 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. SMACNA:
 - a. HVAC Duct Construction Standards - Metal and Flexible.
 - 3. ASTM: A36, A53, A653.
 - 4. NFPA: 90A
 - 5. AASHTO: M81.
 - 6. UL: Building Materials Directory, 181, 555.
- B. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code - Steel", for hangers and supports, AWS D1.2, "Structural Welding Code - Aluminum," for aluminum supporting members, and AWS D9.1, "Sheet Metal Welding Code," for duct joint and seam welding.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Sheet metal duct materials, material thicknesses, and duct construction methods.
 - 2. Shop Drawings: Drawn to 1/4 inch equals 1 foot scale. Show fabrication and installation details for metal ducts.
 - a. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
 - b. Duct layout indicating sizes and pressure classes.
 - c. Elevations of top and bottom of ducts.
 - d. Dimensions of main duct runs from building grid lines
 - e. Coordination with reflected ceiling plans.
 - f. Fittings.
 - g. Reinforcement and spacing.
 - h. Penetrations through fire-rated and other partitions.
 - i. Duct accessories, including access doors and panels.

- j. Hangers and supports, including methods for duct and building attachment, vibration isolation.
3. Certification.
4. Welding certificates.

PART 2 - PRODUCTS

2.01 MATERIALS:

- A. Galvanized Sheet Steel: ASTM A653.
- B. Steel Plate: ASTM A36, Grade A.
- C. Steel Pipe: ASTM A53, Grade A.
- D. PVC-Coated Galvanized Steel: Acceptable by authorities having jurisdiction for use in fabricating ducts with UL 181, Class 1 listing. Lock-forming-quality, galvanized sheet steel complying with ASTM A 653 and having G60 or G90 coating designation. Factory-applied PVC coatings shall be 4 mils thick on sheet metal surfaces of ducts and fittings exposed to corrosive conditions and 2 mils thick on opposite surfaces.
- E. Carbon-Steel Sheets: ASTM A 366, cold-rolled sheets; commercial quality; with oiled, matte finish for exposed ducts.
- F. Stainless Steel: ASTM A 480, Type 316 or 304.
- G. Aluminum Sheets: ASTM B 209, alloy 3003, temper H14 with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.
- H. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts.
- I. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.
- J. Paint:
 1. Zinc-rich gray, No. 721, Detroit Graphite or equal.

2.02 FABRICATION:

- A. Rectangular Duct Fabrication
 1. Fabricate ducts, elbows, transitions, offsets, branch connections, and other construction according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" and complying with requirements for metal thickness, reinforcing types and intervals, tie-rod applications, and joint types and intervals.
 2. Transverse Joints: Prefabricated slide-on joints and components constructed using manufacturer's guidelines for material thickness, reinforcement size and spacing, and joint reinforcement.
 3. Formed-On Flanges: Construct according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible", Figure 1-4, using corner, bolt, cleat, and gasket details.

- B. Instrument Test Holes:
1. Factory-fabricated, airtight, non-corrosive instrument test hole with screw cap and gasket.
- C. Round and Flat-Oval Duct and Fitting Fabrication
1. Diameter as applied to flat-oval ducts in this Article is the diameter of a round duct with a circumference equal to the perimeter of a given size of flat-oval duct.
 2. Round, Longitudinal- and Spiral Lock-Seam Ducts: Fabricate supply ducts of galvanized steel according to SMACNA's "HVAC Duct Construction Standard - Metal and Flexible".
 3. Flat-Oval, Longitudinal- and Spiral Lock-Seam Ducts: Fabricate supply ducts according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible". Fabricate ducts larger than 72 inches in diameter with butt-welded longitudinal seams.
- D. Duct Joints
1. Ducts up to 20 inches in diameter: Interior, center-beaded slip coupling, sealed before and after fastening, attached with sheet metal screws.
 2. Ducts 21 to 72 inches in diameter: Three-piece, gasketed, flanged joint consisting of two internal flanges with sealant and one external closure band with gasket.
 3. Ducts larger than 72 inches in diameter: Companion angle flanged joints per SMACNA "HVAC Duct Construction Standard - Metal and Flexible", Figure 3-2.
 4. Round Ducts: Prefabricated connection system consisting of double-lipped, EPDM rubber gasket. Manufacture ducts according to connection system manufacturer's tolerances.
 5. Flat-Oval Ducts: Prefabricated connection system consisting of two flanges and one synthetic rubber gasket.
- E. 90-Degree Tees and Laterals and Conical Tees: Fabricate to comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible", with metal thicknesses specified for longitudinal-seam straight ducts.
- F. Diverging-Flow Fittings: Fabricate with reduced entrance to branch taps and with no excess material projecting from fitting onto branch tap entrance.
- G. Fabricate elbows using die-formed, gored, pleated, or metered construction. Bend radius of die-formed, gored, and pleated elbows shall be 1-1/2 times duct diameter. Unless elbow construction type is indicated, fabricate elbows as follows.
1. Mitered-Elbow Radius and Number of Pieces: Welded construction complying with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible", unless otherwise indicated.
 2. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from minus 2- to plus 2-inch wg:
 - a. Ducts 3 to 36 Inches in Diameter: 0.034 inch.
 - b. Ducts 37 to 50 Inches in Diameter: 0.040 inch.
 - c. Ducts 52 to 60 Inches in Diameter: 0.052 inch.
 - d. Ducts 62 to 84 Inches in Diameter: 0.064 inch.
 3. Round Mitered Elbows: Welded construction with the following metal thickness for pressure classes from 2- to 10-inch wg:
 - a. Ducts 3 to 26 Inches in Diameter: 0.034 inch.
 - b. Ducts 27 to 50 Inches in Diameter: 0.040 inch.
 - c. Ducts 52 to 60 Inches in Diameter: 0.052 inch.
 - d. Ducts 62 to 84 Inches in Diameter: 0.064 inch.

4. Flat-Oval Mitered Elbows: Welded construction with the same metal thickness as longitudinal-seam flat-oval duct.
5. 90-Degree, 2-Piece, Mitered Elbows: Use only for supply systems or for material-handling Class A or B exhaust systems and only where space restrictions do not permit using radius elbows. Fabricate with single-thickness turning vanes.
6. Round Elbows 8 Inches or Less in Diameter: Fabricate die-formed elbows for 45- and 90-degree elbows and pleated elbows for 30, 45, 60, and 90 degrees only. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.
7. Round Elbows 9 through 14 inches in Diameter: Fabricate gored or pleated elbows for 30, 45, 60, and 90 degrees unless space restrictions require mitered elbows. Fabricate nonstandard bend-angle configurations or nonstandard diameter elbows with gored construction.
8. Round Elbows Larger than 14 Inches in Diameter and All Flat-Oval Elbows: Fabricate gored elbows unless space restrictions require mitered elbows.
9. Die-Formed Elbows for Sizes through 8 Inches in Diameter and All Pressures 0.040 inch thick with 2-Piece Welded Construction.
10. Round Gored-Elbow Metal Thickness: Same as non-elbow fittings specified above.
11. Flat-Oval Elbow Metal Thickness: Same as longitudinal-seam flat-oval duct specified above.

H. PVC-Coated Elbows and Fittings: Fabricate elbows and fittings as follows:

1. Round Elbows 4 to 8 Inches in Diameter: Two piece, die stamped, with longitudinal seams spot welded, bonded and painted with PVC aerosol spray.
2. Round Elbows 9 to 26 Inches in Diameter: Standing-seam construction.
3. Round Elbows 28 to 60 Inches in Diameter: Standard gored construction, riveted and bonded.
4. Other Fittings: Riveted and bonded joints.
5. Couplings: Slip-joint construction with a minimum 2-inch insertion length.

2.09 DOUBLE-WALL DUCT AND FITTING FABRICATION

A. Ducts: Fabricate double-wall (insulated) ducts with an outer shell and an inner duct. Dimensions indicated are for inner ducts.

1. Outer Shell: Base metal thickness on outer-shell dimensions. Fabricate outer-shell lengths 2 inches longer than inner duct and insulation and in metal thickness specified for single-wall duct.
2. Insulation: 1-inch-thick fibrous glass, unless otherwise indicated. Terminate insulation where double-wall duct connects to single-wall duct or uninsulated components, and reduce outer shell diameter to inner duct diameter.
 - a. Thermal Conductivity (k-Value): 0.26 at 75 deg F mean temperature.
3. Solid Inner Ducts: Use the following sheet metal thicknesses and seam construction:
 - a. Ducts 3 to 8 Inches in Diameter: 0.019 inch with standard spiral-seam construction.
 - b. Ducts 9 to 42 Inches in Diameter: 0.019 inch with single-rib spiral-seam construction.
 - c. Ducts 44 to 60 Inches in Diameter: 0.22 inch with single-rib spiral-seam construction.
 - d. Ducts 62 to 88 Inches in Diameter: 0.034 inch with standard spiral-seam construction.

4. Perforated Inner Ducts: Fabricate with 0.028-inch thick sheet metal having 3/32-inch diameter perforations, with overall open area of 23 percent.
 5. Maintain concentricity of inner duct to outer shell by mechanical means. Prevent dislocation of insulation by mechanical means.
- B. Fittings: Fabricate double-wall (insulated) fittings with an outer shell and an inner duct.
1. Solid Inner Ducts: Use the following sheet metal thicknesses:
 - a. Ducts 3 to 34 Inches in Diameter: 0.028 inch.
 - b. Ducts 35 to 58 Inches in Diameter: 0.034 inch.
 - c. Ducts 60 to 88 inches in Diameter: 0.040 inch.
 2. Perforated Inner Ducts: Fabricate with 0.028-inch-thick sheet metal having 3/32-inch-diameter perforations, with overall open area of 23 percent.

PART 3 - EXECUTION

3.01 DUCT INSTALLATION:

- A. Install dampers so as to permit adjustment after completion of the work.
- B. Install dampers without strain or distortion of any part of dampers.
- C. Adjust moving parts to move freely without binding.
- D. Caulk dampers airtight around frames.
- E. Adjust damper adjusting rods to operate freely between open and closed positions.
 1. Cut off projecting ends of rods after adjustment and bend over two inches from bushings.
 2. Leave cut ends smooth and free from burrs.
- F. Where diffuser is located at end of rectangular duct, extend duct minimum of one-neck diameter beyond center line of neck.
- G. Construct and install ducts according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible", unless otherwise indicated.
- H. Replace damaged ductwork and appurtenances.
- I. Install round and flat-oval ducts in lengths not less than 12 feet unless interrupted by fittings.
- J. Install ducts with fewest possible joints.
- K. Install fabricated fittings for changes in directions, size, and shape and for connections.
- L. Install ducts, unless otherwise indicated, vertically and horizontally and parallel and perpendicular to building lines; avoid diagonal runs.
- M. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.

- N. Conceal ducts from view in finished spaces. Do not encase horizontal runs in solid partitions unless specifically indicated.
- O. Coordinate layout with suspended ceiling, fire-and smoke-control dampers, lighting layouts, and similar finished work.
- P. Seal all joints and seams. Apply sealant to male end connectors before insertion, and afterward to cover entire joint and sheet metal screws.
- Q. Fire-Related partition Penetrations: Where ducts pass through interior partitions and exterior walls, install appropriately rated fire dampers, sleeves, and firestopping sealant. Fire and smoke dampers are specified in Section 15820. Firestopping materials and installation methods are specified in Section 07841.
- R. Protect duct interiors from the elements and foreign materials until building is enclosed. Follow SMACNA's "Duct Cleanliness for New Construction".
- S. Provide sheet metal caps on duct ends that are to be connected to future ductwork.

3.02 PVC-COATED DUCT, SPECIAL INSTALLATION REQUIREMENTS

- A. Repair damage to PVC coating with manufacturer's recommended materials.

3.03 UNDERSLAB DUCTS, SPECIAL INSTALLATION REQUIREMENTS

- A. Verify undamaged condition of ducts before enclosure with fill or encasement.
- B. Protect ducts from damage by equipment used in placing fill materials and concrete on or around ducts.
- C. Protect duct openings from damage and prevent entrance of foreign materials.

3.04 SEAM AND JOINT SEALING

- A. Seal duct seams and joints according to SMACNA's "HVAC Duct Construction - Metal and Flexible" for duct pressure class indicated.
 - 1. For pressure classes lower than 2-inch wg, seal transverse joints.
- B. Seal ducts before external insulation is applied.

3.05 HANGING AND SUPPORTING

- A. Support horizontal ducts within 24 inches of each elbow and within 48 inches of each branch intersection.
- B. Support vertical ducts at maximum intervals of 16 feet at each floor.

- C. Install upper attachments to structures with an allowable load not exceeding one-fourth of failure (proof-test) load.
- D. Install concrete inserts before placing concrete.
- E. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
 - 1. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than 4 inches thick.

3.06 CONNECTIONS

- A. Make connections to equipment with flexible connectors according to Section 15820.
- B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.07 FIELD QUALITY CONTROL

- A. Air-Leak Tests for Accessible Ductwork: Perform air-leak tests in accordance with SMACNA HVAC Air Duct Leakage Test Manual.

3.08 CLEANING OF AIR SYSTEM

- A. Before air conditioning or filters are operated, clean inside of air system, including ductwork used for air supply or return.
- B. Accomplish cleaning by means of industrial vacuum cleaners which will effectively remove dust and foreign material from surfaces swept by air stream.
- C. Clean exposed ductwork and leave in satisfactory condition, free from grease, oil and foreign material prior to application of insulation or finish painting.
- D. Clean ducts after the system has been used for adjusting, testing or temporary ventilation.

END OF SECTION

THIS PAGE NOT USED

SECTION 15820

DUCT ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This section specifies providing duct accessories.
- B. Related work specified elsewhere:
 - 1. Ductwork: Section 15810.
 - 2. Identification of Mechanical Equipment and Piping: Section 15075.
 - 3. System Balancing and Testing: Section 15950.
 - 4. Metal Louvers: Section 10200.

1.02 QUALITY ASSURANCE

- A. Comply with NFPA 90A, "Installation of Air Conditioning and Ventilating Systems."
- B. SMACNA:
 - 1. Fire, Smoke and Radiation Damper Installation Guide for HVAC Systems.
- C. Dampers shall be tested and rated in accordance with AMCA Standard 500.

1.03 SUBMITTALS

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: For the following:
 - a. Backdraft dampers.
 - b. Volume dampers.
 - c. Fire dampers.
 - d. Smoke dampers.
 - e. Combination fire and smoke dampers.
 - f. Turning vanes.
 - g. Duct-mounting access doors.
 - h. Flexible connectors.
 - i. Flexible ducts.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - a. Special fittings.
 - b. Manual-volume damper installations.
 - c. Motorized-control damper installations.
 - d. Fire-damper, smoke-damper, and combination fire- and smoke-damper installations, including sleeves and duct-mounting access doors.
 - e. Wiring Diagrams: Power, signal, and control wiring.

PART 2 - PRODUCTS

2.01 SHEET METAL MATERIALS

- A. Comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods, unless otherwise indicated.
- B. Galvanized Sheet Steel: Lock-forming quality; complying with ASTM A 653 and having or G90 coating designation; ducts shall have mill-phosphatized finish for surfaces exposed to view.
- C. Stainless Steel: ASTM A 480.

- D. Aluminum Sheets: ASTM B 209, alloy 3003, temper H14; with mill finish for concealed ducts and standard, 1-side bright finish for exposed ducts.
- E. Extruded Aluminum: ASTM B 221, alloy 6063, temper T6.
- F. Reinforcement Shapes and Plates: Galvanized-steel reinforcement where installed on galvanized sheet metal ducts; compatible materials for aluminum and stainless-steel ducts.
- G. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.02 BACKDRAFT DAMPERS

- A. Description: Multiple-blade, parallel action gravity balanced, with center-pivoted blades of maximum 6-inch width, with sealed edges, assembled in rattle-free manner with 90-degree stop, steel ball bearings, and axles; adjustment device to permit setting for varying differential static pressure.

2.03 VOLUME DAMPERS

- A. General Description: Factory fabricated, with required hardware and accessories. Stiffen damper blades for stability. Include locking device to hold single-blade dampers in a fixed position without vibration. Close duct penetrations for damper components to seal duct consistent with pressure class.
- B. Standard Volume Dampers: Multiple- or single-blade, parallel- or opposed-blade design as indicated, standard leakage rating, with linkage outside airstream, and suitable for horizontal or vertical applications. Select metal compatible with duct.
- C. Low-Leakage Volume Dampers: Multiple- or single-blade, parallel- or opposed-blade design as indicated, low-leakage rating, with linkage outside airstream, and suitable for horizontal or vertical applications.
- D. Jackshaft: 1-inch-diameter, galvanized-steel pipe rotating within pipe-bearing assembly mounted on supports at each mullion and at each end of multiple-damper assemblies.
- E. Damper Hardware: Zinc-plated, die-cast core with dial and handle made of 3/32-inch-thick zinc-plated steel, and a 3/4-inch hexagon locking nut. Include center hole to suit damper operating-rod size. Include elevated platform for insulated duct mounting.

2.05 FIRE DAMPERS

- A. Fire dampers shall be labeled according to UL 555.
- B. Mounting Sleeve: Factory- or field-installed, galvanized sheet steel.
- C. Fusible Links: Replaceable, 165 deg F or 212 deg F rated.

2.07 SMOKE AND COMBINATION FIRE AND SMOKE DAMPERS

- A. General Description: Labeled according to UL 555S. Combination fire and smoke dampers shall be labeled according to UL 555.
- B. Fusible Links: Replaceable.
- C. Frame and Blades: Galvanized sheet steel.
- D. Mounting Sleeve: Factory-installed, galvanized sheet steel; length to suit wall or floor application.
- E. Damper Motors: Modulating and two-position action.

2.08 TURNING VANES

- A. Fabricate to comply with SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for vanes and vane runners. Vane runners shall automatically align vanes.

- B. Manufactured Turning Vanes: Fabricate 1-1/2-inch- wide, single or double-vane, curved blades of galvanized sheet steel set 3/4 inch o.c.; support with bars perpendicular to blades set 2 inches o.c.; and set into vane runners suitable for duct mounting.

2.09 DUCT-MOUNTING ACCESS DOORS

- A. General Description: Fabricate doors airtight and suitable for duct pressure class.
- B. Door: Double wall, duct mounting, and rectangular; fabricated of galvanized sheet metal with insulation fill and thickness for duct pressure class. Include vision panel and butt or piano hinge and cam latches.
- C. Door: Double wall, duct mounting, and round; fabricated of galvanized sheet metal with insulation fill and thickness. Include cam latches.
- D. Pressure Relief Access Door: Single or double wall and duct mounting; fabricated of galvanized sheet metal with insulation fill and thickness for duct pressure class. Include vision panel, latches, and retaining chain.
 - 1. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
- E. Seal around frame attachment to duct and door to frame with neoprene or foam rubber.
- F. Insulation: 1-inch- thick, fibrous-glass or polystyrene-foam board.

2.10 FLEXIBLE CONNECTORS

- A. General Description: Flame-retardant or noncombustible fabrics, coatings, and adhesives complying with UL 181, Class 1.
- B. Metal-Edged Connectors: Factory fabricated with a fabric strip attached to two strips of galvanized sheet steel or 0.032-inch-thick aluminum sheets. Select metal compatible with ducts.
- C. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.
- D. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weatherproof, synthetic rubber resistant to UV rays and ozone.
- E. High-Temperature System, Flexible Connectors: Glass fabric coated with silicone rubber.
- F. High-Corrosive-Environment System, Flexible Connectors: Glass fabric with chemical-resistant coating.

2.11 FLEXIBLE DUCTS

- A. Noninsulated Flexible Duct: UL 181, Class 1, 2-ply vinyl film supported by helically wound, spring-steel wire.
- B. Insulated Flexible Duct: UL 181, Class 1, 2-ply vinyl film supported by helically wound, spring-steel wire; fibrous-glass insulation; polyethylene vapor barrier film.
- C. Flexible Duct Clamps: Stainless-steel band with cadmium-plated hex screw to tighten band with a worm-gear action, in sizes 3 through 18 to suit duct size.

2.12 DUCT ACCESSORY HARDWARE

- A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct insulation thickness.
- B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.01 APPLICATION AND INSTALLATION

- A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards--Metal and Flexible" for metal ducts.
- B. Provide duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and fibrous-glass ducts, stainless-steel accessories in stainless-steel ducts, and aluminum accessories in aluminum ducts.
- C. Install backdraft dampers on exhaust fans or exhaust ducts nearest to outside.
- D. Install volume dampers in ducts with liner; avoid damage to and erosion of duct liner.
- E. Provide balancing dampers at points on supply, return, and exhaust systems where branches lead from larger ducts as required for air balancing. Install at a minimum of two duct widths from branch takeoff.
- F. Provide test holes at fan inlets and outlets.
- G. Install fire and smoke dampers, with fusible links, according to manufacturer's UL-approved written instructions.
- H. Install duct access doors to allow for inspecting, adjusting, and maintaining accessories and terminal units.
- I. Label access doors according to Section 15075.
- J. Install flexible connectors immediately adjacent to equipment in ducts associated with fans and motorized equipment supported by vibration isolators.
- K. For fans developing static pressures of 5-inch wg and higher, cover flexible connectors with loaded vinyl sheet held in place with metal straps.
- L. Connect diffusers or light troffer boots to low pressure ducts with maximum 60-inch lengths of flexible duct clamped or strapped in place.
- M. Install duct test holes where indicated and required for testing and balancing purposes.

3.02 ADJUSTING

- A. Adjust duct accessories for proper settings.
- B. Adjust fire and smoke dampers for proper action.
- C. Final positioning of manual-volume dampers is specified in Section 15950.

END OF SECTION

SECTION 15825

SOUND ATTENUATORS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing factory-fabricated sound attenuators.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AMCA Standards.
 - 3. SMACNA HVAC Duct Construction Standards.
 - 4. UL: 723.
 - 5. NFPA: 130, 255.
 - 6. ASTM: E84.
- B. Source Quality Control:
 - 1. Run tests for subway ventilation-fan attenuators on dynamic insertion-loss performance by duct-to-reverberation-room method with air flowing through sound attenuator at rated capacity.
 - 2. Test methods to eliminate effects due to end reflection, vibration, flanking transmission and standing waves in reverberant room.
 - 3. Take air flow and pressure loss data in accordance with AMCA Standards.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Shop Drawings.
 - 2. Certification.
 - a. Certify that values for sound-pressure levels, i.e., decibels, Re 0.0002 microbar, of cooling tower with attenuators do not exceed those scheduled below measured at 50 feet in free field in any direction.

Octave Band Center Frequency/Hertz	Sound Pressure Level/dB at 50 Feet with Inlet and Outlet Attenuators
63	66
125	61
250	54
500	45
1000	42
2000	41
4000	39
8000	39

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
1. In design and purchase of equipment, provide for interchangeability of items of equipment, subassemblies and parts.
- B. Subway Ventilation-Fan and Jet-Fan Attenuators:
1. Factory-fabricated with nominal rectangular cross section and length as shown.
 2. Outer casing constructed of minimum 22-USSG, galvanized sheet steel in accordance with SMACNA HVAC Duct Construction Standards.
 3. Interior partitions minimum 24-USSG, galvanized, perforated steel sheet.
 4. Factory-banded with 1-1/2 inch square by 1/8-inch steel angle flanges and two-inch bar straps.
 5. Airtight when operated at two inches water-gauge static pressure and rated capacity.
 6. Acoustic filler material:
 - a. Inorganic fibrous glass, permanently odorless.
 - b. Minimum five-percent compression to eliminate voids and setting.
 - c. Combustion rating when tested in accordance with ASTM E84, NFPA 255, or UL 723, maximum 20 for flame spread, 20 for smoke developed and 15 for fuel contributed.
 7. Designed for maximum pressure drop as specified for 100-percent forward flow and 70-percent reverse flow for air flow volume as shown.
 8. Minimum dynamic insertion loss (dB) under operating conditions shown in accordance with Table 15825-1.
 9. Comply with high temperature requirements given in NFPA 130.
- C. Cooling-Tower Sound Attenuators:
1. Factory-fabricated, packaged-type, furnished by tower manufacturer.
 2. Outer casing constructed of minimum 22-USSG, hot-dip galvanized sheet steel in accordance with SMACNA HVAC Duct Construction Standards.
 3. Panels lines:

- a. With weatherproof, inorganic, permanently odorless, fibrous-glass acoustic material.
 - b. Combination rating when tested in accordance with ASTM E84, NFPA 255, or UL 723, maximum 25 for flame spread, 20 for smoke developed and 20 for fuel contributed.
- 4. Lining secured in place with galvanized-steel screening.
 - 5. Removable panels: For access to the eliminator sections and upper interior of tower.
 - 6. Exposed metal surfaces finished with zinc-chromate aluminum paint or manufacturer's standard finish providing equal or greater corrosion protection.
 - 7. Intake attenuators designed to bolt directly to the cooling tower, having removable access doors at ends for entry to moving parts of unit.
 - 8. Discharge attenuators designed to mount directly to top of tower and requiring no additional structural support.
 - 9. Galvanized-sheet-metal hooded inlet provided for protection from weather.
- D. Nameplates:
- 1. Securely attached to each attenuator showing manufacturer's name, model number and serial number.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit sound attenuators within space available without restricting air flow.
- B. Install attenuators in accordance with manufacturer's recommendations and printed instructions.
- C. Provide sheet metal transitions, supports and concrete pads for fan attenuators.
- D. Provide self-supported cooling tower attenuators which can be readily attached.

SECTION 15830

FANS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing fans.
- B. Related Work Specified Elsewhere:
 - 1. Vibration isolation: Section 15070.
 - 2. Ductwork: Section 15810.
 - 3. Control equipment: Section 15900.
 - 4. Motors: Section 16225.
 - 5. Motor starters and control devices: Section 16425.
 - 6. Variable frequency drives: Section 16269.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. AISI Standards.
 - 3. AMCA: 210, 99-2408.
 - 4. NFPA: 130.
 - 5. SAE: 1035,1040.
 - 6. UL 705
- B. Factory Wiring:
 - 1. In accordance with manufacturer's standard practice.
- C. Source Quality Control:
 - 1. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from laboratory Test Data". Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans". Label fans with the AMCA-Certified Ratings Seal.
 - 2. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210, "Laboratory Methods of Testing Fans for Rating.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including construction, electrical characteristics, furnished specialties, and accessories.
 - 2. Shop Drawings: Detail assemblies and indicate dimensions, weights, required clearances, method of field assembly, components and wiring diagrams.
 - a. Performance tests certified by AMCA or performed either in accordance with AMCA 210 or in a laboratory approved by AMCA, for capacities shown.

- b. Performance curves for each fan showing brake horsepower, static pressure and static efficiency plotted against air volume and noise level. For reversible fans, submit curves for both forward and reverse modes.
- 3. Certification:
 - a. For under-platform-exhaust fans, dome-exhaust fans certify that fans are rated and tested in accordance with AMCA 210.
- 4. Operation and Maintenance Manuals.

1.04 JOB CONDITIONS:

- A. Safety Requirements:
 - 1. Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, keys and other rotating parts to prevent danger to personnel.
- B. Coordinate size and location of structural-steel support members.
- C. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.
- D. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories".

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Utility Fan Sets:
 - 1. Description: Belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, and accessories.
 - 2. Housing: Fabricated of steel or aluminum with side sheets fastened with a deep lock seam or welded to scroll sheets.
 - a. Housing Discharge Arrangement: Adjustable to eight standard positions.
 - 3. Fan Wheels: Single-width, single inlet; welded to cast-iron or cast-steel hub and spun-steel inlet cone, with hub keyed to shaft.
 - 4. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
 - 5. Shaft Bearings: Prelubricated and sealed, self-aligning, pillow-block-type ball bearings.
 - 6. Belt Drives: Factory mounted, with final alignment and belt adjustment made after installation.
 - a. Service Factor Based on Fan Motor Size: 1.5.
 - b. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
 - c. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
 - d. Belt Guards: Fabricate of steel for motors mounted on outside of fan cabinet.
 - 7. Accessories:
 - a. Inlet and Outlet: Flanged.
 - b. Companion Flanges: Rolled flanges for duct connections of same material as housing.

- c. Backdraft Dampers: Gravity actuated with counterweight and interlocking aluminum blades with felt edges in steel frame installed on fan discharge.
 - d. Access Door: Gasketed door in scroll with latch-type handles.
 - e. Scroll Dampers: Single-blade damper installed at fan scroll top with adjustable linkage.
 - f. Inlet Screens: Removable wire mesh.
 - g. Drain Connections: NPS 3/4 threaded coupling drain connection installed at lowest point of housing.
 - h. Weather Hoods: Weather resistant with stamped vents over motor and drive compartment.
- 8. Coatings: Powder-baked enamel.
 - 9. Fans designed to ensure that resonance frequency of blade assembly is not within 15 percent of harmonics of rotational frequency.
 - 10. Finished parts of fans, such as shafts and bearings, protected from rust prior to operation by means of wrappings or protective grease or plastic coatings.
 - 11. Exhaust fans under-platform-exhaust fans and dome-exhaust fans, provided with firestats to stop fan when temperature of air being handled reaches 125F.
 - a. Firestat having adjustable range from 100F to 200F and manual reset.
 - 12. Fans with wheels less than 12 inches in diameter, and utility fans operating at less than 0.75 inches WG may have forward-curved blades.
 - 13. Fan construction suitable for operating conditions defined in AMCA 99-2408.

B. Centrifugal Roof Ventilators

- 1. Description: Direct- or belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories.
- 2. Housing: Removable, spun-aluminum, dome top and outlet baffle, square, one-piece, aluminum base with venturi inlet cone.
 - a. Upblast Units: Provide spun-aluminum discharge baffle to direct discharge air upward, with rain and snow drains.
 - b. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.
- 3. Fan Wheels: Aluminum hub and wheel with backward-inclined blades.
- 4. Belt-Driven Drive Assembly: Resiliently mounted to housing, with the following features.
 - a. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
 - b. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
 - c. Pulleys: Cast-iron, adjustable-pitch motor pulley.
 - d. Fan and motor isolated from exhaust airstream.
- 5. Accessories:
 - a. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted inside fan housing, factory wired through an internal aluminum conduit.
 - b. Bird Screens: Mesh aluminum or brass wire.
 - c. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
 - d. Motorized Dampers: Parallel-blade dampers mounted in curb base with electric actuator; wired to close when fan stops.
- 6. Roof Curbs: Galvanized steel; mitered and welded corners; rigid, fiberglass insulation adhered to inside walls; and wood nailer. Size as required to suit roof opening and fan base.

- C. Axial Roof Ventilators
1. Description: Direct- or belt-driven axial fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories.
 2. Housing: Heavy-gage, removable, spun-aluminum, dome top and outlet baffle; square, one-piece, hinged, aluminum base.
 - a. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.
 3. Fan Wheel: Aluminum hub and blades.
 4. Belt-Driven Drive Assembly: Resiliently mounted to housing with the following features:
 - a. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
 - b. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
 - c. Pulleys: Cast-iron, adjustable-pitch motor pulley.
 5. Accessories:
 - a. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted inside fan housing, factory wired through an internal aluminum conduit.
 - b. Bird Screens: Removable mesh aluminum or brass wire.
 - c. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
 - d. Motorized Dampers: Parallel-blade dampers mounted in curb base with electric actuator; wired to close when fan stops.
 6. Roof Curbs: galvanized steel; mitered and welded corners; rigid, fiberglass insulation adhered to inside walls; and wood nailer. Size as required to suit roof opening and fan base.
- D. Upblast Propeller Roof Exhaust Fans
1. Description: Direct- or belt-driven propeller fans consisting of housing, wheel, butterfly-type discharge damper, fan shaft, bearings, motor and disconnect switch, drive assembly, curb base and accessories.
 2. Wind Band, Fan Housing, and Base: Reinforced and braced aluminum containing aluminum butterfly dampers and rain trough, motor and drive assembly, and fan wheel.
 3. Fan Wheel: Replaceable, extruded-aluminum airfoil blades fastened to cast-aluminum hub; factory set pitch angle of blades.
 4. Belt-Driven Drive Assembly: Resiliently mounted to housing; weatherproof housing of same material as fan housing with the following features:
 - a. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
 - b. Shaft Bearings: Prelubricated and sealed, self-aligning, pillow-block-type ball bearings.
 - c. Pulleys: cast-iron, adjustable-pitch motor pulley.
 - d. Motor Mount: On outside of fan cabinet, adjustable base for belt tensioning.
 5. Roof Curbs: galvanized steel; mitered and welded corners; 1-1/2-inch-thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to suit roof opening and fan base.
- E. Centrifugal Wall Ventilators
1. Description: Direct- or belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor and disconnect switch, drive assembly, and accessories.
 2. Housing: Heavy-gage, removable, spun-aluminum, dome top and outlet baffle; venturi inlet cone.

3. Fan Wheel: Aluminum hub and wheel with backward-inclined blades.
4. Belt-Driven Drive Assembly: resiliently mounted to housing, with the following features:
 - a. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
 - b. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
 - c. Pulleys: Cast-iron, adjustable-pitch motor pulley.
 - d. Fan and motor isolated from exhaust airstream.
5. Accessories:
 - a. Disconnect Switch: nonfusible type, with thermal-overload protection mounted inside fan housing, factory wired through internal aluminum conduit.
 - b. Bird Screens: Removable mesh aluminum or brass wire.
 - c. Wall Grille: Ring type for flush mounting.
 - d. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in wall sleeve; factory set to close when fan stops.
 - e. Motorized Dampers: parallel-blade dampers mounted in curb base with electric actuator; wired to close when fan stops.

F. Ceiling-Mounting Ventilators

1. Description: Direct or belt driven Centrifugal fans designed for installing in ceiling or wall or for concealed in-line applications.
2. Housing: Steel, lined with acoustical insulation.
3. Fan Wheel: Centrifugal wheels directly mounted on motor shaft. Fan shrouds, motor, and fan wheel shall be removable for service.
4. Grille: Aluminum, louvered grille with flange on intake and thumbscrew attachment to fan housing.
5. Electrical requirements: Junction box for electrical connection on housing and receptacle for motor plug-in.
6. Accessories:
 - a. Variable-Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.
 - b. Manual Starter Switch: Single-pole rocker switch assembly with cover and pilot light.
 - c. Ceiling Radiation Damper: Fire-rated assembly with ceramic blanket, stainless-steel springs, and fusible link.
 - d. Filter: Washable aluminum to fit between fan and grille.
 - e. Isolation: Rubber-in-shear vibration isolators.
 - f. Manufacturer's standard roof jack or wall cap, and transition fittings.

G. In-Line Centrifugal Fans

1. Description: in-line belt-driven centrifugal fans consisting of housing, wheel, outlet guide vanes, fan shaft, bearings, motor and disconnect switch, drive assembly, mounting brackets and accessories.
2. Housing: Split, spun aluminum with aluminum straightening vanes, inlet and outlet flanges, and support bracket adaptable to floor, side wall, or ceiling mounting.
3. Belt-Driven Units: Motor mounted on adjustable base, with adjustable sheaves, enclosure around belts within fan housing, and lubricating tubes from fan bearings extended to outside of fan housing.
4. Fan Wheels: Aluminum, airfoil blades welded to aluminum hub.
5. Accessories:
 - a. Variable-Speed Controller.

- b. Volume-Control Damper: Manually operated with quadrant lock, located in fan outlet.
- c. Companion Flanges: For inlet and outlet duct connections.
- d. Fan Guards: Galvanized steel mesh in removable frame. Provide guard for inlet or outlet for units not connected to ductwork.
- e. Motor and Drive Cover (Belt Guard): Epoxy-coated steel.

H. Propeller Fans

1. Description: Direct- or belt-driven propeller fans consisting of fan blades, hub, housing, orifice ring, motor, drive assembly, and accessories.
2. Housing: Galvanized-steel sheet with flanged edges and integral orifice ring with baked-enamel finish coat applied after assembly.
3. Steel Fan Wheels: Formed-steel blades riveted to heavy-gage steel spider bolted to cast-iron hub.
4. Fan Wheel: replaceable, extruded-aluminum, airfoil blades fastened to cast-aluminum hub; factory set pitch angle of blades.
5. Belt-Driven Drive Assembly: resiliently mounted to housing, statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with final alignment and belt adjustment made after installation.
 - a. Service Factor Based on Fan Motor Size: 1.4.
 - b. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
 - c. Shaft Bearings: permanently lubricated, permanently sealed, self-aligning ball bearings.
 - d. Pulleys: Cast iron with split, tapered bushing; dynamically balanced at factory.
 - e. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
 - f. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
 - g. Belt Guards: Fabricate of steel for motors mounted on outside of fan cabinet.

I. Centrifugal Fans:

1. Class I or II, nonoverloading.
2. Fan blades:
 - a. Fan wheels larger than 30 inches: Backward-inclined air-foil section.
 - b. Fan wheels 30 inches or less: Backward-inclined plate-type blades.
3. Air entering fan uniformly over inlet area.
4. Fan housing: Fabricated of steel sheets, manufacturer's standard heavy-gauge construction, except for those of low-pressure fans of less than 5,000-cfm capacity which may be fabricated of aluminum, 0.080-inch thick or heavier.
5. Fan wheel rims and blades: Fabricated of steel, manufacturer's standard heavy-gauge construction.
6. Fan wheels: Aluminum or steel provided with manufacturer's standard corrosion-resistant coating.
7. One layer of corrosion-resistant coating on nonworking surfaces of shafts, factory-applied.
8. Inspection openings provided for fan housing having wheels larger than 22 inches in diameter.
 - a. Cover plate having pressure latches on fan housing on scroll sheets located opposite outlets.

9. Large fan housings provided in sections to permit installation or removal through openings available in structure.
10. Field joints: Flanged and bolted.
11. Fans designed to provide self-limiting, nonoverloading power characteristics.
12. Fan driven by V-belt rated at 150 percent of driving-motor brake horsepower.
 - a. Adjustable sheaves furnished on motor, capable of 20-percent adjustment in fan speed, with design fan-capacity setting at approximately midpoint of adjustment.
 - b. Drives provided with belt guard of expanded-metal wire mesh or belt guards with solid-metal side panels with tachometer opening.
13. Motors:
 - a. One-half horse power and above: Totally enclosed, fan-cooled and guarded in accordance with Section 16225.
 - b. Less than 1/2 horsepower: Manufacturer's standard for intended use.
14. Vibration isolators: In accordance with Section 15070.

J. Tubular Centrifugal Fans:

1. Class I or II, belt-drive, nonoverloading, designed for straight through airflow.
2. Housing: Manufacturer's standard heavy-gauge steel for construction.
 - a. Flanged inlet and outlet for connection to ductwork, with inlet and outlet identical in size.
 - b. Welded, cylindrical construction, braced to prevent vibration.
 - c. Fan bearings and drive enclosed and isolated from air stream.
3. Fan wheels:
 - a. Welded construction, centrifugal wheel, with backward-inclined blades.
 - b. Fan wheels 27 inches in diameter or larger supplied with double thickness, air-foil blades.
 - c. Fan wheels less than 27 inches in diameter supplied with plate-type blades.
 - d. Fan wheels statically and dynamically balanced.
4. Fans supplied with stationary conversion vanes on discharge side of wheel designed to reduce turbulence.
5. Fan bearings:
 - a. Heavy-duty, self-aligning ball bearings.
 - b. Lubrication fittings extended to fan casing and provided with covers to effectively exclude water and dirt.
6. Fan shaft accurately machined and ground for proper fit to wheel hub and bearing and designed to operate well below first critical speed.
7. Inside and outside of fan housing factory-painted with baked-enamel primer. Exterior surfaces given an additional factory-coat of corrosion-resistant finish enamel.
8. One coat of corrosion-resistant coating on nonworking surfaces of shafts, factory-applied.
9. Fan driven by V-belt rated at 150 percent of driving-motor brake horsepower.
 - a. Adjustable sheaves furnished on motor allowing 20-percent adjustment in fan speed, with design-capacity setting at approximately midpoint of adjustment.
10. Fan wheels and sheaves splined or keyed and fastened to the shaft with set screws.
11. Internal and external belt guards as necessary for complete protection.
12. Motors:
 - a. One-half horsepower and above: Totally enclosed, fan-cooled and guarded in accordance with Section 16225.
 - b. Less than 1/2 horsepower: Manufacturer's standard for intended use.

- K. Axial Fans:
1. Direct-driven or belt-driven.
 2. Welded tubular-steel casings, except for low-pressure fans of less than 5,000-cfm capacity, which may have aluminum casings.
 3. Equipped with stationary discharge conversion blades and adjustable motor mounts.
 4. Air-foil blades: High-strength cast aluminum or steel.
 5. Blade pitch:
 - a. Fans with wheels 18 inches or larger: Blades field-adjustable without removing wheel from casing.
 - b. Fans with wheels less than 18 inches in diameter: May be equipped with stationary blades.
 6. Flanged-type for fan-casing connections to ductwork.
 7. Internal and external belt guards, as appropriate.
 8. Inlets with smooth, rounded edges.
 9. Air entering and leaving fan axially.
 10. Belt-driven fans:
 - a. Provide with high-grade, open-hearth steel fan shaft accurately machined and ground for proper fit to wheel hub and bearings.
 - b. Fan bearings and drive shafts enclosed and isolated from the air stream.
 - c. Bearings sealed mechanically against dust and dirt, self-aligning and grease-lubricated.
 - d. Fan driven by V-belt rated at 150 percent of driving-motor brake horsepower.
 11. Motors:
 - a. 1/2 horsepower and above:
 1. Belt-driven fans: Totally enclosed, fan-cooled and guarded in accordance with Section 16225.
 2. Direct-driven fans: Totally enclosed, air-over, fully guarded in accordance with Section 16225.
 - b. Less than 1/2 horsepower: Manufacturer's standard for intended use.
- L. Power Roof Ventilators:
1. Direct-driven or belt-driven.
 2. Consisting of fan with housing and weatherproof hood mounted on factory-supplied acoustical-thermal curb.
 3. Fan housing constructed of spun aluminum and arranged to facilitate access for servicing from roof.
 - a. Discharge openings with 1/2-inch wire-mesh bird screen of aluminum or provided with corrosion-resistant coating.
 - b. Acoustical-thermal curb: Product of power roof-ventilator manufacturer.
 - c. Aluminum-blade back-draft dampers sized to fit curb opening.
 - d. Power roof-ventilator housing secured to curb to resist winds of 100 MPH.
 4. Motor: Totally enclosed weatherproof housing located outside of air stream and as specified in Section 16225.
 - a. Motor having unfused power-disconnect switch, mounted under fan housing adjacent to motor.
 - b. Permanently sealed, grease-lubricated, ball bearings or roller bearings.
 5. Belt-driven unit and belt drivers rated for 150 percent of motor-nameplate horsepower.
 - a. Adjustable sheaves to permit 20-percent adjustment in fan speed, with design fan capacity at approximately midpoint of adjustment.
 6. Wheel and drive assembly isolated from base section by means of rubber-in-shear isolators.
- M. Propeller Fans:
1. Direct-connected or belt-connected, motor-driven.

2. Wheels having steel or aluminum blades; statically and dynamically balanced at the factory.
3. Cast or die-formed mounting rings or plates.
 - a. Mounting plates designed to prevent distortion.
 - b. Mounting plates turned up at edges or braced with steel angles.
4. Wire-mesh guard completely surrounding fan blades.
5. Steel shafts for fans which are not mounted directly on motor shafts.
 - a. Shafts accurately finished on working surfaces.
6. Self-aligning sleeve bearings or ball bearings:
 - a. Sleeve bearings:
 1. Ring oiled sleeve bearings or wool-packed and provided with oil reservoirs.
 2. Oiling device arranged in manner so that oil can be added while fan is running without danger of over-oiling.
 - b. Ball bearings:
 1. Prelubricated sealed bearings.
 2. Factory-installed grease fittings to permit external bearing relubrication.
7. Motors:
 - a. Up to and including 1/2 HP: Manufacturer's standard.
 - b. Above 1/2 HP: Section 16225.

N. Under-Platform-Exhaust Fans and Dome-Exhaust Fans:

1. Tube axial, direct-driven, reversible.
2. Air volume in reverse: Minimum of 70 percent of that in forward direction.
3. Minimum efficiency: 75 percent at specified forward direction and operating conditions.
4. Brake horsepower: Not exceeding 100 percent of associated motor-nameplate rating at any point on fan power curve.
5. Construction:
 - a. Fan housing constructed of minimum 1/4-inch welded steel plate, reinforced as necessary and flanged for connection to system ductwork or for mounting as otherwise shown.
 - b. Wheel and motor entirely enclosed within fan housing.
 - c. Stationary curved guide vanes integrally welded with housing and located on discharge side of wheel to straighten motion of air leaving blades.
 - d. Fan wheels: Fabricated of high-strength cast aluminum or steel with air-foil shaped, adjustable blades.
 - e. Blades adjustable without removing wheel. Index and stops at hub to prevent overload of motor.
 - f. Positive-locking device installed for attaching rotor to motor shaft.
 - g. Drain fittings located in low parts of fan housing.
 - h. Fan fabricated of corrosion-resistant materials.
7. Fan motors: Section 16225, with the following additional requirements:
 - a. Totally enclosed, air-over, squirrel cage, induction, reversible, fully guarded.
 - b. Adequate cooling in both directions at 50 percent of flow.
 - c. Motor bearings precision-grade anti-friction type, packed at the factory with special lubricant designed for maximum radial and thrust loads to be encountered in both directions of air flow.
 - d. Double-shielded bearings, minimum 200,000-hour life, regreasable with readily accessible inlet grease fittings and outlet grease plug to allow for in-service greasing, and metering the amount of grease which actually enters the bearings to protect against over-lubrication.
 - e. Grease fittings brought to outside of fan housing and provided with covers which effectively exclude water and dirt between lubrications.

- f. Each motor with a drain plug at bottom of shell.
 - g. Motor speed not to exceed 1,200 rpm.
 - 8. High temperature: Fans and motors capable of meeting high temperature requirements specified in NFPA 130.
- O. Nameplates:
- 1. Fans: Securely attached on each fan showing manufacturer's name, model number and serial number.
 - 2. Motors: As specified in Section 16225.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Secure roof-mounting fans to roof curbs with cadmium-plated hardware. Refer to Section 07730 for installation of roof curbs.
- B. Label units according to requirements specified in Section 15075.
- C. Fit fans and appurtenances within space provided and make readily serviceable.
- D. Provide support beams, concrete pads, support legs, platforms, hangers and anchor bolts required for proper installation of equipment as recommended by manufacturer.
- E. Vibration isolation for fans: As specified in Section 15070.
- F. Concrete pads: As specified in Section 15050.
- G. Axial and tubular centrifugal fans: Provide service access in accordance with Section 15810.
- H. Motor starters and control centers: As specified in Section 16425.

3.02 CONNECTIONS

- A. Duct installation and connection requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Division 15 Section "Duct Accessories".
- B. Install ducts adjacent to power ventilators to allow service and maintenance.
- C. Ground equipment according to Division 16 Section "Grounding and Bonding".
- D. Connect wiring according to Division 16 Section "Wire, Cable and Busways."

3.03 FIELD QUALITY CONTROL

- A. Perform the following field test and inspections and prepare test reports:
 - 1. Verify that shipping, blocking, and bracing are removed.
 - 2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters and disconnect switches.
 - 3. Verify that cleaning and adjusting are complete.

4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Adjust belt tension.
6. Adjust damper linkages for proper damper operation.
7. Verify lubrication for bearings and other moving parts.
8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
9. Disable automatic temperature-control operators, energize motor and adjust fan to indicated rpm, and measure and record motor voltage and amperage.
10. Shut unit down and reconnect automatic temperature-control operators.
11. Remove and replace malfunctioning units and retest as specified above.

- B. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.04 ADJUSTING

- A. Adjust damper linkages for proper damper operation.
- B. Adjust belt tension.
- C. Refer to Division 15 Section "System Balancing and Testing" for testing, adjusting and balancing procedures.
- D. Replace fan and motor pulleys as required to achieve design airflow.
- E. Lubricate bearings.

END OF SECTION

THIS PAGE NOT USED

SECTION 15834

AIR CURTAINS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This Section specifies providing air curtains with hot-water heat, electric heat, gas-fired heater.

1.02 QUALITY ASSURANCE

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NFPA 70.
 - 3. AMCA 220.
 - 4. ARI 410.
 - 5. NSF 37.

1.03 SUBMITTALS

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each unit.
 - 2. Shop Drawings: Signed and sealed by a qualified professional engineer.
 - a. Include plans, elevations, sections, details, and attachments to other work.
 - b. Wiring Diagrams: Power, signal, and control wiring.
 - 3. Operation and Maintenance Data: For air curtains to include in maintenance manuals.

1.04 COORDINATION

- A. Coordinate layout and installation of air curtains and suspension system components with other construction, including light fixtures, fire-suppression-system components, and partition assemblies.
- B. Coordinate installation of wall penetrations and louvers. These items are specified in Section 10200.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Housing Materials: Heavy-gage, electroplated-zinc steel with welded construction and polyester-coated finish.
- B. Intake Louvers: Integral part of the housing, mechanically field adjustable and capable of reducing air-outlet velocity by 60 percent with louver in totally closed position.
- C. Discharge Nozzle: Integral part of the housing, containing adjustable air-directional vanes

- with 20 degree sweep front to back.
- 2.02 FANS**
- A. Fans: Centrifugal, forward curved, double width, double inlet; statically and dynamically balanced.
 - B. Fan Drives: Belt, equipped with belt guards and adjustable sheaves and pulleys for adjusting air-outlet velocity.

- 2.03 MOTORS**
- A. Motor Type: Two speed resiliently mounted, continuous duty, totally enclosed, fan cooled, with integral thermal-overload protection.
 - B. Bearings: Permanently sealed, lifetime, prelubricated, ball bearings.
 - C. Disconnect: Internal power cord with plug and receptacle.

- 2.04 WATER COILS**
- A. Description: Self-draining coil.
 - B. Piping Connections: Threaded on same end.
 - C. Tubes: Copper, complying with ASTM B 75.
 - D. Fins: Copper with.
 - E. Fin and Tube Joint: Mechanical bond.
 - F. Headers: Seamless copper tube with brazed joints, prime coated.
 - G. Frames: Galvanized-steel channel frame.
 - H. Ratings: According to ASHRAE 33.

- 2.05 ELECTRIC HEATING COILS**
- A. Coil Assembly: Comply with UL 1995.
 - B. Frame: Galvanized-steel frame.
 - C. Heating Elements: Open-coil resistance wire of 80 percent nickel and 20 percent chromium, supported and insulated by floating ceramic bushings recessed into casing openings, fastened to supporting brackets, and mounted in galvanized-steel frame.
 - D. Overtemperature Protection: Disk-type, automatically reset, thermal-cutout, safety device;

serviceable through terminal box without removing heater from duct or unit.

1. Secondary Protection: Load-carrying, manually reset or manually replaceable, thermal cutouts; factory wired in series with each heater stage.
- E. Control Panel: Unit mounted with disconnecting means and overcurrent protection. Include the following controls:
1. Magnetic contactor.
 2. Mercury contactor.
 3. Solid-state stepless pulse controller.
 4. Toggle switches; one per step.
 5. Step controller.
 6. Time-delay relay.
 7. Pilot lights; one per step.
 8. Airflow proving switch.

2.06 GAS-FIRED HEATERS

- A. Comply with AGA Z83.8, "Gas Unit Heaters."
1. AGA Approval: Bear AGA label.
 2. Type of Gas: Natural.
- B. Assembly and Wiring: Heaters factory assembled, piped, wired, and tested for 120-V ac.
- C. Housing: Steel, with integral draft hood and inserts for suspension-mounting rods.
1. External Casings and Cabinets: Baked enamel over corrosion-resistant-treated surface.
- D. Heat Exchanger: Stainless steel.
- E. Burners: Cast iron or aluminized steel with stainless-steel inserts.
- F. Venting Provision: Gravity.
- G. Power Venter: 120-V ac, with stainless-steel shaft.
- H. Automatic Gas Control: Single-stage, 24-V ac valve.
- I. Ignition: Electronically control spark with flame sensor.

2.07 FILTERS

- A. Washable Panel Filters: Removable, stainless-steel, baffle-type filters with spring-loaded fastening; with minimum 0.0781-inch- thick, stainless-steel filter frame.
- B. Mounting Frames: Welded, galvanized steel with gaskets and fasteners and suitable for bolting together into built-up filter banks.

2.08 ACCESSORIES

- A. Built-in Thermostat: Line voltage, factory installed and wired to the junction box on air curtain.

- B. Automatic Door Switch: Plunger type installed in door area to activate air curtain when door opens and to deactivate air curtain when door closes.
- C. Start-Stop, Push-Button Switch: Manually activates and deactivates air curtain.
- D. Time-Delay Relay: Factory installed and adjustable to allow air curtain to operate from 0.5 seconds to 10 hours.
- E. Motor-Control Panel: Complete with motor starter, 115-V ac transformer with primary and secondary fuses, terminal strip, and NEMA 250, Type 1 enclosure.
- F. Mounting Brackets: Adjustable mounting brackets for drum-type roll-up doors.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install air curtains with clearance for equipment service and maintenance.

3.02 CONNECTIONS

- A. Piping installation requirements are specified in other Division 15 Sections.
- B. Install piping adjacent to air curtain to allow service and maintenance.
- C. Breaching: Comply with applicable requirements in Division 15 Section, "Breechings, Chimneys, and Stacks." Connect breaching to full size at flue outlet.
- D. Ground equipment according to Division 16 Section "Grounding and Bonding."
- E. Connect wiring according to Division 16 Section "Wire, Cable and Busways."

3.04 FIELD QUALITY CONTROL

- A. Repair or replace malfunctioning units and retest as specified above.

3.04 ADJUSTING

- A. Adjust belt tension.
- B. Adjust motor and fan speed to achieve specified airflow.
- C. Adjust discharge louver and dampers to regulate airflow.
- D. Adjust air-directional vanes.

END OF SECTION

SECTION 15840

AIR TERMINAL UNITS

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section specifies providing the following:
 - 1. Bypass single-duct air terminal units
 - 2. Dual-duct air terminal units.
 - 3. Fan-powered air terminal units.
 - 4. Induction air terminal units.
 - 5. Shutoff single-duct air terminal units.
 - 6. Integral-diffuser air terminal units.
- B. Related work specified elsewhere.
 - 1. Identification of Mechanical Equipment and Piping: Section 15075.
 - 2. Piping Systems: Section 15205.
 - 3. Ductwork: Section 15810.
 - 4. Outlets and Grilles: Section 15850.
 - 5. Control Equipment: Section 15900.
 - 6. Grounding and Bonding: Section 16060.
 - 7. Wire, Cable and Busways: Section 16120.
 - 8. Wiring and Control Devices: Section 16145.

1.02 SUBMITTALS

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each.
 - 1. Product Data: For each type of product indicated, include rated capacities, furnished specialties, sound-power ratings, and accessories.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, required clearances, method of field assembly, components, and location and size of each field connection.
 - a. Include a schedule showing unique model designation, room location, model number, size, and accessories furnished.
 - b. Wiring Diagrams: Power, signal, and control wiring.
 - 3. Operation and Maintenance Data: For air terminal units to include in emergency, operation, and maintenance manuals. include the following:
 - a. Instructions for resetting minimum and maximum air volumes.
 - b. Instructions for adjusting software set points.

1.03 QUALITY ASSURANCE

- A. Product Options: Drawings indicate size, profiles, and dimensional requirements of air terminal units and are based on the specific system indicated.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. NFPA Compliance: Install air terminal units according to NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems."

1.04 COORDINATION

- A. Coordinate layout and installation of air terminal units and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

PART 2 - PRODUCTS

2.01 BYPASS SINGLE-DUCT AIR TERMINAL UNITS

- A. Configuration: Diverting-damper assembly inside unit casing with control components located inside a protective metal shroud.
- B. Casing: 0.034-inch steel.
- C. Diverter Assembly: Galvanized-steel gate, with polyethylene linear bearings.
- D. Multioutlet Attenuator Section: With multiple diameter collars; each with locking butterfly balancing damper.
- E. Hot-Water Heating Coil: Copper tube, mechanically expanded into aluminum-plate fins; leak tested underwater to 200 psig; and factory installed.
- F. Electric Heating Coil: Slip-in-type, open-coil design with integral control box factory wired and installed.
- G. Electric Controls: Damper actuator and thermostat.
- H. Electronic Controls: Bidirectional damper operator and microprocessor-based thermostat.

2.02 DUAL-DUCT AIR TERMINAL UNITS

- A. Configuration: Two volume dampers inside unit casing with mixing attenuator section and control components located inside a protective metal shroud.
- B. Casing: Steel or aluminum.
- C. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
- D. Attenuator Section: Steel or aluminum sheet metal.
- E. Multioutlet Attenuator Section: With multiple diameter collars; each with locking butterfly balancing damper.
- F. DDC Controls: Bidirectional damper operators and microprocessor-based controller and room sensor shall be compatible with temperature controls specified in Division 15 Section 15900.

2.03 FAN-POWERED AIR TERMINAL UNITS

- A. Configuration: Volume-damper assembly and fan in series or in parallel arrangement inside unit casing with control components inside a protective metal shroud.
- B. Casing: Steel or aluminum
- C. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
- D. Fan Section: Galvanized-steel plenum, with direct-drive, forward-curved fan with air filter and backdraft damper.
- E. Attenuator Section: Steel or aluminum sheet metal.
- F. Hot-Water Heating Coil: Copper tube, mechanically expanded into aluminum-plate fins; leak tested underwater to 200 psig; and factory installed.
- G. Electric Heating Coil: Slip-in-type, open-coil design with integral control box factory wired and installed.
- H. Factory-Mounted and -Wired Controls: Electrical components shall be mounted in control box with removable cover. Incorporate single-point electrical connection to power source.
- I. Control Panel Enclosure: NEMA 250, Type 1, with access panel sealed from airflow and mounted on side of unit.

- J. Electronic Controls: Bidirectional damper operator and microprocessor-based controller with integral airflow transducer and room sensor shall be compatible with temperature controls specified in Section 15900.

2.04 INDUCTION AIR TERMINAL UNITS

- A. Configuration: Volume-damper assembly inside unit casing with mechanical induction damper mounted on casing and control components located inside a protective metal shroud.
- B. Casing: Steel or aluminum.
- C. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
- D. Induction Damper: Galvanized-steel, multiblade assembly with self-lubricating bearings.
- E. Hot-Water Heating Coil: Copper tube, mechanically expanded into aluminum-plate fins; leak tested underwater to 200 psig; and factory installed.
- F. Electric Heating Coil: Slip-in-type, open-coil design with integral control box factory wired and installed.
- G. Electronic Controls: Electronic damper operators, electronic controller integral airflow transducer, and electronic thermostat.

2.05 SHUTOFF SINGLE-DUCT AIR TERMINAL UNITS

- A. Configuration: Volume-damper assembly inside unit casing with control components located inside a protective metal shroud.
- B. Casing: Steel or aluminum.
- C. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
- D. Attenuator Section: Steel or aluminum sheet metal.
- E. Multioutlet Attenuator Section: With multiple diameter collars; each with locking butterfly balancing damper.
- F. Hot-Water Heating Coil: Copper tube, mechanically expanded into aluminum-plate fins; leak tested underwater to 200 psig; and factory installed.
- G. Electric Heating Coil: Slip-in-type, open-coil design with integral control box factory wired and installed.
- H. DDC Controls: Bidirectional damper operators and microprocessor-based controller and room sensor shall be compatible with temperature controls specified in Division 15 Section 15900.

2.06 INTEGRAL-DIFFUSER AIR TERMINAL UNITS

- A. Configuration: Volume-damper assembly inside unit casing with integral or attached diffuser.
- B. Casing: Steel or Aluminum.
- C. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
- D. Diffuser: Galvanized-steel insulated plenum with extruded-aluminum or sheet-steel diffuser, having fixed or variable geometry designed to operate from 100 percent to minimum airflow, manual adjustment of airflow direction, and white baked-enamel finish.
- E. Electronic Controls: Bidirectional damper operator and microprocessor-based thermostat with integral airflow transducer and room sensor shall be compatible with temperature controls specified in Section 15900.

- F. Integral thermally powered actuators, sensing duct and room temperature, control diffusion dampers.

2.07 SOURCE QUALITY CONTROL

- A. Identification: Label each air terminal unit with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.
- B. Verification of Performance: Rate air terminal units according to ARI 880.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install air terminal units level and plumb. Maintain sufficient clearance for normal service and maintenance.

3.02 CONNECTIONS

- A. Piping installation requirements are specified in Division 15 Section 15205.
- B. Install piping adjacent to air terminal units to allow service and maintenance.
- C. Hot-Water Piping: In addition to requirements in Division 15 Section 15205, connect heating coils to supply with shutoff valve, strainer, control valve, and union or flange; and to return with balancing valve and union or flange.
- D. Connect ducts to air terminal units according to Division 15 Section 15810
- E. Ground units with electric heating coils according to Division 16 Section 16060.
- F. Connect wiring according to Division 16 Section 16120 "Wire, Cable and Busways", and 16145 "Wiring and Control Devices."
- G. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.
- B. Perform field tests and inspections and prepare test reports.
- C. Remove and replace malfunctioning units and retest as specified above.

3.04 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.

3.05 DEMONSTRATION

- A. Upon completion of installation, in accordance with the General Requirements, furnish on-site services of the manufacturer's engineering representative with specialized experience in the system and its components to instruct Authority personnel in the proper operation and maintenance of each system.

END OF SECTION

SECTION 15850

OUTLETS AND GRILLES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing outlets and grilles.
- B. Related Work Specified Elsewhere:
 - 1. System balancing and testing: Section 15950.
 - 2. Ductwork: Section 15810
 - 3. Duct Accessories: Section 15820

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
- B. Verification of Performance: Rate diffusers, registers, and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets".

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: For each type of project indicated, include rated capacities, furnished specialties, sound power ratings, and accessories.
 - 2. Shop drawings: Detail equipment assemblies and indicate dimensions, required clearances, method of field assembly, components, and location and size of each field connection.
 - a. Include a schedule showing unique model designation, room location, model number, size, and accessories furnished.
 - b. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw drop, static-pressure drop, and noise ratings.
 - 3. Certification.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Grilles and Registers
 - 1. Adjustable Bar Grille:
 - 2. Material: Aluminum, Stainless Steel
 - 3. Finish: Baked enamel, white.

4. Face Blade Arrangement: Fixed horizontal spaced 3/4 inch apart, zero-degree deflection.
5. Frame: 1-1/4 inches.
6. Mounting: Countersunk screw.
7. Damper Type: Adjustable opposed-blade assembly.

B. Ceiling Diffuser Outlets

1. Rectangular and Square Ceiling Diffusers:
 - a. Material: Steel, Aluminum.
 - b. Finish: Baked enamel, white.
 - c. Face Size: 24 by 24 inches.
 - d. Face Style: Three cone.
 - e. Mounting: T-bar, surface.
 - f. Pattern: Adjustable.
 - g. Dampers: Combination damper and grid.
 - h. Accessories:
 - (1) Equaling grid.
 - (2) Plaster ring.
 - (3) Safety chain.
 - (4) Wire guard.
 - (5) Sectorizing baffles.
 - (6) Operating rod extension.
2. Perforated Diffuser:
 - a. Material: Steel backpan and pattern controllers, with steel face.
 - b. Finish: Baked enamel, white.
 - c. Face Size: 24 by 24 inches.
 - d. Duct Inlet: Round or Square. See plans for configuration.
 - e. Face Style: Flush.
 - f. Pattern Controller: Fixed with curved blades at inlet.
 - g. Mounting: T-bar.
 - h. Dampers: Combination damper and grid.
 - i. Accessories:
 - (1) Equaling grid.
 - (2) Plaster ring.
 - (3) Safety chain.
 - (4) Wire guard.
 - (5) Sectorizing baffles.
 - (6) Operating rod extension.
3. Louver Face Diffuser:
 - a. Material: Steel or aluminum.
 - b. Finish: Baked enamel, white.
 - c. Mounting: T-bar, surface.
 - d. Dampers: Combination damper and grid.
 - e. Accessories:
 - (1) Square to round neck adaptor.
 - (2) Adjustable pattern vanes.
 - (3) Plaster ring.
 - (4) Safety chain.
 - (5) Wire guard.
 - (6) Sectorizing baffles.
 - (7) Operating rod extensions.

C. Linear Slot Outlets

1. Linear Bar Grille:
 - a. Material: Aluminum.
 - b. Finish: Baked enamel, white.
 - c. Pencil-Proof Core Spacing Arrangement: 7/32" thick bars spaced 7/16" apart, zero-degree deflection.
 - d. Frame: 1-1/4 inches wide.
 - e. Mounting: Countersunk screw.
 - f. Damper Type: Adjustable opposed-blade assembly.
2. Linear Slot Diffuser:
 - a. Material - Shell: Steel, insulated.
 - b. Material - Diffuser Face: Aluminum.
 - c. Finish: Baked enamel, white.
 - d. Slot Width: 3/4 inch.
 - e. Number of Slots: Two.
 - f. Length: 24 inches, 48 inches.
 - g. Accessories: Plaster frame, inlet damper, insulation.

PART 3 - EXECUTION

3.01 EXAMINATION:

- A. Examine areas where diffusers, registers and grilles are to be installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install diffusers, registers and grilles level and plumb.
- B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practicable. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features of other items conflict with installation, notify Architect for a determination of final location.
- C. Install diffusers, registers, and grilles with airtight connections to ducts and to allow service.

3.03 ADJUSTING

- A. After installation, adjust diffusers, registers, and grilles to air patterns required before starting air balancing.

END OF SECTION

THIS PAGE NOT USED

SECTION 15856

INTAKE AND RELIEF VENTILATORS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This Section specifies providing roof-mounted intake and relief ventilators.
 - 1. Louvered penthouses.
 - 2. Roof hoods.
 - 3. Goosenecks.
- B. Related work specified elsewhere.
 - 1. Roof Accessories: Section 07730.
 - 2. Ductwork: Section 15810.
 - 3. Duct Accessories: Section 15820.

1.02 QUALITY ASSURANCE

- A. Source Limitations: Obtain ventilators through one source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.
- B. Product Options: Information on Drawings and in Specifications establishes requirements for system's aesthetic effects and performance characteristics. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction. Performance characteristics are indicated by criteria subject to verification by one or more methods including preconstruction testing, field testing, and in-service performance.
- C. Product Options: Drawings indicate size, profiles, and dimensional requirements of intake and relief ventilators and are based on the specific equipment indicated. Refer to Division 1 Section "Product Requirements."
 - 1. Do not modify intended aesthetic effects, as judged solely by Authority Representative, except with Authority's approval. If modifications are proposed, submit comprehensive explanatory data to Authority for review.
- D. Welding: Qualify procedures and personnel according to the following:
 - 1. AWS D1.2, "Structural Welding Code--Aluminum."
 - 2. AWS D1.3, "Structural Welding Code--Sheet Steel."

1.03 PERFORMANCE REQUIREMENTS

- A. Structural Performance: Intake and relief ventilators shall be capable of withstanding the effects of gravity loads, wind loads, and thermal movements without permanent deformation of components, noise or metal fatigue, or permanent damage to fasteners and anchors.

1.04 SUBMITTALS

- A. Product Data: For each type of product indicated. For louvers specified to bear AMCA seal, include printed catalog pages showing specified models with appropriate AMCA Certified Ratings Seals.
- B. Shop Drawings: For intake and relief ventilators. Include plans, elevations, sections, details, and ventilator attachments to curbs and curb attachments to roof structure.
- C. Coordination Drawings: Roof framing plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
 - 1. Structural members to which roof curbs and ventilators will be attached.
 - 2. Sizes and locations of roof openings.
- D. Samples for Verification: For each type of exposed finish required for intake and relief ventilators.
- E. Welding certificates.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Aluminum Extrusions: ASTM B 221, Alloy 6063-T5 or T-52.
- B. Aluminum Sheet: ASTM B 209, Alloy 3003 or 5005 with temper as required for forming or as otherwise recommended by metal producer for required finish.
- C. Galvanized-Steel Sheet: ASTM A 653, G90 zinc coating, mill phosphatized.
- D. Stainless-Steel Sheet: ASTM A 666, Type 304, with No. 4 or 6 finish.
- E. Fasteners: Same basic metal and alloy as fastened metal or 300 Series stainless steel, unless otherwise indicated. Do not use metals that are incompatible with joined materials.
- F. Post-Installed Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed, for masonry, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
- G. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.02 FABRICATION, GENERAL

- A. Factory or shop fabricate intake and relief ventilators to minimize field splicing and assembly. Disassemble units to the minimum extent as necessary for shipping and handling. Clearly mark units for reassembly and coordinated installation.
- B. Fabricate frames, including integral bases, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.
- C. Fabricate units with closely fitted joints and exposed connections accurately located and secured.
- D. Fabricate supports, anchorages, and accessories required for complete assembly.
- E. Perform shop welding by AWS-certified procedures and personnel.

2.03 LOUVER PENTHOUSES

- A. Construction: All-welded assembly louvers, mitered corners and aluminum, galvanized-steel, or stainless-steel sheet roof.
- B. Frame and Blade Material and Nominal Thickness: Extruded aluminum, of thickness required to comply with structural performance requirements, but not less than 0.080 inch for frames and blades.
- C. Frame and Blade Material and Nominal Thickness: Galvanized-steel sheet, of thickness required to comply with structural performance requirements, but not less than 0.052 inch for frames and 0.064 inch for blades.
- D. Frame and Blade Material and Nominal Thickness: Stainless-steel sheet, of thickness required to comply with structural performance requirements, but not less than 0.062 inch, with grain running parallel or perpendicular to length of blades and frame members.
- E. Roof Curbs: Galvanized-steel sheet; with mitered and welded corners; 1-1/2-inch thick, rigid fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to fit roof opening and ventilator base.
- F. Bird Screening: Galvanized-steel, 1/2-inch-square mesh, 0.041-inch wire, Aluminum, 1/2-inch-square mesh, 0.063-inch wire, Flattened, expanded aluminum, 3/4 by 0.050 inch thick, or Stainless-steel, 1/2-inch-square mesh, 0.047-inch wire.
- G. Galvanized-Steel Sheet Finish:

1. Factory Priming for Field-Painted Finish.
2. Baked-Enamel Finish: Manufacturer's standard.

2.04 ROOF HOODS

- A. Factory or shop fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figures 5-6 and 5-7.
- B. Materials: Galvanized-steel sheet, minimum 0.064-inch-thick base and 0.040-inch thick-, or Aluminum sheet, minimum 0.063-inch-thick base and 0.050-inch-thick hood; suitably reinforced.
- C. Roof Curbs: Galvanized-steel sheet; with mitered and welded corners; 1-1/2-inch-thick, rigid fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to fit roof opening and ventilator base.
- D. Bird Screening: Galvanized-steel, 1/2-inch- square mesh, 0.041-inch wire, Aluminum, 1/2-inch- square mesh, 0.063-inch wire, Flattened, expanded aluminum, 3/4 by 0.050 inch thick, or Stainless-steel, 1/2-inch-square mesh, 0.047-inch wire.
- E. Galvanized-Steel Sheet Finish:
 1. Factory Priming for Field-Painted Finish.
 2. Baked-Enamel Finish: Manufacturer's standard.

2.05 GOOSENECKS

- A. Factory or shop fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 5-5; with a minimum of 0.052-inch-thick, galvanized-steel sheet.
- B. Roof Curbs: Galvanized-steel sheet; with mitered and welded corners; 1-1/2-inch- thick, rigid fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to fit roof opening and ventilator base.
- C. Bird Screening: Galvanized-steel, 1/2-inch- square mesh, 0.041-inch wire, Aluminum, 1/2-inch- square mesh, 0.063-inch wire, Flattened, expanded aluminum, 3/4 by 0.050 inch thick, or Stainless-steel, 1/2-inch- square mesh, 0.047-inch wire.
- D. Insect Screening: Aluminum, 18-by-16 mesh, 0.012-inch or Stainless-steel, 18-by-18 mesh, 0.009-inch wire.
- E. Galvanized-Steel Sheet Finish:
 1. Factory Priming for Field-Painted Finish.
 2. Baked-Enamel Finish: Manufacturer's standard.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install intake and relief ventilators level, plumb, and in alignment with adjacent work.
- B. Secure intake and relief ventilators to roof curbs. Use concealed anchorages where possible.
- C. Install goosenecks on curb base where throat size exceeds 9 by 9 inches.
- D. Install intake and relief ventilators with clearances for service and maintenance.
- E. Install perimeter reveals and openings of uniform width for sealants and joint fillers.
- F. Install concealed gaskets, flashings, joint fillers, and insulation as installation progresses. Comply with Section 07900 for sealants applied during installation.
- G. Label intake and relief ventilators according to requirements specified in Section 15075.
- H. Protect galvanized and nonferrous-metal surfaces from corrosion or galvanic action by applying a heavy coating of bituminous paint on surfaces that will be in contact with concrete, masonry, or dissimilar metals.

- I. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

3.02 CONNECTIONS

- A. Duct installation and connection requirements are specified in other Division 15 Sections. Drawings indicate general arrangement of ducts and duct accessories.

3.03 ADJUSTING

- A. Adjust damper linkages for proper damper operation.

END OF SECTION

SECTION 15861

DUST COLLECTION SYSTEMS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This Section specifies providing wet centrifugal, dust collection systems:
 - 1. Industrial exhaust fans, ductwork and duct fittings, inlet fittings, dust elimination and collection devices, accessories.
- B. Related work specified elsewhere:
 - 1. Duct Accessories: Section 15820.
 - 2. Fans: Section 15830.
 - 3. Wiring Connection: Section 16125.
 - 4. Motors: Section 16225.

1.02 QUALITY ASSURANCE

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. ACGIH 2091 - American Conference of Governmental Industrial Hygienists.
 - 3. AMCA: 210, 300, 310.
 - 4. ASTM: A90/A90M, A167, A653/A653M, A92M/A924M, A1011/A1011M.
 - 5. AWS D9.1.
 - 6. NFPA 91.
 - 7. NIST PS 15.
 - 8. SMACNA.
 - 9. UL: 181, 214.
- B. Maintain one copy of each document on site.

1.03 SUBMITTALS

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified in each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities, electrical characteristics, furnished specialties, and accessories.
 - a. Fan performance curves.
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, required clearances, method of field assembly, components, water requirements, and location and size of each field connection.
 - 3. Certification
 - 4. Operations and Maintenance Manuals.

1.04 JOB CONDITIONS

- A. Safety Requirements:
 - 1. Properly guard belts, pulleys, chains, gears, couplings, projecting set screws, keys and other rotating parts to prevent danger to personnel
- B. Coordinate size and location of structural-steel support members.
- C. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Section 03300.
- D. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Section 07730.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS

- A. Wheel and Inlet:
 - 1. Backward Inclined: Steel construction with smooth curved inlet flange, back plate, backward curved blades welded or riveted to flange and back plate; cast iron hub riveted to back plate and keyed to shaft with set screws.
 - 2. Radial: Steel construction with inlet flange, reinforced back plate, plate blades with reinforcing gussets and wearing strips welded or riveted to back plate and flange; cast iron hub riveted to back plate and keyed to shaft with set screws.
- B. Housing: Steel, continuously welded with inlet bell and shaped cut-off. Factory finished with enamel or prime coat.
- C. Motors and Drives:
 - 1. Motors: In compliance with Section 16225.
 - 2. V-Belt Drive.
 - 3. Belt Guard.
- D. Accessories:
 - 1. Fixed Inlet Vanes.
 - 2. Discharge Dampers.
 - 3. Inlet/Outlet Screens.

2.02 DUCTWORK AND DUCT ACCESSORIES

- A. Materials:
 - 1. Stainless Steel Ducts.
 - 2. Glass Fiber Reinforced Plastic Ducts.
- B. Ductwork:
 - 1. Fabricate and support to UL 181 in accordance with SMACNA HVAC Duct Construction Standards - Metal and Flexible 2 inch pressure class Round Industrial Duct Construction Standard and Rectangular Industrial Duct Construction Standard and ACGIH Industrial Ventilation Manual except as indicated on Drawings.
 - 2. Fabricate continuously welded round and oval duct fittings two gages heavier than duct gages indicated in SMACNA Standard. Prime coat welded joints.
 - 3. Flexible Connectors: UL 214 listed, fire-retardant impregnated fabric.

2.03 CENTRIFUGAL SEPARATOR

- A. Cyclone dust collector consisting of cyclone with integral fan and structural stand incorporating dust storage.
- B. Heavy-duty Frame and Casing.
- C. Cyclone Efficiency.
- D. Fan.
 - 1. Motor: Refer to Section 16225.
- E. Accessories.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install Work in accordance with standards of authority having jurisdiction standards.
- B. Install fans with resilient mountings and flexible electrical leads. Refer to Section 15070.

- C. Install flexible connections at fan inlet and discharge. Install metal bands of connectors parallel with minimum 1 inch flex between ductwork and fan while running. Refer to Section 15820.
- D. Install Pitot tube openings at locations required for testing of systems, complete with metal cap with spring device or screw to prevent against air leakage. Refer to Section 15820.
- E. Location ducts with sufficient space around equipment to allow normal operating and maintenance activities.
- F. Do not operate fans until ductwork is clean, filters are in place, bearings lubricated, and fan has been test run under observation.

END OF SECTION

THIS PAGE NOT USED

SECTION 15865

FILTERS

PART I -GENERAL

1.01 DESCRIPTION

- A. This section specifies providing air filters.
- B. Related Work Specified Elsewhere:
 - 1. Remote-surveillance devices: Section 15900.
 - 2. Ventilating Units: Section 15725.
 - 3. Rooftop Air Conditioners: Section 15732.
 - 4. Air Conditioning Units -
Chilled Water Cooled: Section 15733.
 - 5. Air Conditioning Units -
Air Cooled Split-System: Section 15737.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. UL 900 Class 1.
 - 2. ASHRAE: 52.1.
- B. Source Quality Control:
 - 1. Factory-tested or tested by an independent laboratory experienced in testing filters; certify compliance with requirements of ASHRAE Standard 52 for arrestance, efficiency, dust-holding capacity and pressure drop.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Product Data: Include manufacturer's technical data for each model indicated, including rated capacities and accessories..
 - 2. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, required clearances and components.
 - 3. Certification.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design of equipment, provide for interchangeability of items of equipment, subassemblies, and parts.
- B. Throwaway (Replaceable) Filters:
 - 1. 1" Flat-panel filter units designed and fabricated for disposal when dust-load limit is reached.
 - 2. Dry or adhesive-coated filter media, as standard with the manufacturer.

3. Maximum air flow through filters: Not exceeding manufacturer's published rated capacity but not exceeding 500 feet per minute at 0.10-inch w.g.
4. Designed to fit within space available and constructed so as to prevent passage of unfiltered air.
5. Filter frames constructed of 18-gauge galvanized steel with air-tight access panels for filter inspection, cleaning and replacement.
6. Filters are UL 900 Class I listed.

C. Replaceable Prefilters

1. 2" Pleated Type
2. 30% Efficiency per ASHRAE Standard 52.
3. Maximum air flow through filters: Not exceeding manufacturer's published rated capacity but not exceeding 500 feet per minute at 0.10-inch w.g.
4. Designed to fit within space available and constructed so as to prevent passage of unfiltered air.
5. Filter frames constructed of 18-gauge galvanized steel with air-tight access panels for filter inspection, cleaning and replacement.
6. Filters are UL 900 Class I listed.

D. Bag Filters:

1. Horizontal air-flow filters of the high-density glass microfibers-type.
2. Capacity based on air-handling capacity of unit to which it is applied with velocity limited to maximum of 500 feet per minute through filter based on net filter area.
3. Provide high-density glass-microfiber filter media, reinforced with a backing to form a lofted filter blanket. Provide filter media with an average efficiency of 80 to 85 percent when tested by ASHRAE 52.1, and with an average arrestance of not less than 98 percent on that standard. Provide UL 900 Class 1 listed filters.
 - a. Remote-surveillance devices: In accordance with Section 15900.
4. Pocket construction: Pockets to consist of glass microfibers chemically bonded to a reinforced UL Class 1 backing. Sew pockets with a tapered stitch which forms a V or wedge-shaped pocket resulting in uniform velocity in the passages of the air-entering and air-exiting sides of the filter. Equip the pockets with a minimum of 40 support points per square foot of filter media:
 - a. Completely seal all stitching points with foam-seal or equivalent. Chemically adhere the pockets around the periphery of the galvanized-steel retainers. Provide retainers with rolled edges to reduce possible cuts to media, or lacerations to installers.
5. Enclosing frame: Construct enclosing frame of a J return channel of 16-gauge galvanized steel. The channel may be 7/8 inch or 1-1/8 inch.
6. Glide/Packs - for side-access applications: Factory fabricate and assemble filter housings. Construct the units of not less than 16-gauge galvanized steel, incorporating two access doors, extruded-aluminum tracks and individual universal holding frames designed to accommodate a wide range of standard size filters in varying efficiency ranges.
7. Leakage at rated airflow, upstream to downstream of filter, holding frame and slide mechanism to be less than one percent at 3-inch w.g. differential.
8. Leakage into housing from ambient atmosphere at rated airflow to be less than 0.5 percent at 3-inch w.g. negative. Manufacturer to submit substantiating test reports.
9. Construct access doors of 16-gauge galvanized steel and position them to facilitate removal and replacement of filters from either side of the housing. Equip each door with adjustable and replaceable post.
10. Provide factory installed 16-gauge galvanized steel transition plates on air-inlet and/or air-exit side to match air-handling unit.

- E. Controls:
 - 1. Control panels factory wired.
 - a. Adjustable pressure-differential sensing device and wiring for remote surveillance.
 - b. Pressure range of 0.02-inch w.g. to 1.0-inch w.g. Accuracy of plus-or-minus 0.03-inch w.g.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances within the space provided and make readily serviceable.
- B. Install bag filters with capacities as shown.
- C. Examine each bag filter's media before installation for seepage and adhesive to surface of container.
- D. Replace bag filters showing evidence of seepage.
- E. After final testing and cleaning of fans and ductwork, replace prefilters and final filter media with new, clean media.

END OF SECTION

SECTION 15900

CONTROL EQUIPMENT

PART 1-GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing automatic temperature controls, remote surveillance and control and local control systems.

1.02 QUALITY ASSURANCE:

- A. Qualifications of Manufacturer:
 - 1. Select manufacturer who maintains full-time organization for installation and service in the Washington, D.C. metropolitan area.
 - 2. Have instruments, piping and wiring installed by representative of temperature control-equipment manufacturer.
- B. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NEMA: 250, ICS 2-1993
 - 3. UL: Electrical Construction Materials Directory.
- C. Design Criteria:
 - 1. Automatic temperature-control systems:
 - a. Design systems to perform functions and operate in sequence as shown or specified for heating, air conditioning, and ventilation.
 - b. Maintain conditions shown or specified.
 - c. Operate and control motor-operated dampers.
 - d. Design control system to interface with fire and smoke-detection system by others to shut off the following fans on activation of fire and smoke-detection system.
 - (1) Battery-room fans
 - (2) Air-conditioning and fans in excess of 2,000 cfm, except the following:
 - (a) Dome-exhaust fans.
 - 2. Remote surveillance and control systems:
 - a. Continuously measure parameters as shown including pressure, temperature and flow. Convert analog values of sensing transducer into seven-bit binary code and transfer to designated interface DTS terminals by relays.
 - b. Monitor abnormal operations, such as high and low limits on pressure, temperature, water level, water flow, damper position, mode-selector switch position and air flow as shown; provide contact closure to designated DTS terminals.
 - c. Design system to compensate for electrical losses in wiring. Design dc-power supplies and signal amplifiers, as necessary
- D. Source Quality Control:
 - 1. Test and stamp air storage tank in accordance with ASME Boiler and Pressure Vessel Code, Section VII, Div. I.
 - 2. Identify each transducer according to type, sensitivity, accuracy and operating range.
 - 3. Each remote-indication system installed to have accuracy shown.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
1. Shop Drawings:
 - a. Complete catalog information and shop drawings for material and equipment including wiring and control diagrams.
 - b. Submittals include, but are not limited, to the following:
 - 1) Air compressors, with motors and controls.
 - 2) Compressed-air storage tanks.
 - 3) Dessicant air drier system including prefilters, after each if provided, after filter.
 - 4) Thermostats.
 - 5) Controllers.
 - 6) Damper operators, electric or pneumatic as applicable.
 - 7) Automatic valves and operators.
 - 8) Dampers.
 - 9) Control panels and cabinets.
 - 10) Gauges and indicators.
 - 11) Transducers.
 - 12) Data-transmission system-interface relays.
 - 13) Sensing devices.
 - 14) Wiring diagrams, control diagrams and layouts for each system.
 - 15) Control, indication and time-delay relays.
 - 16) Damper limit switches.
 - c. Complete set of floor plans of rooms showing by means of graphic coding actual location and mounting heights of thermostats and zone served by each thermostat.
 2. Operation and Maintenance Manuals:
 - a. Complete electrical schematic of each system showing and identifying each internal and external component and internal and external wiring.
 - b. Detailed piping and wiring diagrams showing graphic coding.
 - c. Terminal numbers for wire or pipe connections.
 - d. Complete parts list of internal and external components.

1.04 OPERATION AND MAINTENANCE TRAINING:

- A. Upon completion of installation, furnish services of competent field engineer with specialized experience in temperature control and remote surveillance and control system to train Authority personnel in accordance with the General Requirements and as follows:
1. Instructional period: Three consecutive man-days minimum. A minimum of one day to be devoted to hands-on demonstration of the equipment operation, trouble analysis, repair, adjustment and maintenance.
 2. Train operators in preventive maintenance of systems and to recognize malfunctions.
 3. Provide complete printed operating instructions in manual or handbook form, completely and clearly indexed for ready reference during actual operation and for use as text during instruction of operating personnel.
 - a. Include descriptions of systems, background information and complete procedures for adjustment, calibration, replacement and repair of components in system.

PART 2- PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
 - 1. In design and purchase of equipment, provide for interchangeability of items of piping equipment, subassemblies, parts, motors, starters, relays and transducers.

- B. Automatic Temperature-Control System:
 - 1. Automatic valves:
 - a. Bodies, discs, stems and stuffing boxes designed for minimum working pressure of 125 psi.
 - b. Provide valves of type specified for each of the following body sizes:
 - (1) 1-1/2 inches or smaller: Brass or bronze with screwed or union ends.
 - (2) Four inches and larger: Iron bodies with brass or bronze trimmings and flanged ends.
 - (3) Two inches to three inches: Brass or bronze with screwed or union ends or iron bodies with brass or bronze trimmings and flanged ends.
 - c. Visible position indicators and renewable discs.
 - 2. Automatic dampers, except dome relief dampers:
 - a. Provided by automatic temperature-control manufacturer.
 - b. Factory-fabricated, opposed blade, balanced-type with factory-assembled linkages, mounted in galvanized-steel frames.
 - c. Blades: Flat or formed galvanized steel with interlocking edges or with compressible seals at point of contact.
 - (1) Air-temperature range of seals: Suitable for operation from minus 20F to plus 200F.
 - (2) Supported by thrust bearings for vertically mounted blades.
 - (3) Length of blades between bearings: 48 inches maximum.
 - (4) Width of blades: Eight inches maximum.
 - d. Leakage when closed: Maximum 20 cfm per square foot at static pressure of four inches water gauge.
 - e. Frames: Bar or channel, with corner bracing for rectangular dampers larger than four square feet in area.
 - f. Damper-operating linkage:
 - (1) Adjustable-length galvanized-steel rods capable of withstanding load of at least twice maximum operating force of damper operator without deflection.
 - (2) Joints: Brass pins and clevises or brass ball-and-socket joints.
 - g. Steel parts: Hot-dip galvanized after fabrication.
 - 3. Automatic dampers for dome-exhaust fan:
 - a. Automatic dampers factory-fabricated, constructed of galvanized sheet metal or extruded aluminum. Frames constructed of minimum 13-gauge galvanized sheet steel or extruded aluminum.
 - b. Dampers designed for control by electric motor operators. Mounting provisions for motor operators included in damper assembly.
 - c. Damper blades designed for air velocities to be encountered in system.
 - d. Blades: Maximum width eight inches and 24 inches maximum between bearings, fabricated of galvanized sheet steel, 16-gauge or double 22-gauge minimum.
 - e. Seals designed to withstand air temperatures ranging from minus 20F to plus 200F.

- f. Damper-operating linkage:
 - 1) Adjustable-length galvanized-steel rods capable of withstanding without deflection load of at least twice maximum operating force of damper operator.
 - 2) Joints: Brass pins and clevises or brass ball-and-socket joints.
 - 3) Damper operators attached to operating linkage so as to ensure positive operation without lost motion.
 - g. Motor mounting supported so that operator will not deflect from its normal path when operating under load.
 - h. Steel parts: Hot-dip galvanized after fabrication. Galvanizing: 1.25 ounces, in accordance with ASTM A153.
 - i. Conforming to NFPA 130 high temperature requirements.
4. Space thermostats:
- a. Supplied with subbase for mounting and guards.
 - b. Adjustment devices on controllers locked or concealed.
 - c. Operating points: Minimum range 10 degrees above and 10-percent below operating points shown.
 - d. Provide external thermometer with knob or lever-adjusting devices where shown.
 - e. Thermostat throttling range: 2F maximum.
 - f. Controllers, submaster controllers, lagged sensing elements and space thermostats provided with means for field adjustment of throttling range.
5. Duct thermostats:
- a. Remote sensing-element type, with controller mounted on apparatus control panel.
 - b. Enclosure for operating and adjusting mechanism: Metal or phenolic-resin case.
 - c. Thermostats used for freeze protection: Sensing element 20 feet minimum in length.
 - (1) Thermostat capable of operating when freezing condition exists at one-foot increments anywhere along sensing element.
 - d. Remote transmitter provided when distance from bulb to panel exceeds manufacturer's recommended capillary length.
6. Pipe thermostats:
- a. Immersion-type with liquid-filled separable sockets.
 - b. Remote sensing-element type, used where socket is located minimum five feet above floor.
 - c. Remote transmitter provided when distance from bulb to panel exceeds manufacturer's recommended capillary length.
 - d. Separable sockets: Stainless steel, heavy enough to withstand pulsations and turbulences in fluid controlled.
 - e. Pipe-sensing thermostat for electric heat tracing:
 - 1) Remote bulb suitable for attachment to outside of pipe as shown.
 - 2) Thermostat with DPST contacts, range of zero degree F to 100F and control differential of not more than 8F.
 - 3) Thermostat in NEMA 250, Type 4 enclosure, except NEMA 250, Type 12 enclosure for train tunnels, vent shafts or track-drainage pumping station.
 - 4) Contactor, as necessary, when total amperes of heating tape exceeds rated capacity of thermostat.
7. Pressure gauges:
- a. For individual-mounted controllers: Stem-mounted, two inches diameter minimum.
 - b. For panel-mounted controllers, individual gauges: Two inches minimum

- diameter.
 - c. For panel-mounted controllers, multiple-indication gauges: 3-1/2 inches minimum diameter.
 - 8. Apparatus control panels:
 - a. Separate apparatus control panel or metal cabinet for each air-handling and air-conditioning unit.
 - b. Control instruments located on panel, except fire and freeze-protection instruments.
 - c. Panel constructed of fire-resistant material with nonglare surfaces.
 - 9. Electric damper operators:
 - a. Spring-return type.
 - b. Two-position motor operation.
 - c. Spring returns damper to fail-safe position as shown in event of power failure or termination.
 - d. Opening time: 60 seconds maximum.
 - e. Adjustable stops to control open and closed positions.
 - 10. Time clock:
 - a. Suitable for automatic weekly switching operations of electrical equipment.
 - b. Seven-day cycle with ten-hour spring reserve to maintain programmed switching in event of power failure.
 - c. Capable of being programmed as desired.
 - d. Manual trip mechanism for overriding timer.
 - e. Mechanism powered by single-phase synchronous motor from available internal control power of 120 volts, 60 Hertz.
 - f. Motor capable of operating at temperatures ranging from zero degrees F to 120F.
 - g. Contacts of cadmium alloy, rated for 40-ampere, noninductive service at 120, 208/240, or 277 volts.
 - h. Enclosure: NEMA 250, Type 1, surface-mounted.
 - 11. Selector switch:
 - a. Positions labeled HAND/OFF/AUTOMATIC.
 - b. Maintained contact.
 - c. Oil-tight.
 - d. Contact-rating designation: NEMA ICS 2-1993, with the following additional requirements:
 - (1) Continuous current rating: 10 amperes.
 - (2) Voltage rating: 120 volts, 60 Hertz
 - 12. Damper limit switch:
 - a. Contacts: Single-pole; one NO, one NC; snap-action
 - b. Enclosure: NEMA 250, Type 1.
 - c. Actuator: Level-operated, rotary-type, adjustable, with spring return.
 - d. Mounting: Plug-in type with receptacle tapped for conduit size as shown.
 - e. Contact-rating designation: NEMA A600, with the following additional requirements:
 - (1) Continuous-current rating: 10 amperes.
 - (2) Voltage rating: 120 volts, 60 Hertz.
 - 13. Automatic alternator:
 - a. Equipped with ratchet mechanism to alternate opening and closing of two contacts after each ventilating-unit cycle.
 - b. Electrical requirements:
 - (1) Continuous-current rating: 10 amperes.
 - (2) Voltage rating: 120 volts, 60 Hertz.
 - (3) Enclosure: NEMA 250, Type 1.

- C. Remote Surveillance and Control:
1. DTS Relays:
 - a. Energized from command-center control via DTS.
 - b. Momentary-pulse type requiring no sustained power consumption.
 - c. Maximum coil load: 15 volt-amperes, resistive or suppressed inductive.
 - d. Coil voltage: 28 volts dc.
 - e. Contacts: Compatible with equipment controlled.
 2. General relays:
 - a. Control and indication relays:
 - (1) Functional designations and schematic connections as shown.
 - (2) Number and configuration of contacts as shown.
 - (3) Contact ratings:
 - (a) Maximum switched voltage: 600 volts ac
 - (b) Maximum continuous current: 10 amperes.
 - (c) Capable of making load of 720 volt-amperes ac.
 - (d) Capable of breaking load of 720 volt-amperes ac.
 - (e) Minimum open-contact resistance: 50 megohms, 400 volts dc.
 - (f) Maximum duration of bounce: 50 milliseconds.
 - (4) Modular convertible contacts enclosed in plastic.
 - b. Time-delay relays:
 - (1) Functional designations and schematic connections as shown.
 - (2) Number and configuration of contacts as shown.
 - (3) Capable of operating from minus 20F to plus 165F.
 - (4) Externally adjustable time delay.
 - (5) Contact rating:
 - (a) Current capacity of 20 amperes resistive at 120 volts ac for 100,000 operations.
 - (b) Insulation resistance: 50 megohms at 500 volts dc.
 - (c) Auxiliary contacts for instantaneous transfer or two-step timing as scheduled.
 3. Transducers:
 - a. Rise time: One-second maximum.
 - b. Sensitivity: Constant over operating range shown,
 - c. Adjustment for high and low operating ranges: Manual, calibrated and clearly identified.
 - d. Output: Accommodate three wires, marked with PLUS, MINUS and GROUND SHIELD symbols.
 - e. Transducers requiring external electric power to operate at 120 volts, single-phase, 60 Hertz.
 - f. Transducers requiring external air supply to operate from 20-psi source.
 - g. Housings: Moisture proof and disproof enclosure suitable for environment in which each transducer is located. Transducer nameplate attached to housing
 4. Drainage pumping surveillance:
 - a. Indicating malfunction upon loss of electric power from both sources.
 - b. Indicating malfunction when both pumps are running.
 - c. Indicating malfunction when water level is above or below preset range.
 5. Fan control cabinets:
 - a. Mode-selector switch mounted in front cover:
 - 1) Maintained contact.
 - 2) Oil-tight.
 - 3) Contacts conforming to NEMA ICS 2-1993 rated for 10 amperes continuous current at 120 volts, 60 Hertz.
 - b. Positions of mode-selector switch: Labeled on nameplate as follows:

REMOTE/OFF/LOCAL EXHAUST/LOCAL SUPPLY.

- c. Complete electrical schematic diagram of control cabinet affixed permanently to inner surface of front cover and protected by clear Lucite.
 - (1) Include on schematic diagram parts list for all components of panel and contents, showing complete manufacturer's name., nomenclature and parts number.
 - d. Pilot lights mounted in front cover.
 - (1) Polycarbonate lens.
 - (2) Push to test.
 - (3) Legend plate with mode indicated.
 - (4) 20,000-hour 6.3-volt lamp.
 - e. Control panel surface, lighted by fixture permanently mounted on panel.
 - (1) Fixture to include fireproof lampshade extending width of panel.
 - (2) Average lighting level: 40 foot-candles over entire surface of panel.
 - f. Panel constructed of fire-resistant material with non-glare surface
6. Flow sensor:
- a. Diaphragm differential sensor.
 - b. Single-pole, double-throw, snap-acting switch, 10-ampere rating.
 - c. NC contacts.
 - d. Adjustable set point.
 - e. Operating range of zero degree F to 180F.
7. Electric heat tracing: Section 15725.
- D. AC Switchboard Room Ventilating-Fan Controls:
- 1. Thermostat, flow switches, time-delay relay, selector switch, automatic alternator and limit switches.
 - 2. During each operating cycle, one fan to serve as primary fan and second fan as stand by.
 - 3. Control sequence:
 - a. Dampers on intake and discharge side to remain open when fans are not in operation.
 - b. When room temperature rises to 90F, relief damper(s) open, standby-fan intake damper closes and primary fan starts.
 - c. Control sequence to reverse when room temperature falls.
 - d. After each operating cycle, automatic alternator to reverse functions of automatic and standby fans.
 - 4. Abnormal operation: If primary fan fails to operate, primary-fan intake damper closes, standby-fan intake damper opens and standby fan starts. Relief dampers to remain open during standby-fan operation.
- E. DC Breaker Room Ventilating-Fan Controls:
- 1. Single-stage space thermostat.
 - 2. HAND/OFF/AUTOMATIC switch.
 - 3. Operation:
 - a. Hand: Fan running, dampers open.
 - b. Off: Fan off, dampers closed.
 - c. Automatic:
 - (1) When room temperature rises to 90F, open dampers and start fan.
 - (2) Reverse control process on falling temperature.
- F. Battery Room Fan Controls:
- 1. Battery room exhaust fan to operate continuously.
 - 2. Magnetic starter.

- G. Fire Alarm for Shutdown Interface Box: Data transmission system (DTS) cabinet specified in Section 16130, with the following additional requirements:
 - 1. Cabinet: Hoffman A161206LP.
 - 2. Terminal strip: Terminal as required mounted in upper right-hand quadrant of cabinet.
 - 3. Exterior finish color: Sherwin-Williams Fire Protection Red.
 - a. Yellow letters, one-inch high on cover: FA-FAN SHUTDOWN.

PART 3-EXECUTION

3.01 INSTALLATION:

- A. Fit equipment and appurtenances within space provided and make readily serviceable. All gauges and indicators to be installed so they can be readily read without use of ladder or other means to reach installed items.
- B. Foundations, platforms, or hangers for apparatus in accordance with Sections 03200 and 03300.
- C. Install 18AWG minimum control wiring, as shown and in accordance with Sections 16120 and 16125.
 - 1. Identify each wire at interface cabinet locations.
 - 2. When communication fan-shutdown interface cabinets are installed by others, complete wiring to designated terminals.
- D. Automatic Temperature Control Systems:
 - 1. Install entire automatic temperature-control system, including piping and wiring under supervision of automatic temperature-control equipment manufacturer.
 - 2. Mount damper operators outside of duct or casing with support plates that are completely outside insulation or covering.
 - a. install support plates so as to prevent condensation on damper operator or on supports.
 - 3. Support valves and damper-operator motor mountings so that operator does not deflect from its normal path when operating under load.
 - 4. Locate sensing elements of duct thermostats where they will respond to representative temperature within duct or casing.
 - 5. Duct thermostats and remote transmitters:
 - a. Install outside of ducts and casings.
 - b. Where ducts or casing are insulated, mount thermostats flush with outside insulation, so that moisture will not condense on thermostats or on supports.
 - 6. Duct thermal capillary tubes and wires:
 - a. Install to pierce thermal insulation at least practicable number of points.
 - b. Seal insulation properly where capillaries and wiring pass through.
 - 7. Capillary tubes:
 - a. Protect by conduit, molding or flexible armor.
 - b. Coil capillary tube neatly and fasten excess lengths out of the way.
 - 8. Apparatus control panel:
 - a. Mount bottom of each panel 30 inches above floor.
 - b. Provide 30 inches clearance between rear of panel and wall where conduit or wiring enters panel from rear.
 - c. Mount controls, instrument gauges, thermostats and relays flush on front of panel.
 - d. Install wiring and tubing connections for accessibility in servicing.
 - 9. Apparatus control cabinets:
 - a. Make wiring and tubing connections to control instruments, indicating

- instruments and communication equipment inside cabinet.
 - b. Install pilot lights, manual switches, and pushbutton controllers in cabinet door, so they are visible and operable with door closed.
 - 10. Mount framed schematic temperature-control diagram adjacent to each apparatus control panel or cabinet.
 - 11. Mount time clock on control panel in accordance with manufacturer's recommendations.
 - 12. Mount selector switch in motor-starter enclosure of ventilating units in ac-switchboard rooms.
 - 13. Mount pushbutton station in motor-starter enclosure of exhaust fan in battery rooms.
 - 14. Limit switch:
 - a. Mount on automatic damper blades in AC-Switchboard rooms.
 - b. Set switch contacts to close when damper opens.
 - 15. Install automatic alternator in ac-switchboard rooms which have two ventilating units.
 - 16. Pipe-sensing thermostat for electric tracing:
 - a. Firmly attach remote bulb against pipe at location in which bulb does not touch heating tape.
 - b. Mount thermostat securely on wall at conveniently accessible location.
 - 17. Install electric-control system for the following:
 - a. Heating, ventilating, and air-conditioning systems.
 - b. Pumping Systems.
 - 18. Install flow sensor in designated fans as shown and adjust to open or close contacts as shown at full flow in respective directions.
- E. Remote Surveillance and Control:
 - 1. Coordinate design with the Engineer and provide necessary interface for complete compatibility with DTS system.
 - 2. Coordinate with the Engineer installation of fire-alarm sensors in air units.
 - 3. Provide shielding for sensing and signaling systems to prevent electrical interference.
 - 4. Install flow sensor in designated fan as shown and adjust to close contacts at full flow in respective directions.
- F. Fire-Detection Controls:
 - 1. Coordinate enclosure interface terminal block with the Engineer.
- G. Post diagrams under Lucite with aluminum-channel frames, waterproof glass-fiber backing adjacent to apparatus control panels.

3.02 FIELD QUALITY CONTROL:

- A. Acceptance Testing:
 - 1. Furnish equipment required to perform tests.
 - 2. Submit test procedure for approval.
 - 3. Perform approved tests to verify that control surveillance systems comply with requirements shown and specified.

END OF SECTION

THIS PAGE NOT USED

SECTION 15950

SYSTEM BALANCING AND TESTING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies balancing, adjusting and performance-testing of air-conditioning systems with ductwork and hydronic piping.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. NEBB: Procedural Standards for Testing, Adjusting and Balancing of Environmental Systems.
 - 2. ASHRAE III: Practices for Measurement, Testing, Adjusting and Balancing of Building HVACR Systems.
- B. Instrument Calibration:
 - 1. Calibrate instruments required for air balance within six months prior to use on this project.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
 - 1. Shop Drawings:
 - a. Test and instrument location plans.
 - b. After initial balancing measurements, submit shop drawings for additional equipment such as balancing dampers, pressure taps and balancing cocks necessary to effect proper air and water balance.
 - 2. Certification:
 - a. Complete air balance report certified by professional engineer licensed in the jurisdiction where the work is to be performed.
 - b. Collect data in accordance with referenced standards.
 - c. Submit complete data on standard NEBB testing and balancing report forms without omissions or on approved report forms bearing identical data. Data to include types, serial numbers and calibration dates of instruments and to cover the following:
 - 1) Air-conditioning units: Sections 15733, 15735, and 15737.
 - 2) Rooftop conditioners: Section: 15732.
 - 3) Ductwork including transverse and pilot tube test: Section 15810.
 - 4) Heating Equipment: Section 15765.
 - 5) Outlets and Grilles: Section 15850
 - 6) Air terminal units: Section 15840.
 - 7) Ventilating units: Section 15725.
 - 8) Fans: Section 15830.

- d. Water-balance test reports to include data covering the following:
 - 1) Water coils: Section 15734.
 - 2) Chillers: Section 15625, 15626, and 15628.
 - 3) Cooling towers: Section 15640.
 - 4) Pumps: Sections 15135 and 15185.
 - 5) Control Valves: Section 15900.
 - 6) Heating equipment: Section 15765.
 - 7) Ventilating Units: Section 15725.
 - 8) Water tube boilers: Section 15515.
 - 9) Air terminal units: Section 15840.

PART 2 - PRODUCTS

- 2.01 Provide, as specified in Sections 15820 and 15205, additional equipment, such as balancing dampers, pressure taps and balancing cocks necessary to effect proper air and water balance.

PART 3 - EXECUTION

3.01 BALANCING AND PERFORMANCE TESTING:

- A. After completion of installation of air-conditioning systems, and prior to acceptance by the Engineer, adjust and balance air-handling systems and appurtenances applicable to those systems to deliver the air quantities as specified and as shown. Make final tests after modifications are completed. Seal instrument test holes upon completion of balancing operation.
- B. Air and Water Balance:
 - 1. Perform testing in accordance with referenced NEBB Standard, ASHRAE 111 or other approved standard.
 - 2. Perform tests, adjust and balance when outside conditions approximate design conditions as shown for heating and cooling functions.

END OF SECTION

SECTION 16050
BASIC ELECTRICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section includes the following:
 - 1. Electrical equipment coordination and installation.
 - 2. Sleeves for raceways and cables.
 - 3. Sleeve seals.
 - 4. Common electrical installation requirements.

1.02 RELATED SECTIONS

- A. Pertinent provisions of the following, also apply to the work of this Section, except as they may be modified herein, and are hereby made part of this Specification to the extent required:
 - 1. Section 16120 - Wire, Cable and Busway.
 - 2. Section 16119 - Medium Voltage Cable.

1.03 DEFINITIONS

- A. ATS: Acceptance Testing Specifications.
- B. EPDM: Ethylene-propylene-diene terpolymer rubber.

1.04 SUBMITTALS

- A. Product Data: For each type of product indicated.

1.05 QUALITY ASSURANCE

- A. Test Equipment Suitability and Calibration: Comply with NETA ATS, "Suitability of Test Equipment" and "Test Instrument Calibration."

1.06 COORDINATION

- A. Coordinate arrangement, mounting, and support of electrical equipment:
 - 1. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.
 - 2. To provide for ease of disconnecting the equipment with minimum interference to other installations.
 - 3. To allow right of way for piping and conduit installed at required slope.
 - 4. So connecting raceways, cables, wireways, cable trays, and busways will be clear of obstructions and of the working and access space of other equipment.
- B. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.
- C. Coordinate location of access panels and doors for electrical items that are behind finished surfaces or otherwise concealed. Access doors and panels are specified in Division 8 Section "Access Doors and Frames."
- D. Coordinate electrical testing of electrical, mechanical, and architectural items, so equipment and systems that are functionally interdependent are tested to demonstrate successful interoperability.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers

offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.

2.02 SLEEVES FOR RACEWAYS AND CABLES

- A. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends.
- B. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.
- C. Sleeves for Rectangular Openings: Galvanized sheet steel with minimum 0.052- or 0.138-inch thickness as indicated and of length to suit application.
- D. Coordinate sleeve selection and application with selection and application of firestopping specified in Division 7 Section "Firestopping."

2.03 SLEEVE SEALS

- A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable.
 - 1. Available Manufacturers:
 - a. Advance Products & Systems, Inc.
 - b. Calpico, Inc.
 - c. Metraflex Co.
 - d. Pipeline Seal and Insulator, Inc.
 - 2. Sealing Elements: EPDM, or NBR interlocking links shaped to fit surface of cable or conduit. Include type and number required for material and size of raceway or cable.
 - 3. Pressure Plates: Carbon steel. Include two for each sealing element.
 - 4. Connecting Bolts and Nuts: Carbon steel with corrosion-resistant coating of length required to secure pressure plates to sealing elements. Include one for each sealing element.

PART 3 - EXECUTION

3.01 COMMON REQUIREMENTS FOR ELECTRICAL INSTALLATION

- A. Comply with NECA 1.
- B. Measure indicated mounting heights to bottom of unit for suspended items and to center of unit for wall-mounting items.
- C. Headroom Maintenance: If mounting heights or other location criteria are not indicated, arrange and install components and equipment to provide maximum possible headroom consistent with these requirements.
- D. Equipment: Install to facilitate service, maintenance, and repair or replacement of components of both electrical equipment and other nearby installations. Connect in such a way as to facilitate future disconnecting with minimum interference with other items in the vicinity.
- E. Right of Way: Give to raceways and piping systems installed at a required slope.

3.02 SLEEVE INSTALLATION FOR ELECTRICAL PENETRATIONS

- A. Electrical penetrations occur when raceways, cables, wireways, cable trays, or busways penetrate concrete slabs, concrete or masonry walls, or fire-rated floor and wall assemblies.
- B. Coordinate sleeve selection and application with selection and application of firestopping specified in Division 7 Section "Firestopping."
- C. Concrete Slabs and Walls: Install sleeves for penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of slabs and walls.
- D. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
- E. Rectangular Sleeve Minimum Metal Thickness:

1. For sleeve cross-section rectangle perimeter less than 50 inches and no side greater than 16 inches, thickness shall be 0.052 inch.
 2. For sleeve cross-section rectangle perimeter equal to, or greater than, 50 inches and 1 or more sides equal to, or greater than, 16 inches, thickness shall be 0.138 inch.
- F. Fire-Rated Assemblies: Install sleeves for penetrations of fire-rated floor and wall assemblies unless openings compatible with firestop system used are fabricated during construction of floor or wall.
 - G. Cut sleeves to length for mounting flush with both surfaces of walls.
 - H. Extend sleeves installed in floors 2 inches above finished floor level.
 - I. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and raceway or cable unless sleeve seal is to be installed or unless seismic criteria require a different clearance.
 - J. Seal space outside of sleeves with grout for penetrations of concrete and masonry and with approved joint compound for gypsum board assemblies.
 - K. Interior Penetrations of Non-Fire-Rated Walls and Floors: Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint. Refer to Division 7 Section "Seals and Sealants" for materials and installation.
 - L. Fire-Rated-Assembly Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at raceway and cable penetrations. Install sleeves and seal raceway and cable penetration sleeves with firestop materials. Comply with Division 7 Section "Firestopping."
 - M. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.
 - N. Aboveground, Exterior-Wall Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
 - O. Underground, Exterior-Wall Penetrations: Install cast-iron "wall pipes" for sleeves. Size sleeves to allow for 1-inch annular clear space between raceway or cable and sleeve for installing mechanical sleeve seals.

3.03 SLEEVE-SEAL INSTALLATION

- A. Install to seal underground, exterior wall penetrations.
- B. Use type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.04 FIRESTOPPING

- A. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly. Firestopping materials and installation requirements are specified in Division 7 Section "Firestopping."

3.05 FIELD QUALITY CONTROL

- A. Inspect installed sleeve and sleeve-seal installations and associated firestopping for damage and faulty work.

END OF SECTION

THIS PAGE NOT USED

SECTION 16055
POWER SYSTEM STUDIES

PART 1 GENERAL

1.01 DESCRIPTION

- A. Work Included: The work of this Section consists of furnishing of short circuit studies, protective device evaluation studies, protective device coordination studies, and relay settings for both temporary and permanent systems.
- B. The studies shall include, but not be limited to, portions of the electrical distribution system from the incoming Pepco power source or sources to and including the 480 distribution system down to the 120-Vac level for the electrical distribution system shown on the One Line Diagrams for this project. Normal system connections and those that result in maximum fault conditions shall be included in the study. Provide study to each system with Pepco incoming power source.
- C. A professional electrical engineer registered in the State of Maryland and the District of Columbia shall perform the studies.
- D. Contractor shall submit the studies before receiving final approval from the CM for shop drawings for the power distribution system equipment.
 - 1. If formal completion of the studies causes delay in equipment manufacture, approval may be obtained for a preliminary submittal of sufficient study data to verify that the information indicating device ratings and characteristics will be satisfactory.
- E. Short circuit study and protective device evaluation study, protective device coordination study, load flow study and voltage drop to the farthest point on the system shall be performed.

1.02 RELATED SECTIONS

- A. Section 16130 – Raceways and Boxes.

1.03 SUBMITTALS

- A. In accordance with the requirements of Project management.

1.04 DATA COLLECTION FOR THE STUDIES

- A. Contractor shall provide the required data for preparation of the studies. The primary switchgear/power transformer manufacturer shall furnish Contractor with a listing of the required data immediately after award of the Contract.
- B. Contractor shall expedite collection of the data to assure completion of the studies as required for final approval of the distribution equipment shop drawings and/or before release of the equipment for manufacture.
- C. Characteristic data shall be derived from actual, applicable components obtained from the approved shop drawings.
- D. Contractor shall coordinate with the CM in obtaining short-circuit data from Pepco.

1.05 SHORT CIRCUIT STUDY AND PROTECTIVE DEVICE EVALUATION STUDY

- A. The short circuit study shall be performed with the aid of a digital computer program and shall be in accordance with applicable IEEE and ANSI standards.
- B. The study input data shall include the power company's short circuit contribution, resistance and reactance components of the branch impedances, the X/R ratios, base quantities selected and other source impedances.
- C. Short circuit close and latch duty values and interrupting duty values shall be calculated on the basis of assumed 3-phase and single phase bolted short circuits at each switchgear bus, low voltage motor control center, distribution panelboard, pertinent branch circuit panel and other significant locations through the system. The short circuit tabulations shall include symmetrical fault currents, and X/R ratios. For each fault location, the total duty on the bus, as well as the individual contribution from each connected branch, shall be listed with its respective X/R ratio.
- D. A protective device evaluation study shall be performed to determine the adequacy of circuit breakers, molded case switches, automatic transfer switches, and fuses by tabulating and comparing the short circuit ratings of these devices with the calculated fault currents. Appropriate multiplying factors based on system X/R ratios and protective device rating standards shall be applied. Problem areas or inadequacies in the equipment due to short circuit currents shall be corrected, at no additional cost to the Agency.

1.06 PROTECTIVE DEVICE COORDINATION STUDY

- A. A protective device coordination study shall be performed to provide the calculations and logic decisions required to select or to check the selection of power fuse ratings, protective relay characteristics and settings, ratios and characteristics of associated current transformers, and low voltage breaker trip characteristics and settings. The studies shall be in accordance with applicable IEEE and ANSI standards, and satisfy the requirements of the National Electrical Code (NEC) and local electrical codes.
- B. The coordination study shall include, but not be limited to, medium and low voltage classes of equipment from the utility service connection protective devices to and including the largest rated device in the low voltage motor control centers, panelboards, down to typical 120 VAC branch circuits. The motor management relay, phase and ground overcurrent protection shall be included, as well as settings of adjustable protective devices.
- C. The time-current characteristics of the specified protective devices shall be drawn on log-log paper. The plots shall include complete titles, representative one-line diagram and legends, significant motor starting characteristics, complete parameters of transformers, complete operating bands of low voltage circuit breaker trip curves and fuses. The coordination plots shall indicate the types of protective devices selected, proposed relay taps, time dial and instantaneous trip settings, transformer magnetizing inrush and ANSI transformer withstand parameters, cable thermal overcurrent withstand limits and significant symmetrical and asymmetrical fault currents. All restrictions of the National Electrical Code shall be conformed to and proper coordination intervals and separation of characteristic curves shall be maintained. The coordination plots for phase and ground protective devices shall be provided on a system basis. A sufficient number of separate curves shall be used to indicate the coordination achieved.
- D. The selection and settings of the protective devices shall be provided separately in a tabulated form listing circuit identification, IEEE device number, current transformer ratios and connection, manufacturer and type, range of adjustment and recommended settings. A tabulation of the recommended power fuse selection shall be provided for the medium voltage fuses where applied in the system.
- E. Discrepancies, problem areas, inconsistencies or inadequacies shall be corrected, at no additional cost to the Authority.

1.07 STUDY REPORT

- A. A preliminary report shall be submitted to the CM for review and approval.

- B. The results of the power system studies shall be summarized in a final report.
- C. The report shall be prepared and stamped by a professional electrical engineer registered in the State of Maryland and the District of Columbia.
- D. Six bound copies of the final report shall be submitted.
- E. The report shall include the following sections:
 - 1. Description, purpose, base, and scope of the study, and an overall single line diagram of the power system that is included within the scope of the study.
 - 2. Tabulations of circuit breaker, fuse and other protective device ratings versus calculated short circuit duties, and commentary regarding the same.
 - 3. Protective device time versus current coordination curves, tabulations of relay and circuit breaker trip settings, fuse selection, and commentary regarding the same.
 - 4. Fault current calculations including a definition of terms and guide for interpretation of computer printout.
 - 5. Load flow study.
 - 6. Voltage drop to the furthest point shown on the Drawings.
- F. One copy of the final report shall be submitted to the Power Company for their review.

SECTION 16060

GROUNDING AND BONDING

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing complete grounding and bonding system.
- B. Related Work Specified Elsewhere:
 - 1. Fencing: Division 2.
 - 2. Concrete reinforcement: Division 3.
 - 3. Piping systems: Section 15205.
 - 4. Wire, cable and busways: Section 16120.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. National Electrical Code (NEC)
 - 3. ANSI/IEEE 80-2000, IEEE Guide for Safety in AC Substation Grounding.
 - 4. UL 467, Grounding and Bonding Equipment..
 - 5. American Standards of Testing and Materials (ASTM) B187-00, Standard Specification for Copper Bar, Bus Bar, Rod and Shapes.
 - 6. ITS: Directory of ITS Listed Products.
- B. Source Quality Control:
 - 1. Each item, except for exothermic-welded electrical connections, listed per referenced UL or ITS directory.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings.
- B. Certification.
 - 1. Certified test reports verifying that ground resistance of each ground grid when installed and each ground bus when connected to ground grid does not exceed specified values.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling and to avoid damage.
- C. Store equipment in secure and dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Grounding and Bonding Equipment:
 - 1. General Requirements:
 - a. UL 467.
 - 2. Ground rods: Solid steel, with stainless steel or copper jacket, one-inch or 5/8-inch diameter as shown, by 10 feet long or of necessary length in 10-foot sections.
 - 3. Grounding conductor:
 - a. Grounding electrode conductors:
 - (1) Insulated or bare conductor, as shown, in accordance with the following:
 - (a) Insulated conductor: As specified in Section 16120 for single-conductor cable.
 - (b) Bare conductor: Section 16120.
 - (2) Size:
 - (a) For use in ground grid and for connecting of ground grid to ground bus: 4/0 AWG.
 - (b) For connection of ground bus in train-control, communications, electrical, dispatcher, Bell system and mechanical rooms to main ground bus in ac-switchboard rooms: 2/0 AWG.
 - (c) For other grounding electrode conductors: In accordance with the NEC.
 - b. Equipment grounding conductor:
 - (1) Sized in accordance with the NEC unless otherwise shown.
 - (2) Insulated equipment grounding conductor: Single-conductor cable as specified in Section 16120.
 - (3) Bare equipment grounding conductor integral with multiple-conductor cable: Section 16120.
 - c. Bonding conductor for stray current and cathodic protection and electrical continuity:
 - (1) Insulated or bare conductors, as shown, in accordance with the following:
 - (a) Insulated conductors: As specified in Section 16120 for single-conductor cable.
 - (b) Bare conductor: Section 16120.
 - (2) Size: As shown or as specified.
 - 4. Bus bar: ASTM B187-00, 98-percent-conductivity copper bus bar, size two inches wide by 1/4-inch thick, length as necessary.
 - 5. Terminal lugs:
 - a. For 4/0 AWG and smaller conductors: Copper compression terminal lugs.
 - b. For 250 MCM and larger: Long-barrel, copper, double-compression terminal lugs.
 - 6. Ground connector:
 - a. O-Z, Type KG or equal.
 - b. Two-piece, designed for connecting grounding conductor to bus bar.
 - c. Copper-alloy body and silicon-bronze bolt, nut and lock washer with interlocking clamp.

7. Jumpers: Copper braided or leaf-type flexible jumper, size as necessary.
8. Bus-bar insulators: Fiberglass reinforced-polyester insulator with ½-inch diameter threaded holes at both ends for bus-bar installation.
9. Exothermic welded electrical connections:
 - a. Exothermic process using powdered metals contained in a mold to form a molecular bond between materials to be connected without application of an external source of heat or power in accordance with ANSI/IEEE 80-2000.
 - b. Molds, weld metal and associated accessories designed for making electrical connections between copper and copper, copper and steel, copper and cast iron and copper and ductile iron as required.
 - c. Welding system designed for making connections suitable for the application as follows:
 - (1) Connections made outdoors for grounding using the standard process and not containing phosphorous or any caustic, toxic or explosive materials.
 - (2) Connections made indoors or in confined spaces for grounding using a low-smoke, low-emission process.
 - (3) Connections made specifically for cathodic protection applications using the standard process.
 - d. Molds made of graphite with permanent marking indicating name of manufacturer, model, conductor size, and type and size of welding mixture compatible with the welding process. Mold connection type suitable for making connections between various configurations of items as shown or specified.
 - e. Weld metal consisting of copper oxide and aluminum contained in a moisture-resistant container along with other necessary materials required for the specific application as determined by the manufacturer. Container for applications other than low-smoke, low-emission process to also include suitable starting material.
 - f. Container for weld metal identified with part number, type of metals to be connected and application such as standard outdoor, low emission or cathodic application.

PART 3 - EXECUTION

3.01 GROUNDING:

- A. Ground Connections:
 1. Weld buried ground connections exothermically, in accordance with manufacturer's recommendations. Clean and coat with coal-tar epoxy before backfilling. Encapsulate with epoxy resin buried ground connection of grounding electrode conductors running to ground bus.
 2. Use terminal lug to connect grounding conductor to equipment enclosure. Use ground connector to connect grounding conductor to ground bus. Secure connector or terminal lug to the conductor so as to engage all strands equally. Install terminal lug using tools and pressure recommended by the manufacturer. Indent mark terminal lug with the number of die used for installation.
 3. Exothermically weld connections to ground rods in handholes, junction boxes, manholes, and light poles.
 4. Splices in grounding conductor are prohibited.

5. For making ground connections located indoors and in confined spaces located outdoors such as manholes, use exothermic welds with low-smoke, low-emission process.
- B. Ground Grid:
1. Install ground grid consisting of ground-grid conductors and ground rods buried in earth in pattern and at locations shown.
 2. Use ground rod one-inch in diameter by 10 feet long or of greater length in 10-foot sections as shown.
 3. Bury top of ground rod 24 inches minimum below unfinished surfaces.
 4. Ensure 24-inch minimum separation between ground rods or bare grounding conductors and concrete structures or soldier piles bonded for stray current and cathodic protection.
 5. Interconnect ground rods using 4/0 AWG insulated or bare grounding conductor as shown.
 6. For connecting ground grid to ground bus in associated traction-power substation and ac-switchboard room, provide minimum of four 4/0 AWG insulated grounding electrode conductors as shown.
 7. For connecting ground grid to ground bus in dc tie-breaker station, chiller plant, fan shaft and drainage-pumping station, provide two 4/0 AWG insulated grounding electrode connections.
 8. For additional grounding of service transformer in outdoor location, provide one grounding electrode conductor from nearest ground grid to transformer pad.
 9. Unless otherwise shown, leave pigtail, three-foot six-inches minimum length, above finished floor for connection to ground bus or service-entrance equipment.
 10. When ground grid is provided for electrical room, connect ground grid to ground bus in electrical room with two 4/0 AWG insulated grounding electrode conductors.
- C. Ground Bus:
1. Install ground bus bar, two inches wide by 1/4-inch thick, around the inside periphery of traction-power substation, dc tie-breaker station, ac-switchboard room and electrical rooms; on full length of wall adjacent to service equipment such as switchboard and motor controls in chiller plants and mechanical rooms.
 2. Install ground bus bar, two inches by 1/4 inch by 24 inches long in train-control, communications, dispatcher, Bell system and mechanical rooms, kiosk, fan shafts, drainage-pumping stations, escalator pits, elevator rooms, battery rooms and where shown.
 3. Mount ground bus bar on insulators two feet above finished floor, unless otherwise shown, using cap screws and expandable threaded anchor.
 4. Provide insulator support at each end of ground bus and at three-foot intervals.
 5. In traction-power substation, dc tie-breaker station, ac-switchboard room, chiller plants, fan shafts, and drainage-pumping station, connect the ground bus to 4/0 AWG grounding electrode conductor running from associated ground grid.
 6. In train-control, communications, electrical, dispatcher, Bell system and mechanical rooms, escalator pits, elevator rooms, battery rooms and other locations shown, connect ground bus to main ground bus in associated ac-switchboard room, traction-power substation or dc tie-breaker station, using 2/0 AWG insulated conductor.
 7. Install 4/0 AWG insulated ground conductor, sub-ground bus, with one end connected to ground bus in ac-switchboard room, at following locations:
 - a. In each tunnel for mainline track, support grounding conductor on channel inserts in tunnel wall.

- b. In each cable trough and ductbank along mainline track, install grounding conductor in cable-trough area and conduit reserved for ac power.
 - c. In each cable space under station platform, install grounding conductor on channel inserts on wall.
 - 8. Installing grounding connections in train-control and communication rooms:
 - a. The only ground connection on the bus bar provided for train control and communication equipment grounding is the cable leading to the A. C. Switchboard room.
 - b. Do not bond equipment or metallic structure to the ground bus provided for train control equipment.
 - c. For items requiring bonding, have the bonding conductors go to the nearest ground bus beyond the ground bus provided for train control equipment.
 - d. Grounding transformers to the dedicated train control and communication room ground bus bars is not permitted.
- D. Equipment Grounding Conductor: Provide insulated equipment grounding conductor for following services and as shown:
 - 1. Feeders.
 - 2. Branch circuits.
- E. Grounding of Service Equipment:
 - 1. Ground in accordance with NEC.
 - 2. Ground enclosure and ground bus in switchgear, switchboard, motor-control center or panelboard to ground bus provided in substation or room using insulated grounding electrode conductor.
 - 3. Install copper bonding jumper between neutral and ground bus as shown.
- F. Grounding of Separately Derived AC System:
 - 1. Ground in accordance with NEC.
 - 2. Ground secondary neutral and enclosure of transformers to nearest ground bus or sub-bus using insulated grounding electrode conductor.
 - 3. For transformer located outside of building, install additional grounding connector between transformer secondary neutral/enclosure and ground bus or grid using insulated grounding electrode conductor.
- G. Grounding for Personnel Safety:
 - 1. In substation, electrical and mechanical rooms, tie-breaker stations, chiller plants, fan shaft and pumping stations, bond exposed metallic structure, motor frame, ac-equipment enclosure, ductwork and metallic piping to local ground bus, using minimum of 6AWG insulated grounding conductor as follows:
 - a. Ground multiple items of exposed metallic structure to local ground bus using a separate grounding conductor for each item or by using series-connected grounding conductors to connect two or more items.
 - b. Ground each ac equipment enclosure to local ground bus using a separate grounding conductor.
 - c. Connection of grounding conductor for ac equipment enclosure in series with grounding conductor for exposed metal structure is prohibited.
 - 2. Bond escalator's and elevator's motor frames, ac-equipment enclosures and metallic structures to equipment grounding conductor in ac-power feeder and to local ground bus bar. Provide a second ground path, connecting trusses and guide rails, using a #1/0 AWG insulated ground conductor connected to ground bus bar in A. C. Switchboard room. Leave 20-foot length of conductor coiled up in pits or wellway for

- making the grounding connections to trusses and guide rails by the escalator stage contractor.
3. Bond metallic ladders and stairs in fan shafts, vent shafts and other locations to local ground bus, using insulated grounding conductor, 6AWG minimum.
 4. Bond and ground exposed metallic structures in open areas to separate grounding electrode in accordance with the following requirements:
 - a. Metal pole for mounting light fixtures: Bond and ground each metal pole to separate 5/8-inch diameter by 10-foot long ground rod, buried with top two feet below grade with two-foot separation from footing, using 6AWG insulated grounding conductor.
 - b. Cable troughs alongside track: Bond and ground metal cable troughs to 5/8-inch diameter by 10-foot long ground rod, buried with top two feet below grade, at approximate 50-foot intervals and at each end with two-foot separation from reinforced or buried metallic structures, using 4AWG insulated grounding conductor. At expansion and contraction joints, install 4AWG insulated grounding conductor for electrical continuity.
 - c. Metallic railings and fences alongside track: Bond and ground railings and posts for galvanized steel fence to 5/8-inch diameter by 10-foot long ground rod, buried with top two feet below grade, at approximate 50-foot intervals and at each end, with two-foot separation from railing and fence-post footing and other reinforced structure, using 4AWG insulated grounding conductor. For electrical continuity, where necessary, install flexible copper braided or leaf-type jumper or 4 AWG insulated grounding conductor. In addition to the above requirements for grounding galvanized steel fences, provide the following for grounding PVC-coated steel fences:
 - (1) Bond and ground each fence post to bottom tension wire using 6AWG bare grounding conductor, O-Z Type CG, Burndy Type GAR or equal connector at fence post, and Burndy Type KS or equal tap connector at tension wire.
 - (2) At connections of grounding conductors to posts and tension wires, remove vinyl coating at contact surfaces before making connections and apply vinyl coating over finished connections to match original coating.
 - d. Railing, cable trough and metallic-deck structure at aerial track:
 - (1) In each abutment and pier, install 4/0 AWG insulated grounding conductor with one end connected to pile or one-inch diameter by 10-foot long ground rod, buried with top two feet below grade, with two-foot separation from concrete structure and three-foot pigtail on the top of pier or abutment for bonding and grounding of deck structure.
 - (2) Bond and ground deck structure, cable trough and hand railing to 4/0 AWG insulated grounding conductor installed at each abutment and pier using 4AWG insulated grounding conductor. For providing electrical continuity, where necessary, install flexible copper braided or leaf-type jumper or 4AWG insulated grounding conductor.
 5. In underground locations, bond and ground hand railing and metallic safety walk grating at each end and at approximate 50-foot intervals to nearest ground bus or sub-bus, using 6AWG insulated grounding conductor. For electrical continuity, where necessary, install flexible copper braided or leaf-type jumper or 6AWG insulated grounding conductor.
 6. Station entrance pylon (Type B): Provide multiple ground paths as follows:

- a. Bond and ground the pylon frame using 6AWG insulated grounding conductor to 5/8-inch diameter by 10-foot long ground rod driven so that top of rod is six inches below finished grade.
 - b. Bond and ground the pylon frame to equipment grounding conductor in branch circuit.
7. Handhole, manhole and junction box metallic body, cover frame and cover: Provide a minimum of two ground paths as follows:
- a. Bond and ground handhole, manhole and junction box metallic cover frame and metallic body to 5/8-inch diameter by 10-foot long ground rod driven with top of rod three inches above bottom of manhole, handhole and junction box using 6AWG insulated grounding conductor.
 - b. Provide a minimum of 6AWG insulated grounding conductor and a bronze or brass chain with 210-pound breaking strength in a 1/2-inch or 5/8-inch rubber hose to bond metallic cover to metallic cover frame. Length of cable, chain and hose as required to allow removal of cover adjacent to and clear of handhole and/or manhole opening.
 - c. When cable is spliced in handhole, manhole or junction box, bond metallic cover frame and body to equipment grounding conductor.
8. Exothermically weld or gas torch braze grounding and bonding connection to exposed metallic structure, metallic cable trough, galvanized steel fence, hand railing, metallic safety walk grating, map case and telephone enclosure, frame columns of shelter, pylon and diorama, and metallic cover, metallic cover frame and metallic body of handhole, manhole and junction box. Repair damaged galvanized coating in accordance with Division 2 Repair finish of shelter, map case and telephone enclosure and diorama frame to match existing finish.

3.02 BONDING FOR STRAY CURRENT AND CATHODIC PROTECTION:

- A. Reinforcing Steel At-Grade Sections:
 - 1. Bond reinforcing steel using 250 MCM, Class G, stranded bare conductor exothermically welded to steel straps as shown in accordance with Division 3.
- B. Floating-Slab Expansion Joints:
 - 1. Bond floating-slab expansion joints, using 1/0 AWG, Class G, stranded bare conductor exothermic welded to longitudinal bar.
- C. Metallic Pipe:
 - 1. Bond across joint for the following pipe, pipe fittings and pipe appurtenances, except those welded or soldered joints, using 2AWG insulated conductor as shown and in accordance with Section 15205.
 - a. Buried pipe, except soil pipe unless shown bonded.
 - b. Pressure pipe.
 - c. Pipe parallel to and within 20 feet of centerline of track.
 - 2. Do not bond District of Columbia, Department of Public Works (DCDPW), buried piping systems
- D. Permanent Metal Piles:
 - 1. Interconnect permanent metal piles, except those used in ground grid, using 4/0 AWG insulated conductor exothermically welded to piles. At each end of line of bonded piles, connect 4/0 AWG insulated conductor and terminate it in box inside line structure. Identify conductor termination using non-metallic tags or plastic labels attached to conductor with slip-free plastic lacing or nylon bundling strap.

- E. Drainage Cables in Tunnel, At-Grade and Aerial Sections:
 - 1. Between bonded reinforcing steel and negative switchboard in traction-power substation, install stray-current discharge cable in accordance with the following requirements:
 - a. Adjacent to each traction-power substation, install two 250 kcmil, Class G, stranded bare conductors, one end of each conductor welded to the reinforcing steel which has been bonded as specified herein, and the other end terminated in 12-inch by 18-inch by 4-inch junction box.
 - b. From the junction box, install two 250 kcmil insulated cables in FRE conduit to dc negative switchboard area of the traction-power substation for future connection by others.
- F. Separate reinforcing steel and other buried metallic structures, bonded for stray current and cathodic protection, from ground grid, grounding electrode, or exposed metallic structures grounded for personnel safety. Metallic contact or electrical bonding between two systems is prohibited.

3.03 FIELD QUALITY CONTROL:

- A. Test ground resistance of each ground grid after installation and each ground bus when connected to ground grid, using approved test procedure.
- B. Ground resistance not to exceed the following:
 - 1. Ground grid/bus in ac-switchboard rooms, chiller plants, and traction-power substations: Two ohms.
 - 2. Ground grid/bus in fan shafts, drainage-pumping stations, electrical rooms, dispatcher rooms, Bell system rooms, mechanical rooms and dc tie-breaker stations: Five ohms.
- C. To meet resistance requirements, install additional ground rods or use permanent metal piles as ground rods.
- D. Isolate permanent metal piles used for grounding from those bonded for stray-current and cathodic protection.
- E. Test metallic conduits and raceways, metallic enclosures for equipment, metallic cable troughs, fences, metallic hand railings, metallic safety walk gratings, metallic structures, metallic covers, cover frames and bodies of manholes, handholes and junction boxes, frames of shelters, pylons and dioramas, map case and telephone enclosures, and poles for mounting lighting fixtures for continuity to grounding system.
- F. Test resistance of connection between ground bus in train-control rooms/communications rooms and ground bus in associated ac-switchboard rooms, traction-power substations or dc tie-breaker stations for resistance not to exceed one ohm.
- G. Conduct tests in presence of Engineer.
- H. Inspect and test exothermic welds as follows:
 - 1. Inspect finished exothermic welds for visual characteristics that are consistent with a properly made connection in accordance with the manufacturer's instructions and

- recommendations. Remove welds that do not meet minimum visual requirements as acknowledged by the Engineer, and reweld after cleaning the area to be welded.
2. Test mechanical strength of exothermic weld by applying three sharp blows to the weld with a two-pound hammer using 15-inch strokes. Acceptable welds to sustain the blows without cracking the weld metal or the bond between the two connecting materials. Remove defective welds and reweld after cleaning the area to be welded.

SECTION 16072

ELECTRICAL SUPPORTS AND SEISMIC RESTRAINTS

1.01 SUMMARY

- A. This Section includes the following:
1. Hangers and supports for electrical equipment and systems.
 2. Seismic restraints for electrical equipment and systems.
 3. Construction requirements for concrete bases.

1.02 DEFINITIONS

- A. EMT: Electrical metallic tubing.
- B. IBC: International Building Code.
- C. IMC: Intermediate metal conduit.
- D. NBC: National Building Code.
- E. OSHPD: Office of Statewide Health Planning and Development.
- F. RMC: Rigid metal conduit.
- G. SBC: Standard Building Code.
- H. Seismic Restraint: A structural support element such as a metal framing member, a cable, an anchor bolt or stud, a fastening device, or an assembly of these items used to transmit seismic forces from an item of equipment or system to building structure and to limit movement of item during a seismic event.
- I. UBC: Uniform Building Code.

1.03 SUBMITTALS

- A. Product Data: Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of electrical support and seismic-restraint component used.
1. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an agency acceptable to authorities having jurisdiction.
 2. Annotate to indicate application of each product submitted and compliance with requirements.
- B. Shop Drawings: Indicate materials and dimensions and identify hardware, including attachment and anchorage devices, signed and sealed by a qualified professional engineer. Include the following:
1. Fabricated Supports: Representations of field-fabricated supports not detailed on Drawings.
 2. Seismic Restraints: Detail anchorage and bracing not defined by details or charts on Drawings. Include the following:
 - a. Design Analysis: To support selection and arrangement of seismic restraints. Include calculations of combined tensile and shear loads.
 - b. Details: Detail fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events.
 - c. Preapproval and Evaluation Documentation: By an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).
- C. Coordination Drawings: Show coordination of seismic bracing for electrical components with other systems and equipment in the vicinity, including other supports and seismic restraints.

- D. Welding certificates.
- E. Qualification Data: For professional engineer and testing agency.
- F. Field quality-control test reports.

1.04 QUALITY ASSURANCE

- A. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.
- B. Testing of Seismic Anchorage Devices: Comply with testing requirements in Part 3 and in Division 16 Section "Electrical Supports and Seismic Restraints."
- C. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

1.05 PROJECT CONDITIONS

- A. Site Class as Defined in the IBC: Per local requirements.
- B. S_s , Mapped Maximum Considered Earthquake Spectral Response at Short Periods: Per local requirements.
- C. S_1 , Mapped Maximum Considered Earthquake Spectral Response at 1-Second Period: Per local requirements.
- D. Assigned Seismic Use Group or Building Category as Defined in the IBC: Per local requirements.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 - 1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, manufacturers specified.

2.02 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

- A. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed under this Project, with a minimum structural safety factor of five times the applied force.
- B. Steel Slotted Support Systems: Comply with MFMA-3, factory-fabricated components for field assembly.
 - 1. Available Manufacturers:
 - a. Cooper B-Line; a division of Cooper Industries.
 - b. ERICO International Corporation.
 - c. Allied Support Systems; Power-Strut Unit.
 - d. GS Metals Corp.
 - e. Michigan Hanger Co., Inc.; O-Strut Div.
 - f. National Pipe Hanger Corp.
 - g. Thomas & Betts Corporation.
 - h. Unistrut; Tyco International, Ltd.
 - i. Wesanco, Inc.
 - 2. Finishes:
 - a. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-3.
 - b. Nonmetallic Coatings: Manufacturer's standard PVC, polyurethane, or polyester coating applied according to MFMA-3.
 - c. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-3.
 - 3. Channel Dimensions: Selected for structural loading and applicable seismic

forces.

- C. Nonmetallic Slotted Support Systems: Structural-grade, factory-formed, glass-fiber-resin channels and angles with 9/16-inch-diameter holes at a maximum of 8 inches o.c., in at least 1 surface.
1. Available Manufacturers:
 - a. Allied Support Systems; Aickinstrut Unit.
 - b. Cooper B-Line; a division of Cooper Industries.
 - c. Fabco Plastics Wholesale Limited.
 - d. Seasafe, Inc.
 2. Fittings and Accessories: Products of channel and angle manufacturer and designed for use with those items.
 3. Fitting and Accessory Materials: Same as channels and angles, except metal items may be stainless steel.
 4. Rated Strength: Selected to suit structural loading and applicable seismic forces.
- D. Raceway and Cable Supports: As described in NECA 1.
- E. Conduit and Cable Support Devices: Steel and malleable-iron hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.
- F. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be malleable iron.
- G. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
- H. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
 - a. Available Manufacturers:
 - (1) Hilti, Inc.
 - (2) ITW Construction Products.
 - (3) MKT Fastening, LLC
 - (4) Simpson Strong-Tie Co. Inc.
 2. Mechanical-Expansion Anchors: Insert-wedge-type, stainless steel, for use in hardened portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.
 - a. Available Manufacturers:
 - (1) Cooper B-Line; a division of Cooper Industries.
 - (2) Empire Tool and Manufacturing Co., Inc
 - (3) Hilti, Inc.
 - (4) ITW Construction Products.
 - (5) MKT Fastening, LLC.
 - (6) Powers Fasteners.
 3. Concrete Inserts: Steel or malleable-iron slotted-support-system units similar to MSS Type 18; complying with MFMA-3 or MSS SP-58.
 4. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.
 5. Through Bolts: Structural type, hex head, high strength. Comply with ASTM A 325.
 6. Toggle Bolts: All-steel springhead type.
 7. Hanger Rods: Threaded steel.

2.03 SEISMIC-RESTRAINT COMPONENTS

- A. Rated Strength, Features, and Application Requirements for Restraint Components: As defined in reports by an agency acceptable to authorities having jurisdiction.
1. Structural Safety Factor: Strength in tension, shear, and pullout force of

components used shall be at least five times the maximum seismic forces to which they will be subjected.

- B. Angle and Channel-Type Brace Assemblies: Steel angles or steel slotted-support-system components; with accessories for attachment to braced component at one end and to building structure at the other end.
- C. Cable Restraints: ASTM A 603, zinc-coated, steel wire rope attached to steel or stainless-steel thimbles, brackets, swivels, and bolts designed for restraining cable service.
 - 1. Available Manufacturers:
 - a. Amber/Booth Company, Inc.
 - b. Loos & Co., Inc.
 - c. Mason Industries, Inc.
 - 2. Seismic Mountings, Anchors, and Attachments: Devices as specified in Part 2 "Support, Anchorage, and Attachment Components" Article, selected to resist seismic forces.
 - 3. Hanger Rod Stiffener: Reinforcing steel angle clamped to hanger rod, of design recognized by an agency acceptable to authorities having jurisdiction.
 - 4. Bushings for Floor-Mounted Equipment Anchors: Neoprene units designed for seismically rated rigid equipment mountings, and matched to type and size of anchor bolts and studs used.
 - 5. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for seismically rated rigid equipment mountings, and matched to type and size of attachment devices used.

2.04 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

- A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.
- B. Materials: Comply with requirements in Division 5 Section "Miscellaneous Metal" for steel shapes and plates.

PART 3 - EXECUTION

3.01 APPLICATION

- A. Comply with NECA 1 for application of hangers and supports for electrical equipment and systems, except if requirements in this Section are stricter.
- B. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMT, IMC, and RMC as scheduled in NECA 1, where Table 1 lists maximum spacings less than stated in NFPA 70. Minimum rod size shall be 1/4 inch in diameter.
- C. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted or other support system, sized so capacity can be increased by at least 25percent in future without exceeding specified design load limits.
 - 1. Secure raceways and cables to trapeze member with clamps approved for application by an agency acceptable to authorities having jurisdiction
 - 2. Secure raceways and cables to these supports with two-bolt conduit clamps.
- D. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

3.02 SUPPORT AND SEISMIC-RESTRAINT INSTALLATION

- A. Comply with NECA 1 for installation requirements, except as specified in this Article.
- B. Raceway Support Methods: In addition to methods described in NECA 1, EMT, IMC, and RMC may be supported by openings through structure members, as permitted in NFPA 70.
- C. Install seismic-restraint components using methods approved by the evaluation service providing required submittals for component.

- D. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static and seismic loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb.
- E. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
 - 1. To Wood: Fasten with lag screws or through bolts.
 - 2. To New Concrete: Bolt to concrete inserts.
 - 3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
 - 4. To Existing Concrete: Expansion anchor fasteners.
 - 5. Instead of expansion anchors, powder-actuated driven threaded studs provided with lock washers and nuts may be used in existing standard-weight concrete 4 inches thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4 inches thick.
 - 6. To Steel: Beam clamps (MSS Type 19, 21, 23, 25, or 27) complying with MSS SP-69.
 - 7. To Light Steel: Sheet metal screws.
 - 8. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate by means that meet seismic-restraint strength and anchorage requirements.
- F. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

3.03 INSTALLATION OF FABRICATED METAL SUPPORTS

- A. Comply with installation requirements in Division 5 Section "Miscellaneous Metal" for site-fabricated metal supports.
- B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.
- C. Field Welding: Comply with AWS D1.1/D1.1M.

3.04 CONCRETE BASES

- A. Concrete Bases: Anchor equipment to concrete base according to equipment manufacturer's written instructions and seismic criteria at Project.
- B. Construct concrete bases of dimensions indicated but not less than 4 inches larger in both directions than supported unit, and so expansion anchors will be a minimum of 10 bolt diameters from edge of the base.
 - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around full perimeter of the base.
 - 2. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
 - 3. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 4. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - 5. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
 - 6. Use 3000-psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 3 Section "Cast-in-Place Structural Concrete."

3.05 INSTALLATION OF SEISMIC-RESTRAINT COMPONENTS

- A. Install bushing assemblies for anchor bolts for floor-mounted equipment, arranged to provide resilient media between anchor bolt and mounting hole in concrete base.
- B. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to

wall.

- C. Restraint Cables: Provide slack within maximums recommended by manufacturer.
- D. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, upper truss chords of bar joists, or at concrete members.

3.06 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

- A. Make flexible connections in runs of raceways, cables, wire ways, cable trays, and bus ways where they cross expansion and seismic-control joints, where adjacent sections or branches are supported by different structural elements, and where they terminate with connection to electrical equipment that is anchored to a different structural element from the one supporting them as they approach equipment.

3.07 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.
- B. Testing: Test pullout resistance of seismic anchorage devices.
 1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
 2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless post connection testing has been approved), and with at least seven days' advance notice.
 3. Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.
 4. Test at least four of each type and size of installed anchors and fasteners selected by Architect.
 5. Test to 90 percent of rated proof load of device.
 6. If a device fails test, modify all installations of same type and retest until satisfactory results are achieved.
- C. Record test results.

END OF SECTION

SECTION 16075

ELECTRICAL IDENTIFICATION

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section includes the following:
 - 1. Identification for raceway and metal-clad cable.
 - 2. Identification for conductors and communication and control cable.
 - 3. Underground-line warning tape.
 - 4. Warning labels and signs.
 - 5. Instruction signs.
 - 6. Equipment identification labels.
 - 7. Miscellaneous identification products.

1.02 SUBMITTALS

- A. Product Data: For each electrical identification product indicated.
- B. Identification Schedule: An index of nomenclature of electrical equipment and system components used in identification signs and labels.
- C. Samples: For each type of label and sign to illustrate size, colors, lettering style, mounting provisions, and graphic features of identification products.

1.03 QUALITY ASSURANCE

- A. Comply with ANSI A13.1 and ANSI C2.
- B. Comply with NFPA 70.
- C. Comply with 29 CFR 1910.145.

1.04 COORDINATION

- A. Coordinate identification names, abbreviations, colors, and other features with requirements in the Contract Documents, Shop Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual, and with those required by codes, standards, and 29 CFR 1910.145. Use consistent designations throughout Project.
- B. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.
- C. Coordinate installation of identifying devices with location of access panels and doors.
- D. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.01 RACEWAY AND METAL-CLAD CABLE IDENTIFICATION MATERIALS

- A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway and cable size.
- B. Color for Printed Legend:
 - 1. Power Circuits: Black letters on an orange field.
 - 2. Legend: Indicate system or service and voltage, if applicable.
- C. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

- D. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeves, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.
- E. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeves, 2 inches long, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.
- F. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; 2 inches wide; compounded for outdoor use.

2.02 CONDUCTOR AND COMMUNICATION- AND CONTROL-CABLE IDENTIFICATION MATERIALS

- A. Color-Coding Conductor Tape: Colored, self-adhesive vinyl tape not less than 3 mils thick by 1 to 2 inches wide.
- B. Marker Tapes: Vinyl or vinyl-cloth, self-adhesive wraparound type, with circuit identification legend machine printed by thermal transfer or equivalent process.
- C. Aluminum Wraparound Marker Labels: Cut from 0.014-inch-thick aluminum sheet, with stamped, embossed, or scribed legend, and fitted with tabs and matching slots for permanently securing around wire or cable jacket or around groups of conductors.
- D. Metal Tags: Brass or aluminum, 2 by 2 by 0.05 inch, with stamped legend, punched for use with self-locking nylon tie fastener.
- E. Write-On Tags: Polyester tag 0.15 inch thick, with corrosion-resistant grommet and polyester or nylon tie for attachment to conductor or cable.
 - 1. Marker for Tags: Permanent, waterproof, black ink marker recommended by tag manufacturer.

2.03 UNDERGROUND-LINE WARNING TAPE

- A. Description: Permanent, bright-colored, continuous-printed, polyethylene tape.
 - 1. Not less than 6 inches wide by 4 mils thick.
 - 2. Compounded for permanent direct-burial service.
 - 3. Embedded continuous metallic strip or core.
 - 4. Printed legend shall indicate type of underground line.

2.04 WARNING LABELS AND SIGNS

- A. Comply with NFPA 70 and 29 CFR 1910.145.
- B. Self-Adhesive Warning Labels: Factory printed, multicolor, pressure-sensitive adhesive labels, configured for display on front cover, door, or other access to equipment, unless otherwise indicated.
- C. Baked-Enamel Warning Signs: Preprinted aluminum signs, punched or drilled for fasteners, with colors, legend, and size required for application. 1/4-inch grommets in corners for mounting. Nominal size, 7 by 10 inches.
- D. Metal-Backed, Butyrate Warning Signs: Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs with 0.0396-inch galvanized-steel backing; and with colors, legend, and size required for application. 1/4-inch grommets in corners for mounting. Nominal size, 10 by 14 inches.
- E. Warning label and sign shall include, but are not limited to, the following legends:
 - 1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."
 - 2. Workspace Clearance Warning: "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES."

2.05 INSTRUCTION SIGNS

- A. Engraved, laminated acrylic or melamine plastic, minimum 1/16 inch thick for signs up to 20

sq. in. and 1/8 inch thick for larger sizes.

1. Engraved legend with black letters on white face.
2. Punched or drilled for mechanical fasteners.
3. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

2.06 EQUIPMENT IDENTIFICATION LABELS

- A. Adhesive Film Label: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch.
- B. Adhesive Film Label with Clear Protective Overlay: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch. Overlay shall provide a weatherproof and ultraviolet-resistant seal for label.
- C. Self-Adhesive, Engraved, Laminated Acrylic or Melamine Label: Adhesive backed, with white letters on a dark-gray background. Minimum letter height shall be 3/8 inch.
- D. Engraved, Laminated Acrylic or Melamine Label: Punched or drilled for screw mounting. White letters on a dark-gray background. Minimum letter height shall be 3/8 inch.
- E. Stenciled Legend: In nonfading, waterproof, black ink or paint. Minimum letter height shall be 1 inch.

2.07 MISCELLANEOUS IDENTIFICATION PRODUCTS

- A. Cable Ties: Fungus-inert, self-extinguishing, 1-piece, self-locking, Type 6/6 nylon cable ties.
 1. Minimum Width: 3/16 inch.
 2. Tensile Strength: 50 lb, minimum.
 3. Temperature Range: Minus 40 to plus 185 deg F.
 4. Color: Black, except where used for color-coding.
- B. Paint: Paint materials and application requirements are specified in Division 9 painting Sections.
 1. Exterior Concrete, Stucco, and Masonry (Other Than Concrete Unit Masonry):
 - a. Semigloss Acrylic-Enamel Finish: Two finish coat(s) over a primer.
 - (1) Primer: Exterior concrete and masonry primer.
 - (2) Finish Coats: Exterior semigloss acrylic enamel.
 2. Exterior Concrete Unit Masonry:
 - a. Semigloss Acrylic-Enamel Finish: Two finish coat(s) over a block filler.
 - (1) Block Filler: Concrete unit masonry block filler.
 - (2) Finish Coats: Exterior semigloss acrylic enamel.
 3. Exterior Ferrous Metal:
 - a. Semigloss Alkyd-Enamel Finish: Two finish coat(s) over a primer.
 - (1) Primer: Exterior ferrous-metal primer.
 - (2) Finish Coats: Exterior semigloss alkyd enamel.
 4. Exterior Zinc-Coated Metal (except Raceways):
 - a. Semigloss Alkyd-Enamel Finish: Two finish coat(s) over a primer.
 - (1) Primer: Exterior zinc-coated metal primer.
 - (2) Finish Coats: Exterior semigloss alkyd enamel.
 5. Interior Concrete and Masonry (Other Than Concrete Unit Masonry):
 - a. Semigloss Alkyd-Enamel Finish: Two finish coat(s) over a primer.
 - (1) Primer: Interior concrete and masonry primer.
 - (2) Finish Coats: Interior semigloss alkyd enamel.
 6. Interior Concrete Unit Masonry:
 - a. Semigloss Acrylic-Enamel Finish: Two finish coat(s) over a block filler.
 - (1) Block Filler: Concrete unit masonry block filler.
 - (2) Finish Coats: Interior semigloss acrylic enamel.
 7. Interior Gypsum Board:
 - a. Semigloss Acrylic-Enamel Finish: Two finish coat(s) over a primer.
 - (1) Primer: Interior gypsum board primer.
 - (2) Finish Coats: Interior semigloss acrylic enamel.
 8. Interior Ferrous Metal:
 - a. Semigloss Acrylic-Enamel Finish: Two finish coat(s) over a primer.
 - (1) Primer: Interior ferrous-metal primer.
 - (2) Finish Coats: Interior semigloss acrylic enamel.
 9. Interior Zinc-Coated Metal (except Raceways):
 - a. Semigloss Acrylic-Enamel Finish: Two finish coat(s) over a primer.

- (1) Primer: Interior zinc-coated metal primer.
- (2) Finish Coats: Interior semigloss acrylic enamel.

- C. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.01 APPLICATION

- A. Raceways and Duct Banks More Than 600 V Concealed within Buildings: 4-inch- wide black stripes on 10-inch centers over orange background that extends full length of raceway or duct and is 12 inches wide. Stencil legend "DANGER CONCEALED HIGH VOLTAGE WIRING" with 3-inch- high black letters on 20-inch centers. Stop stripes at legends. Apply to the following finished surfaces:
1. Floor surface directly above conduits running beneath and within 12 inches of a floor that is in contact with earth or is framed above unexcavated space.
 2. Wall surfaces directly external to raceways concealed within wall.
3. Accessible surfaces of concrete envelope around raceways in vertical shafts, exposed in the building, or concealed above suspended ceilings.
- B. Accessible Raceways and Metal-Clad Cables More Than 600 V: Identify with "DANGER-HIGH VOLTAGE" in black letters at least 2 inches high, with self-adhesive vinyl labels. Repeat legend at 10-foot maximum intervals.
- C. Accessible Raceways and Metal-Clad Cables, 600 V or Less, for Service, Feeder, and Branch Circuits More Than 30 A: Identify with orange self-adhesive vinyl label.
- D. Accessible Raceways and Cables of Auxiliary Systems: Identify the following systems with color-coded, self-adhesive vinyl tape applied in bands:
1. Fire Alarm System: Red.
 2. Fire-Suppression Supervisory and Control System: Red and yellow.
 3. Combined Fire Alarm and Security System: Red and blue.
 4. Security System: Blue and yellow.
 5. Mechanical and Electrical Supervisory System: Green and blue.
 6. Telecommunication System: Green and yellow.
 7. Control Wiring: Green and red.
- E. Power-Circuit Conductor Identification: For primary and secondary conductors No. 1/0AWG and larger in vaults, pull and junction boxes, manholes, and handholes use metal tags. Identify source and circuit number of each set of conductors. For single conductor cables, identify phase in addition to the above.
- F. Branch-Circuit Conductor Identification: Where there are conductors for more than three branch circuits in same junction or pull box, use write-on tags. Identify each ungrounded conductor according to source and circuit number.
- G. Conductors to Be Extended in the Future: Attach write-on tags to conductors and list source and circuit number.
- H. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, signal, sound, intercommunications, voice, and data connections.
1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.
 2. Use system of marker tape designations that is uniform and consistent with system used by manufacturer for factory-installed connections.
 3. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and Operation and maintenance Manual.
- I. Locations of Underground Lines: Identify with underground-line warning tape for power, lighting, communication, and control wiring and optical fiber cable. Install underground-line warning tape for both direct-buried cables and cables in raceway.
- J. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Comply with 29 CFR 1910.145 and apply baked-enamel warning signs. Identify system voltage with black letters on an orange background. Apply to exterior of door, cover, or

other access.

1. Equipment with Multiple Power or Control Sources: Apply to door or cover of equipment including, but not limited to, the following:
 - a. Power transfer switches.
 - b. Controls with external control power connections.
 2. Equipment Requiring Workspace Clearance According to NFPA 70: Unless otherwise indicated, apply to door or cover of equipment but not on flush panelboards and similar equipment in finished spaces.
- K. Instruction Signs:
1. Operating Instructions: Install instruction signs to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend where instructions are needed for system or equipment operation.
 2. Emergency Operating Instructions: Install instruction signs with white legend on a red background with minimum 3/8-inch- high letters for emergency instructions at equipment used for power transfer.
- L. Equipment Identification Labels: On each unit of equipment, install unique designation label that is consistent with wiring diagrams, schedules, and Operation and Maintenance Manual. Apply labels to disconnect switches and protection equipment, central or master units, control panels, control stations, terminal cabinets, and racks of each system. Systems include power, lighting, control, communication, signal, monitoring, and alarm systems unless equipment is provided with its own identification.
1. Labeling Instructions:
 - a. Indoor Equipment: Engraved, laminated acrylic or melamine label. Unless otherwise indicated, provide a single line of text with 1/2-inch- high letters on 1-1/2-inch- high label; where 2 lines of text are required, use labels 2 inches high.
 - b. Outdoor Equipment: Stenciled legend 4 inches high.
 - c. Elevated Components: Increase sizes of labels and letters to those appropriate for viewing from the floor.
 2. Equipment to Be Labeled:
 - a. Panelboards, electrical cabinets, and enclosures.
 - b. Access doors and panels for concealed electrical items.
 - c. Electrical switchgear and switchboards.
 - d. Transformers.
 - e. Electrical substations.
 - f. Emergency system boxes and enclosures.
 - g. Motor-control centers.
 - h. Disconnect switches.
 - i. Enclosed circuit breakers.
 - j. Motor starters.
 - k. Push-button stations.
 - l. Power transfer equipment.
 - m. Contactors.
 - n. Remote-controlled switches, dimmer modules, and control devices.
 - o. Battery inverter units.
 - p. Battery racks.
 - q. Power-generating units.
 - r. Voice and data cable terminal equipment.
 - s. Master clock and program equipment.
 - t. Intercommunication and call system master and staff stations.
 - u. Television/audio components, racks, and controls.
 - v. Fire-alarm control panel and annunciators.
 - w. Security and intrusion-detection control stations, control panels, terminal cabinets, and racks.
 - x. Monitoring and control equipment.
 - y. Uninterruptible power supply equipment.
 - z. Terminals, racks, and patch panels for voice and data communication and for signal and control functions.

3.02 INSTALLATION

- A. Verify identity of each item before installing identification products.

- B. Location: Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.
- C. Apply identification devices to surfaces that require finish after completing finish work.
- D. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.
- E. Attach nonadhesive signs and plastic labels with screws and auxiliary hardware appropriate to the location and substrate.
- F. System Identification Color Banding for Raceways and Cables: Each color band shall completely encircle cable or conduit. Place adjacent bands of two-color markings in contact, side by side. Locate bands at changes in direction, at penetrations of walls and floors, at 50-foot maximum intervals in straight runs, and at 25-foot maximum intervals in congested areas.
- G. Color-Coding for Phase Identification, 600 V and Less: Use the colors listed below for ungrounded service, feeder, and branch-circuit conductors.
 - 1. Color shall be factory applied or, for sizes larger than No. 10 AWG if authorities having jurisdiction permit, field applied.
 - 2. Colors for 208/120-V Circuits:
 - a. Phase A: Black.
 - b. Phase B: Red.
 - c. Phase C: Blue.
 - 3. Colors for 480/277-V Circuits:
 - a. Phase A: Brown.
 - b. Phase B: Orange.
 - c. Phase C: Yellow.
 - 4. Field-Applied, Color-Coding Conductor Tape: Apply in half-lapped turns for a minimum distance of 6 inches from terminal points and in boxes where splices or taps are made. Apply last two turns of tape with no tension to prevent possible unwinding. Locate bands to avoid obscuring factory cable markings.
- H. Aluminum Wraparound Marker Labels and Metal Tags: Secure tight to surface of conductor or cable at a location with high visibility and accessibility.
- I. Underground-Line Warning Tape: During backfilling of trenches install continuous underground-line warning tape directly above line at 6 to 8 inches below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16 inches overall.
- J. Painted Identification: Prepare surface and apply paint according to Division 9 painting Sections.

END OF SECTION

SECTION 16118

FIBERGLASS CONDUIT

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This section specifies the furnishing and installing of rigid non-metallic conduits, applicable to medium and low voltage, direct current cable installation work to be performed within the CMNT Shop under this contract.

1.02 RELATED SECTIONS

- A. Pertinent provisions of the following, also apply to the work of this Section, except as they may be modified herein, and are hereby made part of this Specification to the extent required:
1. Section 16120 - Wire, Cable and Busway.
 2. Section 16119 - Medium Voltage Cable.

1.03 QUALITY ASSURANCE

- A. Conform all manufacturing and work to these specifications and to the applicable requirements of the latest edition of the following codes, regulations and standards.
1. Local Building Codes
 2. National Electrical Code (NEC)
 3. National Fire Protection Association (NEPA)
 4. Underwriters Laboratories, Inc. (UL)
 5. Occupational Safety and Health Administration (OSHA)
 6. Institute of Electrical and Electronic Engineers (IEEE)
 7. American National Standards Institute (ANSI)
 8. National Electrical Manufacturers Association (NEMA)
- B. Comply with all other applicable laws, ordinance and requirements of the local agencies and utility companies having jurisdiction.
- C. In the event of any conflicts in the provisions stipulated in the referenced codes, regulations or standards and the specifications, the most stringent provision, as determined by the Project Manager, is to govern.

1.04 SUBMITTALS

- A. Submit manufacturer's data for conduit and fittings specified herein including, but not limited to, dimensions, electrical rating and identification.

PART 2- PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include, but are not limited to, the following:
1. Non-Metallic Conduit
 - a. Canadian General Electric Company (CGE)
 - b. Champion Flame Shield, or,
 - c. Approved equal.

2.02 MATERIALS

- A. Rigid Fiberglass Conduit:
1. Heavy Wall (IPS size) rigid conduit of Fiberglass Reinforced polyester Epoxy (FRE) as manufactured by the pultrusion or filament wound process. At least 50% of the glass reinforcement is to be in the form of continuous strands. FRE conduit suitable for above ground surface mounted duct systems.
 - a. Conform exposed conduit and fittings installed above grade to NEMA Spec. TC-14A for filament wound reinforced thermosetting resin conduit.
 - b. Concrete encase conduit and fittings installed below grade and conform to NEMA Spec. TC-14A, as Listed and Labeled by UL, meeting the requirement of NEC Article 347 for Rigid Nonmetallic Conduit and its use.
 - c. The FRE conduit is to pass the UL 651 flame test and be certified by the manufacturer as such.
 2. Add UV degradation protection to all reinforcement containing materials by use of surface veiling, pigments, dyes or fillers.
 3. Make the pull box and fittings from fiberglass reinforced epoxy (FRE) or polyester compounds.
 4. Utilize in the installation, the bonding agent as recommended by the manufacturer to insure the integrity of the system.
 5. Fiberglass pull boxes, fittings and associated hardware items such as square tubing, threaded rods, nuts, etc., all are to be provided by the same manufacturer.
 6. Certify that the manufacturer's meet the NEMA specification applicable for area of conduit use, TC-14A for exposed or better. Each piece of conduit is to be labeled with the following information, marked clearly and durably every 10 ft or as recommended by the manufacturer:
 - a. Nominal size: (IPS).
 - b. Type: (Heavy Wall).
 - c. Manufacturer's name and trademark.
 - d. Material/resin designation: (i.e. Fiberglass polyester conduit).
 - e. NEMA specification number: (i.e. TC-14A).

2.03 GENERAL REQUIREMENTS

- A. Furnish all items of the materials, design, sizes and ratings shown on the drawings and herein specified.
- B. Furnish materials and equipment bearing evidence of UL approval where UL standards exist and such product listing is available.
- C. Method of fabrication, assembly and installation is optional unless otherwise specifically stated.
- D. Provide products that are free from defects impairing performance, durability, or appearance, and of the commercial quality best suited for the purpose shown on the drawings or specified herein.

PART 3 - EXECUTION

3.01 CONDUIT SIZING, ARRANGEMENT, AND SUPPORT

- A. Install conduit and fitting according to National Electrical Code.

- B. Arrange conduit to maintain headroom and present a neat appearance.
- C. Route exposed conduit and conduit above accessible ceiling parallel and perpendicular to walls and adjacent piping.
- D. Maintain a minimum 6 inch clearance between conduit and piping. Maintain a minimum 12 inch clearance between conduit and heat sources such as flues, steam pipes, and heating appliances.
- E. Arrange conduit supports to prevent distortion of alignment by wire pulling operations. Fasten conduit using galvanized straps, lay-in adjustable hangers, clevis hangers or bolted split stamped galvanized hangers. Coordinate work to embed channel or spot inserts in concrete for supporting conduits, before the concrete is poured for new slabs or walls. Use appropriate anchors to attach conduit supports to existing structures.
- F. Group conduit in parallel runs where practical and use conduit rack constructed of steel channel with conduit straps or clamps. Provide space for 25 percent additional conduit.
- G. Do not fasten conduit with wire or perforated pipe straps. Remove all wire used for temporary conduit support during construction, before conductors are pulled.
- H. Support the conduits in accordance with the criteria established in the National Electric Code.
- I. Unless otherwise shown on the drawings, size conduit for conductor type installed. 3/4-inch (19mm) is the minimum conduit size.

3.02 CONDUIT INSTALLATION

- A. Cut conduit square using a saw or pipe cutter; de-burr cut ends.
- B. Bring conduit to the shoulder of fittings and couplings and fasten securely.
- C. Use conduit hubs or sealing locknuts for fastening conduit to cast boxes, and for fastening conduit to sheet metal boxes in damp or wet locations.
- D. Install no more than the equivalent of three 90-degree bends between boxes.
- E. Use conduit bodies to make sharp changes in direction, as around beams.
- F. Avoid moisture traps where possible; where unavoidable, provide junction box with drain fitting at conduit low point.
- G. Use suitable conduit caps to protect installed conduit against entrance of dirt and moisture.
- H. Use silicone sealant fill to fill the void space in conduit at the entrance and exit of the cables.
- I. Provide # 8 insulated conductor or suitable pull string in empty conduit, except sleeves and nipples.
- J. Install expansion joints where conduit crosses building expansion joints.
- K. Where conduit penetrates fire-rated walls and floors, seal opening around conduit with UL listed foamed silicone elastomer compound. Provide galvanized rigid conduit sleeve for all penetrations, cut sleeve flush with opening.

- L. Route conduit through roof openings for piping and ductwork where possible; otherwise, route through roof jack with pitch pocket.
- M. Maximum Size Conduit in Slabs Above Grade is 1-inch (25mm). Do not route conduits to cross each other in slabs above grade.

END OF SECTION

SECTION 16119

MEDIUM VOLTAGE CABLE

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This Specification covers the design, manufacture, testing, delivery and installation of 2,000 volt, copper conductors, ethylene-propylene rubber (EPR) insulated, low smoke cross linkpolyolefin (XLPO) jacketed power cable.
- B. Following sizes of dc cables, rated 2kV are used in this project.
 - 1. 1000 kCM between DC Switchboard, stinger contactors, and DC Stinger power bus conductor.
 - 2. # 1/0 AWG cables between DC Switchboard, car receptacle contactors, and car receptacle locations.
- C. Cables placed in subsurface ducts will be subject to wet, brackish conditions.
- D. The cable will be subjected to heavy currents cyclical in nature and to continual, intermittent applications of 3,000 volt dc voltage spikes.
 - 1. Furnish the cable in continuous lengths on non-returnable reels. Allow only one length on each reel. Afford reels complete protection to the cable during shipment and handling.
 - 2. Apply a watertight seal to each end of the cable to prevent entrance of moisture during shipment, installation and storage.
- E. The cable specifications described in this Section pertain only to the DC Stinger and car receptacle systems.

1.02 APPLICABLE STANDARDS

- A. The cable shall comply with the latest revisions of all applicable ANSI, ICEA, NEMA,ASTM, NESC and NEC Standards.
 - 1. ANSI, American National Standards Institute
 - 2. ICEA, Insulated Cable Engineers Association
 - 3. NEMA, National Electrical Manufacturers Association
 - 4. ASTM, American Society for Testing and Materials
 - 5. NESC, National Electrical Safety Code
 - 6. NEC, National Electrical Code

1.03 SUBMITTALS

- A. Submit the following technical data, for approval of the Authority Representative.
- B. Technical Data for 1000 KCM conductor. The Contractor is advised that it is essential that the characteristics of the cable be fully explained to meet the ratings described in paragraph 2.1, by furnishing the information required in the following tabulation. Failure to do so will subject the submittal to rejection as incomplete.

	<u>Item Description</u>	<u>Minimum Standard</u>
1.	Conductor Stranding:	[Class D Extra Flexible]
2.	Conductor Material:	[Copper]
3.	Conductor Coating:	[Tin-Coated]
4.	Insulation Material:	[EPR]
5.	Insulation Thickness (minimum):	[2.29 mm (90 mils)]

- | | | | |
|-----|---|--|---------------------|
| 6. | Maximum Copper Temperature: | [90°C] | |
| | a. Continuous: | [90° degrees Celsius] | |
| | b. Emergency: | [130° degrees Celsius] | |
| | c. Short Circuit: | [250° degrees Celsius] | |
| 7. | Minimum Installation Temperature: | [-20° degrees Celsius] | |
| 8. | Jacket Material: | [Lo Smoke XLPO] | |
| 9. | Jacket Thickness (minimum): | [1.65 mm (65 mils)] | |
| 10. | Physical Requirements: | | |
| | | <u>Insulation</u> | <u>Jacket</u> |
| | a. Tensile Strength (minimum): | [1200 psi] | [1700 psi] |
| | b. Elongation at Rupture (minimum): | [150%] | [150%] |
| | c. Set (maximum): | [50%] | [50%] |
| 11. | Aging Requirements: | | |
| | a. After Air Oven Test | [168 Hours] | [168 Hours] |
| | (Indicate Condition): | [121° C] | [100° C] |
| | Tensile Strength and | | |
| | Elongation at Rupture, | | |
| | Percent of Unaged Value: | [75%] [85%] | [75%][75%] |

| | e. Arbor Diameter: | [76 mm (0.3")] | |
| 18. | Electrical Characteristics (Indicate Conditions): | | |
| | a. Resistance: | [.03543] ohms per km | |
| | b. Reactance (Inductive): | [.0919] ohms per km. | |
| | c. Impedance: | [.0985] ohms per km. | |
| 19. | Cable Weight: | [2.41 kg/m (3.582 #/ft)] | [5.2 MNT (11462 #)] |

C. Technical Data for #1/0 conductor. The Contractor is advised that it is essential that the characteristics of the cable be fully explained to meet the ratings described in paragraph 2.1, by furnishing the information required in the following tabulation. Failure to do so will subject the submittal to rejection as incomplete.

