07 JOINTS FOR VITRIFIED CLAY PIPE:**

- A. Immediately before joining vitrified pipe, liberally coat bell with lubricant and fit spigot with gasket.
- B. Join pipes using equipment designed for purpose.

### **3.08 JOINTS FOR CAST-IRON SOIL PIPE AND FITTINGS:**

- A. Immediately before joining cast-iron soil pipe and fittings, liberally coat hub with lubricant and fit spigot with pipes using equipment designed for purpose.

### **3.09 CONNECTIONS WITH EXISTING SEWERS:**

- A. Make connections with existing public sewers in accordance with requirements of the jurisdictional authority.

- B. Do not connect existing sewer to sewer under construction unless approved.

### **3.10 TUNNELING AND JACKING:**

- A. Perform tunneling and jacking by approved methods.
- B. Where open cut is specified and the Engineer permits the work to be done by tunneling or jacking, perform such work as specified and as approved.
- C. Cost of material substitutions required by change of methods will be borne by the Contractor.
- D. Make horizontal borings necessary to lay pipe lines true to line and grade.
- E. When sewers are laid in borings, completely fill void between outside barrel of pipe and boring with cement grout pumped into place.
- F. When drainage pipes are laid in borings, completely fill void between pipe and boring with sand, using water pressure to ensure that voids are filled.
- G. Methods of boring and filling of voids between pipe and boring are subject to approval.

### **3.11 CAST-IN-PLACE CONCRETE CONSTRUCTION:**

- A. Conform to applicable requirements of Sections 03100, 03200 and 03300. Section designer to specify the type of cement to be used. The type of cement will vary depending upon the jurisdiction where the work is performed.
  - 1. Cement. <sup>\*23</sup>
- B. Construct concrete support systems where shown. Section designer to specify the type of mortar to be used. Mortar type will vary depending upon jurisdiction in which the work is performed.
  - 1. Mortar and cement. <sup>\*24</sup>

### **3.12 BRICK CONSTRUCTION:**

- A. Perform brick construction as specified in Section 04215, with the following additional requirements:
  - 1. Use sewer brick wherever brick construction is exposed to flow; otherwise, use manhole brick.
  - 2. Lay sewer brick on edge so that 2-1/4 by 8-inch side is exposed to flow.
  - 3. Lay manhole brick so that every sixth course is a header course.
  - 4. Where practicable, lay each course with a line. For curved courses or those in nonparallel planes, use bonded-and-keyed construction.
  - 5. Do not exceed joint thickness of 3/8 inch in straight courses in parallel planes; for courses curved or in nonparallel planes, make thickest part of joint as thin as practicable.
  - 6. Rack or tooth uncompleted brick construction and parge unexposed surfaces with 1/2 inch of mortar.

### **3.13 MANHOLES:**

- A. Construct manholes of precast sections, cast-in-place concrete or brick as shown.
- B. Provide base of precast or cast-in-place construction. Make watertight connection between base and risers.

- C. Unless otherwise shown, place axes of manholes directly over centerlines of pipes.
- D. Construct appropriate flow channels in bottom of manholes.
- E. Where necessary, build connections for public and residential sewers into manholes. Cut pipe flush with inside wall of structure. Do not build pipe into wall; provide mortar joint between pipe and structure.
- F. Install manhole steps and cast iron frame and cover for each manhole; adjust frame and cover to proper grade by brick construction.
- G. Install joint entry seal gaskets in openings in the walls of 48-inch precast manholes with O-ring joint. <sup>\*25</sup>

### 3.14 CATCH BASINS AND INLETS:

- A. When grading has been substantially completed as approved, construct catch basins of cast-in-place concrete using Class 3500 concrete and steel reinforcement as shown, precast sections or brick as shown.
- B. Cut pipe flush with inside wall of structure. Provide mortar joint between pipe and structure or install water seal as shown.
- C. Install cast iron frame and grate or cover and adjust to proper grade.
- D. Install pipe supports as shown. Fill with concrete after installation. <sup>\*26</sup>

### 3.15 DITCH LINING AND SLOPE PROTECTION:

- A. Slope Preparation:
  - 1. Excavate or fill slopes to the required cross section, lines and grades.
  - 2. Compact earth slopes to not less than 95 percent of the maximum dry density for a depth of not less than 12 inches, as specified in Section 02725.
  - 3. Where lining or protection is to be applied to rock surfaces, clean off mud, debris and loose fragments.
  - 4. Construct toe or cut off walls where shown.
  - 5. Remove loose material and buried debris protruding from subgrade.
  - 6. Placement of aggregate filter:
    - a. Place filter aggregate where shown to depth shown.
    - b. Compact each layer of aggregate filter in accordance with ASTM D698, Method D, to 100 percent at plus-or-minus one percent of optimum moisture content.
- B. Ungrouted Riprap:
  - 1. Place aggregate filter as specified.
  - 2. Place riprap by machine to full course thickness in one operation upward from bottom of slope. Prevent displacement of underlying materials. Dumping of riprap is prohibited.
  - 3. Fill spaces between larger stones to produce nearly even surface with minimum of voids. Manually supplement machine placement of stone to choke in voids.
  - 4. Rearrange individual stones as necessary to ensure that finished configuration conforms to lines, grades and thickness shown.
- C. Bituminous Concrete Paving:

1. Place bituminous concrete where shown to the lines, grades, thickness and shapes shown.
  2. Give base course prime coat of medium-curing, cutback asphalt and allow to cure before hot bituminous concrete is placed.
  3. Place hot-mix bituminous concrete by hand or by machine.
  4. When hand methods are used, place mixture by means of hot shovels or forks and spread with hot rakes to thickness required to obtain specified compacted thickness. Thoroughly rake loose material throughout its depth, to eliminate honeycombing. Use screed boards of width equal to required thickness of lining.
  5. After spreading, compact until specified compacted thickness is obtained.
  6. Place mixture as continuously as practicable to eliminate joints. Where joints are required at end of a day's work or when the placing is discontinued for such period of time that material becomes chilled, form joints as specified.
- D. Cast-in-Place Concrete:
1. Use Class 3500 concrete unless otherwise shown.
  2. Use wood or steel forms.
  3. Place reinforcing steel or wire mesh as shown.
  4. Provide and install dowel bars where shown in accordance with Section 02750.
  5. Locate expansion and contraction joints where shown in accordance with Section 02750.
  6. Unless otherwise shown, give surface wood float finish.
  7. Protect and cure concrete in accordance with Section 03300.
- E. Concrete Masonry Units:
1. Place two-inch layer of sand cushion on previously prepared slope.
  2. Set units firmly by hand in sand cushion with long dimension parallel to base of slope so as to produce even surface.
  3. Lay blocks with open 3/8-inch joints and with joints staggered as shown.
  4. Completely fill joints with mortar.
  5. Protect and cure newly laid blocks for seven days using wet cotton mats or wet burlap.
  6. Lay blocks when the temperature is 40F or above.
- F. Paving Brick:
1. On the previously prepared slope, place concrete base of thickness shown.
  2. Give concrete smooth screed finish.
  3. Clean base, dampen and lay one-inch thick mortar bed.
  4. Lay bricks with long dimension parallel to base of slope, with open 3/8-inch joints and with joints staggered.
  5. Bed bricks firmly in mortar bed so as to produce even surface free from depressions or high spots.
  6. Fill joints completely with mortar.
  7. Protect and cure newly laid brick for a period of seven days using wet cotton mats or wet burlap.
- G. Sodding: Section 02920.
- H. Concrete Pavement:
1. Lay plastic pipe as shown.
  2. Place aggregate filter as specified.
  3. Place concrete base in accordance with specified requirements for cast-in-place concrete.
- I. Concrete with Granite Block Facing:
1. Lay plastic pipe as shown.

2. Place aggregate filter as specified.
3. Place concrete base in accordance with specified requirements for cast-in-place portland cement concrete.
4. Installation of granite block facing:
  - a. Set granite blocks in bedding course, one-inch minimum depth with 3/4-inch joint width.
  - b. Slope bedding to true surface parallel to finished surface of blocks; strike off bedding until true alignment is attained.
  - c. After final sloping, do not disturb bedding prior to laying blocks.
  - d. Lay blocks on bedding course in successive courses with quarry split finish up.
  - e. Align each course, lay true and even and bring to true grade by use of wood mallets or similar tools.
  - f. Lay blocks in continuous sequence.
  - g. Lay no more mortar than can be covered with blocks before end of work day.
  - h. Point voids in joints with preshrunk mortar. Do not point when ambient temperature is 50F and falling. After pointing, scrub surfaces with soap solution and remove stains. Rinse immediately with clean water. Leave work in first class condition, free from mortar stain and other defacement as approved.

J. Gabions:

1. Prepare ground surface smooth and even where gabions will be installed.
2. Assemble gabions and tie together in accordance with manufacturer's instructions.
3. Fill gabions in lifts of 12 inches maximum. Install tie devices in all units with exposed faces, spaced in accordance with requirements of jurisdictional agency.
4. Ensure stone fill is placed without voids larger than approximately smaller stones. Hand-place stones in exposed faces.

### 3.16 CONCRETE HEADWALLS AND WINGWALLS:

A. Excavation:

1. Excavate for foundations and walls to lines and grades shown in accordance with Section 02320.

B. Formwork and Reinforcement:

1. Erect formwork and install reinforcement as shown and in accordance with Sections 03100 and 03200.

C. Concrete Work:

1. Place concrete of class shown and protect and cure in accordance with Section 03300.

D. Backfilling:

1. Backfill and compact in accordance with Section 02320.

### 3.17 COATING APPLICATION AND REPAIR:

A. Preparation of surface: Perform the following in order given:

1. Clean surfaces contaminated with oil or grease using naphtha or xylol.
2. Remove rust and mill scale from surfaces by dry abrasive blasting to commercial finish in accordance with SSPC SP-6.
3. Coat surfaces within 24 hours and before dew point is reached.

4. Apply coating only to surfaces which are dry and free of contaminants. Whip blast surfaces not coated within specified time limit.
5. Application of coating:
  - a. Mix coating in quantity which can be applied within its pot life if in accordance with manufacturer's recommendation. Thin only with approval.
  - b. Apply coating to exterior surfaces of pipes and fittings in accordance with recommendations of coating manufacturer and as follows:
    - 1) Two coats of equal thickness.
    - 2) Total dry film thickness: 20 mils.
    - 3) Pretreat first coat as required prior to application of second coat.
    - 4) Apply second coat before first coat has dried tack-free but not later than 24 hours after application of first coat, unless otherwise recommended by coating manufacturer.
    - 5) Inspect coating prior to burial. Repair damages in accordance with recommendations for field corrections by coating manufacturer.
6. Test cathodic protection as specified in Section 13115.

**3.18 SUBWAY DRAINAGE SYSTEM: Section 02625.**

**3.19 FIELD QUALITY CONTROL:**

- A. Maximum Surface Variation Tolerances:
  1. Grouted riprap: 1-1/4 inches in four feet from true plane.
  2. Bituminous concrete: Plus-or-minus 1/4 inch from specified grade in 25 feet.
  3. Cast-in-place concrete: Plus-or-minus 1/4 inch from specified grade in 15 feet.
  4. Precast concrete block: Plus-or-minus 1/2 inch from specified grade in 25 feet.
  5. Paving brick: Plus-or-minus 1/2 inch from specified grade in 25 feet.
- B. Obstruction Tests:
  1. Perform field tests to verify that installed storm systems are free from obstructions.
  2. Remove obstructions by excavating at the apparent obstruction and repairing or replacing the defective pipe as directed by the Engineer.

**3.20 TRANSPORTATION AND INSTALLATION OF MATERIALS FURNISHED BY OTHERS: \*27**

- A. Transport and install materials furnished at the WSSC's storeyard at Bladensburg or other delivery points designated by the WSSC.
- B. Use only suitable equipment, tools, and appliances for the safe and convenient handling and hauling of materials.
- C. Check that all materials furnished by the WSSC are in satisfactory condition.
- D. Materials damaged, lost or wasted after acceptance will be replaced by the WSSC at the expense of the Contractor.
- E. Material showing inherent defects will be replaced by the WSSC without charge.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

\*1. Add 1.1 C. including 1.a.-b. for contracts where storm systems work is performed within the jurisdiction of WSSC.

- \*2. Add 1.1 D. including 1. for contracts where storm systems work is performed within the jurisdiction of WSSC.
- \*3. Add 1.2 E. including 1.-2. for contracts where storm systems work is performed within the jurisdiction of WASA.
- \*4. Use first version of 1.3 A.4. modification for contracts where storm systems work is performed within the jurisdiction of WSSC.
- \*5. Use second version of 1.3 A.4. for contracts where storm systems work is performed outside the jurisdiction of WSSC.
- \*6. Use first version of 1.3 A.5. modification for contracts where storm systems work is performed within the jurisdiction of WSSC.
- \*7. Use second version of 1.3 A.5. for contracts where storm systems work is performed outside the jurisdiction of WSSC.
- \*8. Use first version of 1.3 A.6. modification for contracts where storm systems work is performed within the jurisdiction of WSSC.
- \*9. Use second version of 1.3 A.6. for contracts where storm systems work is performed outside the jurisdiction of WSSC.
- \*10. Add 1.3 A.9. for contracts where storm systems work is performed within the jurisdiction of WSSC.
- \*11. Add 1.3 D. including 1.-2.a. for contracts where storm systems work is performed within the jurisdiction of WASA.
- \*12. Use first version of 2.1 F.2.f. modification for contracts where storm and sanitary systems work is performed within the jurisdiction of WSSC.
- \*13. Use second version of 2.1 F.2.f. for contracts where storm systems work is performed outside the jurisdiction of WSSC.
- \*14. Add 2.1 F.2.h. for contracts where storm systems work is performed within the jurisdiction of WSSC.
- \*15. Use first version of 2.1 N. including 1.-2. modification for contracts where storm systems work is performed within the jurisdiction of WSSC.
- \*16. Use second version of 2.1 N. including 1.-2. for contracts where storm systems work is performed outside the jurisdiction of WSSC.
- \*17. Add 2.1 DD. including 1.-2. for contracts where storm systems work is performed within the jurisdiction of WSSC.
- \*18. Add 2.1 EE. for contracts where storm systems work is performed within the jurisdiction of Prince Georges County.
- \*19. Add 3.4 G. including 1.-3. for contracts where storm systems work is performed within the jurisdiction of WASA.
- \*20. Use first version of 3.6 including A.-C.4. modification for contracts where storm systems work is performed within the jurisdiction of Fairfax County, Virginia.

**\*21.** Use second version of 3.6 including A.-C.4. for contracts where storm systems work is performed outside the jurisdiction of Fairfax County, Virginia.

**\*22.** Use second version of 3.7 including A.-C.4. for contracts where storm systems work is performed outside the jurisdiction of Fairfax County, Virginia.

**\*23.** Specify the type of cement to be used. The type of cement will vary depending on the jurisdiction and the use of the storm system.

**\*24.** Specify the type of mortar and cement to be used. They will vary depending on the jurisdiction and the use of the storm system.

**\*25.** Add 3.15 G. for contracts where work is performed within the jurisdiction of WSSC.

**\*26.** Add 3.16 D. for contracts where work is performed within the jurisdiction of WSSC.

**\*27.** Add 3.22 including A.-E. for contracts where work is performed within the jurisdiction of WSSC.

**END OF SECTION**

**SECTION 02725  
(Version 1)<sup>\*1</sup>**

**BASE FOR PAVEMENTS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies furnishing, placing, shaping and compacting aggregate base on previously constructed subgrades.
- B. Related Work Specified Elsewhere:
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Concrete pavement: Section 02750.

**1.02 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: D1241, D1557.
- B. Source Quality Control:
  - 1. Not less than 10 days prior to the beginning of work, inform the Engineer of source of material to be used.
  - 2. Once approved, do not change source of supply.
  - 3. Do not construe approval as approval of the entire location but as approval only insofar as material continues to conform to specified requirements.
  - 4. Cooperate with the Engineer so that the Engineer may take samples and make tests as often as he deems necessary.
  - 5. The Engineer has the right to reject material at the job site by visual inspection, pending sampling and testing.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Aggregate Base Materials:
  - 1. ASTM D1241.
  - 2. Grading requirements <sup>\*2</sup>:

Sieve Designation	Percentage By Weight Passing Square Mesh Sieves
2 inches	100
1 inch	70 - 95
3/8 inch	35 - 75
Size 4	20 - 60
Size 10	15 - 45
Size 40	10 - 30
Size 200*	0 - 15

\*Fraction passing the Size 200 sieve to be not greater than 2/3 of the fraction passing the Size 40 sieve.

3. Grading requirements \*3:

Sieve Designation	Percentage By Weight Passing Square Mesh Sieves
2-1/2 inches	100
1 inch	85 - 100
1/2 inch	50 - 92
Size 10	35 - 65
Size 40	15 - 45
Size 200*	3 - 15

\*Fraction passing the Size 200 sieve to be not greater than 2/3 of the fraction passing the Size 40 sieve.

**PART 3 - EXECUTION**

**3.01 EQUIPMENT:**

- A. Place material using equipment designed for the purpose. Use equipment of size and weight necessary to shape material as shown and to compact material to specified minimum density.
- B. Provide sufficient equipment to achieve specified compaction at rate consistent with rate of placement of base material.
- C. Obtain approval of equipment prior to use on the work.
- D. Maintain equipment in first class operating condition while in operation.

**3.02 PLACING MATERIAL:**

- A. Subgrade Preparation: In accordance with Section 02320.
- B. Place material in its final location so as to provide uniformity of grading throughout work.
- C. Use graders for touching up and for working materials into areas which do not permit use of other equipment providing there is continuing conformance to specified requirements and providing approval is obtained.
- D. Place material in uniform layers so that each layer has compacted lift thickness of six inches maximum and three inches minimum.
- E. Where thickness is shown or specified is more than six inches, place material in two or more layers of equal thickness so that specified requirements are met.

**3.03 COMPACTION:**

- A. During placing and compacting, obtain moisture content and dry density within the allowable tolerances specified.

- B. Compact each layer to required density before placing next layer.
- C. Compact areas not accessible to rollers to required density by means of approved mechanical tampers.
- D. Puddling or jetting is prohibited.
- E. Density:
  - 1. Compact material under curbs and gutters, gutters, curbs and pavement to 98 percent of maximum density at proper moisture content.
  - 2. Compact material under sidewalks to 95 percent of maximum density at proper moisture content.

**3.04 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  - 1. Construct base to the following tolerances:
    - a. Thickness of base: Plus zero or minus 3/8 inch.
    - b. Surface of base:
      - 1) Plus 1/8 inch or minus 3/8 inch of elevation shown.
      - 2) Deviation not more than 1/2 inch from steel straightedge as specified in Section 02750.
  - 2. Maintain moisture content within two percent of optimum moisture content.
- B. Tests: Determine optimum moisture content and maximum density in accordance with ASTM D1557.

**3.05 MAINTENANCE:**

- A. Throughout placing and compacting, and until the placing of the succeeding pavement course, maintain base for pavement in specified condition.

**3.06 DEFICIENT BASES:**

- A. Where directed, repair or remove and replace, with new material, pavement base that does not meet requirements.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

**ENDNOTES:**

**\*1.** Use first version of SECTION 02725 BASE FOR PAVEMENTS for contracts where pavement base work is performed outside the jurisdiction of the District of Columbia except as noted. (Use second version for contracts where pavement base work is performed within the jurisdiction of the District of Columbia.)

**\*2.** Use first version of 2.1 A.2. for contracts where pavement base work is performed outside the jurisdiction of the District of Columbia and Prince Georges County, Maryland.

**\*3.** Use second version of 2.1 A.2. modification for contracts where pavement base work is performed within the jurisdiction of Prince Georges County, Maryland.

**END OF SECTION**

**SECTION 02725  
(Version 2)<sup>\*1</sup>**

**BASE FOR PAVEMENTS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing base for pavements as shown, complete in place on previously constructed subgrades.
- B. Related Work Specified Elsewhere:
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Concrete pavement: Section 02750.

**1.02 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: M147, T180, T191.
- B. Source Quality Control:
  - 1. Not less than 10 days prior to the beginning of work, inform the Engineer of proposed source of supply of materials, for testing by the Engineer.
  - 2. Once approved, do not change source of supply.
  - 3. Do not construe approval as approval of the entire location but as approval only insofar as material continues to conform to specified requirements.
  - 4. Cooperate with the Engineer so that the Engineer may take samples and make tests as often as he deems necessary.
  - 5. The Engineer has the right to reject material at the job site by visual inspection, pending sampling and testing.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Aggregate Base Material, General: AASHTO M147, Materials for Aggregate and Soil-Aggregate Base and Surface Courses, as amended in this section.
- B. Use material which is free from frozen material.
- C. Grading requirements:

Sieve Designation	Percentage By Weight Passing Square Mesh Sieves
2 inches	100
1 inch	70 - 100
3/4 inch	60 - 95
No. 4	40 - 75
No. 10	25 - 65
No. 40	10 - 45
No. 200*	2 - 15

\* Fraction passing the No. 200 sieve to be not greater than 2/3 of the fraction passing the No. 40 sieve.

### **PART 3 - EXECUTION**

#### **3.01 EQUIPMENT:**

- A. Place material using equipment designed for the purpose. Use equipment of size and weight necessary to shape material as shown and to compact material to specified minimum density.
- B. Provide sufficient equipment to achieve specified compaction at rate consistent with rate of placement of base material.
- C. Obtain approval of equipment prior to use on the work.
- D. Maintain equipment in first class operating condition while in operation.
- E. At the Engineers discretion, the Engineer may permit the use of graders for touching up and for working materials into areas not amenable to placing by other equipment, providing there is continuing conformance to the requirements.
- F. Use approved mechanical tampers to compact material to the required density in areas that are not accessible to rollers.

#### **3.02 PLACING MATERIAL:**

- A. Subgrade Preparation: In accordance with Section 02320.
- B. Prior to placing the material, check the subgrade, make necessary repairs, and secure the Engineer's approval of the subgrade. Do not place on frozen subgrade. Do not dump the material directly on the subgrade.
- C. Place material in its final location so as to provide uniformity of grading throughout work.
- D. Use graders for touching up and for working materials into areas which do not permit use of other equipment providing there is continuing conformance to specified requirements and providing approval is obtained.
- E. Place material in uniform layers so that each layer has compacted lift thickness of six inches maximum and three inches minimum.
- F. Where thickness is shown or specified is more than six inches, place material in two or more layers of equal thickness so that specified requirements are met.

#### **3.03 COMPACTION:**

- A. During placing and compacting, obtain moisture content and dry density within the allowable tolerances specified.
- B. Compact each layer to required density before placing next layer.
- C. Compact areas not accessible to rollers to required density by means of approved mechanical tampers.
- D. Puddling or jetting is prohibited.

- E. Density:
  - 1. Compact material under curbs and gutters, gutters, curbs and pavement to 100 percent of maximum density at proper moisture content.
  - 2. Compact material under sidewalks to 95 percent of maximum density at proper moisture content.

**3.04 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  - 1. Construct base to the following tolerances:
    - a. Thickness of base: Plus zero or minus 3/8 inch.
    - b. Surface of base:
      - 1) Plus 1/8 inch or minus 3/8 inch of elevation shown.
      - 2) Deviation not more than 3/8 inch from steel straightedge as specified in Section 02750.
  - 2. Maintain moisture content within one percent of optimum moisture content.
- B. Tests: Determine optimum moisture content and maximum density in accordance with AASHTO T180, Moisture and Density Relations of Soils Using a 10-lb. Hammer and an 18-inch Drop, and tested in accordance with AASHTO T191, Density of Soil In-Place by the Sand-Cone Method.

**3.05 MAINTENANCE:**

- A. Throughout placing and compacting, and until the placing of the succeeding pavement course, maintain base for pavement in specified condition.

**3.06 DEFICIENT BASES:**

- A. Where directed, repair or remove and replace, with new material, pavement base that does not meet requirements.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

**ENDNOTES:**

- \*1. Use second version of SECTION 02725 BASE FOR PAVEMENTS for contracts where pavement base work is performed within the jurisdiction of the District of Columbia except as noted. (Use first version for contracts where pavement base work is performed outside the jurisdiction of the District of Columbia.)

**END OF SECTION**

## SECTION 02726

### SUB-BALLAST

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies furnishing, placing and compacting sub-ballast on previously constructed subgrade.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
  2. ASTM: C88, C117, C127, C131, C136, C142, D698, ~~D2922~~ replaced by D6938, ~~D3017~~ replaced by D6938 (duplicate).
- B. Source of Materials:
1. Obtain approval of sub-ballast prior to commencing installation.
  2. Do not change material or source of supply without approval.
- C. Inspection:
1. The Engineer has the right to stop delivery of material to the job site based on visual inspection pending sampling and testing.
  2. If material loaded, being loaded or installed does not conform to specified requirements, the Engineer will reject the material and no further delivery will be accepted until the deficiency is corrected.
  3. Replace defective material.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Certification.
  2. Samples and Documentation:
    - a. Qualification: Submit samples and source of supply sufficiently in advance to obtain approval not less than 30 days prior to anticipated date of commencing installation.

#### PART 2 - PRODUCTS

##### 2.01 MATERIALS:

- A. Sub-Ballast: Crushed stone, with the following additional requirements:
1. Gradation: ASTM C136 and ASTM C117 with the following additional requirements:

Sieve Size	Percent Passing By Weight
1 inch	100
3/8 inch	50 to 85
4	35 to 65
10	25 to 50
40	15 to 25
200	5 to 15

- a. Fraction passing the Size 200 sieve less than two thirds of fraction passing Size 40 sieve.
2. Clay lumps and friable particles: ASTM C142, 0.5 percent maximum.
3. Wear: ASTM C131, 40 percent maximum.
4. Absorption: ASTM C127, 0.5 percent maximum.
5. Soundness: ASTM C88, weighted average loss 15 percent maximum after five cycles of magnesium sulfate tests.

### **PART 3 - EXECUTION**

#### **3.01 PLACING MATERIAL:**

- A. The subgrade shall have been graded, shaped and compacted as required by the plans and specifications. The top of the subgrade required special attention to obtain uniform density. A uniformly smooth surface compacted to specifications is required, containing no ruts, pot holes, loose soil or any imperfection retaining water on the surface. The surface shall be inspected by the engineer and if surface fails to conform to specifications the engineer may require blading, rolling and compacting to provide a satisfactory surface.
- B. Do not place material on subgrade that is muddy, rutted or frozen or has standing water.
- C. The sub-ballast material shall be transported and delivered to the site in a manner that will prevent separation or loss of material. The material shall be placed in layers of 3 inches to 6 inches (or as directed by the engineer) and compacted to a depth and density as required by the plans and specifications.
- D. Prior to placing materials, repair subgrade using sub-ballast.
- E. Place material to provide uniformity of grading throughout work.
- F. If subgrade is dusty, sprinkle it prior to placing sub-ballast.
- G. Install sub-ballast to shape and compacted thickness shown.
  1. Where compacted thickness is six inches or less, place sub-ballast in one layer.
  2. Where compacted thickness is more than six inches, place material in two or more layers of equal thickness of not more than six inches each.
- H. Vehicular traffic is to be kept to a minimum across the newly prepared sub-ballast surface. The contractor shall be responsible for maintaining a firm, true and smooth surface compacted to the required density until track ballast is placed on the sub-ballast.

#### **3.02 COMPACTION:**

- A. During placing and compacting, maintain moisture content within specified tolerance.
- B. Compact material for its full depth to 100 percent of maximum dry density.

#### **3.03 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  1. Construct surface of sub-ballast to the following tolerances:
    - a. Within 0.1 foot of elevation shown.
    - b. Deviation not more than ½ inch from 10-foot straightedge.
  2. During compaction maintain moisture content within two percent of optimum moisture content.
- B. Tests:

1. Determine optimum moisture content and maximum dry density in accordance with ASTM D698.
2. Determine in-place density and moisture content in accordance with ASTM D6938.

#### **PART 4 -MEASUREMENT AND PAYMENT**

##### **4.01 MEASUREMENT**

- A. Measurement of work specified in this Section will be made in the following manner:
  1. No separate measurement.

##### **4.02 PAYMENT**

- A. Compensation for work specified in this Section will be made in the following manner:
  1. Included in the price of the work of which it is a part.

**END OF SECTION**

## SECTION 02727

### BALLAST

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies furnishing mineral aggregate for use as ballast for ballasted track construction.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. CE: CRD-C 119.
  - 3. ASTM: C88, C117, C127, C131, C 136, C142, C535.
  - 4. AREMA: Chapter 1-2-1, (Volume 1), **latest edition**.
- B. Source:
  - 1. Obtain approval prior to installation.
  - 2. Do not change ballast or source without approval.
- C. Inspection:
  - 1. The Engineer has the right to stop delivery of material to job site by visual inspection, pending sampling and testing.
  - 2. If material loaded, being loaded or installed does not conform to specified requirements, the Engineer will reject the material and no further delivery will be accepted until the deficiency has been corrected.
  - 3. Replace defective material.
- D. Testing **and Sampling**:
  - 1. Subject ballast to specified tests, except gradation test, at an approved independent testing facility.
  - 2. Conduct testing, except gradation test, to determine if ballast meets specified requirements.
  - 3. Visual inspection and gradation testing will be made by the Engineer:
    - a. 30 days prior to initial delivery.
    - b. Immediately prior to placement on the track bed.
    - c. Each 4,000 tons of ballast delivered.

**WMATA, or its representatives, reserve the right to visit the producers facility during usual business hours unscheduled to a) observe sampling and testing procedures, b) obtain samples of the prepare material being produced and shipped, and c) review plant inspection methods, quality control procedures, equipment and examine test results of current and previous tests.**
  - 4. **Prior to installation, the supplier shall provide the Engineer with certified results of ballast quality and gradation as conducted by a testing laboratory accepted by the Engineer. The supplier shall receive approval of the Engineer for the Testing Laboratory prior to performing the aforementioned tests.**

4. Recommended limiting values of testing for ballast material:

Property	Ballast Material							
	Granite	Traprock	Quartzite	Limestone	Dolomitic Limestone	Blast Furnace Slag	Steel Furnace Slag	ASTM Test
% Material Passing No. 200 Sieve	1.0%	1.0%	1.0%	1.0%	1.0%	1.0%	1.0%	C 117
Bulk Specific Gravity (See Note 2)	2.60	2.60	2.60	2.60	2.65	2.30	2.90	C 127
Absorption %	1.0	1.0	1.0	2.0	2.0	5.0	2.0	C127
Clay Lumps & Friable Particles	0.5%	0.5%	0.5%	0.5%	0.5%	0.5%	0.5%	C 142
Degradation	35%	25%	30%	30%	30%	40%	30%	See Note 1
Soundness (Sodium Sulfate) 5 cycles	5.0%	5.0%	5.0%	5.0%	5.0%	5.0%	5.0%	C 88
Flat and/or Elongated Particles	5.0%	5.0%	5.0%	5.0%	5.0%	5.0%	5.0%	D 4791
<p>Note 1: Materials having gradation containing particles retained on the 1 inch sieve shall be tested by ASTM C 535. Materials having gradations with 100% passing the 1 inch sieve shall be tested by ASTM C 131. Use grading most representative of ballast material gradation.</p> <p>Note 2: The limit for bulk specific gravity is a minimum value. Limits for the remainder of the tests are maximum values.</p>								

**1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Samples:
    - a. 200-pound samples for gradation test unless otherwise directed by the Engineer. Submit 30 days prior to shipping ballast to work site.
  2. Certification:
    - a. Certificates:

- 1) Submit source of supply sufficiently in advance to obtain approval not less than 30 days prior to anticipated date of commencing installation.
  - b. At time of delivery, submit certificates attesting that material furnished is typical of that tested and conforms to specified requirements.
3. Certified test results:
  - a. Submit not less than two weeks prior to shipping ballast to work site.
4. Handling Procedures: Submit the proposed method of handling.

#### **1.04 PRODUCT DELIVERY, HANDLING, AND STORAGE:**

- A. Deliver, handle, and store the material by methods which prevent damage, fouling and segregation.
- B. The aggregate production facility shall be of such design to permit production and or blending without excessive working of the materials and the facility must be approved by the purchaser.
- C. Blending, stockpiling and other production and handling operations shall be managed by the producer to minimize segregation of the finished product. Stockpiling operations shall be minimize as practical the breakage or excessive fall in stockpiling operations and the movement of wheeled or tracked machines over stockpiled materials shall be limited.
- D. Processed ballast shall be washed and/or rescreened as necessary to remove fine particle contamination as defined by the specification or as directed by WMATA prior to stockpiling in operations using stockpiles or immediately prior to loading operations.
- E. The following are prohibited:
  1. Storage of ballast in cone-shaped piles.
  2. Subjecting ballast to repeated passes of equipment over same levels in stockpile area.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Ballast: Crushed stone from diabase rock, hard, strong, angular, durable, free from injurious amounts of deleterious substances, with the following additional requirements:

1. Gradation:

SIEVE SIZE	PERCENT PASSING BY WEIGHT	
	AREA SIZE 4 Mainline	AREA SIZE 5 Yard
2 inches	100	-
1-1/2 inches	90 to 100	100
1 inch	20 to 55	30 to 70
3/4 inch	0 to 15	0 to 20
1/2 inch	-	0 to 8
3/8 inch	0 to 5	-
Size 4	-	-

2. Fine particles: Material finer than Size 200 sieve, ASTM C117, one percent by weight maximum.
3. Flat and elongated particles: CE CRD-C 119, five-percent maximum.
4. Clay lumps and friable particles: ASTM C142, 0.5-percent maximum.
5. Wear: ASTM C535, 40-percent maximum.
6. Absorption: ASTM C127, 1.5-percent maximum.
7. Soundness: ASTM C88, 5-percent maximum loss after five cycles of the sodium-sulfate test.

**PART 3 - EXECUTION**

**3.01 INSTALLATION:**

- A. Install ballast in accordance with the ballasted trackwork construction requirements of [WMATA Specification Section 5652](#).

**PART 4 - MEASUREMENT AND PAYMENT**

**4.01 MEASUREMENT**

- A. Measurement of work specified in this Section will be made in the following manner:
  1. No separate measurement.

**4.02 PAYMENT**

- A. Compensation for work specified in this Section will be made in the following manner:
  1. Included in the price of the work of which it is a part.

**END OF SECTION**

**SECTION 02740**  
**(Version 1)<sup>\*1</sup>**

**BITUMINOUS PAVEMENT**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing asphaltic surface, binder and base courses on prepared subgrade or previously constructed base course in conformance with sections, lines and grades shown.
- B. Related Work Specified Elsewhere:
  - 1. Base for pavements: Section 02725.

**1.02 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Certification:
    - a. For each delivery of asphaltic material, submit certificate stating type and amount of asphalt and results of specified tests.
  - 2. Documentation:
    - a. Job-mix formula:
      - 1) For each mix to be supplied submit job-mix formula based on expected production averages.
      - 2) In formula establish:
        - a) Weight percent of total aggregate and of aggregate finer than each required sieve size.
        - b) Weight percent of total mix of asphalt cement.
        - c) Temperature of mix when placed.
      - 3) Maintain job-mix formula once approved.
    - b. Weight ticket: For each load of bituminous mixture delivered to the site, submit weight ticket showing the following:
      - 1) Mix type.
      - 2) Mix temperature.
      - 3) Identification of the truck.
      - 4) Tare weight of truck.
      - 5) Loaded weight of truck.
      - 6) Net weight of load.
      - 7) Time of leaving mix plant.
      - 8) Signature of the Engineer's plant representative.

**1.03 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. MSHA. <sup>\*2</sup>
  - 3. VDOT. <sup>\*3</sup>
  - 4. AASHTO: M6, M29, M43, M45, M76, M79, M140, M156, M208, T30, T164, T165, T168. <sup>\*4</sup>
  - 5. AASHTO: M6, M29, M43, M45, M76, M79, M82, M140, M156, M208, T30, T164, T165, T168. <sup>\*5</sup>
  - 6. ASTM: D2950, D3515. <sup>\*6</sup>
  - 7. ASTM: D3515. <sup>\*7</sup>

- B. Sources of Supply:
1. Not less than 20 days prior to beginning the work, inform the Engineer of the source of the materials to be used and obtain approval.
  2. Once approved, do not change source of supply.
  3. Do not construe approval as approval of entire location but as approval only insofar as material continues to meet specified requirements.
  4. Maintain quality of material. Material may be sampled and tested by the Engineer as often as the Engineer deems necessary.
  5. The Engineer has the right to reject material at the job site by visual inspection pending sampling and testing.

#### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Delivery Trucks:
1. For transporting bituminous, mixtures use trucks which show no leakage of oil or grease, have solid metal dump-type beds which are clean and smooth with tight fitting rear gate to prevent loss of materials in transit.
  2. Prior to loading, spray inside surface of truck beds with minimum amount of approved thin oil or mixture of lime and water proportioned 50 gallons of water to 100 pounds of lime necessary to prevent adhesion of the mixture. Do not use kerosene, gasoline or excessive amount of oil.
  3. Equip trucks with coverings to protect loads from weather and with suitable insulation to prevent undue heat loss during transit at temperatures below 40F.
- B. Weighing of Bituminous Mixtures:
1. Provide approved truck scales having both dial and automatic printer or use public scales.
  2. Use scales complying with applicable laws, ordinances and regulations governing use of scales.
  3. Have scales tested and sealed by authorized public official as often as directed to ensure their accuracy.
  4. At least once a week, check tare weight of each truck with full load of fuel and fitted with its equipment.

#### 1.05 JOB CONDITIONS:

- A. Environmental Requirements:
1. Do not place bituminous pavement on wet surfaces.
  2. Place bituminous pavement when temperature of air and base exceed 40F.

### PART 2 - PRODUCTS

#### 2.01 MATERIALS:

- A. Asphalt Cement: AASHTO \_\_\_\_\_.<sup>\*8</sup>
- B. Asphalt Cement: AASHTO \_\_\_\_\_, Table 2, with no requirement for maximum loss on heating.<sup>\*9</sup>
- C. Cut-Back Asphalt for Prime Coat: Equivalent to AASHTO \_\_\_\_\_.<sup>\*10</sup>
- D. Cut-Back Asphalt, AASHTO M82, \_\_\_\_\_. Note 4 option applies.<sup>\*11</sup>

- E. Emulsified Asphalt for Tack Coat: SS-1, SS-1h, CSS-1, or CSS-1h, diluted one-part water to one-part emulsified asphalt. Prior to dilution, emulsified asphalt to comply with AASHTO M140 or AASHTO M208. Apply at rate of 0.05 to 0.15 gallons per square yard.
- F. Aggregate: Coarse and fine aggregate to be free from substantial portions of serpentine or talc materials or carbonate aggregates containing less than 25 percent by weight insoluble residue retained between Size 10 and Size 200 sieves as determined by leaching samples with 6N hydrochloric acid.
1. Coarse aggregate: Crushed stone, AASHTO M79 and AASHTO M76 except for grading. Weight loss not to exceed 15 percent by weight when subjected to five alterations of magnesium sulfate soundness test.
  2. Fine aggregate for hot asphaltic concrete: Consisting of one or a combination of the following materials:
    - a. Material conforming to AASHTO M6 with the following additional requirements:
      - 1) When the material is subjected to five alternations of the magnesium sulfate soundness test, weighted loss not exceeding 12 percent by weight; amount of deleterious substances not exceeding following maximum permissible percent limits by weight:
        - a) Clay lumps: 0.5.
        - b) Coal and lignite: 0.25.
        - c) Material passing size 200 sieve: 3.0.
        - d) Other deleterious substances, such as shale, alkali, mica, coated grains, soft and flaky particles: 2.0.
    - b. Material conforming to specified requirements for No. 10 coarse aggregate in accordance with AASHTO M43.
  3. Fine aggregate for sheet asphalt binder: AASHTO M45, with the following additional requirements:

Sieve Designation	Percentage By Weight Passing Square Mesh Sieves
8	100
50	15 - 40
100	0 - 10
200	0 - 5

4. Fine aggregate for sheet asphalt surface: AASHTO M29, with the following additional requirements:

Sieve Designation	Percentage By Weight Passing Square Mesh Sieves
4	100
10	95 - 100
40	55 - 80
80	15 - 40

5. Mineral filler:

Sieve Designation	Percentage By Weight Passing Square Mesh Sieves
30	100
50	95 - 100
200	70 - 100

**2.02 MIXES:**

- A. Provide mixes in accordance with ASTM D3515 and as specified.
- B. Proportion constituents of job mixes within limits specified in Table 02740-1.
- C. Submit mixes as directed for evaluation of job-mix formula, with bulk specific gravity determined in accordance with AASHTO T165.

**2.03 TEMPERATURE OF MIXES:**

- A. Maintain temperature of mixes within plus-or-minus 25F of that given in job-mix formula. Temperature ranges as specified in Table 02740-2.

**PART 3 - EXECUTION**

**3.01 EQUIPMENT:**

- A. Equipment for Preparing Bituminous Material:
  - 1. Use bituminous paving material prepared in mixing plant conforming to AASHTO M156.
- B. Equipment for Spreading and Finishing Bituminous Material:
  - 1. Use equipment capable of placing material at widths ranging from eight to twelve feet by increments of one foot and at varying thickness.
  - 2. Use machines which spread bituminous mixture without tearing surface. Achieve finish that is smooth, true to cross section, uniform in density and texture and free from hollows, corrugations and other irregularities.
- C. Equipment for Compacting:
  - 1. Provide approved equipment capable of compacting materials to specified Marshall density.

**3.02 BASE PREPARATION:**

- A. Prior to placing bituminous mixture, check line, grade and cross section of underlying course. Repair defective areas.
- B. Have base approved, prior to placement of surface course.
- C. Aggregate and Soil Aggregate Bases:
  - 1. Apply cut-back asphalt primer at rate of 0.2 to 0.5 gallons per square yard when base is damp but with no standing water.

2. Allow 24 hours for base to entirely absorb primer. Blot excess primer with just enough sand to prevent pickup under traffic. Sweep loose sand from base before placing base course.
- D. Portland Cement Concrete, Bituminous and Brick Pavement Bases:
1. Apply tack coat using equipment designed for that purpose.
  2. Apply tack coat uniformly to clean dry base at rate of 0.05 to 0.15 gallons per square yard.
  3. Ensure that surface has cured and is satisfactorily tacky before placing mix.
- E. Immediately prior to placing mix, apply thin coat of hot asphalt cement to contact surfaces of curbs, gutters, manholes and similar structures.

### **3.03 PLACING MIX:**

- A. Place base course mixture in one or more lifts with asphalt paver or spreader to provide nominal compacted thickness as shown. Place surface course mixture with asphalt paver to provide nominal compacted thickness as shown. Minimum lift thickness at least two times maximum particle size. Maximum lift thickness to be that which can be demonstrated to be laid in a single lift and compacted to required uniform density and smoothness. Place material in continuous operation. Correct irregularities before final compaction of mixture.
- B. If equipment being used produces tracks, pulling, indented areas or other permanent blemishes in material being spread, remove such equipment from site and substitute other approved spreading and finishing equipment.
- C. Do not permit direction of movement of paving equipment to be changed by turning on newly completed base, binder or surface courses.
- D. Adjacent to headers, gutters, manholes and similar structures, place surface course so that finished surface is 1/4-inch above edge of structure.
- E. When the Engineer considers it impractical to place mix with two machines, one machine will be permitted. Treat joints created by such operation as cold joints.
- F. Rake joints to eliminate seams between lane passes.

### **3.04 COMPACTION:**

- A. Compact immediately after placing. Initial rolling with steel-wheel tandem roller, steel three-wheel roller, vibratory roller, or pneumatic-tire roller following paver as closely as possible, oriented with drive wheel closest to paver. If intermediate rolling is needed, use pneumatic-tire roller immediately behind initial rolling. Final rolling to eliminate marks from previous rolling. Use vibrating plate compactor or hand tamper to achieve thorough compaction in areas too small for roller. Keep steel wheel rollers wet while rolling.

### **3.05 COLD JOINTS:**

- A. Longitudinal: Apply tack coat to cold material before joining new work.
- B. Transverse: Place bulkhead full depth of course or cut back minimum of three inches from sloping surface with masonry saw. Apply tack coat to cold material.

### **3.06 BULKHEADS:**

- A. Where placement of mix is to be discontinued for such period of time that material will fall below specified street temperature, place suitable bulkhead.
- B. Construct cold joint as specified when work is resumed.

**3.07 HANDWORK:**

- A. When approved, perform bituminous paving work by hand in areas inaccessible to machines.
- B. Undertake handwork using equipment designed and approved for purpose.
- C. Perform handwork so that resulting paving meets specified requirements.

**3.08 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  - 1. Thickness: Place bituminous pavement to within tolerance of plus-or-minus 1/8 inch of thickness shown.
  - 2. Surfaces: Construct surfaces to the following tolerances:
    - a. Base courses to within plus-or-minus 3/8 inch of elevation shown.
    - b. Surface courses to within plus-or-minus 3/16 inch of elevation shown.
    - c. Surfaces to deviate no more than 1/4 inch in the length of 10-foot steel straightedge, not cumulative.
    - d. During compacting, screed surface using straightedge as specified in Section 02750. Adjust rolling procedures so that tolerances are met.
  - 3. Densities required:
    - a. Base courses: 94 percent of Marshall density. <sup>\*12</sup>
    - b. Base courses: 95 percent of Marshall density. <sup>\*13</sup>
    - c. Surface courses: 96 percent of Marshall density.
- B. Testing:
  - 1. Mixes:
    - a. During course of the work submit mixes as directed for testing of gradation and bitumen content in accordance with AASHTO T30 and AASHTO T164 on random samples selected in accordance with AASHTO T168.
  - 2. Determine density of base and surface courses by one of the following methods:
    - a. Test base and surface courses for density and thickness with a nuclear density meter in accordance with ASTM D2950. <sup>\*14</sup>
      - 1) Compute average thickness of base and surface courses from average density and weight per square yard of paving mixture actually used as follows:

$$t = \frac{W}{0.75 d}$$

Where:

t = pavement thickness, in inches.

W = average weight of base or surface mixture actually used, pounds per square yard.

d = compacted density of base or surface course as measured by the nuclear device, pounds per cubic foot.

0.75 = constant.

- b. Not used. <sup>\*\*15</sup>
- c. Test base and surface courses for density by taking test cores at designated locations for testing by the Engineer, number of cores not exceeding one core per 500 square yards of bituminous pavements or two cores per shift, whichever is greater. <sup>\*\*16</sup>
  - 1) Wherever deficient pavement is discovered take such additional cores as directed.
  - 2) Repair core holes promptly using the same mix that was cored; where cores are taken through both base course and surface course simultaneously, use surface course mix for repair work.
- d. Test base and surface courses for density by taking test cores at designated locations for testing by the Engineer, number of cores not exceeding one core per 500 square yards of bituminous pavements or three cores per shift, whichever is greater. <sup>\*\*17</sup>
  - 1) Wherever deficient pavement is discovered take such additional cores as directed.
  - 2) Repair core holes promptly using the same mix that was cored; where cores are taken through both base course and surface course simultaneously, use surface course mix for repair work.

### **3.09 PROTECTION OF BITUMINOUS PAVEMENT:**

- A. Obtain approval for use of pavement by public and construction traffic.
- B. Do not permit traffic to cross uncompleted longitudinal joints.

### **3.10 DEFICIENT PAVEMENT:**

- A. Where directed, replace with new material or repair bituminous pavement that does not meet specified requirements.
- B. Pavement is considered deficient if the densities of three cores from one day's work are below 95 percent or if the density of one core is below 90 percent. <sup>\*\*18</sup>

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

**ENDNOTES:**

\*1. Use first version of SECTION 02740 BITUMINOUS PAVEMENT for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia except as noted. (Use second version for contracts where bituminous pavement work is performed within the jurisdiction of the District of Columbia.)

\*2. Use first version of 1.3 A.2. for contracts where bituminous pavement work is performed within the jurisdiction of the State of Maryland.

\*3. Use second version of 1.3 A.2. for contracts where bituminous pavement work is performed within the jurisdiction of the Commonwealth of Virginia.

\*4. Use first version of 1.3 A.3. for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia and Prince Georges County, Maryland.

\*5. Use second version of 1.3 A.3. modification for contracts where bituminous pavement work is performed within the jurisdiction of Prince Georges County, Maryland.

\*6. Use first version of 1.3 A.4. for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia and Prince Georges County, Maryland.

\*7. Use second version of 1.3 A.4. modification for contracts where bituminous pavement work is performed within the jurisdiction of Prince Georges County, Maryland.

\*8. Use first version of 2.1 A. for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia and Prince Georges County, Maryland

- \*9. Use second version of 2.1 A. modification for contracts where bituminous pavement work is performed within the jurisdiction of Prince Georges County, Maryland.
- \*10. Use first version of 2.1 B. for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia and Prince Georges County, Maryland.
- \*11. Use second version of 2.1 B. modification for contracts where bituminous pavement work is performed within the jurisdiction of Prince Georges County, Maryland.
- \*12. Use first version of 3.8 A.3.a. for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia and Prince Georges County, Maryland.
- \*13. Use second version of 3.8 A.3.a. modification for contracts where bituminous pavement work is performed within the jurisdiction of Prince Georges County, Maryland.
- \*14. Use first version of 3.8 B.2.a. including (1) for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia and Prince Georges County, Maryland.
- \*15. Use second version of 3.8 B.2.a. modification for contracts where bituminous pavement work is performed within the jurisdiction of Prince Georges County, Maryland.
- \*16. Use first version of 3.8 B.2.b. including (1)-(2) for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia and Prince Georges County, Maryland.
- \*17. Use second version of 3.8 B.2.b. including (1)-(2) modification for contracts where bituminous pavement work is performed within the jurisdiction of Prince Georges County, Maryland.
- \*18. Add 3.10 B. for contracts where bituminous pavement work is performed within the jurisdiction of Prince Georges County, Maryland.
- \*19. Use first version of TABLE 02740-1 for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia and Prince Georges County, Maryland.
- \*20. Use second version of TABLE 02740-1 modification for contracts where bituminous pavement work is performed within the jurisdiction of Prince Georges County, Maryland.

**END OF SECTION**

**SECTION 02740**  
**(Version 2)<sup>\*1</sup>**

**BITUMINOUS PAVEMENT**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing bituminous pavements complete in place as shown; placed on bases prepared under Section 02725, Base for Pavements and under Section 02750, Concrete Pavement.
- B. Related Work Specified Elsewhere:
  - 1. Base for pavements: Section 02725.
  - 2. Concrete pavement: Section 02750.
- C. Definitions:
  - 1. Equipment: This includes such specialized devices and tools as are customarily used in the construction of bituminous pavements; e.g., lutes, rakes, irons.

**1.02 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Certification:
    - a. For each delivery of asphaltic material, submit certificate stating type and amount of asphalt and results of specified tests.
  - 2. Documentation:
    - a. Job-mix formula:
      - 1) For each mix to be supplied submit job-mix formula based on expected production averages.
      - 2) In formula establish:
        - a) Weight percent of total aggregate and of aggregate finer than each required sieve size.
        - b) Weight percent of total mix of asphalt cement.
        - c) Temperature of mix when placed.
      - 3) Maintain job-mix formula once approved.
    - b. Weight ticket: For each load of bituminous mixture delivered to the site, submit weight ticket showing the following:
      - 1) Mix type.
      - 2) Mix temperature.
      - 3) Identification of the truck.
      - 4) Tare weight of truck.
      - 5) Loaded weight of truck.
      - 6) Net weight of load.
      - 7) Time of leaving mix plant.
      - 8) Signature of the Engineer's plant representative.

**1.03 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: M6, M17, M20, M29, M43, M45, M76, M79, M81, M82, M140, T30, T164, T165, T168.

3. ASTM: D3515.
- B. Sources of Supply:
1. Not less than 20 days prior to beginning the work, inform the Engineer of the source of the materials to be used and obtain approval.
  2. Once approved, do not change source of supply.
  3. Do not construe approval as approval of entire location but as approval only insofar as material continues to meet specified requirements.
  4. Maintain quality of material. Material may be sampled and tested by the Engineer as often as the Engineer deems necessary.
  5. The Engineer has the right to reject material at the job site by visual inspection pending sampling and testing.
  6. Provide mix for a given area as defined by the Engineer from one mixing plant.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Delivery Trucks:
1. For transporting bituminous, mixtures use trucks which show no leakage of oil or grease, have solid metal dump-type beds which are clean and smooth with tight fitting rear gate to prevent loss of materials in transit.
  2. Prior to loading, spray inside surface of truck beds with minimum amount of approved thin oil or mixture of lime and water proportioned 50 gallons of water to 100 pounds of lime necessary to prevent adhesion of the mixture. Do not use kerosene, gasoline or excessive amount of oil.
  3. Equip trucks with coverings to protect loads from weather and with suitable insulation to prevent undue heat loss during transit at temperatures below 40F.
- B. Weighing of Bituminous Mixtures:
1. Provide approved truck scales having both dial and automatic printer or use public scales.
  2. Use scales complying with applicable laws, ordinances and regulations governing use of scales.
  3. Have scales tested and sealed by authorized public official as often as directed to ensure their accuracy, and within the six months prior for use for the work. The Engineer has the option to require retesting and resealing.
  4. At least once a week and whenever directed by the Engineer, check tare weight of each truck with full load of fuel and fitted with its normal equipment.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
1. Do not place bituminous pavement on wet surfaces.
  2. Place bituminous pavement only when temperature of air and base exceed 40F and when by U.S. Weather Bureau forecast, the temperature is expected to remain above 40F during the course of the work.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Asphalt Cement: AASHTO M20, Penetration Grade 85-100.
- B. Cut-Back Asphalt for Prime Coat: AASHTO M82, Grade MC-30 or MC-70 as conditions warrant.

- C. Emulsified Asphalt for Tack Coat: As conditions warrant, use either of the following:
1. AASHTO M81, Cut-Back Asphalt (Rapid-Curing Type), Grade RC-70.
  2. AASHTO M140, Emulsified Asphalt, Grade SS-1 or SS-1h, diluted with water in the volumetric ratio of three parts emulsion to one part water.
- D. Aggregate: Coarse and fine aggregate free from substantial portions of serpentine or talc materials or carbonate aggregates containing less than 25 percent by weight insoluble residue retained between Size 10 and Size 200 sieves as determined by leaching samples with 6N hydrochloric acid.
1. Coarse aggregate: Crushed stone, AASHTO M79 and AASHTO M76 except for grading. Weight loss not to exceed 15 percent by weight when subjected to five alternations of magnesium sulfate soundness test.
  2. Fine aggregate for hot asphaltic concrete: Consisting of one or a combination of the following materials:
    - a. Material conforming to AASHTO M6 with the following additional requirements:
      - 1) When the material is subjected to five alternations of the magnesium sulfate soundness test, weighted loss not exceeding 12 percent by weight; amount of deleterious substances not exceeding following maximum permissible percent limits by weight:
        - a) Clay lumps: 0.5.
        - b) Coal and lignite: 0.25.
        - c) Material passing size 200 sieve: 3.0.
        - d) Other deleterious substances, such as shale, alkali, mica, coated grains, soft and flaky particles: 2.0.
    - b. Material conforming to specified requirements for No. 10 coarse aggregate in accordance with AASHTO M43.
  3. Fine aggregate for sheet asphalt binder: AASHTO M45, with the following additional requirements:

Sieve Designation	Percentage By Weight Passing Square Mesh Sieves
8	100
50	15 - 40
100	0 - 10
200	0 - 5

**THIS SPACE NOT USED.**

4. Fine aggregate for sheet asphalt surface: AASHTO M29, with the following additional requirements:

Sieve Designation	Percentage By Weight Passing Square Mesh Sieves
4	100
10	95 - 100
40	55 - 80
80	15 - 40
200	0 - 5

5. Mineral filler: Limestone dust, hydrated lime, or portland cement, AASHTO M17; uniformly graded, non-plastic, free from lumps, balls or foreign materials, and having a maximum moisture content of 0.5 percent when incorporated into the bituminous mix.

6.

**2.02 MIXES:**

- A. Provide mixes in accordance with ASTM D3515 and as specified.
- B. Proportion constituents of job mixes within limits specified in Table 02740-1.
- C. Submit mixes as directed for evaluation of job-mix formula, with bulk specific gravity determined in accordance with AASHTO T165.

**2.03 TEMPERATURE OF MIXES:**

- A. Maintain temperature of mixes within plus-or-minus 25F of that given in job-mix formula. Temperature ranges as specified in Table 02740-2.

**PART 3 - EXECUTION**

**3.01 EQUIPMENT:**

- A. General:
  - 1. The requirements specified for equipment are pursuant to the equipment provisions of the General Provisions.
  - 2. The requirements specified for equipment are not intended to be complete; rather, the intent is that the characteristic equipment be used to produce certain of the required results.
  - 3. Suitability of the equipment is a determination made by the Engineer that the equipment will produce the required results.
- B. Batch-Type Bituminous Mixing Plants: Of sufficient capacity to adequately handle the proposed construction; maintained in good mechanical condition; equipped with the necessary scales and measures to ensure proper proportioning of ingredients; and designed, coordinated and operated so as to produce a mixture within the job-mix tolerances. Ensure that defects which would adversely affect the proper functioning of the plants or the quality of the mixture are replaced or repaired immediately upon instruction from the Engineer.
  - 1. Tanks for storage of bituminous material: Capable of heating the material, always under effective and positive control, to specified temperature requirements.

- a. Heating: Accomplished by steam coils, electricity or other means so that no flame can come in contact with the heating tank, and so that uniform heating of the entire contents is provided.
  - b. Circulating system for the bituminous material: Of adequate size to ensure the proper and continuous circulation during the entire operating period.
  - c. Pipelines and fittings: Steam-jacketed or otherwise properly insulated to prevent heat loss.
  - d. Provide separate tanks and delivery lines for each grade of asphalt cement or liquid asphaltic material for mixtures to be produced in the same mixer unit.
2. Feeder for drier: Accurate mechanical means for uniformly feeding the aggregate into the drier so that a uniform production and a uniform temperature may be secured.
    - a. Have each aggregate, except for mineral filler added cold, fed to a central elevator, conveyor or feeder by accurate mechanical means with adjustable gates that will deliver each aggregate in the desired proportion. When more than one cold elevator is used, feed each by a separate feeder unit with the individual controls integrated with a master total control.
    - b. Set and lock the total and proportional controls when so directed by the Engineer.
  3. Driers: Capable of drying and heating the aggregates as specified for any item, and of sufficient capacity to supply the mixing unit at its operating capacity. Drier is to continuously agitate the aggregates during the heating and drying process so that the temperature can be positively regulated.
  4. Screening system for grading the aggregate: Shaker or vibrating type capable of screening the aggregates to specified sizes and proportions, producing a quantity of aggregate sufficient to keep the mixer operating at the rated plant capacity.
    - a. Have screening system equipped with a chute or pipe for removal of oversized aggregate having the discharge end located so as not to create a hazard or nuisance.
    - b. Revolving double-jacketed screens may be accepted if they give satisfactory performance of a maximum plant production.
  5. Storage bins: Of sufficient capacity to supply the mixer when it is operating at full capacity; divided into at least three compartments arranged to ensure separate and adequate storage of appropriate proportions of aggregates; each compartment provided with an adequate overflow opening located so as to prevent backing up of material into other bins.
    - a. Each compartment provided with its individual outlet gate, so designed and constructed that when closed there will be no leakage; gates cutting off quickly and completely.
    - b. Have discharge points of overflow located so that they will not create a hazard or nuisance.
    - c. Bins equipped with adequate tell-tale devices to indicate the position of the aggregate in the bins at the lower quarter points.
    - d. Provide separate dry storage for the mineral filler.
  6. Bituminous control unit: Satisfactory means, either by weighing, metering or volumetric measurements, to obtain the proper amount of bituminous material in the mix within the tolerance specified for the job-mix; with suitable means, either by steam-jacketing or other insulation, for maintaining the specified temperature of the bituminous material in the pipelines, meters, weigh buckets, spray bars, and other containers or flow lines.
  7. Bitumen bucket (if a bucket is used for weighing the bituminous material): Capacity sufficient to hold not less than 20 percent of the weight of aggregate required for one batch; steam-jacketed or equipped with properly insulated electric heating units; and suspended on dial scales or beam scales so that the tare weight of bucket will be shown for each weighing.

- a. Bucket equipped with tell-tale device to accurately control the net weight of bituminous material added to the mix to within two percent above or below the actual weight in pounds required.
  - b. Bucket arranged so that it will deliver molten bitumen in a thin uniform sheet or in multiple streams the full width of the mixer, except in the case of a rotary mixer where bitumen is sprayed.
8. Thermometric equipment: Have plant equipped with the following as approved:
- a. Armored thermometer reading from 200F to 400F, fixed at a suitable location so that the temperature of the bitumen at the bucket or spray bar can be determined.
  - b. Dial-scale, mercury-activated thermometer, electric pyrometer or other approved thermometric instrument, so placed at the discharge chute of the drier as to register automatically or indicate the temperature of the heated aggregate; of such accuracy that the temperature of the aggregate can be maintained within the limits specified; and so located so that its dial is in plain view of the drier fireman or feeder.
9. Mixing time: Positive means to govern the time of mixing and to maintain it constant unless changed by order of the Engineer.
10. Timing devices: Accurate timelock to control the operation of a complete mixing cycle by locking the weight box gate after the charging of the mixer, until the closing of the mixer gate at the completion of the cycle. Timeclock is to lock the bitumen bucket throughout the dry-mixing period and lock the mixer gate throughout the dry-mixing and wet-mixing periods.
- a. Control of the timing is to be flexible and capable of being set at intervals of not more than five seconds throughout cycles up to three minutes.
  - b. A mechanical batch or box counter is to be designed so as to register only upon the actuation of the bucket release and to preclude the register of dry batches or the register of material through the operation of pulling bins.
11. Plant scales: Either the beam or springless-dial type; of a standard make designed as an integral part of the plant; accurate to within one-half percent of the true weight of the load being weighed; having significant graduations that can be easily read to that degree of accuracy; and with dials and indicators in plain view of the operator when on the weighing platform.
- a. Beam-type scales: Balanced on knife edges and fulcrums that are kept clean and constructed so that they will not easily be thrown out of alignment and adjustment; each beam having a locking device which will permit the beam either to be suspended or thrown into action; a separate beam for each size aggregate and a tare beam for balancing the hopper; each aggregate beam equipped with an auxiliary dial or tell-tale that will indicate that the required load to the weighing hopper is being approached and will continue to indicate further movement of the beam after that.
    - 1) For weighing bituminous material, use beam-type scales that are provided with a tare beam and a full-capacity beam.
    - 2) Graduations: Two pounds or smaller.
  - b. Dial scales: Springless and so constructed, installed, and maintained, to be free from vibration; of such size that the numerals on the dial can be easily read from a distance of 25 feet; dials of the compounding type having full complements of index pointers.
    - 1) For weighing asphalt cement, capacity equal to or less than two times the maximum weight of the material to be weighed.
    - 2) Graduations: Such that they can be easily read to the nearest two pounds.
  - c. Weigh box or hopper: Provide means for accurately weighing each bin size of aggregate in a weigh box or hopper suspended on scales and of sufficient size to hold a full batch without hand raking or running over; with gates on both bins and hopper constructed so as to prevent leakage when they are

- closed. Have container supported on knife edges or fulcrums constructed so that it will not easily be thrown out of alignment or adjustment; with edges, ends and sides free from contact with supporting parts that could possibly affect proper weighing; and with adequate clearance of the parts to prevent accumulation of foreign materials. In plants where the weigh box is enclosed for the purpose of minimizing dust nuisance, have some provision made to permit sampling the materials by the Engineer as discharge is made from the storage bins.
- d. Provide ten 50-pound standard test weights at each plant for testing weighing equipment.
12. Mixer unit: Batch mixer of an approved twin-pugmill type or rotary-drum type, with a batch capacity of not less than 2,000 pounds, and capable of producing a uniform mixture within the job-mix tolerances specified; constructed as to prevent leakage of contents until the batch is to be discharged.
    - a. If mixer is the pugmill type, have the clearance of the blades from fixed and moving parts not to exceed 3/4 inch, unless the maximum aggregate particle exceeds 1-1/2 inches.
    - b. If not enclosed, equip the mixer box with a dust hood to prevent loss of dust. When so enclosed, make provision to permit visual inspection of mixing operation by the Engineer.
  13. Dust collectors: When plant is located where dust may be objectionable or become a nuisance or where dust interferes with the efficiency of the operation of the plant, provide proper housing, mixing covers, or dust collecting systems. Make provision to dispose of the material so collected or to return it uniformly to the mixture, as the Engineer may direct.
  14. Safety Requirements:
    - a. Provide a mixer platform sufficiently rigid and of ample size to provide for safe and convenient access to the mixer and pertinent equipment.
    - b. Place adequate and safe stairways to the mixer platform and guarded ladders to other plant units at points where accessibility is necessary during plant operations.
    - c. Thoroughly guard gears, pulleys, chains, sprockets and other dangerous moving parts.
    - d. Always maintain a clear, ample and unobstructed passage in and around the truck loading space. Keep this space free from drippings from the mixing platform.
- C. Continuous-Type Bituminous Mixing Plants: Meet the requirements for batch-type bituminous mixing plants, except for the requirements as to scales and weighing equipment and the requirements for the mixer unit which do not apply. The following are required in continuous mixing plant:
1. Gradation control unit: Means for accurately proportioning aggregate from each bin either by weighing or by volumetric measurement. When gradation control is by volume, have the unit include a feeder mounted under the bin compartments. Equip each bin with an accurately controlled individual gate to form an orifice for volumetrically measuring the material drawn from each bin compartment. Make the orifice of adequate dimensions to provide a positive feed without bridging and with one dimension adjustable by positive mechanical means provided with a lock. Provide indicators graduated from sufficient subdivisions of inches to provide accuracy of measurements, on each gate to show the size of gate opening. If mineral filler is required, proportion it separately, and add it to the mix in such a manner as to ensure uniform distribution.
  2. Weight Calibration of Aggregate Feed: Have plant include a means for calibration of gate openings with weight test samples. Allow materials fed out of the bins through individual orifices to be bypassed to a suitable test box or boxes, the material from each compartment being confined separately. Equip the plant to

handle conveniently test samples of size adequate to provide an accurate gate calibration commensurate with the aggregate size, the gate opening, and the plant capacity setup. Provide an accurate platform scale with a minimum capacity of 500 pounds.

3. Synchronization of Aggregate Feed and Bitumen Feed: Provide satisfactory means to afford positive interlocking control between the flow of aggregate from the bins and the flow of bituminous material from the meter or other proportioning source. Accomplish this control by interlocking mechanical means or by another positive method under the control of the Engineer.
4. Mixer Unit for Continuous Method: Continuous mixer of an approved twin-pugmill type, steam-jacketed and capable of producing a uniform mixture within the job-mix tolerances. Use paddles that are adjustable for angular position on the shafts and reversible to retard the flow of the mix. Have the mixer carry a manufacturer's plate stating the net volumetric contents of the mixer at the several heights inscribed on a permanent gauge. Provide charts showing the rate of feed of aggregate per minute required, controlled by weight method under the following formula. The weights will be determined by tests made by the Engineer.

$$\text{Mixing time in seconds} = \frac{\text{Pugmill dead capacity in lbs.}}{\text{Pugmill output in lbs./sec.}}$$

- D. Trucks for Transporting Bituminous Mixtures: Solid metal, dump-type bed, clean and smooth; with a tight-fitting rear gate to prevent loss of materials while in transit.
  1. Spray the inside surface of the bed with a minimum amount of approved thin oil or a mixture of lime and water proportioned at a rate of 100 pounds of lime to 50 gallons of water, prior to loading, to prevent adhesion of the mixture to the bed. Kerosene and gasoline will not be approved nor will the use of excessive quantities of approved oil be permitted.
  2. Equip each truck with a canvas or other covering of sufficient size to cover the material and protect it from weather. To prevent excessive temperature loss while in transit, equip the trucks with insulating units composed of wood or other approved material between October 15 and March 15, when so directed by the Engineer.
  3. Do not use trucks with appreciable oil leakage that may cause damage to the new bituminous construction.
- E. Bituminous Spreading and Finishing Machines: Use spreading and finishing machine that operates without side forms and of a self-propelled type approved by the Engineer and equipped with the following features:
  1. An efficient steering device of both forward and reverse traveling speeds.
  2. Adjustments, of the manufacturer's standard design, that permit the bituminous material to be placed to a maximum width of not less than 12 feet and to a minimum width of 8 feet; the adjustments made in increments of one foot or less.
  3. Devices to adjust the thickness of material being placed, with suitable hopper for receiving the material, and with distributing screws, rake bars, or similar for evenly placing the mixture in front of the screed.
  4. The screed is a strike-off device operated by cutting, crowding or other practicable action that is effective on the bituminous mixture being placed, that is equipped with a heater, that produces a finished surface of uniform texture, and that is adjustable to the shape of the cross section of the finished surface.
  5. Joint-leveling or joint-blending devices for smoothing and adjusting longitudinal joints between adjacent layers of the same thickness.
  6. Ability to spread the bituminous mixture without tearing the surface and to strike a finish that is smooth, true to cross section, uniform in density and texture, and free from hollows, corrugations and other irregularities.
- F. Tools for Finishing Asphalt Surfaces:

1. Asphalt lute: Wood, with a blade six feet in length, six inches in width, and one-half inch in thickness; edged on the contact surface; with the handle 16 feet in length, to one end of which the blade is firmly affixed with adequate bracing.
  2. Rakes: Metal, not be less than 14 inches wide; with tines of sufficient depth to penetrate and rake the material for its full depth.
  3. Smoothing irons: Metal, weighing not less than 40 pounds; with bearing surface not be less than 80 square inches.
  4. Hand tampers for compaction of bituminous material in locations inaccessible to rollers: Metal, weighing not less than 25 pounds, with tamping face of not less than 48 square inches.
- G. Rollers: Use rollers that are in first-class mechanical condition, complying with the requirements for the individual items as to classifications, weights and service requirements. Use tandem and three-wheel rollers that are power-driven, always capable of being reversed smoothly, and free from backlash, loose-link motion, faulty steering mechanism, and worn king bolts and bearings. A roller of these types that has been improperly weighted or that has in any way been thrown out of its original balance by the application of attachments not approved or not the manufacturer's original standard design will not be permitted on the project; nor will any roller that does not have displayed thereon in permanent legible characters the manufacturer's guaranteed net operating weight as distributed on each axle be permitted on the project. The net operating weight is the actual net weight plus one-half of the total maximum weight of fuel and water. Ensure that rolls have closely fitting spring scrapers, adjustable for forward and reverse motion.
1. Two-Axle Tandem Rollers: Of rigid construction with the following features:
    - a. Having a low center of gravity and balanced on the longitudinal axis, smooth operating friction clutches of the reversing type, smooth operating brakes, both hand-operated and power-operated steering devices.
    - b. The type of driving mechanism is to be such as to give the lowest side clearance possible.
    - c. Equipped with a water sprinkling system having a tank capacity as indicated in the table below, with the water piped to the spray pipes on each roll, the spray pipe extending the full width of the roll and installed so as to be readily cleanable, the water distributed from the spray pipes through cocoa-fiber mats securely suspended against the rolling surface, and having separate valves to control the flow of water to each roll and if enough pressure is not secured by force of gravity, some satisfactory pressure device installed.
    - d. Minimum compression per inch of width of drive roll may include only the net operating weight of the roller, with the distribution of weight such that not more than 68 percent of the total gross weight is placed upon the drive roll.

**THIS SPACE NOT USED**

Manufacturer's rating, tons	5 - 6	10 - 12	15
Minimum diameter, drive roll, inches	42	60	70
Minimum diameter, guide roll, inches	36	48	50
Minimum rolling width, inches	20	20	20
Minimum compression, per inch width of drive roll, pounds	130	220	300
Minimum water sprinkling tank capacity, gallons	70	100	125

2. Three-Axle Tandem Rollers: Of rigid construction with the following features:
- a. Having a low center of gravity and balanced on the longitudinal axis, smooth operating friction clutches of the reversing type, smooth operating brakes of ample capacity, and power-operated steering devices, with both guide rolls steerable and the ratio of steering synchronized.
  - b. The type of driving mechanism is to be such as to give the lowest side clearance possible.
  - c. Equipped with a water sprinkling system having a tank capacity as indicated in the table below, with the water piped to the spray pipes on each roll, the spray pipe extending the full width of the roll and installed so as to be readily cleanable, the water distributed from the spray pipes through cocoa-fiber mats securely suspended against the rolling surface, and having separate valves to control the flow of water to each roll and if enough pressure is not secured by force of gravity, some satisfactory pressure device installed.
  - d. Minimum compression per inch of width of drive roll may include only the net operating weight of the roller, with the distribution of weight such that not more than 68 percent of the total gross weight is placed upon the drive roll.

**THIS SPACE NOT USED**

Manufacturer's rating, tons	12 - 20
Minimum diameter, drive roll, inches	60
Minimum diameter, guide roll, inches	48
Minimum rolling width, inches	54
Minimum compression, per inch width of drive roll, pounds, all three rollers in same plane	210
Minimum water sprinkling tank capacity, gallons	200

3. Pneumatic-Tire Rollers: Provide the following features:
  - a. Multiple-axle, multiple-wheel type with smooth-tread pneumatic tires of equal size staggered on the axles at such spacing and overlaps as will provide uniform compactive pressure for the full compacting width of the roller when operating. In operating pneumatic-tire rollers, have the tires inflated to the same air pressure, within a tolerance of five pounds, and to the pressure required or designated for use.
  - b. If provided, have oscillation of the wheels in a vertical plane only.
  - c. Capable of being ballasted sufficiently to bring its loaded weight to at least 2-1/2 times its own weight and of exerting compactive ground contact pressures of at least 80 psi. Have the roller ballasted to the extent required or designated; and within limits prescribed above, so that the roller provides the compactive ground pressure per square inch that is most efficient under the conditions and for the purpose of its use, and as directed.
  - d. Furnish to the Engineer charts or tabulations showing the contact areas and contact pressures for the full range of tire inflation pressures and for the full range of tire loadings for each type and size compactor tire furnished.
4. Trench Rollers: Provide the following features:
  - a. Constructed so that the guide roll or wheel either operates in tandem with the compression roll on the area to be compacted or in tandem with the auxiliary wheel or roll.
  - b. An auxiliary wheel or roll that operates outside the area to be compacted, mounted upon an axle having height adjustability so that the contact surface of the auxiliary wheel or roll is capable of being adjusted at least 10 inches above and two inches below the rolling plane of the compression roll or the amount necessary to compact the soils base to the plan elevation. If the guide roll or wheel operates in tandem with the auxiliary roll or wheel, it may or may not be adjustable as to height. Have the auxiliary wheel or roll operate upon the surface of the pavement adjacent to the area to be compacted, and at such a distance from the pavement edge as to cause no change thereto. Keep the auxiliary wheel or roll in such adjustment as to

height that the compression roll will develop a smooth compacted surface true to crown.

- c. Smooth operating friction clutches of the reversing type, smooth operating brake of ample capacity, and either hand-operated or power-operated steering devices.
- d. Compression roll may be of hollow-type construction and the minimum weight secured by liquid ballast; minimum 300 pounds compression per inch of width of compression roll; and minimum width of compaction at least 15 inches.
- e. Maximum rolling speed 1-1/2 miles per hour.
- f. Equipped with sprinkling system having a tank or tanks with total capacity of not less than 50 gallons, with the water piped to the spray pipes on each roll, the spray pipes extending the full width of rolls and installed so as to be readily cleanable, the water distributed from the spray pipes through cocoa-fiber mats securely suspended against the rims of the rolls, and having separate to control the flow of water to each roll and if enough pressure is not secured by force of gravity, some satisfactory pressure device installed.

### **3.02 BASE PREPARATION:**

- A. Prior to placing bituminous mixture, check line, grade and cross section of underlying course. Repair defective areas.
- B. Have base approved, before beginning installation work.
- C. Aggregate and Soil Aggregate Bases:
  - 1. Apply primer using equipment designed for that purpose.
  - 2. When base is dry, uniformly apply primer at rate of application directed, approximately 0.15 gallons per square yard.
  - 3. Allow primer to cure satisfactorily before placing mix.
- D. Portland Cement Concrete, Bituminous and Brick Pavement Bases:
  - 1. Apply tack coat using equipment designed for that purpose.
  - 2. Prior applying tack coat, satisfactorily clean the base and verify that base is dry at time of application.
  - 3. Apply tack coat uniformly to clean dry base at rate as directed by the Engineer, 0.02 to 0.05 gallons per square yard.
  - 4. The Engineer has the right to direct omission of tack coat over new bituminous courses, or to order the tack coat to be "run in" by the use of trucks or other rubber-tire equipment.
  - 5. Ensure that surface has cured and is satisfactorily tacky before placing mix.
- E. Immediately prior to placing mix, apply thin coat of hot asphalt cement to contact surfaces of curbs, gutters, manholes and similar structures.

### **3.03 PLACING MIX:**

- A. Place mix by two or more machines operating in echelon in such manner that joints between lanes are hot. Keep machines clean and free from accumulations of asphaltic materials by acceptable means.
- B. If equipment being used produces tracks, pulling, indented areas or other permanent blemishes in material being spread, remove such equipment from site and substitute other approved spreading and finishing equipment.

- C. Do not permit direction of movement of paving equipment to be changed by turning on newly completed base, binder or surface courses.
- D. Adjacent to headers, gutters, manholes and similar structures, place surface course so that finished surface is 1/4-inch above edge of structure.
- E. When the Engineer considers it impractical to place mix with two machines, one machine will be permitted. Treat joints created by such operation as cold joints.

#### **3.04 COMPACTION:**

- A. Compact as soon as the condition of the mix permits. Have rollers start longitudinally at the extreme sides and proceed toward the center of pavement, overlapping on each successive trip by one-half the width of the rear roll. Diagonally roll surface courses in two directions, the second diagonal crossing the lines of the first. Have rolling proceed in one continuous operation until roller marks are eliminated and until courses required density, specified below under Tolerances.
- B. Perform breakdown rolling with a three-wheel steel-wheel roller designed for the purpose; the weight as required for job conditions.
- C. Perform initial finish rolling and final rolling with at least one 10-ton tandem steel-wheel roller and one three-axle tandem steel-wheel roller designed for the purpose.
- D. When temperature is below 50F, the Engineer may direct the use of a 5-ton tandem roller to seal the surface.
- E. Perform intermediate rolling of sheet asphalt with tandem steel-wheel rollers or with self-propelled pneumatic-tire rollers designed for the purpose, as conditions warrant.
- F. Perform intermediate rolling of hot asphaltic concrete with self-propelled pneumatic-tire rollers designed for the purpose.
- G. For binder courses adjacent to structures where use of rollers is impractical, use hand tampers designed for the purpose.
- H. Use trench rollers designed for the purpose where necessary.

#### **3.05 COLD JOINTS:**

- A. Avoid cold joints; permitted only when necessary in the opinion of the Engineer.
- B. Where mix is to be placed against cold asphaltic material, cut back the cold asphaltic material with a power masonry saw a minimum of three inches so that a vertical face of compacted full-thickness material is exposed. Treat this cut face as a contact surface.

#### **3.06 BULKHEADS:**

- A. Where placement of mix is to be discontinued for such period of time that material will fall below specified street temperature, place suitable bulkhead.
- B. Construct cold joint as specified when work is resumed.

#### **3.07 HANDWORK:**

- A. When approved, perform bituminous paving work by hand in areas inaccessible to machines.
- B. Undertake handwork using equipment designed and approved for purpose.
- C. Perform handwork so that resulting paving meets specified requirements.

**3.08 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  - 1. Thickness: Place bituminous pavement to within tolerance of plus-or-minus 1/8 inch of thickness shown.
  - 2. Surfaces: Construct surfaces to the following tolerances:
    - a. Binder courses to within plus-or-minus 3/8 inch of elevation shown.
    - b. Surface courses to within plus-or-minus 3/16 inch of elevation shown.
    - c. Surfaces to deviate no more than 1/8 inch in the length of 10-foot steel straightedge, not cumulative.
    - d. During compacting, screed surface using straightedge as specified in Section 02750. Adjust rolling procedures so that tolerances are met.
  - 3. Densities required:
    - a. Binder courses: 94 percent of Marshall density.
    - b. Surface courses: 96 percent of Marshall density.
- B. Testing:
  - 1. Mixes:
    - a. During course of the work submit mixes as directed for testing of gradation and bitumen content in accordance with AASHTO T30 and AASHTO T164 on random samples selected in accordance with AASHTO T168.
  - 2. Cores: Test base and surface courses for density by taking test cores at designated locations for testing by the Engineer, number of cores not exceeding one core per 500 square yards of bituminous pavements or two cores per shift, whichever is greater.
    - a. Wherever deficient pavement is discovered take such additional cores as directed.
    - b. Repair core holes promptly using the same mix that was cored; where cores are taken through both binder course and surface course simultaneously, use surface course mix for repair work.

**3.09 PROTECTION OF BITUMINOUS PAVEMENT:**

- A. Obtain approval for use of pavement by public and construction traffic.
- B. Do not permit traffic to cross uncompleted longitudinal joints.

**3.10 DEFICIENT PAVEMENT:**

- A. Where directed, replace with new material or repair bituminous pavement that does not meet specified requirements..

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

**ENDNOTES:**

- \*1. Use second version of SECTION 02740 BITUMINOUS PAVEMENT for contracts where bituminous pavement work is performed within the jurisdiction of the District of Columbia except as noted. (Use first version for contracts where bituminous pavement work is performed outside the jurisdiction of the District of Columbia.)

**END OF SECTION**

**SECTION 02750**  
**(Version 1)<sup>\*1</sup>**

**CONCRETE PAVEMENT**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing portland cement concrete pavement, plain or reinforced or both, in conformance with the sections, lines and grades shown.
- B. Related Work Specified Elsewhere:
  - 1. Base for pavements: Section 02725.
  - 2. Concrete reinforcement: Section 03200.
  - 3. Cast-in-place structural concrete: Section 03300.

**1.02 SUBMITTALS:**

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
  - 1. Joint devices.
- B. Certification: As specified in Section 03300, including design mixes.

**1.03 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: M33, M74, M81, M148, M153, M171, M182, M194, M220, M227, T51, T148.
  - 3. FS: TT-P-86, TT-S-00227.
  - 4. ASTM: A185, A370, A615, C33, C294, C920, D3405.
- B. Concrete: Conform to quality assurance requirements as specified in Section 03300 and this section.
- C. Testing: Subject concrete for pavements to test procedures specified in Section 03300.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Aggregates and Cement: As specified in Section 03300.

**1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  - 1. Do not place concrete on frozen soil base.
  - 2. Apply joint sealer when the air temperature is 50F or higher.
- B. Refrain from placing concrete while the temperature is lower than 40F or when by the National Weather Service forecast it may be expected to reach 40F or lower during the 24-hour period following placement of concrete.

## PART 2 - PRODUCTS

### 2.01 MATERIALS:

- A. Subgrade Paper: AASHTO M74.
- B. Polyethylene sheet and tape: AASHTO M171, white opaque for curing.
- C. Wire Fabric: Welded steel-wire fabric, ASTM A185.
- D. Bituminous Paint: AASHTO M81, Grade RC-250.
- E. Joint Devices:
  - 1. Tie bars: ASTM A615, Grade 60.
  - 2. Tie rod assemblies: Tensile requirements of AASHTO M227, Grade 80 based on measured cross-sectional area of unthreaded portion of bar when tested in assembled condition in accordance with ASTM A370.
  - 3. Dowels:
    - a. Plain round bars, AASHTO M227, Grade 80 coated with paint, FS TT-P-86, Type I.
    - b. Dowel sleeves in accordance with the following:
      - 1) Snug fit with dowel bar.
      - 2) Closed end.
      - 3) Limit stop for dowel approximately one inch from closed end.
      - 4) Sufficient rigidity to prevent entry of fresh concrete and collapse during construction.
  - 4. Hook bolt:
    - a. Material: As specified for dowels.
    - b. Fabrication: As shown.
- F. Grease for Dowels: Approved water-resistant grease.
- G. Expansion Joint Materials:
  - 1. Preformed expansion joint fillers:
    - a. Bituminous: AASHTO M33.
    - b. Cork: AASHTO M153, Type II.
    - c. Preformed joint seals: AASHTO M220.
  - 2. Expansion joint sealing compounds:
    - a. Hot-poured: ASTM D3405 and when tested in accordance with AASHTO T51 having ductility not less than 40 centimeter and flow at 140F not greater than one centimeter. Use of ground rubber scrap is prohibited.
    - b. Cold-applied: Single-component type, ASTM C920.
    - c. Elastomeric: FS TT-S-00227, Type 1, Class A.
- H. Burlap: AASHTO M182, Class 3 or 4.
- I. Waterproof paper: AASHTO M171.
- J. White burlap-polyethylene sheet shall conform to AASHTO Designation M171.
- K. Liquid Membrane Forming Curing Compounds: AASHTO M148, Type 1, resin base, wax-free.
- L. Concrete: Section 03300, Class 3500, air-entrained, with the following additional requirements:

1. Portland cement: Type I.
  2. Minimum cement content: Six bags per cubic yard of concrete.
  3. Maximum water content: Water/Cement ratio of 0.45 by weight.
  4. Air content: 6-1/2 percent plus-or-minus 1-1/2 percent by volume.
  5. Slump: 2-1/2 inches plus-or-minus 1/2 inch.
  6. Water reducing admixture: AASHTO M194, Type A or D as directed.
  7. Coarse aggregate:
  8. Size: ASTM C33 and as follows: 57; 67; 57 and 67; 57 and 4; 67 and 4; or 57, 67 and 4.
  9. Deleterious materials: Maximum amount of soft fragments, 2.0 percent by weight; maximum amount of coal and lignite 0.25 percent by weight; and material passing Size 200 sieve 0.5 percent by weight.
    - a. Maximum abrasion loss: 40 percent by weight.
  10. Fine aggregate:
    - a. Deleterious material: Maximum amount of friable particles, 0.5 percent by weight; maximum amount of coal and lignite 0.25 percent by weight; material passing Size 200 sieve three percent maximum by weight.
  11. For bridge decks and bridge sidewalks: Use only crushed trap rock aggregate, trap rock to be diabase rock, ASTM C294.
- M. High-Early-Strength Concrete: As specified for concrete and modified to produce high-early-strength concrete by one or a combination of the following methods.
1. Substitution of Type III or Type I cement in approved mix.
  2. Addition of Type I cement to the approved mix, but so that the total cement does not exceed eight bags per cubic yard of concrete.
  3. Addition of an approved accelerating admixture to approved mix as specified in Section 03300.

## **PART 3 - EXECUTION**

### **3.01 EQUIPMENT:**

- A. Provide appropriate equipment in sufficient quantity and sizes to perform work as specified and shown.
- B. Maintain machinery and equipment on site in first class working condition. Provide necessary tools and supplies for maintenance.
- C. Straightedges and Templates:
  1. Use metal straightedges, 10 feet long, rigidly constructed so as to prevent vertical deflection exceeding 1/32 inch and fitted with handles for ease of use.
  2. Use templates, constructed so as to extend from form to form and to ride on form, having adjustable tines spaced at six-inch intervals and rigidly constructed so as to prevent vertical deflection exceeding 1/32 inch.

### **3.02 BASE:**

- A. Check previously placed base for grade and crown with templates and straightedges for compliance with tolerances specified in Section 02725.
- B. Correct deficiencies in grade, contour and compaction.
- C. Obtain approval of base prior to placing forms and impervious material.

### **3.03 SETTING FORMS:**

- A. Unless concrete is placed against abutting structures, use steel forms to maintain concrete within required tolerance and to support paving equipment.
- B. Use flexible steel forms for curve radii less than 250 feet. For small radius curves and non-standard closures, use approved wood forms. Provide properly drilled forms to accommodate tie rod assemblies.
- C. Set forms accurately and firmly to line and grade throughout entire length of approved base.
- D. Set forms sufficiently ahead of other work to avoid conflict during operations.
- E. Concurrent with setting of forms, cover base with layer of impervious material of either subgrade paper or polyethylene sheet.
  - 1. Subgrade paper: Overlap adjacent strips at least four inches and ends not less than 12 inches.
  - 2. Polyethylene sheet: Overlap sides at least 12 inches.
  - 3. Maintain cover intact until concrete is placed.
- F. Apply one coat of bituminous paint to contact areas of abutting structures and previously placed slabs.

### **3.04 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  - 1. Joints and joint devices: Maximum deviation of 1/4 inch from position shown and 1/8 inch from ten-foot steel straightedge.
  - 2. Dowels: Aligned to tolerance of not more than 1/8 inch in 12 inches.
  - 3. Fabric reinforcement:
    - a. Clearance from vertical surfaces and joints: Minus 1/4 inch or plus 1/2 inch.
    - b. Clearance from top and bottom surfaces: Plus-or-minus 1/4 inch.
    - c. Clearance from top surface of additional reinforcing at penetrating structures: Plus-or-minus 1/8 inch.
  - 4. Top surface of concrete: Maximum deviation of 1/8 inch from ten-foot steel straightedge and within plus-or-minus 1/8 inch of the required elevation.
  - 5. Grooves for joints: Within minus 1/16 inch or plus zero inch of dimensions shown.
  - 6. Thickness of concrete pavement: Within minus 1/8 inch of the thickness shown, in accordance with AASHTO T148.
- B. Testing of Concrete:
  - 1. Conform to requirements specified in Section 03300.

### **3.05 JOINT DEVICES:**

- A. General:
  - 1. Place and secure joint devices to ensure that deviation does not exceed specified tolerances. Finish joints to such tolerances.
  - 2. Provide acceptable means of splicing.
  - 3. Provide satisfactory gages for checking position of joint devices.
  - 4. Where joints are to be completed after placing concrete, mark location of joint devices so as to permit installation of joint to tolerances specified.
  - 5. Where options for construction are permitted, use approved method.
  - 6. Do not disturb joint devices. Do not permit workers to step on joint devices. Realign devices immediately if displaced.
  - 7. Hold initial installation of devices firmly in place by tap bolts installed in holes drilled in forms. If holes in forms have been formed by method other than drilling, use steel washers in addition to tap bolts. After removal of forms replace tap bolts until

adjoining subgrade is ready for concrete placement. Remove tap bolts and install remainder of tie devices prior to placing adjoining slab. Apply heavy coating of bituminous paint prior to placing concrete for adjacent slab.

- B. Construction Joints:
  1. Make transverse construction joints at locations shown; use joint device applicable to particular type of joint.
  2. Install dowels at transverse construction joints, spaced as shown but clearing pavement edges and longitudinal joints by a minimum of six inches. Align dowels both vertically and horizontally to tolerance specified.
  
- C. Contraction Joints:
  1. Provide longitudinal contraction joints between previously placed slabs and new slabs and between slabs and abutting curbs and gutters.
  2. Tie longitudinal contraction joints together by installation of 1/2-inch tie rods or tie-rod assemblies 30 inches long placed across longitudinal contraction joint and spaced as shown. Do not install tie rods or tie-rod assemblies closer than 18 inches to transverse joints.
  3. Make groove for contraction joints by formwork or using an approved joint tooling device. When latter method is used saw joint to one third depth of slab within 24 hours of concrete placement.
  
- D. Expansion Joints and Joint Filler: Make grooves for expansion joints by forming. Where grooves are made by device, use approved device of such design that work can be properly performed.
  1. Prepare preformed expansion joint filler in greatest length possible and no less than ten feet.
  2. Cut filler for joints transverse to the slab in a single piece of the required shape.
  3. Cut pieces for curb and gutter as directed to exact size, from larger pieces.
  4. When splicing joint filler, butt tightly to prevent penetration of concrete between adjacent strips of joint filler.
  5. For longitudinal joints, except at curb and gutter sections, use preformed tongue and groove filler as shown.
  6. Where dowels or other approved load-transfer devices have to penetrate joint filler, properly locate and drill holes of correct size or diameter through filler at required intervals to receive bars and to achieve tight fit.
  7. Make groove for cement pavement for surface course by forming, sawing or leaving preformed joint in place.
  8. Protect preformed joint filler during placing of concrete.

**3.06 PLACING REINFORCEMENT:**

- A. Install welded steel wire fabric in flat sheets where shown in accordance with Section 03200.
- B. Unless otherwise noted, use wire fabric as follows:

Depth of Slab/Inches	Pounds Per 100 Square Feet
6	30
8	50
10	61

- C. Place wire fabric to clear vertical surfaces and joints by two inches and within tolerances specified. Lap sheets distance equal to spacing of wires and tie securely.
- D. Place two layers of wire fabric in concrete pavements over trench cuts, each layer to be of weight and type as specified for thickness of concrete. Position each layer two inches clear of top and bottom surfaces of slab and within tolerance specified. Extend each layer nine inches beyond sides of trench.
- E. Where other structures, such as manholes, penetrate concrete pavements, place wire fabric on one inch centers in each direction so that there is a minimum of two feet of fabric extending horizontally around perimeter of structure. Install layer of fabric one inch clear of top surface of slab and within tolerance specified.
- F. In surface courses, place wire fabric two inches clear of top surface of slab and within tolerance specified.
- G. Install layer of wire fabric to serve as top layer over trenches. Install additional fabric around penetrations.
- H. Except for pavements over trench cuts and around penetrations, do not place wire fabric in base course.

### **3.07 PLACING CONCRETE:**

- A. Supply and place portland cement concrete as specified in Section 03300, with the following additional requirements:
  1. Place concrete only during daylight unless otherwise approved. If placement is authorized during darkness provide adequate lighting system.
  2. Prior to placing concrete around poles, manholes or other structures projecting through pavement, coat such structures heavily with bituminous paint.
  3. Place concrete to the full thickness, deposited in successive batches for full width of slab by means of discharging device which does not cause segregation of materials.
  4. Compact concrete thoroughly during placement.
  5. When spreading by hand, employ sufficient work force for leveling, spading and spreading concrete in front of screed. Do not use rakes for handling concrete.
  6. Deposit concrete as near as practicable to joints but not touching expansion and contraction joint devices. Shovel concrete to height approximately two inches more than depth of the joint. As soon as forms are removed, clean ends of expansion joints of concrete and expose full width of preformed joint filler for full depth of slab. Place concrete against previously constructed slabs only after ends of preformed joint filler have been so cleaned and ends of performed joint filler in slab being poured have been neatly and firmly butted.
  7. Where wire fabric is required, place concrete in layers so that wire fabric may be properly placed. Requirements for machine placing and for vibration apply for each layer. Place layers and wire fabric, large wires running in longitudinal direction in such rapid sequence that monolithic slab will result.
  8. Compact concrete both by internal and surface vibration. Vibrators may be combined with spreading and finishing machines. Compact concrete adjacent to forms, joints, existing concrete or other structures by use of spud vibrator. Insert vibrator in concrete and work along entire length. Avoid contact with joint devices or underlying base. Evidence of honeycomb or lack of compaction constitute basis for rejection of concrete pavement as deficient.
  9. Construction Joints:

- a. Form construction joints where it is necessary and approved to stop concreting for 30 minutes or longer, by staking in a bulkhead and finishing the concrete to the bulkhead.
- b. If, due to an emergency, concreting must be stopped within less than ten feet of a previously formed joint of any type, remove the concrete to the joint prior to resuming the placing of the slab.

### **3.08 INITIAL FINISHING, FLOATING AND FINAL FINISHING:**

- A. Give concrete initial finish by use of finishing machines operated so as to minimize formation of laitance and to give required uniformity of surface and compaction. Remove laitance in approved manner.
- B. Avoid prolonged operation over a given area. Operate the machine over each area of pavement as directed and only as many times and at such intervals as required to give the proper compaction and uniformity of surface.
- C. Keep tops of forms clean to permit true and accurate movement of machine.
- D. On completion of screeding, bring surface to smooth finish by use of floats, eight inches wide and a minimum of four feet long, with handles at least four feet longer than width of slab and not less than 16 feet long.
- E. Operate float transversely with combined longitudinal and transverse motion for sufficient number of passes to smooth ridges and fill depressions.
- F. On completion of floating operations, screed top surface of concrete with deviation not exceeding 1/8 inch from straightedge and within tolerance specified for required elevation. Correct deficiencies by handwork if approved.
- G. After floating and verifying that surface is within specified tolerances, drag surface in longitudinal direction with longitudinal and crosswise motions using burlap so to prevent edges digging into surface of concrete or working crown out of pavement.
- H. Brooming:
  1. Upon completion of burlap dragging, broom finish top surface of pavement. Use street brooms made for the purpose with split bamboo bristles or metal bristles
    - a. Broom width: 14 inches.
    - b. Broom handle: At least one-half slab width.
  2. In general make brooming perpendicular to centerline of paving unless otherwise shown. Prior to brooming, obtain the Engineer's approval of the direction of brooming for each area.
  3. Pull broom gently over surface of pavement from edge to edge walking back and forth on bridge over pavement, holding handle almost vertical and allowing broom to drag lightly over surface without interruption, leaving slight ridges in concrete perpendicular to centerline of pavement.
  4. Overlap ridging. Ridging not more than 1/8 inch in depth with corrugations of uniform character and width.
  5. Complete brooming before rounding edges of pavement and joints.
- I. Round joints and edges to radius shown.
- J. To form flow line for gutters, trowel smooth 12-inch width of pavement adjacent to curbs unless otherwise shown.

- K. Joint Work and Edging: Where there is an option of method for doing joint work, secure approval for the method elected and use only that method.
1. Perform joint work and edging when condition of concrete permits.
  2. Ensure that joints are within tolerances specified and that there is no perceptible lip or depression other than rounding.
  3. Prepare clean grooves rounded to 1/4-inch radius with smooth even walls.
  4. Make grooves for expansion joints by forming. See requirements above for expansion joints.
  5. For joints to be sealed with poured sealer, prepare grooves with dimensions as shown and within tolerance specified. For joints to be sealed with preformed elastomeric seals, leave grooves of dimensions and within tolerances shown. Provide suitable gauges for checking dimensions.
  6. Where joints in surface course are sealed with cold-poured joint sealer, break bottom bond by placing polyethylene tape full width of groove, laid flat along top of preformed joint filler prior to joint sealing.
  7. When using hot-poured or cold-applied joint sealer, use only equipment designed for purpose. Hand-pouring pots are prohibited. Maintain material within temperature range recommended by manufacturer. Apply sealer when air temperature is as specified. Construct so that resulting stripe is straight, neat, of uniform width and joint is filled to 1/4 inch from top surface of pavement.
  8. When placing elastomeric joint seals, use equipment and methods recommended by manufacturer.

### **3.09 CURING:**

- A. Allow finished concrete to cure by one of the following methods for seven days or until concrete has developed flexural strength of 500 psi:
1. Wet burlap: Cover pavement with double thickness of thoroughly wet burlap, overlapping adjacent sheets by at least six inches. Maintain burlap in saturated state by sprinkling until it is removed. Use only clean material free from holes.
  2. Waterproof paper, polyethylene sheet or white burlap-polyethylene sheet: Place material so that adjacent sheets overlap by at least 12 inches. Secure material along side and ends so as to maintain reasonably airtight seal.
  3. Use approved liquid-membrane curing compounds as recommended by manufacturer, using equipment designed for purpose.

### **3.10 REMOVAL OF FORMS:**

- A. Remove forms as soon as condition of concrete permits, but in no case sooner than 12 hours after placement.
- B. When the temperature is below 40F, leave forms in place for at least 48 hours or as directed.

### **3.11 COLD WEATHER CONSTRUCTION:**

- A. Whenever, by the National Weather Service forecast for the locality, the temperature may be expected to reach 50F or lower during the 24-hour period following placement concrete mix, include an approved accelerating admixture in the concrete mix as specified in Section 03300.
- B. Place concrete when temperature conditions are as specified, unless otherwise directed. If placing of concrete is so directed, in addition to adding an accelerating admixture heat aggregates, water or both, so that mix when placed is not less than 55F nor more than 90F. Do not exceed 140F for mixing water and 150F for aggregates.

- C. As soon as concrete has hardened sufficiently to prevent marring, cover pavement surface and edges with dry burlap, building paper or other approved material and subsequent layer of at least six inches of dry hay, straw or other approved material. Maintain such protection for at least three days or until field tests indicate that concrete has attained required strength.
- D. During low temperatures, install truck-mixed concrete immediately upon delivery.
- E. When temperature by National Weather Service forecast will be 40F or lower during the 72-hour period following placement of concrete, do not use membrane curing compound.

**3.12 HOT WEATHER CONSTRUCTION:**

- A. When by National Weather Service forecast, temperature will be 90F or higher during the 24-hour period following placement of concrete, cover pavement by wet-burlap method for first 24 hours, after which curing may be completed by one of the specified methods.

**3.13 PROTECTION OF CONCRETE PAVEMENT:**

- A. Obtain approval prior to permitting use of completed pavement by public and construction traffic.

**3.14 DEFICIENT PAVEMENT:**

- A. Where directed, remove and replace with new materials or correct concrete pavement that does not meet requirements.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

\*1. Use first version of SECTION 02750 CONCRETE PAVEMENT for contracts where concrete pavement work is performed outside the jurisdiction of the District of Columbia. (Use second version for contracts where concrete pavement work is performed within the jurisdiction of the District of Columbia.)

**END OF SECTION**

**SECTION 02750**  
**(Version 2)<sup>1</sup>**

**CONCRETE PAVEMENT**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing portland cement concrete pavements complete in place as shown.
- B. Related Work Specified Elsewhere:
  - 1. Base for pavements: Section 02725.
  - 2. Concrete reinforcement: Section 03200.
  - 3. Cast-in-place structural concrete: Section 03300.

**1.02 SUBMITTALS:**

Submit the following for approval in accordance with the General Requirements with the additional requirements as specified for each:

- A. Shop Drawings:
  - 1. Joint devices.
- B. Certification: As specified in Section 03300, including design mixes.

**1.03 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: M33, M74, M81, M148, M153, M171, M182, M194, M220, M227, T51 T148.
  - 3. FS: SS-S-164, SS-S-195, TT-P-86, TT-S-00227.
  - 4. ASTM: A185, A370, A615, C33, C294, C920.
- B. Concrete: Conform to quality assurance requirements as specified in Section 03300 and this section.
- C. Testing: Subject concrete for pavements to test procedures specified in Section 03300.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Aggregates and Cement: As specified in Section 03300.

**1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  - 1. Do not place concrete on frozen soil base.
  - 2. Apply joint sealer when the air temperature is 50F or higher.
- B. Refrain from placing concrete while the temperature is lower than 40F or when by the National Weather Service forecast it may be expected to reach 40F or lower during the 24-hour period following placement of concrete.

## PART 2 - PRODUCTS

### 2.01 MATERIALS:

- A. Subgrade Paper: AASHTO M74.
- B. Polyethylene sheet and tape: AASHTO M171, white opaque for curing.
- C. Welded Wire Fabric: Welded steel-wire fabric, ASTM A185.
- D. Bituminous Paint: AASHTO M81, Grade RC-250.
- E. Joint Devices: Use joint devices which are so designed that, when under the load of fresh concrete, the parts will deviate no more than 1/4 inch from the position shown and not more than 1/8 inch from the specified tolerances, and that the finish joints can be constructed to these same tolerances. Provide joint devices complete with accessories, approved supporting devices, and installing devices and equipment.
  - 1. Tie bars: ASTM A615, Grade 60.
  - 2. Tie rod assemblies: Tensile requirements of AASHTO M227, Grade 80 based on measured cross-sectional area of unthreaded portion of bar when tested in assembled condition in accordance with ASTM A370.
  - 3. Dowels:
    - a. Plain round bars, AASHTO M227, Grade 80 coated with paint, FS TT-P-86, Type I.
    - b. Dowel sleeves in accordance with the following:
      - 1) Snug fit with dowel bar.
      - 2) Closed end.
      - 3) Limit stop for dowel approximately one inch from closed end.
      - 4) Sufficient rigidity to prevent entry of fresh concrete and collapse during construction.
  - 4. Grease for Dowels: Approved water-resistant graphite grease.
  - 5. Preformed joint fillers: AASHTO M153, Type II.
  - 6. Preformed Plank: Rigid plank of asphalt hardboard or similar material approved by the Engineer.
- F. Joint Sealer Materials:
  - 1. Joint sealing compound: Materials so proportioned that joints will be satisfactorily sealed from moisture and other foreign matter. Add appropriate tinting during manufacture, if necessary, to produce a black color.
    - a. Hot-poured joint sealing compound for joints in concrete pavement: FS SS-S-164 except the use of ground rubber scrap is prohibited. Ductility of not less than 40 centimeter in accordance with AASHTO T51; flow at 140F not greater than 1.0 centimeter.
    - b. Cold-applied joint sealing compound for joints in concrete pavement: FS SS-S-195.
    - c. Joint sealing compound for joints between concrete pavement and other structures: FS TT-S-00227.
- G. Preformed joint seals: AASHTO M220.
- H. Burlap: AASHTO M182, Class 3.
- I. Waterproof paper: AASHTO M171.
- J. White burlap-polyethylene sheet shall conform to AASHTO Designation M171.

- K. Liquid Membrane Forming Curing Compounds: AASHTO M148, Type 1, resin base, wax-free.
- L. Concrete: Section 03300, Class 3500, air-entrained, amended as follows:
1. Portland cement: Type I.
  2. Minimum cement content: Six bags per cubic yard of concrete.
  3. Maximum water content: 0.45 maximum water cement ratio.
  4. Air content: 6-1/2 percent plus-or-minus 1-1/2 percent by volume.
  5. Slump: 2-1/2 inches plus-or-minus 1/2 inch.
  6. Water reducing admixture: AASHTO M194, Type A or D as directed.
  7. Coarse aggregate:
    - a. Size: ASTM C33 Size No. 67 or a combination of Size No. 4 and Size No. 67.
    - b. Deleterious materials: Maximum amount of soft fragments, 2.0 percent by weight; maximum amount of coal and lignite 0.25 percent by weight; and material passing Size 200 sieve 0.5 percent by weight.
    - c. Maximum abrasion loss: 40 percent by weight.
  8. Fine aggregate:
    - a. Deleterious material: Maximum amount of friable particles, 0.5 percent by weight; maximum amount of coal and lignite 0.25 percent by weight; material passing Size 200 sieve three percent maximum by weight.
  9. For bridge decks and bridge sidewalks: Use only crushed trap rock aggregate, trap rock to be diabase rock, ASTM C294.
- M. High-Early-Strength Concrete: As specified for concrete and modified to produce high-early-strength concrete by one or a combination of the following methods.
1. Substitution of Type III or Type I cement in approved mix.
  2. Addition of Type I cement to the approved mix, but so that the total cement does not exceed eight bags per cubic yard of concrete.
  3. Addition of an approved accelerating admixture to approved mix as specified in Section 03300.

## **PART 3 - EXECUTION**

### **3.01 EQUIPMENT:**

- A. General: See General Provision's Article on equipment.
1. Provide suitable equipment in sufficient quantity and sizes to perform work as specified and shown.
  2. Maintain machinery and equipment on site in first class working condition. Provide necessary tools and supplies for maintenance.
  3. The term EQUIPMENT includes such specialized devices and tools that are customarily used in the construction of concrete pavements. The requirements for equipment given are not intended to be complete; rather, the intent is that characteristic equipment be used to produce certain of the required results. The suitability of the equipment is a determination made by the Engineer that the equipment will produce the required results.
- A. Concrete Spreading Machines: Power driven spreaders capable of spreading concrete to the full width and depth specified as it is delivered and as follows:
1. Standard-width machines with adjustments up to five feet.
  2. Controls conveniently grouped in easy reach of the operator.
  3. Multiple speeds in both reverse and forward gear.

4. Capable of spreading concrete to both the depth specified for reinforcement and the full thickness of the slab, without segregation and without interfering with the joints or reinforcement.
  5. Not disturbing the forms due to lateral pressure of the spreading operation; the weight of the machines of such amount and so distributed as not to cause settlement of the forms.
  6. Equipped with dismountable rims to be used when operating on concrete.
  7. Provided with suitable means to keep material off the wheel and the top of the forms or slab.
  8. Spreading accomplished by either a screw, blade, or other suitable device of the reversing type, followed by a strike-off screed; the strike-off screed adjustable to the specified crown and section.
- B. Internal Vibrators Operated Independently of Spreading or Finishing Machines: Use approved type of internal vibrators such as the spud-type, for compacting pavement concrete at joints and edges, operating at a frequency capable of producing at least 5,000 pulsations per minute, and with sufficient cable to permit being moved to any location directed by the Engineer. Do not use vibrators of such weight as to be unwieldy in application.
- C. Concrete Finishing Machines:
1. Power-driven and of the transverse-screed type.
  2. Equipped with traction wheel or wheels with dismountable rims to be used when operating on concrete.
  3. Equipped with two screeds, maintained in the best possible condition and adjustment throughout their use: Front screed used for striking off excess concrete to exact grade and crown; the rear screed used for finishing and smoothing operation.
  4. Screeds constructed of steel, be capable of being adjusted to the specified cross section, and be of such rigidity as to produce the specified crown and cross section.
  5. Each screed of the floating or suspended type, at least 1-1/2 feet longer than the width between the forms, and easily and quickly adjustable to the width required.
  6. Both machine and screeds are to have variable speeds and independently controlled.
  7. The weight of the machines of such amount and so distributed as not to cause settlement of the forms upon which operated.
  8. Provided with suitable means to keep material off the wheel and the top of the forms or slab.
- D. Straightedges: Ten feet long, made of metal with handles suitable for ease of use, and rigidly constructed so that there will be no deflection exceeding 1/32 inch.
- E. Templates: Constructed to extend from form to form and to ride on the form, equipped with adjustable tines spaced at six-inch intervals, and rigidly constructed that there will be no deflection exceeding 1/32 inch.

### **3.02 BASE:**

- A. Base Preparation: In accordance with Section 02725.
- B. Check previously placed base for grade and crown with templates and straightedges for compliance with tolerances specified in Section 02725.
- C. Correct deficiencies in grade, contour and compaction.
- D. Obtain approval of base prior to placing forms and impervious material.

### **3.03 SETTING FORMS:**

- A. Unless concrete is placed against abutting structures, use steel forms to maintain concrete within required tolerance and to support paving equipment.
- B. Use flexible steel forms for curve radii less than 250 feet. For small radius curves and non-standard closures, use approved wood forms. Provide properly drilled forms to accommodate tie rod assemblies.
- C. Set forms accurately and firmly to line and grade throughout entire length of approved base.
- D. Set forms sufficiently ahead of other work to avoid conflict during operations.
- E. Concurrent with setting of forms, cover base with layer of impervious material of either subgrade paper or polyethylene sheet.
  - 1. Subgrade paper: Overlap adjacent strips at least four inches and ends not less than 12 inches.
  - 2. Polyethylene sheet: Overlap sides at least 12 inches.
  - 3. Maintain cover intact until concrete is placed.
- F. Apply one coat of bituminous paint to contact areas of abutting structures and previously placed slabs.

### **3.04 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  - 1. Joints and joint devices: Maximum deviation of 1/4 inch from position shown and 1/8 inch from ten-foot steel straightedge.
  - 2. Dowels: Aligned to tolerance of not more than 1/8 inch in 12 inches.
  - 3. Fabric reinforcement:
    - a. Clearance from vertical surfaces and joints: Minus 1/4 inch or plus 1/2 inch.
    - b. Clearance from top and bottom surfaces: Plus-or-minus 1/4 inch.
    - c. Clearance from top surface of additional reinforcing at penetrating structures: Plus-or-minus 1/8 inch.
  - 4. Top surface of concrete: Maximum deviation of 1/8 inch from ten-foot steel straightedge and within plus-or-minus 1/8 inch of the required elevation.
  - 5. Grooves for joints: Within minus 1/16 inch or plus zero inch of dimensions shown.
  - 6. Thickness of concrete pavement: Within minus 1/8 inch of the thickness shown, in accordance with AASHTO T148.
- B. Testing of Concrete:
  - 1. Conform to requirements specified in Section 03300.

### **3.05 JOINT DEVICES:**

- A. General:
  - 1. Place and secure joint devices to ensure that deviation does not exceed specified tolerances. Finish joints to such tolerances.
  - 2. Provide acceptable means of splicing.
  - 3. Provide satisfactory gages for checking position of joint devices.
  - 4. Where joints are to be completed after placing concrete, mark location of joint devices so as to permit installation of joint to tolerances specified.
  - 5. Where options for construction are permitted, use approved method.
  - 6. Do not disturb joint devices. Do not permit workers to step on joint devices. Realign devices immediately if displaced.
  - 7. Hold initial installation of devices firmly in place by tap bolts installed in holes drilled in forms. If holes in forms have been formed by method other than drilling, use steel washers in addition to tap bolts. After removal of forms replace tap bolts until

adjoining subgrade is ready for concrete placement. Remove tap bolts and install remainder of tie devices prior to placing adjoining slab. Apply heavy coating of bituminous paint prior to placing concrete for adjacent slab.

- B. Construction.
  - 1. Longitudinal: The longitudinal joint at a previously placed slab and the joint between a slab and abutting curb and gutter are longitudinal construction joints.
    - a. For these joints, with the exception of the ones at the curb and gutter sections, use a tongue-and-groove joint of an isosceles trapezoidal section one inch in height with the bases two inches and 2-1/2 inches, respectively; with the groove located as shown
    - b. Tie the separately constructed slab sections together by the installation of longitudinal tie devices.
    - c. The groove for concrete pavement for surface course may be made by forming or sawing as specified below, or by preformed plank left in place.
    - d. Coat edges of the slab first constructed with heavy coat of bituminous paint prior to placing concrete for the adjacent slab.
  - 2. Transverse joints: Make transverse construction joints only at a planned transverse expansion or contraction joint. Accordingly, have transverse construction joint devices conform to the requirements for the particular type of joint.
- C. Contraction Joints:
  - 1. Provide longitudinal contraction joints between previously placed slabs and new slabs and between slabs and abutting curbs and gutters.
    - a. Tie longitudinal contraction joints together by installation of 1/2-inch tie rods or tie-rod assemblies 30 inches long placed across longitudinal contraction joint and spaced as shown. Do not install tie rods or tie-rod assemblies closer than 18 inches to transverse joints.
    - b. Make groove for contraction joints by formwork, sawing or leaving filler in place.
- D. Expansion Joints and Joint Filler:
  - 1. Make grooves for expansion joints by forming. Where grooves are made by device, use approved device of such design that work can be properly performed.
    - a. Prepare preformed expansion joint filler in greatest length possible and no less than ten feet.
    - b. Cut filler for joints transverse to the slab in a single piece of the required shape.
    - c. Cut pieces for curb and gutter as directed to exact size, from larger pieces.
    - d. When splicing joint filler, butt tightly to prevent penetration of concrete between adjacent strips of joint filler.
    - e. For longitudinal joints, except at curb and gutter sections, use preformed tongue and groove filler as shown.
    - f. Where dowels or other approved load-transfer devices have to penetrate joint filler, properly locate and drill holes of correct size or diameter through filler at required intervals to receive bars and to achieve tight fit.
    - g. Make groove for cement pavement for surface course by forming, sawing or leaving preformed joint in place.
    - h. Protect preformed joint filler during placing of concrete.

### **3.06 PLACING REINFORCEMENT:**

- A. Install welded steel wire fabric in flat sheets where shown in accordance with Section 03200.
- B. Unless otherwise noted, use wire fabric as follows:

Slab Thickness (Inches)	Roadway Width	
	Equal to or less than 24'-0"	Greater than 24'-0"
	Pounds/100 Square Feet	Pounds/100 Square Feet
6	44	46
8	51	54
10	61	69

- C. Place wire fabric to clear vertical surfaces and joints by two inches and within tolerances specified. Lap sheets distance equal to spacing of wires and tie securely.
- D. Place two layers of wire fabric in concrete pavements over trench cuts, each layer to be of weight and type as specified for thickness of concrete. Position each layer two inches clear of top and bottom surfaces of slab and within tolerance specified. Extend each layer nine inches beyond sides of trench.
- E. Where other structures, such as manholes, penetrate concrete pavements, place wire fabric on one inch centers in each direction so that there is a minimum of two feet of fabric extending horizontally around perimeter of structure. Install layer of fabric one inch clear of top surface of slab and within tolerance specified.
- F. In surface courses, place wire fabric two inches clear of top surface of slab and within tolerance specified.
- G. Install layer of wire fabric to serve as top layer over trenches. Install additional fabric around penetrations.
- H. Except for pavements over trench cuts and around penetrations, do not place wire fabric in base course.

**3.07 PLACING CONCRETE:**

- A. Supply and place portland cement concrete as specified in Section 03300, with the following additional requirements:
  1. Place concrete only during daylight unless otherwise approved. If placement is authorized during darkness provide adequate lighting system.
  2. Do not place concrete at temperatures below 40F unless otherwise approved; nor place concrete on a frozen base.
  3. Prior to placing concrete around poles, manholes or other structures projecting through pavement, coat such structures heavily with bituminous paint.
  4. Place concrete to the full thickness, deposited in successive batches for full width of slab by means of discharging device which does not cause segregation of materials.
  5. Compact concrete thoroughly during placement.
  6. Place concrete mechanical spreaders except where hand methods for spreading are approved. When spreading by hand, employ sufficient work force for leveling, spading and spreading concrete in front of screed. Do not use rakes for handling concrete.
  7. Deposit concrete as near as practicable to joints but not touching expansion and contraction joint devices. Shovel concrete to height approximately two inches more than depth of the joint. As soon as forms are removed, clean ends of expansion joints of concrete and expose full width of preformed joint filler for full depth of slab.

Place concrete against previously constructed slabs only after ends of preformed joint filler have been so cleaned and ends of performed joint filler in slab being poured have been neatly and firmly butted.

8. Where wire fabric is required, place concrete in layers so that wire fabric may be properly placed. Requirements for machine placing and for vibration apply for each layer. Place layers and wire fabric, large wires running in longitudinal direction in such rapid sequence that monolithic slab will result.
9. Compact concrete both by internal and surface vibration. Vibrators may be combined with spreading and finishing machines. Compact concrete adjacent to forms, joints, existing concrete or other structures by use of spud vibrator. Insert vibrator in concrete and work along entire length. Avoid contact with joint devices or underlying base. Evidence of honeycomb or lack of compaction constitute basis for rejection of concrete pavement as deficient.
10. Construction Joints:
  - a. Form construction joints where it is necessary and approved to stop concreting for 30 minutes or longer, by staking in a bulkhead and finishing the concrete to the bulkhead.
  - b. If, due to an emergency, concreting must be stopped within less than ten feet of a previously formed joint of any type, remove the concrete to the joint prior to resuming the placing of the slab.

### **3.08 INITIAL FINISHING, FLOATING AND FINAL FINISHING:**

- A. Give concrete initial finish by use of finishing machines operated so as to minimize formation of laitance and to give required uniformity of surface and compaction. Remove laitance in approved manner.
- B. Avoid prolonged operation over a given area. Operate the machine over each area of pavement as directed and only as many times and at such intervals as required to give the proper compaction and uniformity of surface.
- C. Keep tops of forms clean to permit true and accurate movement of machine.
- D. On completion of screeding, bring surface to smooth finish by use of floats, eight inches wide and a minimum of four feet long, with handles at least four feet longer than width of slab and not less than 16 feet long.
- E. Operate float transversely with combined longitudinal and transverse motion for sufficient number of passes to smooth ridges and fill depressions.
- F. On completion of floating operations, screed top surface of concrete with deviation not exceeding 1/8 inch from straightedge and within tolerance specified for required elevation. Correct deficiencies by handwork if approved.
- G. After floating and verifying that surface is within specified tolerances, drag surface in longitudinal direction with longitudinal and crosswise motions using burlap so to prevent edges digging into surface of concrete or working crown out of pavement.
- H. Brooming:
  1. Upon completion of burlap dragging, broom finish top surface of pavement. Use street brooms made for the purpose with split bamboo bristles or metal bristles.
    - a. Broom width: 14 inches.
    - b. Broom handle: At least one-half slab width.
  2. In general make brooming perpendicular to centerline of paving unless otherwise shown. Prior to brooming, obtain the Engineer's approval of the direction of brooming for each area.

3. Pull broom gently over surface of pavement from edge to edge walking back and forth on bridge over pavement, holding handle almost vertical and allowing broom to drag lightly over surface without interruption, leaving slight ridges in concrete perpendicular to centerline of pavement.
  4. Overlap ridging. Ridging not more than 1/8 inch in depth with corrugations of uniform character and width.
  5. Complete brooming before rounding edges of pavement and joints.
- I. Round joints and edges to radius shown.
  - J. To form flow line for gutters, trowel smooth 12-inch width of pavement adjacent to curbs unless otherwise shown.
  - K. Joint Work and Edging: Where there is an option of method for doing joint work, secure approval for the method elected and use only that method.
    1. Perform joint work and edging when condition of concrete permits.
    2. Ensure that joints are within tolerances specified and that there is no perceptible lip or depression other than rounding.
    3. Prepare clean grooves rounded to 1/4-inch radius with smooth even walls.
    4. Make grooves for expansion joints by forming. See requirements above for expansion joints.
    5. For joints to be sealed with poured sealer, prepare grooves with dimensions as shown and within tolerance specified. For joints to be sealed with preformed elastomeric seals, leave grooves of dimensions and within tolerances shown. Provide suitable gauges for checking dimensions.
    6. Where joints in surface course are sealed with cold-poured joint sealer, break bottom bond by placing polyethylene tape full width of groove, laid flat along top of preformed joint filler prior to joint sealing.
    7. When using hot-poured or cold-applied joint sealer, use only equipment designed for purpose. Hand-pouring pots are prohibited. Maintain material within temperature range recommended by manufacturer. Apply sealer when air temperature is as specified. Construct so that resulting stripe is straight, neat, of uniform width and joint is filled to 1/4 inch from top surface of pavement.
    8. When placing elastomeric joint seals, use equipment and methods recommended by manufacturer.

### **3.09 CURING:**

- A. Allow finished concrete to cure by one of the following methods for seven days or until concrete has developed flexural strength of 500 psi:
  1. Wet burlap: Cover pavement with double thickness of thoroughly wet burlap, overlapping adjacent sheets by at least six inches. Maintain burlap in saturated state by sprinkling until it is removed. Use only clean material free from holes.
  2. Waterproof paper, polyethylene sheet or white burlap-polyethylene sheet: Place material so that adjacent sheets overlap by at least 12 inches. Secure material along side and ends so as to maintain reasonably airtight seal.
  3. Use approved liquid-membrane curing compounds as recommended by manufacturer, using equipment designed for purpose.
- B. Obtain approval of the Engineer for the curing method elected and use only that method.

### **3.10 REMOVAL OF FORMS:**

- A. Remove forms as soon as condition of concrete permits, but in no case sooner than 12 hours after placement.

- B. When the temperature is below 40F, leave forms in place for at least 48 hours or as directed.

**3.11 COLD WEATHER CONSTRUCTION:**

- A. Whenever, by the National Weather Service forecast for the locality, the temperature may be expected to reach 50F or lower during the 24-hour period following placement concrete mix, include a Type C accelerating admixture in the concrete mix as specified in Section 03300. The accelerating admixture shall comply with AASHTO M 194, Type C, except that it shall contain not more than 500 parts per million chloride ion.
- B. Place concrete when temperature conditions are as specified, unless otherwise directed. If placing of concrete is so directed, in addition to adding an accelerator heat aggregates, water or both, so that mix when laid is not less than 55F nor more than 90F. Do not exceed 140F for mixing water and 150F for aggregates.
- C. As soon as concrete has hardened sufficiently to prevent marring, cover pavement surface and edges with dry burlap, building paper or other approved material and subsequent layer of at least six inches of dry hay, straw or other approved material. Maintain such protection for at least three days or until field tests indicate that concrete has attained required strength.
- D. During low temperatures, install truck-mixed concrete immediately upon delivery.
- E. When temperature by National Weather Service forecast will be 40F or lower during the 72-hour period following placement of concrete, do not use membrane curing compound.

**3.12 HOT WEATHER CONSTRUCTION:**

- A. When by National Weather Service forecast, temperature will be 90F or higher during the 24-hour period following placement of concrete, cover pavement by wet-burlap method for first 24 hours, after which curing may be completed by one of the specified methods.

**3.13 PROTECTION OF CONCRETE PAVEMENT:**

- A. Obtain approval prior to permitting use of completed pavement by public and construction traffic.

**3.14 DEFICIENT PAVEMENT:**

- A. Where directed, remove and replace with new materials or correct concrete pavement that does not meet requirements.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

- \*1. Use second version of SECTION 02750 CONCRETE PAVEMENT for contracts where concrete pavement work is performed within the jurisdiction of the District of Columbia. (Use first version for contracts where concrete pavement work is performed outside the jurisdiction of the District of Columbia.)

**END OF SECTION**

## SECTION 02765

### PAVEMENT MARKINGS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing pavement markings and striping.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples:
    - a. Paint: One quart of each color.
    - b. Spheres: Two pounds.
    - c. Thermoplastic compound: Ten pounds of each color.
    - d. Preformed plastic markings: Five each of plain and reflective, each three inches wide by one-foot long.
  - 2. Certification.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AASHTO: M249-79.
  - 3. USDOT/FHWA: Manual on Uniform Traffic Control Devices for Streets and Highways.
  - 4. Federal Test Method Standard 141.
  - 5. FED STD: 595.
  - 6. FS: TT-P-85, TT-B-1325.
  - 7. ASTM: D638.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver materials in factory-sealed containers plainly marked as follows:
  - 1. Manufacturer's name and address.
  - 2. Location of plant.
  - 3. Material.
  - 4. Color of material.
  - 5. Amount of contents.
  - 6. Date of manufacturer and lot number.

##### 1.05 JOB CONDITIONS:

- A. Environmental Requirements:
  - 1. Traffic zone paint:
    - a. Apply only when ambient air temperature is above 40F and temperature of surface to be painted is above 45F.
    - b. If pavement is wet, allow surface to dry for eight hours minimum after surface appears dry.
    - c. Do not apply glass spheres in strong windy conditions.
  - 2. Extruded thermoplastic compound:

- a. Apply by extrusion at 400F minimum, 440F maximum, when air temperature is more than 35F and pavement temperature is above 50F.
  - b. If pavement is wet, delay application until the pavement has been exposed to at least two hours of direct sunlight after surface appears dry.
3. Preformed plastic traffic markings:
- a. Apply on dry pavement when ambient temperature and temperature of pavement surface is above 60F.
  - b. When temperature of pavement surface is less than 60F and when approved, apply surface heating to degree necessary for application of plastic marking.

B. Protection:

- 1. Provide traffic protective devices and methods of protection to comply with requirements of the jurisdictional authorities.
- 2. Provide and maintain traffic cones, barricades, lights and other protective devices necessary to protect traffic, workmen and completed pavement marking and striping. Remove such devices when marking and striping, including painted sections of curbing and raised traffic bars, have sufficiently cured for intended use.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

A. Traffic Zone Paint:

- 1. Primer: If recommended by paint manufacturer or required by jurisdictional authorities, type as recommended by paint manufacturer.
- 2. Paint: Traffic, FS TT-P-85, white and yellow.

B. Glass Beads: Retroreflective glass spheres, FS TT-B-1325, with the following additional gradation requirements:

US Sieve Size	Percentage Passing
40	100
50	80 - 100
80	35 - 80
100	20 - 50
200	0 - 15

C. Extruded Thermoplastic Compound: Hot-applied alkyd thermoplastic per AASHTO M249-79 and as follows:

- 1. Thermoplastic compound:
  - a. Mixture of thermoplastic resins and other substances compounded for use in traffic markings which, when extruded hot in place and cooled to ambient temperature, will produce stark white or yellow reflective marking stripe.
  - b. Permanently white or yellow, without blemish or discoloration, with straight, clean cut, sharply defined, parallel edges and of uniform cross section.
  - c. Shaped to minimize tire impact and adhere permanently to road.
  - d. Set to solid, non-tacky, non-slippery line of sufficient elasticity to resist cracking and chipping caused by weather and temperature changes, traffic action, as well as pavement crawl and lift in freezing weather.
  - e. After curing, does not react with nor deteriorate in contact with snow

- f. removal chemicals, oil and other substances common to roadway surfaces. Chemically stable and emitting no dangerous fumes.
- g. Especially compounded for traffic markings, with no change in color and brightness characteristics after prolonged exposure to sunlight.
- h. No breakdown or deterioration when held at plastic temperature for extended periods of time nor when repeatedly reheated to plastic temperature.
- i. No change in temperature versus viscosity characteristics through repeated reheatings and from batch to batch.

2. White thermoplastic compound:

- a. Pure white, free from dirt or tint after drying.
- b. Maximum allowable compound deviations from magnesium oxide standard when tested by standard color difference meter, Gardner Color Difference Meter, Gardner Laboratories, Inc. Bethesda, Maryland or equal, with the following minimum requirements:

Scale	Definition	Magnesium Oxide Standardized	Sample
Rd	Reflectance	100	70 minimum
a	Redness - Greenness	0	Minus five to plus five
b	Yellowness - Blueness	0	Minus 10 to plus 10

- c. The white compound pigment containing not less than six-percent titanium dioxide (TiO<sub>2</sub>).

3. Yellow thermoplastic compound:

- a. After drying, yellow, FED STD 595, Color 33538, tested in accordance with Federal Test Method Standard 141, Method 4252.
- b. Pigmented binder well dispersed and free from skins, dirt, foreign objects or ingredients that will cause bleeding, staining or discoloration and consisting of mixture of non-drying synthetic resins at least one of which is solid at room temperature.
- c. Total binder content of thermoplastic compound: 15-percent minimum, 35-percent maximum by weight.
- d. Filler incorporated with resins or binder: White calcium carbonate with compressive strength of 5,000 psi.

D. Preformed Plastic Traffic Markings:

- 1. Composed of preformed plastic, smooth on top surface, undersurfaces factory-coated with pressure-sensitive adhesive coating overlaid with protective paper, polyethylene or other suitable material which remains in place until plastic is ready for application to pavement.
- 2. Plain or reflectorized.
- 3. White or yellow.
- 4. Composition:
  - a. Nonreflectorized plastic material: Consisting of basic plastic and plasticizers, 50-percent minimum by weight.
  - b. Reflectorized plastic material: Consisting of 40-percent minimum by weight of basic plastic and plasticizer and 30-percent minimum by weight of clear, reflective glass spheres, thoroughly and uniformly dispersed throughout plastic.
- 5. Pigmentation:

- a. White plastic markings: Pure white, free from tint and containing not less than six-percent titanium dioxide.
  - b. Yellow plastic markings: Yellow, FED STD 595, Color 33538, Federal Test Method 141, Method 4252.
  - c. Uniform coloring throughout cross section of plastic.
- 6. Low-temperature stress resistance: No indication of breaking, chipping or cracking when sample of specified thickness is abruptly bent to right angle after being immersed in water at 32F for 30 minutes.
  - 7. Resistance to wear: Endure not less than 2,500 cycles of a Taber Abraser, using CS-17 wheels under a load of 1,000 grams, when each 0.001-inch thickness of plastic is tested at 21C.
  - 8. Tensile strength: Nonreflectorized markings not less than 1500 psi; reflectorized markings not less than 750 psi when tested in accordance with ASTM D638.
  - 9. Bond strength: Withstand 50-pound static shear load for 15 seconds average at 21C before complete parting of bond when pair of two-inch wide strips are overlapped two inches and adhesive faces placed together.

### **PART 3 - EXECUTION**

#### **3.01 FIELD QUALITY CONTROL:**

- A. Layout of Work:
  - 1. Lay out lane widths, parking spaces and crosswalks in accordance with regulations of jurisdictional authorities and as shown.
- B. Letters and Symbols:
  - 1. Unless otherwise shown or specified, apply letters, directional arrows and other pavement markings of size and configuration in accordance with referenced USDOT/FHWA Manual on Uniform Traffic Control Devices for Street and Highways.
  - 2. Apply letters, directional arrows and other markings in color shown.
- C. Width and Color of Lines for Pavement Striping:
  - 1. Apply lines for pavement striping as follows:
    - a. Width:
      - 1) Continuous centerline striping and parking space markings: Four inches.
      - 2) Dashed lane striping: Four inches.
      - 3) Solid crosswalk lines: Six inches.
      - 4) Solid stop lines: Twelve inches.
    - b. Lines:
      - 1) Dashed lane lines: White stripes nine feet in length separated by 15 feet of unmarked surface.
    - c. Color:
      - 1) Stripes:
        - a) Solid centerline stripe: White or yellow as shown.
        - b) Lane striping, parking space marking, crosswalk and stop lines: White, unless otherwise shown.
- D. Allowable Tolerances:
  - 1. Traffic-zone paint:
    - a. Width of lines not to vary from specified width by more than 1/8 inch in each linear foot.
    - b. Lengths of skip or lane lines and unpainted surface between skip lines not to vary by more than three inches from specified length.
    - c. Coverage rate maximum: 100 square feet minimum and 110 square feet maximum of surface coverage per gallon of paint, yielding wet-film thickness

- of 0.015 inches minimum.
    - d. Coverage rate of glass spheres: Ten pounds per gallon of paint minimum.
  - 2. Extruded thermoplastic compound:
    - a. Thickness of stripe: 90 to 125 mils.
    - b. Rate of application of binder-sealer: Between 800 linear feet and 1,000 linear feet per gallon for four-inch wide lines. For lines of other widths, apply in proportion based on such rate.
  - 3. Preformed plastic traffic markings:
    - a. Thickness: 0.095 inch, minus 0.005 inch or plus 0.010 inch.
    - b. Width: Four inches, plus-or-minus 1/8-inch per 12-inch length.
  - 4. Painting of curbing and raised traffic bars:
    - a. Wet-film thickness: 0.015 inches minimum.

### 3.02 APPLICATION:

- A. Traffic Zone Paint:
  - 1. Equipment:
    - a. Use equipment suitable for mechanical application of paint and glass spheres.
    - b. Apply paint with atomizing spray machines designed for striping to apply stripes of uniform cross section, and thickness, at specified coverage with clean-cut edges permitting easy and accurate adjustment of width and rate of application as well as immediate shutoff.
    - c. Use automatic mechanical equipment designed and constructed to distribute glass spheres in uniform pattern and at prescribed coverage regardless of variation in speed of travel. Equipment may be integral part of striping machines or self-contained unit designed for attachment to striping machines, so that glass spheres will be applied immediately following application of paint. Use equipment designed and constructed to permit adjustment of coverage rate.
  - 2. Method of application:
    - a. Schedule marking and striping operations to permit paint to set and harden before roadway is opened to traffic.
    - b. Allow hot laid bituminous material to cool, prior to beginning striping operations.
    - c. Remove foreign matter from surfaces prior to painting.
    - d. Apply pigmented binder and glass spheres, mix and thin pigmented binder in accordance with manufacturer's recommendations.
    - e. Apply glass spheres uniformly, immediately following application of paint. Do not premix paint and spheres.
    - f. Apply pavement markings accurately with straight, clean-cut, sharply defined parallel edges and of uniform cross section.
    - g. Clean striping machines as often as necessary to ensure application of markings of specified quality and physical requirements.
- B. Extruded Thermoplastic Compound:
  - 1. Equipment:
    - a. Master kettle:
      - 1) Minimum capacity: 800 pounds of melted compound.
      - 2) Double oil jacket.
      - 3) Thermostatic controls.
      - 4) Approved heating device.
      - 5) Temperature gauges for oil and compound.
      - 6) Integrally mounted chopping device to chop and drop solid compound into kettle.

- b. Liner:
        - 1) Use liners with self-contained heat source, such as propane heater, capable of maintaining compound at drawing temperature of not less than 420F as well as radiant heater installed over die for same purpose.
        - 2) For installation of crosswalk lines, stop lines and solid center lines, use liner with capacity of approximately 150 pounds and automatic sphere dispenser capable of distributing reflective spheres on surface of line while still plastic.
        - 3) For centerline and lane line installation, use mobile unit equipped to automatically install dashed lines in combinations of line and skip up to 40 feet and for application of reflective spheres as specified for smaller liner.
        - 4) Provide for varying die widths in liner to produce specified line widths, including shaping die cutoff device to provide clean, square ends at beginnings and ends of lines.
    - 2. Application of binder-sealer:
      - a. Before applying binder-sealer or thermoplastic compound, prepare roadway surface by buffing and cleaning or other appropriate method.
      - b. Where thermoplastic stripe is to be installed, spray surfaces with binder sealer consisting of two parts epoxy and one-part hardener-catalyst immediately prior to installation of compound.
      - c. Mix binder-sealer fresh each day. Do not premix.
    - 3. Application of thermoplastic compound:
      - a. Apply compound in colors shown and at locations shown.
      - b. Do not use pans and aprons to control width of lines.
      - c. Use equipment including extrusion dies capable of maintaining compound at specified extrusion temperature and density and capable of producing stripe of specified width.
    - 4. Application of glass spheres:
      - a. Perform reflectorizing of thermoplastic compound by immediate application of glass spheres to specified density.
      - b. Perform reflectorizing so that completed line registers not less than 55 on Hunter Nite Visibility Meter.
- C. Preformed Plastic Traffic Markings:
- 1. Prepare roadway surface by removing dirt, dust, oily substances and other foreign matter before installing plastic markings.
  - 2. Do not install plastic marking on wet or damp pavement.
  - 3. Make installations in neat, workmanlike manner with ends and edges of successive strips of material even.
  - 4. Position center and lane markings using chalk as guides.
  - 5. Installation on sheet-asphalt surfaces:
    - a. When plastic markings are to be installed on new sheet-asphalt surfaces, install while asphalt is still hot and immediately before final rolling is performed.
    - b. As part of final rolling operation, position and embed plastic marking into surface.
    - c. To install plastic markings on existing sheet asphalt, accurately locate and press marking into place and obtain final bond by at least two longitudinal passes of ten-ton roller.
  - 6. Installation on asphaltic-concrete surfaces:
    - a. Install as specified for sheet-asphalt surfaces except apply prime coat recommended by manufacturer of plastic markings to pavement surface prior to installation of markings.
  - 7. Installation on portland-cement concrete pavement:

- a. Seal surface of concrete pavement with quick-setting primer to reduce capillary action and improve bond between marking and pavement surface.
  - b. Otherwise install as specified for sheet-asphalt pavement.
- D. Painting of Curbing and Raised Traffic Bars:
- 1. Paint curbing and raised traffic bars with traffic-zone paint.
  - 2. Clean surfaces to be painted of dirt, dust, laitance, oil or other foreign substances.
  - 3. Allow 14 days minimum after installation of portland-cement concrete before painting.
  - 4. Curbing:
    - a. Paint top and front of curbing in locations shown with one coat of nonreflectorized traffic-zone paint as specified.
  - 5. Raised traffic bars:
    - a. Paint surfaces, except bottom of raised traffic bars with one coat of white traffic-zone paint and apply glass spheres before paint has hardened.
    - b. Apply paint and glass spheres as specified.

**END OF SECTION**

## SECTION 02772

### CURBS, GUTTERS AND WALKS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing curbs, gutters, curb and gutters and walks. \*1
- B. This section specifies providing walks, curbs, gutters, curb and gutters, coping curbs and integral curbs. \*2
- C. Related Work Specified Elsewhere:
  - 1. Grading, excavating and backfilling: Section 02320.
  - 2. Base course for pavements: Section 02725.
  - 3. Concrete pavement: Section 02750.
  - 4. Concrete reinforcement: Section 03200.
  - 5. Cast-in-place structural concrete: Section 03300.
  - 6. Granite: Section 04415.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Documentation:
    - a. Where stone curb is provided by street or highway jurisdiction, submit bill of stone curb materials prior to picking up materials at designated storage facility and transporting to site.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: C979.

##### 1.04 PRODUCT DELIVERY AND HANDLING:

- A. Handle stone so as to maintain curb intact with exposed faces unmarred.

#### PART 2 - PRODUCTS

##### 2.01 MATERIALS:

- A. Concrete: Section 02750 and as specified in this section.
- B. Carbon Black:
  - 1. Emulsified: At least 25 percent by weight standard carbon-gas black colloiddally dispersed in liquid medium so that when one part of product is stirred into ten parts of water, resulting liquid, after standing undisturbed for 72 hours, is uniformly colored and contains no fillers nor other material that would adversely affect quality or appearance of concrete.
  - 2. Powder:
    - a. Concrete grade carbon black, meeting the requirements of ASTM C979.

- b. Carbon black powder to disperse in water without floating and to be capable of uniform dispersion in plastic concrete.
- C. Joint Devices:
  - 1. In accordance with Section 02750, with the following additional requirements:
    - a. Dowels: 14 inches long, 3/4-inch diameter for curb and gutter and 1/2-inch diameter for sidewalk.
    - b. Plates for construction joints and planes of weakness: 14-gauge galvanized sheet metal cut to section as necessary.
- D. Expansion Joint Materials:
  - 1. In accordance with Section 02750, with the following additional requirements:
    - a. Preformed joint filler for stone curb, 1/4-inch thick; otherwise, 1/2-inch thick, subject to specified construction requirements.
- E. Granite Curb: Section 04415 and as specified in this section.
- F. Polyethylene Tape: Section 02750.

## **2.02 MIXES:**

- A. Mix exposed aggregate surface course concrete comprising by volume, one part portland cement to three parts granite aggregate or gravel, crushed gravel or crushed stone aggregate as shown, with sand added to form workable mix.
- B. Where concrete walks are shown to be darkened, add 1/2 pound of emulsified carbon black or 1/3 pound of carbon powder per bag of portland cement.

## **2.03 FABRICATION AND MANUFACTURING:**

- A. Fabrication of Granite Curbing:
  - 1. Drill holes are prohibited, unless otherwise specified.
  - 2. Straight granite curbstone:
    - a. Width: Eight inches plus-or-minus 1/8 inch at top surface.
    - b. Front face: Between 12 inches and 14 inches deep.
    - c. Batter: One-inch per foot to depth equal to reveal plus two inches.
    - d. Length: Random, three feet minimum.
  - 3. Radius curb up to and including 100 feet: Radius to have same cross section dimensions as straight curb and cut true to radius ordered. Radius curb to be not less than three feet in length measured on arc.
  - 4. Radius curb greater than 100 feet through 200 feet: Radius to consist of straight sections not exceeding five feet in length with the ends cut to form radial joints.
  - 5. The top surface of curbstone to be finished with four-cut or 550-shot finish, but not both, to approximately true plane, with no projection or depression greater than 1/8 inch.
  - 6. Front face finished same as top surface for depth of reveal plus two inches, except that sawn finish will be acceptable alternate, with no projection or depression greater than 1/8 inch. Remaining depth of front face may be rough cut with depressions or projections not exceeding 1-1/2 inches.
  - 7. Arris line between top and face to have 1/4-inch bullnose.
  - 8. Bottom surfaces to have no projection or depression greater than 1-1/2 inches.

9. Back surfaces to be sawn or split approximately at right angles to plane of top surface. No projection or depression greater than 1/4 inch will be allowed for a distance of four inches from top. Remaining distance to have no projection or depression greater than 1-1/2 inches. Drill holes will be permitted in back surface if they do not show in top arris line.

### **PART 3 - EXECUTION**

#### **3.01 FIELD QUALITY CONTROL:**

- A. Allowable Dimensional Tolerances:
  1. Concrete surfaces constructed in accordance with the following:
    - a. Plus-or-minus 3/16 inch of elevation shown.
    - b. Deviation: 1/8-inch maximum from steel straightedge as specified in Section 02750.

#### **3.02 BASE:**

- A. Ensure that previously placed base is satisfactorily compacted and free from loose material.
- B. Have base approved prior to placing forms and base covering.
- C. Correct deficiencies in grade, contour and compaction.

#### **3.03 FORMS:**

- A. Place forms as specified in Section 02750.

#### **3.04 JOINT DEVICES AND CONTRACTION JOINTS:**

- A. General Requirements:
  1. Place joint devices and contraction joints as specified in Section 02750.
  2. Where work abuts concrete pavement, adjust spacing of joints so that joints of same type coincide with transverse joints of concrete pavement.
  3. Width of preformed expansion joint filler: Same as thickness of concrete pavement minus 3/4 inch.
  4. Concrete curb, gutter and curb and gutter:
    - a. Place two dowels in each joint between eight and twelve inches apart; for curb and gutter place one of the dowels four inches from back of curb. For curb and gutter abutting concrete pavements, complete partial tie rod assemblies in slab. Place preformed expansion joint filler in single piece depressed 1/2-inch below finished surface.
    - b. For curves of 100 feet radius or less, space expansion joints equally at intervals of approximately 15 feet; for radii greater than 100 feet space expansion joints at intervals of 45 feet, with contraction joints at intervals of 15 feet. Form contraction joints, with plates left in place, depressed 1/2-inch below finished surface.
    - c. Where placed in curves of 100 feet radius or less, stop reinforcing steel two inches clear of expansion joints.
  5. Sidewalk:
    - a. Place 1/2-inch preformed expansion joint material between sidewalks and curb where sidewalks are constructed between permanent structure and curb.
    - b. Place transverse expansion joints at intervals of 45 feet. <sup>\*3</sup>

- c. Place transverse expansion joints at intervals of 45 feet, unless otherwise shown. \*4
  - d. Provide dowels in expansion joint spaced at two-foot intervals, clearing edges of sidewalk by one foot. Where sidewalks intersect, place expansion joints in each sidewalk for full width along extension of back edges.
6. Uniform Joint Spacing: For the entire length of each straight or curved run of sidewalk or curb to be placed, lay out the work and adjust joint spacing to provide intervals of equal dimension between joints, including grooves, unless otherwise shown.

### **3.05 CONCRETE AND WIRE FABRIC:**

- A. Place concrete and wire fabric in accordance with applicable requirements of Section 02750 except that top layer of fabric over trench-cuts to clear top surface by 1-1/2 inches, plus-or-minus 1/4-inch tolerance.
- B. Place pipe for weep holes through curbs for rain leaders from building downspouts where shown.

### **3.06 STONE CURB:**

- A. Excavating and backfilling in accordance with Section 02320.
- B. Place no-slump concrete as setting bed.
- C. Ram stone curb into proper position in setting bed and set to line and grade.
- D. Where stone curb ties into existing curb, align exposed abutting surfaces.
- E. Place preformed expansion joint filler at each joint.

### **3.07 FINISHING CONCRETE CURB, GUTTER AND CURB AND GUTTER:**

- A. Remove curb and face forms as soon as condition of concrete permits and perform finishing work on exposed surfaces.
- B. Finish face edge of curb to one-inch radius. Finish other edges to 1/4-inch radius.
- C. Provide steel troweled finish followed by brushing with fine-hair brush.
- D. Remove other forms when condition of concrete permits, but no sooner than 12 hours after placing. Rub surfaces with carborundum stone where necessary.

### **3.08 FINISHING SIDEWALK:**

- A. Work on Authority Property:
  - 1. Strike off and screed top surfaces so that resulting surface is smooth and within specified tolerances.
  - 2. As soon as condition of work permits, perform joint work, edging and marking.
  - 3. Finish edges to 1/4-inch radius.
  - 4. Scoring pattern: Unless otherwise shown, as follows:
    - a. Expansion joints: Install on 45-foot centers. For the entire length of each straight or curved run of sidewalk to be placed, layout the work and adjust joint spacing to provide intervals of equal dimension between joints, including grooves, unless otherwise shown.

- b. Contraction joints: Make transverse grooves 1/3 depth of the concrete at approximately nine-foot equal intervals between expansion joints perpendicular to longitudinal grooves.
  - c. Control joints: Make transverse grooves 1/2-inch deep at approximately three foot equal intervals between contraction joints perpendicular to longitudinal grooves.
  - d. Make longitudinal grooves 1/2-inch deep at approximately three foot equal intervals between and parallel to sides of sidewalk.
  - 5. Finish surface with final light broom finish with fine-hair broom.
  - 6. Construct wheel chair ramps at locations shown.
  - 7. Remove forms when condition of concrete permit, but no sooner than 12 hours after placement. Rub surfaces with carborundum stone where necessary.
- B. Non-Authority Work:
- 1. In accordance with codes and regulations of the jurisdictional authorities.

**3.09 CURING:**

- A. In accordance with Section 02750, except that liquid membrane curing compounds not to be used on curb of curb and gutter when temperatures tend to go lower than 40F within 24 hours after application.
- B. Do not use liquid membrane curing compounds on exposed aggregate concrete or darkened concrete surfaces.

**3.10 SEALING JOINTS:**

- A. Immediately prior to sealing joints, place polyethylene tape width of groove flat on preformed expansion joint filler.
- B. Seal expansion joints in concrete curb, gutter and curb and gutter with poured joint sealer in conformance with Section 02750. Do not seal expansion joints in sidewalk and stone curb.

**3.11 HIGH EARLY STRENGTH CONCRETE:**

- A. Use high-early-strength concrete in accordance with Section 02750 when approved.

**3.12 CORES:**

- A. Where directed, provide test cores in accordance with Section 02750.

**3.13 PROTECTION OF THE WORK:**

- A. Protect new work in accordance with Section 02750.

**3.14 DEFICIENT WORK:**

- A. Remove and replace with new materials or correct as directed work which does not meet specified requirements.

**3.15 INTEGRAL CURBS: \*5**

- A. Pour integral curbs with the pavement slab.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

\*1. Use first version of 1.01 A. for contracts where curb, gutter and walk work is performed outside the jurisdiction of Alexandria, Virginia.

\*2. Use second version of 1.01 B. modification for contracts where curb, gutter and walk work is performed within the jurisdiction of Alexandria, Virginia.

\*3. Use first version of 3.04 A.5.b. for contracts where curb, gutter and walk work is performed outside the jurisdiction of Alexandria, Virginia.

\*4. Use second version of 3.04 A.5.c. modification for contracts where curb, gutter and walk work is performed within the jurisdiction of Alexandria, Virginia.

\*5. Add Article 3.15 including A. for contracts where curb, gutter and walk work is performed within the jurisdiction of Alexandria, Virginia.

**END OF SECTION**

## SECTION 02820

### FENCING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing chain-link fencing, gates and fan guards.
- B. Related Work Specified Elsewhere:
  - 1. Cast-in-place Structural Concrete: Section 03300.
  - 2. Grounding: Section 16060.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Manufacturer's product data and installation instructions for fence, posts, fabric, gates, hardware and accessories.
    - b. Site plan with fence showing locations of bracing, fan guards, gates, ground rods, depression closures and other special fence construction.
    - c. Details of gates, depression closures and other special construction showing fabrication and installation.
    - d. Details for installation of accessories.
  - 2. Samples:
    - a. Chain link fabric: One of each width and type, each 24 inches long.
    - b. Posts, railing, braces, gate frames: One of each size and type, each 24 inches long.
    - c. Truss rod and turnbuckle: One each.
    - d. Tension wire: One, 24 inches long.
    - e. Barbed wire: One, 24 inches long.
    - f. Tension bar: One, 24 inches long.
    - g. Gate corner assembly: One.
    - h. Fabric ties: Four each.
    - i. Rail and brace ends and post caps: Two each.
    - j. Barbed wire extension arms: One each.
    - k. Other materials and accessories: One each.
  - 3. Certification.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWS: D1.1.
  - 3. MS: MIL-P-21035.
  - 4. FS: FF-T-791, RR-F-191/2D, RR-F-191/3D, RR-F-191/4D.
  - 5. ASTM: A121, A392, A413/A413M-01, C1107/C1107M-07a, F668.

#### 1.04 JOB CONDITIONS:

- A. Right of Access to Adjacent Private Property: As shown.

#### PART 2 - PRODUCTS

##### 2.01 MATERIALS:

- A. Fabric:
  - 1. Steel, hot-dip galvanized after weaving, ASTM A392; Class 2 coating, two-inch mesh, No. 9 gauge wire, height shown, both top and bottom selvage twisted and barbed unless otherwise indicated on Contract Drawings. <sup>\*1</sup>
  - 2. PVC-coated steel: ASTM F668 Class 2b; two-inch mesh, 0.148-inch diameter zinc-coated steel core wire, height as shown, black color PVC; top and bottom selvages twisted and barbed, unless otherwise shown on Contract Drawings.
- B. Posts, Top Rails and Braces:
  - 1. FS RR-F-191/3D, with the following additional requirements:
    - a. Posts: Class 1, Grade. Size in accordance with Table I unless otherwise shown.
    - b. Top rails: Class 1, Grade A; Size SP1.
    - c. Bracing: Class 1, Grade A; Size SP1.
    - d. Color coating: Where PVC-coated fabric is specified, provide matching PVC color ASTM F668 Class 2b coating.
- C. Accessories:
  - 1. FS RR-F-191/4D, with the following additional requirements:
    - a. Hot-dip galvanized, unless otherwise specified.
    - b. Wire ties:
      - 1) Fabric: No. 9-gauge steel.
      - 2) Tension wire: No. 11-gauge steel.
    - c. Tension wire: No 7-gauge Steel. <sup>\*1</sup>
    - d. Color coating: Where PVC-coated fabric is specified, provide matching PVC color ASTM F668 Class 2b coating.
- D. Barbed Wire:
  - 1. ASTM A121, Chain Link Fence Grade, 12-1/2 gauge steel wire with 14-gauge, four-point round barbs, five inches on center.
- E. Turnbuckle:
  - 1. FS FF-T-791, Type 1, Form 1, Class 8, Size 3/8 by six, hexagonal heads, UNC threads, hot-dip galvanized. Where PVC-coated fabric is required, provide matching PVC color coating thermally fused to the galvanized steel substrate.
- F. Latch:
  - 1. Plunger bar full height of gate, to engage stop at double gates.
- G. Security Chain:
  - 1. ASTM A413, Grade 43 High Test Chain, case-hardened carbon-steel, 3/8-inch diameter; hot-dipped galvanized at exterior locations.

- H. Padlock:
  - 1. **WMATA Station areas - Corbin Russwin, Catalog No. PL5090 IC high security or equal. All keys are to be turned over to the Engineer or WMATA Representative.**
    - a. Removable interchangeable core; with two keys, keyed and master-keyed as directed.
    - b. Body: Solid extruded brass.
    - c. Six-pin tumblers.
    - d. Shackle: Hardened steel, zinc-plated, 2-5/8 inch shackle length, ball bearing locking heel and toe.
  - 2. **WMATA Track & Line chain-link fence gates areas - Master Lock #5KA, Key A389 with two keys. All keys are to be turned over to the Engineer or WMATA Representative.**
- I. Concrete: Section 03300, Class 3500, air-entrained
- J. Grout: Non-shrink, in accordance with ASTM C1107.
- K. High Zinc-Dust Content Paint: MS MIL-P-21035.

## **2.02 SWING-TYPE GATES:**

- A. Provide swing-type gates, size as indicated on the Contract Drawings, complete with latches, stops (if required by the manufacturer), keepers, hinges and three strands of above the fabric (if shown on the Contract Drawings).
- B. Conform to Federal Specifications RR-F-191/2D, Single Swing Type I, Double Swing Type II, and as follows:
  - 1. Hot-dipped galvanized.
  - 2. Fabrication:
    - a. Fabricate gate perimeter frame from Class 1, Size SP2 pipe per Federal Standard RR-F-191/3D.
    - b. Fabric: Same fabric as used on the fence. Attach fabric securely to the gate frame at intervals not exceeding 15 inches.
    - c. Barbed wire: As specified in 2.1. D above.
    - d. Fan Guard: Materials and fabrication as specified for fencing.
  - 3. Hardware:
    - a. Hinges: Two or more galvanized steel or malleable iron, to suit the gate size: non-lift type, offset to permit 180 degrees opening.
    - b. Latch: Galvanized steel or malleable iron, combination type with provision for padlock.
    - c. Gate stops and center rest: Manufacturers' standard.

