1.0 INTRODUCTION

The Washington Metropolitan Area Transit Authority ("WMATA") is proposing a joint development of the West Falls Church (WFC) Metro Station (the "Project"). The project area is in Falls Church, Virginia. The Project is bounded by I-66 to the north and east; by residential properties and Haycock Road on the south, and by Meridian High School and Northern Virginia Center on the west. A development team consisting of EYA, Hoffman, and Rushmark ("Developer") has been selected and has begun planning of the site. The project location is shown in **Figure 1**. The proposed joint development project would include the following modifications of WMATA facilities to the south of the station:

- Reduce existing commuter Park & Ride capacity from 2,009 spaces to 1,350 spaces, eliminating the south parking lot.
- Relocate the Kiss & Ride spaces to a new roadway closer to station; reduce capacity from 64 spaces to approximately 20 spaces, including about 10 short-term paid spaces, two ADA spaces, and short-term and drop-off spaces.
- Replace the eight south side bus bays currently located in a bus loop with four to eight bus bays along a new roadway immediately adjacent to the station plaza.
- Eliminate or reduce 68 Metro-operated hourly paid parking spaces along the Metro
 Access Road.

Because the Project includes a modification of Metro station facilities and station access, an Environmental Evaluation has been prepared to assess the potential effects of this action. To support WMATA Compact requirements, specifically Section 14(c)(1), this Environmental Evaluation describes the Project, and documents the potential effects of the Metro Station facility modifications on the human and natural environment in terms of transportation, social, economic, and environmental factors. This Environmental Evaluation only assesses impacts where changes to the Metro facilities are proposed.

For purposes of project implementation, the Developer will be responsible for complying with Fairfax County, State of Virginia, and all federal requirements for the Project. WMATA and the Developer will coordinate with Fairfax County and, in accordance with County guidance, follow the county's development process. This includes adhering to the recently enacted Site Specific Plan Amendment to the West Falls Church Transit Station Area, which established the vision and general characteristics of the desired development. The developer will then refine specific plans for the site based on input from county staff and the public for the Concept Development Plan and Final Development Plan submissions necessary to implement the project.

Figure 1. Project Location Map

2.0 EXISTING SITE DESCRIPTION

Metro operates the West Falls Church Metro Station in Fairfax County, Virginia on the Metrorail Orange Line. It is served by Metrobus route 28A, Fairfax Connect routes 703 and 480, and Loudoun County Transit Route 902.

The Metro station has two entrances: the north side is accessible only from a bus loop, and the south side is accessible from buses, kiss-and-ride, and park-and-ride. The south entrance access facilities contain the Project Site. The Metro station entrance on this side is at grade level, with an overpass over eastbound I-66. The tracks and platform are located in the median of I-66 at a lower elevation.

An overview of the existing transportation facilities is shown in **Figure 2** and a detailed description in the subsections below, with a focus on access to the facilities from the south entrance:

Figure 2. Existing Transportation Facilities

2.1 Metrobus and Other Bus Providers

Fairfax Connector (Route 480 to Wolf Trap National Park) and Loudoun County Transit (Route 902 to Broad Run Farms) utilize the northside bus bays. Fairfax County Connector service begins two hours prior to each performance at the Wolf Trap Filene Center and the buses leave every 20 minutes, with the last bus leaving at showtime. Loudoun County Transit service departs from West Falls Church Metrorail Station Monday-Friday at 4:10 p.m., 5:30 p.m., and 6:50 p.m.

Metrobus Route 28A (Leesburg Pike Line) to Tysons Corner and King St-Old Town, and Metrobus shuttles utilize the southside bus bays. Route 28A to Tysons Corner operates seven days a week and departs from the station every 12 minutes every day from 7 a.m.-9 p.m. and every 12-20 minutes after 9 p.m. Route 28A to Alexandria operates seven days a week and departs every 12 minutes every day from 7 a.m.-9 p.m. every 12-20 minutes after 9 p.m. During track work and/or rail shutdown events, bus bays G and H will also be served by Metrobus shuttles. See **Table 1** for bus summary.

Valley Flyer	А	Blacksburg, VA	Virginia Breeze - DRPT	n/a	10:00 a.m.	n/a	n/a	10:00 a.m.	n/a	10:00 a.m.	n/a	
Shuttle	G/H	n/a	Metrobus	During trackwork and/or rail shutdowns, these bays will serve Metrobus rail shuttles.								
ESP	E/F	Prince William County	Omniride	During	During rail shutowns and/or other disruptions, these bays will support Omniride's Emergency Service Plan (ESP)							

The Project does not anticipate bus rapid transit (BRT) services coming into the site. The current Northern Virginia Transportation Commission (NVTC) design for Envision Route 7 locates the BRT stop near the intersection of Chestnut Street on Leesburg Pike approximately ½ mile from the Metro Station entrance.

2.2 Park & Ride

Park & Ride (P&R) demand at the West Falls Church station varies significantly throughout the year, with demand being higher during the spring and fall months. 2019 P&R utilization exceeded 1,200 vehicles on 123 days in 2019, by an average of 86 vehicles. However, utilization

occasionally exceeded 1,400 vehicles or fell below 900 vehicles. Given the variability in utilization throughout the year, WMATA prioritizes annual average peak-hour (AAPH) utilization for planning purposes to maximize revenue potential. Summaries of historical AAPH utilization at the station are provided in **Table 2**.

Table 2. Annual Average Peak-Hour P&R Utilization

Year	AAPH Utilization (approx.)	Notable Events
2010-2013 (avg.)	1,700	
2014	2014 1500 WMATA Silver I	
2015	1050	
2016	900	
2017	850	WMATA P&R daily fare rate decrease
2018	950	I-66 and I-495 toll projects completed
2019	1,100	

When the Silver Line opened, the AAPH utilization steadily declined to a low of 862 vehicles in 2017. The AAPH utilization of the Park & Ride (P&R) increased prior to the pandemic, Source: Parking Analysis, 2021

2.3 Kiss & Ride

WMATA operates one Kiss & Ride (K&R) lot on the southside of the station. There are 47 short-term metered spaces, 9 accessible spaces, and 5 pick-up/drop-off designated spaces. The current K&R is underutilized, and observations indicate that it is likely being used by some riders as daily parking. The observed existing K&R demand was 14 vehicles, prior to the pandemic.

2.4 Paid On-Street Parking

WMATA currently operates 68 metered hourly spaces on Metro Access Road.

This page is intentionally left blank.

3.0 PROJECT DESCRIPTION

The purpose of the project is to partially replace and re-design existing WMATA facilities to facilitate the joint development on land owned by WMATA where the parking lots, bus loop, and green space are located adjacent to the Curtis Memorial Parkway (I-66), as shown in **Figure 1**. The existing WMATA Parking Garage would remain.

The Joint Development of the WMATA parcel is being undertaken to create a mixed-use transitoriented neighborhood, with the following goals:

- Increase Metro ridership not only from development located on Metro's property, but also through improved connections to surrounding development and existing communities.
- Improve transportation safety and efficiency.
- Enhance bicycle and pedestrian access and safety, by including:
 - o Improvements to Station Entrance to increase visibility, and
 - A direct multi-modal link between the city development and the Metro Station, with new bike lanes and sidewalks.
- Promote transit-oriented development surrounding the Metro Station.
- Enhance the surrounding community and create inviting spaces around the Metrorail station's transit facilities.

The selected Developer is responsible for planning, securing entitlements and constructing the project. An amendment to Fairfax County's Comprehensive Plan was recently passed by the Board of Supervisors, which will allow for nearly one-million square feet of development on the Metro site. The Developer's proposed program includes

- 24-acre mixed-use development
- Up to 90 townhouses
- Up to 810 multi-family units
- Up to 10,000 square feet of ground-floor retail
- Up to 110,000 square feet of office
- 9 acres of open space

The final design will be refined through the local planning process.

The proposed Site Plan (see **Figure 3**) requires several modifications to Metro Transit Facilities, which are the subject of this evaluation.

Figure 3. Proposed Site Plan

3.1 Modifications to Parking Facilities

3.1.1 Kiss & Ride

The K&R facility will be concentrated along a new roadway within the development area across from the station plaza and will incorporate approximately 20 K&R Spaces (see **Figure 6**, below). Growth in K&R demand is difficult to predict due to increased market penetration of Transportation Network Companies (TNCs) and an increase in K&R volume combined with decreases in K&R dwell times. Using the same growth rates from the MWCOG model and Fairfax County Land Use Plan (LUP), the projected demand in year 2045 is between 16 and 19 vehicles.

3.1.2 Park & Ride

The existing total Park & Ride (P&R) capacity at the West Falls Church Metro station is 2,009 spaces, the majority of which is accommodated by the existing parking garage. The remaining

parking spaces are in two surface lots, which will be redeveloped into residential and office buildings. It is anticipated that 2045 demand can be met by retaining approximately 1,350-1400 parking spaces, based on pre-COVID travel patterns. A detailed Parking Analysis of the station was prepared and is attached as **Appendix D**.

The project has a phasing plan to retain flexibility to address further parking demand. The project will retain the 1,200-space garage. In Phase 1 and 2, the project will retain an additional 150-200 spaces in the north parking lot (as shown in **Figure 4** below), which will be reconfigured to accommodate a new street grid. The north lot is planned as Phase 3, the last phase of the joint development. Prior to construction of that site – anticipated in about 10 years – Metro will reassess its parking needs. Metro will have the option to either 1) retain the north lot for parking (either as a surface lot or for constructing a new parking garage) or 2) allow the developer to redevelop the site and provide 150-200 commuter spaces in the private garages to be constructed on the site for the office and residential buildings planned there (**Figure 5** below).

Figure 5. Phases 1 & 2: Close south lot and reconfigure access to north lot

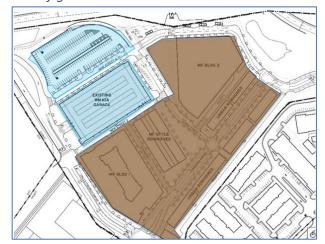

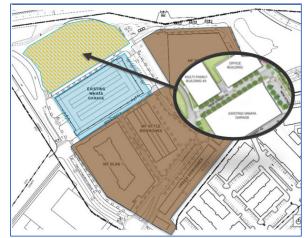

Figure 4. Phase 3: Decide in 2030 (est.) if expansion is needed with north lot development

3.1.3 Paid on-street parking

Metro Access Road is planned to be realigned and reconstructed with a design to support multi-modal access to the Metro Station. This includes bicycle lanes, new sidewalks, and on-street parking. Currently, there are Metro-maintained parking meters along the roadway, available to the public. (Note: Metro has plans to replace the meters with new payment technology systems.) The Project proposes that paid parking would be retained along the street. However, ownership and operations of the paid parking spaces may be transferred to an entity other than Metro, depending on the final ownership and maintenance of the roadway.

3.2 Modifications to Bus Loop

Bus bays that are currently located on the Bus Loop will be relocated to a new roadway that will be immediately parallel to the station plaza. A minimum of four bus bays will be provided along the new roadway and will be designed to meet the requirements needed for the "Standard WMATA Tandem Bus" with sawtooth loading. The site design will allow for up to four additional bus bays and/or bus layover spaces, which may be constructed initially or phased in as needed. (See **Figure 6**.)

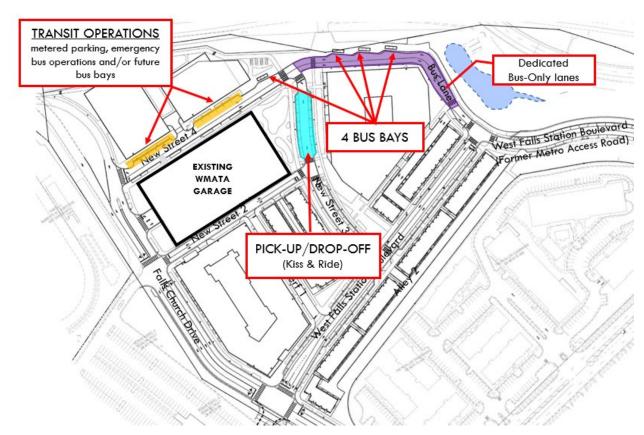

Figure 6. Proposed Bus and Kiss & Ride Facilities

4.0 PROJECT IMPACTS

This section evaluates the potential environmental effects of the Project, which consists of the proposed joint development and associated replacement of WMATA facilities described in Section 3.

4.1 Land Acquisitions and Displacements

Joint Development occurs when a public transportation agency joins with another private or public organization to develop land owned or operated by the transit authority. In the case of the West Falls Church Metro Station, WMATA has selected as its joint developer the team consisting of EYA, Hoffman & Associates, and Rushmark. Transit facilities at the Project site, including Metrorail, Kiss & Ride, Bus Bays, and Park & Ride facilities would remain within WMATA's control. The Developer would be allowed to construct other facilities to achieve transit-oriented development (TOD).

No land acquisitions by WMATA are required for the Project. The existing bus loop will be relocated to bus bays on an adjacent street. The existing Kiss & Ride in front of the Metro Station will be reconstructed to a plaza area and the spaces will be reduced due to demand and located on a street adjacent to the plaza. The WMATA parking garage will remain and will be enhanced. Aside from closing the South parking lot, reducing and reconfiguring P & R spaces, potentially replacing the North parking lot with a garage in the future and potentially removing paid parking on the Metro Access Road, no WMATA facilities will be permanently removed from the site.

Development pad sites will be conveyed to the Developer either fee simple for town houses and condominiums or ground leased for multi-family and office uses. The street grid is proposed to be dedicated as public streets, with appropriate right-of-way transfers or easements provided. The bus bay area, New Street 4, and the Kiss & Ride streets will be retained by WMATA. Private streets will be maintained by the owners of the development phases.

4.2 Transportation

4.2.1 Parking

As part of the Project, the Developer would remove approximately 600-650 Park & Ride spaces through development of the surface parking lots. **Table 3** breaks down existing capacity by facility type, shows other existing facilities, and summarizes proposed capacity in the station area.

Table 3. Existing and Proposed Parking Facilities

Parking Type	Existing Spaces	Proposed Spaces (Phases 1&2)	Proposed Spaces (Phase 3)	Option* (Alternative to Phase 3)
Park & Ride	2,009	~1350	~1350	1,350 to TBD
Kiss & Ride	64	20	20	20

^{*}WMATA will reassess its parking needs prior to Phase 3 and has the option to retain the property to build a Metro garage if determined to be needed.

The remaining 1,350-1,400 Park & Ride spaces are projected to accommodate demand through the year 2045, based on the full parking analysis performed for the West Falls Church Metro Station Development, attached as **Appendix D**.

WMATA will reassess its parking needs for West Falls Church as the Joint Development Project is implemented. Several factors could affect commuter parking demand, including post-COVID changes in commuter travel patterns, the planned openings of Silver Line phase 2 and the I-66 toll lane project, and efforts by Metro to manage parking demand. Additionally, the private development will construct approximately 700 parking spaces, which could potentially be used to serve maximum P&R demand, as described in the parking analysis.

Should there be changes in demand, WMATA is retaining the ability to both add capacity if needed and to manage demand. Prior to Phase 3 of the Joint Development, WMATA will have the option to either 1) retain the north lot for parking (either retaining the surface lot or for constructing a new parking garage expanding capacity) or 2) allow the developer to redevelop the site and provide 150-200 commuter spaces in the private garages to be constructed on the site for the office and residential buildings planned there.

4.2.2 Traffic

A Traffic Impact Study (TIS) was prepared by Gorove Slade in April 2021 in conjunction with a proposal to amend Fairfax County's *Comprehensive Plan* for the West Falls Church Transit Station Area (TSA) in order to provide compatible, non-automobile dependent development. This study was developed in accordance with guidelines and recommendations set forth by the Virginia Department of Transportation (VDOT), Fairfax County, and the City of Falls Church.

Under existing (2019) traffic, all intersections in the area except for VA 7 at Haycock Road operate at acceptable traffic levels of service (LOS) per VDOT standards. Under a future build condition in year 2030, due to anticipated vehicular traffic growth in the area and trips generated from the site development, some intersections in the area will not operate at acceptable LOS without mitigation. As a result, recommended improvements are signal timing

and phasing modifications, addition of travel lanes, and new street connections in the project site. The full traffic study is provided in **Appendix A** *Traffic Impact Study*.

The Developer will be responsible for securing approval of the site plan for any private development, including the final traffic study, from Fairfax County and WMATA. Implementing roadway improvement commitments in these plans and traffic study are conditions for approval.

4.2.3 Metrorail

Transit-oriented joint development at the West Falls Church Metro Station is expected to increase overall ridership at the West Falls Church Metro Station. The addition of the office/multifamily space in accordance with the joint development plan is expected to generate as much as 1,000 new trips per day, based on WMATA's Station Walk Area Ridership Model.

Any increase in ridership at the Metro station due to new employment or residential opportunities associated with the joint development is not expected to be large enough to cause any significant impact on Metrorail operations. An increase in ridership due to the proposed employment uses on site would make better use of existing Metrorail capacity because of the potential for reverse commute rides.

4.2.4 Bus Routes

All routes accessing the bus bays may experience a marginal increase in ridership from people traveling to and from the employment and residential uses associated with the proposed development projects. Bus routes serving the station may experience travel time savings of 10 to 15 percent with route adjustments stemming from the new roadway network and bus bay layout.

4.2.5 Pedestrian and Bicycle Access

Dedicated on-street bicycle infrastructure does not currently exist in the area. Fairfax County's *Comprehensive Plan* calls for a variety of bicycle facility improvements within the vicinity of the study area. In particular, the *Comprehensive Plan* recommends a bike lane along Haycock Road west of I-66 and along Great Falls Street north of I-66, and shared lanes east and south of the respective I-66 crossings. It recommends a shared roadway along Grove Avenue and through the WMATA access drive to the Metro station and a shared-use path from near Falls Church Drive and Haycock Road to the Metro station. The *Comprehensive Plan* highlights a major regional trail system, and a major paved trail at least 8-foot-wide in the vicinity of the study area.

Proposed bicycle facilities around and within the site area are shown in **Figure 7**. The planned trail network is shown in **Figure 8**. Marked crosswalks currently exist at the signalized intersections within the study area, but not on all legs. All marked crossings at signalized

intersections have pedestrian signalization provided, but the full suite of pedestrian crossing amenities is not provided at all locations (accessible pedestrian signals [APS], countdown pedestrian signals [CPS], and detectable warning surfaces on curb ramps). Marked crosswalks are in place on at least a portion of the legs at several unsignalized intersections. Pedestrian paths to Metro exist today and will continue to exist in the future. When the WMATA and Virginia Tech developments are built, pedestrian accessibility and connectivity will be more robust.

Figure 7. Site-Proposed Bicycle Network

Figure 8. Planned Trail Network

4.3 Land Use and Zoning

Based on the Fairfax County Planning & Zoning Viewer, the Project has been assigned a residential (R-30) zone. The purpose of the R-30 zone is to provide for multiple family dwellings at a density not to exceed 30 dwelling units per acre; to provide for affordable dwelling unit developments at a density not to exceed 36 dwelling units per acre; to allow other selected uses, which are compatible with the residential character of the district; and otherwise to implement the stated purpose and intent of the ordinance. The majority of the Project area was determined to have an existing land use classification of utilities due to its use as a transit center. Zoning and current land use are shown in **Figure 9** and **Figure 10**.

Figure 9. Existing Zoning Map

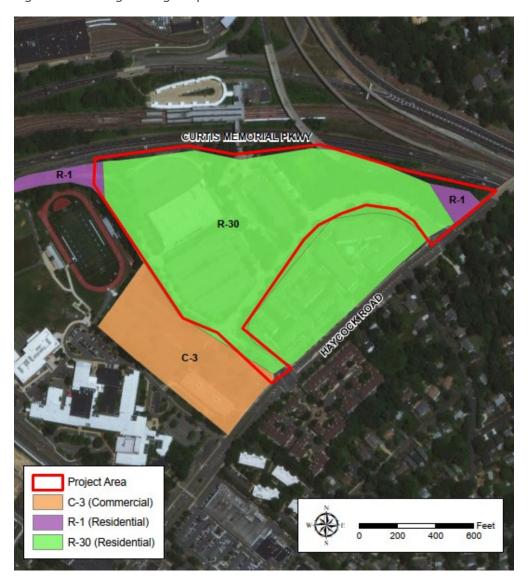

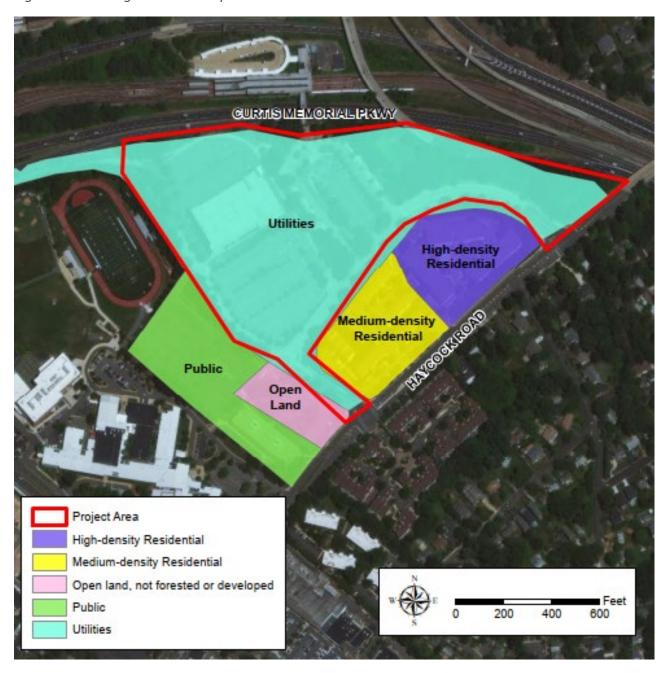

Figure 10. Existing Land Use Map

4.4 Planning Consistency

Table 4 identifies applicable local plans and evaluates the consistency of the Project with them.

Table 4. Local Plans

Plan	Description	Author	Date	Inconsistencies
Concept for Future Development Map	Identifies the West Falls Church Metrorail Station property as one of 11 existing Metrorail stations, and one of 10 Transit Station Areas ("TSAs") in the County. TSAs promote a land use pattern that supports Metrorail by encouraging a mix of uses in a compact, pedestrian-friendly urban form within walking distance of the rail station.	Fairfax County	2012	None
Fairfax County Comprehensive Land Use Plan Map – Baseline Recommendations	Identifies the baseline land use recommendation for the Property as "Public Facilities, Governmental and Institutional Uses," and as a Metrorail station. The Comprehensive Plan map indicates the primary land use recommendation and should be consulted in conjunction with the Area II Plan for more detailed recommendations than generally illustrated on the map.	Fairfax County	2018	None
Fairfax County Comprehensive Plan, 2017 Edition, Area II, McLean Planning District, West Falls Church Transit Station Area	Identifies the West Falls Church TSA as appropriate for higher intensity mixed-use development and is identified as a Transit Development Area ("TDA"). The TDA offers the most viable opportunities for development and redevelopment, including a baseline and options for redevelopment. A revised optional level of development was approved by the Board of Supervisors in July 2021, and recommends the following: - Maximum intensity of up to 0.96 FAR. - Between 105,000 and 120,000 square feet of office use, located adjacent to the Metrorail station entrance. - Between 10,000 and 30,000 square feet of ground floor, community-serving retail or active ground floor uses.	Fairfax County	2021	None

Plan	Description	Author	Date	Inconsistencies
	 Residential use should not exceed a maximum of 900 dwelling units, including approximately 80 townhomes on the periphery of the sub-unit. Maximum building heights ranging from 35 – 120 feet; and Provide publicly accessible parks and open spaces. 			
Transportation Recommendations West Falls Church Transit Station Area – M2 Community Planning Sector	Identifies the planned roadway improvements in the vicinity of the West Falls Church TSA. The following specific transportation improvements are recommended: - A high-quality transit system is expected along the Route 7 corridor. - Appropriately sized bus bays and shelters should be accommodated adjacent to the WMATA Metrorail station entrance; and - Construction of a new two-lane roadway connecting the Metrorail station entrance to a new 2-lane roadway parallel to Haycock Road.	Fairfax County	2015	None
Countywide Trails Plan map	Identifies the County's planned, but not yet built, trail system. Recommendations include a major paved trail (asphalt or concrete), which is eight feet (or more) in width along Haycock Road.	Fairfax County	2018	None
Fairfax County Bicycle Master Plan Map	Identifies the existing and planned bicycle facilities countywide with the following recommended improvements: - A shared roadway facility connecting the Metrorail station entrance to Grove Avenue. - A shared use path from the Metrorail station entrance towards Route 7; and - A bike lane along Haycock Road.	Fairfax County	2014	None

4.5 Neighborhoods and Community Facilities

Within a half-mile of the Project are two public schools (Meridian High School and Mary Ellen Henderson Middle School), Northern Virginia Center (UVA), Mount Royal Park, two shopping centers, and residential housing (see **Figure 11**). Two parks, West End Park and Lemon Road Park, are located just outside the half-mile radius.

The proposed development Project would not create a physical barrier within a neighborhood, isolate a portion of a neighborhood, or have a direct impact on a community facility or access to a community facility.

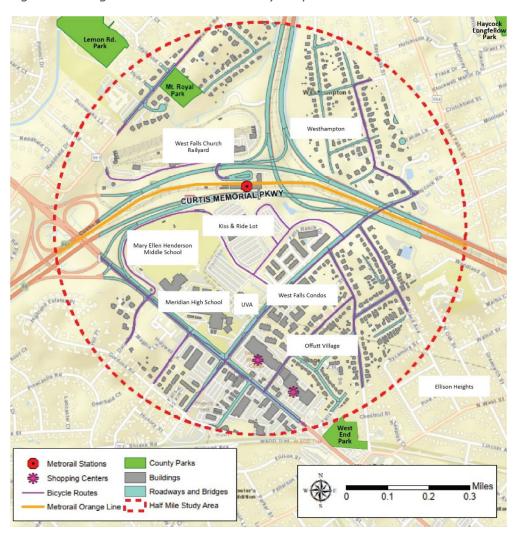

Figure 11. Neighborhood and Community Map

4.6 Environmental Justice Populations

This section identifies minority and low-income populations (collectively "Environmental Justice Populations") in the Project area and assesses the potential for any disproportionately high and adverse impacts to those identified populations. Two block groups were identified within the half mile study area (Block Group 1 and Block Group 5).

4.6.1 Identification of Environmental Justice Populations

A half-mile radius around the Project area was determined to be the appropriate study area boundary ("Census Project Study Area") to analyze the presence of Environmental Justice Populations; all U.S. Census block groups and any portions of block groups that fell within the half-mile boundary of the project site were included. The study area with block groups identified are shown in **Figure 12**. The City of Falls Church and Fairfax County were selected as comparison areas for the Environmental Justice analysis. Minority and low-income populations were then analyzed at the Census block group level using demographic and income data from the U.S. Census Bureau's American Community Survey 5-Year Estimates (2015-2019).

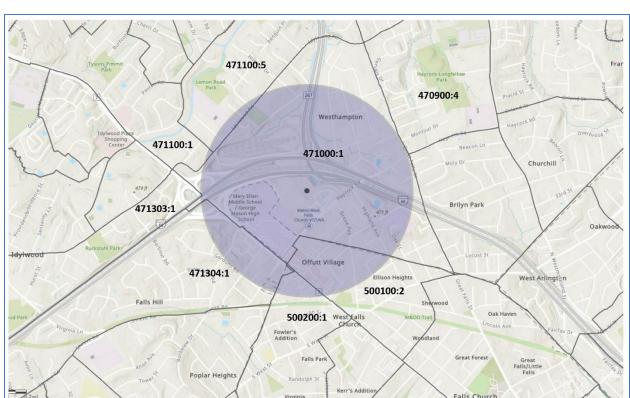

Figure 12. Study Area with Block Groups

Table 5 lists the percentages of minority and low-income residents in the half-mile project study area in comparison to the City of Falls Church and Fairfax County overall. 30.7 percent of the study area population belongs to a minority group, which is about the same as the

percentage within the City of West Falls Church, but lower than Fairfax County. Additionally, 2.4 percent of the study area population is low-income, which is lower than the percentage within the City of Falls Church and that within Fairfax County.

Table 5. Minority and Low-Income Population by Block Group

			Minority		Low-Income			
Census Tract	Block Group	Total Population	Minority Population	Percent (%)	Total Population	Low- Income Population	Percent (%)	
470900	4	4	1	0.0%	4	0	0.0%	
471000	1	1776	539	20.4%	1776	50	1.9%	
471100	1	44	12	0.4%	44	2	0.1%	
471100	5	203	74	2.8%	203	5	0.2%	
471303	1	6	1	0.0%	6	0	0.0%	
471304	1	164	49	1.9%	164	4	0.1%	
500100	2	432	132	5.0%	432	2	0.1%

Minority Total	812	30.7%	4,297	29.4%	593,274	51.7%

4.6.2 Assessment of Disproportionately High and Adverse Impacts

There is no anticipated human environmental impact, including health, economic, and social, on the identified minority and low-income populations within the project study area. No adverse impacts to neighborhoods, community facilities, air quality, noise, vibration, or traffic are anticipated as a result of the Project. Considering these factors, the joint development project would not have "disproportionately high and adverse effects" on identified Environmental Justice Populations.

4.7 Cultural Resources

There are no above-ground historic structures within the Project area, and the ground has been substantially disturbed over the years as a result of development for the original Metro Station facilities.

The Virginia Cultural Resource Information System does not list the property as being located within a registered historic district and has no known archaeological sites.

4.8 Public Parklands

The Mount Royal Park, shown in **Figure 11**, is the only public parkland located within a half-mile of the study area. West End Park and Lemon Road Park are located just outside the half-mile radius. No parks or recreation areas would be impacted by the Project.

4.9 Wetland and Waters of the U.S.

A wetland and waterway delineation of the Project area resulted in the finding of one Palustrine, Unconsolidated Bottom (PUB) pond. This section summarizes the results of the routine wetland and waterway determination.

4.9.1 Methodology

A detailed wetland and Waters of the U.S. delineation was conducted on April 9, 2021 using the 1979 Corps of Engineers Wetlands Delineation Manual and the Regional supplement to the U.S. Army Corps of Engineers Wetland Delineation Manual: Eastern Mountains and Piedmont Region (Version 2.0).

A combination of a desktop assessment and field reconnaissance was employed as part of the effort to determine the presence of wetlands and waterways. The desktop assessment included the review of the following:

- Aerial photography
- Lidar imagery
- United States Geological Survey Topographic maps
- Natural Resources Conservation Service Soil Survey Geographic Database (SSURGO) Web Soil Survey

• United States Fish & Wildlife Service National Wetland Inventory (NWI) mapper After the desktop assessment, a detailed field investigation of existing natural resources was conducted. Wetlands were identified using an approach which requires interpretation of indicators representing hydrology, vegetation, and soils to determine the presence of a wetland. Wetlands typically are required to meet all three parameters to qualify as a wetland. The wetland indicator status of the observed vegetation was identified using the National Wetland Plant List (NWPL) (Lichvar, 2018). Soils were evaluated by using the Munsell Soil Color Chart.