	<u>Item Description</u>	<u>Minimum Standard</u>		
1.	Conductor Stranding:	[Rope Lay Class K]		
2.	Conductor Material:	[Copper]		
3.	Conductor Coating:	[Tin-Coated]		
4.	Insulation Material:	[EPR]		
5.	Insulation Thickness (minimum):	[2.29 mm (90 mils)]		
6.	Maximum Copper Temperature:	[90°C]		
	a. Continuous:	[90° degrees Celsius]		
	b. Emergency:	[130° degrees Celsius]		
	c. Short Circuit:	[250° degrees Celsius]		
7.	Minimum Installation Temperature:	[-20° degrees Celsius]		
8.	Jacket Material:	[Lo Smoke XLPO]		
9.	Jacket Thickness (minimum):	[1.65 mm (65 mils)]		
10.	Physical Requirements:		<u>Insulation</u>	<u>Jacket</u>
	a. Tensile Strength (minimum):		[1200 psi]	[1700 psi]
	b. Elongation at Rupture (minimum):		[150%]	[150%]
	c. Set:		[50%]	[50%]
11.	Aging Requirements:			
	a. After Air Oven Test (Indicate Condition):		[168 Hours]	[168 Hours]
	Tensile Strength and Elongation at Rupture, Percent of Unaged Value:		[121° C]	[100° C]
	b. After Oil Immersion Test (Jacket Only):			
	Indicate Conditions:		[75%] [85%]	[75%] [75%]
	Tensile Strength, and Elongation Percent of Unaged Value (minimum):		[18 hrs/121°C/ASTM #2 Oil]	
	Elongation at Rupture, Percent of Unaged Value (minimum):		[60%]	
12.	Accelerated Water Absorption:		[50%]	
	a. Electrical Method:			
	Increase in Capacitance:			
	1 to 14 Days:		[5.0%]	
	7 to 14 Days:		[3.0%]	
	Stability Factor After 14 Days:		[1.0]	
	b. Gravimetric Method:			
	Water Absorption in Milligrams per 645.16 Square millimeter:		[5.0]	[20.0]
13.	Electrical Requirements (Insulation):			
	a. AC Voltage Test:		[9.5 kV]	
	b. DC Voltage Test:		[28.5 kV]	
	c. Insulation Resistance:		[K = 20,000]	
14.	Cable Outside Diameter:		[17 mm (.681 inch)]	
15.	Allowable Minimum Bending Radius:		[76 mm, (3 inches)]	
16.	Allowable Maximum Pulling Tension:		[1814 kg (4000 pounds)]	

17. Reel Data:
 - a. Diameter: [As recommended by Cable Manufacturer]
 - b. Width: [As recommended by Cable Manufacturer]
 - c. Drum Diameter: [As recommended by Cable Manufacturer]
 - d. Tare Weight: [As recommended by Cable Manufacturer]
 - e. Arbor Diameter: [As recommended by Cable Manufacturer]
18. Electrical Characteristics
(Indicate Conditions):
 - a. Resistance: [.033465 r/km (102 r/1000)] ohms per km.
 - b. Reactance (Inductive): [.0919] ohms per km.
 - c. Impedance:
19. Cable Weight: [.034704] ohms per km.

PART 2 - PRODUCTS

2.01 DC FEEDER CABLE:

- A. General: single conductor, type EPR, ethylene-propylene rubber, feeder cable for use with a 750 volt dc (nominal) traction power distribution system.
- B. Voltage Rating: 2000 Volts, withstand minimum voltage of 1000 Volts dc continuously; and sustain positive and negative voltage spikes of 3000 Volts concurrent with the continuous 750 Volts dc without damage to the cable nor reduction in cable lifetime.
- C. Temperature Rating:
 1. Normal operating conductor temperature: 90°Celsius wet and dry locations per NEMA WC70 continuous rating and 110°Celsius hot spot rating.
 2. Emergency operating conductor temperature: 130°Celsius per NEMA WC70 emergency overload rating is limited to not more than 100 hours per year and a maximum of 5 such 100 hour period in the anticipated cable life.
 3. Allowable conductor temperature reached under short circuit conditions 250°Celsius per NEMA WC70.
- D. Conductors:
 1. Annealed coated copper meeting the elongation, resistivity, finish and coating continuity requirement of ASTM B33 or B3, before stranding.
 2. Meet requirements for compressed Class D conductor per ASTM B-8 for conductors in conduit and cable tray. In addition, provide Class G extra-flexible stranded cable between DC stinger power takeoff conductor termination lug and the feeder cable as required to reduce transference of vibration to the rigid conduit system and to provide an ease of maintenance and installation.
- E. Insulation Jacket Covering:
 1. Composition: The insulation of flame retardant, EP (ethylene propylene) material. A protective jacket of low smoke, zero halogen thermosetting material Cross Link polyolefin (XLPO) shall be provided.
 2. Requirements: The insulation shall be provided with a jacket that is UL labeled "RHW-2", having minimum peel strength of the jacket from the insulation of 4 pounds per inch of width and have an insulation power factor of 2%.
- F. Identification:
 1. The cable shall carry throughout its length a color coded marker thread, as per NEMA requirements, for the purpose of manufacturer identification.
 2. Each length of cable shall be durably printed on the surface and repeated at intervals of 50mm or less with the following information.
 - a. Manufacturer's name
 - b. Cable size and type

- c. Year of manufacture
 - d. Insulation type
 - e. Voltage classification
 - f. Function
- G. Tests: Test and measurements of finished cable and material used in cable manufacturing shall be as prescribed in referenced NEMA Specifications.
- H. Acceptable Manufacturers (or equal):
- 1. The Okonite Company
 - 2. BICC
 - 3. AMERCABLE
 - 4. Rome Cable Corporation
 - 5. Triangle Conduit and Cable Co., Inc.
 - 6. Boston Insulated Wire

2.02 ARC AND FIREPROOFING TAPE

- A. The fireproofing tape material shall be a composite of a heat-resistant, flame-retardant, elastomeric compound permanently bonded to a flexible, conformable fabric backing. There shall be no asbestos, fiberglass or other potentially dangerous components in the tape.
- B. Thickness - The minimum thickness of this material shall be 50 mils (1.27mm).
- C. Retention of Strength after Exposure - At least 80% of the initial tensile strength shall be retained after exposure under the following conditions for 168 hours:
- 1. Distilled Water
 - 2. Salt Water
 - 3. Sewage
 - 4. Sunlight
- D. Cold Temperature Flexibility - The tape shall not crack when subjected to a 360 degree bend around a 1-inch (25mm) mandrel at 14 degrees F (-10 degrees Celsius).
- E. Arc Resistance - The tape shall withstand when wrapped about a 76mm diameter lead sleeve, exposure to heat created by an arc from 22mm electrodes, located 1-inch (25mm) from the sample, generated by not less than 195 nor greater than 210 amperes d-c, for a minimum of 30 seconds. The arc is blown magnetically against the lead tube until it melts at the arc contact point.
- F. Flame Resistance - Prepare the tape to withstand above, the flame created by an aerated transformer oil fire for a period of not less than ten (10) minutes before the lead tube begins to melt. Suspend the sample approximately 1-ft (.3048m) above the surface of the burning oil.
- G. Fireproofing tape shall be Quelpyre Arc and Fireproofing Tape by Quelcor, Inc. or Approved equal.

2.03 CABLE SPLICES AND TERMINATIONS

- A. Splice all dc cables by compression method or by Cadweld. Submit the proposed method of splicing for approval to the Authority Representative.
- B. Submit for approval, proposed splice and termination insulation systems and manufacturer's recommended installation procedures for each type.

2.04 CABLE TAGS

- A. Provide circuit identification tags and install them on cables at termination and splice locations. Select tags from Almetek, Tech Products or Approved equal. Secure tags to cables using nylon cable ties.

PART 3 - EXECUTION

3.01 TESTS

- A. Test the cable at the factory in accordance with applicable NEMA standards.
- B. Provide the Authority Representative with a minimum ten days written notice prior to the factory tests. The Authority Representative reserves the right to witness tests.
- C. Furnish five copies of certified test reports for approval by the Project Manager, prior to shipment of the cable.
- D. All 2 kV-insulated cables shall be field tested after installation by Step Voltage megger test procedure using a megger at 2500 Volts. Obtain the services of an independent testing agency to perform the testing requirements. Submit the name, address, telephone number, and qualifications of the proposed testing agency test procedure for approval at least(16) weeks prior to cable field commissioning tests. In addition, submit for approval the cable commissioning test procedure at least (8) weeks prior to the proposed testing date. Reject any cable exhibiting defects or non-compliance with these Specifications and assume responsibility for all cost incidental to the replacement of the Cable.

3.02 CABLE INSTALLATION

- A. Furnish and install cables as herein specified.
- B. Assume responsibility for all cable lengths and allow sufficient slack for connection to equipment. Seal cable ends immediately after cutting to prevent moisture from entering the cable.
- C. Where existing cable racks are unusable, provide new fiberglass cable racks.

3.03 ARC AND FIREPROOFING TAPE

- A. Wrap cables spirally, fabric side out with a single, half-lapped layer of the fireproofing tape with care taken to insure total coverage of exposed areas. Fasten the tape to the cable with the manufacturer's recommended typing cord.
- B. Wrap cables with the fireproofing tape wherever the cables are exposed, in pull boxes, and in any location where exposed in cable tray.

3.04 CABLE SPLICES AND TERMINATIONS

- A. No straight through inline splices in cables will be permitted except in pullboxes. Make splices, that are made in the pull boxes according to the manufacturer's recommendation, subject to the approval of the Authority Representative. Furnish the Project Manager with seven (7) copies of the manufacturer's recommendations.
- B. Provide compression splices on dc cables. Do the splicing in accordance with the manufacturers recommendation.
- C. Furnish and install heat-shrinkable insulation systems over all DC cable splices. When

applying heat to the heat shrinkable insulation, ensure ample heat, without burning, to effect a proper seal, in accordance with the manufacturer's recommendations. Acceptable heat shrinkable insulation sleeves shall be as manufactured by Raychem, 3M Inc., or approved equal.

- D. Schedule all splicing so that the Authority Representative may visually inspect and witness the procedure at each location.

3.05 TESTS

- A. Test all cables, unless directed otherwise by the Authority Representative, for insulation dielectric strength (meggered) and continuity as described herein and the results properly recorded and submit to the Authority Representative on graphs meeting ICEA standards.

END OF SECTION

THIS PAGE NOT USED

SECTION 16120

WIRE, CABLE AND BUSWAYS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing wire, cable and busways.
- B. Definitions:
 - 1. Cable: Cable having low smoke generating characteristics.
- C. Requirements for single-conductor cable and for multiple-conductor cable as stated except as otherwise specified.
- D. Related Work Specified Elsewhere:
 - 1. Grading, excavating and backfilling: Section 02320.
 - 2. Wire connection accessories: Section 16125.
 - 3. Raceways, boxes and cabinets: Section 16130.

1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is engaged in production of similar wire, cable and busways.
- B. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. National Electrical Code (NEC).
 - 3. Insulated Cable Engineers Association (ICEA): S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692, S-81-570.
 - 4. IEEE: 1202-1991 IEEE Standard for Flame Testing of Cables for Use in Cable Tray in Industrial and Commercial Occupancies, 383-1974 IEEE Standard for Type Test of Class 1E Electrical Cables, Field Splices, and Connections for Nuclear Power Generating Stations.

American Standards of Testing and Materials (ASTM): B3-95, Standard Specification for Soft or Annealed Copper Wire; B8-99, Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft; D471-98e1, Standard Test Method for Rubber Property-Effect of Liquids, E662-97, Standard Test Method for Specific Optical Density of Smoke Generated by Solid Materials.
 - 9. ITS: Directory of ITS Listed Products

- C. Source Quality Control:
 - 1. Cable and busways: Listed or labeled per UL or ITS directory.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings.
- B. Samples:
 - 1. Smoke-density test sample for jacket material: Specified sample will become property of the Authority.
- C. Certification:
 - 1. Certified flame-retardancy test reports (VW-1, IEEE 383, and IEEE 1202, Article 18) and data for tests performed not more than 12 months prior to submittal, for materials which are identical to those of cable furnished. Include test reports with submittal of shop drawings.
 - 2. Submit smoke-density test reports and data for tests performed on the jacket material not more than 12 months prior to the submittal, for materials which are identical to those of the furnished cable. Include test reports with submittal of shop drawings.
 - 3. Certified test reports demonstrating that cable complies with specified requirements and those of referenced ICEA Standards. Submit test reports prior to cable shipments.
 - 4. Certificates from manufacturers verifying that products conform to specified requirements. Include certificate with submittal of shop drawings and with each cable shipment.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each single-conductor cable, each multiple-conductor cable and each busway to show label per referenced UL or ITS directory, size, voltage, manufacturer and number of conductors or phases in accordance with NEC requirements.
- B. Ship each unit securely packaged and labeled for safe handling and shipment.
- C. Store products in a dry and secure facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Single-Conductor and Multiple-Conductor Cable:
 - 1. Type and size: As shown.
 - 2. Rated voltage: 600 volts.
 - 3. Conductors:
 - a. ASTM B3 or B8 annealed copper.
 - b. Size 10 AWG and smaller: Solid or Class B or Class C stranded.
 - c. Size 8 AWG and larger: Class B stranded.
 - 4. Standards: Except as modified, wires and cable complying with the following standards:

- a. Cross-linked polyethylene (XLPE) insulated cable: ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692, S-81-570.
 - b. Other cable: ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692, S-81-570.
5. Non-metallic jacket for single-conductor cable and an overall covering on multiple-conductor cable:
- a. Standard grade THNN/THWN at shop.
 - b. Jacket material free of PVC and PVC-based compounds.
 - (1) Tensile strength, minimum pounds per square inch: 1,800.
 - (2) Elongation at rupture, minimum percent: 150.
 - (3) Aging requirement: After 168 hours in air oven test at 100C, plus-or-minus one degree C:
 - (a) Tensile strength, minimum percentage of unaged value: 100.
 - (b) Elongation at rupture, minimum percentage of unaged value: 80.
 - (4) Oil immersion: 18 hours at 121C, plus-or-minus one degree C, ASTM D471, Table 1, No. 2 oil:
 - (a) Tensile strength, minimum percentage of unaged value: 80.
 - (b) Elongation at rupture, minimum percentage of unaged value: 80.
6. Applied voltage testing:
- a. Single-conductor cable and individual conductors of multiple-conductor cable to be given applied ac voltage dielectric-strength test, i.e., six-hour water-immersion test.
 - b. For single conductors of multiple-conductor cable, conduct tests prior to assembly as multiple-conductor cable.
 - c. Test procedures:
 - (1) Polyethylene-insulated conductors: In accordance with ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, and S-105-692.
 - (2) Other conductors: In accordance with ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, S-105-692, and S-81-570.

B. Single-Conductor Cable:

- 1. Insulated with ethylene-propylene-rubber with non-metallic jacket as specified. UL-Labeled as Type RHW-2.
- 2. Color coding: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.

C. Multiple-Conductor Cable:

- 1. Individual conductors:
 - a. Number of conductors: As shown.
 - b. Construction: Complying with one of the following:
 - (1) Insulated with ethylene-propylene-rubber, with or without non-metallic jacket.
 - (2) Insulated with composite compound of ethylene-propylene-rubber and polyethylene, without outer jacket.
 - (3) Insulated with filled cross-linked polyethylene without jacket.
 - c. Phase and neutral conductors: Individually insulated.
 - d. Neutral conductors: Same size as phase conductors.
 - e. Bare ground conductors: Sized in accordance with the NEC, unless otherwise shown.
 - f. UL Listed as Type RHW-2 or XHHW-2.

2. Conductors assembled with nonwicking, flame-retardant filler to form cable of circular cross section.
 3. Metallic sheath:
 - a. Provide one of the following:
 - (1) Size 1 AWG and larger:
 - (a) Interlocked aluminum-tape armor.
 - (b) Continuous corrugated aluminum sheath conforming to ICEA S-19-81, Table 4-26A.
 - (2) Size 2 AWG and smaller: As specified for 1 AWG and larger or continuous smooth aluminum sheath conforming to ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, and S-105-692.
 - b. Metallic covering not required for multiple-conductor TC cable with overall non-metallic jacket when installed in cable tray.
 4. Multiple-conductor cable provided with overall non-metallic jacket as specified.
 5. Cable UL-listed as follows:
 - a. Non-metallic-sheathed cable: Type TC, suitable for wet and dry locations.
 - b. Metallic-sheathed cable: Type MC, suitable for wet and dry locations.
 6. Color coding:
 - a. Power cables: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
 - b. Control cables: In accordance with ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, and S-105-692.
- D. Fixture Wire: UL 62, with the following additional requirements:
1. Type: SF-2 silicone-rubber insulated or as necessary to suit temperature rating of lighting fixture, minimum 90C.
 2. Conductor: Stranded copper conductor 16AWG or larger as shown.
- E. Bare Conductors: ASTM B3 or B8, annealed copper conductor; 8AWG and larger, Class B stranded, unless otherwise shown or specified.
- F. Busway (Busduct) and Fittings:
1. UL 857, NEMA BU1.
 2. Totally enclosed, three-phase, four-wire feeder busway system, as shown, with necessary fittings, hanging devices, accessories and provision for flange bolting over circuit breaker.
 3. Continuous current rating:
 - a. Secondary tie duct for use in combined substation: Sized in accordance with ANSI C37.20.1, C37.20.2, C37.20.3, and NEC.
 4. Voltage rating: 480/277 volts.
 5. Busway system braced to withstand minimum short-circuit current of 75,000 amperes symmetrical, unless otherwise shown.
 6. Maximum allowable temperature rise in busway at continuous full load above maximum ambient temperature of 40C: 55C.
 7. Housing: Nonventilated, fabricated from galvanized sheet steel. Removable gasketed cover provided at transformer connection for maintenance and test. Hardware galvanized or cadmium-plated.
 8. Joints:
 - a. Single-bolt pressure joint designed for optimum electrical contact and mechanical strength.
 - b. To permit safe testing of its tightness without de-energizing systems.
 - c. To permit removal of duct sections without disturbing adjacent pieces.
 - d. To permit making up joint from one side when busway is installed against wall or ceiling.

9. Busbars: Fabricated from 98-percent-conductivity copper and insulated over entire length except at joints and contact surface. Joints and contact surfaces tin-plated or silver-plated. Neutral bar same size as phase bar. Ground bar half size of phase bar.
10. Entire busway system polarized.
11. Expansion fittings provided where necessary.
12. Flexible connections, braided or laminated, provided for connecting bus conductor to transformer terminals.
13. Finish: Light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install type cable as specified.
- B. Install single-conductor cable in conduit, underfloor duct or wireway. Install UL Type TC multiple-conductor cable in cable trays only. Install UL Type MC multiple-conductor cable and ground cable on channel inserts, cable trays, racks, trench or trough using straps and fasteners as specified in Section 16130. Install UL Type MC multiple-conductor cable in conduit where shown or required. On walls or ceilings, fasten cable and bus duct directly to channel inserts, or use expansion-bolt anchors to attach to concrete and toggle bolts to attach to concrete masonry unit walls. Splice cable only when unavoidable.
- C. Install motor feeders, service connections and extensions in accordance with reference codes. Install motor feeder in 18-inch minimum length liquid-tight flexible conduit at motor conduit box.
- D. Use nylon straps to bundle and secure wire and cable located in panelboards, cabinets, switchboards, motor control centers and switchgear.
- E. Minimum bending radius 12 times outer diameter of cable. Where shown, use shorter bending radius as permitted by NEC, ICEA S-95-658, S-96-659, S-93-639, S-94-649, S-97-682, and S-105-692, and cable manufacturer.
- F. To facilitate pulling cable, use listed per UL or ITS directory lubricant recommended by cable manufacturer.
- G. Use direct-burial cable only for stray current and cathodic protection.
- H. To install direct-burial cable, prepare trench of uniform width and free of sharp projections and rocks and place three-inch bed of sand. Do not pull cable directly into trench from stationary reel; unreel cable beside trench. Place cable on sand bed and backfill with three-inch deep sand cover. Fill remainder of trench with approved fill material and compact in accordance with Section 02320. Provide temporary supports in trench as necessary to prevent damage to insulation or jacket during installation.
- I. In damp and dusty indoor locations, tunnel areas, manholes and outdoor locations, seal cable at conduit termination using duct-sealing compound.

- J. Where shown or necessary, install cable-seal fitting specified in Section 16130 to prevent entry of water into electrical facilities. Where approved, use seal compound specified in Section 16130.

3.02 IDENTIFICATION:

- A. Identify cable terminations, feeders and power circuits using non-metallic fiberboard tags or plastic labels. Attach tags to cable with slip-free plastic lacing or nylon bundling straps. Use designation shown.

3.03 FIELD QUALITY CONTROL:

- A. Furnish equipment required to perform tests. Prior to insulation and high-potential tests, disconnect instruments and equipment which might be damaged during such tests. Conduct tests in presence of the Engineer.
- B. Submit test procedure for approval and perform approved tests including, but not limited to, the following:
1. Single-conductor cable and multiple-conductor cable:
 - a. Test continuity of cable conductors using ohmmeter.
 - b. Proof-test insulation resistance to ground and between insulated conductors for minimum of one minute using 1,000-volt megger. Insulation resistance: 200,000 ohms minimum.
 - c. When cable shows unsteady insulation resistance of less than 200,000 ohms, perform high-potential test at 80 percent of factory ac test voltage or as recommended by cable manufacturer.
 2. Busway:
 - a. Clean contact surfaces before making connections. For bolted connections, apply torque recommended by manufacturer.
 - b. Test resistance of busway connections. Resistance not to exceed value recommended by manufacturer.
 - c. Test insulation resistance to ground and between insulated busbars for minimum of one minute using 1,000-volt megger. Insulation resistance: One-megohm minimum. When busway shows insulation resistance of less than one-megohm minimum, perform high-potential test.
- C. Submit certified test reports.

END OF SECTION

SECTION 16121

DC STINGER SYSTEM AND CONTROLS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This Section covers specifications for furnishing all labor, materials, equipment, services, and tools necessary and required for electrical construction of the following traction power systems.
 - 1. 750 VDC Stinger system for traction power to married pairs for movement inside the shops.

1.02 RELATED SECTIONS

- A. Section 16119 - Medium Voltage Cable

1.03 QUALITY ASSURANCE

- A. Qualifications: Select a manufacturer who is regularly engaged in the repetitive production of stinger systems and controls equipment of the types and ratings described in these specifications. The equipment manufacturer shall have and maintain ISO 9001 or ISO 9002 certification.
- B. The work of this Section, including the products, shall satisfy the applicable requirements of the following standards and regulations of Jurisdictional Authorities:
 - 1. National Electrical Code (NFPA 70)
 - 2. ANSI/IEEE
 - 3. OSHA
 - 4. NEMA including WC70
- C. Inspections and Tests:
 - 1. The Authority Representative reserves the right to witness all tests and manufacturer inspections that the Authority Representative deems necessary.
 - 2. The Contractor and his supplier shall grant the Authority Representative free entry at all times while work under this Specification is being performed.
 - 3. The Contractor shall provide, free of cost, reasonable facilities to satisfy that materials and equipment are being furnished in accordance with these Specifications.\

1.04 SUBMITTALS

- A. Submittals for all stinger equipment components, materials, and systems shall be made as described in these Specifications.
- B. Prepare as-built drawings showing the complete layout of the 750 VDC stinger system and submit to the Authority prior to final acceptance of work.
- C. The Contractor shall include shop drawings, manufacturer's descriptive literature and published details with performance and capacity rating schedules on chart, for all product specified in Part 2 of this Section. Product shop drawings shall indicate fabrication detail and proposed layouts for shop or field fabrication. Include electrical wiring diagrams, details and all necessary dimensions from assembly and from installation.

- D. Operation and Maintenance Manuals
1. The Contractor shall include the following element in each manual; however not necessarily in the order listed:
 - a. Table of Contents.
 - b. Erection or installation instructions.
 - c. Start-up procedures.
 - d. Schedule of preventive maintenance requirements.
 - e. Detailed maintenance procedures and schedule for any routine periodic maintenance.
 - f. Detailed trouble shooting procedures.
 - g. Corrected and approved control and wiring diagrams.
 - h. Data sheet listing pertinent equipment or system information.
 - i. Color photographs (4"x 6") of the constructed and functional stinger system in detail. The photographs shall be bound in a suitable loose-leaf photograph album having individual transparent pages for insertion of the photographs.
 - j. Name, address, and telephone number for each major supplier/manufacturer of the equipment, where spare parts may be obtained for the equipment.
 2. The Contractor shall submit the final operation and maintenance manuals to the Authority Representative. These manuals shall be technically accurate and complete and shall represent the "As-Built" system, piece of equipment, or material. All illustrations, text, and tabular material shall be in final form; copies of all Shop Drawings submitted for approval shall be included for each major piece of equipment.
- E. Certification:
1. The Contractor shall furnish to the Authority Representative, the certified copies of the results of all tests and measurements made to determine the quality and serviceability of the manufactured equipment listed in this Specification Section, at no additional cost to WMATA.
 2. Certification shall include, as a minimum, the following items:
 - a. DC Stinger System
 3. DC Stinger System and Controls - System Integration
- F. Assume complete responsibility for the design, component and material selection, manufacturing, installation, testing, and operation of the DC Stinger power and controls as a system. Integrate the elements and assemblies described in Part 2 of this Specification Section, into a complete, operable, and WMATA-approved DC Stinger System.

PART 2 - PRODUCTS

2.01 DC STINGER (CONDUCTOR/COLLECTOR) SYSTEM

- A. General:
1. The conductor/collector system components shall be UL listed, and shall meet or exceed UL-94 for Combustibility (self-extinguishing characteristics).
 2. The conductor/collector system shall be protected against direct contact in accordance with "finger-safety standard" (UL-E99342). The conductor/collector system shall consist of standardized interchangeable units - track section, coupling sets, dead end caps, track hangers and power takeoff and control trolleys (including cables and cable support/relief assemblies).
 3. This application requires a system of sturdy mechanical design, able to withstand the everyday operating environment common to transit maintenance facilities and as found in areas of vehicle maintenance lifts.

4. The conductor/collector system shall be of sufficient size to conduct all intermittent peak current requirements and a conductor of a cross sectional area of sufficient size for required mechanical strength.
 5. No special tools should be required for installation.
 6. The conductor system shall consist of all necessary conductor sections, hanger supports, insulators, anchor supports, feeder assemblies, expansion joint assemblies, collector (trolley) assemblies and/or special components.
 7. The Contractor shall submit to the Authority Representative plan and details of the Stinger System for review and approval, prior to procurement and installation.
- B. Acceptable Manufacturers
1. Manufacturer shall be ISO 9002 certified. The following manufacturers are approved for manufacture of the DC Stingerpower and control system:
 - a. WAMPFLER Products, Inc. or approved equal
- C. Construction:
1. Internal air clearance or solid dielectrics sufficient to withstand 4500 volt transient potentials on the DC power bus.
 2. Electrical rating of 600 Amperes, 800 VDC nominal.
 3. Design shall maintain pressure tolerances between bus bars and collector trolley pickups without frequent adjustment.
 4. Construction shall allow for longitudinal thermal expansion movement between bus structure and other assembly supporting components or housings. The design shall provide a continuous track giving the control trolley and the power take-off trolley complete freedom of travel over the entire length without any binding.
 5. The design shall maintain the full current carrying capacity throughout the system structure.
- D. Power Conductor:
1. A one piece copper trolley trough of required shape and configuration, with a flat contact surface for the trolley collector assembly, and suitable for the voltage rating.
 2. A current carrying capacity of 1000 amperes based on a 30 degree C rise over a 40 degree C ambient air having sufficient thermal capacity to withstand 300% overload for intermittent duty cycles.
 3. Design utilizing a conductor-supported collector having sufficient mechanical strength to support and electrically feed a 1000 ampere (nominal) rated collector (trolley) assembly (based on a 30 degree C rise over a 40 degree C ambient air).
 4. The conductor hangers shall be cast of a high strength aluminum alloy with an outer nylon coating. Hanger design to provide free conductor movement to accommodate thermal expansion or contraction of the conductor.
 5. No drilling or welding of the conductor rail at time of erection shall be necessary, only bolted connections. Splice joint, anchors, expansion joints and all other required appurtenances shall be provided and shall be manufactured from the same material as the conductor rail.
 6. The electrical efficiency of the components, e.g. splice joints, feeders and expansion joints shall not be less than an equal length of conductor.
 7. The internal and external supporting insulators of fiberglass reinforced polyester compound shall have a flashover strength of four times nominal system voltage when tested per ANSI C29.1 (1988) Electrical Power Insulators, Test methods.
 8. The roof truss-supported Stinger system shall have the conductor rail supported at 8-ft intervals (maximum) between support members center to center.
- E. Stinger Power Collector Trolley:

1. Rated 1000 volts DC, 600 amperes capacity and compatible with the DC power conductor with 300% intermittent overload capacity.
2. The collector or trolley shall be of a captive type design in that the complete assembly shall be supported by and guided by sets of roller wheels within pairs of "C" channel mounted in tandem with the power conductor as required.
3. The trolley housing shall be of NEMA type 4 /IEC 1 P65 enclosure construction.
4. Contact with the power bus shall be by pairs of contact shoes that are spring-loaded and shall be adjusted to permit free longitudinal movement of the complete trolley assembly along the power conductor.
5. Provide horizontal and vertical guide wheels (ball bearing, rubber molded type) as an integral part of the trolley assembly. Supply support wheels designed to carry the dead and come-along dynamic weight of trolley; power cable, and stinger assembly, including pull-off force of stinger from the traveling vehicle shoe. Design shall prevent a 20 degree angle side pull-along force from creating abnormal pressure and shall maintain contact shoe alignment.
6. Collector assembly to accommodate one power conductor as indicated on the Drawings. Provide solderless type pressure cable connectors and insulate connections using heat-shrinkable sleeves as manufactured by Raychem, 3M Products, or approved equal.
7. The complete trolley assembly will consist of a captive trolley for the main conductor and two auxiliary support and movement rollers mounted to a common bracket held in alignment by the captive trolley.
8. The cable connection between the trolley assembly and the stinger cable will be such that the force required to move the trolley assembly longitudinally along the conductor will not be fully placed on the connection itself. Provide strain-relief Kellems grip connectors to support the power cable at the trolley.

F. Stinger Control Station Collector Trolley:

1. The control of the DC power stinger shall be provided by a separate 3-pole AC collector assembly, control trolley take-off system that shall be constructed in tandem with the DC power stinger assembly as shown on the Drawings.
2. (3) conductor, rated 600 VAC, 60 amperes capacity and compatible with the AC multi-conductor control cable.
3. The collector or trolley shall be of a captive type design in that the complete assembly shall be supported by and guided by sets of roller wheels within pairs of "C" channel mounted in tandem with the power conductor as shown on the Drawings.
4. The trolley housing shall be of NEMA type 4 /IEC 1P65 enclosure construction.
5. Contact with the AC control bus shall be by pairs of contact shoes that are spring-loaded and shall be adjusted to permit free longitudinal movement of the complete trolley assembly along the control conductors.
6. Provide horizontal and vertical guide wheels (ball bearing, rubber molded type) as an integral part of the trolley assembly. Supply support wheels designed to carry the dead and come-along dynamic weight of trolley, control cable, and control station pushbutton assembly. Design shall prevent a 20 degree angle side pull-along force from creating abnormal pressure and shall maintain contact shoe alignment.
7. Collector assembly to accommodate (3) control conductors as indicated on the Drawings. Provide solderless type pressure cable connectors or terminal strip .
8. The complete control trolley assembly will consist of a captive trolley for the control conductors (two control wires and a ground) and two auxiliary support and movement rollers mounted to a common bracket held in alignment by the captive trolley.
9. The cable connection between the trolley assembly and the control cable will be such that the force required to move the trolley assembly longitudinally along the conductor will not be fully placed on the connection itself. Provide strain-relief Kellems grip connectors to support the control cable at the trolley.

G. Stinger Assembly

1. The DC power stinger assembly shall be provided with power cable, and service power tip. The control of the DC power stinger shall be provided by a separate 3-pole AC collector assembly, control trolley take-off system that shall be constructed in tandem with the DC power stinger assembly as shown on the Drawings.
2. The design shall meet space restrictions of vehicle lifts and vehicle clearances for safe working procedures.
3. Connection of the power and control cables to the stinger power cable and to the control pushbutton station and collector trolleys shall be via strain relief Kellems grip connectors.
4. Stinger assembly shall be furnished with an extra flexible, rope lay, stranded (class K in accordance with ASTM B172) #4/0 AWG, coated, annealed copper power cable, having low smoke and low toxic silicon rubber insulation thickness rated for 2kV in accordance with NEMA WC70. Provide low smoke, zero halogen crosslinked modified polyolefin jacket.
5. Provide hook on stinger and cable-mounted hanger for storage to facilitate operator to return trolley to starting position for next vehicle movement.
6. Provide end-of-run shock absorber assembly for both the stinger power trolley and the stinger control trolley.
7. Provide one (1) stinger assembly for each mobile collector trolley assembly and one (1) control station assembly for each mobile collector trolley assembly. The stinger assemblies and control station assemblies shall be furnished by the manufacturer of the collector busway and trolley assembly.

H. Control Station Assembly

1. The control station assembly shall be provided with control cable, and pendant-mounted single pushbutton control station.
2. The design shall meet space restrictions of vehicle lifts and vehicle clearances for safe working procedures.
3. Connection of the power and control cables to the stinger power cable and to the control pushbutton station and collector trolleys shall be via strain relief Kellems grip connectors.
4. Stinger assembly shall be furnished with an extra flexible, rope lay, stranded (class K in accordance with ASTM B172) #4/0 AWG, coated, annealed copper power cable, having low smoke and low toxic silicon rubber insulation thickness rated for 2kV in accordance with NEMA WC70. Provide low smoke, zero halogen crosslinked modified polyolefin jacket.
5. Provide hook on stinger and cable-mounted hanger for storage to facilitate operator to return trolley to starting position for next vehicle movement.
6. Provide end-of-run shock absorber assembly for both the stinger power trolley and the stinger control trolley.
7. Provide one (1) stinger assembly for each mobile collector trolley assembly and one (1) control station assembly for each mobile collector trolley assembly. The stinger assemblies and control station assemblies shall be furnished by the manufacturer of the collector busway and trolley assembly.

I. Supporting Insulators:

1. The mechanical and electrical properties of the DC conductor supporting insulator and the external mounting insulators shall meet the following requirements:
 - a. tensile strength 7000 lbs.
 - b. cantilever strength 12000 inch lbs.
 - c. compression strength 65000 lbs.

d.	torsional strength	150 (+) ft.-lbs.
e.	arc resistance	190 seconds - ASTM D495
f.	tracking resistance	1200 min. - ASTM D2302
g.	flame resistance	ASTM D635 Self-Extinguishing Federal LP406b - 164/31
h.	creep distance	plate to plate - 2 7/8 inches (min) insert to insert 3 3/16 inches (min)
i.	dielectric strength	(a) dry - 40 kV minimum (b) wet - 19 kV minimum
j.	impulse	80 kV minimum - (1.5 x 40 wave)

J. Additional System Parameters

1. Operational safety of the stinger system shall require any personnel to be remote from the vehicle movement. It also requires that disengagement of the vehicle shoe clamp be accomplished as a NON-LOAD BREAK operation.
2. Trolley end stop bumper will permit "pull-off" of the stinger from the vehicle collector shoe and will stop trolley travelling at a speed of 5 mph without damage to trolley or overhead busway system (power and control conductors).

K. System Operation:

1. All stinger cable assemblies, control station cable assemblies, power and control system wiring, and auxiliary devices shall permit the following sequence of operation.
 - a. DC voltage to the service power tip is off.
 - b. To make a move, the operator places the stinger service power tip on the vehicle shoe
 - c. The operator then presses the control station momentary pushbutton and continues to press it. Immediately rotating red lights and horns will operate. After a preset time delay (15 seconds), associated DC contactor is energized, and DC traction power is available at the service tip and the vehicle will begin to move.
 - d. Movement is permitted to continue as long as the momentary pushbutton is pressed.
 - e. The control circuit "power on" function is disabled if any emergency (maintained) pushbutton stations are pressed.
 - f. At Brentwood Shop, only one (1) of the stinger systems can be operated at any given time
 - g. at Shady Grove Shop, only one (1) of the stinger systems can be operated at any given time
 - h. After the move is made, the stinger control station momentary pushbutton is released. DC supply power is removed. The stinger is stored on its cable hanger.

L. Control Stations

1. Cord-mounted pendant-type single pushbutton control stations shall have NEMA 4/4X stainless steel enclosure.
2. Flush head momentary pushbutton with 10 ampere rated contacts in accordance with NEMA A600.
3. Acceptable manufacturers shall be Allen-Bradley or approved equal.

M. Relays and Timers

1. All control relays and timers for the operation of the stinger system shall be of the heavy duty industrial type having screw type wire terminals or plug-in sockets. Provide sockets and all mounting hardware for the complete control system.
2. Acceptable Manufacturers

- a. Agastat
- b. Square D Co.
- c. ASCO
- d. Potter Brumfield
- e. Allen Bradley
- f. Approved equal.

N. Contactors

Contactors shall be normally open, magnetically held, single pole, load break with 8-hour enclosed rating of 1250 amperes inductive load at 1000 volts dc. Each contactor shall be provided with silver alloy, adjustable and readily replaceable contacts. The contactor shall have a minimum life under full load conditions of 100,000 cycles. Each pole shall be equipped with a current coil type magnetic blow-out which will provide directed control of the arc away from the current carrying contact surfaces. Each of the contactors shall be supplied with a minimum of two (2) N.O. auxiliary contacts and two (2) N.C. auxiliary contacts rated at 10 amperes. The short-circuit withstand capability shall be coordinated with the available peak-through current of the dc distribution system and shall be sufficiently large so that no damage to the contactor or its enclosure is done during the time it takes the feeder circuit fuse to clear the fault. The contactor shall be controlled with a 120V ac rated coil capable of remote control operation. An internally-mounted 120 volt ac toggle switch which shall disconnect the control power shall be provided. Each contactor shall be provided with a non-metallic NEMA 4 enclosure.

O. Warning Devices

- 1. Provide warning devices to indicate presence of 750 VDC in areas having controlled DC stinger power.
- 2. Provide a warning device circuit, driven by one of the N.O. auxiliary contacts on the stinger contactor, to provide an alarm if the stinger contactor fails to open.
- 3. All stinger areas shall be provided with rotating red lights for visual indication and warning horns for audible indication in the shop areas served by the stinger systems.

P. Spare Parts

- 1. The Contractor shall furnish spare components, parts and service tools as follows:
 - a. (1) - Stinger Power Trolley assembly, complete.
 - b. (1) - Stinger Control Trolley assembly, complete.
 - c. (2) - DC Stinger power cable assemblies, complete (service power tip furnished by WAMTA).
 - d. (2) - DC Stinger control cable assemblies, complete with control station.
- 2. All spare parts shall be packaged in manufacturer's standard cartons, properly labeled and delivered to a location designated by the Authority Representative that is within 20 miles of the Project's location.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Refer to wire and cable sizes or single line diagrams and control ladder diagrams for size and quantity of wires required for the installation.
- B. Clean installed products of this Specification Section where deposits of oil, grease, dirt, dust, mud or debris is present after installation.

- C. Follow the recommendations of the stinger equipment manufacturer that pertain to the start-up and operation of the DC stinger systems.

3.02 FIELD TEST FOR EQUIPMENT OPERATION

- A. Perform the following tests and submit certified test reports to the Authority Representative. Furnish, at no cost to WAMTA, all test equipment, materials, and labor required to perform the tests.
- B. Test performance and operation of the DC stinger system and DC contactor systems and operating procedures, to the satisfaction of the Authority Representative.
 - 1. Testing of controls shall consist of operating each control not fewer than five times.
 - 2. Testing of power circuits and operational procedure shall consist of energizing each stinger bus and provide actual traction power to a married-pair.

END OF SECTION

SECTION 16122

CONTACT RAIL CABLE CONNECTOR ASSEMBLIES FOR TRACTION POWER

PART 1. GENERAL

1.01 SUMMARY

- A. This section specified fabricating, testing and furnishing contact rail cable connector assemblies as specified.
- B. Related Sections
 - 1. Section 16123 - Contact Rail Insulator Assembly For Traction Power
 - 2. Section 16124 - Contact Rail Protection Cover For Traction Power
 - 3. Section 16126 - Contact Rail Anchor Assembly For Traction Power
 - 4. Section 16127 - Contact Rail System Installation For Traction Power
 - 5. Section 16128 - Wire and Cable For Traction Power
- C. Payment and Measurement:
 - 1. Cable Connector Assembly: Lump sum, no separate measurement.

1.02 REFERENCES

- A. Codes, regulations, references, standards and specifications:
 - 1. Does not apply.

1.03 QUALITY ASSURANCE

- A. Testing: Conduct specified testing at no additional cost to the Authority.
 - 1. Compression connectors:
 - a. Prototype testing:
 - 1) Prior to production, assemble three compression connectors on 1,000-KCMIL 2,000-volt cable for use as test connections.
 - 2) Electrical resistance test:
 - a) Procedure:
 - (1) Remove insulation from cable portion of test connectors.
 - (2) Measure resistance between the cable and connector tongue with digital low resistance ohmmeter.
 - (3) With a 10 amp test current, digital low resistance ohmmeter (Kelvin Bridge Type) measure resistance of equivalent length of 1,000-KCMIL 2,000-volt cable.
 - b) Acceptance criteria:
 - (1) Electrical resistance for connection equal to or less than that of equivalent length of 1,000-KCMIL 2,000-volt cable.
 - 3) Tension test:
 - a) Procedure:
 - (1) Subject test connections to sustained tension of 5,000 psi of the nominal conductor cross-sectional

- area for three hours.
 - (2) Retest for electrical resistance after three hours.
 - b) Acceptance criteria:
 - (1) No slipping of cable in connector.
 - (2) No deformation.
 - (3) No increase of electrical resistance beyond that specified.
 - 4) Production Testing:
 - a) After successful prototype testing, production may commence.
 - (1) Prior to delivery, randomly select one percent of each production lot and subject to specified electrical resistance and tension tests.
 - 5) Insulating covers:
 - a) Production testing:
 - (1) Procedure:
 - (a) Prior to delivery, randomly select one percent of each production lot of insulating covers and test insulation resistance at thinnest portion with 1,000-volt dc megohmmeter.
 - (2) Acceptance criteria:
 - (a) Insulation resistance: 1,000,000 ohms minimum.
 - (b) If one insulator cover of a lot fails insulation resistance test, entire lot will be rejected.

1.04 SUBMITTALS

Submit the following in accordance with the Division 1 and with the additional requirements specified for each.

- A. Shop Drawings: Fabrication of cable connector assemblies. Use of drawings for manufacture or fabrication prior to approval is not permitted.
- B. Certification:
 - 1. Certifications that all cable connector assemblies meet or exceed specified requirements.
 - 2. Test procedures.
 - 3. Certified test reports.
 - 4. Method of packaging: Submit prior to packaging and shipping.

PART 2: PRODUCT

2.01 MANUFACTURERS

- A. Cable Connector Assembly
 - 1. MAC Products, Inc. No. B-9180 or equal.
 - 2. SELCO Manufacturing Corp., No. 2610 or equal.

2.02 COMPONENTS

- A. Furnish cable connector assemblies in accordance with the following requirements:
 - 1. Lug: Compression type.
 - 2. Material: 98-percent pure copper. Tongue:
 - 3. Not less than 9/16-inch thick, with fourholes and drilled for 1/2-inch bolts on 1-3/4 inch centers.
 - 4. Complete with silicon-bronze flat washers, lock washers, nuts and bolts.

2.03 INSULATING COVER AND ACCESSORIES

- A. Furnish insulating cover and accessories in accordance with the following requirements:
 - 1. Type: Two-piece.
 - 2. Material: Glass-reinforced polyester.
 - 3. Thickness: Not less than 0.125-inch.
 - 4. Color: Orange.
 - 5. Watertight.
 - 6. Complete with neoprene gaskets, sealing collars and captive screw fasteners.
 - 7. Each assembly, except sealing collar, capable of easy disassembly.

2.04 FABRICATION

- A. Procedures and tooling to be recommended by the manufacturer and strictly complied with by the installer.

PART 3: EXECUTION - Not Used

END OF SECTION

THIS PAGE NOT USED

SECTION 16123

CONTACT RAIL INSULATOR ASSEMBLY FOR TRACTION POWER

PART 1 - GENERAL

1.01 SUMMARY

- A. This section specifies fabricating, testing and furnishing contact rail insulator assemblies as shown and specified.
- B. Related Sections:
 - 1. Section 16122 - Contact Rail Cable Connector Assemblies For Traction Power
 - 2. Section 16124 - Contact Rail Protection Cover Assemblies For Traction Power
 - 3. Section 16126 - Contact Rail Anchor Assembly For Traction Power
 - 4. Section 16127 - Contact Rail System Installation For Traction Power
 - 5. Section 16128 - Wire and Cable For Traction Power
- C. Payment and measurement:
 - 1. Compensation for work specified in this section will be made in the following manner:
 - a. Materials: Lump sum, no separate measurement.

1.02 REFERENCES

- A. Codes, regulations, references, standards and specifications.
 - 1. ASTM A47.
 - 2. ASTM A153.
 - 3. ASTM A164.
 - 4. ASTM D149.
 - 5. ASTM D229.
 - 6. ASTM D256.
 - 7. ASTM D495.
 - 8. ASTM D570.
 - 9. ASTM D638.
 - 10. ASTM D648.
 - 11. ASTM D695.
 - 12. ASTM D790.
 - 13. ASTM D2000
 - 14. ASTM D2303.
 - 15. ANSI B4.1.
 - 16. ANSI B18.2.1.
 - 17. ANSI B18.2.2.
 - 18. ANSI C29.1.
 - 19. ANSI C29.5.
 - 20. UL 94

1.03 QUALITY ASSURANCE

- A. Testing
 - 1. Perform specified testing by a nationally recognized independent testing laboratory at no additional cost to the Authority.

2. The Contractor shall notify the Authority Representative fourteen (14) days in advance of the commencement of testing, including preparation of the test equipment for testing. Testing shall be performed in the presence of the Authority Representative.

B. General testing

1. Randomly select a minimum of one percent of each production lot of 500 insulators of each type as test specimens.
2. Subject specimens to the following tests:
 - a. Electrical resistance test:
 - 1) Procedure:
 - a) Immerse each specimen in water at room temperature.
 - b) After 70 hours, remove and dry thoroughly.
 - c) Provide complete contact by use of wet clay pads on top and bottom of specimen.
 - d) Measure resistance to each specimen with 1,000-volt dc megohm meter or other approved device.
 - 2) Acceptance criteria:
 - a) Electrical resistance: Not less than eight megohms.
 - b) If one insulator of a lot fails, entire lot will be rejected.
 - b. Impulse withstand voltage test.
 - 1) Procedure: In accordance with ANSI C29.1.
 - 2) Acceptance criteria:
 - a) Dry withstand voltage: 30 kV at 60 Hertz for one minute.
 - b) Wet withstand voltage: 20 kV at 60 Hertz for ten seconds.
 - c) If one insulator of a lot fails, the entire lot will be rejected.
3. Insulators used as test specimens prohibited as part of quantity furnished.

C. Porcelain insulators:

1. Impulse flash-over voltage test:
 - a. Subject all insulators to routine flash-over test.
 - b. Procedure: In accordance with ANSI C29.1.
 - c. Acceptance criteria:
 - 1) Insulator and glazing to remain intact.
 - 2) If an insulator fails the flash-over test, it will be rejected.
2. Mechanical test:
 - a. Randomly select a minimum of one percent of each lot of 500 insulators as test specimens.
 - b. Procedure:
 - 1) Attach each insulator and mounting base to oak block.
 - 2) Mount each assembly on rigid foundation simulating service conditions.
 - 3) Place on top of each insulator one of the following type pads:
 - a) Lead: 1/4 inch thick
 - b) Canvas: 1/16 inch thick
 - 4) Attach to malleable iron cap a hardened steel disc 1/2 inch thick and equal in diameter to cap. Place both atop each insulator pad.
 - 5) Subject each test specimen to 10 blows of 15-pound spherical iron weight dropped from height of 36 inches.
 - c. Acceptance criteria:
 - 1) No cracks or fractures.

- 2) If 50 percent or more of specimens fail, entire kiln-lot represented by specimens tested will be rejected.
3. Porosity test:
 - a. From insulators destroyed in other tests, randomly select ten specimens.
 - b. Procedure: In accordance with ANSI C29.1.
 - c. Acceptance criteria:
 - 1) No evidence of penetration of dye into test specimen to an extent visible to the unaided eye.
 - 2) If one insulator of a lot fails, entire lot will be rejected.
4. Insulators used as test specimens prohibited as part of quantity furnished.
5. Verification:
 - a. Compatibility of components of porcelain insulator assemblies:
 - 1) Prior to shipment, randomly select a minimum of one percent of each production lot of 500 of each component.
 - 2) Assemble to ensure that components mate properly.
 - 3) If one assembly fails to meet compatibility requirements, entire lot will be rejected.

1.04 SUBMITTALS

- A. Shop Drawings:
 1. The Contractor shall submit for approval shop drawings for fabrication of the component and assemblies of the contact rail insulators, showing tolerances for all dimensions. No fabrication or manufacture shall be performed prior to drawing approval.
- B. Samples:
 1. One complete insulator assembly for each type.
- C. Documentation:
 1. Certification that all insulator assemblies furnished meet or exceed specified requirements.
 2. Detailed engineering data on materials used in the manufacture of insulator assemblies.
 3. Fabrication details.
 4. Name of proposed independent testing laboratory.
 5. Detailed description of quality control program. Work performed prior to approval is undertaken at the Contractor's risk.
 6. Calibration certificates for quality control testing equipment.
 7. Certified test reports. Submit no later than seven days after completion of tests.
 8. Method of packaging. Submit prior to packaging and shipping.

PART 2 - PRODUCT

2.01 MATERIALS

- A. Furnish porcelain contact rail insulator assemblies in accordance with the following requirements:
 1. General Requirements
 - a. New and undamaged.
 - b. Symmetrical

- c. Free of cracks, voids, air pockets, lamination, metallic substances or other defects rendering them unsuitable for intended service.
 - d. Meeting or exceeding acceptance criteria of specified tests.
 - e. Indelibly marked on underside with model number and identification of manufacturer.
 - f. Rated for a nominal voltage of 750 volts dc.
 - g. Minimum creepage distance over external surface of insulator from energized metal components to ground or to insulator fasteners: Eight inches minimum.
 - h. Resistant to weathering and sudden changes in atmospheric temperature from plus 150F to minus 20F.
 - i. Impervious to moisture, acid and alkali.
 - j. Suitable for use on wood ties and for direct fixation to concrete invert.
 - k. Color: Uniform gray matching sample available from the Authority Representative.
 - l. Designed for composite rail specified in Section 05661 with free-end-to-anchor distance of 500 feet and temperature range of plus 150F to minus 20F.
 - m. Compatible with protection cover assemblies specified in Section 16124, contact Rail Protection Cover Assembly.
2. Porcelain Insulators
- a. Design porcelain insulator assemblies as a system.
 - b. Manufacture components to tolerances ensuring that each component is compatible with all other components.
 - c. Insulators:
 - 1) Material:
 - a) Wet process porcelain, ANSI C29.5.
 - b) Close grained, homogenous and non-absorbent.
 - 2) Dimensions: As shown.
 - 3) Tolerances:
 - a) Variation of maximum dimension between top and bottom face: Plus or minus one percent.
 - b) Variation of diameter of holes from that shown: Plus or minus 1/8 inch.
 - c) Variation of other dimensions: Plus or minus one percent.
 - 4) Glazing:
 - a) Smooth, hard, firmly adherent coating of uniform thickness.
 - b) Continuous over entire surface except as shown.
 - c) Free of checks and bubbles which extend completely through glaze.
 - d) Thermal expansion properties equal to porcelain material used.
 - d. Other components:
 - 1) Malleable iron castings:
 - a) ASTM A47, Grade 32510.
 - b) Free from imperfections.
 - c) Finished surface: Smooth. Grinding to ensure accurate fit with adjoining parts is permitted.
 - d) Galvanized.
 - 2) Tolerances: ANSI B4.1.

- 3) Hardware:
 - a) Dimensions and type: As shown.
 - b) Bolts: Steel, chemical and mechanical requirements in accordance with ANSI B18.2.1, galvanized.
 - c) Nuts: Steel, ANSI B18.2.2, galvanized.
 - d) Neoprene cushions, rings and pads: ASTM D2000, 1BC415.
- 4) Galvanizing:
 - a) ASTM A153 or ASTM A164, Type GS.
 - b) Prior to coating perform the following:
 - (1) Shot blast finished parts in accordance with SSPC-SP-6, except maximum grit size to be SAE G-18, or pickle finished parts in diluted sulfuric acid.
 - (2) Thoroughly remove scale.
 - (3) Thoroughly clean with cold running water.
 - c) Immerse parts in solution of zinc chloride or hydrochloric acid.
 - d) Dry thoroughly.
 - e) Subject parts to zinc bath.

SECTION 16124

CONTACT RAIL PROTECTION COVER ASSEMBLIES

PART 1 - GENERAL

1.01 SUMMARY

- A. This section specifies designing, fabricating, testing and furnishing contact rail protection cover assemblies, including expansion joint protection cover assemblies, as shown and specified. All protection cover assemblies shall be type B.
- B. Related Sections
 - 1. Section 05661 - Contact Rail and Appurtenances For Traction Power
 - 2. Section 16123 - Contact Rail Insulator Assembly For Traction Power
 - 3. Section 16126 - Contact Rail Anchor Assembly For Traction Power
 - 4. Section 16127 - Contact Rail System Installation For Traction Power
 - 5. Section 16128 - Wire and Cable For Traction Power
 - 6. Section 16294 - Contact Rail Heating System For Traction Power
- C. Payment and measurement:
 - 1. Compensation for work specified in this section will be made in the following manner:
 - a. Material - Lump sum, no separate measurement.

1.02 REFERENCES

- A. Codes, regulations, references, standards and specifications:
 - 1. ASTM - A123
 - 2. ASTM - A153
 - 3. ASTM - A313
 - 4. ASTM - A325
 - 5. ASTM - B633
 - 6. ASTM - D149
 - 7. ASTM - D229
 - 8. ASTM - D256
 - 9. ASTM - D570
 - 10. ASTM - D1499
 - 11. ASTM - E84
 - 12. ASTM - G23

1.03 SYSTEM DESCRIPTION

- A. Type B: is a top protection cover for installation in at-grade locations to accommodate the contact rail heating system.

1.04 SUBMITTALS

Submit the following for review in accordance with the Division 1 and with the additional requirements as specified for each:

- A. Shop Drawings:
 1. The Contractor shall in accordance with Division 1 submit for approval shop drawings showing the design and fabrication of contact rail protection cover assembly.

- B. Documentation:
 1. Certification that protection cover assemblies furnished meet or exceed specified requirements.
 2. Detailed engineering data on materials used in manufacture of protection covers.
 3. Fabrication details.
 4. Name of proposed testing laboratory.
 5. Detailed description of quality control Program. Work performed prior to approval is undertaken at the Contractor's risk.
 6. Calibration certificates for quality control testing equipment.
 7. Certified test reports. Submit no later than seven days after completion of tests.
 8. Method of packaging. Submit prior to packaging and shipping.

1.05 QUALITY ASSURANCE

- A. Testing: Have specified testing performed by a nationally recognized testing laboratory at no additional cost to the Authority. The Contractor shall notify the Authority Representative fourteen (14) days in advance of the commencement of testing, including preparation of the test equipment for testing. Testing shall be performed in the presence of the Authority Representative.
 1. Material testing: Prior to fabrication, furnish one test specimen for performance of the following tests:
 - a. Water absorption test:
 - 1) Procedure: Test in accordance with ASTM D570.
 - 2) Acceptance criteria: Maximum absorption rate not exceeding 0.50 percent in 24 hours.
 - b. Flammability tests:
 - 1) Flame resistance:
 - a) Procedure: Test in accordance with ASTM D229.
 - b) Acceptance criteria: Maximum burning time: ten seconds.
 - 2) Flame spread:
 - a) Procedure: Test in accordance with ASTM E84.
 - b) Acceptance criteria:
 - (1) Flame spread: UL-listed, Class A Incombustible with classification not exceeding 25.
 - (2) Chlorine content: Not exceeding that which will emit more than 10 ppm.
 - c. Dielectric test:
 - 1) Procedure: Test in accordance with ASTM D149, Short Time Method.
 - 2) Acceptance criteria: Not less than 250 volts per mil.
 2. Type testing: Prior to fabrication, furnish five rail protection cover assemblies with brackets set at widest spacing shown, as test specimens for performance of all specified tests on contact rail protection cover assemblies and specified mechanical load tests on expansion joint protection cover assemblies.
 - a. Mechanical load test:
 - 1) Procedure: Perform the following in the order given:

- a) Mount protection cover assembly on length or contact rail or approved equivalent.
- b) Static load test:
 - (1) Use 250-pound weight with bottom measuring six inches by twelve inches.
 - (2) Place weight on protection cover at point selected by Authority Representative.
 - (3) One cycle consists of applying weight to assembly for 30 seconds, removing it, and reapplying it 60 seconds later.
 - (4) Test duration: Fifty cycles.
- c) Impact resistance test:
 - (1) Use 250-pound weight with bottom measuring 18 inches square.
 - (2) Drop weight from height of 18 inches onto portion of protection cover directly above centerline of rail and directly above bracket.
 - (3) Subsequently, drop weight from height of 18 inches onto point on protection cover midway between two adjacent support brackets.
- 2) Acceptance criteria:
 - a) Maximum permissible deflection at centerline of rail: 1-½ inches, at all times.
 - b) No splits, cracks or breaks.
 - c) Permanent deformation: Not exceeding 1/8 inch.
 - d) No violation of clearance envelope shown.
- b. Insulation resistance test:
 - 1) Procedure:
 - a) Conduct after mechanical load test.
 - b) Measure resistance between a point in contact with rail and a point on surface of protection cover assembly with 1,000-volt dc megohm meter.
 - 2) Acceptance criteria:
 - a) Resistance: 1,000,000 ohms minimum.
- c. Longevity test:
 - 1) Procedure:
 - a) Expose test specimens to light and water in accordance with ASTM G23 and ASTM D1499.
 - b) Total exposure time: 3,600 hours.
 - c) With 1,000-volt dc megohm meter, test insulation resistance through thinnest portion of protection cover.
 - 2) Acceptance criteria:
 - a) No visible evidence of deterioration.
 - b) Resistance: 1,000,000 ohms minimum.
- d. Izod impact strength test:
 - 1) Procedure:
 - a) Perform after longevity test in accordance with ASTM D256, Method A.
 - 2) Acceptance criteria:
 - a) Average izod impact strength: Four foot-pounds per inch of width.
- e. Production testing:

- 1) General requirements:
 - a) Production testing specified constitutes minimum requirements.
 - b) All components subject to full or partial testing at the discretion of the Authority Representative.
 - c) Items used for testing not to be included in quantities furnished.
 - d) All facets of production testing, particularly location of facility and repair, capacity and calibration of test equipment, subject a approval.
 - e) Notify Authority Representative 14 calendar days prior to scheduled testing dates.
- 2) Procedure:
 - a) Select one percent of protection covers produced in such a way that each group of five specimens represents identifiable lots of 500 lengths of protection cover and 1500 support brackets.
 - b) Subject test specimens to specified mechanical load and resistance rests specified under type testing.
- 3) Acceptance criteria:
 - a) As specified for type testing for mechanical load and resistance.
 - b) If one protection cover assembly of a lot fails to meet requirements, test additional 10 specimens from same lot. If one assembly of additional specimens fails to meet specified requirements, entire lot will be rejected.

PART 2 -PRODUCTS

- A. Design: Design protection cover assembly to meet the following requirements:
 1. Prevention of accidental contact with energized rail components.
 2. Assurance of unimpeded passage of current collector mounted on transit vehicle.
 3. Resistance to sagging produced by intrinsic weight or external loads and forces.
 4. Ease of dismounting and remounting without disassembly of support bracket. Fasteners to be easily removable and reusable.
 5. Configuration:
 - a. Similar to configuration shown.
 - b. Cover not to be integral part of support bracket.
 - c. Basic geometry of cover, curved or chorded.
 - d. Fabricated in 10-foot lengths.
 - e. Continuous and uniform. Gaps at support brackets not exceeding 1/16 inch.
 - f. Support brackets at three-foot four-inch intervals, for Type B protection cover and as shown.
 - g. Arrangement of brackets at expansion joints as shown.
 - h. Assembly to lie within clearance envelope shown.
 6. Compatible with the composite contact rail specified in Section 05661.
- B. Material: Fabricate protection covers of material meeting the following requirements
 1. Glass-reinforced plastic.
 2. No separation or warpage under service conditions during 30-year life expectancy.
 3. Flame spread, flame resistance, chlorine content, water absorption and dielectric

- strength: In accordance with specified testing.
4. Outer surface coated with polyurethane paint, 1.5 mils minimum dry film thickness.
 5. Color: Gray, to match specimen available from the Authority Representative.

C. Support Brackets: Furnish support brackets meeting the following requirements:

1. Design: Two-piece consisting of bracket and clamp as shown.
 - a. Configuration: Compatible with protection cover and with composite contact rail specified in Section 05661.
2. Material: Same as that of protection cover.

D. Nuts, Bolts, and Miscellaneous Hardware:

1. Material
 - a. All nuts, bolts, and flat washers shall be manufactured in accordance with ASTM A325.
 - b. The dimensional data and type hardware for all nuts, bolts and miscellaneous parts shall be recommended by the manufacturer. All steel bolts, nuts, screws and washers shall be galvanized as specified.
 - c. Spring washers shall be manufactured in accordance with the requirements of ANSI B18.21.1.
 - d. Hair pin cotter pins shall conform to the requirements of ASTM A313, Stainless Steel 304.
2. Galvanizing:
 - a. All parts to be galvanized shall be galvanized after manufacture. Unless otherwise specified, parts to be galvanized shall be coated in accordance with the requirements of ASTM A123.
 - b. Bolts and miscellaneous hardware shown or specified to be galvanized shall be coated in accordance with ASTM A153 or alternate method in accordance with ASTM B633 Type I SC-2 for threaded items and SC-3 without threads.
 - c. Before galvanizing, the finished parts shall be pickled or sandblasted and the scale and adhering impurities removed. The pickling shall be done in properly diluted sulfuric acid, after which the parts shall be thoroughly cleaned in running cold water. Sandblasting shall meet or exceed Steel Structures Painting Council SSPC-SP-6, except that the maximum grit size shall be SAE No. G-18. The parts shall then be immersed in a solution of zinc chloride or hydrochloric acid. Immediately following thorough drying, the parts shall be dipped into the zinc bath before corrosion starts again.

SECTION 16125

WIRE CONNECTION ACCESSORIES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing wire-connection accessories, such as connectors, terminal lugs and fittings, bundling straps, insulating tape and resin.

1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is engaged in production of similar wire connection accessories.
- B. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of the jurisdictional authorities.
 2. National Electrical Code (NEC).
 3. UL: 486A, Wire Connectors and Soldering Lugs for Use With Copper Conductors.
 4. American Standards of Testing and Materials (ASTM): D149-97a, Standard Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies; D257-99, Standard Test Methods for DC Resistance or Conductance of Insulating Materials; D412-98a, Standard Test Methods for Vulcanized Rubber and Thermoplastic Rubbers and Thermoplastic Elastomers-Tension; D570-98, Standard Test Method for Water Absorption of Plastics; D638-00, Standard Test Method for Tensile Properties of Plastic; D696-98, Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between -30 C and 30 C with a Vitreous Silica Dilatometer; D792-00, Standard Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement; D1000-99, Standard Test Method for Pressure-Sensitive Adhesive-Coated Tapes Used for Electrical and Electronic Applications; D1518-85(1998)e1, Standard Test Method for Thermal Transmittance of Textile Materials; D5034-95, Standard Test Method for Breaking Strength and Elongation of Textile Fabrics (Grab Test); D5035-95, Standard Test Method for Breaking Force and Elongation of Textile Fabrics (Strip Method); D2240-00, Standard Test Method for Rubber Property-Durometer Hardness; and G21-96, Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi.
 5. American National Standards Institute (ANSI): C119.1, Sealed Insulated Underground Connector System 600V
 6. ITS: Directory of ITS Listed Products.
- C. Source Quality Control:
1. Connectors, terminal lugs and fittings listed, per referenced UL or ITS directory.
 2. Factory testing: Submit certified copies of test report for cable splice and tap-insulation/sealing kits as specified.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings.
- B. Certification.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage.
- C. Store products in secure and dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Connectors, Terminal Lugs and Fittings:
 - 1. In accordance with UL 486A.
 - 2. For 10AWG and smaller conductor cable: Tin-plated copper pressure connectors with nonflammable, self-extinguishing insulation grip with temperature rating equal to that of conductor insulation.
 - 3. For 8AWG to 4/0 AWG conductor cable: Tin-plated copper compression connectors and terminal lugs with nylon insulating sleeve for insulation grip.
 - 4. For 250 Kcmil and larger conductor cable: Long-barrel, double-compression tin-plated copper connectors and terminal lugs with two-hole pad.
 - 5. For multiple-conductor cable: Watertight aluminum fittings with stainless-steel pressure ring and set screws or compression cone for grounding of aluminum sheath of MC cable.
- B. Bundling Straps:
 - 1. Self-locking steel barb on one end, with tapered strap of self-extinguishing nylon, temperature rating minus 40F to plus 185F.
 - 2. For outdoor use: Ultraviolet-resistant.
- C. Insulating Tape:
 - 1. Plastic tape: Vinyl plastic tape with rubber-based pressure-sensitive adhesive, pliable at zero degree F with the following minimum properties when tested in accordance with ASTM D1000-99:
 - a. Thickness: 8.5 mils.
 - b. Breaking strength: 20 pounds per inch width.
 - c. Elongation: 200 percent.
 - d. Dielectric breakdown: 10,000 volts.
 - e. Insulation resistance, indirect method of electrolytic corrosion: 1,000,000 megohms.
 - 2. Rubber tape: Silicone-rubber tape with silicone pressure-sensitive adhesive, with the following minimum properties when tested in accordance with ASTM D1000-99:
 - a. Thickness: 12 mils.
 - b. Breaking strength: 13 pounds per inch width.
 - c. Elongation: 525 percent.
 - d. Dielectric breakdown: 13,000 volts.
 - e. Insulation resistance, indirect method of electrolytic corrosion: 1,000,000 megohms.

3. Arcproof tape: Flexible, coated one side with flame-retardant flexible elastomer, self-extinguishing, non-combustible, with the following minimum properties:
 - a. Thickness, ASTM D1000: 30 mils.
 - b. Breaking strength, ASTM D5034-95 and D5035-95: 50 pounds per inch width.
 - c. Thermal conductivity, ASTM D1518-85: 0.0478 BTU per hour per square foot per degree F.
 - d. Electrical arc resistance: Withstand 200 amperes arc for 30 seconds.
4. Glass tape: Woven-glass fabric tape with pressure-sensitive thermosetting adhesive, with the following minimum properties when tested in accordance with ASTM D1000-99:
 - a. Nominal width: 3/4 inch.
 - b. Thickness: Seven mils.
 - c. Breaking strength: 170 pounds per inch width.
 - d. Elongation: Five percent.
 - e. Dielectric breakdown: 2,500 volts.
 - f. Insulation resistance, indirect method of electrolytic corrosion: 5,000 megohms.

D. Epoxy Resin: Suitable for insulating and moisture sealing cable splices, with the following minimum properties:

1. Dielectric strength, ASTM D149-97a: 400 volts per mil.
2. Volume resistance, ASTM D257-99: 2.8×10^{15} ohm per centimeter cube at 30C.
3. Water absorption, ASTM D570-98:
 - a. 0.193 percent in 24 hours at 23C.
 - b. 0.62 percent in 24 hours at 53C.
4. Tensile strength, ASTM D638-00: 8,000 psi.
5. Elongation, ASTM D638-00: 2.4 percent.
6. Coefficient of expansion, ASTM D696-98: 6.8×10^{-5} inch per inch per degree C.

E. Cable splice and tap-insulation/sealing kit: Suitable for use on 600-volt, 90C cables, material compatible with cable insulation and jacket, meeting the seal test requirements of ANSI C119.1.

1. Heat-shrinkable tubing or wraparound heat-shrinkable sleeve: approved per referenced UL or ITS directory, flame-retardant, corrosion-resistant thick-wall tubing with factory-applied sealant for field insulation on in-line splices and taps or wraparound-type sleeve for retrofit installation on existing splices and taps to provide a watertight seal and insulating encapsulation, with the following additional requirements:
 - a. Material: Cross-linked polyolefin.
 - b. Shrink ratio: 3 to 1 minimum.
 - c. Physical properties:
 - (1) Ultimate tensile strength: 2,350 psi, ASTM D412-98a.
 - (2) Ultimate elongation: 350 percent, ASTM D412-98a.
 - (3) Hardness, Shore D: 42, ASTM D2240-00.
 - (4) Water absorption: 0.050 percent, ASTM D570-98, Method 6.1.
 - (5) Specific gravity: 1.28, ASTM D792-00.
 - d. Electrical properties:
 - (1) Dielectric strength: 450 volts per mil, ASTM D412-98a.
 - (2) Volume resistivity: 1×10^{14} ohm cm, ASTM D257-99.
 - e. Thermal properties:
 - (1) Continuous operating temp.: -55C to +135C.
 - (2) Air oven aging (14 days at 175C):
 - (a) Tensile strength: 2,680 psi.
 - (b) Elongation: 375 percent.

- (3) Low temp. flexibility (4 hours at -55C): No cracking when flexed.
- (4) Heat shock (4 hours at 250C): No cracking, flowing or dripping.
- f. Chemical properties:
 - (1) Corrosivity: Non-corrosive.
 - (2) Fungus resistance: Non-nutrient, ASTM G21-96.
 - (3) Flammability: Self-extinguishing.
 - (4)

PART 3 - EXECUTION

3.01 SPLICES AND TERMINATIONS:

- A. Make wire and cable splices in outlet, junction or pull boxes, in cable troughs or in equipment cabinets. Splices in conduit are prohibited.
- B. Secure connectors or terminal lugs to conductor so as to engage all strands equally.
- C. Do not rupture insulation nor expose bare conductors.
- D. Install compression connectors and terminal lugs using tools and pressure recommended by manufacturer. Indent mark connectors and terminal lugs with number of die used for installation.
- E. Apply anti-corrosion joint compound to connectors, terminal lugs and bolting pads before installation.
- F. Wrap ½-lapped layer of arcproof tape, glass tape overall on cable splices installed in air tunnels, ducts and shafts.
- G. Install terminal fittings on multiple-conductor cable in accordance with manufacturer's recommendation. Completely seal cable from moisture.
- H. On cable splices, taps and terminations in manhole handhole and outdoor junction and pull boxes, cover connectors with electrical putty, wrapped with three layers of plastic tape or final layer of rubber tape and then install watertight encapsulation as follows and under the supervision of kit manufacturer's representative or using a factory-certified installation technician, proficient in field installation of heat-shrinkable sealing kits.
 - 1. Use heat-shrinkable tubing for encapsulation of new splices, taps and terminations.
 - 2. Use wraparound-type heat-shrinkable sleeve for encapsulation of existing splices, taps and terminations.

3.02 CATHODIC PROTECTION SPLICES AND TERMINATIONS:

- A. For splices made in aboveground cable, use compression connectors covered with electrical putty, wrapped with three layers of plastic tape and final layer of rubber tape.
- B. Install compression terminal lugs using tools and pressure recommended by manufacturer. Indent mark terminal lugs with number of die used for installation.
- C. For splices made in direct-burial cable, use thermit weld sealed with cast epoxy-resin encapsulation.

3.03 INSPECTION:

- A. Have splices in direct-burial cable for stray current and cathodic protection inspected by the Engineer before backfilling.
- B. Have splices and taps in manholes, handholes and outdoor junction and pull boxes inspected by the Engineer or the manufacturer's representative, when available.

SECTION 16126

CONTACT RAIL ANCHOR ASSEMBLY FOR TRACTION POWER

PART 1 - GENERAL

1.01 SUMMARY

- A. This section specified fabricating, testing and furnishing contact rail cable connector assemblies as shown and specified.
- B. Related Sections:
 - 1. Section 16122 - Contact Rail Cable Connector Assemblies For Traction Power
 - 2. Section 16123 - Contact Rail Insulator Assembly For Traction Power
 - 3. Section 16124 - Contact Rail Protection Cover Assembly For Traction Power
 - 4. Section 16126 - Contact Rail System Installation For Traction Power
 - 5. Section 16128 - Wire and Cable For Traction Power
- C. Payment and Measurement Basis:
 - 1. Compensation for work specified in this section
 - a. Contact Rail Anchor Assemblies, Furnish, Fabricate and Deliver: Lump Sum.

1.02 REFERENCES

- A. Codes, Regulations, Standards and Specifications:
 - 1. Society of Automotive Engineers (SAE):
 - a. SAE G18.
 - 2. American Society for Testing and Materials (ASTM):
 - a. ASTM A27.
 - b. ASTM A36.
 - c. ASTM A47.
 - d. ASTM A48.
 - e. ASTM A123.
 - f. ASTM A153.
 - g. ASTM A283.
 - h. ASTM A325.
 - i. ASTM A489.
 - j. ASTM A681.
 - k. ASTM B134.
 - l. ASTM B633.
 - m. ASTM D570.
 - n. ASTM D638.
 - 3. American National Standards Institutes (ANSI):
 - a. ANSI B4.1.
 - b. ANSI B46.1.
 - c. ANSI B18.8.1.
 - d. ANSI B18.21.1.
 - 4. Steel Structures Painting Council (SSPC):
 - a. SSPC-SP-6.

1.03 SUBMITTALS

Submit the following for approval in accordance with the Division 1 and with additional requirements as specified for each:

- A. Shop Drawings
 - 1. The Contractor shall submit shop drawings to be used for fabrication of the components and assemblies of the contact rail anchors.
- B. Certification
 - 1. Certification that contact rail anchor assemblies furnished meet or exceed specified requirements and are compatible with the contact rail.
 - 2. Certified test reports for specified factory testing.

1.04 QUALITY ASSURANCE

- A. Testing
 - 1. Production Testing
 - a. Prior to delivery two anchor assemblies of each production lot shall be randomly selected to be used as test specimens.
 - b. Perform the tests in the following sequence in accordance with the referenced codes and standards.
 - 1) Tension test:
 - a) Tension test shall be in accordance with ASTM D638 using a temperature range of plus 40C to minus 17C.
 - b) The minimum acceptable tensile strength shall be 60,000 psi.
 - 2) The impact-resistance test:
 - a) The impact-resistance test shall be conducted within the temperature range of plus 21C to minus 17C.
 - b) The strain insulator rod shall be mounted as a simple beam with 21 inches between supports.
 - c) A 50-pound weight shall be dropped from a height of 12 inches so that it impacts at a midpoint on the rod. Repeat the test three times. No fractures shall occur on the rod.
 - 3) Water-absorption test:
 - a) Water-absorption test shall be performed in accordance with ASTM D570 over a 48-hour period using a temperature range of 20C to 40C.
 - b) Weight gain shall not exceed 0.15 percent of the original weight.
 - 4) DC-resistance test:
 - a) Following the specified water-absorption test, one eight-inch length of 5/8-inch diameter strain insulator rod shall undergo a dc-resistance test. The rod shall show a resistance of not less than eight megohms measured between the end surfaces of the rod.
 - 5) Dielectric test:
 - a) A dielectric test shall be performed on the same rod used in the resistance test.
 - b) The strain insulator rod shall be capable of withstanding an ac potential of 15,000 volts, 60 Hertz applied to the rod surface for three minutes without insulation breakdown or damage.
 - c) If one test specimen of a lot fails to meet specified test requirements, the entire production lot shall be rejected.

- 6) Strain Insulator Rod Testing
 - a) After the rods are assembled to the clevis ends using a resin compound or similar approved adhesive and allowed to cure for 24 hours, proof load test each assembly to 15,000 pounds. No physical damage shall be allowed at the conclusion of testing.

B. For Codes, Regulation, References, Standards and Specifications, refer to Article 1.02.

PART 2 - PRODUCTS

2.01 COMPONENTS

- A. Contact Rail Anchors
 1. Cast Parts
 - a. The contact rail anchor cast parts shall be free of cracks, blemishes, scale, machining flaws, excessive shrinkage or other defects rendering them unsuitable for their intended service. They shall be finished to a true and homogeneous surface and if necessary ground to ensure accurate fit with contiguous parts.
 - b. Steel used in the fabrication shall be medium steel manufactured by the open-hearth, basic-oxygen or electric furnace process, ASTM A27, Grade 65-35, fully annealed and tempered. Malleable iron shall be ASTM-A47, Grade 32510 and gray iron shall be ASTM A48 Class 40C.
 2. Rolled Steel Parts
 - a. Rolled steel parts shall be manufactured by the open-hearth, basic-oxygen or electric-furnace process and shall be in accordance with ASTM A36, ASTM A681 and ASTM A283, Grade C.
 - b. Parts shall be free from cracks, flaws, seams, blisters, imperfect edges and other defects rendering them unsuitable for their intended service. The surface roughness shall not exceed 125 micro inches as prescribed by ANSI B46.1
 3. Tolerances
 - a. All tolerances shall be in accordance with ANSI B4.1.
 4. Galvanizing
 - a. Parts to be galvanized shall be prepared by first pickling in diluted sulfuric acid and cleaning in cold running water. The parts shall then be shot blasted in accordance with SSPC - SP6, maximum grit size SAE G18, followed by immersion in a solution of zinc chloride or hydrochloric acid. After drying, hot-dip galvanize the parts in accordance with ASTM A123, unless otherwise specified. Nuts, bolts, washers, clevis pins and eye bolts shall be galvanized in accordance with ASTM A153 or ASTM B633 Type I SC-2.
 5. Strain Insulator Rods
 - a. The strain insulator rods shall be fabricated from 5/8-inch diameter reinforced plastic consisting of 60 to 65-percent glass fiber uniformly impregnated with 35 to 40-percent thermosetting p
 6. Miscellaneous Hardware
 - a. Nuts, bolts and miscellaneous hardware shall be of the type, material and dimensions as shown. The parts shall be galvanized as specified and manufactured as follow:
 - b. Nuts, bolts and flat washers: ASTM A325.
 - 1) Spring washers: ANSI B18.21.1.
 - 2) Cotter pins: ASTM B134 and ANSI B18.8.1.
 - 3) Eye bolts: ASTM A489.

PART 3 - EXECUTION - Not Used.

END OF SECTION

THIS PAGE NOT USED

SECTION 16127

CONTACT RAIL SYSTEM INSTALLATION FOR TRACTION POWER

PART 1-GENERAL

1.01 SUMMARY

- A. This section specifies the requirements for installation of an operable contact rail system consisting of composite contact rail and all appurtenances including protection equipment and furnishing of ancillary material as specified.
- B. Related Sections:
1. Section 05661 - Contact Rail and Appurtenances For Traction Power
 2. Section 16122 - Contact Rail Cable Connector Assemblies For Traction Power
 3. Section 16123 - Contact Rail Insulator Assemblies For Traction Power
 4. Section 16124 - Contact Rail Protection Cover Assemblies For Traction Power
 5. Section 16126 - Contact Rail Anchor Assemblies For Traction Power
 6. Section 16128 - Wire and Cable For Traction Power
 7. Section 16294 - Contact Rail Heating System For Traction Power
- C. Payment and Measurement
1. Compensation for work specified in this section will be made in the following manner:
 - a. Contact rail system, install: Lump Sum.
 2. Measurement of work specified in this section will be made in the following manner:
 - a. Contact rail system, install: linear foot measured to nearest 0.5 foot along center line of contact rail including end approaches, excluding gaps to include:
 - 1) Insulators, install: includes furnishing and installing insulators, shims and drive spikes.
 - 2) Composite contact rail, install: includes furnishing and installing of composite contact rail, bending rail, attachment of splice joints and installation of anchors, and end approaches.
 - 3) Cable connector assembly, install: includes preparation and installation of 1,000 KCMIL power cable as required and installation of compression connectors and insulating covers.
 - 4) Composite contact rail terminal lugs, install: includes preparation and installation of extra-flexible, 427-strand, power cable as required and installation of the terminal lugs on the composite contact rail.
 - 5) Protection cover, install: includes furnishing and installation of protection cover, support brackets, expansion joint protection cover assemblies and hardware.

1.02 REFERENCES

- A. Code, regulations, references standards and specifications
1. ASTM - D1248
 2. UL
 3. AREMA

1.03 SUBMITTALS

Submit the following for approval in accordance with the Division 1 and with additional requirements

specified for each:

- A. Shop drawings: shims for contact rail height adjustment.
- B. Documentation:
 - 1. The method of bending and tolerances to be allowed for contact rail.
 - 2. The method of brushing, cleaning, and grinding for removing local surface irregularities
- C. Certification:
 - 1. Wire pulling lubricants to be non-injurious to insulation of wire.

1.04 QUALITY ASSURANCE

- A. Testing
 - 1. Electrical resistance of the installed composite rail not to be greater than 0.002 ohms per 1,000 feet at 20 degree centigrade.
 - 2. Sample compression cable connector assemblies will be tested to sustain tension of 5,000 psi for three hours. At the end of three hours, there shall be no slipping of the cable in the connector, deforming or loosening of the connection or increase in the electrical resistance beyond that is specified.
 - 3. Terminal lugs for composite contact rail shall be tested as specified for cable connector assembly compression connections.
- B. For codes, regulations, reference standards and specifications, refer to Article 1.02 above.

PART 2: PRODUCTS

- A. The components furnished under this section shall be as follows:
 - 1. The top surface of each insulator rail clip shall be thoroughly coated with a non-conductive lubricant, Dow-Corning 44 (heavy) grease, or equal, to reduce strain on the insulators caused by the movement of the contact rail.
 - 2. Timber drive spikes to secure insulator to timber ties for ballasted track installment shall be ½ inch in diameter and 6-1/2 inches long. Two spikes will be required for each insulator. Timber drive spikes shall be in accordance with AREMA Plan.
 - 3. Shims as required, up to 1/4 inch shall be used under the insulator for further height adjustment. Shims shall be supplied by the Contractor at no additional cost to the Authority.
 - 4. Shims for contact rail height adjustment shall be 1/8 inches thick high density polyethylene, ASTM D1248, Type III, Class C, Cat. 5, and shall provide full bearing of the insulator on the grout pad in all positions of adjustment. Shims shall be designed to stay in place even if bolts are loose.
 - 5. Shim material may be manufactured without carbon black but shall meet all other requirements.
 - 6. The contact rail anchors shall be secured to the trackbed with 11/16-inch by 6-inch washer-head drive spikes in ballasted track. Drive spikes shall be in accordance with AREMA Plan.
 - 7. All jumper cable installed in conduit at crossovers, transitions and other special track work shall be standard duty, 127-strand, or extra flexible 427-strand power cable.
 - 8. Contact rail connection cable shall be extra flexible 427-strand, power cable. Its length and points of connection to the contact rail shall be as shown and in accordance with contraction requirements of the contact rail.

3.0 EXECUTION

A. Insulator Assemblies

1. Insulators shall be installed as shown and specified.
 - a. The insulators shall be centered and secured in place and shimmed if necessary.
 - b. Insulators shall be installed on the contact rail ties as shown. The distance between insulators shall not exceed ten feet.
 - c. All injurious substances falling on the insulators shall be immediately removed to prevent damage. Upon completion of the work, all insulators shall be inspected and thoroughly cleaned. All insulators chipped, broken or otherwise defective after installation shall be replaced before final acceptance at no additional cost to the Authority.
2. Ballasted Track Installation
 - a. The insulator shall be located to permit positioning the contact rail with respect to the gauge line of the near running rail within the specified tolerances.
 - b. The insulators shall be secured to the contact rail ties by two 1/2-inch diameter by 6-1/2-inch long timber drive spikes per insulator. The ends of ties under insulators shall be adzed or shimmed as necessary to compensate for warped ties. Contact rail ties shall be bored in the field to receive the drive spikes. Position holes to ensure that each insulator is centered across width of tie. The holes shall be 3/8-inch in diameter and six inches deep and treated with pentachlorophenol oil or creosote immediately after boring. The drive spikes shall be started vertically and driven straight. Drive spikes bent during installation shall be withdrawn and new drive spikes driven. Drive spikes shall be driven firmly to the top of the insulator base. Uneven tightening of spikes to adjust rail locating is prohibited

B. Contact Rail:

1. The centerline of the contact rail shall be located as shown on drawings. The contact rail shall be installed to rest evenly and uniformly on all insulator assemblies.
2. No length of contact rail less than 25 feet in length shall be used, except at locations shown, unless otherwise approved. Cuts shall be made only as required to ensure that the end of a run of contact rail falls within the specified tolerances. Cuts shall be made straight and perpendicular to the longitudinal axis of the contact rail. Contact rail for curve radii of less than 400 feet shall be bent to the appropriate curve prior to installation. Contact rail for curve radii greater than 400 feet may also be bent prior to installation to facilitate handling. The method of bending and tolerances to be allowed shall be submitted for approval.
 - a. Ballasted Track Installation: The required relative height of contact rail with respect to the top of running rail for timber ties shall be obtained by using shims under the insulator if necessary. Shims necessary for height adjustment shall be supplied by the Contractor at no additional cost to the Authority.
 - b. If further height adjustment is required, additional shims as required up to 1/4 inch shall be used under the insulator.
 - c. Shims shall be installed with tabs facing the direction of train traffic and a 3 inch finish nail tacked into the timber tie directly adjacent to the insulator base to prevent shims from vibrating out.
3. End Approaches: The end of contact rail sections shall be terminated with end approaches, installed as shown on drawings. They shall be assembled to the contact rail to ensure a smooth running surface. The allowable longitudinal location tolerance shall be plus or minus six inches except at special track work locations where the distance measured from the nearest point of switch shall be as calculated from dimensions shown with a tolerance of minus zero and plus one foot.

4. Splice Joints for Composite Contact Rail: Composite contact rail splice joint shall be installed as specified by the manufacturer of the composite contact rail and approved. Splice joints shall be installed to provide one foot clearance from contact rail insulators. The contractor shall demonstrate that the installed composite rail has an electrical resistance not greater than 0.002 ohms per 1,000 feet at 20 degrees C.
 5. Splice joints may be installed over insulators if the manufacturer demonstrates to the satisfaction of the Authority Representative that designed and furnished joint bars will not come in contact with insulator ears.
- C. Contact Rail Surface Preparation: After installation of the contact rail to the specified tolerances, but prior to its final acceptance, the Contact rail shall be brushed or otherwise cleaned to remove rust and scale from the head of the contact rail. Such brushing or cleaning shall not remove in excess of 0.002 inch from any surface of the rails, except that additional brushing, cleaning or grinding shall be performed as necessary to remove local surface irregularities. The method of brushing, cleaning and grinding shall be submitted for approval prior to use.
- D. Expansion Joints: The relatively short lengths of contact rail associated with this contract do not require expansion joints.
- E. Protection Cover Assembly: The protection cover assembly shall be installed entirely within the clearance envelope shown and in accordance with the manufacturer's recommendations:
1. At end approaches the protection cover shall be maintained at the uniform height above the top of the contact rail and shall not drop with the end approach.
 2. On curve radii under 500 feet, the protection cover may be cut into lengths a minimum of five feet long to conform as closely as possible to the arc of the curve. The protection cover shall lie within the clearance envelope at all times.
 3. For underground installation, protection cover support brackets shall be installed at five-foot intervals maximum; one bracket joining ends of protection cover sections and one at the midpoint of each 10-foot section.
 4. For at-grade installation, protection cover support brackets shall be installed at three foot, four inch intervals maximum; one bracket joining ends of protection cover sections and one at each third point of a 10-foot section.
 5. Additional protection cover brackets shall be installed where necessary. The maximum middle ordinate of a length shall be $\frac{1}{2}$ inch. At contact rail expansion joints, an expansion joint protection cover assembly shall be installed as shown. Contractor shall fabricate expansion joint protection covers from the protection covers as shown. Contractor shall install protection cover support brackets so as to avoid compression fasteners and splice joints in the composite contact rail.
- F. Electric Cabling and Connections
1. Materials shall be furnished and installed by the Contractor, including the cable connector assemblies, extra-flex 1,000 KCMIL cables, and connections to the contact rail.
 - a. All cabling shall be continuous without splices between terminations.
 - b. Cables shall not be bent, either permanently or during installation, to radii less than 10 times the outer diameters, except where shorter radii are approved for conditions making the specified radius impractical. The Contractor shall provide suitable installation equipment to prevent cutting and abrasions of conduit and cable during installation. Any conduit stub-ups broken or damaged shall be repaired as shown. Rod and swab conduits so as to remove water, cement and other foreign matter. Wire pulling lubricants, if used, shall conform to applicable UL requirements. The lubricant shall be

certified by the manufacturer to be non-injurious to such insulation. Pull-lines shall be made of nylon, polyester, polyethylene or other suitable nonmetallic material. Pull-lines shall be attached to cables by means of either woven basket grips or pulling eyes attached directly to the conductors. Only one cable shall be installed per conduit. Pulling tensions on both the conductors and their insulations and jackets shall not exceed the maximum tensions recommended by the cable manufacturer

2. Cable Installed in Conduit: All jumper cable installed in conduit at crossovers, transitions and other special track work shall be standard duty, 127-strand, or extra flexible 427-strand power cable. After installation, all cables shall be tested in accordance with Section 16128. Conduit ends shall be sealed using existing conduit sealing bushings, OZ Gedney Type CSBE-400p-1 or equal, as shown.

G. Cable Connector Assemblies

1. Qualifications for Performing Compression Connections: Prior to installation, the Contractor shall have prepared, under the direction of each foreman who will supervise a crew performing compression connections, two compression assemblies. The test compression assemblies shall be made using the methods and equipment the Contractor proposes to use for the installation. The electrical resistance of the completed connection, when measured between the distal end of cable and the connector tongue, shall not be greater than the resistance of an equivalent length of uncut cable.
2. Installation of Compression Connectors: Compression connectors shall be attached to the cable with the manufacturer's recommended tooling. When bolting tongues together, a lockwasher shall be installed under the head of each bolt and under each nut. All bolted connections shall be tightened with torque wrenches to a uniform torque of 450 inch pounds.
3. Installation of Terminal Lugs for Composite Contact Rail: Cable connections to the composite contact rail shall be one-hole, tin-plated, copper compression connectors. Prior to assembly of the terminal lugs to the composite contact rail, mating surfaces shall receive a liberal coating of oxide-inhibiting paste, NO-OX-ID, Dearborn Chemical, or equal. The oxide-inhibiting paste shall also be applied to all interfaces of the compression fasteners. The methods and equipment used to fasten the terminal lugs to the composite contact rail shall be as recommended by the manufacturer of the rail. Compression fasteners bent or improperly installed shall be replaced. Compression fasteners shall be installed in existing compression fastener holes used to hold the aluminum extrusion in place. Existing steel compression fasteners shall be removed and new fasteners installed to hold the terminal lugs.

END OF SECTION

THIS PAGE NOT USED

SECTION 16128

WIRE AND CABLE FOR TRACTION POWER

PART 1. GENERAL

1.01 SUMMARY

- A. This section specifies furnishing, installing and testing wire and cable.
- B. Compensation for work specified in this section will be made in the following manner and in accordance with the Unit Price Schedule:
 - 1. Wire and Cable Materials: Lump Sum.
 - 2. Installation: Lump Sum.
- C. Related sections include:
 - 1. Section 16294 - Contact Rail Heating System For Traction Power
 - 2. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power

1.02 REFERENCES

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Codes and regulations of the jurisdictional authorities.
 - 2. NEC.
 - 3. ICEA: WC70, T-33 - 655.
 - 4. IEEE: 383.
 - 5. NEMA: WC70.
 - 6. ASTM: B3, B8, D471, B173, E662.
 - 7. UL: 44, 224, 1581, 1569, 1685

1.03 SUBMITTALS

Submit the following for approval in accordance with the Special Conditions and with the additional requirements as specified for each:

- A. Shop Drawings: Submit shop drawings for each type of cable in accordance with Section 16051.
- B. Samples: Specified smoke-density test sample will become property of the Authority.
- C. Certification:
 - 1. Certified flame retardancy test reports and data for tests performed not more than 12 months prior to submittal, for materials which are identical to those of cable furnished.
 - 2. Submit smoke-density test reports and data from tests performed not more than 12 months prior to the submittal for materials which are identical to those of the furnished cable.
 - 3. Certified test reports demonstrating that cable complies with specified requirements and those of referenced ICEA and NEMA Standards.
 - 4. Certificates from manufacturers verifying that products conform to specified requirements. Include certificate with submittal of shop drawings and with each cable

shipment.

1.04 QUALITY ASSURANCE

- A. Qualifications: Select a manufacturer who is regularly engaged in production of similar wire and cable, particularly to Railway or Transit industry in USA.
- B. For Codes, Regulations, Reference Standards and Specifications, refer to Article 1.02.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Mark each single-conductor cable and each multiple-conductor cable to show UL label, size, voltage, manufacturer and number of conductors or phases in accordance with NEC requirements.
- B. Ship each unit securely packaged and labeled for safe handling and shipment.
- C. Store products in a dry and secure facility.

PART 2 PRODUCTS

2.01 MATERIALS

- A. General Requirements for Single-Conductor and Multiple-Conductor Cable:
 - 1. Type and size: Type I cable having low smoke - generating characteristics.
 - 2. Conductors: Type I cable having low smoke generating characteristics.
 - a. ASTM B3 or ASTM B8 annealed copper.
 - b. Size 10 AWG and smaller: Solid or Class B or Class C stranded.
 - c. Size 8 AWG and larger: Class B stranded, unless otherwise specified.
 - d. Other constructions as specified.
 - 3. Standards: Except as modified, wires and cable complying with the following standards: ICEA/NEMA WC70.
 - 4. Nonmetallic jacket for single-conductor cable and individual conductors of multiple-conductor cable and as overall covering on multiple-conductor cable:
 - a. Cross-linked polyolefin.
 - 5. Cross-linked polyolefin complying with the following physical requirements. Properties tested in accordance with ICEA/NEMA WC70. Jacket material free of PVC and PVC-based compounds.
 - 1) Tensile strength, minimum pounds per square inch: 1,800.
 - 2) Elongation at rupture, minimum percent: 150.
 - 3) Aging requirement: After 168 hours in air oven test at 100C, plus or minus 1 degree C:
 - a) Tensile strength, minimum percentage of unaged value: 100.
 - b) Elongation at rupture, minimum percentage of unaged value: 80.
 - 4) Oil immersion: 18 hours at 121degree C, plus or minus one degree C, ASTM D471, Table 1, No. 2 oil:
 - a) Tensile strength, minimum percentage of unaged value: 80.
 - b) Elongation at rupture, minimum percentage of unaged value: 80.

- 5) Jacket materials other than cross-linked polyolefin complying with ICEA/NEMA WC70. Jacket material free of PVC and PVC-based compounds.
 6. Flame retardancy: Single-conductor and multiple-conductor cable demonstrating flame retardancy in accordance with IEEE-383. Not required for medium voltage cable.
 - a. Single-conductor cable and individual conductors of multiple-conductor cable passing vertical flame test. Cable size for testing: 14 AWG.
 - b. Single-conductor cable, Size 1/0 AWG and larger, passing vertical tray flame test, using ribbon gas burner in accordance with UL 44. Cable size for testing: 1/0 AWG.
 - c. Multiple-conductor cable passing vertical tray flame test, using ribbon gas burner. Cable size for testing: 7/C or 9/C with 12 AWG or 14 AWG conductors.
 7. Applied Voltage testing:
 - a. Single-conductor cable and individual conductors of multiple-conductor cable to be given applied ac voltage dielectric strength test, i.e., six-hour water immersion test.
 - b. For single conductors of multiple-conductor cable, conduct tests prior to assembly as multiple-conductor cable
 - c. Test procedures per applicable ICEA/NEMA standards.
- B. Smoke generation: Single-and-multiple-conductor cable jacket materials demonstrating low-smoke generation when tested in accordance with ASTM E662 by independent, nationally recognized testing agency.
1. Conduct tests on specimens of overall jacket material for multiple-conductor cable and of jacket material for single-conductor cable.
 2. Prepare slab specimens for each material .100 inch, plus-or-minus .005-inch thick, identical to those of finished cables and meeting minimum physical requirements specified.
 3. Prior to testing, submit six-inch square portion of each specimen. Tag sample with manufacture's jacket or insulation identification code or number.
 4. Test values not to exceed the following:
 - a. Flaming mode:
 - 1) Uncorrected maximum specific optical density during first four minutes of test: 150.
 - 2) Uncorrected maximum specific optical density for entire 20-minute test: 300.
 - b. Nonflaming mode:
 - 1) Uncorrected maximum specific optical density during first four minutes of test: 150.
 - 2) Uncorrected maximum specific optical density for entire 20-minute test: 300.
- C. 2000-Volt Single-Conductor Cable:
1. Rated voltage: 2000 volts.
 2. Conductor:
 - a. Extra-flexible, 1000 KCMIL cable, Class G stranded for power feeder between cable connector assembly and contact rail.
 - b. Standard 1000 KCMIL cable, Class D stranded for traction power feeder installed in conduit and cable tray.

- c. Standard 500 KCMIL cable, Class D stranded for traction power feeder installed in conduit and cable tray.
 - d. 6 AWG cable for connecting DC surge arrestor to ground.
 - 3. Insulation: Ethylene-propylene rubber, ICEA Type II, 90 degree C, suitable for dry and wet locations.
 - 4. Jacket: Overall nonmetallic jacket of T-33-655 thermoset type II or cross-linked polyolefin.
 - 5. UL labeling: Type RHW-2.
 - 6. Additional requirements:
 - a. Insulation power factor: Two percent maximum.
 - b. Bond jacked to insulation to prevent moisture pockets. Minimum peel strength of the jacket from insulation: Four pounds per inch width for cross-linked polyolefin, and 10 pound per inch for heavy-duty neoprene.
- D. 600-Volt, Single-Conductor Cable:
 - 1. Rated voltage: 600 volts.
 - 2. Insulated with jacketed ethylene-propylene-rubber with nonmetallic jacket UL-labeled Type RHW or unjacketed filled cross-linked polyethylene, UL-labeled Type XHHW-2 or RHW-2.
 - 3. Color coding: In accordance with paragraphs 200-6, 200-7 and 210-5 of the NEC.
- E. Bare Conductor: ASTM B3, annealed copper conductor; 8 AWG and larger, Class B stranded.
- F. Cable Pulling Calculations:
 - 1. The Contractor shall perform pulling calculations in accordance with the cable manufacturer's recommendations, and these specifications. The calculations shall be made by an Electrical Engineer registered in the State of Maryland or the District of Columbia (depending on location) and bear the seal and signature of the engineer who is responsible for the calculations. Calculations shall be made for all conductors when installed in conduit under the following conditions:
 - a. The conduit run exceeds 100 feet vertically;
 - b. The conduit run exceeds 300 feet horizontally; and
 - c. The conduit run contains a total of over 180 degrees of bend.
 - 2. The Contractor shall also provide calculations for any additional run under any condition when requested by the Authority Representative. The calculations shall establish that the Contractor's cable installation can be implemented without damage to any wire or cable.
 - 3. For pulling calculations, consideration shall be given to the following parameters - fill, coefficient of friction, clearance configuration, jam ratio of the cables and conduit, weight correction factor, bend radii, training of cables on entering and existing the conduits, maximum allowable tension, sidewall load, the method of attaching the conductors to the pulling equipment, and weight of the cables. These factors shall be calculated for each pull as required. The contractor shall not exceed the maximum allowable values of sidewall pressure, pulling strain on conductors or sheath, limits of pulling device, and pulling tension.
 - 4. In general, the Contractor shall not exceed the following guidelines:
 - a. The maximum pulling strain on the cable with a pulling eye attached to the conductors is a function of the conductor area as follows: $TM = 0.008 \times n \times CM.$, where TM = Maximum tension (lbs), n = number of conductors, CM = area of each conductor circular miles.
 - b. When a basket-weave grip is used in lieu of a pulling eye, the maximum

tension shall not exceed the value calculated for the pulling eye method or 1000 lbs per grip, whichever is less.

- c. The sidewall pressure loads shall not exceed 300 lb/ft of bend radius, or the Wire and Cable Manufacturer's recommendation, which ever is less.
 - d. The jam ratio shall not fall between 2.8 and 3.2.
 - e. The coefficient of the friction for the cables with lubrication shall be taken to be 0.5.
5. Cable pulling calculations shall be submitted to the Authority Representative for approval. Cable shall not be installed until the contractor receives approval from the Authority Representative for the pulling calculations and cable installation.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install all wiring continuous, without splices, between terminations, except as otherwise noted.
- B. Install single-conductor cable in conduit or cable tray as necessary. On walls or ceilings, fasten cable directly to channel inserts, or use expansion bolt anchors to attach to concrete and toggle bolts to attach to concrete masonry walls.
- C. Use nylon straps to bundle and secure wire and cable located in panelboards, cabinets, switchboards, switchgear and control panels.
- D. Minimum bending radius 12 times outer diameter of cable. Where shown, use shorter bending radius as permitted by NEC, ICEA, and cable manufacturer.
- E. To facilitate pulling cable, use UL-listed lubricant recommended by cable manufacturer.
- F. Use polyethylene or other suitable nonmetallic rope for pulling cable. Attach to cable by means of either woven basket grips or pulling eyes attached directly to the conductors.
- G. In damp and dusty indoor locations, manholes and outdoor locations, seal cable at conduit termination using duct sealing compound.
- H. Where shown or necessary, install cable seal fittings to prevent entry of water into electrical facilities.
- I. The splicing of power and control cables is not permitted in ductbanks, cable troughs or cable trenches. However, if permitted by the Authority Representative, make watertight splices as approved.
- J. The Contractor shall hook up 1000 KCMIL and 500 KCMIL traction power cables at switchgear end and trackside (negative and positive rails) when directed by the Authority Representative.
- K. All 1000 KCMIL and 500 KCMIL cables shall be secured at every rung on the cable tray with tie wraps.
- L. Identify cable terminations, feeders, power and control circuits using the following:
 - 1. Cable Tags: Stainless steel tags punched with conduit or cable number or

- identification as appropriate.
2. Wire Labels: Sleeve-type, heat shrinkable, flame retardant Raychem TMS product line, Type XPE or equal and conforming to UL 224. Wire identification same as corresponding terminal block identification unless otherwise shown. The labels on 1000 KCMIL and 500 KCMIL cable shall be clear, heat shrinkable with 1/2" height yellow lettering stamped on inside. The labels shall have reference of substation or tie breaker station breaker Supervisory control ID number and cable sequence in the branch of the feeder (e.g. BRK. 32-A) at both ends.
 3. Attach tags to cable with slip-free plastic lacing or nylon bundling straps. Use designation shown.

3.02 FIELD QUALITY CONTROL

- A. Furnish equipment required to perform tests. Prior to insulation and high potential tests, disconnect instruments and equipment which might be damaged during such tests. Conduct tests in presence of the Authority Representative. Schedule all tests through the Authority Representative and provide a minimum 48 hours notice.
- B. Submit test procedure for approval and perform approved tests. Do not perform tests without approved test procedure. Schedule all tests through the Authority Representative. Tests include but not limited to the following:
 1. 600-volt single-conductor cable:
 - a. Test continuity of conductors using ohmmeter.
 - b. Disconnect cable under test at both ends. Proof-test insulation resistance between each cable and the conduit in which the cable runs. While conducting the test, all other cables installed in the same conduit with the cable under test shall be connected to ground at one end. Insulation resistance shall be measured with a 1000-volt megger for minimum of one minute between the cable under test and the ground. Insulation resistance: One megohm minimum corrected to 15.6 degree C.
 - c. When cable shows insulation resistance of less than one megohm, perform high potential test at 80 percent of factory dc test voltage or as recommended by cable manufacturer. A gradual decrease of leakage current with time indicates an acceptable cable installation.
 2. 2000-volt single-conductor cable:
 - a. Test continuity of conductors using ohmmeter.
 - b. Proof-test insulation resistance to ground of the cable under test for a minimum of one minute using a 2500-volt three-terminal megger. Insulation resistance: 500 megohms, minimum, corrected to 15.6 degree C. Testing shall be done prior to termination of the cables at the two ends. Terminal lugs shall be installed prior to cable testing. Testing procedure shall be as follows:
 - 1) Proof-test the system insulation resistance to ground of the cable under test using step-voltage testing method.
 - 2) Insulation resistance: 500 megohms, corrected to 15.6 degree C. Testing shall be done after all cables have been installed and lugged.
 - 3) Isolate all cables at trackside and in the switchgear.
 - 4) Secure each cable under test and connect the positive test lead of the megger to one end of the cable under test. Connect the megger ground lead to the station ground busbar.
 - 5) Apply a 1000-volt dc test voltage to the cable for one minute and

- record the end test reading on the data sheet.
- 6) If the megger reading is greater than or equal to 500 megohms, proceed with testing the next cable in the test plan. If the test value is lower than 500 megohms, proceed with the step-voltage test as described below.
 - 7) Step-voltage test:
 - a) Examine and clean cable termination for presence of moisture or contamination.
 - b) Make a second megger test at 1000 volts dc for one minute and record end test reading on data sheet. If reading is less than 500 megohms, proceed with step (c) below, otherwise record new test reading on data sheet with comments depicting corrective action and proceed with testing next cable in the test plan.
 - c) Increase the megger test voltage in increments of 500 volts starting at 1500 volts dc up to 2500 volts dc and perform one minute insulation resistance measurement tests. Record end test readings on data sheet for each incremental test.
 - d) Compare insulation test readings at all levels of test voltage. A decrease of insulation resistance from the 1000 volts dc test voltage to the 2500 volts dc test voltage indicates the cable insulation has incipient weakness and the cable shall be replaced at no cost to the Authority.
 - 8) Repeat the above procedures for all the positive and negative traction power cables.

END OF SECTION

THIS PAGE NOT USED

SECTION 16129
2000 VOLT SHIELDED CABLE

PART 1. GENERAL

1.01 SUMMARY

- A. This section specifies furnishing, installing and testing shielded, low-smoke, halogen-free, low toxicity, single conductor 2000V cable, with standard and "extra-flexible" stranding. Size as shown on the contract drawings or as specified.
- B. Compensation for work specified in this section will be made in accordance with the Unit Price Schedule.
- C. Related sections include:
 - 1. Section 16128 - Wire and Cable For Traction Power
 - 2. Section 16341 - Metal-Enclosed DC Switchgear For Traction Power

1.02 REFERENCES

- A. Pertinent provisions of the current edition of the following listed Codes, Regulations, Reference Standards and Specifications shall apply to the work of this Section, except as they may be modified herein, and are hereby made a part of this Specification to the extent required. In instances of conflict, the more stringent requirement will take precedence.
 - 1. Codes and regulations of the jurisdictional authorities.
 - 2. NEC.
 - 3. ICEA: S-95-658, S-96-659, S-93-639, T-26-465, T-27-581, T-28-562, T-33-655.
 - 4. IEEE: 383.
 - 5. NEMA: WC53, WC54, WC70, WC71, WC74.
 - 6. ASTM: B3, B8, B173, D412, D471, D572, D573, E662.
 - 7. UL: 44, 224, 1072, 1581, 1685
 - 8. MIL: C-24643

1.03 SUBMITTALS

Submit the following for approval in accordance with the Special Conditions and with the additional requirements as specified for each:

- A. Shop Drawings: Submit shop drawings for each type of cable.
- B. Samples: Specified smoke-density test sample will become property of the Authority.
- C. Certification
 - 1. Certified flame retardancy test reports and data for tests performed not more than 12 months prior to submittal, for materials which are identical to those of the furnished cable.
 - 2. Submit smoke-density test reports and data from tests performed not more than 12 months prior to the submittal for materials that are identical to those of the furnished cable.
 - 3. Certified test reports demonstrating that cable complies with specified requirements and those of referenced ICEA and NEMA Standards.

4. Certificates from manufacturer and the Underwriters Laboratories Inc.(UL Listing) verifying that products conform to specified requirements. Include certificates with submittal of shop drawings and with each cable shipment.

1.04 QUALITY ASSURANCE

- A. Qualifications: Select a manufacturer who is regularly engaged in production of similar wire and cable, particularly to Railway or Transit industry in USA. The manufacturer must have in place a quality system in accordance with ISO 9001 or 9002 and be registered by an independent registration organization.
- B. For Codes, Regulations, Reference Standards and Specifications, refer to Article 1.02.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Mark each single-conductor cable to show UL Listing, size, voltage, manufacturer, etc. in accordance with NEC, ICEA/NEMA and UL requirements.
- B. Ship each unit securely packaged and labeled for safe handling and shipment.
- C. Store products in a dry and secure facility.

PART 2 PRODUCTS

2.01 MATERIALS

- A. General Requirements for Single-Conductor Shielded Cable:
1. Type and rating: Type II shielded, low smoke, halogen free, low toxicity 2000 Volt jacketed cable.
 2. Conductors:
 - a. ASTM and ICEA standards.
 - b. Standard 1000kcmil, 127 strand Class D tinned copper.
 - c. Extra-flexible 1000kcmil, 427 strand Class G tinned copper.
 - d. Other constructions, as specified or shown on the contract drawings.
 - e. Cable suitable for dry and wet locations and hostile environmental conditions associated with underground heavy rail transit systems.
 3. Standards: Except as modified, cable shall comply with the Article 1.02.
 4. Conductor insulation: Low smoke, halogen free, low toxicity Ethylene-Propylene Rubber (EPR), ICEA Type II, and have the following properties:
 - a. The low smoke, halogen free, low toxicity EPR insulation shall be capable of withstanding operating copper conductor temperature of 90 degrees C continuous, 130 degrees C emergency overload for standard prescribed periods and 250 degrees C for short circuits. The insulation shall be highly moisture resistant, shall be free-stripping and leave the surface of the conductor clean. An opaque mylar separator may be used between the conductor and the insulation to ease stripping. Any additional tapes (e.g., flame-retardant fiberglass over the tinned copper tape, etc.) deemed necessary by the manufacturer shall be clearly noted.
 - b. Insulation thickness:
 - 1) Minimum average thickness of the EPR insulation wall over the conductor: 90 mils (0.090 inches).

- 2) Minimum average thickness of the supplemental EPR insulation wall over the shield: 80 mils (0.080 inches).

The minimum point thickness for both layers of insulation shall not be less than 90% of the minimum average thickness.

- c. The EPR insulation will have the following physical and electrical characteristics when tested in strict accordance with Article 1.02 standards:

- 1) Tensile strength (minimum): 1200 PSI .
- 2) Elongation (minimum): 150 percent.
- 3) Tensile stress at 100 percent elongation (minimum): 500 PSI.
- 4) When air oven tested for 168 hours at 121 degrees C \pm 1 degree C:
 - a) Tensile strength: 75 percent
 - b) Elongation: 75 percent.
- 5) When Hot Creep tested after conditioning at 150 degrees C \pm 2 degrees C:
 - a) Elongation (maximum): 50 percent
 - b) Set (maximum): 5 percent.
- 6) Electrical properties after water immersion at 75 degrees C \pm 1 degree C:
 - a) Permittivity after 24 hours (maximum): 6.0
 - b) One to 14 days immersion (maximum increase in capacitance): 5 percent
 - c) Seven to 14 days immersion (maximum increase in capacitance): 3 percent
 - d) Stability factor after 4 days (maximum): 1.0,
- OR -
Stability factor difference (maximum) 1 - 14 days: 0.5
- 7) Insulation resistance constant at 15.6 degrees C (minimum): 10,000 meg/1000 feet.

5. Shield:

- a. The shield shall consist of a continuous layer of tin-coated copper tape at least 5 mils (0.005 inches) thick. The tape shall be a minimum width of 0.75 inches and be applied with an overlap of at least 0.25 inches or 25 % of its width.
- b. The tape shall be free from burrs and shall be applied in such a manner that electrical continuity or contiguity will not be distorted or disrupted during normal installation bending. Joints in tapes shall be made electrically continuous by welding, soldering or brazing. Butted tapes shall not be permitted.

Note: Reminder: Apply supplemental EPR over shield before non metallic jacket. See 2.01 A.4.b.2), above.

6. Nonmetallic jacket for single-conductor cable:

- a. Cross-linked polyolefin (XLPO) Thermoset Type II complying with the following physical requirements. Minimum average wall thickness shall be 0.095 inches, minimum thickness at any point 0.080 inches. Properties tested in accordance with ASTM, ICEA, UL, IEEE and MIL specifications, refer to Article 1.02. Jacket material shall be low-smoke, halogen-free, low toxicity, fire retardant. Bond jacket to insulation to prevent moisture pockets between the jacket and insulation. The minimum peel strength of

the jacket from insulation shall be four pounds per inch width.

- 1) Tensile strength, minimum pounds per square inch: 1,600.
 - 2) Elongation at rupture, minimum percent: 150.
 - 3) Aging requirement: After 168 hours in air oven test at 121degrees C \pm 1 degree C:
 - a) Tensile strength, minimum percentage of unaged value: 85.
 - b) Elongation at rupture, minimum percentage of unaged value: 75.
 - 4) When Hot Creep tested after conditioning at 150 degrees C \pm 2 degrees C:
 - a) Elongation (maximum): 100 percent
 - b) Set (maximum): 10 percent.
 - 5) Cold Bend Temperature: minus 25 degrees C.
 - 6) Gravimetric Method - Water Absorption (maximum): 50 mg/in².
 - 7) When oil immersion tested for 18 hours at 121 degrees C \pm 1 degree C:
 - a) Tensile strength: 50 percent
 - b) Elongation: 50 percent.
 - 8) Smoke density, 100 mil slab: Prepare 100 mil (0.100 inches), plus-or-minus 0.005 inches, thick slab specimens for each material identical to those of finished cables and meeting minimum physical requirements specified. Prior to testing, submit six-inch square portion of each specimen. Tag sample with manufacture's jacket or insulation identification code or number. Allowable maximum limits when tested per ASTM E662 by independent, nationally recognized testing agency:
 - a) Flaming mode:
Uncorrected maximum specific optical density during first four minutes of test D_{s4}: 150
Uncorrected maximum specific optical density for entire 20-minute test, D_m: 300
 - b) Nonflaming mode:
Uncorrected maximum specific optical density during first four minutes of test, D_{s4}: 150
Uncorrected maximum specific optical density for entire 20-minute test, D_m: 300
7. The completed cable (including insulation and jacket) will be tested in accordance with ASTM, UL and MIL standards by an independent, nationally recognized testing agency. The combustion requirements and characteristics are:
- a. Acid gas equivalent (maximum): 2 percent
 - b. Halogen content: 0.2 percent
 - c. Flame retardancy: All 2000-volt shielded power cables shall be flame-retardant and shall pass the vertical tray flame test as described in the IEEE - 383, ICEA S-95-658, T-30-520 and UL-1581, 1685. Cable size for testing shall be a minimum 250 kcmil.
8. Applied Voltage testing:
- a. All 2000-volt shielded cable to be given applied AC voltage dielectric strength test, i.e., six-hour water-immersion test.
 - b. Test procedures:

Conductor shall be immersed in water for a minimum of six hours before test. Shielded cables shall be tested from conductor to shield, and tested from shield to water at 11.0 kV AC. Test in accordance with methods outlined in appropriate sections of ICEA, NEMA and UL standards.

B. Cable Pulling Calculations

The Contractor shall perform pulling calculations in accordance with the cable manufacturer's recommendations, and these specifications. The calculations shall be made by an Electrical Engineer registered in the State of Maryland or the District of Columbia (depending on location) and bear the seal and signature of the engineer who is responsible for the calculations. Calculations shall be made for all conductors when installed in conduit under the following conditions:

1. The conduit run exceeds 100 feet vertically;
2. The conduit run exceeds 300 feet horizontally; and
3. The conduit run contains a total of over 180 degrees of bend.

The Contractor shall also provide calculations for any additional run under any condition when requested by the Authority Representative. The calculations shall establish that the Contractor's cable installation can be implemented without damage to any wire or cable.

For pulling calculations, consideration shall be given to the following parameters - fill, coefficient of friction, clearance configuration, jam ratio of the cables and conduit, weight correction factor, bend radii, training of cables on entering and existing the conduits, maximum allowable tension, sidewall load, the method of attaching the conductors to the pulling equipment, and weight of the cables. These factors shall be calculated for each pull as required. The contractor shall not exceed the maximum allowable values of sidewall pressure, pulling strain on conductors or sheath, limits of pulling device, and pulling tension.

In general, the Contractor shall not exceed the following guidelines:

1. The maximum pulling strain on the cable with a pulling eye attached to the conductors is a function of the conductor area as follows: $TM = 0.008 \times n \times CM.$, where TM = Maximum tension (lbs), n = number of conductors, CM = area of each conductor circular mils.
2. When a basket-weave grip is used in lieu of a pulling eye, the maximum tension shall not exceed the value calculated for the pulling eye method or 1000 lbs per grip, whichever is less.
3. The sidewall pressure loads shall not exceed 300 lb/ft of bend radius, or the Wire and Cable Manufacturer's recommendation, which ever is less.
4. The jam ratio shall not fall between 2.8 and 3.2.
5. The coefficient of the friction for the cables with lubrication shall be taken to be 0.5

Cable pulling calculations shall be submitted to the Authority Representative for approval. Cable shall not be installed until the contractor receives approval from the Authority Representative for the pulling calculations and cable installation.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install all cable continuous, without splices, between terminations, except as otherwise noted.
- B. Install single-conductor cable in conduit or cable tray as necessary. On walls or ceilings, fasten cable directly to channel inserts, or use expansion bolt anchors to attach to concrete and toggle bolts to attach to concrete masonry walls.

- C. Minimum bending radius 12 times outer diameter of cable. Where shown, use shorter bending radius as permitted by NEC, and/or appropriate sections of ICEA/NEMA standards and cable manufacturer.
- D. To facilitate pulling cable, use UL-listed lubricant recommended by cable manufacturer.
- E. Use polyethylene or other suitable nonmetallic material for the line to pull the cable. The pulling line should be adequately sized to safely pull the cable into the raceway. The pulling line should be high strength, low stretch and abrasion resistant. Attach to cable by means of either woven basket grips or pulling eyes attached directly to the conductors.
- F. In damp and dusty indoor locations, manholes and outdoor locations, seal cable at conduit termination using duct sealing compound.
- G. Where shown or necessary, install cable seal fitting to prevent entry of water into electrical facilities.
- J. The splicing of power cables is not permitted in ductbanks, cable troughs or cable trenches. However, if permitted by the Authority Representative, make watertight splices as approved.
- K. The Contractor shall hook up 1000 KCMIL traction power cables at switchgear end and trackside (negative and positive rails) when directed by the Authority Representative.
- L. All 1000 KCMIL cables shall be secured at every rung on the cable tray with tie wraps.
- M. Identify cable terminations, feeders, power and control circuits using the following:
 - 1. Cable Tags: Non-ferrous tags or pressure sensitive labels, stamped or printed with cable number or identification as appropriate.
 - 2. Labels: The labels on 1000 KCMIL cable shall be clear, heat shrinkable with ½" height yellow lettering stamped on inside. The labels shall have reference of substation or tie breaker station breaker Supervisory control ID number and cable sequence in the branch of the feeder (e.g. BRK. 32-A) at both ends.
 - 3. Attach tags to cable with slip-free plastic lacing or nylon bundling straps.

3.02 FIELD QUALITY CONTROL

- A. Furnish equipment required to perform tests. Prior to insulation and high potential tests, disconnect instruments and equipment that might be damaged during such tests. Conduct tests in presence of the Authority Representative. Schedule all tests through the Authority Representative and provide a minimum 48 hours notice.
- B. Submit test procedure for approval and perform approved tests. Do not perform tests without approved test procedure. Schedule all tests through the Authority Representative. Tests include but not limited to the following:
 - 1. 2000-volt single-conductor shielded cable:
 - a. Test continuity of conductors using ohmmeter.
 - b. Proof-test insulation resistance to shield or to ground of the cable under test for a minimum of one minute using a 2500-volt three-terminal megger. Insulation resistance: 500 megohms, minimum, corrected to 15.6 degrees C. Testing shall be done prior to termination of the cables at the two ends. Terminal lugs shall be installed prior to cable testing. Testing procedure shall be as follows:
 - 1) For shielded cables, proof-test insulation resistance between conductor and the metallic shield. While conducting the test, the metal shield shall be tied to ground. For unshielded cables, proof-

test the system insulation resistance to ground of the cable. The step-voltage testing method shall be used.

- 2) Testing shall be done after all cables have been installed and lugged. Isolate all cables at trackside and in the switchgear.
- 3) Secure each cable under test and connect the positive test lead of the megger to one end of the cable under test. Connect the megger ground lead to the station ground busbar and/or cable shield, as appropriate.
- 4) Apply a 1000-volt dc test voltage to the cable for one minute and record the end test reading on the data sheet.
- 5) If the megger reading is greater than or equal to 500 megohms, proceed with testing the next cable in the test plan. If the test value is lower than 500 megohms, proceed with the step-voltage test as described below.
- 6) Step-voltage test:
 - a) Examine and clean cable termination for presence of moisture or contamination.
 - b) Make a second megger test at 1000 volts dc for one minute and record end test reading on data sheet. If reading is less than 500 megohms, proceed with step (c) below, otherwise record new test reading on data sheet with comments depicting corrective action and proceed with testing next cable in the test plan.
 - c) Increase the megger test voltage in increments of 500 volts starting at 1500 volts dc up to 2500 volts dc and perform one minute insulation resistance measurement tests. Record end test readings on data sheet for each incremental test.
 - d) Compare insulation test readings at all levels of test voltage. A decrease of insulation resistance from the 1000 volts dc test voltage to the 2500 volts dc test voltage indicates the cable insulation has incipient weakness and the cable shall be replaced at no cost to the Authority.
- 7) Repeat the above procedures for all the positive and negative traction power cables.

END OF SECTION

SECTION 16130

RACEWAYS, BOXES AND CABINETS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing conduit, raceways, cable trays, boxes and cabinets to form raceway and support system for power, communication and control cables.
- B. Related Work Specified Elsewhere:
 - 1. Underground electrical and communications distribution systems: Section 02585.
 - 2. Concrete formwork: Section 03100.
 - 3. Cast-in-place structural concrete: Section 03300.
 - 4. Structural precast concrete: Section 03400.
 - 5. Grounding and bonding: Section 16060.
 - 6. Fire stopping: Section 07841.

1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is engaged in production of similar raceways, boxes and cabinets.
- B. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. National Electrical Code (NEC).
 - 3. National Electrical Manufacturers Association (NEMA): 250, Enclosures for Electrical Equipment (1000 Volts Maximum); VE 1, Metallic Cable Tray Systems.
 - 4. American National Standards Institute (ANSI): C80.1, Rigid Steel Conduit - Zinc Coated; C80.5, Aluminum Rigid Conduit - (ARC); and Z55.1, Gray Finishes for Industrial Apparatus and Equipment.
 - 5. UL: 5, Surface Metal Raceways and Fittings; 6, Rigid Metal Conduit; 50, Enclosures for Electrical Equipment; 94, Test for Flammability of Plastic Materials for Parts in Devices and Appliances; 360, Liquid Tight Flexible Steel Conduit; 514A, Metallic Outlet Boxes; 514B, Fittings for Conduit and Outlet Boxes; 514C, Nonmetallic Outlet Boxes, Flush-Device Boxes and Covers; 884, Underfloor Raceways and Fittings; and 1684, Reinforced Thermosetting Resin Conduit (RTRC) and Fittings.
 - 6. Federal Specifications (FS): FF-S-325C, FF-S-760, TT-S-227.
 - 7. American Standards of Testing and Materials (ASTM): A47/A47M-99, Standard Specification for Ferritic Malleable Iron Castings; A123/A123M-00, Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products; A185-97, Standard Specification for Steel Welded Wire Fabric, Plain, for Concrete Reinforcement; A276-00a, Standard Specification for Stainless Steel Bars and Shapes; A507-00, Standard Specification for Drawing Alloy Steel, Sheet and Strip, Hot-Rolled and Cold-Rolled; A532/A532M-93a(1999)e1, Standard Specification for Abrasion-Resistant Cast Irons; A536-84(1999)e1, Standard Specification for Ductile Iron Castings; A615/A615M-00, Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement; A653/A653M-00, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process; B138-96, Standard Specification for Manganese Bronze Rod, Bar and Shapes; B455-96, Standard Specification for Copper-Zinc-Lead Alloy (Leaded-Brass) Extruded Shapes; B584-00, Standard Specification for Copper Alloy Sand

Castings for General Applications; B633-98, Standard Specification for Electro deposited Coatings of Zinc on Iron and Steel; C109/C109M-99, Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-in. or [50-mm] Cube Specimens); C173-94ae1, Standard Test Method for Air Content of Freshly Mixed Concrete by the Volumetric Method; C231-97e1, Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method; D149-97a, Standard Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies; D495-99, Standard Test Method for High-Voltage, Low-Current, Dry Arc Resistance of Solid Electrical Insulation; D570-98, Standard Test Method for Water Absorption of Plastics; D638-00, Standard Test Method for Tensile Properties of Plastics; D648-00a, Standard Test Method for Deflection Temperature of Plastics Under Flexural Load in the Edgewise Position; and D790-00, Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.

8. American Association of State Highway and Transportation Officials (AASHTO): Standard Specifications for Highway Bridges (SSHB).
 9. ITS: Directory of ITS listed products.
- C. The following items to be listed or labeled per referenced UL or ITS directory:
1. Conduit and fittings.
 2. Surface raceways and fittings.
 3. Underfloor raceways and fittings.
 4. Boxes.
 5. Cabinets.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings.
- B. Certification.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- C. Store products in secure and dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Conduit, Raceways, Cable Trays, Boxes, Cabinets and Fittings:
 1. Size: As shown, minimum conduit size 3/4 inch.
 2. Materials:
 - a. Steel sheet: ASTM A507-00.
 - b. Zinc-coated steel sheet: ASTM A653/A653M-00.
 - c. Cast iron: ASTM A532/532M-93a(1999)e1.

- d. Ductile iron: ASTM A536-84(1999)e1.
 - e. Malleable iron: ASTM A47/A47M-99.
 - f. Bronze extrusion: ASTM B455-96, Alloy C38500.
 - g. Bronze casting: ASTM B584-00, Alloy C83600.
 - h. Rigid fiberglass reinforced epoxy: UL 1684.
 - i. Stainless steel: ASTM A276-00a, Type 304.
3. Zinc coating:
- a. Hot-dip galvanizing: ASTM A123/A123M-00.
 - b. Electro galvanizing: ASTM B633-98.
- B. Galvanized-Steel Rigid Conduit and Fittings: UL 6 and ANSI C80.1, zinc coating tested in accordance with reference test in appendix.
- C. Aluminum Rigid Conduit and Fittings:
- 1. ANSI C80.5 and UL 6.
- D. Liquid-Tight Flexible Conduit and Fittings:
- 1. Applicable requirements of UL 360.
 - 2. Flexible galvanized-steel core with extruded liquid-tight neoprene or PVC jacket overall.
 - 3. Sizes up to 1-1/4 inch provided with continuous copper bonding conductor, spiral wound between convolutions.
 - 4. Sizes 1-1/2 inch and above provided with separate grounding conductor.
- E. Conduit Expansion Fittings and Expansion and Deflection Fittings:
- 1. Materials:
 - a. For galvanized-steel rigid conduit:
 - (1) Expansion fittings: Steel or malleable iron, hot-dip galvanized.
 - (2) Expansion/deflection fittings: Bronze or ductile iron end couplings, neoprene sleeve and stainless steel clamping bands.
 - 2. Conduit expansion fitting: Weatherproof.
 - 3. Conduit expansion and deflection fitting: Watertight.
 - 4. Metallic fittings equipped with bonding jumper cable to provide electrical continuity.
- F. Conduit Connector Fittings:
- 1. UL 514B, material and finish similar to that of conduit with which they are to be used.
 - 2. For enclosures, cabinets, boxes and gutters in electrical rooms and aboveground indoor locations: Threaded nylon-insulated bushing and locknuts.
 - 3. For enclosure, cabinets, boxes and gutters with hub in outdoor, tunnel and underground locations, except electrical rooms: Threaded watertight hub fitting with gasket.
 - 4. For enclosure having punched or formed knockout for conduit entry in outdoor and underground locations, except electrical rooms: Threaded watertight fitting with gasket, nylon-insulated throat and sealing locknut.
- G. Conduit and Cable-Seal Fittings:
- 1. Conduit seal:
 - a. To provide watertight seal between concrete and conduit where it penetrates wall, floor or ceiling.
 - b. Size as shown or necessary.

- c. Materials: Body and pressure clamp of malleable or cast iron with a neoprene sealing grommet and PVC-coated or galvanized-steel pressure rings, oversized sleeve of FRE or galvanized steel.
 - d. Seal between conduit and concrete to withstand pressure from 50-foot head of water without leakage.
2. Cable seal:
- a. To provide watertight seal between cable and conduit for use with single-conductor or multiple-conductor cable as necessary.
 - b. Size as necessary, drilled to accommodate cable.
 - c. Pressure discs of PVC-coated steel and sealing ring of neoprene.
 - d. Seal between cable and conduit to withstand water pressure of 50 psi without leakage.
3. Seal compound:
- a. FS TT-S-227, two-component, fast-setting, polymeric sealing compound to provide watertight seal between concrete and conduit, between cable and conduit.
 - b. Pour-type for horizontal and gun-grade for vertical or overhead application.
 - c. When cured, sealant to have rubber-like flexibility allowing minimum movement of conduit and cable in temperature range of minus 40F to plus 150F without loss of watertight seal.
 - d. Pot life: 15 minutes.
 - e. Minimum ambient temperature for application: 35F.
 - f. Initial cure: 15 minutes.
 - g. Final cure: Seven days.
 - h. Hardness, Durometer A: 20-35.
 - i. Seal between conduit and concrete to withstand pressure from 50-foot head of water without leakage.
 - j. Seal between conduit and single-conductor or multiple-conductor cable to withstand water pressure of 70 psi without leakage.
 - k. Fox Industries, Type FX-571G or approved equal.
- H. Conduit and Cable Supports:
1. Retaining straps and fasteners: FS FF-S-760, with the following additional requirements:
- a. Type, style and size: As necessary.
 - b. Material and finish: Stainless steel, Type 304, or approved equal.
 - c. For separating conduit from masonry surface: Hot-dip galvanized malleable-iron spacer assembled with Style A strap.
 - d. For vertical run of metallic-sheath cable: Basket-weave cable support.
 - e. For fastening conduit or cable to channel inserts: Stainless steel, Type 304, or approved equal.
2. Multiple pipe hangers (trapeze-type): Consisting of two or more hanger rods, horizontal member, U-bolt clamp and other attachment necessary for securing hanger rods and conduit, with the following additional requirements:
- a. Material and finish: Stainless steel, Type 304, or approved equal.
 - b. Hanger rod: Not smaller than 3/8-inch diameter, threaded for sufficient distance at each end to permit at least 1-1/2 inches of adjustment.
 - c. Horizontal member: Channel, 1-1/2 inches square or 1-5/8 inches square by 12 gauge or heavier. Weld two or more channels together for greater strength if necessary.
 - d. Design: Capable of supporting load equal to sum of weights of conduit, cable and hanger plus 200 pounds. At design load, stress at root of thread on

hanger rod 9,500-psi maximum; stress in horizontal member 12,500-psi maximum.

3. Channel inserts:
 - a. Size and shape as shown, 12 gauge or heavier stainless steel, Type 304, or approved equal, with 7/8-inch wide slot.
 - b. For surface mounting: Channel inserts with 9/16-inch base slot, eight inches on center with minimum pullout-load rating of 1,000 pounds per linear foot.
 4. Spot inserts: Rated 800 pounds with safety factor of five, fabricated from steel galvanized after fabrication, covered to prevent entrance of concrete during installation.
- I. Surface Raceways and Fittings: UL 5, fabricated from galvanized steel.
- J. Underfloor Raceways and Fittings:
1. UL 884.
 2. Size: As shown.
 3. Fabricated from steel 14 gauge or heavier steel sheet.
 4. Finish: Corrosion-resistant coating listed per referenced UL or ITS directory.
- K. Boxes and Cabinets:
1. Outlet boxes:
 - a. UL 514A, capable of accommodating conduit as shown.
 - b. Material and finish:
 - (1) Steel, malleable iron, cast iron or ductile iron.
 - (2) Hot-dip galvanized or electro galvanized after fabrication.
 - c. For aboveground indoor locations and electrical rooms: Punched or formed knockouts.
 - d. For outdoor and underground locations, except electrical rooms:
 - (1) Threaded-conduit entrance hub.
 - (2) Threaded watertight fitting with gasket, nylon-insulated throat and sealing locknuts for enclosures having punched or formed knockouts for conduit entry.
 - e. For wall receptacles and switches, single or double devices: Outlet boxes 4-11/16 inch square by 1-1/2 inch deep.
 - f. For floor receptacles: Watertight cast-iron outlet boxes, four inches diameter, of suitable depth and complete with the following:
 - (1) Adjustment screws for final leveling.
 - (2) Bronze floor plate with flush-mounted screw plug, without exposed fastener, M32 finish.
 - (3) Screw plug attached to outlet-box assembly by chain or other means, M32 finish.
 - (4) Bronze floor plate flange, five inches in diameter, extending beyond box 1/2-inch above finished floor, M32 finish.
 - (5) One special screw-plug removal tool with every 10 receptacles.
 - g. For recessed wall-mounted receptacles: Watertight cast-iron outlet box, three-inch diameter, of suitable depth and complete with the following:
 - (1) Bronze faceplate with flush-mounted screw plug, without exposed fasteners, M32 finish.
 - (2) Screw plug attached to outlet-box assembly by chain or other approved means, M32 finish.
 - (3) Bronze faceplate flange, five inches in diameter, extending beyond box, M32 finish.
 - (4) One special screw-plug removal tool with every 10 receptacles.
 2. Junction and pull boxes:

- a. Internal volume up to 100 cubic inches, metallic boxes: UL 514A, non-metallic boxes: UL514C; internal volume above 100 cubic inches, UL 50.
- b. Flush-mounted or surface-mounted as shown.
- c. Size: Suitable to accommodate conduit, raceways, ducts, number of cables and splices shown.
- d. Material and finish:
 - (1) Metallic boxes:
 - (a) Steel, malleable iron, cast iron or ductile iron.
 - (b) Hot-dip galvanized or electro galvanized after fabrication.
 - (2) Non-metallic boxes:
 - (a) Precast concrete: Compressive strength 3,500 psi; air entrainment six-percent minimum, ASTM C173-94ae1 or C231-97e1; Section 03300 and Section 03400 and in accordance with the following:
 - i. Box: Concrete formed with closed bottom and sides and recess at top of box or at edge of cover to provide mating surfaces to prevent lateral movement of flush-mounted cover. Knockouts provided to accommodate conduits as shown.
 - ii. Cover:
 - 1. Material same as for box. Use of metallic cover and cover frame prohibited.
 - 2. Metro Type "B" logo with 3-1/8 inch by 4-inch envelope and service designation recessed in center of cover.
 - 3. Non-protruding provisions provided for lifting.
 - iii. Reinforcement:
 - 1. Sidewalk and landscape locations: Welded wire fabric, ASTM A185-97.
 - 2. Areas subject to vehicular traffic: Deformed steel bars, ASTM A615/A615M-00.
 - iv. Loading:
 - 1. Sidewalk and landscape locations: AASHTO 's SSHB H15-44.
 - 2. Areas subject to vehicular traffic: AASHTO's SSHB H20-44.
 - 3. Hardware: Stainless steel.
 - 4. Size: As shown or next available larger size.
 - (b) Composite material: Sand and gravel bound together with a polymer and reinforced with continuous woven glass strands and in accordance with the following:

Physical Properties	Values	Method
Compressive strength	11,000 psi	ASTM C109
Tensile strength	1,700 psi	ASTM D638
Flexural strength	7,500 psi	ASTM D790

Water Absorption (24 hours)	0.5 percent	ASTM D570
--------------------------------	-------------	-----------

- i. Box: Gray-color material formed with closed bottom and sides and flange with recess at top of box to accommodate flush-mounted cover.
 - ii. Cover:
 - 1. Material same as for box.
 - 2. Skid-resistant top surface with minimum 0.5 coefficient of friction.
 - 3. Metro Type "B" logo with 3-1/8 inch by 4-inch envelope and service designation recessed in center of cover.
 - 4. Secured to box with bolts.
 - 5. Non-protruding provisions provided for lifting.
 - iii. Loading:
 - 1. Sidewalk and landscape locations: AASHTO's SSHB H15-44.
 - 2. Areas subject to vehicular traffic: AASHTO's SSHB H20-44.
 - iv. Hardware: Stainless steel.
 - v. Size: As shown or next available larger size.
- (c) Molded fiberglass-reinforced polyester 1/8-inch thickness, minimum, and in accordance with the following requirements:

Physical Properties	Values	Method
Flexural strength	17,000 psi	ASTM D790
Deflection temperature	400F	ASTM D648
Water absorption (24 hours)	0.5 percent	ASTM D570
Tensile strength	6,500 psi	ASTM D638
Specific gravity	1.8	ASTM D794
Flammability	94-5V	UL 94
Dielectric strength	400 volts per mil	ASTM D149
Arc resistance	180 seconds	ASTM D495

- i. Ultraviolet protection: Fiberglass material containing ultraviolet-inhibitor, or coated with

- polyurethane paint, 1.5 mils minimum dry-film thickness on both inside and outside surfaces.
 - ii. Color: Fiberglass material, gray inside and outside.
 - (d) Molded polyvinyl chloride 1/8-inch thickness, minimum.
 - e. For aboveground indoor locations and electrical rooms: Punched or formed knockouts.
 - f. For outdoor and underground locations, except electrical rooms:
 - (1) Threaded conduit entrance hub.
 - (2) Threaded watertight fitting with gasket, nylon-insulated throat and sealing locknuts for boxes having punched or formed knockouts for conduit entry.
 - 3. Cabinets:
 - a. UL 50, fabricated from galvanized steel.
 - b. Surface-mounted, unless otherwise shown.
 - c. Backplate of reinforced steel for mounting interior components and to ensure rigid support and accurate alignment.
 - d. Provision for cabinet grounding.
 - e. Provide latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.
 - f. Finish: Metallic surface thoroughly cleaned, degreased, primed with zinc primer and coated after fabrication with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
- L. Cable Trays:
- 1. NEMA VE1, ventilated-steel ladder-type.
 - 2. Dimensions: Three inches inside depth; nine inches rung spacing unless otherwise shown.
 - 3. Maximum load rating: 50 pounds per linear foot with safety factor of 1.5 at 12-foot support span.
 - 4. Bend radius:
 - a. For incoming service cable: As required by power company.
 - b. For all other cable: 24 inches or as necessary and approved.
 - 5. Finish: Cable trays, fittings and accessories hot-dip galvanized or electro galvanized after fabrication.
- M. Expansion Bolt Anchors: FS FF-S-325C Group II, stainless steel, Type 304, or approved equal.
- N. Data-Transmission System (DTS) Cabinet:
- 1. Wall-mounted, single-door, NEMA 250 Type 12, with panel, Hoffman Engineering Company, as shown, or approved equal.
 - 2. Enclosure: Formed of minimum 14-gauge steel, seams continuously welded and ground, without openings or knockouts, with threaded-conduit entrance hubs, lugs for mounting enclosure and collar studs for mounting panel. Rolled lip formed on all sides of door opening. Enclosure and door reinforced when size exceeds 30 inches square. Size as shown.
 - 3. Door: Formed of minimum 14-gauge steel, with rolled lip along top and sides to mate with enclosure. Fitted with removable print pocket. Closed-cell neoprene gasket attached with oil-resistant adhesive and steel retaining clips.
 - 4. Hardware: Corrosion-resistant steel continuous piano hinge with removable pin. Hasp and staple for padlocking.
 - 5. Panel: Formed of 12-gauge steel.

6. Finish: Galvanized enclosure, door, panel and latch mechanism. Prepared for painting by manufacturer's standard method in accordance with the following:
 - a. Outside: Phosphatized, primed and finished with two coats of light-gray enamel or epoxy coating, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
 - b. Inside including panel: Two coats of white enamel or epoxy coating.
 7. Breather drain: One 1/2-inch diameter, Crouse-Hinds Catalog No. ECD11, or approved equal.
 8. Grounding stud: Manganese bronze, ASTM B138-96, Alloy No. 675 hard, 3/8-inch high; Evedur GSI, American Brass Company or approved equal.
 9. Terminations: Assembly rail and modular terminals, Weidmuller Terminations, Incorporated or approved equal.
 - a. Terminal: Modular test terminal, Melamine plastic, screw-clamp connections, with socket screws; Type SAKC4, Catalog No. 3406.2 or approved equal, with the following additional requirements:
 - (1) Amperes: 25.
 - (2) Volts: 300.
 - (3) Wire-gauge range: 22AWG to 12AWG.
 - (4) Thickness: 0.256 inch.
 - (5) Listed per referenced UL or ITS directory.
 - (6) Standard accessories; compatible with terminal, with the following additional requirements:
 - (a) End section: Type AP, No. 1179.2 or approved equal.
 - (b) End bracket: Type EWK1, No. 2061.6 or approved equal.
 - (c) Test plug: Type PS, No. 1804.0 or approved equal.
 - (d) Cross-connection combination: QB25, No. 91455.D or approved equal.
 - (e) Disconnect plug for SAKC4 terminal: Type TST, No. 3399.0 or approved equal.
 - b. Assembly rail: Type TS32 steel standard section compatible with terminals, with fixing slots, Catalog No. 1228.0 and standard rail-mounting screws or approved equal.
 - c. Marking tags: Dekafix 6.5-FS or approved equal, consecutive vertical, Number 4682.6 or Number 5766.6 as approved. Consecutive numbering conforming to that of DTS box.
 - d. Group marking carrier with paper marking strip and transparent cover.
 - (1) Type SCHAT5, Catalog No. 2924.6 or approved equal.
 - (2) Type ESO5, Catalog No. 2937.0 or approved equal.
 - (3) SST5, Catalog No. 2940.0 or approved equal.
- O. Fiberglass Conduit and Fittings:
1. Rigid fiberglass reinforced epoxy conduit, UL 1684, IPS (Iron Pipe Size) based conduit.
 2. Conduit shall be manufactured by using filament winding process with minimum fiberglass content of 65 percent by weight and no fillers.
 3. IPS based conduit with nominal wall thickness of 0.09 inches for five-inch nominal conduit size.
 4. Conduits, elbows and fittings manufactured from the same material and using the same manufacturing process.
 5. Conduit sections formed with integral bell and spigot type couplings. Rubber sealing gasket at bell end is prohibited.
 6. Conduits, elbows and fittings provided with protection from exposure to sunlight by pigmentation uniformly dispersed through resin material.

7. Adhesive as recommended by conduit manufacturer.
8. Conduits, elbows and fittings are specified for use throughout a temperature range of -40°F to 230°F, and they are to be protected from exposure to sunlight by pigmentation uniformly dispersed through the resin material.
9. Conduits, elbows and fittings shall be suitable for encasement in concrete below grade and conform to UL 1684, and listed and labeled by UL meeting the requirements of NEC Article 347 for Rigid Nonmetallic Conduit and its use.
10. Each piece of the straight length conduit and each piece of the elbow and other bend made from and for use with such conduit is to be labeled with the following information, mark clearly legible and durable every 10 feet or as recommended by the manufacturer.
 - a. "Reinforced Thermosetting Resin Conduit", "RTRC"; "Fiberglass Reinforced Epoxy Conduit", "FREC"; or equivalent, as applicable.
 - b. Normal Size: (IPS)
 - c. Manufacturer's name and trademark.
 - d. Temperature range for conduit application.
 - e. "Above Ground", "AG", "Below Ground", "BG", or equivalent wording, as applicable.

PART 3 - EXECUTION

3.01 INSTALLATION:

A. General:

1. Use size, type, general routing, location of conduit, raceways, boxes and cabinets as shown and specified.
2. Install metallic raceway, fittings, boxes and cabinets free from contact with reinforcing steel.
3. Where aluminum is placed in contact with dissimilar metal or with concrete, separate contact surfaces by means of gasket, nonabsorptive tape or coating to prevent corrosion.
4. Make metallic conduit, raceways, ducts and cable trays, electrically and mechanically continuous and ground them in accordance with Section 16060.
5. Install FRE conduit where conduit runs are embedded in concrete and where conduit is shown as direct-burial.

B. Conduit:

1. Run exposed conduit parallel to building lines.
2. Install exposed conduit to avoid interference with other work.
3. Traction-power substations, tie-breaker stations, ac-switchboard, electrical, train-control, communication and mechanical rooms: Where shown or where necessary to prevent seepage of subsoil or water into such areas, seal where conduits in contact with concrete and seal cable inside conduit using cable seal or sealing compound in accordance with the following requirements:
 - a. Where shown and as necessary, install cable seal and conduit seal in accordance with the manufacturer's recommendations.
 - b. Use sealing compound where approved and in accordance with manufacturer's recommendations, with the following additional requirements:
 - (1) Before applying sealing compound, prime concrete, conduit and cable surface using primer recommended by manufacturer.
 - (2) Pour or inject compound to prevent voids inside seal and to keep cable centered in conduit.

- (3) Use FRE sleeve for conduit seal installed on traction-power, train-control and communication conduit.
- c. For 13.8 kv incoming-service cable, install cable seal in traction-power substation, ac-switchboard rooms and utility company manholes adjacent to WMATA facilities. Coordinate the work with utility company representative.
- d. In empty conduit installed for future use, install blank cable seal inside conduit to prevent seepage of water.
- e. All conduits free of water before conduit seals are installed.
- 4. Apply lead-free conductive anti-seize compound to threaded-conduit joints.
- 5. In outdoor and underground locations, except electrical rooms, use threaded-conduit hub to attach conduit to equipment enclosure. Use watertight conduit fitting with gasket, nylon-insulated throat and sealing locknuts for attachment of conduit to enclosure having punched or formed knockout.
- 6. In aboveground indoor locations and electrical rooms, use locknut and nylon-insulated bushing to attach conduit to enclosure.
- 7. Install suitable caps or plugs in empty conduit for future extension. Leave approved nylon or polyester pull line in each conduit.
- 8. Thread and ream ends of field-cut conduit to remove rough edges. Use bushing at conduit entrance to boxes, cabinets and equipment enclosures.
- 9. Bends:
 - a. Unless otherwise shown or specified, install conduit bends in accordance with reference codes.
 - b. Install bends in buried conduit in accordance with the following:

Size of Conduit (in inches)	Minimum Radius of Factory-Bend (in inches)	Minimum Radius of Field-Bend (in inches)
3	18	24
4	24	30
5	48	48
6	48	48

- c. Total bends in each conduit run for traction-power cable: 225 degrees maximum.
- d. Bend conduit so that field-made bend is free from cuts, dents and other surface damage.
- 10. Support conduit during construction to prevent distortion and to ensure independent support.
- 11. Support horizontal conduit with one-hole pipe straps or individual pipe hangers.
- 12. Secure conduit supported on multiple-hangers (trapeze) or channel inserts by fasteners suitable for such purpose.
- 13. Where conduit is attached to masonry surface, use malleable-iron spacers with Style A pipe straps.
- 14. Support and secure vertical conduit spanning open areas at intervals not exceeding 10 feet.
- 15. Support conduit above suspended ceiling using applicable specified methods.
- 16. Install conduit so as to drain moisture to nearest outlet or pull box.

17. Use minimum of 18-inch long liquid-tight flexible-conduit connection for equipment enclosure subject to vibration.
18. Do not use wire for support of conduit and cable.
19. Install expansion fitting in exposed conduit runs longer than 300 feet and where shown. Install expansion/deflection fittings where embedded conduits cross structural expansion joints. Where embedded conduits cross a structural contraction joint, paint the external surface of conduit with linseed oil or other compatible bond breaker for two feet on each side of contraction joint.
20. Buried FRE conduit: Install in accordance with the following requirements in addition to those specified elsewhere:
 - a. Arrange conduit to cross each expansion joint at right angle to joint.
 - b. Prevent concrete and other materials from obstructing the conduit. Pack outlets, pull boxes and junction boxes and cap conduit ends prior to pouring concrete.
 - c. Use Tight Lock Joint method to join conduit sections for providing water tightness and pull out strength.
 - d. Provide compatible conduit supports and spacers to maintain position of conduit during placement of concrete.
 - e. Install buried non-metallic conduit for cable over 600 volts in accordance with reference code.
 - f. Waterproof conduit connections.
 - g. Rod and swab conduit after installation so as to remove water, cement and other foreign matter; cap conduit ends. If obstructions cannot be removed or if condition exists which may result in damage to cable, replace conduit.
 - h. Leave approved nylon or polyester pull-line in each conduit.
21. Use metallic conduit or above ground FRE conduit in exposed locations.
22. Conduit installed in outdoor location: Waterproof conduit connection.
23. Use IPS FRE conduit for all concrete-encased applications except as follows:
 - a. Use FRE conduit with minimum wall thickness of 0.95 inch for train control conduit direct buried without concrete encasement where shown.
 - b. Install conduits encased in concrete ductbanks, associated manholes and handholes outside the structural work in accordance with Section 02585.

C. Channel Inserts and Spot Inserts:

1. Surface-mount channel inserts as shown.

D. Surface Raceways:

1. Install as shown.

E. Underfloor Raceways:

1. Install underfloor raceways as specified in Section 03100. Align and level raceways accurately. Hold raceways in place during placing of concrete.

F. Outlet, Junction and Pull Boxes:

1. Mount outlet boxes as shown.
2. Arrange front of box or attached plaster cover flush with finished wall or ceiling.
3. Keep number of knock-outs to minimum.
4. Clean boxes thoroughly after installation and correct damage to boxes and to finish.
5. Install covers on boxes mounted on walls and ceilings.
6. Measure height of wall-mounted outlet box from finished floor to horizontal centerline of cover plate.
7. Fasten floor boxes securely in place.

8. Install junction and pull boxes so that covers are readily accessible.
 9. Do not install boxes above suspended ceilings except where ceilings are removable or definite provision is made for access to boxes.
 10. Use stainless steel (Type 304) mounting channels, retaining straps and fasteners, pipe hangers for conduits and cables; expansion bolt anchors, junction boxes, outlet boxes, cover plates for receptacles, enclosures for load centers in tunnel environment which includes vent and fan shafts and under platform areas.
 11. Use non-metallic boxes as follows:
 - a. Buried with cover flush-mounted with finish grade: Precast concrete or composite material junction and pull boxes within AASHTO load designations as specified.
 - b. For indoor and outdoor locations not subject to pedestrian or vehicular traffic: Molded fiberglass-reinforced polyester junction and pull boxes.
 - c. For outdoor locations but not for burial: Molded polyvinyl chloride junction and pull boxes.
 12. For indoor locations as minimum use NEMA -1 enclosures.
- G. Cabinets:
1. Fasten cabinet securely using expansion bolts, toggle bolts or mounting ears.
 2. Touch-up damaged painted finish.
- H. Cable Trays:
1. Install cable trays neatly, adequately supported and as shown.
 2. For incoming-service cable from power company, install cable tray as approved by the power company.
- I. Use expansion-bolt anchors to secure equipment to concrete surfaces.
- J. Attachments to Prestressed-Concrete Girders:
1. Attach pipes, conduits, boxes or similar items to prestressed girders by welding to embedded plates or bolting to embedded fittings. Drilling into prestressed girders is prohibited, except for track fasteners and appurtenances as shown.
- K. DTS Cabinet and Terminals:
1. Install as shown.
- L. Car Wash Areas:
1. Use PVC-coated galvanized steel conduit.

3.02 FILLING OF OPENINGS:

- A. Where conduit and raceway pass through fire-rated walls, ceilings or floors, provide seals to prevent passage of fire and fumes and to maintain integrity of fire-rated structure in accordance with Section 07841.
- B. Where openings are provided for passage of conduit and raceways in walls, ceilings or floors, use fire-resistant fibrous-glass safing or similar material to seal unused openings to prevent passage of fire and fumes in accordance with Section 07841.
- C. Close unused openings or spaces in floors, walls and ceilings. Plug or cap unused conduit and sleeves.

3.03 IDENTIFICATION:

- A. At end of each run, use stainless steel or aluminum tags, minimum 1-1/2 inch diameter, with stamped markings, minimum 1/4-inch high lettering, and tag holders attached to conduit using a stainless steel band with worm screw clamping device to establish identification of conduits and raceways in accordance with designations shown. Where conduits are terminated flush with concrete structure, install three-ply laminated phenolic plate, engraved through black face to white core and attached adjacent to conduits' entrance by means of non-metallic screws. Engrave conduits' designations within circles arranged in pattern similar to that of conduits.
- B. Identify by red painted color code and by marking EMERGENCY SYSTEM on all boxes and enclosures for emergency circuits to identify them as part of an emergency system in accordance with the NEC.

3.04 FIELD QUALITY CONTROL:

- A. Arrange with the Engineer for inspection and approval of embedded conduit and boxes prior to concrete placement.
- B. Arrange with the Engineer for inspection by electrical utility company representative of incoming-service conduit prior to placing concrete.
- C. Test metallic conduit and boxes for electrical continuity. Conduct tests in presence of Engineer.
- D. Test not less than 0.5 percent of total installed channel inserts and spot inserts as directed for compliance with specified pullout-load rating. Replace and retest inserts which fail. Conduct tests in presence of Engineer.
- E. Arrange with the Engineer for inspection and approval of direct-buried conduits for future train control circuits prior to backfilling.

END OF SECTION

SECTION 16131

DC PEDESTAL AND WALL MOUNTED CONTACTOR SYSTEM

PART 1- GENERAL

1.01 DESCRIPTION

- A. This Section covers specification of the pedestal and wall mounted, enclosed DC contactor system that supplies 750 VDC to the vehicles for on-board testing and operation of non-traction power related loads.
- B. The DC contactor units shall be provided at required locations.
- C. Without limiting and/or restricting the volume of Work or the component details, the following sub-assemblies shall be included in the DC contactor system.
 - 1. 750 VDC contactor assembly including power and control circuits
 - 2. 750 VDC power cable with spring clip connector.
 - 3. Hanger-mount for storage of power cable.
 - 4. Floor-mounted galvanized steel channel support pedestal.
- D. Provide the 750 VDC contactor system as an integrated system, including all feeder conduits and feeder cables from the DC Switchboard Room, miscellaneous conduit support materials, and all labor, tools, and equipment.

1.02 RELATED SECTIONS

- A. Section 16119 - Medium Voltage Cable
- B. Section 16118 - Fiberglass Conduit

1.03 QUALITY ASSURANCE

- A. The work of this Section shall satisfy the applicable requirements of the following standards and regulations of jurisdictional authorities.
 - 1. National Electrical Code (NFPA 70)
 - 2. American National Standards Institute (ANSI)
 - 3. Occupational Safety and Health Administration (OSHA)
 - 4. Institute of Electrical and Electronic Engineers (IEEE)
 - 5. National Electrical Manufacturers Association (NEMA)
- B. All other applicable laws, ordinance and requirements of the local agencies and utility companies having jurisdiction.
- C. In the event of any conflicts in the provisions stipulated in the referenced codes, regulations or standards and the specifications, the most stringent provision, as determined by the Authority Representative is to govern.

1.04 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements set forth in General Requirements.
- B. Submit manufacturer's data for conduit and fittings specified herein including, but not limited to, dimensions, electrical rating and identification.

- C. Prior to final acceptance of work, submit a drawing or drawings showing the complete layout of the 750 VDC Contactor System.
- D. Operations and Maintenance Manual
 - 1. Contractor shall include the following elements in each manual, however, not necessarily in the order listed.
 - a. Table of Contents
 - b. Erection or installation instructions
 - c. Start-up procedures.
 - d. Detailed trouble-shooting procedures
 - e. Corrected and approved control and wiring diagrams.
 - f. Detailed layout and component arrangement drawing for the enclosed DC contactor.
 - g. Bill of Material for the major components (enclosure, relays, control devices, power cord, spring clip connector, etc.) The Bill of Material shall include manufacturer, catalog numbers, essential descriptive information about the component, address of manufacturers, and telephone numbers.
 - h. Color photographs (4"x6") of the constructed and functional DC contactor system in detail. The photographs shall be bound in a suitable loose-leaf photograph album having individual transparent pages for insertion of the photographs.
 - 2. Contractor shall submit the final operation and maintenance manuals to the Authority Representative. These manuals shall be technically accurate and complete, and shall represent the "as-built" system, piece of equipment or material. All illustrations, text, and tabular material shall be in final form: copies of all Shop Drawings submitted for approval shall be included for each major piece of equipment.
- E. Certification: Contractor shall furnish to the Authority Representative, the certified copies of the results of all tests and measurements made to determine the quality and serviceability of the manufactured equipment listed in this specification Section, at no additional cost to WMATA.
- F. DC Contactor System and Controls - System Integration: Assume complete responsibility for the design, component and material selection, manufacturing, installation, testing and operation of the DC Contactor power and controls as a system, into a complete, operable, and WMATA approved DC Contactor System.

PART 2 - PRODUCTS

2.01 DC CONTACTOR ASSEMBLY

- A. 150 Amp, 800 Volts, DC, electrically operated contactor, 120 Volts AC operated solenoid. Provide 120 VAC from external source for control circuit operation. Control relays shall be as manufactured by General Electric Company, Allen-Bradley, ASCO, or approved equal.
- B. Internal air clearances or solid dielectrics sufficient to withstand 4500 volt transient potentials on the circuit.
- C. Acceptable Manufacturer's:
 - 1. Microelectronica Scientifica; Model LTC-250-M-ADA.
 - 2. General Electric Company
 - 3. Westinghouse
 - 4. Approved Equal

2.02 POWER CABLE

- A. 1/C # 1/0 extra flexible Class K copper stranded conductor with low smoke, zero halogen silicon rubber insulation, rated 2 kV.
- B. Power cable shall be 30 feet long. Power cable shall be equipped with a spring-loaded clamp and protective 2kV insulated boot over clip.

2.03 ENCLOSURE - DC CONTACTOR

- A. Provide a Fiberglass, NEMA type 4X wall-mounted enclosure having the following minimum dimensional characteristics: 20.19" high 16.25" wide, and 12.00" deep. (Provide internal mounting panel, (17" high x 13" wide). Provide a larger enclosure if required by the contactor manufacturer for its equipment and circuit arrangement.
- B. Provide wireway to guide 1/0 AWG conductors within the enclosure.
- C. Acceptable Manufacturer's:
 - 1. Hoffman Engineering Co. A-20H1612GQRLP with A-20P16 Panel.
 - 2. Approval Equal.

2.04 CONTROL AND INDICATION

- A. Key Operated "ON" Pushbutton 2-position, cylinder lock momentary (oil tight) pushbutton with key removable in "LOCK" position only.
 - 1. Allen Bradley 800T-EI 1 A or equal, with extra large legend plate.
- B. "OFF" non-illuminated extended head oil tight pushbutton, red color, Form B contact block.
 - 1. Allen Bradley 800MR-N26 or equal. with extra large legend plate.
 - 2. "ON" Pilot Light, oil tight, red lens, push-to-test, full voltage 120 Volt LED, with extra large legend plate.
 - a. Allen Bradley 800T-QTH 1 OR or equal.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install the DC contactor system in accordance with the manufacturer's recommended procedures.

3.02 FIELD TEST FOR EQUIPMENT OPERATION

- A. Perform a continuity test and megger test on the power circuit.
- B. Provide function testing of the control and power circuits with complete 120 VAC control and 750 VDC power.
- C. Contractor shall coordinate the interconnection between the DC Contactor System and the DC switchboard power and control circuits. Contractor shall be responsible for final connections to the DC switchgear and the associated commissioning, and final acceptance of the DC Contactor System by WMATA.

END OF SECTION

THIS PAGE NOT USED

SECTION 16145

WIRING AND CONTROL DEVICES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing switches, cover plates, limit switches, occupancy sensors, receptacles, plugs, magnetic contactors, automatic transfer switches, photoelectric controls and time switches.
- B. Related Work Specified Elsewhere:
 - 1. Wire connection accessories: Section 16125.
 - 2. Grounding and bonding: Section 16060.
 - 3. Raceways, boxes and cabinets: Section 16130.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. National Electrical Code (NEC).
 - 3. National Electrical Manufacturers Association (NEMA):WD1, General Color Requirements for Wiring Devices; KS1, Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum); ICS 2, Industrial Control and Systems: Controllers, Contactors, and Overload Relays, Rated Not More Than 2000 Volts AC or 750 Volts DC; ICS 12, Profiles of Networked Industrial Devices--Part 1: General Rules; NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
 - 4. American National Standards Institute (ANSI): Z55.1, Gray Finishes for Industrial Apparatus and Equipment.
 - 5. UL: 98, Enclosed and Dead-Front Switches; 198D, Class K Fuses; 198E, Class R Fuses; 508, Industrial Control Equipment; 773, Plug-In Locking-Type Photocontrols for Use With Area Lighting; 1008, Transfer Switch Equipment.
 - 6. American Standards of Testing and Materials (ASTM): A47/A47M-99, Standard Specification for Ferritic Malleable Iron Castings; A276-00a, Standard Specification for Stainless Steel Bars and Shapes; and A507-00, Standard Specification for Drawing Alloy Steel, Sheet and Strip, Hot-Rolled and Cold-Rolled.
 - 7. ITS: Directory of ITS Listed Products
- B. Source Quality Control:
 - 1. Following items listed per referenced UL or ITS directory:
 - a. Snap switches.
 - b. Disconnect switches.
 - c. Receptacles and plugs.
 - d. Automatic transfer switch.
 - e. Lighting contactor.
 - f. Photoelectric control.
 - g. Time switch.
 - h. Occupancy sensor.

- C. Qualifications: Select a manufacturer who is regularly engaged in the production of automatic transfer switches.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings.
- B. Certification:
 - 1. Certified test reports of factory tests performed on each automatic transfer-switch unit in accordance with reference standards.
 - 2. Furnish certificate from manufacturer verifying that automatic transfer switches conform to specified requirements. Include certificate with submittal of shop drawings.
- C. Documentation for Automatic Transfer Switch:
 - 1. Submit field test plan within 60 days after award with accompanying documentation in the form of test data recording sheets and list of proposed test equipment for approval prior to testing.
 - 2. Submit certified copies of test data, dated and clearly identified within two weeks after completion of testing.
- D. Operation and Maintenance Manuals for Automatic Transfer Switch.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each item in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling and to avoid damage
- C. Store products in secure and dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Snap Switches:
 - 1. NEMA WD1, specification grade.
 - 2. Rating:
 - a. Twenty amperes at 120-277 volts ac.
 - b. Horsepower-rated when used as disconnecting device for motor circuit.
 - 3. Body and base: Fully enclosed, brown, fire-resistant, non-absorptive thermosetting urea or nylon.
 - 4. Contacts: Silver alloy.
 - 5. Mounting yoke: Corrosion-resistant metal with plaster ears.
 - 6. Poles: Single-pole, double-pole, three-way or four-way as shown.
- B. Disconnect (Safety) Switches:
 - 1. UL 98, NEMA KS1, heavy-duty, fusible or non-fusible as shown.
 - 2. Voltage rating: 240 volts ac, 480 volts ac or 250 volts dc as shown and as necessary.

3. Number of poles and current rating: As shown and as necessary.
4. Fuses:
 - a. UL 198D.
 - b. For fused disconnect switch associated with motor load: UL Class RK5 with time delay or as shown.
 - c. For fused disconnect switch associated with other loads: UL Class RK1 or as shown.
 - d. Current rating: As shown.
5. Enclosure: (NEMA 250)
 - a. Type:
 - (1) For aboveground indoor locations and electrical rooms: Type 1.
 - (2) For outdoor locations: Type 3R.
 - b. Materials:
 - (1) Steel sheet: ASTM A507-00.
 - (2) Malleable iron: ASTM A47/A47M-99.
 - c. Finish: Metallic surface cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
6. Quick-make/quick-break switching mechanism with operating handle external to enclosure with positions labeled ON/OFF and capable of being padlocked in OFF position, defeatable interlock to prevent opening of enclosure door when switch is closed.

C. Receptacles and Plugs:

1. NEMA WD1, specification grade.
2. Rating: 20 amperes at 125 or 250 volts as shown.
3. Base and body: Brown, fire-resistant, non-absorptive thermosetting urea or nylon.
4. Receptacles:
 - a. Outlet: Single or duplex as shown.
 - b. Mounting yoke: Corrosion-resistant metal with plaster ears.
 - c. Configuration:

Rating	NEMA Configuration
Two-pole, three-wire, 20 amps, 125 volts	5-20 R
Two-pole, three-wire, 20 amps, 250 volts	6-20 R

- d. For use in restroom; water service room; locker room; wash rooms; elevator machine room, pit and hoistway; and outdoor locations: Equipped with solid-state ground-fault circuit interrupter with five-milliampere trip level.
5. Plugs:
 - a. Configuration and design: As follows unless otherwise shown:

Rating		NEMA Configuration
Two-pole, three-wire, 20 amps, 125 volts	Urea or neoprene with cord grip	5-20 P
Two-pole, three-wire, 20 amps, 250 volts	Armored cap with cord grip	6-20 P

D. Cover Plates:

1. Wall plates:
 - a. NEMA WD1, suitable for specified receptacles and switches, size suitable for recess-mounted or surface-mounted associated outlet box, stainless steel, ASTM A276-00a, Type 304, or approved equal.
 - b. For above ground indoor service areas and electrical rooms: Steel, stainless steel or aluminum plate, as standard with the manufacturer.
 - c. For receptacles in outdoor and underground locations, except electrical rooms: Stainless steel, ASTM A276-00a, Type 304, wall plate with gasketed spring-loaded hinged cover.
2. Floor plates: Section 16130.

E. Automatic transfer switch: UL-1008, electromechanical, in surface-mounted enclosure as shown, with the following additional requirements:

1. Operating and electrical characteristics:
 - a. Capable of transferring load automatically from normal source to alternate source when the voltage drops to 85 percent of rated voltage on any phase for set time. Operating point adjustable over range of 80 to 90 percent of rated voltage and time-delay adjustable over range from zero to five minutes in increments of at least eight steps.
 - b. Capable of transferring load automatically from alternate source to normal source when normal source returns to 90 percent of rated voltage for set time. Operating point adjustable over range of 85 to 100 percent of rated voltage and time-delay adjustable over range from zero to five minutes in increments of at least eight steps.
 - c. Capable of transferring load automatically from normal source to alternate source when normal source failure is simulated by integral test switch.
 - d. Rating:
 - (1) Number of poles: Three or four.
 - (2) Voltage rating: 480-volt, three-phase, three-wire or 480Y/277-volt, three-phase, four-wire, 60 Hertz system as shown.
 - (3) Current rating: As shown and rated 100 percent.
 - (4) Transfer time: Ten cycles maximum on 60-Hertz base after initiation signal.
 - (5) Short-circuit current rating, rms symmetrical amperes: 14,000; 22,000; 25,000; 30,000; 35,000; or 50,000 as required and shown.
 - (6) Capacity to close into available short-circuit current or let-through current of fuses without functional degrading.

- e. Solid-state control panel for sensing and control logic with accuracy of plus-or-minus two percent on voltage and frequency settings over a temperature range of minus 20 degrees to plus 70 degrees.
- 2. Design and construction features:
 - a. Mechanically held, electrically operated, double-throw switch.
 - b. Electrical and mechanical interlock to prevent maintained neutral position.
 - c. Designed to break-before-make on transfer and retransfer.
 - d. Equipped with renewable silver-alloy contact.
 - e. Neutral bus or terminal provided on 480Y/277-volt, three-phase, four-wire unit to allow interconnection of neutral conductors.
 - f. Pilot lights on door to indicate switch position as follows:
 - (1) On normal source: Green light.
 - (2) On alternate source: Red light.
 - g. Pilot lights on door to indicate:
 - (1) Normal source available: Green or white light.
 - (2) Alternate source available: Red or white light.
 - h. Contacts opened by single solenoid, motor operator or stored energy mechanism.
 - i. Handle provided to permit manual operation of automatic transfer switch for maintenance purposes.
 - j. Power conductors made of silver-plated copper bus.
 - k. Equipment ground lug provided.
- 3. Enclosure:
 - a. Type:
 - (1) For aboveground indoor locations and electrical rooms: NEMA Type1.
 - b. Door: Hinged with handle and latch.
 - c. Material: Steel.
 - d. Finish: Metallic surface thoroughly cleaned, degreased, primed with zinc primer and finished with gray enamel, ANSI Z55.1, Color No. 61; two mils minimum DFT.

F. Lighting Contactors:

- 1. NEMA ICS 2, UL 508, electrically held, equipped with silver-alloy contacts, designed to control incandescent, tungsten, halogen, fluorescent, high-intensity discharge lamp load.
- 2. Number of poles: As shown.
- 3. Continuous current rating: As shown.
- 4. Line and load voltage: 480-volt or 208-volt three-phase or 277-volt or 120-volt single-phase as shown.
- 5. Control coil rated 120 volts.
- 6. 480-volt or 277-volt to 120-volt control transformer fused on secondary and primary as required.
- 7. Control:
 - a. Heavy-duty, three-position selector switch with positions labeled HAND/OFF/AUTO for lights controlled by photo-electric cell.
 - b. ON-OFF push button for indoor lights.
- 8. Enclosure: NEMA 250, Type 1; fabricated from steel, cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.

- G. Photoelectric Control:
1. UL 773, designed to respond to natural daylight with 15-second inherent delay to prevent functioning due to sudden bright light such as vehicle lights or lightning and to operate in ambient temperature from minus 50C to plus 60C.
 2. Adjust to turn lights ON at two plus-or-minus one foot-candles, unless otherwise specified. ON to OFF ratio: One to three.
 3. Rating: 1,800VA at 120 volts or 277 volts, 60 Hertz, as shown.
 4. Contacts:
 - a. For control of outdoor lights: SPST, NC contact.
 5. Cells: Hermetically sealed.
 6. Enclosure: Weatherproof and tamper proof aluminum or non-metallic enclosure equipped with locking receptacles when mounted on fixture or designed for mounting on outlet box as shown and as necessary.
- H. Limit Switches:
1. NEMA ICS 2, industrial-control.
 2. Suitable for mounting in folding-gate cabinet. Switch contacts closed when cabinet door is fully closed and latched. Switch contacts opened when respective cabinet door is not fully closed.
 3. Voltage rating: 120 volts ac.
 4. Current rating: 10-amperes continuous.
 5. Enclosure: NEMA 250, Type 13.
 6. Actuator: Lever-operated and adjustable, with spring return.
 7. Mounting: Plug-in type with receptacle tapped for conduit size as shown.
 8. Contacts: Single-pole double-throw; one NO, one NC; snap action.
- I. Time Switch:
1. Seven-day and 24-hour calibration for each day time switch, listed per referenced UL or ITS directory, heavy-duty type suitable for controlling type of lighting fixtures shown.
 2. Type: As shown, with contacts capable of switching continuous load of 20 or 40 amperes per pole at 277 volts as necessary.
 3. Seven-day, 24-hour dial with day and night zones and 24-hour calibration for each hour clearly marked.
 4. Providing up to four automatic ON/OFF operations each day.
 5. Removable ON/OFF trippers designed for minimum ON period of one hour and minimum two-hour period between one OFF operation and next ON operation.
 6. Provision for manual ON and OFF operation of switch by hand without disturbing weekly preset schedule.
 7. Provision for omitting operation of switch on selected days.
 8. Spring-driven reserve power suitable for operation of switch for 16 hours minimum after failure of power. On restoration of power, switch transfers to synchronous motor drive and automatically rewinds spring.
 9. Terminals designed to accommodate up to 8AWG conductor cable.
 10. Operation at 480/277Y or 208Y/120 volts, 60 Hertz as shown and within temperature range of zero degree F to plus 140F.
 11. Enclosure:
 - a. NEMA 250, Type 1, steel, surface-mounted.
 - b. Hinged flush front door with catches and spring-loaded door pull.
 - c. Finish: Metallic surfaces cleaned and degreased, primed with zinc primer and finished with one coat of light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.

- J. Occupancy Sensor:
1. UL 508, passive infra-red motion detector designed for wall mounting over single-gang outlet box, minimum radio frequency interference and use with incandescent and fluorescent lighting fixtures and electronic ballasts.
 2. Voltage rating: 120-277 volts ac.
 3. Switching capacity:
 - a. 120-volt operation: 800 watts minimum.
 - b. 277-volt operation: 1,500 watts minimum.
 4. Coverage area: 1,000 square feet.
 5. Detection zone:
 - a. Horizontal: 180 degrees.
 - b. Vertical: 5 degrees.
 6. Ambient light sensing: Photocell for preventing operation of lights at ambient light levels above an adjustable setting.
 7. Adjustments: Adjustable settings for time delay, sensitivity and light level concealed by tamper proof cover. Time delay adjustable from 10 seconds to 15 minutes after motion stops.
 8. Operating mode: OFF/AUTO.
 9. Detection indicator: LED.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install switches, limit switches, occupancy sensors, receptacles, automatic transfer switches, lighting contactor, photoelectric controls and time switches as shown and in accordance with referenced codes and standards in Article 1.02, and manufacturer's instructions.
- B. Install cover plate on switch and receptacle.
- C. Install cover plate with gasketed spring-loaded cover, on each receptacle in outdoor and underground locations except electrical rooms.
- D. Ground disconnect switch, time switches, automatic transfer switches, receptacles, snap switches, photoelectric controls and lighting-contactor enclosures in accordance with Section 16060.
- E. Make power cable connections to snap switches, plugs, time switches, occupancy sensors, photoelectric controls, receptacles, automatic transfer switches and lighting contactors by means of integral mechanical connectors. If such items are not furnished with integral mechanical connectors, make connections using compression connectors in accordance with Section 16125.
- F. Make power cable connections to snap switches and receptacles using their side screw wiring connection terminals.
- G. Apply matching touch-up paint as necessary.