## **2.03 CANTILEVERED SLIDE GATE:**

- A. Conform to Federal Specification RR-F-192/2D, Type III.
- B. Barbed Wire: As specified in 2.01 D. above.

## PART 3 - EXECUTION

### 3.01 FENCE INSTALLATION:

- A. Perform necessary clearing, grubbing, excavation and filling to provide clear line-of-fence runs.
- B. Set posts in concrete footings, sized as shown. **All end, corner, pull and intermediate posts are to be embedded a minimum of 3 foot below final grade. Footing depth shall be a minimum of 3 feet 6 inches.**
- C. Extend concrete to two inches above ground line at posts and slope to drain away from posts. Form top 12 inches of footing, with remainder poured against excavated hole.
- D. Space posts at 10 feet maximum and eight feet minimum on centers. Place additional posts at each abrupt change in grade.
- E. Where rock is encountered, drill holes two inches deeper than depth shown and two inches greater than outside diameter of post. After post is placed as shown and specified, and supported, fill remaining void with one-to-three grout mixture of cement and sand.
- F. Where fence is located on concrete structure, weld post to base plate, thickness and size as shown on Contract Drawings. Erect fence post truly vertical, where necessary using shims of approved alloy. Secure to structure with anchor bolts; number, diameter and length as shown on Contract Drawings. Fill void under base plate with non-shrink grout. Bolts, base plate and weld to be hot-dipped galvanized.
- G. Space pull posts at approximately 500-foot intervals for straight runs and at each vertical angle point. Install corner posts at each horizontal angle point. Provide corner, end and pull posts with horizontal braces and tie rods on each side of posts extending to and connecting to adjacent line posts.
- H. After posts are installed and grout has set, install top rail or tension wire and securely anchor at ends and to line posts before hanging fabric.
- I. Secure ends of fabric by tension bars threaded through loops in fabric and secured to posts by bands with bolts and nuts or other approved devices.
- J. Attach fabric outside framing system, away from Authority property. Stretch fabric by securing one end and applying sufficient tension by mechanical fence stretchers. Fasten fabric to line posts, tension wire and top railing with tie wires at spacing shown.
- K. Hold bottom of fabric as uniformly as possible to, but in no case to exceed, two inches above finished grade.
- L. Provide barbed wire where shown. Install support arms at 45 degrees upward and outward from Authority property; extend corner, gate and end posts as shown. Stretch barbed wire to remove kinks and sags and secure to bracket arms, using tension bands for attachment to posts.

- M. Install gates, gate stops and fan guards as shown.
- N. Set gate stops in concrete accurately so that plunger can be fully engaged.
- O. Furnish one chain with one padlock for each gate.
- P. Grounding: Section 16060.

### **3.02 GATE INSTALLATION**

- A. Install gates plumb, level and secure for full opening without interference. Install ground-set items in concrete for anchorage, as detailed on the Contract Drawings. Adjust the hardware for smooth operation and lubricate where necessary.
- B. Attach barbed wire as shown on the Contract Drawings.

### **3.03 DEFECTIVE WORK:**

- A. Remove and replace fencing which is improperly located and is not true to line and grade, and posts which are not plumb.
- B. Repair damaged galvanizing by thoroughly wire brushing damaged area to remove loose and cracked zinc coating, and paint with two coats of high zinc-dust content paint. Allow first coat to dry thoroughly before applying second coat.

## **PART 4 -MEASUREMENT AND PAYMENT**

### **4.01 MEASUREMENT**

- A. Measurement of work specified in this Section will be made in the following manner:
  - 1. No separate measurement.

### **4.02 PAYMENT**

- A. Compensation for work specified in this Section will be made in the following manner:
  - 1. Included in the price of the work of which it is a part.

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

### **ENDNOTES**

**\*1.** Please verify that Standard Drawings conform to the revised Specifications for Section 02820; particularly that Utility Standard Drawing ST-U-34 contains Note 8 stating that fabric on Type A & A-1 fences less than 72 inches high have both top & bottom selvages knuckled, and that Note 8 is referenced on applicable section of CHART; and contains notes to Details 2 & 3 indicating maximum height of bottom tension wire above grade is 6 inches.

**END OF SECTION**

## SECTION 02845

### TRAFFIC CONTROL DEVICES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing vehicular traffic barriers and raised concrete traffic bars.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Certification:
    - a. Certificates from guardrail element manufacturer and pressure preservative-treatment plant stating that materials furnished meet specified requirements.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWWA: C1, P8.
  - 3. AASHTO: T68.
  - 4. ASTM: A36, A123, A153, A307.
  - 5. FS: TT-P-641.
- B. Allowable Dimensional Tolerances:
  - 1. Steel guardrail elements fabricated to width and depth tolerance of minus 1/8 inch.
  - 2. Dimensions of concrete posts and raised concrete traffic bars: Plus-or-minus 1/8 inch of dimensions shown.
  - 3. Dimensions of timber posts and bracket blocks: Plus-or-minus 1/2 inch of dimensions shown.

#### PART 2 - PRODUCTS

##### 2.01 MATERIALS:

- A. Guardrail:
  - 1. Steel posts and brackets:
    - a. Structural steel: ASTM A36.
  - 2. Wood posts and bracket blocks:
    - a. Number 1 Dense SR southern pine, minimum stress-grade 1400f.
    - b. Well-seasoned, sound and free from splits, cracks and other defects.
    - c. Pressure treated in accordance with AWWA Standard C1 using pentachlorophenol preservative in light petroleum solvent conforming to AWWA Standard P8.
  - 3. Concrete posts:
    - a. Concrete reinforcement: Section 03200.
    - b. Concrete: Section 03300 and 03400.
  - 4. Rail elements and terminal sections:
    - a. Rail elements and terminal sections fabricated from open-hearth or electric-furnace steel of thickness shown. Sheet shaped into beam with longitudinal corrugations forming section 12 inches minimum width and three inches minimum depth.

- b. Fabrication:
    - 1) Edges of rail element straight and smooth.
    - 2) Steel sheet subject to standard mill tolerances for gauge.
  - c. For steel-beam type guardrail installed on curves having radius of more than 20 feet and less than 150 feet: Rail elements convex or concave as shown.
  - d. Elongation of two-inch specimen of sheet steel used for rail elements: 12-percent minimum when tested in tension in accordance with AASHTO T68.
  - e. Comply with the following:
    - 1) Tensile strength of specimen of full size of rail element, including a splice at center of specimen: 70,000-psi minimum.
    - 2) Post connections to withstand 5,000-pound side pull in both directions.
    - 3) Section of rail with traffic face up, freely supported at both ends of 12-foot span, to support concentrated load of 2,000 pounds at center of span with maximum deflection of two inches.
  - f. Rail elements and terminal pieces hot-dip galvanized after fabrication.
5. Hardware:
- a. Bolts and nuts: Steel, ASTM A307, Grade A.
  - b. Post and splice bolts machined, button-head, shoulder bolts with roll threads, Class 2A fit before galvanizing. Shoulder or neck to have an oval shape as shown. Hexagon nuts for rail connections to be machined American Standard heavy-type with recess to accommodate shoulder on bolts.
  - c. Bolts and nuts for offset steel brackets: American Standard heavy-type.
  - d. Plate washers fabricated from steel conforming to requirements specified for rail elements and terminal connections.
  - e. Hot-dip galvanized after fabrication.
6. Galvanizing:
- a. Steel posts, post anchors, brackets, rail elements and terminal sections hot-dip galvanized after fabrication in accordance with ASTM A123.
  - b. Hardware hot-dip galvanized after fabrication in accordance with ASTM A153. Zinc coating: Two ounces per square foot minimum.
  - c. Replace components on which galvanizing is damaged with new material having properly galvanized surfaces.
7. Primer coating: FS TT-P-641.
8. Non-shrink grout: Section 03300, shrinkage compensating.
9. Welding: Section 05120.

**B. Raised Traffic Bars:**

- 1. Formwork: Section 03100 or 03400.
- 2. Reinforcing steel: Section 03200.
- 3. Concrete: Section 03300, Class 3000, air-entrained.
- 4. Portland-cement grout: Section 03300.
- 5. Adhesive for attaching traffic bars to pavement: Polyvinyl acetate or asphaltic emulsion. If asphaltic emulsion is used, do not use clay or similar substances as emulsifying agents. Consistency of adhesive suitable for heavy trowel application at prevailing ambient temperature.
- 6. Anchor pins: Section 03200, concrete reinforcing rods.

**2.02 FABRICATION AND MANUFACTURE:**

**A. Steel Posts, Brackets and Post Anchors:**

- 1. Cut ends square. Punch or drill posts and brackets as shown.
- 2. After being cut to length and punched or drilled, hot-dip galvanize posts and brackets separately before bolting.
- 3. On end steel posts and adjacent posts weld steel channel anchor, 15.3 pounds per linear foot and one-foot three-inches long minimum.

- a. Weld anchors to posts and hot-dip galvanize.
    - b. Welding: Section 05120.
  - 4. Replace components on which galvanizing is damaged with new material having properly galvanized surfaces.
- B. Wood Posts and Bracket Blocks:
  - 1. Cut ends square. Drill posts and bracket blocks as shown.
  - 2. After cutting to length and drilling, saturate cut ends and holes with same preservative as that used for pressure treatment.
- C. Concrete Posts:
  - 1. Precast concrete, Class 5000, in accordance with Section 03300, eight inches square by five feet-nine inches.
  - 2. Reinforcement as shown and in accordance with Section 03200.
  - 3. Cure in accordance with Sections 03300 and 03400.
- D. Traffic Bars:
  - 1. Apply shop mark on each raised traffic bar with water-resistant paint showing the following:
    - a. Date of manufacture.
    - b. Identifying mark of manufacturer.

### **PART 3 - EXECUTION**

#### **3.01 EQUIPMENT:**

- A. Where posts are to be set in drilled holes, use mobile auger.
- B. Where steel posts are to be driven in place, use mobile drop hammer equipped with leads and mounted on track or on crawler treads. Protect heads of posts with driving cap designed to fit section of post being driven.

#### **3.02 POSTS IN DRILLED HOLES:**

- A. Drill holes plumb, accurately positioned and of diameter and depth shown.
- B. Position posts in hole to alignment shown; brace in position until remainder of hole has been backfilled with excavated material or concrete as shown.
- C. Place backfill in layers six inches maximum and compact in accordance with Section 02320.
- D. Dispose of surplus excavated material in accordance with Section 02320.
- E. In unpaved areas, carry backfill to height of two inches above surface of ground and slope to drain away from post.
- F. When holes in paved areas are shown to be backfilled with excavated material, place and compact backfill to bottom of pavement. Where pavement is portland-cement concrete pavement, fill remainder of hole with concrete to surface of pavement. Where pavement surface is asphaltic concrete, stop concrete fill two inches below final grade and fill remainder of hole with asphaltic concrete of same type as existing surface. Tamp asphaltic concrete well and slope to drain away from post.
- G. Where shown to be encased in concrete, compact concrete well and carry it to height of two inches above natural ground and slope to drain. Trowel finish surface.

### **3.03 POST DRIVEN IN PLACE:**

- A. Ensure that posts are plumb and located as shown. Remove and redrive posts which are not in compliance.
- B. Drive steel posts before offset bracket is attached.
- C. After driving, top of posts to have substantially same cross-sectional dimensions as body of posts and be free of bends and damage to galvanizing coat. Remove posts not in compliance and drive new replacement post.
- D. Drive posts carefully to prevent damage to utility facilities; if such facilities are encountered, relocate posts. Repair facilities damaged by construction operations.

### **3.04 POST SET ON CONCRETE PAVEMENTS AND DECK SLABS:**

- A. Where steel-beam guardrail is installed on existing portland-cement concrete pavement or deck slabs, fabricate steel post assembly as shown. Anchor assembly to pavement or deck slab with through-bolts or four-unit expansion anchors as shown.
- B. Clean pavement or deck surface area where base plate is to be installed. Set post with base plate over bolts; plumb and shim posts to proper grade and alignment with metal shims.
- C. Work nonshrink grout under plate to ensure full contact of bearing area. Remove shims as soon as concrete has hardened sufficiently to support weight of post. Finish edges true and smooth.

### **3.05 INSTALLATION OF STEEL-BEAM GUARDRAIL:**

- A. Install brackets and blocks on roadway side of posts. Tighten bolts after rail elements have been attached and entire assembly adjusted to line and grade.
- B. Erection of Rail Elements and Terminals Sections:
  - 1. Erect rail elements and terminal sections on posts and post brackets previously set to produce smooth continuous rail to line and grade shown. Install rail with double-corrugation face toward traffic.
  - 2. Bolt edges and center corrugation fully.
  - 3. Make vertical adjustment at posts by use of oversize bolt holes in posts and brackets as shown. If oversize holes do not permit sufficient adjustment, reset post until guardrail is properly aligned.
  - 4. After rail has been correctly aligned, tighten bolts. Check or burr threads projecting beyond nut to prevent removal.
  - 5. Where steel beam-type guardrail is shown anchored to bridge piers or terminating at concrete parapet walls, punch slotted bolt holes in rail elements terminating at such locations and make connections as shown. Flame-cutting is prohibited.
- C. Where approved, repair damaged zinc coating by wire brushing damaged area to remove loose or cracked zinc coating and applying two coats of primer.
- D. Punching, drilling, reaming, cutting or welding rail elements or terminal pieces in the field is prohibited except as approved.

### **3.06 INSTALLATION OF RAISED TRAFFIC BARS**

- A. Install raised traffic bars at locations shown.
- B. Before adhesive is applied, remove dirt, dust, grease, oil and other foreign matter that would adversely affect bond of adhesive.
- C. Apply adhesive to surfaces in such quantity that firm even bearing is obtained throughout entire contact area. Remove excess adhesive.
- D. Where use of steel pins is shown, drill holes through pavement, before adhesive is applied.
- E. After adhesive has been applied and bars properly positioned, drive steel pins in place with top of pin two inches below top of bar. Firmly press bar into adhesive, fill pin holes with portland-cement grout flush with top of bar.
- F. Where traffic bars extend across pavement joints, cut bars and make open joint of same width as joint in pavement.
- G. Painting: In accordance with Section 02765.
- H. Installation of traffic bars which are chipped, cracked or otherwise defective is prohibited.
- I. Protect completed installation until final acceptance.

**3.07 FIELD QUALITY CONTROL:**

- A. Top of post: Plus-or-minus 1/4 inch of elevation shown.
- B. Location of post: Plus-or-minus 1/4 inch of location shown.

**END OF SECTION**

## SECTION 02871

### BICYCLE RACKS AND STORAGE LOCKERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies furnishing and installing bicycle racks and storage lockers.

##### 1.02 QUALITY ASSURANCE:

- A. Conform to the following codes, regulations, reference standards and specifications:
- B. Codes and regulations of jurisdictional authorities.
- C. FS: FF-S-325C.
- D. ASTM: F593.
- E. UL 94-V2.

##### 1.03 SUBMITTALS:

Submit for approval in accordance with the Special Conditions and with the additional requirements as specified for each:

- A. Shop Drawings: Provide manufacturer's literature showing details bicycle racks and storage locker construction, size, anchors, locks and installation instructions.
- B. Samples: Submit one each of the following. Usable approved samples will be returned by the Engineer for use in the work:
  - C. Anchor bolt.
  - D. Lock.
- E. Certifications:
  - 1. Submit certification from the manufacturers that the bicycle rack, storage locker and lock products to be supplied are compatible with specified substrate materials and will perform satisfactorily for not less than seven years.
- F. Documentation:
  - 1. Bike rack and storage locker installation procedures.
  - 2. Submit a packaging plan for the bike rack and locker units to the Engineer for approval.

##### 1.04 PACKAGING, DELIVERY, STORAGE AND HANDLING:

- A. Protect, package and deliver all bike rack and locker units complete. Deliver products to site in original unopened moisture-proof containers clearly labeled indicating manufacturer's name, type, grade and color.

- B. Store all products in approved dry area and protect from contact with soil and from exposure to the elements and contamination. Store on pallets so as to prevent damage and moisture penetration. Protect materials from rust-causing conditions and protect all materials from freezing or excessive heat.
- C. Handle assembled bike locker units in such a manner as to prevent damages to surfaces. Handle all products so as to prevent breakage of containers and damage to materials.

## **PART 2 - PRODUCTS**

### **2.01 BICYCLE RACKS**

- A. Manufacturer: High Security Bicycle Racks Co., Rack III or approved equal.
- B. Frame: All welded galvanized steel construction.
  - 1. Posts and Arms: Tubing members; 1-1/2 inch x 1-1/2-inch, 1/8-inch thick.
  - 2. Base: channel member; 4-inch x 1 5/8 inch, 3/16-inch thick.
  - 3. Locking Bars: Solid round bar, 1-inch diameter.
- C. Style: Traditional, double-unit.
- D. Security: Three-point locking system for wheel and frame. Shielded padlock receptacle to accept chain, cable and U-shaped bike locks.
- E. Size: 23 1/2-inches high, 28-inches wide, 48-inch length.
- F. Anchors: Three (3) 1/2-inch x 4 1/2-inch stainless steel expansion anchor bolts as indicated.
- G. Steel Finish: Manufacturer's standard powder coat finish.
- H. Color: As selected by the Engineer from Manufacturer's standard colors.

### **2.02 BICYCLE LOCKERS**

- A. Manufacturer: ProPark Bicycle Security Locker as manufactured by Cycle-Safe, Inc., or approved equal.
- B. Construction: Compression-molded thermoset compound, glass-fiber reinforced conforming to UL 94-V2. Formed doors and roof with frames of interlocking flanges.
- C. Model: [M/10DFR, M/12DFR, M/20DFR, and M/24DFR.]
- D. Hardware:
  - 1. Lock: Contract restricted as manufactured by Medco High Security Lock Co., or approved equal, individually keyed with five duplicate keys conforming to WMATA master key systems; R17D, R34H and d93D with 0951 cylinder.
  - 2. Latch: Stainless steel with recessed 18 ga. stainless steel plate.
  - 3. Hinges: stainless steel.

- E. Anchorage: 3/8-inch x 1-1/2-inch stainless-steel expansion type anchor bolts, four per unit as indicated.
- F. Leveling Brackets: Concealed adjustable, 3-inch vertical adjustment.
- G. Interior Partitions: Exterior grade OSB panels, sealed.
- H. Finish: Manufacturer's standard Acrylic Urethane, textured semi-gloss finish.
- I. Color: Manufacturer's standard.

**2.02 FASTENERS.**

- A. Provide fasteners as recommended by the manufacturer: Anchor bolts: FS FF-S-325, Group II, Type 3, Class 3, fabricated from stainless steel, Type 303/304. One-piece steel expander-type with bottom grooves, integral threaded stud per ASTM 593. Anchor bolts with pull-out force not less than 1,500 pounds.

**PART 3 - EXECUTION**

**3.01 INSPECTION AND COORDINATION:**

- A. Inspect the site, substrates and conditions under which the bicycle lockers will be installed. Report to the Engineer conditions that may adversely affect the work or that differ substantially from conditions shown. Follow Engineer's direction regarding such conditions.

**3.02 INSTALLATION:**

- A. As bicycle lockers are being transported and installed, prevent flexing and stressing of the lockers or other possibility of damage. Take precautions as work is being performed.
- B. Install bicycle racks and storage lockers in locations and configurations shown following manufacturer's installation instructions: Drill holes to accommodate installation of anchor bolts, adjust footing and leveling brackets and set anchor bolts. Install anchors as recommended by manufacturer to develop their rated pull-out strength. Fasten work in place so that items will not be distorted, finish will not be impaired, nor the fasteners overstressed from expansion and contraction. Set slab-mounted lockers in locations shown, install plumb, level and in true alignment with adjoining work.

**3.02 CLEANUP:**

- A. Remove all construction debris from the site.

**END OF SECTION**

## SECTION 02872

### STATION MEZZANINE ENCLOSURES AND PLATFORM SHELTERS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing mezzanine enclosures and station platform shelters.
- B. Related Work Specified Elsewhere:
  - 1. Premolded expansion joint filler: Section 03100.
  - 2. Cement grout and nonshrink grout: Section 03300.
  - 3. Sealant: Section 07900.
  - 4. Chain and padlock: Section 08710.
  - 5. Tempered glass and safety plastic: Section 08800.
  - 6. Field painting: Section 09920.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWS: D1.1.
  - 3. AWI: Architectural Woodwork Quality Standards.
  - 4. SDI: 100.
  - 5. FS: FF-S-325.
  - 6. ASTM: A36, A53, A123, A153, A181, A193, A307, A366, A384, A500, A501, A570, A780, B455, C307, C413, C509, C579, C580, D2559.
- B. Qualifications of Welding Personnel: Employ welders whose qualification is certified in accordance with AWS Standard D1.1. Such certification is to remain in force for the duration of the welding operations under this Contract.
- C. Job Mock-Ups:
  - 1. Complete full-size mock-up of typical bay of mezzanine-area enclosure.
  - 2. Complete full-size mock-up of station platform shelter.
- D. Lock Functions and Keying: Require hardware supplier to provide padlock and chain and meet with Engineer to finalize cremone bolt lock-functions and keying requirements.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Include details of construction, connections, anchors, interfacing with the work of other trades, schedules and setting diagrams.
    - b. Minor variations in detail for the purpose of improving fabrication and installation procedures, but not affecting general design or structural stability, will be given consideration.
    - c. Note extent of shop-applied finishes and field-painted finishes.
    - d. Use field measurements for critical dimensions and indicate them as such.

2. Samples:
  - a. Three of each type of the following products used in the work:
    - 1) Steel frame section: 12 inches long, with bolting flange.
    - 2) Steel face sheet: 12 inches square.
    - 3) Gasket material: 12 inches long.
    - 4) Wood: 2-1/2 inches by 5-1/2 inches by 12 inches.
    - 5) Fasteners, attachments devices to substrates and other accessories.
  - b. One sample of each of the following:
    - 1) Cremone bolt, trim, and escutcheon.
    - 2) Three 12-inch long assemblies of enclosure frame and stops for panels, with means of attachment to enclosure framework.
3. Certification.
  - a. Certified test reports: Certified test reports verifying that epoxy grout conforms to specified requirements.
  - b. Certification that welding personnel are currently qualified in accordance with AWS D1.1.

#### **1.04 PRODUCT, DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to the jobsite in original unopened containers or wrappings clearly labeled with manufacturer's name and brand designation, referenced specification number, type and class as applicable.
- B. Store products in an approved dry area, protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products to prevent breakage of containers and damage to products.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Steel Tubing: ASTM A500, ASTM A501.
- B. Steel Bars, Plates and Shapes: ASTM A36.
- C. Hot-rolled carbon steel sheets and strips: ASTM A570.
- D. Cold-rolled steel sheets and strip for forming processes: ASTM A366.
- E. Sleeves: Steel pipe, Schedule 40, ASTM A53, with welded steel-plate bottom.
- F. Bolts:
  1. Carbon steel: ASTM A307, with mated nuts, washers, and anchors, hot-dip galvanized.
  2. Stainless steel: ASTM A193, Class 1A.
  3. Expansion shields: FS FF-S-325; Group, Type and Class best suited to each purpose as approved.
- G. Screws: Corrosion-resistant, either hot-dip galvanized or stainless steel, oval, tamper-resistant design as approved. Where exposed, finish to match material being fastened.
- H. Glazing Materials:
  1. Glass: 1/4-inch tempered glass specified in Section 08800.

2. Plastic: Clear safety plastic, 1/4-inch thick minimum specified in Section 08800.
  3. Gaskets: Neoprene, ASTM C509. Shore A Durometer, scale of hardness 50-60.
  4. Butyl tape: Preshimmed, Tremco Polyshim II or equal.
- I. Wood: Natural-finished white oak, select-grade or better, dried to moisture content of 12-percent maximum. Formed from one piece of solid edge-grain lumber or glue-laminated boards matched for color and grain and with nonstaining adhesive complying with ASTM D2559.
- J. Core material: Continuous phenolic-resin-impregnated honeycombed paper.
- K. Paint: Shop finish (primer):
1. Manufacturer standard primer, providing it complies with primer requirements of Section 09920 and is compatible with undercoat and finish coat. Finish paint: Section 09920.
  2. Zinc-rich paint: MS MIL-P-21035.
- L. Cremona Bolt:
1. Handle: Bronze, ASTM B455 Alloy C38500.
  2. Pins, washers, nuts and bolts: Stainless steel, ASTM A193, Alloy C30400.
  3. Padlock and chain: Section 08710.
- M. Flanges: ASTM A181.
- N. Cement Grout and Nonshrink Grout: Section 03300.
- O. Epoxy Grout:
1. Nonshrink, nonstaining, 100-percent solids, two-component or three-component epoxy-resin system, that has been in successful use for an equivalent application for a minimum of five years.
  2. On horizontal applications: Self-leveling type.
  3. On vertical and overhead surface application: Non-sag type.
  4. Physical properties:

Property	Requirement	ASTM Test Method
Tensile strength	1,800-psi minimum in seven days	C307
Compressive strength	13,500-psi minimum in 28 days	C579
Modulus of rupture	13,500 psi	C580
Water absorption	One-percent maximum, two hours at 212F	C413

- P. Sealant: Section 07900.
- Q. Premolded Expansion-joint Filler: Section 03100.
- R. Filler Panels:
1. Structural steel, ASTM A36.

- S. Galvanizing Repair Compound:
  - 1. Stick form, melting point 600F to 650F,
  - 2. GALVABAR or equal.

## 2.02 FABRICATION:

- A. Fabricated as shown on approved shop drawings.
- B. Hollow-metal panels. Fabricate in accordance with SDI 100, Grade III, model 2A, one of the following styles:
  - 1. Seamless hollow-steel construction.
  - 2. Seamless composite construction.
- C. Cremona bolt: Fabricate and assemble as shown.
- D. Fabricate and fasten metalwork to prevent distortion and overstressing from expansion and contraction of metal. Conceal fastenings wherever practicable.
- E. Perform welding in accordance with AWS D1.1. Grind exposed welds smooth. Finish flush and grind smooth welds exposed after installation.
- F. Align members to provide true planes and square openings for installation of glass panels. Fabricate horizontal and vertical members square, level, plumb with respect to other members and true within a tolerance of plus-or-minus 1/8 inch. Cap mullions.
- G. Fabricate woodwork to AWI Architectural Woodwork Quality Standards, Premium-Grade.
- H. Pre-Assembly and final Installation: Insofar as practicable, preassemble and fit work of this section in shop to ensure proper field assembly. To the extent that work cannot be shop-assembled with permanent connections; pre-assemble, mark and disassemble before shipment.
- I. Galvanizing: For installations exposed to weather and elsewhere where indicated, hot-dip galvanize enclosures and gates after fabrication and prior to finishing. Galvanize in largest assembled units possible.
  - 1. Use hot-dip galvanizing process in accordance with ASTM A123, ASTM A153 and ASTM A384 as applicable.
  - 2. Clean and phosphatize surface as needed for priming.
  - 3. Prior to priming, treat welds and cut edges with a galvanizing repair compound at a rate of two ounces per square foot, and prepare for priming.
- J. Swing Gates
  - 1. Fabricate to operate smoothly with minimum applied pressure.
  - 2. Detail and construct assemblies to permit replacement of components that wear without disassembling entire gate.
- K. Miscellaneous Components:
  - 1. Fabricate metal items indicated on the drawings from materials shown or, if not otherwise described, from galvanized steel wherever exposed to the weather or in contact with concrete or masonry.
  - 2. Make miscellaneous items to the size and configuration indicated, welded or bolted at joints to develop full strength equal to a continuous member, and in every way complete for the intended purpose and finished in appearance.

### **2.03 SHOP PAINTING:**

- A. Shop paint (prime) before shipment. Work primer well into joints. Do not prime surfaces to be field-welded.
- B. Ensure that galvanized surfaces are phosphatized before priming.
- C. Thoroughly clean bare steel as recommended by primer manufacturer and in accordance with SSPC SP11 and apply one shop primer coat; work well into joints. Do not prime surfaces to be field-welded.
- D. On surfaces not accessible for field painting after erection, apply two coats of primer in shop.
- E. Finish Paint: Silicone-alkyd, two coats over primer; color to be determined. See Section 09920.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Verify dimensions before proceeding. Measure structure to ensure accurate fit to other construction, including wall-to-wall dimensions, floor-to-ceiling dimensions and those controlled by other trades.
- B. Remove foreign substances from surfaces to receive work described in this section.
- C. Protect surrounding surfaces from damage while performing the work of this section.

### **3.02 INSTALLATION:**

- A. General:
  - 1. Coordinate work of this section with work of other trades.
  - 2. Fit work to adjoining construction as shown on Contract Drawings and approved shop drawings.
  - 3. Install work plumb and true, properly align, and securely fasten as shown on Contract Drawings and approved shop drawings.
  - 4. Firmly anchor mullion of each station-platform shelter to withstand inward or outward wind pressure of 25 psf.
  - 5. Touch-up prime coat to cover field welds and damaged areas.
  - 6. Install glass and glazing material per specifications in Section 08800.
  - 7. Install cremone bolt and adjust operation as approved.
- B. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
  - 1. Wire-brush areas to be coated to bright metal.
  - 2. Apply galvanizing repair compound at rate of two ounces per square foot and prepare for priming.
- C. Epoxy Grouting:
  - 1. Remove contaminants from surfaces receiving and coming into contact with the grout. Remove surface contaminants such as curing compounds from holes that receive grout. Ensure that surfaces to receive grout are dry at the time of grouting.
  - 2. Prime surfaces in accordance with grout manufacturer's recommendations unless manufacturer recommends against priming.

3. Mix and place epoxy grout for locations shown or specified as recommended by grout manufacturer. Level exposed surfaces of grout joints with adjacent surfaces. Grind rough or raised projections smooth and flush with adjacent surfaces.
- D. Painting and Repairing Coated Surfaces:
1. Before enclosing construction, paint items that will be concealed in finished work.
  2. Where shop primer coat is abraded or burned by welding, clean, apply galvanizing repair compound and touch-up. Touch-up primed surfaces with same material as original coating.
  3. See Section 09920 for field painting.

**3.03 CLEAN-UP:**

- A. Remove from the site rubbish and debris caused by this work.
- B. Leave areas surrounding the work in broom-clean condition.

**END OF SECTION**

**SECTION 02890**

**MARKERS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing markers.
- B. Related Work Specified Elsewhere:
  - 1. Concrete reinforcement: Section 03200.
  - 2. Cast-in-place concrete: Section 03300.
  - 3. Precast Structural Concrete: Section 03400.

**1.02 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data:
    - a. Manufacturer's construction details showing materials, dimensions and profiles for each individual component.
  - 2. Shop Drawings:
    - a. Plans, elevations and sections detailing fabrication and erection. Show anchors, reinforcements, accessories, layout, installation details, colors and finish treatments.
    - b. Message list including wording and lettering layout. Include full-size details of special graphics.
    - c. Setting drawings, templates and directions for installation of anchors to be installed as work in other sections.

**1.03 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications.
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. FS: QQ-B-654, WW-T-791.
  - 3. ASTM: B36, B135
- B. Survey Certification:
  - 1. All Right-Of-Way markers shall be set by a surveyor registered in the area where the work is to be performed.
  - 2. The following certification statement or a similar statement is required and shall be placed on all approved Mylar sepia as-built Right-of-Way drawings:

"I hereby certify to the best of my knowledge that the Right-Of-Way markers shown on this as-built drawing have been set in accordance with the coordinate information provided by WMATA as shown on the Contract Documents."

\_\_\_\_\_ (seal)  
**Registered Surveyor in the State of Maryland** \*\*

\_\_\_\_\_ (seal)  
**Registered Surveyor in the Commonwealth of Virginia** \*\*

\_\_\_\_\_ (seal)  
**Registered Surveyor in the District of Columbia** \*\*

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Precast Concrete: Section 03400.
- B. Concrete: Section 03300, Class 3500, air-entrained.
- C. Concrete Reinforcement: Section 03200.
- D. Bronze Discs:
  - 1. 3 ½ inch diameter domed survey marker forged from sold unleaded bronze in accordance with ASTM B98-98 with a classic 3 inch long and 5/8 inch diameter split-style tapered stem designed for use in concrete or rock (the Corp of Engineers Type 1 disc). Like or equivalent to the Berstsen C-1 Bronze 3 ½ inch domed marker #C35DB.
  - 2. Refer to Standard Drawings ST-C-3 and ST-C-19 for additional details on bronze discs and installation.
- E. Epoxy Hilti

### **2.02 FABRICATION AND MANUFACTURE:**

- A. Markers and Monuments:
  - 1. Legend:
    - a. Apply legend shown for various markers and monuments using characters of size and type shown. Clearly indicate use.
  - 2. Bronze disc markers:
    - a. Bronze discs as specified with imprinted or stamped legend.
  - 3. Precast-concrete markers and monuments:
    - a. Four inches square by length shown, with 1/2-inch chamfered edges.
    - b. Precast concrete.
    - c. One 29-inch long, No. 4 steel-reinforcing bar centered in casting.
    - d. With lettering, when shown, incised v-shaped, 1/4-inch wide and 3/16-inch in depth.

## **PART 3 - EXECUTION**

### **3.01 BRONZE DISCS FOR MARKERS AND MONUMENTS:**

- A. Except as shown, form discs into convex shape 3/16 inch in depth with edges free from burrs and blemishes.
- B. Press legend into the upper surface of disc so that surface is not raised. Ensure that legend conforms to that shown for markers and monuments.
- C. Do not place letters closer than 1/8 inch to outer rim of marker. Letters in outer ring of legend, 1/2-inch high; medium-sized letters, 7/32-inch high. Place letters along radius of disc. Imprint legend symmetrically about center of disc.
- D. When bronze-disc markers are set in concrete pavements and roadways, set stem in drilled hole and secure with approved epoxy cement, like or equivalent to Hilti HIT Hy 150.
- E. At other locations, set bronze-disc markers into tops of markers and monuments as specified; set markers and monuments in ground at locations shown.

**3.02 PRECAST-CONCRETE MARKERS AND MONUMENTS:**

- A. Install precast-concrete markers and monuments at locations and to elevations shown or as directed.
- B. Set markers and monuments as shown. Compact bottom of excavation to prevent settlement.

**END OF SECTION**

**SEE ENDNOTES BELOW. THEY ARE AN ESSENTIAL PART OF THIS SECTION UNTIL EDITED BY SECTION DESIGNER.**

**ENDNOTES:**

- \*1. Enter jurisdictions as applicable for the project locations.

## SECTION 02920

### TOPSOIL, SEEDING AND SODDING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing and maintaining seeding and sodding, including grass, crownvetch and lespedeza.
- B. Related Work Specified Elsewhere.
  - 1. Site grading: Section 02320.
  - 2. Removal and restoration of existing landscaping: Section 02205.
  - 3. Landscaping: Section 02930.
- C. Definitions:
  - 1. UMPC: University of Maryland, College Park
  - 2. Numerical fertilizer analysis: Three-digit number indicates nitrogen, phosphoric acid and potash percentages by weight. Thus, 3-25-25 means three-percent nitrogen, 25-percent phosphoric acid and 25-percent potash by weight.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications: Keep always available at the work site a copy of each of the cited references.
  - 1. Codes and regulations of the jurisdictional authorities.
  - 2. USDA-SCS.
  - 3. UMPC: Current publication of Agronomy Mimeo #77 (Turfgrass Cultivar Recommendations for Maryland).
  - 4. ASTM: C51.
- B. Personnel Qualifications:
  - 1. Superintendent: Use a Superintendent with previous knowledge and verifiable experience in supervising seeding and sodding work of similar size and scope. Have the Superintendent present whenever work is being performed and have the Superintendent responsible for controlling the quality of work and inspecting completed work to ensure that Contract requirements are met. The Superintendent is the primary contact person with the Engineer regarding seeding and sodding work.
  - 2. Workers: Have the work performed only by experienced workers, who through related training and verifiable previous on-the-job experience, are familiar with the technical aspects of seeding and sodding, and with the materials and equipment used for each operation. Have each worker abide by the code of ethics or professional conduct established by the Landscape Contractors Association MD-DC-VA.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples and Certification:
    - a. Submit in accordance with Table 02920-1 and as follows:
      - 1) Seed: Each seed bag bearing the following upon delivery:
        - a) Analysis tag.

- b) Certification tag.
    - c) Maryland or Virginia State tags where applicable.
  - 2) Inoculant: Sample packet of inoculant, viable bacteria, true to legume strain required and listing source.
  - 3) Sod: Maryland or Virginia State-Certified, each delivery bearing a Maryland or Virginia certification tag and label as required by law.
  - 4) Topsoil: Submit supplier's name and address and source of topsoil. Submit certified report of soil laboratory test results listing textures, pH, P and K nutrients, soluble salt, organic matter and mechanical analysis as to percentage of sand, silt and clay. Do not deliver topsoil to site until approved. Approval does not constitute final acceptance.
  - 5) Fertilizer: Labeled with manufacturer's name and address, guaranteed analysis, including nutrient and its derived source and listing of potential acidity.
  - 6) Limestone and acidifying agent: Labeled with manufacturer's name and address, chemical analysis, oxide content and size gradation of each used.
  - 7) Mulch and mulch binder: Labeled with manufacturer's name and address, material components, trademark, chemical analysis, species, size, age and source.
  - 8) Herbicide: Labeled with manufacturer's name and address and chemical analysis. Include in submittal the Material Safety Data Sheet, with copies to the Engineer and Contractor's Safety Officer.
- b. Usable samples will be returned.
- 2. Documentation:
  - a. Personnel qualifications: A list of the qualifications and experience of the workers, and qualifications and experience of the Superintendent, as attested by knowledge and experience in supervising contracts of similar size and scope in the past.
  - b. Soil tests for crownvetch and lespedeza areas: Submit certified report of soil tests *made by a* local state agricultural experiment station or agricultural laboratory recommended by U.S. Department of Agriculture. Test for pH, P and K nutrients, soluble salt, organic matter and mechanical analysis as to percentage of sand, silt and clay; and include recommended quantities of soil amendments to be added to produce the target pH value and to produce optimal growing conditions for the target crop.
  - c. Furnish one test for each 500 square feet of each crownvetch and lespedeza planting area, and not less than one test for each area.
  - d. Equipment list: A list of the equipment anticipated for use, including the make and model, year manufactured.

#### **1.04 PRODUCT INSPECTION, DELIVERY, STORAGE AND HANDLING:**

- A. General: Materials and supplies are subject to inspection and sampling for testing. Allow no seed, sod, fertilizer, straw or other agronomic materials or supplies on site other than those for the project
- B. Seed: Deliver with labels and tags.
- C. Inoculants: Store inoculant containers below 70F until used. Keep containers sealed until contents are used in their entirety. Use inoculants before expiration date shown on packet. Using inoculants exposed to temperatures of 70F or greater is prohibited.

- D. Sod: Deliver sod with labels and tags.
  - 1. Deliver sod to job within 24 hours after being cut; place sod within 36 hours after being cut.
  - 2. Prior to and after delivery during wet weather, allow sod to dry to the extent that will prevent tearing during handling and laying. During dry weather, water sod to ensure its vitality and prevent dropping of the soil in handling.
- E. Topsoil: During hauling operations, keep walkway and roadway surfaces clean. Promptly remove fallen material.

#### **1.05 JOB CONDITIONS:**

- A. Conduct seeding and sodding only under favorable seasonal conditions throughout the period of the Contract as determined by the Engineer. Install no work during adverse weather or during periods when soil conditions are unfavorable as determined by the Engineer. Do not plant or lay sod during freezing weather, when planting area is muddy or frozen, nor when sod is frozen.
- B. Protection: During progress of operations, protect walls, walks, curbs, benches, established lawn areas, plant material, and other site improvements by adequate means acceptable to the Engineer.
  - 1. Weight Restrictions: Do not overload entrance paving, sidewalks and curbs.
  - 2. Pollution: Take necessary and adequate measures to prevent soil erosion, air pollution and water pollution by the materials and equipment used during construction.
  - 3. Repairs: If damage by the Contractor should occur, it is the Contractor's responsibility to repair or replace per the Engineer's direction, as acceptable to concerned parties, and at no additional cost to the Authority. Perform work so that damaged areas make smooth, satisfactory, and imperceptible transitions to existing adjacent work. Use materials and methods conforming to current standards for the area damaged, matching adjacent materials in appearance, and meeting approval of jurisdictional authorities and the Engineer.
- C. If, at any time, the Engineer determines that work is unsatisfactory or being conducted in an unsafe manner, immediately cease such work activities upon notification.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Seed: Free of quack grass, timothy, bentgrass, clover, dock, annual bluegrass, cheat, chess, chickweed, crabgrass, plantain, black medic and, except where specified in Table 02920-2, Canada Bluegrass. Kentucky Bluegrass and red fescue free of tall fescue.
  - 1. Grass Seed: Dated material from last available crop, with date of test not more than nine months before date of sowing; listed as Proven Cultivars in the latest Agronomy Mimeo #77 (Turfgrass Cultivar Recommendations for Maryland), *published by UMPC*; and as specified in Table 02920-2 below.
  - 2. Crownvetch Seed: Dated material from last available crop, with date of test not more than nine months before date of sowing. Germination portion consisting of minimum 35-percent normal sprouts, maximum 35-percent hard seed and as specified in Table 02920-4.
  - 3. Appalow Sericea Lespedeza Seed: Germination portion consisting of minimum 35-percent normal sprouts, maximum 35-percent hard seed and as specified in Table 02920-5.

B. Inoculant: Adaptable culture of live nitrogen-fixing bacteria true to legume strain used.

C. Sod:

1. Well-rooted Maryland or Virginia State-Certified sod, at least 18 months old. Varieties, identical to one of the following, or as approved:
  - a. Seed mixture specified in Table 02920-3.
  - b. Proven Cultivars in the latest Agronomy Mimeo #77, published by UMPC, certified 90-percent Turf-type Tall Fescue and 10-percent Kentucky Bluegrass.
2. Sod and attached soil free from noxious weeds such as Bermuda grass, quack grass, garlic, Johnson grass, Canada thistle and other turf weeds.
3. Mowed in production field to height of not more than 2-1/2 inches within five days prior to lifting.
4. Machine cut in sections not less than 2-1/2 feet in length nor less than 12 inches in width and to a depth equal to growth of fibrous roots, uniform soil thickness of 3/4 inch, plus-or-minus 1/4 inch. Measurement for thickness to exclude top growth and thatch.
5. Cut in sections or strips strong enough to support its own weight and retain size and shape when suspended vertically from firm grasp on upper 10 percent of section. Small, irregular or broken pieces of sod are prohibited. Sod on Beck Roll is permitted.

D. Topsoil: Weathered surface soils or natural friable loam obtained from approved sources, free of subsoil, hard fragments and stones larger than one-inch across greatest dimension, objectionable salts, noxious weeds and plants, debris and other materials inferior to surface soils or that would be toxic or harmful to growth; containing not less than 1.5-percent organic matter as determined by Walkley-Black Method; capable of sustaining normal, healthy growth and development of seed and sod scheduled and specified. Seed shall not be placed in topsoil which has been treated with soil sterilants until sufficient time has elapsed to allow for the dissipation of toxic materials.

1. Grading analysis:

Sieve	Minimum Percent Passing
2 inches	100
1/2 inch	90
1/4 inch	80
No. 10	70

2. Test and analysis of proposed topsoil material: Performed by local state agricultural experiment station or agricultural laboratory recommended by the U.S. Department of Agriculture, including recommendations for fertilizer and pH adjustment for target crop, and meeting the following requirements.
  - a. Acidity range: pH 5.5 to pH 7.5, inclusive. When topsoil pH is not within pH 5.5 - pH 7.5, modifications to correct topsoil pH shall be made according to the recommendations of the soil test lab, or the applicable State Cooperative Agricultural Extension Service.
  - b. Salinity by electrical-conductivity measurement: 500-ppm soluble salt maximum.
  - c. Fertility: Rated high in natural nutrients in pounds per acre based on the standard soil test in laboratory.
  - d. Texture: Classification consisting of 5-percent to 25-percent clay, 20-percent to 60-percent sand and 15-percent to 45-percent silt as determined by hydrometer or pipette method. Sand, silt and clay as defined by USDA-SCS.

- E. Fertilizer:
1. For grass seeded and sodded areas: Commercial fertilizer of standard quality, recommended by approved soil test report; 10-22-22.
  2. For crownvetch seeded areas: Use both of the following:
    - a. Commercial fertilizer of standard quality; 0-20-20 or 3-25-25.
    - b. Blue Chip Nitroform, slow-release nitrogen, granular form, of standard quality; 38-0-0.
  3. For appalow-sericea-lespedeza seeded areas: Commercial fertilizer of standard quality, recommended by approved soil test report; 10-22-22.
- F. Limestone: ASTM C51, Dolomitic, Agricultural Grade.
1. Capable of neutralizing soil acidity and containing not less than 85 percent calcium and magnesium carbonates
  2. Sieve analysis: 95-percent passing No. Eight sieve and 40-percent passing a No. 100 sieve. For hydroseeding, use pulverized limestone.
  3. Containers labeled to show chemicals.
- G. Acidifying Agent: As approved per soil analysis recommendations and seeding method.
- H. Mulch:
1. Wood-cellulose fiber: Containing no growth or germination-inhibiting factors and dyed green.
    - a. Properties:
      - 1) Fiber length: Approximately 3/8 inch.
      - 2) Diameter: Approximately 1/32 inch.
      - 3) Acidity range: pH 4.0 to 8.5, inclusive.
      - 4) Ash content: 1.6-percent maximum.
      - 5) Water-holding capacity: 90-percent minimum.
    - b. Packaging: Furnish fibers air-dry in packages not exceeding 50 pounds gross, with net weight shown on package.
    - c. Source: Conwed Hydro Mulch by Conwed Corp., St. Paul, MN 55101 or equal.
  2. Straw: Wheat, barley, oat or rye straw, threshed, air-dried and free from Canada thistle, dock, Johnson grass and other foreign matter.
  3. Mulch blanket: Knitted construction of biodegradable yarn with uniform openings, Gulf States Paper Corporation, Tuscaloosa, AL 35401 or equal.
    - a. 150-foot lengths or greater.
    - b. U-shaped staples: As standard with mulch-blanket manufacturer.
- I. Mulch Binders: Non-asphaltic only.
1. Synthetic binder for use with the following:
    - a. Wood-cellulose fiber: Terra Tack 1 by Grass Growers, Plainfield, NJ 07061; Soil-Gard by Alco Chemical Company, Philadelphia, PA 1913, or equal.
    - b. Straw: Terra Tack 1 by Grass Growers, Plainfield, NJ 07061 or equal.
  2. Biodegradable netting for use with straw: Conwed Erosion Control Netting by Conwed Corporation, St. Paul, MN 55101 or equal.
- J. Herbicides:
1. Broadleaf weed control: Trimec by P.B.I. Gordon Corporation, Kansas City, KS 66118 or equal.
  2. Pre-emergent crabgrass control: Balan by Elanco Products Company, Division of Eli Lilly Corporation, Indianapolis, IN 46206 or equal.
  3. Post-emergent crabgrass control: A.M.A., D.S.M.A., M.A.M.A. or Calcium Methyl Arsenate by W.A. Cleary Company, Somerset, NJ 08873 or equal.
  4. Perennial bunch-grass control: Round-up by Monsanto Agricultural Products Company, Wilmington, DE 19810 or equal.

- K. Stakes (for pegging sod): Wood or other biodegradable stakes suitable for the purpose, measuring 1/2-inch by one-inch by 12 inches.
- L. Water: Potable.

**2.02 SEED MIXTURES:**

- A. Grass Seed: Tables 02920-2 and 02920-3.
- B. Crownvetch Seed: Table 02920-4.
- C. Lespedeza Seed: Table 02920-5.
- D. Hydroseeding Crownvetch and Lespedeza Seed: Tables 02920-6 and 02920-7.

**2.03 EQUIPMENT:**

- A. Dry-Type Seeder: Brillion seeder, drill seeder or other approved mechanical seeder.
- B. Spraying Equipment for Hydroseeding: Use water tank equipped with liquid-level gauge calibrated in increments not larger than 50 gallons over entire range of tank capacity with gauge visible to nozzle operator. Use tank equipped with agitation system capable of maintaining solids in complete suspension until used.

**PART 3 - EXECUTION**

**3.01 PLACING TOPSOIL:**

- A. After completion of construction work in the area, prepare surface of subsoil. Finish to lines shown and parallel to proposed finished grade, as approved. Remove rocks and other foreign materials 1-1/2 inches or greater in any dimension. Immediately prior to covering with topsoil, loosen prepared subsoil surface to a minimum depth of four inches. Leave no depressions.
- B. Place and spread topsoil over areas to be seeded and sodded except areas to receive crownvetch or lespedeza (unless Contract Drawings require 2:1 or greater slopes to be sodded or seeded), to depth which will produce four-inch depth after natural settlement and will conform to finish lines, grades and elevations.
- C. When placing topsoil on slopes, work topsoil into subsoil to minimum depth of four inches to eliminate slip-plane between the two materials. Leave topsoil at surface to ensure germination of seed.
- D. After spreading topsoil, rake up and remove large stiff clods, hard lumps, large rocks, roots, stumps, litter and other foreign matter.
- E. Maintain specified depth of topsoil from time placed until specified seed or sod is established.
- F. If soil or weather conditions are unsuitable, cease topsoil operations. Resume topsoil operations when proper conditions prevail.

**3.02 SEEDING GRASS:**

- A. Dry Seeding: After placing topsoil, proceed as follows:
1. Seed bed preparation:
    - a. pH adjustment: Adjust topsoil pH to raise it by applying limestone or approved acidifying agent or elemental sulfur to lower the topsoil pH at per-acre rate recommended by approved soil test report so as to obtain a 6.5 pH. Apply separately prior to fertilizing and seeding operations. Work into the top three inches of soil.
    - b. Fertilizing: After acidity adjustment and within 24 hours before seeding, apply fertilizer at per-acre rate recommended by approved soil test report. Use machine spreader and lightly drag or rake fertilizer into top 1/4 inch of soil.
  2. Seeding: Clean seeders as approved prior to applying seed. Apply seed mixture directly after fertilizing.
    - a. Sow specified grass seed mixture from March 1 to April 30 and from August 15 to October 15. Extend or reduce specified periods as approved and as required by weather and soil conditions.
    - b. Sow at minimum rate as specified in Table 02920-3.
    - c. Work seed in to depth of 1/4-inch maximum.
    - d. Finish as follows:
      - 1) Lawn areas with slopes up to 3:1: Raked surface.
      - 2) Roadside areas with slopes up to 3:1: Scarified surface.
      - 3) Slopes over 3:1: Leave surface in irregular condition with ridges running parallel to contour of slope to prevent erosion.
  3. Rolling: Directly after seeding, roll lawn areas with slopes up to 3:1 using approved lawn roller, weighing 40 to 60 pounds per foot of width, unless intervening precipitation would cause such rolling to be detrimental.
- B. Hydroseeding: After placing topsoil, proceed as follows:
1. Seed bed preparation:
    - a. Clean hydroseeders as approved prior to coming on site.
    - b. pH adjustment: Adjust soil pH by either applying limestone or approved acidifying agent or elemental sulfur at per-acre rate recommended by approved soil test report so as to obtain a 6.5 pH. Apply separately prior to fertilizing and seeding operations.
      - 1) Use only pulverized limestone to raise soil pH.
      - 2) Apply not more than 300 pounds of limestone for each 100 gallons of water.
      - 3) After applied limestone mixture has dried, work into the top three inches of soil.
    - c. Apply elemental sulfur as recommended, and incorporate into top three inches of soil.
    - d. After pH adjustment, again grade and dress seed beds for lawn areas to raked surface.
  2. Fertilizing and seeding: After seed bed preparation, apply fertilizer-seed mixture.
    - a. Apply fertilizer at per-acre rate recommended by approved soil test report.
    - b. Apply seed at same rates and times specified for dry seeding. Mix seed and fertilizer together in proportions to meet required application rates.
    - c. If mulching with wood-cellulose fiber on areas with slopes up to 3:1, add mulch to seed and fertilizer mixture.
  3. Application method:
    - a. Apply mixtures by means of high-pressure spray directed upward into air so that mixtures fall to ground in uniform spray. Do not direct nozzle of hand-held hose toward ground in manner that would produce erosion or runoff.
    - b. Make uniform applications at required rate, with two passes at 90 degrees to each other, to ensure uniformity and prevent misses.
    - c. Agitate mixtures constantly from time mixed until application to seed bed.

- d. Use mixtures within eight hours after mixing.

### 3.03 SEEDING CROWN VETCH:

- A. Seed Bed Preparation: After construction work in the area has been completed, proceed as follows:
  1. Grading: Rough grade to remove large stones and roots. Remove or break up clods greater than one-foot diameter. Chisel surface to depth of four to six inches. When preparing slopes, chisel parallel to contour of slope.
  2. pH adjustment: Adjust soil pH by applying limestone or approved acidifying agent or elemental sulfur at per-acre rate in Table 02920-6, except as recommended by approved soil test report so as to obtain a 6.5 pH. Apply separately prior to fertilizing and seeding operations.
    - a. Apply 2/3 of limestone when seed bed is prepared. Work this into the top six inches of soil.
    - b. Apply remaining 1/3 of limestone with seed mixture.
  3. Fertilizing: After acidity adjustment, apply fertilizer at per-acre rate in Table 02920-6, except as recommended by approved soil test report.
  4. Hydraulic overseeding: For overseeding existing vegetation, cut existing vegetation to height of three inches and remove resultant refuse prior to overseeding.
- B. Seed Preparation:
  1. Inoculate crownvetch seed on day it is used.
  2. Reinoculate seeds not sown within 24 hours following inoculation.
- C. Hydroseeding: Clean hydroseeders as approved prior to coming on site.
  1. From March 1 to October 15, sow specified crownvetch seed mixture (Table 02920-4) at a rate of 100 pounds per acre.
  2. From June 1 to August 15 sow specified crownvetch seed mixture (Table 02920-4) at a rate of 100 pounds per acre, except add an additional three-percent by weight of Loehmans Weeping Lovegrass.
  3. Extend or reduce specified periods as approved and as required by weather and soil conditions.
  4. Bare areas: Perform application-sequence Stages I and II, specified below.
  5. Existing vegetation areas (hydraulic overseeding): Perform only application-sequence Stage I, specified below. Obtain the Engineer's on-site approval on whether to use nozzle or hose for hydraulic overseeding.
  6. Application method:
    - a. Apply mixtures by means of high-pressure spray directed upward into air so that mixtures fall to ground in uniform spray. Do not direct nozzle of hand-held hose toward ground in manner that would produce erosion or runoff.
    - b. Make uniform applications at required rate, with two passes at 90 degrees to each other, to ensure uniformity and prevent misses.
    - c. Agitate mixtures constantly from time mixed until application to seed bed. Use mixtures within eight hours after mixing.
    - d. Use inoculated crownvetch in slurry with fertilizers within one hour after mixing. Use fresh crownvetch seed and reinoculate seed whenever this requirement cannot be met.
  7. Application sequence:
    - a. Stage I, Table 02920-5: Load materials into water-filled tanks in proportion to tank size; agitate until smooth slurry is formed. Spray on seed bed at rates specified. Follow within two hours with Stage II.
    - b. Stage II, Table 02920-6: Mulch area within two hours after completing Stage I. Use straw mulch for slopes up to 2:1. Use mulch blanket for slopes greater than 2:1. Do not use wood-cellulose fiber.

### 3.04 SEEDING LESPEDEZA:

- A. Seed Bed Preparation: After construction work in the area has been completed, proceed as follows:
1. Grading: Rough grade to remove large stones and roots. Remove or break up clods greater than one-foot diameter. Chisel surface to depth of four to six inches. When preparing slopes, chisel parallel to contour of slope.
  2. pH adjustment: Adjust soil pH by applying limestone or approved acidifying agent, or elemental sulfur at per-acre rate in Table 02920-6, except as recommended by approved soil test report so as to obtain a 6.5 pH. Apply separately prior to fertilizing and seeding operations.
    - a. Apply 2/3 of limestone when seed bed is prepared. Work this into the top six inches of soil.
    - b. Apply remaining 1/3 of limestone with seed mixture.
  3. Fertilizing: After acidity adjustment, apply fertilizer at per-acre rate in Table 02920-6, except as recommended by approved soil test report.
  4. Hydraulic overseeding: For overseeding existing vegetation, cut existing vegetation to height of three inches and remove resultant refuse prior to overseeding.
- B. Seed Preparation:
1. Have lespedeza seed hulled, scarified and inoculated for spring sowing.
  2. Inoculate lespedeza seed on day it is used.
  3. Reinoculate seeds not sown within 24 hours following inoculation.
- C. Hydroseeding: Clean hydroseeders as approved prior to coming on site.
1. Sow specified lespedeza seed (Table 02920-5) from March 1 to April 30 and August 15 to October 31 at the rate of 90 pounds per acre.
  2. Extend or reduce specified period as approved and as required by weather and soil conditions.
  3. Bare areas: Perform application-sequence Stages I and II, specified below.
  4. Existing vegetation areas (hydraulic overseeding): Perform only application-sequence Stage I, specified below. Obtain the Engineer's on-site approval on whether to use nozzle or hose for hydraulic overseeding.
  5. Application method:
    - a. Apply mixtures by means of high-pressure spray directed upward into air so that mixtures fall to ground in uniform spray. Do not direct nozzle of hand-held hose toward ground in manner that would produce erosion or runoff.
    - b. Make uniform applications at required rate, with two passes at 90 degrees to each other, to ensure uniformity and prevent misses.
    - c. Agitate mixtures constantly from time mixed until application to seed bed. Use mixtures within eight hours after mixing.
    - d. Use inoculated lespedeza in slurry with fertilizers within one hour after mixing. Use fresh crownvetch seed and reinoculate seed whenever this requirement cannot be met.
  6. Application sequence:
    - a. Stage I, Table 02920-5: Load materials into water-filled tanks in proportion to tank size; agitate until smooth slurry is formed. Spray on seed bed at rates specified. Follow within two hours with Stage II.
    - b. Stage II, Table 02920-6: Mulch area within two hours after completing Stage I. Use straw mulch for slopes up to 2:1. Use mulch blanket for slopes greater than 2:1. Do not use wood-cellulose fiber.

### 3.05 MULCHING:

- A. General:

1. Mulch according to the following slope limitations, except as limited for crownvetch and lespedeza.
  2. Mulch within two hours after seeding as follows:
  3. Immediately replace displaced mulching.
- B. Slopes up to 3:1:
1. Wood-cellulose fiber:
    - a. Apply at a net dry weight 1,500 pounds per acre.
    - b. Apply hydraulically with seed and fertilizer at rate of 50 pounds per 100 gallons of water.
  2. Straw:
    - a. Methods of application:
      - 1) Hand spreading: 4,000 pounds per acre (100 pounds per 1,000 square feet). Cover areas uniformly to depth of not less than two inches of loose material.
      - 2) Blowing: Use of cutters is permitted in blowing equipment if at least 95-percent of mulch is six inches or more in length. For cut mulches applied by blowing method, achieve uniform distribution and loose in-place depth of not less than two inches.
      - 3) Mulch-binder application:
        - a) Synthetic binder: Apply according to manufacturer's instructions.
        - b) Biodegradable netting: Apply according to manufacturer's instructions.
- C. Slopes 2:1 to 3:1: Straw as specified above.
- D. Slopes over 2:1: Mulch blanket, applied and stapled according to manufacturer's instructions.

### 3.06 SODDING:

- A. Sod Bed Preparation: After placing topsoil, proceed as follows:
1. pH adjustment: Adjust soil pH by applying limestone or approved acidifying agent, or elemental sulfur at per-acre rate recommended by approved soil test report so as to obtain a 6.5 pH. Mix into soil to a depth of four inches minimum.
  2. Fertilizing: After pH adjustment, apply fertilizer at per-acre rate recommended by approved soil test report. Mix into soil to a depth of four inches minimum.
  3. Compact topsoil with lawn roller or tractor roller to three inches of final compacted thickness as approved.
- B. Laying Sod:
1. Lay sod between September 15 and June 1, grown from seed varieties identical to grass seed mixture in Table 02920-3, or sod which is Blue-Tag certified.
  2. Extend or reduce specified period as approved and as required by weather and soil conditions.
  3. When soil surface is hot or dry, wet soil to a depth of two inches, six to eight hours before sodding. Do not accept or lay dried sod.
  4. Place sod by hand with butted joints and no overlapping. When Beck Roll of sod is used, lay also in accordance with the supplier's instructions.
  5. Lay first row of sod in straight line. Place subsequent rows parallel to and tightly against each other. Stagger perpendicular joints to promote more uniform growth and strength. Do not stretch sod. On slopes, lay sod parallel to contour of slope.
  6. Peg sod placed on slopes 2:1 or greater. Peg each strip or section of sod with at least two stakes not more than two feet apart. Drive stakes flush with top of sod so that roots are in contact with topsoil.

7. Water sod immediately to prevent excessive drying during progress of work. Sod which dries out will be rejected.
8. Roll entire area as sodding is completed in each section so that sod is without surface irregularities, such as depressions and high spots.
9. Irrigate immediately after rolling, enough to wet underside of sod and one inch of soil immediately below.

### **3.07 MAINTENANCE AND REPLACEMENT:**

- A. Maintenance: Maintain seeding, sodding and incidental work during seeding and sodding and thereafter for a period of 120 days for work performed in the spring and for 90 days of subsequent growing weather for work performed in the fall. Perform the following and other operations of care appropriate for promotion of healthy growth, so that work is in an approved condition throughout maintenance period; uniform in color, quality and coverage; and free of weeds, insects, diseases, surface damage and other imperfections:
  1. Watering:
    - a. First week: Perform watering daily to keep soil and sod pads continuously moist, maintaining moist topsoil to a depth of at least four inches. Water prior to heat of the day as necessary to prevent wilting or as approved.
    - b. Subsequent weeks: Water seeded and sodded areas to maintain moisture in upper four inches of soil for promotion of deep root growth.
  2. Mowing: Mow only when seed or sod has firmly rooted, is securely in place and has grown to height of six inches. Mow to height of three inches at first cutting. Thereafter, do not remove more than 1/3 of grass leaf at any cutting. Maintain Kentucky Bluegrass between height of two and 2-1/2 inches and tall fescue at height of three inches, unless otherwise directed.
  3. Edging: Edge walks during alternate mowings.
  4. Rolling: Roll to maintain uniform surface.
  5. Applying herbicides: Apply in spray form. Do not apply when temperature exceeds 80F or during periods of drought. Have workers wear personal protective equipment appropriate for the submitted MSDS.
  6. Clean-up: Remove rubbish and debris caused by this work. Keep site clean during maintenance period.
- B. Replacing Seeding and Sodding: During maintenance period and until Final Acceptance, replace seeded and sodded areas that are dead, unhealthy, unsightly or badly impaired. Replace as soon as possible during the specified planting seasons. Make such replacements in the same manner as required for original seeding and sodding.

### **3.08 SUBSTANTIAL COMPLETION INSPECTION (SCI):**

- A. Substantial Completion Inspection will be held by the Engineer after completion of seeding and sodding to verify that the work was performed as defined in the Contract Documents.
- B. The Contractor will not be held responsible or liable for damage by animals, by malicious or careless human agencies over which the Contractor has no control, by fire or storm, or by vehicular accidents by others that occur after the Substantial Completion Inspection.

### **3.09 FINAL ACCEPTANCE:**

- A. Request inspection for final acceptance at least 10 days before end of maintenance period.
- B. Replace rejected seeded and sodded areas as specified so that repair or replacement plantings are rooted and established prior to final acceptance.

- C. Final acceptance of crownvetch or lespedeza areas requires a minimum of nine vigorous, healthy seedlings evenly distributed per each square yard after 12 weeks of growing weather following germination.

<b>TABLE 02920-1: MATERIALS SUBMITTAL CHART</b> This chart indicates minimum length of time required for the approval process before intended use and by which submittals must be made, as well as the minimum quantity for each sample. Useable samples will be returned.			
ITEM	TIME	QUANTITY	COMMENT
SEED	40 days	10 pounds or 5 kilograms  5 pounds or 3 kilograms	If seed is purchased as a mixture.  Per component prior to blending if Contractor blends mixture.
INOCULANT	7 days	1 packet	Keep temperature of inoculant below 70F (21C).
SOD	7 days	--	Notification of source.
FERTILIZER	14 days	50 pounds (25 kilograms)	Provide sample of each type of fertilizer used. Unopened container.
LIMESTONE	14 days	50 pounds (25 kilograms)	As specified. Unopened container.
MULCH	7 days	10 pounds (5 kilograms)  1 unbroken bale  1 square yard (1 square meter)	Wood-cellulose fiber mulch.  Straw mulch.  Mulch blanket including staples.
MULCH BINDER	14 days	1 quart (1 liter)  1 square yard (1 square meter)	Synthetic binder.  Biodegradable netting including staples.
TOPSOIL	28 days	25 pounds (15 kilograms)	--
HERBICIDE	7 days	1 quart (1 liter)	Unopened container. Include MSDS
OTHER MATERIAL	7 days	As directed and as approved	--

## SECTION 02930

### LANDSCAPING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing and maintaining landscape plantings, edge plantings and related accessories. It also specifies existing tree pruning and removal requirements.
- B. Related Work Specified Elsewhere:
  - 1. Site grading: Section 02320.
  - 2. Seeding and sodding: Section 02920.
  - 3. Removal and restoration of existing landscaping: Section 02205.
  - 4. Reforestation: Section 02933.
- C. Definitions:
  - 1. Landscape Plantings (Outside Reforestation areas and in Median strips): Designed planting of trees and shrubs within lawn or established areas, as shown. Landscape plantings are indicated on the Drawings with a square symbol as shown on the key in the Drawings.
  - 2. Edge Plantings: Planting of trees and shrubs along edge of reforestation areas, as shown. Edge plantings are indicated on the Drawings with a triangular symbol as shown on the key in the Drawings.
  - 3. Reforestation: Planting of trees and shrubs within designated reforestation areas. These reforestation areas are outside the limits of existing woodlands and wetlands and of landscape and mow areas, as shown. Reforestation planting areas are indicated on the Drawings with small circles as shown on the key in the Drawings.
  - 4. Plants or Plant Material: Vegetation, including trees, shrubs, ground cover, vines, and seasonal flowers.
  - 5. Size: The factor controlled by dimensions representing caliper, height or spread. For standard quality a dimension is given for caliper, height or spread, whichever is a typical characteristic of the plant. For specimen quality, all dimensions may be specified.
  - 6. Condition: The factor controlled by vitality and ability to survive and thrive and be comparable with normal plants of the same species and variety in the vicinity, at the same season of the year, free from physical damage or adverse condition that would prevent thriving, whether dormant or growing.
  - 7. Foliage line: Maximum dimension measured from ground to lowest part of body of plant.
  - 8. Quality: Structure and form as evidenced by density and number of canes and branches, compactness, symmetry and general development, without consideration of size or condition.
    - a. Standard: The least acceptable quality, good average uniform growth, absence of irregularities, typical characteristics of the species and variety, nursery-grown, well-formed, and uniformly branched, sound, healthy, vigorous and free of disease and insects, and having healthy, well-developed root systems, and having the minimum number of canes specified or conforming to minimum quality index. Plant materials below specified standard will be considered unacceptable culls and are not acceptable.

- b. Specimen: An exceptionally heavy, symmetrical, tightly knit plant, trained or favored in its development and appearance so as to be An unquestionably and outstandingly superior in form, of the designated species or cultivar number of branches, compactness and symmetry.
- 9. Spread: Single dimension that represents the minimum acceptable width. Where range is shown between two spread dimensions, the lesser is the minimum acceptable.
- 10. Root Protection Zone (Area): The root protection area is an area equal to a radius of 1.5 feet for each inch of diameter at breast height (dbh) (i.e.; a 10-inch dbh tree will require protection 15 feet from the main trunk in every direction.
- 11. Diameter at Breast Height (DBH): The DBH is the trunk diameter measured at a point 4.5 feet (Maryland State Standard) above the average ground level. If the trunk divides into several smaller trunks at a point lower than 4.5 feet (Maryland State Standard) from the ground, the tree size is the diameter measured at the highest point on the single trunk.
  - a. If a tree falls between sizes as listed in the bid schedule, the tree is placed in the next larger size. For example, a 17-1/2 inch diameter tree is placed in the 18-inch to 23-inch size.
- 12. Tracing: Careful cutting of bark along the line of sap flow to encourage wound closure and to smoothly outline the wound area.
- 13. Girdling Roots: Surface roots whose circular growth around the base of a tree trunk or around other roots applies pressure to the bark thereby restricting the sap flow.
- 14. Stumps: Stumps include the base of the trunk and visible surface roots attached to the trunk no more than three feet high, measured from the average ground level. Stump size is the diameter of the cut wood surface as measured across the narrowest portion.
- 15. B&B: Balled and burlapped.
- 16. NIC: Not in Contract.
- 17. Other Terms: The following in accordance with ANSI Z60.1:
  - a. Height.
  - b. Cane.
  - c. Caliper: Determine caliper measurement by taking the average of two trunk caliper measurements at right angles six inches above the root crown.
  - d. Height of branching.

## 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications: Keep always available at the work site a copy of each of the cited references.
  - 1. Codes and regulations of jurisdictional authorities, including but not limited to NPS, MNCPPC and MDNR.
    - a. Wherever specific reference is made to NPS, MNCPPC and MDNR, it applies to work performed on or affecting the property governed by these agencies.
  - 2. ANSI: Z60.1 (American Standard for Nursery Stock), Z133.1 (Safety Requirements for Pruning, Trimming, Repairing, Maintaining and Removing Trees and Cutting Brush).
  - 3. Bailey's Standard Cyclopedia of Horticulture.
  - 4. American Joint Committee on Horticultural Nomenclature (AJCHN): Standardized Plant Names.
  - 5. Hortus III.
  - 6. USDA-SCS.
  - 7. FS: O-F-241.
  - 8. ASTM: A36, A48, A53, A153, A307, A501, C51, D448, D2729, F593.
- B. Source Quality Control:

1. Verification of availability: Before bidding, verify sources of supply of the plants on the plant schedule, including requirements for size, species, variety and quality shown and specified.
  2. Furnish plant materials certified by state or federal Department of Agriculture to be free from disease or infestation.
  3. Obtain plants climatized to the Project area. Acclimate plants for a minimum of 3 months. Supply plants only from nurseries within U.S.D.A. Plant Hardiness Zone 6 or 7, and not more than 500 miles from the Project site.
  4. Pre-select and tag at the nursery the large plants of quality and number indicated, prior to inspection by the Engineer.
  5. Inspection of plant material:
    - a. Inspection: Have plant material inspected and trees seal-tagged by the Engineer at the nurseries prior to digging. Have representative samples of shrubs and miscellaneous plants sealed.
      - 1) To be approved, remaining plants are to be equal to sealed samples. Obtain approval of plants after delivery and before planting.
      - 2) Inspection and approval of plants at the nursery or at delivery is for quality, size and variety only and will not abolish or abrogate the right of rejection for failure to meet other requirements discovered during the progress of the work.
    - b. Travel expenses: In the bid price, include related Authority-incurred expenses for the Engineer's travel. Allow sufficient time for travel advance to be processed, minimum 2-weeks.
      - 1) Appropriate expenses include the costs associated with meals, lodging and transportation; i.e., airfare, auto rental, parking, tolls, and privately owned vehicles at the rate per mile currently in effect under Federal Travel Regulations. Daily lodging and meal expenses may not exceed the per diem limits allowed under the provisions of the Federal Travel Regulations in effect at the time the expenses are incurred. Air travel is limited to regularly scheduled airline flights, coach class, whenever possible
      - 2) In these costs allow for maximum 8-hour work days, including suitable inspection time and round-trip travel time.
      - 3) No costs are borne by the Contractor for Authority-furnished labor.
    - c. The NPS and MNCPPC, as applicable to the planting location, have the right to inspect, select and tag plants before delivery to the job site. If this inspection is made, it will be at the nursery at no additional cost to the Contractor.
  6. Inspection of topsoil.
    - a. Make arrangements with the Engineer for inspection at the source. Furnish travel expenses as specified for Inspection of Plant Material.
    - b. Obtain representative topsoil samples for submittal as specified in Section 02920.
    - c. Contractor is liable and responsible for any deleterious soil material brought on site, and subsequent pollution abatement clean-up.
- C. Personnel Qualifications:
1. Superintendent: Use a Landscaping Superintendent with previous knowledge and verifiable experience in supervising landscaping work and grounds maintenance of similar size and scope. Have the Superintendent present whenever work is being performed and have the Superintendent responsible for controlling the quality of work and inspecting completed work to ensure that Contract requirements are met. The Superintendent is the primary contact person with the Engineer regarding landscaping work.

2. Arborist: Perform tree pruning and removal work under the direction and general supervision of an Arborist certified by the International Society of Arboriculture, PO Box 908, Urbana, IL 61801, telephone 217/328-2032; or by a Maryland-licensed Tree Expert; who has verifiable experience and technical competence in tree physiology, identification, diagnosis of disorders, and current tree care and safety practices in accordance with accepted industry standards. The Arborist is responsible for controlling the quality of pruning and removal work and for inspecting such completed work.
  3. Tree Crew Supervisor: Have tree pruning and removal work performed under the full-time supervision of an experienced Tree Crew Supervisor to accompany each tree crew while work is being performed. Ensure that the Tree Crew Supervisor has verifiable work experience as a full time direct supervisor of shade tree pruning and climbing work crews.
  4. Workers: Have the work performed only by experienced workers, who through related training and verifiable previous on-the-job experience, are familiar with the technical aspects of landscape planting, grounds maintenance, with the hazards of tree pruning and removal work, and with equipment used for each of these operations as applicable. Have each worker abide by the code of ethics or professional conduct established by the Landscape Contractors Association MD-DC-VA, the National Arborist Association and the International Society of Arboriculture.
- D. Pre-Planting Conference: Hold a pre-planting conference prior to planting landscaped areas.
1. Set a time, date, and location agreeable to the Engineer and personnel of the Contractor, and jurisdictional agency, including but not limited to, NPS and MNCPPC, who are responsible for the contractual obligations of these parties. Participation of these parties at this conference is mandatory prior to beginning planting.
  2. Have discussion topics include, but not limited to, confirmation of exact plant substitutions previously accepted by the Engineer.
  3. Make notations on plans to document direction received from the jurisdictional agency, including but not limited to, NPS and MNCPPC, and send record copies to attendees.
  4. After conference, notify the Engineer 48 hours prior to beginning landscape planting work. Notify MDNR through the Engineer.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Location list: Within 10 calendar days after receipt of NTP, submit a complete list of locations of plant material subject to inspection. Should plant material be exhausted from these sources, the Contractor is responsible to locate elsewhere, at no additional cost to the Authority.
  2. Request for Substitutions: Submit requests for plant material substitutions, if necessary, within 10 days of NTP.
    - a. If a substitute is to be used on and jurisdictional agency, including but not limited to, NPS property, it requires approval by the Engineer and the NPS, or applicable agency.
    - b. The Engineer will approve substitutions only after thorough evaluation has been made concerning the need for such a change based upon the unavailability of plant material specified. If size changes are made, the Engineer will require equal total caliper inches for trees as bid, or if limited by space, extra numbers of plants equitable to unit cost bid price; at no additional cost to the Authority.
  3. Work routes and details: Submit plans of entire project site clearly marked to show proposed work routes of crews and equipment, turning radii, and locations of

temporary protective markers, barriers and storage areas, coordinated with details of methods to distribute concentrated loads so as not to compact soil unacceptably (above 75% maximum density). Do not route through zones designated for planting.

- B. Samples: Samples of each required type of material specified in Table 02930-1. Samples failing to meet specified requirements are unacceptable. Resubmit new samples of satisfactory material until approved.
- C. Certifications:
  - 1. Complete, certified reports attesting that proposed materials comply with specified requirements. Furnish certificates of inspection of plant materials by state or federal agency prior to delivery.
    - a. Topsoil: As specified in Section 02920.
    - b. Antidesiccant: Submit certificate from the antidesiccant manufacturer as evidence that the antidesiccant material can be safely used on both deciduous and evergreen plants. Mandatory use, if any plants installed outside the specified planting period.
  - 2. Copies of each license and certificate necessary for complying with Federal, State, and municipal laws, codes, and regulations prior to delivery.
- D. Documentation:
  - 1. Personnel qualifications: A list of the qualifications and experience of the workers, and qualifications and experience of the Landscaping Superintendent, Arborist and Tree Crew Supervisor, as attested by knowledge and experience in supervising contracts of similar size and scope in the past.
  - 2. Soil Density Tests: Submit soil proctor tests made by a qualified independent soil-testing agency, acceptable to the Engineer, stating soil density. Perform tests where directed by the Engineer. Compaction by rolling or operating heavy equipment is not permitted within planting locations. Maximum density of subgrade in planting locations is 75 percent. Disc or rototill bottom of plant beds to remove hard pan that may exist and remove rocks and debris off site, at no extra cost to the Authority.
    - a. Before beginning work: Furnish one pre-construction soil proctor test to 24-inch depth for each 100 square feet of approved work routes and storage areas.
    - b. After completing work: Furnish one post-construction soil proctor test to 24-inch depth for each 100 square feet of approved work routes and storage areas.
    - c. Perform additional soil proctor tests if correcting soil density is required.
  - 3. Topsoil pH Tests: Submit soil pH tests made by a qualified independent soil-testing agency, acceptable to the Engineer, stating soil pH. Report suitability of pH for growth of target crop in each area. State recommended quantities of soil amendments to be added to produce a satisfactory Ph.
    - a. Furnish one test for each 500 square feet of each planting area, and not less than one test for each area.
    - b. After adjusting pH, furnish one test for each 300 square feet of each pH-adjusted areas, and not less than one test for each area.
    - c. Confirming orders: Within 10 calendar days after receipt of NTP, submit confirming orders from the nursery for plant material.
  - 4. Packing slips: Certified plant materials packing slips with each delivery.
  - 5. Reports: Furnish copies of the following reports to the Engineer either on a daily or weekly basis as requested.
    - a. Daily Work Log: Maintain a daily work log recording the quantities of trees and shrubs installed, and their locations.
    - b. Maintenance Reports:
      - 1) Prepare monthly reports describing the work of the previous month and work scheduled for the following month.

- 2) At the end of maintenance period, submit maintenance schedules and instructions for future maintenance.
6. Equipment list: A list of the equipment anticipated for use, including the make and model, year manufactured, tag number if applicable, and date of last inspection. If requested by the Engineer, submit a list of the equipment to be used for each delivery order. Have the listed equipment on the job site when necessary during the execution of the delivery order.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Delivery:
  1. Notify the Engineer at least 48 hours before each delivery. Describe in writing the method of shipment and include an itemized list of quantity and sizes. Do not deliver plants until the areas for planting are prepared as required, and approved by the Engineer.
  2. With each delivery, include certified packing slip for the shipment listing types and sizes of plants, types of materials, and quantities of each shipped. Inspect received materials against packing slip promptly upon arrival at the job site.
  3. Deliver materials and products to the job site in their original unopened containers or wrappings, clearly labeled with the manufacturer's name and address, material components, trademark, chemical analysis, species, age and source. Materials and supplies are subject to inspection and sampling for testing.
  4. Allow no agronomic materials or supplies on site other than those for the project.
  5. Protect plants from weather and adequately pack them to provide protection against climate and breakage during transit. When shipment is made by open vehicle, tie and cover plant materials to prevent wind-shipping and dehydration. When shipment is made by closed vehicle, carefully pack and adequately ventilate plants to prevent condensation on or overheating of plants during transit.
  6. Spray evergreen and deciduous plants in leaf with an anti-transpirant in accordance with manufacturer's instruction to protect from drying.
  7. Protect roots of bare-root plants with approved nursery packing. Keep damp during delivery and storage. If planting is delayed, heel-in plants in topsoil or wet straw and keep moist.
  8. Do not expose fertilizer to weather until used. Completely protect fertilizer before use and do not store in direct contact with the ground.
- B. Plant Identification Labels: Mark plants with identification before delivery to the site. Make labels durable and legible stating the correct botanical name and size/caliper in weather-resistant ink or embossed letters. Securely attach labels to each plant in a manner that will not restrict growth. Maintain labels until they are removed by the Contractor at final acceptance or when directed otherwise by the Engineer.
- C. Move plants marked B&B on plant list with root systems as intact solid units and with root balls of earth firmly wrapped.
- D. Exercise care during every handling operation so as to prevent damage to bark, branches, roots and stem, and to preclude cracked root balls. Use platforms under balls whenever hoisting plants. Do not use plants with cracked, broken or loosely wrapped root balls. Handle plants only by root balls. Plants handled by tops will be rejected. Protect plant roots, root balls and tops from sun or drying winds until planted.
- E. Do not stack root balls. This will mean that for a 40-foot flat bed trailer, the number of 1.75-inch to 2-inch B&B plants may not exceed 130.
- F. Do not handle soil in a frozen or muddy condition.

## 1.05 JOB CONDITIONS:

- A. Conduct planting operations only under favorable seasonal conditions throughout the period of the Contract as determined by the Engineer. Install no plants during adverse weather or during periods when soil conditions are unfavorable as determined by the Engineer. Do not plant when ground is frozen.
- B. Daily Work Log: Coordinate daily work log with work performed, recording numbers of plants planted and their locations.
  - 1. To indicate progress, attach color-coded survey tape in the planting areas, with a different color tape per month and marked with the date of installation in weather-resistant ink, keyed to the Plant Schedule shown.
  - 2. Securely attach tape to each plant in a manner that will not restrict growth. Maintain tape on plants until removal is directed by the Engineer.
- C. Protection: During progress of operations, protect walls, walks, curbs, benches, lawn areas, plant material, and other site improvements by adequate means acceptable to the Engineer.
  - 1. Existing Vegetation: Preserve and protect existing vegetation such as trees, shrubs, and grass on or adjacent to the site which do not reasonably interfere with the construction. Box and protect trees and shrubs that may be subject to construction activities within the root protection area with chain link or wood fencing as directed by the Engineer.
  - 2. Weight Restrictions: Do not overload entrance paving, sidewalks and curbs. These areas are limited to a maximum load of 1,250 pounds per square foot.
  - 3. Existing Utilities and Structures: The existence and location of underground utilities on the plans are not guaranteed. Investigate and verify locations in the field before starting work. The Contractor will be held responsible for damages to, and for maintenance and protection of existing utilities and structures.
    - a. Obtain copies of available as-built utility drawings from the Engineer for reference.
    - b. Contact the local utility companies concerned to inform them of excavation plans.
    - c. To locate utilities in the field, contact Miss Utility at 800/257-7777, 48 hours in advance of work.
    - d. Perform excavation in vicinity of existing structures and utilities with great care.
  - 4. Pollution: Take necessary and adequate measures to prevent soil erosion, air pollution and water pollution by the materials and equipment used during construction.
  - 5. Repairs: If damage by the Contractor should occur, it is the Contractor's responsibility to repair or replace per the Engineer's direction, as acceptable to concerned parties, and at no additional cost to the Authority. Perform work so that damaged areas make smooth, satisfactory, and imperceptible transitions to existing adjacent work. Use materials and methods conforming to current standards for the area damaged, matching adjacent materials in appearance, and meeting approval of jurisdictional authorities and the Engineer.
    - a. Replace damaged existing turf areas with approved sod per Section 02920.
- D. Root Protection Zone (Area): Do not permit heavy equipment or vehicles or the stockpiling of materials in the root protection area without advance permission of the Engineer. Where such activity is allowed within the root protection area, provide an ample mitigation plan to prevent the possibility of damage to the tree trunk and roots, or to increase soil compaction.
  - 1. If the Engineer approves construction activities within the root protection area, protect tree trunks and shrubs with chain link fence or wooden fencing as directed, cover the entire root protection area with landscape fabric and weed barrier as approved, and mulch with four inches of mulch prior to construction. Placing metal

- plates, tree pruning, fertilization, aeration and irrigation may also be required as directed by the Engineer.
2. If damage by the Contractor should occur, it is the Contractor's responsibility to repair or replace per the Engineer's direction, as acceptable to the applicable regional jurisdictions, including, but not limited to NPS, MNCPPC, and at no additional cost to the Authority.
  3. For pruning or removal of existing trees, obtain approval by the NPS or the MNCPPC, as applicable, through the Engineer. Tree pruning and removal, except as shown, is NIC. and at no additional cost to the Authority.
- E. If, at any time, the Engineer determines that work is unsatisfactory or being conducted in an unsafe manner, immediately cease such work activities upon notification.

#### **1.06 SCHEDULING AND COORDINATION:**

- A. General:
1. Perform planting operations according to Contractor's detailed and updated plan of the work as approved by the Engineer.
  2. Schedule and arrange work so as not to interfere with normal activities of the applicable regional jurisdictions including, but not limited to NPS and MNCPPC land and adjacent properties. Advance notice will be given to the Contractor if a conflict is expected. Remove plant debris, personnel and equipment that could interfere with an activity or event prior to the activity.
- B. Planting Seasons: The times of year in which planting is permitted is limited by the planting seasons for plant types as stipulated by the appropriate regional jurisdictional agency. Authority planting seasons are as follows. These time periods also include the time required, after initial planting, for staking, pruning and mulching operations.
1. Evergreen material:
    - a. Fall planting: September 15 through November 30.
    - b. Spring planting: March 1 through May 15.
  2. Deciduous material:
    - a. Planting period: October 15 through April 30.
    - b. White and Willow Oaks, Ironwood, dogwoods and other species as specifically directed, may be planted in spring only: March 1 through April 30.
  3. Subject to the Engineer's approval, extend or reduce planting season as required by weather and soil conditions. Preparations for planting may begin earlier than the specified seasons if weather permits and if the staking of plant locations has been approved.

#### **1.07 WARRANTY:**

- A. Six months in addition to the requirements of the General Provisions for a total of 18 months, commencing the day the landscaping is accepted.
- B. Contractor has the responsibility for plant material locations that may be considered by the Contractor to be affected by adverse conditions, such as undesirable soil pH, water table factors, or poor drainage. Contractor also has responsibility during and following adverse weather conditions such as periods of excessive precipitation, extreme temperatures, wind and drought.
- C. As specified in Part 3, Concurrent Maintenance and Warranty Period, seasonally replace dead plants and plants that have died back beyond normal pruning lines as determined by the Engineer and at no additional cost to the Authority.

## PART 2 - PRODUCTS

### 2.01 MATERIALS:

#### A. Plants and Plant Materials:

1. Provide plants meeting the requirements of the plant schedule as shown, identified by botanical and common names and in accordance with applicable standards of quality, size, condition and type listed.
2. Supply only plants free from disease, well-branched, in full foliage when in leaf and with healthy normal root systems. Have plants freshly dug, nursery-grown, and meeting the other specified requirements. Cold storage plants are unacceptable.
3. Plants in marked cans, pots, or other containers on the plant schedule are to have been grown in the containers for a minimum of three months and a maximum of two years. Ensure that plant roots filling the containers show no evidence of being or having been root-bound.
4. B&B plants: Use B&B plants that meet the Recommended Balling and Burlapping Specifications of ANSI Z60.1. Specifically: freshly dug by hand or with a mechanical tree digger in good condition, free of hydraulic leaks, with blades aligned and free of damage; roots wrapped firmly with untreated burlap, and bound carefully with untreated sisal or jute twine, cord or ungalvanized wire mesh; in a manner so as not to damage the bark, break branches, or destroy the natural shape.
5. Root ball: Dig trees so that the root crown is at the top of the root ball. Make diameter and depth of root balls sufficient to encompass fibrous and feeding root systems.
6. Provide genus, species and cultivar names which agree with the nomenclature of the most current edition of Hortus III by L.H. Bailey, Hortorium, Cornell University.

#### B. Topsoil:

1. Weathered surface soils or natural friable loam obtained from approved sources, free of subsoil, hard fragments and stones larger than one-half inch across greatest dimension, objectionable salts, noxious weeds and plants, debris and other materials inferior to surface soils or that would be toxic or harmful to growth; containing not less than 1.5-percent organic matter as determined by the Walkley-Black Method; capable of sustaining normal, healthy growth and development of seed and sod scheduled and specified.
2. Grading analysis:
  - a. All material must pass through a two-inch screen. Remove all material larger than two inches from the site.

SIEVE	MINIMUM PERCENT PASSING
2 inches	100
½ inch	90
¼ inch	80
No. 10	70

3. Test and analysis of proposed topsoil material: Performed by local state agricultural experiment station or agricultural laboratory recommended by U.S. Department of Agriculture and meeting the following requirements:
  - a. Soil pH range: Between pH 5.0 and pH 7.6 inclusive.
  - b. Soil salinity by electrical-conductivity measurement: 500-ppm soluble salt maximum.

- c. Soil fertility: Rated high in natural nutrients in pounds-per-acre based on the standard soil test in laboratory.
  - d. Soil texture: Classification consisting of 5 to 25-percent clay, 20 to 60-percent sand, and 15 to 45-percent silt as determined by hydrometer or pipette method. Sand, silt and clay as defined by USDA-SCS.
- C. Fertilizer:
  - 1. Commercial fertilizer: FS O-F-241, Type I, of grade noted, Level B, composite and bearing manufacturer's guaranteed statement of analysis. Unless otherwise shown or specified, use 10-10-10 , slow-release, meeting the following minimum requirements:
    - a. Nitrogen content: Ten percent; slow-release, 50-percent organic.
    - b. Available phosphoric acid: Ten percent.
    - c. Potash content: Ten percent.
  - 2. Soluble fertilizer: Standard commercial grade, 15-30-15 or higher analysis, Rapid-Gro or equal.
  - 3. Packet tree and shrub fertilizer, minimum two-year time release: Root-Contact Packet, Sando Products, Inc., Prairie du Chien, Wisconsin 53821; Eeesy Grow, Specialty Fertilizer, Inc., Suffern, New York, 10901; 21 Gram, Planting Tablets, 200-10-5 Agriform International Chemicals, Inc.; or equal.
- D. Stable manure: Well-rotted cow manure. Free from fresh manure, sawdust, wood chips, tanbark, long straw, stones, chemicals used to hasten decomposition artificially, or other substances injurious to plants.
- E. Perlite: Granules, sterile, uniform gradation, insoluble, high water-holding capacity; as available from Pennsylvania Perlite Corporation, Lehigh Valley, Pennsylvania 18001 or equal.
- F. Mulch:
  - 1. Mulch blanket: Knitted construction of bio-degradable yarn with uniform openings, Hold-Gro as manufactured by Gulf States Paper Corporation, Tuscaloosa, Alabama 35401 or equal.
    - a. 150-foot lengths or greater.
    - b. U-shaped staples: As supplied by mulch-blanket manufacturer.
  - 2. Shredded hardwood or shredded pine bark: Sound, non-decomposed bark free from sticks, stones, clay and other foreign and toxic substances, with 50 percent over the minimum size indicated.
    - a. Regular size: 1/2-inch to two inches.
    - b. Extra-Coarse size: One inch to three inches.
    - c. Sources: Cove Dehydrated Products, Martinsburg, Pennsylvania 16662; Weyerhaeuser Garden Bark, Weyerhaeuser Company, Silva Products Department, Takoma, Washington 98401; or equal.
- G. Crushed Stone: ASTM D448, Size 57.
- H. Pea Gravel: Smooth, rounded pieces of gravel, clean and free from objectional materials, such as soft particles, coal and lignite particles, or friable particles, graded from 1/4 to 3/8 inch in size.
- I. Sand: Sharp, common, coarse, wet sand as approved, for use under plants.
- J. Peat Moss: Type 1 sphagnum peat moss (at least 75-percent), finely divided, with a pH of 3.1 to 5.0, moistened prior to and at time of use.
- K. Perforated Plastic Pipe: ASTM D2729.

- L. Landscape Fabric and Weed Barrier: Porous geotextile fabric for water and nutrient exchange; tear-resistant, minimum four ounces per square yard; Typar Landscape Fabric, DeWitt Earthmat, Pro 5, or equal.
- M. Limestone: Agricultural or dolomitic, ASTM C51, capable of neutralizing soil acidity and containing not less than 85 percent of total carbonates. Containers or sacks labeled to show chemical and mechanical analysis.
- N. Plant Hormone: Vitamin powder; Transplantone, American Chemical Paint Co., Ambler, Pennsylvania 19002; Super Thrive, Vitamins Institute, 5409 Satsuma Avenue, North Hollywood, California 91601; or equal.
- O. Antidesiccant for Retarding Excessive Loss of Plant Moisture and Inhibiting Wilt: Sprayable, water-insoluble vinyl-vinylidene complex which will produce a moisture-retarding barrier not removable by rain or snow. Capable of forming a film at temperature commonly encountered out-of-doors during planting season and with the moisture-vapor transmission rate of the resultant film not more than 10 grams per 24 hours at 70-percent humidity; Wilt-Pruf, as manufactured by Wilt-Pruf Nursery Specialty Products, Inc., Greenwich, Connecticut 06830; Vapor Gard as manufactured by Miller Chemical Company, Hanover, Pennsylvania 17331; or equal.
- P. Tree Stakes and Guys:
1. Stakes: Sound No. 2 Douglas fir or rough sawn straight-grain oak of uniform size.
    - a. Type 1: Two-inch square or 2-1/2 inches in diameter, eight feet long, with six-inch point at one end. Paint with two heavy brush coats of dark walnut oil stain before installation. After installation, cut off stakes square to a level two inches above the wires.
    - b. Type 2: Two-inch square by 30 inches long and notched to bold wires.
  2. Metal stakes: Steel angle, zinc-coated, ASTM A153, 1/4-inch thickness, 1-3/4 inches by 1-3/4 inches by 30 inches long.
  3. Pipe: ASTM A53, hot-dip galvanized, 1-1/4 inch OD eight feet long.
  4. Wood flags: 1/2 inch by two inches by ten inches, painted white.
  5. Turnbuckles: Galvanized, ASTM A153, three-inch minimum adjustment and 5/16-inch minimum diameter threaded opening fitted with screw eyes.
  6. Wires: Zinc-coated steel, No. 12 wire.
  7. Wire guards: Sound, two-ply, 5/8-inch inside diameter, round hose of fabric and rubber, black or green color.
  8. Ring bolts: 1/4-inch by three-inch tie-wire anchor HILTI HKT 14, HILTI Fastening Systems, Langley Park, Maryland 20783; or equal.
- Q. Wrapping Material:
1. Tree wrap: Two thicknesses of crinkled paper cemented together with bitumen, waterproof, four inches wide; as manufactured by Bemis Bag Company, Chase Bag Company, Sisakraft or equal. Use as directed by Engineer or required by jurisdiction, always applicable for plants subject to sun scald.
  2. Twine: Lightly tarred medium or coarse sisal yarn.
- R. Watering Pipe: As shown.
- S. Marker Stakes: Sound No. 2 Douglas fir, or equivalent grades of rough sawn straight-grain oak, rough sawn cypress, hard pine, cedar, or locust; straight, of uniform size, 3/4-inch x 2-inch x 18 inches, pointed at one end.
- T. Tree Grates, Tree Grate Frames and Tree Guards:

1. Round tree grates: As shown, or with five-foot diameter, radial pattern, and expandable, as approved.
  2. Square tree grates: As shown.
  3. Guards: As shown.
  4. Cast iron: ASTM A48.
  5. Steel angles, plates and collars: ASTM A36.
  6. Steel tubing: ASTM A501.
  7. Bolts and washers: ASTM A307, zinc-coated.
  8. Screws: Stainless steel, ASTM F593, Alloy S30400.
  9. Tubing and collars: Shop-painted in accordance with Section 05500; finished as shown.
  10. Steel bars: ASTM A36.
- U. Hedge Guards: PVC-coated chain link fencing and accessories as specified in Section 02820, and as shown; consisting posts, fabric, tension wire and ties.
- V. Water: Potable.
- W. Composted screened leaf mold:
1. Processed leaves aerobically composted, free from litter such as glass, paper, plastic and other foreign substances, as approved.
  2. Source: Leaf-Gro as available from Maryland Environmental Services, 2020 Industrial Drive, Annapolis, Maryland 21401 (301) 261-8596, or equal. Do not use composted sewage sludge.

## **2.02 PLANTING MIXTURES:**

- A. Planting Mixture A:
1. Use: For backfilling plant pits of deciduous and evergreen trees, shrubs, excluding azaleas:
  2. Mixture: Four parts topsoil and one part leaf mold or decomposed cow manure plus five pounds of 10-10-10 fertilizer per cubic yard, mixed on site to an approved consistency.
- B. Planting Mixture B:
1. For backfilling plant pits of deciduous and evergreen groundcover and vines and all azaleas:
  2. Mixture: Four parts topsoil, one part leaf mold and one part perlite plus five pounds of 10-10-10 slow-release fertilizer per cubic yard, all mixed on site to an approved consistency.

## **2.03 EQUIPMENT:**

- A. Use only equipment that meets federal OSHA, state and local safety requirements and that is properly licensed. This includes but is not limited to equipment such as bucket trucks, aerial lifts, chipper trucks, wood trucks and stump grinders, which may be needed to correctly perform landscaping, maintenance, and tree pruning and removal in accordance with the requirements.
- B. Have the name or logo of the Contractor or subcontractor clearly displayed on trucks used on the job.
- C. Use equipment of sizes that clear access routes, protective markers and barriers by 2 feet or more on each side.
- D. Do not use material storage devices or equipment that could increase compaction of existing, undisturbed soils.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION FOR PLANTING:**

- A. See Article above on Scheduling and Coordination.
- B. Pre-Planting Conference: See Article above, under Quality Assurance.
- C. Locate and mark location of each underground utility.
- D. Mark outlines on the ground for locations of individual trenches and planting beds as approved. Have the Engineer approve marked locations before excavating.
  - 1. Drive marker stakes with at least eight inches projecting above surrounding ground cover.
  - 2. Paint top four inches of each stake according to the following color schedule and mark stakes with plant common name and sizes for each location:
    - a. Evergreens: Blue.
    - b. Deciduous trees: Red.
    - c. Flowering trees: Yellow.
- E. Do not permit personnel, vehicles, or equipment not directly associated with the work into the planting areas.
- F. Inspect Plants: Do not plant if plants appear damaged, unhealthy, insect infested, or if the root ball is cracked or broken either before or during planting operation.

### **3.05 PRESERVATION OF EXISTING PLANTS:**

- A. Preserve and protect existing plants in accordance with the existing Plant Schedule as shown and with the requirements of Section 02205.

### **3.02 EXCAVATION FOR PLANTING:**

- A. Exercise care during entire time of excavation and planting work so as to prevent contact with, disturbance of or unearthing of utilities and devices. Hand excavate wherever necessary to ensure this level of care.
- B. Exercise care in excavating tree pits at locations with existing drainage systems so as to prevent contact with, disturbance of or unearthing of drainage systems. Hand excavate wherever necessary to ensure this level of care. Place landscape fabric as shown. Staple per manufacturer's directions.
- C. Plant Locations: Locate plants as shown on the Contract Drawings, from dimensions shown, and as approved by the Engineer after locations are marked per the Preparation for Planting requirements specified above.
- D. Excavate pits, trenches, and beds with vertical sides and flat bottoms, to dimensions shown.
- E. Excavate pits to a minimum depth of 24 inches, measured from finished grades, or as shown.
- F. Make pits for bare-root plants to diameters at least 12 inches larger than the maximum spread of the roots and to minimum depth of at least 12 inches below the roots of the plant as placed.

- G. Make pits for balled or potted plants, with ball or container less than 12 inches in diameter, to diameters at least 16 inches larger and depth to size of ball or container. Alleviate hardpan compaction by rototilling or discing sub-soil beneath plant.
- H. Make pits for balled or potted plants, with ball or container 12 inches or greater in diameter, to diameters at least 24 inches larger and minimum depth to size of ball or container.
- I. Install trench drain for trees on slopes greater than 3:1 in locations as shown. Excavate four to six inches wide. Start bottom of trench at elevation of bottom of plant ball and extend away on low side of plant location until daylighted. Fill bottom twelve inches of trench with pea gravel. Backfill to surface with excavated material from trench. Blend surplus over area next to trench. Cover surface with material to match the surrounding area.
- J. Make beds for ground cover plants to the length and width shown with minimum depth of six inches. Install landscape fabric beneath mulch layer, stapling per manufacturer's directions.
- K. Backfill plant pits that are abandoned due to unsuitable conditions with same excavated material, grade and seed.
- L. Before the close of each working day, barricade open pits. When pits are excavated more than fourteen days in advance of planting, backfill the excavations with the planting mixture specified.
- M. Remove and dispose of rocks, debris and excess excavated material off site. Set aside excavated soil needed for backfill mix and to form saucers.

### **3.03 PLANTING:**

- A. Set plants plumb and straight with allowance for settlement. Set watering pipe as shown.
- B. Place balled plants so that the top of the root ball bears the same relation to finish grade as it bore to previous finish grade in nursery, or 1/8 higher than depth of root ball= approximately two inches higher. Place fertilizer packets or tablets in accordance with manufacturer's recommendations alongside the base of root ball. Backfill with specified planting mixture in 12-inch layers and tamp each layer to fill voids until planting mixture is at grade. Cut and remove burlap and lacing six inches away from trunk, or as approved. Leave remainder of burlap and lacing intact. Soak plant with water containing plant hormone.
- C. Open and remove containers from potted plants. If the growing medium is comprised of 75 percent or more of peat, perlite, sand or like material other than soil, pull visible roots away from container medium leaving the roots partially exposed. Place plants in plant pit or trench and carefully place backfill planting mixture among exposed roots. Continue backfilling and tamping in six-inch layers until finish grade is reached. Soak with water containing plant hormone.
- D. Remove and store existing tree grates and replace when planting is complete.
- E. Placement of bare-root plants: Place in pit or trench, cut off broken or frayed roots, spread root system, backfill with planting mixture in six-inch layers, settle to finish grade with water containing plant hormone.
- F. Create saucer around isolated plants with soil to retain water unless otherwise shown. Bring beds to smooth, even surfaces which will conform to established grade after full settlement has occurred. Plant shrubs as a bed, using weed barrier fabric beneath mulch when shrubs are spaced less than six foot on center (6' O.C.), unless otherwise detailed.

- G. Place specified planting mixture in groundcover bed at six-inch depth or as otherwise shown in contract drawing detail , place landscape weed barrier and then top with a layer of mulch to depth of three inches after compaction.
- H. Remove groundcover plants from pots with root system intact and set in mulched planting beds, cut through weed barrier, in the spacing and arrangement shown. Work soil firmly around each plant and restore the mulching material. Settle to finish grade with water containing plant hormone. On slopes greater than 2:1, after preparing planting beds and mulching, but prior to planting, apply mulch blanket as directed and staple according to manufacturer's instructions.
- I. When pits are dug in wet areas or where subsoil will not permit drainage as shown, set plant higher than normal using extra depth of crushed stone or sand, up to 12 inches total depth, to keep ball from settling. Set top of plant root ball up to six inches higher than grade, as directed. Blend the immediate area outside the saucer with suitable soil to meet existing grade.
- J. Topsoil or approved fine, dry subsoil excavated or augered from plant pits may be used to form saucers. If plant pits are augered, break down side of the hole to permit root penetration.
- K. Create soil berm around downhill portion of planting pits on slopes.
- L. Cultivating: Cultivate trenches and shrub beds to the line shown. Cultivate area around isolated plants at least six inches beyond diameter of pit.
- M. Mulching: After planting and cultivating are completed, spread a layer of mulch on finished grade around plants to a depth of three inches after compaction. Lay landscape fabric beneath shrubbery beds, groundcover areas, and in tree pits, stapling as necessary per manufacturer's directions. Spread mulch around isolated plants over an area at least six inches greater than diameter of the pit and extend mulch over berm saucers as shown. Completely cover trenches and shrubbery beds with mulch. In planters and beds, spread a layer of mulch to depth of three inches after compaction.
- N. Pruning: Prune plant material after installation as approved to thin branches and foliage and yet retain species shape and trim hedges as shown. Do not cut leaders.
1. Remove limbs, branches, canes and runners which require trimming with a clean cut flush with trunk or adjacent stem.
  2. When pruning lateral branches, cut at the same angle as that at which the buds are growing from the branches. Cut at a distance of 1/8-inch to 1/4-inch beyond the buds to avoid injuring them.
  3. Sterilize cutting tools with alcohol before proceeding to next plant after pruning out infected twigs and branches.
- O. Planting in Planters: Install crushed stone, landscape fabric and weed barrier, planting mixture and mulch as shown. Mound planting mix as shown for positive drainage. Do not work soil when frozen.
- P. Flower Beds: Plant flowers as shown, at planting seasons recommended by regional jurisdictions and/or growers.
- Q. Wrapping: Check with Engineer for necessity. For plants prone to sun scald use immediately after planting, spirally wrap trunk and main branches of trees with an overlay of two inches starting at the bottom. Tie wrap securely in place with twine.

- R. Guying: Within three days after planting, guy each tree four-inch caliper or larger as shown. Protect trees at points of contact by use of wire guards. After installation, cut stakes square to a level two inches above the wires.
- S. Staking: Support trees smaller than four-inch caliper within three days after planting by staking at perimeter line of ball as specified and to sufficient depth to hold tree rigid. Drive stakes vertically to achieve uniform height of five feet-six inches above finish grade or as directed. Do not twist or pull. Wire tree with wire guards interlocked to each stake at four inches above finish grade, or as directed.
  - 1. Planting areas: Three stakes, 120-degrees apart.
  - 2. Trees with grates: Four stakes, 90-degrees apart.
- T. Installation of Hedge Guard: Space hedge guard posts at a maximum of eight feet on centers. On curves with radii less than 100 feet, space hedge guard posts at a maximum of four feet on centers. Drive posts plumb to a height of three feet-six inches; protect end of pipe. Install one-cubic foot of concrete around base of end post in each run to serve as pull anchor. Secure fabric to posts with ties spaced 12 inches on centers. Install tension wire two inches below top of fabric. Install permanent caps on posts.
- U. Removal of Seals and Tags: As approved.

### **3.04 EXISTING TREE PRUNING AND REMOVAL:**

- A. Safety:
  - 1. Conduct operations in accordance with national and local fire and safety codes, laws, rules, regulations and ANSI Z133.1 Safety Requirements for Pruning, Trimming, Repairing, Maintaining and Removing Trees and Cutting Brush.
  - 2. Have employees wear reflective, bright orange vests while conducting operations in or adjacent to roadways.
  - 3. Do not permit any one except the operator within six feet of a power saw.
  - 4. Block off the work area to pedestrians, other workers and vehicles.
  - 5. Look for, note and report to the Engineer in writing the presence of the slightest structural weakness, disease conditions, decayed trunk or branches, split crotches or branches, or other hazardous condition that has potential for damage to property or personal injury.
- B. Tree Pruning:
  - 1. Prune and thin trees when in foliage according to the Pruning Standards for Shade Trees (revised 1988) by the National Arborist Association. The classes of pruning are as follows:
    - a. Class I Fine Pruning: Fine pruning consists of removing dead, dying, diseased, interfering, objectionable, obstructing and weak branches, as well as selective thinning to lessen wind resistance. Removal of such branches includes those on the main trunks as well as those within the leaf area. An occasional branch as described above up to ½-inch in diameter may remain within the main leaf area where it is not practical to remove.
    - b. Class II Medium Pruning: Medium pruning consists of removing dead, dying, diseased, interfering, objectionable and weak branches on the main trunk as well as those within the leaf area. An occasional branch up to one inch in diameter may remain within the main leaf area where it is not practical to remove.
    - c. Class III Coarse Pruning: Coarse pruning consists of removing dead, diseased, or obviously weak branches, two inches in diameter or greater.
    - d. Class IV Cutting Back or Drop Crotch Pruning: Cutting back or drop crotch pruning consists of reducing tops, sides, underbranches or individual limbs.

- 1) Undertake this practice only in cases of utility line interference, or where certain portions of the roots or root systems have been severely damaged, or when there is unusual and rapid tree growth, where it is necessary to reduce the top, sides or underbranches, or for specific topiary training or dwarfing.
  - 2) When cutting back, do not reduce more than 1/3 of the total area as a single operation. When cutting back trees, only drop crotch as much as necessary. Make every effort to cut back to a lateral, one-third of the diameter of the cut being made.
  - 3) In reducing overall size, give attention to the symmetrical appearance. Keep top higher and sides reduced in order to maintain a tree-like form.
  - 4) Contact the Engineer prior to pruning a tree specified as Class I or Class II pruning if said pruning will reduce the surface area of the tree by more than 25 percent. Report tree structural problems.
2. Cut back dead, diseased and dying wood into healthy wood.
  3. On trees known to be diseased, disinfect tools after use on each tree with methyl alcohol at 70 percent (denatured wood alcohol diluted appropriately with water) or Chlorox bleach solution.
  4. Remove weak crotches, defined as split or rotted wood between two trunks of limbs that may break and fall during high wind.
  5. Where branches cross and rub together or are forming a V-crotch, remove one branch without ruining the appearance of the tree.
  6. Selectively prune trees which are developing more than one dominant leader in order to promote a single dominant leader by sub-dominating the other competitive branches. Make selection of the dominant leader with consideration of the tree's natural form, health, and structure.
  7. Inspect old injuries. Where appropriate, trace those not closing properly and where callus growth is not already completely established.
  8. Remove girdling roots.
  9. Trimming for clearance:
    - a. Trim trees to provide three feet of clearance from adjacent buildings and structures.
    - b. For street trees and trees over walks, trails, and picnic areas over six inches diameter at breast height (dbh), remove lateral limbs and water sprouts from the main trunk of the tree to a height of 12 feet above the ground. For trees over 10 inches dbh, remove lateral limbs and water sprouts from the main trunk of the tree to a height of fourteen feet above the ground.
    - c. Prune trees in the vicinity of electrical or phone lines so as to provide six to eight feet of clearance between lines and the nearest limb.
  10. Remove branches with a slanting cut starting just above a vigorous bud or shoot and running back across the limb at a 45 degree angle. Make cuts sufficiently close to the trunk or parent limb, without cutting into the branch collar or leaving a protruding stub, so that closure can readily start under normal conditions. Make clean cuts.
  11. Precut branches that are too heavy to handle to prevent splitting or peeling the bark. Where damage to other trees, foliage or property is possible, lower branches safely to the ground by ropes or equipment. Under no circumstances drop branches or main trunks freely onto a road, shoulder or paved surface.
  12. Trim salvageable branches by removing smaller branches flush with the surface of the main branch.
  13. Do not remove entire or large portions of healthy, sound limbs in order to facilitate the removal of dead or dying terminals.
  14. Complete required pruning and removals at the site of each tree, including removal of logs and debris, before initiating work on the next tree.
  15. Do not use chain saws or circular power blades to remove branches less than two inches in diameter.

16. Do not use wounding paint,
17. Do not use climbing hooks while pruning.

C. Tree and Stump Removal:

1. Take every reasonable precaution, including but not limited to topping, sectioning and lifting of trees, diagnosing soundness of existing wood, and planning escape routes for workers to prevent damage to other vegetation, property, utility lines and persons and to prevent gouging and erosion of soils as a result of removal operations.
2. Fell trees only when there is an adequate felling area at least equal in radius to the height of the tree. Top and remove in sections trees that cannot be felled due to proximity of buildings, conductors, adjacent trees, or lack of an adequate felling area.
3. Properly rope, guy, or anchor trees to be felled that may cause damage to property or existing vegetation.
4. Climbing hooks may be worn for tree removal work.
5. Remove stumps to a depth of 12 inches below grade. Backfill and level the stump hole with clean wood-waste material.
6. Completely remove each tree, including removal of logs and debris, before initiating work on the next tree.

D. Debris removal:

1. Cut branches over six inches into 18 to 24 inch lengths.
2. Chip material less than six inches in diameter.
3. Collect, deliver, and unload wood and chips to a location specified by the Engineer. If approved, chips may be blown into adjacent natural areas.
4. Remove wood, debris and chips on a daily basis. Sale of wood is not permitted on the project site.

**3.05 INTERIM MAINTENANCE (UNTIL SCI):**

- A. While planting is in progress, perform interim maintenance and management practices on work completed. During the post-planting period and until the SCI, properly care for plants furnished; performing watering, cultivating, and other maintenance tasks necessary to keep the plants in a live, healthy condition.
- B. Maintain plants and work incidental thereto by performing the following and other operations of care to promote root growth and plant health so that plants are in an approved condition throughout the interim maintenance period. Perform work in a manner which maintains the original intent of the reforestation and landscape design. Submit maintenance reports and schedules as specified.
1. Watering and draining: Water plants as required twice each month, or more frequently if weather conditions require such, as directed.
  2. Weeding: Weed by hand the mulched area around each plant and within bedded areas, at least twice each month during the growing season. Remove weeds from the site immediately. As directed, approved chemical weed killers may be used with precautions to prevent undesired damage resulting from such use. Submit Herbicide spill plan and daily use log, when required by jurisdictional agency.
  3. Pruning: Prune plants to ensure a desired growth habit and to remove dead wood, as directed and approved.
  4. Mulching: Mulch to maintain the depth as indicated or as directed.
  5. Securing stakes: Replace or adjust as necessary to maintain stability.

- C. Periodically inspect plants during the interim maintenance period and notify the Engineer in writing of suspected problems. The Contractor is responsible for insect and disease control on Authority property. Take necessary measures to ensure effectiveness of the treatment and plant survival. Insect and disease control are the responsibility of the NPS and MNCPPC, unless brought in by Contractor's plant source.

**3.06 SOIL DENSITY ADJUSTMENT:**

- A. After completion of work and before Substantial Completion Inspection (SCI), have the soil-proctor testing along work routes and storage areas performed as required above under Submittals, Documentation.
- B. Adjust unacceptably compacted soil to a maximum of 75 percent maximum dry density in accordance with the Engineer's directions and at no additional cost to the Authority. In root protection zone, use of decompaction machinery is unacceptable.

**3.07 SUBSTANTIAL COMPLETION INSPECTION (SCI):**

- A. A Substantial Completion Inspection will be held by the Engineer after completion of planting to verify that the work was performed as defined in the Contract Documents.
- B. Do not remove tags, labels, etc. after SCI. These are needed during Concurrent Maintenance and Warranty period. Remove such identifications only at final acceptance.
- C. SCI commences the Concurrent Maintenance and Warranty Period of the Contract for items accepted as of this inspection.

**3.08 CONCURRENT MAINTENANCE AND WARRANTY PERIOD:**

- A. See warranty requirements in General Provisions, General Requirements, and specified in Part 1 of this section.
- B. After the Engineer has accepted the completed work in accordance with SCI, perform post-planting maintenance and plant management concurrent with the warranty period. During this period, properly care for plants; performing the following and other beneficial operations of care for promotion of root growth and plant life so that each plant is in an approved condition at the Substantial Completion Inspection and throughout the maintenance period:
  - 1. Watering and draining: Water plants as required twice each month. Every two weeks during the growing season, examine or sound the watering pipe at each plant to determine if too much water is collecting in the plant pit. Remove surplus water by pump or syphon without staining the pavement. Bi-weekly check relative moisture content of soil for typical tree and typical area of shrub or hedge planting; weekly during the months of July and August. Use Peerless Moisture Indicator, Tree-Type; or equal; following manufacturer's recommendations. Provide sufficient water to maintain relative moisture content of 25 to 30 percent. Provide water, fittings, hose, and water tanks as required to perform watering operation.
  - 2. Weeding: As necessary, perform seasonal weeding in the mulched area around each plant and in bedded areas, at least twice each month. Pull roots by hand or use approved chemical weed killers. Submit Herbicide spill plan and daily use log, when required by jurisdictional agency. Correct any damage resulting from such use and do not spray when winds are over. Remove weeds from the site.

3. Controlling insects and diseases: Treat plants year-round with an approved chemical spray or systemic chemical as necessary to prevent insects, disease and fungus. Take necessary measures to ensure effectiveness of the treatment and plant survival. Submit Pesticide spill plan and daily use log, when required by jurisdictional agency. Protect vehicles and construction in the vicinity from damage or staining.
  4. Pruning: Prune plants during each growing season to develop a desired growth habit and to remove dead wood.
  5. Fertilizing: Fertilize trees, shrubs, hedge plants and groundcover once between May 15 and July 1 with 15-30-15 soluble fertilizer, or equal, at the manufacturer's recommended rate.
  6. Edging: At least twice during the growing season, edge around the mulched area of each plant.
  7. Mulching: Mulch to maintain the depth as shown.
  8. Wrapping: Rewrap to maintain protection and a neat appearance. Remove wrapping at end of first winter period after planting as approved. Repair damaged areas previously covered by wrapping.
  9. Securing guys and stakes: Replace or adjust to maintain stabilization. Before end of maintenance period, remove stakes and guys above grade.
- C. Removing and Replacing Plants: After early Spring and early Fall seasonal inspections and written notification by the Engineer of the plant material to be removed and replaced, proceed as follows:
1. Remove or cut off at ground line said plant materials that are dead or in an unhealthy, unsightly or badly impaired condition, within three weeks after notification.
  2. Replace the plant materials during the next specified planting season with healthy plants of the same kinds and sizes as originally specified. Make such replacements in the same manner as specified for the original planting. Notify the Engineer prior to performing the work.
  3. Attach color-coded tag indicating replacement, and mark with the date of replacement in weather-resistant ink, keyed to the Plant Schedule shown. Securely attach tag to each plant in a manner that will not restrict growth. Maintain tag on plants until removal is directed by the Engineer.
  4. Failure to notify Contractor of plant material to be removed or replaced does not relieve the Contractor from warranty obligations.
- D. The Contractor will not be held responsible or liable for damage by animals, by malicious or careless human agencies over which the Contractor has no control, by fire or storm, or by vehicular accidents by others that occur after the Substantial Completion Inspection.
- E. Clean-Up: Leave paved surfaces broom clean and stain free. Remove rubbish and debris caused by this work. Keep site clean during maintenance period.

### **3.09 FINAL ACCEPTANCE:**

- A. Prior to final acceptance, perform final cleanup, including removal of stakes above grade, guys, signs and other items as directed by the Engineer, and for remulching plants and beds to a loose measurement as specified. Place no mulch against a trunk or stem.
- B. Cut off watering pipe projecting above the mulch level.
- C. Replace rejected plants as specified.
- D. Submit maintenance reports and schedules as specified.

- E. Request inspection for final acceptance at least 10 days before the end of the Concurrent Maintenance and Warranty Period.

**PART 4 - MEASUREMENT AND PAYMENT**

**4.01 BASIS:**

- A. Compensation for work specified in this section will be made in the following manner for work done satisfactorily based upon the lump sum price for the work of this section:
1. Installation: 70-percent of lump sum price, pro-rated monthly during planting operations.
  2. Concurrent Maintenance and Warranty: 20-percent of lump sum price, pro-rated monthly or quarterly after planting operations.
  3. Final Acceptance: 10-percent of lump sum price, for satisfying Contract requirements pertaining to Final Acceptance.

<b>TABLE 02930-1: MATERIALS SUBMITTAL CHART</b>			
This chart indicates the minimum length of time required for the approval process before intended use and by which submittals must be made, as well as the minimum quantity for each sample. Useable samples will be returned.			
ITEM	TIME	QUANTITY	COMMENT
Fertilizer	14 days	50 pounds (25 kilograms)	Sample of each type to be used in unopened container.
Mulch	7 days	10 pounds (5 kilograms)	--
Crushed Stone	7 days	10 pounds (5 kilograms)	--
Sand	7 days	10 pounds (5 kilograms)	--
Plastic Pipe	7 days	3 feet (1 meter)	--
Mulch Blanket	7 days	1 square yard (1 square meter)	Include staples.
Pea Gravel	7 days	10 pounds (5 kilograms)	--

ITEM	TIME	QUANTITY	COMMENT
Plant Hormone	14 days	10 pounds (5 kilograms)	--
Antidessicant	7 days	1 pint (0.5 liter)	--
Tree Stakes and Guys	14 days	1 each	Sample of complete guying system to be used.
Wrapping Material	14 days	1 foot (30 centimeters)	Sample of complete wrapping system to be used.
Landscape Fabric and Weed Barrier	7 days	1 square yard (1 square meter)	--
Marker Stakes	7 days	1 each	--
Tree Grates and Guards	14 days	1 each	Sample of complete system to be used.
Perlite	14 days	10 pounds (5 kilograms)	--
Peat Moss	14 days	10 pounds (5 kilograms)	--
Limestone	14 days	50 pounds (25 kilograms)	Sample in unopened container.
Hedge Guard	14 days	6 feet (2 meters)	Sample of complete system to be used.

ITEM	TIME	QUANTITY	COMMENT
Topsoil	28 days	25 pounds (15 kilograms)	--
Screened Leaf Mold	14 days	50 pounds (25 kilograms)	Sample in unopened container
Herbicide	14 days		Supply MSDS and use directions
Other Material	--	--	As directed.

**DIVISION 3 - CONCRETE**

03100	CONCRETE FORMWORK
03200	CONCRETE REINFORCEMENT
03300	CAST-IN-PLACE STRUCTURAL CONCRETE
03331	CAST-IN-PLACE ARCHITECTURAL CONCRETE
03370	SHOTCRETE
03400	STRUCTURAL PRECAST CONCRETE
03415	PRESTRESSED CONCRETE
03450	PLANT - ARCHITECTURAL PRECAST CONCRETE

**END OF SECTION**

## SECTION 03100

### CONCRETE FORMWORK

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies formwork for concrete structures and other facilities.
- B. Related Work Specified Elsewhere:
  - 1. Concrete reinforcement: Section 03200.
  - 2. Cast-in-place structural concrete: Section 03300.
  - 3. Structural precast concrete: Section 03400.
  - 4. Prestressed concrete: Section 03415.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ACI: 347, Publication # 4
  - 3. Western Woods Producers Association : Western Lumber Grading Rules.
  - 4. CE: CRD-C 572.
  - 5. AASHTO: M153.
  - 6. ASTM: D1056, D1149, D1692.
  - 7. APA: HDO Plywood Exterior Grade.
  - 8. U.S. Product Standard : PS 1
- B. Responsibilities:
  - 1. Design and construction of formwork is the responsibility of the Contractor, subject to review by the Engineer.
- C. Design Criteria:
  - 1. Design formwork for vertical loads and lateral pressures in accordance with ACI 347.
  - 2. Design formwork system which is adequately braced and has adequate strength and stability to ensure finished concrete within the specified tolerances.
  - 3. When necessary to maintain the specified tolerances, design camber into the formwork to compensate for anticipated deflection and creep due to the weight and pressure of the fresh concrete, prestressing forces and construction loads.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Working Drawings:
    - a. Include details of form types, methods of form construction and erection, design computations and location of form joints and form ties, location and dimensions of blockouts and openings in structure, and embeds.
  - 2. Samples:
    - a. Each type of waterstop proposed for use, each one foot long: Two.
    - b. Each type of premolded expansion-joint filler proposed for use, each six inches by 12 inches: Two.
    - c. Proposed dovetail anchor slot, each twelve inches long: Two.
    - d. Snap-off form ties: Two.

3. Certification:
  - a. Manufacturer's certificates.
  - b. Certified test reports of specified concrete tests.
4. Documentation:
  - a. Calculations: Early form removal calculations as specified certified by a professional engineer registered in the area where the work is to be performed. Submit in advance for obtaining approval prior to form removal.

## PART 2 - PRODUCTS

### 2.01 MATERIALS:

- A. General:
  1. Wood forms:
    - a. All framing lumber stress-graded.
    - b. Lumber in direct contact with concrete, dressed on at least the contact side, with dressed or tongue-and-groove edges; other lumber may be dressed or rough.
    - c. Where vertical board finish is shown or specified, use the following:
      - 1) Form board: Tongue-and-groove, Number 1 Common or better, Ponderosa or White pine, in accordance with the Western Lumber Grading Rules book published by WWPA (not the Southern Pine Inspection Bureau grading rules), one-inch nominal thickness, four-inch nominal width, groove S2S milled or beveled one side only and center matched with 45-degree beveled edges to produce sharp V-shaped 3/8-inch wide in concrete. Four-inch tongue-and-groove boards to be toenailed at edge or face-nailed to backer board.
      - 2) Smooth concrete: Tongue-and-groove, square cut unturned edges, Number 1 Common or better, Ponderosa or White pine, in accordance with the Western Lumber Grading Rules book published by WWPA (not the Southern Pine Inspection Bureau grading rules), one-inch nominal thickness, four inches nominal width, S2S and center-matched.
  2. Plywood forms:
    - a. APA grade-marked:
      - 1) B-B Plyform Exterior grade Group I or II for unexposed finished concrete.
    - b. APA High-Density Overlay (HDO) plywood;
      - 1) B or better face veneer Exterior grade Group I for exposed to public view finished concrete..
    - c. USPS : PS 1
  3. Tubular fiber forms:
    - a. Spirally constructed of laminated plies of fiber.
    - b. Wall thickness as recommended by the manufacturer to meet load requirements of various uses and sizes.
    - c. Outside surface wax-coated for moisture resistance.
    - d. Inside surface of column forms coated with bond-breaker compound and fabricated so that finish concrete surfaces are smooth and free of spiral and seam marking.
  4. Fibrous-glass reinforced plastic forms:
    - a. One-piece dome system forms, fabricated of plastic reinforced with fibrous glass.
    - b. Molded under heat and pressure using matched metal dies.

- c. Special sizes and cross sections with thickness, reinforcement and surface finish as necessary to form concrete surfaces that are smooth and free of irregularities.
- 5. Steel forms:
  - a. One-piece dome system forms.
  - b. Special sizes and cross sections as shown, with metal gauges, reinforcement, stiffeners and surface finish as necessary to form concrete surfaces that are smooth and free of irregularities and concrete stain.
- 6. Hardboard:
  - a. For concrete not exposed to public view: tempered, smooth-one-side (S1S) panels not less than 3/16-inch thick, in accordance with AHA IS 1.
- 7. Form ties:
  - a. Factory-fabricated, snap-off metal type, of adequate design to minimize form deflection and preclude concrete spalling upon removal.
  - b. Fabricated so that set-back in concrete is such that portion of tie remaining after snap-off and removal of exterior portions is at least 1-1/2 inches below concrete surface.
- 8. Form release agent: Chemically reactive liquid product that will not bond with, stain, or impair concrete surfaces. Follow form panel manufacturers approved product and recommendations for application. Agents containing castor oil are prohibited
- 9. Preformed expansion joint filler: AASHTO M153.
  - a. Type I: Sponge rubber.
  - b. Type II: Cork. Type III: Self-expanding cork.
- 10. Waterstops: PVC, CE CRD-C 572.
- 11. Dovetail-anchor slots: 22-gauge electrogalvanized steel, with removable felt filler.
- 12. Chamfer strips: Except where other sizes are shown, 3/4-inch by 3/4-inch triangular fillets milled from clear, straight-grain pine, surfaced-each-side, or extruded-vinyl tape.
- 13. Miscellaneous preformed strips for reveals, rustications and similar joints: Fabricated of wood, metal, plastic or other approved material formed to cross sections shown.
- 14. Hydraulic-cylinder well casing: Assembly of pipe, coupling and bottom end cap, of thermosetting-polymer vinylester resin reinforced with fibrous glass, with integral waterstop and anchor flange at invert slab as shown and concrete contact area surfaced with alkaline-resistant barrier, with the following additional requirements:
  - a. Properties.
    - 1) Minimum density at 73F: 0.060 pound per cubic inch.
    - 2) Minimum tensile strength at 73F: 12,000 psi.
    - 3) Minimum compressive strength: 18,000 psi.
    - 4) Minimum flexural strength: 20,000 psi.
    - 5) Minimum flexural modulus of elasticity at 73F: 1,500,000 psi.
    - 6) Maximum fire-spread rate: 25.
    - 7) Maximum heat-distortion temperature at 264 psi: 215F.
    - 8) Maximum water absorption in 24 hours at 73F: 0.02 percent.
  - b. Wall thickness: As shown but not less than 3/8 inch.
  - c. Inside diameter: 20 inches.
  - d. Pipe furnished with fewest number of joints, watertight, developing full strength of section, made true and straight, with not more than 1/2-inch deviation from vertical for entire length of pipe.
- 15. Conduit: Schedule 40, black steel pipe, butt-welded as specified in Section 15205.
- 16. Premolded Elastic Filler for elevator hoistways:
  - a. Closed-cell neoprene:
    - 1) ASTM D1056, Grade SCE-45.
    - 2) Water absorption: No increase in weight in excess of two percent when tested in accordance with ASTM D1056 and completely immersed in water for 70 hours at room temperature.

- 3) Flame resistance: Self-extinguishing when tested in accordance with ASTM D1692.
  - 4) Resistance to ozone cracking: No cracking when tested in accordance with ASTM D1149, after exposure to 100-pphm ozone in air for 100 hours at 100F with specimens under 20-percent strain.
17. Bonding adhesive: As recommended by manufacturer of premolded elastic filler.

## **PART 3 - EXECUTION**

### **3.01 CONSTRUCTION AND WORKMANSHIP:**

- A. Concrete finishes and usage locations of various types of forms and form lining: As shown or specified.
- B. Unless otherwise shown for concrete surfaces exposed to public view, use HDO Plywood in largest practicable continuous panels to produce plane, smooth surface free from grain imprint, patchmarks, and discoloration.
- C. Construct adequately braced formwork so that resulting concrete surfaces conform to specified tolerances.
- D. Brace forms, falsework and centering adequately to retain forms in position as shown on approved working drawings.
- E. Provide mortar-tight forms of wood, plywood, fibrous-glass-reinforced plastic, steel or other approved materials which conform to shapes, lines and dimensions shown and produce smooth surface without fins and projections.
- F. Where shown or directed because of lagging or form irregularity, and where concrete surfaces will not be exposed to public view, line inner form surfaces with hardboard as follows:
  1. Use widest available width of hardboard.
  2. Line areas less than four feet wide with single-width piece of hardboard.
  3. Offset lining joints from those in backing.
  4. Fasten securely to backing with galvanized or aluminum nails driven flush.
- G. Forms shall be clean of any rust, molds, concrete scale..etc.

### **3.02 FIELD QUALITY CONTROL:**

- A. Allowable Tolerances:
  1. Construct elements except concrete linings of tunnels to meet allowable tolerances of dimensions, elevations and positions shown and specified in Section 03300.
  2. Prior to installation, test hydraulic cylinder well casing assembly hydrostatically at 60 psi pressure for two hours in the presence of the Engineer.

### **3.03 COATING FORMS:**

- A. Lightly coat form panels with chemically reactive release agent prior to initial concrete placement and before each subsequent placement.
- B. Do not allow excess coating material to stand in puddles in forms nor to come into contact with concrete against which fresh concrete is to be placed.

- C. Coat with release agent bolts and rods that are to be completely removed or to be free to move

**3.04 EMBEDDED ITEMS:**

- A. Ensure that items to be embedded in concrete are free from oil and foreign matter that would weaken bond of concrete to such items.
- B. Install in formwork inserts, anchors, sleeves and other items specified elsewhere. Close ends of conduits, piping and sleeves embedded in concrete with caps or plugs.
- C. Install continuous dovetail-anchor slots where shown.
- D. Complete tests on piping and other items before starting concrete placement.
- E. Before depositing concrete, check location and support of piping, electrical conduits and other items which are to be wholly or partially embedded.

**3.05 OPENINGS AND RECESSES IN CONCRETE:**

- A. Provide openings and recesses; place sleeves furnished by other trades.

**3.06 JOINTS:**

- A. Unless otherwise directed, make contraction, expansion and construction joints only where shown. Where concrete will be exposed to public view, use largest practicable size sheets to minimize joints.
- B. Form keyways as shown.
- C. Continue reinforcing steel and wire fabric across joints unless they are shown as being free to move.
- D. Make maximum distance between transverse contraction joints 50 feet or as shown, as measured along centerline of track on tangent alignment.
- E. Install premolded joint filler at locations shown. Extend filler from bottom of concrete up flush to finish concrete surface or hold down below finish surface as shown.
- F. Make splices in premolded filler in manner to preclude penetration of concrete between joint faces.
- G. Where premolded joint filler is held below finish concrete face, install in the form a water-soaked wood strip of dimensions shown, to form, after removal, proper size slot to receive sealant compound specified in Section 07900.

**3.07 WATERSTOPS:**

- A. Install waterstops in construction joints below grade and where shown. Use six-inch minimum width, except use nine-inch minimum width in tunnel structures, or as shown.
- B. Support and protect that portion of waterstop which extends beyond bulkhead, during placing of concrete and subsequent removal of forms.

- C. Position waterstops so as to clear reinforcement. Ensure that the waterstop does not get misaligned or misplaced during concreting.
- D. Make field splices by heat-sealing square cut ends of waterstop using hot metal plate or thermostatically controlled electric-heating iron designed for such purpose. Join ends when material becomes molten, maintaining continuity of ribs and bulbs; allow to cool before stressing.
- E. Make field splices to develop watertightness equal to that of unspliced material and tensile strength of not less than 50 percent of unspliced material. Have 90-degree splices and as many other splices as possible made in the factory.

**3.08 REMOVAL OF FORMS, FALSEWORK AND CENTERING:**

- A. Maintain forms, falsework and centering in place until the concrete has attained minimum percentage of specified design strength in accordance with Schedule 1:

**THIS SPACE INTENTIONALLY LEFT BLANK**

Structural Member	Minimum Percentage of Specified Design Strength	
	Schedule 1	Schedule 2
Footings; inverts; sides of beams; slabs and girders; slabs and beams on grade	25	20
Free-standing walls, columns and piers	40	30
Cut-and-cover box structure exterior walls; retaining walls	50	30
Cut-and-cover box structure roofs	80	40
Stairways	80	60
Soffits, beams, slabs and girders; clear span between supports,		
under 20 feet	80	60
over 20 feet	90	70
Tunnels, except intersecting sections	80	35
Station arches, except intersecting sections	80	40
Cantilevers	90	70

- B. Early removal of forms, falsework and centering will not be allowed for concrete strength values below Schedule 2, but will be allowed for concrete strength values between Schedule 1 and Schedule 2 only after:
1. The Engineer has approved calculations showing anticipated concrete strengths at time of proposed early removal based on:
    - a. Ratio of dead load over live load.
    - b. Span, height and shape.
    - c. Ratio of rise over span.
    - d. Reshoring.
    - e. Loads, resultant stresses and deformations to which concrete and reinforcing steel will be subjected at time of removal, subsequent to removal and until concrete has attained design strength.
    - f. Prevailing site conditions.
  2. Concrete strength attained prior to form removal has been determined by analysis of quality-assurance data in accordance with Section 03300.
- C. Do not remove wood board forms within 48 hours of pouring concrete.
- D. Do not alter loading conditions on concrete subsequent to removal of forms if it results in exceeding permissible stresses and deformations at attained concrete strengths.

- E. The Engineer may permit early removal of concrete support without submittal of calculations prior to attainment of specified design strength if he considers such submittals to be unnecessary.

**3.09 INSTALLATION OF HYDRAULIC-CYLINDER WELL CASINGS:**

- A. Cement bottom end cap to casing pipe with solvent cement prior to installation. Solvent cement, procedures, environmental requirements and instructions for proper cementing as recommended by pipe manufacturer.
- B. Accurately position, plumb and set as shown. Separate casing, including anchor flange, two inches minimum from reinforcing steel and other metallic material.
- C. Except as otherwise specified, perform excavation and backfill as specified in Section 02320. Do not jack or drive casing. Backfill excess excavation around exterior of casing with sand.
- D. Recheck casing for orientation and secure immediately prior to pouring of concrete slabs in which it is to be set.
- E. Deviation of alignment of centerline of casing not more than 1/2 inch from true vertical, end-to-end.

**END OF SECTION**

## SECTION 03200

### CONCRETE REINFORCEMENT

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies reinforcement for concrete structures and other facilities.
- B. Related Work Specified Elsewhere:
  - 1. Concrete formwork: Section 03100.
  - 2. Cast-in-place structural concrete: Section 03300.
  - 3. Structural precast concrete: Section 03400.
  - 4. Prestressed concrete: Section 03415.
  - 5. Asphalt or bitumen fill in concrete notches at copper bonding: Section 07125.
  - 6. Additional copper bonding work adjacent to traction power substations: Section 16060.
- C. Definitions:
  - 1. Cover: Thickness of concrete between outside surface of reinforcement and outside face of concrete.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ACI: SP-66, 318.
  - 3. CRSI: Manual of Standard Practice; Placing Reinforcing Bars.
  - 4. AASHTO: Standard Specifications for Highway Bridges.
  - 5. ASTM: A82, A185, A615, A775, A706.
- B. Allowable Tolerances:
  - 1. Cut and bend reinforcing steel to conform to dimensions shown within the following tolerances:
    - a. Sheared length: Plus-or-minus one inch.
    - b. Depth of truss bars: Plus zero or minus 1/2 inch.
    - c. Stirrups, ties and spirals: Plus-or-minus 1/2 inch.
    - d. All other bends: Plus-or-minus one inch.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Detail reinforcing in accordance with ACI SP-66.
    - b. Bar lists showing the individual weight of each bar, total weight of each bar size and total weight of bars on list. Base calculated weights on theoretical unit weights shown in ASTM A615, Table 1.
    - c. Details showing bonding of reinforcement for stray current and cathodic protection.
  - 2. Certification:
    - a. Manufacturer's certificates.
    - b. Mill tests on each heat showing chemical and physical analyses performed in accordance with ASTM A615, as modified by ACI 318.

- c. Record of mill tests traceable to individual reinforcement bars supplied to the project.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Ship reinforcing steel in bundles limited to one size and length.
- B. Tag each bundle at mill with waterproof tag showing name of mill, heat number, grade and size of bars and identifying number.
- C. Protect reinforcing steel and wire fabric from damage; foreign matter such as dirt, oil and grease; and rust-causing conditions.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Reinforcing Steel Bars:
  - 1. ASTM A615, Grade 60, modified in accordance with ACI 318.
  - 2. ASTM A706, for all welding reinforcing bars, except for electrical bonding.
  - 3. Epoxy Coating: ASTM A775, as shown.
- B. Spiral Reinforcement: ASTM A82 or ASTM A615, Grade 60.
- C. Welded Steel-Wire Fabric: ASTM A185.
- D. Metal Accessories: As recommended by CRSI Manual of Standard Practice. Where concrete surfaces will be exposed to public view in finish structure, use supports with plastic-protected legs or stainless steel legs.

### **PART 3 - EXECUTION**

#### **3.01 CUTTING AND BENDING:**

- A. Perform cutting and bending in the shop. Bend steel cold. Do not bend or straighten bars so as to damage material.
- B. Do not bend bars in the field except to correct minor errors and damage occurring during shipping and handling.

#### **3.02 BAR SUPPORTS AND SPACERS:**

- A. Support bars by means of bolsters or chairs with no less than minimum required by ACI SP-66.
- B. Reinforcing steel in bottom of slabs resting on earth may be supported by concrete brick or mortar blocks.
- C. In walls, columns, piers and abutments hold reinforcing steel in position by means of mortar blocks, bar supports or spacers wired to reinforcing steel.
- D. Do not use stones, clay bricks, wood blocks or pieces of broken concrete to support reinforcing steel.
- E. Do not place bars or fabricated mats on layers of fresh concrete as work progresses.

### **3.03 PLACING AND FASTENING:**

- A. Arrange and place reinforcing steel as shown.
- B. Secure reinforcement positively against displacement during placing of concrete.
- C. Wire or clip bars together as recommended in CRSI Placing Reinforcing Bars.
- D. Maintain reinforcing steel accurately in locations shown in tops of inverts to permit arrangements of anchor bolts for rail-tie plates.
- E. Before placement, ensure that reinforcement is free from dirt, mill scale, rust scale, oil, grease and other foreign matter.

### **3.04 SPLICING:**

- A. Furnish reinforcing bars in full lengths as shown on the Contract Drawings and approved shop drawings.
- B. Do not splice bars unless approved in writing.
- C. Make splices when authorized, in accordance with ACI 318, except make all butt splices by welding with a capacity of not less than 125 percent of minimum yield strength of bar. Mechanical connections for tensile splice shall be by cadweld only. connections for t Cadweld only. However, mechanical connection for precast prestressed structures and parking garages, when the splice is located inside the precast member, may be made by NMB Splices instead of the Cadweld, with prior approval of the Authority.

### **3.05 ELECTRICAL BONDING:**

- A. Weld steel straps to transverse end reinforcing bars and longitudinal reinforcing bars adjacent to joints between pour sections at locations shown.
- B. No electrical bonding is required for epoxy coated rebars.
- C. Thermit weld or cadweld stranded, bare-copper conductors to adjacent steel strips at specified end locations. Likewise, weld copper conductors to lapped, welded-wire fabric at joints in slabs at locations shown.
- D. Additional copper bonding work adjacent to traction power substations: Section 16060.
- E. Asphalt or bitumen fill in concrete notches at copper bonding: Section 07125.

### **3.06 STUDS:**

- A. Install welded studs in track invert slabs on top of transverse bars 10 feet on center and on first transverse bar at each end of units. Expose tops of studs and set flush with top surface of slab.

### **3.07 INSPECTION:**

- A. Placement of concrete prior to approval of reinforcement and electrical bonding work is prohibited.

### 3.08 CONCRETE PROTECTION FOR REINFORCEMENT (COVER):

- A. Underground Box Section Structures:
  - 1. Invert slab:
    - a. Top steel: Two inches.
    - b. Bottom steel: Three inches.
  - 2. Roof slab:
    - a. Top steel: Two inches.
    - b. Bottom steel: 1-1/2 inches.
  - 3. Exterior walls:
    - a. Outer-face steel: Three inches.
    - b. Inner-face steel: 1-1/2 inches.
  - 4. Center walls: 1-1/2 inches.
  - 5. Beams, girders and columns: 1-1/2 inches.
  - 6. Intermediate floors, platform slabs and stairs: 3/4 inches.
- B. Retaining Walls:
  - 1. Footing:
    - a. Top steel: Two inches.
    - b. Bottom steel: Three inches.
  - 2. Wall:
    - a. Outer-face steel: Three inches.
    - b. Inner-face steel: Two inches.
- C. Other Underground Structures:
  - 1. Outer-face steel: Three inches.
  - 2. Inner-face steel: Two inches.
  - 3. Drainage slot: Two inches.
  - 4. Safety walk: 1-1/2 inches.
  - 5. Beams, girders and columns: 1-1/2 inches.
  - 6. Intermediate floors, platform and slabs and stairs: 3/4 inch.
- D. Above-Ground Structures:
  - 1. Prestressed concrete bearing highway or transit loads: In accordance with AASHTO Standard Specifications for Highway Bridges.
  - 2. Ancillary structures including precast prestressed structures: : ACI 318.

### 3.09 EPOXY COATING:

- A. Preparation of surface: Perform the following in order given:
  - 1. Clean surface contaminated with oil and grease using naphtha or xylol.
  - 2. Remove weld slag, rust and mill scale from surfaces by wire brushing.
  - 3. Coat surfaces immediately with methyl-methacrylate primer.
  - 4. Apply coating only to surfaces which are dry and free of contaminants.

**END OF SECTION**

## SECTION 03300

### CAST-IN-PLACE STRUCTURAL CONCRETE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing portland-cement cast-in-place concrete.
- B. Related Work Specified Elsewhere:
  - 1. Concrete pavement: Section 02750.
  - 2. Curbs, gutters and walks: Section 02772.
  - 3. Chemical grout: Section 2415.
  - 4. Concrete formwork: Section 03100.
  - 5. Concrete reinforcement: Section 03200.
  - 6. Structural precast concrete: Section 03400.
  - 7. Prestressed concrete: Section 03415.
  - 8. Asphalt or bitumen fill: Section 07125.
  - 9. Copper bonding work: Section 16060.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ACI: 201.2R, 211.1, 304, 309, 318, 318.1.
  - 3. AASHTO: M182, T26.
  - 4. NBS: Handbook 44.
  - 5. USBR: Concrete Manual.
  - 6. FS: A-A-341A, HH-I-521, K-P-146.
  - 7. ASTM: A43, A47, A48, C31, C33, C39, C40, C42, C87, C88, C94, C131, C150, C171, C172, C260, C295, C309, C311, C330, C494, C535, C586, C595, C618, C665, C685, C881, C989, C1107, C1260, D98, E328.
  - 8. CPMB (Concrete Plant Manufacturer's Bureau): Concrete Plant Standards.
- B. Testing Laboratory:
  - 1. Furnish the services of an independent testing laboratory. Employment of an independent laboratory does not relieve the Contractor of the obligation to perform the work in accordance with requirements of the Specifications and Drawings. Submit certified results of the tests performed.
  - 2. Furnish proof that the laboratory satisfies the requirements of the American Council of Independent Laboratories' Recommended Requirements for Independent Laboratory Qualification. Laboratory need not be a member of the American Council of Independent Laboratories.
  - 3. Certify that testing equipment has been calibrated by an accredited calibration agency at not more than 12-month intervals using devices of accuracy traceable to the National Institute of Standards and Technology (NIST) or accepted values of material physical constants
- C. Properties of Concrete:
  - 1. General:
    - a. Design mixes to produce concrete of proper workability, durability, strength, maximum density, minimum shrinkage and permeability.
    - b. Design mixes to have minimum water content per cubic yard of concrete, cement content corresponding to appropriate water-cement ratio, largest

- permissible maximum size specified of coarse aggregate available and optimum percentage of fine aggregate.
- c. Use maximum size of coarse aggregate in accordance with ACI 211.1.
  - d. Use same brand from same source throughout the work.
  - e. Use aggregates from same source throughout the work.
  - f. Use ground-iron blast-furnace slag and fly ash from the same sources respectively throughout the work.
2. Durability:
- a. Maximum water cementitious materials ratio as per ACI 318, Chapter 4 and ACI 201.2R.
  - b. Use a suitable combination of approved air-entraining admixture and water reducer to reduce water content and permeability of the concrete, provided such admixtures do not adversely affect other specified properties of concrete.
  - c. For precast prestressed parking garages -
    - 1) The four-inch thick cast-in-place concrete overlay topping over the double tees on top level of the Parking Structure, the concrete shall attain 28 days minimum compressive strength of 7,000 psi with a water-cement ratio of 0.38 or less. The cast-in-place concrete overlay topping wash strips over the inverted tee beams on top level and wash strips over the inverted tee beams on all other levels, and all cast-in-place concrete wash areas over the double tees, the concrete shall attain 28 days minimum compressive strength of 5,000 psi with a water-cement ratio of 0.40 or less. And for all other cast-in-place concrete, the concrete shall attain 28 days minimum compressive strength with a water-cement ratio of 0.45 or less.
    - 2) Use a calcium nitrite-based corrosion inhibitor as specified in Section 03300.2.1.T, in the cast-in-place wash strips or areas, in the cast-in-place concrete overlay topping.
3. Workability:
- a. Use approved chemical admixtures as needed for workability so that concrete can be placed, consolidated, and finished without segregation or excessive bleeding.
4. Strength:
- a. Design mix for each class and type of concrete of each specified strength based on overdesign factor in accordance with ASTM C94. Unless otherwise shown, working-stress method applies to structures.
  - b. Design each class of concrete in accordance with the following:
    - 1) Not more than the following percentages of strength tests to have values less than specified strength:
    - 2) Working-stress method: 20 percent.
    - 3) Ultimate-strength method: 10 percent.
    - 4) Prestressed structures: 10 percent.
    - 5) Average of the following numbers of consecutive strength tests to be equal to or greater than specified strength:
      - a) Working-stress method: Six.
      - b) Ultimate-strength method: Three. Prestressed structures: Three.
  - c. When number of tests totals six or less, average to be in accordance with Note 21 of ASTM C94.
5. Appearance:
- a. Cured concrete exposed to public view shall be uniform in color, texture and finish with no discernible form or patch marks, grain imprint, joint irregularities or discoloration. Use only manufacturer approved chemically reactive release agents on HDO plywood forms.
  - b. Final selection and approval for color shall be made by the Engineer.

- D. Method of Proportioning:
  - 1. Proportion mixes as described in ACI 211.1.
  - 2. Approximate mixing-water and air-content requirements for mixes of different slumps and nominal maximum sizes of aggregates as specified in ACI 211.1, Table 5.3.3.
  - 3. Do not vary proportions of ingredients of approved mixes without written approval.
- E. Demonstration Section:
  - 1. Before proceeding with tunnel lining, completely seal a 25-foot long demonstration section using materials and methods to be used in the work in accordance with specified requirements.
- F. Ready-Mixed Concrete: ASTM C94.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: Manufacturer's literature completely describing each material, standard, test data, installation instructions and special instructions or safety precautions applicable to the materials.
    - a. Samples:
      - 1) Concrete surface sealer: Two, each one pint.
      - 2) Membrane-forming curing compound: Two of each type, each one pint.
  - 2. Sandblast finish:
    - a. Number 6 sandblast finish as specified, each 12 inches square by two inches: Two.
    - b. Seal 1/2 of face of each sample with concrete surface sealer.
    - c. If samples are not approved or if concrete mix is changed, submit additional samples until approved.
    - d. When samples have been approved, submit details of procedures followed to produce approved surface finish including, but not limited to, the following:
      - 1) Size and type of nozzle.
      - 2) Air pressure.
      - 3) Distance of nozzle from surface blasted.
      - 4) Duration of blast.
  - 3. Concrete panels of each type of concrete used in the work: Two each, 18 inches square by two inches thick.
  - 4. Certification:
    - a. Ingredients:
      - 1) Submit with mix design, laboratory test reports and mill or manufacturer's certificates verifying that ingredients conform to specified requirements. Use ingredients in design mix which are representative samples of materials to be used in the work.
      - 2) Submit test results whenever the aggregates, cement or other additives to be used in the concrete come from a different lot, source, other area of the quarry, different quarry or from other than the representative stockpile or batch from which the original material was tested and approved.
    - b. In case the source, brand or characteristic properties of ingredients need to be varied during the term of the Contract, submit revised laboratory-mix report in accordance with procedures specified for original mix design.
    - c. Batch tickets:

- 1) Before unloading at the site, submit certification or delivery ticket from concrete supplier with each batch delivered to the site bearing the following information:
    - a) Name of supplier.
    - b) Name of batching plant and location.
    - c) Serial number of ticket.
    - d) Date.
    - e) Truck number.
    - f) Specific job designation: Contract number and location.
    - g) Volume of concrete in cubic yards.
    - h) Class and type of concrete.
    - i) Time loaded.
    - j) Type and brand of cement.
    - k) Weight of cement and fly ash or ground-iron blast-furnace slag.
    - l) Maximum size of aggregates.
    - m) Weights of coarse and fine aggregates.
    - n) Maximum amount of water to be added and amount of water added at the site.
    - o) Kind and amount of admixtures.
5. Documentation:
- a. Proposed methods for controlling concrete temperature and plans for placing concrete taking into account sun, heat, wind, ambient air temperature or other limitations of facilities that will prevent proper finishing or curing.
  - b. Quality control plan for floor treatment. Submit as specified prior to installation.
  - c. Quality control reports. Submit as specified after installation.
  - d. Design mixes:
    - 1) Prior to placing concrete, submit design mixes for each class and type of concrete, certifying that proposed concrete ingredients and proportions will result in concrete mix meeting specified requirements.
    - 2) Include for each class and type of concrete as many mix designs as there are combinations of different ingredients or types of ingredients anticipated to cover requirements of the work.
    - 3) Establish mix designs through an approved design laboratory.
    - 4) Design concrete mix for protection against alkali-aggregate reactivity.
    - 5) The Contractor may present for approval a concrete mix previously approved for Authority work provided such mix is made with proposed ingredients that meet requirements and provided that concrete has complied with compressive-strength requirements based on control record of at least 30 consecutive-strength tests recently obtained.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Aggregates :
1. Transport and stock pile aggregate separately according to sources and gradations. Handle so as to prevent segregation, loss of fines and contamination by earth or other foreign materials.
  2. If aggregates show segregation or if different grades become mixed, rescreen before placing in proportioning bins.

3. Do not combine aggregate from different sources or of different gradations except to obtain different gradations.
  4. Do not transfer aggregates directly from trucks, railroads cars or barges to proportioning bins when moisture content is such that it will affect accurate proportioning of concrete mixture. In such cases, stockpile aggregate until excess moisture drains off.
- B. Packaged Cement:
1. Deliver to project site in original sealed packages labeled with weight, name of manufacturer, brand and type.
  2. Store packages in watertight building.
  3. Do not use cement which has been reclaimed by cleaning bags.
  4. Do not use cement which has been exposed to moisture or contaminated.
  5. Deliver packages conforming to weight specified.
  6. Packaged cement will be subject to testing.
- C. Bulk Cement:
1. Store bulk cement separately from other cement and protect to prevent exposure to moisture and contamination.
  2. In ready-mix plant, provide facilities to maintain separation of cement meeting specified requirements from other cement.
  3. Provide in cement manufacturer's plant, facilities for sampling cement at weighing hopper or in feed line immediately before entering hopper.
- D. Ready-Mixed Concrete: ASTM C94.
- E. Blast-Furnace Slag or Fly Ash for use with Portland Cement:
1. Transport in covered carriers.
  2. Store in watertight bins or silos to provide protection from dampness and contamination. When compartmented bins are used, conduct periodic, but not less than weekly checks between adjacent bins to avoid contamination of either of the stored materials.
- F. Concrete Additives, Sealers and Corrosion Inhibitor . As required by the manufacturer.

## **1.05 WARRANTY**

- A. Penetrating Concrete Sealer: Provide a minimum effective service life warranty of 10 years for the penetrating concrete sealer.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Cementitious Materials:
1. Portland Cement: ASTM C150, Types I and II. Use Type II only for underground structures.
    - a. Alkali content not to exceed 0.6 percent.
  2. Blended Hydraulic Cement: ASTM C595 Type IS and IP.
- B. Ground-Iron Blast Furnace Slag: ASTM C989, Grade 100 or 120.
- C. Fly Ash: ASTM C311 and ASTM C618, Class F:
1. Loss on ignition not to exceed 4 percent.

2. Maximum available alkalis (for combination of cement and fly ash) not to exceed 0.6 percent based on proportions to be used and alkalinity measurements for cement and fly ash individually or in combination.
  - a. Fly ash used to be qualified for each source.
3. Uniform color when used in concrete exposed to public view.

D. Aggregates:

1. Aggregates for normal concrete and shotcrete: ASTM C33 with the following additional requirements:

- a. Coarse aggregate: Gravel, crushed gravel or crushed stone.

- 1) Deleterious substances:

- a) Maximum allowable amounts:

<u>Substance</u>	<u>Maximum Allowable Percentage by Weight</u>
(1) Soft particles:	5.0
(2) Coal and lignite particles:	0.5
(3) Friable particles:	0.25
(4) Material passing Size 200 sieve:	1.0
(5) Thin or elongated pieces:	15.0
(6) Other local deleterious substances:	1.0

- b) Soft particles: Higher percentage may be approved where concrete is not subject to abrasion, provided concrete strength is achieved without the use of excess cement.

- c) Crushed aggregates: If material finer than Number 200 sieve consists of dust of fracture essentially free from clay or shale, percentage may be increased to 1.5.

- d) Thin or elongated pieces: Length of pieces to be greater than five times the smallest dimensions of a circumscribing rectangular prism.

- 2) Percentage of wear: 45 maximum when tested in accordance with ASTM C131 and ASTM C535.

