Metrorail Station Pedshed and Bikeshed Atlas

Second Edition

2024

Washington Metropolitan Area Transit Authority

Introduction

Many elements influence how riders access Metro by walking, bicycling, or using micromobility. Physical barriers such as highways, rivers, and disjointed street and sidewalk networks can make accessing stations difficult, dangerous, or essentially impractical for some customers. “Traffic stress” from real or perceived safety issues on roads can deter bicycle travel. Pedsheds and bikesheds allow us to visualize the areas around Metrorail stations and assess which provide the best access to pedestrians, bicyclists, and micromobility users.

This document builds off the first *Metrorail Station Walk Shed Atlas* published in 2015 by adding *low-stress* and *total* bikesheds for each station, along with updated pedsheds. We’ve also made interactive pedshed and bikeshed maps available online for review and download.

We can use these maps to understand where barriers in the pedestrian and bicycle network exist, as well as to identify station areas with the potential for unlocking new ridership by foot, mobility device, bike, or scooter. We intend to repeat our methodology with improved data inputs in future years to produce more accurate pedsheds and bikesheds.

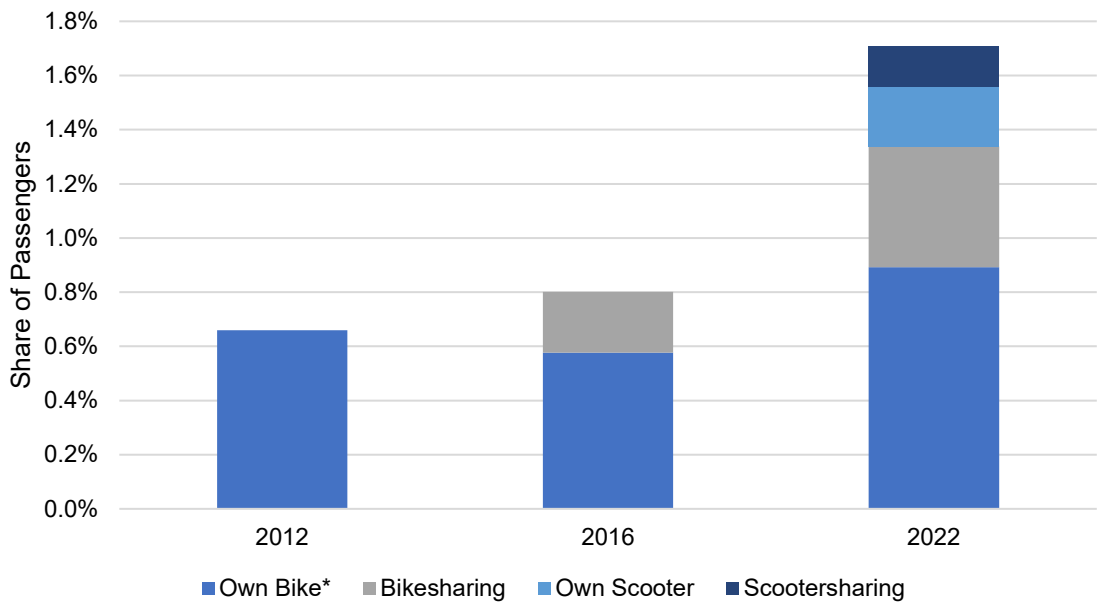
A Note on Terminology

We use the term “pedsheds” instead of “walksheds” to be more inclusive of pedestrians who may use mobility devices such as wheelchairs. Additionally, routes captured within a “bikeshed” are often also conducive for travelers using a wide range of shared or private micromobility devices, including e-scooters.

Background

One of the priorities outlined in *Your Metro, The Way Forward*, Metro’s Strategic Transformation Plan, is to provide safe and accessible routes to transit for pedestrians and bicyclists. **Nearly two-thirds of Metrorail riders already start their trip by walking**, but the share of riders accessing Metro by walking can vary drastically by station. For example, according to the results of our 2022 Metrorail Passenger Survey, over 80% of riders access Clarendon station by walking, but only 9% of riders walk to Southern Avenue station.

Bicycle access and micromobility use have grown over the past decade (see Figure 1). Today, just over 1% of Metro riders start their trip by bicycling, twice the share of bicyclists from 2012. The share of bicyclists also varies by station, with as many as 8% of riders reaching College Park-UMD station by bike, and under 1% of riders biking to Shady Grove. Insights from our pedsheds and bikesheds can help us work with our partners to achieve our Strategic Transformation Plan goal of **increasing the share of riders who access Metro by bicycle to 3.5% by 2030**.



*Metro did not differentiate between personal bicycles and bikeshare in our 2012 passenger survey

Figure 1: Passengers Accessing Metro by Bicycle and Micromobility

Methodology

Step 1: Gather Geospatial Data

To develop our pedsheds and bikesheds, the project team first gathered available geospatial data on the pedestrian and bicycle network. For pedsheds, we used sidewalk and crosswalk data. For bikesheds, we used "Level of Traffic Stress" (LTS) measures available for DC and Maryland jurisdictions. We used Functional Roadway Classifications and speed limits as proxies for LTS in Virginia, where LTS measures were not available at the time of development.

Step 2: Clean and Review Network

When sidewalks or roads did not line up across jurisdictional boundaries, we manually connected these segments to reflect complete networks. The team then reviewed sidewalk and road data by comparing it with recent satellite imagery.

Step 3: Run Network Analysis

Next, the project team performed a network analysis, which generated footprints out from stations along connected segments of the pedestrian and bicycle networks. The analysis considered the distance of *actual* paths accessible to pedestrians and bicyclists on suitable infrastructure, which resulted in shapes that are typically smaller than simple *as-the-crow-flies* buffers.

For pedsheds, we used a half-mile distance as the cutoff along the pedestrian network. For *low-stress* bikesheds, we used LTS levels 1 through 3, which include roads with dedicated or shared bicycle facilities, up to three miles from the station. In Virginia, our proxy measure included roads with speed limits up to 30 MPH. For *total* bikesheds, we included all known on-road facilities that could accommodate bicycle travel, up to LTS level 4, again up to three miles from a station.

Step 4: Describe Characteristics of Pedsheds and Bikesheds

Similar to our first atlas, we have included snapshots of key demographic and employment characteristics in our final station pedsheds and bikesheds. The project team calculated estimated household and employment totals using demographic and business location data from Esri, a geographic information system software company. Finally, average weekday station ridership from January 2023 through September 2023 was obtained through Metro's Ridership Data Portal.

What's Next

Moving forward, we hope to periodically update the atlas with improved data. We know, for example, that our bikesheds will be more accurate once we include off-road bicycle facilities, such as multi-use trails, in the bicycle network. We'd also like to incorporate Level of Traffic Stress measures for bicycle routes in Virginia as they become available.

As outlined in our Strategic Transformation Plan, Metro is committed to working with our partner jurisdictions to increase station area safety and access for pedestrians, bicyclists, and micromobility users. This atlas is an important tool for helping us realize that goal. By periodically reviewing and updating this atlas, Metro and our partners can identify opportunities to improve network connectivity and increase ridership.