4.9.2 Desktop Assessment – Soils

The SSURGO Web Soil Survey identified five, non-hydric, soil types within the project area. The soil survey report and mapping are included in **Appendix B** *Preliminary Desktop Review of Readily Available Data*. All soils within the project area are included in **Table 7**.

Table 7. Soils within Project Area

Map Unit Symbol	Map Unit Name	Acres in Project Area	Slope (%)	Hydric Rating
95	Urban land	14.7	•	No
101	Urban land- Wheaton complex	2.1	-	No
105B	Wheaton- Glenelg complex	0.3	2 to 7	No
105C	Wheaton- Glenelg complex	2.1	7 to 15	No
102	Wheaton loam	5.0	2 to 25	No

4.9.3 Desktop Assessment - NWI

Based on the desktop review of the NWI online mapping tool, no wetlands or waterways were identified within the Project area. A map of the Project area from NWI is included in **Appendix B** *Preliminary Desktop Review of Readily Available Data*.

4.9.4 Results

WET-1 (Wetland-1)

WET-1 is a stormwater management pond classified as PUB (see **Figure 13**). The pond's area is mapped as being underlain by Wheaton Loam 2-25% slope soil, with no frequency of flooding. The Wheaton Loam soil series does not have a hydric rating and is very well-drained. The depth to the water table is typically more than 80 inches. The hydrology for the open water pond is supplemented by periodic rainwater flooding from adjacent stormwater conveyed runoff channels. In their natural condition, these soils and their associated hydrology supported no known wetland community.

The development of a stormwater pond on these soils required extensive manipulation of the landscape and hydrology. Ponds were excavated, and underground drainage systems were installed to provide the necessary drainage to develop the metro station. Although the ponds were excavated to depths that typically would intercept the groundwater, they were likely lined with clay to ensure that water levels remained consistent for aesthetics purposes.

No Project impacts to WET-1 are anticipated. A photo of WET-1 is included in **Appendix C** Photo Log.

Figure 13. Natural Resources Map

4.9.5 County and State Water Resource Buffers

A minimum 25-foot-wide wetland buffer is required by state and county regulation. No impacts to the wetland buffer by the project are anticipated.

A review of Fairfax County's Potential Wetlands Area Map was performed, which resulted in no identified Waters of the US or Potential Wetlands within the project area, other than the delineated PUB.

4.10 Floodplains

The effective Federal Emergency Management Agency ("FEMA") Flood Insurance Rate Map ("FIRM") shows that there are no floodplains present within the Project area. The Project area is classified as an area of minimal flood hazard. See **Figure 14**.

Figure 14. National Flood Hazard Map

4.11 Water Quality

The Project is not anticipated to affect the water quality of the adjacent streams and wetlands. Stormwater management facilities will be constructed in accordance with Fairfax County

regulations, which control the rate and water quality of stormwater runoff. The Developer is solely responsible for obtaining all required permits and the stormwater management plan development. The overall joint development project will result in significant improvements to the treatment of stormwater management onsite.

Project area is not within a Chesapeake Bay Critical Area, does not contain highly erodible soils, and is not within a Tier II watershed. The Project site is within a watershed with a Total Maximum Daily Load for sediment. Erosion, sediment control, and site stabilization requirements will be integrated into site construction per Fairfax County Erosion and Sediment Control requirements. A Water Quality Impact Assessment will also be required. No new discharges (i.e., industrial), from the Project are anticipated that would require a National Pollutant Discharge Elimination System (NPDES) permit.

4.12 Air Quality

The Project site is located in Fairfax County, which is part of the EPA-defined Metropolitan Washington Air Quality Designation Area. The Greater Metropolitan Washington area is currently designated as a nonattainment area for 8-hour ozone (O3) and annual average particulate matter less than 2.5 microns (PM2.5). The Metropolitan Washington area is in attainment for all other pollutants including carbon monoxide (CO), particulate matter less than 10 microns (PM10), nitrogen dioxide (NO2), sulfur dioxide (SO2), and lead (Pb).

No impact is anticipated by the Project.

4.13 Forest Stands

The Project is not anticipated to affect any forest stands. In addition, no specimen, champion, or historic trees have been located on the site.

The Developer will be required to comply with Fairfax County's Tree Conservation Ordinance. The Developer will complete corresponding Tree Conservation Plans for any effect on forest stands and will be required to gain approval through the Land Development Services Division of Fairfax County. Per the Code of Virginia, based on the land use zoning of the Project area, the Developer will be required to maintain ten percent tree canopy.

The amount of reforestation required will be calculated using multiple factors such as net tract areas, land use category, existing forest cover, sensitive environmental features, and proposed clearing. Reforestation can occur either on- or off-site and may include the use of a preapproved tree canopy bank or paying into a tree canopy fund. The Developer would be responsible for implementing the approved Tree Conservation Plans for any impact to forest stands resulting from the Project.

4.14 Threatened and Endangered Species

No impact to federally-protected species or habitat is expected as a result of the Project.

An official species list of potential threatened and endangered species from the USFWS IPaC online application (see **Appendix C** *Preliminary Desktop Review of Readily Available Data*) was reviewed for the project area. The Northern Long-eared Bat (NLEB) was the only species identified in the official species list for the Project area. No critical habitats were identified. The Virginia Department of Wildlife Resources (VDWR) provides an online mapping tool to help determine if projects are near NLEB habitat. Based on the VDWR NLEB Hibernacula mapping tool, there are no NLEB habitats located near the Project area, see **Figure 15**.

The Developer would be solely responsible for any permits or other documentation required related to protected species and critical habitats.

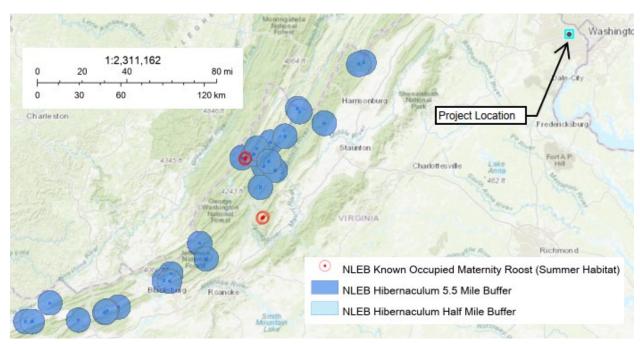

Figure 15. NLEB Hibernacula Map

4.15 Utilities

The Project is not anticipated to affect utilities that serve the project site and adjacent neighborhoods, including water, sewer, electric, and natural gas services. The Developer is responsible for providing adequate utility services for the proposed development and re-routing any affected existing utilities.

4.16 Hazardous and Contaminated Materials

Hazardous and contaminated materials include oil and other hazardous substances that present an imminent and substantial danger to the public health and the environment. Federal and state laws that regulate hazardous and contaminated materials include:

- Comprehensive Environmental Response, Compensation, and Liability Act;
- Resource Conservation and Recovery Act;
- Toxic Substances Control Act;
- Clean Water Act; and
- Clean Air Act.

A Phase I Environmental Site Assessment (ESA) was conducted for the Project (ECS Mid-Atlantic, LLC, October 15, 2019) consistent with the requirements of the American Society of Testing and Materials (ASTM) ESA procedures. The Phase 1 ESA Report is attached to this Environmental Evaluation as **Appendix E**.

A regulatory database search report was provided by Environmental Data Resources, Inc. (EDR). The database search involves researching a series of Federal, State, Local, and other databases for facilities and properties that are located within specified minimum search distances from the subject property. The report identified the subject property on the VA TIER 2 database for the storage of sulfuric acid. Information related to the purpose and duration of storage of sulfuric acid was not reported in the database listing. The property was not listed on the Resource Conservation and Recovery Act (RCRA) Information System (RCRIS), which would indicate generation or handling of hazardous wastes. In addition, the records obtained from the Fairfax County Fire Department indicated that the sulfuric acid was stored in traction power station, which is not located on the current subject property. Based on the absence of a RCRIS Generator listing or a reported release, this onsite listing is not considered to be a Recognized Environmental Condition (REC) for the subject property. The EDR report identified several offsite properties within the minimum ASTM search distances. Based on our review of available public records, none of the database listings are believed to represent a REC for the Project area.

4.17 Noise and Vibration

Existing noise sources within and adjacent to the project area are dominated by motor vehicle traffic along I-66 and VA-267 (the Dulles Toll Road), and Metro operations. No sources of vibration exist within the Project area since the West Falls Church Metro Station Platform is located in the median of I-66.

No impact on existing noise-sensitive receptors is anticipated as a result of the Project. If the Project is constructed, the existing Metrobus and Metrorail transit operations would continue to operate as they do now, and no increase in service is anticipated. The Metrorail tracks would continue to function as they do now; the tracks would not be realigned nor would any new switches be constructed on the tracks as a result of the project being built. The existing bus routes would continue to serve the Metro station as they do now although they would so from the proposed relocated bus bays on an adjacent street.

The Developer is solely responsible for quantifying and mitigating noise and vibration impacts from the Project on the private development project. The Developer is also responsible for constructing the joint development in a manner that mitigates potential noise and vibration impacts from rail, mass transit, and station-related sources to the Project's new residences and commercial uses. This mitigation includes compliance with the Fairfax County Noise Ordinance (Fairfax County Code, Chapter 108.1 – Noise Ordinance).

4.18 Secondary and Cumulative Impacts

4.18.1 Secondary Impacts

No adverse secondary impacts are anticipated as a result of the Project. Secondary impacts of the project would result from the increase in permanent residents and workers at the Project area. The joint development's office, housing, and commercial uses would increase the overall employee and resident population of the Falls Church area and would contribute to a marginal increase in economic activity in the project vicinity, including demand for goods, services, and housing.

4.18.2 Cumulative Impacts

No adverse cumulative impacts are anticipated because of the Project.

<u>Transit</u>

The completion of the proposed joint development is projected to increase transit ridership at the Metro station and increase bus ridership on routes serving the Metro Station.

 Metrorail – WMATA assessed the impact of increased ridership from the joint development on the Metrorail station using the Station Walk Area Ridership Model and estimates up to 3,200 additional riders per day. The additional ridership is not

anticipated to cause station crowding. The joint development has employment as well as residential users, and therefore a portion of the generated Metro trips would be in the reverse commute direction (outbound AM, inbound PM), compared to the majority of current Metro station customers. The additional ridership is not anticipated to lead to crowding on the Orange Line.

 Metrobus – WMATA assessed the impact of increased ridership from the completion of proposed phases of joint development on the bus services at the Metro Station. The results were that no additional bus bays would be needed on the south side of the Metro station.

4.19 Construction Impacts

During construction of the Project, pedestrian and vehicular traffic will be disrupted. Maintenance of Traffic (MOT) plans will be required for each phase, to reroute surface traffic and maintain access to and operations of Park & Ride, bus loop, Kiss & Ride, bicycle and pedestrian facilities. The new street network with bus lanes and sidewalks, bus loop, Kiss & Ride will be constructed in Phase 1. During construction of all phases, on-site Park & Ride capacity may be reduced. In Phase 1, the North Lot will be reconfigured. In Phases 2 and 3, on-site parking in the North Lot may be reduced for construction staging in support of the development project. If commuter parking demand justifies it, alternative off-site parking is to be provided.

Construction noise may impact surrounding neighborhoods, from the operation of construction machinery and vehicles and activities such as potential pile driving for the multi-family and office buildings. The Developer is solely responsible for ensuring that all construction activities adhere to noise control regulations as established in the Fairfax County Noise Ordinance, including time of day restrictions. Additional specific requirements may be established by the county through the plan review process.

Emissions from on-site diesel equipment and increased truck traffic and fugitive dust could negatively impact air quality during construction. "Good housekeeping" methods to minimize project-related dust include keeping dirt wet, rinsing vehicles exiting the site, providing street sweeping, and implementing other dust minimization measures when needed.

5.0 PUBLIC INVOLVEMENT

WMATA and the Developer will keep the public informed about the proposed Project through public outreach. A public hearing in accordance with the WMATA Compact will be scheduled, to be announced in a Notice published with this report. The hearing will provide the public with the opportunity to comment on the proposed modifications to the site.

The subject of this hearing will be on the following changes to Metro transit facilities:

- Permanent closure of the Park & Ride South Lot for future development, reducing parking capacity from 2,009 to about 1,350-1,400.
- Reduction of Kiss & Rides spaces from 64 to about 20 and relocation of the Kiss & Ride
 Parking Spaces to a proposed adjacent street
- Relocation of the existing eight bus bays within the Bus Loop to a proposed adjacent street, with four to eight bus bays which may be implemented as needed.
- Elimination of Metro-operated paid spaces along the Metro Access Road, with the intent allowing another public agency or entity to operating the spaces depending on the future ownership of the road.

Notice of the public hearing will be published in the *area newspapers*. Additionally, information about the proposed changes will be posted in multi-language print publications across the region and on social media.

A public hearing staff report summarizing comments received during the public comment period with staff responses will be released for public review and comment. The staff report will be made available online and in hard copy at WMATA headquarters and as may be further described in the Notice.

WMATA will collect comments from the public through the following ways:

- Comments and documents submitted online at wmata.com/plansandprojects
- A Compact Public Hearing
- Written comments mailed to: Office of the Secretary, Washington Metropolitan Area Transit Authority, 300 7th Street, NW, Washington, DC 20024

All comments must be received by 5 pm October 31, 2022 to be included in the public record.

The hearing process above is to be held by WMATA, about only the changes in transit facilities. The proposed private development components – the type, mix and density of development - will be subject to public involvement requirements of Fairfax County. The Project has followed an elaborate community engagement plan as part of the Fairfax County Comprehensive Plan Amendment process. From January 2019 to April 2021, a community task force worked with County staff and neighboring communities to develop draft recommendations for the Project.

More than 20 Task force meetings were held to collect public feedback on the Project. Task force meeting agendas, recordings, and presentation materials are publicly available through Fairfax County's Planning Division website. Additionally, details about the proposed project were presented by the developer at a Community Meeting on May 11, 2021, to the Fairfax County Planning Commission on June 16, 2021 and to the Fairfax County Board of Supervisors on July 13, 2021 when the amendment was adopted. Information about the comprehensive plan amendment is available on Fairfax County's website: www.fairfaxcounty.gov/planning-development/plan-amendments/west-falls-church-tsa-study

Going forward, the developer plans additional outreach to neighborhood associations, as it advances development plans through the county approval process.

TECHNICAL MEMO

TO: Steven Segerlin, WMATA

FROM: Adam Greenstein, WSP

SUBJECT: July 2020 Parking Analysis, West Falls Church Metrorail Station

DATE: August 10, 2021

1.0 INTRODUCTION

WMATA is planning joint development (JD) of the West Falls Church (WFC) Metro station. As part of the planning process, a parking analysis was performed in July 2020 to define current park-and-ride (P&R) demand, identify approaches to forecasting future P&R demand, analyze methods to optimize the existing and future capacity of the P&R, and modernize the kiss-and-ride (K&R) facilities to meet demand within the new development.

2.0 CURRENT P&R DEMAND

2.1 Average Annual Daily Ridership, P&R Demand, and Parking Capacity

Ridership at the WFC station had held relatively steady between 10,100 to 10,700 average annual daily riders (AADR) from 2010 through 2013. Ridership sharply declined to approximately 7,000 AADR when the Silver Line opened in June 2014, as passengers from northwest of the station towards Tysons and Reston migrated to stations along the Silver Line. Ridership decreased to a low of 2,400 AADR in 2017, rebounding slightly to 2,600 AADR in 2019.

WSP USA 3rd Floor 1 East Pratt Street Baltimore, MD 21202

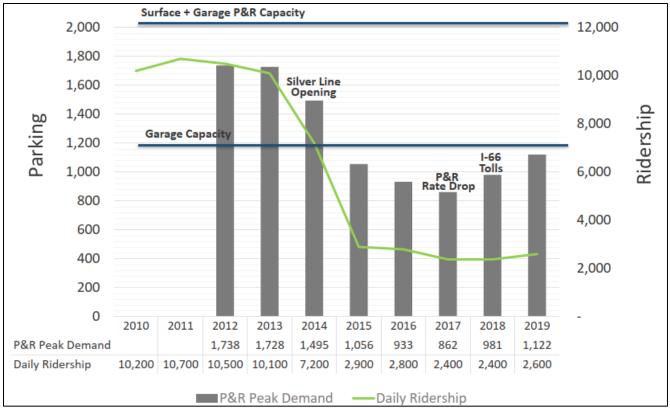

Figure 1: Rail Ridership and P&R Capacity/Demand

The existing combined capacity of the parking facility at WFC station is 2,009 spaces, of which approximately 1,200 are garage spaces. The annual average peak-hour (AAPH) utilization of the P&R was approximately 1,730 vehicles between 2010 and 2013. When the Silver Line opened, the AAPH utilization steadily declined to a low of 862 vehicles in 2017. The AAPH utilization of the P&R had been increasing prior to the pandemic, also influenced by the reduction of the P&R rate at West Falls Church to \$3 per day (compared to \$4.95 at nearby Orange and Silver Line stations) and the opening of the I-495 Express Toll Lanes (ETL) in 2018, with an AAPH of 1,122 vehicles in 2019. This figure is still below the garage capacity. It is not possible to isolate a single variable nor produce elastic coefficients based on current available data.

2.2 Seasonal Fluctuations in P&R Utilization

P&R utilization at the WFC station varies significantly throughout the year, with demand being higher during the spring and fall months. P&R utilization exceeded garage capacity on 123 days in 2019 by an average of 86 vehicles. However, there were some days with higher utilization, occasionally exceeding 1400 vehicles. There were also days with utilization below 900 vehicles, mostly between late December and late January. Given the high variability in P&R utilization throughout the year, WMATA prioritizes AAPH demand for planning purposes to maximize utilization and revenue potential. As shown above, the 2019 AAPH for the WFC station was 1,122 vehicles. WMATA will be using this figure for forecasting furture demand.

Figure 2: P&R Utilization (Calendar Year 2019)

3.0 FUTURE P&R DEMAND

3.1 P&R Demand Forecasting Approach

There are no agreed-upon industry standards for analyzing transit parking demand. Multiple approaches exist that can be used to forecast P&R demand. In lieu, WMATA produced a sensitivity analysis by comparing different household (HH) growth rates within the park-shed. The park-shed is determined from customer SmarTrip card registration data, as described below. HH growth rates were derived from two sources:

- 1. Metropolitan Washington Council of Governments (MWCOG) Cooperative Forecasts a coarse tool based on Transportation Analysis Zones (TAZ)
- 2. Fairfax County Land Use Plan (LUP) more granular tool based on underutilized parcels

The resulting HH growth projection is then multiplied by a demand coefficient to determine the projected number of new customers to be added to the existing demand to forecast future demand.

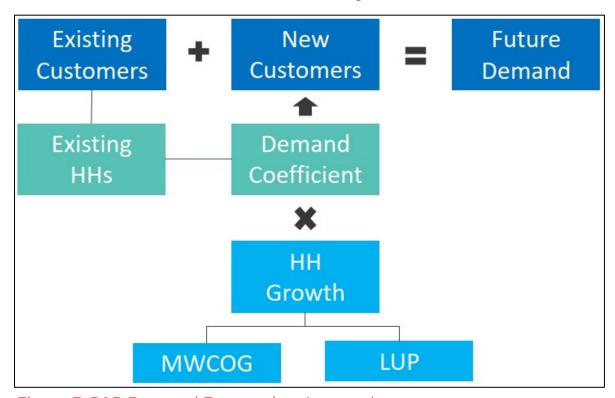

Figure 3: P&R Demand Forecasting Approach

3.2 Core Parkshed

As stated above, the park-shed is determined from customer SmarTrip card registration data. Approximately 27% of WFC P&R customers have registered SmarTrip cards identifying their home addresses. Of the registered P&R customers, roughly 74% reside within two miles of the station, representing the core demand for WMATA's planning purposes. Therefore, the core park-shed for the WFC station is roughly a two-mile radius from the station.

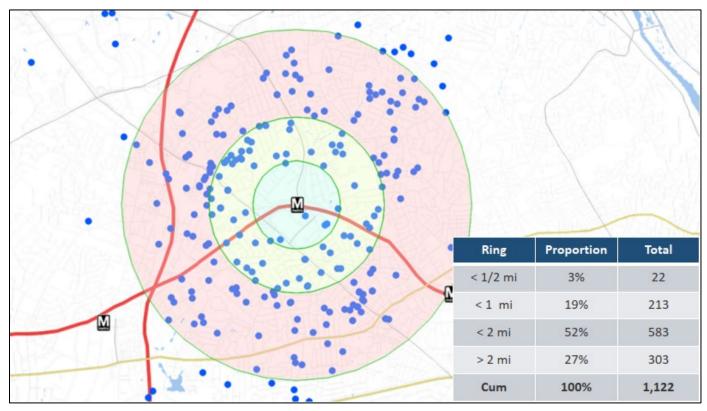

Figure 4: WFC P&R Core Park-Shed

40,394 households exist within the 2-mile radius. The P&R customer-to-household ratio, the demand coefficient used to forecast growth, within the two-mile radius is 0.018 per household.

3.3 Predicting Demand Beyond the Core Parkshed

Many challenges exist in predicting demand beyond the two-mile core park-shed. Customers consider multiple factors when they choose to park at WFC, and many of these factors have changed over time. Some examples of these factors include, but are not limited to, the following:

- Silver Line opening (June 2014)
- New garages at the Fairfax station
- Lower P&R rates (2017)
- Highway tolling (I-66, 2018)
- Roadway construction
- Increased traffic congestion

Other factors are anticipated to be introduced into the decision, including new bus rapid transit (BRT) lines, tolls implemented outside the Capital Beltway, and the new direct access ramp from I-66 eastbound to the WFC station, which is currently under construction and expected to open by spring 2021. Additionally, some customer address data is likely to be inaccurate since it is understood that not all customers update their home addresses on their SmarTrip cards when they relocate.

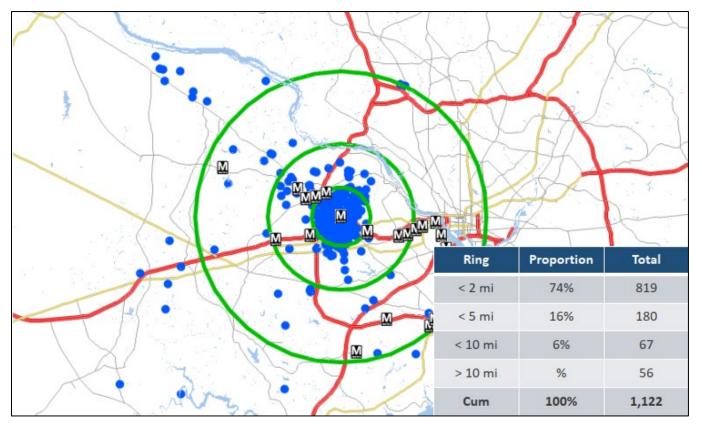

Figure 5: P&R Demand Beyond the Core Park-Shed

3.4 HH Growth Rate Variability

The forecasted HH growth rates vary dramatically between data sources. The MWCOG Cooperative Forecasts model projects a growth rate of 1.2% per year, which amounts to an additional P&R demand of 264 vehicles by 2045, resulting in a total P&R demand of 1386 vehicles. In contrast, the Fairfax County LUP forecasts a growth rate of 0.3% per year, which amounts to an additional 71 vehicles, resulting in a total P&R demand of 1193 vehicles by year 2045. The LUP model forecast is more likely to accurately reflect future conditions.

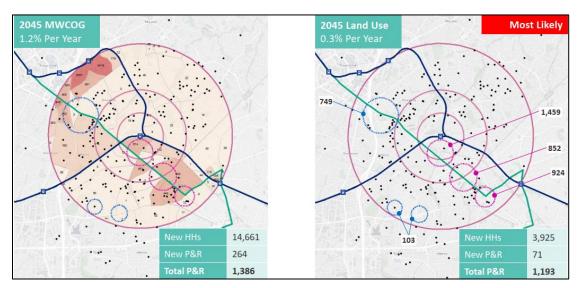

Figure 6: Comparison of MWCOG and Land Use Plan HH Growth Forecasts

The variability in growth rates between the MWCOG forecast and the Fairfax County LUP also results in high variability in projecting when P&R demand will exceed current P&R garage capacity, a key measure in determining when different phases of planned JD should take place in order to keep up with P&R demand. Using the MWCOG forecast model, it is projected that garage capacity will be exceeded by 2025, while the projection using the LUP forecast is that the garage capacity will not be exceeded until after 2045.

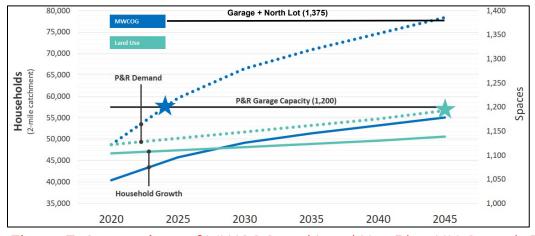

Figure 7: Comparison of MWCOG and Land Use Plan HH Growth Forecasts

3.5 Additional Factors

A variety of additional factors could also impact future parking demand at West Falls Church:

- Post-pandemic changes in commuter behavior Following the end of the pandemic, changes in commuter behavior may occur, with potentially large increases in telework, which may reduce peak parking demand.
- Major transportation investments in the area Both the Silver Line Phase 2 project (which includes the
 addition of approximately 10,000 commuter parking spaces) and the I-66 toll lane project may impact
 commuter parking demand at West Falls Church.
- Demand management efforts WMATA is completing a Parking Master Plan for its parking portfolio, which will include strategies to consider shifting demand to stations with excess capacity. For instance, there were approximately 2,650 vacant spaces available at Dunn Loring and Vienna stations combined on an average weekday prior to the pandemic.

4.0 ACCOMMODATING MAXIMUM P&R DEMAND

4.1 Proposed Parking Plan

The proposed parking plan takes into consideration the projected P&R demand per the LUP forecast, maintaining approximately 1,375 P&R spaces on the site (1,350-1,400 depending on surface lot design). Additionally, the plan includes a phased approach, with an option to further increase P&R spaces if deemed necessary.

The JD project has three phases. Phase 1 involves keeping the existing P&R garage (1200 spaces) and the north lot (175 spaces) in service, for a total of approximately 1,375 spaces. A multi-family residential building ("MF1") would be constructed in this phase, adding 306 private garage spaces. Phase 2 involves the construction of a second multi-family residential building ("MF2"), adding another 270 private garage spaces.

Prior to Phase 3, anticipated to occur in approximately 10 years, WMATA will reassess its P&R needs for the station. WMATA will have the option to retain the north lot and use it to construct additional P&R capacity, if needed. Or, WMATA could allow the developer to redevelop the north lot to include an office building, a third multi-family residential building ("MF3"), and parking facilities to serve both buildings and include 175 P&R spaces to replace those displaced from the surface lot.

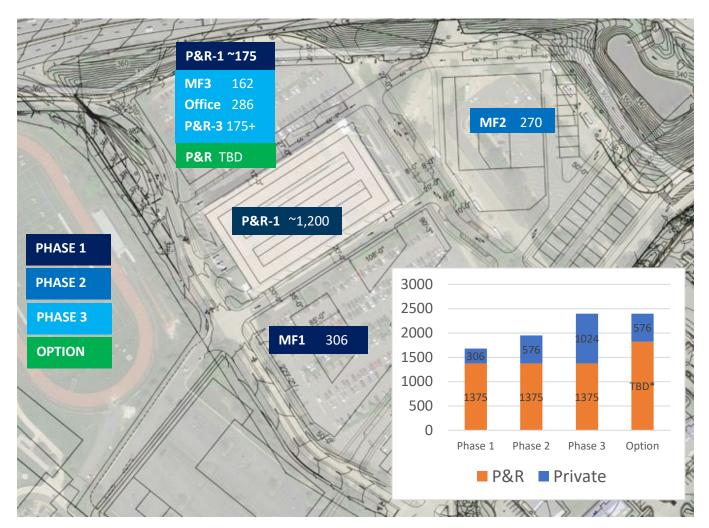

Figure 8: Proposed Phased Parking Plan

(*the amount of parking for the north lot option would need to be determined through further demand and feasibility analysis)

4.2 Solutions to Support Maximum Demand

A mix of solutions is being considered to support maximum demand at the WFC station JD. WMATA and the developer plan to explore shared parking facilities to maximize parking availability utilizing digital signing and mobile applications to direct users to available spaces. Or alternatively, the developer could make excess spaces available for public parking, which could be utilized by Metro customers.

P&R capacity will be reduced to approximately 1,375 spaces (1,350 to 1,400 spaces). Between demand for the P&R facility (WMATA) and residential parking demand, the total demand is projected reach or exceed full P&R capacity. The addition of 306 private garage parking spaces within the WFC JD facility will have the capacity to provide additional parking capacity to support projected demand.

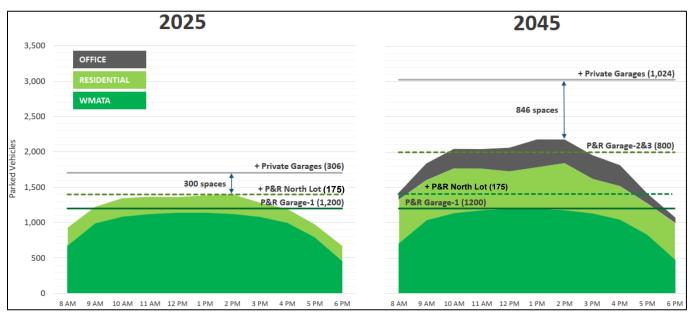

Figure 9: Mix of Solutions to Support Maximum Demand

By Phase 3 / Optional Phase (2045), total parking demand at the WFC JD facility is projected to total approximately 2,200 vehicles between the P&R demand, office parking demand, and residential parking demand. Private garages within the WFC JD facility will have capacity for 1,024 vehicles that can support maximum demand.

The private garages are expected to have excess capacity. Mixed-use projects in activity centers in northern Virginia have parking facilities with supply ranging from 0.2 to 1.3 spaces per unit for multi-family residential (MFR) developments and 1.0 to 2.0 spaces per 1,000 gross square feet (GSF) for office development projects. Peak hour utilization for case examples near WFC is below 80% (mostly between 60% and 80%) of constructed capacity, as can be seen from the two examples in the figure below.