3.02 FIELD QUALITY CONTROL:

- A. Furnish necessary test equipment and perform the following in the presence of the Engineer, in accordance with approved procedures:

1. Test time switches, receptacles and contactors for connection in accordance with wiring diagram.
 2. Test equipment enclosure for continuity to grounding system.
 3. Check tightness of cable connections of snap switches, receptacles, time switches, occupancy sensors, disconnect switches, automatic transfer switches, lighting contactors, photoelectric controls and limit switches.
 4. Test operations of circuits and controls of switches, occupancy sensors, receptacles and contactors.
 5. Automatic transfer switches:
 - a. Test switches for connection in accordance with wiring diagrams.
 - b. Calibrate and set voltage-sensing device for each source and time delay for transfer and retransfer as follows and as approved:
 - (1) Automatic transfer switches for fan shafts and drainage pumping stations: Time delay setting for transfer equal to total of 30 seconds for each connected motor or additional time as required.
 - (2) Time delay setting for retransfer equal to or greater than time delay setting for transfer.
 - c. Perform automatic transfer of load in accordance with the following requirements:
 - (1) With power available on both the normal and alternate sources, initiate automatic transfer from the normal source to the alternate source by opening the disconnect switch or circuit breaker on the line side of the automatic transfer switch for the normal source. Check that the switch position changes to the alternate source and remains connected to the alternate source.
 - (2) With power available on the alternate source and the switch connected to the alternate source, initiate automatic transfer to the normal source by closing the disconnect switch or circuit breaker on the line side of the automatic transfer switch for the normal source. Check that the switch position changes to the normal source and remains connected to the normal source.
 - (3) If testing indicates failure to comply with specified requirements, modify settings for the automatic transfer switch so that the specified requirements are met. Conduct additional tests witnessed by the Engineer to prove compliance with specified requirements.
- B. Submit certified test reports for compliance with field quality control requirements.

END OF SECTION

SECTION 16225

MOTORS

PART 1 - GENERAL

1.01 DESCRIPTIONS:

- A. This section specifies providing motors.
- B. Related Work Specified Elsewhere:
 - 1. Grounding and bonding: Section 16060.
 - 2. Wire connection accessories: Section 16125.
 - 3. Raceways, boxes and cabinets: Section 16130.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
 - 2. NEC.
 - 3. IEEE: 85, 112.
 - 4. NEMA: MG1.
 - 5. ANSI: Z55.1.
 - 6. ASTM: A582.
 - 7. OSHA: 1910.95.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Outline dimensions.
 - 2. Cross section showing internal construction and weight.
 - 3. Connection diagram.
- B. Certification.
- C. Operation and Maintenance Manuals.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship each motor securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Store motors in secure and dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. Motors:
 - 1. NEMA MG1, squirrel-cage, induction-type, unless otherwise shown.

2. Rating:
 - a. Horsepower: As shown.
 - b. Voltage and frequency:
 - (1) Motors, 1/2 HP and smaller: 115-volt, single-phase, 60 Hertz.
 - (2) Above 1/2 HP: 460-volt, three-phase, 60 Hertz, unless otherwise specified or shown.
 - (3) For motors in air-conditioning units:
 - (a) For units up to and including 10,000 BTUH: 115-volt, single-phase, 60 Hertz.
 - (b) For units from over 10,000 BTUH up to and including 36,000 BTUH: 208-volt, single-phase, 60 Hertz.
 - (c) For units over 36,000 BTUH: 460-volt, three-phase, 60 Hertz.
 - c. RPM: As shown.
 - d. Time rating: Continuous, unless otherwise shown.
 - e. Nominal full-load efficiency: Premium Efficiency when tested in accordance with NEMA MG1 and IEEE 112.
3. Design:
 - a. Single-phase motors: Design N, suitable for full-voltage across-the-line starting.
 - b. Three-phase motors: Design B, unless otherwise shown, with the following additional requirements:
 - (1) Up to and including 50-HP motors: Suitable for full-voltage across-the-line starting.
 - (2) Above 50-HP motors: Suitable for reduced-voltage starting.
4. Service factor:
 - a. Motors, one HP and smaller: In accordance with NEMA MG1.
 - b. Above one-HP up to and including 200-HP motors: 1.15.
 - c. Above 200-HP motors: 1.00.
5. Insulation: Class and allowable temperature rise above average ambient temperature of 30C and maximum ambient temperature of 40C as follows:
 - a. Integral-horsepower motors:
 - (1) Dripproof motors: Class B insulation with Class B temperature rise.
 - (2) Totally enclosed motors: Class F insulation with Class B temperature rise, unless otherwise shown or specified.
 - b. Fractional-horsepower motors: In accordance with NEMA MG1.
6. Noise level: NEMA MG1-12.49 but not to exceed requirements of OSHA 1910.95 when measured in accordance with IEEE 85.
7. Enclosure:
 - a. Dripproof, fully guarded; totally enclosed fan-cooled guarded; or totally enclosed air-over as specified.
 - b. Heavy-duty steel or cast-iron frame.
 - c. End bell:
 - (1) Up to 10HP: With cast-iron or aluminum end bells.
 - (2) 10HP and above: With cast-iron end bells.
 - d. Mounting: Foot-mounted on pad or adjustable pad, if necessary or as otherwise shown.
 - e. Provision for grounding.
 - f. Finish: Red-oxide zinc-chromate primer with finish coat of light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
 - g. Totally enclosed air-over:
 - (1) Variation to totally enclosed fan-cooled machines with air flow for cooling supplied by fan specified elsewhere.

- (2) Fan/motor application factory-engineered for air flow shown or specified.
- 8. Conduit box:
 - a. Diagonally split, suitably gasketed.
 - b. Type:
 - (1) Up to 10HP: Steel, cast iron or aluminum with threaded or punched conduit holes.
 - (2) 10HP and above: Cast iron with threaded conduit holes.
 - c. Size suitable to accommodate motor and line leads including taping.
 - d. Capable of rotation in each 90-degree position.
- 9. Bearings:
 - a. Unless otherwise specified, average life 15 years, but not less than three years at continuous operation, with double shields.
 - b. Integral-horsepower motors:
 - (1) Five HP and smaller: Sealed ball bearings or roller bearings.
 - (2) Above five HP: Ball bearings or roller bearings with grease fittings and pressure-relief fittings for in-service lubrication.
 - c. Fractional-horsepower motors:
 - (1) 1/6 HP and larger: Sealed ball bearings.
 - (2) Below 1/6 HP: Sealed ball bearings or sleeve.
- 10. Motors for hermetically sealed and semi-hermetically sealed compressors: NEMA MG1, 18.076 through 18.093.
- 11. Motors for close-coupled pumps: Stainless-steel shaft in accordance with ASTM A582, Type 303.
- 12. Provide nameplate on each motor in accordance with NEMA MG1-10.37.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install motors where shown and in accordance with the NEC.
- B. Install conduit in accordance with Section 16130.
- C. Connect power cable in accordance with Section 16125.
- D. Ground motor enclosure in accordance with Section 16060.

3.02 FIELD QUALITY CONTROL:

- A. Furnish necessary equipment and perform the following tests:
 - 1. Check and test wiring connections in accordance with wiring diagram.
 - 2. Test to ensure that insulation resistance of motor winding is 10 megohms minimum.
 - 3. Test motor enclosure for continuity to grounding system.
 - 4. Test motors for proper operation with their associated controls.
- B. Submit certified test reports.

END OF SECTION

THIS PAGE NOT USED

SECTION 16260

UNINTERRUPTIBLE POWER SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing uninterruptible power system (UPS) consisting of rectifier/charger, storage battery, battery-disconnect circuit breaker, inverter, power transfer switch, main emergency panelboard, and floor mat.
- B. Related Work Specified Elsewhere:
1. Raceways, boxes and cabinets: Section 16130.
 2. Wire, cable and busways: Section 16120.
 3. Grounding and bonding: Section 16060.
 4. Circuit breakers, panelboards and load centers: Section 16440.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
1. Comply with codes and regulations of jurisdictional authorities.
 2. National Electrical Code (NEC).
 3. National Electrical Manufacturers Association (NEMA): PE1, Uninterruptible Power Systems
 4. American National Standards Institute (ANSI): C39.1, Requirements, Electrical Analog Indicating Instrument; and Z55.1, Gray Finishes for Industrial Apparatus and Equipment.
 5. ANSI/NEMA: PB1, Panelboards, and 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
 6. ANSI/IEEE: C57.12.90, Test Code for Liquid-Immersed Distribution, Power, and Regulating Transformers; 450, IEEE Recommended Practice for Maintenance, Testing, and Replacement of Vented Lead-Acid Batteries for Stationary Applications, and 484, IEEE Recommended Practice for Installation Design and Installation of Vented Lead-Acid Batteries for Stationary Applications.
 7. UL: 50, Enclosures for Electrical Equipment; 67, Panelboards; 94, Tests for Flammability of Plastic Materials for Parts in Devices and Appliances; and 198C, High-Interrupting-Capacity Fuses, Current Limiting Type.
 8. American Standards of Testing and Materials (ASTM): B187-00 Standard Specification for Copper Bar, Bus Bar, Rod, and Shapes; and D635-98 Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position.
 9. ANSI/American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc. (ASHRAE): 52.1, Gravimetric and Dust Spot Procedures for Testing Air-Cleaning Devices Used in General Ventilation for Removing Particulate Matter.
 10. ANSI/American Hardboard Association (AHA): 135.4, Basic Hardboard.
 11. The equipment manufacturer shall maintain ISO 9001 or ISO 9002 certification

B. Source Quality Control:

1. Design and production tests: Perform and submit, in accordance with the General Requirements certified test results for the following tests on the uninterruptible power system or provide certified test reports on identical unit. Furnish certified test reports showing test data and results as well as manufacturer's comments on oscillograph traces obtained during in-rush test and short-circuit coordination tests.
 - a. Storage battery: Perform tests to determine the following:
 - (1) Ampere-hour rating of battery during three-hour discharge period.
 - (2) Charge rate starting from fully discharged state based on 105-volt terminal voltage, to 90-percent of fully charged state within 12 hours.
 - (3) Maximum short-circuit current available at battery terminals at full charge.
 - b. Rectifier/Charger: Perform tests to ensure that:
 - (1) Unit has capacity to feed specified load including overload capacity of static inverter.
 - (2) Output voltage regulation is within specified tolerance.
 - (3) Unit has specified efficiency at rated output.
 - (4) Unit is current limiting when activated by an external contact closure from an engine driven generator.
 - c. Static inverter: Perform tests to ensure that:
 - (1) Unit has capacity to feed rated kVA into load which has power factor of 0.8 lagging.
 - (2) Unit has capacity to deliver specified overload.
 - (3) Output voltage has sine wave with maximum of five-percent total harmonic distortion.
 - (4) Output voltage and frequency regulation are within specified limits.
 - (5) Efficiency at rated output at unity power factor of load is within specified limits.
 - d. Power transfer switch: Perform tests as recommended by the manufacturer and verify compliance with specified requirements.
 - e. Uninterruptible power system: Perform following tests with UPS in normal operating mode and alternate power available on transfer switch:
 - (1) In-rush test: Test to verify that power transfer switch and inverter power circuits remain operative without reset or replacement of protective devices while the following test is performed:
 - (a) 480-208Y/120-volt transformer with primary protection and full-load on secondary side as specified below connected to load side of power transfer switch, close transformer primary switch 10 times to provide maximum magnetizing in-rush. Record calibrated oscillograph traces of three-phase output voltages and line currents on load side of power transfer switch. Include oscillograph traces with the submittals.
 - i. Inverter below 25 kVA: Nine-kVA transformer with disconnect switch fused at 20 amperes on primary side.
 - ii. Inverter 25 kVA or larger: 15-kVA transformer with disconnect switch fused at 30 amperes on primary side.

- (2) Short-circuit coordination test: Test to verify that distribution-panel fuses clear fault and that protective devices in inverter and power transfer switch continue to function without reset and equipment remains fully operable while the following test is performed:
 - (a) With main emergency panelboard connected to load side of power transfer switch using 10 feet of 1/0-AWG three-conductor cable, with UL Class J or RK1 fuses sized as follows, in one panelboard feeder, with specified short-circuit current available at input terminals of rectifier/charger and at bypass-circuit terminals of power transfer switch, close fuse switch on bolted three-phase fault at load terminals of branch circuit. Repeat test three times and record calibrated oscillograph traces of three-phase voltages of inverter output and bypass source, and fault current from power transfer switch.
 - i. In panelboard fed by inverter below 25 kVA: 20-ampere fuses.
 - ii. In panelboard fed by inverter 25 kVA and larger: 30-ampere fuses.
- (3) Input power factor: Test to determine input power factor at rated inverter output.

- C. Furnish products of a manufacturer regularly engaged in the manufacture of uninterruptible power systems.
- D. Qualifications of Instructor for Operation and Maintenance Training: Qualifications will be considered adequate when the following is demonstrated:
 - 1. Instructor has in-depth knowledge of the design, packaging, operations, maintenance and trouble-shooting of the systems to be taught.
 - 2. Instructor has been trained in teaching methods or has previous satisfactory experience in teaching with emphasis on the subject matter to be covered in the course of instruction.

1.03 SUBMITTALS:

- A. General: Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:
- B. Shop Drawings: In accordance with Table 16260-1.
- C. Certification.
- D. Documentation:
 - 1. Submit field-test plan and documentation within 60 days after award with accompanying documentation in the form of test-data recording sheets and list of proposed test equipment.
 - 2. Do not proceed with testing until plan and documentation are approved.

3. Indicate in scope of test plan method of testing equipment in order to ensure safe and orderly transition from installation, through initial energizing, to specified field testing.
 4. Accompanying documentation to include data-recording sheets as used by manufacturer for in-plant testing of equipment and devices or as used by large industrial users of specified equipment.
 5. Submit certified copies of test data, dated and clearly identified within two weeks after completion of testing.
 6. Certified test data for specified enclosure intake filter performances.
 7. Instructor qualifications: Five copies of resume which outlines each instructor's qualifications and skills not later than 180 calendar days prior to commencement of training.
- E. Operations and maintenance training material: Five copies not later than 180 calendar days prior to commencement of training.
- F. Operations and Maintenance Manuals:
1. Include in manuals general theory of operation of the Uninterruptible Power System including description, purpose and function of:
 - a. Battery.
 - b. Rectifier/Charger.
 - c. Inverter.
 - d. Transfer switch.
 - e. Maintenance bypass arrangement.
 - f. Logic power supplies.
 - g. All logic boards.
 2. Describe and include in manuals procedures for:
 - a. Battery testing and for optimizing:
 - (1) Float voltages.
 - (2) Equalizing voltages.
 - (3) Equalizing time adjustments.
 - b. Operational checks of:
 - (1) Transfer to bypass source.
 - (2) Retransfer from bypass to inverter.
 - c. Alignment and adjustment of operating, detector and alarm circuits including rectifier, inverter and power transfer switch logic boards.
 - d. Troubleshooting to include test procedures and system logic in identifying malfunctions.
 3. Include in manual the shop drawings listed in Table 16260-1. Print shop drawings on folded pages in accordance with the General Requirements.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Ship battery cells assembled and filled to proper level with electrolyte and fully charged.

- C. Temporary Bracing: Where necessary, brace each unit for hoisting, lowering and skidding into position. Temporary internal bracing of the equipment labeled as follows: TEMPORARY-REMOVE BEFORE OPERATION.
- D. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit in accordance with the General Requirements impact chart with manufacturer's recommendations for disposition of damaged materials.
- E. Store equipment in secure and dry storage facility.

1.05 WARRANTY FOR STORAGE BATTERY:

- A. In addition to warranty requirements of the General Provisions, furnish a four-year warranty for a total of five years against defective parts and workmanship and a 19-year warranty for intended operation for a total of 20 years.

1.06 OPERATION AND MAINTENANCE TRAINING:

- A. Perform operation and maintenance training in accordance with the General Requirements and the following additional requirements for development and performance of operation and maintenance training for uninterruptible power system:
- B. Use only instructors who are fully qualified for their presentations as required above under Quality Assurance.
- C. Concept of Training:
 - 1. Design classroom and field instruction to cover in detail the functions of each item of equipment. Cover fault isolation and troubleshooting technique to the extent necessary to permit a technician to diagnose and repair faulty modules. Design instruction to provide Authority maintenance personnel with practical experience in the performance of preventive and corrective maintenance. Provide troubleshooting and fault isolation of simulated faults for each item of equipment in the unit substation.
 - 2. Develop and provide all operation and maintenance training necessary for Authority-designated personnel to support the power equipment. Have classroom instruction include not only the anatomy and functioning of the parts under discussion, but the essentials of their routine care, including lubrication schedules, adjustments, limits, test frequency, inspection frequency, troubleshooting, removal and replacement. Have instruction cover theory of operation of the power systems, individual modules and special protective circuits. Use flow diagrams to show sequence of events and time required to complete each event.
 - 3. Have the course include performance of preventive maintenance operations on the equipment and hands-on troubleshooting of each subsystem.
 - 4. In training, assume the Authority's employees have no knowledge of the features of the new equipment. The Authority is permitted to videotape all class presentations.

D. Training materials:

1. Develop first-generation reproducible training material.
2. Conduct training using final manuals approved by the Authority and certified by the Contractor as being correct, as-built and reproducible. These materials become the property of the Authority at the end of program.
3. Develop the following training materials for each course:
 - a. Instructor material for each course.
 - b. Course outline: Course outline with learning objectives. Include a topic outline for each item of equipment. Include in maintenance training a section devoted to system-fault analysis and troubleshooting. State the learning objectives for each topic.
 - c. Lesson plans: A set of lesson plans for each item of equipment, corresponding to the topic outline, and containing the following information:
 - (1) Lesson title.
 - (2) Instruction time.
 - (3) Objectives.
 - (4) Training aids required.
 - (5) Instruction sequence (outline).
 - (6) Tests.
 - (7) Summary.
 - d. Training aids: For each topic, develop optimum use of visual aids, including transparencies size eight-inch by 10-inch, 35-mm slides, films, and mockups. Provide approved shop drawings in transparency.
 - e. Instructional material: Use the applicable equipment operation and maintenance manuals as the primary source of instructional material. In addition, develop notebooks for each course containing such additional drawings, descriptive information and procedures necessary to ensure that the learning objectives are met in an orderly and timely manner. Arrange notebook material by each item of equipment and sequence according to the topic outline.
 - f. Course topic outlines and schedules: Have the topic outline and schedules for each course contain the following:
 - (1) Description of course including course objectives and training program level.
 - (2) Course length and recommended numbers of students per course.
 - (3) List of training materials required including documentation and equipment.
 - (4) For each topic outline for the course, a topic objective and the time allotted to the topic.
 - (5) Schedules listing the major topics and subtopics on a time allocation for each topic.
 - g. Instructor guides and training aids: Have the instructor guide for each course include:
 - (1) Table of contents listing each topic and the time allotted.
 - (2) List of applicable documents.
 - (3) List of training materials.
 - (4) Course learning objectives, course length and recommended number of students.

- (5) Provide each topic with a cover sheet listing topic, objective, time allotted and training aids required.
- (6) Include training aids with the instructor guides.
- h. Student workbook: Reproduce diagrams, drawings and procedures from engineering data and manuals and include them in student handout.

E. Instructional Equipment: Conduct training utilizing installed equipment in normal operating conditions, permitting the trainees to perform hands-on work.

F. Course of Instruction:

- 1. Conduct this course for Authority-designated individuals; providing in-depth instruction on the fundamentals involved in the design of the complete system combined with practical aspects of operation and maintenance. Include also the following:
 - a. Practical exercises that require the trainees to make use of the operation and maintenance manuals.
 - b. Familiarization with the assembly, subassembly and components that make up a total system. Include instruction and practical exercises in troubleshooting at a level higher than that performed by equipment operators.
 - c. Use and replacement of original assemblies, subassemblies and components with compatible assemblies, subassemblies and components manufactured by others.
 - d. Handouts to each trainee that include information drawings, shop drawings, catalog cuts, manufacturer's literature, equipment maintenance check lists and other literature describing the total system.
 - e. Video and color slide presentations showing system installation, operation, troubleshooting, maintenance, module removal and replacement.
 - f. Tools and test equipment necessary to conduct operation and equipment maintenance troubleshooting.
- 2. Supplemental Training: In the event Contractor changes or performs modifications to equipment subsequent to the training that impact form, fit or function; provide supplementary training to the Authority's training instructor on a one-time basis.

G. Scope: The training program consists of the following:

Course Title	Length of Course Hours	Number of Persons Per Course	Number of Courses	Total Number of Course Hours
Operation and Maintenance Training	80	10	2	160

- 1. Provide practical training on equipment for not less than 60-percent of the course duration.
 - a. Location: Conduct training classes at facilities provided by the Authority.
 - b. Times: Set class times at the convenience of the Authority.

2. Contractor may propose four courses at 40 hours each in lieu of two courses at 80 hours each subject to approval.

H. Equipment:

1. Training equipment: Supply and deliver to the Engineer after completion of the course special tools required for maintenance training.
2. Test equipment: Supply and deliver to the Engineer after completion of the course test equipment required for maintenance training.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

A. General: Comply with NEMA PE1.

1. Interchangeability: Components of same type, size, rating, functional characteristics and make are to be interchangeable.
2. Enclosure:
 - a. Rectifier/charger, inverter, and power transfer switch provided with common ANSI/NEMA 250, Type 1-EFVF enclosure (Evacuated forced ventilation with inlet air filters), or ANSI/NEMA 250, Type 1-FVFF enclosure (Forced ventilation with inlet air filter and outlet air filter), with gasketed dust-tight doors.
 - b. Intake filter: Intake filter easily removable from front of unit, throw-away or washable, providing an average ANSI/ASHRAE 52.1 efficiency of 30-percent and an average ANSI/ASHRAE 52.1 arrestance of 95-percent.
 - c. Design: Panel-type, with hinged front door suitable for mounting meters and accessories, ventilated for satisfactory operation of equipment under ambient temperature up to 105F.
 - d. Fabricated from minimum 14-gauge steel sheet and reinforced with steel framework to form rigid structure with smooth outer surface free of burrs, ridges or other blemishes.
 - e. Equipped with latch and handle; screw fastenings will not be accepted in lieu of latch.
 - f. Provision for grounding enclosure.
 - g. Finish: Metallic surfaces cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1 Color 61, two mils minimum DFT.
3. Control and instrument wiring:
 - a. Factory-installed.
 - b. Wire: Type SIS tinned-copper wire; 22AWG minimum for control logic and printed circuit card and 18AWG minimum for other control circuits. Class C or D stranded wire used for wiring across hinged joints.
 - c. Wire terminals: Tinned-copper ring or spade-type compression terminals with insulated sleeve installed in accordance with manufacturer's recommendations.
 - d. Wire identification: Each wire identified with the circuit number corresponding to that shown on wiring diagrams adjacent to terminal connections.

4. Fuses: Current-limiting fuse installed in each control circuit and where necessary for protection and coordination in power circuits.
5. Nameplates:
 - a. Provide nameplate on each UPS in accordance with reference standards.
 - b. Three-ply, laminated phenolic plates; engraved through black face to white core and attached by means of steel rivets or screws.
 - (1) Lettering to be vertical Gothic using a round or square cutter. V-shaped groove not acceptable.
 - (2) Each UPS enclosure labeled with nameplate 1-1/2 inches high with letters one-inch high: UNINTERRUPTIBLE POWER SYSTEM.
 - (3) Each main emergency panelboard labeled with nameplate one-inch high with letters 1/2-inch high: EMERGENCY POWER PANEL.
 - c. Provide nameplate on each charger, battery, inverter and power transfer switch showing manufacturer's name, brand designation, reference standard, type, class, rating, wiring diagram and serial number, as applicable.
 - d. In addition to other information normally displayed on the equipment, provide nameplates showing switch positions, meaning of indicator lamps and other pertinent information.
6. System controls and indicators: Located on the front of the UPS cabinet; and as per manufacturer standard product with the following minimum requirements:
 - a. Monitoring and control: Provide a microprocessor based unit status display and controls section designed for convenient and reliable user operation. The monitoring functions such as metering status and alarms shall be displayed on a graphical LCD display. Additional feature of the monitoring and control system shall include graphical display of single line diagram of the UPS, menu-driven with pushbutton navigation, real time clock, alarm history with time and date, and battery back-up memory. All operation and parameters are firmware controlled, thus eliminating the need for manual adjustments or potentiometers.
 - b. Metering display:
 - (1) Input AC voltage, line to line, and line to neutral for each phase.
 - (2) Input AC current for each phase.
 - (3) Input frequency.
 - (4) DC bus voltage.
 - (5) Battery current and direction (charge/discharge).
 - (6) System output AC voltage, line to line and line to neutral for each phase.
 - (7) System output AC current for each phase.
 - (8) System output frequency.
 - (9) Bypass input voltage, line to line, line to neutral for each phase.
 - (10) Elapsed time-discharging battery.
7. Status displays, alarm messages and indication lights: Minimum requirement as specified for the rectifier/charger, inverter and power transfer switch units with the following additional requirements:
 - a. Indication lights: Long-life LED.
 - b. Clear identification of each indication light.
 - c. All alarm messages and indications resettable with push-button.

- d. Controls: A graphical LCD mimic screen to depict a single line diagram of the UPS with switch positions and power flow.
 - e. Operation Instructions: Display to provide all necessary instructions and step-by-step procedure for each sequence of operation
8. Accessibility of circuit boards and components:
- a. Front accessibility to rectifier/charger, inverter, and power transfer switch, including all cable connections.
 - b. Where a circuit-alignment procedure is required and adjustments require measurement of circuit points on circuit boards: Accessible test points on cards with appropriate designations and supplementary removable extender boards provided for making points accessible.
 - c. Sub-assemblies, parts and circuit boards that may require replacement: Arranged and mounted so that replacement requires no soldering or special tools.
 - d. All cable and conduit connections: Through top of cabinet.
9. Operational noise level: Not exceeding 70dB measured six feet from the equipment on the A weighting network of a general-purpose sound-level meter at slow response. Test conditions and correction factors in accordance with ANSI/IEEE C57.12.90.
10. Supervisory contacts: As specified for the rectifier/charger, inverter and power transfer switch units, with the following additional requirements:
- a. Dry-type sealed contacts rated to switch 500 milliamperes at 250 volts dc or three amperes at 24 volts dc.
 - b. Contact resistance: 0.10-ohm maximum.
 - c. Contact bounce: Five milliseconds maximum.
 - d. Wired to terminal block for remote connection to supervisory system.

B. Storage Battery:

- 1. Complete with accessories and battery racks.
- 2. Battery: UPS Cycle Duty, Industrial Flooded Lead Acid Cell.
 - a. Round cell or equal. Plate construction: Pure lead cylindrical cone-shaped. Positive grid minimum 0.2 inches thick.
 - b. Discharge capacity: Capable of providing dc inverter input to give rated inverter output at 0.8 power factor for three hours at 77F while simultaneously providing average load of 1.8 kW dc for switchgear operation and control, with peak demands of six kW for five seconds at each 30-minute interval during specified duration. Minimum battery-terminal voltage: 105 volts under full-load at end of three-hour discharge period.
 - c. Cycling duty: Capable of numerous cycling discharges at full load. Corresponding number of cycles for each discharge duration representing 100-percent of the available cycles: 30 seconds, up to 10,000 events; 30 seconds to 1.5 minutes, up to 2,000 events; 1.5 minutes to 4 minutes, up to 600 events and 3 hours, 50 events minimum.
 - d. Cell container:
 - (1) Extra-strength transparent plastic providing clear view of cell interior.
 - (2) Flammability rating: UL 94-V2, ASTM D635-98 self extinguishing, minimum Low Oxygen Index (LOI) 30-percent.
 - (3) Integral molded ribs for supporting internal elements without developing stresses caused by variation of temperature.

- (4) Ample sediment space below cell plate to prevent premature battery failure.
 - (5) Mark indicating level of electrolyte to be maintained.
 - e. Post type: Two or four, square copper insert posts with dual bolt holes.
 - f. Container cover:
 - (1) Sealed to provide permanent leakproof seal. Sufficient clearance from plate grids to allow for expansion and contraction of plate without cracking or splitting. Replace cells determined to have a cover leak within the warranty period at no additional cost to the Authority.
 - (2) Insulating material: Free from circuit leakage and impurities detrimental to plates or separators and impervious to absorption of electrolyte.
 - (3) NEMA flame arrester vent plugs.
 - (4) Flammability Rating: UL 94-VO, ASTM D635-98, self extinguishing.
 - g. Post seal: Historically proven and demonstrated leak-proof design. Replace cells determined to have a post seal leak within the warranty period at no additional cost to the Authority.
 - h. Factory test and shipping capacity: 100-percent capacity at time of delivery from factory. Factory tested for similar float and end of discharge voltages. Batteries tested together with a maximum difference of plus and minus 0.03 volts from the average cell voltage.
3. Accessory equipment:
- a. One syringe hydrometer with specific-gravity scale range no greater than 1.100 to 1.300.
 - b. One thermometer.
 - c. One torque wrench for battery connection.
 - d. Two cell-lifting devices complete with strap and spreader.
 - e. Two sets of stainless steel connecting bolts, nuts and washers.
 - f. Two sets of intercell connectors.
 - g. One set of manufacturer-recommended interrack cable and load-terminal lugs.
 - h. Pegboard: Hard board, ANSI/AHA 135.4, tempered, one smooth side (S1S), 1/4-inch nominal thickness, perforated, sized to accommodate all products specified above. Framed with one-inch by one-inch hardwood. Paint frame and hardboard in color selected by the Engineer. Include hardware for wall-mounting and pegboard accessories suited to the products to be mounted. Provide one-inch high nameplates as specified, with accessory names inscribed in 1/2-inch-high letters.
 - i. One portable lifting jig for battery, as recommended by battery manufacturer, in each battery room.
 - j. Battery Cycle Monitor: C&D BCM1100 or equal, electronic logging and event recorder/monitor to provide summary information for validating battery manufacturer's warranty. Install monitor in accordance with manufacturer instructions and requirements. Provide signal wiring, power wiring and conduits to ensure correct operation. Provide power wiring and conduits from nearest available distribution panel as selected by the Engineer. Ensure that

Monitor meets manufacturer's requirements for verifying load cycling warranty. As a minimum, make monitor able to:

- (1) Measure battery room temperature, present, maximum and minimum values. Maintain a register of the dates and values of the minimum and maximum occurrences.
 - (2) Indicate float voltage with record retrieval of the maximum and minimum values.
 - (3) Monitor the following parameters during discharge:
 - (a) Time of day the event started.
 - (b) Battery voltage at start and end of discharge.
 - (c) Battery load current during discharge.
 - (d) Length of time of the discharge.
 - (4) Provide a summary read-out showing detailed information on number of cycles on the battery.
 - (5) Provide alarm contacts to signal an event is occurring on the battery.
 - (6) Indicate total Kilowatt hours taken out of the battery.
 - (7) Indicate total ampere-hours taken out of battery.
 - (8) Indicate percent of cycle life remaining in battery.
4. Battery rack:
- a. Round Cell Battery:
 - (1) Two-tier type fabricated from polyester-glass-composite that is acid resistant, flame retarding, maintenance-free, electrical insulator.
 - (2) Floor mat: Durable, 1/4-inch thick, electrolyte-resistant black rubber mat
5. Enclosed dc circuit breaker:
- a. Two-pole, 250-volt dc, molded-case circuit breaker as specified in Section 16440.
 - b. Enclosure: ANSI/NEMA 250, Type 1, marked ON/OFF, capable of being padlocked in OFF position.
 - c. Location: In battery room.
- C. Rectifier/Charger:
1. Solid-state, three-phase: Continuous-duty rectifier including the following requirements:
 - a. Bridge rectifiers: Silicon-controlled or power transistor.
 - b. Six-pulse minimum, each pulse fully controlled.
 - c. Electronic current-limiting control for output.
 - d. Output voltage: Maximum six-percent rms ripple with battery not connected.
 2. Electrical characteristics:
 - a. For converting 480-volt, three-phase, 60 Hertz alternating current to direct current with characteristics suitable for charging associated battery and for providing input to the associated inverter.
 - b. Float and equalizing charge rate: As necessary for proper charging of associated battery, with the following additional requirements:
 - (1) Float voltage adjustable between 125 and 135 volts.
 - (2) Equalizing voltage adjustable between 135 and 144 volts.
 - c. Output rating: To provide dc input to inverter for giving rated inverter output while simultaneously providing average load of 1.8-kW dc for switchgear

loads as specified, with sufficient rating to simultaneously recharge the battery to 90-percent or more of fully charged condition in a 12-hour period from a discharged battery voltage of 105 volts.

- d. Output voltage regulation: Within plus-or-minus one percent from zero to 100-percent of charger rated capacity for ac supply-voltage variation of plus-or-minus 10-percent at 480 volts and supply-frequency variation of plus-or-minus five-percent at 60 Hertz.
 - e. Efficiency: 95-percent minimum at nominal input voltage with rectifier/charger supplying 100-percent of rated load.
 - f. Power factor: Input power factor minimum 0.7 with rated input voltage, UPS supplying 100-percent load, and battery on minimum float voltage.
3. Accessory equipment:
- a. Meters: As specified in Article 2.1.A.6.b
 - b. Indicating lights or status displays:
 - (1) One to monitor ac supply voltage (low voltage or loss on any phase).
 - (2) Status displays:
 - (a) Input circuit breaker closed.
 - (b) Rectifier/charger in float or equalizing mode.
 - (c) Rectifier/charger failed.
 - (d) For ungrounded dc system: Ground-fault indication lights.
 - c. Relay equipped with one NO contact and one NC contact for indicating normal and failure status of rectifier/charger output at remote location.
 - d. One 480-volt, three-pole, molded-case circuit breaker or one integrally fused circuit breaker in accordance with Section 16440 for incoming power to protect against available short-circuit current of rms symmetrical amperes at 0.15 power factor not less than the following based on substation-transformer capacity as shown:
 - (1) 750-kVA transformer: 17,500.
 - (2) 1,000-kVA transformer: 25,000.
 - (3) 1,500-kVA transformer: 35,000.
 - (4) 2,000-kVA transformer: 42,000.
4. Automatic control:
- a. Current-limiting device or circuit capable of limiting output current to rating of charger without disconnecting charger from battery or ac power supply. Provide a current limit, 0% to 25%(adjustable) of nominal full load current to limit the battery recharge current when activated by a remote
 - b. Automatic recharging on equalizing cycle after return of input ac voltage following an outage. Input current rate of increase limited (ramped) to achieve full-load input capability in no more than 15 seconds after turn-on.
 - c. Adjustable equalizing timer with range from one-hour to 60 hours minimum. Timer-adjustment function identified.
 - d. Built-in overload protection including short circuit at output terminals.
5. Manual control:
- a. Manual momentary contact switch to initiate equalizing operation and timer.
 - b. Manual momentary contact switch to stop equalizing operation, restore float operation and reset timer.
 - c. Screwdriver slot or locking knob-operated devices for adjusting float voltage and equalizing voltage, with function identified.

- D. Static Inverter:
1. Solid-state design using Insulated Gate Bipolar Transistor (IGBT) with Pulse Width Modulation/Step wave.
 2. Electrical characteristics:
 - a. Input voltage: Nominal input-voltage range from low voltage of 105 volt to highest equalizing voltage of 144 volts as specified for battery.
 - b. Output voltage: 480Y/277-volt, three-phase, four-wire, 60 Hertz.
 - c. Output rating:
 - (1) kVA rating: As shown.
 - (2) Capable of delivering rated three-phase KVA with any one phase 30-percent unbalanced from the other two phases within the dc input-voltage limits, and not exceeding three-percent voltage unbalance for any phase combination with no manual adjustment.
 - (3) Capable of delivering rated KVA into load which has power factor of 0.8 lagging.
 - d. Output-wave form: Sine wave, maximum of five-percent total harmonic distortion.
 - e. Output-voltage regulation: Zero to 100-percent rated load and dc input voltage within stated limits:
 - (1) Balanced load: Plus-or-minus one percent.
 - (2) Unbalanced load at 30-percent of rated load: Plus-or-minus 2.5 percent.
 - f. Output-voltage stability: With 100-percent step-load change, balanced load: Plus-or-minus 10-percent maximum deviation. Recovery to stated regulation band within six cycles.
 - g. Output-frequency control and synchronization:
 - (1) Inverter-output frequency phase locked to bypass source whenever source frequency is within plus-or-minus two-percent of standard 60 Hertz.
 - (2) Inverter-frequency control to shift to crystal- controlled oscillator in inverter whenever utility reference frequency goes outside limits. Whenever utility source returns within the frequency limits, frequency control to return to bypass source.
 - (3) Crystal-controlled oscillator to maintain a stable, continuous, standard 60-Hertz frequency within plus-or-minus one-half percent.
 - (4) Phase-lock control to maintain output-voltage wave of each phase to within six electrical degrees of the utility voltage wave (bypass source).
 - h. Overload rating: 125-percent of rated load for 15 minutes (without bypass source); 200-percent for 30 seconds (without bypass source).
 - i. Starting characteristics: Capacity to start at any load within overload rating with and without external ac power source.
 - j. Fault and surge override: Capacity to:
 - (1) Sustain fault at load terminals of main emergency panelboard until fault is cleared or load is transferred.
 - (2) Override magnetizing in-rush current of transformer as follows:
 - (a) Inverter below 15 kVA: Nine-kVA transformer.

- (b) Inverter 25 kVA and larger: 15-kVA transformer.
 - k. Inverter automatic shutdown: To occur when battery voltage reaches lower limit of 105 volts. Battery to continue to supply the specified switchgear load.
 - l. Inverter to restart automatically when dc voltage reaches nominal value of 125 volts.
 - m. Efficiency: Not less than the following with load power factor of 0.8 lagging.
 - (1) 15 kVA or less: 80-percent.
 - (2) 20 kVA through 50 kVA: 84-percent.
- 3. Accessory equipment:
 - a. Meters: As specified in Article 2.1A.6.b
 - b. Indicating lights or status displays:
 - (1) Inverter operating in normal mode.
 - (2) Inverter operating in standby mode or power transfer switch in bypass mode.
 - (3) Inverter operating and phase locked.
 - (4) DC voltage below minimum float voltage or above maximum equalizing voltage.
 - (5) Overtemperature.
 - (6) Low cooling air flow.
 - (7) Overload.
 - c. Relays and controls:
 - (1) Adjustable three-phase undervoltage relay or static circuitry to sense each phase of inverter output for initiating transfer to bypass power source. Initiation voltage adjustable over range of 80-percent to 90-percent of rated voltage.
 - (2) Voltage-sensing circuitry to prevent retransfer of load to the inverter unless voltage is within specified tolerance and frequency is phase locked within tolerance.
 - (3) Signals from the frequency and synchronization control to be used to inhibit retransfer from bypass to inverter if out-of-tolerance.
 - (4) Inverter control for restarting of a shutdown inverter.
 - (5) Manual ON/OFF control switch. ON position of switch to restart inverter for full-automatic operation.
 - (6) Devices and circuitry to protect inverter from dc over/under voltage, overload, short-circuit, and overtemperature.
 - (7) Device and circuitry equipped with two supervisory contacts, one NC and one NO, for remote monitoring inverter-output status.
- E. Static Transfer Switch: An integral part of the UPS; silicon-controlled rectifier-type with the following requirements:
 - 1. Automatic transfer of inverter load to bypass source: Transfer to be made under the following conditions provided transfer/retransfer selector switch is in automatic position:
 - a. Inverter-output failure occurs.
 - b. Overload is equal to or less than 25-percent for more than 15 minutes.
 - c. Overload greater than 25-percent occurs.
 - d. Inverter is shutdown with manual switch.

2. Automatic retransfer of load to inverter: Retransfer to be made under following conditions provided transfer/retransfer selector switch is in automatic position:
 - a. The overload condition is removed.
 - b. Inverter-output voltage is within specified tolerance for magnitude and frequency and within six electrical degrees of the bypass-source voltage.
 3. Manual transfer and retransfer:
 - a. Transfer of inverter load to the bypass source initiated by a switch closure. Inverter to remain operating and ready to accept the load.
 - b. Retransfer initiated by automatic control when transfer/retransfer selector switch is in automatic position.
 4. Switch identified as a transfer/retransfer selector switch: Two-position selector switch with positions labeled as follows:
 - a. AUTOMATIC (TRANSFER AND RETRANSFER).
 - b. MANUAL TRANSFER (INHIBIT RETRANSFER).
 5. Electrical characteristics:
 - a. Rated voltage: 480/277-volt, three-phase, 60 Hertz with neutral bus for four-wire bypass-source service and UPS-output neutral connection.
 - b. Rated continuous current: 125% rated load continuously and 200% rated load for 30 seconds.
 - c. Withstand capability: Withstand short-circuit current available at bypass source. Vendor may provide current-limiting protection to provide required withstand. Current-limiting fuses to provide coordination with the bypass source and the branch-circuit protection in the main emergency panelboard.
 - d. Capacity to close into short-circuit or let-through of fuses without functional degrading other than fuse clearing.
 6. Indicating lights or status displays:
 - a. Bypass-source undervoltage, overvoltage, loss of a phase, or out-of-frequency tolerance.
 - b. Power transfer switch on bypass.
 7. Maintenance bypass capability:
 - a. A manually operated maintenance bypass switching arrangement to transfer the UPS output load to the bypass ac source without interruption of UPS output while electronically isolating or permitting the isolation of the static transfer switch and the inverter from the bypass source.
 8. Circuit and device with two supervisory contacts, one NO and one NC for monitoring status of power transfer switch feeding load from inverter output or from bypass source.
- F. Main Emergency Panelboard:
1. ANSI/NEMA PB1, UL 67 fused-switch panelboard.
 2. Enclosure:
 - a. ANSI/NEMA 250, Type 1, fabricated from galvanized steel, surface-mounted, unless otherwise shown.
 - b. Minimum of four-inch side gutter and six-inch top and bottom gutters.
 - c. Mounting channel drilled and tapped to accommodate any combination of fused switches.
 - d. Provide latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.
 - e. Provisions for enclosure grounding.

- f. Finish: Metallic surfaces degreased, cleaned, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1 Color 61; two mils minimum DFT.
- 3. Busbar:
 - a. ASTM B187-00, 98-percent-conductivity copper with silver-plated or tin-plated contact surface, drilled and tapped to accommodate any combination of fused switch units.
 - b. Neutral and ground bus of the same rating as that of phase bus. Neutral bus mounted on insulated block.
 - c. Rated at minimum 150-percent of inverter rating and not less than power transfer switch bypass overcurrent protection.
- 4. Type of service: 277/480 volts, three-phase, four-wire, 60 Hertz.
- 5. Type of mains: Main lugs only, located at top or bottom as shown.
- 6. Branch circuit: Equipped with fused switch unit, number of circuits as shown.
- 7. Fused switch unit:
 - a. Individually enclosed, quick-make/quick-break switching mechanism with silver-alloy contacts, external operating handle with provision for padlocking in ON or OFF positions.
 - b. Mechanical defeatable door interlock to prevent opening door when the switch is in ON Position.
 - c. Pressure-type fuse clip, with Class J cartridge fuse conforming to UL 198C.
 - d. Number of poles: As shown.
 - e. Current rating: As shown. Maximum rating 30 amperes.
 - f. If single-pole fused switch unit is not available, use a two-pole or three-pole fused switch unit for each circuit shown with a single-pole fused switch unit. Two or more separate circuits are not to be fed from a two-pole or three-pole fused switch unit.
- 8. Fuse time-current characteristic coordinated with upstream fuse time-current characteristic for providing selective overcurrent tripping.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install UPS where shown in accordance with the following requirements:
 - 1. Storage battery: Anchor battery rack to floor, then mount and connect battery cells in accordance with manufacturer's recommendations, with the following additional requirements:
 - a. For connecting cells mounted on same rack, use lead-plated or tin-plated solid-copper conductor as recommended by battery manufacturer.
 - b. For connecting cells mounted on different racks, use Class D stranded single-conductor insulated cable sized the same as the battery cable. Run cable in two-inch, galvanized-steel rigid conduit in accordance with Section 16130.
 - c. Use nylon-insulated bushing at each end of conduit where cable passes through conduit to protect cable insulation from damage.
 - d. Install conduit and cable to connect battery to UPS as shown.

- e. Use two-tier-battery racks as specified for battery type used. All batteries to be easily accessible from floor. Three-tier and three-step racks are prohibited.
 - 2. Anchor UPS enclosure to floor as shown and approved. Install input and output power and control wiring as shown and as approved in accordance with Section 16120. Ground enclosure in accordance with Section 16060.
 - 3. Main emergency panelboard: Install as shown and in accordance with Section 16440.
 - 4. Install pegboard at location approved by the Engineer. Mount accessories and associated nameplates on pegboard.
- B. Initial Energizing:
- 1. Initial energizing of each UPS will be under the guidance of the manufacturer's engineering representative who will advise Contractor and Authority personnel on step-by-step procedures.
- C. Apply touch-up paint where necessary.
- D. Floor Mat for Battery Rack: Cover walking area with floor mat cut to fit entire room layout, six inches larger than the overall width and length of rack to protect floor from electrolyte.

3.02 FIELD QUALITY CONTROL:

- A. Field Testing and Inspection:
- 1. General:
 - a. Conduct field inspection and field testing at each ac switchboard room to ensure proper operation of devices and equipment provided.
 - b. Operation and protective-device setting: The Contractor is responsible for setting and calibration of protective devices for proper operation during field testing.
 - 2. Field inspection:
 - a. Prior to field testing, check equipment installation in accordance with manufacturer's recommendations and applicable IEEE and ANSI standards, including verification of the following:
 - (1) Connection of circuit in accordance with wiring diagram.
 - (2) Tightness of cable and busbar connections.
 - (3) Battery-intercell bus-link integrity.
 - 3. Field Testing:
 - a. Furnish equipment to perform tests.
 - b. Provide services of manufacturer's engineering representative and supporting field crew for a period not less than three man-days. Conduct tests in the presence of the Engineer. Perform approved tests including, but not limited to, those specified.
 - c. Test grounding conductors and enclosures on equipment for continuity to room ground bus.
 - d. Storage battery:
 - (1) Measure battery-charging voltage, electrolyte specific gravity and level.

- (2) Compare measured value and correct to manufacturer's specified tolerances.
- e. Power transfer switch:
 - (1) Calibrate and set voltage-sensing device and transfer time-delay as specified and as approved.
 - (2) Perform automatic transfer by:
 - (a) Simulating loss of inverter output.
 - (b) Return to normal power.
- f. Uninterruptible power system:
 - (1) Perform load test at inverter rated output with UPS operating in normal mode. Provide equipment necessary to achieve rated capacity load.
 - (2) Under the following conditions, perform automatic-throwover operation and manual restoration of utility service in associated ac switchboard room and check for normal operation of UPS:
 - (a) With UPS in normal mode and feeding connected load.
 - (b) With battery fully charged, no ac power fed to rectifier/charger and alternate feeder to power transfer switch and UPS feeding connected load.
 - (3) In combined ac switchboard room: Check for normal operation of UPS when feeding rated load during simultaneous loss of both 13.8-kV or 34.5-kV, as applicable, feeders and subsequent manual restoration of both services.
 - (4) With no ac power available to UPS, stop and restart inverter five times.
 - (5) Acceptance testing:
 - (a) Perform installation related measurement and acceptance testing in accordance with ANSI/IEEE 450 and ANSI/IEEE 484. In the event of a conflict between this procedure and the ANSI/IEEE documents, this procedure will take precedence.
 - (b) Calibrate test equipment used during this procedure, calibration date not older that one year from the date of testing, calibrations traceable to NIST. Have calibration stickers visible on all applicable equipment. As a minimum, calibrate the following equipment with accuracy as stated:

	<u>Equipment</u>	<u>Accuracy</u>
i.	Multimeter	± 0.1%
ii.	Microhm meter	± 0.5%
iii.	Current measuring equipment	± 1 amp
iv.	Cell voltage monitor equipment	± 0.5%
(c)	Initial measurements:	
i.	Read and record individual cell voltages to two decimal places while the battery is on a normal float charge.	

- ii. Read and record the ac ripple voltage out of the rectifier utilizing an ungrounded oscilloscope. Read and record ac ripple current utilizing an ac clamp on meter.
 - iii. Read and record intercell connection resistance using a microhm meter . Remake and re-measure any connection that has a resistance measurement more than 10-percent or 5 microhms, whichever is greater, over the average for each type of connection.
 - iv. Read and record each cell's internal impedance or conductance. Note make and model of meter.
 - v. Read and record the specific gravity of each cell.
 - vi. Read and record the temperature of each cell and the ambient temperature of the room.
- (d) Rectifier test:
- i. Apply ac load at inverter rated output with UPS operating in normal mode. Have battery connected and fully charged.
 - ii. Using infrared thermography, scan accessible UPS internal components. Also, scan UPS fuses, circuit breakers, associated circuit breakers, and UPS ac feed networks where accessible. Record abnormal heating and save these images for incorporation into the report.
 - iii. With full ac load still applied, attached dc load to UPS output. Slowly increase dc load until the point where the UPS rectifier is at current limit. This will occur when the voltage begins to sag to a point where current will begin to flow from the battery. Reduce load slightly so that no current is being drawn from the battery. Record the total dc current out of the UPS rectifier at the current limit point. Leave the rectifier at this current limit point for 20 minutes. During the 20 minutes, utilize infrared thermography to scan components as outlined above. Record abnormal heating and save these images for incorporation into the report. Utilizing an ungrounded oscilloscope, read and record the ac ripple voltage out of the rectifier at the current limit point. Also, measure and record the ac ripple current using an ac clamp on meter.
 - iv. Remove the load from both the rectifier section and the UPS ac output.
- (e) Full UPS test:
- i. Attach a monitor to the battery to measure every individual cell voltage. Ensure that this monitor can read and record every cell voltage not less than

once per minute. Also use the monitor to measure and record overall battery voltage and total battery discharge current

- ii. Attach an automatic load bank to the battery. When initiated, have the load bank provide a constant 1.8 KW load to the battery until the end of the full UPS test. Every 30 minutes increase this load to 6.0 kW for five seconds and then return it to 1.8 KW. Program this to occur automatically until the end of the full UPS test.
- iii. Apply ac load at inverter rated output with UPS operating in normal mode. Have battery connected and fully charged.
- iv. Trip breaker feeding ac power to rectifier/charger. This will initiate the UPS to operate on battery. Simultaneously, initiate the dc load bank and the battery voltage/current monitor. While test is running, utilize infrared thermography to scan the battery, associated interconnects, and ups components where accessible. Record abnormal heating and save these images for incorporation into the report. Continue the test until the under-voltage device operates on the UPS. Record the time and the battery voltage when this occurs. Turn off the dc load bank and stop the battery voltage/current monitor.
- v. Attach a current monitor to the battery that can measure and record current into the battery every 10 minutes. Disconnect all other load equipment and monitors. Re-energize circuit breaker to UPS. Start monitoring current. Check monitor after 12 hours. Record ampere hours that have been returned to the battery.
- vi. Remove all equipment from UPS area. Read and record float voltages.

(f) Pass-fail criteria:

- i. The UPS battery is acceptable only if the battery operates for a minimum of three hours and the battery capacity is a least 90-percent. No individual cell capacity may be less than 80-percent. Base capacity on a temperature correction to 77F.
- ii. Specific gravities are to be within the manufacturer's specified values.
- iii. Intercell connection resistances are to be within 10-percent or five microhms, whichever is greater, over the average for each type of connection.

- iv. Have the battery 90-percent charged within 12 hours after returning normal power to the UPS. This can be determined by the ampere hours returned to the battery after the 12-hour period. At least 100-percent of the ampere hours removed from the battery must be returned to the battery in order to be 90-percent charged.
- (g) Report: Include the following items:
 - i. Abnormal heating detected by the infrared thermography.
 - ii. Time of battery operation under full load. Include final overall battery voltage at time of UPS under-voltage device operation.
 - iii. Battery capacity percentage corrected to 77F. Base this on the battery manufacturer's's constant power data.
 - iv. Graph of overall battery voltage versus time. Supply this data also in tabular form.
 - v. Graph of individual cell voltages at the three-hour point, at the final reading, and at the 80-percent, 90-percent and 100-percent capacity points. Supply this data also in tabular form.
 - vi. Graphical display of cell float voltages before and after test, with the required minimum and maximum values annotated. Supply this data also in tabular form.
 - vii. Graphical display of temperature-corrected cell specific gravities with the required minimum and maximum values annotated. Supply this data also in tabular form.
 - viii. Graphical display of impedance/conductance values. Supply this data also in tabular form.
 - ix. Current limit value of rectifier section of UPS.
 - x. Print-out of ac ripple voltage wave form during full-load and no-load conditions. Include ac ripple current values.
- (6) After battery is discharged to level of 105 volts, initiate equalizing mode. After 12 hours, measure ampere hours to determine that 90-percent of recharge condition remains; then recharge to 100-percent level.
- (7) Simulate operations of rectifier/charger, inverter and power transfer switch operations for verifying equipment-status indication at DTS cabinet.
- (8) Set UPS to normal mode with rectifier/charger on automatic control.
- g. Compliance:
 - (1) If testing indicates failure to comply with specified requirements, replace, correct or modify equipment so that it does comply.

- (2) Conduct additional tests witnessed by the Engineer to prove compliance with specified requirements.

B. Field-Testing Personnel:

1. Provide services of manufacturer's engineering representative to perform specified field-testing program.
2. When more than one representative is involved, Contractor to ensure proper coordination.
3. Provide engineering, technicians and journeymen personnel as necessary to set-up and implement testing.

C. Authority Tests:

1. The Authority reserves the right to require the Contractor to conduct acceptance tests of voltage regulation and sound level on each UPS at each passenger station within one-year after installation.
2. In order to perform sound-level tests, the Contractor may re-create test conditions of applicable standards to the extent possible without disturbing existing structure or installed equipment or materials.

D. Submit certified test report

SECTION 16269

VARIABLE FREQUENCY CONTROLLERS

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section includes solid-state, PWM, VFCs for speed control of three-phase, squirrel-cage induction motors. Provide VFCs compatible with the equipment being controlled.

1.02 DEFINITIONS

- A. BMS: Building management system.
- B. IGBT: Integrated gate bipolar transistor.
- C. LAN: Local area network.
- D. PID: Control action, proportional plus integral plus derivative.
- E. PWM: Pulse-width modulated.
- F. VFC: Variable frequency controller.

1.03 SUBMITTALS

- A. Product Data: For each type of VFC. Include dimensions, mounting arrangements, location for conduit entries, shipping and operating weights, and manufacturer's technical data on features, performance, electrical ratings, characteristics, and finishes.
- B. Shop Drawings: For each VFC.
 - 1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings. Include the following:
 - a. Each installed unit's type and details.
 - b. Nameplate legends.
 - c. Short-circuit current rating of integrated unit.
 - d. Listed and labeled for series rating of overcurrent protective devices in combination controllers by an NRTL acceptable to authorities having jurisdiction.
 - e. Features, characteristics, ratings, and factory settings of each motor-control center unit.
 - 2. Wiring Diagrams: Power, signal, and control wiring for VFCs. Provide schematic wiring diagram for each type of VFC.
- C. Manufacturer Seismic Qualification Certification: Submit certification that VFCs, accessories, and components will withstand seismic forces defined in Division 16 Section "Electrical Supports and Seismic Restraints." Include the following:
 - 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 - a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."
 - b. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
 - 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate

- and describe mounting and anchorage provisions.
- 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- D. Qualification Data: For **manufacturer and testing agency**.
- E. Field quality-control test reports.
- F. Operation and Maintenance Data: For VFCs, all installed devices, and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 1 Section "Operation and Maintenance Data," include the following:
 - 1. Routine maintenance requirements for VFCs and all installed components.
 - 2. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
- G. Load-Current and Overload-Relay Heater List: Compile after motors have been installed and arrange to demonstrate that selection of heaters suits actual motor nameplate full-load currents.
- H. Load-Current and List of Settings of Adjustable Overload Relays: Compile after motors have been installed and arrange to demonstrate that dip switch settings for motor running overload protection suit actual motor to be protected.

1.04 QUALITY ASSURANCE

- A. Manufacturer Qualifications: A qualified manufacturer. Maintain, within 100 miles of Project site, a service center capable of providing training, parts, and emergency maintenance and repairs.
- B. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a member company of the InterNational Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
 - 1. Testing Agency's Field Supervisor: Person currently certified by the InterNational Electrical Testing Association or the National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Part 3.
- C. Source Limitations: Obtain VFCs of a single type through one source from a single manufacturer.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and market for intended use.
- E. Comply with NFPA 70.
- F. Product Selection for Restricted Space: Drawings indicate maximum dimensions for VFCs, minimum clearances between VFCs, and adjacent surfaces and other items. Comply with indicated maximum dimensions and clearances.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Deliver VFCs in shipping splits of lengths that can be moved past obstructions in delivery path as indicated.
- B. Store VFCs indoors in clean, dry space with uniform temperature to prevent condensation. Protect VFCs from exposure to dirt, fumes, water, corrosive substances, and physical damage.
- C. If stored in areas subject to weather, cover VFCs to protect them from weather, dirt, dust, corrosive substances, and physical damage. Remove loose packing and flammable materials from inside controllers; install electric heating of sufficient wattage to prevent condensation.

1.06 PROJECT CONDITIONS

- A. Environmental Limitations: Rate equipment for continuous operation, capable of driving full load without derating, under the following conditions, unless otherwise indicated:
 - 1. Ambient Temperature: 0 to 40 deg C.
 - 2. Humidity: Less than 90 percent (non-condensing).
 - 3. Altitude: Not exceeding 3300 feet.
- B. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:
 - 1. Notify Owner no fewer than two days in advance of proposed interruption of electrical service.
 - 2. Indicate method of providing temporary electrical service.
 - 3. Do not proceed with interruption of electrical service without Owner's written permission.
- C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for VFCs, including clearances between VFCs, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

1.07 COORDINATION

- A. Coordinate layout and installation of VFCs with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3 Section "Cast-in-Place Concrete."
- C. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 7 Section "Roof Accessories."
- D. Coordinate features of VFCs, installed units, and accessory devices with pilot devices and control circuits to which they connect.
- E. Coordinate features, accessories, and functions of each VFC and each installed unit with ratings and characteristics of supply circuit, motor, required control sequence, and duty cycle of motor and load.

PART 2 - PRODUCTS

2.01 VARIABLE FREQUENCY CONTROLLERS

- A. Description: NEMA ICS 2, IGBT, PWM, VFC; listed and labeled as a complete unit and arranged to provide variable speed of an NEMA MG 1, Design B, 3-phase induction motor by adjusting output voltage and frequency.
 - 1. Provide unit suitable for operation of premium-efficiency motor as defined by NEMA MG 1.
- B. Design and Rating: Match load type such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.
- C. Output Rating: 3-phase; 6 to 60 Hz, with voltage proportional to frequency throughout voltage range.
- D. Unit Operating Requirements:

1. Input ac voltage tolerance of 208 V, plus or minus 5 percent or 380 to 500 V, plus or minus 10 percent.
 2. Input frequency tolerance of 50/60 Hz, plus or minus 6 percent.
 3. Minimum Efficiency: 96 percent at 60 Hz, full load.
 4. Minimum Displacement Primary-Side Power Factor: 96 percent.
 5. Overload Capability: 1.1 times the base load current for 60 seconds; 2.0 times the base load current for 3 seconds.
 6. Starting Torque: 100 percent of rated torque or as indicated.
 7. Speed Regulation: Plus or minus 1 percent.
- E. Isolated control interface to allow controller to follow control signal over an 11:1 speed range.
1. Electrical Signal: 4 to 20 mA at 24 V.
 2. Pneumatic Signal: 3 to 15 psig (20 to 104 kPa).
- F. Internal Adjustability Capabilities:
1. Minimum Speed: 5 to 25 percent of maximum rpm.
 2. Maximum Speed: 80 to 100 percent of maximum rpm.
 3. Acceleration: 2 to a minimum of 22 seconds.
 4. Deceleration: 2 to a minimum of 22 seconds.
 5. Current Limit: 50 to a minimum of 110 percent of maximum rating.
- G. Self-Protection and Reliability Features:
1. Input transient protection by means of surge suppressors.
 2. Under- and overvoltage trips; inverter overtemperature, overload, and overcurrent trips.
 3. Motor Overload Relay: Adjustable and capable of NEMA ICS 2, Class 10 performance.
 4. Notch filter to prevent operation of the controller-motor-load combination at a natural frequency of the combination.
 5. Instantaneous line-to-line and line-to-ground overcurrent trips.
 6. Loss-of-phase protection.
 7. Reverse-phase protection.
 8. Short-circuit protection.
 9. Motor overtemperature fault.
- H. Multiple-Motor Capability: Controller suitable for service to multiple motors and having a separate overload relay and protection for each controlled motor. Overload relay shall shut off controller and motors served by it when overload relay is tripped.
- I. Automatic Reset/Restart: Attempts three restarts after controller fault or on return of power after an interruption and before shutting down for manual reset or fault correction. Bidirectional autospeed search shall be capable of starting into rotating loads spinning in either direction and returning motor to set speed in proper direction, without damage to controller, motor, or load.
- J. Power-Interruption Protection: To prevent motor from re-energizing after a power interruption until motor has stopped.
- K. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.
- L. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.
- M. Input Line Conditioning: As required by WMATA.
- N. VFC Output Filtering: As required by WMATA.
- O. Status Lights: Door-mounted LED indicators shall indicate the following conditions:
1. Power on.
 2. Run.
 3. Overvoltage.

4. Line fault.
 5. Overcurrent.
 6. External fault.
- P. Panel-Mounted Operator Station: Start-stop and auto-manual selector switches with manual speed control potentiometer and elapsed time meter.
- Q. Indicating Devices: Meters or digital readout devices and selector switch, mounted flush in controller door and connected to indicate the following controller parameters:
1. Output frequency (Hz).
 2. Motor speed (rpm).
 3. Motor status (running, stop, fault).
 4. Motor current (amperes).
 5. Motor torque (percent).
 6. Fault or alarming status (code).
 7. PID feedback signal (percent).
 8. DC-link voltage (VDC).
 9. Set-point frequency (Hz).
 10. Motor output voltage (V).
- R. Control Signal Interface:
1. Electric Input Signal Interface: A minimum of 2 analog inputs (0 to 10 V or 0/4-20 mA) and 6 programmable digital inputs.
 2. Pneumatic Input Signal Interface: 3 to 15 psig.
 3. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the BMS or other control systems:
 - a. 0 to 10-V dc.
 - b. 0-20 or 4-20 mA.
 - c. Potentiometer using up/down digital inputs.
 - d. Fixed frequencies using digital inputs.
 - e. RS485.
 - f. Keypad display for local hand operation.
 4. Output Signal Interface:
 - a. A minimum of 1 analog output signal (0/4-20 mA), which can be programmed to any of the following:
 - 1) Output frequency (Hz).
 - 2) Output current (load).
 - 3) DC-link voltage (VDC).
 - 4) Motor torque (percent).
 - 5) Motor speed (rpm).
 - 6) Set-point frequency (Hz).
 5. Remote Indication Interface: A minimum of 2 dry circuit relay outputs (120-V ac, 1 for remote indication of the following:
 - a. Motor running.
 - b. Set-point speed reached.
 - c. Fault and warning indication (overtemperature or overcurrent).
 - d. PID high- or low-speed limits reached.
- S. Communications: Provide an RS485 interface allowing VFC to be used with an external system within a multidrop LAN configuration. Interface shall allow all parameter settings of VFC to be programmed via BMS control. Provide capability for VFC to retain these settings within the nonvolatile memory.
- T. Manual Bypass: Magnetic contactor arranged to safely transfer motor between controller output and bypass controller circuit when motor is at zero speed. Controller-off-bypass selector switch sets mode, and indicator lights give indication of mode selected. Unit shall

be capable of stable operation (starting, stopping, and running), with motor completely disconnected from controller (no load).

- U. Bypass Controller: NEMA ICS 2, full-voltage, non-reversing enclosed controller with across-the-line starting capability in manual-bypass mode. Provide motor overload protection under both modes of operation with control logic that allows common start-stop capability in either mode.
- V. Integral Disconnecting Means: NEMA AB 1, instantaneous-trip circuit breaker or NEMA KS 1, fusible switch with lockable handle.
- W. Isolating Switch: Non-load-break switch arranged to isolate VFC and permit safe troubleshooting and testing, both energized and de-energized, while motor is operating in bypass mode.
- X. Remote Indicating Circuit Terminals: Mode selection, controller status, and controller fault.

2.02 ENCLOSURES

- A. NEMA type 1, fabricated from galvanized steel, surface-mounted, unless otherwise required.
- B. Minimum 3 inch wire gutters on all sides.
- C. Mounting Channel drilled and tapped to accommodate any combination of fused switches.
- D. Provide latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.
- E. Provisions for enclosure grounding.

2.03 ACCESSORIES

- A. Devices shall be factory installed in controller enclosure, unless otherwise indicated.
- B. Push-Button Stations, Pilot Lights, and Selector Switches: NEMA ICS 2, heavy-duty type.
- C. Stop and Lockout Push-Button Station: Momentary-break, push-button station with a factory-applied hasp arranged so padlock can be used to lock push button in depressed position with control circuit open.
- D. Control Relays: Auxiliary and adjustable time-delay relays.
- E. Standard Displays:
 - 1. Output frequency (Hz).
 - 2. Set-point frequency (Hz).
 - 3. Motor current (amperes).
 - 4. DC-link voltage (VDC).
 - 5. Motor torque (percent).
 - 6. Motor speed (rpm).
 - 7. Motor output voltage (V).
- F. Historical Logging Information and Displays:
 - 1. Real-time clock with current time and date.
 - 2. Running log of total power versus time.
 - 3. Total run time.
 - 4. Fault log, maintaining last four faults with time and date stamp for each.
- G. Current-Sensing, Phase-Failure Relays for Bypass Controller: Solid-state sensing circuit with isolated output contacts for hard-wired connection; arranged to operate on phase failure, phase reversal, current unbalance of from 30 to 40 percent, or loss of supply

voltage; with adjustable response delay.

2.04 FACTORY FINISHES

- A. Finish: Manufacturer's standard paint applied to factory-assembled and -tested VFCs before shipping.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas, surfaces, and substrates to receive VFCs for compliance with requirements, installation tolerances, and other conditions affecting performance.
- B. Examine roughing-in for conduit systems to verify actual locations of conduit connections before VFC installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLICATIONS

- A. Select features of each VFC to coordinate with ratings and characteristics of supply circuit and motor; required control sequence; and duty cycle of motor, controller, and load.
- B. Select horsepower rating of controllers to suit motor controlled.

3.03 INSTALLATION

- A. Anchor each VFC assembly to steel-channel sills arranged and sized according to manufacturer's written instructions. Attach by bolting. Level and grout sills flush with mounting surface.
- B. Install VFCs on concrete bases.
- C. Comply with mounting and anchoring requirements specified in Division 16 Section "Electrical Supports and Seismic Restraints."
- D. Controller Fuses: Install fuses in each fusible switch. Comply with requirements in Division 16 Section "Fuses."

3.04 CONCRETE BASES

- A. Coordinate size and location of concrete bases. Verify structural requirements with structural engineer.
- B. Concrete base is specified in Division 16 Section "Basic Electrical Materials and Methods," and concrete materials and installation requirements are specified in Division 3.

3.05 IDENTIFICATION

- A. Identify VFCs, components, and control wiring according to Division 16 Section "Electrical Identification."
- B. Operating Instructions: Frame printed operating instructions for VFCs, including control sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of VFC units.

3.06 CONTROL WIRING INSTALLATION

- A. Install wiring between VFCs and remote devices according to Division 16 Section

"Conductors and Cables."

- B. Bundle, train, and support wiring in enclosures.
- C. Connect hand-off-automatic switch and other automatic-control devices where applicable.
 - 1. Connect selector switches to bypass only manual- and automatic-control devices that have no safety functions when switch is in hand position.
 - 2. Connect selector switches with control circuit in both hand and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

3.07 CONNECTIONS

- A. Conduit installation requirements are specified in other Division 16 Sections. Drawings indicate general arrangement of conduit, fittings, and specialties.
- B. Ground equipment according to Division 16 "Grounding and Bonding."

3.08 FIELD QUALITY CONTROL

- A. Prepare for acceptance tests as follows:
 - 1. Test insulation resistance for each enclosed controller element, bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to perform the following:
 - 1. Inspect controllers, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
 - 2. Assist in field testing of equipment including pretesting and adjusting of solid-state controllers.
 - 3. Report results in writing.
- C. Testing Agency: Owner will engage a qualified testing and inspecting agency to perform field tests and inspections and prepare test reports.
- D. Testing Agency: Engage a qualified testing and inspecting agency to perform the following field tests and inspections and prepare test reports:
- E. Perform the following field tests and inspections and prepare test reports:
 - 1. Perform each electrical test and visual and mechanical inspection, except optional tests, stated in NETA ATS. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

3.09 ADJUSTING

- A. Set field-adjustable switches and circuit-breaker trip ranges.

3.10 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain variable frequency controllers. Refer to Division 1 Section "Demonstration and Training."

END OF SECTION

SECTION 16270

TRANSFORMERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing transformers.
- B. Related Work Specified Elsewhere:
 - 1. Wire connection accessories: Section 16125
 - 2. Grounding and bonding: Section 16060.
- C. Design Criteria:
 - 1. Floor loading: Transformer base compatible with floor design-loading of 250 pounds per square foot.

1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is regularly engaged in the repetitive production of transformers and automatic voltage regulators of the types and ratings described in these specifications using the latest technology and who has a proven record of successful manufacturing and testing of same or similar type equipment. The equipment manufacturer shall have and maintain ISO 9001 or ISO 9002 certification.
- B. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
 - 2. NEC.
 - 3. NEMA: ST1, ST20, 107, 250.
 - 4. ANSI: C57.12.50, C57.12.51, Z55.1.
 - 5. ASTM: D3487.
 - 6. ANSI/IEEE: C57.12.00, C57.12.90, C57.12.91, C57.15, C57.94, C57.113, C57.124, C62.11.
 - 7. IEEE: C57.12.01.
 - 8. UL: 506, 1561, 1562.
- C. Factory Testing:
 - 1. General requirements for distribution transformers:
 - a. Perform design tests and short-circuit tests on one transformer of each type and rating furnished in this Contract.
 - b. Perform routine tests, impulse test and partial discharge test on each transformer furnished in this Contract.
 - 2. Dry-type transformers: Perform design and routine tests in accordance with IEEE C57.12.01 and ANSI/IEEE C57.12.91 and the following additional tests:
 - a. Perform impulse test without using surge arrestors to protect the transformer.
 - b. Perform partial discharge test to establish partial discharge inception and extinction voltage during induced voltage test in accordance with ANSI/IEEE C57.124 and the following requirements:
 - (1) Measure partial discharge in pico-coulombs at 10-percent increments when the voltage is raised from 70 percent to 200 percent and lowered from 200 percent to 70 percent of rated voltage during the induced voltage test to verify the following requirements:
 - (a) Inception of partial discharge occurs above 120 percent of

- rated voltage when voltage is raised from 70 percent to 200 percent. At 120 percent, the partial discharge reading shall be 10 pico-coulombs or less.
 - (b) Extinction of partial discharge occurs above 120 percent of rated voltage when voltage is lowered from 200 percent to 70 percent and partial discharge level is below 10 pico-coulombs.
 - c. Perform short-circuit tests in accordance with IEEE C57.12.01 and ANSI/IEEE C57.12.91.
- 3. Oil-filled transformers: Perform design and routine tests in accordance with ANSI/IEEE C57.12.00 and C57.12.90 and the following additional tests:
 - a. Perform lightning impulse test without using surge arrestors to protect the transformer.
 - b. Perform partial discharge test using one of the following test methods:
 - (1) Perform partial discharge test to determine radio-influence voltage and associated partial discharge inception and extinction in accordance with NEMA 107 and the following requirements:
 - (a) Measure radio-influence voltage in micro-volts at 25-percent increments when the voltage is raised from 100 percent to 200 percent and lowered from 200 percent to 100 percent of rated voltage during the induced voltage test to verify the following requirements:
 - i. Radio-influence voltage not to exceed 250 micro-volts for transformers with 13.8 kV primary voltage and 650 micro-volts for transformers with 34.5 kV primary voltage.
 - ii. Inception (i.e. sudden increase in radio-influence voltage as the voltage is raised from 100 percent to 200 percent) occurs above 120 percent of the highest tap voltage.
 - iii. Extinction (i.e. sudden decrease in radio-influence voltage as the voltage is lowered from 200 percent to 100 percent) occurs above 120 percent of the highest tap voltage.
 - (2) Perform partial discharge test to determine terminal partial discharge level and partial discharge at five-minute intervals on each terminal during a 60-minute period of induced voltage test in accordance with ANSI/IEEE C57.113 and to verify the following requirements:
 - (a) Terminal partial discharge level not-to-exceed 200 pico-coulombs.
 - (b) Partial discharge measurements during a 60-minute period meet the requirements of ANSI/IEEE C57.113.
 - (3) Perform short-circuit tests in accordance with ANSI/IEEE C57.12.00 and C57.12.90.
- 4. Perform design and routine tests for general-purpose transformers in accordance with NEMA ST20.
- 5. Notify the Engineer not less than 14 days prior to factory testing to allow witnessing of tests.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- B. Shop Drawings: In accordance with Section 16360.
- C. Certification:
 - 1. Furnish certified test report of all design and short-circuit tests performed on one transformer of each type and rating furnished in this Contract or on identical transformers built by same manufacturer within the last five years.
 - 2. Furnish certified test report of all routine, impulse and partial discharge tests performed on each transformer furnished in this Contract.
 - 3. Furnish certificates from manufacturers verifying that products conform to specified requirements. Include certificates with submittal of shop drawings.
- B. Documentation:
 - 1. Field-testing plan: In accordance with Section 16360.
- C. Operation and Maintenance Manuals: In accordance with Section 16360.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Temporary Bracing: Where necessary, brace transformer for hoisting, lowering and skidding into position. Label temporary internal bracing: TEMPORARY - REMOVE BEFORE OPERATION.
- C. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact-record chart with manufacturer's instructions for disposition of damaged materials.
- D. Store transformers in secure and dry storage facility.

1.05 OPERATION AND MAINTENANCE TRAINING:

- A. In accordance with the General Requirements and Section 16360.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Transformers:
 - 1. Interchangeability: Components of the same type, size, rating, functional characteristics, and make are to be interchangeable.
 - 2. Nameplate provided on each transformer in accordance with reference standard.
 - 3. Efficiency/losses:
 - a. Dry-type, three-phase transformers, 501 kVA and larger:
 - (1) Full-load efficiency: 98.0-percent minimum.
 - (2) Half-load efficiency: 98.5-percent minimum.
 - (3) No-load loss, maximum, of nameplate kVA rating:
 - (a) 13.8 kV - 480Y/277-volt units: 0.5 percent.
 - 4. Impedance voltages:
 - a. Three-phase transformers, 501 kVA and larger:
 - (1) 13.8 kV - 480Y/277 volt units: 5.75 percent.
 - b. Other transformers, lower ratings or lower voltages: In accordance with applicable standard or manufacturer's standard.

5. Magnetic circuit:
 - a. Material: Best quality non-aging silicon steel sheet with high-magnetic permeability and low hysteresis and eddy-current losses. Sheet insulated on both sides with inorganic material to minimize eddy current.
 - b. Laminations cut in direction of grain, free of burrs and uniformly stacked in same direction without gap. Lap and butt joints closely fitted and rigidly clamped to minimize core loss and noise level.
 - c. Capable of up to 10-percent overvoltage excitation while maintaining magnetic-flux density below saturation level.
6. Audible sound level: Distribution transformers designed to limit average sound level to within the following maximum values when measured at the factory in accordance with ANSI/IEEE C57.12.91 for dry-type transformers and in accordance with ANSI/IEEE C57.12.90 for oil-filled transformers:
 - a. Dry-type, three-phase transformers:

Transformer Rating in kVA	Sound Level in dB for Ventilated, Self-Cooled Rating	Sound Level in dB for Ventilated, Forced-Air-Cooled Rating
150	55	-
225, 300	58	-
500	60	67
750, 1,000	64	67
1,500	65	68
2,000	66	69
3,500	68	71
3,750	70	73
150, 225, 300	56	61
500	56	61
750	57	61
1,000	58	61

- b. General-purpose transformers designed to limit average sound level to within maximum values in NEMA ST20.
7. Winding:
 - a. Dry-type, 3-phase transformer, 501KVA and larger.
 - (1) Copper conductors free from burrs, kinks or slivers. Each winding braced for high-mechanical strength and spaced to provide adequate circulation for coolant.
 - b. Dry-type, 3-phase and single-phase transformer 500KVA and smaller.
 - (1) Copper or aluminum conductors free from burrs, kinks or slivers. Each winding braced for high-mechanical strength and spaced to provide adequate circulation for coolant.
8. Buses: Transformers equipped with adequately supported copper or aluminum buses, with the following additional requirements:

- a. Busbar silver-plated or tin-plated at bolted connection point.
- b. Joints welded or bolted for mechanical and electrical short-circuit stresses.
- 9. Ground pad: Enclosure equipped with grounding pad, drilled and tapped for connection to station grounding system.
- 10. Finish: Metallic surfaces degreased, cleaned with iron-phosphate solution, rinsed with chromic acid solution, dried and finished with light-gray coating, ANSI Z55.1, Color 61; two mils minimum DFT as follows:
 - a. Indoor location: Electrostatically deposited polymer polyester powder or epoxy powder, cured by baking and UL recognized, or spray enamel.
 - b. Outdoor location: Epoxy enamel.
- 11. Nameplate: Provided on each transformer showing manufacturer's name and brand designation, reference standard, type, class, rating and other required information as applicable in accordance with reference standard.
- 12. Space heaters:
 - a. Each distribution transformer for indoor use provided with 120-volt, single-phase, 60 Hertz heating element to facilitate drying and prevent condensation under no load or light load conditions.
 - b. Heaters enclosed in grille guard with no sharp edges and located so that they are accessible for replacement. Heaters controlled by thermostat adjustable from 40F to 80F. Panel ammeter, approximately 2-1/2 inches square, marked to indicate heater load. Thermostat set in accordance with manufacturer's recommendations.
 - c. Power and control circuits to heaters and thermostat connected and protected up to devices and to incoming junction box with galvanized-steel rigid conduit or liquid-tight flexible conduit. Heater power junction box sized four inches square by two inches minimum depth and located at top of transformer for top entry of minimum 3/4-inch conduit. Remote connection leads to power source labeled: 120-volt and NEUTRAL.

B. Distribution Transformers:

- 1. Transformers for indoor use:
 - a. IEEE C57.12.01, ANSI C57.12.50, C57.12.51, ANSI/IEEE C57.12.91, UL 1562, floor-mounted, dry-type, ventilated self-cooled/forced-air-cooled, Class AA/FA, or ventilated self-cooled, Class AA, as specified, double-wound, three-phase, 60 Hertz with secondary neutral brought out, and using the following type of winding construction for both primary and secondary windings of a transformer:
 - (1) Solid cast-coil windings.
 - b. kVA rating:
 - (1) Transformers, 501 kVA and larger: Ventilated self-cooled kVA rating as shown, with capacity in current-carrying parts to permit 33-1/3 percent increase in kVA rating (Class AA/FA) by operation of integral forced-air cooling fans.
 - (2) Transformers, 300 kVA and smaller: Ventilated self-cooled, Class AA, kVA rating as shown.
 - c. Voltage rating: 13.8 kV delta to 480Y/277 volts, as shown.
 - d. Enclosure:
 - (1) NEMA 250, Type 2 dripproof enclosure with removable front and rear panels and ventilation louvers to prevent entrance of falling dirt and liquids and accidental access to live parts.
 - (2) Provision for jacking, lifting, skidding, and towing in any direction.
 - (3) Provision for complete isolation of core and coils from the enclosure using rubber vibration isolation pads or other suitable means.
 - (4) Core visibly grounded to ground pad with flexible grounding

- conductor sized in accordance with applicable ANSI and UL Standards.
- (5) Exterior surfaces of core and structural members of core and coil assembly protected from corrosion after assembly with a coating having a temperature rating exceeding the temperature rating of the associated transformer insulation system.
- e. Rated insulation-level withstand:
- (1) 13.8 kV - 480Y/277 volt units:
- (a) High-voltage winding, lightning basic-impulse voltage (BIL) without the use of surge arrestors: 95 kV.
- (b) High-voltage winding, low-frequency withstand: 34 kV.
- (c) Low-voltage winding, lightning basic-impulse voltage (BIL):
- i. Transformers with solid cast-epoxy windings: 30 kV.
- (d) Low-voltage winding, low-frequency withstand: 4 kV.
- f. Transformer terminals:
- (1) High-voltage side: Provide tin-plated terminal pads in air-filled transition compartment suitable to receive and terminate cable or bus connections from high-voltage switchgear, as applicable. Bushings or terminations through sidewall of transformer enclosure to have minimum BIL equal to that of transformer.
- (2) Low-voltage side: Provide tin-plated terminal pads in air-filled transition compartment opposite high-voltage side, suitable for bus connection to low-voltage switchgear. Terminations and transformer secondary bus or terminal supports to have short-circuit current-withstand equal to that of low-voltage switchgear; minimum BIL equal to that of transformer.
- g. Insulation system:
- (1) 185°C insulation system for dry-type transformers having solid cast-epoxy windings with maximum allowable continuous full-load temperature rise above average ambient temperature of 30C and maximum ambient temperature of 40°C:
- (a) By winding resistance: 80C.
- (b) By hottest spot in winding: 110C.
- (2) 185C insulation system for dry-type transformers having solid cast-epoxy windings with maximum allowable continuous full-load temperature rise above average ambient temperature of 30C and maximum ambient temperature of 40C:
- (a) By winding resistance: 80C.
- (b) By hottest spot in winding: 110C.
- h. Taps:
- (1) Capable of delivering rated output at each setting.
- (2) 13.8 kV - 480Y/277 volt units: Two 2-1/2 percent taps above and four 2-1/2 percent taps below rated voltage on primary side.
- (3) Tap changing on face of coil using removable links accessible from front or back of transformer.
- i. Thermometer/auxiliary relay:
- (1) Digital-type thermometer with scale range as required and two sets of contacts.
- (2) One set of thermometer contacts designed to operate two auxiliary relays powered by associated transformer:
- (a) First relay with minimum of one NC and one NO contact for remote supervisory indication.

- (b) Second relay for operation of forced-air cooling fans through an automatic-manual selector switch on transformers rated 501 kVA and larger.
 - (3) Second set of thermometer contacts to trip essential main feeder at impermissible transformer over temperature.
 - (4) Contacts set in accordance with manufacturer's recommendations.
 - (5) Auxiliary relay may be located in associated low-voltage switchgear.
 - (6) Relay contacts for remote indication to be wired to accessible terminal block, with the following additional requirements:
 - (a) Rated 250 milliamperes at 250 volts dc or three amperes at 24 volts dc.
 - (b) Dry-sealed, with resistance of 0.10 ohms maximum.
 - (c) Contact bounce: Five milliseconds maximum.
 - j. Solid cast-epoxy winding construction:
 - (1) Each winding for each phase separately cast as a rigid tubular coil and installed coaxially around the core.
 - (2) Each winding reinforced with glass cloth.
 - (3) Epoxy characteristics:
 - (a) High electrical, mechanical and thermal strength.
 - (b) Non-flammable and self-extinguishing.
 - (c) Coefficient of expansion compatible with that of copper windings.
 - (d) Suitable for operation in ambient temperature range from minus 40C to plus 40C without cracking or degradation.
 - (e) Nonhygroscopic and suitable for operation at 40C ambient temperature and 100-percent humidity.
 - (4) Epoxy cast in metal mold under vacuum to ensure homogeneous casting free from voids.
 - (5) Windings fabricated in a facility with successful experience in the manufacture of solid cast-epoxy transformer windings.
 - k. Forced-air cooling fans and control panel:
 - (1) Forced-air cooling fans to permit 33-1/3 percent increase in transformer ventilated self-cooled kVA rating.
 - (2) Power supply for fans and control panel provided from associated transformer. Fans, control panel and associated circuits equipped with protective devices.
 - (3) Control panel flush-mounted with transformer enclosure and equipped with the following:
 - (a) Automatic-manual selector switch for controlling forced-air cooling fans. Fans activated by thermometer in automatic position.
 - (b) Indicating lights:
 - i. Green light for control power available.
 - ii. Amber light for fans operating.
 - (c) Automatic exercising of fans once a month.
2. Transformers for outdoor use:
- a. ANSI/IEEE C57.12.00, C57.12.90, floor-mounted, oil-filled, self-cooled/forced-air cooled, Class OA/FA or self-cooled, Class OA, as specified, double-wound, three-phase, 60 Hertz with secondary neutral brought out through insulating bushing.
 - b. kVA rating:
 - (1) Transformers, 501 kVA and larger: Self-cooled kVA rating as shown, with capacity in current-carrying parts to permit 15-percent increase in kVA rating (Class OA/FA) by operation of integral forced-

- air cooling fans.
 - (2) Transformers, 300 kVA and smaller: Self-cooled, Class OA, kVA rating as shown.
- c. Enclosure:
 - (1) Sealed-tank construction with lifting brackets, cooling radiator, braced and anchored to withstand jacking, skidding and towing.
 - (2) Equipped with two one-inch pipe fittings, one at top and one at bottom of tank, for filling and filter connection; one one-inch drain valve; and one 3/8-inch sampling valve.
- d. Insulating oil: ASTM D3487. Mineral insulating oil free from polychlorinated biphenyl (PCB) contamination.
- e. Rated insulation level:
 - (1) For 13.8 kV to 480Y/277-volt transformers: Class 15 kV, capable of withstanding:
 - (a) Low-frequency voltage: 70 kV.
 - (b) Full-wave basic-impulse voltage: 200 kV.
 - (2) For 34.5 kV to 480Y/277-volt transformers: Class 34.5 kV, capable of withstanding:
 - (a) Low-frequency voltage: 70 kV.
 - (b) Full-wave basic-impulse voltage: 200 kV.
- f. Bushings:
 - (1) 13.8 kV - 480Y/277-volt transformers:
 - (a) Primary bushings with glazed-porcelain surface, located on sidewall of transformer, with 15 kV insulation class with minimum 110 kV BIL in an air-filled junction box.
 - (b) Secondary-line bushings with glazed-porcelain surface, located on sidewall of transformer opposite primary bushings, with 1.2 kV insulation class with minimum 10 kV BIL in an air-filled junction box.
 - (2) Secondary neutral bushings:
 - (a) Low-voltage neutral bushings to be provided for each transformer.
 - (b) Low-voltage neutral bushings same as low-voltage line bushings, except neutral bushings may have reduced low-frequency insulation level in accordance with ANSI/IEEE C57.12.00.
 - (3) Provide silver-plated terminal pads suitable to receive cable terminals on high-voltage side and to receive cable terminals or bus connectors on low-voltage side, as necessary.
- g. Maximum allowable temperature rise under continuous full-load above ambient temperature of 30C average, 40C maximum.
 - (1) By winding resistance: 55C.
 - (2) By hottest spot in winding: 65C
- h. Taps:
 - (1) Capable of delivering rated output in each position.
 - (2) For 34.5 kV to 480Y/277-volt transformers: Two 2-1/2 percent taps above and two 2-1/2 percent taps below rated voltage on primary side.
- i. Tap changer:
 - (1) Externally mounted and manually operated no-load tap changer with locking provision for each position.
 - (2) Tap-change operating handle arranged for operation at no-load only through key interlocking with associated primary breaker in open position.
- j. Thermometer/auxiliary relay: As specified for transformers for indoor use.

- k. Liquid-level indicator: Float-operated magnetic-type continuously indicating liquid level, installed for easy removal and replacement without unsealing transformer enclosure.
 - l. Pressure-relief device: Mechanically operated self-resetting and self-reclosing type with manually resettable visual indicator and set of NO contacts to initiate tripping of associated primary breaker when pressure-relief device is activated.
 - m. Pressure vacuum-gauge range: Minus 10 to plus 10 psig.
 - n. Forced-air cooling fans and control panel:
 - (1) Forced-air cooling fans to permit 15-percent increase in transformer self-cooled kVA rating.
 - (2) Power supply for fans and control panel provided from associated transformer. Fans, control panel and associated circuits equipped with protective devices.
 - (3) Control panel with NEMA 250, Type 3R enclosure and equipped with the following:
 - (a) Automatic-manual selector switch for controlling forced-air cooling fans. Fans activated by thermometer in automatic position.
 - (b) Indicating lights:
 - i. Green light for control power available.
 - ii. Amber light for fans operating.
 - iii. Automatic exercising of fans once a month.
 - o. Surge arrester: ANSI/IEEE C62.11, intermediate class with metal-oxide varistor construction, one per phase, mounted on high-voltage terminals in air-filled junction box with the following requirements:
 - (1) For 13.8 kV - 480Y/277 volt unit: Hubbell/The Ohio Brass Company Type PVR, Catalog Number 218613, or equal, with ratings as follows:
 - (a) Duty-cycle voltage, kV, rms: 15.
 - (b) Maximum continuous operating voltage, kV, rms: 12.7.
 - (c) Insulation-withstand impulse test voltage, kV: 110.
- C. General-Purpose and Specialty Transformer:
- 1. NEMA ST20 and ST1, UL 506 and 1561, indoor, dry, double-wound with insulated copper conductor, suitable for operation on 60 Hertz.
 - 2. Rating:
 - a. kVA rating: As shown.
 - b. Voltage rating:
 - (1) Three-phase transformers: 480 volts primary to 208Y/120 volts secondary with secondary neutral brought out.
 - (2) Single-phase transformers: 480 or 277 volts primary to 120 volts secondary.
 - 3. Enclosures:
 - a. 9 kVA and below: Non-ventilated, NEMA 250, Type 3R weatherproof enclosure with encapsulated core and coils.
 - b. Above 9 kVA: Ventilated, NEMA 250, Type 2 drip-proof enclosure with removable front panel and louvers to prevent entrance of falling dirt and accidental access to live parts, and with lifting brackets or holes.
 - c. 45 kVA and below: Wall-mounted unless otherwise shown.
 - d. Above 45 kVA: Floor-mounted or platform-mounted as shown.
 - 4. Insulation system as specified below, capable of withstanding full-wave impulse of 10 kV.

kVA Rating	Insulation System
1 - 2	150C
3 - 30	185C
Above 30	220C

5. Maximum allowable temperature rise under continuous full-load above an average ambient temperature of 30C and maximum of 40C.

kVA Rating	1 - 2	3 - 30	Above 30
By winding resistance	150C	115C	150C
By hottest spot in winding	185C	145C	180C

6. Taps:

- a. Tap-changing links providing taps as follows, capable of delivering rated output in each position.
- b. Single-phase transformers: Provide taps on primary side in accordance with the following:

kVA Rating	Quantity	Taps Size:	Percent-age of rated voltage
3 - 15	2	5	below
25 - 100	4	2-1/2	below
	2	2-1/2	above

- c. Three-phase transformers: Provide taps on primary side in accordance with the following:

kVA Rating	Quantity	Taps Size:	Percent-age of rated voltage
30 - 300	4	2-1/2	below
	2	2-1/2	above
9 - 15	2	5	below
6 and below	None required		

- D. Automatic Voltage Regulator:

- ANSI/IEEE C57.15, indoor, self-air-cooled, induction-type.
- Compensating automatically for voltage drop on long feeder runs of nominal 480-volt, three-phase, three-wire or nominal 480/277-volt, three-phase, four-wire, 60 Hertz system as shown.
- Range of regulation: As necessary to maintain output voltage of regulator at receiving

- end of feeder not less than 466 volts or 480 volts as specified, minimum range of plus 10 percent and minus 10 percent range of regulation. Regulation adjustable over full range in increments of one percent or less.
4. Circuit kVA rating: As shown.
 5. Equipped with automatic solid-state control for maintaining output voltage within plus-or-minus one percent of pre-selected voltage level over temperature range of minus 30C to plus 40C.
 6. Speed of response: Voltage correction to start within four cycles and complete within three seconds for two-percent change and within 10 seconds for adjustment to required voltage.
 7. Capable of withstanding a minimum of 15 times rated full-load current under short-circuit condition.
 8. Operating mechanism permanently lubricated.
 9. Full-load efficiency: 98-percent minimum.
 10. 150C insulation system; maximum allowable temperature rise under continuous full-load above an average ambient temperature of 30C and maximum ambient temperature of 40C: 80C.
 11. Enclosure: Fabricated from sheet steel, wall-mounted or floor-mounted as appropriate, as follows:
 - a. Electric rooms, traction-power substations and tie-breaker stations: NEMA 250, Type 1.
 - b. Fan shafts and pumping stations: NEMA 250, Type 3R.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install each transformer and automatic voltage regulator in position shown and in accordance with manufacturer's recommendations and NEC requirements.
- B. Make power-conductor and control-wire connections in accordance with manufacturer's drawings, Section 16125 and as shown.
- C. Ground each transformer and automatic voltage regulator as shown and in accordance with Section 16060.
- D. Connect space heater circuit to prevent condensation during installation.

3.02 FIELD QUALITY CONTROL:

- A. Prior to testing, check transformer installation in accordance with ANSI/IEEE C57.94.
- B. Submit field-testing plan including, but not limited to, the following tests. Furnish equipment and perform the following tests in the presence of Engineer, in accordance with approved procedure:
 1. Distribution transformers: In accordance with Section 16360.
 2. General-purpose and specialty transformers:
 - a. Perform insulation-resistance tests winding-to-winding and winding-to-ground. Record and correct resistance value to temperature.
 - b. Perform ac high-voltage tests between high-voltage winding and low-voltage winding, between high-voltage winding and ground and between low-voltage winding and ground. Perform tests at 65 percent of factory test voltage for one-minute duration.
 - c. Test voltage ratio of each tap. Results not to deviate more than 0.5 percent from calculated ratio. Set taps as directed.
 - d. Check polarity by means of vector check.
 3. Automatic voltage regulator:

- a. Test circuit for connection in accordance with wiring diagram.
 - b. Test insulation of nongrounded conductors to ensure 10-megohms minimum resistance to ground.
 - c. Test regulator enclosure for continuity to grounding bus.
 - d. Set output voltage and check actual output voltage and speed of voltage correction as follows:
 - (1) For regulator supplying ventilation fans in fan shaft, set output voltage to 466 volts minimum and check actual output voltage and speed of voltage correction for providing required voltage output within specified time for each increment of additional load brought on line by sequential automatic starting of fan motors when load is supplied by each of two sources.
 - (2) For regulator supplying pumps in drainage pumping station, set output voltage to 466 volts minimum and check actual output voltage and speed of voltage correction for providing required voltage output within specified time for each increment of additional load brought on line by automatic starting of the first pump followed by the second pump when load is supplied by each of two sources.
 - (3) For regulator supplying facilities other than fan shafts and drainage pumping stations described above, set output voltage to nominal 480 volts and check actual output voltage and speed of voltage correction for providing required voltage output within specified time to the connected load.
 - e. For regulators supplying ventilation fans in fan shafts and pumps in drainage pumping stations, check actual output voltage and speed of voltage correction for providing required output when total load of all connected motors is transferred from one source to the second source by simulating power failure in each of the two sources connected to the automatic transfer switch.
- C. Submit certified test reports.

END OF SECTION

SECTION 16294

CONTACT RAIL HEATING SYSTEM FOR TRACTION POWER

PART 1. GENERAL

1.01 SUMMARY

- a. This section specifies installation of a complete contact rail heating system comprised of numerous sub-systems and components.
- b. New contact rail heat tape, fiberglass channel/extrusion, and attachment clips will be furnished by WMATA for installation by Contractor.
- c. This work includes but is not limited to the following:
 - i. Furnishing and delivery to job site of all materials other than WMATA-furnished materials.
 - ii. Removal of selected contact rail heat tape at indicated locations necessitated by relocation of existing contact rail, and installation of new contact rail heat tape after relocation of contact rail. Extend and reconnect existing power circuits to new (replacement) contact rail heat tape.
 - iii. Existing control panels/controllers are to be reused. Relocate if and as necessary as part of track rework.
- d. Related Work Specified Elsewhere
 - i. Section 01006 - Program Criteria for Traction Power and Yard Lighting
 - ii. Section 16128 - Wire and Cable For Traction Power
- e. Measurement and Payment
 - i. Wiring: Lump sum.
 - ii. Conduit: Lump sum.
 - iii. Installation and field-testing: Lump Sum.

1.02 DEFINITIONS

- A. Definitions:
1. Contact Rail Heater: A heating cable installed on the contact rail to electrically heat the mass of the rail. The cable is one of parallel circuit design utilizing a metal alloy/fiber composite heating element spirally wrapped around the parallel bus wires of the cable.
 2. 32°F Substrate: A metal surface that is maintained at 32°F.
 3. Nominal service voltage: The voltage at which the heater cables are expected to operate when in normal operation, i.e., 750V DC.
 4. Rated Power Output: The watt/foot of heating cable, eight feet or longer, energized at 750V DC, when mounted on a 32°F substrate.
 5. Sheath Temperature: The temperature of the outermost jacket.
 6. Maximum Sheath Temperature: The highest sheath temperature that a heater is

capable of generating when powered at 750V DC in still air.

7. Factory Fabricated: A heating cable including terminations and lead wires completely assembled and tested at the manufacturer's plant prior to shipment.
8. Heat Transfer Aids: Includes any materials that are extruded on to the heater for the purpose of conducting heat from the heater to the contact rail.
9. Traction Power Zone: Includes all contact rail fed from a DC switchgear feeder breaker.

1.03 SUBMITTALS

Submit the following for approval in accordance with the Division 1 and with the additional requirements as specified for each:

- A. Documentation:
 1. Submit Installation and Maintenance Manuals: as required by Division 1.

1.04 QUALITY ASSURANCE

- A. Codes, Regulations, Reference Standards and Specifications:
 1. Codes and regulations of jurisdictional authorities.
 2. ASTM: A283, B368, B633, D88, D130, D149, D217, D256, D495, D543, D570, D638, D648, D696, D790, D792, D942, D1056, D1263, D1264, D2509, D2565, D3032, F593, G3, PRACTICE G26 METHOD 1.
 3. IEEE STD 515 - 1997
 4. IEEE STD 515.1- 1995
- B. Production Tests: Visual Examination for overall uniformity and acceptable surface quality.

PART 2 PRODUCTS

2.01 EQUIPMENT - CONTACT RAIL HEAT TAPE

Contact rail heat tape will be furnished by WMATA for installation by the Contractor.

2.02 EQUIPMENT - HEATER CONTROLLERS

- A. Existing heater controllers are to be reused.
- B. Existing Track side Heater Control Panels are to be reused.
- C. Existing Zone Heater Control Panels are to be reused.
- D. Existing Fusebox Disconnects are to be reused.
- E. Existing Master Heater Control Panels are to be reused.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Complete the power wiring circuits and the control power circuits in accordance with requirements of shop drawings.

- B. Contact Rail Preparation:
 - 1. Aluminum-Clad (Composite) Contact Rail: Clean the side of contact rail where heater is to be installed. Area to be cleaned will cover the upper portion of the aluminum extrusion beneath the rail head and extends the entire length of the rail. Clean aluminum extrusion using a soft wire brush or wooden scraper. Exercise extreme care when cleaning the aluminum extrusion to prevent surface gouging.
 - 2. Install heater tape elements within four (4) hours of rail surface preparation at each individual job location.
 - 3. Obtain written approval from Authority Representative when motorized tools are to be used to accomplish wire brushing of rail surface.

- C. Installation of Heater Tape:
 - 1. Contractor shall make field survey and measurements for actual lengths of heater cable prior to ordering of heater cable.
 - 2. Prepare contact rail surfaces prior to heater installation.
 - 3. Where heater is installed on field side, terminate the heater cable as close as possible to either the end-approach or the traction power cable connections to the third rail. Do not install heater tape over end-approach, power cable connections or expansion joint.
 - 4. Where heater is installed on railside, terminate the heater cable as close as possible to the end-approach of the contact rail. The cables for connections and power termination on either side shall be routed to the field side for continuation of circuits and shall be secured safely without any slack to avoid their interference with rail or equipment movement on the rail side.
 - 5. Adhere to the installation instructions noted in these Specifications, as well as those in the heater element manufacturer's installation instructions. Bring any differences to the immediate attention of the Authority Representative for clarification. Install heater on the aluminum cladding found on aluminum-clad contact rail. Make sure that complete heater assembly does not interfere with existing operation of collector shoe or contact rail protection covers assemblies, etc.
 - 6. In general, installation of heater tape elements involves utilization of a fiberglass channel and clip system to provide intimate contact between the element itself and the rail surface. Mechanical strain relief clamps are also used when going around rail splice bars and at element ends.
 - 7. Each particular contact rail site scheduled for heater installation work, will require discrete tape element lengths.
 - 8. Provide special abrasion pads for protection of the heater tape at any protrusion or burrs on rail and splice plates. Do not install fiberglass channel on such locations.
 - 9. Route power lead wires away from the head of the rail and secure to prevent damage by passing trains.

3.02 IDENTIFICATION

- A. Identify field assembled heaters at the power termination and with Circuit number description using a heat shrinkable permanent ink labeling system.

3.03 FIELD QUALITY CONTROL

- A. Furnish equipment required to perform tests. Prior to insulation resistance tests, isolate the heater circuit. Conduct tests in the presence of the Authority Representative.
- B. Perform heating system testing in each subsystem to complete the testing of the total installed system specified in Article 1.05.
- C. Submit test procedure for approval and perform approved tests. Do not perform tests without approved test procedure. Schedule all tests through the Authority Representative. Tests include but not limited to the following:
 - 1. Visually inspect heater for continuous coverage by the containment channel, sufficient attachment clips, and abrasion pads at all welds, brackets, and obstructions.
 - 2. Measure insulation resistance using 1000V DC megger between heater conductors and contact rail. Must be greater than 1000 megohms - ft.
 - 3. Perform operation tests.
- D. Field Testing and Inspection:
 - 1. General Requirements:
 - a. Conduct field testing and inspection of each sub-system to ensure proper operation of equipment provided.
 - 2. Field Inspection:
 - a. Prior to field testing, check equipment installation, including verification of the following:
 - 1) Integrity of insulation.
 - 2) Integrity of #4 AWG cable exothermic connection to contact rail and running rail.
 - 3) Tightness of connections for control, power and ground wiring.
 - 4) Adequate support to provide proper contact between heater tape and contact rail.
 - 5) Adjustment of pick-up current of each magnetic current relay.
 - 6) Adjustment of time-delay pick-up time for each time-delay relay.
 - 7) Proper operation of door safety interlocking in track-side heater control panel.
 - 3. Field Testing:
 - a. Furnish equipment required to perform tests and provide evidence of calibration.
 - b. Provide services of manufacturer's engineering representative and supporting field crew.
 - c. Prior to insulation resistance tests, disconnect instruments and equipment which might be damaged during such tests. Conduct tests in presence of the Authority Representative.
 - d. Submit test procedure for approval and perform approved tests. Do not perform tests without approved test procedure. Schedule all test through the Authority Representative.
 - e. Perform insulation resistance test of 60-second duration on all equipment in accordance with the following requirements:
 - 1) Test Voltage:

<u>Voltage Rating</u>	<u>Test Voltage</u>
150-750V	1,000V, dc
 - 2) Insulation resistance: kV rating plus one megohm but not less than minimum value recommended by manufacturer.
 - f. Continuity Check

- g. Perform functional tests on control, interlocking, and supervisory indication circuits, including verification of interconnections between equipment and interface points.
 - h. Energize and test each heater circuit for proper operation.
- E. Field Testing Personnel:
 - 1. Provide services of qualified manufacturer's engineering representatives to perform specified field testing program
 - 2. When more than one representative is involved, the Contractor is responsible for coordination of testing effort.
 - 3. Provide engineers, technicians and journeymen as necessary to set up and implement testing.
- F. Submit certified test reports within seven days after field tests.

END OF SECTION

THIS PAGE NOT USED.

SECTION 16320

HIGH-VOLTAGE SWITCHGEAR

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing 13.8 kV metal-clad switchgear.
- B. Related Work Specified Elsewhere:
 - 1. Raceways, boxes, and cabinets: Section 16130.
 - 2. Wire, cable and busways: Section 16120.
 - 3. Wire connection accessories: Section 16125.
 - 4. Grounding and bonding: Section 16060.
- C. Design Criteria:
 - 1. Floor loading: Switchgear compatible with floor design-loading of 250 pounds per square foot.
 - 2. Switchgear suitable for anchoring to a concrete floor steel-trowel finished to tolerance level of 1/8 inch in 10'-0".

1.02 QUALITY ASSURANCE:

- A. Qualifications: Select a manufacturer who is regularly engaged in production of similar switchgear.
- B. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
 - 2. NEC.
 - 3. NEMA: SG4.
 - 4. ANSI: C37.06, Z55.1.
 - 5. ANSI/IEEE: C37.09, C37.20.2, C37.90, C57.13, C62.11.
 - 6. AHA: IS1.
- C. Factory Testing: Submit design tests or certified copies of test reports for identical units performed for each type and rating of circuit breaker as assembled in its complete switchgear unit including bus compartment.
 - 1. Circuit-breaker tests: In accordance with the requirements of ANSI/IEEE C37.09 including the following:
 - a. Design tests:
 - 1) Rated maximum voltage.
 - 2) Rated voltage-range factor.
 - 3) Rated frequency.
 - 4) Rated continuous-current test.
 - 5) Short-circuit rating.
 - 6) Rated standard operating duty.
 - 7) Rated permissible tripping delay.
 - 8) Rated interrupting time.
 - 9) Rated reclosing time.
 - 10) Rated dielectric strength.
 - 11) Rated control voltage.

- 12) Load-current switching.
- 13) Mechanical life.
- b. Production tests: Applicable tests in accordance with ANSI/IEEE C37.09.
- 2. Switchgear assembly tests: In accordance with ANSI/IEEE C37.20.2 and including the following:
 - a. Design tests for metal-clad switchgear:
 - 1) Dielectric tests.
 - 2) Rated continuous-current tests.
 - 3) Short-time current-withstand test.
 - 4) Momentary-current test.
 - 5) Mechanical endurance tests.
 - 6) Flame-resistance and tracking-resistance tests for sheet, molded or cast insulating materials for support of primary buses and connections.
 - 7) Flame-resistance test for applied insulation metal-clad switchgear.
 - 8) Paint qualification test.
 - b. Production tests for metal-clad switchgear: Applicable tests in accordance with ANSI/IEEE C37.20.2.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings: In accordance with Section 16360.
- B. Certification:
 - 1. Certify switchgear complies with 250 pounds per square foot floor-load design.
 - 2. Certified test reports for specified factory testing.
- C. Documentation:
 - 1. Short-circuit calculations and coordination study: In accordance with Section 16360.
 - 2. Field-testing plan: In accordance with Section 16360.
- D. Operations and Maintenance Manuals: In accordance with Section 16360.

1.04 PRODUCT DELIVERY, STORAGE, AND HANDLING:

- A. Ship each unit securely packaged, braced and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Temporary Bracing: Where necessary, brace switchgear for hoisting, lowering and skidding into position. Label temporary internal bracing of switchgear: TEMPORARY-REMOVE BEFORE OPERATION
- C. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact-record chart with manufacturer's instructions for disposition of damaged material.
- D. Assembly for Shipment:
 - 1. Design enclosures to permit lifting by jacks or slings and moving horizontally on rollers or skidding in any direction.

2. Maximum dimensions of shipping sections to be coordinated with the dimensions of access hatches, corridors and doors to ensure shipping dimensions will allow movement of switchgear through structure without damage to equipment or structure or undue difficulty.
 3. For shipping split, coil interconnecting wiring on one side of the shipping split with matching terminal block on other side of split. Identify wiring and terminal-block points for reconnection.
 4. Draw-out relays mounted in their proper cases with moving parts properly secured and packed for shipment.
 5. Removable circuit-breaker elements packaged separately.
- E. Store switchgear in secure and dry storage facility.

1.05 OPERATION AND MAINTENANCE TRAINING:

- A. In accordance with the General Requirements and with Section 16360.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for 13.8 kV Metal-Clad Switchgear:
1. ANSI/IEEE C37.20.2, for indoor use.
 2. Common ratings of switchgear:
 - a. Rated frequency: 60 Hertz.
 - b. Rated continuous current: 1,200 amperes.
 - c. Rated momentary current: Corresponding to circuit-breaker momentary ratings.
 3. Insulation structure:
 - a. Material not to support combustion, produce toxic gases, absorb moisture or track.
 - b. When subjected to electric arc, emission of conducting materials from insulating structure limited so as not to interfere with performance of circuit breaker.
 4. Primary circuit breaker:
 - a. NEMA SG4 and ANSI C37.06, for indoor use.
 - b. Type: Three-pole, single-throw, drawout-type.
 - c. Electrically powered, spring-charged, stored-energy operating mechanism, with the following additional requirements:
 - (1) Voltage requirements:
 - (a) Charging of stored-energy operating mechanism: 125 volts dc.
 - (b) Closing by means of closing release coil capable of operation from 100-140 volts dc.
 - (c) Tripping by means of shunt trip coil capable of operation from 70-140 volts dc.
 - (2) Mechanically and electrically trip-free.
 - (3) Unless otherwise specified, closing release coil energized by means of push-button.
 - (4) Shunt trip coil energized manually by push-button or automatically by relay.

- (5) Equipped with mechanical devices on front of breaker to actuate closing and tripping operations in case of failure of control power.
 - (6) Compressed-spring, stored-energy operating mechanism, with sufficient energy storage for closing/opening operation at rated short-circuit current or at related capabilities.
 - (7) Stored-energy mechanism automatically charged within 10 seconds following each closing of circuit breaker.
 - (8) Stored-energy mechanism suitable for manual charging by means of removable handle in case of failure of control power.
 - (9) White indicator light on control panel of circuit-breaker unit or mechanical indicator on front of breaker to indicate that stored-energy closing mechanism is charged.
- d. Racking mechanism:
- (1) Horizontal-drawout breaker: Manually-operated mechanism designed to permit racking of breaker with door closed by inserting crank through opening of limited size in door.
 - (2) Vertical-lift breaker:
 - (a) Racking accomplished electrically using control switch inserted into receptacle mounted on breaker door to permit racking with door closed.
 - (b) White and amber indicator lights provided at raise/lower control switch.
 - (c) Manual racking mechanism for emergency use.
 - (3) Racking-mechanism gear ratio: To permit one man to raise or lower breaker or rack it in and out manually in four minutes maximum.
 - (4) When breaker element is in fully-lowered or racked-out position, circuit breaker, complete with its operating mechanism, capable of being withdrawn from housing and moved on wheels integral with mechanism. Separate handling device for moving circuit breaker, other than transfer truck or fifth-wheel steering bar, is prohibited.
 - (5) Positive stops for preventing overtravel and guides for proper alignment of breaker.
- e. Grounding:
- (1) When breaker is in connected position, case and frame grounded by positive contact with ground bus.
 - (2) Breaker ground shoe designed to connect breaker frame to ground bus prior to engagement of primary-breaker terminals.
 - (3) Ground connection capable of carrying fault current equal to rated short-circuit current and related necessary capabilities.
- f. Interlocks: Provide suitable interlocks to perform the following functions:
- (1) Automatic discharge of stored-energy mechanism of the circuit breaker prior to its withdrawal from the unit.
 - (2) Prevent raising and lowering or racking in and out unless circuit breaker is in OPEN position.
 - (3) Prevent removal of vertical-lift breaker until it is entirely lowered.
 - (4) Prevent either electrical or manual operation of the breaker unless it is in the operating or test position.
 - (5) Automatically trip associated secondary main breaker when the primary breaker trips. This interlocking scheme does not prevent primary breaker from closing when associated secondary main breaker is open.

- g. Primary connection: Connection between the removable and stationary unit made by male-and-female contacts, with the following additional requirements:
 - (1) Silver-plated, high-pressure contacts.
 - (2) Automatic shutter to cover contact orifice when breaker is withdrawn and to uncover orifice when breaker is returned to connected position.
 - (3) Automatic shutters constructed to withstand force of racking mechanism in case shutters fail to open when breaker is racked into position.
 - h. Secondary connection: Control and interlocking-circuit connections between stationary and removable elements of switchgear made using device consisting of recessed stationary receptacle and set of self-aligning multiple-contact plugs on removable elements with sufficient number of contacts to accommodate control and interlock circuits, including spares, without resorting to auxiliary relays.
 - i. Non-resettable mechanical-operation counter registering one count for each circuit-breaker closing operation.
 - j. Mechanical position indicator, showing breaker as OPEN or CLOSED.
 - k. Auxiliary contacts for indicating CLOSED and OPEN position of the circuit breaker at remote location, with the following additional requirements:
 - (1) Dry contacts, minimum of one NC and one NO, rated 250 milliamperes at 250 volts or three amperes at 24 volts dc, wired to accessible terminal block.
 - (2) Contact resistance not to exceed 0.10 ohm in closed state when operating in circuit with open-circuit voltage of three volts dc and closed-circuit current of 10 milliamperes.
 - (3) Contact bounce not to exceed five milliseconds.
5. Current transformers:
- a. ANSI/IEEE C57.13, molded rubber or epoxy construction, wound-type transformer, complying with ANSI/IEEE requirements for relaying accuracy classification under burden imposed by devices specified. Minimum relay current transformer accuracy class is C-200. Mounted in a compartment isolated from the control panel. When approved by the Engineer, fully insulated, window-type current transformer may be used.
 - b. Quantity: Three.
 - c. Current ratio: As shown and determined by approved coordination study.
 - d. Insulation class:
 - (1) 13.8 kV with basic-impulse insulation level of 95 kV full-wave.
 - e. Capable of withstanding thermal and magnetic stresses from flow of current equal to the momentary and interrupting rating of the circuit breaker.
 - f. Maximum allowable-temperature rise under continuous full load above an average ambient temperature of 55C:
 - (1) By winding resistance: 30C.
 - (2) By hottest spot in winding: 40C.

- g. Transformer secondary neutral and frame individually grounded by copper wire to switchgear ground bus. Keep each ground connection run as short as possible. Avoid grouping such connections with control or other wiring.
6. Potential transformers:
- a. ANSI/IEEE C57.13, molded rubber or epoxy, one of the following configurations:
 - (1) Current-limiting primary fuses mounted on drawout carriage.
 - (2) Drawout transformer with integrally mounted fuses.
 - b. Quantity: One.
 - c. Connection:
 - (1) For 13.8 kV source: Phase-to-ground.
 - d. Voltage ratio:
 - (1) For 13.8 kV source: 14.4 kV to 120 volts.
 - (2) Insulation class:
 - (3) For 13.8 kV source: 13.8 kV with basic-impulse insulation level of 95 kV full-wave.
 - (4) Maximum allowable temperature rise under continuous full load above average ambient temperature of 55C:
 - (5) By winding resistance: 30C.
 - (6) By hottest spot in winding: 40C.
 - e. Install in switchgear so as to allow access from the floor without use of ladder.
2. Protective relays:
- a. General requirements:
 - (1) Semi-flush mounted, adjustable drawout relays each with test switches.
 - (2) Rustproof-metal rectangular cases finished in dull black.
 - (3) With targets, hand reset for targets and seal-in units.
 - (4) Contact and adjusting device readily visible, accessible and adjustable from front of relay.
 - (5) Designed, constructed and tested in accordance with applicable requirements of ANSI/IEEE C37.90.
 - b. Overcurrent relays:
 - (1) Three 50/51 phase-time and instantaneous-overcurrent relays and one 50N/51N residual ground-time and instantaneous-overcurrent relay for 34.5 kV service or three 50/51 phase-time and instantaneous-overcurrent relay and one 50N residual-ground instantaneous-overcurrent relay for 13.8 kV service, as appropriate.
 - (2) Exact characteristics and settings determined by manufacturer to provide necessary protection and coordination.
 - (3) Having very inverse time characteristics where protection and coordination permit.
 - (4) Relays set as low as practicable, time-dial setting and current tap, to provide fault protection and coordination with overcurrent device on associated secondary main breaker.
 - (5) Relays operating associated lockout relay as follows:
 - (a) 13.8 kV switchgear: Relays 50/51 and 50N.
 - (b) Voltage relay:
 - (6) For 13.8 kV source: One undervoltage/overvoltage (27/59), single-phase, time-voltage relay.

- c. One rotary, hand-reset, 125-volt dc lockout relay, equipped with green light for indicating reset position.
 - d. Auxiliary relays: Provided where required, General Electric Company Type HGA or HFA or equal, mounted inside instrument compartment.
 - e. Relay test equipment: One test set suitable for testing all solid-state relays furnished.
3. Circuit-breaker control switch: Heavy-duty, rotary, with red pistol-grip operating handle, switch position marked TRIP/NORMAL/CLOSE, with spring return to normal and indicator lights as follows:
- a. Red light: Circuit breaker is closed.
 - b. Green light: Circuit breaker is open.
 - c. Amber light: Circuit breaker is automatically tripped.
4. Test switches: Provided between instrument transformers and the protection relays as follows:
- a. One test switch on line side of overcurrent relays and lockout relay.
 - b. One test switch on line side of undervoltage/overvoltage relay.
5. Control panel: For relays, meters and control equipment, hinged panel of formed steel, with rolled edges and conveniently located handle for opening.
6. Line-voltage indicators: Three neon glow-tube, capacitance-coupled, high-voltage indicators, Airco Type RS or equal.
7. Surge arrestor:
- a. ANSI/IEEE C62.11, intermediate class with metal-oxide varistor construction, one per phase, mounted on line side of circuit breaker with the following requirements:
 - (1) For 13.8 kV source: Hubbell/The Ohio Brass Company Type PVI, Catalog Number 218613, or equal, with ratings as follows:
 - (a) Duty-cycle voltage kV, rms: 15.
 - (b) Maximum continuous operating voltage, kV, rms: 12.7.
 - (c) Insulation-withstand impulse test voltage, kV: 110.
8. Indicator lights: LED
9. Space heaters:
- a. Each unit of switchgear provided with 120-volt, single-phase, 60-Hertz heating element to facilitate drying and prevent condensation.
 - b. Heaters enclosed in grille guard with no sharp edges and located so that they are accessible for replacement without requiring de-energization of switchgear bus. Heaters controlled by thermostat adjustable from 40F to 80F. Panel ammeter, approximately 2-1/2 inches square, marked to indicate heater load. Thermostat set in accordance with manufacturer's recommendations.
 - c. Power and control circuits to heaters and thermostat connected and protected up to devices and to incoming junction box with 1/2-inch minimum size conduit. Heater-power junction box sized four inches square by two inches minimum and located at top of switchgear for top entry of minimum 3/4-inch conduit.
10. Instrument and control wiring: Instrument and control wiring including electrical interlocks and intercompartment wiring factory-installed in accordance with the following requirements:
- a. Wire: Copper conductor minimum 14AWG, insulation rated 600 volts, Type SIS or equal. Use flexible Class C or higher stranded, insulated copper wire for wiring across hinged joints.

- b. Use one continuous length of wire from terminal to terminal without splice or tap.
 - c. Install and connect removable-element control wiring in accordance with manufacturer's standards for circuit-breaker wiring.
 - d. Design and install control wiring so that trouble in one main circuit cannot be communicated to control wiring of another main circuit.
 - e. Make connections only at terminals of device, on terminal blocks or on control buses. Make wiring connections using insulated-shank ring-type terminals.
 - f. Terminate interconnecting wiring between cubicles and compartments on terminal blocks before wiring to components.
 - g. Terminal blocks: With washerhead screw-type terminals, circuit-marking strips for indicating control-wire number, phenolic laminated dust cover and 10-percent minimum spare terminal points.
 - h. For each wire, use corresponding identification on terminal-block marking strips and identify internal wiring at each termination, with same number as that shown on wiring diagram, using plastic sleeve.
 - i. External wiring:
 - (1) External control wiring to enter from bottom or top.
 - (2) Allow space to route and terminate external single-conductor or multiple-conductor control cable.
 - (3) Top entrances provided with removable coverplates for field-drilling of conduit and cable entrance holes.
 - j. Tests:
 - (1) Check wiring for accuracy, open circuits, short-circuits, ground connections and insulation integrity by means of high-potential, continuity and operational tests.
 - (2) Subject wiring to high-potential test of 1,500 volts to ground for one minute.
 - (3) Verify that wiring is in accordance with manufacturer's wiring diagrams. Check complete wiring, including interconnections at shipping breaks.
11. Enclosure:
- a. Dead-front, free-standing, indoor metal enclosure designed for lineup with 13.8 kV to 480Y/277-volt transformer.
 - b. Steel structure with framework of welded or bolted structural steel, free from distortion and welding strain and sufficiently rigid to support equipment under normal and short-circuit conditions.
 - c. Switchgear cubicles and circuit-breaker compartment equipped as follows:
 - (1) 13.8 kV enclosure:
 - (a) Front: Hinged door.
 - (b) Rear: Bolted cover with alignment pins or hinged door with padlock provisions.
 - (2) Bolted cover furnished with alignment studs and keyhole slots for positioning prior to bolting.
 - (3) Hinged front door in accordance with the following:
 - (a) Handle and three-point latch to hold door securely closed.
 - (b) Doorstop to hold door open.
 - (c) Structural reinforcing provided as necessary to prevent sagging of door.

- (d) Circuit-breaker compartment door designed not to hinder movement of breaker in and out of compartment when door is open and doorstop set.
 - (4) Circuit breaker cubicles to provide for interchangeability of removable circuit-breaker elements.
 - d. Transition compartment sized as necessary, with front and rear bolted covers to line up and coordinate with transformer.
 - e. Finish: Metallic surfaces degreased, primed and finished light-gray enamel, Color No. 61, ANSI Z55.1 in accordance with reference standard; two mils minimum dry-film thickness.
12. Nameplates:
- a. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless-steel rivets or screws. Vertical Gothic lettering using a round or square cutter. V-shaped groove is prohibited.
 - b. Provide nameplate on each switchgear showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable in accordance with reference standard.
 - c. Provide additional functional nameplates for each component.
 - (1) Each switchgear labeled with nameplate 1-1/2 inches high, inscribed in letters one-inch high: 13.8 kV METAL-CLAD SWITCHGEAR .
 - (2) Each switchgear compartment labeled with nameplate one-inch high, inscribed in letters 1/2-inch high: INCOMING LINE PRIMARY BREAKER or AUXILIARY COMPARTMENT, as appropriate.
 - (3) In addition to other information normally displayed on equipment, provide one-inch nameplate showing in letters 1/2-inch high switch positions, meaning of indicator lamp and other pertinent information.
13. Major components to be products of the same manufacturer.
14. Switchgear accessories: One set of the following accessories for each substation as applicable:
- a. One breaker test cabinet with provision for electrical operation of circuit breaker with control switch and provision for other accessories as necessary.
 - b. One transfer truck or fifth-wheel steering bar.
 - c. Crank for manually racking circuit breaker in switchgear cubicle.
 - d. One circuit-breaker maintenance lever.
 - e. One spare set of each type of high-voltage fuse.
 - f. One complete set of relay test plugs and relay test switch.
 - g. One set of special tools necessary for erection, operation and maintenance of switchgear including ones recommended by relay manufacturer including breaker secondary or control disconnect coupler.
 - h. Pegboard: Hardboard, AHA IS1, tempered, S1S, 1/4-inch nominal thickness, perforated, sized to accommodate all products specified in paragraphs 2.1 A.19.a. through 2.1 A.19.g. Framed with one-inch by one-inch hardwood. Frame and hardboard painted color selected by the Engineer. Include hardware for wall mounting and pegboard accessories suited to the products to be mounted. Provide nameplates as specified in paragraph 2.1 A.17. one-inch wide, with accessory names inscribed in 1/2-inch vertical letters.
 - i. 13.8 kV grounding, phasing and testing device: Designed to be inserted into the switchgear unit in place of and in the same manner as the circuit breaker removable elements, to permit grounding either the bus or the line, or making external connections to either the bus or the line for phasing purposes, testing purposes or both, with the following additional requirements.

- (1) Momentary and three-second current carrying capacities equal to or greater than those of the circuit breaker removable elements.
- (2) BIL rating: 95 kV.
- (3) Include a power-operated circuit closing device (grounding switch) so arranged with a gang-operated three-pole selector disconnect switch to effectively ground either the bus or the line when the device is inserted into the unit and closed, with the following additional requirements:
 - (a) Closing by means of a portable remote control push-button station mounted on the end of a 50-foot, four-conductor, flexible (class C Stranding) cable providing common, close, trip and ground conductors.
 - (b) Power obtained through the secondary disconnecting device in the switchgear unit.
- (4) Grounding device solidly connected to the switchgear ground bus in the operated or grounded position. Make provisions for padlocking in the grounded position.
- (5) No automatic tripping provided.
- (6) Provide suitable windows or transparent enclosure and barriers to permit visual observation of the position of all selector switch blades before the device is inserted into the stationary housing.
- (7) Fabricate steel panels from No. 11 USSG steel.
- (8) Connect the selector switch hinge end directly to the grounding switch.
- (9) Provide insulated covers for bolt heads used to attach insulated panel to the front of the device if not at ground potential.
- (10) External connections for testing made by insulated plug connectors for insertion in deep ports or wells accessible at the face of the device. One set of test ports connected directly to the bus. A second set of test ports connected directly to the line terminals.
 - (a) Mount ports on insulating material and provide closing shutters of like material.
 - (b) Provide separate closing shutter for each set of test ports; each shutter with provisions for padlocking in the closed position.
 - (c) Provide three test plugs or probes for each grounding, phasing and testing device for external connections.
- (11) The Contractor is responsible for obtaining approval of shop drawings and submittal including catalog data from electric utility company for the grounding, phasing and testing device prior to manufacturing. Make submittals to the Engineer for obtaining electric utility company approval.

2. 13.8 kV Metal-Clad Switchgear:

1. Rating for switchgear assembly:
 - a. Rated nominal voltage: 13.8 kV.
 - b. Rated maximum voltage: 15.0 kV.
 - c. Insulation level, 60 Hertz withstand: 36 kV, rms.
 - d. Insulation level, impulse withstand: 95 kV.
2. Potheads or terminators:
 - a. Provision for mounting one three-phase pothead or three single-phase terminators or cables terminated with stress cones furnished by 13.8 kV-

- source electric utility company (Potomac Electric Power Company) for incoming line connections and grounding.
- b. Short flexible connector installed between each pothead or terminator connecting lug and rigid bus. Where cables are terminated without potheads or terminators, provide two-hole NEMA drilling for cable terminal lugs furnished by 13.8 kV-source electric utility company and furnish cable support.
 - c. Pothead or terminator mounted in inverted position with incoming service cable at the top and connecting lugs below unless otherwise shown.
3. Primary circuit breaker:
- a. Type: Air-break or vacuum-break.
 - b. Rating on symmetrical basis:
 - (1) Nominal voltage class, kV, rms: 13.8.
 - (2) Nominal three-phase MVA Class: 750.
 - (3) Rated maximum voltage, kV, rms: 15.
 - (4) Rated withstand test voltage:
 - (a) Low frequency, kV, rms: 36.
 - (b) Impulse, kV: 95.
 - (5) Rated continuous current at 60 Hertz, amp, rms: 1,200.
 - (6) Rated interrupting-time cycles: Five maximum.
 - (7) Rated voltage-range factor (k): 1.30.
 - (8) Rated short-circuit current at rated maximum, kV, amp, rms: 28,000.
 - (9) Maximum symmetrical interrupting capability, amp, rms: 36,000.
 - (10) Closing and latching capability, amp, crest: 97,000.
4. Buses:
- a. General requirements:
 - (1) Copper bus bars of sufficient size to carry specified current without exceeding allowable-temperature rise stated in ANSI, NEMA and IEEE Standards.
 - (2) Capable of withstanding the mechanical stresses and heat from maximum short-circuit current.
 - (3) Bus connections bolted or welded. Contact surfaces of bolted connections silver-plated or tin-plated.
 - (4) Each joint having impedance not more than that of bus bar of equal length and clamped to maintain such impedance throughout life of equipment.
 - (5) Connection coordinated for proper mating with adjacent equipment terminals and enclosures. Provide flexible joint at transformer connection to avoid overstressing transformer or circuit-breaker insulators and coordinated with transformer-bushing locations. Flexible connection to be leaf or braid-type. Provide access plates for assembly and inspection of connections and joints.
 - b. Power buses: Three-phase, three-wire buses fully insulated with factory-installed, flame-retardant, nonhygroscopic, track-resistant insulation. Provide each bolted connection with minimum of four bolts equipped with palnut or equal and fully insulated.
 - c. Incoming-line bus device for connecting portable ground clamp:
 - (1) Connecting device consisting of copper bracket with 7/16-inch diameter bronze or copper rod positioned horizontally and parallel to rear of switchgear.
 - (2) Connecting device mounted near pothead on each incoming bus.

- (3) Connecting device to provide three-inch length between end supports of rod and minimum 2-1/2 inch radial clearance around rod.
 - (4) Connecting device accessible from rear of switchgear following removal of bolted cover or opening of padlockable door.
 - (5) Six-inch insulating barriers to be provided on each side of connecting devices or stirrups and extending to rear of switchgear a minimum of six inches all around.
 - (6) Size, thickness, insulating material and placement of insulating barriers designed to achieve adequate mechanical strength without compromising voltage withstand specified for switchgear.
 - (7) Design coordinated and approved by 13.8 kV-source electric utility company.
- d. Ground bus:
- (1) Copper bus, not less than two inches by 1/4-inch provided throughout length of switchgear section.
 - (2) In switchgear unit where power cables enter or leave switchgear at top as shown, copper ground bus not less than one inch by 1/8 inch extending from main ground bus to top of unit for grounding incoming cable-ground sheath or shielding tape by short connection to bus.
 - (3) Joints in ground bus made with two bolts minimum and overlap of four inches.
 - (4) Mechanical connector provided in each unit for field connection of 4/0 to 500 KCMIL ground cable to switchgear ground bus.
- e. Control bus:
- (1) 125-volt dc bus not less than 6AWG copper.
 - (2) One two-pole knife switch provided in switchgear cubicle for disconnecting control circuit.
 - (3) UL Class J or RK-5 fuses used for control and auxiliary-service protection.
 - (4) Closing circuit fused; tripping circuit unfused.
 - (5) White light mounted on control panel to indicate availability of dc control power.
5. Auxiliary cubicle:
- a. Indoor metal cubicle for installing metering transformers, design coordinated with 13.8 kV-source electric utility company.
 - b. Separate compartment for mounting two 15 kV current transformers furnished by 13.8 kV-source electric utility company, with the following additional requirements:
 - (1) Current transformer accessible through sealable hinged door. Bolted access plates prohibited.
 - (2) Connection between bus and current transformer of same size and current rating as that of main bus.
 - (3) Compartment sized and arranged so that current transformer can be readily removed or replaced after cubicle is installed as integral part of switchgear assembly.
 - c. Separate compartment for mounting two 14,400/120-volt potential transformers furnished by 13.8 kV-source electric utility company, with the following additional requirements:
 - (1) Equipped with sealable hinged door. Bolted access plates prohibited.

- (2) Fuse clips one-inch long, mounted on 11-1/2 inch centers for accommodating fuse size 1-9/16 inch diameter ferrules and 12-7/8 inches long.
 - (3) Provide silver-plated contact designed to provide adequate contact pressure.
 - (4) Drawout carriage designed so that contacts are disconnected and visibly grounded before fuses become accessible for checking or replacement.
 - (a) Sealable in closed and operating positions.
 - (b) Equipped with high-voltage connectors and fuse clips.
 - (5) For grounding cases of transformers, one connection extended from ground bus to the potential-transformer compartment.
 - (6) Compartment designed to provide access to potential transformers from the floor without use of ladder.
- d. One 10-inch square by six-inch deep pull box for secondary connecting of electric utility company metering transformers, with the following additional requirements:
- (1) Equipped with two 1-1/2 inch conduits, one to current-transformer compartment and one to potential-transformer compartment.
 - (2) Provision for installing one 1-1/2 inch conduit from pullbox to electric utility company metering panel.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install switchgear in position as shown and in accordance with manufacturer's recommendation and the NEC.
- B. Install conduit, raceways, boxes and cabinets as shown and in accordance with Section 16130.
- C. Make power-cable and control-wire connections as shown and in accordance with Section 16125.
- D. Make grounding connections as shown and in accordance with Section 16060.
- E. Make arrangements with applicable electric utility company for making connections with incoming lines.
- F. Use services of manufacturer's engineering representative for assistance in field assembly, installation and testing of the switchgear in accordance with Section 16360.
- G. Connect space-heater circuit to prevent condensation during installation.
- H. Install breaker test cabinet and connect it to 125-volt dc supply.
- I. Install pegboard at location approved by the Engineer. Mount switchgear accessories and associated nameplate on pegboard.

J. Install wire, cable and busways in accordance with Section 16120.

3.02 FIELD QUALITY CONTROL:

A. Switchgear Field-Testing and Inspection: As specified in Section 16360.

END OF SECTION

SECTION 16341

1.02 QUALITY ASSURANCE

- A. Comply with the requirements of Section 01470

PART 2 - PRODUCTS

2.01 DC SWITCHGEAR

- A. Except as hereinafter specified, the shop dc switchgear and switchboards shall be designed, constructed and tested in accordance with the requirements of ANSI C37.14 and ANSI C37.20 and shall include all features and accessory equipment specified therein. Supervisory control and indication, automatic reclosing equipment, remote indication, automatic reclosing equipment, impulse trip devices and lightning arresters will not be required. The switchgear shall include the ground relaying and lockout relay, ammeter shunts, and ammeters. The circuit breaker which feeds the shop dc switchboard shall be equipped with a key interlock which shall permit the closing of the circuit breaker in the connected position only when the front doors of the compartments of the shop dc switchboard are closed. The key shall be retained in the breaker when the breaker is in the connected position and closed.
- B. The DC feeder breaker shall be manufactured by Control Power Corporation (Type HSNP) or by Whipp & Bourne (Type MM74) or approved equal, with the following requirements:
 - 1. When subjected to electric arc, emission of conducting materials from insulating structure limited so as not to interfere with performance of circuit breaker.
 - 2. Power circuit breaker compliant with NEMA SG3, ANSI/IEEE C37.14, ANSI C37.16/16a, C37.17. Single-pole, single-throw, air break, high-speed, drawout type, with electrically controlled solenoid closing, mechanically latching, and electrically controlled tripping, mechanically and electrically trip-free, complying with applicable parameters in Table 11 of ANSI C37.16a and with the following additional requirements. For the purposes of this specification, a single-pole breaker constitutes a switching device with a single current path and a single arcing path during current interruption
 - a. Nominal voltage: 750 Volts dc.
 - b. Rated maximum voltage: 800 Volts dc.
 - c. Insulation dielectric withstand: 4200 Volts.
 - d. Short-circuit interrupting capacity: 200 kA. In addition complying with rated peak current and short-time current ratings in Table 11, ANSI C37.16a.
 - e. Operation counter: Non-resettable with at least four digits for recording trip operations.
 - f. Endurance: Electrical and mechanical endurance performance not less than requirements in ANSI C37.16 table 14.
 - g. Control voltage:

- 1) 125 Volts dc nominal, individually fused.
 - 2) Upon loss of control voltage, circuit breaker shall automatically open. The under voltage release mechanism shall be designed and rated to operate at 135V DC continuously without overheating.
- h. Racking mechanism: The circuit breaker alignment, shutter mechanism and racking mechanism are considered an integral part of the circuit breaker. There shall be adequate clearance between equipment of the circuit breaker element and all equipment mounted on the switchgear enclosure. The racking mechanism shall be designed and constructed for moving the breaker between three (3) positions : the disconnected, test and connected positions. Clockwise rotation of the racking mechanism shall result in breaker movement toward the connected position and when in the fully racked-in connected position the racking mechanism shall turn freely. Counterclockwise rotation of the breaker racking mechanism shall result in breaker movement from the connected to the test and then to the disconnected position. The racking mechanism shall be a manually operated closed-door mechanism, designed to prevent over-travel, and equipped with guides for alignment of the breaker with a stationary unit and an indicator to show breaker position within the compartment. Use of an electro-mechanical toggle device for racking mechanisms will not be permitted. An inertia block device shall be installed in the cubical to absorb the force of the circuit breaker being inserted.
- i. Connected position: Both primary disconnect device and secondary disconnect device in full contact, breaker ready for normal operation.
- j. Test position: Primary disconnect device open and separated by a safe distance, secondary disconnect device in full contact.
- k. Disconnected position: Both primary disconnect device and secondary disconnect device open and separated by a safe distance.
- l. Primary connection (main disconnects): Connections between the removable and stationary unit made by male-and-female contacts, with the following additional requirements:
- 1) Silver-plated, high pressure contacts.
 - 2) Automatic shutter to cover the contact orifices when the breaker is withdrawn and uncover the orifices when breaker is returned to connected position.
 - 3) The racking mechanism gear ratios shall be designed in combination with the design of the shutters covering the main stationary disconnect, such that the shutters can withstand the force of the racking mechanism if the shutters fail to open as the breaker is racked in.
- m. Secondary connection (control and auxiliary disconnects): Control and interlocking circuit connections between stationary and removable elements of switchgear made using device consisting of recessed stationary receptacle and set of self-aligning contacts to accommodate control and interlock circuits, including spares, without resorting to auxiliary relays.
- n. Auxiliary switch contacts: Operated by breaker mechanism in both the connected and test position with sufficient number of contacts for operation, indication and interlocking of the breaker together with at least four spare sets of reversible contacts, each wired through secondary disconnect device contacts to accessible terminal blocks.
- o. Shunt trip device for 135 VDC operation.
- p. Electrically operated, mechanically latched, electrically and mechanically trip free, non-pumping, quick make, quick break mechanism insuring full contact pressure until the time of opening with following additional requirements:
- 1) Voltage requirement.

- a) Closing by means of closing solenoid mechanism and coil capable of operation from 90-140 Volts dc.
- b) Tripping by means of tripping solenoid mechanism and coil capable of operation from 70-140 Volts dc.
- 2) Equipped with mechanical device on front of breaker, available with door closed, to manually (without electrical power) actuate tripping operations and with indicator, visible with door closed, to show open or closed condition. Operable in the disconnected, test and connected positions.
- q. Arc chute: The arc chute shall be comprised of a number of vertical steel arc splitter plates designed to confine and direct the arc and break the arc into a number of smaller arcs which are cooled and extinguished as the arcs move toward the top of the plates. Sucker Loops are to be included in the metallic splitter plates. Splitter plates are to be insulated at the extremity to ensure that the arcs are extinguished. The arc chute is to be constructed to prevent the escape of arc plasma and the emission of metal from beneath the arc chute. The manufacturer shall demonstrate to the satisfaction of the Authority that the design of the switchgear does not result in operation of Energized Structure Relay or Grounded Structure Relay under fault openings, and that a voltage is not impressed on control wiring under fault conditions. The design of the switchgear and associated control and relaying equipment shall ensure against breakdown of insulation to ground for all fault conditions.
- r. Main contacts: Surfaced with silver, nonwelding silver alloy or equivalent combining high conductivity and necessary arc-resistant properties.
- s. Integral wheels for moving a circuit breaker element in and out of a cubicle and sized to carry breaker weight without deforming or cutting into the concrete or amazite surface. Plastic wheels are not acceptable. The wheels shall roll (not slide) and guide the circuit breaker between full length guide bars to align the circuit breaker element to engage the racking mechanism. No lifting devices shall be permitted to lift the circuit breakers in and out of its switchgear cubicle.

C. Series Trip Device

- 1. The circuit breaker shall be provided with direct acting forward and reverse current series trip device, adjustable between 75 percent and 300 percent of the circuit breaker continuous and current ratings.

D. Lock-Out Relay

- 1. The shop dc switchgear shall be furnished with a lockout relay, whose function shall be to trip and lockout the air circuit breaker.

E. Grounding Relays

- 1. The shop dc switchgear shall be provided with a high resistance ground relay, connected between the dc switchgear enclosure and ground which shall detect any accidental grounding of either the dc switchgear metal enclosures or the switchboard. The switchgear and the switchboard will be bonded together and both will be insulated from ground except through the high resistance ground relay. The high-resistance ground relay shall be provided with auxiliary contacts to permit installation of a local annunciator. The ground relaying network shall be fail-safe so that if its own circuit should malfunction, an annunciator is initiated. The switchgear and switchboard shall be provided with a "hot structure" ground relay, connected between the dc switchgear/switchboard enclosures and ground and which shall detect any part of the metal enclosures which may become energized. The "hot structure" ground relay shall be provided with auxiliary contacts connected to the dc switchgear look-out relay to initiate tripping and lock-out of the dc circuit breakers in

the switchgear. The ground relaying network shall be fail-safe so that its own circuit should malfunction, an annunciator is initiated.

2.02 DC SWITCHBOARD

- A. The shop dc switchboard shall be a dead front, free-standing, metal enclosed assemble, suitable for indoor service. The switchboard shall contain dc positive bus and bus connections, fusible branch circuit switches, and terminal connectors and all other auxiliary equipment and devices required. Shipping sections including shipping skids shall be of sufficiently small size to facilitate installation during construction, and subsequent maintenance/replacement by WMATA forces without demolition of structural or finished components of the completed shop buildings.
- B. Switchboard Service
 - 1. The switchboards shall be used to supply power to stingers and car receptacles at 750V dc. Ambient temperature will not exceed 40°C.
- C. Switchboard Standards
 - 1. Except as otherwise noted herein, the switchboard shall be designed, constructed and tested in accordance with the applicable provisions of ANSI Standard C37.20 and its supplements a, b and c (IEEE Standard No. 27) "Switchgear Assemblies Including Metal Enclosed Bus".
- D. Switchboard Ratings
 - 1. The switchboard shall have the following ratings from ANSI C37.20.
 - a. Rating Nominal Voltage 750 volts dc
 - b. Rating Maximum Voltage 800 volts dc
 - c. Insulated Test Level 2,775 volts dc
 - d. Withstand 3,900 volts dc Short Circuit Rating
 - e. Peak 75,000 amperes
 - f. Steady-State 75,000 amperes
 - g. Rate-of-rise 2,000,000 amperes per second
 - 2. Continuous Current Ratings - As indicated.
 - 3. The switchboard assembly, including all components, shall be designed to safety withstand the available short circuit currents without damage.
- E. Switchboard Enclosures
 - 1. Metal enclosed switchboard structure shall be rigid, self supporting, self contained steel, constructed in accordance with ANSI C37.20 "Standards for switchgear assemblies including metal-enclosed bus". Each branch feeder switch shall be fully compartmentalized so that they permit isolated access while serving load and confine faults to a single compartment. All switches shall be externally operable. The nominal height of the switchboard shall not exceed 90 inches. The enclosure shall be insulated from and anchored to a concrete floor which shall be covered by an insulating topping. (Leveling channels will not be furnished). The supplier shall provide the means for insulated anchoring to the finish floor. Wherever the switchboard enclosure is less than three feet from any vertical building surfaces such as a wall or column, the Contractor shall form sheet insulation of a non-hygroscopic type required to insulate the vertical building surfaces to a height of nine feet above the floor. A 2500 volt 60 Hz high-potential insulation test will be given to the insulation between enclosure and ground and also between the surface of the wall insulation and ground, upon completion of installation.
- F. Design
 - 1. The switchboard shall be designed and arranged to provide convenient access to all

components for normal operation and maintenance. The switches and fuses shall be accessible from the front of the switchboard, but they shall be enclosed behind full height front doors. The front doors shall be full height, not more than 36 inches wide, with viewing windows so that the positions of the switches will be visible without opening the doors. The front doors shall be key-interlocked with the dc main circuit breaker so that the doors cannot be opened without the insertion of a key, which shall be available from the circuit breaker only when the breaker is open. The key shall be retained in the front door until the door is closed and locked to prevent closing of the circuit breaker with the door open. The front doors shall be designed so that they can be closed and locked when the switches are either open or closed. The buswork and cable connections shall be accessible from the rear of the switchboard. The rear of the switchboard shall be provided with removable covers.

G. Branch Circuit Switches

1. Each branch switch shall be single pole, non-load break with current limiting fuse. The fuse compartment shall have a hinged door interlocked with the handle so the door cannot be opened while the switch is in the "ON" position. Provisions shall be provided to padlock the switch in the "Off" position.
2. Branch Circuit switches and fuses supplying power to the stingers shall be rated at 600 amperes at 750V dc. Branch circuit switches supplying power to receptacles shall be rated at 150 amperes at 750V dc.

H. Terminal Connectors

1. The combination switches shall be provided with solderless terminal connectors for outgoing cables. Connectors shall be of the long barrel, double indentation, compression type. The connectors shall be of one piece tubular construction formed of pure electrolytic copper and tin-plated to resist corrosion.

I. Nameplates

1. Each switch shall be provided with a circuit identifying nameplate. Nameplates shall consist of three-ply laminated phenolic plates (21/2"x 61/2") engraved through black face to white core. Lettering shall be 1/2 high condensed vertical gothic using a rounded or square cutter. V-shaped grooves are not acceptable. Nameplate legends shall be as follows:
 - a. DC STINGER NO. 1 (etc.)
 - b. DC RECEPTACLE POWER - NO. 1 (etc.)

J. Incoming Line Section

1. The DC switchboard shall be provided with an incoming line section which shall include provisions for the connections of incoming feeders (cables, or bus, as required.) Cable connectors shall be of the long barrel, double-indentation, compression type. The connectors shall be of one piece tubular construction formed of pure electrolytic copper and tin-plated to resist corrosion. Connectors shall be NEMA standard.

K. Ground Relaying

1. The switchboard enclosure shall be insulated from ground. The enclosure will be bonded to the dc switchgear, so that the switchgear-mounted ground and hot structure relays shall monitor and protect the switchboard, as well as the switchgear, from accidental grounding and accidental energizing of the enclosure.

L. Dc Bus and Bus Connections

1. The dc switchboard bus shall be made of electrical conductivity, high quality copper or aluminum of sufficient size to limit the temperature to 55 degrees C. The switchboard bus shall be adequately braced and supported to withstand mechanical forces exerted during short circuit conditions. All connections shall be tightly bolted.

M. Testing

1. The dc distribution switchboard shall be tested with fuses in place and shall withstand for one minute, without breakdown, a 60 cycle alternating potential of 3.7 times the maximum rated voltage. The switchgear shall also withstand for one minute, without breakdown, a direct current test voltage of 5.2 times the maximum rated voltage.
2. The test potential is to be increased gradually from zero until the required test value is reached and is to be held at the value for one minute.

END OF SECTION

SECTION 16360

UNIT SUBSTATIONS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing substation equipment for 13.8 kV primary service.
- B. Related Work Specified Elsewhere:
 - 1. Wire connection accessories: Section 16125.
 - 2. Grounding and bonding: Section 16060.
 - 3. High-voltage switchgear: Section 16320.
 - 4. Low-voltage switchgear and switchboard: Section 16435.
 - 5. Transformers: Section 16270.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
 - 2. NEC.
 - 3. ANSI/IEEE: 141.
 - 4. IEEE: C57.93, C57.94.
- B. Main Components for Substation: Produced for assembly as specified, factory-coordinated and tested before delivery to job site as follows:
 - 1. 13.8 kV metal-clad switchgear 13.8 kV to 480Y/277-volt transformer: For in-line assembly.
 - 2. 480-volt switchgear and switchboard: For assembly of various sections as integral unit for in-line assembly with transformer where shown.
- C. Qualifications of Instructor for Operation and Maintenance Training: Qualifications will be considered adequate when either of the following is met:
 - 1. Designer of the system is the instructor and has the ability to communicate facts about the system in understandable terms.
 - 2. Instructor has been trained in teaching methods and is familiarized fully with the subject matter.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings: In accordance with Table 16360-1.
 - 1. Submit shop drawings for high-voltage switchgear to electric utility company as applicable for the service area, for coordination and approval by the power company.
 - 2. Submit to the Engineer shop drawings approved by the power company as well as shop drawings for complete unit-substation equipment.
- B. Certification.

- C. Documentation:
1. Short-circuit calculations and system coordination study for system protection and selective overcurrent tripping:
 - a. In accordance with ANSI/IEEE 141 for fault calculations and coordinated system protection.
 - b. Include high-voltage source, relays, fuses if used, on high-voltage switchgear, transformer, low-voltage switchgear, molded-case circuit breakers for low-voltage feeders in switchboards, panelboards, motor control centers and motor starters.
 - c. Available short-circuit currents based on power company contribution of 750 MVA for 13.8 kV service and actual motor contribution at low-voltage switchgear but not less than 25 percent of transformer kVA rating for motor contribution if the actual is less.
 - d. Recommended settings and adjustment of protective devices.
 2. Field-test plan and documentation:
 - a. Submit field-test plan within 60 days after award, with accompanying documentation in the form of test-data recording sheets and list of proposed test equipment.
 - b. Do not proceed with testing until plan and documentation are approved.
 - c. Indicate in scope of test plan how equipment will be tested to ensure safe and orderly transition from installation, through initial energizing, to specified field-testing.
 - d. Accompanying documentation to include standard data-recording sheets as used in manufacturer's in-plant testing of equipment and devices or as used by major utilities or large industrial users of specified equipment. Submit certified copies of test data, indexed by substation, within two weeks after completion of testing.
 - e. Verify schematic diagrams for proper operation. Submit one complete set of certified yellow-line schematics at time of initial energizing of equipment. Schematic diagrams to indicate verification and tests of functional and protective devices. Indicate each circuitry correction or modification in red-line.
 3. Instructor qualifications: Five copies of resume which outlines each instructor's qualifications and skills not later than 180 calendar days prior to commencement of training.
- D. Operations and maintenance training material: Five copies not later than 180 calendar days prior to commencement of training.
- E. Operation and Maintenance Manuals: In accordance with Table 16360-2.

1.04 OPERATION AND MAINTENANCE TRAINING:

- A. Perform operation and maintenance training in accordance with the General Requirements and the following additional requirements for development and performance of operation and maintenance training for unit substation.
- B. Use only instructors who are fully qualified for their presentations as required above under Quality Assurance.
 1. Concept of Training: Design classroom and field instruction to cover in detail the functions of each item of equipment. Cover fault isolation and troubleshooting

technique to the extent necessary to permit a technician to diagnose and repair faulty modules. Design instruction to provide Authority maintenance personnel with practical experience in the performance of preventive and corrective maintenance. Provide troubleshooting and fault isolation of simulated faults for each item of equipment in the unit substation.

2. Develop and provide all operation and maintenance training necessary for Authority-designated personnel to support the power equipment. Have classroom instruction include not only the anatomy and functioning of the parts under discussion, but the essentials of their routine care, including lubrication schedules, adjustments, limits, test frequency, inspection frequency, troubleshooting, removal and replacement. Have instruction cover theory of operation of the power systems, individual modules and special protective circuits. Use software flow diagrams in order to show sequence of events and timing of system operations.
3. Have the course include hands-on troubleshooting of all subsystems. Allot students adequate time for performing preventive-maintenance operations on the equipment in addition to troubleshooting "bugged" system.
4. In training, assume the Authority's employees have no knowledge of the features of the new equipment. The Authority is permitted to videotape all class presentations.

C. Training Methods and Materials:

1. Develop first-generation reproducible training material.
2. Conduct training using final manuals approved by the Authority and certified by the Contractor as being correct, as-built and reproducible. These materials become the property of the Authority at the end of program.
3. Develop and furnish the following training materials for each course for the Combined Training Program:
 - a. Instructor material for each course.
 - b. Course outline: Course outline with learning objectives. Include a topic outline for each item of equipment. Include in maintenance courses a section devoted to system-fault analysis and troubleshooting. State the learning objectives for each topic.
 - c. Lesson plans: A set of lesson plans for each item of equipment, corresponding to the topic outline, and containing the following information:
 - (1) Lesson title.
 - (2) Time.
 - (3) Objectives.
 - (4) Training aids required.
 - (5) Instruction sequence (outline).
 - (6) Tests.
 - (7) Summary.
 - d. Training aids: For each topic, develop optimum use of visual aids, including transparencies size 8-inch by 10-inch, 35-mm slides, films, and mockups. Provide approved shop drawings in transparency.
 - e. Instructional material: Use the applicable equipment operation and maintenance manuals as the primary source of instructional material. In addition, develop notebooks for each course containing such additional drawings, descriptive information and procedures necessary to ensure that the learning objectives are met in an orderly and timely manner. Arrange notebook material by each item of equipment and sequence according to the topic outline.
 - f. Course topic outlines and schedules: Have the topic outline and schedules for each course contain the following:.

- (1) Description of course including course objectives and type of training, Level One, Level Two or Level Three.
 - (2) Course length and recommended numbers of students per course.
 - (3) List of training materials required including documentation and equipment.
 - (4) For each topic outline for the course, a topic objective and the time allotted to the topic.
 - (5) Schedules listing the major topics and subtopics on a time allocation for each topic.
- g. Instructor and training aids: Have the instructor guide for each course include:
- (1) Table of contents listing each topic and the time allotted.
 - (2) List of applicable documents.
 - (3) List of training materials.
 - (4) Course learning objectives, course length and recommended number of students.
 - (5) Provide each topic with a cover sheet listing topic, objective, time allotted and training aids required.
 - (6) Include training aids with the instructor guides.
- h. Students handouts: Reproduce diagrams, drawings and procedures from engineering data and manuals and include them in student handout.
- D. Instructional Equipment: Conduct training utilizing installed equipment in normal operating conditions, except use maintenance training-lab equipment for shop and maintenance instruction.
- E. Training Program:
1. Include the following:
 - a. Level One - Equipment-Operating Training Course: Conduct this course for Authority-designated personnel; providing training for equipment operation and troubleshooting, and basic theory of operation of each piece of equipment. In handouts include specific check lists on each piece of power equipment.
 - b. Level Two - Field-Maintenance Training Course: Conduct this course for Authority-designated personnel; emphasizing preventive maintenance, as well as location and correction of faults and equipment failures. Present sufficient training in operation, theory of operation and fault isolation to isolate problems to modules on subassemblies. Stress use of the maintenance manuals to help identify faults.
 - c. Level Three - Shop-Maintenance Training Course: Conduct this course for Authority-designated personnel; providing in-depth training on theory of operation of the systems, individual components, each subassembly (including Contractor-designed, off-the-shelf OEM and other vendor-supplied assemblies), special test equipment; shop test procedures, module and printed circuit board, all replacement and troubleshooting procedures to the circuit-board level, overhaul and testing procedures, operations procedures, and preventive-maintenance procedures. Provide information drawings, including schematics, bills of material and other material required to troubleshoot to the component level.
 2. Supplemental Training: In the event Contractor changes or performs modifications to equipment subsequent to the training that impact form, fit or function; provide supplementary training to the Authority's training instructor on a one-time basis.

- F. Scope: The following number of Authority personnel will attend the training program:

Course Title	Length of Course Hours	Number of Students Per Session	Number of Courses	Number of Course Hours
Field Maint.	80	6	2	160
Shop Maint.	40	8	1	40

1. Provide practical training on equipment for not less than 60 percent of the course duration.
 - a. Location: Conduct training classes at facilities provided by the Authority.
 - b. Times: Set class times at the convenience of the Authority.
2. For Level Two - Field-Maintenance Training Course, the Contractor may propose four courses at 40 hours each in lieu of two courses at 80 hours each subject to approval.

G. Equipment:

1. Training equipment: Supply and deliver to the Engineer special tools required for maintenance training.
2. Test equipment: The Field-Level maintenance training requires students to use test equipment provided by the Contractor. The Shop-Level maintenance training requires students to use test equipment provided by the Contractor.
3. Service equipment: Prior to final turnover to the Authority, furnish and install the following for substation maintenance equipment:
 - a. 72" x 36" x 36" heavy-duty metal storage cabinet with four-shelf arrangement.
 - b. Eight-foot fiberglass step ladder.
 - c. Full set of approved, half-size electrical and equipment shop drawings, bound in stiff cover resistant to oil, water and wear. Make drawings capable of being stored in the metal cabinet.
 - d. Wall-mounted Maintenance Map/Single Line Diagram. Use frame made of metal with lexan or plexiglass. Mount frame as directed.
 - e. 30" x 48" x 34"-high heavy-duty metal work bench with task stool, reinforced steel top, 1/4-inch thick rubber matting covering entire top, and one 12-gauge steel shelf for full width and depth of bench with back turned up two inches.

1.05 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Deliver and handle equipment as specified.
- B. Store equipment in secure and dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. High-Voltage Switchgear: Section 16320, kV rating, type and quantity as shown.
- B. Low-Voltage Switchgear and Switchboard: Section 16435, quantity as shown.

- C. Transformers: Section 16270, voltage rating, type and quantity as shown.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install substation equipment at location shown in accordance with manufacturer's recommended installation procedure, the NEC and as follows:
1. Install high-voltage switchgear in accordance with Section 16320, low-voltage switchgear in accordance with Section 16435 and transformers in accordance with Section 16270. Arrange and connect the switchgear and the transformers as shown.
 2. Make power-cable and control-wire connections as shown and in accordance with Section 16125.
 3. Make grounding connections as shown and in accordance with Section 16060.
 4. Interconnect secondary of two substations to form secondary selective network as shown. In combined switchboard room, use bus duct for secondary tie feeder.
 5. Arrange with electric utility company for providing primary service to switchgear and coordinate incoming-service termination details.
 6. Apply touch-up paint where necessary.
- B. Manufacturer's Engineering Representative:
1. Arrange for assistance of manufacturer's engineering representative during field-assembly, installation and adjustment of substation equipment.
 2. Initial energizing of each substation to be under guidance of manufacturers' engineering representative who will advise Authority personnel on step-by-step procedure.

3.02 FIELD QUALITY CONTROL:

- A. Field-Testing and Inspection:
1. General requirements:
 - a. Conduct field-testing and inspection at each ac-switchboard room to ensure proper operation of equipment provided
 - b. Relays and trip-device setting: The Contractor is responsible for setting protective relays and trip devices in accordance with approved coordination study and their calibration for proper operation during field-testing.
 2. Field inspection:
 - a. Prior to field-testing, check equipment installation in accordance with manufacturer's recommendations and ANSI/IEEE 141 including, but not limited to, verification of the following:
 - (1) Integrity of bus insulation.
 - (2) Tightness of connections.
 - (3) Adequate support of busbars.
 - (4) Correct grounding, anchoring and alignment of switchgear in accordance with manufacturer's drawings.
 - (5) Ease of racking drawout breakers in and out of cubicle.
 - (6) Physical interchangeability of similar circuit breakers.
 - (7) Adjustment of circuit-breaker contact.
 - (8) Functioning of interlock and closing of safety shutter with breaker in disconnect or withdrawn position
 - (9) Transformer installation in accordance with IEEE C57.93 and C57.94.

- (10) Verify mechanical clearances and proper operation of disconnecting and grounding devices associated with potential transformers.
- (11) Tightness of bolted bus joints by calibrated torque-wrench method, based on manufacturer's recommended values.
- (12) Ground-fault system:
 - (a) Inspect for physical damage and compliance with approved shop drawings. Verify location relative to sensors of main neutral-to-ground bus disconnect link and avoidance of multiple ground connections in combined-switchboard rooms.
 - (b) Inspect control-power transformer to ensure adequate capacity for system.
 - (c) Inspect zero-sequence system for symmetrical alignment of core-balance transformers about current-carrying conductors.
 - (d) Verify by device operation, ground-fault device circuit nameplate identification.
- (13) Calibrate protective devices/relays and set them in accordance with approved coordination study.

3. Field-testing:

- a. Furnish equipment required to perform tests.
- b. Provide services of manufacturer's engineering representative and supporting field crew for a period not less than three man-days. Conduct tests in the presence of the Engineer. For each item, submit for approval and perform approved tests including, but not limited to, those specified.
- c. Perform insulation-resistance test of 60-second duration in accordance with the following requirements:
 - (1) Test voltage:

Voltage Rating	Test Voltage
150 - 600 volts	1,000 volts
601 - 5,000 volts	2,500 volts
Above 5,000 volts	5,000 volts

- (2) Insulation resistance: kV rating plus one megohm but not less than minimum value recommended by manufacturer.
- (3) Do not perform dielectric-withstand test unless insulation resistance is equal to or greater than minimum value specified.
- d. For high-voltage switchgear, low-voltage switchgear and switchboard:
 - (1) Perform insulation-resistance test between phase-to-phase and phase-to-ground.
 - (2) Test grounding conductors and enclosures for continuity to room ground bus.
 - (3) Test protective relays and trip devices, except power fuses in accordance with ANSI/IEEE 141 procedures, modified as necessary, for compliance with approved coordination study.
 - (4) Test operation of each circuit and control in accordance with approved sequence.
 - (5) Test interlock system as follows:
 - (a) Make closure attempt on locked open devices.

- (b) Make opening attempt on locked closed devices.
- (6) Dielectric-withstand tests: Perform dielectric-withstand test of 60-second duration on entire assembled and erected switchgear and switchboard lineup using 60-Hertz voltage level as specified. Perform tests in accordance with reference standards and as follows:
 - (a) 13.8 kV switchgear: 27,000 volts rms.
 - (b) 480-volt switchgear and switchboard: 2,500 volts rms.
 - (c) Control wiring: 1,500 volts rms.
- (7) Test current-transformer circuits for polarity, ratio and protective-device operation by secondary-injection method.
- (8) Test potential transformer ratio and polarity.
- (9) Perform functional tests on control, interlocking, blocking and supervisory circuits, including verification of interconnections between equipment and interface points which have been installed by others. Verification of these tests to be substantiated by lined-in schematics and signed by the Contractor and the Engineer.
- e. Distribution transformers:
 - (1) Perform insulation-resistance test between winding-to-winding and winding-to-ground. Correct resistance value to temperature.
 - (2) Test transformer shell and neutral terminal for continuity to ground bus.
 - (3) Perform ac high-voltage test between high-voltage winding and ground and low-voltage winding and ground. Perform test at 75 percent of factory test voltage for 60-second duration.
 - (4) Test voltage ratio for full-winding and taps. Test result not to deviate more than 0.5 percent from calculated ratio. Set transformer tap as directed.
 - (5) Check polarity or phase relation.
 - (6) Check contacts of dial-type thermometer for indicating normal and overtemperature condition of transformers at remote location and to initiate tripping of associated essential main-feeder breaker or primary breaker as appropriate under abnormal temperature conditions. Set thermometer contacts in consultation with manufacturer, as necessary.
 - (7) Transformer for outdoor use:
 - (a) Test transformer for oil leaks in accordance with IEEE C57.93.
 - (b) Test samples of insulating liquid from top and bottom of tank.
 - (c) Test to verify that dielectric strength is not less than 22 kV for mineral oil.
- f. Substation busway:
 - (1) Where directed, test resistance of busway connections. Resistance not to exceed value recommended by manufacturer.
 - (2) Test insulation resistance to ground and between insulated busbar.
 - (3) On busway showing insulation resistance of less than one megohm, perform high-potential test of 60-second duration at 2,200 volts, rms.
 - (4) Check phase rotation and phase crossing on buses when energized from either source.
- g. Ground-fault systems:

- (1) Insulation resistance: Remove neutral-ground disconnect link and measure system neutral insulation resistance to ensure that no shunt ground paths exist. System neutral insulation to be 10,000 ohms minimum, preferably one megohm or greater. Reinstall link.
 - (2) Determine relay pickup current by primary injection at sensor and operation of circuit interrupting device. Pickup current to be within ten percent of device setting.
 - (3) Test relay timing by injecting 150 percent and 300 percent of pickup current into sensor. Relay timing to be within manufacturer's published time-current characteristic curve.
- h. Proof of compliance:
- (1) If testing indicates failure to comply with specified requirements, replace, correct or modify equipment so that it does comply.
 - (2) Conduct additional tests witnessed by the Engineer to prove compliance with specified requirements.

B. Field-Testing Personnel:

1. Provide services of qualified manufacturer's engineering representatives to perform specified field-testing program.
2. When more than one representative is involved, the Contractor is responsible for coordination of testing effort.
3. Provide engineers, technicians and journeymen as necessary to set up and implement testing.

C. Authority Tests:

1. The Authority reserves the right to require the Contractor to conduct acceptance tests of sound level on each transformer unit at each passenger station within one year after installation.
2. In order to perform sound-level tests, the Contractor may recreate test conditions of applicable standards to the extent possible without disturbing existing structure or installed equipment or materials.

THIS SPACE NOT USED

D. Submit certified test reports.

TABLE 16360-1 SCHEDULE OF SHOP DRAWINGS REQUIREMENTS			
Item	Requirements	Submit (a)	Within Days (b)
1.	Outline dimensions, including weights and foundation requirements for equipment furnished.	X	90 (c)
2.	Front views, floor plans, and mounting details for equipment furnished.	X	90 (c)
3.	One-line diagrams	X	120 (c)
4.	List of standard symbols and nomenclature.	X	120 (c)
5.	Elementary diagrams with description of each circuit.	X	120 (c)

SECTION 16425

MOTOR STARTERS AND CONTROL CENTERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing motor starters and control centers.
- B. Related Work Specified Elsewhere:
 - 1. Grounding and bonding: Section 16060.
 - 2. Circuit breakers, panelboards and load centers: Section 16440.
 - 3. Motors: Section 16225.
 - 4. Wire connection accessories: Section 16125.
 - 5. Raceways, boxes and cabinets: Section 16130.
 - 6. Unit substations Section 16360.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
 - 2. NEC.
 - 3. NEMA AB1, ICS-2, ICS-2.3, 250.
 - 4. ANSI: Z55.1.
 - 5. ASTM: A47, A653, B187.
 - 6. UL: 845, Electrical Construction Materials Directory
 - 7. ITS: Directory of ITS Listed Products.
- B. The following items to be listed or labeled per referenced UL or ETL directory.
 - 1. Motor starter.
 - 2. Combination starters.
 - 3. Motor circuit protectors.
 - 4. Motor control centers.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Interconnection wiring diagrams.
- B. Certification.
- C. Operation and Maintenance Manuals.
- D. Short-circuit calculations and coordination study in accordance with Section 16055.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Store motor starters and control centers in secure and dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Motor Starters:
 - 1. Interchangeability: Equipment of same type, size, rating, functional characteristics and make is to be interchangeable.
 - 2. NEMA ICS-2, ac general-purpose, Class A.
 - 3. Rating: Continuous-current rating suitable for associated motor as shown.
 - 4. Type:
 - a. Up to and including ½ HP: Manual starter operable on 120-volt, single-phase, 60 Hertz supply unless otherwise shown.
 - b. From above ½ HP up to and including 50 HP: Across-the-line magnetic starter operable on 480-volt, three-phase, 60 Hertz supply.
 - c. Above 50 HP: Closed-transition autotransformer starter operable on 480-volt, three-phase, 60 Hertz supply.
 - 5. Provide ground-fault protection with five-ampere pick-up in each motor starter for fans in fan shafts and pumps in drainage-pumping stations.
 - 6. Enclosure:
 - a. Type:
 - (1) For aboveground indoor locations and electrical rooms: NEMA 250, Type 1.
 - (2) For outdoor locations: NEMA 250, Type 3R.
 - b. Materials:
 - (1) Zinc-coated steel sheet: ASTM A653, coating designation G90, minimum thickness 14 gauge.
 - (2) Malleable iron: ASTM A47.
 - c. Finish: Metallic surface cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
 - 7. Nameplate:
 - a. Nameplate provided on each motor starter and control center in accordance with NEMA ICS, showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable.
 - b. Additional functional nameplates for each component as follows:
 - (1) Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless-steel rivets or screws.
 - (2) Lettering to be vertical gothic using a round or square cutter. V-shaped groove not acceptable.
 - (3) Each starter labeled with one-inch wide nameplate showing starter's designation and function in ½-inch high characters.
- B. Manual Starters: Quick-make/quick-break toggle mechanism, manual-reset thermal-overload device, position indicator showing ON/OFF/TRIPPED positions, red indicating light showing closed position.

- C. Across-The-Line Magnetic Starter:
1. Reversing or nonreversing as shown.
 2. NEMA size: As shown, not smaller than NEMA 1.
 3. 480-volt primary to 120-volt secondary control transformer with fuse in the primary circuit
 4. Manual-reset overload relay, one per phase, with the following additional requirements:
 - a. In starter for motors in fan shafts: Magnetic-type sensitive to current.
 - b. In starters for motors in other locations: Thermal-type.
 5. Two NO contacts with provision for addition of two NO or NC contacts.
 6. Nonreversing-type: START/STOP pushbutton mounted on door.
 7. Reversing-type: FORWARD/REVERSE/STOP pushbutton mounted on door.
 8. HAND/OFF/AUTO selector switch provided when specified.
- D. Autotransformer Starter:
1. Reversing or nonreversing closed-transition type as shown.
 2. NEMA size: As shown.
 3. Adjustable taps for 50, 65 and 80 percent of line voltage.
 4. 480-volt primary to 120-volt secondary control transformer with fuse in primary circuit.
 5. Manual-reset overload relay, one per phase.
 - a. In starter for motors in fan shafts: Magnetic-type sensitive to current.
 - b. In starters for motors in other locations: Thermal-type.
 6. One pneumatic adjustable timing relay.
 7. Two NO contacts with provision for addition of two NO or NC contacts.
 8. Nonreversing-type: START/STOP pushbutton mounted on door.
 9. Reversing-type: FORWARD/REVERSE/STOP pushbutton mounted on door.
 10. HAND/OFF/AUTO selector switch provided when specified.
- E. Motor Circuit Protectors (MCP):
1. NEMA AB1, molded-case, quick-make/quick-break, mechanically trip-free switching mechanism with adjustable magnetic trip for instantaneous short-circuit protection.
 2. Rating:
 - a. Number of poles: Three.
 - b. Continuous-current rating: As shown, not less than full-load current of motor.
 - c. Voltage: 480-volt, three-phase, 60 Hertz.
 - d. Interrupting rating: As shown.
 - e. Trip range: As necessary to provide maximum protection to associated motor.
 3. Where shown or necessary, individually removable current limiter, internally mounted on load side of MCP, with the following additional requirements:
 - a. Limiter current rating and time-current limiting characteristics coordinated with time-current characteristics of MCP to provide the following:
 - (1) Interruption by MCP under fault-current level up to interrupting capacity of MCP.
 - (2) Interruption by current limiter in conjunction with the MCP of fault-current level above interrupting capacity of MCP.
 - (3) Where necessary to protect associated motor starter. Limit fault-current below withstand capability of the starter.
 - (4) Where necessary to protect associated motor-circuit conductors. Limit fault-current below withstand capability of cable insulation.
 - b. Current-limiter housing interlocked with MCP tripping mechanism so that breaker will trip upon removal of cover.
 - c. Equipped with common trip mechanism for tripping all poles simultaneously on blowing of current limiter to prevent single phasing.

- d. Capable of interrupting minimum fault-current up to 100,000 rms symmetrical amperes at 480 volts ac.
- F. Combination Starter:
- 1. NEMA ICS-2, rated 480 volts, three-phase, 60 Hertz.
 - 2. Motor starter: Across-the-line magnetic or autotransformer starter as shown and specified.
 - 3. One 480-volt, three-pole MCP.
 - 4. Externally mounted operating handle with position indicator showing ON/OFF/TRIPPED condition of MCP. Operating handle interlocked for preventing opening and closing of door when MCP is in ON position. Defeater provided to bypass interlock. Provision for padlocking in OFF position.
- G. Motor Control Centers:
- 1. NEMA ICS-2.3, Class 1, Type B, rated 480-volt, three-phase, 60 Hertz, totally enclosed, deadfront, free-standing, modular assembly having vertical and horizontal buses, wireways, compartments equipped with circuit breakers, MCP and starters as shown.
 - 2. Enclosure: Modular assembly allowing maximum of six compartment units in one vertical assembly and units' layout in any combination without structural interference, with the following additional requirements:
 - a. Type:
 - (1) Above ground indoor locations and electrical rooms: NEMA 250, Type 1.
 - (2) Outdoor locations: NEMA 250, Type 3R.
 - b. Each unit compartment provided with individual door having concealed hinges. Unit door mechanically interlocked with unit circuit breaker to prevent opening or closing when the circuit breaker is in the ON position. Defeater provided to bypass interlock. Provision for padlocking in OFF position.
 - c. Horizontal wireway with removable coverplate provided at top and bottom for wiring between sections, incoming conduit and cable, motor and control wiring. Top trough separated by barrier from main horizontal bus.
 - d. Vertical wireway, with its own door, provided adjacent to each vertical assembly and accessible to two adjacent vertical assemblies when applicable.
 - e. Reinforced with adequate steel framework to form rigid structure with smooth outer surface free of burrs, ridges or other blemishes.
 - f. Zinc-coated steel sheet: ASTM A653 coating designation G90, minimum thickness 14 gauge
 - g. Finish: Metallic surface cleaned, degreased, primed with zinc primer and finished with light-gray enamel, ANSI Z55.1, Color 61; minimum dry-film thickness, two mils.
 - 3. Horizontal and vertical buses: Main horizontal buses provided at top of structure. Vertical buses for feeding power to each compartment provided in each vertical assembly and securely bolted to main buses.
 - a. Busbar: ASTM B187, 98-percent-conductivity copper, contact surfaces tin-plated, fully insulated by extruded sleeve or wound tape.
 - b. Each horizontal and vertical bus rated for a minimum of 600 amperes and 300 amperes, respectively, with current density not to exceed 1,000 amperes psi or to meet ANSI temperature of 50-degree rise unless otherwise shown.
 - c. Each bus rigidly held by bus supports which have high-dielectric qualities, are moisture-resistant, noncarbonizing and nontracking and have vertical creepage surfaces to prevent faults due to buildup of conductive dirt.