- 3) Weighted percentage of loss: 15-percent maximum by weight when subjected to five cycles of magnesium sulphate soundness test in accordance with ASTM C88.

- 4) Gradation: In accordance with ASTM C33, Table 2, and represented by a smooth gradation curve within required limits.

- b. Fine aggregate:

- 1) Washed natural sand or washed stone sand. Stone sand may be subject to special gradation requirements as directed.

- 2) Gradation in accordance with ASTM C33.

- a) Minimum percentages of material passing Size 50 and Size 100 sieves may be reduced to five and zero, respectively, if aggregate is to be used in concrete with three percent minimum air entrainment, or in concrete containing more than 517 pounds of cement per cubic yard.

- 3) Weighted percentage of loss not more than 12 percent by weight when subjected to five cycles of magnesium sulphate soundness test in accordance with ASTM C88.

- 4) Deleterious Substances:

<u>Substance</u>	<u>Maximum Allowable Percentage by Weight</u>
a) Friable particles:	1.0
b) Coal and lignite:	0.5
c) Material passing the Size 200 sieve:	5.0
d) Other deleterious substances, such as shale, alkali, mica, coated grains, soft and flaky particles:	2.0
5) Free from injurious amounts of inorganic impurities as determined by ASTM C40. Should materials fail to pass test for organic impurities in sand for concrete, retest in accordance with ASTM C87. If fine aggregate shows by colorimetric test a darker color than that of sample originally approved for the work, stop using such aggregate until approved tests have been made to determine whether change in color is indicative of injurious amount of deleterious substances.	
c. Evaluate for potential alkali aggregate reactivity:	
1) Perform a petrographic examination in accordance with ASTM C295. The petrographic analysis will identify the constituents of the fine and coarse aggregate and will also identify aggregate found to be potentially alkali-carbonate reactive. Fine and coarse aggregate containing more than the following quantities of constituents is unacceptable:	
a) Optically strained, microfractured or microcrystalline quartz exceeding five percent (a common constituent of granite and granite gneiss).	
b) Chert, Metaquartzite, Chalcedony or combination thereof exceeding three percent. However, fine aggregate may contain up to eight percent provided that mortar bar test results are acceptable.	
c) Tridymite or cristobalite exceeding one percent.	
d) Opal exceeding five percent.	
e) Natural volcanic glass in volcanic rocks exceeding three percent.	
2) Test aggregate for alkali-silica reactivity in accordance with ASTM C1260. Aggregate sources that exhibit a C1260 mean mortar bar expansion at 16 days greater than 0.08 percent are unacceptable.	
3) Aggregate identified by the petrographic analysis to be potentially alkali-carbonate reactive is to be further evaluated in accordance with ASTM C586. Expansion of test specimen cylinders not to exceed 0.10 percent after 28 day immersion in NaOH solution.	
d. Aggregate which fails the evaluation criteria for potential alkali aggregate reactivity may be reclassified as acceptable if prior field performance demonstrates that the aggregate is nonreactive. Include service records (material records, batch quantities, exposure conditions, and petrographic evaluation) demonstrating the aggregate to be nonreactive in the mix design submittal.	
2. Aggregates for Lightweight Structural Concrete: ASTM C330, with the following additional requirements:	
a. Coarse aggregate:	
1) Composition: Expanded shale, clay or slate, predominantly lightweight, cellular and granular.	

- 2) Percentage loss: 10-percent maximum by weight when subjected to five cycles of the magnesium sulphate soundness test in accordance with ASTM C88.
- 3) Gradation: In accordance with ASTM C330, Table 1.
- 4) Unit weight: In accordance with ASTM C330, Table 2.
- b. Fine aggregate:
  - 1) Composition: Particles of expanded shale, clay, slate or ASTM C33 natural sand as necessary to obtain specified compressive strength and comply with specified air-dry unit weight for lightweight structural concrete.
  - 2) Gradation: In accordance with ASTM C330, Table 1.
  - 3) Unit weight: In accordance with ASTM C330, Table 2.
  - 4) Percentage loss: 10 percent maximum by weight when subjected to five cycles of magnesium sulfate soundness test in accordance with ASTM C88.
- E. Water:
  - 1. Natural potable water with no pronounced taste or odor.
  - 2. Containing no impurities, suspended particles, algae or dissolved natural salts in quantities that will cause:
    - a. Corrosion of reinforcing steel.
    - b. Volume change that will increase shrinkage cracking.
    - c. Efflorescence.
    - d. Excessive air entraining.
  - 3. pH: Not less than five.
  - 4. When tested in accordance with AASHTO T26, standard mortar-briquette tests to show no indication of unsoundness, no change in setting time in excess of plus-or-minus 30 minutes and no reduction in strength in excess of 10 percent.
- F. Ready-Mixed Concrete: ASTM C94, Option C.
- G. Admixtures:
  - 1. In accordance with the following:
    - a. Air-entraining admixtures: ASTM C260.
    - b. Chemical admixtures: ASTM C494.
  - 2. Approved brands: Chlorides may be present in admixtures provided total chloride in mixing water of proposed concrete mixture, including chloride ions contributed by admixture or admixtures, aggregate and mixing water is not in excess of 150 ppm.
  - 3. Meeting requirements of reference standards or documented to have five-year minimum history of demonstrably satisfactory performance for similar structures under equivalent conditions.
- H. Aluminum Powder: FS A-A-341A, free of oil, grease, soluble alkalis and organic materials, gradation as approved.
- I. Ferrous Aggregate:
  - 1. Cast-iron particles, ASTM A43, ASTM A47, or ASTM A48, free of oil, grease, soluble alkalis and organic materials.
  - 2. Aggregate graded as follows:

<u>Sieve Designation</u>	<u>Percentage by Weight</u>
<u>US Standard Square Mesh</u>	<u>Passing Individual Sieves</u>
3/8 inch	—
Size 4	100
Size 8	90 - 100
Size 16	75 - 90

Size 30	45 - 60
Size 50	15 - 25
Size 100	10 - 20

3. If recommended by manufacturer and approved, in lieu of the above gradation use lower percentage of aggregate passing Size 100 sieve.
- J. Abrasive Aggregate: 60 to 75 percent silicon-carbide abrasive, bonded by vitreous ceramic material, black, graded from 12 to 30.
- K. Floor Treatment:
1. Sealer: Zinc or magnesium fluosilicate and wetting agent formulated and mixed with water in concentration recommended by manufacturer.
  2. Floor hardener system:
    - a. Floor hardener:
      - 1) Free from non-ferrous metallic particles, filler material, silica sand, natural aggregates, rust and materials which disguise rust.
      - 2) Ready-to-use formulation proportioned, mixed and packaged at factory ready for application.
      - 3) Ingredients proportioned to maintain two parts well-graded iron aggregate to one part consisting of cement, plasticizing agents and other ingredients designed to absorb moisture from floor slab.
      - 4) Color: Per sample, or as selected by the Engineer.
      - 5) Masterplate 200, Master Builders, or equal.
    - b. Floor curing compound:
      - 1) Clear modified-acrylic resin.
      - 2) Moisture retention: In accordance with ASTM C309 when applied at a rate of 400 square feet per gallon.
      - 3) Masterkure, Master Builders, or equal.
- L. Penetrating Concrete Sealer:
1. Penetrating silane sealer, which is readily absorbed into concrete substrate and which reacts chemically to provide a hydrophobic barrier that will not wear off when exposed to sunlight or wheel traffic; which allows concrete to breath, allowing the escape of water vapor but preventing the absorption of surface water; colorless; not altering the surface texture of the concrete substrate. See Warranty requirements.
  2. Provide one of the following:
    - a. Chem-Trete BSM 40, Hüls America, Inc. (1-800-828-0919).
    - b. Penetrating 40, Sonneborn Division Chemrex (1-800-CHEMREX).
    - c. Master Seal SL40, Master Builders Technologies.
- M. Curing Materials:
1. Plastic sheeting: Polyethylene, ASTM C171.
    - a. Curing sheet: Type 1.1.1 and 1.1.2.
    - b. Vapor barrier: Clear 10-mils thickness.
  2. Burlap sheet: AASHTO M182, Class 3 or 4.
  3. Tarpaulin: FS K-P-146.
  4. Blanket insulation: FS HH-I-521.
  5. Membrane-forming curing compound: ASTM C309, Type 1-D, 100 resin with fugitive dye, and Type 2.
- N. Epoxy Mortar:
1. Epoxy: ASTM C881, Type III-C, grey.
  2. Sand: Clean, dry, well-graded particles, passing Size 16 sieve, with the following additional requirements:

Individual Sieve Size

Percent by Weight Retained on Sieve

30	26 to 36
50	18 to 28
100	11 to 21
Pan	25 to 35 (range shown is applicable when 60 to 100 percent of pan is retained on Size 200 sieve)

- O. Chemical Grout: Section 02415.
- P. Paver Tile Setting Bed:
1. Concrete: 3500 psi.
  2. Reinforcement: 4 x 4 - W4.0 x W4.0, Section 03200, furnish in sheets, not rolls
- Q. Elastomeric Concrete:
1. Elastomeric Concrete to consist of an aggregate and binder mixture proportioned by the manufacturer.
  2. Manufacturer qualifications: Manufacturer to have the following minimum qualifications:
    - a. Ten years experience in the manufacturing of elastomeric concrete materials.
    - b. Qualified personnel, factory trained and certified in the proper installation procedures, are to be available during construction.
  3. Manufacturers: The naming of certain manufacturers is intended to establish a standard of quality. Elastomeric Concrete from the following manufacturers is acceptable:
    - a. Delcrete Elastomeric Concrete by the DS Brown Company, PO Box 158, North Baltimore, OH 45872, telephone (419)257-3561.
    - b. Wabocrete by Watson Bowman Acme Corporation, 95 Pineview Drive, Amherst, NY 14228, telephone (716)691-7566.
  4. Equal Products: Other manufacturers or material suppliers who wish to propose their product as equal to this specification submit product information and a working sample along with independent physical test property verification, and product literature for review and approval.
- R. Waterstop: Section 03100.
- S. Chairs for Reinforcement: Plastic or stainless steel.
- T. Corrosion-inhibitor in concrete. The corrosion-inhibitor shall be calcium nitrite-based admixture DCI or approved equal. Use four (4) gallons per cubic yard of the corrosion inhibitor when the water-cement ratio is 0.40 or less and use three and a half gallons (3-1/2) per cubic yard when water-cement ratio is 0.38 or less. For precast prestressed parking structures/garages use the corrosion-inhibitor in cast-in-place concrete overlay topping over the double tees and the inverted tee beams on top level and for cast-in-place concrete in wash strips and wash areas on all levels.

## 2.02 SAMPLING:

- A. Sample concrete ingredients prior to use and have them tested by an approved laboratory in accordance with methods specified. Subsequently test materials as often as necessary to verify that materials conform to specified requirements and that quality of product is maintained.

- B. Make arrangements for the Engineer to witness sampling and testing. Submit record of test results.
- C. Ready-Mixed Concrete: ASTM C94.

### **2.03 GROUT MIXES:**

- A. Portland-cement grout:
  - 1. Prepare grout composed of portland cement, sand and water.
  - 2. Use portland-cement grout under bearing plates, in recesses, holes and surfaces under structural members and at other locations shown.
  - 3. Do not use staining ingredients in grout exposed to view.
  - 4. Formulation: Two parts sand and one-part cement measured by volume.
  - 5. Mix grout with sufficient water to permit placing and packing, approximately 45 minutes prior to use.
- B. Nonshrink grout: ASTM C1107.
- C. Shrinkage-compensating grout:
  - 1. Use shrinkage-compensating grout for setting structural members, anchor bolts, embedded items or items of equipment and machinery on hardened concrete.
  - 2. Prepare nonstaining shrinkage-compensating grout with portland cement, sand and aluminum powder and use in accordance with manufacturer's recommendations.
  - 3. Prepare shrinkage-compensating grout for use up to two inches thick as follows, measured by volume:
    - a. One-part portland cement, Type I or II.
    - b. One-part fine natural-sand aggregate, graded as specified.
    - c. One-part ferrous aggregate, graded as specified, combined with Type-A chemical admixture, oxidation agent and water in sufficient amount to permit placing and packing.
- D. Premixed shrinkage-compensating grout:
  - 1. In lieu of specified shrinkage-compensating grout, use premixed ready-to-use formulation when approved. Approval will be based on manufacturer's certification that:
    - a. Material will perform as specified.
    - b. Composition and proportioning of grout materials is essentially as specified for shrinkage-compensating.
    - c. Formulation has been used successfully in like applications for at least five years.
  - 2. Proportion ingredients in accordance with the manufacturer's recommendations.
- E. Mixing water:
  - 1. Proportion mixing water in accordance with grout manufacturer's recommendation or to produce flowable mixture without segregation or bleeding.
- F. Curing:
  - 1. After grout has attained initial set, keep damp for 24 hours minimum.

## **PART 3 - EXECUTION**

### **3.01 FIELD QUALITY CONTROL:**

- A. Classes of Concrete:

1. Classes of concrete are designated by numerals corresponding to their specified 28-day compressive strength in pounds per square inch as determined by ASTM C94.
2. Concrete classes used in this project are specified. Unless otherwise indicated, use Class 3500.
3. Each class of concrete may comprise one or more mixes determined by maximum size of aggregate, cement factor and types of admixtures used.
  - a. Portland cement may be used alone or mixed with either ground-iron blast-furnace slag or fly ash. Do not use fly ash in architectural concrete exposed to public view.
  - b. Maximum allowable ground-iron blast-furnace slag: 50 percent of the total weight of the portland cement and ground-iron blast-furnace slag mixture.
  - c. Maximum allowable fly ash: 20-percent of the total weight of the portland cement and fly-ash mixture.
4. Concrete with fly ash or ground-iron blast-furnace slag may be used at locations shown on the drawings.

B. Types of Concrete:

1. Types of concrete are designated as Concrete Other than Lightweight and Lightweight Structural Concrete.

C. Minimum Cement Factor:

1. Observe minimum cement factor for various classes of concrete other than lightweight, as follows:

Class of Concrete	Minimum Cement Factor Bags Per Cubic Yard Of Concrete
5,000	6.5
3,500 - 4,000	6.0
2,500 - 3,000	5.0

\* one bag of cement = 94lbs. of cement

2. If a mix of portland cement and ground-iron blast-furnace slag or portland cement and fly ash is used, the mix is the basis of determining the bags per cubic yard of concrete.

D. Air Entrainment:

1. Determine air content of concrete in accordance with ASTM C94.

E. Testing of Concrete:

1. General:
  - a. Provide the Engineer with molds and concrete, and cast specimens for testing. In addition, furnish necessary testing equipment and tools to perform sampling, slump tests and yield tests. Furnish boxes for shipping samples.
2. Perform strength tests by making not less than one set of standard cylindrical test specimens for each 100 cubic yards of concrete or any portion thereof for each structure.
  - a. For each work shift, when concrete is delivered, make at least one set of specimens. A set of test specimens consists of at least three standard cylinders from a batch.
  - b. Perform slump tests, unit weight and air content tests with no less frequency than that of strength-specimen sets.
3. Concrete strengths:

- a. Determine strengths from standard test specimens according to ASTM C31 and ASTM C172 and cured and tested in accordance with ASTM C39 by the testing laboratory. Core drilling and testing in accordance with ASTM C42. Consider the effects of corrosion-inhibiting admixture and other admixtures on the strength of the concrete, in the concrete mix design. The corrosion-inhibiting admixture and other admixtures must be present in the concrete used for the test of the proposed mix strength.
  - b. Compute and evaluate in accordance with ASTM C94.
- F. Variability of Constituents in Concrete:
- 1. Take representative samples of concrete mortar.
  - 2. Maximum allowable unit-weight variation of air-free mortar taken from consecutive batches as discharged from mixer:
    - a. Average of two mortar weights: 0.8-percent maximum.
    - b. Average of six mortar weights: 0.5-percent maximum.
  - 3. Maximum allowable weight variation of coarse aggregate per cubic foot of concrete taken from consecutive batches as discharged from mixer.
    - a. Average of two weights: Five-percent maximum.
- G. Batching Plant:
- 1. Arrangement:
    - a. Provide separate bins or compartments for each size or classification of aggregate and for bulk portland cement, ground-iron blast-furnace slag or fly ash.
  - 2. Compartments:
    - a. Provide compartments of ample size, so constructed that materials will be kept separated under working conditions. Equip batching plant so that flow of each material into its batcher is stopped automatically when designated weight has been reached.
    - b. Weigh aggregates in separate weight batches with individual scales or cumulatively in one batcher on one scale. Weigh bulk cement on separate scale in separate weight batcher. Weigh ground-iron blast-furnace slag or fly ash on the same scale in the same weight batcher containing the bulk cement. Weigh and record bulk cement first; then add to the bulk cement, weigh and record the ground-iron blast-furnace slag or fly ash. Weigh and record the cumulative bulk cement and ground-iron blast-furnace slag or the bulk cement and fly ash.
    - c. Water amount may be measured by weight or volume. If measured by weight, do not weigh cumulatively with other ingredients.
    - d. Interlock batching controls so that charging mechanism cannot be opened until scales have returned to zero. Satisfy these requirements by semi-automatic batching system as defined in the Concrete Plant Standards of the CPMB, with specified interlocking, or by automatic-batching system as defined in the Concrete Plant Standard.
    - e. Arrange plant so as to continuously facilitate inspection of operations. Provide facilities for obtaining representative samples of aggregate from each bin or compartment for test purposes.
    - f. Deliver materials from batching equipment within limits specified in ASTM C94.
    - g. Subject to approval, accomplish batching in accordance with ASTM C685, in lieu of weight batching, provided batching plant complies with requirements of CPMB Concrete Plant Standards.
  - 3. Water batcher and admixture dispensers:
    - a. Provide equipment for batching water and air-entraining or other admixtures at batching plant except in cases where mixing is to be performed at jobsite in paving mixers or in truck mixers.

- b. Provide water-measuring device capable of measuring mixing water within specified requirements for each batch. Provide mechanism for delivering water to mixers so that leakage does not occur when valves are closed.
  - c. Interlock filling and discharge valves for water batcher so that discharge valve cannot be opened before filling valve is fully closed.
  - d. Introduce admixtures in solution form.
  - e. Provide measuring devices for admixtures capable of ready adjustment to permit varying quantity of admixture to be batched. Interlock dispenser for admixtures with batching and discharging operations so that batching and discharging of mixture will be automatic.
  - f. If noninterlocked dispensers are permitted, check calibration of dispensers at directed intervals. Record results of such calibration for inspection by the Engineer.
4. Moisture control:
- a. Provide plant capable of ready adjustment to compensate for varying moisture contents of aggregate and to change weights of materials being batched. Provide approved electric moisture meter for measurement of moisture in fine aggregate. Calibrate as often as directed.
  - b. Moisture content of fine aggregate not to exceed eight percent. Arrange sensing element so that measurement is made near batcher.
5. Scales:
- a. Provide accurate measurement facilities for and control of each of the materials entering each batch of concrete. Provide accurate weighing equipment in accordance with NBS Handbook 44.
  - b. Include in each weighing unit a visual springless dial to indicate scale load at each stage of weighing operation or include beam scale with beam balance indicator to show scale in balance at zero load and at each beam setting, indicator to have undertravel and overtravel equal to at least five percent of capacity of beam.
  - c. Provide standard test weights and other auxiliary equipment necessary to verify operating performance of each scale or other measuring device.
  - d. Make periodic tests in the presence of the Engineer at directed intervals. Upon completion of each check test and before further use of indicating, recording and control devices, make adjustments, repairs or replacements as necessary to ensure satisfactory performance.
6. Recorders:
- a. Provide accurate recorder for producing digital printout of scale readings corresponding to each concrete ingredient of each concrete batch, including zero initial readings; indicate presence of each individual admixture by corresponding code in lieu of weight or volume record.
  - b. Record water in gallons where batched by volume. In addition, on each printout show date and time of batching, identification number identical to that of concrete delivery ticket and codes for mix design and for project section.
  - c. Prepare printout in duplicate and submit one copy with its corresponding concrete ticket at the time and site of concrete placement.
  - d. House each recorder in locked cabinet.
  - e. Place recorders in position convenient for observation by plant operator and the Engineer.
7. Protection:
- a. Protect weighing, indicating and control equipment against exposure to dust and weather; isolate against vibration or movement caused by other operating equipment.
8. Dry batching:
- a. When bulk cement and aggregates are hauled from central batching plant to mixers, place cement, ground-iron blast-furnace slag or fly ash for each

batch in an individual compartment which, during transit, will prevent cement from intermingling with aggregates and will prevent loss of cement.

- b. Provide bins of batch trucks with suitable covers to protect materials.
- c. Provide batch compartments of sufficient capacity to prevent loss in transit and to prevent spilling and intermingling of batches as compartments are being emptied.

H. Allowable Concrete Finish Tolerances:

- 1. Finish concrete elements to dimensions, elevations and positions shown within the tolerances specified for each:
  - a. Formed surfaces such as walls, roof soffits, columns, beams and girders: Plus-or-minus 1/4 inch.
  - b. Arches: Plus-or-minus 1/2 inch.
  - c. Bearing-assembly locations of aerial structure piers and abutments: Plus-or-minus 1/16 inch.
  - d. Traction-power substations, tie-breaker stations and ac-switchboard rooms: Plus zero or minus 1/4 inch.
  - e. Safety walks, vertical and horizontal: Plus-or-minus 1/2 inch.
  - f. Station platforms:
    - 1) Vertical: Plus-or-minus 1/4 inch.
    - 2) Horizontal, measured from centerline of track to edge of platform: Plus 1/4 inch or minus zero.
  - g. Invert slabs and floating slabs:
    - 1) Maximum deviation from profile grade: Plus zero or minus 1/2 inch.
    - 2) Maximum deviation from 10-foot steel straightedge: Plus-or-minus 1/8 inch, noncumulative.
    - 3) Verify adequacy of finish for draining by hosing area. Ponding or obstructions to flow toward invert drains constitute defects.
  - h. Invert under floating slabs:
    - 1) Maximum deviation from profile grade: Plus zero, minus 1/2 inch.
    - 2) Maximum deviation from 10-foot steel straightedge: Plus-or-minus 1/8 inch, noncumulative.

I. Water tightness Criteria:

- 1. Maximum allowable water leakage:
  - a. Permanent-support lining for circular and horseshoe tunnels, including joints:
    - 1) 0.14 gallons per minute per 250 linear feet.
    - 2) 0.07 gallons per minute in any 10 linear feet.
  - b. Single-box, cut-and-cover line structures, including joints:
    - 1) 0.12 gallons per minute per 250 linear feet.
    - 2) 0.06 gallons per minute in any 10 linear feet.
  - c. Double-box or cross-over, cut-and-cover line structures, including joints:
    - 1) 0.08 gallons per minute per 250 linear feet.
    - 2) 0.04 gallons per minute in any 10 linear feet.
  - d. Passenger stations, other public spaces, NATM tunnels and two-pass system tunnels where full wrap-around waterproofing is used: No leakage permitted.

**3.02 MATERIAL PREPARATION:**

A. Mixing Concrete:

- 1. Operations:
  - a. Provide concrete mixers that discharge concrete of uniform composition and consistency.

- b. Combine coarse aggregates of different gradation and identical sources, provided corresponding concrete mix has been approved. The use of alternate batches of gravel, crushed gravel or crushed stone of a single size is prohibited.
  - c. Adequacy of mixing will be determined by the Engineer by means of mixer performance tests in accordance with USBR Concrete Manual, Designation 26, Variability of Constituents in Concrete, in the appendix.
  - d. The Engineer may reduce size of batch to be mixed or increase mixing time when charging and mixing operations fail to produce concrete which conforms to specified requirements and which has uniform coloration and consistency.
  - e. Add water prior to, during and following mixer-charging operations. Do not overmix or add water to maintain consistency.
  - f. Use of concrete to which water in excess of amount permitted by approved design mix has been added to overcome conditions caused by excessive retention in mixer is prohibited.
2. Central-mixed concrete:
- a. Arrange mixers in centralized mixing plant so that mixing action in mixers can be conveniently observed by the Engineer and plant operator.
  - b. Do not load mixers in excess of rated capacity. Mix concrete ingredients in batch mixer for not less than period of time specified for various mixer capacities after each ingredient except full amount of water is in mixer. Reduce mixing time if thorough mixing as specified can be obtained in less time and if approved.
  - c. Mixing time:

Cubic-Yard Capacity of Mixer	Mixing Time
2 or less	1-1/2 minutes
3	2 minutes
4	2-1/2 minutes
More than 4	To be determined per ASTM C94 tests by the Engineer

- d. Equip each mixer with mechanically operated batch counter and timing and signaling device to indicate completion of mixing period.
3. Truck-mixed concrete: Use equipment and procedures that conform to the requirements of ASTM C94 and ACI 304, Chapter 5, with the following additional requirements:
- a. Introduce materials, including water and mixtures, into the mixing drum only at the central batching plant, or
  - b. Transport aggregates from the central plant to the jobsite in the mixing drum and add measured and recorded cement, admixtures and water into the drum prior to mixing at discharge point.
  - c. When ice is used, add it with the water and counted as part of the water-cement ratio.

- d. Place concrete within 90 minutes after cement is introduced into the mixing drum.
  - e. Accomplish initial mixing by 70 to 100 revolutions with drum rotating at the manufacturer's recommended speed. 30 revolutions at mixing speed will be required, if the addition of water is permitted. Do not exceed total of 300 mixing and agitating revolutions.
4. Temperature control:
- a. Use preparation methods capable of producing concrete with temperature 85F maximum and 55F minimum at time of placement.
  - b. Do not heat concrete ingredients to temperature higher than that necessary to keep temperature of mixed concrete as placed within specified temperatures.
  - c. Do not heat water in excess of 140F.
- B. Admixtures:
- 1. Introduce admixtures in solution form.
  - 2. Air-entraining admixture: Use for concrete exposed to weathering or in contact with rock or moist soil.
  - 3. Chemical admixtures:
    - a. Use water-reducing admixtures in concrete areas below grade in contact with rock, earth or fill.
    - b. Employ admixtures without interfering with specified air-content dosage of air-entrained concrete.
    - c. Except as otherwise specified or approved, use of water-reducing, set-retarding or set-accelerating admixtures is prohibited.
    - d. If introduction of certain admixtures to improve concrete strength is approved, do not reduce cement content below minimum amounts specified.
- C. Consistency:
- 1. For concrete to be compacted by approved mechanical vibrators, maintain slump range at point of delivery within the following limits:
    - a. Concrete pavement, pavement base, sidewalk and incidental construction: Two to three inches.
    - b. Unreinforced concrete other than pavements: One to three inches.
    - c. Reinforced concrete: Two to four inches.
    - d. Concrete placed by pumping and concrete for filling steel-shell piles: Four to five inches.
    - e. Do not use concrete if slump exceeds maximum by 1/2 inch or more.
- D. Lightweight Structural Concrete:
- 1. Prepare lightweight structural concrete with minimum cement content as follows:

Compressive Strength	Cement Content Bags Per Cubic Yard
2,000 psi	4 to 7
3,000 psi	5 to 8
4,000 psi	6 to 9
5,000 psi	7 to 10

- 2. Air-entrainment:
  - a. Use air-entraining admixture in lightweight structural concrete to provide not less than four nor more than six percent of entrained air.

3. Dry unit weight:
  - a. Prepare lightweight structural concrete to provide air-dry weight required by design but not less than 90 pounds per cubic foot.
4. Consistency:
  - a. Maintain slump range within two to four inches.

### **3.03 CONVEYING:**

- A. General:
  1. Provide equipment for conveying concrete from mixer with continuous flow of concrete to point of placement without segregation.
  2. Provide arrangement at discharge end of conveyor to prevent segregation.
  3. Design long conveyor runs to discharge concrete into hopper, without segregation, before it is deposited in forms.
  4. Ensure that pumps, pneumatic equipment, pipes, chutes and troughs are cleaned of dirt and concrete before use.
- B. Chutes and Troughs:
  1. Use only ferrous-metal-lined chutes and open troughs. Where steep slopes are unavoidable, equip chutes or troughs with baffles to minimize segregation of aggregates. Keep chutes or open troughs clean of hardened concrete by flushing with water after each use.
  2. Discharge water used for cleaning outside lines of structure. Lay out chutes or open troughs with slope one-foot vertical to two feet horizontal maximum and one-foot vertical to three feet horizontal minimum.
  3. Discharge chutes 20 feet or more in length into hopper before final distribution.
- C. Adjustable Length Pipes (Elephant Trunks):
  1. Use flexible pipes of ferrous metal, rubber or plastic, six inches minimum diameter so as to prevent segregation of concrete.
  2. Position chutes or flexible pipes so that concrete is delivered in continuous flow to points not more than five feet horizontally and five feet vertically from final location. In vicinity of expansion and contraction joints, reduce horizontal distance to three feet maximum.
  3. Clean flexible pipes and elephant trunks after each use.
- D. Buggies:
  1. Construct runways for buggies so they will not come into contact with or be supported by reinforcing steel of structure.
- E. Pumping and Pneumatic Conveying Equipment:
  1. Use pumping and pneumatic conveying equipment, designed to handle without segregation types, classes and volumes of concrete to be conveyed.
  2. Operate pump or pneumatic equipment so that continuous stream of concrete without air pockets is produced. Position discharge end of line as near final position of concrete as possible but in no case more than five feet away.
  3. At conclusion of placement, clean equipment. Discharge debris and flushing water outside of forms.

### **3.04 PLACEMENT:**

- A. General:
  1. Prior to placing concrete, remove debris and extraneous material from interior of forms.

2. Place first lift of concrete on wet surface. Consolidate by dragging vibrator along edges of joints. Make sure there is no free or standing water over the surface.
3. Place concrete continuously and as rapidly as possible after mixing. Do not use vibrators for shifting mass of fresh concrete.
4. Place concrete in layers of such thickness that no concrete will be deposited on concrete which has hardened sufficiently to cause formation of seams or planes of weakness. Cover each layer of concrete with fresh concrete within 45 minutes.
5. Do not place concrete which has attained initial set or concrete which has contained mix water for more than 90 minutes.
6. Remove temporary spreaders in forms when concrete has reached elevation which makes them unnecessary.
7. Place column concrete using adjustable-length flexible pipes or elephant trunks to avoid dropping concrete over five feet. In monolithic placements, do not deposit concrete in supported elements such as beams, girders and slabs until concrete previously deposited in columns or walls has completed its settlement shrinkage, but not to the point at which concrete in supporting members will not permit vibrator to sink into its mass of its own weight.
8. Placing will not be permitted when sun, heat, wind or limitations of facilities will prevent finishing and curing.
9. Concrete temperature at time of placement:
  - a. 55F, minimum.
  - b. 85F, maximum.
10. Unless approved, do not continue concreting when descending ambient air temperature falls lower than 40F.
11. Prior to placing fresh concrete against rock or previously placed concrete, take necessary steps, such as flushing with water, to ensure removal of foreign matter which would adversely affect bond.
12. Maintain wire fabric and other reinforcing in proper position on chairs during concrete placement.

B. Underwater Concrete Placement:

1. Place concrete carefully and continuously in compact mass by means of tremie or underwater bottom-dump bucket; do not disturb after depositing. Maintain still water at point of deposit. Use tight forms. In placing concrete, produce approximately horizontal surfaces.
2. Do not perform pumping within area until concrete has set at least 48 hours.
3. Tremie:
  - a. Provide tremie consisting of watertight tube, 10-inch minimum diameter, with hopper at top. Equip tube with device to close discharge end and prevent water from entering tube while charging tube with concrete.
  - b. Support tremie so as to permit free movement of discharge end over entire top surface of work and to permit rapid lowering when necessary to retard or stop flow of concrete.
  - c. Close discharge end at start of work to prevent water entering tube and maintain entirely sealed, except when concrete is being placed. Keep tremie tube full of concrete.
  - d. Maintain continuous flow until work is complete and resulting concrete seal is monolithic and homogenous. Control tremies so that concrete will be effectively compacted into horizontal layers not more than 12 inches thick.
  - e. Space tremies so as to avoid segregation.

C. Consolidation:

1. Consolidate concrete thoroughly as it is placed in order to secure a dense mass. Work concrete well around reinforcement, embedded items and into the corners of forms. Consolidate concrete in accordance with ACI 309.
2. Use internal vibrators unless external vibrators are approved.

3. Use vibrators capable of generating frequencies of not less than 7,000 impulses per minute. Verify that vibrators have power and amplitude factor so as to visibly affect mass of concrete of one-inch slump over radius of at least 18 inches. Prevent formation of laitance and accumulation of excessive water on surface of concrete as it is deposited. Remove excessive water by pumping or other approved means.
4. When consolidating concrete in haunches, girders, beams or slabs, ensure that vibrator penetrates and revibrates previously placed concrete in top of supporting members.
5. Do not use vibrators where internal vibration might cause damage to embedded items; in such cases spading is required.

### **3.05 CURING AND PROTECTING:**

- A. General:
  1. Protect freshly placed concrete from excessively hot or cold temperatures. Maintain without drying for period of time necessary for hydration of cement and proper hardening of concrete.
  2. Provide sufficient tarpaulins to cover completely or enclose forms and working areas prior to and during placing and finishing operations.
  3. Cure newly placed concrete continuously for seven days at ambient temperature in excess of 55F.
  4. Cure concrete in subway structures by normal curing method specified.
  5. During curing period keep steel and wood forms wet. If forms are removed during curing, use one of the following methods of curing immediately and continue for remainder of the curing period.
- B. Normal Curing and Protection:
  1. Use one of the following methods for flat surfaces, weather permitting:
    - a. Use ponding on horizontal surfaces providing surface is continuously submerged for required curing period.
    - b. Apply continuous sprinkling with nozzle or nozzles which, during first 24 hours, atomize flow of water providing a mist and not a spray. Do not apply moisture under pressure directly upon concrete; avoid flowing or washing on surfaces while susceptible to erosion.
    - c. Cover entire surface of concrete with double thickness burlap sheet, laid directly on concrete and kept continuously wet. Maintain in good condition.
    - d. Sprinkle concrete surface as specified for at least 18 hours and immediately cover with waterproof curing sheet, free from holes or tears. Hold in position so that entire surface of concrete is fully and continuously covered.
    - e. Do not damage burlap, waterproof sheet or concrete surfaces.
- C. Membrane-Forming Curing Compound:
  1. Use curing compound when approved for circumstances where application of moisture is impracticable and where such compounds will not jeopardize appearance of concrete. Except as otherwise specified, use Type-1 compound, uniformly applied over surface at thickness recommended by manufacturer. Thoroughly mix compound and apply within one hour after mixing.
  2. Where surfaces are subject to sunlight, apply Type-2 compound. Except for surfaces exposed to public view and architectural finished concrete.
  3. Do not apply wax-resin curing compounds to surfaces requiring bond for additional concrete or where bonded surface coating such as paint, tile, dampproofing, waterproofing or roofing is to be applied.
    - a. Do not apply curing compound to floors to be chemically sealed.

4. Warm or stir curing compound if necessary for satisfactory application in accordance with manufacturer's recommendations. If film of compound is damaged before expiration of curing period, repair immediately with additional compound.
  5. Inside surfaces of tunnels, cut-and-cover boxes and other surfaces specifically approved may be cured with Type-1 membrane curing compound.
  6. Finish surfaces prior to application of curing compound. Do not use curing compound on construction joints.
  7. Apply curing compound in two coats. Apply first coat immediately after stripping of forms and acceptance of concrete finish.
  8. If surface is dry, thoroughly wet concrete with water and apply curing compound just as surface film of water disappears. Apply second coat after first coat has set.
  9. Protect coating against damage for at least 10 days after application. If damage occurs, apply additional coating.
  10. If use of curing compound results in streaked or blotchy appearance, cease operations and use other method of curing until cause of defective appearance is corrected.
- D. Floor Treatment:
1. In accordance with recommendations of manufacturer of floor hardener, apply floor curing compound and curing sheet to surfaces to receive floor hardener.
  2. Where such surfaces are subject to sunlight, protect them by tenting white opaque, polyethylene waterproof sheet.
- E. Protection of Rod Reinforcement:
1. After forms are removed, coat rod reinforcement and dowels extending beyond concrete surfaces with application of neat cement paste.
  2. Remove hardened cement paste and resultant debris immediately prior to extension of reinforcement or installation of formwork.

### **3.06 COLD WEATHER CONCRETING:**

- A. Do not place concrete when ambient temperature is less than 55 ° F and falling. Do not place concrete unless the form temperature at the time of placement is at least 40 ° F.
- B. When ambient temperature is 40 ° F and falling, carry out one of the following procedures to protect placed concrete:
1. Heating:
    - a. Enclose forms or structures and heat to maintain concrete and air within enclosure at not less than 55 ° F for seven days after placement.
    - b. Maintain relative humidity at not less than 40 percent during curing period when heat is applied to enclosures. Arrange stoves, salamanders or heaters so as to provide uniform distribution of heat. Vent combustion gases to outside air. Do not let hot air blow across concrete surfaces.
    - c. After seven-day curing period, reduce temperature within enclosure gradually at maximum rate of 20 ° F per day until outside temperature has been reached.
    - d. Provide continuous and adequate fire protection and watchmen when heating units are in operation.
  2. Form insulation:
    - a. Insulate forms with blanket insulation of approved type and thickness to maintain concrete at 55 ° F minimum for seven days.
    - b. Protect top of placed concrete by tarpaulins or other approved waterproof material over insulation.

- C. Do not allow concrete to freeze in a saturated condition prior to achieving a strength of 4000 psi.

### **3.07 HOT WEATHER CONCRETING:**

- A. When temperature in forms is 75F or above, carry out the following procedures to protect placed concrete:
  - 1. Protect concrete from direct sunlight.
  - 2. Keep forms moist by means of cool-water sprinkling or application of wet burlap or cotton mats.
  - 3. At 90F or above cool aggregates with water spray hoses.
  - 4. Cool truck barrels with water spray system.

### **3.08 JOINTS:**

- A. General:
  - 1. Unless otherwise shown make construction joints bonded joints by roughening surface to expose aggregates. Clean and roughen surface by wet sandblasting, by cutting with high-pressure water jet with a minimum pressure of 2,000 psi or by other approved means. Perform cleaning after concrete has hardened to prevent raveling of surface.
  - 2. Exercise caution in cleaning concrete to prevent damage to waterstops.
  - 3. Treat overlays on slabs the same as for rock or other bonded joint.
  - 4. Place construction joints at locations shown, or at locations approved by the Engineer.
- B. Horizontal Construction Joints:
  - 1. Joints within 18 inches of tops of faces are prohibited.
  - 2. Trowel top surface of concrete adjacent to forms smooth to minimize visible joints on exposed faces. Remove laitance and other objectionable materials from joint surface to expose sound concrete as soon as concrete is firm enough to retain its form.
  - 3. Immediately after placement of concrete, remove accumulations splashed on exposed reinforcement and surfaces of adjacent forms before concrete attains initial set.
- C. Other Joints:
  - 1. Place concrete for rock tunnels with vertical contraction joints, with vertical or sloping construction joints or continuously without joints.
  - 2. Install forms for vertical joints. Remove forms as soon as concrete has attained sufficient strength to be self-supporting.
- D. Waterstops:
  - 1. Provide waterstops per Section 03100, Article 3.7.
  - 2. Rework or replace concrete where waterstop has moved unacceptably.
  - 3. Support water stop in exact position, do not sink water stops in fresh concrete.

### **3.09 CONCRETE FINISHING:**

- A. When forms are removed, do not remedy voids, stone pockets and other defects until the Engineer has inspected them and given directions.
- B. Finish concrete surfaces as shown and as follows:
  - 1. Number-1 Form Finish:

- a. Immediately following form removal, remove fins and irregular projections from surfaces exposed to view or those that will receive waterproofing.
  - b. Prepare pointing mortar not more than 30 minutes prior to use.
  - c. Cure mortar patches as specified under curing and protection.
  - d. Leave contraction joints and articulated joints in completed work carefully tooled and free of mortar and concrete.
  - e. Leave joint filler exposed for its full length with clean and true edges.
  - f. Apply this finish to structures, unless otherwise shown.
2. Number-2 Wet-Rubbed Finish:
    - a. Start rubbing of concrete after removal of forms and as soon as its condition will permit. Keep concrete thoroughly saturated with water before starting this work.
    - b. Allow sufficient time to elapse before wetting down to allow pointing mortar to thoroughly set. Rub surfaces with medium-coarse carborundum stone.
    - c. Continue rubbing until form marks, projections and irregularities have been removed, voids are filled and uniform surface is obtained.
    - d. Leave paste produced by rubbing in place. Obtain final finish by rubbing with fine carborundum stone and water after concrete above surface being treated has been cast. Continue rubbing until entire surface is of smooth texture and uniform color. After final rubbing is completed and surface has dried, rub with burlap to remove loose powder and objectionable marks.
  3. Number-3 Broomed Finish:
    - a. Where floors and other areas are shown to have rough finish, strike-off surface with screeds and wood floats at elevation shown.
    - b. Before concrete has achieved initial set, broom transversely to flow of traffic with stiff, medium-bristle broom especially made for intended purpose to develop corrugations not more than 1/8-inch deep.
  4. Number-4 Steel-Troweled Finish:
    - a. Where floors are shown to have a steel-troweled finish, screed concrete to established grades and compact with wood or power-driven disc float.
    - b. After surface has hardened sufficiently, finish with steel trowel to dense hard finish, free of trowel marks.
    - c. Do not use dry cement or mixture of dry cement and sand to absorb water.
  5. Number-5 Wood-Float Finish:
    - a. Screed inverts of subway structure, floors not specified or shown to be finished otherwise, areas below floating slabs and areas to receive dampproofing, waterproofing or roofing to a true and uniform surface conforming to shape and elevations shown.
    - b. Follow with wood-float finish to tolerances specified.
    - c. On slabs and floors, where drainage is shown, maintain accurate slopes for drainage.
    - d. Protect floors and slabs until final acceptance.
  6. Number-6 Sandblast-Sealer Finish:
    - a. Where concrete surfaces are shown to receive sandblast finish and a sealer prepare sample using sandblast finish on file in the Engineer's office as criterion.
    - b. Prepare samples with degree of sandblasting which will produce uniform texture on surface of concrete. Blast to achieve smooth, sanded surface approximately equivalent to 100-120 grit sandpaper finish.
    - c. Sandblasted surfaces will be inspected before sealing and compared with approved samples.
    - d. Apply concrete surface sealer to sandblast finish in accordance with approved procedures.
  7. Number-7 Natural-Board Finish:
    - a. After stripping forms, cut back form ties as specified. Touch-up holes created by form ties and damaged or defective finish using grout closely

matching surrounding concrete. Accomplish grouting and repairs as specified. Knock-off heavy elongated fins, but do not rub down.

8. Number-8 Abrasive-Aggregate Finish:
    - a. After screeding and floating as for Number-4 Finish, apply abrasive aggregate at rate of not less than 0.6 pound per square foot.
    - b. Sprinkle evenly in two applications using one half the amount for each application. Apply second half at right angle to first.
    - c. Follow with wood float; lightly tamp or roll surface to embed aggregate flush with concrete surface.
    - d. Lightly steel trowel to smooth, even finish.
    - e. After curing, rub surface using abrasive brick with water to slightly expose abrasive aggregate.
- C. Do not sprinkle water or cement on surfaces to be trowel finished.

### 3.10 FLOOR TREATMENT:

- A. Sealer:
  1. Water cure floor surfaces to be sealed for 28 days minimum and ensure that they are completely dry before treatment.
  2. Complete overhead work before sealer is applied.
  3. Apply liquid floor sealer in three separate coats as recommended by the manufacturer using maximum quantity recommended. Allow to dry between applications.
- B. Floor-Hardener System:
  1. Areas of application: Concrete floor surfaces as shown.
  2. Preparation:
    - a. Strike concrete to established grade using wooden strike-off bar. Further level and consolidate concrete with wood bull float or wood darby immediately following strike-off. Complete before free moisture rises to surface.
    - b. Begin floating adjacent to columns, forms and walls where concrete is most likely to stiffen first.
  3. Application:
    - a. Apply at uniform rate of 1.8 to 2.2 pounds of hardener per square foot of floor surface.
    - b. Apply first shake to floated concrete adjacent to forms, columns, and walls where moisture will be lost first. Apply 2/3 of specified total shake immediately following floating of total area as follows:
      - 1) Distribute evenly.
      - 2) Throwing shake is prohibited.
      - 3) Perform hand floating with wood floats. Magnesium floats are prohibited.
    - c. Use finishing machines with float blades as soon as shake has absorbed moisture as evidenced by darkening of surface. Do not allow float blades to dig into surface. Float sufficiently to bring moisture from base slab through shake.
    - d. Immediately after floating first shake, apply remaining 1/3 of total specified shake in the same manner and machine float as specified. Plan operations to avoid necessity of sprinkling water on surface.
    - e. As surface stiffens as evidenced by loss of sheen, finish by hand steel trowel removing marks and pinholes; leave surface in uniform condition with relatively smooth but nonslip surface.
  4. Field service:

- a. During installation, provide services of qualified representative of manufacturer to aid in proper use of product. Notify manufacturer three days minimum prior to initial application of product.
- 5. Quality control:
  - a. Prior to installation, submit for approval detailed quality-control plan describing method of application of floor hardener and listing items to be checked to ensure that materials are placed at proper time and in proper manner to achieve optimum durability of finished floor surface. Prior to submittal, have quality-control plan authenticated by qualified representative of material manufacturer indicating manufacturer's approval.
  - b. Submit quality-control reports authenticated by manufacturer's representative verifying that installation has been made in accordance with approved quality-control plan.

### **3.11 DEFECTIVE CONCRETE:**

- A. Concrete will be considered defective unless it is structurally sound, watertight, properly finished and within specified tolerances.
- B. Concrete in place that is deemed structurally defective will be checked by the Engineer by drilled core specimens. If testing of core specimens shows that strength is less than 85 percent of specified strength, costs incurred in taking and testing of core specimens will be borne by the Contractor.
- C. Replace, strengthen or correct defective concrete as directed.

### **3.12 PROTECTION FROM AND REMOVAL OF STAINS:**

- A. Protect concrete structure from rust staining by structural-steel members or from other substances during the work.
- B. If staining should occur, remove stains and restore concrete to its original color.

### **3.13 DAMAGED WORK:**

- A. Before final acceptance of the work, neatly repair damaged surfaces, corners of concrete and concrete finish.
- B. Where surface repairs are permitted, finish damaged areas to smooth, dense watertight condition.
- C. Replace concrete that is not satisfactorily repaired.

### **3.14 CORRECTIVE WORK:**

- A. Submit corrective action patching procedure.
- B. If correction of defects is approved, remove defective concrete; key area to be repaired, soak surface with water and patch with approved materials. Patch architectural concrete so as to match existing. Use bonding agents applied to the substrate or mixed with patching material only as approved by the Engineer.
- C. Clean surface cavities produced by form ties, other holes, honeycomb spots, broken corners or edges and other defects. Saturate with water and point with mortar paste consisting of

cement and fine aggregate mixed in proportions to give same appearance as original concrete.

- D. Prepare pointing mortar not more than 30 minutes prior to use. Cure mortar patches properly. Carefully tool contraction and articulated joints in completed work and keep them free of concrete. Where necessary, leave joint filler exposed for its full length with clean and true edges.
- E. Tolerance deviations and other surface defects may also be corrected, if approved, by grinding high areas and swales. Leaks in station electrical rooms, TPSS and TBS shall be epoxy injected.
- F. Where necessary or when directed, repair leakage in excess of specified maximum allowable, by means of contact grouting, chemical grouting or other approved means.
- G. Where corrective work is unsatisfactory, completely remove such work and replace with new work complying with specified requirements.

### **3.15 EPOXY MORTAR REPAIRS:**

- A. Surface Preparation:
  - 1. Remove defective concrete with chipping hammers or other approved equipment. To prevent removing extra material and causing cracks, saw-cut concrete area to be removed into maximum six-inch square checkerboard pattern 4-1/2 inches deep.
  - 2. Prepare exposed concrete surface by sandblasting clean and allowing to dry thoroughly. Surface drying may be accomplished by air jet. Ensure that compressed air used in cleaning and drying is free from oil or other contaminating materials.
  - 3. Maintain concrete surface in sufficient depth at temperature of 65F minimum during first four hours after placement of epoxy bond coat. Preheating may be done with radiant heaters or other approved means. Do not preheat concrete in excess of 200F with final surface temperature below 105F at time of placing epoxy materials.
- B. Application of Epoxy Bonding Agents:
  - 1. Prepare epoxy bonding agent in accordance with manufacturer's recommendations.
  - 2. Apply epoxy bonding agent to prepared dry concrete surface at coverage of 80 square feet per gallon maximum or as recommended by manufacturer
  - 3. Epoxy bonding agent may be applied by any convenient and safe method which will yield effective coverage, such as squeegees, brushes or rollers.
  - 4. During application of epoxy bonding agent, ensure that material is confined to area being bonded; avoid contamination of adjacent surfaces. Extend epoxy bond coat slightly beyond edges of repair area.
- C. Application of Epoxy Mortar:
  - 1. Mix epoxy components in accordance with manufacturer's recommendations.
  - 2. Proportion: 5-1/2 parts sand by weight to one-part epoxy.
  - 3. Mix components with slow-speed mechanical device.
  - 4. Prepare mortar in small batches so that each batch can be completely mixed and placed within approximately 30 minutes.
  - 5. Do not add thinners or dilutants to mortar mixture.
  - 6. Immediately after application of epoxy bonding agent, place, tamp, flatten and smooth epoxy mortar.
  - 7. Work mortar to grade.
  - 8. Steel-trowel finish. Trowels may be heated to facilitate finishing.
- D. Curing:

1. Cure epoxy mortar repairs immediately after completion at 60F minimum until mortar is hard.
2. Initiate post-curing of four hours minimum at surface temperature of 90F minimum, 110F maximum.
3. Heat may be applied by using portable propane heaters, infrared heaters or other approved sources positioned to attain necessary surface temperature.
4. Do not subject epoxy-bonded epoxy mortar to moisture until after specified post-curing has been completed.

**3.16 CONCRETE OVERLAYS AND TILE SETTING BEDS:**

- A. General:
1. Water blast (3,000 - 5,000 psi) or sand blast the substrate.
  2. Keep slabs continuously wet for 24 hours prior to concrete placement. Substrate to be air blown just prior to concrete placement.
  3. Place concrete in two pours of equal thickness. Place welded-wire-fabric reinforcement on first pour and then place second pour.
  4. Use a vibratory screed on overlays.
  5. Float slab and apply light broom finish. Cure slabs with water.
  6. Remove laitance by methods in number one above if the overlay requires a bonding surface for tile or other treatments.
  7. Continuously moist cure of overlay( setting bed) for seven(7) days.

**END OF SECTION**

## SECTION 03331

### CAST-IN-PLACE ARCHITECTURAL CONCRETE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This Section specifies cast-in-place architectural concrete, including form work reinforcement accessories, concrete materials, concrete mix design, placement procedures, and finishes.
- B. Related Work Specified Elsewhere:
  - 1. Concrete Formwork: Section 03100 .
  - 2. Concrete Reinforcement: Section 03200.
  - 3. Cast-in-Place Structural Concrete: Section 03300.
  - 4. Seals and Sealants: Section 07900.

##### 1.02 DEFINITION:

- A. Cast-in-Place Architectural Concrete: Concrete that is exposed to view on surfaces of the completed structure or building and that requires special concrete materials, formwork, placement, or finishes to obtain specified architectural appearance.
- B. Design Reference Sample: Sample designated by The Engineer in the Contract Documents that reflects acceptable surface quality and appearance of cast-in-place architectural concrete.
- C. Reveal: Projection of the coarse aggregate from the matrix after exposure.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the Special Conditions and with the additional requirements as specified for each:
  - 1. Product Data: For each type of manufactured material and product indicated.
  - 2. Design Mixes: For each concrete mix. Include alternate mix designs when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.
  - 3. Shop Drawings: Show formwork construction including form-facing joints, rustications, construction and contraction joints, form joint-sealant details, form tie location and patterns, inserts and embedments, cutouts, cleanout panels, and other items that visually affect cast-in-place architectural concrete.
  - 4. Samples: For each of the following materials
    - a. Form-facing panel.
    - b. Form-release agent.
    - c. Form ties.
    - d. Form liners.
    - e. Cement.
    - f. Coarse- and fine-aggregate gradations.
    - g. Chamfers and rustications.
    - h. Curing compound.
    - i. Coloring admixtures.
  - 5. Samples for Verification: Architectural concrete samples, cast vertically, approximately 18 by 18 by 2 inches, of finishes, colors, and textures to match the design reference sample. Include Sample sets showing the full range of variations expected in these characteristics.

6. Material Test Reports: From a qualified testing agency indicating and interpreting test results of the following for compliance with requirements indicated, based on comprehensive testing of current materials:
7. Material Certificates: Signed by manufacturers certifying that each of the following materials complies with requirements:
  - a. Cementitious materials and aggregates.
  - b. Admixtures.
  - c. Curing compounds.
8. Placement Schedule: Submit concrete placement schedule before start of architectural concrete placement operations. Include location of all joints including construction joints.

#### **1.04 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  1. ASTM C 33, C 94, C 144, C 150, C 171, C 260, C 309, C 494, C 618, C 881, C920, C 979, C989, C 1077, C 1059, E 329, E 548, M 182
  2. ACI CP-1,117, 301, 303, 303.1, 309R.
  3. AAMA 810.1.
  4. AASHTO M 182.
- B. Installer Qualifications: An experienced cast-in-place architectural concrete contractor who has specialized in installing cast-in-place architectural concrete similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- C. Concrete Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products complying with ASTM C 94 requirements for production facilities and equipment.
- D. Testing Agency Qualifications: An independent testing agency, acceptable to authorities having jurisdiction, qualified according to ASTM C 1077 and ASTM E 329 to conduct the testing indicated, as documented according to ASTM E 548.
  1. Personnel conducting field tests shall be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-1 or an equivalent certification program recognized by ASTM C 1077.
- E. Source Limitations for Cast-in-Place Architectural Concrete: Obtain each color, size, type, and variety of concrete material and concrete mix from one manufacturer with resources to provide cast-in-place architectural concrete of consistent quality in appearance and physical properties.
- F. ACI Standards: Comply with ACI 303.1, "Specification for Cast-in-Place Architectural Concrete"; ACI 301, "Specification for Structural Concrete"; and ACI 117, "Specifications for Tolerances for Concrete Construction and Materials," unless more stringent provisions are indicated.
- G. Sample Panels: Before casting architectural concrete, produce sample panels to demonstrate the approved range of selections made under sample Submittals. Produce a minimum of 3 sets of full-scale sample panels, cast vertically, approximately 48 by 48 by 6 inches minimum, to demonstrate the expected range of finish, color, and texture variations.
  1. Locate panels as indicated or, if not indicated, as directed by the Engineer.
  2. Demonstrate methods of curing aggregate exposure, sealers, and coatings, as applicable.
  3. In presence of The Engineer, damage part of an exposed-face surface for each finish, color, and texture, and demonstrate materials and techniques proposed for

- 4. repair of tie holes and surface blemishes to match adjacent undamaged surface
  - 4. Maintain sample panels during construction in an undisturbed condition as a standard for judging the completed Work.
  - 5. Demolish and remove sample panels when directed.
- H. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Meetings."

## **PART 2 - PRODUCTS**

### **2.01 FORM-FACING MATERIALS:**

- A. General: Comply with Section 03300 for formwork and other form-facing material requirements.
- B. Form-Facing Panels for As-Cast Finishes: Steel, glass-fiber-reinforced plastic, or other approved nonabsorptive panel materials that will provide continuous, true, and smooth architectural concrete surfaces. Furnish in largest practicable sizes to minimize number of joints.
- C. Form-Facing Panels for As-Cast Finishes: Exterior-grade plywood panels, nonabsorptive, that will provide continuous, true, and smooth architectural concrete surfaces, high-density overlay, Class 1, or better.
- D. Forms for Cylindrical Columns, Pedestals, and Supports: Metal, glass-fiber-reinforced plastic, paper, or fiber tubes that will provide surfaces with gradual or abrupt irregularities not exceeding specified formwork surface class. Provide units with sufficient wall thickness to resist plastic concrete loads without detrimental deformation.
- E. Pan-Type Forms: Glass-fiber-reinforced plastic or formed steel, stiffened to resist plastic concrete loads without detrimental deformation.
- F. Form Liners: Units of face design, texture, arrangement, and configuration indicated or to match design reference sample. Furnish with manufacturer's recommended liquid-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent surface treatments of concrete.
- G. Rustication Strips: Metal, rigid plastic, or dressed wood with sides beveled and back kerfed; nonstaining.
- H. Chamfer Strips: Metal, rigid plastic, elastomeric rubber, or dressed wood, 3/4 by 3/4 inch, minimum; nonstaining.
- I. Form Joint Tape: Compressible foam tape, pressure sensitive, AAMA 810.1, minimum 1/4 inch thick.
- J. Form Joint Sealant: Elastomeric sealant complying with ASTM C 920, Type M or S, Grade NS, that adheres to form joint substrates.
- K. Sealer: Penetrating, clear, polyurethane wood form sealer formulated to reduce absorption of bleed water and prevent migration from wood of set-retarding chemicals.
- L. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect architectural concrete surfaces and will not impair subsequent treatments of those surfaces.
  - 1. Formulate form-release agent with rust inhibitor for steel form-facing materials.

- M. Surface Retarder: Chemical liquid set retarder, for application on form-facing materials, capable of temporarily delaying final hardening of newly placed concrete surface to depth of reveal specified.
- N. Form Ties: Factory-fabricated, glass-fiber-reinforced plastic, internally disconnecting or removable ties designed to resist lateral pressure of fresh concrete on forms and to prevent spalling of concrete on removal.
  - 1. Furnish ties with tapered tie cone spreaders that, when removed, will leave holes not larger than 3/4 inches in diameter on concrete surface.
  - 2. Furnish internally disconnecting ties that will leave no corrodible metal closer than 1-1/2 inches, plus reveal projection of exposed aggregate, from the plane of architectural concrete surface.
  - 3. Heavy-duty forms engineered to resist the concrete without ties, to avoid difficulty in matching concrete color and patching form tie holes, may be submitted for approval by the engineer. This procedure is applicable only for the architectural concrete arches indicated.
  - 4. Furnish ties with integral water-barrier plates to walls indicated to receive dampproofing or waterproofing.

## **2.02 REINFORCEMENT ACCESSORIES:**

- A. Comply with Section 03200 and 3300 for steel reinforcement and other accessory requirements.

## **2.03 CONCRETE MATERIALS:**

- A. Portland Cement: ASTM C 150, Type I, II, or III, white color, use Type I unless otherwise approved in writing by the engineer, single source for entire Project.
  - 1. Alkali content not to exceed 0.6 percent.
  - 2. Fly Ash: ASTM C 618, Class C or F.
  - 3. Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
- B. Normal-Weight Coarse Aggregate: ASTM C 33, single source for entire Project as follows:
  - 1. Weathering Region and Class shall be 5S (severe).
  - 2. Nominal Maximum Aggregate Size: 3/4 inch, uniformly graded.
- C. Normal Weight Fine Aggregate: ASTM C144, natural sand from single source.
- D. Water: Potable, complying with ASTM C94 except free of wash water from mixer cleanout operations.
- E. Chemical Admixtures: Certified by manufacturer to contain not more than 0.1 percent water-soluble chloride ions by mass, compatible with other admixtures and cementitious materials. Admixtures containing calcium chloride are prohibited.
  - 1. Air-Entraining Admixture: ASTM C 260.
  - 2. Water-Reducing Admixture: ASTM C 494, Type A.
  - 3. High-Range, Water-Reducing Admixture: ASTM C 494, Type F.
  - 4. Water-Reducing and Accelerating Admixture: ASTM C 494, Type E.
  - 5. Water-Reducing and Retarding Admixture: ASTM C 494, Type D.
- F. Coloring Admixture: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures, free of carbon black; color stable, nonfading, and resistant to lime and other alkalis.
  - 1. Color: As necessary or if necessary to match color of sample provided.

## **2.04 CURING MATERIALS:**

- A. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, washed to prevent concrete staining, weighing approximately 9 oz./sq. yd. when dry.
- B. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
- C. Clear, Liquid Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B.
  - 1. For integrally colored concrete, curing compound shall be pigmented type approved by coloring admixture manufacturer.
  - 2. For concrete indicated to be sealed, curing compound shall be compatible with sealer.

#### **2.05 REPAIR MATERIALS:**

- A. Bonding Agent: ASTM C 1059, Type II, non-redispersible, acrylic emulsion or styrene butadiene.
- B. Epoxy-Bonding Adhesive: ASTM C 881, two-component epoxy resin, capable of humid curing and bonding to damp surfaces, of class and grade to suit requirements, and as follows:
  - 1. Types IV and V, load bearing, for bonding hardened or freshly mixed concrete to hardened concrete.

#### **2.06 CONCRETE MIXES:**

- A. Prepare design mixes for each type and strength of cast-in-place architectural concrete determined by either laboratory trial mix or field test data bases. Proportion concrete according to ACI 211.1 and ACI 301.
- B. Use a qualified independent testing agency for preparing and reporting proposed concrete mix designs for the laboratory trial mix basis.
- C. Proportion concrete mix as follows:
  - 1. Compressive Strength (28 Days): 4000 psi.
  - 2. Maximum Water-Cementitious Materials Ratio: 0.46.
  - 3. Maximum Slump: 4 inches.
- D. Cementitious Materials: For cast-in-place architectural concrete exposed to deicers, limit percentage, by weight, of cementitious materials other than portland cement according to ACI 301 requirements.
- E. Air Content: Add air-entraining admixture at manufacturer's prescribed rate to result in architectural concrete at point of placement having an air content of 6 percent within a tolerance of plus 1 percent or minus 1.5 percent. Delete below if integrally colored concrete is not required.
- F. Coloring Admixture: Add coloring admixture to architectural concrete mix according to manufacturer's written instructions.

#### **2.07 CONCRETE MIXING:**

- A. Ready-Mixed Concrete: Measure, batch, mix, and deliver cast-in-place architectural concrete according to ASTM C 94, and furnish batch ticket information.
- B. When air temperature is between 85 and 90 deg F, reduce mixing and delivery time from 90 to 75 minutes; when air temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.

## **PART 3 - EXECUTION**

### **3.01 FORMWORK:**

- A. General: Comply with Section 03100 Concrete Formwork for formwork and embedded items.
- B. Comply with ACI 303.1 limits on form-facing panel deflection.
- C. Fabricate forms for easy removal without hammering or prying against concrete surfaces. Provide crush or wrecking plates where stripping may damage cast-in-place surfaces. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical. Kerf wood rustications, keyways, reglets, recesses, and the like, for easy removal.
  - 1. Do not use rust-stained, steel, form-facing material.
- D. Provide temporary openings for cleanouts and inspection ports where interior area of formwork is inaccessible. Close openings with panels tightly fitted to forms and securely braced to prevent loss of concrete mortar. Locate temporary openings in forms at inconspicuous locations.
- E. Chamfer exterior corners and edges of cast-in-place architectural concrete.
- F. Coat contact surfaces of wood rustications and chamfer strips with sealer before placing reinforcement.
- G. Form openings, chases, offsets, sinkages, keyways, reglets, blocking, screeds, and bulkheads required in the Work. Determine sizes and locations from trades providing such items.
- H. Clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, and other debris just before placing concrete.
- I. Seal form joints and penetrations at form ties with form joint tape or form joint sealant to prevent mortar leaks
- J. Retighten forms and bracing before placing concrete, as required, to prevent mortar leaks and maintain proper alignment.
- K. Coat contact surfaces of forms with form-release agent, according to manufacturer's written instructions, before placing reinforcement.

### **3.02 REINFORCEMENT AND INSERTS:**

- A. General: Comply with Section 03200 Concrete Reinforcement for fabricating and installing steel reinforcement.
- B. Set wire ties with ends directed into concrete, not toward exposed concrete surfaces.

### **3.03 REMOVING AND REUSING FORMS:**

- A. Formwork, for sides of beams, walls, columns, and similar parts of the Work, that does not support weight of concrete may be removed after cumulatively curing at not less than 50 deg F for 24 hours after placing concrete, provided concrete is hard enough to not be damaged by form-removal operations and provided curing and protection operations are maintained.
- B. Leave formwork, for beam soffits, joists, slabs, and other structural elements, that supports weight of concrete in place until concrete has achieved at least 70 percent of 28-day design

compressive strength. Remove forms only if shores have been arranged to permit removal of forms without loosening or disturbing shores.

- C. Clean and repair surfaces of forms to be reused in the Work. Do not use split, frayed, delaminated, or otherwise damaged form-facing material. Apply new form-release agent.
- D. When forms are reused, clean surfaces, remove fins and laitance, and tighten to close joints. Align and secure joints to avoid offsets. Do not use patched forms for architectural concrete surfaces.

### **3.04 JOINTS:**

- A. Construction Joints: Install construction joints true to line with faces perpendicular to surface plane of cast-in-place architectural concrete so strength and appearance of concrete are not impaired, at locations indicated or as approved by the Engineer.
  - 1. Place joints perpendicular to main reinforcement. Continue reinforcement across construction joints, unless otherwise indicated.
  - 2. Use bulkhead forms with keys of plywood, wood, or expanded galvanized steel sheet, unless otherwise indicated. Embed keys at least 1-1/2 inches into concrete. Align construction joint within rustications attached to form-facing material.
  - 3. Locate joints for beams, slabs, joists, and girders in the middle third of spans. Offset joints in girders a minimum distance of twice the beam width from a beam-girder intersection.
  - 4. Locate horizontal joints in walls and columns at underside of floors, slabs, beams, and girders and at the top of footings or floor slabs.
  - 5. Space vertical joints in walls as indicated. Locate joints beside piers integral with walls, near corners, and in concealed locations where possible.
  - 6. Use epoxy-bonding adhesive at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
- B. Contraction Joints: Form weakened-plane contraction joints true to line with faces perpendicular to surface plane of cast-in-place architectural concrete so strength and appearance of concrete are not impaired, at locations indicated or as approved by The Engineer.

### **3.05 CONCRETE PLACEMENT:**

- A. Before placing concrete, verify that installation of formwork, reinforcement, and embedded items is complete and that required inspections have been performed.
- B. Do not add water to concrete during delivery, at Project site, or during placement, unless approved by The Engineer.
- C. Deposit concrete continuously between construction joints. Deposit concrete to avoid segregation.
- D. Deposit concrete in forms in horizontal layers no deeper than 24 inches and in a manner to avoid inclined construction joints. Place each layer while preceding layer is still plastic, to avoid cold joints.
  - 1. Consolidate placed concrete with mechanical vibrating equipment. Use equipment and procedures for consolidating concrete recommended by ACI 309R.
  - 2. Do not use vibrators to transport concrete inside forms. Insert and withdraw vibrators vertically at uniformly spaced locations no farther than the visible effectiveness of the vibrator.
- E. Cold-Weather Placement: Section 03300.

F. Hot-Weather Placement: Section 03300.

**3.06 FINISHES, GENERAL:**

- A. Architectural Concrete Finish: Match The Engineer's design reference sample, identified and described as indicated.
- B. Related Unformed Surfaces: At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a texture matching adjacent formed surfaces.
  - 1. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces, unless otherwise indicated.
- C. Maintain uniformity of special finishes over construction joints, unless otherwise indicated.

**3.07 AS-CAST FORMED FINISHES:**

- A. Rough-Formed Finish: As-cast concrete texture imparted by form-facing material with tie holes and defective areas repaired and patched. Remove fins and other projections exceeding ACI 347R limits for class of surface specified.
- B. Smooth-Formed Finish: As-cast concrete texture imparted by form-facing material, arranged in an orderly and symmetrical manner with a minimum of seams. Repair and patch tie holes and defective areas. Remove fins and other projections exceeding 1/8 inch in height.
- C. Sand Blast-Sealer Finish: Section 03300.

**3.08 CONCRETE CURING:**

- A. Protect freshly placed concrete from premature drying and excessive cold or hot temperatures according to ACI 301.
- B. Begin curing immediately after removing forms from concrete. Cure by one or a combination of the following methods that will not mottle, discolor, or stain concrete:
  - 1. Moisture Curing: Keep exposed surfaces of cast-in-place architectural concrete continuously moist for not less than seven days with the following materials:
    - a. Water.
    - b. Continuous water-fog spray.
    - c. Absorptive cover, water saturated and kept continuously wet. Cover concrete surfaces and edges with 12-inch lap over adjacent absorptive covers.
  - 2. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least 12 inches, and sealed by waterproof tape or adhesive. Cure for not less than seven days. Immediately repair any holes or tears during curing period; use cover material and waterproof tape.
  - 3. Curing Compound: Mist concrete surfaces with water. Apply curing compound uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.

**3.09 FIELD QUALITY CONTROL:**

- A. General: Comply with Section 03300 for field quality-control requirements

### **3.10 REPAIRS, PROTECTION, AND CLEANING:**

- A. Repair and cure damaged finished surfaces of cast-in-place architectural concrete when approved by The Engineer. Match repairs to color, texture, and uniformity of surrounding surfaces and to repairs on approved mockups.
  - 1. Remove and replace cast-in-place architectural concrete that cannot be repaired and cured to The Engineer's approval.
- B. Protect corners, edges, and surfaces of cast-in-place architectural concrete from damage; use guards and barricades.
- C. Protect cast-in-place architectural concrete from staining, laitance, and contamination during remainder of construction period.
- D. Clean cast-in-place architectural concrete surfaces after finish treatment to remove stains, markings, dust, and debris.
- E. Wash and rinse surfaces according to concrete finish applicator's written recommendations. Protect other Work from staining or damage due to cleaning operations.
  - 1. Do not use cleaning materials or processes that could change the appearance of cast-in-place architectural concrete finishes.

**END OF SECTION**

## SECTION 03370

### SHOTCRETE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing shotcrete in permanent lining work.
- B. Related Work Specified Elsewhere:
  - 1. Rock reinforcement: Section 02420.
  - 2. Chemical grout: Section 02431.
  - 3. Concrete: Section 03300.
- C. Definitions:
  - 1. Shotcrete: Portland-cement concrete applied from a nozzle by compressed air and containing, if necessary, admixtures to provide quick set, high early-strength and satisfactory adhesion.
- D. Shotcrete Test Strengths:
  - 1. Specified testing strengths have been modified by length to diameter ratio (L/DR) adjustments and coring correction factors that will achieve design strength of 5,000 psi.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: C31, C33, C39, C42, C150, C192, C266, C494.
- B. Qualifications of Applicator:
  - 1. Have work performed by firm regularly engaged in shotcreting.
  - 2. Employ qualified nozzle operators who have had previous experience or training in application of shotcrete on at least two projects of comparable nature. Perform work under immediate supervision of foreman with at least three years experience. Have each nozzle operator demonstrate for approval, acceptable proficiency in uniformity of application of shotcrete to vertical and overhead test panels before beginning production work.
- C. Uniformity of Materials:
  - 1. In applied production work, use same cement, aggregate and water used in approved test areas and test units. Minor adjustment permitted subject to prior approval. Maintain specified strengths.
- D. Mix Design and Testing Prior to Production:
  - 1. Develop shotcrete mix by laboratory compatibility tests and field trials as specified at least 60 days prior to the actual application of shotcrete.
  - 2. Perform compatibility tests to determine cements and additives to be used in field trial mixes. Determine initial and final set for additive concentrations of varying percentages of cement content by weight contemplated for use in the work.
  - 3. Make laboratory and field trial mixes with ingredients identical to those proposed for use in the work.

4. To ascertain compatibility of ingredients and optimum proportions, develop shotcrete mix having strength and characteristics necessary for actual application.
  5. Accelerating admixture:
    - a. Use approved accelerating admixture to develop quick set as follows:
      - 1) Time of initial setting: Three minutes maximum.
      - 2) Time for final setting: 12 minutes maximum.
    - b. Determine time of setting in accordance with ASTM C266 with the following additional requirements:
      - 1) Add accelerator to 50 grams of cement in preparation of paste, together with water to produce water-cement ratio in varying percentages expected to be used in actual shotcrete application.
      - 2) Use minimum possible time interval to attain proper mixing without disturbing initial set of paste.
      - 3) Additional modifications to accommodate quick-set accelerators: As approved.
  6. Standard concrete-cylinder testing:
    - a. Choose materials and proportions so that three cast cylinders six inches by 12 inches made with no additive will achieve average minimum strength at 28 days of 7,000 psi. Cast cylinders in accordance with ASTM C192 and test in accordance with ASTM C39. Cast and test three cylinders minimum for each combination of materials proposed.
  7. Field trial:
    - a. After completion and approval of laboratory tests, make field trials using selected mixes to accommodate capability of equipment, workmanship and material under field conditions prior to actual application of shotcrete.
    - b. Make field application of each mix selected for field trial on at least three horizontal overhead and three vertical test panels to simulate construction conditions.
    - c. Shoot test panels measuring not less than 18 inches square by six inches.
    - d. Cure test panels in accordance with ASTM C31.
    - e. Within 24 hours after shooting, obtain from each panel and submit a minimum of seven full-depth cores each three inches in diameter.
    - f. Average three cores from each panel to comprise one test.
    - g. Perform field-trial work in the presence of the Engineer.
    - h. The Engineer will cut specimens to length equal to diameter and test specimens in accordance with ASTM C42 except as otherwise specified. Soaking of specimens prior to testing is prohibited. The Engineer will make no L/DR correction in reporting results.
    - i. Achieve strengths as follows:
      - 1) Average strength of six tests, three overhead and three vertical, at 24 hours: 2,000-psi minimum.
      - 2) Average strength of six tests, three overhead and three vertical, at 28 days: 5,540-psi minimum.
  8. Proportions:
    - a. Proportion shotcrete mixes equivalent to those of a concrete mix having between 6.5 and 8.5 bags of cement per cubic yard.
- E. Testing:
1. Before proceeding with the work in accordance with manufacturer's published instructions, completely seal by the methods and materials to be used in the work the following:
    - a. Circular or single-horseshoe tunnels: 25-foot section of area of tunnel roof described by arch of approximately 45 degrees on each side of tunnel's vertical centerline, extending to one-foot minimum beyond outside face of third-rail cover and on opposite side of track to one-foot beyond outside face of track rail.

- b. Station vaults: 10-foot section of station-roof area described by arch of approximately 75 degrees on each side of station vault's vertical centerline, extending to one-foot minimum beyond back face of station's precast-concrete liner panels.
- c. Crossover vaults: 10-foot section of area of crossover roof described by arch of approximately 67 degrees on each side of crossover's vertical centerline extending to one-foot minimum beyond outside face of third-rail cover on one side and on opposite side of track to one-foot beyond outside face of track rail.

#### **1.02 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples:
    - a. On completion of field trial, submit 42 test specimens of each trial mix, seven from each test panel, proposed for use in the work together with relevant data which demonstrate conformance with specified requirements. These specimens will be tested by the Engineer to verify such conformance.
  - 2. Certification:
    - a. Mill or manufacturer's certificates with mix design verifying that materials meet specified requirements.
    - b. Certified test reports without adjustment for type or size of specimen.
    - c. Personnel documentation as required under Quality Assurance article above.
  - 3. Documentation:
    - a. Prior to making laboratory compatibility tests, submit detailed plan showing methods and proportions to be used in such tests. The Engineer may inspect tests and materials at any time.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Store and handle basic materials in accordance with Section 03300.

#### **1.05 JOB CONDITIONS:**

- A. Alkali hydroxides and other chemicals contained in shotcrete admixtures are moderately toxic and can cause skin and respiratory irritation unless adequate safety measures are taken.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Portland Cement: ASTM C150 Type I or Type III. If Type II is specified, Type I or III may still be used provided tricalcium aluminate is less than eight percent.
  - 1. Alkali content not to exceed 0.6 percent.
- B. Aggregate: Section 03300, with following additional requirements:
  - 1. Uniformly well-graded and not exhibiting extremes of gradation, in accordance with ASTM C33.
  - 2. Specific gravity: 2.55 minimum.
  - 3. Maximum aggregate size: No. 67.
- C. Water: Section 03300.

- D. Admixtures: ASTM C494, Type C, with the following additional requirements:
  - 1. Containing no water-soluble chlorides or materials corrosive to steel nor those which can cause other detrimental effects such as cracking or spalling.
  - 2. In accordance with reference standard or documented history of demonstrable satisfactory performance in mix of similar proportions.
  - 3. Chemical Grout: Section 02431. Use soil-solidification agent only when shotcrete is to be in contact with earth.

## **PART 3 - EXECUTION**

### **3.01 FIELD QUALITY CONTROL:**

- A. Testing During Construction:
  - 1. Furnish three-inch diameter core test specimens with minimum length of six inches, three for each 50 cubic yards of material used in Stage-II and Stage-III shotcrete.
  - 2. Take cores from completed work at locations and on date directed.
  - 3. The Engineer will cut test cores to length equal to diameter and test cores in accordance with ASTM C42 and as specified. The Engineer will make no L/DR correction in reporting the results.
  - 4. Test specimens shall be cured/conditioned wet or dry, depending on wet/dry condition shotcrete will be under load.
  - 5. After application of the first 500 cubic yards of shotcrete, the Engineer may call for test specimens at the reduced rate of three per 100 cubic yards of material.
  - 6. Additional specimens will be required upon failure of original cores. Should additional specimens show acceptable strength, the work will be accepted. If additional specimens show unacceptable strength, the work will be rejected. Furnish additional specimens as directed.
  - 7. Plug voids caused by coring operation with material equal to shotcrete in-place and workmanship to ensure continuity of lining with respect to watertightness, strength and appearance.
  - 8. Shotcrete strengths determined by testing during construction:
    - a. Average strength of three cores from one area: 4,670-psi minimum when tested at 28 days.
    - b. Minimum strength of a single core: 4,120 psi at 28 days.
- B. Watertightness Criteria:
  - 1. Permanent-support lining for circular or single-horseshoe tunnels:
    - a. Maximum-allowable water leakage:
      - 1) 0.14 gallon-per-minute per 250 linear feet.
      - 2) 0.07 gallon-per-minute in any 10 linear feet.
  - 2. Permanent-support lining for station vaults or crossover vaults:
    - a. Prior to application of Stage-III shotcrete:
      - 1) Control water flow by appropriate approved methods.
    - b. Maximum allowable water leakage after application of Stage-III shotcrete:
      - 1) 0.08 gallon-per-minute per 250 linear feet.
      - 2) 0.04 gallon-per-minute in any 10 linear feet.

### **3.02 PROPORTIONING AND MIXING:**

- A. Have aggregate and cement proportioned by an approved batching plant based on weight or volume and in accordance with the applicable requirements of Section 03300.
- B. For dry-mix process, maintain moisture content of combined aggregate in range of three to six percent of oven-dry weight of aggregate at time of mixing with cement.

- C. Use mixed material within one-hour after adding cement.
- D. Accurately proportion and thoroughly mix additive with other ingredients.

### **3.03 SHOTCRETE APPLICATION:**

- A. Remove loose material, mud and other foreign matter from new and previously shotcreted surfaces that are to receive shotcrete.
- B. After cleaning, keep surfaces moist until shotcrete is applied.
- C. Hold nozzle at predetermined distance and position so that stream of flowing material is applied as nearly as possible at right angles to surface to be covered.
- D. Maintain steady nozzle motion as layer is built up to thickness shown or specified.
- E. Apply shotcrete of uniform consistency to maximize binding, cohesion and density, to minimize rebound and segregation and to prevent sagging of applied shotcrete.
- F. Acceptable shotcrete consists of dense, uniform concrete without segregation or discernible weakness of bond between layers accomplished without reuse of rebound.
- G. Do not apply shotcrete to frozen surfaces.

### **3.04 SEQUENCE OF OPERATIONS:**

- A. Apply shotcrete lining in three stages.
- B. Stage I:
  - 1. Apply first shotcrete layer to surface of excavation exposed by blasting. Complete operation within three hours.
  - 2. Install rock bolts, steel-rib supports and their assemblies after Stage-I shotcrete application.
- C. Stage II: Apply shotcrete to provide continuous blocking of steel-rib supports within specified distance from heading.
- D. Stage III: Apply shotcrete to surfaces to total thickness shown within specified distance from heading.
- E. Cure final shotcrete layer for seven days in accordance with Section 03300. Remove laitance, loose material and rebound. Sound surface layer with hammer to verify absence of voids, rebound pockets, aggregate pockets and unbonded areas.

### **3.05 CONTROL OF WATER:**

- A. Prior to Stage-II shotcrete application, control water flows and seepage to comply with specified watertightness criteria. Control water by appropriate approved methods.
- B. To eliminate water penetration, completely seal areas as specified for quality assurance using approved methods and materials.

### **3.06 DEFECTIVE SHOTCRETE:**

- A. All shotcrete which lacks uniformity or exhibits segregation, low strength, honeycombing or laminations will be regarded as defective. Stage-II and III shotcrete will be considered defective unless it is crack-free and watertight.
- B. Remove and replace or otherwise correct all defective shotcrete as directed.

**END OF SECTION**

## SECTION 03400

### STRUCTURAL PRECAST CONCRETE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies precast-concrete work.
- B. Related Work Specified Elsewhere:
  - 1. Concrete formwork: Section 03100.
  - 2. Concrete reinforcement: Section 03200.
  - 3. Cast-in-place structural concrete: Section 03300.
  - 4. Prestressed concrete: Section 03415.
  - 5. Flashing and reglets: Section 07600.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ACI: 503.
  - 3. ASTM: A666, C143, C50, C881, C1107.
  - 4. PCI: MNL 116, Plant Certification Program.
- B. Manufacturer's Qualifications: Use only a precast concrete manufacturing plant (or site) certified by PCI Plant Certification Program.
  - 1. Certification is required at time of bidding and throughout construction time.
  - 2. Furnish certification in the following product groups and categories: A1, C1, plus additional certification as appropriate to the visibility and use of precast units required.
  - 3. Furnish name, qualifications and evidence of recent experience on work comparable to that specified.
  - 4. Do not commence work until fabricator has been approved.
- C. Test Units:
  - 1. Prior to production runs of precast elements, cast at least two full-size test units as specified.
  - 2. Color, texture, finish and workmanship subject to approval.
- D. Uniformity of Materials:
  - 1. To minimize irregularities in color and texture, use same cement, aggregate and water in delivered production units as that used in approved samples and test units.
- E. Repair of Defective Concrete: Effect epoxy-mortar repairs in accordance with ACI 503.4-.7, except as otherwise specified.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Have drawings and calculations certified by a registered professional engineer who is licensed to practice in the jurisdiction where the work is to be performed and is experienced in the work of this section.

- b. Include details of form fabrication, profiles, joints, reinforcing steel, clips, anchors, inserts, reglets, lifting devices, connection to other work and placement and erection sequence.
  - c. Submit prior to fabrication of units and ordering material.
- 2. Samples:
  - a. Panels representing color, texture and general finish of test units and production panels, each 12 inches square by 1-1/2 inches: Two. Submit prior to fabrication.
  - b. Gasket and flashing materials proposed for use, each 12 inches long: Two.
- 3. Certification:
  - a. Certificates from concrete supplier as specified in Section 03300.
  - b. Certification or published listing of manufacturer per Quality Assurance paragraph above.
- 4. Documentation:
  - a. Prior to installation of units, submit schedule indicating sequence of installation, joints, support and bracing system and anchoring system.
  - b. Design mix. Submit prior to use for test units.
  - c. Delivery tickets from concrete supplier in lieu of certification as specified in Section 03300.
- 5. Quality Control Plan: Provide production quality control in accordance with the requirements of PCI MNL 116.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Store and handle basic materials in accordance with Section 03300.
- B. After completion of fabrication and curing, transport and store units.
- C. Avoid damaging of surfaces, edges and corners and creating of stresses within units.
- D. Keep units under cover and protected until installed.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Concrete: Section 03300, Class 5000 unless otherwise shown; slump of 3-1/2 inches plus-or-minus 1/2 inch as determined by ASTM C143.
  - 1. Color matching sample on file with the Engineer.
- B. Formwork:
  - 1. One of the following in accordance with Section 03100.
    - a. Fibrous-glass-reinforced plastic forms.
    - b. Steel forms.
    - c. Epoxy-coated concrete forms.
  - 2. Use largest sizes possible to produce units without visible joints.
- C. Reinforcement: Section 03200, welded-wire fabric to be galvanized.
- D. Gaskets:
  - 1. ASTM C509, preformed, expanded closed-cell neoprene sponge, acid-resistant, nonstaining, inert to temperature changes, sized to provide constant compression in joint and in pieces as long as practicable to minimize field splices.
  - 2. Gasket cement: Type recommended by gasket manufacturer.

- E. Anchors, Dowels and Accessories Cast Into Precast Units: Steel, hot-dip galvanized.
- F. Joint Connections: Stainless steel, ASTM A666.
- G. Surface Sealer:
  - 1. Methyl-methacrylate-based water repellent.
  - 2. Compliant with Federal and local VOC limitations.
  - 3. Nonpeeling, low viscosity and surface penetrating.
  - 4. Water-repellent, performing as a warranted barrier to moisture penetration for minimum of five years under exterior exposure.
  - 5. Colorless, nonyellowing, nonglossy, not affecting color, texture or surface of concrete for life of material.
- H. Sandblasting Sand: One-size silica sand equivalent to Ottawa Sand Grade, graded to pass Size 20 sieve and retained on Size 30 sieve.
- I. Non-shrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C1107, with fluid consistency and a 30-minute working time.
- J. Epoxy Adhesive: Non-sagging. Consist of epoxy resin bonding material and a hardener. Epoxy shall conform to ASTM C881

### **PART 3 - EXECUTION**

#### **3.01 FABRICATION OF TEST UNITS:**

- A. In order to determine materials, proportions and techniques which will result in required color, texture, finish and strength and which will be used in precast concrete production, cast at least two full-size test units, using forms, concrete mix proportions, admixtures and methods proposed for production work.
- B. Design mix to conform to Section 03300 and submit for approval prior to use in test units.
- C. Cast test units as directed to simulate production run, incorporating reinforcing and embedded items as shown.
- D. Maintain complete records of proportions, mixing, consolidation and curing procedures during casting.
- E. Prepare a set of at least four test cylinders during casting of each test unit for compressive tests as specified in Section 03300.
- F. If approved, precast-concrete elements may be cured by accelerated method such as steam treatment. The Engineer may direct that test cylinders be cured in accordance with curing process selected in order to determine satisfactory period of hardening of concrete in the units.
- G. Sandblasting and Sealing:
  - 1. After curing and when so directed, sandblast test units to determine conditions for achieving required texture of concrete surface. Use specified silica sand.
  - 2. Determine required surface texture by varying blasting pressure, size of nozzle, duration of blasting and distance between nozzle and surface. Maintain complete records of sandblasting.

3. After sandblasting test units, seal surface with application of sealing compound as specified.
  4. Prior to application of sealer, thoroughly clean surface by application of water or air. Apply sealer as recommended by manufacturer.
  5. Keep complete record of each sealer application.
  6. Utilize approved procedures and materials on the basis of test applications specified for sandblasting and sealing of surfaces of precast-concrete work.
- H. After test units are approved, fabricate units using mix, ingredients, sandblasting technique and sealer formulation used to prepare test units.
- I. If strength, color, texture, finish or workmanship of test units is rejected, cast additional units until units meet requirements and approval is obtained.

**3.02 FABRICATION OF PRODUCTION UNITS:**

- A. Fabricate units in number and sizes shown and specified to match approved test units.
- B. Deliver units to site in compliance with erection schedule.

**3.03 DEFECTIVE AND DAMAGED CONCRETE UNITS:**

- A. Do not install units with surface imperfections such as air bubbles, joint lines, warpage, stains, uneven matrix plane or uneven exposure of aggregate or units which are warped, cracked, broken, spalled, stained or otherwise defective.

**3.04 ERECTION:**

- A. Lift, support and erect precast members so as to prevent damage or overstressing. Handle precast members by means of lifting inserts, loops or other approved means.
- B. After erection remove lifting loops, bend them over or cut them flush with the surface of the concrete. If insert material may cause stains to surfaces exposed to view, inset cut and patch concrete.
- C. Set members in position properly leveled, aligned and braced as shown.
- D. Install members so that their erected position does not differ from position shown on approved shop drawings by more than allowable tolerances.
- E. Bring defects detected after erection to the attention of the Engineer who will conduct inspection. Where in his opinion structural adequacy is impaired, replace member.

**END OF SECTION**

## SECTION 03415

### PRESTRESSED CONCRETE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies prestressed concrete work.
- B. Related Work Specified Elsewhere:
  - 1. Concrete formwork: Section 03100.
  - 2. Concrete reinforcement: Section 03200.
  - 3. Cast-in-place structural concrete: Section 03300.
  - 4. Precast concrete: Section 03400.
- C. Definitions:
  - 1. Site or job site: Location where members are to be manufactured.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. PCI: MNL 116, Plant Certification Program.
  - 3. ASTM: A416, A421, A722, C109, C404, C618.
- B. Fabricator Qualifications: Use only a prestressed concrete manufacturing plant (or site) certified by PCI Plant Certification Program.
  - 1. Certification is required at time of bidding and throughout construction time.
  - 2. Furnish certification in the following product groups and categories: A1, C1, plus additional certification as appropriate to the visibility and use of prestressed units required.
  - 3. Furnish name, qualifications and evidence of recent experience on work comparable to that specified.
  - 4. Do not commence work until fabricator has been approved.
- C. Installer qualifications: Use only an experienced installer who has completed prestressed concrete work similar in material, design and extent to that indicated for this Project and with a record of successful in-service performance.
- D. Allowable Tolerances:
  - 1. Fabricate prestressed-concrete members in accordance with dimensional tolerances indicated in referenced PCI standard.
- E. Sampling and Testing:
  - 1. Concrete:
    - a. Perform sampling, testing and frequency of testing in accordance with Section 03300, except as otherwise specified.
    - b. Mold three sets of at least two cylinders for each casting bed each day it is used or for each 100 cubic yards of concrete or fraction thereof for each prestressed-concrete structure. In any case, have at least six cylinders cast for each group of members cast from each batch.
    - c. Cure cylinders for stress transfer in same environment as members or structures they represent.

- d. Test one set for compressive strength at stress transfer and one set on twenty-eighth day.
  - e. Have tests performed by approved independent testing agency.
  - f. The Engineer may test concrete at any time during fabrication operations.
  - g. For major members carrying rapid transit loads or underpinning loads or as directed, perform sampling and testing in accordance with ASTM A416 and ASTM A421.
2. Tendons:
- a. Furnish samples for testing from each size and each heat of prestressing bars, from each manufactured reel of prestressing-steel strand, from each coil of prestressing wire and from each lot of anchorage assemblies and bar couplers to be used. With each sample of prestressing-steel wires, bars or strands furnished for testing, submit certificate stating manufacturer's minimum guaranteed ultimate tensile strength of sample furnished. Prior to installation submit certified test results from each manufacturer for each type of low-relaxation steel.
  - b. Furnish testing materials and equipment.
  - c. Assign individual lot number to bars of each size from each mill heat, wire from each coil, and strand from each manufactured reel to be shipped to site and tag so that each lot can be accurately identified at job site. Likewise, identify each lot of anchorage assemblies and bar couplers to be installed.
  - d. Unidentified prestressing steel, anchorage assemblies or bar couplers received at site will be rejected.
  - e. Submit the following samples of materials and tendons, selected by the Engineer from prestressing steel at plant or jobsite:
    - 1) For wire, strand or bars: One sample of each size from each heat or reel.
    - 2) If prestressing tendon is to be prefabricated, one completely fabricated prestressing tendon five feet in length for each size of tendon, including anchorage assemblies. If the prestressing tendon is to be assembled at jobsite, sufficient wire or strand and end fittings to make up one complete prestressing tendon five feet in length for each size of tendon, including anchorage assemblies.
    - 3) If prestressed tendon is a bar, one five-foot length complete with one end anchorage; if couplers are to be used with the bar, two four-foot lengths of bar equipped with one coupler and fabricated to fit coupler.
  - f. For prefabricated tendons, notify the Engineer at least 10 working days prior to commencing installation of end fittings or heading of wires. The Engineer will inspect end-fitting installations and wire headings while such fabrication is in progress at the plant and will arrange for testing of material to be shipped to the site.
  - g. Do not ship prefabricated tendons to the site until they are released by the Engineer. Tag each tendon before shipment as specified.
  - h. Material released by the Engineer will be rejected if subsequently damaged or found defective.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Have drawings and calculations for prestressed products certified by a registered professional engineer who is licensed to practice in the

- jurisdiction where the work is to be performed and who is experienced in the work of this section.
- b. Include the following:
    - 1) Description of equipment to be used and procedure for constructing prestressed-concrete members.
    - 2) Ductwork and method of holding ducts in position, tendon or bar sizes, splicing of bars, unit weights, materials and stress grade, jack clearances and procedures, stressing sequence, initial-tensioning forces, pressure gauge or load cell for determining loads, calculated friction and elastic-shortening losses and tendon or bar elongation, anchorage details and anchorage-slippage losses, bonding and grouting procedures, mild-steel placement, provisions for camber and clearances and concrete dimensions.
    - 3) Details of procedures for yard and site, handling, transporting, storing and erecting. If necessary, furnish design calculations. Show embedded items including, but not limited to, inserts, anchors, couplings, fittings, vent-hole openings and anchorage pockets. Show method of tendon support for post-tensioned systems during tendon-placing operations.
    - 4) Complete details and substantiating calculations of method and materials proposed for use in prestressing operations, including additions or rearrangement of reinforcing steel from that shown. Calculate, detail and show individual tendon layout and anchorage arrangement to satisfy design requirements and to avoid interferences. Coordinate with embedded items. Changes or rearrangement of details shown permitted only with approval. Ensure that spacing of tendon is sufficient for full encasement of each tendon in concrete. Plan sequence of installation to minimize fitting problem of various components embedded in prestressed member. Show camber computations.
    - 5) Stress/strain curve of tendons and bars. Show amount of slip normally expected in seating anchorage devices as opposed to that assumed in design calculations. Show friction-wobble coefficient and friction-curvature coefficient expected from tendons and bars and duct material. Show complete stress diagram for each tendon size or type.
    - 6) Bills of materials, erection diagrams and details of connections to other work.
    - 7) Details and design calculations for size and thickness of anchor plates and corresponding reinforcement necessary for each system to guarantee safe transfer of forces into end block. Show amount, size and arrangement of such reinforcement to be installed at anchorage zones and along path of tendons to prevent bursting and splitting concrete members when subjected to prestressing forces. Special Anchorage Devices, as defined by the AASHTO Guide Specifications for Design and Construction of Segmental Concrete Bridges, shall be approved based on the results of testing representing actual jobsite conditions.
2. Working Drawings:
    - a. Complete working drawings and necessary calculations for formwork and falsework.
    - b. Include compensation for deflection as necessary to construct structure to lines and grades shown.
    - c. Consider loads, forces and stresses to be imposed during casting and post-tensioning elements of structure.

3. Samples: As previously specified.
4. Certification:
  - a. Tendons:
    - 1) Certificates for each five reels or coils or fraction thereof.
    - 2) Submit certificates prior to delivery of tendons to jobsite.
    - 3) Applicable certificates to accompany each shipment of tendons.
  - b. Hydraulic jacks:
    - 1) Certified calibration curves for each hydraulic jack.
  - c. Certified test reports:
    - 1) Concrete tests.
    - 2) Tendons: For each size of strand to be used in the work, submit test certificates showing physical, chemical and stress/strain test properties including modulus of elasticity and stating guaranteed minimum ultimate tensile and yield strength.

5. Documentation:
  - a. Specified calculations.
  - b. Records of tendon elongation promptly upon completion of post-tensioning of each member.

- B. Quality Control Plan: Provide production quality control in accordance with the requirements of PCI MNL 116.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Prestressing Steel:
  1. Protect prestressing steel against physical damage and rust or other results of corrosion at all times from manufacture to grouting or encasing in concrete. Physically damaged prestressing steel will be rejected. Rust or other corrosion will be cause for rejection.
  2. Package prestressing steel in containers or shipping forms for protection against physical damage and corrosion during shipping and storage. Place corrosion inhibitor and rust preventive in package or form or use corrosion-inhibiting carrier-type packaging material. If approved, apply corrosion inhibitor directly to steel.
  3. Use corrosion inhibitor which has no deleterious effect on steel, concrete or bond strength of steel to concrete.
  4. Replace or restore to original condition damaged packaging or forms.
  5. Clearly mark shipping package or form with statement that package contains high-strength prestressing steel, and caution that care be used in handling. Show type, kind, amount and placement date of corrosion inhibitor used. Include safety recommendations and instructions for use.
  6. When prestressing steel for post-tensioning is installed in members prior to placing and curing concrete, provide protection against rust or other corrosion, until grouted, by means of corrosion inhibitor placed in ducts or applied to steel in duct.
  7. Do not stress tendons until 28 day compressive strength is verified.
- B. Members:
  1. Handle, store and transport completed members and member components so as to prevent damage.
  2. Maintain beams in upright position.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Concrete:
  - 1. Section 03300: Class 5000, unless otherwise specified.
- B. Grout:
  - 1. Materials for grout: Section 03300 and ASTM C404. Pozzolans, if used: ASTM C618.
- C. Formwork and Accessories: Section 03100.
- D. Reinforcing Steel: Section 03200.
- E. Tendons, Anchorage, Couplers and Ducts:
  - 1. Pretensioning tendons:
    - a. Steel strand: ASTM A416, Grade 270, regular or low-relaxation.
    - b. Strand similar to specified steel strand but with different number of wires per strand: As approved.
    - c. Steel wire: ASTM A421.
  - 2. Post-tensioning tendons:
    - a. Strand as specified or shown for pre-tensioning either in single-strand units or in multiple-parallel-strand units, with wedge-type anchorages.
    - b. Button heads to be cold-formed symmetrically about axes of wires so that butt develops minimum guaranteed ultimate tensile strength of wire. Use of cold-forming process that causes indentations in wire is prohibited.
    - c. Prestressing bars:
      - 1) Fabricated and processed in accordance with ASTM A722 and as specified.
      - 2) High-tensile-strength hot-rolled alloy steel, individually cold-stretched and thermally stress-relieved to ensure uniform stress/strain characteristics and to obtain yield strength not less than 85 percent of required minimum guaranteed ultimate tensile strength.
      - 3) In accordance with the following minimum requirements:
      - 4)

Properties	Regular Grade	Special Grade
a) Ultimate tensile strength	150,000 psi	160,000 psi
b) Modulus of elasticity at 70 percent of manufacturer's minimum guaranteed ultimate strength	29x10 <sup>6</sup> psi	30x10 <sup>6</sup> psi

- 5) High-strength, thermally stress-relieved, large steel cables with socketed ends fitted with anchorage nuts on peripheries of sockets and meeting required breaking strength, yield strength, elongation, composition and other pertinent requirements may be used if approved. Oil-tempered wires are prohibited.
- 3. Unbonded tendons are prohibited unless approved.

4. Anchorages and couplers:
    - a. Steel anchorages and couplers as approved if compatible with particular installation. Anchorage devices to hold prestressing steel at load-producing stress of not less than 95 percent of specified minimum ultimate tensile strength of prestressing steel. Anchorages with cut threads or notches are prohibited on prestressing steel. Fabricate stressing anchorages to provide adjustable-seating loss. Ensure that each anchorage is capable of lift-off, de-tensioning and re-tensioning tendon at any time prior to grouting.
  5. Ducts:
    - a. Galvanized ferrous metal.
    - b. Strong enough to retain shape and resist damage during construction.
    - c. Capable of preventing entrance of cement paste and water from concrete.
    - d. Incapable of causing electrolytic action or deterioration in concrete.
    - e. When grouting is necessary, ensure that:
      - 1) Inside diameter of duct is at least 1/4-inch larger than bar or strand tendons or, in the case of parallel-wire cable tendons, that inside area of duct is at least 100-percent larger than area of tendon.
      - 2) Ducts have grout holes at each end and at high points.
      - 3) Ducts have drain holes at low points.
    - f. Grout and vent-hole connections to duct made with metallic structural fasteners. Connections to be mortar-tight, taped as necessary. Provide grout holes with means to inject grout. Provide positive shutoff valves.
- F. Corrosion Inhibitor: Water-soluble oil; VISCONORUST 84-18, Viscosity Oil Company, or equal.

### **PART 3 - EXECUTION**

#### **3.01 CONCRETE:**

- A. Mixing and Placing:
  1. Mix concrete in accordance with the requirements of Section 03300, with the following additional requirements:
    - a. Do not use admixtures containing chlorides, fluorides or nitrates.
    - b. Use more than one admixture only if compatible with each other. If used, add separately during batching sequence.
  2. Placement of concrete: Section 03300.
- B. Sampling and Testing:
  1. Perform sampling and testing as specified.
- C. Concrete Protection for Reinforcement: Section 03200
- D. Compaction of Concrete:
  1. Compact concrete by means of internal, external or surface vibrators as approved and as follows:
    - a. Use internal vibrators on sections that are sufficiently large to admit them.
    - b. Use external vibrators on smaller sections and sections produced by extrusion or slip-form method.
    - c. Surface or screed vibrators may be used for flat slabs.
  2. Use vibrators having operating frequencies of at least 7,000 impulses per minute and higher frequencies if approved. Use vibrators only for compacting, not for moving concrete along forms.
- E. Patching:

1. Thoroughly clean and hammerpack holes left by tie rods, strand hold-down devices or other temporary inserts with stiff dry mortar made with same type of sand and cement used in concrete. In areas of tensile stress, bond hole patches with approved epoxy resin.
2. Members with honeycombs of such depth as to expose tendons will be examined by the Engineer for structural adequacy. Where in the Engineer's opinion impairment of structural adequacy is apparent, member will be rejected.
3. Where honeycombed areas are to be repaired, remove loose material and cut area back until coarse aggregate breaks under chipping; coat area with layer of epoxy bonding agent and patch with grout matching existing concrete color and strength. Obtain approval of proposed method and materials.

F. Curing: Section 03300.

G. Finishes:

1. Types of concrete finishing: As shown and specified.

### **3.02 FORMS:**

- A. Ensure that joints are smooth and tight to prevent leakage of mortar. Maintain accurate alignment of forms during casting operations. Check form alignment and grade for each casting.
- B. Make provisions in form-anchorage system for anticipated differential movement of beds and forms during casting and curing operations. In details of forms, ties, inserts, bulkheads and other accessories, detail forms and anchor them so that differential movement cannot occur or loosen them so that movement can occur without damage to member or forms. Ensure that bearing devices supporting prestressed members are free to rotate and that expansion bearings are free to translate during post-tensioning operation.
- C. Clean beds and forms thoroughly before casting. Do not allow coatings used for bond breakers to accumulate in bottoms of forms. For members to be cured by artificial heat, provide for ventilation of void forms.
- D. In areas subject to freezing and thawing, make provisions for draining voids.
- E. Treat surfaces in contact with concrete with effective bond breaker.
- F. Prevent contamination of tendons by bond breaker, mud, grease or other detrimental substances.
- G. Provide bolting fittings and welding plates for embedment in prestressed members to allow later attachment of conduits, pipes, boxes and similar items.

### **3.03 JACKS:**

- A. Equip each jack used to stress tendons with pressure gauge or load cell to determine jacking stress.
- B. If pressure gauge is used, provide accurate, easily readable dial at least six inches in diameter. Calibrate each jack and its gauge as a unit with cylinder extension in approximate position in which it will be at final jacking force. Provide certified calibration chart as specified.

- C. If inconsistencies occur between measured elongation and jack gauge reading, recalibrate gauge. If further discrepancies occur, determine cause and report to the Engineer. Agreement within seven percent will be satisfactory.
- D. If load cell is used, calibrate and provide with indicator by means of which prestressing force in tendon may be determined. Ensure that range of load cell is such that lower 10 percent of manufacturer's-rated capacity will not be used in determining jacking stress.

**3.04 TENDONS:**

- A. Placement and Tensioning of Tendons for Prestressing:
  - 1. Prior to stringing tendons, inspect bottom of forms for cleanliness and accuracy of alignment.
  - 2. String tendons singly or in multiples.
  - 3. Splicing of wires or strands is prohibited.
  - 4. Cut length of each tendon between tendon vise and coil or reel.
  - 5. Do not string tendons incorporating points previously gripped by tendon vises or wedges within lengths to be stressed. Do not use notched, nicked, pitted, rusted or otherwise damaged tendons.
  - 6. Provide tendon vises or wedges capable of anchoring stressing loads positively with a minimum of differential slippage. Have vises or wedges cleaned, lubricated and inspected between each use.
  - 7. Discard grips which become visibly worn or distorted or which allow excessive slippage. Furnish full set of cleaned and inspected tendon vises or wedges before commencing each stressing operation. Ensure that vises and wedges are free of rust and physical damage.
  - 8. Position tendons to conform to tensioning detail dimensions shown. Prevent sagging and kinking of tendons. Support tendons as necessary to maintain proper position and prevent vertical movement during pouring of concrete. Permissible deviations from profile shown on approved shop drawings as follows:

Depth of Member	Permissible Deviation
a) Less than 10 inches	Plus-or-minus 1/8 inch
b) Ten inches or more	Plus-or-minus 1/4 inch

- 9. After straight wire tendons have been positioned, apply initial force to each tendon to eliminate slack and to provide uniform initial-stress condition in all tendons prior to final stressing. Initial force may be applied only by pressure jacks equipped with proper gauging system for measuring initial force.
- 10. Do not weld or make grounds for welding equipment on forms or on steel in member after prestressing steel has been installed.
- 11. Maintain records of elongation of each tendon and tension applied to each tendon.
- 12. Use load cells to calibrate load-measuring devices and to check initial force on at least 10 percent of tendons.
- 13. Regardless of method used, measure initial load within tolerance of plus-or-minus 50 pounds or two percent, whichever is larger.
- 14. Do not use elongation measurements as measure of initial stress.
- 15. Perform final stressing as shown on approved shop drawings.
- 16. If prestressing bars less than 30 feet long are used, measure elongation by means of dial indicators.

- B. Tendon Vises for Pretensioning:
1. Use tendon vises for pretensioning capable of anchoring tendon positively without slippage after seating.
  2. Have steel cases for tendon vises proof-tested by manufacturer to at least 95 percent of guaranteed minimum tensile stress of prestressing steel.
  3. Maintain chucks in serviceable condition. Discard chucks that become visibly worn or show evidence of allowing post-seating slippage of tendon.
- C. Post-Tensioning:
1. Perform sequence and staging of post-tensioning in accordance with approved shop drawings. Perform special techniques, such as overjacking with following reduction of load or jacking from both ends of the tendon, in accordance with approved shop drawings.
  2. Stress post-tensioned prestressing steel by means of hydraulic jacks equipped with accurately calibrated, easily readable hydraulic pressure gauges or load cells to permit reading stress in prestressing steel throughout stressing operation.
  3. Keep records of tension and elongation of each tendon at all stages and submit records as specified. Make readings of elongations to within plus-or-minus 1/32 inch when dial indicators are used, reading accuracy to be accordingly higher.
  4. At the time of stressing first member of each type, check stresses in individual tendons and verify calculated frictional losses and seating losses to establish post-tensioning procedure and ensure uniform results.
  5. Recheck may be directed if it appears that stress shown is not being obtained.
  6. If the measured elongation is within seven percent, and the jacking force as measured by the pressure gauge is within five percent of theoretical, tendons may be cut and sealed for grouting. If an elongation or force is outside of these limits, obtain written approval before cutting and capping post-tensioned anchorage.
  7. If friction losses in post-tensioned tendon exceed calculated friction losses shown, relieve tendons of stress, lubricate with water-soluble oil or graphite spray and retension.
  8. Anchor prestressing steel at initial stresses (transfer) calculated to result in final force shown. Initial stress not to exceed 70 percent of minimum ultimate tensile strength of prestressing steel at any point of tendon.
  9. During jacking of prestressing steel, do not exceed 80 percent of the minimum guaranteed ultimate tensile strength of tendon.
  10. Make accurate measurements of anchorage slippage losses at time of anchoring first tendon of each type of member and compare with assumed slippage losses. In case of deviation, de-tension tendon; repeat tensioning in accordance with special approved procedure or by shimming as necessary for particular system.
  11. When necessary and approved, make adjustments to post-tensioning procedure to obtain required stresses.
  12. Submit for approval proposed remedy for inconsistencies which occur between measured elongation and jack-gauge readings and which cannot be corrected by specified recalibration of gauge nor by lubrication of tendons. Replace tendon, if necessary.
  13. Immediately after concreting, check ducts for obstructions by drawing cleaning device through them, by blowing through or by movement of tendon. Immediately prior to installation of tendons in ducts, demonstrate that ducts are free of water, debris and other obstructions.

### 3.05 GROUTING:

- A. Immediately prior to grouting, clean ducts of foreign materials and remove corrosion inhibitor by thoroughly flushing duct with water and dry by blowing. Unless prestressing steel is

adequately protected from corrosion, complete grouting operation within 28 days after concrete is placed around ducts but not later than 10 days after stressing.

- B. Mix grout as recommended by manufacturer, as tested and approved or for 1-1/2 minutes in high-speed mechanical mixer; pass through strainer into pumping equipment which has provision for recirculation. Begin pumping grout as soon as possible after mixing. Pumping may be continued as long as grout retains proper consistency.
- C. Use grout consisting mainly of cement and water unless gross inside area of duct exceeds five times tendon area, in which case fine sand may be added.
- D. When approved, add aluminum powder of proper fineness or other approved material in quantity sufficient to obtain a maximum of 10-percent expansion of grout when measured unconfined.
- E. Base proportions of materials on results of tests made on grout to achieve the following:
  - 1. Water content: Minimum necessary for proper placement.
  - 2. Water-cement ratio: Limited to maximum of 0.45 by weight.
  - 3. Minimum seven-day compressive strength: 2,500 psi for two-inch cubes molded, cured and tested in accordance with ASTM C109.
- F. Do not retemper grout.
- G. Inject grout into ducts and anchorage fittings. Continue flow until grout of consistency equivalent to that injected, flows from vent openings without presence of air in bubbles. Ensure that there is enough grout in supply bin to prevent suction of air.
- H. Close vent openings progressively in direction of flow. After vent openings are closed, raise grouting pressure to 100-psi minimum and plug injection hole. Keep accurate records of progress of grouting operations.
- I. In the event of blockage or interruption of grouting, remove grout from duct by flushing with water. Provide water pump in standby condition.
- J. Prevent water trapped in ungrouted ducts from freezing.
- K. Maintain temperature of concrete around grouted tendons at 45F or higher for at least three days after grouting.

### **3.06 STRESS TRANSFER:**

- A. Perform stress transfer to pretensioned or post-tensioned members only after concrete strength, as demonstrated by test cylinders, is in accordance with the transfer strength specified or shown.
- B. Minimum transfer strengths of concrete:
  - 1. Centrally stressed members: 3,000 psi.
  - 2. Eccentrically stressed members: 3,500 psi.
  - 3. Bridge beams or other members in which camber must be minimized: 4,000 psi.
  - 4. Post-tensioned members: 4,000 psi or as shown.
- C. If precast concrete has been moist-heat cured, perform de-tensioning immediately following curing period while concrete is still warm and moist.
- D. In de-tensioning operations, release tension so as to minimize eccentricity between resultant of prestressing forces and the vertical centroidal axis of member and so as to minimize

sudden or shock loading. Limit maximum eccentricity about vertical centroidal axis to one strand.

- E. Prior to detensioning, remove or loosen forms, ties, inserts, holddowns or other devices that would restrict longitudinal movement of members along bed.

**END OF SECTION**

## SECTION 03450

### PLANT - ARCHITECTURAL PRECAST CONCRETE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing precast architectural concrete units and thin-brick-faced, precast architectural concrete units.
- B. Related Work Specified Elsewhere:
  - 1. Concrete Unit Masonry: Section 04220.
  - 2. Flashing and Sheet Metal: Section 07600.
  - 3. Seals and Sealants: Section 07900.

##### 1.02 PERFORMANCE REQUIREMENTS:

- A. Structural Performance: Provide precast architectural concrete units and connections capable of withstanding design loads within limits and under conditions indicated.
- B. Structural Performance: Provide precast architectural concrete units and connections capable of withstanding the following design loads within limits and under conditions indicated:
  - 1. Dead Loads: <Insert applicable dead loads.>
  - 2. Live Loads: <Insert applicable live loads.>
  - 3. Wind Loads: <Insert applicable wind loads or wind-loading criteria including basic wind speed, importance factor, and exposure category.>
  - 4. Earthquake Loads: <Insert applicable earthquake design data including seismic coefficient and importance factor.>
  - 5. Design framing system to maintain clearances at openings, to allow for construction tolerances, and to accommodate live load deflection of primary building structure as follows:
    - a. Upward and downward movement of 1/2 inch.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements specified for each:
  - 1. Product Data: For each type of product indicated.
  - 2. Design Mixes: For each concrete mix.
  - 3. Shop Drawings: Detail fabrication and installation of precast architectural concrete units. Indicate member locations, plans, elevations, dimensions, shapes, cross sections, limits of each finish, and types of reinforcement, including special reinforcement.
    - a. Indicate separate face and backup mix locations and thicknesses.
    - b. Indicate locations and extent and treatment of dry joints if two-stage casting is proposed.
    - c. Indicate welded connections by AWS standard symbols. Detail loose and cast-in hardware, inserts, connections, and joints, including accessories.
    - d. Indicate locations and details of anchorage devices to be embedded in other construction.
    - e. Indicate locations and details of thin brick units and joint treatment.
    - f. Comprehensive engineering analysis signed and sealed by the qualified professional engineer responsible for its preparation.

4. Samples: For each type of finish indicated on exposed surfaces of precast architectural concrete units, in sets of 3, illustrating full range of finish, color, and texture variations expected; approximately 12 by 12 by 2 inches.
5. Samples for each thin brick unit required, including special shapes, showing the full range of colors, textures, and dimensions expected.
  - a. Grout Samples for Initial Selection: Color charts consisting of actual sections of grout showing the manufacturer's full range of colors.
6. Welding Certificates: Copies of certificates for welding procedures and personnel.
7. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
8. Material Certificates: Signed by manufacturers certifying that each of the following items complies with requirements:
  - a. Concrete materials.
  - b. Reinforcing materials and prestressing tendons.
  - c. Admixtures.
  - d. Bearing pads.
  - e. Water-absorption test reports.
  - f. Thin brick units and accessories.

#### **1.04 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of the jurisdictional authorities.
  2. AASHTO: M251
  3. ACI: 211.1, 211.2, 216/TMS 0216.1, 305R, 306.1, 318.
  4. AISI: 1018-1020.
  5. ANSI: A118.6, 108.10.
  6. APA: Architectural Precast Concrete-Color and Texture Selection Guide.
  7. ASTM: A27, A36, A47, A82, A108, A123A, A184, A185, A276, A283, A307, A416, A496, A497, A500, A572, A615, A618, A666, A675, A706, A767, A775, A884, C33, C42, C67, C144, C150, C260, C330, C494, C567, C618, C979, C1088, C1017, C1107, C1240, D412, F593.
  8. AWS: D1.1, D1.4.
  9. CRSI: Manual of Standard Practice.
  10. DOD: P-21035A.
  11. FS: TT-P-664.
  12. PCI: MNL 117, MNL 120, MNL 124.
  13. SSPC: PA 1, Paint 20, Paint 25, SP 3.
- B. Installer Qualifications: An experienced installer who has completed precast architectural concrete work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- C. Fabricator Qualifications: A firm that complies with the following requirements and is experienced in manufacturing precast architectural concrete units similar to those indicated for this Project and with a record of successful in-service performance.
  1. Assumes responsibility for engineering precast architectural concrete units to comply with performance requirements. This responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.
  2. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are

- defined as those performed for installations of precast architectural concrete that are similar to those indicated for this Project in material, design, and extent.
3. Participates in PCI's Plant Certification program and is designated a PCI-certified plant for Group A, Category A1--Architectural Cladding and Load Bearing Units [or in APA's Plant Certification Program for Production of Architectural Precast Concrete Products and is designated an APA-certified plant].
  4. Has sufficient production capacity to produce required units without delaying the Work.
  5. Is registered with and approved by authorities having jurisdiction.
- D. Design Standards: Comply with ACI 318 and the design recommendations of PCI MNL 120, "PCI Design Handbook--Precast and Prestressed Concrete."
- E. Quality-Control Standard: For manufacturing procedures and testing requirements, quality-control recommendations, and dimensional tolerances for types of units required, comply with PCI MNL 117, "Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products."
- F. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel"; and AWS D1.4, "Structural Welding Code--Reinforcing Steel."
- G. Calculated Fire-Test-Response Characteristics: Where indicated, provide precast architectural concrete units whose fire resistance has been calculated according to [PCI MNL 124, "Design for Fire Resistance of Precast Prestressed Concrete,"] [ACI 216.1/TMS 0216.1, "Standard Method for Determining Fire Resistance of Concrete and Masonry Construction Assemblies,"] and is acceptable to authorities having jurisdiction.
- H. Sample Panels: Before fabricating precast architectural concrete units, produce sample panels to establish the approved range of selections made under sample Submittals. Produce a minimum of 3 sets of full-scale sample panels, approximately 48 inches long by 48 inches high, to demonstrate the expected range of finish, color, and texture variations.
1. Locate panels where directed by the Engineer.
  2. In presence of the Engineer damage part of an exposed-face surface for each finish, color, and texture, and demonstrate materials and techniques proposed for repair of surface blemishes to match adjacent undamaged surfaces.
  3. Maintain sample panels during construction in an undisturbed condition as a standard for judging the completed Work.
  4. Demolish and remove sample panels when directed
- I. Preinstallation Conference: Conduct conference at Project site to comply with requirements of Division 1 Section "Project Meetings."

#### **1.05 PRODUCT DELIVERY, STORAGE, AND HANDLING:**

- A. Deliver precast architectural concrete units to Project site in such quantities and at such times to ensure continuity of installation. Store units at Project site to prevent cracking, distorting, warping, staining, or other physical damage, and so markings are visible.
- B. Lift and support units only at designated lifting and supporting points as shown on Shop Drawings.

#### **1.06 SEQUENCING:**

- A. Furnish anchorage items to be embedded in or attached to other construction without

delaying the Work. Provide setting diagrams, templates, instructions, and directions, as required, for installation.

## **PART 2 - PRODUCTS**

### **2.01 MOLD MATERIALS:**

- A. Molds: Provide molds and, where required, form-facing materials of metal, plastic, wood, or another material that is nonreactive with concrete and dimensionally stable to produce continuous and true precast concrete surfaces within fabrication tolerances and suitable for required finishes
- B. Form Liners: Units of face design, texture, arrangement, and configuration indicated.

### **2.02 REINFORCING MATERIALS:**

- A. Reinforcing Bars: ASTM A 615/A 615M, Grade 60, deformed.
- B. Low-Alloy-Steel Reinforcing Bars: ASTM A 706/A 706M, deformed.
- C. Galvanized Reinforcing Bars: ASTM A 767/A 767M, Class II zinc coated, hot-dip galvanized after fabrication and bending, as follows:
  - 1. Steel Reinforcement: [ASTM A 615/A 615M, Grade 60] [ASTM A 706/A 706M], deformed.
- D. Epoxy-Coated Reinforcing Bars: ASTM A 775/A 775M or ASTM A 934/A 934M, as follows:
  - 1. Steel Reinforcement: [ASTM A 615/A 615M, Grade 60] [ASTM A 706/A 706M], deformed.
- E. Steel Bar Mats: ASTM A 184/A 184M, assembled with clips, as follows:
  - 1. Steel Reinforcement: [ASTM A 615/A 615M, Grade 60] [ASTM A 706/A 706M], deformed bars.
- F. Plain-Steel Wire: ASTM A 82, [as drawn] [galvanized].
- G. Deformed-Steel Wire: ASTM A 496.
- H. Epoxy-Coated-Steel Wire: ASTM A 884/A 884M, Class A coated, [plain] [deformed].
- I. Plain-Steel Welded Wire Fabric: ASTM A 185, fabricated from [as-drawn] [galvanized] steel wire into flat sheets.
- J. Deformed-Steel Welded Wire Fabric: ASTM A 497, flat sheet.
- K. Epoxy-Coated-Steel Welded Wire Fabric: ASTM A 884/A 884M, Class A coated, [plain] [deformed].
- L. Supports: Manufacturer's bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire fabric in place according to CRSI's "Manual of Standard Practice," PCI MNL 117, and as follows:
  - 1. For uncoated reinforcement, use [all-plastic] [CRSI Class 1 plastic-protected] [CRSI Class 2 stainless-steel] bar supports.
  - 2. For epoxy-coated reinforcement, use [CRSI Class 1A epoxy-coated or other dielectric-polymer-coated wire] [all-plastic] bar supports

3. For zinc-coated reinforcement, use [galvanized wire or dielectric-polymer-coated wire] [all-plastic] bar supports.

#### **2.03 PRESTRESSING TENDONS:**

- A. Prestressing Strand: ASTM A 416/A 416M, Grade 250 or 270, uncoated, 7-wire, low-relaxation strand.

#### **2.04 CONCRETE MATERIALS:**

- A. Portland Cement: ASTM C 150, Type I or Type III, [gray] [and] [white], of same type, brand, and source.
  1. Standard gray portland cement may be used for nonexposed backup concrete.
- B. Normal-Weight Aggregates: Except as modified by PCI MNL 117, ASTM C 33, with coarse aggregates complying with Class 5S.
  1. Face-Mix Coarse Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining.
    - a. Gradation: [Uniformly graded] [Gap graded] [To match design reference sample].
  2. Face-Mix Fine Aggregates: Selected, natural or manufactured sand of the same material as coarse aggregate, unless otherwise approved by the Engineer.
- C. Lightweight Aggregates: ASTM C 330.
- D. Coloring Admixture: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures, temperature stable, nonfading, and alkali resistant.
- E. Water: Potable; free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 117.
- F. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.
- G. Water-Reducing Admixture: ASTM C 494, Type A.
- H. Retarding Admixture: ASTM C 494, Type B.
- I. Water-Reducing and Retarding Admixture: ASTM C 494, Type D.
- J. High-Range, Water-Reducing Admixture: ASTM C 494, Type F.
- K. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494, Type G.
- L. Plasticizing Admixture: ASTM C 1017.
- M. Fly Ash Admixture: ASTM C 618, Class C or F.
- N. Metakaolin Admixture: ASTM C 618, Class N.
- O. Silica Fume Admixture: ASTM C 1240.

#### **2.05 STEEL CONNECTION MATERIALS:**

- A. Carbon-Steel Shapes and Plates: ASTM A 36/A 36M.

- B. Carbon-Steel Headed Studs: ASTM A 108, AISI 1018 through AISI 1020, cold finished; AWS D1.1, Type A or B, with arc shields.
- C. Carbon-Steel Plate: ASTM A 283/A 283M.
- D. Malleable Steel Castings: ASTM A 47.
- E. Carbon-Steel Castings: ASTM A 27/A 27M, Grade 60-30.
- F. High-Strength, Low-Alloy Structural Steel: ASTM A 572/A 572M.
- G. Carbon-Steel Structural Tubing: ASTM A 500, Grade B.
- H. Wrought Carbon-Steel Bars: ASTM A 675/A 675M, Grade 65.
- I. Deformed-Steel Wire or Bar Anchors: ASTM A 496 or ASTM A 706/A 706M.
- J. Carbon-Steel Bolts and Studs: ASTM A 307, Grade A; carbon-steel, hex-head bolts and studs; carbon-steel nuts; and flat, unhardened steel washers.
- K. Finish: For exterior steel items, steel in exterior walls, and items indicated for galvanizing, apply zinc coating by [hot-dip process according to ASTM A 123/A 123M, after fabrication, and ASTM A 153/A 153M, as applicable] [electrodeposition according to ASTM B 633, SC 3].
  - 1. Galvanizing Repair Paint: High-zinc-dust-content paint with dry film containing not less than 94 percent zinc dust by weight, and complying with DOD-P-21035A or SSPC-Paint 20.
  - 2. Shop-Primed Finish: Prepare surfaces of nongalvanized steel items, except those surfaces to be embedded in concrete, according to requirements in SSPC-SP 3 and shop-apply [lead- and chromate-free, rust-inhibitive primer, complying with performance requirements in FS TT-P-664] [SSPC-Paint 25] according to SSPC-PA 1.
- L. Reglets: [PVC extrusions.] [Stainless steel.] [Copper.] [Reglets are specified in Section 07600, Flashing and Sheet Metal.]
- M. Welding Electrodes: Comply with AWS standards.
- N. Accessories: Provide clips, hangers, plastic shims, and other accessories required to install precast architectural concrete units.

**2.06 STAINLESS-STEEL CONNECTION MATERIALS:**

- A. Stainless-Steel Plate: ASTM A 666, Type 304, of grade suitable for application.
- B. Stainless-Steel Bolts and Studs: ASTM F 593, alloy 304 or 316, hex-head bolts and studs; stainless-steel nuts; and flat, stainless-steel washers.
- C. Stainless-Steel Headed Studs: ASTM A 276.

**2.07 BEARING PADS:**

- A. Provide bearing pads for precast architectural concrete units as follow
  - 1. Elastomeric Pads: AASHTO M 251, plain, vulcanized, 100 percent polychloroprene

- (neoprene) elastomer, molded to size or cut from a molded sheet, 50 to 70 Shore A durometer, minimum tensile strength 2250 psi per ASTM D 412.
2. Random-Oriented, Fiber-Reinforced Elastomeric Pads: Preformed, randomly oriented synthetic fibers set in elastomer. Surface hardness of 70 to 90 Shore A durometer.
  3. Cotton-Duck-Fabric-Reinforced Elastomeric Pads: Preformed, horizontally layered cotton-duck fabric bonded to an elastomer. Surface hardness of 80 to 100 Shore A durometer.
  4. Frictionless Pads: Tetrafluoroethylene, glass-fiber reinforced, bonded to mild-steel plate, of type required for in-service stress.
  5. High-Density Plastic: Multimonomer, nonleaching, plastic strip.

## 2.08 GROUT MATERIALS:

- A. Sand-Cement Grout: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.
- B. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C 1107, of consistency suitable for application.

## 2.09 THIN BRICK UNITS AND ACCESSORIES:

- A. Thin Brick Units: ASTM C 1088, Grade Exterior, Type TBX, [not less than 1/2 inch] [3/4 inch] [1 inch] thick, and as follows:
  1. Face Size: Standard, 2-1/4 inches high by 8 inches long.
  2. Face Size: Modular, 2-1/4 inches high by 7-1/2 to 7-5/8 inches long.
  3. Face Size: Engineer modular, 2-3/4 to 2-13/16 inches high by 7-1/2 to 7-5/8 inches long
  4. Face Size: Closure modular, 3-1/2 to 3-5/8 inches high by 7-1/2 to 7-5/8 inches long.
  5. Face Size: Utility, 3-1/2 to 3-5/8 inches high by 11-1/2 to 11-5/8 inches long.
  6. Where shown to "match existing," provide face brick matching color, texture, and face size of existing adjacent brickwork.
  7. Special Shapes: Include corners, edge corners, and end edge corners.
  8. Initial Rate of Absorption: Less than 30 g/30 sq. in. per minute when tested per ASTM C 67.
  9. Efflorescence: Provide brick that has been tested according to ASTM C 67 and is rated "not effloresced."
  10. Surface Coloring: Brick with surface coloring, other than flashed or sand-finished brick, shall withstand 50 cycles of freezing and thawing per ASTM C 67 with no observable difference in the applied finish when viewed from 10 feet
  11. Face Color and Texture: [Match Architect's samples] [Medium brown, wire cut] [Full-range red, sand molded] [Gray, velour].
  12. Back Surface Texture: Scored, combed, wire roughened, or ribbed.
- B. Setting Mortar: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 4 parts sand, by volume, with minimum water required for placement.
- C. Latex-Portland Cement Pointing Grout: ANSI A118.6 and as follows: Select one or both types of grout from first two subparagraphs below.
  1. Dry-grout mixture, factory prepared, of portland cement, graded aggregate, and dry, redispersible, ethylene-vinyl-acetate additive for mixing with water; uniformly colored

2. Commercial portland cement grout, factory prepared, with liquid styrene-butadiene rubber or acrylic-resin latex additive; uniformly colored.
3. Colors: [As indicated by manufacturer's designations] [Match Engineer's samples] [As selected by Engineer from manufacturer's full range].

#### **2.10 CONCRETE MIXES:**

- A. Prepare design mixes for each type of concrete required. Delete subparagraph below if fly ash or silica fume is not permitted. Revise percentage to suit Project.
  1. Limit use of fly ash and silica fume to not exceed, in aggregate, 25 percent of portland cement by weight.
- B. Design mixes may be prepared by a qualified independent testing agency or by qualified precast plant personnel at precast architectural concrete fabricator's option.
- C. Limit water-soluble chloride ions to the maximum percentage by weight of cement permitted by ACI 318.
- D. Normal-Weight Concrete Face and Backup Mixes: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:
  1. Compressive Strength (28 Days): 5000 psi or greater
  2. Maximum Water-Cementitious Materials Ratio: 0.45.
- E. Water Absorption: 12 to 14 percent by volume, tested according to PCI MNL 117.
- F. Lightweight Concrete Backup Mixes: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.2, with materials to be used on Project, to provide lightweight concrete with the following properties:
  1. Compressive Strength (28 Days): 5000 psi or greater.
  2. Unit Weight: Calculated equilibrium unit weight of 115 lb/cu. ft., plus or minus 3 lb/cu. ft., according to ASTM C 567.
- G. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 117.
- H. When included in design mixes, add other admixtures to concrete mixes according to manufacturer's written instructions.

#### **2.11 MOLD FABRICATION:**

- A. Molds: Accurately construct molds, mortar tight, of sufficient strength to withstand pressures due to concrete-placement operations and temperature changes and for prestressing operation
  1. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and supports to maintain stability of liners during concreting. Coat form liner with form-release agent.
- B. Maintain molds to provide completed precast architectural concrete units of shapes, lines, and dimensions indicated, within fabrication tolerances specified.
  1. Edge and Corner Treatment: Uniformly [chamfered] [radiused].

#### **2.12 THIN BRICK FACINGS:**

- A. Place form liner templates accurately to provide grid for thin brick facings. Provide solid backing and supports to maintain stability of liners while placing thin bricks and during concreting.
- B. Securely place thin brick units face down into form liner pockets.
- C. Completely fill joint cavities between thin brick units with sand-cement mortar, and place precast concrete backing mix while sand-cement mortar is still fluid enough to ensure bond
  - 1. Mix and install grout according to ANSI 108.10. Completely fill joint cavities between thin brick units with grout, and compress into place without spreading grout onto faces of thin brick units. Remove excess grout immediately to prevent staining of brick.
  - 2. Tool joints to a [slightly concave] [grapevine] [V-]shape when pointing grout is thumbprint hard.
- D. Clean faces and joints of brick facing.

### 2.13 FABRICATION:

- A. Cast-in Anchors, Inserts, Plates, Angles, and Other Anchorage Hardware: Fabricate anchorage hardware with sufficient anchorage and embedment to comply with design requirements. Accurately position for attachment of loose hardware, and secure in place during precasting operations. Locate anchorage hardware where it does not affect position of main reinforcement or concrete placement.
- B. Furnish loose steel plates, clip angles, seat angles, anchors, dowels, cramps, hangers, and other hardware shapes for securing precast architectural concrete units to supporting and adjacent construction.
- C. Cast-in reglets, slots, holes, and other accessories in precast architectural concrete units to receive windows, cramps, dowels, reglets, waterstops, flashings, and other similar work as indicated.
- D. Cast-in openings larger than 10 inches in any dimension.
- E. Reinforcement: Comply with recommendations in CRSI's "Manual of Standard Practice" and PCI MNL 117 for fabricating, placing, and supporting reinforcement.
  - 1. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete.
  - 2. Accurately position, support, and secure reinforcement against displacement during concrete-placement and consolidation operations. Completely conceal support devices to prevent exposure on finished surfaces.
  - 3. Place reinforcement to maintain at least 3/4-inch minimum coverage. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
  - 4. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
- F. Reinforce precast architectural concrete units to resist handling, transportation, and erection stresses.
- G. Prestress tendons for precast architectural concrete units by either pretensioning or posttensioning methods. Comply with PCI MNL 117.
  - 1. Delay detensioning or posttensioning of precast, prestressed architectural concrete units until concrete has reached its indicated minimum design release compressive

strength as established by test cylinders cured under the same conditions as concrete.

- H. Mix concrete according to PCI MNL 117 and requirements in this Section. After concrete batching, no additional water may be added.
- I. Place face mix to a minimum thickness after consolidation of the greater of 1 inch or 1.5 times the maximum aggregate size, but not less than the minimum reinforcing cover.
- J. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in precast concrete units. Comply with requirements in PCI MNL 117 for measuring, mixing, transporting, and placing concrete.
  - 1. Place backup concrete to ensure bond with face mix concrete.
- K. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items. Use equipment and procedures complying with PCI MNL 117.
- L. Comply with ACI 306.1 procedures for cold-weather concrete placement.
- M. Comply with ACI 305R recommendations for hot-weather concrete placement.
- N. Identify pickup points of precast architectural concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint or permanently mark casting date on each precast architectural concrete unit on a surface that will not show in finished structure.
- O. Cure concrete, according to requirements in PCI MNL 117, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture.
- P. Discard precast architectural concrete units that are warped, cracked, broken, spalled, stained, or otherwise defective unless repairs are approved by the Engineer.

#### **2.14 FABRICATION TOLERANCES:**

- A. Fabricate precast architectural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with the following product tolerances:
  - 1. Overall Height and Width of Units, Measured at the Face Exposed to View: As follows:
    - a. 10 feet or under, plus or minus 1/8 inch.
    - b. 10 to 20 feet, plus 1/8 inch, minus 3/16 inch.
    - c. 20 to 40 feet, plus or minus 1/4 inch.
    - d. Each additional 10 feet, plus or minus 1/16 inch.
  - 2. Overall Height and Width of Units, Measured at the Face Not Exposed to View: As follows:
    - a. 10 feet or under, plus or minus 1/4 inch.
    - b. 10 to 20 feet, plus 1/4 inch, minus 3/8 inch.
    - c. 20 to 40 feet, plus or minus 3/8 inch.
    - d. Each additional 10 feet, plus or minus 1/8 inch.
  - 3. Total Thickness or Flange Thickness: Plus 1/4 inch, minus 1/8 inch.
  - 4. Rib Thickness: Plus or minus 1/8 inch.
  - 5. Rib to Edge of Flange: Plus or minus 1/8 inch.
  - 6. Distance between Ribs: Plus or minus 1/8 inch.
  - 7. Variation from Square or Designated Skew (Difference in Length of the Two

- Diagonal Measurements): Plus or minus 1/8 inch per 72 inches or 1/2 inch total, whichever is greater.
8. Length and Width of Block-outs and Openings within One Unit: Plus or minus 1/4 inch.
  9. Location and Dimension of Block-outs Hidden from View and Used for HVAC and Utility Penetrations: Plus or minus 3/4 inch.
  10. Dimensions of Haunches: Plus or minus 1/4 inch.
  11. Haunch Bearing Surface Deviation from Specified Plane: Plus or minus 1/8 inch.
  12. Difference in Relative Position of Adjacent Haunch Bearing Surfaces from Specified Relative Position: Plus or minus 1/4 inch.
  13. Bowing: Plus or minus L/360, maximum 1 inch.
  14. Local Smoothness: 1/4 inch per 10 feet.
  15. Variation between Adjacent Thin-Brick-Facing Products: 1/16 inch.
  16. Warping: 1/16 inch per 12 inches of distance from the nearest adjacent corner.
  17. Tipping and Flushness of Plates: Plus or minus 1/4 inch.
  18. Dimensions of Architectural Features and Rustications: Plus or minus 1/8 inch.
- B. Position Tolerances: For cast-in items measured from datum line location, as indicated on Shop Drawings.
1. Weld Plates: Plus or minus 1 inch.
  2. Inserts: Plus or minus 1/2 inch.
  3. Handling Devices: Plus or minus 3 inches
  4. Reinforcing Steel and Welded Wire Fabric: Plus or minus 1/4 inch where position has structural implications or affects concrete cover; otherwise, plus or minus 1/2 inch.
  5. Reinforcing Steel Extending out of Member: Plus or minus 1/2 inch of plan dimensions.
  6. Tendons: Plus or minus 1/4 inch, vertical; plus or minus 1 inch, horizontal
  7. Location of Rustication Joints: Plus or minus 1/8 inch.
  8. Location of Opening within Panel: Plus or minus 1/4 inch.
  9. Flashing Reglets: Plus or minus 1/4 inch.
  10. Flashing Reglets at Edge of Panel: Plus or minus 1/8 inch.
  11. Reglets for Glazing Gaskets: Plus or minus 1/8 inch.
  12. Electrical Outlets, Hose Bibs: Plus or minus 1/2 inch.
  13. Haunches: Plus or minus 1/4 inch.
  14. Allowable Rotation of Plate, Channel Inserts, Electrical Boxes: 2-degree rotation or 1/4 inch maximum over the full dimension of the unit.

## 2.15 FINISHES:

- A. Finish exposed-face surfaces of precast architectural concrete units to match approved design reference sample and as follows:
1. Design Reference Sample: <Insert description and identify fabricator and code number of sample.>
  2. PCI and APA's "Architectural Precast Concrete--Color and Texture Selection Guide," of plate numbers indicated.
  3. Smooth-Surface Finish: Provide surfaces free of pockets, sand streaks, and honeycombs, with uniform color and texture.
  4. Textured-Surface Finish: Impart by form liners or inserts to provide surfaces free of pockets, streaks, and honeycombs, with uniform color and texture.
  5. Bushhammer Finish: Use power or hand tools to remove matrix and fracture coarse aggregates.
  6. Retarded Finish: Use chemical retarding agents applied to concrete forms and washing and brushing procedures to expose aggregate and surrounding matrix surfaces after form removal.

7. Abrasive-Blast Finish: Use abrasive grit, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces.
  8. Acid-Etched Finish: Use acid and hot-water solution, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces.
  9. Honed Finish: Use continuous mechanical abrasion with fine grit, followed by filling and rubbing procedures.
  10. Polished Finish: Use continuous mechanical abrasion with fine grit, followed by filling and rubbing procedures.
  11. Sand-Embedment Finish: Use selected stones placed in a sand bed in bottom of mold, with sand removed after curing.
  12. Finish exposed [top] [bottom] [and back] surfaces of precast architectural concrete units to match face-surface finish.
- B. Finish exposed [top] [bottom] [and back] surfaces of precast architectural concrete units by smooth, steel-trowel finish.
- C. Finish unexposed surfaces of precast architectural concrete units by float finish.

## **2.16 SOURCE QUALITY CONTROL:**

- A. The Authority will employ an independent testing agency to evaluate precast architectural concrete fabricator's quality-control and testing methods.
1. Allow the Authority's testing agency access to material storage areas, concrete production equipment, concrete placement, and curing facilities. Cooperate with the Authority's testing agency and provide samples of materials and concrete mixes as may be requested for additional testing and evaluation.
- B. Quality-Control Testing: Test and inspect precast concrete according to PCI MNL 117 requirements.
- C. Strength of precast concrete units will be considered deficient if units fail to comply with ACI 318 requirements.
- D. Testing: If there is evidence that the strength of precast concrete units may be deficient or may not comply with ACI 318 requirements, the Authority will employ an independent testing agency to obtain, prepare, and test cores drilled from hardened concrete to determine compressive strength according to ASTM C 42.
1. A minimum of three representative cores will be taken from units of suspect strength, from locations directed by the Engineer.
  2. Cores will be tested in an air-dry condition.
  3. Strength of concrete for each series of 3 cores will be considered satisfactory if the average compressive strength is equal to at least 85 percent of the 28-day design compressive strength and no single core is less than 75 percent of the 28-day design compressive strength.
  4. Test results will be made in writing on the same day that tests are performed, with copies to the Engineer, Contractor, and precast concrete fabricator. Test reports will include the following:
    - a. Project identification name and number.
    - b. Date when tests were performed.
    - c. Name of precast concrete fabricator.
    - d. Name of concrete testing agency.
    - e. Identification letter, name, and type of precast concrete unit or units represented by core tests; design compressive strength; type of break; compressive strength at breaks, corrected for length-diameter ratio; and

direction of applied load to core in relation to horizontal plane of concrete as placed.

- E. Patching: If core test results are satisfactory and precast concrete units comply with requirements, clean and dampen core holes and solidly fill with precast concrete mix that has no coarse aggregate, and finish to match adjacent precast concrete surfaces.
- F. Defective Work: Precast architectural concrete units that do not comply with requirements, including strength, manufacturing tolerances, and finishes, are unacceptable. Replace with precast concrete units that comply with requirements.

### **PART 3 - EXECUTION**

#### **3.01 EXAMINATION:**

- A. Examine substrates and conditions for compliance with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Do not install precast concrete units until supporting concrete has attained minimum design compressive strength.

#### **3.02 INSTALLATION**

- A. Install clips, hangers, and other accessories required for connecting precast architectural concrete units to supporting members and backup materials.
- B. Install precast architectural concrete. Provide temporary supports and bracing as required to maintain position, stability, and alignment as units are being permanently connected.
  - 1. Install bearing pads as precast concrete units are being erected.
  - 2. Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.
  - 3. Remove projecting hoisting devices and use sand-cement grout to fill voids within recessed hoisting devices flush with surface of concrete.
- C. Anchor precast architectural concrete units in position by bolting, welding, grouting, or as otherwise indicated. Remove temporary shims, wedges, and spacers as soon as possible after anchoring and grouting are completed.
- D. Welding: Perform welding in compliance with AWS D1.1 and AWS D1.4, with qualified welders
  - 1. Protect precast architectural concrete units and bearing pads from damage by field welding or cutting operations and provide noncombustible shields as required.
  - 2. Repair damaged steel surfaces by cleaning and applying a coat of galvanizing repair paint to galvanized surfaces.
  - 3. Repair damaged steel surfaces by cleaning and repriming damaged painted surfaces.
- E. At bolted connections, use lock washers or other acceptable means to prevent loosening of nuts.
- F. Grouting Connections: Grout connections where required or indicated. Retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are completely filled. Place grout to finish smooth, level, and plumb with adjacent concrete

surfaces. Keep grouted joints damp for not less than 24 hours after initial set. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.

### **3.03 ERECTION TOLERANCES:**

- A. Install precast architectural concrete units level, plumb, square, and true, without exceeding the following noncumulative erection tolerance
  - 1. Plan Location from Building Grid Datum: Plus or minus 1/2 inch.
  - 2. Plan Location from Centerline of Steel: Plus or minus 1/2 inch.
  - 3. Top Elevation from Nominal Top Elevation: As follows:
    - a. Exposed Individual Panel: Plus or minus 1/4 inch.
    - b. Nonexposed Individual Panel: Plus or minus 1/2 inch.
    - c. Exposed Panel Relative to Adjacent Panel: 1/4 inch.
    - d. Nonexposed Panel Relative to Adjacent Panel: 1/2 inch.
  - 4. Support Elevation from Nominal Support Elevation: As follows:
    - a. Maximum Low: 1/2 inch.
    - b. Maximum High: 1/4 inch.
  - 5. Maximum Plumb Variation over the Lesser of Height of Structure or 100 Feet: 1 inch.
  - 6. Plumb in Any 10 Feet of Element Height: 1/4 inch.
  - 7. Maximum Jog in Alignment of Matching Edges: 1/4 inch.
  - 8. Joint Width (Governs over Joint Taper): Plus or minus 1/4 inch.
  - 9. Maximum Joint Taper: 3/8 inch.
  - 10. Joint Taper in 10 Feet: 1/4 inch.
  - 11. Maximum Jog in Alignment of Matching Faces: 1/4 inch.
  - 12. Differential Bowing or Camber, as Erected, between Adjacent Members of Same Design: 1/4 inch.

### **3.04 FIELD QUALITY CONTROL:**

- A. Testing: The Authority will engage a qualified independent testing and inspecting agency to perform field tests and inspections
- B. Field welds and connections using high-strength bolts will be subject to tests and inspections.
- C. Testing agency will report test results promptly and in writing to Contractor and the Engineer.
- D. Remove and replace work that does not comply with specified requirements.
- E. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of corrected work with specified requirements.

### **3.05 REPAIRS:**

- A. Repair exposed exterior surfaces of precast architectural concrete units to match color, texture, and uniformity of surrounding precast architectural concrete if permitted by the Engineer.
- B. Remove and replace damaged precast architectural concrete units if repairs do not comply with requirements.

### **3.06 CLEANING:**

- A. Clean exposed surfaces of precast concrete units after erection to remove weld marks, other markings, dirt, and stains.
  - 1. Wash and rinse according to precast concrete fabricator's written recommendations. Protect other work from staining or damage due to cleaning operations.

2. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes.

**DIVISION 4 - MASONRY**

04050 MORTAR, GROUT AND MASONRY ACCESSORIES  
04215 BRICK MASONRY  
04220 CONCRETE UNIT MASONRY  
04415 GRANITE

**END OF SECTION**

## SECTION 04050

### MORTAR, GROUT AND MASONRY ACCESSORIES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies furnishing mortar, grout, and accessories for masonry work, including brick masonry, concrete unit masonry, granite and other stone masonry. The installation of such material is specified in the various masonry sections.
- B. Related Work Specified Elsewhere:
  - 1. Brick masonry: Section 04215.
  - 2. Concrete unit masonry: Section 04220.
  - 3. Granite: Section 04415.
  - 4. Seals and sealants: Section 07900.
  - 5. Flashing and sheetmetal: Section 07600.
  - 6. Miscellaneous metals: Section 05500.
  - 7. Concrete formwork: Section 03100.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Manufacturer's data: Recommendations for use of materials, preparation of substrate, limitations and special instructions for materials necessary to the work.
    - b. Granite: Section 04415.
  - 2. Samples:
    - a. Three of each type of the following products used in the work:
      - 1) Mortars: Cured samples showing color of each type.
      - 2) Accessories: Representative samples of each type.
      - 3) Certification.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: A36, A82, A153, A276, A666, A775, C114, C144, C150, C207, C270, C476, C665, C780, C881, C1019, D570, D638, D695, D1525, D2000, D2240, F593, F594.
  - 3. FS: HH-I-521.
- B. Source Quality Control:
  - 1. Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from one manufacturer for each cementitious component and from one source or producer for each aggregate.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to job site in their original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type and class as applicable.

- B. Store products so as to prevent water intrusion, dampness and deterioration. Store loose materials sand and aggregates so as to prevent intrusion of foreign materials.
- C. Handle products so as to prevent breakage of containers and damage to products.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  - 1. Do not use materials or aggregates that are covered with frost. Do not mix mortar when the temperature is below that specified for masonry work.
  - 2. Provide protective covering and heat as specified for masonry work.
  - 3. Perform work under environmental conditions consistent with manufacturer's recommendations for materials being used in the work.

### **PART 2 - PRODUCTS**

#### **2.01 MORTAR AND GROUT MATERIALS:**

- A. Cement:
  - 1. ASTM C150, Type I, portland cement, packaged in one-cubic-foot waterproof bags.
    - a. For exterior walls, use low alkali cement; maximum 0.60 percent total alkali when tested according to ASTM C114.
    - b. For below grade use type II cement and lime.
  - 2. Cement for brick masonry:
    - a. Factory-prepared, color-blended with nonstaining, inorganic coloring pigment.
    - b. Pigments not to exceed 10 percent of weight of cement.
    - c. Pigment blended in such quantity to produce cured mortar color matching face brick when mixed with hydrated lime and fine aggregate.
- B. Hydrated Lime:
  - 1. ASTM C207, Type S.
  - 2. Uniform color for similar work.
- C. Fine Aggregate: Clean, sharp, masonry sand, ASTM C144. For joints less than 1/4 inch, grade aggregate with 100 percent passing the Number 16 sieve.
- D. Water: Potable.
- E. Pigment: As necessary to produce colored mortar matching color of brick unless otherwise indicated.
- F. Admixtures: Do not add admixtures including air-entraining agents, accelerators, retarders, water repellent agents, antifreeze compounds, or other admixtures unless otherwise indicated.
- G. Epoxy for Epoxy Mortar: Two-component, ASTM C881, Type 3, Grade 3, Class C, with the following additional requirements:
  - 1. Component A: Modified-epoxy resin of epichlorohydrin bisphenol A-type, containing suitable viscosity control agents and having epoxide equivalent of 180-200.
  - 2. Component B: Primarily reaction product of aromatic amine and an aliphatic amine with epoxy resin of epichlorohydrin bisphenol A-type.
  - 3. Ratio of Component A to Component B: By volume, 1:2.
  - 4. Properties of mixed components:
    - a. Solids content: 100 percent by weight.

- b. Pot life: 20 to 30 minutes at 73F.
- c. Tack-free time, thin film: Two to four hours at 73F.
- d. Final cure, 75-percent ultimate strength, ASTM D695: Two days at 73F.
- e. Initial viscosity, A plus B: 250 to 350 cps at 73F.
- 5. Properties of cured material:
  - a. Tensile strength, ASTM D638: 5,000-psi minimum at 14 days, 73F cure.
  - b. Tensile elongation, ASTM D638 modified: One to three percent at 14 days, 73F cure.
  - c. Compressive strength, ASTM D695: 10,500-psi minimum at 28 days, 73F cure.
  - d. Water absorption, ASTM D570: One-percent maximum.
  - e. Bond strength: 2,000-psi minimum at 14 days.
  - f. Hardened to hardened: 73F cure.
  - g. Vicat softening temperature, ASTM D1525: 121F minimum.
- H. Aggregate for Epoxy Mortar: Silica sand, Size 20 to Size 40, dust-free and moisture-free.

## 2.02 MORTAR AND GROUT MIXES:

- A. Mortar Mixes for Brick Masonry: ASTM C270, types as follows:
  - 1. Type S: For exterior loadbearing masonry and for masonry in contact with earth, proportioned by volume as follows:
    - a. Portland cement: One part.
    - b. Hydrated lime: 1/4 to 1/2 part.
    - c. Fine aggregate: Not less than 2-1/2 nor more than three times sum of volumes of cement and lime.
    - d. Pigment: As necessary to produce colored mortar matching color of brick unless otherwise indicated.
  - 2. Type N: For interior non loadbearing masonry, proportioned by volume as specified for Type S, except 1/2 to 1-1/4 parts hydrated lime.
  - 3. Color: As shown or as selected by the Engineer.
- B. Mortar Mixes for Concrete Unit Masonry: As specified for brick masonry, except pigment not required.
- C. Mortar Mixes for Granite Setting Bed:
  - 1. Granite, except paving, apron at pylons, platform edging, stair treads and landings: Nonstaining mortar composed of one-part portland cement and one-part plastic lime hydrate to four or five parts fine aggregate, ASTM C270, Type N. Pointing mortar of same composition, colored to matched granite.
  - 2. Granite paving and granite apron at pylons: Nonstaining mortar composed of one-part portland cement to no more than four parts natural sand. For pointing use specified preshrunk mortar.
  - 3. Stair treads and landings: Epoxy mortar consisting of one-part epoxy to 3-1/4 parts of aggregate by loose volume.
  - 4. Platform edging: Epoxy mortar consisting of one-part epoxy to 1-1/2 parts of aggregate by loose volume.
- D. Grout: For setting steel lintels and similar items, grouting mortar composed of one-part portland cement and two parts fine aggregate with sufficient lime putty added to obtain quick set.
- E. Preshrunk Mortar: Dry, premixed, ready-to-use formulation.

## 2.03 ACCESSORIES:

- A. Continuous joint reinforcement:
1. Accessories for Brick and Concrete Unit Masonry:
    - a. Prefabricated continuous-reinforcing tie system fabricated of wire conforming to ASTM A82. Flush-welded cross ties, nine-gauge wire, hot-dip galvanized after fabrication in accordance with ASTM A153, Class B2, 1.50 ounces for side and cross rods.
    - b. Fabricate joint reinforcement in straight lengths of not less than 10 feet of truss design with continuous diagonal cross ties spaced maximum 16 inches o.c.
      - 1) Make width of unit 1-1/2 inches to two inches less than thickness of wall.
      - 2) For multi-wythe wall, provide one side rod for each face shell of masonry more than four inches in width; plus one side rod for each wythe of masonry four inches or less in width.
      - 3) At cavity walls, provide integral drips on cross rods. Where horizontal joints of outer wythe does not align with back-up joints, provide adjustable two-piece tab design to engage the outer wythe by at least 1-1/2 inches.
    - c. Corner reinforcement: Prefabricated, shop-welded corner-L and intersection-T units matching the continuous wall units.
    - d. Spacing: See related work sections.
  2. Dovetail anchors:
    - a. Flexible, adjustable or corrugated 1-inch wide dovetail anchors of 12 gauge galvanized steel. Place anchors every 16 inches in height of wall at intersections of masonry walls and concrete, and for masonry furring of concrete. Dovetail slots are specified in Section 03100, by same manufacturer of anchors.
  3. Wall plugs:
    - a. Galvanized 26-gauge corrugated metal, approximately three inches long and of standard manufacture, where necessary for attaching other work.
  4. Z-type rigid-steel anchors: Steel, ASTM A36, 1/4-inch thick by 1-1/2 inches wide by 28 inches long, galvanized; with one two-inch opposing 90-degree bend at each end.
  5. Corrugated-steel anchors: 14 gauge by 1-1/4 inches by 20 inches with one two-inch 90-degree bend, with 18 inches of corrugation.
  6. Steel framing anchors: Fabricated of 3/16-inch galvanized wire tie and galvanized flat-steel strap one-inch wide by 22 gauge or 3/4-inch wide by 12 gauge.
  7. Weep-hole tubes: 3/8-inch OD, medium density, nonstaining, polyethylene tubes of lengths ensuring complete panel penetration and unobstructed flow. Fire-resistant compressible filler: Inorganic, non-asbestos mineral fiber safing insulation, with foil facing to impede smoke passage; moisture resistant, mildew-proof and vermin-proof, noncorrosive and nondeteriorating; UL-listed; meeting ASTM C665 and FS HH-I-521 Type III, except for identification marking.
  8. Control joint gasket: Solid styrene-butadiene-rubber compound per ASTM D2000, 2AA-805, factory extruded into shapes for use with standard sashblock to provide stability to masonry walls at expansion and control joints; minimum shear strength 540 psi, durometer hardness 80 (plus or minus 5) per ASTM D2240. Provide T-shape and X-shape for vertical joints as appropriate, flat shape beneath load-relieving angles.
  9. Cavity Drainage System: 1 inch thick by 10 inches high by 5 feet long section of high density polyethylene or nylon mesh designed to allow moisture to flow downward in cavity joint.
  10. Masonry Cell Insulation: Molded polystyrene Insulation Units - Rigid, cellular thermal insulation formed by the expansion of polystyrene - resin beads or granules in a closed mold to comply with ASTM 578, Type I. Provide specially shaped units designed for installing in cores of masonry units.