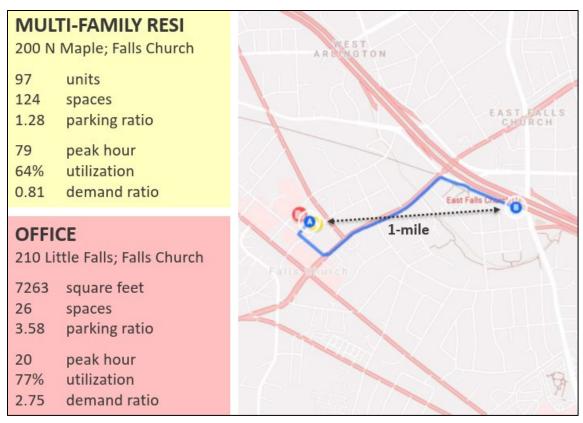

Figure 10: Excess Capacity at Nearby Private Garages

The development team for WFC proposes the following ratios:

- MFR 0.9 spaces per unit
- Office 2.0 space per 1,000 GSF

These ratios are within the range of surrounding mixed-use development projects, and similar peak-hour utilization is expected in the private garages at the WFC JD site.

6.0 MODERNIZING THE KISS & RIDE FUNCTION

6.1 Current (Pre-COVID) kiss & Ride Demand

The maximum observed usage of the K&R (Pre-COVID) is 28% of the total capacity of 64 spaces. Approximately 50% of the vehicles observed are typically unoccupied and may be daily parkers instead of short-term parking. The following K&R peak-hour demand has been observed:

- 8:00-9:00 AM 134 vehicles
- 5:00-6:00 PM 127 vehicles

Hourly turnover of vehicles is high during peak hours, indicating that most vehicles arriving at the station K&R facility are for pick-up/drop-off activity.

Figure 11: Current K&R Demand

Minimal queuing was observed for passenger pick-up, ranging from two to four vehicles. Many unoccupied vehicles were seen at expired parking meters or did not have appropriate tags for occupying spaces designated by the Americans with Disabilities Act (ADA). Based on the K&R spaces observed being used by waiting vehicles, the current peak K&R demand is 14 spaces.

6.2 Proposed Kiss & Ride Capacity

Growth in K&R demand is difficult to predict given the increasing market penetration of Transportation Network Companies (TNCs). K&R volumes have been observed to be increasing, while dwell times have been decreasing. Modernizing K&R facilities requires the application of a greater diversity of space typologies:

- A. ADA spaces
- B. Waiting spaces
- C. Curbside pick-up/drop-off spaces

K&R demand was estimated using the current K&R peak demand and applying the forecasted MWCOG and LUP HH growth rates from the two-mile park-shed. Year 2045 demand is projected to be between 16 and 19 spaces (LUP and MWCOG, respectively).

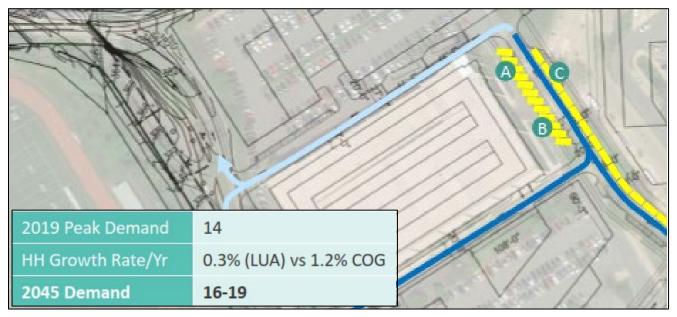

Figure 12: Projected K&R Demand

In contrast, the WMATA Station Area Planning Guide formula suggests that 8.4 spaces are required. In the proposed JD concept, 2 ADA K&R spaces, 10 metered K&R spaces, and 7 to 10 pick-up/drop-off spaces are recommended.

7.0 SUMMARY AND CONCLUSIONS

P&R demand at the WFC station has halved after the opening of the Silver Line in 2014 but has been steadily increasing since then, likely influenced by multiple factors such as P&R rate-drop and the opening of the I-495 ETL. It is not possible to isolate any single variable nor produce a reliable formula based on current available data. Due to seasonal fluctuations in P&R utilization, WMATA uses AAPH utilization to determine demand. The AAPH at the WFC station in 2019 was 1,122 vehicles. There is no established industry standard for analyzing transit parking demand. WMATA uses a sensitivity analysis using growth rates from the MWCOG model and Fairfax County LUP within the two-mile core park-shed. The County LUP forecast AAPH of 1193 vehicles is a more likely scenario and was used for this analysis. The parking plan for the WFC station will maintain about 1,375 P&R spaces at the station, with WMATA reassessing its parking needs prior to the development of the north lot. At that time, WMATA will have the right to retain the north lot and use it to construct additional P&R capacity if needed, or let the developer build private mixed-use development there, along with 175 P&R spaces. It is expected that the private office and residential parking will have excess capacity and will be used to meet maximum P&R demand.

The current K&R is underutilized, and observations indicate that it is likely being used by some riders as daily parking. The observed existing K&R demand was 14 vehicles. Growth in K&R demand is difficult to predict due to increased market penetration of TNCs and an increase in K&R volume combined with decrease in K&R dwell times. Using the same growth rates from the MWCOG model and Fairfax County LUP, the projected demand in year 2045 is between 16 and 19 spaces. The WMATA Station Area Planning Guide suggests 8.4 spaces are required. The K&R is being proposed with 2 ADA spaces, 10 metered spaces, and 7 to 10 pick-up/drop-off spaces to meet maximum K&R demand

INTRODUCTION AND SUMMARY

Purpose, Introduction, and Study Objectives

This report presents the findings of a Traffic Impact Study (TIS) conducted for the proposed redevelopment of the existing Washington Metropolitan Area Transit Authority (WMATA) West Falls Church metro and the Virginia Polytechnic Institute and State University (Virginia Tech/VT) sites, located in the Dranesville Magisterial District of Fairfax County, Virginia. This study was conducted in conjunction with a proposal to amend Fairfax County's *Comprehensive Plan* for the West Falls Church Transit Station Area (TSA) in order to provide compatible, non-automobile dependent development.

The site is anticipated to be complete and in operation by 2030. The WMATA West Falls Church metro development (to be referred to in this study as the "WMATA site") will be reconstructed and is projected to consist of approximately 130 kSF of office space, 10 kSF of retail space, and 865 residential dwelling units (DU). The VT site is projected to consist of an additional 181 kSF of office space, 18 kSF of retail space, 440 residential DU, and 160 kSF of institutional uses. Combined, the site is anticipated to ultimately consist of 311 kSF of office space, 28 kSF of retail space, 1,305 residential DU, and 160 kSF of institutional uses.

This study was developed in accordance with guidelines and recommendations set forth by the Virginia Department of Transportation (VDOT), Fairfax County (County), and the City of Falls Church (City). This document was prepared in accordance with best professional practices and standards in order to assess the impact of the proposed developments on the surrounding transportation systems and recommends improvements to lessen or negate those impacts. This traffic impact study involves the evaluation of anticipated roadway conditions with and without the proposed developments and recommends possible transportation improvements and strategies to offset both the impacts of the increase in future traffic demand and the changes in traffic operations and characteristics due to the development. This traffic impact study serves to assist public officials and developers to balance interrelations between efficient traffic movements with necessary access.

The following tasks were completed as part of this study:

- A scoping meeting was held with VDOT (Northern Virginia District), the County, and the City, which included discussions about the parameters of the study and relevant background information. Additional meetings have been held between the parties, discussing further information, assumptions, and interim findings. A copy of the signed scoping document for this traffic impact study is included in Appendix A.
- Field reconnaissance in the vicinity of the site was performed to collect information related to existing traffic controls, roadway geometry, and traffic flow characteristics.
- Traffic counts were conducted at the existing study intersections in May of 2018 and in May of 2019 during the weekday morning and afternoon peak periods and utilized in accordance with the scoping meeting.
- The scenarios analyzed in this study include 2019 Existing Conditions, 2030 Future Conditions without Development, 2030 Future Conditions with Development, 2045 Future Conditions without Development, 2045 Future Conditions with Development. Furthermore, the analyses included for 2045 horizon year are for planning level purposes.
- The intersections of Haycock Road at Village Crossing Road and at Falls Reach Drive were included in the analysis network (*Synchro*) files.
- The 2030 Future Conditions without Development traffic volumes were projected based on an inherent growth rate
 of 1.0% (one percent), compounded annually between 2019 and 2030 to account for regional growth along the road

network and include identified background development(s) and roadway improvement(s) that were discussed in scoping meeting with VDOT, County, and City staff.

- The proposed site generated traffic volumes were derived based on the methodology outlined in the Institute of Transportation Engineers' (ITE) <u>Trip Generation Manual</u>, 10th Edition publication.
- The 2030 Future Conditions with Development traffic volumes were projected based on regional growth, existing regional and site traffic patterns, anticipated background development(s) and roadway improvement(s), and plans for the proposed developments.
- The 2045 Future Conditions without Development traffic volumes were projected based Fairfax County Department of Transportation's (FCDOT) travel demand forecasting model projections.
- The 2045 Future Conditions with Development traffic volumes were based on FCDOT's travel demand forecasting model projections, projected roadway improvement(s), and plans for the proposed developments.
- The 2045 horizon year analyses will include link analyses and volume-to-capacity (v/c) ratios.
- An assessment of the previous crashes has been conducted at existing study intersections.

Sources of data for this study include information provided by VDOT, the County, the City, AECOM, and the office files and field reconnaissance efforts by Gorove/Slade Associates, Inc.

Executive Summary

Site Location and Study Area

The site is currently located northeast of Leesburg Pike (Rte. 7), northwest of Haycock Road (Rte. 703), and south of Interstate 66 (I-66) in the Dranesville Magisterial District of Fairfax County, Virginia. The site is part of the West Falls Church Transit Station Area (TSA) and is part of a highway overlay district.

For the purpose of this study, the analysis presented herein includes 14 existing study intersections (12 external intersections and two internal intersections). Furthermore, the analysis includes three additional future intersections that are anticipated to be constructed with proposed redevelopment of George Mason High School and Mary Ellen Henderson Middle School in Falls Church, Virginia (referred to in this study as the "West Falls Church Economic Development site").

The study intersections are as follows:

- 1. I-66 eastbound off-ramp and Leesburg Pike (Rte. 7) (partial-movement, signalized)
- 2. Leesburg Pike (Rte. 7) and Dale Drive (Rte. 1128) (partial-movement, unsignalized)
- 3. Leesburg Pike and Mustang Alley (full-movement, unsignalized)
- 4. Leesburg Pike and Chestnut Street (Rte. 1750) / Grace Community Church (partial-movement, unsignalized)
- 5. Leesburg Pike and Shreve Road / Haycock Road (Rte. 703) (full-movement, signalized)
- 6. Haycock Road and Mustang Alley (full-movement, unsignalized)
- 7. Haycock Road and Falls Church Drive (full-movement, signalized)
- 8. Haycock Road and Grove Avenue (Rte. 1745) (full-movement, unsignalized)

April 8, 2021

- 9. Haycock Road and WMATA Metro Entrance (Metro Access Drive) (full-movement, signalized)
- 10. Haycock Road and Highland Avenue (Rte. 2318) (full-movement, unsignalized)
- 11. Haycock Road and Turner Avenue (Rte. 7541) (full-movement, unsignalized)
- 12. Haycock Road and Great Falls Street (Rte. 694) (full-movement, signalized)
- 13. Falls Church Drive at Nova Driveway (VT Parking Lot Entrance) / WMATA Metro Entrance (Metro Access Drive) (internal intersection, full-movement, unsignalized)
- 14. Falls Church Drive at Nova Driveway (VT Parking Lot Entrance) / WMATA Park & Ride Garage Entrance (internal intersection, full-movement, unsignalized)

Furthermore, as noted in the scoping document, the intersections of Haycock Road at Village Crossing Road and at Falls Church Drive were included in the analysis network (*Synchro*) files for reference but were not included in this document.

Description of Proposed Development

This study was conducted in conjunction with a proposed to amend Fairfax County's *Comprehensive Plan* for the West Falls Church Transit Station Area (TSA) in order to provide compatible, non-automobile dependent development. The anticipated redevelopment of the site is anticipated to be complete by 2030. The WMATA site will consist of approximately 130 kSF of office space, 10 kSF of retail space, and 865 residential dwelling units (DU). The VT site is projected to consist of an additional 181 kSF of office space, 18 kSF of retail space, 440 residential DU, and 160 kSF of institutional uses. Combined, the site is anticipated to ultimately consist of 311 kSF of office space, 28 kSF of retail space, 1,305 residential DU, and 160 kSF of institutional uses.

Principal Findings and Conclusions

Based on the above guidelines, the analysis presented in this report supports the following conclusions:

Existing Conditions (2019) Scenario

- Traffic counts were collected at existing intersections in May of 2018 and in May of 2019. These traffic counts were balanced in order to develop a baseline for the analysis.
- Analysis of the traffic data found the following system peak hours:

Weekday Morning (AM) Peak Hour: 7:45 AM to 8:45 AM

Weekday Afternoon (PM) Peak Hour: 5:00 PM to 6:00 PM

Based on the capacity analysis, all signalized intersections operate at an overall acceptable Level of Service (LOS)
with the exception of the Leesburg Pike and Haycock Road intersection. The intersection operates overall at a LOS E
during both peak hours.

Future Conditions without Development (2030)

To account for future conditions, an inherent growth rate of 1.0% per year, between 2019 and 2030, was applied to all movements at the intersection of Route 7 and Haycock Road. Additionally, traffic associated with the proposed High School & West Falls Church Economic Development, a development abutting the site, was taken into consideration in order to determine future traffic volumes.

- A couple of roadway improvements are anticipated to be developed and in operation by 2030. VDOT is currently in the process of constructing a connector ramp on the eastbound I-66 off-ramp towards Route 7; the connector ramp would act as a by-pass for vehicles heading towards the site and the West Falls Church Metro station. Additionally, the intersection of Chestnut Street at Route 7 is anticipated to be converted to a signalized, full-movement intersection with the proposed High School & West Falls Church Economic Development
- Based on the capacity analysis, all intersections operate at an overall acceptable LOS under 2030 future conditions
 without development with the exception of the Leesburg Pike and Haycock Road intersection (similar to 2019
 existing conditions) and the Haycock Road and Great Falls Street intersection.

Future Background with Current Comprehensive Plan Development Conditions (2030)

- The WMATA and VT developments are anticipated to be fully constructed and in operation by 2030. Under the current *Comprehensive Plan* for Fairfax County, the WMATA and VT sites could develop approximately 962 multifamily residential units and 240 kSF of institutional uses, which is anticipated to generate approximately 484 additional trips in the AM peak hour, 459 additional trips in the PM peak hour, and 5,556 daily trips after transit and transportation demand management (TDM) reductions.
- Based on the capacity analysis, all intersections operate at an overall acceptable LOS under 2030 future background current comprehensive plan conditions with the exception of the Leesburg Pike and Haycock Road intersection and the Haycock Road and Great Falls Street intersection (similar to 2030 Future Conditions without Development).

Future Conditions with Development (2030) Scenario

- The WMATA and VT developments are anticipated to be fully constructed and in operation by 2030. The proposed developments are anticipated to generate approximately 709 additional trips in the AM peak hour, 695 additional trips in the PM peak hour, and 8,182 daily trips after transit, transportation demand management (TDM), internal, and commercial pass-by reductions.
- Due to increased traffic demand from the developments, road improvements will be necessary in order to achieve acceptable levels of service / maintain similar traffic operation conditions as compared to future without development conditions during the weekday morning (AM) and weekday afternoon (PM) peak hours. The following mitigations are proposed to improve operations at the study intersections:
 - Route 7 at Haycock Road
 - Add southbound thru lane on Haycock Road; and
 - Adjust signal timings to accommodate new configuration.
 - Haycock Road and Falls Church Drive
 - Restripe the eastbound approach on Falls Church Drive to a shared thru/right and an exclusive left turn lane which will operate under permitted + protected phasing.
 - Modify signal timings to accommodate new configuration.
 - Haycock Road at Great Falls Street
 - Change eastbound and westbound Haycock Road lane configuration from left/thru, right to left, thru/right; and
 - Modify signal timings to account for the change in roadway geometry.
 - Haycock Road at Grove Avenue
 - Add a northbound right turn lane to provide an exclusive left lane and an exclusive right lane.

- Route 7 Corridor
 - Optimize traffic signal timings along Route 7 to promote progression and to account for the modifications to the Route 7 and Haycock Road intersection.
- Haycock Road Corridor
 - Optimize traffic signal timings along Haycock to promote progression and to account for the modifications to the Route 7 and Haycock Road intersection.
- Based on the capacity analyses, the roadway improvement strategy would mitigate potential impacts of the
 development, resulting in similar to or better overall levels of service/reduced delays as compared with future
 conditions without development conditions or without the proposed comprehensive plan amendment.

Future Conditions with Development (2030) - Alternative Conditions without Virginia Tech Redevelopment

- This scenario is presented to provide analysis without the VT redevelopment. Under this scenario, only the WMATA development is anticipated to be redeveloped per the proposed Comprehensive Plan Amendment (CPA) and in operation by 2030. This scenario does not assume a new direct connection between Leesburg Pike (Rte. 7) and the WMATA site via Commons Drive. Such conditions are unlikely to be realized, but are included for completeness.
- The WMATA development is anticipated to generate approximately 236 additional trips in the AM peak hour, 285 additional trips in the PM peak hour, and 3,454 daily trips after transit, transportation demand management (TDM), internal, and commercial pass-by reductions.
- Due to increased traffic demand from the developments, road improvements will be necessary in order to achieve acceptable levels of service / maintain similar traffic operation conditions as compared to future without development conditions during the weekday morning (AM) and weekday afternoon (PM) peak hours. The mitigation strategy presented in the Future Conditions with Development (2030) is also proposed for the Alternative "without VT" scenario.
- Based on the capacity analyses, the roadway improvement strategy would mitigate potential impacts of the
 development, resulting in similar overall levels of service/reduced delays as compared with future conditions
 without development conditions or without the proposed comprehensive plan amendment.

Future Conditions without Development (2045) - Planning Scenario

The site is anticipated to be constructed and in operation by 2030. Due to the development requiring with a comprehensive plan amendment (CPA), it was recommended that the road network near the site be analyzed 15 years after the anticipated build-out. This scenario, which analyzes the future conditions for the year 2045 with respect to the current *Comprehensive Plan*, and, as agreed to in the scoping document, is to be used as a planning-only scenario.

- To account for future conditions, future traffic volumes without the CPA along the Route 7 and Haycock Road corridors were approximated based on Fairfax County Department of Transportation's (FCDOT) travel demand forecasting model projections. The FCDOT model incorporated trips in association with the development of the proposed property under the existing *Comprehensive Plan*. It was assumed that the WMATA and VT sites could develop approximately 962 multi-family residential units and 240 kSF of institutional uses under the current *Comprehensive Plan*.
- Based on the segment capacity analysis, the Route 7 and Haycock Road Corridors are anticipated to operate at a volume-to-capacity (v/c) ratio of 0.64 or less.

<u>Future Conditions with Development (2045) – Planning Scenario</u>

The site is anticipated to be constructed and in operation by 2030. Due to the development requiring a CPA, it was recommended that the road network near the site be analyzed 15 years after the anticipated build-out. This scenario analyzes the future conditions for the year 2045 with respect to the CPA, and, as agreed to in the scoping document, is to be used as a planning only scenario.

- To account for future conditions, future traffic volumes along the Route 7 and Haycock Road corridors were approximated based on FCDOT's travel demand forecasting model projections. The FCDOT model incorporated trips in association with the development of the proposed property under the existing *Comprehensive Plan*. In order to account for any changes in the road network with the proposed comprehensive plan amendment, the current comprehensive plan development program was compared to the one proposed in this study by assigning the site generated differential to the road network.
- Based on the segment capacity analysis, the Route 7 and Haycock Road Corridors operate at a volume-to-capacity
 (v/c) ratio of 0.66 or less.

Thus, none of the segments of along the Route 7 and Haycock Road Corridors are expected to exceed the capacity of the existing roadway facilities as a result of the proposed development under 2045 conditions.

Overall Conclusion

The roadway improvement strategies recommended would mitigate the traffic impacts of the WMATA and VT sites through 2030. The combination of new street connections and turn lane improvements would result in in acceptable overall levels of service/reduced delays as compared with future conditions without the proposed comprehensive plan amendment (CPA).

As indicated in the 2045 planning scenario, the Route 7 and Haycock Road Corridors would have adequate through capacity to accommodate the anticipated development of the WMATA and VT sites.

April 8, 2021

BACKGROUND INFORMATION: PROPOSED DEVELOPMENT (SITE & NEARBY)

Description of the Existing Site

This report presents the findings of a TIS conducted for the proposed redevelopment of the existing WMATA West Falls Church metro and the VT sites, located in Fairfax County, Virginia.

Site Location

The site is generally located in the Dranesville Magisterial District of Fairfax County, northeast of Leesburg Pike (Rte. 7), northwest of Haycock Road (Rte. 703), and south of Interstate 66 (I-66), as shown in Figure 1. Of note, the Figure 1 incudes the location of existing and future study intersections that were included as part of the analysis.

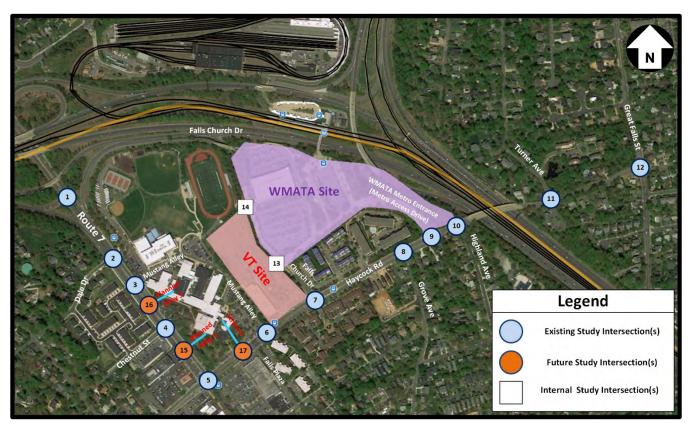

Figure 1: Site Location

Description of the Parcel

The redevelopment site is composed of a total of seven parcels, and the total site area is approximately 31.5 acres.

The WMATA site is approximately 23.99 acres and occupies five parcels, which can be identified on Fairfax County Tax Maps with the following PIN#: 0403-01-0013, 0403-01-0083, 0403-01-0084, 0404-02-0001, and 0404-02-0002. Primary site access is provided via the access road to the West Falls Church Metrorail Station and Falls Church Drive. With the construction of the High School & West Falls Church Economic Development site to the southwest, additional access points to the development along Route 7 will be provided.

The Virginia Tech site is approximately 7.53 acres and occupies two parcels, which can be identified on Fairfax County Tax Maps with the following PIN#: 0403-01-0092 and 0403-01-0092A. Primary site access is provided via Falls Church Drive.

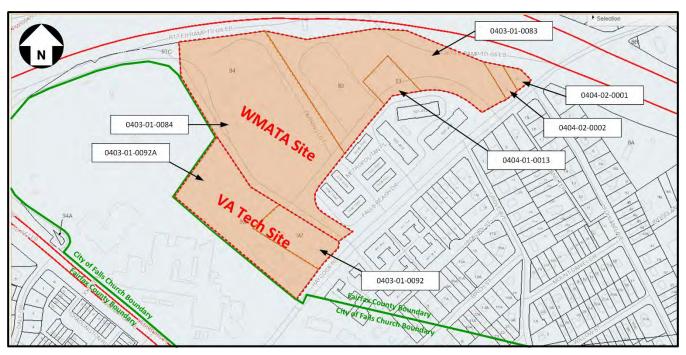

Figure 2: Parcel Map

Location within Jurisdiction and Region

The site is generally located in the Dranesville Magisterial District of Fairfax County, Virginia. The site abuts the City of Falls Church boundary to the south and to the west. The site is adjacent to the City's West Falls Church Economic Development site.

The site is illustrated in terms of its regional location and the developments' boundaries in Figure 3.

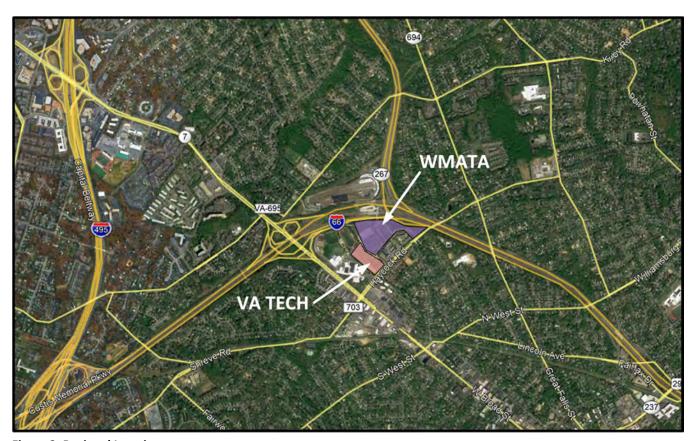

Figure 3: Regional Location

Comprehensive Plan Recommendations

Fairfax County's *Comprehensive Plan* provides the recommendation for Public Facilities for the WMATA site, and the recommendation for Mixed Uses for the VT site. The *Comprehensive Plan* includes the recommendation to widen or improve Leesburg Pike and Shreve Road. Of note, there is also a recommendation for a pedestrian crossing over Leesburg Pike at some location between I-66 and Chestnut Street, and a goal to include bicycle and pedestrian facilities in coordination with redevelopment along Leesburg Pike and Shreve Road. A map of the *Comprehensive Plan Transportation Recommendations* is shown in Figure 4.

Figure 4: Comprehensive Plan - Transportation Recommendations

Zoning for the Site and Nearby Uses

The existing zoning for the WMATA site is R-1 (Residential, 1 dwelling unit/acre) and R-30 (Residential, 30 dwelling units/acre), while the Virginia Tech site is currently zoned for C-3 (Office). The overall site is part of the West Falls Church Transit Station Area (TSA). The zoning map for the County is illustrated in Figure 5.

The comprehensive plan recommendation map is illustrated in Figure 6.

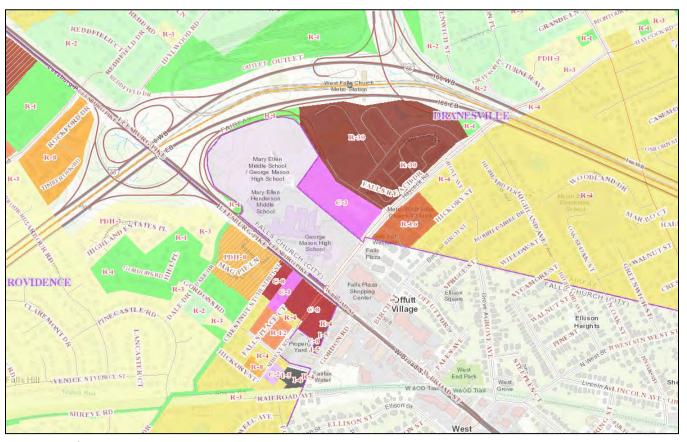

Figure 5: Fairfax County Zoning Map

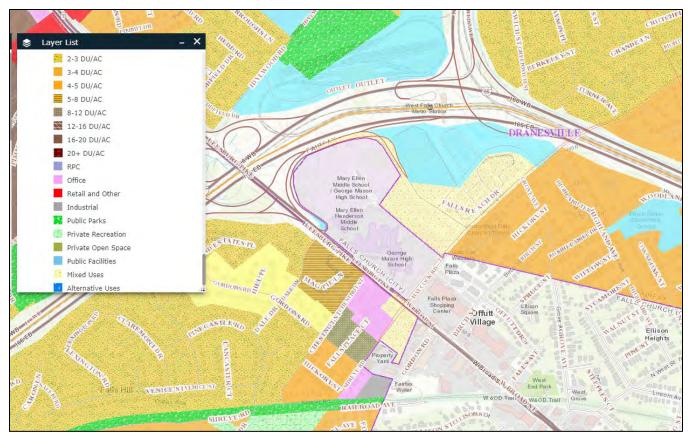

Figure 6: Fairfax County Comprehensive Plan Recommendation Map

Nearby Future Uses

The proposed WMATA and VA Tech sites are anticipated to be complete and in operation by 2030. In addition, one major nearby background development is anticipated to in operation by 2030: the High School & West Falls Church Economic Development site. The background development is situated adjacent to the proposed development within the boundaries of the City of Falls Church, Virginia.

The High School & West Falls Church Economic Development site is currently occupied by an 800-student high school and a 600-student middle school. The background site is anticipated to be redeveloped and is anticipated to include a 1,500-student high school, a 600-student middle school, 330 kSF of office, 134 kSF of retail, 680 residential units, 225 senior housing units, a 10 kSF daycare and a 150-room hotel. Total site buildout is planned for the year 2025. The proposed background development is anticipated to generate approximately 1,092 additional trips in the weekday morning (AM) peak hour and 912 additional trips in the weekday afternoon (PM) peak hour.

The High School & West Falls Church Economic Development site is currently accessed by one full access point on Route 7, one right-in/right-out (RIRO) on Route 7, and two full access points on Haycock Road. The redevelopment will create an additional RIRO and right-out (RO) driveway on Route 7. The internal circulation within the background site will create connectivity between all the proposed buildings on site and would promote and support additional connectivity to and from the proposed WMATA and VA Tech sites in addition. The development includes a few roadway improvements, including a signal at the intersection of Route 7 and Chestnut Street / Commons Drive, two signals along Haycock Road (at Road C and at Mustang Alley), and a third northwestbound lane on Route 7 between Haycock Road and Mustang Alley. Additional information is included in subsequent section of this report.

A traffic impact study for the background development was conducted by Gorove/Slade for the City of Falls Church Department of Public Works. The background study, titled *High School & West Falls Church Economic Development*, was submitted to VDOT, the City, and the County for review in conjunction with a Signal Justification Report (SJR) pertaining to the modification to the intersection of Route 7 and Chestnut Street/Commons Drive. The TIA and SJR were both approved by VDOT.

Descriptions of Geographic Scope and Limits of the Study Area

The geographic scope of the study area was developed in accordance with VDOT, Fairfax County, and the City of Falls Church guidance. The scoping document for this study has been included in Appendix A.

Existing Roadways

The site is generally located northeast of Leesburg Pike (Rte. 7), northwest of Haycock Road (Rte. 703), and south of Interstate 66 (I-66) in the Dranesville Magisterial District of Fairfax County, Virginia.

The analysis presented herein includes 14 existing study intersections (12 external intersections and two internal intersections). Furthermore, the analysis includes three additional future intersections that are anticipated to be constructed with proposed redevelopment of George Mason High School and Mary Ellen Henderson Middle School in Falls Church, Virginia (referred to in this study as the "West Falls Church Economic Development site").

Detailed roadway descriptions are provided in the Existing Conditions (2019) section of this study.