- d. Bus assembly braced to withstand short-circuit rating of 22,000 symmetrical amperes, rms or available short circuit determined by short-circuit calculations, whichever is greater.
 - e. Unit guides provided in unit compartment for aligning starter stubs.
 - f. Continuous bare-copper ground bus, 1/4-inch by two-inch cross-section, provided throughout length of control center.
- 4. Motor starter: Across-the-line magnetic or autotransformer starter, as shown and specified, with tin-plated stub assembly for connecting to vertical buses in unit compartment.
 - 5. Circuit breaker:
 - a. Main circuit breaker: One 480-volt, three-pole, rating as shown and in accordance with Section 16440.
 - b. Branch circuit breaker: One 480-volt, three-pole MCP for each unit compartment.
 - 6. Indicator light: One red light mounted on each unit compartment showing ON position of circuit breaker.
 - 7. Nameplate: As specified under General Requirements for motor starters, with the following additional requirement:
 - a. Each motor control center labeled with 1-1/2 inch wide nameplate showing designation in one-inch high characters.
 - b. Each compartment labeled with one-inch wide nameplate showing function and number of the motor controlled in 1/2-inch high characters.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Embed iron sills for anchoring motor control center flush with raised concrete pad as shown.
- B. Install motor starters and control centers as shown in accordance with manufacturer's recommendations.
- C. Install conduit in accordance with Section 16130 and the NEC.
- D. Connect power cable and control wire as recommended by manufacturers and as follows:
 - 1. Make power-cable and control-cable connections to manual starters, across-the-line magnetic starters and autotransformer starters by means of integral mechanical connectors. If such items are not furnished with integral mechanical connectors, make connections using compression connectors in accordance with Section 16125.
- E. Install motor starters and control centers as shown and in accordance with the NEC and Section 16225.
- F. Ground motor starter, complete motor control center in accordance with Section 16060.
- G. Apply touch-up paint as necessary.

3.02 TESTING:

- A. Furnish necessary equipment and perform the following tests:
 - 1. Test circuits for connections in accordance with wiring diagram.
 - 2. Test to ensure that insulation resistance to ground of nongrounded conductor is in accordance with Section 16060.

3. Test equipment enclosures for continuity to grounding system.
 4. Test operation of circuits and controls.
- B. Submit certified test reports.

END SECTION

SECTION 16435

LOW-VOLTAGE SWITCHGEAR AND SWITCHBOARD

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing 480-volt switchgear and switchboard.
- B. Related Work Specified Elsewhere:
 - 1. Raceways, boxes, and cabinets: Section 16130.
 - 2. Wire connection accessories: Section 16125.
 - 3. Grounding and bonding: Section 16060.
 - 4. Circuit breakers, panelboards, and load centers: Section 16440.
 - 5. Unit substations: Section 16360.
 - 6. Uninterruptible power system: Section 16260.
- C. Design Criteria:
 - 1. Floor loading: Compatible with floor design loading of 250 pounds per square foot.
 - 2. Switchgear and switchboard suitable for anchoring to a concrete floor steel trowel finished to a tolerance level of 1/8 inch in 10 feet.

1.02 QUALITY ASSURANCE:

- A. Qualifications:
 - 1. Select manufacturer regularly engaged in production of switchgears and switchboards.
 - 2. Furnish low-voltage switchgear, switchboard, and their main components from one manufacturer.
- B. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
 - 2. NEC.
 - 3. NEMA: PB2.
 - 4. ANSI: C37.16, C37.17, C37.50, Z55.1.
 - 5. UL: 891.
 - 6. ASTM: B187.
 - 7. ANSI/IEEE: C37.13, C37.20.1, C57.13.
- C. Factory Testing: Submit design tests or certified copies of test reports on identical units performed for each type and rating of circuit breakers as assembled in its complete switchgear or switchboard unit including bus compartment.
 - 1. Circuit breaker tests in accordance with requirements of ANSI C37.50 and including the following:
 - a. Design test:
 - (1) Trip-device calibration-check test.
 - (2) AC dielectric withstand-voltage test.
 - (3) Continuous-current test.
 - (4) Overload-switching test.
 - (5) Endurance tests.
 - (6) Short-circuit current tests.
 - (7) Short-time current test.

- b. Production tests: All applicable tests in accordance with the requirements of ANSI C37.50.
 - 2. Switchgear assembly tests: In accordance with the requirements of ANSI/IEEE C37.20.1 and including the following:
 - a. Design tests:
 - (1) Dielectric tests.
 - (2) Rated continuous-current tests.
 - (3) Short-time current withstand tests.
 - (4) Short-circuit current withstand tests.
 - (5) Mechanical endurance tests.
 - (6) Flame-resistance tests.
 - (7) Rod entry test.
 - (8) Paint qualification test.
 - b. Production tests: All applicable tests in accordance with requirements of ANSI/IEEE C37.20.1.
 - 3. Switchboard assembly tests: In accordance with the requirements of NEMA PB2 and UL 891 and including the following:
 - a. Design tests:
 - (1) Temperature-rise tests.
 - (2) Short-circuit current tests.
 - (3) Enclosure tests.
 - (4) Dielectric test.
 - b. Production tests: All applicable tests in accordance with requirements of NEMA PB2 and UL 891.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings: In accordance with Section 16360.
- B. Certification: Certified test reports for specified factory testing.
- C. Documentation:
 - 1. Short-circuit calculations and system coordination study: In accordance with Section 16360.
 - 2. Field-testing plan: In accordance with Section 16360.
- D. Operation and Maintenance Manuals: In accordance with Section 16360.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Ship each unit securely packaged, braced and labeled for safe handling in shipment and to avoid damage and distortion.
- B. Temporary Bracing: Where necessary brace switchgear for hoisting, lowering and skidding into position. Label temporary internal bracing: TEMPORARY - REMOVE BEFORE OPERATION.
- C. Protection Against Concealed Damage: Include within shipping container mechanical impact recorder of rating recommended by manufacturer for shipment by railroad and submit impact-record chart with manufacturer's instruction for disposition for damaged material.

- D. Assembly for Shipment:
1. Design enclosures to permit lifting by jacks or slings and moving horizontally on rollers or skidding in any direction.
 2. Maximum dimensions of shipping sections to be coordinated with dimensions of access hatches, corridors and doors to ensure shipping dimensions will allow movement of switchgear through structure without damage to equipment or structure or undue difficulty.
 3. Draw-out relays mounted in their proper cases with moving parts properly secured and packed for shipment.
 4. Removable circuit-breaker elements packaged separately.
 5. For shipping split, interconnecting wiring coiled on one side of shipping split with matching terminal block on other side of split. Wiring and terminal block points identified for reconnection.
- E. Store switchgear in secure and dry storage facility.

1.05 OPERATIONS AND MAINTENANCE TRAINING:

- A. In accordance with the General Requirements and Section 16360.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Switchgear:
1. ANSI/IEEE C37.20.1, for indoor use.
 2. Ratings:
 - a. Maximum voltage: 508 volts.
 - b. Frequency: 60 Hertz.
 - c. Insulation level: Low-frequency withstand: 2.2 kV.
 - d. Continuous current: As shown and in accordance with reference standards.
 - e. Short-time current: In accordance with reference standards and approved coordination study.
 3. Insulation structure:
 - a. Not to support combustion, produce toxic gases, absorb moisture or track.
 - b. When subjected to electric arc, emission of conducting materials from insulating structure limited so as not to interfere with performance of circuit breaker.
 4. Power circuit breakers:
 - a. ANSI/IEEE C37.13, ANSI C37.16, three-pole, single-throw, air-break drawout-type, with manually or electrically controlled closing and electrically controlled tripping, mechanically and electrically trip-free, with the following additional requirements:
 - (1) System nominal voltage: 480 volts.
 - (2) Rated maximum voltage: 508 volts.
 - (3) Rated frequency: 60 Hertz.
 - (4) Insulation dielectric-withstand: 2,200 volts.
 - (5) Three-phase short-circuit current rating (symmetrical amperes): As shown and in accordance with reference standards and approved coordination study.
 - (6) Frame size (amperes):
Secondary main circuit breaker: Minimum frame size suitable to carry continuous forced-air cooling rating of its distribution

transformer.

- (a) Essential main and secondary tie circuit breakers:
Minimum frame size as shown.
- (7) Equip each power circuit breaker with a solid-state tripping system consisting of three current sensors, microprocessor-based controlled-phase overcurrent trip device, time coordinated ground fault protection and flux-transfer shunt trip. Provide trip device complying with ANSI C37.16, and C37.17, with adjustable long-time and short-time elements, communication interface, power metering and non-volatile memory for protective settings, Cutler Hammer Digitrip RMS 810, Siemens Static Trip III CP, or equal. Range of trip-device current rating in amperes and setting as shown and in accordance with approved coordination study. True RMS sensing protection to be achieved by analyzing the secondary current signals from the circuit breaker current sensors and initiating trip signals to the circuit breaker. Protective settings, metering values and stored data to be accessible from the data communication network interface and locally from a digital alpha-numeric display unit mounted on the trip unit or breaker. Additional features to include:
 - (a) Provide the trip unit with an information system that provides LED's to indicate mode of trip following an automatic-trip operation. The indication of the mode to be retained after an automatic trip. Provide a trip reset button to turn off the LED indication after automatic trip.
 - (b) Provide the trip unit with a front panel display that indicates the protection-function settings. Have the unit continuously self-checking and provide a visual indication that the internal circuitry is being monitored and is fully operational.
 - (c) Provide the trip unit with a portable secondary current test set with matching connector plug or with an integral test panel, either of which enables the user to select the values of test currents within the range of available settings; with the basic protective settings not affected during testing operations.
 - (d) Provide an alpha-numeric display to indicate cause of trip, instantaneous value of maximum phase current and level of fault current that initiated an automatic-trip operation.
 - (e) Have the trip unit include a potential transformer module (PTM), suitable for operation up to 600 volts, 60 Hz; the primary of the PTM connected internally to the load side of the circuit breaker through a dielectric disconnect plug.
 - (f) Equip the trip unit with an energy-monitoring function processor to provide at a minimum; Phase Current (amps), Peak Demand (kilowatts), Present Demand (kilowatts), and Energy Consumption (kilowatt-hours).
 - (g) Equip the trip unit with a communication interface via a network twisted pair for remote monitoring and control.
 - (h) Provide the unit with an external power supply if voltage source is different than that provided to control the breaker; the main supply to the power supply to be 125 volts dc.
- (8) Operation counter.
- (9) Endurance: Electrical and mechanical-endurance performance not less than requirements in reference standard.
- (10) Control voltage: 125 volts dc nominal, individually fused.

- (11) Racking mechanism: With connected, test and disconnected positions; manually operated closed-door mechanism by insertion of crank through small opening in door; positive stops for preventing overtravel and guides for alignment of breaker with stationary unit; racking- mechanism gear ratio and design such that in combination with design of shutters covering main stationary disconnect, force required to puncture or damage shutters or breaker disconnect will become sufficiently large and readily apparent to protect against failure of shutters to open as breaker is racked in.
- (12) Primary connection (main disconnects): Connection between the removable and stationary unit made by male-and-female contacts, with the following additional requirements:
 - (a) Silver-plated high-pressure contacts.
 - (b) Automatic shutter to cover the contact orifices when the breaker is withdrawn and uncover orifices when breaker is returned to connected position.
 - (c) Automatic shutters constructed to withstand force of racking mechanism in case shutters fail to open when breaker is racked into position or shutter opening visible as breaker is racked into position.
- (13) Secondary connection (control and auxiliary disconnects): Control and interlocking-circuit connections between stationary and removable elements of switchgear made using device consisting of recessed stationary receptacle and set of self-aligning multiple-contact plugs on removable elements with sufficient number of contacts to accommodate control and interlock circuits, including spares, without resorting to auxiliary relays.
- (14) Spare auxiliary contacts for DTS: As shown to indicate closed and open positions for circuit breaker at remote location. Dry-type minimum of one NC and one NO rated 15 voltamperes, 250 volts dc, five milliseconds contact-bounce maximum and not more than 0.10-ohm contact resistance. Wired through secondary contacts to terminal blocks.
- (15) Shunt trip device.
- (16) For electrically operated breakers: Electrically powered, spring-charged, stored-energy operating mechanism, with following additional requirements:
 - (a) Voltage requirement:
 - i. Charging of stored-energy operating mechanism: 125 volts dc.
 - ii. Closing by means of closing release coil capable of operation from 100 - 140 volts dc.
 - iii. Tripping by means of shunt trip coil capable of operation from 70 - 140 volts dc.
 - (b) Closing release coil energized by means of pushbutton, control switch or automatically by interlocking/control signal.
 - (c) Shunt trip coil energized manually by pushbutton, control switch or automatically by interlocking/control signal.
 - (d) Equipped with mechanical devices on front of breaker to actuate closing and tripping operations in case of failure of control power.
 - (e) Compressed-spring stored-energy mechanism with energy storage sufficient for closing-opening operation at rated

- short-circuit current or at related required capabilities.
 - (f) Stored-energy mechanism automatically charged within 10 seconds following each closing of circuit breaker.
 - i. Stored-energy mechanism suitable for manual charging by means of removable or built-in handle in case of failure of control power.
 - ii. Automatic discharge of stored-energy mechanism prior to circuit-breaker withdrawal.
 - (g) White indicating light or flag provided on escutcheon of each circuit-breaker unit to indicate that stored-energy closing mechanism is charged.
 - (17) For manually operated breakers: Manually, spring-charged, stored-energy mechanism, with the following additional requirements:
 - (a) Built-in spring charging handle in front of breaker with indicator on escutcheon to indicate that stored-energy closing mechanism is charged.
 - (b) Closing by means of releasing stored energy by pushbutton or charging handle itself.
 - (c) Tripping by means of shunt trip coil capable of operation from 70 - 140 volts dc and by mechanical device on front of breaker.
 - (d) Compressed-spring stored-energy mechanism with energy storage sufficient for closing-opening operation at rated short circuit current or at related required capabilities.
 - (e) Automatic discharge of stored-energy mechanism prior to circuit-breaker withdrawal.
 - (18) Electrically controlled closing: On tie breakers only.
 - 5. Space heater:
 - a. Each vertical section of switchgear provided with 120-volt, single-phase, 60 Hertz heating element to facilitate drying and prevent condensation.
 - b. Heaters enclosed in grille guards with no sharp edges and located so that they are easily accessible for replacement without de-energization of switchgear bus. Heaters thermostatically controlled. Thermostat adjustable from 40F to 80F. Thermostat set in accordance with manufacturer's recommendation. Panel ammeter approximately 2-1/2 inches square, marked to indicate heater load.
 - 6. Bus bars:
 - a. General requirements:
 - (1) ASTM B187, 98-percent-conductivity copper.
 - (2) Current rating:
 - (a) Size sufficient to carry specified current and complying with applicable requirements of UL, ANSI, NEMA, IEEE and NEC.
 - (b) Bus rating for secondary main-breaker unit and bus connection to transformer sized for continuous forced-cooling rating of transformer.
 - (3) Capable of withstanding mechanical stresses and heat due to maximum short-circuit current.
 - (4) Bus contact surface silver-plated or tin-plated at connection.
 - (5) Each joint having impedance not more than that of bus bar of same length and clamped to maintain that impedance throughout life of equipment.
 - (6) Connection coordinated for proper mating with adjacent equipment terminals and enclosures. At transformer connection, flexible joint

and access plate provided for assembly and inspection of such joints.

- b. Power buses: Three-phase, four-wire copper buses, neutral bus of same rating as that of phase bus. Each bolted connection with four bolts minimum.
- c. Ground bus:
 - (1) Copper bus, not less than two inches by 1/4 inch provided throughout length of switchgear section.
 - (2) In switchgear unit where power cables enter or leave switchgear at top, copper ground bus not less than one inch by 1/8 inch extended from main ground bus to top of unit.
 - (3) Joints in ground bus made with four bolts and overlap of four inches.
 - (4) Mechanical connector provided in each unit for field connection of 4/0 through 500 kcmil ground cable to switchgear ground bus.
- d. Ground-to-neutral link provided at each ac switchgear in accordance with NEC for grounding of neutral. For services in same ac-switchboard room, single-grounding electrode connection to tie-point of neutral from each power source is permitted.
- e. Control bus:
 - (1) 125-volt dc bus; copper, No. 6 AWG minimum.
 - (2) One two-pole knife switch provided in switchgear cubicle for disconnecting the control circuit.
 - (3) UL Class J or RK-5 fuses used for control and auxiliary-service protection.
 - (4) Closing circuit fused; tripping circuit unfused.
 - (5) White light to indicate availability of dc control power.

7. Control and instrument wiring:

- a. Factory-installed.
- b. Insulation-rated, 600 volts, Type SIS, No. 14 AWG minimum copper conductor. Flexible Class C or higher stranded insulated copper wire used for wiring across hinged joints.
- c. One continuous length of wire used from terminal to terminal without splices or taps.
- d. Removable-element control wiring installed and connected according to manufacturer's standard for circuit-breaker wiring.
- e. Control wiring so designed and installed that fault in one main circuit cannot be transferred to control wiring of another main circuit.
- f. Connections made at terminals of device, on terminal blocks or on control buses. Wiring connection made using insulated-shank ring-type terminals.
- g. Interconnecting wiring between cubicles and compartments terminated on terminal blocks before being wired to components.
- h. Terminal blocks: With screw terminals, circuit-marking strips for indicating control wire number, phenolic-laminated dust cover and minimum of 10-percent spare terminal points.
- i. For each individual wire, corresponding identification used on the wiring diagrams.
- j. Internal wiring identified at each termination, with same number shown on wiring diagram, using suitable plastic sleeve attached within six inches of terminal connections.
- k. External wiring: Provision made for external control wiring to enter from bottom or top and with space allowed to terminate external multiple-conductor copper control cable. Top entrances provided with removable coverplates for field-drilling of conduit and cable entrance holes.
- l. Testing:

- (1) Check wiring for accuracy, open circuits and short-circuits, ground connections and insulation integrity by means of high-potential, continuity and operational tests.
 - (2) Subject wiring to high-potential test of 1,500 volts to ground for one minute or as recommended by the manufacturer.
 - (3) Verify that wiring is in accordance with manufacturer's wiring diagrams.
 - (4) Check wiring completely, including interconnections at shipping breaks.
8. Fuses: Current-limiting fuse installed in each control circuit except tripping circuit. Tripping control circuit to include green and red indicating lights to monitor availability of trip power with the red light in series with the trip coil to also monitor continuity of trip coil.
9. Enclosure:
- a. Dead-front, free-standing, indoor steel enclosure designed for line up with 13.8 kV to 480Y/277-volt transformer.
 - b. Steel structure with framework of welded or bolted structural steel, free from distortion and welding strain and sufficiently rigid to support equipment under normal and short-circuit conditions.
 - c. Switchgear cubicles and circuit-breaker compartment equipped with hinged front door and either hinged rear door or bolted rear covers. Bolted covers furnished with alignment studs and keyhole slots for positioning prior to bolting.
 - d. Each power circuit breaker in separate metal-enclosed compartment.
 - e. Circuit-breaker compartment door designed not to hinder movement of breaker in and out of compartment when door is open and doorstop set.
 - f. Barriers provided in bus compartment to separate bus section as follows:
 - 1) Main bus from tie bus.
 - 2) Main bus from essential bus.
 - g. Transition compartment sized as necessary with front and rear bolted covers to line up and coordinate with transformer.
 - h. Circuit-breaker compartment to provide for interchangeability of removable elements within frames of same size and operating characteristics.
 - i. Finish: Metallic surfaces degreased and finished with light-gray enamel, ANSI Z55.1, Color 61 in accordance with ANSI/IEEE C37.20.1 two mils minimum DFT.
10. Nameplate:
- a. Nameplate provided on each switchgear showing manufacturer's name and brand designation, the referenced standard, type, class and rating as applicable in accordance with reference standard.
 - b. Additional functional nameplates for each component, relay, meter, terminal block, etc. with the following requirements:
 - (1) Three-ply, laminated phenolic plates; engraved through black face to white core and attached by means of stainless-steel rivets or screws, provide on each switchgear and its components.
 - (2) Lettering: Vertical gothic using round or square cutter. V-shaped groove not acceptable.
 - (3) Each switchgear section labeled with nameplate one-inch high bearing the following inscription in letters ½-inch high: 480-VOLT SWITCHGEAR.
 - (4) Each switchgear compartment labeled with nameplate ½-inch high bearing, as appropriate one of the following inscriptions in letters 1/4-inch high: SECONDARY MAIN BREAKER, SECONDARY TIE BREAKER.

- (5) In addition to other information normally displayed on equipment, provide nameplate to show switch positions, meaning of indicator lamp and other pertinent information.
11. Ground-fault protection system:
- a. Time coordinated and with solid-state microprocessor based trip unit with the following additional requirements:
 - (1) Current-adjustment range: 100 to 1,200 amperes, with three calibration marks minimum.
 - (2) Time-adjustment band: Instantaneous and six- and 12-cycle calibration marks.
 - (3) Setting: As shown and as necessary to maximize protection and proper coordination in accordance with approved coordination study.
- B. Low-Voltage Switchgear:
- 1. Secondary main and tie cubicle: Equipped with the following:
 - a. Secondary main circuit breaker: Power circuit breaker with microprocessor-based phase-overcurrent trip device, shunt trip device, ground-fault protection, position-indicating lights, spare auxiliary contacts for DTS, accessories and interlocks.
 - b. Secondary tie circuit breaker: Power circuit breaker with microprocessor-based phase-overcurrent trip device, shunt trip device, electrical closing device, ground-fault protection, spare auxiliary contacts for DTS, position-indicating lights, accessories and interlocks. One or two tie breakers provided as shown.
 - c. Current transformers:
 - (1) ANSI/IEEE C57.13, window-type with polarity markers to operate digital power metering.
 - (2) Quantity: Three.
 - (3) Current ratio: As necessary for forced-cooling rating of distribution transformer with five-ampere secondary.
 - (4) Insulation class: 600 volts with basic-impulse insulation level of 10 kV full-wave.
 - (5) Maximum allowable temperature rise under continuous full-load above average ambient temperature of 55C.
 - (a) By winding resistance: 30C.
 - (b) By hottest spot in winding: 40C.
 - (6) Accuracy class: 0.6B - 0.5 or better.
 - d. Potential transformer:
 - (1) ANSI/IEEE C57.13, wound-type with polarity markers to operate voltage relay and meters.
 - (2) Quantity: Three.
 - (3) Voltage ratio: 480 volts primary to 120 volts secondary.
 - (4) Insulation class: 600 volts with basic impulse-insulation level of 10 kV full-wave.
 - (5) Maximum allowable temperature rise under continuous full-load above average ambient temperature of 55C.
 - (a) By winding resistance: 30C.
 - (b) By hottest spot in winding: 40C.
 - (6) Accuracy class: 0.6 W or X.
 - (7) Transformers connected WYE-WYE with three-phase and neutral potential bus.
 - e. Power metering and communication interface:
 - (1) Each switchgear equipped with a digital power meter, Cutler Hammer IQ Data Plus II, Siemen 4700. Voltage inputs provided from

potential transformers (PTs) connected to the main secondary 480-volt bus. Current inputs provided from external- mounted current transformers with five-amp secondary output, mounted to measure currents on the secondary main bus. CT and PT ratios to be field selective. Provide a communications option tied into the communication network.

- (2) Each breaker equipped with a microprocessor-based trip device provided with a data communication interface tied into a local-area communication network.
- (3) Each switchgear provided with a two-wire local-area network tied into a central monitoring system, Cutler Hammer Assemblies Electronic Monitor II (AEM II), Siemens Power Monitor. Have the monitor provide local status of all breakers, load data, metering parameters, cause of trip, min./max. values, etc. Install the local area network to mitigate problems associated from electrical fields and electromagnetic interference.
- (4) Provide a separate RS-232 (DB-9) plug and network interface/translator, panel mounted with protective dust cover, for customer interface from a Notebook- type computer (IBM Compatible). Provide networking software and any special network interface board/PCMCIA for use with Authority-furnished notebook-type computer. The user interface software to be a Windows version, providing data access to all device parameters and metering values.
- (5) Power Supply: All metering equipment control power or its external power supply(s) to be powered from 125-volt DC control power or 120-volt ac, 60 Hz provided from one of the following sources:
 - (a) Emergency panel
 - (b) Load side of secondary breaker.
 - (c) Line side of secondary main breaker with necessary equipment including auxiliary relays to ensure that control power is available after operation of transfer scheme.

f. Test switches: Provided between instrument transformers, meters and relays as listed below:

- (1) ABB Style FT-1.

2. Feeder main cubicle: Equipped with the following:

- a. Feeder circuit breakers: Each circuit breaker with microprocessor-based phase- overcurrent trip device, shunt trip, ground-fault protection, position-indicating lights and necessary accessories and interlocks.

C. Electrical Interlocks: Provide interlocks and coordination with primary-service switchgear, as applicable, for performing the following functions:

1. Modes of operation: Normal, automatic throwover, manual restoration and maintenance throwover as follows:
 - a. Normal: All power circuit breakers, except tie breaker, are closed. Tie breaker is normally open.
 - b. Automatic throwover: Automatic throwover operation occurs only when an undervoltage condition occurs in one of the primary feeders and when other secondary main breaker is closed.
 - (1) Where primary service is through 13.8 kV metal-clad switchgear, tripping of primary breaker caused by undervoltage condition automatically trips secondary main breaker and initiates closing of secondary tie breaker. Automatic throwover operation is blocked if secondary main breaker or primary breaker has tripped because of

overcurrent or ground-fault condition.

- c. Manual restoration: When proper-voltage condition has been restored, substation may be retransferred to normal mode. After primary breaker has been closed or after primary voltage has been re-established as evidenced by return to normal of transformer secondary voltage, both tie breakers are tripped first from a common tie breaker trip switch, followed by closing of secondary main breaker, all manually.
 - d. Maintenance throwover: Same as automatic but initiated manually by simulating undervoltage condition at potential test switch followed by manual restoration as specified.
2. To prevent paralleling two sources and to prevent feedback through transformer into primary lines.
 3. To trip secondary main breaker when primary breaker trips. Tripping of secondary main breaker does not trip primary breaker.
 4. To operate simultaneously two tie breakers in passenger stations having two separate ac-switchboard rooms.
 5. To allow each drawout circuit breaker in test position to be closed or tripped by local operation and to inhibit interlocking/control signals to or from breaker when in such position.
 6. To provide time coordinated ground-fault protection. In addition, ground-fault protection for secondary main and tie circuit breakers to provide reliable operation under any operating condition without nuisance tripping because of partial cancellation of stray currents flowing in neutral.
 7. In combined ac switchboard room: Ground-fault protection on secondary main and tie breakers designed to trip secondary main breaker associated with fault and to prevent nuisance tripping of other secondary main breaker.
 8. Interconnecting control wiring between two remotely located unit substations to be designed for installation in a two-inch conduit minimum.

D. General Requirements for Switchboards:

1. NEMA PB2, UL 891.
2. Ratings:
 - a. Normal voltage: 480 volts.
 - b. Frequency: 60 Hertz.
 - c. Rated continuous current: As shown.
 - d. Short-circuit rating: As shown.
3. Molded-case circuit breakers: Section 16440.
4. UL listed.
5. Bus:
 - a. ASTM B187, 98-percent-conductivity copper.
 - b. Continuous-current rating: As shown.
 - c. Capable of withstanding mechanical stresses and heat due to maximum short-circuit current.
 - d. Bus contact surfaces: Silver-plated or tin-plated at connection.
 - e. Neutral bus rating: Same as that of phase bus.
 - f. Control bus: 125-volt dc; copper, No. 6 AWG minimum; with UL Class J or RK-5 fuses for each compartment where necessary.
 - g. Ground bus secured to each vertical-section structure and extending entire length of switchboard.
6. Control wiring:
 - a. Insulation rated 600 volts, Type SIS, copper, No. 14 AWG minimum. Flexible, Class C or higher, stranded wire used for wiring across hinged joints.
 - b. One continuous length of wire used between terminals without splices or

- taps.
 - c. Connections made at terminal of device, on terminal blocks or at control bus, using tinned copper-ring compression terminals with insulated sleeve.
 - d. Interconnect wiring between compartments terminated on terminal blocks before being wired to components.
 - e. Terminal blocks: With screw-type terminals, circuit-marking strips for indicating wire number, phenolic-laminated dustcover and 10-percent minimum spare terminal points.
 - f. For each individual wire, same identification used on each terminal block marking strip.
- 7. Ground-fault protection system:
 - a. Time coordinated ground fault protection system with solid state adjustable tripping device.
 - (1) Solid-state, adjustable.
 - (2) Current adjustable range: As per manufacturer
 - (3) Time adjustment band: As per manufacturer.
 - (4) Setting: As shown or as necessary to maximize protection and coordination.
- 8. Enclosure:
 - a. Dead-front, free-standing indoor steel enclosure designed for lineup with 480-volt switchgear, where applicable.
 - b. Steel structure with framework of welded or bolted structural steel, free from distortion and welding strain and sufficiently rigid to support equipment under normal and short-circuit conditions.
 - c. Each breaker compartment equipped with hinged door or bolted cover in front and bolted rear cover. Bolted covers furnished with headed studs and keyhole slots for hanging in position before bolting.
 - d. Vertical barrier provided between feeder main cubicle and the essential switchboard.
 - e. Individually mounted feeder breakers externally operable. Highest breaker handle not more than six-feet six-inches above floor.
 - f. Interconnections between feeder-main cubicle bus and switchboard bus shall be provided by using internal busbar and rated, segregated and braced in accordance with applicable reference standards.
 - g. Spaces for future breakers to include necessary bus connections and device supports.
 - h. Finish: Metallic surfaces degreased and finished with light-gray enamel, ANSI Z55.1, Color 61, in accordance with ANSI/IEEE C37.20.1, two mils minimum DFT.
 - i. Adjustable breaker lifting device mounted on top of switchgear.
- 9. Nameplates:
 - a. Nameplate provided on each switchboard and its components in accordance with reference standards.
 - b. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by means of stainless-steel rivets or screws, provided on each switchboard and its components.
 - c. Lettering: Vertical gothic using round or square cutter. V-shaped groove not acceptable.
 - d. Each switchboard cubicle labeled with nameplate one-inch high bearing, as appropriate, one of the following inscription in letters ½-inch high: SWITCHBOARD.
 - e. In addition to other information normally displayed on equipment, provide nameplate to show breaker handle positions, meaning of indicator lamp and other pertinent information.

- E. Switchboards:
1. Equipped with individually mounted circuit breaker, each with solid state trip device, with integral time coordinated ground-fault protection and space heater.
 2. Adjustable instantaneous (magnetic) trip settings: As necessary for coordination.
 3. Bus bars on load side extending to rear of cubicle.
 4. Phase, neutral and ground buses and 125-volt dc control bus.
 5. Suitable for service entrance.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install switchgear in position as shown and in accordance with the NEC.
- B. Install conduits and raceways as shown and in accordance with the Section 16130.
- C. Make power-cable and control-wire connections as shown and as follows:
 1. Make power-cable and control-wire connections to circuit breakers, current-limiting circuit breakers and integrally fused circuit breakers by means of integral mechanical connectors. If such items are not furnished with integral mechanical connectors, make connections using compression connectors in accordance with Section 16125.
- D. Make grounding connections as shown and in accordance with Section 16060.

3.02 FIELD QUALITY CONTROL:

- A. In accordance with Section 16360.

END OF SECTION

THIS PAGE NOT USED

SECTION 16440

CIRCUIT BREAKERS, PANELBOARDS AND LOAD CENTERS

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies furnishing, installing, connecting and testing of circuit breakers, panelboards and load centers.
- B. Related Work Specified Elsewhere:
 - 1. Raceways, boxes and cabinets: Section 16130.
 - 2. Wire, cable and busways: Section 16120.
 - 3. Wire connection accessories: Section 16125.
 - 4. Grounding and bonding: Section 16060.
 - 5. Field painting: Section 09920.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of the jurisdictional authorities.
 - 2. NEC.
 - 3. NEMA: AB1, PB1, ST20, 250.
 - 4. ANSI: Z55.1.
 - 5. UL: 50, 67, 198C, 489, 891, Electrical Construction Materials Directory.
 - 6. ASTM: A276, B187.
 - 7. ITS: Directory of ITS Listed Products.
- B. Source Quality Control:
 - 1. Each item listed per referenced UL or ITS directory.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings.
- B. Certification.

1.04 PRODUCT DELIVERY, STORAGE AND HANDLING:

- A. Mark each circuit breaker, panelboard and transformer in accordance with applicable reference standard.
- B. Ship each unit securely packaged and labeled for safe handling and to avoid damage or distortion.
- C. Store products in secure and dry storage facility.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements:
1. Interchangeability: Components of the same type, size, rating, functional characteristics and make are to be interchangeable.
 2. Finish for enclosures for enclosed circuit breakers, panelboards, emergency-service panelboards and load centers:
 - a. Clean and degrease metallic surfaces.
 - b. Prime with zinc primer.
 - c. Finish with one coat of light-gray enamel, ANSI Z55.1, Color 61. Minimum dry-film thickness: Two mills.
- B. Circuit Breaker: NEMA AB1, UL 489, molded-case, bolt-on, quick-make/quick-break, mechanically trip-free switching mechanism, with thermal trip for inverse time-delay overcurrent protection and magnetic trip for instantaneous short-circuit protection. Shunt-trip device for tripping by ground-fault relay as shown. Frame size 225 amperes and above equipped with interchangeable thermal trip and adjustable magnetic-trip unit. Designed to carry continuous rating in ambient temperature of 40C with the following parameters as shown:
1. Number of poles.
 2. Rated voltage.
 3. Rated interrupting current.
 4. Trip setting.
 5. Frame size.
- C. Integrally Fused Circuit Breaker:
1. NEMA AB1, molded-case, quick-make/quick-break, mechanically trip-free switching mechanism.
 2. Thermal trip for inverse time-delay overload and magnetic trip for instantaneous short-circuit protection. Shunt-trip device for tripping by ground-fault relay as shown. Frame size 400 amperes and above equipped with interchangeable thermal and adjustable magnetic trips.
 3. Individually removable current limiter, internally mounted on load side of circuit breaker, with rating and time current limiting characteristics that coordinate with time current-tripping characteristics of circuit breakers to provide the following:
 - a. Interruption of circuit breaker under fault-current level up to interrupting capacity of circuit breaker.
 - b. Interruption by current limiter in conjunction with circuit breaker under fault-current level above interrupting capacity of circuit breaker.
 - c. Where necessary to protect downstream panelboard, limit fault current at branch circuit breakers below their interrupting capacity.
 - d. Where necessary to protect associated feeder/branch circuits, limit fault current below short-circuit current withstand capability of cable.
 4. Removable cover provided over current-limiter section of circuit breaker with interlock for tripping of breaker upon removal of cover and to prevent turning circuit breaker to ON position with cover removed.
 5. Equipped with common trip mechanism for tripping all breaker poles simultaneously on blowing of current limiter to prevent single phasing.
 6. Capable of interrupting minimum fault current of 100,000-rms symmetrical amperes at 480 volts ac.
 7. Circuit breaker rating:
 - a. Number of poles: As shown.
 - b. Frame size: As shown.

- c. Voltage rating: 480 volts.
- d. Interrupting capacity: As necessary to coordinate with current limiter.
- e. Trip setting: As shown.

D. Enclosed Circuit Breaker:

- 1. NEMA AB1.
- 2. Circuit breaker: As shown and as specified. Overcurrent trip device coordinated to provide selective tripping under overload conditions.
- 3. Enclosure:
 - a. Galvanized steel, surface-mounted, unless otherwise shown.
 - b. Type:
 - (1) Above-ground indoor locations and electrical rooms: NEMA 250, Type 1.
 - (2) Outdoor locations: NEMA 250, Type 3R.

E. Panelboard:

- 1. NEMA PB1, UL 67.
- 2. Enclosure:
 - a. UL 50.
 - b. Galvanized steel, surface-mounted unless otherwise shown.
 - c. Type:
 - (1) Aboveground indoor locations and electrical rooms: NEMA 250, Type 1.
 - (2) Outdoor locations: NEMA 250, Type 3R.
 - d. Gutter size:

	Main Bus Rating Amperes	Minimum Top and Bottom Gutter Size in Inches	Minimum Side Gutter Size in Inches
(1)	100 and below	4	4
(2)	225	6	4
(3)	400 and over	8	4

- e. Interior components mounted on backplate of reinforced steel for rigid support and accurate alignment.
- f. Provide latch and handle in accordance with UL 50; screw fastenings will not be accepted in lieu of latch.
- g. Provision for enclosure grounding.
- 3. Busbars:
 - a. ASTM B187.
 - b. 98-percent-conductivity copper.
 - c. Contact surface silver-plated or tin-plated.
 - d. Rating of neutral and ground bus: Equal to that of phase bus.
 - e. Neutral bus mounted on insulating block.
 - f. Neutral and ground busbars equipped with integral mechanical connectors.
- 4. AC panelboards:
 - a. Type of service: Three-phase, four-wire, 277/480 volt or 120/208 volt or as shown.

- b. Type of main: Main lugs or circuit breakers or integrally fused circuit breakers as shown, conforming to requirements specified, located at top or bottom as necessary
 - c. Branch circuit: Circuit breakers or integrally fused circuit breakers as shown, conforming to requirements specified, number of circuits as shown.
 - d. Circuit breaker: Trip device coordinated with that of upstream circuit breakers to provide selective tripping.
 - e. Suitable for service entrance where necessary.
5. DC Panelboard:
- a. Type of service: 125-volt dc, two-wire.
 - b. Type of main: Two-pole circuit breaker, 100-ampere frame, 100-ampere trip and 10,000-ampere interrupting capacity, unless otherwise shown.
 - c. Branch circuit: Two-pole circuit breakers, 100-ampere frame and 10,000-ampere interrupting capacity, in accordance with specified requirements, quantities as follows unless otherwise shown:
 - (1) With 20-ampere trip: Two minimum.
 - (2) With 30-ampere trip: Two minimum.
 - (3) With 50-ampere trip: Two minimum.
 - d. Enclosure finish: As specified under General Requirements for this section, except color to be OSHA red as specified in Section 09920.
6. Emergency-power panelboard:
- a. NEMA PB1, UL 67, fused-switch.
 - b. Enclosure:
 - (1) Galvanized steel, surface-mounted unless otherwise shown.
 - (2) Type:
 - (a) Above-ground indoor locations and electrical rooms: NEMA 250, Type 1.
 - (b) Outdoor locations: NEMA 250, Type 3R.
 - (3) Minimum of four inches side gutter and six inches top and bottom gutter.
 - (4) Mounting channel drilled and tapped to accommodate any combination of fused switch.
 - c. Busbar:
 - (1) ASTM B187.
 - (2) 98-percent-conductivity copper.
 - (3) Contact surface silver-plated or tin-plated.
 - (4) Rating of neutral and ground bus: Equal to that of phase bus.
 - (5) Neutral bus mounted on insulating block.
 - (6) Drilled and tapped to accommodate any combination of fused switch unit.
 - (7) Neutral and ground bus equipped with integral mechanical connectors.
 - d. Type of service: As shown.
 - e. Type of mains: Main lugs or fused switch unit as shown, located at top or bottom as necessary.
 - f. Branch circuit: Equipped with fused switch unit, number of circuits as shown.
 - g. Fused switch unit:
 - (1) Individually enclosed, quick-make/quick-break switching mechanism.
 - (2) Equipped with the following:
 - (a) Silver-alloy contacts.

- (b) External operating handle capable of being padlocked in ON or OFF position.
 - (3) Defeatable door interlock to prevent opening the door when operating handle is in ON position.
 - (4) Pressure-type fuse with Class J cartridge fuse conforming to UL 198C.
 - (5) Current rating and number of poles: As shown; maximum rating, 30 amperes.
 - (6) Use two-pole or three-pole switch unit if single-pole switch unit is not available.
7. Fuse time-current characteristic coordinated with upstream fuse time-current characteristic to provide selective overcurrent tripping.

F. Nameplates:

- 1. Three-ply, laminated phenolic plates, engraved through black face to white core and attached by stainless-steel rivets or screws.
- 2. Lettering: Vertical gothic using round or square cutter. V-shape groove is prohibited.
- 3. Each panelboard labeled with nameplate one-inch high bearing ½-inch high inscriptions as appropriate.
- 4. Nameplate for emergency-power panelboard to bear inscription EMERGENCY POWER.

G. Load Centers:

- 1. Enclosure:
 - a. UL 891, stainless steel, ASTM A276, Type 304, or approved equal.
 - b. Type:
 - (1) Above-ground indoor locations and electrical rooms: Non-ventilated indoor.
 - (2) Underground locations, except electrical rooms and tunnel areas: Non-ventilated outdoor.
 - (3) Outdoor locations and tunnel areas: Non-ventilated outdoor.
- 2. Transformer:
 - a. NEMA ST20, dry, self-cooled, epoxy-encapsulated, double-wound with insulated copper conductor with 185C-insulation system capable of withstanding full-wave impulse voltage of 10KV.
 - b. Five kVA load center: Single-phase, 60 Hertz, 480 volts primary to 120/240 volts secondary.
 - c. Nine kVA load center: Three-phase, 60 Hertz, 480 volts primary to 120/208Y volts secondary.
 - d. Fifteen kVA load center: Three-phase, 60 Hertz, 480 volts primary to 120/208Y volts secondary.
 - e. Maximum allowable temperature rise under continuous full load above ambient temperature of 30C and 40C maximum:
 - (1) By winding resistance: 115C.
 - (2) By hottest spot in winding: 145C.
- 3. Circuit breaker:
 - a. Bolt-on or plug-in, as specified.
 - b. Primary circuit breaker: 480 volts, bolt-on, 14,000-rms symmetrical amperes interrupting capacity, 100-ampere frame, with the following additional requirements:
 - (1) For five kVA load center: Two-pole breaker with 20-ampere trip setting.

- (2) For nine kVA load center: Three-pole breaker with 25-ampere trip setting.
 - (3) For 15 kVA load center: Three-pole breaker with 40-ampere trip setting.
 - c. Secondary main circuit breaker:
 - (1) Bolt-on, two or three poles as shown, 240 volts, 10,000-rms symmetrical amperes interrupting capacity with trip setting as follows:
 - (a) For five kVA load center: 25 amperes.
 - (b) For nine kVA load center: 30 amperes.
 - (c) For 15 kVA load center: 50 amperes.
 - d. Branch circuit breaker:
 - (1) Single-pole, plug-in, 120 volts, 10,000-rms symmetrical amperes interrupting capacity.
 - (a) For five kVA load center: Four breakers, each with 20-ampere trip setting.
 - (b) For nine kVA load center: Six breakers, each with 20-ampere trip setting.
 - (c) For 15 kVA load center: Twelve breakers, each with 20-ampere trip setting.
 - e. Nameplate: Laminated plastic, one-inch high, attached by means of stainless-steel rivets or screws, showing load-center number in 1/2-inch high white characters engraved on black background.
4. Neutral and ground bus bar equipped with mechanical connectors.

H. Current-Limiting Circuit Breaker:

- 1. NEMA AB1, UL 489, molded-case, quick-make/quick-break, mechanically trip-free switching mechanism.
- 2. Thermal trip for inverse time-delay overcurrent protection and magnetic trip for instantaneous short-circuit protection. Shunt trip device for tripping by ground-fault relay as shown.
- 3. Limit the fault current, without the use of fusible element, to provide the following:
 - a. Protect associated cable by limiting the fault let-through energy to a value below the short-circuit withstand capability of the cable.
 - b. Protect downstream panelboard by limiting fault current at branch circuit breakers within their interrupting capabilities.
- 4. Circuit-breaker rating:
 - a. Number of poles: As shown.
 - b. Frame size: As shown.
 - c. Voltage rating: 480 volts.
 - d. Interrupting capacity: Minimum 100,000-symmetrical RMS amperes.
 - e. Trip setting: As shown.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install panelboards at locations shown, with bottom not less than 12 inches above floor. Use multiple-section panelboards to meet such spacings if necessary.
- B. Mount panelboards and load centers with front straight and plumb.

- C. When feeder serves more than one panelboard or panelboard section, install separate junction box or provide adequate gutter area for termination of feeders and bus taps.
- D. Install single and/or multiple-conductor cable in accordance with Section 16120. Connect branch circuit wires as shown. Connect neutral wire of branch circuit to neutral bar in panelboard.
- E. Install load centers where shown.
- F. Make conduit connections in accordance with Section 16130.
- G. Make power cable connections to circuit breakers, integrally fused circuit breakers, fused switch units, neutral and ground bus bars in panelboard and load centers and enclosed circuit breakers by means of integral mechanical connectors. If such items are not furnished with integral mechanical connectors, make connections using compression connectors in accordance with Section 16125.
- H. Ground panelboards, load centers and enclosed circuit-breaker enclosures in accordance with Section 16060 and the NEC.
- I. Apply matching touch-up paint where necessary.

3.02 DIRECTORY OF CIRCUITS:

- A. Furnish each panelboard and load center with legibly printed circuit directory located on inside of enclosure.

3.03 FIELD QUALITY CONTROL:

- A. Furnish necessary equipment and perform the following tests:
 1. Molded-case circuit breakers: Perform pole-to-pole and pole-to-ground insulation resistance tests with 1,000V dc megger. Insulation resistance to be 50 megohms minimum.
 2. Panel boards and load centers: Perform insulation-resistance tests of each bus section phase-to-phase and phase-to-ground for one minute using 1,000V megger. Insulation resistance to be not less than manufacturer's recommended minimum or two megohms minimum.
 3. Test circuit connections in accordance with wiring diagram.
 4. Test panelboard and load-center enclosures for continuity to grounding system.
 5. Check cable connections to circuit breakers and fused switch unit for tightness.
 6. Check setting of adjustable magnetic trips for compliance with approved coordination study.
- B. Submit certified test reports.

SECTION 16491

FUSES

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section includes the following:
1. Cartridge fuses rated 600 V and less for use in switches, panelboards, switchboards, controllers and motor-control centers.
 2. Spare-fuse cabinets.

1.02 SUBMITTALS

- A. Product Data: Include the following for each fuse type indicated:
1. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.
 2. Let-through current curves for fuses with current-limiting characteristics.
 3. Time-current curves, coordination charts and tables, and related data.
 4. Fuse size for elevator feeders and elevator disconnect switches.
- B. Ambient Temperature Adjustment Information: If ratings of fuses have been adjusted to accommodate ambient temperatures, provide list of fuses with adjusted ratings.
1. For each fuse having adjusted ratings, include location of fuse, original fuse rating, local ambient temperature, and adjusted fuse rating.
 2. Provide manufacturer's technical data on which ambient temperature adjustment calculations are based.
- C. Operation and Maintenance Data: For fuses to include in emergency, operation, and maintenance manuals. Include the following:
1. Let-through current curves for fuses with current-limiting characteristics.
 2. Time-current curves, coordination charts and tables, and related data.
 3. Ambient temperature adjustment information.

1.03 QUALITY ASSURANCE

- A. Source Limitations: Obtain fuses from a single manufacturer.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- C. Comply with NEMA FU 1.
- D. Comply with NFPA 70.

1.04 PROJECT CONDITIONS

- A. Where ambient temperature to which fuses are directly exposed is less than 40 deg F or more than 100 deg F, apply manufacturer's ambient temperature adjustment factors to fuse ratings.

1.05 COORDINATION

- A. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size.

1.06 EXTRA MATERIALS

- A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fuses: Quantity equal to 20 percent of each fuse type and size, but no fewer than 5 of each type and size.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Cooper Bussman, Inc.
 - 2. Eagle Electric Mfg. Co., Inc.; Cooper Industries, Inc.
 - 3. Ferraz Shawmut, Inc.
 - 4. Tracor, Inc.; Littelfuse, Inc. Subsidiary.

2.02 CARTRIDGE FUSES

- A. Characteristics: NEMA FU 1, nonrenewable cartridge fuse; class and current rating indicated; voltage rating consistent with circuit voltage.

2.03 SPARE-FUSE CABINET

- A. Cabinet: Wall-mounted, 0.05-inch-thick steel unit with full-length, recessed piano-hinged door and key-coded cam lock and pull.
 - 1. Size: Adequate for storage of spare fuses specified with 15 percent spare capacity minimum.
 - 2. Finish: Gray, baked enamel.

3. Identification: "SPARE FUSES" in 1-1/2-inch- high letters on exterior of door.
4. Fuse Pullers: For each size of fuse.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.
- B. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 FUSE APPLICATIONS

- A. Service Entrance: T, fast acting.
- B. Feeders: Class RK1, time delay.
- C. Motor Branch Circuits: Class RK1, time delay.
- D. Other Branch Circuits: Class RK1, time delay.

3.03 INSTALLATION

- A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.
- B. Install spare-fuse cabinet(s).

3.04 IDENTIFICATION

- A. Install labels indicating fuse replacement information on inside door of each fused switch.

END OF SECTION

THIS PAGE NOT USED

SECTION 16525

INTERIOR LIGHTING FIXTURES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing lighting fixtures.
- B. Related Work Specified Elsewhere:
 - 1. Field painting: Section 09920.
 - 2. Grounding and bonding: Section 16060.
 - 3. Wire, cable and busways: Section 16120.
 - 4. Wire connection accessories: Section 16125.
 - 5. Raceways, boxes and cabinets: Section 16130.
 - 6. Wiring and control devices: Section 16145.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
 - 2. NEC.
 - 3. UL: 496, 542, 1029, 1570, 1571, 1572, Electrical Construction Materials Directory.
 - 4. FS: FF-B-588, FF-P-395, FF-S-325C.
 - 5. MS: MIL-C-450.
 - 6. FED STD: 595.
 - 7. PEI: 1001.
 - 8. SSPC: SP-8, SP-10.
 - 9. ASTM: A53, A167, A276, A123, A507, A575, B26, B85, B117, B136, B137, B209, B221, B244, D635, D1056, D1400, D2240.
 - 10. AASHTO: M314, LTS-3.
 - 11. ITS: Directory of ITS Listed Products.
 - 12. AA: Standard finishes as designated by the Aluminum Association and referenced in NAAMM Metal Finishes Manual.
 - 13. ANSI/IEEE: C62.41.
 - 14. IEEE Publication 587.
 - 15. ANSI Standards.
 - 16. FCC Rules and Regulations, Part 15, Part 18.
 - 17. NEMA 1
 - 18. AISI.
 - 19. IES: RP-20
- B. Each lighting fixture to be labeled or listed per referenced UL or ITS directory.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Include photometric curves.

- B. Samples: One of each type of fixture.
- C. Certification:
 1. Verification that each fixture is in compliance with applicable codes, regulations, reference standards and specifications for the location at which it is to be used. Indicate requirements that each fixture meets.

1.04 PRODUCT DELIVERY, STORAGE, AND HANDLING:

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Store lighting fixtures in secure and dry storage facility.

1.05 WARRANTY:

- A. Globes and Diffusers: In addition to warranty requirements of the General Provisions, furnish warranty against discoloration and distortion for a total of four years.
- B. Lamps: Warrant the life of lamps for periods specified.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Lighting Fixtures:
 1. Interchangeability: Components of same type, size, rating, functional characteristics and make are to be interchangeable.
 2. In accordance with UL 1570, UL 1571 and UL 1572.
 3. Materials:
 - a. Steel:
 - (1) Sheet: ASTM A507, 22-gauge minimum.
 - (2) Bar: ASTM A575.
 - b. Steel pipe: ASTM A53, Type S.
 - c. Stainless steel:
 - (1) Sheet: ASTM A167, 22-gauge minimum.
 - (2) Bar: ASTM A276, Type 316.
 - (3) Finish: AISI Alloy S30400, NAAMM Finish No. 4, unless otherwise shown.
 - d. Aluminum: Alloy as recommended by manufacturer, unless otherwise shown or specified.
 - (1) Sheet and plate: ASTM B209.
 - (2) Extrusion: ASTM B221, 0.109-inch minimum thickness, unless otherwise shown.
 - (3) Cast:
 - (a) Die cast: ASTM B85, 0.1875-inch minimum thickness, unless otherwise shown.
 - (b) Sand cast: ASTM B26, 0.1875-inch minimum thickness, unless otherwise shown.
 - (c) Color-anodized cast: Kalcolor Casting Alloy No. 2 or equal.
 4. Lamps:
 - a. In accordance with applicable ANSI Standards.
 - b. Tungsten-halogen:
 - (1) Wattage: Per WMATA requirements or match existing.
 - (2) Size: T-3.

- (3) Base: Recessed single contact.
- (4) Rated life: 4,000 hrs.
- (5) Operating voltage:
 - (a) 1,500-watt lamps: 277 volts, 60 Hertz.
 - (b) All other lamps: 120 volts, 60 Hertz.
- c. Incandescent:
 - (1) Wattage: Per WMATA requirements or match existing.
 - (2) Finish: Inside frosted unless otherwise shown.
 - (3) Base:
 - (a) Up to 200 watts: Medium screw base
 - (b) Above 200 watts: Mogul screw base.
 - (4) Operating voltage: 120 volts, 60 Hertz.
 - (5) Rated life: 2,500 hours.
 - (6) Bulb size: Per WMATA requirements or match existing.
- d. Mercury vapor:
 - (1) Watt rating: Per WMATA requirements or match existing.
 - (2) Color: Deluxe white.
 - (3) Finish: Per WMATA requirements or match existing.
 - (4) Base:
 - (a) Up to 100 watts: Medium screw base.
 - (b) Above 100 watts: Mogul screw base.
 - (5) Rated life: 24,000 hours.
 - (6) Bulb size: Per WMATA requirements or match existing.
- e. Fluorescent:
 - (1) Wattage and size: Per WMATA requirements or match existing.
 - (2) Color: Warm white.
 - (3) Type:
 - (a) PL7 compact, PL13 compact.
 - (b) F6T5/CW and F20T12WW, Preheat start.
 - (c) F32T8/WW, Rapid start.
 - (4) Rated life:
 - (a) Super-high output (SHO), very-high output (VHO) and high output (HO) lamps: 12,000 hours.
 - (b) F32T8/WW: 20,000 hours.
 - (c) PL compact lamps: 10,000 hours.
 - (5) Base:
 - (a) Super-high output (SHO), very-high output (VHO) and high output (HO) lamps: Recessed double contact.
 - (b) F32T8/WW: Medium bi-pin.
 - (c) PL7 medium.
- f. Metal-halide:
 - (1) Wattage: Per WMATA requirements or match existing.
 - (2) Size: Per WMATA requirements or match existing.
 - (3) Color: Clear unless otherwise noted.
 - (4) Lamp operating position: Per WMATA requirements or match existing.
 - (5) Base: Mogul.
 - (6) Rated life:
 - (7)
 - (a) 175 watt: 7,500 hours.
 - (b) 400 watt: 15,000 hours.
 - (c) 1,000 watt: 10,000 hours.
- g. High-pressure sodium:
 - (1) Wattage: Per WMATA requirements or match existing.
 - (2) Size: Per WMATA requirements or match existing.

- (3) Coating: Clear, unless otherwise specified.
 - (4) Base: Medium or mogul.
 - (5) Rated life: 24,000 hours.
5. Lampholders:
- a. Incandescent, mercury vapor, metal halide and high-pressure sodium:
 - (1) In accordance with UL 496.
 - (2) Black or white thermosetting phenolic compound, glazed-porcelain or neoprene base and body as shown. Neoprene unit molded in one-piece, weatherproof, oil-resistant, with vibration-absorbing socket construction.
 - (3) Incandescent: Rated 660 watts, 250 volts for medium screw base.
 - (4) Mercury vapor, high-pressure sodium and metal halide:
 - (5) Rated 660 watts, 600 volts: Medium screw base.
 - (6) Rated 1,500 watts, 600 volts: Mogul screw base.
 - (7) Provide mechanical self-retaining neoprene gasket for dust and moisture proof seal between lamp and lampholder.
 - (8) Provide vibration proof feature to prevent incandescent lamp from loosening in lampholder in S-1 fixture
 - b. Fluorescent:
 - (1) In accordance with UL 542.
 - (2) Rated 660 watts, 600 volts.
 - (3) Integral starter holder for preheat-type lamps, with starter.
 - (4) White, thermosetting phenolic-compound base and body, silver-plated phosphorous-bronze contacts, self-aligning neoprene gasket face.
 - c. Tungsten-halogen: Porcelain with silver-plated contacts, to suit RSC lamp base.
6. Ballasts:
- a. Mercury-vapor lamps, high-pressure sodium lamps and metal-halide lamps:
 - (1) UL 1029, high-power-factor type.
 - (2) Operable on 120-volt or 277-volt, 60 Hertz as shown or necessary, type and rating suitable for associated lamp.
 - (3) Capable of starting lamp at ambient temperature of minus 20F and above.
 - (4) Equip with individual fuse protection installed in ballast compartment of fixture.
 - b. Fluorescent lamps:
 - (1) FCC part 15 subpart J, UL listed Class P.
 - (2) Operable on 120-volt or 277-volt, 60 Hertz, as shown or necessary, type and load rating suitable for associated lamps.
 - (3) Capable of starting lamps at ambient temperature as follows:
 - (a) F32T8/WW lamps: Zero degree F.
 - (4) Sound rating:
 - (a) For use with F32T8/WW lamps installed in office areas: A.
 - (b) For use with F32T8/WW lamps installed in ancillary areas: B or better.
 - (5) Maximum utilization of two-lamp ballasts in public-area lighting fixtures.
 - (6) Equipped with individual fuse protection, installed in the fixture wiring channel.
7. Fixture body and housing: Shape, size and material as shown.
8. Reflector: Shape, size and material Per WMATA requirements or match existing. Aluminum or stainless steel polished to mirror finish unless otherwise specified. Minimum thickness 22 gauge unless otherwise specified.
9. Diffusers:

- a. Shape and size as shown, one-piece molded or extruded clear virgin acrylic or polycarbonate plastic having the following properties:
 - (1) Interior diffusing with smooth exterior surface.
 - (2) Self-extinguishing, in accordance with ASTM D635.
 - (3) No material color change when used with 4500K fluorescent lamp.
 - (4) No apparent yellowing after 500 hours exposure to fluorescent-lamp source under conditions similar to those existing in the lighting fixture.
 - (5) No alteration to optical properties of the fixture when finished diffuser treated with anti-static wax.
 - b. Formed by carefully controlled processes so that the finished piece retains its design contours and dimensions at normal operating temperature.
 - c. Resistance to shrinking, warping, crazing, cracking, or discoloring, either in service or when stored in the manufacturer's standard shipping containers under normal conditions.
10. Globes:
- a. Clear seamless polycarbonate or high-impact heat-resistant glass as shown.
 - b. Shape and size: Per WMATA requirements or match existing.
 - c. Minimum thickness: 0.125 inch, surface free from visible mold seam.
 - d. Reduction in strength: 10-percent maximum after five years.
 - e. Maximum haze: Two percent.
 - f. Minimum light transmittance: 88 percent.
11. Lenses:
- a. Plastic lenses: Clear polycarbonate as shown, minimum thickness 0.06 inch.
 - b. Glass lenses: 1/4-inch tempered glass, laminated glass, or 1/8-inch double-strength clear glass as shown, capable of absorbing ultraviolet rays when used with mercury-vapor or metal-halide lamps.
 - c. Refracted lenses: Heat-resistant, annealed, clear borosilicate glass, with the following additional requirements:
 - (1) Initial lumen distribution on horizontal plane evenly from zero to 90 degrees: 55 to 60 percent.
 - (2) Minimum efficiency: 85 percent.
12. Fixture wire: Section 16120.
13. Gasket:
- a. Keyed gasket: One-piece, extruded solid neoprene having Type A durometer hardness of 30 plus-or-minus five when tested in accordance with ASTM D2240.
 - b. Self-retaining gasket:
 - (1) One-piece, closed-cell sponge neoprene, soft or medium density.
 - (2) Resistant to aging, heat, ultra-violet light, water, oil, weathering and setting as determined by ASTM D1056.
 - (3) Cemented to component with resilient neoprene sealing compound compatible with finish. Adhesive not applied to diffuser.
 - c. Silicone gasket equal to neoprene, at Contractor's option.
14. Hardware:
- a. Latches, catches, release mechanisms, hinges, screws, bolts, studs, nuts, rivets, washers and springs. Heavy-duty stainless steel or bronze.
 - b. Latches and catches: Captive-type.
 - c. Operating hardware: Self-retaining type.
15. Construction:
- a. Fixture body, reflectors, wiring channels, end caps and castings formed so as to prevent buckling or distortion.
 - b. Minimum of two wire clips provided in wiring channel to support wiring. Self-cleaning air filter provided on breather ports.

- c. Seams and joints continuously welded and ground smooth.
 - d. When aluminum will be in contact with dissimilar metal, separate contact surfaces with gasket, nonabsorptive tape, or coating to prevent corrosion.
16. Finish:
- a. Baked enamel: Nonspecular finish consisting of six-stage hot-cleaning wash, phosphate coat, prime coat, and finish coat of sprayed white or other color acrylic enamel as shown, baked at 350F for a minimum of 30 minutes, with the following additional requirements:
 - (1) Dry-film thickness (DFT) per ASTM D1400: 1.25 mils minimum.
 - (2) Undercutting of enamel film from scored line after exposing to 10-percent salt spray for 1,500 hours, per ASTM B117: 0.067-inch maximum.
 - (3) Baked white enamel after 100 hours exposure to fadeometer: 86-percent minimum reflectance factors, no appreciable visual color change.
 - (4) Bronze color: FED STD 595, Color No. 20040.
 - b. Porcelain enamel: Opaque, fused vitreous surface finish, 88-percent average reflectance factor, in accordance with the following standards:
 - (1) On steel: PEI 1001.
 - (2) On aluminum alloy: PEI 1001.
 - c. Specular anodized coating: 14-stage process for permanently sealed specular or semispecular finish, as shown, in accordance with patented electrolytic process, Alzak or equal. When shown dark-bronze color, match Duranodic 313 Dark Bronze.
 - d. Clear anodic coating: AA-M22C22-A41, minimum coating thickness 0.8 mil, coating weight 35 milligrams per square inch, hot-water seal overall, tested in accordance with the following requirements:
 - (1) Coating weight: ASTM B137.
 - (2) Coating thickness: ASTM B244.
 - (3) Sealing test: ASTM B136.
 - (4) Undercutting of anodic film from scored line after exposing to 10-percent salt spray for 1,500 hours, in accordance with ASTM B117: 0.067-inch maximum.
 - e. Color-anodized finish: NAAMM AA-M22-C22A42, minimum coating thickness 0.8 mil, coating weight 35 milligrams per square inch, hot-water seal overall, tested in accordance with the following requirements:
 - (1) Coating weight: ASTM B137.
 - (2) Coating thickness: ASTM B244.
 - (3) Sealing test: ASTM B136.
 - (4) Color: Dark Bronze. Kaiser Aluminum Color, Statuary Bronze; Alcoa Color, Dark Bronze, Duranodic 313.
 - f. Zinc coating: ASTM A123.
 - g. Factory-painting: Prepare surfaces by pickling in accordance with SSPC SP-8. Apply coating of 7.0-mil total DFT as follows:
 - (1) First coat: Inorganic zinc-silicate primer, 2.5-mil DFT.
 - (2) Second coat: High-build epoxy primer, 3.0-mil DFT.
 - (3) Third coat: Aliphatic polyurethane, 1.5-mil DFT, FED STD 595, Color No. 20040.
 - h. Field painting: Section 09920.
 - i. Electrostatic-powder coating: Prepare surfaces by sandblast cleaning complying with SSPC SP-10 near-white blast cleaning, applying coating promptly after cleaning. Ground material to be coated. Apply coating as electrostatically-charged dry powder using electrostatic spray gun to produce DFT of six mils plus-or-minus two mils. Cure by heat treatment.

17. Mark each fixture and its components in accordance with applicable reference standard.
18. Conduit: Section 16130.
19. Connectors: Section 16125.
20. Fasteners: Size and type to match existing or best suited to use.
 - a. Expansion anchors: FS FF-S-325C, Group II, Type 3, Class 1, stainless steel, Type 303.
 - b. Toggle bolts: FS FF-B-588.
 - c. Powder-actuated: FS FF-P-395.
 - d. Finish: Where exposed, custom finish exposed parts to match surface being fastened.
21. Photoelectric control: Section 16145.

2.02 LIGHTING FIXTURES:

- A. Lighting Fixtures: Types per WMATA requirements, match existing and as follows:
 1. Type 1 fixture:
 - a. Open, industrial-type, fluorescent.
 - b. Lamps: Two 32-watt F32T8/WW.
 - c. Body: Aluminum or 20-gauge steel channel-shaped body, end plates, cover and reflector. Knockouts in body and end plates as shown. Attach end plates to body with noncorrosive screws. Double-strength construction for steel channel.
 - d. Finish:
 - (1) Channel, end plates, and cover:
 - (a) Steel: White baked enamel.
 - (b) Aluminum: Clear anodic coating.
 - (2) Reflector: White baked enamel for aluminum and steel.
 2. Type 2 fixture: Same as Type 1, except fixture equipped with one-piece acrylic-plastic diffuser in extruded aluminum or steel frame; with octolens surface.
 3. Type 3 fixture:
 - a. Open, strip-type, fluorescent.
 - b. Lamps: Two 18-watt F18T8/WW.
 - c. Body: Aluminum or 20-gauge steel channel, end plates and cover. Knockouts in body and end plates as shown. End plates attached to body with noncorrosive screws. Double-strength construction for steel channel.
 - d. Finish:
 - (1) Steel: White baked enamel, interior and exterior.
 - (2) Aluminum: Clear anodic coating.
 4. Type 4 fixture:
 - a. Enclosed, watertight, fluorescent, for mounting on channel inserts.
 - b. Lamp: One 32-watt F32T8/WW.
 - c. Enclosure:
 - (1) Body: Extruded-aluminum housing with die-cast aluminum end caps, flanged to provide solid seat for gasket between body and door frame.
 - (2) Door frame: Extruded aluminum, minimum of three hinges riveted to door and housing, 0.2-inch diameter stainless-steel hinge pins and minimum of three door-fastening screws.
 - (3) Door-fastening screws: Quick-turn, slotted, pan-head, captive, corrosion-resistant, location to provide uniform pressure on door gaskets.
 - (4) Diffuser: Clear, inside-ribbed polycarbonate plastic.
 - (5) Reflector: Aluminum, three-part, with portion concealing ballast flush-hinged to permit wiring connections and ballast replacement.

- d. Finish:
 - (1) Enclosure: Clear anodic coating.
 - (2) Reflector: White baked enamel.
- 5. Type 4A fixture: Two tandem-mounted Type 4 fixtures, with two lamp ballasts, as shown.
- 6. Type 5 fixture:
 - a. Enclosed fluorescent fixture.
 - b. Lamp: One 32-watt F32T8/WW.
 - c. Enclosure: Steel housing and end plates. Knockouts where shown. End plates attached to housing with noncorrosive screws. Diffuser: Clear acrylic plastic.
 - d. Finish:
 - (1) Enclosure: White baked enamel.
 - (2) Reflector: White baked enamel.
- 7. Type 6A fixture:
 - a. Enclosed, vapor-tight, compact fluorescent, for pendant mounting.
 - b. Housing: Cast aluminum, with threaded hub for 3/4-inch conduit, and cast-aluminum guard.
 - c. Globe: Clear glass with high-impact resistance.
 - d. Finish: Clear anodic coating.
 - e. Fluorescent lamp: One PL13 compact.
- 8. Type 6B fixture: Same as Type 6A, except for mounting on outlet box.
- 9. Type 6C fixture: Same as Type 6A, except bracket-type for mounting on wall.
- 10. Type 6D fixture: Same as Type 6C, except complete with outlet box.
- 11. Type 7A fixture:
 - a. Enclosed, vapor-tight, high-pressure sodium for ceiling mounting.
 - b. Housing: Cast aluminum, with ballast compartment cast aluminum, guard.
 - c. Globe: Clear glass with high-impact resistance.
 - d. Finish: Two coats of gray epoxy enamel.
 - e. Lamp: One 50-watt, clear, BT-25, high-pressure sodium.
- 12. Type 7B fixture: Same as 7A, except wall-mounted.
- 13. Type 7C fixture: Same as 7A, except pendant-mounted. Center topped and integrally counter-weighted so fixture hangs plumb.
- 14. Type 8 Fixture:
 - a. Enclosed, weatherproof high-pressure sodium for wall mounting, UL-listed "Suitable for Outdoor and Wet Locations".
 - b. Housing: Die-cast aluminum luminaire, integral ballast housing and grid guard, with tamper-resistant stainless-steel hardware.
 - c. Refractor: Pressed, clear, prismatic, single-piece, thermal/shock-resistant, borosilicate glass or polycarbonate.
 - d. Finish: Electrostatic powder-coated, FED STD 595 Color No. 20040.
 - e. Lamp: One clear, high-pressure sodium, wattage as shown.
- 15. Type 9 Fixture: Emergency trip station light:
 - a. Enclosed and gasketed weatherproof, mercury-vapor fixture mounted on steel channel and tube as shown, UL-listed as Suitable for Outdoor and Wet Locations.
 - b. Housing: Die-cast copper-free aluminum luminaire with 90-degree arm for wall mounting, integral ballast housing, grid guard and threaded globe seat, with tamper-resistant stainless steel hardware.
 - c. Globe: Thermal shock-resistant and impact-resistant blue, tempered glass with threads to ensure secure fit to housing.
 - d. Finish: Natural.
 - e. Lamp: Mercury-vapor, 40-watt B-17.

- f. Ballast: H45 type, Class H insulated, capable of starting 40-watt mercury-vapor lamp at ambient temperature of minus 20F and above, suitable for remote mounting.
 - g. Remote ballast enclosure: Fiberglass or aluminum with polyester powder paint finish, front access, weather tight construction, 3/4-inch conduit entry and exit knockouts, with mounting lugs suitable for mounting on channel inserts or on wall as shown.
 - h. Source: Hubbell catalog number VMWX-5050C-R, or approved equal.
16. Type X fixture:
- a. Exit sign for top, side, back or pendant-mounting, as needed. With directional arrows. Color of lettering and arrows to comply with jurisdictional requirements.
 - b. Lamps: Ultra-long-life light-emitting diodes (LED) mounted on a circuit board to operate on 120V or 277V, single phase, 60-Hz supply. Have LED's protected by a clear panel and special optical diffuser.
 - c. Housing: Die-cast aluminum, 0.125-inch minimum wall thickness. Concealed hinges and latching mechanism.
 - d. Door: Die-cast aluminum, 0.125-inch minimum thickness; open-face with phosphorescent-glass panel and six-inch high letters; color of letters and field as required by the jurisdictional authority, using fired-on ceramic colors.
 - e. Finish: Clear-satin anodic coating, unless otherwise shown.
- B. Other Lighting Fixtures: Types per WMATA requirements, with materials and finishes specified.
- C. Light Fixtures shall be Class 1 Division 2 type at the Blow Pit and Parts Cleaning Room.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install lighting fixtures as follows:
- 1. Mount fixtures rigidly in place. Use expansion anchors and machine screws for concrete surfaces and toggle bolts for hollow concrete-masonry surfaces. Use appropriate fasteners for attachment to other surfaces. Support lighting fixtures independent of suspended acoustical-panel ceiling systems.
 - 2. Where aluminum contacts concrete or dissimilar metal, separate contact surfaces with gasket, nonabsorptive tape or bituminous coating to prevent corrosion. Use stainless-steel fasteners.
 - 3. Mount fixtures plumb, level and in straight lines. Install stems of suspended fixtures plumb. Group-mounted fluorescent fixtures to appear as one unit.
 - 4. Install 12-inch minimum length of liquid-tight flexible conduit for connection between fixture and outlet box in accordance with Section 16130. Use fixture wire from outlet box in branch circuit to lighting fixture in accordance with Section 16120, and connect fixtures to branch circuit in accordance with Section 16125
 - 5. Install chase nipple where fluorescent fixtures are installed in continuous groups. Clean lamps, diffusers, globes, reflectors and exposed-to-view surfaces of fixtures after aiming and adjusting has been approved.

3.02 FIELD QUALITY CONTROL:

- A. Testing:

1. Furnish necessary personnel and equipment and perform tests and adjustments in the presence of the Engineer. Schedule adjustment of exterior installations to occur during hours of darkness.
2. Test lighting circuits for continuity and operation.
3. Test fixtures for continuity of grounding system.
4. Aim and adjust fixtures to provide optimal distribution pattern as needed and as approved.

END OF SECTION

SECTION 16526

LIGHTING FIXTURES AND MOUNTING POLES

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. This section specifies providing lighting fixtures and mounting poles.
- B. Related Work Specified Elsewhere:
 - 1. Grading, excavation and backfilling: Section 02320.
 - 2. Concrete formwork: Section 03100
 - 3. Concrete reinforcement: Section 03200.
 - 4. Cast-in-place structural concrete: Section 03300.
 - 5. Field painting: Section 09920.
 - 6. Grounding and bonding: Section 16060.
 - 7. Wire, cable and busways: Section 16120.
 - 8. Wire connection accessories: Section 16125.
 - 9. Raceways, boxes and cabinets: Section 16130.
 - 10. Wiring and control devices: Section 16145.

1.02 QUALITY ASSURANCE:

- A. Codes, Regulations, Reference Standards and Specifications:
 - 1. Comply with codes and regulations of jurisdictional authorities.
 - 2. NEC.
 - 3. UL: 496, 542, 1029, 1570, 1571, 1572, Electrical Construction Materials Directory.
 - 4. FS: FF-B-588, FF-P-395, FF-S-325C.
 - 5. MS: MIL-C-450.
 - 6. FED STD: 595.
 - 7. PEI: 1001.
 - 8. SSPC: SP-8, SP-10.
 - 9. ASTM: A53, A167, A276, A123, A507, A575, B26, B85, B117, B136, B137, B209, B221, B244, D635, D1056, D1400, D2240.
 - 10. AASHTO: M314, LTS-3.
 - 11. ITS: Directory of ITS Listed Products.
 - 12. AA: Standard finishes as designated by the Aluminum Association and referenced in NAAMM Metal Finishes Manual.
 - 13. ANSI/IEEE: C62.41.
 - 14. IEEE Publication 587.
 - 15. ANSI Standards.
 - 16. FCC Rules and Regulations, Part 15, Part 18.
 - 17. NEMA 1
 - 18. AISI.
 - 19. IES: RP-20
- B. Each lighting fixture to be labeled or listed per referenced UL or ITS directory.

1.03 SUBMITTALS:

Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

- A. Shop Drawings:
 - 1. Include photometric curves.
- B. Samples: One of each type of fixture.
- C. Certification:
 - 1. Verification that each fixture is in compliance with applicable codes, regulations, reference standards and specifications for the location at which it is to be used. Indicate requirements that each fixture meets.
 - 2. Calculations: Submit calculations by a professional engineer registered in the jurisdiction where material is to be installed certifying that assemblies of foundation, anchor bolts, pole, arms and luminaire will withstand specified wind pressure, wind speed, stress, deflection, vibration and fatigue.

1.04 PRODUCT DELIVERY, STORAGE, AND HANDLING:

- A. Ship each unit securely packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Store lighting fixtures and mounting poles in secure and dry storage facility.

1.05 WARRANTY:

- A. Globes and Diffusers: In addition to warranty requirements of the General Provisions, furnish warranty against discoloration and distortion for a total of four years.
- B. Lamps: Warrant the life of lamps for periods specified.

PART 2 - PRODUCTS

2.01 PRODUCTS AND MATERIALS:

- A. General Requirements for Lighting Fixtures:
 - 1. Interchangeability: Components of same type, size, rating, functional characteristics and make are to be interchangeable.
 - 2. In accordance with UL 1570, UL 1571 and UL 1572.
 - 3. Materials:
 - a. Steel:
 - 1) Sheet: ASTM A507, 22-gauge minimum.
 - 2) Bar: ASTM A575.
 - b. Steel pipe: ASTM A53, Type S.
 - c. Stainless steel:
 - 1) Sheet: ASTM A167, 22-gauge minimum.
 - 2) Bar: ASTM A276, Type 316.
 - 3) Finish: AISI Alloy S30400, NAAMM Finish No. 4, unless otherwise shown.
 - d. Aluminum: Alloy as recommended by manufacturer, unless otherwise shown or specified.
 - 1) Sheet and plate: ASTM B209.
 - 2) Extrusion: ASTM B221, 0.109-inch minimum thickness, unless otherwise shown.
 - 3) Cast:
 - a) Die cast: ASTM B85, 0.1875-inch minimum thickness, unless otherwise shown.

- b) Sand cast: ASTM B26, 0.1875-inch minimum thickness, unless otherwise shown.
 - c) Color-anodized cast: Kalcolor Casting Alloy No. 2 or equal.
- 4. Lamps:
 - a. In accordance with applicable ANSI Standards.
 - b. High-pressure sodium:
 - 1) Coating: Clear, unless otherwise required.
 - 2) Base: Medium or mogul.
 - 3) Rated life: 24,000 hours.
- 5. Lampholders:
 - a. high-pressure sodium:
 - 1) In accordance with UL 496.
 - 2) Black or white thermosetting phenolic compound, glazed-porcelain or neoprene base and body. Neoprene unit molded in one-piece, weatherproof, oil-resistant, with vibration-absorbing socket construction.
 - 3) High-pressure sodium:
 - a) Rated 660 watts, 600 volts: Medium screw base.
 - b) Rated 1,500 watts, 600 volts: Mogul screw base.
 - 4) Provide mechanical self-retaining neoprene gasket for dust and moisture proof seal between lamp and lampholder.
 - 5) Provide vibration proof feature to prevent incandescent lamp from loosening in lampholder in S-1 fixture
- 6. Ballasts:
 - a. High-pressure sodium lamps:
 - 1) UL 1029, high-power-factor type.
 - 2) Operable on 120-volt or 277-volt, 60 Hertz as necessary, type and rating suitable for associated lamp.
 - 3) Capable of starting lamp at ambient temperature of minus 20F and above.
 - 4) Equip with individual fuse protection installed in ballast compartment of fixture.
- 7. Fixture body and housing: Shape, size and material as required.
- 8. Reflector: Shape, size and material as required. Aluminum or stainless steel polished to mirror finish. Minimum thickness 22 gauge.
- 9. Lenses:
 - a. Plastic lenses: Clear polycarbonate, minimum thickness 0.06 inch.
 - b. Glass lenses: 1/4-inch tempered glass, laminated glass, or 1/8-inch double-strength clear glass, capable of absorbing ultraviolet rays.
- 10. Fixture wire: Section 16120.
- 11. Gasket:
 - a. Keyed gasket: One-piece, extruded solid neoprene having Type A durometer hardness of 30 plus-or-minus five when tested in accordance with ASTM D2240.
 - b. Self-retaining gasket:
 - 1) One-piece, closed-cell sponge neoprene, soft or medium density.
 - 2) Resistant to aging, heat, ultra-violet light, water, oil, weathering and setting as determined by ASTM D1056.
 - 3) Cemented to component with resilient neoprene sealing compound compatible with finish. Adhesive not applied to diffuser.
 - c. Silicone gasket equal to neoprene, at Contractor's option.
- 12. Hardware:
 - a. Latches, catches, release mechanisms, hinges, screws, bolts, studs, nuts, rivets, washers and springs. Heavy-duty stainless steel or bronze.
 - b. Latches and catches: Captive-type.

- c. Operating hardware: Self-retaining type.
13. Construction:
- a. Fixture body, reflectors, wiring channels, end caps and castings formed so as to prevent buckling or distortion.
 - b. Minimum of two wire clips provided in wiring channel to support wiring. Self-cleaning air filter provided on breather ports.
 - c. Seams and joints continuously welded and ground smooth.
 - d. When aluminum will be in contact with dissimilar metal, separate contact surfaces with gasket, nonabsorptive tape, or coating to prevent corrosion.
14. Finish:
- a. Baked enamel: Nonspecular finish consisting of six-stage hot-cleaning wash, phosphate coat, prime coat, and finish coat of sprayed white or other color acrylic enamel, baked at 350F for a minimum of 30 minutes, with the following additional requirements:
 - 1) Dry-film thickness (DFT) per ASTM D1400: 1.25 mils minimum.
 - 2) Undercutting of enamel film from scored line after exposing to 10-percent salt spray for 1,500 hours, per ASTM B117: 0.067-inch maximum.
 - 3) Baked white enamel after 100 hours exposure to fadeometer: 86-percent minimum reflectance factors, no appreciable visual color change.
 - 4) Bronze color: FED STD 595, Color No. 20040.
 - b. Clear anodic coating: AA-M22C22-A41, minimum coating thickness 0.8 mil, coating weight 35 milligrams per square inch, hot-water seal overall, tested in accordance with the following requirements:
 - 1) Coating weight: ASTM B137.
 - 2) Coating thickness: ASTM B244.
 - 3) Sealing test: ASTM B136.
 - 4) Undercutting of anodic film from scored line after exposing to 10-percent salt spray for 1,500 hours, in accordance with ASTM B117: 0.067-inch maximum.
 - c. Color-anodized finish: NAAMM AA-M22-C22A42, minimum coating thickness 0.8 mil, coating weight 35 milligrams per square inch, hot-water seal overall, tested in accordance with the following requirements:
 - 1) Coating weight: ASTM B137.
 - 2) Coating thickness: ASTM B244.
 - 3) Sealing test: ASTM B136.
 - 4) Color: Dark Bronze. Kaiser Aluminum Color, Statuary Bronze; Alcoa Color, Dark Bronze, Duranodic 313.
 - d. Zinc coating: ASTM A123.
 - e. Factory-painting: Prepare surfaces by pickling in accordance with SSPC SP-8. Apply coating of 7.0-mil total DFT as follows:
 - 1) First coat: Inorganic zinc-silicate primer, 2.5-mil DFT.
 - 2) Second coat: High-build epoxy primer, 3.0-mil DFT.
 - 3) Third coat: Aliphatic polyurethane, 1.5-mil DFT, FED STD 595, Color No. 20040.
 - f. Field painting: Section 09920.
 - g. Electrostatic-powder coating: Prepare surfaces by sandblast cleaning complying with SSPC SP-10 near-white blast cleaning, applying coating promptly after cleaning. Ground material to be coated. Apply coating as electrostatically-charged dry powder using electrostatic spray gun to produce DFT of six mils plus-or-minus two mils. Cure by heat treatment.
15. Mark each fixture and its components in accordance with applicable reference standard.
16. Conduit: Section 16130.

17. Connectors: Section 16125.
18. Anchor bolts, nuts and washers:
 - a. AASHTO M314, hot-dip galvanized.
 - b. Bolts hooked, unless otherwise shown or recommended by manufacturer of pole or structure being anchored.
 - c. Two nuts and one washer for each anchor bolt for plumbing pole or leveling structure.
 - d. Finish: Where exposed, custom finish exposed parts to match surface being fastened.
19. Mounting poles:
 - a. Steel or aluminum, straight or tapered as required. Complete assembly of anchor bolts, pole, arms and luminaire designed to withstand wind pressure (P) developed by wind speed (V) of 80 MPH in accordance with AASHTO LTS-3. Pole assembly to fully comply with AASHTO requirements for permissible stresses, deflection, vibration and fatigue. Ratio of deflection to pole height under action of applicable static loading not to exceed 1/60.¹¹
 - b. Base assembly: Steel base plate, designed to withstand full-bending movement of shaft and welded to shaft; anchor bolts; and base cover.
 - c. Handhole size: As required, with 12-gauge steel sheet coverplate.
 - d. Polygonal-shaped poles fabricated with sharp bends.
 - e. Longitudinally welded with welds continuous and ground smooth.
20. Grout: Section 03300, nonshrink. Where recommended by manufacturer, prime surfaces to be grouted.
21. Concrete base, including forms and reinforcement: Division 3, Sections 03100, 03200, and 03300.
22. Bituminous coating: MS MIL-C-450.
23. Photoelectric control: Section 16145.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install lighting fixtures as follows:
 1. Mount fixtures rigidly in place.
 2. Where aluminum contacts concrete or dissimilar metal, separate contact surfaces with gasket, nonabsorptive tape or bituminous coating to prevent corrosion. Use stainless-steel fasteners.
 3. Mount fixtures plumb, level and in straight lines.
- B. Installation of Pole-Mounted Fixtures:
 1. Prepare and compact that earth foundation for mounting in accordance with Section 02320. Form and reinforce concrete base as required and in accordance with Sections 03100 and 03200. Mix and place concrete in accordance with Section 03300. Use finish Number 2 for exposed surfaces. Use templates for setting anchor bolts.
 2. Install mounting pole at locations determined by design. Use double nuts to erect poles plumb. Pack void between concrete base and pole with grout in accordance with Section 03300.
 3. Install conductors in accordance with Section 16120, leaving three-foot minimum lengths of conductors for fixture connections; tape or otherwise secure in place pending final connection.
 4. Install lighting fixtures in accordance with approved shop drawings.
 5. Connect wiring using connectors in accordance with Section 16125. Tape connections.
 6. Install photoelectric controls as required or in accordance with fixture manufacturer's instructions and in accordance with Section 16145.

7. Ground lighting fixtures and mounting poles in accordance with NEC and Section 16060.
8. Apply touch-up paint where necessary in accordance with Section 09920.

3.02 FIELD QUALITY CONTROL:

- A. Ensure that earth foundation for mounting poles is prepared and compacted in accordance with Section 02320.
- B. Testing:
 1. Furnish necessary personnel and equipment and perform tests and adjustments in the presence of the Authority Representative. Schedule adjustment of exterior installations to occur during hours of darkness.
 2. Test lighting circuits for continuity and operation.
 3. Test fixtures and mounting poles for continuity of grounding system.
 4. Aim and adjust fixtures to provide required distribution pattern.

END OF SECTION

SECTION 16700

SCOPE OF WORK - COMMUNICATIONS

1.01 SUMMARY:

- A. General communications requirements shall include design of the communications systems to support new tracks, new shop facilities, and necessary connections to the operating system and OCC at Greenbelt, Brentwood, and Shady Grove Yards in accordance with WMATA Design Criteria, and WMATA Standard Specification Sections. They shall include procurement of all necessary material, installation, provisions for support and test equipment, initial spares, training of operators and maintenance personnel, provision of as-built drawings, technical manuals and Operations and Maintenance manuals, installation testing, and inspection and punch list correction of the finished system.
- B. The new communications must interface with the existing yard and operating system communications, and must be installed on a not to interfere basis with yard or mainline operations.

1.02 Tasks:

- A. Prepare designs in accordance with WMATA Design Criteria and other contract documents or references:
 - 1. Survey the existing systems at the yard with the understanding that , wherever practicable, the existing systems should be expanded rather than replaced.
 - 2. Provide the specification sections and drawings for the procurement, installation, extension, integration, testing and cut-over of yard communications systems for the new facilities, and for necessary modifications to existing systems. Include provisions for Carrier Transmission System, Fiber Optics System, Yard Public Address System, Talk Back System, Telephone System, Radio System, Fire and Intrusion Alarm System, Closed Circuit Television System, Mobile Radio extension to cover the interior of the new shops, communications power distribution system, control consoles, elevator emergency communications, network facilities, other miscellaneous communications systems as required, and equipment, spares, ancillary equipment, technical documentation, and related items.
 - 3. Provide specification sections and drawings for any necessary modification to the communications systems, and existing yard buildings and other facilities communications.
 - 4. Include any necessary modifications or additions in the Jackson Graham Building communications equipment room.
 - 5. Prepare drawings, specification sections and other information required to fully integrate the systems to be installed in the new facilities for the yards with the already existing systems.
 - 6. Provide conduit requirements including line diagrams, schedules and details as necessary for construction.
 - 7. Develop installation space, HVAC and electrical requirements for the normal and emergency communications in the new shops.
 - 8. Coordinate requirements with other systems and coordinate design with train control, trackwork, elevator, traction power and electrical service power designs.
 - 9. Prepare test procedures and test plans for the integration, cut-over and acceptance of the new communications systems.
- B. Procure required equipment and material:
 - 1. Furnish fiber optic cable, coaxial cable and copper wire as necessary for the various communications items.
 - 2. Furnish all telephone, public address, talk-back, data transmission, carrier transmission, fiber optics, fire alarm, CCTV and other components and equipment

- required for the communications systems.
3. Furnish or update communications system control consoles as required.
4. Furnish -48VDC, 120VAC and other electrical equipment for communications system power.
5. Furnish all test equipment necessary to maintain the communications systems.
6. Furnish initial spares required for maintenance of the new communications systems.

C. Construction:

1. Fabrication and installation of the new and modified portions of the yard communications, including testing, integration, and qualification of all items and sub-systems.
2. The above construction is all encompassing and includes all pertinent related items and appurtenances associated with the communications system.
3. During the renovation process support the demolition, relocation, and restoration of all yard facilities to ensure continuing operation of all critical communications systems.
4. Include in-progress and final inspection of all new or modified communications systems.

D. Acceptance:

1. Provide final integration, cut-over and testing of all new and affected existing communications systems.
2. Conduct Substantial Completion Inspection in conjunction with the Authority's Representative.
3. Correct all punch list items.
4. Provide training to operation and maintenance personnel for the new communications systems.
5. Provide as-built documentation, including manuals and as-built drawings, for all items furnished and installed.
6. Provide as-built updates to support new yard emergency response maps.
7. Provide as-built updates to Gatehouse Data Files.

2.01 Design-Builder RESPONSIBILITIES:

- A. The Design-Builder shall design the communications to support the new S & I shop expansion and renovations to include the systems listed below in updating the communications to support the Greenbelt, Brentwood, and Shady Grove facilities. The Design-Builder shall make all necessary connections so that the new and existing equipment information is relayed back to the Jackson Graham Building without interruption of WMATA's communications systems.

2.02 CARRIER TRANSMISSION SYSTEM

A. General Requirements

1. The Carrier Transmission System (CTS) is an integral part of the WMATA telecommunications network used to multiplex voice and data transmissions of the WMATA Rail Rapid Transit System into a trunked digital carrier. The CTS uses a T1 digital format to transmit trunked information between the CTS hub at the Jackson Graham Building and terminal locations (passenger stations, yards and selected buildings) along the WMATA right-of-way.
2. The principal means of transmitting trunked (T1) information within the WMATA network is Optical Fiber.
3. This Section covers the installation of T1 terminals and/or related equipment in the Yards and the Jackson Graham Building.

4. The Design-Builder shall upgrade the existing Carrier Transmission System as necessary to support the Yard upgrades.
5. The Design-Builder shall only use equipment fully compatible with the existing system. If the existing system can not be expanded, the Design-Builder shall provide for new CTS channel bank design and install between the appropriate Yard and the Jackson Graham Building for voice/data communications.
6. The CTS shall be interfaced to the existing WMATA FOS available at the appropriate main line station, or at the appropriate Yard, as directed by the WMATA Representative .

B. Yard Specific Requirements

1. No major interface to the existing Carrier Transmission System is anticipated as part of this project. The Design-Builder is responsible to survey total requirements to ensure that the existing systems can accommodate all new requirements.

2.03 FIBER OPTIC SYSTEM

A. General Requirements

1. The Fiber-Optics System (FOS) will provide the transmission medium for multiplexed voice and data signal transmissions between the Jackson Graham Building and the Yards. The Carrier Transmission System (CTS) is utilized to multiplex voice and data signals.
2. The Backbone Fiber-Optic System at the relevant Yards is in place and will require no upgrades as part of this program.

B. Yard Specific Requirements

1. No major interface to the existing Carrier Transmission System is anticipated as part of this project. The Design-Builder is responsible to survey total requirements to ensure that the existing systems can accommodate all new requirements

2.04 YARD PUBLIC ADDRESS SYSTEM

A. General Requirements

1. The Public Address System shall provide for announcements to be made in all Yard buildings.
2. The Public Address System shall consist of loudspeakers, including enclosures and baffles, and paging horns. A Telephone Access Paging System, power amplifiers, distribution panels and jack field panels shall be provided in the Communications Equipment Room.
3. The loudspeakers of the Public Address System shall be grouped into individual zones. The Public Address System shall be configured to permit announcements to be made to the speakers in an individual zone, or simultaneously to a combination of any and all zones (ALL PAGE) by dialing the appropriate zone code(s).
4. The Telephone Access Paging System shall accept an audio input from the existing Telephone System and provide the appropriate dialed zone decoding and audio routing of the announcements to the desired zone amplifiers, which provide audio

amplification for announcements to each zone circuit. The audio inputs and outputs of the Telephone Access Paging System shall be connected to a distribution panel.

5. Jack field panels shall provide audio test points for the Public Address System. Each Public Address Loudspeaker circuit shall be wired through a jack field panel to a loudspeaker distribution panel. In addition, the loudspeaker distribution panels shall provide single point ground connections for the Public Address System cabling.
6. The Design-Builder shall upgrade the existing Public Address System if found inadequate to support the new Yard shop facilities, renovations, and relocations.
7. The Design-Builder shall determine how to upgrade the existing Public Address System to provide coverage for the new Yard shop facilities. If the existing system is inadequate to provide coverage the Design-Builder shall use Specification 16823, attached in this RFP as a Reference on the scope of work, installation and example of equipment for procurement.

B. Yard Specific Requirements

1. The requirements for Yard S&I shop Public address System and Telephone Access Paging System are applicable to all Yards in this project.

2.05 YARD TALK BACK SYSTEM

A. General Requirements

1. Provide voice paging from the Yard Communications Console located in the Yard Control Room, to personnel located track side (via nearby loudspeaker/talkback stations) or to the Gatehouse Building console.
2. Provide the ability for track side personnel or Gatehouse personnel to verbally answer a page or signal the Yard Communications console that they want to talk to the Yard dispatcher.
3. Broadcast an emergency tone, originating from the Communications Console, to the loudspeaker/talkback stations located track side.
4. Broadcast an "All Call" verbal message, originating from the Communications Console, to all of the loudspeaker/talkback stations located track side.
5. The Yard Talkback System (also known as the Talkback System) will provide paging and talkback service between the Yard Communications Console located in the Gatehouse and the talkback stations located along the tracks throughout the yard area.
6. The Yard Talkback System includes a master control panel in the Yard Communications Console from which the Yard Dispatcher can call the talkback stations located in the vicinity of track switching points throughout the Yard. This panel gives the dispatcher the ability to select a specific Yard talkback station, to select all talkback stations simultaneously, to broadcast an emergency tone and/or identify and listen to an incoming call from a Yard talkback station.
7. The Yard talkback stations provide trackside personnel with the ability to hear a voice page over loudspeakers (they only have to be in the vicinity of the station, not directly in front of it); the ability to verbally respond by talking toward the loudspeaker(s); or to signal the Yard Communications Console, by pushing a button, when they want to talk to the dispatcher.

B. Yard Specific Requirements

1. There are no plans to upgrade the Yard Talkback System. The Design-Builders responsibility is limited to the repair of collateral damage to the existing system. If additional information is required see Section 16840 of these specifications.

2.06 YARD TELEPHONE SYSTEM

A. General Requirements

1. The Yard Telephone System is part of the WMATA Telecommunications Network. Its purpose is to provide telephone service to WMATA personnel working within the Yard limits.
2. Telephone instruments associated with the Yard Telephone System shall also be capable of accessing the Yard Public Address System.
3. The Yard Telephone System shall provide automatic Dual Tone Multiple Frequency (DTMF) tone telephone service in the Yard S & I shop and other yard facilities. All telephone instruments shall be wired to the existing S&I Shop Communications Room using dedicated CAT 5 cable and tie cables as required. All telephone instruments (with their own station number) shall be cross connected to the appropriate demark point.
4. Digital feature telephone instruments shall be installed in most Yard administrative areas where telephone service is required. In some ancillary structures and shop areas, analog single-line ruggedized wall telephones shall be installed.
5. Analog single line telephone instruments shall be installed in Emergency Trip Station (ETS) enclosures.
6. The Yard Telephone System shall include an interface to the Yard Public Address System. Personnel within the yard shall be able to access and make voice communications over the Yard Public Address System, by dialing a restricted four (4) digit access code.
7. Intercom calling capability will be available between telephone instruments located throughout the yard, via the existing Yard Telephone System. Intercom calls can be expedited by programming telephone extension numbers, which are frequently called, into the memory (auto-dial) feature of telephones equipped with this function.
8. The Design-Builder shall upgrade the existing Yard Telephone System to provide service as required to all new, renovated, or relocated shop facilities.

B. Yard Specific Requirements

1. Greenbelt Yard - The primary Telephone System interface at this location is a ROLM 8000 Satellite PABX located in the existing S&I Shop Communications Room. This PABX will require expansion and all administrative telephone instruments must be digital and compatible with this system.
2. Brentwood Yard - The primary Telephone System interface at this location is a ROLM 8000 Satellite PABX located in the existing S&I Shop Communications Room. It is not anticipated that this PABX will require expansion, however the Design-

Builder must review pre and post renovation service requirements to determine final PABX design. All administrative telephone instruments must be digital and compatible with this system.

3. Shady Grove Yard - The primary Telephone System interface at this location is an Avaya, Inc digital key system. This key system can accommodate limited expansion. The Design-Builder must survey this facility to determine final system requirements. If necessary an additional or replacement digital key system must be provided. All administrative telephone instruments must be digital and compatible with the existing key system.
4. All Yards - At all yards a category 5 data cable must be run with each administrative telephone cable and terminated in dual jack with the telephone cable for LAN/WAN use.

2.07 YARD MOBILE RADIO SYSTEM

1. The Yard Mobile Radio System consists of two subsystems; the Yard Dispatcher's Mobile Radio Subsystem and the Yard Gatehouse Radio Subsystem.
 2. The WMATA Yard Dispatcher's Mobile Radio Subsystem (hereinafter referred to as ("Yard Dispatcher's Radio Subsystem")) shall provide two-way voice communications between a base station and WMATA Yard personnel (with portables), between the base station and transit trains within the confines of the yard and lead track areas.
 3. The WMATA Yard Gatehouse Mobile Radio Subsystem (hereinafter referred to as the ("Yard Gatehouse Radio Subsystem")) shall be used to communicate with the Transit Police and Security network (MTPD) within the yard area on the primary MTPD frequency.
- B. Yard Specific Requirements
1. All Yards - The Design-Builder shall evaluate coverage of the Yard Dispatchers Radio Subsystem in the interior areas of existing, renovated, and new S&I Shop facilities. If necessary the Design-Builder shall provide off-the-air antennas, wide band amplifiers, and antennas within the shop areas to enhance coverage.

2.08 YARD CLOSED CIRCUIT TELEVISION

- A. General Requirements
1. The Closed Circuit Television (CCTV) System consists of two independent CCTV Systems.
 2. The Gatehouse CCTV System shall provide the Gatehouse attendants with surveillance of major parking bays and the yard perimeter. The primary use of this system is for the purpose of surveillance and security.
 3. The Yard Operations Control CCTV System shall provide the Yard Tower attendants with surveillance of interlocking switching track areas. The primary use of this system is to facilitate yard operations.
- B. Yard Specific Requirements
1. Greenbelt Yard - This Yard Tower has an existing CCTV and monitoring capability.

No additional facilities are anticipated as being required under this project.

2. Brentwood Yard - This Yard Tower has an existing CCTV and monitoring capability. No additional facilities are anticipated as being required under this project.
3. Shady Grove Yard - This Yard Tower has no existing CCTV capability. Construction of the new S&I Shop addition will obstruct the attendants view of key interlockings. The Design-Builder shall provide a CCTV System to support yard operations for this Control Room. The system must provide views of all yard interlockings and include PT&Z capability for all cameras. The system shall include monitors, switchers, PT&Z control panel, power supplies, and all other equipment to provide an integrated independent system.
4. No improvements are anticipated for the Gatehouse CCTV System. The Design-Builder is responsible for the repair and restoration due to collateral damage during construction. This responsibility includes the possible obstruction of camera fields of view.

2.09 YARD ELECTRICAL POWER DISTRIBUTION SYSTEM

- A. The Yard Electrical Power Distribution System provides power distribution from the 3-phase, 4-wire, 120/208 VAC, primary power feed, to the Yard communication systems. This system shall be tied in to the S & I shop facilities at all yards.
- B. The Electrical Power Distribution System described herein includes the following facilities:
 1. 110/120 VAC Emergency Power (from existing UPS) for communications equipment in the Yard Operations Building Communications Equipment Room, Bell/ITSV (Data) Room, Yard Control Room and the Gatehouse.
 2. -48 VDC power for communications equipment in the Communications Equipment Room.
- C. The 120 VAC Emergency Power Distribution System described herein includes but is not limited to the following components:
 1. In the Communications Equipment Room;
 - a. Power Distribution Panelboard
 - b. AC Power Receptacles
 - c. AC Power Disconnect Switches
 2. In the Bell/ITSV (Data) Room;
 - a. AC Power Disconnect Switch
 - b. AC Power Receptacles
 3. In the Yard Tower
 - a. AC Power Disconnect Switch
 - b. AC Power Receptacles
 4. In the AC Switchboard Room
 - a. Power Transformer
 5. In the Gatehouse
 - a. Emergency AC Power Disconnect Switch
 - b. Emergency Power Distribution Panelboard
 - c. AC Power Receptacles
 6. In the S & I shop
 - a. AC Power Disconnect Switch
 - b. AC Power Receptacles
 - c. Required conduits and fittings, junction boxes, feeder wires, and branch circuit wiring and cabling to apportion the 120 VAC power to the communications systems and facilities equipment.

- D. The -48 VDC Power Distribution System described herein includes but is not limited to the following components:
 - 1. In the Communications Equipment Room;
 - a. -48 VDC Power Supply
 - b. -48 VDC Power Distribution System Status Panel.
 - 2. The -48 VDC Power Distribution System provides fail safe service by load-sharing several power supplies. Power supplies may be removed from the active -48 VDC Power Distribution System for repair, or added for increased capacity without disrupting communications services.
- E. The Status Panel provides voltage and current metering for the -48 VDC Power Distribution System. The Status Panel also distributes -48 VDC power to the Carrier Transmission (CTS), and Fiber Optic (FOS) Systems equipment racks and, as needed, to any other communications equipment racks requiring a source of -48 VDC powers. The -48 Vdc shall be run and connected to the S & I shop communications room.
- F. Yard Specific Requirements
 - 1. The Design-Builder shall determine the additional electrical loads at each yard location and add or reconfigure power distribution equipment to accommodate the communications system expansions and additions.

2.10 YARD CONSOLES

- A. General Requirements
 - 1. All WMATA yards have a Communications Console in the yard Gatehouse and the YardTower.
- B. Yard Specific Requirements
 - 1. At Greenbelt and Brentwood Yards no Communications Console modifications or upgrades are anticipated under this project.
 - 2. At Shady Grove the Design-Builder will be responsible for integrating the Yard Operations Control CCTV System controls into the existing Yard Tower Console.

2.11 YARD FIRE ALARM SYSTEM

- A. General Requirements
 - 1. The Design-Builder shall expand the existing Yard Fire Alarm systems as necessary to support the coverage of the new and renovated S & I shop facilities in accordance with all applicable codes and regulations. The reporting features shall be displayed in the Gatehouse, Yard Control Room, and the Jackson Graham Building. Where expansion is impracticable, the expansion area shall be covered as necessary by a new Fire Alarm system.
 - 2. Yard Intrusion Alarms at all yards has recently been updated by WMATA and is now an independent system from the Fire Alarm System. All new intrusion detection or access control must interface to this system.
 - 3. Each S&I Shop location must have a new or updated Graphic Annunciator Panel showing all zones in that facility.
 - 4. The Design-Builder is responsible for coordination with the appropriate local jurisdiction for approvals and occupancy permits. Submittals to local jurisdictions for

approval must be reviewed by WMATA prior to submission.

B. Yard Specific Requirements

1. Greenbelt Yard - The new S&I Shop at this yard will require a new Fire Alarm system and Graphic Annunciator Panel. This system shall provide a summary alarm to one of the zone modules of the existing Kiddie 1000 Fire Alarm Panel located in the communications room of the existing S&I shop. This will fulfill the requirement for reporting to the Gatehouse, Control Room, and Jackson Graham Building.
2. Brentwood Yard - This facility will require the rezoning and rewiring necessary to support the renovations of existing yard facilities. Fire Alarm System capacity should not be an issue at this facility.
3. Shady Grove Yard - This facility is served by a Kiddie 1000 Fire Alarm System that is presently utilized at full capacity. The new S&I Shop Addition will require a new Fire Alarm System. The Design-Builder will also be required to provide rezoning and rewiring necessary to support renovations within the existing S&I Shop. If a zone can be freed in the Kiddie 1000 Panel during this process, then connecting the new system to this zone will fulfill reporting requirements to the Gatehouse, Control Room, and Jackson Graham Building.
4. All Yards - A new Intrusion System has recently been installed in all yards which includes Edwards EST -3 panels. The Design - Builder may wish to consider integrating the Fire Alarm System upgrades into this panel subject to the Authority Representative's approval.

2.12 DATA COMMUNICATION SYSTEM

A. General Requirements

1. The Yard Data Communications System is part of the WMATA computer network. Its purpose is to accommodate present and long term requirements of WMATA Information Technology Services (ITSV) for the transmission of digital data between WMATA facilities. Initially, ITSV requires the transmission of data between the existing Mainframe computer in the Jackson Graham Building, and Terminals and Personal Computers to be installed by others in the Yard Buildings.

B. Yard Specific Requirements

1. Greenbelt Yard - At this yard the Data Communication System will require a multi-fiber tie cable(s) from the new S&I Shop to the yard Operations Building communications room. This cable(s) shall include a minimum of 18 multi-mode and 6 single mode fibers. Routing shall be to the existing S&I Shop communications room. Fiber termination equipment and SC patch panels shall be provided and installed in the Communications Room at both locations. The new cable(s) is to remain un-terminated with 100 feet coiled in each Communications Room. In the new S&I Shop the Design-Builder shall run and terminate in wall jacks and patch panels CAT 5 data cable to all administrative telephone locations and other selected locations within the shop area. In addition the Design-Builder shall support the moves and changes required during renovation of existing S&I Shop facilities.
2. Brentwood Yard - The effort at this location will primarily involve support and restoration of Data Communications during the S&I Shop renovation process. CAT 5 cable shall be run to all administrative telephone locations and be terminated in wall jacks and patch panels.

3. Shady Grove Yard - At this location the Design-Builder must provide new CAT 5 cable distribution and termination to support the new S&I Shop additions. CAT 5 cable shall be run to all administrative telephone locations and be terminated in wall jacks and patch panels.

3.0 MAJOR ITEMS ESTIMATED QUANTITIES:

- A. The Design-Builder is responsible for determining the actual quantities of communications system major items, components and cabling. Major items shall be interpreted to include incidental items, not specifically mentioned, but required for complete and proper system operation.

3.01 CARRIER TRANSMISSION SYSTEM:

ITEM DESCRIPTION	GREENBELT YARD	BRENTWOOD YARD	SHADY GROVE YARD

SECTION 16701

DEFINITIONS OF COMMUNICATION SYSTEM TERMS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Standard Definitions
 - 1. Definitions pertaining to the communication design and equipment description shall conform to the standard definitions promulgated by the following organizations unless otherwise specified in this Section (16701)
 - a. Current versions of the Association of American Railroads (AAR)
 - b. Electronic Industries Alliance (EIA)
 - c. The Institute of Electrical and Electronics Engineers, Inc. (IEEE)
 - d. The National Fire Prevention Association (NFPA)
 - e. Local and state building and fire procedure codes not superseded by provision of the "Fire Protection Equipment and Life Safety Agreements" executed between WMATA and local jurisdictions.

- B. Order of Priority
 - 1. Where definitions conflict, the order of priority shall be:
 - a. Definitions of Communications Systems Terms (Section 16701)
 - b. Current versions of the Association of American Railroads (AAR);
 - c. EIA;
 - d. IEEE.
 - e. NFPA

- C. Glossary of Communication Terms Used in These Communication Specifications

1.01 RELATED SECTIONS

All Sections in the 16700 and 16800 Series.

1.02 REFERENCES

- A. Current versions of the Association of American Railroads (AAR)
- B. Electronic Industries Alliance (EIA)
- C. The Institute of Electrical and Electronics Engineers, Inc. (IEEE)
- B. "Fire Protection Equipment and Life Safety Agreements" executed between WMATA and local jurisdictions

1.04 GLOSSARY OF COMMUNICATION TERMS

Words, terms, and phrases used in these Communication System Specifications are defined as follows:

AAR:

Association of American Railroads
50 F Street, N.W.
Washington, D.C. 20001-1564

Absorption Losses:

(Fiber Optics) Reduction in light amplitude or strength caused by impurities in the optical fiber and by the scattering of light from the optical fiber.

AC Service Room:

Room housing equipment and facilities for the distribution of ac power throughout an installation such as a passenger station or shop building.

Alarm:

An alerting signal indicating an abnormal condition.

Alphanumeric:

Alphabetic and numeric representation, letters, numbers, and symbols.

Amplitude Modulation (AM):

The process of varying the amplitude of a carrier wave in accordance with the instantaneous value of a modulating signal.

Ambient:

Typical of the environment. Specifically used to designate properties of the surroundings which are measurable and distinguishable from absolute zero energy levels.

Angstrom:

(Fiber Optics) A unit of optical wavelength historically used in the field of optics, but not an International System unit. 1 Angstrom=0.1 nanometer.

American Standard Code for Information Interchange (ASCII):

Consists of 10 or 11 bits per character - one start bit, seven information bits, one parity bit, one or two stop bits.

Ancillary Building:

A room, area or structure which is not considered typical to all Metrorail passenger stations.

Annunciator:

An audible signaling device which usually includes signal lights, each one indicating the conditions that exist or have existed in an associated circuit.

ANSI:

American National Standards Institute
1819 L Street, NW
Suite 600
Washington, DC 20036

Armored Cable:

A cable provided with a wrapping of metal primarily for the purpose of mechanical protection. The armor is sometimes used as an electrical shield.

ASTM:

American Society for Testing and Materials
100 Barr Harbor Drive
West Conshohocken, Pennsylvania 19428-2959

At-Grade:

That portion of the system which is constructed at the approximate elevation of the adjacent ground surface.

Attenuation:

1. A decrease in the amplitude of a signal as it travels along or through a transmission medium, usually expressed as a ratio or in dB.
2. (Fiber Optics) A measure of the decrease in energy transmission (loss of light) expressed in dB/km. In optical waveguides it is primarily due to absorption losses and scattering losses.

Attenuation Distortion:

Distortion caused by the non-uniform attenuation or gain of a system, with respect to frequency, under specified terminal conditions.

Audio Frequency:

Frequency range approximately equal to 15 Hz to 20,000 Hz (i.e. frequencies typically audible by human ears).

Authority, The:

Washington Metropolitan Area Transit Authority (WMATA).

(The) Authority Representative

Wherever, on the Information Drawings or in the Specifications, the term "Authority Representative" is used, it shall mean the duly authorized representative of the Contracting Officer.

Auto Scan:

The automatic scan of the TV cameras in the horizontal (pan) plane.

Automatic Fare Collection (AFC):

Computer controlled system for the collection of fares, control of access, and associated functions.

Automatic Frequency Control (AFC):

Means whereby the frequency of a circuit is automatically maintained, within specified limits, with respect to a reference frequency.

Avalanche Photodiode (APD):

(Fiber Optics) One type of receiver or detector used in the receiving portion of Fiber-Optics terminals or repeaters. It is called a detector or receiver, since it detects and converts the light signal to a copy of the original electrical signal.

Bandwidth:

1. Limiting frequencies between which the performance of a device or system falls within specified limits.
2. (Fiber Optics) The capacity of an optical fiber to transmit information, expressed in bits of information transmitted per specific time period for a specific length of optical waveguide. Bandwidth is limited by pulse spreading or broadening due to dispersion, so that adjacent pulses overlap and cannot be distinguished.

Ballast:

1. Crushed rock or stones placed between, under, and at the ends of railroad ties.
2. (Electronics) A device utilized to limit current flow.

Battery:

An assembly of cells electrically connected for producing electric energy. In telephone systems, it usually refers to centralized dc source, located in the central office, nominally -48 volts.

Baud:

1. Unit of signaling speed equal to the number of discrete signal events per second.
2. Binary Coded Decimal (BCD)
3. A notation in which each individual decimal digit is represented by a pattern of "ones" and "zeros."

Bit:

A binary digit, 0 or 1 in number representation, with the radix 2.

Bus:

A conductor, or group of conductors, that serve as a common connection for two or more circuits.

Cable Binder:

A wrapping of tapes or cords around several conductors of a multiconductor cable used to hold them together which may be color coded to designate the group of conductors enclosed.

Cable Tray:

1. A tray or rack used for the installation and support of cable.
2. Cable Trough
3. A trough used for the installation, support, and protection of cable.

Call:

The act of establishing and completing a telephone connection from one telephone instrument to another.

Called Party:

The telephone instrument at the "distant end" being called.

Calling Party:

The telephone instrument that originates the call.

Cardioid (Pattern):

A heart-shaped pattern obtained as a response or radiation characteristic of certain directional antennas, or as the response characteristic of certain types of microphones.

Cassette:

A small reel-to-reel tape magazine on which is recorded analog or digital information.

Cassette Recorder:

A tape recorder used to record or playback cassettes.

CCS:

Hundred-Call-Seconds - A measure of communications traffic equal to one hundred seconds of communicating. In practice, "CCS" is used for hundred call seconds per hour.

Central Office:

Equipment in a telephone system that provides centralized switching, battery, and supervision for a group of subscribers or terminals (i.e. a Main PABX or Satellite PABX Equipment Room).

Channel:

A path for transmitting electrical signals.

Character:

A combination of bits denoting a specific alphanumeric symbol.

Chromatic or Material Dispersion:

(Fiber Optics) This refers to "colors" or wavelengths in a lightwave source. Light rays with different wavelengths travel along a fiber at different speeds. The broader the range of wavelengths emitted, the more light pulse will spread as it traverses the length of the fiber.

Circuit:

1. A conductor or system of conductors through which an electric current is intended to flow.
2. A network providing one or more closed paths.

Cladding:

(Fiber Optics) The low refractive index material which surrounds the core of the fiber and protects against surface contaminant scattering. The cladding may be glass or clear plastic. In interoffice telecommunication systems, glass cladding is used.

C-Message Weighting:

Noise weighting used in a noise measuring set to simulate use of the Type 500 telephone (which has characteristics that are typical of most modern telephone instruments in commercial use in this Metropolitan area).

Combined Distribution Frame (CDF):

A distribution frame which, in addition to the functions of an MDF, provides for the cross-connection of the PABX subscriber line multiple and the subscriber line circuits.

Command Message:

Digital message transmitted from the Mobile Radio System control console to base stations to query status or to direct action.

Command Message Enable:

Message used to cause selected base station(s) to be ready for two-way voice operation.

Command Message Station Connect:

Message used to restore a base station(s) to service in the system in a quiescent mode with its receiver in a monitoring condition with squelch operating.

Command Message Station Disconnect:

Message used to intentionally remove a base station(s) from service in the system.

Commercial Telephone Network:

The public telephone system. In the WMATA area, usually Bell Atlantic for local public network and special services cable connections.

Communications Equipment Room:

Room housing centralized communications equipment for an installation such as a Metrorail passenger station or yard.

Communications Ground:

An earth ground connection of 5 ohms or less resistance that is provided in the Communications Equipment Room in each passenger station and yard for the sole purpose

of grounding communications equipment. The Communications Ground in the Communications Equipment Room at Jackson Graham Building has a resistance of 1 ohm or less to earth.

Compondor:

A combination of a compressor at one point in a communications path for reducing the amplitude range of signals followed by an expander at another point for a complementary increase in the amplitude range. The purpose is to improve the ratio of the signal to the interference entering the path between the compressor and the expander.

Compartmental Cable:

A multiconductor cable with its core divided into two compartments, a transmit section and a receive section, which are separated by an insulated metallic divider.

Conduit:

A tube-like structure for electrical wires or cables. Conduit may be either rigid or flexible, metallic or non-metallic, as specified.

Conduit Stub Out:

A short length of conduit that is joined as a branch to a conduit run and, as used in these Specifications, is the termination of a conduit run.

Console:

A panel or cabinet on which are mounted switches or lamps for use by a human operator in monitoring and controlling equipment and functions.

Contact Rail:

A bus bar alongside a track that carries electric energy for the propulsion of trains.

Core:

(Fiber Optics) The light conducting portion of the optical fiber, defined by the high refractive index region. The core is normally in the center of the optical fiber, bounded by the cladding material.

Coverage:

Inclusion within the range of a communications device, equipment unit, system or medium.

Crosstalk:

Undesired signal coupling between two different communications channels or signal components.

Data Acquisition and Display System (DADS):

A system for the collection, recording, consolidation, and display of fare collection data at the passenger stations.

Enhanced Data Acquisition and Display System (EDADS):

An upgraded version of the DADS System.

Data Transmission System (DTS):

The bi-directional, non-vital digital communications system between Central Control and the Train Control Room. The DTS utilizes a channel of the CTS as a transmission medium.

Decibel (dB):

1. Unit used to express the ratio between two amounts of electrical power, P₁ and P₂, defined as:

$$\text{dB} = 10 \log_{10} \frac{P_1}{P_2}$$

2. Also used to express voltage and current ratios, defined as: (Voltages and currents must be measured with identical impedances.)

$$\text{dB} = 20 \text{Log}_{10} \frac{V_1}{V_2} = 20 \text{Log}_{10} \frac{I_1}{I_2}$$

3. Also used to express intensity of sound; defined as equal to 20 times the common logarithm of the ratio of the sound pressure of a wave to a reference pressure of 0.0002 dyne per square centimeter.

dBm:

Measure of absolute electrical power in decibels referred to one milliwatt.

dBm0:

A measure of power, with reference to zero dBm, at the reference transmission level point (RTLTP).

dBnc0:

A measure of noise power in dB above one picowatt measured with a C-message weighting network referred to or measured at an RTLTP.

Delay Distortion:

Distortion caused by differences in transit time for different frequencies within a specified system bandwidth.

(The) Design-Builder:

1. The person, partnership, corporation, or joint venture that is awarded the prime contract to complete the design and provide the facilities, equipment, and installations described in these Specifications. The usage of this term in these Specifications also includes subcontractors, suppliers, vendors, and employees thereof, except as otherwise stated (subject at all times to the Contractor's responsibility therefore).
 2. The person or company who is awarded a contract to complete the design and provide all the facilities, equipment, and installations described in these Specifications.
- Desk Telephone:
A telephone instrument designed for desk top use.

Detector:

A device used to sense a particular condition - smoke, temperature, open circuit, received signal, etc.

Dial:

Normally, a face plate which has been graduated into arbitrary units. As a special case, in telephony, the hand operated device used to generate pulses or tones for establishing connections over a telephone switching system.

Dialing:

The act of operating a dial - specifically, a telephone dial. As used in this document, includes the act of operating a telephone instrument "touchtone" pad.

Diode Auctioneering:

A method of obtaining redundancy in use of power supplies by utilizing diode coupling from each power supply to a common load.

Direct Burial:

A method of installing cable underground, not in conduit or duct, in such a manner that it cannot be removed without disturbing the soil.

Dry Contact:

An electrical contact through which no direct current flows.

Duct Bank:

An arrangement of conduit providing more than one duct to accommodate and protect cables between two points.

DTMF:

Dual Tone Multifrequency audio signaling scheme utilized as the standard subscriber line tone signaling method in the USA. Also known as Touch-tone dialing, which is a copyrighted Bell Telephone Company term for such signaling. (Utilized for some other remote control devices also.)

Duplex:

Type of operation that permits simultaneous communications in both directions.

EIA:

Electronic Industries Alliance
2500 Wilson Boulevard
Arlington, Virginia 22201

E&M Signaling:

A signaling system characterized by the use of separate paths for the signaling and voice signals. The M lead transmits battery or ground to the distant end of the circuit while incoming signals are received as ground or open on the E lead.

E&M Trunk:

An audio trunk circuit utilizing E&M signaling.

Electro-Mechanical:

An electrical device with moving parts.

Elevated:

That portion of the Metrorail System which is constructed above the adjacent ground surface.

Emergency Power:

Electrical power provided to operate essential equipment during periods of failure of primary power source.

Emergency Trip Station (ETS):

An enclosure containing an emergency telephone and an electric switch to de-energize a section of the contact rail.

ETS Telephone:

An emergency telephone generally located along Metrorail R.O.W. and collocated with or enclosed in Emergency Trip Station boxes in most instances.

(The) Engineer:

Wherever, on the Information or Contract Drawings or in the Specifications, the term "Engineer" is used, it shall mean the "Authority Representative" or other duly authorized representative of the Contracting Officer.

Engineering Services:

Engineering Service to be provided, as detailed in Article 3.1, Article 3.20, and as required elsewhere in these Specifications and Contract Drawings.

Entrance Escalator:

Escalator from street level to a passenger station.

Environment:

The universe within which the system must operate, the elements over which the designer has no control.

Error Rate:

The ratio of the number of characters of a message(s) received incorrectly to the total number of characters of the message(s) received.

Factory Test:

Test of equipment at the manufacturer's plant.

Failure:

An inability to perform an intended function.

Fare Gates:

Gate in stations through which passengers pass separating FREE (UNPAID) and PAID areas.

FCC:

Federal Communications Commission
445 12th Street, SW
Washington, D.C. 20554

Fiber Buffer:

(Fiber Optics) A material that may be used to protect an optical fiber from physical damage, thus providing mechanical isolation and/or protection.

Fiber Bundle:

(Fiber Optics) In a fiber optics cable, a group of parallel optical fibers over which a loose-fitting jacket (fiber buffer) has been extruded. (As used in "loose tube" type fiber optic cables, for example).

Fiber Optics:

(Fiber Optics) The branch of optical technology concerned with the transmission of radiant power through fibers made of transparent materials such as glass, fused silica, or plastic.

Fiber Optics Cable:

A cable made up of several optical fibers incorporated into an assembly of organic materials arranged for providing the necessary tensile strength, external protection, and handling properties. (Communications cables usually utilize "loose tube" or "open channel" type internal construction.)

Fire Zone:

A portion of a building, installation or area designated for fire detection by a specific circuit.

Flutter:

Cyclic deviation of signaling power (with a period in the neighborhood of 10 Hz for audio, for example).

Foot Lambert (fl):

The amount of light energy reflected from an object or scene equal to the product of illumination in footcandles and the luminous reflectance of the object or scene.

4-Wire Terminating Set:

A hybrid set for interconnecting a four-wire and a two-wire circuit (usually refers to audio frequency devices).

Free (Unpaid) Area:

Area of passenger station to which public has access prior to passing through fare gates.

Frequency Modulation (FM):

The process of varying the instantaneous frequency of a sine wave carrier by an amount proportional to the instantaneous value of a modulating signal.

Frequency Response:

The measure of effectiveness with which a circuit or device receives or transmits a range of frequencies.

Frequency Shift Keying (FSK):

The form of frequency modulation in which the modulating wave shifts the output frequency between predetermined values, and the output wave has no phase discontinuity (usually accomplished at audio frequencies).

Fuse:

An overcurrent protective device with a circuit-opening part that is heated and severed by the passage of overcurrent through it.

Fuse Alarm:

A circuit which produces a visual or audible signal to indicate a blown fuse.

Fusion Splice:

(Fiber Optics) A splice accomplished by the application of localized heat sufficient to fuse or melt the ends of two lengths of optical fiber, forming a continuous, single fiber.

Gallery Place:

A Metrorail passenger station located at the junction of Routes B, E, and F, which is a secondary hub of the WMATA Rail Rapid Transit System.

Gatehouse:

A building at the entrance to a Metrorail train yard, from which control of pedestrian and vehicular (other than trains) access to the yard is exercised.

Graded-Index:

(Fiber Optics) An optical fiber type wherein the core refractive index decreases almost parabolically radially outward toward the cladding. This type of fiber combines high-bandwidth capacity with moderately high coupling efficiency.

Ground:

A conducting connection, whether intentional or accidental, by which an electric circuit or equipment is connected to the earth, or to some conducting body of relatively large extent that serves in place of the earth. A common return to a point of zero potential. (Intentional grounding for WMATA projects providing low resistance current return paths to the earth.)

Half Duplex:

A method of operation in which two-way communication is possible, but only one way at a time.

Handset/Speaker Station:

A self-contained terminal station of the paging-intercom subsystem of the Yard Public Address System.

Hardware:

Physical entities such as computers, equipment, and instruments. Also parts made of metal such as fasteners, straps, clamps, and anchors.

Harmonic Distortion:

Non-linear distortion of a system or transducer characterized by the appearance in the output of harmonics, other than the fundamental component, when the input wave is sinusoidal.

Hertz (Hz):

Unit of frequency equal to one cycle per second.

ICEA:

Insulated Cable Engineers Association
PO Box 440
South Yarmouth, Massachusetts 02664

Identifying Digits:

Alphanumeric digits that identify each passenger station and yard.

Idle:

In communications systems, indicates a circuit, device or system is not in active use (i.e. in the quiescent state).

Idle Noise:

That noise which is inherent in a circuit or device and is not contingent upon modulation.

IEEE:

Institute of Electrical and Electronics Engineers, Inc.
345 East 74th Street
New York, N.Y. 10017

Impedance:

The opposition in an electrical circuit to the flow of alternating current.

Impulse Noise:

Noise characterized by transient disturbances separated in time by quiescent intervals.

Inbound Track:

Track that is normally used by trains traveling toward Metro Center passenger station in the A, B, C, D, G, and K routes; and towards the Gallery Place passenger station in the E, F, and L routes.

Incident Scene Illumination:

The amount of light expressed in foot-candles which is actually falling on an object.

Index of Refraction:

(Fiber Optics) The relative index of refraction is a fraction or ratio of the velocity of light in one medium, compared to the velocity of light in another medium.

Infrared:

(Fiber Optics) The region of the electromagnetic spectrum between the long-wavelength of the visible spectrum (about 750nm) and the shortest microwaves (about 1300nm). Infrared is used extensively in the transmission of light through optical waveguides.

Injection Laser Diode:

(Fiber Optics) A laser employing a forward-biased semiconductor junction as the active medium. Light is emitted from the diode edge.

Insertion Loss:

The loss resulting from the insertion of a transducer or other device in a transmission system.

Install:

When used in these Specifications, the verb install shall signify that the Contractor shall furnish, install, and test the equipment and materials specified, unless specifically indicated differently in the text.

Interface:

A shared boundary. The interconnection between two pieces of equipment or systems/facilities.

Interlocking:

An arrangement of signals and signal appliances interconnected so that their operations must succeed each other in proper sequence, thereby permitting train movements over controlled routes, only if safe conditions exist.

Intermodulation Noise:

That noise which is contingent upon modulation and results from any non-linear characteristic in the path or device.

Interphone:

Equipment used to provide telephone communications between personnel at various locations within a defined space. As used in these Specifications, provides communications between the Station Manager in the Kiosk and the public.

Intrusion Zone:

A portion of a building, installation or an area designated for detection of intrusion by a specific circuit.

Jacket:

A thermoplastic or thermosetting covering, sometimes fabric reinforced, applied over the insulation, core, metallic sheath or armor of a cable.

Jackfield:

An arrangement of telephone jacks, usually grouped on a mounting strip, to provide convenient access to lines and equipment for testing.

Joint Electron Device Engineering Council (JEDEC):

Cooperative effort of Electronic Industries Alliance (EIA) and National Electrical Manufacturers Association (NEMA).

Key Telephone System (KTS):

Assemblage of telephone relay or electronic equipment which provides switching and control of telephone service within a localized area. KTS equipment is differentiated from PABX equipment primarily by more limited switching functions. Insofar as external telephone trunks are concerned, KTS equipment is generally limited to applications requiring less than 100 subscriber lines and the provision of service that is generally limited to a single building or area of a building.

Kiosk:

A booth-like structure within Metrorail passenger stations which contains station monitoring and control facilities and from which an attendant may provide information and assistance to passengers.

Laser:

(Fiber Optics) A device that produces optical radiation using population inversion to provide Light Amplification by Stimulated Emission of Radiation and (generally) an optical resonant cavity to provide positive feedback.

Light Emitting Diode (LED):

A pn junction semiconductor device that emits incoherent optical radiation when biased in the forward direction.

Main Distribution Frame (MDF):

Provides for the termination and cross connection of outside lines entering a building, including electrical protection devices, internal subscriber lines, and terminal equipment.

Manhole:

A subsurface chamber or opening in the route of a conduit or duct run that provides facilities for splicing, testing, and maintaining cables and conductors.

Manual Pull Box:

Specifically refers to FIRE alarm switch which, when operated manually, initiates a FIRE alarm.

MDF/Protector Cabinet:

Specifically refers to a cabinet located in passenger stations and yard buildings containing MDF and cable protection facilities.

Major Items:

Major Items are defined as items listed in Estimated Quantities Tables 3.1-X.X.

Mechanical Splice:

(Fiber Optics) An optical fiber splice accomplished by fixtures or materials, rather than by thermal fusion. Index matching material may be applied between the two fiber ends.

Metro Center:

A Metrorail passenger station located at the junction of routes A, B, C, and D which is the major hub of the WMATA Rail Rapid Transit System.

Microbar:

Unit of pressure equal to one dyne per square centimeter.

Millisecond (ms):

A unit of time equal to one one-thousandth of a second.

Mobile Radio Unit:

A radio transmitter/receiver designed for installation in a vehicle or train.

Modal Dispersion:

(Fiber Optics) The component of pulse spreading caused by differential optical path lengths in a multimode fiber.

Modem:

A modulator and demodulator housed in a common assembly.

Multi-Mode Fiber:

(Fiber Optics) An optical fiber that will allow more than one mode to propagate. May be either a graded index or step index configuration.

Multiline Telephone:

A telephone instrument with the capability of being connected to more than one line.

Multiplexer (MUX):

A device which combines several inputs into a single output.

Muting:

The action of reducing a sound level.

NEMA:

National Electrical Manufacturers Association
1300 North 17th Street
Suite 1847
Rosslyn, Virginia 22209

Noise:

Any undesired, interfering signal contained in a communications channel or circuit.

Noise Weighting:

An amplitude-frequency characteristic of a noise measuring set. C-Message weighting is so designed as to give numerical readings which approximate the amount of transmission impairment, due to noise, that an average listener experiences using a specific commonly utilized modern class of telephone subset. "Flat" weighting and other wideband weighting may be utilized to measure noise on data channels. Meters designed to measure ambient noise (environmental) utilize other weighting networks (to obtain readings in dBa, for example).

Numerical Aperture:

(Fiber Optics) Measure of light acceptance of an optical fiber.

OCC:

Operations Control Center (now in the Jackson Graham Building which was previously designated as the OCC Building - OCCB on some WMATA documentation). The operational center for the WMATA Metrorail and Metrobus systems (includes centralized operations and communications functions). Also known as Central Control and Command Center.

OCCS:

Operations Control Center - Security. Usually refers to the consoles in the Security Center for the WMATA system.

Off-Hook:

A telephone line condition or the signal indicating that the circuit is in use (i.e., the handset is off its switch-hook).

Omni-Directional:

1. (Antenna) An antenna having essentially non-directional pattern in azimuth but that may have a directional pattern in elevation in many instances.
1. (Microphone) A microphone, the response of which is essentially independent of the direction of sound input.

On-Hook:

A telephone line condition or the signal indicating that the circuit is idle - not in use.

On-Site Test:

Test of equipment or system after installation in its operational location.

Open:

A break or discontinuity in a circuit which normally passes a current.

Optical Fiber:

(Fiber Optics) Any filament or fiber, made of dielectric material, that guides light.

Outbound Track:

Track normally used by trains traveling away from Metro Center passenger station in the A, B, C, D, G, and K routes, and away from Gallery Place passenger station in the E, F, and L routes.

Override:

A communications trunk feature whereby one call has a greater priority of using a common facility over another call.

PABX:

A designation used in the national telephone system to denote a privately owned telephone switching center which operates by the use of dialing (i.e. Private Automatic Branch Exchange). PABXs can be differentiated from KTS systems by their generally more extensive trunk and remote line switching capability, and by the fact that they generally handle 60 or more subscriber lines.

PABX Extension:

A telephone instrument connected to a PABX.

PAID Area:

Area of passenger station to which the passengers have access after passing through fare gates.

Paging-Intercom:

A system which provides for public address type paging and telephone type intercom service.

Parity:

Used in digital code formats for self-checking in which the total number of 1s or 0s in an acceptable code is always odd or always even, depending on whether an odd or even parity check is used.

Passenger Station:

A location which provides the public access to the WMATA Rail Rapid Transit System (Metrorail System). Provides facilities for payment of fares, train information, entrance and exit of passengers.

Phase Modulation (PM):

The process of varying the angle of a carrier from its reference value by an amount proportional to the instantaneous value of a modulating signal.

Pin Photodiode:

(Fiber Optics) A diode with a large intrinsic region sandwiched between p-doped and n-doped semiconducting regions. A commonly used detector or receiver in fiber systems.

Plug-In Unit:

A communications device so designed that connections to the device may be completed through pins, plugs, jacks, sockets, receptacles or other forms of ready connectors.

Portable Radio:

A radio transmitter/receiver designed to be carried by or on a person.

Power Distribution Panel:

A facility which provides for the distribution of power circuits and overload protection for those circuits.

Power Supply:

A unit for converting power from an ac or dc source into ac or dc power at voltages suitable for supplying power to equipment.

Pre-empt:

A communications trunk feature whereby one call takes a common trunk facility away from another call.

Primary Cable:

Specifically refers to the normally on-line cable of the dual redundant communications cable facility of the Fiber Optics/Carrier Transmission Systems.

Protection Tube:

An expulsion arrester or glow-discharge cold cathode tube that employs a low-voltage breakdown between two or more electrodes to protect circuits against over-voltage.

Pulse Dispersion:

(Fiber Optics) The separation or spreading of the input characteristics of the optical signal that appears along the length of the optical fiber and limits the useful transmission bandwidth of the fiber. Expressed in time and distance as nanoseconds per kilometer. Three basic mechanisms for dispersion are the material effect, the waveguide effect, and the multimode effect.

PT&Z Camera(Pan, Tilt, Zoom):

A television camera with facility for remote control of azimuth, elevation, and zoom.

Public Address System:

A system which provides transmission, amplification, and reproduction of speech with high communications band fidelity and sufficient power to make sound simultaneously available, and fully intelligible, to large numbers of people.

Pulse Code Modulation (PCM):

A modulation process involving the conversion of a wave form from analog to digital by means of coding. Usually a form of pulse modulation in which a code is used to represent quantized values of instantaneous samples of the signal waves.

Push-To-Talk (Operation):

Voice communications on a circuit in one direction at a time requiring activation of a switch prior to and during transmission.

Quench:

An action whereby an active circuit is stifled or inhibited.

Radio Base Station:

A complete assemblage of equipment for radio transmission and reception including antenna(s) and control devices or interfacing equipment accommodating remote control devices.

Rail Rapid Transit System:

The portion of the WMATA transportation system that is a third-rail electrified system, as distinguished from the motor bus operations.

Rapid Battery Charger:

Electrical device used for rapidly charging storage batteries.

Redundancy :

The existence in a system of more than one means of accomplishing a given function, for the purpose of increasing security or reliability.

Reliability :

The probability of performing a specified function, without failure and within design parameters, for the period of time intended under actual operating conditions.

Redundant Cable:

Specifically refers to the secondary cable of the dual cable facility of the Fiber Optic/Carrier Transmission Systems.

Reference Transmission Level Point (RTLTP):

In a communications system it is an arbitrarily chosen point to which the levels at all other points in the system are referenced. It is frequently the input to the 2-wire side of the 2-wire/4-wire terminating set at the transmitting end of a telephone channel.

Remote Building:

An area or structure (frequently containing support equipment, such as: Fan shafts, chiller plants, substations, and tie breaker stations) generally within or along the WMATA right-of-way, but not part of a passenger station or yard. Remote buildings may also include MRS Two-Way Line Drivers, Fire and/or Intrusions alarm detectors, wayside telephones, etc.

Relay Contact Types:

1. FORM-A: SPNO (Single-Pole, Normally Open) Contact
2. FORM-B: SPNC (Single-Pole, Normally Closed) Contact
2. FORM-C: SPDT (Single-Pole, Double-Throw) Contact

Remote Terminal Unit (RTU):

A modem installed at each ATC field control location (usually at passenger station TCRs) to act as the interface unit between the Data Transmission System (DTS) and the local ATC and support system functions.

Response Message:

Digital message transmitted from base station(s) of the Mobile Radio System to the control console with information in reply to a command message initiated at the control console.

Revenue Service:

The transportation of passengers who have paid a fare.

Revenue System:

The portion of the METRO System on which revenue service is conducted.

Right-of-Way (R.O.W.):

1. The land or structure surface occupied by the Metrorail Transit System, especially for its mainline. Also, the land or structure surface used by another transportation facility such as a railroad or highway.
2. The right of traffic on a given route to take precedence.

Ringdown:

A method of signaling in which ringing current is transmitted over a circuit to operate a device or circuit to produce a steady signal.

Ringing:

The audible or visual signal produced by an alternating or pulsating current to signal a telephone station, central office or other terminating equipment.

Root Mean Square (rms):

The square root of the mean of the squares of the sum of instantaneous voltages or currents during a complete cycle.

Rotary Hunting Group (RHG):

A group of telephone lines which are accessible under a common calling number and are used sequentially as calls are received.

Scene Highlight Brightness:

The amount of illumination which is reflected off an object of interest expressed in foot lamberts.

Seize:

In communications signaling terminology, to take control of a connecting circuit.

Sensitivity:

The degree to which a component, circuit or system is affected by some condition.

Sensor:

A device for detection of a condition or change in condition - such as smoke, temperature, humidity, light level, open circuit, closed circuit.

Service and Inspection (S&I) Yard:

Yard which provides for the make-up, cleaning, maintenance, inspection, and repair of trains.

Shield:

A housing, screen or other object, usually conductive, that substantially reduces the effect of electric or magnetic fields on one side and upon devices or circuits on the other side.

Shop Building:

Building within a Metrorail yard or elsewhere which houses repair facilities.

Short Circuit:

An abnormal connection of relatively low resistance between two points of different potential in a circuit.

Simplex:

A method of operation in which communications takes place in one direction only.

Singing Point:

The point at which the gain is just sufficient to make the circuit break into oscillation.

Single Mode Fiber:

(Fiber Optics) An optical fiber in which only the lowest order mode can propagate at the wavelength of interest.

Slotted Coaxial Cable:

A coaxial cable with slots cut into the outer conductor, thereby permitting radio frequency radiation into and from the cable.

Software:

Computer programs and routines; a collection of related utility, assembly, and other programs that are desirable for proper utilization of a device or equipment; detailed procedures, documents, manuals, drawings, and diagrams relating to a device, equipment or system.

Solid State:

A device or system whose operation is dependent upon a combination of optical, electrical or magnetic phenomena occurring within a solid. Functions are performed by semiconductors and wholly static components, i.e., resistors, capacitors, etc.

Span Section:

A span section is defined in these Specifications as a transmission segment of the Fiber Optic System or Carrier Transmission System that extends from the Control Center to and including the passenger station, yard or other intermediate repeater or terminal of the span.

Spare:

Equipment, assemblies or components, complete or in parts, on hand for repair or replacement.

Speech-Plus:

Method of operation that permits the simultaneous transmission of speech and telegraph signals over a single voice channel.

Sound Pressure Level (SPL):

A measure, in dB, of acoustic loudness, usually designated to be the effective rms sound pressure referenced to 0.0002 dyne per square centimeter.

Squelch:

An action whereby a signal is completely cut off, unless a predetermined threshold level is attained.

Stationing:

A system for establishing reference points along the Rail System. Civil stationing is used in initial design and development of the Rail Right-Of-Way. Train Control Stationing is later established as a permanent reference for operation of the Rail System.

Storage and Inspection Yard:

A Metrorail yard which provides for the make up of trains and for the cleaning and minor maintenance of cars. No major repair facilities are provided.

Sub-Ballast:

Crushed rock or stone that is placed between the ballast and the sub-grade.

Subscriber Loop:
A circuit that is formed by the subscriber's telephone, the cable pairs and other conductors, and the telephone central office, PABX or other terminating equipment.

Substation, Traction Power:
Building housing equipment and facilities for providing electrical energy to the trains via the contact rail.

Subway:
That portion of the system which is constructed beneath the ground surface (i.e. underground Metrorail facilities).

Supervision:
The process of monitoring the condition of a circuit to determine its status.

Supervisory Alarm Subsystem (SAS):
A subsystem of the Technical Control Facility which provides for the transmission of alarm information from a remote terminal in passenger stations and yards to the Control Center.

Talkback System:
A system of the yard which provides two-way voice communications between the Yard Communications Console and the track areas.

Talk Path:
In a telephone or radio system, the circuit or channel which provides for the transmission of voice signals.

Terminal Strip (Board):
An insulating base equipped with terminals for connecting wires.

Third Rail:
See contact rail.

Tie Breaker Station:
Building housing power switching equipment for the purpose of sectionalizing contact rail power.

Tone Call:
A system of exchanging calling or alerting signals and acknowledgment signals between mobile radio units and base stations that utilize modulated tones in the voice band.

Tone Dialing:
The transfer of digital information from a telephone instrument to a central office or other terminal device utilizing multi-frequency tones. (Typically by standard DTMF tone signaling)

Tone Generator:
A device for providing audio frequency currents suitable for signaling purposes.

Total Harmonic Distortion (THD):
A measure of the total effect of the various higher order harmonics of a sinusoidal signal.

Trackbed:
The area and material directly under the track which provides support to the track. It includes ties, ballast or other supporting material.

Train Control Contractor:
The contractor who has been awarded a contract to provide Automatic Train Control System.

Train Control Room:
A room located in a passenger station or at some other strategic point to house wayside ATC equipment including a Remote Terminal Unit. A major wayside control point for the ATC system.

Trunk:
A one or two-way channel connecting two telephone central offices, or a central office and an individual terminal.

Vehicular Radio:
Radio transmitter/receiver and associated equipment designed to be installed in and operated from vehicles.

Voltage Standing Wave Ratio (VSWR):

The ratio of the highest to the lowest voltage of a standing wave at a feed through point.
Wayside Telephone System:

A subsystem of the WMATA Telephone System.

Wet Contact:

An electrical contact through which direct current flows.

WMATA:

Washington Metropolitan Area Transit Authority

Headquarters Building:

Jackson Graham Building

600 Fifth Street, N.W.

Washington, D.C. 20001

WMATA Configuration:

The arrangement of hardware or software, wiring, etc. within the equipment, equipment racks, rooms, or systems utilized by WMATA.

WOW:

The slow cyclic deviation of audio signaling power with an approximate period of 0.5 Hz.

Yard:

A system of Metrorail tracks and buildings within defined limits provided for the make-up of trains, storage of cars, and for cleaning, maintenance, inspection, and repair of trains.

Yard Control Room:

The room in the yard which contains the yard train control console.

SECTION 16703

COMMUNICATIONS STANDARD SPECIFICATIONS - ENGINEERING SERVICES

PART 1 - GENERAL

1.01 DESCRIPTION OF ENGINEERING SERVICES

The Design-Builder is required, under WMATA Communications Systems Specifications, to design, furnish, install, test, and document communications systems that conform to WMATA operational, performance and other requirements outlined therein. Standard Specifications apply where more specific requirements are not included in other (specific systems) specifications.

1.02 SECTION INCLUDES

Standard Specifications for Design-Builder-furnished engineering services. These Specifications apply to all engineering services and to all equipment furnished unless otherwise specified elsewhere in this Contract (i.e. conflicting Specification requirements found in other Specification sections or on Information Drawings take precedence over Standard Specifications in this section).

1.03 REFERENCES

- A. Federal Communications Commission (FCC) - (Specifically Parts 15, 90 and other applicable regulations)
- B. National Electrical Code (NEC)
- C. Underwriters Laboratories (UL)
- D. American National Standards Institute (ANSI)
- E. Rural Electrification Administration (REA)
- F. Insulated Cable Authority's Representatives Association (ICEA)
- G. Electronic Industries Alliance (EIA)
- H. National Electrical Manufacturers Association (NEMA)
- I. Institute of Electrical and Electronic Authority's Representatives , Inc. (IEEE)
- J. Association of American Railroads (AAR)
- K. WMATA General Provisions and Standards Specifications for Construction Projects.

1.04 ENVIRONMENTAL

- A. The communications system/facility shall be such that, when operating within the specified environmental limits, the maximum temperature attained by any component shall be lower than that which will adversely affect the life or performance of equipment.
- B. Unless otherwise specified, equipment shall be fully operable without damage or functional degradation under any combination of the following:

1. Ambient Temperature -18°C to 55°C.
 2. Relative Humidity 0 percent to 95 percent. (This requirement does not apply to equipment installed at the Jackson Graham Building).
- C. Permanently mounted equipment, exclusive of the equipment installed and operated in the Jackson Graham Building, shall be so constructed or installed that it will remain fully operative while being vibrated with simple harmonic motion having an amplitude of 0.005 inch (total excursion of 0.01 inch), with the frequency varied uniformly from 10 cycles to 55 cycles per second for a period of 30 minutes in each of three mutually perpendicular planes.
- D. All moving contacts (including relay contacts, jack contacts, switch contacts) shall be protected from dust.
- E. Equipment panels shall be furnished with dust covers. Proper internal air flow shall be provided when dust covers are in position during operation of the equipment.
- F. Unused mounting spaces in equipment racks, equipment cabinets, kiosk cabinetry and consoles shall be provided with blank panels which are consistent with the arrangement of the assembly.
- G. The circuitry of kiosk equipment panels, yard console equipment panels, and other custom-developed equipment shall be completely enclosed to protect against moisture and dust.
- H. Each system, facility, and subsystem element will generally be operated in the unfavorable electrical environment of a rail rapid transit system characterized by heavy direct-current and chopper-controlled pulsating direct-current propulsion equipment, which will cause electrostatic, electromagnetic, and radiated interference. Suitable effective engineering techniques and installation practices shall be incorporated to eliminate the effects of such interference on the performance of the systems, equipment, and devices furnished or installed by the Design-Builder, and those provided by others for use within or outside of the Metrorail System.
- I. Some sources of interference are: 60 Hz ac system, dc traction power system, propulsion power contact shoe and third rail arcing, rotating machinery, lightning discharges and high energy level, chopper-controlled propulsion systems. The arcing between the transit car contact shoe and the third rail which is supplying up to 780 volts dc is a major source of electrical noise. The noise spectrum includes harmonics which vary in amplitude with the change in loading of the section. Relatively high amplitude noise impulses occur throughout the spectrum.

1.05 INTERCHANGEABILITY

- A. Standard commercial products shall be furnished whenever such equipment and materials will satisfy the stated Specifications. Suitable modified standard commercial devices shall be furnished when required to satisfy Specification requirements. Custom developed and fabricated equipment units and devices shall be confined to those items for which suitable off-the-shelf commercial products are not available to guarantee compliance with the Specifications. When custom design, fabrication, or assembly is required, every effort shall be made to minimize the number of different modules, solid-state devices, etc. used.
- B. With each system, subsystem and facility, two or more like functions shall be performed by identical units. In no case shall the equipment or hardware used in one portion of a system, subsystem or facility be different from that used in another portion to perform the same function under similar operating and environmental conditions.

- C. Insofar as possible equipment shall be physically and plug compatible with recent versions of existing Authority equipment performing similar functions and used for comparable applications elsewhere in similar WMATA facilities. The use of adapter plugs, interface boxes, and replacement mounting brackets or enclosures that fit available space and mounting holes may be allowed by the Authority's Representative to maintain interchangeability, when competitive products that do not require such devices are determined to be unavailable (applicable to off-the-shelf major equipment items only). Custom designed and custom fabricated equipment must be fully interchangeable without requiring the use of such devices. If a determination is made to allow use of such devices, the Design-Builder shall provide all necessary adapters and interface devices with each item of equipment furnished, at no additional cost to the Authority.
- D. Major items of equipment furnished by the Design-Builder shall be within the physical size and configuration limitations specified in provisions of this Contract. If such specifications are not included in the provisions of this Contract, major items of equipment shall be of a physical size and configuration closely comparable to equipment currently in use for comparable applications elsewhere in similar WMATA facilities.
- E. Exception: Lighter weight and smaller sized, more modern versions of equipment are sought by the Authority where their use presents significant advantages. The use of new generations of equipment that differ in size and are not fully interchangeable will be considered for approval by the Authority's Representative, in order to take advantage of significant technological improvements developed by industry.

1.06 MAINTAINABILITY AND RELIABILITY

- A. The physical and mechanical configurations of equipment and rack assemblies shall give a high priority to the ease with which units may be inspected and removed.
- B. Except as otherwise specified, rack mounted equipment shall be mounted on standard equipment racks or in standard equipment cabinets. Each rack and cabinet configuration shall present a neat and orderly appearance and shall be uniform for like systems/facilities at all Communications Equipment Rooms.
- C. Equipment units or subassemblies shall be easily removable from rack, cabinet, or equipment cases without the need to disturb unit rack/cabinet/case wiring.
- D. Equipment units shall utilize plug-in printed circuit cards or plug-in assemblies whenever the quantity, equipment, size and weight of the components lend themselves to this technique
- E. Printed circuit cards in rack mounting equipment units shall plug into either card files or card drawers, whenever feasible and practical.
- F. Printed circuit cards shall be keyed to prevent incorrect interchange of cards. However, cards performing a given function in a subsystem or subsystem element shall be interchangeable with cards of another subsystem element performing the same function whenever practical.
- G. The replacement of a printed circuit card plug-in subassembly, or component by a new unit shall not require compensating adjustments of devices other than the circuit card or component replaced.
- H. Equipment and installation engineering services and designs shall incorporate accepted industry standards and good engineering practices selected to enhance maintainability and

reliability.

- I. Test points shall be provided for printed circuit cards to permit detection of a failure without removal of wiring. Go/No-Go techniques shall be used to localize failures where possible. Card extenders may be used for this purpose.
- J. Test points shall be readily accessible and clearly designated, and shall be capable of accepting probes and connectors furnished with standard test equipment. All testing shall be performed at the front of racks whenever practical.
- K. Appropriate equipment, electrical test points, fuses, and adjustment controls shall be available at the front panel.
- L. Equipment units shall be of ample capacity and of proper arrangement to perform the functions specified, under the conditions specified, and shall operate in accordance with the specified reliability criteria.

1.07 CUSTOM DEVELOPED AND Design-Builder MODIFIED OFF-THE-SHELF EQUIPMENT

- A. The construction, panel and chassis layouts, circuit arrangements, components, graphics, and component layouts of custom-developed equipment shall be approved by the Authority's Representative. Drawings detailing all aspects of the developed equipment shall be submitted for preliminary review and comment. The submitted drawings shall include details of the required external connections. After incorporating the comments and obtaining acceptance by the Authority's Representative, the Design-Builder shall fabricate prototypes of the custom-developed equipment (one for each custom-developed item) in accordance with the approved configurations. The prototypes shall be submitted for evaluation, inspection, testing, and acceptance or rejection by the Authority. Production models shall not be manufactured until the acceptance of the corresponding prototype by the Authority's Representative (including incorporating any additional comments). Only production models shall be furnished to fulfill the requirements of these Specifications.
- B. Design-Builder modified "off-the-shelf" commercial product major items shall be subject to the same review, and all prototype requirements specified above for custom developed equipment, except as otherwise directed by the Authority's Representative. Relief from these requirements will be considered in instances where only minor modifications are proposed.
- C. At the discretion of the Authority's Representative, equipment developed and manufactured specifically to fulfill a WMATA requirement, although considered by the manufacturer as "off-the-shelf," shall be considered as developed equipment and shall comply with the requirements specified herein.

PART 2 - PRODUCTS

END OF SECTION

SECTION 16704

COMMUNICATIONS STANDARD SPECIFICATIONS - INSTALLATION

PART 1 -GENERAL

1.01 SECTION INCLUDES

Standard Specifications for Design-Builder-furnished installation services. These Specifications apply to all Design-Builder installation services, unless otherwise specified elsewhere in this Contract (i.e. conflicting Specification requirements found in other Specification sections, or on Information Drawings take precedence over Standard Specifications in this section). Unless otherwise specified, communications, electronics and electrical installations shall be governed by the provisions of the "National Electrical Code, Standard of the National Board of Fire Underwriters for Electrical Wiring and Apparatus." All provisions of this code must be considered applicable, whether specifically mentioned in the body of these Specifications or not. In no case shall the installation in one portion of the system be different from the installation in other portions for similar configurations under similar operating and environmental conditions, unless specified.

1.02 REFERENCES

- A. Federal Communications Commission (FCC) - (Specifically Parts 15, 90 and other applicable regulations)
- B. National Electrical Code (NEC)
- C. Underwriters Laboratories (UL)
- D. American National Standards Institute. (ANSI)
- E. Rural Electrification Administration (REA)
- F. Insulated Cable Engineers Association (ICEA)
- G. Electronic Industries Alliance (EIA)
- H. National Electrical Manufacturers Association (NEMA)
- I. Institute of Electrical and Electronic Engineers Association, Inc. (IEEE)
- J. Association of American Railroads (AAR)
- K. WMATA General Provisions and Standards Specifications for Construction Projects

1.03 CONDUIT PLANT

- A. Unless otherwise specified, all wiring in structures and tunnels that is external to equipment enclosures and racks, shall be installed in suitable Intermediate Metal Conduit (IMC), or shall be installed in existing cable tray, underfloor duct, or racked to existing channel inserts on tunnel walls, if space is available and assigned by the Authority's Representative. All conduit and cable installations shall be subject to the approval of the Authority's Representative.

- 
- B. Available embedded conduit will be assigned for use by the Design-Builder when not reserved for other requirements. Conduit cleaning, the construction of conduit extensions or rearrangements, cable rerouting, and the construction of conduit plant to enclose all remaining wiring shall be furnished by the Design-Builder. Surface conduit construction shall not be permitted in most public areas of stations or in a few other places. Core boring of structures may be required to obtain means of passage during conduit plant construction.
 - C. Inside diameters of conduit shall be determined by the Design-Builder, based on the NEC, using the appropriate fill factors for the class of service and number and size of conductors. The proposed conduit sizes shall be submitted to the Authority's Representative for approval. Conduits smaller than 0.75 inch shall not be used.
 - D. All exposed conduit runs shall be installed parallel to walls, floors and ceilings, whenever possible, except where pitch is required for proper drainage. Conduits shall be rigidly supported at intervals not to exceed eight feet. Standard one-hole, malleable iron galvanized pipe straps of the proper size shall be used for single conduit runs on concrete surfaces. Where conduits are supported on concrete surfaces, machine-bolt type expansion shields and bolts of the proper size shall be used. All screws, bolts and fittings for conduit supports shall be galvanized or cadmium plated. Stainless steel 304 conduit spacers shall be used for conduits running on flat surfaces. Standard conduit elbows or field bends are permitted; they shall not be less than the minimum radius, as required by the NEC.
 - E. Conduits shall be connected to equipment metal enclosures using two locknuts and a bushing, except where conduit hubs are provided. Where enclosures, fittings with openings, or boxes of any type are installed in locations determined by the Authority to be subject to moisture, watertight conduit fittings shall be used. Watertight covers with seals shall be provided, and approved sealant applied to openings to effectively prevent the entry of moisture.
 - F. All conduit entering Communications Equipment Rooms of passenger stations and yards shall be covered and sealed. Watertight conduit and cable seals shall be used where the building or structure penetration is at a lower elevation than the manhole or below the water table.
 - G. All terminal ends of conduits shall be provided with insulated metallic bushings.
 - H. Whenever a conduit or exposed cable enters or leaves a box, it shall be permanently tagged, external to the box, with a plastic tag approved by the Authority's Representative. The tags shall be permanently stenciled with a number which shall identify the conduit or cable with an assigned circuit.
 - I. All conduits installed shall be free of burrs and other sharp edges throughout the entire length. Conduit fittings or boxes shall be installed in conduit runs, where required, to limit the number of bends to a maximum of three 90-degree bends or equal. All conduits used shall be thoroughly cleared by pulling through a mandrel tool, and shall be blown clean by forcing compressed air through the run before wires or cables are pulled.

1.04 CUTTING AND PATCHING

- A. All necessary cutting and patching of existing construction shall be provided by the Design-Builder for the installation of the equipment and cables.

- B. All cuttings shall be of the appropriate required sizes and shapes for the materials, cables and equipment to be installed. All cuttings shall be performed using the appropriate type of tools and equipment for the corresponding surfaces and material. The locations, sizes, shapes, and methods of performance for all cuttings shall be subject to approval by the Authority.
- C. All patching shall match existing adjacent construction to the satisfaction of the Authority, using the best possible workmanship of the various trades involved. All required material, compounds, sealants and hardware for all patching shall be provided. Fire wall integrity shall be maintained in appropriate construction.
- D. Services shall be provided by the Design-Builder for the removal and reinstallation of all necessary existing items (i.e., platform tiles, manhole covers) to accomplish the installations. Replacement shall be provided for any removed items that are damaged or missing during the performance of work, at no additional cost to the Authority. Replacements shall be identical in manufacture and type to the damaged or missing items.
- E. All existing items and construction (i.e., platform tiles, plenums, ceilings, floors, lighting fixtures, junction boxes, structures, and finishes) that are damaged, changed, or modified in the performance of work shall be restored to their original condition and/or surfaces. Appropriate required material, hardware, paints, finishes, and compounds shall be provided. Any items that are damaged, which are determined to be unrepairable, are to be replaced at no additional cost to the Authority. Replacements shall be identical in manufacture and type to the damaged items.

1.05 JUNCTION BOXES

- A. Junction boxes shall be furnished and installed for terminating cable runs and for pulling of cables. Boxes provided in conduit runs, to minimize the number of 90-degree bends in a run, shall be considered junction boxes, although used only for the pulling of cable.
- B. All boxes shall be mounted plumb and level and shall be rigidly anchored to the supporting surface. Machine bolt type expansion anchors shall be used to fasten boxes to concrete surfaces where inserts are not otherwise provided. In no case shall bolts of less than 0.25-inch diameter be used. Stainless steel spacers shall be used on bolts to provide a 0.25-inch air space between boxes and mounting surfaces.
- C. All boxes shall have a number stenciled on the cover. Numbers shall identify the service of the circuits in the box, as approved by the Authority's Representative.

1.06 CABLE TRAYS

- A. Unless otherwise specified, cable tray construction shall be allowed only in Communications Equipment Rooms and other equipment rooms assigned for the installation of significant quantities of communications-related equipment. Tray supports shall be located on eight-foot centers, maximum, and shall be subject to the approval of the Authority's Representative. Sufficient supports shall be provided to keep the loaded cable tray deflection to 0.25 inch maximum at mid-span. Tray supports and trays shall be mounted plumb and level.
- B. Tray supports, angle iron, or prefabricated channels shall be anchored to ceilings or walls by machine-bolt type expansion anchors and 0.5-inch minimum diameter bolts. Where cable tray fittings occur in a run, trays shall be supported immediately adjacent to, and on both sides of, the fittings.

- C. Trays shall be bolted to support members. Precautions shall be taken to prevent anchoring bolts from damaging cables placed in the trays.
- D. Cable tray fill shall not exceed 75 percent of the cross-sectional area of the tray, assuming an area of each cable to be equal to the square of the cable diameter.

1.07 EQUIPMENT MOUNTING

Unless otherwise specified, equipment shall be anchored to the concrete walls, floors, or ceilings by machine-bolt type expansion shields and 0.5-inch minimum diameter bolts. The number of bolts shall be adequate to provide a rigid and safe support. Where required, concrete bases or pedestals shall be provided by the Design-Builder with anchor bolts cast in place for the mounting of equipment. All equipment shall be mounted plumb and level.

1.08 PAINTING

All painted areas damaged in route to, or at the installation site, shall be repainted with matching colors by the Design-Builder. The surfaces of equipment and material not accessible after mounting shall be painted prior to installation.

1.09 WIRE AND CABLE

- A. Powdered soapstone or other suitable lubricating medium non-injurious to insulation shall be used, if required, when pulling wires or cables in conduits or ducts.
- B. Each conduit, duct and pipe shall be cleaned before installing cables therein. The conduits, ducts and pipes shall be maintained in a clean and dry condition during the installation process up to and including the time which each conduit, duct, and pipe is sealed
- C. Wires shall not cross one another when they are pulled into a conduit nor shall the conductors be pulled tight or kinked in conduit fittings or boxes.
- D. Cables shall be laid, not pulled, into trays or in troughs provided by others. Cables shall be installed with a minimum amount of crossover in the trays and troughs and shall not be placed tightly around bends. Where cables enter or leave trays via conduits, such conduits shall be rigidly affixed and supported at their ends by suitable brackets and conduit straps from the sides of the trays.
- E. Wires and cables shall be permanently tagged with plastic tags at each entry to and exit from all equipment terminal blocks. Tags shall be permanently marked to identify the system in which the wire or cable is used. Tags and markings shall be subject to the approval of the Authority's Representative.
- F. All cable pairs, including spares, shall be terminated on connectors, protectors, or line terminating blocks on the MDF.
- G. Solder with a minimum of 60 percent tin and 40 percent lead with non-corrosive flux shall be used in soldering wires and cables.
- H. The Design-Builder shall seal all openings through which cable, conduit and cable trays pass. The material used to seal the openings shall be furnished and installed by the Design-Builder.

It shall be a fire retardant, non-toxic material and shall comply with the local fire prevention code.

- I. All exposed wires and cables entering or leaving equipment housing or junction boxes shall be protected from abrasion by sharp metallic edges. Chase nipples shall be provided in openings having conduit hubs. Chase nipples and locknuts shall be provided in drilled or punched openings.
- J. The Design-Builder shall seal all openings in equipment enclosures and junction boxes where exposed cables enter the enclosure or box. A pliable sealing compound made expressly for the purpose shall be furnished and installed after the cables are in place.
- K. Nylon straps shall be furnished and installed for bundling and cabling of conductors where two or more single conductors of the same circuit are run exposed in cable trays or in cable troughs. Straps shall be installed approximately every five (5) feet along the cable run. Wires of multi-conductor cables exposed by the stripping of the cable jacket for termination shall be trimmed in a neat, workmanlike manner and tied approximately every three inches with nylon straps. Care shall be taken in terminating or splicing cable. Removal of insulation shall be done in a manner which does not nick the conductor material. In no case shall the conductor be kinked or bent at sharp angles. Smooth bends shall be utilized.
- L. Appropriate exposed cables entering or leaving equipment enclosures and junction boxes shall be protected from abrasion by sharp metallic edges. Chase nipples shall be provided in openings having conduit hubs. Chase nipples and locknuts shall be provided in drilled or punched openings.
- M. All cables and wires installed in environmental air plenums, cable vaults, and under passenger station platforms shall be placed in appropriately sized electrical metallic tubing (EMT) unless otherwise specified.
- N. Appropriate channel inserts, arms and insulators shall be provided to support cables in the manholes of the duct bank.
- O. Dewatering and removal of all dirt and trash from trenches, manholes, pull chambers, cable troughs, surface trenches, conduit and duct banks shall be provided prior to, and maintained during, the installation of cables.
- P. Cables shall be permanently tagged with plastic tags at each entry to and exit from all junction boxes, cable trays, cable ladders, equipment enclosures, conduits, ducts and pipe. Appropriate identification shall be permanently marked on each tag. These plastic tags shall be provided in two forms: Sleeve and flat. The sleeve form shall be of the heat shrinkable type and shall be properly sized to fit the cable for which it is intended. The sleeve form type may be used on cables with an outer diameter of 1/2 inch or less. The flat form type shall be made of flat sheet stock with slots for installation with nylon tie-wrap fasteners. The markings on the tags shall be provided in a color that will contrast sharply with the color of the associated tags. The plastic tags shall be properly installed.
- Q. Low-smoke, low-toxicity (not PVC) plenum rated wire and cable shall be utilized throughout installations of equipment in the Jackson Graham Building Communications Equipment Room (i.e., for cables extending outside of equipment enclosures, for inside plant cables extending to other rooms and floors, but not for outside plant cables extending to areas outside of the building), unless otherwise specified. Exceptions may be allowed by the Authority's

Representative when such plenum rated cable is not commercially obtainable only from equipment manufacturers, and when appropriate to avoid potential electrical signal mismatching, or to otherwise improve system performance or reliability.

1.10 DIRECT FIXATION IN TUNNEL AREAS

- A. Unless otherwise directed, cables shall be installed along the tunnel walls in an organized fashion within the area allotted for communications cables. Cable crosses shall be kept to a minimum.
- B. Channel inserts have been provided by others, mounted on approximately four-foot centers, in the tunnel walls. Stainless steel type fasteners or mounting devices shall be provided to secure the cables to the channel inserts. Cables shall be individually mounted to the channel inserts. Cable shall be secured to each channel insert. The fasteners or mounting devices shall be properly sized to the cable, or shall be adjustable to the proper size to support the cable without undue compression. Prior to cable installation, the channel inserts shall be cleaned and foreign material shall be removed, where necessary.
- C. Unless otherwise specified, cables shall be installed on the channel inserts in the space allocated for communications cables.
- D. In those areas where the specified locations for cables within the tunnels do not coincide with the channel inserts provided by others, or when channel inserts are not available for communications cables, and as necessary to secure MRS antennas, and other cables, appropriate type cable ladder with hardware, cement anchors, fasteners, and mounting devices, shall be provided to secure cables to the tunnel structure. Appropriate type cement anchors, fasteners, and mounting devices, shall also be provided to secure cables to the tunnel structure when routed to equipment, equipment housings, junction boxes, terminals, and conduits.
- E. Sufficient slack shall be provided in the cables between fasteners and mounting devices to allow for expansion and contraction of the cables without damage to the cables or the fasteners and mounting devices.
- F. The Authority is installing Tunnel Ventilation Barriers in the tunnels between passenger stations in the vicinity of some fan shafts. The Design-Builder shall install communications cables running along the tunnel walls through the cable openings that are provided in the Tunnel Ventilation Barrier structures. Openings are either provided on the side near the cable runs or at the top near the ceiling area of the tunnel.

1.11 CABLE TROUGHS ALONG THE TRACK RIGHTS-OF-WAY

- A. Cable troughs along the track rights-of-way are utilized for the installation of Communications cables, Automatic Train Control cables and Traction Power Substation (TPSS) control cables.
- B. A vertical metal divider has been installed throughout most of the length of the track right-of-way cable troughs to separate the TPSS control cables from the Automatic Train Control and Communications cables. In some locations, the metal divider has been omitted in favor of a small TPSS-control-cable trough mounted within the regular cable troughs.
- C. The following conditions and potential problems with the track rights-of-way cable troughs are noted:

1. The covers for the cable troughs may not be of uniform length of drilling, i.e., each cover section should be regarded as unique to that particular section of trough.
 2. The pressure of ballast on the outside of all metallic constructed cable troughs may cause the outer side to deflect somewhat when the top covers are removed, a condition which may interfere with reinstallation of the trough covers.
 3. The covers are not watertight.
- D. The following required installation services shall be provided by the Design-Builder when installing cables in the track rights-of-way cable troughs:
1. Removal of snow, ice, dirt and debris from the metal trough covers to obtain access.
 2. Removal of all the metal trough covers.
 3. Removal of fluids, snow, ice, dirt and debris from the troughs.
 4. Protection of all cables already installed in the cable troughs.
 5. Provision for access to conduits entering the cable troughs (possibility of shifting already installed cables).
 6. Proper reinstallation of the trough covers when cable installation is completed.

1.12 FIBER-OPTIC COMMUNICATION CABLE

- A. Splicing of single mode fiber-optic communications cable is authorized only at designated cable terminal locations and in Communications Equipment Rooms (splicing trays or enclosures) at passenger stations and transit yards, and in other approved locations, only when essential to join the ends of one or more standard or larger sized full reels of cable together with one partial reel of cable. Only low loss (0.20 dB or less) fusion type splicing and splicing to factory installed pigtailed connectors will be authorized. Approval of the exact location and methods utilized to make and protect each splice shall be obtained from the Authority's Representative prior to commencing field work.

1.13 COPPER INSIDE PLANT CABLE

- A. Splicing is not authorized in cables within the passenger station limits, or within ancillary structures, garages, parking lots, and transit yard S&I Shop and Operations Buildings.

1.14 COAXIAL, TRIAXIAL AND SPECIAL PURPOSE CABLE

- A. Splicing is not authorized in coaxial and triaxial cables, or in cable or cable harnesses designated by equipment manufacturers or the Authority's Representative as "special purpose cable." Properly installed and protected connectors shall be used in lieu of splicing.

1.15 COPPER OUTSIDE PLANT CABLE

- A. Outside plant cables extending beyond passenger station limits shall be free of splices, unless approval for splicing is obtained from the Authority's Representative. Approval may be granted for splice(s) in cable runs or CTS cable spans, only if the following conditions exist:
- B. No more than one splice in each individual cable run (or individual CTS cable span) shall be authorized except where deemed necessary to join two or more standard sized full reels plus one partial reel of cable together to make up the required length for an individual cable run (or individual CTS cable span) which extends between two cable end terminations.
- C. Exception:

1. Splicing of multi-pair copper CTS cables shall not be allowed within 400 feet of either end of the span.

1.16 SPLICE CASE TYPES

- A. Highly durable, watertight splice cases shall be furnished and installed in accordance with the manufacturer's instructions, when splicing is authorized. Filled splice cases shall be utilized when splicing filled cable (REA PE-39 telephone and CTS cable, for example).

1.17 SPLICE CASE (AND FIBER-OPTIC CONNECTOR) TECHNICAL SPECIFICATIONS

- A. Splice case (and fiber-optic connector) technical specifications and samples must be submitted to the Authority's Representative for review and approval prior to installation.

1.18 SPLICE CASE PHYSICAL PROTECTION

- A. Splice cases must be protected from physical damage and must be accessible (i.e. in manholes, hand-holes, cable troughs, terminal or junction boxes, or other protected locations readily accessible for maintenance purposes.) Splices shall not be placed in conduit.

1.19 MAINTENANCE OF FIBER-OPTIC AND COPPER CONDUCTOR IDENTIFICATION

- A. When multi-conductor copper or fiber-optic cables are spliced, the same color code, number and group identification shall be maintained throughout the entire cable run. Conductors and individual fibers shall be clearly identified at both end terminals (or cable ends - if not terminated).

1.20 SIGNAL ATTENUATION, CONTINUITY, CROSSTALK AND GROUNDING

- A. Splicing shall be accomplished in such a manner that optical or electrical signal attenuation, discontinuities, or cross-talk, do not appreciably increase as a result of such splicing. Cable shields, armor, and all other metallic elements shall be bonded across splices with copper straps and clamps or other approved hardware, to maintain electrical continuity with less than 0.2 ohm increase in resistance. Grounding for electrical protection shall be accomplished as specified or as approved by the Authority's Representative (or, if not specified or detailed in the Authority's Representative's approval, in accordance with applicable NEC provisions).

1.21 AS-BUILT RECORD DRAWING REQUIREMENTS

- A. The Design-Builder shall clearly indicate the location, size, and type of all splices and terminals on As-Built Record Drawings.

1.22 EQUIPMENT ENCLOSURES AND JUNCTION BOXES

- A. All equipment enclosures and junction boxes shall be mounted plumb and level, and shall be rigidly anchored to the supporting surface. Appropriate type expansion anchors and bolts shall be used to fasten the enclosures and boxes to support surfaces. An adequate number of bolts of the proper diameter with lock washers shall be used, but in no case shall bolts of less than 0.25 inch diameter be used. Stainless steel 304 spacers shall be used on bolts to provide a 0.25-inch air space between all enclosures/boxes and mounting surfaces.

- B. Where equipment enclosures and junction boxes are to be mounted on walls of material other than concrete, the method of mounting and the hardware to be used shall be approved by the Authority.
- C. All junction boxes and equipment enclosures shall have a unique identification stenciled on one exposed accessible surface and on the exterior of the cover. The painted stencil markings shall be applied with a procedure that produces clear, legible letters/numbers without voids and without paint running between the stencil and the surface being marked. The marking paint shall provide a definite contrast with the surface on which it is applied.

1.23 BURIED CABLES

- A. When direct burial of cable is specified, the following shall apply:
 - 1. Only cable and wire specified by the manufacturer to be for direct burial shall be buried.
 - 2. Cable shall be buried not less than 42 inches below grade and shall be below the frost line. The cable trench shall have a minimum width of 12 inches or three times the cable diameter, whichever is greater. The trench floor shall be free of rock, roots and debris, and shall provide a smooth bed for the cable. A minimum of four inches of sand shall be placed on the trench floor. The cable shall be placed in the trench, on the top of the sand, with slack and without kinks or bends. The cable shall be covered with four inches of sand before backfilling. If the trench spoil is used for backfill, it shall be free of rock, stone and debris. The backfill shall be compacted and leveled at specified grade. At no time shall a communications cable or wire be buried within 12 inches of a power conductor.
 - 3. The Design-Builder shall provide all shoring required. The Design-Builder shall mark the cable trench for future location and identification.
 - 4. No digging below the ties within the trackbed shall be permitted. The trackbed is defined as the area along the track extending one foot beyond the end of each track tie.
 - 5. When it is necessary to drive conduit under the trackbed, Authority approval shall be obtained for each case prior to commencement of work. The request for approval shall include details on the type of conduit, depth below surface and method.
 - 6. All wires and cables shall be tested after installation as detailed in Table 3.22-1 and other applicable specification provisions. Installation Completion Tests shall verify that cable shields and armor are bonded across each splice or junction box authorized (if any), and that twisted pairs maintain their identity and continuity end-to-end without crosses, shorts, opens, transpositions or splits. Insulation resistance tests shall be made either with an insulation resistance test set or a dc megohm meter utilizing a test voltage of 250 Vdc or greater, and shall be made in the presence of the Authority's Representative's designee.

1.24 SPECIAL REQUIREMENTS FOR STAINLESS STEEL CORROSION RESISTANT HARDWARE

- A. Except as otherwise specified, equipment enclosures, cabinets, boxes and hardware of all types in tunnels, tunnel crossovers, along the surface rights-of-way, and in all ancillary structures that are open to tunnels (vent shafts, fan shafts, pumping stations, etc. - excluding rooms within these areas that are heated/air conditioned) shall consist of stainless steel 304 material. Also, except as otherwise specified, equipment enclosures, cabinets, boxes and hardware of all types; in platform plenums (and including track side walls and under-platform slab and extensions into service rooms); along station train room safety walks, in stairways, corridors, and plenums that are not heated/air conditioned; and in all shafts to the surface and

dome reliefs, escalator well ways, elevator pits and surface elevator shafts, shall consist of stainless steel 304 material.