- B. Accessories for Granite:
1. Stainless steel, ASTM A276 or A666, Type 304, for anchors, cramps, angles, dowels, plates, bolts or other accessories in contact with stone.
  2. Anchor sizes:
    - a. Anchors with dowels: 3/16 inch by one inch in cross section.
    - b. Two-way anchors: 1/8 inch by two inches in cross section.
    - c. One-way anchors: 1/8 inch by one inch in cross section.
    - d. Anchors to stone: Anchors of necessary length and of type that turn into stone minimum of 1/2 inch.
    - e. Anchors to concrete: Heavy-duty sleeve style or wedge-type anchors with 3,000-pound hold-fast strength or anchors suitable for use with dovetail slots.
    - f. Lewis anchors for lifting stones: 3/4 inch in diameter.
    - g. Other anchors: Sizes as shown on approved shop drawings.
    - h. Fasteners for Stainless-Steel Anchors: Annealed stainless-steel bolts, nuts, and washers; ASTM F593 for bolts and ASTM F594 for nuts.
    - i. Setting Shims: Strips of vulcanized neoprene, 50 to 70 Shore A durometer, nonstaining to stone, sized to suit joint thicknesses and depths of stone supports without intruding into required depths of joint sealants or causing third-side adhesion between sealant and setting shims.
    - j. Weep and Vent Tubes: Medium-density polyethylene tubing, 1/4-inch OD and of length required to extend from exterior face of stone to cavity behind.
  3. Sizes for other accessories:
    - a. Dowels: Minimum of 1/2 inch in diameter, designed to extend two inches into stone and two inches into concrete.
    - b. Cramps: 1/8-inch by one-inch plate with 3/8-inch dowels at each end designed to extend into stone and concrete a minimum of one inch.
    - c. Angles, plates, and bolts: Sizes as shown on approved shop drawings.
- C. Steel lintels: Section 05500.
- D. Masonry lintels: Section 04220.
- E. Flashing: Section 07600.

### **PART 3 - EXECUTION**

#### **3.01 MIXING OF MORTAR:**

- A. Mix mortar materials in an approved clean mechanical mixer for at least three minutes and not more than five minutes with a minimum amount of water to produce workable consistency.
- B. Mortar which has stiffened because of evaporation of water may be retempered by adding water as needed to restore necessary consistency. Use mortar within 2-1/2 hours of initial mixing.
- C. Use an approved method of measuring materials and mortar that will control and accurately maintain specified proportions throughout the work. Shovel measure is prohibited. Measure sand in damp, loose condition.
- D. Apply pre-shrunk mortar in accordance with the manufacturer's instructions.
- E. For alteration and restoration work, tint or modify mix to match mortar of existing masonry.

- F. The Engineer may direct a test of the mortar in accordance with ASTM C780 and a test of the grout for compressive strength per ASTM C1019 to establish compliance with specified requirements.

**END OF SECTION**

## SECTION 04215

### BRICK MASONRY

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing brick masonry.
- B. Related Work Specified Elsewhere:
  - 1. Mortar, grout and masonry accessories: Section 04050.
  - 2. Miscellaneous metal: Section 05500.
  - 3. Seals and sealants: Section 07900.
  - 4. Demolition: Section 02220.
  - 5. Concrete Unit Masonry: Section 04220.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples:
    - a. Three sets of each type of the following products used in the work:
      - 1) Face brick: Assemble each set to show the complete variation and percentage proportion of color, texture and other variable properties of appearance.
        - (a) Size and shape for general use.
        - (b) Special shapes and sizes used in the work.
      - 2) Common brick.
    - b. Brick panels:
      - 1) Construct sample masonry panels of exposed brick masonry, of size not less than four feet square by eight inches thick incorporating reinforcement, flashing, face brick and backup units. Construct sample panel on site, with face brick facing same direction as major facade of the work.
      - 2) If necessary to produce an acceptable standard of appearance and workmanship, construct additional panels until approved.
      - 3) Use types of material, color variation, mortar, bond, thickness and tooling of joints, method of laying and workmanship typical and standard for the installation. Clean sample panel as specified for finished work.
      - 4) Maintain panels in good condition and protect from moisture penetration until completion of masonry work and removal is directed.
  - 2. Certification.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. BIA: Technical Notes on Brick Construction No. 7B.
  - 3. ASTM: C62, C216.
- B. Source Quality Control:

1. All brick used in the work to be from the same run.

**1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to the job site in good condition.
- B. Keep products dry. Prevent contact with soil.
- C. Handle products so as to prevent chipping and breaking.

**1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  1. The following are prohibited:
    - a. Use of products that are covered with frost.
    - b. Erection of masonry when temperature is below 40F or tending to fall below 40F, unless suitable fireproof protective covering and heat are provided to maintain work and materials above 40F.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. General:
  1. For alteration and restoration work:
    - a. Provide bricks of same size, type, grade and appearance as existing brick work.
    - b. Brick salvaged under Section 02220 may be used if approved.
- B. Face Brick:
  1. ASTM C216, Type FBS, Grade SW, wire-cut.
  2. Size 2-1/4 inches by 3-5/8 inches by 7-5/8 inches.
  3. Color: Richtex No. 761M by Richland Shale Products Company, Columbia, SC; No. 320 Grey Wirecut by Taylor Clay Products Company, Salisbury, NC.; or approved equal.
  4. Special shapes: 100-percent solid for the following locations:
    - a. Flat header wall caps.
    - b. End units on rowlock header wall caps.
    - c. Corners of soldier courses.
    - d. Corbels.
    - e. Pierced screen walls.
    - f. Where construction would result in exposed cores.
    - g. Where shown.
- C. Common Brick:
  1. ASTM C62, wire-cut; Grade SW.
  2. First quality, hard grade, standard size.
- D. Cleaning Solution:
  1. Formulated for cleaning new brick work, containing no acid.
  2. Type which will not stain, discolor or otherwise adversely affect surfaces with which it comes into contact.
- E. Accessories: Section 04050.

- F. Steel Lintels and Shelf Angles: Section 05500.

### **PART 3 - EXECUTION**

#### **3.01 PREPARATION:**

- A. Remove dirt, debris, oil, grease and other foreign matter from surfaces to receive brick masonry.
- B. Built-In Work:
  - 1. Verify and coordinate locations of chases and openings for pipes, conduit, ducts and locations of flashing and weep holes.
  - 2. Establish layout lines and verify proper setting of bucks and frames.

#### **3.02 ERECTION:**

- A. Construct masonry as recommended in BIA Technical Notes on Brick Construction Number 7B, Water Resistance of Brick Masonry Construction and Workmanship Part III of III.
- B. Erect new masonry to conform to approved sample panels. For alteration and restoration work, match existing masonry.
- C. Erect adjoining walls simultaneously. Do not erect walls more than five feet above adjoining walls. Tothing is prohibited. Cover and protect tops of unfinished walls. Protect cavities from mortar and debris.
- D. Plumb piers and walls. Level brick courses using uniform joint thickness. Use power-driven, masonry saws for cutting material. Build external corners square, unless otherwise shown.
- E. Provide structural and pattern bonding as shown or as specified.
- F. Place reinforcement and build in openings for pipes, conduits, ducts, chases and other work as shown.
- G. Grout and set in place steel lintels furnished by other trades for openings in masonry walls.
- H. Install flashing, reglets and weep holes over lintels and where shown. Lap joints in flashing four inches minimum and bond with mastic. Install through-wall flashing to within ½ inch of inside and outside faces of wall. Set flashing in full bed of mortar and trowel full bed of mortar to ensure complete contact.
- I. Use facing brick for exposed brickwork. Select face brick from various stock piles so that they may be integrated to prevent segregating color ranges and bricks from different runs. Use same color mortar proportions throughout work.
- J. Prior to laying face brick, lay out work so that bond and design are maintained plumb and level and joints are of uniform width throughout the work.
- K. Do not use segments of bricks less than one half in size at corners or at openings. Use same sizes of bricks or same sizes of brick segments in same course at each side of jambs of openings or piers. Where cutting of units is necessary, use motor driven masonry saw.
- L. Thoroughly drench brick with water just before laying. Cover brick uniformly with mortar, shove and press into place, with no voids in wall joints, at window frames or at door frames.

- M. Where dovetail anchors are required, provide anchors vertically at each slot, maximum 16 inches on center and solidly fill in joints against concrete with mortar. Ensure that joints at anchors and bond courses are filled.
- N. Unless otherwise shown, use 3/8-inch concave joints, carefully tooled to form smooth, dense surface. Avoid burrs at intersections and mortar discoloration.
- O. Lay face brick from exterior with bed joints, head joints and collar joints full and level, faces plumb, joints uniform and bonds accurate.
- P. For alteration and restoration work, provide beds, coursing and face joints to match existing brick masonry precisely.
- Q. Place continuous joint reinforcement in courses 16 inches on center as shown. Use specially fabricated sections at corners and intersections.
- R. Provide expansion and control joints in masonry walls as shown. Ensure that joints are straight, uniform and of thickness shown. Ensure that clear joints are free of water, mortar and other obstructions. Leave continuous open joint for caulking and sealing in accordance with Section 07900. Provide cavity drainage system on top of the flashing inside the cavity. Drainage system shall be continuous at cell cavity flashing.
- S. Masonry anchors and accessories: In accordance with Sections 04050 and 04220.
- T. Accessories: Section 04050.
- U. Fill jambs of hollow metal frames solid with grout, as laying of brick progresses.
- V. As the work progresses, clean masonry with stiff brush before mortar sets.
- W. Install steel lintels where shown on Contract Documents or approved shop drawings.

### **3.03 REPAIRING, POINTING AND CLEANING:**

- A. Repairing:
  - 1. Remove and replace units that are loose, chipped, broken, stained or otherwise damaged; or if units do not blend properly with adjoining units. Install item units to match adjoining units and in fresh mortar, pointed to eliminate evidence of replacement.
- B. Pointing:
  - 1. When approved, point holes in joints of exposed brick masonry surfaces by completely filling with preshrunk mortar.
    - a. Pre-wet joint and holes before pointing.
    - b. Tool to match adjacent joints. Protect from premature drying.
  - 2. Correct defective joints by cutting out mortar and solidly refilling with new mortar.
  - 3. Point exposed raked joints of brick masonry with mortar and tool to match approved sample panel.
  - 4. Pre-wet holes and joints before pointing. Protect masonry from premature drying.
- C. Cleaning:
  - 1. After pointing, wet exposed brick-masonry surfaces and clean with soap-and-water solution applied with stiff-fiber brushes leaving masonry clean, free of mortar daubs and with tight mortar joints throughout. The use of acid is prohibited.

2. Allow masonry walls to cure at least three weeks in summer and five weeks in winter before final cleaning.
3. Test clean methods on sample wall panel; leave 1/2 panel uncleaned for comparison purposes. Obtain approval of sample cleaning before proceeding with cleaning of masonry.
4. Begin cleaning at top and work down.
  - a. Remove as much mortar from brick as is possible with scrapers or wire brushes; taking care not to discolor mortar or brick.
  - b. Dampen walls thoroughly with water to prevent loose materials from being drawn into pores of dry brick below and to prevent build-up of dry detergents.
5. Clean surfaces thoroughly with specified cleaning solution. Rinse and flush with clean water immediately after cleaning.
6. Leave work in first class condition, free from mortar stain or other defacement.

**END OF SECTION**

## SECTION 04220

### CONCRETE UNIT MASONRY

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing concrete unit masonry and glazed concrete masonry.
- B. Related Work Specified Elsewhere:
  - 1. Mortar, grout and masonry accessories: Section 04050.
  - 2. Brick masonry: Section 04215.
  - 3. Miscellaneous metal: Section 05500
  - 4. Flashing and sheet metal: Section 07600.
  - 5. Seals and sealants: Section 07900.
  - 6. Concrete reinforcement: Section 03200.
  - 7. Cast-in-place structural concrete: Section 03300.
  - 8. Structural precast concrete: Section 03400.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples for Initial Selection: Samples in small-scale form showing the full range of colors and textures available for each different exposed masonry unit required.
  - 2. Samples:
    - a. Three sets of each type of the following products used in the work.
      - 1) Concrete masonry units (CMU):
        - a) Lightweight.
        - b) Normal weight.
        - c) Special shapes.
        - d) Glazed.
      - 2) Precast lintels.
      - 3) CMU lintels.
    - b. Concrete masonry panels:
      - 1) Construct sample panels for exposed work only. Build panels not less than four feet square by eight inches thick, incorporating reinforcement and concrete masonry units. See Section 04215 for brick panels. Construct one panel of concrete glazed and unglazed masonry units.
      - 2) Use types of material, color variation, mortar, bond, tooling of joints, method of laying and workmanship shown or specified.
      - 3) Maintain panels in good condition and protect from moisture penetration until completion of masonry work and removal is directed.
      - 4) Approval of mock ups is for color, texture and blending of masonry unit; relationship of mortar and sealant colors to masonry unit colors; tooling of joints; and aesthetic qualities of workmanship.
      - 5) Maintain panel in good condition and protect from moisture penetration until completion of masonry work. Panel may remain as part of finished work after approval.
  - 3. Shop Drawings: Show fabrication and installation details for the following:
    - a. Comply with ACI 315, "Details and Detailing of Concrete Reinforcement." Show elevations of reinforced walls.

- B. Certification.

#### **1.02 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NCMA: TEK Manual for Concrete Masonry Design and Construction.
  - 3. ASTM: A615, C33, C55, C90, C129, C150, C744, E119.
  - 4. ACI: 315, 530.1-99.
  - 5. UL: Fire Resistance Directory.
- B. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, through one source from a single manufacturer for each product required.
- C. Fire-Resistance Ratings: Where indicated, provide materials and construction identical to those of assemblies with fire-resistance ratings determined per ASTM E119 by a testing and inspecting agency, by equivalent concrete masonry thickness, or by another means, as acceptable to authorities having jurisdiction.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to jobsite in good condition.
- B. Keep products clean and dry. Prevent contact with soil.
- C. Handle products so as to prevent chipping and breakage.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  - 1. The following are prohibited:
    - a. Use of products that are covered with frost.
    - b. Erection of masonry when the temperature is below 40F or tending to fall below 40F, unless suitable fireproof protection covering and heat are provided to maintain work and materials above 40F.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. CMU:
  - 1. General:
    - a. Nominal dimensions:
      - 1) Face size: 7-5/8 inches by 15-5/8 inches.
      - 2) Thickness: As shown.
    - b. For exposed work, units of uniform medium texture, free from defects and of uniform dimensions. Furnish special units as necessary.
    - c. Units having UL Fire Resistance Directory ratings to achieve fire ratings for walls as required by local building codes and as shown.
    - d. Units free from iron and other substances that will stain plaster or paint.
  - 2. Lightweight CMU:
    - a. Hollow, lightweight loadbearing concrete units: ASTM C90, Type I.
    - b. Solid, lightweight loadbearing concrete units: ASTM C90, Type I.

- c. Lightweight concrete brick: ASTM C55, Type I, Grade N.
    - d. Aggregate: Limited to expanded shale or slate.
    - e. Hollow, light-weight non-load bearing concrete units: ASTM C129, Type 1
  - 3. Normal-weight CMU:
    - a. Solid loadbearing units: ASTM C90, Type I.
    - b. Exposed alteration and restoration work: Units of same type, grade, size, color variation, texture and appearance as existing masonry work.
  - 4. Concrete fill for CMU bond beams and reinforced masonry unit cores: Class 3500; maximum aggregate size, 3/4 inch, and in accordance with Section 03300.
- B. Glazed CMU:
  - 1. Prefaced or glazed concrete masonry units shall conform to the requirements specified above for C90 concrete masonry units, and the facing to the following requirements:
    - a. Glazing (Facing): ASTM C744.
- C. Lintels:
  - 1. General:
    - a. Provide lintels of same height and width, texture and density as CMU and 16 inches longer than width of opening, free of cracks and chipped and broken edges.
    - b. Concrete:
      - 1) Portland cement in accordance with Section 03300: ASTM C150, Type I.
      - 2) Reinforcing steel bars in accordance with Section 03200: ASTM A615, Grade 60.
      - 3) Aggregate: ASTM C33, graded from 1/8 inch to 3/8 inch.
  - 2. Precast lintels: Class 3500 concrete in accordance with Section 03400, reinforced full length with No. 5 reinforcing bars in accordance with Section 03200, one at top and one at bottom for each four inches nominal width, and No. 2 ties at eight inches on center at each end, unless otherwise shown.
    - a. CMU lintels:
    - b. Lightweight loadbearing lintel-type CMU complying with specified requirements.
    - c. Filled with Class-3000 concrete minimum in accordance with Section 03300 and reinforced in accordance with Section 03200 for width and span as specified for precast lintels, unless otherwise shown.
  - 3. Steel Lintels: Section 05500.
- D. Masonry Accessories: Section 04050.
- E. Cleaning Solution: Section 04215.
- F. Mortar and Grout: Sections 04050 and 03300.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Clean foreign substances which would affect bond of mortar from surfaces to receive CMU.
- B. Built-In Work.
  - 1. Verify locations of chases and openings for pipes, conduits and ducts.
  - 2. Establish locations for walls and partitions; verify that door frames and other built-in work provided by others are or can be properly located.

### 3.02 ERECTION:

- A. Erect exposed CMU masonry work to conform to approved sample panel.
- B. Use of loadbearing and non-loadbearing units shall be governed by locations and purposes to be served. Except as otherwise shown, follow these general uses:
  - 1. Loadbearing: Backup loadbearing masonry walls and for bearing partitions.
  - 2. Non-loadbearing: Furring, non-bearing partitions and backup non-loadbearing masonry walls.
  - 3. Solid: Where specifically required by drawings, for fireproofing structural steel and for partitions with fire ratings.
- C. Erect adjoining walls simultaneously. Do not erect walls more than five feet above adjoining walls. Tothing is prohibited. Cover and protect the tops of unfinished walls.
- D. Plumb piers, walls and partitions. Level courses using uniform joint thickness for interior work, build external corners with bullnose units.
- E. Place reinforcement and build in openings for pipes, conduits, ducts, chases, frames and other work as shown.
- F. Grout in accordance with Sections 04050 and 03300 and set in place miscellaneous steel lintels furnished by other trades for openings in masonry walls in accordance with Section 05500. Provide eight-inch minimum bearing on adjacent masonry unless otherwise indicated.
- G. As the work progresses, keep masonry clean by stiff brushing with fiber brush. Do not wet units before laying up. Unless otherwise shown, lay units in running bond.
  - 1. Set cored units with cells vertical, unless manufactured with horizontal cores. Open ends not permitted.
  - 2. Lay out so that at jambs and internal and external angles, the headers in alternate courses are at least 2 inches long. Use "Z shapes if necessary , especially with glazed masonry units.
  - 3. Lay units out so that no cut piece is less than 5 inches long; not less that 2 inches high
  - 4. Lay concrete units up suitable for painting. See finish schedules.
- H. Prevent smearing mortar on surface of exposed units. If mortar smears occur, remove while soft.
- I. Carefully cut faces of units for electrical or other outlets and cut-out backs for conduit and other piping. Where possible, use full-size units. Do not use portions of units shorter than four inches. Perform cutting with power-driven masonry saws.
- J. Build partitions straight, plumb, true to line and uniform in thickness unless shown otherwise. Anchor partitions at junctions with CMU exterior walls using Z-type steel anchors, rigid or corrugated, Z-bar anchors vertically 24 inches on center maximum unless otherwise shown. Use dovetail anchors spaced not over 16 inches on vertical centers where partitions abut concrete walls or concrete columns and steel framing anchors where partitions abut steel columns. Start partitions on concrete slabs and extend to structure above, except where shown to be erected only to ceiling.

- K. Use CMU or precast lintels except where steel lintels are shown. Use precast lintels for four-inch CMU partitions. For other CMU partitions and walls, use lintels fabricated at plant or at jobsite from concrete-masonry lintel units. Provide eight-inch minimum bearing on adjacent masonry unless otherwise indicated.
- L. Fill cells of CMU with mortar in accordance with Section 04050, adjacent to openings and around built-in and embedded items.
- M. Place prefabricated continuous joint reinforcement in alternate horizontal joints above grade and each horizontal joint below grade. Terminate each side of expansion joints. Use specially fabricated sections at corners and intersections.
- N. Fill cells solid with grout in accordance with Sections 04050 and 03300 where vertical reinforcement is installed within CMU walls.
- O. Fill heads and jambs of hollow metal frames solid with mortar in accordance with Section 04050, as laying of units progresses.
- P. Tooling joints:
  1. After mortar has attained initial set, finish and compact with non-staining metal jointing tool, forcing mortar tight against masonry units and closing all hair line cracks and crevices.
  2. All interior and exterior joints tooled concave type, except as stated below or noted otherwise.
    - a. At wall faces to receive other facing materials having mortar backing, strike joints flush.
    - b. At concealed joints and joints on cavity side of cavity walls, strike flush.
- Q. Mortar Bedding in accordance with Section 04050:
  1. Hollow units shall be laid with full mortar coverage on horizontal and vertical face shells, except that webs shall also be bedded in all courses of piers, columns, and pilasters, and in the starting course of footings and solid foundation walls, and where adjacent to cells or cavities to be reinforced and/or filled with mortar or grout.
  2. Solid units laid with full head and bed joints.
  3. Masonry units:
    - a. Laid in beds of mortar of such plasticity and fullness and spread with trowel so that pressing and shoving units will obviate dashing or slushing joints after units are laid. Mortar shall not be "furrowed".
    - b. In cavity walls, mortar shall be beveled on cavity side to prevent protruding mortar fins and subsequent dropping of mortar into cavity.
    - c. For interior and exterior faces of walls, prior to placing units, one end of each stretcher shall be fully covered with mortar.
    - d. For any wall thickness, leave no voids whatever, except space in cavity walls.
- R. Top of Non-Loadbearing Partitions: Build non-loadbearing interior partitions full height of story to underside of solid floor or roof structure above, unless shown otherwise. Build as follows depending on the movement requirements of floor or structure above, and as shown:
  1. Install fire resistant compressible filler in joint between top of partition and underside of structure above.
  2. Fill top joint with mortar in accordance with Section 04050, after dead-load deflection of structure above approaches final position.
- S. Installation of Masonry Accessories:
  1. Wall anchors:

- a. Space Z-type rigid-steel anchors at intersections of loadbearing CMU walls and control joints.
  - b. Space corrugated-steel anchors 16 inches on centers vertically at control joints located not more than two feet from intersections of CMU walls.
2. Steel framing anchors: Install anchors to attach CMU walls to structural steel building frame at 16 inches on centers horizontally and vertically. Weld anchors to structural steel so as to achieve full strength of anchor system.
  3. Soldier-course anchors: Install corrugated-steel anchors in horizontal mortar joints of soldier coursing, except where continuous wall reinforcement is used. Space anchors 24 inches on centers horizontally.
  4. Flashing: Install flashing to provide positive keying to mortar.
  5. Weep holes: Install at two feet on centers at terminations of through-wall flashing, base flashings, lintels, or relief angles, and as shown.
  6. Control joint gasket: Install in sash-type CMU and between wythes in accordance with manufacturer's instructions and as shown. Seal weather side of control joints with sealant and backup rod as specified in Section 07900.
- T. Bond Beams:
1. Provide bond beams in walls where shown.
  2. Construct similar to CMU lintels, except beams to be continuous, except at control joints.

### **3.03 POINTING AND CLEANING:**

- A. Pointing:
1. When approved, point holes in joints of exposed CMU masonry surfaces by completely filling with preshrunk mortar.
  2. Point exposed raked joints of CMU masonry with mortar and tool to match approved samples panels.
- B. Cleaning:
1. After pointing, wet and clean exposed CMU masonry surfaces with soap-and-water solution, applied with stiff-fiber brushes leaving masonry clean, free of mortar daubs and with tight mortar joints throughout. The use of acid is prohibited.
  2. Allow masonry walls to cure at least three weeks in summer and five weeks in winter before cleaning.
  3. Begin cleaning at top and work down.
  4. Remove as much mortar from masonry as is possible by hand with wooden paddles and nonmetallic scraper hoes or chisels or stiff bristle brushes taking care not to deface masonry units.
  5. Remove specific stains by cleaning method indicated in NCMA TEK 8-2 applicable to type of stain present on exposed surfaces.
  6. Clean surfaces thoroughly and carefully with specified cleaning solution.
  7. Rinse and flush with clean water immediately after cleaning.
  8. Leave work in clean condition, free from mortar stain or other defacement.

**END OF SECTION**

## SECTION 04415

### GRANITE

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing granite for architectural work.
- B. Related Work Specified Elsewhere:
  - 1. Mortar, grout and masonry accessories: Section 04050.
  - 2. Seals and sealants: Section 07900.
  - 3. Cast-in-place structural concrete: Section 03300.
  - 4. Platform edge light glass lenses and sealant: Section 08800.

##### 1.02 PERFORMANCE REQUIREMENTS:

- A. Stone Abrasion Resistance: Minimum abrasive-hardness value of 12, as determined per ASTM C241.
- B. Static Coefficient of Friction: ASTM C1028, values as follows:
  - 1. Level Surfaces: A minimum of 0.6.
  - 2. Step Treads: A minimum of 0.6.
  - 3. Ramp Surfaces: A minimum of 0.8.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Show the following:
      - 1) Bedding, bonding and jointing of granite, including typical and special anchoring, expansion-joint details and interface with other work.
      - 2) Dimensions and setting numbers of each stone in plan and elevation, including grading data for drainage.
  - 2. Working Drawings:
    - a. Include full explanation of erection methods and installation procedures, temporary loading, anchor design, surface preparation, setting materials, bonding, testing and other work as directed.
    - b. For granite walls, include structural analysis data signed and sealed by the qualified professional structural engineer responsible for their preparation.
  - 3. Samples:
    - a. Submit three sets of samples of each type of granite used in the work, showing full range of color, texture, veining, fissures and finish of each type; each sample 12 inches square by one-inch thick. Include a minimum of two pieces in each set with maximum number of pieces in each set as necessary to demonstrate full range and variations.
      - 1) Material delivered or erected not within approved range samples will be rejected.
    - b. Epoxy for mortar dams and epoxy fill and for setting dowels: Manufacturer's standard container.
    - c. Non-staining wedge.

- d. Stainless steel dowel.
- e. Platform edge glass lens and sealant: Section 08800.
  - 1) Cured six-inch long strip of grout matching existing white granite grout joint color for granite slab transverse joint grouting: Section 04050.
  - 2) Platform joint sealant: Section 07900.
- 4. Documentation:
  - a. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
  - b. Quality-Assurance Program.
- 5. Certification.

**1.04 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications.
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NBGQA: Specifications for Architectural Granite.
  - 3. ASTM: C241, C615, C1028.
- B. Qualifications of Granite Quarries:
  - 1. Obtain granite from approved quarries having capacity and facilities for furnishing the quantity, size and quality of granite required.
  - 2. Provide the product of one quarry matching approved samples.
  - 3. Source Limitations for Stone: Obtain each variety of stone, regardless of finish, from a single quarry with resources to provide materials of consistent quality in appearance and physical properties.
  - 4. Installer Qualifications: An experienced installer who has completed dimension stone cladding systems similar in material, design, and extent to those indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- C. Quality Assurance Program: Before installing granite edging, walls and stairs, construct mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for completed work.
  - 1. Granite edging:
    - a. Demonstration installation:
      - 1) Demonstration installation to consist of three adjacent units to be installed in the work or as otherwise directed.
      - 2) Perform work as shown and in accordance with approved shop drawings and working drawings, using specified materials.
    - b. Testing:
      - 1) In the presence of the Engineer and in accordance with approved working drawings, test each unit of the demonstration installation by placing end of crowbar at each end of unit and prying with a force that would lift an unbonded piece of stone with 50 psf live load. Protect stone from touching crowbar directly. In the presence of the Engineer, before joint sealants are installed, test the bonded strength of each unit after two-hour cure time by applying an uplift load of 2,000 pounds at each drainage opening below the granite as approved.
      - 2) If a unit fails to pass test by lifting or cracking of unit or setting bed, remove unit, revise setting procedures and reset unit. Repeat, as necessary, until approval is obtained.

- 3) Do not proceed with remainder of the work until demonstration installation, procedures and personnel are approved.
  2. Stair treads and landings:
    - a. Prior to erection at site, test each stair tread and stair landing to withstand live load of 300 psf for duration of not less than 15 minutes. Test only components which perform a structural function and are not supported over their entire length by cast-in-place concrete.
  3. Granite walls:
    - a. Build mockups of typical exterior wall with dimension stone cladding, approximately 72 inches long by 48 inches high or as directed by the Engineer.
    - b. Show typical components, attachments to building structure, and methods of installation. Include sealant-filled joint complying with requirements in Section 07900.
- D. Professional Structural Engineer Qualifications: A professional structural engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of granite wall cladding systems that are similar to those indicated for this Project in material, design, and extent.

#### **1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Pack granite so as to prevent damage in transit, and deliver in accordance with Contract schedule and setting sequence.
- B. Deliver each piece of granite with code mark on unexposed face, corresponding to shop drawings using nonstaining paint. Deliver and unload granite. Prevent damage and soiling during delivery and unloading of granite.
- C. Protect from disfiguring elements.
- D. Separate granite from wood skids with polyethylene or other nonstaining material. Store under waterproof covering, and keep dry.
- E. Remove rejected stones from jobsite immediately.

#### **1.06 JOB CONDITIONS:**

- A. Environmental Requirements:
  1. Do not use frozen materials or materials mixed or coated with ice or frost. Remove and replace dimension stone cladding damaged by frost or freezing conditions.
  2. Erection and pointing of granite when ambient temperature is below 50F and or tending to fall below 50F is prohibited.
- B. Cold-Weather Protection: When night-time temperature is forecasted within 50 to 25 Deg F: Cover dimension stone cladding with a weather-resistant membrane for 48 hours after construction. Do not install granite when night time temperature is forecasted below 25 Deg.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Granite:
  1. Granite Building Stone Standard: ASTM C615.

2. NBGQA Specifications for Architectural Granite, free from starts, cracks or seams which might impair its structural integrity or appearance.
  3. Color classification: Granite matching grain, color and variegation of all white, fine-to-medium-grain granite as listed in referenced NBGQA standard.
  4. Exposed surfaces finished in accordance with the following and as shown:
    - a. Type 1: Thermal finish or four-cut, slip-resistant.
    - b. Type 2: Six-cut, stippled.
    - c. Type 3: Honed-dull sheen without reflections.
    - d. Type 4: Split face, nominal depth of 3-1/2 inches. Use Type 4 for all Granite Sets.
  5. Where stone thickness permits, provide lewis holes for lifting stones weighing over 100 pounds. Make lewis holes not closer than two inches from finished face of stone nor in exposed portions of stone.
  6. For alteration and restoration work, use granite salvaged from existing work. If salvaged granite is not sufficient, provide new granite to match existing granite in type, size and appearance.
- B. Mortar Materials and Granite Accessories: Section 04050.
- C. Portland Cement Paste: Section 03300.
- D. Granite platform edge glass lenses and setting materials:
  1. Glass lenses: Salvage and reuse existing lenses to greatest extent possible. If Engineer determines existing lenses cannot be reused: Section 08800.
  2. Glass lens sealant: Section 08800.
  3. Lead shims or lead rope: Section 08800.
- E. Dowels: Salvage and reuse existing dowels to greatest extent possible. If Engineer determines existing dowels cannot be reused: Dowels for platform edge granite slab dowels: Section 04050, minimum 1/2-inch diameter, of sufficient length to extend into stone 1/2 thickness of stone and to extend two inches into structural concrete.
- F. Epoxy mortar and epoxy fill for mortar dams and epoxy for setting dowels for Granite Edge Slabs: Section 04050.
- G. Non-staining shim wedges to support granite slabs during curing of epoxy mortar dams: As approved.

### **PART 3 - EXECUTION**

#### **3.01 EXAMINATION:**

- A. Examine surfaces to receive dimension stone cladding and conditions under which dimension stone cladding will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of dimension stone cladding.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.02 PREPARATION:**

- A. Runways, Scaffolds and Hoists: Provide and move scaffolding, temporary runways, temporary floors, staging and hoists in accordance with specified safety requirements.

- B. Substrate: Remove foreign substances that would affect bond of mortar from surfaces to receive granite.
- C. Advise installers of other work about specific requirements for placement of inserts, flashing reglets, and similar items to be used by dimension stone cladding Installer for anchoring, supporting, and flashing of dimension stone cladding system. Furnish installers of other work with Drawings or templates showing locations of these items.

### **3.03 FABRICATION AND ERECTION:**

- A. General:
  - 1. Fabricate granite in sizes and with joint patterns shown on Contract Drawings and approved shop drawings.
  - 2. Installation of granite which is not within the approved range of color, texture, finish, veining and fissures; is mismatched; shows flaws or imperfection in cutting; or has other defects is prohibited.
  - 3. Provide openings for installation of work of other trades in accordance with approved shop drawings. Coordinate size of rabbet at expansion joint in granite platform edging with the expansion joint dimension and the size of compression seal.
  - 4. Provide 1/4-inch joints, unless otherwise shown on Contract Drawings and approved shop drawings.
  - 5. Unless otherwise shown, completely fill joints in granite work and rake out to depth of 3/4 inch, except paving joints and pylon-apron joints showing grout.
  - 6. Set stones accurately in alignment with other stones and adjacent work. Set stones in full mortar beds. Level and plumb stones as work progresses.
  - 7. Set finish surfaces in true and even planes, with uniform jointing. Take up and reset loose, hollow sounding slabs. Leave surface free of mortar stain and other defacements.
  - 8. Where epoxy materials are used, follow manufacturer's recommendations.
  - 9. Granite paving over waterproofing: Carefully place granite and setting materials over waterproofing so protection materials are not displaced and waterproofing is not punctured or otherwise damaged. Replace protection materials that become displaced and arrange for repair of damaged waterproofing before covering with paving.
    - a. Provide cork joint filler in accordance with Section 07900, where indicated, at waterproofing that is turned up on vertical surfaces or, if not indicated, provide temporary filler or protection until granite paving installation is complete.
- B. Tolerances: Meet NBGQA Specifications for Architectural Granite.
- C. Paving and Granite Apron at Pylons:
  - 1. Do not put down more setting bed than can be covered in the same day.
  - 2. Dust setting bed with portland cement and butter underside of stone with neat portland cement paste in accordance with Section 03300 and pound into place at proper elevation.
  - 3. Where concrete is to be cast against stone, parge contact surface with not less than 1/2 inch of nonstaining setting mortar in accordance with Section 04050.
- D. Benches: Provide bench seats and backs in one piece with no joints.
- E. Walls:
  - 1. Fabrication: Fabricate granite wall units in sizes and shapes required to comply with requirements indicated, including details on Drawings and Shop Drawings.

- a. Cut and drill sinkages and holes in granite for anchors, fasteners, supports, and lifting devices as indicated or needed to set stone securely in place; shape beds to fit supports.
  - b. Cut granite to produce pieces of thickness, size, and shape indicated and to comply with fabrication and construction tolerances recommended by applicable stone association or, if none, by stone source, for faces, edges, beds, and backs.
  - c. Minimum Thickness: 1-½ inches.
  - d. Cut granite panels to produce joints of uniform width and in locations indicated.
  - e. Provide minimum anchorage as follows and in accordance with standard practice:
    - 1) Not less than one anchor for every six square feet of stone.
    - 2) Minimum of two anchors at each head and bed joint.
- F. Application to Floor Hatches and Other Metal Items:
- 1. Apply granite to recessed floor hatches and other metal surfaces by the use of epoxy mortar in accordance with Section 04050.
  - 2. Use epoxy of type and brand recommended by manufacturer to set granite on metal and in accordance with Section 04050. Continue paving pattern of adjacent surfaces over hatch covers.
- G. Application of Granite Platform Edging:
- 1. Set granite with epoxy mortar in accordance with recommendations of epoxy manufacturer, and with Section 04050 and with approved quality-assurance program.
  - 2. Set dowels with epoxy mortar not less than 1-1/2 inches into granite. Allow mortar to cure to not less than 75 percent of its ultimate compressive strength.
  - 3. Place epoxy mortar as shown, using mortar dams or other approved method of forming. Adjust as required to obtain full contact of epoxy mortar with granite. Apply epoxy mortar in a self-leveling consistency. Set granite, embedding it into epoxy mortar. To permit drainage, maintain spaces between mortar dams as shown.
  - 4. Expansion joints: Coordinate the distance between granite edge stones with the required expansion joint size (width) for the temperature of the structure at the time stones are set. See structural drawings.
  - 5. Install lamps in accordance with Division 16 and install lead shims, glass lenses, and seal lenses in accordance with Section 08800.
  - 6. Resetting platform edge granite slabs:
    - a. The following is Red Tag work and is limited to only the number of granite slabs that can be reset in one work shift:
      - 1) Preparation for raising granite slabs: Remove IRIS screw anchors and metal wireway sections. Sawcut granite edge slabs' transverse joints both vertically and horizontally. Remove platform edge light lenses and lamps. Dig out epoxy bedding material.
      - 2) Provide and move staging and hoists in accordance with safety requirements and as approved. Lift up existing granite slab edge unit(s). Store units to be reset so as to prevent damage and discoloration. Replacement of damaged and broken slabs in kind is the responsibility of the Contractor.
      - 3) Remove dowels and salvage as many as possible of the existing stainless steel granite anchoring pins for re-use. Replacement of damaged and missing items in kind is the responsibility of the Contractor.
      - 4) Demolish existing epoxy setting dams that support granite and remove to expose structural slab.

- 5) Clean and prepare surfaces of unit(s) and structural slab to receive new epoxy setting dams. Where existing concrete has not been treated with MMA, scarify slab to provide proper substrate for new epoxy mortar dams. Do not scarify MMA patches or MMA-treated concrete. Remove foreign substances that would affect bond of epoxy mortar from surfaces of concrete slab receiving granite.
- 6) Laser survey or set string line as necessary to establish elevations for granite slabs as necessary.
- 7) Mix epoxy mortar in accordance with manufacturer's instructions and place mortar bulkheads or other approved forming method to form setting dams at a width to match existing and at a height as required to set granite slabs to proper elevation, leaving eight-inch wide drainage channels between setting dams. Pour neat epoxy between epoxy mortar bulkheads to a slighter higher elevation. Remove excess mortar and neat epoxy and adjust as required to obtain full contact between epoxy and granite.
- 8) Reset dowels or set new dowels as necessary at not less than two inches into concrete structural slab and to extend into granite 1/2 depth of granite. Set non-staining wedges for support to allow proper curing of epoxy dams when granite is reset.
- 9) Set original granite slab unit(s) on intermittent epoxy dams and dowels at proper elevations, providing uniform 1/4-inch joints between adjacent units, except as necessary to match existing. Set granite slabs accurately to corrective alignment between adjacent slabs and existing work and with finish surfaces in true and even planes. After each granite edge unit is set, take measurements to verify that unit is at proper elevation and location. Level and plumb granite slabs as work progresses. Take up and reset loose, hollow sounding units.
- 10) Install lead shims, reinstall platform edge lamps, and reinstall glass lenses and reseal lenses in accordance with Section 08800.
- 11) Remount IRIIS metal wireway sections with screw anchors.
- 12) After epoxy dams have cured, perform bond strength testing as previously specified.

H. Granite Sets:

1. Random ashlar pattern with broken course and range or stacked bond, as shown.

**3.04 POINTING AND CLEANING:**

A. Pointing:

1. After setting mortar has cured, point voids in joints of exposed granite paving and pylon aprons with preshrunk mortar. Remove excess mortar.
2. Seal joints in granite work with sealants in accordance with Section 07900, except paving joints and pylon-apron joints.

B. Cleaning:

1. Clean joint surfaces and remove dirt, coatings, moisture and other foreign substances which could interfere with bond. Recaulk granite edge slabs' transverse joints both vertically and horizontally with grout and let cure.
2. Thoroughly and carefully clean work by approved means and leave in first class condition, free from mortar or other defacement. Clean all exposed granite surfaces, including joints, with water and washing compound soap powder solution in accordance with recommendations of manufacturer. Sponge and wash thoroughly. Use of acid or acid cleaners is prohibited. Remove stains by approved means. Clean granite masonry surfaces, including those grouted or sealed, with soap-

powder solution and fiber brushes to remove stains. Thoroughly and carefully clean work and leave in first-class condition, free from mortar stains or other defacement. Immediately after cleaning, rinse surfaces with clear water. Polish with clean dry cloths.

- C. Protection:
  - 1. Protect granite work from damage after erection. Provide protective boxing or other suitable means whenever necessary in the absence of specific instructions from the Engineer. Do not use materials that will stain or deface granite. Use galvanized nails in protective boxing.
  - 2. Continuously protect granite work from water during construction and until installation is complete and is approved.
  - 3. Protect granite work from traffic of any kind for not less than two hours after setting. Remove protection immediately after two hours curing.

**3.05 FIELD QUALITY ASSURANCE:**

- A. Granite Platform Edging:
  - 1. Perform work in accordance with approved quality-assurance program.
  - 2. Change of procedures and personnel without approval is prohibited.

## SECTION 05091

### RAIL WELDING

#### NOTE:

Section 1 (Parts 1 - 4) of this specification includes rail welding by Electric Flash-Butt Welding method.

Section 2 (Parts 5 - 8) of this specification includes rail welding by the Thermite Rail Welding method.

#### SECTION 1 - ELECTRIC FLASH-BUTT WELDING

##### PART 1 - GENERAL

###### 1.01 SECTION INCLUDES

- A. The work specified in this section shall include the fabrication of continuous welded rail (CWR) strings by electric flash-butt welding, including testing, inspection, and qualification of welding and welders.
- B. The work specified in this section shall also include movement of rail from the manufacturer to the Contractor's welding plant, from the welding plant to the welded string storage location and from the storage location to the final placement in track location.

###### 1.02 RELATED SECTIONS

- A. Section 05651- General Track Construction
- B. Section 05652 - Ballasted Track Construction
- C. Section 05653 - Direct Fixation Track Construction
- D. Section 05656 - Running Rail

###### 1.03 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association (AREMA) Manual for Railway Engineering, Vol. I, Chapter 4, Specification for Fabrication of Continuous Welded Rail (**latest addition**).
- B. ASTM E18
- C. **ASTM E709 (replaced E109)**
- D. **ASTM E94 (replaced E142)**
- E. ASTM E164
- ~~F. **ASTM E709 (duplicate)**~~
- G. AWS D1.1

- H. USNRC Rules and Regulations, Title 10, Atomic Energy, Part 20.
- I. ASNT SNT-TC-1A Recommended Guidelines for Qualification and Certification of Non-Destructive Testing Personnel.

#### 1.04 SUBMITTALS

- A. The Contractor shall submit procedures and documentation in accordance with the Section 01300 and as follows.
- B. Approval of the following items shall be obtained prior to production welding:
  - 1. Identification of welding plant with internal shear and major items of equipment to be used.
  - 2. Standards of welding machine performance as recommended by the manufacturer.
  - 3. Oscillograph record of each qualification weld showing number and duration of preheat impulses, flashing time, upset current time, platen travel during flashing, and platen travel distance for upset cycle.
  - 4. Report of test results of each qualification weld.
  - 5. Schedule showing string number, length, proposed stockpile location and installation location.
- C. Production weld approval shall be based on these items:
  - 1. Oscillograph records of production welds.
  - 2. Production welding record.
- D. Deliver five each taper gauges graduated in hundredths of an inch, with cases, to the Engineer. Taper gauges shall become Authority property.
- E. Deliver four (4) each 36 inch steel straight edges, as manufactured by L. S. Starrett Company of Athol, Massachusetts, or approved equal, to the Engineer. Straight edges shall become Authority property.

#### 1.05 QUALITY ASSURANCE

- A. The Contractor shall inspect rail for straightness at the manufacturer's plant.
- B. Plant Qualification
- C. General
  - 1. Using the welding plant, personnel and procedures proposed for production welding, make six qualification welds, three for each type of rail.
  - 2. The qualification welds shall be made in the presence of the Engineer. Pieces of the Authority furnished short rails shall be used for making the qualification welds.
  - 3. Weld tests shall provide sufficient detail to establish capability of the welding apparatus to meet specified welding requirements.
- D. Qualification Weld Testing: The six qualification welds shall be tested by radiography, hardness testing, metallurgical testing and ultrasonic testing in the following manner:
  - 1. Radiography:
    - a. Radiography shall be conducted in accordance with **ASTM E94** using short wave length radiation. The use of nuclear by products for radiography shall be in accordance with USNRC Rules and Regulations, Title 10, Atomic Energy, Part 20. The transportation, handling and storage of hazardous materials used in the examination of welds shall be performed only by or

- under the supervision of a person of proven experience and ability, operating under a proper license.
- b. Film shall be capable of producing sharp images, and be free of processing and mechanical defects. High speed, coarse-grained film is prohibited. Fine films shall be used covering head, web and each side of base as shown on **Exhibit 05091-A**. Identify each film by contract number, rail identification, date of test, name of testing agency and the view.
  - c. Acceptance of the weld shall be based on the weld having full penetration, complete fusion and being free of flaws. A letter shall accompany each film plate bearing information given on the film, certifying compliance with **ASTM E94** and stating whether or not the weld satisfies specified requirements.
  - d. Radiograph plates shall be compared to ultrasonic scans to determine the ability of ultrasonic equipment to identify inclusions or other weld defects. If necessary, compare radiograph plates with ultrasonic scans using the ultrasonic reference blocks. Results of this comparison shall be made in a separate report and include recommended ultrasonic equipment to be used and sensitivity requirements.
2. Hardness testing:
- a. Hardness testing shall be in accordance with current AREMA "Specification for Fabrication of Continuous Welded Rail" (**latest edition**) and "Specification for the Quality Assurance of Electric Flash-butt Welding of Rail."
  - b. The hardness test shall be performed in accordance with ASTM E18, using a 150kgf diamond sphere conical penetrator. Hardness and location shall be recorded.
3. Metallurgical Tests:
- a. A one foot specimen of each weld shall be sectioned longitudinally through the centerline of the rail. Each specimen shall be etched to enable observation of the hardness pattern, metallurgical properties and the heat affected zone.
  - b. An acceptable weld as determined by the metallurgical test shall meet the following criteria:
    - 1) Steel shall consist of fine-grained pearlite structure with small interlamellar spacing.
    - 2) The hardness pattern in the etched section shall have a uniform distribution.
    - 3) The heat affected zone shall be parallel and fully extended on both sides of the weld.
    - 4) The weld joint shall be planar.
    - 5) Uniform zone of plastic deformation resulting from upset operation shall extend equally on both sides of the weld point.
  - c. An 8x10 black and white photograph and a description of the metallurgical properties including grain structure and distribution shall be submitted.
4. Ultrasonic test, slow bend test and magnetic particle test in accordance with the AREMA Manual (**latest edition**).
5. All test samples are to be permanently marked for identification and returned to the Engineer at the completion of testing.

#### **1.06 DELIVERY, STORAGE AND HANDLING**

- A. It shall be the Contractor's responsibility to make all arrangements for shipment and handling of the rail. The Contractor shall:
1. Coordinate unwelded rail stick movement from the manufacturer's plant to the welding site by rail and truck as necessary.
  2. Obtain any required permits from state, regional or local jurisdictions.
  3. Make arrangements for loading, unloading and stacking rail sticks.

- B. Handle and store rail so that it is not damaged either before or after welding.
  - 1. Stacking of sticks shall be as approved by the Engineer and layers shall be separated by wood lathing.
  - 2. Rail shall be handled in a manner that prevents damage to fasteners, rail and structures.
  - 3. Rail shall not be dropped or dragged on the trackbed. The use of rollers is required.

## **PART 2 - PRODUCTS**

### **2.01 RAIL FOR CONTINUOUS WELDED RAIL**

- A. Rail for the Work shall be furnished by the Contractor in accordance with **WMATA** Standard Specification Section 05656, Running Rail.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION FOR WELDING**

- A. The welding plant shall be set up on Authority property as approved by the Engineer.
- B. Rail welding shall be in accordance with the current AREMA Manual "Specification for Fabrication of Continuous Welded Rail" (**latest edition**), "Specification for the Quality Assurance of Electric Flash-butt Welding of Rail" and as specified herein.
- C. Rail for installation in this Contract shall be welded in accordance with a string schedule approved by the Engineer. Strings should be not less than 720 feet in length in order to minimize field connections, unless shorter strings are required to satisfy conditions of rail type or installation. Each string shall be of only one rail type; standard or head hardened rail.
- D. Rails shall be welded using an electric flash butt welding plant equivalent to the Chessie System plant at Russell, KY or Amtrak Plant at New Haven, CT. An equivalent portable plant may be set up within the contract area.
- E. Rail Inspection Prior to Welding
  - 1. Inspect each rail end prior to welding for deviations from lateral line in either direction and for upsweep, downsweep or droop.
  - 2. Rail with upsweep, downsweep or droop and rail failing to comply with the tolerances shown on **Exhibit 05091-B** shall be cut back a sufficient distance to achieve the required alignment. Rails shall be cut clean and within 1/32 inch of square by means of rail saws or abrasive cutting discs.
  - 3. Torch cutting of rail is prohibited. Cutting shall be done at no additional cost to the Authority.
- F. Rail End Preparation for Welding: Immediately prior to welding, all rail ends shall be wire brushed to remove mill scale or other dirt which might hinder the flow of electric current.
- G. Alignment in Weld Machine:
  - 1. Alignment of the rail in the welding machine shall be done on the head of the rail.
  - 2. Vertical alignment shall provide for a flat running surface within 0.01 inch between the abutting rail ends.
  - 3. Horizontal alignment shall distribute head width differences evenly between each side of the head. No horizontal offset shall exceed 0.03 inch on either side of the head. No horizontal offset shall exceed 0.10 inch on either side of the base of the rail.

### 3.02 WELDING OF RAILS

- A. All welding procedures shall be approved prior to use and as a minimum shall be in accordance with the following:
  - 1. Forge welds to point of no further plastic deformation with upset of 5/8 inch minimum.
  - 2. Each weld to achieve full penetration, complete fusion, and be free of flaws and inclusions.
- B. Record welding machine performance with an oscillograph recorder or computer printout.
  - 1. Record platen movement and current impulses.
  - 2. The oscillograph record shall be compared with the approved procedure record from the qualification welds. If the record indicates performance which is not in conformance with the approved procedure, the weld will be rejected.
  - 3. The recorder shall be calibrated each day.
- C. If flashing is interrupted with less than ½ inch of flashing distance remaining before upsetting, the rails shall be reclamped and flashing initiated again.
- D. Grinding shall be done immediately following welding at an elevated temperature.
- E. Welds shall be ground to meet the following finishing tolerances:
  - 1. A finished deviation of not more than plus or minus 0.005 inch of the parent section of the rail head shall be allowed.
  - 2. The weld at the top and sides of the rail head shall be finished to plus or minus 0.010 inch of the parent section.
  - 3. The bottom and sides of rail base shall be finished to within plus or minus 0.010 inch of the parent section.
  - 4. The web zone, underside of head, web, top of base, both fillet each side, shall be finished to within 1/8 inch of parent contour or closer but shall not be deeper than parent section.
  - 5. Finishing shall eliminate all cracks visible to the unaided eye.
  - 6. All notches created by offset conditions or twisted rails shall be eliminated by grinding to blend the variations on both sides of the head and base for a distance of 18 inches.
  - 7. All fins on the weld due to grinding and/or shear drag shall be removed prior to final inspection.
- F. All rails used for electric-flash-butt welds shall have scale removed down to bring metal in those areas of the rail where welding current-carrying electrodes contact the rail. The weld and adjacent rail for a distance clearing the electrodes shall be rejected if the areas of the electrodes contact there is not more than 95% of the mill scales removed. Rails showing evidence of electrode burns shall be rejected. An electrode burn is considered to exist where the metal has been displaced.

### 3.03 WELD QUALITY AND TESTING

- A. Inspection and Testing of Welds: Each weld shall be tested and examined by the magnetic particles method, ultrasonic examination method and by the visual method as follows:
  - 1. Magnetic Particle Examination:
    - a. Magnetic particle inspection shall be performed using the dry powder method in accordance with ASTM E709, with the rail at a temperature of less than 800 deg. F.

- b. To be acceptable the particles shall form a regular longitudinal pattern indicating homogeneity of the weld and freedom from defects, surface irregularities and internal discontinuities.
  - 2. Ultrasonic Examination:
    - a. Ultrasonic examination shall be performed by an independent testing agency under contract to the Authority who will perform ultrasonic examination to the following standards:
    - b. Subsequent to the magnetic particle inspection, all welds will be ultrasonically inspected in accordance with ASTM E164.
    - c. Ultrasonic test equipment will be capable of detecting a 3/64 inch discontinuity, 6-1/2 inches below the top rail. The sensitivity and resolutions of the proposed equipment shall use appropriate area amplitude and distance amplitude reference blocks made of material similar to the rail steels being tested.
    - d. All equipment will be equipped with a distance amplitude correction feature. The equipment will be calibrated daily using an 11W calibration block made of rail steel.
    - e. All welds giving fault indication in ultrasonic testing shall be cut out and the rails rewelded according to these specifications.
    - f. The Contractor shall provide a weather resistant enclosure with adequate ventilation and light for ultrasonic inspection.
  - 3. Visual Inspection for Final Alignment of Finished Welds:
    - a. The combined vertical offset and crown camber at ambient temperature shall not exceed 0.060 inches as shown on **Exhibit 05091-C, Fig. 1.**
    - b. No dip camber shall be allowed as shown on **Exhibit 05091-C, Fig. 2.**
    - c. Combined horizontal offer and horizontal kink camber at ambient temperature shall not exceed 0.060 inches as shown on **Exhibit 05091-C, Fig. 3.**
    - d. Welds shall be free of cracks, fins, and sharp edges.
- B. Correction of Defective Welds: Each production weld failing to meet all acceptance criteria will be considered defective. This shall include welds considered defective by the Authority contracted Ultrasonic Inspector.
  - 1. Defective welds shall be cut out by means of rail saw or abrasive disc.
  - 2. Use extra initial flash to burn off cut surface, reclamp, and reweld.
  - 3. Rewelds shall be inspected as specified for initial welds.
- C. Submit Production Welding Records to the Engineer at the end of each days production.
  - 1. Oscillograph record of each weld and reweld.
  - 2. Production welding record in accordance with **Exhibit 05091-D and 05091-E.**
- D. Marking of Rail Strings:
  - 1. Mark each end and every 100 feet of each rail string with a paint suitable for application to steel and which is weather resistant for a period of two years. High strength rail strings shall be marked with orange paint. Standard rail strings shall be marked with white paint.
  - 2. Each string shall be sequentially numbered and the beginning of welding end marked to permit correlation of each weld with the Production Welding Record.

## **PART 4 - MEASUREMENT AND PAYMENT**

### **4.01 MEASUREMENT**

- A. Measurement and payment for work specified in this Section shall be made in the following manner:
  - 1. No separate measurement.

## **4.02 PAYMENT**

- A. Compensation for work specified in this Section will be made in the following manner:
  - 1. Included in the price of the work of which it is a part.

## **SECTION 2 - THERMITE RAIL WELDING**

### **PART 5 - GENERAL**

#### **5.01 SECTION INCLUDES**

- A. The work specified in this section shall include the fabrication of continuous welded rail (CWR) strings by thermite rail welding, including testing, inspection, and qualification of welding and welders.
- B. The work specified in this section shall also include movement of rail from the manufacturer to the Contractor's welding plant, from the welding plant to the welded string storage location and from the storage location to the final placement in track location.

#### **5.02 RELATED SECTIONS**

- A. Section 05651- General Track Construction
- B. Section 05652 - Ballasted Track Construction
- C. Section 05653 - Direct Fixation Track Construction
- D. Section 05656 - Running Rail

#### **5.03 REFERENCES**

- A. American Railway Engineering and Maintenance-of-Way Association (AREMA) Manual for Railway Engineering, Vol. I, Chapter 4, Specification for Fabrication of Continuous Welded Rail (latest addition).
- B. ASTM E18
- C. ASTM E709 (replaced E109)
- D. ASTM E94 (replaced E142)
- E. ASTM E164
- ~~F. ASTM E709 (duplicate)~~
- F. AWS D1.1
- G. USNRC Rules and Regulations, Title 10, Atomic Energy, Part 20.
- H. ASNT SNT-TC-1A Recommended Guidelines for Qualification and Certification of Non-Destructive Testing Personnel.

#### 5.04 SUBMITTALS

- A. The Contractor shall submit procedures and documentation in accordance with the Section 01300 and as follows.
- B. Approval of the following items shall be obtained prior to production welding:
  - 1. Identification of welding kit and major items of equipment to be used.
  - 2. Record of welding kit performance as recommended by the manufacturer.
  - 3. Record of each qualification weld, including manufacturer's kit shelf life/expiration date, rail temperature before and after weld installation, and straightness test acceptance.
  - 4. Report of test results of each qualification weld.
  - 5. Schedule showing string number, length, proposed stockpile location and installation location.
- C. Production weld approval shall be based on these items:
  - 1. Ultrasonic test results .
  - 2. Production welding record.
- D. Deliver two each rail thermometers and taper gauges graduated in hundredths of an inch, with cases, to the Authority Representative. Taper gauges shall become Authority property.
- E. Deliver two each 36 inch steel straight edges, as manufactured by L. S. Starrett Company of Athol, Massachusetts, or approved equal, to the Authority Representative. Straight edges shall become Authority property.

#### 5.05 QUALITY ASSURANCE

Quality Assurance/Quality Control shall be in accordance with the Design-Builder's Construction Quality Management Plan.

- A. The Contractor shall inspect rail for straightness in the initial qualification weld.
- B. Qualification
  - 1. Initial welds shall be inspected and tested in the presence of qualified Authority personnel to assure quality of procedures and workmanship.
- C. General
  - 1. Using the welding kit, personnel and procedures proposed for production welding, make four qualification welds, two for each type of rail. These welds may be retained for the project if acceptable.
  - 2. The qualification welds shall be made in the presence of the Authority Representative.
  - 3. Weld tests shall provide sufficient detail to establish capability of the welding apparatus and procedures to meet specified welding requirements with the rail supplied.
- D. Qualification Weld Testing - The six qualification welds shall be tested by ultrasonic testing in the following manner:
  - 1. Ultrasonic test, in accordance with AREMA Manual requirements (latest edition).
  - 2. All test samples are to be permanently marked for identification and returned to the Authority Representative at the completion of testing.

## **5.06 DELIVERY, STORAGE AND HANDLING**

- A. It shall be the Contractor's responsibility to make all arrangements for shipment and handling of the rail. The Contractor shall:
  - 1. Coordinate unwelded rail stick movement from the manufacturer's plant to the welding site by rail and truck as necessary.
  - 2. Obtain any required permits from state, regional or local jurisdictions.
  - 3. Make arrangements for loading, unloading and stacking rail sticks.
- B. Handle and store rail so that it is not damaged either before or after welding.
  - 1. Stacking of sticks shall be as approved by the Authority Representative and layers shall be separated by wood lathing.
  - 2. Rail shall be handled in a manner that prevents damage to fasteners, rail and structures.
  - 3. Rail shall not be dropped or dragged on the trackbed. The use of rollers is required.

## **PART 6 - PRODUCTS**

### **6.01 RAIL FOR CONTINUOUS WELDED RAIL**

Rail for the Work shall be furnished by the Design-Builder in accordance with the Standard Specification Section 05656, Running Rail.

## **PART 7 - EXECUTION**

### **7.01 PREPARATION FOR WELDING**

- A. The welding location may be set up on Authority property as approved by the Authority Representative.
- B. Rail welding shall be in accordance with the current AREMA Manual "Specification for Fabrication of Continuous Welded Rail", and as specified herein.
- C. Rail for installation in this Contract shall be welded in accordance with a string schedule approved by the Authority Representative. Strings shall be designed in order to minimize field connections and to the maximum length practical for fabrication and handling. The schedule shall show the following for each string.
  - 1. The string designation.
  - 2. The track name where the string will be placed.
  - 3. The begin and end track station where the string will be located.
  - 4. Whether the string will be in the left or right rail when facing up station.
  - 5. The rail type in the string or for each portion of a string.
  - 6. Where there is more than one rail type in a string, the track station where rail types join in a string.
  - 7. The end of the string where welding will begin.The track names and stationing systems shown on the Track Alignment Plan and Profile drawings shall be used in the string schedule.
- D. The string designation shall be a unique code identification for each string that indicates
  - 1. The track
  - 2. Left or right rail
  - 3. A consecutive sequential number or letter system that increases with increasing track station.

- E. (Not used).
- F. Rails shall be stacked and welded so that when the resulting rail string is stored and subsequently placed in track, rail brands for both rails will face to the right when looking up stationing.
- G. Rail Inspection Prior to Welding
  - 1. Inspect each rail end prior to welding for deviations from lateral line in either direction and for upsweep, downsweep or droop.
  - 2. Rail with upsweep, downsweep or droop and rail failing to comply with the tolerances shown on **Exhibit 05091-B** shall be cut back a sufficient distance to achieve the required alignment. Rails shall be cut clean and within 1/32 inch of square by means of rail saws or abrasive cutting discs.
  - 3. Torch cutting of rail is prohibited. Cutting shall be done at no additional cost to the Authority.
- H. Rail End Preparation for Welding: Immediately prior to welding, all rail ends shall be wire brushed to remove mill scale or other dirt.
- I. Alignment of Rail for Weld:
  - 1. Alignment of the rail in the welding machine shall be done on the head of the rail.
  - 2. Vertical alignment shall provide for a flat running surface within 0.01 inch between the abutting rail ends.
  - 3. Horizontal alignment shall distribute head width differences evenly between each side of the head. No horizontal offset shall exceed 0.03 inch on either side of the head. No horizontal offset shall exceed 0.10 inch on either side of the base of the rail.

## 7.02 WELDING OF RAILS

- A. All welding procedures shall be approved prior to use and as a minimum shall be in accordance with the following:
  - 1. Produce welds with upset of 5/8 inch minimum before shearing.
  - 2. Each weld to achieve complete fusion, and be free of flaws and inclusions.
- B. (Not used).
- C. (Not used).
- D. Grinding shall be done immediately following welding at an elevated temperature.
- E. Welds shall be ground to meet the following finishing tolerances:
  - 1. A finished deviation of not more than plus or minus 0.005 inch of the parent section of the rail head shall be allowed.
  - 2. The weld at the top and sides of the rail head shall be finished to plus or minus 0.010 inch of the parent section.
  - 3. (Not used).
  - 4. The bottom and sides of rail base, the web zone, underside of head, web, top of base, both fillet each side, shall be finished to within 1/4 inch of parent contour or closer but shall not be deeper than parent section.
  - 5. Finishing shall eliminate all cracks visible to the unaided eye.
  - 6. All notches created by offset conditions or twisted rails shall be eliminated by grinding to blend the variations on both sides of the head and base for a distance of 18 inches.

7. All fins on the weld due to grinding and/or shear drag shall be removed prior to final inspection.
- F. Welds at pedestal tracks shall not be suspended; i.e., the rail weld shall be located at the pedestal support plate. The rail base of these welds shall be ground to the same tolerances as the rail head.

### 7.03 WELD QUALITY

- A. Inspection of Welds: Each weld shall be examined by ultrasonic examination method and by the visual method as follows:
1. Ultrasonic Examination:
    - a. Ultrasonic examination shall be performed by an independent testing agency under contract to the Authority who will perform ultrasonic examination to the following standards:
    - b. Subsequent to the magnetic particle inspection, all welds will be ultrasonically inspected in accordance with ASTM E164.
    - c. Ultrasonic test equipment will be capable of detecting a 3/64 inch discontinuity, 6-1/2 inches below the top rail. The sensitivity and resolutions of the proposed equipment shall use appropriate area amplitude and distance amplitude reference blocks made of material similar to the rail steels being tested.
    - d. All equipment will be equipped with a distance amplitude correction feature. The equipment will be calibrated daily using an 11W calibration block made of rail steel.
    - e. All welds giving fault indication in ultrasonic testing shall be cut out and the rails rewelded according to these specifications.
    - f. The Contractor shall provide a weather resistant enclosure with adequate ventilation and light for ultrasonic inspection.
  2. Visual Inspection for Final Alignment of Finished Welds:
    - a. The combined vertical offset and crown camber at ambient temperature shall not exceed 0.060 inches as shown on **Exhibit 05091-C, Fig. 1**.
    - b. No dip camber shall be allowed as shown on **Exhibit 05091-C, Fig. 2**.
    - c. Combined horizontal offset and horizontal kink camber at ambient temperature shall not exceed 0.060 inches as shown on **Exhibit 05091-C, Fig. 3**.
    - d. Welds shall be free of cracks, fins, and sharp edges.
- B. Correction of Defective Welds: Each production weld failing to meet all acceptance criteria will be considered defective. This shall include welds considered defective by the Authority contracted Ultrasonic Inspector.
1. Defective welds shall be cut out by means of rail saw or abrasive disc.
  2. Use extra initial flash to burn off cut surface, reclamp, and reweld.
  3. Rewelds shall be inspected as specified for initial welds.
- C. Submit Production Welding Records to the Authority Representative at the end of each days production.
1. Production welding record in accordance with **Exhibit 05091-D and 05091-E**.
- D. Marking of Rail Strings:
1. Mark each end and on both sides of the rail web every 100 feet of each rail string with a paint suitable for application to steel and which is weather resistant for a period of two years.
  2. High strength rail shall be marked with orange paint.
  3. Standard rail shall be marked with white paint.

4. Each string shall be marked on both ends with its string designation code and the respective beginning and ending station shown on the string schedule.
  - a. When two or more strings are welded into one longer string, then, where the ends of two strings join, the strings shall be marked with their string designation codes and the respective beginning and ending station shown on the string schedule.
5. The end of the string where welding began shall be marked to show that is the end where welding began. The welding shall begin on the end shown on the string schedule. The string designation code and the beginning of welding mark shall be coordinated to permit correlation of each weld with the Production Welding Record.

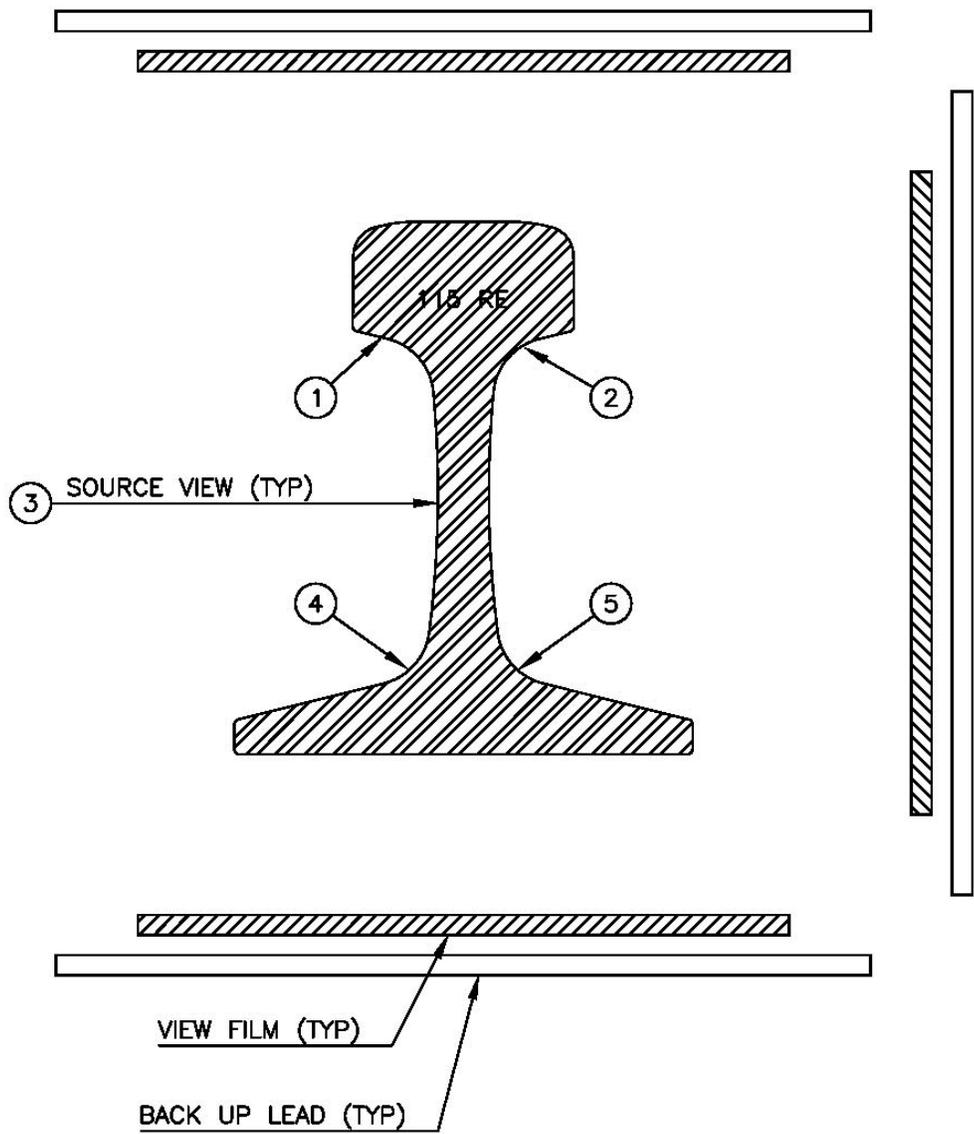

## **PART 8 - MEASUREMENT AND PAYMENT**

### **8.01 MEASUREMENT**

No separate measurement of work specified in this Section will be made.

### **8.02 PAYMENT**

Compensation for work specified in this Section will be included in the price of the work of which it is a part.

## SECTION 05120

### STRUCTURAL STEEL

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies structural steel work.
- B. Options:
  - 1. Substitution of rolled shapes for welded sections and vice versa is permitted, provided that shapes and sections to be substituted are approved and comply with the following:
    - a. Keep depth, width, average or mean thickness, web shear area, moments of inertia, torsional constant and warping constant to be at least equal to those for shape or section shown. Maintain clearances and other dimensions shown as critical.
    - b. Have steel shapes, plates and bars conform to same ASTM designation as material for which substitution is made.
- C. Related Work Specified Elsewhere:
  - 1. Finish painting for structural steel: Section 09920.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWS: D1.1.
  - 3. AASHTO: Interim 1981 Fracture Control Plan; Standard Specifications for Highway Bridges, including supplements. Where conflict occurs between AWS and AASHTO, AASHTO governs.
  - 4. AISC:
    - a. Specification for Structural Steel Buildings-Allowable Stress Design and Plastic Design.
    - b. Manual of Steel Construction-Allowable Stress Design.
    - c. Code of Standard Practice for Steel Buildings and Bridges.
    - d. Allowable Stress Design Specification for Structural Joints using ASTM A325 or A490 Bolts.
    - e. Specifications for Architecturally Exposed Structural Steel.
  - 5. ASNT: Recommended Practice SNT-TC-1A.
  - 6. SSPC: SP-6, SP-10.
  - 7. ANSI: B27.2.
  - 8. MS: MIL-P-21035.
  - 9. FS: TT-P-645
  - 10. ASTM: A6, A27, A36, A108, A109, A123, A148, A153, A242, A307, A325, A370, A449, A490, A500, A501, A514, A517, A572/572M, A588, A668, A673, A709, A780, B663, B766.
- B. Source Quality Control:
  - 1. Testing and inspection:
    - a. Nondestructive-test requirements for welded members:
      - 1) Perform the following:

- 2) Tension butt welds in fracture-critical nonredundant members and member components of structures subject to repetitive dynamic loading: 100 percent of welds inspected by radiographic and ultrasonic examination.
  - 3) Butt welds of flange material for compression and tension splices: 100 percent of welds inspected by ultrasonic examination.
  - 4) Butt welds for web splices beginning at point of maximum stress: 40 percent of welds inspected by ultrasonic examination.
  - 5) Fillet welds connecting web plates to flange plates: 25 percent of welds inspected by magnetic particle inspection.
  - 6) For all other fillet-weld connections: 10 percent of welds inspected by magnetic particle inspection.
  - 7) The Engineer may designate additional items to be inspected by radiography.
- b. Mill testing:
- 1) For identified stock materials provide three specimens from each heat number, one for tension test, one for bend test and one for Charpy V-notch impact test.
  - 2) Cut, machine and test specimens in accordance with ASTM A370.
  - 3) Perform Charpy V-notch impact test for tension flanges and other tension components of aerial structures in accordance with Table 05120-1.
- c. Bolts:
- 1) The Engineer will randomly select at least five bolts for test purposes from each bin of bolts furnished.
- C. Qualification of Welding Personnel and Procedures:
1. Prior to qualifying welding personnel and welding procedures, confirm an agreement with the Engineer as to procedural details, sequence of welding, handling of materials to be inspected, and approval of electrodes, wire, flux and other welding materials and equipment.
  2. Employ welding personnel whose qualification is certified in accordance with AWS D1.1. Such certification is to remain in force for the duration of the welding operations under this Contract.
  3. Do not start fabrication until qualification has been successfully completed.
- D. Qualification of Nondestructive-Testing Personnel:
1. Nondestructive testing of fracture-critical members to be conducted by personnel qualified as NDT Level II or Level III in accordance with ASNT SNT-TC-1A.
  2. Level-II technicians to be supervised by Level III-personnel.
- E. Stock Material:
1. For qualification of welding personnel and procedures and for quality-assurance testing, use only stock materials which can be identified as having been rolled from a given heat and for which certified mill tests can be produced.
  2. When stock material is proposed, inform the Engineer of such intention at least 10 days in advance of commencing fabrication to permit sampling and testing. Select identified material from as few heats as possible.
- F. Welder's Identification Mark (for Fabrication Shops):
1. Assign each welder and welding operator an identification mark to stamp on pieces he has welded.
  2. Have welder or welding operator place his identification mark by metal-die stamp in letters 3/8-inch high in position that identification of welder or operator will appear

adjacent to each of his welds in finally assembled members for ready reference to radiographic films and for identification by the Engineer.

- G. Elevator Hoistways:
  - 1. Fabricate framing not to exceed 1/8-inch deviation from dimensions shown throughout. Perform straightening where necessary.

### **1.03 SUBMITTALS:**

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
  - 1. Structural details: Include the following:
    - a. Bills of materials giving complete information for fabrication and erection of component parts of structures including material and finish information.
    - b. Details of location, type, sizes of bolts and welds and for welded structures details of welding as specified.
    - c. Structural computations for Contractor-designed work certified by a professional engineer registered in the jurisdiction where the work is to be performed.
  - 2. Match marks:
    - a. Provide diagram showing match marks for connecting structural parts assembled in shop for purpose of drilling or reaming holes in field connections.
  - 3. Welding:
    - a. Complete shop details of qualification test specimens.
    - b. Include information on specimen identification, number of pieces and welding procedure specification, type of material, sizes of pieces and welds and other variables affecting detail or tests.
  - 4. Erection Plan:
    - a. Details of methods of erection proposed to be used, including calculated stresses for proposed erection certified by a professional engineer registered in the jurisdiction where the work will be performed. Do not proceed until approval has been received.
  - 5. Manufacturer's test procedures for bolts.
- B. Certification:
  - 1. Certified mill test reports of structural steel at least 10 days prior to start of fabrication.
  - 2. Certified quality-assurance testing and inspection reports.
  - 3. Certification verifying that welding personnel have been qualified in accordance with AWS D1.1 and as specified above under Qualifications of Welding Personnel and Procedures.
  - 4. Manufacturer's certification that bolts meet approved testing.
  - 5. Certification of nondestructive-testing personnel.

### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. General:
  - 1. Load, transport, unload and store structural materials so as to keep them clean and free from damage.
  - 2. Store material on platforms, skids or other supports above the ground and ensure proper drainage and protection from corrosion.

- B. Steelwork:
  - 1. When handling and shipping steelwork, prevent bending, scraping or over stressing members.
  - 2. Block projecting parts likely to be bent or damaged during handling with wood or other approved material
  - 3. Replace pieces bent or damaged unless repair is approved.
  - 4. Indicate weight on members weighing more than three tons by means of paint contrasting with shop coat.
- C. Bolts and Nuts:
  - 1. Ship small parts such as bolts, nuts, washers, pins, fillers and small connecting plates or angles in boxes, crates or barrels.
  - 2. Pack separately bolts of each length and diameter and loose nuts or washers of each size.
- D. Paint:
  - 1. Have paint materials delivered in manufacturer's original sealed containers, bearing manufacturer's label and name, specification identification number where applicable as well as month and year of manufacture.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  - 1. Welding:
    - a. When welding during cold weather, avoid chilling weld metal within zone of welding influence and avoid restraining manual functions of welder or welding operator.
    - b. When temperature where steel is stored is more than 20F below that of welding shop, move steel to be welded into shop sufficiently in advance of welding to allow it to attain shop temperature prior to welding.
    - c. Steel to be free of moisture. Dry as necessary by application of heat not exceeding 100F.
    - d. Do not weld when shop temperature is below 40F.
  - 2. Painting:
    - a. Apply paint when temperature of steel and paint is above 40F and temperature is forecast to remain above 40F until paint has dried.
    - b. Painting steel at a temperature which can cause blistering, porosity or conditions otherwise detrimental to life of paint is prohibited. When paint is applied in hot weather or thinned in cold weather, ensure that specified thickness of paint coating is obtained.
    - c. Application of paint in rain, wind, snow, fog or mist or when steel surface temperature is below dew point is prohibited, unless otherwise approved. If painting in damp or cold weather is unavoidable, provide protective covering and heat steel and surrounding air to 40F minimum. Maintain this temperature until weather conditions permit discontinuance.

### **PART 2- PRODUCTS**

#### **2.01 MATERIALS:**

- A. General Requirements for Rolled-Steel Plates, Shapes and Bars: ASTM A6.
- B. Carbon-Steel Plates, Shapes and Bars: ASTM A36, ASTM A709, Grade 36.

- C. High-Strength, Low-Alloy, Structural-Steel Plates, Shapes and Bars: ASTM A242.
- D. High-Strength, Low-Alloy, Structural, Columbium-Vanadium Structural Steel: ASTM A572/A572M.
- E. Corrosion-Resistant Structural Steel: ASTM A242., A588
- F. High-Strength, Low-Alloy, Corrosion-Resistant Structural-Steel Shapes, Plates, and Bars: ASTM A588.
- G. Low-Carbon Steel Bolts and Nuts: ASTM A307, Grade A or B.
- H. High-Strength Carbon-Steel Bolts, Nuts and Washers for Structural Joints: ASTM A325; for bolts over one-inch diameter, ASTM A449.
- I. High-Strength Alloy-Steel Bolts, Nuts and Washers for Structural Joints: ASTM A490.
- J. Round Washers Other Than Those In Contact With High-Strength Bolt Heads And Nuts: ANSI B27.2, Type B.
- K. Beveled Washers:
  - 1. Square, smooth and sloped to make contact surfaces of bolt head and nut parallel.
  - 2. Diameter of hole in square beveled washers as follows:
    - a. For bolts less than one-inch diameter: 1/16-inch larger than bolt size.
    - b. For bolts larger than one-inch diameter: 1/8-inch larger than bolt size.
- L. Carbon-Steel Forgings: ASTM A668, Class C.
- M. Alloy-Steel Forgings: ASTM A668, Class G.
- N. Structural-Steel Tubing:
  - 1. Structural framing for elevator hoistways: ASTM A500, Grade B.
  - 2. Other structural tubing: ASTM A501.
- O. High-Strength Steel Casting: ASTM A148, metal type as shown.
- P. Mild-To-Medium-Strength Carbon-Steel Castings: ASTM A27, grade as shown.
- Q. Shear Connectors:
  - 1. Cold-rolled carbon-steel strip.
  - 2. Stud-welding fasteners with upset head developing tensile strength of 65,000 psi-minimum and yield strength of 52,000-psi minimum.
  - 3. Complying otherwise to the following:
    - a. Cold-finished bars, Grade 1015, Grade 1018 or Grade 1020, semi-killed or fully killed: ASTM A108.
    - b. Low-carbon steel suitable for welding: ASTM A109.
  - 4. Stud welding conforming to AWS D1.1.
  - 5. Sizes and shapes: As shown.
  - 6. Lengths to be after-weld lengths.
  - 7. Studs arc-welded to parent metal as shown.
  - 8. Before welding, parent-metal surface to be free from rust, oil, paint, plating and other foreign matter.
  - 9. Heat treat parent metal where needed to develop full weld strength.
- R. Galvanizing:

1. Steel products specified as galvanized to be hot-dip galvanized after fabrication in accordance with the following:
  - a. Zinc coatings on products fabricated from rolled, dressed and forged steel shapes, plates and strips: ASTM A123.
  - b. Zinc coating on iron and steel hardware: ASTM A153.
  - c. Zinc coating on assembled steel products: ASTM A123.
  - d. Zinc-coating weight: Two ounces per square foot minimum.
  - e. Zinc-dust zinc-oxide primer conforming to MS MIL-P-21035 applied in accordance with ASTM A780 in two coats for repairs to damaged surfaces after removal of loose or cracked zinc coating.
- S. Electroplated Zinc Coating: ASTM B663 for type specified.
- T. Cadmium Plating: ASTM B766 for type specified.
- U. Paint for Shop Prime Coating: FS TT-P-645.
- V. Cleaning Solution: Muriatic acid solution, specific gravity 1.18, prepared in a solution of one-part muriatic acid and five parts water.

### **PART 3 - EXECUTION**

#### **3.01 FABRICATION:**

- A. Workmanship and finish to best commercial practice accomplished in structural or bridge shops.
- B. Straightening Material:
  1. Use rolled material that, before being laid off or worked, is straight within tolerances specified in ASTM A6.
  2. Perform straightening where necessary by approved methods which will not overstress material.
  3. Do not heat-shrink low-alloy structural steel.
  4. Achieve fabrication tolerances which will result in full bearing.
  5. Perform straightening, planing and connecting of portions of members in bearing assemblies and in direct bearing after fabrication as necessary to provide full bearing assemblies and bearing areas.
- C. Cutting:
  1. Flame-cut edges of members subject to dynamic loading by mechanically guided torch or by hand. Remove nicks by grinding to depth not exceeding 1/4 inch.
  2. Shape re-entrant corners notch-free to radius of 1/2-inch minimum.
  3. Perform flame cutting so that metal does not carry stress during cutting operation.
  4. Direct flame so that remaining material is not damaged.
- D. Planing and Facing:
  1. Plane to depth of 1/4 inch sheared edges of plates more than 5/8-inch thick which will carry calculated stress.
  2. Face and bring abutting joints to even bearing where shown.
  3. Fabricate floor beams, stringers and girders having end connection angles to exact length back-to-back of connection angles.
  4. For compression joints depending on contact, prepare bearing surfaces to a common plane by milling, sawing or other approved means.

5. Where end connections are faced, ensure that finished thickness of angle is not less than that shown.
- E. Bolt Holes:
1. Punch or drill holes for bolts.
  2. Subpunch or subdrill and ream assemblies using steel template for alignment of connections as necessary. Flame cutting is prohibited.
  3. Subdrill or subpunch holes 3/16-inch less than nominal diameter of bolt; drill or ream holes 1/16-inch greater than nominal diameter of bolt.
- F. Connections:
1. Except where welded or ASTM A307 bolted connections are shown, use ASTM A325 or ASTM A490 bolts for shop connections.
  2. Unless otherwise shown, bolt field connections using ASTM A325 or ASTM A490 bolts in accordance with AISC Specifications for Structural Joints.
  3. Use of ASTM A490 bolts for dynamic or fluctuating loadings is prohibited.
- G. Plates:
1. Bent plates: For load carrying cold-bent plates, use identified stock and arrange direction of bending at right angles to direction of rolling. Ensure radius of bend, measured on concave face of metal, is not less and preferably more than the following:

Angle of Plate Bend in Degrees	Minimum Radius
61 - 90	1.0T*
91 - 120	1.5T*
121 - 150	2.0T*

\*T = Plate thickness.

2. Sheared plates: For gusset plates or connection plates, use sheared plates designed to resist applied loads in more than one direction in plane of plate.

### 3.02 WELDING:

- A. Perform welding in accordance with AWS D1.1.
- B. Perform procedure and sequence of welding so as to avoid needless distortion and to minimize stresses. Straighten transverse warpage of flanges, if necessary, by controlled heating along outside face.
- C. Make allowance in shop for expected weld shrinkage in laying out and assembling members. Trim members to size when most or all of welding has been completed.
- D. Complete butt welds in flange joints before flanges are assembled on web. Use extension blocks on such joints when making ends of butt welds, removing extension blocks only upon completion and cooling of weld. Ensure ends of welds are finished smooth and flush with edges of abutting parts. Use double-V-flange butt welds, unless otherwise shown. Back puddle all end craters.
- E. Make welds in web plates where shown.

- F. Prior to ultrasonic or radiographic testing of butt welds of flanges and webs, grind or machine weld reinforcement of joint to remove irregularities of weld surface so that it merges smoothly with base surface; one side for ultrasonic testing and both sides for radiographic testing.
- G. Ensure that welded joints which are to be radiographed are free of paint, scale and grease. Grind off welded ripples and surface irregularities on both sides of joint. Grind perpendicular to length of weld and to such a degree that resulting radiographic contrast due to remaining irregularities cannot mask or be confused with that of objectionable defect and so that weld surface will merge smoothly into adjoining surface.
- H. Repair defective welds by chipping or melting out such defects from one or both sides of joint removing no more weld metal than necessary to correct defect. Reweld and have weld retested radiographically.
- I. Welded Structures Subjected to Dynamic Loads:
  - 1. Do not use backup bars for fracture-critical nonredundant members or member components, as defined by AASHTO on Interim 1981 Fracture Control Plan.
  - 2. Avoid use of backup bars elsewhere, unless explicitly permitted by original design.
  - 3. When use of backup bars is unavoidable because of practicality but not explicitly permitted by original design, remove backup bar after welding is completed and affected surfaces of weld metal and base metal is ground flush. Roughness of ground surfaces to be similar to that of surrounding unaffected plate surface.

### **3.03 BOLTING:**

- A. Connections using high-strength steel bolts in accordance with AISC Specifications for Structural Joints using ASTM A325 or ASTM A490 bolts.
- B. Assemble high-strength bolted parts so that they fit solidly together when assembled. Do not use gaskets or other compressible materials.
- C. Remove scale, dirt, burrs and other defects likely to prevent proper seating when assembling joint surfaces, including those adjacent to washers.
- D. Remove oil, paint, lacquer and galvanizing from contact surfaces of friction joints.
- E. Use two nuts on unfinished bolts and turned bolts in tension.
- F. Tightening Bolts:
  - 1. Tighten ASTM A325 or A490 bolts to bolt tension not less than proof load given in AISC Specifications for Bolts.
  - 2. If approved, tighten by means of properly calibrated wrenches or turn-of-nut method.
  - 3. When tightening, place hardened washer under nut or bolt head, depending on which element is turned in tightening operation.
  - 4. Calibrate torque wrenches daily by tightening bolt assembly in device capable of indicating actual bolt tension.
  - 5. Install three bolts minimum from each lot.
  - 6. Nuts or bolts to be in tightening motion when torque is measured.
  - 7. Adjust power wrenches to cut-out or stall at required tension.
- G. Arrange bolts so that heads show in areas exposed to public view.

### **3.04 SHOP ASSEMBLY:**

- A. Undertake complete or progressive shop assembly of continuous plate and box girders, rigid frames, bents and towers when shown. Obtain approval of progressive shop-assembly procedure.
- B. Clean surfaces of metals in contact with each other with high speed wire brushes before assembling.
- C. Assemble parts to line and fit; drill or ream bolt holes while assembled. Hand reaming is prohibited unless approved.

### **3.05 SHOP PRIME PAINTING:**

- A. Clean steel surfaces in accordance with SSPC SP-6 or SP-10.
- B. Shop Painting:
  - 1. Shop paint structural-steel work which will be left bare in finished structures.
  - 2. Do not shop paint the following:
    - a. Surfaces within three inches of joints to be field welded.
    - b. Galvanized surfaces and surfaces to be galvanized.
    - c. Contact surfaces: Apply rust-inhibitive treatment to such surfaces; remove by means of appropriate solvent prior to assembly.
    - d. Surfaces to be encased in concrete or in fire-protection material.
    - e. Weathering steel.
  - 3. Use paint-spraying equipment, if approved, with type of spray gun recommended by paint manufacturer for paint being applied.
  - 4. Use brushes of good quality bristle. Nylon brushes and roller coaters are prohibited.
  - 5. Neutralize areas of welding which are to be painted by applying specified cleaning solution. Wash neutralized area thoroughly with clean water and allow to dry before painting.
  - 6. Apply shop prime coat at minimum wet-film thickness of three mils. Give surfaces which will be inaccessible after assembly or erection three coats of paint before assembly.
  - 7. Caulk small cracks, cavities and open seams around stiffeners and connections with pasty mixture of red lead and linseed oil or approved caulking putty and allow to dry before applying full shop coat.
  - 8. Apply stripe coat of paint to edges, corners, bolts, welds and other sharp edges before giving steel full shop coat of paint. Apply stripe coat at least one-inch beyond area to be striped and allow to dry before applying full shop coat.
  - 9. Paint erection marks and weight on each member after shop coat has dried.
  - 10. Complete shop painting and ensure paint has completely dried prior to shipment of steel.

### **3.06 ERECTION:**

- A. Install anchor bolts accurately in positions shown.
- B. If anchor bolts are cast in substructure masonry during its construction, ensure that each bolt is firmly held in its correct position and elevation by suitable templates.
- C. If approval is given for installing anchor bolts in preformed holes or in drilled holes in concrete or masonry, use approved nonshrink, nonstaining grout to secure them in place.

- D. Set bearing assemblies to lines and grades shown and adjust to horizontal position shown.
- E. Erect steel structures true and plumb following match marks.
- F. Use temporary bracing to support loads to which structures may be subjected including erection equipment and their operations. Leave bracing in place as long as safety requires.
- G. Report immediately to the Engineer errors in shop fabrication or deformation resulting from handling or transportation which prevent proper erection and fitting of parts.
- H. As erection progresses perform sufficient bolting of work to support dead load, wind load and erection load. Perform permanent bolting when enough alignment has been accomplished to ensure that as much of structure as possible will be supported by such fastening work.
- I. Ensure that holes are not enlarged and that metal in vicinity of holes is not disturbed by drifting during assembly.
- J. Enlargement of holes to accept bolts for connections is prohibited unless approved. Make enlargement by reaming not by burning. Avoid hand reaming.
- K. Do not field weld main stress members.
- L. Bond premolded elastic filler with adhesive to structural framing at elevator hoistways.

**3.07 NONDESTRUCTIVE TESTING OF FIELD WELDS:**

- A. Perform pertinent testing specified for source quality control.

**3.08 FIELD TOUCH-UP PAINTING:**

- A. Retouch surfaces where shop coat has been damaged using paint and paint-film thickness identical to original shop coat.
- B. After erection, clean field bolts, nuts and adjacent areas and apply coat of paint identical to original shop coat.
- C. Finish painting for structural steel in accordance with Section 09920.

<b>TABLE 05120-1</b>				
<b>BASE METAL CHARPY V-NOTCH REQUIREMENTS<sup>a</sup> FOR FRACTURE-CRITICAL MEMBERS</b>				
<b>ASTM</b>	<b>Thickness, Inches (mm)</b>	<b>Zone 1<sup>b</sup></b>	<b>Zone 2<sup>c</sup></b>	<b>Zone 3<sup>d</sup></b>
A36	Up to 4 inches (101.6)	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
A572 <sup>e</sup>	Up to 4 inches (101.6) mechanically fastened	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
	Up to 2 inches (50.8) welded	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
A588 <sup>e</sup>	Up to 4 inches (101.6) mechanically fastened	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
	Up to 2 inches (50.8) welded	25 at 70F (33.9 Nm at 21.1C)	25 at 40F (33.9 Nm at 4.4C)	25 at 10F (33.9 Nm at minus 12.2C)
	Over 2 inches to 4 inches (50.8 to 101.6) welded	30 at 70F (40.7 Nm at 21.1C)	30 at 40F (40.7 Nm at 4.4C)	30 at 10F (40.7 Nm at minus 12.2C)
A514 <sup>f</sup>	Up to 4 inches (101.6) mechanically fastened	35 at zero degree F (47.5 Nm at minus 17.8C)	35 at zero degree F (47.5 Nm at minus 17.8C)	35 at minus 30F (47.5 Nm at minus 34.4C)
	Up to 2-1/2 inches (63.5) welded	35 at zero degree F (47.5 Nm at minus 17.8C)	35 at zero degree F (47.5 Nm at minus 17.8C)	35 at minus 30F (47.5 Nm at minus 34.4C)
	Over 2-1/2 inches to 4 inches (63.5) welded	45 at zero degree F (61.0 Nm at minus 17.8C)	45 at zero degree F (61.0 Nm at minus 17.8C)	Not permitted

<sup>a</sup> CVN impact testing to be P-plate frequency testing in accordance with ASTM A673. Code Charpy test pieces with respect to heat/plate number and record such code on mill-test report of steel supplier with test result. If directed, package broken pieces from each test (three specimens, six halves) and forward to the quality-assurance organization of the jurisdictional authority. Use average of three tests. If energy value for more than one of three specimens is below minimum average requirements or if energy value for one of three specimens is less than 2/3 of specified minimum requirements, retest and obtain energy value from each of three retest specimens equal to or exceeding specified minimum average requirement.

<sup>b</sup> Zone 1: Minimum service temperature zero degree F (minus 17.8C) and above.

- \*c Zone 2: Minimum service temperature from minus 1F to minus 30F (minus 28.3C to minus 34.4C).
- \*d Zone 3: Minimum service temperature from minus 31F to minus 60F (minus 35C to minus 51.1C).
- \*e If the yield strength of the material exceeds 65 ksi (448.159MPa), reduce temperature for CVN value for acceptability by 15F (8.3C) for each increment of 10 ksi (68.947MPa) above 65 ksi (448.159MPa). Yield strength is value given in certified mill-test report.
- \*f ASTM A517 Charpy requirements are the same as for ASTM A514.

**END OF SECTION**

## SECTION 05210

### STEEL JOISTS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing steel joists.
- B. Related Work Specified Elsewhere:
  - 1. Bearing plates and miscellaneous steel framing: Section 05120.
  - 2. Field painting: Section 09920.

##### 1.02 QUALITY ASSURANCE:

- A. Reference Codes and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWS: D1.1.
  - 3. SJI (Steel Joint Institute): Standard Specifications and Load Tables for Series-K Open-Web Steel Joist, Series-LH Longspan Steel Joists and Joist Girders.
  - 4. SSPC: Steel Structures Painting Manual.
  - 5. FS: TT-P-645.
- B. Qualification of Welding Personnel:
  - 1. Employ welding personnel whose qualification is certified in accordance with AWS D1.1. Such certification is to remain in force for the duration of the welding operations under this Contract.

##### 1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
  - 1. Detailed joist and erection drawings showing erection marks, SJI-designation numbers, locations and spacing; bearing-plate and anchor-bolt layouts; bridging details and connections; shop coating; and details necessary for installation. Drawings to be signed and sealed by a professional engineer registered in the jurisdiction where the work will be performed.
- B. Certification:
  - 1. Certificate verifying compliance with SJI specifications.
  - 2. Certification that welding personnel are currently qualified in accordance with AWS D1.1, and as specified above under Qualification of Welding Personnel.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Load, transport, unload and store steel joists by means which will prevent damage.
- B. Use waterproof coverings during transit and storage to protect shop coats and prevent corrosion.
- C. Store off the ground preferably supported by their end bearings.

#### PART 2 - PRODUCTS

## **2.01 MATERIALS:**

- A. Steel Joists: Designations shown, fabricated in accordance with SJI requirements. Extended ends and ceiling extensions designed to support loads shown.
- B. Shop Coating: In accordance with FS TT-P-645 and SSPC recommendations of the Steel Structures Painting Manual, except that asphalt coating is prohibited for joists specified to be field-painted.
- C. Bridging: Member sizes, end anchorages and accessories in accordance with SJI requirements.
- D. Bearing plates and miscellaneous steel framing: Section 05500.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Install steel joists and bridging in accordance with SJI recommendations.
- B. Ensure that bearing plates are set in accordance with approved working drawings. Install joists of proper designations at locations shown.
- C. Perform welding in accordance with AWS D1.1. Burning of holes, undercutting or other operations which reduce strength of joists are prohibited.
- D. Permanently secure bridging and decking before applying construction or design loads to steel-joist installation.
- E. Ensure that construction loads, such as stacked materials, do not exceed designed capacity of the installation.
- F. Repair or replace damaged joists as directed.

### **3.02 FIELD PAINTING:**

- A. Repair shop coating where damaged. Remove welding flux, rust and other foreign matter. Coat welded and damaged areas with coating to match shop-applied coating.
- B. Use joists with asphalt coating only in areas which have ceilings.
- C. Paint joists exposed to view in completed project in accordance with Section 09920.

### **3.03 FIELD QUALITY CONTROL:**

- A. Inspect steel joists for broken welds, bent chords or web members and other damage harmful to structural integrity of joists.
- B. Verify size, spacing, top-chord alignment and level, and tightness of fasteners.
- C. Monitor field welding for compliance with AWS D1.1 requirements.

**END OF SECTION**

## SECTION 05310

### METAL DECKING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing metal roof decking.
- B. Related Work Specified Elsewhere:
  - 1. Touch up and field painting of metal deck: Section 09920.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AISI Specifications for the Design of Light-Gauge Cold-Formed Steel Structural Members.
  - 3. AWS: D1.1.
  - 4. SDI (Steel Deck Institute): Design Manual for Floor Decks and Roof Decks.
  - 5. ASTM: A653/A653M.
- B. Qualification of Welding Personnel:
  - 1. Employ welding personnel whose qualification is certified in accordance with AWS D1.1. Such certification is to remain in force for the duration of the welding operations under this Contract.

##### 1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
  - 1. Include details of fabrication and erection including materials, dimensions, methods of joining, welding, accessories, fastenings and openings through decking.
- B. Samples:
  - 1. Three of each type of the following products used in the work.
    - a. Decking: Six inches by width of material.
    - b. Accessories.
    - c. Fasteners.
- C. Certification:
  - 1. Certification that welding personnel have been qualified in accordance with AWS D1.1.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products in good condition.
- B. Store products so as to preclude corrosion, deterioration and damage.
- C. Handle products so as to prevent damage.

### **1.05 JOB CONDITIONS:**

- A. Do not apply construction loads, such as roofing materials and aggregate, in excess of the live loads for which the deck is designed.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Steel Decking:
  - 1. Galvanized: ASTM A653/A653M, Coating G60 or G90, gauge as shown.
  - 2. Where terne-coated stainless steel is to be installed over decking, fabricate decking with clear space between ribs 1/2-inch wide maximum.
- B. Accessories:
  - 1. Types shown or necessary to complete installation, such as 14-gauge recessed sump pans for roof drains, cover plates where panels abut or change direction and closure plates.
  - 2. Same gauge and finish as decking, unless otherwise shown or specified.
- C. Fasteners: As shown on approved shop drawings.

### **2.02 FABRICATION:**

- A. Deck units countersunk at ends to form smooth, flush top surface at overlapping ends, except for 12-gauge and 14-gauge material.
- B. Deck units having interlocking side laps, in standard width and longest practicable lengths
- C. Steel Roof Deck: Gage and depth as shown.
- D. Metal Forming (corrugated):
  - 1. Maximum Flexural Working Stress: 33,000 psi.
  - 2. Maximum Roof Deflection: 1/240 of span, c/c of supports, under live load.
  - 3. Maximum Floor Deflection: 1/360 of span, c/c of supports, under live load.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION:**

- A. Erect steel decking and accessories in accordance with approved shop drawings and manufacturer's recommendations.
- B. Place decking units on the supporting steel, align and adjust to final position before permanently fastening.
- C. If supporting beams are not in proper alignment or at correct elevation to provide bearing and alignment of deck units; do not place decking units in deficient areas until necessary corrections have been made.
- D. Continue decking over three or more spans.
- E. Perform welding in accordance with AWS D1.1.

- F. Use electric-arc welding to weld deck panels to end supports as shown on the Contract Drawings or on approved shop drawings. Where panel ends meet, provide minimum two-inch overlap and weld to fuse ends of units together.
- G. Crimp side joints of adjacent panels and weld at intervals not exceeding three feet.
- H. Remove burrs and sharp edges.
- I. Where welding occurs through deck, use welding washers and plug welds to ensure proper attachment.
- J. Cut bevels and perform other special cutting and fitting at jobsite.
- K. Provide necessary support framing and reinforcement and openings for items penetrating deck panels.
- L. Coordinate cutting of openings for work of other trades with trades involved.
- M. Do not hang mechanical equipment or other loads from steel deck.
- N. Repair areas where galvanizing has been damaged by welding or cutting operations using cold galvanizing compound acceptable to the Engineer.
- O. Clean galvanized roof sheets with zinc oxide residue or evidence of rusting with solvent and apply zinc-rich paint to restore corrosion resistance.

**3.02 CLEAN-UP:**

- A. Clean up rubbish and debris caused by this work and remove from site.
- B. Leave decks and areas surrounding work in broom-clean condition.

**END OF SECTION**

## SECTION 05500

### MISCELLANEOUS METAL

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing miscellaneous metal, with the exception of ornamental (architectural) metal and metalwork provided as a part of mechanical, electrical and construction systems.
- B. Related Work Specified Elsewhere:
  - 1. Concrete, concrete fill and nonshrink grout: Section 03300.
  - 2. Structural steel: Section 05120.
  - 3. Handrails and Railings: Section 05521.
  - 4. Gratings and Floor Plates: Section 05531.
  - 5. Field painting: Section 09920.
  - 6. Concrete formwork: Section 03100.
  - 7. Concrete reinforcement: Section 03200.
  - 8. Wire Mesh Partitions: Section 10605

##### 1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings: Detail fabrication and erection of each metal fabrication indicated.
  - 1. Include plans, elevations, sections, and details of metal fabrications and their connections. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections.
  - 2. Manufacturer's standard drawings may be submitted in lieu of Contractor-prepared shop drawings if manufacturer's standard drawings show required details.
- B. Certification:
  - 1. Certification that welding personnel are currently qualified in accordance with AWS D1.1.
  - 2. Mill Certificates: Signed by manufacturers of stainless-steel sheet certifying that products furnished comply with requirements for corrosion resistance of Type 316 stainless steel.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWS: D1.1.
  - 3. AISC: Specification for Structural Steel for Buildings-Allowable Stress Design and Plastic Design (Do not use plastic design).
  - 4. SSPC: SP 11, Paint 12.
  - 5. FED STD: 595.
  - 6. MS: MIL-P-21035.
  - 7. FS: A-A-462, FF-B-588, FF-H-116, FF-P-395, FF-S-325, RR-T-650, TT-P-86.

8. ASTM: A36, A53, A74, A108, A123, A167, A193, A229, A242, A276, A307, A313, A325, A413, A490, A501, A536, A570, A572, A588, A666, A780, A786/A786M, B 221, B 632, B633, D412, D1187, E488, F 593, F 594, F1554.
9. AGA: The Design and Fabrication of Galvanized Products.
10. ANSI: A14.3
11. ASME: A 17.1, B18.6.3, B18.21.1, B18.22.1.

B. Qualifications of Welding Personnel:

1. Welding: Qualify procedures and personnel according to the following:
  - a. AWS D1.1, "Structural Welding Code--Steel."
  - b. AWS D1.2, "Structural Welding Code--Aluminum."
  - c. AWS D1.3, "Structural Welding Code--Sheet Steel."
  - d. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification. Such certification is to remain in force for the duration of the welding operations under this Contract.

C. Fabricator Qualifications: A firm experienced in producing metal fabrications similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.

D. Coordinate installation of anchorages for metal fabrications. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

**1.04 PROJECT CONDITIONS:**

A. Field Measurements: Where metal fabrications are indicated to fit walls and other construction, verify dimensions by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating metal fabrications without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions. Allow for trimming and fitting.

**1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products undamaged.
- B. Store products so as to prevent rust.
- C. Handle products so as to prevent damage.
- D. After completion of factory testing, package and ship hatches as directed.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. General Requirements:
  - 1. Insofar as practicable, furnish similar products of a single manufacturer.
  - 2. Metal Surfaces, General: For metal fabrications exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

### **2.02 FERROUS METALS:**

- A. Structural steel: Plates, shapes, bars and angles, ASTM A36.
- B. Rolled-Steel Floor plate: ASTM A786/A786M; Fabricate raised-pattern floor plates from rolled-steel floor plate, galvanized after fabrication, of thickness and in pattern indicated below:
  - 1. Thickness: Minimum 1/4 inch, unless otherwise shown or calculated.
  - 2. Pattern: No. 2, or as selected from manufacturer's standard patterns; flat back.
- C. High-strength low-alloy structural steel:
  - 1. ASTM A242.
  - 2. Resistance to atmospheric corrosion: Four times that of carbon steel, minimum.
- D. Load-carrier beams: ASTM A588.
- E. Structural tubing: ASTM A501.
- F. Steel Pipe: ASTM A 53, standard weight (Schedule 40), unless another weight is indicated or required by structural loads.
- G. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A666, Type 304. Type 316L for corrosive environments.
- H. Stainless-Steel Bars and Shapes: ASTM A276, Type 304. Type 316L for corrosive environments.
- I. Hot-rolled carbon steel sheets and strips: ASTM A570.
- J. Pipe, Pipe Sleeves and Pipe Fittings:
  - 1. Cast iron: ASTM A74, service weight.
  - 2. Steel: ASTM A53, galvanized unless otherwise shown or specified.
- K. Guard Chain: ASTM A413, Class Grade 28, galvanized steel, 9/32-inch thick, complete with stainless-steel eyes, spring-loaded catches and mounting components.

### **2.03 ALUMINUM:**

- A. Aluminum Extrusions: ASTM B221, Alloy 6063
- B. Aluminum-Alloy Rolled Tread Plate: ASTM B632/B 632M, Alloy 6061.
- C. Cast Aluminum.

## 2.04 COATINGS:

- A. Shop Primer for Ferrous Metal: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.
- B. Zinc-rich paint: MS MIL-P-21035.
- C. Electrodeposited zinc coating: ASTM B63
- D. Galvanizing repair compound: Stick form, melting point 600F to 650F, GALVABAR or equal.
- E. Bituminous coating: Cold-applied asphalt mastic complying with SSPC Paint 12, except containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D1187.

## 2.05 FASTENERS:

- A. General: Provide Type 304 or 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, where built into exterior walls. Select fasteners for type, grade, and class required.
- B. Screws: Material, type and size to suit the purpose; steel, except stainless, cadmium-plated.
  - 1. Stainless steel, ASTM A193, Alloy S30400.
- C. Machine bolts: Material, type and size best suited to the purpose. Minimum tensile strength 60,000 psi.
  - 1. Carbon steel: ASTM A307, Grade B, galvanized.
  - 2. Stainless steel: ASTM A193, Class 1A.
- D. Toggle bolt: FS FF-B-588.
- E. Drive stud: FS FF-S-325, Group 6.
- F. Expansion shield: FS FF-S-325 Group I, Type 2, Class 2, Style 1; Group II, Type 3, Class 1; Group IV, Type 1; best suited to the purpose.
- G. Screw anchors: Lead or plastic for wood or metal screws.
- H. Anchor-bolt sleeve: Corrugated high-density polyethylene plastic.
- I. Powder actuated: FS FF-P-395.
- J. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
  - 1. Material: Alloy Group 1 or 2 stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.
- K. Internally Threaded Steel Anchor: ASTM A108.

## 2.06 CONCRETE AND GROUT:

- A. Nonshrink Grout: Section 03300.
- B. Concrete Fill: Normal weight, minimum 3,000 psi structural concrete as required in Section 03300, except limit the max. coarse aggregate size to #8.
  - 1. Non-slip aggregate: Fused aluminum oxide grits or crushed emery, factory graded and packaged, rust-proof, non glazing and unaffected by moisture and cleaning materials.
  - 2. Surface hardener: Water-soluble, inorganic fluosilicate compound for curing, hardening and dustproofing fresh concrete.

## **2.07 FABRICATION, GENERAL:**

- A. Shop Assembly: Preassemble items in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
- B. Shear and punch metals cleanly and accurately. Remove burrs.
- C. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- D. Weld corners and seams continuously to comply with the following:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove welding flux immediately.
  - 4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- E. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
- F. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.
- G. Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.
- H. Allow for thermal movement resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening up of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
  - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- I. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges
- J. Remove sharp or rough areas on exposed traffic surfaces.

- K. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat-head (countersunk) screws or bolts. Locate joints where least conspicuous.

## **2.08 LADDERS:**

- A. General: Fabricate ladders for locations shown, with dimensions, spacings, details, and anchorages as indicated.
  - 1. Comply with ANSI A14.3, unless otherwise indicated.
  - 2. For elevator pit ladders, comply with ASME A17.1.
- B. Siderails: Continuous, 1/2-by-2-1/2-inch steel flat bars, with eased edges.
- C. Bar Rungs: 3/4-inch diameter steel bars, spaced 12 inches o.c., unless shown otherwise.
- D. Fit rungs in centerline of side rails; plug-weld and grind smooth on outer rail faces.
- E. Support each ladder at top and bottom and not more than 48 inches o.c. with welded or bolted steel brackets. Size brackets to support design loads specified in ANSI A14.3.
- F. Provide nonslip surfaces on top of each rung by coating with abrasive material metallurgically bonded to rung by a proprietary process.
- G. Galvanize ladders, including brackets and fasteners, in exterior locations and in areas with corrosive environments:

## **2.09 LADDER SAFETY CAGES:**

- A. General: Fabricate ladder safety cages to comply with ANSI A14.3. Assemble by welding or riveting.
- B. Primary Hoops: 5/16-by-4-inch steel flat bar hoops. Provide at tops and bottoms of cages and spaced not more than 20 feet o.c.
- C. Secondary Intermediate Hoops: 5/16-by-2-inch steel flat bar hoops, spaced not more than 48 inches o.c. between primary hoops.
- D. Vertical Bars: 5/16-by-2-inch steel flat bars secured to each hoop, spaced approximately 9 inches o.c.
- E. Fasten assembled safety cage to ladder rails and adjacent construction by welding or riveting, unless otherwise indicated.
- F. Galvanize ladder safety cages, including fasteners, in exterior locations and in areas with corrosive environments.

## **2.10 SHIP'S LADDERS:**

- A. General: Design in accordance with AISC Specification for Structural Steel for Buildings-Allowable Stress Design, NAAMM Metal Stairs Manual and applicable OSHA requirements.
  - 1. Minimum live load for stairs: 100 psf.
  - 2. Stringers: At platforms and landings, extend stringers around perimeters. Close ends with continuously welded closure plates, ground smooth and flush.

- B. Provide ship's ladders where shown or indicated. Fabricate of open-type construction with structural-steel channel or steel plate stringers, steel pipe handrails, and steel bar grating treads, unless otherwise indicated. Provide brackets and fittings for installation.
- C. Treads, platforms and landings fabricated of steel plate with nonslip surface or steel grating, as shown.
- D. As far as practicable, holes for rivets, bolts and screws located in concealed positions.
- E. Galvanize ship's ladder, including fasteners, in exterior locations and in areas with corrosive environments.
- F. Comply with applicable requirements in Section 05520 for steel pipe railings.

**2.11 SAFETY TREAD:**

- A. FS RR-T-650, Type C, metallic, nonskid, class and style as shown.
- B. Drilled and countersunk to receive flathead screws.

**2.12 STEEL LINTELS:**

- A. Fabricated of structural steel.
- B. Multiple members riveted or welded back-to-back or separated by spacers.
- C. Shop-painted, except hot-dip galvanized after fabrication where used in exterior walls.

**2.12 SHELF ANGLES:**

- A. Fabricate shelf angles from steel angles of sizes indicated and for attachment to concrete framing. Provide horizontally slotted holes to receive 3/4-inch bolts, spaced not more than 6 inches from ends and 24 inches o.c., unless otherwise indicated.
- B. For cavity walls, provide vertical channel brackets to support angles from backup masonry and concrete. Align expansion joints in angles with indicated control and expansion joints in cavity-wall exterior wythe.
- C. Galvanize shelf angles to be installed in exterior walls.
- D. Furnish wedge-type concrete inserts, complete with fasteners, to attach shelf angles to cast-in-place concrete.

**2.13 CORNER GUARD, CURB ANGLE AND BUMPER:**

- A. Fabricated of structural steel.
- B. Shop-painted.

**2.14 UNDERGROUND SAFETY WALK:**

- A. Locking pin: Stainless steel, diameter to fit receptacle in hinge assembly with tolerance not greater than plus-or-minus 1/64 inch.
- B. Locking-pin chain: Fabricated of 0.128-inch diameter steel spring wire.

- C. Plug-welded in accordance with AWS D1.1.
- D. Stainless steel: ASTM A276, Alloy S20200.
- E. Bolts and washers: ASTM A325 or ASTM A490, nonrising and vibration-proof.
- F. Spring wire: ASTM A229, Class 1 or 4.
- G. Ferrous-metal components galvanized after fabrication.
- H. Gratings and Floor Plates: Section 05531.

**2.15 AERIAL SAFETY WALK:**

- A. Fabricated of floor plate, diamond pattern, flatback.
- B. Abrasive surface on plates, unless otherwise shown.
- C. Structural-steel angle frames anchored to supporting structure.
- D. Plates in sections of convenient lengths for handling and with finger holes for lifting.
- E. Galvanized after fabrication.
- F. Bolts: Stainless steel.

**2.16 SCREEN AT PLATFORM BENCH:**

- A. Materials:
  - 1. Base: Steel, welded.
  - 2. Bar frame: Steel, welded.
  - 3. Screen:
    - a. Wire cloth: 0.080-inch diameter steel-wire mesh, galvanized after weaving.
    - b. Frame: Steel, drilled for fasteners, holes punched for wire mesh and corners welded, galvanized.
- B. Fabrication: Insert wire cloth with wires parallel to frame members, with ends of wires through holes in frame and welded to inner surface of channel.
- C. Finish: Field-painted in accordance with Section 09920; FED STD 595, Color No. 20040.

**2.17 CAST NOSING:**

- A. Cast aluminum: Cross-hatched units, 4 inches wide with 1-inch lip, for casting into concrete steps
- B. Apply bituminous paint to concealed bottoms, sides, and edges of units set into concrete.

**2.18 PEDESTRIAN BARRIER:**

- A. Tubing: Hot-formed square steel. Fabricated as follows:
  - 1. Heated and bent smoothly without distortion
  - 2. Joints fully welded as shown.
  - 3. Intersections coped, fully welded and ground smooth and flush.

- B. Plate: Structural steel.
- C. Floor-cover flange: Cast steel, as shown.
- D. Finish: Shop-coated and finish painted in accordance with Section 09920.

**2.19 BOLLARDS:**

- A. Pipe: Black Steel, ASTM A53, Type E, Grade A, Schedule 80, sized as shown, with 1/4-inch steel-plate cap welded all around and weld ground smooth
- B. Eyebolt: 1/4-inch diameter steel rod with 1/2-inch diameter eye.
- C. Concrete fill: Section 03300, Class 3000.
- D. Coating:
  - 1. Shop paint.
  - 2. Finish paint: Aliphatic system as specified in Section 09920.
  - 3. Hot-dip galvanize exterior bollards in accordance with ASTM A123 before bonderizing and shop priming.
- E. Chain: Guard chain, galvanized and painted to match bollard.

**2.20 PARKING METER POSTS:**

- A. Pipe: Black steel, ASTM A53, Type E, Grade A, Schedule 40, two-inch nominal OD.
- B. Hot-dip galvanize after cutting to length.
- C. See Sections 03100, 03200, and 03300 for concrete footing.

**2.21 MISCELLANEOUS ITEMS:**

- A. Fabricate metal items indicated on the drawings from materials shown or, if not otherwise described, from steel or from galvanized steel wherever exposed to the weather or in contact with concrete or masonry.
- B. Make miscellaneous items to the size and configuration indicated, welded or bolted at joints to develop full strength equal to a continuous member, and in every way complete for the intended purpose and finished in appearance.
- C. Pylon-Base Ring: Structural steel, galvanized after fabrication.
- D. Lifting Eye: ASTM A572, Grade 50, one-inch diameter steel rod, welded, galvanized after fabrication.

**2.22 FINISHES:**

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
  - 1. Finish metal fabrications after assembly.
- B. Galvanizing:
  - 1. Clean ferrous metal thoroughly before applying zinc coating.
  - 2. Apply zinc coating to products after fabrication, by hot-dip method, using coating weighing not less than 2.0 ounces per square foot.

- C. Shop Paint:
  - 1. Ferrous metal thoroughly cleaned as recommended by primer manufacturer and in accordance with SSPC SP11 and, except for items to be encased in concrete, given prime coat of paint.
  - 2. Zinc yellow iron-oxide primer or red-lead base primer applied so as to thoroughly cover surfaces without leaving runs or sags.
- D. Stainless Steel: Remove tool and die marks and stretch lines or blend into finish. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- E. Aluminum: AA-M10 (Mechanical Finish: as fabricated, unspecified).
- F. Non-Slip Abrasive Surfaces: SLIP-NOT as manufactured by the W. S. Molnar Company or approved equal. Fabricate from steel plate or bar with abrasive material metallurgically bonded to steel by a proprietary process. Provide material with coefficient of friction of 0.6 or higher when tested according to ASTM C1028.

### **PART 3 - EXECUTION**

#### **3.01 PREPARATION:**

- A. Remove foreign substances from surfaces to receive metal items.
- B. Protect surrounding surfaces from damage while performing the work of this section.

#### **3.02 INSTALLATION, GENERAL:**

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal fabrications to in-place construction. Include threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws, and other connectors.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal fabrications. Set metal fabrications accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- C. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- D. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- E. Field Welding: Comply with the following requirements:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove welding flux immediately.
  - 4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

- F. Corrosion Protection: Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint.

**3.03 INSTALLING NOSINGS:**

- A. Center nosings on tread widths.
- B. For nosings embedded in concrete steps or curbs, align nosings flush with riser faces and level with tread surfaces.

**3.04 INSTALLING BOLLARDS:**

- A. Anchor bollards in concrete with pipe sleeves preset and anchored into concrete. After bollards have been inserted into sleeves, fill annular space between bollard and sleeve solidly with nonshrink, nonmetallic grout, mixed and placed to comply with grout manufacturer's written instructions. Slope grout up approximately 1/4 inch toward bollard.

**3.05 PAINTING AND REPAIRING COATED SURFACES:**

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finished work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.
- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
  - 1. Wire-brush areas to be coated to bright metal.
  - 2. Apply galvanizing repair compound at rate of two ounces per square foot.

**END OF SECTION**

## SECTION 05511

### METAL STAIRS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing Adjust list below to suit Project. steel stairs with concrete-filled treads, industrial stairs with steel floor plate treads, industrial stairs with steel grating treads.
- B. Related Work Specified Elsewhere:
  - 1. Cast-In-Place Structural Concrete: Section 03300.
  - 2. Handrails and Railings: Section 05521.
  - 3. Miscellaneous Metal: Section 05500.
  - 4. Field Painting: Section 09920.

##### 1.02 PERFORMANCE REQUIREMENTS:

- A. Structural Performance: Provide metal stairs capable of withstanding the following structural loads without exceeding the allowable design working stress of the materials involved, including anchors and connections. Apply each load to produce the maximum stress in each component of metal stairs.
  - 1. Treads and Platforms of Metal Stairs: Capable of withstanding a uniform load of 100 lbf/sq. ft. or a concentrated load of 300 lbf on an area of 4 sq. in., whichever produces the greater stress; or higher load if required by the jurisdictional authority where the stair is installed.
  - 2. Stair Framing: Capable of withstanding stresses resulting from loads specified above in addition to stresses resulting from railing system loads.
  - 3. Limit deflection of treads, platforms, and framing members to L/360 or 1/4 inch, whichever is less or as required by the jurisdictional authority where the stair is installed.
- B. Metal stairs shall be designed in accordance with AISC's "Specification for Structural Steel for Buildings-Allowable Stress Design," NAAMM's "Metal Stairs Manual" and applicable OSHA requirements.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each.
  - 1. Product Data: For metal stairs and the following:
    - a. Prefilled metal-pan stair treads.
    - b. Precast concrete treads.
    - c. Nonslip aggregates and nonslip-aggregate finishes.
    - d. Steel floor plate.
    - e. Grout.
  - 2. Shop Drawings: Show fabrication and installation details for metal stairs. Include plans, elevations, sections, and details of metal stairs and their connections. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections.
  - 3. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

4. Samples for Initial Selection: Manufacturer's color charts or sections of units showing the full range of colors and patterns for the following products
5. Samples for Verification: For the following products. Prepare Samples from the same material to be used for the Work.
  - a. Stair treads with nonslip-aggregate surface finish.
  - b. Floor plate treads.
  - c. Grating treads.
6. Welding Certificates: Copies of certificates for welding procedures and personnel.

### **1.03 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of the jurisdictional authorities.
  2. ADA: Americans with Disabilities Act.
  3. AGA: The Design and Fabrication of Galvanized Products.
  4. AISC: Specification for Structural Steel for Buildings-Allowable Stress Design
  5. ASME: B18.2.1, B18.6.3, B18.21.1, B18.22.1.
  6. ASTM: A36, A82, A90, A123, A143, A153, A185, A283, A307, A366, A384, A500, A510, A563, A611, B633, C1028, C1107, D1187, E488, F593, F594.
  7. AWS: D1.1, D1.3.
  8. FS: TT-P-664
  9. MS: MIL-P-21305.
  10. NAAMM: Metal Bar Grating Manual for Steel, Stainless Steel, and Aluminum Gratings and Stair Treads, Metal Finishes Manual for Architectural and Metal Products, Metal Stairs Manual.
  11. SSPC: Paint 12, PA-1, SP 3, SP 6/NACE No. 3.
- B. Installer Qualifications: Arrange for metal stairs specified in this Section to be fabricated and installed by the same firm.
- C. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of metal stairs (including handrails and railing systems) that are similar to those indicated for this Project in material, design, and extent.
- D. Fabricator Qualifications: A firm experienced in producing metal stairs similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
- E. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel," and AWS D1.3, "Structural Welding Code--Sheet Steel."

### **1.05 COORDINATION:**

- A. Coordinate installation of anchorages for metal stairs. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

## **PART 2 - PRODUCTS**

### **2.01 FERROUS METALS:**

- A. Metal Surfaces, General: Provide metal free from pitting, seam marks, roller marks, and other imperfections where exposed to view on finished units. Do not use steel sheet with variations in flatness exceeding those permitted by referenced standards for stretcher-leveled sheet.
- B. Steel Plates, Shapes, and Bars: ASTM A36.
- C. Steel Tubing: Cold-formed steel tubing complying with ASTM A500.
- D. Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from plate complying with ASTM A 36/A 36M or ASTM A 283/A 283M, Grade C or D.
- E. Steel Bars for Gratings: ASTM A36.
- F. Wire Rod for Grating Crossbars: ASTM A510.
- G. Uncoated, Cold-Rolled Steel Sheet: Commercial quality, complying with ASTM A366/A366M; or structural quality, complying with ASTM A611, Grade A, unless another grade is required by design loads.
- H. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

## **2.02 FASTENERS:**

- A. General: Provide zinc-plated fasteners with coating complying with ASTM B633, Class Fe/Zn 25 for exterior use, and Class Fe/Zn 5 where built into exterior walls. Select fasteners for type, grade, and class required.
- B. Bolts and Nuts: Regular hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563; and, where indicated, flat washers.
- C. Machine Screws: ASME B18.6.3.
- D. Lag Bolts: ASME B18.2.1.
- E. Plain Washers: Round, carbon steel, ASME B18.22.1.
- F. Lock Washers: Helical, spring type, carbon steel, ASME B18.21.1.
- G. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
  - 1. Material: Carbon-steel components zinc-plated to comply with ASTM B 633, Class Fe/Zn 5.
  - 2. Material: Alloy Group 1 or 2 stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.

## **2.03 COATINGS:**

- A. Shop Primer for Ferrous Metal: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664, selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for

- B. Galvanizing (zinc-coating by hot-dipped process): ASTM A90, ASTM A123, or ASTM A143, ASTM A153 or ASTM A384, as applicable.
- C. Zinc-rich paint: MS MIL-P-21305.
- D. Galvanizing Repair Compound: Stick form, melting point 600-degree F to 650-degree F, GALVABAR or equal.

**2.04 CAST ABRASIVE NOSINGS:**

- A. Fabricate units from cast iron in sizes and configurations indicated and in lengths necessary to accurately fit openings or conditions. Provide units with an integral corundum or silicon carbide abrasive finish. See Section 05500, "Miscellaneous Metals."
- B. Provide anchors for embedding units in concrete, either integral or applied to units, as standard with manufacturer.
- C. Apply bituminous paint to concealed bottoms, sides, and edges of units set into concrete.
- D. Provide a cross-hatched surface texture, unless other surfaces are indicated.

**2.05 GROUT:**

- A. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

**2.06 CONCRETE FILL AND REINFORCING MATERIALS:**

- A. Concrete Materials and Properties: Comply with requirements in Section 03300, "Cast-in-Place Concrete" for normal-weight, ready-mixed concrete with a minimum 28-day compressive strength of 3000 psi, limit the max. coarse aggregate size to #8, unless higher strengths are indicated.
- B. Nonslip-Aggregate Finish: Factory-packaged and graded abrasive aggregate made from fused, aluminum-oxide grits or crushed emery; rustproof and nonglazing; unaffected by freezing, moisture, or cleaning materials.
- C. Welded Wire Fabric: ASTM A185, 6 by 6 inches--W1.4 by W1.4, unless otherwise indicated.
- D. Surface Hardener: Water-soluble, inorganic fluosilicate compound for curing, hardening and dustproofing fresh concrete.

**2.07 PRECAST CONCRETE TREADS:**

- A. Concrete Materials and Properties: Comply with requirements in Section 03300, "Cast-in-Place Concrete" for normal-weight, ready-mixed concrete with a minimum 28-day compressive strength of 5000 psi and a total air content of not less than 4 percent or more than 6 percent.
- B. Reinforcing Wire Fabric: Galvanized, welded wire fabric, 2 by 2 inches by 0.062-inch-diameter wire; comply with ASTM A185 and ASTM A82, except for minimum wire size.

**2.08 FABRICATION, GENERAL:**

- A. Fabricate and prepare products required to be galvanized in accordance with recommendations of AGA.
- B. Provide complete stair assemblies, including metal framing, hangers, struts, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure. Delete subparagraphs below if not required.
  - 1. Join components by welding, unless otherwise indicated.
  - 2. Use connections that maintain structural value of joined pieces.
  - 3. Fabricate treads and platforms of exterior stairs so finished walking surfaces slope to drain.
- C. NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual," for class of stair designated, unless more stringent requirements are indicated.
  - 1. Architectural class, where indicated.
  - 2. Commercial class, unless otherwise indicated.
  - 3. Service class, unless otherwise indicated.
  - 4. Industrial class, where indicated.
- D. Shop Assembly: Preassemble stairs in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation
- E. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges. Shear and punch metals cleanly and accurately. Remove sharp or rough areas on exposed surfaces.
- F. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- G. Weld connections to comply with AWS and the following:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove welding flux immediately.
  - 4. Weld exposed corners and seams continuously, unless otherwise indicated.
  - 5. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- H. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat-head (countersunk) screws or bolts. Locate joints where least conspicuous.
- I. Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.

## **2.09 STEEL-FRAMED STAIRS:**

- A. Stair Framing: Fabricate stringers of structural-steel channels, plates, or a combination of both, as indicated. Provide closures for exposed ends of stringers. At platforms and landings, extend stringers around perimeters. Close ends with continuously welded closure plates, ground smooth and flush. Construct platforms of structural-steel channel headers and miscellaneous framing members as indicated. Bolt or weld headers to stringers; bolt or weld

framing members to stringers and headers. If using bolts, fabricate and join so bolts are not exposed on finished surfaces.

1. Where masonry walls support metal stairs, provide temporary supporting struts designed for erecting steel stair components before installing masonry.
- B. Metal Risers, Subtread Pans, and Subplatforms: Form to configurations shown from steel sheet of thickness necessary to support indicated loads, but not less than 0.0677 inch.
1. Steel Sheet: Uncoated cold-rolled steel sheet, unless otherwise indicated.
  2. Directly weld metal pans to stringers; locate welds on side of subtreads to be concealed by concrete fill. Do not weld risers to stringers.
  3. Attach cast abrasive nosings to risers. Make nosings full width of tread, with noses flush with riser faces and level with tread surfaces.
- C. Steel Floor Plate Treads, Risers, and Platforms: Form to configurations shown from abrasive-surface floor plate of thickness necessary to support indicated loads, but not less than 1/4 inch.
1. Abrasive-Surface Floor Plate: Fabricate from steel plate, with abrasive material metallurgically bonded to steel by a proprietary process. Provide material with coefficient of friction of 0.6 or higher when tested according to ASTM C1028.
    - a. Products: Subject to compliance with requirements, provide one of the following:
      - 1) Mebac; IKG Borden.
      - 2) SLIP-NOT; W. S. Molnar Company.
      - 3) Or equal.
  2. Form treads with integral nosing and back edge stiffener. Weld steel supporting brackets to stringers and weld treads to brackets.
  3. Fabricate platforms with integral nosings matching treads and weld to platform framing.
- D. Floor Grating Treads and Platforms: Form to configurations shown from metal bar grating; fabricate to comply with NAAMM MBG 531, "Metal Bar Grating Manual for Steel Stainless Steel, and Aluminum Gratings and Stair Treads."
1. Fabricate treads and platforms from welded steel grating or pressure-locked steel grating with bearing bars and crossbars of sizes to meet the required loads.
  2. Surface: Serrated.
  3. Finish: Galvanized.
  4. Fabricate grating platforms with nosing matching that on grating treads. Provide toeplates at open-sided edges of grating platforms. Weld grating to platform framing.

## **2.10 STAIR HANDRAILS AND RAILINGS:**

- A. General: Comply with applicable requirements in Section 05521 Delete paragraph above or below.
1. Railings may be bent at corners, rail returns, and wall returns, instead of using prefabricated fittings.
  2. Connect railing posts to stair framing by direct welding, unless otherwise indicated.

## **2.11 FINISHES:**

- A. General:
1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
  2. Finish metal stairs after assembly.
- B. Galvanizing:

1. Clean ferrous metal thoroughly before applying zinc coating.
  2. Apply zinc coating to products after fabrication, by the hot-dip method, using coating weighing not less than two ounces per-square-foot.
- C. Preparation for Shop Priming: Prepare uncoated or non-alvanized ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed items:
1. Interiors (SSPC Zone 1A): SSPC-SP 3, "Power Tool Cleaning."
- D. Apply shop primer to non-galvanized surfaces of gratings, frames, and supports, except those with galvanized finishes and those to be embedded in concrete or masonry, unless otherwise indicated. Comply with SSPC-PA 1, "Paint Application Specification No. 1," for shop painting.
1. Do not apply primer to galvanized surfaces.
  2. Stripe paint corners, crevices, bolts, welds, and sharp edges.
  3. For items shown or indicated to receive paint: Section 09920.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION, GENERAL:**

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free from rack.
- C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete, unless otherwise indicated.
- D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- E. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- F. Field Welding: Comply with the following requirements:
1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  2. Obtain fusion without undercut or overlap.
  3. Remove welding flux immediately.
  4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- G. Install precast treads with adhesive supplied by manufacturer.

#### **3.02 INSTALLING METAL STAIRS WITH GROUTED BASEPLATES:**

- A. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of baseplates.

- B. Set steel stair baseplates on wedges, shims, or leveling nuts. After stairs have been positioned and aligned, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with grout.
  - 1. Use nonmetallic, nonshrink grout, unless otherwise indicated.
  - 2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

### **3.03 INSTALLING STEEL RAILINGS AND HANDRAILS:**

- A. Adjust handrails and railing systems before anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated or, if not indicated, as required by design loads. Plumb posts in each direction. Secure posts and railing ends to building construction as follows:
  - 1. Anchor posts to steel by welding directly to steel supporting members.
  - 2. Anchor handrail ends to concrete and masonry with steel round flanges welded to rail ends and anchored with postinstalled anchors and bolts.
- B. Attach handrails to wall with wall brackets. Provide bracket with 1-1/2-inch clearance from inside face of handrail and finished wall surface. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads. Secure wall brackets to building construction as follows:
  - 1. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
    - a. For hollow masonry anchorage, use toggle bolts.

### **3.04 PAINTING AND REPAIRING COATED SURFACES:**

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finish work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.
- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
  - 1. Wire brush areas to be coated to bright metal.
  - 2. Apply galvanizing repair compound at rate of two ounces per-square-foot.

**END OF SECTION**

**SECTION 05521  
HANDRAILS AND RAILINGS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This section specifies providing Adjust list below to suit Project.steel pipe and tube handrails and railings and PVC pipe handrails and railings.
  
- B. Related Work Specified Elsewhere:
  - 1. Miscellaneous Metal: Section 05500.
  - 2. Metal Stairs: Section 05511.
  - 3. Ornamental Metal: Section 05700.
  - 4. Field Painting: Section 09920
  - 5. Wire Mesh Partitions: Section 10605

**1.02 PERFORMANCE REQUIREMENTS:**

- A. General: In engineering handrails and railings to withstand structural loads indicated, determine allowable design working stresses of handrail and railing materials based on the following: Retain only those requirements below that apply to materials specified in Part 2.
  - 1. Structural Steel: AISC S335, "Specification for Structural Steel Buildings Allowable Stress Design and Plastic Design with Commentary."
  - 2. Cold-Formed Structural Steel: AISI SG-673, Part I, "Specification for the Design of Cold-Formed Steel Structural Members."
  
- B. Structural Performance of Handrails and Railings: Provide handrails and railings capable of withstanding the following structural loads without exceeding allowable design working stresses of materials for handrails, railings, anchors, and connections:
  - 1. Top Rail of Guards: Capable of withstanding the following loads applied as indicated or higher if required by the jurisdictional authority where installed
    - a. Concentrated load of 200 lbf applied at any point and in any direction.
    - b. Uniform load of 50 lbf/ft. applied horizontally and concurrently with uniform load of 100 lbf/ft. applied vertically downward.
    - c. Concentrated and uniform loads above need not be assumed to act concurrently.
  - 2. Handrails Not Serving As Top Rails: Capable of withstanding the following loads applied as indicated or higher if required by the jurisdictional authority where installed:
    - a. Concentrated load of 200 lbf applied at any point and in any direction.
    - b. Uniform load of 50 lbf/ft. applied in any direction.
    - c. Concentrated and uniform loads above need not be assumed to act concurrently.
  - 3. Infill Area of Guards: Capable of withstanding a horizontal concentrated load of 200 lbf applied to 1 sq. ft. at any point in system, including panels, intermediate rails, balusters, or other elements composing infill area or higher if required by the jurisdictional authority where installed.
    - a. Load above need not be assumed to act concurrently with loads on top rails in determining stress on guard.

- C. Thermal Movements: Provide handrails and railings that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
  - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- D. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

### **1.03 SUBMITTALS:**

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: For the following:
  - 1. Manufacturer's product lines of handrails and railings.
  - 2. Grout, anchoring cement, and paint products.
- B. Shop Drawings: Show fabrication and installation of handrails and railings. Include plans, elevations, sections, component details, and attachments to other Work.
  - 1. For installed handrails and railings indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- C. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for products with factory-applied color finishes.
- D. Samples for Verification: For each type of exposed finish required, prepared on components indicated below and of same thickness and material indicated for the Work. If finishes involve normal color and texture variations, include sample sets showing the full range of variations expected.
  - 1. 6-inch-long sections of each distinctly different linear railing member, including handrails, top rails, posts, and balusters.
  - 2. Fittings and brackets.
  - 3. Assembled sample of railing system, made from full-size components, including top rail, post, handrail, and infill. Show method of finishing members at intersections. Sample need not be full height
- E. Product Test Reports: From a qualified testing agency indicating products comply with requirements, based on comprehensive testing of current products.
- F. Welding Certificates: Copies of certificates for welding procedures and personnel.

### **1.04 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ADA: Americans with Disabilities Act.
  - 3. AGA: The Design and Fabrication of Galvanized Products.
  - 4. AISC: S335.
  - 5. AISI: SG-673, Part I.
  - 6. ASTM: A36, A53, A90, A123, A143, A153, A384, A500, A780, B633, C1107, D256, D635, D638, D695, D790, E488, E548.

7. AWS: D1.1, D1.3.
  8. FED STD: 595.
  9. FS: A-A-462, FF-B-588, FF-H-116, FF-P-395, FF-S-325, TT-P-644.
  10. NAAMM: Metal Finishes Manual for Architectural and Metal Products, Pipe Railing Manual.
  11. SSPC: PA 1, Paint 5, SP 6, SP 7.
- B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of handrails and railings that are similar to those indicated for this Project in material, design, and extent.
- C. Testing Agency Qualifications: An independent testing agency with the experience and capability to conduct the testing indicated, as documented according to ASTM E548.
- D. Welding: Qualify procedures and personnel according to AWS D1.1 "Structural Welding Code-Steel, and AWS D1.3," Structural Welding Code-Sheet Steel".
- E. Source Limitations: Obtain each type of handrail and railing through one source from a single manufacturer.

#### **1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products undamaged.
- B. Store handrails and railings in a dry, well-ventilated, weathertight place.
- C. Handle products so as to prevent damage.

#### **1.06 PROJECT CONDITIONS:**

- A. Field Measurements: Verify handrail and railing dimensions by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating handrails and railings without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.

#### **1.07 COORDINATION:**

- A. Coordinate installation of anchorages for handrails and railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

#### **1.08 SCHEDULING:**

- A. Schedule installation so handrails and railings are mounted only on completed walls. Do not support temporarily by any means that does not satisfy structural performance requirements.

## **PART 2 - PRODUCTS**

### **2.01 FERROUS METALS:**

- A. Metal Surfaces, General: Provide metal free from pitting, seam marks, roller marks, stains, discolorations, and other imperfections where exposed to view on finished units.
- B. Steel and Iron: Provide steel and iron in the form indicated, complying with the following requirements:
  - 1. Steel Pipe: ASTM A53; finish, type, and weight class as follows
    - a. Black finish, unless otherwise indicated.
    - b. Galvanized finish for exterior installations and where indicated. Type E, Grade A, standard weight (Schedule 40) for rails and extra heavy weight (Schedule 80) for posts, unless another grade and weight are required by structural loads.
  - 2. Steel Tubing: Cold-formed steel tubing, ASTM A500, Grade A, unless another grade is required by structural loads.
  - 3. Steel Plates, Shapes, and Bars: ASTM A36.
- C. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails, unless otherwise indicated.

### **2.02 POLYVINYL CHLORIDE (PVC) FOR NON-CONDUCTIVE RAILINGS:**

- A. Custom colored, fade-resistant PVC pipe and fittings, meeting the structural performance requirements with the following minimum properties:
  - 1. Compressive Strength, ASTM D695: 8,100 psi.
  - 2. Tensile Strength, ASTM D638: 6,500 psi.
  - 3. Flexural Strength, ASTM D790: 11,000 psi.
  - 4. Flexural Modulus, ASTM D790: 350,000 psi.
  - 5. Izod Impact, ASTM D256: 5.0 ft-lb/in minimum.
  - 6. Flamability, ASTM D635: Self-extinguishing.
  - 7. UL Rating: UL 94-V-O, minimum thickness 0.062-inch.
  - 8. Color: Intergrally pigmented PVC in Brown color, FED STD 595B color 20040.

### **2.03 FIBERGLASS REINFORCED PLASTIC (FRP) NON-CONDUCTIVE RAILINGS:**

- A. Fabricated from isophthalic-polyester or vinyl ester resin poltruded fiberglass components with polyurethane UV coating, flame retardant per ASTM E4 Class I, meeting the structural performance requirements and with the following minimum properties:
  - 1. Compressive Stress, ASTM D695: 30,000 psi.
  - 2. Tensile Stress, ASTM D638: 30,0000 psi.
  - 3. Flexural Stress, ASTM D790: 30,0000 psi.
  - 4. Flexural Modulus, ASTM D790: 1.6 x 10<sup>6</sup> psi.
  - 5. Flamability: Self-extinguishing.
  - 6. Color: Manufacturer's standard unless otherwise indicated.

### **2.04 WELDING MATERIALS, FASTENERS, AND ANCHORS:**

- A. Welding Electrodes and Filler Metal: Provide type and alloy of filler metal and electrodes as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.

- B. Fasteners for Anchoring Handrails and Railings to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring handrails and railings to other types of construction indicated and capable of withstanding design loads.
  - 1. For steel handrails, railings, and fittings, use plated fasteners complying with ASTM B633, Class Fe/Zn 25 for electrodeposited zinc coating.
- C. Fasteners for Interconnecting Handrail and Railing Components: Use fasteners fabricated from same basic metal as fastened metal, unless otherwise indicated. Do not use metals that are corrosive or incompatible with materials joined.
  - 1. Provide concealed fasteners for interconnecting handrail and railing components and for attaching them to other work, unless otherwise indicated.
  - 2. Provide Phillips flat-head machine screws for exposed fasteners, unless otherwise indicated.
- D. Cast-in-Place and Postinstalled Anchors: Anchors of type indicated below, fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488 conducted by a qualified independent testing agency.
  - 1. Cast-in-place anchors.
  - 2. Expansion anchors.
- E. Anchoring Devices:
  - 1. Toggle bolt: FS FF-B-588.
  - 2. Drive Stud: FS FF-S-325, Group 6.
  - 3. Expansion Shield: FS FF-S-325, Group I, Class 2, Style 1; Group II, Type 3, Class 1, Group IV, Type 1; best suited to the purpose.
  - 4. Screw Anchors: Lead or plastic for wood or metal screws.
  - 5. Anchor-bolt sleeve: Corrugated high-density polyethylene plastic.
  - 6. Powder actuated: FS FF-P-395.

## **2.05 COATINGS:**

- A. Shop Primer for Ferrous Metal: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.
- B. Shop Primer for Galvanized Steel: Zinc-dust, zinc-oxide primer formulated for priming zinc-coated steel and for compatibility with finish paint systems indicated, and complying with SSPC-Paint 5.
- C. Galvanizing (zinc-coating by hot-dipped process): ASTM A90, ASTM A123, or ASTM A143, ASTM A153 or ASTM A384, as applicable.
- D. Galvanizing Repair Compound: Stick form, melting point 600-degree F to 650-degree F, GALVABAR or equal.
- E. Bituminous Paint: Cold-applied asphalt mastic complying with SSPC-Paint 12, except containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D 1187.

## **2.06 GROUT AND ANCHORING CEMENT:**

- A. Nonshrink, Nonmetallic Grout: Premixed, factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.
- B. Erosion-Resistant Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound. Provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

## **2.07 FABRICATION, GENERAL:**

- A. Fabricate and prepare products required to be galvanized in accordance with recommendations of AGA.
- B. Fabricate handrails and railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.
- C. Assemble handrails and railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- D. Form changes in direction of railing members as follows:
  - 1. By bending.
  - 2. By radius bends of radius indicated on approved shop drawings.
- E. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of handrail and railing components.
- F. Welded Connections: Fabricate metal handrails and railings for connecting members by welding. Cope components at perpendicular and skew connections to provide close fit, or use fittings designed for this purpose. Weld connections continuously to comply with the following:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove flux immediately.
  - 4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.
- G. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect handrail and railing members to other work, unless otherwise indicated.
- H. Provide inserts and other anchorage devices for connecting handrails and railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by handrails and railings. Coordinate anchorage devices with supporting structure.

- I. For railing posts set in concrete, provide preset sleeves of steel not less than 6 inches long with inside dimensions not less than  $\frac{1}{2}$  inch greater than outside dimensions of post, and steel plate forming bottom closure, unless indicated otherwise on approved shop drawings.
- J. For removable railing posts, fabricate slip-fit sockets from steel tube whose ID is sized for a close fit with posts; limit movement of post without lateral load, measured at top, to not more than one-fortieth of post height. Provide socket covers designed and fabricated to resist being dislodged.
  - 1. Provide chain with eye, snap hook, and staple across gaps formed by removable railing sections at locations indicated. Fabricate from same metal as railings.
- K. Shear and punch metals cleanly and accurately. Remove burrs from exposed cut edges.
- L. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.
- M. Cut, reinforce, drill, and tap components, as indicated, to receive finish hardware, screws, and similar items.
- N. Provide weep holes or another means to drain entrapped water in hollow sections of handrail and railing members that are exposed to exterior or to moisture from condensation or other sources.
- O. Fabricate joints that will be exposed to weather in a watertight manner.
- P. Close exposed ends of handrail and railing members with prefabricated end fittings.
- Q. Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated. Close ends of returns, unless clearance between end of railing and wall is 1/4 inch or less.
- R. Toe Boards: Where indicated, provide toe boards at railings around openings and at edge of open-sided floors and platforms. Fabricate to dimensions and details indicated on approved shop drawings.

## **2.08 FABRICATION, PIPE RAILINGS AND RAILING GATES:**

- A. Pipe: Black steel, ASTM A53, Type E, Grade A, standard weight (Schedule 40) for rails and extra heavy weight (Schedule 80) for posts, unless another grade and weight are required by structural loads, 1 inch nominal ID unless otherwise shown on approved shop drawings. Fabricated in accordance with NAAMM, "Pipe Railing Manual" and as shown on approved shop drawings.
- B. Plates, shapes and bars: Structural Steel.
- C. Intersections neatly coped, fully welded and ground smooth.
- D. Heated and bent smoothly, without distortion.
- E. Galvanized after fabrication.
- F. Hardware:
  - 1. Hinges: FS FF-H-116, Type 2127H, US2H finish.

2. Cane bolt: FS A-A-462.
3. Double-acting latch:
  - a. Shop fabricated.
  - b. Housing and strike: Steel, ASTM A36.
  - c. Turn piece and bolt: Bronze, US10B
  - d. Spring: Phosphor bronze.

#### **2.09 FABRICATION, HANDRAILS:**

- A. Pipe: Black steel, ASTM A53, Type E, Grade A, standard weight (Schedule 40), 1 inch nominal ID, unless otherwise indicated on approved shop drawings.
- B. Returned to walls at ends with quarter-round bends, with wall flanges welded to bends.
- C. Wall brackets included.
- D. Galvanized after fabrication.
- E. Bonderized and shop primed.

#### **2.10 FABRICATION, PVC NON-CONDUCTIVE RAILINGS:**

- A. Factory manufactured pipe railing assembly consisting of pigmented PVC pipe with prefabricated connections and bends, and with galvanized steel pipe reinforcing inside the posts. Size and arrangement as shown on approved shop drawings and as determined from field measurements.
- B. Deformation Requirement: Support loading required under "Performance Requirements" with a minimum recovery from deflection of 99 percent.
- C. Rails and Posts: Two laminated PVC pipes, one inside the other; inner pipe Schedule 80 and extended to receive tee, cross and end fittings; outer pipe Schedule 40.
- D. Post Reinforcing: Hot-dipped galvanized steel pipe, Schedule 80, of length to reinforce entire height of railing, sized to fit snugly inside inner PVC pipe and extended at floor to anchor into concrete.
- E. Rail Reinforcing: If required for design load, provide hot-dipped galvanized steel pipe, Schedule 40 or Schedule 80 as necessary, of length to reinforce entire length of rail, sized to fit snugly inside inner PVC pipe.
- F. Splice Tubes: Schedule 80 PVC pipe to ensure rigid splices in rails and at end fittings.
- G. Tee, Cross and End Fittings, and Spacers: Schedule 40 PVC pipe matching rail and post diameter and finish.
- H. End Plates: Solid PVC, four-inch diameter  $\hat{A}$ ½-inch thick plate with an integral two-inch long stub of same diameter as splice tube; four pre-drilled countersunk 3/8-inch holes.
- I. Welding Solvent: As recommended by manufacturer.
- J. Color: Metro Brown 20040. Color extending through thickness of PVC.
- K. Grout: Nonshrink as specified, except with 9,000 psi compressive strength.

- L. Source: Safron , Inc. (305)233-5511, or equal.

**2.11 FABRICATION, FRP NON-CONDUCTIVE RAILINGS:**

- A. Factory manufactured tube railing assembly consisting of pigmented FRP tube with prefabricated connections, bends and all fittings. Size and arrangement as shown on approved shop drawings and as determined from field measurements.
- B. Rails and Posts: 2-inch X 2-inch X 1/4-inch square tube manufactured by the pultrusion process. All posts and rails shall use the same tube size. All tubing for handrail to have a minimum 1/4" wall thickness.
- C. Kickplate: Unless indicated otherwise, provide 4-inch pultruded fiberglass shape.
- D. Anchoring devices: Stainless steel anchor bolts or studs, minimum 1/2-inch diameter, extending no less than 2 -1/4 inches into the concrete, or as recommended by railing manufacturer.
- E. Epoxy: As recommended by railing manufacturer.
- F. Color: Manufacturer's standard color unless otherwise indicated.

**2.12 FINISHES, GENERAL:**

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

**2.13 STEEL FINISHES:**

- A. Galvanized Handrails and Railings: Hot-dip galvanize exterior steel and iron handrails and railings to comply with ASTM A123. Hot-dip galvanize hardware for exterior steel and iron handrails and railings to comply with ASTM A153/A153M.
- B. Galvanizing: Hot-dip galvanize items as indicated to comply with applicable standard listed below:
  - 1. ASTM A123, for galvanizing steel and iron products.
  - 2. ASTM A153/A153M, for galvanizing steel and iron hardware.
- C. Fill vent and drain holes that will be exposed in finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.
- D. For galvanized handrails and railings, provide galvanized fittings, brackets, fasteners, sleeves, and other ferrous components.

- E. Preparation for Shop Priming: After galvanizing, thoroughly clean handrails and railings of grease, dirt, oil, flux, and other foreign matter, and treat with metallic-phosphate process.
- F. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed handrails and railings:
  - 1. Exteriors (SSPC Zone 1B): SSPC-SP 6, "Commercial Blast Cleaning."
  - 2. Interiors (SSPC Zone 1A): SSPC-SP 7, "Brush-off Blast Cleaning." Apply shop primer to prepared surfaces of handrail and railing components, unless otherwise indicated. Comply with requirements in SSPC-PA 1, "Paint Application Specification No. 1," for shop painting. Primer need not be applied to surfaces to be embedded in concrete or masonry.
  - 3. Do not apply primer to galvanized surfaces.
  - 4. Stripe paint edges, corners, crevices, bolts, and welds.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION, GENERAL:**

- A. Fit exposed connections together to form tight, hairline joints.
- B. Perform cutting, drilling, and fitting required to install handrails and railings. Set handrails and railings accurately in location, alignment, and elevation; measured from established lines and levels and free from rack.
  - 1. Do not weld, cut, or abrade surfaces of handrail and railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
  - 2. Set posts plumb within a tolerance of 1/16 inch in 3 feet.
  - 3. Align rails so variations from level for horizontal members and from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet.
- C. Adjust handrails and railings before anchoring to ensure matching alignment at abutting joints. Space posts at interval indicated, but not less than that required by structural loads.
- D. Where pipe railing is mounted on concrete, attach by means of bolts and expansion shields. If concrete surface upon which posts are to be set is low, use full-size steel shims to bring railing to correct elevation.
- E. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing handrails and railings and for properly transferring loads to in-place construction.

#### **3.02 RAILING CONNECTIONS:**

- A. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in "Fabrication" Article whether welding is performed in the shop or in the field.
- B. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches of post.

#### **3.03 ANCHORING POSTS:**

- A. Use steel pipe sleeves preset and anchored into concrete for installing posts. After posts have been inserted into sleeves, fill annular space between post and sleeve with the following anchoring material, mixed and placed to comply with anchoring material manufacturer's written instructions:
- B. Form or core-drill holes not less than 5 inches deep and 3/4 inch larger than OD of post for installing posts in concrete. Clean holes of loose material, insert posts, and fill annular space between post and concrete with the following anchoring material, mixed and placed to comply with anchoring material manufacturer's written instructions:
  - 1. Nonshrink, nonmetallic grout.
- C. Cover anchorage joint with flange of same metal as post, attached to post as follows:
  - 1. Welded to post after placing anchoring material.
- D. Leave anchorage joint exposed; wipe off surplus anchoring material; and leave 1/8-inch build-up, sloped away from post.
- E. Anchor posts to metal surfaces with oval flanges, angle type, or floor type as required by conditions, connected to posts and to metal supporting members as follows:
  - 1. For steel pipe railings, weld flanges to post and bolt to metal supporting surfaces.
  - 2. Install removable railing sections, where indicated, in slip-fit metal sockets cast in concrete.

#### **3.04 ANCHORING RAILING ENDS:**

- A. Anchor railing ends into concrete and masonry with round flanges connected to railing ends and anchored into wall construction with postinstalled anchors and bolts.
- B. Anchor railing ends to metal surfaces with flanges bolted to metal surfaces.
  - 1. Weld flanges to railing ends.

#### **3.05 ATTACHING HANDRAILS TO WALLS:**

- A. Attach handrails to wall with wall brackets. Provide bracket with 1-1/2-inch clearance from inside face of handrail and finished wall surface.
- B. Locate brackets not more than four feet on centers, or less if required to support structural loads.
- C. Secure wall brackets to building construction with 3/8-inch bolts and expansion shields, powder actuated fasteners or toggle bolts, as applicable.

#### **3.06 PVC AND FRP NON-CONDUCTIVE RAILINGS:**

- A. Install in accordance with approved shop drawings and manufacturer's printed instructions.

#### **3.07 PAINTING AND REPAIRING COATED SURFACES:**

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finish work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.

- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
  - 1. Wire brush areas to be coated to bright metal.
  - 2. Apply galvanizing repair compound at rate of two ounces per-square-foot.

**3.08 PROTECTION:**

- A. Protect finishes of handrails and railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at the time of Substantial Completion.
- B. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

**END OF SECTION**

## SECTION 05531

### GRATINGS AND FLOOR PLATES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section includes providing Adjust list below to suit Project.steel gratings, corrosion-resistant gratings, and underground safety walk gratings and floor plates.
  - 1. Related Work Specified Elsewhere:
    - a. Structural Steel: Section 05120.
    - b. Miscellaneous Metal: Section 05500.
    - c. Metal Stairs: Section 05511.
    - d. Handrails and Railings: Section 05521.

##### 1.02 PERFORMANCE REQUIREMENTS:

- A. Structural Performance: Provide gratings capable of withstanding the following structural loads without exceeding the allowable design working stress of the materials involved, including anchors and connections:
  - 1. Steel gratings: For walkways, ventilation shafts, light wells and other locations subject to possible vehicular traffic: Capable of withstanding AASHTO HS-20-44 load or higher load if required by the jurisdictional authority where the grating is installed.
  - 2. Steel gratings: For track drainage pumping stations and other locations subject to foot traffic only: Capable of withstanding a uniform load of 250 lbf/sq. Ft. Limit deflection to 1/200 of span.
  - 3. Corrosion-resistant gratings: Capable of withstanding a uniform live load as shown or specified.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For the following:
    - a. Gratings.
    - b. Clips and anchorage devices for gratings.
    - c. Paint products (if applicable).
  - 2. Shop Drawings: Show fabrication and installation details for gratings. Include plans, elevations, sections, and details of connections. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections.
    - a. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
  - 3. Mill Certificates: Signed by manufacturers of stainless-steel sheet certifying that products furnished comply with requirements.
  - 4. Welding Certificates: Copies of certificates for welding procedures and personnel.
  - 5. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

##### 1.04 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of the jurisdictional authorities.
  2. ADA: Americans with Disabilities Act.
  3. ASME: B18.21.1, B18.22.1.
  4. ASTM: A36, A90, A123, A143, A153, A242, A307, A384, A510, A570, A536, A563, C633, A653, A780, B633, C1028, D1187, E140, E384, F594.
  5. AASHTO HS-20-44.
  6. AWS: D1.1, D1.3.
  7. FS: RR-G-661.
  8. MS: MIL-P-21305.
  9. NAAMM: MBG 531, MBG 532.
  10. SSPC: PA 1, SP 3, SP 6/NACE No. 3, Paint 12
  
- B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of gratings that are similar to those indicated for this Project in material, design, and extent.
  