The study area includes the following existing intersections:

- 1. I-66 eastbound off-ramp and Leesburg Pike (Rte. 7) (partial-movement, signalized)
- 2. Leesburg Pike and Dale Drive (Rte. 1128) (partial-movement, unsignalized)
- 3. Leesburg Pike and Mustang Alley (full-movement, unsignalized)
- 4. Leesburg Pike and Chestnut Street (Rte. 1750) / Grace Community Church (partial-movement, unsignalized)
- 5. Leesburg Pike and Shreve Road / Haycock Road (Rte. 703) (full-movement, signalized)
- 6. Haycock Road and Mustang Alley (full-movement, unsignalized)
- 7. Haycock Road and Falls Church Drive (full-movement, signalized)
- 8. Haycock Road and Grove Avenue (Rte. 1745) (full-movement, unsignalized)
- 9. Haycock Road and West Falls Church Metro (full-movement, signalized)
- 10. Haycock Road and Highland Avenue (Rte. 2318) (full-movement, unsignalized)
- 11. Haycock Road and Turner Avenue (Rte. 7541) (full-movement, unsignalized)
- 12. Haycock Road and Great Falls Street (Rte. 694) (full-movement, signalized)
- 13. Falls Church Drive at Nova Driveway (VT Parking Lot Entrance) /WMATA Metro Entrance (Metro Access Drive) (internal intersection, full-movement, unsignalized)
- 14. Falls Church Drive at Nova Driveway (VT Parking Lot Entrance) / WMATA Park & Ride Garage Entrance (internal intersection, full-movement, unsignalized)

Furthermore, as noted in the scoping document, the intersections of Haycock Road at Village Crossing Road and at Falls Church Drive were included in the analysis network (*Synchro*) files yet were not included in this document.

Planned Future Transportation Improvements

Roadway Improvements

The roadway improvements identified within the study area for this site include arterial roadway widenings or improvements on Leesburg Pike and Shreve Road, as identified in Fairfax County's *Comprehensive Plan*. These improvements are shown in Figure 4. Of note, the proposed Comprehensive Plan Amendment for the station area does not preclude these widenings.

Regional Improvements

As part of VDOT's I-66 Inside the Beltway improvements, a new connector ramp from eastbound I-66 to the West Falls Church Metro Station is currently in design and is planned for build out by 2025. The ramp is currently under construction.

The new ramp, shown in Figure 7, will exist within VDOT's existing right of way adjacent to the development site. The new ramp will reduce the number of vehicles exiting eastbound I-66 onto Leesburg Pike and making left turns onto Haycock Road within the study area.

This approved project will include the addition of signage and pavement markings that direct traffic and promote wayfinding. Additional wayfinding will be explored during the SESP process.

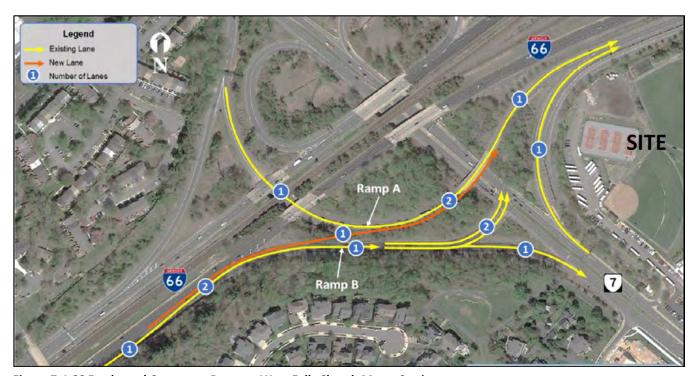

Figure 7: I-66 Eastbound Connector Ramp to West Falls Church Metro Station

EXISTING CONDITIONS (2019)

Existing Transit Services

Two WMATA Metrobus routes currently serve the site area. The existing bus routes are shown in Figure 8, and the expected headways are summarized in Table 1. The site is also within ½ mile of the West Falls Church Metro Station.

Figure 8: Existing Metrobus Routes

Table 1: 2019 Existing Bus Routes

				Typical Headway/Frequency (minutes)				Weekday Service		Saturday Service		Sunday Service	
Route	Direction	From	То	Peak	Off-Peak	Saturday	Sunday	First	Last	First	Last	First	Last
28A	Eastbound	Tysons Corner Station	King StOld Town Station	20	20-30	20-30	30	5:30 AM	12:45 AM	5:50 AM	12:45 AM	5:50 AM	11:30 PM
204	Westbound	King StOld Town Station	Tysons Corner Station	20	20-30	20-30	30	4:18 AM	11:35 PM	6:00 AM	11:25 PM	6:05 AM	10:05 PM
эт	Eastbound	McLean Station	West Falls Church Station	24	60	60	-	5:35 AM	10:35 PM	6:35 AM	10:35 PM	-	-
31	Westbound	West Falls Church Station	McLean Station	24	60	60	-	5:48 AM	10:05 PM	7:05 AM	10:05 PM	-	-

The planned transit projects are shown in Figure 9. As shown, the Broad Street (Route 7) is anticipated to serve the site area.

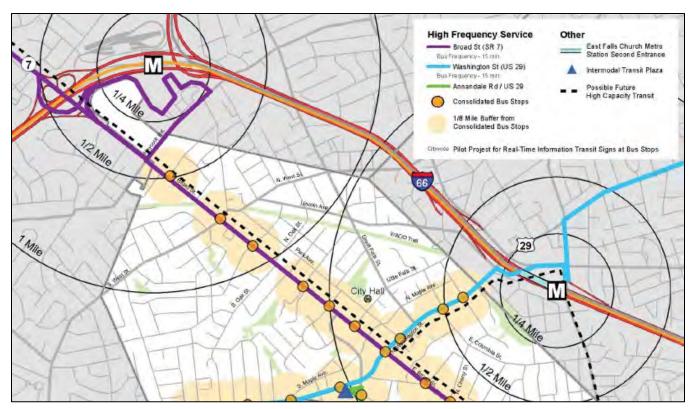

Figure 9: Planned Transit Projects

Existing Bicycle and Pedestrian Facilities

Dedicated on-street bicycle infrastructure does not currently exist in the area. Fairfax County's *Comprehensive Plan* calls for a variety of bicycle facility improvements within the vicinity of the study area. In particular, the *Comprehensive Plan* recommends a bike lane along Haycock Road west of I-66 and along Great Falls Street north of I-66, and sharrows east and south of the respective I-66 crossings. It recommends a shared roadway along Grove Avenue and through the WMATA access drive to the Metro station, and a shared use path from near Falls Church Drive and Haycock Road to the Metro station. The *Comprehensive Plan* highlights a major regional trail system, and a major paved trail at least 8-foot-wide in the vicinity of the study area. Existing and recommended bicycle facilities in the study area are shown in Figure 10. The trail network is shown in Figure 11.

Crosswalks currently exist at the signalized intersections within the study area but not on all approaches. The existing pedestrian facilities are shown in Figure 12. Pedestrian paths to the metro exist today and will continue to exist in the future. When the WMATA and Virginia Tech developments are built, the pedestrian paths will further improve.

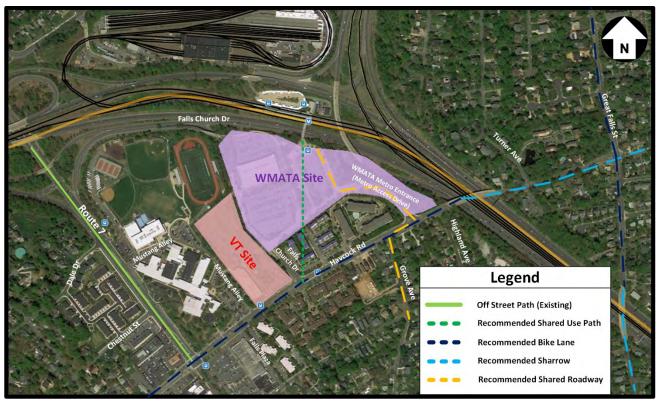

Figure 10: Existing and Planned Bicycle Network (Fairfax County Comprehensive Plan)

Figure 11: Trail Network (Fairfax County Comprehensive Plan)

Figure 12: Existing Pedestrian Facilities

Existing Roadway Network

A description of the major roadways within the study area is presented in Table 2. The existing local roadway network, including lane configurations and traffic controls, is illustrated in Figure 13 and in Figure 14.

Table 2: 2019 Existing Road Network

Roadway	RTE#	VDOT Classification	Lanes	Speed	AADT (vpd)	
I-66 East Ramp	I-66	Interstate Ramp	2	35 mph (Advisory)	10,000* (west partial)	
Leesburg Pike	7	Other Principal Arterial	4	25 mph	30000*	
West Broad St	7	Other Principal Arterial	4	25 mph	30000*

 $[*] Source: VDOT\ 2018\ AADT\ Traffic\ Data\ (http://www.virginiadot.org/info/2018_traffic_data.asp)$

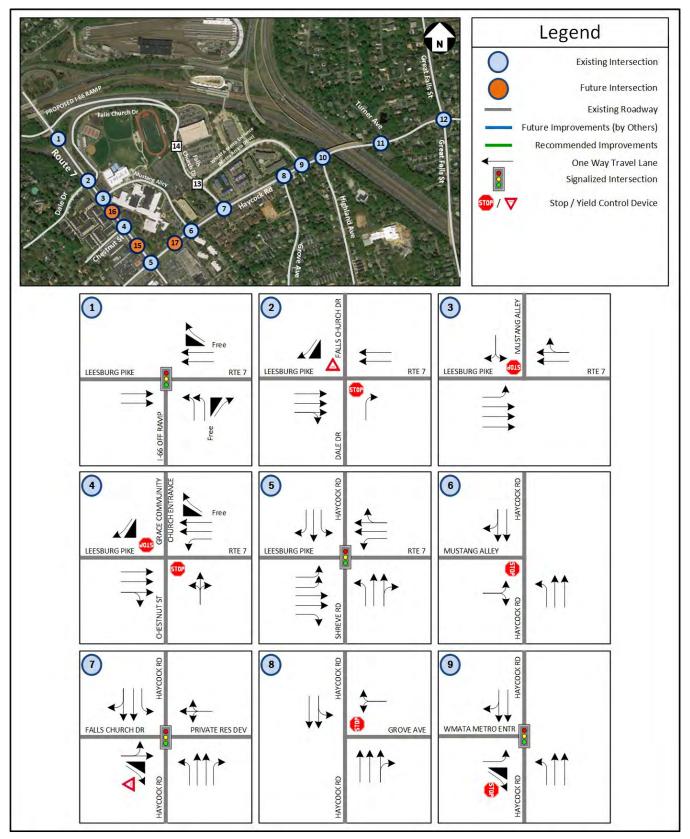

Figure 13: 2019 Existing Conditions – Roadway Lane Configuration and Traffic Control Devices (1 of 2)

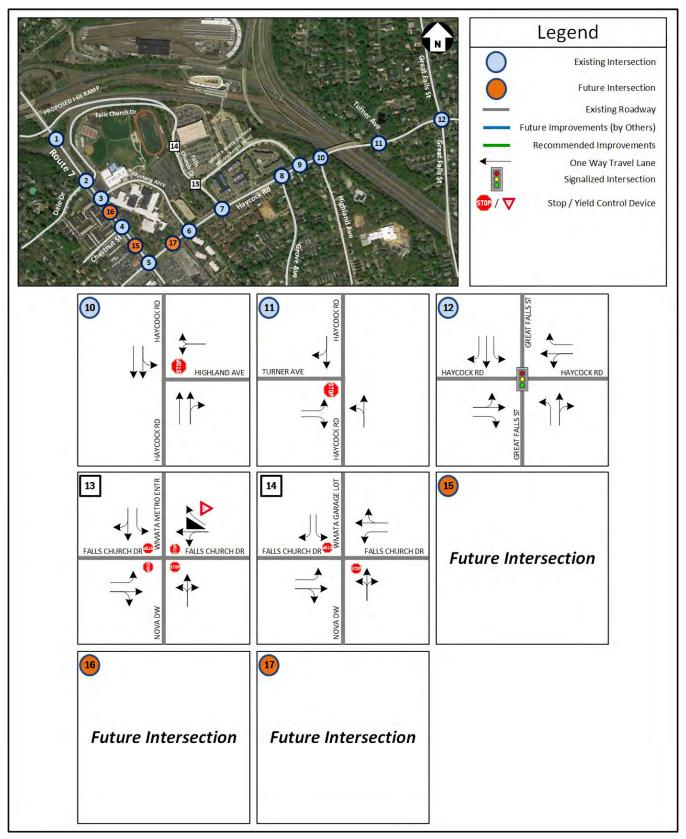

Figure 14: 2019 Existing Conditions – Roadway Lane Configuration and Traffic Control Devices (2 of 2)

Historical Crash Data

Historic crash data at the study intersections was obtained from VDOT for the most recent three years (January 2016 to March 2019).

The crash data is summarized in Table 3.

Table 3: Crash Data (January 2016 – March 2019)

Intersection	Number of Crashes	Number of Property Damage Crashes	Number of Crashes Resulting in Injury	Number of Fatal Crashes	Crash Rate (Crashes per MEV)
I-66 East Ramp & Leesburg Pike	10	4	6	0	0.23
Leesburg Pike & Dale Dr/Falls Church Dr	9	8	1	0	0.17
Leesburg Pike & Mustang Alley	2	0	2	0	0.04
Leesburg Pike & Chestnut St/Grace Community Church	28	15	13	0	0.57
Leesburg Pike & Shreve Rd/Haycock Rd	16	10	6	0	0.27
Haycock Rd & Mustang Alley	8	3	5	0	0.39
Haycock Rd & Falls Church Dr	0	0	0	0	0
Haycock Rd & Grove Ave	1	1	0	0	0.05
Haycock Rd & West Falls Church Metro	1	0	1	0	0.05
Haycock Rd & Highland Ave	1	1	0	0	0.05
Haycock Rd & Turner Ave	0	0	0	0	0
Haycock Rd & Great Falls St	5	3	2	0	0.20

As shown in the table above, the intersection of Leesburg Pike and Chestnut Street/Grace Community Church had the highest number of reported crashes (28) during the study period. This intersection is planned to be converted into a right-in/ right-out (RIRO) configuration as a background improvement which should improve safety. A Signal Justification Report (SJR) has been submitted to VDOT for review toward this effort of signalization.

The crash rates shown for each intersection are calculated as crashes per one million entering vehicles (MEV), and were calculated based on the following formula:

$$Rate_{intersection} = \frac{1,000,000* \# of \ Crashes}{\# of \ Years* 365 \left(\frac{days}{year}\right)* ADT_{approach}}.$$

The approach ADT comes from calculations for the existing ADTs, as per Figure 15 and Figure 16 in the subsequent section.

The crash data provided by VDOT is included in Appendix B.

Existing Conditions (2019) Traffic Volumes

Vehicular turning movement counts were collected at existing study intersections on Thursday, May 3, 2018, on Tuesday, May 22, 2018, and on Thursday, May 9, 2019. A list of the study intersections by count date is provided below:

- Thursday, May 3, 2018
 - Haycock Road (Rte. 703) and Grove Avenue (Rte. 1745)
 - o Haycock Road (Rte. 703) and Falls Church Drive
 - Leesburg Pike (Rte. 7) and Chestnut Street (Rte. 1750) / Grace Community Church Entrance
 - Leesburg Pike (Rte. 7) and Dale Drive (Rte. 1128)
 - Leesburg Pike (Rte. 7) and Mustang Alley
- Tuesday, May 22, 2018
 - Haycock Road (Rte. 703) and Mustang Alley
- Thursday, May 9, 2019
 - o I-66 eastbound off-ramp and Leesburg Pike (Rte. 7)
 - Leesburg Pike (Rte. 7) and Shreve Road / Haycock Road (Rte. 703)
 - Haycock Road (Rte. 703) and Highland Avenue (Rte. 2318)
 - Haycock Road (Rte. 703) and Turner Avenue (Rte. 7541)
 - Haycock Road (Rte. 703) and Great Falls Street (Rte. 694)
 - Haycock Road (Rte. 703) and WMATA Metro Entrance (Metro Access Drive)
 - Falls Church Drive and Nova Driveway (VT Parking Lot Entrance) /WMATA Metro Entrance (Metro Access Drive)
 - Falls Church Drive and Nova Driveway (VT Parking Lot Entrance) / WMATA Park & Ride Garage Entrance

Analysis of the traffic data found the following system peak hours:

Weekday Morning (AM) Peak Hour: 7:45 AM to 8:45 AM

Weekday Afternoon (PM) Peak Hour: 5:00 PM to 6:00 PM

In order to derive the baseline traffic volumes for the 2019 Existing Condition scenario, it was necessary to balance the road network and increase traffic volumes at some study intersections in order to account for difference in the 2018 and 2019 counts. As such, the road network was then balanced conservatively where appropriate. The existing peak hour traffic volumes are illustrated in Figure 15 and in Figure 16. The raw traffic count data are included in Appendix C.

It should be noted that the average daily traffic (ADT) volumes illustrated in Figure 15 and in Figure 16 are based off the k-factors from 2018 VDOT historic traffic data and the afternoon peak hour volumes. If traffic data was not available for a given approach, it was assumed to have a k-factor of 0.10.

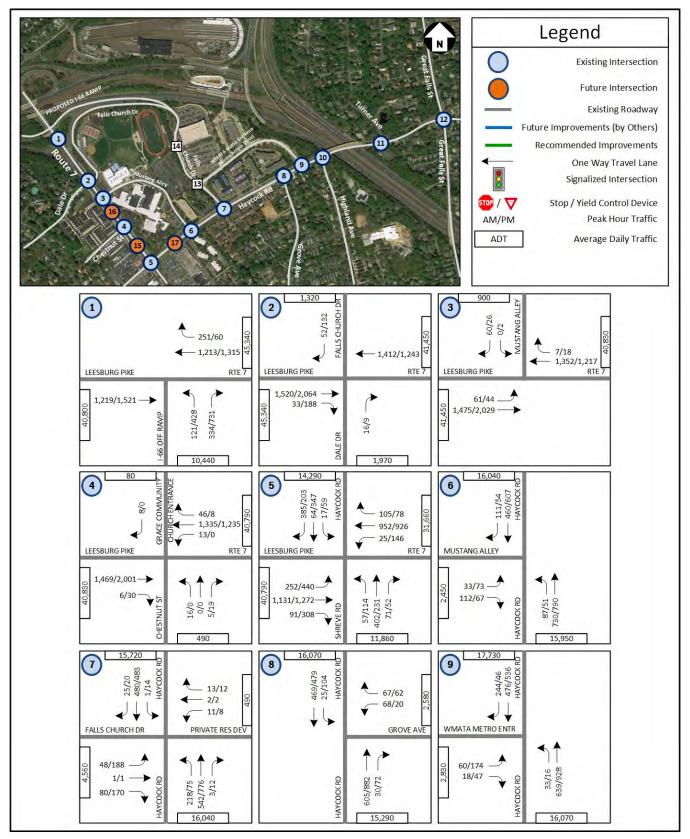

Figure 15: 2019 Existing Conditions – Vehicular Traffic Volumes (1 of 2)

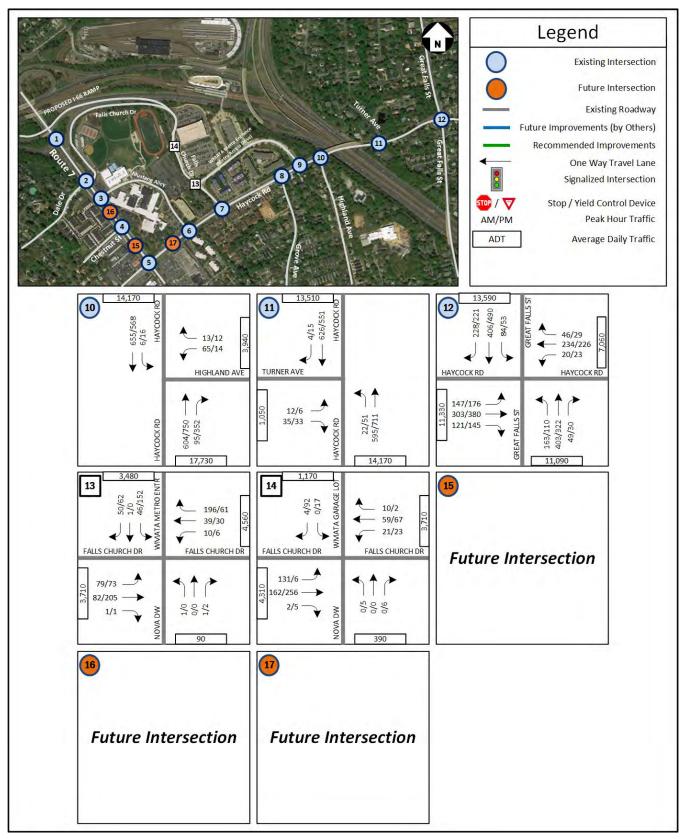

Figure 16: 2019 Existing Conditions – Vehicular Traffic Volumes (2 of 2)

Existing Condition (2019) Intersection Capacity Analysis

Intersection capacity analyses were performed for the Existing Conditions (2019) scenario at the study area intersections during the weekday morning (AM) and afternoon peak (PM) peak hours. *Synchro*, version 10, was used to analyze the study intersections with results based on the <u>Highway Capacity Manual</u> (HCM) 2010 methodology¹ and includes level of service (LOS), delay, and queue length comparisons for the turning movements analyzed. *Synchro* files with existing signal timings were provided by VDOT staff and used as a base for the existing analysis.

The existing peak hour factors (by intersection) acquired from the traffic counts, with a minimum of 0.85, were used in the analysis of existing conditions. Heavy vehicle percentages of major movements used in the analysis were based on the traffic counts collected. The lane configurations were field verified.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The results of the intersection capacity analyses from *Synchro* are presented in Table 4 and graphically in Figure 17 and in Figure 18. The results are expressed in LOS and delay (seconds per vehicles) for overall signalized intersections and per approach and lane group by intersection. The signalized intersections that operate overall at LOS E or F are shown in red. The 50th and 95th percentile queues were also determined from *Synchro* and are expressed in feet.

The description of different LOS and delays are included in Appendix D. The detailed analysis worksheets of 2019 Existing Conditions are contained in Appendix E.

Table 4: 2019 Existing Conditions – Intersection Capacity Analysis Results

		Effective Storage Length (ft.)*		AM Pea	ak Hour		PM Peak Hour				
No.	Intersection (Movement)		LOS	Delay	50th % Queue	95th % Queue	LOS	Delay	50th % Queue	95th % Queue

	Eastbound Left	140	В	13.5		10	В	12.2		8	
	Southbound Approach		С	17.1			С	19.8			
	Southbound Left/Right		С	17.1		15	С	19.8		10	

NOTES:

^[1] Effective storage length is based on the storage length plus one-half of the taper length per TOSAM guidelines.

^{[2] \$:} Delays (reported from Synchro) exceed 300 seconds in TWSC.

^{[3] #: 95}th percentile queues (reported from Synchro) exceed capacity; actual queues may be longer. Queues shown are based on the maximum after two cycles.

^[4] m: 95th percentile volume and queues (reported from Synchro) are metered by upstream signal.

¹ It should be noted that HCM 2000 methodology was used in lieu of HCM 2010 if the HCM 2010 methodology was not applicable. HCM 2010 could not be applicable in such cases as nonstandard National Electrical Manufacturers Association (NEMA) configurations, shared lane configurations, placement of loop detectors, etc. This condition was agreed to in the scoping document.

NOTES:

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The capacity analysis results indicate that all signalized intersections operate at an overall acceptable LOS under existing conditions with the exception of the Leesburg Pike and Haycock Road intersection. The intersection operates overall at a LOS E during both peak hours.

The results of the intersection capacity analyses for the existing conditions are illustrated in Figure 17 and in Figure 18.

^[1] Effective storage length is based on the storage length plus one-half of the taper length per TOSAM guidelines.

^{[2] \$:} Delays (reported from Synchro) exceed 300 seconds in TWSC.

^{[3] #: 95}th percentile queues (reported from Synchro) exceed capacity; actual queues may be longer. Queues shown are based on the maximum after two cycles.

^[4] m: 95th percentile volume and queues (reported from Synchro) are metered by upstream signal.

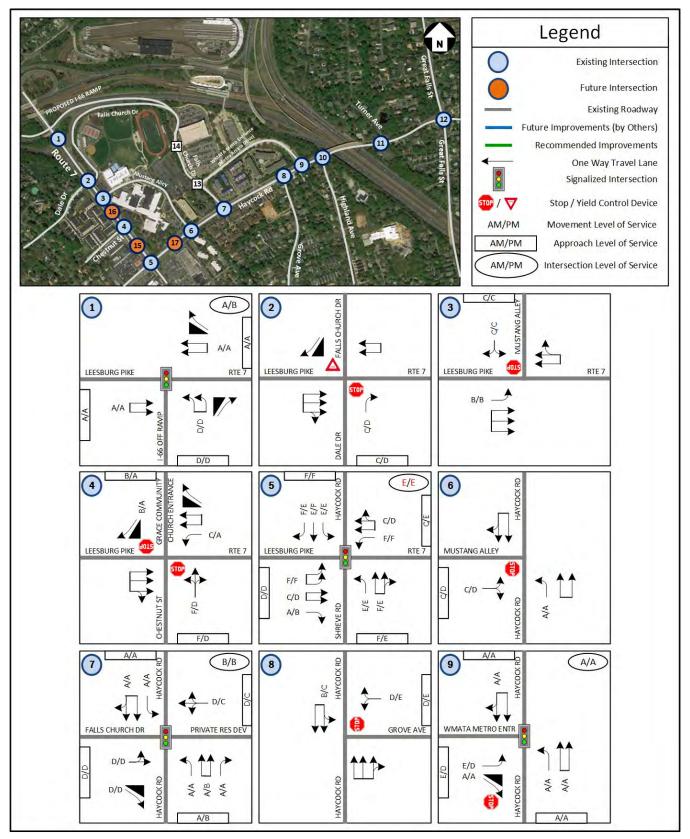

Figure 17: 2019 Existing Condition – Levels of Service Results (1 of 2)

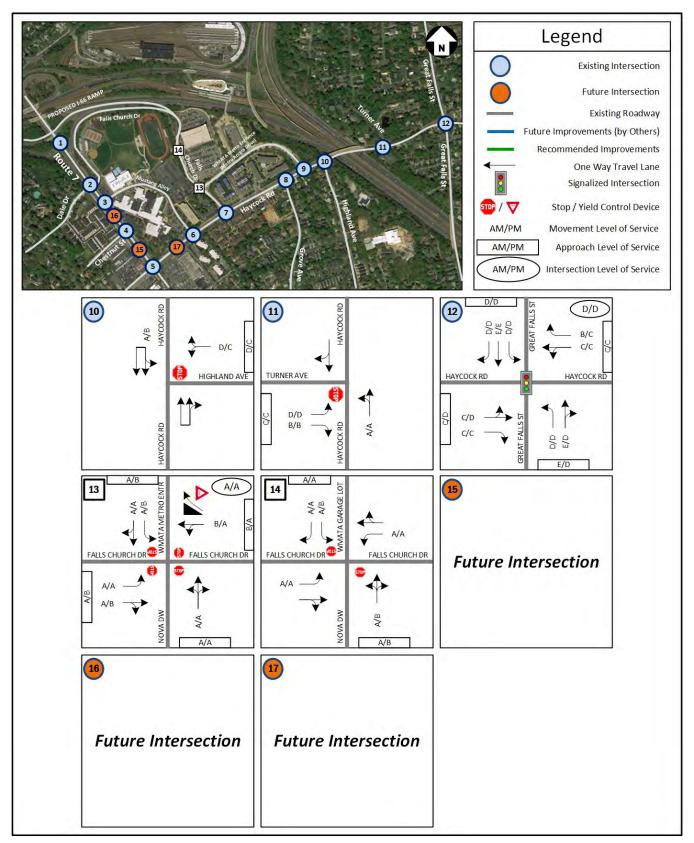

Figure 18: 2019 Existing Condition – Levels of Service Results (2 of 2)

FUTURE CONDITIONS WITHOUT DEVELOPMENT (2030)

The WMATA and VT developments are anticipated to be fully constructed and in operation by 2030.

Future Conditions without Development (2030) Traffic Volumes

Inherent Growth

The proposed WMATA and VT developments are anticipated to be fully constructed and in operation by 2030. To account for future conditions, and as agreed upon by VDOT, County, and City staff, an inherent growth rate of 1.0% annually over an eleven-year period (between 2019 and 2030), totaling 11.56% growth of the existing volumes, was applied to all movements at the intersection of Route 7 and Haycock Road. The growth in traffic demand at the subject intersection was carried to subsequent study intersections along Route 7 and along Haycock Road in order to balance the road network. It is anticipated that these growth volumes would account for any potential developments (not mentioned below) that would affect the surrounding vicinity and increased demand on the road network.

The inherent regional growth volumes are illustrated in Figure 20 and in Figure 21.

Potential Background Development(s)

In addition to the applied inherent regional growth accommodating increase traffic demand, one background development was identified in the meeting with VDOT, the County, and the City for inclusion in this study. The background development was the High School & West Falls Church Economic Development site, located immediate adjacent to the WMATA and VT developments.

The High School & West Falls Church Economic Development site is currently occupied by an 800-student high school and a 600-student middle school. The proposed development program includes a 1,500-student high school, a 600-student middle school, 330 kSF of office, 134 kSF of retail, 680 residential units, 225 senior housing units, a 10 kSF daycare, and a 150-room hotel. Total site buildout is planned for the year 2025. The background site's conceptual plan and approximate location is illustrated in Figure 19.

A traffic impact study for the background development was conducted by Gorove/Slade for the City of Falls Church Department of Public Works. The background study, titled *High School & West Falls Church Economic Development*, was submitted to VDOT, the City, and the County for review in conjunction with a Signal Justification Report (SJR) pertaining to the modification to the intersection of Route 7 and Chestnut Street. Both studies have been approved by VDOT.

The background development trips associated with the High School & West Falls Church Economic Development site are illustrated in Table 5 and graphically in Figure 22 and in Figure 23. The proposed background development is anticipated to generate approximately 1,092 additional trips in the AM peak hour and 912 additional trips in the PM peak hour along the road network after reductions.

Based on the study, a TDM/mode split reduction of 35% was assumed for the High School & West Falls Church Economic Development site, given the sufficient sidewalk access surrounding the site and connecting the site to the West Falls Church Metrorail station. The High School & West Falls Church Economic Development site background trips, illustrated in Figure 22 and in Figure 23, include a combination of anticipated site generated trips, anticipated pass-by trip diversions, and the removal of existing trips associated with the existing high school and middle school.

Figure 19: High School & West Falls Church Economic Development Background Development For conceptual purposes only.