- B. Exception: Galvanized conduit may be used with stainless steel 304 mounting hardware. Electronic equipment connectors, and other relatively small sized specialty items that are not available in Stainless Steel 304 material may be allowed by the Authority's Representative as exceptions (Ref. Article 3.1 Request for Approval Of Minor Technical Specification Deviation).
- C. Unless otherwise specified, stainless steel equipment enclosures, cabinets, and boxes with dull gray colored epoxy paint applied shall be utilized in areas where surface glare may be visible to rail car operators, to avoid glare.
- D. Definitions: "Hardware" includes bolts, screws, clamping devices, anchoring devices, threaded rods, nuts, washers, hangers, covers/wall plates etc. "Boxes" includes junctions boxes, outlet boxes, disconnect switch boxes, circuit breaker boxes, and terminal boxes, etc. "Cabinets" includes terminal cabinets, equipment cabinets, MDF cabinets, and power distribution panelboards. (Note: Definitions include, but are not limited to, the items listed herein.)

Measurement Description

NOTES:

1. Additional tests may be required in accordance with other applicable Specification provisions.
2. The Authority may require the testing, or may elect to re-test, the insulation resistance of tunnel wall, duct bank, or direct burial outside plant cable during periods of high dampness or high ground water. Any single failure to obtain the minimum required readings shall be considered conclusive in determining that defects requiring Design-Builder repair or replacement are present.
3. Disconnect grounded and terminated cable elements as necessary to facilitate testing.
4. Full information concerning the type, application, to/from terminal destinations, junction boxes/splices (if any), size, conductor size, and actual installed length, must be included on test data sheets for each cable tested.
5. Notwithstanding manufacturers specifications or REA standards, cable(s) that does not meet minimum readings specified shall be replaced by the Design-Builder, at no additional cost to the Authority.

PART 2 PRODUCTS

PART 3 EXECUTION

NOT USED

END OF SECTION

SECTION 16705

COMMUNICATIONS STANDARD SPECIFICATIONS - EQUIPMENT AND MATERIAL

PART 1 - GENERAL

1.01 SECTION INCLUDES

Standard Specifications for Design-Builder-furnished equipment and materials. These Specifications shall apply to all equipment and materials furnished, unless otherwise specified elsewhere in this Contract (i.e. conflicting Specification requirements found in other Specification sections or on Information Drawings take precedence over Standard Specifications in this section).

1.02 REFERENCES

- G. Electronic Industries Alliance (EIA)
- H. National Electrical Manufacturers Association (NEMA)
- I. Institute of Electrical and Electronic Engineers Association, Inc. (IEEE)
- J. Association of American Railroads (AAR)
- K. WMATA General Provisions and Standards Specifications for Construction Projects.

PART 2 - PRODUCTS

2.01 EQUIPMENT RACKS

- A. Construction - Open Frame, Aluminum 3-Inch X 1.410 Channel, 1/4 Inch Thick.
- B. Panel Mounting Size - Standard 19-inch or 23-inch panels
- C. Finish - Baked Enamel
- D. Color - ANSI 61 Gray
- E. Hole Spacing - Standard EIA 1.75-inch vertical rack mounting spaces

- F. Hole Size - No. 12-24
- G. Base Width - 20.25 inches for 19-inch panels and 24.25 inches for 23-inch
- H. Base Depth - 15-inches.
- I. Base Mounting Holes - Front-to-back, centers of 12.5-inches and side-to-side centers of 16.0-inches and 20.0-inches.
- J. Rack Height - Maximum 7.5 feet.
- K. Equipment racks shall have a ground bus bar, bolt mounted near the top of the rack, consisting of a 6.0-inch by 0.25-inch by 0.5-inch copper bar drilled and tapped for six connections. The ground bus bar shall be electrically connected to the equipment rack.

2.02 EQUIPMENT CABINETS

- A. Construction - Assembled frame with a flush frame base, suitable side panels and top panel, a front door and a rear door.
- B. Assembled frame - Zinc plated 14-gauge steel and shall have the required front-to-back stiffeners to distribute the equipment load.
- C. Base - Zinc plated 14-gauge steel or greater.
- D. Panel Mounting Rails - Drilled and tapped in accordance with EIA Standard RS-310-C.
- E. Front Door and Rear Door - 16-gauge steel with a lockable handle.
- F. Ventilation - Louvers front door and/or the rear.
- G. Finish - Baked enamel/acrylic, gray color.
- H. Cabinet Height - Maximum 7.5 feet.
- I. Equipment cabinets shall have a ground bus bar, bolt mounted near the top of the rack, consisting of a 6.0-inch by 0.25-inch by 0.5-inch copper bar drilled and tapped for six connections. The ground bus bar shall be electrically connected to the equipment cabinet.

2.03 DISTRIBUTION FRAMES

- A. All systems distribution frames, including the Main Distribution Frame (MDF)/Protector Cabinet, shall consist of the required multisection cable terminal housings, top and bottom assemblies for each housing, a hinged end section at both ends of the distribution frame, a lift-out door for each housing, and a fungus resistant solid plywood backboard in each housing. Each housing of the distribution frame shall contain four distribution rings to permit neat installation of wires and cables within the housing.
- B. Finish - Baked enamel gray color.
- C. Multi-section cable terminal housings shall have a ground bus bar installed near the bottom on the plywood backboard, consisting of a 6.0-inch by 0.25-inch by 0.5-inch copper bar. The ground bus bar shall be drilled and tapped for the required ground connections within the housing. The ground bus bar shall be electrically isolated from the distribution frame enclosures.

2.04 JUNCTION BOXES

- A. Junction boxes shall be constructed of 12-gauge sheet steel, except for sizes 24-inch x 36-inch and smaller, which shall be constructed of 14-gauge sheet steel. Boxes shall have all seams welded. The boxes shall be finished to be a NEMA Type 4 rating with the door/cover gasket with an oil resistant gasket material and adhesive. Boxes shall be either galvanized, and painted with ANSI 61 gray paint after priming or shall be a phosphatized surface with ANSI 61 gray polyester powder coating applied. Associated hardware shall be constructed of stainless steel. Junction boxes shall be sized to provide ample space for terminating the wires and cables installed at each location, including terminal blocks and considering the minimum bending radii of cables. Junction boxes exposed to the weather shall have all wire entrances protected from weather and dust with a pliable sealing compound, and shall be equipped with a drain plug.
- B. Junction boxes shall be furnished and installed complete with terminals, fittings, mounting brackets, cable supports and all other necessary hardware. All conductors within a junction box (including spares) shall be terminated on terminal blocks. Junction boxes to be used only for the pulling of cable do not require terminals.
- C. Where the Design-Builder furnishes and installs junction boxes as means of terminating cables, cable supports shall be provided in the boxes.
- D. The Design-Builder may request a waiver to use outlet boxes in lieu of junction boxes for specific application(s) in specific locations. The request must be approved by the Authority prior to the purchase of material or the beginning of installation.

2.05 CONDUIT PLANT

- A. All conduit, except as noted, shall be intermediate metal conduit (IMC). The rigid metal conduit shall conform to UL Standard Number 6, Rigid Metal Conduit and National Electric Code Article 345 Intermediate Metal Conduit. The exterior surface shall be thoroughly and evenly coated with metallic zinc applied directly to the surface of the steel (electroplated zinc coating). The conduit furnished shall be supplied in nominal 10-foot lengths, threaded on each end with one coupling attached. The intermediate metal conduit, elbows, coupling, and fittings shall be protected by corrosion protection when subject to severe corrosive influences. Conduit fittings selected for removable covers shall be complete with gaskets and blank covers.
- B. Flexible conduit shall be provided only where specifically required by these Specifications or where, at the request of the Design-Builder, its use has been approved by the Authority Representative and allowed by the National Electrical Code. The flexible conduit shall be constructed of interlocking spiral strip steel of the best quality. The flexible conduit shall be thoroughly annealed and fully coated with metallic zinc. The flexible conduit shall conform to Underwriters Laboratories standards and Federal Specification WW-C-5568. The flexible conduit shall have an extruded liquid-tight neoprene jacket in those locations where the conduit will be exposed to a wet environment, or required by the Authority Representative for an approved installation. Appropriate type and sized connectors, couplings and fittings supplied or recommended by the manufacturer for the specific flexible conduits shall be provided.
- C. Rigid non-metallic conduit shall be provided only where specifically required by these Specifications or where, at the request of the Design-Builder, its use has been approved by the Authority's Representative and allowed by the National Electrical Code. Unless otherwise specified, the rigid non-metallic conduit shall be classified as heavy wall type construction.

Appropriate type and sized connectors, couplings and fittings supplied or recommended by the manufacturer for the rigid non-metallic conduit shall be provided.

- D. The Design-Builder shall furnish systems and facilities and select equipment with features that will allow for the utilization of cables sized to fit existing conduit (if any), or the Design-Builder shall be required to furnish and install suitable conduit to Authority standards to accommodate the communications cables required.

2.06 CABLE TRAYS

- A. Cable trays shall be prefabricated aluminum, open ladder type, approximately 3 inches in depth and shall conform to NEMA Standard VE-1. The width of cable trays shall be determined by the Design-Builder, but shall be a minimum of 6 inches. Cable tray bottoms shall have rungs on 4-inch centers. Where applicable, a cantilevered single "wall support" type of tray shall be used.
- B. The cable trays shall support a 100 pound per linear-foot load, with a maximum mid-span deflection of 0.25 inch when considered as a simple beam with supports on eight-foot centers.
- C. Appropriate type and size curved sections, cross sections, tee sections, fittings, accessories and supports shall be furnished in accordance with the manufacturer's recommendations.

2.07 CABLE LADDERS

- A. Cable ladders shall be prefabricated aluminum, open ladder type, approximately three (3) inches in depth and shall conform to NEMA Standard VE-1. The width of cable ladders shall be determined by the Design-Builder to support cables in cable vault or mounted on wall when conduit is not available or conduit is not suitable for installation.

2.08 HARDWARE

- A. Unless otherwise specified, all mounting hardware shall be galvanized. Appropriate type mounting hardware shall be provided for the corresponding supporting surfaces.
- B. Unless otherwise specified, brackets for the mounting and supporting of equipment and material in passenger station areas, yard buildings and other facility buildings shall be painted. Unless otherwise specified, brackets installed in tunnel or outdoor areas shall be galvanized after fabrication in accordance with ASTM A386.
- C. All bolts, nuts and washers for mounting and supporting of equipment within equipment enclosures shall be cadmium plated.

2.09 PAINTING

- A. Equipment furnished and installed by the Design-Builder other than galvanized, copper, plastic and electrical contact surfaces shall be factory painted internally and externally, except as otherwise specified.
- B. Paint colors shall be selected to match existing equipment, where applicable, and shall be subject to the approval of the Authority's Representative.

2.10 SPECIAL REQUIREMENTS FOR STAINLESS STEEL CORROSION RESISTANT HARDWARE

- A. Except as otherwise specified, equipment enclosures, cabinets, boxes and hardware of all types in tunnels, tunnel crossovers, along the surface right-of-way, and in all ancillary

structures that are open to tunnels (vent shafts, fan shafts, pumping stations, etc. - excluding rooms within these areas that are heated/air conditioned) shall consist of stainless steel 304 material. Also, except as otherwise specified, equipment enclosures, cabinets, boxes and hardware of all types; in platform plenums (and including track side walls and under-platform slab and extensions into service rooms); along station train room safety walks, in stairways, corridors, and plenums that are not heated/air conditioned; and in all shafts to the surface and dome reliefs, escalator well ways, elevator pits and surface elevator shafts, shall consist of stainless steel 304 material.

- B. Exceptions: Galvanized conduit may be used with stainless steel 304 mounting hardware. Gray colored fiberglass boxes may be utilized for Emergency Trip Station(ETS) Telephones (Ref. Article 3.7 for product specifications). Non-metallic mounting hardware may be utilized for tunnel and passenger station Mobile Radio System (MRS) antenna cable mounting (Ref. Article 3.13 for product specifications). Electronic equipment connectors, and other relatively small sized specialty items, that are not available in Stainless Steel 304 material, may be allowed by the Authority's Representative as exceptions (Ref. Article 3.1, Request for Approval Of Minor Technical Specification Deviation).
- C. Unless otherwise specified, dull "powder gray" colored Original Equipment Manufacturer (OEM) factory painted exterior surfaces of stainless steel 304 equipment enclosures, cabinets, and boxes shall be utilized in areas where surface glare may be visible to rail car operators, or the Design-Builder shall neatly apply dull colored epoxy paint to surfaces to avoid glare. McMaster-Carr Supply Company (New Brunswick, NJ) Catalog No. 7892T78 (from Cat. #98) gray primer (or approved equal) shall be utilized for the Design-Builder applied paint.
- D. Definition: "Hardware" includes bolts, screws, clamping devices, anchoring devices, threaded rods, nuts, washers, hangers, covers/wall plates etc. "Boxes" includes junction boxes, outlet boxes, disconnect switch boxes, circuit breaker boxes, and terminal boxes, etc. "Cabinets" includes terminal cabinets, equipment cabinets, MDF cabinets, and power distribution panelboards. (Note: definitions include but are not limited to the items listed herein.)

2.11 ELECTRICAL

- A. All electrical and electronic components furnished in accordance with this Contract shall be:
 - 1. New and free of manufacturing defects;
 - 2. Free of storage and handling damages;
 - 3. Clearly and permanently labeled with value or identification type;
 - 4. Rated to operate at power, voltage, and current levels exceeding, by at least 20 percent, those which the components will be subject to in service, unless otherwise noted;
 - 5. Commercially available;
 - 6. Capable of operating in the environment specified in these Specifications;
 - 7. Identical, if performing the same function; and
 - 8. Selected with tolerance limits such that the equipment fabricated from the components shall not malfunction over the specified system/facility or equipment operating range.
- B. The selection of the electrical and electronic components shall be such as to provide maximum convenience and safety to personnel in installing, operating and interchanging a complete assembly or component part. Provisions shall be made to prevent personnel from accidentally coming into contact with hazardous voltages. Components shall be selected to prevent reversed assembly or installation of connectors and cables. Cables shall be suitably identified with their mating connections.

- C. Any deviation from these requirements and the requirements detailed herein, including those inherent in standard production equipment, shall be subject to the approval of the Authority's Representative.

2.12 TRANSISTORS AND DIODES

- A. All transistors and diodes shall carry a Joint Electronic Device Engineering Council (JEDEC) number, shall be available from at least two manufacturers, and shall be silicon. Specially selected transistors and diodes within a type number shall not be permitted.
- B. Resistors shall have a maximum tolerance of plus-or-minus 5 percent and shall be rated to dissipate a minimum of 1.5 times the maximum power they will be required to dissipate in operation.
- C. Zener diodes used for voltage regulation or reference levels shall be of such rating that they will not be damaged if the entire load is removed abruptly, and shall have a Zener voltage tolerance of plus-or-minus 5 percent or better.
- D. Zener diodes used for transient protection shall be of such a rating that they will not be damaged in performing their function within all actual conditions encountered in the operating system/facility.

2.13 CAPACITORS

- A. Wet electrolytic capacitors shall not be used. Only dry electrolytic capacitors shall be provided.
- B. Capacitors shall have a maximum tolerance of plus-or-minus 10 percent and shall be rated for at least 1.5 times the maximum peak voltage they will be subjected to in operation.

2.14 OTHER SEMICONDUCTORS

- A. All other semiconductors shall carry a Joint Electronic Device Engineering Council (JEDEC) number and shall be available from at least two manufacturers. All other semiconductors shall be of the silicon type, unless otherwise approved, in writing, by the Authority's Representative.

2.15 INTEGRATED CIRCUITS

- A. All integrated circuits (ICs) shall be available from at least two manufacturers. The Design-Builder shall take all necessary precautions to ensure that no system or facility using ICs shall malfunction in any fashion due to internally or externally generated noise or cross-talk.
- B. Integrated circuits shall not be damaged by the failure or partial failure of any one or any combination of the various supply voltages. Integrated circuits shall not be damaged by overvoltage of 1.4 times the normal supply voltage, or by short circuits on their inputs and/or outputs.

2.16 TRANSFORMERS

- A. All transformers provided under this Contract shall be of air-cooled, dry type, unless otherwise approved by the Authority's Representative.

- B. Unless otherwise specified, all transformers shall have minimum interwinding and winding to core breakdown voltage of 600 Vdc. Transformers used in electronic circuitry are an exception.
- C. Unless otherwise specified, all transformers shall conform to the following requirements:
 - 1. Core laminations shall be grain oriented silicon steel. Maximum flux densities shall be substantially below saturation level. The core volume shall allow efficient transformer operation at 10 percent above the highest tap voltage. All laminations must be core plated or annealed, free of burrs and firmly butted. The core laminations shall be tightly clamped and compressed to provide quiet operation. Transformers shall not emit audible noise in excess of 50 design-Builder referenced to .0002 dynes per sq. cm., at a distance of three feet, while operating at rated voltage and load.
 - 2. Coil conductors shall be continuous with terminations brazed or welded without auxiliary flux material. The entire core and coil assembly shall be pre-dried by heat, impregnated with varnish or other approved compound, and cured at a minimum of 350 degrees F to reduce hot spots and seal out moisture. Coils shall be protected with an outer layer of glass tape or similar quality insulation.
- D. Unless otherwise specified, all transformers provided under this Contract shall be equipped with suitably insulated screw terminals for all primary and secondary lead wires. Transformers used in electronic circuitry and video isolation transformers are an exception. Appropriate type video connectors shall be provided for the input and output leads of video isolation transformers.

2.17 POWER SUPPLIES

- A. Unless otherwise specified, all power supplies shall have the characteristics and meet the requirements listed herein.
- B. Power supplies shall be for continuous duty and shall be rated at a minimum of 120 percent of maximum load at 50 degrees C.
- C. Power supplies shall be selected for mounting in a standard 19-inch equipment rack and shall be housed in a metal panel-chassis combination with no exposed electrical connections or wires. Appropriate type terminals shall be provided on the rear of the chassis for the connections of all external input and output power leads. An appropriate sized power cord (internally connected) may be provided for the input power leads.
- D. Power supplies shall be selected for natural convection cooling. No supplementary fans or other cooling devices will be allowed.
- E. The power supplies shall not be damaged by a sustained input voltage varying from 0 to 150 percent of the rated input voltage. Power supplies shall have current limiting, which shall protect the power supplies from damage due to overload or short circuits. Overvoltage protection shall be contained on those power supplies driving solid-state circuitry.
- F. Each power supply shall have an output voltmeter, an output ammeter, and a normally illuminated power light (lamp or LED) mounted on its front cover. All panel mounted indicating, adjusting, and protective devices, or openings for such devices, shall be legible and permanently labeled.
- G. Each power supply shall be equipped with a failure alarm device, which shall detect any internal failure that will impair the ability of the power supply to deliver its full rated load. This device shall be normally energized by a small percentage of the rated load current of the

power supply. Upon detection of a failure, the failure alarm device shall provide an independent contact closure for an external alarm indication circuit. The contacts shall be wired to appropriate type terminals on the rear of the chassis. In addition, the failure alarm device shall extinguish the normally illuminated power light on the front cover, when a failure is detected.

- H. Unless otherwise specified, all redundant power supplies shall be diode coupled to the loads with the corresponding main power supplies.

2.18 CONNECTORS

- A. Connectors shall be provided on wires, multi-conductor cables, coaxial cables, and triaxial cables, when required to permit the connection to or removal of equipment items for maintenance, as determined by the Authority's Representative. In-line connectors shall be provided only where specifically required by these Specifications or where, at the request of the Design-Builder, its use has been approved by the Authority's Representative. Appropriate type and size connectors shall be provided for the joining, splicing, and terminating of all coaxial cables and triaxial cables.
- B. Unless otherwise specified, connectors shall not be required for the termination of wires and cables to those equipment items which contain screw type terminals as the interface connection for wires and cables. Connectors shall not be provided in system distribution frames. Appropriate type mating connectors, recommended by the manufacturers, shall be provided for those equipment items requiring connectors for the interfacing of wires and cables. Appropriate type connector assemblies and mating connectors shall be provided to interface wires and cables to all equipment (including system control panels) in the Kiosk and yard consoles.
- C. Appropriate type, size, and rated power connectors (plugs) shall be provided to interface equipment power cords and cables to ac power receptacle strips, ac power outlet assemblies, and ac outlets.
- D. Unless otherwise specified, all multi-conductor cable connectors (including those provided for custom-made equipment and control panels) shall consist of a molded plastic connector block equipped to hold the required number of contacts, a protective shell (plastic or metal), a mechanical keying device, a device to grip the external wiring firmly in order to prevent strain on the contacts, and the required solderless contacts (pins or sockets). The pin and socket contacts shall be fabricated from commercial bronze or brass and have a minimum 0.00003-inch gold plating over nickel underplate. The pins and sockets shall be appropriately sized to interface the corresponding conductor sizes that are to be terminated to the connector. Connectors provided on equipment for the interfacing of wires and cables shall be firmly secured to the chassis.
- E. All connector assemblies shall be easily connected and disconnected by hand. Tools used to apply connector contacts to wires and cable conductors shall be of the size and type recommended by the manufacturer of the connector.
- F. Each connector shall be marked in such a manner that its mating half shall be distinctly identified as being related to each other, but to no other connector within the immediate area. These identification markings shall be applied in such a manner that they will not be obscured or worn off in normal use.
- G. All conductors (including spares) within a cable that interfaces with a connector shall be terminated in the connector.

- H. All in-line connectors installed in wires and cables located inside structures, within tunnel areas, and all connectors installed to equipment which are not located within rooms of passenger stations, ancillary buildings and yards shall be protected by silicon sealer coating, enclosed by heat shrinkable tubing (sleeves). This requirement shall be excluded for all connections with a weatherproof classification.
- I. All in-line connections installed in manholes, hand-holes, cable troughs or cable trenches (direct burial) shall be enclosed in filler splice cases, utilizing products and methods approved by the Authority's Representative.
- J. In-line connection shall not be allowed in conduits, ducts, pipes and cable trays.
- K. All locations of in-line connections shall be documented on As-Built drawings.

2.19 RELAYS, SWITCHES AND PUSHBUTTONS

- A. All electromagnetic relays shall be plug-in type and secured to their corresponding socket to reduce the effects of shock and extreme vibration. Where applicable, retaining wire springs shall be provided with the relays. The contacts of the electromagnetic relays shall be palladium, silver, or gold plated, or shall be mercury-wetted. All contacts shall be bifurcated and shall have a wiping action. The coil and contacts of each electromagnetic relay shall be enclosed in a protective dust cover. Unless otherwise specified or required for a specific function within the associated circuitry, all double throw contacts shall be break-make type (Form "C").
- B. All solid-state relays shall be completely encapsulated in a rugged epoxy case. A minimum of 2500-Vrms isolation shall be provided between the input and the output of all solid-state relays.
- C. All relays shall be of the appropriate type (Vac or Vdc operation) and be of the required input control rating for their intended use. The contacts of the electromagnetic relays and the isolated outputs of the solid state relays shall have ratings that equal or exceed the corresponding connected load requirements (voltage and current).
- D. Arc suppression circuits shall be provided for all relays used in electronic circuitry. Arc suppression may be built into the relays or provided on the printed circuit cards on which the relays are mounted. All time delay relays shall have solid-state timing circuits.
- E. All switch and pushbutton contacts shall be palladium, silver or gold-plated. The contacts shall have a wiping action and shall be rated for their intended use. All switches and pushbuttons shall have a long life expectancy of more than 10,000 operations.
- F. Unless otherwise specified, the types of switches (rocker, toggle, etc.), the operation of the pushbuttons and switches (momentary action, maintained action, etc.), and the configuration of the pushbuttons and switches on developed equipment shall be determined by the Design-Builder and approved by the Authority's Representative. Unless otherwise specified, all pushbuttons and switches on developed equipment shall contain LEDs, if indicators are required. Mechanical interlocking shall be provided when required. Full guard bezel which surrounds the button to help prevent accidental operation and barriers between pushbuttons and switches shall be provided, upon request by the Authority.
- G. All switches and pushbuttons on equipment shall be permanently labeled. Labeling of the switches and pushbuttons shall either be provided on the surface of the equipment to which they are mounted or provided on the switches and pushbuttons themselves. All graphics on pushbuttons and switches shall be hot stamped in a color that will contrast with the color of the buttons (lenses).

2.20 TEST POINTS

Test points shall be provided for each major function. Labeled test points on printed circuit boards and other plug-in modules shall be accessible while the device is in operation.

2.21 PRINTED CIRCUIT BOARDS

- A. All printed circuit boards (cards) shall be constructed of fire-resistant glass epoxy material of NEMA quality FR4 or better. Cards shall have sufficient thickness to permit easy insertion and removal without buckling or breaking and shall be keyed to prevent incorrect interchange. All circuits on the printed circuit boards shall be formed by etching. Conductor material shall be copper and shall be protected from exposure to air.
- B. Boards shall be produced with plated through holes, for component mounting and connecting, and for interfacial connections. If all interconnecting circuitry is confined to one side of the board, the board may be produced with unsupported holes for mounting the components which will be soldered to the pattern side of the board.
- C. Printed circuit boards shall be coated with an approved moisture-proofing compound after assembly, except when this requirement is waived by the Authority's Representative, due to non-availability from manufacturers of approved off-the-shelf dust protected equipment units.
- D. Each printed circuit board shall be permanently and legibly marked with a unique number identifying that type of circuit board (i.e., model number). In addition, each printed circuit board shall be permanently and legibly marked with a unique serial number.

2.22 LED AND INDICATING LAMPS

- A. All indicating lights (LEDs and lamps) shall have a life expectancy of 25,000 hours minimum. All indicating lights shall be operated between 85 percent and 95 percent of their rated voltage.
- B. All indicating lights on equipment shall be permanently labeled. Labeling of the indicating lights shall either be provided on the surface of the equipment to which they are mounted or provided on their associated lenses. All graphics on the lenses shall be hot stamped in a color that will contrast with the color of the lenses.
- C. Unless otherwise specified, all indicating lights (LEDs and lamps) shall be replaceable from the front of the light assemblies.
- D. Unless otherwise specified, all numeric and alphanumeric displays shall be solid state LED display or liquid crystal display. Numeric characters shall be 7-segment type display and alphanumeric characters shall be 14-segment type display. However, a dot matrix display will be considered upon request by the Design-Builder. Unless otherwise specified, all character displays shall be a minimum of ½-inch. Appropriate filters and windows shall be provided.

2.23 METERS

- A. Unless otherwise specified, traditional meter movements shall have a full scale accuracy of ± 2 percent.
- B. All meters shall be of the appropriate type for their intended use; i.e., a meter with an ampere scale shall not be acceptable for the measurement of milli-amperes. All meters shall be legible and permanently labeled.

2.24 TERMINAL BLOCKS

- A. All terminal blocks and terminal strips shall be rated for service at 300 volts minimum. All terminal blocks and terminal strips shall be of the appropriate current rating for corresponding terminated circuits. All terminals of the terminal blocks and terminal strips shall be sized to accept corresponding terminated wire and cable conductor sizes (gauges). Resistance of the terminals shall not exceed 0.0002 ohms.
- B. Unless otherwise specified, terminal blocks and terminal strips provided in junction boxes, equipment enclosures, system distribution frames, equipment cabinets, and termination facilities shall be of the modular, feed-thru type mounted to a metal channel or be of the single molded construction barrier type.
- C. Unless otherwise specified, the modular, feed-thru type terminal blocks and terminal strips shall have pressure clamp contact terminals suitable for solid and stranded wire. Appropriate sized (length) continuous mounting channel shall be provided for each terminal block and terminal strip. Appropriate accessories (end sections, channel clamps, partitions, mounting hardware, etc.) shall be provided for each terminal block and terminal strip. Disconnect apparatus (without removing wires) shall be provided in the terminal assemblies of those terminal blocks and terminal strips, which are utilized in conjunction with protector block assemblies, or otherwise specified within these Specifications.
- D. The barrier type terminal blocks and terminal strips shall be constructed of molded fire-retardant thermoplastic with double row terminals. The terminals shall consist of binding head screws, with the two screws associated with each terminal electrically connected with a brass strip. Appropriate mounting hardware shall be provided for each terminal block and terminal strip.

2.25 PROTECTOR BLOCKS

- A. Unless otherwise specified, each protector block shall be selected for the termination of two pairs (four conductors). The base of each protector block shall be constructed of molded fire-retardant thermoplastic and shall be equipped with four binding posts and four related screw-in arrester units. The four binding posts shall be connected internally to the corresponding arrester units. Each binding post shall be equipped with two nuts and four beveled washers. A ground plate shall be provided on the face of the base of each protector block between the arrester units. The arrester units shall be 2-electrode gas type and provide 400 Vdc fail-short protection.
- B. Multiple protector blocks (two pair type) shall be provided and installed adjacent to each other (vertical rows) for the termination of multi-conductor cables containing more than two pairs.
- C. Appropriate length brass or copper mounting and ground bar assemblies shall be provided for the installation and grounding of the protector blocks. Each mounting and ground bar assembly shall have a minimum of two binding posts with appropriate nuts and washers for the termination of ground wires. Appropriate hardware shall be provided to secure and ground the protector blocks to the mounting and ground bar assemblies. Appropriate mounting hardware shall be provided to install the mounting and ground bar assemblies.
- D. Unless otherwise specified, all wires and cables that enter/exit the Communications Equipment Rooms of passenger stations and yards to/from the WMATA right-of-way shall be terminated on protector blocks in the Communications Equipment Room. All wires and cables that enter/exit equipment within the WMATA right-of-way and enter/exit remote ancillary buildings shall be terminated on protector blocks at the equipment and in the remote ancillary buildings. All wires and cables that enter/exit yard buildings and other special buildings shall be terminated on protector blocks in the yard buildings and special buildings.

All wires and cable conductors (including spares) shall be terminated on protector blocks at each location. Coaxial cables and triaxial cables are exceptions.

2.26 FUSES AND CIRCUIT BREAKERS

All equipment shall be protected by fuses or circuit breakers of the appropriate size. Fuses and circuit breakers shall be readily accessible, surface mounted, on all equipment. Fuse wire within the equipment shall not be acceptable.

2.27 WIRES AND CABLES

- A. Only continuously extruded outer jackets free of polyvinylchloride (PVC) and PVC-based compounds shall be furnished on cables provided in these Specifications. Exceptions may be allowed by the Authority's Representative when such cable is not commercially obtainable only from equipment manufacturers, and when appropriate to avoid potential electrical signal mismatching, or to otherwise improve system performance or reliability.
- B. All single conductor wire and individual conductors of multi-conductor cables shall be copper and shall be insulated.
- C. Multi-conductor cable shall be made by assembling individual or twisted pairs of insulated conductors into a tight cylindrical form. Individual conductors or twisted pairs in a cable having more than two wires shall be assembled helically and with adjacent layers wound in opposite directions. Twisted pairs shall consist of two individually insulated conductor cables with a length of lay as short as good construction will permit, but not longer than ten inches. Where more than one twisted pair is included, length of lay of adjacent pairs shall differ by at least one-half inch.
- D. Unless otherwise specified, all multi-conductor cables installed within the WMATA right-of-way shall contain a metallic shield and a corrugated metallic tape armor. The shield and armor shall be separated by an inner jacket.
- E. Multi-conductor cables containing more than two conductors shall contain 20 percent spare conductors, or two spare conductors (two spare pairs if composed of twisted pairs), whichever is greater.

2.28 HOOK-UP-WIRE

- A. All wiring within electronic equipment selected, or wired by the Design-Builder shall have passed the Underwriters Laboratories VW-1 Vertical Flame Test. The wire size shall be commensurate with the application.
- B. All wires within electronic subassemblies and assemblies shall be identified by adequate color-coding, in accordance with best commercial practices.

2.29 GROUNDING

- A. Communications systems and facilities, equipment and cables shall be grounded using a single-point grounding scheme. Each Communications Equipment Room will have a separate isolated ground bus bar, provided by others, designated as "communications ground."
- B. Unless otherwise specified, the shields of all single shielded communications cables, the shields of multi-conductor cables that have individually shielded pairs, and the inner shield of all double shielded communications cables and communications cables with separate shield and armor, shall be grounded only at a single point and only to the "communications

ground." These shields shall be electrically continuous throughout the cable length by bonding across all splices and terminations in equipment enclosures and junction boxes.

- C. The outer shield of all double shielded communications cables and the armor of all communications cables with separate shield and armor shall be grounded only at a single point in each cable section. The single point ground shall be located at the end of the cable section nearest to the associated Communications Equipment Room. Cable sections originating at Communications Equipment Rooms shall have the outer shield or armor grounded to the "communications ground."
- D. The Information Drawings show details of the cable grounding scheme.
- E. Equipment racks and equipment cabinets shall be electrically isolated from the building structure, adjacent equipment racks and equipment cabinets. Minimum resistance between adjacent equipment racks and equipment cabinets, and between equipment racks and equipment cabinets and the building structure, shall be 10 megohms. Each equipment rack and equipment cabinet shall be individually wired to the communications ground, via the copper ground bus bar on the equipment rack and equipment cabinet, by a No. 6 AWG, stranded, insulated wire, Type XHHW.
- F. Each copper ground bus bar in the multi-section cable terminal housings of the MDF/Protector Cabinet and the systems distribution frames shall be wired to the communications ground by a No. 6 AWG, stranded, insulated wire, Type XHHW.
- G. All power conductors shall be electrically insulated from equipment racks and equipment cabinets, and power ground shall be separate and isolated from communications ground. Conduit containing power conductors running from ac distribution boxes to equipment racks, equipment cabinets, ac receptacle boxes on equipment racks and equipment cabinets shall be insulated from the equipment cabinet or equipment rack by means of short lengths of non-conducting conduit.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Adjacent equipment racks and equipment cabinets shall have a 0.25-inch separation between upright members. They shall be mechanically secured to each other by 0.25-inch nylon bolts and spacers.
- B. Adjacent equipment racks and equipment cabinets shall use rigid non-metallic conduit for interconnecting wiring.

END OF SECTION

THIS PAGE NOT USED

SECTION 16706

COMMUNICATIONS SYSTEM SUBMITTALS & SERVICES

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Submittal procedures
- B. Construction progress schedules
- C. Proposed Products list
- D. Product Data
- E. Shop Drawings
- F. Contract Record Drawings
- G. Spare Parts
- H. Samples
- I. Design data
- J. Test reports
- K. Certificates
- L. Manufacturer's instructions
- M. Manufacturer's field reports

1.02 REFERENCES

AGC (Associated General Contractors of America) publication "The Use of CPM in Construction - A Manual for General Contractors and the Construction Industry."

1.03 SUBMITTAL PROCEDURES

- A. Transmit each submittal with Authority Representative accepted form.
- B. Sequentially number the transmittal form - Revise submittals with original number and a sequential alphabetic suffix.
- C. Identify Project, Design-Builder, Subcontractor or supplier, pertinent drawing and detail number, and specification section number, as appropriate.
- D. Apply Design-Builder's stamp, signed certifying that review, approval, verification of Products required, field dimensions, adjacent construction Work, and coordination of information is in accordance with the requirements of the Work and Contract Documents.

- E. Schedule submittals to expedite the Project, and deliver to Authority's Representative. Coordinate submission of related items.
- F. For each submittal for review, allow 30 days excluding delivery time to and from the Design-Builder.
- G. Identify variations from Contract Documents and Product or system limitations that may be detrimental to successful performance of the completed Work.
- H. Provide space for Design-Builder and Authority's Representative review stamps.
- I. When revised for resubmission, identify all changes made since previous submission.
- J. Distribute copies of reviewed submittals as appropriate. Instruct parties to promptly report any inability to comply with requirements.

1.04 PROPOSED PRODUCTS LIST

- A. Submit list of major products proposed for use, with name of manufacturer, trade name, and model number of each product.
- B. For products specified only by reference standards, give manufacturer, trade name, model or catalog designation, and reference standards.
- C. The Design-Builder shall use the major products described in the Communications Sections when practical, to avoid increasing WMATA's maintenance requirements.
- D. If "equal" products are proposed by the Design-Builder, he shall insure that the proposed products will interface and operate properly with other Design-Builder-supplied products, subsystems and systems, and with existing communications products, subsystems, and systems.
- E. Whenever the Design-Builder proposes a new major product (one where salient characteristics have been described in any Communications Section) that has not been previously used on the Transit System, the Design-Builder shall include that new product in his training program to be conducted for WMATA operations and maintenance personnel.

1.05 PRODUCT DATA

- A. Product Data For Review:
 - 1. Submitted to Authority's Representative for review for the limited purpose of checking for conformance with information given and the design concept expressed in the contract documents.
 - 2. After review, provide copies and distribute in accordance with SUBMITTAL PROCEDURES article above and for record documents purposes.
- B. Product Data For Information:
 - 1. Submitted for the Authority Representative's review.
- C. Product Data For Project Close-out:
 - 1. Submitted for the Authority's benefit during and after project completion.
- D. Submit the number of copies that the Design-Builder requires, plus two copies that will be

retained by the Authority's Representative.

- E. Mark each copy to identify applicable products, models, options, and other data. Supplement the manufacturers' standard data to provide information specific to this Project.
- F. Indicate Product utility and electrical characteristics, utility connection requirements, and location of utility outlets for service for functional equipment and appliances.
- G. After review distribute in accordance with the Submittal Procedures article above and provide copies for record documents.

1.06 SHOP DRAWINGS

- A. The Design-Builder shall, unless otherwise directed, submit of all communications system shop drawings to the Authority's Representative for approval. Drawings developed for this project shall be 11" x 17".
- B. The Design-Builder shall develop an Engineering Drawing Index which shall be submitted to the Authority's Representative for review and approval. The drawing index shall include descriptive titles, drawing numbers, revision numbers, and the dates of completion of drawings for communications systems and facilities covered in these Specifications and for all Design-Builder-furnished equipment. The Engineering Drawing Index shall be definitive as to the availability and content of subsequent drawings. It shall be compatible in format and drawing number sequence with Authority Drawing Index for previous Communications Contracts and subject to approval. The Authority's Representative shall assign the drawing number sequence. The drawing number sequence shall be 15XXX. The Design-Builder shall be responsible for maintaining, revising and updating the Engineering Drawing Index for the duration of the Contract. The Engineering Drawing Index shall be revised and updated quarterly, or as required by the Authority's Representative. A completed Final Drawing Index shall be provided to the Authority's Representative at the conclusion of the Contract.
- C. Shop drawings shall be complete, detailed and dimensioned. All necessary shop drawings shall be provided for use in fabricating, assembling, handling, erecting, installing, connecting, trouble-shooting, testing, and maintaining each complete system/facility, all changes to existing systems, facilities and equipment, and all equipment furnished, as follows:
 - 1. Equipment installation drawings, including sections, elevations, and floor plans showing dimensions necessary for installation, equipment base or mounting details, and location of entrance/exit for cable(s).
 - 2. Outline drawings indicating overall dimensions, aisle space requirements, locations of all devices mounted on equipment racks/cabinets and panels, locations of all terminal blocks or connectors for connections to external cable, and removable plates for cable entry; sufficient detail shall be provided to show accessibility for maintenance.
 - 3. Complete detail system/facility block and level diagrams for each system/facility and for all equipment that is provided by the Design-Builder; each block shall represent one specific function, and each apparatus shall be divided into as many blocks as required. Such system/facility diagrams shall also include existing equipment details.
 - 4. Complete cable/wire plan and riser diagrams for each system/facility and all equipment that is provided by the Design-Builder; including designations, destinations, color codes, and termination details for the conductors of each cable and wire.
 - 5. Separate and complete schematic and logic functional diagrams for circuits of equipment furnished by the Design-Builder; circuits which are repetitive may be shown as a single schematic and/or logic functional diagram with identical parts indicated.

- All variations in circuitry must be clearly shown on individual diagrams for each subsystem. Notes which indicate exceptions to typical layout schematics or logics will not be acceptable. Schematic and logic diagrams shall indicate signal flow for all inputs and outputs, bus connections, and all terminal points for external connection. These shall be clearly identified and in agreement with corresponding terminal points on the wiring diagrams. Functional blocks plus their module schematic diagrams on separate drawings will be acceptable for solid-state portions of the logic servicing a specific function. Logic diagrams and schematic diagrams shall conform to the applicable IEEE standards or to alternate approved standards.
6. Interconnecting wiring drawing(s) for each piece of equipment, indicating all terminal points for external cable connections, including cable designations, wire colors or designations; the number of conductors in each cable; and the destination of each cable, by reference to the appropriate unit and Design-Builder's drawing number or point device and drawing number as provided in the Information Drawings.
 7. Wiring drawings with all terminals, relays, modules, and other devices shown in their relative physical locations shall be provided. Each drawing shall indicate exact point-to-point connections between interconnected devices and between devices and terminals for external connections. Wire lists and cable running lists will be accepted if they include a description and a diagram of the system/facility. The Design-Builder shall be responsible for the accuracy of the wiring, terminal point identifications, device identifications, and device designations which shall be in exact agreement with schematic functional diagrams accepted by the Authority's Representative.
 8. Schematics and wiring diagrams for all printed circuit boards with all electronic components and test points shown in their relative locations.
 9. Both the schematic functional diagrams and the wiring drawings shall indicate all the points essential for troubleshooting, with their respective operating voltage levels, logic state, current, or other applicable measurable parameters.
 10. Fabrication and assembly drawings for developed equipment, including panel and chassis layouts, circuit designs, components, graphics, component layouts and list of material.
 11. Additional requirements specified in the various Communications Sections.
- D. Groups of associated drawings shall be submitted together, so that Authority reviewers can evaluate the composite design and interface considerations involved for specification compliance. Submissions not in compliance with the foregoing requirement may be returned by the Authority without action.
- E. Separate drawings shall be furnished for each Yard Communications System for each of the respective WMATA Yards and Shops. Site specific drawings shall be developed for each system. Notes which indicate exceptions to a typical drawing shall not be acceptable.
- F. During construction, (after Shop Drawing approval) the Design-Builder shall maintain for inspection by the Authority's Representative a record set of Shop Drawings annotated to show all authorized changes incorporated as work progresses. Three set of annotated Shop Drawing shall be submitted not later than three working days after changes are authorized by the Authority's Representative. Information shall include, but not be limited to, the following:
1. Field changes of any type.
 2. Changes accomplished by Change Orders (Change Orders may also specify requirements for the prior submission and approval of Shop Drawings before work commences).
- G. Before Substantial Completion Inspection (SCI), the Design-Builder shall furnish to the Authority's Representative Shop Drawings for the record, all clearly revised and completed and brought up to date, showing the permanent construction as actually accomplished. Not later

than 15 calendar days after Substantial Completion, updated shop drawings shall also be submitted on electronic media using the latest version of AutoCad (.DWG) or other Authority approved drawing file formats.

- H. Work in the Contract requires modifications, reconfigurations and connections of various existing communications systems and facilities in the transit yards, sites along the rights-of-way and the Jackson Graham Building. Upon request by the Design-Builder, and approved by the Authority's Representative, existing Authority Record Drawings may be obtained to incorporate the requirements of this Contract and may be submitted as Contract Shop Drawings. Process for utilizing the Authority Record Drawings shall be in accordance with the requirements of the CONTRACT RECORD DRAWINGS article of this Section.

1.07 CONTRACT RECORD DRAWINGS

A. General:

1. Before the scheduled date of the Final Acceptance of all Contract work, the Design-Builder shall submit approved as-built drawings, and electronic media for the completed work.

B. As-built Drawings:

1. As-built CONTRACT RECORD DRAWINGS shall include Installation Drawings, Shop Drawings, Working Drawings, kiosk data file drawings and revisions to all affected existing Authority Record Drawings.
2. Authority Record Drawings are as-built drawings provided to the Authority in previous communications contracts. The Design-Builder shall coordinate with the Authority to determine which existing Authority Record Drawings require revisions.
3. The Authority will furnish the Authority Record Drawings which require revisions from which the Design-Builder shall make reproductions for his use in preparing as-built drawings. Images shall be clear, sharp and readily legible.
4. Revisions to Authority Record Drawings shall match the base drawings in line weights, symbols, and lettering style and size. Drafting shall be performed with AutoCad software, and shall match original Information Drawings in line weights, symbols, and lettering style and size.
5. The Design-Builder shall submit three sets of prints of as-built drawings in a timely manner for review and approval.
6. Additions and corrections resulting from Authority review comments shall be incorporated by the Design-Builder. Three copies shall be submitted to the Authority not later than the applicable date specified in the Contract Schedule. Final As-Built Drawings shall also be submitted on electronic media (5 sets of CD-ROM's) using either AutoCAD(.DWG) or other Authority approved drawing file formats.
7. Completed as-built Contract Record Drawings shall bear the signature of an officer of the Design-Builder's organization, certifying compliance with as-built conditions using a rubber stamp, or electronic facsimile, as follows:

As-Built

Date _____

I certify that this drawing
accurately depicts the work
as constructed.

An Officer of the Company

Signature _____ Title _____

Design-Builder'S NAME

1.08 SPARE PARTS

This Contract includes the requirement for Communications spare parts. The Design-Builder shall assure that all spare parts required by this Contract are provided and delivered in accordance with the requirements of Division 1.

1.09 TRAINING

- A. The objective of the training program shall be to train WMATA maintenance and operating personnel to properly operate, diagnose, troubleshoot and maintain the communications equipment and/or systems provided by, or affected by, work in this Contract. Training shall be provided to cover the operations and maintenance of systems, equipment and components which have not previously been installed on the Metrorail System.
- B. The Design-Builder's training program shall be conducted by fully qualified instructors. The instructors shall have thoroughly mastered the specific specialized subject matter involved and shall have the ability to impart technical information to others in easily understood terms.

1.10 SAMPLES

- A. Samples For Review:
 - 1. Submitted to Authority's Representative for review for the limited purpose of checking for conformance with information given and the design concept expressed in the contract documents.
 - 2. After review, produce duplicates and distribute in accordance with Submittal Procedures article above and for record documents purposes.
- B. Samples For Information:
 - 1. Submitted for the Authority Representative's knowledge.
- C. Samples For Selection:
 - 1. Submitted to Authority's Representative for aesthetic, color, or finish selection.
 - 2. Submit samples of finishes from the full range of manufacturers' standard colors, textures, and patterns for Authority's Representative selection.
 - 3. After review, produce duplicates and distribute in accordance with Submittal Procedures article above and for record documents purposes.
- D. Submit samples to illustrate functional and aesthetic characteristics of the Product, with integral parts and attachment devices. Coordinate sample submittals for interfacing work.
- E. Include identification on each sample, with full Project information.
- F. Submit the number of samples specified in individual specification sections, one of which will be retained by Authority's Representative.
- G. Reviewed samples that may be used in the Work are indicated in individual specification sections.
- H. Samples will not be used for testing purposes unless specifically stated in the specification section.

1.11 DESIGN DATA

- A. Submitted for the Authority Representative's review.
- B. Submit for information for the purpose of assessing conformance with information given and the design concept expressed in the contract documents

1.12 TEST REPORTS

- A. Submitted for the Authority Representative's review.
- B. Submit test reports for information for the purpose of assessing conformance with information given and the design concept expressed in the contract documents.

1.13 CERTIFICATES

- A. When specified in individual specification sections, submit certification by the manufacturer, installation/application subcontractor, or the Design-Builder to Authority's Representative, in quantities specified for Product Data.
- B. Indicate material or Product conforms to or exceeds specified requirements. Submit supporting reference data, affidavits, and certifications as appropriate.
- C. Certificates may be recent or previous test results on material or Product, but must be acceptable to Authority's Representative.

1.14 MANUFACTURER'S INSTRUCTIONS

- A. When specified in individual specification sections, submit printed instructions for delivery, storage, assembly, installation, start-up, adjusting, and finishing, to Authority's Representative for delivery to Authority in quantities specified for Product Data.
- B. Indicate special procedures, perimeter conditions requiring special attention, and special environmental criteria required for application or installation.
- C. Refer to Section 16707 - Communications Systems Tests, Manufacturers' Field Services article.

1.15 MANUFACTURER'S FIELD REPORTS

- A. Submitted for the Authority Representative's review.
- B. Submit report within 30 days of observation to Authority's Representative for information.
- C. Submit for information for the purpose of assessing conformance with information given and the program criteria expressed in the contract documents.

SECTION 16707

COMMUNICATIONS SYSTEMS TESTS

PART 1 - GENERAL

1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The Design-Builder shall provide and maintain the inspection and test plans required to cover the equipment, materials, and services specified herein.

1.02 RELATED SECTIONS NOT USED

1.03 REFERENCES

- A. American National Standards Institute (ANSI) Standard ANSI/ISO/ASQC Q9002-1994

1.04 DEFINITION OF TERMS

- A. Inspection and Test Plan: A document detailing how the Design-Builder will inspect and test Contract equipment, materials, workmanship, and services.
- B. Inspection: The physical act of verifying, by measurement and examination of the equipment, materials, workmanship, and services, that they conform to approved documents and established quality requirements

PART 2 - PRODUCT

NOT USED

PART 3 EXECUTION

3.01 TESTING MANAGEMENT

- A. This Section contains requirements which are unique to the communications equipment. The requirements herein shall be completed in addition to testing specified elsewhere in this specification.

3.02 INSPECTION AND TESTING

- A. The Design-Builder shall establish and implement a Unified Test Program that will ensure all communications and related systems, equipment, material and services, furnished during the performance of this Contract, meet the technical requirements and standards specified, as well as all performance criteria.
- B. As part of the Design-Builder's area of responsibility for the Unified Test Program, the Design-Builder will be required to:
 - 1. Develop a comprehensive Test Plan detailing methods and test procedures to be utilized to ensure compliance with all applicable specifications.

2. Develop detailed test procedures for each individual test within each category of testing, except Authority tests.
 3. Submit the Test Plan (including Authority System Validation Tests, Substantial Completion Acceptance, and Final Acceptance Programs) and all test procedures to the Authority's Representative for evaluation, review, and acceptance or rejection. Revise and resubmit until acceptance by the Authority's Representative is received.
 4. Furnish personnel, calibrated test equipment, tools, and miscellaneous supplies as necessary to perform all tests and retests, and to maintain all systems and equipment during the test period and until acceptance by the Authority.
 5. Coordinate Unified Test Program activities with the schedules and activities of other Design-Builders and with the Authority's Representative, to avoid conflicts with Authority operational requirements.
 6. Perform tests and inspections as detailed in all approved test procedures.
 7. Evaluate test procedure and inspection results and documentation. Prepare detailed test evaluation reports, summary reports and progress reports.
 8. Submit all raw test data, test results, evaluations, and summary reports for evaluation, review and acceptance or rejection by the Authority's Representative.
 9. Prepare and submit revised test procedures and test plans to correct procedural and technical errors or omissions discovered in those documents, after their initial Authority acceptance.
 10. Furnish corrective actions to effect Specification compliance, including: Remedy test program deficiencies, and system, equipment, material, workmanship, and documentation deficiencies promptly upon request by the Authority's Representative.
 11. Perform retesting and additional inspections until successful results are obtained, evaluated, and accepted by the Authority's Representative.
 12. Participate in Authority Pre-final Inspections, Substantial Completion (if any), and Final Acceptance activities. Clean the equipment and work site, secure the equipment, and remain responsible for prompt repair or replacement in the event of loss or damage until acceptance by the Authority is received. Furnish inventory services and demonstrate system or equipment operation in support of requests by the Authority. Provide support and access so that the Authority's Representatives, Technicians, Mechanics and Inspectors can inspect and test any portion of the work during normal work hours.
 13. Provide Unified Test Program reports on a monthly basis beginning within 30 days after the Authority's Representative's acceptance of the Test Plan, and continuing until the final completion of all contract work.
- C. The performance of each task requirement shall be subject to the Authority's Representative's acceptance of methods, procedures, and results, for Specification compliance, and as to scheduling for the benefit of the Authority.
- D. A Preliminary Test Plan shall be submitted to the Authority's Representative for review. Subsequently, the Final Test Plan shall be submitted to the Authority's Representative for review and acceptance or rejection. In the event of rejection or subsequent rejections, corrected re-submissions shall be delivered to the Authority's Representative within 15 days after the receipt of each rejection.
- E. Detailed test procedures shall be submitted to the Authority's Representative for review and acceptance or rejection. In the event of rejection or subsequent rejections, corrected re-submissions shall be delivered to the Authority's Representative within 15 days after receipt of each rejection. Approved test procedures shall be required prior to commencing any associated test.

- F. Each individual test procedure shall include, but not be limited to: An outline of test objectives, detailed step-by-step procedures with required results and allowable tolerances for each measurement or observation, diagrams illustrating all required test set-ups, manufacturer and model number of each unit and accessory item of required test equipment, and further details as may be required by the Authority's Representative to ensure that both Design-Builder and Authority field forces are presented with a totally comprehensive, understandable and accurate working procedure.
- G. The Design-Builder shall include complete and adequate safety procedures, warnings, and emergency instructions in Test Plans and test procedures, as appropriate. Test procedures shall also include complete examples of test Data Record Forms with required resultant values and allowable tolerances, in accordance with Specification requirements.
- H. The Authority reserves the right to perform additional non-destructive tests and inspections at any time during the course of the contract work. Results indicating deficiencies involving noncompliance with Specification requirements will be reported to the Design-Builder for corrective action.

3.03 DEFICIENCIES

- A. If the Authority's Representative determines from test data acquired from any category of test(s) that the system, equipment, materials, technical documentation, or services furnished do not conform to any Specification requirement(s), the Design-Builder shall recommend appropriate remedial action based on an analysis of test results within fifteen days after receipt of the Authority's Representative's notice of deficiency. When such recommendations relate to Authority's Representativeing deficiencies, the Design-Builder shall, upon receipt of the Authority's Representative's approval, make the necessary changes to all equipment and documentation of the type to be delivered or previously delivered (even if previously accepted) during the course of the Contract, at no additional cost to the Authority.
- B. When recommendations relate to other deficiencies such as quality control and installation workmanship, the Design-Builder shall correct all deficiencies at each location, at no additional cost to the Authority. Retesting after the changes have been completed (Factory Tests and Inspections, Installation Completion Tests and Inspections, and Technical Documentation Verifications) shall be required in whole or part, as determined by the Authority's Representative, at no additional cost to the Authority. If the timely correction of all deficiencies is not completed to effect Specification compliance, as evidenced by the Authority's Representative's acceptance of retest results, the Authority's Representative will initiate remedial actions to the benefit of the Authority. Such actions may include the exercise of warranty, correction of deficiency, delay of payments, disputes or default, and termination actions, in accordance with the General Provisions, or actions of benefit to the Authority, in accordance with any combination of these and other Specification provisions.

3.04 CATEGORIES OF TESTS

- A. Tests and inspections shall be required in each of seven categories, as listed below:
 - 1. Factory tests and inspections, including factory certifications and factory calibration certifications.
 - 2. Installation completion tests and inspections.
 - 3. System and integration tests.
 - 4. System validation tests and evaluations (Authority Conducted Program).
 - 5. Substantial Completion acceptance tests and inspections (if any) (Authority Conducted Program).
 - 6. Technical documentation verification inspections.

7. Final acceptance tests and inspections (Authority Conducted Program).
- B. Each test and inspection in each category shall be comprehensive, so that sufficient test result data and inspection result data is furnished to permit complete detailed examination and evaluation, as determined by the Authority's Representative.
- C. Additional specialized testing shall also be furnished, as defined in individual system specification Sections .
- D. Retesting, and the acceptance or rejection of test results, documentation, and evaluations, shall be within the discretion of the Authority's Representative.

3.05 FACTORY TESTS AND INSPECTIONS

- A. All equipment and materials, including custom developed Additional Equipment and any custom developed Test Equipment, furnished in accordance with these Specifications, shall be subject at all times and during all stages of manufacture and assembly, to inspection, test, and rejection by the Authority's Representative. The Authority's Representative may elect to accept factory or Design-Builder certifications in lieu of complete test result data for certain items when, 1) a WMATA accepted factory test has been previously conducted on one or more production samples or identical deliverable products, 2) the same brand and model of the product to be furnished has proven reliable in Authority revenue service for one year or more, or 3) to simplify test program administration when not adverse to achieving Test Program objectives.
- B. Before offering items for inspection or test, the Design-Builder shall furnish a complete set of applicable drawings for Authority use including, but not limited to, schematics, wiring diagrams, major assembly drawings, manufacturing drawings for custom developed equipment, and detailed specifications for the equipment and materials to be tested.
- C. The Design-Builder shall submit Factory Test and Inspection Plans and Procedures to the Authority's Representative for review. Tests required shall be performed at the point of manufacture and the point of assembly before shipment to the field. The Design-Builder shall furnish additional testing by an independent testing laboratory if the manufacturer's Factory Test Plan or Procedures are determined by the Authority's Representative to be inadequate to verify Specification compliance (a maximum of three major items may be designated by the Authority's Representative for independent laboratory testing at no additional cost to the Authority).
- D. After the Authority's Representativeing Development Review for each system has been submitted and approved by the Authority's Representative, Factory Tests and Inspections shall be scheduled for major items, custom prototypes, and other items of equipment and material designated for such testing by the Authority's Representative, to verify compliance with environmental criteria, quality assurance, specified performance, grade of components, reliability, and workmanship including manufacturing processes. The Design-Builder shall advise the Authority's Representative, in writing, when manufacturing of equipment begins and again two weeks prior to date of scheduled inspection or tests.
- E. A "Report of Factory Visit" for the purpose of confirmation and subsequent agreement of any decisions made on site shall be prepared by the Design-Builder and submitted to the Authority's Representative ten working days subsequent to each factory visit by the Design-Builder, Authority's Representative, or designated Authority Representative. Each report shall include the purpose of the visit, summary of tests performed and decisions made or required prior to factory certification and shipment.

- F. Two copies of test results certified by the manufacturer or an independent laboratory shall be furnished to the Authority's Representative for review and acceptance or rejection prior to shipment. Equipment shall not be shipped before the factory test results have been accepted by the Authority's Representative. Optionally, the Authority may elect to accept Design-Builder certified test and inspection results in lieu of manufacturer or independent laboratory certified test results.
- G. A 200 hour burn-in period (power on - attended or unattended) shall be required for all units of electrically operated and powered custom-made major items of equipment prior to installation, in accordance with instructions from the Authority's Representative. Each unit of custom made equipment shall be set up and powered on the Design-Builder's, SubDesign-Builder's, or supplier's premises. Reports of such activity shall be furnished to the Authority's Representative.

3.06 INSTALLATION COMPLETION TESTS AND INSPECTIONS

- A. Installation Completion Tests and Inspections shall be performed after installation to ensure that equipment and materials were not damaged in shipment and that they are properly installed and functioning in accordance with specified criteria, parameters and good commercial practice. Installation Completion Tests and Inspections shall consist of:
 - 1. Visual inspection with check-off lists to verify the following:
 - a. That full compliance with requirements detailed in the General Equipment and Material Standards and General Installation Standards sections of these Specifications has been met.
 - b. That only approved products have been used.
 - c. That Factory Tests and Inspections have been satisfactorily completed for major items, as required.
 - d. That inventory of major equipment and material items is available and accurate.
 - e. That equipment is installed in agreement with approved installation shop drawings.
 - f. That wire and cable terminations as to location, cable identification, routing, color code, and workmanship have been identified.
 - g. That Time Domain Reflectometry (TDR) measurements of all coaxial and outside plant cables have been made. Printed TDR records of each coaxial and outside plant cable shall be delivered to the Authority to illustrate the length of cable run (proven by demonstrating an open and a short condition before final termination), and the absence of any detectable faults on each coaxial cable and each outside plant cable pair after installation of the cable.
 - 2. Detailed testing shall be required to demonstrate that material and equipment installed meet the criteria and possess the characteristics and parameters contained in the Contract Specifications; including additional requirements and stated tolerances that are specified in Design-Builder Authority's Representative and product approval data submissions and in manufacturer's published specifications attributed to approved products.
- B. The testing of all items of equipment and material shall include electrical, mechanical, operational, and functional parameters. Such parameters include, but are not limited to: Levels of voltages, currents, power, distortion, noise, cross-talk, insulation resistance, continuity, attenuation (optical and electrical), physical strength, suitability of mounting method, paint and marking quality, graphics quality and style, location of operating controls and adjustments, and maintainability.

- C. These tests shall be performed after the installation of material and equipment and shall be in addition to any Factory Tests and Inspections previously performed. The Design-Builder shall perform all necessary alignments, adjustments, and maintenance prior to requesting the scheduling of Installation Completion Tests and Inspections.
- D. The Design-Builder shall advise the Authority's Representative, in writing, two weeks prior to the date(s) of scheduled tests and inspections. The Authority's Representative will witness these tests. Two certified copies of Installation Completion Test and Inspection data shall be submitted to the Authority's Representative within seven (7) days after test completion for review and acceptance or rejection.

3.07 SYSTEM AND INTEGRATION TESTS

- A. System and Integration Tests shall be on-site performance tests to verify that all operating parameters and functions perform as specified and that each system performs as specified in conjunction with each system or subsystem with which it interfaces. The Design-Builder shall demonstrate that all material and equipment elements of each installed system function together to meet the system criteria specified. Each system shall be powered a minimum of 48 hours prior to commencing system and integration tests. The Authority's Representative shall be notified, in writing, seven (7) days prior to equipment being powered. Failures shall be recorded by the Design-Builder and findings furnished to the Authority's Representative at the end of the 40 hours. The Design-Builder shall also include a description of corrective actions taken.
- B. The Design-Builder shall be responsible for meeting all System and Integration Test requirements including testing and documenting interface compatibility and integration with existing Authority-owned systems and equipment.
- C. Each and every interface shall be verified as to operation, function, level, and voltage. The Design-Builder shall test across the interface points; however, these tests shall only be made under the supervision of appropriate Authority personnel. When minor adjustment to, or reconfiguration of, existing equipment is required, the Design-Builder shall notify the Authority's Representative, in writing, of the required adjustment or reconfiguration. Authority personnel will make the adjustment or reconfiguration in the presence of the Design-Builder. The Design-Builder shall be responsible for the necessary adjustments or reconfigurations of Design-Builder-furnished equipment to ensure proper functioning, as specified.
- D. The successful completion of all specified Factory Tests and Inspections, and Installation Completion Tests and Inspections, including the correction of all outstanding discrepancies and subsequent retesting, is required as a prerequisite to System and Integration Tests.
- E. The tests will vary with each specific system. However, each test shall include all operating parameters and functions. Tests shall be conducted on a location-by-location basis with all failures and discrepancies noted. The Design-Builder shall not engage in further testing until the Authority's Representative has verified that the Design-Builder has taken necessary corrective action with respect to those failures and discrepancies. The Design-Builder shall retest after each successive failure and corrective action to verify Specification compliance.
- F. The Design-Builder shall advise the Authority's Representative, in writing, two weeks prior to the date(s) of scheduled tests. Prior to commencing the System and Integration Tests, the Design-Builder shall provide failures recorded and corrective action taken, at the conclusion of powering equipment a minimum of 40 hours. The Authority's Representative will witness these tests. Two certified copies of System and Integration Test data sheets shall be

submitted to the Authority's Representative within seven (7) days after test completion for review and acceptance or rejection.

3.08 MEASURING AND TEST EQUIPMENT

- A. The Design-Builder shall establish and implement measures for the selection, calibration, and control of measuring and test equipment (M&TE) used to determine conformance.
- B. M&TE of a range, accuracy, and sensitivity conforming with measurement tolerances specified within this contract shall be selected and used.
- C. Calibration procedures shall require M&TE identification and establish frequency of calibration, calibration method, acceptance criteria, records to be generated, and the action to be taken when results are unsatisfactory.
- D. M&TE shall be periodically calibrated using certified references traceable to the National Institute of Standards and Technology (NIST), to other nationally recognized standards when no such NIST standards exist, or to a documented standard acceptable to the Authority's Representative when none of the preceding standards exist.
- E. The calibration of M&TE shall be checked at prescribed intervals if testing or inspection will continue over an extended period.

3.09 INSPECTION AND TEST STATUS

- A. The Design-Builder shall establish and implement measures to identify and maintain the inspection and test status of systems, equipment or components until these are accepted by the Authority's Representative, to ensure that only purchased items that have passed the required inspection and test have been used.
- B. The means for status identification shall be such that the surface of the item is not damaged nor its use impaired. Status identification may also be via inspection records, test software, physical location, or other suitable means, which indicate the conformance or nonconformance of these items with regard to inspection and tests performed.

3.10 CONTROL OF NONCONFORMANCE

- A. The Design-Builder shall establish and implement measures to prevent the inadvertent use or installation of nonconforming items.
- B. Procedures shall provide for identification, segregation, documentation, evaluation, and disposition of nonconforming items, define the responsibility and authority for the disposition of nonconforming item.
- C. Nonconforming items shall be positively identified and the matter brought to the attention of Supplier's management representative, the Authority's Representative, and the appropriate OEM, subDesign-Builder or sub-supplier.
- D. The Design-Builder shall hold the nonconforming item from further work and, where possible, shall be physically segregated in an area clearly marked, until the responsible parties have provided for the disposition of the item.
- E. The disposition of a nonconforming item may be:
 - 1. Reworked (to meet original requirements)

2. Accepted as-is
 3. Repaired (to meet an alternative criteria)
 4. Re-graded (for alternative use)
 5. Rejected, returned to vendor, or scrapped
- F. The Design-Builder shall obtain written approval from the Authority's Representative prior to using a nonconforming item as-is or repairing it to be acceptable to a standard different from the original standard.
- G. Nonconforming items that have been repaired or reworked shall be re-inspected or retested by the party responsible for the original inspection or test in accordance with approved acceptance standards before being declared acceptable.
- H. The technical details of nonconformity that have been accepted as-is and of any repairs made shall be included in "as-built" documentation.
- I. Items for return to vendor shall be removed from the area of work and controls placed to prevent the reuse of the item or any part of it.
- J. Rejected or scrapped items shall be removed from the area of work and rendered unusable in a manner that prevents their inadvertent use.

3.11 CORRECTIVE ACTION

- A. The Design-Builder shall establish and implement measures to:
1. Investigate the cause(s) of noncompliance and nonconformance, and identify action(s) to prevent recurrence.
 2. Implement corrective action to minimize or eliminate noncompliance or nonconformance.
 3. Apply controls over the implementation of corrective action.
 4. Incorporate the preventive action into procedures.

END OF SECTION

SECTION 16710

COMMUNICATIONS GROUNDING

PART 1 - GENERAL

1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. This section describes hardware, and installation methods that the Contractor shall use to insure the installation of a competent grounding system that will avoid/minimize ground-loops, and Electromagnetic Interference (EMI) problems in the operation of the communications systems installed under this Contract. In addition to the methods detailed in this Section, the Design-Builder shall insure that his crews adhere to all generally accepted installation practices that are meant to minimize interference between communications systems

1.02 SECTION INCLUDES

- A. Equipment and Rack Grounding.
- B. Cable Shield Grounding.

1.03 REFERENCES

- C. NFPA 130 - Standard for Fixed Guideway Transit Systems

1.04 SUBMITTALS

- A. Submit under provisions of Section 16706.
- B. Shop Drawings: Indicate electrical system wiring diagram.

PART 2 - PRODUCTS

NOT USED

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Ground Communication system and facilities, equipment and cables using a single-point grounding scheme. Each Communication Equipment Room will have a separate isolated ground bus bar designated as "communications ground."
- B. Unless otherwise specified, ground the shields of all single shielded communications cables, the shields of multi-conductor cables that have individual shielded pairs, and the inner shield of all double shielded communications cables and communications cables with separate shield and armor only at a single point and only to the "communications ground." These shields shall be electrically continuous throughout the cable length by bonding across all splices and terminations in equipment enclosures and junction boxes.
- C. Ground the outer shield of all double-shielded communications cables and the armor of all communications cables with separate shield and armor only at a single point in each cable

section. Locate the single point ground at the end of the cable section nearest to the associated Communications Equipment Room. Ground outer shield or armor cable sections originating at Communications Equipment Rooms to the "communications ground."

- D. Electrically isolate equipment racks and equipment cabinets from the building structure, adjacent equipment racks and equipment cabinets. Minimum resistance between adjacent equipment racks and equipment cabinets, and between equipment racks and equipment cabinets and the building structure, shall be 10 megohms. Individually wire each equipment rack and equipment cabinet to the communications ground, via the copper ground bus bar on the equipment rack and equipment cabinet, by a No. 6 AWG, stranded, insulated wire, Type XHHW or THHN.
- E. Wire each copper ground bus bar in the multi-section cable terminal housings of the Main Distribution Frame (MDF)/ MDF/Protector Cabinet and the systems distribution frames to the communications ground by a No. 6 AWG, stranded, insulated wire, Type XHHW or THHN.
- F. Electrically insulate all power conductors from equipment racks and equipment cabinets, with a separate power ground isolated from communications ground. Insulate Conduit containing power conductors running from ac distribution boxes to equipment racks, equipment cabinets, ac receptacle boxes on equipment racks and equipment cabinets from the equipment cabinet or equipment rack by means of short lengths of non-conducting conduit.

END OF SECTION

SECTION 16716

COMMUNICATIONS YARD ELECTRICAL POWER DISTRIBUTION SYSTEM

PART 1-GENERAL

1.01 PURPOSE

- A. The Yard Electrical Power Distribution System provides power distribution from a 3-phase, 4-wire, 120/208 VAC, primary power feed, to the Yard communication room disconnect switch. This system shall be modified as necessary to provide power to the various communications systems.

1.02 SYSTEM DESCRIPTION

- A. The Communications Power Distribution System described herein includes the following facilities:
1. 110/120 VAC Emergency Power (from existing UPS) for communications equipment in the Yard Communications Equipment Room(s), Yard Control Room and the Gatehouse.
 2. -48 VDC power for communications equipment in the Communications Equipment Room.
- B. The 120 VAC Emergency Power Distribution System described herein includes but is not limited to the following components:
1. In the Communications Equipment Room;
 - a. Power Distribution Panelboard
 - b. AC Power Receptacles
 - c. AC Power Disconnect Switches
 2. In the Yard Control Room
 - a. AC Power Disconnect Switch
 - b. AC Power Receptacles
 3. In the Gatehouse
 - a. Emergency AC Power Disconnect Switch
 - b. Emergency Power Distribution Panelboard
 - c. AC Power Receptacles
 4. Required conduits and fittings, junction boxes, feeder wires, and branch circuit wiring and cabling to apportion the 120 VAC power to the communications systems and facilities equipment.
- C. The -48 VDC Power Distribution System described herein includes but is not limited to the following components:
1. In the Communications Equipment Room;
 - a. -48 VDC Power Supply
 - b. -48 VDC Power Distribution System Status Panel.
- D. The -48 VDC Power Distribution System provides fail safe service by load-sharing several power supplies. Power supplies may be removed from the active -48 VDC Power Distribution System for repair, or added for increased capacity without disrupting communications services.
- E. The Status Panel provides voltage and current metering for the -48 VDC Power Distribution System. The Status Panel also distributes -48 VDC power to the Carrier Transmission (CTS),

and Fiber Optic (FOS) Systems equipment racks and, as needed, to any other communications equipment racks requiring a source of -48 VDC powers. The -48 Vdc shall be modified as necessary for additional equipment loads.

PART 2-PRODUCTS

2.01 MAJOR ITEMS TECHNICAL REQUIREMENTS

- A. The Major Items listed below shall conform to the operational and performance requirements of these Specifications. Incidental items, not specifically mentioned but required for complete and proper system operation, shall be furnished and installed by the Design-Builder.

2.02 POWER DISTRIBUTION PANEL BOARD

- A. Square D Co., Model No. NQOD424L100CU with Model No. MH23WP NEMA 12 enclosure (or approved equals).
- B. Type: NQOD, 3-phase, 4 wire, 120/208 Vac, main lugs only with isolated solid neutral bus and a ground bus.
- C. Capacity: 20 single-pole branch circuit breakers.
- D. Panel Amperage: Main Lugs, 100 Amps.
- E. Enclosure: NEMA Type 12 surface mounting and surface screw front cover with hinged door and flush lock.
- F. Circuit Breakers: 16 single-pole NEMA Standard AB-1.

2.03 FIRE AND INTRUSION POWER DISCONNECT SWITCH

- A. Square D Co., Model No. H221NA.
- B. Type: NEMA Standard KS1 (latest edition), type LD, and NEMA type 12, 2-pole, 3-wire, 240 Vac, single throw, fused with isolated solid neutral bus and a ground bus.
- C. Amperage Rating: 30 Amps.
- D. Fuse Rating: Appropriate for the Fire and Intrusion Alarm System power requirements.
- E. Surface Mount enclosure with knockouts.
- F. Color: OSHA red.

2.04 10 OUTLET AC POWER RECEPTACLES

- A. Wiremold Company Multioutlet System/Plugmold 2000, Series GB, Model No. 20GB506 (or approved equal).
- B. Prewired receptacles on 6-inch centers.
- C. 3-wire circuit, insulated ground conductor.

- D. Receptacles grounded to raceway.

2.05 6 OUTLET AC POWER RECEPTACLES

- A. Wiremold Company Multioutlet System/Plugmold 2000, Series GB, Model No. 20GB306 (or approved equal).
- B. Prewired receptacles on 6-inch centers.
- C. 3-wire circuit, insulated ground conductor.
- D. Receptacles grounded to raceway.

2.06 DUPLEX AC POWER RECEPTACLE

- A. Arrow Hart Division, Cooper Industries Model No. IG5362 with Model No. IG8248 wall plate (or approved equals).
- B. Rated for 20 Amps, 125 VAC.
- C. Isolated ground receptacle.
- D. Color: orange.

2.07 WIRE

- A. Triangle Pwc., Inc., Everene, Type RHW (or approved equal)
- B. Insulation Type: Cross linked Polyethylene in accordance with ICEA S-66-524.
- C. Conductors: 12 AWG or larger Class B stranded copper
- D. Voltage Rating: 600 volts.

2.08 GROUND CLAMP

- A. Wiremold Company Multioutlet System/Plugmold 2000, Model No. 2009 (or approved equal).
- B. Compatible with plugmold 2000
- C. For use on multi-outlet systems.
- D. Plated.

2.09 -48 VDC POWER SUPPLY

- A. Power Conversion Products model No. PS-19 shelf (or approved equal).
- B. Complete with PCP Model No. MOD-4812 rectifier modules (quantity of 2 per shelf).
- C. Input: 95-130VAC, 60 HZ (nominal), Power Factor: PF>90%.
- D. -48VDC, 24 AMP Load sharing output.

- E. Rectifier Output Failure indicator with Form "C" alarm contacts.
- F. High DC Voltage shutdown.
- G. 19-inch Rack mount complete with 23-inch rack mount adapters and hardware.

2.10 -48VDC POWER SYSTEM STATUS PANEL

- A. Power Conversion Products: Mini Load Center Model No. MDM-48-75 complete with 6 appropriately sized alarm breakers (or approved equals).
- B. Voltage and current metering (2% accuracy).
- C. High/Low DC Voltage Alarm Form-C Contacts.
- D. 6-position alarm breaker power distribution panel.
- E. 19-inch Rack Mount complete with 23-inch rack mount adapters and hardware.

2.11 CCTV EQUIPMENT CABINET POWER ISOLATION/STEP-DOWN TRANSFORMER

- A. Secondary: Able to supply 110/115 VAC, 1KVA (nominal).
- B. Wall/cabinet mount case style.
- C. Grounded Faraday electrostatic shield.
- D. UL-listed.

2.12 120 VAC POWER DISTRIBUTION TERMINAL STRIP

- A. Weidmuller Model SAKR terminal blocks with Model EK2 ground blocks and model SAKS1 Fuse block (or approved equals).
- B. 10 AMP fuse with indicator.
- C. Disconnect/test terminal blocks.
- D. Complete with test sockets, labeling, fuses, protective cover(s), and all required terminal block mounting hardware and accessories.

2.13 110 VAC POWER RECEPTACLE STRIP

- A. WABER, INC. Model No. UL24RA-6 (or approved equal).
- B. Six-110 VAC Receptacles.
- C. Illuminated on/off switch.
- D. UL-approved.

- E. Complete with all required installation and mounting hardware, wiring, and any required modification.

2.14 CCTV EQUIPMENT CABINET

- A. Metallic construction, NEMA-4X rated.
- B. Complete with Vapor Corrosion Inhibitor (VCI-Emitter), Cortec Corp. Model No. VCI-105 (or approved equal).
- C. Wall Mount.
- D. Complete with all required mounting and installation hardware.

2.15 FUSED POWER DISCONNECT SWITCH

- A. Square D Co., Model No. H321A, with Field Installable Solid Copper Neutral Assembly, Model No. H60SNC, and with Field Installable Copper Grounding Kit Model No. PKOGTC-1 (or approved equals).
- B. Type: NEMA Standard KS1 (latest edition), type LD, and NEMA type 12K, 3-pole, 4-wire, 240 VAC, single throw, fused with isolated solid neutral bus and a ground bus.
- C. Amperage Rating: 30 Amps.
- D. Fuse Rating: As appropriate for the connected system power requirements.
- E. Surface Mount enclosure with knockouts.

2.16 CCTV POWER ISOLATION TRANSFORMER

- A. Acme Model T-3-53043-S (or approved equal).
- B. Primary 120/240 VAC, single phase.
- C. Secondary 120/240 VAC, single phase.
- D. 3.0 KVA.
- E. Grounded Faraday Electrostatic shield.
- F. Floor/Wall mount.

2.17 POWER TRANSFORMER

- A. Acme Model T-2-53014-S (or approved equal).
- B. Primary: 240 VAC; single phase.
- C. Secondary: 120/240 VAC.
- D. 5 KVA.
- E. Grounded Faraday Electrostatic shield.

- F. Floor/Wall mount.

PART 3-INSTALLATION

3.01 INSTALLATION

- A. Installation shall conform to, but not be limited to, acceptable practices and standards specified to date by the National Electrical Code, AAR specifications and EIA standards.
- B. The Design-Builder shall furnish and install all junction boxes, terminals, connectors, fuses, circuit breakers, hardware, wiring and cabling, conduits and fittings, and make all connections and cross-connections required for complete operational installations.
- C. The Design-Builder shall provide branch circuit breaker designations and typical configurations for Power Distribution Panelboards. The Design-Builder shall calculate full load AC power requirements per branch circuit and shall configure each panelboard for an optimum phase load balance. The Design-Builder shall submit the calculations to the Authority's Representative for approval. The calculations shall indicate the full load AC power requirements for each item of equipment connected to each branch circuit.
- D. In the Communications Room, the Design-Builder shall install an AC power receptacle strip on each new communications equipment rack and console, and in each new equipment cabinet. The Design-Builder shall install the required mounting hardware to secure the AC power receptacle strips to the communications equipment racks cabinets and consoles. The Design-Builder shall install a ground clamp in each raceway of the AC power receptacle strips to ensure that the raceway base is grounded to the communications equipment rack, cabinet or console. The AC power receptacle strips shall be installed so that they do not create obstructions to mounted equipment within the communications equipment racks, cabinets and consoles, and so that all AC outlets are accessible.
 - 1. The Design-Builder shall install the appropriate branch circuit conductors (power phases and neutral) to provide 110/120 VAC communications power to each AC power receptacle strip on all communications equipment racks, cabinets, and consoles.
 - 2. The Design-Builder shall use appropriately sized rigid steel conduit.
- E. In the Gatehouse, the Design-Builder shall surface mount a completely assembled Emergency Power Distribution Panelboard and an Emergency Power Disconnect Switch in a location to be approved by the Authority's Representative.
 - 1. The Design-Builder shall make the following installations of power feeders (power phases, neutral and equipment ground) using appropriately sized rigid steel conduit where ever existing embedded conduit is not available:
 - a. From the Emergency Power Disconnect Switch to the Emergency Power Distribution Panelboard.
 - b. From the entry side of the Emergency Power disconnect Switch to the Secondary side of the Gatehouse Emergency Power Transformer in the Yard Operations Building AC Switchboard.

2. The Design-Builder shall provide and install the duplex receptacles, associated enclosures and cover plates within the Gatehouse and console as required. The Design-Builder shall install the required mounting brackets and hardware to secure the enclosures of the duplex receptacles to the Gatehouse structure and/or console.
 - a. The duplex receptacles shall be installed so that they do not create obstructions to the mounting equipment within the Gatehouse console, and so that all receptacles are accessible.
 - b. The Design-Builder shall install branch circuit conductors (power phases, neutral and equipment ground) using appropriately sized flexible metallic conduit from the Gatehouse Emergency Power Panelboard to the provided duplex receptacles within the Gatehouse Cabinetry.
- F. The Design-Builder shall install a 110/120 VAC Power Distribution Terminal Strip and a 110/120 VAC Power Receptacle Strip within new and existing the CCTV Equipment Cabinets located in ancillary buildings and structures. The Design-Builder shall install the required mounting hardware to secure the distribution and receptacle strips within the CCTV Equipment Cabinets.
1. The Design-Builder shall install a ground clamp in each raceway of the AC power receptacle strips to ensure that the raceway base is grounded to the CCTV Equipment Cabinet. The AC power receptacle strips shall be installed so that they do not create obstructions to mounted equipment within the CCTV Equipment Cabinets and so that all outlets are accessible.
 2. The Design-Builder shall install branch circuit conductors (power phases, neutral and equipment ground) from an appropriate emergency AC power source to the Power Isolation/Step-down Transformer using appropriately sized rigid steel and non-conducting conduit, and in accordance with the Contract Drawings and the following additional criteria:
 - a. If emergency power is not locally available, the Design-Builder shall make use of an appropriate Power Distribution Panelboard with a spare/unused breaker position nearest to the CCTV Equipment Cabinet.
 - b. The Design-Builder shall provide and install the proper size circuit breaker and appropriately label the circuit in the Power Distribution Panelboard.
 - c. Depending upon the physical dimensions of the CCTV Equipment Cabinet, the Design-Builder shall install a Power Isolation/Step-down Transformer within or adjacent to the CCTV Equipment Cabinet.

3.02 GROUNDING

- A. All conduit shall be electrically insulated from communications equipment racks, cabinets and consoles; power ground shall be separate and isolated from the communications ground. Conduit containing branch circuit conductors shall be insulated from the communications equipment racks, cabinets and consoles by means of short lengths of non-conducting conduits.

- B. Short lengths of flexible metallic conduit shall be provided in the communications equipment racks, cabinets and consoles between the non-conducting conduit and the AC power receptacles and strips. Each branch circuit shall contain a separate home-run neutral conductor.

END OF SECTION

SECTION 16720

COMMUNICATIONS YARD TELEPHONE SYSTEM SPECIFICATIONS

PART 1-GENERAL

1.01 PURPOSE

- A. The Yard Telephone System is part of the WMATA Telecommunications Network. Its purpose is to provide telephone service to WMATA personnel working within the Yard limits.
- B. Telephone instruments associated with the Yard Telephone System shall also be capable of accessing the Yard Public Address System.

1.02 SYSTEM DESCRIPTION

- A. The Yard Telephone System shall provide automatic Dual Tone Multiple Frequency (DTMF) tone telephone service in the Yard S & I shop and other yard facilities. All telephone instruments shall be wired to the existing S&I Shop Communications Room using dedicated CAT 5 cable and tie cables as required. All telephone instruments (with their own station number) shall be cross connected to the appropriate demark point.
- B. Digital feature telephone instruments shall be installed in most Yard administrative areas where telephone service is required. In some ancillary structures and shop areas, analog single-line ruggedized wall telephones shall be installed.
- C. Analog single line telephone instruments shall be installed in Emergency Trip Station (ETS) enclosures.
- D. The Yard Telephone System shall include an interface to the Yard Public Address System. Personnel within the yard shall be able to access and make voice communications over the Yard Public Address System, by dialing a restricted four (4) digit access code.
- E. Intercom calling capability will be available between telephone instruments located throughout the yard, via the existing Yard Telephone System. Intercom calls can be expedited by programming telephone extension numbers, which are frequently called, into the memory (auto-dial) feature of telephones equipped with this function.
- F. The Design-Builder shall upgrade the existing Yard Telephone System to provide service as required to all new, renovated, or relocated shop facilities.
- G. Verizon Telephone Company public pay stations shall be provided by others in selected locations within the Yard.

1.03 EMERGENCY TRIP STATION (ETS) TELEPHONE

Dustproof DTMF single-line analog telephone instruments shall be located in Emergency Trip Station (ETS).

1.04 SYSTEM PERFORMANCE REQUIREMENTS

The Design-Builder shall be responsible for the overall performance and testing of the complete Telephone System including ETS Telephones, and Yard Public Address System access. The following system performance requirements are designed to ensure that the Telephone System delivered meets

the specified performance requirements of the Washington Metropolitan Area Transit Authority.

1.05 SYSTEM PARAMETER AND REQUIRED PERFORMANCE

- A. Frequency response from end-to-end: 300 Hz to 3000 Hz, maximum 6 dB loss.
- B. Maximum Actual Measured Loss (AML) shall not exceed 8.5 dB at 1000 Hz when measured from the Communications Equipment Room to telephone instrument location - terminated into 900 ohms impedance.
- C. Noise objective of 20 dBrnC with 30 dBrnC maximum measured noise terminated into 900 ohm impedance.
- D. The DC loop resistance shall not exceed 1300 ohms being terminated into a short circuit.
- E. Loop DC current not less than 23 mA.
- F. Balance ratio not less than -50 dB.

1.06 MAJOR ITEM TECHNICAL REQUIREMENTS

The Major Items listed below shall conform to the operational and performance requirements of these Specifications. Incidental items, not specifically mentioned but required for complete and proper system operation, shall be furnished and installed by the Design-Builder.

PART 2 - PRODUCTS

2.01 TELEPHONE INSTRUMENTS

- A. The Design-Builder shall install telephone instruments appropriate to the existing PABX or Key System in each yard. The Authority Representative will identify the type of instrument to be installed at each location.
- B. Single Line and Digital Feature Telephones
 - 1. Analog-Cortelco 2500 BE Beige, DTMF, fully modular, desk or wall mountable (or approved equal).
 - 2. Digital Key System - Avaya model 4412D+ Display, desk or wall mountable (or approved equal).
 - 3. Digital PABX System - ROLM Model ROLMphone 240, desk or wall mountable (or approved equal).
- C. Digital Full feature Telephones
 - 1. Digital Key System - Avaya model 4424D+ Display, desk or wall mountable (or approved equal).
 - 2. Digital PABX System - ROLM Model ROLMphone 400, desk or wall mountable (or approved equal).

2.02 RUGGED TELEPHONE INSTRUMENTS

- A. Suitable for harsh environments.
- B. High-impact, anti-corrosive enclosure, resistant to chemicals and solvents.
- C. Sealed DTMF keypads.

- D. Sealed electronic ringer with loud ringer broadcast.
- E. With 15 foot extra strength cord.
- F. Noise canceling microphone.
- G. Connects to standard RJ11C modular jack.
- H. Mountable in weather proof enclosure.
- I. GAI-Tronics, Model 246 (or approved equal).

2.03 WEATHERPROOF ENCLOSURES

- A. Suitable for outdoor applications.
- B. High-impact, anti-corrosive enclosure, resistant to chemicals and solvents.
- C. Spring Door Return.
- D. Compatible with Rugged Telephone Instrument.

2.04 EMERGENCY TRIP STATION TELEPHONE INSTRUMENT

- A. Gai-Tronics Model K93112 (or approved equal).
- B. Analog Telephone Instrument with electronic ringer, DTMF keypad covered with protective seal.
- C. Face plate of heavy gauge steel, corrosion resistant, dustproof.
- D. Handset: Cradle of cast aluminum with nylon coating with heavy duty handset cord of appropriate length to fit into enclosure.

2.05 PROTECTOR BLOCKS

- A. Cook Electric W492-LCGX (or approved equal).
- B. With 400 VDC gas style arrestors.
- C. With required mounting hardware and appropriately sized enclosures.

2.06 TERMINAL BLOCKS

- A. 66-Type quick clip style with fanning strips.
- B. Connectorized when feasible.
- C. Siemens Company S66B series; Cook Electric C66M Series, (or approved equal).

2.07 OUTSIDE PLANT TIE CABLE

- A. Essex CASPIC-F+M 19-AWG (or approved equal).

- B. Filled shielded telephone cable with mechanical protection, sized as required.
- C. Conductors: Solid annealed copper conductors insulated with color coded polyolefin, standard telephone color code, twisted into pairs.
- D. Core covering: Non-hygroscopic dielectric tape.
- E. Shield: Inner polymer coated .2mm aluminum and outer polymer coated .15mm steel. Interfaces of shielding system flooded with waterproofing compound.
- F. Mechanical Protection: .15mm corrugated steel shield, flooded on both sides.
- G. Outer jacket: Black, low density, high molecular weight polyethylene.
- H. Shall meet REA Specification PE-39.

2.08 INSIDE PLANT CABLE

- A. Category 5e four pair cable.

2.09 ETS TELEPHONE CABLE

- A. Filled core, armored cable intended for direct burial applications in high risk area.
- B. Conductors solid annealed copper in 22 AWG.
- C. 3-pair with each conductor having an insulation consisting of an inner coating of natural, insulating-grade high density cellular polyethylene and a thin outer skin of color-coded high-density solid polyethylene.

2.10 DISTRIBUTION FRAME/CABLE TERMINAL HOUSING

- A. Terminal housing with easy cable access.
- B. Expandable.
- C. Fungus resistant plywood backboards.
- D. Removable doors.
- E. Distribution rings where required.
- F. Includes all necessary hardware for securing backboard and fastening sections together.
- G. Sized as required to accommodate all terminations and protectors for each location.

2.11 TELEPHONE JACK/FACEPLATE

- A. Modular wall plate system.
- B. Equipped with either a snap-in module (RJ 14) for two-line Analog feature telephones or with a snap-in module for a standard (RJ-11) single-line Analog telephone instrument.

- C. Shall mount flush to 2" x 4" junction box.
- D. Ivory Color.

2.12 PHONE- CALL BELL

A combination bell and solid state relay. An extension ringing device to attract attention to phone. Activate by ringing frequency (16-70 Hz). Benjamin Div./Thomas Ind. Part B ARR5060-120V (or approved equal).

2.13 REDUNDANT RINGING GENERATOR WITH AUTOMATIC TRANSFER ASSEMBLY

- A. Peco II Assembly, Model PEC 3877 (or approved equal).
- B. Mounting Frame Part No. 6064108S.
- C. Two 50 Watt ringing generator modules, Part No. 63134035S adjusted to produce a 105 VAC, 20 Hz signal.
- D. Monitor and automatic transfer circuitry to provide contact closure to the Technical Control Facility when a transfer occurs.
- E. Shall mount in standard 19-inch equipment rack.

PART 3-EXECUTIONS

3.01 GENERAL TELEPHONE INSTALLATION

The Design-Builder shall furnish and install the miscellaneous equipment, hardware, racks, jacks, terminals, protector blocks, enclosures, connecting blocks wiring, cabling conduit, fittings, wired connections and cross connections for a complete operational telephone system. This includes the telephone and cable installations in the various locations along the carrier transmission system.

3.02 TELEPHONE INSTRUMENT INSTALLATION

- A. Telephone instruments shall be installed in the new or renovated S & I shops.
- B. Outside plant telephone cable with over voltage protection shall be installed for the wiring of all telephone circuits outside of the Yard Operations Building.

3.03 RUGGED TELEPHONE INSTALLATION/MISCELLANEOUS AREAS

The Design-Builder shall furnish and install the appropriate conduit, fittings, and connectors to each rugged telephone instrument. The Design-Builder shall provide the appropriately sized hole in the rugged telephone instrument enclosure for connecting the conduit.

3.04 EMERGENCY TRIP STATION INSTALLATION

Emergency Trip Station enclosure within the yard. Emergency Trip Station telephone instruments shall be wired to Distribution Frame protector blocks in the Yard Operations Building Communications Equipment Room via Outside Plant Telephone Cable. All conductors, including spares, of Outside plant Cable installed for ETS Telephone Instruments shall be terminated to protector blocks and terminal blocks at the MDF within the Communications Room of the Yard Operations Building. The Design-Builder shall install protector blocks and terminal blocks in each Emergency Trip Station

enclosure to terminate the telephone line pair to be connected to the ETS Telephone Instrument. The Design-Builder shall furnish and install a plaque indicating the telephone number of the Yard Control Room Console inside each ETS enclosure.

3.05 TELEPHONE OUTLET INSTALLATION

The Design-Builder shall furnish and install telephone outlet boxes in all required yard buildings.

3.06 TELEPHONE JACK/FACEPLATE INSTALLATION

The Design-Builder shall furnish and install the required type of Telephone Outlet faceplate (modular wall plate with either a RJ-11 or with a RJ-14C snap-in module) at each telephone outlet. Telephone Jack Face plates shall be installed for any additional locations where telephone instruments are required.

3.07 TELEPHONE CABLE INSTALLATION

The Design-Builder shall install a CAT 5 inside plant cable between each telephone outlet and its associated Cable Terminal Housing or Distribution Frame (depending on location). The Design-Builder shall terminate all conductors, including spares, of each CAT 5 cable to terminal blocks within the Cable Terminal Housing or Distribution Frame.

3.08 SURFACE MOUNTED CONDUIT INSTALLATION

- A. The Design-Builder shall furnish and install the required appropriate type, size and color wire mold and surface mounted conduit and fittings, distribution/pull boxes and junction boxes to complete installation from the Distribution Frame or Cable Terminal Housing to the telephone outlet location as necessary in all yard buildings.
- B. In yard buildings, the Design-Builder shall furnish and install the appropriately sized conduit and fittings above the ceiling to connect the junction box to the outlet location. The Design-Builder shall be responsible for replacing any ceiling panels damaged during installation at no cost the Authority.

3.09 DISTRIBUTION FRAME/CABLE TERMINAL HOUSINGS

The Design-Builder shall install a Distribution Frame in the Yard Communications Equipment Room. A Cable Terminal Housing shall be installed in all other buildings. The Distribution Frame and Cable Terminal Housings shall contain the necessary protector blocks and terminal blocks to terminate and cross connect all telephone circuits. The Design-Builder shall terminate all cable pairs, including spares, at the Distribution Frame and Cable Terminal Housings. All conductors, including spares, of outside plant cables shall terminate to protector blocks and terminal blocks at the Distribution Frame and at each Cable Terminal Housing.

3.10 CIRCUIT IDENTIFICATION PROCEDURES

The Design-Builder shall identify each telephone circuit at both the Telephone Outlet location and at all points of termination. The circuit identification code shall be unique for each Telephone Outlet and indicate the location of the Telephone Outlet.

END OF SECTION

SECTION 16721

COMMUNICATIONS TELE/DATA CABLING SYSTEM

Part 1 GENERAL

1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The Tele/Data Cabling System is part of the WMATA telecommunications network. Its purpose is to provide telephone and LAN/WAN service to WMATA personnel in selected locations within, and associated with, the Yard Buildings.
- B. All local telephone and data outlets shall be wired, using star topology, to the S&I Building Communications Room using dedicated cable pairs. The Design-Builder shall provide and test all required cable and terminations to the EIA/TIA specifications listed in this document. The length of each individual cable from the MDF to the information outlet shall not exceed 295-feet.
- C. The Design-Builder shall provide a dual 5-way Active Data Bridge shall be installed in the 19-inch CTS Rack in the Yard Communications Room.
- D. The Design-Builder shall install printed labels for all cables and cords, distribution frames, and outlet locations. No labels shall be written by hand. Machine labeling shall be used on all information outlets, patch panels, punch blocks, feed cables, etc.
- E. Provide AC outlets for equipment convenience and power.

1.02 SECTION INCLUDES

Placement of Cat-5e cable and terminations.

1.03 REFERENCES

- A. National Electrical Manufacturers Association (NEMA) Standard Publication 250-1997, Enclosures for Electrical Equipment (1000 Volts Maximum)
- B. National Electric Code
- C. ANSI/EIA/TIA-568-B Commercial Building Wiring Standard
- D. ANSI/EIA/TIA-568-B.2-1 Commercial Building telecommunications
- E. Cabling Standard Twisted pair Components Addendum1 -
- F. Transmission Performance Specifications for 4-Pair 100 Ohm Category 5e
- G. ANSI/EIA/TIA-568-B.2-6 Commercial Building telecommunications
- H. Cabling Standard Twisted pair Components Addendum 6 - Related Components Test Procedure.

1.04 SUBMITTALS

- A. Submit under provisions of Section 16706.
- B. Shop Drawings - Indicate electrical characteristics and connection requirements, including system-wiring diagram.
- C. Product Data - Provide showing electrical characteristics and connection requirements for each component.
- D. Manufacturer's Installation Instructions - Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.
- E. Data outlets shall consist of a dual gang box with a modular 2 port face plate. One port shall be dedicated for voice and one port for LAN connectivity.
- F. The Design-Builder shall provide cable and a wall plate for Elevator Emergency phones.

1.05 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience.
- B. Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer: Service facilities within 50 Miles of Project.

1.06 SYSTEM PERFORMANCE REQUIREMENTS

- A. The following overall system performance objectives are applicable to WMATA's LAN System, and shall be maintained when performing the work in this Contract.
 - 1. All Cat 5e cable shall conform to EIA/TIA 568 B Commercial Building Wiring Standard and the EIA/TIA for unshielded twisted pair (UTP). The performance limits shall include: Insertion Loss, Near End Crosstalk (NEXT), Power Sum Near End Crosstalk (PSNEXT) Equal Level Far End Cross Talk (ELFEXT), Power Sum Equal Level Far End Cross Talk (PSELFEXT) Return Loss, Propagation Delay, and Delay Skew.
 - 2. All Plenum Category 5e Unshielded Twisted Pair (UTP) cables shall be composed of 24 AWG bare solid-copper conductors, insulated with FEP or other approved substituted material. Where required the cable shall be sheathed with a low smoke PVC or Flex Halar jacket to meet NEC requirements. Unless otherwise noted on the floor plans or within this document, all information outlets for 24-AWG copper cable shall be:
 - a. RJ45 type/8 position/8 conductor
 - b. Insulation displacement
 - c. Modular 568A Cat 5e rated
 - d. Universal application/multi vendor supportive accepting most phone and data plugs

PART 2 PRODUCTS

2.01 INSIDE PLANT CABLE CATEGORY 5e CABLE (UTP)

Provide 4-pair UTP cable that is Underwriter's Laboratories (UL) listed type, MPP, CMR or CMP.

Cables shall consist of one four pair category 5-e (Cat-5e), color blue, and one four pair category 5-e, color pink. The pink cable shall be assigned to the LAN network. The Blue shall be assigned to the phone system.

2.02 CATEGORY 5e CABLE TERMINATIONS

All Category 5e outlets shall utilize cross-over lead technology to address data circuits applications up to 100 MHz and meet or exceed the following electrical, mechanical and NEXT specifications listed below

- EIA/TIA Category 6- TSB40-A
- Data Rate: Fully supports 100Mbps TP-PMD at 328 ft (100m) over UTP per ANSI X3T9.5, and 155 MBPS ATM. Compatible with 16 MBPS IEEE 802.5 Token Ring applications. Compatible with 10 MBPS Institute of Electrical and Electronics Engineers Inc., (IEEE) 802.3, 10BASE- T applications.
- Insulation resistance: 500M Ohm minimum
- Dielectric withstand voltage 1,000 VAC RM5, 60 HZ .minimum, contact-to-contact and 1,500 VAC RMS, 60 Hz minimum to exposed conductive surface
- Contact resistance: 20 M Ohm maximum
- Current rating: 1.5 A at 68°F (20°C) per IEC Publication 512-3, Test 5b
- UL Listed
- ISO 9001 Certified Manufacturer
- CSA Certified
- Comply with FCC Part 68
- Plug Insertion Life: 750 insertions
- Contact Force: 3.5 oz (99.29) minimum using FCC-Approved modular plug
- Plug Retention Force: 30-lb. (133N) minimum between modular plug and jack
- Temperature Range: -40°F to 150°F (-40°C to 66°C)

2.03 TERMINAL BLOCKS

Siemons 66M series with Category 5e spacing mounted on 89-type brackets.

2.04 VOICE AND DATA OUTLETS

- A. All UTP Outlets shall be wired EIA/TIA 568A.
- B. The data outlet shall be dual gang with back boxes for flush mount applications.

2.05 DUAL 5 WAY ACTIVE DATA BRIDGE

- A. Manufacturer and Product - Tellabs Model No. 4445A (or approved equal).
- B. Ratings
 - 1. Dual five-way balance active data bridge
 - 2. Power Requirements: -48Vdc
 - 3. Transformer-coupled ports adjustable from -10 to +10 Design-Builder

2.06 DATA BRIDGE MOUNTING SHELF

- A. Manufacturer and Product - Tellabs type 10 Part Number 1011 (or approved equal).
- B. Ratings
 - 1. Wire wrap mounting shelves
 - 2. 19 in rack mount
 - 3. Accepts up to 11 standard Tellabs Type 10 modules

PART 3 EXECUTION

3.01 INSTALLATION

A. GENERAL

1. All cable plant installed by the Design-Builder shall be fully tested in accordance with the applicable certifying agency testing practices and procedures prior to acceptance.
2. The Design-Builder shall provide any necessary screws, anchors, clamps, tie wraps, distribution rings, wire, miscellaneous grounding and support hardware, etc. necessary to facilitate the installation of this project.
3. It shall be the responsibility of the Design-Builder to furnish any special installation equipment or tools necessary to properly complete the project. This may include, but is not limited to, tools for terminating cables, testing and splicing equipment for copper/fiber cables, communication devices, jack stands for cable reels, or cable wrenches.
4. The Design-Builder shall be responsible for printed labels for all cables and cords, distribution frames, and outlet locations, at the time of delivery. No labels will be written by hand. Machine labeling shall be used on all information outlets, patch panels, punch blocks, feed cables, etc.
5. The Design-Builder shall not place any distribution cabling alongside power lines, or share the same conduit, channel or sleeve with electrical apparatus.
6. The Design-Builder shall ensure that the maximum pulling tensions of the specified distribution cables are not exceeded and cable bends maintain the proper radius during the placement of the facilities.
7. All Cables/fibers will be connected in numerical order in the MDF .

3.02 TELEPHONE CABLING INSTALLATION

- A. Telephone instruments locations shall have a dedicated Cat 5e cable from the telephone location to the Communications Room. No bridge cable taps shall be permitted.
- B. All cables will terminate in the communications room. The Design-Builder shall furnish and install telephone jacks, tele/data jacks and all miscellaneous equipment as required for a complete cable installation.
- C. Provide a separate cable (other than the Elevator Machine Room telephone) to the Elevator Controller that terminates at a surface mount type jack. The Elevator Contractor will be responsible for connection from this point to the elevator cab phone box via the traveling cable.

3.03 LAN CABLING INSTALLATION

- A. The 4-pair CAT 5e UTP cables shall be run using a star topology from the Communications Room to each information outlet. All cable routes to be approved by WMATA prior to installation of the cabling.
- B. The length of each individual run of copper cable from the MDF on each floor to the information outlet shall not exceed 295-ft. (90m.)
- C. Design-Builder shall observe the bending radius and pulling strength requirements of the 4-pair UTP cable during handling and installation.
- D. Each run of cable between the termination block interconnection unit and the information

outlet shall be continuous without any joints or splices.

- E. In suspended ceiling areas, the Design-Builder shall bundle station wiring with plastic cable ties at appropriate distances. The cable bundling shall be supported via "J" hooks attached to the existing building structure and framework no more than 60" apart. Bundles shall not exceed EIA/TIA maximum diameter specifications.
- F. If all interiors are not obstructed, the Design-Builder will conceal horizontal distribution wiring within the walls. If such obstructions exist, conduit shall be used.

3.04 AUTOMATIC ENERGY MANAGEMENT SYSTEM(AEMS) INSTALLATION

- A. Install a 5 way Active Data Bridge in the 19 inch CT5 Rack in the Control Tower Communications Room.
- B. WMATA will connect the output of the 5way bridge, via the MDF, to a 4W-E&M channel card. WMATA will connect one port to the existing substation RTU.
- C. The Installer will connect one port to the new 5&1 RTU. The connection from the data bridge to the RTU's shall be CAT -5e.
- D. WMATA will use an existing port on a 9 way bridge installed in the Communication Equipment Room of the Jackson Graham Building, or furnish and install a new 9 way bridge and connect one of these ports via the CDF, to 4W-E&M channel cards in the Jackson Graham Building CT5 Terminals: Digroup "B", Channel 24 of the associated passenger station(s).

3.05 CIRCUIT IDENTIFICATION

- A. The Design-Builder shall tag all telephone and data cables. The Design-Builder shall stencil all termination cabinets.
- B. The Design-Builder shall label all wall plates and jack terminations. Labeling shall provide for identification of all cable termination end points.

3.06 DEMONSTRATION

- A. Demonstrate operation and maintenance of Products to Owner's personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with Owners' personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.

- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.
- H. Demonstrate testing procedure.

END OF SECTION

SECTION 16731

FIRE ALARM SYSTEM

PART 1 GENERAL

1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. The purpose of the Fire Alarm (FA) System is to provide alarm warnings to assist Washington Metropolitan Area Transit Authority (WMATA) employees in protecting the public, employees, and property. For this installation, the Yard Service and Inspection Buildings are the only areas requiring upgrades. The Fire Alarm (FA) System is monitored at the Guard House by the Guard. The Fire Alarm System described herein includes, but is not limited to, the following components
1. Microprocessor controlled unit
 2. FA Liquid Crystal Display (LCD) Annunciator Panel
 3. Addressable Fire Detection System
 4. Graphic Annunciator Panel
- B. The Common Control Unit located, in the Communications Equipment Room, shall be a programmable addressable system which contains all the logic and circuitry required to supervise and control the Fire Detectors. Fire Detectors and other addressable devices are connected to the Common Control Unit via a signaling line circuit and are programmed to annunciate by device or zone. The Common Control Unit contains trouble circuitry powered from a dedicated power source that electrically supervises all circuit wiring for a "Short" or an "Open." The Common Control Unit performs the following functions:
1. Provides alarm detection of each addressable device.
 2. Provides trouble detection of each addressable device.
 3. Provides audible and visual "trouble" and "alarm" indications at the FA LCD Annunciator panel.
 4. Provides common system controls to the FA LCD annunciator panel.
 5. Provide contact closures to indicate "trouble" conditions.
 6. Provide special interfacing between the FA System and the elevators.
 7. Provides electrical power for the signaling line circuits and notification appliance circuits as needed.
- C. The Microprocessor Common Control Unit is modular in construction to provide for ease of maintenance and expansion. The following types of modules are used in a typical FA System for this type of building:
1. Signaling Line Circuit Modules -Contain circuitry to recognize inputs and control outputs from addressable devices and to provide supervision of all devices on the circuit.
 2. Power Supply Modules -Provide primary and backup power, and supervision for the Fire Alarm System.
- D. The Common Control Unit shall be designed to operate with smart sensors" (sensors which transmit a digital data message to the Common Control Unit when triggered).
- E. LCD Annunciator Panel shall be located at the Guard House and in the building entranceway. The LCD Annunciator Panel shall contain a multi-line LCD display capable of displaying text messages. The LCD Annunciator Panel shall provide the following features:

1. Alarm, Supervisory, and Trouble conditions shall be indicated on the multi-line display and by a tone-alert.
 2. Each reported condition shall allow a push-button to silence the tone-alert, but retain the display text until the reported condition is returned to normal.
 3. System display shall indicate alarm status. identification of the device. type of alarm, number of alarms. supervisory conditions. and system troubles.
- F. All Fire Detectors shall transmits a programmable data message to the Common Control Unit when alarmed. All fire detector Alarms and Trouble Indications report directly to the Common Control Unit. which displays the alarms on the FA LCD Annunciator Panel. The Fire Detection System provides controls to and/or interfaces with the following systems and equipment:
1. Ventilation Fans
 2. Wet Fire Suppression System
 3. Elevators
 4. Manual Pull Stations
- G. Detector Usage
1. Combination Detectors (Rate-of-Rise and Fixed Temperature) shall be used to monitor room and area ambient temperature and temperature change to include elevator hoist ways when allowed by the NFPA 72.
 2. Fixed Temperature Detectors shall be used to monitor room and area temperature.
 3. Multi-sensor Photoelectric/Ionization/Heat Detectors shall be used to detect the presence of smoke.
 4. Duct Detectors shall be used to detect the presence of smoke in ventilation duct work.
 5. Multi-sensor detectors shall be used in AC switchboard rooms.
- H. The Wet Fire Suppression (Sprinkler) System is monitored by the Common Control Unit via addressable input modules and displayed on the FA LCD Annunciator Panel. Tamper switches detect any movement of the Fire Main manual shut-off valves and provide a "Trouble" condition in the Fire Zone associated with that Sprinkler System. Upon activation of the Sprinkler System. a flow valve detector provides a contact closure. thereby creating an "Alarm" condition in the addressable module associated with that Sprinkler System.
- I. Upon detection of smoke within an Elevator Machine Room. all elevators associated with the Elevator Machine Room shall immediately return to the designated floor, or alternate as appropriate. The elevator(s) shall remain at this-designated level and elevator cab controls (except for emergency controls) are rendered inoperative as long as smoke is detected within the associated Elevator Machine Room .
- J. Activation of a Manual Pull Station shall cause an Alarm signal in the associated Fire Zone and energize the notification appliance circuits for building evacuation.
- K. For annunciation purposes. Fire Zones are assigned in accordance with the following criteria:
1. No Fire Zone shall contain more than 10,000 square feet. The 10,000 square feet zone shall be contiguous.
 2. No Fire Zone shall contain more than four rooms plus a connecting passageway.
 3. No Fire Zone shall contain more than ten Detectors.
 4. The maximum distance between any two points of a Fire Zone shall not exceed 300 feet.

5. Each elevator machine room shall be assigned a separate fire zone.
- L. The FA System is to provide an immediate alarm indication on the Gate House and S&I annunciator panels upon the activation of any Fire Detector, flow valves and tamper switches. In addition, a summary alarm output must be provided and interfaced to the existing Yard FIA system for transmission to the Jackson Graham Building.
 - M. The audible alarm signal and an LED are activated upon receipt of a Detector Alarm. Depressing the "Alarm Acknowledge" pushbutton shall silence the audible signal. The LED light shall extinguish after the Fire Detector initiating the alarm has been attended, repaired or replaced. Depressing the "Alarm Acknowledge" pushbutton in response to an alarm in any zone shall not inhibit the audible alarm signal from being activated upon receipt of a detector alarm in subsequent zones.
 - N. A wiring fault (trouble condition) affecting circuit operation shall cause an audible and visual trouble indication at the FA LCD Annunciator Panel and shall cause a "Trouble" signal (contact closure) to be activated. A trouble condition shall not activate FA System zone alarms. The operation of a pushbutton to acknowledge a trouble alarm shall silence the audible trouble signal, but the associated LED indicator shall remain on until the fault is corrected. Correcting the fault shall extinguish the associated LED.
 - O. Activation of a Manual Pull Station shall cause an audible and visual indication at the FA LCD Annunciator Panels and shall also energize an audible/visual alarms. The audible and visual indications on the FA LCD Annunciator Panel shall be similar to any other detected Fire Alarm.
 - P. Signaling devices installed in pit areas are to be considered ancillary devices.

1.02 SECTION INCLUDES

- A. Fire Alarm common control panel
- B. Manual fire alarm stations
- C. Smoke and heat detectors
- D. Signaling devices
- E. Gatehouse Fire Alarm LCD Annunciator panel

1.03 REFERENCES

- A. NFPA 130 - Standard for fixed guide way transit system
- B. UL 1076 - Proprietary Burglar Alarm and Systems
- C. ANSI/ASME A17.1 - Safety Code for Elevators and Escalators
- D. NFPA 72 - National Fire Alarm Code

1.04 SYSTEM DESCRIPTION

- A. FA System - A state-of-the-art addressable, software-programmable FA System shall be designed, installed, tested, and documented. The addressable, software-programmable system shall be designed to report detected events using data messages to the LCD Annunciator Panel via the Common Control Unit. Fire Detectors are to be installed in the S&I building. The FA system shall be designed to be monitored by the Yard Gate Security Guard.
- B. Capacity
 - 1. The Common Control Unit shall be equipped to supervise the number of alarm points needed to meet Specification coverage requirements and to allow the addition of at least 25% additional sensors without the addition of modules or other modifications.
 - 2. The LCD Annunciator Panel shall be equipped to allow the supervision of at least 25% additional alarm points without panel hardware modifications.
 - 3. The quantity of devices is shown on the drawings.

1.05 SUBMITTALS

- A. Conformance to requirements of NFPA 130
- B. Shop Drawings: Provide LCD Annunciator layout and system wiring diagram showing each device and wiring connection required.
- C. Product Data: Provide electrical characteristics and connection requirements.
- D. Test Reports: Indicate satisfactory completion of required tests and inspections.
- E. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of products.

1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the products specified in this section with minimum three years documented experience, and with service facilities within 100 miles of Project.
- B. Installer: Company specializing in installing the products specified in this section with minimum three years documented experience, and certified as fire alarm installer in the local jurisdiction where the equipment is being installed.

1.07 REGULATORY REQUIREMENTS

- A. Conformance to requirements of NFPA 70 and NFPA 101
- B. Furnish products listed and classified by UL as suitable for purpose specified and indicated.

1.08 MAINTENANCE SERVICE

Furnish service and maintenance of fire alarm system until Final Completion.

1.09 EXTRA MATERIALS

- A. For each manual pull station so eqJipped provide a spare break-glass rod.
- B. Provide a spare key of each lock being installed.
- C. Provide one, or 20% (whichever is greater) additional (spare) detectors of each type of automatic smoke detector [without base].

PART 2 PRODUCTS

2.01 FIRE COMMON CONTROL PANEL

- A. Manufacturer and product - Edwards Systems Technology EST -3 (or approved equal)
- B. Control Panel - Modular Constructi9n with surface wall mounted enclosures.
- C. Capacity - Supports up to 125 intelligent Signature detectors and 125 intelligent Signature modules.
- D. Power supply - Adequate to serve control panel modules, remote detectors, remote LCD Annunciator, relays. and alarm signaling devices. Include battery-operated emergency power supply with capacity for operating system in standby mode for 12 hours followed by alarm mode for 10 minutes.
- E. System Supervision - Component or power supplies failure places system in trouble mode.
- F. Initiating Device Circuits - Supervised zone module with alarm and trouble indication; occurrence of single ground or open condition places circuit in trouble mode but does not disable that circuit from initiating an alarm. A supervised, microprocessor based, single Signature driver controller module is used to coordinate, process, and interpret information received from and sent to Signature devices. This is a Common Control Unit (CCU), local rail mounted module that provides an interface between the 3-CPU(1) module and Signature series devices.
- G. Indicating Appliance Circuits: Supervised signal module, sufficient for signal devices connected to system; occurrence of single ground or open condition places circuit in trouble mode but does not disable that circuit from signaling an alarm.

2.02 INITIATING DEVICES

- A. Manufacturer
 - 1. Edwards Systems Technology (or approved equal)
 - 2. Manual Station: EST SIGA-278. Surface mounted, non-coded type, dual action manual station. Provide manufacturer's standard back box. SIGA-278 station is a contemporary style manual station made from durable red colored Lexan. An alarm may be initiated by lifting the upper door marked "LIFT THEN PULL HANDLE", then pulling the alarm handle.
- B. Spot Heat Detector: Fixed temperature, 135 degrees F (57 degrees C.) EST Signature Series

Intelligent Heat Detectors. The detector shall gather analog information from their fixed temperature and/or rate-of-rise heat sensing elements and convert it into digital signals. The detector's on-board microprocessor shall measure and analyze these signals. It shall compare the information to historical readings and time patterns to make an alarm decision. Digital filters shall remove signal patterns that are not typical of fires.

- C. Spot Heat Detector: Combination rate-of-rise and fixed temperature, rated 135 degrees F (57 degrees C), and temperature rate of rise of 15 degrees F (8.3 degrees C). EST Signature Series Intelligent Heat Detectors. The detector shall gather analog information from their fixed temperature and/or rate-of-rise heat sensing elements and convert it into digital signals. The detector's on-board microprocessor shall measure and analyze these signals. It shall compare the information to historical readings and time patterns to make an alarm decision. Digital filters shall remove signal patterns that are not typical of fires. Ancillary normally open contacts, if needed, shall be provided by additional control modules.
- D. Ceiling Mounted Smoke Detector: NFPA 72E, photoelectric/ionization/heat type with adjustable sensitivity, plug-in base. EST Signature Series Intelligent Digital Multi sensor Detectors. Provide two-wire detector with common power supply and signal circuits.
- E. Ceiling Mounted Smoke Detector: NFPA 72E, photoelectric type with adjustable sensitivity, plug-in base. Signature Series Intelligent Digital Photoelectric Detector. Provide two-wire detector with common power supply and signal circuits.
- F. Duct Mounted Smoke Detector: NFPA 72E photoelectric type] with auxiliary SPDT relay contact. Signature Series Intelligent Digital Photoelectric Detector equipped with air sampling tubes.

2.03 SIGNALING/NOTIFICATION APPLIANCES

- A. Manufacturer - Edwards Systems Technology (or approved equal)
- B. Strobes
 - 1. Meets or exceeds Year 2004 UL requirements for standards UL 1638 and UL 1971.
 - 2. Complies with ADA Code of Federal Regulation, Chapter 28, Part 36, Final Rule.
 - 3. Mounts on standard 4-inch square electrical box.
 - 4. Two wire operation; Terminals accept #18 to #12AWG wire
- C. Combination Horn/Strobe
 - 1. NFPA 72G, surface type fire alarm horn
 - 2. Sound Rating: 96 dBA at 10 feet (3M)
 - 3. Provide integral strobe lamp and flasher in accordance with specifications for strobe unit.
- D. Pit Area Strobes
 - 1. Strobes mounted in pit areas shall be of weatherproof design and installation and compatible with other system devices.
 - 2. Use EST CS-405-7A (15 candela), EST CS-405-8A, or approved equal.
 - 3. Mount according to manufacturers instructions using weatherproof surface box, EST series 449 or approved equal.

2 .04 CONTROL RELAY MODULES

- A. Manufacturer - Edwards Systems Technology SIGA-CR (single gang box mount) or SIGA-MCR (UIO motherboard mount) (or approved equal.)
- B. Control modules shall be Signature compatible I/O modules with automatic device mapping and electronic addressing. Details about the module shall be permanently stored in its non-volatile memory and the module shall automatically update historic information. Modules shall be available in standard mount and plug-in (UIO) configurations.
- C. The intelligent input/output modules shall feature multiple user-set personality codes that define the module's behavior. Separate I/O and data loop connections shall be made to each module.
- D. The control relay module shall provide a Form C dry relay contact. The on-board microprocessor shall ensure the relay is in the proper ON/OFF state. Upon command from the loop controller, the relay shall activate the relay contact.
- E. SIGA-CR - Standard mount models shall mate to North American two-gang or one-gang electrical boxes.
- F. SIGA-MCR - Plug-in UIO modules mount shall mount to UIO motherboards. Motherboards shall accommodate individual risers for each on-board module, or shared risers in any combination with their UIO modules. All wiring connections shall be made to terminal blocks on the motherboard.
- G. Characteristics
 - 1. Operating Current -100micro amps
 - 2. Operating Voltage -15.2 to 19.95 VDC (19 VDC nominal)
 - 3. Relay Rating -Form C
 - a. 24VDC -2 amps -pilot duty
 - b. 120VAC- 0.5 amps
 - c. 220VAC -0.5 amps
 - 4. Operating temperature -32 deg F to 120 deg F
 - 5. Humidity -0 to 93% non-condensing
 - 6. LED Operation
 - a. On-board Green LED -flashes when polled
 - b. On-board Red LED -flashes when in alarm/active

2 .05 SOLID-STATE FAN RELAYS (NORMALLY-OPEN CONTACTS)

- A. Manufacturer - Teledyne Part No. SSR1200480D25 (or approved equal).
- B. Contact Configuration: Normally open.
- C. Output current rating: 25-amps.

2 .06 FAN RELAYS (NORMALLY-CLOSED CONTACTS)

- A. Manufacturer - Teledyne Part No. S2840B5SSR (or approved equal)
- B. Contact Configuration - Normally closed

C. Output current rating - 25-amps.
2 .07 ICD ANNUNCIATOR

- A. Manufacturer - Edwards Systems Technology 3-LCD (or approved equal.)
- B. The FA annunciator shall provide both display and keypad functions to indicate system status and arming/disarming the system. The unit shall support additional display functions such as fire/security annunciation.
- C. The unit shall feature a backlit 8 lines of 21 characters LCD readout.
- D. It will be powered from 24VDC provided by the fire alarm panel. It shall draw 95mA or less.
- E. It shall communicate with the fire alarm panel using RS-485 protocol.
- F. The keypad shall provide both tactile and audible user feedback to facilitate entry of information.
- G. User entries shall be menu driven, and capable of executing system commands. A context sensitive help system shall be available to the user at any time.
- H. All keypad/display addressing shall be electronic, jumpers or DIP switches shall not be considered as equivalent to electronic addressing. All data within the unit shall be stored in non-volatile memory to prevent data loss.
- I. The unit shall be constructed of a thermoplastic housing with integral (removable) cover, and be suitable for mounting directly on a finished wall or standard 4" square or 2-gang electrical boxes. All wiring terminations shall be to an integral terminal strip.
- J. Install in Gatehouse on ceiling using a custom manufactured bracket, field fit. Install in S&I Building using manufacturer's standard wall mount.

2 .08 FA DISTRIBUTION FRAME/CABINET

Manufacturer - Sun West Engineering Model No. PBI-036030207 (or approved equal)

2 .09 TERMINALS

- A. Manufacturer - Weidmuller, Model No. SAKR (or approved equal)
- B. Disconnect feature - Knife switch design, remains attached to terminal block body.
- C. Complete with test sockets, labeling, and all required terminal block mounting hardware and accessories.

2.10 INTRA-BUILDING CONDUIT WIRING

- A. Manufacturer -Not specified

- B. Non-power limited cable for fire protective signaling circuits.
- C. Characteristics
 - 1. Solid copper conductors in the following configurations:
 - a. 1 pair 18AWG
 - b. 2 pair 18AWG
 - c. 1 pair 16AWG
 - d. 2 pair 16AWG
 - e. 1 pair 18AWG -shielded
 - f. 2 pair 18AWG -individually shielded
 - g. 3 pair 18AWG -individually shielded
 - h. 1 pair 16AWG -shielded
 - 2. Red jacket
 - 3. In accordance with NEC Article 760
 - 4. UL listed, subject 1424
 - 5. Type NPLF
- D. Number of conductors shall be based on equipment requirements shown in drawings

2.11 INTER-BUILDING CABLE

- A. Manufacturer -Not specified
- B. REA PE-39 or ISMA 60-6 with aluminum or copper shield. 4 or 6 pair #16 shielded.

2.12 PROTECTOR BLOCKS

- A. Manufacturer: Coming (Seicor) W492-LCGX (or approved equal)
- B. Ratings
 - 1. Unit Type - Two-pair
 - 2. Protection Type - Gas Tube Arrester
 - 3. Nominal Voltage Rating - 400 Volts
 - 4. Mounting - Mounting/Grounding bar

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install products in accordance with manufacturer's instructions.
- B. Mounting location
 - 1. In office areas install manual station with operating handles 4 feet 6 inches [1.4 M] above floor. Install audible and visual signal devices 7feet 6 inches [2.3 M] above floor.
 - 2. In open shop area, and as shown on drawings, mount signaling devices on roof trusses below 30-feet above finished floor. Initiating devices will be mounted as noted above.
 - 3. In shop pits mount signaling devices on walls to maximize their visibility.
- C. Use 18 AWG minimum size conductors for fire alarm detection and signal circuit conductors.

Install wiring in conduit.

- D. Mount end-of-line device box with last device or separate box adjacent to last device in circuit.
- E. Make conduit and wiring connections to sprinkler flow switches, sprinkler valve tamper switches, duct smoke detectors, and fan shutdown relays.
- F. Install conductors and appropriate zone wiring to interconnect the FA System Common Control Unit.
- G. Provide and install all required wiring, junction boxes, terminal strips, control relays, and cabling from the Elevator Machine Room and other controlled devices to the FA Common Control Unit.
- H. Interface the control relay contacts to the elevator control equipment. Install within the Elevator Machine Room conduit, wires and cables, junction boxes, terminal strips, and any other mechanical and/or electronic equipment necessary to affect the interface described herein.

3 .02 FIELD QUALITY CONTROL

- A. Field inspection and testing will be performed under provisions of Section 16707.
- B. Test in accordance with NFPA 72H and local fire department requirements.

3 .03 MANUFACTURER'S FIELD SERVICES

- A. Prepare and start systems under provisions of Section 16707.
- B. Include services of certified technician to supervise installation, adjustments, final connections, and system testing.

3 .04 FIRE ALARM WIRE AND CABLE COLOR CODE

- A. Provide fire alarm circuit conductors with insulation color coded as follows, or using color tape at each conductor termination and in each junction box.
- B. Power Branch Circuit Conductors: Black, Red, White.
- C. Initiating Device Circuit: Black, Red.
- D. Detector Power Supply: Violet, Brown.
- E. Signal Device Circuit: Blue (positive +)' White (negative -).

3 .05 ADJUSTING

Adjust operating Products and equipment to ensure smooth and unhindered operation.

3 .06 ELEVATOR INTERACTION AND COORDINATION

- A. Install elevator circuits in accordance with ANSI/ASME A 17.1, Safety Code for Elevators and

Escalators and NFPA 72, National Fire Alarm Code. Elevator hoistways and machinery spaces are sprinklered. Elevator power must be removed prior to the application of water. Power removal will be accomplished with a fusible shunt trip switch as described in the Electrical specifications.

- B. Elevator shutdown shall be monitored by the Fire Alarm system for integrity.
- C. Elevator power shutdown is to occur prior to the sprinkler activation. Shutdown shall be accomplished by the activation of heat detectors located in the hoistway and machine room. Heat detectors are required to be located within two feet of each sprinkler head. Heat detectors will be set to 135 F, and sprinkler heads will be set to 165 F. See also Sprinkler specifications.
- D. The heat detectors shall activate a Control Relay, which in turn will supply power to the shunt trip coil and cause the disconnecting means to open the circuit.
- E. A Volt Monitor Relay is required to monitor for presence of the shunt trip voltage. This relay shall be placed in parallel to the shunt trip coil so that it receives the same voltage. Then the contacts from this relay shall be monitored for integrity by the fire alarm system. If at any time the voltage is not present to the relay, a trouble signal would be sent to the fire alarm system and annunciate an alarm.
- F. Upon system activation, the elevator is sent to the shop floor where the doors stay open. If the fire gets to the point where it is detected by the heat detector(s), power is removed before it gets hot enough to release water through the sprinkler heads. In the event the smoke detector outside the elevator on the Shop Floor level is activated the alternate elevator park location shall be the Basement level.
- G. The Control Relay shall be monitored for integrity by the fire alarm system to make sure that the wiring remains intact and must be located within three feet of the shunt trip device.

3 .07 DEMONSTRATION

- A. Demonstrate operation and maintenance of Products to Owner's personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with Owners' personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

END OF SECTION

THIS PAGE NOT USED

SECTION 16791

COMPREHENSIVE RADIO COMMUNICATIONS SYSTEM

PART 1 GENERAL

1.01 SECTION DESCRIPTION AND BASIC REQUIREMENTS

- A. This Section describes the basic components of the WMATA Comprehensive Radio Communications System (CRCS) used at the Yard Service and Inspection (S&I) facility. This section installs a bi-directional amplifier and associated cables, and antennas, to provide improved service inside the S&I building.
- B. The purpose of the WMATA Metrorail Subsystem is to provide two-way voice communications between control consoles, provided by others, located within the WMATA Rail Operations Control Center (RAIL OCC), and portable, vehicular and rail car radios, utilized throughout the WMATA Rail Rapid Transit System and the Washington Metropolitan Area. The work in this contract is to extend that coverage into the S&I building.
- C. The WMATA CRCS is a shared, digital, trunked, simulcast radio system operating in the UHF (490 MHz) portion of the frequency band. The WMATA CRS is a jointly shared radio system used by Metrorail, Metrobus, Metro Transit Police Department (MTPD), and various maintenance disciplines.
- D. Vehicular and portable radios shall not be provided under this contract.
- E. Unlike line section head-end amplifiers, the shop unit will NOT have an alarm subsystem.

1.02 SECTION INCLUDES

NOT USED

1.03 REFERENCES

- A. National Electric Code (NEC)
- B. Federal Communication Commission (FCC)

1.04 SUBMITTALS

- A. Design-Builder shall size all equipments and materials included in contract and provide information in the Final Design Submittal.
- B. System Final Design
- C. Shop Drawings - Indicate electrical characteristics and connection requirements, including complete and detailed system wiring diagram.

- D. Product Data - Provide showing electrical characteristics and connection requirements for each component.
- E. Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.
- F. Radio coverage performance field demonstration results.
- G. As-built drawings
- H. Operations and Maintenance Manuals.

1 .05 QUALIFICATIONS

- A. Manufacturer - Company specializing in manufacturing the Products specified in this section with minimum five years documented experience.
- B. Supplier - Authorized distributor of specified manufacturer with minimum three years documented experience.
- C. Installer - Authorized installer of specified manufacturer with service facilities within 50 miles of Project and with minimum five years documented experience.
- D. Radio coverage for requirements at all WMATA facilities within the project area, using portable radio units at hip level, shall be as follows (whichever is better radio coverage)
 - 1. Delivered Audio Quality (DAQ) equal to 4.0.
 - 2. Equivalent to 98% availability or 99.0% of the shop floor 99.0% of the time.

1 .06 MAINTENANCE SERVICE

Furnish service and maintenance of the S&I CRS until Final Completion.

PART 2 PRODUCTS

2 .01 EXTERNAL ANTENNA

- A. Manufacturer - Decibel Products Model DB436-E (or approved equal)
- B. Description – Roof -mounted, UHF yagi antenna complete with mounting hardware.
- C. Electrical Data
 - 1. Frequency Range: 488-512
 - 2. VSWR: 1.5 to 1 or less
 - 3. Nominal Impedance - 50-ohms
 - 4. Forward Gain - 10dBd
 - 5. Polarization - Vertical
 - 6. Maximum Power Input - 250-watts
 - 7. Vertical Beamwidth (half-power) - 44deg

8. Horizontal beamwidth (half-power) - 60deg
9. Front-to-Back Ratio - 16dB
10. Lightning Protection - Direct ground
11. Standard Termination - Type

D. Mechanical Data

1. Support Boom - 1"OD with 0.083 wall
2. Elements - Aluminum
3. Mounting Brackets - Galvanized Steel
4. Maximum Exposed Area (flat plane equivalent) - 0.45-sq. ft.
5. Lateral Thrust at 100 mph - 18 lbf
6. Wind Rating, without ice - 125 mph
7. Wind Rating, with 0.5" radial ice - 90 mph
8. Dimensions - 14.5" by 35"
9. Net weight - 7 lbs
10. Mounting Clamps - Stainless steel V-bolts
11. Minimum Power - 100-watts.
12. Frequency Range - 406-512 MHz
13. Minimum Vertical Beamwidth - 75-degrees

2.02 INTERNAL ANTENNA

A. Manufacturer - Decibel Products ASP-7A or approved equal

B. Description - Quarterwave ground plane antenna, unity gain.

C. Electrical Data

1. Power handling - 100 watts maximum
2. Frequency Range - 108 to 512 MHz
3. VSWR - less than 1.5 to 1
4. Impedance - 50 ohms nominal
5. Lightning protection - Built-in gap type arrester
6. Termination - SO-239 (accepts PL-259 connector)

D. Mechanical Data

1. Length - 26 inches at lowest frequency
2. Weight - 0.75 lbs
3. Radiating Element - Chrome-plated brass
4. Radials - Stainless steel
5. Mounting - U-bolt supplied for 1-1/4" maximum OD tubing

2.03 FLEXIBLE FOAM-DIELECTRIC Y2-INCH COAXIAL CABLE

A. Manufacturer and Product - Andrew Corporation; Superflexible HEL/AX Model No. FSJ4RN-50B (or approved equal).

B. Ratings - Impedance: 50 ohms with a non-halogenated, flame-retardant and smoke-resistant jacket.

2 .04 CRS DUAL-BAND UHF BI-DIRECTIONAL LINE AMPLIFIER

- A. Manufacturer and Product - KAVAL Telecom, Inc. Bi-Directional Amplifier BDA 1300-XCC4-B (or approved equal)

- B. Description
 - 1. Line amplifier for extending multi-channel UHF radio systems coverage throughout tunnel areas and other confined spaces
 - 2. Housed in NEMA-style enclosed cabinet
 - 3. Linear Amplification - equipment shall be capable of passing analog and digital trunked system protocols in the UHF bands
 - 4. Equipped with microprocessor control module that allows installers and technicians the ability to set and check all system parameters of the amplifier at the time of installation or during a regular or emergency service call. The module maintains non-volatile memory of all system parameters allowing quick module replacement without system realignment. The microprocessor control also has the following:
 - a. Password protection
 - b. Self diagnosis and continuous monitoring
 - c. Battery backup and management control
 - d. Thermal management control
 - e. Over current/under current fault monitoring
 - f. Automatic (AGC) and digital (DGC) gain controls
 - g. RS-232 interface
 - 5. Gain control that allows up to 14 dB adjustments in 1 dB increments
 - 6. Nominal maximum gain of 38 dB and a pass band ripple of +/- 2.5 design-Builder
 - 7. 3rd Order Intercept Point of 45 dBm and Noise Figure less than 9 design-Builder
 - 8. Capable of a maximum RF input of + 10 dBm
 - 9. All subsystem components shall be modular for quick replacement.
 - 10. Input/output impedance of 50 Ohms
 - 11. Operating temperature of -30 to +50 C
 - 12. N-female input and output connectors
 - 13. Cabinet shall be NEMA style with approximate dimensions of 23H X 24W X 7D inches.

2 .05 CO-AXIAL CABLE

- A. Manufacturer and Product - Timesmicrowave LMR500-UF (or approved equal)

- B. Description
 - 1. Provide coaxial cable of a flexibility and bendability cable design. The flexible outer conductor shall enable tight bend radius.
 - 2. RF Shielding shall be 50 dB greater than typical single shielded coax (40 dB). The multi-ply bonded foil outer conductor is rated conservatively at > 90 dB (i.e. >180 dB between two adjacent cables).
 - 3. Weatherability - Cables shall be designed for outdoor exposure and have a life expectancy in excess of 10 years.

- C. Electrical and mechanical characteristics:

CHARACTERISTIC	VALUE
Size-Nominal	1/2'

Impedance	50 ohms
Cutoff Frequency	12 GHz
Propagation Speed	0.85 C
Peak Power Rating	16kW
DC Resistance, inner conductor	0.86 ohms/1000 feet
DC Resistance, outer conductor	1.65 ohms/1000 feet
DC Breakdown	2,500 volts
Jacket Spark	8,000 volts RMS
Capacitance	23.9 pF/ft
Inductance	0.06 mH/ft
Outer Conductor	Aluminum tape - 0.376" Overall braid, tinned copper
Inner Conductor	Stranded BC
Diameter over Jacket	0.500 inches
Diameter over Copper Outer Conductor	0.405 inches
Diameter Inner Conductor	0.142 inches
Minimum Bending Radius	5 inches
Bending Moment	1.25 lb-ft
Cable weight.	0.1 lb/ft
Tensile Strength	260 lb
Flat Plate Crush Strength	35 lb/in
Attenuation	2.6 max dB/100 feet at 450 MHz

2.06 CO-AXIAL CABLE CONNECTORS

- A. Appropriate for each type and size cable
- B. Type "N" connectors and/or PL-259 as appropriate
- C. Covered with shrink sleeving or other approved waterproof covering

2.07 CABLE GROUNDS

- A. Provide cable grounds at the base of the antenna and at the outside cable entrance into the cabinet.
- B. Ground shall be Andrew Company SureGround Grounding Kit or approved equal.
- C. Description: Provide a one-piece grounding assembly with weatherproofing molded into the grounding strap providing a minimum of 200 mm of surface contact area.
- D. Universal ground lug that can be fitted to a one- or two- hole earthing attachment point.
- E. Waterproof to IEC529, IP68.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Metrorail Radio Subsystem
 - 1. The Design-Builder shall install the CRS amplifiers, the antennas, and all related equipment and material as shown on the Information Drawings, in a location approved by the Authority Representative .
 - 2. The Design-Builder shall install the required cabling, conduit and fittings, connectors, AC receptacles, junction boxes, and hardware and make the necessary connections and cross-connections to provide 120-Vac, 60-Hz power .
 - 3. The Design-Builder shall install the required co-axial cable, and appropriate size and RF type connectors, to interconnect the equipment.
 - 4. The Design-Builder shall label each end of every cable run to display cable use, cable number designation, and end terminal destinations.
- B. Internal Antenna
 - 1. Mount antenna to building ceiling joist, pointing down, near center of S&I shop floor.
 - 2. Install and connect cables to BDA.
- C. Bidirectional Amplifier
 - 1. Install on mezzanine level, near stairwell. locate so door can be opened.
 - 2. Install power and coax cables.
- D. External Antenna
 - 1. Mount antenna on building antenna mount.
 - 2. Install lightning protection.
 - 3. Install and connect cables to BDA.
 - 4. Aim antenna to obtain best signal from WMATA donor site.

3 .02 ADJUSTING

Adjust operating Products and equipment to ensure smooth and unhindered operation.

3 .03 DEMONSTRATION

- A. Demonstrate operation and maintenance of Products to WMATA personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified person who is knowledgeable about the Project.
- C. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with WMATA personnel in detail to explain all aspects of operation and maintenance.
- D. Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, maintenance, and shutdown of each item of equipment at equipment location.
- E. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- F. Demonstrate system operation.
- G. Conduct walking tour of Project and briefly describe function, operation, and maintenance of each component.

END OF SECTION

SECTION 16823

YARD PUBLIC ADDRESS SYSTEM SPECIFICATIONS

PART 1-GENERAL

1.01 PURPOSE

The Public Address System shall enable announcements to be made throughout the Yard buildings. The announcements shall originate from telephones within the buildings.

1.02 SYSTEM DESCRIPTION

- A. The Public Address System shall provide for announcements to be made in the Yard building. Announcements shall originate from telephone instruments within the TCR/Tower and other yard buildings.
- B. The Public Address System shall consist of loudspeakers, including enclosures and baffles, and paging horns installed in selected rooms and locations within each Yard building. A Telephone Access Paging System, power amplifiers, distribution panels and jack field panels shall be provided in the Communications Equipment Room.
- C. The loudspeakers of the Public Address System shall be grouped into individual zones throughout the yard buildings. The Public Address System shall be configured to permit announcements to be made to the speakers in an individual zone, or simultaneously to a combination of any and all zones (ALL PAGE) by dialing the appropriate zone code(s).
- D. The Telephone Access Paging System shall accept an audio input from the Yard Telephone System and provide the appropriate dialed zone decoding and audio routing of the announcements to the desired zone amplifiers, which provide audio amplification for announcements to each zone circuit. The audio inputs and outputs of the Telephone Access Paging System shall be connected to a distribution panel.
- E. Jack field panels shall provide audio test points for the Public Address System. Each Public Address Loudspeaker circuit shall be wired through a jack field panel to a loudspeaker distribution panel. In addition, the loudspeaker distribution panels shall provide single point ground connections for the Public Address System cabling.

1.03 OPERATING DESCRIPTION

The Public Address System shall provide the communications and control link from the telephone system to the speakers throughout the Yard buildings. The Public address System shall enable announcements to be made from the telephone sets to the Public Address System speakers within the yard buildings by dialing the appropriate code to address the selected zone(s).

1.04 SYSTEM PERFORMANCE REQUIREMENTS

- A. The Design-Builder shall be responsible for the overall performance of the Public address System. The following overall system performance requirements are designed to ensure that the Public address System, delivered under these Specifications, meet the performance requirements of the Washington Metropolitan Area Transit Authority.
- B. Total System Performance
 - 1. Frequency Response: ± 5 dB over the range 200Hz to 8KHz
 - 2. Noise Level: 60 dB less than rated output
 - 3. Loudspeaker System Sound Pressure Level:
 - a. At least 100dB (ref. 0.0002 dynes/cm²) measured from 1 meter from front, on axis, of loudspeaker for areas with ceiling heights greater than or equal to 25 feet.
 - b. At least 70 dB (ref. 0.0002 dynes/cm²) measured 1 meter from front, on axis, of loudspeaker for areas with ceiling heights less than 25 ft.
 - 4. System Harmonic Distortion: less than 5% over the range 250Hz to 5.5KHz

PART 2-PRODUCTS

2.01 MAJOR ITEM TECHNICAL REQUIREMENTS

The Major Items listed below shall conform to the operational and performance requirements of these Specifications. Incidental items, not specifically mentioned but required for complete and proper system operation, shall be furnished and installed by the Design-Builder.

2.02 TELEPHONE ACCESS PAGING SYSTEM

- A. The Design-Builder shall furnish and install a Telephone Access Paging System which shall include decoding circuitry to provide selection of at least four individual zones, and all zones during an "ALL PAGE".
- B. The telephone interface shall work in conjunction with the existing WMATA telephone system. A dedicated telephone extension number provided by WMATA shall provide access to the paging system.
- C. The telephone shall be Valcom Model V-9973 and page zone access by a Valcom V-2006 (or approved equal).
- D. The Design-Builder shall be responsible for determining, providing and installing the required Telephone System and Public Address System hardware and software to interface these systems together. The Design-Builder shall ensure that the Telephone System, Telephone Access Paging System, and the Public Address System are compatible and function properly together.

2.03 POWER AMPLIFIER

- A. The Design-Builder shall furnish and install power amplifiers in the Communications Equipment Room. Each Power Amplifier shall be equipped with enough Power Modules to drive its assigned loudspeaker zone at specified performance with at least a 20% power reserve.
- B. ALTEC LANSING model 2280B (or approved equal), with the following characteristics
 1. Power Output: Capable of at least 375 watts continuous rms (50-10,000 Hz) @ 70.7 volts.
 2. Total Harmonic Distortion: Less than 1% (50- 10,000 Hz) @ 70.7 volts.
 3. Frequency Response: Plus or Minus 1dB (30 - 15,000 Hz).
 4. Input impedance: 600 ohm and 10K ohm balanced.
 5. Complete with input/output modules needed to provide specified audio performance in each loudspeaker zone.

2.04 LOUDSPEAKERS

- A. The Design-Builder shall furnish and install loudspeakers in selected rooms and areas of the Yard buildings, as required. The Design-Builder shall submit to the Authority Representative for approval a proposed loudspeaker layout, including transformer taps to be used and the power level distributed between loudspeakers. The Design-Builder shall furnish any alternate audio transformers/pads needed to adjust any individual loudspeaker/horn that cannot be adjusted to a acceptable sound level using the specified transformer.
- B. Atlas/Soundolier Model UHT70C-U51 (or approved equal) with the following characteristics:
 1. Loudspeakers shall be 8-inch diameter, 8 Ohm, with a frequency response of ± 2 dB over 30Hz to 19,000 Hz and a power rating of 7 watts. The loudspeakers shall be a high efficiency, low distortion, per-manent magnet type with a moisture resistant seamless cone. The loud-speakers shall be suitable for either recessed or surface mounting (EIA standard mounting hole spacing on the loudspeaker basket). The loudspeakers shall have mounting holes for a speaker transformer on the rear of the basket.
 2. Each loudspeaker shall have a 70.7 volt matching transformer providing selectable power levels of $\frac{1}{2}$, 1, 2, and 5 watts to the loudspeaker.

2.05 PAGING HORNS

- A. The Design-Builder shall furnish and install paging horns in all assigned areas, as required. The Design-Builder shall submit to the Authority Representative for approval a proposed paging

horn layout, including transformer taps to be used and the power level distributed between paging horns.

- B. GAI-tronics Model 13315-003 Driver with GAI-tronics Model 13306-001 Horn (or approved equal) with the following characteristics:
1. The paging horns shall be of a weatherproof design consisting of a water-sealed all-metal construction and gray baked epoxy finish suitable for use both at indoor and outdoor locations.
 2. The paging horns shall contain built-in 70.7-volt line transformers with selectable audio power levels of 3.7, 7.5, 15, and 30 watts.
 3. Each paging horn shall include a mounting assembly which shall permit precise installation positioning in the vertical and horizontal planes.
 4. A protective cover with a built in strain relief for the connecting cable.
 5. The paging horns shall be complete with all necessary accessories.

2.06 LOUDSPEAKER ENCLOSURES AND BAFFLES

The Design-Builder shall furnish and install a loudspeaker enclosure with baffle for each loudspeaker. Two types of loudspeaker enclosures shall be provided: one type for installation of loudspeakers in areas with a suspended ceiling, and the other for surface mount installation of loudspeakers.

2.07 RECESSED LOUDSPEAKER ENCLOSURES

Atlas/Soundolier Model No. T195-8 (or approved equal) with the following characteristics:

- A. recessed type loudspeaker enclosure made of heavy gauge steel construction with a rust preventative coating. The interior shall be undercoated with patched jute lining to prevent mechanical and acoustical resonances. In addition, the enclosure shall have slotted receptacles to accept the torsion springs of the associated baffle.
- B. The enclosure shall be sized for the installation of an 8 inch loudspeaker and shall have a depth of 5 inches.
- C. A Mounting ring shall be provided for each enclosure to extend the enclosure through the suspended acoustical ceiling.
- D. The baffle for this loudspeaker enclosure shall be round with a diameter of 12 inches to accommodate the 8 inch loudspeaker, have welded studs on the rear for the mounting of the loudspeaker, have two torsion spring devices and shall be finished in baked white enamel.
- E. The enclosure and the baffle shall be appropriate for the loudspeaker selected.

2.08 SURFACE MOUNT LOUDSPEAKER ENCLOSURES

Atlas/Soundolier Model No. 410-8 (or approved equal) with the following characteristics:

- A. The enclosure and baffle for a surface mount loudspeaker installation shall be one complete assembly. This assembly shall be round, unidirectional, and a surface mount type.
- B. The assembly shall be manufactured of aluminum and shall have a satin finish coated by a clear acrylic baked finish.
- C. The interior of the assembly shall be undercoated with a patched jute lining to prevent acoustical and mechanical resonances.
- D. The assembly shall be sized for the installation of an 8-inch loudspeaker and shall have a depth of approximately 4-1/2 inches.
- E. The loudspeaker grille of the assembly shall be of one piece construction and have the required mounting holes for securing the loudspeaker to the grille.
- F. The loudspeaker enclosure and baffle assembly shall be appropriate for the loudspeaker selected.

2.09 WALL-MOUNT LOUDSPEAKER

The Design-Builder shall furnish and install one wall-mount loudspeaker in the Train Control Building. The loudspeaker shall have a 70.7 volt matching transformer providing selectable power taps of 1, 2, 4 and 7.5 watts. The loudspeaker shall be surface mounted in a 4" square box. Wiring to speaker

shall be enclosed in 1/2" conduits. ATLAS/SOUNDOLIER Model SVT-77U (or approved equal).

2.10 JACK FIELD PANEL

- A. The Design-Builder shall furnish and install jack field panels in the Communications Equipment Room of the TCR/Tower/Operations Building. The number of jack field panels furnished shall be sufficient to accommodate the connections for all of the Public Address System loudspeaker circuits.
- B. ADC Telecommunications Model PJ30A panel with PJ899 strip (or approved equal) each jack field panel frame shall have 2 rows and accommodate 52 normal-through telephone jacks. The jack field panel frame shall be made of black plastic with steel mounting brackets reinforcing strips. In addition, the jack field panel frame shall contain two marking designation strips with a clear plastic cover mounted at the top and bottom of the front side for identification of the jacks.
- C. The jack field panel shall contain 52 ADC Telecommunications Model PJ339W (or approved equal) telephone jacks. Each shall be tip-ring-sleeve type with normal-through for the tip and ring. Each telephone jack shall have gold cross bar contacts and wire-wrap tails.
- D. The Design-Builder shall furnish and install patch cord holders, complete with patch cords, in the Communications Equipment Room for each jack field panel provided. The patch cord holder shall be mounted to a blank panel on the equipment rack containing the Public Address System equipment.
- E. The Design-Builder shall furnish and install six patch cords for each Jackfield panel provided. The patch cords provided with each shall be six feet in length, two conductor (tip and ring) with shielding and have the ADC Telecommunications Model PJ047B (or approved equal) mating plugs to interface to the Jackfield jacks. Two of the six patch cords provided with each panel shall have the two conductors on one end terminated with wire spade lugs, with the shields connected only at the mating plug.

2.11 LOUDSPEAKER DISTRIBUTION PANEL

The Design-Builder shall furnish and install loudspeaker distribution panels in the Communications Equipment Room. Each distribution panel shall be fabricated from the following:

- A. Standard 19-inch aluminum rack mount panel: 0.125 inch thick with smooth mill finish, and slotted holes positioned at EIA standard spacing.
- B. Loudspeaker distribution panel terminal barrier strip. Curtis Industries, Inc., #2015 15 terminals (or approved equal).
- C. Loudspeaker distribution panel jumper stock. Curtis Industries, Inc., #267-A42-5 Plated Brass (or approved equal).

2.12 SPEAKER/HORN WIRE

Belden No. 88760, single pair, plenum, overall Beldfoil Shield, 18 AWG, Standard Conductors (or approved equal).

PART 3-EXECUTION

3.01 GENERAL PUBLIC ADDRESS SYSTEM INSTALLATION

The Design-Builder shall install a complete Operational Public Address System, as described herein, in the S & I shop. The Design-Builder shall furnish and install all equipment racks, loudspeaker channel supports, jack fields, distribution panels, protector blocks complete with accessories, conduit, wire mold, and fittings, junction boxes, installation hardware, and make all connections and cross connections for complete installations.

3.02 COMMUNICATIONS EQUIPMENT ROOMS

- A. The Design-Builder shall install the completely assembled Telephone Access Paging System, power amplifiers, and the distribution panels and jack field panels in a standard 19-inch open equipment rack in the Communications Equipment Room.

- B. The Design-Builder shall furnish and install the necessary intrarack wiring between the pieces of equipment, the necessary connectors, and make all necessary connections and cross-connections. The intrarack wiring shall be shielded, stranded, 20 AWG, twisted pair cable. The shields of the cable shall only be grounded at the distribution panels.
- C. The Design-Builder shall furnish and install the required cables, connectors and plugs, and make the necessary connections to provide 120 VAC, 60 Hz power from the AC power receptacle strip to the Public Address System equipment.
- D. The Design-Builder shall furnish and install all required hardware to interface the Public Address System to the Telephone System. The Design-Builder shall make all connections and cross connections between the telephone system and the Telephone Access Paging System.
- E. The Design-Builder shall furnish and install the required terminals and make the required connections to connect the Telephone Access Paging System to the power amplifiers for each zone.
- F. The Design-Builder shall furnish and install the required cabling and hardware to connect the ac power receptacle strip in racks to the 120 Vac, 60 Hz UPs Power Distribution Panel Located in the Communications Room.
- G. The Design-Builder shall furnish and install all conduits, wire mold, sleeves and fittings for loudspeaker conductors.

3.03 LOUDSPEAKER/PAGING HORN INSTALLATION GENERAL

- A. The Design-Builder shall install the loudspeakers, with the appropriate type enclosures and baffles, and the paging horns in the selected rooms and areas as shown on the Information Drawings.
- B. The installation of the paging horns and loudspeakers, with their associated enclosures and baffles, shall not interfere with existing air ducts, air duct diffusers, lighting fixtures, plumbing, fire detectors, and fire sprinkler system equipment.

3.04 SUSPENDED CEILING LOUDSPEAKER INSTILLATION

- A. At the suspended ceiling loudspeaker locations, the Design-Builder shall remove and be responsible for the condition of the suspended ceiling panels required to accomplish the installations.
- B. The Design-Builder shall furnish and install two channel supports for each loudspeaker installation. The channel furnished supports shall be appropriate to support the loudspeakers selected.
- C. The Design-Builder shall mount the round recessed enclosure with mounting ring to the channel supports. The Design-Builder shall cut a hole in the suspended ceiling section which shall contain the speaker. The hole shall be centered, as conditions permit.
- D. The Design-Builder shall install the channel supports with the round recessed enclosure and mounting ring on top of the suspended ceiling section that shall contain the loudspeaker. The Design-Builder shall attach the loudspeaker with matching transformer to the round recessed baffle and attach the baffle to the enclosure with the mounting ring.
- E. Upon completion of the installations, the Design-Builder shall replace the undamaged removed panels. The Design-Builder shall furnish and install, at no additional cost to the Authority, new suspended ceiling panels for any existing panels damaged during the installation. The new suspended ceiling panels shall be identical in manufacture and type to the existing suspended ceiling panels that are damaged.

3.05 SURFACE MOUNT LOUDSPEAKER INSTALLATION

- A. For the surface mount loudspeaker installations, the Design-Builder shall be responsible for maintaining the original condition of the plaster building ceiling. Upon completion of the installations, the Design-Builder shall, at no additional cost to the Authority, replace, repair, or reconstruct any portion of the plaster building ceiling that was damaged during the installation. The replaced, repaired, or reconstructed portions of the plaster building ceiling

shall be identical in appearance to the original adjacent undamaged areas of the plaster building ceiling.

- B. The Design-Builder shall attach the round enclosure to the plaster ceiling. The method of installation shall be determined by the Design-Builder and approved by the Authority Representative. The Design-Builder shall install the loudspeaker with matching transformer to the grille of the enclosure and install the grille to the enclosure.

3.06 PAGING HORN INSTALLATION

The paging horns with built in transformer shall be wall mounted at heights approved by the Authority Representative. The Design-Builder shall provide the mounting hardware for installation at each paging horn location.

3.07 LOUDSPEAKER AND PAGING HORN CABLING

- A. All conduits, sleeves and fittings shall be provided by the Design-Builder from the Communications Equipment Room of the building to Public Address speaker/horn outlets at selected locations within the rooms and areas of the Yard S & I shop. These conduits will be either imbedded in the or surface mounted to the structures (walls, ceilings, floors, etc.) of the buildings. Cables routed shall terminate on enclosed protector blocks and terminal strips within the S & I shop.
- B. In the areas where there is acoustical suspended ceilings, the conduit shall be provided on the structural ceiling above the acoustical suspended ceiling.
- C. In the areas where there is either plaster or metal deck ceilings, the conduit and speaker outlets shall be flush mounted in, or surface mounted on the ceiling and walls.
- D. The Design-Builder shall furnish and install the appropriate type and size conduit and fittings to connect each type of loudspeaker enclosure and paging horn to junction boxes for the passage of the cabling to the loudspeakers and paging horns.
- E. The Design-Builder shall provide the required passageways and conduit sleeves in the building structures for the installation of the conduit between the loudspeaker enclosures and paging horns. Flexible metallic conduit shall be provided for the loudspeaker enclosures that are installed in acoustical suspended ceiling. Rigid steel conduit shall be provided for the loudspeaker enclosures that are attached directly to the metal deck building ceiling, and for the paging horns.
- F. The Design-Builder shall furnish and install the required single pair, 18 AWG, stranded, shielded cables and make the necessary connections to interconnect the loudspeakers and paging horns in the circuit configurations shown on the Information Drawings. The Design-Builder shall furnish and install the required single pair cables to connect the loudspeaker/paging horn circuits to the jack fields in the Communications Equipment Room.
- G. The Design-Builder shall furnish and install the single pair 18 AWG, stranded, shielded cables and make the necessary connections to extend the loudspeaker/paging horn circuit cables terminated on the jack field panels to the distribution panels in the 19-inch equipment rack.
- H. The Design-Builder shall furnish and install the required terminals in the distribution panels to terminate all conductors and shields of the individual loudspeaker/paging horn circuit cables.
- I. The Design-Builder shall make the necessary cross-connections on the distribution panels to connect the appropriate announcement zone output to the loudspeaker/paging horn circuits.

END OF SECTION

SECTION 16831

YARD CONSOLES

PART 1-GENERAL

1.01 PURPOSE

- A. This Specification Section is included for informational purposes only to cover the possibility that the Design-Builder requires interface information as part of the final design. No specific console modifications are included as part of the Scope of Work, Section 16700, except for the possible integration of the CCTV System additions at the Shady Grove Yard Control Room.

1.02 YARD COMMUNICATIONS CONSOLE

- A. The Yard Communications Console shall be a self-contained, table top console housing, a Talkback Control panel, a CCTV Pan, Tilt and Zoom panel, a cable terminating facility and AC power receptacles.
- B. The console shall be of steel construction equipped for mounting standard 19-inch console panels. The console shall be designed for attachment to a conference table top.
- C. The Design-Builder shall mount the (9") CCTV Monitor on the conference table top.

1.03 GATEHOUSE CONSOLE

- A. The Gatehouse Console shall be a self-contained console housing a Talkback Station Panel (with remote amplifier), an Intrusion alarm Subsystem Annunciator Panel, a Fire Alarm Subsystem Annunciator Panel, a 9-inch Television Monitor Assembly, a CCTV Control Panel, a coax Video Receiver Panel, a PT&Z Star-Distribution Panel, a Gatehouse Intercom Panel, wire and cable terminating facilities and AC power receptacles.
- B. The console shall be of steel construction equipped for mounting standard 19-inch console panels. The consoles shall be designed for attachment to the walls and floor of the Gatehouse.

PART 2-PRODUCTS

2.01 MAJOR ITEM TECHNICAL REQUIREMENTS

- A. The Design-Builder shall design, fabricate, furnish, install, and test or furnish and deliver to the Authority, as detailed herein, the following major items in the quantities indicated below. All other materials, equipment and services not specifically listed but otherwise specified or required for full and complete consoles and the Gatehouse intercom network shall be furnished by the Design-Builder. The provisioning of samples, prototypes, cable splicing allowances and wastage of material during installation efforts shall be the Design-Builder's responsibility at no additional cost to the Authority.

2.02 YARD COMMUNICATIONS CONSOLE

- A. The Design-Builder shall design, fabricate, furnish and install a Yard Communications Console in the Yard Control Room of the Yard Operation Building in the Yard. Included with the Yard Communications Console shall be a cable terminating facility provided inside the console.

- B. The Design-Builder shall furnish and install a conference table for the mounting of the Yard Communications Console and 9" TV monitor.

2.03 CONSOLE

- A. The Yard Communications Console shall be a self-contained, single bay table top cabinet. The cabinet shall be constructed of 16 gauge steel and shall provide for the mounting of 19-inch wide equipment panels in the front section of the cabinet.
- B. Refer to Information Drawings for the cabinet dimensions and profile. The cabinet shall be constructed so that equipment panels can be installed or removed without disassembly.
- C. The cabinet frame shall be reinforced to provide rigidity required to maintain alignment. Accurately machined surfaces shall be provided to assure proper positioning. Steel shall be accurately rolled and have a smooth finish. Joints shall be formed to a tight fit with abutting edges flush and securely welded. Joints shall be welded their full length and dressed flush on exposed surfaces. Spot welding shall be used when practicable in preference to screws or rivet fasteners. Holes for screws or bolts shall be drilled and countersunk. All bolts, nuts, washers and screws shall be cadmium plated. The finish work shall be strong and rigid and neat in appearance. Surfaces shall be smooth and free from warps and buckles. Front panel openings shall be recessed and tapped in accordance with EIA Standard RS-310C.
- D. The cabinet shall have the required appropriately sized and shaped top panel, side panels and back panel to fully enclose the cabinet. The back panel shall be perforated to provide ventilation for the equipment that will be mounted on the console. The finish on the cabinet frame, top panel, side panels and back panel shall be Hammer stone Gray.
- E. Appropriate protected passageways shall be provided at the rear portion of the bottom panel (if provided) for the installation of cables to the various equipment within the console and for the installation of the power conductors to the ac duplex receptacles. In addition, an appropriate protected passageway shall be provided at the bottom rear portion of the right side panel for the installation of the cables to the MRS radio base station microphone and telephones that will be installed on the conference table adjacent to the Yard Communications Console.

2.04 CONSOLE PANELS AND EQUIPMENT

- A. The Design-Builder shall furnish and install the following equipment panels and equipment in the Yard Communications Consoles in the space indicated on the Information Drawings:
 - 1. Talkback Control Panel as specified and provided in the Yard Talkback System section.
 - 2. Yard Telephone instruments as specified and provided in the Yard Telephone System section (not part of console).
 - 3. Three AC duplex receptacles as specified and provided in the Electrical Power Distribution Systems section.
 - 4. Mobile radio base station microphone and cabling interface with the mobile radio base station in the TCR/Tower/Operations Building." (not part of console).
 - 5. CCTV control panel with the PT&Z panels as specified and provided in the Yard CCTV System Section.

2.05 CABLE TERMINATING FACILITY

- A. The Design-Builder shall furnish and install the required terminals inside the Yard Communications Console to terminate all conductors (including spares) of the cables associated with the Yard Public Address panel, and the Talkback Control Panel from the Communications Equipment Room. In addition, the Design-Builder shall furnish and install a line Terminal Block inside the Yard Communications Console to terminate all conductors

(including spares) of the cable(s) associated with Yard Telephone and CCTV control system from the Communications Equipment Room.

- B. All terminals shall be Weidmuller Terminations, Inc., Type SAKR (Test screw sockets) Test/Disconnect Terminals with necessary accessories or approved equal. The Line terminal Blocks shall be a 4 x 26 matrix, with wire wrap terminals on both sides. The Line Terminal Blocks shall be Northern Telecom Model No. 132-2624 (or approved equal).
- C. The Design-Builder shall furnish and install the required mounting brackets and hardware to install the terminals and Line Terminal Block of the Cable Terminating Facility to the cabinet frame. The Design-Builder shall configure the Cable Terminating Facility so that the terminals and Line Terminal Block are accessible upon the removal of the back or front panel.

2.06 CONFERENCE TABLE

- A. The Design-Builder shall furnish and install a 30-inch by 60-inch oak conference table in the Yard Control Room of the Yard Operation Building for the mounting of the Yard Communications Console, MRS base station microphone and telephones.

2.07 GATEHOUSE CONSOLE

- A. The Design-Builder shall design, fabricate, furnish and install a Gatehouse Console in the Gatehouse of the yard. Included with the Gatehouse Console shall be a wire and cable terminating facility provided at the Gatehouse.

2.08 CONSOLE

- A. The Gatehouse Console shall be a self-contained, double bay floor mounted cabinet. The cabinet shall be constructed of 16 gauge steel and shall provide for the mounting of 19-inch wide equipment panels in the front section of the cabinet (both bays).
- B. Each cabinet bay shall be comprised of a Turret Frame and a vertical Instrument Frame. The Turret Frame shall consist of a 20-degree sloped front that provides 21-inches of sloped panel space. The vertical Instrument Frame shall provide 12 1/4-inches of vertical panel space in the front section. The cabinet bays shall be constructed so that equipment panels can be installed or removed without disassembly.
- C. The cabinet frames shall be reinforced to provide rigidity required to maintain alignment. Accurately machined surfaces shall be provided to assure proper positioning. Steel shall be accurately rolled and have a smooth finish. Joints shall be formed to a tight fit with abutting edges flush and securely welded. Joints shall be welded their full length and dressed flush on exposed surfaces. Spot welding shall be used when practicable interference to screws or rivet fasteners. Holes for screws or bolts, shall be drilled and countersunk. All bolts, nuts, washers and screws shall be cadmium plated. The finish work shall be strong and rigid and neat in appearance. Surfaces shall be smooth and free from warps and buckles. Front panel openings shall be recessed and tapped in accordance with EIA Standard RS-310C.
- D. The cabinet bays shall have the appropriately sized and shaped top panels, side panels, and back panels to fully enclose the assembled cabinet (two bays). In addition, the Design-Builder shall furnish and install the appropriately sized and shaped louvered panels in the side section of the Instrument Frame of each cabinet bay as shown on Information Drawings. The finish of the cabinet frames, top panels, side panels, back panels, and side louvered panels shall be ANSI-61 Gray.
- E. Appropriate protected passageways shall be provided in the back panels and the bottom panels (if provided) for the installation of cables/wires to the various equipment within the console. In addition, appropriate protected passageways shall be provided for the installation

of power conductors (in conduit) to the AC duplex receptacles with the console in locations determined by the Design-Builder.

2.09 CONSOLE PANELS AND EQUIPMENT

- A. The Design-Builder shall furnish and install the following equipment panels and equipment in the Gatehouse Console in the space indicated on Information Drawings:
 - 1. Talkback Station Panel with associated amplifier as specified and provided in the Yard Talkback system section.
 - 2. Fire and Intrusion Alarm Subsystem Annunciator Panel as specified and provided in the Yard Fire and Intrusion Alarm System section.
 - 3. One 9-inch television monitor assembly as specified and provided in the Yard Closed Circuit Television System section.
 - 4. Yard CCTV Control Panel as specified and provided in the Yard Closed Circuit Television System section.
 - 5. Required AC duplex receptacles and receptacle strips as specified and provided in the Electrical Power Distribution Systems section.
 - 6. A PT&Z Star-Distribution Panel as specified and provided in the Yard Closed Circuit Television System Section.

2.10 WIRE AND CABLE TERMINATING FACILITY

- A. The Design-Builder shall furnish and install a wire and cable terminating facility in the Gatehouse to terminate all wires and cables (except video cables) that enter and exit the Gatehouse.
- B. The Design-Builder shall furnish and install a Protector Cabinet to contain a portion of the components of the wire and cable terminating facility. The Protector Cabinet shall be a NEMA 4 type enclosure. The Protector Cabinet shall be appropriately sized and shaped to contain the required components of the wire and cable terminating facility plus 10% expansion.
- C. The Design-Builder shall furnish and install the required protector blocks in the Protector Cabinet to terminate all wires and cables (including spares) that exit and enter the Gatehouse. Coax video cables associated with the Yard Closed Circuit Television System are not to be terminated on protector blocks, but installed directly to the appropriate equipment. The protector blocks shall be Cook Electric W492-LCGX Protector Blocks with 400 Vdc gas arrestors or approved equal.
- D. The Design-Builder shall furnish and install the required terminals in the Gatehouse console to extend the terminated wires and cables at the protector blocks in the Protector Cabinet to the Gatehouse Console. The Design-Builder shall furnish and install a Line Terminal Block in the Gatehouse Console for the Yard Telephone Panel. All terminals shall be Weidmuller Terminations, Inc., Type SAKR (test screw sockets) Test/Disconnect Terminals with necessary accessories or approved equal. The Line Terminal Blocks shall be a 4 x 26 matrix, with wire wrap terminals on both sides. The Line Terminal Blocks shall be Cook Electric 130-3784 (or approved equal).
- E. The Design-Builder shall furnish and install the required mounting brackets and hardware to install the terminals and the Line Terminals Block to the console frames. The Design-Builder shall configure the terminals and the Line Terminal Block so that they are accessible from the bottom front portion of the console by removing the front panels.

2.11 GATEHOUSE DATA FILES

- A. The Design-Builder shall design, draw, publish and deliver to the Authority twelve sets of Gatehouse Data Files.

- B. Each Gatehouse Data File shall consist of six or more 11" x 17" drawings. The drawings shall be as follows:
1. Telephones - a cross reference of telephone numbers and telephone locations within the yard and yard buildings.
 2. Fire Zones - a cross reference of the designated fire zones, building and room numbers and descriptions for all areas within the yard.
 3. Intrusion Zones - a cross reference of the designated intrusion zones, building and room numbers (as required) and descriptions for all areas of the yard.
 4. Public Address - a diagram showing room description, and location of Public Address speakers and horns within the yard and yard buildings.
 5. Talkback System - a cross reference of talkback stations by station number and location for all talkback stations within the yard.
 6. CCTV - a cross reference of TV monitor assignments and arrangements, CCTV camera designations, locations and areas of coverage for all cameras and monitors within the yard.
- C. The Authority's Representative shall furnish the Design-Builder with format and symbols for the Gatehouse Data files.
- D. Each drawing shall be sealed in a protective plastic laminate. Each Gatehouse data file shall be in looseleaf booklet form. The covers shall be 11" x 17". The cover material shall be a minimum of 60 pound punched paper with holes reinforced with plastic, cloth or metal. Covers shall be sealed in a protective plastic laminate.
- E. A draft copy of each Gatehouse data file shall be submitted to the Authority's Representative for approval prior to reproduction and assembly.
- F. The Design-Builder shall furnish a complete set of mylar reproducible drawings for each Gatehouse Data File, and electronic copies (in AutoCAD release 2000 format) on diskette.

PART 3-EXECUTION

3.01 INSTALLATION

- A. The Design-Builder shall install a complete operational Yard Communication Panel for Yard Control Console and Gatehouse Console, as described herein, in the Yard.
- B. Installation shall conform, but not limited, to accepted practices specified by the National Electrical Code, the Association of American Railroads and the Electronic Industries Association.
- C. The Design-Builder shall furnish and install all terminals, hardware, wiring and cabling, conduits and fittings, and make all connections and cross connections required for a complete operational installation.

3.02 YARD COMMUNICATIONS CONSOLE

- A. The Design-Builder shall install the conference table in the Yard control Room of the Service and Inspection Shop Building in the vicinity where the existing conduit/cable duct from the Communications Equipment Room enters the room (at floor level). Exact location shall be approved by the Authority's Representative.
- B. The Design-Builder shall install the fully assembled Yard Communications Console securely to the conference table top in the Yard control Room. Contract Drawing provide mounting details. The exact mounting location of the console on the table top shall be approved by the Authority's Representative.

- C. The Design-Builder shall install the Talkback Control Panel in the Yard Communications Console in accordance with Information Drawings.
- D. The Design-Builder shall install the CCTV Pan Tilt and Zoom Control panel in the Yard Communication console in accordance with Information Drawings.
- E. The Design-Builder shall furnish and install the required cabling and wire harnesses, connectors, and make the necessary connections and cross-connections to connect the Talkback Control Panel, the Yard Telephone Panel to the cable terminating facility in the Yard Communications Console.
- F. The Design-Builder shall install the ac duplex receptacles inside the Yard Communications Console in locations approved by the Authority's Representative. The Design-Builder shall provide the required conduit and fittings, power conductors, receptacle enclosures, and make the necessary connections to connect the ac duplex receptacles to the Communications Equipment Room Power Distribution Panelboard, as specified in the electrical Power Distribution Systems section. The Design-Builder shall furnish and install the required ac power receptacles, wires and cables, conduit, and make the necessary connections and cross-connections to provide 120 Vac, 60 Hz primary power to the various equipment in the Yard Communications Console from the ac duplex receptacles.
- G. The Design-Builder shall furnish and install an appropriately sized enclosed cable duct system between the Yard Communications Console and the existing conduit/cable duct entrances at floor level in the Yard Control Room for the passage of cables to the console. The provided cable duct system shall enter the console at the rear section of the bottom of the console.
- H. The Design-Builder shall make the necessary connections to terminate the various communications systems multiconductor cables from the Communications Equipment Room to the cable terminating facility.

3.03 GATEHOUSE CONSOLE

- A. The Design-Builder shall install the fully assembled Gatehouse Console in the Gatehouse as shown on Information Drawings. The Gatehouse Console shall be secured to the floor and the walls of the Gatehouse.
- B. The Design-Builder shall install the Talkback Station panel, the Intrusion Alarm Subsystem Annunciator Panel, the Fire Alarm Subsystem Annunciator Panel, the Yard CCTV Control Panel, the dual 9-inch Television Monitor assembly, and the Pan, Tilt and Zoom panel in the Gatehouse Console in accordance with Information Drawings.
- C. The Design-Builder shall install the amplifier associated and the Talkback Station panel in the Gatehouse Console. The exact mounting locations of the amplifiers shall be approved by the Authority's Representative.
- D. The Design-Builder shall install the required terminals and the Line Terminal Block of the wire and cable terminating facility inside the Gatehouse Console. The locations of the terminals and Line Terminal Block shall be approved by the Authority's Representative. The Design-Builder shall furnish and install the required cable harnesses, connectors, and make the necessary connections between the various equipment in the Gatehouse Console and to connect the panels and console equipment as required to the terminals and Line Terminal Block of the wire and cable terminating facility.

- E. The Design-Builder shall install the Protector Cabinet on an interior wall of the Gatehouse. The Design-Builder shall furnish and install the appropriately sized cable passageway in the Gatehouse structure to connect the Gatehouse Console to the Protector Cabinet.
- F. The Design-Builder shall install the required protector blocks of the wire and cable terminating facility in the Protector Cabinet.
- G. The Design-Builder shall make the necessary connections to terminate the various communications systems cables (except the coax video cables) to the Gatehouse on the protector blocks of the wire and cable terminating facilities. The Design-Builder shall furnish and install the required wiring, and make all necessary connections and cross-connections between the protector blocks and the terminals of the wire and cable terminating facilities. The Design-Builder shall furnish and install the required ground wires, connectors, and make the necessary connections to ground the protector blocks.
- H. Gatehouse Power Distribution shall consist of the required conduits and fittings, junctions boxes, branch circuit wires, and the appropriate type AC receptacles to apportion the primary power to the communications systems and facilities equipment within the Gatehouse as shown on Information Drawings. A power distribution Panelboard is provided by others in the Gatehouse for the connection of the required branch circuits.
- I. The Yard Communications Console grounding bar shall be connected to the Communications ground in the Communications Equipment Room. Console equipment shall be isolated from building and power grounds.

END OF SECTION

THIS PAGE NOT USED

SECTION 16840

YARD TALKBACK SYSTEM SPECIFICATIONS

PART 1-GENERAL

1.01 PURPOSE

This specification is included for information purposes only. No modifications or additions are included in the Scope of Work (Section 16700) for this project. The purpose of the Yard Talkback System is to:

- A. Provide voice paging from the Yard Communications Console located in the Yard Control Room, to personnel located track side (via nearby loudspeaker/talkback stations) or to the Gatehouse Building console;
- B. Provide the ability for track side personnel or Gatehouse personnel to verbally answer a page or signal the Yard Communications console that they want to talk to the Yard dispatcher;
- C. Broadcast an emergency tone, originating from the Communications Console, to the loudspeaker/talkback stations located track side;
- D. Broadcast an "All Call" verbal message, originating from the Communications Console, to all of the loudspeaker/talkback stations located track side.