- C. Fabricator Qualifications: A firm experienced in producing gratings similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
  
- D. Metal Bar Grating Standards: Comply with applicable requirements of the following:
  1. Non-Heavy-Duty Metal Bar Gratings: Comply with NAAMM MBG 531, "Metal Bar Grating Manual for Steel, Stainless Steel, and Aluminum Gratings and Stair Treads."
  2. Heavy-Duty Metal Bar Gratings: Comply with NAAMM MBG 532, "Heavy-Duty Metal Bar Grating Manual."
  
- E. Welding: Qualify procedures and personnel according to the following:
  1. AWS D1.1, "Structural Welding Code--Steel."
  2. AWS D1.3, "Structural Welding Code--Sheet Steel."
  3. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.

**1.05 PROJECT CONDITIONS:**

- A. Field Measurements: Where gratings are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
  1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating gratings without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions. Allow for trimming and fitting.

**1.06 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products undamaged.
- B. Store products so as to prevent rust.
- C. Handle products so as to prevent damage.

**1.07 COORDINATION:**

- A. Coordinate installation of anchorages for gratings, grating frames, and supports. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. General Requirements:
  - 1. Insofar as practicable, furnish similar products of a single manufacturer.
  - 2. Metal Surfaces, General: For metal fabrications exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

### **2.02 FERROUS METALS:**

- A. Steel Plates, Shapes, and Bars: ASTM A36.
- B. High-Strength Low Alloy Structural Steel:
  - 1. ASTM A242.
  - 2. Resistance to atmospheric corrosion: Four times that of carbon steel, minimum.
- C. Wire Rod for Grating Crossbars: ASTM A510.
- D. Uncoated Steel Sheet: ASTM A570, Grade 33.
- E. Galvanized Steel Sheet: ASTM A653, structural quality, Grade 33, with G90 coating.
- F. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy to be welded.
- G. Ductile Iron: ASTM A536.
- H. Grating: Steel, bar and crossbar type as shown, hot-dipped galvanized after fabrication and sizing, FS RR-G-661, Type , Class 1 or 2.

### **2.03 COATINGS:**

- A. Shop Primer for Ferrous Metals: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements in FS TT-P-664; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.
- B. Zinc-rich paint: MS MIL-P-21305.
- C. Galvanizing (zinc-coating by hot-dipped process): ASTM A90, ASTM A123, or ASTM A143, ASTM A153 or ASTM A384, as applicable.
- D. Galvanizing Repair Compound: Stick form, melting point 600-degree F to 650-degree F, GALVABAR or equal.

- E. Bituminous Coating: Cold-applied asphalt mastic complying with SSPC Paint 12, except containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D1187.

#### **2.04 FASTENERS:**

- A. General: Provide Type 304 or 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, where built into exterior walls. Select fasteners for type, grade, and class required.
- B. Bolts and Nuts: Regular hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563; and, where indicated, flat washers.
- C. Plain Washers: Round, carbon steel, ASME B18.22.1.
- D. Lock Washers: Helical, spring type, carbon steel, ASME B18.21.1.
- E. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
  - 1. Material: Carbon-steel components zinc-plated to comply with ASTM B 633, Class Fe/Zn 5.
  - 2. Material: Alloy Group 1 or 2 stainless-steel bolts complying with ASTM F593 and nuts complying with ASTM F594.

#### **2.05 FABRICATION:**

- A. Shop Assembly: Fabricate grating sections in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
- B. Form from materials of size, thickness, and shapes indicated, but not less than that needed to support indicated loads.
- C. Shear and punch metals cleanly and accurately. Remove burrs.
- D. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated.
- E. Fit exposed connections accurately together to form hairline joints.
- F. Welding: Comply with AWS recommendations and the following:
  - 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - 2. Obtain fusion without undercut or overlap.
  - 3. Remove welding flux immediately. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space anchoring devices to secure gratings, frames, and supports rigidly in place and to support indicated loads.
  - 4. Fabricate toeplates at height indicated to fit grating units and weld to units in shop, unless otherwise indicated.

#### **2.06 STEEL GRATINGS:**

- A. Angles or other structural shapes as supports for grating: Structural steel.

- B. Grating manufactured by electro-pressure welding or pressure-locking process, forming sound welded or pressure-locked joints at intersection of bars and having bars in the same plane.
- C. For walkways, ventilation shafts, light wells and other locations subject to possible vehicular traffic:
  - 1. Traffic Surface: Plain.
  - 2. Gratings: Rectangular type subject to loadings identified under "Performance Requirements.
- D. For track bed drainage pumping stations and other locations subject to foot traffic only:
  - 1. Traffic Surface: Serrated.
  - 2. Gratings: Rectangular type, unless otherwise shown, subject to loadings identified under "Performance Requirements." Fabricated of 1-1/4-inch by 1/8-inch bearing bars at 1-3/16-inch o.c. and crossbars at 4 inches o.c.
- E. Steel Finish: As follows:
  - 1. Shop primer applied according to manufacturer's standard practice.
  - 2. Hot-dip galvanized with a coating weight of not less than two ounces per-square foot of coated surface.
- F. Fabricate removable grating sections with banding bars attached by welding to entire perimeter of each section. Include anchors and fasteners of type indicated or, if not indicated, as recommended by manufacturer for attaching to supports.
  - 1. Provide not less than four weld lugs for each heavy-duty grating section, with each lug shop welded to two bearing bars.
  - 2. Provide not less than four saddle clips for each grating section composed of rectangular bearing bars 3/16 inch or less in thickness and spaced 15/16 inch or more o.c., with each clip designed and fabricated to fit over two bearing bars.
  - 3. Furnish removable steel gratings equipped with locking lugs and provision for bolting to supporting members with stainless steel bolts.
- G. Fabricate cutouts in grating sections for penetrations indicated. Arrange cutouts to permit grating removal without disturbing items penetrating gratings.
  - 1. Edge-band openings in grating that interrupt four or more bearing bars with bars of the same size and material as bearing bars.
- H. Do not notch bearing bars at supports to maintain elevation.

**2.07 CORROSION-RESISTANT GRATINGS:**

- A. Fabricate from high-strength low alloy structural steel.
- B. Grating manufactured by electro-pressure welding or pressure-locking process, forming sound welded or pressure-locked joints at intersection of bars and having bars in the same plane.
- C. Grating system shall be fabricated to mechanically secure units in place and of such size to permit one-man operation.
- D. Traffic Surface: As shown.
- E. Gratings: Rectangular type, unless otherwise shown, subject to loadings identified under "Performance Requirements." Fabricated of 2-inch by 3/16-inch bearing bars at 5-inch o.c. and with crossbars at end of six-foot long units.

- F. Subject to compliance with requirements, products are manufactured by Blaw-Knox Company, Irving Grating Company, Reliance Steel Products Company or equal.

## **2.08 UNDERGROUND SAFETY WALK GRATINGS:**

- A. Angles or other structural shapes as supports for grating: As shown.
- B. Grating bearing bars and end-bearing bar of material shown manufactured by electro-pressure welding or pressure-locking process, forming sound welded or pressure-locked joints at intersection of bars and having bars in the same plane, size and design as shown.
  - 1. Designed to provide for hinged section of grating bolted to walls. Grating of such size to permit one-man operation and manual position vertically or horizontally.
  - 2. Structural steel plate hinges bolted to supporting construction with holes and slots as shown.

## **2.09 FLOOR PLATES:**

- A. Steel Floor Plates: Form to configurations shown from abrasive-surface floor plate of thickness necessary to support indicated loads, but not less than 1/4 inch.
  - 1. Abrasive-Surface Floor Plate: SLIP-NOT as manufactured by the W. S. Molnar Company or approved equal:
    - a. Surface Texture: Grade 1, fine.
    - b. Surface: All metal plasma stream deposition process bonds surface to substrate. Anti-slip primarily martensitic steel surface consisting of a random hatch matrix.
    - c. Surface Hardness, Rockwell C Scale, ASTM E 140 and E 384: Minimum of 55.
    - d. Bond Strength, Surface to Substrate, ASTM C 633: Minimum of 4,000 psi.
    - e. Coefficient of Friction, Anti-Slip Surface: Minimum of 0.6.
    - f. UL Listed: Slip-resistant.

## **2.10 GRATING FRAMES AND SUPPORTS:**

- A. Steel Frames and Supports: Fabricate from structural-steel shapes, plates, and bars of welded construction to sizes, shapes, and profiles indicated and as necessary to receive gratings. Miter and weld connections for perimeter angle frames. Cut, drill, and tap units to receive hardware and similar items.
- B. Equip units with integrally welded anchors for casting into concrete or building into masonry.
  - 1. Unless otherwise indicated, space anchors 24 inches o.c. and provide minimum anchor units in the form of steel straps 1-1/4 inches wide by 1/4 inch thick by 8 inches long.
  - 2. Galvanize frames and supports unless otherwise indicated.

## **2.11 FINISHES:**

- A. General:
  - 1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
  - 2. Finish gratings, frames, and supports after assembly.
- B. Galvanizing:
  - 1. Clean ferrous metal thoroughly before applying zinc coating.

2. Apply zinc coating to products after fabrication, by the hot-dip method, using coating weighing not less than two ounces per-square-foot.
- C. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed items:
  1. Exteriors (SSPC Zone 1B): SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning".
  2. Interiors (SSPC Zone 1A): SSPC-SP 3, "Power Tool Cleaning."
- D. Apply shop primer to uncoated surfaces of gratings, frames, and supports, except those with galvanized finishes and those to be embedded in concrete or masonry, unless otherwise indicated. Comply with SSPC-PA 1, "Paint Application Specification No. 1," for shop painting.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION, GENERAL:**

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing gratings to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing gratings. Set units accurately in location, alignment, and elevation; measured from established lines and levels and free from rack.
- C. Provide temporary bracing or anchors in formwork for items that are to be built into concrete or masonry.
- D. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade the surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.
- E. Field Welding: Comply with the following requirements:
  1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  2. Obtain fusion without undercut or overlap.
  3. Remove welding flux immediately.
- F. Corrosion Protection: Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint.

### **3.02 INSTALLING GRATINGS:**

- A. General: Install gratings to comply with recommendations of referenced metal bar grating standards that apply to grating types and bar sizes indicated, including installation clearances and standard anchoring details.
- B. Attach removable units to supporting members with type and size of clips and fasteners indicated or, if not indicated, as recommended by grating manufacturer for type of installation conditions shown.
- C. Use bolts, screws or locking lugs to secure safety walk gratings; do not weld.
- D. Consecutively number walkway plate covers with steel stamp after screwed to support channels.

**3.03 PAINTING AND REPAIRING COATED SURFACES:**

- A. Before erection or enclosing construction, paint items that support masonry or will be concealed in finish work, except items encased in concrete.
- B. Where shop coat is abraded or burned by welding, clean and touch-up.
- C. Touch-up primed surfaces with same material as coating.
- D. Where aluminum parts come in contact with concrete or steel, coat contact surfaces of aluminum with bituminous coating.
- E. Coat field welds and repair damage to zinc-coated surfaces in accordance with ASTM A780 and as follows:
  - 1. Wire brush areas to be coated to bright metal.
  - 2. Apply galvanizing repair compound at rate of two ounces per-square-foot.

**END OF SECTION**

## SECTION 05581

### FORMED METAL FABRICATIONS - STATION KIOSKS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies the fabrication and installation of steel cladding and insulated panels for station kiosks.
- B. Related Work Specified Elsewhere:
- C. Cast-in-Place Structural Concrete: Section 03300.
- D. Structural Steel: Section 05120.
- E. Structural Steel Metal Decking: Section 05310.
- F. Seals and Sealants: Section 07900.
- G. Finish Hardware: Section 08710.
- H. Glass and Glazing: Section 08800.
- I. Metal Doors and Frames: Section 08810.
- J. Acoustical Snap-In Metal Pan Ceilings: Section 09520.
- K. Field Painting: Section 09920.
- L. Kiosk Mechanical Work: Section 15736.
- M. Grounding and Bonding: Section 16060.
- N. Wire and Cable: Section 16120.
- O. Wire Connection Accessories: Section 16125
- P. Raceways, Boxes and Cabinets: Section 16130.
- Q. Wiring and Control Devices: Section 16145.
- R. Circuit Breakers, Panelboards and Load Centers: Section 16440.
- S. Lighting Fixtures: Section 16525
- T. Kiosks Systems: Section 16733.

##### 1.02 SUBMITTALS:

Submit the following samples for approval in accordance with the Special Conditions and with the additional requirements as specified for each:

- A. Shop Drawings:
  - 1. Details of construction and installation of fabricated items including materials, dimensions, methods of joining, welding, fastening and anchoring.
  - 2. Obtain approval for minor variations in detail for the purpose of improving fabrication and installation procedures, but not affecting general design for structural stability.
- B. Samples: Three of each of the following in each finish to be used in the work:
  - 1. Sheet metal: Four inches square.
  - 2. Tubing and extension: Six inch lengths.
  - 3. Insulated panels: Six inches square. Fabricate to show typical metal panel with fasteners on two edges, opened to expose core material on two edges. Furnish with required finish material on one face and unfinished on other face.

### **1.03 QUALITY ASSURANCE:**

- A. Reference Codes and Specifications:
  - 1. Codes and regulations of the jurisdictional authorities.
  - 2. ASTM: A36, A501, A526, B221, C272, C518, D696, D1621, E84, E96.
  - 3. FED STD: 595A.
  - 4. AWS: D1.1.
  - 5. MS: MIL-P-21035
  - 6. SSPC: SP-2, SP-3, SP-10
- B. Qualification of Welders:
  - 1. Employ operators, who have been qualified previously by the test as described by the American Welding Society's Standard D1.1, to perform welding.
  - 2. Furnish certificates that each operator has passed the tests.

### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products in good conditions
- B. Store products so as to prevent corrosion, deterioration, and damage.
- C. Handle products so as to prevent damage.
- D. Deliver fabricated insulated panels to the site individually wrapped and packed to avoid damage. Protect from water, dirt, and other potentially harmful substances.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. General: Insofar as practicable, furnish products of a single manufacturer.
- B. Steel Sheet (Steel Cladding): ASTM A526, coating G235, thickness of sheet as shown.
- C. Steel Rods, Bars, and Shapes: ASTM A36.
- D. Aluminum Bars: ASTM B221, alloy 6063-T52.
- E. Screws: Corrosion resistant, finished to match adjacent material.
- F. Pop Rivets: Stainless steel with mandrel head, series 4.
- G. Rigid Insulation: Extruded polystyrene rigid foam, Styrofoam HI-115 by DOW Chemical Company, or approved equal, with the following additional requirements:

Flame Spread	ASTM E84	Less than 25.
Compressive strength	ASTM D1621	115-psi minimum at five percent deflection.
Water absorption	ASTM C272	1.0 percent maximum.
Water vapor transmission	ASTM E96	1.0 perm maximum for one-inch thickness
Linear coefficient of thermal expansion	ASTM D696	3.5 times 10 <sup>-5</sup> inches per degree Fahrenheit in a range of minus 260°F to plus 70°F.
Thermal conductivity at 40°F mean	ASTM C518	0.185 BTU/hr/ft <sup>2</sup> /degree F/inch, maximum.

- H. Adhesive: Rubber-based, solvent-dispersed type, compatible with the insulation and meeting AFG-01 and HUDFHA UM60 Standards.
- I. Polyurethane Finish: Polane System by Sherwin-Williams, or approved equal.
  - 1. Shop primer: Rust-inhibitive vinyl epoxy, Wash Primer Green, P60.
  - 2. Intermediate high-build coat: Title Clad II Primer, B62.
  - 3. Finish color coat: Polane, semi-gloss sheen, FED STD 595A Color No. 20040.
  - 4. Spatter surface texture: Polane T, semi-gloss sheen, Spatter Surface Texture, FED STD 595A, Color No. 20040.
- J. Lifting Hardware: Stanley No. 1215, No. 2, or approved equal, minimum 3-1/2 inches by 3-3/4 inches with 2-1/4 inch outside diameter of lifting ring, 19/32-inch overall depth. Thickness of steel minimum 0.083 inches, zinc-plated finish.
- K. Miscellaneous fasteners, clips, and angles: Type and size as shown, galvanized and finished to match adjacent material.
- L. Galvanizing Repair Compound: Zinc-dust zinc-oxide primer conforming to MS MIL-P-21035.
- M. Bituminous Paint, Preformed Tape: Material as approved.

**2.02 FABRICATION, GENERAL:**

- A. Do not start work prior to approval of shop drawings.
- B. Verify dimensions before proceeding with work. Obtain measurements at structure.
- C. Match mark shop-prepared work to ensure proper assembly and fit in the field.
- D. Match exposed work to produce continuity of line and design. Accurately fit and rigidly secure joints in exposed work with hairline contacts. Wherever possible, position holes for fasteners in concealed areas.

- E. Coat welds and repair damage to zinc-coated surfaces as follows:
- F. Wire brush areas to be coated to bright metal.
- G. Apply galvanizing repair compound at a rate equal to two ounces of zinc per square foot. Feather edges of the application.
- H. Use only material free from mill scale, flake rust and mill pitting.
- I. form and finish items to shape and size with sharp angles and lines. Provide cut-outs to sizes and in locations required.
- J. Countersink metalwork to receive the required hardware, and provide proper bevels and clearances.
- K. Weld plates on for mounting hardware. Drill or punch holes for bolts and screws. Conceal fastenings wherever practicable.
- L. Grind exposed edges of work smooth. Construct joints exposed to weather to exclude water.
- M. Provide brackets, lugs, and similar accessories, required for installation, as part of the metal item.
- N. Fasteners, Anchors, and Inserts: Use sizes and types shown on approved shop drawings.
- O. Bituminous Paint, Preformed Tape: Material as approved.

**2.03 FABRICATION, INSULATED PANELS:**

- A. Steel sheet: Brake-form or die-form as required, free from oil-canning, bends, warps, and other defects. Drill or punch as required for assembly and installation. Continuously weld corners and connections, and grind smooth and flush.
- B. Rigid insulation core: One layer for total thickness required. Cut to size and shape to fit over core of panels to thickness shown, tight around perimeter.
- C. Assembly: Apply adhesive to steel sheet faces according to manufacturer's recommendation. Provide full adhesive contact between core and face sheets for wall and roof panels. Provide full adhesive contact between core and lower face sheet at floor panels.
- D. Glazing members: Screw aluminum bar sections to insulated panels as shown.
- E. Install pass-through with door or inside and trim secured on exterior as shown.
- F. Install lifting hardware with sheet metal screws, one at each corner of hardware plate.

**2.03 FABRICATION, STEEL CLADDING:**

- A. Form as shown, free from oil-canning, bends, warps and other defects.
- B. Drill or punch for attachment to structural members so that fasteners will not be visible after installation of monitoring cabinets.

**2.04 FINISH, GENERAL:**

- A. Prepare surface for priming as follows:

- B. Clean bare steel surfaces according to SSPC SP-10 (Near-White Metal Blast Cleaning).
- C. Clean galvanized steel surfaces according to SSPC SP-2 (Hand Tool Cleaning) or SP-3 (Power Tool Cleaning) and the recommendation of the paint manufacturer, so as to remove white rust (zinc oxide) but not to remove the galvanizing.
- D. Coat welds and repair damage to zinc-coated surfaces as follows:
  - 1. Wire brush areas to be coated to bright metal.
  - 2. Apply galvanizing repair compound at a rate equal to two ounces of zinc per square foot. Feather edges of the application.
- E. Apply minimum coating as follows to all metals:
  - 1. First coat, primer: 0.3 mils DFT.
  - 2. Second coat, intermediate high-build coating: 4.0 mils DFT.
  - 3. Third coat, finish color coat: 2 mils DFT in brown color, FED STD 595A Color No. 20040. Omit on totally concealed surfaces only.
  - 4. Fourth coat, spatter surface texture: Texture matching approved sample, in brown color, FED STD 595A Color No. 20040. Omit on totally concealed surfaces only.
- F. Apply finish on exposed areas and edges of each insulated panel.
- G. Separate dissimilar metals at surfaces of contact with one coat of alkali-resistant bituminous paint or other protective coating to prevent galvanic action.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION, GENERAL:**

- A. Provide anchors and inserts in sufficient number for proper fastening of metal items.
- B. Set metalwork accurately, level, plumb, and in true alignment with adjoining work.
- C. Drill holes as required for bolts and screws in supports, steel cladding and in insulated panels when in different locations from hole prepared in shop fabrication. Conceal fasteners where possible. Where exposed fasteners are necessary, match fasteners to adjacent metals.
- D. Use fastenings and anchors of size and type as shown on approved shop drawings. Conceal fasteners wherever practicable.
- E. Provide sealant material as required to seal panels against moisture infiltration, in accordance with Section 07900.
- F. Coordinate installation of ornamental metal work with work of other trades.
- G. Provide protection against galvanic action between dissimilar metals by completely covering contact surfaces with heavy brush coat of bituminous paint or by separating contact surfaces with preformed tape.
- H. Protect exposed metal work throughout work to prevent scratches, stains, discoloration and other damage.
- I. Set metal items level, plumb, and in true alignment with adjoining work. Set built-up parts true to line and without sharp bends, twists or kinks.
- J. Fasten metal work in place so that items will not be distorted, finish will not be impaired, nor fasteners overstressed from expansion and contraction of metal.

**3.02 INSTALLATION, STEEL CLADDING:**

- A. Apply to structural members by securing in position with sheet metal screws or pop rivets, fastener selections as best suited for purpose intended to provide secure anchorage and stability of cladding material. Locate fasteners at points not visible from the interior or exterior of the kiosk after installation of cabinets.

**3.03 CLEAN-UP:**

- A. Upon completion of installation, clean surfaces of metalwork by procedures recommended by metalwork manufacturer.
- B. Clean-up rubbish and debris caused by this work and remove from the site
- C. Leave areas surrounding the work in broom-clean condition.

**3.04 PAINTING AND REPAIR OF SURFACES:**

- A. Where finish coat is damaged during shipment or installation, field touch-up damaged areas with air-dry paint of type to fuse with finish material as recommended by manufacturer of finish material/

**3.05 ACCEPTANCE TEST/INSPECTION:**

- A. The table below shall be utilize to preform the acceptance test/inspection for the kiosk construction.

ITEM	PASS	FAIL
Compliance with all requirements in Section 4 and Kiosk Enclosure Fabrication Contract drawings.		
Check for proper structural fit and finish (no sharp metal edges, proper fit at corners etc.)		
Check for proper operation of door and door lock		
Check for proper fit of glass		
Check paint for nicks, scratches and proper application.		
Test and measure to ensure proper voltages (AC) is $\pm$ 5% of specified voltage.		
Test AC circuit breakers proper operation.		
Test all lights.		
Test all air conditioning controls and calibrate temperature setting with a thermometer and provide calibration chart.		
Test all heater controls for proper operation.		

**END OF SECTION**

## SECTION 05651

### GENERAL TRACK CONSTRUCTION

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This section specifies general track construction procedures and requirements including laying continuous welded rail, joining CWR strings, final alignment and inspection. The Contractor shall comply with all **safety and health regulations** identified in **Section 01450**. Associated train control and traction power Sections are located elsewhere in this Specification.
- B. Track construction shall include main/primary track and storage track as indicated on the Drawings, and specified herein.

##### 1.02 RELATED SECTIONS

- A. Section 05091 - Rail Welding
- B. Section 05652 - Ballasted Track Construction
- C. Section 05653 - Direct Fixation Track Construction
- D. Section 05654 - Special Trackwork Construction - Ballasted
- E. Section 05655 - Special Trackwork Construction - Direct Fixation
- F. Section 05656 - Running Rail
- G. Section 05658 - Track Appurtenances and Other Track Material
- H. Section 05660 - Restraining Rail and Lubricators
- I. Section 06130 - Timber Ties
- J. Section 06131 - Composite (Plastic) Ties
- K. Section 06132 - Timber Grade Crossings

##### 1.03 REFERENCES

- A. Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.
  - 1. American Railway Engineering and Maintenance-of-Way Association, Manual for Railway Engineering, herein referred to as the AREMA Manual, **latest edition**.
  - 2. American Railway Engineering and Maintenance-of-Way Association, Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio.
  - 3. American Society of Testing and Materials (ASTM).

##### 1.04 SUBMITTALS

- A. Submittals shall be in accordance with Section 01300, Submittals of these Specifications.

- B. Submittals shall include certificates of compliance, codes and regulations of the jurisdictional authorities as well as other submittals stipulated in these Specifications.
- C. Provide five each AREMA approved rail thermometers. Two of the five shall be a quick reading digital type. The thermometers shall become WMATA property.
- D. Provide four Geismar RCAT-A1 two-piece combination track levels and gauges, or approved equal, with current calibration. They shall become WMATA property.
- E. Provide three Aldon AL-102 combination rolling track gauge readers and digital track levels, equipped with distance counters and carrying cases, or approved equal, with current calibration. They shall become WMATA property.
- F. Submit method and equipment for transport of rail.
- G. Submit rail end-hardening procedure and the personnel who will perform the end-hardening of the rails in the field.
- H. Submit test reports on two samples of field end-hardened rail which shall be tested by an approved independent laboratory.
- I. Submit for approval detailed procedures of the following items required in connection with laying and joining CWR strings:
  - 1. String schedule showing length and location of strings.
  - 2. Equipment to be used.
  - 3. Procedure for positioning CWR strings in track, setting gaps between strings and initial fastening.
  - 4. Procedure for lining, gauging and profiling of rails, and tightening of anchor bolts.
  - 5. Procedure for joining CWR strings, including method of obtaining correct gap if joined at a different temperature than at which it was laid.
  - 6. Procedure for destressing/anchoring CWR strings to zero thermal stress temperature, including control of rail movement and installing rail clips for fastening of rail to plates or D.F. fasteners.
  - 7. Special procedure for closing last string with previously anchored rail or special trackwork.
- J. **Completed and signed Record of CWR Laying Form provided in Section 05651 (Exhibit 05651-C / Part 2 of 2).**

## **1.05 QUALITY ASSURANCE**

- A. Perform all measures necessary to assure quality of the Work. This shall include source quality control and field quality control requirements specified in these Specifications.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS**

- A. General: All trackwork materials required by the specifications for the track construction, except those furnished by the Authority, shall be furnished by the Contractor.

- B. Metal tags to mark the superelevation on curved track shall be made of a corrosive resistant metal such as anodized aluminum or brass. Tags shall be placed at start of superelevation and at every 1/8 inch change until full superelevation is reached.

### **PART 3 - EXECUTION**

#### **3.01 CONSTRUCTION EQUIPMENT**

- A. Track gauge, guardrail, flangeway width, curve radii, rail sections and special trackwork components are designed for WMATA Metro Rail Vehicle and Crane Car operation. Modify on-track equipment, as required, to operate over this track without causing damage to the track structure. Damages to the track structure shall be repaired by Contractor at his own expense.
- B. Clearance for the on-track equipment shall conform to the requirements for vehicle clearances.
- C. Contractor's equipment shall not exceed the design loads. Further information concerning vehicle characteristics will be provided by the Authority upon request by Contractor. Verify that proposed equipment meets these requirements.

#### **3.02 MONUMENTATION**

- A. Monuments will be furnished and installed by other trades to establish the centerline of both the outbound and inbound main track.
- B. Monuments will be set at all points of change in horizontal alignment including TS, SC, CS, ST, PC, PT, PCC and SS and on tangents and within curves as needed to provide monuments not more than 1,000 feet apart throughout the work. All adjacent monuments will be intervisible. The location of the monuments will be as stated below:
  - 1. Aerial Structure: On or near track centerline.
  - 2. Underground Sections: Offset outside the track invert section.
  - 3. At-grade Sections: Offset outside the track invert section.
- C. The **WMATA** Engineer will provide the Contractor with identifications and elevations to one thousandth of a foot for all monuments.
- D. The use of controls for survey other than the monumentation described above shall be at the Contractor's risk.

#### **3.03 ALIGNMENT AND PROFILE DATA**

- A. Track shall be constructed conforming to the alignment and profile data shown on the drawings as modified by the requirements in these specifications.
- B. Alignment information shown on the drawings refers to geometric control points for the track. Alignment is based on the centerline of track, equidistant between gauge sides of the running rails. Profile refers to top of the lower rail in final position.
- C. Construction of direct fixation track shall not begin until final alignment data is available.

#### **3.04 ENGINEERING STATIONING**

- A. Engineering stationing is not continuous and is subject to equations.

- B. Engineering stationing is used to reference all geometric control points.
- C. Mathematized alignment data for each track is included in drawings.

### **3.05 TRACK GAUGE**

- A. Track gauge will be measured between points 5/8 inch below top of rail on the inside faces of the running rails.
- B. Track gauge, except as shown in special trackwork, shall be as follows:
  - 1. Tangent and curves with radius greater than or equal to 1,425 feet:
    - a. Mainline Track: 4 feet, 8-1/4 inches.
    - b. Yard Tracks: 4 feet, 8-1/2 inches.
  - 2. Curve of radius greater than or equal to 755 feet and less than 1,425 feet:
    - a. Mainline Track: 4 feet, 8-1/4 inches.
    - b. Yard Tracks: 4 feet, 8-1/2 inches.
  - 3. Curve of radius greater than or equal to 350 feet and less than 755 feet:
    - a. Yard Track: 4 feet, 8-1/2 inches.
  - 4. Curve of radius less than 350 feet:
    - a. Yard Track: 4 feet, 9 inches
    - b. Yard Track with restraining rail: 4 feet, 9-1/4 inches.

### **3.06 TRACK GAUGE TRANSITIONS**

- A. Gauge widening at spiraled curves shall begin at the junction of the spiral curve and tangent, proceed toward the circular curve and be completed at the junction of the spiral curve and the circular curve or before. Gauge widening at unspiraled curves shall be done on the tangents and shall be completed at the junction of the tangent and the circular curve.
- B. Gauge transitions at special trackwork shall be accomplished by suitable adjustment of the rail on the diverging route side.

### **3.07 SUPERELEVATION**

- A. Track curves shall be superelevated as indicated on the drawings.
- B. The outer rail shall be elevated above the inner rail, which shall be at the required profile grade line as indicated on the drawings.
- C. The superelevation at the tangent-to-spiral point shall be zero and shall increase uniformly through the length of the spiral to full elevation of the outer rail at the spiral-to-curve point. Provide this spiral and superelevation at the ends of simple curves and segments of compound curves as indicated. Attain the superelevation on curves without spirals over equal lengths on the tangent and curve, and increase linearly throughout the rate of change length.
- D. Turnouts and crossovers shall not be superelevated, unless specifically noted on the drawings.
- E. Track curve information shall be as indicated on the drawings. Shop pre-curved rail shall be marked by the manufacturer for proper installation by the Contractor.

### 3.08 TRACK TOLERANCES

- A. The final gauge, cross level, superelevation, horizontal and vertical alignment of all tracks shall be as specified within the tolerances as shown in **Exhibit 05651-A** for each specific type and class of track.
- B. Variations of gauge, cross level and superelevation with respect to tolerances shall be at a rate of change not exceeding 1/8 inch per 31 feet of track.
- C. Strings of high strength rail shall be located within plus or minus 20 feet of the locations shown on the drawings.
- D. Prior to start of rail installation the Contractor shall furnish to the Engineer three Aldon AL - 102 Combination Rolling Track Level and Gauge Readers equipped with optional distance counters and carrying cases, or approved equal. Also furnish to the **WMATA** Engineer four Geismar RCAT-A1 two-piece combination track levels and gauges.

### 3.09 CLEARANCE ENVELOPE

- A. The transit car outline in the design of the Metro system is shown in **Exhibit 05651-C** for information.
- B. Equipment proposed for use by the Contractor for performance of work under this Contract shall be submitted for approval. The submittal shall include a drawing showing the outline of the proposed equipment superimposed on the transit car outline.

### 3.10 TYPES OF RAIL

- A. Rail for use as running rail shall be 115 RE tee rail in all main/primary tracks and yard/storage tracks.
- B. Running rail shall be either standard carbon, head hardened or premium/high strength rail as indicated on the Contract Drawings.
- C. Restraining rail shall be 132 RE head hardened or high strength rail in accordance with AREMA requirements. **Reference Section 05656 for specific WMATA requirements for running rail.**
- D. Emergency guard rail: Structural angle, cover plates and base plates shall be as indicated on the Contract Drawings and shall comply with ASTM A36.
- E. Special trackwork components, closure rails and ladder track rails shall have premium rails.
- F. 115 RE tee rail will be used in the following locations:
  - 1. Ballasted Main/Primary Track
  - 2. Ballasted Yard/Storage Track
  - 3. Direct Fixation Track

### 3.11 RUNNING RAIL REQUIREMENTS

- A. Running rail procurement is covered under Section 05656, Running Rail.
- B. Running rail for use in continuous welded rail (CWR) track shall be welded in accordance to Section 05091, Rail Welding.

- C. Transport and distribute rail:
1. Rail shall be transported and distributed in such a manner and by use of such equipment that bumping or striking of the rail will be avoided. The method and equipment used by the Contractor shall be subject to approval by the Engineer. Continuous welded rail (CWR) shall be transported and laid in place in an efficient, expeditious manner that will prevent damage to fasteners, rail and structures.
  2. Rail should not be dropped or dragged on the track bed. The use of rollers is required to facilitate transporting and reduce the risk of damage to rail, track fasteners, track appurtenances and facilities.
- D. Procedure of laying and joining CWR strings: Submit for Engineer's approval the detailed procedure of the following items of work required in connection with laying and joining CWR strings.
1. String schedule showing length and location of strings.
  2. Equipment to be used.
  3. Procedure for positioning CWR strings in track, setting of gaps between strings and initial fastening.
  4. Procedure for lining, gauging, profiling of rails and tightening of anchor bolts.
  5. Procedure for joining CWR strings including method of obtaining correct gap if joined at a different temperature than at which it was laid.
  6. Procedure for destressing/anchoring strings to zero thermal-stress temperature, including control of rail movement and installing rail clips for fastening of rail to D.F. Fasteners.
  7. Special procedure for closing last string with previously anchored rail/special trackwork units.
- E. Cutting and drilling of rails:
1. No holes or cuts in the CWR shall be permitted except as shown and specified. Rails shall be cut square and clean by means of rail saws or abrasive cutting disks. **No rail is to be cut for** the installation of a bonded joint within 5 feet of an electric weld.
  2. For joints, 500 KCMIL negative return cables and restraining rail separator blocks, holes shall be located as shown and as directed by the Engineer. Holes shall be cylindrical, of the proper diameter for the bolt required and drilled directly through the web of the rail with an approved rail drill. Holes associated with the restraining rail shall have the additional requirement of split sleeve - cold expansion as specified in Section 05660, Restraining Rail and Lubricators. An approved template shall be used as a guide for drilling holes. In no case shall a joint bar be used for this purpose. All rejected rail holes must be saw-cut from the rail. All holes shall be reamed smooth, ends beveled and burrs removed. Cutting rail or burning holes in rail by use of a torch is prohibited. Accurately space holes for bolting of rail and drill with a rail drill in accordance with the current requirements of AREMA Manual for Railway Engineering, Specifications for Rail Drilling, Bar Punchings and Track Bolts.
- F. Beveling of Rail Ends:
1. Bevel rail ends at non-bonded insulated joints in accordance with current AREMA Standard Plan No. 1005.
  2. Rail ends in bonded joints shall be beveled in accordance with the joint manufacturer's written specifications. Unless otherwise stated manufacturer's written specifications, rail ends shall be beveled in accordance with AREMA page 4-M-2 "Where rail is to be beveled, it is recommended that such beveling extend 1/16 inch back from the rail end and to a depth of 1/8 inch plus, from the surfaces."

G. End-Hardening

1. In bonded joints, rail ends that are not of head hardened or high strength rail shall be end-hardened in the field. Joints bars and their insulating material shall be removed from rail ends during the end-hardening process.
  - a. The end-hardening procedure and the personnel who perform the end-hardening of the rails in the field shall be subject to approval by the **WMATA** Engineer, which will depend upon the acceptance of two samples of field end-hardening performed according to the approved procedure and by the personnel who will perform the field end-hardening. The two samples of field end-hardened rail shall be tested by an approved independent laboratory. The Contractor shall notify the Engineer 48 hours prior to the performance of field end-hardening of rails.
2. End Hardening Tests:
  - a. The two samples shall be tested for Brinell hardness in accordance with ASTM E10, in a grid pattern on the rail head surface of 1/8 inch increments for a distance of six inches from the end of the rail.
  - b. The hardness number and location shall be recorded.
  - c. After the hardness test is performed, one sample shall be sectioned for one foot along the centerline of rail and the other sample shall be sectioned transversely 1/2 inch from the end of rail. These cross sections shall be etched to enable the observation of the hardness pattern.
3. Acceptance Criteria:
  - a. The hardness measured at a spot on the centerline of the head 1/4 inch to 1/2 inch from the end of the rail shall show a Brinell hardness number range of 341 to 401 when decarburized surface has been removed.
  - b. The heat-affected zone defined as the region in which the hardness is above that of the parent metal shall cover the full width of the rail head and extend longitudinally a minimum of 1-1/2 inch from the end of the rail. The effective hardness zone 1/2 inch from the end of the rail shall be at least 1/4 inch deep.
  - c. A report of hardness determination shall be given to the **WMATA** Engineer.
  - d. The hardness pattern shall be uniform across the top surface of the rail head.
  - e. The etched cross sections of the rail shall exhibit a uniformly distributed hardness pattern.

### 3.12 LAYING CONTINUOUS WELDED RAIL

A. CWR String:

1. At the time each string of CWR is laid on the installed tie plate or D.F. Fastener to its final line and profile in accordance with the approved working drawings submitted under Section 05091, Rail Welding. The temperature of the string and other data shall be measured and recorded. Information to be recorded shall be as shown on **Exhibit 05651-C (Part 1 of 2)**.
2. The strings shall be laid with a gap between them to permit joining and destressing without unnecessary cutting of rail. Each gap shall be based on the temperature of the rail, the length of the string and as specified below.
  - a. Only the gap required for the joint shall be provided between the end of the existing rail and the first adjacent CWR strings.
  - b. The destressing gap shall be located at the other end of the string, the free end.
  - c. Each succeeding string shall be laid with its beginning end even with the end of the gap computed for the previous string, and shall have its corresponding destressing gap located at its free end. See **Exhibit 05651-C (Part 2 of 2)** for record of CWR laying.

- B. Rail Temperature and Rail Thermometer:
1. Rail temperature shall be determined by means of reliable AREMA standard rail thermometers as specified in Chapter 5 of the AREMA Manual (**latest edition**).
    - a. Place two (2) rail thermometers on the shaded side of the rail base next to the web and leave in place until no change in the readings are detected, but not less than ten minutes.
    - b. Take the average of the two temperature readings at the time of adjusting the gap between rail ends.
  2. If the rail temperature deviates from the specified zero thermal stress range, fastening or anchoring of rail shall cease until the rail temperature returns to within the specified range and the rail has been vibrated to relax localized stress build-up.
  3. Deliver five (5) each AREMA approved rail thermometers to the Engineer within 30 days after NTP.
  4. Two of the five thermometers shall be a quick reading digital type. Thermometers shall become Authority Property.

- C. Determining Gap Between Rail Ends:
1. The gap between CWR strings or between CWR and bolted rail shall be determined by the equation:  $G=(t-T)(L)(K)+Q$

Where: G=rail gap in inches;  
t=zero thermal stress temperature for type of track construction (Sections 05652 and 05653);  
T=Average actual rail temperature at time of laying degrees F.;  
L=One-half the sum of the length of the rail being laid and the length of the preceding rail;  
K=Coefficient of thermal expansion for rail steel, (0.000078 inch per foot per degree F.); and  
Q=Rail gap as required by manufacturers of field weld kit in inches. For bonded standard joints, as recommended by the respective manufacturer. For bonded insulated joints, Q equals the end post thickness.

### 3.03 LINING, GAUGING, AND PROFILING CWR

- A. Each CWR string shall be brought to approximate final line, gauge and profile before joining, destressing and anchoring. The procedures specified for ballasted or direct fixation track construction, as appropriate, shall be used
- B. Use of Dutchman (Short Rails Between Rail Ends):
1. The Contractor shall insert a dutchman between the ends of all CWR strings, a short piece of rail equal in length to the rail gap (G) minus ½ inch where the rail gap (G) is determined by the formula above. This requirement does not apply if the calculated rail gap (G) is less than 1-1/2 inches. The dutchman shall be inserted at the time the rail is laid to prevent damage to the rail ends during rail laying or other operations requiring the passage of on-track equipment over the rail joints.
  2. The short rail shall be removed prior to anchoring, and when the rail temperature results in a calculated closure of the rail gap.
- C. Initial Fastening of Rail
1. Prior to use by on-track equipment, newly laid rail shall be fastened at proper gauge at not less than every fifth fastener on tangents and curves of radius greater than 1,900 feet and at every third fastener for curves of radius of 1,900 feet or less.

2. The method of preventing damage due to thermal expansion shall be submitted for approval.

### 3.14 JOINING CWR STRINGS

- A. Before destressing/anchoring each string of CWR, its beginning end shall be joined to the previously anchored string.
- B. Main/primary track CWR strings shall be joined in the field by ~~field welding bonded standard joints~~.
- C. Yard and secondary track CWR shall be joined by ~~field welding bolted standard joints~~.
- D. Joints shall not be placed in the following locations unless specifically shown or specified otherwise:
  1. Within 19 feet from the center of bonded or bolted joints in the same rail.
  2. Within eight feet of joints in the opposite rail.
  3. Within eight feet of shop welds in the same rail.
- E. Standard Joint Requirements: Standard joints shall be installed in accordance with Section 05658, Track Appurtenances and Other Track Material.

### 3.15 DESTRESSING/ANCHORING OF CWR

- A. After the beginning end of a string of CWR has been joined to the previously destressed/anchored string, it shall be destressed and immediately thereafter anchored. Installation of the Pandrol e2056 Spring Clips shall be considered as anchoring the rail.
- B. Each string shall have its length adjusted for the zero thermal stress temperature, vibrated to relieve internal stresses and be fully anchored.
- C. When a CWR string closes on a fully anchored string the fully anchored string shall have its anchors removed for 300 feet and shall be readjusted to zero thermal-stress temperature at the time it is joined.
- D. Adjusting Rail for Zero Thermal Stress:
  1. Rail shall be adjusted for zero thermal-stress by either heating, cooling or pulling the rail, the adjustment shall be monitored by observing the movement of the rail at its quarter points and free end. The required movement to achieve zero thermal stress shall be computed using the formula given in Article 3.12.C ~~of this specification section~~.
  2. The rail temperature shall be taken as close to the time of destressing as practicable and as specified in Article 3.12.B.
  3. The destressing and closing of the gaps shall be obtained by uniformly expanding or contracting the rail string throughout its entire length. The Contractor shall verify this by computing and measuring the required movement at the quarter points and free end of the string. The actual movement shall not differ from the computed required amount of movement equivalent to a temperature difference of 10 degrees F for the length of rail being monitored.
  4. At the time of destressing/anchoring the second rail in a track shall be within 5 degrees F (3 degrees C) of the temperature at which the first rail was destressed/anchored.

- E. Anchoring: Immediately following the destressing of the rail it shall be anchored by the installation of Pandrol Spring Clips. If the rail moves beyond the allowable range specified herein before it is anchored, the destressing operation shall be repeated and the rail reanchored.
- F. Record of Laying, Joining, Destressing/Anchoring: A record of rail laying, joining, and destressing/anchoring data shall be made by the Contractor and be witnessed and approved by the Authority Inspector, for each installed string of CWR. The record shall be made on and include the data shown on **Exhibit 05651-C (Part 1 of 2)**.

### **3.16 FINAL ALIGNMENT AND TRACK INSPECTION**

- A. The final horizontal and vertical alignment, gauge cross level and superelevation shall be within the specified tolerances.
- B. In order to determine the acceptability of finished track, the Authority will make an inspection of the track.
- C. Track deviations, as disclosed by the inspection, which exceed specified tolerances shall be corrected by the Contractor at no additional cost to the Authority.

## **PART 4 - MEASUREMENT AND PAYMENT**

### **4.01 MEASUREMENT:**

- A. Measurement of work specified in this section will be made in the following manner:
  - 1. General Track Construction: No separate measurement.

### **4.02 PAYMENT:**

- A. Compensation for work specified in this section will be made in the following manner:
  - 1. General Track Construction: Included in the price of work of which it is a part.

TRACK CONSTRUCTION TOLERANCES

TYPE AND CLASS OF TRACK	GAUGE VARIATION	CROSS LEVEL AND SUPERELEVATION VARIATION	VERTICAL TRACK ALIGNMENT		HORIZONTAL TRACK ALIGNMENT	
			TOTAL DEVIATION	MIDDLE ORDINATE IN 62' CHORD	TOTAL DEVIATION	MIDDLE ORDINATE IN 62' CHORD
DIRECT FIXATION, MAIN	±1/8"	±1/8"	±1/4"	±1/8"	±1/4"*	±1/8"
BALLASTED, MAIN	±1/8"	±1/8"	±1/2"	±1/8"	±1/2"*	±1/8"
DIRECT FIXATION, YARD & SECONDARY	±1/8"	±1/8"	±1/2"	±1/8"	±1/4"	±1/8"
BALLASTED, YARD & SECONDARY	+1/4" -1/8"	±1/4"	±1/2"	±1/4"	±1/2"	±1/8"

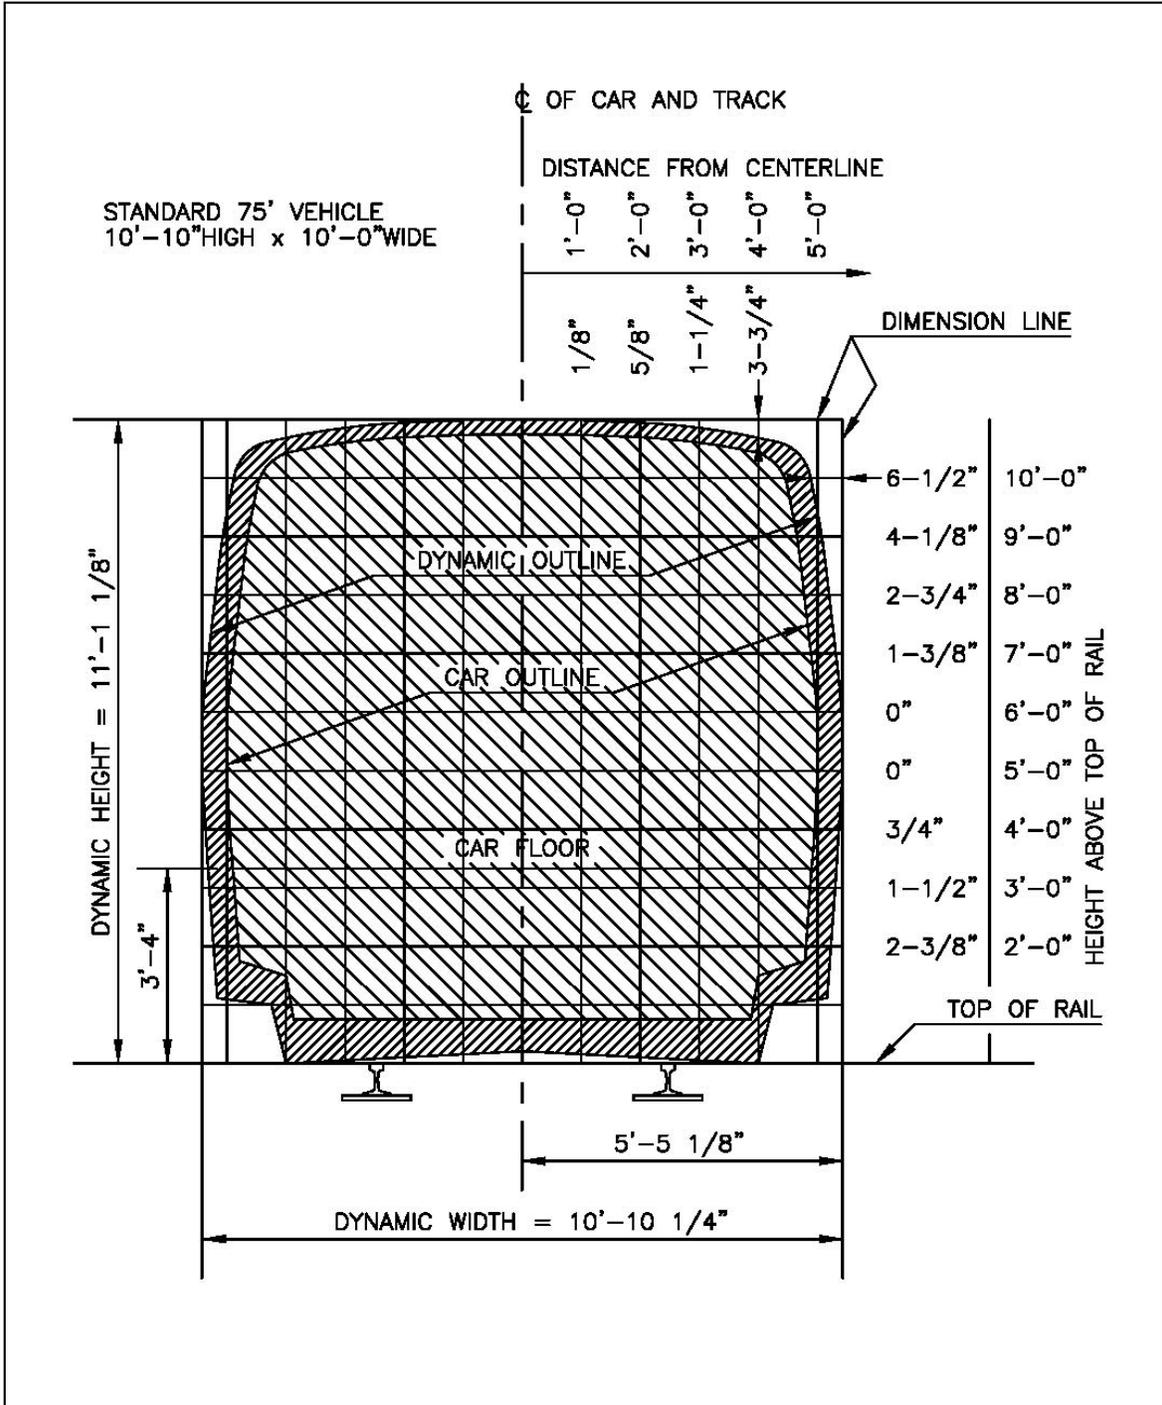

TOTAL DEVIATION IS MEASURED BETWEEN THE THEORETICAL AND ACTUAL ALIGNMENTS AT ANY POINT IN THE TRACK.

\* TOTAL DEVIATION IN STATION AREAS SHALL BE 0" TOWARD PLATFORM AND 1/4" AWAY FROM PLATFORM.

END OF SECTION

## SECTION 05652

### BALLASTED TRACK CONSTRUCTION

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. The work in this Section shall include the construction of ballasted track as indicated on the drawings and as specified in these specifications.
- B. The construction of ballasted track shall include:
  - 1. Preparation of subgrade and placement of sub-ballast and ballast.
  - 2. Hauling of construction materials.
  - 3. Distribution and spacing of ties.
  - 4. Laying, destressing and joining of continuous welded rail (CWR) strings
  - 5. Construction of ballasted track
- C. The above construction is encompassing and includes all pertinent trackwork related items associated with track construction such as the standard and insulated joints; rail cutting and stress adjustment; tamping, surfacing lining and gauging and all other operations necessary to construct an acceptable completed track structure.
- D. Unless otherwise shown or specified, trackwork within limits of ballasted special trackwork units is not included in this Section.

##### 1.02 RELATED SECTIONS

- A. Section 02726 - Sub-Ballast.
- B. Section 02727 - Ballast.
- C. Section 05091 - Rail Welding.
- D. Section 05651 - General Track Construction.
- E. Section 05654 - Special Trackwork Construction - Ballasted.
- F. Section 05656 - Running Rail.
- G. Section 05658 - Track Appurtenances and Other Track Material.
- H. Section 05660 - Restraining Rail and Lubricators.
- I. Section 06130 - Timber Ties.
- J. Section 06131 - Composite (Plastic) Ties.
- K. Section 06132 - Timber Grade Crossing.

##### 1.03 REFERENCES

- A. Codes and regulations of the jurisdictional authorities.

- B. American Railway Engineering and Maintenance-of -Way (AREMA), Manual for Railway Engineering (**latest edition**), herein referred to as the AREMA Manual are as follows:
1. Chapter 4, Part 1, Rail Drilling, Bar Punching and Track Bolts.
  2. Chapter 5, Part 4, Specifications for Track Construction.
- C. **American Society of Testing and Materials (ASTM).**

#### 1.04 SUBMITTALS

- A. Submittals shall be specified in Section 01300, Submittals. The following submittals shall be made **and submitted** by Contractor:
1. Detailed descriptions of construction procedures required for the work specified in this Section.
  2. Samples required for the work specified in this Section.
  3. Test results required for the work specified in this Section.
  4. Working Drawings showing the proposed method for temporary fastening of rail during installation.
  5. Required rail temperature record forms for rail laying and rail fastening operations.
  6. Five (**5 each AREMA approved**) thermometers as specified in Section 05651, General Track Construction, Article 3.12, Laying Continuous Welded Rail.
  7. **Method and equipment for transport of rail.**
  8. **Submit for approval detailed procedures of the following items required in connection with laying and joining CWR strings:**
    - a. **String schedule showing length and location of strings.**
    - b. **Equipment to be used.**
    - c. **Procedure for positioning CWR strings in track, setting gaps between strings and initial fastening.**
    - d. **Procedure for lining, gauging and profiling of rails.**
    - e. **Procedure for joining CWR strings, including method of obtaining correct gap if joined at a different temperature than at which it was laid.**
    - f. **Procedure for destressing/anchoring CWR strings to zero thermal stress temperature, including control of rail movement and installing rail anchors and spiking rail down.**
    - g. **Special procedure for closing last string with previously anchored rail or special trackwork.**
  9. **Completed and signed Record of CWR Laying Form provided in Section 05651 (Exhibit 05651 C / Part 2 of 2).**

#### 1.05 QUALITY ASSURANCE

- A. In order to determine the acceptability of the installation, the Contractor shall make a survey of the completed track, and provide the Engineer with a copy for review. Deviations from the drawings which exceed tolerances specified in Section 05651, General Track Construction, shall be corrected by the Contractor at no additional cost to WMATA.

## PART 2 - PRODUCTS

### 2.01 MATERIALS

- A. The following track materials shall be furnished by the Contractor and any additional items necessary to construct an acceptable, completed track structure.
1. Sub-ballast
  2. Ballast

3. Ties
4. Special Trackwork
5. Running Rail
6. Track Appurtenances and Other Track Material
7. Metal Tags (to mark superelevation)
8. Restraining Rail and Lubricators (as required)
9. Bumping Posts (as required)

## **PART 3 - EXECUTION**

### **3.01 GENERAL**

- A. All ballasted main/primary track shall be constructed with Pandrol spring clips, elastic fastener tie plates punched for four 7/8 inch screw spikes and four 7/8 inch screw spikes.
- B. Track within the limits of ballasted special trackwork units shall be constructed as specified for Special Trackwork Construction.
- C. Ballasted track construction includes realignment of existing tail tracks to meet with the new track alignments to be extended.
- D. Ballasted track construction includes placing sub-ballast and ballast, distributing and lining ties; installing, anchoring, and joining CWR strings, raising and lining track; and other incidentals as required and as specified for General Track Construction as modified

### **3.02 TOLERANCES FOR BALLASTED TRACK**

- A. Deviation from the gauge, cross level, superelevation, horizontal alignment and vertical alignment shall not exceed the tolerance specified.

### **3.03 PLACEMENT OF SUB-BALLAST**

- A. Subballast shall be distributed, placed and compacted in accordance with Section 02726, Subballast.
- B. Prior to placement of subballast all trash and debris shall be removed from subgrade.
- C. Subgrade shall be clear and void of tire ruts, large stone or other deleterious objects before placement of subballast.
- D. Subgrade shall be dry before placement of subballast.

### **3.04 INITIAL LAYER OF BALLAST**

- A. **Ballast shall be distributed, placed and compacted in accordance with Section 02727, Ballast.**
- B. An initial layer of ballast shall be uniformly distributed over the finished subballast and compacted before tie distribution. The ballast shall not be distributed on the roadbed until the subballast has been approved. Subballast fouled or distributed by the Contractor's operations shall be repaired by the Contractor at no additional cost to the Authority.
- C. The initial layer of ballast shall be limited to a total compacted depth that will establish the track surface at least four inches below final grade, with further provision that each compacted lift shall be a maximum depth of four inches.

- D. The ballast depth shall conform to the cross sections shown. Each lift of ballast shall be uniformly spread. Each lift of ballast shall be fully compacted by a self-propelled pneumatic-tired roller or a vibrating compactor.
- E. The self-propelled pneumatic-tired roller shall have a minimum gross weight of nine tons and the vibratory compactor shall have a minimum weight of 5,000 pounds capable of applying a dynamic load of 18,000 pounds or more. The equipment selected by the Contractor shall be subject to approval by the Engineer.

### **3.05 DISTRIBUTION AND SPACING OF TIES**

- A. All ties shall be carefully distributed and properly spaced on the initial layer of ballast with every fourth tie being a contact rail tie unless otherwise specified or shown.
- B. Care shall be exercised in the placement of contact rail ties to ensure the proper offset for contact rail supports.
- C. Unnecessary handling, distribution and reloading of ties shall be avoided. To the extent practicable, ties shall be distributed in proper position for use without further handling. They shall be unloaded in a manner that will not damage the ties. In no case shall ties be dropped. Ties shall be moved only with tie tongs or by leverage with a bar.
- D. Ties shall be installed radially on curves and at right angles to the centerline of tangent track at the designed spacing prior to rail installation. The lined side shall be the outside of each track for all main and yard/storage lead tracks. Main track shall be considered double track regardless of separation.
- E. Contact rail ties shall be installed to properly support the contact rail on the side of the track as shown. The line end shall be lined with the adjacent ties.
- F. Ties damaged as a result of improper handling by the Contractor and rejected by the Engineer shall be removed and replaced with new ties.
- G. Timber ties shall be adzed only with the Engineer's approval and shall be installed with the heartwood face down.
- H. Tie Boring:
  - 1. All timber or composite (plastic) ties shall be bored in the field. Timber tie boring shall be performed with the heartwood face down. For cut spikes, the holes shall be 9/16 inch in diameter and not less than five inches nor more than six inches deep. For screw spikes, the ties shall be bored as directed by the manufacturer or as directed by the Engineer. The location and number of holes shall conform to the location and number of spikes required for the type of track or special trackwork unit in which the tie is to be installed. Boring of holes in excess of the number of spikes used will not be permitted.
  - 2. A tolerance of plus or minus 1/16 inch will be permitted in the distance between spike holes. The spike holes shall be located in such a manner that each tie plate will be centered on the tie at a right angle to the rail when the spikes are driven into place. A tolerance of 1/8 inch in the centering of the holes across the width of the tie will be permitted. Timber tie holes shall be treated with pentachlorophenol oil or creosote immediately after boring.
- I. Tie Spacing
  - 1. Ties shall be spaced on an average of 27 inch centers, for main track unless otherwise shown.

2. Tie spacing at approach slabs shall be as shown.
3. Tie spacing on restraining rail track shall be on an average of 24 inch centers.
4. Tie spacing shall be as specified or shown with a tolerance of plus or minus 1 inch.

### **3.06 LAYING CONTINUOUS WELDED RAIL (CWR)**

- A. Laying, anchoring and joining CWR shall be as specified.
- B. Zero Thermal Stress Temperature
  1. The rail shall be anchored at a temperature of 85 deg. F plus 5 deg. for minus 10 deg. F (30 deg. C plus 3 deg. C or minus 6 deg. C).
  2. The temperature of opposite rails when anchored shall be within 5 deg. F (3 deg. C) of each other.
- C. Fastening Rail To Ties
  1. Materials for fastening rail to ties shall be as specified for Track Appurtenances and OTM.
  2. Tie plates shall be installed under running rails on all ties. Spiking pattern shall be as follows:
    - a. Pandrol Tie Plates - 4 screw spikes
  3. Prior to installing tie plates, the contact surfaces of the tie plates shall be cleaned to allow full bearing of the tie plate upon the tie. Tie plates shall be centered on the tie and placed normal to the centerline of the rail so that the outside shoulder of the plate will have full bearing against the base of rail.
  4. Spikes shall be started vertically and square and driven straight. Straightening of spikes will not be permitted. Spikes bent during driving shall be withdrawn and the holes plugged with treated tie plugs as specified for Track Appurtenances and OTM.
- D. Rail Anchoring: Installation of Pandrol spring clips shall be considered as anchoring the rail.

### **3.07 SURFACING AND LINING**

- A. Ballasting
  1. Following the assembly of the track, ballast shall be unloaded in the tie cribs and shoulders of the track structure to restrain movement or buckling of the track due to temperature changes.
  2. Such ballast unloading shall provide an adequate amount of ballast for the track raise with sufficient surplus to continue to hold the track after the raise.
- B. Surfacing
  1. Track surfacing shall be done by methods which will prevent undue bending of the rail or straining of the joints.
  2. The amount of track lift shall not exceed four inches nor endanger the horizontal or vertical stability of the track. The track shall be given at least two raises of not less than one inch nor more than three inches each raise.
  3. All ties pulled loose during surfacing shall be replaced to full bearing against the rail and properly secured.
  4. Track surfacing will not be permitted until the cribs are filled with ballast nor will surfacing be permitted when the ambient temperature is higher than 95 deg. F.
- C. Tamping
  1. Tamping of ballast shall be done with approved power tamping equipment of the vibratory squeeze type. Control or cycling of the power tamper shall provide the maximum proper compaction of ballast uniformly along the track.

2. The ballast shall be thoroughly tamped on both sides of the tie from a point 15 inches inside the rails to the ends of the tie, with the exception of contact rail ties where tamping shall be only to a point opposite the ends of the adjacent cross tie. Tamping will not be permitted at the center of the tie outside of the above stated limits. For each tie, tamping shall proceed simultaneously inside and outside both running rails on both sides of the tie.
- D. Final Surface and Alignment
1. The final surface and alignment of all track shall be within the specified ballasted track construction tolerances, executed by machines with automatic lining equipment or with combined lifting, lining and tamping equipment. Final tamping and lifting shall be effected by equipment fitted with tamping heads between axles or of arch -bar construction.
  2. After the final surfacing and alignment of track is completed the ballast shall be dressed to conform to the ballast section shown and as directed by the Engineer. The portion of sub-ballast outside the toe of slope of the ballast shall have a smooth, even surface, sloped as shown.
  3. A manual dressing, as directed by the Engineer will be required to ensure a one inch clearance between the base of rail and top of ballast.
- E. Ballast Compaction
1. Following tamping and lining, but prior to installation of contact rail and insulators, the crib and shoulders of all track shall be compacted by a machine specifically designed to compact the crib and shoulders simultaneously. The compactor shall operate on all shoulders and in those cribs where special trackwork components do not interfere with the operation of the machine. After compaction of ballast no further shaping of the ballast section will be permitted except as directed by the Engineer.
  2. The crib compacting tool work faces shall measure nine inches by 14 inches with the nine-inch dimension parallel to the rail. Crib compacting tool work faces shall appear as flattened V's when viewed normal to the nine-inch dimension and the depth of the V shall be 3/4-inch plus or minus 1/16-inch. There shall be a minimum of eight crib compacting tools, two on each side of each rail. The shoulder compacting tool work faces shall conform to the designed ballast section outline from 1-1/2 inches beyond the tie ends horizontally to the beginning of the 2:1 shoulder slope, continuous to within six inches of the ballast toe at the sub-ballast. The length of work faces in the direction of travel shall not be less than 33 inches, with flared ends in the direction of travel to avoid plowing of ballast shoulders. For superelevated and spiraled sections, the shoulder tools shall be adjustable such that the 2:1 ballast shoulder slope will be maintained as shown.
  3. The compacting tool work faces shall vibrate with a frequency between 2200 and 3000 Hertz. The vibrational amplitude shall be between 0.058 inch and 0.117 inch. The vibrating work faces shall apply a pressure between 14 psi and 21 psi to the surface of the ballast. The pressure applied shall be the same for all operations and remain constant throughout the job and shall be monitored by a permanently affixed calibrated pressure gauge. The compacting tools shall be applied to both crib and shoulders for a period of between three and six seconds duration at each crib successively.
- F. Ballast Inspection: The Contractor, shall remove a maximum of one percent of the ties, selected at random by the WMATA Engineer, to allow inspection of the ballast compaction beneath the ties to determine the variables of each piece of tamping and compaction equipment and for spot checking of the production work.
- G. Superelevation Marker Tags
1. The required amount of superelevation in ballasted tracks shall be shown on metal marker tags affixed to the tops of ties.

2. Tags shall be placed at start of superelevation to show zero superelevation and at every 1/8 inch change until full superelevation is reached.
3. Tags shall be fastened with two nails to the top of the nearest tie approximately one foot inside the high rail and shall be placed so they can be read while facing against the traffic, on tracks of assigned direction. Tags shall be placed at the point of full superelevation so that they may be read facing the high rail, to plainly indicate the authorized full superelevation.
4. Tags shall be made of a corrosive-resistant metal such as anodized aluminum or brass. Fastening nails shall be of the same material as the tags.
5. Tags shall be stamped in 1/8 inch increments from zero superelevation to maximum superelevation. Whole numbers and fractions shall be stamped in characters ½ inch minimum in height.
6. Tags shall be a minimum of .050 inches thick, 1-1/4 inches wide and two inches long.

#### **PART 4 - MEASUREMENT AND PAYMENT**

##### **4.01 MEASUREMENT:**

- A. Measurement of work specified in this section will be made in the following manner:
  1. Ballasted Track Construction: No separate measurement.

##### **4.02 PAYMENT:**

- A. Compensation for work specified in this Section will be made in the following manner:
  1. Ballasted Track Construction: Included in the price of work it is a part.

**END OF SECTION**

## SECTION 05653

### DIRECT FIXATION TRACK CONSTRUCTION

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. The work specified in this Section shall include the construction of direct fixation (DF) track, as indicated on the Drawings. Direct fixation track construction (DFTC) includes the requirements for qualifying the construction methods; surface preparation of existing concrete and stirrups; forming, placing, and curing reinforced track concrete; installing DF rail fasteners; and installing continuous welded rail (CWR).
- B. Direct fixation track construction is comprised of the installation of grout pads and direct fixation rail fasteners, installing running rail, anchoring, joining CWR strings and other incidentals as specified. The track shall be constructed as specified for General Track Construction (GTC) and as specified herein.
- C. Direct fixation track construction shall use resilient spring clip direct fixation fasteners, vibration attenuating direct fixation fasteners and "Stiff" direct fixation fasteners with slip-in Pandrol shoulders within Special Trackwork where shown. Type of fastener to be installed at a given location shall be as indicated on the contract drawings.
- D. Prior to start of DFTC all under track drains and invert conduits shall be proofed with a mandrel. Following completion of DFTC all under track drains and invert conduits shall again be proofed with a mandrel to demonstrate that the Contractor's operations have not plugged the drains or conduits.
- E. Prior to the second proofing of track drains, but after all other work is complete, the underground portions of direct fixation track shall be thoroughly washed two separate times, including inbound and outbound tracks, overhead, sidewalls and invert. Washing equipment shall be capable of attaining at least 2500 psi nozzle pressure and shall be approved by the Engineer prior to start of washing.

  - 6. ASTM C150 - Standard Specification for Portland Cement.
  - 7. ASTM D2240 - Standard Test Method for Rubber Property - Durometer Hardness.
  - 8. ASTM D2936 - Standard Test Method for Direct Tensile Strength of Intact Rock Core Specimens (C900 - STM for Pullout Strength of Hardened Concrete).
  
- D. Steel Structures Painting Council (SSPC):
  - 1. Specification SP1 - Solvent Cleaning
  - 2. Specification SP5 - White Metal Blast Cleaning.

#### 1.04 SUBMITTALS

- A. A work plan shall be submitted for approval prior to the beginning of construction. The work plan shall include a step-by-step construction sequence accompanied by descriptions and sketches as needed to describe the following:
  - 1. The method of laying out the work including grout pads, inserts and fasteners, to result in finished track meeting alignment requirements within the specified tolerances.
  - 2. The method of preparing concrete invert surfaces to obtain the specified bond of grout pad to invert.
  - 3. The method of locating and drilling insert holes and setting inserts to specified position and elevation. Include hole diameter and depth.
  - 4. The details for securing the fastener inserts in the trackbed invert including the following:
    - a. Brand/manufacturer of each component.
    - b. Temperature range of substrate for setting inserts and curing anchor material supported by test data.
    - c. Wetness range for placing and curing anchor material.
    - d. Packing, storing, handling, proportioning, mixing and placing details.
    - e. Hole cleaning, brushing, blowing and drying details.
    - f. Insert cleaning and degreasing details.
    - g. Method for measuring and controlling substrate temperature during setting and curing of material.
  - 5. Details of the insert including shop drawings or catalog cuts and certification of chemical composition and physical characteristics to verify compliance with these specifications.
  - 6. The details of the grout pad sizes, and procedures for forming, mixing, placing and curing including items 4. a. thru d. and g. above.
  - 7. The grout mix design identifying materials, proportions and additives.
  - 8. Curing materials for grout pads.

9. Required rail temperature record forms for rail laying and rail fastening operations.
10. Five (5) each AREMA approved thermometers as specified in Section 05651, General Track Construction, Article 3.12, Laying Continuous Welded Rail.
11. Method and equipment for transport of rail.
12. Submit for approval detailed procedures of the following items required in connection with laying and joining CWR strings:
  - a. String schedule showing length and location of strings.
  - b. Equipment to be used.
  - c. Procedure for positioning CWR strings in track, setting gaps between strings and initial fastening.
  - d. Procedure for lining, gauging and profiling of rails.
  - e. Procedure for joining CWR strings, including method of obtaining correct gap if joined at a different temperature than at which it was laid.
  - f. Procedure for destressing/anchoring CWR strings to zero thermal stress temperature, including control of rail movement and installing rail anchors and spiking rail down.
  - g. Special procedure for closing last string with previously anchored rail or special trackwork.
13. Completed and signed Record of CWR Laying Form provided in Section 05651 (Exhibit 05651 C / Part 2 of 2).

#### 1.05 QUALITY ASSURANCE

- A. The Contractor shall make the following submittals and tests before constructing direct fixation track.
- B. Submit a Preliminary Work Plan for approval containing the information specified.
  1. Perform grouting material tests.
  2. Perform grout pad qualification tests.
  3. Perform anchoring material tests.
  4. Upon approval of the work plan, DFTC shall proceed using the material, methods and procedures stated in the plan.
  5. Quality control tests in the plan shall be performed in the manner and to the intervals specified and the results furnished to the Engineer within 14 days after performing each test.
  6. No track construction shall commence prior to approval of the final work plan.
- C. Testing of Grouting Materials
  1. Test specified shall be conducted on specimens of the proposed materials by an approved independent laboratory. Results of the test shall be submitted for approval.
  2. Compressive Test:
    - a. Compressive test shall be made on three 3-inch by 6 inch cylinders in accordance with the requirements of ASTM C39.
    - b. To be acceptable, the average compressive strength shall not be less than 3500 psi nor more than 6000 psi at 28 days.
- D. Grout Pad Qualification Testing
  1. The Contractor shall prepare four 1-1/4 inch thick grout pads in each of two areas of the existing trackbed designated by the Engineer. The preparation of the invert, and the placement of grout pads shall be as proposed in the Contractor's work plan. Each area shall exhibit differing invert conditions.

2. The grout pads shall be allowed to cure for 28 days, after which core specimens from grout pads shall be taken of a size as required by ASTM D2936. The perimeter of any hole shall be six inches minimum from any adjacent hole and a maximum of two inches from an edge of the grout pad.
3. The specimens shall be taken at locations as directed by the Engineer. Cores shall be taken using diamond core drills and shall be oriented normal to the grout pad surface with a tolerance of plus or minus one degree.
4. The cores shall be tested in direct tension using methods specified in ASTM D2936. All cores shall be tested to failure. To be acceptable the minimum tensile strength, including the bond shall not be less than 125 psi. If failure occurs in the invert concrete at less than 125 psi an additional core shall be tested.
5. Grout pads from which cores were removed may be used for the final installation providing the cores pass the specified test and the pads are otherwise acceptable. Holes shall be filled with specified grout and the top surface shall be finished to the tolerances of the surrounding grout pad.
6. Grout pads that fail to pass the test shall be completely removed and the holes in the invert shall be patched as specified.
7. The Contractor shall perform insert drilling tests on the grout pads (full depth of insert) to determine optimum insert drilling period. Hole(s) shall be drilled 24 hours, 48 hours, 72 hours, 7 days, 14 days, and 28 days after pads are placed. Pads shall be placed in such a manner that insert drilling tests can be performed without affecting adjacent portions of the grout pad to be used for qualification testing. All holes to be filled full depth after test with specified grout. Test results shall be submitted for approval.

E. Fastener Insert Pull-Out Testing

1. Inserts shall be installed according to the work plan in each of two areas of existing concrete trackbed exhibiting different invert conditions as directed by the Engineer. The sites selected **and witnessed** by the Engineer will be chosen to demonstrate the temperature and wetness limits of the anchoring material.
2. A restrained test shall be performed in each area, in which a 3-1/2 inch square by 1/2 inch thick steel plate, with a 0.9687 inch diameter hole in the center shall be placed over insert on the concrete trackbed. The insert bolt shall be installed and then have an upward vertical load applied, bearing against the steel plate, until a load of 40,000 pounds occurs. The load shall then be released. Six inserts and bolts in each area shall be tested in this manner.
3. For the unrestrained test, the steel plate shall be removed. The insert bolt shall again have an upward vertical load applied, in such a manner that no vertical load is applied to the concrete trackbed within a radius of six inches from the insert until a load of 6,000 pounds is attained.
4. Testing shall be no additional cost to the Authority.
5. Acceptance Criteria for Insert Pull-Out Testing
  - a. During the restrained test there shall be no evidence of failure of the insert anchoring system before a load of 40,000 pounds is attained.
  - b. During unrestrained test there shall be no evidence of failure by slippage or cracking of the insert anchoring material before a load of 6,000 pounds is attained.

F. Quality Control Requirements

1. The Contractor's Work Plan shall include the Contractor's quality control plan for DFTC. As a minimum, the following quality control measures shall be included:
  - a. Three 3-inch by 6-inch cylinders of grout shall be taken from the production mix and cured under the same conditions as the grout pads. At the end of 28 days the cylinders shall be tested in accordance with ASTM C109.

The average compressive strength shall not be less than 3,500 psi nor more than 6,000 psi. Samples shall be taken from each 200 feet of track constructed or each days work, whichever is less.

- b. The grout pad qualification test shall be performed on three cores each 200 feet of track or each day if less than 200 feet of grout are placed per day. The test procedure and acceptance criteria shall be the same as specified in the qualification test.
- c. The unrestrained insert pull-out test shall be performed on one insert on each rail every 200 feet. Should the insert or the bond fail, the Contractor shall test every insert in both directions to define, to the Engineer's satisfaction, a zone of defective inserts. All inserts in such a zone shall be made and labeled as directed by the Engineer.
- d. All materials or installation determined to be defective in accordance with the quality control program shall be removed and new materials installed and tested in accordance with the quality control program. In the event of a second failure during any retest, the Contractor shall modify his work plan to include corrective actions to be taken before any further work with the failed material is to continue. All removal and replacement shall be at no additional cost to the Authority.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS**

- A. Grout
  1. Grout shall have a design strength of 4,000 psi and shall be premeasured, prepackaged, requiring only the addition of water, and shall consist of Portland cement, fine aggregate, coarse aggregate and additives.
  2. Grout shall be low-shrink, contain no expansive cement, metallic particles or air entraining agents.
  3. Grout shall have been used in like application for not less than three years and perform successfully as specified under quality assurance.
  4. The components of grout selected shall meet the following requirements, listed below.
    - a. Portland Cement: ASTM C150, Type I or II.
    - b. Fine Aggregates: ASTM C33.
    - c. Coarse Aggregates: ASTM C33, 3/8 - inch maximum.
    - d. Water: Potable
      - 1) Additives: As recommended by manufacturer and approved
      - 2) Curing compound: Conforming to AASHTO M148, Type I-D and as recommended by grout manufacturer.
- B. Insert Anchoring Material
  1. Fox Industries FX-830, polyester resin, Fox Industries FX-816 or equal.
  2. Ramset/Red Head EPCON System, Ceramic C Formula with static mix nozzle, two-part epoxy or approved equal.
- C. Fastener Anchorage Assembly
  1. Insert:
    - a. Steel conforming to mechanical requirements of ASTM A449 and chemical composition of ASTM A325, Type 3, or equal, with chromium, nickel and copper in such combination to achieve maximum corrosion resistance consistent with strength and hardness requirements.
      - 1) Threaded to 1-1/2 inch depth to receive ASTM A325 7/8-inch bolt.

- 2) Designed and tested to meet 40,000 - pound bolt load without yielding.
  - 3) Washer face bearing against fastener equal to bearing area of A325 heavy hex nut for 7/8-inch bolt.
  - 4) Length and anchorage configuration designed and tested to withstand 12,000 pounds unrestrained pull-out and 250 foot - pounds torque without yielding and with four to five inches embedment in concrete exclusive of grout pad thickness.
  - 5) Each insert furnished with a firmly fixed and easily removable plug or nylon or plastic material to exclude concrete or other materials from entry during transport, handling and installation. Plugs shall be capable of re-insertion and, if re-inserted, shall still exclude concrete or other materials from entry.
  - 6) Inserts shall be coated with an epoxy resin insulating coating, 100-percent dry powder epoxy resin, Scotch Kote Brand Protective Resin No. 206N, Minnesota Mining and Manufacturing Company; Corvel Epoxy ECB - 1363A, Polymer Corporation; or equal. The coating application shall be in accordance with the coating manufacturer's recommendations and as approved, with the following additional requirements:
    - a) Remove oil, grease and other foreign matter shall be removed by solvent, caustic degreasing or by steam cleaning in accordance with SSPC Specification SP 1.
    - b) Prepare surface to white metal in accordance with SSPC Specification SP 5.
    - c) Preheat the inserts to a uniform temperature of not less than 325 deg. F, checking and recording temperature every hour.
    - d) Dip inserts into fluidized bed of proper temperature and density to provide complete and uniform coverage of surfaces except interior threads when provided.
    - e) Immediately oven cure at a temperature between 400 deg. F and 425 deg. F for a time which will ensure complete cure of the epoxy resin.
    - f) The epoxy coating shall be not thinner than 10 mils nor thicker than 20 mils when tested by a magnetic mil gauge at not less than two areas of the insert; epoxy coating having runs, sags or chips will not be acceptable. When tested in accordance with ASTM D2240, epoxy coatings shall have a hardness not less than 85 nor more than Shore D.
2. Bolt:
    - a. Furnished with Standard D.F. Fasteners: ASTM A449 for Mechanical Properties; A325 Type 3 for Chemical Properties .
  3. Washer:
    - a. Furnished with Standard D.F. fasteners.
  4. Methyl Methacrylate
    - a. Silikal R41si primer by Silikal North America, Inc., FX-821 (mma) by Fox Industries, Inc., or approved equal.
  5. **Elastomeric (Stiff) Direct Fixation Fastener, F-20 Type, produced by L. B. Foster, or approved equal.**

**PART 3 - EXECUTION**

**3.01 INSTALLATION**

A. Direct fixation rail fastener

1. Direct fixation rail fasteners shall be installed in pairs, opposite each other within a tolerance of one inch, at right angles to the centerline of track, one fastener under each running rail. Fastener shall be spaced as follows:

Fastener Spacing (Inches)		
All tracks except those listed below.	Average Individual Spacing (Design Spacing)	30
	Average of 20 consecutive fasteners(20 spaces, plus or minus three inches	30
	Maximum Individual Spacing	33
Special Track-work and Joints	Average Individual Spacing (Design Spacing)	As shown
	Maximum Individual Spacing	As shown plus 3 inches

2. The fasteners inserts shall be located 5-1/4 inches from the centerline of rail measured normal to the rail and 1-3/4 inches from the centerline of fastener measured parallel to the rail. The fastener inserts shall be symmetrically located in the upper right quadrant and lower left quadrant of the fastener as referenced along the centerline of rail.
3. A transverse, four-inch, heavy-duty cast-iron pipe, connecting Type 1 drain inlets to the main track drain is located in the concrete invert below the running rail. Where the top of the connecting pipe is less than six inches below the concrete surface at the running rail, the fastener shall be located to provide not less than three inches clearance between the fastener insert holes and the nearest surface of the pipe.
4. The fasteners are designed with a lateral adjustment feature having a range of plus or minus 1/2 -inch. The range of adjustment is for both construction tolerances and re-gauging, but may not include gauge widening for curves and special trackwork. The Contractor shall install fasteners in such a manner that after final gauging and aligning of the track not less than 1/2-inch of the lateral adjustment range of each fastener remains for tightening of the gauge.

B. Chipping of Concrete Trackbed

1. Trackbed surfaces where grout pads are to be installed shall be chipped to a depth of approximately 1/4-inch to expose aggregate and provide a surface suitable for grout bonding. Chipping equipment and procedures shall be approved by the Engineer.
2. The Contractor shall submit for approval computations for the actual amount of chipping required and the proposed method. No chipping shall be done without prior approval.
3. In areas chipped in excess of that required for the installation of grout pads, the Contractor shall restore the invert to its original grades by filling chipped surface with grout pad material from which the coarse aggregate has been removed, or by filling with approved patching mortar.

4. The Contractor shall, immediately upon completion of the chipping work, clean-up and remove debris and any water resulting from the chipping.

C. Grout Pads

1. Grout pads shall be installed in direct fixation track to provide an even surface for the support of the rail fastener. The pad shall be located and its surface leveled to provide the fastener full bearing support at all positions of lateral adjustment of the fasteners along the entire length of grout pad.
2. Grout pads shall be 20 inches wide, not less than nine feet nor more than 10 feet long. There shall be a minimum of six inches of the existing trackbed exposed between grout pads.
3. Grout pads shall not be constructed over construction joints. Where grout pads overlap as-built drainage troughs, the Contractor shall proceed as directed by the Engineer. For special trackwork, the grout pad shall extend no less than 1/2-inch beyond the elastomer pad and shall be configured to provide adequate trackbed drainage.
4. The grout pad thickness shall be a minimum of 3/4-inch. Contractor shall be responsible for providing grout quantities as needed to a maximum of 3 inches at no additional cost to the Authority. Additional thickness of rail grout pads on curved track shall be computed from invert dimensions shown in typical sections for superelevated track. Grout exceeding the 3-inch maximum on the high rail for superelevation purposes will also be at no additional cost to the Authority.
5. Grout pads over two inches thick shall be reinforced as shown,
6. Except within the limits of special trackwork and unless otherwise directed by the Engineer, grout pads shall be laid to provide the running rails a 40:1 cant toward the center of the track. Cant may vary from 33:1 to 50:1. Pads within the limits of special trackwork shall provide no cant to the rail and shall be flat to plus-or-minus 0.3 degrees.
7. The difference in elevation of two adjacent grout pads on the same rail, adjusted for grade, shall not exceed 1/16 inch.

D. Grout Installation

1. Preparation
  - a. The surface shall be clean, sound and free of standing water. Foreign substances and laitance shall be removed to expose firmly embedded coarse aggregate.
  - b. Divert running water temporarily to achieve water free area to install grout pad.
  - c. If a bonding agent is used, the recommendations of the manufacturer of the bonding agent shall be submitted for approval; and once approved, strictly followed in handling, mixing, placing and curing.
2. Forms
  - a. Forms shall be constructed of coated wood, metal, or equal, and anchored securely. They shall be leakproof and strong enough to retain grout in place. Provision shall be made to give the top of grout pads the specified cant.
  - b. Slip forming of grout pads may be used provided the finished grout pad meets all other requirements of the specifications and drawings.
3. Mixing
  - a. The components of Portland cement grout, in the approved proportion, shall be mixed thoroughly to ensure even distribution of components.
  - b. Mixing shall be done as near the grouting site as possible.
  - c. Water added shall be the maximum required to achieve the design water content, including the moisture entrained in the aggregate. Water is not available in the tunnels /cut and cover box structures.

Water for mixing grout and all other purposes shall be provided from sources outside of the tunnels/cut and cover box structures.

- d. Material temperature shall be within the approved limits set by the manufacturer. Once mixed, grout not placed within its working time shall be discarded.

4. Placing and Curing

- a. The placing of grout shall be as recommended by the grout manufacturer.
- b. The grout shall be kept wet and curing compound shall be applied as recommended by the manufacturer of the curing compound.

E. Fastener Insert Installation

1. Drilling Insert Holes

- a. Inserts shall be located with sufficient accuracy to ensure compliance with specified tolerances and as required by the rail fastener design.
- b. Holes shall be drilled to a depth not greater than 5-1/2 inches in the concrete trackbed below the grout pad and the diameter shall not be greater than 2-1/4 inches. Holes shall be drilled normal, plus-or-minus one degree to the plane of the rail base.
- c. The Contractor's method of drilling the concrete trackbed for D.F. inserts shall not spall the concrete, delaminate the grout pads nor compromise structural integrity of the tunnel/cut and cover box structure.
- d. Spacing for transverse reinforcing bars in the concrete trackbed is as shown on the Drawings. To decrease the possibility of interference with the drilling of the insert holes, exposed vertical fender studs welded to the transverse reinforcing bars have been provided in all underground D.F. track at longitudinal intervals of 10 feet. As a further aid in locating reinforcement bars, a pacometer is available for loan from the Authority. Special care shall be taken on aerial structures to prevent damage to tensioning cables.
- e. In the event any of the following occur, the Contractor shall immediately notify the Engineer and under his direct supervision proceed as follows:
  - 1) If a longitudinal reinforcing bar is encountered while drilling an insert hole, drilling shall be continued until the hole has reached design depth.
  - 2) If a transverse reinforcing bar is encountered while drilling an insert hole before reaching the design depth, the hole shall be relocated a minimum distance of three inches or as directed by the Engineer. Whenever a hole is relocated, the original hole shall be filled with approved insert anchoring material.
  - 3) If the hole is drilled to a depth greater than 5-1/2 inches, it shall be filled with grout or anchor material to the design depth.
- f. Insert holes shall be free of dust and debris prior to installation of the inserts. All debris from drilling insert holes shall be removed from the work site without damage to existing facilities. The Contractor shall take measures to prevent clogging of permanent drainage facilities. Prior to completion of the Contract, **the Contractor** shall ensure that permanent drainage facilities are left free of foreign matter.

2. Setting Inserts

- a. Insert holes shall be installed in accordance with the approved procedure and shall be embedded not less than four inches in the concrete trackbed below the grout pad.
- b. Before the installation, inserts shall be free of rust, dirt and other deleterious substances.
- c. Inserts shall be set normal plus-or-minus one degree to the plane of the rail base. The insert and anchoring material surface shall be no higher than zero inch and not lower than 1/32 inch from the top plane of the grout pad.

3. Setting Fasteners
  - a. Fasteners shall be placed on grout pads and secured by the use of bolts. Anchoring of a string of CWR in direct fixation track shall be accomplished by installing devices furnished by the fastener manufacturer, which are for the purpose of holding the rail on the fastener. The installation of the direct fixation fastener shall be in accordance with the fastener manufacturer's recommended installation procedure.
  - b. Rail fasteners shall be kept clean and free of dirt, grout and other substances which could reduce the electrical-insulating characteristics of the fastener. Inserts shall be kept free of rust, dirt and other substances. The use of shims is prohibited unless specifically approved by the Engineer on a case by case basis.
  
- F. Laying Continuous Welded Rail on Direct Fixation Rail Fasteners
  1. Laying, anchoring and joining of CWR shall be as specified for General Track Construction with the following additional requirements:
    - a. Zero Thermal Stress Temperature
    - b. The rail in underground direct fixation track shall be installed, joined and anchored to produce zero thermal-stress in the rail at 60 deg. F plus-or-minus 10 deg. F (16 deg. C plus-or-minus 6 deg. C).
      - 1) Aerial, at-grade and approach slab rail shall be anchored at a temperature of 85 deg. F plus 5 deg. F or minus 10 deg. F (30 deg. C plus 3 deg. C or minus 6 deg. C).
      - 2) The temperature of opposite rails when anchored shall be within 5 deg. F (3 deg. C) of each other.
    - c. Lining Direct Fixation Track
      - 1) Rail shall be brought to final line and grade with the rail bearing against the field side shoulder (TPI Fastener) or centered between the rail clamps (Lord Fasteners) of the fastener; the rail or fastener shall then be moved laterally to obtain corrected line and gauge. The anchor bolts shall then be tightened.
      - 2) Anchor bolts on all direct fixation rail fasteners under a string of CWR shall be fully tensioned in accordance with the approved installation procedure before anchoring of CWR string is begun.
    - d. Tensioning Anchor Bolts
      - 1) Bolts shall be in tightening motion when the torque is measured. Torque wrenches shall be accurate within plus-or-minus 10 foot-pounds. Calibration of a torque wrench in order to translate the tension requirement into the foot-pound setting shall be determined by laboratory test in an accurate device capable of indicating actual bolt tension from each lot to be installed.
      - 2) Final bolt tension shall be 30,000 pounds with a tolerance of plus 10 percent and minus 20 percent.
      - 3) Calibration of wrenches shall be by tightening, in a device capable of indicating actual bolt tension, not less than three bolts taken from each lot to be installed.
      - 4) Power wrenches shall be adjusted to stall or cut out at the required tension.
      - 5) If manual torque wrenches are used, the torque indication corresponding to the calibrated tension shall be noted and used for the installation of the tested lot.
      - 6) Calibrate wrenches immediately prior to bolt tensioning operation and every six months thereafter, including two (2) Authority owned torque wrenches.

- e. Joining and Anchoring CWR Strings
    - 1) After lining the CWR in underground, aerial, at-grade or approach slab direct fixation track it shall be joined, de-stressed and anchored as specified in General Track Construction.
- G. Sealing Aerial Structure Grout Pads
1. Description: All direct fixation aerial structure grout pads shall be sealed with two coats of methyl methacrylate.
  2. Surface Preparation
    - a. Complete within 24 hours prior to sealing of pads.
    - b. Clean existing sides of grout pads and 6 inches of invert adjacent to pads of loose materials, oils, greases, and other foreign substances.
    - c. Use high pressure (minimum 500 psi) water blast to clean pad sides and surrounding perimeter of invert.
    - d. Remove water and debris with compressed air from which the oil has been removed.
    - e. Dry surface around pad by torch when directed by the Engineer. The pad and surrounding area shall be surface dry.
  3. Application
    - a. Apply to previously prepared surface.
    - b. Apply only during dry weather and not sooner than 48 hours after precipitation ceases. Do not perform work when ice crystals are present in concrete voids.
    - c. Apply primer with brushes on the dry clean surface. Apply primer evenly to obtain a closed, sealing film on the four sides of each pad and on a three inch perimeter of invert adjacent to the pad.
    - d. Apply primer quickly and continuously, without returning to areas already primed.
    - e. Apply first primer coat to sides of pads and invert in liberal quantities, especially at bond line.
    - f. Apply second primer coat not sooner than 30 minutes after the first application.
  4. Safety Precautions
    - a. The uncured primer is flammable. Take appropriate precautions. After curing, the primer will not support combustion.
    - b. The primer may present a minimal dermatological hazard to certain individuals. Persons involved in mixing and application of the primer must wear protective clothing such as, but not limited to, rubber gloves and goggles.
    - c. In general, all accident prevention regulations with respect to flammable materials, presently in force, must be observed. A dry chemical ABC fire extinguisher shall be on hand while products are in use.
    - d. Component B is flammable and a strong irritant. Handle with appropriate precautions. Protective gear, not limited to goggles, rubber gloves and rubber boots must be worn.
    - e. Provide an eyewash facility.
    - f. Smoking is prohibited on the job site.
    - g. If contact with skin occurs, wash immediately with soap and water, and contact a physician. If contact with eyes occurs, immediately flush with water for 15 minutes and contact a physician.
    - h. Wash contaminated clothing before reuse; discard contaminated shoes.
  5. Quality Control
    - a. Surface Seal Test
      - 1) The **WMATA** Engineer will visually inspect the surface of the treated pads and invert **with the Contractor**.

- 2) Acceptance Criteria: No voids or cracks which could absorb water are allowed.
- 3) Remedial Measures: Repair pads showing insufficient treatment with additional coat (s) of methyl methacrylate.

#### **PART 4 -MEASUREMENT AND PAYMENT**

##### **4.01 MEASUREMENT**

- A. Measurement of work specified in this Section will be made in the following manner:
  1. No separate measurement.

##### **4.02 PAYMENT**

- A. Compensation for work specified in this Section will be made in the following manner:
  1. Included in the price of the work of which it is a part.

**END OF SECTION**

**SECTION 05654**  
**SPECIAL TRACKWORK CONSTRUCTION - BALLASTED**

**PART 1 - GENERAL**

**1.01 SECTION INCLUDES**

- A. The work in this Section shall include the construction of ballasted special trackwork as indicated on the Contract Drawings and as specified.

**1.02 RELATED SECTIONS**

- A. Section 02726 - Sub-Ballast
- B. Section 02727 - Ballast
- C. Section 05091 - Rail Welding
- D. Section 05651 - General Track Construction.
- E. Section 05652 - Ballasted Track Construction
- F. Section 05656 - Running Rail
- G. Section 05658 - Track Appurtenance and Other Track Material
- H. Section 05659 - Special Trackwork
- I. Section 06130 - Timber Ties
- J. Section 06131 - Composite (Plastic) Ties

**1.03 REFERENCES**

- A. Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.
  - 1. American Railway Engineering and Maintenance-of-Way Association (AREMA), Manual for Railway Engineering herein referred to as AREMA Manual (**latest edition**).
  - 2. American Railway Engineering and Maintenance-of-Way Association (AREMA), Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio (**latest edition**).

**1.04 SUBMITTALS**

- A. The Contractor shall develop and submit for the Engineer's approval a detailed installation plan, including sketches, for all special trackwork installation. Particular emphasis should be placed on alignment and clearances, and methods of checking each.
- B. Submittals shall be as specified in Section 01300, Submittals. The following submittals shall be made by the Contractor:
  - 1. The name(s) of the suppliers and manufacturers for the special trackwork components.

2. Shop drawings for the various types of special trackwork and supporting drawings.
3. Installation and maintenance instructions by the manufacturer for the various trackwork components.
4. Detailed description of construction procedures required for the work specified in this Section submitted at least 30 calendar days before beginning the work.
5. Test results required for the work specified in this Section and related work specified elsewhere.

C. Shop Drawings for all Special Trackwork Construction (Ballasted Track) shall be transmitted with paper copies and CADD (latest version) to WMATA as per the requirements of the contract.

#### **1.05 QUALITY ASSURANCE AND SAFETY**

- A. In order to determine the acceptability of the installation, the Contractor shall make a survey of the special trackwork and provide the Engineer with a copy of the report. Deviations from the drawings or specifications which exceed tolerances specified shall be corrected by the Contractor at no additional cost to the Authority.
- B. Switch points shall mate and rest under the undercut stock rail and provide a continuous contact with stock rail the length of the machined point rail face adjacent to the stock rail.
- C. Switch points shall bear on all slide plates as shown by grease marks and feeler gauges in the thrown operating position.
- D. Operation of switch point shall be unrestricted and allow for smooth switch machine operation with current draw to suit WMATA's standard switch machine.
- E. Contractor's Work Trains:
  1. Contractor shall not operate his work trains over special trackwork until it has been assembled and secured in place to the satisfaction of the Engineer.
  2. Switch points shall be secured to the satisfaction of the Engineer before work trains or other on-track equipment are passed over turnouts.
- F. WMATA, or its representatives, reserve the right to visit the producers facility during usual business hours unscheduled to: a) observe panel or special trackwork assemblies and material, b) observe sampling and inspection procedures, b) obtain samples of the prepare material being produced and shipped, and c) review plant inspection methods, quality control procedures, equipment and examine inspection test results of current and previous tests.

#### **1.06 DELIVERY, STORAGE AND HANDLING**

- A. The Contractor shall handle all special trackwork materials in such a manner as to prevent damage during loading, transporting, unloading, storing and installing.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS**

- A. The Contractor shall supply the special trackwork turnouts and crossings as listed on the Contract Drawings, including all materials necessary to provide a complete installation.

- B. The following materials in accordance with the bills of materials on the drawings for special trackwork and general track construction shall be furnished as described, including but not limited to:
1. Sub-Ballast
  2. Ballast
  3. Running Rail
  4. Track Appurtenances and Other Track Material
  5. Special Trackwork
  6. Timber Ties / Composite (Plastic) Ties
- C. Other materials:
1. Switch stands, connecting rods and associated hardware as shown on the Drawings.
  2. Furnish a dry graphite lubricant for application to the riser plates. The lubricant shall have low electrical conducting properties.
  3. Furnish switch machines, operating rods and switch machine mountings for power operated turnouts, as described in Division 16 of the Contract Specifications.
  4. Furnish all additional track materials required within the special trackwork limits to construct an acceptable, completed special trackwork structure as specified herein.

### **PART 3 - EXECUTION**

#### **3.01 GENERAL**

- A. Construction of special trackwork on ballasted track shall be as specified and shall comply with the applicable portions of Ballasted Track Construction (BTC), Section 05652.
- B. Ballasted special trackwork will be factory assembled on all switch ties. After Authority inspection and approval, the switch will be shipped in one piece, except for long ties.
- C. The remainder of the unit will be disassembled and the switch ties banded into bundles identified as to turnout, crossing and location in accordance with the special trackwork installation drawings prepared by the fabricator.
- D. Tracks through the center diamond of crossovers shown as CWR shall be high strength rail. Through main line tracks between turnouts of crossovers shown as CWR shall be standard rail.
- E. Lubrication
1. At the time of installation all sliding surfaces of special trackwork assemblies shall be lubricated with an approved dry-film graphite lubricant.
  2. Vertical switch rod clips shall be greased in accordance with the manufacturer's recommendations.
  3. The specified lubrication shall be maintained as necessary to ensure proper operation of all components throughout the duration of this Contract.
- F. Adjustments
1. The Contractor shall make all mechanical adjustments, including those required for train control and switch machine installation, as directed by the Engineer prior to the final acceptance of special trackwork to ensure that special trackwork units are in alignment to their plates and proper operating condition.
- G. Switch Machine: Switch machines and operating rods will be furnished and installed by other trades.
- H. Switch Rods: Adjust for throw **as illustrated in the contract documents**.

- I. Rail Ends: Rail ends to be connected to CWR will be drilled in the field.
- J. Joints
  - 1. All furnished joints required to assemble the turnout shall be installed by the Contractor. **All rail joint bolts are to be torqued as per specifications.**
  - 2. All joints, standard or insulated, connecting a turnout to other trackage shall be furnished and installed by the Contractor. This normally consists of one pair of joints ahead of the point of switch and two pairs of joints beyond the frog; one pair on the through track and one pair on the turnout track.

### **3.02 SUB-BALLAST**

- A. Sub-Ballast shall be as specified in Section 02726, Sub-Ballast.

### **3.03 BALLASTING**

- A. Ballast shall be uniformly tamped under both sides of each tie, directly under each running rail and for a distance of 15 inches on both sides of the rail.
- B. The top of the ballast section shall be one inch below the base of rail throughout special trackwork units except in the cribs between the point and heel of the switch rails, where the ballast level shall be three inches below the base of the rail.
- C. Additional clearance at vertical switch rods shall be provided as needed to allow unrestricted movement. The width and slope of the shoulders shall be as shown.

### **3.04 SWITCH TIES**

- A. Switch ties shall be spaced and lined as shown.
- B. Ties shall be lined at right angles to the centerline of the thru-main line tangent track.
- C. The line side for all turnout units is the side on which the straight stock rail is located. The line side for diamond units is designated by the special trackwork fabricator and indicated on his installation drawings. Tie end on the line side are the line ends.
- D. Switch tie spacing shall have a tolerance of plus or minus ½ inch with the exception of the switch machine ties which shall have a tolerance of plus or minus 1/4 inch.
- E. Ties shall be added only with approval of the Engineer.
- F. All ties will be bored for 7/8" screw spikes.
- G. The Contractor will adz switch timbers to compensate for minor warpage and thereby provide correct rail surfacing only at the Engineer's direction. Adzing shall be at no additional cost to the Authority.

### **3.05 PLATES**

- A. All plates shall be located as shown.
- B. Elastic Fastener (Pandrol) tie plates shall be used at all support locations not having special frog or switch plates or AREMA standard-gauge switch plates.

- C. All plates shown within the limits of ballasted special trackwork will be factory assembled on the switch ties.
- D. Ties will be bored to accommodate all spike locations in all plates.
- E. Where plates span two or more ties, spikes will not be installed and the plates will be shipped separate from the ties.
- F. All plates occupying one tie including standard tie plates shall be spiked to the tie.

### **3.06 SPIKING**

- A. Spiking of ballasted special trackwork shall be as specified for BTC with the following additional requirements:
  - 1. All spikes holes shall be pre-bored.
  - 2. A sufficient number of 7/8 " screw spikes are to be furnished with each turnout to complete its field assembly.

### **3.07 ANCHORING**

- A. Upon installation of the Pandrol spring clips, special trackwork units shall be considered anchored.

### **3.08 TOLERANCE**

- A. Tolerances shall conform to the AREMA Portfolio and Manual, unless modified by these specifications and drawings.
- B. The gauge, cross level, superelevation, and horizontal and vertical alignment of ballasted special trackwork shall be as shown and specified.
- C. Tolerances shall be as specified for ballasted track construction.
- D. Switch points in normal position shall be square within 5/8 inch.
- E. At the Engineer's direction, the Contractor shall be required to provide some spike lining in the pre-plated tolerances. Minor spike lining will be allowed only after the Contractor has demonstrated that the switch points and frogs have been correctly oriented. This shall be at no additional cost to the Authority.

## **PART 4 - MEASUREMENT AND PAYMENT**

### **4.01 MEASUREMENT**

- A. Measurement of work specified in this Section will be made in the following manner:
  - 1. No separate measurement.

### **4.02 PAYMENT**

- A. Compensation for work specified in the Section will be made in the following manner:
  - 1. Included in the price of work of which it is a part.

**END OF SECTION**

## SECTION 05655

### SPECIAL TRACKWORK CONSTRUCTION - DIRECT FIXATION

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. The work specified in this Section shall include: the construction of direct fixation special trackwork as indicated on the Contract Drawings and as specified.

##### 1.02 RELATED SECTIONS

- A. Section 05091 - Rail Welding
- B. Section 05651 - General Track Construction
- C. Section 05653 - Direct Fixation Track Construction
- D. Section 05656 - Running Rail
- E. Section 05657 - Direct Fixation Rail Fasteners
- F. Section 05658 - Track Appurtenances and Other Track Material
- G. Section 05659 - Special Trackwork

##### 1.03 REFERENCES

- A. Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.
  - 1. American Railway Engineering and Maintenance-of-Way Association (AREMA), Manual for Railway Engineering herein referred to as AREMA Manual (**latest edition**).
  - 2. American Railway Engineering and Maintenance-of-Way Association (AREMA), Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio (**latest edition**).

##### 1.04 SUBMITTALS

- A. The Contractor shall develop and submit for the Engineer's approval a detailed installation plan, including sketches, of all special trackwork installation. Particular emphasis should be placed on alignment and clearances, and methods of checking each.
- B. Submittals shall be as specified in Section 01300, Submittals. The following submittals shall be made by the Contractor:
  - 1. The name(s) of the suppliers and manufacturers for the special trackwork components.
  - 2. Shop drawings for the various types of special trackwork and supporting drawings.
  - 3. Installation and maintenance instructions by the manufacturer for the various trackwork components
  - 4. Detailed description of construction procedures required for the work specified in this Section submitted at least 30 calendar days before beginning the work.
  - 5. Test results required for the work specified in this Section and related work specified

- elsewhere.
- 6. Copies of AWS welder qualification certificates.

C. Shop Drawings for all Special Trackwork Construction (Direct Fixation Track) shall be transmitted with paper copies and CADD (latest version) to WMATA as per the requirements of the contract.

## 1.05 QUALITY ASSURANCE AND SAFETY

- A. In order to determine the acceptability of the installation, the Contractor shall make a survey of the special trackwork and provide the Engineer with a copy of the report. Deviations from the Drawings which exceed tolerances specified shall be corrected by Contractor at no additional cost to the Authority.
- B. Switch points shall mate and rest under the undercut stock rail and provide a continuous contact with stock rail the length of the machined point rail face adjacent to the stock rail
- C. Switch points shall bear on all slide plates as shown by grease marks and feeler gauges in the thrown operating position.
- D. Operation of switch point shall be unrestricted and allow for smooth switch machine operation with current draw to suit WMATA's standard switch machine.
- E. Contractor's Work Trains
  1. Contractor shall not operate his work trains over special trackwork until it has been assembled and secured in place to the satisfaction of the Engineer.
  2. Switch points shall be secured to the satisfaction of the Engineer before work trains or other on-track equipment are passed over turnouts.
- F. WMATA, or its representatives, reserve the right to visit the producers facility during usual business hours unscheduled to: a) observe special trackwork assemblies and material, b) observe sampling and inspection procedures, b) obtain samples of the prepare material being produced and shipped, and c) review plant inspection methods, quality control procedures, equipment and examine inspection test results of current and previous tests.

## 1.06 DELIVERY, STORAGE AND HANDLING

- A. The Contractor shall handle all special trackwork materials in such a manner as to prevent damage during loading, transporting, unloading, storing and installing.

## PART 2 - PRODUCTS

### 2.01 MATERIALS

- A. The Contractor shall supply the special trackwork turnouts and crossings as listed on the Contract Drawings, including all materials necessary to provide a complete installation.
- B. The following materials in accordance with the bills of materials on the drawings for special trackwork and general track construction shall be furnished as described, including but not limited to:
  1. Running Rail
  2. Direct Fixation Rail Fasteners
  3. Track Appurtenances and Other Track Material
  4. Special Trackwork

- C. Other materials:
  - 1. Switch stands, connecting rods and associated hardware as shown on the Drawings.
  - 2. Furnish a dry graphite lubricant for application to the riser plates. The lubricant shall have low electrical conducting properties.
  - 3. Furnish switch machines, operating rods and switch machine mountings for power operated turnouts, as described in Division 16 of the Contract Specifications.
  - 4. Furnish all additional track materials within the special trackwork limits to construct an acceptable completed special trackwork structure as specified herein.

## **PART 3 - EXECUTION**

### **3.01 GENERAL**

- A. Construction of special trackwork on direct fixation track shall be as specified and shall comply with the applicable portions of Direct Fixation Track Construction (DFTC), Section 05653.
- B. Direct fixation special trackwork will be factory pre-assembled in accordance with Special Trackwork, Section 05659, for Authority inspection and approval. The special trackwork will then be packaged and shipped in accordance with the specifications.
- C. Tracks through the center diamond of crossovers shown as CWR shall be high strength rail. Through main line tracks between turnouts of crossovers shown as CWR shall be standard rail.
- D. Lubrication
  - 1. At the time of installation all sliding surfaces of special trackwork assemblies shall be lubricated with an approved dry-film graphite lubricant.
  - 2. Vertical switch rod clips shall be greased in accordance with the manufacturer's recommendations.
  - 3. The specified lubrication shall be maintained as necessary to ensure proper operation of all components throughout the duration of this Contract.
- E. Adjustments
  - 1. The Contractor shall make all mechanical adjustments, including those required for train control and switch machine installation, as directed by the Engineer prior to the final acceptance of special trackwork to ensure that special trackwork units are in alignment to their plates and proper operating condition.
- F. Switch Machine: Switch machines and operating rods will be furnished and installed by others.
- G. Switch Rods: Adjust for throw **as illustrated in the contract documents**.
- H. Rail Ends: Rail ends to be connected to CWR will be drilled in the field.
- I. Joints
  - 1. All furnished joints required to assemble the turnout shall be installed by the Contractor. **All rail joints are to be torqued as per specifications**.
  - 2. All joints, standard or insulated, connecting a turnout to other trackage shall be furnished and installed by the Contractor. This would usually be one pair of joints ahead of the point of switch and two pairs of joints beyond the frog; one pair on the through track and one pair on the turnout track.

### **3.02 CHIPPING**

- A. Chipping of the concrete trackbed shall be as specified for DFTC.

### **3.03 PLACING OF GROUT PADS**

- A. Grout pads shall be cast in place and shall conform to the requirements shown and specified for DFTC.
- B. Grout pads shall be coordinated with the Engineer to provide clearance for ATC wayside equipment.
- C. Grout pads shall be placed prior to installation of special trackwork.

### **3.04 DRILLING ANCHOR HOLES**

- A. Anchor stud holes for special plate anchorage assemblies shall be drilled at the locations shown within a tolerance of plus or minus 1/16 inch.
- B. Insert holes for direct fixation rail fasteners within special trackwork units and holes for special plate anchorage assemblies shall be as specified for DFTC and as follows.
  - 1. Special plate anchorage assembly holes shall be drilled 4-1/2 to 5-1/2 inches deep, 1-1/8 to 1-3/4 inches in diameter, and normal to the concrete surface plus or minus one degree.
  - 2. The base plate may be used as a guide for drilling anchor bolt holes.
  - 3. All debris shall be removed.

### **3.05 SETTING ANCHOR ASSEMBLY**

- A. The Anchor Assembly for special plates shall be specified in Section 05658, Track Appurtenances and Other Track Material, and as shown. They shall be set normal to the concrete surface plus or minus one degree and shall be installed using the bolt anchoring material and procedures as specified, tested and approved for DFTC.

### **3.06 SECURING SPECIAL PLATES**

- A. During installation of special plates, anchor bolts shall be fitted with protective sleeves to prevent thread damage. Anchorages for special plates shall be assembled as shown.
- B. After the grout pads and anchoring material have attained sufficient strength as determined by the Engineer, anchor bolts shall be tightened until the spring washer coils have a gap of 0.075 inch, plus or minus 0.005 inch. The tightening shall be verified to the satisfaction of the Engineer by the use of a feeler gauge.
- C. Rail clamp bolts shall be torqued to 21,000 pounds tension. The Contractor shall furnish and calibrate torque wrenches and feeler gauges to check the torquing of anchor bolts and rail clamp bolts. Torque wrenches shall be accurate within plus or minus 10 foot-pounds. The feeler gauges and the calibration of torque wrenches shall be subject to approval.
- D. Frog guard rail plates shall be field-welded to frog plates by an AWS qualified welder.

### **3.07 DIRECT FIXATION RAIL FASTENERS**

- A. Direct fixation rail fasteners of the type shown (standard or stiff) shall be installed in special trackwork at all support locations where special plates are not shown. The installation shall comply with the requirements for DFTC.

### **3.08 TOLERANCES**

- A. Tolerances shall conform to the AREMA Portfolio and Manual, unless modified by these specifications and drawings.
- B. The final gauge, cross level, superelevation, horizontal alignment and vertical alignment of direct fixation special trackwork shall be as specified for direct fixation track construction for GTC.
- C. Tolerances shall be as specified for direct fixation track construction.
- D. Switch points in normal position shall be square within 5/8 inch.

## **PART 4 - MEASUREMENT AND PAYMENT**

### **4.01 MEASUREMENT**

- A. Measurement of work specified in this Section will be made in the following manner:
  - 1. No separate measurement.

### **4.02 PAYMENT**

- A. Compensation for work specified in the Section will be made in the following manner:
  - 1. Included in the price of work of which it is a part.

**END OF SECTION**

## SECTION 05656

### RUNNING RAIL

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies manufacture and delivery of standard and head hardened (high strength) 115RE steel running rail for use in transit track.

##### 1.02 RELATED SECTIONS

- A. Section 05091 - Rail Welding
- B. Section 05651 - General Track Construction

- F. Section 05655 - Special Trackwork Construction - Direct Fixation
- G. Section 05658 - Track Appurtenances and Other Track Material (OTM)
- H. Section 05659 - Special Trackwork

##### 1.03 REFERENCE STANDARDS

- A. Work shall be performed in accordance with the following applicable Codes, Regulations, Reference Standards and Specifications.
  - 1. The American Railway Engineering and Maintenance-of-Way Association (AREMA), Manual for Railway Engineering, herein referred to as the AREMA Manual, Volume 1, Chapter 4, Rail (latest edition).
  - 2. American Society for Testing and Materials (ASTM)
    - a. ASTM E10 Standard Method of Brinell Hardness for Metallic Materials
    - b. ASTM A578 Ultrasonic Testing

##### 1.04 SUBMITTALS

- A. Submit to the Engineer a description of the method of transport for approval prior to shipment.
- B. Mill Inspection:
  - 1. Make specified tests and inspections at the mill prior to shipment.
  - 2. **Submit to the WMATA Engineer all information required of the Steel Rail Inspection Form shown in Exhibit A.**
  - 3. Provide free access for the **WMATA** Engineer to all fabrication and test facilities where work is being performed for this Contract.
- C. Provide rail test records, including mechanical properties tests, hardness measurements, ultrasonic test records and all other required test documentation, for informal review during the in-plant inspection.

## 1.05 QUALITY CONTROL

- A. Develop and maintain a quality control program regulating methods, procedures, and processes to ensure compliance with standards of quality required by the Contract Documents.
- B. Within 30 days after the effective date of the Notice of Proceed, submit for approval of the WMATA Project Manager a detailed narrative explaining the Quality Control program and procedures to be utilized for the work and a description of the organization to be used on the Contract.
- C. Records of all inspection work by the Contractor shall be kept complete and available to the Engineer during the performance of the Contract; and to such other agencies and for longer periods as may be specified elsewhere in the Contract.
- D. Perform all tests and analyses specified in Chapter 4 of the AREMA Manual and submit the results in accordance with this Section.
- E. Ultrasonically test all rail for internal defects in accordance with ASTM A578.
- F. Testing shall conform to the requirements of the AREMA Specifications for Steel Rails
- G. Make all rail tests and inspections at the mill prior to shipment. Assume full responsibility for all testing indicated. Give the Engineer sufficient notice when testing in any form is proposed so he may witness the tests.
- H. Provide the Engineer free entry at all times to the manufacturer's mill to inspect the processing and testing of rail while work on this Contract is being performed.
- I. Perform all tests specified herein at no additional cost.
- J. Testing must be witnessed and certified by a qualified independent testing firm or individual.
- K. **Qualification of Testing Personnel:**
  - 1. Personnel performing tests and inspections shall be qualified for such work by virtue of prior experience or training.
  - 2. Personnel performing nondestructive testing shall be qualified and certified in accordance with SNT-TC-1A. Only persons certified for NDT Level I and working under a NDT Level II person or persons certified for NDT Level II shall perform nondestructive testing.
- L. **Testing Equipment.** Testing equipment shall be in good operating condition, of adequate capacity and range, and accurately calibrated. Testing equipment calibration shall be certified and traceable to recognized national standards such as the National Institute of Standards and Technology. Such certified calibration test reports must be made available to the Engineer upon request.
- M. **Test Report.**
  - 1. A report of test results of each test shall be submitted which includes rail section, rail type, heat number, test name, identity of test sample, test procedure references, specified requirements, actual test results, non-conformance if any, and interpretation of the results. The format for the test report shall be arranged so that the data is presented in an orderly manner.
  - 2. The rail mill's standards, computer generated, test reports may be used.

3. Copies of calibration certificates shall be submitted with the initial test reports. If test equipment is recalibrated while work is being performed, calibration certificates shall be submitted for the recalibrated test equipment with test reports of the first tests performed after recalibration. In lieu of submitting calibration certificates, the manufacturer may maintain the certificates at its facility available to the Engineer at all times during the performance of the contract and for a three year retention period thereafter.
- N. The Engineer shall be notified in writing not less than ten (10) business days in advance of dates scheduled for any tests or inspections. The Engineer retains the right to witness the tests or conduct visual inspection prior to rail loading at the plant.

## 1.06 DELIVERY, HANDLING AND STORAGE

- A. Handle rails carefully to avoid damage.
- B. Load rail head up with the branding on all rails facing in the same direction.
- C. Sort and load rails together according to their markings. Do not intermix rails of different markings in loading. If there are not sufficient rails of one marking for a full car, smaller groups consisting of tiers of different markings may be loaded onto one car.
- D. Load all rails of the same radius together in the same or adjacent tiers.
- E. Load rails with adequate wood strips between the tiers or rail to prevent damage in transit.
- F. Delivery shall be F.O.B. job site in the Washington Metropolitan Area as directed by the Engineer.

## PART 2 - PRODUCTS

### 2.01 RAIL

- A. Standard Rail
  1. Rail Section and Weight shall be new 115 RE rail section, and shall be in conformance with AREMA Recommended Rail Sections, 115 RE Rail Section and Specifications for Steel Rails, **latest edition**.
  2. Rail shall be suitable for joining into continuous welded strings using both electric flashbutt and exothermic welding methods.
  3. The steel shall be cast by a continuous casting process, or by other methods approved by the Engineer.
  4. Length:
    - a. The standard length of rails shall be either 78 or 80 feet, **or as specified**.
    - b. Up to 10 percent of the total tonnage accepted for each individual rolling will be accepted for each individual rolling will be accepted in shorter lengths of 79, 78, 77, 75, 70, 65 and 60 feet.
- B. High Strength (Head Hardened) Rail
  1. High strength rail shall meet all of the requirements of Standard Rail and as follows:
    - a. High strength rail shall be either head hardened or fully heat treated.
    - b. High strength rail shall conform to all requirements for high strength rail specified in the AREMA Manual for Railway Engineering, Chapter 4 (**latest addition**).

- c. Rails shall have a Brinell Hardness between 341 and 397 BHN. A maximum hardness of 410 BHN may be exceeded in accordance with AREMA rail standards; however, if 410 BHN is exceeded, the manufacturer must examine the microstructure in the head, at 100X or higher, and confirm that a fully fine pearlitic microstructure is maintained and demonstrated in the head with certified test results. The manufacturer is to provide certified test results, prior to shipment and acceptance, for any BHN Brinell Hardness exceeding 410 BHN.
- d. Minimum tensile strength: 140,000 psi.
- e. Minimum yield strength: 95,000 psi.
- f. No untempered martensite shall be present within the rail.

### **PART 3 - EXECUTION**

#### **3.01 GENERAL**

- A. A mill certificate shall be furnished to the Engineer containing the following data:
  - 1. The identity of each rail in a charge by heat, ingot and letter.
  - 2. The identity of each equivalent sample by heat.
  - 3. The dates of all phases of heat treatment for each charge.
  - 4. A listing of the accepted and rejected rail in each charge.
  - 5. Rail section and type.
  - 6. Number of pieces in each heat.
  - 7. Chemical analysis.
  - 8. List of Brinell Hardness readings.
  - 9. Ultrasonic test results.
  - 10. Macrotech test results.
  - 11. Submit a storage procedure covering, as a minimum, the following subjects for storage of running rail at the manufacturer's facility:
    - a. Handling methods in and out of storage, including crane and details of lifting rig.
    - b. Environmental conditions.
    - c. Inventory control procedures.
    - d. Security of stored materials.
- B. Product Data and Test Program. Submit the following for review and approval by the Engineer prior to rail production in accordance with the approved schedule:
  - 1. Steel manufacture process description for making and casting or teaming the steel.
  - 2. Hydrogen elimination process description for hydrogen elimination.
  - 3. Production records and production test results. Submit the following for review and approval by the engineer at the time of each shipment.
  - 4. Rail inspection results for each test and inspection specified by AREMA and herein.

### **PART 4 - MEASUREMENT AND PAYMENT**

#### **4.01 MEASUREMENT**

- A. Measurement of work specified in this Section will be made in the following manner:
  - 1. No separate measurement.

#### **4.02 PAYMENT**

- A. Compensation for work specified in the Section will be made in the following manner:
  - 1. Included in the price of work of which it is a part.

**END OF SECTION**

## SECTION 05657

### DIRECT FIXATION RAIL FASTENERS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. Work under this Section covers furnishing all labor, materials, and equipment for the manufacture, testing, fabrication and delivery of direct fixation rail fasteners for installation in underground box structures, aerial structures and at-grade slabs. **Specification and supply of these fasteners does not include rail clips and anchor bolt assemblies.**

##### 1.02 RELATED SECTIONS

- A. Section 05651 - General Track Construction
- B. Section 05653 - Direct Fixation Track Construction
- C. Section 05655 - Special Trackwork Construction - Direct Fixation
- D. Section 05656 - Running Rail

#### 1.04 SUBMITTALS

- A. Contractor's Shop Drawings and Data
  - 1. Submittals shall be as specified in Section 01300: Submittals
  - 2. Submit Shop Drawings and other data, including design calculations, which are required by the Specifications or which are necessary to adequately perform the work. Shop Drawings are to be complete and detailed.
  - 3. Submit all drawings, data and schedules in accordance with the specified time requirements. If time requirements are not specified, submit in timely manner to permit no less than 21 days for appropriate review by the WMATA Engineer.
  - 4. Contractor submittals shall be checked, coordinated, and approved by the Contractor before they are submitted for the approval of the Engineer. Submittals lacking Contractor's approval may be returned to the Contractor for resubmission.
- B. Samples:
  - 1. Unless otherwise indicated, submit not less than two identical samples of the direct fixation fastener.
  - 2. Label each sample indicating:
    - a. Contract Name and Number.
    - b. Name of Contractor and Subcontractor.
    - c. Material or equipment represented.
    - d. Source.
    - e. Name of producer and brand.
    - f. Reference Specifications Section and Article Number.
- C. Quality Control Program Plans
  - 1. Quality assurance/control plan as specified herein.
  - 2. Test program plan as specified herein.
- D. Qualification Test Results
  - 1. Submit the following for review and approval prior to commencing fastener manufacture.
    - a. Certification of the elastomer samples used in the qualification testing.
    - b. Elastomer qualification test results for each test specified herein.
    - c. Fastener body metal qualification test results for each test specified herein.
  - 2. Submit qualification test results within 14 days after completing of testing. Submit elastomer certification with the elastomer qualification test results.
- E. Production Test Results
  - 1. Submit the following for review and approval prior to shipping each fastener production lot.
    - a. Certification of the elastomer samples used in the production testing of each production lot as detailed herein.
    - b. Elastomer production test results for each test specified herein.
    - c. Fastener production test results for each test specified herein.
- F. Submit the method and materials of packaging for shipment and storage no later than 60 days prior to the initial shipment.

## 1.05 QUALITY CONTROL

- A. Develop and maintain a quality control program regulating methods, procedures, and processes to ensure compliance with standards of quality required by the Contract Documents.
- B. Within 30 days after the effective date of the Notice to Proceed, submit for approval of the Project Manager a detailed narrative explaining the Quality Control Program and procedures to be utilized for the work and a description of the organization to be used on the Contract. All work undertaken by the Contractor before approval of his quality control program will be at the Contractor's risk. The Project Manager will monitor the Contractor's methods, procedures, and processes for compliance with the approved program.
- C. Keep complete records of all inspection work by the Contractor available to the Project Manager during the performance of the Contract; and to such other agencies and for longer periods as may be specified elsewhere in the Contract.
- D. **WMATA, or its representatives, reserve the right to visit the producers facility during usual business hours unscheduled to a) observe sampling and testing procedures, b) obtain samples of the prepare material being produced and shipped, and c) review plant inspection methods, quality control procedures, equipment and examine test results of current and previous tests.**

## 1.06 DESIGN REQUIREMENTS

- A. The direct fixation rail fasteners shall have the following primary functions:
  - 1. Support the running rail and secure it to the concrete trackbed using the minimum number of parts possible.
  - 2. Provide vertical, lateral and longitudinal stability, and provide for vertical and lateral adjustments.
  - 3. Provide a specific longitudinal restraint.
  - 4. Provide electric insulation for the rail, thus isolating it from the concrete trackbed.
  - 5. Isolate vibrations and attenuate noise generated by the moving wheel of the vehicles on the rails.
- B. Fastener and Its Components:
  - 1. The fastener shall be for 115 RE Rail section.
  - 2. The rail hold-down spring clips shall be considered part of the fastener.
  - 3. The body of the fastener is a metal base element and a metal top element with an elastomeric pad bonded between them. Bonding shall occur during the vulcanization process.
  - 4. **The fastener body anchorage assembly shall be comprised of two female type anchorage inserts for embedment into the epoxy grout on a concrete track bed and two anchor bolts for securing the fastener body to the anchor inserts and to the concrete track bed.**  
**The fastener body anchorage design shall not pass through the top plate and shall anchor thru the bottom plate only.**
  - 5. **The rail hold down assemblies shall be designed so that when removed, the rail may be lifted vertically until it is completely free of the rail fastener without disturbing the horizontal or vertical alignment of the rail fastener body.**
  - 6. **The rail fastener body design shall provide on each side of the rail base a positive means of preventing more than 1/8 inch total lateral movement of the rail base relative to the fastener in event of failure or loosening of one or both rail hold-down assemblies.**

The design feature shall be integral cast into the top plate component at a minimum height of 9/32 inches from the top of the rail seat and shall extend across the entire width of the fastener body in the direction longitudinal to the running rail on both field and gage sides.

7. The rail hold-down assembly device shall not be dependent on elastomeric components in torsion.
8. Bonding of any part of the rail fastener to the grout pad will not be permitted.
9. Longitudinal and lateral restraint properties of the rail fastener shall be identical in both directions
10. The stability of the rail fastener in the lateral direction shall not be dependent solely upon the strength of the bond of the elastomer to metal.
11. Molding:
  - a. Contractor's name or trademark shall be molded into the elastomer.
  - b. Each cavity in a mold shall have a cavity identification mark which is molded into the elastomer. If more than one mold is used, then each cavity in a mold shall have a mold identification mark which is molded into the elastomer.
  - c. Each molding cycle which produces one or less fasteners from each cavity in a mold is a heat.
  - d. Consecutive heats from a mold shall be numbered consecutively.
  - e. The elastomer's production batch number and the heat number shall be marked on each fastener in a permanent manner. The marking shall be visible in the installed position.
  - f. The location and method of marking of identification data shall be shown on a shop drawing.
  - g. In an orderly manner, each mold/heat/cavity permutation shall be assigned a unique sequential part number and part numbers shall be assigned to lots.
  - h. A tabulation of lot, part, batch, mold, heat and cavity shall be developed as part of the Quality Assurance Program.
12. Welding shall not be used.
13. The base of the fastener is parallel to the rail seat so as to provide no cant to the rail. The slope tolerance is plus and minus 0.37%. The rail seat area is flat having maximum convexity and concavity of less than 0.001 inch per inch when measured from a straight edge.
14. Anchor bolts
  - a. The fastener includes anchor bolts, 7/8 inch in diameter, for securing the fastener to the concrete trackbed under a tension of 30,000 pounds per anchor bolt.
  - b. The anchor bolts will be threaded into female threaded inserts set in the concrete trackbed.
  - c. Anchor bolts, including washers, and threaded inserts shall be considered parts of the fastener.
  - d. The fastener is also capable of being anchored by placement over 7/8 - inch threaded studs.
  - e. The anchor bolts engage not less than one inch and not more than one and one -half inches of the threaded insert in the installed position.
  - f. Other than the standard protective coating applied by the bolt and insert manufacturers, no oil, sealant or other compound shall be applied to the threads.
15. The bottom of the base element shall be free of elastomer except that minimal flashing will be acceptable providing it does not interfere with retention of proper anchor bolt tension.

16. Except as required to meet other requirements specified herein, elastomer surfaces shall be smooth with a finish and appearance equal to or better than an F-3 designation in accordance with the RMA Handbook.
17. The rail fastener shall be comprised of as few components as is economically and technically feasible for ease of assembly, disassembly and maintenance, and shall be designed to permit installation and replacement of the entire assembly or any of its components by one man using standard, ~~conventional hand tools~~ **by one man using conventional hand tools.**
18. ~~The overall distance between the base of the rail fastener and the base of the rail with the rail fastener in the installed position shall be 1-1/2 inches (desired) with 1-3/8" minimum and 1-3/4" maximum distances.~~
19. ~~When completely assembled, the overall dimension of the rail fastener, including the elastomer, shall stay within a design envelope of 10 inches maximum in width measured parallel to the rail and 18 inches in length measured normal to the rail.~~
20. ~~The fastener body anchorage assembly shall provide for two anchor bolts, each 7/8 inch in diameter, for securing the fastener to the epoxy grout pad and concrete track bed. The anchor bolts shall be symmetrically located as shown in Figure A with respect to the rail fastener body center lines. As shown in **Exhibit A** the anchorage assembly bolts shall be located in the upper right-hand quadrant and low left-hand quadrant of the rail fastener as referenced along the centerline of rail. The rail fastener shall also be designed to be capable of being anchored by placement over existing 7/8-inch threaded stud bolts in lieu of the anchor bolts and female anchor inserts. The adjustment washers shall be designed so that they can be used for either the anchor bolts or the threaded studs.~~
21. ~~The underside of the rail fastener body shall be a flat, continuous plane with no projections below the top of the grout pad.~~
22. ~~No portion of the completely assembled rail fastener, including the rail clips and anchor bolts, shall extend any higher than 3-1/2 inches measured vertically from the base of the rail centerline.~~
23. ~~Recesses in the rail fastener shall be free draining in all positions of lateral adjustment up to a maximum actual superelevation of 4-1/2 inches.~~
24. ~~The rail fastener body shall provide an electrical leakage distance of not less than 1-1/8 inch measured from the grounded portion of the fastener to the charged portion by the most direct path that does not pass through an insulating material. The minimum distance of separation between any point of the top plate to the bottom plate shall be 1/2 inch and shall contain a full and complete section of elastomer material. The entire top and side surfaces of the metal plates of the fastener body shall contain a minimum coating of 1/16 inch, exclusive of the serrated area of the fastener body anchorage location.~~

C. Damping of Force

1. The direct fixation rail fastener shall be designed to provide damping of lateral and vertical forces transferred to anchor bolts
2. The fastener plates shall have full bearing on the elastomer in all positions of lateral adjustment and shall have a means of preventing displacement of the elastomer under operating conditions
3. The stability of the fastener in any direction shall not be dependent solely upon the strength of any bonding of the elastomer to metal.

D. Adjustment Requirement.

1. Lateral Adjustment:
2. ~~The rail fastener shall provide a minimum of plus or minus 1/2 inch rail lateral adjustment in 1/8 inch increments. All lateral adjustment shall be provided at the anchor bolts.~~

The rail fastener body shall provide a means of 1" total lateral adjustment having a range of plus or minus ½ inch via a serrated mechanism at each anchor location. Serration shall be vertical, a minimum of 5/32" high, and integrally cast into the bottom plate. The bottom of the vertical serration shall be raised a minimum of 1/8 inches above the top of the bottom plate. Together with a serrated adjustment washer, the system shall allow adjustment in either lateral direction in increments of 1/8". Friction alone as a means of adjustment will not be permitted. The serration shall have not less than three interlocking serrations engaged in any position of lateral adjustment. The adjustment feature shall be integral with the rail anchorage assemblies.

2. Friction shall not be used as a means for adjustment or for preventing lateral movement.
3. If lateral adjustment employs serrations on any component, each serrated interface shall have at least three engaged serrations. There shall be a minimum of three linear inches of serration engagement per fastener. Serrations shall be machined or cast to a minimum depth of 1/16 inch. Cap plates, if used, shall cover the opening to any ground potential in every position of adjustment and form a reasonable seal to prevent the intrusion of dirt, metallic particles, and other material.
4. Each rail fastener shall be furnished with all components required for all specified increments of lateral adjustment. Components of the rail fastener shall not be replaced or added to the basic configuration in order to laterally adjust the rail.

E. Vertical Adjustment:

1. Vertical rail adjustment capability shall be a minimum of ½ inch in 1/16 inch increments, provided by shims.
2. All requirements of these Specifications shall be satisfied for all increments of fastener adjustment.

## 1.07 FASTENER QUALIFICATION TESTING

A. General:

1. The qualification tests specified herein shall be performed by an independent testing facility approved by the WMATA Engineer and shall be a member of the American Council of Independent Laboratories. Qualification testing may be performed at any test facility, including such facilities at the contractor's plant, provided they meet the approval of the WMATA Engineer and satisfy the requirements of the American Council of Independent Laboratories "Manual of Practice, Quality Control System" - Requirements for Testing and Inspection Laboratory, and ASTM E320. Testing equipment shall be in good repair, of adequate capacity and shall be accurately calibrated. Copies of calibration certificates shall be submitted to the WMATA Engineer. The WMATA Engineer shall be notified not less than 14 days in advance of dates scheduled for quality control tests. All testing shall be performed at no additional cost to the Authority and is to be performed post-award and prior to manufacture of production quantities. Previously approved and supplied product design meeting the requirements of this specification shall be exempt from the Qualification Testing. Production Testing as specified shall be performed.
2. Prior to testing, the Contractor shall submit shop drawings detailing the rail fastener components and a detailed description of the steps required for its complete installation as well as the replacement of individual components. Upon approval by the WMATA Engineer of the shop drawings and installation description, rail fasteners shall be fabricated for testing.
3. Before beginning any tests, a detailed description of all tests shall be submitted to the WMATA Engineer for approval. The description shall completely detail the test procedure and shall include drawings showing the relationship of the fastener and all significant components of the testing equipment, including the test block and anchor bolts.

4. From a lot of not less than twenty standard direct fixation fasteners, sixteen will be selected at random by the WMATA Engineer. If additional fasteners are necessary to meet these test requirements they shall be furnished at no additional cost to the Authority.
5. Each of the fasteners selected for testing shall be carefully measured and examined to determine the compliance with these specifications and the approved shop drawings.  
Upon satisfactory completion of this examination eight fasteners will be retained by the Authority and the remaining eight fasteners shall be returned to the Contractor for execution of the Qualification Performance Tests by an independent laboratory.
6. Except as otherwise specified herein, each test shall be performed on two completely assembled rail fasteners at thirty inch center-to-center spacing, with a section of 115RE rail not less than 42 inches long mounted and clipped thereon. Before assembly, all parts shall be cleaned and dried. The fastener shall be assembled as shown in the approved shop drawings and installation description, and all threaded elements shall be tensioned as specified. The test fasteners shall be mounted on a concrete test block and anchored with 7/8 inch diameter ASTM A325, "Standard Specifications for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength", threaded stud bolts to simulate field installation. The anchorage shall not fail under loadings imposed by any test specified below.
7. The concrete test block shall be reinforced concrete with dimensions as shown on **Exhibit D**.  
The concrete shall have a minimum 28 day strength of 4,000 pounds per square inch as determined by ASTM C39, "Compressive Strength of Cylindrical Concrete Specimens". The reinforcing steel shall be Grade 60 per ASTM A615, "Standard Specifications for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement".
8. Two pairs of threaded stud bolts shall be drilled and epoxied into the concrete test block. The stud bolts shall project 3-1/2 inches out from the top surface of the concrete. The stud bolts shall be positioned as they would be in track for two fasteners 30 inches apart measured parallel to the rail. The holes for the dowels shall be 1-1/8 to 1-3/4 inch diameter and 5-1/2 inches deep. The epoxy to be used shall provide a minimum unrestrained pullout strength of 20,000 pounds. As an alternate, the stud bolts may be replaced with 7/8 inch anchor bolts and female inserts epoxy grouted into the concrete block.
9. Before commencing any tests the rail fastener(s) shall be stabilized at a temperature of 24 degrees C, plus or minus 6 degrees C for a minimum of four hours.
10. Should any fastener assembly fail a test, perform the entire sequence of test on the eight new fastener assemblies. Should a fastener assembly from a sample lot fail a test, the entire lot is rejected and the Contractor is to provide a new random sample lot to the WMATA Engineer, from which a sample of eight fasteners will be returned to the Contractor for testing by the independent laboratory. If the design of the fastener must be modified to pass any test, shop drawings of the new design shall be submitted to and approved by the WMATA Engineer before retesting is continued. Manufacture at least ten fastener assemblies of the new design and perform all tests on the new fastener design. Continue the revision, approval and test cycle until the fastener assemblies are accepted. Four (4) weeks is allotted for redesign, approval, and testing commencement. The Authority reserves the right to terminate the contract for default should the Contractor fail to develop an approved fastener within a reasonable amount of time after award so as to prevent their capability of complying with the delivery schedule.

#### **1.08 ELASTOMER QUALIFICATION TESTING**

1. Each test listed below shall be performed on two specimens.
2. The specimens used for the test shall be certified by the Contractor to have been taken from the production size batch used for making the fastener and to have cured in a manner equivalent to the cure used for the fastener.

3. Prior to the testing, all elastomer specimens shall be conditioned for not less than two days at 23 degree C plus or minus 2 degree C and 50% plus or minus 5% relative humidity
4. Tests performed on specimens are:
  - a. **Hardness Test** - The Durometer A hardness shall be between 45 and 55 as measured in accordance with ASTM D2240, "**Indentation Hardness of Rubber and Plastics by Means of a Durometer**".
  - b. **Tensile Strength and Ultimate Elongation Test** - When tested in accordance with ASTM D412, "**Tension Testing of Vulcanized Rubber**", the tensile strength shall be 2,350 psi or greater and the ultimate elongation shall be ~~500-~~ 400 percent or greater.
  - c. **Compression Test** - The elastomer shall be tested for 22 hours in accordance with ASTM D395, Method B **to determine the percent of compression set**. The test shall be conducted at 70 degree C. And the set shall not exceed 25 percent.
  - d. **Accelerated Aging of Rubber Test** - In accordance with ASTM D573, "**Accelerated Aging of Vulcanized Rubber**", the test sample shall be aged for 70 hours at 70 degree C. The percentage of decrease of tensile strength shall not exceed 25 percent; the percentage of decrease of ultimate elongation shall not exceed 25 percent; and the change in hardness, measured on the Durometer A scale, shall not exceed 10 points.
  - e. **Resistance to Ozone Cracking Test** - Test specimens shall be prepared in accordance with **Procedure A of ASTM D518, "Resistance to Surface Cracking of Stretched Rubber Components"**. The test specimens shall be tested in accordance with ASTM D1149, "**Accelerated Ozone Cracking of Vulcanized Rubber**", at a temperature of 40 degree C and at an ozone partial pressure of 50 mPa. The elastomer shall not exhibit any cracking when examined in accordance with ASTM D1149 at the end of a 100-hour exposure.
  - f. **Compression Set at Low Temperature Test** - When tested at minus 10 degree C for 70 hours in accordance with ASTM D1229, "**Low Temperature Compression Set of Vulcanized Elastomers**", the compression set at 30 minutes after release (t@30 reading) shall not exceed 37 percent
  - g. **Oil Absorption Test** -
    - 1) One test shall be conducted with **IRM 903** (No. 3) oil at 23 degree C for 70 hours. The volume change for the No. 3 oil shall not exceed 60 percent.
    - 2) A second test using a different sample shall be conducted with **IRM 903** (No. 1) oil at 23 degree C for 70 hours in accordance with ASTM D471, "**Change in Properties of Elastomeric Vulcanizates Resulting from Immersion in Liquids**", to determine the volume change of the elastomer. The volume change for the No. 1 oil shall not exceed 10 percent.
  - h. **Adhesion to Metal Test** - This test shall be performed on specimens of elastomer which are to be bonded in the finished fastener in accordance with ASTM D429, **Method A, "Adhesion of Vulcanized Rubber to Metal"**, the failure must be entirely Type R (eg. **Elastomer tears before bond fails**). The metal substrate, preparation, adhesive and bonding process shall be the same as that used for the manufacture of the direct fixation rail fastener.
  - i. **Resistance to Tearing Test** - When tested in accordance with ASTM D624, "**Standard Test Method for Rubber Property - Tear Resistance**", the resistance to tearing shall be not less than 100 pounds per inch.
  - j. **Flame Spread and Smoke Generation Test** - The elastomer shall be tested in accordance with ASTM E162, "**Standard Test Method for Surface Flammability of Materials Using a Radiant Heat Energy Source**", to determine the Flame Spread Index<sub>s</sub>.

The elastomer shall be tested in accordance with NFPA No. 258-1982, Smoke Generated by Solid Materials Test, in both the flaming and nonflaming modes to determine the Smoke Generation Specific Optical Index,  $D_s$ . The elastomer shall not exhibit any flaming drippings when tested. No acceptance criteria are specified for the Flame Spread Index,  $L_s$  and the Smoke Generation Specific Optical Index,  $D_s$ . These indices shall be reported to the Authority for information only.

k. **Electrical Resistivity Test - Prepare a fully assembled fastener and apply 500 V dc. to the rail head for three minutes with all anchor bolts and metal base elements grounded. The elastomer shall be tested and measured in accordance with ASTM D257 "Standard Test Method for D-C Resistance or Conductance of Insulating Materials", to determine the resistivity of the elastomer. Next, remove the fastener from the test block and immerse it in potable water for 70 hours at 70 degrees C. Immediately after removal from the water immersion, without drying and with no portion of the fastener less than 35 degrees C, reinstall the fastener on the test block and test for electrical resistance and impedance. For testing under wet conditions, immerse elastomer in potable water with a resistivity of 1,000 to 1,500 ohm-cm. Adjust resistivity of potable water if required by addition of sodium chloride. The minimum volume resistivity under dry condition shall be  $10^{12}$ -ohm-cm and  $10^{11}$ -ohm-cm under wet condition.**

l. **Water Absorption Test - The elastomer shall be tested in accordance with ASTM D570, "Standard Test Method for Water Absorption of Plastics", to determine the change in weight of elastomer due to absorption of water. Immerse specimens in distilled water for 24 hours at a temperature of 23 degree C prior to testing. The elastomer shall have a maximum increase in weight of 1.0 percent.**

~~5. When tested in a Monsanto Oscillating Disk Rheometer the rheology data shall fall within the limits shown on Exhibit H~~

~~6. When tested with a Fisher-Young Gravitometer, the specific gravity shall be 1.19 plus or minus 0.2.~~

l. **Rheology (Cure and Strength Indicator) Test -**

- 1) Test the elastomer in accordance with ASTM D2084.
- 2) During qualification testing a cure curve shall be developed based on the rheology test results for approval by the WMATA Engineer. Specification limits shall be established at several points along the curve for approval by the WMATA Engineer.
- 3) During production testing the cure curves shall be compared to the qualification test cure curve. The production test curve shall be within the specification limits.

m. **Specific Gravity Test -**

- 1) Test the elastomer in accordance with ASTM D297
- 2) During the qualification testing the specific gravity of the elastomer shall be determined. During the production testing the specific gravity shall be plus or minus 0.02 of the specific gravity determined during the qualification testing.

## **1.09 FASTENER BODY METAL QUALIFICATION TESTING**

A. Prepare three Charpy impact test specimens in accordance with ASTM E23, "Standard Method for Notched Bar Impact Testing of Metallic Materials", from the same metal used for the top and bottom plates of the fastener body. Each metal sample shall have met the minimum impact requirements and be approved by the WMATA Engineer before fastener assembly qualification testing proceeds.

- B. Conduct a Charpy impact test on each specimen at a temperature of 21 degree C in accordance with ASTM E23. The fracture energy shall be greater than three foot-pounds. The test report shall include all the information required by ASTM E23. The fracture energy shall be greater than 3 foot-pounds for irons and 15 foot-pounds for steel.
- C. High Frequency Resonance Test
  - 1. Suspend the top plate with a nylon, hemp, polyethylene or cotton rope, or an elastomer band of sufficient strength to support the top plate without failure. Mount an accelerometer of mass not greater than 0.05 kg at the center of the rail seat area, with an axis of sensitivity normal to the rail seat. The accelerometer signal shall be appropriately conditioned with a charge amplifier or voltage preamplifier and analyzed with a minimum 400 line spectrum analyzer, while striking an end of the top plate with a hammer in a direction normal to the rail seat plane.
  - 2. The frequencies of the top plate's modes of vibration, identified by maxima in the spectrum of the response of the top plate to hammer impacts, shall be greater than 600 Hz.

## 1.10 FASTENER ASSEMBLY TESTING

- A. Test Sequence:
  - 1. Eight (8) complete rail fastener assemblies are required to conduct the tests. Assemble and mount two fasteners on each concrete block designated as A, B, C, and D. The set of fasteners shall be subjected to the following tests as specified below. All fasteners shall be subjected to each of the static tests as specified below:
  - 2. Fasteners A shall undergo the Vertical and Lateral Repeated Load Test and then undergo the Repeated Load Test With One Anchor Bolt. Fasteners A shall then again undergo each Static Test without replacement of any component. For the Longitudinal Restraint Test, the fasteners shall not be disassembled from the rail after the Repeated Load Test with One Anchor Bolt, nor shall the rail hold down assemblies be re-torqued.
  - 3. Fastener B shall be subjected to Dynamic to Static Stiffness Ratio Test, then undergo Heat Aging Process, and then retested through each of the Static Tests without replacement of any component followed by another Dynamic to Static Stiffness Ratio Test.
  - 4. Fasteners C shall be undergo Heat Aging Process and then tested for Uplift Repeated Load Test followed by Corrosion Process. Fasteners C shall then be retested through each of the Static Tests without replacement of any component.
  - 5. Fasteners D shall be tested as specified below for the Push-Pull Test. Fasteners D shall then be retested through each of the tests for Static Tests, without replacement of any component. For the Longitudinal Restraint Test, the fasteners shall not be disassembled from the rail after the Push-Pull Test, nor shall the rail hold down assemblies be re-torqued.
- B.. The sequence shall be performed without replacement of any fastener component. ~~Components may be reset and/or tightened after the Repeated Load Test, Push-Pull Test and Longitudinal Restraint Test.~~
- C. Static Tests:
  - 1. Vertical Load Test - A vertical load increasing in increments of 2,000 pounds to a maximum load of 32,000 pounds shall be applied downward at the center of the rail head midway between the two fasteners and normal to the rail.

The load shall be applied at the rate of not less than 200 pounds per minute nor more than 2000 pounds per minute. For each increment of load the vertical deflection of the rail head shall be measured to the nearest 0.001 inch and recorded. The load shall be removed and the final position of the rail head measured and recorded. The recorded values for vertical load vs. deflection shall be plotted on a graph as shown on Exhibit F.

Acceptance Criteria -

- a. Calculate the fastener stiffness as the slope of a straight line determined by a linear least-squares regression of the load per fastener versus each deflection for load per fastener between 4,000 pounds and 12,000 pounds. The fastener stiffness shall be within 15 percent of 140,000 pounds per inch. The load versus displacement curve shall be within the limits identified in Exhibit F.
- b. The tangent to load-versus-deflection curve at each load between and including 4,000 pounds and 12,000 pounds per fastener shall be within 10 percent of the fastener stiffness determined above. For the purpose of calculation, the tangent to the load versus deflection curve at each deflection,  $X_n$ , and each load,  $P_n$ , are approximated as:

$$(P_{n+1} - P_{n-1}) / (X_{n+1} - X_{n-1})$$

where P is the load at deflection  $X_n$ .

- c. Total deflection of the elastomer at the 15,000 pound load per fastener shall not exceed 25 percent of the uncompressed thickness. After removal of the maximum load, the fastener shall return to within 0.005 inch of its original position within one minute.  
At no time during the tests shall a fastener component exhibit any sign of failure by slippage, yielding, fracture, or bond failure.
- d. Values obtained when this test is repeated, after performance of other tests, shall be within 20 percent of the initial test values.

2. Vertical Uplift Test - A vertical load shall be applied to the center of the rail head midway between the two fasteners and normal to the rail, alternating from a vertical downward load to a vertical upward load. The peak load per cycle shall be increased in increments of 200 pounds each cycle to 4,800 pounds. The loads and deflections shall be continually measured to the nearest 0.001 inch and simultaneously recorded on a load versus time graph and a deflection versus time graph respectively. The load shall be removed and the final position of the rail head measured and recorded. The reaction force to the uplift load shall be applied to the test block on which the fastener is mounted.

Acceptance Criteria - The ratio of the deflection for the total uplift test load to the deflection for the total vertical downward test load shall be between plus 5 percent and plus 135 percent of the deflection for a 4,000 pound downward vertical load as determined from the Vertical Load Test. When the vertical load is continuously varied from vertical downward loads to uplift loads, there shall be no indication of backlash or free play at times when the load or the deflection changes direction. After removal of the maximum load, the rail shall immediately return to within 0.005 inch of its original position. At no time during the test shall any fastener component, including the anchorage to the test block, exhibit any sign of failure by slippage, yielding or fracture.

3. Lateral Load Test - While applying a vertical load of 27,000 pounds downward at the center of the rail head midway between the two fasteners and normal to the rail, a lateral load, increasing in increments of 1,000 pounds to a maximum load of 18,000 pounds, at a rate of 1,000 pounds per minute, shall be applied horizontally to the rail head at a point 0.625 inch below the top of rail at the location of vertical load.

For each load increment, the lateral deflection of the rail head at a point 0.625 inch below the top of rail shall be measured to the nearest 0.001 inch and recorded. The lateral load shall be removed and the final position of the rail head measured and recorded. The recorded values for lateral load vs. deflection shall be plotted on a graph similar to **Figure E**.

---

**Acceptance Criteria** - The lateral load versus deflection curve for each fastener shall lie within the envelope shown on **Exhibit G**. The lateral deflection of the rail head for a lateral load of 4,000 pounds per fastener shall not exceed 0.150 inch. The average lateral deflection at maximum load shall not exceed 0.360 inch. After removal of the load, the difference between the original and final positions of the gauge line shall not exceed 0.062 inch. At no time during the test shall any fastener component exhibit any sign of failure by slippage, yielding or fracture.

4. **Lateral Restraint Test** - A lateral load increasing in increments of 1,000 pounds from zero pounds to 10,000 pounds shall be applied normal to the rail at the base of rail midway between the two fasteners.

The lateral deflection of the rail shall be measured at the intersection of the centerline of the fastener and the gauge line of the rail to the nearest 0.001 inch and recorded after each increment of loading.

**Acceptance Criteria** - At no time during the test shall any component of the fastener show signs of slippage, yielding, or fracture. The difference between the original and final positions of the gauge line shall not exceed 0.062 inch. The lateral deflection of the rail when fully loaded shall not exceed 0.125 inches from original gauge line of the rail.

5. **Longitudinal Restraint Test** - During the longitudinal restraint test, the rail ends shall be supported on a roller or other low friction supports, properly elevated to prevent the longitudinal load from binding the rail in the fastener.

A load shall be applied longitudinally at the centerline of rail at the base of the rail increasing in increments of 500 pounds up to a total of 7,000 pounds or until the rail deflects 0.6 inch from the initial condition, whichever occur first. The rate at which load is applied shall be approximately 1,000 pounds per minute. Each load increment shall be maintained constant at a minimum of 30 seconds or until the longitudinal deflection of the rail ceases before increasing the load to the next increment. For each load the longitudinal deflection of the rail relative to the fastener shall be measured to the nearest 0.001 inch and recorded. The longitudinal load shall be removed at slippage of rail and the final position of the rail measured and recorded. The recorded values for longitudinal load vs. deflection shall be plotted on a graph as shown on **Exhibit H**.

---

**Acceptance Criteria** - The longitudinal load vs. deflection curve, when plotted on **Exhibit H**, shall lie entirely within the shaded area. The difference between the original and final positions of the rail shall not exceed 0.125 inch plus the slippage distance of the rail. At no time during the test shall any fastener component exhibit any sign of failure by slippage, yielding, bond failures or fracture except that slippage which may occur between the rail clip and the rail.

6. **Voltage Withstand Test** - Prepare a fully assembled fastener and apply a DC potential of 15KV between the rail head and the metal base plate of the fastener body for one minute.

Acceptance Criteria - The elastomer shall withstand this test with no visible damage such as splits, cracks, pinholes or fractures, and no evidence of arcing, arc tracking, or other voltage breakdown.

7. Electrical Resistance & Impedance Tests -

a. Electrical Resistance Test - Mount a completely assembled fastener on 1/4 inch thick metallic ground plate sized to extend ½ inch beyond all edges of the fastener.

1) Dry Resistance - 24 hours prior to testing, store the assembled fastener in a clean, dry environment with ambient temperature of 60F to 80F and 50 to 70 percent humidity. Apply 100 volts DC between the rail head and the ground plate for three minutes. Measure the applied voltage and the resulting current flow, or directly measure the resistance with an accuracy of plus or minus two percent.

2) Wet Resistance - Perform this test on the same fastener that passed the Dry Resistance Test. Place the assembled fastener in a nonmetallic trough or suitable container. Size the container such that there is a minimum of two inches between the sides and bottom of the fastener/ground plate assembly and sides and bottom of the container. Pour water into the container to a level midway up to the rail web covering all surfaces of the fastener. Maintain this level of immersion for 10 minutes. The water resistivity shall be 1,000 to 1,500 ohm-cm (use potable water and adjust resistivity by addition of sodium chloride). Drain water from container to a level ½ inch below the ground plate, and without drying or otherwise disturbing the fastener, apply 100 volts DC to the rail head and ground plate and calculate the resistance within 15 seconds. Repeat measurement and calculation every five minutes for the first hour and every ten minutes for the second hour.

3) Electrical Impedance Test - On a fully assembled fastener, apply a potential of 50 volts AC to the rail head for three minutes for each increment of measurement for frequencies from 20Hz to 10kHz, in increments of 20Hz up to 100 Hz, 200 Hz to 1,000 Hz, and 2,000 Hz up to 10kHz. Measure the impedance after three minutes with an accuracy of plus or minus two percent and record for each frequency.

Acceptance Criteria (for Electrical Resistance & Impedance Tests) -

a. Dry DC Resistance - not less than 20 megohms.

b. Wet DC Resistance - not less than one megohms for the average of three consecutive readings within two hours after draining. The difference between each of the three readings and the average reading shall not exceed 10 percent of the average reading.

c. The minimum impedance for any frequency between 100 hz through 10 khz shall not be less than 9,500 ohms.

8. Vertical and Lateral Repeated Load Test - Loads shall be applied to the rail head in such a manner as to produce a vertical downward load of 28,000 pounds, and lateral loads midway between the two fasteners, 0.625 inch below top of rail, of 8,000 pounds to the gauge side of the rail head and 5,000 pounds to the field side of the rail head. The application of the lateral loads shall be alternated, each combined with alternate application and release of the vertical load, a total of three million complete cycles. Application of the field side load and then the gauge side load with two applications of the vertical load constitutes one cycle.

The frequency shall be regulated to prevent the temperature of the components from exceeding 70 degree C. Re-torquing of threaded elements subsequent to the completion of 500,000 cycles of loading will not be permitted without the written approval of the WMATA Engineer.

---

Acceptance Criteria - The fastener shall withstand the three million cycles of load application with no evidence of failure by slippage, yielding, wear, grooving or fracture at any time during the test.