^{*}Based on Existing Counts

Potential Roadway Improvement(s)

Two roadway improvements were considered as part of the study per the scoping meeting:

- VDOT Route 7 Connector Ramp (currently under construction as part of VDOT's Inside the Beltway initiative)
 - The purpose of the VDOT Route 7 Connector Ramp is to provide vehicles on eastbound I-66 direct access to the West Falls Church Metrorail station parking. In addition, the ramp would provide an alternative pathway for vehicles traveling from eastbound I-66 towards northeast Haycock Road (by passing the Route 7 Corridor).
 - o This approved project will include the addition of signage and pavement markings that direct traffic and promote wayfinding. Additional wayfinding will be explored during the SESP process.
- Route 7 and Chestnut Street Roadway Improvements
 - With the construction of the High School & West Falls Church Economic Development site, it is anticipated
 that the intersection of Chestnut Street will be converted to a four-legged full-movement intersection with

A) The pass by reduction for the shopping center is based on the ITE Trip Generation methodology, as provided in the 10th Edition Handbook. The average rate for shopping centers is 34% for the PM Peak. For all other time periods, the default pass by rate is 25%.

B) The pass-by/diverted trip reduction for the day care is based on the ITE Trip Generation methodology, as provided in the 10th Edition Handbook

⁽¹⁾ residential / office - smaller of 5% of residential trips or 5% of office trips

⁽²⁾ residential / retail - smaller of X% of residential trips or X% of retail trips; AM: X = 5%, PM: X = 10%, Daily: X = 15%

⁽³⁾ office/retail - smaller of 5% of office trips or 5% of retail trips

⁽⁴⁾ hotel/office - use 15% of hotel/motel trips, unless the overall volume of the office traffic is more than the overall volume of hotel/motel traffic use in which case use the smaller of 10% of the hotel/motel traffic or the office traffic

the construction of Commons Drive, the shift in the terminus of Chestnut Street at Route 7, and the closure of a partial-movement driveway along the south frontage of Route 7.

- o Commons Drive is anticipated to act as the background development's "main street" and would replace a partial-movement driveway associated with the existing high school site.
- As noted previously, a Signal Justification Report (SJR) pertaining to the modification to the intersection of Route 7 and Chestnut Street / "future" Commons Drive has been approved by VDOT.

Based on multiple meetings with the City, a few additional improvements were identified for inclusion in the future condition with respect to the construction of the High School & West Falls Church Economic Development site:

- Haycock Road and Street C Improvements
 - o A traffic signal with designated pedestrian crossings is planned to be installed.
- Haycock Road and Mustang Alley
 - o A traffic signal with designated pedestrian crossing is planned to be installed.
- Route 7 Corridor
 - Per the request of VDOT and FCDOT, a third northwestbound lane on Route 7 will be installed along the frontage of High School & West Falls Church Economic Development site. The lane will serve as a right turn lane for the background site but is ultimately intended to be used a third through lane.

A graphic showing the location of the Route 7 Connector Ramp was shown previously in Figure 7. The reroute of traffic volumes, pertaining to the Route 7 Connector Ramp, are illustrated in Figure 24 and in Figure 25. The proposed roadway improvements along Route 7 associated with High School & West Falls Church Economic Development site are illustrated in Figure 26. As noted, previously, a partial-movement private driveway will be closed off with the realignment of Chestnut Street. Traffic associated with the private driveway was rerouted to utilize relocated Chestnut Street in order to provide a conservative assessment of future conditions. The reroute of traffic volumes, pertaining to the modifications to Chestnut Street, are illustrated in Figure 27.

The lane configuration for the Future without Development (2030) scenario is shown in Figure 28 and in Figure 29.

Future (2030) without Development Traffic Volumes

The background projects and roadway improvements were combined together with the inherent growth on the network and the existing traffic volumes in order to generate future conditions without development (2030). The traffic volumes for the Future (2030) without Development scenario are presented in Figure 30 and in Figure 31.

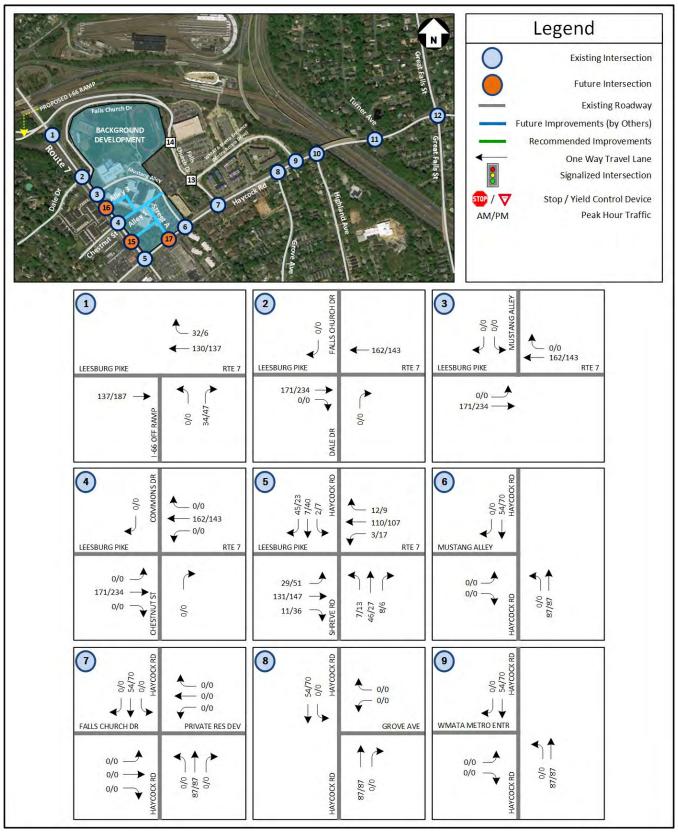

Figure 20: Inherent Growth (2019 to 2030) (1 of 2)

Figure 21: Inherent Growth (2019 to 2030) (2 of 2)

Figure 22: Background Development Traffic Volumes (1 of 2)

Note: The volumes above reflect a total of the subtraction of existing trips, addition of pass-by trips of the background development, and addition of new High School & West Falls Church Economic Development site trips, consistent with methodology of High School & West Falls Church Economic Development traffic study; therefore, volumes illustrated above may be shown as negative.

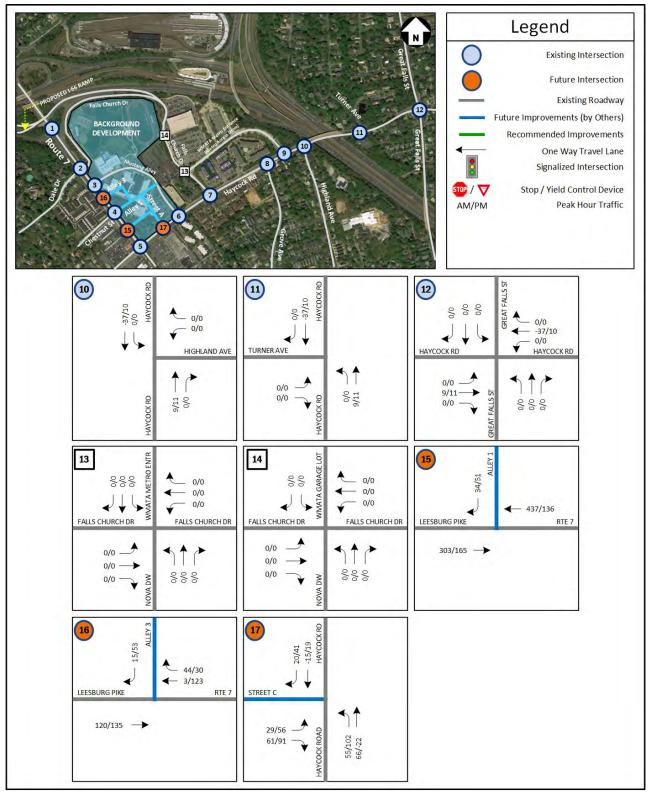

Figure 23: Background Development Traffic Volumes (2 of 2)

Note: The volumes above reflect a total of the subtraction of existing trips, addition of pass-by trips of the background development, and addition of new High School & West Falls Church Economic Development site trips, consistent with methodology of High School & West Falls Church Economic Development traffic study; therefore, volumes illustrated above may be shown as negative.

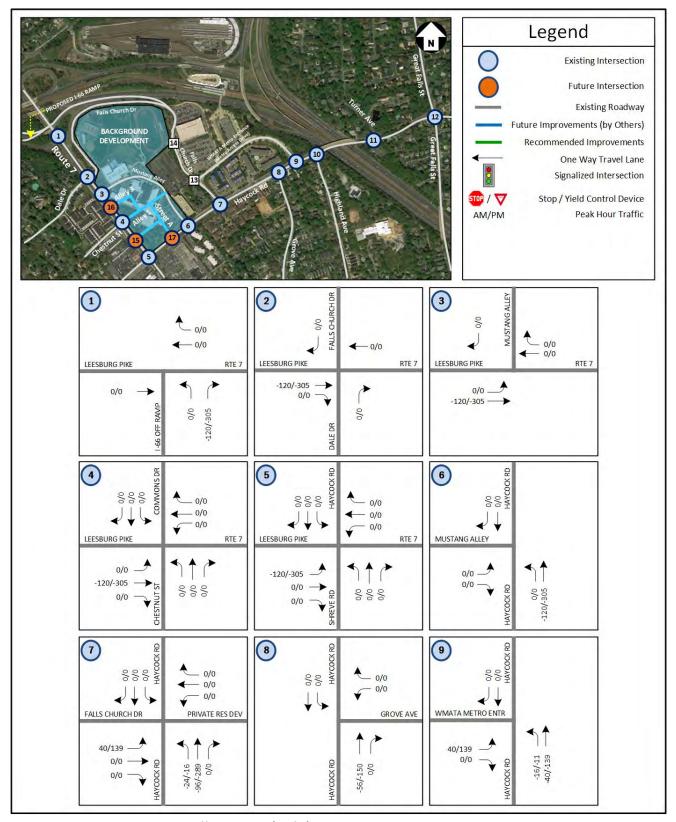

Figure 24: I-66 Ramp Rerouted Traffic Volumes (1 of 2)

Note: Methodology considered in rerouting the trips is per VDOT's <u>Transform I-66: Inside the Beltway Route 7 Connector Ramp Modified Interchange Modification Report (IMR)</u> (August 2017).

Figure 25: I-66 Ramp Rerouted Traffic Volumes (2 of 2)

Note: Methodology considered in rerouting the trips is per VDOT's <u>Transform I-66: Inside the Beltway Route 7 Connector Ramp Modified Interchange Modification Report (IMR)</u> (August 2017).

Figure 31: Future (2030) without Development Traffic Volumes (2 of 2)

Future Conditions without Development (2030) Intersection Capacity Analysis

Intersection capacity analyses were performed for the Future without Development (2030) scenario at the study area intersections during the weekday morning (AM) and afternoon peak (PM) peak hours. *Synchro*, version 10, was used to analyze the study intersections with results based on the <u>Highway Capacity Manual</u> (HCM) 2010 methodology and includes level of service (LOS), delay, and queue length comparisons for the turning movements analyzed.

The peak hour factors (by intersection) acquired from the traffic counts, with a minimum of 0.92, were used in the analysis of future conditions. Heavy vehicle percentages of major movements used in the analysis were based on the traffic counts conducted.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The results of the intersection capacity analyses from *Synchro* are presented in Table 6 and graphically in Figure 32 and in Figure 33. The results are expressed in LOS and delay (seconds per vehicles) for overall signalized intersections and per approach and lane group by intersection. The signalized intersections that operate overall at LOS E or F are shown in red. The 50th and 95th percentile queues were also determined from *Synchro* and are expressed in feet.

The detailed analysis worksheets of 2030 Future without Development Conditions are contained in Appendix F.

NOTES:

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology.

The capacity analysis results indicate that all intersections operate at an overall acceptable LOS under 2030 future conditions without development conditions with the exception of the Leesburg Pike and Haycock Road intersection and the Haycock Road and Great Falls Street intersection. The intersection of the Leesburg Pike and Haycock Road is anticipated to continue to operate at an overall unacceptable level of service during both peak hours. The intersection of Haycock Road and Great Falls Street begins to operate at an overall unacceptable level of service during the PM peak hour.

The results of the intersection capacity analyses for the future conditions without development are illustrated in Figure 32 and in Figure 33.

April 8, 2021

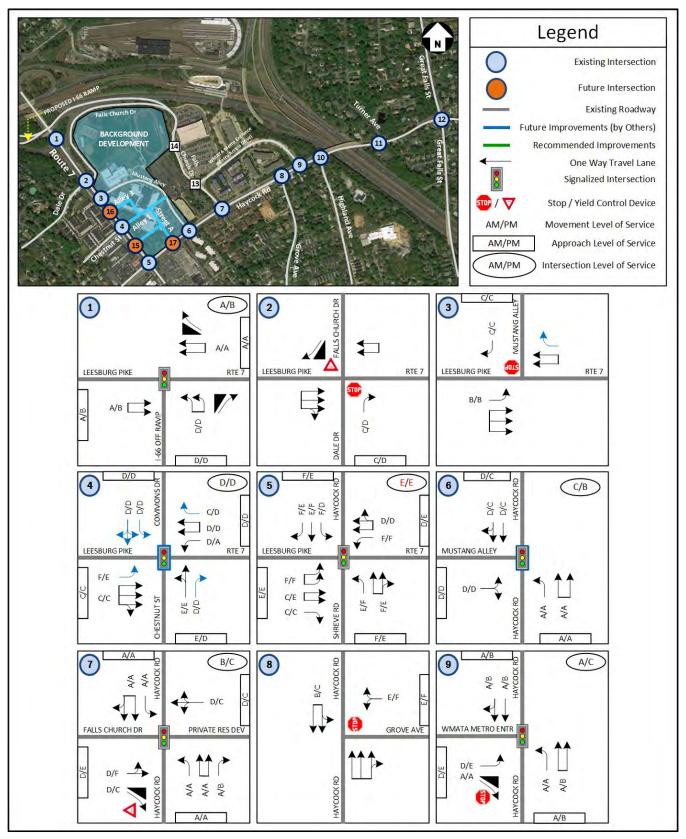

Figure 32: 2030 Future Conditions without Development – Levels of Service Results (1 of 2)

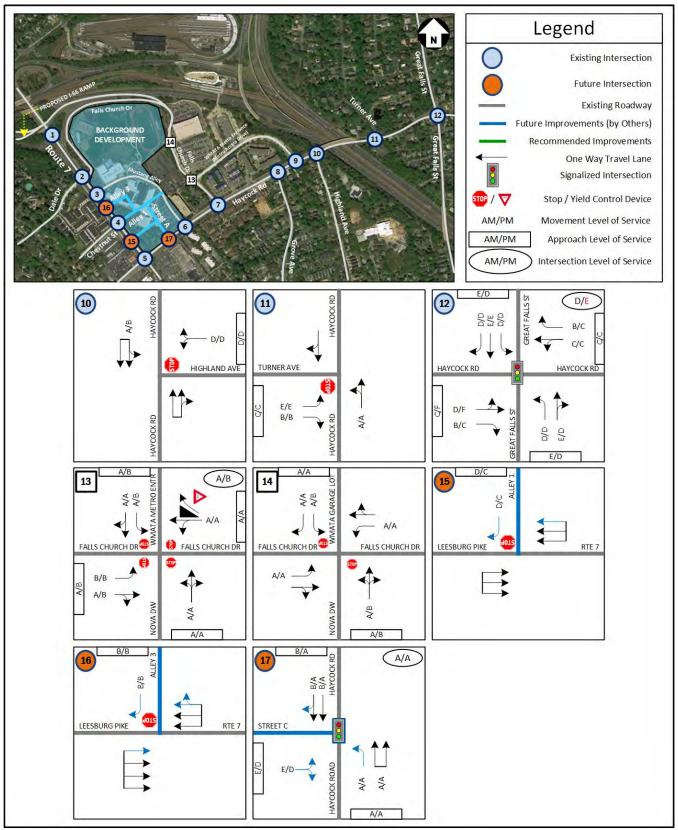

Figure 33: 2030 Future Conditions without Development – Levels of Service Results (2 of 2)

FUTURE BACKGROUND WITH CURRENT COMPREHENSIVE PLAN DEVELOPMENT CONDITIONS (2030)

Based on comments received by the County, the future conditions with the development of the proposed property under the existing *Comprehensive Plan* was analyzed. It was assumed that the WMATA and VT sites could develop approximately 962 multi-family residential units and 240 kSF of institutional uses under the current *Comprehensive Plan*. Of note, the current *Comprehensive Plan* allows for an alternative mixed-use development on the VT site that would replace the 240 kSF of institutional uses for 130 DU and 43.8 kSF of commercial. For the proposes of this analysis, it was assumed the developments would be redeveloped subject to the current *Comprehensive Plan* (with institutional use on the VT site). The "future background" development program was projected to be completed and in operation by 2030 in order to provide consistent comparison to both future without and with development conditions.

Site Description

The WMATA West Falls Church metro development (to be referred to in this study as the "WMATA site") will be reconstructed and is projected to consist of approximately 130 kSF of office space, 10 kSF of retail space, and 865 residential dwelling units (DU). The VT site is projected to consist of an additional 181 kSF of office space, 18 kSF of retail space, 440 residential DU, and 160 kSF of institutional uses. Combined, the site is anticipated to ultimately consist of 311 kSF of office space, 28 kSF of retail space, 1,305 residential DU, and 160 kSF of institutional uses.

Under the current *Comprehensive Plan* for Fairfax County, the WMATA and VT sites was considered to develop with approximately 962 multi-family residential units and 240 kSF of institutional uses.

Site Access

Primary site access will be provided via the access roads along the West Falls Church Metrorail Station roadway and Falls Church Drive. With the construction of the High School & West Falls Church Economic Development site to the southwest, additional access points to the development along Route 7 will be provided.

Two roadway improvements were considered as part of the study per the scoping meeting and would influence access to the site:

- VDOT Route 7 Connector Ramp (currently under construction as part of VDOT's Inside the Beltway initiative)
 - o The purpose of the VDOT Route 7 Connector Ramp is to provide vehicles on eastbound I-66 direct access to the West Falls Church Metrorail station parking. In addition, the ramp would provide an alternative pathway for vehicles traveling from eastbound I-66 towards northeast Haycock Road (by passing the Route 7 Corridor).
 - This approved project will include the addition of signage and pavement markings that direct traffic and promote wayfinding. Additional wayfinding will be explored during the SESP process.
- Route 7 and Chestnut Street Roadway Improvements
 - o With the construction of the High School & West Falls Church Economic Development site, it is anticipated that the intersection of Chestnut Street will be converted to a four-legged full-movement intersection with the construction of Commons Drive, the shift in the terminus of Chestnut Street at Route 7, and the closure of a partial-movement driveway along the south frontage of Route 7.

- o Commons Drive is anticipated to act as the background development's "main street" and would replace a partial-movement driveway associated with the existing high school site.
- As noted previously, a Signal Justification Report (SJR) pertaining to the modification to the intersection of Route 7 and Chestnut Street / "future" Commons Drive has been submitted to VDOT, the City of Falls Church, and Fairfax County for review in tandem with a revised traffic study for the High School & West Falls Church Economic Development site.

Based on multiple meetings with the City, a few additional improvements were identified for inclusion in the future condition with respect to the construction of the High School & West Falls Church Economic Development site:

- Haycock Road and Street C Improvements
 - A traffic signal with designated pedestrian crossings is planned to be installed.
- Haycock Road and Mustang Alley
 - A traffic signal with designated pedestrian crossing is planned to be installed.
- Route 7 Corridor
 - Per the request of VDOT and FCDOT, a third northwestbound lane on Route 7 will be installed along the frontage of High School & West Falls Church Economic Development site. The lane will serve as a right turn lane for the background site but is ultimately intended to be used a third through lane.

A graphic showing the location of the Route 7 Connector Ramp was shown previously in Figure 7. The reroute of traffic volumes, pertaining to the Route 7 Connector Ramp, are illustrated in Figure 24 and in Figure 25. The proposed roadway improvements along Route 7 associated with High School & West Falls Church Economic Development site are illustrated in Figure 26. As noted, previously, a partial-movement private driveway will be closed off with the realignment of Chestnut Street. Traffic associated with the private driveway was rerouted to utilize relocated Chestnut Street in order to provide a conservative assessment of future conditions. The reroute of traffic volumes, pertaining to the modifications to Chestnut Street, are illustrated in Figure 27.

The lane configuration for the 2030 Future Background with Current Comprehensive Plan Development Conditions would be identical to the Future without Development (2030) scenario and is illustrated in Figure 28 and in Figure 29.

Current Comprehensive Plan Site Trip Generation

In order to calculate the trips generated by the development under future background current comprehensive plan conditions, the Institute of Transportation Engineer's (ITE's) <u>Trip Generation Manual</u>, 10th Edition publication, was used in order to determine the trips going into and out of the study site during the AM and PM peak hours, as well as, the typical number of weekday daily trips associated with the site.

The current comprehensive plan development's site trip generation is illustrated in Table 7.

As illustrated in Table 7 and as agreed to during the scoping meeting for this study, a TDM/mode split reduction of 45% was applied, consistent with Fairfax County trip reduction goals and other studies in the area. A 45% mode split reduction is justified given the sufficient sidewalk access surrounding the site and connecting the site to the West Falls Church Metrorail station.

Of note, though internal trip reductions and pass-by trip reductions were assumed under 2030 future with development conditions (as discussed in subsequent sections of this report), these reductions were not applied in Table 7. The internal reductions were not applied due to the lack of synergy between the residential and institutional uses. Similarly, pass-by reductions were not applied due to lack of anticipated retail development under current comprehensive plan conditions.

Table 7: Current Comprehensive Plan Site Trip Generation

			Weekday							
ITE Land Use Code			AN	1 Peak F	lour	PN	1 Peak F	lour	Daily	
Trip Generation, 10th Ed.		Quantity	In	Out	Total	In	Out	Total	Total	
Residential	221 Multifamily (Mid-Rise)	962 DU	82	233	315	237	152	389	5,241	
Mode Split/TDM Reduction	45% AM/PM/Daily		-37	-105	-142	-107	-68	-175	-2,358	
Residntial Subtotal			45	128	173	130	84	214	2,883	
Academic	540 Junior /Community College	240 kSF	435	130	565	223	223	446	4,860	
Mode Split/TDM Reduction	45% AM/PM/Daily		-196	-59	-254	-100	-100	-201	-2,187	
Academic Subtotal			239	72	311	123	123	245	2,673	
By-Right Site Trips with Reduct	tions		284	200	484	253	206	459	5,556	

The current comprehensive plan development of the site is anticipated to generate approximately 484 additional trips in the AM peak hour, 459 additional trips in the PM peak hour, and 5,556 daily trips after TDM reductions.

Current Comprehensive Plan Site Trip Distribution and Assignment

The distribution and assignment of the current comprehensive plan site generated trips was based on the existing and anticipated traffic patterns, engineering judgement, and the nature of the current comprehensive plan development. The current comprehensive plan trips were assigned based on the peak hour direction of approaches approved for the 2030 future with development conditions. The direction of approach are discussed in further detail in subsequent sections of this report and are illustrated in Figure 43 and in Figure 44 for the AM and PM peak hours, respectively.

Using the direction of approaches for the AM and PM peak hours and the anticipated future road network, the site generated trips were assigned to the road network as illustrated in Figure 34 and in Figure 35 for the current comprehensive plan residential portions of the developments and in Figure 36 and in Figure 37 for the current comprehensive plan institutional portions of the developments.

Current Comprehensive Plan Future Conditions (2030) Traffic Volumes

In order to determine the traffic volumes on the roadways in the vicinity of the development, the current comprehensive plan site generated traffic volumes for the proposed development under current comprehensive plan conditions were added to the 2030 Future without Development traffic volumes. The traffic volumes for the 2030 Future Background with Current Comprehensive Plan Development Conditions are presented in Figure 38 and in Figure 39.

Current Comprehensive Plan Future Conditions (2030) Intersection Capacity Analysis

Intersection capacity analyses were performed for the Future Background with Current Comprehensive Plan Development Conditions (2030) scenario at the study area intersections during the weekday morning (AM) and afternoon peak (PM) peak hours. *Synchro*, version 10, was used to analyze the study intersections with results based on the <u>Highway Capacity Manual</u> (HCM) 2010 methodology and includes level of service (LOS), delay, and queue length comparisons for the turning movements analyzed.

The peak hour factors (by intersection) acquired from the traffic counts, with a minimum of 0.92, were used in the analysis of future conditions. Heavy vehicle percentages of major movements used in the analysis were based on the traffic counts conducted.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The results of the intersection capacity analyses from *Synchro* are presented in Table 8 and graphically in Figure 40 and in Figure 41. The results are expressed in LOS and delay (seconds per vehicles) for overall signalized intersections and per approach and lane group by intersection. The signalized intersections that operate overall at LOS E or F are shown in red. The 50th and 95th percentile queues were also determined from *Synchro* and are expressed in feet.

The detailed analysis worksheets of 2030 Future Background with Current Comprehensive Plan Development Conditions (with Chestnut Street improvements) are contained in Appendix G.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology.

The capacity analysis results indicate that all intersections operate at an overall acceptable LOS under 2030 Future Background with Current Comprehensive Plan Development Conditions with the exception of the Leesburg Pike and Haycock Road intersection and the Haycock Road and Great Falls Street intersection. The intersection of the Leesburg Pike and Haycock Road and the intersection of Haycock Road and Great Falls Street are anticipated to continue to operate at an overall unacceptable level of service during at least one peak period as compared to the future without development scenario.

The results of the intersection capacity analyses for the 2030 Future Background with Current Comprehensive Plan Development Conditions are illustrated in Figure 40 and in Figure 41.

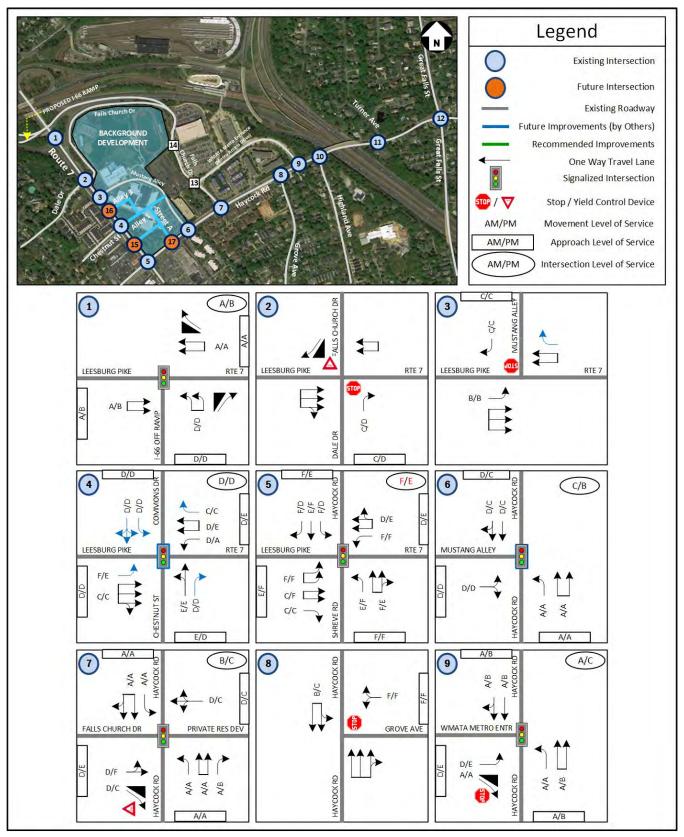

Figure 40: 2030 Future Background with Current Comprehensive Plan Development Conditions – Levels of Service Results (1 of 2)

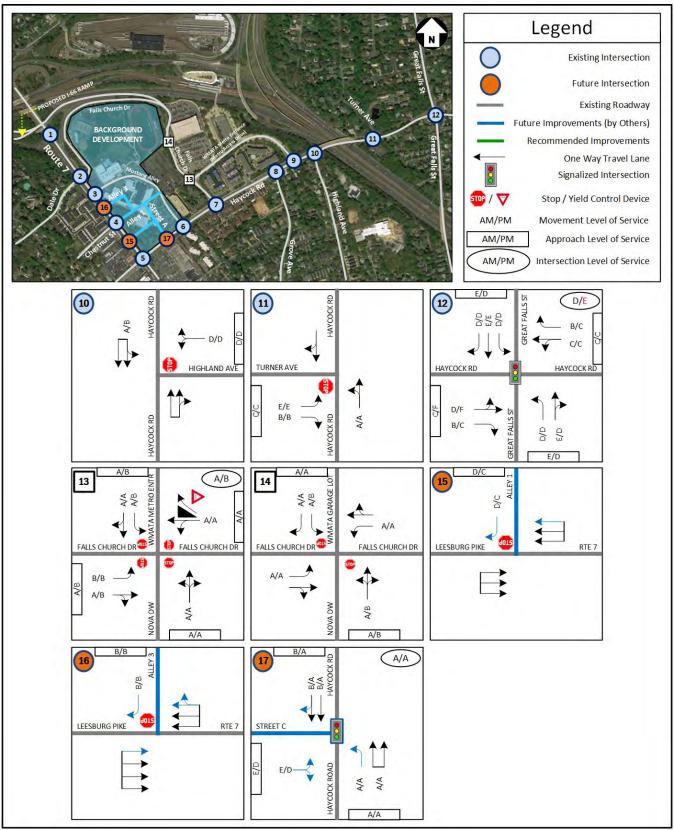

Figure 41: 2030 Future Background with Current Comprehensive Plan Development Conditions – Levels of Service Results (2 of 2)

FUTURE CONDITIONS WITH DEVELOPMENT (2030)

The WMATA and VT developments are anticipated to be fully constructed and in operation by 2030.

Site Description

The WMATA West Falls Church metro development (to be referred to in this study as the "WMATA site") will be reconstructed and is projected to consist of approximately 130 kSF of office space, 10 kSF of retail space, and 865 residential dwelling units (DU). The VT site is projected to consist of an additional 181 kSF of office space, 18 kSF of retail space, 440 residential DU, and 160 kSF of institutional uses. Combined, the site is anticipated to ultimately consist of 311 kSF of office space, 28 kSF of retail space, 1,305 residential DU, and 160 kSF of institutional uses.

Figure 42 illustrated the proposed conceptual plans for the WMATA and VT sites.

Figure 42: WMATA and VT Site Development Plans

Note: For conceptual purposes only.

Site Access

Primary site access will be provided via the access roads along the West Falls Church Metrorail Station roadway and Falls Church Drive. With the construction of the High School & West Falls Church Economic Development site to the southwest, additional access points to the development along Route 7 will be provided.

Site Trip Generation

In order to calculate the trips generated by the proposed developments, the Institute of Transportation Engineer's (ITE's) <u>Trip Generation Manual</u>, 10th Edition publication, was used in order to determine the trips going into and out of the study site during the AM and PM peak hours, as well as, the typical number of weekday daily trips associated with the site.

The proposed development's site trip generation is illustrated in Table 9. Of note, the proposed development program presented in the scoping meeting was slightly higher in intensity than what is presented in this study. As discussed in subsequent meetings between representatives of the Applicant and the reviewing agencies, the trip generation was revised to more accurately match the proposed intensity within the current Comprehensive Plan Amendment.

