

Northern Bus Garage

Noise, Vibration, and Dust Monitoring Report (October 2023)

Noise, Vibration, and Dust levels were monitored as part of the reconstruction of Northern Bus Garage, 4615 14th Street, NW, Washington, DC, for the month of October 2023.

The following memorandum identifies the monitoring points and instruments, presents the data, and provides a brief analysis of the results per monthly monitoring report attached by Geo Instruments for Clark Construction. The report is organized by medium: noise, vibration, and dust. Figures and graphs are attached. The red dashed line on each of the graphs represents the monitoring thresholds, which are summarized below for each instrument.

Noise Monitoring

Five noise monitors are positioned around the perimeter of the project site. (See Figure 1) Under DC regulations, the regulatory standard is 80 dBA, measured 25 ft from the property line (20 DCMR 2802.1). Because the noise monitoring devices are placed on the property line (rather than a 25 ft offset), the monitoring threshold for site activities is adjusted to 85 dBA (assuming the noise level will dissipate). Noise levels and vibration levels were measured automatically with Micromate and Geophone Instrument.

A detailed review of the data while compiling this months report revealed that the Mic5 hardware required evaluation, and was replaced.

numerous noise level exceedances at all hours of the day and all days of the week. Mic2 recorded the highest noise levels of any location after working hours and during work hours. Mic1 and Mic2 were like one another with 39% and 44% of the exceedances coming outside of working hours, respectively. Mic3 and Mic4 were also similar to each other with about 33% of its exceedances outside of working hours. Mic5 recorded 47% of its exceedances during nights and weekends. Please see table 1 (The “Work Hours” category includes all weekend shifts and evening shifts that were worked during the month).

Vibration Monitoring

Five vibration monitors are positioned around the perimeter of the project site. (See Figure 1) Vibration thresholds are based the WMATA Design Criteria. Monitors VM-1 and VM-2 are set at a lower vibration threshold due to their proximity to the historic façade, which is more sensitive to any movement. Noise levels and vibration levels were measured automatically with Micromate and Geophone Instrument.

Table 2

Instrument Type	Monitoring Threshold
Vibration Monitor (VM-1)	0.2 in/sec
Vibration Monitor (VM-2)	0.2 in/sec
Vibration Monitor (VM-3)	2.0 in/sec
Vibration Monitor (VM-4)	2.0 in/sec
Vibration Monitor (VM-5)	2.0 in/sec

No operating issue with the monitoring instruments was identified. The seismographs at locations VM-1, VM-3, VM-4, and VM-5 were due for annual calibration. These were exchanged with newly calibrated units.

Graphs showing monitoring results are presented in Graphs 1 to 5.

No vibration exceedance was reported during the month.

Dust Monitoring Threshold Values and Exceedances:

Three dust monitors are positioned at the project site. (See Figure 2) EPA regulatory thresholds are based on a 24-hour

monitoring period; the project has adopted thresholds to monitor site levels and provide an indication of when EPA standards might be exceeded. (See Table 3) Dust measurements were monitored using Aeroqual Dust Sentry Pro.

Table 3

Dust Monitoring Measurement	Monitoring Threshold
Particulates (PM2.5)	40 µg/m ³
Particulates (PM10)	50 µg/m ³

DM2 began experiencing power interruptions after a battery exchange on October 19. It was discovered that the battery was not holding a charge above 11 volts resulting in interruptions in overnight measurements. The faulty battery was removed and replaced with a fresh battery. Two of the units have been fitted with hardware that allows tracking and alarming upon low voltage. Due to site restrictions, DM1 cannot be plugged into main power so continued battery swaps will be the interim solution until site conditions change.

Graphs showing monitoring results are presented in Graphs 6-11.

There was one air quality exceedances in the month of October 2023. DM1 recorded a PM2.5 of 50 µg/m³ and a PM10 of 54 µg/m³ on October 27 at 6:32pm due to higher winds in the evening.

Table 1: Noise Summaries

VM-1 Mic

VM1-MIC		
	Exceedance	Percentage
Work hours	601	61.45%
After hours	157	16.05%
Weekends	220	22.49%
Total	978	100%

	Work hours	After hours	Weekends
Lmax	111.3	109.3	107.3
Lmin	72.3	55.9	55.6
L10	87	73	74
L90	74	62	61
Leq	81	78	77.8

VM-2 Mic

VM2-MIC		
	Exceedance	Percentage
Work hours	187	56.67%
After hours	68	20.61%
Weekends	75	22.73%
Total	330	100%

	Work hours	After hours	Weekends
Lmax	115.7	115.7	112.7
Lmin	80	66.9	66.9
L10	84	70	75
L90	81	68	71
Leq	82	76.8	74.3

VM-3 Mic

VM3-MIC		
	Exceedance	Percentage
Work hours	369	66.85%
After hours	78	14.13%
Weekends	105	19.02%
Total	552	100%

	Work hours	After hours	Weekends
Lmax	108.7	107.3	110.8
Lmin	67.2	50.5	57.6
L10	85	73	75
L90	74	56	63
Leq	78.7	76	80.4

VM-4 Mic

VM4-MIC		
	Exceedance	Percentage
Work hours	56	67.47%
After hours	11	13.25%
Weekends	16	19.28%
Total	83	100%

	Work hours	After hours	Weekends
Lmax	98.9	100.7	100.6
Lmin	61.5	44.2	44.4
L10	74	62	65
L90	64	48	49
Leq	77.5	70.1	65

VM-5 Mic

VM5-MIC		
	Exceedance	Percentage
Work hours	157	53.22%
After hours	49	16.61%
Weekends	89	30.17%
Total	295	100%

	Work hours	After hours	Weekends
Lmax	113.7	107.7	106
Lmin	91.3	90.9	90.8
L10	92	91	91
L90	92	91	91
Leq	91.5	91.1	90.8

NOTES:

- Exceedance analyses are presented in the left table. Noise level summaries are presented in the right table.
- Measurements and Key:
 Lmax: Maximum Noise Level (for the month, in dBA)
 Lmin: Minimum Noise Level (for the month, in dBA)
 L10: The noise level exceeded 10% of the time (for the month, in dBA)
 L90: The noise level exceeded 90% of the time (for the month, in dBA)
 Leq: Equivalent Continuous Sound Level, an 'average' (for the month, in dBA)