9. Repeated Load Test with One Anchor Bolt - After completion of the Vertical and Lateral Repeated Load Test, the fastener shall be reassembled as specified using only the original components previously subjected to testing. The Vertical and Lateral Repeated Load Test shall then be repeated with a minimum of 15,000 cycles with the gauge side anchor bolt loosened to a minimum of 1/4 inch gap.

---

Acceptance Criteria - The fastener and concrete block shall withstand the 15,000 cycles of loading with the gauge side anchor bolt loosened with no evidence of failure by slippage, yielding or fracture.

10. Heat-Aging Process - Fully assemble a fastener as specified above except the anchor bolts need not be installed and age the fastener in an air oven for a period of 166 hours at a temperature of 70 degree C using the aging methods specified in ASTM Designation D573, "Accelerated Aging of Vulcanized Rubber by the Oven Method". This is a conditioning process for the fasteners that will be further tested as indicated in **Exhibit E**.

11. Corrosion Process - Expose the fastener body, without loose components, to a five percent solution in accordance with ASTM B117, "Standard Test Method for Salt Spray (Fog) Testing", for 500 hours. This is a conditioning process for the fasteners that will be further tested as indicated in **Exhibit E**.

12. Uplift Repeated Load Test - The rail fasteners, fully assembled as specified above, shall have loads applied to the rail head in such a manner as to produce alternating vertical downward load of 20,800 pounds and a vertical upward load of 4,800 pounds at the centerline of the rail and midway between the two fastener normal to the rail. The application of the two vertical loads shall constitute one complete cycle and shall be applied for a minimum of 1.5 million cycles. The frequency shall be regulated to prevent the components' temperature from exceeding 70 degree C. Retorquing threaded elements subsequent to completion of 500,000 cycles of loading will not be permitted.

Acceptance Criteria - The fastener shall withstand 1.5 million complete cycles of load application with no evidence of failure. Upon visual inspection, no component of the fastener, shall exhibit any evidence of failure by yielding, slippage or fracture.

The rail shall exhibit no evidence of wear or grooving that would contribute to a failure of the rail under operating conditions.

13. Push-Pull Test - During the Push-Pull Test, the rail ends shall be supported on rollers or other low friction supports, properly elevated to prevent the longitudinal load from binding the rail in the fasteners. A cycling longitudinal load shall be applied to the centroid of the rail at one end to deflect the rail plus and minus 3/4 inch about the initial position for a total of 50 cycles.

Immediately afterward, a cycling load equal to 80% of the ultimate slippage loads as recorded in the longitudinal restraint test shall be applied for a total of 25,000 pushing and pulling cycles. Repositioning of the rail clips at anytime will not be permitted.

Acceptance Criteria - The fastener shall withstand 25,000 cycles of loading with no evidence of failure. Upon visual examination, no component of the fastener, shall exhibit any evidence of failure by yielding slippage or fracture, except that slippage may occur between rail clips and rail but not between rail clips and the fastener body.. The rail shall exhibit no evidence of wear or grooving that would contribute to rail failure under operating conditions.

14. Dynamic to Static Stiffness Ratio Test - Using the same assemblage as noted in the Vertical Load Test, Apply an oscillating downward load at the centerline of the rail head and the centerline of the fastener so as to produce a sinusoidal load alternating between 8,000 and 18,000 pounds at a rate of between 10 and 20 hertz.

Continuously record the load and deflection versus time on a high speed oscillograph or high speed digital recorder. After a minimum of 1,000 cycles, determine the dynamic stiffness from the ratio of peak-to-trough force to peak-to-trough deflection from the recorded data.

Between five to ten minutes after completion of the dynamic stiffness measurement and removal of all load , apply a vertical load beginning at zero pounds and increasing in 2,000 pound increments to a maximum of 20,000 pounds, at a rate not less than 200 pounds per minute nor more than 2,000 pounds per minute, at the centerline of the fastener assembly. For each increment of load between 2,000 and 20,000 pounds, record the vertical deflection of the rail head to the nearest 0.001 inch. The static stiffness of the fastener shall be the difference in load divided by the difference in deflection between 8,000 and 18,000 pounds.

---

Acceptance Criteria - The dynamic stiffness shall not exceed 1.5 times the static stiffness.

## 1.11 DELIVERY, HANDLING AND STORAGE

- A. Fasteners shall be packed and shipped in a manner that shall prevent a load on any fastener from exceeding 1,000 pounds.
- B. Fasteners shall not be stored by the Contractor in a wet location or where the ambient temperature will exceed 120 degree F.
- C. Fasteners shall be packaged on wood pallets and wrapped in minimum 6 MIL plastic to permit outdoor storage in a secured area. Rail hold-down assemblies, shoulders, bolts, nuts and other loose items shall be packaged by component type in secure shipping kegs or boxes and clearly identified. The method and materials of packaging shall be submitted for approval by the **WMATA** Engineer.
- D. The Contractor shall replace all fasteners damaged during packaging, pre-delivery storage and shipping without additional cost to the Authority.
- E. Fasteners shall be delivered FOB to Authority furnished storage sites **as directed by the WMATA Engineer to the Washington Metropolitan area**. Unloading and final storage will be by others. Provide the **WMATA** Engineer two weeks notice prior to any fastener delivery.

- F. Fasteners used in the production quality control testing shall be packed and labeled separately from the rest of their lot.

**PART 2 - PRODUCTS**

**2.01 MATERIAL REQUIREMENTS**

~~A. Fastener components shall comply with the following material requirements:~~

- ~~1. Metal Plate
 
  - ~~a. The top, bottom and cover plates shall be metal castings of grade 65-45-12 ductile iron per ASTM A-536.~~
  - ~~b. The chemical composition shall meet the acceptable level per SAE J434.~~
  - ~~c. The Brinell hardness in accordance with ASTM E-10 shall be within 156-217 BHN range per SAE J434. The microstructure shall be within limits set by SAE J434. The fracture energy at 21.1C in accordance with ASTM E-23 shall be greater than 3 foot-pounds.~~
  - ~~d. The test report shall include all information listed in paragraph 12 of ASTM E E23.~~~~
- ~~2. Elastomer: Elastomer shall be a blend of 85% natural rubber and 15% chloroprene and shall comply with the following requirements:-~~

**A. Fastener Body:**

- 1. Metal Components:**
  - a. Both the metal top plates and bottom plates shall be one-piece ductile iron. The minimum thickness of the top plate shall be ½ inch and 3/8 inch for the bottom plate.**
  - b. The ductile iron castings shall be minimum Grade 65-45-12 in accordance with ASTM A536, "Standard Specifications for Ductile Iron Castings". The chemical composition shall meet the acceptable level per SAE J434, "Automotive Ductile Iron Castings". The Brinell hardness when tested in accordance with ASTM E10, "Standard Test Method for Brinell Hardness of Metallic Materials", shall be within 156-217 BH range per SAE J434.**
- 2. Elastomer:**
  - a. The minimum thickness of the elastomer between the top plate and the bottom plate parallel to the rail seat shall be ½ inch .**
  - b.. The elastomer shall be neoprene or natural rubber or a blend of neoprene and natural rubber.**
- 3. Manufacturing Tolerances:**
  - a. Manufacturing tolerances for the fastener shall be as shown in Table 1.**

<b>Table 1 - Direct Fixation Fastener Manufacturing Tolerances</b>	
<b>DIMENSION</b>	<b>TOLERANCE</b>
Length and width	Plus or minus 1/8 inch
Height	Plus or minus 1/32 inch
Squareness	All angles within plus or minus 1/32 inch
Centering of holes	Plus or minus 1/32 inch
Diameter of holes	Plus or minus 1/32 inch
Durometer Shore A	Plus or minus 5

Serration depth	Plus or minus 1/64 inch
Serration spacing	Plus or minus 1/64 inch
Width between shoulders at rail base	Plus 1/16 inch or minus zero inch

B. Rail Hold Down Assembly: Rail clip shall be a resilient spring clip type such as the Pandrol e-2056 (left handed) and as specified herein. Spring-wedge type rail clips will not be permitted. Rail clip shoulder shall be cast as integral part of the metal top plate. Welding of the rail clip shoulder to the top plate will not be permitted.

1. Materials - Rail clips shall be forged from alloy steel bars and heat treated to achieve the minimum spring action holding power as specified herein.
2. Minimum Design Criteria:
  - a. Clips must be one piece, threadless and detachable.
  - b. There shall be two clips to each complete rail fastener assembly.
  - c. Holding force shall be generated by spring action.
  - d. Surface hardness of clips shall be between 44 and 48 HRC.
  - e. The range of vertical hold down force (toe load) per clip shall be between 2,100 and 3,000 lbs. with a total force range of 4,200 to 6,000 lbs. per rail seat.
  - f. The minimum static longitudinal slip per complete rail fastener assembly, with two clips shall be 3,000 lbs.
  - g. Field installation and removal of clips shall be accomplished by one man using standard track tools or by commercially available equipment.
  - h. Clip shall be proven design and produced by an ISO 9000 certified manufacturer with a minimum of ten years documented in-track experience in the United States.

C. Rail Anchorage Assembly - Anchor bolts shall be 7/8 inch diameter, carbon steel, electroplated with zinc in accordance with ASTM B633, Type II, SC 4.

~~D. Clip bolts shall be heavy hex structural, Type 3, ASTM A325.~~

- ~~1. The one sixteenth inch shims shown on **Exhibit D** shall be made of steel and shall provide full bearing support to the bottom of the fastener.~~
- ~~2. Rail clip shall be in accordance with AISI 5160 and shall have a Rockwell hardness between 44 degree C and 48 degree C in accordance with ASTM E18.~~

## ~~2.02 STIFF DIRECT FIXATION FASTENER SYSTEM~~

~~A. The Stiff Direct Fixation Fastener System shall consist of the following components:~~

- ~~1. Fastener body (elastomeric tie plate), part number J-16281-1 as manufactured and previously supplied to WMATA by Lord Corporation, Erie, PA.~~
- ~~2. Pandrol Slip in Shoulder as manufactured and previously supplied to WMATA by Pandrol, Inc. and shown on their Drawing No. 5705, "Cast Shoulder to Suit Lord Plate" for 115 RE Rail, two per fastener body.~~
- ~~3. Pandrol Spring Clip, Type PR602A, two per fastener body.~~
- ~~4. Anchor bolt, heavy hex structural, Type 3, ASTM A325 7/8" - 9 x 3 - 1/4", two per fastener body.~~
- ~~5. Washer, hardened weathering steel, ASTM F436, 2" O.D., 0.94" I.D. and 1/8" thick, two per fastener body.~~
- ~~6. Anchor insert as specified in Section 05653, Direct Fixation Track Construction, 2.01.C.1, two per fastener body.~~

## 2.02 VIBRATION ATTENUATING DIRECT FIXATION FASTENER (EGG TYPE)

- A. The Vibration Attenuating Direct Fixation Fastener or egg-type fastener shall be manufactured by Advanced Track Products, Inc. (ATP), and previously supplied to the Authority or an approved equal.
- B. In addition to being highly resilient, the fastener must provide:
  - 1. Vertical and lateral stability to the rail
  - 2. Longitudinal restraint to the rail
  - 3. Electrically isolate the rail from the trackbed
  - 4. Satisfactory service life comparable to that expected of standard direct fixation fasteners.

~~2.03 ELECTRICALLY INSULATED BALLASTED TRACK FASTENERS (EIBTF)~~

- ~~A. Electrically Insulated Ballasted Track Fasteners (EIBTF) shall be as manufactured by L. B. Foster, Co., and previously supplied to the Authority, or an approved.~~
- ~~B. Fasteners include fastener bodies, rail clips and screw spikes.~~

~~2.04 F-17 DIRECT FIXATION FASTENER~~

- ~~A. As applicable, and if specified, the Standard Fastener F-17 design shall be as shown on the Contract Drawings.~~

**PART 3 - EXECUTION**

**3.01 FASTENER TESTING - SOURCE QUALITY CONTROL**

- A. Test Plan:
  - 1. Tests specified herein shall be performed in accordance with the approved test plan.
  - 2. The Contractor shall notify the **WMATA** Engineer fourteen days in advance of the commencement of testing including preparation of the test equipment for testing.
  - 3. Testing shall be performed in the presence of the **WMATA** Engineer unless otherwise approved in writing by the **WMATA** Engineer.
- B. Starting Tests and Procedures:
  - 1. After a test sequence is begun, it shall be completed.
  - 2. In the event of failure of a test rig component, the **WMATA** Engineer shall determine if the failure was attributable to the fastener.
  - 3. If the fastener did contribute to the failure, or if there is doubt, then, with the approval of the **WMATA** Engineer, the testing shall cease and the test report shall be submitted with all findings.  
If the fastener did not contribute to the failure, the component shall be replaced and the testing continued.
- C. Configuration for Testing:
  - 1. Testing Setup and Preparation:
    - a. Except for specific tests noted herein, ~~four~~ **eight** fasteners complete with the modified rail section, as shown in ~~Exhibit C~~ **Exhibit A** and of length as determined ~~from Exhibit D~~, shall be used.
    - b. Before assembly, the fasteners shall be clean and dry.

- c. The fasteners shall be spaced one inch apart.
  - d. The fasteners shall be mounted and anchored on a test block and the spring clips shall be positioned to hold the modified rail section.
  - e. The anchor bolts shall be torqued to 300 foot-pounds.
  - f. All reactions to load shall be through the fasteners to the test block.
  - g. The test block shall be of reinforced concrete with female threaded inserts cast or set on it to receive the 7/8-inch fastener anchor bolts. The top surface of the test block shall be a flat plane with a wood float finish and with the face of the inserts set parallel to the surface with a tolerance of plus zero above and minus 1/32-inch below the surface.
    - 1) Concrete: The strength of the concrete shall be 4,000 psi as determined from standard test specimens taken in accordance with ASTM C31 and ASTM C172 and cured and tested in accordance with ASTM C39. Rebar shall be placed as shown in Exhibit D.
    - 2) Inserts:
      - a) Inserts shall be of corrosion resistant steel threaded to 1-1/2 inch depth to receive ASTM A325 7/8-inch bolts and shall meet 40,000-pound bolt load.
      - b) Washer face bearing of the insert against the fastener shall be equal to the bearing area of an A563 heavy nut for 7/8-inch bolt.
      - c) Length and anchorage configuration shall withstand 12,000 pounds unrestrained pullout and resist 250 foot-pounds torque without yielding.
      - d) Inserts shall be coated with an epoxy resin insulating coating, 100-percent dry powder epoxy resins, Scotch Kote Brand Protective Resins No. 203, Minnesota Mining and Manufacturing Company; Corvel Epoxy ECB-1363A, Polymer Corporation; or equal.
  - 2. Instrumentation:
    - a. Instrumentation for all required deflection and rotation measurements shall be designed so as to measure each rail motion parameter relative to the test block.
    - b. Each instrument shall be designed to measure the motion intended with minimum effects on the data from other motions.
- D. Temperature: Before commencing, and during all tests, the fastener shall be stabilized at an ambient temperature of 22 degrees C, plus or minus 5 degrees C unless otherwise specified.

~~E. Spring Rate and Deflection Test:~~

~~1. The set of fasteners shall be tested as follows:~~

- ~~a. The four fasteners shall be loaded and have the deflections measured as shown in Exhibit D. The modified rail section shall be instrumented for rotation about its longitudinal axis. The total vertical and lateral response loads will be the sum of the load values measured on the two vertical and lateral load cells between the loading rams and the load points. Exhibit E shows the vertical and lateral response loading as a function of time. The vertical load points shall be loaded equally with a vertical load that varies as shown by Curve V. The occurrence of one wave as shown by Curve V shall be considered as one cycle. The lateral load points shall be loaded equally with a lateral load that varies as one cycle. The lateral load points shall be loaded equally with a lateral load that varies as shown by Curve L. The~~

vertical and lateral loads shall occur simultaneously as shown in **Exhibit E**. The direction of the lateral load shall reverse, as shown by Curve L and Reverse Curve L in **Exhibit E**, with every cycle. There may be a no-load pause between cycles of no longer than one half of the cycle length.

b. The fasteners shall be pre-loaded with 1,000 cycles of Case 1 loading. After the pre-load cycles, the instruments used to monitor deflection and rotation shall be zeroed in a no-load condition. Then the Case 1 loading shall be cycled 10 times during which data of vertical and lateral loads, deflections and rotation as functions of time shall be analog graphs shall be recorded directly from the instrumentation's output signal. At the completion of the 10 cycles the load shall be removed and data shall be continuously collected for one minute after the loads are removed.

c. The test data shall be presented in both analog and digitized form. The analog graphs shall be drawn at a rate of not less than 100 mm per second during the 10 cycles and not less than one mm per second during the one minute period after the loads are removed. The vertical scale shall be set to make full use of a strip chart which is at least 40 mm wide per channel. Analog graphs of loads (for each load cell), deflections (for each deflection) and rotations at each end shall include calibration (scales) and annotation which fully describe the graphs. Digitized data shall show vertical and lateral fastener loads, average vertical deflection, average lateral deflection at base of rail, and average rotation values at every 0.01 seconds for each cycle and at one minute of rest after release of the loads. The fastener load shall be computed as one fourth of the total response load. The digitized data may be a computer printout formatted similar to **Exhibit F**. The lateral deflection to be reported in **Exhibit F** is the average value at the base of the rail.

d. All deflection and rotation instrumentation shall measure, relative to the test block, to the nearest 0.001 inch and 0.02 degrees, respectively. The instrumentation for measuring the response loads (the total load applied to all four fasteners) shall have an accuracy of plus and minus two percent or plus and minus 50 pounds whichever is larger. The test operator shall perform the tests so that the instrumentation indicates that the response load is within plus and minus 100 pounds of the specified loads.

e. The fastener shall also be tested as in the preceding steps a. through d. with the loads shown for Case 2 on **Exhibit E**.

2. Fastener Test Set to Satisfy Acceptance Criteria: Each fasteners in a four fastener test set shall satisfy the following acceptance criteria:

a. The fastener shall demonstrate response repeatability for each loading case. Repeatability shall be demonstrated if the deflections for a fastener at each load level indicated by the lettered points on Curves V and L do not vary by more than plus or minus 0.002 inch or plus or minus seven percent whichever is larger, from the average for the 10 cycles. Once repeatability has been demonstrated, the fifth cycle of the 10 recorded shall be chosen from each of the loading cases for further analysis as follows:

b. For each case, the spring rate for the fastener shall be determined from the maximum downward vertical fastener load (first occurrence of Point B; **Exhibit E**, Curve V) and the downward vertical fastener deflection which occurs at that time. The average spring rate for the four fasteners shall be between 90,000 and 100,000 pounds per inch.

c. The digital data shall be grouped into increments in the following manner:

1) Vertical:

a) Three equal time increments from zero deflection near 0.20 seconds to peak deflection near Point B (**Exhibit E**, Curve V) at 0.36 seconds.

b) One increment from peak deflection near Point B (**Exhibit E**, Curve V) at 0.36 seconds to peak deflection near Point

- ~~c) One increment from peak deflection near Point C (**Exhibit E**, Curve V) at 0.43 seconds to peak deflection near Point B (**Exhibit E**, Curve V) at 0.50 seconds.~~
- ~~d) Three equal time increments from peak deflection near Point B (**Exhibit E**, Curve V) at 0.50 seconds to zero deflection near 0.66 seconds.~~
- ~~2) Lateral:~~
  - ~~a) Three equal time increments from zero deflection near 0.20 seconds to peak deflection near Point E (**Exhibit E**, Curve L) at 0.36 seconds.~~
  - ~~b) Two equal time increments from peak deflection near Point E (**Exhibit E**, Curve L) at 0.36 seconds to Point F (**Exhibit E**, Curve L) near 0.50 seconds.~~
  - ~~c) Three equal time increments from Point F (**Exhibit E**, Curve L) at 0.50 seconds to zero deflection near 0.66 seconds.~~
- ~~3) Incremental Spring Rates:~~
  - ~~a) Linear regression shall be used to determine the incremental fastener spring rate for each increment fastener spring rate for each increment as previously defined. The incremental spring rates shall be shown **Exhibit F**. The minimum incremental spring rate shall not be less than 80 percent for vertical and 70 percent for lateral of the maximum incremental spring rate for the first three increments beginning near 0.20 seconds. The criteria shall be applied individually to both the vertical and lateral data for Cases 1 and 2.~~
- ~~d. The vertical deflection at Point A on Curve V for Cases 1 and 2 shall not be less than 0.000 inches and shall indicate a deflection in the up direction.~~
- ~~e. Maximum elastomer compressive and shear strains shall not exceed 25 percent and 50 percent respectively for Case 1 shown on **Exhibit E**.~~
- ~~f. The peak average lateral deflections measured six inches above the rail base for Case 2 shall be between 0.322 and 0.344 inches and for Case 1 shall be between 0.186 and 0.228 inches. The maximum angle of rotation of the modified rail section about the longitudinal axis shall not exceed 0.5 degree for Case 1.~~
- ~~g. After completion of the loading cycles and with one minute of rest with no load, the vertical deflections shall not exceed 0.005 inch and the average lateral deflections at both the rail base and six inches above the base shall not exceed 0.01 inch.~~
- ~~h. The rail base shall remain in full contact with the rail seat of the fastener during the cycling.~~
- ~~i. The analog data shall show uniform deflection and load indicating no free play.~~
- ~~j. At no time during the test shall any fastener component, including the anchorage to the test block, exhibit any sign of failure by slippage, yielding or fracture. Analog data shall be reviewed for indications of slippage, yielding or fracture.~~
- ~~k. When this test is repeated in the test sequence the deflections shall not have increased by more than 10 percent and the spring rate shall not have decreased by more than 10 percent from the initial performance.~~

F. Longitudinal Restraint Test:

- ~~1. On a set of fasteners for the "first loading" a load shall be applied longitudinally to the rail, at the intersection of the rail centerline and the bottom of the base of the rail, with increasing increments of 1,000 pounds until the rail deflects 1.0 inch from the initial~~

condition relative to the test block. For each load, the longitudinal deflection relative to the test block for the rail and each fastener shall be measured to the nearest 0.001 inch and shall be recorded. The longitudinal load shall be removed and the final position (after one minute) of the rail and of each fastener shall be measured and recorded. After resetting the deflection gauges to zero the test shall be repeated in the opposite direction for the "second loading". For each direction the recorded values for longitudinal load versus rail deflection and average fastener deflection shall be plotted on a graph as shown in **Exhibit G**. Deflection gauges shall be zeroed with no load applied to the rail (the original position). Each load increment shall be maintained constant within plus or minus two percent of nominal or plus or minus 50 pounds, whichever is greater, until the longitudinal deflection of the rail ceases before the data is read and recorded. The longitudinal deflection shall be determined as having ceased when the deflection rate is less than 0.001 inch per 30 seconds:

2. ~~Test Acceptance Criteria:~~

- a. ~~For the "first loading", the longitudinal load versus rail deflection curve, when plotted in **Exhibit G**, shall lie entirely within the limits defined by the "Upper Limit" and the "Lower Limit, First Loading".~~
- b. ~~For the "Second Loading" the "Upper Limit" and the "Lower Limit", Second Loading" limits shall be used~~
- c. ~~The slippage between the rail and fastener shall not occur prior to 0.15 inches of rail deflection relative to the test block.~~
- d. ~~The difference between the original and final average fastener deflections shall not exceed 0.125 inch.~~
- e. ~~At no time during the test shall any fastener component exhibit any sign of failure by slippage, yielding, or fracture, except that slippage which may occur between the fastener and the rail.~~

G. ~~Electrical Resistance Test:~~

1. ~~Fasteners and All Components:~~

- a. ~~Each of the four fasteners with all components shall be immersed for 70 hours in boiling distilled de-ionized water. The fasteners shall be fully enveloped in the boiling action.~~
- b. ~~After removal from the water, with surface air drying and with the fastener at a temperature in the range of 29 deg. C plus or minus 6 deg. C, each fastener shall be installed separately on test block, with a 0.25 inch thick steel ground plate dimensioned large enough and situated to extend a minimum of 0.25 inches beyond the periphery of the fastener and located between the fastener and the test block, and tested for electrical resistance.~~
- c. ~~With both anchor bolts of a fastener grounded to the ground plate, 100 volts dc shall be applied between the rail head and the ground plate for three minutes. The actual current flow shall be measured to the nearest 0.1 microampere and recorded.~~
- d. ~~Then 1,000 volts dc shall be applied between the rail head and ground plate for two hours, after which 100 volts dc shall be applied again for three minutes and the actual current flow shall be measured, as above, and recorded.~~
- e. ~~A potential of 50 volts RMS ac shall be applied between the rail head and ground plate for three minutes for each increment of measurement for frequencies from 20 Hertz to 10 kilohertz in increments of measurement of 20 Hz up to 100 Hz; 200 Hz up to 1 kHz; and 2kHz up to 10 kHz. The impedance after three minutes after three minutes shall be determined with an accuracy of plus or minus two percent and recorded for each frequency.~~

2. ~~Acceptance Criteria:~~

- a. ~~The maximum current for 100 volts dc shall be 1.0 microampere.~~
- b. ~~The minimum impedance for any frequency with 50 volts RMS ac shall be 10,000 ohms.~~

~~II. Repeated Load Test:~~

- ~~1. The test fasteners shall be loaded and instrumented as described for the Spring Rate and Deflection Test except that in **Exhibit E** (2 of 2), Cases 4 and 5 shall be used and the direction of the lateral load, Curve L, shall not be reversed at any time. The direction of the lateral load relative to the fasteners shall be the same for both cases.~~
- ~~2. No adjustments (re-torquing, re-application or resetting) of any component during this test shall be made without approval from the Engineer. All adjustments shall be reported.~~
- ~~3. For every two cycles of testing each case shall be cycled one time. Each case shall be cycled a total of 90,000 cycles. The analog and digital instrumentation and recording devices for the lateral and vertical response loads and deflections shall be operative and used to monitor the test. At 10,000 and 179,000 total cycles, 100 continuous cycles of vertical and lateral response loads and deflections shall be recorded as analog load data and shall be reported in the test report. Of the 100 cycles, one sample of each of the two cases shall be digitized in increments of 0.01 seconds and reported in the test report as shown in **Exhibit F**. The digitized data may be formatted similar to **Exhibit F** with a computer printout.~~
- ~~4. Acceptance Criteria:
  - ~~a. At no time during the test shall any fastener component, including the anchorage to the test block, exhibit any sign of failure by slippage, yielding or fracture.~~
  - ~~b. More than a 10 percent increase in deflection or decrease in spring rate during the test is a sign of failure.~~
  - ~~c. The final anchor bolt~~
  - ~~d. torque shall not be less than 290 foot-pounds for any bolt.~~
  - ~~e. On the end of the fastener from which the maximum lateral load is directed, the elastomer shall be free of blemishes and blisters.~~
  - ~~f. On the other end, a surface blister or blemish no longer than 3/4 inch in length is acceptable and in the cut out region parallel to the rail, for the shimmed fasteners only, tears may occur with a maximum depth of 5/16 inch.~~
  - ~~g. Bottom holes shall be free of all tears.~~~~

~~I. Push-Pull Test II~~

- ~~1. Application of Cyclical Longitudinal Load
  - ~~a. A cyclical longitudinal load shall be applied at the rate of one cycle per second to the base of the rail at the rail centerline to slip the rail relative to the top metal element plus and minus 1/2 inch about the initial position for a total of 2,000 cycles. A different cycle rate may be submitted for approval.~~
  - ~~b. No adjustment (retorquing, re-application or resetting) of any component during the cycling shall be made without approval of the Engineer. All adjustment shall be reported.~~~~
- ~~2. Acceptance Criteria:
  - ~~a. At no time during the test shall any component of the fastener shown signs of failure by yielding, fracture or slippage except for slippage of the rail relative to the fastener.~~
  - ~~b. The rail shall exhibit no evidence of wear, polishing, or grooving that would contribute to rail failure under operating conditions.~~
  - ~~c. Minor polishing or grooving due to removal of mill scale and surface irregularities that occurs due to the slippage of the rail through the fastener will not be cause for rejection subject to approval by the Engineer.~~~~

**E. Production Quality Control:**

1. General - Following successful completion of the qualification tests, acceptance of the qualification test reports by the WMATA Engineer, and start of the fastener assembly manufacturing, Production type quality control sampling and testing shall be conducted and performed by an independent testing facility approved by the WMATA Engineer and shall be a member of the American Council of Independent Laboratories. Elastomer samples and fastener assemblies shall be selected from regular production and subjected to testing to ensure that high quality standards are maintained and that design requirements set forth in these specifications are met through the completion of the production process.
2. Production Elastomer Tests -
  - a. Samples of elastomer from every mixed batch of material used in the manufacture of production fastener shall be tested to verify compliance of the elastomer batch mix with the following testing requirements:
    - 1) Hardness Test
    - 2) Tensile Strength and Ultimate Elongation Test
    - 3) Specific gravity : and
    - 4) Cure Characteristic in accordance with ASTM D2084 or an equivalent industry accepted standard.
  - b. Certificate of Compliance from the supplier of the elastomer shall be submitted to the Engineer guaranteeing compliance of the elastomer with requirements of these specifications.
3. Fastener Assembly Tests
  - a. Production quality control testing of fasteners shall be performed on two (2) fasteners from the first 50 fasteners and on two (2) fasteners from each production lot. A production lot is defined as a quantity of manufactured and completed fasteners produced in a continuous run, but not to exceed 5,000 units. As requested, fasteners may be selected for testing by the WMATA Engineer. Permanently mark the fasteners used for production testing and meeting all test requirements as production test fasteners and deliver fasteners to the Authority. These fasteners shall be subjected to the following tests:
    - 1) Vertical Load Test
    - 2) Vertical Uplift Test
    - 3) Lateral Load Test
    - 4) Lateral Restraint Test
    - 5) Longitudinal Restraint Test
    - 6) Voltage Withstand Test
    - 7) Electrical Resistance Test
    - 8) Vertical and Lateral Repeated Load Test (500,000 cycles)
  - b. The configuration for testing and the acceptance criteria shall be as specified above, and the value obtained for the slope of the load-deflection curve in the Vertical load Test shall be within 20 percent of that obtained in the original compliance testing.
  - c. The quality control tests shall commence no later than fourteen days after fabrication of the fastener. Should any fastener fail to meet the test requirements, two additional fasteners from that same production lot shall be tested. In the event any of the two additional fasteners fail, 100 percent of the remainder of the lot shall be rejected or tested and only those successfully passing all tests shall be incorporated in the final delivered quantity.
  - d. In addition to the quality control tests and at the discretion of the WMATA Engineer, all components of the rail fasteners shall be subjected to full or partial testing for compliance with these specifications.

The cost of all such additional testing required by the WMATA Engineer

for any component that is proved to comply with these specifications will be at the expense of the Authority. The cost of all such additional testing of any component that is proven not to comply with these specifications shall be at no expense to the Authority.

- e. Production quality control testing may be performed at any test facility, including such facilities at the contractor's plant, provided they meet the approval of the WMATA Engineer and satisfies the requirements of the American Council of Independent Laboratories "Manual of Practice, Quality Control System" - Requirements for Testing and Inspection Laboratory, and ASTM E320. Testing equipment shall be in good repair, of adequate capacity and shall be accurately calibrated. Copies of calibration certificates shall be submitted to the WMATA Engineer. The WMATA Engineer shall be notified not less than 14 days in advance of dates scheduled for quality control tests.
  - f. Two copies of the results of all tests shall be submitted to the WMATA Engineer within seven days after performance of the tests.
4. Acceptance - Final acceptance of production lots of direct fixation rail fasteners will be based upon the fastener and all its components complying with these specifications as determined by the WMATA Engineer, based on the results of the quality control tests and the certified statements submitted to the WMATA Engineer by the Contractor.

### **3.02 APPROVAL**

- A. General - Prior to approval of the rail fastener, the Contractor shall submit to the WMATA Engineer the following:
  - a. Six copies of both the approved shop drawings of the fastener. This information shall give special attention to torquing of bolts, use of gauges (if required), setting of lateral adjustment devices, and other details of assembly that may not be readily apparent from the shop drawings of the fastener.
  - b. Three rail fasteners complete with elastomer and all hardware as specified herein.
  - c. Six copies of certified statements describing the chemical composition of all elastomer components of the rail fastener.
  - d. Six copies of a certified laboratory report of the results of all Qualification tests specified herein.
- B. Alteration of Rail Fasteners - After approval of the rail fasteners by the Authority, no change in the design or manufacturing process shall be made without the written approval of the WMATA Engineer. The WMATA Engineer, at his discretion, may require the testing, certification, and approval of any altered rail fastener at no additional cost to the Authority. All production of rail fasteners which have not been approved by the Authority shall be at the Contractor's risk.

## **PART 4 - MEASUREMENT AND PAYMENT**

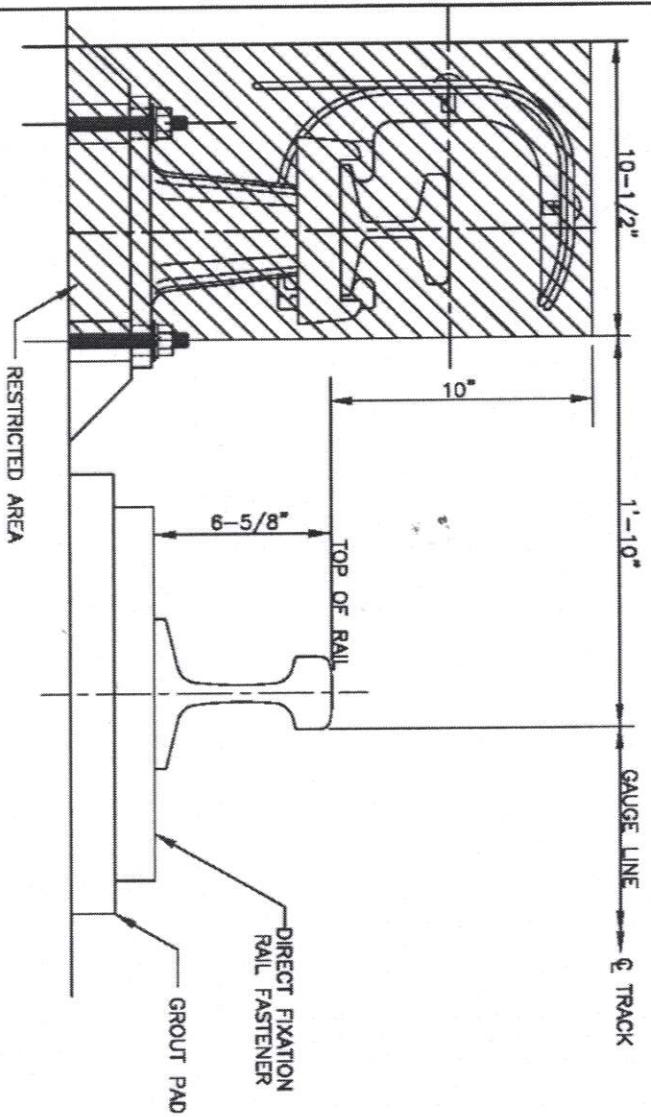

### **4.01 MEASUREMENT**

- A. Measurement of work specified in this section will be made in the following manner:
  - 1. No separate measurement.

**4.02****PAYMENT**

- A. Compensation for work specified in this Section will be made in the following manner:
  - 1. Included in the price of the work of which it is a part.

## SECTION 05658

### TRACK APPURTENANCES AND OTHER TRACK MATERIAL

#### PART 1 - GENERAL

##### 1.01 SUMMARY

- A. This Section specifies **designing, fabricating, testing and furnishing** of track appurtenances. The Work specified herein consists of furnishing and installing bonded standard joints, bonded insulated joints, bumping posts, tie plates with resilient rail clips, spikes, tie plugs, emergency guard rail, derail, switch stand, and other track materials required for track construction.
- B. All track appurtenances and other track material (OTM) shall be new and conform to the requirements **as specified**. All materials shall conform to the dimensional requirements for 115 RE rail, as recommended by current AREMA Specifications or as specified.

##### 1.02 RELATED SECTIONS

## 1.04 QUALITY ASSURANCE

- A. Quality Assurance Program - Refer to Section 05651, General Track Construction, and conform to the requirements of the Quality Assurance Program.
- B. Testing Laboratory Services - Refer to Section 01410, Testing Laboratory Services
- C. Before permanently installing either bonded standard joints or bonded insulated joints, pre-qualify each crew and its foreman by testing two samples of each type of bonded joint in accordance with the Longitudinal Compression Test specified herein. Prepare test samples in track. The bonded insulated joints tests shall be performed with one sample using high strength rail and the other sample using standard rail. Both bonded standard joint samples shall use high strength rail.
  - 1. The two sample joints shall have a 1/4-inch gap between the rail ends.
  - 2. The joints shall be tested in compression. A load shall be applied longitudinally in increments of 25,000 pounds. Each load increment shall be maintained constant until the longitudinal deflection of the rail ceases before increasing the load to the next increment.
  - 3. The load shall be increased in these increments until a total load of 650,000 pounds is attained or failure occurs. At each increment of loading, the load and differential movement of the rail and joint bars shall be measured to 0.0001 inch and recorded.
  - 4. The assembled joints may be sawn in half where the rails are butted together. The sawing shall be done in such a manner as to prevent overheating or damage to the bond and the cut shall be perpendicular to the centerline of the top of the rail with a tolerance of plus or minus one degree. A device shall be fabricated so that the reaction at the sawn ends occur only on the face of the joint bars.
  - 5. At no time shall any of the bonded standard rail joints show any indication of slippage before a compressive load of 650,000 pounds is applied to the joint, nor shall the magnitude of the differential movement be more than 1/8-inch in any direction. At the completion of the test, after the load in the rail has been released, the relative position of rail and joint bar shall be within 1/32-inch of its original value.
  - 6. The test shall be performed by an approved independent laboratory. Should any sample joint fail to meet the specified requirements of the test, another joint may be tested or a different manufacturer's product may be tested as directed by the engineer. For qualification testing, materials required shall be furnished by the contractor at no additional cost to the Authority.
  - 7. Failure of any test sample disqualifies the responsible foreman for permanent installation work. Assign a new foreman and repeat procedure and test.
  - 8. Bonded insulated joint bar and bonded standard joint bar to conform to:
    - a. Fishing height: plus or minus 1/64 inch
    - b. Length: plus or minus 1/8 inch
    - c. Straightness, as determined by a 36-inch straightedge: plus or minus 1/32 inch
    - d. End post thickness: plus or minus 1/64 inch
    - e. Projection below base of rail - 1/16 inch
    - f. Bolt hole location - as specified in AREMA Manual for Railway Engineering, Chapter 4, for 36-inch joint bar modified to receive 1-1/8 inch bolt.
- D. Equipment: Use equipment that is specifically designed to fasten proprietary bolts in bonded joint installation. Use the same equipment for field installation of bonded joints and for assembling test samples.
- E. Tolerances
  - 1. Other track material (OTM) to conform to tolerances as per AREMA.

F. Testing of Elastomer Material

1. The following test shall be performed on each of two pads or on specimens taken from two pads that are identical in all respects to the elastomer proposed for use in special trackwork. All testing shall be at no expense to the Authority.
2. In the event specimens cannot be taken from finished pads, samples certified by the supplier to have been taken from a batch of compound used for making the elastomeric component and having a cure equivalent to the cure of the elastomer component shall be used for the tests.
  - a. The elastomer shall be tested in accordance with ASTM D412, to determine the tensile strength and the ultimate elongation. The tensile strength shall be not less than 1500 psi and the ultimate elongation shall be not less than 350 percent.
  - b. The elastomer shall be tested for 22 hours at 100C in accordance with ASTM D395, Method B, to determine the percent of compression set. The compression set shall not exceed 30 percent.
  - c. The elastomer shall be aged for 336 hours at 70C in accordance with ASTM D573. The change of hardness and the percentage of change from the original tensile strength and original ultimate elongation shall not exceed 40 percent. The change in hardness, measured on the Durometer A scale shall not exceed 10 points.
  - d. Test specimens shall be prepared in accordance with Procedure A of ASTM D518. The test specimens shall be tested in accordance with ASTM D1149, at a temperature of 40C, and at an ozone concentration of 50 pphm. The elastomer shall not exhibit any cracking when examined in accordance with ASTM D1149 at the end of a 100 hour exposure.
  - e. The elastomer shall be tested at minus 10C for 94 hours in accordance with ASTM D1229, to determine the percent compression set at 30 minutes after release (t30 reading). The compression set shall not exceed 50 percent.
  - f. One test for oil absorption shall be conducted with ASTM No. 3 oil at 100C for 70 hours and another test using a different sample shall be conducted with ASTM No. 1 oil at 100C for 70 hours in accordance with ASTM D471, to determine the volume change of the elastomer. The volume change for the No. 1 oil shall not exceed minus 10 or plus 20 percent. The volume change for the No. 3 oil shall not exceed 100 percent all not exceed 100 percent.
  - g. Prior to commencing production of elastomer pad sheets, a prototype pad, using the chemical composition intended for production pads, shall be prepared and tested using a one inch by eight inch by one foot nine inch steel plate with two special plate anchorage assemblies two inches from the edges of diagonally opposite corners. The plate and the prototype pad shall be assembled, mounted on a reinforced concrete slab simulating actual field conditions, and subjected to the following tests.
    - 1) A vertical load increasing in increments of 1000 pounds to a maximum load of 15,000 pounds shall be applied downward at the center of plate normal to the plate. For each load the vertical deflection of the center of the plate shall be measured to the nearest 0.001 inch and recorded. The load shall be removed and the final position of the plate measured and recorded. The recorded values for vertical load and deflection shall be plotted on a graph as shown on **Exhibit 05658-C**.
    - 2) The load vs. deflection curve shall lie within the envelope shown on **Exhibit 05658-C** for loads in the range from 4,500 pounds to the load corresponding to a 120,000 pound vehicle.

Throughout that loading range, the spring rate of the fastener, slope of the load-deflection curve, shall not be less than 80,000 pounds per inch or more than 130,000 pounds per inch and shall be of a constant slope within 10 percent. In the event the curve fails to meet the requirements specified above, the chemical formulation of the pad, the coring size, or both shall be modified and the new elastomer pad design retested.

- 3) An electrical resistance test with one anchor bolt grounded, 100 volts dc shall be applied to the rail head for three minutes. The actual current flow shall be measured to the nearest 0.1 microampere and recorded. Then 1000 volts dc shall be applied to the rail head for two hours, after which 100 volts dc shall be applied again for three minutes and the actual current flow shall be measured, as above, and recorded. A potential of 50 volts rms ac shall be applied to the rail head for three minutes for each increment of measurement for frequencies from 20 Hertz to 10 kilohertz in increments of measurement of 20 Hz up to 100 Hz; 200 Hz up to 1000 Hz; and 2000 Hz up to 10 kHz. The impedance after three minutes shall be determined with an accuracy of plus or minus two percent and recorded for each frequency. The maximum current for 100 volts dc shall be 1.0 microampere. The minimum impedance for any frequency with 50 volts rms ac shall be 10,000 ohms.

#### 1.05 SUBMITTALS:

- A. Refer to Section 01300, Submittals.
- B. Certificates of Compliance for materials specified in Part 2: Products
- C. **The Contractor shall submit for approval shop drawings for fabrication of the components and assemblies for all appurtenances listed in this section. No fabrication or manufacturing shall be performed prior to drawing approval. Provide** shop drawings on:
1. Bonded insulated and bonded standard joints
  2. Standard joints
  3. Proprietary bolts and fasteners
  4. Hydraulic bumping posts
  5. Tie plates
  6. Rail clips
  7. Screw spike insulators
  8. Shims for DF Fasteners
  9. Fabrication of the elastomer pads together with a detailed description of the chemical composition and manufacturing processes used in making the elastomer pads.
- D. The Contractor, shall in accordance with Specification Section 01300, Submittals, submit shop drawings or detailed catalog cuts of track appurtenances and OTM not fully shown or not in conformance with AREMA Portfolio of Trackwork Plans and Specifications. **No fabrication or manufacturing shall be performed prior to drawing approval.**
- E. Product data on:
1. Bonded insulated joints and adhesives
  2. Bonded standard joints and adhesives
  3. Proprietary bolts and fasteners
  4. Hydraulic bumping posts
  5. Tie plates, rail clips, elastomer pads and screw spike insulators

6. Corrosion preventing oil or grease
  7. Elastomer pads
- F. Four samples of Fox Industries FX-120 Grade Track Crossing (or approved equal): Six inch by six inch sample.
- G. Two elastomer pads, or samples taken from pads, for each type of pad specified herein.
- H. Certificates and procedure reports:
1. Certificates of product conformance
  2. Qualification tests for bonded insulated joints and bonded standard joints
  3. Crew qualification tests for bonded joint installation
  4. Negative return bonding installation procedure
  5. Certified statements showing the results of all elastomer pad tests specified herein.
  6. Elastomer pad formulations tested and approved for use on an Authority project within five years prior to opening of bids will be accepted without further testing provided the Contractor submits copies of such certified test reports and verifies the materials furnished are the same as those tested.
  7. Certified statements from the supplier of the elastomer shall be submitted stating compliance of the elastomer with the requirements of these specifications.
- I. Record of field connections:
1. A record of each bonded standard joint shall be submitted
  2. Prior to fabrication, emergency guard rail schedule of string lengths and expansion gap locations

## **PART 2 - PRODUCTS**

### **2.01 BOLTED JOINTS (INSULATED AND STANDARD)**

- A. General Requirements: Johnson "Blue" Vulca Bond, or approved equal, with the following requirements:
1. Insulated joints shall be highly resistant to abrading, cracking, cutting, spalling and fatigue failure under impact loads, and shall exhibit deflection characteristics comparable to standard bolted joints.
  2. Joint bars shall be quenched and tempered carbon steel in accordance with the AREMA Manual.
  3. Joint bars shall be 36 inches in length.
  4. Joint bars shall have six, 1 - 1/8 inch diameter bolt holes.
  5. Joint bars shall provide full web contact. Inside face of insulated joint bars shall have the insulating material pre-bonded and shall be smooth with no stamping or branding.
  6. End posts shall project 1/4 inch, plus or minus 1/16 inch, below the base of rail.
  7. All insulated joints shall be furnished complete with bars, end posts, bushings, washer plates, bolts, nuts and washers.
  8. Bolts and nuts shall conform to the material requirements of current AREMA Specifications for Heat-Treated Carbon-Steel Track bolts and Carbon-Steel Nuts.
  9. Track bolts shall be oval necked and have a nominal diameter of 5 - 1/2 inches in length in conformance with current AREMA Design for Track Bolts and Nuts.
  10. Spring washers shall be single coil, helical spring washers for 1 inch bolts and shall conform to current AREMA Specifications for Spring Washers.
  11. Flat washers shall be 2 - 1/4 inches OD, 1 - 3/16 inch ID and 1/8 inch minimum thickness and shall conform to current AREMA Specifications.

## **2.02 BUMPING POSTS**

- A. Revenue Vehicle Bumping Post
  - 1. Requirements: Furnish Hydro-Bumper, Holley Engineering Company, or approved equal, with the following minimum requirements:
  - 2. Design:
    - a. Suitable for installation on ballasted track and direct fixation track.
    - b. Permit bolting to web of running rail without anchorage to cross ties or concrete.
    - c. Symmetrical about centerline of track.
    - d. No part extending more than two inches below base of rail.
    - e. Fabricated to dimensions shown.
    - f. Equipped with head capable of absorbing 1,000,000 foot-pounds of energy in 30 inches travel.
  - 3. Provided with one coat of manufacturer's standard shop coat applied to exterior surfaces after complete removal of all foreign matter.
  - 4. Furnish the product of an established manufacturer regularly engaged in the production of bumping posts.
- B. Maintenance Vehicle Bumping Post
  - 1. Steel bumping post, Type WA, Western-Cullen-Hayes, Inc., or approved equal.
    - a. Shock-absorbent head of multiple-spring-and-shockpad design.
    - b. Permit installation by bolting to running rails without anchorage to cross-ties or concrete invert.
    - c. No part extending more than two inches below base of rail.
  - 2. Install at the end of M/W tracks in accordance with the manufacturers requirements.
  - 3. Provided with one coat of manufacturer's standard shop coat applied to exterior surfaces after complete removal of all foreign matter.
  - 4. Furnish the product of an established manufacturer regularly engaged in the production of bumping posts.

## **2.03 TIE PLATES**

- A. Fastener tie plates for Pandrol Spring Clip e2056, 5 - 1/2" rail base, 7" wide and punched for 7/8" screw pikes as manufactured by Pandrol, Inc. Bethlehem Steel, or approved equal.
- B. All tie plates shall be canted 40 to 1 inward.

## **2.04 SPIKES**

- A. Screw spikes, as manufactured by Pandrol, Inc., Bridgeport, NJ, or approved equal, shall be 7" in length, 7/8" diameter, hot forged, made from medium carbon steel to meet ASTM A66. The head shall be configured for use with a 7/8" socket.
- B. Cut track spikes shall be 6 inches by 5/8 inch with reinforced throat, and shall conform to current AREMA "Specifications for Soft-Steel Track Spikes" and "Design for Cut Track Spikes".

## **2.05 TIE PLUGS**

- A. Tie plugs shall be treated, five inches in length and conform to current AREMA Specifications for Tie Plugs for 5/8-inch spikes.

## **2.06 EMERGENCY GUARD RAIL**

- A. Structural angle, cover plates, and base plates shall be as shown and shall comply with ASTM A36.
- B. Structural angle shall be fabricated as specified in the current AISC, Manual of Steel Construction.
- C. Holes shall be punched or drilled through the member perpendicular to its face and shall be clean cut, without torn or ragged edges.
- D. Structural angles shall be furnished in lengths of not less than 25 feet.
- E. Structural angles and plates shall be given a shop coating of rust inhibiting primer, Title Clad II Hi-Bild Primer by Sherwin Williams; 9100 High Performance Epoxy by Rust - Oleum, or approved equal, at the point of fabrication, except that contact areas within three inches of surfaces to be field welded shall not be shop coated. No finish coats of paint are required for emergency guard rail.
- F. Washer head drive spike 3/4 inch x 7 inch as manufactured by A&K Railroad Materials, Inc. Lewis Bolt & Nut Company, L. B. Foster Company, or approved equal.

## **2.07 DERAIL**

- A. Sliding type, Model HBP, Hayes Track Appliance Company, or approved equal.
- B. No part of derail shall extend more than 1 - ½ inches above top of rail when derail is in non-derailing position. Designed for height of 7 - ½ inches from top of rail to bottom of guide box flanges. Stroke: 6- 1/4 inches or less to move from off-rail position to derailing position. Equipped with designated derail blocks.

## **2.08 SWITCH STAND**

- A. Switch stand for installation on hand throw switch shall be Foster Parallel-Throw, Low-Type, Design 51A as manufactured by L. B. Foster Company, or approved equal.

## **2.09 SPRING CLIPS**

- A. Pandrol type e2056
- B. Two per tie plate

## **2.10 SHIMS FOR DF FASTENERS**

- A. Shims for DF fasteners shall be galvanized steel in 1/8-inch and 1/16-inch thicknesses and shall provide full bearing of the fastener on the grout pad.
- B. Slotted shims will not be permitted.
- C. The Contractor shall submit for the Engineer's approval shop drawings of the shims proposed for use.

## 2.11 ELASTOMER PADS

- A. Elastomer pads shall be furnished for use under special plates in special trackwork and shall be fabricated from polychloroprene (neoprene) as specified below
- B. Physical Characteristics
  - 1. Elastomer pads shall be 3/4 inch thick and extend 1 inch beyond the plate edges on all sides.
  - 2. All pads shall have a Durometer A hardness of 50 in accordance with ASTM D2240.
  - 3. Elastomer pads furnished for use under all special plates shall be cut from a uniformly cored sheet conforming to the following requirements:
    - a. Coring shall consist of cylindrical holes 11/16 inch in depth. A continuous membrane 1/16 inch thick shall close one end of all holes.
    - b. Cored holes shall be 1-5/8 inches on center measured between adjacent holes in all directions.
    - c. Anchor bolt holes, 1-5/8 inch in diameter, shall be cut at the required locations on the pad.
    - d. Tolerances for finished pads shall be as follows:
      - 1) Length and width: Plus or minus 1/4 inch.
      - 2) Thickness: Plus or minus 0.03 inch.
      - 3) Squareness: Plus or minus 1 degree.
      - 4) Centering of holes: Plus or minus 1/32 inch.
      - 5) Diameter of holes: Plus or minus 1/32 inch.
      - 6) Durometer: Plus or minus 5 points.
    - e. The diameter of the core holes shall be as follows:
      - 1) Pads for use under all special plates having a longitudinal dimension greater than 12 inches measured along the rail shall have a diameter of 1 - 1/8 inch.
      - 2) Pads for use under plates having a longitudinal dimension measured along the rail equal to or less than 12 inches shall have a diameter of 3/4 inch.

## 2.12 RAIL TROUGH BACKFILL (BUILDING)

- A. Fill trenches for tracks within shop buildings with Fox Industries FX-120 Grade Track Crossing, or approved equal.

## 2.13 ANCHOR ASSEMBLY

- A. Threaded Studs
  - 1. Partially - threaded studs shall be as shown, shall be 7/8 - inch diameter for plates in special trackwork and shall conform to ASTM A449 except that chemical requirements shall conform to ASTM A325 for Type 3 bolts, with the chromium, nickel, and copper elements in such combination to achieve maximum corrosion resistance consonant with strength and hardness requirement.
  - 2. They shall be furnished with ASTM A325 nuts, DH Grade and Finish.
  - 3. In addition, nuts shall be a type which provides a positive means of preventing loosening due to in-service vibrations, conforming to Industrial Fastener Institute Standards IFI - 100 and IFI - 101.
  - 4. Studs shall have the embedded portion deformed to resist a nut removal torque of 250 foot - pounds minimum.
  - 5. The studs, nuts and washers shall be galvanized or cadmium plated of such type and thickness as to achieve maximum corrosion protection without causing excessive embrittlement or galling.

- B. Insulating Materials
  - 1. The insulating fiber washer and one piece fiber washer/sleeve shall conform to the requirements shown on the Contract Drawings and as specified herein.
  - 2. All insulating washers and sleeves shall conform to the requirements specified in the NEMA Standard Publication, LI-1 Grade G-10.
- C. Double - Coil Spring Washers
  - 1. Double - coil spring washers for use in special trackwork shall be galvanized or cadmium - plated parallel coil spring washers as shown and specified.
  - 2. Using six randomly selected production double - coil spring washers, measure load vs. deflection from 1,000 pounds to 3,000 pounds in 200 - pound increments to determine the deflection or spring compression required to obtain 2,000 - pound bolt tension.

### **PART 3 - EXECUTION**

#### **3.01 PREPARATION**

- A. Bolted Joints (Bonded joint and standard joint installation):
  - 1. End-harden rail ends of standard rail as specified in Section 05651, General Track Construction.
  - 2. Remove rail brands which are located in joint bar rail contact areas. All rail brands shall be removed from the rail by grinding for the entire length of the joint bar.
  - 3. Rail welds shall be at least eight feet from the center of the joint.
  - 4. Drill rail holes in conformance with the Contract Drawings and AREMA Specifications or manufacturer's printed instructions using a template as the drilling guide. Debur field drilled holes.
  - 5. Calibrate bolt-tightening equipment by testing three typical bolts in a device capable of indicating actual bolt tension.
- B. Fox Industries FX-120 Grade Track Crossing: Comply with manufacturer's requirements.

#### **3.02 INSTALLATION:**

- A. Joints:
  - 1. Bonded insulated joints shall be installed at all insulated joint locations shown. The exact location will be furnished by the Engineer. No insulated joint, except within the limits of special trackwork, shall be installed without the Engineer's approval. All other joints shall be bonded standard joints. Bonded standard joints used to connect CWR strings shall be installed with negative return bonds.
  - 2. The bonded joint shall be supported by the appropriate direct fixation fastener or plate as shown.
  - 3. Additional preparation and the installation shall be in accordance with the manufacturer's recommendations. The manufacturer's recommendations will include procedures for sandblasting of rail and heat curing of assembled joints.
  - 4. All bonded joints shall be installed under the direct supervision of a qualified foreman.
  - 5. Bolted Standard Joints
    - a. Standard joints shall be assembled with a full complement of bolts, nuts and spring washers. Before installing joint bars, rail surfaces to be covered by the bars shall be cleansed and coated with an oil or grease approved by the Engineer to prevent corrosion.
    - b. Bolts shall be installed and the nuts threaded finger tight.

- c. Bolt tension shall then be increased to 20,000 to 30,000 lbs. by use of a track wrench or power torque wrench. Bolts shall be tightened starting from the center bolts and working to the end bolts.
  - d. Bolts shall be tightened twice; first, after the track has been brought to approximately true alignment; second, immediately before the completion and final acceptance of the trackwork. Re-tightened track bolts shall be brought to a tension of 15,000 to 25,000 lbs.
  - e. Bolted standard joints used to connect CWR strings shall be installed with negative return bonds.
    - 1) Negative return bonds shall be as specified in this Section's article for Negative Return Bonding.
6. Bolted Insulated Joints:
- a. Installation shall be in accordance with the manufacturer's recommendations and as directed by the Engineer.
  - b. Rail surfaces within the insulated joint bars shall be clean and free of oil, dirt, rust and metal filings.
  - c. Joint Resistance Testing will be as specified in this Section's article for Insulated Joint Resistance Test.
7. Insulated Joint Resistance Test: All testing shall be **witnessed** by the **WMATA** Engineer.
- a. Equipment: The insulated joint resistance test shall be conducted using the following Authority test equipment (See **Exhibit 05658-A**):
  - b. General Railway Signal (GRS) Track Quality Meter (TQM) 20182-36 GR.1.
  - c. Standard Resistance Test Fixture.
  - d. Acceptance Criteria: The insulated joint shall have a minimum resistance of 5,000 ohms.
8. Negative Return Bonding:
- a. The Contractor shall furnish and install negative return bonds as specified and shown at all bonded standard joints used to join CWR strings.
  - b. Negative Return Bonds: Shall include two web type at each location.
  - c. Web Bond: Manufactured Bond, 500 KCMIL, stranded copper, single conductor, 2000 volt, UL Type RHW, 48 inches long insulated, as manufactured by Erico Products, Inc., fastened to rail with 5/8" compression fastener, Huck Manufacturing Co. C50LR-BR20-16 and terminal lug, Bundy Type, YA34-L, each end.
  - d. The Contractor shall install all negative return bonds in accordance with the manufacturer's instructions.
  - e. The Contractor shall submit installation procedures for approval.
  - f. The contact surfaces of the running rail web shall be cleaned on each side of mill scale, oil, grease or other foreign matter to near white finish.
  - g. Any raised lettering from the steel mill shall be ground flat with the adjacent surface.
  - h. Each negative return bond shall be installed with sufficient amount of slack to accommodate expansion or contraction.
9. Electrical Testing of Negative Return Bonding
- a. The bond resistance of each negative bonded joint shall be tested by the Contractor to verify that it does not exceed 0.000050 ohms.
  - b. The Null Balance method of testing shall be employed utilizing the four terminal arrangement, two potential and two current terminals. The P1 and P2 leads shall be attached to the rail 46 inches apart and equal distance from the ends of the 500 KCMIL cable. The C1 and C2 current leads shall be attached to the rail approximately six inches outside of the P1 and P2 leads. The meter dials shall then be manipulated to achieve a balanced condition of the meter. This procedure is to be followed for each negative return bonded rail joint.

The resistance of each bonded rail joint shall be recorded and submitted to the **WMATA Engineer**. Bonds which exceed 0.000050 ohms shall be removed, replaced and retested. **Reference Exhibit 05658-A.**

10. Record of Field Connections
  - a. A record of each bonded standard joint shall be submitted **for review and approval by the WMATA Engineer.**
  - b. This record shall be in the format shown in Exhibit 05658-B.
  
- B. Bumping Posts:
  1. Prior to final acceptance, bumping posts shall be cleaned, sand blasted, primed, painted and lubricated as directed by the Engineer. Gauge transitions to provide the required track gauge for bumping posts installations shall be as specified for Section 05651, General Track Construction.
  2. Bumping post shall be installed where shown and specified on the Contract Drawings.
  3. Insulated joints shall be installed as shown and specified **in the field installation drawings.**
  4. All holes in the running rails for bumping post installation shall be centered 2 - 7/8 inches above the base of the rail and shall be drilled in conformance with AREMA requirements.
  5. Flame cutting of holes will not be permitted.
  6. Prior to final acceptance, the Contractor shall make all adjustments directed by the **WMATA Engineer** to ensure that all bumping posts are in proper operating condition and ready for service.
  
- C. Fox Industries FX-120 Grade Track Crossing: Comply with manufacturer's requirements.

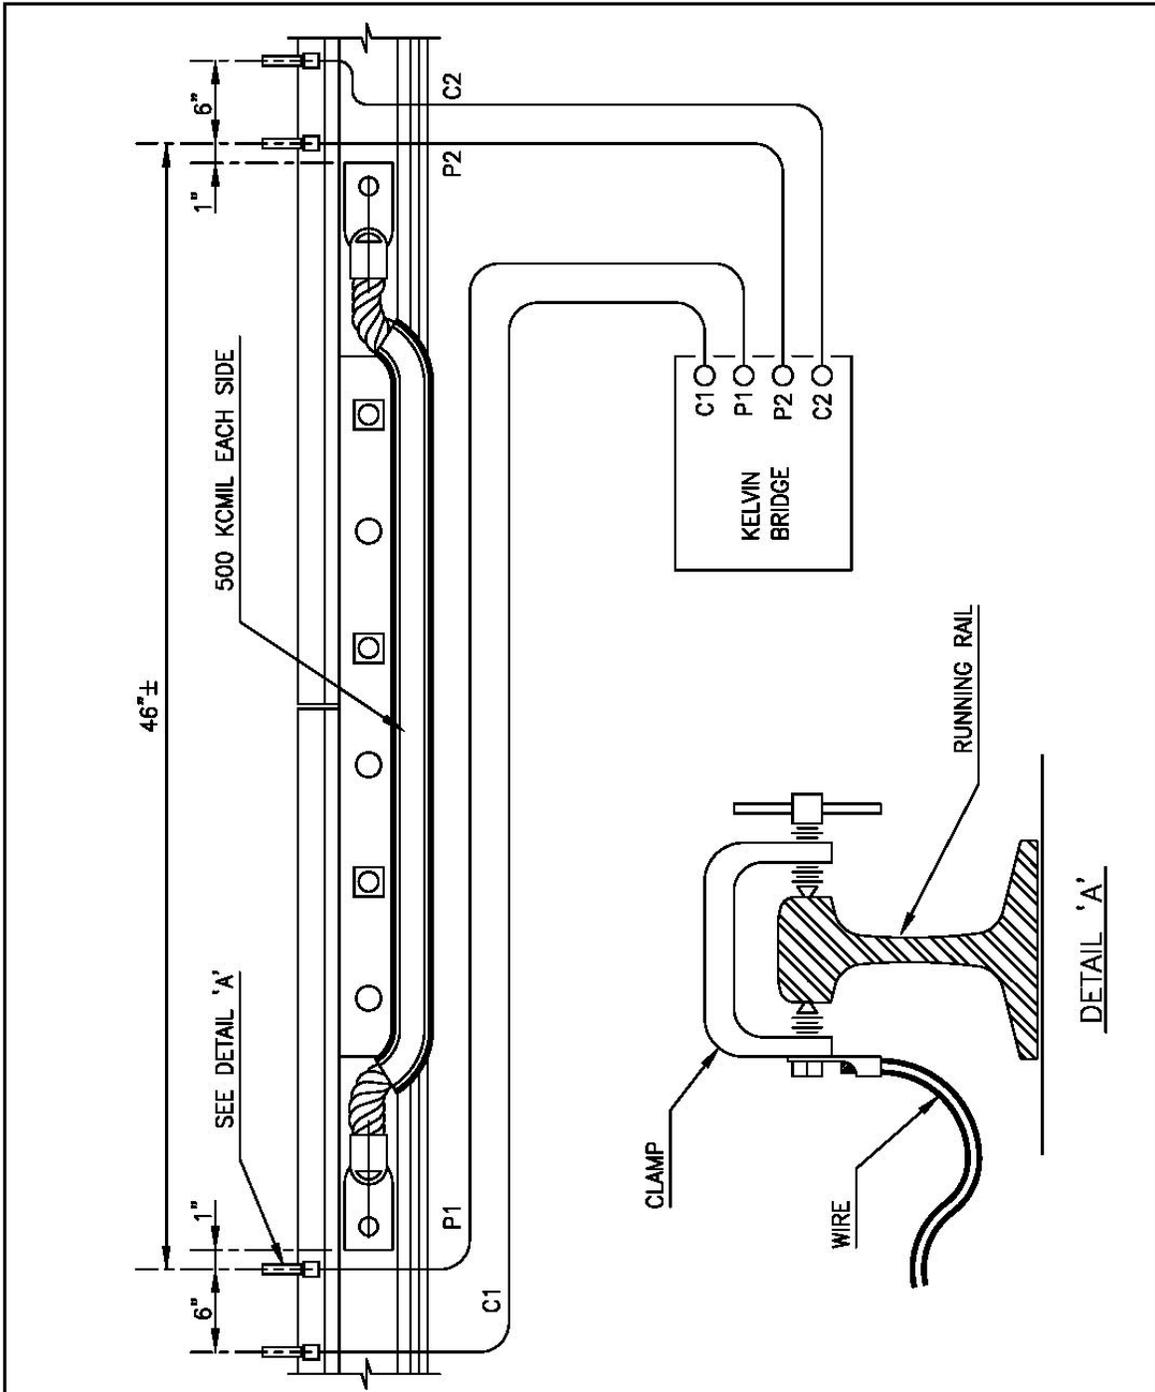

#### **PART 4 - MEASUREMENT AND PAYMENT**

##### **4.01 MEASUREMENT:**

- A. Measurement of work specified in this Section will be made in the following manner:
  1. No separate measurement.

##### **4.02 PAYMENT:**

- A. Compensation for work specified in this Section will be made in the following manner:
  1. Included in the price of the work of which it is a part.

## SECTION 05659

### SPECIAL TRACKWORK

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies manufacture, fabrication, shop assembly, inspection, testing, packaging and shipping special trackwork materials.
- B. Special trackwork shall include components for installations in both ballasted and direct fixation track.
- C. This Section also specifies fabricating and furnishing guarded turnouts as shown and specified.

##### 1.02 RELATED SECTIONS

- A. Section 05651 - General Track Construction
- B. Section 05652 - Ballasted Track Construction (BTC)
- C. Section 05653 - Direct Fixation Trackwork Construction (DFTC)
- D. Section 05654 - Special Trackwork Construction - Ballasted
- E. Section 05655 - Special Trackwork Construction - Direct Fixation
- F. Section 05656 - Running Rail
- G. Section 05657 - Direct Fixation Rail Fasteners
- H. Section 05658 - Track Appurtenances and Other Track Material
- I. Section 06130 - Timber Ties
- J. Section 06131 - Composite (Plastic) Ties

##### 1.03 REFERENCES

Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.

- A. American Railway Engineering and Maintenance-of-Way Association, Manual for Railway Engineering, herein referred to as the AREMA Manual.
- B. American Railway Engineering and Maintenance-of-Way Association, Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio.
- C. American Society of Testing and Materials (ASTM)
- D. Association of American Railroads (AAR) Signal Manual

- E. American Council of Independent Laboratories' Manual of Practice
- F. American Welding Society (AWS)
- G. Industrial Fastener Institute (IFI)

#### **1.04 QUALITY ASSURANCE/CONTROL**

- A. Quality Assurance Program - Refer to Section 05651, General Track Construction, and conform to the requirements of the Quality Assurance Program.
- B. Tolerances: Conform to the AREMA Portfolio - Plan No. 1010-89, Permissible Variations in Completed Frogs; Plan No. 1011-84, Permissible Variations in Completed Switches; the AREMA Manual, Section 7, and the AREMA Manual, Section 5, in all aspects unless modified by the contract documents.
- C. Codes, Regulations, Reference Standards and Specifications:
  - 1. Except as modified in the contract documents, design, manufacture, test, assemble, inspect, ship, unload and stack special trackwork in accordance with the AREMA Portfolio and the AREMA Manual.
  - 2. Except as modified in the contract drawings, use rail in the special trackwork conforming to the requirements of the AREMA Manual, Chapter 4, and Section 05656, Running Rail.

#### **1.05 TESTING**

- A. Notify the Authority in writing not less than 14 days in advance of dates scheduled for any test. The Authority retains the right to witness testing. Do not conduct test until authorized by the Authority.
- B. Testing Laboratory:
  - 1. Perform qualification and production quality control tests using either an independent testing laboratory or a qualified manufacturer's laboratory reviewed by the Authority. If an independent testing laboratory is selected, it shall be a member of the American Council of Independent Laboratories. If a manufacturer's laboratory is selected, it shall satisfy the requirements of the American Council of Independent Laboratories' Manual of Practice - Quality Control System - Requirements for A Testing and Inspection Laboratory, and ASTM E329.
  - 2. The selected laboratory shall use the proper equipment and qualified personnel for testing such as described in this Section.
- C. Testing Equipment: Provide equipment in good operating condition, of adequate capacity and range, and accurately calibrated. Use testing equipment that is in calibration with standards which are certified and traceable to the National Bureau of Standards within one year immediately preceding the test date. Submit copies of calibration certificates with test reports.
- D. Documentation: In conjunction with the specified tests, submit the following documents for review:
  - 1. Test program plan: In this plan, identify Contractors' approach for accomplishing each of the specified qualification and production quality control tests. Include the projected schedule for test procedure submittals, test executions, and test results report submittals.
  - 2. Test procedures for each test, describing the objective, equipment, and instrumentation that will be used, procedure to be implemented, and the anticipated

results. Include working drawings detailing test equipment and set-up of direct fixation rail fastener that will be tested.

3. Test report:
  - a. A separate report of test results for each test which includes original data calculations, test procedure references, test equipment identification, test personnel, date of test, specified requirements, actual test results, nonconformance if any, and interpretation of the results. Highlight conformance or deviation in a report summary.
  - b. Accompany the written test reports with a photographic record of the tests. Include photographs of sufficient clarity to distinguish relevant details as described or referenced in the respective written report.

## **1.06 PRODUCTION QUALITY CONTROL TESTS OF INSULATION PIECES**

- A. Test insulated gauge plates and switch rods in accordance with AAR Signal Manual, Part 14.5.3.

## **1.07 SUBMITTALS**

- A. Refer to Section 01300, Submittals.
- B. Shop drawings for special trackwork components, including the following
  1. Insulated curved split switches, including stock rails.
  2. Insulated switch rods, including clip assemblies.
  3. All insulation materials, parts and assemblies.
  4. Closure rails.
  5. Frog guard rails.
  6. All special plates, including details of components.
  7. Switch panel details.
  8. Rail braces.
  9. Direct fixation rail fasteners, including details of components.
  10. Complete layouts and details for all types of turnouts, single crossovers, double crossovers, and crossing diamonds.
  11. Installation drawings for each type of assembly used during construction.
- C. Product data:
  1. Certification of the procedure used in the depth hardening of frog castings
  2. Test data for the rail used in all fabrication for compliance with AREMA and these specifications.
- D. Refer to Section 01322, Certificates and Reports, and submit the following:
  1. Certificates of material compliance required by AREMA and this Specification.
  2. Test reports of chemical analyses, Brinell hardness, electrical insulation, and other tests required by AREMA and this Specification.
  3. Frog depth hardening results
- E. Testing laboratory, testing equipment, test program plan, test procedures and test reports for the direct fixation rail fasteners, including the following testing laboratory information for review by the Authority prior to testing:
  1. Name and address of the laboratory
  2. A description of the facilities and testing equipment that will be assigned for this testing.
  3. Names, experience, and qualifications of the personnel that will be laboratory's experience in performing this testing.

4. For the testing of the direct fixation rail fasteners, a list of the laboratory's experience in testing this type of rail fasteners or fastener - like assemblies
- F. A certified copy of reports on the analyses and tests required by referenced ASTM specifications.
- G. Contractor's method for locating all special plates, not in the switch panel, which span two or more ties, drilling the ties and holding the plates in place during shop assembly and inspection.
- H. Configuration and method of fabrication for switches.
- I. Check list or measurement report for all switches and frogs approved by the Engineer. This shall show the design size and allowable tolerance required by AREMA, or as shown and specified in these contract documents, as well as the actual size.
- J. Detailed description of the procedure for bonded insert and bonded joint installation approved by the Engineer.
- K. Method of packaging and loading each unit approved by the Engineer.

#### **1.08 PREASSEMBLY**

- A. Completely assemble, prior to shipment, the turnouts, crossing diamonds, and crossovers in Contractor's fabrication shop for inspection by the Contractor's Quality Control (QC) Staff, For mainline turnouts and crossovers, assemble on the specified switch ties and/or the direct fixation fasteners which will be incorporated into the Work.
- B. Fully bolt and assemble rail joints for all turnouts. For inspection, use temporary joint bars with "C" clamps for shop assembly. Install 3/16 inch end post shim where insulated joint bars are indicated. Do not apply adhesive during this process.
- C. No bracing, wedging, or support blocking will be permitted to hold components to proper gauge and alignment.
- D. Variations from the Authority reviewed shop drawings or other contract documents will constitute noncompliance and will not be accepted for shipment unless or until proper modification are made and reviewed by the Authority.
- E. Make available to the Authority, without charge, the facilities and assistance to examine the work during its progress, and when the product is finished, to satisfy the Authority that the finished product will comply with the contract documents. Provide templates and one yard straight edge or longer, as necessary, to check flangeways, rail end drilling, switch rail planing, and other features of the Work usually checked by templates.
- F. Present material for inspection in a safe area away from excessive noise and manufacturing activities. Provide labor to facilitate inspection of the top, side and bottom of frogs and switches.
- G. With minimal bar pressure acting on the switch rail at rod number 1, 25% or more of the switch point contact length, starting from the tip of the point, shall make positive, firm contact with the ball of the stock rail.
- H. With no pressure acting on the switch rail, the maximum allowable spring back between the switch point and the ball of the stock rail shall be 3/16 inch, measure six inches back from the tip of the point.

- I. For inspection and review, match mark rails in appropriate colors, and sequentially number fasteners or switch ties, in accordance with the Authority reviewed System. Submit the match marking and numbering system on the Contracting Drawings for the Contractor's QC Staff before match marking and numbering commences.

## **PART 2 - PRODUCTS**

### **2.01 GENERAL REQUIREMENTS**

- A. Special trackwork materials, including oval-neck track bolts of one-inch nominal diameter, nuts and spring washers, and special trackwork assemblies shall be in accordance with AREMA except as modified on the contract drawings and specifications.
- B. Rail, switches, frogs and other track material shall be in accordance with AREMA dimensional requirements for 115 RE rail section except as modified on the contract drawings and specifications.
- C. Heel ends of switch rails, and ends of stock, closure and connecting rails shall be beveled in accordance with AREMA requirements.
- D. Cut all rail ends in accordance with AREMA requirements except that tolerance to be taken up in the rail base.
- E. Drill rail ends to receive 36-inch, six-hole joint bars in accordance with AREMA and as shown. Standard joints shall be drilled to allow butting of rail ends. Insulated joints shall be drilled to allow for a 3/8-inch end post. Drill holes in accordance with joint manufacturers instructions, plus or minus 1/32-inch.
- F. All rail shall be in accordance with Section 05656, Running Rail.
  1. Guard rails: 132 RE section.
  2. All other rail: 115 RE section.
- G. Drill and ream holes with edges beveled.
- H. All joints required for installation shall be new material.
- I. Supply all ties in accordance with Section 06130, Timber Ties or Section 06131, Composite (Plastic) Ties.

### **2.02 STOCK RAILS, CLOSURE RAILS AND CONNECTING RAILS**

- A. Length: As shown plus or minus 1/8-inch.
- B. All ends drilled except ends to be connected to CWR which shall be drilled in the field.

### **2.03 FROGS**

- A. Railbound manganese steel construction as shown
- B. Frog casting
  1. Depress heel of manganese frog casting in accordance with AREMA Plan 617-89.
  2. Depth-harden impact areas of manganese frog castings.
- C. Frog inserts

1. Cast inserts of carbon steel in accordance with AREMA Specification M3.
  2. Provide inserts of one-piece construction.
  3. Provide inserts having full-face contact conforming to configuration of 115 RE rail.
  4. Provide available bonding area per inch of length equivalent to that available for bonded standard joints where applicable. Adjust dimensions of bonded inserts to allow for glue and fabric.
  5. Ensure the inserts are smooth and straight and do not exceed the following permissible variations:
    - a. Width between rail webs: Plus or minus 1/32-inch of that shown.
    - b. Depth of flangeway groove: Plus or minus 1/16-inch of that shown.
    - c. Length of insert: Plus or minus 1/8-inch of that shown.
    - d. Straightness of all portions of inserts adjacent to rail using 36-inch straightedge: Plus or minus 1/32-inch.
    - e. Finishing height variance of inserts from that required for bonding area: Plus or minus 1/64-inch.
- D. Assembly: Prior to delivery, assemble frogs as shown.
1. Bonding adhesive: As manufactured for bonded joint bars by Allegheny Drop Forge Company, Portec, Inc. or equal, applied as directed by the manufacturer to all contact surfaces between inserts and rail.
  2. Secure frog, except for insert, with 1-3/8 inch diameter high strength bolts in accordance with AREMA requirements.
  3. Assemble inserts with 1-1/8 inch diameter high-strength bolts, ASTM A490, and lock nuts. Position bolt holes in accordance with AREMA Plans 621-89 and 1010-89 and as shown. Bolt holes 1-3/8 inches in diameter plus or minus 1/32- inch.
  4. Flat washers: ASTM F436.
  5. Equip bolts as shown with one beveled or flat headlock washer and one flat or beveled washer to provide square bearing and to permit tightening of nuts by wrench.
  6. Lock nuts: IFI-100 and IFI-101, ASTM A563, Grade C.
  7. Tension bolts to between 75 percent and 85 percent of proof load. Exact value as directed by the Engineer. Ascertain bolt tension by means of torque wrench. Determine desired torque by test similar to that described in IFI-101.

## 2.04 FROG GUARD RAILS

- A. Length: 12'-6"
- B. Complete with blocks and bolts as shown.

## 2.05 SWITCHES

- A. Switch Rails: As shown.
  1. Switch rails and stock rails: In accordance with Section 05656, Running Rail, and AREMA Plan 221-62, Detail 5100.
    - a. Stock rails may be thick web or constructed with reinforcing bars.
    - b. Stock rail lengths: as shown or as required for switch panel..
  2. Bolts, rivets, fittings and spring washers in accordance with Appendix A of the AREMA, Portfolio.
    - a. Fabricate five bolt heel joint assembly in accordance with AREMA Plan 221-62 and AREMA Manual.
    - b. Fabricate forged steel rail stops in accordance with AREMA requirements.
    - c. Switch inserts with bolts: As specified for frog inserts.

- B. Drill stock rails for ballasted special trackwork as shown. Switch heaters will be furnished and installed by other trades.

## **2.06 SWITCH RODS**

- A. Switch rods and clips of vertical design, Type MJS, modified as shown.
  - 1. Insulated construction.
  - 2. Assembled.
  - 3. Test in accordance with AAR requirements.
  - 4. Length: As shown.
- B. Switch rods must be capable of at least one (1) inch plus/minus adjustment after the initial specified 5 inch throw has been set.
- C. Contractor's shop drawings shall provide the required spread measurement for each switch rod which are needed to support the specified throw.

## **2.07 RAIL BRACES**

- A. Boltless adjustable brace equal to those formerly manufactured by Bethlehem Steel, modified to permit installation of one inch diameter electric switch heaters on rail web of ballasted turnouts.
- B. Shop weld rail brace backing blocks to switch plates.
- C. Rail brace backing blocks to permit mounting on 3/4-inch thick flat plates. Allow for modification to fit 1/4-inch recessed gauge plates. Ensure that distance from rail base to horizontal bearing surface of backing block is the same in each case to permit use of standardized wedge.
- D. Clearance between backing block and rail base: Determined by design of selected brace.
- E. Brace shall use left-hand Pandrol spring clips e2056.

## **2.08 PLATES**

- A. Furnish special trackwork units with special plates as shown, fabricated of 3/4-inch thick steel, ASTM A36 in accordance with designs shown or AREMA requirements.
- B. Plates complete with specified rail base backing blocks, riser plates, rail stops and rail clamp blocks welded thereon.
- C. Riser plates and rail stops fabricated of ASTM A36 steel as shown and as specified.
- D. Punch holes in each plate perpendicular to face. Cut clean without torn or ragged edges.
- E. Straighten plates cold in press or roller until surface and line requirements are met. The following tolerances are not cumulative.
  - 1. Plate thickness: Plus or minus 1/32-inch.
  - 2. Middle ordinate: Place plate on horizontal support. Place straightedge or wire string from one end of plate to the other on the concave side. Measure distance between plate surface and straightedge or stringline. Distance not to exceed 0.001 inch per inch of length with surface upsweep or downsweep uniform.
  - 3. Plate thickness of dual rail stops, single rail stops and riser plates: Plus or minus 1/32-inch.

4. Straightness of edge of dual rail stops, single rail stops and riser plates parallel and adjacent to base of running rail: Plus or minus 1/32-inch.
  5. Transverse dimension of dual rail stops: Plus or minus 1/32-inch.
  6. Tolerances other than those specified: Plus or minus 1/8-inch.
  7. Spike hole locations for ballasted special trackwork: Plus or minus 1/8-inch.
- F. Identification of plates:
1. Stamp with suitably sized characters not less than 1/2-inch in height, located on top surface and plainly visible when assembled.
  2. Include Contract Number and identification designation as shown.
- G. Fillet weld rail braces, rail stops, riser plates and rail clamps to their respective plates as shown in accordance with AWS D1.1.
- H. In special trackwork fabricated for ballasted trackwork, seven inch wide elastic fastener tie plates suitable for e2056 Pandrol spring clips shall be used at all support locations not having special frog, switch, gauge or guard plates.

## **2.09 GAUGE PLATES**

- A. Switch gauge plates as shown and as specified for plates.
- B. Insulation shall be a four hole 7-1/2" x 8" x 3/4" epoxy fiberglass splice block fastened to the plate with Huck type compression fasteners. The insulating material shall have a tensile strength of 70 ksi, compressive strength of 100 ksi and a tensile modulus of  $3.4 \times 10^6$ .

## **2.10 TURNOUT GUARD RAIL**

- A. Length: As shown.
- B. Complete with blocks and bolts as shown.
- C. Type: 132 RE rail.
- D. Planned in accordance with AREMA Plan No. 504-89.

## **2.11 RAIL JOINTS**

- A. Furnish all standard and insulated joints within the turnout

## **2.12 GUARDED TURNOUTS**

- A. Guard Rail Stop:
  1. Ductile Iron: ASTM A536, Grade 65-45-12 to fit 115 RE rail and as supplied for NYCTA guarded turnouts.
    - a. Direct Fixation Turnouts:
      - 1) Ductile iron rail stops shall be attached to the steel plate with 7/8" square neck carriage bolts, ASTM A325, inserted through a square punched hole from the underside of the plate. A heavy hex nut, Grade 3 ASTM 563 and flat washer, weathering steel ASTM F436 shall complete the assembly; three bolts, nuts and washer per rail stop.
    2. Ballasted Turnouts:
      - a. Ductile iron rail stops shall be attached to the tie and plate; three studs with nuts and washers per rail stop. Cast rail stops and house chairs shall be

fastened through the ties with 7/8 " diameter double end threaded studs, flat washers and heavy hex nuts. The nuts and washers shall be fastened to the stud on the underside of the tie and on top of the casting similar to NYCTA guarded turnouts.

3. The rail stop shall be backed with a 6" x 2" x 1/2" steel block welded to the rail plate.
- B. Manganese Housing Assembly:
1. Cast manganese steel: AREMA Manual.
  2. Housing: Similar to that manufactured for the NYCTA.
    - a. Direct fixation - 6' - 2 1/2" long.
    - b. Ballasted track - 5' - 5" long.
  3. Housing Chairs: Ductile Iron ASTM A536 Grade 65-45-12, as manufactured for NYCTA.
    - a. Direct fixation housing chairs shall be fastened to steel plates and gauge plates similar to ductile iron rail stops, except that one hole, as shown, in each chair shall be sized for an anchor assembly instead of the square neck carriage bolt.
    - b. Ballasted housing chairs shall be fastened to ties, steel plates and gauge plates similar to ductile iron rail stops.
    - c. The first housing chair number shall be configured for bolting to a 132 RE guard rail which continues ahead of the point of switch as shown.
  4. No part of the housing shall extend more than 1-1/2 inches above the top of rail.

## **PART 3 -EXECUTION**

### **3.01 INSTALLATION**

- A. Direct Fixation Special Trackwork Fabrication
1. Fabrication of special trackwork for direct fixation track shall be as specified and shall comply with the applicable related Sections:
    - a. General Track Construction (GTC), Section 05651.
    - b. Direct Fixation Trackwork Construction (DFTC), Section 05653.
    - c. Special Trackwork Construction - Direct Fixation, Section 05655.
    - d. Direct Fixation Rail Fasteners, Section 05657.
  2. Tolerances
    - a. The final gauge, cross level, superelevation, horizontal alignment and vertical alignment of direct fixation special trackwork shall be as shown and specified. Tolerances shall be as specified for direct fixation track construction for GTC. Switch points in normal position shall be square within 5/8 inch.
- B. Ballasted Special Trackwork Fabrication
1. Fabrication of special trackwork for ballasted track shall be as specified and shall comply with the applicable related Sections:
    - a. General Track Construction (GTC), Section 05651.
    - b. Ballasted Track Construction (BTC), Section 05652.
    - c. Special Trackwork Construction - Ballasted, Section 05654.
    - d. Track Appurtenances and Other Track Material, Section 05658
    - e. Timber Ties, Section 06130
    - f. Composite (Plastic) Ties, Section 06131.
  2. Tolerances
    - a. The gauge, cross level, superelevation, and horizontal and vertical alignment of ballasted special trackwork shall be as shown and specified. Tolerances shall be as specified for ballasted track construction for BTC. Switch points in normal position shall be square within 5/8 inch

- b. Screw spike holes drilled in ties shall be 11/16 inch diameter and not less than five inches nor more than six inches deep.
    - c. Tolerance of plus or minus 1/16 inch shall be maintained for the distance between screw spike holes.
    - d. Tolerance of plus or minus 1/8 inch shall be maintained in the centering of screw spike holes across the width of the tie.
  - 3. Ties shall be bored for screw spikes, and only screw spikes will be permitted in special trackwork.
  - 4. The number and locations of holes shall conform to the location and number of screw spikes shown for each special plate.
  - 5. Elastic fastener tie plates shall have four screw spikes, one at each corner.
  - 6. Boring of holes in excess of those required will not be permitted.
  - 7. Boring in timber ties shall be performed with the heartwood face down. Holes bored in timber ties shall be treated with pentachlorophenol oil immediately after boring.
  - 8. Holes shall be located so that each tie plate will be centered on the tie at a right angle to the rail.
  - 9. Prior to installing tie plates, the surface of the tie shall be swept clean to allow full bearing of the plate on the tie.
  - 10. Boring and spiking will ensure that the outside shoulder of the plates will have full bearing against the rail base when the rails are at proper line and gauge.
  - 11. Spikes shall be started vertically and square, and shall be installed straight. Straightening of spikes will not be permitted. Spikes bent during installation shall be withdrawn and the holes plugged (with treated tie plugs if wood, as per manufacturers instruction if composite). Screw spikes shall be installed firmly to the top surface of the plates.
  - 12. All special plates, not in the switch panel, which span two or more ties shall not be spiked during shop assembly to preclude un-spiking for disassembly and packaging. The Contractor's method for locating these plates, drilling the ties and holding the plates in place during shop assembly and inspection shall be approved by the Engineer.
- C. Identification Numbers:
- 1. As shown on the drawing, each turnout has an identification number. This number shall be stamped on a metal tag and the tag affixed to each panel and separate component bundle.
  - 2. Tags shall be made of corrosive-resistant metal such as anodized aluminum or brass. Fastening nails shall be of the same material as the tags. Numbers shall be stamped in characters 1/2 inch minimum in height. Tags shall be a minimum of .050 inches thick, 1-1/4 inches wide and two inches long.
- D. Package and label parts and replacement materials in moisture-proof containers suitable for shipment and storage.
- E. Take special care to package anchor inserts for direct fixation rail fasteners, so as to prevent damage to the epoxy coating.
- F. Submit method of packaging to the Contractor's QC Staff for acceptance before shipping the anchor inserts.
- G. Attach copies of shipping list in the package and so that the list is readable from the exterior of the package.

#### **PART 4 - MEASUREMENT AND PAYMENT**

**4.01 MEASUREMENT:**

- A. Measurement of work specified in this Section will be made in the following manner:
  - 1. No separate measurement.

**4.02 PAYMENT:**

- A. Compensation for work specified in this Section will be made in the following manner:
  - 1. Included in the price of the work of which it is a part.

**END OF SECTION**

## SECTION 05659

### SPECIAL TRACKWORK

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This Section specifies manufacture, fabrication, shop assembly, inspection, testing, packaging and shipping special trackwork materials.
- B. Special trackwork shall include components for installations in both ballasted and direct fixation track.
- C. This Section also specifies fabricating and furnishing guarded turnouts as shown and specified.

##### 1.02 RELATED SECTIONS

- A. Section 05651 - General Track Construction
- B. Section 05652 - Ballasted Track Construction (BTC)
- C. Section 05653 - Direct Fixation Trackwork Construction (DFTC)
- D. Section 05654 - Special Trackwork Construction - Ballasted
- E. Section 05655 - Special Trackwork Construction - Direct Fixation
- F. Section 05656 - Running Rail
- G. Section 05657 - Direct Fixation Rail Fasteners
- H. Section 05658 - Track Appurtenances and Other Track Material
- I. Section 06130 - Timber Ties
- J. Section 06131 - Composite (Plastic) Ties

##### 1.02 REFERENCES

- A. Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.
  - 1. American Railway Engineering and Maintenance-of-Way Association, Manual for Railway Engineering, herein referred to as the AREMA Manual, **latest edition**.
  - 2. American Railway Engineering and Maintenance-of-Way Association, Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio, **latest edition**.
  - 3. American Society of Testing and Materials (ASTM)
  - 4. Association of American Railroads (AAR) Signal Manual
  - 5. American Council of Independent Laboratories' Manual of Practice
  - 6. American Welding Society (AWS)
  - 7. Industrial Fastener Institute (IFI)

#### 1.04 QUALITY ASSURANCE/CONTROL

- A. Quality Assurance Program - Refer to Section 05651, General Track Construction, and conform to the requirements of the Quality Assurance Program.
- B. **Quality Assurance Program must be submitted to the Authority and must be consistent with ISO 9001.**
- C. Tolerances: Conform to the AREMA Portfolio - Plan No. 1010-89, Permissible Variations in Completed Frogs; Plan No. 1011-84, Permissible Variations in Completed Switches; the AREMA Manual, Section 7, and the AREMA Manual, Section 5, in all aspects unless modified by the contract documents.
- D. Codes, Regulations, Reference Standards and Specifications:
  - 1. Except as modified in the contract documents, design, manufacture, test, assemble, inspect, ship, unload and stack special trackwork in accordance with the AREMA Portfolio and the AREMA Manual. **After approval by the Engineer, match mark all components and package as specified.**
  - 2. **Contractor's checklist/measurement report shall be provided. The checklist shall be completed and submitted to the Engineer for approval prior to shipping any special trackwork.**
  - 3. Except as modified in the contract drawings, use rail in the special trackwork conforming to the requirements of the AREMA Manual, Chapter 4, and Section 05656, Running Rail.\
- E. **WMATA, or its representatives, reserve the right to visit the producers facility during usual business hours unscheduled to a) observe sampling and testing procedures, b) obtain samples of the prepare material being produced and shipped, and c) review plant inspection methods, quality control procedures, equipment and examine test results of current and previous tests.**

#### 1.05 TESTING

- A. Notify the Authority in writing not less than 14 days in advance of dates scheduled for any test. The Authority retains the right to witness testing. Do not conduct test until authorized by the Authority.
- B. Testing Laboratory:
  - 1. Perform qualification and production quality control tests using either an independent testing laboratory or a qualified manufacturer's laboratory reviewed by the Authority. If an independent testing laboratory is selected, it shall be a member of the American Council of Independent Laboratories. If a manufacturer's laboratory is selected, it shall satisfy the requirements of the American Council of Independent Laboratories' Manual of Practice - Quality Control System - Requirements for A Testing and Inspection Laboratory, and ASTM E329.
  - 2. The selected laboratory shall use the proper equipment and qualified personnel for testing such as described in this Section.
- C. Testing Equipment: Provide equipment in good operating condition, of adequate capacity and range, and accurately calibrated. Use testing equipment that is in calibration with standards which are certified and traceable to the National Bureau of Standards within one year immediately preceding the test date. Submit copies of calibration certificates with test reports.

- D. Documentation: In conjunction with the specified tests, submit the following documents for review:
1. Test program plan: In this plan, identify Contractors' approach for accomplishing each of the specified qualification and production quality control tests. Include the projected schedule for test procedure submittals, test executions, and test results report submittals.
  2. Test procedures for each test, describing the objective, equipment, and instrumentation that will be used, procedure to be implemented, and the anticipated results. Include working drawings detailing test equipment and set-up of direct fixation rail fastener that will be tested.
  3. Test report:
    - a. A separate report of test results for each test which includes original data calculations, test procedure references, test equipment identification, test personnel, date of test, specified requirements, actual test results, nonconformance if any, and interpretation of the results. Highlight conformance or deviation in a report summary.
    - b. Accompany the written test reports with a photographic record of the tests. Include photographs of sufficient clarity to distinguish relevant details as described or referenced in the respective written report.

#### **1.06 PRODUCTION QUALITY CONTROL TESTS OF INSULATION PIECES**

- A. Test insulated gauge plates and switch rods in accordance with AAR Signal Manual, Part 14.5.3.

#### **1.07 SUBMITTALS**

- A. Refer to Section 01300, Submittals.
- B. Shop drawings for special trackwork components, including the following
1. Insulated curved split switches, including stock rails.
  2. Insulated switch rods, including clip assemblies.
  3. All insulation materials, parts and assemblies.
  4. Closure rails, turnout rails and connecting rails as provided in the contract documents.
  5. Frog and frog guard rails.
  6. All special plates, including details of components.
  7. Switch panel details.
  8. Rail braces and housing chairs.
  9. Direct fixation rail fasteners, including details of components.
  10. Complete layouts and details for all types of turnouts, single crossovers, double crossovers, and crossing diamonds.
  11. Installation drawings for each type of assembly used during construction.
- C. Product data:
1. Certification of the procedure used in the depth hardening of frog castings.
  2. Test data for the rail used in all fabrication for compliance with AREMA and these specifications.
- D. Refer to Section 01322, Certificates and Reports, and submit the following:
1. Certificates of material compliance required by AREMA and this Specification.
  2. Test reports of chemical analyses, Brinell hardness, electrical insulation, and other tests required by AREMA and this Specification.
  3. Frog depth hardening results

- E. Testing laboratory, testing equipment, test program plan, test procedures and test reports for the direct fixation rail fasteners, including the following resting laboratory information for review by the Authority prior to testing:
  - 1. Name and address of the laboratory
  - 2. A description of the facilities and testing equipment that will be assigned for this testing.
  - 3. Names, experience, and qualifications of the personnel that will be laboratory's experience in performing this testing.
  - 4. For the testing of the direct fixation rail fasteners, a list of the laboratory's experience in testing this type of rail fasteners or fastener - like assemblies
- F. A certified copy of reports on the analyses and tests required by referenced ASTM specifications.
- G. Contractor's method for locating all special plates, not in the switch panel, which span two or more ties, drilling the ties and holding the plates in place during shop assembly and inspection.
- H. Configuration and method of fabrication for switches.
- I. Check list or measurement report for all switches and frogs approved by the Engineer. This shall show the design size and allowable tolerance required by AREMA, or as shown and specified in these contract documents, as well as the actual size.
- J. Detailed description of the procedure for bonded insert and bonded joint installation approved by the Engineer.
- K. Method of packaging and loading each unit approved by the Engineer.

**1.08 PREASSEMBLY**

- A. Completely assemble, prior to shipment, the turnouts, crossing diamonds, and crossovers in Contractor's fabrication shop for inspection by the Contractor's Quality Control (QC) Staff, For mainline turnouts and crossovers, assemble on the specified switch ties and/or the direct fixation fasteners which will be incorporated into the Work.
- B. Fully bolt and assemble rail joints for all turnouts. For inspection, use temporary joint bars with "C" clamps for shop assembly. Install 3/16 inch end post shim where insulated joint bars are indicated. Do not apply adhesive during this process.
- C. No bracing, wedging, or support blocking will be permitted to hold components to proper gauge and alignment.
- D. Variations from the Authority reviewed shop drawings or other contract documents will constitute noncompliance and will not be accepted for shipment unless or until proper modification are made and reviewed by the Authority.
- E. Make available to the Authority, without charge, the facilities and assistance to examine the work during its progress, and when the product is finished, to satisfy the Authority that the finished product will comply with the contract documents. Provide templates and one yard straight edge or longer, as necessary, to check flangeways, rail end drilling, switch rail planing, and other features of the Work usually checked by templates.
- F. Present material for inspection in a safe area away from excessive noise and manufacturing activities. Provide labor to facilitate inspection of the top, side and bottom of frogs and switches.

- G. With minimal bar pressure acting on the switch rail at rod number 1, 25% or more of the switch point contact length, starting from the tip of the point, shall make positive, firm contact with the ball of the stock rail.
- H. With no pressure acting on the switch rail, the maximum allowable spring back between the switch point and the ball of the stock rail shall be 3/16 inch, measure six inches back from the tip of the point.
- I. For inspection and review, match mark rails in appropriate colors, and sequentially number fasteners or switch ties, in accordance with the Authority reviewed System. Submit the match marking and numbering system on the Contracting Drawings for the Contractor's QC Staff before match marking and numbering commences.
- J. Provide the record of the Contractor's completed turnout inspection checklist to WMATA.

## **PART 2 - PRODUCTS**

### **2.01 GENERAL REQUIREMENTS**

- A. Special trackwork materials, including oval-neck track bolts of one-inch nominal diameter, nuts and spring washers, and special trackwork assemblies shall be in accordance with AREMA except as modified on the contract drawings and specifications.
- B. Rail, switches, frogs and other track material shall be in accordance with AREMA dimensional requirements for 115 RE rail section except as modified on the contract drawings and specifications.
- C. Heel ends of switch rails, and ends of stock, closure and connecting rails shall be beveled in accordance with AREMA requirements.
- D. Cut all rail ends in accordance with AREMA requirements except that tolerance to be taken up in the rail base.
- E. Drill rail ends to receive 36-inch, six-hole joint bars in accordance with AREMA and as shown. Standard joints shall be drilled to allow butting of rail ends. Insulated joints shall be drilled to allow for a 3/8-inch end post. Drill holes in accordance with joint manufacturers instructions, plus or minus 1/32-inch.
- F. All rail shall be in accordance with Section 05656, Running Rail.
  - 1. Guard rails: 132 RE section.
  - 2. All other rail: 115 RE section.
- G. Drill and ream holes with edges beveled.
- H. All joints required for installation shall be new material.
- I. Supply all ties in accordance with Section 06130, Timber Ties or Section 06131, Composite (Plastic) Ties.

### **2.02 STOCK RAILS, CLOSURE RAILS AND CONNECTING RAILS**

- A. Length: As shown plus or minus 1/8-inch.
- B. All ends drilled except ends to be connected to CWR which shall be drilled in the field.

- C. Standard Rail and weight shall be new 115 RE rail section, and shall be in conformance with AREMA recommended rail sections, 115 RE rail section and specifications for steel rails, (latest edition).
- D. Rail lengths as identified in the contract documents. The standard rail length of rails shall be either 39, 78 or 80 feet.
- E. Refer to Section 5656.2.01 for physical characteristics of running rails.

## 2.03 FROGS

- A. Railbound manganese steel construction as shown
- B. Frog casting
  - 1. Depress heel of manganese frog casting in accordance with AREMA Plan 617-89.
  - 2. Depth-harden impact areas of manganese frog castings.
- C. Frog inserts
  - 1. Cast inserts of carbon steel in accordance with AREMA Specification M3.
  - 2. Provide inserts of one-piece construction.
  - 3. Provide inserts having full-face contact conforming to configuration of 115 RE rail.
  - 4. Provide available bonding area per inch of length equivalent to that available for bonded standard joints where applicable. Adjust dimensions of bonded inserts to allow for glue and fabric.
  - 5. Ensure the inserts are smooth and straight and do not exceed the following permissible variations:
    - a. Width between rail webs: Plus or minus 1/32-inch of that shown.
    - b. Depth of flangeway groove: Plus or minus 1/16-inch of that shown.
    - c. Length of insert: Plus or minus 1/8-inch of that shown.
    - d. Straightness of all portions of inserts adjacent to rail using 36-inch straightedge: Plus or minus 1/32-inch.
    - e. Finishing height variance of inserts from that required for bonding area: Plus or minus 1/64-inch.
- D. Assembly: Prior to delivery, assemble frogs as shown.
  - 1. Bonding adhesive: As manufactured for bonded joint bars by Allegheny Drop Forge Company, Portec, Inc. or equal, applied as directed by the manufacturer to all contact surfaces between inserts and rail.
  - 2. Secure frog, except for insert, with 1-3/8 inch diameter high -strength bolts in accordance with AREMA requirements.
  - 3. Assemble inserts with 1-1/8 inch diameter high-strength bolts, ASTM A490, and lock nuts. Position bolt holes in accordance with AREMA Plans 621-89 and 1010-89 and as shown. Bolt holes 1-3/8 inches in diameter plus or minus 1/32- inch.
  - 4. Flat washers: ASTM F436.
  - 5. Equip bolts as shown with one beveled or flat headlock washer and one flat or beveled washer to provide square bearing and to permit tightening of nuts by wrench.
  - 6. Lock nuts: IFI-100 and IFI-101, ASTM A563, Grade C.
  - 7. Tension bolts to between 75 percent and 85 percent of proof load. Exact value as directed by the Engineer. Ascertain bolt tension by means of torque wrench. Determine desired torque by test similar to that described in IFI-101.

## 2.04 FROG GUARD RAILS

- A. Length: 12'-6"
- B. Complete with blocks and bolts as shown.

## 2.05 SWITCHES

- A. Minimum yield strength: 95,000 psi.
- B. Switch Rails: As shown.
  - 1. Switch rails and stock rails: In accordance with Section 05656, Running Rail, and AREMA Plan 221-62, Detail 5100.
    - a. Stock rails may be thick web or constructed with reinforcing bars.
    - b. Stock rail lengths: as shown or as required for switch panel..
  - 2. Bolts, rivets, fittings and spring washers in accordance with Appendix A of the AREMA, Portfolio.
    - a. Fabricate five bolt heel joint assembly in accordance with AREMA Plan 221-62 and AREMA Manual.
    - b. Fabricate forged steel rail stops in accordance with AREMA requirements.
    - c. Switch inserts with bolts: As specified for frog inserts.
- C. Drill stock rails for ballasted special trackwork as shown. Switch heaters will be furnished and installed by other trades.
- D. Floating heel blocks for No. 10 and No. 15 switch as shown.
- E. Floating heel block for No. 8 guarded switch as manufactured by Rail Products and Fabricators or equal.
- F. The guarded turnouts shall have a modified five bolt hell joint assembly to accommodate the stock rail, switch rail and guard rail in accordance with AREMA Plan 221-62 and AREMA Specifications.

## 2.06 SWITCH RODS

- A. Switch rods and clips of vertical design, Type MJS, modified as shown.
  - 1. Insulated construction.
  - 2. Assembled.
  - 3. Test in accordance with AAR requirements.
  - 4. Length: As shown.
- B. Switch rods must be capable of at least one (1) inch plus/minus adjustment after the initial specified 5 inch throw has been set.
- C. Contractor's shop drawings shall provide the required spread measurement for each switch rod which are needed to support the specified throw.

## 2.07 RAIL BRACES

- A. Boltless adjustable brace equal to those formerly manufactured by Bethlehem Steel, modified to permit installation of one inch diameter electric switch heaters on rail web of ballasted turnouts.
- B. Shop weld rail brace backing blocks to switch plates.

- C. Rail brace backing blocks to permit mounting on 3/4-inch thick flat plates. Allow for modification to fit 1/4-inch recessed gauge plates. Ensure that distance from rail base to horizontal bearing surface of backing block is the same in each case to permit use of standardized wedge.
- D. Clearance between backing block and rail base: Determined by design of selected brace.
- E. Brace shall use left-hand Pandrol spring clips e2056.

## **2.08 PLATES**

- A. Furnish special trackwork units with special plates as shown, fabricated of 3/4-inch thick steel, ASTM A36 in accordance with designs shown or AREMA requirements.
- B. Plates complete with specified rail base backing blocks, riser plates, rail stops and rail clamp blocks welded thereon.
- C. Riser plates and rail stops fabricated of ASTM A36 steel as shown and as specified.
- D. Punch holes in each plate perpendicular to face. Cut clean without torn or ragged edges.
- E. Straighten plates cold in press or roller until surface and line requirements are met. The following tolerances are not cumulative.
  - 1. Plate thickness: Plus or minus 1/32-inch.
  - 2. Middle ordinate: Place plate on horizontal support. Place straightedge or wire string from one end of plate to the other on the concave side. Measure distance between plate surface and straightedge or string line. Distance not to exceed 0.001 inch per inch of length with surface upsweep or downsweep uniform.
  - 3. Plate thickness of dual rail stops, single rail stops and riser plates: Plus or minus 1/32-inch.
  - 4. Straightness of edge of dual rail stops, single rail stops and riser plates parallel and adjacent to base of running rail: Plus or minus 1/32-inch.
  - 5. Transverse dimension of dual rail stops: Plus or minus 1/32-inch.
  - 6. Tolerances other than those specified: Plus or minus 1/8-inch.
  - 7. Spike hole locations for ballasted special trackwork: Plus or minus 1/8-inch.
- F. Identification of plates:
  - 1. Stamp with suitably sized characters not less than 1/2-inch in height, located on top surface and plainly visible when assembled.
  - 2. Include Contract Number and identification designation as shown.
- G. Fillet weld rail braces, rail stops, riser plates and rail clamps to their respective plates as shown in accordance with AWS D1.1.
- H. In special trackwork fabricated for ballasted trackwork, seven inch wide elastic fastener tie plates suitable for e2056 Pandrol spring clips shall be used at all support locations not having special frog, switch, gauge or guard plates.

## **2.09 GAUGE PLATES**

- A. Switch gauge plates as shown and as specified for plates.

- B. Insulation shall be a four hole 7-1/2" x 8" x 3/4" epoxy fiberglass splice block fastened to the plate with Huck type compression fasteners. The insulating material shall have a tensile strength of 70 ksi, compressive strength of 100 ksi and a tensile modulus of  $3.4 \times 10^6$ .

## 2.10 TURNOUT GUARD RAIL

- A. Length: As shown.
- B. Complete with blocks and bolts as shown.
- C. Type: 132 RE rail.
- D. Planned in accordance with AREMA Plan No. 504-89.

## 2.11 RAIL JOINTS

- A. Furnish all standard and insulated joints within the turnout.
- B. End post shall be reinforced epoxy fiberglass or approved equal.

## 2.12 GUARDED TURNOUTS

- A. Guard Rail Stop:
  - 1. Ductile Iron: ASTM A536, Grade 65-45-12 to fit 115 RE rail and as supplied for NYCTA guarded turnouts.
    - a. Direct Fixation Turnouts:
      - 1) Ductile iron rail stops shall be attached to the steel plate with 7/8" square neck carriage bolts, ASTM A325, inserted through a square punched hole from the underside of the plate. A heavy hex nut, Grade 3 ASTM 563 and flat washer, weathering steel ASTM F436 shall complete the assembly; three bolts, nuts and washer per rail stop.
  - 2. Ballasted Turnouts:
    - a. Ductile iron rail stops shall be attached to the tie and plate; three studs with nuts and washers per rail stop. Cast rail stops and house chairs shall be fastened through the ties with 7/8" diameter double end threaded studs, flat washers and heavy hex nuts. The nuts and washers shall be fastened to the stud on the underside of the tie and on top of the casting similar to NYCTA guarded turnouts.
  - 3. The rail stop shall be backed with a 6" x 2" x 1/2" steel block welded to the rail plate.
- B. Manganese Housing Assembly:
  - 1. Cast manganese steel: AREMA Manual.
  - 2. Housing: Similar to that manufactured for the NYCTA.
    - a. Direct fixation - 6' - 2 1/2" long.
    - b. Ballasted track - 5' - 5" long.
  - 3. Housing Chairs: Ductile Iron ASTM A536 Grade 65-45-12, as manufactured for NYCTA.
    - a. Direct fixation housing chairs shall be fastened to steel plates and gauge plates similar to ductile iron rail stops, except that one hole, as shown, in each chair shall be sized for an anchor assembly instead of the square neck carriage bolt.
    - b. Ballasted housing chairs shall be fastened to ties, steel plates and gauge plates similar to ductile iron rail stops.

- c. The first housing chair number shall be configured for bolting to a 132 RE guard rail which continues ahead of the point of switch as shown.
4. No part of the housing shall extend more than 1-1/2 inches above the top of rail.

## 2.13 ELASTOMER PADS

- A. Elastomer pads shall be furnished for use under special plates in special trackwork shall be fabricated from polychloroprene (neoprene) as shown and as specified below.
- B. Physical Characteristics
  1. Elastomer pads shall be 3/4 inch thick and extend 1 inch beyond the plate edges on all sides.
  2. All pads shall have a Durometer A hardness of 50 in accordance with ASTM D2240.
  3. Elastomer pads furnished for use under all special plates shall be cut from a uniformly cored sheet conforming to the following requirements:
    - a. Coring shall consist of cylindrical holes 11/16 inch in depth. A continuous membrane 1/16 inch thick shall close one end of all holes.
    - b. Cored holes shall be 1-5/8 inches on center measured between adjacent holes in all directions.
    - c. Anchor bolt holes, 1-5/8 inch in diameter, shall be cut at the required locations on the pad.
    - d. Tolerances for finished pads shall be as follows:
      - 1) Length and width: Plus or minus 1/4 inch.
      - 2) Thickness: Plus or minus 0.03 inch.
      - 3) Squareness: Plus or minus 1 degree.
      - 4) Centering of holes: Plus or minus 1/32 inch.
      - 5) Diameter of holes: Plus or minus 1/32 inch.
      - 6) Durometer: Plus or minus 5 points.
    - e. The diameter of the core holes shall be as follows:
      - 1) Pads for use under all special plates having a longitudinal dimension greater than 12 inches measured along the rail shall have a diameter of 1 - 1/8 inch.
      - 2) Pads for use under plates having a longitudinal dimension measured along the rail equal to or less than 12 inches shall have a diameter of 3/4 inch.
- C. Testing of Elastomer Material
  1. The following test shall be performed on each of two pads or on specimens taken from two pads that are identical in all respects to the elastomer proposed for use in special trackwork. All testing shall be at no expense to the Authority.
  2. In the event specimens cannot be taken from finished pads, samples certified by the supplier to have been taken from a batch of compound used for making the elastomeric component and having a cure equivalent to the cure of the elastomer component shall be used for the tests.
    - a. The elastomer shall be tested in accordance with ASTM D412, to determine the tensile strength and the ultimate elongation. The tensile strength shall be not less than 1500 psi and the ultimate elongation shall be not less than 350 percent.
    - b. The elastomer shall be tested for 22 hours at 100C in accordance with ASTM D395, Method B, to determine the percent of compression set. The compression set shall not exceed 30 percent.
    - c. The elastomer shall be aged for 336 hours at 70C in accordance with ASTM D573. The change of hardness and the percentage of change from the original tensile strength and original ultimate elongation shall not exceed 40 percent. The change in hardness, measured on the Durometer A scale shall not exceed 10 points.

- d. Test specimens shall be prepared in accordance with Procedure A of ASTM D518. The test specimens shall be tested in accordance with ASTM D1149, at a temperature of 40C, and at an ozone concentration of 50 pphm. The elastomer shall not exhibit any cracking when examined in accordance with ASTM D1149 at the end of a 100 hour exposure.
- e. The elastomer shall be tested at minus 10C for 94 hours in accordance with ASTM D1229, to determine the percent compression set at 30 minutes after release (t30 reading). The compression set shall not exceed 50 percent.
- f. One test for oil absorption shall be conducted with ASTM No. 3 oil at 100C for 70 hours and another test using a different sample shall be conducted with ASTM No. 1 oil at 100C for 70 hours in accordance with ASTM D471, to determine the volume change of the elastomer. The volume change for the No. 1 oil shall not exceed minus 10 or plus 20 percent. The volume change for the No. 3 oil shall not exceed 100 percent all not exceed 100 percent.
- g. Prior to commencing production of elastomer pad sheets, a prototype pad, using the chemical composition intended for production pads, shall be prepared and tested using a one inch by eight inch by one foot nine inch steel plate with two special plate anchorage assemblies two inches from the edges of diagonally opposite corners. The plate and the prototype pad shall be assembled, mounted on a reinforced concrete slab simulating actual field conditions, and subjected to the following tests.
  - 1. A vertical load increasing in increments of 1000 pounds to a maximum load of 15,000 pounds shall be applied downward at the center of plate normal to the plate. For each load the vertical deflection of the center of the plate shall be measured to the nearest 0.001 inch and recorded. The load shall be removed and the final position of the plate measured and recorded. The recorded values for vertical load and deflection shall be plotted on a graph as illustrated in Specification Section 05658, **Exhibit 05658-C**.
  - 2. The load vs. deflection curve shall lie within the envelope illustrated in Specification Section 05658, **Exhibit 05658-C** for loads in the range from 4,500 pounds to the load corresponding to a 120,000 pound vehicle. Throughout that loading range, the spring rate of the fastener, slope of the load-deflection curve, shall not be less than 80,000 pounds per inch or more than 130,000 pounds per inch and shall be of a constant slope within 10 percent. In the event the curve fails to meet the requirements specified above, the chemical formulation of the pad, the coring size, or both shall be modified and the new elastomer pad design retested.
  - 3. An electrical resistance test with one anchor bolt grounded, 100 volts dc shall be applied to the rail head for three minutes. The actual current flow shall be measured to the nearest 0.1 microampere and recorded. Then 1000 volts dc shall be applied to the rail head for two hours, after which 100 volts dc shall be applied again for three minutes and the actual current flow shall be measured, as above, and recorded. A potential of 50 volts rms ac shall be applied to the rail head for three minutes for each increment of measurement for frequencies from 20 Hertz to 10 kilohertz in increments of measurement of 20 Hz up to 100 Hz; 200 Hz up to 1000 Hz; and 2000 Hz up to 10 kHz. The impedance after three minutes shall be determined with an accuracy of plus or minus two percent and recorded for each frequency.

The maximum current for 100 volts dc shall be 1.0 microampere.  
The minimum impedance for any frequency with 50 volts rms ac shall be 10,000 ohms.

## **2.14 SEPARATOR BLOCKS**

- A. Separator blocks shall be five inches long made of steel or cast iron configured for a 1-7/8 inch flangeway between 115 RE running rail and 132 RE guard rail.
- B. Connect separator blocks with a 1-3/8 inch high strength, square head bolt, spring washer and heavy hex nut with one beveled or flat headlock washer and one flat or beveled washer to provide square bearing and to permit tightening of nuts by wrench.

## **2.15 GUARD RAIL JOINTS**

Except for the insulated joint shown in the rail layout diagram, joints in the guard rail shall not be nearer than four (4) feet to a joint in the 115 RE running rail.

## **2.16 TIMBER TIES**

See Specification Section 06130.

# **PART 3 - EXECUTION**

## **3.01 INSTALLATION**

- A. Direct Fixation Special Trackwork Fabrication
  - 1. Fabrication of special trackwork for direct fixation track shall be as specified and shall comply with the applicable related Sections:
    - a. General Track Construction (GTC), Section 05651.
    - b. Direct Fixation Trackwork Construction (DFTC), Section 05653.
    - c. Special Trackwork Construction - Direct Fixation, Section 05655.
    - d. Direct Fixation Rail Fasteners, Section 05657.
  - 2. Tolerances
    - a. The final gauge, cross level, superelevation, horizontal alignment and vertical alignment of direct fixation special trackwork shall be as shown and specified. Tolerances shall be as specified for direct fixation track construction for GTC. Switch points in normal position shall be square within 5/8 inch.
- B. Ballasted Special Trackwork Fabrication
  - 1. Fabrication of special trackwork for ballasted track shall be as specified and shall comply with the applicable related Sections:
    - a. General Track Construction (GTC), Section 05651.
    - b. Ballasted Track Construction (BTC), Section 05652.
    - c. Special Trackwork Construction - Ballasted, Section 05654.
    - d. Track Appurtenances and Other Track Material, Section 05658
    - e. Timber Ties, Section 06130
    - f. Composite (Plastic) Ties, Section 06131.
  - 2. Tolerances
    - a. The gauge, cross level, superelevation, and horizontal and vertical alignment of ballasted special trackwork shall be as shown and specified. Tolerances shall be as specified for ballasted track construction for BTC. Switch points in normal position shall be square within 5/8 inch

- b. Screw spike holes drilled in ties shall be 11/16 inch diameter and not less than five inches nor more than six inches deep.
    - c. Tolerance of plus or minus 1/16 inch shall be maintained for the distance between screw spike holes.
    - d. Tolerance of plus or minus 1/8 inch shall be maintained in the centering of screw spike holes across the width of the tie.
  3. Ties shall be bored for screw spikes, and only screw spikes will be permitted in special trackwork.
  4. The number and locations of holes shall conform to the location and number of screw spikes shown for each special plate.
  5. Elastic fastener tie plates shall have four screw spikes, one at each corner.
  6. Boring of holes in excess of those required will not be permitted.
  7. Boring in timber ties shall be performed with the heartwood face down. Holes bored in timber ties shall be treated with pentachlorophenol oil immediately after boring.
  8. Holes shall be located so that each tie plate will be centered on the tie at a right angle to the rail.
  9. Prior to installing tie plates, the surface of the tie shall be swept clean to allow full bearing of the plate on the tie.
  10. Boring and spiking will ensure that the outside shoulder of the plates will have full bearing against the rail base when the rails are at proper line and gauge.
  11. Spikes shall be started vertically and square, and shall be installed straight. Straightening of spikes will not be permitted. Spikes bent during installation shall be withdrawn and the holes plugged (with treated tie plugs if wood, as per manufacturers instruction if composite). Screw spikes shall be installed firmly to the top surface of the plates.
  12. All special plates, not in the switch panel, which span two or more ties shall not be spiked during shop assembly to preclude un-spiking for disassembly and packaging. The Contractor's method for locating these plates, drilling the ties and holding the plates in place during shop assembly and inspection shall be approved by the Engineer.
- C. Identification Numbers:
  1. As shown on the drawing, each turnout has an identification number. This number shall be stamped on a metal tag and the tag affixed to each panel and separate component bundle.
  2. Tags shall be made of corrosive-resistant metal such as anodized aluminum or brass. Fastening nails shall be of the same material as the tags. Numbers shall be stamped in characters ½ inch minimum in height. Tags shall be a minimum of .050 inches thick, 1-1/4 inches wide and two inches long.
- D. Package and label parts and replacement materials in moisture-proof containers suitable for shipment and storage.
- E. Take special care to package anchor inserts for direct fixation rail fasteners, so as to prevent damage to the epoxy coating.
- F. Submit method of packaging to the Contractor's QC Staff for acceptance before shipping the anchor inserts.
- G. Attach copies of shipping list in the package and so that the list is readable from the exterior of the package.

**PART 4 - MEASUREMENT AND PAYMENT**

**4.01 MEASUREMENT:**

- A. Measurement of work specified in this Section will be made in the following manner:
  - 1. No separate measurement.

**4.02 PAYMENT:**

- A. Compensation for work specified in this Section will be made in the following manner:
  - 1. Included in the price of the work of which it is a part.

**END OF SECTION**

## SECTION 05660

### RESTRAINING RAIL AND LUBRICATORS

#### PART 1 GENERAL

##### 1.01 SECTION INCLUDES

- A. Furnish, fabrication and installation a restraining rail system.
- B. Furnish and install the lubricators to include concrete pads, lubrication distribution system, track connections and testing.
- C. Furnish and install all required electrical work for the lubrication system.

##### 1.02 RELATED SECTIONS

- A. Section 05651- General Track Construction
- B. Section 05652 - Ballasted Track Construction
- C. Section 05653 - Direct Fixation Track Construction
- D. Section 05656 - Running Rail
- E. Section 05658 - Track Appurtenances and Other Track Material (OTM)
- F. Division 16 - Contact Rail Sections

##### 1.03 REFERENCES

- A. Pertinent provisions of the following listed standards and publications shall apply to the Work, except as they may be modified herein, and are hereby made part of these Specifications to the extent required.
  - 1. American Railway Engineering and Maintenance-of-Way Association (AREMA), Manual for Railway Engineering, herein referred to as the AREMA Manual, **latest edition**.
  - 2. American Railway Engineering and Maintenance-of-Way Association (AREMA), Portfolio of Trackwork Plans, herein referred to as the AREMA Portfolio.
  - 3. American Society for Testing and Materials (ASTM):
  - 4. National Electric Code (NEC) and regulations of the jurisdictional authorities.
  - 5. Insulated Cable Engineers Association (ICEA)
  - 6. National Electrical Manufacturers Association (NEMA)
  - 7. Institute of Electrical and Electronics Engineers (IEEE)
  - 8. Underwriters Laboratories (UL)
  - 9. Military Specifications (MIL or MILSPEC)

##### 1.04 SUBMITTALS

- A. Submittals shall be as specified in Section 01300, Submittals.
- B. Submit a list of proposed suppliers, of all components within 90 days of notice to proceed. Subsequent changes in proposed suppliers shall be submitted as they occur.

- C. Submit the following to the **WMATA** Engineer for approval at least 120 days before the anticipated rolling dates.
- D. Date schedule of 132 RE rail production, inspection, shipment and final delivery.
  - 1. Detailed description of the steel metallurgy
  - 2. Lengths in which the restraining rail section will be provided.
  - 3. Description of the method and verification testing to achieve the required rail hardness.
  - 4. Detailed description of the metallurgy and method of fabrication of the mounting brackets.
  - 5. Detailed description of other components used in the restraining rail and guard rail assemblies including but not limited to shims, bolts, washers, nuts, etc.
- E. Provide two sample bracket assemblies (unpainted), each consisting of one bracket with one foot of restraining rail and all necessary hardware.
- F. Submit the method of handling and shipping for review and approval at least four (4) weeks before shipping of 132 RE rail and accompanying brackets and hardware.
- G. Submit the marking scheme for restraining rail and guard rail identification for installation not less than 30 days before fabrication.
- H. Provide processing reports and a list showing the heat and ingot for every piece for informal review during the in-plant inspection and formally submit the same information to the **WMATA** Engineer.
- I. Provide test records, including mechanical properties tests, hardness measurements, ultrasonic test records and all other required test documentation, for informal review during the in-plant inspection and formally submit the same information to the **WMATA** Engineer.
- J. Lubricator Electrical Work:
  - 1. Submit shop drawings and manufacturer's literature.
  - 2. Submit descriptions and **all** wiring diagrams of equipment.
  - 3. Submit field test procedures for cable.
  - 4. Submit flame retardance and smoke density test reports and data for tests performed not more than 12 months prior to submittal, for cables which are identical to the cable furnished.
  - 5. Provide certified test reports demonstrating that the cable complies in all respects with the requirements of the referenced Standards and Tests, and as modified herein.
  - 6. Provide certificate of conformance to specified wire requirements. Include certificate with submittal of shop drawings and with each cable shipment.
- K. **Deliverables: Provide the WMATA Engineer one (1) Operation & Maintenance Manual and complete Parts Manual for each rail lubricator.**

#### **1.05 QUALITY CONTROL**

- A. Develop and maintain a quality control program regulating methods, procedures, and process to ensure compliance with standards of quality required by the Contract Documents.
- B. Records of all inspection work by the Contractor shall be kept complete and made available to the **WMATA** Engineer during the performance of the Contract.

- B. Inspection and Testing:
1. The products and material incorporated into the work will be subject to inspection by the Engineer at the Contractor's and Subcontractor's facilities, place of manufacture, the shipping point, and at the shipping destination. Inspection and tests by the **WMATA** Engineer will be performed in such a manner as not to unduly delay the work.
  2. **WMATA, or its representatives, reserve the right to visit the producers facility during usual business hours unscheduled to a) observe sampling and testing procedures, b) obtain samples of the prepare material being produced and shipped, and c) review plant inspection methods, quality control procedures, equipment and examine test results of current and previous tests.** Whether or not the **WMATA** Engineer inspects or tests any materials, the Contractor will not be relieved from any responsibility regarding defects or other failures to meet the Contract requirements, nor will such inspection or testing be considered as a guarantee of acceptance of any material which may be delivered later.
  3. Perform all tests and analyses specified in the AREMA Manual (**latest edition**) and submit the results to the **WMATA** Engineer for approval.
  4. Make all rail tests and inspections at the mill prior to shipment. Assume full responsibility for all testing indicated. Give the **WMATA** Engineer sufficient notice when testing in any form is proposed so he may witness the tests.
  5. Provide the **WMATA** Engineer free entry at all times to the manufacturer's mill to inspect processing and testing of rail while work on this Contract is being performed.
  6. Performed all tests specified herein at no additional cost to the Authority.
  7. Testing must be witnessed and certified by a qualified independent testing firm or individual.

#### **1.06 DELIVERY, HANDLING AND STORAGE**

- A. Restraining rail shall be stacked and banded for shipment according to normal practice. Brackets shall be palletized.
- B. Package small loose parts, i.e. bolts, washers and nuts in secure shipping boxes and kegs.
- C. Lift restraining rail at two points, with the rail weight evenly distributed to each lift point. Handle carefully to avoid damage.
- D. Load restraining rail with adequate wood strips between the tiers of rail to prevent damage in transit.

### **PART 2 - PRODUCTS**

#### **2.01 RESTRAINING RAIL SYSTEM**

- A. Rail: 132 RE head hardened or high strength in accordance with AREMA Requirements
  1. Hardness: 341 to 388 Brinell
  2. Length: 39 feet minimum
- B. Separator Block: Cast Ductile Iron.
- C. Shims: ASTM A36.
- D. Bolts: 1-3/8" diameter, square head, Type 3, ASTM A325.
- E. Nut: Hexagonal, Grade C3, ASTM A563.

- F. Steel Base Plate and Stop Block: ASTM A36.
- G. Spring Washer: AREMA Manual, Section 4.
- H. Flat Washer: Hardened weathering ASTM F436 steel.
- I. Screw Spike: As specified in Section 05658, Track Appurtenances and OTM.
- J. Pandrol Shoulders: As manufactured by Pandrol, Inc. or approved equal.
- K. Joints: As shown; and as specified in Section 05658, Track Appurtenances and OTM.
- L. Rail Brace: Boltless adjustable brace similar to those formerly manufactured by Bethlehem Steel for use with left-hand Pandrol Spring Clips, e2056.

## 2.02 LUBRICATORS

- A. Portec Protector IV Electric Wayside Lubricator including all hoses, clamps, fittings and lubricant distribution system. (No substitute or "or Equal" lubricator will be approved).
  - 1. The lubricator housing shall have two mounting brackets on each side to provide for anchoring with ½" expansion anchors into a concrete base pad.
  - 2. No electrically conductive materials that are a part of the lubricator system shall be installed closer than two feet to any running rail. ~~Non-conducting grease fittings shall be installed on all grease hoses.~~(NOTE: reason for omission: non-conducting grease fittings does not exist per manufacturer).
- B. Concrete: ASTM C94, 3500 psi with entrained air.
- C. Steel Rebar: ASTM A615, Grade 60.
- D. Cast Iron: ASTM A532.
- E. Ductile Iron: ASTM A536
- F. Malleable Iron: ASTM A47.
- G. Stainless Steel 304: ASTM A240, A276.

## 2.03 LUBRICATOR ELECTRICAL WORK

- A. Liquid-tight Flexible Conduit and Fittings: Applicable requirements of UL 360, flexible galvanized steel core, extruded liquid-tight neoprene or PVC jacket overall.
  - 1. Sizes up to 1-1/4 inch provided with continuous copper bonding conductor, spiral wound between convolutions.
  - 2. Sizes 1-1/2 inch and above provided with separate grounding conductor.
- B. Conduit Connector Fittings:
  - 1. UL 514B, material and finish similar to that of conduit with which they are to be used.
  - 2. For enclosures, cabinets, boxes and gutters in electrical rooms: Threaded nylon insulated bushing and locknut.
- C. Cable:
  - 1. UL-labeled as Type RHW-2 or XHHW-2, 600 volts; copper, size as shown; 10AWG and smaller, solid or stranded; 8AWG and larger, Class B stranded.

2. Standards: Except as modified, cable complying in all respects with ICEA S-68-516, NEMA WC8 or ICE S-66-524, NEMA WC7, as appropriate.
  3. Nonmetallic Jacket: Chlorosulfonated polyethylene, cross-linked polyolefin or heavy-duty neoprene, as follows:
    - a. Chlorosulfonated polyethylene complying with ICEA S-68-518, NEMA WC8.
    - b. Cross-linked polyolefin or heavy-duty neoprene with the following requirements when tested in accordance with Part 6 of ICEA S-68-516.
      - 1) Tensile strength: 1800 psi minimum.
      - 2) Elongation at rupture: 150 percent minimum.
      - 3) After air oven aging of 168 hours at 100 deg. C, tensile strength at least 100 percent of unaged value and elongation at least 80 percent of unaged value.
      - 4) After immersion for 18 hours in ASTM D471 Oil No. 2 at 121 deg. C, tensile strength and elongation at least 80 percent of original values.
    - c. Jacket material free of PVC and PVC-based compounds.
  4. Flame Retardancy: Cable passing vertical flame test as described in IEEE 383. Cable size for testing: Smaller than #1/0. Comply with UL and ICEA S-68-516.
  5. Smoke Generation: Single and multi-conductor cable jacket materials demonstrating low-smoke generation when tested in accordance with ASTM E662.
  6. Applied Voltage Testing:
    - a. All cable to be given applied voltage dielectric strength test, after six-hour water-immersion test in accordance with the following test procedures:
      - 1) Polyethylene insulated conductors: In accordance with the paragraphs 6.14.1, 6.14.2, 6.14.5 and 3.5.2 of ICEA S-66-524.
      - 2) Other conductors: In accordance with paragraphs 3.5.2, 6.27.1, and 6.27.2 of ICEA S-68-516.
- D. Connectors and Terminal Lugs: UL 486 with the following additional requirements:
1. For 10 AWG and smaller conductor cable: Pressure type tin-plated copper connectors having nonflammable and self-extinguishing insulation grip with temperature rating equal to that of the conductor insulation.
  2. For 8 AWG to 4/0 AWG conductor cable: Compression type tin-plated copper connectors and terminal lugs having nylon insulating sleeve or heat shrinkable insulator for insulation grip.
  3. Hardware: High strength silicon, bronze, corrosion resistant, non-magnetic, and electrolytic action free when in contact with copper.
- E. Bundling Straps: Self-locking steel barb on one end, with tapered strap of self-extinguishing nylon, temperature rating minus 65 deg. F to plus 250 deg. F.
- F. Insulating Tape:
1. Plastic tape: Vinyl plastic with rubber-based pressure-sensitive adhesive, pliable at zero degree F with the following minimum properties when tested in accordance with ASTM D1000
    - a. Thickness: 8.5 mils.
    - b. Breaking strength: 20 pounds per inch width.
    - c. Elongation: 200 percent.
    - d. Dielectric breakdown: 10,000volts.
    - e. Insulation resistance, indirect method of electrolytic corrosion: 1,000,000 megohms.

- G. Grounding and Bonding Equipment: UL 467, IEEE 80, with the following additional requirements:
1. Grounding conductor: Insulated conductor, size as shown and in accordance with NEC Tables 250-94 and 250-95 as applicable. Insulated conductor complying with the requirements specified for single conductor cable.
  2. Terminal lugs:
    - a. For 4/0 AWG and smaller conductors: Copper compression terminal lugs.
  3. Ground connector:
    - a. Type as shown or equal.
    - b. Copper alloy body and silicon bronze bolt, nut and lock washer with interlocking clamp.
  4. **Jumpers:** Copper braided or leaf-type flexible jumper, size as necessary.
  5. **Equipment ground kits: Insulated/isolated with a minimum up to eight grounded circuits. Install on inside wall of fiberglass enclosure. Secure kits to fiberglass enclosure using bolts and nuts.**
- H. Sealing compound:
1. FS TT-S-227, two component, fast-setting, polymeric sealing compound to provide watertight seal between concrete and conduit, between cable and conduit.
  2. Pour-type for horizontal and gun-grade for vertical or overhead application.
  3. When cured, sealant to have rubber-like flexibility allowing minimum movement of conduit and cable in temperature range of minus 40 deg. F to plus 150 deg. F without loss of watertight seal.
  4. Pot life: 15 minutes.
  5. Minimum ambient temperature for application: 35 deg. F.
  6. Initial cure: 15 minutes.
  7. Final cure: Seven days.
  8. Hardness, Durometer A: 20-35.
  9. Seal between conduit and single-conductor cable to withstand water pressure of 70 psi without leakage.
  10. Fox Industries, Type FX-571-G or equal.
- I. GFI Circuit Breaker:
1. NEMA AB1.
  2. Ground fault interrupter (**GFI**) circuit breaker: As shown and as specified. Overcurrent trip device coordinated to provide selective tripping under overload conditions.
- J. Expansion Bolt Anchors: Stainless Steel 304 in accordance with ASTM A276.
- K. Grounding stud: Manganese bronze ASTM B138, Alloy No. 675 hard, 3/8 inch high; Evedur GSI, American Brass Company or equal.
- L. Cable splice and tap-insulating/sealing kit: Suitable for use on 600-volt, 90C cables, material compatible with cable insulation and jacket, meeting the seal test requirements of ANSI C119.1.
1. Heat-shrinkable tubing UL-approved, flame-retardant, corrosion-resistant thick-wall tubing with factory-applied sealant for field insulation on in-line splices and taps to provide a watertight seal and insulating encapsulation, with the following additional requirements:
    - a. Material: Cross-linked polyolefin.
    - b. Shrink ratio: 3 to 1 (min.)
    - c. Physical properties:
      - 1) Ultimate tensile strength: 2,350 psi, ASTM D41
      - 2) Ultimate elongation: 350% minimum, ASTM D412
      - 3) Hardness, Shore D: 42, ASTM D2240.

- 4) Water absorption: 0.02%, ASTM D570, Method 6.1.
- 5) Specific gravity: 1.2, ASTM D792.
- d. Electrical properties:
  - 1) Dielectric strength: 450 volts per mil, ASTM D149.
  - 2) Volume resistivity:  $1 \times 10^{15}$  ohm cm, ASTM D257.
- e. Thermal properties:
  - 1) Continuous operating temp.: -55 to +135 deg. C.
  - 2) Air oven aging (14 days @ 175 deg. C):
    - a) Tensile strength: 2,680 psi.
    - b) Elongation: 375%.
  - 3) Low temperature flexibility (4 hours @ -55 deg. C): No cracking when flexed.
  - 4) Heat shock (4 hours @ 250 deg. C): No cracking, flowing or dripping.
- f. Chemical properties:
- g. Corrosivity: Non-corrosive, MIL-I-23053/15.
- h. Fungus resistance: Non-nutrient, ASTM G21.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

- A. Restraining Rail System
  1. Shop weld rail brace stop block and Pandrol shoulders to base plate.
  2. Install restraining rail system where shown. Install one base plate and bracket on each tie between the end limits of the restraining rail.
  3. Fasten base plate and bracket to the ties in accordance with the requirements of Section 05653, Ballasted Track Construction using six screw spikes, or in accordance with the requirements of Section 05653, Direct Fixation Track Construction as appropriate.
  4. Field drill the running rail and restraining rail to provide holes as required for the installation of spacer blocks and joints.
  5. Holes shall be cylindrical, of the diameter shown and drilled with an approved rail drill.
  6. Use an approved template as a guide for drilling holes.
  7. All holes drilled in the 115 RE running rail and 132 RE restraining rail for spacer blocks or joints shall be cold worked using the Railroad Cold Expansion process by Fatigue Technology, Inc., Seattle, Washington, or approved equal. The process shall be performed in accordance with the manufacturer's instructions by a crew whose supervisor has been trained by the manufacturer.
  8. Cut rail only as necessary to meet the following criteria:
    - a. The minimum rail length between an insulated joint and a standard joint shall be 15 feet.
    - b. The minimum rail length adjacent to a 15 foot rail shall be 24 feet.
    - c. The minimum rail length adjacent to an end section shall be 15 feet.
    - d. The number of intact 39 foot rail lengths shall be maximized.
    - e. End sections shall be the maximum length feasible.
  9. Rails shall be cut square and clean by means of rail saw or abrasive cutting disks. Rail end beveling shall be performed at all rail cuts and shall be in accordance with current AREMA Manual requirements for Beveling or Slotting of Rail Ends and AREMA Portfolio Plan No. 1005 (latest edition).
  10. Locate restraining rail insulated joints between the same fastener plates as the insulated joints in the adjacent running rail. Join rail as illustrated in the contract documents.

11. Assemble all non-insulated joints with thermite welds in accordance with AREMA requirements and the approved weld kit manufacturer's instructions. Four hole strap bars with cast-on fin clearance shall be installed on each side of the rail around the thermite weld.
12. Install bolts and nuts finger tight before tensioning bolts to 20,000 to 25,000 pounds by use of a track wrench or power torque wrench, starting from the center bolts and working to the end bolts. Immediately before the completion and acceptance of work, re-tighten track bolts to a tension of 15,000 to 25,000 pounds.
13. The thermite welded joints shall be centered over a plate. The base of the 132 RE rail shall be ground free of weld fins to fit flush on the plate.
14. Insulated joints shall be assembled with all components shown without rail gaps.
15. Install the restraining rail so that the flangeway is 1-7/8 inches plus or minus 1/8 inch measured 5/8 inch below the top of the running rail. Tighten the restraining rail hold down bolts to 75 percent of the proof load for the size of the bolt used.

B. Lubricators

1. Install lubricator in accordance with the manufacturer's recommendations where shown and as specified herein. **If specific mounting locations for the restraining rail lubricators are not specified, mount as per WMATA Trackwork Standard Drawing ST-TW-RR-006 (Lubricator Location At Grade) or as per the WMATA Engineer's direction.**
2. Mount lubricator to the concrete using expansion anchors and ½ " diameter bolts.
3. Install track assemblies and grease distribution system to the inbound track and outbound track in accordance with the manufacturer's recommendations. **A site visit by the lubricator manufacturer and site diagrams is required to determine the most optimal approach.**
4. The train detection system that initiates the release of lubricant shall be configured to release to the appropriate restraining rail when the train is moving in the normal direction **of traffic for both directions of train movement.**
5. Install grease hoses in accordance with the manufacturer's recommendations. Anchor hoses to ties with appropriate clips at a minimum spacing of 10 feet.
6. Perform electrical work as specified in the technical specification for electrical work.
7. At the completion of installation, the Lubricator Reservoir shall be filled with an appropriate lubricant approved by the **WMATA Engineer.**
8. Test lubricator system for proper application of lubricant as specified by the manufacturer and approved by the **WMATA Engineer.**

C. Lubricator Electrical Work:

1. The Contractor shall carefully examine all contract drawings and specifications and be responsible for the proper fitting of materials and equipment at each location as indicated, without substantial alteration. In as much as the drawings are generally diagrammatic and because of the small scale of the drawings, it is not possible to indicate all offsets, fittings and accessories which may be required. Furnishing such fittings and accessories as may be required to meet such conditions shall be at no additional cost to the Authority.
2. The Contractor shall verify exact location , size and extent of all existing utilities, obstructions, and/or other conditions which may affect the proposed work under the project. The Contractor shall take every precaution to prevent damage to existing work and shall repair any damage as a result of this Work.
3. Conduit:
  - a. Install conduit and fittings where conduit runs are shown.
  - b. Install exposed conduit parallel or perpendicular to the running rails as shown and avoid interference with existing work.

- c. Thread and ream the ends of field-cut conduit to remove rough edges. Use locknuts and bushings at conduit entrance to boxes, cabinets and equipment enclosures.
  - d. Bend conduit so that bends are free from cuts, dents and other damage.
  - e. Support horizontal conduit with one-hole pipe straps or individual pipe hangers.
  - f. Apply lead -free conductive **anti-seize** compound to threaded conduit joints.
  - g. Use minimum of 18-inch long liquid-tight flexible conduit connection to equipment subject to vibration.
  - h. Rod and swab conduit after installation, removing water and foreign matter.
  - i. Waterproof conduit connections.
4. Cable:
- a. Install cable as shown.
  - b. Use nylon straps to bundle and secure wire and cable in panelboards.
  - c. Use a minimum bending radius 12 times outer diameter of cable. Where shown, use shorter bending radius as permitted by NEC, Appendix H of ICEA S-66-524, NEMA WC7 and cable manufacturer.
  - d. To facilitate pulling cable, use UL-listed lubricant recommended by cable manufacturer.
  - e. Connect cables to equipment using integral mechanical connectors or compression connectors.
  - f. Identify feeder terminations to lubricators using nonmetallic fiberboard tags or plastic labels.
  - g. Attach tags to cable with slip-free plastic lacing or nylon bundling straps. Tags shall designate the panelboard name and circuit numbers serving lubricators. **Demonstrate that identification tagging of cabling and panelboard has been field verified with the WMATA Engineer present.**
  - h. Splicing of power cables is not permitted. An exception may be granted by the **WMATA** Engineer only in extraordinary conditions. Authorization for such an exception must be obtained from the Engineer in advance of making a splice. Any such exception must be fully documented and recorded on as-built drawings. The splice must be made watertight as shown.
5. Wire connection accessories:
- a. Secure connections or terminal lugs to the conductor to engage all strands equally.
  - b. Do not rupture insulation nor expose bare conductors.
  - c. Install compression connectors and terminal lugs using tools and pressure recommended by the manufacturer. Indent mark connectors and terminal lugs with number of die used for installation.
  - d. Apply anti-corrosion joint compound to connectors, terminal lugs and bolting pads before installation.
6. Grounding and bonding:
- a. Ground Connections:
    - 1) Use terminal lug to connect grounding conductor to equipment enclosure.
    - 2) Use continuous grounding conductor without splices.
  - b. Equipment grounding conductor: Provide equipment grounding conductor for single-phase branch circuits.
  - c. Bond metallic ac equipment enclosures to equipment grounding conductor in ac power feeder.
7. Connect branch circuit wires as shown.

8. Make power cable connections to circuit breakers, new molded case circuit breakers and neutral and ground bus bars in panelboards and enclosed circuit breakers by means of integral mechanical connectors as shown. If such items are not furnished with integral mechanical connectors, make connections using compression connectors.
9. On cable splices, taps and terminations cover connectors with electrical putty , wrapped with three layers of plastic tape or final layer or rubber tape and then install watertight encapsulation as follows and under the supervision of kit manufacturer's representative or using a factory-certified installation technician, proficient in field installation of heat-shrinkable sealing kits.
10. Use heat-shrinkable tubing for encapsulation of new splices, taps and terminations.
11. Field Quality Control:
  - a. After completion of installation and filling the reservoir with an approved lubricant, demonstrate proper performance of all equipment in the presence of the **WMATA** Engineer.
  - b. Test all metallic equipment enclosures, galvanized rigid steel conduits and liquid-tight flexible conduits for continuity to the grounding system.
  - c. Test non-grounded conductors for insulation resistance to ground of 10 megohms. When cable shows unsteady insulation resistance of less than 10,000 ohms, perform high potential test at 80 percent of factory ac test voltage or as recommended by cable manufacturer.
  - d. Test continuity of conductors using ohmmeter.
  - e. Test circuits for connection in accordance with the wiring diagram.
  - f. Check connections to circuit breakers for tightness.
  - g. Molded Case Circuit Breakers: Perform pole-to-pole and pole-to- ground insulation resistance tests with 1000 volt d.c. megger. Insulation resistance to be 50 megohms minimum.

#### **PART 4 - MEASUREMENT AND PAYMENT**

##### **4.01 MEASUREMENT:**

- A. Measurement of work specified in this Section will be made in the following manner:
  1. No separate measurement.

##### **4.02 PAYMENT:**

- A. Compensation for work specified in this Section will be made in the following manner:
  1. Included in the price of the work of which it is a part.

**END OF SECTION**

## SECTION 05661

### CONTACT RAIL AND APPURTENANCE FOR TRACTION POWER

#### PART 1: GENERAL

##### 1.01 SUMMARY

- A. This section specifies designing, fabricating, testing and furnishing a composite contact rail system, including the composite contact rail, splice joints, expansion joints, end approaches, terminal lugs, and all appurtenances ~~as shown and specified~~.
- B. Related Sections:
  - 1. Section 16127 - Contact Rail System Installation For Traction Power

~~C. Payment and Measurement:~~

- ~~1. Compensation for work specified in this section will be made in the following manner:
  - a. Work performed by the Contractor pursuant to fabricating and delivering contact rail, splice joints, expansion joints, end approaches, terminal lugs, nuts, bolts and miscellaneous hardware: Lump sum.~~

##### 1.02 REFERENCES

- A. Codes, regulations, references standards and specifications:
  - 1. AREA Manual for Railway Engineering for Continuous Cast Rail.
  - 2. ANSI H35.1, Type A6101-T6
  - 3. ASTM B317, Type B.
  - 4. Steel Structure Painting Council, SSPC-SP-10.
  - 5. NEMA CC1.
  - 6. ASTM B117.
  - 7. ASTM A2, Grade 65-35.
  - 8. ASTM A47, Grade 32510
  - 9. ANSI B4.1
  - 10. ASTM A325
  - 11. ASTM B134
  - 12. ANSI B18.8.1
  - 13. ASTM A153
  - 14. ~~ASTM A123~~ B695
  - 15. Steel Structure Painting Council, SSPC-SP-6
  - 16. SAE No. G-18
  - 17. ANSI C37.34

##### 1.03 SYSTEM DESCRIPTION

- A. Composite Contact Rail
  - 1. The composite contact rail shall consist of a steel base rail, with one aluminum extrusion fastened to each side of the web area of the base rail, continuous over the finished length.
- B. Appurtenances
  - 1. Appurtenances include expansion joints, end approaches, cast parts, terminal lugs, disconnect switch, nuts, bolts, and miscellaneous hardware.

## 1.04 SUBMITTALS

- A. Shop Drawings
  - 1. The Contractor shall submit for approval shop drawings for fabrication of the components and assemblies of the composite contact rail and appurtenances. No fabrication or manufacture shall be performed prior to drawing approval.
- B. Certification:
  - 1. Certification that composite contact rail and appurtenances furnished meet or exceed specified requirements
  - 2. Certified test reports.

## 1.05 QUALITY ASSURANCE

- A. Electrical Tests
  - 1. Splice Joint DC Resistance
    - a. Two sections of the composite rail, each 36 inches **or more in length**, shall be joined together. At a constant room temperature the resistance across the joint shall be measured in accordance with NEMA CCI and compared to an equal length of unjointed composite rail at the same temperature.
    - b. If the resistance across the jointed rail exceeds **by more than five percent** the resistance of the unjointed rail the joint design will be rejected.
  - 2. Composite Rail and Splice Joint Thermal Cycle
    - a. Using the same jointed and unjointed sections used in the dc-resistance test, the specimens shall be cycled thermally for a minimum of ten cycles. Each thermal cycle shall consist of lowering the rail temperature to minus 5C and measuring the resistance of the specimens, then raising the temperature of the specimens to plus 117C and measuring the resistance again for a minimum of ten cycles.
    - b. If at any time the resistance of the jointed or unjointed sections exceeds the requirements of these specifications, the design will be rejected.
  - 3. Composite Rail and Splice Joint Assembly Salt-spray Test
    - a. Using the same jointed and unjointed sections used in the dc resistance test, perform a 500-hour salt-spray test in accordance with the requirements of ASTM B117.
    - b. If, at the end of the test, the resistance of either specimen increases by more than five percent, the design will be rejected.
  - 4. Electrical Characteristics
    - a. The assembled composite contact rail shall have an electrical resistance not greater than 0.002 ohms per 1,000 feet at 20C. **The manufacturer shall provide certificates of product conformance.**
    - b. The composite rail shall be capable of conducting 5,000 amperes dc continuous with a temperature rise not to exceed 40C above 30C ambient in still air.
    - c. The rail shall be capable of withstanding a fault current of 135,000 amperes dc, or equivalent ac, for 100 milliseconds without mechanical or thermal damage.
    - d. The Contractor shall submit certification of **all the listed** electrical characteristics of the composite contact rail.
- B. Testing of Terminal Lugs
  - 1. Two assemblies from each lot of terminal lugs shall be tested. Failure of any assembly to pass the following tests will cause rejection of the entire lot.
  - 2. A completed compression connection shall provide electrical resistance not greater than an equivalent length of uncut cable when measured between the **distant** end of the cable and the connector tongue.
  - 3. Bare conductors shall be used for performing tests.

4. Resistance measurement shall be taken before and after the tests specified below.
5. The test connections shall then be subjected to a sustained tension of 5,000 psi of the nominal conductor cross sectional area for a period of three hours. At the end of three hours, there shall be no increase in electrical resistance of the connection beyond that specified. There shall be no slipping of the conductor in the connector nor deformity or loosening of the connection.
6. Provide certificates of product performance.

C. For codes, regulation, references, standards and specifications, refer to Article 1.02 above.

## **PART 2: PRODUCTS**

### **2.01 MATERIALS**

#### **A. Composite Contact Rail**

##### **1. Steel Base Rail**

- a. The steel base rail shall be new No. 1 or No. 2 rail conforming to the current requirements of the AREA Manual for Railway Engineering for continuous cast rail. No. 2 rails will be accepted for not more than 15 percent, by weight, of the total base rail furnished.
- b. The standard length of the steel base rail shall be 39 feet at a temperature of 60F. Shorter lengths, varying in increments of one foot from 39 to 25 feet, will be accepted for a maximum of 11 percent, by weight.
- c. A maximum variation of plus-or-minus ½ inch of the stated length for each rail will be permitted.

##### **2. Aluminum Extrusions**

- a. The aluminum extrusions shall be of a uniform cross section and shall conform to the alloy and temper requirements of ANSI H35.1, Type A6101-T6 and shall also conform to the requirements of ASTM B317, Type B.
- b. The extrusions shall be formed to permit maximum clamping force with the steel base rail and the cable terminal lugs to create the maximum electrical contact area. In addition, they shall permit rail tongs to grasp the head of the steel base rail for lifting the composite rail without damage to the aluminum extrusions.
- c. Sufficient clearance at the base shall be provided to permit mounting of the contact rail protection cover assembly, clearing insulator ears and other appurtenances. Sufficient clearance shall be provided at the rail head to mount the specified contact rail heater supplied in other contract.

##### **3. Splice Joint**

- a. The splice joint assembly shall consist of two aluminum alloy extrusions of the same material specified for composite rail aluminum extrusion, except that the internal contour of the splice joint extrusion shall conform to the external contour of the composite rail aluminum extrusion to ensure proper vertical and horizontal alignment of the composite rail sections.
- b. The splice joint assembly shall provide ample contact surface for the transfer of electrical current across the joint and the joint shall have a resistance no greater than that of an equal length of composite rail.
- c. The splice joint extrusions shall be pre-drilled as required to accept four 7/8-inch diameter steel compression fasteners, as manufactured by the Huck Manufacturing Company, or equal.
- d. The assembled splice joint shall be capable of withstanding a 25,000-pound longitudinal tension force across the joint without exceeding the yield point of its components.

#### **B. Appurtenances**

##### **1. Expansion Joints**

- a. The expansion joint assembly shall consist of the following;

- 1) Two bars of medium carbon steel, ASTM A27, Grade 65-35 or malleable iron, ASTM A47, Grade 32510.
  - 2) Two sections of steel base rail as **required**.
  - 3) Aluminum extrusions.
  - 4) Accessories as **required**.
- b. The aluminum extrusions shall be bolted to each base rail to allow the attachment of a splice joint assembly on each section.
  - c. The internal contour of the expansion joint bars shall conform to the external contour of the modified steel base rail sections to ensure proper alignment horizontally and vertically and to create a smooth passage across the joint for the collector shoe. The assembled modified steel base rail sections shall be pre-drilled as **required**.
  - d. The expansion joint assembly shall be designed to accommodate 12 inches of movement for each 1,000 feet of composite contact rail.
2. End Approaches
    - a. The end approaches shall consist of sections of steel base rail as specified, cut and welded to provide a smooth transition for the collector shoe onto the composite contact rail.
    - b. The end approaches shall be supplied in lengths of 11 feet and five-feet six-inches as shown. The mating end of each end approach shall contain sufficient length of aluminum extrusion bolted to the web to allow the attachment of a splice joint assembly.
    - c. The end approaches shall be **pre-drilled**.
3. Cast Parts
    - a. Cast parts for the composite rail assembly, including expansion joints, shall be manufactured as specified.
    - b. Castings shall be free of cracks, flaws, blemishes, scale, or any other defect that would be detrimental to the service for which they are intended. The finish surface shall be smooth and shall fit all adjoining parts accurately. Grinding will be permitted to ensure the specified fit.
    - c. Medium Steel Castings
      - 1) Steel for casting shall be medium steel made by the open-hearth, basic oxygen or electric-furnace process, ASTM A27, Grade 65-35.
      - 2) All castings shall be fully annealed by heating to a temperature above the transformation range and, after being held for a proper time at this temperature, cooled slowly and uniformly in the furnace.
      - 3) Steel castings shall be free from defects such as cracks, machining flows, porosity or excessive shrinkage and shall be finished to a true and homogenous surface.
    - d. Malleable-iron castings
      - 1) Parts cast from malleable iron shall conform to ASTM A47, Grade 32510.
4. Terminal Lugs
    - a. Terminal lugs shall be compression-type lugs compatible with 1,000-KCMIL, 427-strand cable. Terminal lugs shall be 98 percent pure copper. The entire lug shall be hot-dip, tin-coated, 0.3 mils minimum thickness. Tongues shall not be less than two inches square by ½ inch thick and drilled for a 5/8-inch diameter fastener.
5. Disconnect Switch
    - a. Outdoor, moisture-resistant, single-pole, single-throw, bolted pressure type/no-lead-break, manually operated mechanism for operation on 750 volts dc.
    - b. In accordance with ANSI C37.34.
    - c. Continuous current rating: **4000** ~~1200~~ amperes dc **minimum** as shown with temperature rise not exceeding 50C over 30C ambient.