As illustrated in Table 9 and as agreed to during the scoping meeting for this study, internal trip reductions and pass-by trip reductions were applied to the trip generation in order to account for anticipated inner-development interactions and existing capture. Furthermore, a TDM/mode split reduction of 45% was applied to the trip generation as agreed to by VDOT, County, and City scoping meeting. A 45% mode split reduction is justified given the sufficient sidewalk access surrounding the site and connecting the site to the West Falls Church Metrorail station.

Proposed Development Site Trips witl	n Reductions		438	271	709	314	381	695	8,182

A) The pass by reduction for the shopping center is based on the ITE Trip Generation methodology, as provided in the 10th Edition Handbook. The average rate for shopping centers is 34% for the PM Peak. For all other time periods, the default pass by rate is 25%.

The proposed developments are anticipated to generate approximately 709 additional trips in the AM peak hour, 695 additional trips in the PM peak hour, and 8,182 daily trips after TDM, internal, and external pass-by reductions.

Site Trip Distribution and Assignment

The distribution and assignment of the site generated trips was based on the existing and anticipated traffic patterns, engineering judgement, and the nature of the proposed development with guidance and input from VDOT, FCDOT and the City of Falls Church staff.

The site direction of approach for the analyzed peak hours is illustrated in Figure 43 and in Figure 44 for the AM and PM peak hours, respectively. As agreed to in the scoping document, separate direction of approaches were utilized between peak hours in order to more precisely model roadway conditions.

Using the direction of approaches for the AM and PM peak hours and the current design of the proposed development, the site generated trips were assigned to the road network as illustrated in Figure 45 and in Figure 46 for the residential portions of the developments and in Figure 47 and in Figure 48 for the commercial/non-residential portions of the developments.

⁽¹⁾ residential / office - smaller of 5% of residential trips or 5% of office trips

⁽²⁾ residential / retail - smaller of X% of residential trips or X% of retail trips; AM: X = 5%, PM: X = 10%, Sat: X = 10%, Daily: X = 15%

⁽³⁾ office/ retail - smaller of 5% of office trips or 5% of retail trips

⁽⁴⁾ academic/retail - use the smaller of 10% of academic traffic or 10% of retail traffic

The pass-by trips, associated with the development's commercial services, were assigned to the road network, as illustrated in Figure 49 and in Figure 50.

Future Conditions with Development (2030) Traffic Volumes

In order to determine the traffic volumes on the roadways in the vicinity of the development, the site generated traffic volumes and associated pass-by trips for the proposed development were added to the 2030 Future without Development traffic volumes. The traffic volumes for the 2030 Future with Development conditions are presented in Figure 51 and in Figure 52.

It should be noted that the 2030 future with development traffic volumes at the internal intersections (Intersection 13 and 14; shown on Figure 52) vary from the combination of the 2030 future without development traffic volume, external site generated trips, and external pass-by trips, as the internal configuration of the site will be modified with the redevelopment (thus impacting the internal routing of metro buses as well as vehicles associated with park-and-ride garage and utilizing the kiss-and-ride)

Future Conditions with Development (2030) – Roadway Improvement Strategy

The WMATA and VT developments are anticipated to be fully constructed and in operation by 2030.

Due to increased traffic demand on the future road network, road improvements will be necessary in order to achieve acceptable levels of service or maintain similar traffic operation conditions as compared to future without development conditions during the weekday morning (AM) and weekday afternoon (PM) peak hours.

The analysis presented herein provides possible roadway improvements strategies along Route 7, along Haycock Road, and at the major intersection connecting the two corridors. Furthermore, the analysis herein provides a baseline scenario (i.e., 2030 Future with Development but without any roadway improvements implemented) to illustrate how the improvements would impact road conditions.

The individual scenarios are listed below along with intersections targeted for improvement:

- Baseline
 - No Improvements along Route 7
 - No Improvements along Haycock Road
- Proposed Mitigations
 - Improvements recommended along Haycock Road (at Falls Church Drive, at Grove Avenue, and at Great Falls Street)
 - Optimization of the traffic signals along Route 7 and along Haycock Road

Of note, the signal at Chestnut Street along Route 7 was assumed to be constructed as a background condition. The individual improvements by intersection are described in subsequent subsections.

In addition to the aforementioned roadway improvements, the two study intersections within the site along Falls Church Drive may be signalized at the ultimate build-out in order to promote connectivity and improve internal circulation. As the current layout of the development is conceptual and may change prior to site plan, the baseline scenario herein assumes that both internal intersections (Study Intersections 13 and 14) continue to operate similar under existing conditions, whereas the mitigated scenario discussed in this study assumes that both internal intersections would operate under signal control. The final configuration and control type used at these two intersections will be determined prior site plan and when the internal circulation characteristics of the site are finalized.

Future Conditions with Development (2030) – Baseline Scenario

Intersection Capacity Analysis

Intersection capacity analyses were performed for the Future with Development (2030) "baseline" scenario at the study area intersections during the weekday morning (AM) and afternoon peak (PM) peak hours. *Synchro*, version 10, was used to analyze the study intersections with results based on the <u>Highway Capacity Manual</u> (HCM) 2010 methodology and includes level of service (LOS), delay, and gueue length comparisons for the turning movements analyzed.

The peak hour factors (by intersection) acquired from the traffic counts, with a minimum of 0.92, were used in the analysis of future conditions. Heavy vehicle percentages of major movements used in the analysis were based on the traffic counts conducted.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The results of the intersection capacity analyses from *Synchro* are presented in Table 10. The results are expressed in LOS and delay (seconds per vehicles) for overall signalized intersections and per approach and lane group by intersection. The signalized intersections that operate overall at LOS E or F are shown in red. The 50th and 95th percentile queues were also determined from *Synchro* and are expressed in feet.

The detailed analysis worksheets of 2030 Future with Development Conditions (Baseline) are contained in Appendix H.

- [6] 50th Percentile Queues are not reported for TWSC intersections under HCM2010 Methodology.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The capacity analysis results indicate that all signalized intersections operate at an overall acceptable LOS under 2030 future conditions with development conditions with the exception of the Leesburg Pike and Haycock Road intersection and the Haycock Road and Great Falls Street intersection.

Due to the increased demand on the road network with the developments in-place, the following mitigation strategy was assessed along the Route 7 and Haycock Road corridors as part of this study.

Future Conditions with Development (2030) – Proposed Mitigation

In order to achieve acceptable levels of service or maintain similar traffic operation conditions as compared to future without development conditions, the following roadway improvements are recommended (by intersection):

- Route 7 at Haycock Road
 - o Add southbound thru lane on Haycock Road; and
 - Adjust signal timings to accommodate new configuration.
- Haycock Road and Falls Church Drive
 - Restripe the eastbound approach on Falls Church Drive to a shared thru/right and an exclusive left turn lane which will operate under permitted + protected phasing.
 - Adjust signal timings to accommodate new configuration.
- Haycock Road at Great Falls Street
 - o Change eastbound and westbound Haycock Road lane configuration from left/thru, right to left, thru/right; and
 - Modify signal timings to account for the change in roadway geometry.
- Haycock Road at Grove Avenue
 - Add a northbound right turn lane to provide an exclusive left lane and an exclusive right lane.
- Route 7 Corridor
 - Optimize traffic signal timings along Route 7 to promote progression and to account for the modifications to the Route 7 and Haycock Road intersection.
- Haycock Road Corridor
 - Optimize traffic signal timings along Haycock to promote progression and to account for the modifications to the Route 7 and Haycock Road intersection.

In addition to the aforementioned roadway improvements, the two study intersections within the site along Falls Church Drive may be signalized at the ultimate build-out in order to promote connectivity and improve internal circulation. As the current layout of the development is conceptual and may change prior to site plan, the baseline scenario assumed that both internal intersections (Study Intersections 13 and 14) continued to operate similar under existing conditions, whereas the mitigated scenario discussed in this study assumes that both internal intersections would operate under signal control. The final configuration and control type used at these two intersections will be determined prior site plan and when the internal circulation characteristics of the site are finalized.

The traffic volumes for the 2030 Future with Development conditions are presented in Figure 51 and in Figure 52. The lane configuration with the recommended improvements is illustrated in Figure 53 and Figure 54.

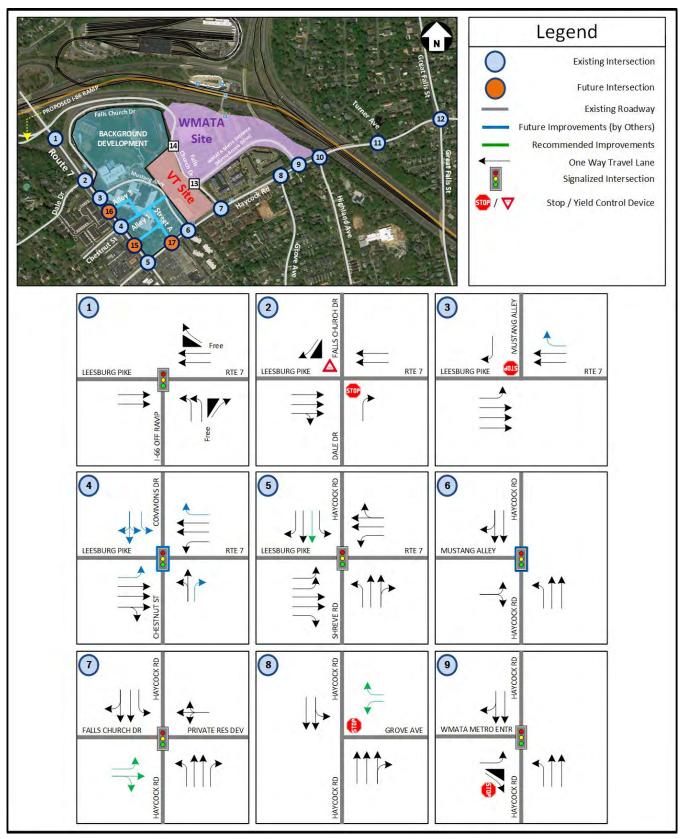

Figure 53: 2030 Future Conditions with Development and with Proposed Mitigations – Roadway Lane Configuration and Traffic Control Devices (1 of 2)

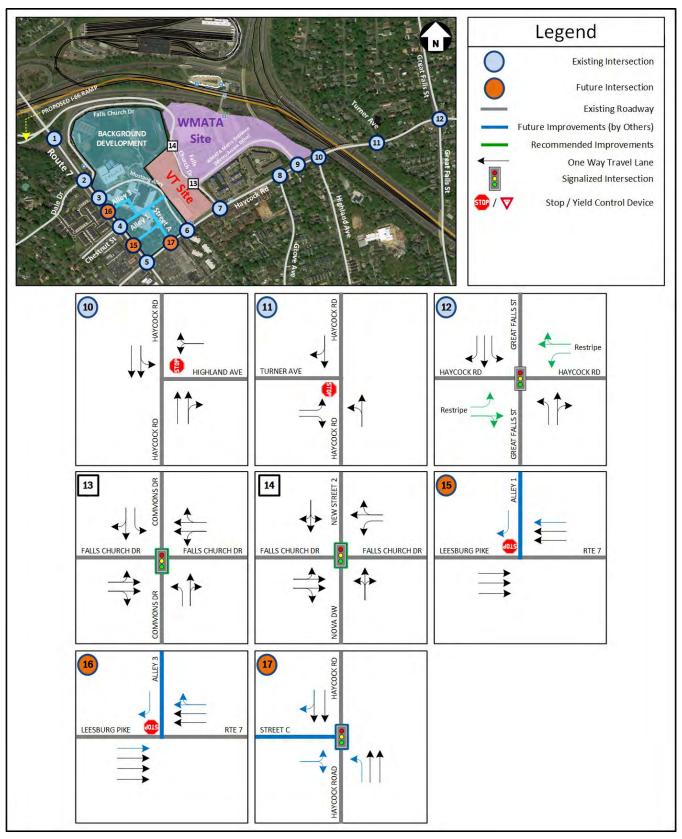

Figure 54: 2030 Future Conditions with Development and with Proposed Mitigations – Roadway Lane Configuration and Traffic Control Devices (2 of 2)

Intersection Capacity Analysis

In order to assess the impacts of the proposed roadway improvements presented in this scenario, intersection capacity analyses were performed for the Future with Development (2030) scenario at the study area intersections during the weekday morning (AM) and afternoon peak (PM) peak hours. *Synchro*, version 10, was used to analyze the study intersections with results based on the <u>Highway Capacity Manual</u> (HCM) 2010 methodology and includes level of service (LOS), delay, and queue length comparisons for the turning movements analyzed.

The peak hour factors (by intersection) acquired from the traffic counts, with a minimum of 0.92, were used in the analysis of future conditions. Heavy vehicle percentages of major movements used in the analysis were based on the traffic counts conducted.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The results of the intersection capacity analyses from *Synchro* are presented in Table 11. The results are expressed in LOS and delay (seconds per vehicles) for overall signalized intersections and per approach and lane group by intersection. The signalized intersections that operate overall at LOS E or F are shown in red. The 50th and 95th percentile queues were also determined from *Synchro* and are expressed in feet.

The detailed analysis worksheets of 2030 Future with Development Conditions – Proposed Mitigations are contained in Appendix I.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The capacity analysis for 2030 future with development conditions and with the proposed improvements indicates that all of the signalized study intersection would operate similar to 2030 future without development conditions or better. The intersection of Haycock Road and Leesburg Pike would continue to operate at unacceptable levels of service during the AM peak hour but would improve over future background conditions and would begin to operate acceptably (overall) during the PM peak hour.

The results of the intersection capacity analyses for the 2030 future conditions with development and proposed mitigation strategies are illustrated in Figure 55 and in Figure 56.

Of note, with respect to the intersection of Falls Church Drive at New Street 2 / Nova Driveway (Study Intersection 14), a signal was assessed as a proposed roadway improvement internal to the site. Based on the analysis above, a signal would allow the side streets at the intersection to operate at acceptable levels of service during the peak hours but would consequently interrupt traffic flow along Falls Church Drive. Given these conditions, further analysis regarding the implementation of a signal at this location should be conducted prior to site plan and when the internal circulation characteristics of the site are finalized.

Figure 55: 2030 Future Conditions with Development and with Proposed Mitigations – Levels of Service Results (1 of 2)

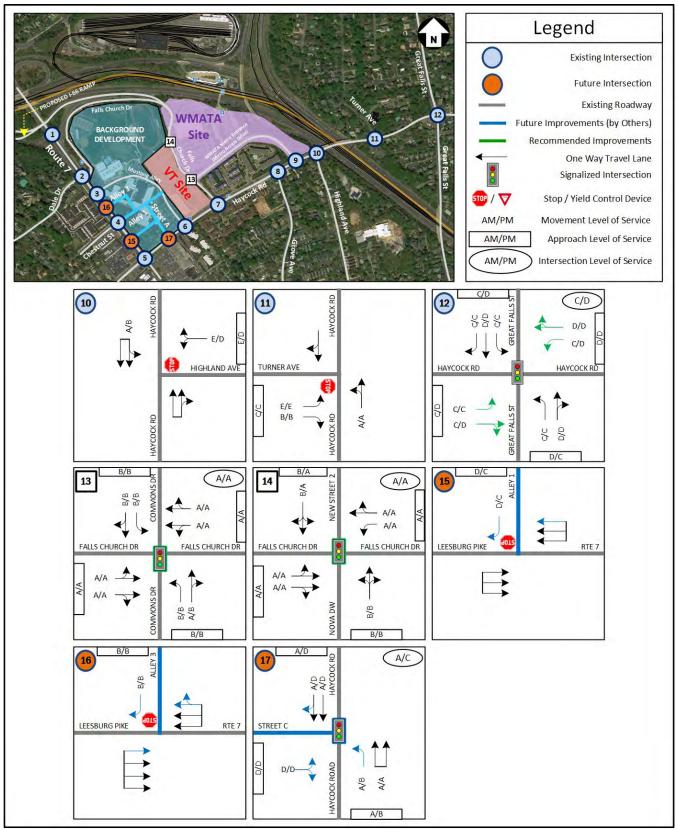

Figure 56: 2030 Future Conditions with Development and with Proposed Mitigations – Levels of Service Results (2 of 2)

FUTURE CONDITIONS WITH DEVELOPMENT (2030) - ALTERNATIVE WITHOUT VT SCENARIO

This scenario presented to provide analysis without the Virginia Tech redevelopment. It is noted that the Comprehensive Plan Amendment continues to call for the redevelopment of both sites and it is not anticipated that this scenario will be realized; it is only included to present a worst-case evaluation in terms of road connectivity. Under this scenario, WMATA is anticipated to be fully constructed and in operation by 2030 without the VT development.

Site Description and Site Access

The WMATA site will be reconstructed and is projected to consist of approximately 130 kSF of office space, 10 kSF of retail space, and 865 residential dwelling units (DU).

Under this scenario, primary site access will continue to be provided via the access roads along the West Falls Church Metrorail Station roadway and Falls Church Drive. However, this scenario does not have a direct connection between the site and Route 7.

Site Trip Generation

In order to calculate the trips generated by the proposed developments, the Institute of Transportation Engineer's (ITE's) <u>Trip Generation Manual</u>, 10th Edition publication, was used in order to determine the trips going into and out of the study site during the AM and PM peak hours, as well as the typical number of weekday daily trips associated with the site. The WMATA development's site trip generation is illustrated in Table 12.

As illustrated in Table 12 and as agreed to during the scoping meeting for this study, internal trip reductions and pass-by trip reductions were applied to the trip generation in order to account for anticipated inner-development interactions and existing capture. Furthermore, a TDM/mode split reduction of 45% was applied to the trip generation as agreed to by VDOT, County, and City scoping meeting. A 45% mode split reduction is justified given the sufficient sidewalk access surrounding the site and connecting the site to the West Falls Church Metrorail station.

Proposed Development Site Tr	ips with Reductions		111	125	236	136	149	285	3,454

A) The pass by reduction for the shopping center is based on the ITE Trip Generation methodology, as provided in the 10th Edition Handbook. The average rate for shopping centers is 34% for the PM Peak. For all other time periods, the default pass by rate is 25%.

The proposed WMATA development is anticipated to generate approximately 236 additional trips in the AM peak hour, 285 additional trips in the PM peak hour, and 3,454 daily trips after TDM, internal, and external pass-by reductions.

Site Trip Distribution and Assignment

The distribution and assignment of the site generated trips is consistent with what was shown in the previous scenarios. Using the direction of approaches for the AM and PM peak hours and the current design of the proposed development, the WMATA generated trips were assigned to the road network as illustrated in Figure 57 and in Figure 58 for the residential portions of the developments and in Figure 59 and in Figure 60 for the commercial/non-residential portions of the developments.

The pass-by trips, associated with the development's commercial services, were assigned to the road network, as illustrated in Figure 61 and in Figure 62.

Future Conditions with Development (2030) Traffic Volumes

In order to determine the traffic volumes on the roadways in the vicinity of the development, the site generated traffic volumes and associated pass-by trips for the proposed development were added to the 2030 Future without Development traffic volumes. The traffic volumes for the 2030 Future with Development conditions are presented in Figure 63 and in Figure 64.

⁽¹⁾ residential / office - smaller of 5% of residential trips or 5% of office trips

⁽²⁾ residential / retail - smaller of X% of residential trips or X% of retail trips; AM: X = 5%, PM: X = 10%, Sat: X = 10%, Daily: X = 15%

⁽³⁾ office/ retail - smaller of 5% of office trips or 5% of retail trips

⁽⁴⁾ academic/retail - use the smaller of 10% of academic traffic or 10% of retail traffic

Future Conditions with Development (2030) – Alternative Without VT Scenario – Roadway Improvement Strategy

The analysis presented herein includes the two following scenarios:

- Baseline
 - No Improvements along Route 7
 - No Improvements along Haycock Road
- Proposed Mitigations
 - o Improvements recommended along Haycock Road (at Falls Church Drive and at Great Falls Street)
 - o Optimization of the traffic signals along Route 7 and along Haycock Road
 - The proposed mitigations for this scenario are consistent with the Future with Development (2030) Proposed Mitigations scenario.

Future Conditions with Development (2030) – Alternative without Virginia Tech - Baseline Scenario Intersection Capacity Analysis

Intersection capacity analyses were performed for the Future with Development (2030) – Alternative No VT – "baseline" scenario at the study area intersections during the weekday morning (AM) and afternoon peak (PM) peak hours. *Synchro,* version 10, was used to analyze the study intersections with results based on the <u>Highway Capacity Manual</u> (HCM) 2010 methodology and includes level of service (LOS), delay, and queue length comparisons for the turning movements analyzed.

The peak hour factors (by intersection) acquired from the traffic counts, with a minimum of 0.92, were used in the analysis of future conditions. Heavy vehicle percentages of major movements used in the analysis were based on the traffic counts conducted.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The results of the intersection capacity analyses from *Synchro* are presented in Table 14. The results are expressed in LOS and delay (seconds per vehicles) for overall signalized intersections and per approach and lane group by intersection. The signalized intersections that operate overall at LOS E or F are shown in red. The 50th and 95th percentile queues were also determined from *Synchro* and are expressed in feet.

The detailed analysis worksheets of 2030 Future with Development Conditions – Alternative No VT - (Baseline) are contained in Appendix J.

NOTES:

^[1] Effective storage length is based on the storage length plus one-half of the taper length per TOSAM guidelines.

^{[2] \$:} Delays (reported from Synchro) exceed 300 seconds in TWSC.

^{[3] #: 95}th percentile queues (reported from Synchro) exceed capacity; actual queues may be longer. Queues shown are based on the maximum after two cycles.

^[4] m: 95th percentile volume and queues (reported from Synchro) are metered by upstream signal.

^{[6] 50}th Percentile Queues are not reported for TWSC intersections under HCM 2010 Methodology.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The capacity analysis results indicate that all signalized intersections operate at an overall acceptable LOS under 2030 future conditions with development conditions with the exception of the Leesburg Pike and Haycock Road intersection and the Haycock Road and Great Falls Street intersection.

Due to the increased demand on the road network with the developments in-place, the following mitigation strategy was assessed along the Route 7 and Haycock Road corridors as part of this study.

Future Conditions with Development (2030) – Alternative without Virginia Tech Scenario - Proposed Mitigation

As discussed in the previous sections, roadway improvements are proposed in order to achieve acceptable levels of service or maintain similar traffic operation conditions as compared to future without development conditions. The same mitigations that were proposed in the previous section are also proposed for the Alternative No VT Scenario and include:

- Route 7 at Haycock Road
 - o Add southbound thru lane on Haycock Road; and
 - o Adjust signal timings to accommodate new configuration.
- Haycock Road and Falls Church Drive
 - Restripe the eastbound approach on Falls Church Drive to a shared thru/right and an exclusive left turn lane which will operate under permitted + protected phasing.
 - Adjust signal timings to accommodate new configuration.
- Haycock Road at Great Falls Street
 - o Change eastbound and westbound Haycock Road lane configuration from left/thru, right to left, thru/right; and
 - Modify signal timings to account for the change in roadway geometry.
- Haycock Road at Grove Avenue
 - Add a northbound right turn lane to provide an exclusive left lane and an exclusive right lane.
- Route 7 Corridor
 - Optimize traffic signal timings along Route 7 to promote progression and to account for the modifications to the Route 7 and Haycock Road intersection.
- Haycock Road Corridor
 - Optimize traffic signal timings along Haycock to promote progression and to account for the modifications to the Route 7 and Haycock Road intersection.

In addition to the aforementioned roadway improvements, the two study intersections within the site along Falls Church Drive may be signalized at the ultimate build-out in order to promote connectivity and improve internal circulation. As the current layout of the development is conceptual and may change prior to site plan, the baseline scenario assumed that both internal intersections (Study Intersections 13 and 14) continued to operate similar under existing conditions, whereas the mitigated scenario discussed in this study assumes that both internal intersections would operate under signal control. The final configuration and control type used at these two intersections will be determined prior site plan and when the internal circulation characteristics of the site are finalized.

The lane configuration with the recommended improvements under are again illustrated in Figure 65 and Figure 66.

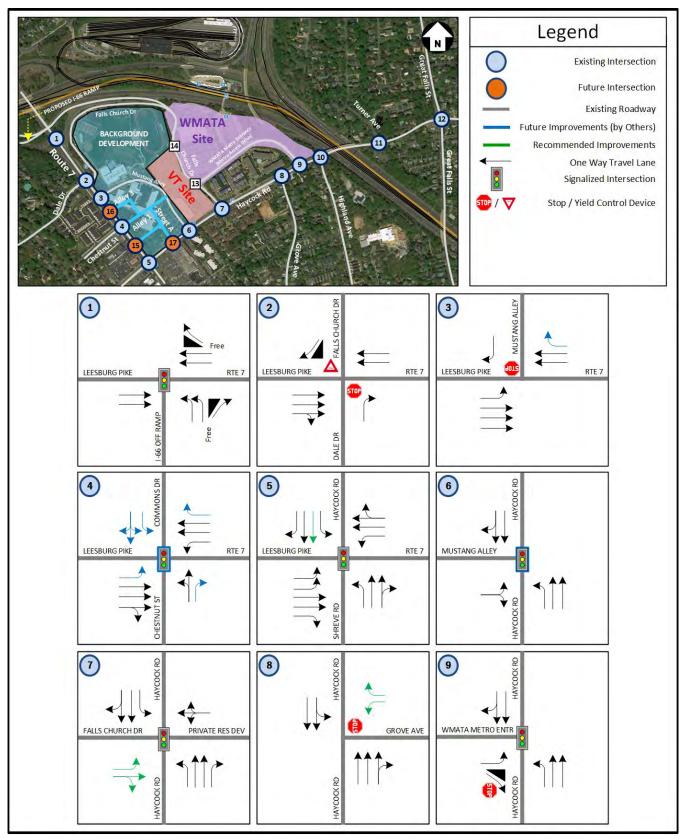

Figure 65: 2030 Future Conditions with Development – Alternative No VT Scenario – Roadway Lane Configuration and Traffic Control Devices (1 of 2)

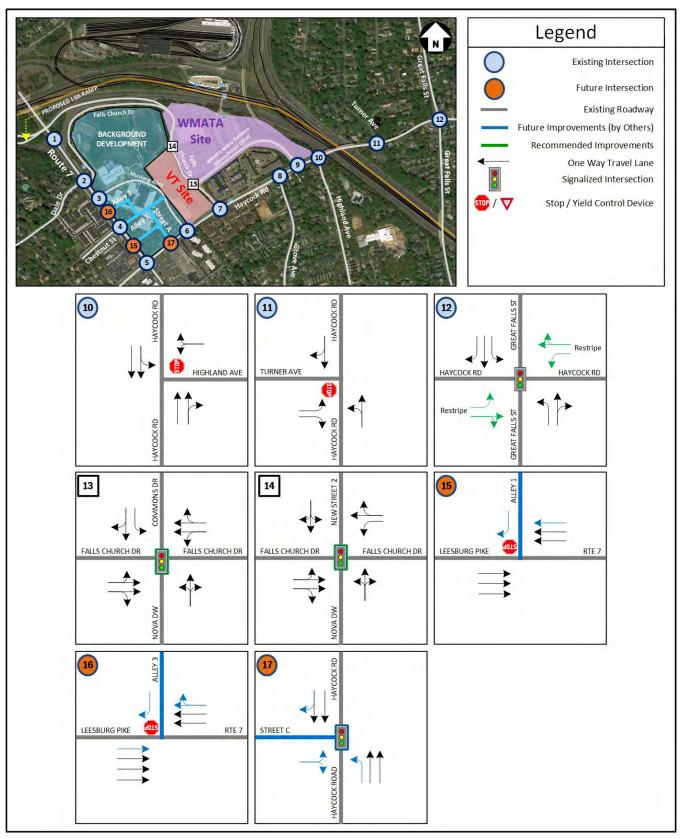

Figure 66: 2030 Future Conditions with Development – Alternative No VT Scenario – Roadway Lane Configuration and Traffic Control Devices (2 of 2)

Intersection Capacity Analysis

In order to assess the impacts of the proposed roadway improvements presented in this scenario, intersection capacity analyses were performed for the Future with Development (2030) scenario at the study area intersections during the weekday morning (AM) and afternoon peak (PM) peak hours. *Synchro*, version 10, was used to analyze the study intersections with results based on the <u>Highway Capacity Manual</u> (HCM) 2010 methodology and includes level of service (LOS), delay, and queue length comparisons for the turning movements analyzed.

The peak hour factors (by intersection) acquired from the traffic counts, with a minimum of 0.92, were used in the analysis of future conditions. Heavy vehicle percentages of major movements used in the analysis were based on the traffic counts conducted.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The results of the intersection capacity analyses from *Synchro* are presented in Table 14. The results are expressed in LOS and delay (seconds per vehicles) for overall signalized intersections and per approach and lane group by intersection. The signalized intersections that operate overall at LOS E or F are shown in red. The 50th and 95th percentile queues were also determined from *Synchro* and are expressed in feet.

The detailed analysis worksheets of 2030 Future with Development Conditions - Alternative No VT Scenario are contained in Appendix K.

NOTES:

- [1] Effective storage length is based on the storage length plus one-half of the taper length per TOSAM guidelines.
- [2] \$: Delays (reported from Synchro) exceed 300 seconds in TWSC.
- [3] #: 95th percentile queues (reported from Synchro) exceed capacity; actual queues may be longer. Queues shown are based on the maximum after two cycles.
- [4] m: 95th percentile volume and queues (reported from Synchro) are metered by upstream signal.
- [6] 50th Percentile Queues are not reported for TWSC intersections under HCM2010 Methodology.

Per the scoping meeting between the VDOT, County, and City staff, it is desirable to strive for an overall intersection LOS of D or better for traffic operations using the HCM methodology. The capacity analysis for 2030 Future with Development Conditions – Alternative No VT Scenario indicates that all of the signalized study intersection would operate similar to 2030 future without development conditions or better. The intersection of Haycock Road and Leesburg Pike would continue to operate at unacceptable levels of service during the AM peak hour but would begin to operate acceptably (overall) during the PM peak hour.

The results of the intersection capacity analyses for the 2030 future conditions with development and proposed mitigation strategies are illustrated in Figure 67 and in Figure 68.

As noted previously, with respect to the intersection of Falls Church Drive at New Street 2 / Nova Driveway (Study Intersection 14), a signal was assessed as a proposed roadway improvement internal to the site. Based on the analysis above, a signal would allow the side streets at the intersection to operate at acceptable levels of service during the peak hours but would consequently interrupt traffic flow along Falls Church Drive. Given these conditions, further analysis regarding the implementation of a signal at this location should be conducted prior to site plan and when the internal circulation characteristics of the site are finalized.