1.02 YARD TALKBACK SYSTEM DESCRIPTION

- A. The Yard Talkback System (also known as the Talkback System) will provide paging and talkback service between the Yard Communications Console located in the Gatehouse, the talkback stations located along the tracks throughout the yard area.
- B. The Yard Talkback System includes a master control panel in the Yard Communications Console from which the Yard Dispatcher can call the talkback stations located in the vicinity of track switching points throughout the Yard. This panel gives the dispatcher the ability to select a specific Yard talkback station, to select all talkback stations simultaneously, to broadcast an emergency tone and/or identify and listen to an incoming call from a Yard talkback station.
- C. The Yard talkback stations provide trackside personnel with the ability to hear a voice page over loudspeakers (they only have to be in the vicinity of the station, not directly in front of it); the ability to verbally respond by talking toward the loudspeaker(s); or to signal the Yard Communications Console, by pushing a button, when they want to talk to the dispatcher.

1.03 OPERATING DESCRIPTION

- A. The following is a functional description of the operation of the Yard Talkback System from the Talkback Control Panel in the Yard Communications Console:
 - 1. Depress the pushbutton associated with the desired talkback station.
 - 2. Switch the "TALK/LISTEN" switch to the talk position.
 - 3. Speak into the loudspeaker on the panel.
 - 4. Personnel in the vicinity of a called talkback station respond by speaking in the direction of the loudspeakers mounted at the top of the selected Yard Talkback Standard.
 - 5. A conversation between a Talkback Control panel and a talkback station is controlled

by the "TALK/LISTEN" switch on the Talkback Control Panel.

- B. The attendant at the Talkback Control panel in the Yard Communications Console may "Page" all talkback stations by:
 - 1. Depressing the "ALL CALL" pushbutton.
 - 2. Switching the "TALK/LISTEN" switch to the TALK position.
 - 3. Speaking into the loudspeaker on the panel.
 - 4. The attendant at the Talkback Control Panel may transmit a warning signal by depressing the "EMERGENCY CALL" pushbutton. The warning signal shall be broadcast by the loudspeakers of all talkback stations.
- C. The attendant at the Yard Communications Console, upon conclusion of a conversation over the Yard Talkback System, depresses the "RESET" pushbutton. This returns the Yard Talkback System to its quiescent state.

1.04 YARD TALKBACK STATION

- A. The operation of the Yard Talkback System from a Talkback Standard located along the track is accomplished by:
 - 1. Pushing the "CALL" pushbutton mounted on the talkback standard.
 - 2. Listening for the Communications Console response.
 - 3. Speaking into the loudspeaker mounted at the top of the talkback standard.
- B. The operation of a "CALL" pushbutton on a talkback standard will:
 - 1. Light the pushbutton lamp on the Yard Control Room Control Panel associated with that particular talkback station.
 - 2. Activate a chime in the Yard Control Room.
- C. The attendant at the Control Panel then:
 - 1. Depresses the illuminated talkback station pushbutton.
 - 2. Switches the talk/listen switch to the talk position.
 - 3. Speaks into the loudspeaker on the panel.

1.05 GATEHOUSE TALKBACK CONSOLE PANEL

- A. The operation of the Yard Talkback System from the Gatehouse console is accomplished by:
 - 1. Depressing the "PUSH-TO-CALL" pushbutton.
 - 2. Listening for the Yard Communications Console voice response.
 - 3. Speaking into the loudspeaker on the console panel.

1.06 SYSTEM PERFORMANCE REQUIREMENTS

- A. The following performance requirements are the minimum acceptable parameters for the Yard Talkback System to operate properly. The Design-Builder shall engineer the Talkback System and select equipment that will meet or exceed these requirements. The Design-Builder shall, upon completion of the system, deliver a system conforming to the operational intent of these requirements and the talkback needs of the Washington Metropolitan Area Transit Authority (WMATA).

1.07 TALK OUT SPECIFICATIONS

- A. For the system configured in a talk out configuration (the talkback station speakers are used as loudspeakers), the following parameters shall apply when a 300-3000 Hz audio signal test source is used at the Yard Communications Console Talkback panel (in the Gatehouse) in lieu

of, but at the same input voltage level as the panel speaker/microphone:

- B. Standard talk out speaker power >103 dB at 4 feet (as measured by a test microphone connected to an appropriate power meter).
- C. Talk out distortion (as measured by a test microphone connected to an appropriate distortion meter): <1.5% total harmonic distortion (330-3000 Hz).
- D. Talk out speaker(s) total audio dispersion: two speakers (90 degree dispersion each) mounted back to back (published specification).
- E. Talk out system frequency response: ± 1.5 dB or better between 300-3000 Hz (as measured and charted by use of a test microphone connected to an appropriate power meter or equivalent).

1.08 TALKBACK SPECIFICATIONS

- A. For the system configured so that the talkback station speakers are configured as microphones, the following parameters should apply as measured at the Yard Communications Console Talkback panel speaker leads.
- B. Talkback system frequency response: ± 1.5 dB or better between 300-3000 Hz for all speaker/microphone inputs.
- C. Standard mounted talkback speaker/ microphone(s) sensitivity (for a 1000 Hz audio source of 70 dB, ref. 0.0002 microbars [moderately louder than normal conversation], 10 feet directly in front of the speaker standard) shall produce at the Yard Communications Console Talkback speaker:
 - 1. Full Talkback System panel audio output, when the panel volume control is adjusted to its maximum.
 - 2. and <1.5% harmonic distortion in item a.
 - 3. where both a. and b. are measured under conditions of non-train movement and normal environmental noise, i.e., 20-45 dB, ref. 2000 microbars.

1.09 SPECIAL ENVIRONMENTAL CONSIDERATIONS

- A. All equipment shall be fully operational without damage or functional degradation under any combination of the following:
 - 1. Ambient temperature -30°C to +60°C.
 - 2. Relative humidity 0 percent to 95 percent.
 - 3. All standards and standard mounted components shall be considered outdoor equipment and shall be capable of withstanding the effects of:
 - a. rain, salt, dust, oil, and other pollutants.
 - b. winds up to and including 90 MPH with rime icing.
 - c. vigorous and normal use.
 - d. train related vibrations.

PART 2-PRODUCTS

2.01 MAJOR ITEM TECHNICAL REQUIREMENTS

- A. The items listed in this section of these Specifications shall be considered the major, but not necessarily the only items that the system is comprised of. Items not stated, but that are necessary for testing and proper system operation shall be provided by the Design-Builder.

- B. The following is a list of the major items required to accomplish the talkback functions:
1. Master Yard Talkback Panel with loudspeaker located in the Yard Communications Console in the Rail Yard Control Room.
 2. Gatehouse Talkback Panel with loudspeaker.
 3. Weatherproof Speaker Talkback Stations.
 4. Distribution Frame in the Communications Equipment Room of the Yard TCR/Tower/Operations Building.
 5. Talkback Control Unit with multi tone generator in the Communication Equipment Room.
 6. Cable Termination Frame in the Gatehouse.
 7. Cable Termination Blocks for the Yard Control Console and Gatehouse Panels.
 8. Gatehouse Amplifier and Control unit.

2.02 YARD COMMUNICATIONS CONSOLE TALKBACK PANEL

- A. The Console Talkback Panel shall be 19 inches wide and shall be constructed for the Yard Communications Console located in the Yard Control Room. All necessary enclosures and peripheral pieces necessary for this purpose shall be provided by the Design-Builder.
- B. A chime shall be provided and installed to alert the console operator to an incoming call from one of the talkback stations or from the Gatehouse.
- C. All interfaces as described in these Specifications shall be provided by the Design-Builder.
- D. Primary features that the Console Talkback Panel shall have are:
1. Multi-position split screen illuminated pushbutton switches. Each talkback station will have its respective button.
 2. A loudspeaker to be used:
 - a. for listening to the field stations or Gatehouse panel calls;
 - b. to serve as the microphone for paging or conversation purposes.
- E. A spring loaded toggle switch labeled "TALK/LISTEN", normally in the LISTEN position.
- F. An illuminating pushbutton labeled "ALL CALL", that can permit a simultaneous page to go out over all field stations and the Gatehouse panel.
- G. An illuminating pushbutton labeled "EMERGENCY CALL" that connects the control panel to all the field stations and the Gatehouse panel. This switch activates a distinctive tone signal from the multi-tone generator as an emergency alert signal. The switch shall be protected from accidental activation by a flip type cover.
1. A volume control for changing the loudspeaker output level.
 2. An illuminating momentary pushbutton switch labeled "RESET", used to return the system to its quiescent state.
 3. A separate single stroke chime to indicate an incoming call.
- H. The top portion of the illuminating pushbutton switches shall light when the switch is depressed for calling or answering a talkback station. The bottom portion of the switches shall illuminate when a call is made from a talkback station or the Gatehouse panel. The pushbutton switches shall contain legends listing the Talkback Station Number on the lower portion of the switch, in accordance with the Information Drawings. It shall extinguish when the call is answered.
- I. The Yard Communication Talkback Panel shall be GAI-Tronics Model No. L91043, (or

approved equal).

2.03 TALKBACK CONTROL UNIT

- A. The Design-Builder shall provide a Talkback Control Unit to be located in the Communications Equipment Room of the TCR/Tower/Operations Building. The Talkback Control Unit shall include the following:
1. Control function circuitry for the Yard Talkback System.
 2. Terminal blocks for wire and cable terminations.
 3. Circuitry to distribute primary power to the talkback stations.
 4. Amplifier.
 5. Multi tone generator with the required circuitry to generate at minimum three types of tones - steady siren, slow wailing, and fast wailing.
 6. DC Power Supply with 120 VAC, 60 Hz input, and appropriate DC output compatible with the talkback system supplied. The DC power used shall not exceed 60 Vdc.
- B. The circuitry, terminal blocks, amplifier and power supply shall be protected by a metal enclosure to protect the equipment from moisture, dust, inadvertent contact with other objects or persons, and other problems of an accidental nature. The AC and DC power leads shall be protected by fuses or circuit breakers.
- C. The metal enclosure shall be at minimum a NEMA TYPE 1 (36" H x 30" w x 6" D) enclosure and be made of 14-gauge steel with a gray lacquer finish. The steel cover panel for the metal enclosure shall be a 12-gauge white enamel finished steel cover panel. Enclosures and panels exceeding these characteristics will be considered.
- D. The Talkback Control unit shall be GAI-Tronic Alarm Merge/Isolate Cabinet Model No. L91044, (or approved equal).

2.04 TALKBACK STANDARDS - RAIL YARD

- A. The Design-Builder shall construct Talkback Standards, for the yard talkback stations. Each Talkback Standard shall consist of:
1. Concrete base.
 2. Metal stanchion.
 3. Amplifier.
 4. Weatherproof enclosure.
 5. Weatherproof enclosure cover.
 6. "CALL" pushbutton.
 7. Two weatherproof speaker horns.
 8. Circuitry to provide switching the speaker horns from output to input devices.
 9. The concrete base shall be sized and shaped as shown on Information Drawings. Four anchor bolts shall be imbedded in the concrete base for mounting the metal stanchion. A one and one half inch elbow PVC sleeve shall be embedded in the center of the concrete base for passage of the cable to the stanchion. Each metal stanchion shall consist of:
 10. 1/2-inch aluminum pipe.
 11. 1-1/4 -inch aluminum pipe.
 12. 1-1/2-inch diameter aluminum pipe.
 13. 1/4 - inch thick aluminum plate base.
- B. The 1-1/2 inch diameter aluminum pipe shall be attached to the aluminum plate base with four 3/8-inch thick aluminum plate gussets. Adjustment gussets shall be perpendicular to each other. The 1-1/2-inch diameter aluminum pipe with the 3/8-inch thick aluminum plate base

shall be attached to the concrete base with four 1/2-inch diameter anchor bolts. The 1-1/2 inch diameter aluminum pipe shall extend from the aluminum plate base to the bottom of the weatherproof amplifier enclosure. The 3/8-inch thick aluminum plate base shall have sized mounting holes for installation on the concrete base. Information Drawings provide details on the metal stanchions.

- C. A weatherproof enclosure shall be secured to the aluminum pipe at the height shown on the Information Drawings. The 1-inch diameter aluminum pipe shall extend from the top of the weatherproof enclosure to the top of the stanchion. The weatherproof enclosure shall be at minimum a NEMA Type 4 enclosure. The weatherproof enclosure shall house the following:
1. Barrier-type terminal strip for terminating the direct burial cable from the Communications Equipment Room.
 2. Speaker horn switching circuitry.
 3. "CALL" pushbutton.
 4. Amplifier.
- D. The amplifier shall fit in the metal enclosure and have the following characteristics:
1. Input Power - 24 Vdc nominal Current @25 Vdc 1.0 A max
 2. Speaker Amplifier: Output: Push-pull, Class B, 12 watts min, @24Vdc Amplifier
 3. Sensitivity: 0.5 Volts: at rated output
 4. Frequency Response: 250-4000 Hz \pm 1.5 Db
 5. Distortion: 1% max total harmonic distortion @1,000 Hz, 12 watts
 6. Regulation: Full to no load -1 dB max rise
 7. Input Impedance: 50,000 ohms nominal
 8. Temperature Range: -30°C to +70°C
- E. A weatherproof momentary normally open contact pushbutton switch sealed against oil and water. The pushbutton shall be connected to the barrier-type terminal strip of the enclosure with 18 AWG, single conductor wires. The label "CALL" shall be printed below the pushbutton on each enclosure cover, the lettering shall be Helvetica Medium, black and shall be 1-inch in height. The label will be weatherproof and element resistant, and shall be inseparable from the weatherproof enclosure.
- F. A control relay or equivalent circuitry for the talk/listen function shall be wired in each enclosure of each stanchion. This will switch the output to input of the amplifier.
- G. The Design-Builder shall also provide the following, as required for the installation:
1. Conduit.
 2. Hub plates.
 3. Gaskets.
 4. Reducers.
 5. Conduit Tees.
 6. Other accessories for passage of burial cable and speaker wires from inside the aluminum pipe to the weatherproof enclosure.
- H. Two weatherproof speaker horns shall be furnished with each Talkback Standard. The weatherproof speaker horns shall be secured to the top of the stanchion by:
1. 1 1/4 inch conduit tee.
 2. 1/2--inch diameter aluminum pipe.
 3. Required mounting accessories.
- I. There shall be 3/8-inch diameter access holes provided in the 1 1/2-inch diameter aluminum pipe for passage of the speaker wire from inside the aluminum pipe of the stanchion to the horns. Information Drawings show installation details for mounting the horns to the metal stanchion.

The weatherproof GAI-tronics Model 13320-002 (or approved equal) speaker horns shall have the following characteristics:

1. Aluminum horn with gray epoxy finish for corrosion resistance.
 2. Locking swivel mount to allow precise positioning
 3. Compact integral 8 ohm 30 watt driver
 4. Low Frequency Cut-off 250 Hz
 5. Dispersion Angle: 90°
 6. Sound Pressure level: 116 dB @12 W, 119 dB @30 W
 7. Frequency Range: at least 450 - 6000Hz
 8. Air Column Length: 1.4 ft
 9. Dimensions (Approx.): 10.3" Diameter by 9" long.
- J. Each horn shall be connected to the barrier-type terminal strip of the weatherproof enclosure. A 2-conductor, twisted, 14 AWG, shielded outdoor cable shall be used.
- K. All mounting hardware and supporting of Equipment in enclosures shall be stainlesssteel.

2.05 CONSOLE TALKBACK PANEL GATEHOUSE

- A. The Design-Builder shall provide a Talkback Station 19" rack mountable 3.5" high panel in the Gatehouse Console. The Panel shall consist of:
1. Talkback loudspeaker.
 2. "PUSH-TO-CALL" pushbutton switch.
 3. Volume control for the loudspeaker output.
- B. The "PUSH-TO-CALL" pushbutton switch shall signal the Talkback Control Panel in the Yard Control Room Console.
- C. The Design-Builder shall install a Station Amplifier. The Station amplifier shall be housed in an amplifier enclosure independent of the Talkback Station Panel.
- D. A control relay or other circuitry for the talk/listen function shall be installed in the amplifier enclosure. This will switch the Panel loudspeaker from output to input of the amplifier.
- E. The Talkback Station Panel shall be GAI-Tronics Corporation, Model L91046, or approved equal.

2.06 DISTRIBUTION FRAME

- A. The Yard Talkback Distribution Frame shall contain the required protector blocks and terminals to terminate all Yard Talkback System cables including spares entering and leaving the Communications Equipment Room in the Service and Inspection Shop Building. Cables external to the Service and Inspection Shop Building shall be terminated on the protector blocks.
- B. The Distribution Frame shall consist of:
1. Terminal housing with top and bottom assemblies. Hinged and sections.
 2. Fungus resistant plywood backboards.
 3. Lift-out doors.
 4. Distribution rings.
- C. The frame shall be Cook Electric, Model C-202, or approved equal.
- D. The terminal blocks shall HAVE Test Socket Screws, with accessories, and be Weidmuller, Model SAKC-4, (or approved equal). The protector blocks shall be complete with 400 Vdc gas

arrestors and ground bar assemblies. The protector blocks shall be Cook Electric, Model W492-LCGX, (or approved equal).

- E. Information Drawings provide details of the layout with a wiring block diagram of the Talkback Distribution Frame.

2.07 CABLE TERMINATION FRAME GATEHOUSE

- A. The Gatehouse Termination Frame shall contain the required protector blocks and terminals to terminate all Yard System cables including spares entering and leaving the Gatehouse Room.
- B. The Frame shall consist of:
 1. Terminal housing with top and bottom assemblies.
 2. Hinged end sections.
 3. Fungus resistant plywood backboards.
 4. Lift-out doors.
 5. Distribution rings.
- C. The Frame shall be Cook Electric, same as previous page.
- D. The terminal blocks shall HAVE Test Socket Screws, with accessories, and be Weidmuller, Model SAKC-4, or approved equal. The protector blocks shall be complete with 400 Vdc gas arrestors and ground bar assemblies. The protector blocks shall be Cook Electric, Model W492-LCGX, or approved equal .
- E. Information Drawings provide details of the layout with a wiring block diagram of the Gatehouse Frame.

2.08 AUDIO CABLE

- A. Independent Cable Corporation type "Filled Direct Earth Burial Communications Cable" (or approved equal)
- B. Insulation Rating: 300 Volts
- C. 3-Pair, 16-AWG solid copper conductors
- D. Inner Jacket: Polyethylene
- E. Outer Jacket: Black Polyethylene
- F. Shield: Copper Tape
- G. Overall Steel Armor
- H. Shall meet IMSA Spec. 60-6

2.09 POWER CABLE

- A. Clifford Cable Corporation type "Direct Earth Burial Signal Communications Cable"(or approved equal)
- B. Insulation Rating: 600 Volts

- C. 2-Pair, 14-AWG solid copper conductors
- D. Inner Jacket: Polyethylene
- E. Outer Jacket: Black Polyethylene
- F. Shield: Copper Tape
- G. Overall Steel Armor
- H. Shall meet IMSA Spec. 20-6

PART 3-INSTALLATION

3.01 GENERAL

- A. The Design-Builder shall install in the Rail Yard a complete operational Talkback System, as described in these Specifications.
- B. The Design-Builder shall furnish and install all terminals, hardware, wiring, cabling, conduits, fittings, connections and cross-connections required for a complete operational system. This includes the proper grounding of all equipment. The Design-Builder shall provide wiring to supply the dc power to all dc operated equipment and the 110/120 Vac, 60 Hz power to all AC operated units in these Specifications.

3.02 COMMUNICATIONS EQUIPMENT ROOM

- A. The Design-Builder shall install on a wall in the Communications Equipment Room:
 - 1. Distribution Frame.
 - 2. Talkback Control Unit.
 - 3. Multi tone Generator.
- B. The locations for the equipment shall be approved by the Authority's Representative.
- C. The Design-Builder shall connect the Talkback Control Unit to the terminals on the Talkback Distribution Frame and the multi tone generator.
- D. The Design-Builder shall wire between the various terminals and protector blocks on the Talkback Distribution Frame. Ground bars, grounding and ground wiring shall be provided by the Design-Builder.
- E. The Design-Builder shall make the connections to provide 120 Vac, 60 Hz power to the Talkback Control Unit from the Communications Equipment Room Power Distribution Panel board.
- F. The Design-Builder shall make the connections to provide dc power to each of the yard Talkback Stations. This power shall feed through the Talkback Distribution Frame in the Communications Equipment Room, via the 4 conductor power cables.

3.03 YARD TALKBACK CONSOLE - YARD CONTROL ROOM

- A. The Design-Builder shall install the Talkback Control Panel in the Yard Talkback Console as

shown on Information Drawings. The Design-Builder shall install the single stroke chime in the interior of the Yard Communications Console.

- B. The Design-Builder shall wire the chime to the Cable Termination Block in the Yard Communications Console.
- C. The Design-Builder shall install a 25-pair (22 AWG) cable and a 12-pair (22 AWG) cable from the Cable Termination Block in the Talkback console to the Talkback Distribution Frame in the Communication Equipment Room.

3.04 GATEHOUSE BUILDING CABLE TERMINATION FRAME

- A. The Design-Builder shall place a Cable Termination Frame in the Gatehouse as outlined in these Specifications. The Design-Builder shall install a 3-pair, 16-AWG Audio Cable between the Gatehouse Cable Terminating Frame protector blocks and the protector blocks on the Distribution Frame in the Communication Equipment Room of the Yard Operations Building. The Design-Builder shall terminate all wires including spares. Protector block grounding at both ends shall be implemented by the Design-Builder as approved by the Authority's Representative. The Design-Builder shall wire 110/120 Vac, 60 Hz power to the Gatehouse Remote Talkback Amplifier from the duplex AC power receptacles or the AC Power Panel of the Gatehouse.

3.05 YARD TALKBACK STANDARDS OPEN RAIL TRACK AREA

- A. The Design-Builder shall install the completely assembled Talkback Standards along the tracks within the yard limits. The Talkback Standards shall be installed in the vicinity of the yard track switching points. Information Drawings show proposed locations and installation details of the Talkback Standards.
- B. The exact location of each Talkback Standard shall be approved by the Authority's Representative. The Design-Builder shall make a field survey with the Authority's Representative to determine the locations of the Talkback Standards and obtain T/C & Communications conduit locations in vicinity of Talkback Standards locations throughout yard.
- C. The Design-Builder shall install Power and Audio Cables between each Talkback Station and the Main Distribution Frame in the Yard Operations Building. The Design-Builder shall terminate all wires including spares on protector blocks. All remaining cross-connections and dc wiring shall be performed by the Design-Builder

3.06 GATEHOUSE CONSOLE

- A. The Design-Builder shall install the Talkback Station Panel amplifier with enclosure in the Gatehouse Console. This is shown on the Information Drawings and outlined in these Specifications.
- B. The Design-Builder shall perform all the wiring between the amplifier, the Talkback Station Panel, the Cable Termination Block, and the Talkback Cable Termination Frame in the Gatehouse Building. Final 110/120 Vac wiring shall be completed as outlined in these Specifications.

END OF SECTION

SECTION 16853

YARD CLOSED CIRCUIT TELEVISION SYSTEM

PART 1 - GENERAL

1.01 PURPOSE

This Section specifies certain basic requirements for the design and fabrication of Yard Closed Circuit Television System modifications and expansions. The Closed Circuit Television (CCTV) System consists of two independent CCTV Systems. The Gatehouse(Yard Security) CCTV System provides the Gatehouse attendants with surveillance of major parking bays and the yard perimeter. The Yard Control CCTV System shall provides the Yard Control Room attendants with surveillance of interlocking switching track areas. This specification is intended to specifically address Yard Control CCTV requirements at Shady Grove Yard. The Yard Control System at Shady Grove Yard shall be totally independent of the Gatehouse (Yard Security) CCTV System.

1.02 SYSTEM DESCRIPTION

- A. The Yard Control CCTV System described herein includes, but is not limited to, the following components:
1. CCTV Cameras.
 2. Pan and Tilt Units.
 3. PT&Z Control Panels.
 4. CCTV Monitors
 5. CCTV Patch Panel.
 6. PT&Z Terminal Panel.
 7. CCTV Camera Power Distribution Panel(s).
 8. Fiber Optic Video Transmitter Cards.
 9. Fiber Optic Video Receiver Cards.
 10. Fiber Optic Video Card Cage.
- B. The Gatehouse CCTV System has recently replaced by a new Yard Security CCTV System. Selected As-Built drawings of this system are available for review if required.
- C. Each CCTV camera equipped with a pan and tilt unit shall also be equipped with a zoom lens.
- D. CCTV monitors located in the Yard Control Room shall be used to monitor the video output from each CCTV camera in the Yard-Control CCTV System. CCTV monitors shall be located

in the Yard Communications Console or other designated area located within the Yard Control Room.

- E. The CCTV Patch Panel(s) and test/patch cords shall provide access to the CCTV circuits for the purpose of testing and maintenance.
- F. Fiber Optic Video Links shall provide a means of transmitting CCTV Camera Video and PT&Z signals over a fiber optic facility.
- G. Fiber Optic Video Links shall be used for all inter-building conduit paths between a camera and its control point.

1.03 OPERATING DESCRIPTION

- A. The Yard Control CCTV System shall provide the Control Tower attendant with fields of view covering at least 90 percent of the yard interlocking switching track areas, exclusive of the areas in the direct view of the Yard Control Tower.
- B. The Control Tower attendant shall be provided the ability to view multiple interlockings simultaneously with either individual monitors and or split screen arrangements. The attendant must have the ability to select any individual camera for full screen viewing and PT&Z control. The ability to establish pre-sets for each PT&Z camera and to program manual or sequential displays for all cameras shall be included.
- C. Determination of size and location of color monitors and control functions shall be based on the best ergonomic design compatible with final console arrangements and the Control Tower attendants mode of operation. Final selections are subject to approval by the Authority Representative.
- D. Digital recording of the Yard Control CCTV cameras is not included in the scope of this project.

PART 2 - PRODUCTS

2.01 SYSTEMS PERFORMANCE REQUIREMENTS

The Design-Builder shall be responsible for the performance of the Closed Circuit Television Systems. The following system performance requirements are designed to ensure that the Closed Circuit Television Systems delivered under these Specifications meet the performance requirements of the Washington Metropolitan Area Transit Authority.

A. OVERALL PERFORMANCE REQUIREMENTS FOR CCTV SYSTEMS

- 1. Minimum Scene Illumination
 - a. Each CCTV camera shall provide a usable video output with IR filter and AGC on with a faceplate illumination of 0.04 footcandles (or less).
 - b. A faceplate illumination of 0.2 foot-candles (or less) with IR filter and AGC off shall cause a full video output from the CCTV camera
- 2. Resolution

- a. The center limiting vertical resolution, as determined by viewing on any CCTV monitor, as produced by a signal originating from each associated CCTV camera and passing through the installed cable and distribution equipment for each CCTV system, shall not be less than 350 lines in the center when all system equipment is operated to any combination of values within those specified. The horizontal resolution measured under these conditions shall not be less than 550 TV lines in the center of the picture when viewing on any CCTV monitor.
3. Video Signal Level
 - a. Video signal levels shall conform to level requirements of EIA Standard RS-170 when measured at the input of the installed CCTV monitors.
 4. Scanning Lines
 - a. 525 lines per frame, interlaced 2:1 Standard RS-170 with no discernible interlace jitter or pairing on the monitor.
 5. Frame Frequency
 - a. 30 frames per second.
 6. Aspect Ratio
 - a. Height to width ratio of 3 to 4.
 7. Environmental Standards
 - a. All equipment mounted outdoors shall be fully operational without damage or functional degradation under any combination of the following environmental/working conditions:
 - 1) Ambient temperature -40 degrees C to +55 degrees C.
 - 2) Relative humidity 0 percent to 100 percent.
 - 3) Operation to +60 degrees C shall be fully satisfactory with less than 100 lines reduction in camera horizontal resolution.
 - 4) Rain, salt, dust, oil, and other pollutants.
 - 5) Winds up to and including 90 MPH with rime icing.
 - 6) Vigorous and normal use.
 - 7) Train related vibrations.
 - b. Noise
 - 1) Operation of any aspect of the system, including the pan & tilt unit or zoom lens function controls, shall not produce any discernible noise on the CCTV monitor. The signal-to-noise ratio under all

transit system operating conditions shall be degraded by no more than 3 dB.

8. Coverage Requirements

- a. The Yard-Control CCTV System equipment shall include television cameras whose combined fields of view shall provide primary coverage for at least 90 percent of the interlocking switching track areas, exclusive of the areas in the direct view of the Yard Control Room.

2.02 FIBER OPTIC VIDEO LINK

- A. The Fiber Optic Video Link is used to transmit CCTV video and PT&Z control signals over long distances through areas of high EMI. The use of fiber optics also eliminates ground loops and eliminates the need for equalization amplifiers needed on long runs of copper cable.
- B. The Fiber Optic Video Link typically consists of a Fiber Optic Transmitter, a Fiber Optic Facility, and a Fiber Optic Receiver.
- C. The transmitter module shall convert a standard NTSC baseband video signal and PT&Z control signals to an optical signal for transmission over a fiber optic facility. The transmitter modules shall have a stand-alone mounting topology.
- D. From the opposite end of the fiber optic facility, the receiver module shall convert the transmitter's optical signal into a standard NTSC baseband video and PT&Z control signals.
- E. The Fiber Optic Link shall have sufficient optical budget to overcome facility and termination losses incurred to transmit and receive signals a minimum distance of 3 kilometers.
- F. The Design-Builder shall be responsible for optical connector compatibility between fiber optic facilities and fiber optic video links.

2.03 MAJOR ITEM TECHNICAL REQUIREMENTS

The Major Items listed below shall conform to the operational and performance requirements of these Specifications. Incidental items, not specifically mentioned, but required for complete and proper system operation shall be furnished and installed by the Design-Builder.

- A. CCTV CAMERAS (PT&Z)
 1. Philips Model LTC 0928/25-F G3 Envirodome 18X Day/Night Integrated PTZ CCD Camera w/Fiber Module and 4.1 -73.8 mm Lens (or approved equal).
 2. The PTZ cameras shall be capable of providing a color or black and white video output. During the day, or whenever lighting levels are adequate, these cameras shall produce a color signal. At night, or whenever lighting levels become too low for usable color video, these cameras shall automatically switch to the monochrome mode and remove the IR filter for improved performance. The capability to manually switch between modes shall be provided.

3. The PTZ cameras shall be capable of providing 360 degrees of continuous pan coverage at 120 degrees per second.
4. The PTZ cameras shall be provided with programmable pre-position features to automatically pan/tilt/zoom to the appropriate view in response to commands, and to sequence to predetermined viewing areas for video tours when so programmed.

B. CCTV MONITORS

1. SVGA High Brightness LCD Monitor 15 to 20 inch. Stealth Model SV1500-PM-HB (or approved equal). Actual screen size shall be largest practical within range given dependant on mounting arrangement (i.e. console, ceiling, wall, or desktop) to be determined by Design-Builder. Model number given is for technical characteristics exclusive of screen size.

C. FIBER OPTIC LINK

1. Accommodates standard NTSC video signal and PT&Z control signals.
2. Video Input/Output signal 1V p-p.
3. 15 MHz Video Bandwidth.
4. Video Input/Output impedance 75 ohms unbalanced.
5. Operating environment -20 deg C to +65 deg C, 0 to 95% relative humidity (non condensing).
6. 110 Vac operation.
7. Shall include required hardware for mounting in CCTV equipment cabinets or in 19-inch equipment rack (Yard Operations/Maintenance Building, Communications Equipment Room and Shop Facility Building Communications Equipment Room.)

D. VIDEO SWITCHER/CONTROL SYSTEM

1. Philips - Allegiant Microprocessor-Based Video Switcher/Control System Model No.LTC 8300/xx sized to support camera quantity (or approved equal).
2. Must include all necessary software and peripherals to provide the Yard Control Tower Attendant maximum viewing flexibility and selective PT&Z control of all cameras.

E. PARAPET MOUNT ADAPTERS

1. Philips LTC 9230/00 (or approved equal)

F. COAXIAL VIDEO CABLE (75 OHM)

1. RG59 type coaxial cable
2. 75-ohm impedance.

G. 2-CONDUCTOR SHIELDED POWER CABLES

1. BELDEN 1032A TSP #18 (or approved equal)

H. VIDEO TEST/PATCH PANEL

1. Trompeter Model #JS-24L (or approved equal).
2. Accommodates 12 patch jacks (listed below).
3. 19-inch rack mount.
4. Height: 2 rack units (3.5 inches).
5. With stainless steel identification strip with card and plastic window for identification of each connector on panel.

I. VIDEO PATCH JACKS

1. Trompeter Model #J14WT-75 (or approved equal).
2. Normal thru signal path.
3. Patching terminates unused side in 75 ohms.
4. BNC rear connectors (75 ohm).
5. WECO patch connectors (75 ohm).

J. TEST/PATCH CORDS (PATCH PLUG TO PATCH PLUG)

1. Trompeter Electronics, Inc., Model No. PCW-24-75 (or approved equal).
2. Length : 2 feet.
3. Connectors: 75 ohm WECO patch plugs.
4. RG59 type coaxial cable.

K. TEST/PATCH CORDS (PATCH PLUG TO BNC)

1. Trompeter Electronics, Inc. Model No. UPCWX-60-75 (or approved equal).
2. Length 5 feet.
3. Connectors: 75 ohm WECO to 75 ohm BNC.
4. RG59 type coaxial cable.

L. CCTV CAMERA POWER DISTRIBUTION PANEL

1. Alarmsaf Model TV244-300 Multi - Camera Power Supply.120 VAC/24/VAC (or approved equal).

M. FIBER OPTIC CABLE

1. Siecor 002K51-31141-24 (2) Fiber Loose-tube, 62.5 Micron (or approved equal)
2. Environmental: -40oC to +70oC.

PART 3 EXECUTION

3.01 GENERAL CLOSED CIRCUIT TELEVISION SYSTEM INSTALLATION

- A. The Design-Builder shall furnish power supplies and install all terminals, hardware, wiring and cabling, connectors and adapters, conduits and fittings, and make all the necessary connections and cross-connections required for complete operational installation. The onus shall be on the Design-Builder to verify product compatibility and system performance of all equipment, including equipment specified under the Major Items sections of this Contract.

3.02 GROUNDING

The Design-Builder shall design a grounding scheme for the Closed Circuit Television System that shall comply with the following requirements:

- A. All CCTV equipment installed in Communications Equipment Rooms shall be connected to Communications ground.
- B. Shields of all copper coaxial cables shall be grounded only to the communications ground in a Communications Equipment Room or the Gatehouse.
- C. The grounds of CCTV equipment installed in CCTV equipment cabinets shall be electrically isolated from power/building ground.
- D. All CCTV cameras shall be isolated from ground through structures and wiring, except for a single ground path via the shield of the video coaxial cable to the communications ground from a Communications Equipment Room and, except for a single ground path, via the shield of the video coaxial to the Fiber Optic video transmitter, or to the ground from an insulated CCTV equipment cabinet.
- E. All installed video connectors and adapters shall be covered with shrink sleeving to electrically isolate the connectors from power/building ground.

3.03 CAMERA EQUIPMENT

- A. The Design-Builder shall install the CCTV cameras in enclosures with the appropriate type mounting brackets. The Design-Builder shall optimize the camera coverage identified in these Specifications by identifying conduit stub-outs with appropriate conduit extensions necessary to provide the optimum coverage. The Design-Builder shall submit the optimum design layout of the cameras and lens types as part of the Engineering Definition Review. The Engineering Definition Review shall be used to assist the Authority's Representative in determining the adequacy of the design and, in conjunction with a field survey, determining the exact location

of each CCTV camera. The bottom of installed CCTV cameras shall, ideally, be two feet or greater above the finished parapet, and may extend beyond the inside edge of the parapet as specified or approved by the Authority's Representative. CCTV camera conduit routing shall be approved by the Authority's Representative.

3.04 CCTV SYSTEM CABLING

A. VIDEO CABLE

1. The Design-Builder shall install coaxial cable for all video connections.

B. VIDEO CONNECTORS

1. The Design-Builder shall install the required video connectors and adapters and connect the video cables to the CCTV equipment. Video connectors shall be crimp type with weatherproof gaskets. Shrink Sleeving (with two layers of electrical tape for splices) shall be installed on video connectors and adapters that are exposed to the environment, including splices. All splices shall be TDR tested and approved by the Authority's Representative.

C. MULTICONDUCTOR PT&Z CONTROL CABLE

1. The Design-Builder shall install and connect a shielded multiconductor cable to the following CCTV system components:
 - a. From Pan and Tilt units and Zoom lens controls on cameras equipped with PT&Z, to PT&Z fiber optic interface.
 - b. From the fiber optic interface to PT&Z control receivers (Gatehouse CCTV System).
 - c. From the fiber optic interface to PT&Z Control Panels (Yard-Control CCTV System).

D. POWER CABLES

1. The Design-Builder shall install and connect shielded twisted pair primary power cables from CCTV Camera Power Distribution Panels (in Communications Equipment Rooms) and from ac power terminal strips (in ancillary buildings with CCTV equipment cabinets) to the appropriate CCTV Cameras and heaters in Pan and Tilt Units.

E. FIBER OPTIC CABLE

1. The Design-Builder shall install fiber optic cable between fiber optic video transmitters and receivers to establish the required fiber optic video links as shown on the Contract Drawings. Each fiber optic cable run shall be continuous and without splices.
2. Installation in conduit:
 - a. The Design-Builder shall use communications conduit reserved for CCTV.
 - b. If the CCTV conduit is filled, the Design-Builder shall use the least filled communications conduit.

- 
3. At each end of a fiber run, the Design-Builder shall coil 10 feet of slack fiber cable before termination and store neatly in the appropriate CCTV equipment rack/cabinet.
 4. The slack fiber coils and any bends in the fiber incurred during installation shall have a bending radius greater than or equal to the manufacturer's specified minimum cable bending radius.

F. COMMUNICATIONS EQUIPMENT ROOM CCTV INSTALLATION

1. The Design-Builder shall install the CCTV equipment located in the Communications Equipment Rooms on 19-inch equipment racks.

G. FIBER OPTIC CONNECTORS

1. The Design-Builder shall install the required fiber optic connectors and adapters and connect the fiber optic cables to the fiber optic video link equipment.
2. All connectors shall have a ceramic or stainless steel ferrule and incorporate a strain relief technique/mechanism.
3. Repeatable connector losses shall be less than 0.7dB using either chemical bonding or mechanical crimp to achieve fiber captivation.

TRANSIT VEHICLE CHARACTERISTICS

PART 1 - GENERAL

1.01 ELECTRICAL EQUIPMENT CHARACTERISTICS

The characteristics of the chopper-controlled BREDA vehicle electrical equipment are as follows:

- A. The normal operating frequency of the propulsion and braking chopper will be 273.0 Hz, with a tolerance of +/-6 Hz on the 15th harmonic, which is 4095 Hz.
- B. The normal range of frequency drift of the propulsion and braking chopper, will be +/-0.01 percent.
- C. The level of inductive interference produced by the propulsion chopper and all auxiliary choppers will be not greater than that shown in Graph 1, Level of Induced Interference which represents the magnitude of open-circuit rail-to-rail potential vs. the train control frequency spectrum. The open circuit rail-to-rail potential presented in Graph 1 is the worst-case rail-to-rail potential that would be measurable at any point beneath the vehicle with no train control equipment connected to the rails. The values given are a composite from all emitting sources on the married pair.
- D. The level of conductive interference produced by the propulsion chopper and all auxiliary choppers will be not greater than that shown in Graph 2, Level of Conductive Interference which represents the magnitude of the AC component of the return current from a single car (4 motors) vs. the train control frequency spectrum. The AC current component shown in Graph 2 is the worst-case composite of the interference produced by all of the electrical subsystems of a single married pair. The train control frequency spectrum is 50 Hz to 15,000 Hz.

LEVEL OF INDUCED INTERFERENCE

(AS MEASURED WITH A SD345 SPECTRUM ANALYZER, DISPLAYING RESOLUTION BANDWIDTH OF 5Hz OR LESS, USING A LINEAR AVERAGING MODE WITH 16 OR MORE SAMPLES AVERAGED)

SECTION 16911

SCOPE OF WORK

YARD SIGNAL CONTROL AND INTERLOCKING SYSTEM

PART 1: GENERAL

1.01 DESCRIPTION: The Washington Metropolitan Area Transit Authority (WMATA) is embarking on a Metro Matters Shops Program where the primary objective is to expand and improve current operations at both the Brentwood Yard and Shady Grove Yard. Work to be accomplished under this project is diverse and includes various tasks such as the installation of new turnouts and shop lead tracks, track realignment, installation of new wayside signaling equipment and train control room signaling equipment, yard control machine revisions and building of civil infrastructure to support signaling. This Section describes the general scope, functional design, and other requirements for the Yard Signal Control and Interlocking (YSCI) system work to be accomplished in Brentwood Yard and Shady Grove Yard.

1.02 GENERAL FEATURES BRENTWOOD YARD AND SHADY GROVE YARD

- A. The new yard signaling system control and indication logic shall either be relay or microprocessor based and meet the design requirements provided under this Contract. The Design-Builder shall use Entrance-Exit type philosophy for routing train movements throughout the turnouts. The yard signaling system logic shall be designed using traditional vital and non-vital signaling philosophy consistent with the existing in-service signaling system at Brentwood Yard and Shady Grove Yard.
- B. A Yard Control Machine located in the Yard Tower shall be used to control routing throughout the yard by utilization of pushbuttons and switches located on the Yard Control Machine.
- C. Single rail power frequency track circuits shall be provided to ensure train detection throughout the yard turnouts and shop lead tracks.
- D. Trailable switch machines layouts with external switch circuit controllers shall be installed on all new turnouts.
- E. Switch rail heaters and crib heaters shall be installed on all new power operated yard switch machine turnouts. Control of the heaters shall be from the Yard Control Machine.
- F. Transit style wayside signals shall be installed at the limits of all interlockings to provide the train operator with a proceed or stop aspect.
- G. Interconnecting signal cables between the wayside equipment and Yard train control room shall be routed through new ductbanks, surface trench and conduit systems designed, furnished and installed by the Design-Builder under this contract. Where existing ductbank and conduit systems can accommodate the additional cabling without exceeding fill limitations, they may be used subject to Authority approval.

1.03 SCOPE OF WORK

- A. The work to be performed for the YSCI system under this Contract shall comply with the requirements of the Program Criteria and the Specifications. The Design-Builder may propose alternatives to the existing facilities, the criteria and the specifications within the parameters established for the project. It shall be the Design-Builder's responsibility to

provide conclusive evidence that acceptance of an alternative is in the best interests of the Authority. Project Specific Drawings developed to identify signal work, WMATA Typical Layout Drawings and selected Yard As-Built Drawings to demonstrate the existing circuit and equipment configurations are provided as Information or Reference Drawings to enable the Design-Builder to understand the expected installation methods and functional requirements. The Design-Builder's design shall be based on the existing conditions within the respective yards. Complete sets of Yard As-Built Drawings will be furnished by the Authority upon request by the Design-Builder. The Design-Builder shall be responsible to incorporate any changes marked on the TCR Room Book of Plans that have not been incorporated in the permanent drawings.

- B. Brentwood Yard: The Design-Builder shall furnish the design, manufacture, documentation, delivery, storage, installation, demonstration, testing, interface requirements, placing into service and as-built drawings for the new YSCI system in the Brentwood Yard. This work shall include, but not limited to the following components:
1. Train Control Room Enlargement:
 - a. Install interior building walls to provide additional space as required to accommodate the additional Yard Signal Control and Interlocking equipment. Remove the existing wall providing alternate support or relocation of any equipment attached to or mounted on the wall. The train control equipment shall be protected from physical damage and dust during all construction and demolition work.
 2. Trailable switch machine layouts
 - a. Provide new SW 93 switch layout to relocated Maintenance-of-Way Track 10.
 - b. Provide new SW 103 switch layout to new Shop Track 9C.
 - c. Provide new SW 105 switch layout to new Shop Track 9A.
 - d. Provide new SW 205 switch layout to relocated Shop Track 9.
 - e. Provide new SW 207 switch layout to new Shop Track 9A.
 - f. Provide new SW 209 switch layout to new Shop Track 9B.
 3. Snowmelter cases:
 - a. Provide new Snowmelter Control Case for new Switch 93.
 - b. Provide new Snowmelter Control Case for new Switches 103 and 105.
 - c. Provide new Snowmelter Control Case for new Switch 205.
 - d. Provide new Snowmelter Control Case for new Switches 207 and 209.
 4. Snowmelter rods and crib heaters
 - a. Provide new Snowmelter rods and crib heaters for new Switches 93, 103, 105, 205, 207 and 209.

5. Single rail power frequency track circuits
 - a. Provide new and reconfigured track circuits for the new interlockings and lead tracks.
6. Wayside signals:
 - a. Provide new signal layouts to replace existing Signals 92 and 102 if required to be relocated by new trackwork.
 - b. Provide new signal layouts for new Signals 96, 104, 106, 108, 204, 206, 208 and 210.
7. Yard Signal Control Logic:
 - a. Provide vital and non-vital equipment and circuits to implement changes and additions to accommodate the program track changes. Non-vital circuit requirements may be satisfied with the use of microprocessors or non-vital relay logic.
8. Yard Control Panel Replacement:
 - a. Replace three existing panels of the Yard Control Machine with new panels equipped with new switches, pushbuttons, indicator lamps and other panel control and indication components for the existing and new tracks. The required replacement panels may be engraved phenolic panels or mosaic tile compositions and shall be wired to plug connectors to expedite panel replacement.
9. Signal bonding:
 - a. Provide signal bonding as required for new and modified turnouts.
 - b. Provide signal bonding around any existing insulated joints which are not required in the new track circuit configurations.
10. Power bonding:
 - a. Provide power bonding as required for new and modified turnouts.
 - b. Provide power bonding on shop and yard tracks to connect new tracks to existing negative return system.
 - c. Provide power bonding around any existing insulated joints which are not required in the new track circuit and negative return rail configurations.
11. Cabling:
 - a. Provide new cabling between the Train Control Room and the wayside equipment.
 - b. Provide all necessary temporary and permanent wiring within the Train Control Room.

- c. Provide all necessary cabling between the Train Control Room and the Yard Control Room.
 - 12. Ductbank, Conduit and Surface Trench:
 - a. Provide new ductbank, conduit and surface trench to expand or supplement the existing facilities to accommodate the new cabling requirements.
 - b. Relocate, modify or replace existing conduits and surface trenches which interfere with new road and driveway construction.
 - 13. Revisions and additions to the existing power distribution system:
 - a. Provide new power distribution equipment as necessary to accommodate the additional electrical loads for the new signal equipment.
 - 14. Event recording:
 - a. Provide a new Event Recorder for monitoring the signal control and interlocking system functions of the entire yard.
 - 15. Power supplies, associated subsystems, equipment, materials, cables, hardware, and appurtenances, to provide a complete operating signal system as described.
- C. Shady Grove Yard: The Design-Builder shall furnish the design, manufacture, documentation, delivery, storage, installation, demonstration, testing, interface requirements, placing into service and as-built drawings for the new YSCI system in the Shady Grove Yard. This work shall include, but is not limited the following components:
- 1. Trailable switch machine layouts
 - a. Provide new SW 161 switch layout to relocated shop Track 6.
 - b. Provide new SW 167 switch layout to new shop Track 7.
 - c. Provide new SW 165 switch layout to new shop Track 8.
 - d. Provide new SW 163 switch layout to new shop Track 10.
 - e. Provide new SW 147 switch layout to relocated shop Track 6.
 - f. Provide new SW 149 switch layout to new shop Track 7.
 - g. Provide new SW 173 switch layout to new shop Track 8.
 - h. Provide new SW 169 switch layout to new shop Track 9.
 - i. Provide new SW 171 switch layout to new shop Track 10.
 - j. Provide new SW 95 switch layout to new M/W 7 Track.
 - 2. Snowmelter cases

- a. Provide new Snowmelter Control Case for new Switch 161 and 165.
 - b. Provide new Snowmelter Control Case for new Switch 163 and 167.
 - c. Provide new Snowmelter Control Case for new Switch 147.
 - d. Provide new Snowmelter Control Case for new Switches 149 and 169.
 - e. Provide new Snowmelter Control Case for new Switch 173.
 - f. Provide new Snowmelter Control Case for new Switch 171.
 - g. Provide new Snowmelter Control Case for new Switch 95.
3. Snowmelter rods and crib heaters
- a. Provide new Snowmelter rods and crib heaters for new Switches 95, 147, 149, 161, 163, 165, 167, 169, 171, and 173.
4. Single rail power frequency track circuits
- a. Provide new and reconfigured track circuits for the new interlockings and lead tracks.
5. Wayside signals
- a. Provide new signal layouts to replace existing Signals 92, 94, 96, and 100 if required to be relocated by new trackwork.
 - b. Provide new signal layouts for new Signals 162, 164, 166, 168, 170, 172, 174 and 176.
6. Yard Signal Control Logic
- a. Provide vital and non-vital equipment and circuits to implement changes and additions to accommodate the program track changes. Non-vital circuit requirements may be satisfied with the use of microprocessors or non-vital relay logic.
7. Yard Control Panel Replacement:
- a. Replace three existing panels of the Yard Control Machine with new panels equipped with new switches, pushbuttons, indicator lamps and other panel control and indication components for the existing and new tracks. The replacement panels shall be wired to plug connectors to expedite panel replacement. The required replacement panels may be engraved phenolic panels or mosaic tile composition however, if mosaic tile type panel is provided, all panels on the machine must be replaced.
8. Signal bonding:
- a. Provide signal bonding as required for new and modified turnouts.

- b. Provide signal bonding around any existing insulated joints which are not required in the new track circuit configurations.
 - c. Provide signal bonding and new track circuit connections to accommodate the car shop blow pit extensions.
9. Power bonding:
- a. Provide power bonding as required for new and modified turnouts.
 - b. Provide power bonding on shop and yard tracks to connect new tracks to existing negative return system.
 - c. Provide power bonding around any existing insulated joints which are not required in the new track circuit and negative return rail configurations.
 - d. Modify existing negative return bonding to accommodate the car shop blow pit extensions.
10. Wire and Cabling:
- a. Provide new cabling between the Train Control Room and the wayside equipment.
 - b. Provide all necessary temporary and permanent wiring within the Train Control Room.
 - c. Provide all necessary cabling between the Train Control Room and the Yard Control Room.
11. Ductbank, Conduit and Surface Trench:
- a. Provide manholes, ductbanks, conduit and surface trench as determined necessary to replace the existing facilities that interfere with the construction of the new shop building.
 - b. Relocate, modify or replace existing conduits and surface trenches which interfere with new road and driveway construction.
 - c. Provide new ductbank, conduit and surface trench to expand or supplement the existing facilities to accommodate the new cabling requirements.
12. Revisions and additions to the existing power distribution system:
- a. Provide new power distribution equipment as necessary to accommodate the additional electrical loads for the new signal equipment.
13. Event recording:
- a. Update the existing Event Recording System to incorporate the new equipment.

14. Power supplies, associated subsystems, equipment, materials, cables, hardware, and appurtenances, to provide a complete operating signal system as described.

D. The Design-Builder shall furnish the management, labor, data, design, relay logic, testing services, training, manuals, parts, materials, tools, equipment, appurtenance, and incidentals necessary to complete the work in accordance with the Contract requirements.

E. The Design-Builder shall be responsible for the design, installation, test and final acceptance of all interfaces between the existing Yard Signal Control and new YSCI system.

F. Products and Materials: The Design-Builder shall furnish, unless otherwise specified in the Contract, all material, implements, machinery, equipment, tools, supplies, transportation, and temporary utilities necessary for the prosecution and completion of the work.

G. Design: The Design-Builder's design shall include, but not be limited to the following:

1. System Design: Provide as required, signal circuits, operational descriptions and all other system type designs that depict system operational requirements.

2. Product Design: Provide detail design, circuits, drawings, test results and documentation of necessary components, and subsystems in conformance with all requirements specified in the specifications.

3. Circuit Design: Provide the circuitry, detail design, testing, circuit check and drawings in conformance with all requirements specified in these Specifications. The Design-Builder shall design the new YSCI circuits in accordance with the existing WMATA circuit design standards for Brentwood Yard and Shady Grove Yard.

4. Installation Design: Provide complete electrical and mechanical design drawings for installation of the required signal equipment in conformance with all requirements detailed in the specifications.

5. Interface Design. It shall be the responsibility of the Design-Builder to determine that all new signaling system interfaces and control logic circuitry are compatible with current conditions. The Design-Builder shall request the as-built drawings from WMATA prior to the start of design. Any discrepancies encountered between the as-built drawings and as-built conditions shall be noted by the Design-Builder and immediately brought to the attention of WMATA.

6. The Signal Control and Interlocking System equipment manufacturer shall be the Designer of Record and shall be directly responsible to the principle design-build firm.

H. Testing:

1. Factory Acceptance Testing: It shall be the responsibility of the Design-Builder to perform factory acceptance testing of signaling equipment and components not previously approved for installation on the WMATA Metrorail System. The design-Builder shall develop a Factory Acceptance Testing procedure and submit for approval.

2. Field Testing: The Design-Builder shall obtain approval for the test plan and procedures as set forth in these specifications prior to starting field testing. The Design-Builder shall perform all tests necessary to ensure that the Signal system performs according to the specifications.
- I. System Support:
 1. The Design-Builder shall furnish the signal system with the support materials and services such as manuals, spare parts, initial provisioning and equipage, and training as specified in the specifications.
 2. The Design-Builder shall also provide testing and maintenance support after the yard has been certified for train operations as specified.
 - J. Damage During Construction: The Design-Builder shall be responsible for the repair and/or replacement in kind of any cabling and equipment damaged during the construction.
 - K. Insulated Joints: It shall be the responsibility of the Design-Builder to confirm that the new trackwork design for insulated and non-insulated rail joints meets the functional requirements for the new signaling system. This work shall also include verification that the existing insulated and non-insulated rail joints are installed in the correct locations to support and integrate with the new and existing signaling system.

1.04 STAGING:

Staging of interim and new YSCI systems shall be incorporated in a comprehensive Staging Plan for the Brentwood Yard and Shady Grove Yard that minimizes impacts to the existing Yard operations during construction. The Staging plan shall be fully coordinated with others performing work in the same area and include all necessary manpower and equipment requirements to meet the needs of the temporary and final Yard signal control. The Design-Builder's work shall consist of, but not limited to, the following:

- A. Design, install and test interim or temporary YSCI circuits.
- B. Design, install and test interim or temporary interface YSCI circuits.
- C. Furnish, install and test interim or temporary YSCI equipment.
- D. Furnish, install and test temporary signal and power bonding.
- E. Furnish, install and test temporary YSCI cables.
- F. Maintain, up-to-date circuit plans that reflect all interim or temporary changes.
- G. Provide operations descriptions for all interim operating situations.

1.05 YARD TRAIN CONTROL ROOM

- A. The Design-Builder shall provide adequate space in both the Brentwood Yard and Shady Grove Yard Train Control Rooms for the installation of new signaling equipment. This work shall include expanding the Brentwood Yard Train Control Room by relocating existing walls.

1.06 CONDUITS AND DUCTBANKS

- A. It shall be the responsibility of the Design-Builder to furnish and install the necessary civil infrastructure to support the installation of all signaling cabling and equipment. Part of the Design-Builder's work shall be to modify, relocate or replace an existing ductbank at Shady Grove to allow the construction of the new shop building.

1.07 YARD CONTROL MACHINE – SHADY GROVE AND BRENTWOOD

- A. The Design-Builder shall replace the existing yard control panels where applicable to incorporate all new controls, indications and hardware to accommodate the new yard turnouts and tracks. The replacement panels shall be equipped with new pushbuttons, switches, lamps and other devices as well as plug connection cables. These modifications shall be accomplished in a manner that will ensure seamless integration between the existing yard control machine and existing yard control panels to remain.

1.08 INTERFACE REQUIREMENTS

- A. The Design-Builder shall be responsible for all coordination, integration and interfaces between signaling systems furnished, existing equipment and equipment furnished by others. This shall include all design, labor, materials, tools, equipment and supplies necessary to provide interfaces that are functionally seamless. It will be the design-builders responsibility to coordinate and schedule sub-contractor work activities to avoid conflicts.

1.09 WARRANTY OF CONSTRUCTION

- A. The warranty period for all goods, supplies, systems and equipment except spare parts shall be two (2) years after final acceptance of the work. Final Acceptance is as defined in The General Provisions.

1.10 SUBMITTALS

- A. The Design-Builder shall submit performance data and final design and installation drawings to the designated Authority Representative for approval of all equipment which the Design-Builder proposes to use under this Contract. The Engineer's approval will be for the purpose of minimizing changes and delays in the field and shall in no way relieve the Design-Builder of full responsibility for providing complete, safe, reliable, and coordinated operating systems and subsystems for yard signal control and interlocking systems which are compatible with the existing Metrorail ATC system in every respect.
- B. It shall be the responsibility of the Design-Builder to ensure that competent personnel are assigned and retained for the task of preparing the required submittals and all other documentation necessary to comply with the Specifications. Submitted documents shall be complete. Submitted circuit and equipment drawings shall have been thoroughly checked for completeness and accuracy and shall bear the initials or signature of a fully qualified checker in witness thereof before being submitted to the designated Authority Representative for approval.
- C. The Design-Builder shall submit all required schedules, inspection procedures, inspection reports, progress reports, test procedures, test reports and other specified documentation to the designated Authority Representative as described in Section 01330 with respect to the scheduled progression of the work.
- D. When submitting drawings, manuals and other documentation to the designated Authority Representative for the initial approval of some product, subsystem, or layout, the Design-

Builder shall submit all drawings, manuals and other documentation germane to the subject, at one time. The submittal shall also include all applicable catalog cuts, certified test reports, and any other related items which the designated Authority Representative considers necessary to evaluate the submittal. This logical grouping of documentation necessary to completely cover the subject concerned, shall be known as a submittal package.

- E. Any product, subsystem or layout, shall receive final design approval with no more than one resubmittal. The designated Authority Representative will review the initial submittal and no more than one resubmittal of each product, subsystem, or layout as part of the requirements of this subsection. It shall be the responsibility of the Design-Builder to ensure that in the event a resubmittal of the initial submittal is necessary, he has, in the resubmittal, either:
 - 1. Responded in the manner suggested to all the designated Authority Representative's comments made in the first review, or;
 - 2. Taken exception in writing to any of the designated Authority Representative's first review comments which he believes should not be incorporated by him in his first resubmittal, and responded in the manner suggested to all the designated Authority Representative's other comments made in the first review. When taking exception to the designated Authority Representative's comments, the Design-Builder shall state his reasons for not complying, and offer a workable alternative consistent with the intent of the Specifications.
- F. In instances where a complete submittal or resubmittal is approved by the designated Authority Representative, but is later found to be in error or unworkable, the designated Authority Representative reserves the right to withdraw the earlier approval and require correction and resubmittal of the earlier submittal.
- G. The format and media required for certain submittals shall be as follows:
 - 1. Drawings:
 - a) Submittals of new drawings shall be made with the prescribed number of prints, and on magnetic media in the AUTOCAD 2000 format.
 - b) Changes to existing drawings may be manually marked to show the necessary equipment additions, changes and removals in a clear and comprehensible manner. The submittal shall be made with the prescribed number of prints.
 - 2. Tables, Charts and Data Sheets
 - a) The required tables, charts and data sheets shall be made with the prescribed number of hard copy sets, and on magnetic media in a Corel Quattro Pro 9 (Corel Office 2000) format.
- H. Yard Signal submittals shall be made in accordance with the requirements specified in Section 01113 Systems Integration and Section 16912, ATC Submittal Requirements.

PART 2: PRODUCTS

2.01 FUNCTIONAL DESIGN REQUIREMENTS

- A. YSCI ground equipment will be located along the track where necessary. Other equipment will be located in Yard Train Control Room and/or Yard Control Room.

1. Equipment typically located along the tracks include:
 - a. Track circuit bootlegs
 - b. Track switch machines
 - c. Junction Boxes
 - d. Track switch rod and rail heaters
 - e. Signs or other wayside indication equipment
 - f. Snow melter control cabinets
 - g. Wayside Signals
 - h. Foundations

2. Equipment located in Yard Train Control Room:
 - a. Signal logic circuitry
 - b. Power supplies
 - c. Track circuit components
 - d. Electronic Components

3. Equipment located in the Yard Control Room
 - a. Yard Control Machine

2.02 PRODUCT REQUIREMENTS

- A. Provide a proven and modern signal system in all respects, in both systemwide aspects and component design.
- B. All equipment and material shall be standard products of manufacturers regularly engaged in the production of signal and control equipment and material, and shall conform to the UL, NEMA, ANSI and AREMA standards, where applicable.
- C. Assemblies and components, which perform identical functions within the signal system, shall be mechanically and electrically interchangeable. Standardized commercially available components of multiple sources shall be used whenever possible, particularly for items which require replacement at predictable intervals.
- D. All equipment and material shall be new and free of manufacturing defects.

2.03 SAFETY REQUIREMENTS

- A. The design shall minimize the possibility of unsafe failure arising from procedural error and neglect, including:
 1. Careless adjustment of equipment and controls.
 2. Incorrect assembly of equipment.
 3. Insufficient maintenance.

2.04 IDENTIFICATION METHODS

- A. All signal equipment modules, assemblies, subassemblies and wires shall be identified by means of tags or other means as specified.

2.05 ELECTROMAGNETIC COMPATIBILITY

- A. Ensure that the signal system shall operate within the yard operational environment. The Design-Builder shall further ensure that the signal equipment will operate as intended without either suffering or causing harmful electromagnetic interference, conducted, radiated, or induced.

PART 3: EXECUTION

3.01 DESIGN

- A. The Design-Builder shall develop and furnish to the Authority complete designs for the Yard Signal Control and interlocking System included in this Contract as specified in Section 01112.
- B. The Design-Builder shall complete the final Yard Signal Control and Interlocking System circuit and detail design in conformance with all requirements and restraints specified herein.
- C. The Design-Builder shall provide complete mechanical design for installation of the required wayside Yard Signaling equipment.

3.02 FABRICATION AND PROCUREMENT

- A. Upon receiving approval of required submittals, the Design-Builder shall proceed with the procurement, manufacture, factory testing, shipment and/or storage of all approved material and equipment in such a manner that it is available in good working order, at the time and place scheduled.

3.03 DELIVERY AND STORAGE

- A. The Design-Builder shall be responsible for safe and protected transportation and storage of all Yard Signal System equipment and materials from the time of its manufacture or procurement until such time that it is installed.

3.04 JOINT PRE-INSTALLATION INSPECTION

- A. Prior to the field installation of wayside equipment along the track right-of-way the Design-Builder shall participate with the designated Authority Representative in a joint field inspection to determine:
 - 1. The suitability of the Design-Builder's final design for the installation of wayside equipment relative to existing field conditions, with special emphasis on clearance and sighting considerations;
 - 2. The final, exact location for each piece of Yard Signaling equipment which cannot be installed in the normally specified manner due to some obstruction or restriction.
- B. The Design-Builder shall produce dimensioned sketches to document the final, non-standard equipment locations agreed upon. These sketches shall be initialed and dated by the Design-Builder and the designated Authority Representative, and one copy retained by each.

3.05 INSTALLATION

- A. The Design-Builder shall install all necessary Train Control Room, Yard Signal Control and Interlocking equipment in the TCR's .
- B. The Design-Builder shall install all necessary trackside equipment.
- C. The Design-Builder shall install replacement control machine faceplate panels in the Yard Control Room
- D. All installation work shall be performed in accordance with stamped approved drawings. No installation work shall begin without a copy of the applicable approved drawings on site.
- E. The Design-Builder shall take all measures and perform all work necessary to protect his installed equipment and circuitry from damage due to dust, moisture, heat, cold and other potentially damaging conditions

3.06 FIELD DOCUMENTATION

- A. An as-built copy of the Room Book of Plans shall be kept in each Train Control Room during all phases of installation and test. The room as-built plans shall reflect the current status of room and wayside wiring at all times.
- B. Failure to maintain the room as-built plans will result in suspension of all activities until complete up-dates are made.

3.07 INSPECTIONS AND TESTING

- A. Type Acceptance Testing
 - 1. All Yard Signal Control and Interlocking System equipment proposed for use on the WMATA Metrorail System under this Contract which is not identical to equipment already in regular use on the WMATA Metrorail System shall be subject to Type Acceptance Testing to determine whether it meets the specified requirements in a manner acceptable to the designated Authority Representative.
 - 2. The Design-Builder shall devise, perform and document such tests, subject to the direction and approval of, and observation by, the designated Authority Representative,
 - 3. The decision of the designated Authority Representative with regard to the acceptability of proposed new equipment, equipment configuration, methodology, and circuitry will be final.
- B. Factory Inspections and Tests
 - 1. The Design-Builder shall perform and document factory and procurement inspections and tests on Yard Signal Control and Interlocking System materials, equipment and systems to be installed under this Contract.
- C. Field Inspections and Tests
 - 1. The Design-Builder shall perform and document field inspections and tests on all Yard Signal Control and Interlocking Systems and equipment as specified in

3.08 TIE-INS AND ACTIVATION

- A. The Design-Builder shall work in close cooperation and coordination with the Authority when making the required modifications and additions to existing, operating circuits and equipment in order to place the new Yard Signal Control and Interlocking Systems in operation in a safe and efficient manner without interfering with revenue service or other normal METRORAIL operations
- B. When the expansion to the yard is put into operation, the Design-Builder shall:
 - 1. Disconnect all applicable existing TCR equipment which is no longer required.
 - 2. Remove and deliver to the Authority, in good working condition, all of the Authority's existing yard signaling equipment which is no longer required.

3.09 SAFETY

- A. The Design-Builder shall conduct an System Safety Program for all areas of wayside and trackage equipped under this Contract to ensure the safety of the equipment, circuits and systems installed, and the safety of all personnel involved in the associated installation and testing activities.

3.10 INSTRUCTION AND TRAINING

- A. The Design-Builder shall provide, as a minimum, special instruction and training to thoroughly acquaint appropriate Authority operating and maintenance personnel with equipment and circuits furnished under this Contract which are different from those used on previous operating segments of the METRO system.

3.11 DOCUMENTATION

- A. The Design-Builder shall provide both on-going and final, "AS-BUILT" documentation of all equipment, systems, programs, tests, inspections, installation methods, procedures, and circuits required or necessary under this Contract. Any existing drawings which require revisions to reflect the work performed under this contract, shall be redrawn in CADD format and integrated with new drawings to form a complete set of drawings.

3.12 SYSTEM TESTING SUPPORT

- A. The Design-Builder shall assist the Authority in the system testing of all interface circuits, systems and subsystems.

3.13 INSTALLATION

- A. Unless modified elsewhere in these specifications, the electrical installation shall be governed by the provisions of the NEC Standard of the National Board of Fire Underwriters for Electrical Wiring and Apparatus, and the AREMA manuals. All provisions of these Codes shall be considered applicable whether or not specifically mentioned in these specifications.

3.14 SALVAGED EQUIPMENT

- A. At the discretion of the Engineer, any existing signal equipment to be removed and retired from service shall be salvaged and delivered by the Design-Builder to WMATA.

END OF SECTION

THIS PAGE NOT USED

SECTION 16912

YARD SIGNAL SYSTEM SUBMITTAL REQUIREMENTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the various types of Yard Signals submittals required by the Yard Signal Control and Interlocking Systems portion of this Contract as described in Section 101.111.B, Design-Builder's Submittals and Section 01113, Systems Integration.
- B. The equipment and sub-systems included in the 30%, 90%, and 100% Systems Integration Design approval will not require further approval unless subject to type acceptance.

1.02 TYPES OF YARD SIGNAL SUBMITTALS

The basic types of Yard Signal submittals required include:

- A. Train Control Drawings
- B. Technical Review Documentation
- C. Samples
- D. Certifications
- E. Special Documentation
- F. Inspection Reports
- G. Test Plans and Procedures
- H. Test Reports and Data Sheets
- I. Contract Record Drawings

1.06 INTERPRETATION OF APPROVAL AND REVIEW

The designated Authority' Representative's approval will be for the purpose of minimizing changes and delays in the field and shall in no way relieve the Design-Builder of full responsibility for providing complete, safe, reliable, and coordinated working operating systems and subsystems for Yard Train Control which are compatible with the current METRO Yard Signal system in every respect.

1.07 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01250	Contract Modification Procedures
Section 101.III.B,	Design-Builder's Submittals
Section 16991	Yard Signal Drawings and Tracings.

1.08 REFERENCES

- A. ASTM E329
- B. Military Specification MIL-M-09868
- C. Association for Information and Image Management (AIIM) Specification MS32-1985
- D. ANSI PH1.41-1984.

PART 2 - PRODUCTS

2.01 FORMAT AND MEDIA

- A. The format and media required for the various types of Yard Signals submittals shall be as follows:
1. Yard Signal Control and Interlocking Systems Drawings
 - a. Submittals of the drawings shall be made with the prescribed number of prints on magnetic media in the AUTOCAD format (AUTOCAD Level to be determined by the Authority), or on optical media (format to be determined by the Authority):
 - b. The final submittal of AS-BUILT drawings shall include:
 - 1) Magnetic Media in appropriate AUTOCAD format, or on optical media in a format approved by the Authority
 - 2) Prints
 - c. See Section 16991, Yard Signal Drawings and Tracings.
 2. Technical Review Submittals:

See Section 01113, Systems Integration.
- B. Contract Record Yard Signal Drawings
As-built Yard Signal Drawings:
1. As-built Yard Signal drawings shall include all new Train Control Drawings for the Yard Signal Control and Interlocking System and revisions to all affected existing Authority Record Drawings.
 2. Revisions to Authority Record Drawings shall match the base drawings in line weights, symbols, and lettering style and size. Drawings shall be provided in AutoCAD 2000 magnetic media format.
 3. Completed as-built drawings shall bear the signature of an officer of the Design-Builder organization, certifying compliance with as-built conditions.

AS-BUILT <i>Date</i>	
_____ I certify that this drawing accurately depicts the work as constructed.	
(An Officer of the Design-Builder)	
_____ Signature	_____ Title
Design-Builder'S NAME	

PART 3 - EXECUTION

3.02 TRAIN CONTROL DRAWING SUBMITTALS

- A. Submit, unless otherwise directed, one reproducible and three legible copies of all new and marked-up existing Yard Signal Control and Interlocking System drawings to the designated Authority's Representative for approval. These drawings shall be complete and detailed. Train Control drawings shall include, but not be limited to, the following:
1. Title Sheet
 2. Index Sheets
 3. Nomenclature Description Sheets
 4. Relay/Contact Location Charts
 5. Cable Plans
 6. Double Line Track Plans
 7. Arrangement Plans
 8. Product Drawings
 9. Equipment Installation Drawings
 10. Circuit Drawings
 11. Typical Drawings (circuits and/or equipment layouts)
 12. Energy Distribution Schematics
 13. Wiring Diagrams
 14. System Drawings
 15. Control Panel Drawings (to include Back-Panel Wiring)
 16. Tie-in Drawings
 17. Interface Drawings
 18. Cut-In Drawings (as applicable)
 19. TC Maintenance Telephone System Drawings
 20. Trenching Plans
 21. Technical Documentation:
 - a. Inspection Procedures & Reports
 - b. Spare Material and Equipment Lists.
 - c. Cable Lists.
 - d. Test Equipment Lists.
 - e. Power Tabulation Sheets.
 - f. Operational Descriptions.
 - g. Test Procedures & Reports.
 - h. Cut-In Procedures.
 - i. Progress Reports.
- B. Criteria for the approval of these drawings are set forth in Section 16991, Yard Signal Drawings and Tracings.
- C. Upon approval by the designated Authority Representative, each copy of the Train Control drawings will be identified as having received such approval by being so stamped and dated. One reproducible set of Train Control drawings will be returned to the Design-Builder.

3.05 CERTIFICATION

See Section 01113, Systems Integration.

3.07 INSPECTION REPORTS

See Section 01113, Systems Integration.

3.08 TEST PLANS AND PROCEDURES

See Section 01113, Systems Integration.

3.09 TEST REPORTS AND DATA SHEETS

- A. See Section 01113, Systems Integration.
- B. Submit the original and three copies of pre-printed data sheets in advance of the test report for each required test procedure.
- C. Pre-printed data sheets should include all known variables prior to the collection of any actual test data. Examples:
 - 1. Known expected values (voltages, currents or resistances)
 - 2. Track circuit, signal, switch machine, cable names, etc.
 - 3. Wayside equipment locations and chain markers.
 - 4. Required routes.

3.10 CONTRACT RECORD YARD SIGNAL DRAWINGS

- A. Basic Requirements:

During installation and testing of the Yard Signal Control and Interlocking System, the Design-Builder shall maintain a record set of Yard Signal drawings annotated to show all changes incorporated as work progresses. Information shall include, but not be limited to, the following:

 - 1. Field changes of equipment, dimensions, wiring and detail.
 - 2. Changes accomplished by change orders.
- B. As-built Yard Signal drawings:
 - 1. Shall include all new Train Control Drawings for the Train Control System and revisions to all affected existing Authority Record Yard Signals Drawings.
 - 2. Authority Record Yard Signals Drawings are as-built drawings provided to the Authority under previous or concurrent related contracts. The Design-Builder shall coordinate with the Authority to determine which existing Authority Record Drawings require revision.
 - 3. The Design-Builder shall :
 - a. Submit three sets of prints and three electronic file copies of as-built drawings for initial review and approval.
 - b. Additions and corrections shall be incorporated by the Design-Builder and three sets of prints and three electronic file copies shall be prepared and submitted to the Authority for review and approval.

END OF SECTION

SECTION 16914

ENVIRONMENTAL REQUIREMENTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section describes the environmental conditions under which the Yard Signal equipment and systems furnished and installed under this Contract shall function and specifies certain measures which the Design-Builder shall take to prevent environmental interference with the Yard Signal System.

1.02 PHYSICAL ENVIRONMENT

- A. All Yard Signal equipment housed in Train Control Rooms shall function in accordance with the Specifications over a room temperature range of -22 degrees F to +158 degrees F at relative humidities of 5 percent non-condensing to 95 percent, inclusive.
- B. All wayside Yard Signal equipment not housed in Train Control Rooms shall function in accordance with the Specifications over a temperature range of -40 degrees F to +158 degrees F at relative humidities of 5 percent non-condensing to 95 percent, inclusive.
- C. Wayside Yard Signal equipment not housed in Train Control Rooms shall operate in accordance with the Specifications when subject to the climatic conditions indigenous to the Washington, D.C. metropolitan area within the extreme limits of precipitation and wind force recorded in data published by the United States Government, Department of Commerce, National Oceanic & Atmospheric Administration, Environmental Data Service.
- D. All Yard Signal equipment housed in Train Control Rooms shall be so constructed and installed that it will remain fully operational while being vibrated, with simple harmonic motion having an amplitude, acceleration and frequency as listed below, for a minimum period of 15 minutes in each of three mutually perpendicular planes.

Sweep Frequencies	Peak to Peak Displacement	Acceleration
5-12 Hz	0.02 inches	--
12-1000 Hz	--	0.14g peak or 0.10g rms

- E. Wayside Yard Signal equipment not housed in Train Control Rooms shall be so constructed and installed that it will remain fully operational while being vibrated, with simple harmonic motion having an amplitude, acceleration, and frequency as listed below, for a minimum period of 15 minutes in each of three mutually perpendicular planes.

Sweep Frequencies	Peak to Peak Displacement	Acceleration
5-20 Hz	0.2 inches	--
20-1000 Hz	--	4.2g peak or 3.0g rms

- F. All electrical contacts on Yard Signal equipment (including relay contacts, jack contacts

and switch contacts) shall be protected from dust and moisture.

1.03 ELECTRICAL ENVIRONMENT

- A. Each system and subsystem element will generally be operated in the unfavorable electrical environment of a Rail Rapid Transit System characterized by heavy direct-current propulsion equipment which will cause electrostatic, electromagnetic, inductive, conductive, and radiated interference.
- B. Some of the possible sources of electrical interference are:
 - 1. Alternating current 60 Hz systems
 - 2. Direct current traction power systems
 - 3. Propulsion power contact shoe and third-rail arcing
 - 4. Rotating machinery
 - 5. Lightning discharges
 - 6. Public and private communications systems
 - 7. Wayside and carborne Yard Signal equipment

1.04 REFERENCES

- A. ANSI/IEEE C37.90.2
- B. AREMA Signal Manual, Part 2.4.25
- C. Section16922

PART 2 – PRODUCTS

2.01 PRODUCTS AND MATERIALS

Provide all products and materials necessary for the protection of the Yard Signal System against interference by the physical or electrical environment. The products and materials so used shall not themselves constitute a threat to human health or safety, or interfere with the operation of equipment or systems furnished or installed by other disciplines.

2.02 EQUIPMENT

Provide all wayside Yard Signal equipment which has enclosed, internal air-filled cavities, with appropriate moisture control devices as follows:

- A. Follow the recommendations of Part 2.4.25 of the AREMA Signal Manual to minimize condensation and frost buildup in the wayside Yard Signal equipment.
- B. In items of wayside Yard Signal equipment where the screened, shielded vents and drains or heaters of the AREMA recommendation do not appear to be a practical solution to controlling condensation, exclude moisture-laden air by other means such as true hermetic sealing or displacement of the air by an approved potting compound.
- C. Where wires enter a sealed unit, approved heavy-duty plug couplers with minimal internal air spaces and hermetic headers shall be utilized. Cable connections to such plug couplers shall be potted with an approved, flexible, rubber-like compound.

PART 3 - EXECUTION

3.01 PHYSICAL INTERFERENCE

Include in the design, fabrication, and installation, all additional equipment, systems, and procedures which may prove necessary to prevent external or internal physical interference with the proper operation of the Yard Signal System.

3.02 ELECTRICAL INTERFERENCE

- A. Ascertain (using ANSI/IEEE C37.90.2 as a standard) the specific electrical environment to which the various elements of the Yard Signal System equipment will be exposed in all areas covered by this Contract.
- B. Incorporate such design techniques and installation practices necessary to protect the Yard Signal System furnished under this Contract from any electrostatic, electromagnetic, radiated, or direct electrical interference.

END OF SECTION

THIS PAGE NOT USED

SECTION 16915

BASIC YARD SIGNAL EQUIPMENT REQUIREMENTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies certain basic requirements for the design and fabrication of Yard Signal Control and Interlocking System and equipment, the methods which the Design-Builder shall use to mount and wire various types of equipment, and the manner in which equipment components, modules and racks shall be arranged.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signaling Submittal Requirements
Section 16916	Basic Yard Signal Circuit Requirements
Section 16922	Lightning/Surge Protection and Grounding Systems

1.03 SUBMITTALS

See Section 16912

PART 2 - PRODUCTS

2.02 PACKAGING OF EQUIPMENT

The mixing of equipment associated with two subsystems in one plug-in assembly will not be acceptable.

2.03 COMPONENT PROTECTION

Components shall be protected from damage in the event a plug-in unit is removed while the equipment is energized.

2.04 ADJUSTMENTS

A. Adjustable components

Potentiometers, adjustable resistors and other adjustable circuit components shall be electrically sized and inserted in the circuits in such a manner that acceptance test results can be achieved by the related circuits when the device is adjusted to no less than 25 percent of its range and no more than 75 percent of its range.

B. Two or more points of adjustment which are required during the same operation shall be located within 12 inches of each other and in such a way that they can be operated by one man. Interacting adjustments shall be avoided.

C. The replacement of a component or PC card with a spare shall not require compensating adjustments to the associated components or modules. If compensating adjustments are required, they shall be limited to the device to be replaced or repaired.

2.05 TEST POINTS

A. Test points for checking essential voltages and wave forms and for injecting test signals shall be provided for trouble-shooting and routine maintenance.

B. Test points shall be provided to detect defective PC boards and equipment modules without the disconnection of wires.

C. All test points shall be readily accessible when the equipment is in the normal operating position and shall be clearly labeled.

D. Test points shall be capable of accepting probes and connectors used with standard test equipment such as voltmeters and oscilloscopes, except where only special test equipment and connectors supplied by the Design-Builder will serve.

2.06 VISUAL INDICATIONS

A. Built-in Go/No-Go indicators or meters shall be provided when frequent observation or adjustments are necessary, or when portable test equipment would not provide the necessary information or accuracy.

B. Visual indicators shall not require removal of covers to view.

C. Exceptions are microprocessors with hinged doors which do not require tools to open.

2.07 ELECTRONIC EQUIPMENT

All electronic equipment used on this Contract shall be semiconductor.

PART 3 - EXECUTION

3.07 EQUIPMENT MOUNTING

- A. All equipment shall be mounted plumb and level.
- B. The Design-Builder shall provide special facilities for required protection and grounding of non-rack-mounted equipment, e.g., wall mounted equipment, at no additional cost to the Authority. The methods and materials used to provide such protection shall be as previously approved by the designated Authority's Representative. See Section 16922.
- C. Unless otherwise specified herein:
 - 1. Equipment shall be anchored to concrete walls, floors, or ceilings by machine-bolt type expansion shields and 1/2 inch minimum diameter bolts.
 - 2. Sufficient bolts shall be used to provide a rigid and safe support, subject to the designated Authority's Representative's approval.
 - 3. Where necessary, concrete bases or pedestals shall be provided by the Design-Builder, with anchor bolts cast in place for the mounting of equipment.

END OF SECTION

THIS PAGE NOT USED

SECTION 16916

BASIC CIRCUIT REQUIREMENTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies basic requirements for the various types of vital and non-vital circuits required in the Yard Signal Control and Interlocking System.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

- Section 01113 Systems Integration
- Section 16912 Submittal Requirements
- Section 16915 Basic Yard Signal Equipment Requirements
- Section 16917 Basic Interlocking Requirements
- Section 16941 Basic Yard Signal Electrical and Electronic Component Requirements
- Section 16942 Printed Circuit Cards
- Section 16943 Vital Relays
- Section 16944 Non-Vital Relays and Timers
- Section 16945 Plugboards and Cabinets for Relays and PC Cards
- Section 16946 Yard Signal Transformers
- Section 16947 Ground Detectors
- Section 16948 Plug Connectors
- Section 16949 Yard Signal Wire and Cable
- Section 16958 Computerized Yard Control System
- Section 16989 Yard Tests And Inspections
- Section 16991 Yard Signal Drawings and Tracings

1.03 FAIL-SAFE CIRCUIT DESIGN CRITERIA

A. Vital Circuitry

1. Vital circuits shall be based on closed-loop principles; i.e, broken wires, damaged or dirty contacts, a relay failing to respond when energized, or a loss of power supply energy shall not result in unsafe conditions.
2. Fail-safe circuit design for vital circuits shall be achieved by conforming to the fail-safe design criteria specified in Section 16915, Basic Yard Signal Equipment Requirements, in addition to arranging the circuitry in conformance with the principles specified above.

B. Electronic Circuitry

Electronic fail-safe circuit design shall provide protection against the following types of component failures:

1. Two terminal devices:
 - a. open,
 - b. short,

- c. partial open,
- d. partial short
- 2. Multi-terminal devices - any combination of :
 - a. opens,
 - b. shorts,
 - c. partial opens,
 - d. partial shorts

1.04 VITAL CIRCUITS

- A. The following types of circuits are considered vital to the safety of the Yard Signal system:
 - 1. Track Circuits
 - 2. Switch Operating Circuits
 - 3. Switch Locking Circuits
- B. Regardless of how they are implemented, vital circuits shall be of fail-safe design.
- C. Except when specified otherwise, all circuits which energize a vital relay located outside of a Train Control Room and all circuits which energize a vital relay located inside a Train Control Room but which contain contacts located outside of the Train Control Room in which the relay is located, shall be two-wire, double-break circuits and shall be energized from an ungrounded dc power supply.
- D. In addition to these requirements, if non-vital relays are used in vital circuits, it shall be assumed that these relays can fail so that front contacts weld, back contacts weld, or any combination of these events may occur. It shall be assumed that the welding of a front contact will not prevent back contacts from conducting when the relay is de-energized, and that the welding of a back contact will not prevent front contacts of the relay from conducting when the relay is energized. It shall also be assumed that an armature may stick in any position. None of the above events, when they occur, shall cause unsafe conditions.
- E. Switch Operation circuits shall be two-wire, polar, double-break circuits. Overload Stick Relays shall be circuited to meet the operating requirements established in Section 16943. The remaining vital circuits shall be positive-energy, single-break circuits. All of the relays used in these circuits shall have one side of each relay, or each individually controlled relay coil, connected directly to negative energy (common).
- F. When the number of contacts required in vital circuits demand the use of repeater relays, minor circuits shall be operated by contacts of the repeater relays. Minor circuits are defined as those involved in panel illumination, pushbutton box indication illumination, and other similar circuits. The circuits controlled by the prime relay and its repeaters shall be coordinated so that unsafe or undesirable conditions cannot occur if a repeater relay fails to pick up.

1.05 NON-VITAL CIRCUITS

- A. The following types of circuits are not considered vital to the safety of the Yard Signal System:
 - 1. Route Initiation Circuits
 - 2. Route Selection Circuits except specified Pushbutton Stick Circuits
 - 3. Lever Repeater Circuits
 - 4. Switch Indication Circuits
 - 5. Alarm Circuits

- 
6. Blown Fuse Circuits
 7. Switch Repeater Circuits
 8. Switch Correspondence Circuits
 9. Time Locking Circuits
 10. Route Locking Circuits
 11. Detector Locking Circuits
 12. Traffic Locking Circuits
 13. Signal Control Circuits

- B. All non-vital electrical circuits shall be positive energy, single break circuits of the switching type and shall not depend upon timing or precise voltage control for their proper operation.
- C. All non-vital relays shall have one side of each relay, or each individually controlled relay coil, connected directly to negative energy (common).
- D. When the number of non-vital relay contacts required demands the use of repeater relays, minor circuits shall be operated by the contacts on the repeater relays. Minor circuits are defined as those involving panel illumination, pushbutton box indication illumination, DTS indications, and other similar circuits.

1.06 ELECTRONIC CIRCUITS

- A. Electronic circuits interfaced with, or operating in conjunction with Yard Signal relay circuits shall be designed to perform as required by these Specifications.
- B. When electronic circuits are used, either positive one or negative zero logic shall be employed with ground being the other potential.

1.07 OVERLOAD PROTECTION

- A. The Design-Builder shall incorporate appropriately sized fuses, circuit breakers or resistors into the positive side of all grounded Train Control circuits for overcurrent protection.
- B. The Design-Builder shall incorporate appropriately sized fuses, circuit breakers or resistors into both the positive and negative sides of all un-grounded Train Control circuits for overcurrent protection, unless otherwise specified or specifically authorized by the designated Resident Engineer. Circuit breakers used for such service shall be of the single-unit, dual-breaker type.
- C. The Design-Builder shall, to the greatest extent practicable, provide sufficient protection devices and shall group the Yard Signal circuits in such a manner that the tripping of a circuit breaker or the blowing of a fuse will affect service on only one track or one portion of an interlocking.

1.08 MULTIPLE-FEED PROTECTION

The Design-Builder shall ensure that no circuit is fed from more than one energy bus or from more than one overload protective device on a single energy bus.

1.09 RELAY COIL SNUBBING

Wherever a capacitor is used in parallel with one or more relay coils for snubbing purposes, a resistor shall be used in series with the capacitor to prevent shorting the circuit in case of capacitor failure.

1.10 QUALITY ASSURANCE

- A. See Section 01113, Systems Integration.
- B. All Yard Signal System circuits shall be tested as specified in Section 16989, Yard Tests And Inspections

1.11 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements.

PART 2 - PRODUCTS

2.01 COMPONENTS FOR VITAL CIRCUITS

Vital circuits shall be implemented with:

- A. Relays specified in Section 16943, Vital Relays
- B. Electrical and electronic components specified in Section 16941, Basic Yard Signal Electrical and Electronic Component Requirements
- C. Vital signal wire and cable as specified in Section 16949, Signal Wire and Cable
- D. Combinations of the above devices

2.02 COMPONENTS FOR NON-VITAL CIRCUITS

- A. Non-vital circuits shall be implemented with:
 - 1. Relays and timer equipment specified in Section 16944, Non-Vital Relays and Timers
 - 2. Electrical and electronic components specified in Section 16941, Basic Yard Signal Electrical and Electronic Component Requirements
 - 3. Printed Circuit Cards specified in Section 16942, Printed Circuit Cards
 - 4. Combinations of the above devices
- B. Vital relays specified in Section 16943 may also be used in non-vital circuits.

PART 3 - EXECUTION

3.03 WIRES PER TERMINAL

- A. No more than two wires shall be connected to a single terminal or contact pin other than an AAR terminal unless specifically authorized in writing by the designated Resident Engineer.
- B. No more than three wires shall be connected to a single AAR terminal.

3.04 TRACK CIRCUIT INDICATION

The failure of any track circuit shall result in a "track occupied" indication.

3.05 ENERGY LOOPS

- A. Wherever energy is fed from a bus to more than one equipment point in succession:
 - 1. the energy feed wire shall be looped back to the same bus terminal or another terminal on the same bus.
 - 2. Where the energy feed is through an overload-protective device, both sides of the loop shall originate at the same protective device.

- B. Energy loops shall be subject to the following limitations:
 - 1. No more than 30 equipment points or circuits shall be fed from a given energy loop.
 - 2. No more than four rows of equipment shall be fed from a given energy loop.
 - 3. Each energy loop wire shall be sized to carry the maximum normal load which could be imposed by the equipment and/or circuits fed by that loop.

END OF SECTION

THIS PAGE NOT USED

SECTION 16917

BASIC INTERLOCKING REQUIREMENTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the basic requirements for the yard interlockings which the Design-Builder shall furnish, install and test, or partially modify and test under this Contract.
- B. Each interlocking shall be provided with a full complement of safety facilities. These facilities shall meet the requirements of all applicable FRA regulations.
- C. All Yard Signal circuitry for the interlockings shall be as specified in Section 16916, Basic Yard Signal Circuit Requirements, and/or as shown on the Information Drawings.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Submittal Requirements
Section 16916	Basic Yard Signal Circuit Requirements
Section 16941	Basic Yard Signal Electrical and Electronic Component Requirements
Section 16942	Printed Circuit Cards
Section 16943	Vital Relays
Section 16944	Non-Vital Relays and Timers
Section 16945	Plugboards and Cabinets for Relays and PC Cards
Section 16946	Yard Signal Transformers
Section 16947	Ground Detectors
Section 16948	Plug Connectors
Section 16949	Yard Signal Wire and Cable
Section 16971	Racks and Cable Trays
Section 16972	Junction Boxes
Section 16973	Conduit
Section 16974	Locks and Keys
Section 16975	Foundations
Section 16977	Tagging and Marking
Section 16978	Miscellaneous Train Control Components and Materials
Section 16979	Surface Trench
Section 16989	Yard Tests And Inspections

1.03 INTERLOCKING LIMITS

- A. Interlocking limits shall be defined by special track circuit boundaries and controlled wayside signals as indicated on the drawings. These track circuit boundaries will include insulated joints furnished as part of the trackwork installation.

- B. The signal aspects, names and indications to be used by the controlled wayside signals shall be as follows:

ASPECT	NAME	INDICATION
RED over RED	STOP	STOP
LUNAR WHITE (STEADY)	ROUTE CLEAR	PROCEED

1.04 INTERLOCKING TRACK CIRCUITS

- A. Yard interlocking circuits shall be of the AC Power frequency type. Insulated joints will serve as the boundaries of these circuits. The number of insulated joints within each interlocking will be kept to a minimum required to provide for proper operation of the power frequency track circuits.
- B. Track circuits in the new shop lead tracks to the S&I Structure and main storage tracks shall be of the series type.
- C. Loss of shunt protection shall be provided for switch detector tracks. This protection shall consist of a delay in the track relay restoration and shall be provided by a timer circuit as shown on the Information Drawings.
- D. The number, type and boundaries of track circuits to be used within interlockings shall be determined by the Design-Builder subject to the approval of the Authority's Representative.

1.05 TRACK SWITCHES

- A. Interlocking track turnouts and crossovers will be fabricated with 115 lb. RE rail by other disciplines.
- B. The Design-Builder shall furnish and install trailable Alstom Model 6 track switch operating layouts for all newly installed interlocking turnouts and crossovers as specified in Section 16964, and as shown on the drawings.

1.06 SPEED COMMANDS

No speed commands or door-control commands shall be transmitted to the trains, either intentionally or accidentally.

1.07 LOCKING REQUIREMENTS

Electric locking shall be provided to prevent unsafe switch operation and to prevent the clearing of signals for opposing or conflicting routes. The Design-Builder shall provide the following types of locking

- A. Approach Locking - shall be provided to lock switches within a route governed by a cleared wayside signal and to prevent clearing signals for opposing or conflicting routes when a cleared wayside signal is set to STOP and a train is closer than safe braking distance from that signal. Approach Locking shall also prevent simultaneous clearing of opposing signals at a given interlocking. One Approach Locking Relay shall be provided for each wayside signal as shown on the Drawings.

- B. Time Locking - shall be provided to lock switches within a route governed by a cleared wayside signal and to prevent clearing wayside signals for opposing or conflicting routes when a cleared wayside signal is set to stop. Time Locking shall also prevent simultaneous clearing of opposing signals within an interlocking. One Time Locking relay shall be provided for each wayside signal as shown on the Drawings.
- C. Route Locking -shall be provided to lock switches within a route after a train has accepted the wayside signal governing the entrance to the route and to prevent the clearing of opposing signals within the interlockings. Two Route Locking Relays, one for each direction of traffic, shall be provided for each section of track between opposing interlocking signals. Additional Route Locking Relays shall be provided to permit sectional release of Route Locking as required by the Drawings.
- D. Switch Locking (Detector Locking) - shall be provided to prevent operation of a track switch when the track in which the switch is located is occupied, i.e., the track relay is down, or it is otherwise unsafe or undesirable to throw the switch. One Switch Locking Relay shall be provided for each single turnout, for each single crossover, and for each half of a double crossover, all as shown on the Drawings.
- E. Traffic Locking - shall prevent clearing opposing signals into a section of track between two interlockings or intermediate signals, or combinations thereof. Individual Traffic Locking circuits shall be provided for each mainline track between each pair of interlockings, (or intermediate signals) as shown on the Drawings. A signal governing movement into a section of track for which traffic locking is effective shall not clear until traffic direction has been established and locked in the direction of movement for which the signal governs. Traffic Locking shall also prevent the established direction of traffic in a traffic block from being reversed so long as the traffic block is occupied.

1.08 NEGATIVE TRACTION RETURN

See Section 16968 and the Drawings for negative return bonding requirements in the interlocking areas. The Drawings establish the basic guidelines for the Design-Builder's design of the negative traction return system at interlockings.

1.09 ROUTE CONTROL

Route control shall be initiated by the Yard Control Machine and executed when safe.

1.10 QUALITY ASSURANCE

See Section 01113, Systems Integration.

1.11 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements.

PART 2 - PRODUCTS

2.01 ELECTRICAL AND MECHANICAL EQUIPMENT

All electrical and mechanical equipment for track circuits, track switch operating layouts, signal layouts, snowmelter layouts, negative return bonding, signal rail bonding, yard control panels, and vital

and non-vital interlocking circuitry furnished under this Contract shall be as specified in the individual specification sections covering the equipment and as shown on the Drawings.

PART 3 - EXECUTION

3.01 INSTALLATION

The various electrical and mechanical devices composing each interlocking control system shall be installed as specified in the Sections describing those devices and as shown on the Drawings.

3.02 OPERATION

- A. The final operation of interlockings furnished and installed or modified under this Contract shall conform to the operation of similar types of interlockings existing at the yard in which the work is performed.
- B. Control by means of the Yard Control Machine shall be as specified in Sections 16957.

END OF SECTION

SECTION 16921

YARD SIGNAL POWER DISTRIBUTION SYSTEMS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of modifications to the Power Distribution System inside each Train Control Room included in this Contract. The Power Distribution Systems shall include all power supplies, transformers, transfer and bypass equipment, buses, feeders, and mains required to accept electrical energy from the two 3-phase power sources in the Train Control Room, modify this energy as required, and distribute it at the proper voltages to the various pieces of Yard Signal equipment.
- B. Design each Power Distribution System to achieve the best load balance practicable.
- C. Each Power Distribution System shall include a power failure and over current alarm system circuit.
- D. All power supply distribution systems, regardless of rated system voltage, current or frequency, shall deliver the system voltage to the module, device or appliance connected to that system at not less than 95 percent, nor more than 105 percent of the nominal voltage rating of the module, device or appliance.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	System Integration

Section 16989	Yard Tests And Inspections

1.03 POWER SOURCE

See Section 01113, Systems Integration.

1.04 BASIC TCR POWER DISTRIBUTION REQUIREMENTS

See Section 01113, Systems Integration.

1.05 QUALITY ASSURANCE

See Section 01113, Systems Integration.

PART 2 - PRODUCTS

2.01 SEE SECTION 01113, SYSTEMS INTEGRATION

PART 3 - EXECUTION

3.01 INSTALLATION

See Section 01113, Systems Integration.

3.02 IDENTIFICATION

Tag and label the equipment, cables, and buses comprising the modifications and additions to the Yard Signal Power Distribution System as specified in Section 16977, Tagging and Marking.

3.03 POWER TRANSFER SENSIVITY

The Yard Signal Power Distribution System shall be so configured that normal inrush current during a power transfer by the Automatic Transfer Switch shall not trip any input or output fuses or breakers.

END OF SECTION

SECTION 16922

LIGHTNING/SURGE PROTECTION AND GROUNDING SYSTEMS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing, installation, and testing of lightning protection, surge protection and grounding systems for Train Control Rooms, and the grounding of signals, Train Control equipment cases, junction boxes, and other Train Control equipment or apparatus hereinafter specified or shown on the Information Drawings to require grounding. It is the intent of these Specifications that the Design-Builder shall perform all work and furnish and install all equipment necessary to provide complete, operating lightning protection, surge protection and grounding systems which are effective in protecting all Train Control systems from damage and operational malfunction.
- B. Ground connection to the track rails or use of the neutral conductors of the power company or any signal power supply system will not be permitted.
- C. The Design-Builder's design shall preclude any "closed loops" in the Train Control Room lightning protection and grounding systems.
 - 1. A "closed loop" in these systems is a condition which may occur due to multiple contact points between two or more sections of cable tray, or between any combination of cable tray, cable shielding, ground wire, and ground bus bar.
 - 2. Where shielded cable is used, the cable shield shall be grounded, but no electrically contiguous segment of the cable shielding shall be grounded at more than one point.
- D. Provide a complete system of devices to protect the Train Control circuits and equipment from lightning and other electrical surges.
- E. Within Train Control Rooms:
 - 1. The resistance between earth ground and the room prime ground bus shall not exceed 15 ohms.
 - 2. Grounding bus bars furnished under this contract shall have a minimum cross section of one and one-half by one-quarter inches, and shall be made of hard drawn pure copper having a minimum conductivity of 98 percent per ASTM B187-73.
 - 3. Each bar shall be straight and of rectangular cross section. All surfaces shall be true and free of imperfections. Train Control Room "prime" ground bus bars shall be at least two feet in length.
 - 4. Miscellaneous hardware, including such items as lugs, washers, studs, and bolts used for ground connections, shall be bronze.
- F. Outside Grounding Equipment:
 - 1. When grounding rods are required, the rod and clamp shall be in accordance with requirements for grounding material as specified in Section 16978, Miscellaneous Train Control Components and Materials. The connection between the ground rod and the apparatus shall be No. 6 AWG soft drawn, extra-flexible copper wire, or 4/0 wire if more than one ground rod is necessary.

2. Ground rods installed to meet the 15-ohms-or-less requirement shall be either multiple ground rods or sectional rods. Rods connected in multiple shall be spaced a minimum distance of six feet apart.

1.02 RELATED SECTIONS

Related work specified else where shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signaling Submittal Requirements
Section 16914	Environmental Requirements
Section 16923	TC Maintenance Telephone System
Section 16947	Ground Detectors
Section 16952	DC Power Supplies
Section 16965	Signal Layouts
Section 16969	Snowmelter Layouts
Section 16971	Racks and Cable Trays
Section 16978	Miscellaneous Train Control Components and Material
Section 16989	Yard Tests And Inspections

1.03 QUALITY ASSURANCE

See Section 01113, System Integration.

1.04 SUBMITTALS

See Section 01113, System Integration.

PART 2 - PRODUCTS

2.01 GROUND DETECTORS

Ground detectors shall be as specified in Section 16947.

2.02 LIGHTNING AND SURGE PROTECTION EQUIPMENT

- A. Primary surge arresters shall have the ability to shunt relatively high current surges to ground with relatively little overshoot.
- B. Secondary surge suppressors shall have the ability to shunt-to-ground any surge overshoot from the primary arrester devices.
- C. The intermediate impedance devices shall have characteristics which will allow them to assist the initiation of operation of the primary arresters and protect the secondary surge suppressors, and yet not interfere with the normal operation of the Train Control circuits and equipment they are assisting to protect.

PART 3 - EXECUTION

3.01 GROUNDING OF OUTSIDE EQUIPMENT

- A. The following items of wayside equipment at locations external to Train Control Rooms shall each be grounded in the manner specified:
 - 1. All controlled signals required by the final design.
 - 2. All metallic Train Control equipment cases and cable junction boxes.
- B. No more than three pieces of equipment to be grounded shall be connected to each driven ground.
- C. The ground connection wire from each piece of equipment to its associated ground rod shall be run in as direct a path as practicable. No looping or cascading of ground connection wires will be permitted.
- D. All ground rods shall have the grounding wire attached to the ground rod four inches above grade in order to facilitate maintenance inspection. The ground rod shall be driven in such a location that it does not create a tripping hazard.

3.02 GROUNDING OF INSIDE EQUIPMENT

- A. Train Control equipment located the TCR provided by other disciplines shall be grounded as follows:
 - 1. Each equipment rack and entrance rack shall be grounded via a single point ground to overhead grounding bus bars which shall be installed continuously along each row of racks. Each grounding bus bar shall be properly sized and supported at sufficient intervals to prevent sagging. The grounding bus bars shall be mechanically attached via stand-off insulators to the cable tray support system. Joints in the cable tray shall be bonded and each cable tray, consisting of one, two or more sections so bonded, shall be single-point connected to the adjacent ground bus bar. All ground connections to racks, trays and other equipment shall be arranged to facilitate easy removal to allow the testing of the electrical isolation between each item of equipment and the ground bus. Surfaces of equipment shall be cleaned of paint, rust, corrosion, oil, or other possible insulating material, before ground connections are made. Joints in ground bus bar shall be kept to a minimum. When joints are necessary, they shall be shown in detail on the Design-Builder's design drawings for the grounding system, as approved by the Designated Authority's Representative.
 - 2. The Design-Builder shall make all ground connections in the Train Control Room to a prime ground bus bar furnished and installed by others. This prime ground bus bar will be a minimum of two feet in length and Control system related connections required. It will be of sufficient length to accommodate all Train be mounted on insulating stand-offs on a wall of the Train Control Room, approximately four feet above the floor. This prime ground bus bar will be connected to a number 4/0, six foot pigtail (provided by others) which is the lead to the main ground connection for the applicable room. Each ground wire connected to the room prime ground bus bar shall be identified by an embossed metal tag indicating the wire's origin.
 - 3. Ground bus bars as installed shall be free from sharp edges. All joints shall be assembled with a uniform pressure of 200 pounds per square inch.
 - 4. Items of Train Control equipment:
 - a. Which contain an external ground post, shall be grounded to their respective rack and not directly to the room prime ground.
 - b. Train Control equipment which contains an internal connection to the ac distribution system neutral, shall not be grounded.
 - c. All other individual apparatus not located on racks and shown on the Information Drawings or herein specified to be grounded shall be connected

to the room prime ground bus with individual insulated No. 6 AWG (or larger as necessary) extra-flexible soft drawn copper wire. These connections shall be designed to be of the shortest possible length consistent with good workmanship and the layout of the room.

5. If shielded cable is used as part of the Design-Builder's Train Control System, each electrically continuous segment of cable shielding shall be grounded at only one point.

3.03 LIGHTNING AND SURGE PROTECTION

Conform to all wiring and equipment installation methods and procedures known, and provide all types and levels of lightning arresters and surge protectors necessary, to protect the Train Control equipment from damage or operational interference.

END OF SECTION

SECTION 16923

TC MAINTENANCE TELEPHONE SYSTEM

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Provide all telephone jacks and plugs, terminals, jack boxes, rotary selector switches, interconnecting twisted pair wiring and speaker phones to expand the existing system to incorporate the new equipment provided under this contract. No instrument ringing shall be provided.
- B. Provide TC Maintenance Telephone jacks in or on each of the following pieces of equipment as applicable under this Contract
 - 1. Power, Entrance, and Equipment Racks (2 per rack; front and back)
 - 2. Large Junction Boxes, to include TC/COMM Interface Cabinets and DTS interface boxes or cabinets furnished by other disciplines, and Wayside Interface or Distribution Junction Boxes furnished by the Contractor.
 - 3. Signal Junction Boxes
 - 4. Switch-and-Lock Movements

PART 2 - PRODUCTS

2.01 TELEPHONE JACKS

Telephone jacks for the TC Maintenance Telephone System shall be Type NL-112B as manufactured by Switchcraft, Inc., or approved equal, except that Type N-112B may be used on racks in the TCRs or on thin sheet metal boxes. Springs shall be silver-plated, nickel silver. A nylon bushing shall be provided to insulate jack sleeves from mounting surfaces. Terminals at all telephone jack locations shall be arranged to accommodate at least two pairs of No. 16 AWG wires.

2.02 EXTERNAL JACKS

All telephone jacks mounted on junction boxes or equipment housings outside of Train Control Rooms shall be enclosed in wired entrance boxes or weatherproof housings and shall be equipped with spring-loaded jack-covers, Switchcraft No. 520, or approved equal.

2.03 TELEPHONE PLUGS

All telephone plugs shall be Type 267 as manufactured by Switchcraft Inc. or approved equal. Plugs shall have solder terminals with built-in strain-relief clamp.

2.04 SPEAKER PHONES

- A. Furnish six speaker phones for each of the TCRs modified under this Contract. Each speaker phone shall operate from either an internal power supply fed by external 120V ac, or a self-contained battery pack using conventional penlite batteries which shall be easily replaceable. Each speaker phone shall be equipped with a call button switch and a push-to-talk button switch.
- B. The speaker phones shall meet or exceed the following specifications:
1. Receive Mode
 - Sensitivity: -30dBm
 - Impedance: 600 ohms, 300 Hz to 3kHz
 - Frequency Response: ± 3 dB from 300 Hz to 3kHz
 - Audio Power: 200mw
 2. Transmit Mode
 - Output: ± 5 dBm
 - Impedance: 600 ohms, 300 Hz to 3kHz
 - Frequency Response: ± 3 dB from 300 Hz to 3kHz
 3. Physical
 - Size: (Maximum) 8 inches x 5 inches x 4 inches
 - Weight: (Maximum) 24 oz. (including batteries)
 4. Battery
 - Type: Dry - Alkaline
 - Cell Size: AA (1.5V penlite)
 - Life: 125 hours minimum
 5. Protection - No damage to the speaker phone shall result from connection across 120V ac or 150V dc.
 6. Leads - shall be six feet long and equipped with type 267 plugs; lead insulation breakdown voltage shall be 600V ac.
- C. An adaptor cable shall be provided with each speaker phone. The adaptor cable shall consist of a six foot length of extra flexible single-pair cable, with an insulated jack to accept the type 267 plug at one end and a pair of insulated alligator clips at the opposite end.
- D. Speaker Phones shall be "Nobelphone Portable Telephone Model P-11" as manufactured by Nobel Co., Ltd., Tokyo, Japan, or approved equal, modified to meet additional requirements specified above.

2.05 SELECTOR SWITCH UNITS

A rotary, six-pole, six position wafer switch shall be furnished to select various combinations of TC Maintenance Telephone connections at each Train Control Room. This switch and a terminal strip of pressure-clamp type communications terminals shall be mounted on a metal plate suitable for installation in a standard size space on the entrance rack. The mounting plate shall be steel with a

black or gray enamel finish, or anodized aluminum. The front of the plate shall be clearly and permanently marked to indicate the various connection combinations available for the various positions of the rotary switch, all as shown on the Information Drawings. The back of the plate shall be marked to indicate the terminal coordinates for the switch plate wiring.

PART 3 - EXECUTION

3.01 INSTALLATION

A. External Jacks

The weatherproof external jacks shall be so mounted on external cases, housings and junction boxes that the jacks may be used without opening the junction box, case or housing. The two wires from the telephone jack shall be terminated on terminals mounted inside the associated case, housing or junction box. The Design-Builder shall make twisted pair connections to other locations from these terminals.

B. External Wiring

1. The Design-Builder shall use No. 16 AWG twisted pair cable, as specified in the non-vital wire portion of Section 16949, Signal Cable and Wire, to connect all the external TC Maintenance Telephone jacks mounted on Yard Signal equipment within the control limits of each TCR to the selector switch in that TCR as shown on the Information Drawings. The Design-Builder shall install a separate twisted pair cable for each track in each direction from the TCR. Each cable shall connect all the TC Maintenance Telephone jacks mounted on Yard Signal and support system equipment located along that particular track within the TCR area limits. The twisted pair installed along each track shall be extended to connect with the corresponding TC Maintenance Telephone pair from each adjacent TCR as shown on the Information Drawings.
2. The Design-Builder shall use one No. 19 AWG twisted pair out of each special control and indication cable to connect the TC Maintenance Telephone jack in each DTS Interface junction box to the TC Maintenance Telephone System in the Train Control Room as shown on the Information Drawings.

C. Internal Wiring

The Design-Builder shall use No. 16 AWG twisted pair cable to connect all of the TC Maintenance telephone jacks on panels, racks and junction boxes located within each TCR, to the selector switch in that TCR. Two individual single-conductor wires twisted together will not be acceptable.

D. Jack and Plug Wiring

All jacks and plugs shall be wired with white insulated wire on the tip side and black insulated wire on the ring side.

- #### **E.**
- In all instances, the TC Maintenance Telephone jacks shall be installed in such a manner that they are easily seen and easily accessible for use. A room-temperature vulcanizing adhesive sealant shall be applied to the threads of phone jacks to prevent them from loosening due to vibration and use.

3.02 FIELD TESTING

- A. Test each TC Maintenance Telephone jack after the system has been installed in the field to assure a minimum resistance of one megohm between each jack and the equipment on which it is mounted.
- B. The TC Maintenance Telephone System provided under this Contract shall be tested to ensure that voice communications with a minimum signal-to-noise ratio of 15dB can be maintained through the extreme ends of all possible TC Maintenance Telephone circuits:
 - 1. Between TCRs located within the new route segment,
 - 2. Between these TCRs and external wayside equipment jacks along each track within the new route segment,
 - 3. Between all the TCRs and wayside equipment jacks located within the route segment provided under this Contract and the nearest adjacent TCR originally equipped under previous contracts,
 - 4. Between all TCRs and DTS junction boxes newly connected under this Contract.
- C. The minimum resistance and minimum signal-to-noise ratio characteristics specified above shall be regarded as part of the criteria for acceptance of the TC Maintenance Telephone System. The Design-Builder shall provide whatever effort and material is required to meet these criteria at no additional cost to the Authority.
- D. Record the results of the above described field tests for submittal to the designated Resident Engineer.

END OF SECTION

SECTION 16929

EVENT RECORDING SYSTEM

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the design, furnishing, installation, testing and documentation by the Design-Builder of changes and additions to the existing Shady Grove Yard Event Recording System which shall monitor, record, store, print and display in various formats, the status of various Yard Train Control functions over a period of time. It is the intent of this Section that the Design-Builder shall perform the detail design, implementation, testing and documentation of a new, microprocessor-controlled monitoring and recording system for the Brentwood Yard Signal Control and Interlocking System that is accurate, user friendly, versatile in output formats, easily expandable, and easy to troubleshoot and maintain, and which meets all stated or implied requirements of these Specifications. It is further the intent of this Section that the Design-Builder shall prepare and present instruction manuals and a comprehensive course of instruction in the operation and maintenance of this system for selected Authority personnel.
- B. The Event Recording System shall consist of:
1. A computer-based processing unit having:
 - a. A storage unit with sufficient capacity to identify and store all specified yard Signal Control and Interlocking System event system event changes over a 32 day period with redundant backup on a hard disk drive and a removable backup media such as a zip drive or tape drive with capacity large enough to store 32 days of data. The minimum storage capability of the storage unit provided shall be one gigabyte.
 - b. An intelligent reading device which, upon interrogation, shall transmit the stored information in various formats to a local or remote display monitor and/or printer. The printed event changes shall be described in plain English with a minimum use of abbreviations and technical terms.
 - c. An internal diagnostic subsystem complete with error detection contact closure wired to external terminals. The contact closure provided shall be adequate for extended operation of an external indication relay.

- d. All necessary interfacing devices for the parallel input and output of information.
- 2. A local, internal VGA CRT display monitor and a 101 key ruggedized keyboard.
- 3. A local plug-in printing device.
- 4. A 1.44 MB floppy disc drive in addition to the primary memory.
- 5. A minimum of two Serial Output Ports and two Parallel Output Ports.
- 6. Applicable power supplies with a built-in standby capacity for two days of operation without external power.
- 7. All specified wired vital and non-vital relay contact closures in the various Yard TCRs (or their computer generated equivalents from the Computerized Yard Control System for non-vital indications) .
- 8. All interfacing wiring and/or data links for the data points to be monitored.
- 9. A rack in the Yard Train Control Room for the mounting of the components of the recording system.
- 10. All applicable software for the operation of the system as specified herein and as approved by the Authority's Representative. This software shall be completely documented with flow charts, definitions of terms used, and written explanations of its operation. The final, as-built version of this software, including any commercially available compiler, shall become the property of the Authority.
- C. A programmable answering feature shall be provided and ancillary devices provided for connecting the Event Recording System to the TCR telephone line. This shall allow the Event Recording System to be interrogated from a remote location and to transmit stored information to a remote monitor and/or printing device.
- D. The Contractor shall provide all equipment, wiring practices and other features necessary to protect all components of the Event Recording System from radio interference, lightning discharges and power surges.
- E. The Contractor shall provide instruction manuals and training courses for designated Authority personnel for the operation and maintenance of this system.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, work specified in the following Sections and documents:

Section 01113	Systems Integration
Section 16912	Yard Signaling Submittal Requirements
Section 16916	Basic Yard Signal Circuit Requirements
Section 16922	Lightning/Surge Protection and Grounding of Equipment
Section 16942	Printed Circuit Cards

Section 16943	Vital Relays
Section 16945	Plugboards and Cabinets for Relays and PC Cards
Section 16957	Yard Control Machine
Section 16958	Computerized Yard Control System
Section 16971	Racks and Cable Trays
Section 16989	Yard Test and Inspections

1.03 QUALITY ASSURANCE

See Section 01113, Systems Integration.

1.04 SUBMITTALS

See Section 16912 Yard Signal Submittal Requirements.

1.05 DELIVERY, STORAGE AND HANDLING

- A. The various modules included in the event recording system shall be properly crated during shipment. All damages incurred in transit or caused by mishandling or improper storage shall be the Designer-Builder responsibility and shall be corrected to the satisfaction of the Authority's Representative at no additional cost to the Authority.

PART 2 - PRODUCTS AND MATERIALS

2.01 BASIC SYSTEM REQUIREMENTS

- A. The Event Recording System shall meet the following minimum requirements:
1. The system shall be equipped to monitor a minimum of 500 points. Modular construction shall be utilized such that the initial system can be easily expandable in the field to monitor up to 1000 points.
 2. All data points shall be monitorable continually, including during viewing and/or printing, both locally and/or remotely via RS232 interface. One local monitoring device, and two remote test monitoring devices shall be supplied.
 3. All detected changes of state shall be recorded with the device identification, new status, and the time and date of occurrence.
 4. Event printouts and/or displays shall be accurate to 0.1 second.
 5. Displays and printouts shall be menu driven and manually initiated from a local or remote keyboard or other interrogating device.
 6. Displayed and/or printed data shall include the following information in a format easily readable and understandable by Train Control maintenance personnel:
 - a. Type of Event,
 - b. Julian date,
 - c. Time of occurrence,

- d. Point identification, and
 - e. New state.
7. Standby battery shall be provided as an integral part of the Event Recording System to prevent loss of the time base during external power failures or shut-down periods up to two days in duration.
 8. Controls shall be provided for setting the date and the time; for initiating the viewing and/or printing of stored data in the desired format, and; for adding new devices to be monitored.
 9. The printer shall be capable of printing one event per line, two lines per second.
 10. Input wiring to the system shall be easily removable to facilitate testing.
 11. Detection of an error in the Event Recording System (by the internal diagnostic subsystem) shall cause a change in status of the externally wired error detection contact closure.
 12. The system shall include automatic and manually-initiated screen saving.
 13. The Event Recorder shall have a relational database to display related recorded events.
 14. Storage devices and output ports shall be the latest industry standard.
 15. Communications shall be the latest industry protocols.

2.02 INPUT STORAGE

- A. The minimum storage capability of the hard disk drive provided shall be one gigabyte. The Design-Builder shall furnish sufficient storage media for 32 days of events.
- B. The program which controls the hard disk drive storage shall store the yard events in a file format labeled on a daily basis (0000-2400 hours) by date and year, with one separate file for each day. These files shall be further subdivided by the type of event, i.e., switch machines, controlled signals, track occupancy, auxiliary devices, alarms, etc.
- C. The event storage program shall automatically rotate through the storage area, erasing the oldest of the 32 daily files at the start of each new day's recording.

2.03 OUTPUTS

- A. The processor shall have the capability of outputting information to a local or remote monitor, printing device or floppy disc in various menu-driven, operator-selectable formats as approved by the Authority's Representative. These formats shall include, but not be limited to:
 1. Single device status over a selected period of time.
 2. Single device status real time.
 3. Multiple device status over a selected period of time

4. Multiple device status real time
5. Complete file for a particular day
6. All devices, real time

B. The type of format, time period, and device identification shall be selectable by the interrogator from a menu appearing on the monitor. The menu shall also enable the interrogator to select the output device or devices. Output to the local or remote monitors shall have complete scrolling capabilities.

2.04 SPARE MATERIAL

- A. The Design-Builder shall furnish the following spare material for the Event Recording System:
1. For each type of printed circuit card used, ten percent spare cards or one spare card, whichever is greater.
 2. One carton (or not fewer than 6 rolls or fan- fold packages) of print-out paper.
 3. Other spare material as may be recommended by the manufacturer(s) of the various system modules.

PART 3 EXECUTION

3.01 INSTALLATION

- A. The Contractor shall install the major computer components of the Event Recording System on a rack in the Yard (main) Train Control Room in a manner previously approved by the Authority's Representative.
- B. The Contractor shall provide indication contacts on appropriate equipment for use by the Event Recording System. These functions shall include, but not be limited to the following, unless otherwise authorized by the Authority's Representative:

Function	Contact Closure
1. Track occupancy (Except Yard Storage Tracks)	(TR or TYPR)
2. Signal clearing	(HG)
3. Normal switch	(NWC)
4. Reverse switch	(RWC)
5. Switch locked	(LR)
6. Snowmelter control request	(SMZ)

Function	Contact Closure
----------	-----------------

7.	Snowmelter "ON" indication	(SMZ and SMYK)
8.	Ground detected	(AC and DC ground detector relays)
9.	Blown fuse or tripped breaker	(BFPK)
10.	Yard Computer Malfunction	(YCMK)
11.	AC Power Transfer	(ATWK)
12.	DC Power off	(POK)
13.	Traffic Locked Normal	(NFR)
14.	Traffic Locked Reverse	(RFR)
15.	Traffic Stick	(FS)
16.	Snowmelter Failure	(SMFYK)
17.	Dragging Equipment	(DEQK)
18.	Yard/Mainline Interface Under Yard Control	(LYDZS)
19.	Yard/Mainline Interface Under Mainline Control	(LBAZS)

- C. The Contractor shall provide plug connector receptacles for the Event Recording System wiring on the racks containing equipment to be monitored in the various Yard TCRs.
- D. The Contractor shall provide the interconnecting cable between the event recording equipment and test contact receptacles on the various racks, and between the rack test contact receptacles and the appropriate test contacts on the equipment mounted on the racks.
- E. The Contractor shall provide all necessary wiring and interfaces between the Event Recording System and the Computerized Yard Control System, if provided.

END OF SECTION

SECTION 16931

YARD SIGNAL MAINTENANCE AND TEST FACILITIES

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A This Section specifies the furnishing and installation by the Design-Builder of certain storage and maintenance facilities and equipment at the yards modified under this contract. TCR maintenance and test equipment may be substituted with equipment of similar value to satisfy the needs of a particular room, as approved by the Authority's Representative.
- B Provide the following at each Train Control Room and TCER equipped under this Contract:
 - 1. A workbench and stool for reading plans.
 - 2. A wall-mounted storage cabinet for spare parts.
 - 3. A 6-foot fiberglass stepladder.

PART 2 - PRODUCTS

2.01 TCR MAINTENANCE EQUIPMENT

- A Workbench
 - 1. The workbench shall be 42 inches high, 60 inches wide, and 30 inches deep.
 - 2. The framework for the bench shall be 14-gauge cold rolled steel.
 - 3. Side panels shall be 14-gauge cold rolled steel, and the under panels shall be 16-gauge steel.
 - 4. The bench top shall be Formica bonded to three-quarter inch thick plywood.
 - 5. The bench shall have a heavy-duty drawer, supported by the bench frame and capable of storing a Room Book of Plans under the bench top.
 - 6. The drawer shall be steel as specified above and shall have the following minimum dimensions:
 - a. 4 inches high
 - b. 40 inches wide
 - c. 25 inches deep.
- B Stool
 - 1. The stool shall have a 14 inch diameter seat with tubular steel adjusting leg extensions that lock securely at one inch intervals.
 - 2. The legs shall be adjustable from 18 inches to 27 inches.
- C Cabinet
 - 1. The storage cabinet shall be made of steel.
 - 2. It shall be
 - a. 36 inches high,
 - b. 60 inches wide, and
 - c. 16 inches deep, with one shelf.
 - d. Shelf height shall be adjustable. supported every 15 inches.
 - e. The cabinet shall have 4 doors for access.

D Stepladder

The stepladder shall be:

1. heavy-duty, type 1A
2. 6-foot self-supporting
3. fiberglass
4. folding ladder

E Locker

The locker shall be made of steel. The locker shall be 72 inches high, 36 inches wide, and 18 inches deep, and shall have four adjustable-height shelves. The locker shall have a full-height hinge, and lockable double doors.

F Print Storage Rack

The print storage rack shall be wall mounted or mounted on the side of an existing equipment rack. This storage rack shall support the room plans by suspending them from their binding on the left margin. The rack shall be adequately sized to support all bound drawings of the Train Control Room Book of Plans. The rack shall be safely positioned in such a manner that the rack and stored plans do not impede normal access to any Train Control equipment and do not block any personnel passageways in the Train Control Room. The rack shall be mounted at such a height that the bottom of the stored plans is at least 18 inches above the floor.

PART 3 - EXECUTION

3.01 INSTALLATION

- A Install the TCR maintenance equipment in each Train Control Room or as otherwise approved by the designated Resident Engineer.
- B Mount the storage cabinet on the wall above the workbench. The bottom of the storage cabinet shall be no less than 15 inches above the top of the workbench.

END OF SECTION

SECTION 16932

SPARE YARD SIGNAL EQUIPMENT AND SELECTABLE ITEMS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Specifications for
 - 1. The furnishing of spare Yard Signal equipment for this Contract.
 - 2. The furnishing of a price list of recommended Yard Signal-related tools and equipment components.
 - 3. The method to be used to determine prices to be charged to the Authority for items of Spare Yard Signal Equipment, and for items of Recommended Yard Signal Tools and Equipment Components.

- B. The Design-Builder shall furnish and deliver to the Authority the quantities of spare Yard Signal equipment specified, and the quantities of selectable Yard Signal tools and equipment components chosen by the Authority from the approved price list submitted by the Design-Builder.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 16911	Scope of Work
Section 16912	Yard Signaling Submittal Requirements
Section 16964	Trailable Switch Operating Layouts
Section 16965	Signal Layouts
Section 16969	Snowmelter Layouts

1.03 QUALITY ASSURANCE

See Section 16912, Yard Signal Submittal Requirements.

1.04 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements.

PART 2 - PRODUCTS AND MATERIALS

2.01 SPARE EQUIPMENT

Furnish the following complete items and modules of spare equipment:

- A. One complete Alstom Model 6 track switch operating layout. This layout shall include:

1. All items specified for a track switch operating layout in Section 16964, Trailable Switch Operating Layouts. The specific layout of the switch, i.e. right or left hand, shall be determined by the Authority's Representative.
2. One complete set of special adjusting tools for yard switch machine, and a switch circuit controller to match the above layout.

- B. One each of any items provided under this Contract which have not previously been installed on WMATA property.

2.02 RECOMMENDED YARD SIGNAL TOOLS AND EQUIPMENT COMPONENTS

The Design-Builder shall provide a price list of recommended Yard Signal tools and equipment components required under this Contract.

PART 3 - EXECUTION

3.01 DETERMINATION OF PRICES

- A. Prices for items of Spare Yard Signal Equipment (Part 2.01) and for items of Recommended Yard Signal Tools and Equipment Components (Part 2.02) which are manufactured by the Design-Builder shall not exceed 85% of the Design-Builder's published catalog prices in effect at the time of ordering such equipment.
- B. Prices for items of Spare Yard Signal Equipment (Part 2.01) and Recommended Yard Signal Tools and Equipment Components (Part 2.02) which are not manufactured by the Design-Builder shall not exceed 85% of the published catalog prices in effect at the time of ordering such equipment.

3.03 PREPARATION

- A. All spare equipment provided under this Section shall be packaged or treated to preclude deterioration of the product due to environmental conditions.
- B. All spare equipment, tools and equipment component items shall be properly packaged or crated by the Design-Builder to prevent damage to the items during shipment and storage.

3.04 DELIVERY

- A. Upon notification by the Design-Builder of the delivery schedule, the designated Authority's Representative will furnish WMATA part numbers for all spare Yard Signal equipment, tools and equipment components to be delivered. Each tool, equipment component and piece of spare equipment shall be identified by the Design-Builder with a WMATA identification number prior to delivery to the Authority.
- B. The Design-Builder shall deliver the spare Yard Signal equipment items to the address or addresses designated by the Authority no later than the Contract completion date specified in SECTION 101, Article IX, Commencement, Prosecution and Completion of Work.

END OF SECTION

SECTION 16941

**BASIC YARD SIGNAL ELECTRICAL
AND
ELECTRONIC COMPONENT REQUIREMENTS**

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies basic electrical requirements for Yard Signal work, and the characteristics of certain basic electrical components which shall be furnished and installed by the Design-Builder.
- B. This Section specifies basic electronic requirements for Yard Signal work, and the characteristics of certain basic electronic components which shall be furnished and installed by the Design-Builder.

1.02 BASIC ELECTRICAL AND ELECTRONIC COMPONENT REQUIREMENTS

All electrical and electronic components provided under this Contract shall be:

- 1. New and free of manufacturing defects,
- 2. Free of storage and handling damage,
- 3. Clearly and permanently labeled with value and type identification,
- 4. Rated to operate at power, voltage, current and temperature levels at least 20 percent in excess of those to which the components will be subjected in service,
- 5. Available from the manufacturer within 90 days of order, with a guaranteed supply for 20 years.
- 6. Commercially available in the Washington, D.C. area.
- 7. Capable of operating as required in the environmental conditions specified in Section 16914, Environmental Requirements.
- 8. Any Yard Signal module, device or appliance, furnished or provided under this Contract, which requires power to be supplied from a power supply system, regardless of system voltage, current, or frequency, shall be capable of operating satisfactorily and continuously at any voltage throughout the range of plus or minus 8 percent of the rated system voltage.

1.03 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 16911	Scope of Work
Section 16912	Yard Signaling Submittal Requirements
Section 16914	Environmental Requirements
Section 16921	Yard Signal Power Distribution Systems
Section 16931	Yard Signal Maintenance and Test Facilities
Section 16942	Printed Circuit Cards
Section 16978	Miscellaneous Train Control Components and Materials

1.05 QUALITY ASSURANCE

See Section 01113, Systems Integration.

PART 2 - PRODUCTS

2.01 FUSES

- A. Fuses shall be of the non-renewable, fibre-case, time-lag, fusion type.
- B. Fuses for installation on equipment racks and all fuses associated with power supplies shall be of the indicating type.
Note: This does not apply to AC track circuit fuses.
- C. Fuses shall be rated for a minimum of 125 percent of the maximum connected load and derated for an ambient operating temperature of 120 degrees F.

2.05 CIRCUIT BREAKERS

- A. Provide circuit breakers which meet the following requirements:
 - 1. Each breaker shall have a short-circuit current interrupting rating in excess of the short-circuit current capability of the power supply to which it is connected.
 - 2. Each breaker shall have a nominal trip current rating of not less than 125 percent of the maximum steady current required by its load, derated for an ambient operating temperature of 120 degrees F, and in no case, less than two times the current rating of the largest connected branch circuit current limiting device.
 - 3. When the breaker is utilized to supply power to loads with inrush current ratings higher than their steady current ratings, the selected breaker shall have a time-delay characteristic curve suitable for that load, according to the breaker manufacturer's recommendations.
 - 4. The breaker shall have endurance ratings equal to or greater than 5000 operations at rated voltage and current.
- B. The Design-Builder shall select a breaker with characteristics designed to meet environmental conditions encountered in TCRs as stated in Section 16914, Environmental Conditions.
- C. Circuit breakers shall be UL-listed.

2.06 TERMINAL BLOCKS

- A. Basic Characteristics
Terminal blocks shall be modular, with solderless connections of the pressure clamp type. Connection resistance shall not exceed 0.0002 ohms. Terminals of the pressure clamp type shall be suitable for solid or stranded wire. Individual modular blocks shall have the following features:
 - 1. Built-in facility for affixing tags for identification.
 - 2. Terminals cross-connectable by shunt straps or sliding links as applicable.
 - 3. All metal parts recessed below the surface of the insulating material.
- B. Insulation
 - 1. Terminal blocks shall be rated for service at 600 volts minimum.
 - 2. Terminal block insulating material shall meet the requirements of ASTM Specification D-704, Type 6-695

2.07 TERMINALS FOR WIRES AND CABLES

- A. All stranded signal wires of size 6 AWG or smaller to be terminated on terminal posts under this Contract shall be fitted with the approved crimp-on type terminal lugs.
- B. Lugs for wires larger than No. 6 AWG shall be insulated with heat shrink tubing.

2.08 TRANSFORMERS

Transformers shall not emit audible noise in excess of 40 dB referenced to 0.0002 dynes per sq. cm. at a distance of two feet while operating at rated voltage and load.

2.09 SEMICONDUCTOR DEVICES

- A. All transistors, diodes, zener diodes or other semi-conductors furnished under this Contract shall carry a Joint Electron Device Engineering Council (JEDEC) number and shall be used within the published specifications for that number.
- B. All semiconductors furnished under this Contract shall be of the silicon type.
- C. Zener diodes used for voltage regulation or reference levels shall be of such rating that they will not be damaged if the entire load is removed abruptly, and shall have a zener voltage tolerance of plus-or-minus 5 percent or better.

PART 3 - EXECUTION

3.01 ELECTRICAL INSTALLATION

- A. Install all basic electrical components of the correct type, size and rating required to provide the specified operation of the Yard Signal system. This shall include replacement of basic electrical components damaged or burned out in the course of installation and testing.
- B. Fuses shall be installed and removed using a suitable tool designed for such use. Provide a properly sized fuse puller within reach of every fuse in every rack containing fuses. The fuse pullers shall be attached to the racks at intervals not exceeding every third rack by means of non-conductive lanyards of the shortest length sufficient to reach all fuses in the three adjacent racks. These pullers shall be installed prior to commencement of any electrical test activities.
- C. Lugs shall be attached to the conductor with a tool made by the same manufacturer as the lug and/or terminal being used. The tool shall be equipped with a ratchet device which ensures proper application of the lug and which will not release until proper compression is attained. Tools which are excessively worn, damaged, abused, or show evidence of missing parts shall not be used. A minimum of one of each type of crimping tool shall be furnished.
- D. The Design-Builder shall use removable type contacts on plugboards for plug-in relays.
 - 1. The method of attaching the wires to the removable contacts shall be a solderless connection,
 - 2. Plugboards for vital relays may be solderless or soldered.
- E. The method proposed for the application of solderless type terminals to wires of 1000 volt class shall be fully described and submitted to the designated Authority's Representative for approval.

END OF SECTION

THIS PAGE NOT USED

SECTION 16942

PRINTED CIRCUIT CARDS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the characteristics of printed circuit (PC) cards which shall be furnished and installed by the Design-Builder.
- B. The design and construction of PC cards of the same subsystem shall be of the same design. Cards of different subsystems shall be of the same design and construction wherever practicable.

1.02 RELATED SECTIONS

- A. Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 16929	Event Recording System
Section 16941	Basic Yard Signal Electrical and Electronic Component Requirements
Section 16945	Plugboards and Cabinets for Relays and PC Cards
Section 16957	Yard Control Machine
Section 16958	Computerized Yard Control System

1.03 QUALITY ASSURANCE

- A. See Section 16912, Yard Signal Submittal Requirements.

PART 2 PRODUCTS

2.01 BASIC DESIGN

- A. The Design-Builder shall arrange the PC card circuitry in such a manner that terminals assigned to a given power supply, common, or ground shall be the same on each PC card in each subsystem.
- B. The Design-Builder shall arrange the remaining PC card circuitry in such a manner that terminals assigned to a given function shall be the same on all PC cards in each subsystem.
- C. PC cards containing circuits performing logic functions which affect train safety or train routing shall be designed and circuited in such a way that removal or insertion of a PC card shall not create an unsafe condition.

2.02 CONSTRUCTION

- A. Printed circuit cards shall be constructed of glass epoxy material meeting the requirements of NEMA Type FR-4.
- B. PC cards shall be of sufficient thickness to permit easy insertion and removal without buckling or breaking.
- C. PC cards shall be mechanically keyed to prevent incorrect interchange, or electrically interlocked to prevent operation in the event of incorrect interchange. They may also be interlocked through software programming.
- D. Conductor material shall be copper and shall be protected from exposure to air.
- E. Circuits shall be formed by etching. The etched circuits of vital PC cards shall conform exactly to the logic of the corresponding vital circuits contained in the Specifications. No external jumpers shall be used on vital PC cards provided under this Contract, either initially, or on replacement cards.
- F. PC cards shall be coated with an approved moisture-proofing compound.

2.03 COMPONENT MOUNTING

- A. PC card-mounted-components which weigh more than one-half ounce or have a displacement of more than one-half cubic inch shall have a structural attachment to the card which is separate from the electrical attachment.

2.04 IDENTIFICATION

- A. Each type of PC card shall be permanently and legibly marked with a unique number identifying that type of PC card.
- B. Each PC card shall be permanently and legibly marked with a unique serial number.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Printed circuit cards shall be installed in 19-inch card file cabinets of the type specified in Section 16945, Plugboards and Cabinets for Relays and PC Cards, or in other special hardware approved by the designated Authority Representative.

END OF SECTION

SECTION 16943

VITAL RELAYS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of all relays to be used in circuits which are vital to the safety of train control or operation. This shall include biased neutral relays, switch operating relays, switch overload relays, vital dc timer relays, vane type ac track relays and special purpose dc neutral relays.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 16911	Scope of Work
Section 16912	Yard Signaling Submittal Requirements
Section 16916	Basic Yard Signal Circuit Requirements
Section 16945	Plugboards and Cabinets for Relays and PC Cards
Section 16971	Racks and Cable Trays
Section 16977	Tagging and Marking
Section 16989	Yard Test and Inspections

1.03 QUALITY ASSURANCE

See Section 01113, Systems Integration.

1.04 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements.

1.05 DELIVERY, STORAGE AND HANDLING

Vital relays shall be shipped separately from the racks in which they are to be mounted.

PART 2 - PRODUCTS

2.01 BASIC REQUIREMENTS

- A. All vital dc relays furnished shall conform to the applicable recommendations established by the AREMA Signal Manual, Part 6.2.1 (Tractive Armature DC Neutral Plug-in Relay) and Part 6.4.1 (DC Relays).
- B. All vital dc timer relays shall conform to the recommendations established by the applicable sections of Part 6.1.20 (Time Element Relay) of the AREMA Signal Manual.

- C. All ac track relays shall conform to the recommendations established by Part 6.4.5 (AC Relays) and Part 6.1.35 (AC Induction Type Relay) of the AREMA Signal Manual.
- D. All vital relays shall be of the US&S PN-150 type or the GRS (Alstom Signaling Inc.) "B" type, or an approved equal.
- E. All vital dc timer relays furnished under this Contract shall be identical and shall be Microchron Timer Relays, Drawing No. 50800-100, GR.2, as manufactured by Alstom Signaling Inc. (formerly General Railway Signal Company) of Rochester, New York, or an approved equal.
- F. All vital relays and their plugboards shall be equipped with mechanical registration devices to prevent relays of the wrong style, contact arrangement, or operating characteristics from being mounted on any given plugboard. These registration devices shall be applied to the vital relays and their plugboards prior to mounting the relays on the plugboards for factory testing of rack wiring.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. All vital relays shall be rack mounted.
- B. Relays shall be mounted at their preassigned locations on the racks only after the racks have been permanently mounted in the Train Control Room.

3.02 SPECIAL REQUIREMENTS

- A. Each biased neutral relay and each track relay, or their relay-repeater combinations, shall have at least one spare dependent front-back contact or one spare independent front and one spare independent back contact. This requirement shall be met throughout the installation and test period and at the conclusion of all field corrections.
- B. One Normal and one Reverse Switch Operating Relay shall be provided for each switch movement.
- C. One Switch Overload Relay shall be provided for each switch movement.
- D. Each track relay or track relay-repeater combination shall have one back contact wired out to a plug coupler for use by a track indication panel, as specified in Section 16956, Interlocking Control Panels. If the vital track relay is repeated by a non-vital logic relay, a contact on the non-vital repeater relay may be used for this purpose.
- E. No more than 90 percent of the available relay space in each relay rack shall be filled at the time of installation, and no more than 95 percent of the available relay space in each relay rack shall be filled upon completion of all field corrections and testing.
- F. Where vital relays are added to existing Train Control Room racks, the new relays shall be mounted in conformance with the existing relays, i.e., in such a manner that the fronts of all relays in the rack are in the same vertical plane.

END OF SECTION

SECTION 16944

NON-VITAL RELAYS AND TIMERS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of relays and timers used in circuitry not considered vital to the safety of train control or operation.

1.02 DESCRIPTION

Non-Vital Relays are specified in three categories as follows:

- A. Non-vital logic relays
- B. Non-vital general purpose interfacing relays
- C. Non-vital heavy duty interfacing relays

1.03 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, work specified in the following Sections and documents:

Section 16911	Scope of Work
Section 16912	Yard Signaling Submittal Requirements
Section 16916	Basic Yard Signal Circuit Requirements
Section 16942	Printed Circuit Cards
Section 16943	Vital Relays
Section 16945	Plugboards and Cabinets for Relays and PC Cards
Section 16971	Racks and Cable Trays
Section 16989	Yard Test and Inspections

1.04 QUALITY ASSURANCE

See Section 01113, Systems Integration.

1.05 SUBMITTALS

See Section 16912 Yard Signal Submittal Requirements.

PART 2 - PRODUCTS

2.01 BASIC NON-VITAL RELAY REQUIREMENTS

- A. Non-vital logic relays shall conform to the recommendations established by the AREMA Signal Manual, Part 6.3.5 (Detachable DC Non-vital Relay).
- B. Non-vital logic relays shall be type "J," as manufactured by the Alstom Signaling, Inc., or type LP-100, as manufactured by the Union Switch & Signal Company, or an approved equal.

- C. All non-vital logic relays furnished under this Contract shall be identical.
- D. Non-vital relays and timers provided shall be available from the manufacturer. Equipment which is no longer manufactured, or equipment for which the manufacture is scheduled to be discontinued shall not be acceptable.

PART 3 - EXECUTION

3.01 INSTALLATION

Logic Relays and Heavy-Duty Interfacing Relays

- A. Non-vital logic relays and non-vital heavy interfacing relays shall be mounted in racks or metal cabinets as shown on approved plans. No more than 90 percent of the available relay space in each rack or cabinet shall be filled at the time of installation, and no more than 95 percent of the available relay space in each rack or cabinet shall be filled upon completion of all field corrections and testing.
- B. Cabinets used to mount these relays shall have transparent front plates which do not support combustion. These cabinets shall be mounted in racks as specified in Section 16971.

END OF SECTION

SECTION 16945

PLUGBOARDS AND CABINETS FOR RELAYS AND PC CARDS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing, installation, and wiring of various mounting devices for vital and non-vital relays and printed circuit cards.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be lifted to, the following Sections:

Section 16911	Scope of Work
Section 16912	Yard Signaling Submittal Requirements
Section 16915	Basic Yard Signal Equipment Requirements
Section 16916	Basic Yard Signal Circuit Requirements
Section 16942	Printed Circuit Cards
Section 16943	Vital Relays
Section 16944	Non-Vital Relays and Timers
Section 16948	Plug Connectors
Section 16949	Signal Wire and Cable
Section 16977	Tagging and Marking
Section 16978	Miscellaneous Train Control Components and Materials

1.03 QUALITY ASSURANCE

See Section 01113, Systems Integration.

1.04 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements.

PART 2 - PRODUCTS

2.01 BASIC RELAY PLUGBOARD REQUIREMENTS

- A. Plugboards for vital relays, non-vital logic relays, and non-vital heavy-duty interfacing relays shall have the following characteristics:
1. The plugboard shall be designed for vertical mounting.
 2. The plugboards shall be designed for the insertion of removable contacts attached to the external wiring.
 3. The plugboards shall be designed in such a manner that the removable contacts shall make direct contact with the relay coil leads and the relay contact springs.
 4. Arc suppression, when required, shall be built into the relay plugboards or shall be mounted on the back of the plugboards, if it is not built into the relays themselves.
 5. The back of each vital relay plugboard shall be equipped with a tag to indicate the nomenclature of the relay for which it is wired.

- 
6. Plugboards shall be identical for each type of plug-in relay.
 7. Plugboards for plug-in relays shall be designed for the insertion of removable contacts. The removable contacts shall be designed for connection to the wires by means of solder less connections.
- B. Plugboards for vital relays shall have the following features in addition to those specified above.
1. Vital relay plugboards shall be equipped with one voltage test post and one combination voltage-and-current test post unless otherwise specified.
 2. Vital relay plugboards for biased-neutral frequency-selection (QR) relays shall be equipped with one voltage test post and one combination voltage-and-current test post for the coil leads of each coil.
 3. Each current test post shall be so designed that ammeter leads can be attached and the test post opened to check the current without interrupting current flow to the relay coil involved.

2.03 CABINETS

- A. Cabinets used to house non-vital relays and printed circuit cards, shall be of rigid metal construction and shall be designed for mounting on standard 19-inch equipment racks.
- B. Cabinets shall be constructed of a non-corroding metal or shall be painted to the manufacturer's standard to match the finish of the equipment racks in which they are to be mounted.
- C. Each cabinet shall have a transparent front dust cover which will permit easy viewing of relay name tags and indication lights.
1. This dust cover shall be made of a shatter-proof material which will not support combustion or emit poisonous or corrosive gases, even when exposed to flame or extreme heat.
 2. The cover shall be hinged or otherwise attached for easy removal from the cabinet.
 - a. Fasteners for the front dust cover shall be of the rugged, metal, half-turn, twist-lock design.
 - b. The rear cover shall either be hinged or secured with screws or fasteners of the half-turn, twist-lock design. The screws for fastening the rear cover shall have slotted heads with knurled finger grips and captive lockwashers for ease of assembly into a captive nut on the module.
- D. Relay and printed circuit board cabinets shall be equipped with plug connectors of the type specified in Section 16948, Plug Connectors.
1. These plug connectors shall be mounted on the back panel of the cabinet.
 2. Internal wiring between these plug connectors and the relay plugboards, or the PC card connectors, shall be as specified for module wiring in Section 16949, Signal Wire and Cable.
 3. Sufficient slack shall be provided in this wiring to permit easy access to the relay plugboards and/or printed circuit card connectors mounted inside the cabinet when the cabinet back panels are open.

PART 3 - EXECUTION

3.01 INSTALLATION OF RELAY PLUGBOARDS

- A. Relay plugboards shall be factory installed and wired. A full complement of non-corroding fasteners shall be used to mount the plugboards on equipment racks or in relay cabinets.

- B. Stripping and crimping tools recommended by the manufacturer of the contacts shall be used to make all wire-to-contact connections. A minimum of one of each type of crimping tool shall be furnished.
- C. Each contact wire shall be of sufficient length to permit the contact to which it is connected to be moved to any contact position on the same relay plugboard. The wiring to each removable contact shall carry an approved tag indicating the relay contact number assigned to the wire.

3.02 INSTALLATION OF RELAY CABINETS

- A. Cabinets for non-vital relays shall either be rack mounted prior to shipment or installed on the racks in the field.
- B. Cabinets shall be marked with their identifying geometric coordinates as specified in Section 16977, Tagging and Marking.

END OF SECTION

THIS PAGE NOT USED

SECTION 16946

YARD SIGNAL TRANSFORMERS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of all transformers for Yard Signal power distribution and isolation purposes, and for such other purposes as may be required to accomplish the functions specified herein.

1.02 GENERAL REQUIREMENTS

- A. Transformers shall be in accordance with the recommendations of Part 14.2.10 (Transformer, Dry Type) of the AREMA Signal Manual.
- B. The Design-Builder shall furnish transformers having nameplate ratings at least 25 percent in excess of the maximum computed loads they are to supply.

1.03 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 16911	Scope of Work
Section 16912	Submittal Requirements
Section 16921	Yard Signal Power Distribution Systems
Section 16959	Series Type Track Circuit Layouts
Section 16963	Power Frequency Track Circuit Layouts
Section 16965	Signal Layouts
Section 16989	Yard Test and Inspections

1.04 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.05 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements

PART 2 - PRODUCTS

2.01 BASIC TRANSFORMER REQUIREMENTS

- A. Transformers shall not emit audible noise in excess of 50 dB (referenced to .0002 dynes per sq. cm.) at a distance of three feet while operating at rated voltage and load.
- B. Coil conductors shall be continuous with terminations brazed or welded without auxiliary flux material. The entire core and coil assembly shall be predried by heat, impregnated with varnish or other approved compound, and cured at a minimum of 350 degrees F to reduce

hotspots and seal out moisture. Coils shall be protected with an outer layer of glass tape or similar quality insulation.

- C. Yard Signal transformers furnished under this Contract shall have insulation capable of withstanding 3000 volts DC between windings or from winding to core. The insulating material shall be subject to the approval of the designated Resident Engineer.
- D. Yard Signal transformers furnished under this Contract shall be equipped with suitably insulated screw terminals, or standard AAR binding posts, for all primary and secondary lead wires.

2.02 POWER FREQUENCY TRACK TRANSFORMERS

- A. The 60-Hz track circuit transformers required to supply power to track circuits shall meet the following requirements in addition to those specified above:
 - 1. Track transformers shall have a nominal primary voltage of 120 volts,
 - 2. Shall also have primary winding taps and terminals for 110 and 115 volts.
 - 3. The secondary windings shall be provided with taps and terminals to supply voltages in one-volt increments up to a maximum of 15 volts.
 - 4. Track transformers shall be capable of carrying the track circuit load plus 25 percent, but in no case shall they be rated less than 300 VA.

2.03 SERIES TRACK CIRCUIT TRANSFORMERS

- A. Track feed transformers shall have a nominal primary voltage of 120 volts. Track feed transformers shall also have primary winding taps and terminals for 110 and 115 volts.
- B. The Secondary windings of the track feed transformers shall be provided with taps and terminals to supply voltages in one volt increments up to a maximum of three volts.
- C. The windings of the step-up transformers used for track relay pickup purposes shall be wound in the ratio of one-to-forty. No adjusting taps are required on either the input or output windings of these transformers.
- D. The track feed transformers and relay pickup transformers shall be capable of carrying the track circuit load plus 25%, but in no case shall they be rated less than 60 VA for each associated track circuit.

2.04 SIGNAL HEAD TRANSFORMERS

Signal head transformers shall meet the requirements specified in Section 16965, Signal Layouts, in addition to the Basic Transformer Requirements specified above.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Power and isolation transformers shall be rack mounted.
- B. Mounting panels or brackets shall be rigidly designed so that they do not sag under the weight of the transformer.

END OF SECTION

SECTION 16947

GROUND DETECTORS

PART 1 GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of Ground Detectors for the uninterruptible, ungrounded, 120 Vac, and the ungrounded 28 Vdc energy buses in each Train Control Room.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 16911	Scope of Work
Section 16912	Yard Signaling Submittal Requirements
Section 16922	Lightning/Surge Protection and Grounding Systems
Section 16989	Yard Test and Inspections

1.03 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.05 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements

PART 2 PRODUCTS

2.01 BASIC DESIGN REQUIREMENTS

- A. The dc ground detector shall be sensitive enough to detect leakage currents from either terminal of the floating supply to ground through leakage paths having resistances throughout the range of zero to 10,000 ohms.
- B. The ac ground detector shall be sensitive enough to detect currents to ground (from either terminal of the floating supply) which would flow through an impedance of 2000 ohms.
- C. The ground detection schemes utilized shall allow the detectors to be immune to transient current flows that may be the result of charging distributed supply-to-ground capacitances.
- D. The detectors shall also be immune to induced power line ripple which may exist between the supply leads and ground.
- E. The ground detectors shall have a memory capability to provide an indication of a momentary or intermittent supply to ground leakage condition.

- F. The operation of the ground detectors shall not interfere with the operation of power, communication or Yard Signal circuits or equipment.
- G. The ground detector circuits shall meet the fail-safe design criteria with respect to open circuits. The shorting or opening of any component part of the ground detector circuits shall be detectable.
- H. The "made" ground in the ground detecting part of the circuits shall be checked to validate its presence. This check shall be continuously made in a fail-safe manner.
- I. The ground detector repeater relays shall be vital relays and shall be energized when no ground is being or has been detected.
- J. The ground detector circuits shall operate over the specified temperature range and over a voltage range of from zero volts to 10 percent above the rated voltage of the power supply with which they are associated.

2.02 OPERATION AND INDICATIONS

- A. It shall be necessary to manually reset either ground detector to its normal operating condition after a ground has been detected. The ground detector shall not remain in its normal indication position upon reset if the ground condition has not been eliminated.
- B. Each ground detector shall be equipped with two indicator lights:
 - 1. A white indicator to indicate that both buses are clear of grounds.
 - 2. A red indicator to indicate that a ground has occurred.
- C. Each ground detector shall be equipped with an electrically isolated contact to provide remote indication of a detected ground.
- D. Each ground detector shall be equipped with a three-position, center-off, momentary-contact test switch to check the operation of that detector by providing momentary leakage paths from ground to the buses being monitored. The impedance of these paths shall be
 - 1. 10,000 ohms for dc ground detectors
 - 2. 2000 ohms for ac ground detectors.

PART 3 EXECUTION

3.01 INSTALLATION

The Design-Builder shall install ground detectors in any new power racks in each TCR.

END OF SECTION

SECTION 16948

PLUG CONNECTORS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of multiple position plug connector assemblies required to connect multiconductor cables and/or individual wires to the internal wiring of racks, control panels or equipment modules.

1.02 DESCRIPTION

- A. These assemblies shall hold and insulate individually mated, extractable pin-and-socket contacts which shall be mechanically crimped to individual wires or wire wrap pins.
- B. The connector assemblies shall be easily connected and disconnected by hand and shall be provided with mechanical locking and keying devices.
- C. Two basic types of connectors shall be furnished; a 28 contact, vital circuit type, and a 50 contact, non-vital circuit type.

1.03 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signaling Submittal Requirements
Section 16949	Yard Signaling Signal Wire and Cable
Section 16978	Miscellaneous Train Control Components and Materials

PART 2 - PRODUCTS

2.01 PLUG CONNECTOR ASSEMBLY

Each plug connector assembly shall consist of the following:

- A. A two-part molded plastic connector block equipped to hold an appropriate number of solderless, pin-and-socket contacts.
- B. Devices for the mechanical locking and keying of the connector block halves.
- C. Protective shells for both connector block halves.
- D. A strain relief device for the external wiring portion of the connector assembly.
- E. Solderless, extractable pin-and-socket contacts.

2.02 CONNECTOR BLOCKS

- A. The connector blocks shall consist of molded dielectric plastic shaped to accept the required number and types of contact pins, contact sockets and locking, keying and mounting devices. The dielectric material shall exhibit a minimum insulation resistance of 100 megohms as measured between adjacent pairs of contacts and between the accessory hardware and the closest contacts in each connector assembly half immediately after being exposed to 100 percent relative humidity at 120 degrees F for a period of at least 48 hours.
- B. The contact cavities shall be arranged in a rectangular grid configuration. The opening for each contact shall be uniquely identified by a coordinate molded into both the mating and wiring faces of each part of the connector block.
- C. The 28 contact, vital plug connector blocks shall provide a surface leakage distance of not less than 1/4 inch between contacts and between the contacts and any other metallic part of the connector assembly.

2.03 LOCKING AND KEYING

- A. Each plug connector assembly shall include a device for mechanically locking the two mated parts together.
- B. Mechanical devices and facilities shall also be provided to allow the mating parts of connector assemblies to be keyed in such a manner that they cannot be coupled except when in the correct position relative to each other and cannot be coupled to the mating parts of other coupler assemblies keyed in a different pattern and to no other plug connector assembly within the immediate area.

2.04 PROTECTION AND STRAIN RELIEF

- A. Each half of the plug connector block shall be protected by a metal shield which shall extend beyond the mating surface. These two shields shall overlap when the connector halves are coupled.
- B. The external wiring portion of each plug connector assembly shall be equipped with a device to grip the external wiring firmly in order to prevent strain on the plug connector contacts.

2.05 PIN AND SOCKET CONTACTS

- A. The pin and socket contacts shall be fabricated from commercial bronze or brass and plated with gold over nickel underplate. The retention springs of the pin and socket contacts shall be fabricated from stainless steel.
- B. The contacts shall be fabricated and classified in the required selection of sizes to accept wire sizes 16 through 22, AWG.

- C. Contact current rating and termination resistance shall meet the requirements of the following table with properly sized contacts applied to the wire sizes specified.

WIRE SIZE (AWG)	16	18	20	22
Minimum Current Rating (Amperes)	13.0	10.0	7.5	5.0
Maximum Termination Resistance (Milliohms) at rated current	1.7	2.0	2.7	4.0

- D. Contact termination resistance shall be measured in accordance with Method 307 of MIL-STD-202 at the rated current specified for each wire size.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. The 28 way, vital plug connector assembly shall be required where any vital circuits are to be interconnected and the 50 way, non-vital plug connector assembly shall be used where no vital circuits are to be interconnected.
- B. A plug connector may be dedicated to a single 50 or 30 conductor cable or it may be shared by several cables or types of wire. When plug connectors are dedicated to single multiconductor cables, 20 percent of the wires and connector contacts shall be reserved for future working circuits.
- C. When a plug connector is assembled to a multiconductor cable, the strain relief device shall grip the cable outer sheath.
- D. When a vital plug connector is dedicated to a 30 conductor cable, all but two of the cable wires shall be terminated on connector contacts. The two extra wires shall be properly terminated and inserted into any contact cavity of the connector block. These wire ends shall be folded, taped, and stored under the strain-relief clamp for possible future service.
- E. When a non-vital plug connector is dedicated to a 50 conductor cable, each wire shall be terminated properly on a connector contact.
- F. In each case, a uniform scheme shall be followed in assigning specific cable wires to specific connector contacts.
- G. Where a full hand grasp is required to connect or disconnect a plug connector, a minimum of two inches of clear space shall be provided around the connector. A minimum of three-quarters of an inch of clear space shall be provided around connectors which can be connected or disconnected with thumb and fingertips only.
- H. Plug connectors shall be located and installed in such a manner that no part of the plug connector or its cable will extend beyond the wire routing as defined by the wire supports and in no circumstances shall the connector or its cable be permitted to protrude into an aisle.

- I. Each plug connector assembly, as finally installed, shall be marked in such a manner that its mating halves shall be distinctly identified as being related to each other, but to no other plug connector assembly within the immediate area. These identification markings shall be applied in such a manner that they will not be obscured or worn off in normal use.
- J. Tools used to apply plug connector contacts to wire and tools used to extract contacts from the plug connector blocks shall be the size and type recommended by the manufacturer of the plug connector assemblies. A minimum of one of each type of these tools, to include one of each type of tool which may be necessary for the removal and/or replacement of the jack-screws shall be furnished under Section 16978.
- K. The Design-Builder shall furnish and install a mating blank plug coupler, complete with all accessory hardware, for each rack or module plug coupler installed as "future" or "spare."

END OF SECTION

SECTION 16949

YARD SIGNAL WIRE AND CABLE

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section includes specifications for the internal and external wire and cable to be used for the Yard Signal Control and Interlocking Systems.

1.02 INTERNAL SIGNAL WIRE AND CABLE

- A. Internal wire and cable shall be used only for wiring inside train control rooms, signal equipment houses and cases.
- B. Internal wire and cable shall comply with applicable recommendations of the AREMA Signal Manual.
- C. Internal plug connected cable assemblies shall be as specified in this section and in Section 16948. Plug Connectors.

1.03 EXTERNAL SIGNAL WIRE AND CABLE

- A. This Section specifies the furnishing and installation of the three basic groups of cable required for Yard Signal system wiring external to the Train Control Rooms and signal equipment housings. The basic external cable groups are:
 - 1. Signal Cables
 - 2. Special Control and Indication Cables
 - 3. Negative Propulsion Return Cables
- B. The Design-Builder shall provide properly designed, well made, and thoroughly tested external cable for vital and non-vital signal circuit, and negative propulsion return applications, which will render long service life to the Authority.
- C. External cable furnished by the Design-Builder shall be of rugged construction and shall have insulating and jacketing materials capable of a 40 year average service life. These cables shall be suitable for use in the environment to be encountered in the WMATA Rail Rapid Transit System and shall be certified for continuous operation at 90 degrees C in wet or dry locations, whether in trays, troughs, duct bank or conduits, above or below ground, or installed directly in the ground. All external cable furnished by the Design-Builder shall be termite proof.
- D. External signal cables supplied shall meet or exceed the requirements of the current applicable standards of ICEA, NEMA, UL, ASTM, and the recommendations of Part 10.3.19 of the AREMA Signal Manual, with modifications and/or additions as detailed herein. Individual conductor insulation shall be Ethylene Propylene Rubber (EPR) as described in ICEA S-95-658.
- E. Multiconductor external signal cables permitted under this Contract shall have 2, 5, 7, 9, 12, 14, 19, 27, or 37 conductors. Multiconductor Special Control and Indication cables permitted under this Contract shall have 2, 6, 18, 25 or 50 twisted pairs.
- F. Multiconductor external signal cables containing more than two conductors shall contain 20-percent spare conductors or two spare conductors, whichever is greater. Local distribution

cable shall contain ten percent spare conductors or one spare conductor, whichever is greater, except that two conductor local distribution cables (such as track circuit leads) will not require spare conductors.

- G. The requirements of these Specifications shall apply when there is a difference between the requirements of these Specifications and other specifications referenced herein.
- H. All insulation and jacketing compounds offered on this Contract by the cable manufacturer shall be formulated, applied, and, where applicable, vulcanized by the cable manufacturer in his own facilities, except as specified herein.
- I. If the cable manufacturer does not normally compound and otherwise prepare insulating materials in its own plant, it is acceptable for the cable manufacturer to have its proprietary formulations compounded and prepared at another, non-owned facility which complies with the manufacturing and end-product quality requirements specified herein.
- J. The Design-Builder may request the option, on an individual case basis, of providing, conduit, sleeves, pipe, core-boring or other special cable installation facilities approved by the designated Authority Representative, which will either reduce the amount of cable required by providing more direct cable runs, or will provide access where no direct access was provided by others. (The Design-Builder shall inform the designated Authority Representative at least two weeks in advance, and shall obtain approval at least one week in advance, of any core-boring work.)

1.05 QUALITY ASSURANCE FOR YARD SIGNAL WIRE AND CABLE

- A. All wire and cable manufacturers supplying wire and cable for this Contract must be approved by the designated Authority Representative. The Design-Builder shall provide all of the data necessary for the demonstrations and tests required by the designated Authority Representative. Approval will be based on the following criteria:
 - 1. Past Performance and Experience
The cable manufacturer must have had at least ten years of successful experience

in supplying wire and cable to the railway/rapid transit industry for use as vital circuit signal control cable. A certified list of such installations spanning the past ten years shall be provided by each cable manufacturer desiring to be considered.

2. Quality Assurance Program:

- a. The manufacture of wire and cables shall comply with the requirements of Specification Section 00722, Quality Control/Quality Assurance and shall incorporate a Quality Assurance Program which meets the intent of the ASQC Standard C1-1985 corrected 1987, General Requirements for a Quality Program. Such compliance shall promote the production of properly designed, well made, and thoroughly tested cable which will render long service life to the user. Efficient methods of production, test, and product evaluation shall be used, but prime concern shall be focused on the necessary formal quality requirements to ensure that wire and cable failure cannot be attributed to actions or lack of actions by the manufacturer.
- b. The manufacturers of wire and cable, and, where applicable, the cable insulation and/or jacket insulation material manufacturer(s), must have had a printed Quality Assurance Program, applicable to the type(s) of cable or insulation to be provided under this Contract, continuously in effect for at least seven years.
- c. If the cable manufacturer has its proprietary cable insulation material formulations compounded and prepared at another, non-owned facility, this facility shall be subject to the same Quality Assurance Program procedures, systems, and requirements that have been approved for the cable manufacturer's use in its own facilities, and shall be subject to audit by the Authority.

3. Technical Data

- a. Each manufacturer of wire and cable shall provide full technical data which demonstrates his (and, where applicable, the cable insulation manufacturer's) compliance with the requirements of these Specifications for each specified cable type to be provided.
- b. Each manufacturer of wire and cable shall provide sample pre-printed data sheets which include:
 - (1) a Certified Test Report;
 - (2) an Inspection Sheet for Wire and Cable;
 - (3) a Physical Test Report, and;
 - (4) a Quality Assurance Traceability Schematic.

4. Qualification Tests

- a. Each manufacturer of wire and cable (and, where applicable, the insulation and/or jacket insulation material manufacturer) shall conduct the required qualification or prototype testing which demonstrates compliance with the requirements of these Specifications for each specified cable type.
- b. The Authority reserves the right to witness any or all of the qualification tests and shall be notified two weeks in advance of the testing.

B. After Selection

Each finished wire and cable shall be traceable to the test data on file for each step in its manufacturing process. The tests which must be conducted during manufacture of the wire and cable shall include the following:

1. Physical and mechanical properties for each batch of insulating material, and, where used, for each batch of conductor jacketing material.
2. Physical and mechanical properties for each batch of external cable outer sheath material.
3. Electrical properties for one reel of finished conductor fabricated from each batch or combination of batches of insulating and jacketing material.
4. Electrical properties for one reel of finished external cable from each batch of cable outer sheath material.

5. Specified Flame Test for each conductor size for each batch or combination of batches of insulating and jacketing material.
 6. Specified Flame Test for each conductor size for each batch of cable outer sheath material.
 7. Specified Smoke Density Test for each batch or combination of batches of insulating and jacketing material.
 8. Individual insulated conductors used in external cables, prior to cabling, shall be either AC or DC water tank tested after a minimum immersion time of six hours. For these tests, which shall be conducted per ICEA S-95-658, Section 6.10.1, test voltages shall be applied for a period of five minutes. While still immersed, the insulated conductors shall be subjected to the applicable test voltages as follows:
 - a. Minimum AC Test Voltage = 120 volts per mil of insulation thickness
 - b. Minimum DC Test Voltage = 375 volts per mil of insulation thickness
 9. Voltage tests required for each reel of finished wire or cable after application to the shipping reel shall be either the AC Voltage test or the DC Voltage test. For these tests, which shall be conducted per ICEA S-68-516, Section 6.10.1, test voltages shall be applied for a period of five minutes. The appropriate minimum test voltages shall be as follows:
 - a. Minimum AC Test Voltage = 120 volts per mil of insulation thickness
 - b. Minimum DC Test Voltage = 375 volts per mil of insulation thickness
- C. The Authority reserves the right to witness any or all of the above tests and shall be notified two weeks in advance of each of the above tests.
- D. The Design-Builder shall prepare and certify a report for each of the above tests, to include all pertinent facts concerning the conditions and results of that test, plus the backup information required.

1.06 SUBMITTALS FOR INTERNAL SIGNAL WIRE AND CABLE:

- A. Complete technical data describing the internal wire and cable which the Design-Builder proposes to furnish in compliance with the requirements of this specification section.
- B. Certified test reports of all breakdown tests conducted on finished internal wire and cable as specified.
- C. Certified test reports of all flame tests conducted on finished internal wire and cable as specified.

1.07 SUBMITTALS FOR EXTERNAL WIRE AND CABLE:

- A. The Design-Builder shall submit two certified copies of the following to the designated Authority Representative for approval:
 1. A certified list of each cable manufacturer's railway/rapid transit signal installations for the past ten years.
 2. Each cable manufacturer's (and, where applicable, each insulation and/or jacket material manufacturer's) Quality Assurance Program.
 3. Full technical data for each type of cable which each cable manufacturer intends to supply.
 4. Test procedures for cable and cable insulating material.
 5. Test reports of cable tests conducted in the field in accordance with approved testing procedures.
- B. Information to be supplied by certified cable test reports for external cable shall include, but not be limited to, the following:
 1. Report number
 2. Date and location of test

3. Description of test and test conditions
 4. Complete cable or wire description
 5. Lot, batch, and/or reel identification number
 6. Quantitative test results
 7. Summary of the test results
 8. Information on the components of the cable tested to include batch numbers and physical and electrical properties.
 9. Traceability data.
- C. Submit detailed drawings showing the method and materials he intends to use to support cables in manholes and pull chambers
- D. Submit to the designated Authority Representative a program for maintaining and assuring the mechanical and electrical integrity of cable during cable pulls into pipe or conduit, as recommended by the cable manufacturer.
- E. Submit the manufacturer's recommended pulling tension for each type of cable to be used, for both cable grip and core hitch methods. The formula(s) for determining multi-cable pull calculations shall also be included. This information shall be submitted prior to any cable pull.
- F. Two copies of a "Pull Sheet" for each planned cable pull shall be submitted by the Design-Builder to the designated Authority Representative at least one week prior to each actual cable pull. This "Pull Sheet" shall include the following information:
1. Date of proposed pull
 2. Cable nomenclature(s)
 3. Cable type(s)
 4. Cable routing
 5. Recommended pulling method
 6. Maximum recommended tension (as determined by the type of cable and pulling method, or, for multi-cable pulls, by calculation using the applicable formula(s).
 7. Room for recording the date of the actual pull, the maximum pull tension experienced during the pull, and any other pertinent information concerning the pull.
- G. Approved Pull Sheets will be returned to the Design-Builder prior to the proposed pull. The Design-Builder shall record the date of the actual pull, the actual method used, the maximum tension experienced during the pull, and other pertinent information, and resubmit the Pull Sheet(s) to the designated Authority Representative.

1.07 DELIVERY, STORAGE AND HANDLING FOR YARD SIGNAL WIRE AND CABLE

- A. Shipping, storage and handling of wire and cable shall be in accordance with the recommendations contained in Part 10.4.1 of the AREMA Signal Manual, the applicable cable manufacturer's recommendations, and as further specified herein.
- B. Cables shall be reeled in such a manner that both ends are accessible for testing on the reel.
- C. Mark each single-conductor cable and each multiple-conductor cable to show UL label, size, voltage, manufacturer and number of conductors in accordance with NEC requirements.
- D. Store the cables in a dry and secure facility.
- E. During storage and handling prior to final conductor termination, cable ends shall be sealed to prevent the entrance of moisture.

PART 2 - PRODUCTS

2.01 INTERNAL WIRE AND CABLES

A. Internal Wire Conductors shall meet the requirements specified below:

1. Conductors:

a. Stranded Conductors:

- 1) Conductors shall be soft or annealed copper wire for electrical purposes, per the latest revision of ASTM B-33 and B-3.
- 2) Strands and rope members shall be concentrically stranded using unilay (UNI), concentric (CON), and bunch (BUN) construction as specified in table below:

Conductor Size (AWG)	Stranding (NO/Size)	Strand Type	Conductor Nominal Diameter		Nominal DC Resistance @ 20 Degrees C	
			(mils)	(mm)	(Ohms/1000ft)	(Ohms/km)
24	19/36	UNI	23.6	.599	25.7	84.3
22	19/34	UNI	29.6	.752	15.8	51.8

* Double Pass Concentric

b. Solid Conductors:

- 1) Conductors shall be soft or annealed copper wire for electrical purposes, per the latest revision of ASTM B-33 and B-3.
- 2) Solid conductors for wire wrap:

Conductor Size (AWG)	Conductor Nominal Diameter		Nominal DC Resistance @ 20degreesC	
	(Mils)	(mm)	(Ohms/1000 ft)	(Ohms/km)
30	10.3	.262	114	374
28	13	.330	70.5	231
26	16.4	.417	44.7	147
24	20.7	.526	27.8	91.2
22	26.1	.655	17.1	56.1
20	32.9	.836	10.5	34.4

4. Insulation for stranded and solid wires:

- a. The insulation material for stranded and solid conductor wires shall be modified ethylene tetrafluoroethylene (ETFE) per ASTM D3159-a, unless otherwise specified.
- 1) All insulation for AWG 12 through AWG 24 shall be Tefzel 200 or equivalent. Tefzel HT-2127 or equivalent may be substituted for Tefzel 200 for enhanced flexibility.
 - 2) All insulation for AWG 10 through 500 kcmil shall be Tefzel 280 or equivalent.
 - 3) All insulation for the solid conductor wire wrap wire shall be Tefzel 750 or equivalent per UL Subject 758, Style 10125 and will include wire sizes AWG 26-30.
- b. Wire Construction: The finished wire diameters, weights, and ampacity ratings:

Stranded Wires Rated 0-600V

Conductor Size (AWG)	Nominal Insulation Thickness		Nominal Wire OD		Nominal Weight		Ampacity
	(mils)	(mm)	(mils)	(mm)	(lbs/M ft)	Kg/Km	
24	15	.381	53.6	1.361	2.8	4.17	1.5

20	6	.152	44.9	1.141	3.7	5.51	-

* Ampacity rating not available for these low amperage circuits.

c. Insulation Thickness shall not be less than 90% per NEMA HP-100-1991, Section 3.2. for Stranded and Solid Wires:

d. Wire Performance Requirements:

1) The insulation shall be applied directly to the surface of the specified conductors and shall adhere tightly to the surface, but shall be free stripping and shall leave the conductor clean.

2) The following tests shall be performed for each production run.

a) Impulse dielectric or direct current spark test 100% of the wire per the following requirements:

	Impulse Dielectric Test Voltage KVAC (Peak)	DC Spark Test Voltage KVDC
Wire rated 0-150V	1.5	3.0
Wire rated 0-300V	5.0	7.0
Wire rated 0-600V	6.5	12.0
Wire rated 0-1000V	8.0	16.0
Wire rated 0-2000V	10.0	20.0

3) The insulation must meet the aging requirements, heat distortion, insulation resistance, and dielectric constant (SIC) requirements of NEMA HP100.2-1991, Table 2-1 and the additional tests specified herein.

e. Color Coding of Wires:

1) Internal wires shall be color coded in accordance with the approved wire manufacturer's standard practice or as described below:

a) Cables of unpaired wires shall be solid color in the color sequence as shown below. The second color is achieved by using a stripe that is clearly identifiable and permanent.

b) Table - Color Code of Individual Wires of Multi-conductor Cables.

1.	Black	26.	Black/Violet
2.	Brown	27.	Black/Gray
3.	Red	28.	Black/White
4.	Orange	29.	Brown/Black
5.	Yellow	30.	Brown/Red
6.	Green	31.	Brown/Orange
7.	Blue	32.	Brown/Yellow
8.	Violet	33.	Brown/Green
9.	Gray	34.	Brown/Blue
10.	White	35.	Brown/Violet
11.	White/Black	36.	Brown/Gray
12.	White/Brown	37.	Brown/White
13.	White/Red	38.	Red/Black
14.	White/Orange	39.	Red/Brown
15.	White/Yellow	40.	Red/Orange
16.	White/Green	41.	Red/Yellow
17.	White/Blue	42.	Red/Green
18.	White/Violet	43.	Red/Blue
19.	White/Gray	44.	Red/Violet
20.	Black/Brown	45.	Red/Gray
21.	Black/Red	46.	Red/White
22.	Black/Orange	47.	Orange/Black
23.	Black/Yellow	48.	Orange/Brown
24.	Black/Green	49.	Orange/Red
25.	Black/Blue	50.	Orange/Yellow

c) In paired cables, one wire of each pair shall be white and the other wire shall be coded in accordance with the sequence of the first 21 wires given in table above, omitting the solid white. This color sequence shall be repeated as required to provide identification of all pairs.