- d. Dielectric withstand voltage from switch and mounting base across open contacts: 3000 volts dc minimum for one minute.
  - e. Momentary fault current rating: 160,000 amperes dc with rate of rise of 10 amperes per micro-second.
  - f. Terminals equipped with lugs for connection of ~~two~~ **four (4)** 1000 KCMIL, 427 strand, copper cables on each side as shown.
  - g. Designed to prevent opening or closing by gravity or vibration or of its own accord.
  - h. Insulating operating-handle mechanism with mechanical latch to prevent accidental opening or closing and capable of being padlocked in open or closed position.
  - i. Enclosure:
    - 1) NEMA Type 3R in accordance with ICS 6.
    - 2) Capable of withstanding 200-pounds force without damage to switch or enclosure.
    - 3) Minimum three-inch clearance to exposed terminals of switch in open and closed positions.
    - 4) Material: Fiberglass, 1/8-inch minimum thickness.
    - 5) Size: To fit within limits shown on drawing.
    - 6) Cover: Designed to provide easy access to switch. Equipped with stainless steel piano hinge and hasp.
    - 7) Cable openings: Compatible with switch terminals; furnished with Type GRE sealing bushings suitable for 1000 KCMIL cable, O.Z. Electrical Manufacturing Co., Inc., or equal.
    - 8) Flanges and mounting hardware: Furnished as necessary to mount enclosure on concrete base and to mount switch in enclosure.
6. Nuts, Bolts, and Miscellaneous Hardware
- a. All nuts, bolts, and flat washers shall be manufactured in accordance with ASTM A325.
  - b. The dimensional data and type hardware for all nuts, bolts and miscellaneous parts shall be as shown on **the manufacturing** drawings. Steel bolts, nuts, and washers shall be galvanized as specified below.
  - c. Cotter pins shall conform to ASTM B134, and ANSI B18.8.1
7. Galvanizing
- a. **Bolts and miscellaneous hardware to be mechanical zinc coated in accordance with ASTM A695.**
  - c. Before galvanizing, the finished parts shall be pickled or sandblasted and the scale and adhering impurities thoroughly removed. The pickling shall be done in properly diluted sulfuric acid, after which the parts shall be thoroughly cleaned in cold, running water.
  - d. Sand-blasting shall meet or exceed Steel Structure Painting Council SSPC-SP-6, except that the maximum grit size shall be SAE No. G-18.
  - e. The parts shall then be immersed in a solution of either zinc chloride or hydrochloric acid. Immediately following thorough drying, the parts shall be dipped into the zinc bath before corrosion starts again.
8. Tolerances for Fits.
- a. Tolerances for fits shall be in accordance with ANSI B4.1.

## 2.02 FABRICATION

- A. Composite Contact Rail
  - 1. Method of Assembly
    - a. Prior to final assembly of the aluminum extrusions to the steel base rail, the contact surfaces of the steel base rail shall be sandblasted to near white finish in accordance with Steel Structures Painting Council SSPC-SP-10.
    - b. After sandblasting, the surfaces of both the steel base rail and the aluminum extrusions shall be cleaned of all oil, grease and other foreign matter.

- c. The aluminum extrusions shall be free of aluminum oxide at the time of application of the oxide-inhibiting paste.
- d. Following the cleaning process, all mating surfaces shall receive a liberal and evenly distributed coating of oxide-inhibiting paste, Dearborn Chemical Product NO-OX-1D or equal. Oxide-inhibiting paste shall also be applied to all interface surfaces of the fasteners.
- e. After application of the oxide-inhibiting paste, the aluminum extrusions shall be permanently attached to the steel base rail on maximum 19-inch centers with 5/8-inch diameter steel compression fasteners, as manufactured by the Huck Manufacturing Company or equal.
- f. The installed fastener shall provide a minimum 19,000-pound clamping force. The fastening system shall maintain the aluminum extrusions in stable, intimate electrical contact with the steel base rail under all conditions of thermal expansion and contraction from zero degree to 150F.
- g. The assembled composite rail sections shall be **pre-drilled** on each end to accept a splice joint assembly as **required**. After assembly all excess oxide-inhibiting paste shall be removed from each rail.

**PART 3: EXECUTION - Not Used**

**PART 4 - MEASUREMENT AND PAYMENT**

**4.01 MEASUREMENT AND PAYMENT**

- A. Compensation for work specified in this section will be made in the following manner:
  - 1. Work performed by the Contractor pursuant to fabricating and delivering contact rail, splice joints, expansion joints, end approaches, terminal lugs, nuts, bolts and miscellaneous hardware: Lump sum.

**END OF SECTION**

## SECTION 05662

### CONTACT RAIL INSULATOR FOR TRACTION POWER

#### PART 1: GENERAL

##### 1.01 SUMMARY

- A. This section specifies fabricating, testing and furnishing fiberglass contact rail insulator as shown and specified.
- B. Related section: Section 05661 - Composite Contact Rail.

##### 1.02 REFERENCES

- A. Codes, regulations, references, standards and specifications as required.
  - 1. ASTM D149.
  - 2. ASTM D229.
  - 3. ASTM D256.
  - 4. ASTM D495.
  - 5. ASTM D570.
  - 6. ASTM D638.
  - 7. ASTM D648.
  - 8. ASTM D695.
  - 9. ASTM D790.
  - 10. ASTM D2303.
  - 11. ANSI B4.1.
  - 12. ANSI B18.2.1.
  - 13. ANSI B18.2.2.
  - 14. ANSI C29.1.
  - 15. ANSI C29.5.
  - 16. UL 94

##### 1.03 QUALITY ASSURANCE

- A. Testing
  - 1. Perform specified testing by a nationally recognized independent testing laboratory at no additional cost to the Authority.
  - 2. The Contractor shall notify the engineer fourteen (14) days in advance of the commencement of testing, including preparation of the test equipment for testing. Testing shall be performed in the presence of the Engineer unless otherwise approved by the WMATA Engineer in writing.
  - 3. Qualification Test:
    - a. Prior to production of insulators, perform all material and production test shown in this Section, and submit test results to the WMATA Engineer.
    - b. Certification for material tests are acceptable.

- c. In lieu of qualification tests, the contractor may submit prior tests results for the insulator, if the prior test are for fiberglass insulator material previously approved by WMATA.

B. General testing

1. Randomly select a minimum of two percent of each production lot of 500 insulators of each type as test specimens.
2. Subject specimens to the following tests:
  - a. Electrical resistance test:
    - 1) Procedure:
      - a) Immerse each specimen in water at room temperature.
      - b) After 70 hours, remove and dry thoroughly.
      - c) Provide complete contact by use of wet clay pads on top and bottom of specimen.
      - d) Measure resistance to each specimen with 1,000-volt dc megohm meter or other approved device.
    - 2) Acceptance criteria:
      - a) Electrical resistance: Not less than eight megohms.
      - b) If one insulator of a lot fails, entire lot will be rejected.
  - b. Impulse withstand voltage test.
    - 1) Procedure: In accordance with ANSI C29.1.
    - 2) Acceptance criteria:
      - a) Dry withstand voltage: 30 kV at 60 Hertz for one minute.
      - b) Wet withstand voltage: 20 kV at 60 Hertz for ten seconds.
      - c) If one insulator of a lot fails, the entire lot will be rejected.
3. Insulators used as test specimens prohibited as part of quantity furnished.

C. Insulators must meet the following procedures as required or equivalent.

1. Material tests:

TEST ITEM	PROCEDURE	ACCEPTANCE CRITERIA *
Arc resistance	ASTM D495	180 seconds
Dielectric strength	ASTM D149, short-time test	100 volts per mil
Water absorption	ASTM D570, 24 hours at 23C	Weight increase: 0.3 percent maximum
Flammability	UL 94	Class 94V-O
Flame resistance	ASTM D229, Method II	Ignition time: 80 seconds minimum Burning time: 60 seconds maximum
Heat distortion	ASTM D648	Deflection temperature 390F at 264 psi
Izod Impact	ASTM D256, Method A or equivalent for other materials.	Average impact strength: 16 foot-pounds per inch width of specimen
Flexural strength	ASTM D790 or equivalent for other materials.	24,000 psi
Tensile strength	ASTM D638 or equivalent for other materials.	12,000 psi
Compressive strength	ASTM D695 or equivalent for other materials.	20,000 psi
Tracking resistance	ASTM D2303	Time to track: at 2,500 volts ac 600 minutes

\* Minimum unless otherwise specified.

2. Production testing:

a. General Requirements:

- 1) Production testing specified constitutes minimum requirements.
- 2) All insulators subject to full or partial testing at the discretion of the WMATA Engineer.

- 3) Insulators used for testing are not to be included in quantities furnished.
  - 4) All facets of production testing, particularly location of facility and repair, capacity and calibration of test equipment, subject to approval.
  - 5) Notify the WMATA Engineer fourteen calendar days prior to scheduled testing dates.
  - 6) If one insulator of a lot fails, the entire lot will be rejected.
- b. Randomly select a minimum of two percent of each lot of 500 insulators as test specimens.
- c. Load test:
- 1) Procedure:
    - a) Mount 50% of the specimens on a rigid vertical support with centerline of holes on a horizontal plane.
    - b) Mount 50% of the specimens on a rigid vertical support with centerline of holes on a vertical plane.
    - c) Vertically apply a steady, even, downward pressure on the insulator head until it fails.
    - d) Record pressure being exerted when first crack occurs in specimen.
    - e) Record pressure being exerted when specimen fails.
  - 2) Acceptance criteria:
    - a) Withstand:
      - (1) To first visual crack: 1,200 pounds minimum.
      - (2) To failure: 2,400 pounds minimum.
- d. Compressive load test:
- 1) Procedure:
    - a) Mount insulator on flat horizontal surface.
    - b) Mount steel plate one-inch thick by 4-1/2 inches diameter on top of insulator.

- 2) Acceptance criteria:
    - a) Withstand:
      - (1) To first visual crack: 10,000 pounds minimum.
      - (2) To failure: 20,000 pounds minimum.
  - e. Dielectric strength test:
    - 1) Procedure:
      - a) ASTM D149, Short-time Test.
    - 2) Acceptance criteria:
      - a) Dielectric strength:
        - (1) Perpendicular chair 100 volts per mil.
        - (2) Perpendicular cap: 100 volts per mil.
  - f. Insulators used for testing are not to be included in quantities furnished.
3. Mechanical test:
- a. Randomly select a minimum of one percent of each lot of 500 insulators as test specimens.
  - b. Procedure:
    - 1) Attach each insulator and mounting base to oak block.
    - 2) Mount each assembly on rigid foundation simulating service conditions.
    - 3) Place on top of each insulator one of the following type pads:
      - a) Lead: 1/4 inch thick
      - b) Canvas: 1/16 inch thick
    - 4) Attach to malleable iron cap a hardened steel disc ½ inch thick and equal in diameter to cap. Place both atop each insulator pad.
    - 5) Subject each test specimen to 10 blows of 15-pound spherical iron weight dropped from height of 36 inches.
  - c. Acceptance criteria:
    - 1) No visible cracks or fractures.
    - 2) If 50 percent or more of specimens fail, entire lot represented by specimens tested will be rejected.

## **1.04 SUBMITTALS**

### **A. Shop Drawings:**

1. The Contractor shall submit for approval shop drawings for fabrication of the component and assemblies of the contact rail insulators, showing tolerances for all dimensions. No fabrication or manufacture shall be performed prior to drawing approval.

### **B. Samples:**

1. One complete insulator assembly for each type.

### **C. Documentation:**

1. Certification that all insulator assemblies furnished meet or exceed specified requirements.
2. Detailed engineering data on materials used in the manufacture of insulator assemblies.
3. Fabrication details.
4. Name of proposed independent testing laboratory.
5. Detailed description of quality control program. Work performed prior to approval is undertaken at the Contractor's risk.
6. Calibration certificates for quality control testing equipment.
7. Certified test reports. Submit no later than seven days after completion of tests.
8. Method of packaging. Submit prior to packaging and shipping.

## **PART 2: PRODUCT**

### **2.01 MATERIALS**

#### **A. Furnish contact rail insulator in accordance with the following requirements:**

1. General Requirements
  - a. New and undamaged.
  - b. Symmetrical
  - c. Free of cracks, voids, air pockets, lamination, metallic substances or other defects rendering them unsuitable for intended service.
  - d. Meeting or exceeding acceptance criteria of specified tests.
  - e. Indelibly marked on underside with model number and identification of manufacturer.
  - f. Rated for a nominal voltage of 750 volts dc.

- g. Minimum creepage distance over external surface of insulator from energized metal components to ground or to insulator fasteners: Eight inches minimum.
- h. Resistant to weathering and sudden changes in atmospheric temperature from plus 150F to minus 20F.
- i. Impervious to moisture, acid and alkali.
- j. Suitable for use on wood ties and for direct fixation to concrete invert.
- k. Color: Gray.
- l. Designed for composite rail specified in Section 05661 with free-end-to-anchor distance of 500 feet and temperature range of plus 150F to minus 20F.

2. Insulators

- a. Fiberglass reinforced thermoset polyester , material grade 46-16-60 or approved equal.
- b. Compression molded.
- c. Dimensions: As shown.
- d. Tolerance: As shown in the drawing.
- e. Appearance: Smooth and uniform.

**PART 3 - MEASUREMENT AND PAYMENT**

**3.01 MEASUREMENT**

No separate measurement of work specified in this section will be made.

**3.02 PAYMENT**

Compensation for work specified in this section will be made in the following manner:

- 1. Materials: Lump sum, no separate measurement.

\* \* \*

## SECTION 05700

### ORNAMENTAL METAL

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing ornamental (architectural) metalwork.
- B. Related Work Specified Elsewhere:
  - 1. Not used.
  - 2. Hydraulic elevator: Section 14200.

##### 1.02 PERFORMANCE REQUIREMENTS FOR HANDRAILS AND RAILINGS:

- A. Structural Performance of Handrails and Railings: Provide handrails and railings complying with requirements of ASTM E 985 for structural performance, based on testing performed according to ASTM E 894 and ASTM E 935.
- B. Thermal Movements: Provide handrails and railings that allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
  - 1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.
- C. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings: Show fabrication and installation of ornamental metal. Include plans, elevations, component details, and attachments to other Work. Indicate materials and profiles of each ornamental metal member, fittings, joinery, finishes, fasteners, anchorages, and accessory items.
    - a. Include setting drawings, templates, and directions for installing anchor bolts and other anchorages.
    - b. Obtain approval for minor variations in detail for the purpose of improving fabrication and installation procedures, but not affecting general design for structural stability.
  - 2. Samples for Verification: Three of each of the following in each finish to be used in the work. For each profile and pattern of fabricated metal and for each type of metal finish required, prepared on metal of same thickness and alloy indicated for the Work.
    - a. Include 6-inch long samples of linear shapes, tubing and extrusions
    - b. Include 4-inch square samples of plates and sheet metal.
    - c. Welded joints: For color matching.
    - d. Brazed joints: Typical for work involved.
  - 3. Certification:
    - a. Welding Certificates: Copies of certificates for welding procedures and

- personnel.
- b. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
- c. Certified test reports: Certified test reports verifying that epoxy grout conforms to specified requirements.
- d. Certification that adhesive is appropriate for the long-term intended use.

#### **1.04 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWS: A5.7, A5.8, D1.1, D1.3.
  - 3. PEI: S-100.
  - 4. MS: MIL-C-18480.
  - 5. ASTM: A36, A48, A153, A276, A312, A366, A413, A424, A500, A501, A536, A554, A653, A666, A743, B43, B135, B455, B584, C307, C413, C552, C579, C580, D1187, D3656, E527.
  - 6. ANSI: A156.18.
  - 7. FS TT-P-664.
  - 8. SSPS-Paint 5, Paint 12.
  - 9. NAAMM.
- B. Installer Qualifications: Arrange for installation of ornamental metal specified in this Section by the same firm that fabricated it.
- C. Fabricator Qualifications: A firm experienced in producing ornamental metal similar to that indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
- D. Welding Standards: Qualify procedures and personnel according to the following:
  - 1. AWS D1.1, "Structural Welding Code--Steel."
  - 2. AWS D1.3, "Structural Welding Code--Sheet Steel."

#### **1.05 DELIVERY, STORAGE, AND HANDLING:**

- A. Store ornamental metal inside a well-ventilated area, away from uncured concrete and masonry, and protected from weather, moisture, soiling, abrasion, extreme temperatures, and humidity.
- B. Deliver and store cast-metal products in wooden crates surrounded by sufficient excelsior to ensure that products will not be cracked or otherwise damaged.

#### **1.06 PROJECT CONDITIONS:**

- A. Field Measurements: Where ornamental metal is indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
  - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating ornamental metal without field measurements. Coordinate other construction to ensure that actual dimensions correspond to established dimensions.

## 1.07 COORDINATION

- A. Coordinate installation of anchorages for ornamental metal items. Furnish Setting Drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

## PART 2 - PRODUCTS

### 2.01 MATERIALS, GENERAL:

- A. Insofar as practicable, furnish products of a single manufacturer.

### 2.02 METALS:

- A. General: Provide metals free from surface blemishes where exposed to view in finished unit. Exposed-to-view surfaces exhibiting pitting, seam marks, roller marks, stains, discolorations, or other imperfections on finished units are not acceptable.
- B. Bronze: Provide copper alloy of type and form indicated to comply with the following requirements:
  - 1. Extruded Shapes: ASTM B455, Alloy UNS No. C38500 (extruded architectural bronze).
  - 2. Plate, Sheet, Strip, and Bars: ASTM B36, Alloy UNS No. C28000 (muntz metal, 60 percent copper).
  - 3. Seamless Pipe: ASTM B43, Alloy UNS No. C23000.
  - 4. Seamless Tubes: ASTM B135, Alloy UNS No. C23000 (red brass, 85 percent copper).
  - 5. Delete subparagraph above or below. Verify availability and color match with other copper-alloy forms. See Evaluations.
  - 6. Sand Castings: ASTM B584, Alloy UNS No. C86500 (No. 1 manganese bronze).
  - 7. Stainless Steel: Grade and type designated below for each form required:
  - 8. Pipe: ASTM A312, Grade TP 304.
  - 9. Castings: ASTM A743, Grade CF 8 or Grade CF 20.
  - 10. Sheet, Strip, Plate, and Flat Bar: ASTM A666, Type 304.
  - 11. Bars and Shapes: ASTM A276, Type 304. Select subparagraph above or below.
- C. Steel: Provide steel in form indicated to comply with the following requirements:
  - 1. Tubing: Cold formed, ASTM A500.
  - 2. Steel Plate, Shapes, and Bars: ASTM A36.
  - 3. Steel Sheet:
    - a. Commercial-quality, cold-rolled, stretcher-leveled, carbon-steel sheet complying with ASTM A 366, Class I, matte finish.
    - b. ASTM A653, mild-annealed, leveled, cold-rolled, galvanized, 16-gauge.
- D. Base Metal for Porcelain Enamel: ASTM A424, vitreous enameling steel of low metalloid and copper content, manufactured and processed for the production of architectural porcelain enamel units, 16-gauge.
- E. Porcelain Enamel Panel Liners: ASTM A653, hot dipped galvanized steel sheet, G90 zinc coating, 20-gauge.

### 2.03 MISCELLANEOUS MATERIALS:

- A. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as

recommended by producer of metal to be welded, complying with applicable AWS specifications, and as required for color match, strength, and compatibility in fabricated items.

- B. Fasteners: Use fasteners of same basic metal as fastened metal, unless otherwise indicated. Do not use metals that are corrosive or incompatible with materials joined.
  - 1. Provide concealed fasteners for interconnecting ornamental metal components and for attaching them to other work, unless otherwise indicated.
  - 2. Provide concealed fasteners for interconnecting ornamental metal components and for attaching them to other work, unless exposed fasteners are unavoidable or are the standard fastening method.
  - 3. Provide Phillips flat-head machine screws for exposed fasteners, unless otherwise indicated.
  
- C. Cast-in-Place and Postinstalled Anchors: Anchors of type indicated below, fabricated from corrosion-resistant materials with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete as determined by testing per ASTM E 488 conducted by a qualified independent testing agency.
  - 1. Cast-in-place anchors
  - 2. Chemical anchors.
  - 3. Expansion anchors.
  
- D. Insect Screen: ASTM D3656, with aluminum or galvanized steel frame as shown.
  
- E. Epoxy Grout: Nonshrink, nonstaining, 100-percent solids, two-component or three-component epoxy-resin system, that has been in successful use for an equivalent application for a minimum of five years.
  - 1. On horizontal applications: Self-leveling type.
  - 2. On vertical and overhead surface application: Non-sag type.
  - 3. Physical properties:

Property	Requirement	ASTM Test Method
Tensile strength	1,800-psi minimum in seven days	C307
Compressive strength	13,500-psi minimum in 28 days	C579
Modulus of rupture	13,500 psi	C580
Water absorption	One-percent maximum, two hours at 212F	C413

- F. Panel Core: Cellular glass, ASTM C552, Type IV, one-inch thick.
  
- G. Shop Primer for Ferrous Metal: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements of FS TT-P-664; selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.
  
- H. Shop Primer for Galvanized Steel: Zinc-dust, zinc-oxide primer formulated for priming zinc-coated steel and for compatibility with finish paint systems indicated, and complying with SSPC-Paint 5.

- I. Bituminous Paint: Cold-applied asphalt mastic complying with SSPC-Paint 12, except containing no asbestos fibers, or cold-applied asphalt emulsion complying with ASTM D1187
- J. Adhesive: Hot spray contact cement, certified by fabricator as appropriate for the long-term intended use

#### **2.04 FABRICATION, GENERAL:**

- A. Form ornamental metal to required shapes and sizes, with true curves, lines, and angles. Provide components in sizes and profiles indicated, but not less than that needed to comply with requirements indicated for structural performance.
- B. Provide necessary rebates, lugs, and brackets to assemble units and to attach to other work. Drill and tap for required fasteners, unless otherwise indicated. Use concealed fasteners where possible.
- C. Comply with AWS for recommended practices in shop welding and brazing. Provide welds and brazes behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed joints of all flux, and dress all exposed and contact surfaces.
  - 1. Type, size and spacing of welds: As shown on approved shop drawings.
  - 2. Remove weld spatter and welding oxides from finished surfaces by descaling and grinding.
  - 3. Use oxyacetylene method for welding joints of extruded architectural bronze, 16-B&S gauge or heavier.
  - 4. To ensure color match at exposed joints, insert pieces of the base metal or low-fuming bronze, conforming to AWS A5.7, Classification R Cu Zn C as filler material. Adjust oxidizing flame to minimize porosity of joint.
  - 5. Grind and polish welded beads on exposed polished surfaces to match and blend with finish on adjacent parent metal.
- D. Mill joints to a tight, hairline fit. Cope or miter corner joints. Form joints exposed to weather to exclude water penetration.
- E. Provide castings that are sound and free of warp, cracks, blowholes, or other defects that impair strength or appearance. Grind, wire brush, sandblast, and buff castings to remove seams, gate marks, casting flash, and other casting marks.
- F. Finish exposed surfaces to smooth, sharp, well-defined lines and arris.
- G. Assemble items in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- H. Cleaning metal surfaces:
  - 1. After grinding and polishing or where subject to severe forming operations, remove extraneous material from metal surfaces, thoroughly rinse with clear water and dry.
  - 2. Remove lubricants used in fabrication before work leaves shop.
  - 3. Match-mark materials for field assembly as necessary. Arrange sequence of shipments to expedite erection and to minimize field handling of material.

#### **2.05 FABRICATING HANDRAILS AND RAILINGS:**

- A. Nonwelded Connections: Fabricate handrails and railings to interconnect members with concealed mechanical fasteners and fittings, unless otherwise indicated. Fabricate members

and fittings to produce flush, smooth, rigid, hairline joints.

1. Fabricate splice joints for field connection using an epoxy structural adhesive where this is fabricator's standard splicing method.
- B. Welded Connections: Fabricate handrails and railings for connecting members by welding. Cope components at perpendicular and skew connections to provide close fit, or use fittings designed for this purpose. Weld connections continuously to comply with the following:
1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  2. Obtain fusion without undercut or overlap.
  3. Remove flux immediately.
  4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces
  5. Provide welded connections for stainless-steel handrails and railings.
  6. Provide welded connections for ferrous handrails and railings.
- C. Retain paragraph and subparagraphs below if required for brazing copper-alloy railings. See Evaluations. Brazed Connections: Fabricate bronze handrails and railings for connecting members by brazing. For connections made during fabrication, braze corners and seams continuously to comply with the following:
1. Use materials and methods that match color of base metal, minimize distortion, and develop maximum strength and corrosion resistance.
  2. Remove flux immediately.
  3. Where exposed field connections are necessary, insert inside sleeves and secure at bottom with flush screws to provide hairline joint. Finish exposed surfaces smooth and blended so no roughness shows after finishing and brazed surface matches contours of adjoining surfaces.
- D. Form changes in direction of railing members as follows shown on approved shop drawings. Retain one of seven subparagraphs below; if retaining more than one, also retain last subparagraph. If there is a need to limit specific methods to selected locations or to railings of different metals, select method that predominates as default by adding phrase ", unless otherwise indicated," and qualify other methods retained by adding phrase "where indicated."
- E. Form simple and compound curves by bending members in jigs to produce uniform curvature for each repetitive configuration required; maintain profile of member throughout entire bend without buckling, twisting, or otherwise deforming exposed surfaces of handrail and railing components
- F. For handrails and railings with nonwelded connections that are exposed to exterior or to moisture from condensation or other sources, provide weep holes or another means to drain water entrapped in hollow sections of railing members.
- G. Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated; close ends of returns.
- H. Close exposed ends of handrail and railing members with manufacturer's standard prefabricated end fittings.
- I. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect handrail and railing members to other work, unless otherwise indicated.
1. Furnish inserts and other anchorage devices for connecting handrails and railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by handrails and railings. Coordinate anchorage devices with

- supporting structure.
2. For railing posts set in concrete, provide preset sleeves of steel, not less than 6 inches long and inside dimensions not less than 1/2 inch greater than outside dimensions of post, with steel plate forming bottom closure.

**2.06 FABRICATING BRONZE CLADDING:**

- A. Brake-formed as shown on approved shop drawings. Laminate to backup material to achieve permanent bond and as recommended by bronze manufacturer.
- B. Fit and braze exposed joints in cladding with copper-phosphorous alloy or silver alloy, conforming to AWS A5.8, Classification B Cu P-5 and B Ag 1, respectively. Clean joints and apply flux properly before brazing. After brazing, remove excess brazing metal from face of work.

**2.07 FABRICATING STEEL CLADDING:**

- A. Formed of steel sheet ASTM 366, with baked-enamel finish.
- B. Weld and fill seams and joints before finishing.

**2.08 INSULATED PANELS FOR ELEVATOR HOISTWAYS:**

- A. Consisting of exposed face of bronze or stainless steel sheet, back face of steel sheet, panel core and adhesive.
- B. Fabricated as specified for bronze or stainless steel cladding.

**2.09 PORCELAIN ENAMEL PANELS:**

- A. Laminated type in sizes and shapes shown conforming with PEI standards specified.

**2.10 FINISHES, GENERAL:**

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

**2.11 BRONZE FINISHES:**

- A. Base-metal finish: Medium satin wheel-polished or belt-polished with aluminum oxide or silicon carbide abrasives of 80-120 grit, using a peripheral wheel speed of 6,000 fpm to a smooth dull finish with a directional pattern.
- B. Applied finish: ANSI A156.18 finish number 613, dark oxidized satin bronze, oil rubbed; oxide or sulfide chemical process using immersion or brushed on application as recommended by the manufacturer.
  1. Color of finish: Match sample on file with the Authority's Representative.

**2.12 STAINLESS-STEEL FINISHES:**

- A. Remove or blend tool and die marks and stretch lines into finish.

- B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- C. Satin, Directional Polish: ANSI A156.18 finish number 654, satin stainless steel.
- D. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

### **2.13 STEEL FINISHES:**

- A. Galvanizing: Hot-dip galvanize products made from rolled, pressed, and forged steel shapes, castings, plates, bars, and strips indicated to be galvanized to comply with ASTM A 123.
  - 1. Hot-dip galvanize iron and steel hardware indicated to be galvanized to comply with ASTM A 153.
- B. Fill vent and drain holes that will be exposed in finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.
- C. Preparation for Shop Priming: After galvanizing, thoroughly clean ornamental metal of grease, dirt, oil, flux, and other foreign matter, and treat with metallic-phosphate process.
- D. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed ornamental metal:
  - 1. Exteriors (SSPC Zone 1B): SSPC-SP 6, "Commercial Blast Cleaning."
  - 2. Interiors (SSPC Zone 1A): SSPC-SP 7, "Brush-off Blast Cleaning."
- E. Factory-Primed Finish: Apply air-dried primer immediately after cleaning and pretreatment, to provide a minimum dry film thickness of 2 mils per applied coat, to surfaces that will be exposed after assembly and installation, and to concealed, nongalvanized surfaces.
- F. Baked-Enamel Finish:
  - 1. Primer: Kem Hi-Temp Heat-Flex II 450 Primer by Sherwin-Williams, or equal.
  - 2. Finish coat: Kem Hi-Temp Heat-Flex 450 Finish by Sherwin-Williams, or equal.
  - 3. Porcelain Enamel Finish: PEI S-100, Specification for Architectural Porcelain Enamel on Steel for Exterior Use: Class AA or Class A.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Remove foreign substances and irregularities from surfaces against which metalwork is to be placed.

### **3.02 INSTALLATION, GENERAL:**

- A. Coordinate installation of ornamental metalwork with work of other trades. Provide anchorage devices and fasteners where necessary for securing ornamental metal to in-place construction.
- B. Perform cutting, drilling, and fitting required to install ornamental metal. Set products accurately in location, alignment, and elevation; measured from established lines and levels. Provide temporary bracing or anchors in formwork for items to be built into concrete, masonry, or similar construction.

- C. Fit exposed connections accurately together to form tight, hairline joints or, where indicated, with uniform reveals and spaces for sealants and joint fillers. Where cutting, welding, and grinding are required for proper shop fitting and jointing of ornamental metal, restore finishes to eliminate any evidence of such corrective work.
- D. Do not cut or abrade finishes that cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing, or provide new units as required.
- E. Fasten metalwork in place so that items will not be distorted, finish will not be impaired, nor fasteners over stressed from expansion and contraction of metal.
- F. Protect exposed metalwork throughout work to prevent scratches, stains, discoloration and other damage. Restore protective coverings that have been damaged during shipment or installation. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at same location.
  - 1. Retain protective coverings intact; remove coverings simultaneously from similarly finished items to preclude nonuniform oxidation and discoloration.
- G. Field Welding: Comply with applicable AWS specification for procedures of manual shielded metal arc welding, for appearance and quality of welds, and for methods used in correcting welding work. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Grind exposed welded joints smooth and restore finish to match finish of adjacent surfaces.
- H. Provide protection against galvanic action between dissimilar metals by completely covering contact surfaces with heavy brush-coat of bituminous paint or by separating contact surfaces with preformed tape.
- I. Apply heavy brush-coat of bituminous paint to contact surfaces of ornamental metals, except stainless steel, which come into contact with concrete, mortar or other masonry. Do not apply paint onto concrete or masonry surfaces. Apply to metal, let cure, then apply metal fabrication to concrete or masonry.

### **3.03 INSTALLING HANDRAILS AND RAILINGS:**

- A. Adjust handrails and railings before anchoring to ensure alignment at abutting joints.
- B. Concrete-Anchored Posts in Sleeves: Insert posts in preset sleeves, cast into concrete, and fill annular space between posts and sleeve with epoxy grout.
  - 1. Remove contaminants from surfaces receiving and coming into contact with the grout. Remove surface contaminants such as curing compounds from holes that receive grout. Ensure that surfaces to receive grout are dry at the time of grouting.
  - 2. Prime surfaces in accordance with grout manufacturer's recommendations.
  - 3. Mix and place epoxy grout for locations shown or specified as recommended by grout manufacturer. Level exposed surfaces of grout joints with adjacent surfaces. Grind rough or raised projections smooth and flush with adjacent surfaces. Retain paragraph above or below or delete both if no posts in concrete.
- C. Anchor posts to metal surfaces with fittings designed for this purpose.
- D. Non-welded Connections: Use mechanical or adhesive joints for permanently connecting railing components. Use wood blocks and padding to prevent damage to railing members and fittings. Seal recessed holes of exposed locking screws using plastic cement filler colored to match finish of handrails and railing

- E. Welded Connections: Use fully welded joints for permanently connecting railing components by welding. Cope or butt components to provide 100 percent contact or use fittings designed for this purpose.
- F. Anchor railing ends into concrete or masonry with fittings designed for this purpose.
- G. Anchor railing ends to metal surfaces with fittings using concealed fasteners.
- H. Anchor railing ends to metal surfaces by welding.
- I. Expansion Joints: Provide expansion joints at locations indicated or, if not indicated, at intervals not to exceed 40 feet. Provide slip-joint internal sleeve extending 2 inches beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches of post.

**3.04 CLEANING:**

- A. Upon completion of installation, clean surfaces of metalwork by procedure recommended by metalwork manufacturer.
- B. Clean up rubbish and debris caused by this work and remove from the site.

**3.05 PROTECTION:**

- A. Protect finishes of ornamental metal from damage during construction period with temporary protective coverings approved by ornamental metal fabricator. Remove protective covering at the time of Substantial Completion.
- B. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

**END OF SECTION**

## SECTION 05810

### EXPANSION JOINT COVER ASSEMBLIES

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing expansion joint cover assemblies.
- B. Related Work Specified Elsewhere:
  - 1. Cast-In-Place Structural Concrete: Section 03300.
  - 2. Expansion Joint Systems: Section 05811.
  - 3. Flashing and Sheet Metal: Section 07600.
  - 4. Seals and Sealants: Section 07900.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements specified for each:
  - 1. Product data for each type of expansion joint cover assembly specified, including manufacturer's product specifications, installation instructions, details of construction relative to materials, dimensions of individual components, profiles, and finishes.
  - 2. Shop drawings showing fabrication and installation of expansion joint cover assembly including plans, elevations, sections, details of components, joints, splices, and attachments to other units of Work.
  - 3. Samples for initial selection purposes in the form of manufacturer's color charts, actual units, or sections of units showing full range of colors, textures, and patterns available for each exposed metal and elastomeric material of expansion joint cover assembly indicated.
  - 4. Samples for verification purposes in full-size units of each type of expansion joint cover assembly indicated; in sets for each finish, color, texture, and pattern specified, showing full range of variations expected in these characteristics.
    - a. Install elastomeric material for joints samples to verify color selected.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ADA: Americans with Disabilities Act.
  - 3. AAMA: 603.8, 605.2, 606.1, 607.1, 608.1
  - 4. ANSI/UL: 263.
  - 5. ASTM: A167, B209, B221, B455, C920, D2000, E119, E1399.
  - 6. NAAMM: Metal Finishes Manual.
  - 7. NFPA: 251.
  - 8. UBC: 43-1.
- B. Single-Source Responsibility: Where practical, obtain expansion joint cover assemblies specified in this Section from one source from a single manufacturer. Coordinate compatibility with expansion joint cover assemblies specified in other sections.
- C. Fire-Test-Response Characteristics: Where indicated, provide expansion joint cover assemblies identical to those assemblies whose fire resistance has been determined per ANSI/UL 263, NFPA 251, U.B.C. 43-1, or ASTM E119, including hose stream test of vertical wall assemblies, by a testing and inspecting agency acceptable to authorities having jurisdiction.
  - 1. Fire-Resistance Ratings: Not less than the rating of adjacent construction.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Aluminum: ASTM B221, alloy 6063-T5 for extrusions; ASTM B209, alloy 6061-T6, sheet and plate.
  - 1. Protect aluminum surfaces to be placed in contact with cementitious materials with a protective coating.
- B. Bronze: ASTM B455, alloy C38500 for extrusions; alloy C28000 Muntz Metal for plates.
- C. Brass: UNS alloy C26000 for half hard sheet and coil.
- D. Stainless Steel: ASTM A167, Type 304 with 2B finish, unless indicated otherwise, for plates, sheet, and strips.
- E. Extruded Preformed Seals: Single or multicellular elastomeric profiles as classified under ASTM D2000, designed with or without continuous, longitudinal, internal baffles. Formed to fit compatible frames, in color indicated or, if not indicated, as selected by the Engineer from manufacturer's standard colors.
- F. Preformed Sealant: Manufacturer's standard elastomeric sealant complying with ASTM C920, Use T, factory-formed and -bonded to metal frames or anchor members; in color indicated or, if not indicated, as selected by the Engineer from manufacturer's standard colors.
  - 1. Joints 2 Inches Wide and Less: Withstand plus or minus 35 percent movement of the joint width without failure.
  - 2. Joints Greater Than 2 Inches to 4 Inches Wide: Withstand plus or minus 50 percent movement of the joint width without failure.
- G. Seismic Seals: Typically for exterior application, two single-layered elastomeric profiles, one interior and one exterior, as classified under ASTM D2000; retained in a set of compatible frames, in color indicated or, if not indicated, as selected by the Engineer from manufacturer's standard colors. At manufacturer's option, omit interior profile for interior application.
- H. Fire Barriers: Designed for indicated or required dynamic structural movement without material degradation or fatigue when tested according to ASTM E1399. Tested in maximum joint width condition with a field splice as a component of an expansion joint cover per ANSI/UL 263, NFPA 251, U.B.C. 43-1, or ASTM E119, including hose stream test of vertical wall assemblies by a nationally recognized testing and inspecting agency acceptable to authorities having jurisdiction.
- I. Accessories: Manufacturer's standard anchors, fasteners, set screws, spacers, flexible moisture barrier and filler materials, drain tubes, lubricants, adhesive, and other accessories compatible with material in contact, as indicated or required for complete installations.

### **2.02 EXPANSION JOINT COVER ASSEMBLIES:**

- A. General: Provide expansion joint cover assemblies of design, basic profile, materials, and operation indicated on approved shop drawings. Provide units comparable to those indicated or required to accommodate joint size, variations in adjacent surfaces, and dynamic structural movement without material degradation or fatigue when tested according to ASTM E1399. Furnish units in longest practicable lengths to minimize number of end joints. Provide hairline mitered corners where joint changes directions or abuts other materials. Include closure materials and transition pieces, tee-joints, corners, curbs, cross-connections, and other accessories as required to provide continuous joint cover assemblies.

- B. Moisture Barrier: Provide manufacturer's continuous, standard, flexible vinyl moisture barrier under covers at locations indicated on approved shop drawings.
- C. Fire-Rated Joint Covers: Provide expansion joint cover assemblies with manufacturer's continuous, standard, flexible fire barrier seals under covers at locations indicated on approved shop drawings to provide fire-resistive rating not less than the rating of adjacent construction.
- D. Coverless Fire Barrier: Provide manufacturer's continuous standard flexible fire barrier seals at locations indicated on approved shop drawings to provide fire-resistive rating not less than the rating of adjacent construction.
- E. Metal Floor-to-Floor Joint Cover Assemblies: Provide continuous extruded metal frames of profile indicated with seating surface and raised floor rim or exposed trim strip to accommodate flooring and concealed bolt and anchors embedded in concrete. Provide assemblies formed to receive cover plates of design indicated and to receive filler materials (if any) between raised rim of frame and edge of plate. Furnish depth and configuration to suit type of construction and to produce a continuous flush wearing surface with adjoining finish floor surface.
  - 1. Partially Concealed Cover: Provide one frame on each side of joint, designed to accommodate manufacturer's floor cover plate and filler.
  - 2. Exposed Cover: Provide one frame on each side of joint, designed to support floor plate and filler
  - 3. Flat Cover Plates: Provide cover plates of profile and wearing surface indicated. Extend flat plates to lap each side of joint.
    - a. Filler Insert: Furnish abrasive-resistant flexible gasket filler between edge of cover plate and raised rim of frame to accommodate required movement
  - 4. Fixed Cover Plates: Attach one side of the cover plate to a frame or finished wearing surface, with other side resting on other frame or finished wearing surface to allow free movement.
  - 5. Self-Centering Cover Plates: Concealed centering device with the cover plate secured in or on top of frames as to have free movement on both sides.
  - 6. Floor Cover Plate Wearing Surfaces: Provide cover plates with the following type of wearing surfaces.
    - a. Plain.
    - b. Fluted.
    - c. Recessed to receive full thickness of flooring material.
    - d. Abrasive plate.
    - e. Adhesive filled plate.
    - f. Adhesive strip plate.
- F. Floor-to-Wall Joints: Provide one frame on floor side of joint only. Provide wall side frame where required by manufacturer's design.
  - 1. Angle Cover Plates: Attach angle cover plates for floor-to-wall joints to wall with countersunk, flat-head exposed fasteners secured to drilled-in-place anchor shields, unless otherwise indicated, at spacing recommended by joint cover manufacturer.
- G. Wall, Ceiling, and Soffit Joint Cover Assemblies: Provide interior wall and ceiling expansion joint cover assemblies of same design and appearance. Provide exterior wall and soffit expansion joint cover assemblies of same design and appearance. Provide wall expansion joint cover assemblies compatible with floor expansion joint cover assemblies design and appearance.
  - 1. Fixed Metal Cover Plates: Provide a concealed, continuously anchored frame fastened to wall, ceiling, or soffit only on one side of joint. Extend cover to lap each side of joint and to permit free movement on one side. Attach cover to frame with cover in close contact with adjacent finish surfaces.

2. Floating Metal Cover Plates: Cover plate secured in or on top of frames to permit free movement on both sides.
  3. Self-Centering Cover Plates: Concealed centering device with the cover plate secured in or on top of frames to permit free movement on both sides.
  4. Flexible Filler: Secure the approved flexible filler between frames to compress and expand with movement.
- H. Joint Cover Assemblies with Preformed Seals: Provide joint cover assemblies consisting of continuously anchored aluminum extrusions and continuous extruded preformed seals of profile indicated or required to suit types of installation conditions shown. Furnish extrusions designed to be embedded in or attached to concrete with lugs. Vulcanize or heat-weld splices (if any) to ensure hermetic joint condition.
1. Cover Plate: Include extruded aluminum cover plate fastened to one side of joint and extend plate to lap each side of joint to permit free movement with cover in close contact with adjacent contact surfaces.
- I. Joint Cover Assemblies with Elastomeric Sealant: Provide continuous cover joint assemblies consisting of elastomeric sealant factory-bonded to extruded aluminum frames of profile indicated or required to suit types of installation conditions shown. Provide frames for floor joints with means for embedding in or anchoring to concrete without using exposed fasteners and that will result in exposed surfaces of sealant and aluminum frames finishing flush with adjacent finished floor surface without exposing anchors.
- J. Compression Seals: Preformed, elastomeric extrusions having internal baffle system in sizes and profiles shown or as recommended by the manufacturer. Provide lubricant and adhesive for installation recommended by the manufacturer.
- K. Foam Seal: Nonextruded, low-density, cross-linked, nitrogen-blown ethylene vinyl acetate polyethylene copolymer foam. Provide adhesive for installation recommended by the manufacturer.

### **2.03 METAL FINISHES:**

- A. General: Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations, except as otherwise indicated. Apply finishes to products in factory after fabrication. Protect finishes on exposed surfaces before shipment.
- B. Aluminum Finishes: Finish designations prefixed by AA conform to the system established by the Aluminum Association for designating aluminum finishes.
1. Mill Finish: AA-M10 (unspecified mill finish).
  2. Class II, Clear-Anodized Finish: AA-M12C22A31 [Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class II Architectural, clear film thicker than 0.4 mil].
  3. Class I, Clear-Anodized Finish: AA-M12C22A41 [Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class I Architectural, clear film thicker than 0.7 mil] complying with AAMA 607.1.
  4. Class II, Color-Anodized Finish: AA-M12C22A32/A34 [Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class II Architectural, film thicker than 0.4 mil with integral color or electrolytically deposited color].
  5. Class I, Color-Anodized Finish: AA-M12C22A42/A44 [Mechanical Finish: as fabricated, nonspecular; Chemical Finish: etched, medium matte; Anodic Coating: Class I Architectural, film thicker than 0.7 mil with integral color or electrolytically deposited color] complying with AAMA 606.1 or AAMA 608.1.
    - a. Color: As selected by the Engineer from within standard industry colors and color density range.
  6. Baked Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited

chemicals; Chemical Finish: chemical conversion coating, acid chromate-fluoride-phosphate pretreatment; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's specifications for cleaning, conversion coating, and painting.

- a. Organic Coating: Thermosetting modified acrylic enamel primer/topcoat system complying with AAMA 603.8 except with minimum dry film thickness of 1.5 mils, medium gloss
  - b. Color: As selected by the Engineer from manufacturer's standard colors.
7. High-Performance Organic Coating: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: chemical conversion coating, acid chromate-fluoride-phosphate pretreatment; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturer's instructions.
- a. Fluoropolymer Two-Coat Coating System: Manufacturer's standard two-coat thermocured system, composed of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 605.2.
  - b. Fluoropolymer Three-Coat Coating System: Manufacturer's standard three-coat thermocured system composed of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluorocarbon topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 605.2.
    - 1) Resin Manufacturers: Subject to compliance with requirements, provide fluoropolymer coating systems containing resins produced by one of the following manufacturers:
      - a) Ausimont USA, Inc. (Hylar 5000).
      - b) Elf Atochem North America, Inc. (Kynar 500).
      - c) Or equal.
    - 2) Color and Gloss: As selected by the Engineer from manufacturer's standard choices for color and gloss. Retain below for covers in contact with masonry or concrete.
8. Factory-Primed Concealed Surfaces: Protect concealed metal surfaces to be placed in contact with concrete or masonry with a shop coat of manufacturer's standard primer on the contact surfaces.
- C. Bronze Finish: Comply with NAAMM "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
1. Natural Satin Finish: CDA Designation M32, mechanical finish, directional textured, medium satin.
- D. Stainless Steel Finishes: Comply with NAAMM "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
1. Bright, Cold-Rolled Unpolished Finish: AISI No. 2B finish.
  2. Bright, Directional Polish: AISI No. 3 finish.
- E. Factory Finish: Manufacturer's standard factory finish.

## **PART3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Manufacturer's Instructions: In addition to requirements of these specifications, comply with manufacturer's instructions and recommendations for phases of Work, including preparing substrate, applying materials, and protecting installed units.
- B. Coordinate and furnish anchorages, setting drawings, templates, and instructions for installation of expansion joint cover assemblies to be embedded in or anchored to concrete

or to have recesses formed into edges of concrete slab for later placement and grouting-in of frames.

- C. **Fastening to In-Place Construction:** Provide anchorage devices and fasteners where necessary to secure expansion joint cover assemblies to in-place construction, including threaded fasteners with drilled-in expansion shields for masonry and concrete where anchoring members are not embedded in concrete. Provide fasteners of metal, type, and size to suit type of construction indicated and provide for secure attachment of expansion joint cover assemblies.

### **3.02 INSTALLATION:**

- A. **Cutting, Fitting, and Placement:** Perform cutting, drilling, and fitting required to install expansion joint covers. Install joint cover assemblies in true alignment and proper relationship to expansion joints and adjoining finished surfaces measured from established lines and levels. Allow adequate free movement for thermal expansion and contraction of metal to avoid buckling. Set floor covers at elevations to be flush with adjacent finished floor materials. Locate wall, ceiling, roof, and soffit covers in continuous contact with adjacent surfaces. Securely attach in place with required accessories. Locate anchors at interval recommended by manufacturer, but not less than 3 inches from each end and not more than 24 inches on center.
- B. **Continuity:** Maintain continuity of expansion joint cover assemblies with a minimum number of end joints and align metal members mechanically using splice joints. Cut and fit ends to produce joints that will accommodate thermal expansion and contraction of metal to avoid buckling of frames. Adhere flexible filler materials (if any) to frames with adhesive or pressure-sensitive tape as recommended by manufacturer.
- C. **Extruded Preformed Seals:** Install seals complying with manufacturer's instructions and with minimum number of end joints. For straight sections provide preformed seals in continual lengths. Vulcanize or heat-weld field splice joints in preformed seal material to provide watertight joints using procedures recommended by manufacturer. Apply adhesive, epoxy, or lubricant-adhesive approved by manufacturer to both frame interfaces before installing preformed seal. Seal transitions according to manufacturer's instructions.
- D. **Elastomeric Sealant Joint Assemblies:** Seal end joints within continuous runs and joints at transitions according to manufacturer's directions to provide a watertight installation.
- E. **Seismic Seals:** Install interior seals in continual lengths; vulcanize or heat-weld field splice joints in interior seal material to provide watertight joints using manufacturer's recommended procedures. Install exterior seal in standard lengths. Seal transitions and end joints according to manufacturer's instructions.
- F. **Fire Barriers:** Install fire barriers, including transitions and end joints, according to manufacturer's instructions so that fire-rated construction is continuous.

### **3.03 CLEANING AND PROTECTION:**

- A. Do not remove protective covering until finish work in adjacent areas is complete. When protective covering is removed, clean exposed metal surfaces to comply with manufacturer's instructions.

**END OF SECTION**

## SECTION 05811

### EXPANSION JOINT SYSTEMS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing exterior (pedestrian and vehicular) traffic joints, exterior (wall and ceiling) joints, exterior soffit joints, interior (pedestrian and vehicular) traffic joints, interior (wall and ceiling) joints and interior soffit joints.
- B. Related Work Specified Elsewhere:
  - 1. Cast-In-Place Structural Concrete: Section 03300.
  - 2. Expansion Joint Cover Assemblies: Section 05810.
  - 3. Flashing and Sheet Metal: Section 07600.
  - 4. Seals and Sealants: Section 07900.

##### 1.02 DEFINITIONS:

- A. Architectural Joint System: Any filler or cover used to span, fill, cover, or seal a joint, except expanding foam seals and poured or foamed in-place sealants.
- B. Cyclic Movement: Periodic change between widest and narrowest joint widths in an automatically mechanically controlled system.
- C. Fire Barriers: Any material or material combination, when fire tested after cycling, designated to resist passage of flame and hot gases through a movement joint.
- D. Maximum Joint Width: Widest linear gap a joint system tolerates and performs its designed function without damaging its functional capabilities.
- E. Minimum Joint Width: Narrowest linear gap a joint system tolerates and performs its designed function without damaging its functional capabilities.
- F. Movement Capability: Value obtained from the difference between widest and narrowest widths of a joint opening typically expressed in numerical values (inches) or a percentage of nominal value of joint width.
- G. Nominal Joint Width: Width of linear gap indicated as representing the conditions existing when architectural joint systems will be installed or, if no nominal joint width is indicated, a width equal to the sum of maximum and minimum joint widths divided by two

##### 1.03 PERFORMANCE REQUIREMENTS:

- A. General: Provide factory-fabricated architectural joint systems capable of withstanding the types of loads and of accommodating the kinds of movement, and the other functions for which they are designed including those specified below, without failure. Types of failure include those listed in Appendix X3 of ASTM E1399.
  - 1. Vehicular Traffic Joints: Support vehicular traffic across joint.
  - 2. Pedestrian Traffic Joints: Support pedestrian traffic across joint.
  - 3. Exterior Joints: Maintain continuity of weather enclosure.
  - 4. Joints in Fire-Resistance-Rated Assemblies: Maintain fire-resistance ratings of assemblies.
  - 5. Joints in Smoke Barriers: Maintain integrity of smoke barrier.

6. Joints in Acoustically Rated Assemblies: Inhibit passage of airborne noise.
7. Other Joints: Where indicated, provide joint systems that prevent penetration of water, moisture, and other substances deleterious to building components or content.
8. Seismic Joints: Remain in place on exposure to seismic activity (movement).
9. Joints in Surfaces with Architectural Finishes: Serve as finished architectural joint closures.

## **1.02 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  1. Product Data: Include manufacturer's product specifications, construction details, material and finish descriptions, and dimensions of individual components and seals.
  2. Shop Drawings: For each joint system specified, provide the following:
    - a. Placement Drawings: Include line diagrams showing entire route of each joint system, plans, elevations, sections, details, joints, splices, locations of joints and splices, and attachments to other Work. Where joint systems change planes, provide Isometric Drawings depicting how components interconnect to achieve continuity of joint covers and fillers.
  3. Samples for Initial Selection: Manufacturer's color charts consisting of units or sections of units showing the full range of colors, textures, and patterns available for each exposed metal and elastomeric material of joint system indicated.
    - a. Include similar Samples of material for joints and accessories involving color selection.
  4. Samples for Verification: Full-size units 6 inches long of each type of joint system indicated; in sets for each finish, color, texture, and pattern specified, showing the full range of variations expected in these characteristics.
  5. Product Test Reports: From a qualified testing agency indicating architectural joint systems comply with requirements, based on comprehensive testing of current products.

## **1.05 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of the jurisdictional authorities.
  2. AAMA: 606.1, 607.1, 608.1, 2603, 2604, 2605.
  3. ADA: Americans with Disabilities Act.
  4. ASTM: A666, B36, B209, B221, B455, E119, E814, E1399, E1612, E1783.
  5. NAAMM: Metal Finishes Manual for Architectural and Metal Products.
  6. UL: 2079.
- B. Source Limitations: Where practical, obtain architectural joint systems through one source from a single manufacturer. Coordinate compatibility with adjoining joint systems specified in other Sections.
- C. Fire-Test-Response Characteristics: Where indicated, provide joint systems incorporating fire barriers that are identical to those of assemblies tested for fire resistance per **[ASTM E 119] [and] [ASTM E 814] [UL 2079]**, including hose-stream test of vertical wall assemblies, by a testing and inspecting agency acceptable to authorities having jurisdiction.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. Aluminum: ASTM B221, alloy 6063-T5 for extrusions; ASTM B209, alloy 6061-T6 for sheet and plate.
  - 1. Apply manufacturer's standard protective coating on aluminum surfaces to be placed in contact with cementitious materials.
- B. Bronze: ASTM B455, alloy C38500 for extrusions; alloy C23000 Red Brass for plates.
- C. Brass: ASTM B36/B36M, UNS alloy C26000 for half hard sheet and coil.
- D. Stainless Steel: ASTM A666, Type 304 with No. 2B finish, unless otherwise indicated, for plates, sheet, and strips.
- E. Preformed Seals: Single or multicellular extruded elastomeric seals designed with or without continuous, longitudinal, internal baffles. Formed to be installed in frames or with anchored flanges, in color indicated or, if not indicated, as selected by the Engineer from manufacturer's standard colors.
- F. Preformed Silicon-Foam Sealant System: Section 07900.
- G. Strip Seals: Elastomeric membrane or tubular extrusions with a continuous longitudinal internal baffle system throughout complying with ASTM E 1783; used with compatible frames, flanges, and molded-rubber anchor blocks.
- H. Compression Seals: Preformed, elastomeric extrusions having internal baffle system complying with ASTM E1612 in sizes and profiles indicated or as recommended by manufacturer.
- I. Preformed Cellular Foams: [Nonextruded, low-density, crosslinked, nitrogen-blown ethylene-vinyl-acetate copolymer] [Neoprene] [or] [polyurethane] extruded, compressible foam.
- J. Fire Barriers: Any material or material combination, when fire tested after cycling, designated to resist the passage of flame and hot gases through a movement joint.
- K. Accessories: Manufacturer's standard anchors, clips, fasteners, set screws, spacers, flexible moisture barrier and filler materials, drain tubes, lubricants, adhesives, and other accessories compatible with material in contact, as indicated or required for complete installations.

## **2.02 EXPANSION JOINT SYSTEMS:**

- A. General: Provide joint systems of design, basic profile, materials, and operation indicated on approved shop drawings. Provide units with the capability to accommodate joint widths indicated and variations in adjacent surfaces.
  - 1. Furnish units in longest practicable lengths to minimize number of end joints. Provide hairline mitered corners where joint changes directions or abuts other materials.
  - 2. Include closure materials and transition pieces, tee-joints, corners, curbs, cross-connections, and other accessories as required to provide continuous joint systems.
  - 3. Frames for Strip Seals: Designed with semiclosed cavity that provides a mechanical lock for seals of type indicated.
  - 4. Public Arena Seals: Non-slip seals designed for installation on treads and risers and to lie flat with adjacent surfaces, and complying with ADA guidelines for public areas.

5. Cyclic-Movement-Test-Response Characteristics: No evidence of visual fatigue, inability to cycle between designated joint widths, or other types of failure as determined by testing products identical to those indicated per ASTM E1399 including Appendix X3.
6. Fire-Resistance Ratings: Provide manufacturer's standard fire barrier with a rating not less than that of adjacent construction.
7. Moisture Barrier: Provide manufacturer's standard unit.

### **2.03 FINISHES, GENERAL:**

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

### **2.04 ALUMINUM FINISHES:**

- A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- B. Mill Finish: AA-M10 (Mechanical Finish: as fabricated; no other applied finish unless buffing is required to remove scratches, welding, or grinding produced in fabrication process).
- C. Class II, Clear Anodic Finish: AA-M12C22A31 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.010 mm or thicker) complying with AAMA 607.1.
- D. Class I, Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 607.1.
- E. Class II, Color Anodic Finish: AA-M12C22A32/A34 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, integrally colored or electrolytically deposited color coating 0.010 mm or thicker).
- F. Class I, Color Anodic Finish: AA-M12C22A42/A44 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.018 mm or thicker) complying with AAMA 606.1 or AAMA 608.1.
  1. Color: As selected by the Engineer from the full range of industry colors and color densities.
- G. Baked-Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's specifications for cleaning, conversion coating, and painting.
  1. Organic Coating: Thermosetting, modified-acrylic enamel primer/topcoat system complying with AAMA 2603 except with a minimum dry film thickness of 1.5 mils, medium gloss.
  2. Color: As selected by the Engineer from manufacturer's full range.
- H. High-Performance Organic Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic

Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

1. Fluoropolymer Two-Coat System: Manufacturer's standard two-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2604.
2. Fluoropolymer Three-Coat System: Manufacturer's standard three-coat, thermocured system consisting of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 2605.
  - a. Color and Gloss: As selected by the Engineer from manufacturer's full range.

## **2.05 STAINLESS STEEL FINISHES:**

- A. Remove tool and die marks and stretch lines or blend into finish.
- B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- C. Bright, Cold-Rolled, Unpolished Finish: No. 2B finish.
- D. Bright, Directional Polish: No. 4 finish.
- E. Satin, Directional Polish: No. 6 finish.
- F. Mirrorlike Reflective, Nondirectional Polish: No. 8 finish.
- G. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

## **2.06 COPPER ALLOY FINISHES:**

- A. Finish designations prefixed by CDA comply with the system established by the Copper Development Association for designating copper-alloy finish systems, as defined in NAAMM's "Metal Finishes Manual for Architectural and Metal Products."
  1. Remove tool and die marks and stretch lines or blend into finish.
  2. Grind and polish surfaces to produce uniform, directionally textured polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.
- B. Standard Finish Designation: CDA M32 (Mechanical Finish: directionally textured, medium satin).

## **PART 3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Prepare substrates according to architectural joint system manufacturer's written instructions.
- B. Coordinate and furnish anchorages, Placement Drawings, and instructions for installing joint systems to be embedded in or anchored to concrete or to have recesses formed into edges of concrete slab for later placement and grouting-in of frames.

- C. **Fastening to In-Place Construction:** Provide anchorage devices and fasteners where necessary to secure joint systems to in-place construction, including threaded fasteners with drilled-in expansion shields for masonry and concrete where anchoring members are not embedded in concrete. Provide fasteners of metal, type, and size to suit type of construction indicated and to provide for secure attachment of joint systems.

### **3.02 INSTALLATION:**

- A. Comply with manufacturer's written instructions for handling and installing architectural joint assemblies and materials, unless more stringent requirements are indicated.
- B. Coordinate installation of architectural joint assembly materials and associated work so complete assemblies comply with assembly performance requirements.
- C. Terminate exposed ends of exterior architectural joint assemblies with factory-fabricated termination devices to maintain waterproof system.
- D. Install factory-fabricated transitions between building expansion joint cover assemblies and roof expansion joint assemblies to provide continuous, uninterrupted, watertight construction.
- E. Coordinate the size of joint opening at the time joint segments are set in position (distance between joint segments) with the temperature of the structure and the designed joint movement.
- F. **Cutting, Fitting, and Placement:** Perform cutting, drilling, and fitting required to install joint systems.
  - 1. Install joint cover assemblies in true alignment and proper relationship to joints and adjoining finished surfaces measured from established lines and levels.
  - 2. Allow adequate free movement for thermal expansion and contraction of metal to avoid buckling.
  - 3. Set covers in horizontal surfaces at elevations that place exposed surfaces flush with adjoining finishes.
  - 4. Locate covers in continuous contact with adjacent surfaces.
  - 5. Securely attach in place with required accessories.
  - 6. Locate anchors at interval recommended by manufacturer, but not less than 3 inches from each end and not more than 24 inches o.c.
- G. **Continuity:** Maintain continuity of joint systems with a minimum number of end joints and align metal members. Cut and fit ends to produce joints that will accommodate thermal expansion and contraction of metal to avoid buckling of frames. Adhere flexible filler materials, if any, to frames with adhesive or pressure-sensitive tape as recommended by manufacturer.
- H. **Extruded Preformed Seals:** Install seals to comply with manufacturer's written instructions and with minimum number of end joints.
  - 1. For straight sections, provide preformed seals in continuous lengths.
  - 2. Vulcanize or heat-weld field splice joints in preformed seal material to provide watertight joints using procedures recommended by manufacturer.
  - 3. Apply adhesive, epoxy, or lubricant adhesive approved by manufacturer to both frame interfaces before installing preformed seals.
  - 4. Seal transitions according to manufacturer's written instructions.
  - 5. Install foam seals with adhesive recommended by manufacturer and heat seal all splices.

- I. Joint Systems with Seals: Seal end joints within continuous runs and joints at transitions according to manufacturer's written instructions to provide a watertight installation.
- J. Seismic Seals: Install interior seals in continuous lengths. Install exterior seal in standard lengths and vulcanize or heat-weld field splice joints to provide watertight joints using manufacturer's recommended procedures. Seal transitions and end joints according to manufacturer's written instructions.
- K. Fire Barriers: Install fire barriers to provide continuous, uninterrupted fire resistance throughout length of joint, including transitions and end joints.

**3.03 CLEANING AND PROTECTION:**

- A. Do not remove protective covering until finish work in adjacent areas is complete. When protective covering is removed, clean exposed metal surfaces to comply with manufacturer's written instructions.

**END OF SECTION**

## SECTION 05840

### BEARINGS

#### PART 1 - GENERAL

##### 1.02 DESCRIPTION:

- A. This section specifies spherical and elastomeric bearings, fixed and sliding types, as shown. Pot Bearings shall not be used.
- B. Related Work Specified Elsewhere:
  - 1. Structural Steel: Section 05120.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of the jurisdictional authorities.
  - 2. AWS: C-2.2, D 1.1.
  - 3. AASHTO: Standard Specifications for Highway Bridges, including supplement and M235. Where conflict occurs between AWS and AASHTO, AASHTO governs.
  - 4. AISC:
    - a. Specification for the Design, Fabrication and Erection of Structural Steel for Buildings.
    - b. Code of Standard Practice for Steel Buildings and Bridges.
    - c. Specifications for Structural Joints using ASTM A325 and A490 Bolts.
  - 5. AISI: C1018, C1020.
  - 6. ANSI: B18.2, B27.2.
  - 7. ASTM: A167, A240, A 709, C287, D621, D1777, D2256.
  - 8. ASNT: Recommended Practice SNT-TC-1A.
  - 9. MS: MIL P23236
- B. Source Quality Control:
  - 1. Testing and inspection:
    - a. Nondestructive-test requirements for welded members:
      - 1) Perform the following:
      - 2) For all fillet-weld connections: 10 percent of welds inspected by magnetic particle inspection.
      - 3) The Engineer may designate additional items to be inspected by radiography.
    - b. Bolts: The Engineer will randomly select at least five bolts for test purposes from each bin of bolts furnished.
- C. Qualification of Welding Personnel and Procedures:
  - 1. Prior to qualifying welding personnel and welding procedures, confirm an agreement with the Engineer as to procedural details, sequence of welding, handling of materials to be inspected, and approval of electrodes, wire, flux and other welding materials and equipment.
  - 2. Employ welding personnel whose qualification is certified in accordance with AWS Standard D1.1. Such certification is to remain in force for the duration of the welding operations under this Contract.
  - 3. Do not start fabrication until qualification has been successfully completed.
- D. Qualification of Nondestructive-Testing Personnel:

1. Nondestructive testing of fracture-critical members to be conducted by personnel qualified as NDT Level II or Level III in accordance with ASNT SNT-TC-1A.
  2. Level-II technicians to be supervised by Level III-personnel.
- E. Stock Material:
1. For qualification of welding personnel and procedures and for quality-assurance testing, use only stock materials which can be identified as having been rolled from a given heat and for which certified mill tests can be produced.
  2. When stock material is proposed, inform the Engineer of such intention at least 10 days in advance of commencing fabrication to permit sampling and testing. Select identified material from as few heats as possible.
- F. Welder's Identification Mark:
1. Assign each welder and welding operator an identification mark to stamp on pieces he has welded.
  2. Have welder or welding operator place his identification mark by metal-die stamp in letters 3/8-inch high in position that identification of welder or operator will appear adjacent to each of his welds in finally assembled members for ready reference to radiographic films and for identification by the Engineer.
- G. Bearing Manufacturer:
1. Qualification of Bearing Manufacturer: The Contractor shall demonstrate that the selected bearing manufacturer has a successful performance record for at least ten (10) years in the design and fabrication of spherical bearings in structures similar to the Work herein. The manufacturer shall also be capable of ensuring a close control over the materials, workmanship and quality within his facilities.
  2. Certification of Bearing Quality: The Contractor shall submit the following certification for approval by the Engineer:
    - a. Bearing certificate of conformance.
    - b. Test reports and certification of all materials included in the construction of all the bearings.
  3. Inspection Facilities: The manufacturer shall be required to furnish facilities for the testing and inspection of the complete bearings and/or representative samples in his plant or at an independent test facility.
- H. Testing of Bearings:
1. Sampling:
    - a. Select at random at least one sample from each "lot" of completed bearings at the manufacturer's plant.
    - b. One "lot" consists of one of the following:
      - 1) No more than 24 fixed or modified fixed bearings of one "load category".
      - 2) No more than 25 expansion bearings of one "load category".
    - c. One "load category" may consist of bearings of differing vertical load capacity but not to exceed a range of capacity differing by more than 300 kips.
  2. Friction Test:
    - a. Specially made bearings are not to be used; only actual bearings to be used in the project are to be tested. Test in accordance with the requirements of Section 18.8.3 of the current addition of AASHTO "Standard Specifications for Highway Bridges". A sample from each lot of expansion bearing is to be tested.
  3. Proof Load Test:
    - a. Test one bearing from each production "lot" of fixed and expansion bearings.

- b. Apply a load to the test bearings equal to 150% of the rated design capacity of the bearing simultaneously rotated 0.02 radians or the design rotation, which is greater, for one hour.
  - c. During the test or subsequently upon disassembly, the bearing shall show no sign of deformation or extrusion of the PTFE.
- 4. Material Tests:
  - 5. One sample of PTFE is to be taken from each "lot".

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Structural details: Include the following:
      - 1) Bills of materials giving complete information for fabrication and erection of component parts of structures including material and finish information.
      - 2) Details of location, type, sizes of bolts and welds and for welded structures details of welding as specified.
      - 3) Structural computations for Contractor-designed work certified by a professional engineer registered in the area where the work is to be performed.
    - b. Match marks:
      - 1) Provide diagram showing match marks for connecting structural parts assembled in shop for purpose of drilling or reaming holes in field connections.
    - c. Welding:
      - 1) Complete shop details of qualification test specimens.
      - 2) Include information on specimen identification, number of pieces and welding procedure specification, type of material, sizes of pieces and welds and other variables affecting detail or tests.
    - d. Manufacturer's test procedures for bolts.
    - e. Bearings:
      - 1) The manufacturer is to submit detailed assembly drawings and any attachments in sufficient detail for proper review of the contract and this specification.
      - 2) Shop drawings are to include but not be limited to the following information:
        - a) Plan view and section elevation including all relative dimensions.
        - b) Details of all components and sections showing all materials incorporated into the bearing.
        - c) All ASTM, AASHTO and other material designations.
        - d) Vertical, horizontal, rotation and movement capacity.
        - e) A schedule of all bearing offsets if required by the project.
        - f) Paint or coating requirements.
        - g) Complete design calculations verifying conformance with the provisions of this specification and certified by a professional engineer registered in the jurisdiction where the work is performed. Do not proceed until approval has been received
- B. Certification:
  - 1. Certified mill test reports of structural steel at least 10 days prior to start of fabrication.

2. Certified quality-assurance testing and inspection reports.
3. Certification verifying that welding personnel have been qualified in accordance with AWS D1.1.
4. Manufacturer's certification that bolts meet approved testing.
5. Spherical-type bearings:
  - a. The certification package is to contain the following:
    - 1) Materials test reports for all steels used except AISI C1018 and C1020 for which a mill conformance certificate is acceptable.
    - 2) Certificate of Compliance for all non-ferrous metals.
    - 3) Certificate of Compliance for PTFE and any adhesives used. A certificate of compliance for the bearings executed by an officer of the manufacturer's company.
    - 4) Certificate of Compliance for any dowels or bolts supplied
    - 5) Test reports for the performance tests.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. General:
  1. Load, transport, unload and store structural materials so as to keep them clean and free from damage
- B. Steelwork: See section 05120.
- C. Bolts and Nuts: See section 05120.
- D. Paint: See section 05120.
- E. Bearings:
  1. Bearings are to be securely banded together as units so that they may be shipped to the jobsite and stored without relative movement of the bearing parts or disassembly at any time. Bearings are to be wrapped in moisture resistance and dust resistant material to protect against shipping and jobsite conditions.
  2. Take care to ensure that bearings at the jobsite are stored in a dry sheltered area free from dirt or dust until installation.
  3. When bearings are to be inspected on site, they are to be inspected within one week of arrival and may not be disassembled except under the supervision of the manufacturer or his representative or with the written approval of the manufacturer. Following inspection, the wrapping is to be reapplied and the bearings kept clean until installation.
  4. Removal of sole and top plates of bearings for separate attachment to the structure is not permitted except under the direct supervision of the manufacturer.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  1. Welding: See section 05120.
  2. Painting: See section 05120.

### **PART 2- PRODUCTS**

#### **2.01 MATERIALS:**

- A. PTFE sliding surfaces conforming to the material requirements of AASHTO Section 18.8. Reprocessed material shall not be used.

- B. Stainless Steel sliding surfaces conforming to ASTM A167 or A240 Type 304 with a surface finish 20 micro-inches rms. or less. Welded stainless steel overlay produced using Type 309L electrodes.
- C. Solid Stainless Steel stock for spherical bearings core conforming to ASTM A 240, Type 318 or Type 304 or to ASTM A167, Type 304, with a minimum yield strength of  $F_y$  equal 30,000 psi.
- D. Steel in Bearings:
  - 1. Bearings for Aerial Line Sections
  - 2. Bearing assemblies used in the line sections of the aerial structure with span lengths of 80 feet or more, shall be self lubricating bearing assemblies to provide rotation and longitudinal movement as needed for expansion joints. The bearing assembly shall be an integral unit composed of:
    - a. Spherical bearings plates - A convex solid stainless steel plate with surface of woven PTFE fabric mechanically interlocked to the substrate plate, and a mating concave solid stainless steel plate with finished bearing surface. The spherical interface shall provide rotational movement in any direction.
    - b. Flat bearing plates - A flat plate with the PTFE material similarly fixed on the sliding surface, and a solid stainless steel concave mating plate, as described in [1] above, with a flat finished sliding surface, to provide longitudinal translation movement. The relative movement between these two flat surfaces is to be restricted to the longitudinal direction.
      - 1) The PTFE fabric shall have a minimum thickness of 1/16" and is to meet the following requirements:
        - a) Hardness at 78°F per ASTM D676 - 50-65 Durometer D
        - b) Tensile strength per ASTM D638 - 2800 psi (Min. Avg.)
        - c) Elongation per ASTM D1708 - 200% (Min. Avg.)
        - d) The coefficient of friction between the steel plate and the PTFE surface shall be no greater than .06 at 800 psi compressive loading.
      - 2) The stainless steel surfaces shall have a finish of 20 RMS.
  - 3. Elastomeric bearings for Aerial Stations:
    - a. Criteria for the design shall be governed by AASHTO Section 14 "Elastomeric bearings". Method A or B is to be used as applicable. The compressive strain should not exceed 7%.
    - b. Bearing assemblies to be used in aerial stations shall be the sliding plate type bearing which allows translation by sliding of a self lubricating surface across a smooth hard solid stainless steel mating surface. The assembly is to have solid stainless steel bearing plate on the upper unit with sole plate and a preformed fabric pad with a rigidly confined PTFE bearing surface in the lower unit with masonry plate.
    - c. The preformed fabric pad shall meet AASHTO Specifications 10.3.12 "Preformed Fabric Pads" and capable of withstanding loads of 10 ksi perpendicular to the plane of lamination.
    - d. The metal bearing plate shall be fabricated from minimum of 13 gage stainless steel, and have a mirror finish with a minimum 20 micro inches RMS on the PTFE bearing side.
    - e. The coefficient of friction between the steel plate and the PTFE surface shall be no greater than .06 at 800 psi compressive loading.
  - 4. Expansion bearings shall be sized and set at the time of construction to allow for the following:
    - a. The maximum temperature movement based on the mean 48 hour prior temperature.

- b. The anticipated rotation and movement due to creep, shrinkage and elastic shortening from time of setting through day 400. These computed rotation and movements shall be increased by a factor of 1.3.
  - 5. Materials and fabrication for all type bearings, shall be in accordance with AASHTO, Section 18, Division II, and with the contract specifications.
- E. All steel, except stainless steel, used in fabrication of structural bearings, including masonry, sole plates, hold-down bolts and plates, etc., to be in accordance with ASTM A709, Grade 50W, unless otherwise shown in the Contract Drawings.
  - 1. All steel surfaces exposed to the atmosphere (except stainless) may at the manufacturer's option, be either shop painted with a coat of epoxy coal-tar protective coating system or zinc metalized.
    - a. Epoxy coal-tar coating in accordance with the requirement of Military Specification MIL-P23236, Class 2, and be applied at a minimum wet-film thickness of 10 mils.
    - b. Apply the metalized coatings in accordance with industry standards and AWS C-2.2.
  - 2. Prior to application of the protective coating, the surfaces to be coated or metalized are to be cleaned in accordance with the recommendations of the manufacturer of the system.
- F. Bolts and Nuts: ANSI B18.2.1 and B18.2.2.
- G. Round Washers Other Than Those In Contact With High-Strength Bolt Heads And Nuts: ANSI B27.2, Type B.
- H. Beveled Washers:
  - 1. Square, smooth and sloped to make contact surfaces of bolt head and nut parallel.
  - 2. Diameter of hole in square beveled washers as follows:
    - a. For bolts less than one-inch diameter: 1/16-inch larger than bolt size.
    - b. For bolts larger than one-inch diameter: 1/8-inch larger than bolt size.
- I. For all other materials, see section 05120.

## 2.02 DESIGN OF BEARINGS:

- A. General:
  - 1. Multi-Rotational bearings are to be designed to accommodate the loads, forces and movements specified in the bearing schedule.
  - 2. Maximum design stresses for all bearing components are not to exceed the allowable design stresses of the applicable issue of the AASHTO "Standard Specifications for Highway Bridges" and the applicable sections of this specification.
  - 3. Minimum "Design Rotation" capacity is .015 radians or as specified in the contract plans.
  - 4. Minimum horizontal capacity is 10% of the vertical capacity.
  - 5. Bearings are to be designed for 1 inch additional total movement capacity in each direction specified under "Design Movement" in the "Bearing Schedule". Spacing between the guides of the bearing do not require this additional movement capacity.
  - 6. Bearings are to be designed so that all rotational and sliding elements can be replaced with a minimum of jacking.
  - 7. All dimensions in this specification are in the customary units of the United States.
- B. Design of Rotational Elements:
  - 1. Spherical Element-Concave Surface-PTFE/Woven Teflon Fabric Pad:

- a. The spherical radius shall be determined such that the resulting geometry of the bearing is capable of withstanding the greatest ratio of horizontal force to vertical load under all loading conditions to prevent unseating the concave element.
  - b. If required during construction, mechanical safety restraints shall be incorporated to prevent overturning.
  - c. Maximum design rotation of the structure itself plus 0.03 radians shall be considered in the bearing design to prevent overturning or uplift.
  - d. Calculations showing the determination of the radius shall be submitted for approval. The projected area of sheet PTFE shall be designed for a maximum working stress of 3500 psi at the full load of the structure.
  - e. The projected area of woven fiber PTFE shall be designed for a maximum working stress of 6000 psi at the full load of the structure.
  - f. The concave surface shall face down whenever possible.
  - g. The minimum edge and center thickness shall be 3/4".
  - h. For sheet PTFE the minimum thickness shall be 1/8" and recessed for 1/16" in the spherical element.
  - i. PTFE fabric shall be a minimum of 1/16" thick when measured in accordance with ASTM D1777.
  - j. PTFE woven fabric shall be mechanically interlocked with the stainless steel substrate in accordance with the requirements of Section 18.8.2.1.3 of AASHTO.
2. Rotational Elements-Spherical Convex Surfaces
- a. The convex element shall be designed for the following service rotation in radians:
    - 1) Service rotation = "Design Rotation" + 0.03: where Design Rotation refers to the rotation of the structure itself.
  - b. When convex elements are connected to masonry or distribution plates it shall be by means of a fillet weld around the entire perimeter or set into a cavity and sealed by welding or other acceptable means.
  - c. The minimum edge thickness shall be 3/4".
  - d. For PTFE/Stainless and sliding surfaces, the stainless surface shall be one of the following:
    - 1) ASTM A240 Type 304, 13 gage thick with a 20 micro-inch rms finish.
    - 2) Solid stainless steel ASTM A240 Type 304 or 304L shall be equal to or less than a 20 micro-inch rms finish.
    - 3) Stainless steel weld overlay a minimum of 3/32" thick with a 20 micro-inch rms finish.
  - e. If sheet PTFE is used for guided surfaces, it shall be pigmented.
- C. Design of Non-Rotational Elements:
- 1. PTFE Sliding Surfaces:
    - a. Sheet PTFE sliding surfaces, filled or unfilled, are to be designed for 3500 psi average maximum working stress at the fully factored dead and live load of the structure.
    - b. Sheet PTFE is to be minimum of 1/8 inch thick, epoxy-bonded into a square-edge recess 1/16 inch deep.
    - c. Fabric PTFE sliding surfaces are to be designed for 6000 psi average maximum working stress at the fully factored dead and live load of structure.
    - d. Fabric PTFE is to have a minimum thickness of 1/16 inch and be epoxy-bonded to the substrate using a system that prevents migration of epoxy through the fabric. Any edges, other than the selvage are to be oversown or recessed so that no cut fabric edges are exposed.
    - e. PTFE used on guide bars shall be pigmented
  - 2. Stainless Steel Sliding Surfaces:

- a. The stainless steel surface is to cover the mating surface in all operating positions plus one inch in each direction of movement. This is to conform with the requirements of Article 2.2.A.5.
  - b. Sheet stainless steel is to be minimum of 13 gage thick and connected to the substrate by a continuous weld around the entire perimeter. The sheet is to be in full contact with the substrate.
  - c. Stainless steel sliding surfaces are to be, preferably, face down.
  - d. Stainless steel welded overlay is to be a minimum of 3/32 inches thick after welding, grinding and polishing and be produced using Type 309L electrodes.
3. Guide Bars:
- a. May be integral by machining from the solid, welded or connected with high strength fasteners. High strength fasteners are to be designed using .25 X Ultimate Strength in shear.
  - b. Guide bars are to be designed for the specified horizontal forces, but not for less than 10 percent of the vertical capacity of the bearing.
  - c. The total space between the guide bars and guided members (both sides) is to be, preferably, 1/16 inch or as specified.
  - d. Guided members must have their contact area within the guide bars in all operating positions.
  - e. Guiding off the fixed base or any extensions of it where transverse rotation is anticipated is to be avoided.

## 2.03 FABRICATION:

- A. Rotational Elements:
- 1. Spherical bearing machined diameters shall be + or - 0.015". Convex radius dimensions shall be + 0.000" - 0.010". Concave radius dimensions shall be + 0.010" - 0.000"
  - 2. Mating surfaces shall be as in Design section, external edges may be "as cast" or flame-cut.
    - a. Lower surface of convex element shall be Class "C" tolerance.
- B. Non-Rational Elements:
- 1. Masonry and distribution plate tolerances:
    - a. Plan dimensions under 30 inches, minus 0-inch plus 3/16 inch.
    - b. Plan dimensions over 30 inches, minus 0-inch plus 1/4 inch.
    - c. Thickness tolerance shall be minus 0.030-inch plus 0.060-inch. Masonry plates used with Spherical Bearings, Class "C" for the underside and Class "A" for the upperside.
  - 2. PTFE sliding surface tolerance:
    - a. Plan dimensions "total design area" plus 5 percent minus 0 percent.
    - b. Substrate flatness Class "B" Spherical Bearings.
  - 3. Stainless steel sheet is to be seal-weld around the entire perimeter using techniques which ensure it remains in contact with the backing plate. Finish, 20 micro-inches rms or better. Flatness to Class "A" tolerance
  - 4. Sole plates conforming to:
    - a. Plan dimensions under 30 inches minus 0-inch plus 3/16-inch.
    - b. Plan dimensions over 30 inches minus 0-inch plus 1/4-inch.
    - c. Center line Thickness, minus 1/32-inch plus 1/8-inch.
    - d. Flatness of surface in contact with poured in place concrete, none, in contact with stainless steel sliding surface, Class "A", in contact with another steel plate, Class "B".
    - e. No edge shall be thinner than 3/4-inch.

- f. Bevels shall be machined to an angular tolerance of plus-or-minus 0.002 radians.
  - g. Flatness of beveled surfaces shall be Class "A".
  - 5. Guide bar tolerances:
    - a. Length, unless integral with plate plus-or-minus 1/8-inch.
    - b. Section dimensions, plus-or-minus 1/16-inch.
    - c. Flatness where it bears on another plate Class "A".
    - d. Bar-to-bar, nominal dimensions plus-or-minus 1/32-inch.
    - e. Not more than 1/32-inch out of parallel.
  - 6. Overall bearing height is to be not more than 3/16-inch or less than 1/16-inch under nominal dimension. All edges shall be broken and not sharp.
- C. Determination of Flatness and Tolerances:
- 1. Flatness of bearings is determined by the following method:
    - a. A precision straightedge, longer than the nominal dimension to be measured, shall be placed in contact with the surface to be measured or as parallel to it as possible.
    - b. Select a feeler gage having a tolerance of plus or minus 0.001 inch and attempt to insert it under the straightedge. Since layering of feeler gages tends to degrade accuracy, the least number of blades shall be used.
    - c. Flatness is acceptable if the feeler does not pass under the straightedge.
    - d. Flatness tolerances are arranged in the following classes:
      - 1) Class "A" 0.0005 inch X "Nominal Dimension".
      - 2) Class "B" 0.001 inch X "Nominal Dimension".
      - 3) Class "C" 0.002 inch X "Nominal Dimension".
    - e. "Nominal Dimension" will be interpreted as a actual dimension of the plate, in inches, under the straightedge.
    - f. In determining flatness, the straightedge may be located in any position on the surface to be evaluated and not necessarily at 90 degrees to the edges.
    - g. A 1-inch border around the plate is to be ignored in determining flatness.

### PART 3 - EXECUTION

#### 3.01 FABRICATION: See Section 05120.

- A. Bearings:
  - 1. The manufacturer of the bearing is also to furnish all details pertaining to the bearing assemblies including the following:
    - a. Masonry and sole plates.
    - b. Anchor studs and pins.
    - c. Guide bars or shear blocks.
    - d. High-Strength bolts.
    - e. Stainless steel sheets and PTFE sheets.
    - f. Shipping straps or retaining clamps. Miscellaneous details.
  - 2. Sizes, dimensions and details pertaining to the spherical bearing core that are not shown on the Drawings are to be designed and determined by the bearing manufacture for the loading and movements shown on the Drawings and in the Contract Specification.
  - 3. Details shown on the Drawings for the bearings, outside of the actual spherical-bearing core, may have to be adjusted to suit actual dimensions and requirements of the spherical-bearing furnished by the manufacturer. See Bearing Notes on the Drawings.
  - 4. Bolts in guide bars or shear blocks, and sole and masonry plates are to be capable of being removed in the field for bearing replacement. Studs on masonry and sole

plates are to be positioned as shown and to clear reinforcement in pier columns, abutment beamseats and box girders.

**3.02 WELDING:** See Section 05120.

**3.03 BOLTING:** See Section 05120.

**3.04 ERECTION:**

- A. Set bearing assemblies to lines and grades shown and adjust to horizontal position shown.
- B. Bearings Installation:
  - 1. Bearings are to be evenly supported over their upper and lower surfaces under all erection and service conditions.
  - 2. Bearings are to be lifted by their undersides only or by specially designed lifting lugs.
  - 3. When installing bearings, care is to be taken to avoid damage to and contamination of bearings surfaces.
  - 4. Align the centerlines of the bearing assembly with those of the substructure and superstructure. On guided bearings, special care must be taken to properly align the guiding mechanism with the designated expansion direction of the structure.
  - 5. Bearings straps or retaining clamps are to be left in place as long as possible to ensure parts of bearings are not inadvertently displaced relative to each other. Care must be taken to remove straps or clamps before any normal structural movement takes place, such as post-tensioning, etc.
  - 6. Set offsets of upper and lower bearing parts as required by Contract Drawings.
  - 7. Provide blockouts in concrete for placement of the bearings. Do not cut any reinforcement in pier columns or abutment beam seats. Studs on masonry and sole plates may be shifted slightly from dimensions shown on the bearings to clear reinforcement in substructures and the box girders. Set bearings on a level plane and fill blockout in accordance with the following:
    - a. Clean entire blockout surfaces, concrete and reinforcement of rust, misplaced mortar and other foreign materials.
    - b. Immediately following the cleaning operation, dry the entire surfaces, concrete and reinforcement, and uniformly coat both with an epoxy bonding compound conforming to AASHTO Specification M235, Class III, in accordance with the manufacturer's recommendations.
    - c. Set and level the bearings to the correct elevations.
    - d. Fill the blockout with cement grout of a type which exhibits zero shrinkage when tested in accordance with ASTM C287. Grout to contain no aluminum powder, iron particles, chlorides, sulphites, fluorides or nitrates.

## SECTION 06075

### WOOD PRESERVATIVE TREATMENT

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies preservative treatment of timber and lumber where shown.
- B. Unless otherwise shown, apply preservative treatments as follows:
  - 1. Creosote: Apply creosote treatment to wood which meets all of the following :
    - a. Is to be in contact with water or earth.
    - b. Is to be exposed to weather but not painted.
    - c. Is not subject to handling after installation.
  - 2. Pentachlorophenol and copper naphthenate: Apply pentachlorophenol and copper naphthenate treatment to wood which meets all of the following:
    - a. Is exposed to the weather.
    - b. May or may not be painted.
    - c. Is subject to handling after installation.
  - 3. Water-borne preservatives:
    - a. Use in approved locations.
- C. Definitions:
  - 1. PPT: Pressure-preservative treated.
  - 2. FRT: Fire-retardant treated.
  - 3. MSDS: Material safety data sheets.

##### 1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: Manufacturer's product data and MSDS, including instructions for handling, storing, installing and finishing treated material.
- B. Certification: Submit certification that furnished meet specified requirements with each shipment of treated timber and lumber.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWPA Standards: C2, C3, C9, C20, C27, C35, M4, P1, P2, P5, P8, P17.
- B. Source Quality Control:
  - 1. Use only preservative treatment materials which have been tested and approved.
  - 2. After treatment have each piece of material stamped with the American Wood Preserver's Institute Quality Mark to indicate compliance with specified requirements.
  - 3. Inform the Engineer when treated wood is ready for inspection.
  - 4. Ship treated wood only after inspection and approval.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Handling:
  - 1. Handle treated items with rope slings or other approved means. Do not drop, bruise, break outer fibers or penetrate surface with sharp tools.
  - 2. When stacking timber, avoid use of sharp tools for handling or turning in leads.
- B. Storage:
  - 1. Ensure that storage area has been cleared of debris and vegetation to at least four feet beyond limits of stored materials.
  - 2. Provide drainage away from stored materials.
  - 3. Store piles of timber and lumber so as to permit ready access and free air circulation.
  - 4. Store treated timber and lumber at least 12 inches above surface of ground.
  - 5. Stack ties no more than 20 layers high nor 10 feet wide.

#### **PART 2 MATERIALS:**

##### **2.01 MATERIALS:**

- A. Creosote: AWPA P1.
- B. Creosote and Coal-Tar Solution: Coal-tar distillate or solution of coal tar in coal-tar distillate conforming to AWPA P2.
- C. Pentachlorophenol: AWPA P8.
- D. Copper Naphthenate: AWPA P8..
- E. Waterborne Preservatives: AWPA P5.
- F. Fire Retardant Formulations: AWPA P17.

#### **PART 3 - EXECUTION**

##### **3.01 TREATMENT:**

- A. General:
  - 1. Prior to treating timber and lumber, perform fitting, cutting, drilling and mortising of joints.
  - 2. After treatment, kiln-dry lumber and plywood to a maximum moisture content of 19 and 15 respectively.
- B. Pressure treat timber and lumber in accordance with AWPA C2. For creosote, creosote solutions and oil-borne preservatives, use empty-cell treatment. If retention specified is greater than can be obtained by empty-cell process, inject water-borne preservative by full-cell process.
- C. Piles: Unless otherwise shown, apply creosote treatment to timber piles in accordance with AWPA C3.
- D. Poles: Unless otherwise shown, apply creosote treatment to timber poles in accordance with AWPA C35.

- E. Plywood (PPT): Pressure preservative treat plywood where indicated in accordance with AWPA C9.
- F. Plywood (FRT): Pressure fire retardant treat plywood where indicated in accordance with AWPA C27.
- G. Miscellaneous Wood Framing: Treat indicated items and the following in accordance with AWPA C2.
  - 1. Wood cants, nailers, curbs , equipment support bases, blocking stripping and similar members in connection with roofing, flashing, vapor barriers and waterproofing.
  - 2. Wood sills, sleepers, blocking, furring, stripping and similar concealed membrane in contact with masonry or concrete.
  - 3. Wood framing members less than 18 inches above grade.
  - 4. Wood floor plates installed over concrete slabs directly in contact with earth.
- H. Fire-Retardant Treatment for Lumber (FRT): Fire-retardant wood treatment in accordance with AWPA C20.
- I. Incising:
  - 1. For lumber with least dimension between two inches and three inches, incise wide faces by means of suitable power-driven machine prior to treatment.
  - 2. For timber with least dimension in excess of three inches, incise all four faces.

### **3.02 TREATMENT OF FIELD CUTS:**

- A. Treat bare surfaces resulting from drilling, cutting, tapping or damage of timber and lumber in accordance with AWPA M4.
- B. Apply same treatment to cutoff surfaces of timber piles not embedded in concrete.

**END OF SECTION**

## SECTION 06075

### WOOD PRESERVATIVE TREATMENT

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies preservative treatment of timber and lumber where shown.
- B. Unless otherwise shown, apply preservative treatments as follows:
  - 1. Creosote: Apply creosote treatment to wood which meets all of the following :
    - a. Is to be in contact with water or earth.
    - b. Is to be exposed to weather but not painted.
    - c. Is not subject to handling after installation.
  - 2. Pentachlorophenol and copper naphthenate: Apply pentachlorophenol and copper naphthenate treatment to wood which meets all of the following:
    - a. Is exposed to the weather.
    - b. May or may not be painted.
    - c. Is subject to handling after installation.
  - 3. Water-borne preservatives:
    - a. Use in approved locations.
- C. Definitions:
  - 1. PPT: Pressure-preservative treated.
  - 2. FRT: Fire-retardant treated.
  - 3. MSDS: Material safety data sheets.

##### 1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product Data: Manufacturer's product data and MSDS, including instructions for handling, storing, installing and finishing treated material.
- B. Certification: Submit certification that furnished meet specified requirements with each shipment of treated timber and lumber.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWWA Standards: C2, C3, C9, C20, C27, C35, M4, P1, P2, P5, P8, P17.
- B. Source Quality Control:
  - 1. Use only preservative treatment materials which have been tested and approved.
  - 2. After treatment have each piece of material stamped with the American Wood Preserver's Institute Quality Mark to indicate compliance with specified requirements.
  - 3. Inform the Engineer when treated wood is ready for in
  - 4. spection.
  - 5. Ship treated wood only after inspection and approval.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Handling:
  - 1. Handle treated items with rope slings or other approved means. Do not drop, bruise, break outer fibers or penetrate surface with sharp tools.
  - 2. When stacking timber, avoid use of sharp tools for handling or turning in leads.
- B. Storage:
  - 1. Ensure that storage area has been cleared of debris and vegetation to at least four feet beyond limits of stored materials.
  - 2. Provide drainage away from stored materials.
  - 3. Store piles of timber and lumber so as to permit ready access and free air circulation.
  - 4. Store treated timber and lumber at least 12 inches above surface of ground.
  - 5. Stack ties no more than 20 layers high nor 10 feet wide.

#### **PART 2 MATERIALS:**

##### **2.01 MATERIALS:**

- A. Creosote: AWPA P1.
- B. Creosote and Coal-Tar Solution: Coal-tar distillate or solution of coal tar in coal-tar distillate conforming to AWPA P2.
- C. Pentachlorophenol: AWPA P8.
- D. Copper Naphthenate: AWPA P8..
- E. Waterborne Preservatives: AWPA P5.
- F. Fire Retardant Formulations: AWPA P17.

#### **PART 3 - EXECUTION**

##### **3.01 TREATMENT:**

- A. General:
  - 1. Prior to treating timber and lumber, perform fitting, cutting, drilling and mortising of joints.
  - 2. After treatment, kiln-dry lumber and plywood to a maximum moisture content of 19 and 15 respectively.
- B. Pressure treat timber and lumber in accordance with AWPA C2. For creosote, creosote solutions and oil-borne preservatives, use empty-cell treatment. If retention specified is greater than can be obtained by empty-cell process, inject water-borne preservative by full-cell process.
- C. Piles: Unless otherwise shown, apply creosote treatment to timber piles in accordance with AWPA C3.
- D. Poles: Unless otherwise shown, apply creosote treatment to timber poles in accordance with AWPA C35.

- E. Plywood (PPT): Pressure preservative treat plywood where indicated in accordance with AWPA C9.
- F. Plywood (FRT): Pressure fire retardant treat plywood where indicated in accordance with AWPA C27.
- G. Miscellaneous Wood Framing: Treat indicated items and the following in accordance with AWPA C2.
  - 1. Wood cants, nailers, curbs , equipment support bases, blocking stripping and similar members in connection with roofing, flashing, vapor barriers and waterproofing.
  - 2. Wood sills, sleepers, blocking, furring, stripping and similar concealed membrane in contact with masonry or concrete.
  - 3. Wood framing members less than 18 inches above grade.
  - 4. Wood floor plates installed over concrete slabs directly in contact with earth.
- H. Fire-Retardant Treatment for Lumber (FRT): Fire-retardant wood treatment in accordance with AWPA C20.
- I. Incising:
  - 1. For lumber with least dimension between two inches and three inches, incise wide faces by means of suitable power-driven machine prior to treatment.
  - 2. For timber with least dimension in excess of three inches, incise all four faces.

### **3.02 TREATMENT OF FIELD CUTS:**

- A. Treat bare surfaces resulting from drilling, cutting, tapping or damage of timber and lumber in accordance with AWPA M4.
- B. Apply same treatment to cutoff surfaces of timber piles not embedded in concrete.

**END OF SECTION**

## SECTION 06100

### ROUGH CARPENTRY

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies rough carpentry for wood blocking, roof sheathing, rooftop equipment bases and support curbs, miscellaneous lumber and accessories.
- B. Related Work Specified Elsewhere:
  - 1. Wood Preservative Treatment: Section 06075.
  - 2. Roof Accessories: Section 07730.
  - 3. Flashing and Sheet Metal: Section 07600.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
- B. Product Data for metal framing anchors and construction adhesives.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
- B. Comply with codes and regulations of the jurisdictional authorities.
  - 1. ALSC: NGR.
  - 2. DOC PS20.
  - 3. AWPA C2, C9, C20, C27, M4.
  - 4. UL.
  - 5. APA.
  - 6. FS FF-N-105.
  - 7. CAB NER-272.
  - 8. ASME A153, A307, A563, A653, B18.6.1, B18.2.1

##### 1.04 DELIVERY, STORAGE, AND HANDLING:

- A. Keep materials under cover and dry. Protect from weather and contact with damp or wet surfaces. Stack lumber, plywood, and other panels. Provide for air circulation within and around stacks and under temporary coverings.
  - 1. For lumber and plywood pressure treated with waterborne chemicals, place spacers between each bundle to provide air circulation.

#### PART 2 - PRODUCTS

##### 2.01 LUMBER, GENERAL:

- A. Lumber Standards: Comply with DOC PS 20, "American Softwood Lumber Standard," and with applicable grading rules of inspection agencies certified by American Lumber Standards Committee's (ALSC) Board of Review.

- B. Dressed sizes of green lumber are larger than dry lumber under DOC PS 20. Where nominal sizes are indicated, provide actual sizes required by DOC PS 20 for moisture content specified. Where actual sizes are indicated, they are minimum dressed sizes for dry lumber.

## **2.02 WOOD-PRESERVATIVE-TREATED MATERIALS:**

- A. General: Where lumber or plywood is indicated as preservative treated or is specified to be treated, comply with applicable requirements of AWWA C2 (lumber) and AWWA C9 (plywood). Mark each treated item with the Quality Mark Requirements of an inspection agency approved by ALSC's Board of Review.
  - 1. Do not use chemicals containing chromium or arsenic.
- B. Pressure treat aboveground items with waterborne preservatives to a minimum retention of 0.25 lb/cu. ft.. After treatment, kiln-dry lumber and plywood to a maximum moisture content of 19 and 15 percent, respectively. Treat indicated items and the following:
  - 1. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.
  - 2. Wood sills, sleepers, blocking, furring, stripping, and similar concealed members in contact with masonry or concrete.
  - 3. Wood framing members less than 18 inches above grade.
  - 4. Complete fabrication of treated items before treatment, where possible. If cut after treatment, apply field treatment complying with AWWA M4 to cut surfaces. Inspect each piece of lumber or plywood after drying and discard damaged or defective pieces.

## **2.03 FIRE-RETARDANT-TREATED MATERIALS:**

- A. General: Where fire-retardant-treated wood is indicated, comply with applicable requirements of AWWA C20 (lumber) and AWWA C27 (plywood). Identify fire-retardant-treated wood with appropriate classification marking of UL; U.S. Testing; Timber Products Inspection, Inc.; or another testing and inspecting agency acceptable to authorities having jurisdiction.
  - 1. Research or Evaluation Reports: Provide fire-retardant-treated wood acceptable to authorities having jurisdiction and for which a current model code research or evaluation report exists that evidences compliance of fire-retardant-treated wood for application indicated.
- B. Interior Type A: For interior locations, use chemical formulation that produces treated lumber and plywood with the following properties under conditions present after installation:
  - 1. Bending strength, stiffness, and fastener-holding capacities are not reduced below values published by manufacturer of chemical formulation under elevated temperature and humidity conditions simulating installed conditions when tested by a qualified independent testing agency.
  - 2. No form of degradation occurs due to acid hydrolysis or other causes related to treatment.
  - 3. Contact with treated wood does not promote corrosion of metal fasteners.

## **2.04 DIMENSION LUMBER:**

- A. General: Provide dimension lumber of grades indicated according to the ALSC National Grading Rule (NGR) provisions of the inspection agency indicated.

## **2.05 MISCELLANEOUS LUMBER:**

- A. General: Provide lumber for support or attachment of other construction, including rooftop equipment curbs and support bases, cant strips, bucks, nailers, blocking, furring, grounds, stripping, and similar members.
- B. Fabricate miscellaneous lumber from dimension lumber of sizes indicated and into shapes shown.
- C. Moisture Content: 19 percent maximum for lumber items not specified to receive wood preservative treatment.

**2.06 ROOF SHEATHING:**

- A. General: Where structural-use panels are indicated for the following concealed types of applications, provide American Plywood Association (APA)-performance-rated panels complying with requirements designated under each application for grade, span rating, exposure durability classification, and edge detail (where applicable).
  - 1. Thickness: Provide panels meeting requirements specified but not less than thickness indicated.
  - 2. Span Ratings: Provide panels with span ratings required to meet "Code Plus" provisions of APA Form No. E30, "APA Design/Construction Guide: Residential & Commercial."

**2.07 FASTENERS:**

- A. General: Provide fasteners of size and type indicated that comply with requirements specified in this Article for material and manufacture.
  - 1. Where rough carpentry is exposed to weather, in ground contact, or in area of high relative humidity, provide fasteners with a hot-dip zinc coating per ASTM A 153 or of Type 304 stainless steel.
- B. Nails, Wire, Brads, and Staples: FS FF-N-105.
- C. Power-Driven Fasteners: CABO NER-272
- D. Wood Screws: ASME B18.6.1
- E. Lag Bolts: ASME B18.2.1.
- F. Bolts: Steel bolts complying with ASTM A 307, Grade A; with ASTM A 563 hex nuts and, where indicated, flat washers.

**2.08 METAL FRAMING ANCHORS:**

- A. General: Provide galvanized steel framing anchors of structural capacity, type, and size indicated and as follows:
  - 1. Research or Evaluation Reports: Provide products for which model code research or evaluation reports exist that are acceptable to authorities having jurisdiction and that evidence compliance of metal framing anchors for application indicated with building code in effect for Project.
  - 2. Allowable Design Loads: Provide products with allowable design loads, as published by manufacturer, that meet or exceed those indicated. Manufacturer's published values shall be determined from empirical data or by rational engineering analysis, and demonstrated by comprehensive testing performed by a qualified independent testing agency.

- B. Galvanized Steel Sheet: Hot-dip, zinc-coated steel sheet complying with ASTM A 653, G60 coating designation; structural, commercial, or lock-forming quality, as standard with manufacturer for type of anchor indicated.

### **PART 3 - EXECUTION**

#### **3.01 INSTALLATION, GENERAL:**

- A. Discard units of material with defects that impair quality of rough carpentry and that are too small to use with minimum number of joints or optimum joint arrangement.
- B. Set rough carpentry to required levels and lines, with members plumb, true to line, cut, and fitted.
- C. Fit rough carpentry to other construction; scribe and cope as required for accurate fit. Correlate location of furring, nailers, blocking, grounds, and similar supports to allow attachment of other construction.
- D. Apply field treatment complying with AWPA M4 to cut surfaces of preservative-treated lumber and plywood.
- E. Securely attach rough carpentry work to substrate by anchoring and fastening as indicated, complying with the following:
  - 1. Counsel of American Building Officials: CABO NER-272 for power-driven staples, P-nails, and allied fasteners.
  - 2. Published requirements of metal framing anchor manufacturer.
- F. Use common wire nails, unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood; predrill as required.
- G. Use hot-dip galvanized or stainless-steel nails where rough carpentry is exposed to weather, in ground contact, or in area of high relative humidity.

#### **3.02 WOOD GROUNDS, NAILERS, BLOCKING, AND SLEEPERS:**

- A. Install wood nailers, blocking, and sleepers where shown and where required for screeding or attaching other work. Form to shapes shown and cut as required for true line and level of attached work. Coordinate locations with other work involved.
- B. Attach to substrates to support applied loading. Recess bolts and nuts flush with surfaces, unless otherwise indicated. Build into masonry during installation of masonry work. Where possible, anchor to formwork before concrete placement.

**END OF SECTION**

## SECTION 06130

### TIMBER TIES

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. The section specifies furnishing timber cross ties, contact rail ties and switch ties as shown and specified.

##### 1.02 RELATED SECTIONS

- A. Section 05651 - General Track Construction
- B. Section 05652 - Ballasted Track Construction
- C. Section 05654 - Special Trackwork Construction - Ballasted
- D. Section 05659 - Special Trackwork
- E. Section 05660 - Restraining Rail and Lubricators

##### 1.03 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association (AREMA), **latest edition:**
  - 1. AREMA Manual for Railway Engineering
  - 2. AREMA Portfolio of Trackwork Plans
  - 3. AREMA Specifications for Ties
  - 4. AREMA Specification for Preservatives
  - 5. AREMA Specification for Treatment
  - 6. AREMA Records of Treatment and Reports of Inspection.
- B. American Wood Preserver 's Association (AWPA)
  - 1. AWPA Standard C6
  - 2. AWPA Standard M3

##### 1.04 SUBMITTALS

- A. Submittals shall be made on accordance with Section 01300, Submittals
- B. Documentation
  - 1. Proposed method of delivery. Submit not late than 60 days prior to delivery.
  - 2. Proposed anti-splitting devices and location in tie.
  - 3. Proposed manner of marking treated ties to indicate compliance with specifications.
  - 4. Certificate of Compliance with AWPA Standard M3 for tie treatment.

##### 1.05 QUALITY ASSURANCE

- A. Inspection:
  - 1. The Engineer will inspect in accordance with pertinent sections of the AREMA Manual (**latest edition**), as modified herein.

2. Acceptance criteria: Failure to meet any pertinent part of AREMA requirements (latest edition) or these specifications constitutes cause for rejection. AREMA inspection requirements are to include, but not limited to, the physical requirement inspection criteria as outlined in Chapter 30, Section 3.1.1.4 (decay, holes, knots, shake, split, checks, slope of grain, bark seams and manufacturer defects).
3. Averaging of dimensions, with respect to measurement for size acceptance, is not permitted.
4. Provide suitable equipment, facilities and assistance required by the Engineer to effect inspections.
5. Inform the Engineer when treated wood is ready for inspection.
6. Do not deliver material until inspected and approved for shipment by the Engineer.
7. Final inspection and approval of ties will occur as a part of the final inspection of installed ballasted track.
8. WMATA, or its representatives, reserve the right to visit the producers facility during usual business hours unscheduled to: a) observe sampling and inspection procedures, b) obtain samples of the prepare material being produced and shipped, and c) review plant inspection methods, quality control procedures, equipment and examine inspection test results of current and previous tests.

#### **1.06 DELIVERY, STORAGE AND HANDLING**

- A. It shall be the Contractor's responsibility to make all arrangements for storage, shipment and handling of the ties.
- B. Tie stacks shall not exceed 20 layers each.
- C. Ties will be stacked with branding visible.
- D. Ties shall be handled in a manner that prevents damage.
- E. Ties shall not be dropped or dragged on the trackbed.

### **PART 2 - PRODUCTS**

#### **2.01 TIMBER**

- A. Furnish ties in accordance with the requirements as specified in this section:

### **PART 3 - EXECUTION**

#### **3.01 REQUIREMENTS**

- A. General Requirements:
  1. All ties shall be new.
  2. Physical requirements in accordance with the AREMA manual, as modified herein. (Reference the physical requirement criteria as outlined in Chapter 30, Section 3.1.1.4 - decay, holes, knots, shake, split, checks, slope of grain, bark seams and manufacturer defects).
  3. AREMA 7" Grade.
  4. All ties shall be Oak wood species.
  5. Sawed top, bottom and sides.
  6. Free of checks over two inches deep or extending more than eight inches from end of tie.

- B. Anti-splitting devices shall be nail plates in accordance with the AREMA Manual, as modified herein.
1. Minimum size 5 - ½ inches x 7 inches.
  2. Nail plates shall be installed by a method or machine that presses them into the end of the tie. Hammer installation of nail plates is not allowed and will be a cause for the rejection of the ties.
  3. Incise all sides prior to treatment to a depth of 3/4 inch. Thickness of incisor teeth shall not exceed 7/32 inch.
  4. Free of knots greater than ½ inch diameter for areas indicated in the AREMA Manual.
- C. Individual Requirements:
1. Cross ties:
    - a. Length: Eight feet six inches.
    - b. Straightness: A cross tie will be considered straight when a line along a side from the middle of one end to the middle of one end to the other end is everywhere more than 2-3/4 inches from the top and bottom of the tie.
  2. Contact rail ties:
    - a. Length: Ten feet.
    - b. Free of knots greater than ½ inch diameter in area of contact rail insulator, i.e., 100 through 110 inches from line end.
    - c. AREMA Size 5 requirements apply to contact rail insulator area.
    - d. Straightness: A contact rail tie will be considered straight when a line along the tip from the middle of one end to the middle of the other end is everywhere more than two inches from both sides.
  3. Switch ties:
    - a. Switch ties within Special Trackwork, as shown on the drawings.
    - b. Length: As shown in the contract documents.
    - c. Free of knots greater than ½ inch diameter for areas indicated in the AREMA Manual.
    - d. Straightness: A contact rail tie will be considered straight when a line along the top from the middle of one end to the middle of the other end is everywhere more than two inches from both sides.
- D. Preservative Treatment:
1. All timbers shall be bored for screw spikes. The holes shall be treated with copper naphthenate.
  2. Ties shall be treated in accordance with the requirements of AWPA Standard C6 for Cross Ties and Switch Ties. Conditioning prior to treatment shall be in accordance with Paragraph 3.2, Boulton Drying Process, of the above standard.
  3. Immediately following conditioning, the ties shall be pressure treated. Because of the environmental problems and other reasons, alternative preservative used shall be copper naphthenate. The minimum quality control requirements shall be in accordance with AWPA Standard M3. The treating company shall furnish a Certificate of Compliance with this standard, and shall certify the treatment according to the foregoing Specification.
  4. The Authority Engineer will determine when ties are ready for treatment.
  5. Use only tested and approved preservatives.
  6. Stamp each treated tie to indicate compliance with these specifications.
  7. Complete AREMA or AWPA forms for treatment of ties.

**PART 4 - MEASUREMENT AND PAYMENT**

**4.01 MEASUREMENT:**

- A. Measurement of work specified in this section will be made in the following manner:
  - 1. No separate measurement.

**4.02 PAYMENT:**

- A. Compensation for work specified in this section will be in the following manner:
  - 1. Included in the price of the work of which it is a part.

**END OF SECTION**

## SECTION 06131

### COMPOSITE (PLASTIC) TIES

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. This section specifies furnishing composite (plastic) cross ties, contact rail ties and switch ties as shown and specified.

##### 1.02 RELATED SECTIONS

- A. Section 05651 - General Track Construction
- B. Section 05652 - Ballasted Track Construction
- C. Section 05654 - Special Trackwork Construction - Ballasted
- D. Section 05659 - Special Trackwork
- E. Section 05660 - Restraining Rail and Lubricators

##### 1.03 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association (AREMA), **latest edition:**
  - 1. AREMA Manual for Railway Engineering
  - 2. AREMA Portfolio of Trackwork Plans
  - 3. AREMA Specifications for Ties
- B. ASTM D696
- C. ASTM D6108
- D. ASTM D6109
- E. ASTM D6111
- F. ASTM D6117

##### 1.04 DESIGN REQUIREMENTS

- A. The tie shall be designed to resist rail seat positive, rail seat negative, tie center negative and tie center positive bending moments. Refer to the AREMA Manual (**latest edition**) for design considerations for the composite tie.
- B. Tie design shall be based on American railroad 100 ton capacity freight car and train operations. The Contractor must submit documentation indicating that the plastic or composite railroad tie which is to be provided to the Authority has been successfully tested in such railroad application. The railroad tie shall have safely functioned under railroad conditions without failure.

- C. Anticipated service life of the tie shall be 50 years. Tie shall support the weight and dynamic forces of the rail and trains without failure requiring the tie to be replaced during the anticipated service life.

#### **1.05 SUBMITTALS**

- A. Submittals shall be made on accordance with Section 01300, Submittals
- B. Documentation
  - 1. Proposed method of delivery. Submit to the Engineer at least 60 days prior to delivery.
  - 2. Proposed damage protection and treatment.
- C. The manufacturer shall submit sealed calculations of the design.
- D. The manufacturer shall submit MSDS data for the tie.
- E. The manufacturer shall provide certified test reports, **and any other documents to substantiate certification**, that the ties being provided meet or exceed the specified physical properties.

#### **1.06 QUALITY ASSURANCE**

- A. Inspection:
  - 1. In accordance with pertinent sections of the AREMA Manual as modified herein.
  - 2. Acceptance criteria: Failure to meet any pertinent part of AREMA requirements **(latest edition)** or these specifications constitutes cause for rejection.
  - 3. Averaging of dimensions, with respect to measurement for size acceptance, is not permitted.
  - 4. Provide suitable equipment, facilities and assistance required by the Engineer to effect inspections.
  - 5. Inform the Engineer when composite (plastic) ties are ready for inspection.
  - 6. Do not deliver material until inspected and approved for shipment by the Engineer.
  - 7. Final inspection and approval of composite (plastic) ties will occur as a part of the final inspection of installed ballasted track.
  - 8. **WMATA, or its representatives, reserve the right to visit the producers facility during usual business hours unscheduled to: a) observe sampling and inspection procedures, b) obtain samples of the prepare material being produced and shipped, and c) review plant inspection methods, quality control procedures, equipment and examine inspection test results of current and previous tests.**

#### **1.07 DELIVERY, STORAGE AND HANDLING**

- A. It shall be the Contractor's responsibility to make all arrangements for storage, shipment and handling of the ties.
- B. Ties shall be handled in a manner that prevents damage.
- C. Ties shall not be dropped or dragged on the trackbed.

### **PART 2 - PRODUCTS**

## 2.01 MATERIALS

### A. Properties

1. Composition: plastic composite formulation of foamed, colored, recycled polyolefin plastic reinforced with materials such as fiber glass or styrene. No wood or rubber material over 3% is allowed.
2. Color shall be black.
3. Ties shall not require use of toxic preservatives.
4. Ties shall resist decay and insect attack. Water absorption shall not cause loss of strength requiring the tie to be replaced.
5. Ties shall be non-conductive electrically.
6. Ties shall be non-hazardous and non-leaching.

## 2.02 REQUIREMENTS

### A. General Requirements:

1. All ties shall be new.
2. Physical requirements, design and manufacture: Pertinent sections of the AREMA manual (**latest edition**), as modified herein.
3. Ties shall interact with the ballast and distribute the weight of the train to the underlying roadbed. Tie surface shall provide resistance to lateral movement, equal to or better than a wood tie of the same dimensions.
4. Ties shall hold gauge of track on tangent and curves similar to the wood tie of the same dimensions.
5. Ties shall permit the application of standard rail, tie plate and hold-down fasteners, such as screw spikes or cut spikes, without requiring special procedures for installation other than ordinary predrilling of the tie. The hole diameter shall be of sufficient size to prevent splitting of the tie during installation of the track screw spike but shall not permit the track screw spike to back-out after installation due to vibration from passing trains.
6. Ties shall provide rail seat loading (compression) without failure. Ties shall be stiff enough to support the weight but flexible enough to absorb the vibration of passing trains.
7. All tie surfaces shall be non-skid.
8. Tie surfaces shall have slip resistance equal to or better than a wood tie.
9. Ties shall not be prone to failure due to extreme weather related heat or freezing temperatures.
10. Ties shall not warp or sag to the level of permanent deformation which would require replacement of the tie.
11. Ties shall not require end caps. Ties shall not split or crack requiring the tie to be replaced.
12. Tie surface degradation due to sunlight (UV radiation) exposure shall not exceed 0.003" per year.
13. Tie surface deterioration due to abrasion shall not exceed that of a wood tie.
14. Tie surface flatness in the area of the tie plate, 11" from each end and for a distance of 20", shall be within 0.125".
15. All ties shall have a thickness tolerance +1/8", -0". Width tolerance +/-1/4". Length tolerance +1/2", -0".
16. Ties for installation in ballasted track shall have three (3) sides (two - 7" sides and one - 9" side) knurled to resist lateral movement in the ballast.
17. Straightness: All ties will be considered straight when a line along a side from the middle of one end to the middle of one end to the other end is everywhere more than 2-3/4 inches from the top and bottom of the tie.
18. **Ties should not split or crack in anyway requiring the tie to be replaced.**

19. Material surface degradation due to solar ultraviolet (UV) radiation exposure shall not exceed 0.003 inch (0.076 mm) per year.

- B. Individual Requirements:
1. Cross ties:
    - a. Length: Eight feet six inches.
  2. Contact rail ties:
    - a. Length: Ten feet.
    - b. AREMA Size 5 requirements apply to contact rail insulator area.
  3. Switch ties:
    - a. Switch ties within Special Trackwork, as shown on the drawings.
    - b. Length: As shown.

**2.03 TESTING AND TECHNICAL DATA**

- A. Mechanical Properties and Test Method
1. Composite railroad tie samples shall be tested per the appropriate ASTM test standards for the mechanical properties listed in the table below by an independent testing agency.
  2. Actual test results shall be submitted on a form similar to Exhibit A.
  3. The typical values shown in the following table represent anticipated material parameters based on "as manufactured" plastic tie specimens measuring 7"x 9" or 4'x 6" in cross-section. Strength values shown are at failure. Design allowable values shall have a minimum factor of safety against failure of 2.5.

Mechanical Properties/Test Method	Typical Value	Size of Test Specimen
Specific Gravity ASTM D6111-97	0.90	7" x 9"
Density - ASTM D6111-97	45.0 lbs. per cu ft	7" x 9"
Coefficient of Thermal Expansion - ASTM D696-91	0.00007 in/in per degree F (Max.)	7" x 9"
Compressive Strength - ASTM D6108-97 (Compression Parallel to Grain)	3,000 psi minimum	4" x 6"
Compressive Strength - ASTM D6108-97 (Compression Perpendicular to Grain)	1,000 psi minimum	7" x 9"
Permanent Deformation Under Load ASTM D6108-97 (Compression Perpendicular to Grain)	0.0015 inch (Max.)	7" x 9"
Modulus of Elasticity (Compression) ASTM D6108-97	170,000 psi minimum	4" x 6"
Flexural Strength - ASTM D6109- 97	2,500 psi minimum	4" x 6"

Modulus of Elasticity (Flexure) ASTM D6109-97	200,000 psi minimum	4" x 6"
Shear Strength - ASTM D6109-97 (Calc.)	1,000 psi minimum	4" x 6"
Mechanical Fasteners - ASTM D6117-97 Screw Spike Pullout	2,500 lbs. minimum	7" x 9"

- B. Rail Seat Compression Test shall be as follows:
1. Test specimen(s) shall be from as manufactured plastic ties with 7" x 9" in cross-section and cut to thirty inches in length.
  2. The tie shall rest on a flat surface, on it's nine inch face, shall be loaded from the top through a one foot section of AREMA 115 RE rail secured to the tie with a Pandrol tie plate and "e" clip and two screw spikes. The Pandrol tie plate shall be 7 3/4" by 14 7/8" dimension (standard dimensional tolerances apply). The tie plate shall be centered on the plastic tie segment in a Universal Test Machine (200,000 pound hydraulic).
  3. The head of the rail shall be loaded in 10,000 pound increments beginning at 70,000 pounds.
  4. Loading shall increase until tie failure or deformation of 0.125 inches.
  5. The load at failure shall be recorded and the compressive (bearing) stress under the tie plate shall be calculated using the tie plate dimension.
  6. Deformation to the tie shall be measured and recorded. Tie deformation shall not exceed 0.125 inches.
- C. Permanent Deformation Under Load Test:
1. Test specimen(s) shall be from as manufactured plastic ties with a 7" x 9" cross-section and cut to thirty inch length.
  2. The tie shall rest on a flat surface, on it's nine inch face, shall be loaded from the top thru a one foot section of AREMA 115 RE rail secured to the tie with a Pandrol tie plate and "e" clip and two screw spikes. The Pandrol tie plate shall be 7 3/4" by 14 7/8" dimension (standard dimensional tolerances apply). The tie plate shall be centered on the plastic tie segment in a Universal Test Machine (200,000 pound hydraulic).
  3. The head of the rail shall be loaded for one hour at each 5,000 pound increment
  4. Unload the rail and record the amount of permanent deformation.
  5. The permanent deformation after the load is removed shall not exceed 0.0015 inches.
  6. Screw spike withdrawal resistance testing:
  7. Standard uncoated Style "U" track screw spike, 3/4" diameter, 5-1/2" length and 1/4" end taper.
  8. Predrilling of the crosstie shall be permitted. The hole diameter shall be of sufficient size to prevent splitting of the tie during installation of the track screw spike but shall not permit the track screw spike to back-out after installation due to vibration from passing trains.

## PART 3 - EXECUTION

### 3.01 INSTALLATION

- A. The composite (plastic) ties shall be installed in compliance with the Ballasted Track Construction: Section 05652.

## **PART 4 - MEASUREMENT AND PAYMENT**

### **4.01 MEASUREMENT**

- A. Measurement of work specified in this section will be made in the following manner:
  - 1. No separate measurement.

### **4.02 PAYMENT**

- A. Compensation for work specified in this section will be in the following manner:
  - 1. Included in the price of the work of which it is a part.

**EXHIBIT A**

**SAMPLE OF MECHANICAL PROPERTIES TABLE**

PROPOSAL INCLUDES MECHANICAL PROPERTIES TABLE TO BE FILLED WITH  
TEST RESULT VALUES BY SUPPLIER

**MECHANICAL PROPERTIES TABLE - VALUES TO BE WRITTEN BY SUPPLIER**

<b>Mechanical Properties/Test Method</b>	<b>Typical Value</b>	<b>Size of Test Specimen</b>
Specific Gravity - ASTM D6111-97	<b>VALUES TO BE WRITTEN BY SUPPLIER</b>	7" x 9"
Density - ASTM D6111-97		7" x 9"
Coefficient of Thermal Expansion -ASTM D696-91		7" x 9"
Compressive Strength - ASTM D6108-97 (Compression Parallel to Grain)		4" x 6"
Compressive Strength - ASTM D6108-97 (Compression Perpendicular to Grain)		7" x 9"
Permanent Deformation Under Load ASTM D6108-97 (Compression Perpendicular to Grain)		7" x 9"
Modulus of Elasticity (Compression) ASTM D6108-97 (170,000 psi minimum)		4" x 6"
Flexural Strength - ASTM D6109-97		4" x 6"
Modulus of Elasticity (Flexure) ASTM D6109-97		4" x 6"
Shear Strength - ASTM D6109-97 (Calc.)		4" x 6"
Mechanical Fasteners - ASTM D6117-97 Screw Spike Pullout		7" x 9"

**END OF SECTION**

## SECTION 06132

### TIMBER GRADE CROSSINGS

#### PART 1 - GENERAL

##### 1.01 SECTION INCLUDES

- A. The section specifies furnishing solid timber panel grade crossings as shown on the Contract Drawings. Solid timber panel grade crossings shall be in accordance with the current requirements of the AREMA "Guidelines for the Construction or Reconstruction of Highway - Railway Crossings" except as modified herein.

##### 1.02 RELATED SECTIONS

- A. General Track Construction: Section 05651
- B. Ballasted Track Construction: Section 05652

##### 1.03 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association (AREMA), **latest edition**:
  - 1. AREMA Manual for Railway Engineering
  - 2. AREMA Portfolio of Trackwork Plans
  - 3. AREMA "Guidelines for the Construction or Reconstruction of Highway - Railway Crossings"
  - 4. AREMA Specification for Preservatives
  - 5. AREMA Specification for Treatment
  - 6. AREMA Records of Treatment and Reports of Inspection
- B. American Wood Preserver 's Association (AWPA)
  - 1. AWPA Standard C6
  - 2. AWPA Standard M3

##### 1.04 SUBMITTALS

- A. Submittals shall be made on accordance with Section 01300, Submittals
- B. Documentation
  - 1. Proposed method of delivery. Submit prior to delivery.
  - 2. Proposed anti-splitting devices and location in timbers.
  - 3. Proposed manner of marking treated timbers to indicate compliance with specifications.
  - 4. Certificate of Compliance with AWPA Standard M3 for timber treatment.

##### 1.05 QUALITY ASSURANCE

- A. Inspection:
  - 1. In accordance with pertinent sections of the AREMA Manual (**latest edition**), as modified herein.

2. Acceptance criteria: Failure to meet any pertinent part of AREMA requirements (latest edition) or these specifications constitutes cause for rejection. AREMA inspection requirements are to include, but not limited to, the physical requirement inspection criteria (decay, holes, knots, shake, split, checks, slope of grain, bark seams and manufacturer defects).
3. Averaging of dimensions, with respect to measurement for size acceptance, is not permitted.
4. Provide suitable equipment, facilities and assistance required by the Engineer to effect inspections.
5. Inform the Engineer when treated wood is ready for inspection.
6. Do not deliver material until inspected and approved for shipment by the Engineer.
7. Final inspection and approval of ties will occur as a part of the final inspection of installed ballasted track.
8. WMATA, or its representatives, reserve the right to visit the producers facility during usual business hours unscheduled to: a) observe sampling and inspection procedures, b) obtain samples of the prepare material being produced and shipped, and c) review plant inspection methods, quality control procedures, equipment and examine inspection test results of current and previous tests.

## **PART 2 - PRODUCTS**

### **2.01 GENERAL REQUIREMENTS**

- A. Furnish timbers in accordance with the requirements, as specified in this section:
- B. Crossing timbers shall be sawed, treated oak made into panels approximately 8 feet in length. Field side sections shall be 20 inches wide consisting of two 10 inch timbers and gauge side sections shall be 25-1/2 inches wide consisting of three 8-1/2 inch timbers.
- C. Each gauge section shall have a filler block of such size and shape as to provide a snug fit against the rail web and a flangeway 2-1/2 inches wide and 3 inches deep.
- D. Each section shall be made up using three 3/4 inch spiral dowel pins.
- E. Each section shall have 8 holes for use in anchoring the section to the ties with lag screws. These holes shall be 13/16 inches in diameter and shall have a 2-5/8 inches counter bore 1-1/4 inches deep in the top side.
- F. Each section shall be anchored in place with 10 inches long, 3/4 inch diameter lag screws. After the lag screw is in place, the counter bore shall be filled with a mastic material.
- G. Sections shall be full depth with the top surface in the plane of the top of rail and the bottom of the section resting directly on the cross tie.

## **PART 3 - EXECUTION**

### **3.01 REQUIREMENTS**

- A. The Contractor shall construct the crossings as shown on the Contract Drawings.
- B. Grade crossing track shall be ballasted track using standard AREMA Tie Plates, Plan No. 8, Punching A and Cut Spikes, with ties spaced at 19-1/4 inch centers.

- C. Prior to place timbers, grade crossing track shall be brought to final alignment and grade within the tolerances for ballasted yard and secondary track as specified in Section 05651, General Track Construction.
- D. Ballast shall be added to provide full cribs and level shoulders.
- E. Ties shall be swept clean of all loose ballast and debris prior to placing timbers. The timbers shall then be properly located, so that the heart wood will be on the bottom side.
- F. No shims shall be used between timbers and cross ties.
- G. The outside ends of end timbers shall be beveled. The bevel shall have dimensions of 4 inches measured horizontally and vertically.
- H. All bored holes and bevels shall be treated with pentachlorophenol or creosote immediately after boring and beveling.
- I. Two field sections and two gauge sections shall constitute one grade crossing panel.

#### **PART 4 - MEASUREMENT AND PAYMENT**

##### **4.01 MEASUREMENT:**

- A. Measurement of work specified in this section will be made in the following manner:
  - 1. No separate measurement.

##### **4.02 PAYMENT:**

- A. Compensation for work specified in this section will be in the following manner:
  - 1. Included in the price of the work of which it is a part.

**END OF SECTION**

## SECTION 06402

### INTERIOR ARCHITECTURAL WOODWORK

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This Section specifies providing wood cabinets, plastic-laminate cabinets, wood countertops, plastic-laminate countertops, solid-surfacing-material countertops.
  - 1. Related Work Specified Elsewhere:
    - a. Rough Carpentry: Section 06100.
    - b. Seals and Sealants: Section 07900.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
- B. Product Data: For each type of product indicated, including cabinet hardware and accessories, and finishing materials and processes.
- C. Shop Drawings: Show location of each item, dimensioned plans and elevations, large-scale details, attachment devices, and other components.
  - 1. Show locations and sizes of furring, blocking, and hanging strips, including concealed blocking and reinforcement specified in Section 06100.
  - 2. Show locations and sizes of cutouts and holes for installed in architectural woodwork.
- D. Samples for Initial Selection: Manufacturer's color charts consisting of units or sections of units showing the full range of colors, textures, and patterns available for each type of material indicated.
  - 1. Plastic laminates.
  - 2. Solid-surfacing materials.
- E. Samples for Verification: For the following:
  - 1. Plastic-laminate-clad panel products, 8 by 10 inches, for each type, color, pattern, and surface finish.
  - 2. Solid-surfacing materials, 6 inches square.
  - 3. Exposed cabinet hardware and accessories, one unit for each type.
- F. Certification: Signed by manufacturers of woodwork certifying that products furnished comply with requirements.
- G. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. AWI: Section 400 & 700, AGS.

3. Builders Hardware Manufacturer's Association (BHMA): A156.9, A256.11, A156.18, B01361, B01521, B02011, B03141, B04071, B04081, B04013, B05091, E07121, E7041, 613, 630, 640
  4. ANSI A208.2, Z124.3
  5. NEMA LD 3.
- B. Installer Qualifications: An experienced installer who has completed architectural woodwork similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- C. Fabricator Qualifications: A firm experienced in producing architectural woodwork similar to that indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
- D. Quality Standard: Unless otherwise indicated, comply with AWI's "Architectural Woodwork Quality Standards" for grades of interior architectural woodwork, construction, finishes, and other requirements.
1. Provide AWI Quality Certification Program certificate indicating that woodwork complies with requirements of grades specified.

#### **1.04 DELIVERY, STORAGE, AND HANDLING:**

- A. Do not deliver woodwork until painting and similar operations that could damage woodwork have been completed in installation areas. If woodwork must be stored in other than installation areas, store only in areas where environmental conditions comply with requirements specified in "Project Conditions" Article.

#### **1.05 PROJECT CONDITIONS:**

- A. Environmental Limitations: Do not deliver or install woodwork until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.
- B. Field Measurements: Where woodwork is indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
1. Locate concealed framing, blocking, and reinforcements that support woodwork by field measurements before being enclosed and indicate measurements on Shop Drawings.
  2. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating woodwork without field measurements. Provide allowance for trimming at site, and coordinate construction to ensure that actual dimensions correspond to established dimensions.

#### **1.06 COORDINATION:**

- A. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of Work specified in other Sections to ensure that interior architectural woodwork can be supported and installed as indicated.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS:**

- A. General: Provide materials that comply with requirements of the AWI quality standard for each type of woodwork and quality grade specified, unless otherwise indicated.
- B. Wood Products: Comply with the following:
  - 1. Medium-Density Fiberboard: ANSI A208.2, Grade MD-Exterior Glue.
- C. High-Pressure Decorative Laminate: NEMA LD 3, grades as indicated, or if not indicated, as required by woodwork quality standard.
  - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering high-pressure decorative laminates that may be incorporated into the Work include, but are not limited to, the following:
    - a. Formica Corporation.
    - b. International Paper; Decorative Products Div.
    - c. Wilsonart International; Div. of Premark International, Inc.
- D. Adhesive for Bonding Plastic Laminate: Unpigmented contact cement.
- E. Solid-Surfacing Material: Homogeneous solid sheets of filled plastic resin complying with material and performance requirements in ANSI Z124.3, for Type 5 or Type 6, without a precoated finish.
  - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
    - a. Corian; DuPont Polymers.
    - b. Surell; Formica Corporation.
    - c. Fountainhead; International Paper, Decorative Products Div.
    - d. Gibraltar; Wilsonart International, Div. of Premark International, Inc.

### **2.02 CABINET HARDWARE AND ACCESSORIES:**

- A. Butt Hinges: 2-3/4-inch, 5-knuckle steel hinges made from 0.095-inch- thick metal, and as follows:
  - 1. Semiconcealed Hinges for Flush Doors: BHMA A156.9, B01361.
  - 2. Semiconcealed Hinges for Overlay Doors: BHMA A156.9, B01521.
- B. Back-Mounted Pulls: BHMA A156.9, B02011.
- C. Wire Pulls: Back mounted, 5 inches long, 2-1/2 inches deep, and 5/16 inches in diameter.
- D. Catches: Magnetic catches, BHMA A156.9, B03141.
- E. Adjustable Shelf Standards and Supports: BHMA A156.9, B04071; with shelf rests, B04081.
- F. Shelf Rests: BHMA A156.9, B04013.
- G. Drawer Slides: Side-mounted, full-extension, zinc-plated steel drawer slides with steel ball bearings, BHMA A156.9, B05091, and rated for the following loads:
  - 1. Box Drawer Slides: 100 lbf.
  - 2. File Drawer Slides: 200 lbf.
- H. Door Locks: BHMA A156.11, E07121.

- I. Drawer Locks: BHMA A156.11, E07041.
- J. Grommets for Cable Passage through Countertops: 2-inch OD, black, molded-plastic grommets and matching plastic caps with slot for wire passage.
- K. Exposed Hardware Finishes: For exposed hardware, provide finish that complies with BHMA A156.18 for BHMA finish number indicated. Dark, Oxidized, Satin Bronze, Oil Rubbed: BHMA 613 for bronze base; BHMA 640 for steel base; match Architect's sample.
  - 1. Satin Stainless Steel: BHMA 630.
- L. For concealed hardware, provide manufacturer's standard finish that complies with product class requirements in BHMA A156.9.

### **2.03 INSTALLATION MATERIALS:**

- A. Furring, Blocking, Shims, and Hanging Strips: Softwood or hardwood lumber, kiln-dried to less than 15 percent moisture content.
- B. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage. Provide nonferrous-metal or hot-dip galvanized anchors and inserts on inside face of exterior walls and elsewhere as required for corrosion resistance. Provide toothed-steel or lead expansion sleeves for drilled-in-place anchors.

### **2.04 FABRICATION, GENERAL:**

- A. Interior Woodwork Grade: Provide [**Premium**] [**Custom**] grade interior woodwork complying with the referenced quality standard.
- B. Wood Moisture Content: Comply with requirements of referenced quality standard for wood moisture content in relation to ambient relative humidity during fabrication and in installation areas.
- C. Complete fabrication, including assembly, finishing, and hardware application, to maximum extent possible, before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting. Retain subparagraph below if Architect will visit woodwork shop and examine work before it is shipped to Project site.
- D. Shop cut openings, to maximum extent possible, to receive hardware, appliances, plumbing fixtures, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings.

### **2.05 PLASTIC-LAMINATE CABINETS AND COUNTERTOPS:**

- A. Quality Standard: Comply with AWI Section 400 requirements for laminate cabinets.
- B. AWI Type of Cabinet Construction: Flush overlay.
- C. Laminate Cladding for Exposed Surfaces: High-pressure decorative laminate complying with the following requirements:
  - 1. Horizontal Surfaces Other Than Tops: HGS.
  - 2. Vertical Surfaces: HGS.
  - 3. Edges: HGS.

- D. Materials for Semiexposed Surfaces: Provide surface materials indicated below:
  - 1. Surfaces Other Than Drawer Bodies: Thermoset decorative overlay.
- E. Colors, Patterns, and Finishes: Provide materials and products that result in colors and textures of exposed laminate surfaces complying with the following requirements:
  - 1. Provide selections from laminate manufacturer's full range of colors and finishes in the following categories:
    - a. Solid colors.
    - b. Patterns.

## **2.06 SOLID-SURFACING-MATERIAL COUNTERTOPS:**

- A. Quality Standard: Comply with AWI Section 400 requirements for countertops.
- B. Solid-Surfacing-Material Thickness: 3/4 inch.
- C. Colors, Patterns, and Finishes: Provide materials and products that result in colors of solid-surfacing material complying with the following requirements:
  - 1. Provide selections from manufacturer's full range of colors and finishes.
- D. Fabricate tops in one piece with shop-applied backsplashes and edges, unless otherwise indicated. Comply with solid-surfacing-material manufacturer's written recommendations for adhesives, sealers, fabrication, and finishing.
- E. Drill holes in countertops for plumbing fittings in shop.

## **PART 3 - EXECUTION**

### **3.01 PREPARATION:**

- A. Condition woodwork to average prevailing humidity conditions in installation areas before installation.
- B. Before installing architectural woodwork, examine shop-fabricated work for completion and complete work as required, including removal of packing and backpriming.

### **3.02 INSTALLATION:**

- A. Quality Standard: Install woodwork to comply with AWI Section 1700 for the same grade specified
- B. Install woodwork level, plumb, true, and straight. Shim as required with concealed shims. Install level and plumb (including tops) to a tolerance of 1/8 inch in 96 inches.
- C. Scribe and cut woodwork to fit adjoining work, and refinish cut surfaces and repair damaged finish at cuts.
- D. Cabinets: Install without distortion so doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete installation of hardware and accessory items as indicated.
  - 1. Install cabinets with no more than 1/8 inch in 96-inchsag, bow, or other variation from a straight line.

2. Fasten wall cabinets through back, near top and bottom, at ends and not more than 16 inches o.c. with No. 10 wafer-head screws sized for 1-inch penetration into wood, blocking, or hanging strips.
- E. Countertops: Anchor securely by screwing through corner blocks of base cabinets or other supports into underside of countertop.
1. Align adjacent solid-surfacing-material countertops and form seams to comply with manufacturer's written recommendations using adhesive in color to match countertop. Carefully dress joints smooth, remove surface scratches, and clean entire surface.
  2. Install countertops with no more than 1/8 inch in 96-inch sag, bow, or other variation from a straight line.
  3. Secure backsplashes to walls with adhesive.
  4. Caulk space between backsplash and wall with sealant specified in Section 07900.

### **3.03 ADJUSTING AND CLEANING**

- A. Repair damaged and defective woodwork, where possible, to eliminate functional and visual defects; where not possible to repair, replace woodwork. Adjust joinery for uniform appearance.
- B. Clean, lubricate, and adjust hardware.

**END OF SECTION**

## SECTION 07110

### DAMPPROOFING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing dampproofing.
- B. Related Work Specified Elsewhere:
  - 1. Cast-in-Place Structural Concrete: Section 03300.
  - 2. Cast-in-Place Architectural Concrete: Section 03331

##### 1.02 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Product data for each type of product specified, including data substantiating that materials comply with requirements for each dampproofing material specified. Include recommended method of application, recommended primer, number of coats, coverage or thickness, and recommended protection course.
- B. Certification:
  - 1. Certification that materials furnished meet specified requirements and are compatible with each other.
  - 2. Certification by dampproofing manufacturer that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs).

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Codes and regulations of the jurisdictional authorities.
  - 2. ASTM: D41, D449.
- B. Demonstration Area:
  - 1. Prepare 100-square foot specimen of typical dampproofing application using specified methods and materials.
  - 2. Location of demonstration area as directed. Dampproofing will be visually and physically examined by the Engineer.
  - 3. If demonstration area is disapproved, prepare additional demonstration area. Do not proceed with dampproofing until demonstration area has been approved. Approved demonstration area will serve as the standard of quality and workmanship for dampproofing work specified in this section.
- C. Installer Qualifications: Engage an experienced Installer who has completed bituminous dampproofing similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to the jobsite in their original unopened containers clearly labeled with manufacturer's name, brand designation, referenced specification number, type and class, as applicable.
- B. Store products in approved dry area, protected from contact with soil and from exposure to the elements. Keep products dry.

- C. Handle products so as to prevent breakage of containers and damage to products.

**1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  - 1. Application of dampproofing to unprotected surfaces in wet weather or to surfaces on which ice, frost, water or dampness is visible is prohibited.
  - 2. Application of dampproofing when ambient temperature is below 40F is prohibited.
- B. Substrate: Proceed with dampproofing only after substrate construction and penetrating work have been completed.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Asphalt Primer: ASTM D41.
- B. Asphalt: ASTM D449, Type A.
- C. Portland Cement Grout: Section 04050.

**PART 3 - EXECUTION**

**3.01 PREPARATION:**

- A. Do not start dampproofing until requirements for curing concrete have been completed and surfaces have thoroughly dried.
- B. Clean surfaces to be dampproofed of loose and foreign material, concrete fins and dirt.
- C. Moisten and point holes, honeycombs, cracks, cavities and concrete fill with portland cement grout and allow to cure completely before covering. See Section 03300 for curing and protection.

**3.02 APPLICATION:**

- A. Apply dampproofing, consisting of two prime coats and one seal coat of dampproofing materials, to surfaces shown to receive dampproofing.
  - 1. Apply two coats of primer to surfaces to be dampproofed at rate of one gallon per 100 square feet. Allow first coat to dry thoroughly before second coat is applied.
  - 2. Do not heat prime-coat material for application.
  - 3. After second prime coat has thoroughly dried, brush one coat of hot asphalt as applicable over primed surface at minimum rate of 15 pounds per 100 square feet of surface; fill cracks, voids and crevices.
  - 4. Do not heat asphalt in excess of 400F.
  - 5. Apply dampproofing coat so as to ensure continuous surface free of dull or porous spots. Give dull or porous spots additional coating of hot asphalt.
  - 6. Perform finished work to conform to dimensions shown; do not disfigure other areas or parts of structure by dripping or spreading of materials.

**3.03 PROTECTING AND CLEANING:**

- A. Protect finish work during application of dampproofing and repair damage.

- B. Remove spots and spattering of the damproofing from finish work and leave the entire work area in first-class condition.
- C. Remove damproofing rubbish from the premises and leave spaces in broom-clean condition.

**END OF SECTION**

## SECTION 07125

### MEMBRANE WATERPROOFING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing fluid-applied membrane waterproofing, rubberized-asphalt sheet membrane waterproofing and protection courses.
- B. Related Work Specified Elsewhere:
  - 1. Cast-in-Place Structural Concrete: Section 03300.
  - 2. Cast-in-Place Architectural Concrete: Section 03331.
  - 3. Brick: Section 04215.
  - 4. Concrete block: Section 04220.
  - 5. Mortar: Section 04050.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: Include manufacturer's written instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties of waterproofing.
  - 2. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins to adjoining waterproofing, and other termination conditions.
    - a. Include joint and anchorage details, materials and description of sequence of operation.
  - 3. Samples: Four of each type of the following materials used in the work:
    - a. Membrane: 12 inches square.
    - b. Adhesive: Half-pint containers.
    - c. Butyl gum tape: Small rolls.
    - d. Hardboard: 12 inches square.
    - e. Protection board: 12 inches square.
- B. Certification:
  - 1. Certification that materials furnished meet specified requirements and are compatible with each other.
  - 2. Certification that the applicator is approved by the manufacturer.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. American Hardboard Association Industry: AHAI Standard 1.
  - 3. FS: TT-S-230.
  - 4. ASTM: A123, C42, C78, C90, C171, C192, C272, C293, E96, D41, D146, D226, D412, D449, D572, D638, D790, D1621, D1668, D4586, E96, E154.
- B. Qualifications of Waterproofing Applicator:
  - 1. Use applicator who is approved by the manufacturer.

2. Employ workers who have had experience in waterproofing of specified type on jobs of similar size and comparable structures. Have approved full-time superintendent or foreman supervise and direct waterproofing operations.
  3. Inform the Engineer of proposed schedules and locations of waterproofing work.
- C. Obtain waterproofing materials, sheet flashings, and protection course through one source from a single manufacturer.
- D. Pre-installation Conference: Conduct conference at Project site. Review requirements for waterproofing, including surface preparation specified under other Sections, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to job site in original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type and class, as applicable.
- B. Store products in approved dry area with roll goods standing on ends. Protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
1. Application of waterproofing to unprotected surfaces in wet weather or to surfaces on which ice, frost or dampness is visible is prohibited.
  2. Unless otherwise approved, application of waterproofing unless ambient temperature is at least 40F and rising is prohibited.
  3. Maintain rolls of material at a temperature of at least 50F for a period of not less than 24 hours prior to installation.
- B. Provide ventilation in accordance with specified safety requirements.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Asphalt: ASTM D449, Type A.
- B. Asphaltic Primer: ASTM D41
- C. Glass Fabric: ASTM D1668, Type I or III.
- D. Asphalt-Saturated Felt: ASTM D226, Type I.
- E. Asphalt Cement (Asbestos-Free): ASTM D4586.
- F. Waterproof Building Paper: ASTM C171, Regular.

- G. Rubberized-Asphalt Sheet Membrane Waterproofing: Tough, pliable self-adhering waterproofing sheet of polyethylene film, coated on one side with a layer of adhesive-consistency rubberized asphalt, with the following additional requirements:

Characteristic	Value	Test Method
Thickness:		
a. Polyethylene film	4 mils	-
b. Rubberized asphalt	56 mils	-
c. Rubberized asphalt membrane total	60 mils	-
Permeance	0.1 perm	ASTM E96 Method B
Pliability, 180-degree bend over 1/4-inch mandrel at minus 30F	Unaffected	ASTM D146
Peel adhesion, 7 days dry plus 7 days at 120F plus 7 days dry or 7 days wet	5.0 pounds per inch, minimum	FS TT-S-230 Modified
Cycling over crack 15F, crack opened and closed from 0 inches to 1/4 inch	No effect 100 cycles	-
Puncture resistance, membrane	40 pounds minimum	ASTM E154
Tensile strength, membrane	250 pounds per square inch minimum	ASTM D412 Die C Modified

- H. Asphaltic Mastic:
1. Solvent-base, containing synthetic rubber, asphalt and other components, suitable for troweling, as recommended by membrane manufacturer.
  2. Dry-film requirements:
    - a. Aging: No cracking, flowing, crazing, blistering, or delamination when subjected to 192 hours in oxygen bomb at 158F and 300-psi oxygen pressure in accordance with ASTM D572.
    - b. Water permeability: 0.05-perm maximum when applied 1/32-inch thick over kraft paper and tested in accordance with ASTM E96.
    - c. Stress: No cracking or delamination when 1/64-inch thick layer is applied on metal and bent five times 360 degrees at zero F on 1/16-inch mandrel.
- I. Bonding and Joining Materials for Butyl Membrane:
1. Adhesive: For bonding butyl membrane to adjacent surfaces, as recommended by manufacturer of sheeting material.
  2. Butyl compound: Self-vulcanizing for splicing joints in butyl membrane, as recommended by manufacturer.

3. Butyl gum tape: Unvulcanized butyl-gum rubber with polyethylene-backing material for splicing tape, as recommended by membrane manufacturer.
  4. Flexible butyl-sheet rubber for flashings: As recommended by membrane manufacturer and as specified.
- J. Protection Course Materials:
1. Concrete: Section 03300, class as shown.
  2. Concrete block: Section 04220, ASTM C90, Type I.
  3. Common brick: Section 04215, type and grade as shown
  4. Concrete plank: Lightweight, reinforced-concrete plank, tongue-and-groove sides and ends, 16 inches wide, two inches thick, 10 feet long.
  5. Protection board:
    - a. Semi-flexible board, five ply or more, composed of asphaltic core sealed under heat and pressure between two liners of asphalt-saturated kraft paper or felt bonded to independent waterproofing during manufacturing process. Thickness as recommended by manufacturer.
    - b. Extruded, rigid polystyrene-foam board, one-inch thick. Compressive strength 25-psi minimum, ASTM D1621; water absorption 0.1 percent, ASTM C272.
    - c. Portland-cement mortar: Section 04050.
- K. Epoxy-Injection Material for Repair of Leaks: Two-part epoxy-adhesive materials, containing 100-percent solids, having aromatic curing-agent surface M-phenylenediamine and meeting or exceeding the following minimum requirements:
1. Flexure strength: 400 psi in accordance with ASTM D790.
  2. Tensile strength: 1,200 psi in accordance with ASTM D638.
  3. Bond strength: ASTM C293 and as follows:
    - a. Prepare concrete-beam test specimen in accordance with ASTM C192, using concrete mix design for 1-1/2 inch aggregate.
    - b. Break concrete beam in accordance with ASTM C78.
    - c. Bond broken beam using epoxy with bond-line thickness of 20 mils and cure for seven days at constant temperature of 65F.
    - d. After curing, rebreak beam in accordance with ASTM C78.
    - e. Attain specified values of flexure and tensile strength for repaired beam.
    - f. Cores taken for testing in accordance with ASTM C42.
- L. Protection-Board Adhesive: As recommended by the protection-board manufacturer.

## **2.02 WATERPROOFING SYSTEMS:**

- A. Fluid-Applied Membrane System:
1. Asphaltic primer.
  2. Membranes: One of the following:
    - a. Glass fabric.
    - b. Asphalt-saturated felt.
  3. Accessories:
    - a. Asphaltic mastic.
    - b. Asphalt cement.
    - c. Butyl-gum tape.
    - d. Boots.
    - e. Iron clamps and bolts: Hot-dip, galvanized, ASTM A123, Grade 100; ASTM A153 Class A.
- B. Rubberized-Asphalt Sheet Membrane System:
1. Asphaltic primer.

2. Rubberized-asphalt membrane.
3. Accessories:
  - a. Asphaltic mastic.

### **PART 3 - EXECUTION**

#### **3.01 PREPARATION:**

- A. Place membrane waterproofing after concrete has cured as specified in Section 03300 and surface is completely dry.
- B. Keep surfaces thoroughly dry, immediately before and during application of waterproofing.
- C. Should surface of the concrete become temporarily damp, dry surface.
- D. Remove laitance, dust, dirt, projections, oil, grease and other matter by brooming, scraping, air-hosing or combination of such methods. Surface to be approved prior to application of waterproofing material.
- E. Provide one-inch asphaltic mastic cants (fillets) in internal corners.
- F. Prepare preconstructed protection of courses where shown in accordance with recommendations of membrane manufacturer. Fill holes and grooves.
- G. Treat vertical surfaces with trowel coat of asphalt cement to fill pores and irregularities and level low areas to provide smooth surface for application of membrane waterproofing.

#### **3.02 GENERAL INSTALLATION REQUIREMENTS:**

- A. Tightly fit waterproofing to structure without voids or kinks. Upon completion, allow no cuts, holes, pockets, bulges, wrinkles, folds or creases in surfaces of finished waterproofing; if such defects are present, repair by patching as specified. If waterproofing is damaged, punctured or in any way pervious and cannot be effectively patched or repaired, remove and replace to extent necessary to ensure that structure is waterproof.
- B. Mop surfaces to be waterproofed in sections. Begin waterproofing at low point. Allow sufficient fabric for suitable overlap and anchorage at upper edge.
- C. If leaks occur in areas where backfilling has not been placed, cut-out waterproofing and protection and patch as necessary to ensure watertight barrier. Where membrane is inaccessible, stop leaks with epoxy injection.
- D. Cover horizontal surfaces of membrane waterproofing on which backfill is to be placed with portland-cement concrete of class and thickness shown and as specified in Section 03300.
- E. Protect penetrations in membrane, such as pipes, conduits, piles, struts, walers and other braces. Provide sleeves, clamping rings or other approved devices at penetrations and install with counterflashing where shown and mastic tape where needed to ensure watertight joint.
- F. Where shown in concrete floors and roof, fill electrical-bonding notches with asphalt cement finished flush with top of concrete.

### 3.03 FLUID APPLIED MEMBRANE SYSTEM:

- A. General:
1. Approximately 24 hours before first mopping is applied, cover concrete surfaces to be waterproofed with one coat of asphaltic primer at minimum rate of one gallon per 100 square feet. Work primer well into surfaces to achieve uniform coating.
  2. Completely cover concrete surfaces so that no concrete is left exposed. On fabric surfaces, apply mopping sufficiently heavy to conceal weave completely. For each mopping use not less than 4-1/2 gallons per 100 square feet of surface.
  3. Regulate the work so that installed membrane receives final asphalt mopping before end of day. Thoroughly seal laps.
  4. Before applying membrane on exterior of expansion and construction joints, lay strip of waterproof building paper twelve inches wide; extend six inches on each side of joint and secure to surface near edges using approved method.
  5. Do not permit one layer of membrane to touch another layer, or concrete surface; separate each by mopped coat of hot asphalt.
  6. At edges of membrane, insert membrane into reglets as shown and caulk with approved mixture of asphalt cement, or butyl-gum tape and necessary boots to prevent water intrusion between waterproofing and surface being waterproofed.
  7. Where pipes, sleeves for pipes, or drains, penetrate surfaces to be waterproofed, provide synthetic-membrane flashings and two additional plies of membrane extending at least one-foot beyond edge of flashing, set in place with hot moppings of asphalt. Where flashing sleeves are not shown, flash membrane onto pipe or conduit with hot moppings of asphalt and secure with galvanized-iron clamps and bolts or by other approved methods.
- B. Heating of Asphalt:
1. Heat asphalt to flow freely not exceeding 350F; stir frequently to avoid local overheating. Provide heating kettles of quality, number and capacity to service work adequately. Keep spare serviceable burners available at site for immediate replacement of malfunctioning burners. Keep kettleman in attendance during operation to ensure that maximum specified temperatures are not exceeded.
  2. Employ kettle operators experienced in operating and maintaining type of equipment being used. Provide large metal pans at least one-inch deep under kettle to prevent drippings or fuel leaks from falling on prepared concrete or membraned surfaces. Ensure that each kettle is continuously equipped with calibrated thermometer.
  3. Collect strippings from drums daily and remove from site. Set up kettles immediately adjacent to work in progress to reduce carrying distance of hot buckets.
  4. Lower hot asphalt with extreme care to avoid endangering workmen in trench or excavation.
- C. Two-Ply Work:
1. For first strip of membrane, use half-width; for second, use full-width, lapped full width of first strip.
  2. For each succeeding strip, use full-width and overlap so that entire area has two layers of membrane except at joints. Lap joints two inches minimum, producing three plies at such overlaps.
  3. Give entire surface final mopping of hot asphalt. When protective covering is shown, place covering on final mopping of asphalt while still hot.
- D. Three-Ply Work:
1. Proceed as for two-ply work, except use 1/3-width for first strip; for second strip use 2/3-width; and for the third and succeeding strips use full-width. Overlap strips at least two inches, resulting in surface being completely covered by three plies, with four plies at overlaps.

- E. More Than Three-Ply Work:
  - 1. Build in shingle fashion similar to three-ply work by adding as many plies as are shown. In joining membrane waterproofing to waterproofing in place, clean and heat in-place waterproofing before joining new waterproofing to that previously laid and overlap such joints one-foot minimum.
  - 2. At intersections of walls with horizontal surfaces, and at other locations, lap the greater number of plies of membrane over the other plies a minimum of one foot.
  - 3. Reinforce waterproofing at angles and expansion joints and at other locations where membrane may be subjected to unusual strain. Reinforce by means of two additional plies of saturated fabric and alternate moppings of asphalt. At angles between floor and wall provide reinforcing strips of sufficient width to extend six inches minimum on floor and four inches up wall. Extend strips at vertical corners five inches minimum on each side of corner.
  
- F. Patching:
  - 1. Where the Engineer permits patching of defective waterproofing, extend first patching ply 12 inches minimum beyond outermost edge of defective portion.
  - 2. Extend second and each succeeding ply of patch three inches minimum beyond preceding ply.
  - 3. For patch area use at least as many new plies as specified for original membrane.

#### **3.04 RUBBERIZED ASPHALT SHEET MEMBRANE SYSTEM:**

- A. Prime concrete surfaces as recommended by membrane manufacturer. Do not prime surfaces more than 36 hours prior to applying membrane. Allow primer to dry for one hour or until tack-free. Do not prime metal surfaces, but ensure that they are dry and free of grease, oil, dust, rust and other contaminants.
- B. Apply membrane to clean primed surfaces. Lay membrane from low points or drains toward high points in shingle fashion. Overlap each strip 2-1/2 inches minimum and roll down firmly and completely.
- C. Double-cover inside and outside corners with membrane by applying initial strip of minimum 12-inch width centered along axis of corner. Mortar inside corners; round outside corners.
- D. Double-cover construction and control joints with membrane. Apply double thickness of membrane over sealed expansion joints.
- E. Provide troweled bead of asphaltic mastic as recommended by membrane manufacturer to perimeter of membrane placed in each day's operation and to outside edges of membrane after the membrane is placed.
- F. At areas around drains, posts and other protrusions, install double layer of membrane and coat liberally with asphaltic mastic.
- G. Immediately before covering membrane, inspect carefully and patch holes, tears, misaligned or wrinkled seams and other discontinuities with membrane or mastic. Conduct 24-hour flood test with minimum two-inch head of water on horizontal areas. Repair leaks, using methods recommended by membrane manufacturer.
- H. Place specified protection material on membrane within five days after application. Apply material in accordance with manufacturer's written instructions, as shown and as specified.