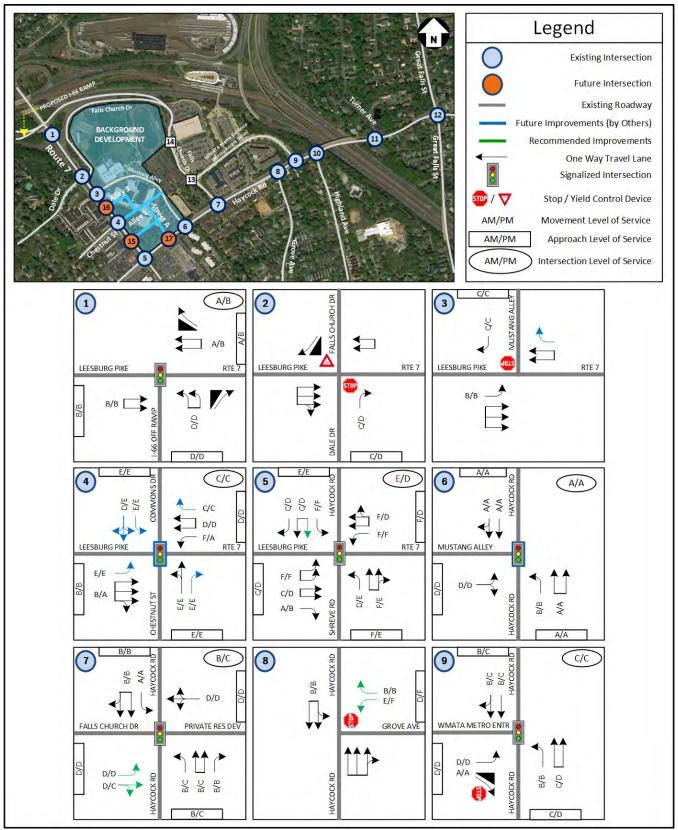

Figure 67: 2030 Future Conditions with Development - Alternative No VT Scenario - Levels of Service Results (1 of 2)

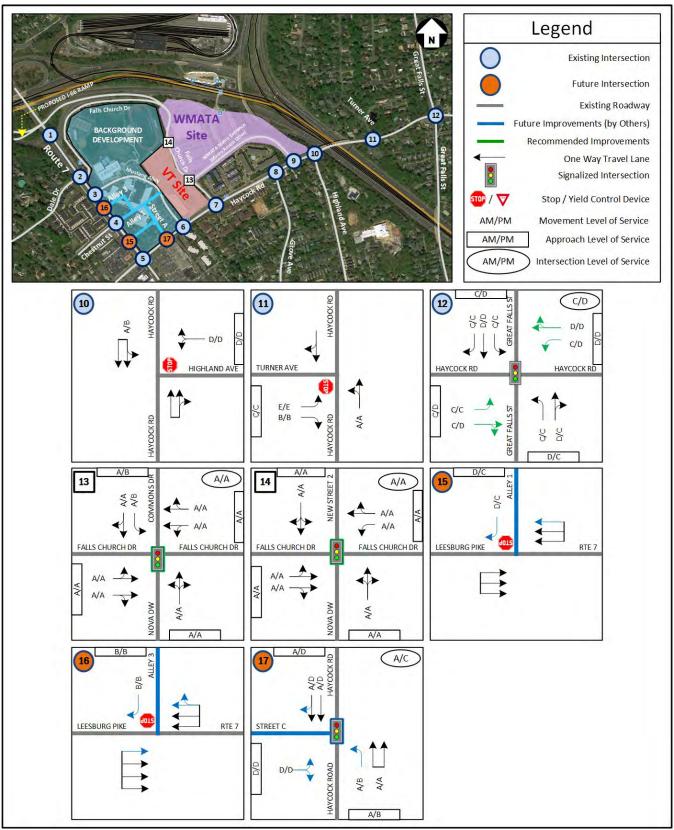

Figure 68: 2030 Future Conditions with Development – Alternative No VT Scenario – Levels of Service Results (2 of 2)

FUTURE CONDITIONS WITHOUT DEVELOPMENT (2045) – PLANNING SCENARIO

For the purposes of this study, the development is anticipated to be constructed by 2030. Based on discussions with VDOT, the County, and the City, a planning level analysis was recommended for the year 2045.

Future Conditions without Development (2045) Traffic Volumes

In order to forecast future roadway traffic volumes for the year 2045, future traffic volumes along the Route 7 and Haycock Road corridors were approximated based on Fairfax County Department of Transportation's (FCDOT) travel demand forecasting model projections. The 2045 travel demand model analyzed six major intersection along the corridors. The six major intersections were as follows:

- I-66 eastbound off-ramp and Leesburg Pike (Rte. 7)
- Leesburg Pike (Rte. 7) and Dale Drive (Rte. 1128)
- Leesburg Pike and Shreve Road / Haycock Road (Rte. 703)
- Haycock Road and Falls Church Drive
- Haycock Road and WMATA Metro Entrance (Metro Access Drive)
- Haycock Road and Great Falls Street (Rte. 694)

Of note, FCDOT models incorporated trips in association with the development of the proposed property under the existing *Comprehensive Plan*. It was assumed that the WMATA and VT sites could develop approximately 962 multi-family residential units and 240 kSF of institutional uses under the current *Comprehensive Plan*. The 2045 future without development traffic volumes are illustrated in Figure 69. The travel demand forecast models are provided in Appendix L.

Future Conditions without Development (2045) – Segment Capacity Analysis

As noted previously, the 2045 future without development scenario is to be used for planning purpose only. As such, in order to determine the potential future traffic demand along the Route 7 and Haycock Road Corridors, the projected 2045 traffic volumes were used to determine the volume-to-capacity (v/c) rate at 21 locations within the vicinity of the study area.

The evaluation locations are illustrated in Figure 70, and the results of the segment capacity analyses are shown in Table 15. It should be noted that for the purpose of this analysis, the capacity used was based on the industry standard of 1,900 vehicles per hour per lane on an interrupted-flow thoroughfare.

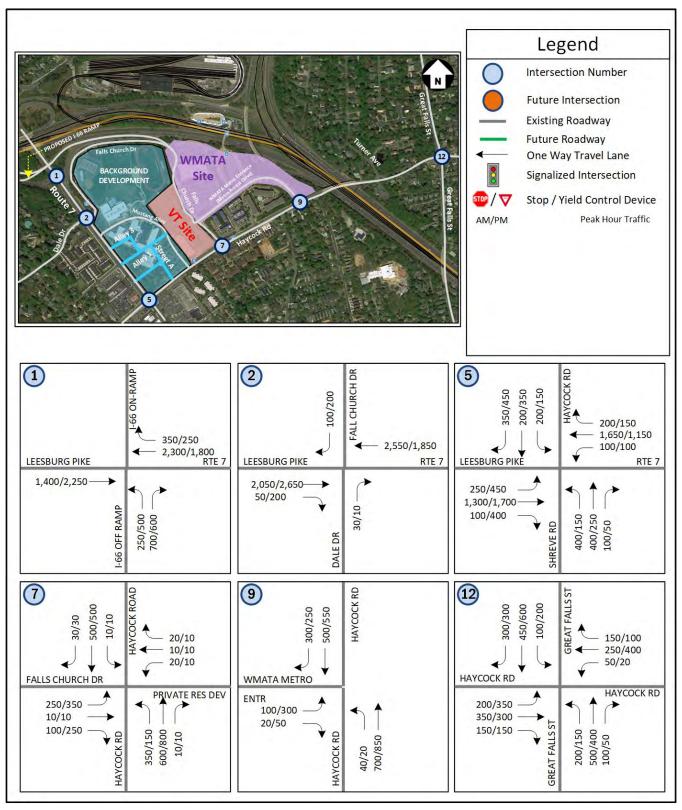

Figure 69: 2045 Future without Development - Vehicular Traffic Volumes

12	Great Falls Street, East of Intersection 12	2	1,450	3,800	0.38	1,370	3,800	0.36
12	Haycock Road, South of Intersection 12	2	1,450	3,800	0.38	1,650	3,800	0.43

As can be seen in Table 15, the 21 study locations operate at a V/C of 0.64 or less.

FUTURE CONDITIONS WITH DEVELOPMENT (2045) – PLANNING SCENARIO

For the purposes of this study, the development is anticipated to be constructed by 2030. Based on discussions with VDOT, the County, and the City, a planning level analysis was recommended for the year 2045.

Future Conditions with Development (2045) Traffic Volumes

In order to forecast future roadway traffic volumes for the year 2045, future traffic volumes along the Route 7 and Haycock Road corridors were approximated based on Fairfax County Department of Transportation's (FCDOT) travel demand forecasting model projections. The 2045 travel demand model analyzed six major intersection along the corridors. The six major intersections were as follows:

- I-66 eastbound off-ramp and Leesburg Pike (Rte. 7)
- Leesburg Pike (Rte. 7) and Dale Drive (Rte. 1128)
- Leesburg Pike and Shreve Road / Haycock Road (Rte. 703)
- Haycock Road and Falls Church Drive
- Haycock Road and WMATA Metro Entrance (Metro Access Drive)
- Haycock Road and Great Falls Street (Rte. 694)

As mentioned previously, the FCDOT models incorporated trips in association with the development of the proposed property under the existing *Comprehensive Plan*. It was assumed that the WMATA and VT sites could develop approximately 962 multifamily residential units and 240 kSF of institutional uses under the current *Comprehensive Plan*.

In order to account for any changes in the road network with the proposed comprehensive plan amendment, the current comprehensive plan development program was compared to the one proposed in this study, as illustrated in Table 9. The comparison is shown on Table 16 and is based on the Institute of Transportation Engineers' (ITE's) <u>Trip Generation Manual</u> (10th Edition).

Table 16: Site Trip Generation (Current Comprehensive Plan v. Proposed)

					V	l e e k d :	ау

Total			812	519	1,331	623	744	1,367	16,070
VT+WMATA - FC COG Model			295	156	451	163	369	532	5,969
Retail Pass-by Reductions	25%/34	1%/25% AM/PM/Daily	-9	-5	-14	-9	-12	-21	-235
Mode Split/TDM Reductions (45% of No	on-Retail)	45% AM/PM/Daily	-116	-62	-178	-61	-141	-202	-2,263
Total Reductions			-125	-67	-192	-70	-153	-223	-2,498
2045 Net New External Trips from CO	OG and Propo	sed Delta	170	89	259	93	216	309	3,471

As illustrated in Table 16, it is anticipated that the total number of trips generated by the site during the AM and PM peak hours, as well as, during an average weekday would increase with the construction of the proposed development program under the comprehensive plan amendment. In order to forecast 2045 future traffic volumes with the proposed development, the net increase in trips were assigned to the future road network. Of note, in order to be consistent with the trip generation analysis from the 2030 scenario, pass-by trip reductions and TDM/mode split reductions were applied to the trip generation. The assignment of the increase in anticipated trips along the road network was based on the vehicular directions of approach illustrated in Figure 43 and in Figure 44. The resulting assignment of trips is illustrated in Figure 71.

In order to determine the traffic volumes on the roadways in the vicinity of the development, the increased site generated traffic volumes for the proposed development were added to the 2045 Future without Development traffic volumes. The traffic volumes for the 2030 Future with Development conditions are presented in Figure 72.

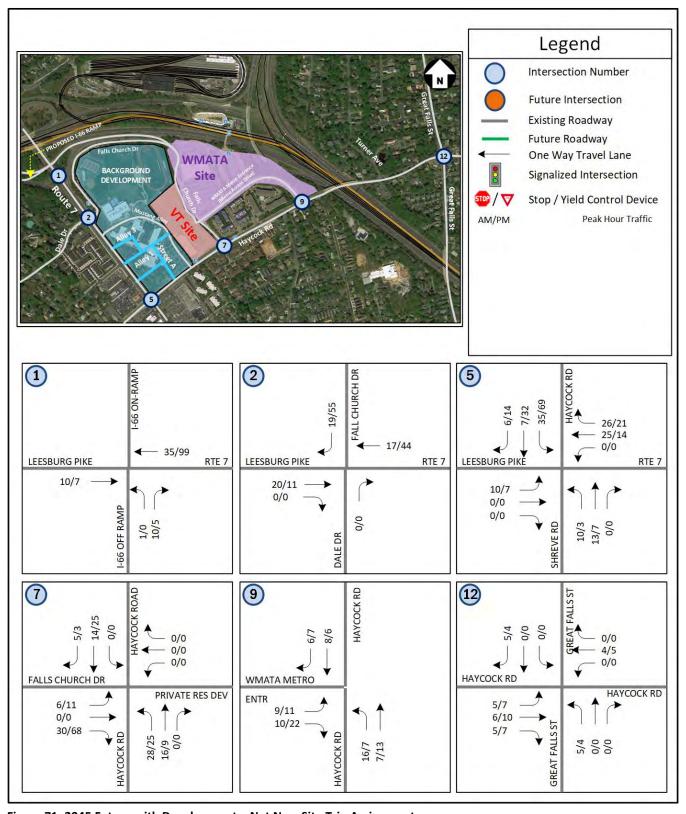

Figure 71: 2045 Future with Development – Net New Site Trip Assignment

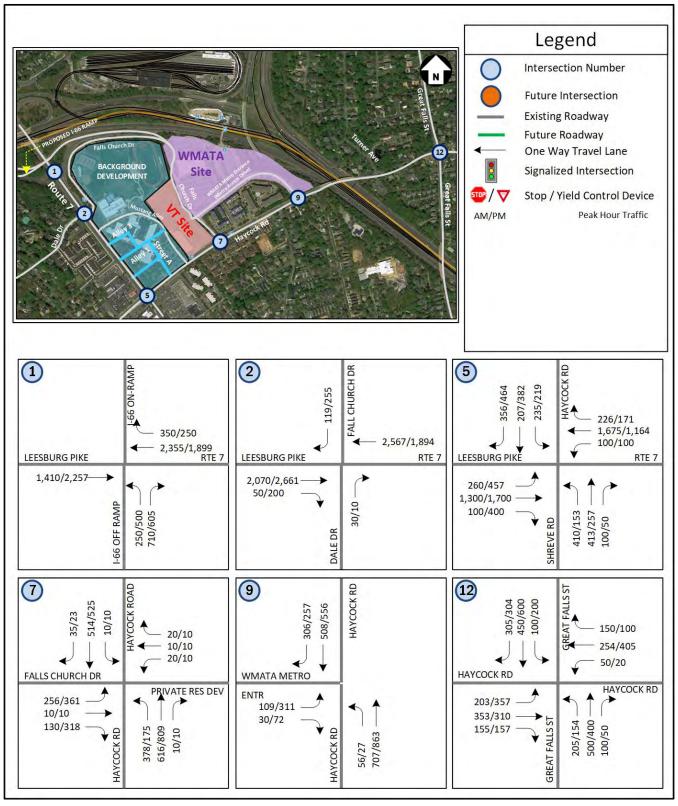

Figure 72: 2045 Future with Development - Vehicular Traffic Volumes

Future Conditions with Development (2045) - Segment Capacity Analysis

As noted previously, the 2045 future with development scenario is to be used for planning purpose only. As such, in order to determine the potential future traffic demand along the Route 7 and Haycock Corridors, the projected 2045 traffic volumes with the development in place were used to determine the volume-to-capacity (v/c) rate at 21 locations within the vicinity of the study area.

The evaluation locations are illustrated in Figure 70, and the results of the segment capacity analyses are shown in Table 17. It should be noted that for the purpose of this analysis, the capacity used was based on the industry standard of 1,900 vehicles per hour per lane on an interrupted-flow thoroughfare.

Table 17: 2045 Future Conditions with Development – Segment Capacity Analysis Results

			Α	M Peak Ho	ur	P	M Peak Ho	ur
INT	Segment	Lanes of Thru Lanes	Volume per Hour	Hourly Capacity	Volume- to- Capacity	Volume per Hour	Hourly Capacity	Volume- to- Capacity
			(V)	(C)	V/C	(V)	(C)	V/C
1	Route 7, West Leg of Intersection 1	4	3,995	7,600	0.53	4,656	7,600	0.61
1	I-66 On-Ramp, North Leg of Intersection 1	1	350	1,900	0.18	250	1,900	0.13
1/2	Route 7, East Leg of Intersection 1 & West Leg of Intersection 2	4	4,805	7,600	0.63	5,011	7,600	0.66
1	I-66 Off-Ramp, South Leg of Intersection 1	2	960	3,800	0.25	1,105	3,800	0.29
2	Falls Church Drive, North Leg of Intersection 2	1	119	1,900	0.06	255	1,900	0.13
2	Route 7, East Leg of Intersection 2	4	4,667	7,600	0.61	4,565	7,600	0.60
2	Dale Drive, South Leg of Intersection 2	2	80	3,800	0.02	220	3,800	0.06
5	Route 7, West Leg of Intersection 5	4	4,101	7,600	0.54	2,557	7,600	0.34
5	Haycock Road, North of Intersection 5	4	1,697	7,600	0.22	1,950	7,600	0.26
5	Route 7, East of Intersection 5	4	3,636	7,600	0.48	3,404	7,600	0.45
5	Shreve Road, South of Intersection 5	2	1,330	3,800	0.35	1,342	3,800	0.35
7	Falls Church Drive, West of Intersection 7	4	819	7,600	0.11	897	7,600	0.12
7	Haycock Road, North of Intersection 7	4	1,451	7,600	0.19	1,738	7,600	0.23
7	Haycock Road, South of Intersection 7	4	1,010	3,800	0.27	1,085	3,800	0.29
9	Metro Entrance, West of Intersection 9	4	501	7,600	0.07	667	7,600	0.09
9	Haycock Road, North of Intersection 9	4	1,630	7,600	0.21	1,987	7,600	0.26
9	Haycock Road, South of Intersection 9	4	1,301	7,600	0.17	1,518	7,600	0.20
12	Great Falls Street, West of Intersection 12	2	1,710	3,800	0.45	1,961	3,800	0.52
12	Haycock Road, North of Intersection 12	2	1,010	3,800	0.27	1,085	3,800	0.29
12	Great Falls Street, East of Intersection 12	2	1,460	3,800	0.38	1,381	3,800	0.36
12	Haycock Road, South of Intersection 12	2	1,480	3,800	0.39	1,687	3,800	0.44

As can be seen in Table 17, the 21 study locations operate at a V/C of 0.66 or less. Therefore, none of the segments of Route 7 or along Haycock Road are expected to exceed the capacity of the facility as a result of the proposed development.

CONCLUSION

This report presents the findings of a Traffic Impact Study (TIS) conducted for the proposed redevelopment of the existing Washington Metropolitan Area Transit Authority (WMATA) West Falls Church metro and the Virginia Polytechnic Institute and State University (Virginia Tech /VT) sites, located in the Dranesville Magisterial District of Fairfax County, Virginia. This study was conducted in conjunction with a proposal to amend Fairfax County's *Comprehensive Plan* for the West Falls Church Transit Station Area (TSA) in order to provide compatible, non-automobile dependent development.

This traffic impact analysis supports the following major conclusions:

Existing Conditions (2019) Scenario

- Traffic counts were collected at existing intersections in May of 2018 and in May of 2019. These traffic counts were balanced in order to develop a baseline for the analysis.
- Analysis of the traffic data found the following system peak hours:

Weekday Morning (AM) Peak Hour: 7:45 AM to 8:45 AM

Weekday Afternoon (PM) Peak Hour: 5:00 PM to 6:00 PM

Based on the capacity analysis, all signalized intersections operate at an overall acceptable Level of Service (LOS)
with the exception of the Leesburg Pike and Haycock Road intersection. The intersection operates overall at a LOS E
during both peak hours.

Future Conditions without Development (2030)

- To account for future conditions, an inherent growth rate of 1.0% per year, between 2019 and 2030, was applied to all movements at the intersection of Route 7 and Haycock Road. Additionally, traffic associated with the proposed High School & West Falls Church Economic Development, a development abutting the site, was taken into consideration in order to determine future traffic volumes.
- A couple of roadway improvements are anticipated to be developed and in operation by 2030. VDOT is currently in the process of constructing a connector ramp on the eastbound I-66 off-ramp towards Route 7; the connector ramp would act as a by-pass for vehicles heading towards the site and the West Falls Church Metro station. Additionally, the intersection of Chestnut Street at Route 7 is anticipated to be converted to a signalized, full-movement intersection with the proposed High School & West Falls Church Economic Development
- Based on the capacity analysis, all intersections operate at an overall acceptable LOS under 2030 future conditions
 without development with the exception of the Leesburg Pike and Haycock Road intersection (similar to 2019
 existing conditions) and the Haycock Road and Great Falls Street intersection.

Future Background with Current Comprehensive Plan Development Conditions (2030)

The WMATA and VT developments are anticipated to be fully constructed and in operation by 2030. Under the current Comprehensive Plan for Fairfax County, the WMATA and VT sites could develop approximately 962 multifamily residential units and 240 kSF of institutional uses, which is anticipated to generate approximately 484 additional trips in the AM peak hour, 459 additional trips in the PM peak hour, and 5,556 daily trips after transit and transportation demand management (TDM) reductions.

 Based on the capacity analysis, all intersections operate at an overall acceptable LOS under 2030 future background current comprehensive plan conditions with the exception of the Leesburg Pike and Haycock Road intersection and the Haycock Road and Great Falls Street intersection (similar to 2030 Future Conditions without Development).

Future Conditions with Development (2030) Scenario

- The WMATA and VT developments are anticipated to be fully constructed and in operation by 2030. The proposed developments are anticipated to generate approximately 709 additional trips in the AM peak hour, 695 additional trips in the PM peak hour, and 8,182 daily trips after transit, transportation demand management (TDM), internal, and commercial pass-by reductions.
- Due to increased traffic demand from the developments, road improvements will be necessary in order to achieve acceptable levels of service / maintain similar traffic operation conditions as compared to future without development conditions during the weekday morning (AM) and weekday afternoon (PM) peak hours. The following mitigations are proposed to improve operations at the study intersections:
 - Route 7 at Haycock Road
 - Add southbound thru lane on Haycock Road; and
 - Adjust signal timings to accommodate new configuration.
 - Haycock Road and Falls Church Drive
 - Restripe the eastbound approach on Falls Church Drive to a shared thru/right and an exclusive left turn lane which will operate under permitted + protected phasing.
 - Modify signal timings to accommodate new configuration.
 - Haycock Road at Great Falls Street
 - Change eastbound and westbound Haycock Road lane configuration from left/thru, right to left, thru/right; and
 - Modify signal timings to account for the change in roadway geometry.
 - Haycock Road at Grove Avenue
 - Add a northbound right turn lane to provide an exclusive left lane and an exclusive right lane.
 - Route 7 Corridor
 - Optimize traffic signal timings along Route 7 to promote progression and to account for the modifications to the Route 7 and Haycock Road intersection.
 - Haycock Road Corridor
 - Optimize traffic signal timings along Haycock to promote progression and to account for the modifications to the Route 7 and Haycock Road intersection.
- Based on the capacity analyses, the roadway improvement strategy would mitigate potential impacts of the
 development, resulting in similar to or better overall levels of service/reduced delays as compared with future
 conditions without development conditions or without the proposed comprehensive plan amendment.

Future Conditions with Development (2030) - Alternative Conditions without Virginia Tech Redevelopment

This scenario is presented to provide analysis without the VT redevelopment. Under this scenario, only the WMATA development is anticipated to be redeveloped per the proposed Comprehensive Plan Amendment (CPA) and in operation by 2030. This scenario does not assume a new direct connection between Leesburg Pike (Rte. 7) and the WMATA site via Commons Drive. Such conditions are unlikely to be realized, but are included for completeness.

- The WMATA development is anticipated to generate approximately 236 additional trips in the AM peak hour, 285
 additional trips in the PM peak hour, and 3,454 daily trips after transit, transportation demand management (TDM),
 internal, and commercial pass-by reductions.
- Due to increased traffic demand from the developments, road improvements will be necessary in order to achieve acceptable levels of service / maintain similar traffic operation conditions as compared to future without development conditions during the weekday morning (AM) and weekday afternoon (PM) peak hours. The mitigation strategy presented in the Future Conditions with Development (2030) is also proposed for the Alternative "without VT" scenario.
- Based on the capacity analyses, the roadway improvement strategy would mitigate potential impacts of the development, resulting in similar overall levels of service/reduced delays as compared with future conditions without development conditions or without the proposed comprehensive plan amendment.

Future Conditions without Development (2045) – Planning Scenario

The site is anticipated to be constructed and in operation by 2030. Due to the development requiring with a comprehensive plan amendment (CPA), it was recommended that the road network near the site be analyzed 15 years after the anticipated build-out. This scenario, which analyzes the future conditions for the year 2045 with respect to the current *Comprehensive Plan*, and, as agreed to in the scoping document, is to be used as a planning-only scenario.

- To account for future conditions, future traffic volumes without the CPA along the Route 7 and Haycock Road corridors were approximated based on Fairfax County Department of Transportation's (FCDOT) travel demand forecasting model projections. The FCDOT model incorporated trips in association with the development of the proposed property under the existing *Comprehensive Plan*. It was assumed that the WMATA and VT sites could develop approximately 962 multi-family residential units and 240 kSF of institutional uses under the current *Comprehensive Plan*.
- Based on the segment capacity analysis, the Route 7 and Haycock Road Corridors are anticipated to operate at a volume-to-capacity (v/c) ratio of 0.64 or less.

Future Conditions with Development (2045) - Planning Scenario

The site is anticipated to be constructed and in operation by 2030. Due to the development requiring a CPA, it was recommended that the road network near the site be analyzed 15 years after the anticipated build-out. This scenario analyzes the future conditions for the year 2045 with respect to the CPA, and, as agreed to in the scoping document, is to be used as a planning only scenario.

- To account for future conditions, future traffic volumes along the Route 7 and Haycock Road corridors were approximated based on FCDOT's travel demand forecasting model projections. The FCDOT model incorporated trips in association with the development of the proposed property under the existing *Comprehensive Plan*. In order to account for any changes in the road network with the proposed comprehensive plan amendment, the current comprehensive plan development program was compared to the one proposed in this study by assigning the site generated differential to the road network.
- Based on the segment capacity analysis, the Route 7 and Haycock Road Corridors operate at a volume-to-capacity (v/c) ratio of 0.66 or less.

Thus, none of the segments of along the Route 7 and Haycock Road Corridors are expected to exceed the capacity of the existing roadway facilities as a result of the proposed development under 2045 conditions.

Overall Conclusion

The roadway improvement strategies recommended would mitigate the traffic impacts of the WMATA and VT sites through 2030. The combination of new street connections and turn lane improvements would result in in acceptable overall levels of service/reduced delays as compared with future conditions without the proposed comprehensive plan amendment (CPA).

As indicated in the 2045 planning scenario, the Route 7 and Haycock Road Corridors would have adequate through capacity to accommodate the anticipated development of the WMATA and VT sites.

Background Traffic Studies Considered	High School and West Falls Church Economic Development Projects Traffic Impact Analysis
Plan Submission	☐ Master Development Plan (MDP) ☐ Generalized Development Plan (GDP) ☐ Preliminary/Sketch Plan ☐ Other Plan type (Comp. Plan)
Additional Issues to be Addressed	

NOTES on ASSUMPTIONS:

General Assumptions

- 1. Synchro files/signal timings will be obtained from VDOT.
- 2. The scenarios to be included in the study are Existing (2019), Future without Development (2030), Future with Development (2030), and Future without Development (2045).
- Will analyze conditions with and without planned improvements at the intersection of Route 7 with Chestnut Street.
- 4. The intersections of Haycock Road at Village Crossing Road and Falls Reach Drive will not be analyzed as study intersections, but will be coded in the Synchro network.

Assumptions for Estimated Build Year (2030) -

- A growth rate of 1.0 % will be applied to all turning movement volumes at the intersection of Route 7 and Haycock Road for the period between 2019 and 2030 and will be carried as through volumes at other study intersections.
- 6. Existing peak hour factors in the range of 0.85 to 1.00 will be used for existing scenarios (by intersection). The default peak hour factor of 0.92 (by intersection) will be used for future scenarios unless the existing peak hour factor is found to be higher.
- 7. Heavy vehicle percentages from the traffic counts will be utilized for major movements.
- Will strive to achieve an overall LOS of D for future conditions. Will show intersection, approach, and movement LOS.
- 9. HCM 2010 methodology will be utilized where applicable. HCM 2000 methodology would be used elsewhere.
- 10. Crash data obtained from VDOT's Crash Analysis Tool will be analyzed at existing study intersections.

Assumptions for Horizon Year (2045) -

- 11. FCDOT travel demand forecasting model projections will be provided by the county and utilized for the 2045 Scenarios. Daily volumes and link analysis and v/c ratios will be provided for 2045 only.
- 12. Will analyze conditions with and without planned improvements at the intersection of Route 7 with Chestnut Street.

It is important for the applicant to provide sufficient information to county and VDOT staff so that questions regarding geographic scope, alternate methodology, or other issues can be answered at the scoping meeting.

A) The pass by reduction for the shopping center is based on the ITE Trip Generation methodology, as provided in the 10th Edition Handbook. The average rate for shopping centers is 34% for the PM Peak. For all other time periods, the default pass by rate is 25%.

⁽¹⁾ residential / office - smaller of 5% of residential trips or 5% of office trips

⁽²⁾ residential / retail - smaller of X% of residential trips or X% of retail trips; AM: X = 5%, PM: X = 10%, Sat: X = 10%, Daily: X = 15%

⁽³⁾ office/ retail - smaller of 5% of office trips or 5% of retail trips

⁽⁴⁾ academic/retail - use the smaller of 10% of academic traffic or 10% of retail traffic

Note:

The County's comprehensive plan recognizes the VT and WMATA parcels as part of Land Unit A. This allows for a combined of 1,110 DU and 43,800 square feet office/retail uses on these two parcels. This is used as Allowable Option 1 in the table above. As an alternative to the base zone allowable development, the comprehensive plan provides an option to develop approximately 240,000 square feet of institutional use replacing 130 DU and 43,800 square feet of office/retail space from the base allowable option. This is represented as Allowable Option 2 in the table above.