5. Jacket:

a. Jacket of extruded black low density; high molecular weight polyethylene material shall be provided for:

- 1) Single conductor cables.
- 2) Outer jacket of multiple conductor cables.

b. Average jacket thickness on single conductor cables shall be 15 mils minimum.

c. Average jacket thickness for outer or overall jacket on multiple conductor cables shall be 45 mils minimum.

d. Minimum jacket thickness at any point shall not be less than 80 percent of that specified.

2.02 INDIVIDUAL EXTERNAL WIRE CONDUCTORS

A. General Requirements

1. All conductors of external wire and cable, including the individual conductors of multi-conductor signal cables, shall be rated for continuous operation at 90 degrees C in wet or dry locations, whether in trays, troughs or conduits above or below ground, exposed runs, or direct buried. The rated life shall be 40 years.
2. The insulation of external signal cables shall be either Grade E-1 or E-2 ethylene propylene rubber per ICEA S-95-658. Individual conductors shall be insulated with either Type I EPR insulation per Part 2.02.C.1., or Type II EPR Insulation per Part 2.02.D. of this Section. All single conductor external signal cable shall have a jacket which meets the requirements of Part 2.02.D. of this Section.
3. The insulation of negative propulsion return cables shall be Type II ethylene propylene rubber. Negative propulsion return cable shall have a jacket which meets the requirements of Part 2.02.E.2. of this Section.
4. The insulation or insulation system of external wire and cable shall fit tightly to the conductor and shall be free-stripping. Insulation or insulation system thickness shall be in accordance with the following table:

Conductor Size (AWG)	Average Wall Thickness (mils)* (as determined by ICEA S-95-658 Section 6.2)
0 to 600V Service	
16 to 8	78
7 to 2	94
1 TO 1000	109
601 to 2500V Service	
14 to 000 AWG	156
225 to 1000 KCMIL	190

* The minimum wall thickness shall be not less than 90 percent of the average wall thickness.

B. Conductor Requirements

1. Signal Conductors:
 - a. Material - soft annealed copper ASTM B-33
 - b. Construction - stranded ASTM B-8
 - c. Coating - continuous tin alloy
(for vital signal cable only) ASTM B-33
 - d. Resistance - ICEA S-95-658
(NEMA WC 70)
Section 2.3
 - e. Stranding:
 - (1) smaller than 14 AWG ASTM B-8 Cl. B
 - (2) 14 AWG to 00 AWG ASTM B-8 Cl. C
2. Negative Propulsion Return Conductors:
 - a. Material - soft annealed copper ASTM B-33
 - b. Construction - stranded ASTM B-8
 - c. Resistance - ICEA S-95-658
(NEMA WC 70)
Section 2.3

- d. Stranding:
 - (1) Extra-flexible, 1000 KCMIL cable, Class G stranded (427 Strands)
 - (2) Standard 1000 KCMIL cable, Class D stranded (127 Strands)
 - (3) 500 KCMIL Ropelay
- C. Type I Insulation & Insulation System Requirements
1. Primary insulation:
 - a. Material - rubber-like, vulcanized during construction ICEA S-95-658 (NEMA WC 70)
 - b. Chlorine content, maximum % by weight Zero
 - c. Physical properties, original:
 - (1) Tensile strength, minimum psi 1000
 - (2) Elongation at rupture, minimum % 250
 - (3) Tensile stress, minimum psi at 200% elongation 600
 - d. Physical properties after aging: (air oven, at 121 degrees C)
 - (1) Tensile strength, minimum % of original 80
 - (2) Elongation at rupture, minimum % of original 75
 - e. Mechanical water absorption:
 - maximum (mg/sq. in.) after 7 days immersion at 70 degrees C 8
 2. Jacket:
 - a. Material - rubber-like, vulcanized during construction ICEA S-95-658 (NEMA WC 70)
 - b. Chlorine content, maximum % by weight 20
 - c. Physical properties, original:
 - (1) Tensile strength, minimum psi 1800
 - (2) Elongation at rupture, minimum % 300
 - (3) Tensile Stress, minimum psi at 200% elongation 800
 - d. Physical properties after aging: (air oven, at 121 degrees C)
 - (1) Tensile strength, minimum % of original 85
 - (2) Elongation at rupture, minimum % of original 45
 - e. Oil immersion, 18 hours, 121 degrees C, ASTM No. 2 oil:
 - (1) Tensile strength, minimum % of original 70
 - (2) Elongation at rupture minimum % of original 70
 - f. Mechanical water absorption;
 - maximum (mg/sq. in.) after 7 days immersion at 70 degrees C 20
 - g. Oxygen index min. (ASTM D2863) 30
 - h. Smoke Density Rating, as per ASTM E662-83 using a 100 mil slab thickness:
 - (1) Flaming Mode,
 - (a) 4 minute 325 (max.)
 - (b) 20 minute peak 400 (max.)
 - (2) Non-Flaming Mode
 - (a) 4 minute 325 (max.)
 - (b) 20 minute peak 480 (max.)
 3. Primary Insulation and Jacket Combined:
 - a. Flame Resistance, as per ICEA S-95-658, Section 6.8.3 Pass
 - b. Cold Bend, -35 degrees C, for 3 hours, Mandrel diameter = 10 x O.D. No cracks
 - c. Insulation resistance constant (K)
 - minimum at 15.6 degrees C 10,000
 - d. Surface resistivity, minimum (megohms) 200,000
 - e. Electrical stability in water, as per ICEA S-95-658 (NEMA WC 70) Section 9.12

- f. Dielectric constant, SIC:
 - (1) Maximum after 24 hours immersion 3.5 SIC
 - (2) Maximum increase between 1 and 14 days 2.0%
 - (3) Maximum increase between 7 and 14 days 1.5%
 - (4) Maximum Dielectric constant, SIC between 1 and 90 days (with no failure) 3.6 SIC

D. Type II Insulation Requirements

- 1. Material - rubber-like, vulcanized during construction ICEA S-95-658 (NEMA WC 70)
- 2. Chlorine content, maximum % by weight Zero
- 3. Physical properties, original:
 - a. Tensile strength, minimum psi 1500
 - b. Elongation at rupture, minimum % of original 250
 - c. Tensile Stress, minimum psi at 200% elongation 800
- 4. Physical properties after aging:
 - a. 168 hours oxygen pressure, 80 degrees C, 300 psi:
 - (1) Tensile strength, minimum % of original 85
 - (2) Elongation at rupture, minimum % of original 75
 - b. Air pressure heat, 20 hours, 128 degrees C, 80 psi:
 - (1) Tensile strength, minimum % of original 75
 - (2) Elongation at rupture, minimum % of original 50
- 5. Oil immersion, 18 hours, 121 degrees C, ASTM No. 2 oil:
 - a. Tensile strength, minimum % of original 50
 - b. Elongation at rupture, minimum % of original 50
- 6. Mechanical water absorption, maximum (mg/sq. in.) after 7 days immersion at 70 degrees C 15
- 7. Flame Resistance, as per ICEA S-95-658, Section 6.19.6 Pass
- 8. Smoke Density Rating, as per ASTM E-662-83, using a 100 mil slab thickness:
 - a. Flaming Mode,
 - (1) 4 minute 325 (max.)
 - (2) 20 minute peak 400 (max.)
 - b. Non-Flaming Mode,
 - (1) 4 minute 325 (max.)
 - (2) 20 minute peak 480 (max.)
- 9. Cold Bend, -35 degrees C, for 3 hours
Mandrel diameter = 10 x O.D. No cracks
- 10. Insulation resistance constant (K)
Minimum at 15.6 degrees C 25,000
- 11. Surface resistivity, minimum (megohms) 200,000
- 12. Electrical stability in water, as per ICEA S-95-658 (NEMA WC 70) Section 9.12:
- 13. Dielectric constant, SIC:
 - a. Maximum after 24 hours immersion 3.5 SIC
 - b. Maximum increase between 1 and 14 days 2.0%
 - c. Maximum increase between 7 and 14 days 1.5%
 - d. Maximum Dielectric constant, between 1 and 90 days (with no failure) 3.6 SIC

E. Requirements for Negative Propulsion Return Cables

- 1. Insulation:
Ethylene-propylene rubber, ICEA Type E-2, 90°C, suitable for dry and wet locations.
- 2. Jacket:
 - a. Overall nonmetallic jacket of chloro-sulfonated polyethylene, or cross-linked polyolefin.

- b. Cross-linked polyolefin jacket shall comply with the following physical requirements. Properties tested in accordance with Part 6 of ICEA S-95-658 (NEMA WC 70) where ethylene-propylene-rubber (EPR) insulation is used. Jacket material shall be free of PVC and PVC-based compounds.
 - (1) Physical Properties, original:(ASTM D-412)
 - (a) Tensile strength, minimum pounds/square inch:1800
 - (b) Elongation at rupture, minimum percent: 150
 - (2) Physical Properties after aging 168 hours, (ASTM D-573) air oven test at 100 degrees C, +/-1 degree C:
 - (a) Tensile strength, minimum percentage of unaged value: 100
 - (b) Elongation at rupture, minimum percentage of unaged value: 80
 - (3) Oil immersion: 18 hours at 121 degrees C, (ASTM D-471) +/-1 degree C, Table 1, No. 2 oil:
 - (a) Tensile strength, minimum percentage of unaged value: 80
 - (b) Elongation at rupture, minimum percentage of unaged value 80
 - c. Jacket materials other than cross-linked polyolefin shall comply with ICEA S-95-658 (NEMA WC 70). Jacket material shall be free of PVC and PVC-based compounds.
- 3. Additional Requirements:
 - a. Insulation Power Factor: 2 % maximum.
 - b. Bond jacket to insulation to prevent moisture pockets.
 - c. Minimum peel strength of the jacket from insulation:4 lbs/inch width.
 - d. UL labeling: Type RHW-2.
 - 4. Negative propulsion return cable shall demonstrate flame retardancy in accordance with vertical tray flame test, UL44.
 - 5. Negative Propulsion Return Cables shall pass applied ac voltage dielectric strength test, i.e., six-hour water-immersion test, in accordance with Section 6.10.1 of ICEA S-95-658.

2.03 MULTICONDUCTOR SIGNAL CABLE

- A. General
 - 1. Where used in this Section, the term "multiconductor signal cable" shall be interpreted as meaning any multiconductor cable applied in circuits, either vital or non-vital, the function of which has a direct effect upon the operation of trains or the ability of the system or subsystems to implement control upon the trains.
 - 2. All multiconductor external signal cable shall be assembled from conductors which meet the requirements of Part 2.02, Individual External Wire Conductors.
- B. External Cable Assembly
 - 1. External Cable Assembly shall be per ICEA S-95-658 (NEMA WC70), Part 5.
 - 2. Multiconductor external cable shall be made by assembling individual or twisted pairs of insulated conductors into a tight cylindrical form. Individual or twisted pairs in a cable having more than two wires shall be assembled helically and with adjacent layers wound in opposite directions.
 - 3. Twisted pairs shall consist of two individually insulated conductors cabled with a length of lay as short as good construction will permit, but not longer than ten inches. Where more than one twisted pair is included, the length of lay of adjacent pairs shall differ by at least one-half inch.
 - 4. Twisted pairs shall not be provided in combination with individual wires in the same cable.
 - 5. Interstices shall be filled with moisture-resistant fillers.

6. A marker tape printed with sequential footages at one foot intervals shall be placed with the core. In addition to the footages this marker tape shall display, at intervals of no more than 30 inches, the name of the cable manufacturer and the year in which the cable was manufactured. The complete core assembly shall be wrapped with flame-retardant core tape, or tapes, with a 12.5-percent minimum lap. As an option, the core assembly shall be encased in an extruded, flame-retardant, moisture resistant, elastomeric cushion layer of the following thickness:

Core Diameter (inches)	Thickness (mils)
0 - 1.5	47
1.501 & larger	62

7. When an extruded rubber cushion layer is used, a pull cord shall be included beneath the cushion layer to provide for efficient stripping of this layer. This cord shall be compatible with all other components of the cable.
8. The taped cable core shall be covered with suitable bedding tape(s) when flat metal armor tape is used or with an inner jacket when corrugated metal armor tape is used.
9. Multiconductor external cables of 8 or more conductors shall have a 0.005-inch thick bronze (or an 0.008-inch thick zinc) corrugated or flat tape armor which shall be helically applied and overlapped approximately 12 percent. An overall separator tape shall be applied over the armor tape to protect the armor from attack by the overall jacket material.
10. The core, with or without armor, shall be covered with an outer jacket having a nominal thickness in accordance with ICEA S-95-658, Table 4-4. The inner jacket, when corrugated tape armor is used, shall be of sufficient thickness and so formulated to completely fill the voids on the underside of the corrugated metal tape. Cable jacketing material shall conform to the cable jacket specification contained herein.

C. Cable Identification and Conductor Markings

1. In addition to the internal sequential marker tape, the cables shall have the following information imprinted on the surface of the outer jacket at intervals of not more than three feet:
 - a. Manufacturer's name
 - b. Number of conductors
 - c. Size of conductors
 - d. Voltage rating
2. Individual conductors of multiconductor signal cables shall be imprinted at intervals of not more than six inches with the conductor identification. The identification shall be in the form of a number printed in both numeral form and English.
3. The cable and conductor markings shall be of a color which contrasts with the material on which it is imprinted and shall be of sufficient size to be easily recognized. The markings shall be permanent.

D. Cable Jacket Specification

1. Material - rubber-like, vulcanized during construction: ICEA S-95-658
(NEMA WC 70)
2. Chlorine content, maximum % by weight 15
3. Physical properties, original:
 - a. Tensile strength, minimum psi 1800
 - b. Elongation at rupture, minimum % 300
 - c. Tensile stress, minimum psi at 200% elongation 800

4. Physical properties after aging 168 hours, 121 degrees C, air oven;
 - a. Tensile strength, minimum % of original 85
 - b. Elongation at rupture, minimum % of original 45
5. Oil immersion, 18 hours, 121 degrees C, ASTM No. 2 oil:
 - a. Tensile strength, minimum % of original 70
 - b. Elongation at rupture, minimum % of original 70
6. Mechanical water absorption,

maximum (mg/sq. in.) after 7
days immersion at 70 degrees C 20
7. Oxygen Index, minimum (ASTM D2863) 30
8. Smoke density rating, as per ASTM E662-83, using a 100 mil slab thickness:
 - a. Flaming Mode,

(1) 4 minute	325 (max.)
(2) 20 minute peak	400 (max.)
 - b. Non-Flaming Mode,

(1) 4 minute	325 (max.)
(2) 20 minute peak	480 (max.)
9. Cold bend, -35 degrees C, for 3 hours

Mandrel diameter = 10 x O.D. No cracks
10. Surface resistivity, minimum (megohms) 200,000

E. Finished Cables

1. Finished cables having 7 or fewer conductors shall be capable of passing the IEEE Vertical Tray Flame Propagation Test, IEEE Standard 383-1974, or the UL-44 Vertical Tray Flame Test. The test sample shall have 7 or fewer conductors.
2. Finished cables having 8 or more conductors shall be capable of passing the following horizontal flame test. The test sample shall have 8 or more conductors.
 - a. Support a four-foot length of the multi-conductor cable specimen horizontally over a ribbon gas burner. The cable shall be supported parallel to the burner length in a manner which will maintain a spacing of 3/4 inch to two inches between the burner and the cable throughout the test.
 - b. The cable specimen shall be connected to a 3-wire, 120-240 volt circuit such that conductor-to-conductor and conductor-to-metal-armor-tape shorts will be indicated.
 - c. The flame temperature shall be monitored by a thermocouple and the flame temperature output regulated at 1400-1500 degrees F. The thermocouple shall be located in the flame close to, but not touching, the surface of the cable.
 - d. Readings of the thermocouple output shall be recorded each minute during the test.
 - e. The cable will be acceptable if no shorts are detected within six minutes after the flame is ignited.

2.04 SPECIAL CONTROL AND INDICATION CABLE

- F. Multiconductor cable applied in non-vital signal circuits, i.e., signal circuits the functions of which do not control or affect the ability to control operation of trains, shall conform to the following requirements:**
1. Minimum conductor size 19 AWG
 2. Chlorine content of insulation, maximum percent by weight 22
 3. Inner jacket PE or PVC
 4. Metal tape armor, helically applied, bronze or zinc:
 - a. Minimum thickness

(1) Bronze:	5 mils
-------------	--------

	(2)	Zinc:	8 mils
	b.	Minimum overlap	12%
5.		Outer jacket	PVC or XLPVC
6.		Chlorine content of jacketing materials, maximum percent by weight	22

- G. Finished cables shall be capable of passing the IEEE Vertical Tray Flame Propagation Test set forth in IEEE Standard 383-1974, or the Vertical Tray Flame Test in UL 44. In all other respects, cable shall conform to ICEA Pub. No. S73-532 for 600 volt rated cable.

PART 3 - EXECUTION

3.01 CONDUCTOR SIZING

- A. All conductors shall be sized per the National Electrical Code, but shall not be smaller than the minimum conductor sizes specified herein.
- B. Conductors shall be sized in such a manner that voltage drop at the farthest load does not exceed 3 percent during peak load conditions.

3.02 INSTALLATION OF INTERNAL WIRE AND CABLE

- A. Wires and cables shall be installed in a neat, workmanlike manner. Cables in trays or in troughs shall be laid therein and pulled into same. Cables shall be installed with a minimum amount of cross-over in the trays and troughs and shall not be pulled tightly around bends. All exposed wires and cables entering or leaving equipment racks or housings shall be protected from abrasion.
- B. Nylon straps shall be provided and installed for bundling and cabling of conductors where two or more single conductors of the same circuit are exposed in cable trays or cable troughs. Straps shall be installed approximately every five feet along the cable run. Wires of multiconductor cables exposed by the stripping of the cable jacket for terminations shall be trained in a neat, workmanlike manner and tied approximately every three inches with nylon straps.
- C. There shall be no point-to-point redundancy of wires for increased current capacity.
- D. Single conductor No. 14 wire shall be used for interconnecting switch machines and junction boxes, signal junction boxes and lamp compartments, and interconnecting other miscellaneous internal equipment.
- E. The smallest size wire the Design-Builder shall use for power cross termination and power wiring shall be No. 14 AWG. If No. 14 does not satisfy the load current requirements, the wire shall be increased in size according to the load requirements.

3.03 MODULE WIRING

All module wiring shall be accomplished with solderless or solder connections or stranded wire with crimped connections. Minimum wire size shall be No. 22 AWG.

3.04 RACK WIRING

- A. Rack wiring shall be accomplished with solderless connections. Wire used for rack wiring shall be stranded wire, minimum size No. 20 AWG, or multiconductor cables as specified. Where wires of a multiconductor cable are used for intra-rack wiring, any unused conductors shall be folded back and taped.

- B. Rack wiring shall be neatly tied into compact bundles. The main bundles and branches shall be secured to the racks in a manner which shall preclude physical damage due to pressure or abrasion, and prevent the wire weight from being supported by the wire terminations, connections, or plug connectors. The arrangement of the wire bundles and cables shall be such that they do not interfere with visual inspection, troubleshooting, or repair of the rack mounted equipment.

3.05 RACK-TO-RACK WIRING

- A. Rack-to-rack wiring shall be accomplished with solderless connections using multiconductor cables as specified, or single conductors tied into bundles to form unjacketed multiconductor cables.
- B. Unjacketed multiconductor cables shall consist of individual conductors of size 14 AWG or larger wire and shall have a maximum tie spacing of six inches.
- C. All rack-to-rack wiring shall be routed via the overhead cable trays, with one foot of slack between the cable tray and each rack to which the cable is connected.
- D. Cables shall not be pulled into the cable trays, but shall be laid loosely and neatly in the trays with a minimum of crosses.
- E. Cable connections to all racks except the entrance racks shall be via plug connections. Cable connections to the entrance racks may be made in the same manner as field wiring.

3.06 HIGH VOLTAGE WIRING

Internal wire used in circuits directly connected to the rails and internal wire used in circuits which operate at voltages in excess of 600 volts shall meet the requirements of this Section for 601 to 2500 volt service.

3.07 EXTERNAL CABLE APPLICATION

- A. The Design-Builder shall be responsible for the sizing of all conductors greater than the minimum size specified, due to the application of his design or due to voltage losses caused by long cable runs. Where special cable configurations and/or conductor sizes larger than the minimum sizes specified herein are necessary to meet the specified operating conditions of the system, the Design-Builder shall provide same at no additional cost to the Authority. Increases in required conductor size shall be in accordance with the National Electrical Code.
- B. If the Design-Builder's additions to the Yard Signal Control and Interlocking System requires the use of shielded cable, the Design-Builder shall provide the required shielded cables, and all additional related terminating required to provide single-point grounding of the shield at no additional cost to the Authority. The shielded cable supplied shall meet all requirements of these cable specifications and the shield shall be grounded as specified in Section 16922, Lightning/Surge Protection and Grounding Systems. Armor tape shall not be considered as a substitute for a shield. Each electrically contiguous segment of armor tape shall be grounded at only one point.

- C. The Design-Builder shall furnish and install the amounts of specified types of external cable necessary to provide a complete Yard Signal System. The various types of cable and their applications shall include, but not be limited to, the following:
1. GROUP I - SIGNAL CABLES
 - a. TC Maintenance Telephone
Size No.16 AWG twisted pair cable, shall be furnished and installed to connect all telephone jacks of the TC Maintenance Telephone System along the wayside. See Section 16923, TC Maintenance Telephone System, and the Information Drawings.
 - b. Power Frequency Track Circuits
 - (1) One-thousand-volt-class single conductor cable shall be furnished and installed for 60-Hz track circuits. The only exception is that, in areas of high concentration of 60-Hz track leads, these circuits may be accumulated into a dedicated 1000-volt-class multiconductor cable between the TCR and the wayside distribution junction box.
 - (2) Cable for the feed end of each 60-Hz track circuit shall be minimum size No. 10 AWG. Cable for the relay end of such track circuits shall be minimum size No. 14 AWG from the TCR to the wayside junction box.
 - (3) Feed end track circuit leads extending more than 400 feet and relay end track circuit leads extending more than 1000 feet shall be increased in conductor size to compensate for the additional cable length resistance losses.
 - (4) The cables between the wayside junction box and the running rail connections shall be single conductor, size 10 AWG, 1000 volt class, for both direct fixation and ballast construction.
 - (5) Cable used for 60-Hz track circuit signal rail jumpers in crossovers shall be single conductor size 6 AWG, 1000-volt class, as shown on the Information Drawings. The long signal-rail jumper used to connect the two "halves" of the signal rail in a diamond or universal crossover 60-Hz track circuit shall be installed in schedule 80 F.R.E. conduit.
 - c. The common return leads for series type track circuits shall consist of single conductor No.6 AWG, 1000-volt class cables. The track circuit leads for the signal rail of the series track circuit shall consist of a single conductor No.8 AWG, 1000-volt class cable for each signal rail. The series track circuit relay-end cables between the series track equipment case and the train control room shall consist of one or more single, or six twisted pair No. 14 AWG.
 - d. Controlled Signals
A seven conductor, size 14 AWG cable shall be furnished and installed between each controlled signal and its associated Train Control Room or wayside distribution box. See Section 16965, Signal Layouts.
 - e. Trailable Yard Switch Machines
The cables to be furnished and installed between each switch junction box and the TCR (or an interlocking distribution junction box) shall be a single seven conductor (minimum size 14 AWG) for control and indication and a single five conductor (minimum size 10 AWG) for operation, or one composite cable (made up of two or more minimum size 10 AWG conductors) for operation, plus ten or more (minimum size 14 AWG) conductors for control, indication and spares. The minimum size of the two conductors for operation shall be increased to size 8 AWG if the distance from the switch junction box (or interlocking distribution junction box) to the TCR is more than 400 ft., and shall be increased to

size 6 AWG if this distance exceeds 1000 ft. See Section 16964, Yard Trailable Switch Operating Layouts.

- f. Interlocking Control Distribution
The Design-Builder shall furnish and install one or more of the following multiconductor signal cables between each interlocking distribution junction box and its associated TCR to consolidate control, operation, and indication wiring:
 - (1) 12c No. 14
 - (2) 19c No. 14
 - (3) 5c No. 10
 - (4) 7c No. 10
- g. Snowmelter Control and Indication
A nine conductor, size 14 AWG cable shall be furnished and installed between the TCR and each snowmelter control case for control and indication purposes, and for energization of the SM case heaters. See Section 16969, Snowmelter Layouts.
- h. Snowmelter Energy Supply
The Design-Builder shall furnish and install a single conductor, No. 1 AWG (minimum size), 1000-volt-class underground cable between the propulsion power contact rail and the snowmelter control case via the contact rail Fuse Box.
- i. Snowmelter Heating Elements
 - (1) The Design-Builder shall furnish and install:
 - (a) A single conductor, size 6 AWG, 1000-volt-class underground cable between the snowmelter control housing and each running-rail snowmelter heating element controlled from that housing, and;
 - (b) A single conductor, size 10 AWG, 1000-volt-class underground cable between the snowmelter control housing and each switch rod heater unit controlled from that housing.
 - (2) Maximum length for each of these cables shall be 75 feet unless otherwise authorized in writing by the Authority Representative. See Section 16969, Snowmelter Layouts, and the Information Drawings.

2. GROUP II - SPECIAL CONTROL AND INDICATION CABLE

(None required.)

3. GROUP III - NEGATIVE PROPULSION RETURN CABLE

- a. All Negative Propulsion Return Cable shall be rated for 2000 Volts. The insulation shall be Ethylene-propylene rubber, ICEA Type II, 90°C, suitable for dry and wet locations.
- b. The cable shall have an overall nonmetallic jacket of chlorosulfonated polyethylene or cross-linked polyolefin. The jacket shall be bonded to the insulation to prevent moisture pockets. The minimum peel strength of the jacket from the insulation shall be four pounds per inch width for either type of jacketing used.
- c. The insulation power factor shall not exceed two percent.
- d. The cable shall carry UL labeling, Type RHW-2.
- e. Cable furnished and installed for negative-return, compression-bolted rail-web bonding shall be single conductor, 500 KCMIL, Ropelay with 2000-volt-class insulation. See Section 16968, Track Bonding Layouts.

3.08 CABLE INSTALLATION

A. General

1. The installation of wire and cable shall conform to Part 10.4.40 (Wiring) and Part 10.4.1 (Wires & Cables) of the AREMA Signal Manual except as modified herein.
2. The Design-Builder shall notify the designated Authority Representative at least 24 hours prior to installing cables.
3. The Design-Builder shall provide sufficient slack in cable conductors at all terminating posts to enable three reterminations of the conductor due to broken eyelets without reservicing or re-potheading the cable. In types of installation where the cable cannot be constrained, sufficient cable slack shall be provided to prevent damage to the cable due to vibration.
4. Signal cable shall not be bent to a radius less than 20 times the diameter of the cable during installation or as finally installed, except as permitted in writing by the designated Authority Representative.
5. Cable splices will not be allowed.
6. All cable entrance openings in equipment enclosures, manholes and junction boxes shall be sealed with either a compression type fitting or pliable sealing compound after the cable is in place. Sealing compound shall be used to seal the area around cable where the cable emerges from the end of a conduit, pipe or duct bank. The Design-Builder shall install conduit sealing bushings in the ends of all unused Train Control conduits to prevent fluids or gases in the conduits from entering the enclosure. These bushings shall be Type CSBI as manufactured by O-Z/Gedney, or approved equal.
7. A suitable lubricating medium (Cable Pulling Lubricant), as specified in Section 16978, shall be used when pulling cables into conduit, pipe, or duct bank.
8. Where cable transfers from trays or troughs to conduit the ends of the conduit shall, for guidance, be fitted with plastic end bells to prevent damage to the cable.
9. Wherever multiple conductor cables are terminated the outer sheath of the cable shall be carefully removed to the point of cable entrance. At the end of the cable sheath or covering, two layers of plastic electrical tape shall be applied. This tape shall be Reference No. 88, as manufactured by the 3M Company, or an approved equal. As an alternative, the Design-Builder shall apply a heat shrink sleeve to the end of the cable sheath.
10. The Design-Builder shall be responsible for the dewatering and removal of all dirt and trash from trenches, pipe, manholes, pull chambers, cable trough, surface trench, conduit and duct bank prior to and during the installation of cable, at no additional cost to the Authority.

B. Buried Installation

1. Horizontal runs of buried cable greater than 15 feet shall be installed in PVC conduit per the requirements of this Section.
2. Cable shall be buried to a uniform depth of not less than 30 inches. A bed of sand at least four inches thick shall be provided in the bottom of the trench. The cable shall be laid neatly, but loosely on this sand bed, with a minimum of cable crossings. The cable shall then be covered with a minimum of four inches of sand before backfilling. Loam or clay, free of lumps, stones or other debris, may be substituted for sand only with the prior written approval of the Authority Representative. Backfill shall be compacted to not less than 95 percent of the maximum dry density of the respective materials as determined by AASHTO Test Designation T-99.
3. Cable passing under tracks or under ballast, or within track right-of-way shall be installed in conduit. Track right-of-way is defined as an area encompassing the ties and rail and extending two feet beyond the ends of each tie. The Design-

- Builder shall furnish Schedule 80 PVC conduit for this purpose and shall bury this conduit not less than 30 inches below the ties. See Section 16973, Conduit.
4. In all areas beyond the right-of-way area where cables cannot be buried to a uniform depth of 30 inches, the Design-Builder shall, at no additional cost to the Authority, either install surface trench or install the cable in concrete encased Schedule 80 PVC to the maximum uniform depth allowable by field conditions. At transition areas between buried and non-buried installation, the cable shall be protected by Schedule 80 PVC. Horizontal runs of PVC buried at or greater than a depth of 30 inches will not require concrete encasement.
 5. Where cable leaves the ground at other than buildings, or in foundations or pedestal mounted junction boxes, it shall be protected by heavy duty, two-ply, fiber reinforced rubber hose or Schedule 80 PVC conduit. The top end of each hose or conduit shall be filled with sealing compound where the cable emerges.
 6. The cables used as track leads between the rail connections and the wayside junction box shall be protected by vertical bootlegs of heavy duty, two-ply, fiber reinforced, one-inch I.D. neoprene hose where they pass through the ballast and the subgrade. Cable not extending beyond the far rail shall be placed in heavy duty, two-ply, fiber reinforced, one-half inch I.D. neoprene hose or Schedule 80 PVC conduit which shall be clamped to the side of the crosstie as shown on the Information Drawings.
 7. Cable shall be installed in a steel or wrought iron pipe wherever the cable passes under pavement or roadway. This pipe shall extend two feet beyond the edges of the pavement.
 8. The Design-Builder shall be responsible for all shoring required to prevent undermining and cave-ins during cable burying operations and shall also be responsible for any damages or lost time resulting from inadequate shoring. Any trench over 3 feet deep shall be shored.
 9. Where a buried cable enters a conduit, pipe, pedestal, or concrete foundation, for an equipment case, junction box, or other piece of Train Control equipment in which the cable is to be terminated, or bootlegs for track circuit or snowmelter connections, a five foot slack coil of that cable shall be installed in a trench below the point of entrance.
 10. Cable required to carry current at 600 volts or more shall not be installed in the same trench as signal or other low voltage cable without prior written consent of the Authority Representative.
 11. Install mylar cable marking tape at a depth of six inches while backfilling each cable trench.

C. Non-Buried Installation

1. Installation in Trays, Troughs or Surface Trench
Cable installed in trays, troughs or surface trench shall be laid therein and not pulled into place. Cables installed in trays, troughs and surface trench shall have a minimum amount of crossover and shall not be pulled tightly around bends.
2. Installation in Conduit or Pipe
 - a. Remove any foreign material from conduits by using an appropriate mandrel. The Design-Builder shall then clear or swab dry each conduit or pipe before installing cable therein. It shall be the Design-Builder's responsibility to prove existing conduits prior to use. The Design-Builder shall maintain the conduits and/or pipe in a clean and dry condition during the installation process up to and including the time each conduit or pipe is sealed as specified, at no additional cost to the Authority.
 - b. The Design-Builder shall have an approved Pull Sheet in his possession for each cable pull executed, and shall record thereon the date of the pull, the method used, the maximum pull tension experienced for each applicable pull, and other pertinent data. The Design-Builder shall resubmit a copy of each completed Pull Sheet to the designated Authority

- Representative within one week of the pull. See Part 1.07.F of this Section.
- c. Conduct cable pulls in accordance with the cable manufacturer's recommendations. In the absence of any such specific recommendations, the Design-Builder shall use an approved wire cable grip extending not less than 18 inches back from the end of the cable when pulling cable. The clutch on the pulling device shall be set to slip at 50 percent of the weight per 1000 feet of the cable to be pulled or at the manufacturer's maximum force rating, whichever is less. The equipment used for pulling cable shall be equipped with a dynamometer which shall indicate the pulling force in pounds. An approved cable pulling lubricant, as specified in Section 16978, shall be applied to the cable when installing cable in conduit or pipe.
 - d. Cables shall not cross one another when they are pulled into a conduit or pipe and care shall be taken not to have the conductors pulled tight or kinked in conduit fittings or boxes. All cables to be installed in a given conduit or pipe shall be pulled and installed simultaneously.
 - e. Furnish and install potheads and filling compound where cables enter or leave conduit or pipe. The potheads and filling compounds shall be as specified in Section 16978, Miscellaneous Train Control Components and Materials, and shall be applied in conformance with the manufacturer's instructions.
3. Installation in Manholes and Pull Chambers
- a. Furnish and install clamps or other cable restraining hardware in manholes or other areas where support is needed for cables entering or leaving conduit or pipe or passing through the manhole. Apply an identification tag to each TC cable in every manhole.
 - b. Sufficient slack shall be provided in each cable so that the bending radius of each cable shall not be less than 20 times the diameter of the cable. Where the specified minimum bending radii of cables do not allow strapping or clamping to channel inserts, the Design-Builder shall furnish and install approved manhole racks with insulators to support the cables.
 - c. All mounting and fastening materials used by the Design-Builder shall be stainless steel. Use of anodized channel is unacceptable in manholes and pull chambers.
 - d. Cables shall be installed in a manner which will prevent their injury by persons and equipment entering and exiting the manholes via ladders or other climbing devices.
 - e. Cables shall be installed and supported in manholes and pull chambers in accordance with the approved version of drawings the design Builder has submitted for this work.
4. Special Installation Requirements
- a. Provide sufficient slack in all cable installation runs to prevent damage to the cable or its terminations due to expansion or contraction.
 - b. Provide appropriate special protection for cables in areas where the cables are unavoidably exposed to hazardous conditions such as vibration or sharp corners on equipment. The Design-Builder shall be responsible for replacing, at no additional cost to the Authority, any cable he has installed which is subsequently damaged as a result of his failure to provide such special protection.

END OF SECTION

SECTION 16951

TRANSFER AND BYPASS EQUIPMENT

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of Automatic Transfer and Bypass-Isolation equipment as part of each new TCR Power Distribution system provided under this Contract. For each TCR, this equipment shall include:

- A. A high speed, single phase Automatic Transfer Switch to supply an uninterruptible 120 volt, 60 Hz bus.
- B. A one-way, bypass-to-normal Bypass-Isolation Switch to provide a safe and convenient means of bypassing and isolating the Automatic Transfer Switch for test and maintenance purposes without interrupting Yard Signal functions.
- C. All devices and wiring required to cause the Transfer and Bypass equipment to function as specified herein.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signaling Submittal Requirements
Section 16916	Basic Yard Signal Circuit Requirements
Section 16921	Yard Signal Power Distribution Systems
Section 16922	Lightning/Surge Protection and Grounding Systems
Section 16941	Basic Yard Signal Electrical and Electronic Component Requirements
Section 16989	Yard Test and Inspections

1.03 SWITCHING

- A. The Automatic Transfer Switch shall immediately throw from the Normal to the Reserve service whenever the Normal 120 volt, 60 Hz bus falls below 85 percent of its nominal voltage and the Reserve voltage is 85 percent of nominal or higher.
- B. Once the switch has thrown to the Reserve 120 volt, 60 Hz service, it shall remain in that position until the Normal service voltage returns to at least 95 percent of its nominal value and remains in that range for a time period adjustable from 15 seconds to five minutes, whereupon the switch shall retransfer the load to the Normal service. This "return-delay time" feature shall be nullified and the switch shall immediately retransfer to the NORMAL position if the Reserve service falls below 85 percent of its nominal value and the Normal service voltage is at least 85 percent of its nominal value.

1.04 BYPASS AND ISOLATION

- A. The Bypass-Isolation Switch shall perform two functions:
 - 1. Connect the load directly to the Normal service without interrupting service to the load.
 - 2. Electrically isolate the Automatic Transfer Switch from the load and both services.

- B. Interlocks shall be provided to prevent
 - 1. Moving the bypass switch handle from the AUTOMATIC to the BYPASS-TO-NORMAL position unless the Automatic Transfer Switch is in its NORMAL position and the Normal service is at least 85 percent of its nominal value.
 - 2. Isolation of the Transfer Switch prior to bypassing the load to the Normal service.
 - 3. Removal of the load bypass connection prior to reconnecting of the Automatic Transfer Switch to the load and both services.
 - 4. Moving the bypass switch handle from the BYPASS-TO-NORMAL to the AUTOMATIC position unless the Automatic Transfer Switch is in its NORMAL position.

1.05 QUALITY ASSURANCE

See Section 01113 Systems Integration

1.06 SUBMITTALS

See Section 16912 Submittal Requirements

PART 2 - PRODUCTS

2.01 AUTOMATIC TRANSFER SWITCH

- A. The Automatic Transfer Switch shall be of the electrically operated, mechanically held type, rated for continuous duty in an unventilated sheet metal enclosure. All accessory control and indication devices shall be removable from the front of the Transfer Switch without removal of the switch panels from the enclosure and without disconnection of drive linkages or power conductors. The Transfer Switches provided shall meet the requirements of Underwriters Laboratories Standard UL 1008 for Automatic Transfer Switches and other requirements specified herein.
- B. The switching mechanism shall have only two positions, NORMAL and RESERVE, inherently interlocked mechanically and with main contacts mechanically attached to a common shaft. The switching mechanism shall cause the main contacts to transfer the load from one service to another with an output power interruption period of sufficient brevity not to cause any track relays or traffic sticks to drop, and not to cause any other failure in the Yard Signal System.
- C. The main contacts shall be of the brush, segmented, or silver alloy, wiping action type and shall be protected by arcing contacts in sizes above 40 amperes. The "constant current" rating for the main contacts and associated arc-quenching apparatus shall be at least 20 percent higher than the maximum working load computed for the transfer switch by the Design-Builder and approved by the designated Authority's Representative. The contact configuration shall utilize magnetic forces to keep main contacts closed when subject to high fault currents.
- D. The transfer switch shall have the thermal capacity to carry its withstand rating without contact welding or electrical or mechanical damage.
- E. Sensing and control relays shall be continuous duty industrial control type with minimum contact rating of 10 amperes. The voltage sensitive relays shall be of the close differential type, factory adjusted for 95 percent pickup and 85 percent drop-out. The return-delay time relay shall be adjustable from 15 seconds to five minutes in at least eight steps.
- F. Each Automatic Transfer Switch shall be equipped with the following test and adjustment features

1. A spring-return test pushbutton or equivalent which shall, when operated, cause the switch to transfer from the NORMAL to the RESERVE position. The transfer switch shall then remain in the RESERVE position until the test button has been released and the preset return-delay time period has run out. The test pushbutton shall be clearly identified by a metal or phenolic label or approved equal.
 2. Facilities for testing and adjusting the undervoltage sensitivity for both the Normal and Reserve services.
 3. Facilities for testing and adjusting the return-delay time mechanism.
- G. The Automatic Transfer Switch shall be equipped with the following indication features:
1. At least five independent auxiliary contacts shall be provided for transfer switch position indicating use. Three of these contacts shall close when the transfer switch is in the NORMAL position and the other two shall close when the switch is in the RESERVE position. All of these auxiliary contacts shall have 10 ampere minimum continuous contact rating and shall be activated by the switching mechanism.
 2. The Transfer Switch shall include four LED indicating light units:
 - a. One amber LED unit to indicate the availability of Normal service energy of the proper voltage (Normal voltage sensing relay energized)
 - b. A second amber LED unit to indicate the availability of Reserve service energy of the proper voltage (Reserve voltage sensing relay energized)
 - c. A green LED unit to indicate when the transfer switch is in the NORMAL position
 - d. A red LED unit to indicate when the transfer switch is in the RESERVE position
 3. The indications provided by these LED indicators shall be visible from the outside of the Transfer Panel. The LED units shall be, as applicable:
 - a. SP940112-R (RED)
 - b. SP940224-R (GREEN)
 - c. SP940112-R (AMBER)
 - d. As manufactured by Data Display Products of El Segundo, California, or approved equal.
- H. The Automatic Transfer Switch, complete with all its control, test and indication equipment, shall be housed in a non-ventilated NEMA-12 type enclosure constructed of 11 gauge sheet metal. Provision shall be made for locking the doors of this enclosure. The enclosure shall be finished in grey ANSI-61, or approved equal. The switch position and power indicating lights shall be mounted on the front of this enclosure. This assembly of power transfer equipment shall be known as the Transfer Panel.
- I. Each control, test or indicating device mounted on the front of the Transfer Panel shall be clearly identified by a metal or phenolic label firmly attached to the panel.

2.02 BYPASS-ISOLATION SWITCH

- A. Each Bypass-Isolation Switch shall be compatible with its associated Automatic Transfer Switch and shall be designed to the same standards as the Automatic Transfer Switch. The Bypass-Isolation Switch shall have "withstand current" abilities equal to or greater than the associated Automatic Transfer Switch.
- B. The Bypass-Isolation Switch shall be arranged so that one person can perform the bypass and isolation functions through the operation of a maximum of two handles at a common deadfront panel:
1. A handle labeled BYPASS CONTACTS which shall connect the load to the Automatic Transfer Switch when in the AUTOMATIC position, and which shall transfer the load from the transfer switch to the Normal service by means of make-before-break contacts when rotated to the NORMAL position.

2. A handle labeled ISOLATION CONTACTS which shall disconnect the Automatic Transfer Switch from both the Normal and Reserve service leads when moved from the CLOSED to the OPEN position. Provision shall be made for padlocking this handle in the OPEN position.
- C. The Bypass-Isolation Switch shall be equipped with the following indication features:
1. A red indicating LED light (of the same type as used on the Transfer Switch) on the faceplate of the Bypass-Isolation Switch which shall be illuminated when the BYPASS CONTACTS handle is in the BYPASS-TO-NORMAL position.
 2. Sufficient auxiliary contacts to provide remote ac power and bypass indications. One of these contacts shall close only when the BYPASS CONTACTS handle is in the AUTOMATIC position and another contact shall close only when the BYPASS CONTACTS handle is in the BYPASS-TO-NORMAL position. These contacts shall have a 10 ampere minimum continuous contact rating and shall be activated by the bypass mechanism.
- D. The Bypass-Isolation Switch shall be housed in an isolated compartment of the Transfer Panel enclosure. The Bypass-Isolation Switch shall have a metal faceplate of its own. The operating handles and the BYPASS indication light shall be mounted on this faceplate. Housing and faceplate metal which is not inherently non-corrosive shall be finished in grey ANSI-61 or approved equal.
- E. The two operating handles, the two positions for each handle, and the BYPASS indication LED light unit shall all be clearly identified by metal or phenolic labels firmly attached to the faceplate of the Bypass-Isolation Switch.
- F. A fail-safe solenoid lock or similar device shall be included in the Bypass-Isolation Switch to prevent movement of the BYPASS CONTACTS handle except when the Transfer Switch is in the NORMAL position and Normal service energy of the proper voltage is available.

2.03 TERMINALS AND WIRING

The Bypass-Isolation Switch, and the Automatic Transfer Switch together with its accessory control and indication devices, shall be completely factory wired internally.

- A. Auxiliary contacts for external indication of interlocking control purposes shall be wired to external solderless terminals of the pressure clamp type.
- B. All external power, load, control, and indication terminals shall be clearly identified by permanent tags or markings.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. The Design-Builder shall wall mount the Transfer Switch and the Bypass-Isolation Switch as shown on the approved drawings.
- B. The Transfer and Bypass Equipment shall be wired utilizing single conductor, stranded wire and jumpers.

END OF SECTION

SECTION 16952

DC POWER SUPPLIES

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of direct current power supplies of various voltages and capacities to supply power to all wayside direct current Yard Signal equipment furnished or installed under this Contract.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration	
Section 16912	Submittal Requirements	
Section 16914	Environmental Requirements	
Section 16915	Basic Yard Signal Equipment Requirements	
Section 16916	Basic Yard Signal Circuit Requirements	
Section 16921	Yard Signal Power Distribution Systems	
Section 16922	Lightning/Surge Protection and Grounding Systems	
Section 16941	Basic Yard Signal Electrical and Electronic Component	Require ments

Section 16989	Yard Test and Inspections	

1.03 QUALITY ASSURANCE

See Section 01113 Systems Integration

1.04 SUBMITTALS

See Section 16912 Yard Signal Submittal Requirements

PART 2 - PRODUCTS

2.01 BASIC DC POWER SUPPLY REQUIREMENTS

All DC power supplies furnished under this Contract shall be immune to external RF energy from portable 2-way radios and personal communications devices such as cellular telephones, and shall meet the following basic requirements:

- A. Transformers used in DC power supplies shall not emit audible noise in excess of 50 dB (referenced to 0.0002 dynes per square cm.) at a distance of three feet when operated anywhere within the range of input and output voltages and currents specified
- B. Power supplies requiring filter capacitors shall be so designed that their filter capacitors can be replaced without removing the power supply from the rack on which it is mounted.

- C. Power supplies shall have sufficient insulation to be cable of withstanding, for one minute, 600 volts, 60 Hz applied
 - 1. Between the input leads (connected together) and the output leads (connected together).
 - 2. Between the input leads (connected together) and the chassis.
 - 3. Between the output leads (connected together) and the chassis.
- D. Power supplies shall be designed for natural convection cooling. No supplementary fans or other cooling devices will be allowed.
- E. The power supplies shall be designed for a continuous duty cycle with the exception of the WHB which shall be designed for an average five percent duty cycle.
- F. Each DC power supply shall be equipped with a failure alarm device which shall detect any internal failure which would impair the ability of the power supply to deliver its full rated load. This device shall be normally energized by a small percentage of the rated load current of the power supply and shall cause two separately wired internal contacts to open when a failure is detected. One of these contacts shall be independently wired to binding posts for an external alarm indication circuit. The second contact shall be used to light an indication lamp or LED indicator mounted on the power supply. (See Section 16955, Track and Alarm Indication Panels, and the Information Drawings.) This circuit shall function even if the output voltage is maintained by a tandem power supply. The power supply shall be so designed that the internal failure indication lamp or LED can be replaced without removing the power supply or any adjacent equipment from the rack.
- G. The power supplies shall not be damaged by a sustained input voltage varying from 0 to 150 percent of the rated input voltage. Nominal supplied input voltages may range from 110V to 125V per leg at the incoming feeder disconnect.
- H. The power supplies shall be sized in such a manner that no individual power supply operates at less than 20 percent of its rated current output during normal operation.
- I. The power supplies shall self-limit their output current to no more than 200 percent of their rated load. Reverse output current protection shall be provided to prevent shorting or sagging of tandem supplies in the event of filter capacitor failure.
- J. Each power supply shall be clearly and permanently labeled with the following:
 - 1. Manufacturer's name
 - 2. Part or model number
 - 3. Serial number
 - 4. Input rating
 - 5. Output rating (Continuous or intermittent)

2.02 POWER SUPPLIES FOR MAJOR DC BUSES

All power supplies used to feed the four major DC buses (B28G, LB, B5G and WHB) shall meet the following requirements in addition to the basic requirements specified in Part 2.01 of this Section:

- A. Each power supply shall be housed in a metal panel-chassis combination with no exposed electrical connections or wires. A perforated protective cover shall be used to provide for convective heat transfer. Metal used in this housing and cover which is subject to corrosion shall be protected by zinc plating or an approved equivalent finish applied after forming.

- B. The front panel shall be designed for use in mounting the power supply in a standard 19-inch rack with EIA hole spacing. All panel mounted indicating, adjusting or protective devices, or openings for such devices, shall be legibly and permanently labeled.
- C. Each power supply shall have an output voltmeter, an output ammeter and a normally illuminated power failure light (lamp or LED) mounted on its front panel. As an option, the Contractor shall provide this metering on a separate panel in the same rack as the power supplies. Meter accuracy shall be ± 2 percent with nominal readings at center scale.
- D. Terminals
 - 1. The power supplies shall be equipped with standard AAR type binding posts (No. 14-24 studs) within the chassis, for the connection of all external input and output power leads. Terminals for external connections to the internal failure alarm contacts shall be of the 8-32 barrier strip type or standard AAR type binding posts. Each terminal shall be permanently labeled. No terminal shall protrude outside the chassis.
 - 2. Where 120-volt input terminals are in close proximity to failure indication terminals, a grounded metal barrier shall be provided to prevent accidental application of 120V to the other terminals.
- E. Internal circuit breakers or fuses shall be easily made and locked from outside the power supply.
- F. Output voltage adjustment over the specified range shall be easily made and locked from outside the power supply.

2.03 LOCAL POWER SUPPLY

- A. These power supplies shall be provided to feed the grounded 28 VDC bus (B28G-N28G or B12G-N12G) for operating Yard Signal logic circuits entirely contained within the Train Control Rooms and non-vital circuits which extend outside the TCRs.
- B. These power supplies shall meet the following requirements in addition to the requirements specified in Parts 2.01 and 2.02 of this Section.
 - 1. Output Current
 - a. These power supplies shall be furnished in no more than three maximum continuous current ratings selected as required by the application.
 - b. Each power supply shall have a short-time overload rating stamped on the nameplate. The overload rating shall be at least 125 percent of rated load sustained for one minute out of any ten consecutive minutes.
 - c. Output current shall be limited to 250 percent of maximum continuous rating. If this short circuit current is sustained for 30 ± 10 seconds, an internal hand-resettable protective device shall operate to disconnect input power, without harm to power supply components. If this short circuit current is sustained for less than the 30 seconds, recovery of normal output voltage shall be automatic upon removal of the short circuit condition.
 - d. Reverse output current shall be prevented by circuitry contained within the power supply. This circuitry shall isolate all of the active components within the power supply (including filter capacitors) from the output terminals of the supply. If a circuit other than a blocking diode is used for control of reverse current, a small amount of reverse current will be allowed; however, this shall not exceed 2 percent of the rated current.
 - 2. Output Voltage (During Warm-Up Period)
 - a. The power supply output shall stabilize within a period of 20 minutes after rated input voltage is applied to the supply. During this period, the output

- voltage shall not be greater than 120 percent of rated DC voltage, regardless of load.
- b. During the warm-up period, ripple shall not exceed 3 percent of the rated voltage (as measured peak-to-peak), and noise shall be limited to 7 percent of the rated voltage (as measured peak-to-peak) at any frequency.
3. Output Voltage (After Warm-Up Period)
- a. The output voltage shall be adjustable to plus or minus 0.1 percent of the system voltage, at rated input voltage, with an ambient temperature of 25 degrees C, when operating at 50 percent of rated output current.
 - b. Regulation of Output Voltage
 - (1) The output voltage at 50 percent load current, shall not vary more than ± 2 percent for input voltage variations of ± 15 percent of rated voltage at constant ambient temperature.
 - (2) The output voltage at 50 percent load current and constant rated input voltage shall not vary more than ± 2 percent over a temperature range of -30 degrees C to +70 degrees C at constant rated line voltage.
 - (3) The output voltage, from no load to full rated load current, at constant rated input voltage and constant ambient temperature, shall not vary from the output voltage at 50 percent load current by more than plus or minus one half of one percent.
 - (4) After the warm-up period and once adjusted to a rated voltage with given constant input and load conditions, the output voltage shall not vary more than ± 0.5 percent in a 72 hour period.
 - (5) With the worst combination of load current and line voltage, and with temperature variation ranging from -30 degrees C to +70 degrees C, the output voltage shall never vary more than ± 12 percent of rated voltage.
 - c. Variation in output voltage due to load changes of up to 50 percent of maximum load and for a 10 millisecond interruption of input power shall be limited to ± 1.0 percent of rated output voltage, peak. Recovery to the point where the waveform stays within the ripple tolerance shall occur within 80 milliseconds of the initiation of the load change.\
 - d. Once the power supply output voltage has stabilized
 - (1) Output ripple, related to the power frequency, shall not exceed one half of one percent of rated voltage.
 - (2) Noise, unrelated to the power frequency, shall be limited to one half of one percent of rated voltage peak-to-peak at any frequency.
 - e. If the circuitry of the power supply is such that failure of one or more components within the supply could cause an output voltage greater than that allowed in the requirements of this article, an overvoltage circuit shall be added which senses this overvoltage condition and shuts the power supply down. Such circuitry may be of the "crowbar" type which causes an overcurrent protection condition resulting in the operation of the unit's overcurrent feature in consequent (manually resettable) shutdown. This circuit shall be designed to limit peak overvoltage conditions to a maximum of 125 percent of the rated continuous voltage.
4. These power supplies shall be designed and rated to operate on 120 or 208 ± 15 volts RMS (Nominal), derived from one or all three phases of a 208Y/120V, 60 Hz, 3-phase, 4-wire grounded neutral service bus.
5. Circuitry shall be provided within the power supply for control of the output voltage in a manner which shall cause the power supply to share the total bus load equally with all other parallel connected (tandem) power supplies feeding a given bus.

6. The 100-ampere power supply units shall have a minimum individual MTBF of 100,000 hours. Supply units of 50 amperes rating and less shall have a minimum individual MTBF of 150,000 hours. MTBF shall be calculated at 50 percent load. The maximum MTTR for any individual local power supply unit shall be one hour.

2.04 LINE POWER SUPPLY (LB-LC)

These power supplies shall be provided to feed the non-grounded DC bus (LB-LC) for operating the 28 Vdc Yard Signal vital logic circuits which extend outside the Train Control Rooms.

2.05 WHB POWER SUPPLIES (WHB-WHC)

- A. These power supplies shall be provided to feed the non-grounded WHB DC bus (WHB-WHC) for trailable switch machine and snowmelter control circuits.
- B. These power supplies shall be rated at a current value sufficient to simultaneously operate five trailable switch machines.
- C. These power supplies shall deliver to the trailable switch machine movements, at any load, or temperature between 0 degrees C and +70 degrees C, their rated voltage (110 Vdc on the specified machines) plus or minus 5 percent, at rated input voltage, and an ambient temperature of 25 degrees C. The output voltage may vary somewhat from its rating during warm-up, but it shall not exceed 120 percent of rated voltage and the warm-up period shall not be greater than 20 minutes.
- D. The ripple and noise of these power supplies shall not interfere with any electrical or electronic system furnished by the Design-Builder or with the Communications Systems.
- E. These power supplies shall be designed and rated to operate on 208 volts RMS, 3 phase, derived from a 208Y/120V, 60 Hz, 3 phase, 4 wire grounded neutral, source. The input voltage may vary as much as ± 15 percent, and the frequency may vary ± 0.5 Hz.
- F. A minimum of three bussed terminals shall be provided for each power supply polarity. Four terminals shall be provided for the output of the two contacts of the failure circuit.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. DC Power supplies shall be rack mounted.
- B. Mounting panels or brackets shall be rigidly designed so that they do not sag under the weight of the power supply.

END OF SECTION

THIS PAGE NOT USED

SECTION 16957

YARD CONTROL MACHINES

PART 1 - GENERAL

- 1.01** Design-Builder shall perform all detail design, construction, factory testing, field installation, field testing and final documentation of the modifications to the existing Yard Control Machines. These modifications shall be designed to permit monitoring of track occupancy, switch position, signal aspects, and traffic direction established for all tracks in the yard expansion area and for local auxiliary switch control and local manual "entrance-exit" control of route selection through the interlockings. These panels shall also include facilities for controlling and monitoring snowmelter layouts, where applicable. The Modified Consoles/Panels are to appear similar to and function as a replacement of the existing Yard Control Machine Panels.
- 1.02** The Design-Builder shall design the modifications to the Yard Control Machines in accordance with the style of the existing Yard Control Machines. As an alternative, the Design-Builder may replace the engraved panels with one or more mosaic tile type panel sections. If this alternative is adopted, the entire panel shall be replaced and equipped with necessary switches, pushbuttons, lamps, fasteners, hinges, locking mechanisms and other hardware. The modified control machine shall appear as a new machine providing a geographical representation of the entire yard.
- 1.03** The modification to the Yard Control Machines shall be designed to control and/or monitor the signals, switches, snowmelters, track circuits, and associated Train Control functions of the expansion to the Yards as described in the Program Criteria. New faceplate panels shall incorporate all existing Yard Signal Control functions.
- 1.04** The Yard Control Machines shall use light emitting diodes (LED) to display the following indications:
- A. Track Occupancy indications for all tracks within the limits of yard control, and for certain mainline tracks in approach to the yard,
 - B. Route Locked indications for all interlockings and running tracks within the Yard Limits.
 - C. "Available Exit" indications,
 - D. Switch Alignment indications,
 - E. Switch Locked and Trained Switch indications
 - F. Signal Status indications,
 - G. Signal Fleeting indications,
 - H. Vital Traffic indications for the Yard Lead tracks,
 - I. Power and Alarm indications,
 - J. Snowmelter Control, and Snowmelter Failure indications

1.05 The Yard Control Machine Consoles and/or Panels shall interface with and/or contain the following as appropriate for the expansion of the yards:

- A. A "SNOWMELTER"* toggle switch to control all snowmelters in the yard.
- B. A "SWITCH POSITION"* pushbutton, located on the control machines as shown on the provided Information Drawings, to cause the current position (NORMAL or REVERSE) of every track switch in the yard to be indicated,
- C. An "INDICATION TEST"* pushbutton, located on the control machines as shown on the provided Typical Drawings, to momentarily energize all indicator lights on the faceplate for test purposes. When this pushbutton is depressed, all RED LEDs shall be illuminated. When this pushbutton is pulled, all WHITE, AMBER, GREEN or other non-RED LEDs shall be illuminated.
- D. An ALARM CUTOFF pushbutton to silence audible alarms generated by the existing alarm circuits and any additional alarms provided under this Contract.

1.06 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration

Section 16989	Yard Test and Inspections

1.07 QUALITY ASSURANCE

See Section 01113 Systems Integration.

1.08 SUBMITTALS

See Section 16912 Yard Signal Submittal Requirements.

1.09 DELIVERY, STORAGE AND HANDLING

The Design-Builder shall take whatever measures may be necessary to protect the Yard Control Machine panels from damage or marring during shipment, storage, installation, and testing. Panels which are marred or otherwise damaged prior to acceptance by the Authority shall be replaced by the Design-Builder.

PART 2 - PRODUCTS AND MATERIALS

2.01 Panel Faceplate Construction

- A. The material of the faceplates of the Train Control and Indication panels shall be laminated black/white/black phenolic or approved equal. The track and equipment layout shall be engraved thereon to produce a white configuration on a black background. The strength and thickness of the faceplate material shall be sufficient to ensure that no cracking, warping, separation or significant deflection of the faceplate occurs. The method used to attach the faceplates to their respective frames shall allow easy removal and replacement without damage to the faceplates or frames.
- B. As an alternative, each panel faceplate may be composed of an assembly of small individually engraved 1/8 inch thick black/white/black phenolic plates, supported on a three dimensioned metal grid carrier structure, which shall also support the necessary control and indication hardware modules.
- C. All panel faceplate edges shall be rigidly supported by a metal frame and by the control machine frame. Supplementary cross braces shall be added as necessary to prevent panel deflection.

2.02 PANEL COMPONENTS:

- A. All control and indication modules shall be securely attached to the panel faceplate but shall be removable without damage to the module or faceplate.
- B. All panel hardware including, but not limited to, pushbuttons, switches, levers and indicators shall be new and free of manufacturing defects.

PART 3 - EXECUTION

3.01 PANEL WIRING

- A. Panel wiring between the Train Control Room and the Yard Control Machine shall be terminated in plug connectors to facilitate off-site testing and to expedite the panel replacements.

END OF SECTION

SECTION 16958

COMPUTERIZED YARD CONTROL SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This section permits the substitution of a computer-based Yard Control System for the performance of most of the non-vital functions of the Yard Signal Control and interlocking System, such as the request and indication of routes throughout the yard and on the yard leads, in lieu of a system implemented with non-vital relay circuitry.
- B. It shall be understood that the word "computer", when used in this section, refers to one or more solid state electronic processors, complete with all auxiliary and support equipment, as selected by the design-builder, and approved by the Authority Representative. The "computer" shall have adequate logic capacity to perform the route Entrance-Exit functions and most of the other non-vital functions of the Yard-Signal Control and Interlocking System. It shall not be additionally assigned to functions which require the use of vital relays, as specified in other sections of these specifications, unless specifically authorized in writing by the Authority Representative.
- C. It is the intent of this section to enable the design-builder to make use of the flexibility of the computer to reduce the cost of the yard changes and additions.
- D. The equipment shall comply with the requirements defined by the graph presented on Page TC-7 of the Program Criteria, which specifies the maximum allowable Mean Time To Repair (MTTR) for any Mean Time Between Failures (MTBF) experienced by the equipment and systems comprising the Yard Signal Control and Interlocking System.
- E. The yard operator's Yard Control and Indication Panel (part of the Yard Interlocking Control; Machine) shall be of the type specified in Section 16957, Yard Control Machines.
- F. The Design-Builder shall furnish both conventional and computer-equivalent circuit drawings (or equivalent software logic statements) for all of the non-vital functions that are to be performed by a computer in the Computerized Yard Control system. The logic and operation of the computerized system shall be at least the equivalent, in terms of safety and speed of operation, to the logic and operation of the non-vital relay circuits shown in the Information Drawings.

1.02 RELATED SECTIONS

1.03 QUALITY ASSURANCE

See Section 01113, Systems Integration.

1.04 SUBMITTALS

See Section 16912, Yard Signaling Submittal Requirements

1.05 DESIGN REQUIREMENTS

- A. The Design-Builder shall prepare the following drawings for approval by the Authority Representative prior to fabrication or procurement of yard control system computer equipment:
1. Drawings showing the arrangement of the engraved control and indication panel diagrams, brackets, hinges, symbols and lettering, and the location of all required control and indication hardware mounted thereon.
 2. Complete circuit drawings for the computer assembly and all the required control and indication functions to be performed by the computer.
 3. Complete wiring diagrams for the computer assembly. This shall include complete back-panel wiring diagrams for all control machine control and/or indication panels.
 4. Drawings showing the mechanical details for all the various items of the computer assembly and the control and indication hardware required for the control panels, with the method of mounting these devices on the panel or in the enclosure.
 5. Drawings showing the details of the cable assemblies to be used in connecting the computer assembly to the equipment racks and to the control panels of the Yard Control Machine.
 6. Arrangement plans and assembly drawings having complete parts lists keyed to the assembly or arrangement shown.
- B. The Design-Builder's revised circuit drawings and their software equivalent statements shall be submitted to the Authority Representative for approval within 120 working days following the Notice to Proceed (NTP). The circuits shall be complete and show all interfaces and interface terminal connections between the portions at various locations, and between various pieces of equipment. The circuit drawings shall comply with Section 16991, Yard Signal Drawings and Tracings.
- C. The Design-Builder shall submit a complete software package for the Computerized Yard Control System within 120 working days of NTP. This package shall include, but not be limited to:
1. program functional specifications
 2. program detail specifications

3. a completely documented program printout of the entire program of the computer.
 4. flow charts
 5. a programming manual
 6. a key sheet that lists and defines all symbols and aspects of the program.
 7. complete software equivalent circuits, or equivalent software statements for the non-vital circuits of the Yard Signal Control and Interlocking System. These shall be in Boolean equivalent form.
- D. The computer program shall be broken down in a logical manner, with comments or remarks to provide easily understood sections.
- E. The Design-Builder shall not proceed with fabrication or procurement of the computer, or its associated equipment until it has obtained the Authority Representative's approval of all the drawings, lists, printouts, and key sheets applicable to the assembly.
- F. The Design-Builder shall submit a Factory Test Procedure for the computer assembly. This test procedure shall be in conformance with the requirements specified in Section 16989, Yard Tests and Inspections. The Design-Builder shall obtain the Authority Representative's approval of this procedure prior to manufacture of the computer assembly. Manufacture or procurement of the computer without prior approval by the Authority Engineer shall be at the Design-Builder's risk.
- G. The Design-Builder shall submit a Factory Test Procedure for the testing of the computer and the control machine, with sufficient I-O equipment and the test fixtures to prove the operation of the proposed system. This test procedure shall include provisions for the testing of all operational aspects of the equipment according to the requirements of Section 16916, Basic Yard Signal Circuit Requirements.
- H. The Design-Builder shall submit Factory Test Reports, as stipulated by his approved Factory Test Procedure. The computer shall not be shipped from its point of fabrication until these Factory Test Reports have been approved by the Authority Representative.
- I. The Design-Builder shall furnish a documented test report for each of the boards comprising the computer, or computers furnished, verifying that it operates correctly when subjected (while in monitored operation) to testing throughout the full range of temperature and voltage specified. The I-O boards shall be similarly tested, but the Design-Builder may elect to temperature-test only one I-O board out of five. All I-O boards shall receive an operational test at room temperature.
- J. The Design-Builder shall submit a proposed course outline for the required instruction of Authority personnel in the operation and maintenance of the computer and its related equipment.

1.06 DELIVERY

The Design-Builder shall deliver the complete, corrected and tested software package for the Computerized Yard Control System to the Authority Representative at least 60 calendar days before the scheduled cut-over date for the new Yard Control Panels.

PART 2 - PRODUCTS AND MATERIALS

2.01 COMPUTER REQUIREMENTS

- A. The computer, and its associated equipment shall meet the physical and electrical environmental requirements specified.
- B. The computer Input and Output connections shall be fully isolated from the power supply of the computer.
- C. The cables connect the main Entrance-Exit computer with the equipment at the satellite locations shall be shielded, or of other special construction as may be necessary, but it shall be constructed of the same materials, and to the same quality standards as the other cables specified for this contract. The quantity, size, and arrangement of conductors shall be as required by the Design-Builder for proper operation and protection of approved computer equipment.

2.02 MECHANICAL REQUIREMENTS

- A. The computer shall make use of plug-in printed circuit cards. Each card shall be labeled with its function, a means of application identification, a serial number, and a model drawing number.
- B. The printed circuit cards shall be housed in rigid frames containing a motherboard for the mounting of printed circuit card plug-in receptacles. This motherboard shall be either a printed circuit card or a hard-wired plane. The frame shall contain full length card guides to assure that the plug-in contacts of each plug-in card correctly mate with the motherboard connectors.
- C. Each plug-in location shall be labeled with the identity of the card type intended for that position. The frame shall incorporate a method of keying each location so that cards cannot be inserted in incorrect locations.
- D. Cards which are physically identical, but which differ because of programming contained in Read-Only-Memory (ROM, PROM, or EPROM) shall be considered, for purposes of identification and plug-in interlocking, as different cards.
- E. The Design-Builder shall specifically assess the desirability of removing a printed circuit card while the system has power applied to it. If he determines that this should **not** be allowed, because of a detrimental effect to program or component, he shall equip the card frame with a power interlock guard, which automatically removes power from the system before any card can be removed. This guard may be made card-selective, if advantageous, so that certain cards may be removed, without operation of a power interlock.
- F. The card frame shall be constructed and mounted in a manner that allows adequate air movement to prevent localized hot-spots that would prevent the assembled and mounted equipment from meeting the environmental and reliability requirements of these specifications.
- G. The card frame shall contain electromagnetic shielding, if necessary, to allow the assembled and mounted system to meet the environmental requirement of these specifications.
- H. The card frame shall be mounted in a rack in the Yard (Main) Train Control Room. This section of the rack shall include a Computer Control Panel that shall contain all necessary

housekeeping and testing controls and indications for the computer. This panel shall be mounted at the top of the rack section. If computer equipments located at a satellite field location, the card frame shall be mounted in a rack which meets requirements of these specifications, and is suitable for such mounting.

2.03 ELECTRICAL REQUIREMENTS

- A. The computer, and its associated equipment, shall be powered by conservatively rated power supplies provided as part of this item. These supplies shall meet the temperature and electrical requirements of these specifications. At the Design-builder's discretion, these supplies shall operate from either the 120 V ac supply or the voltage supply provided for the relays. In either case, these supplies shall be equipped with transient protection to protect the supplies, and the computer, from power line transients as high as six kilovolts.
- B. The Design-builder shall include in the design of this system all equipment and wiring configurations known to protect the computer and its ancillary devices from damage due to lightening or other energy surges. Superior lightning and transient protection shall also be provided for any data transfer lines extending from the commuter housing to locations referenced to a grounding system that is not that of the computer housing. See Section 16922, Lightning/Surge Protection and Grounding Systems

2.04 PROGRAMING REQUIREMENTS

- A. Design-Builder shall provide a means of programming the computer, initially , and as subsequent changes, improvements, and replacements warrant. This means may take the form of a test fixture that shall become the property of the authority at the time of yard acceptance, or, upon prior approval by the Authority, it may take the form of a programing service approved by the Authority, utilizing a furnished coupling unit for making corrections (via a telephone connection) from a programming computer on the Design-Builder's, or other designated premises. If the later alternative is selected, the Design-Builder shall agree, by certified letter, to maintain this service for a minimum of fifteen (15) years, or provide, at any time during the period, an alternative programming means that is satisfactory to the Authority Representative. If the programming service is selected, the Design-Builder shall provide the service for the first year after yard acceptance, at no extra cost to the Authority, and thereafter, at a reasonable hourly charge.
- B. The Design-Builder shall provide two forms of diagnostics, as outlined herein, for each location housing a portion of the "Yard Computer". The degree of refinement in each of these regimes is at the discretion of the Design-Builder, but he shall keep in mind that diagnostic are instrumental in attaining the MTTR specified in Article 1.01 of this section, and that the Authority Representative will be looking for evidence of compliance with this requirement.
 - 1. The Design-Builder shall provide a diagnostics routine to continuously monitor the operation of the computer and its peripheral devices. This may be implemented by the solution of a sample argument during the time the computer is not being used in its Entrance-Exit application, or, it mat take some other form suggested by the Design-Builder (and approved by the Authority Representative) to prove the continue validity of the computational results. In any case, the detection of a computer or peripheral failure by this diagnostic routine shall trigger an alarm. This alarm shall be both audible (with reset pushbutton), and visible on the yard control panel, and shall register on the Event Recorder specified in Section 16929, Event Recording System of these specifications. A visible alarm shall also be displayed in the Train Control

Room. This alarm system should identify the printed circuit board to be replaced, as approved by the Authority Representative.

2. The Design-Builder shall provide a diagnostic routine that can be activated by maintenance personnel to locate a defective printed circuit board of the system that has, through failure of some component located thereon, caused a system shutdown, or other failure of the computer, and which has not been specifically detected and reported by the continuous diagnostics monitor, This may take the form of a hand-held, plug-in diagnostic device and LED indicators (located in printed circuit boards) or it may take some other form suggested by the Design-Builder and approved by the Authority Representative. This routine shall be very thoroughly documented in a maintenance manual.

C. Wherever LEDs are used for troubleshooting or diagnostic purposes, they shall be labeled with the function (or malfunction) they represent.

2.05 SPARE REQUIREMENTS

A. The Design-Builder shall provide, in addition to the plug-in printed circuit cards comprising the computer, a set of cards to be used as replacements. This set of "spare" cards shall contain at least one card for every different card type utilized in the operating system. In addition, where more than one card of the same type is utilized in the system, the Design-Builder shall provide either one card, or 20% of the total number of identical cards used in the operating system, whichever is greater.

B. The spare cards shall be identical to, and interchangeable with, the cards in the operating system.

C. Cards that are physically identical, but differ because of onboard programming shall be considered, for the purposes of spare requirements, as different card types.

D. The Design-Builder shall also provide one spare card cage for each unique module in the computerized Yard Control System.

E. One or more rugged and portable carrying cases with hinged and latched covers and a handle on top shall be provided to house and protect all of the spare printed circuit cards. Card guides shall be fitted into the interior of the case to hold each card and prevent unwarranted contact between the components of any two cards. The bottom of the inside of the case shall be fitted with a one-inch resilient foam pad (closed-cell neoprene) for the protection of the cards from impact during insertion into the case or during transit. The maximum weight of any case with its cards installed shall be twenty-five pounds.

F. The Design Builder shall deliver all spare printed circuit cards and associated equipment to the Authority at least 60 days before the Operational Readiness Date (ORD) for the Yard changes and additions.

2.06 TEST FIXTURE REQUIREMENTS

A. The Design Builder shall provide a complete set of test fixtures for the yard computer. This "set" shall consist of one or more portable units, and shall include any special test devices, instruments, or fixtures which are necessary or desirable to set-up, inspect, maintain, or facilitate the repair of any part of the yard control computer.

- B. The "set" of test fixtures shall include the capability to test and troubleshoot all PC boards used in the Computerized Yard Control System, including I/O boards.
- C. Also included shall be such necessities as board extenders, leads, adapters, and special tools. The Design-Builder shall not include or duplicate any test device furnished under another section of these Specifications. Equipment for actual repair of the printed circuit boards shall not be included.

2 .07 SUPPLIES

The Design-Builder shall provide, if necessary for the equipment selected, sufficient paper and ink supplies for one year.

2.08 INSTRUCTION MANUALS

The Design Builder shall provide instruction manuals for all items of hardware and software included in the computer-based Yard Control System.

PART 3 - EXECUTION

3 .01 DELIVERY, STORAGE AND HANDLING

The Design Builder shall take whatever measures may be necessary to protect the computer and its associated equipment from damage or marring during shipment installation, and testing. If the equipment is marred or otherwise damaged prior to acceptance by the Authority, it shall be repaired to the satisfaction of the Authority Representative or be replaced by the Design-Builder at no additional cost to the Authority.

3 .02 INSTALLATION

- A. The Design Builder shall install the computer-based Yard Control system complete with its program and all appliances necessary to provide a system which operates properly, is readily maintained and is in accordance with these Specifications.
- B. The Design Builder shall separate power wiring from control and indication wiring to the greatest extent practicable and install wiring and equipment in conformance with practices known to improve protection from lightning or other electrical surges. See Section 16922, Lightning/Surge Protection and Grounding Systems.

3 .03 TESTING

- A. The Design Builder shall factory test a complete system, in the presence of the Authority Representative, according to the test procedure he has produced and which the Authority Representative has previously approved. This system shall be composed of the equipment specified in Parts 1 and 2 of this Section. This test shall be successfully completed to the satisfaction of the Authority Representative before the equipment to be furnished is shipped from the factory.

- B. Design-Builder shall field test the installed computer-based yard control system according to a test procedure which he has produced and which the Authority Representative has previously approved.
- C. This testing shall be in the presence of Authority-designated personnel. A minimum of two week's notice shall be given before the commencement of testing.
- D. A log book shall be utilized during, and subsequent to, field testing to record the stop-by-step process of making any changes to the program, should they for any reason, be necessary. This log book shall be updated at the conclusion of each day's work. Failure to provide and utilize a log book will prevent approval of all test reports associated with the computer checkout.
- E. Upon satisfactory completion of operational testing of the Computerized Yard Control System and approval of the test results, the Design Building shall deliver to the Authority three copies of a printout of the completely revised program, three copies of the revised flow charts, three copies of all revised documentation, and the up-to-date logbook.
- F. The final revised program shall be entered into the memories of the computer system, as well as the spare boards.
- G. The complete system test shall be run two times
 1. For the system with original boards and, following approval
 2. For the system with its boards replaced by the spare boards.

3 .04 AUTHORITY PERSONNEL INSTRUCTION

The Design Builder shall provide, on the Authority's premises, classroom and hands-on instruction for the operation and maintenance of the Computerized Yard Control System, for twelve persons designated by the Authority. The instruction shall include in-depth information on the basic design of the Computerized yard Control system. this course shall be presented during the final installation stage of the Computer control system at no additional cost to the Authority.

END OF SECTION

SECTION 16959
SERIES TYPE TRACK CIRCUIT LAYOUTS

PART 1 - GENERAL

1.01 DESCRIPTION

- A. This section specifies the furnishing and installation of series type single rail track circuits, utilizing 60 Hz energy for train detection.
- B. Minimum track circuit length, per operating track, shall be 50 feet.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration.
Section 16912	Yard Signal Submittal Requirements
Section 16914	Environmental Requirements
Section 16917	Basic Interlocking Requirements
Section 16941	Basic Component Requirements
Section 16944	Non-Vital Relays and Timers
Section 16946	Transformers
Section 16949	Signal Wire and Cable
Section 16968	Track Bonding Layouts
Section 16989	Yard Test and Inspections

1.03 QUALITY ASSURANCE

See Section 01113 Systems Integration

1.04 SUBMITTALS

See Section 16912 Yard Signal Submittal Requirements

PART 2 - PRODUCTS

2.01 TRACK TRANSFORMERS

Track transformers shall be as specified in Section 16946, Transformers.

2.02 ADJUSTABLE RESISTORS

Adjustable resistors shall meet the requirements specified in Section 16941, Basic Component Requirements, and be as described below:

- A. The maximum resistance and continuous capacity ratings for the relay pickup resistor shall be matched to the type of non-vital track relay selected.
- B. The relay pickup resistor shall have a slide tap adjustment over its full resistance range.

2.03 TRACK FUSES

Fuses shall be as specified in Section 16941, Basic Component Requirements, and shall be rated for 600 volts and 6.25 amperes.

2.04 TRACK RELAY

The track relay shall be a non-vital, DC relay as specified in Section 16944 Non-Vital Relays and Timers.

2.05 WIRING

Wiring for power frequency track circuits shall be in accordance with Section 16949, Signal Cable and Wire.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Series type track circuits shall be arranged to provide continuous train detection.
- B. The track relay, diodes and relay pickup adjusting resistor for each track circuit shall be located in a train control room.
- C. The track fuse, track feed transformer, and relay pickup transformer for each track circuit shall be located in a train control equipment case on the wayside in close proximity to the applicable track circuit.
- D. Series type track circuits shall be installed as determined by the Design-Builder subject to review and approval by the Authority's Representative.

3.02 OPERATION

- A. Series type track circuits shall operate satisfactorily, without false occupancy indications, down to a minimum ballast resistance of 4 ohms per 1000 feet.
- B. Series type track circuits shall operate in a satisfactory manner under the environmental conditions described in Section 16914, Environmental Requirements.

END OF SECTION

SECTION 16963

POWER FREQUENCY TRACK CIRCUIT LAYOUTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of single-rail track circuit layouts, utilizing 60 Hz energy, for train detection.
- B. Minimum track circuit length, per operating track, shall be 50 feet.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration.
Section 16912	Yard Signal Submittal Requirements
Section 16914	Environmental Requirements
Section 16917	Basic Interlocking Requirements
Section 16941	Basic Component Requirements
Section 16943	Vital Relays
Section 16946	Transformers
Section 16949	Signal Wire and Cable
Section 16968	Track Bonding Layouts
Section 16989	Yard Test and Inspections

1.03 QUALITY ASSURANCE

See Section 01113 Systems Integration

1.04 SUBMITTALS

See Section 16912 Yard Signal Submittal Requirements

PART 2 - PRODUCTS

2.01 TRACK TRANSFORMERS

Track transformers shall be as specified in Section 16946, Transformers.

2.02 ADJUSTABLE RESISTORS

Adjustable resistors shall meet the requirements specified in Section 16941, Basic Component Requirements, and be as described below:

- A. The resistor in the feed end shall be 3.0 ohms with a continuous capacity of 200 watts. It shall be capable of a current of 10 amperes and shall have taps allowing the selection of 0.5, 1.0, and 1.5 ohms.

- B. The resistor at the relay end shall be 25 ohms with a continuous capacity of 100 watts. It shall be capable of a current of 3 amperes and have taps allowing the selection of 12, 8 and 4 ohms.

2.03 TRACK FUSES

Fuses shall be as specified in Section 16941, Basic Component Requirements, and as described below:

- A. The fuse in the feed end of the track circuit shall be 600 volt, 8 amperes.
- B. The fuse in the relay end of the track circuit shall be 600 volt, 2 amperes.

2.04 TRACK RELAY

The ac track relay shall be as specified in Section 16943, Vital Relays.

2.05 WIRING

Wiring for power frequency track circuits shall be in accordance with Section 16949, Signal Cable and Wire.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Power frequency track circuits shall be arranged to provide continuous train detection.
- B. All power frequency track circuit equipment shall be located in the local Train Control Room, with the exception of wayside junction boxes and cabling.
- C. The track feed transformer and the local coil of the track relay for each power frequency track circuit shall be fed from the same energy source and phase.
- D. Power frequency track circuits shall be installed as determined by the Design-Builder subject to review and approval by the Authority's Representative.

3.02 OPERATION

- A. Shunting sensitivity of power frequency track circuits shall be .06 ohms or more under dry weather conditions.
- B. Power Frequency track circuits shall operate in a satisfactory manner under the environmental conditions described in Section 16914, Environmental Requirements.

END OF SECTION

SECTION 16964

YARD TRAILABLE SWITCH OPERATING LAYOUTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of Yard Trailable Switch Operating Layouts at the locations indicated on the information drawing track plans.
- B. Each Track Switch Operating Layout shall consist of:
 - 1. A Trailable Switch Machine
 - 2. A Switch Circuit Controller
 - 3. An arrangement of rods and hardware to connect the Switch Machine to the switch points for throwing and detecting purposes
 - 4. All the necessary cable, wire, junction boxes and electrical fittings required to connect the Switch Machine and Circuit Controller electrically to the TCR for operation and indication purposes.
- C. The Design-Builder shall install ALSTOM Model 6 Trailable Switch Machines exclusively for this Contract.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signal Submittal Requirements
Section 16923	TC Maintenance Telephone System
Section 16949	Signal Cable and Wire
Section 16972	Junction Boxes
Section 16989	Yard Test and Inspections

1.03 QUALITY ASSURANCE

- A. See Section 01113, Systems Integration.

1.04 SUBMITTALS

- A. See Section 16912,
- B. Submit mechanical and electrical drawings for each type of Switch Operating Layout proposed for this Contract. The mechanical drawings shall include keyed material lists complete with part numbers. The drawings to be submitted shall include, but not be limited to:
 - 1. Overall mechanical layouts showing relative location of major components
 - 2. Detailed drawings of the various rods, connecting hardware and electrical fittings
 - 3. Control, operating, indicating and internal heating circuits
 - 4. Detailed wiring diagrams for the Switch Operating Layout movement mechanism and its associated wayside junction box.

1.05 DELIVERY, STORAGE AND HANDLING

All unpainted ferrous metal surfaces of Switch Operating Layout equipment shall be coated with NO-OX-ID "E" grease, petroleum jelly or an approved equivalent, before the equipment is shipped from point of manufacture. Parts constructed of a non-ferrous material or having a painted finish will not require this protective coating.

PART 2 - PRODUCTS

2.01 Trailable Yard Switch Movement

- A. A Trailable Switch Machine shall be provided as part of each Switch Operating Layout.
- B. A Switch Circuit Controller shall be provided as part of each Switch Operating Layout.

2.02 Trailable Yard Switch Operating Layouts

This section specifies the final design, furnishing and installation by the Design-Builder of trailable switch operating layouts for guarded-point switches. The specifications included under this subheading are to be considered additions to all other requirements outlined in this document.

- A. A symbol form, shown on the Double Line Track Drawings, is used to indicate various locations where trailable switch operating layouts are to be furnished and installed. The guarded point housing (by others) is located on the "diverging" side of each turnout in the yard.
- B. For this Contract, Alstom Model 6 Switch Machines, DWG. No. 52500-004-18 shall be installed exclusively in all layouts.
- C. The switch circuit controller shall be a separate piece of equipment equipped with four front and four back dependent contacts to check the position of the switch points. It shall be operated by a separate, insulated detector rod attached to a point lug mounted on the switch point nearest to the switch machine and circuit controller housing, whether that switch point is normally open or normally closed.
- D. Threaded parts of the switch operating layouts which require periodic adjustments or maintenance, such as throw rods, detection rods, and mounting bolts, shall conform to American standards. American standards shall also apply to threaded conduit outlets.
- E. Switch mechanisms shall be equipped with 110 volt dc motors. The mechanisms shall be capable of operating the switch points through a full stroke on 80 percent of nominal voltage in not more than 1.5 seconds, and shall exert at least 1000 pounds retaining force on the switch points in both their NORMAL and REVERSE positions.
- F. All trailable switch operating mechanisms shall have a timing relay incorporated within the switch operating network. The timing relay shall remove energy from the NWR and RWR relays if an obstruction is encountered. The timing relay shall operate in no less than three seconds, and no more than five seconds after the point detector contacts open.

- G. The trailable switch operating mechanisms provided by the Design-Builder will be required to operate No. 6 and No. 8 guarded-point switches having a throw of up to 5.00 inches. The layouts for these switches shall be substantially as shown on the Information Drawings.
- H. Each trailable switch operating layout shall be circuited in such a manner that, after being trailed through, it shall be electrically restorable to correspondence, but only by appropriate manipulation of a special, sealed "Trailed Switch Reset" pushbutton located in the Train Control Room. This pushbutton shall be of the same type and manufacture as the pushbuttons specified in Section 16957, Yard Control Machines.

2.03 RODS

- A. Provide the following separate, insulated rods and associated equipment as part of each Track Switch Operating Layout
 1. Throw rod and throw rod basket
 2. Detector rod and point detector lug
- B. No welded components will be allowed. All rods and lugs shall be forged unless otherwise directed in writing by the designated Authority's Representative.
- C. When offsets are required in the rods, the rods shall be offset during manufacture. At least 15 inches of threaded area shall be supplied on each rod to accommodate a wide latitude of operating adjustments.
- D. Insulation required for the above rods and equipment shall be of the type recommended in Part 14.5.3 of the AREMA Signal Manual.
- E. The rods shall be of appropriate length to provide the specified distance from centerline of track to centerline of switch layout. Any modifications necessary to meet this requirement shall be performed by the Design-Builder in a manner satisfactory to the Authority's Representative at no additional cost to the Authority.

2.04 JUNCTION BOX

- A. Each Switch Operating Layout shall include a junction box suitable for terminating the interconnecting wire and cable adjacent to the Trailable Switch Layout.
- B. A cast iron, pedestal mounted junction box shall be furnished for layouts to be situated in ballasted construction areas. See Section 16972, Junction Boxes.
- C. A TC Maintenance Telephone jack shall be installed in the junction box. See Sections 16972 and 16923.
- D. If the switch machine junction box or WJ is located on the opposite side of the track from the switch machine, or if the WJ is located at a distance greater than 12 feet from the switch machine, an additional TCM phone jack (which is accessible without removing any covers) shall be installed at or near the switch machine.

2.05 PULL BOX AND ELECTRICAL FITTINGS

- A. Each Track Switch Operating Layout shall include all the conduit, connectors, terminal blocks and other electrical fittings required for the switch control, operation and indicating wiring between the Trailable Switch Layout and the TCR.

2.06 MISCELLANEOUS HARDWARE

- A. Two cast metal letters, "N" and "R", at least three inches high, painted white, and drilled to provide a means of attaching them, shall be furnished to denote the Normal and Reverse positions of the switch points.
- B. Furnish all screws, bolts, nuts, washers, pins, cotter keys, shims, plates and other hardware required to connect the rods to the Trailable Switch Layout and to the switch points. In ballasted track areas the Design-Builder shall also furnish tie straps as shown on the Information Drawings.

2.07 PAINTING

All equipment described in this Section shall be painted in accordance with the recommendations of Sections 29 and 30 of Part 2.4.30 of the AREMA Signal Manual. The finish color shall be black.

2.08 EQUIPMENT PROVIDED BY OTHER DISCIPLINES

- A. The switch rods of each track switch will be furnished as part of the trackwork.
- B. Switch ties for mounting the switch machine and circuit controller will be furnished as part of the track turnout for each new Track Switch Operating Layout in yard track areas.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Switch Operating Layouts shall be installed as per approved installation drawings.
- B. In ballasted construction areas, the Design-Builder shall be responsible for any ballast removal required to install the switch operating layouts. Excess ballast shall be spread evenly between ties in the vicinity of the track switch. Likewise, the Design-Builder shall be responsible for all drilling, dapping, shifting, relocating or replacement of ties that may be necessary to meet the requirements indicated on the approved drawings. Whenever ties are shifted, relocated or replaced, the Design-Builder shall re-tamp them to a fully stable condition. The Design-Builder shall be responsible for restoring the track to proper alignment and profile at no additional cost to the Authority.
- C. Cables terminating in the switch junction box shall be dressed and potheaded as specified in Section 16949. The individual conductors shall be fanned in a neat workmanlike manner, and properly tagged and terminated. Internal wire, as specified in Section 16949, shall terminate in the switch junction box and also in the switch mechanism in a neat workman like manner.

This wire shall also be properly tagged and terminated. The wire between the switch junction box and the switch mechanism, or switch circuit controller, shall be installed in an appropriate length of flexible hose as specified in Section 16973. The hose shall be fastened to the switch junction box, switch circuit controller, and switch mechanism with stainless steel hose clamps as specified in Section 16973.

- D. Where the switch circuit controller cover opens into the dynamic outline of the transit cars, the Design-Builder shall provide a means for the quick and easy removal of the cover for maintenance purposes.

3.02 IDENTIFICATION

The two cast metal letters "N" and "R" shall be securely mounted inside the running rails, attached to the first tie adjacent to, but not supporting, the switch points to denote the Normal and Reverse positions of the switch points. The letter "N" shall be mounted on the normally open point side as shown on the Information Drawings.

3.03 LUBRICATION

- A. Lubricate all moving parts and bearing points of the switch machine upon switch machine installation, with lubricants approved by the designated Resident Engineer. Any moving parts of the switch layout which are frozen shall be freed prior to being lubricated.
- B. Upon installation of the layout, grease the various rod fittings, thoroughly clean, and apply an Authority approved graphite lubricant to the tie plates under the switch points, and to the inside of the joint bars holding the heels of the switch-point rails. Rusted plates shall be wire brushed to remove any scale prior to being lubricated.
- C. Apply a supplemental coating of NO-OX-ID "E" grease, or approved equivalent, to exposed threaded surfaces to prevent corrosion.

3.04 ADJUSTMENT

- A. Adjust the rods in such a manner that the proper point detector contacts indicate switch closure when a switch point is within 1/8 inch of its stock rail and no point detector contacts are closed when both switch points are 1/4 inch or more from their respective stock rails, with the specified obstruction measurements being made 6 inches back from the switch points.
- B. The adjustment shall result in the switch points being at least 4-3/4 inches, and not more than 5-1/8 inches from the stock rails when in their "Open" position. For guarded-point switches, the adjustments shall result in switch points being at least 3-3/4 inches, and no more than 4 inches from the stock rails when open.
- C. Final adjustment shall result in a complete "tuck" of the point rail under the machined portion of the stock rail, with point-to-stock rail contact.
- D. These adjustments shall be maintained by the Design-Builder from the time of installation until acceptance by the Authority. All of these adjustments shall be verified (and corrected if necessary) by the Design-Builder, not more than 30 days prior to acceptance by the Authority.

3.05 MAINTENANCE

Switch Operating Layouts shall be properly lubricated, adjusted, and maintained by the Design-Builder on a regular timed basis until use and possession of the switches is taken by Authority Rail Systems Maintenance at the time of acceptance by the Authority. The Authority will assume responsibility for switch adjustment and maintenance at that time.

END OF SECTION

SECTION 16965

SIGNAL LAYOUTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of Signal Layouts at the various locations required under this contract, and the final design by the Design-Builder of modifications to standard signal layouts where necessary.
- B. Each Signal Layout shall consist of:
 - 1. A complete color light signal unit
 - 2. All required mounting devices and related hardware
 - 3. All electrical fittings and cable required to provide the specified signal control and/or lighting circuitry for the wayside signal unit.
- C. Types of Signals to be provided: Controlled Signals (Three Lenses - R/LW/R)
- D. All signals shall be identical.
- E. Controlled signals shall be used to govern the movement of trains:
 - 1. Through interlocking plants (Interlocking Signals) (or as "Repeater Signals" for Interlocking Signals where sighting problems or other special situations are encountered.);
 - 2. For entrance to segments of "running tracks" between interlockings (Intermediate Signals), or;
 - 3. From tail track storage areas (Holdout Signals).
- F. Based upon on-site inspection, the Design-Builder shall determine, for every required signal location, if there is a potential sighting, clearance or interference problem for signals installed in the normally specified manner. For every signal location where such a potential problem exists, the Design-Builder shall design and submit thorough documentation for whatever alterations and/or additions to the normal installation layout are necessary to overcome the potential problem.

1.03 QUALITY ASSURANCE

See Section 01113, Systems Integration.

1.04 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements.

1.05 DELIVERY, STORAGE AND HANDLING

Signal lamps shall be shipped separately from the signals.

PART 2 - PRODUCTS

2.01 SIGNAL UNITS

A. Each color light signal unit shall consist of the following components.

1. Housing
2. Lenses
3. Lamps and lamp receptacles
4. Adjustable transformers
5. Backlights
6. Terminal boards and wiring
7. Number plate
8. Mounting device
9. Lens hoods
10. Mast and base or wall mounting bracket, as applicable.
11. Ladder or pole steps, as applicable

B. Signal units shall be similar to those depicted on Alstom Signaling Inc. (GRS) Drawing No. 45906-358, Union Switch & Signal Inc. (US&S) Part No. N451357, or approved equal.

2.05 SIGNAL HEAD TRANSFORMERS

The transformers shall have a nominal primary voltage of 120 volts, a nominal secondary voltage of 10 volts and power rating of 60 watts, all at 60 Hz. They shall have input voltage taps for 110 to 125 volts in five-volt steps, and output voltage taps for five to 12 volts in one-volt steps.

2.07 NUMBER PLATES

- A. Equip each Controlled Signal and Marker Signal with a sheet steel number plate. The number plates shall have white reflex-reflecting lettering on a black synthetic enamel background.
- B. The number plate for each Controlled Signal shall have two lines of 2-inch high lettering. The top line shall be the route initial and location designation number, and the bottom line shall be the signal number. The lettering on the plate shall be of similar design, layout and dimensions as found on the existing yard signal number plates.
- C. Number plates shall meet the applicable recommendations established by Part 14.6.1 of the AREMA Signal Manual.

2.09 MAST AND BASE

- A. The mast for each mast-mounted signal shall consist of an approved pipe pole four inches in diameter supported by an approved split cast-iron base of the appropriate type with a junction box.
- B. The cast-iron base shall be of the junction box type. The junction box base shall be equipped with at least six pairs of AAR terminals for the signal lamp wiring and a weatherproof telephone jack for the TC Maintenance Telephone System. The AAR terminals shall be accessible by a cover or door, equipped with provisions for padlocking. Opening this cover or door shall not require the removal of any other part of the signal assembly.

Note: Each type of base shall have four mounting holes suitable for 3/4-inch diameter foundation bolts arranged on 9-1/2 by 9-1/2 inch centers.

2.10 POLE STEPS

Pole steps shall be of the double-sided type, mounted as follows:

- A. The top step shall not be lower than 5 feet below the top of the signal.
- B. The bottom step shall be 1 foot above the pole base.
- C. The maximum distance between steps shall not exceed 12 inches.
- D. Steps shall be uniformly spaced.

2.12 PAINTING

Paint the metal components of each signal layout in accordance with the recommendations of Part 2.4.30 of the AREMA Signal Manual. The finish coat of paint shall be dull black.

PART 3 - EXECUTION

3.01 INSTALLATION

Attach the base for each mast-mounted signal to the concrete foundation by means of anchor bolts cast into the concrete.

3.02 LOCATION AND HEIGHT

- A. Install signals on the right side of the right-of-way (for the direction in which their aspects govern) wherever clearance and sighting conditions permit. Controlled signals shall be located 6 ft. (+0,-1) downstream from the effective Insulated Joint (IJ).
- B. Mast-mounted Controlled signals shall normally be installed with their bottom lens 7'-4" above top-of-rail.

3.03 ALIGNMENT AND FOCUSING

- A. Signals shall be aligned and focused, both horizontally and vertically, in such a manner that the aspects displayed, when viewed from a position seven feet above the top of the right-hand running rail, shall be distinct, unmistakable and continuously visible over a distance of 500 feet upstream from the signals, day or night, under the most adverse environmental conditions indigenous to the Washington, D.C. metropolitan area.
- B. Where track or tunnel curvature, grade change, or other conditions make sighting impossible at 500 feet, the signal shall be mounted, aligned and focused to provide continuous sighting over the greatest distance possible, but under no circumstances shall this continuous sighting distance be less than 300 feet.

END OF SECTION

SECTION 16968

TRACK BONDING LAYOUTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of all negative return bonding required to complete the negative propulsion return system.
- B. This Section specifies the furnishing and installation of "signal rail" joint, switch jumper, and transposition bonding for power frequency track circuits.

1.02 NEGATIVE RETURN BONDING

Negative Return Bonding is required as follows

- A. Around all negative-return rail, bolted or "glued," and non-insulated rail joints in special trackwork areas
- B. To and around trackwork frogs in the negative-return rail, and to isolated pieces of running rail in the frog assemblies
- C. To the heels of negative-return rail track switch points
- D. As a transposition bond in the middle of single crossovers using power frequency track circuits, and wherever the location of negative-return rails must be transposed
- E. As cross bonding between parallel track impedance bonds, and between through track and diverging track impedance bonds at junction switches.
- F. Around all extraneous or abandoned insulated joints in negative-return running rails,
- G. Between the two closure rails of each turnout adjacent to the turnout frog.
- H. At such other locations as necessary to provide an electrically bonded path of adequate capacity for the negative propulsion current around non-insulated, bolted connections in the negative return running rails.

1.03 SIGNAL RAIL BONDING

- A. All signal rail within the limits of power frequency track circuits to be provided under this Contract shall be properly bonded to provide complete power frequency track circuits having the greatest degree of broken-rail protection and shunt detection
- B. Provide all signal rail bonding necessary to provide a series path for the track circuit current through the greatest length of signal rail practicable.

- C. Do not bond around frogs in the signal rail, but provide signal rail bonding to the ends of the frog castings, where necessary, or to frog-flangeway/signal-rails, which are continuous through the frog.
- D. Provide signal rail bonds between the extremities of the two legs of the track circuit signal rail which extend to insulated joints beyond each signal frog of a diamond crossover.
- E. Provide all signal rail bonds and transpositions necessary to produce a single, continuously bonded, maximum-length path through the signal rail and around all bolted or "glued" non-insulated joints in the signal rail.
- F. Where restraining rail is used in conjunction with a signal running rail, bond each end of each individual rail segment of restraining rail to its associated running rail.
- G. Signal rail bonding connections shall be made as close to the rail joints as practicable to ensure maximum broken rail detection.

1.04 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signal Submittal Requirements
Section 16917	Basic Interlocking Requirements
Section 16949	Signal Wire and Cable
Section 16963	Power Frequency Track Circuit Layouts
Section 16978	Miscellaneous Train Control Components and Materials
Section 16989	Yard Test and Inspections

1.05 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.06 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements

PART 2 - PRODUCTS

2.01 NEGATIVE-RETURN-RAIL JOINT BONDS

Negative-return-rail joint bonds shall be fabricated for compression bolting to the web of the rail. They shall consist of 500 kcmil size, insulated, ropelay cable, 48 inches long with Burndy type YA34-L terminal lugs on each end, two for each location, except only one for switch point rail heels.

2.02 1000 KCMIL CABLE BONDS

Substation-return bonding, cross-bonding or switch bonding (to include running-rail-transposition bonding at single switches), shall consist of a 1000 kcmil cable which meets the requirements of

Section 16949, with an appropriate connector which meets the requirements of these Specifications, on each end.

2.03 CABLE-TO-RAIL CLAMPS

Base-of-Rail clamps for connecting negative propulsion return cables to the running rails shall be sized to accommodate 115 RE rail and 1000 kcmil cable, as shown on the Information Drawings. Rail clamps shall be Part Number 115-1000, as manufactured by Connector Products, Inc., Camden/Pennsauken, New Jersey, or approved equal.

2.04 COMPRESSION EYE FITTINGS

H. Compression-eye type terminal fittings shall be used to attach 1000 kcmil cable to impedance bonds and certain other terminating devices. The compression terminal shall be made of drop-forged copper and formed for compression onto the strands of the cable in accordance with approved methods used by manufacturers experienced in this class of manufacture. Terminals shall be of soft ductile copper, drilled for bolting onto the ears of the impedance bonds or other terminating devices without cracking. Care shall be taken in compressing terminals to strands so as not to reduce the cross section of the conductor or to injure any of the individual strands. The strands, at the point where they leave the terminal, shall be sufficiently soft to permit being bent to an angle of 90 degrees with the axis of the cable and back to their normal position without breaking. Auxiliary sleeves of the terminal shall be arranged so as not to pinch the wires entering the sleeves.

2.05 WELDED RAIL HEAD NEGATIVE RETURN BONDS

- A. Prefabricated rail head bonds for welding around joints between consecutive rails shall be 250 kcmil size, 13 inches long, two for each location; as manufactured by Erico Products, Inc., Cadweld Type C bond, or approved equal.
- B. Negative return rail head bonds for welding between adjacent, non-consecutive rails or to frog wing rails shall be 250 kcmil size, of appropriate length for each individual location, with appropriate components as manufactured by Erico Products, Inc., or approved equal.
- C. The welding material shall consist of a copper exothermic mixture appropriate for the types of rail to which the bonds are to be welded.

2.06 MISCELLANEOUS NEGATIVE RETURN BONDING HARDWARE

Fasteners for compression-bolted bond connections shall be 5/8-inch diameter compression fasteners, Huck MFG. Co. C50LR-BR20-16 (for two bonds) or C50LR-BR20-12 (for one bond).

2.07 SIGNAL RAIL JOINT BONDS

- A. Non-insulated signal rail joint bonds shall be commercial bonds as manufactured by Erico Rail Transportation Producers Type SBPAJB-"A" or approved equal, consisting of sixteen extra-galvanized steel wires and three copper wires.
- B. Insulated signal rail joint bonds shall be assembled by the Design-Builder and shall consist of two commercially available track connectors and the required length of insulated cable. The track connectors and cable shall be as close as practicable to the same size/gauge and

composition as the non-insulated signal rail joint bonds.

- C. Signal bond wires shall be as recommended in Part 8.1.25 of the AREMA Signal Manual except as otherwise specified herein.

PART 3 - EXECUTION

3.01 INSTALLATION OF NEGATIVE RETURN BONDING

- A. Provide negative-return bonding around all non-insulated negative-return rail joints and around all extraneous or abandoned insulated joints, both in running tracks and within interlocking limits. Two 500 kcmil insulated cable, compression-bolted rail web bonds (one on each side of the web of the rail) shall be used for this purpose wherever possible. These bonds shall be properly bolted to the center of the web of the rails in the positions indicated on the Information Drawings. The Design-Builder shall drill and de-bur 21/32-inch holes at the center-line of the web of rails for the 5/8-inch fasteners.
- B. Should conditions be encountered where it is not practicable to install either compression-bolted bonds or clamped, base-of-rail bonds, appropriate bond connections of the expansion pin type or the welded rail-head type shall be used.
- C. Install all negative return rail joint bonds, rail transposition bonds, and switch, frog, and cross bonds as specified herein. Joint bonds shall be installed close to the ends of the rail joint bars in order to maximize broken rail detection. All 500 kcmil rail bonds shall be compression-bolted to the rail at the centerline of the web of the rail.
- D. For all rail-head and rail-web bonding, the bond terminal lugs and the surfaces of the rails which are to come in contact with the molten metal or the terminal lugs shall be ground clean with a vitrified grinding wheel. The rail brand shall also be ground off in areas where rail-web bolted bonds are to be applied. After grinding, terminal lugs and rails shall be cleaned with Inhibisol, or other approved, non-toxic solvent, to remove all traces of grease and dirt. The applicator brush shall be kept free of dirt and debris during cleaning operations.
- E. Welded rail-head bonds shall be attached to the rail by an approved exothermic process in such a manner as to ensure the necessary mechanical and electrical connection. The welding mixture shall be appropriate for the type(s) of rail to which the bonds are to be welded.
- F. After thoroughly cleaning the applicable surfaces of the rail and the connector hardware for compression-bolted bonds and base-of-rail clamped bonds, the Design-Builder shall liberally coat the surface of the copper conductor, and the mating surfaces of the rail and the connector hardware with an anti-oxidation compound before assembly. This compound shall be "Kopr-Shield" Part No. CP128, as manufactured by Thomas & Betts or approved equal. The bond shall then be attached to the rail in such a manner as to ensure the necessary mechanical and electrical connection.
- G. Base-of-rail cable clamps, as shown on the Information Drawings, shall be installed as per manufacturer's instructions. The torque recommended by the manufacturer shall be applied by torque wrench to ensure the necessary mechanical and electrical connection.
- H. Compression-bolted rail web bonds shall be installed as per the manufacturers instructions,

using the recommended equipment to attach properly sized terminating devices to the center of the web of the rail.

3.02 INSTALLATION OF SIGNAL RAIL BONDING

- A. Install all signal rail joint bonds, jumpers and transposition bonds as specified herein, in accordance with the manufacturer's instructions, and as shown on the detailed installation drawings submitted by the Design-Builder.
- B. For all signal rail bonding, no hole shall be drilled through the rail brand. Holes shall be drilled perpendicular to the rail by an approved rail drilling machine within plus or minus three-sixteenths inch of the neutral axis of the rail. Holes shall be a maximum of three-eighths inch in diameter. All holes shall be cleaned and deburred before the bonds are installed. Bond wires shall be installed the same day as the hole is drilled. In the event bond wires cannot be installed the same day, the bond hole shall be protected with a suitable plug for protection against the elements. The bond pin shall not be driven to the pin's shoulder. After the bond pin has been driven, a coating of no-oxide grease shall be applied to the surface of the bond where it contacts the rail. Under no circumstances shall any lubricant be applied before the bond has been driven.
- C. Where space does not permit the drilling of the hole into the web of the rail for installation of switch bonds, the hole shall be drilled into the base of the rail.
- D. It shall be the Design-Builder's responsibility to ensure that signal bonding for each given track circuit does not cause the signal rail to become grounded or to contact some extraneous energy source or the signal rail of another track circuit.
- E. Signal rail joint bonds shall be held in place by a protector clips.

END OF SECTION

THIS PAGE NOT USED

SECTION 16969

SNOWMELTER LAYOUTS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of snowmelter layouts for all track switches within the limits of this Contract. These locations are indicated on the Information Drawings.
- B. Each snowmelter layout shall consist of:
1. a contact rail fuse box
 2. two tubular electric heating elements (switch point snowmelters) for attachment to the stock rails of turnouts in the switch point area
 3. two power-limiting (auto-therming) switch rod heater units for installation under the throw rod and lock rods
 4. a snowmelter control unit (case) for the wayside control and indication of the snowmelters and switch rod heaters and foundations
 5. all external signal cable, conduit, rail connections and other miscellaneous hardware required to mount this equipment and to interconnect it with the TCR as specified herein, and as shown on the Information Drawings

1.02 RELATED SECTIONS

1.04 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements

1.05 SHIPPING AND HANDLING

- A. All snowmelter heating elements furnished under this Contract shall be packed, shipped and handled in such a manor that they are delivered to the Authority work site and installed without bends, kinks or any other damage.
- B. All snowmelter layout parts furnished by the Design-Builder which are damaged in the course of shipment, handling or installation, shall be replaced by the Design-Builder.

PART 2 - PRODUCTS AND MATERIALS

2.01 SWITCH POINT SNOWMELTER HEATING ELEMENTS

The snowmelter heating elements provided under this Contract shall be Chromalox switch point heaters designed specifically for WMATA applications, per Chromalox drawing "Track Switch Heater for WMATA".

2.02 SWITCH ROD HEATER UNITS

- A. The snowmelter heating elements provided under this Contract shall be Chromalox switch point heaters designed specifically for WMATA applications, per Chromalox drawing "Track Switch Heater for WMATA".
- B. Each heater unit case shall bear the following legend on its top surface in three-inch high red letters:

DANGER - HIGH VOLTAGE - THIS SIDE UP

2.03 SNOWMELTER CONTROL UNITS

- A. Snowmelter control case housings shall be of a type as manufactured by Robroy Industries, of Belding, Michigan, or approved equal.
- B. Each Snowmelter Control Unit shall consist of a fiberglass case containing all the components specified herein to control and indicate the operation of the snowmelter heating elements and switch rod heater units for a maximum of two track switches.
- C. Contactors
Snowmelter contactors shall be 60 Amp. 750 Vdc, Part No. LTHS60, as manufactured by Microelettrica Scientifica, or approved equal.
- D. Snowmelter Current Monitoring Devices
Snowmelter Current Monitoring Devices shall be DC Current Monitors, Series 930400 of appropriate amperage as manufactured by Gort Electronics Company, or approved equal.

- E. Case Heaters
Each snowmelter control case shall be equipped with two 100 watt, 500 ohm, 120 volt insulated strip heaters, wired in parallel and mounted as shown on the Information Drawings to control moisture condensation within the housing.
- F. Local Disconnects
 1. Provide a manual knife switch (rated at 1000 volts DC, 100 amps) in an insulated enclosure to enable maintenance personnel to control all high voltage energy to the case, as indicated on the Information Drawings.
 2. Provide an enclosed 250 volt manual breaker switch disconnect for the case heaters, mounted in the case as indicated on the Information Drawings.
- G. Fuses
Fuses shall be Gould-Shawmut A100X form 101 type 4, as manufactured by the Gould-Shawmut Company, of Newburyport, Massachusetts.
- H. Wire
 1. All snowmelter control case internal wiring shall be insulated for 1000 volts and shall meet the applicable requirements specified in Section 16949, Signal Wire and Cable.
 2. Low voltage control, indication and communication wiring shall be run separately from all the 750 volt heater element wiring.
- I. Terminals
 1. Solderless screw type terminals of the appropriate size shall be provided at the bottom or on the hinge side of the control case backboard for the 750 volt wiring terminations.
 2. Standard AAR binding post terminals shall be provided at the top of the latch side of the control case backboard for the low voltage control, indication, case heater, and communication wiring terminations.
- J. Telephone Jack
See Section 16923, TC Maintenance Telephone System.

2.04 CONTACT RAIL FUSE BOX

- A. Contact Rail Fuse Boxes shall be Fused Disconnect, Part No. 350000-8X (up to 60 Amp fuse) or Part No. 350000-9X (60-150 Amp fuse), as manufactured by UniTrac Systems Inc., 100 Impulse Way, P.O. Box 889, Mount Olive, NC 28635, or approved equal.
- B. One contact rail fuse box shall be provided to feed each snowmelter control case required.

2.05 WIRE AND CABLE

Wire and cable for snowmelter layouts shall be as specified in Section 16949, Signal Wire and Cable. All heater element and switch rod heater unit wiring shall be insulated for 1000 volts.

2.06 CONDUIT

Conduit used to protect snowmelter wire and cable surface runs in direct-fixation areas, and for entrance to the snowmelter control cases, shall be schedule 80 PVC or fiberglass reinforced epoxy (FRE), as specified in Section 16973, Conduit.

PART 3 - EXECUTION

3.01 INSTALLATION OF SNOWMELTERS

Install all snowmelter heating elements on the field side of the stock rails in a manner which meets the following requirements

- A. The heater shall be located on the stock rail with the active part extending from two feet ahead of point-of-switch to the vicinity of the heel block.
- B. The heater shall be secured to the lower half of the web of the rail by means of supports spaced 18 inches to 24 inches apart (except at the anti-creep collar). One support shall be located on the rail ahead of the switch point. Special support clamps shall be provided for securing the heater half of the separable connectors to the rail in such a manner that the alignment rib on the connector is visible.
- C. A heater support shall be placed against each end of the anti-creep collar on the heater to prevent longitudinal movement. All other supports shall be arranged to allow longitudinal movement of the heater as a result of expansion and contraction.
- D. All supports shall be secured by means of 3/8 inch corrosion-resistant bolts.
- E. Drill 13/32 inch holes in the web of the stock rails (at the neutral axis) for the 3/8 inch bolts used to secure the heater support clamps and terminal housing support clamps. The bolts shall be inserted from the gauge side of the rail with the washers and nuts installed on the field side of the rail.
- F. Leads between the heating elements and the control case shall be located so as to minimize possible damage. Where necessary, mechanical protection shall be provided.

3.02 INSTALLATION OF SWITCH ROD HEATER UNITS

- A. Install Switch Rod Heater Units and all associated control, operation and indication wiring as specified herein and as indicated on the Information Drawings.
- B. Two Switch Rod Heater Units shall be provided as part of each Snowmelter Layout. One unit shall be installed under the switch throw rod and the other unit shall be installed under the switch lock rod.
- C. The Design-Builder shall remove the ballast to the level of the bottom of the ties in the two cribs under the switch rods, and in a direct line beyond these cribs to provide a drainage path for the crib.

- D. The heater units shall be centered in each crib, with the energy leads located on the end away from the switch machine, as indicated on the Information Drawings. The distance from the bottom of the switch rod to the top of the heater unit shall not exceed two inches.
- E. Plug-connect the heater units to their appropriate energy and negative-return leads and secure the leads and plug connectors to the ties, or to the surface of the concrete slab, as applicable, to prevent the leads from catching on carborne equipment or presenting a tripping hazard to maintenance personnel, all as indicated on the Information Drawings. There is no "polarity" requirement for the individual switch rod heater units, but each unit must be connected in parallel with a snowmelter heating element.
- F. Install tie straps or brackets above each crib containing a Switch Rod Heater Unit to prevent the heater unit from moving upward out of the crib.
- G. Each Switch Rod Heater Unit for a given switch shall be wired in parallel with one of the Snowmelter Heating Elements for that switch.

3.03 INSTALLATION OF SNOWMELTER CONTROL UNIT

- A. Each snowmelter control unit shall be located more than ten feet from other signal and electrical equipment, if practicable, but no closer than six feet from other signal and electrical equipment, and no more than 75 feet from the snowmelter heating elements and switch rod heater units it controls.
- B. Snowmelter control cases shall be mounted on foundations of the type specified in Section 16975, Foundations.
- C. The snowmelter control cases shall be mounted with the front, back and sides vertical and the top and bottom horizontal, all within a tolerance of 1/8 inch.
- D. The cases shall be installed in such a manner that their doors shall open, close, seal and lock properly without binding.
- E. Upon installation, each snowmelter control case shall be locked with a padlock of the type specified in Section 16974, Locks and Keys.

3.04 SNOWMELTER CONTROL CASE CONNECTIONS

Install two vertical conduits in the bottom of each snowmelter control case. Install all high voltage wiring in the conduit near the hinge side of the case and all low voltage control, indication and communication wiring in the conduit near the latch side of the case.

3.05 INSTALLATION OF FUSE BOX

The contact rail fuse box shall be installed as indicated on the Information Drawings.

3.06 RAIL CONNECTIONS

- A. The snowmelter energy supply cable to the contact rail fuse box shall be connected to the power third rail by means of an exothermic weld as shown on the Information Drawings.

- B. The negative return lead for each snowmelter heating element shall be connected to the neutral axis of the nearest negative propulsion return rail by means of an exothermic weld as shown on the Information Drawings.
- C. The negative return lead for each switch rod heater unit shall be connected to the neutral axis of the same negative propulsion running rail as the negative return lead of its parallel-connected snowmelter heating element. Under no circumstances shall the negative return lead for a switch rod heater unit be connected to the opposite running rail from the negative return lead of its parallel-connected snowmelter heating element.

3.07 IDENTIFICATION

- A. The identification letters "SM" and the number(s) for each snowmelter layout controlled from that case shall be stenciled on both the inside and outside of the case door. (The identification number(s) shall correspond to the number(s) of the track switch(es) for which snowmelters are controlled from that case.) The lettering shall be at least two inches high. This stencilling shall be in addition to the embossed metal name tag required on the outside of the case door.
- B. The positive and negative leads of each snowmelter heating element, switch rod heater unit, and both high voltage cables emerging from the contact rail fuse box shall be provided with brass tags engraved with the legend "DANGER - 750 VOLTS".
- C. The brass tags shall be securely attached to the power cable or wire with No. 14 AWG stainless steel wire in such a manner that the insulation on the power leads is not damaged.
- D. Each contact rail fuse box shall have an approved type of label or stencil applied to an outside end of the box, designating the number(s) of the applicable track switch snowmelter layout(s) energized from that box.

3.08 SURFACE MOUNTED CONDUIT

Dedicated conduit runs shall be provided for high-voltage snowmelter energy cables.

3.09 DOCUMENTATION

Place a complete, AS-BUILT set of drawings for the applicable snowmelter layout(s) in the print pocket on the door of each snowmelter control case.

END OF SECTION

SECTION 16971

RACKS AND CABLE TRAYS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of free standing, shock mounted metal racks in the Train Control Rooms to support various types of Yard Signal equipment. Three basic types of racks shall be provided as follows:
1. Entrance racks
 2. Power Racks
 3. Equipment Racks
- B. This Section specifies the design, furnishing, installation and inspection of cable tray systems above and adjacent to racks in and about the Train Control Rooms.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration

Section 16949	Signal Wire and Cable
Section 16977	Tagging and Marking
Section 16989	Yard Test and Inspections

1.03 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.03 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements

1.04 DELIVERY, STORAGE AND HANDLING

Any cable tray sections damaged during shipment, storage, or handling shall be replaced by the Design-Builder

PART.2 - PRODUCTS

2.01 BASIC RACK CONSTRUCTION

- A. All racks shall have frame weldments constructed of 14-gauge cold-rolled steel and designed to mount standard 19-inch equipment panels. Neither the width nor the depth of the frame unit shall exceed 24 inches. The frame weldment shall be designed to accept universally adjustable panel mounting hardware. The panel mounting angles shall be constructed with standard EIA hole spacing.
- B. The racks shall be mounted on, and secured, to 12-gauge cold-rolled steel bases, floor-supported to make free-standing units. These bases shall be 24 inches deep (front to back) and the same width as the rack, and shall be 3-1/2 inches high. These bases shall provide an insulation resistance between the rack frame and ground of at least 100,000 ohms.
- C. Chassis supports or guides shall be provided for auxiliary support of heavy equipment such as power supplies. The chassis supports shall be made of 11-gauge cold rolled steel. They shall be capable of being mounted directly to the panel-mounting angles and shall permit side-to-side guide adjustment.
- D. Each rack shall be equipped with a ground connector of the bolted type to permit removal of the ground connection for testing insulation between racks. See Section 16922.
- E. The overall height of each rack shall not exceed 7-1/2 feet.
- F. Each rack shall be equipped with two TC Maintenance Telephone Jacks of the type specified in Section 16923, and as shown on the Information Drawings.
- G. All racks shall be painted gray.
- H. Each rack shall be identified by its manufacturer's standard nameplate, as specified in Section 16977, Tagging and Marking. This nameplate shall not extend beyond the edge of the supporting metal to which it is attached.
- I. Each rack shall be further identified, front and back, with its identifying type and location number by means of a painted stencil. (See Section 16977, Tagging and Marking). The "type" and "location" letters and numbers shall be at least 1 inch in height. The various rack types shall be designated as follows:
 - 1. "E" - Entrance Racks
 - 2. "P" - Power Racks
 - 3. "B" - Vital Interlocking Support Racks
 - 4. "J" - Non-Vital Interlocking Support Racks
 - 5. Rack location stenciling shall be located on the racks and not on modules in the racks.

2.02 POWER RACKS

- A. The rear of the panel of the Power Supplies shall be open for ventilation and shall be completely shielded from contact with any external object by small plastic covers, mounted in place over each part, or group of parts. These covers shall be made of 1/4 inch thick shatter-proof plastic material which will not support combustion or emit poisonous or corrosive gases when exposed to flame or extreme heat. Other approved material may be utilized. These covers shall be easily removed and replaced, but the fastenings shall be secure.

- B. The Design-Builder shall permanently mount high-voltage warning signs on the back, front and exposed sides of each power rack.

2.03 EQUIPMENT RACKS AND ENTRANCE RACKS

- A. Equipment racks and Entrance racks shall be enclosed with formed 16-gauge cold-rolled sheet metal on the top, bottom and on both ends of each row of adjacent racks.
- B. Entrance racks shall be equipped with molded terminal blocks which conform to the recommendations of Part 14.1.5 of the AREMA Signal Manual and such other terminal blocks and plug connectors as may be required by these Specifications.

2.04 EQUIPMENT ARRANGEMENT AND MOUNTING

- A. The arrangement of equipment on the racks shall present a neat and orderly appearance. Equipment serving similar functions shall be in the same relative location on all racks.
- B. Relays and equipment modules shall not be mounted at a height exceeding 6 feet from the floor.
- C. Provide a minimum of 10 percent spare module, component and relay spaces, spare terminals, and spare plug-connector points on each rack or group of racks serving a common function. This 10 percent spare equipment space, terminals and plug-connector points shall be in addition to any space, terminals and plug-connector points reserved for specifically designated possible future additions to the TCR.
- D. Track relays for a given track shall be located on the racks so that they reflect the geographical sequence of the actual track circuits they represent.
- E. Track repeater relays shall be located adjacent to the track or repeater relays they repeat or parallel.
- F. Repeater relays for other than track relays shall be located wherever their contacts are most needed in order to keep wire runs to minimum length.
- G. Terminal blocks and plug connectors for inter-rack and external wiring connections shall be located in the top row of each equipment rack. Where terminal blocks or plug connectors are mounted on swing-out "doors," the Design-Builder shall provide a means to prevent accidental contact between such terminals or plug couplers and adjacent equipment.

2.05 RACK WIRING

- A. Internal rack wiring shall be pre-wired prior to installation in the Train Control Rooms.
- B. Internal rack wiring shall be accomplished as specified in Section 16949, Signal Wire and Cable.

2.06 CABLE TRAYS

- A. Cable trays shall be of the "ladder" type, constructed of aluminum, or other suitable material commercially available. Where applicable a cantilevered single "wall-support" type of tray shall be provided.

- B. Cable trays shall be P-W Industries Cable Tray System 064D02, as manufactured by P-W Industries, Inc. (Cornwell Heights, PA 19020), or approved equal, with the following requirements:
1. Rung spacing shall be six inches maximum where rack-to-rack wiring consists of individual conductors of size 14 AWG or larger wire tied into bundles to form unjacketed multiconductor cable routed via the cable trays. Rung spacing shall be six inches minimum where cable tray is used exclusively for jacketed multiconductor cable.
 2. Minimum tray width shall be 6 inches.
 3. All fittings, supports and accessories shall be furnished in accordance with the manufacturer's recommendations.
 4. There shall be no sharp edges or corners on the cable tray which would damage the cables or present a safety hazard to humans.

2.07 FIBERGLASS SUPPORTS FOR CABLE TRAYS

- A. Where the Design-Builder's cable tray layout includes any support mounting to the equipment and entrance racks, such mounting shall be by means of approved fiberglass arms or stand-offs.
- B. Fiberglass support arms, where required to insulate the cable tray from the equipment racks, shall be flame retardant, reinforced polyester laminate Class "B", 130 degrees C electrical sheet, meeting NEMA GPO-2 requirements, ASTM Specification D1532-67T, as manufactured by Hayside Division of Alco Standard Co., or approved equal.

PART 3 - EXECUTION

3.01 RACK INSTALLATION

- A. The Design-Builder shall install the racks in rows with a spacing of 5 feet between centerlines of rows and from wall to row centerline wherever possible. Where 5 foot spacing cannot be obtained, the Design-Builder shall attempt to maintain 4.5 foot minimum spacing for front-to-front oriented rows and 3.5 foot minimum spacing for back-to-back oriented rows. Under no circumstances shall rack row spacing be less than 3.5 feet.
- B. Rows of racks shall be oriented to have adjacent rows either front-to-front or back-to-back wherever possible.
- C. A minimum 2-foot aisle shall be provided between the walls of the TCR and the ends of the rack rows.
- D. The row of racks nearest the wall, if closer than five feet to the wall, shall not face the wall.
- E. The Design-Builder shall shim rack bases as necessary to maintain level rack height within each row.
- F. The Design-Builder shall ground each individual rack to a room ground bus. See Section 16922. The racks shall be insulated from each other and from any supporting framework and

shall only be electrically connected via the common ground connection. The value of the insulating resistance shall be at least one megohm.

- G. Rack-to-rack wiring shall be accomplished as specified in Section 16949.

3.02 CABLE TRAY DESIGN

The Design-Builder shall design and provide a design of changes and additions to the signal cable tray system for each Train Control Room in which wire and cable is installed under this Contract.

3.03 CABLE TRAY INSTALLATION

- A. The cable trays shall be assembled at the site of the work in accordance with the manufacturer's instructions and the approved installation drawings.
- B. Tray supports shall be anchored to ceilings or walls by machine-bolt type expansion anchors and one-half inch minimum diameter bolts.
- C. The Design-Builder shall not use any method of connecting or supporting cable trays which would reduce the rated load carrying capacity of the trays or could possibly result in damage to cables placed in the trays.
- D. Where cable tray splice joints occur in a run, trays shall be supported immediately adjacent to and on both sides of the splice fitting.
- E. All metal cable trays shall be bonded and grounded as described in Section 16922.
- F. All metal cable trays shall be insulated from all walls, ceilings, racks and conduit runs. The value of the insulating resistance shall be at least 1000 ohms.
- G. The final position of cable on the trays shall result in minimal loading eccentricity.
- H. Maximum deflection of the runs shall not exceed 0.25 inches when fully loaded. A fully loaded cable tray is defined as a load consisting of the Contract cable requirement plus the 100 percent for the possible future load.

END OF SECTION

THIS PAGE NOT USED

SECTION 16972

JUNCTION BOXES

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of track-side junction boxes associated with track switch layouts, signal layouts, power frequency and pushbutton layouts, interlocking cable distribution, and other necessary wayside yard signal equipment.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signaling Submittal Requirements
Section 16923	TC Maintenance Telephone System
Section 16963	Power Frequency Track Circuit Layouts
Section 16964	Trailable Yard Switch Operating Layouts
Section 16965	Signal Layouts
Section 16974	Locks and Keys
Section 16977	Tagging and Marking

1.03 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.04 SUBMITTALS

See Section 16912, Yard Signaling Submittal Requirements

PART 2 PRODUCTS

2.01 BASIC REQUIREMENTS

- A. All junction boxes shall conform to NEMA-4X and U.L. requirements. Junction boxes shall be constructed of
 - 1. Cast iron - shall have stainless steel or brass cover hardware sheet metal, or fiberglass material approved by the Authority's Representative. Cast iron junction boxes shall have stainless steel or brass cover hardware.
 - 2. Fiberglass - the finish to be Pleogen 2907 ISO Gel-Coat, or similar polyester base material, in thickness of 15 to 20 mils Cast
- B. Covers shall be hinged and gasketed with a neoprene gasket to provide a dustproof and weatherproof enclosure. Covers shall be equipped with a three-point latching arrangement, complete with handle and facilities for accepting the shackle of a padlock of the type specified in Section 16974.

- C. Junction boxes shall be of sufficient size to provide ample space for the specified minimum bending radii of cables and wires.
- D. Junction boxes shall be provided complete with all necessary terminals and a weatherproof Telephone Jack as specified in Section 16923.
- E. Fiberglass junction boxes shall be provided complete with print pockets, sized as per manufacturer's standard, and located on the inside of the junction box cover or door.
- F. Junction boxes shall be equipped with drain plugs.
- G. Cast-iron junction boxes shall be furnished complete with appropriate pedestals.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Provide junction boxes of appropriate size for the terminals and equipment required.
- B. Junction boxes shall be installed in conformance with the approved installation drawings.
- C. In those instances where there is no room for a person between the box and the dynamic clearance envelope of the transit cars, the Design-Builder shall apply moisture-proof warning labels of an Authority-approved design and size to the inside and outside of the covers of the junction boxes. These labels shall consist of a background of black and luminescent yellow diagonal stripes, and shall bear the legend "NO CLEARANCE" in black letters on a white horizontal stripe.

END OF SECTION

SECTION 16973

CONDUIT

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of conduit and associated fittings.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signal Submittal Requirements
Section 16949	Signal Wire and Cable
Section 16963	Power Frequency Track Circuit Layouts
Section 16964	Trailable Yard Switch Operating Layouts
Section 16965	Signal Layouts
Section 16972	Junction Boxes
Section 16977	Tagging and Marking
Section 16978	Miscellaneous Train Control Components and Materials
Section 16989	Yard Test and Inspections

1.03 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.04 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements

PART 2 - PRODUCTS

2.01 RIGID STEEL CONDUIT AND FITTINGS

- A. All rigid steel conduit and fittings required by these Specifications shall be galvanized. Galvanized steel, rigid conduit shall be used in equipment rooms and beneath paved roadways. This conduit shall be consistent with ANSI C80.1.
- B. Fittings for rigid steel conduit shall be of malleable iron, threaded, and shall be protected by hot-dip galvanizing. Conduit fittings designed for removable covers shall be complete with gaskets and blank covers.

2.02 POLYVINYL CHLORIDE CONDUIT AND FITTINGS

- A. At outdoor or embedded locations where conduit is specifically required to be thick-wall, Schedule 80, polyvinyl-chloride (PVC) conduit shall be furnished and installed. PVC conduit shall not be installed on concrete surfaces exposed to sunlight.
- B. Where conduit elbows are used, they shall be Schedule 80 and of the long radius type.

2.03 FIBERGLASS REINFORCED EPOXY (FRE) CONDUIT

- A. In all confined areas such as tunnels where exposed conduit runs are required, the appropriately sized fiberglass reinforced epoxy (FRE) conduit shall be furnished and installed.
- B. Fiberglass reinforced epoxy conduit shall be FRE Rigid Non-Metallic Fiberglass Conduit as manufactured by FRE Conduit Inc., 1885 Swarthmore Ave., Lakewood, NJ 08701, or approved equal.
- C. FRE conduit installed shall have a minimum dielectric strength of 500 volts per mil, tensile strength (axial) of 11,000 psi, and an "HB" flammability rating.
- D. FRE conduit installed shall have a minimum compressive load withstand rating of 3500 pounds per foot of conduit, and a minimum average impact resistance value of 25 foot-pounds.
- E. FRE conduit and fittings installed by the Design-Builder shall bear nationally accepted testing laboratory approval from U.L. and C.S.A.
- F. Conduit combustion by-products shall not contain chlorine gas in excess of trace levels and always less than safe OSHA limits.

2.04 CORDURA HOSE CONDUIT AND FITTINGS

Flexible hose utilized as conduit shall be furnished and installed where required. It shall be vari-purpose, internal tube hose with braided CORDURA rayon reinforcement and a "HYCAR" neoprene cover as made by the ACME-Hamilton Mfg. Corp., or approved equal. Where so required, the hose ends shall be pushed over suitable fittings, which provide a snug fit, and fastened with stainless steel clamps as manufactured by the W.D. Allen Mfg. Co., or approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION OF CONDUIT

- A. Conduit shall be installed as specified in the National Electrical Code or as specified herein, whichever is more restrictive.
- B. At wayside train control electrical equipment locations, the Design-Builder shall install lengths of the appropriate type of conduit to extend the embedded conduit installed by others to the proper location.
- C. Wiring in horizontal runs in the trackway in ballasted areas, shall be in Schedule 80 PVC conduit buried at a uniform depth of 30 inches, (42 inches from the top of the rail).

- D. Wiring in vertical runs in the track in ballasted areas shall be in CORDURA Hose Conduit where it runs to a device on the ties or rails, and in Schedule 80 PVC in all other places.
- E. Wiring in runs attached to the sides of ties shall be in Schedule 80 PVC conduit.
- F. All exposed conduit runs shall be installed parallel to walls, floors and ceilings. Conduits shall be supported at intervals not to exceed eight feet for rigid steel conduit and four feet for flexible conduit. PVC conduit (and fiberglass reinforced conduit) shall be supported at intervals dependent upon its diameter as required in Table 347-8 of the National Electrical Code. Cast, single-hole, malleable iron, galvanized pipe straps of the proper size shall be used for the support of individual conduit runs on concrete surfaces. Where conduit is supported on concrete surfaces, rust-proof stud anchors as specified in Section 16978 shall be used. Galvanized conduit spacers (back straps) shall be used with the conduit clamps to space the conduit away from the mounting surface.
- G. Conduit shall be of sufficient size to leave, as a minimum after installation of wire, the percentage of free space specified in the National Electrical Code.
- H. All bends and offsets in rigid conduit shall be made on a forming tool to prevent damage to the conduit. Rigid conduit bends made in the field shall be in accordance with the manufacturer's recommended procedure. Care shall be taken not to overheat rigid conduit during the bending process.
- I. Steel conduit threads shall be painted with anti-seize, anti-corrosion surface treatment compound, such as Thomas & Betts KOPR-SHIELD, or an approved equal to ease assembly, make them watertight, prevent rust and enhance conductivity.
- J. Rigid conduit shall not be clamped or connected to equipment racks or trays in equipment rooms in any manner which results in an electrically conductive path between the conduit and the rack or tray.
- K. Fittings with removable side plates (pull boxes) shall be installed on long conduit runs at intervals of no more than 75 feet. In the less-than-75-foot conduit segments thus formed, an additional fitting of the same type shall be added each time the total number of degrees in bends exceeds 180. All such fittings shall be of sufficient length to allow the installation of wire or cable without exceeding its minimum bending radius, either as installed or during installation. The minimum bending radius shall be as specified by the manufacturer, or as specified in Articles 370-18 or 370-51 (as applicable) of the National Electrical Code, or as necessary to comply with the applicable minimum cable bending radii specified herein, whichever is more restrictive.
- L. Radii of conduit bends shall meet the requirements of the National Electrical Code.
- M. Conduit shall be connected to equipment enclosures and junction boxes in accordance with the approved installation drawings. Proper fittings with appropriate gasketing and protective bushings shall be utilized.
- N. All conduit shall be properly cleaned (before pulling wires or cables) by either blowing compressed air through the run or by swabbing.

- O. All conduit installed by the Design-Builder shall be identified as described in Section 16977, Tagging and Marking.
- P. PVC fittings shall be attached to PVC conduit utilizing both pre-conditioner and cement.
- Q. On long runs of PVC conduit, expansion joints shall be installed at intervals not to exceed 75 feet.
- R. A short (1 to 3 foot) section of liquid-tight flexible metal or CORDURA hose conduit shall be provided where rigid conduit is to be connected to a device which consist of, or contains, a rotating or vibrating mass.
- S. All conduits provided in the TCR for train control, but not used, shall be grounded and closed with a watertight fitting.
- T. Install metallic raceway, fittings, boxes and cabinets, free from contact with reinforcing steel.
- U. To prevent corrosion where aluminum is placed in contact with dissimilar metal or with concrete, separate contact surfaces by means of a gasket, non-absorptive tape or special coating.

END OF SECTION

SECTION 16974

LOCKS AND KEYS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of the various types of locks, keys and key switches required to secure Yard Signaling equipment and apparatus housings furnished under this Contract.
- B. The proprietary "rights" to all locks, keys, key switches and keying combinations furnished under this Contract shall be assigned to the Authority.

1.02 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signaling Submittal Requirements
Section 16914	Environmental Requirements
Section 16964	Yard Trailable Switch Operating Layouts
Section 16965	Signal Layouts
Section 16972	Junction Boxes

1.02 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.03 SUBMITTALS

See Section 16912, Yard Signaling Submittal Requirements

PART 2 - PRODUCTS

2.01 BASIC REQUIREMENTS

- A. The locking mechanism for all locks and key switches furnished under this Contract shall be of the 7-pin cylinder type.
- B. All lock rotation shall be 90 degrees clockwise from locked position at 12 o'clock to unlocked position at 3 o'clock.
- C. The coding of the various types of locks and keys furnished under this Contract shall be identical to the coding presently in use on the WMATA Rail Rapid Transit System.
- D. All locks furnished under this Contract shall be keyed to one of two combinations and to a single master combination

1. The first combination and the master combination shall be provided to key the following locks
 - a. Padlocks
 - b. Cabinet Locks
 - c. Cam Locks
2. The second combination and the master combination shall be provided to key the following locks:
 - a. Key Switch

E. The keys supplied under the terms of this article shall not be reproducible commercially.

2.02 PADLOCKS

- A. Padlocks shall be solid blocks of extruded brass or stainless steel, bored to receive the locking mechanism. The shackle shall be made of case hardened steel. The locking mechanism shall be operable from its own key and the master key, and shall be designed in such a manner that keys can be removed from the padlock in both the locked and unlocked positions.
- B. The lock shackle shall lock at both heel and toe. The steel shackle pull strength shall exceed 2500 lbs.
- C. The length and width of shackle opening shall be sufficient to allow the padlocks to be installed on all pieces of Yard Signaling equipment for which they are required.
- D. Padlocks shall be of a type and quality normally associated with railroad type outdoor services and shall be designed to operate satisfactorily in all weather conditions indigenous to the Washington, D.C. metropolitan area, as described in Section 16914, Environmental Requirements.
- E. Padlocks shall be type 21B722 with AR-3 cylinder as manufactured by Best Lock Corp., or equal.
- F. Padlocks shall be furnished without chains.

2.03 CABINET AND CAM LOCKS

- A. Cabinet and cam locks furnished shall be suitable for mounting on 14 gauge sheet steel, and/or 1/4 inch phenolic panels.
- B. The locking mechanism for cabinet and cam locks shall be so designed that keys can be removed from the locks in both the locked and unlocked positions.
- C. Cabinet locks shall be type BT1004AD as manufactured by Fort Lock Corp., or equal.
- D. Cam locks shall be type N1058AD-186421-1906-49 and/or type N1058AD-186425-2508-49 as manufactured for Fort Lock Corp., or equal.

2.04 KEY SWITCHES

- A. Key switches furnished shall be suitable for flush mounting on 14 gauge steel or 1/4 inch phenolic panels. Each switch shall be supplied with a special two-flange washer to prevent rotation in phenolic panels.
- B. Insertion of the proper key into the tumbler and rotation of the key in a clockwise direction shall cause an internal electrical switch to close. When the key is rotated to this clockwise position, it shall be impossible to remove the key from the tumbler.
- C. Returning the key to the normal position by counter-clockwise rotation shall cause the internal electrical switch to open. When in this position, it shall be possible to remove the key.
- D. The internal electrical switch shall have sufficient current carrying capacity to control a 28 volt (nominal) signal type relay without damage to the switch contacts.
- E. Key switch locks shall be type SW21138AXMKX2KXSC as manufactured for Fort Lock Corp., or equal, and keyed to WMATA Y1A master and appropriate Y001 or Y002 key codes.

2.05 KEYS

- A. The Design-Builder shall furnish three types of keys as follows:
 - 1. Master keys to unlock all types of locks and key switches specified herein.
 - 2. Keys to unlock only the key switches specified herein.
 - 3. Keys to unlock only the padlocks, cabinet locks and cam locks specified herein.
- B. Each type of key shall be distinctly marked for the use intended, but in such a manner that the marking system employed cannot be used for commercial duplication.
- C. Each type of key shall be identical to the corresponding type presently in use on the WMATA rail system.
- D. Keys shall be made of brass or stainless steel.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Padlocks - Padlocks shall be installed at the locations specified on all signals, junction boxes, switch machines, circuit controllers, snowmelter control cases and other wayside Yard Signal equipment housings not equipped with integral cabinet or cam locks.
- B. Key Switches and Cam Locks - Key Switches and suitable cabinet or cam locks shall be installed on Yard Control Panels.

END OF SECTION

THIS PAGE NOT USED

SECTION 16975

FOUNDATIONS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of foundations for sign, signal, junction box and pushbutton masts, and, where applicable, for snowmelter control cases.

1.02 DESCRIPTION

- A. Foundations for sign, signal, junction box and pushbutton masts shall be precast, reinforced concrete and shall be of either monolithic or sectional construction.
- B. Foundations for snowmelter control cases shall each consist of two identical units, one to support each end of the snowmelter control case, or a single fabricated unit. These units shall be at least four feet high, and shall be constructed of cast iron, hot-dip galvanized steel, reinforced concrete, or some approved combination thereof.
- C. Foundations shall not be procured or constructed by the Design-Builder, until drawings of the proposed foundations have been approved by the designated Authority's Representative.

1.03 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections

Section 01113	Systems Integration
Section 16912	Yard Signal Submittal Requirements
Section 16965	Signal Layouts
Section 16969	Snowmelter Layouts
Section 16972	Junction Boxes
Section 16978	Miscellaneous Train Control Components and Materials
Section 16989	Yard Test and Inspections

1.04 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.05 SUBMITTALS

See Section 16912, Yard Signal Submittal Requirements

1.06 DELIVERY, STORAGE AND HANDLING

Any chipped, cracked or damaged foundations shall be repaired or replaced.

PART 2 - PRODUCTS

2.01 BASIC COMPONENTS

- A. Cement, aggregates, mixing water and reinforcement used for precast foundation units and cast-in-place foundation structures shall conform to the applicable requirements specified in the current edition of the AREMA Manual for Railway Engineering.
- B. Metal used for Snowmelter Control Case foundation units shall be as recommended in the applicable portions of Part 15.1 of the AREMA Signal Manual.

2.02 CONCRETE FOUNDATIONS

- A. Foundations shall be provided complete with anchor bolts, nuts and washers, all in accordance with the applicable portion of Part 14.4 of the AREMA Signal Manual and Section 16978 of these Specifications.
- B. Spacing of anchor bolts shall be as required to properly support the equipment to be mounted.
- C. Precast concrete foundations shall be made of concrete of average compressive strength of 4000 p.s.i., air-entrained for exterior locations.
- D. The concrete used in cast-in-place foundations shall have an average compressive strength of 3000 p.s.i.

2.03 SNOWMELTER CONTROL CASE FOUNDATIONS

Snowmelter control case foundations shall be fabricated in accordance with the detailed drawings submitted by the Design-Builder.

PART 3 - EXECUTION

3.01 PREPARATION

Provide compacted crushed stone bases for all train control equipment foundations installed in ballasted track areas under this Contract.

3.02 INSTALLATION

- A. Train control equipment foundations shall be installed in accordance with the installation drawings approved by the designated Authority's Representative for that purpose. All foundations for yard signal equipment shall be vertical and level, as installed.
- B. Protect all anchor bolt thread, washers, and nuts from damage until such time as the train control equipment is installed.

END OF SECTION

SECTION 16977

TAGGING AND MARKING

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies the furnishing and installation of identifying markings on yard signal items furnished under this Contract, either directly on the item or through the use of suitable marking tags properly applied to the item.
- B. These markings shall be of the following types which are described in Part 2 of this Section.
- | | |
|---------|--------------------------------------|
| Type 1 | Cast Metal |
| Type 2 | Sheet Steel - Reflective Coated |
| Type 3 | Embossed Metal |
| Type 4 | Die-Stamped Nameplate |
| Type 5 | Printed Plastic |
| Type 6 | Painted Stencil |
| Type 7 | Ink Stamped |
| Type 8 | Etched Copper |
| Type 9 | Engraved Phenolic |
| Type 10 | Wire Tags Exposed to Direct Sunlight |
| Type 11 | Temporary Tags |
- C. Tagging and marking shall be further in accordance with specific considerations specified in the following listed Related Sections. Also listed are the marking types that generally apply to the equipment specified in each Section.

1.04 SUBMITTALS

See Section 16912, Yard Signaling Submittal Requirement

PART 2 - PRODUCTS

2.01 MARKER TYPE 1 - CAST METAL

This marker (used for switch-and-lock movement layouts) shall be at least three inches high and of a thickness to ensure ruggedness. It shall be made of cast metal and shall be painted white. All edges shall be slightly rounded and free of burrs. The casting shall be free of cracks or voids.

2.02 MARKER TYPE 2 - SHEET METAL REFLECTIVE COATED

- A. This marker (used for signal number plates and wayside signs) shall be of a minimum 1/8 inch thickness and a size to allow visibility as specified elsewhere in these Specifications. The reflectorized coatings or appliques shall be applied per the manufacturer's specifications and shall be free of air pockets, cuts, tears, loose edges and blemishes of any kind.
- B. If a ferrous sheet metal is selected, the marker must be fully protected from rusting according to the Design-Builder's standard painting procedures as approved by the designated Authority's Representative. This procedure must include complete corrosion proofing surface preparation before paint application.
- C. If aluminum is selected as the marker material, it must be of sufficient thickness and hardness to remain stiff and straight under field conditions.

2.03 MARKER TYPE 3 - EMBOSSED METAL

- A. This type of marker shall consist of a sheet metal strip approximately one inch wide and of sufficient thickness for ruggedness and durability. It shall be embossed by a stamping machine capable of producing crisp letters approximately one half inch high. The metal shall be lead bearing, galvanized or non-ferrous so that it will not be subject to deterioration by rust.
- B. The marker shall be flat and straight and free from sharp edges.

2.04 MARKER TYPE 4 - DIE-STAMPED NAMEPLATE

- A. This marker shall be the manufacturer's standard nameplate which shall contain pertinent data such as
1. Manufacturer's name
 2. Serial number
 3. Model number
 4. Date of manufacture (where required)
 5. Drawing number
 6. Identifying type and location number (as applicable)
- B. The nameplate shall be made of a non-corroding material. The dies and stamping process shall provide good legibility and permanence.

2.05 MARKER TYPE 5 - PRINTED PLASTIC

- A. This type of marker shall be applied to each conductor and cable not exposed to direct sunlight, and to devices not otherwise identified. (TYPE 10 Markers shall be used for wires and cables exposed to direct sunlight.)
- B. TYPE 5 Markers shall be available in two forms, sleeve and flat
1. Sleeve Tags
 - a. The sleeve form shall be of the heat shrinkable type and shall be sized from 3/32-inch through 1/2-inch diameter to properly fit the wire for which it is intended. The sleeve shall be made from radiation crosslinked polyolefin (for service to 125 degrees C) or modified fluorocarbon (for service to 200 degrees C) tubing which is white in color. The printing shall be done in black and shall be permanently set through the use of a suitable infrared heater. These sleeve tags shall be of the "TMS" type as manufactured by Raychem Corporation, or approved equal.
 - b. The legend on the sleeve tag shall always read from left to right, with the first nomenclature indicating the "from" location and the second nomenclature indicating the "to" location.
 2. Flat Tags
 - a. The flat form shall be made of flat, white, sheet stock with slots for application to large conductors, cables, and conduits (not subject to painting) with nylon tie-wrap fasteners. These tags shall also be used for identifying indicators, relays, and other devices where slide-in holders are provided.
 - b. These tags shall be one and one-half inches long by three-quarter inches wide with one, five sixteenth inch hole located in the center of the width. The distance from the edge of tag to the hole shall be approximately nine thirty-seconds of an inch. The untreated tag shall be milk white "vinylite," or approved equal, approximately seven hundredths of an inch thick.
 - c. The identifying nomenclature space shall allow for three rows of lettering. The tag material shall be capable of receiving typed-on characters by conventional means. The height of the lettering shall be not less than one-eighth inch.
 - d. After lettering, the face side of the tag shall be covered with a clear plastic coating, "vinylite," or approved equal, of at least one hundredth of an inch thickness. The back of the tag shall be covered with a milk white coating "vinylite," or approved equal, of at least one hundredth of an inch thickness.

- e. The nomenclature applied to tags to go on terminal racks and boards shall show the terminal post identification on the top line. The functional nomenclature shall appear on the bottom line, or, if required, on the middle and bottom lines. The terminal posts shall be identified by geometry coordinates, such as rack, row and post number.

2.06 MARKER TYPE 6 - PAINTED STENCIL

This type of marking may be utilized for identification of large objects such as racks or enclosures providing they are not subject to field painting (use type 3 in this case) and providing the mark is clearly and neatly applied. The marking paint shall provide a definite contrast with the surface on which it is applied, e.g., black paint on a gray surface would not be acceptable.

2.07 MARKER TYPE 7 - INK STAMPED

This type of marking shall be utilized for the identification of components not otherwise identified. The color of the ink shall be either black or white, whichever provides the greatest contrast with the background color.

2.08 MARKER TYPE 8 - ETCHED COPPER

This marker type is an alternate to type 7 which may be utilized on printed circuit cards for identification of card or components.

2.09 MARKER TYPE 9 - ENGRAVED PHENOLIC

This marker type shall be utilized for all special purpose panels. The material shall be white phenolic sheet with thin layers of black phenolic laminated to both sides. Panels shall contain no detectable filled areas resulting from errors, mistakes or changes. The panel shall be free from chips or scratches. Where the edges of the panel are visible, they shall be carefully finished with a durable matte black paint. The surface of the panel shall be buffed with a fine abrasive to remove any shininess and produce a matte finish.

2.10 MARKER TYPE 10 - WIRE TAGS EXPOSED TO DIRECT SUNLIGHT

- A. This marker type shall be utilized in lieu of Marker Type 5 to identify wires and cables exposed to direct sunlight. The identifying lettering shall be as specified for MARKER TYPE 5 for similar application, but these markers shall be made of material that will not corrode, rot, melt, or otherwise decay, or lose their legibility, due to moisture or the effects of sunlight.
- B. The Design-Builder may use embossed metal markers as specified for MARKER TYPE 3 for the purpose of identifying wires and cables exposed to direct sunlight.

2.11 MARKER TYPE 11 - TEMPORARY TAGS

This marker type shall be utilized to identify circuit changes, apparatus or any other device when, in the course of testing, an error in the permanent tag or label is noted. These tags shall be of a size and quality to readily identify the wire or apparatus until such time as the permanent tag is available.

PART 3 - EXECUTION

3.01 APPLICATION

- A. The tags and markings shall be applied during manufacture wherever possible or in the field where necessary.
- B. The following special precautions shall be observed when applying tagging and marking per above mentioned type
 1. Marker Type 1 - The cast metal marker shall be suitably applied with rivets or flat head screws. If the fasteners penetrate the surface to which they are applied, suitable sealant shall be utilized to ensure watertight integrity of the unit. When flat head screws are used with nuts and washers, they must be secured in such a manner as to prevent loosening due to vibration with consequent entry, into and fouling of the internal operation of the trailable yard switch mechanism.
 2. Marker Type 2 - The sheet metal, reflective coated marker shall be securely fastened in place utilizing stainless steel hex bolts, lock washers and nuts, of diameter appropriate for marker size. A large stainless steel washer shall be used on the front surface of the sign, with a neoprene gasket between it and the reflective surface, to prevent tearing or gouging of the reflectorized surface. Alternately, the sign may be fastened with a suitable bracket welded or otherwise fastened to the back surface and presenting no discontinuity of the front surface.
 3. Marker Type 3 - The embossed metal marker shall be applied by rivets, screws, stainless steel wire, or an adhesive method, to all field equipment subject to periodic painting or obscuring accumulations of dirt or grime. Examples of this equipment are
 - a. Conduits
 - b. Junction Boxes
 - c. Impedance Bonds
 - d. Track Loops
 - e. Station Stopping Distance Markers
 4. Marker Type 4 - The Die-stamped Nameplate shall be applied by an approved adhesive method or rivets. This marker shall be applied to racks and all equipment or apparatus which requires a test procedure as specified in other Sections.
 5. Marker Type 5
 - a. The printed plastic marker shall be properly installed so that the printed legend indicates the proper identification of the wire terminal adjacent to the sleeve.
 - b. The sleeve form shall be located at the termination of the wire and may be used as insulation over an uninsulated pressure-applied terminal.
 - c. The sleeve shall be oriented on the wire so that the printed legend will start at the terminal, before the heat is applied to shrink the sleeve onto the wire.
 - d. The sleeve shall be used on wires of sizes up to and including No. 0 AWG.
 - e. The sleeve shall also be used to identify multiple conductor cables up to 1/2-inch in diameter.
 - f. The tag form shall be securely fastened to the intended object with nylon tie-wrap fasteners inserted in the slots in a manner that does not obscure the legend, and the tag shall be positioned so that it is right side up and readable when installed. The tie-wrap shall be tight enough to prevent the tag from moving from its desired position.
 6. Marker Type 6 - The Painted Stencil marking shall be applied with a procedure that produces clear, legible letters without voids and without paint running between the

- stencil and the surface being marked. No paint shall be allowed to reach the surface being marked around the outside edge of the stencil.
7. Marker Type 7 - The Ink Stamped markings shall be neatly and uniformly applied. Stamped markings that are not complete as a result of improper positioning of the stamp or that are blurred or smeared will not be acceptable.
 8. Marker Type 8 - The Etched Copper marking utilized on printed circuit cards, shall be legible and shall not be obscured by any component mounted on the card.
 9. Marker Type 9 - The Engraved Phenolic markings on control panels shall be applied with letters, numerals and lines engraved through the black layer and well into the white base to provide clean edges and distinct letters. Panels shall be fastened in place without damage from nicking or chipping. Screwheads shall be flat or oval and shall have a black matte (or black anodized) finish. Screwheads that are burred by a screwdriver shall be replaced.
 10. Marker Type 10 - Tags which will be exposed to direct sunlight shall be attached with material which will not corrode or rot due to moisture, or decompose due to ultraviolet light.
 11. Marker Type 11 - Temporary tags shall be attached with string, generally in the same location as required for the permanent tag. Temporary tags shall be replaced with permanent tags before each of the Authority acceptance levels listed elsewhere in these Specifications.

END OF SECTION

SECTION 16978

MISCELLANEOUS TRAIN CONTROL COMPONENTS AND MATERIALS

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing and installation of miscellaneous components and materials which form part of train control equipment or systems which are specified in other Sections of these Specifications.

1.02 RELATED SECTIONS

Related Work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	Yard Signaling Submittal Requirements
Section 16915	Basic Yard Signaling Equipment Requirements
Section 16922	Lightning/Surge Protection and Grounding Systems
Section 16971	Racks and Cable Trays
Section 16972	Junction Boxes
Section 16973	Conduit

1.03 QUALITY ASSURANCE

See Section 01113 Systems Integration

PART 2 - PRODUCTS

2.01 BOLTS, NUTS AND WASHERS FOR TRAIN CONTROL WORK

- A. Nuts and threads shall be in accordance with the AREMA Signal Manual, Part 14.6.20, Recommended Design Criteria for Bolts, Nuts and Threads. Plain washers shall be in accordance with the AREMA Signal Manual, Part 14.6.21, Recommended Design Criteria for Plain and Spring Lock Washers. Steel shall be in accordance with the AREMA Signal Manual, Part 15.1.4, Section 1, Recommended Developmental Criteria for Various Types of Steel.
- B. Bolts, nuts and washers shall be hot-dip galvanized, or they shall be made of brass or stainless steel.
 1. Cold galvanizing, plating and anodizing will not be acceptable.
 2. Where regular maintenance requires periodic removal of bolts, the bolts, nuts and washers shall be stainless steel.

2.02 ANCHORS

Stainless steel stud anchors shall be used for mounting Train Control equipment to concrete and masonry structures.

2.03 POTHEADS AND FILLING COMPOUND

- A. Potheads for multiconductor Train Control cable shall have neoprene end seals similar to those manufactured by the Okonite Co., or approved equal.
- B. The filling material shall be "encapsulating resin" as manufactured by Preformed Line Products Company, FX-70 Polymetric Joint Sealant as manufactured by Fox Industries of Baltimore, Maryland, or approved equal, and shall be applied in accordance with the manufacturer's instructions.
- C. At locations where the outdoor end of a conduit entering a TCR or other structure is at a higher elevation than the indoor end, so that water entry is a problem, the Design-Builder shall provide conduit sealing bushings on both ends of the conduit after removing all water and moisture from the conduit. The fitting shall be as manufactured by O-Z/GEDNEY Co., type CSBG or approved equal product. At locations known to have a problem with infiltration of water under pressure, the Design-Builder shall install an additional seal 10 inches inside the end of the conduit. This seal shall be the O-Z type CSBI or approved equal product. Apply Dow Corning No. 96081 RTV to the cables at the locations of the seals. Fill space between the O-Z fittings with Dow-Corning No. 3-6548 Silicone RTV Foam under pressure. O-Z seal screws shall be torqued per the manufacturer's specifications.

2.04 SWITCH PLATE LUBRICANT

Dylon Grade SP-MS All Weather Switch Plate Lubricant, as manufactured by Dylon Industries, Inc., Cleveland, OH 44144, or equal, shall be furnished and applied by the Design-Builder to lubricate switch point tie plates and the inside of the joint bars holding the heels of the switch point rails.

2.05 CORROSION PROTECTION

Protection for machined/finished surfaces, threaded rods and nuts and other parts which are susceptible to rusting, shall be a corrosion-preventive compound, NO-OX-ID "A Special", as manufactured by Sanchem, Inc., or approved equal.

2.06 GROUNDING EQUIPMENT

- A. Driven ground rods shall be copper-clad steel, or the non-rusting type as manufactured by Copperweld Corporation, or approved equal. Each rod shall be at least eight feet in length and at least five-eighths inch diameter.
- B. Ground rod clamps shall be bronze with tamper-proof safety set screws
- C. Connections to ground rods and ground buses shall be made with No. 6 bare copper wire, No. 6 insulated copper wire, No. 4/0 copper wire, or one-eighth inch by one and one-half inch flat, hard drawn, bare copper strip, as applicable to the equipment to be grounded.

2.07 SEALING COMPOUND

Sealing compound shall be "Duxseal" as manufactured by the Manville Company, or an approved equal.

2.08 PAINT AND FINISH

- A. All paint and painting procedures shall be in accordance with the applicable recommendations of Part 2.4.30 of the AREMA Signal Manual, where the recommendations of the AREMA Signal Manual do not conflict with the requirements of these Specifications.
- B. The surface of equipment and material not accessible after mounting shall have the final finish coat applied prior to installation.

2.09 CABLE PULLING LUBRICANT

The cable pulling lubricant shall be compatible with all cable jackets and noninjurious to cable insulation.

PART 3 - EXECUTION

NOT USED

END OF SECTION

THIS PAGE NOT USED

SECTION 16979
SURFACE TRENCH

PART 1 - GENERAL

1.01 SECTION INCLUDES

This Section specifies the furnishing, installation and use of surface trench as an alternative to the use of conventional direct-burial cable trenching.

1.02 DESCRIPTION

- A. The surface trench shall consist basically of channel sections with covers, installed in such a manner that the covers are approximately two inches above the surface of the ground.
- B. Cables shall enter and exit the surface trench runs from the bottom.

1.03 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 01113	Systems Integration
Section 16912	ATC Submittal Requirements
Section 16949	Signal Wire and Cable

1.04 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.05 SUBMITTALS

See Section 16912, ATC Submittal Requirements

PART 2 - PRODUCTS

2.01 TRENCH SECTIONS

Surface trench shall be one of the following, or an approved equal

- A. "Plastibeton Channel System", as manufactured by Synertech Moulded Products, Inc., 332 South Michigan Avenue, Chicago, Illinois 60604
- B. "Fibercrete", as manufactured by Concast, Incorporated, 15325 Babcock Avenue, Rosemont, Minnesota 55068
- C. "Trenwa Precast Concrete Trench System", as manufactured by Trenwa Inc., 1419 Alexandria Pike, Fort Thomas, Kentucky 41075

2.02 ASSOCIATED PARTS AND MATERIALS

Furnish and install all sand backfill required for cable installation in the surface trench runs.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Surface trench units shall be installed in such a manner that the top surface of their covers generally follows the ground contour and is approximately two inches above the final ground level
- B. Surface trench runs shall be installed in accordance with the manufacturer's instructions. The Design-Builder shall take care not to disturb existing direct-buried cable while installing surface trench or installing cable therein.
- C. Where surface trench runs cannot avoid crossing over natural or man-made drainage facilities, the Design-Builder shall provide adequate structure to support the surface trench runs plus an additional load of 500 lbs/sq.-ft. without interfering with the function and capacity of the drainage facilities.
- D. Where surface trench runs must run parallel to natural or man-made drainage facilities, the Design-Builder shall provide adequate structure to prevent undermining, displacement, or other damage to the surface trench runs, and to prevent the surface trench runs from becoming part of the drainage system. This shall be accomplished by providing sufficient drainage for the surface trench runs and by installing the runs in such a manner that surface running water is prevented from entering the runs. Any gaps between the ends of the trench cover sections shall not exceed one-quarter inch.
- E. Install a bed of sand at least three inches deep in the bottom of each surface trench run before installing cable in the run.
- F. The cables laid loosely and neatly in the trench with a minimum of crosses. Cable, during installation and as finally installed, shall not be bent to a radius less than 20 times its diameter, and shall not be pulled tightly around corners. Sufficient slack shall be provided in each cable in each cable trench segment to prevent damage to the cable.
- G. Provide longitudinal dividers in surface trench runs which will contain both high-voltage (greater than 200V) and low-voltage cables, and separate the cables accordingly.
- H. Each cable installed in a surface trench run shall be identified by a weatherproof tag at each end of its run in the surface trench and at intervals not to exceed 100 feet.
- I. The Design-Builder shall not install the surface trench cover sections until the installation of the trench itself, and the installation of all required cables, have been completed.
- J. Remove all trash and ballast from the surface trench before installing the trench covers.

END OF SECTION

SECTION 16989

YARD TESTS AND INSPECTIONS

PART 1 - GENERAL

1.01 SYSTEMS DESIGN INTEGRATION

The Design-Builder shall incorporate the tests and inspections described in this section into his systems integration plans and procedures.

1.02 DESCRIPTION

- A. This Section provides a general description of the inspections and tests which the Design-Builder and/or his sub-contractor shall perform to demonstrate that systems, sub-systems, assemblies, subassemblies, and components supplied under this Contract are in compliance with these Specifications, and specifies certain test equipment to be furnished by the Design-Builder and delivered to the Authority.
- B. Tests and inspections shall be made during the progress of this Contract and after completing the installation of equipment. These tests and inspections shall include:
 - 1. Field inspections and tests
 - 2. Factory tests
 - 3. Circuit breakdown tests
 - 4. Wiring verification tests
 - 5. Continuity tests
 - 6. Resistance tests
 - 7. Voltage and current tests
 - 8. Time tests
 - 9. Operating tests
- C. When a device or system does not meet the Specification requirements, the Design-Builder shall make the necessary corrections and shall be responsible for the total cost of additional tests required to prove compliance.
- D. The Design-Builder shall provide equipment and apparatus required for the tests and shall disconnect and reconnect any connections necessary in performing the tests.
- E. As a general requirement of these Specifications, the test procedures and tests which the Design-Builder develops and performs shall not only ensure that the Train Control equipment, circuits, systems and subsystems are performing the functions which are required, in the manner specified (POSITIVE TESTING), but shall also ensure that the Train Control equipment, circuits, systems and subsystems are NOT allowing or creating conditions which could have an unsafe or undesirable effect upon METRORAIL operations, METRORAIL equipment, METRO workers, or the public in general (NEGATIVE TESTING). While the POSITIVE TESTING requirements and some of the NEGATIVE TESTING requirements are set forth in these Specifications in considerable detail, it shall also be incumbent upon the Design-Builder, based upon past experience and familiarity with his own equipment, to include in the test procedures and tests, requirements for actions and verifications which shall either:
 - 1. Reveal any additional potential or existing unsafe or undesirable conditions, or:
 - 2. Prove that unsafe or undesirable conditions do not exist.

- F. These requirements shall apply not only to conditions inherent to the Train Control system, but to potentially unsafe or undesirable conditions resulting from interaction between the Train Control system and other systems or the operating environment.

1.03 QUALITY ASSURANCE

- A. All inspection and/or test plans, procedures, and reports shall comply with FRA rules and regulations, where applicable. A prerequisite for the approval of any inspection or test procedure will be the approval of the associated inspection or test plan.
- B. Each component and unit of the Yard Signal Control and Interlocking System provided by the Design-Builder shall have an inspection performed at its point of manufacture. Evidence of this inspection and acceptability shall be indicated on the item where practicable.
- C. The Authority Representative reserves the right to witness any or all tests and inspections in the Design-Builder's and/or sub-Contractor's plants. The Design-Builder shall advise the Authority Representative a minimum of two weeks in advance of each factory test. When tests are to be conducted continuously, as a production-line routine, the Design-Builder shall advise the Authority Representative two weeks in advance of the start of such tests and shall indicate the duration period in which such tests will be conducted.
- D. The Design-Builder shall complete all approved component and subsystem tests to demonstrate that the installation meets the Specifications and design requirements prior to any operational testing of systems.
- E. The Authority reserves the right to witness any or all installation inspections and pre-installation quality assurance inspections of equipment. The Design-Builder shall advise the Authority Representative 24 hours in advance of all such inspections.
- F. The Design-Builder shall perform on WMATA property all tests required to ensure the proper and safe operation of all systems and subsystems and to prove the adequacy and acceptability of the total installation specified herein. The tests to be performed shall cause each system and subsystem to be sequenced through its required operations, including the imposition of simulated conditions to prove that the installation complies with all specified fail-safe requirements.
- G. The Authority Representative will have the right to witness any or all field tests conducted. The Design-Builder shall notify the Authority Representative in writing at least 48 hours prior to each field test.

1.04 SUBMITTALS

- A. The Design-Builder shall submit a test plan which shall include the following:
 - 1. The tests to be performed on each type of component or unit.
 - 2. The numbers of each type of component or unit to be tested.
 - 3. Description of how the tests the Design-Builder proposes to perform demonstrate that all equipment supplied under the Contract is in accordance with the requirements of these Specifications.
 - 4. A testing schedule which shall delineate the order in which the various field tests shall be made and indicate how the Design-Builder plans to meet the installation and testing dates required by the Contract. This schedule shall include an estimate of the number of man-days required for each test and the number of men the Design-Builder plans to have available for testing.

- B. The Design-Builder shall submit, no later than 90 days prior to commencement of tests, a test procedure and pre-printed data sheets and/or inspection sheets for each field and factory test. These procedure and data sheets shall be broken down into the following sections:
1. Title Sheet - containing the test procedure, title, number, and revision date. Also included shall be a statement of the purpose of the test contained in a paragraph, or more as required, to present a concise, complete picture of the factors being tested.
 2. Table of Contents.
 3. List of test prerequisites and status of same.
 4. List of abbreviations used in test.
 5. List of test equipment required for the test.
 6. Preliminary information (background information further clarifying the purpose of the test).
 7. Test description.
 8. Data sheets for recording results which include maximum and minimum values describing expected results.
- C. The Design-Builder shall submit, no later than 90 days prior to commencement of tests, a basic test report document for every field and factory test required in these Specifications. This document shall include titled lines for the following information where possible:
1. Verification that:
 - a. The installation is complete and correct.
 - b. All prerequisite tests have been completed successfully.
 - c. All necessary documents are available for the specific test.
 2. Name and number of test.
 3. Date and time of start and conclusion of test.
 4. Names of personnel performing test.
 5. Name of Test Supervisor.
 6. Time Test Supervisor was present during test.
 7. Names, model numbers, calibration dates and serial numbers of all instruments used in test.
 8. Results of test.
 9. List of difficulties encountered in test.
 10. Recommendations and authorization for remedial action and retest.
 11. Signature of test personnel and Test Supervisor.
- D. The Design-Builder shall record the results of each test as herein specified, and deliver this test result documentation to the Authority Representative. The Design-Builder shall also furnish certified test results for tests performed by any sub-contractor when such tests are required within these Specifications. All test reports shall be checked and approved by the Design-Builder prior to submittal to the Authority Representative.

PART 2 - PRODUCTS AND MATERIALS

2.01 TEST EQUIPMENT

- A. Test equipment supplied by the Design-Builder, both for the Authority and for his own use, shall be of the proper type, capacity, range and accuracy to perform the required tests and inspections. This equipment shall be in good working order and properly calibrated at the time the tests or inspections are conducted.

- B. Each piece of Special Test Equipment required by the Design-Builder to inspect, test, adjust, tune or otherwise modify the equipment to be provided under this Contract shall, at the conclusion of all field tests which make use of it, become the property of, and be delivered to, the Authority. This requirement shall be limited to a quantity of one piece of equipment of each type, regardless of the quantity the Design-Builder requires to expedite his testing program. This includes any commercial equipment and any computer software (including service costs and source code) that are utilized in any field test or demonstration.

PART 3 - EXECUTION

3.01 FACTORY TEST PROCEDURES

- A. The Design-Builder shall furnish Factory Test Reports to confirm that either he or his sub-contractor have performed all required factory tests of systems, subsystems, assemblies, subassemblies, and components supplied under this Contract. These tests shall verify design and nameplate ratings, and adequate and proper performance.
- B. All systems, subsystems, and equipment shall be 100 percent inspected and tested.
- C. All components other than those related to fail-safe circuits, may be tested on a sampling basis.
- D. When factory tests require specific meter or test instrument readings, the pre-printed data sheet shall show the allowable range of values for each part of the test. The test report shall also contain a checkoff system for each action and a blank space adjacent to the expected value in which to record the test readings. When tests include observations of pertinent responses that do not require instrument readings, each response shall have its own checkmark. No single checkmark shall be used for groups of responses.
- E. If, during the factory test, a discrepancy is found, it shall be corrected and any affected portion of the test shall be repeated. No piece of equipment with an uncorrected discrepancy shall be shipped.
- F. If, during the factory test, a discrepancy is found which cannot be corrected, testing shall be discontinued and the Authority Representative shall be notified and furnished with the test results and all particulars.
- G. Each device requiring factory test shall be given a model number to which the test documents are keyed. Any change in the organization or construction of the device shall result in a new model number or alternatively, the same model number, but a new series number. Each device requiring factory test shall have a serial number which shall be unique for any given model number. These numbers shall appear on the device.
- H. When test results are not recorded on a test-data plate affixed to the equipment or unit, the Design-Builder shall furnish certified test reports for each item at the time of delivery.

3.02 FACTORY TESTS AND INSPECTIONS - INSTRUMENT RACKS

- A. The entire complement of instrument racks for a given Train Control Room shall be set up at the point of assembly, with all equipment installed. The racks shall be interconnected with plug connector cables, in accordance with the approved drawings. The Design-Builder shall, where required or necessary, furnish and use approved test fixtures to simulate functions

external to the Train Control Room. All functions of the system shall be tested to determine that each function of the system operates as required.

- B. The Design-Builder shall make adjustments and shall correct defects in the rack wiring as necessary to obtain proper operation.
- C. All design changes found necessary to obtain proper operation shall be submitted to the Authority Representative for approval.

3.03 FIELD TEST PROCEDURES

- A. The tests performed shall cause each system and subsystem to be sequenced through POSITIVE and NEGATIVE testing of its required operations to demonstrate that the installation complies with all specified failure design requirements. Simulated tests at the factory for vital equipment such as track circuits will not be acceptable. The Authority Representative must be satisfied that the test procedure adequately determines that the equipment is working properly, in a safe manner, and that it meets or exceeds the requirements of these specifications. The Authority Representative will signify his satisfaction with the test procedure by placing his signature on the first page of the document. Test procedures which have not been signed by both the Authority Representative and the Design-Builder will not be considered valid. Tests conducted in conformance with an invalid procedure will not be approved.
- B. The quality of the installation shall be demonstrated by field tests for continuity, insulation resistance, resistance of ground connections, circuit breakdown, visual inspection and any other tests required by the Authority Representative. These tests shall be performed prior to any operational testing of systems or subsystems. Insulation resistance tests on factory wired equipment may be performed at the equipment manufacturing site.
- C. The Design-Builder's test procedures shall consist of pre-printed data sheets or inspection sheets for each test. When completed by the field test personnel and checked for accuracy and completeness, the sheet shall be submitted as the test report.
- D. When tests require specific meter or test instrument readings, the pre-printed data sheet shall show the allowable range of values for each part of the test. The test report shall also contain a check-off system for each action and a blank space adjacent to the expected value in which to record the test readings. When tests include observations of pertinent responses which do not require instrument readings, each response shall have its own checkmark. No single checkmark shall be used for groups of responses.
- E. The test reports shall also contain a final description sheet on which the Design-Builder shall record discrepancies found and action taken. This documentation shall be furnished to the Authority Representative.
- F. All test reports shall be dated and signed by the responsible employee of the Design-Builder, or sub-Contractor, on the day the test is performed. Space shall also be provided for the signature of the witnessing inspector.
- G. The Design-Builder shall show on his report the specific test instruments used on each test, with the instruments identified by name, type, serial number and calibration date.

- H. If, during field testing, the Design-Builder discovers errors due to field wiring and connections which do not agree with the approved circuit plans, the Design-Builder may correct such errors without prior approval of the Authority Representative.
- I. The Design-Builder shall not, however, make any changes to the approved circuit, as designed, without prior written approval of the Authority Representative.
- J. The Authority Representative will make all final determinations as to whether only a part, or the whole test, shall be re-run when any specific field test does not meet the requirements specified for the test.
- K. Whenever a reference ground is required in the performance of a field test, only grounds of resistance values which conform to those specified in Section 16922. shall be used. The Design-Builder shall identify the test ground used and its resistance value on the data sheets for the test being performed. The use of test grounds of unknown value will not be permitted. Any tests performed by the Design-Builder using unknown grounds will be rejected and must be redone by the Design-Builder.