#### **3.05 PROTECTION OF WATERPROOFED SURFACES:**

- A. Install protection courses as soon as practicable after waterproofing is placed. Do not place loads on exposed membrane waterproofing. Traffic on such exposed membrane waterproofing is prohibited.
- B. Provide temporary protection as required pending installation of permanent protection.
- C. Exercise care in placing protection courses against waterproofing so as not to break, tear, puncture or otherwise damage waterproofing.
- D. Provide protection of waterproofing surfaces as shown and as specified.
  - 1. Concrete: Place concrete protection courses in accordance with the applicable requirements of Section 03300 and as shown.
  - 2. Concrete blocks and common brick: Lay concrete blocks and common brick in portland-cement mortar, as shown and in accordance with the related work sections
  - 3. Concrete plank: Erect concrete plank with tight tongue-and-groove joints as shown.
  - 4. Insulation board:
    - a. Apply protection-board adhesive in accordance with the manufacturer's instructions.
    - b. Fit boards carefully and neatly around pipes and projections and cover up entire surface of waterproofing.
  - 5. Protection board: Affix protection board to membrane surface by butting and taping or lapping and taping in accordance with manufacturer's written instructions and as approved.
  - 6. Backfill: At depths of 10 feet or more from top of structure, excluding reliefs, place layer of sand 12 inches thick over membrane as approved.

### **3.06 REPAIR OF LEAKS:**

- A. Repair areas of concrete which leak, including cracks and other defective areas, and areas where membrane is inaccessible by using injected waterproofing or by repair methods that provide an impervious and watertight envelope around affected areas. Use epoxy-injection method.
  - 1. Epoxy injection:
    - a. Commence epoxy-injection work after embankment or other backfill and waterproofing membrane have been placed to full required height on structure and for minimum distance of thirty feet beyond extent of repair area.
    - b. Install injection work from interior side of repair areas by port-to-port method. Port spacing: Approximately 1-1/2 times thickness of receiving concrete section.
    - c. Preseal intermediate joints to prevent escape of epoxy and complete each repair area for its entire length before commencing work in another area.
    - d. Before proceeding, sweep space in vicinity of joint or crack receiving epoxy and leave in a generally clean condition. Remove dirt, laitance and other loose material from areas receiving epoxy by means of compressed-air jet.
    - e. At joints and cracks, complete in order floors, walls and ceilings. Proceed with work from port-to-port, beginning at one end of joint. Inject epoxy by means of small nozzle held tightly against port. Continue operation until material begins to exude from next port. Repeat operations from port-to-port until entire area has been treated in one continuous operation. Seal ports as necessary to prevent drips or runout.
    - f. Remove ports and finish surface of joints and cracks flush with adjacent concrete surfaces leaving no indentations or evidence of port fittings. Point joint surfaces and remove excess material from adjacent surfaces as necessary to leave joint smooth.

- g. Equip injection pumps with device to positively indicate failure to pump in proper proportions, as well as bypass valves and gauges compatible with pump.
- h. The Engineer may take cores at any location for inspection and testing. When it is determined that epoxy material has not penetrated to sufficient depth or is otherwise unsatisfactory, costs of coring and testing are the responsibility of the Contractor; where tests demonstrate that work is not substandard, costs of coring and testing will be paid by the Authority.
- i. When cores demonstrate that epoxy has penetrated less than 90 percent of crack volume within core, work will be considered defective. Repair defective work by refilling cracks at such locations to achieve at least 90-percent penetration.

**END OF SECTION**

## SECTION 07137

### TUNNEL WATERPROOFING (Two-Pass System)

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing a permanent waterproofing system and associated construction drainage between the initial and the final linings.
- B. Related Work Specified Elsewhere:
  - 1. Subway drainage: Section 02625.
  - 2. Earth tunneling: Section 02415.
  - 3. Precast concrete tunnel lining: Section 02425.
  - 4. Cast-in-place concrete: Section 03300.
  - 5. Miscellaneous metal: Section 05500.
- C. Definitions:
  - 1. Waterproofing: Geomembrane and geotextile installed around the entire circumference of the tunnel (invert and arch) between initial and final linings.
  - 2. Geotextile: Geofabric providing groundwater drainage channel and protection of the geomembrane from sharp object projections of the initial lining.
  - 3. Geomembrane: Synthetic membrane specifically formulated for waterproofing tunnel structure against groundwater pressure.
  - 4. Invert drain: Temporary invert drain pipe
  - 5. Water barrier: Water barriers installed around the entire circumference of tunnel where indicated.
  - 6. Geo-drain filter fabric: Installed at weep holes where indicated.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: A276, D257, D374, D638, D746, D751, D1777, D2136, D3776, D3787, D4491, D4533, D4632, D4716.
  - 3. NFPA: 701.
- B. Manufacturer's Qualifications:
  - 1. Select a manufacturer who is regularly engaged in the production of similar geomembranes, geotextiles and water barriers.
- C. Supervision and Training:
  - 1. Have manufacturer's representative present during first 10 working days of installation.
  - 2. Execute installation testing under direct supervision of an individual with recent, continuous and successful experience in the installation of tunnel membrane linings.
  - 3. Provide personnel involved in lining installation and testing with training prior to beginning lining installation.
- D. Membrane Protection:
  - 1. Provide method and material to detect damage to geomembrane from final lining reinforcement placement.

### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with additional requirements as specified for each:
  - 1. Material Samples:
    - a. Geomembrane: One square foot.
    - b. Double welded seam: One foot long.
    - c. Geotextile: One square foot.
    - d. Membrane attachment system: Two.
    - e. Water barrier: One foot long, welded to geomembrane.
    - f. Geo-drain filter fabric: One square foot.
  - 2. Manufacturer's Installation Recommendations:
    - a. Storage.
    - b. Handling.
    - c. Installation.
    - d. Seaming.
    - e. Attachment.
    - f. Testing.
    - g. Repair instructions.
    - h. Special instructions for corners and intersections.
    - i. Installation equipment.
    - j. Damage detection method.
  - 3. Manufacturer and Installer Qualifications:
    - a. Evidence of manufacturer and installation qualifications.
    - b. Resume of lining installation supervisors.
  - 4. Certification of compliance with the requirements of this specification.
  - 5. Shop drawings, including as a minimum the following:
    - a. Sheet layout of geomembrane detailing seams.
    - b. Details of seams, form bulkhead protection, attachment assembly for embedded lining items and other construction details.
    - c. Water barrier and geo-drain filter fabrics locations and details attachment.
  - 6. Working drawings including sequence of installation and details of invert drain support.

### 1.04 JOB CONDITIONS:

- A. Install waterproofing only after acceptance of initial lining.
- B. Replace or repair sections of the waterproofing membrane determined to be defective in accordance with geomembrane seam testing or visual inspection.

## PART 2 - PRODUCTS

### 1.01 2.01 MATERIALS:

- A. Geotextile:
  - 1. Non-woven, needle punched, 100 percent polypropylene geotextile of uniform thickness and surface texture.
  - 2. Minimum Physical Properties:

<u>Property</u>	<u>Testing Method</u>	<u>Minimum Specifications</u>
Thickness (mils)	ASTM D1777	285
Unit Weight (oz./sq. yd.)	ASTM D3776	22
Grab Strength (lbs.)	ASTM D4632	285/340
Elongation (percent)	ASTM D4632	85
Trapezoidal Tear (lbs.)	ASTM D4533	135/155
Burst Strength (psi)	ASTM D3787	400
In-Plane Flow Rate (gpm/ft. width)	ASTM D4716	0.04
pH Range	—	2 to 13

- B. Geomembrane:
1. General: Plasticized PVC (PVC-P) waterproofing membrane of uniform surface texture reinforced with woven reinforcing fabric of glass felt.
  2. Physical Properties:

<u>Property</u>	<u>Testing Method</u>	<u>Minimum Specifications</u>
Thickness (inch)	ASTM D751	
Invert		0.118
Arch		0.079
Ultimate Tensile Strength (lbs./sq. in.)	ASTM D638	2000
Ultimate Elongation (percentage)	ASTM D638	
glass-felt-reinforced membrane		200
woven-fabric-reinforced membrane		25
Flammability	NFPA 701	Self Extinguishing
Dielectric Strength (volts/mil.)	ASTM D257	440 to 462
pH Range	—	2 to 13

<u>Property</u>	<u>Testing Method</u>	<u>Minimum Specifications</u>
Low Temperature Bend	ASTM D2136	Pass at minus 40F
Woven Reinforcing Fabric (oz./sq. yd.)	—	13 for woven-fabric-reinforced membrane

- C. Invert Drain:
  1. PVC pipe: Section 02625.
  2. Support: Manufactured of PVC compatible materials.
- D. Attachments: Manufactured of PVC compatible materials, with recess for metal washers and nail.
- E. Water Barriers:
  1. Base seal type water barrier with 6 rib minimum configuration, 1-1/2 inches minimum height, minimum 16 inches wide, manufactured from polyvinyl-chloride plastic compound, compatible with geomembrane.

2. Physical Properties:

<u>Property</u>	<u>Testing Method</u>	<u>Minimum Specifications</u>
Thickness (inch)	ASTM D374	0.125
Ultimate Tensile Strength (lbs./sq. in.)	ASTM D638	2000
Ultimate Elongation (percent)	ASTM D638	300
Low Temperature Impact	ASTM D746	Pass at minus 20F

- F. Geo-Drain Filter Fabric:
  1. BML Enterprises' B-Drain 60 or AKZO Industrial Systems Co.'s Enkadrain Type 9120 or approved equal.
  2. Physical Properties:

<u>Property</u>	<u>Testing Method</u>	<u>Minimum Specifications</u>
Tensile Strength (lbs.)	ASTM D4632	100
Weight (oz./sq.yd.)	ASTM D3776	4.0
Water Flow Rate (gpm/sq. yd.)	ASTM D4491	160

- G. Sponge Rubber: Neoprene, closed cell, minimum 1/4-inch thick, as approved by PVC membrane waterproofing manufacturer.
- H. Neoprene Adhesive: As approved by PVC membrane waterproofing manufacturer.
- I. Batten Plates: Stainless steel, ASTM A276.
- J. Expansion Anchor Bolts: Section 05500, hot-dip galvanized.
- K. Nonshrink Grout: Section 03300.

## **PART 3 - EXECUTION**

### **3.01 INITIAL LINING PREPARATION:**

- A. Repair damaged or spalled areas having a depth of greater than one inch.
- B. Patch or plug recesses left from temporary supports of greater than 1-1/2 inches in diameter or least dimension, installed in initial lining for construction purposes.
- C. Where surface offsets between initial liners exceeds 2-1/2 inches, place cement mortar or bush hammer to provide for a smooth transition from one lining to the next.
- D. Remove sharp points and protrusions.

### **3.02 INVERT DRAIN:** Install as shown.

### **3.03 DRAINAGE FABRIC AND SYNTHETIC MEMBRANE:**

- A. Installation sequence:
  - 1. Installation of geotextile with attachment assembly.
  - 2. Welding of geomembrane of attachments.
  - 3. Welding of seams.
  - 4. Testing.
  - 5. Installation of water barrier and filter fabric.
  - 6. Testing.
- B. Attachment of geotextile membrane:
  - 1. Place attachment assemblies to achieve snug fit of geotextile membrane.
  - 2. Provide minimum of two attachments for 10 square feet of waterproofing in the arch and one attachment per 10 square feet in the invert.
  - 3. Provide additional attachments if required to provide support and fit to initial lining.
- C. Provide sufficient scaffolding to allow inspection of installation.
- D. Overlap materials minimum of three inches to form seams
- E. Use radial seams in typical cross-sections unless otherwise approved.
- F. Provide double seams unless single seams are approved.
- G. Provide second layer of geomembrane welded over single seams. Second layer to completely cover single seams.
- H. Where reinforcement is shown, use approved method to detect damage to geomembrane.
- I. Provide attachment for reinforcement without penetration of the geomembrane.
- J. Ensure flush contact between reinforcement spacers and geomembrane.
- K. Provide minimum 1-1/2 inch clearance between items embedded in final lining and geomembrane, except grout pipes.
- L. After the initial cast-in-place liner has cured, cap the drain pipe.
- M. Provide attachment of water barriers at final cast-in-place liner construction joints at locations shown.

- N. Provide attachment of geo-drain filter fabric at weep hole locations.

**3.04 GEOMEMBRANE SEAM TESTING:**

- A. General:
  - 1. Perform tests in presence of Engineer
  - 2. Perform tests as installation progresses. Before installation continues, repair and retest seams that fail tests.
  - 3. Maintain written record for test results, repairs, and retesting.
- B. Double Seams:
  - 1. Test by applying internal air pressure between seams.
  - 2. Test at 30 psi for 10 minutes.
  - 3. Reject seam if pressure falls below 27 psi.
- C. Single Seams (repairs and circular tunnel-structure interface only):
  - 1. Perform visual inspection while running a rounded screwdriver or similar tool along the joint after the weld has cooled.
- D. Water Barrier Welds: Spark test weld for capability of maintaining dielectric integrity at 2,500 volts minimum.
  - 1. Directly behind each single weld between water barrier and membrane, insert one 18 gauge bare copper wire for testing.
  - 2. Test the full length of the water barrier weld unless directed otherwise by the Engineer.
  - 3. Document the welds tested and the number of defects repaired. Provide documentation to the Engineer.
- E. Replace or repair sections of the membrane determined to be defective at no additional cost to the Authority.

**END OF SECTION**

## SECTION 07138

### TUNNEL WATERPROOFING (NATM SYSTEM)

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies furnishing and installing the permanent waterproofing system for the NATM tunnels installed between the shotcrete and the cast-in-place concrete linings.
- B. Related Work Specified Elsewhere:
  - 1. Subway drainage system: Section 02625.
  - 2. Earth tunneling: Section 02416.
  - 3. NATM excavation: Section 02417.
  - 4. NATM shotcrete lining: Section 02426.
  - 5. Cast-in-place concrete: Section 03300.
  - 6. NATM concrete lining: Section 02427.
- C. Definitions:
  - 1. Tunnel waterproofing: Layered system of geomembrane and geotextile installed around the entire circumference of the tunnel between shotcrete and cast-in-place concrete linings to prevent intrusion of groundwater into the interior of the finished structure.
  - 2. Geotextile: Fabric providing protection of the synthetic membrane from sharp projections of the shotcrete surface to which the membrane is applied.
  - 3. Geomembrane: Synthetic waterproofing membrane specifically formulated for sealing underground structures against intruding groundwater and forming an electrical insulative barrier.
  - 4. Water barrier: Base seal waterstop welded to membrane.
  - 5. Sectioning: Water barriers arranged to seal off individual membrane sections.
  - 6. Weepholes: Pipes typically installed near water barrier intersections and invert to drain water in case of leakage. These pipes are also used for repair in case of leakage by remedial grouting.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: D257, D374, D638, D1593, D1777, D1785, D3776, D3787, D4533, D4632.
  - 3. NFPA: 701.
- B. Manufacturer's Qualifications:
  - 1. Select manufacturers who are regularly engaged in the production of similar materials for underground structures.
  - 2. Supply and install only products specifically designed and manufactured for this type of work.
- C. Supervision and Training:
  - 1. Execute installation and testing under direct supervision of an individual with recent, continuous and successful experience in the installation of waterproofing systems for underground structures using membrane materials as specified.
  - 2. Provide trained personnel for installation and testing operations. Ensure that the installer has a minimum of five years experience in the installation of flexible

membranes in underground waterproofing installations. Have installer demonstrate proficiency of each welder in the field for respective approval by the Engineer.

- D. Demonstration Section: Before proceeding with waterproofing installation, completely seal a minimum 30-foot-long demonstration section using materials and methods to be used in the work in accordance with specified requirements.

### **1.03 SUBMITTALS:**

- A. Submit the following for approval in accordance with the General Requirements and with additional requirements as specified for each:
1. Shop Drawings: Include as a minimum:
    - a. Sequence of waterproofing installation relative to construction sequence.
    - b. Details of attachment assembly, connections to waterproofing of adjacent structures, break-out structures, waterproofing at penetrations.
    - c. Layout of sectioning by water barriers including detailed location of weep holes.
    - d. Type and method of membrane protection at termination of work.
    - e. Sheet layout of membrane detailing locations and types of seams.
    - f. Manufacturer's Installation Procedures for:
      - 1) Storage.
      - 2) Handling.
      - 3) Seaming.
      - 4) Attachment.
      - 5) Smooth surfaces.
      - 6) Testing.
      - 7) Installation equipment.
      - 8) Detection of physical damage.
      - 9) Methods of local repair.
      - 10) Special instructions for corners and intersections/interfaces.
      - 11) Sequencing of waterproofing installation relative to formwork and concrete placement.
      - 12) Methods and materials used for prevention and detection of damage to the membrane by the above and any other construction equipment and materials.
  2. Samples:
    - a. Geotextile: One square foot.
    - b. Geomembrane: One square foot including double welded seam one foot long.
    - c. Attachment assembly: Three pieces.
    - d. Protective fabric: One square foot.
    - e. Water barrier: One foot length welded to membrane.
  3. Certifications:
    - a. Certification of compliance with the requirements of this specification.
    - b. Resume of waterproofing installation supervisor.

### **1.04 DELIVERY, STORAGE AND HANDLING:**

- A. Deliver materials and products in labeled packages. Store and handle in compliance with manufacturer's instructions, recommendations and material safety data sheets. Place material on a smooth surface free of rocks or other protrusions which may damage the material. Protect from damage from sunlight, weather, excessive temperatures and construction operations. Remove damaged materials from the site and dispose of in accordance with applicable regulations.

- B. Store flammable materials in a cool, dry area distant from sparks and open flames.

**1.05 JOB CONDITIONS:**

- A. Install waterproofing only after surfaces to which geomembrane and geotextile will be applied have been accepted by the waterproofing installer and the Engineer.
- B. Provide sufficient access to allow for thorough inspection.
- C. Repair sections of the waterproofing determined to be defective by testing or which have been damaged during or after installation at no additional cost to the Authority.
- D. Prior to waterproofing installation, prove the absence of continuing and significant deflection or increase of stress.
- E. Drain off water that may be trapped between waterproofing and shotcrete by means of perforated drain pipes or drain mattings.

**1.06 WARRANTY:**

Provide a warranty for the watertightness of the structure for two years beyond the final work completion date.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. Geotextile: Non-woven polypropylene geotextile of uniform thickness and surface texture with the following minimum physical properties and testing methods:

<u>Property</u>	<u>Testing Method</u>	<u>Minimum Specifications</u>
Thickness (mils)	ASTM D1777	285
Unit Weight (oz./sq. yd.)	ASTM D3776	22
Grab Strength (lbs.)	ASTM D4632	285
Elongation (percent)	ASTM D4632	85
Trapezoidal Tear (lbs.)	ASTM D4533	35
Burst Strength (psi)	ASTM D3787	400
Chemical Resistance	—	pH value 2 to 13

- B. Geomembrane: Polyvinyl chloride (PVC) waterproofing membrane of uniform thickness and surface texture. PVC membrane non-reinforced with the following minimum physical properties under respective testing methods:

<u>Property</u>	<u>Testing Method</u>	<u>Minimum Specifications</u>
Thickness (inch)	ASTM D374	0.079
Ultimate Tensile Strength (lbs./sq. in.)	ASTM D638	2,200
Ultimate Elongation (percentage)	ASTM D638	230
Low Temperature Impact	ASTM D1593	Pass at minus 20C
Chemical Resistance	—	pH value 2 to 13
Flammability	NFPA 701	Self Extinguishing
Dielectric Strength (volts/mil.)	ASTM D257	440 to 465
Dielectric Constant		
60 Hertz	—	3.4 to 3.5
10 <sup>6</sup> Hertz	—	3.3 to 3.4
Power Factor		
60 Hertz	—	0.006 to 0.007
10 <sup>6</sup> Hertz	—	0.030 to 0.040

- C. Attachments: Membrane attachment disk manufactured of membrane-compatible materials with minimum three-inch diameter with one steel washer embedded in disk. Attachment of discs with minimum 1-1/4 inch nails.
- D. Water Barriers: Continuous strip weldable to membrane with six embedment ribs of the following minimum dimensions: 15-inch minimum width, 1-1/2 inch minimum height. Intersections of water barriers pre-fabricated at workshop on site or by manufacturer.
- E. Protective Concrete: Section 03300, minimum class 2,500 psi, thickness as shown.
- F. Weepholes: Three-inch polyvinyl chloride (PVC) pipe schedule 40, ASTM D1785, length as shown.
- G. Invert Drain:
  - 1. PVC pipe: Section 02625.
  - 2. Support: Manufactured of PVC-compatible materials.

### **PART 3 – EXECUTION**

#### **3.01 PREPARATION OF SURFACE:**

- A. Cut off and patch projecting portions of dowels flush with the face of the shotcrete surface and remove temporary supports and hangers installed in shotcrete lining for construction purposes.
- B. Ensure that embedded elements of the shotcrete lining are covered by at least one inch of shotcrete prior to installing geotextile and sealing membrane.
- C. General Smoothness Criteria: Earth Tunneling, Section 02416.

- D. Apply leveling shotcrete to areas that do not conform with the above requirements. Apply shotcrete in accordance with Section 02426.
- E. Remove loose soil and debris.
- F. Repair damaged or spalled surfaces, voids and cracks having depths greater than one inch with shotcrete, quick setting grout, mortar or equal.
- G. Apply four-inch shotcrete layer at support of excavation walls to which geomembrane and geotextile will be applied at transitions to cut-and-cover structures as shown.
- H. Ensure that surfaces are free of oils, grease and gasolines.

### **3.02 GEOTEXTILE AND GEOMEMBRANE:**

- A. General Installation Sequence:
  - 1. Install geotextile with attachments assembly.
  - 2. Weld geomembrane to attachment assemblies.
  - 3. Weld seams.
  - 4. Test seams.
- B. Installation Area:
  - 1. Place geotextile and geomembrane so as to cover the whole waterproofing area as shown.
  - 2. Use radial seams in typical tunnel cross sections unless otherwise directed.
  - 3. Use longitudinal seams at lap between invert and arch section.
- C. Attachment:
  - 1. Place attachment assemblies in surface depressions to achieve tight fit of geotextile.
  - 2. Provide minimum of four attachments per 10 square feet of waterproofing area.
  - 3. Provide additional attachment where necessary to achieve secure support and snug fit to shotcrete lining.
- D. Geomembrane:
  - 1. Provide double hot-wedge welded seams unless otherwise approved.
  - 2. Single Seams: Where single seams are required and approved, weld second layer of geomembrane to completely cover single seams unless otherwise approved.
  - 3. Prior to placement of concrete, re-inspect membrane for possible damages or other detrimental effects to membrane, such as build-up of water behind the membrane, and perform remedial work as required.
- E. Water Barriers and Weepholes:
  - 1. Install weepholes as shown prior to concrete lining placement.
  - 2. As approved, arrange exact location of weepholes. Following concreting, contact grouting and repair grouting, clean weepholes and grout pipes in roof by approved methods and ensure that pipes are in operating conditions.
  - 3. Document at a minimum the following and submit to the Engineer in form of a table:
    - a. Location of weepholes.
    - b. Location of water barriers and size of selections.
    - c. Date of pipe installation.
    - d. Names and signatures of installer and supervisor of sectioning and weepholes.
    - e. Date of concreting and contact grouting.
    - f. Names of workers and supervisors for respective work.

**3.03 INVERT DRAIN:**

- A. Install as shown.

**3.04 CONCRETE REINFORCEMENT AND OTHER EMBEDDED ITEMS:**

- A. Where reinforcement is placed, use approved methods to detect damage of geomembrane due to installation of reinforcement.
- B. Provide minimum of two inches of clearance between embedded items and geomembrane.
- C. Ensure flush contact between reinforcement spacers and geomembrane.

**3.05 TESTING OF GEOMEMBRANE SEAMS:**

- A. General:
  - 1. Perform tests in the presence of the Engineer.
  - 2. Perform tests as installation progresses. Repair and retest seams that failed before continuing installation.
  - 3. Maintain written records of test results, repairs and retesting.
- B. Double Seams: Perform test by applying internal air pressure between seams as follows:
  - 1. Test Pressure: 30 psi.
  - 2. Performance Requirements: Air pressure loss less than 10 percent after 10 minutes.
- C. Single Seams:
  - 1. Including heat welding to water barriers or special fittings
  - 2. Check welds for continuity by either of the following visual inspections:
    - a. Run a rounded screwdriver along the joint after the weld has cooled.
    - b. Blow stream of air under high pressure against the weld and observe opening of the weld. Re-weld and test any discontinuity.
- D. Replace or repair sections of the membrane determined to be defective at no additional cost to the Authority.

**3.06 LEAK REMEDIATION:**

- A. Monitor structure interior by regular inspection for water leakage until the final work completion date. Beyond this date the structure to be inspected by the Authority.
- B. If water leakage exceeds minimum allowable limits as specified in the watertightness criteria in Section 03300, undertake remedial measures consisting of:
  - 1. Grouting through weepholes using suitable grouts, eg. Silangels, Dynagrout or equal within the area of sectioning.
  - 2. Prior to beginning grouting work, submit grouting plan procedure and sample of grouting materials for approval.
  - 3. Establish injection pressure by means of on-site demonstration. Do not exceed structural capacity of the structure.
- C. Do not penetrate or puncture membrane, except for permanent purposes using proven watertightness techniques as approved.

**END OF SECTION**

## SECTION 07165

### METALLIC WATERPROOFING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing metallic waterproofing.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: C33, C144, C150.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Include detailed mixing, application and curing procedures from the metallic-waterproofing compound manufacturer.
  - 2. Certification:
    - a. Certification that materials furnished meet specified requirements and are compatible with each other.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver materials to the jobsite in their original unopened containers clearly labeled with manufacturer's name, brand designation, reference specification number, type and class, as applicable.
- B. Store materials in approved dry area and protect from contact with soil and from exposure to the elements. Keep materials dry.
- C. Handle materials so as to prevent breakage of containers and damage to products.

##### 1.05 JOB CONDITIONS:

- A. Environmental Requirements:
  - 1. Application of metallic waterproofing when ambient temperature is below 50F is prohibited.
  - 2. Do not apply metallic waterproofing until surfaces to be treated are enclosed or protected from excessive temperature changes.
  - 3. Keep water level below surface being treated until completion of curing treatment.

#### PART 2 - PRODUCTS

##### 2.01 MATERIALS:

- A. Portland Cement: ASTM C150, Type I.
- B. Sand Aggregate: ASTM C144 for brush coat; ASTM C33 for protective coat.

- C. Water: Potable.
- D. Metallic Waterproofing Compound: Pulverized iron consisting of not less than 85 percent by weight of metallic aggregate with iron-oxide content not exceeding five percent by weight of iron, and chemical oxidizing agent within minimum of three percent and maximum of five percent by weight of compound.
  1. Compound free of oil, paraffin, bitumen and other foreign substances.
  2. Gradation requirements for iron particles:

Sieve Size	Percent Passing By Weight
20	100
30	95 to 100
40	90 to 100
60	65 to 100
100	45 to 70
200	10 to 25

**PART 3 - EXECUTION**

**3.01 PREPARATION:**

- A. Wire brush surfaces to receive metallic-waterproofing treatment down to firm unspalled surfaces; ensure that surfaces are clean and free from loose materials, debris and deleterious substances such as oil and grease.
- B. Strip and clean construction joints, grooved recesses and intersections of vertical and horizontal surfaces; remove loose material.
- C. Install anchorage items prior to application of waterproofing. Except for anchorage items, obtain approval for completed work prior to attachment of utilities to waterproofed surfaces.

**3.02 TEST AREA:**

- A. Prepare 100-square foot specimen of typical waterproofing application using specified methods and materials.
- B. Location of test area as directed. Waterproofing will be visually and physically examined for bond and loose materials by the Engineer.
- C. Failure of waterproofing to bond or appearance of excessive loose materials constitute grounds for rejection of proposed waterproofing materials and method of application. If test area is rejected, remove applied finish leaving base clean and acceptable for new application.
- D. If necessitated by rejection of original test area, provide additional test areas. Do not proceed with waterproofing work until test area has been approved. Leave in place and open to observation as criteria for waterproofing work specified in this section.

**3.03 APPLICATION:**

- A. Pack grooved recesses and intersections of vertical and horizontal surfaces with waterproofing mortar mixed in proportions of one-part portland cement to two parts sand aggregate, with 25 pounds of waterproofing compound added for each sack of cement. Do not use mortar that has been wet-mixed longer than 45 minutes.
- B. Pack mortar into grooves and finish flush with adjacent surfaces. Finish internal angles to a 1/2-inch cove. Brush-coat construction joints with metallic-waterproofing mortar prior to placement of adjoining concrete.
- C. Saturate surfaces, except cut-back or undercut walls, with water and apply a minimum total amount of 30 pounds for three brush-coats of metallic-waterproofing compound per 100 square feet of surface, mixed and applied in accordance with approved procedure.
- D. Saturate cut-back or undercut walls, with water and apply bond coat of metallic-waterproofing compound and water. Fill walls flush and smooth with portland-cement mortar and metallic-waterproofing compound in proportion of ten pounds of compound to each sack of cement. Fill and patch in layers not exceeding 3/4-inch thickness, work into voids, compact and finish flush with adjacent surfaces.
- E. Accomplish waterproofing work so that surface is uniformly oxidized.
- F. After waterproofing vertical surfaces, apply minimum 3/8-inch thick protective coating consisting of one-part portland cement to two and one-half parts sand aggregate, directly over metallic-waterproofing treatment. Float protective coating to smooth level surface.
- G. Moist-cure metallic waterproofing for seven days minimum in accordance with Section 03300.

**3.04 PROTECTING AND CLEANING:**

- A. Protect finish work during application of waterproofing. Repair or replace damaged finish work as directed.
- B. Remove spots and spattering of waterproofing from finish work and leave entire work area in a condition acceptable to the Engineer.
- C. Remove all waterproofing rubbish from premises and leave spaces in broom-clean condition.

**END OF SECTION**

## SECTION 07170

### BENTONITE WATERPROOFING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing bentonite composite sheet membrane waterproofing and waterstop, including accessories and related items.
- B. Related Work Specified Elsewhere:
  - 1. Cast-In-Place Structural Concrete: Section 03300.
  - 2. Cast-In-Place Architectural Concrete: Section 03331.
  - 3. Seals and Sealants: Section 07900.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Samples:
    - a. Three of each type of the following materials used in the work:
      - 1) Composite sheet membrane waterproofing: 12 inches square.
      - 2) Tapes: Two feet long.
      - 3) Fasteners: Sets of 12.
      - 4) Termination bar: Two feet long.
      - 5) Mastic: One pint container.
      - 6) Waterstop material: Two feet long.
      - 7) Granular bentonite: One pound container
      - 8) Polyethylene sheets: 12 inches square.
      - 9) Primer: One pint container.
      - 10) Protection board: 12 inches long.
  - 2. Manufacturer's Certification: Submit written certification, signed by the manufacturer or authorized representative, per the following requirements:
    - a. Prior to the submittal of shop drawings, certify that the waterproofing materials are compatible with the groundwater and soil characteristics. Perform required groundwater and soil testing to confirm compatibility of materials at no additional cost to the Authority. A written report of acceptability or required modifications to the bentonite mix to suit the subsurface conditions is to be submitted by the manufacturer.
    - b. Certify that the submitted shop drawings and installation instructions correctly describe the waterproofing system to be installed.
    - c. Certify that the materials furnished are compatible with each other.
    - d. Prior to installation, certify that the substrate is in an acceptable condition for membrane installation.
    - e. At completion of the installation, certify that the materials used in the work were in accordance with these Specifications, and that they were installed in accordance with the material manufacturer's installation instructions and recommendations.
  - 3. Complete catalogue cuts for each bentonite material used in the work, including manufacturer's installation instructions and data sheets indicating tensile strength, elongation, puncture resistance, resistance to hydrostatic head, pliability, permability and water migration.
  - 4. Manufacturer's Field Report: Submit copies of project inspection reports confirming proper installation of waterproofing system.

5. Shop Drawings: Submit shop drawings, certified as reviewed and approved by the manufacturer, showing waterstop and waterproofing membrane details at penetrations in the membrane (for pipes, conduits, etc.), corners of structures, ends of the membrane, joints in the structure, and interfaces with adjacent structures. Indicate joint or termination detail conditions, and conditions of interface with other materials. Indicate the sequence of installation of the materials.

### **1.03 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  1. Comply with codes and regulations of jurisdictional authorities.
  2. AASHTO: M171.
  3. ASTM: C272, D146, D226, D412, D449, D543, D638, D751, D781, D1621, D1668, E96, E154.
- B. Qualifications of Applicator:
  1. Furnish evidence from manufacturer that the waterproofing applicator is a qualified applicator of the material to be applied.
- C. Manufacturer
  1. Obtain primary waterproofing materials of each type required from a single manufacturer. Provide secondary materials only as recommended by manufacturer of primary materials.
  2. Arrange for waterproofing system manufacturer to inspect and approve the waterstop and waterproofing membrane installation and to provide job service at no additional cost to the Authority.
  3. Make arrangements with the manufacturer to provide on-site consultation and inspection services to ensure the correct installation of the waterstop and waterproofing membrane at no additional cost to the Authority. Have the manufacturer monitor the waterstop and membrane installation on a full time basis during initial installation period, and at least once a week thereafter, until completion of the waterproofing work.
  4. Have the manufacturer's representative present at the time any phase of the work is started. Apply waterstop and waterproofing membrane only over substrate previously approved by the manufacturer's representative and the Engineer.
  5. Have the manufacturer's representative make periodic visits to the site as work proceeds as necessary for consultation and for expediting the work in the most practical manner.
- D. Preinstallation Conference:
  1. Prior to installation of waterproofing and associated work, meet at project site with waterproofing installer and installers of each component of associated work, including manufacturer's representatives and inspection personnel, to coordinate related requirements with waterproofing work. Review material selections and procedures to be followed in performing work. Perform a sample installation of each of the waterproofing materials. Notify Engineer at least 48 hours before conducting meeting.

### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to the job site in their original unopened containers clearly labeled with manufacturer's name, brand designation, type and class, as applicable.
- B. Store products in approved dry area and protect from contact with soil and from exposure to elements. Keep products dry.

- C. Handle products so as to prevent breakage of containers and damage to products.

**1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  1. Application of waterproofing to surfaces on which ice or frost is visible is prohibited. Keep substrate free of ponded water.
  2. Install and proceed with waterproofing and associated work only when existing and forecasted weather conditions will permit work performance in accordance with manufacturer's recommendations and warranty requirements for specific project requirements.

**1.06 WARRANTY:**

- A. In addition to warranty requirements of the General Provisions, furnish a four-year warranty for a total of five years against defective materials and workmanship.

**PART 2 – PRODUCTS**

**2.01 MATERIALS:**

- A. Polyethylene Sheet: AASHTO M171, clear, eight mils thick, reinforced.
- B. Bentonite Composite Waterproofing Membrane:
  1. Membrane: Multiple component sheet membrane composed of high density polyethylene (HDPE) laminated to bentonite that is coated with a protective layer of spun polypropylene or protected with high-strength woven geotextile. The membrane is to exhibit the following properties:

<u>Property</u>	<u>Test Method</u>	<u>Result</u>
Weight of Sodium Montmorillonite (Bentonite)		one pound per square foot minimum
Thickness of HDPE	—	20 mils
Total thickness of membrane	—	180 mils plus or minus 10 mils
Tensile strength	ASTM D412	4,000 psi
Ultimate elongation	ASTM D638, Type 4	700 percent
Puncture resistance	ASTM E154	160 pounds
Resistance to hydrostatic head; 150 feet of water	ASTM D751 Method A	Zero leakage
Pliability; 180 degree bend over one-inch mandrel at minus 25F; 10,000 cycles	ASTM D146	No cracks
Permeance	Membrane applied	$2.7 \times 10^{-13}$ cm/sec

to porous stone and placed in permeameter. Pressure increased to equivalent of 150 foot water head.

Chemical resistance                      ASTM D543                      No damage

C. Joint Tape:

1. Self-adhering, four-inch wide, minimum 60-mils thick, multi-purpose rubberized asphalt membrane, laminated to a polyethylene film reinforcing. Use for permanently sealing the seams. Compatible with the membrane system used.

<u>Property</u>	<u>Test Method</u>	<u>Result</u>
Tensile strength	ASTM D412C	250 psi
Elongation	ASTM D412C	350 percent
WVT at 80F	ASTM E96B	0.1 maximum gr/sq.ft./hr./in. Hg
Peel adhesion	—	Joint tape is applied over the seams of membrane. Wipe membrane clean and free from dust or moisture.
Pliability	ASTM E96b	Passes at minus 25F
Membrane	ASTM E154	40 pound minimum
Film	ASTM D781	250 inches per ounce
Burial (16 weeks)		unaffected
Hydrostatic head	—	150 feet minimum

D. Termination Bar:

1. Aluminum alloy bar, factory pre-punched, designed for use as termination bar, edge protector or caulk bar for membranes and systems specified.

E. Primer for Tapes and Waterstops:

1. Bonding agent for use as primer at concrete, masonry, metal and wood surfaces and as recommended by manufacturer.

F. Water Barrier Tape:

1. Tape consisting of a layer of bentonite, approximately 3/16-inch thick by one-inch, three-inches and six-inches wide, sandwiched between an open woven mesh and a spun bond polypropylene fabric, with one side coated with pressure sensitive adhesive and release paper.

G. Mastic:

1. Thick compound of expandable mastic containing not less than 55 percent high swelling, Wyoming-type sodium montmorillonite (bentonite) for use at voids, honeycombs, penetrations, tie-backs, cants and similar conditions.

- H. Granular Bentonite:
  - 1. High quality, Wyoming-type, sodium montmorillonite (bentonite), similar to material used in membrane specified above, for use in forming coves and for filling voids during installation of waterproofing systems. Granular, high-swelling Wyoming-type bentonite weighing 60 pounds per cubic foot minimum, and capable of expanding a minimum of 10 times its apparent dry volume when added to water.
  - 2. Granule size: 90 percent minimum passing Size 20 mesh with less than five percent passing Size 200 mesh.
- I. Bentonite Composition Waterstop:
  - 1. Multiple composite waterstop cube, one-inch wide by 3/4-inch high, of laminated sodium montmorillonite (bentonite) reinforced with two layers of polyester netting and non-woven polypropylene, with one side coated with pressure sensitive adhesive and release paper, or a bentonite and butyl rubber based waterstop.
- J. Fasteners:
  - 1. Case hardened nails with enlarged head or caps to hold membrane.
  - 2. Head or cap to be one-inch in diameter, minimum.
  - 3. Fluted shank of appropriate length to fasten waterproofing membrane or joint seal.
- K. Asphalt: ASTM D449, Type A.
- L. Fibrous-Glass Membrane: ASTM D1668, Type I or III.
- M. Asphalt-Saturated Felt: ASTM D226, Type I.
- N. Protection Course Material:
  - 1. Mud slab and concrete protection course: Section 03300, Class 3500.
  - 2. Protection Board:
    - a. Semi-flexible board, five-ply or more, composed of asphaltic core sealed under heat and pressure between two liners of asphalt-saturated kraft paper or felt, bonded to independent waterproofing during the manufacturing process. Thickness as recommended by manufacturer.
    - b. Extruded, rigid polystyrene-foam board, one-inch thick. Compressive strength 25-psi minimum, ASTM D1621; water absorption 0.1 percent, ASTM C272.
- O. Protection Board Adhesive: As recommended by the protection board manufacturer.

## **PART 3 – EXECUTION**

### **3.01 INSPECTION:**

- A. General: Inspect surfaces to receive waterproofing membrane system. Ensure that voids greater than 3/8-inch are filled with grout or with mastic, and that sharp projections are removed.
- B. Do not install membrane or system in standing water. Have accidental water accumulation pumped out and proper drainage ensured. Restore the bentonite waterproofing system if damage occurs. Comply with temperature limitations for each product.
- C. Vacuum or broom clean surfaces to receive tape, adhesive products or primers. Ensure that such surfaces are free of dust, dirt, snow, ice and other contaminants not compatible with applied products.

### 3.02 PREPARATION:

- A. Layout: Layout project to determine anticipated conditions prior to start of work. Note termination and penetration conditions and determine preferred methods for creating waterproof envelope.
- B. Voids: Fill voids greater than 3/8-inch with mastic and remove sharp projections in substrate.
- C. Coves: Form coves, one-inch to two-inches, with granular bentonite at intersections of walls and footings. Form coves with mastic at vertical inside corners, under ledges and at penetrations.
- D. Priming: Prime surfaces immediately prior to application of tapes and waterstops with specified primer. Prime surfaces, including concrete, masonry, metal and wood, to properly prepare areas to receive waterstop, taped applications and terminations.

### 3.03 INSTALLATIONS:

- A. General: Conform to manufacturer's installation instructions and the following: If the waterproofing membrane is damaged during installation, overlap the damaged area with another piece of waterproofing membrane, providing the minimum overlap around the damaged area per the manufacturer's recommendations. Fasten the overlap piece of membrane and seal along its edges per the manufacturer's recommendations.
- B. Below Slab-On Grade:
  - 1. Ensure that mud slab surfaces are level and prepared as specified above. Apply polyethylene slip sheet, minimum eight mils thick, with seams lapped minimum six inches prior to installing membrane.
  - 2. Place membrane over prepared surfaces in such a manner as to ensure minimum handling. Fit material closely and seal around inlets, outlets and other projections. Follow installation procedures as recommended by membrane manufacturer.
  - 3. Install membrane with HDPE side up with edges overlapped a minimum of six inches. Staple joints every eight inches on center and wipe joint surfaces clean and free of dirt, dust, moisture and other foreign material. Apply joint tape to joint areas and press together immediately. Compress membrane and joint sealant tape with roller using 10 psi nominal pressure. Remove wrinkles, holidays and fishmouths. Carefully inspect seams and reseal voids. Install only as much membrane as can be covered in one day.
  - 4. Protect membrane from damage caused by rebar chairs with sharp edges and construction operations by placing three-inch concrete protection course, or per manufacturer's recommendation.
  - 5. Pour granular bentonite, adhere water barrier tape or bentonite composite waterstop, and trowel mastic around penetrations as directed by the manufacturer. Place custom fitted collar of membrane as directed by the manufacturer.
  - 6. Extend the waterproofing membrane 12 inches up or beyond the perimeter slab form. Use this excess material to overlap with wall waterproofing membrane.
  - 7. Inspect and replace damaged waterproofing material before placing concrete.
- C. Backfilled Walls:
  - 1. General: Place membrane, with the HDPE side facing installer, over prepared surfaces, vertically and horizontally as applicable for conditions, to ensure minimum handling of products. Fit materials closely and seal around inlets, outlets and other

- penetrations and projections. Comply with installation procedures as recommended by membrane manufacturer.
2. Field Joints: Install membrane shingle fashion to prevent intrusion of water. Overlap a minimum of six inches typically, depending on installation conditions.
    - a. Vertical Seam Application: Nail at 24 inches to 48 inches on center as recommended by manufacturer for conditions indicated. Tape seams with joint tape.
    - b. Horizontal Seam Applications: Nail at 18 inches on center, maximum. Tape seams with joint tape as specified above.
  3. Penetrations: Prior to pouring the wall concrete, wrap water barrier tape or bentonite composite waterstop around the pipe or sleeve within the wall area as recommended by the manufacturer. Cut membrane to fit snugly at penetration. Form cove around penetrations with specified mastic. Provide site fabricated collar made from waterproofing membrane to fit tightly around penetration and press firmly to embed fully in mastic. Fasten collar and tape in place.
  4. Termination: Terminate membrane applications as shown and as follows:
    - a. Install membrane into reglet as shown and fasten termination bar at top of membrane. Position to properly apply elastometric sealant, specified in Section 07900, Seals and Sealants. Space fasteners as eight inches on center. Confirm suitability of substrate to accept fasteners.
    - b. Protect membrane from damage by placing protection board against the membrane prior to backfilling operations in accordance with manufacturer's recommendations.
- D. Underground Roof Slabs:
1. General: Place membrane over prepared surfaces in such a manner as to ensure minimum handling. Fit closely and seal around inlets, outlets and other penetrations and projections. Follow installation procedures as recommended by membrane manufacturer.
  2. Install membrane with bentonite side down, facing roof slab, in shingle fashion. Start installation at lowest point.
  3. Field Joints: Provide lapped and sealed joints in field using joint tape. Form lapped joints by lapping edges a nominal six inches, unless larger overlap is recommended by membrane manufacturer. Wipe contact surfaces of pieces clean and free of dust, dirt, moisture and other foreign materials. Apply joint tape to joint area and press together immediately. Compress membrane and joint tape with roller using 10 psi nominal pressure. Remove wrinkles, holidays and fishmouths. Carefully inspect seams and reseal voids.
  4. Penetrations: Prior to pouring the roof concrete, wrap water barrier tape or bentonite composite waterstop around the pipe or sleeve within the slab area as recommended by the manufacturer. Install membrane around penetrations. Liberally apply mastic or granular bentonite around penetration. Install site fabricated collar, made from waterproofing membrane, fit tightly around penetration and tape in place.
  5. Transitions and Terminations: Comply with manufacturer's instructions for conditions, applications, transitions and terminations.
  6. Protect membrane from damage by placing three inch concrete protection course.
- E. Lagging and Shoring Applications:
1. General: Place membrane over prepared surfaces in such a manner as to ensure minimum handling. Fit closely and seal around inlets, outlets and other projections. Cover openings larger than one inch with minimum 1/4-inch thick plywood, or fill with grout. Follow installation procedures as recommended by membrane manufacturer.
  2. Membrane Installation: Install membrane as directed by manufacturer, with bentonite surface facing installer. When installed, prior to placement of concrete against the bentonite face, secure membrane and accessories to prevent

displacement or damage. Start installation at low point and install shingle fashion to prevent intrusion of water with minimum 12 inches overlap. Install nails only at seams as described above under Backfilled Walls. Apply mastic over the nail heads and staples. Close fishmouths, blousing and holidays with staple hammer at four inches on center.

3. Penetrations: Trowel apply mastic at penetrations and other locations to provide a complete and proper waterproofing envelope. Furnish and install site fabricated collar made from waterproofing membrane to fit tightly around penetration and press firmly to embed fully in mastic. Fasten collar in place. Wrap water barrier tape or bentonite composite waterstop around pipe or sleeve within the wall area prior to pouring the concrete, as recommended by the manufacturer.
  - a. At special conditions, including but not limited to soldier piles and beams, construction joints, pipe penetrations and other conditions, based on manufacturer's printed product data, apply water barrier tape.
4. Transitions and Terminations: Comply with the manufacturer's specific instructions for special conditions, applications, transitions and terminations.
5. After membrane installation, drape polyethylene sheets with seams lapped a minimum of six inches over membrane and fasten securely. Immediately before or concurrently with placement of concrete, remove sheets, exposing membrane.

F. Joints:

1. Waterproof contraction and construction joints at exterior walls and slabs using PVC waterstop, composite bentonite or bentonite composite water barrier tape as shown.
2. Trowel smooth the joint surfaces where bentonite composite waterstop is to be installed. If the surface becomes roughened during the preparation of a bonded joint per Section 03300, install mastic prior to installing the bentonite composite waterstop.
3. Install primer and nail bentonite composite waterstop in place at 12 inches on center as recommended by the manufacturer.
4. Do not install bentonite composite waterstop in wet conditions except as recommended by the manufacturer.

**3.04 PROTECTION OF WATERPROOFED SURFACES:**

- A. Install protection course as soon as practicable after waterproofing membrane is placed. Do not place loads on exposed waterproofing membrane. Traffic on exposed waterproofing membrane is prohibited.
- B. Provide temporary protection as required pending installation of permanent protection.
- C. Exercise care in placing protection course against waterproofing membrane so as not to break, tear, puncture or otherwise damage waterproofing membrane.
- D. Protect waterproofing surfaces as shown and with the following:
  1. Concrete: Place concrete protection course and mud slab in accordance with the applicable requirements of Section 03300 and as shown.
    - a. Protection Board: Affix protection board to membrane surface by butting and taping, or lapping and taping, in accordance with manufacturer's written instructions and as approved.

**3.05 REPAIR OF LEAKS:**

- A. Repair leak areas by means of a bentonite slurry, epoxy injection or both methods to provide impervious and watertight envelope around affected areas.

- B. Pump bentonite slurry toward outside of structure through drilled holes, at a pressure not exceeding 50 psi, to create waterproof layer.
- C. Submit repair schedule and methods for approval before proceeding with work.

**END OF SECTION**

**SECTION 07180**  
**TRAFFIC COATINGS**

**PART 1 - GENERAL**

**1.01 DESCRIPTION:**

- A. This Section includes traffic coatings for the following applications:
  - 1. Vehicular traffic.
- B. Related Sections include the following:
  - 1. Structural Precast Concrete - Section 03331

**1.02 SUBMITTALS**

- A. Product Data: For each product indicated.
- B. Shop Drawings: Show extent of each traffic coating. Include details for treating substrate joints and cracks, flashings, deck penetrations, and other termination conditions. Include layout of traffic striping and markings.
- C. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors, textures, and patterns available for each type of product indicated.
- D. Samples for Verification: For each type of traffic coating required, prepared on rigid backing and of same thickness and material indicated for the Work.
  - 1. Provide stepped samples on backing large enough to illustrate build-up of traffic coatings.
- E. Material Certificates: Signed by manufacturer certifying that traffic coatings comply with requirements, based on comprehensive testing of current product formulations within the last three years.
- F. Maintenance Data: To include in maintenance manuals specified in Division 1. Identify substrates and types of traffic coatings applied. Include recommendations for periodic inspections, cleaning, care, maintenance, and repair of traffic coatings.

**1.03 QUALITY ASSURANCE**

- A. Installer (Applicator) Qualifications: An experienced applicator who has specialized in installing work similar in material, design, and extent to that indicated for this Project and who is acceptable to manufacturer.
- B. Source Limitations: As follows:
  - 1. Use traffic coatings of a single manufacturer.
  - 2. Obtain primary traffic coating materials, including primers, from traffic coating manufacturer. Obtain secondary materials including aggregates, sheet flashings, joint sealants, and substrate repair materials of type and from source recommended by traffic coating manufacturer.
- C. Fire-Test-Response Characteristics: For traffic coatings as follows:
  - 1. Fire-response testing was performed by UL, ITS, or another independent testing and inspecting agency that is acceptable to authorities having jurisdiction and that performs testing and follow-up services.

2. Provide materials identical to those of traffic coatings tested according to ASTM E 108 for deck type and slopes indicated and that comply with requirements for roof-covering Class indicated.
- D. Mockups: The Engineer will select one representative surface for each traffic coating and each substrate to receive traffic coatings. Apply each coating to at least 200 sq. ft. 20 sq. m of each substrate to demonstrate surface preparation, joint and crack treatment, thickness, texture, color, and standard of workmanship.
1. Remove and reapply mockups until they are approved by The Engineer.
  2. Keep approved mockups undisturbed during construction as a standard for judging completed traffic coatings. Undamaged mockups may be incorporated into the Work.

#### **1.04 DELIVERY, STORAGE, AND HANDLING**

- A. Deliver materials in original packages and containers with seals unbroken and bearing manufacturer's labels showing the following information:
1. Manufacturer's brand name.
  2. Type of material.
  3. Directions for storage.
  4. Date of manufacture and shelf life.
  5. Lot or batch number.
  6. Mixing and application instructions.
  7. Color.
- B. Store materials in a clean, dry location protected from exposure to direct sunlight. In storage areas, maintain environmental conditions within range recommended in writing by manufacturer.

#### **1.05 PROJECT CONDITIONS**

- A. Environmental Limitations: Apply traffic coatings within the range of ambient and substrate temperatures recommended in writing by manufacturer. Do not apply traffic coatings to damp or wet substrates, when temperatures are below 40 deg F 5 deg C, when relative humidity exceeds 85 percent, or when temperatures are less than 5 deg F 3 deg C above dew point.
1. Do not apply traffic coatings in snow, rain, fog, or mist, or when such weather conditions are imminent during the application and curing period. Apply only when frost-free conditions occur throughout the depth of the substrate.

#### **1.06 WARRANTY**

- A. General Warranty: Special warranty specified in this Article shall not deprive Owner of other rights Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.
- B. Special Warranty: Written warranty, signed by traffic coating manufacturer agreeing to repair or replace traffic coatings that do not comply with requirements or that deteriorate during the specified warranty period. Warranty does not include deterioration or failure of traffic coating due to unusual weather phenomena, failure of prepared and treated substrate, formation of new substrate cracks exceeding 1/16 inch 1.6 mm in width, fire, vandalism, or abuse by snowplow, maintenance equipment, and truck traffic.
1. Deterioration of traffic coatings includes, but is not limited to, the following:
    - a. Adhesive or cohesive failures.
    - b. Abrasion or tearing failures.

- c. Surface crazing or spalling.
  - d. Intrusion of water, oils, gasoline, grease, salt, deicer chemicals, or acids into deck substrate.
- C. Warranty Period: Five years from date of Substantial Completion.

## **PART 2 - PRODUCTS**

### **2.01 MATERIALS**

- A. Physical Requirements: Provide traffic coatings complying with ASTM C 957.
- B. Material Compatibility: Provide primers; base, intermediate, and top coats; and miscellaneous materials that are compatible with one another and with substrate under conditions of service and application, as demonstrated by the manufacturer based on testing and field experience.

### **2.02 TRAFFIC COATING**

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Dura-Deck 800V ; Pecora Corporation.
- B. Primer: Manufacturer's standard factory-formulated primer recommended for substrate and conditions indicated.
- C. Preparatory and Base Coats: Single- or multicomponent aromatic liquid urethane elastomer.
- D. Intermediate Coat: Single- or multicomponent aromatic liquid urethane elastomer.
- E. Top Coat: Single- or multicomponent aromatic liquid urethane elastomer.
  - 1. Color: As selected by The Engineer from manufacturer's full range.
- F. Component Coat Thicknesses: As recommended by manufacturer for substrate and service conditions indicated.
- G. Aggregate: Uniformly graded washed silica sand of particle sizes, shape, and minimum hardness recommended in writing by traffic coating manufacturer.
  - 1. Spreading Rate: As recommended by manufacturer for substrate and service conditions indicated.
    - a. Top Coat: As required to achieve slip-resistant finish.
- H. Fire-Test-Response Characteristics: Class A roof covering per ASTM E 108.

### **2.03 MISCELLANEOUS MATERIALS**

- A. Sheet Flashing: Sheet material recommended by manufacturer.
- B. Adhesive: Manufacturer's recommended contact adhesive.
- C. Reinforcing Strip: Manufacturer's recommended fiberglass mesh.
- D. Traffic Paint: Alkyd-resin ready mixed, complying with AASHTO M 248.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION**

- A. Examine substrates, with Applicator present, for compliance with requirements and for other conditions affecting performance of traffic coatings.
  - 1. For the record, prepare written report, endorsed by Applicator, listing conditions detrimental to performance.
  - 2. Verify compatibility with and suitability of substrates.
  - 3. Begin coating application only after minimum concrete curing and drying period recommended by traffic coating manufacturer has passed, after unsatisfactory conditions have been corrected, and after surfaces are dry.
  - 4. Verify that substrates are visibly dry and free of moisture. Test for moisture by method recommended in writing by manufacturer.
  - 5. Application of coating indicates acceptance of surfaces and conditions.

### **3.02 PREPARATION**

- A. Clean and prepare substrates according to manufacturer's written recommendations to produce clean, dust-free, dry substrate for traffic coating application.
- B. Mask adjoining surfaces not receiving traffic coatings, deck drains, and other deck substrate penetrations to prevent spillage, leaking, and migration of coatings.
- C. Concrete Substrates: Mechanically abrade concrete surfaces to a uniform profile according to ASTM D 4259. Do not acid etch.
  - 1. Remove grease, oil, paints, and other penetrating contaminants from concrete.
  - 2. Remove concrete fins, ridges, and other projections.
  - 3. Remove laitance, glaze, efflorescence, curing compounds, concrete hardeners, form-release agents, and other incompatible materials that might affect coating adhesion.
  - 4. Remove remaining loose material to provide a sound surface, and clean surfaces according to ASTM D 4258.

### **3.03 TERMINATIONS AND PENETRATIONS**

- A. Prepare vertical and horizontal surfaces at terminations and penetrations through traffic coatings and at expansion joints, drains, and sleeves according to ASTM C 1127 and manufacturer's written recommendations.
- B. Provide sealant cants at penetrations and at reinforced and nonreinforced deck-to-wall butt joints.
- C. Terminate edges of deck-to-deck expansion joints with preparatory base-coat strip.
- D. Install sheet flashings at deck-to-wall expansion and dynamic joints, and bond to deck and wall substrates according to manufacturer's written recommendations.

### **3.04 JOINT AND CRACK TREATMENT**

- A. Prepare, treat, rout, and fill joints and cracks in substrates according to ASTM C 1127 and traffic coating manufacturer's written recommendations. Before coating surfaces, remove dust and dirt from joints and cracks according to ASTM D 4258.
  - 1. Comply with recommendations in ASTM C 1193 for joint-sealant installation.

### **3.05 TRAFFIC COATING APPLICATION**

- A. Apply traffic coating material according to ASTM C 1127 and manufacturer's written recommendations.
  - 1. Start traffic coating application in presence of manufacturer's technical representative.
  - 2. Verify that wet film thickness of each component coat complies with requirements every 100 sq. ft/9 sq. m.
  - 3. Apply traffic coatings to prepared wall terminations and vertical surfaces to height indicated and omit aggregate on vertical surfaces.
  
- B. Apply traffic paint for striping and other markings with mechanical equipment to produce uniform straight edges. Apply at manufacturer's recommended rates for a 15-mil/0.38-mm minimum wet film thickness.

**END OF SECTION**

## SECTION 07210

### BUILDING INSULATION

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing building insulation.
- B. Related Work Specified Elsewhere:
  - 1. Wood preservation treatment: Section 06075.
  - 2. Built-Up Roofing: Section 07515.
  - 3. Flashing and Sheet Metal: Section 07600.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Include manufacturer's material, handling, adhesive-mixing and application instructions for each type of product used in the work.
    - b. Woodnailers, cant strips.
    - c. Each tapered and flat roof insulation system.
      - 1) Show location and spacing of wood nailers and cants that are required for securing insulation and for back nailing of roofing felts. Show a complete description for the procedures for the installation of each phase of the system indicating the type of materials thicknesses, identity codes, sequence of laying insulation, special methods for cutting and fitting of insulation, and special precautions. The drawings shall be based on installation of the insulation in conjunction with the roofing system specified in Section 07515.
  - 2. Samples:
    - a. Three of each type of the following materials used in the work:
      - 1) Insulation: 12- inch square units; pint container for loose fill.
      - 2) Adhesive: Pint containers.
      - 3) Fasteners: Six of each type.
      - 4) Asphalt: Pint containers.
      - 5) Vapor Barrier: 12 inches square.
      - 6) Cant strip: 12 inches long.
  - 3. Certification:
    - a. Submit certification from manufacturer of insulation verifying that insulation applicator is approved by manufacturer, and has successfully performed at least three satisfactory insulation installations using methods and materials similar to those specified.
    - b. Certification that materials furnished meet specified requirements and are compatible with each other.
  - 4. Test Reports:
    - a. Submit flame spread and smoke developed ratings in accordance with ASTM E84.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:

1. Comply with codes and regulations of the jurisdictional authorities.
2. ASTM: C516, C518, C549, C552, C665, C728, C1289, D41, D226, D312, D2626, D4586, E84.
3. FM: A/S4470, P7825.
4. FS: HH-I-1972/3.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to jobsite in their original unopened containers or wrappings clearly labeled with manufacturer's name and brand designation, referenced specification number, type, class and rating as applicable.
- B. Store products in approved dry area and protect from contact with soil, exposure to the elements and temperatures lower than 40F or higher than 150F. Keep products dry; store rolled goods standing on end.
- C. Handle products so as to prevent breakage of containers and damage to products.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  1. Application of roof insulation when ambient temperature is lower than 40F or when ice, frost or dampness are visible on the roof decks is prohibited.
  2. Maintain temperature of 55F minimum in structure for 48 hours prior to, during and 48 hours after application of wall insulation.
- B. Allowable Roof Loads:
  1. During insulation application do not use equipment of weight which exceeds allowable roof load.
- C. Coordinate insulation work with related roofing work.

### **PART 2 - PRODUCTS**

#### **2.01 ROOF INSULATION MATERIALS:**

- A. General: Use roof insulation materials acceptable to the roofing manufacturer. See related roofing specifications in other sections.
- B. Insulation Board: One of the following materials for which installed thickness will produce overall average thermal resistance of R19.5, including decrease in thermal resistance value due to aging; and which is labeled and classified as a roof deck construction material by UL for use in Fire-Classified metal roof deck assemblies (TGKX), or by FM for use in Class-1 metal-roof-deck construction.
  1. Composite polyisocyanurate (including polyurethane) board, ASTM C1289, Type III, factory faced with perlite insulation board on one side and asphalt-saturated felt on the other.
  2. Perlite board, ASTM C728, Type 1; except with 35-psi compression resistance at five percent consolidation, and with integral factory-treatment designed to improve bond with built-up roofing membranes.
- C. Tapered Insulation Board: Where roof slope through the use of tapered insulation is required, use approved insulation board as specified above, but factory fabricated so as to provide smooth drainage inclines (1/8-inch, 1/4-inch and 1/2-inch per 12 inches), as shown.
- D. Asphalt Primer: ASTM D41.

- E. Steep Asphalt: ASTM D312, Type III, or IV.
- F. Asphalt-Saturated Felt: ASTM D226, Type I.
- G. Asphalt Base Sheet: ASTM D2626.
- H. Asphalt Cement (Asbestos-Free): ASTM D4586.
- I. Asphalt for Glaze Coats: ASTM D312.
- J. Adhesive: Manufacturer's standard.
- K. Wood Nailers and Edges: Preservation treated per Section 06075.
- L. Cant Strips and Tapered Edge Strips: Pre-fabricated from urethane or mineral aggregate board.
- M. Nails and Tin Caps for Vapor Barriers: 11-gauge, annular-thread, 3/8-inch head, galvanized roofing nails and flat-disc galvanized-tin caps, 1-3/8 inch minimum diameter or galvanized combination nails and caps with one-inch heads.
- N. Insulation Nails: Types standard with insulation manufacturer.
- O. Clips and Fasteners: Types standard with metal-roof deck manufacturer; stainless steel or zinc coated, 18-gauge minimum.

## **2.02 WALL INSULATION MATERIALS:**

- A. Batt Insulation:
  1. Fibrous flexible blankets faced with a reinforced foil-kraft facing vapor retarder.
  2. Complies with ASTM C665, type III, Class B, Category 1.
  3. Fire hazard classification rating of 25/50 or less, per ASTM E84.
  4. Vapor Barrier Facing: Perms maximum, 0.1 when tested in accordance with ASTM C518.
  5. Thermal Resistance Minimum: R value of II except where indicated otherwise on the drawings. Thickness as indicated on drawings.
- B. Loose-Fill Insulation:
  1. Perlite: ASTM C549, Type IV (water-repellant and dust-control treated).
  2. Vermiculite: ASTM C516, Type II (water-repellant treated), Premium Grade..

## **2.03 PERIMETER AND CAVITY WALL INSULATION:**

- A. Rigid Board types of cellular glass or polystyrene insulation with 15 psi compressive strength.
  1. Cellular glass (Foamglass): ASTM C552. Minimum R value: 5.0 per inch of thickness
  2. Polystyrene: ASTM C578, Minimum R value: 4.35 per inch of thickness with density of 1.0 lbs. Per cubic foot.
- B. Adhesive and Fastenings: As recommended by the manufacturer.
- C. Insulation inserts for concrete masonry units cores.

## **PART 3 - EXECUTION**

### 3.01 PREPARATION:

- A. Prepare surfaces smooth, dry, clean, and free of projections, oil, grease, wax, rough mortar, debris and other substances that might prevent proper application of insulation.
- B. Allow decks and wall surfaces to dry thoroughly before application of insulation. Test for dampness per manufacturer's recommendations.
- C. Cut mortar joints flush with masonry walls. Remove fins and projections left after removal of concrete forms.
- D. Back plaster walls with cement mortar, if necessary to obtain smooth surfaces.

### 3.02 APPLICATION OF ROOF INSULATION:

- A. General Requirements for Application:
  - 1. Apply insulation in direct contact with roof deck or over vapor barrier, as shown. Keep roof-insulation materials dry before, during and after application. Place perlite side of composite insulation face up.
  - 2. Apply insulation to deck so that continuous longitudinal joints are parallel to short dimension of roof; stagger cross joints by starting alternate courses with half-size insulation boards. Keep insulation 1/2-inch clear of vertical surfaces.
  - 3. When using multiple layers of insulation, stagger the joints of each succeeding layer in both directions with respect to layer below. Embed succeeding layers firmly in solid mopping of steep asphalt.
  - 4. Mop sufficient area to provide complete embedment of one board at a time.
  - 5. Except for strip-mopping on metal decks, use 25 pounds minimum of asphalt per 100 square feet of roof deck for mopping each layer of insulation in place.
  - 6. Provide treated-wood nailers at edges of roofs and at intersections with vertical surfaces. Provide additional treated-wood nailers at necessary intervals for nailing insulation on non-nailable decks or for nailing roofing felt.
  - 7. Do not heat steep asphalt above 450F. Do not heat asphalt used for glaze coats above 400F. Apply steep asphalt at no less than 350F. Apply glaze coat at no less than 325F.
- B. Application on Concrete Decks:
  - 1. Completely cover concrete decks with asphalt primer at minimum rate of one gallon per 100 square feet of roof surface.
  - 2. Vapor barrier:
    - a. Provide vapor barrier consisting of two plies of asphalt-saturated felt with each ply lapped not less than 19 inches and mopped-in with steep asphalt. Vapor barrier, consisting of one layer of asphalt base sheets and weighing not less than 35 pounds minimum per 100 square feet, may be provided in lieu of two felt plies. Lap base sheets not less than four inches at sides and ends; solidly mop-in with steep asphalt.
    - b. Mop-in vapor barriers at rate of 25 pounds minimum of steep asphalt per 100 square feet. Ensure that vapor barriers are free of wrinkles and buckles. Press air bubbles out to obtain proper adhesion between surfaces.
    - c. At walls, edges and vertical projections, extend vapor barrier six inches to form lap to be wrapped around edge of insulation.
  - 3. Apply insulation as specified under general requirements for application.
  - 4. If roof slope exceeds one inch per foot, provide wood nailers for nailing insulation to roof deck. Use six nails minimum per eight square feet of insulation.
- C. Application on Steel Decks:

1. Apply insulation so that joints occur on solid bearing surfaces only rather than over open ribs. Apply insulation of the indicated thickness and as required to achieve the roof slopes indicated.
  2. Before insulation is installed, uniformly strip-coat high sections of steel deck with asphalt primer using 1/2-gallon minimum per 100 square feet of roof surface. Allow primer to dry.
  3. Strip-mop high sections of deck using not less than 12 pounds of steep asphalt per 100 square feet of roof surface. Do not permit asphalt to flow into ribs or flutes of decking.
  4. Place insulation while asphalt is still hot and fluid. When multiple layers of insulation are used, mop-in second layer and succeeding layers as specified under general requirements for application.
  5. Fastening of insulation on steel decks:
    - a. If roof slope exceeds one inch per foot, supplement asphalt moppings with mechanical fasteners. Where mechanical fastening is required, provide approved steel-deck, manufacturer's standard, nonpiercing, double-prong steel clips designed to fit into ribs of decking.
    - b. Provide fastener of length necessary to accommodate thickness of insulation and with holding power 120 pounds minimum per fastener.
    - c. Provide clips at the rate of 25 clips minimum per 100 square feet.
- D. Cant Strips and Tapered Edge Strips:
1. Cant strips:
    - a. Where shown or specified, provide 45-degree cant strips at intersections of roof with vertical surfaces extending above roof. Place cant strips on insulation and fit flush against vertical surfaces.
    - b. Where possible, nail cant strips to adjoining surfaces. For installation against non-nailable materials, place cant strips in heavy mopping of steep asphalt or set in asphalt cement.
    - c. Do not install projections, such as vent pipes and braces, through cant strips or within 10 inches from cant strips.
  2. Tapered edge strips:
    - a. Where shown or specified, provide tapered edge strips in right angle formed by junction of roof and wood nailing strips that extend above roof level. Fit strips flush against vertical surfaces of wood nailing strips.
    - b. Where possible, nail edge strips to adjoining surfaces. Where installed against non-nailable materials, apply strips in heavy mopping of steep asphalt or set in asphalt cement.
- E. Protection:
1. Cover each day's application of insulation, which cannot be roofed over, with at least one glaze coat of hot bitumen.
  2. Protect open ends of each day's work with temporary water cut-offs; remove cut-offs when work is resumed.
  3. Protect open spaces between insulation and parapets or other walls and spaces at curbs, scuttles, expansion joints and similar locations until permanent roofing and flashing is applied. Storing, walking, wheeling or trucking directly on insulation or on roofed surfaces is prohibited; provide smooth, clean board or plank walkways, runways and platforms as necessary.
  4. Limit storage loads on platforms and wheeling loads to 40 psf uniformly distributed. Limit size and weight of mechanical equipment used for insulation work so that deflection of roof deck under its use does not exceed 1/240 of deck span.

### **3.03 APPLICATION OF MASONRY-CELL WALL INSULATION:**

- A. Follow manufacturer's recommended installation practices.
- B. Pour loose-fill insulation into cells of concrete masonry units as masonry work progresses. Use approved procedures to ensure complete filling of cells.
- C. Minimize free fall impact and dust formation.

**3.04 APPLICATION OF BATT INSULATION:**

- A. The vapor barrier facing shall face toward the warm-in-winter side of the space.
- B. Lay batts on top of soffit tightly butted together.
- C. Attach wall mounted batts with, mechanical fasteners as required for permanent installation.

**3.05 APPLICATION OF PERIMETER CAVITY WALL INSULATION:**

- A. Secure vertical insulation with mechanical fasteners sufficient to permanently retain all insulation in place during subsequent construction operations.
- B. Fitted with tight butt joints with openings for penetrations nearly cut for tight fit.
- C. Placed just prior to subsequent construction operations to prevent damage of insulation left exposed. Coordinate with masonry work. Prevent damage during placement of fill and compaction or concrete against insulation.
- D. Place insulation in concrete masonry unit cores at plant prior to job site delivery.

**3.06 CLEAN-UP:**

- A. Clean up rubbish and debris caused by this work and remove from site.
- B. Remove drippings of asphalt and adhesives in exposed places on brick, concrete, steel, metal or other surfaces.

**END OF SECTION**

## SECTION 07411

### SHEET METAL ROOFING SYSTEMS

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies preformed, prefinished standing seam and flat seam metal roofing, metal fascia panels, flashing, and accessories.
- B. Related Work Specified Elsewhere:
  - 1. Metal Decking: Section 05310.
  - 2. Flashing and Sheet Metal: Section 07600.
  - 3. Roof Accessories: 07730.
  - 4. Seals and Sealants: 07900.

##### 1.02 PERFORMANCE REQUIREMENTS:

- A. Install sheet metal roofing capable of withstanding normal thermal movement, wind loading, structural movement, thermally induced movement, and exposure to weather without failure or infiltration of water into the building interior or through the canopy structure.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements for approval and with the additional requirements as specified for each:
  - 1. Product Data: For each product indicated.
    - a. Submit product data indicating the metal roofing systems meet the specified requirements and indicating compliance with minimum specified ASTM and U.L. requirements.
  - 2. Shop Drawings: Show details for forming, joining, and securing metal roofing, and for pattern of seams. Show expansion-joint details and waterproof connections to adjoining work and at obstructions and penetrations. Include details of construction relative to materials, dimensions of individual components, profiles, and finishes.
    - a. Submit calculations with registered engineer seal, verifying roof panel and attachment method resists wind pressures imposed on it pursuant to applicable building codes.
  - 3. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for metal roofing with color-coated finishes.
  - 4. Samples for Verification: 12-inch- square specimens of metal roofing material with specified finishes applied. Where finishes involve normal color and texture variations, include Sample sets of 2 or more units showing the full range of variations expected.
  - 5. Certifications.

#### 1.04 QUALITY ASSURANCE:

- A. Installer Qualifications: Engage an experienced installer who has completed sheet metal roofing similar in material, design, forming method, and extent to that indicated for this Project and with a record of successful in-service performance.
- B. Select a Manufacturer specializing in Architectural Sheet Metal Products with five (5) years minimum experience.
- C. Codes, regulations, Reference Standards and Specifications:
  - 1. ASTM A653, A666, A775, B209, B370, C920, D 226, D523, D926, D4214, D1970E 699-99, E 1646 E 1680-95, E1592-98
  - 2. SMACNA - Architectural Sheet Metal Manual.
  - 3. CDA - Copper Development Association Handbook.
  - 4. AAMA 1402.
- D. General: Provide manufactured sheet metal roofing assemblies complying with performance requirements indicated and capable of withstanding structural movement, thermally induced movement, and exposure to weather without failure or infiltration of water into the building interior.
  - 1. Air Infiltration: Provide manufactured roof panel assemblies with permanent resistance to air leakage through assembly of not more than 0.09 cfm/sq. ft. of fixed roof area when tested according to ASTM E 1680 at a static-air-pressure difference of 4.0 lbf/sq. ft.
  - 2. Water Penetration: Provide manufactured roof panel assemblies with no water penetration as defined in the test method when tested according to ASTM E 1646 at a minimum differential pressure of 20 percent of inward acting, wind-load design pressure of not less than 6.24 lb/sq. ft. and not more than 12.0 lb/sq. ft.
  - 3. Wind-Uplift Resistance: Provide roof panel assemblies that meet requirements of UL 580 for Class 90 wind-uplift resistance. Design Load: 90 m.p.h., basic wind load velocity.
  - 4. Structural Performance: Provide manufactured roof panel assemblies capable of safely supporting design loads indicated under in-service conditions with vertical deflection no greater than the following, based on testing manufacturer's standard units according to ASTM E 1592 by a qualified independent testing and inspecting agency.
    - a. Maximum Deflection: 1/140 of the span.
    - b. Design Load: 30 p.s.f.
- E. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in the jurisdiction where the Project is located and who is experienced in providing engineering services of the kind indicated.
- F. Field Measurements: Verify location of structural members and openings in substrates by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
  - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, either establish opening dimensions and proceed with fabricating roof panels without field measurements or allow for trimming panel units. Coordinate roof construction to ensure actual locations of structural members and to ensure opening dimensions correspond to established dimensions.

### **1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver metal coils, panels, and other roofing materials so they will not be damaged or deformed. Package roofing materials for protection against transportation damage.
- B. Handling: Exercise care in unloading, storing, and erecting roofing materials to prevent bending, warping, twisting, and surface damage.
- C. Stack materials on platforms or pallets, covered with tarpaulins or other suitable weathertight and ventilated covering. Store metal roof coils and panels to ensure dryness. Do not store coils or panels in contact with other materials that might cause staining, denting, or other surface damage.

### **1.06 WARRANTY:**

- A. General Warranty: Special warranties specified in this Section shall not deprive the Authority of other rights the Authority may have under other provisions of the General Provisions and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
- B. Special Finish Warranty: Submit a written warranty executed by the manufacturer covering failure of the factory-applied exterior finish on metal roofing within the specified warranty period and agreeing to repair finish or replace sheet metal roofing that evidences finish deterioration. Deterioration of finish includes, but is not limited to, color fade, chalking, cracking, peeling, and loss of film integrity.
  - 1. Finish Warranty Period: Nineteen (19) year guarantee in addition to the warranty provisions of the General Provisions for at total of 20 years from date of Substantial Completion.
- C. Special Weathertight Warranty: Submit a written warranty executed by the manufacturer agreeing to repair or replace sheet metal roofing that fails to remain weathertight within the specified warranty period.
  - 1. Weathertight Warranty Period: One year guarantee in addition to the warranty provisions of the General Provisions for at total of 2 years from date of Substantial Completion.

## **PART 2 - PRODUCTS**

### **2.01 ROOFING SHEET METALS:**

- A. Metallic-Coated Steel Sheet Prepainted with Coil Coating: Steel sheet metallic coated by the hot-dip process and prepainted by the coil-coating process to comply with ASTM A 755ASTM A 755M and the following requirements:
  - 1. Galvanized Steel Sheet: ASTM A 653, G90 (ASTM A 653M, Z275); structural quality.
  - 2. Finish: Apply the following organic coating in a thickness of not less than 0.0336 inch, unless otherwise indicated. Furnish appropriate air-drying spray finish in matching color for touchup.
    - a. Durability: Provide coating field tested under normal range of weather conditions for minimum of 20 years without significant peel, blister, flake, chip, crack, or check in finish; without chalking in excess of a chalk rating

of 8 according to ASTM D 4214; and without fading in excess of 5 Hunter units.

- 1) Fluoropolymer 2-Coat Coating System: Manufacturer's standard 2-coat, thermocured system composed of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight with a total minimum dry film thickness of 0.9 mil and 30 percent reflective gloss when tested according to ASTM D 523.
  - b. Color: As selected by Architect from manufacturer's full range of colors.
- B. Aluminum Sheets: ASTM B 209 (ASTM B 209M) for Alclad alloy 3003 or 3004 with temper as required to suit forming operations and finish indicated.
1. Surface: Smooth, flat, mill finish.
  2. High-Performance Organic Coating Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations relative to applying and designating finishes. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturer's written instructions.
    - a. Fluoropolymer 3-Coat Coating System: Manufacturer's standard 3-coat, thermocured system composed of specially formulated inhibitive primer, fluoropolymer color coat, and clear fluoropolymer topcoat, with both color coat and clear topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight; complying with AAMA 1402.
      - 1) Color and Gloss: As selected from manufacturer's full range of choices for color and gloss.
- C. Copper Sheet: ASTM B 370, cold-rolled copper sheet, H00 temper, unless otherwise indicated.
1. Weight (Thickness): 16 oz./sq. ft., unless otherwise indicated.
- D. Stainless-Steel Sheet: ASTM A 666, Type 304, dead soft, fully annealed.
1. Finish: 2D (dull).
- E. Terne-Coated Stainless-Steel Sheet: ASTM A 666, Type 304, dead-soft, fully annealed stainless-steel sheet, coated on both sides with terne alloy (80 percent lead, 20 percent tin) to produce a nominal total coating weight of 1.45 oz./sq. ft.
1. Thickness and Weight: 0.018 inch plus coating, weighing approximately 0.82 lb/sq. ft. including coating, unless otherwise indicated.
  2. In lieu of spot tests to determine coating weight, manufacturer may submit nondestructive radiographic test results and certification showing that terne-coating weight of sheets furnished for Project complies with requirements.

## **2.02 UNDERLAYMENT MATERIALS:**

- A. Self-Adhering, Polymer-Modified, Bituminous Sheet Underlayment: ASTM D 1970, minimum 40 mils thick. Provide primer when recommended by underlayment manufacturer.
- B. Building Paper: Minimum 5 lb/100 sq. ft., rosin sizing.
- C. Felts: ASTM D 226, Type II (No. 30), asphalt-saturated organic felts.

### **2.03 MISCELLANEOUS MATERIALS:**

- A. General: Provide materials and types of fasteners, solder, welding rods, protective coatings, separators, sealants, and accessory items as required for a complete roofing system and as recommended by sheet metal manufacturer and fabricator for metal roofing work, unless otherwise indicated.
- B. Expansion-Joint Sealant in accordance with Section 07900: For hooked-type expansion joints, which must be free to move, provide nonsetting, nonhardening, nonmigrating, heavy-bodied polyisobutylene sealant.
- C. Terne Base Coating: Red iron-oxide/linseed oil paint, with iron oxide as 40 percent minimum of pigment and linseed oil as 50 percent minimum of vehicle.
- D. Metal Accessories in accordance with Section 07600: Provide components matching sheet metal roofing in finish and material that are required for a complete roofing system, including the following:
  - 1. Clips, flashings, and ridge closure strips.
  - 2. Trim, copings, fascia.
- E. Sealing Tape: Pressure-sensitive, 100 percent solids, polyisobutylene compound sealing tape with release paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape.
- F. Elastomeric Joint Sealant: ASTM C 920, of base polymer, type, grade, class, and use classifications required to produce joints in roofing that will remain weathertight and as recommended by the roofing manufacturer for installation indicated and in accordance with Section 07900
- G. Bituminous Coating: Cold-applied asphalt mastic, SSPC-Paint 12, compounded for 15-mil dry film thickness per coat, unless otherwise indicated. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.
- H. Snow Guards: Section 07730.

### **2.04 FABRICATION:**

- A. General: Fabricate sheet metal roofing to comply with details shown, with metal roofing manufacturer's written instructions, and with recommendations of SMACNA's "Architectural Sheet Metal Manual" that apply to the design, dimensions, metal, and other characteristics of installation indicated. For copper roofing, comply with details shown and with recommendations of CDA's Copper Design Handbook.
- B. Fabricate sheet metal to allow for expansion in running work sufficient to prevent leakage, damage, and deterioration of the Work. Form exposed sheet metal work to fit substrates without excessive oil canning, buckling, and tool marks, true to line and levels indicated, and with exposed edges folded back to form hems.
- C. Expansion Provisions: Where lapped or bayonet-type expansion provisions in the Work cannot be used, or would not be sufficiently waterproof and weatherproof, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with sealant (concealed within joints).
- D. Sealant Joints: Where movable, nonexpansion-type joints are indicated or required to produce weathertight seams, form metal to provide for proper installation of elastomeric sealant, in compliance with SMACNA standards.

- E. Separations: Separate metal from noncompatible metal or corrosive substrates by coating concealed surfaces at locations of contact with bituminous coating or other permanent separation as recommended by manufacturer or fabricator.
- F. Lap-Seam Roof Panels: Manufacturer's standard factory-formed, lap-seam roof panel assembly designed for mechanical attachment of panels to roof purlins using exposed fasteners and sealants.
- G. Standing-Seam Roof Panels: Manufacturer's standard factory-formed, standing-seam roof panel assembly designed for concealed mechanical attachment of panels to roof purlins or deck.
  - 1. Standing-seam roof assemblies vary among manufacturers. Revise paragraph below to reflect assembly desired.
  - 2. Clips: Provide minimum 0.0625-inch- thick, stainless-steel panel clips designed to meet negative-load requirements.
  - 3. Cleats: Mechanically seamed cleats formed from minimum 0.0250-inch- thick, stainless-steel or nylon-coated aluminum sheets.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION:**

- A. Examine substrates and conditions, with Installer present, for compliance with requirements indicated for conditions affecting performance of sheet metal roofing. Do not proceed with installation until unsatisfactory conditions have been corrected

### **3.02 PREPARATION:**

- A. Coordinate metal roofing with rain drainage work, flashing, trim, and construction of decking as specified in Section 05310, parapets, walls, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.
- B. Promptly remove protective film, if any, from exposed surfaces of metal roofing. Strip with care to avoid damage to finish.

### **3.03 INSTALLATION, GENERAL:**

- A. Install roofing to comply with sheet metal roofing manufacturer's written instructions, unless otherwise indicated.
- B. Separate dissimilar metals by painting each metal surface in area of contact with a bituminous coating, by applying rubberized-asphalt underlayment to each metal surface, or by other permanent separation as recommended by manufacturers of dissimilar metals.
- C. Install felt underlayment and building paper slip sheet on substrate under metal roofing, unless otherwise recommended by sheet metal manufacturer. Use adhesive for temporary anchorage, where possible, to minimize use of mechanical fasteners under metal roofing. Apply from eave to ridge in shingle fashion and lap joints 2 inches minimum.
- D. Underlayment is limited to placing building paper only directly under terne metal.

- E. Coat back side of metal roofing with bituminous coating where it will contact wood, ferrous metal, or cementitious construction.
- F. Paint back side of terne roofing with terne base coating, 1.0-mil dry film thickness, where slope of roofing is 3 inches per foot (1:4) or less.
- G. Form and fabricate sheets, seams, strips, cleats, valleys, ridges, edge treatments, integral flashings, and other components of metal roofing to profiles, patterns, and drainage arrangements shown and as required for leakproof construction. Provide for thermal expansion and contraction of the Work. Seal joints as shown and as required for leakproof construction. Shop fabricate materials to greatest extent possible.
- H. Sealant-Type Joints: Where sealant-filled joints are used, embed hooked flanges of joint members not less than 1 inch into sealant. Form joints to completely conceal sealant. When ambient temperature is moderate, between 40 and 70 deg F, at time of installation, set joint members for 50 percent movement either way. Adjust setting proportionately for installation at higher ambient temperatures. Do not install sealant-type joints at temperatures below 40 deg F. Comply with requirements of Section 07900: Joint Sealants for handling and installing sealants.
- I. Fabricate and install work with lines and corners of exposed units true and accurate. Form exposed faces flat and free of buckles, excessive waves, and avoidable tool marks, considering temper and reflectivity of metal. Provide uniform, neat seams with minimum exposure of solder, welds, and sealant. Fold back sheet metal to form a hem on concealed side of exposed edges, unless otherwise indicated.
- J. Conceal fasteners and expansion provisions where possible in exposed work and locate to minimize possibility of leakage. Cover and seal fasteners and anchors as required for a tight installation.
- K. Stainless-Steel Roofing: Tin edges of uncoated sheets to be soldered, for a width of 1-1/2 inches, using solder recommended for stainless steel and acid flux. Promptly remove every trace of acid flux residue from metal after tinning. Comply with manufacturer's recommended methods for cleaning and neutralization. Clean exposed surfaces of stainless steel of every substance that is visible or that might cause corrosion of metal.
- L. Tin uncoated copper surfaces at edges of sheets to be soldered, for a width of 1-1/2 inches, using solder recommended for copper work. Where surfaces to be soldered are lead coated, do not tin edges, but wire brush lead coating before soldering.
- M. Rivet joints in uncoated aluminum where necessary for strength. Clean exposed surfaces of every substance that is visible or that might cause corrosion of metal or deterioration of finish.
- N. Install metal accessories in accordance with Section 07600.
- O. Install snow guards in accordance with Section 07730.

### **3.04 CLEANING:**

- A. Clean exposed metal surfaces of substances that interfere with uniform oxidation and weathering.

**3.05 PROTECTION:**

- A. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure metal roofing is without damage or deterioration at the time of Substantial Completion.

**END OF SECTION**

## SECTION 07515

### BUILT-UP ROOFING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing built-up roofing.
- B. Related Work Specified Elsewhere:
  - 1. Thermal insulation, nailers and cants: Section 07210.
  - 2. Metal counter flashing and other sheet metal: Section 07600.
  - 3. Roof accessories: Section 07730.

##### 1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. ASTM: D41, D312, D1668, D1863, D2178, , D4586.
  - 3. National Roofing Contractor's Association (NRCA):The NCRA Roofing and Waterproofing Manual.
- B. Single Source: Provide products as produced or recommended by the roofing system manufacturer.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Shop Drawings:
    - a. Include the following:
      - 1) Manufacturer's material, handling, and application instructions.
      - 2) Step-by-step application procedure proposed.
      - 3) Show perimeter details, tapered insulation layout (as applicable), penetration details, drainage details and other typical and special conditions.
      - 4) Staging plan showing access points, waste disposal, storage areas, etc.
  - 2. Certification:
    - a. Submit certification from manufacturer of roofing, that roofing applicator is approved by manufacturer and has successfully performed at least three satisfactory roofing installations using materials and methods similar to those specified.
    - b. Certification that materials furnished meet specified requirements and are compatible with each other and with adjacent materials under Related Work Specified Elsewhere.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to jobsite in their original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type, class and rating as applicable.
- B. Store products in approved dry area with roll goods standing on ends and protect from contact with soil and from exposure to the elements. Keep products dry.

- C. Handle products so as to prevent breakage of containers and damage to products.
- D. Do not exceed designed live load of roof deck when stockpiling materials in areas of work.

**1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  - 1. Application of roofing when precipitation is occurring or when ice, frost or dampness is visible on roof decks is prohibited.
  - 2. Application of roofing when ambient temperature is lower than 40F is prohibited, unless otherwise approved.
  - 3. Maintain rolls of felt at 60F minimum 24 hours minimum prior to installation.

**1.06 WARRANTY:**

- A. One year in addition to the requirements of the General Provisions for a total of two years.

**PART 2 - PRODUCTS**

**2.01 MATERIALS:**

- A. General:
  - 1. Insofar as practicable, furnish products produced or recommended by a single roofing system manufacturer, including roofing system products specified in other sections.
- B. Thermal Insulation, Nailers and Cants: Section 07210.
- C. Asphalt Primer: ASTM D41.
- D. Asphalt: ASTM D312.
  - 1. Type I, 135F-151F softening point for level to 1/4-inch slope (*use not permitted*)
  - 2. Type II, 158F-176F softening point for 1/4-inch to one-inch slope.
  - 3. Type III, 185F-205F softening point for one-inch to three-inch slope.
  - 4. Type IV, 210F-225F softening point for three-inch to six-inch slope.
- E. Asphalt Cement(Asbestos-Free): ASTM D4586.
- F. Asphalt-Saturated and Coated Organic Felt Base Sheet: ASTM D2626 (*use not permitted*).
- G. Asphalt-Saturated Organic Roofing Felt: ASTM D226, Type I, perforated (*use not permitted*).
- H. Asphalt Glass Felt: ASTM D2178, Type IV or Type VI.
- I. Base Flashing Cap Sheet: Roofing system manufacturer's standard asphalt impregnated and coated composite sheet, glass fiber or polyester reinforced, with or without surface granules.
- J. Aggregate for Surfacing: ASTM D1863, light-colored crushed stone, slag or gravel, opaque to ultraviolet radiation.
- K. Walkway Surface: Homogenous core of asphalt, plasticizers and inert fillers bonded by heat and pressure between two saturated and coated inorganic sheets, with the walking surface

finished with gray ceramic granules. Supply in 36-inch wide by 72-inch long sheets, 1/2-inch thick minimum.

- L. Nails: 11-gauge, annular-thread, galvanized roofing nails with 3/8-inch diameter head or combination nail with head one-inch square minimum.
- M. Tin Caps: Flat discs of galvanized sheet steel 28-gauge minimum and 1-3/8 inches minimum diameter.
- N. Combination Nails: Square-head cap 11-gauge, hot-dip galvanized, annular thread with one-inch diameter cap.
- O. Glass-Fiber Fabric: Woven glass cloth, treated with asphalt, ASTM D1668, Type I.
- P. Metal Counter Flashing and Other Sheet Metal: Section 07600.
- Q. Roof Accessories: Section 07730.

### **PART 3 - EXECUTION**

#### **3.01 EXAMINATION AND PREPARATION OF SURFACES:**

- A. Clean substrates of dust, debris and other substances detrimental to roofing installation according to roofing system manufacturer's written instructions. Remove sharp projections.
- B. Examine substrates, areas, and conditions under which roofing will be applied, with installer present, for compliance with requirements.
- C. Verify proper secure placement of roof openings, penetrations, insulation, roof accessories and roof drains.
- D. Verify that substrates are smooth, dry, clean and free of projections or debris that might damage roofing materials.
- E. Do not proceed with installation until unsatisfactory conditions have been corrected.

#### **3.02 INSTALLATION:**

- A. General: Perform installation in accordance with the NCRA Roofing and Waterproofing Manual unless specified or shown differently.
  - 1. Apply roofing perpendicular to roof slope progressively and continuously. Provide starter sheets to maintain specified number of felt plies throughout roof. Extend roofing plies to tops of cant strips.
  - 2. Protect edges of each day's application of felt, except for coated base sheet, with glaze coat of hot Type-III asphalt. Apply glaze coat at minimum rate of 15 pounds of asphalt per 100 square feet of roof surface.
  - 3. Do not store materials on applied roofing. Provide sufficient crew to complete roofing work on area begun before end of each day's work.
  - 4. Roll felt into bitumen not more than three feet behind mop; broom thoroughly with roofer's smoothing brushes to ensure thorough bonding of sheets to eliminate air pockets, wrinkling and buckling. Felt may be machine applied if approved. Do not lay plies dry and turn back laps for mopping between plies.
  - 5. Heat Types-II, III and IV asphalts 450F maximum; do not keep heated overnight.

6. Apply asphalt at no less than 350F. Use thermometers to check temperature of asphalt during heating and application. Keep kettle operator in attendance during entire operation to ensure that maximum specified temperatures are not exceeded.
7. Provide smooth, clear, board or plank runways and platforms near supports for traffic over partially or completely finished roofing.
8. Follow commercial practice and recommendations of manufacturer and supplier for handling and use of materials, except as otherwise specified.

B. Materials Schedule:

1. Each of the following for each 100 square feet of roof area:

Materials	Specification Amount
Base sheet	1 ply
Felt	3 plies
Asphalt - on deck	25 pounds
Asphalt - between plies	60 pounds
Asphalt - top pouring	60 pounds
Aggregate: One of the following: Slag Gravel or crushed stone	300 pounds 400 pounds

2. Base flashing is additional to the quantities above.

C. Application:

1. For direct application to concrete decks, coat decks uniformly with asphalt primer using not less than one gallon per square of roof area and allow to dry thoroughly.
2. Apply hot Type-III or Type IV asphalt uniformly in a solid mopping over primer or insulation at minimum rate of 25 pounds of asphalt per 100 square feet. On roofs of precast units, apply felt strips four inches or more in width centered over joints of precast units in cold-applied asphalt cement before solid mopping. Apply base sheet in hot asphalt with ends and edges lapped four inches over preceding sheet and sealed with hot asphalt.
3. Apply hot asphalt uniformly to base sheet at minimum rate of 20 pounds per 100 square feet. Apply three felt plies in hot asphalt, shingle fashion, each sheet in each ply lapping 24-3/4 inches over preceding ply. Lap ends of sheets six inches minimum and stagger laps in adjacent courses 12 inches minimum. Mop hot asphalt full lap-width of each ply so that felt never touches felt. Apply not less than 20 pounds of asphalt per 100 square feet between successive plies.
4. On roof slopes greater than one inch per foot, nail each ply of felt on slopes as specified. Correct fishmouths, breaks, blisters and other defects before flood-coating roofing.
5. Flood coat: After felt flashing applications, repairs and corrective actions have been completed and approved, coat entire surface uniformly with hot asphalt, poured from dipper, at minimum rate of 60 pounds per 100 square feet.
6. Aggregate surfacing: Immediately embed gravel, crushed stone or slag into hot asphalt.
7. Double surfacing: Provide double surfacing of aggregate in addition to normal requirement under each board of walkway-surface material as follows:
  - a. Apply not less than 80 pounds of hot asphalt poured from dipper per 100 square feet of roof area.

- b. Embed immediately into hot asphalt 200 pounds minimum of slag or 300 pounds minimum of gravel or crushed stone.
- D. Nailing On Roof Slopes Greater Than One Inch Per Foot:
  - 1. Nail each ply of felt. Run felt perpendicular to roof slope and nail to embedded nailers parallel to slope.
  - 2. Nail felt to each nailer with two nails spaced approximately two and eight inches from upper edge of felt.
- E. Base Flashing: Follow NRCA Roofing and Waterproofing Manual details and roofing system manufacturer's details.
  - 1. Provide flashing in angles formed where roof decks abut walls, curbs, ventilators, pipes and other vertical surfaces and wherever necessary to make work watertight.
  - 2. Prime walls and curbs; allow to dry before flashing is applied.
  - 3. Apply base flashing in two layers: first of asphalt glass felt and topped with base flashing cap sheet cut in strips 12 feet long maximum with reinforced fabric side toward wall.
  - 4. Extend flashing felt onto roof over membrane six to eight inches from toe of cant. Nail felt 1-1/2 inches from top edge of felt with roofing nails and tin caps at 10-inch maximum spacing.
  - 5. Seal top of flashing with strip of glass fiber fabric embedded in 1/8-inch thick asphalt cement, extending from one-inch above top of felt to one-inch below nail heads.
  - 6. Lap ends of felt three inches minimum, staggered in each ply, and seal watertight with asphalt cement. Apply six-inch wide strip of asphalt-saturated felt with asphalt cement to seal lower edge of flashing installation.
  - 7. Cement felt to underlying surfaces and to each other with asphalt cement applied not less than 1/16-inch thick or 35 pounds per 100 square feet for each coating.
- F. Stripping-In:
  - 1. Strip-in roof-accessory aprons, pipe sleeves and metal flashings as follows:
    - a. Prime surfaces and allow to dry. Strip-in with two layers of asphalt-saturated felt cemented with asphalt cement.
    - b. Extend felt three and six inches, respectively, beyond edge of apron, flange or flashing.
  - 2. Gravel stops, fascias and scuppers:
    - a. Strip-in with two layers of asphalt-saturated felt, one 10-inch strip and one 12-inch strip.
    - b. Solidly mop strips with hot bitumen.
- G. Roof-Drain Flashing Application:
  - 1. Strip-in roof drain with two layers of asphalt-saturated felt, one 10 inches wide and one 12 inches wide, set in asphalt cement or hot bitumen.
  - 2. Heavily coat flashing ring of drain with asphalt cement before installing felt flashing. Clamp roofing felt and felt flashing securely in drain clamping ring.
  - 3. Apply trowel coat of asphalt cement width of trowel on top of felt around clamping ring before flood coat and application of aggregate. Embed aggregate into asphalt cement.
- H. Metal Fascias and Flashings:
  - 1. Where metal fascias or other metal flashing extend into built-up roofing, extend felt plies under metal with first two plies turned over succeeding plies and back 12 inches.
  - 2. After metal flashing is placed, apply two plies of asphalt-saturated felt flashing, set in pitch-base asphalt cement, over that part of metal extending onto roof.

- I. Approval of Flashing: Obtain approval of complete flashing and connections of roofing with other work before applying final coating and surfacing materials.
- J. Traffic Surfaces: Apply walkway-surface material in hot asphalt over double-aggregate surfacing in individual boards with 10-inch separation between each board. Extend separation through top surfacing to provide drain through walkways at level of original surfacing.

### **3.03 FIELD QUALITY CONTROL:**

- A. Tests:
  - 1. The Engineer may cut six-inch by 24-inch test specimens from roof; one specimen for each 5,000 square feet, but not less than one specimen for each roof level or area. In the event of test cuts, immediately restore roof to its original state, using same number of plies and moppings, shingled-out not less than 26 inches on sides of cut.
  - 2. Should examination and test of specimens disclose lack of specified material or nonconformity to specified requirements, the Engineer may order removal of roofing and replacement as specified, order that additional materials be applied uniformly over entire surface at least to the amount of deficiency disclosed in test specimens or order other corrections to be made.
- B. Prevention of Roof-Drain System Clogging:
  - 1. Prevent asphalt and other roofing materials from entering and clogging roof drains and conductors.
  - 2. Repair or replace clogged or damaged components as directed.
  - 3. Remove roof-drain plugs when no work is taking place or during precipitation.
- C. Correct deficiencies in or remove built-up roofing that does not comply with requirements. Repair substrates, reinstall roofing and repair flashings to a condition free of damage and deterioration.
- D. Prevent asphalt and other roofing materials from spilling or migrating onto surfaces of other construction. Clean spillage using cleaning agents and procedures recommended by manufacturer of affected construction.

### **3.04 CLEAN-UP:**

- A. Clean up rubbish and debris caused by this work and remove from the site.
- B. Promptly remove drippings of pitch and asphalt in exposed places on brick, concrete, steel, copper and other surfaces to prevent irreparable damage to exposed finish surfaces.

**END OF SECTION**

## SECTION 07553

### SELF-ADHERING MODIFIED BITUMINOUS MEMBRANE ROOFING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION

- A. This Section includes the following:
  - 1. Protected, self-adhering roofing membrane, two ply.
  - 2. Insulation.
  - 3. Aggregate ballast.
  - 4. Roof pavers.
  
- B. Related Sections include the following:
  - 1. Rough Carpentry: Section 06100.
  - 2. Flashing and Sheet Metal: Section 07600
  - 3. Roof Specialties: Section 07730
  - 4. Piping Systems: Section 15205

##### 1.02 PERFORMANCE REQUIREMENTS

- A. Install self-adhering modified bituminous membrane roofing and flashing system with compatible components that will not permit passage of liquid and will withstand wind loads, flotation loads, thermally induced movement, and exposure to weather without failure.

##### 1.03 SUBMITTALS

- A. Product Data: For each type of roofing material indicated.
  
- B. Shop Drawings: Show locations and extent of roofing. Include plans, sections, details, and attachments to other Work, for substrate joints and cracks, flashing sheets, roof penetrations, inside and outside corners, vertical intersections, roof slope, expansion joints, and membrane terminations.
  - 1. Show locations, extent, and details of roof pavers.
  
- C. Samples for Verification: For each of the following products:
  - 1. 12-by-12-inch300-by-300-mm square of flashing sheet.
  - 2. 12-by-12-inch300-by-300-mm square of board insulation.
  - 3. 10 lb4.5 kg of aggregate ballast in gradation indicated.
  - 4. Roof paver, full sized, in each color and texture required.
  
- D. Installer Certificates:: Signed by manufacturers certifying that installers comply with requirements.
  
- E. Qualification Data: For Installer.
  
- F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for current formulation of self-adhering modified bituminous membrane roofing.
  
- G. Research/Evaluation Reports: For self-adhering modified bituminous membrane roofing.
  
- H. Maintenance Data: For roofing system to include in maintenance manuals.
  
- I. Warranties: Draft of special warranty specified in this Section.

- J. Inspection Report for Information: Copy of roofing system manufacturer's inspection report of completed roofing membrane.

#### **1.04 QUALITY ASSURANCE**

- A. Installer Qualifications: An employer of workers trained and approved by manufacturer.
- B. Source Limitations: Obtain roofing membrane materials through one source from a single manufacturer.
- C. Fire-Test-Response Characteristics: Provide self-adhering modified bituminous membrane roofing with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.
  - 1. Exterior Fire-Test Exposure: Class A; complying with ASTM E 108, for application and slopes indicated.
- D. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

#### **1.05 DELIVERY, STORAGE, AND HANDLING**

- A. Deliver materials to Project site in original containers with seals unbroken, labeled with manufacturer's name, product brand name and type, date of manufacture, and directions for storing and mixing with other components.
  - 1. Handle and store roofing materials and place equipment in a manner to avoid significant or permanent damage to deck or structural supporting members.
- B. Protect roofing insulation materials from damage and from deterioration by sunlight, moisture, soiling, and other sources. Store in a dry location.

#### **1.06 PROJECT CONDITIONS**

- A. Environmental Limitations: Apply roofing within the range of ambient and substrate temperatures recommended by roofing system manufacturer. Do not apply roofing to a damp or wet substrate.
  - 1. Do not apply roofing in snow, rain, fog, or mist.

#### **1.07 WARRANTY**

- A. Special Roofing Membrane Manufacturer's Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace roofing that does not remain watertight and base flashing that does not remain watertight or that splits, tears, or separates at seams or from substrate within specified warranty period.
  - 1. Warranty also includes board insulation and roof pavers.
  - 2. Warranty does not include failure of roofing membrane due to formation of new joints and cracks in roof deck in excess of 1/16 inch 1.6 mm wide.
  - 3. Warranty Period: 15 years from date of Substantial Completion.

### **PART 2 - PRODUCTS**

#### **2.01 MANUFACTURERS**

- A. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:

## 2.02 ROOFING MEMBRANE

- A. Self-Adhering Modified Bituminous Roofing Membrane: 50-mil-1.3-mm- thick, minimum, sheet consisting of 46 mils1.2 mm, minimum, of rubberized asphalt laminated to a 4-mil-0.10-mm- thick, cross-laminated, high-density polyethylene film; with release liner on adhesive side.
  - 1. Physical Properties: As follows, measured per standard test methods referenced:
    - a. Tensile Strength (Membrane): 250 psi1.7 MPa minimum; ASTM D 412, Die C, modified.
    - b. Ultimate Elongation: 250 percent minimum; ASTM D 412, Die C, modified.
    - c. Pliability: Pass at minus 25 deg Fminus 32 deg C; ASTM D 146.
    - d. Crack Cycling: Unaffected after 100 cycles of 1/8-inch3-mm movement; ASTM C 836.
    - e. Puncture Resistance: 40 lbf180 N minimum; ASTM E 154.
    - f. Water Absorption: 0.15 percent weight-gain maximum after 48-hour immersion at 70 deg F21 deg C; ASTM D 570.
  - 2. Underlayment Membrane: Self-leveling, two-component, elastomeric, cold fluid-applied modified urethane.

## 2.03 AUXILIARY MATERIALS

- A. General: Furnish auxiliary materials recommended by roofing system manufacturer for intended use and compatible with roofing.
  - 1. Furnish liquid-type auxiliary materials that meet VOC limits of authorities having jurisdiction.
- B. Concealed Flashing Membrane: Self-adhering, rubberized-asphalt composite sheet of same material, construction, and thickness as roofing membrane.
- C. Metal Counterflashing: Metal counterflashing is specified in Division 7 Section "Sheet Metal Flashing and Trim."
- D. Liquid Membrane: Trowel grade, two-component, elastomeric, cold fluid-applied urethane.
- E. Mastic and Sealant: Liquid mastic and sealant recommended by manufacturer.
- F. Metal Termination Bars: Manufacturer's standard predrilled stainless-steel or aluminum termination bars, approximately 1 by 1/8 inch25 by 3 mm thick; with anchors.
- G. Fabric Mat: Woven or nonwoven polypropylene, polyolefin, or polyester fabric mat; water permeable and resistant to UV-light degradation; of type and weight recommended by insulation manufacturer for application.

## 2.04 INSULATION

- A. Board Insulation: ASTM C 578; extruded polystyrene, of type, minimum density, and minimum compressive strength indicated below; fabricated with rabbeted edges and with one side having ribbed drainage channels:
  - 1. Type VI, 1.8 lb/cu. ft.29 kg/cu. m and 40 psi276 kPa. Retain paragraph and selected subparagraph below if mortar-faced, extruded-polystyrene roofing insulation is required.
- B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
  - 1. Board Insulation:
    - a. Diversifoam Products.

- b. Dow Chemical Company (The).
- c. Owens Corning.
- d. Tenneco Building Products.

## 2.05 AGGREGATE BALLAST

- A. Aggregate Ballast: Washed, crushed stone or smooth stone that will withstand weather exposure without significant deterioration and will not contribute to membrane degradation. Provide one of the following sizes in accordance with applicable wind load design:
  - 1. Size: ASTM D 448, Size 5, ranging in size from 1/2 to 1 inch13 to 25 mm.
  - 2. Size: ASTM D 448, Size 4, ranging in size from 3/4 to 1-1/2 inches19 to 38 mm.
  - 3. Size: ASTM D 448, Size 2, ranging in size from 1-1/2 to 2-1/2 inches38 to 63 mm.

## 2.06 ROOF PAVERS

- A. Roof Pavers: Heavyweight, hydraulically pressed, concrete units, with top edges beveled **3/16 inch5 mm**, factory cast for use as roof pavers; absorption not greater than 5 percent, ASTM C 140; no breakage and maximum 1 percent mass loss when tested for freeze-thaw resistance, ASTM C 67; and as follows:
  - 1. Size: 24 by 24 inches600 by 600 mm. Manufacture pavers to dimensional tolerances of plus or minus 1/16 inch1.6 mm in length, height, and thickness
  - 2. Weight: In accordance with wind load design.
  - 3. Colors and Textures: As selected by The Engineer from manufacturer's full range.
  - 4. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
    - 5. Hanover Architectural Products, Inc.
    - 6. Rapid Building Systems.
    - 7. Roofblok, Ltd.
    - 8. Sunny Brook Pressed Concrete Co.
    - 9. Wausau Tile, Inc.; Terra-Paving Div.
    - 10. Westile Roofing Products.

## PART 3 - EXECUTION

### 3.01 EXAMINATION

- A. Examine substrates, areas, and conditions under which roofing will be applied, with Installer present, for compliance with requirements and other conditions affecting performance.
  - 1. Proceed with installation only after minimum concrete drying period recommended by roofing system manufacturer has passed.
  - 2. Verify that concrete substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
  - 3. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.02 PREPARATION

- A. Clean and prepare substrate according to manufacturer's written recommendations. Provide clean, dust-free, and dry substrate for roofing application.
- B. Mask off adjoining surfaces not receiving roofing to prevent spillage from affecting other construction.
- C. Protect roof drains and other deck penetrations to prevent spillage and migration of roofing fluids.

- D. Remove grease, oil, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
- E. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
- F. Prepare, fill, and treat joints and cracks in substrate. Remove dust and dirt from joints and cracks according to ASTM D 4258.
  - 1. Install roofing membrane strip and center over treated construction and contraction joints and cracks exceeding a width of 1/16 inch1.6 mm.
- G. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations through roofing and at drains and protrusions.

### **3.03 ROOFING MEMBRANE INSTALLATION**

- A. Install roofing membrane according to roofing membrane manufacturer's written instructions.
- B. Install fluid-applied underlayment membrane to substrate over area to receive roofing membrane and base flashing. Spread over roof deck to form a uniform, seamless membrane, average 60 mils1.5 mm thick, but not less than 40 mils1 mm thick. Allow to cure for at least 24 hours before subjecting to foot traffic.
  - 1. Install fluid-applied underlayment membrane to extend beyond height of concealed flashing membrane.
- C. Install liquid-membrane beads at roof-deck-supported wall junctions. Install transition membrane strips centered over inside and outside corners and at roof terminations.
  - 1. Install bead of liquid membrane on horizontal inside corners.
- D. Install self-adhering modified bituminous membrane roofing.
- E. Two-Ply Application: Apply and firmly adhere membrane over underlayment membrane. Accurately align sheets and maintain uniform side laps of not less than 50 percent of sheet width to provide minimum coverage of 2 thicknesses of membrane. Maintain uniform 6-inch-150-mm- wide end laps. Overlap and roll seams and stagger end laps. Seal T-joints at end laps of top ply.
- F. Apply membrane from low point to high point of roof deck to ensure that side laps shed water.
- G. Repair tears, voids, and lapped seams in roofing not complying with requirements. Slit and flatten fishmouths and blisters. Patch with roofing membrane extending 6 inches150 mm beyond repaired areas in all directions.
- H. Correct deficiencies in or remove roofing membrane that does not comply with requirements, repair substrates, reapply roofing membrane, and repair flashing sheets.

### **3.04 FLASHING INSTALLATION**

- A. Install concealed flashing membrane at terminations, at roof edges, and at penetrations through roofing membrane, according to roofing membrane manufacturer's written instructions.
- B. Install concealed flashing membrane and extend up walls or parapets a minimum of 8 inches200 mm above insulation.

- C. Install termination bars and mechanically fasten to top of concealed flashing membrane at terminations and perimeter of roofing.
- D. Seal junction of roofing membrane and concealed flashing membrane with mastic or sealant fillets.

### 3.05 INSULATION INSTALLATION

- A. Loosely lay board insulation units over roofing membrane, with long joints of insulation in continuous straight lines and with end joints staggered between rows. Abut edges and ends between units.
- B. Install one or more layers of insulation to achieve required thickness over roofing membrane. Cut and fit to within 3/4 inch 19 mm of projections and penetrations.
- C. Install fabric mat over insulation, overlapping edges and ends at least 12 inches 300 mm. Do not lap ends of fabric sheets within 72 inches 1800 mm of roof perimeter. Extend fabric 2 to 3 inches 50 to 75 mm above ballast at perimeter and penetrations. Apply additional layer of fabric around penetrations to prevent aggregate from getting between penetration and insulation. Do not cover drains or restrict water flow to drains.

### 3.06 BALLAST INSTALLATION

- A. Apply ballast uniformly over fabric mat at rate required by insulation manufacturer, but not less than the following, carefully spreading aggregate to minimize possibility of damage to membrane. Apply ballast as insulation is installed, leaving roofing membrane insulated and ballasted at end of workday. Provide one of the following in accordance with wind load design:
  1. Ballast: 15 lb/sq. ft. 75 kg/sq. m, Size 5 aggregate within 48 inches 1200 mm of roof perimeter and 24 inches 600 mm of roof penetrations; 10 lb/sq. ft. 50 kg/sq. m, Size 5 aggregate elsewhere.
    - a. Install one row of roof pavers in lieu of aggregate ballast to roof perimeter and penetrations.
  2. Ballast: 15 lb/sq. ft. 75 kg/sq. m, Size 4 aggregate within 48 inches 1200 mm of roof perimeter and 24 inches 600 mm of roof penetrations; 12 lb/sq. ft. 60 kg/sq. m, Size 4 aggregate elsewhere.
  3. Ballast: 12 lb/sq. ft. 60 kg/sq. m, Size 4 aggregate to field of roof; lay 2 rows of roof pavers at roof perimeters and penetrations according to insulation manufacturer's written instructions.
  4. Ballast: 15 lb/sq. ft. 75 kg/sq. m, Size 2 aggregate within 48 inches 1200 mm of roof perimeter and 24 inches 600 mm of roof penetrations; 13 lb/sq. ft. 65 kg/sq. m, Size 2 aggregate to field of roof; lay 3 rows of roof pavers to corners of roof according to insulation manufacturer's written instructions. Mechanically fasten securement strapping to first row of corner edge roof pavers.
  5. Ballast: 13 lb/sq. ft. 65 kg/sq. m, Size 2 aggregate to field of roof; lay 3 rows of concrete pavers at roof perimeter, corners, and penetrations according to insulation manufacturer's written instructions. Mechanically fasten securement strapping to first row of perimeter and corner edge roof pavers.
  6. Ballast: 15 lb/sq. ft. 75 kg/sq. m, Size 2 aggregate within 24 inches 600 mm of roof penetrations; 13 lb/sq. ft. 65 kg/sq. m, Size 2 aggregate to field of roof; lay 4 rows of roof pavers along roof perimeter and at corners according to insulation manufacturer's written instructions. Mechanically fasten securement strapping to first two rows of perimeter and corner edge roof pavers.
  7. Walkway Pavers: Lay roof-paver walkways using roof pavers of size indicated or, if not indicated, of manufacturer's standard size.

### 3.07 ROOF-PAVER INSTALLATION

- A. Lay roof-paver ballast according to insulation manufacturer's written instructions.
  - 1. Install roof pavers on pedestals set according to pedestal manufacturer's written instructions.

### **3.08 FIELD QUALITY CONTROL**

- A. Engage a qualified testing agency to observe flood tests and to determine and report leaks.
- B. Flood Testing: Flood test each roof deck area for leaks, according to recommendations in ASTM D 5957, after completing roofing and flashing, but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.
  - 1. Flood to an average depth of 2-1/2 inches65 mm with a minimum depth of 1 inch25 mm and not exceeding a depth of 4 inches100 mm. Maintain 2 inches50 mm of clearance from top of base flashing. Water depth not to exceed load capacity of roof deck.
  - 2. Flood each area for 24 hours.
  - 3. After flood testing, repair leaks, repeat flood tests, and make further repairs until roofing and flashing installation is watertight.
- C. Final Roof Inspection: Arrange for roofing system manufacturer's technical personnel to inspect roofing installation on completion of roofing membrane and flashing.
  - 1. Notify The Engineer 48 hours in advance of date and time of inspection.
- D. Correct deficiencies in or remove roofing that does not comply with requirements, repair substrates, reapply roofing, and repair flashing.
  - 1. After flood tests, repair leaks and make further repairs until roofing installation is watertight.
- E. Additional testing, at Contractor's expense, will be performed to determine compliance of corrected Work with requirements.

### **3.08 PROTECTING AND CLEANING**

- A. Protect roofing according to manufacturer's written recommendations to prevent damage and wear during application and remainder of construction period.
- B. Protect installed insulation from damage due to UV-light exposure, physical abuse, and other causes. Provide temporary coverings where insulation will be subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.
- C. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

**END OF SECTION**

## SECTION 07600

### FLASHING AND SHEET METAL

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing miscellaneous-waterproofing sheet metal including metal flashings, copings, exposed trim, fasciae, gravel stops, reglets, scuppers, gutters and downspouts, conductor heads, splash pans, drip edges, roof and roof-to-wall expansion joint covers, shower pans, overhead piping safety pans, metal accessories, gutter screens, strainers, red-rosin paper, solder, and related nailing strips and miscellaneous wood supports.
- B. Related Work Specified Elsewhere:
  - 1. Brick Masonry: Section 04215.
  - 2. Concrete Unit Masonry: Section 04220
  - 3. Rough Carpentry: Section 06100.
  - 4. Seals and Sealants: Section 07900.
  - 5. Roof Accessories: Section 07730.
  - 6. Sheetmetal Roofing Systems: Section 07411.
  - 7. Built-up Roofing: Section 07515.

##### 1.02 PERFORMANCE REQUIREMENTS:

- A. General: Install sheet metal flashing and trim to withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failing.
- B. Fabricate and install flashings at roof edges to comply with recommendations of FM Loss Prevention Data Sheet 1-49 for the following wind zone:
  - 1. Wind Zone 3: Wind pressures of 46 to 104 psf.

##### 1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data including manufacturer's material and finish data, installation instructions, and general recommendations for each specified flashing material and fabricated product.
  - 2. Shop Drawings:
    - a. Show both shop-fabricated and site-fabricated work, indicating where each item is fabricated. Include complete details of joints, supports and fasteners, in accordance with SMACNA Architectural Sheet Metal Manual standard details where applicable.
    - b. Show dimensions and locations of wood nailing strips, miscellaneous wood supports and details of installation.
    - c. Fabricated Masonry Flashing: Detail corner units, end-dam units, and other special applications.
  - 3. Samples: Three of each type of the following materials used in the work:
    - a. Stainless steel: 12 inches square.
    - b. Lead-coated copper: 12 inches square.
    - c. Bituminous paint: Pint containers.
    - d. Aluminum coping: 12-inch by 12-inch corner section.
    - e. Stainless steel coping: 12-inch by 12-inch corner section.

- f. Reglets: 12-inch strips.
- g. Expansion-joint cover: 12-inch strips.
- h. Downspout and gutter: 12-inch length with anchor strap.
- i. Copper-Laminated Flashing: 12 inches square.
- j. Coil-coated galvanized steel: 12 inches square.
- k. Copper: 12 inches square.
- l. Metal accessories.

B. Certification.

#### **1.04 QUALITY ASSURANCE:**

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. SMACNA: Architectural Sheet Metal Manual.
  - 3. FS: QQ-L-201, UU-B-790.
  - 4. AAMA: 606.1.
  - 5. NRCA: Roofing and Waterproofing Manual.
  - 6. ASTM: A167, A755, B32, B101, B209, B221, B370.
  - 7. UL: 580 for Class 90 wind-uplift resistance.
  - 8. FM: Loss Prevention Data Sheet 1-49.
  - 9. Copper Development Association: Copper in Architecture Handbook.
- B. Installer Qualifications: Engage an experienced Installer who has completed sheet metal flashing and trim work similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- C. Coordinate Work of this Section with interfacing and adjoining Work for proper sequencing of each installation. Ensure best possible weather resistance, durability of Work, and protection of materials and finishes.

#### **1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to jobsite in original unopened containers clearly marked with manufacturer's name and brand designation, reference specification number, type and class as applicable.
- B. Store products in approved dry area and protect from contact with soil and exposure to the elements. Keep products dry.
- C. Handle products so as to prevent breakage of containers and damage to products.

### **PART 2 - PRODUCTS**

#### **2.01 MATERIALS:**

- A. Stainless Steel:
  - 1. Through-wall flashing (mechanically keyed) sheets: ASTM A167, Type 304, soft annealed, minimum thickness 0.012 inch.
  - 2. Fascia, exposed trims, reglets, roof drain flashings, base flashings, counterflashings, flashing receivers, valley flashings, drip edges, eave flashings, equipment support flashings, roof penetration flashings, roof expansion joint covers, scuppers: ASTM A167, Type 304, hard tempered, minimum thickness 0.0187 inch, unless otherwise shown or indicated.

3. Copings, gravel stops, and roof-to-wall expansion joint covers: ASTM A167, Type 304, hard tempered, minimum thickness 0.025 inch, unless otherwise shown or indicated.
    - a. Backing or stiffeners required to prevent oil-canning and waviness.
    - b. Finish: No. 2D.
- B. Copper Sheet and Strips: ASTM B370; temper H00, cold-rolled except where temper O60 is required for forming:
1. Shower pans: Not less than 16-ounces/square foot, unless otherwise shown.
  2. Concealed copper-laminated flashing:
    - a. Manufacturer's standard laminated flashing consisting of 7-oz./sq. ft. sheet copper bonded with asphalt between 2 layers of glass-fiber cloth. Use only where flashing is fully concealed in masonry.
- C. Lead-Coated Copper:
1. ASTM B101, cold-rolled copper sheet with temper O60 (soft) for flashing, temper H00 or H01 for other uses as appropriate, sheet weight and lead coating weight as specified below:
    - a. Gutters with girth up to 20 inches, downspouts, conductor heads, reglets, base flashings, counterflashings, flashing receivers, valley flashings, drip edges, eave flashings, equipment support flashings, roof drain flashings, roof penetration flashings, roof expansion joint covers, roof-to-wall expansion joint covers, and splash pans: Copper sheet weighing not less than 16 ounces/square foot.
    - b. Scuppers: Copper sheet weighing not less than 20 ounces/square foot.
    - c. Gutters with girth larger than 20 inches and overhead piping safety pans: Copper sheet weighing not less than 24 ounces/square foot.
    - d. Both sides of copper sheet coated with lead weighing not less than 12 nor more than 15 pounds/100 square feet, unless otherwise indicated.
- D. Coil-Coated Galvanized Steel Sheet:
1. Zinc-coated, commercial quality steel sheet with thickness as specified below conforming to ASTM A755, G90 coating designation, coil coated with high-performance fluoropolymer coating of not less than 1 mil thick (0.2 mil primer and 0.8 mil fluoropolymer) each side, unless otherwise specified.
  2. Counter flashings and flashings receivers: Minimum thickness of steel sheet 0.0217 inch, unless otherwise shown or indicated.
  3. Fasciae, trims, drip edges, eave flashings, base flashings, valley flashings, and equipment support flashings: Minimum thickness of steel sheet 0.0276 inch, unless otherwise shown or indicated.
    - a. Backing or stiffeners for fasciae and trims required to prevent oil-canning and waviness.
- E. Aluminum:
1. Extruded anodized fasciae, exposed trims, copings and gravel stops: ASTM B221, Alloy 6063-T52, minimum thickness 0.125 inch.
  2. Alloy sheet anodized scuppers, roof expansion joint covers, and roof-to-wall expansion joint covers: ASTM B209, Alloy 5005-H14, minimum thickness 0.050 inch.
  3. Alloy sheet anodized drip edges, eave flashings, base flashings, counterflashings, and flashing receivers: ASTM B209, Alloy 5005-H14, minimum thickness 0.040 inch.
  4. Finish: Class I color anodized finish with anodic layer thicker than 0.7 mil, dark bronze color, per AAMA 606.1, Guide Specifications and Inspection Methods for Integral Color Anodic Finishes for Architectural Aluminum.

- F. Lead:
  - 1. Flashing for plumbing vents:
    - a. Sheet lead, FS QQ-L-201, minimum 2-1/2 pounds per square foot.
  
- G. Miscellaneous Items:
  - 1. Red-rosin paper:
    - a. FS UU-B-790, Type I, Style 1b, 5 lb/sq., sized building paper.
  - 2. Vinyl tape: As recommended by the metal product manufacturer as a dissimilar metal separator.
  - 3. Wood blocking: Section 06100.
  - 4. Bituminous Paint: As recommended by the manufacturer as a dissimilar metal separator.
  - 5. Solder: ASTM B32, with flux-core; of the following solder alloys. Use another alloy if it is demonstrated to the Engineer that better results, including visual as applicable, can be achieved on the particular metals being joined.
    - a. For stainless steel: Tin/silver solder, Alloy Grade Sn96, with acid flux of type recommended by stainless steel manufacturer.
    - b. For copper: 50-50 tin/lead solder, Alloy Grade Sn50, with rosin flux. For lead-coated copper: 60-40 tin/lead solder, Alloy Grade Sn60, with rosin flux.
  - 6. Sealant:
    - a. Elastomeric: Section 07900.
    - b. Epoxy Seam Sealer: Two-part, non-corrosive, aluminum seam-cementing compound as recommended by aluminum manufacturer for exterior and interior non-moving joints including riveted joints.
    - c. Mastic Sealant: Polyisobutylene, nonhardening, nonskinning, nondrying, nonmigrating sealant.
  - 7. Metal Accessories and Fasteners: Provide sheet metal clips, straps, anchoring devices, and similar accessory units as required for installation of Work, matching, matching finish of exposed heads, or compatible with material being installed as approved; noncorrosive; size and thickness required for performance per approved samples.
  - 8. Gutter Screen: 1/4-inch non-corrosive hardware cloth installed in sheet metal frames.
  - 9. Adhesives: Type recommended by flashing sheetmetal manufacturer for waterproof and weather-resistant seaming and adhesive application of flashing sheetmetal.
  - 10. Roofing Cement: ASTM D4586, Type I, asbestos free, asphalt based.
  - 11. Asphalt Mastic for under flashing receivers and counterflashing and paint on lap seams and base flashing: SSPC-Paint 12, solvent-type mastic, nominally free of sulfur and containing no asbestos fibers, compounded for 15-mil dry-film thickness per coat.

## **2.02 FABRICATION, GENERAL:**

- A. Sheet Metal Fabrication Standard: Fabricate sheet metal flashing and trim to comply with recommendations of SMACNA's "Architectural Sheet Metal Manual" that apply to the design, dimensions, metal, and other characteristics of the item indicated.
- B. Comply with details shown to fabricate sheet metal flashing and trim that fit substrates and result in waterproof and weather-resistant performance once installed. Verify shapes and dimensions of surfaces to be covered before fabricating sheet metal.
- C. Form exposed sheet metal Work that is without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems.

- D. Expansion Provisions: Space movement joints at maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped or bayonet-type expansion provisions in the Work cannot be used or would not be sufficiently weatherproof and waterproof, form expansion joints or intermeshing hooked flanges, not less than one-inch deep, filled with mastic sealant (concealed within the joints).
- E. Fabricate nonmoving joints with flat-lock seams. For tin edges to be seamed, form seams and solder. For aluminum to be seamed, form seams and seal with epoxy seam sealer and rivet joints for additional strength as approved.
- F. Sealed joints: Form movable joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.
- G. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of sheet metal exposed to public view.
- H. Fabricate cleats and attachment devices from same material as sheet metal component being anchored or from compatible, noncorrosive metal recommended by sheet metal manufacturer.
  - 1. Size: As recommended by SMACNA manual or sheet metal manufacturer for application but never less than thickness of metal being secured.

### **2.03 SHEETMETAL FABRICATIONS:**

- A. Downspout: Plain, rectangular, lead-coated copper in accordance with SMACNA Architectural Sheet Metal Manual standards, unless otherwise shown.
- B. Gutters: Lead-coated copper in accordance with SMACNA standards.
- C. Gutter Screen: Fabricate screen and frame of approved material
- D. Reglets:
  - 1. Stainless steel or lead-coated copper, matching flashing material, closed-slot, friction-type.
- E. Roof and Wall-to-Roof Expansion Joint Covers:
  - 1. Combination of neoprene and lead-coated copper or stainless steel, with the following additional requirements:
    - a. Cover with neoprene bonded to metal edgings by means of neoprene-based adhesive comprising primer and vulcanizing cement to produce high-strength bond.
    - b. For neoprene part of cover, cured neoprene sheet, tensile strength 1,500-psi minimum, elongation 250-percent minimum, bonded to metal with peel-pull value of 25 pounds per inch minimum at right angles; thickness and width as shown.
    - c. Edgings of metal cover, four inches wide, perforated with holes four inches on centers minimum.
- F. Coping and Gravel Stops:
  - 1. Extruded aluminum or stainless steel, assemblies tested for wind-uplift resistance in accordance with UL 580 for Class 90-uplift resistance, or greater as required by jurisdictional authority, with testing performed by testing agency acceptable to the Engineer.

- a. Size: 10-foot long sections, with factory-fabricated corners and intersections, formed with no visible fasteners.
  - b. Movement joint design: Incorporate a waterproof seal using an internal weep system and rubber or vinyl seals into the non-welded joints.
  - c. Fasteners and clips: As standard with the manufacturer for required wind-uplift resistance. Where exposed, finish to match the metal finish.
- G. Flashing for Plumbing Vents:
- 1. Lead, sized to extend at least four inches horizontally on roof around pipe, over pipe, and one-inch inside pipe.
- H. Strainer:
- 1. Stainless-steel ,12-gauge wires spaced not greater than 1/2-inch apart, as shown and as approved.
- I. Miscellaneous-waterproofing sheetmetal flashings, fasciae, trims, drip edges, scuppers, conductor heads, shower pans, splash pans, and overhead piping safety pans:
- 1. Fabricated from material as previously specified, sized as shown and as approved.

### **PART 3 - EXECUTION**

#### **3.01 PREPARATION:**

- A. Clean dirt, debris, grease, oil and other foreign substances from surfaces that are to receive metalwork. Coordinate with work of other Sections: 04215, 04220, 07411, and 07730.

#### **3.02 INSTALLATION:**

- A. Coordinate flashing and sheet metal with the work of other trades. Shop-fabricate the work whenever possible. Provide for expansion and contraction of sheet metal.
- B. Install the work of this Section in accordance with the NRCA Roofing and Waterproofing Manual, performance requirements, manufacturers' instructions and SMACNA's Architectural Sheet Metal Manual. Anchor units securely in place by methods indicated and conceal fasteners where possible. Set units true to line and level with exposed edges folded back to form hems. Install exposed sheetmetal without excessive oil canning, buckling and tool marks. Verify shapes and dimensions of surfaces to be covered prior to fabrication and trim to fit substrates. Install work with laps, joints and seams that will be permanently watertight and weatherproof. Provide for thermal expansion of metal units. Space movement joints at a maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped or bayonet-type expansion provisions cannot be used or would not be sufficiently weatherproof and waterproof, form expansion joints of intermeshing hooked flanges not less than one-inch deep and fill with mastic sealant concealed within joints. Form nonexpansion joints in metal to accommodate elastomeric sealant to comply with SMACNA standards. Fill joint with sealant and form metal to completely conceal sealant. Use joint adhesive for non-moving joints specified not to be soldered. Fabricate non-moving seams in sheetmetal with flat-lock seams, except fabricate non-moving seams in aluminum with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints as approved for additional strength.. Tin edges to be seamed, form seams and solder.
- C. Perform cutting, drilling and other operations in connection with sheet metal work to accommodate work of other trades. Provide accessories as recommended by SMACNA Architectural Sheet Metal Manual.

- D. Where sheet metal abuts or interfaces with adjacent materials, join as shown on approved shop drawings. Isolate dissimilar metals by use of compatible coatings or other approved methods. Apply red-rosin paper backing for sheet metal applied to any surface to permit movement caused by expansion or to prevent galvanic action.
- E. Soldering:
1. Clean surfaces to be soldered to remove oils and foreign matter. Brush liberal amount of flux on seams, solder immediately, neutralize acid and clean.
  2. Solder slowly, thoroughly heating seam and completely sweating solder through full width of seam. Use ample solder for full width along seams.
  3. Do not solder aluminum and coil-coated galvanized steel sheet. Pre-tinning is not required for lead and lead-coated copper. Do not use torches for soldering, heat surfaces to receive solder and flow solder into joint. Fill joint completely. Completely remove flux and spatter from exposed surfaces.
- F. Seams:
1. Flat lock: 3/4-inch wide, minimum.
  2. Solder lap: One-inch wide, minimum
  3. Unsoldered plain lap: Three-inches wide, minimum.
  4. Seams: Corresponding to direction of flow.
- G. Form flashings from material shown or specified made up from sheets eight to 10 feet long with locked and soldered seams into units of not more than 16 feet. Join units together with three-inch wide loose-locked seams filled with sealant before units are joined. Runs of flashing shorter than 16 feet will not require loose-seam joints. Miter corners and join by locked and soldered joints.
- H. Install expansion-joint covers as indicated and in accordance with manufacturer's recommendations. Splice ends of adjoining lengths of covers with neoprene tabs applied to both faces with approved adhesive. Provide prefabricated corners, intersections and crossovers.
- I. Form cap flashing at parapet walls and other vertical surfaces to extend into metal reglets built into structure and prefilled with sealant. Lap built-up roof flashings and form metal to provide spring action against roof flashings. Prior to installation, coat flashing portions to be concealed with bituminous paint.
- J. Where cants do not occur at intersections of roof decks and vertical surfaces of walls and other construction, provide flashings. Extend base flashings up vertical surfaces eight inches unless otherwise shown, behind metal cap flashing and out onto roof or horizontal surface not less than eight inches. Coat back sides of base flashing with bituminous paint and set into angle formed by roof and vertical surfaces after three plies of roofing-felt reinforcement have been laid. Nail flange with nails spaced three inches on centers and 3/4-inch from edge into wooden nailer provided in roof slab. Secure metal flashing at roof edges according to FM Loss Prevention Data Sheet 1-49 for specified wind zone.
- K. Reglets: Form reglets to reproduce detail and design shown. Form sharp, even and true profiles, bends and intersections. Lock or lap joints and solder or reinforce joints as shown on approved shop drawings or specified. Install reglets to receive counterflashings: Furnish reglets for installation under Division 3 concrete and under Division 4 masonry.
- L. Coping: Install coping in accordance with manufacturer's recommendations. Locate fasteners and clips as follows:
1. At joints and at five-foot maximum intervals.
  2. Center butt joints over anchor clips.
  3. Secure in place allowing for thermal expansion and establishing watertight joint.

- M. Counterflashings: Coordinate installation of counterflashings with installation of assemblies to be protected by counterflashing. Install counterflashings in reglets or receivers. Secure in a waterproof manner by means of snap-in installation and sealant, lead wedges and sealant, interlocking folded seam, or blind rivets and sealant. Lap counterflashing joints a minimum of 2 inches and bed with sealant.
- N. Roof-Drainage System: Install drainage items fabricated from sheet metal, with straps, adhesives, and anchors recommended by SMACNA's Manual or the item manufacturer, to drain roof in the most efficient manner. Coordinate roof-drain flashing installation with roof-drainage system installation. Coordinate flashing and sheet metal items for steep-sloped roofs with roofing installation. Install strainer at top of downspout.
- O. Equipment Support Flashing: Coordinate equipment support flashing installation with roofing and equipment installation. Weld or seal flashing to equipment support member.
- P. Roof-Penetration Flashing: Coordinate roof-penetration flashing installation with roofing and installation of items penetrating roof. Install flashing as follows:
  - 1. Turn flashing down inside vent piping, being careful not to block vent piping with flashing.
  - 2. Seal and clamp flashing to pipes penetrating roof, other than lead flashing on vent piping.
- Q. Install continuous gutter screens on gutters with noncorrosive fasteners, arranged as hinged units to swing open for cleaning gutters.
- R. Overhead-Piping Safety Pan: Suspend pans from pipe and install drain line to plumbing waste or drain line.
- S. Splash Pans: Install where downspouts discharge on low-sloped roofs, unless otherwise shown. Set in roof cement or sealant compatible with roofing material.
- T. Install sealant in accordance with Section 07900.
- U. Install wood blocking in accordance with Section 06100.

**3.03 CLEAN-UP:**

- A. Clean up rubbish and debris caused by this work and remove from site.
- B. Promptly remove drippings and stains of materials from exposed surfaces.
- C. Provide final protection and maintain conditions that ensure sheet metal flashing and trim Work during construction is without damage or deterioration other than natural weathering at the time of Substantial Completion.

**END OF SECTION**

## SECTION 07730

### ROOF ACCESSORIES

#### PART1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section specifies providing roof hatches, equipment supports, roof vents, snow guards and miscellaneous roof accessories.
- B. Related Work Specified Elsewhere:
  - 1. Rough Carpentry: Section 06100.
  - 2. Seals and Sealants: Section 07900.
  - 3. Roof Anchors: Section 11010

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
  - 1. Product Data: For each type of product indicated. Include construction details, materials, dimensions of individual components and profiles, and finishes.
  - 2. Shop Drawings: Show fabrication and installation details. Indicate dimensions, weights, loadings, required clearances, method of field assembly, and components. Include plans, elevations, sections, details, and attachments to other Work.
  - 3. Coordination Drawings: Roof plans drawn to scale and coordinating penetrations and roof-mounted items. Show the following:
    - a. Size and location of roof accessories specified in this Section.
    - b. Method of attaching roof accessories to roof or building structure.
    - c. Other roof-mounted items including mechanical and electrical equipment, ductwork, piping, and conduit.
  - 4. Samples for Verification: For each type of exposed finish required, prepared on Samples in manufacturer's standard sizes, and of same thickness and material indicated for the Work. If finishes involve normal color or shade variations, include sample sets showing the full range of variations expected. Provide a mock-up of custom-fabricated items
  - 5. Certification.

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
  - 1. Comply with codes and regulations of the jurisdictional authorities.
  - 2. NRCA: Roofing and Waterproofing Manual.
  - 3. SMACNA: Architectural Sheet Metal Manual.
  - 4. ASTM: A653, A729, A780, B209, B221, C920, C1036, D256, D4586, E527.
  - 5. UL 793, 972.
  - 6. SSPC - Paint 12
  - 7. NFPA: 204M.
  - 8. NAAMM.

##### 1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver products to jobsite in original unopened containers clearly labeled with manufacturer's name and brand designation, type, class and rating as applicable.
- B. Store products in approved dry area and protect from contact with soil and from exposure to the elements.
- C. Handle products to prevent breakage of containers and damage to products.

#### PART 2 - PRODUCTS

## 2.01 MATERIALS, GENERAL:

- A. Aluminum Sheet: ASTM B 209 for alclad alloy 3005H25 or alloy and temper required to suit forming operations, with mill finish, unless otherwise indicated
- B. Extruded Aluminum: ASTM B 221 alloy 6063-T52 or alloy and temper required to suit structural and finish requirements, with mill finish, unless otherwise indicated
- C. Galvanized Steel Sheet: ASTM A 653 with G90 coating designation; commercial quality, unless otherwise indicated.
  - 1. Structural Quality: Grade 40, where indicated or as required for strength.
- D. Aluminum-Zinc Alloy-Coated Steel Sheet: ASTM A 792 with Class AZ-50 coating, structural quality, Grade 40, or as required for strength.
- E. Plastic Sheet: Unless additional thickness is required for light transmittances, provide glazing plastic sheet thickness required for 40-lbf/sq. ft. external and 20-lbf/sq. ft. internal loading pressures as recommended by the manufacturer for the size and shape indicated.
  - 1. Polycarbonate: Thermoformable, monolithic polycarbonate sheets manufactured by the extrusion process, burglar-resistance rated per UL 972 with average impact strength of 16 ft-lbf/in. of width when tested according to ASTM D 256, Method A (Izod)
- F. Insulation: Manufacturer's standard rigid or semirigid glass-fiber board of thickness indicated.
- G. Wood Nailers: Not less than 1-1/2 inches thick complying with Section 06100.
- H. Fasteners: Same metal as metals being fastened, or nonmagnetic stainless steel or other noncorrosive metal as recommended by manufacturer. Match finish of exposed fasteners with finish of material being fastened.
  - 1. Where removing exterior exposed fasteners affords access to building, provide nonremovable fastener heads.
- I. Gaskets: Manufacturer's standard tubular or fingered design of neoprene, EPDM, or PVC; or flat design of foam rubber, sponge neoprene, or cork.
- J. Bituminous Coating: SSPC-Paint 12, solvent-type bituminous mastic, nominally free of sulfur and containing no asbestos fibers, compounded for 15-mil dry film thickness per coating.
- K. Mastic Sealant: Polyisobutylene; nonhardening, nonskinning, nondrying, nonmigrating sealant.
- L. Elastomeric Sealant: Generic type recommended by unit manufacturer that is compatible with joint surfaces; ASTM C 920, Type S, Grade NS, Class 25, and Uses NT, G, A, and, as applicable to joint substrates indicated, O and in accordance with Section 07900.
- M. Roofing Cement: ASTM D 4586, nonasbestos, fibrated asphalt cement designed for trowel application or other adhesive compatible with roofing system.

## 2.02 ROOF CURBS AND EQUIPMENT SUPPORTS:

- A. General: Provide roof curbs capable of supporting superimposed live and dead loads, including equipment loads and other construction to be supported on roof curbs. Coordinate dimensions with rough-in information or Shop Drawings of equipment to be supported.
- B. Fabrication: Unless otherwise indicated or required for strength, fabricate units from minimum 0.0747-inch thick, structural-quality, hot-dip galvanized or aluminum-zinc alloy-coated steel sheet; factory primed and prepared for painting with welded or sealed mechanical corner joints.

### 2.03 ROOF HATCHES:

- A. General: Fabricate units to withstand 40-lbf/sq. ft. external and 20-lbf/sq. ft. internal loading pressure. Frame with minimum 9-inch- high, integral-curb, double-wall construction with 1-1/2-inch insulation, formed cants and cap flashing (roofing counterflashing), with welded or sealed mechanical corner joints. Provide double-wall cover (lid) construction with 1- inch-thick insulation core. Provide gasketing and equip with corrosion-resistant or hot-dip galvanized hardware including pintle hinges, hold-open devices, interior padlock hasps, and both interior and exterior latch handles.
- B. Type: Single-leaf personnel access.
  - 1. For Ladder Access: 30 by 36 inches.
  - 2. For Ship's Ladder Access: 30 by 54 inches.
    - a. For Stair Access: 30 by 102 inches.
- C. Type: Double leaf for equipment access.
  - 1. Size: 72 by 96 inches.
- D. Material and Finish: Galvanized steel, baked enamel.
- E. Sloping Roofs: Where slope or roof deck exceeds 1/4 inch per foot (1:48), fabricate hatch curbs with height tapered to match slope to level tops of units.

### 2.04 SMOKE VENTS:

- A. General: Automatically operated roof vents for heat and smoke constructed to operate (open) without power source that could be interrupted during a fire. Custom fabricate units only to extent necessary to comply with indicated dimensions and other special requirements.
- B. Live Load and Uplift: Unless otherwise indicated, fabricate to withstand a minimum 10-lbf/sq. ft. external live load and 30-lbf/sq. ft. uplift.
- C. Regulatory Requirements: Comply with provisions of the following:
  - 1. UL 793, for construction and performance of automatically operated roof vents for heat and smoke
  - 2. NFPA 204M, for heat-and-smoke vent design constraints, operation, size, and location.\
- D. Framing: Fabricate from the following materials, with manufacturer's standard welded or sealed mechanical corner joints, including cap flashing (roofing counterflashing):
  - 1. Material: Formed sheet or extruded aluminum or galvanized steel, at Contractor's option
    - a. Finish: Baked enamel.
    - b. Finish: High-performance organic coating.
  - 2. Unit Support: Double-wall curb construction with 1-inch insulation, of height indicated or, if not indicated, for mounting with height minimum 9 inches above roof membrane.
    - a. Provide formed cants and base profile coordinated with roof type and insulation thickness.
  - 3. Sloping Roofs: Where slope of roof deck exceeds 1/4 inch per foot(1:48), fabricate curbs with height tapered to match slope to level tops of units.
- E. Dome-Type Units: Manufacturer's standard gravity-opened, shrink-back and drop-out, acrylic or PVC sheet, dome unit for 165 deg F activation. Provide glazing system for easy replacement of activated domes and for drainage of condensation to exterior.
  - 1. Inner Double-Dome Color: Bronze.

### 2.05 SNOWGUARDS:

- A. L-shaped stop-type, metal or plastic.
- B. Provide in accordance with approved mock-up sample.

## **2.06 FINISHES, GENERAL:**

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## **2.07 ALUMINUM FINISHES:**

- A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- B. Conversion-Coated and Factory-Primed Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below).
  - 1. Organic Coating: Air-dried primer of not less than 2.0-mil/0.5-mm dry film thickness.
- C. Baked-Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's specifications for cleaning, conversion coating, and painting. Below references AAMA standard for pigmented organic coating on extrusions. Color as selected by the Authority's representative.
- D. High-Performance Organic Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
  - 1. Fluoropolymer Two-Coat System: Manufacturer's standard two-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight. Color as selected by the Authority's representative.

## **2.08 GALVANIZED STEEL SHEET FINISHES:**

- A. Surface Preparation: Clean surfaces with nonpetroleum solvent so surfaces are free of oil and other contaminants. After cleaning, apply a conversion coating suited to the organic coating to be applied over it. Clean welds, mechanical connections, and abraded areas, and apply galvanizing repair paint specified below to comply with ASTM A 780.
  - 1. Galvanizing Repair Paint: High-zinc-dust-content paint for regalvanizing welds in steel, complying with SSPC-Paint 20.
- B. Baked-Enamel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-enamel finish consisting of prime coat and thermosetting topcoat, with a minimum dry film thickness of 1 mil for topcoat. Comply with paint manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of 2 mils.

## **PART 3 - EXECUTION**

### **3.01 INSTALLATION**

- A. General: Comply with manufacturer's written instructions. Coordinate installation of roof accessories with installation of roof deck, roof insulation, flashing, roofing membranes, penetrations, equipment, and other construction involving roof accessories to ensure that each element of the Work performs properly and that combined elements are waterproof and weather tight. Anchor roof accessories securely to supporting structural substrates so they are capable of withstanding lateral and thermal stresses, and inward and outward loading pressures
- B. Install roof accessory items according to construction details of NRCA's "Roofing and Waterproofing Manual," unless otherwise indicated,
- C. Separation: Separate metal from incompatible metal or corrosive substrates, including wood, by coating concealed surfaces, at locations of contact, with bituminous coating or providing other permanent separation.
- D. Flange Seals: Unless otherwise indicated, set flanges of accessory units in a thick bed of roofing cement to form a seal.
- E. Cap Flashing: Where required as component of accessory, install cap flashing to provide waterproof overlap with roofing or roof flashing (as counterflashing). Seal overlap with thick bead of mastic sealant.
- F. Operational Units: Test-operate units with operable components. Clean and lubricate joints and hardware. Adjust for proper operation.
- G. Heat-and-Smoke Vents: Locate, install, and test according to NFPA 204M.
- H. Install wood nailers in accordance with Section 06100.
- I. Install sealants in accordance with Section 07900.
- J. Adhere snow guards to sheetmetal roofing by approved silicone sealant as specified in Section 07900. Locate and space snow guards in accordance with manufacturer's recommendations. Where snow guards are located on standing seams, provide approved mechanical fastenings.

### **3.02 CLEANING AND PROTECTION:**

- A. Clean exposed surfaces according to manufacturer's written instructions. Touch up damaged metal coatings.

**END OF SECTION**

## SECTION 07815

### SPRAYED FIREPROOFING

#### PART 1 - GENERAL

##### 1.01 DESCRIPTION:

- A. This section includes providing sprayed fireproofing for application to structural steel.

##### 1.02 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings:
    - a. Product data, installation instructions, and recommendations for each sprayed fireproofing product and auxiliary material, demonstrating compliance with requirements. Include written data verifying that applied thicknesses meet specified hourly fire-resistance ratings.
    - b. Structural framing plans indicating the following:
      - 1) Surface preparation requirements required prior to fireproofing application.
      - 2) Extent of sprayed fireproofing for each different construction and fire-resistance rating including the following:
        - a) Applicable fire-resistive design designations of inspecting and testing agency acceptable to authorities having jurisdiction.
        - b) Minimum thicknesses needed to achieve required fire-resistance ratings of structural components and assemblies.
      - 3) Treatment of fireproofing after application.
  2. Samples: Three of each type of the following:
    - a. Sprayed fireproofing sample 12 inches square by 3/8 inch thick.
    - b. Metal lath, anchorage devices, and accessories.
    - c. In-place samples of each type of fireproofing sprayed on structural-steel elements where directed and in thickness required for specified hourly fire-resistance ratings for testing by the Engineer.
  3. Quality Assurance Submittals:
    - a. Qualification Data: For firms and persons specified in the Quality Assurance article to demonstrate their capabilities and experience.
    - b. Code Approval: Submit research or evaluation reports of the model code organization acceptable to authorities having jurisdiction showing that sprayed fireproofing products comply with the building code.
    - c. Manufacturer's certification that the sprayed fireproofing system and each product used are compatible with adhesives, primers and other surface coatings on substrates indicated.
  4. Certification:

##### 1.03 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications.
1. Comply with codes and regulations of the jurisdictional authorities.
  2. UL: Fire Resistance Directory, Building Materials Directory.
  3. ASTM: E84, E119, E605, E736, E759, E760, E761, E859, E937, G21.

4. AWCI: Technical Manual 12-A.
- B. Fire-Test-Response Characteristics: Provide sprayed fireproofing products identical to those used in assemblies tested for the following fire-test-response characteristics by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify packages containing fireproofing with appropriate classification markings of applicable testing and inspecting agency.
  1. Fire-Resistance Ratings: As indicated by reference to fire-resistive designs listed in UL Fire Resistance Directory, or in the comparable publication of another testing and inspecting agency acceptable to authorities having jurisdiction, for fire-resistive assemblies where sprayed fireproofing serves as direct-applied protection, tested in accordance with ASTM E119.
  2. Surface-Burning Characteristics: As indicated for each sprayed fireproofing product required, tested in accordance with ASTM E84.
- C. Manufacturer Qualifications: Obtain sprayed-on fireproofing system materials from a single manufacturer who evaluates and licenses installers to ensure products are properly installed.
- D. Installer Qualifications: Employ an experienced installer licensed by the sprayed fireproofing manufacturer as having the necessary skill, training, experience and staff to install manufacturer's products as specified and in accordance with manufacturer's recommendations.
- E. Certify that each product in the sprayed fireproofing system is compatible with adhesives, primers, and other surface coatings on substrates.
- F. Provide fireproofing products containing no asbestos.

#### **1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:**

- A. Deliver products to jobsite in original unopened containers clearly labeled with manufacturer's name and brand designation, referenced specification number, type, class and ratings as applicable.
- B. Store products in an approved dry area. Protect from contact with soil and from exposure to the elements. Keep products dry.
- C. Handle products to prevent breakage of containers and damage to products.
- D. Use materials with limited shelf life within period indicated. Discard materials whose shelf life has expired.

#### **1.05 JOB CONDITIONS:**

- A. Environmental Requirements:
  1. Application of sprayed fireproofing when temperature of substrate material or ambient temperature is lower than 40F is prohibited. Maintain temperature above 40F until fire proofing is cured and dried.
  2. Additional environmental requirements in accordance with manufacturer's recommendations.
  3. Provide ventilation in area to receive sprayed fireproofing, introducing fresh air and exhausting air continuously for 24 hours after application to maintain nontoxic, unpolluted, safe working area.

- B. Coordination: Coordinate installation work to minimize need for other trades to cut into applied fireproofing.
  - 1. Perform application only when substrate construction and penetrating work is complete.
  - 2. Ensure that attachments to steel for work of other trades are complete before application of fireproofing.
  - 3. Immediately patch cut-away fireproofing to comply with requirements for original work.
  - 4. Install fireproofing prior to installation of ductwork, piping, conduits, suspended equipment and other obstructions.

## **PART 2 - PRODUCTS**

### **2.01 SPRAYED CEMENTITIOUS FIREPROOFING:**

- A. General: Factory-mixed, dry formulation listed in the UL Building Materials Directory or by another testing and inspecting agency acceptable to authorities having jurisdiction, consisting of portland cement, additives and mineral aggregates mixed with water at project site to form a slurry for pumping and dispersal by compressed air.
- B. Physical Properties: Minimum values, unless otherwise indicated or higher values required to attain designated fire-resistance ratings, measured per standard test methods referenced with each property listed below:
  - 1. Dry Density: 15 pcf for average and individual densities regardless of density indicated in referenced fire-resistive design, or greater if required to attain fire-resistance ratings indicated, as determined per ASTM E605 or Appendix A, Alternate Method for Density Determination, of AWC Technical Manual 12-A.
  - 2. Bond Strength: 300 psf as determined in accordance with ASTM E736.
  - 3. Compressive Strength: 1400 psf as determined in accordance with ASTM E761.
  - 4. Surface-Burning Characteristics: Provide materials with the following maximum surface-burning characteristics as determined in accordance with ASTM E84.
    - a. Flame spread: 10.
    - b. Smoke developed: 0.
  - 5. Corrosion Resistance: No evidence of corrosion as determined in accordance with ASTM E937.
  - 6. Deflection: No cracking, spalling, delamination or the like as determined in accordance with ASTM E759.
  - 7. Effect of Impact on Bonding: No cracking, spalling, delamination or the like as determined in accordance with ASTM E760.
  - 8. Air Erosion: Maximum weight loss of 0.0025 gram per sq. ft. in 24 hours as determined per ASTM E859.
  - 9. Fungal Resistance: No observed growth on specimens in accordance with ASTM G21.
  - 10. Thickness: Provide minimum average thickness required for fire-resistive design indicated according to the following criteria, but not less than 3/8 inch, as determined per ASTM E605.
    - a. Where the referenced fire-resistive design lists a thickness of one inch or greater, the minimum allowable individual sprayed-on fireproofing thickness is the design thickness minus 1/4 inch.
    - b. Where the referenced fire-resistive design lists a thickness of less than one inch but more than 3/8 inch, the minimum allowable individual sprayed-on fireproofing thickness is the greater of 3/8 inch or 75 percent of the design thickness.

## **2.02 AUXILIARY FIREPROOFING MATERIALS**

- A. General: Provide auxiliary fireproofing materials that are acceptable to primary material manufacturer, are compatible with sprayed fireproofing products and substrates and are approved by UL or another testing and inspecting agency acceptable to authorities having jurisdiction for use in the fire-resistive designs indicated.
- B. Substrate Primers: Unless fireproofing manufacturer recommends against priming, provide primer that complies with one or more of the following requirements:
  - 1. Bond strength complies with requirements specified in UL Fire Resistance Directory for coating materials based on a series of bond tests in accordance with ASTM E736.
  - 2. Primer is identical to those used in assemblies tested for the fire-test-response characteristics of sprayed-on fireproofing, in accordance with ASTM E119, by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
- C. Adhesive for Bonding Fireproofing: Product approved by manufacturer of sprayed-on fireproofing.
- D. Metal Lath, Anchorage Devices and Accessories: Use only stainless steel, zinc alloy or hot-dip galvanized types as recommended by manufacturer for applications indicated.
- E. Topcoats: Type as recommended by manufacturer for applications indicated.

## **PART 3 - EXECUTION**

### **3.01 EXAMINATION:**

- A. Examine substrates with installer present to determine that they are in satisfactory condition to receive sprayed-on fireproofing. A substrate is in satisfactory condition if it complies with the following:
  - 1. Substrate is free of oil, grease, rolling compounds, incompatible primers, loose mill scale, dirt, or other foreign substances capable of impairing bond of fireproofing with substrate under conditions of normal use or fire exposure.