Document Number	Crash Date	Crash Time	Collision Type	Crash Description	KABCO Severity Code	Latitude	Longitude	Pedestrian Fatality Count	Non Pedestrian Fatality Count	Pedestrian Injury Cnt	Non Pedestrian Injury Count	Work Zone Related
160680019	1/19/2016	14:39	2. Angle	VEHICLE 1 WAS TRAVELING EAST ON RT 7/LEESBURG PIKE UNDER 166. DRIVER 2 WAS EXITING OFF 166 EASTBOUND AND ATTEMPTING TO MAKE A LEFT TURN ONTO WESTBOUND LEESBURG PIKE ON A GREEN LIGHT. DRIVER 1 STATED THAT HE WAS UNFAMILIED WITH AREA AND WHEN HE APPROACHED TRAFFIC LIGHT HE WAS LATE IN SEEING THE RED LIGHT. DRIVER 1 STATED THAT HE ATTEMPTED TO STOP. AS A RESULT VEHICLE 1 STRUCK THE LEFT SIDE OF VEHICLE 2. DRIVER 2 STATED THAT HIS LEFT ARM HURT, HOWEVER REFUSED RESCUE ON SCENE. DRIVER 1 AT FAULT, CHARGED WITH FAILING TO MAINTAIN PROPER CONTROL.	Possible Injury (C)	38.89796	-77.19563	0	0	0	1	2. No
160620336	1/20/2016	19:20	1. Rear End	V3 WAS IN THE RIGHT LANE ATTEMPTING TO PULL OVER ROADWAY DUE TO INVOLVEMENT IN A SEPERATE CRASH AT 704S LEESBURG PIKE. V2 WAS BEYOND 704S LEESBURG STOPPED IN LANE DUE TO SNOWY CONDITIONS AND STOPPED VEHICLES. V1 WAS TRAVELING EAST IN THE SAME LANE AND REAR-ENDED V2. V1 THEN RICOCHETED INTO V3, SIDESWIPING HIS LEFT SIDE. DRIVER OF V1 HELD AT FAULT.	No Injury (O)	38.89433	-77.19002	0	0	0	0	2. No
160780102	2/25/2016	17:40	2. Angle	VEHICLE 1 WAS TRAVELING NORTH ON HAYCOCK RD AND ATTEMPTED TO TURN LEFT INTO A PARKING LOT. THERE WAS HEAVY TRAFFIC ON SOUTHBOUND HAYCOCK AND DRIVER 1 THOUGHT SHE HAD ROOM TO MAKE TURN. WHILE VEHICLE 1 WAS IN THE INTERSECTION, IT WAS STRUCK BY VEHICLE 2 AND PUSHED INTO VEHICLE 3. NO INJURIES WERE REPORTED.	No Injury (O)	38.89609	-77.18912	0	0	0	0	2. No
160750081	3/1/2016	18:50	1. Rear End	VEH 2 DECELERATED FOR TRAFFIC AND STOPPED JUST PAST THE STOP LINE ON EB LEESBURG PK AT SHREVE RD. VEH 1 DECELERATED, BUT COULD NOT STOP AND COLLIDED WITH VEH 2.	Possible Injury (C)	38.89479	-77.19076	0	0	0	1	2. No
160780136	3/5/2016	9:44	1. Rear End	VEH 1 AND VEH 2 WERE BOTH TRAVELING EB ON RT 7/LEESBURG PIKE WHEN TRAFFIC SLOWED IN FRONT OF THEN FOR THE TRAFFIC SIGNAL LOCATED AT RT 7 AND SHREVE RD. APPROX 150FT PRIOR TO THE INTERSECTION WITH SHREVE RD, VEH 2 SLOWED TO A 5TOP NEAR CHESTNUT ST. DRIVER 1 DID NOT REALZE VEH 2 HAD STOPPED UNTIL IT WAS TOO LATE AND REAR-ENDED VEH 2.	No Injury (O)	38.89569	-77.19212	0	0	0	0	2. No
160960016	3/8/2016	18:55	2. Angle	VEH 1 ENTERED INTO EB LEESBURG PIKE FROM THE WB LANES OF LEESBURG PIKE TO CHESTNUT ST. TWO LANES OF BE LEESBURG PIKE HAD STOPPED TO ALLOW VEH 1 TO ENTER. VEH 1 PROCEEDED THROUGH TO THE 3RD LANE WHERE HE WAS STRUCK BY VEH 2. THERE WERE MO INJUREIS REPORTED. THERE WAS MEDIUM DAMAGE TO BOTH VEHICLES. BOTH VEHICLES WERE TOWED AT THE REQUEST OF THE OWNERS. INSURANCE INFORMATION WAS EXHANGED BETWEEN BOTH PARTIES. DRIVER OF VEH 1 IS AT FAULT.	No Injury (O)	38.89559	-77.19202	0	0	0	0	2. No
161040044	4/4/2016	19:01	2. Angle	D1 WAS TURNING LEFT ONTO CHESTNUT ST FROM RT7WB. VEHICLES ON FIRST TWO EB LANES OF RT7 WERE STOPPED AND D1 BEGAN TO CROSS THE 3RD LANE WHEN STRUCK BY D2. D2 WAS TRAVELING ON THE FAR RIGHT EB LANE OF RT7. D2 NOTICED THAT THE TRAFFIC ON THE TWO LEFT EB LANES WERE SLOWING DOWN BUT HER LANE WAS MOVING. UPON COMING TO THE INTERSECTION WITH CHESTNUT ST, SAW D1 COME ACROSS ONTO HER LANE AT WHICH TIME SHE STRUCK THE VEHICLE.	No Injury (O)	38.89556	-77.19199	0	0	0	0	2. No
161470278	5/6/2016	15:19	2. Angle	14 WAS EXECUTING A LEFT TURN FROM WESTBOUND LEESBURG PIKE TO SOUTHBOUND CHESTMUT ST. V2 WAS TRAVELING EASTBOUND ON LEESBURG PIKE. V1 MADE THE LEFT TURN AND WAS STRUCK ON THE PASSENGER SIDE BY V2 WITHIN THE INTERSECTION. NO INJURIES WERE REPORTED. V1 WAS CITED FOR FAILING TO YIELD RIGHT OF WAY ON A LEFT TURN.	No Injury (O)	38.89561	-77.19199	0	0	0	0	2. No
162030023	6/23/2016	17:44	2. Angle	Veh 1 was attempting to make a left turn onto Chestnut St from WB Leesburg Pike when it was struck by vehicle 2. Vehicle 2 was traveling in the far right lane of EB Leesburg Pike when vehicle 1 failed to yield the right of way and crossed into the path of vehicle 2 causing it to strike vehicle 1 in the passenger side. Veh 3 was stopped at the intersection waiting to make a right hand turn onto EB Leesburg Pike when it was struck by veh 1. After veh 2 struck Veh 1 in the side, veh 1 was pushed into yeh 3.	Possible Injury (C)	38.89561628	-77.19197887	0	0	0	2	2. No
162040036	6/29/2016	17:16	2. Angle	V1 WAS TRAVELING WB ON RT7. V2 WAS TRAVELING EB ON RT7. TRAFFIC WAS STOPPED IN THE TWO STRAIGHT LANES OF EB RT7 AND THE RIGHT TURN LANE WAS STILL OPEN. V1 WAS ATTEMPTING TO MAKE A LEFT TURN ONTO CHESTMUT ST, MADE IT THROUGH THE FIRST TWO STRAIGHT LANES OF TRAVEL. AS V1 PROCEEDED TO ENTER THE RIGHT TURN LANE, V2 STRUCK V1.	Non-Incapacitating Injury (B)	38.89559	-77.19203	0	0	0	1	2. No
162520038	7/23/2016	5:01	2. Angle	Veh #1 was E/B Rt7/Leesburg Pike and drifted on to the median. Veh #1 struck a Keep Right sign and continued over the curb on to Shreve Rd.	No Injury (O)	38.89468	-77.19071	0	0	0	0	2. No
162350024	7/29/2016	8:36	2. Angle	D2 WAS TRAVELING STRAIGHT AND STRUCK D1 AS D1 WAS TURNING LEFT INTO THE INTERSECTION.	No Injury (O)	38.8956	-77.19204	0	0	0	0	2. No
162210121	7/30/2016	15:10	4. Sideswipe - Same Direction	Veh2 was traveling on Rt 7 WB just after Shreve Rd in the right lane. Veh1 was traveling in the same direction in the left lane. For an unknown reason Vehl pulled into Veh2's lane sideswiping Veh2 and forcing the vehicle off the road. Once off the road Veh2 struck a guide wire for a pole causing the wire to snap. No other damage done to the pole or wire. Veh1 fled the scene without stopping to provide information. Veh1 found at fault for the accident.	Possible Injury (C)	38.89547	-77.19148	0	0	0	1	2. No
162185020	8/3/2016	21:36	12. Ped	VEH#1 was traveling West on West Broad Street. The vehicle made a right turn onto Haycock Road while there was a pedestrian traveling west bound in the crosswalk. VEH#1 began a 360 maneuver striking the pedestrian in the left arm. VEH#1 continued north on Haycock Road. The pedestrian crossing sign showed him he had the right of way. No visible injury for the pedestrian.	Possible Injury (C)	38.89475	-77.19027	0	0	1	0	2. No

162520044	8/5/2016	17:29	2. Angle	Veh #1 was attempting to make left turn from Highland Ave onto s/b Haycock Rd. Vehicle #2 was traveling north on Haycock Rd in left lane of travel. Driver #1 was making left turn and did not account for second travel lane and pulled into the path of vehicle #2. As a result vehicle #1 struck front right corner of vehicle #2. Driver #1 at fault for failing to pay full time and attention.	No Injury (O)	38.89939	-77.18443	0	0	0	0	2. No
162580063	8/22/2016	15:31	2. Angle	VEH 1 WAS ENTERING INTO EB LEESBURG PIKE FROM THE WB LANES OF LESSBURG PIKE TO CHESTNUT ST. TWO LANES OF EB LEESBURG PIKE HAD STOPPED TO ALLOW VEH 1 TO ENTER. VEH 1 PROCEEDED THROUGH TO THE 3RD LANE WHERE SHE WAS STRUCK BY VEH 2. DRIVER OF VEH 1 STATED THAT SHE (GUNNED IT) THROUGH. RESCUE RESPONDED TO CHECK ON DRIVER OF VEH 2 DUE TO PREGNANCY. SHE WAS TRANPORTED TO FFX HOSPITAL FOR OBSERVATION. DRIVER OF VEH 1 REPORTED NO INJURIES. THERE WAS MEDIUM DAMAGE TO BOTH VEHICLES. AIRBAGS DEPLOYED ON VEH 1. BOTH VEHS WERE DRIVEABLE. VEH 2 WAS TURNED OVER TO DRIVER 1'S BOYFRIEND, LUIS RAMOS. INSURANCE INFORMATION WAS EXCHANGED BETWEEN BOTH PARTIES. DRIVER OF VEH 1 IS AT FAULT.	Possible Injury (C)	38.8956	-77.19206	0	0	0	1	2. No
162910003	8/23/2016	18:05	2. Angle	Veh 1 was entering into EB Leesburg Pike from the WB lanes of Leesburg Pike to Chestnut St. Two lanes of EB Leesburg Pike had stopped to allow veh 1 to enter. Veh 1 proceeded through to the 3rd lane, where she was struck by Veh 2. Injuries were sustained by all 3 occupants in Veh 2. Driver of Veh 1 also sustained an injury to her right arm. Rescue responded and attended to all involved parties. There was major damage to both vehs. Airbags (side and front) deployed of vehs 1 and 2. Both vehs were towed at the request of the owners. Insurance information was exchanged between both parties. Driver of Veh 1 is a fault.	Non-Incapacitating Injury (B)	38.89561	-77.19205	0	0	0	4	2. No
162520112	8/25/2016	11:46	1. Rear End	DI was travelling east bound on Leesburg Pike by Chestnut St when he rear ended D2. DI admitted to following to closely and not being able to stop in time. DI cited.	Possible Injury (C)	38.89582	-77.1924	0	0	0	1	2. No
162990014	8/29/2016	16:34	2. Angle	VEH #1 TRAVELING EAST ON TO LOUING ADMIC LOUDY INNEL. DELINE, VEH #1 2 WAS AT RED LIGHT FOR WEST RT 7 FROM 166 EAST EXIT. DRIVER# 2 STATED THAT LIGHT TURNED GREEN AND HE ENTERED INTERSECTION WHEN STRUCK BY VEHICLE #1, VEH #1. VEH #1 DISREGARD RED LIGHT AND STRUCK FRONT END OF VEH# 2. DRIVER #1 AT FAULT	Incapacitating Injury (A)	38.89794	-77.19554	0	0	0	3	2. No
162580094	9/1/2016	17:49	1. Rear End	Veh 1 struck Veh 2 while on EB Leesburg Pike underneath I-66. Veh 1 was stopped behind Veh 2 in the left lane. Driver of Veh 1 stated that the light turned green and he proceeded. Driver of Veh 2 stated that the light was red and did not move. Veh 1 struck Veh 2. Driver of Veh 2 stated that she hit her nose upon impact. Passenger in Veh 2 also complained of back pain. No injuries were reported from Veh 1. There was minor damage to Veh 1 and little to no damage on Veh 2. Both cars were driveable. Info was exchanged between both parties. Driver of veh 1 is at fault.	Incapacitating Injury (A)	38.8981	-77.19579	0	0	0	2	2. No
163090034	9/22/2016	14:43	1. Rear End	VEH 2 AND 3 WERE STOPPED IN RIGHT LANE OF E/B LEESBURG PIKE AT STOP LIGHT FOR 166. DRIVER 1 STATED THAT HE WAS ATTEMPTING TO BEGAN A LANE CHANGE FROM RIGHT LANE TO LEFT LANE. THEN REALIZING THAT A VEHICLE IN LEFT LANE WAS NEXT TO HIM, HE WAS UNABLE TO STOP IN TIME AND STRUCK THE REAR OF VEH 2 AND PUCHING 2 INTO THE REAR OF VEH 3. BOTH DRIVER 2 AND 3 WERE SEEN BY RESCUE FOR MINOR INJURY, DRIVER # 1 AT FAULT.	Possible Injury (C)	38.89806	-77.19578	0	0	0	2	2. No
162695187	9/23/2016	15:07	2. Angle	Veh2 was traveling southbound in the left lane of Haycock Rd. Veh1 was stopped at the entrance to 7124 Leesburg Pike on Haycock Rd intending to make a left turn. Veh1 began to move and attempted to make the left turn. Veh2 struck Veh1. The time of the crash was approximately 1507 hrs. There is a sign attached to the stop sign at the Haycock Rd entrance that states: "Right Turn Only 7AM TO 8AM 2:30PM TO 3:30PM." Driver1 stated that she saw the sign but indicated that people turn left during that time all the time. Veh1 sustained damage to its rear taillight, bumper, quarterpanel. Veh2 sustained damage to its front end. Driver1: Katerine Roberson 703-431-1619 Allstate 977115890 Owner1: Andrea Roberson 703-403-2487 Driver2: Jennifer Hathaway 571-269-3078 Geico 4204513271 Driver1 was cited for 46.2-826 (Fail to Yield Entering Hwy). Her court date was set for November 2nd 2016 at 0900 hrs in Falls Church GDC.	Possible Injury (C)	38.89576	-77.19194	0	0	0	2	2. No
162990027	10/4/2016	17:03	2. Angle	V1 was WB Leesburg Pike making a left turn onto Chestnut St. The traffic on the left lane and middle lane facing WB stopped to let her through so she can make the left turn. DI did not see V2 on the far right lane going straight causing a T-bone collision. DI is at fault for fail to pay full time and attention.	Possible Injury (C)	38.89562	-77.192	0	0	0	1	2. No
162965054	10/21/2016	18:28	2. Angle	On October 21, 2016 at 1828 hours, I responded to the 100-BLK of Haycock Rd, for a three car accident. When I arrived on scene there were not any reported injuries. Mr. Zimmermann was pulling out of the Giant parking lot, as he crossed north-bound of Haycock Rd he went in between a gap of two stand-still cars on the inner lane of south-bound Haycock Rd. When he inched out to go to the outer lane, Mr. Wasilewski had the right of way headed down the outer lane as they collided. Mr. Wasilewski said he was going straight on the outer lane of Haycock Rd, as Mr. Zimmermann pulled out into his lane, causing them to collide. Mr. Li was at a stand still in traffic, he did not notice Mr. Zimmermann pull behind him to get to the outer lane. The accident between Mr. Zimmermann and Mr. Wasilewski caused them to push into the passenger side rear bumper of Mr. Li Accident exchange forms were given to all parties. Henry's towing arrived and removed Mr. Wasilewski's car. Mr. Zimmermann's insurance: State Farm # 132322702332B Contact # (631-576-6263) Mr. Wasilewski's insurance: Liberty Mutual # A0S2381482187054 Contact # (703-846-9205) Mr. Li's insurance: Erie # Q072513206 Contact # (702-55-6266)	No Injury (O)	38.89566	-77.1895	0	0	0	0	2. No

			T		I	1						
163540040	11/18/2016	13:28	8. Non-Collision	BOTH VEHICLES WERE TRAVELING EAST ON RT7LEESBURG PIKE APPROACHING THE INTERSECTION WITH RT1128DALE DR, WITH VEH 1 IN THE CENTER LANE WITH VEH 2 IN THE RIGHT LANE. VEH1 ATTEMPTED TO CHANGE LANES INTO THE RIGHT LANE AND DID NOT SEE VEH 2, CAUSING VEH 2 TO AVOID A COLLISION BUT SWERVED INTO THE CURB WHICH CAUSED DAMAGE TO THE VEHICLE. THERE WAS NO COLLISION BETWEEN VEH 1 AND VEH 2.	No Injury (O)	38.8967	-77.19379	0	0	0	0	2. No
170050008	11/22/2016	9:18	2. Angle	Vehicle #2 was sitting \$B on Great Falls, in the right turn lane, at a red light. Bicycle #1 was sitting NB on Great Falls, in the traight thru lane, at a red light. The light for the left turn lane changed to green and Veh #2 proceded to turn left onto Haycock. Bicycle #1 proceded against the red light through the intersection. Veh #2 struck Bicycle #1.	Possible Injury (C)	38.9017	-77.17949	0	0	0	1	2. No
170200025	12/27/2016	8:13	1. Rear End	DRIVER 2 WAS HEADING EAST ON LEESBURG PIKE PREPARING TO STOP AT A RED LIGHT AT THE IGG EXIT RAMP WHEN HER VEHICLE WAS STRUCK FROM BEHIND BY VEHICLE 1 WHICH NEVER SLOWED DOWN. BOTH PARTIES WERE TRANSPORTED, NON-LIFE THREATENING TO FAIRFAX HOSPITAL.	Incapacitating Injury (A)	38.89808	-77.19576	0	0	0	2	2. No
170260015	1/11/2017	12:17	4. Sideswipe - Same Direction	Vehs 1 and 2 were both traveling EB on Rte 7/Leesburg Pike. Veh 1 was in the center lane of three lanes traveling East Bound. Veh 2 was in the far right lane traveling EB. Veh 1 attempted to change lanes and make a right turn onto Dale Dr from Rte 7 and side swiped veh 2 in the process. Veh 1 struck the front left side of veh 2 with its front right side.	No Injury (O)	38.89688	-77.19401	0	0	0	0	2. No
171140002	1/17/2017	15:21	2. Angle	Veh #2 was n/b on Haycock Rd and entered the intersection of Great Falls St on a solid green light. Vehicle #1 was east bound on Great Falls St. Due to inattention, Driver #1 did not see the red light and was unable to stop before entering the intersection. Vehicle #1 collided with Vehicle #2 within the intersection.	Possible Injury (C)	38.90171	-77.17952	0	0	0	1	2. No
172795305	1/24/2017	7:40	2. Angle	V1 (703-241-5837) was making a left hand turn into the private parking lot of 1200 block of W. Broad Street. V2 (703-638-3908) was traveling straight ahead in the right hand lane. V1 failed to yield to oncoming traffic and struck V2 at an angle. The entire right side quarter panels of V1 were scratched and dented. V2 sustained significant damage to the front bumper area of the vehicle. V1 (ErieBQ062206069) exchanged accident information with V2 (Geico#0330480408).	Possible Injury (C)	38.89564	-77.18939	0	0	0	2	2. No
170575110	2/20/2017	9:11	2. Angle	DRIVER #1 ENTERED CHESTNUT STREET FROM EB LEESBURG PIKE BY MISTAKE. SHE MADE A WIDE U- TURN WITHIN THE INTERSECTION THUS STRIKING VEHICLE #2 HEADED EB ON LEESBURG PIKE. NO INJURIES REPORTED. BOTH VEHICLES WERE TOWED BY HENRY'S AT OWNERS REQUEST.	No Injury (O)	38.89558	-77.19201	0	0	0	0	2. No
170565142	2/25/2017	15:15	2. Angle	V1 EXITED A PRIVATE PARKING LOT AND WAS ATTEMPTING TO CROSS ALL LANES OF TRAFFIC TO GET INTO THE LEFT TURN LANE. V2 WAS PROCEEDING IN THE LEFT TURN LANE. AS V1 CONTINUED FORWARD, THE FRONT LEFT CORNER WAS STRUCK BY THE FRONT RIGHT CORNER OF V2. NO INJURIES WERE REPORTED. V1 STATED ANOTHER DRIVER WAVED HER FORWARD TO PROCEED PRIOR TO THE CRASH.	No Injury (O)	38.89498	-77.19091	0	0	0	0	2. No
170845067	3/24/2017	7:57	2. Angle	V2 TRAVELING EAST ON LEESBURG PIKE. V1 MADE A LEFT FROM WEST LEESBURG PIKE TO GO SOUTH ON CHESTNUT ST. D1 DID NOT SEE V2 THAT WAS IN THE FAR RIGHT LANE, IMPACTING IT. D1 WAS CHARGED WITH FAIL TO PAY FULL TIME AND ATTENTION. 82-4-24	No Injury (O)	38.89562	-77.19206	0	0	0	0	2. No

171375062	5/16/2017	19:33	1. Rear End	On May 16, 2017 at 1933 hours, I responded to a two vehicle accident at the 100 Block of Haycock Road. Mr. Anokye-Tieku was stationary in the center lane of traffic waiting for the traffic light to turn green in his Toyota Prius (VA/VH-6041), VH2. Mr. Ahmad was behind Mr. Anokye-Tieku's vehicle in the center lane driving a Toyota Sienna (VA/XVY-2333), VH1. Mr. Ahmad sid that he took his veys off of the road and rear-ended Mr. Anokye-Tieku's vehicle. VH1 had minor damage to the front bumper. VH2 had minor damage to the rear bumper. Mr. Ahmad had three passengers and none of them reported any injuries. Mr. Anokye-Tieku had one passenger and they both said they had minor whiplash. Medic 106 arrived on scene and cleared Mr. Anokye-Tieku, and Mr. Penn, his passenger. Mr. Anokye-Tieku was driving a TNC vehicle through the company Lyft. Mr. Penn was his customer, and Mr. Penn was not using any safety restraints at the time of the incident. Mr. Anokye-Tieku was not able to provide me the TNC vehicle number. Mr. Ahmad was cited with following too closely (VUS-16-3033). His court date is set to be on June 28, 2017 at 0900 hours. Mr. Ahmad's (VH1) phone # 703-935-9792 Mr. Anokye-Tieku's (VH2) phone # 571-332-3095	Possible Injury (C)	38.89484	-77.19071	0	0	0	5	2. No

VEHICLE #1 FAILED TO YIELD RIGHT OF WAY AND COLLIDED WITH VEHICLE #2.	No Injury (O)	38.89562	-77.19205	0	0	0	0	2. No
190485245 2/15/2019 18:37 2. Angle VEHICLE #1 FAILED TO YIELD RIGHT OF WAY AND COLLIDED WITH VEHICLE #2. No Injury (0) 38:8947 -7/.19035 0 0 0 0 2. No	190485245	2/15/2019	18:37	2. Angle		No Injury (O)	38.8947	-77.19035	0	0	0	0	2. No

190575283	2/22/2019	17:01	2. Angle	See Incident Report 19-00308 [02/26/2019 16:31, PUELMEN, 24, FLCH] Vehicle #1 stated that he was exiting the parking lot of 7124 Leesburg Pike to make a left turn to northbound Haycock Rd. Vehicle #2 stated that she was traveling in the right southbound Iane in the 100 block of Haycock Rd. As a result the front of Vehicle #1 crashed into the right side of Vehicle #2. Driver #1 admitted that he did not see Vehicle #2 as he was exiting the parking lot as he believed he yielded to all vehicles. Damage to Vehicle #1 was sustained in the front hood and the front bumper. Vehicle #2 sustained damage to the right tire rims, and the front and rear passenger side doors. No injuries were reported and both vehicles were able to leave the scene without assistance. Driver #1 Devon Boldt 571-249-0392 Driver #2 Gail Holland 571-426-0007	No Injury (O)	38.89467	-77.19056	0	0	0	0	2. No
190585315	2/24/2019	21:15	4. Sideswipe - Same Direction	VEHICLE 2 ATTEMPTED TO MAKE AN UNSAFE LANE CHANGE TO THE RIGHT AND STRUCK VEHICLE 1 ON THE SIDE. VEHICLE 2 THEN FLED THE SCENE. THE VEHICLE MAKE/MODEL AND OPERATOR/OWNER ARE UNKNOWN.	No Injury (O)	38.89661	-77.19361	0	0	0	0	2. No
190665177	3/6/2019	18:39	2. Angle	VEHICLE #2 WAS NORTH BOUND ON SHREVE RD. VEHICLE #1 FAILED TO YIELD RIGHT OF WAY WHILE MAKING A LEFT TURN ON TO LEESBURG PIKE. VEHICLE #1 COLLIDED WITH VEHICLE #2.	No Injury (O)	38.89461	-77.19042	0	0	0	0	2. No

Appendix D: Level of Service Definitions

LEVEL OF SERVICE DEFINITIONS

All capacity analyses are based on the procedures specified by the Transportation Research Board, Special Report 209: *Highway Capacity Manual (HCM)*, 2000. Levels of service (LOS) range from A to F. A brief description of each level of service for signalized and unsignalized intersections is provided below.

Signalized Intersections: Level of service is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection and the delay associated with each directional movement. The levels of service for signalized intersections are defined below:

- Level of Service A describes operations with very low average delay per vehicle, i.e., less than 10.0 seconds.
 This occurs when progression is extremely favorable, and most vehicles arrive during the green phase. Most vehicles do not stop. Short signal cycle lengths may also contribute to low delay.
- Level of Service B describes operations with average delay in the range of 10.1 to 20.0 seconds per vehicle. This generally occurs with good progression and/or short cycle lengths. More vehicles stop than for LOS A, causing higher levels of average delay.
- Level of Service C describes operations with delay in the range of 20.1 to 35.0 seconds per vehicle. These higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level although many still pass through the intersection without stopping. This is generally considered the lower end of the range of the acceptable level of service in rural areas.
- Level of Service D describes operations with delay in the range of 35.1 to 55.0 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and/or high traffic volumes as compared to the roadway capacity. Many vehicles are required to stop and the number of vehicles that do not have to stop declines. Individual signal cycle failures, where all waiting vehicles do not clear the intersection during a single green time, are noticeable. This is generally considered the lower end of the range of the acceptable level of service in urban areas.
- <u>Level of Service E</u> describes operations with delay in the range of 55.1 to 80.0 seconds per vehicle. These higher delay values generally indicate poor progression, long cycle lengths, and high traffic volumes. Individual cycle failures are frequent occurrences. LOS E has been set as the limit of acceptable conditions.
- <u>Level of Service F</u> describes operations with average delay in excess of 80.0 seconds per vehicle. This is considered to be unacceptable to most drivers. This condition often occurs with over-saturation, i.e., when traffic arrives at a flow rate that exceeds the capacity of the intersection. It may also occur at high volumes with many individual cycle failures. Poor progression and long cycle lengths may also contribute to such delays.

Unsignalized Intersections: At an unsignalized intersection, the major street through traffic and right-turns are assumed to operate unimpeded and therefore receive no level of service rating. The level of service for the minor street and the major street left-turn traffic is dependent on the volume and capacity of the available lanes, and, the number and frequency of acceptable gaps in the major street traffic to make a conflicting turn. The level of service

grade is provided for each conflicting movement at an unsignalized intersection and is based on the total average delay experienced by each vehicle. The delay includes the time it takes a vehicle to move from the back of a queue through the intersection.

The unsignalized intersection level of service analysis does not account for variations in driver behavior or the effects of nearby traffic signals. Therefore, the results from this analysis usually indicate worse levels of service than may be experienced in the field. The unsignalized intersection level of service descriptions are provided below:

- <u>Level of Service A</u>. Describes operations where there is very little to no conflicting traffic for a minor side street movement, i.e., an average total delay of less than 10.0 seconds per vehicle.
- <u>Level of Service B</u>. Describes operations with average total delay in the range of 10.1 to 15.0 seconds per vehicle.
- <u>Level of Service C</u>. Describes operations with average total delay in the range of 15.1 to 25.0 second per vehicle.
- <u>Level of Service D</u>. Describes operations with average total delay in the range of 25.1 to 35.0 seconds per vehicle.
- <u>Level of Service E</u>. Describes operations with average total delay in the range of 35.1 to 50.0 seconds per vehicle.
- Level of Service F. Describes operations with average total delay of 50 seconds per vehicle. LOS F exists when there are insufficient gaps of suitable size to allow a side street demand to cross safely through or enter a major street traffic stream. This level of service is generally evident from extremely long total delays experienced by side street traffic and by queuing on the minor approaches. It is important to note that LOS F may not always result in long queues but may result in adjustments to normal driver behavior.

Intersection Summary

Description: 7070

Queue shown is maximum after two cycles.

Queue shown is maximum after two cycles.

Timing Plan: 2019 PM PEAK

Volume exceeds capacity, queue is theoretically infinite.

⁹⁵th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Volume exceeds capacity, queue is theoretically infinite. Queue shown is maximum after two cycles.

⁹⁵th percentile volume exceeds capacity, queue may be longer.

m Volume for 95th percentile queue is metered by upstream signal

Intersection Summary

Description: 704010

Queue shown is maximum after two cycles.

Queue shown is maximum after two cycles.

[~] Volume exceeds capacity, queue is theoretically infinite.

^{# 95}th percentile volume exceeds capacity, queue may be longer.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Description: 694030

Timing Plan: 2030 FB PM PEAK

Volume exceeds capacity, queue is theoretically infinite. Queue shown is maximum after two cycles.

⁹⁵th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Queue shown is maximum after two cycles.

Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Description: 704010

Queue shown is maximum after two cycles.

Queue shown is maximum after two cycles.

[~] Volume exceeds capacity, queue is theoretically infinite.

^{# 95}th percentile volume exceeds capacity, queue may be longer.

m Volume for 95th percentile queue is metered by upstream signal.

Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Description: 704010

Queue shown is maximum after two cycles.

Queue shown is maximum after two cycles.

Volume exceeds capacity, queue is theoretically infinite.

^{# 95}th percentile volume exceeds capacity, queue may be longer.

m Volume for 95th percentile queue is metered by upstream signal.

Description: 694030

Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Description: 7070

Queue shown is maximum after two cycles.

Volume exceeds capacity, queue is theoretically infinite. Queue shown is maximum after two cycles.

⁹⁵th percentile volume exceeds capacity, queue may be longer.

m Volume for 95th percentile queue is metered by upstream signal.

Volume exceeds capacity, queue is theoretically infinite. Queue shown is maximum after two cycles.

⁹⁵th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Description: 704010

Queue shown is maximum after two cycles.

Queue shown is maximum after two cycles.

[~] Volume exceeds capacity, queue is theoretically infinite.

^{# 95}th percentile volume exceeds capacity, queue may be longer.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Description: 694030

Timing Plan: TF30 ALT PM

Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Intersection Summary

 ^{# 95}th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
 m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Description: 7070

Reduced v/c Ratio

Queue shown is maximum after two cycles.

0.85

0.81

0.11

0.35

Queue shown is maximum after two cycles.

Volume exceeds capacity, queue is theoretically infinite.

⁹⁵th percentile volume exceeds capacity, queue may be longer.