3.04 FIELD TESTS AND INSPECTIONS

- A. Basic Requirements
 - 1. Field tests and inspections shall include, but not be limited to, the following:
 - a. Ground verification test.
 - b. Power racks - energy distribution system and failure alarm checks.
 - c. Breakdown test of all vital circuitry.
 - d. Wiring verification of all non-vital circuitry.
 - e. Vital function tests.
 - f. Operating test.
 - g. Logic verification tests.
 - h. All applicable inspections and tests prescribed by Part 2.4.1 of the AAR Signal Manual, where the AAR inspections and tests do not conflict with other requirements of these Specifications.
 - 2. The TCR power distribution system shall be tested for crosses and proper energy levels before ground detectors are made operational.
 - 3. The ground detectors shall be operational before circuit breakdown tests and interlocking tests are made.
 - 4. All ground detectors shall be maintained in operation and shall be monitored continuously throughout field testing.
 - 5. The Design-Builder shall submit plotted traces showing actual transfer times. Transfer times shall be measured by interrupting the service under test and measuring the output of the Transfer Switch.
- B. Specific field tests and inspections which the Design-Builder shall perform shall include, but not be limited to, the following:
 - 1. Resistance of Negative Return Bonds (YTP-1)

Electrical tests of negative return rail bonding, cross bonds and negative return traction feeder cable shall be conducted and recorded as herein described using a Biddle Portable Kelvin Bridge, Catalog No. 72-439 or an equivalent test instrument with corresponding range and accuracy.

 - a. Resistance of Compression-Bolted Connections
 - (1) Each complete negative-return rail joint bond of the compression-bolted (double) 500 KCMIL type, shall have an installed resistance not to exceed 0.000160 ohms plus 0.000011 ohms for each foot of

paired 500 KCMIL cables installed. The resistance of each individual bolted connection shall not exceed 0.000080 ohms.

- (2) The Null Balance method of testing shall be employed utilizing the four terminal arrangement, two potential and two current terminals. The C1 and C2 current leads shall be attached to the head of the rail six inches outside of each end of the power bond being tested. The P1 and P2 leads shall then be attached to the base of the rail one inch outside of each end of the power bond being tested. The meter dials shall then be manipulated to achieve a balanced condition of the meter.

(a) A similar procedure shall be followed when testing individual cable-to-rail connections.

- (3) Resistance of Clamped Connections

(a) Prior to performing the resistance test on base-of-rail clamped negative-return rail joint bonds or connections, the cap screw on each cable clamp shall be tightened to the specified pressure with a correctly calibrated torque wrench, according to the approved procedure.

(b) Each complete negative-return rail joint bond of the clamped 1000 KCMIL cable type, shall have an installed resistance not to exceed 0.000160 ohms plus 0.000011 ohms for each foot of installed cable. The resistance of each individual clamped connection shall not exceed 0.000080 ohms.

(c) The Null Balance method of testing shall be employed utilizing the four terminal arrangement, two potential and two current terminals. The C1 and C2 current leads shall be attached to the head of the rail six inches outside of each end of the power bond being tested. The P1 and P2 potential leads shall be applied to the base of the rail one inch outside of each end of the power bond being tested. The meter dials shall then be manipulated to achieve a balanced condition of the meter.

(d) A similar procedure shall be followed when testing individual cable-to-rail connections.

- (4) Cross-Bonding

(a) The installed resistance of each 1000 KCMIL cross bond cable shall not exceed 0.000160 ohms plus 0.000011 ohms for each foot of cable installed. The Null Balance method of testing shall be employed.

2. Inspection and Test of Cable Installation (YTP-2)

The following items shall be checked, as required, during and after installation. The Design-Builder shall determine that:

- a. A visual inspection of the exposed portion of the cable shows the exterior to be free of nicks, gouges or any obvious damage.
- b. The cable is properly installed and supported in the correct location, and adequate slack has been provided to prevent strain on the terminations.
- c. The cable shows adequate insulation resistance (at least one megohm for circuits operating at 600 volts and below, and at least 100 megohms for circuits operating above 600 volts) to ground and between each conductor and all other conductors. (The cables shall be disconnected by opening terminal links, or by other means, for these tests.) These tests shall be conducted using a Biddle No. 212159CL Megger, or approved equal.

- d. Any discrepancy found has been recorded on approved forms and brought to the attention of the Authority Representative.
 - e. The tags have been checked.
 - f. All insulation resistance has been recorded.
 - g. Cable of the proper size, voltage and type has been installed. (If substitution was necessary and was authorized and made, the plans shall show these changes.)
3. Inspection and Tests of Equipment Grounds (YTP-3)
The following items shall be checked and the Design-Builder shall determine that:
- a. The grounding systems called for in these specifications or shown on the Information Drawings are in place and correctly installed.
 - b. A visual inspection shows all ground connections tight, free of paint and suitably protected from physical damage and corrosion.
 - c. A visual inspection shows all ground leads sufficiently heavy (per Specification), short, direct and free of bend radii less than six inches.
 - d. The resistance between each bus and earth ground is not greater than 15 ohms for outside equipment and for Train Control Rooms, using the Ratio Ground Resistance test method. All connections to ground buses shall be tested to verify proper and adequate connections and the absence of ground return loops.
 - e. The resistance from each equipment ground connection to the ground bus has been checked and recorded.
 - f. One path, and only one path, exists between the TCR prime ground bus bar and ground. (Disconnecting the leads from the bar to ground shall show a DC resistance from the bar to ground of over 10 thousand ohms.)
4. Tests of TC Maintenance Telephone System (YTP-4)
The following items shall be checked and the Design-Builder shall determine that:
- a. The Yard TC Maintenance Telephone system is operating properly insofar as the following qualities are concerned:
 - (1) Clarity of tone (distinctness and freedom from distortion) at all normal working levels.
 - (2) Uniform volume level among units at midpoint on the control with a good range of adjustability of the control.
 - b. Each phone jack is installed, properly placed, and wired correctly according to these specifications, and is not a source of hum, noise or static as determined by an actual listening test.
 - c. The system functions as intended and herein specified.
 - d. Each leg of the system, as measured at the farthest jack, has a signal-to-noise ratio of 15 dB or greater.
 - e. The resistance between the conductor pairs and between each conductor and ground is greater than 1 megohm.
5. Tests of Transfer & Bypass Equipment (YTP-5)
The following items shall be checked and the Design-Builder shall determine that:
- a. A complete operational test of the Automatic Transfer and Bypass Equipment indicates that the system functions as intended and herein specified.
 - b. The measured transfer time to transfer the load from one service to another does not exceed .05 second.
6. Power System Operational Test (YTP-6)
- a. The Design-Builder shall determine that energy at all required levels is available in the Train Control Rooms, and properly distributed to equipment requiring it both in the field and in the TCRs. He shall check that no grounds, shorts, open circuits, crosses or misplaced wiring exist in the power

distribution system. Any malfunctions, lack of power, or blown fuses shall be reported for later correction and retesting. All alarm circuits shall be tested by simulating power or equipment failure. All standby or reserve power circuitry shall be checked both for completeness and satisfactory operation.

- b. The Design-Builder's test shall include the following:
 - (1) Check AC power supplies for correct voltage levels, and phasing where required.
 - (2) Check DC power supplies for correct voltage levels and correct polarity.
 - (3) Check and adjust transformer taps where required.
 - (4) Check and make operational all ground detectors.
 - (5) Check for proper voltage and current levels at the various equipment units under both "load" and "no-load" conditions.
- 7. Testing and Adjusting Wayside Signals (YTP-7)
Each signal shall be checked to verify the following:
 - a. The signal displays the proper aspect for the signal control relay positions.
 - b. The intensity and alignment is correct when viewed from an approaching train.
 - c. The signal receives energy at 9 volts and the voltage does not vary beyond the range of +10 percent and -5 percent during normal power supply and load fluctuation.
- 8. Testing and Adjusting Trailable Switch Machines (YTP-8)
Each trailable switch movement shall be checked to verify the following:
 - a. The switch movement is properly placed, installed, lubricated, free of abnormal mechanical resistance, and wired according to the plans.
 - b. The switch movement receives energy at the proper voltage, and the voltage remains within tolerance during operation of the movement.
 - c. That all internal and external mechanisms are in adjustment according to the manufacturer's instructions.
 - d. The movement responds to a blocked point in the manner specified.
 - e. The movement draws the correct current at the voltage supplied as specified by the manufacturer.
 - f. The movement responds in the correct direction according to the control relays and the appropriate repeater relays are energized.
 - g. The movement heater(s) are in place and are not drawing excessive current.
 - h. The movement layout and all its components are tagged and marked as specified in Section 16964, Yard Trailable Switch Operating Layouts.
 - i. If the movement includes a hand-throw feature, the movement can be hand thrown to both extreme positions and cannot be operated electrically with the hand throw feature activated.
 - j. The movement can be hand cranked to both extreme positions and cannot be operated electrically with the crank in place.
 - k. The opposite repeater relay is shunted when the switch is full normal or full reverse, and both repeater relays are shunted when the switch is in neither the full normal nor the full reverse position.
- 9. Track Circuit Tests - 60 Hertz (YTP-9)
 - a. Each track circuit shall be tested to verify the following:
 - (1) Shunting sensitivity of 0.5 ohms at feed end, relay end, and all fouling points.
 - (2) Defective insulated joint protection.
 - (3) Proper relay operation.

- b. The test report shall contain a tabulation of all circuit parameters used to achieve proper operation.
 - c. All applicable tests which are necessary to prove that 60 Hz series track circuits meet the requirements of these Specifications shall be performed by the Design-Builder.
10. Non-Vital Circuit Verification Test (YTP-10)
- a. All circuits shall be tested in their entirety for the correct operation of and response to each contact on each circuit element, such as relays and contactors. Where parallel paths exist, the tests shall validate each path, and circuits shall be opened if required to ensure the proper test.
 - b. Each circuit shall be tested by simulating all operating conditions to verify that the circuit operates in accordance with the Specifications and/or approved drawings.
 - c. As each circuit is checked out, contact by contact, from energy plus to energy minus, the corresponding circuit in the circuit plans shall be delineated with green pencil so that no wire, contact, coil, device or connection is overlooked. All coordinates for identifying apparatus locations shall likewise be checked.
 - d. On relays with exposed contacts, circuits may be checked by placing a thin strip of plastic between the appropriate pair of contacts and checking to see that this break de-energizes the relay of the circuit being checked. These plastic strips shall be configured so that they cannot be inadvertently left in place after the test. These plastic strips can be utilized to separate multiple circuit paths so that each contact in the remaining single circuit path may be checked.
 - e. Where parallel paths exist in a relay circuit, the circuit shall be checked to prove that all paths are energized from the same fuse (or circuit breaker), and only that fuse (or circuit breaker).
 - f. All terminations shall be checked to ensure that no extraneous connections exist.
 - g. Both ends of each wire shall be checked during these tests to be certain that their terminations are solidly applied and that they are properly held in their correct place.
 - h. Wires used for temporary connections for these tests shall be of vividly contrasting color to the rack wire, or alternatively, these wires shall be identified by a green paper tag fastened to the wire with string. These wires shall be removed at the end of the tests.
11. Vital Circuit Verification Test (YTP-11)
- a. Sub-paragraphs a., b., e., f., g., and h., of the non-vital circuit verification test (YTP-10) shall also apply to this test.
 - b. This test shall be done by removing contact terminals from plugboards at each contact and checking to see that the appropriate energized relay(s) drop.
 - c. A brown colored pencil shall be used to checkmark each connection on the set of plans (included with the test submittal) to indicate that each circuit element and termination has been checked as required in this procedure.
 - d. All circuit elements shall be checked in the breakdown test. This shall include, but not be limited to, relay test posts, pushbutton contacts, switch machine contacts, resistors and fuses.
12. Interlocking Plant Test (YTP-12)
- a. Interlocking plant test shall be made to determine the safe and proper operation of all functions of the yard interlocking. The test sequence shall be designed to test each function in accordance with these Specifications and

the applicable requirements of the current edition of "Rules, Standards and Instructions Governing the Installation, Maintenance and Repair of Signal and Train Control Systems, Devices, and Appliances" as published by the Office of Safety, Federal Railroad Administration of the U.S. Department of Transportation.

- b. Interlocking plant tests to be performed shall include, but not be limited to, the following:
 - (1) Time locking,
 - (2) Traffic locking,
 - (3) Route locking and sectional release locking,
 - (4) Verification of timing of time releases,
 - (5) Switch locking,
 - (6) Prevention of preconditioning,
 - (7) Control machine indications,
 - (8) Detector locking, and
 - (9) No premature quick release of route in the event of power failure.
 - c. When more than one type of locking is in effect at the same time, sufficient tests shall be conducted to verify the effectiveness of each type of locking.
 - d. Each route shall be tested for route security. This test shall be made by establishing the routes and falsely picking the Route Check Relay for each opposing or conflicting signal while observing that associated signals stay at STOP and the associated signal clearing relays remain de-energized.
 - e. Tests shall be performed to ascertain that a fuse failure will interfere with the operation of one route only, wherever possible.
13. Interlocking Operational Tests (YTP-13)
- a. Interlocking operational tests shall be made by aligning all possible routes, one at a time, and observing the following conditions:
 - (1) The called-for route clears.
 - (2) All conflicting routes are prevented from clearing.
 - (3) All possible parallel routes can be cleared.
 - (4) Fleeting can be established, where applicable.
 - (5) Response in field is correct.
 - (6) Control machine response is correct.
 - (7) Where applicable, traffic is aligned.
 - (8) When simulating a train movement through the aligned route, the following conditions are observed:
 - (a) Response in field is correct.
 - (b) Control machine response is correct.
 - (c) Where applicable, sectional release of routing is correct and consistent with clearance requirements.
 - (9) When aligning a route, then initiating a cancel of that route, the following conditions are observed:
 - (a) Time locking is in effect for the prescribed time.
 - (b) Conflicting routes cannot be cleared while time locking is in effect.
 - (c) Control machine response is correct.
 - b. The Design-Builder shall also perform a "Route Stability" test, where applicable, to ensure that the provisions of Section 16952. have been complied with, as they relate to the simultaneous operation of switch machines. This test shall be performed as follows:
 - (1) In each route which contains three or more switch machines, all the turnouts and crossovers in the route shall be pre-positioned with their respective test keys so that simultaneous movement of all of these

switch machines will occur when the route is called for by the entrance-exit circuits. As the route aligns, the Design-Builder shall observe to verify that:

- (a) There is no resulting excessive voltage drop in any portion of the power distribution system.
 - (b) There is no resulting excessive current in any portion of the power distribution system.
 - (c) There is no resulting tripping of circuit breakers or blowing of fuses.
- (2) If the simultaneous movement of the switches for the called route does cause excessive voltage drops, excessive current, the tripping of breakers, or the blowing of fuses, these facts shall be noted and recorded on the data sheets for the equipment in the route under test, and the Design-Builder shall notify the Authority Representative of this fact within 48 hours. If no such problem occurs. The Design-Builder shall certify this to be true on the data sheets for the equipment in the route under test. If such a problem exists, the Design-Builder shall submit proposed corrective measures to the Authority Representative within 15 days, for approval. Upon making any corrections necessary to obtain the Authority Representative's approval, the Design-Builder shall promptly implement the approved corrective measures and retest the problem area at no additional cost to the Authority.
14. Snowmelter Operational Test (YTP-14)
Each snowmelter layout shall be checked to verify the following:
- a. Controls and indications on the Yard Control Panel operate properly.
 - b. Each snowmelter heating element and switch rod heater unit is energized from the proper fuse and is supplying the correct amount of heat. Temperatures shall be obtained using infrared heat gun or strap-on thermometers and shall be recorded on the data sheets.
 - c. The door interlock circuits on the Snowmelter Control case function properly.
 - d. The snowmelter control case heaters are functioning properly.
15. Insulated Joint Tests (YTP-15)
Each insulated joint in the running rails, gauge plates, switch rods, throw rods, and circuit controller rods shall be tested by the ratio method, using a track quality meter, as manufactured by General Railway Signal Company, or approved equal.
- a. With a standard 1000 ohm resistor placed across the joint, and with audio frequency current supplied by the track quality meter, the ratio between the current flowing through the insulated joint and the current flowing through the standard resistor shall be determined by use of the current probe of the track quality meter.
 - b. Utilizing this ratio, calculations shall be made by an approved formula to determine the resistance of the insulated joint itself.
 - c. If the resistance so determined is less than 5000 ohms, the insulated joint will be regarded as defective, and the Design-Builder shall notify the Authority Representative of this defect.

3.05 Acceptance Testing and Safety Certification

- A. The following tests will be conducted by WMATA as part of the Acceptance and Safety Certification.
 - 1. Track Circuit Verification

- a. Power Frequency (AC) Track Circuit
- b. Series Track Circuit
2. Cable Integrity Test
 - a. Switch Cable
 - b. Signal Cable
3. Switch Tests
 - a. Switch Detector Locking
 - b. Prevention of Switch Pre-conditioning
4. Time & Route Locking
 - a. Route Locking
 - b. Time Locking
5. Opposing Signal Tests
6. Traffic Locking Test
7. Detector Test
8. Loss of Shunt Test
9. Two Track Release Test
10. Sectional Release Test

SECTION 16991

YARD SIGNAL DRAWINGS AND TRACINGS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section contains specifications for the production and furnishing of Yard Signal Control and Interlocking System tracings, drawings, and CD-ROMs, and describes the general format of the drawings, types of drawings, and the manner in which information shall be displayed on these drawings.
- B. Drawings shall be prepared and submitted separately for each respective yard in which work is included in this contract

1.02 BASIC DESCRIPTION

- A. Drawings shall be divided into two basic types. Each type shall be furnished in a separate book. The typical drawings common to all TCR locations shall be contained in a "Book of Typical Plans." Drawings specific to a particular TCR location shall be contained in a "Room Book-of-Plans" for that particular room.
- B. Drawings for the existing Yard Signaling systems are on file at the Authority's offices. The Design-Builder may refer to these drawings and may obtain prints of any of these drawings required for completion of work under this Contract.
- C. When the work requires alteration or additions to existing Drawings, the Authority will furnish the Record Drawings which require revisions. From these the Design-Builder shall produce new drawings or CDROM's to replace or supplement the existing drawings, all as specified herein.
- D. The effective date and identification number, to be inscribed on the final tracings, will be furnished by the Authority Representative prior to the time the tracings reach As-Built condition and are ready for the Design-Builder's final processing.
- E. The Design-Builder shall produce the various types of drawings required by these specifications in a manner similar to that depicted on the corresponding typical drawings or example existing yard drawings included in the Information Drawings.

1.03 RELATED SECTIONS

Related work specified elsewhere shall include, but not be limited to, the following Sections:

Section 16911	Scope of Work
Section 16912	Yard Signal Submittal Requirements
Section 16916	Basic Circuit Requirements
Section 16931	Yard Signal Maintenance and Test Facilities

1.04 TYPES OF DRAWINGS

The types of drawings to be provided shall include, but not be limited to, the following as applicable:

- A. Drawings indicating the track configuration including the location of pertinent items of Yard Signaling related facilities, such as signals, trailable switch layouts, junction boxes, snowmelter control housings, equipment cases, ductbanks, manholes, cable surface trench, TCRs, Shop Buildings, and other relevant wayside equipment and ancillary facilities. These drawings shall be drawn in a geographical representation of the yard and tracks and shall be known as Double Line Track Plans.
- B. Drawings showing the arrangement of equipment, facilities, or components in a room, rack, junction box, housing, cabinet, or module - These drawings shall be known as Arrangement Plans.
- C. Drawings showing the dimensions and internal mechanical and electrical details of particular pieces of equipment or assemblies - These drawings shall be known as Product Drawings, but shall bear the title of the particular piece or type of equipment shown.
- D. Drawings on which detailed information is shown for the mechanical installation of Train Control equipment, such as signals, trailable switch machine layouts and snowmelter layouts - These drawings shall be known as Installation Drawings.
- E. Drawings which indicate the point-to-point cable runs and identify cable make-up and conductor wire size - These drawings shall be known as Cable Plans.
- F. Drawings showing the exact location of direct burial and surface cable trench runs, as applicable - These drawings shall be known as Trenching Plans.
- G. Drawings showing the various types of control, operating and indication circuits required - These drawings shall bear the title of the particular function(s) performed by the circuits illustrated, but shall all be classified as Circuit Drawings.
- H. Schematic drawings of various energy distribution systems or subsystems - These drawings shall be known as Energy Distribution Schematics.
- I. Drawings showing the details of electrical connections for various pieces of yard signaling equipment - These drawings shall bear the title of the particular piece of equipment, but shall all be classified as Wiring Diagrams. This category shall include "Back Panel Wiring Diagrams" for all control and indication panels provided under this Contract.
- J. Drawings showing the wiring and connection diagrams for individual systems and subsystems supplied on this Contract, for example, the separate drawings showing the TC Maintenance Telephone lines emanating from each TCR and showing all terminations of these lines within the Contract limits - These drawings shall be known as TC Maintenance Telephone System Drawings. Wiring diagrams of the connections between the various parts of a system shall be fully detailed with all terminals and wire numbers. They shall be complete and all on one page if possible. No connections shall be omitted. All interface connections shall show destinations, preferably graphically, but if not practical, through the use of adequate nomenclature. Reference may be made to drawings in the "Room Book-of-Plans," or the "Book of Typical Plans."
- K. Drawings showing complete Material Lists for all assemblies, subassemblies and components supplied on this Contract - These Material Lists shall include all information necessary for preparing an order to the supplier for replacement of such equipment. As an option, these

Material Lists may be provided on 8.5 x 11 inch paper, or may be included as part of related drawings. All items shown on these material lists shall be completely described, to include identifying sources, size, configuration, mating and attaching characteristics, functional characteristics and performance requirements, and "form, fit and function" data contained on specification control drawings, catalog sheets, and outline drawings. Items such as resistors, capacitors, nuts, bolts, and other general hardware, shall be described only once for this Contract provided they are adequately cross-referenced.

- L. Drawings entitled "List of Spare Parts" for all assemblies, subassemblies and components supplied on this Contract - These lists of spare parts shall include the recommended stock quantities for routine maintenance of the equipment for one year and shall include a sub-list of spare parts that are considered critical and for which extended amounts of time required for acquisition would create undesirable down-time for the equipment.
- M. Drawings entitled "List of Tools" for all assemblies, subassemblies and components requiring the use of tools - These drawings shall list all common and special tools required to perform inspection, adjustment, maintenance and repair. Special tools are those developed to perform a unique function related to a particular piece of equipment, which are not available from common commercial sources. Special tools shall be so identified on the list.
- N. Drawings showing complete circuits which, with minor modifications and details added, will be used repetitively throughout the Contract work - These shall drawings be known as Typical Circuit Drawings and shall have the word "Typical" included in the title along with the circuit or function name shown.
- O. Index sheets for each TCR Book of Plans.

1.05 QUALITY ASSURANCE

See Section 01113, Systems Integration

1.06 SUBMITTALS

See Section 16912, ATC Submittal Requirements

PART 2 - PRODUCTS

2.01 MATERIALS FOR TRACINGS

The final As-Built drawings shall be printed on four-mil-thick mylar in *AutoCAD 2000* format by automated techniques approved by the Designated Authority's Representative.

2.02 BOOKS OF DRAWINGS

The Design-Builder shall supply books of specific Yard Signaling drawings for submittal packages and plan books as required elsewhere in these Specifications. These books of drawings shall consist of the following components:

- A. A group of drawings assembled in a logical order.
- B. An index sheet of the same size as the drawings.

- C. Protective cover and backing sheets. The name of the submittal package or name and location of the plan book shall be printed on the cover sheet in two-inch-high letters.
- D. A device for binding the left-hand edges of the drawings firmly, but in such a manner that drawings may be easily added, removed, or replaced without damage to the drawings or the binding.

PART 3 - EXECUTION

3.01 BASIC FORMAT REQUIREMENTS FOR YARD SIGNALING DRAWINGS

- A. Each drawing (maximum size of sheet, 22 inches by 36 inches) shall have a blank area 3-1/2 inches by 3-1/2 inches, located adjacent to the title block in the lower right hand corner.
- B. The title block shall display the following:
 - 1. Number and type of drawing
 - 2. Date of drawing and all revisions
 - 3. Name of Yard and specific Train Control Room area
 - 4. Name of Design-Builder and SubDesign-Builder submitting drawing
 - 5. Clear identification of contents and location of the work
 - 6. Specification title and Contract number
- C. All lettering or printing shall be at least 0.10 inches high and shall be produced by automated means. Freehand printing or lettering will not be acceptable.
- D. Notes shall be located as far toward the right border of the drawing as possible.

3.02 SPECIAL REQUIREMENTS FOR YARD SIGNALING CIRCUIT DRAWINGS

- A. Circuitry shall be presented on the drawing with a minimum of crossed or offset lines.
- B. Circuits shall not be drawn as schematics, but shall be drawn to reflect the actual wiring of the circuits. A uniform method shall be used to indicate the actual location of double wire connections when it is not desirable to show both wires at the point of termination. If the final circuit is not wired as shown on the Design-Builder's drawing, the Design-Builder shall revise his tracings to indicate the actual wiring before final, As-Built prints are made.
- C. No more than two wires shall be shown connected to a single terminal or contact pin other than an AAR terminal unless specifically authorized by the designated Authority Representative. No more than three wires shall be shown connected to a single AAR terminal.
- D. Complete circuits shall be shown on each drawing insofar as possible. A minimum of continuations shall be used. When continuations must be used, they shall be clear and specific and shall include the identity of the continuation sheet and the unique identity of the specific continuation. Wherever practicable, these "continuations" shall "line up" from drawing to drawing.
- E. Circuits shall be drawn with relay coils, timers, motors or other operated devices shown near the right or left border of the drawing wherever practical. Where there is a choice, the right border shall be favored.

- F. Track relay contacts in Yard Signaling circuits shall be inserted successively in conformance with the geographical succession of the track circuits themselves insofar as possible and practical.

3.03 PLAN BOOKS

- A. The Design-Builder shall maintain two sets of plan books in each TCR in which Yard Signaling equipment is installed under this Contract. Each of these sets shall consist of two books of drawings:
1. One book shall consist of all the Yard Signaling drawings for the area controlled from that particular TCR and shall include applicable prints from adjacent TCRs to show the non-local portions of traffic circuits and other line circuits appearing in the local TCR. This book shall also include
 - a. A copy of the wiring diagram for each wayside Yard Signaling junction box and control case located within the area controlled from that TCR
 - b. Complete Yard Signaling cable plans for the entire area controlled from that TCR.
 2. The second book shall consist of typical circuits and typical arrangement or internal layout plans and wiring diagrams for the various pieces of ATC equipment common to the various TCRs.
- B. Both sets of these books shall be updated immediately to reflect any changes made in the circuits or equipment. Work shall not proceed within a TCR area of control until such updates are made. One set of these updated plan books for each TCR shall never leave the TCR, and shall be left in the TCR when the TCR is transferred to Authority control.
- C. The Design-Builder shall maintain a complete set of up-to-date plan books for all TCR locations included in this Contract at his on-site headquarters.
- D. Three additional copies of the typical books and three additional copies of each TCR book of drawings shall be furnished to the Authority at the time the Design-Builder begins work in the TCR.

3.04 AS-BUILT DRAWINGS

The completed As-Built drawings shall bear the signature of an officer of the Design-Builder's organization, certifying compliance with as-built conditions, as specified in Section 16912.

3.05 CD-ROMs

The individual formats required for the various CD-ROMs to be furnished by the Design-Builder shall be as directed by the Designated Authority Representative.

AMENDMENT NO. 1
TO

METRO MATTERS - Design/Build: Rail Yards Expansion Project
at Brentwood, Greenbelt, and Shady Grove Yards

Phase II - Request for Technical / Price Proposals

CONTRACT NO. FN5008

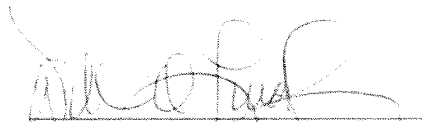

TO WHOM IT MAY CONCERN:

The proposal documents accompanying solicitation RFP-FN5008/FMP are hereby changed in part as follows:

1. The date established for Receipt of Proposals remains unchanged.
2. Proposers are hereby notified that all Questions pertaining to this solicitation and requests for Site Visits must be submitted by e-mail to fpohlmann@wmata.com with copies to wlinde@wmata.com and itriolo@wmata.com.
3. Proposers are notified that Questions received by WMATA after December 22, 2004 will not be responded to until January 3, 2005 at the earliest. In addition, no further Site Visits will be scheduled until January 3, 2005.
4. WMATA's responses to Proposer's Questions raised thru December 15, 2004 are attached.

ACKNOWLEDGMENT

Offerors are required to acknowledge receipt of this amendment in writing on the Proposal Form in the space provided or by separate letter or telegram prior to the date established for receipt of proposals.

William O. Linde, Jr.
Contracting Officer
Office of Procurement and Materiel

QUESTIONS AND ANSWERS

Question 1: In reviewing the Table of Contents for Division 0, it became apparent that page numbers are not accurate and that entire sections are not reflected. Can WMATA reissue a corrected Table of Contents?

Answer: Our review indicates that due to inconsistencies in printers and problems associated with bulk reproduction of documents, some of the copies provided for Book 1 (Division 0 and 1) were not in the correct format or order. For this reason we have reissued Book 1 (Division 0 and 1) in its entirety to all Phase II participants.

Question 2: Section 00102, Section 00434 - Notes to Proposers # 1: Since these Sections state that multiple contracts will be awarded, if a proposer submits a price and technical proposal for just one of the projects and not the other, is it WMATA's intent to reject the proposal?

Answer: WMATA intends to award one or more contracts for the RFP based on the best interests of the Authority. Since both contracts will be evaluated for award at the same time, it is necessary that all proposers submit price and technical proposals for both projects. Failure to do so may result in ineligibility for award with such determination to at the Authority's sole and absolute discretion.

Question 3: Section 0102 (K.2) states that the Design-Builder must coordinate with "Utility companies and jurisdictional agencies affected or having jurisdiction over the Project through the Authority Representative". Is it WMATA's intent that the successful Design-Builder submit all required submissions either to the separate County Permit Office, and the District of Columbia Permit Office and affected Utility companies to the Authority Representative and then WMATA will be responsible for submission to the agencies?

Answer: No. It is WMATA's intent that the Design-Builder prepare all submittals as required and forward same to the Authority Representative for review and comment. Forwarding of submittals to the agencies after WMATA review is the Design-Builder's responsibility.

Question 4: Section 00102(O.1.b.1) states that the Design-Builder shall coordinate delivery of the plantings to the worksite for installation by the Builder. The Builder will contract with a landscaping company who is usually responsible for coordinating the delivery of planting materials selected by the Designer and installation of such once they arrive at the jobsite. Is it WMATA's intent to have the Designer schedule the delivery of the planting material in lieu of the landscaping contractor? If so, this could prove to be a scheduling problem.

Answer: It is WMATA's intent to clearly state that the Design-Builder is responsible both for delivery and installation of the planting materials. Distribution of labor and coordination of work with the landscape contractor is also the Design-Builder's responsibility.

Question 5: Section 00102(O.1.a) states that the Builder is responsible for performing Quality Control for construction and the Designer for performing Quality Assurance during construction in accordance with Section 01470. Is it WMATA's intent that the Builder provide the normal Quality Control Procedures and the Designer provide on-site Quality Assurance functions? Or does the Quality Assurance referred to in Section 00102 deal mainly with the Quality Assurance that the Designer provides in the normal administrative functions relating to RFIs, submittals, reviewing non-conformance items identified by the Builder, etc.?

Answer: Quality Assurance by the Designer during construction refers to those actions necessary to ensure that the Project is constructed by the Builder in accordance with the approved Final Design Specifications and Drawings as provided by the Designer for construction of the Project. Quality Control refers to those actions normally performed by the Builder during the construction process to ensure compliance with WMATA specifications and the approved Quality Control Plan.

Question 6: Section 00201(P.1), Section 00792 - Section 00201(P.1) outlines the requirements for the Disadvantaged Business Enterprises. This section reads, "... and also of the Federal Transit Administration (FTA) and the U. S. Department of Transportation (USDOT) in receiving and participating in federally assisted contracts." In addition, Section 00792(F.1) states that the "... federal government is not a party to this contract and shall not be subject to any obligations or liabilities to the Authority, Design-Builder, or any other party ...". Do these Projects contain any funds from either the FTA or USDOT?

Answer: These projects are federally-funded, however, the intent of Section 00792 is simply to state that the federal government is not a party to any contract resulting from this solicitation. WMATA is partially funded from federal grants provided to FTA as a Third-Party Grantee under the requirements of FTA Circular FTA C 4220.1E, "Third Party Contracting Requirements" and therefore must comply with the requirements for participation by Disadvantaged Business Enterprises as stated as well as other federally-mandated requirements.

Question 7: Section 00201(V.2) refers to WMATA's tax exempt policy. Is it accurate to say the Proposers need to include taxes in their cost for the Brentwood project?

Answer: Proposers need to include all relevant sales taxes in their proposal for the Brentwood project.

Question 8: Section 00204.D.2.F indicates that "A detailed CPM schedule with narrative description of the construction methodology, including equipment, materials, and manpower to be employed to construct the project." is to be provided. Considering

the Design-Build nature of the project, the short RFP period, and the target price format, is it really necessary to provide a cost-loaded, equipment-loaded CPM schedule, or will a schedule which identifies the critical path and narrative be sufficient?

Answer: Due to the basis of award for these Projects being "Fixed Price / Best Design", it is necessary that Proposers provide a fully cost-loaded CPM schedule as described in order to make a determination as to what value is being provided within the target price. One of these factors is the value provided as far as construction methodology, value of equipment and materials provided and manpower, particularly as far as skilled versus semi-skilled or unskilled labor.

Question 9: Section 00204.D.3.B.2 indicates that the Project Manager must have a "professional engineering certification". Does the Project Manager for the Design-Builder need to be a Certified Professional Engineer?

Answer: Yes.

Question 10: Section 00341.A indicates that the "Authority anticipates Categorical Exclusions (CE) as a result of its own environmental investigations. Copies of the CE's are available upon request". Can WMATA provide copies of the CE's to the Proposers at this time?

Answer: Copies of the CE's will be provided to all proposers. Categorical Exclusions (CE's) are issued by FTA if it can be shown that there are no significant impacts to the environment as a result of a specific project. FTA's approval will void the need for a detailed environmental impact statement, which is a lengthy process.

Question 11: Section 00433 is included in the RFP for the Proposers to identify brand name or equal substitutions in the technical proposal. Since this Project is a Design-Build project and the design will take an extended period of time, it does not seem practical to provide "or equal" lists for products that are yet to be fully designed. Does this form need to be provided in the technical proposal?

Answer: Yes. One of the factors for technical evaluation is the major equipment to be provided. Division 11 includes Appendix A, "MAJOR SHOP EQUIPMENT LISTING" which clearly identifies which equipment will be evaluated. The Design-Builder must complete the Section 00433 to indicate what Major Equipment is being offered. As stated, brand names indicated in the Specifications are for descriptive purposes only, equals will be considered as shown under Section 00204.D.1.B., except where specifically stated otherwise.

Question 12: Section 00453 outlines the requirements of the Disadvantaged Business Enterprise (DBE) Program. Can WMATA provide a current 2004 DBE Program Directory?

Answer: For copies of the DBE Directory, please contact the Office of Civil Rights at (202) 962-2384.

Question 13: Section 00724.A. requires that the Design-Builder submit a schedule to the Authority 15 days after the award of the Contract. Based on the fact that the Proposers have to submit a detailed proposal schedule and that the project is a Design-Build project, the design will not have progressed far enough to provide another more detailed schedule within 15 days of Contract Award. Could this requirement be revised to require the Design-Builder to submit a baseline schedule within 15 days of the 60% design?

Answer: Yes. The updated detailed schedule can be submitted with the 60% design submittal.

Question 14: Section 00749 E. indicates that the "Authority will allow as an element of work accomplished, i.e., progress towards completion, only 50 percent of the invoiced cost of materials or equipment delivered to the site, or suitable location as described in paragraph D above, but not incorporated in the construction up to the time the materials or equipment are actually incorporated into the work." These projects have very large amounts of major equipment that have a long fabrication and delivery lead time. The manufacturers of these large equipment packages will not agree to only being paid 50% of the material price until installed. Can this requirement be relaxed to allow the manufacturers of the large packages of equipment to be paid for material actually fabricated, but not yet incorporated into the work, in full?

Answer: Authority regulations generally do not permit the use of "Advance Payments" for work not performed. In some cases, a request can be made by WMATA to the Federal Transit Administration (FTA) for an exception based on sound business reasons providing that adequate security for such advance payment is obtained. However, the granting of this exception by FTA cannot be guaranteed.

Question 15: Section 01110.1.04.a.3. indicates that the construction of the Brentwood shop main floor must be coordinated with WMATA so that disrupted maintenance functions at Brentwood can be accommodated at other WMATA facilities. It also states that this may result in delayed access to the main floor until other facilities, e.g., Greenbelt, are available. Section 00825 indicates that the Greenbelt Yard has an interim completion milestone of 765 calendar days after NTP and that the Greenbelt/Shady Grove Yards Project has a milestone of 825 calendar days after NTP. Is it the intent to have all of the work at the Greenbelt Project site complete within the 765 calendar days or only a portion complete so work at the Brentwood shop level can begin? Since the Brentwood project will be awarded separately and possibly to a separate Design-Builder from the Greenbelt/Shady Grove project, how will the scheduling and coordination of getting Greenbelt ready to accept the equipment from Brentwood be handled?

Answer: It is WMATA's intent to award one or more contracts from RFP FN5008/FMP. For this reason, it is possible that the two projects could be awarded to a single Design-Builder and/or to separate Design-Builders. WMATA's primary concern during construction of each of these projects is continuity of service at the affected

facilities. Brentwood Yard is being modified to allow it to be converted from a heavy truck and wheel maintenance facility to an inspection facility and Greenbelt is being modified to accept the heavy truck and wheel maintenance functions from Brentwood. In order to ensure that continuity of service is maintained, it will be necessary for certain areas at Greenbelt to be completed before work on the Brentwood main shop floor can proceed. Should a single contract be awarded, the Design-Builder will be responsible for coordinating all work with the Authority and developing a construction schedule that indicates compliance with this restriction. Should separate contracts be awarded, the Design-Builder for the Brentwood project is advised of these restrictions on work performance. It is recognized that the Design-Builder for the Brentwood project will have no direct responsibility for the Greenbelt project, however, they will be expected to coordinate their work efforts with the Greenbelt Design-Builder through the Authority so as to ensure that operations at these facilities are not adversely impacted.

The interim milestone shown in Section 00825 for Greenbelt Yard refers to work in the Yard only, not the entire Greenbelt Project. Currently there is no requirement for the Design-Builder to transfer equipment from Brentwood to Greenbelt. Should such be required, it would be treated as a change to the contract subject to equitable adjustment.

Question 16: Section 01112, Section 16900. In the past, WMATA has required that the Train Control Equipment Manufacturer be the Designer of Record for the system. Is it WMATA's intent on these projects to have the Train Control Equipment Manufacturer be the Designer of Record for the Train Control System?

Answer: Yes, the Train Control Equipment Manufacturer must be the Designer of Record for the Train Control System.

Question 17: Section 01330.1.03.A. requires that a preliminary submittal list be provided for Authority approval at the Pre-Design-Build Conference within 10 calendar days after the Award of the Contract. This requirement does not seem to be realistic for a Design-Build project since the actual design of the project will have just begun. In addition, Section 01330.A.1 requires that a Contract Documents Submittal Log be provided within 60 days of NTP. Can these requirements be relaxed to more accurately reflect these requirements for a Design-Build project?

Answer: The time requirements cited apply to submittal of design documents only and therefore will not be relaxed. The log of construction submittals should be submitted prior to the start of construction on a date to be determined by the Authority Representative and the Design-Builder.

Question 18: In reviewing the RFP, it became apparent that there were some copying problems that caused entire sections to be improperly copied. Can WMATA provide corrected copies?

Answer: Yes. Reissued RFP documents for Book 1 (Divisions 0 and 1) will be issued to all

Phase II participants as soon as possible.

Question 19: Section 00204.D.3.B. indicates the Key Personnel that must be included in the Technical Proposal. Section 01111.1.05 also provides a list of key personnel which is different from the list provided in Section 00204. Are the only personnel that need to be listed in the proposal the Key Personnel listed in Section 00204?

Answer: Section 00204 refers to Key Personnel whose qualifications will be evaluated as part of the Technical Proposal submitted by the Design-Builder. Section 01111 includes additional key personnel that must be included for the project and shown on the project-specific organizational chart but whose qualifications are not part of the technical evaluation with the following exceptions for which the descriptions are synonymous: Project Manager and Overall Program Manager; Design Manager and Design Engineering Manager; Superintendents and Construction General Superintendent; Quality Control Manager and Quality System Manager for QA/QC.

Question 20: Item B.2 of the Architectural Program Criteria for Shady Grove indicates that a new 15 ton overhead crane is to be installed at the truck repair hoist area. On sheet A16-A-02 this bridge crane is indicated as a 3 ton bridge crane. In addition, Section 1.06.D.8 indicates that a 3 ton bridge crane be provided at Shady Grove. Please confirm whether a 15 ton bridge crane or a 3 ton bridge crane is required?

Answer: A 15-ton bridge crane is desired at Shady Grove.

Question 21: Item B.3 and B.4 of the Architectural Program Criteria for Shady Grove indicates that we need to provide adequate bathroom facilities on the ground floor to accommodate the maximum number of men and women working on the day shift. Item C.1 and C.2 of the Architectural Program Criteria for Shady Grove indicates that we provide adequate lockers and benches in the locker rooms for the maximum number of men and women working in one shift. Please provide an approximate maximum amount of the men and women who work on the day shift so these areas be adequately sized and accommodated.

Answer: Currently there are approximately 110 employees at Shady Grove. Expect number of employees to increase by 70 to a total of 180 when the shop addition is operational. Woman's locker room has excess capacity now and will not have to be modified. Men's locker room has approximately 70 permanent lockers and 40 temporary lockers. Based on current gender mix and type of work to be performed, great majority of new employees will be male. Therefore, the full compliment of 70 new employees should be accommodated in the men's locker room. In addition the approximate 40 temporary lockers shall be removed and replaced with permanent lockers.

Question 22: Section 01110.1.04.A.4.a.(2) and b.(1) indicate that the heavy truck and wheel maintenance functions are to be relocated from Brentwood to Greenbelt as directed by the Authority. Is the Design-Builder responsible for relocation of equipment currently being utilized at Brentwood to the Greenbelt location?

RFP FN5008/FMP - Amendment 001

METRO MATTERS

Design/Build: Rail Yards Expansion Project at Brentwood, Greenbelt, and Shady Grove Yards

Answer: No. This is provided for information purposes only to indicate the intent of the Authority. Should any equipment need to be moved from Brentwood to Greenbelt it will be accomplished by the Authority.

Question 23: Section 01113.1.06.C.3.b. indicates that the Final 100% Systems Integration Design shall include "written disposition of the 90% design review comments", however, there is no reference to a 90% submittal requirement. Please clarify.

Answer: Revise Section 01113.1.06.C.3.b to read "60%" in place of "90%" as shown.

Question 24: Section 01115.1.02.B. and C. indicate that these documents are "To be provided prior to award". Are these documents to be provided by the Design-Builder as part of the Technical Proposal or by the Authority?

Answer: These documents will be provided to the Design-Builder by the Authority prior to award.

* * * * END QUESTIONS AND ANSWERS * * * *

SECTION 10600

STORAGE RETRIEVAL SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

- A. The general extent and scope of work to be performed under this Section consist of the furnishing and installation of a storage and retrieval system in the new Component Parts Storage rooms at the Greenbelt Annex and the Shady Grove Shop. The existing storage and retrieval system in the Greenbelt Shop may be dismantled and reused in the Shady Grove Shop with modifications as necessary to generally conform to the requirements of this specification.
- B. The provisions of Section 11001, Equipment General Requirements, apply to work of this Section.

1.02 QUALITY ASSURANCE:

- A. Experience: Equipment shall be produced by a manufacturer of established reputation with a minimum of five years experience supplying specified
- B. Reference Standards:
 - a. ANSI - American National Standards Institute.
 - b. OSHA - Occupational Safety & Health.

1.03 SUBMITTALS:

- A. Submit the following for approval in accordance with the requirements set forth in General Conditions and with the additional requirements as specified for each:
 - 1. Certificates: Fourteen days prior to shipment, submit four copies of certification that equipment to be delivered is in compliance with applicable codes.
 - 2. Shop Drawings: In accordance with the requirements of Section 01330; Design Construction Submittal Procedures, submit six copies of complete shop drawings to the Authority for approval, including but not limited to:
 - a. Equipment arrangement
 - b. Equipment outline dimensions
 - c. Assembly and subassemblies
 - d. Air systems
 - e. Wiring diagrams and schematics
 - f. Installation
 - 3. Operations and Maintenance Manual: Submit in accordance with the requirements of General Conditions, Section 001780; Closeout Submittals.
 - 4. Operations and Maintenance Training: Submit in accordance with requirements of General Conditions, Section 01820; Demonstration and Training, and Section 11001; Equipment General Requirements.

5. Contract Record Drawings: Submit in accordance with the requirements of General Conditions, Section 01330; Design Construction Submittal Procedures, and Section 01780, Closeout Submittals.

1.04 DELIVERY, STORAGE, AND HANDLING:

- A. Ship equipment upon notification by the Engineer.
- B. Package, handle and store to prevent damage.

1.05 WARRANTY:

- A. Furnish warranty for the work in this Section in accordance with the General Conditions.

1.06 TRAINING PROGRAM:

- A. Design Builder is responsible for training as outlined in General Conditions, Section 01820; Demonstration and Training, and Section 11001; Equipment General Requirements.
- B. Number of Personnel to be Trained and class size:

Level of Training	Approximate Number of Individuals to be Trained	Maximum Class Size	Minimum Number of classes
Level I	8	8	1
Level II	4	4	1

PART 2 - PRODUCTS

2.01 STORAGE RETRIEVAL SYSTEM:

- A. General: This specification covers a storage retrieval system employing 1) integral lifting forks mounted on top of 2) variable location racks which accept 3) removable steel pallets. It includes the physical and mechanical requirements of that equipment, as well as the engineering assistance to be supplied by the vendor.
- B. Features and Construction
 - 1. Storage racks
 - a. The storage rack shall have a maximum capacity of 25,000 pounds per section and 50,000 pounds per bay.
 - b. The overall height of the storage rack shall be 13'-0".
 - c. The clear opening between columns shall be 1 ½" greater than the pallet width.

- d. The overall depth of each rack shall be 1 ½" greater than the pallet depth.
2. Columns
- a. Columns shall be accurate and straight.
 - b. Columns shall be 13'-0" long.
 - c. Roll formed front columns shall be a minimum of 3 ½" wide (left to right) by a minimum 2 ½" deep by a minimum 12 gauge thick steel and shall rest on a 5 ½" by 8" (minimum of 44 sq. in.) Bearing pad.
 - d. Formed rear columns shall be a minimum 7-7/8" wide (left to right) by a minimum 2-5/8" deep by a minimum 10 gauge steel and shall rest on a 5 ½" by 8" (minimum of 44 sq. in.) Bearing pad.
 - e. Each bearing pad shall be anchored to the floor with a minimum of two ½" diameter expansion anchors.
 - f. Each bearing pad shall have a minimum ½" diameter leveling screw, independent of the anchors, with a vertical adjustment of 5/16" minimum.
 - g. Each column shall have pallet retainer notches spaced a maximum of 3-7/8" on center.
 - h. The notches on the front columns shall be hooked for positive pallet engagement, while the notches on the rear columns shall be designed to facilitate loading and unloading without resistance or snagging.
 - i. Column spacing shall be a maximum of 5" on center greater than the pallet width.
3. Bridge Assembly
- a. The bridge assembly shall run on rails mounted lengthwise on the top of the storage rack and shall support the trolley and mast assemblies free and clear above the floor.
 - b. The bridge shall be constructed of rectangular welded box construction using 6" x 12 pound/ft wide flange beam construction and shall be capable of supporting 2,000 pounds live load.
 - c. The bridge wheels shall be 9" diameter double flange type with needle roller bearings with pressure grease fittings.
 - d. A rail sweep shall be mounted in front of each wheel for derailment protection.
 - e. Bridge shall have a cantilevered extension at one end.
4. Trolley Assembly
- a. The trolley assembly shall run on four wheels inside the flanges of the bridge beam and shall support the mast assembly.
 - b. The wheels shall be a minimum 5" diameter flange-less wheel with permanently lubricated ball bearings.

- c. The trolley must be capable of supporting 2,000 pounds live load and shall be constructed of integral flanged steel plate to prevent binding of the turntables.
 - d. In addition to the load bearing wheels, four stabilizing bearings shall be used to keep the trolley aligned within the bridge.
 - e. Multiple trolleys shall be provided to serve all aisles.
5. Rails
- a. The rails shall be constructed of a minimum 20 pound per yard ASCE steel.
 - b. The rails shall be mounted with sufficient accuracy to provide a smooth riding runway and must be capable of supporting the weight of the bridge, trolley, mast assemblies, and a 2,000 pound load.
 - c. Rails shall terminate with stops capable of restraining a fully loaded bridge/mast assembly.
6. Mast Assembly
- a. The mast shall be constructed of two 6" minimum steel channels connected by ladder type truss members and shall be mounted to the trolley with a 360 degree continuous rotation turntable.
 - b. The turntable shall be a ball bearing type and capable of free rotation when carrying a 2,000 pound load.
 - c. The rollers supporting the fork mounting plate assembly must operate inside the channels on high strength machined rails.
 - d. There shall be sufficient rollers to keep the fork assembly square and stable as it is raised and lowered by the chain hoist.
 - e. The mast shall be provided with a positive stop lock mechanism to prevent free-fall of the fork assembly in case of hoist chain breakage. The mechanism must restrain the free falling load in 3/4" travel or less.
 - f. Mast operating handles shall be mounted outboard of the mast for ease of rotation and shall be shrouded to prevent operator injury.
 - g. A minimum of 1/4" thick Plexiglass viewing window that is a minimum of 17" square shall be located in the mast at eye level.
 - h. A protective canopy and a trolley stop shall be provided over the operator for operator safety.
7. Forks
- a. The forks shall be mounted, adjustable for pitch and width, and have a 2,000 pound capacity measured 21" from the root.
 - b. The forks shall be minimum 4" wide by 1 1/4" thick by a minimum of 1" less than the depth of the pallet.

8. Pallets
 - a. Steel pallets shall be capable of holding 2,000 pound uniformly distributed load.
 - b. The pallets shall mate with the racks and be adjustable using the forks of the mast assembly described above.
 - c. The pallets shall be a minimum of No. 16 gauge steel and shall be reinforced with three to five "v" supports running left to right or perpendicular to the forks.
 - d. The pallets shall have two-way (front to back) entry with enclosed fork guides on the front and shall have hooks at the front to provide self-centering engagement on the front columns.
 - e. Provide 5 pallets per individual storage section. Design Builder to verify total number of pallets prior to shipping. Pallets shall each have a back lip 1 ½" high and a magnetic label holder.
9. Tub Kits
 - a. A tub kit shall consist of four sidewalls which can be attached to a pallet to form a tub.
 - b. Each tub shall be designed such that it can be divided into four equal size compartments using one partition (running back to front) and two dividers (running left to right).
 - c. Sidewalls, partitions, and dividers shall be a minimum No. 14 gauge steel.
 - d. Provide six tub kits, each with a wall height of 8 3/4".
10. Electrical Operation
 - a. Each mast and trolley/bridge system shall be provided with an electrically operated hoist capable of raising and lowering a 2,000 pound load at a speed of 16 feet per minute.
 - b. The hoist shall have a 1 HP motor and shall be dual voltage with electrical characteristics: 208 volt, 3 phase, 60 hertz, or 460 volt, 3 phase, 60 hertz. The hoist shall be wired for 208 volt, 3 phase, 60 hertz for this project. All 115V power requirements for controls and lights shall be provided through a step-down transformer.
 - c. The hoist shall be provided with a mechanical load brake (positive-stop type) connected to the load sheave, a solenoid-operated springset multiple disc-type motor brake, and an overload limiting clutch (wet cone type) located in the hoist transmission.
 - d. An insulated four bar power system and sliding power collector with replaceable shoes shall be provided to supply the electrical power to the trolley/bridge as specified above. Three of the bars shall supply power and the fourth bar shall be ground.

- e. Up/down controls operating with 115V control circuit shall be by push-button and located on the mast assembly convenient to a standing operator.
 - f. The system shall have a key-lock power on/off switch. The key shall not be removable in the ON position. All key-lock power switches shall be keyed alike.
 - g. Two 150 watt minimum reflector type flood lights shall be mounted on the trolley/bridge to provide in-use illumination. The lights shall operate on 115 VAC.
 - h. The light control shall be integral with the on/off switch such that the lights are on when the system is on.
 - i. Electrical components of the system shall conform to the applicable standards of UL and NEMA. All items of the same type and rating shall be identical.
 - j. All electrical wiring shall conform to the standards of the National Electric Code and applicable UL standards.
 - k. Protective insulated bushings shall be provided at all places where wiring passes through openings in metal panels and frames.
 - l. All electrical connections shall be suitably supported to prevent breakage and other damage.
 - m. Wiring shall be coded so that each wire can be easily identified from maintenance manuals, wiring schematics, and other documentation.
11. Safety Mesh
- a. Safety Mesh shall be provided to cover the rear of the individual storage bays and the open ends.
12. Finish
- a. Color shall be manufacturer's standard blue for the storage support structure; green for the pallets and safety yellow for the mast.
 - b. All painted surfaces shall be cleaned and iron phosphated and shall be coated with enamel and backed in accordance with supplier's directions.
 - c. The finish shall level out to produce a smooth, uniform surface without runs, wrinkles, grit areas of thin film, and separation of color.
13. Manufacturer
- a. Specifications are based on equipment identified herein by Manufacturer's name and model, and shall serve as the basis for determining acceptable standards of quality, performance, workmanship, construction and minimum features. Storage and retrieval System as manufactured by:

Stanley Vidmar
 11 Grammess Road
 Allentown, Pennsylvania 18103
 Telephone: (215) 797-6600;

or approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install equipment specified herein in strict accordance with the approved shop drawings and manufacturer's installation instructions.
- B. Install material storage units at locations indicated on the approved Design and Shop Drawing following installation procedures recommended by the manufacturer. Provide mounting hardware as required.

3.02 FIELD QUALITY CONTROL:

- A. Provide the services of a qualified manufacturer's representative to perform the following:
 - 1. Supervise installation.
 - 2. Supervise testing, in the presence of the Engineer to ensure proper operation of the equipment.
 - 3. Provide instruction to the Authority's personnel in the proper operation and maintenance of the equipment.

AMENDMENT NO. 2

TO

METRO MATTERS - Design/Build: Rail Yards Expansion Project
at Brentwood, Greenbelt, and Shady Grove Yards

Phase II - Request for Technical / Price Proposals

CONTRACT NO. FN5008

TO WHOM IT MAY CONCERN:

The proposal documents accompanying solicitation RFP-FN5008/FMP are hereby changed in part as follows:

1. The date established for Receipt of Proposals is hereby extended to **February 18, 2005**.
2. Proposers are hereby notified that an Amendment is to be issued shortly which will add an Option for the Expansion of the Alexandria S & I Rail Yard and Shops located at 3201 Eisenhower Avenue, Alexandria, VA 22314-4548. The scope of the Option will add 12 inspection and maintenance bays, extend two existing blow-down pits to support married pairs, trackwork, and expansion of the Shop area consistent with those to be performed at Shady Grove. This Amendment will include an Appendix to the Project Manual incorporating all relevant information, such as: specific evaluation criteria, conceptual design, geotechnical information, contract drawings, etc.. The Alexandria Rail Yard Project will be evaluated in conjunction with the Greenbelt / Shady Grove Project on a "Best Design / Fixed Price" basis. The exercise of the Option is predicated on receipt of funding, Board approval, and environmental clearances. The Option may be exercised at any time by the Authority within 365 calendar days of the Contract Award for the Greenbelt / Shady Grove Project.
3. Proposers should send e-mails to fpohlmann@wmata.com with copies to jtriole@wmata.com and wlinde@wmata.com should they desire to schedule Site Visits for Alexandria.
4. WMATA's responses to some of the Proposer's Questions raised since December 15, 2004 are attached. Additional responses will follow by separate Amendment.

5. The following additional companies have expressed an interest in providing their services for this Project:

Company	Rochester Signal, Inc.	Dynatran, Div. of Dynalectric Co.
Address	3505 Butler Street Pittsburgh, PA 15201	22930 Shaw Road, Suite 100 Dulles, VA 20166-9448
Contact Person	Jay Viraq, Director of Engineering	Bill Smith, Project Manager
Phone No.	(412) 687-6820	(703) 742-3796
Fax No.	(412) 687-6821	(703) 742-3592
E-mail	jviraq@rochestersignal.com	wsmith@dynalectric-dc.com
Specialty	Signal circuit design and detail; manufacturing and wiring management; systems testing and integration	Communications

6. Attached please find a separate Listing showing the additional information provided with this Amendment.

ACKNOWLEDGMENT

Offerors are required to acknowledge receipt of this amendment in writing on the Proposal Form in the space provided or by separate letter or telegram prior to the date established for receipt of proposals.

William O. Linde, Jr.
 Contracting Officer
 Office of Procurement and Materiel

January 13, 2005

QUESTIONS AND ANSWERS

Note: For ease of reference, WMATA has indicated the Question Number as received from the Design-Builder in parentheses at the end of each question (ex. DB Ref. 22).

Question 1: Section 00204.D.1.A requires that the Proposers address certain situations at each of the sites. Item #5 of the Shady Grove site indicates that the construction of the blow down pit must occur between the months of March and September. Item #7 suggests that it is WMATA's intent to have the construction of the blow pit completed in the least amount of time. Section 00103 indicates that the Projected Award Date is March 21, 2005. Considering the award date, the anticipated design timeframe, permitting process timeframe, and construction time for the blow pit, it appears that the blow pit construction would not occur until Calendar year 2006. Will WMATA relax the constraint of only working on the blow pit during the months of March through September so the construction of the blow pit can be completed as expeditiously as possible? (DB Ref. 22)

Answer: The constraint of only working on the blow pit during the months of March through September is hereby removed. Primary focus is to get the blow pit work completed in the shortest time frame possible.

Question 2: During our site visit to the Shady Grove site, we identified that water was infiltrating into the Switchgear Room through the electrical conduits feeding the panels from the bottom. It appeared that the water had been infiltrating through the conduit for an extended period of time. Is it WMATA's intent for the Design-Builder on this project to correct the water infiltration? (DB Ref. 23)

Answer: Yes it is WMATA's intent for the Design-Builder to correct the water infiltration problem in the Shady Grove AC Switchgear Room. Refer to Electrical Program Criteria 1.04.B.3.b.(4).

Question 3: During our site visit to the Brentwood and Greenbelt sites, we had discussion concerning the equipment that is identified in the RFP at Greenbelt. Several areas of the Architectural Program Criteria at Greenbelt states "Install existing Brentwood and/or Greenbelt equipment and/or procure and install new equipment ...". The Fixed Equipment list for the Greenbelt Site on sheets M1210-054 through M1210-058 of the RFP drawings indicates that all equipment will either be new or existing from the existing Greenbelt S & I shop. During our site visits, we were informed that we will not be required to relocate any of the equipment from the Brentwood Shop to the Greenbelt shop.

Please verify that all equipment to be provided at the Greenbelt shop will be either new or relocated from the existing Greenbelt shop as identified in the Fixed Equipment list and that all references in the Greenbelt Program criteria to existing equipment from the Brentwood shop will be removed. (DB Ref. 24)

Answer: For purposes of this contract, all Greenbelt equipment will either be new or relocated from the existing Greenbelt Shop. Major Shop Equipment items are identified in Item 3 of Schedule A in the Price Schedule. All other new Greenbelt equipment is considered Minor Shop Equipment. A \$1.5 M allowance is provided for the Minor Shop Equipment in Schedule C of the Price Schedule. WMATA will select those items of Minor Equipment to be furnished and installed by the Design-Builder.

Question 4: Section 00825.A.2.b indicates that the Final Completion of the Brentwood Yard Project shall be NTP + 910 Calendar days. Sheet M1210-157 of the Brentwood RFP Drawings lays out the suggested staging sequence for this site. Items 1 – 4 of this staging plan generally details what work can be accomplished at this shop prior to getting the Greenbelt Shop work completed. Is it WMATA's intent to issue the NTP for the Brentwood project at the same time the NTP for the Greenbelt and Shady Grove project, or is it the intent to award the NTP for the Brentwood project at a later date based on the progress of the Greenbelt shop? If it is the intent to award the Brentwood project at the same time as the other project, than the milestone schedule only allows for either 85 calendar days after the completion of the Shady Grove/Brentwood Project or 145 days after the completion of the Greenbelt Yard project. This timeframe is unrealistic for the renovation of this facility. Please clarify the intent. (DB Ref. 25)

Answer: On reviewing construction schedule developed by WMATA, interim completion for Greenbelt Yard should be 599 cd's not 765 cd's.

Question 5: The attached list of equipment is shown on the Fixed Equipment List on sheets M1210-054 through M1210 – 058 of the Greenbelt site as being removed from the existing Greenbelt facility, but the final location is indicated as "To Be Determined". Is it the intent for this equipment to be relocated in the existing Greenbelt Shop, New Greenbelt Annex, Other location within the WMATA system or be demolished? (DB Ref.26)

Answer: All such equipment will be relocated within the Greenbelt site.

Question 6: During our site visits to the three shops, we were informed that all other equipment and/ or materials in the shops not identified on the equipment lists to be removed would be removed by WMATA personnel prior to work beginning at the sites. Please confirm that the Proposers are not responsible for removing any equipment and/or materials not identified to be removed on the equipment list. (DB Ref. 27)

Answer: It is confirmed that the Proposers are not responsible for removing any equipment and/or materials not identified to be removed on the equipment list.

Question 7: During our site visit to the Brentwood shop, we were informed that all of the existing coaxial cable running throughout the shop basement could be demolished

and not replaced as it was no longer being used. Please confirm that the Proposers are not responsible for rerouting and replacing existing coaxial cable in the Brentwood shop basement. (DB Ref. 29)

Answer: Proposers are not responsible for rerouting and replacing existing coaxial cable in the Brentwood shop basement.

Question 8: The site drawings for the Greenbelt shop show the new forklift aisle outside of the existing Greenbelt shop turning the corner at the existing Loading Dock adjacent to the existing Component Parts Storage Room. During our site visit to the Greenbelt shop, we were informed that the forklift aisle should only extend to the existing curb, where a curb cut will be installed and not around the corner to the existing loading dock. Please confirm that the above indicates the actual direction for the forklift aisle. (DB Ref. 30)

Answer: Forklift aisle should extend to existing curb only and not around corner to existing loading dock. Curb cut shall be installed at curb.

Question 9: Note 6 on sheet M1210-324 directs the contractor to remove the existing below grade fuel tank (in front of the Shop at Shady Grove Yard). During the walk-through on December 16, 2004, the concrete pad above the fuel tank appeared to be relatively new. Can WMATA provide the size and capacity of the existing fuel tank, and the as-built drawings of the installation? In addition, please clarify who will be responsible for removing the heating oil stored in the tank? (DB Ref. 34)

Answer: Design-Builder will be responsible for removing the heating oil from the tank. Capacity of fuel tank is 20,000 gallons. PDF file of as-builts for the Heating Oil tank replacement Contract FM6207, as well as available design drawings for the Day Tank Installation Contract is attached in CD format.

Question 10: The contractor has been directed to "relocate" two above ground glycol tanks at Shady Grove Yard. Please confirm that all components of the glycol tanks including all related piping is to be above ground. In addition, please confirm that the glycol tanks in their current location do not have any underground piping that needs to be abandoned and removed. (DB Ref. 35)

Answer: Regarding the existing tanks the only underground component is the electrical feed. The new tanks will similarly not have any underground piping except for the electrical feed.

Question 11: Please clarify whether the new salt dome must be in place and operational prior to dismantling the salt dome in its current location? In addition, please clarify who will be responsible for physically relocating the salt from the existing salt dome into the salt dome in its new location? (DB Ref. 38)

Answer: Whether the new salt dome has to be in place and operational prior to dismantling

the existing salt dome depends on the time of year. If between April and September can get by without salt dome. During other months of the year a salt dome must be operational. Design-Builder will be responsible for physically relocating the salt from the existing salt dome to the relocated salt dome.

Question 12: At Shady Grove Yard, the RFP requires that we relocate one diesel pump and one gasoline pump. It appears that the pumps are fed from underground fuel tanks located adjacent to the current location of the pumps. The utility drawings do not indicate any underground fuel lines leading from the tanks to the pumps. Does WMATA have an as-built drawing showing these underground fuel lines? In addition, the location of the existing underground fuel tanks is under where the new concrete service road. We cannot locate any requirement to relocate the fuel tanks in the RFP. Is it the intent to leave the fuel tanks in their current location and install new piping to the new pump locations? (DB Ref. 40)

Answer: PDF files for the as-built drawings for A-16a Shady Grove Service and Inspection Yard Contract 1A0161 showing tank and piping is attached in CD format. Refer to Drawings A16a-P-8, E-30, and M-12, 13 and 14. Possibility that piping has been modified. WMATA is checking on this. As far as relocating the fuel tanks, that will be determined by final design. Also included are the electronic files for as-built drawings from the A-16d Shady Grove General maintenance Field Base Contract 1A0164, B-5b Brentwood Major Repair Yard Contract 1B0051, and E-11a Greenbelt Service and Inspection Yard Contract 1E0111 for use and information.

Question 13: RFP Section 00100 Paragraph C (page 00100-4) states that WMATA will provide the complete approved design of track work for all 3 sites. Will WMATA also provide complete design for the Contact Rail, Contact Rail Gaps, and Contact Rail End Approaches? (DB Ref. 41)

Answer: Complete design does not include final designs for the Contact Rail, Contact Rail Gaps, and Contact Rail End Approaches. Design-Builder to provide

Question 14: RFP Section 00321.C indicates that the Authority has copies of previous Geotechnical information other than that provided in the RFP. Will WMATA please provide copies of the information listed in 00321.C? (DB Ref. 43)

Answer: Yes. Copies are included with this Amendment.

Question 15: Our copy of Figure 1 of the Phase II ESA Subsurface Soil Investigation (for Brentwood) performed by EEE Consulting dated September 29, 2004 does not include the entire site. It appears that it was an 11" X 17" page that was folded during copying. Can WMATA please provide a clean copy of Figure #1. (DB Ref. 44)

Answer: Yes. Copy is included in this Amendment.

Question 16: Please reference the new exit access aisle as shown on drawing M1210-226. Are these aisles to be painted and/or accented with perimeter painted lines? Is there a WMATA standard for Exit Access Aisles? Please clarify? (DB Ref. 45)

Answer: Markings for new exit access aisle to match existing aisle's markings.

Question 17: Please reference demolition general note 14 on sheet M1210-216. This note instructs the Design Builder to clean existing dust and debris from the building and work areas. Being that this machine shop has been well used, dust and debris exist at all levels. Our concern is that the Design Builder will be forced to clean the entire facility of dust and debris regardless of where the dust and debris originated from. Please clarify that the intent of this requirement only relate to the dust and debris generated by the operation of the Design-Builder and not the dust and debris created by the past and ongoing shop operations. (DB Ref. 53)

Answer: The Design-Builder is responsible to clean dust and debris that he generates.

Question 18: Please reference "New Work General" Note 6 on sheet M1210-216. This note instructs the Design Builder to level, fill and patch all existing floors. There are no limits or defined areas on the plans in conjunction to this general note. Is the intent to level, fill and patch the floor at all floor locations including basement, ground floor and mezzanine? Please provide more information and/or limitations to the extent of this work. (DB Ref. 54)

Answer: Design Builder is to fill and patch all existing floors within his work area and any other areas that are damaged by his operations.

Question 19: In Drawing Book 4, Drawing Number ST-S-021 (M1210-503), "Typical Bonding for Retaining Wall Detail", Note 5 states "Epoxy coated rebar and wire mesh shall not be electrically bonded". Can this stray current control philosophy apply to other structural elements, particularly new shop building foundations and floor slabs? If epoxy coated rebar is an acceptable means of isolation and is utilized, please confirm that collector bars, welded longitudinal rebar, and test stations are not required. (DB Ref. 55)

Answer: Refer to Specification Section 03200, Concrete Reinforcement, Article 3.05 Electrical Bonding. Paragraph B. states "No electrical bonding is required for epoxy coated rebars.

* * * * END QUESTIONS AND ANSWERS * * * *

Attachments/Enclosures:

Question 14: One (1) copy each of Previous Geotechnical Reports regarding soils in the vicinity of the proposed work. (Reference Specification Section 00321.C.)

1. Greenbelt Yard Consolidated Heavy Repairs
 - a. MRCE Report No. 228 - Contract 3Z7256- Greenbelt S & I Yard- Section E011a/c, Greenbelt Route Supplementary Subsurface Investigation, March 25, 1991.
 - b. MRCE Report No. 229 - Contract 3Z7256- Greenbelt S & I Yard- Section E011a/c, Greenbelt Route Supplementary Subsurface Investigation, July 30, 1991.
2. Brentwood Shop Expansion
 - a. MRCE Second Supplementary Report - Modification No. 5 - Contract No. TAC 20-68-E - East Coach Yard Buildings - Subsurface Investigation, April 9, 1969.
 - b. MRCE Supplementary Report - Modification No. 6 - Contract No. TAC 20-68-E - B & O Route, East Coach Yard Buildings - Subsurface Investigation, May 13, 1969.
3. Shady Grove Shop Expansion
 - a. MRCE Report No. 147 - Contract Mod. No. 3Z725M-012- Section A016a - Rockville Route - Subsurface Investigation, May 24, 1976.
 - b. MRCE Report No. 120 - Contract Mod. No. 3Z725K-022- Section A016a & A017 - Rockville Route - Subsurface Investigation, December 23, 1974.
 - c. MRCE Report No. 152 - Contract No. 3Z725N- Section A016b - Rockville Route - Subsurface Investigation, July 29, 1977.

Question 15: One (1) copy Figure 1 from the Brentwood Phase II ESA Subsurface Soil Investigation by EEE dated September 29, 2004.

Questions 9 and 12:

One (1) CD containing the following PDF files:

1. As-Built drawings for the Shady Grove Yard Heating Oil Tank Replacement Contract FM6207.
2. Design drawings for the Shady Grove Yard Day Tank Installation Contract.
3. As-built drawings for the A-16a Shady Grove Service and Inspection Yard Contract 1A0161.
4. As-built drawings for the A-16d Shady grove General maintenance Field Base Contract 1A0164.
5. A-built drawings for the B-5b Brentwood Major Repair Yard Contract 1B0051.
6. As-built drawings for the E-11a Greenbelt Service and Inspection Yard Contract 1E0111.

WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY
CONSTRUCTION CONTRACT RFP-FN5008/FMP

Serial Number: RFP-FN5008/FMP
Date of Issue: December 3, 2004
Proposal Due Date: February 18, 2005

WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY
600 FIFTH STREET, N.W.
WASHINGTON, DC 20001

January 27, 2005

AMENDMENT NO. 3

TO

METRO MATTERS - Design/Build: Rail Yards Expansion Project
at Brentwood, Greenbelt, and Shady Grove Yards

Phase II - Request for Technical / Price Proposals

CONTRACT NO. FN5008

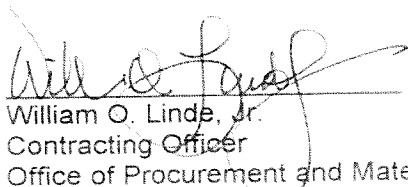

TO WHOM IT MAY CONCERN:

The proposal documents accompanying solicitation RFP-FN5008/FMP are hereby changed in part as follows:

1. The date established for Receipt of Proposals remains unchanged.
2. Update on issuance of Option for the Expansion of the Alexandria S & I Rail Yard and Shops: Amendment 4 should be issued next week. It will include a separate Proposal Submittal Date for the Option work.
3. WMATA's responses to some of the Proposer's Questions are attached. Additional responses will follow by separate Amendment.
4. Attached please find a separate Listing showing the additional information provided with this Amendment.

ACKNOWLEDGMENT

Offerors are required to acknowledge receipt of this amendment in writing on the Proposal Form in the space provided or by separate letter or telegram prior to the date established for receipt of proposals.

William O. Linde, Jr.
Contracting Officer
Office of Procurement and Materiel

January 27, 2005

QUESTIONS AND ANSWERS

Note: For ease of reference, WMATA has indicated the Question Number as received from the Design-Builder in parentheses at the end of each question (ex. DB Ref. 22).

Question 1: In the drawings for the Brentwood facility, we are unable to locate the new rooms B036 and B037, though they are discussed in the Architectural Program Criteria. Please clarify if these new rooms are required and direct us to more information on the proposed locations and design of these rooms. (DB Ref. 1)

Answer: Rooms B036 and B037 are identified in the Project Drawings, Book 2, Drawing B5-A09 (M210-224).

Question 2: On page 1 of the Architectural Program Criteria, paragraph 1.01.A.4 directs us to provide signage as shown on the "signage drawings". We have been unable to locate any signage drawings with our set of documents. Please provide us with the signage drawings described in this paragraph. The same paragraph also mentions a building identification sign (type 5). What is identification sign (type 5) as mentioned in this note? Are there signs required by code that are not mentioned in the specifications? Please verify that we are to provide signage as it relates to the new additions and that the Design/Builder is not responsible for any signage requirements in the existing facilities. (DB Ref. 2)

Answer: Design-Builder is responsible for signage as it relates to the new additions only. Informational signage drawings from the Branch Avenue Yard contract are provided in this amendment for guidance on signage criteria and types. Design-Builder is responsible for furnishing and installing all signs required by both WMATA and code.

Question 3: Paragraph 1.07.A.11 of the Architectural Program Criteria requires the design-builder to provide an inspection report, as well as patching of existing waterproofing system in the existing building basement. Does this requirement apply to the entire basement areas of each project location? Please clarify the intent and further define the scope of this requirement. (DB Ref. 3)

Answer: The intent is to provide protection from water infiltration where new work is to be performed. This includes foundations, pits, underground chases, etc.

Question 4: Is the latest WMATA approved method of stray current protection now being employed for elevators acceptable for the new elevators anticipated at each of the three (3) yards? (DB Ref. 4)

Answer: Yes. See Book 4, Drawing ST-ELEV-001 (M1210-501), and referenced DD drawings.

Question 5: At the Shady Grove shop, are drawings available showing the plan and profile of both the existing 78" and the existing 90" storm water sewer piping systems? If so, please provide. (DB Ref. 6)

Answer: Reference the A-16a Contract 1A0161 as-builts provided in Amendment No. 2

Question 6: What are the heaviest anticipated loads for the proposed elevated platforms adjacent to the Inspection Pit and Blow Pit areas? (DB Ref. 7)

Answer: Structural Program Criteria, Article 1.02.A.3.f. states the load to be used as the basis for structural design of the platform and pits is 250 psf.

Question 7: Can the elevator pits provided by the expansion program(s) be constructed with the standard WMATA grated pit for the use of a portable sump pump, or are permanent dedicated elevator pit sump pumps required as indicated in Mechanical Program Criteria 1.11.H.1? (DB Ref. 9)

Answer: Permanent dedicated elevator pit sump pumps are the local code requirements. The elevator pits are unattended structures and in the case of hydraulic elevators, the discharge from the sump must be routed through an oil separator before being finally discharged into the city storm drain system.

Question 8: In the Architectural Program Criteria, paragraph 1.02., Codes, Regulation, Reference Standards and Specifications, paragraph L, three locations refer to code review agencies and requirements. Specification section 00102.3.J notes that code related discussions have been conducted with the three jurisdictional agencies. Are the notes/minutes/results of meetings/contacted persons and other design criteria agreed upon available to the Design-Build teams? (DB Ref. 11)

Answer: Attached to this Amendment are:

- a. Minutes of November 22, 2004 meeting with PG County DPW&T and DER regarding Greenbelt,
- b. PB letters to District of Columbia Fire Department and Department of Consumer and Regulatory Affairs, both dated January 21, 2005 summarizing phone conversations regarding code compliance at Brentwood.
- c. MDE letter dated January 10, 2005 approving SWM concept at Greenbelt.
- d. Environmental Categorical Exclusions from signed January 11, 2005 by FTA with FTA cover letter dated January 14, 2005, for all three sites (Brentwood, Shady Grove, Greenbelt).

Additional meetings with Montgomery County and DC officials planned.

The Forest Stand Delineation and Forest Conservation Exemption Review

has been submitted to Maryland National Capital park and Planning Commission. Approved plans will be provided when received.

- Question 9: In specification section 00102.3.J, the proposer is required to submit for a building permit to the three jurisdictional agencies. Our contacts to date indicate that:
- a. there is a master agreement with Montgomery County Department of Permitting for WMATA to be their own permitting agent;
 - b. Prince Georges County asks for a "courtesy review", with no use & occupancy permit or fees required;
 - c. some Utilities require review and permitting;
 - d. MDE has site development authority at Shady Grove and Greenbelt, as stated in the RFP;
 - e. Question #3 of addenda #1 is noted; and
 - f. the requirement that the projects are to be built to the listed codes is acknowledged.

Please clarify in what areas WMATA has permitting authority, as some of the above information is inconsistent with the RFP and the ultimate permitting procedure can become a time component of the construction schedule. (DB Ref. 12)

Answer: Design-Builder should note that the Master Agreements with the local jurisdictions are over 30 years old and were based on the design-bid-build approach. Since this construction will take place by WMATA solely on WMATA property, building permits and use and occupancy permits are not required. However, County approvals for the fire protection systems and haul route are required. Refer to the November 22, 2004 minutes of meeting with Prince George's County, provided in the response to Question 8 above, for its requirements. An existing Use and Occupancy Permit does exist for the Brentwood Shop, so it can be assumed that, for now, a new or revised one will be required from DC. WMATA is attempting to clarify this. All affected utilities will require review and approval/permit from the utility's owner.

The Maryland Department of the Environment (MDE) has approval authority for erosion and sediment control measures and storm water management designs at both Shady Grove and Greenbelt. Overall site development authority lies more with the Maryland National Capital Park and Planning Commission (MNCPPC).

- Question 10: The following drawings are missing from Book 3 (Shady Grove) YA99-G-102 through 110 (9 sheets). Will the complete Train Control book of plans be issued for each of the locations? (DB Ref. 13)

Answer: Drawings YA99-G-102 through YA99-G-102 are attached as part of this amendment. Note that the information drawings are not intended to show all existing conditions; reference Specification Section 16911, Paragraph 1.03A. Complete set of Train Control Book of Plans will be furnished by the Authority to the successful proposer upon request.

Question 11: On all three (3) sites, please confirm that WMATA will remove the loose rails, small equipment, crates, trailers, etc from the scope of work limits. Please verify that the Design/Build Contractor will only remove/relocate the items noted on the drawings to be moved. If this is not the case, please provide us with detailed list(or drawing) denoting all of the materials/structures that are required to be relocated by the Design /Build Contractor. (DB Ref. 14)

Answer: It is assumed this question concerns areas outside the Shops, within the Design-Builder's limits of work. The Design-Builder will relocate the container and storage boxes within his limits of work to an accessible location within each Yard. Location to be acceptable to WMATA. WMATA will relocate loose materials such as rails, ties, third rail insulators. As this is still being coordinated within WMATA, additional information will follow on this issue.

Question 12: On all three (3) sites, please provide us with additional information pertaining to the movement/relocation plans for the current WMATA personnel. Which areas of the facilities are to remain fully operational at all times? (DB Ref. 15)

Answer: Refer to other responses. All areas not designated for turn over to the Design-Builder to remain operational. Design-Builder needs to be more specific.

Question 13: On all three (3) sites, please provide us with additional information (ie "as-builts") pertaining to any existing support of excavation systems that were installed (and possibly remained) during the construction of the facilities. (DB Ref. 16)

Answer: With the as-builts provided in Amendment No. 2, all available as-builts have been provided. Working or shop drawings that might show additional information are not available.

Shady Grove Shop Expansion

Question 14: At Shady Grove, drawing A16-A-09, note 13 references a "knock-out-panel". Has an existing masonry header beam and brick relief angle been provided at this knock-out panel? (DB Ref. 17)

Answer: This is an existing knockout panel with existing header support.

Question 15: Southwest of the proposed Blow Pit Expansion there is a slab with several manhole covers and monitoring wells. Please clarify what this is and provide us with "as-builts" as required? (DB Ref. 18)

Status: This was the location of the original fuel oil storage tank which was abandoned in place. Refer to Drawing A16b-M-61 (M369-204) in the as-built files previously provided. WMATA is currently scheduling to have the four monitoring wells grouted in February 2005.

Question 16: Are there any available documents that detail the existing drainage system in the Blow Pits? (DB Ref. 19)

Answer: Reference the A-16b (1A0161) as-built files provided. See Drawing A16b-M-10 (M369-153).

Question 17: Please provide us with "as-built" drawings for the installation of all of the existing underground storage tanks. (DB Ref. 20)

Answer: This information has been provided with the additional as-built drawings provided in Amendment No. 2. If there are other tanks in question, please be specific.

Greenbelt Yard Consolidated Heavy Repairs

Question 18: Reference drawing E11-A-14 on the Greenbelt project. Due to conflicts with the existing water main and existing sprinkler assembly piping, can the proposed new track and turntable at the Steam and Degreasing Room G108 be modified or deleted? (DB Ref. 21)

Answer: Yes. An amendment to the reference drawing will be issued modifying the current layout.

Question 19: Reference drawing E11-A-14 on the Greenbelt project. Can the limits of the proposed 5-ton bridge crane be modified to avoid mechanical, electrical, and plumbing conflicts North of column line 14? (DBE Ref. 22)

Answer: Yes, the limits of the 5-ton bridge crane can be modified. An Amendment modifying the referenced drawing will be issued.

Question 20: Reference drawing E11-A-11 on the Greenbelt project. Can the proposed track and turntable near column line F15 be relocated or deleted to avoid conflicts with the existing train controls, existing electric, and existing motor control centers? If not, where should these existing items be relocated? (DB Ref. 23)

Answer: Items cannot be relocated to the extent that would be beneficial. Suggest that the existing panels be located in a grouping with the new panels required for the new truck hoists.

Question 21: Please provide details for the existing site slabs at the South end of the yard, Area "K", where the storage tracks are being relocated. (DB Ref. 24)

Answer: Details provided in E-11a (1E0111) as-built drawing files provided in Amendment No. 2.

Question 22: At the Greenbelt project, can the grass area North of the existing salt dome be made available for the Design/Build Contractor's laydown/parking/office complexes? (DB Ref. 25)

Answer: No. The area adjacent to the storm water management pond bordered by the loop track and access road is an environmentally sensitive area and cannot be used.

Question 23: Please provide civil drawings of Area "N", if available. (DB Ref. 26)

Answer: Reference the E-11a as-built files provided in Amendment No. 2.

Question 24: For the duration of work inside the existing Greenbelt shop, does the Design/Build Contractor have complete unfettered access to all areas of work? Will all WMATA employees and equipment be completely vacated from Areas 4, 5, 6, 7, 8, 9, 10? Are there functions/equipment in Areas 4, 5, 6, 7, 8, 9, and 10 that must remain operational while the Design/Build Contractor is working in the existing Greenbelt shop? (DB Ref. 27)

Answer: Design-Builder will not have complete unfettered access to all areas of work at any time. Phasing will be required to ensure no disruption in critical activities. A detailed work plan will be required. Areas 8, 9 and 10 must be to a point of functionality before equipment can be moved from 5 and 6. An alternate lift area must be functional prior to working in Sections 5 and 6.

Question 25: Does the completion of the work in the existing Greenbelt facility have to be phased for WMATA use and occupancy? Please provide us with additional information pertaining to the movement/relocation plans for all of the current WMATA personnel who are currently occupying areas which are to be renovated. (DB Ref. 28)

Answer: Yes, work will have to be phased to ensure critical operations are maintained. See response to above Question 24. Proposer needs to be more specific.

Question 26: At the existing waste oil area, please define what equipment must be moved by the Design Build Contractor. (DB Ref. 29)

Answer: All equipment must be moved by the Design-Build Contractor.

Brentwood Shop Expansion

Question 27: Regarding the Brentwood Shop Expansion, please confirm that there will be no interim/phased occupancy of the project by WMATA. (DB Ref. 30)

Answer: As far as the shop area no interim/phased occupancy is contemplated. However, beneficial occupancy of the new/renovated office areas, lunch room and locker

rooms/restrooms shall be provided as soon as possible, prior to final completion of the Brentwood construction.

Question 28: Please confirm that all WMATA employees will vacate the entire Mezzanine level before the Design/Build Contractor commences work on the Mezzanine. (DB Ref. 31)

Answer: No, employees will not vacate the Mezzanine level. See response to Question No. 76.

Question 29: Regarding the Brentwood Shop Expansion, please define the existing equipment, services, functions, and areas that need to remain in operation to support the daily functions associated with the continuous operation of tracks 7, 8, and 9. (DB Ref. 32)

Answer: Tracks 7, 8 and 9 must be kept functional. All hoists and turntables along these tracks, the hoist equipment room in the basement, shop power, fire suppression, sprinklers, compressed air. Design-Builder should note that the air compressor cooling tower is located on the loading dock roof. Before this can be removed a replacement cooling tower must be in operation.

Question 30: Please confirm that all WMATA employees will vacate the entire Basement Area "1" level before the Design/Build Contractor commences work in this Area. For example rooms B011 to B023 are not modified by the Design/Build Contractor, but it is unclear if we are to maintain services and access to these areas or if they will be vacant. In addition, noisy and heavy structural demolition nearby would impact these rooms and could create a safety issue. (DB Ref. 33)

Answer: No, WMATA will not vacate the entire Basement Area "1". Services and access to the rooms not being modified should be maintained. See response to Question No. 75.

Question 31: Regarding the Brentwood Shop Expansion, the new freight elevator machine room is currently located in the footprint of the existing loading dock and ramp. Does the freight elevator need to be operational before the existing ramp is taken out of service? Can the proposed freight elevator machine room be relocated? (DB Ref. 34)

Answer: Yes, the new freight elevator needs to be operational before the existing ramp is taken out of service. Yes, the proposed freight elevator machine room can be relocated.

Question 32: Regarding the Brentwood Shop Expansion, since the train control tower remains operational during the entire shop expansion, how will the WMATA employees

access the control tower when stair #1 is out of service and the mezzanine structural modifications are being performed? (DB Ref. 35)

Answer: Reference to Stair #1 above should be existing stair #2. See Drawing B5-A-30 (M1210-245). In response to the question, access through the mezzanine offices will not be permitted for the temporary construction period or for the final configuration. Another means of access will be necessary. A permanent covered metal staircase outside the west wall of the building between column lines 1 and 3 is suggested with the upper landing and door at the location of the existing window between columns lines 2 and 3.

Question 33: Regarding the Brentwood Shop Expansion, will parking for construction workers be allowed on-site? (DB Ref. 36)

Answer: No.

Question 34: Regarding the Brentwood Shop Expansion, during the structural renovation of the mezzanine level, please confirm that the equipment in Train Control Room B204 must remain functional and accessible. (DB Ref. 37)

Answer: All train control equipment must remain functional and accessible.

Question 35: Please verify if there are any time restrictions on the removal of the existing wheel truing machine. (DB Ref. 38)

Answer: See response to Question 74.

Question 36: Are there any restrictions on duration of outage on track 11 to allow for the installation of the new pit/wheel truing machine? (DB Ref. 39)

Answer: Work should be accessed from the south end of the shop, leaving the north end of Track 11 available to WMATA. WMATA will give up use of the one truck lift on Track 11 between column lines 11 and 12 to facilitate construction for and installation of the new pit/wheel truing machine. Work must be done in as short a time frame as possible. A detailed work plan will be needed.

Question 37: Please provide a copy of the existing occupancy permit for the (Brentwood) S&I shop and clarification on which part of shop it covers. (DB Ref. 40)

Answer: Copy attached.

Question 38: Please confirm that all storage/equipment at the basement level will be removed by WMATA for the full length of building between column lines D & F at the start of construction. (DB Ref. 41)

Answer: Storage shelves and their contents in the Storage Room area will be removed by WMATA between column lines D&F. Design-Builder can begin removing wheel truing machine, elevator and two truck hoists at start of construction. See response to Question 74. For locker room/rest rooms and lunch room see Response to Question 75. Also see answer to Question 62. Other loose materials and equipment not identified on the fixed equipment list will be removed by WMATA.

Question 39: Please confirm that all equipment, in the areas of the Design/Build Contractor's scope, at the Ground level will be removed by WMATA. If not, please provide a comprehensive list of all equipment that the Design Build Contractor must remove/relocate. (DB Ref. 42)

Answer: Design-Builder is responsible for removing equipment items listed in Fixed Equipment Schedule.

Question 40: Please confirm that the traction power/train control/COMM are not isolated from the WMATA main line. (DB Ref. 43)

Answer: Confirmed.

Question 41: Will the existing hazardous storage shed in area "D" be relocated by WMATA? (DB Ref. 44)

Answer: Yes, WMATA will relocate the existing hazardous storage shed in area "D".

Question 42: Please note that the existing "Component Shop" will not fit in the designated double-wide trailer. Is the Design Build/Contractor to provide the equivalent square footage of the existing "Component Shop"? (DB Ref. 45)

Answer: Comparable area is required to house an arrangement where the component shop functions can be efficiently and effectively performed. Design-Builder shall determine minimum requirements for this and provide an area large enough to accommodate it, which may be larger than a double-wide trailer. Arrangement subject to the approval of WMATA

General Questions

Question 43: Please confirm that submittal approval for a typical item will apply for all three sites, if properly noted. (DB Ref. 46)

Answer: Submittal approval for a typical item will apply for all three sites, if properly noted. Details for "properly noted" to be approved by WMATA.

Question 44: Please confirm that all existing COMM that must be relocated or modified is currently sufficient and suitable for modifications/relocations. (DB Ref. 48)

Answer: Communications Systems at some of the Yards have no further expansion capabilities and will require new or supplemental systems. These issues are addressed in the specific yard requirements in Specification Section 16700, Scope of Work - Communications.

Question 45: Please verify that the Design/Build Contractor will not be required to refinish/repaint the existing construction (ie overhead framing, roof deck, columns, walls, utilities, etc) except where we tie in new work. (DB Ref. 49)

Answer: Verified.

Question 46: At Greenbelt, the existing Component Parts Storage (GE117, reference drawing E11-A-30) is full of existing shelving and other storage materials. The Fixed Equipment Schedule does not indicate that the GC is to remove any material from this area. Please verify that this material be removed by WMATA. (DB Ref. 50)

Answer: WMATA will move the parts and materials from the shelves in the existing storage room when the new storage room in the Greenbelt Annex is ready. Design-Builder to dismantle and remove shelving and other components of the Storage Retrieval System. Existing System may be salvaged and reinstalled in the new Shady Grove storage room.

Question 47: Please provide us with a sketch of the exterior loading dock area at the Greenbelt Annex that better defines the final layout of this area? Reference the Architectural Program Criteria, page 13 and drawing E11-A-17. (DB Ref. 51)

Answer: The concept for the exterior loading dock is illustrated in the Project Drawings, Book 1, Drawings E11-A-09 and E11-A-25.

Revise in its entirety project Manual, Book 2, Architectural Program Criteria, 1.03.C.2.R to read as follows:

"Component Parts Storage - 7200 S.F.; G128: Procure and install a component parts storage system comprising a combination of pallet rack shelving, cantilever rack systems, bin type shelving, secure shelving systems and vertical carousel shelving systems, as defined by WMATA. Secure the room with concrete masonry unit walls.

Ceiling finish is to be open to structure above. The wall finish is to be epoxy paint full height of CMU. The floor finish is to be epoxy paint on concrete substrate. Provide 6-inch diameter concrete filled steel bollards at both side of all overhead coiling doors and at room side of freight elevator. Provide adjacencies with direct access to freight elevator, clerk's office, supervisor's office, interior central corridor,

and covered receiving area. Provide exterior forklift access at the south exterior wall into the adjacent central corridor via a 12 FT. high x 12 FT. wide insulated coiling door with indirect connection to components parts storage area. Provide two (2) 12 FT. high x 12 FT. wide overhead coiling doors with adjacent man doors leading into adjacent internal central corridor. Provide a 12 FT. high x 12 FT. wide insulated overhead coiling door and adjacent man door at the northeastern exterior wall of the components parts storage room with direct access to the covered receiving area. The receiving area is a covered open elevated dock with protection on three sides. The dock area consists of 500 S.F. with one (1) pit type dock leveler with exterior dock bumpers at each side. Provide direct access from receiving dock area to grade."

Specification Section 10600, Storage Retrieval System, is being issued with this amendment.

Question 48: Does the leveler need any special requirements in order to interface with the rails at the Shady Grove loading dock? (reference drawing A16-A-09) Or, will a crane be required? (DB Ref. 52)

Answer: There are no special requirements and no crane is required.

Question 49: At Shady Grove, the rails from the new addition run through the knockout panel to the rails for track #6. Are any special provisions required to transfer items between the two sets of rails (i.e., turntable, or jib crane)? (DB Ref. 53)

Answer: There are no special requirements.

Question 50: At Greenbelt, we are to install three (3) 15-ton bridge cranes on the same set of rails in Areas 5-6 over G101 and G102. What is the span and travel of these cranes? How do these cranes interface with the existing crane in that area? (DB Ref. 54)

Answer: Both existing cranes to be removed. All new cranes to access the entire area (4, 5 and 6) and shall have perimeter sensors.

Question 51: At Greenbelt, we are to install two (2) 5-ton bridge cranes on the same set of rails in Areas 8-9 over G105. The Architectural Program Criteria (pages 8 & 9) says they should run from A-C and from 10-16. But drawing E11-A-14 shows the cranes stopping short of 16, at the edge of area G107. Please clarify. (DB Ref. 55)

Answer: The crane's limit will be prior to column line 15. Amendment drawings will be issued showing revision.

Question 52: At Greenbelt, the Architectural Program Criteria states that we are to retain and refurbish the bridge crane system currently in place over G107. Please verify that this refers to the two (2) 2-Ton bridge cranes by Virginia Crane. (DB Ref. 56)

Answer: This referenced criteria refers to the two (2) 2-Ton bridge cranes by Virginia Crane.

Question 53: At Greenbelt, the Architectural Program Criteria, page 12 when describing Area G125, it calls out for a 3-Ton bridge crane, but it references column lines 33-34, already covered by the crane mentioned for area G120. Area G125 is between lines 36-37, and no crane is indicated on the drawings above this area. Also, APC-32 and the Fixed Equipment Schedule both indicate there are four (4) total 3-Ton cranes in the Annex. Please confirm there is no crane required for area G125 between column lines 36 and 37. (DB Ref. 57)

Answer: No crane is required for area G125 between column lines 36 and 37.

Question 54: At Greenbelt, Item 1020 on the Equipment List (drawing E11-A-06) indicates 6 new Jib Cranes to be installed at the Annex, and to see the plans for locations. Only 5 cranes appear to be on the drawings with that label (rooms G117, G120 (x2), G125, G217). Please clarify. (DB Ref. 58)

Answer: The remaining cranes are located in G107 in the existing Greenbelt Shop. The Equipment List will be revised to reflect a total of seven (7) jib cranes.

Question 55: There are a number of equipment items shown on the "existing" plans that are neither shown on the new plans, nor listed on the Fixed Equipment Schedules. Are these items to be removed and "scrapped" by WMATA? Some of the items include the following:

@ Greenbelt: Items 507, 597

@ Brentwood: Items 8, 59, 60, 94, 116, 249, 289, 314 (DB Ref. 59)

Answer: All items referenced above are representations of space between equipment or not actual fixed equipment and should be deleted.

Question 56: Equipment Item 605 at Greenbelt is shown on the new drawings, but not listed in the Fixed Equipment Schedule. Please clarify what this item is. (DB Ref. 60)

Answer: Item was found to be an open space and was deleted.

Question 57: A number of items are listed in the Fixed Equipment Schedule as being installed in particular areas, but not shown on the drawings. Please provide us with a layout of these rooms with the following items:

Greenbelt Area G102: Items 231 through 278, and 515 to 517

Greenbelt Area G105: Items 279 through 284, and 524 to 525

Greenbelt Area G107: Item 542

Greenbelt Area G227: Item 353 (DB Ref. 61)

Answer: All layouts were intended to be visual aids with final location determined between

the Design-Builder and WMATA.

Question 58: Greenbelt drawing E11-A-18 shows the passenger elevator with two doors at the second level of the Annex. The drawing also indicates steps right beside the elevator going down to the elevated walkway to the main building. This would imply that the two doors from the elevator are actually at different elevations. Please clarify the stops and elevations of this elevator. (DB Ref. 62)

Answer: The passenger elevator in question is a three-stop elevator. The first stop is a front entrance door only at the elevation of the basement level. The second stop is a front entrance door on at the elevation of the elevated walkway. The third stop is a rear entrance door only at the elevation of the new shop second floor.

Question 59: At Brentwood, page 22 of the Architectural Program Criteria indicates to provide a three-stop freight elevator. We found the Basement and Ground Floor stops on the drawings. However, where is the third stop? (Passenger elevator on other side of building also has three stops, but that's because it services the mezzanine.) (DB Ref. 63)

Answer: The freight elevator in question is a three-stop elevator. The first stop is a front entrance door only at the elevation of the basement level. The second stop is a front entrance door on at the elevation of the existing ground floor level of the open shop area. The third stop is a rear entrance door only at the elevation of the new elevated receiving area.

Question 60: The Fixed Equipment Lists for all three sites depict many items (primarily at the Brentwood facility) which are indicated to be moved to "TBD". Please verify that the movement of these items will be by WMATA. (DB Ref. 64)

Answer: No. Movement of these items is to be by the Design-Builder. See response to Question 73.

Question 61: The Greenbelt Annex drawings show a large number of items which are labeled with text only, but no equipment labels. Are we responsible for providing these items? If so, please provide additional information. (DB Ref. 65)

Answer: Reference Drawings E11-A-16 thru 19. Drawings provide conceptual layouts showing functionality of shop only and may change as a result of final design. The "text only" equipment you refer to will be covered by the \$1.5M minor equipment allowance.

Question 62: The Brentwood existing drawing B5-A-24 shows a number of items in areas B029 and B030. The Fixed Equipment List indicates these items (as well as Item 377, not shown) to be relocated from these areas to a location "TBD". During the site walk it was stated that WMATA would clean out the basement prior to GC work at

Brentwood. Will WMATA be moving these items or not? If so, to where? (DB Ref. 66)

Answer: At the beginning of construction WMATA will have the basement area between column lines D and F cleared and other others areas as agreed upon for work to progress, except for the items on the fixed equipment list. Design-Builder responsible for moving items on fixed equipment list. Note that items in the Pneudraulics Shop B030 between column lines F and H will not be relocated at the beginning of construction. Pneudraulics Shop to remain operational until a replacement shop is provided and operational at Greenbelt or some other location. WMATA will direct the Design-Builder where to move the items in Corridor B029 at the beginning of construction.

Question 63: Note #6 on drawing M1210-386, states that "all existing floors shall be leveled, filled and patched". Please verify that this note only applies to floor areas within our scope of work limits, or areas which we disturb. (DB Ref. 67)

Answer: See response to Question No. 18 in Amendment No.2.

Question 64: Please clarify the security requirements inside the shop yards. In particular, what are the requirements for construction vehicles crossing the tracks. Are flagmen required? Who will provide the flagmen? Do they need special training? Do they need radios, or any other special equipment? (DB Ref. 68)

Answer: See response to Question No. 77. They will need whatever equipment a roadway flag person would normally use. As they WILL NOT be flagging trains, they will have no need for radios.

Question 65: We assume that the Design/Build contractor is not responsible to bring the entire existing facilities up to current code requirements (ie ADA, fire alarm, sprinkler, etc). Please verify that the Design/Builder's scope of work is limited to the immediate area of disturbance only. (DB Ref. 69)

Answer: It is not the intent to bring the entire existing facilities up to current code requirements. However, the Design-Builder shall ensure that the final product complies with code; and this may require some work outside his immediate area of disturbance. Design-Builder should refer to the Architectural Program Criteria Section 1.02, Codes, Regulations, Reference Standards and Specifications; and Code Analysis Drawings A16-A-01, B5-A-01 and E11-A-01. Design-Builder's code review and analysis are required before final determination can be made.

Question 66: In the specifications, book 1 - Section 00200-17 Article D.1.A.1.a - Shady Grove Site - Relocation of underground utilities. Considering the footprint of the building, new roadways, and new track construction, are other / additional manholes and/or ductbanks impacted? (DB Ref. 70)

Answer: The list of underground utilities provided in Specification Section 00204, Article D.1.A.1 is not intended as a complete list of underground utilities that will be impacted by program construction, but, as stated, identifies some design and construction challenges for the purpose of evaluating the Proposer's design solutions as part of the Phase II Technical Proposal Evaluation. There are other manholes and ductbanks which will likely be impacted, but how and to what extent will depend on the proposer's approach to design and construction. It is suggested that the Proposers thoroughly review project and as-built drawings provided and conduct site inspections as necessary to evaluate existing utility conditions.

Question 67: Please clarify the meaning of paragraph 1.01.C in Section 14100. The second sentence in the paragraph is confusing. Confirm the intent that all body supports (at both Shady Grove and Brentwood) shall have the capacity to raise and lower married pairs of cars. (DB Ref. 71)

Answer: Confirmed. Intent is that all body supports (at both Shady Grove and Brentwood) shall have the capacity to raise and lower married pairs of cars.

Question 68: During our site visit to the Brentwood shop, we noticed that the paint on the existing roof decking was separating from the roof decking through out the shop. Please confirm that the Proposers are not responsible for repainting the existing roof decking. (DB Ref. 28)

Answer: Proposers are not responsible for painting the existing roof decking.

Question 69: The Mechanical Program Criteria for heating the new shop expansion at Shady Grove (PROJECT MANUAL BOOK 2, page 9, Part 1.04A.3.b(2) states that the existing fuel oil fired boilers in the basement mechanical room shall be used to furnish the heating hot water supply and return for the new 16 bay maintenance shop. Please confirm that the existing boilers have sufficient spare capacity to provide the hot water required for space heating and for preheating the ventilation air in the new shop expansion area. PROJECT DRAWING BOOK 3 (Drawing A16-A-09) shows new architectural space identified for a new boiler room in the proposed new shop expansion area. This seems to conflict with the requirement to utilize the existing boiler plant for building heat in the expanded shop space. Please clarify WMATA's intent for heating the space in the new shop expansion. (DB Ref. 32)

Answer: The existing boiler has sufficient capacity for the existing facility plus the new blow pit expansion. The Boiler Room located in the Inspection/Repair Area is to be used to locate a new boiler that will heat the new expansion.

Question 70: Will there be any time constraints (i.e. hours of the day) on when demolition activities within the three shops can occur. This will apply to all operations using equipment such as air-hammers and concrete saws that produce excessive noise and potential vibration? (DB Ref. 39)

Answer: Shops operate 24 hours a day, seven days a week. Bulk of the people work day shift from 6:00 am to 3:00 pm., so most advantageous times for demolition are the off-shifts after 3:00 pm and before 6:00 am. However, work may be permitted any time of day. Noise, vibration fumes and dust from the Design-Builder's operations are all concerns and must be taken into account in a detailed work plan with abatement measures identified where needed. Any disruptive type activities shall be coordinated with Safety and Operations through the Authority Representative. The Design-Builder's operations must comply with the most stringent provisions of the occupational safety and health statutes and regulations of OSHA and the local jurisdictions and meet WMATA specified requirements.

Question 71: *Response provided in Amendment No. 2, Question No. 12. Have further information to be provided in Amendment No. 3.*

At Shady Grove Yard, the RFP requires that we relocate one diesel pump and one gasoline pump. It appears that the pumps are fed from underground fuel tanks located adjacent to the current location of the pumps. The utility drawings do not indicate any underground fuel lines leading from the tanks to the pumps. Does WMATA have an as-built drawing showing these underground fuel lines?

In addition, the location of the existing underground fuel tanks is under where the new concrete service road. We cannot locate any requirement to relocate the fuel tanks in the RFP. Is it the intent to leave the fuel tanks in their current location and install new piping to the new pump locations? (DB Ref. 40)

AM 2 Response: PDF files for the as-built drawings for A-16a Shady Grove Service and Inspection Yard Contract 1A0161 showing tank and piping will be provided on a CD. Refer to Drawings A16a-P-8, E-30, and M-12, 13 and 14. Possibility that piping has been modified. WMATA is checking on this. As far as relocating the fuel tanks, that will be determined by final design. (AM2, #12)

AM3 Addendum: Addendum to Response given for Question 12 in Amendment No. 2: Approximately ten years ago single wall fiberglass piping was replaced with double-wall fiberglass piping. Diesel lines should be in same location; gasoline lines may be somewhat different than what is shown in A-16a as-builts. As-builts for this new work could not be found. Will provide electronic files of design drawings.

Question 72: At the Shady Grove site, a portion of the existing Train Control and Communications duct bank runs in the footprint of the addition. It is likely that a large portion of the duct bank will need to be relocated. In reviewing sheets M292-270 through M292-278, it is apparent that the as-built drawings indicate the manhole locations and duct bank characteristics. However, the drawings do not indicate the direct burial path of the ATC cables from the manholes to the wayside equipment junction boxes. Can WMATA provide the as-built locations of these direct bury cable runs?

Section 00204.D.1.A.1.a indicates that the 24 way ATC and communication duct bank needs to be relocated. This section does not address the 60 way duct bank running between the existing building and Manhole TC/C-A. Is it the intent to relocate this duct bank in addition to the 24 way identified?

In reviewing the as-built information, it appears that the following duct banks and manholes may need to be relocated:

- a. Manhole TC/C-A and 60 way duct bank TC/C5 running from the building to this manhole.
- b. Manhole TC/C-B and duct bank 24 way TC/C1 running between manhole TC/C-A and TC/C-B.
- c. Manhole TC/C-E and duct bank 36 way TC/C6 running from manholes TC/C-A to manhole TC/C-E.
- d. Manhole TC/C-H and duct bank 12 way TC/C18 running from manhole TC-C-B to manhole TC/C-H.

Please address the following issues related to the potential relocation of these existing items:

1. Is it WMATA's intent to relocate all of the existing work listed above?
2. Will WMATA accept cable splices for this relocated work or will all new cables runs be required?
3. Will WMATA provide as-built drawings showing the path of the existing direct burial runs and a detailed inventory of the cables in the affected areas?
4. Will WMATA require system/ safety testing for all of the relocated work?
5. If system/ safety testing is required, will WMATA provide the full requirements of the system/ safety re-certification process for the cable relocation/ replacement? (DB Ref. 42)

Answer: Reference: Drawings M292-270 through M292-278 Shady Grove Yard

1. It is WMATA's intent to relocate/replace only the ductbank between Manholes TC/C-A and TC\C-B which conflicts with pits in the shop floor for vehicle hoists. It is anticipated that other parts of the ductbank system can be protected and retained through innovative design and construction techniques. Relocation/replacement of other sections of the ductbank is not prohibited if that proves to be the most cost efficient way to resolve potential conflicts with shop building and track construction. It should be noted that the final ductbank provisions must accommodate both the existing and new cables. Surface trench, as described in the specifications and shown on drawings, is considered an acceptable alternative to underground ductbank.
2. Cable splices are not allowed per Specification Section 16949 3.08A.5.

Cables required to be relocated should be considered for replacement between existing termination points unless an acceptable alternative is proposed.

3. Respective as-built Signal and Communications drawings identify the cables by number of conductors (or pairs) and wire size that are routed through the ductbank system; however, the drawings do not indicate the path or depth of direct burial portions of the cable runs.
4. Relocated/replaced cables should be tested the same as new cables.
5. WMATA will perform certification testing of the relocated/replaced cabling as necessary for re-certification based upon the Design-Builder's performance and documentation of required conductor continuity and insulation resistance tests.

Question 73: The Fixed Equipment List on the above mentioned drawings of the Brentwood shop are detailed as being removed from the existing Brentwood location, but the final location is indicated as "To Be Determined". Please provide more information on final location. Will the existing equipment need to be stored before being transported to its final destination? Please clarify. (DB Ref. 46)

Answer: Can not provide any additional information at this time. Some of the equipment may be moved to Greenbelt, some may be relocated within Brentwood. This will be determined during final design. DB should state in their proposal what assumptions were made on this issue. Should something else be directed by WMATA, it could be eligible for an equitable adjustment under the contract.

Question 74: Equipment Item 383 Wheel Truing Machine- Underfloor is identified as to be "scrap". Is it the intent for the Design Builder to scrap this machine? The Miscellaneous column for this item list "S/N 10272". Is this the Serial Number for this equipment or another designation? Please verify that WMATA will allow immediate removal of this piece of equipment upon start of Construction. (DB Ref. 47)

Answer: Upon review of this question, WMATA has decided that it does not want the Item 383 Wheel Truing Machine to be scrapped. If the machine cannot be modified and used for the in-line wheel truing machine to be installed on track 11, then it should be turned over to WMATA in good condition to be stored at a site to be determined. The S/N 10272 designation is the Serial Number for this particular piece of equipment. WMATA will allow immediate removal of this machine, along with the elevator at Column Lines D and 11, the truck hoist at Column line D between Column lines 11 and 12 and the truck hoist at Column Line D between Column Lines 14 and 15, with certain conditions. Refer to Drawing B5-A-28 (M1210-243). These conditions include:

1. Wheel truing machine must be removed in such a way that it can be reused

- at another location.
2. Access to the freight elevator between column lines G and H and column lines 11 and 12 is maintained.
 3. After removal of the wheel truing machine and truck hoist between column lines 11 and 12, the tracks shall be restored so that a truck can be moved from Track 9 through the vacated hoist and wheel truing machine areas to the Truck Drop Table/Freight Elevator between column line G and H. These tracks can be taken out of service when the main shop floor between column lines D and F is turned over to the Design-Builder.
 4. The removed truck hoists shall be turned over to WMATA in good condition at a location to be determined.
 5. Any openings in the ground floor slab due to removal of equipment shall be immediately protected to avoid personnel or equipment from falling through.

Question 75: Sheet M1210-225 BRENTWOOD details the complete renovation and replacement of the men's and women's locker/shower rooms, locker rooms, and office areas. Who, if anyone, is responsible to provide temporary facilities for these displaced areas? If these accommodations are required to be done by the Design Builder, please clearly identify location and criteria to meet. The anticipated construction time for the complete demolition of the existing facilities and the reconstruction of the new facilities will be approximately 3-6 months. Please provide more information. (DB Ref. 48)

Answer: Specification Section 01110, Summary of Work, Article 1.04.A.2.a.(4) currently restricts early access to this area. If early access is desired, then temporary replacement facilities must be provided by the Design-Builder for the lunch room and locker room/rest rooms. Referring to Drawing B5-A-23 (M1210-238) which shows existing conditions, areas available for temporary facilities include Room B010 Office No.#2 and the adjacent area between its north wall and column line 3a; the area between column lines G and H and column lines 4 and 9. WMATA would clear these areas. Temporary facilities should include, for men's room: two (2) showers, three (3) toilets, three (3) urinals, three (3) lavatories and lockers same in number as existing; for women's room: two (2) showers, two (2) toilets, one (2) lavatories and lockers same in numbers as existing. Temporary facilities could possibly be placed on a raised platform with drainage to the existing sewage ejection pump.

Question 76: Sheet M1210-232 BRENTWOOD outlines the renovation work in the existing mezzanine offices, see note 4 on B5-A-17. Please detail how this work can be accomplished as well as the work hour constraints that may be placed on the work. Will the office continue to be occupied? Can the work be done during regular day time? Will the Design Builder be required to work only at night? Will temporary dust partitions need to be used? Also please provide information on how to accomplish the installation of the new Stair # 2 B212 if these are will remain occupied. Please provide additional information. (DB Ref. 49)

Answer: Mezzanine offices will continue to be occupied during construction. Offices are manned from 5:00 am to 5:00 pm, so construction work shall be conducted from 5:00 pm to 5:00 am. and performed in stages so as to minimize disruption to the occupants. Adequate dust partitions will be required. A sufficient area around new stair no. 2 will be provided to facilitate construction of the new stairs; more specifically approximate area from column line G to half-way between column lines E and F, and from column line 1 to near column line 3 at the north wall of Office B216. Access will have to be maintained from one end of the mezzanine to the other while this work is going on. A detailed work plan will be required. Note that new stair no 2 comes down in the existing LAN Server office and therefore cannot be constructed until access to the main shop floor is given and some of its offices are relocated.

Question 77: Please reference note 4 on sheet M1210-157. This note instructs the Design Builder to be responsible for crossing the tracks in a safe manner. Access to the Brentwood project requires the crossing of WMATA tracks and AMTRAK tracks. Will crossing guards be required at all WMATA and AMTRAK track crossings? Who will provide and pay for the the cost of crossing guards? Please provide additional information. (DB Ref. 50)

Answer: The Amtrak tracks at entrance to Brentwood are protected by road crossing equipment. The problem is that when entering the yard two stops are required, one for security and the other prior to crossing an unprotected interior yard track. Both of these stops will leave the rear of a truck fouling the Amtrak right-of-way. There are also several additional unprotected interior yard track crossings. A procedure needs to be established wherein all deliveries are scheduled and the contractor provides WMATA qualified flagman at the appropriate crossings to flag the trucks, not the trains. The procedure should also address the need for the truck driver to stop prior to entering the Amtrak road crossing, get out of the truck and walk to the security check point to obtain permission to enter the yard. That way we don't block Amtrak's right-of-way during the security screening process. A similar process needs to be established at all yards where it will be necessary to cross at interior unprotected road crossings with equipment and personnel. WMATA qualification of flag persons would require an additional element of instruction during the ROW training course and would be given only to proposed flag persons.

Question 78: Please reference note 3 on sheet M1210-157. This note allows the Design Builder to have office space and storage in the BRENTWOOD basement. How much space would be available? Would the space be available for the entire construction duration? Who would be responsible for clearing the space of loose and fixed equipment or materials? How much space would be available for office and storage? Please provide additional information. (DB Ref. 51)

Answer: Intent of note is to permit Design-Builder to use available space in work area between column lines D & F for office and storage. Nothing outside this area.

Space would be available for contract duration.

Question 79: Please reference demolition general note 13 on sheet M1210-216. This note limits the use of equipment unless approved by the Owner. Please provide additional information. Will construction equipment ordinarily used in the pursuit of the project construction be limited by the Owner? What are the parameters for approval by the Owner? Are the parameters noise-related? Please provide additional information. (DB Ref. 52)

Answer: Equipment will be evaluated based upon the hazards associated with using the equipment in the shop/yard environment and the extent to which the hazards can be mitigated. Main concerns are noise, vibration fumes and dust. A detailed work plan will be required.

Question 80: Sheet M1210-228 illustrates a new wheel truing (Equipment ID # 1011) pit being installed on track #11 at the Brentwood Shop. Item 1.04.46 of the Architectural Program Criteria for Brentwood discusses the requirements for the Wheel Truing Pit. Neither the drawings nor the Program Criteria discuss any requirement for a car progression system for this new wheel truing pit. Is a car progression system required for this new wheel truing pit? If a car progression system is required, is it the intent for the car progression system to be installed in the slab? If it is required to be placed in the slab, we do not feel that the existing slab is thick enough to install the chain channel that would run the length of the track. In addition, four 2 foot deep pits will need to be installed for the drive motors and idler sprockets. A detailed plan view of this area is not included in the RFP documents, but during our site visit we believe that track #11 runs over an existing electrical room, so thickening the floor slab may have an adverse effect on the electrical service. Please advise. (DB Ref. 56)

Answer: It is not the intent of the Authority to install an "in slab" car progression system. The intent is for the Design Builder to provide a cable wench progression system as supplied by Wheel Truing Machine vendor.

RFP FN5008/FMP
METRO MATTERS
Design/Build: Rail Yards Expansion Project at Brentwood, Greenbelt, and Shady Grove Yards
Amendment 003

Attachments/Enclosures:

Question 41: One (1) CD containing following design drawings for Shady Grove Service and Inspection Yard Underground Fuel Storage Tank Modifications:

9408-160
9408-161
9409-191
9409-192
9511-466
9511-467

Question 2: One (1) half-size each of Informational Branch Avenue Storage Yard Graphics Drawings:

OF-YD-AS-2, Site Key Plan
OF-YD-AS-4, Building - Key Plans
OF-YD-AS-6, Signage Types
OF-YD-AS-7, Signage Types
OF-YD-AS-8, Signage Types
OF-YD-AS-9, Signage Types
OF-YD-AS-10, Signage Types
OF-YD-AS-11, Templates & Fonts
OF-YD-AS-12, Details
OF-YD-AS-13, Details

Question 8: One (1) copy each of :

- WMATA Memo of Minutes of November 22, 2004 meeting with PG County DPW&T and DER regarding Greenbelt,
- PB letters to District of Columbia Fire Department and Department of Consumer and Regulatory Affairs, both dated January 21, 2005 summarizing phone conversations regarding code compliance at Brentwood.
- MDE letter dated January 10, 2005 approving SWM concept at Greenbelt.
- Environmental Categorical Exclusions from signed January 11, 2005 by FTA with FTA cover letter dated January 14, 2005, for all three sites (Brentwood, Shady Grove, Greenbelt).

Question 10: One (1) half-size each of Informational Train Control Drawings for Shady Grove Yard, Train Control Wayside Cable Plans: YA99-G-102 through YA99-G-110 (nine drawings)

Question 37: One (1) copy of Certificate of Occupancy for the Brentwood Shop

Question 47: Specification Section 10600, Storage Retrieval System, new pages 10600-1 through 10600-8.

Serial Number: RFP-FN5008/FMP
Date of Issue: December 3, 2004
Proposal Due Date: February 18, 2005

**WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY
600 FIFTH STREET, N.W.
WASHINGTON, DC 20001**

February 17, 2005

**AMENDMENT NO. 4
TO**

**METRO MATTERS - Design/Build: Rail Yards Expansion Project
at Brentwood, Greenbelt, and Shady Grove Yards**

Phase II - Request for Technical / Price Proposals

CONTRACT NO. FN5008

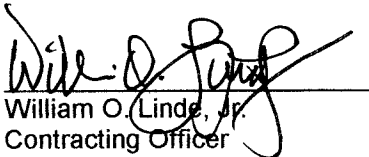

TO WHOM IT MAY CONCERN:

The proposal documents accompanying solicitation RFP-FN5008/FMP are hereby changed in part as follows:

1. The date established for Receipt of Proposals is hereby extended to February 25, 2005 at 2:00 pm.
2. Appendix A - Project Manual for the Alexandria Shop Expansion Option, Books 1, 2, and Project Drawings Book 5 are attached. Separate Price and Technical Proposals are due on the Alexandria Option on April 8, 2005.
3. WMATA's responses to Proposer's Questions are attached. No further questions on anything other than the Alexandria Option will be accepted.
4. Attached please find a separate Listing showing the additional information provided with this Amendment.
5. Replace the following Pages with those attached and revised as follows:
Pgs. 00800-19 to 00800-47, Appendix D, Wage Rates

ACKNOWLEDGMENT

Offerors are required to acknowledge receipt of this amendment in writing on the Proposal Form in the space provided or by separate letter or telegram prior to the date established for receipt of proposals.

William O. Linde, Jr.
Contracting Officer
Office of Procurement and Materiel

February 17, 2005

Note: For ease of reference, WMATA has indicated the Question Number as received from the Design-Builder in parentheses at the end of each question (ex. DB ref. 22).

I. Revisions to Amendment No. 3 Answers:

Answers to several questions provided in Amendment No 3 are being revised. Delete the Amendment No. 3 Answers to Questions 38, 39, 60, 62, 73 and 75 and replace with the following Answers:

AM3 Question 38: Please confirm that all storage/equipment at the basement level will be removed by WMATA for the full length of building between column lines D & F at the start of construction. (DB Ref. 41)

Revised Answer: Storage shelves and their contents in the Storage Room area will be removed by WMATA between column lines D&F. Design-Builder can begin removing wheel truing machine, elevator and two truck hoists at start of construction. See response to AM3 Question 74. For locker room/rest rooms and lunch room see Response to AM3 Question 75. Also see answer to AM3 Question 62.

AM3 Question 39: Please confirm that all equipment, in the areas of the Design/Build Contractor's scope, at the Ground level will be removed by WMATA. If not, please provide a comprehensive list of all equipment that the Design Build Contractor must remove/relocate. (DB Ref. 42)

Revised Answer: See Answer to AM3 Question 73.

AM3 Question 60: The Fixed Equipment Lists for all three sites depict many items (primarily at the Brentwood facility) which are indicated to be moved to "TBD". Please verify that the movement of these items will be by WMATA. (DB Ref. 64)

Revised Answer: See response to Am3 Question 73.

AM3 Question 62: The Brentwood existing drawing B5-A-24 shows a number of items in areas B029 and B030. The Fixed Equipment List indicates these items (as well as Item 377, not shown) to be relocated from these areas to a location "TBD". During the site walk it was stated that WMATA would clean out the basement prior to GC work at Brentwood. Will WMATA be moving these items or not? If so, to where? (DB Ref. 66)

Revised Answer: At the beginning of construction WMATA will have the basement area between column lines D and F cleared and other others areas

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

as agreed upon for work to progress. Note that items in the Pneudraulics Shop B030 between column lines F and H will not be relocated at the beginning of construction. Pneudraulics Shop to remain operational until a replacement shop is provided and operational at Greenbelt or some other location.

AM3 Question 73: The Fixed Equipment List on the above mentioned drawings of the Brentwood shop are detailed as being removed from the existing Brentwood location , but the final location is indicated as "To Be Determined". Please provide more information on final location. Will the existing equipment need to be stored before being transported to its final destination? Please clarify. (DB Ref. 46)

Revised Answer : Reference the Answer to Question No. 15 in Amendment No. 1. There is no requirement for the Design-Builder to relocate Brentwood equipment whose location is noted "To Be Determined", unless specifically noted in answers to other questions.

AM3 Question 75: Sheet M1210-225 BRENTWOOD details the complete renovation and replacment of the men's and women's locker/shower rooms, locker rooms, and office areas. Who, if anyone, is responsible to provide temporary facilities for these displaced areas? If these accommodations are required to be done by the Design Builder, please clearly identify location and criteria to meet. The anticipated construction time for the complete demolition of the existing facilities and the reconstruction of the new facilities will be approximately 3-6 months. Please provide more information.(DB Ref. 48)

Revised Answer: Specification Section 01110, Summary of Work, Article 1.04.A.2.a.(4) currently restricts early access to this area. If early access is desired, then temporary replacement facilities must be provided by the Design-Builder for the lunch room and locker room/rest rooms. Referring to Drawing B5-A-23 (M1210-238) which shows existing conditions and B5-A-09 (M1210-224) which shows proposed conditions, areas available for temporary facilities include Room B010 Office No.#2 and the adjacent area between its north wall and column line 3a; the fenced area between column lines H and L and column lines 4 and 6. WMATA would clear these areas. Temporary facilities should include, for men's room: three (3) showers, three (3) toilets, three (3) urinals, two (2) lavatories and 260 lockers; for women's room: one (1) shower, two (2) toilets, two (2) lavatories and 20 lockers. Temporary facilities could possibly be placed on a raised platform with drainage to the existing sewage ejection pump. Construction of Electrical Room B036 in this area would have to be deferred until completion of the new locker rooms rest rooms.

II. New Answers

Question 1: At Shady Grove Yard, with regards to “removing and relocating” the underground fuel tank, the fuel pump, the diesel pump and the two glycol tanks, has a contaminated soil remediation plan been developed? Does WMATA currently have a program or process in place for handling contaminated soils should they be encountered? If so, please provide documentation and /or instructions for handling “dirty’ soil. (DB Ref. 36)

Answer: There is no past history of leakage from the underground gasoline or diesel tanks and piping or the glycol tanks. WMATA is not anticipating any contaminated soils in this area.

Question 2: Sheet M1210-323 indicates that there is a “HAZMAT Locker” located near the existing Salt Storage Building in Shady Grove Yard. Is this locker currently being utilized? If so, where should this locker be relocated?

In addition, please clarify that this locker is intended to allow WMATA personnel respond to a Hazardous Material spill and does not currently contain any hazardous materials. (DB Ref. 37)

Answer: Locker is currently being used to store ice melting chemicals and cement mix. It is not for a response to a hazardous material spill and does not contain any hazardous materials. Locker to be relocated within Shady Grove Yard to a location approved by WMATA.

Question 3: On past projects WMATA has provided the direct fixation fasteners for the track sections within the shop buildings. We could not find mention of who is to provide these in the RFP. Please clarify who is to provide the Direct Fixation Fasteners? (DB Ref. 57)

Answer: WMATA will provide direct fixation fasteners.

Question 4: Section 1.06 of the Architectural Program Criteria provides a list of certain equipment. This section provides the names of the WMATA Preferred Vendors for several of the items of equipment; however several equipment items did not have preferred vendors listed. Please provide the WMATA preferred providers for the attached list of equipment.

In addition, please provide the requirements for the items on the attached spreadsheet where specifications are not provided (i.e. forklift, prefabricated storage buildings, etc.) (DB Ref 58)

Answer: For Greenbelt: Reference Drawing E11-A-06, M1210-058.

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

Storage Equipment Specification, Section 10600, entitled "Storage Retrieval System", was provided in Amendment No. 3. Reference Answer to Amendment 3 Question 47.

Delete Dock Lift, Item 1045, Shop Work Station, Item 1046, and Forklift, Item 1048, from the "Major Shop Equipment List" given in Specification Article 00434, Price Schedule, Schedule A, Item 3. These items will be included in the \$1.5M allowance for Minor Shop Equipment, Item 3, Schedule C of the Price Schedule.

The Car Component repair and Test Equipment, Item 1047, is already included in the \$1.5M allowance for Minor Shop Equipment .

For Brentwood:

Reference Drawing B5-A-05 (M1210-220).

Delete Storage Equipment System, Item 1034. Reference response to Question 78b in Amendment 4.

Also delete the following equipment:

Item 1043	Forklift
Item 1036	Shop Work Station
Item 1039	Car Component Repair & Test Equip
Item 1037	Cleaning Equipment System
Item 1038	Steam Pressure Washing
Item 1040	Prefab Storage Bldg System
Item 1041	Material Lift System
Item 1042	Jacking Carriage

For Shady Grove:

Reference Drawing A16-A-02 (M1210-387)

Storage Equipment Specification, Section 10600, entitled "Storage Retrieval System", was provided in Amendment No. 3. Reference Answer to Amendment 3 Question 47.

Delete the following equipment:

Item 1031 Fork Lift
Item 1033 Shop Work Station
Item 1027 Car Component Repair & Test Equip
Item 1028 Jacking Carriage

Item 1025 Steam Cleaner Pressure Washer

Specification is provided for Bridge Cranes and Jib Cranes. Provider must meet requirements in specification.

Question 5: Section 00101.C.1 states that WMATA will provide the track alignment and trackwork designs for the three sites. Please verify that WMATA will provide all re-design of the trackwork as needed based on the field surveys performed as the design process progresses. In addition, please verify that WMATA will design all of the track work details required. (DB Ref. 59)

Answer: Refer to Answer to Question 13 in Amendment No, 2. Design-Builder to provide any re-design needed as a result of final design process. Trackwork details not provided in project Drawings are to be provided by the Design-Builder.

Question 6: In reviewing the trackwork design for the Shady Grove site as illustrated on sheet M1210-339 it does not appear that the trackwork geometry as it enters the shop conforms to the WMATA standards, as the tracks appear to enter the shop on a curve. Please verify that the tracks leading into the shop on the curve is acceptable. (DB Ref. 60)

Answer: The curve enters the building as noted. WMATA has waived the criteria in this instance. Final building design should set the vehicle door width to accommodate any vehicle overhang caused by the curve.

Question 7: Who is responsible for paying the PEPCO fees associated with the new/replacement 13.8 kV PEPCO feeders. (DB Ref. 61)

Answer: Design-Builder.

Question 8: Does the asbestos concrete piping used for the existing PEPCO 5 inch ducts need to be disposed of as ACM hazardous waste? (DB Ref. 62)

Answer: If it has asbestos in it, pipe should be considered ACM hazardous waste, but not RCRA hazardous waste, unless there are other considerations.

Question 9: The existing fire alarm panel at Brentwood is on a wall that will have to be demolished. The panel will have to be relocated or replaced. If we remove and relocate the existing panel will we have to upgrade the shop system to current codes? If we replace the existing panel with a more modern panel will we have to upgrade the shop system to current codes? (DB Ref. 63)

Answer: Any and all replacements will have to be done to meet current code.

Question 10: The AC duct bank and PEPCO duct bank at Shady Grove will have to be demolished. This will require new AC cubicles for both PEPCO feeders to the substation. Does WMATA have a contact at PEPCO to identify the route and our options. (DB Ref. 64)

Answer: Contact is Mike Bell at 301-548-4352 or Bob Brown at 202-388-2602.

Question 11: The Shady Grove tower view will be obstructed by the new building. In order to provide the tower with visual observation of the yard, it is anticipated that PTZ

CCTV cameras will provide adequate viewing of the yard. Please confirm that the tower needs to have visual observation of the yard, and that WMATA does not have a problem with the camera approach with monitors in the tower. (DB Ref. 65)

Answer: Yes, the control tower will need to have visual observation of the operational yard. The camera approach is acceptable.

Question 12: Please provide as-built information about the communication conduits running to the Shady Grove Gate House. How many conduits are there? Where do they go? What size are they? Which ones are empty? Which ones have dead cable that can be removed? (DB Ref. 66)

Answer: See Drawing SGSIY-FSS-30-1 and -2 provided as an attachment.

Question 13: While on our site visits we noted that each shop apparently had an intrusion and detection systems installed which was not shown in the as-built drawings. Is it the intent for the Design-Builder to maintain these existing systems and then extend them into the new work, or is it the intent for the Design-Builder to install a new intrusion system for the new work? (DB Ref. 67)

Answer: Yes, the intent is for the Design-Builder to maintain these existing yard security systems and extend them into the new work.

Question 14: Item 46 of the Architectural Criteria on page 29 and Item 3 on page 33 requires, in general terms only, that the Contractor is to provide equipment and manpower to "assist" the manufacturer with installation of the Wheel Truing Machine. Please provide a specific scope of work that the Design-Builder will be responsible for. (DB Ref. 68)

Answer: It is the intent of the Authority that the Design Builder coordinate with the equipment manufacturer to provide a seamless installation of the Wheel Truing Machine. A specific scope of work must be developed by the Design Builder in conjunction with the WTM manufacturer.

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

Question 15: The attached list of New Equipment for the Greenbelt Shop does not have sufficient information to provide pricing for. Please provide the appropriate Manufacturer, model number, and any other specifics for the following list of equipment:

1. Item # 1044 Storage Equipment System
- Item # 1045 Dock Lift
- Item # 1046 Shop Work Station
- Item # 1048 Fork Lift (DB Ref. 69)

Answer: See response to Question 4.

Question 16: The response to Question #9 included in Addendum #1 indicated that the Construction Project Manager needed to be a Certified Professional Engineer. In subsequent conversations since this addendum was issued, it is our understanding that this requirement may be waived by WMATA. Please clarify if the Project Manager for the Design-Builder needs to be a Certified Professional Engineer? (DB Ref. 70)

Answer: The Project Manager for the Design-Builder does not have to be a Professional Engineer (PE), although it would be considered favorably in the Technical Evaluation if he or she were a PE.

Question 17: During a recent site visit to the Greenbelt Shop, it became apparent that the existing car hoist equipment on the track West of F line is not equipped with body hoisting capabilities. Since the trucks cannot be removed from the car on this track, it does not appear that the turntables and associated new bar rail shown to be installed in this area would be functional.

Can the two turntables be deleted?

Can the rail heading East from the turntable located adjacent to Column line #11 be deleted between the new turntable and two adjacent truck tracks?

Can the rail heading East from the new turntable adjacent to Column Line #14 be deleted all the way to the other new turntable adjacent to Column Line D. In addition, can the other turntable adjacent to Column Line D be deleted? (DB Ref. 71)

Answer: Refer to Drawing E11-A-11 (M1210-063). Delete the two proposed turntables shown on Track 5a South, delete the rail heading east from each deleted turntable in its entirety, including the proposed turntable adjacent to column lines D and 14. Drawing E11-A-11 and the Fixed Equipment List Drawing E11-A-06 have been amended to reflect these changes.

Question 18: During a recent site visit to Greenbelt we discussed the limits of the new

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

bridge crane between Column Lines A and C as shown on sheets M1210-065 and M1210-066. As we discussed, the last steel column in the area is adjacent to Column Line #15. In addition, the existing services (water, fire line, gas) in this area will not allow the crane to pass beyond Column Line #15.

Please confirm our discussion that the limits of this bridge crane will be between Column Line #10 and Column Line #15. (DB Ref. 72)

Answer: Confirmed. Revised drawing is being issued.

Question 19: Sheet M1210-064 show a fence enclosure around the new lift equipment, turntable, and truck track between Column Line D and F and adjacent to Column Line 18. It appears that this fence line was left over on the drawing from the existing conditions plan.

Please confirm that this fence does not need to be installed. (DB Ref. 73)

Answer: Confirmed. Fence does not need to be installed.

Question 20: Item 1.03.C.1.a of the Greenbelt Architectural Program Criteria identifies that three new 15 ton bridge cranes are to be installed between Column Lines D and F. However the limits of the Bridge Crane are not identified. Please confirm that the limits of the new bridge cranes will be from Column Line #1 to Column Line #19.

In addition, the RFP documents do not include a drawing for Area #4 of the Greenbelt Shop. Please provide a drawing for this area. (DB Ref. 74)

Answer: Confirmed, limits of new bridge cranes shall be from Column Line 1 to Column Line 19. A new Drawing for Area #4 will not be issued.

Question 21: The response to Question #3 issued with Addendum #2 indicates that all equipment not included in Item #3 of Schedule A in the Price Schedule shall be included in the Equipment Allowance. Please verify that this Allowance is to include the Equipment, Installation of the Equipment, Services to the Equipment, and Hookup of the Equipment. (DB Ref. 75)

Answer: Yes, this Allowance includes the Equipment, Installation of the Equipment, Services to the Equipment, Hookup of the Equipment and Testing.

Question 22: The Response to Question #4 included in Addendum #2 indicates that the Interim Completion for the Greenbelt Yard should be 599 calendar days after NTP in lieu of the 765 calendar days specified in the RFP. In reading the RFP, we cannot locate a definition of what is entailed in the Interim Milestone. Please provide clarification on what is included in the Interim

Milestone for Greenbelt? (DB Ref. 76)

Answer: The intent is to complete all work at Greenbelt in 599 calendar days. It is noted as an Interim Completion Date because completion of Greenbelt is required before final contract completion, which will include Shady Grove and possibly Brentwood. Interim contract completion for Greenbelt includes completion of all work to provide a complete, functional, certifiable Annex Building and Main Shop.

Question 23: The Brentwood, existing shop Drawing B5-M-42 (M1210-292) shows an existing Lube Oil Tank and Waste Oil Tank. Proposed Drawing B5-A-16 (M1210-231) shows a new Waste Oil Storage Room B134. Please provide information on WMATA's intent for this new Room. Will this room be used for waste oil storage only or is there a requirement for a Lube Oil Tank as well? If waste oil only, will shop personnel bring the waste oil to this room in portable carts for local discharge into the tank, or is process piping and pumps required throughout the shop, and if so, where? If a Lube Oil Tank is required, provide information regarding the product, and distribution requirements to outlying shop points, if any. (DB Ref. 77)

Answer: Room will be used for waste oil only. Shop personnel will bring oil to room. Design-Builder will need to provide a removal or suction point to remove waste oil from the tank. An overflow alarm on tank, locally alarmed, should be provided.

Question 24: At Brentwood, proposed Drawing B5-A-10 shows a new Carwash Equipment Room B014, and existing shop Drawing B5-M-37 shows an existing Carwash Equipment Room, but we can find no information that identifies what equipment is to be relocated, if any. Please provide the requirements for these rooms and a statement regarding temporary provisions, if any, since both these rooms are within the work zone. (DB Ref. 78)

Answer: All existing equipment to be relocated to proposed location. There is no requirement for temporary provisions during construction.

Question 25: At the Shady Grove shop, are drawings available locating the existing 2,000 gallon used oil tank located near the existing loading dock? If so, please provide. (DB Ref. 5)

Answer: All available as-built drawings have been provided.

Question 26: In the Architectural Program Criteria, paragraph 1.07.A. lists numerous specification sections that have not been included in the issued RFP Specifications. They are as follows:

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

1. 08331-Overhead Coiling Doors
2. 09971-Epoxy Mastic Flooring
3. 10265-Impact-Resistant Wall Protection
4. 10520-Fire Protection Specialties
5. 14215-Freight Elevators

Please clarify if these components are to be included in the building program(s) and provide specifications as appropriate. (DB Ref. 8)

Answer: The above referenced specification sections shall be provided by the Design-Builder upon completion of final design as appropriate.

Question 27: Are there any roofing/flashing warranties in effect at the three (3) sites? If so, please provide copies of these warranties. What are the ages of the existing roofing systems? Please provide us with the names of the manufacturers and installers of each system. (DB Ref. 10)

Answer: Attached are the following warranties:

- | | |
|------------------------|---|
| Shady Grove S&I Shop - | 20-year warranty dated 06/09/2000 from GAF and a 15-year warranty dated 02/20/98 from Johns Manville. Roofers, Inc. to perform additional repairs on this roof. |
| Brentwood S&I Shop - | 15-year warranty dated 06/11/96 from red Shield. |
| Greenbelt S&I Shop - | Warranty not found as of issuance of this amendment. |

Question 28: Please confirm that a COMM splice handhole can be incorporated whenever the COMM must be relocated. (DB Ref. 47)

Answer: Handholes should be used exclusively to route cables between conduits. No general permission is given to splice cables in any handhole. If no other option exists and that fact can be documented, Design-Builder must request a variance for each such particular case.

Question 29: At the Brentwood facility, what are the limits of the VCT floor finish in room B015? No wall is shown on the East side. (DB Ref. 72)

Answer: Room B015 is identified as General Storage Area. The Architectural Program Criteria, under section 1.04.A.16 does not identify VCT in this area.

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

Question 30: At the Brentwood facility, on drawing B5-A-10 at General Storage Area B015, the existing concrete aisles are coated with a material not listed in the **original** documents. 1) Do we recoat the areas under the racks that have not received a coating? 2) Do we remove the existing coating? 3) Do we recoat the uncoated areas? 4) What is this existing material? (DB Ref. 73)

Answer: At Brentwood it is intended that WMATA will relocate and consolidate storage shelves to the area between column lines F and H, freeing up the area between column lines D and F for the Design-Builder. This consolidation will occur before the Design-Builder has access to the basement. This area will further be consolidated by WMATA near the completion of work. Therefore, the Design-Builder is not required to recoat the area identified in the question above.

Question 31: Specification section 11200 – mentions an “optional transfer crane”. Is such a crane required? If so, please provide us with the capacity requirements for this crane. (DB Ref. 74)

Answer: Transfer Crane is an OPTION which can be exercised by the Authority. Design Builder shall provide a price as an OPTION for this piece of equipment. Section 11200 goes on to indicate that the “transfer crane bridge shall be electrically driven with two 2 1/2 ton hoists and one 1/2 ton hoist on a second bridge attached to the main bridge to facilitate gearbox handling.”

Question 32: In the Shady Grove “as-built” drawings, section 1 on drawing A16b-S-35 shows the foundation designed for a “future platform” between shop tracks 2 & 3. Are there any such requirements at any of the three sites for our present design and construction to take into account “future construction” considerations. Please clarify. (DB Ref. 75)

Answer: A platform in the area mentioned above is not in this scope of work.

Question 33: Specification section 11160-Loading Dock Equipment, lists Truck Levelers under the summary of work, but no details have been given for the levelers anywhere in the section. Please confirm that Truck Levelers are not required for this project. (DB Ref. 76)

Answer: Truck leveler is not required.

Question 34: Specification section 11160-Loading Dock Equipment, calls out Truck Restraints, but none are called for on the drawings or in the Program Criteria. Should we provide one truck restraint at each Dock Leveler? Or, verify that truck restraints are not required for this project. (DB Ref. 77)

Answer: Truck restraints are required at each dock leveler.

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

Question 35: Brentwood drawing B5-A-05 lists equipment item 1034 "Storage Equipment System". What is this, and where is it located? (DB Ref. 78)

Answer: Reference response to Question 30. Storage Equipment System is not required for Brentwood. Delete Item 1034.

Question 36: At the Brentwood Shop, can the location of the existing Wheel Truing Machine be adjusted, if possible, to avoid the removal, relocation, and/or replacement of adjacent structures and/or equipment? Please describe the constraints/limitations associated with the existing Wheel Truing Machine. (DB Ref. 79)

Answer: Wheel Truing Machine (WTM) location must allow for a married pair to fit in the building on both sides of the WTM. Clearances to equipment using track 12 must also be acceptable. Any adjustments to the WTM location must be approved by the Authority.

Question 37: Specification Section 00102, J indicates "WMATA will obtain conceptual storm water management approvals from MDE for the Greenbelt Site only". Please provide a copy of the conceptual plan and MDE approvals. (DB Ref. 80)

Answer: Reference Answer to Question 8 in Amendment No. 3. Copy of MDE letter dated January 10, 2005 approving storm water management concept provided. January 7, 2005 referenced drawings in MDE's letter are included in Amendment 4. SWM report dated December 31, 2004 is also included.

Question 38: For the new and revised foundation work in the existing Greenbelt Main shop area, can we install sheet piling to manage the existing ground water? (DB Ref. 81)

Answer: Design Builder shall submit water intrusion mitigation measures during final design.

Question 39: In reviewing the CADD drawings provided by WMATA it was noted that both the existing and proposed track alignment drawings (SG-exist ctr trk.dwg & SG-alignment.dwg) don't align with either the existing site (SHADYGROVE.dwg) or the proposed Architectural drawings (a-flr-01.dwg). The existing building as-built drawings show the centerline distance between Tracks 5 and 6 to be 20 feet. The existing alignment files measures 21'-10". The distance between the center lines of existing Track 6 and proposed Track 7 is 82'-9" in the architectural plans and is 88'-0" in the alignment files. The proposed building files shows proposed Track 7 to be 15 feet from the outside edge of the train control room wall to the center line of the track. The distance between Tracks 7, 8, 9, and 10 is shown as

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

20 feet center to center. The Proposed alignment file measures 19 feet center to center and 20 feet to the outside wall of the train control room. We first thought it was a scaling issue with the alignment files but the stationing ticks on the alignments measure 50 feet between ticks. This is causing a great deal of confusion.

- Since the Architectural plans align with the site topo, are we to assume that the Architectural plans are correct to cost out the building construction? But if we hold the building plans the Track alignment layout has an impact on the rest of the site layout (roads, utilities, storm sewers, etc). Which is correct? Please clarify. (DB Ref. 82)

Answer: Track alignment will be adjusted to match the Architectural plans. New track drawings will be issued when completed.

Question 40: What are the lightning protection requirements for all three sites? (DB Ref. 83)

Answer: WMATA does not have any specific Lightning Protection requirements. It is the intent of the Authority that all building grounding meet the Authorities Design Criteria, however, Lightning Protection shall be determined by local codes and requirements.

Question 41: Specification Section 01520-1.07 addresses the equipment to be provided by the Design/Build Contractor for the Authority Representative's Facility. Paragraph 1.07 C, item 14 indicates that the field office shall be furnished with new equipment. However subparagraph "c" indicates that the Authority will provide the computers and printers. Please confirm. (DB Ref. 84)

Answer: Confirmed. WMATA will provide computers and printers.

Question 42: Appendix D to section 00800 Wage Determination Rates, are rates for "heavy" construction. Please verify that all workers at all three (soon to be 4) sites are to be paid in accordance with the heavy rates set out in appendix D, not general building rates. (DB Ref. 85)

Answer: Yes. Appendix 'D' Davis-Bacon rates apply to all three sites

Question 43: Is a submersible hydraulic pump allowed for the elevators? (DB Ref. 86)

Answer: No. WMATA does not allow submersible hydraulic pumps for elevators.

Question 44: Are freight elevator doors to be side slide, or bi-parting? (DB Ref. 87)

Answer: The doors are to be bi-parting, that is, center opening.

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

Question 45: Please provide the size of the freight elevator doors. The Architectural Program Criteria says that the car needs to fit a forklift with a 4x4 pallet. (DB Ref. 88)

Answer: A standard Class "A" freight elevator with bi-parting doord is designed to accommodate the loading of materials using a forklift with a 4x4 pallet

Question 46: Please provide the class of elevator for the freight car. (DB Ref. 89)

Answer: Class "A" 6000 lbs. Is recommended.

Question 47: The Greenbelt Main shop has both an existing 15-Ton and a 2-Ton bridge crane in Areas 5 and 6. It appears that the intent is to leave the existing 15-Ton crane, but to scrap the 2-Ton crane. Please confirm if this is correct, and if so, whether WMATA or the D/B contractor should remove the 2-Ton crane. In addition, there is a short "spur line" going into Area 2 which appears to allow the trolley from the 15-Ton crane to access that area. Will the new 15-Ton cranes need to be compatible with this spur? (DB Ref. 90)

Answer: Reference response to Question 50 in Amendment No. 3. Both 15T and 2T cranes to be removed by the Design-Builder. New 15T crane should be compatible with spur or spur modified to be compatible with new crane.

Question 48: Will service catwalks be required for double-girder crane? (DB Ref. 91)

Answer: Service catwalks are required.

Question 49: Page 9 of the Architectural Program Criteria states that at the Greenbelt shop, "the existing bridge crane system in the area (G 107) shall be retained and refurbished." During our recent job walk, the two 2-Ton cranes in that area appear to be in good shape. Please define and further clarify the scope that is required to "refurbish" these cranes. (DB Ref. 92)

Answer: Cranes shall be professionally inspected and brought to a certifiable "state of good repair".

Question 50: In Amendment #2, question #3 stated that the minor shop equipment is included in the \$1,500,000 allowance described on the price proposal form. Please provide us with a list that defines all equipment (by equipment number and description) that is to be included in this allowance. (DB Ref. 93)

Answer: This is for Greenbelt. Reference Answer to Question 3 in Amendment 2. Minor Shop Equipment is defined as all equipment listed in the Fixed Equipment List on Drawings E11-A-02 through E11-A-06, except for those items identified in Item 3 of Schedule 'A' in the Price Schedule. Minor shop

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

equipment will be selected by WMATA from the Fixed Equipment List. The \$1.5M allowance will cover these purchases. The amount of the allowance will be adjusted up or down depending on the equipment WMATA selects from the list.

Question 51: On the Greenbelt project, should equipment item #1047 (shown on drawing E11-A-06) be included under the "Major Equipment" section on the Price Schedule? On the Price Schedule, Item 3 "Major Shop Equipment" does not include item #1047 in its description. Please clarify if we are to include this item, and if so, where are we to include the pricing? (DB Ref. 94)

Answer: Item #1047, Car Component Repair and Test Equipment System, is not included in the Major Shop Equipment. It will be covered in the \$1.5M allowance for Minor Shop Equipment described in the previous question.

Question 52: On the Greenbelt & Brentwood projects, there are numerous pieces of equipment that are described as being "relocated". Please clarify whether this "relocation" is to be provided by WMATA or the Design/Builder. If this work is to be performed by the Design/Builder, where are we include the costs on the price proposal form? Please clarify. (DB Ref. 95)

Answer: Reference response to Question No. 15 in Amendment no 1. For Brentwood, there is no requirement for the Design-Builder to relocate Brentwood equipment whose location is noted as "TBD" on the Fixed Equipment Lists, unless specifically noted in other answers to Design-Builder's questions. Design-Builder is responsible for relocating all other listed equipment at Brentwood. For Greenbelt, Design-Builder is responsible for relocating all equipment noted to be relocated on the Fixed equipment Lists. Costs for relocation of equipment shall be included in Item 2-E of Price Schedule, Interior Construction and Finishes, for each site.

Question 53: On drawing A16-A-09 at Shady Grove, there is a note that directs us to provide a center platform at the Blow Pit extension. We have been unable to determine the extent of this new platform. Please provide us with additional details that locate the extent of this new Center platform. (DB Ref. 96)

Answer: Platform shall run the entire length of the existing and proposed extension on the blow pit. Platform shall be located between the two married pairs and provide a positive seal between the edge of the platform and the rail cars. Platforms, both right side and left side, to be at a height to provide access to the interior of the vehicle and to provide a positive seal (to avoid particles from migrating above platform during blow pit operations).

Question 54: At the Greenbelt shop walk-thru, there appeared to be four (4) rail storage tracks located south of column line 8 at the existing wheel truck storage

area. The current set of as-built drawings for the Greenbelt shop does not show four tracks. The drawings do not show the "fourth track" (i.e. closest to column line F). Was this "fourth track" added to the Greenbelt shop at a later time? What is the centerline dimension of the "fourth track"? Does this "fourth track" centerline match the centerline of the track closest to column line F? Please verify that the current layout of this "fourth track" aligns with the final track layout. Please provide us with as-built drawings of this "fourth track". (DB Ref. 97)

Answer: As-built drawings for the fourth track could not be found. From field measurements taken it appears the tracks do line up as shown on Drawing E11-A-11 (M1210-063). It is the desire of the Authority that the stated existing track centers align with the proposed location of the new truck shop tracks to provide for transition and movement of trucks from the storage area to the truck repair area.

Question 55: On page 8 of the Architectural Program Criteria, paragraph 1.03.C.1.a; directs us to connect the new trackwork at the Truck Repair & Rebuild Shop to the "three (3) tracks within the Truck Storage area located south of column line 8". (see question above concerning 3 vs. 4 tracks) It goes on to say that the existing "tracks within the Truck Storage area shall be reconfigured as required to align with the Truck Shop tracks". The existing set of tracks (second set) that are centered approximately 20'-4" from column line D are located 1'-2" to the east of where they should be. Is it WMATA's intent that the existing tracks be removed entirely from this area? Or, would it be possible to abandon the existing track in place and simply "cut-in" new track to align with the proposed Truck Shop tracks? Please verify. (DB Ref. 98)

Answer: See Answer to Question 54 above. WMATA does not intend to remove the existing tracks. If one of the existing tracks does not line up with the new truck shop track, a crane will be utilized to move the truck assemblies.

Question 56: On page 5 of the Architectural Program Criteria, paragraph 1.02.L.1.c states that the Greenbelt Annex must be located a minimum of 60' from the existing paint shop in order to maintain its status as an "unlimited area building" for code requirements. Does this 60' dimension include what appears to be a loading dock structure located from column line AA-32 to AA-33? The loading dock appears to be approximately 20' wide coming off of column line AA. This would provide only 40' of clearance to the existing paint shop. Please clarify. (DB Ref. 99)

Answer: WMATA's consultant is currently coordinating with the Prince George's County Fire Department to obtain a variance for or approval of the existing design. WMATA has no intention of adjusting the location of the Annex. If a variance cannot be obtained with the current design, walls and roof will be

removed from loading dock.

Question 57: At the Greenbelt Shop, what is the required capacity for equipment item #286, the Jib Crane for the Wheel Boring Mill? (DB Ref. 100)

Answer: Crane is offered as an option with the wheel bore machine and has a 1 ton capacity. Note Item #286 is included in the \$1.5M allowance for Greenbelt "Minor Shop Equipment". See Answer to Question No. 3 in Amendment No. 2.

Question 58: In specification section 14401, paragraph 1.02.A.5.d requires the crane and hoist manufacturers to be both ISO-9001 and QS-9000:98TE supplement certified and registered. Many of the crane manufacturers do not meet both of these requirements, including companies with numerous units in operation at existing WMATA facilities. Please consider removing this requirement, or revising to simply ISO-9001 and no-load testing by CMAA member. (DB Ref. 102)

Answer: Crane and hoist manufacturers to be ISO-9001 certified and registered. Delete the requirement to be QS-9000:98TE certified and registered.

Question 59: There appear to be two different uses for the term "Major Equipment". Specification section 00200 and 11001 refer to a list of equipment in the Appendix A in section 11001. Item 3 under Schedule A in the Price Schedule refers to a number of items on the Fixed Equipment lists. However, these two lists are different, and cause confusion, whereby a 2-Ton Jib crane is considered Major Equipment as item 1020, but Minor Equipment as item 229, in the same facility. Please consider revising the equipment pieces listed under Item 3, Schedule A to reflect the list shown in Appendix A in Section 11001. (DB Ref. 103)

Answer: Reference Answer to Question 4 in Amendment 4 for changes to Item 3 under Schedule A in the Price Schedule. Other than the changes noted in the Referenced Answer, no other changes to listings will be made.

Question 60: Specification section 14401 – Cranes calls for class "D" service for bridge cranes and built-up type hoists with horizontally split gear cases. From our job walks, it appears that the existing cranes do not have these designs, but instead standard type wire rope package hoists. Furthermore, it is not possible to provide such a hoist design on single girder bridge cranes and jib cranes. Please advise. (DB Ref. 104)

Answer: Where appropriate underhanging wire rope type cranes can be substituted.

Question 61: Please verify that the four (4) 15-Ton bridge cranes (Shady Grove / Greenbelt) and the two (2) 5-Ton bridge cranes (Greenbelt) are of a double

girder design, and that the rest of the bridge cranes are single girder. (DB Ref. 105)

Answer: Verified as stated.

Question 62: Please verify that the three(3) 15-Ton bridge cranes at Greenbelt are the only ones required to be under-running (due to existing conditions), and the rest can be top-running. (DB Ref. 106)

Answer: Verified as stated.

Question 63: At Shady Grove, drawing A16-A-13 (M1210-398) has a Keyed Note #12 which reads "Drains and material cart rails full length of pit). Will the Design/Build contractor be responsible for providing the material cart rails? If so, please provide more information. (DB Ref. 107)

Answer: Intent was to provide rails in the pit for the material carts to travel on, but this is not compatible with operations at other WMATA shops. Delete requirement for material cart rails.

Question 64: In the Mechanical Program Criteria, page 11, paragraph 1.05.A.1 states "All existing, retrofitted and new office and shop areas shall be evaluated for use and shall be modified or designed to meet all current codes, standards, and/or the Program Criteria for ventilation rates." However, on page 3, paragraph 1.04.1.a lists a site specific scope of work for existing Greenbelt Shop; page 5, paragraph 1.04.2a lists a site specific scope of work for existing Brentwood Shop; and page 8 paragraph 1.04.3a list a site specific scope of work for Shady Grove Shop. Please verify that our scope of work is limited to the site specific scope and does not apply to the "All existing" areas. (DB Ref. 108)

Answer: Any existing areas not specifically mentioned in the site specific scope of work that may be affected by the Design-Builder's final design and construction, requires an evaluation by the Design-Builder for use and shall be modified or designed to meet all current codes, standards, and/or the Program Criteria for ventilation rates.

Question 65: Shady Grove Drawing A16-TC-03 does not show signals 92 & 94 positioned between Turnout (TO) 149 and TO 171. However, on drawing A16-TC-06 the signal is shown. Please advise us as to the correct location and orientation of the signals.(i.e. Signal 92 permits a movement from ___ to ___.) (DB Ref. 109)

Answer: For proposal pricing purposes, Signals 92 and 94 should be included at the locations shown on drawing A16-TC-06. The final number and locations of all signals associated with the track changes must be determined by the

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

Design-Builder, as a design function, to satisfy the yard operational flexibility and safety requirements addressed in the Program Criteria.

Question 66: Shady Grove Drawing A16-TC-02 depicts Signal 158 (existing), and Signal 160, 162, 164, 166, & 168. Specifications section 16911-5, 1.03.C.5.b identifies 162, 164, 166, & 168 as NEW. What about Signal 160? (DB Ref. 110)

Answer: Signal 160 is presently located in an area where Shop Lead Track 6 is required to be realigned or replaced and Signal 160 will therefore have to be relocated. It is expected that all signals that require relocation to be replaced with complete new layouts and cabling.

Question 67: Shady Grove Drawing A16-TC-03 – Signals 62 and 74 are depicted as being across the track from each other while drawings A16-TC-07 show them with a track circuit between them. Please advise as to the proper layout and orientation. (DB Ref. 111)

Answer: Signals 62 and 74 are presently located across the track from each other in reference to the same set of insulated joints. It is not considered likely that the program track changes will require any change in the location of Signals 62 and 74. The separation of the two signals on Control Machine Drawing A16-TC-07 does not indicate a track circuit between them but provides space behind the panel for lamp sockets and pushbutton mechanisms.

Question 68: Section 16911 gives no information concerning Train Control work required at Greenbelt and the remaining RFP documentation does not provide sufficient information to determine if it is required. No Train Control modifications would be required if tracks FY-1, FY-2, and FY-3 have no track circuits, no related signals, and the turnouts are operated by manual switch machines with no indications. Please verify that this is the case. (DB Ref. 112)

Answer: The track changes at Greenbelt Yard are not expected to require any changes to the Yard Signal Control and Interlocking System due to the changes and additions to only involve non-signaled tracks with hand throw switch stands.

Question 69: Please clarify the conflict in Section 16700 Scope of Work – Communications.
In section 3.01 and 3.02 there is no major interface listed. If there is no major interface, the Design-Builder should not be responsible for surveying this equipment, as indicated in section 2.02 and 2.03. (DB Ref. 113)

Answer: The Communications Scope of Work (Section 16700) includes a general description of all yard communications systems and then provides a

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

preliminary assessment of the changes and additions at each of the three yards in this program. As required in the Scope of Work, the Design-Builder is expected to survey the existing conditions and become familiar with all the Yard Communications Systems and their interfaces in order to perform a fully integrated design. Although no Major interfaces to the Carrier and Fiber Optic Systems are anticipated, the actual requirements will be determined by the Design-Builder. The Design-Builder is responsible to avoid interference and damage to existing systems, therefore a knowledge of these systems not requiring changes is considered essential.

Question 70: Please clarify the conflict in Section 16700 Scope of Work – Communications. It is the Design-Builder’s responsibility to expand on the existing communication equipment and not to replace or provide new systems that are currently in use. That may or may not be required for the Telephone, Fire Alarm and Public Address Systems as indicated in 2.04-A-7, 2.06-B-2&3, and 2.11 A-1. (DB Ref. 114)

Answer: It is incorrect to assume, “It is the Design-Builder’s responsibility to expand on the existing communication equipment and not to replace or provide new systems that are currently in use.” Although it is preferable f o r systems to be expanded to cover the additional requirements associated with the shop expansions, this is not possible in some locations, for some systems. The Communications Scope of Work includes a preliminary assessment of the existing systems, however, the proposers are strongly encouraged to make their own assessment with a site inspection. The actual communications requirements for the new and expanded shop facilities are to be determined during the design by the Design-Builder, and the existing systems may not be suitable for use in these areas due to system components no longer being available or control units already used to capacity.

Question 71: In the Shady Grove expanded shop building, do the columns need to be sized for a future overhead crane spanning the four new tracks? (DB Ref. 115)

Answer: Columns do not have to be sized for a future crane.

Question 72: Item #1046 in the Greenbelt shop and item #1036 in the Brentwood shop and item #1033 in the Shady Grove shop is called out to be a Shop Work Station? Please provide us with more information describing this piece of equipment. (DB Ref. 116)

Answer: Reference response to Question 4 in Amendment No. 4..

Question 73: Item #1037 in the Brentwood shop is called out to be “Cleaning Equipment for Additional Bays”. Please provide us with more information describing this

piece of equipment and it's intended purpose. (DB Ref. 117)

Answer: Reference response to Question 4 in Amendment No. 4.

Question 74: What is a Car Component Repair & Test System? (Greenbelt item 1047, Brentwood item 1039, Shady Grove item 1027) What components of the car are to be repaired/tested? Please provide us with more information describing this piece of equipment and it's intended purpose. (DB Ref. 118)

Answer: Reference response to Question 4 in Amendment No. 4.

Question 75: What is desired for the Pre-Fab Storage Buildings? (Brentwood item 1040) What sizes are required? Please provide us with more information describing this piece of equipment and it's intended purpose. (DB Ref. 119)

Answer: Reference response to Question 4 in Amendment No. 4.

Question 76: What is a Jacking Carriage? (Brentwood item 1042, Shady Grove item 1028) What is it lifting, and what capacity is required? Please provide us with more information describing this piece of equipment and it's intended purpose. (DB Ref. 120)

Answer: Reference response to Question 4 in Amendment No. 4.

Question 77: Please clarify the requirements for the Shady Grove new/existing blow pit D.C. stinger system requirements. The traction power program criteria appears to conflict with the RFP drawings A16-A-09(M1210-394) and A16-A-13(M1210-398) regarding the number of stingers and stinger locations. Should we provide a fifth and sixth D.C. stinger to serve tracks #2 & #3 as indicated on drawings A16-A-09 and A16-A-13? Is there an existing blow pit in any of the other yards where the stinger bus and control bus are installed under the pit platforms and mounted on the pit walls? Please clarify. (DB Ref. 121)

Answer: In Book 2 Traction Power and Lighting Program Criteria, Section 1.03 System Description, paragraph 13. Sentence that reads: "A fifth new stinger/trolley assembly is to be provided to serve the new construction (blow pit) area for tracks 2 and 3; this stinger assembly shall be located between tracks 2 and 3, to serve either track, and shall provide power not only to the new blow pit construction area (approximately 85 feet in length) but also the existing blow pit area at tracks 2 and 3.", will be edited to read: "A fifth and sixth new stinger/trolley assembly is to be provided to serve the new construction (blow pit) area for tracks 2 and 3; this stinger assembly shall be located alongside (wall mounted) tracks 2 and 3 to serve the respective track, and shall provide power not only to the new blow pit construction area (approximately 85 feet in length) but also the existing

blow pit area at tracks 2 and 3.”

This type system is used in the SEPTA system in Philadelphia at the Fern Rock maintenance facility blowdown, and other major transit facilities.

Question 78: Specification section 02270-page 1, paragraph 1.01.C says that the gas company will do it's own work as it relates to gas distribution and services. The Architectural Program Criteria directs the Design/Build contractor to provide “natural gas supply” to numerous rooms in the project. Please clarify the gas company's scope of work for this project. Also, please provide us with the location(s) of the gas meters for the Greenbelt site. (DB Ref. 122)

Answer: Contact was made with Ms. Jennifer Eugene of Washington Gas Light (WGL) Engineering Sales Staff (703-750-4844). Ms. Eugene advised that the Yard is supplied off of a main provided with up to 50 lbs. pressure. Also the service size pipe is four inches. The yard has three meters which are probably located at the Paint shop, S&I shop and the O&M Building. WGL could not confirm at this time if that was the actual location of the meters. WGL will provide the engineering, construction and materials for any piping up to and including the meter. WGL would need the anticipated load, additional load and connected load figures to determine if any additional work/materials on its part are required. A Service Information Request containing this information will be required by WGL from the Design/Builder. Ms. Eugene advised that she may be contacted with questions concerning this matter.

Question 79: In the Project Manual – Book 1; specification section 00200-page 11- references an electronic copy of the proposal “as required”. Please verify that we are to submit only paper documents with this proposal submission. If this is not the case, then we suggest that the proposer's be given adequate time (ie one or two weeks) after the submission date to submit this information electronically. (DB Ref. 123)

Answer: Electronic copy can follow paper document submittal by one week.

Question 80: Specification section 02468-page 1: paragraph 1.01.D- references unit prices for caissons. Please verify that these unit prices are not required for this project. (DB Ref. 124)

Answer: Unit prices for caissons are not required. It is suggested that cost for caisson drilling be included in Price Schedule Item 1-B, Earthwork, and concrete in Item 2-B, Concrete and Masonry.

Question 81: Specification section 03200 references epoxy reinforcing steel. We have been unable to locate where this project would need epoxy coated

reinforcing steel. Please verify that this project does not require epoxy coated reinforcing steel. (DB Ref. 125)

Answer: There is no requirement for epoxy coated reinforcement or epoxy coated WWF.

Question 82: Specification section 03300-page 10; paragraph 2.01.Q references elastomeric concrete. We have been unable to locate where this project would need elastomeric concrete. Please verify that this project does not require elastomeric concrete. (DB Ref. 126)

Answer: It is anticipated elastomeric concrete may be used to repair damaged or spalled concrete within the limits of work.

Question 83: Specification section 03300-page 11; paragraph 2.01.T references corrosion-inhibitor in concrete. This is typically used in precast concrete garages for WMATA. Please verify that this project does not require corrosion-inhibitor in the concrete. (DB Ref. 127)

Answer: There is no requirement for corrosion inhibitor in the concrete.

Question 84: In the Architectural Program Criteria on page 18, room G222 (Greenbelt Annex) – Component Parts Storage Room calls for us to provide a component parts storage system “as defined by WMATA”. Please provide us with additional inform clarifying this WMATA “definition” of the component parts storage system. (DB Ref. 128)

Answer: Specification 10600, Storage Retrieval System issued in Amendment No. 3. Reference answer to Question 47 in Amendment No. 3.

Question 85: At the Shady Grove project, is the start of the remodeling of the existing Men’s and Women’s locker/toilet areas constrained by the completion of the new Mezzanine lunchroom? (DB Ref. 129)

Answer: Yes. Existing Men’s and Women’s locker/toilet area must remain in service until replacement facilities are available.

Question 86: At the Shady Grove project, the existing stinger line is below the header height at the future knock-out panel. Do you require that the stinger be raised or modified, or is the current vertical clearance at the existing stinger sufficient? (DB Ref. 130)

Answer: Current vertical clearance sufficient.

Question 87: The response to Question No. 15 in Amendment No. 1 regarding the Interim Completion in Section 00825 states that “Greenbelt Yard refers to work in

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

the yard only, not the entire Greenbelt project". Please clarify what portion is to be complete for Interim Completion and Final Completion. In addition, confirm that the New Greenbelt Annex and Main Greenbelt Shop Reconfiguration must be complete before the start of construction on the Brentwood main floor level. (DB Ref. 131)

Answer: Reference Answer to Amendment 4 Question 22. Except for any exceptions noted in previous answers, Greenbelt Annex and Main Shop must be operational before start of construction on the Brentwood main floor level, so that there can be a continuous flow of maintenance functions.

Question 88: The response to Question No. 32 in Amendment No. 3 indicates that a permanent covered metal staircase is to be constructed outside of the west wall of the building between column lines 1 and 3 for permanent access to the control tower. Since an existing six foot wide surface cable trench crosses this same area, is it your intent to build over this existing surface cable trench or relocate it, if possible? (DB Ref. 132)

Answer: The intent is to build over the surface cable trench, while maintaining access to it.

Question 89: With regard to Question 74 in Addendum No. 3; If the existing Hegenscheidt Model 104 wheel truer cannot be modified for installation on Track 11, does WMATA have a preference for manufacturer and/or model of a new machine? Does WMATA require either milling or lathe reprofiling? (DB Ref. 133)

Answer: Reference Architectural Program Criteria for Brentwood, Section 1.04, Article B.46 for new machine. Modification of existing machine or procurement of new machine will be at the expense of WMATA.

Question 90: This contract requires a new dust collector for the Shady Grove blow pit extension. Is a screenwall required around the new dust collector? (ie-similar to the current configuration at the Greenbelt Shop?) Please verify. (DB Ref. 134)

Answer: Provide screenwall around the new dust collector at Shady Grove.

Question 91: What flooring is required for the new Freight Elevators? (DB Ref. 136)

Answer: Steel plate flooring would be compatible with the type of elevator this is. Reference Answers to Amendment 4 Questions 45 and 46.

Question 92: What training is required for the Elevators? Does specification section 11001 apply? If so, what level of training is required (I, II, III)? (DB Ref.

137)

Answer: The Contractor shall develop and provide operation and maintenance training in accordance with the General Requirements and as follows:

1. Three days of classroom plus two days of at-the-site training to be repeated five times with 15 students per class.
2. Time and place of training will be determined by WMATA, but must be completed no later than 30 days before Final Completion.
3. Training shall be organized to make optimum use of the required maintenance and operation manuals including training for replacement of all parts contained in the Parts Inventory list.
4. Provide one additional copy of all required submittals to the Engineer for forwarding to WMATA RAIL/ELES.
5. Provide two copies of training materials along with visuals and handouts to the Engineer for forwarding to WMATA/TRNG.

Question 93: Please provide more information on the gate type for the freight elevators. Manual vs automatic, bi-parting vs side sliding vs center opening, etc..? (DB Ref. 138)

Action: "Gates" are not intended for the freight elevators. Doors to be bi-parting and center opening per answer to Amendment 4 Question 44. Doors to be automatic.

Question 94: Montgomery County DPS has indicated that all redevelopment of the Shady Grove site will be treated as 100% impervious and a 100 year flood plain analysis must be performed on the existing 78/90 inch pipe system. Are we responsible to perform this analysis? Is information available to perform this analysis? Are we responsible to increase the size of the existing storm piping or perform any modifications to the off-site regional storm water pond? If the existing 78/90 inch pipe system is inadequate, are we responsible to design/build a new on-site SWM pond? (DB Ref. 139)

Answer: Proposal should be based on information provided. A preliminary analysis has been conducted by WMATA's consultant and a preliminary Stormwater Management report prepared. The purpose of the SWM report was to investigate stormwater management requirements needed for the Shady Grove Yard improvements; to advance the understanding of the project with

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

Maryland Department of the Environment (MDE); and to demonstrate that a workable SWM plan is achievable. A copy of the SWM Report dated February 16, 2005 is attached.

Question 95: The Answer, Item c, to Question #8 in Amendment No. 003 references the MDE letter dated January 10, 2005. Item No. 1 in this letter references "PI plans". Please clarify what these plans are and provide them to us. (DB Ref. 140)

Answer: Above referenced letter was from MDE, approving SWM concept at Greenbelt Yard. "PI plans" are preliminary investigation plans and are the same as those provided as an attachment to the Answer for Amendment 4 Question 37. See list of Attachments, Roman Numeral II.

Question 96: For mechanical equipment placed on the roof of the new Greenbelt Annex, will a screenwall be required? (DB Ref. 143)

Answer: WMATA does not have a roof top equipment screening requirement. Screening of roof top mechanical equipment shall be determined by local code and local zoning requirements.

Question 97: The Answer to Question 27 in Amendment No. 003 indicates "...beneficial occupancy of the new/renovated office areas, lunch room and locker rooms/rest shall be provided as soon as possible, prior to final completion of the Brentwood construction." It appears that the new ground office area from column line 1 to column line 5 must be constructed, and occupied before the removal of the existing office space from column line 1 to 4. Please confirm. (DB Ref. 144)

Answer: Confirmed. Or equivalent temporary office area must be provided subject to approval by WMATA.

Question 98: The Answer to Question 8 in Amendment No. 003 indicates that additional meetings with Montgomery County and DC officials are planned. Please provide any information or meeting minutes from these meetings. (DB Ref. 145)

Answer: No additional meetings to date. However, Brentwood Yard Improvements Stormwater Management Report dated November 30, 2004 is enclosed in response to above question. Greenbelt Yard Improvements Stormwater Management report provided in response to Amendment 4 Question 37; and Shady Grove Yard Improvements Stormwater Management Report provided in response to Amendment 4 Question 94.

Question 99: The Answer to Question 8 in Amendment No. 003 indicates that plans submitted to The Forest Stand Delineation and Forest Conservation

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

Exemption Review will be provided when received. Can we get a copy of the plans and the subsequent approval? (DB Ref. 146)

Answer: WMATA's consultants are still coordinating with MDE and addressing comments. Approved plans will be provided when as soon as available.

Question 100: At the Greenbelt Shop, the answer to question #24 in Amendment No. 003 indicates that an alternate lift area must be functional prior to working in Sections 5 and 6. Please clarify. Since there is no new lift in Areas 8, 9, and 10, are we to provide a temporary lift? Are we required to attempt to phase the work in Areas 5 and 6 so that the existing lifts are available? (DB Ref. 141)

Answer: Work must be phased in such a way that two truck lifts will always be functional at Greenbelt for truck maintenance. Temporary lifts will not be allowed because of safety concerns. WMATA plans to temporarily divert some truck maintenance work normally handled at Greenbelt to the Branch Avenue Yard Shop during the period that only two lifts will be operating at Greenbelt.

Question 101: At the Greenbelt Shop, the Answer to question #25 in Amendment No. 003 indicates, "work will have to be phased to ensure critical operations are maintained." Please define critical operations, functions, durations, etc. (DB Ref. 142)

Answer: All maintenance activities are critical and must continue with minimal or no disruption. Except for the wheel press activities, it is understood that there may be some disruption when equipment is moved from one location to another within Greenbelt, but this time of disruption must be minimized. An example of this would be the time to relocate the wheel boring mill (item 528) within the Greenbelt Shop. Regarding wheel press operations, the new wheel press (item 1008) must be operating before the existing wheel press (item 523) is taken out of service and relocated.

Question 102: Can WMATA provide us with hardware maps of the existing Rolm 8000 Satellite PABX Equipment at the Greenbelt and Brentwood Yards? These would be needed to determine how to expand the existing Rolm equipment currently in use. (DB Ref. 135)

Answer: WMATA is checking on the availability of these hardware maps. Assume that WMATA will provide.

Question 103: The Mechanical Program Criteria for heating the new shop building at Greenbelt (PROJECT MANUAL BOOK 2, page 5, Part 1.04A.1.b(1) does not specify the type of heating system required. Given that the existing building utilizes natural gas for the energy source it seems reasonable that

Design/Build: Rail Yards Expansion project at Brentwood, Greenbelt and Shady Grove Yards

a natural gas system (as opposed to, say, fuel oil fired boilers) would be desired by WMATA. Please comment on WMATA's preference, if any, for heating the new building, and please confirm that adequate spare natural gas capacity is available on site to supply the new shop. (DB Ref. 33)

Answer: Natural gas is preferred. Reference Answer to Amendment 4 Question 78. It would appear that sufficient gas is available.

Question 104: At the Greenbelt shop, The RFP requires three (3) new 15 Ton bridge cranes (equipment Item 1019) for use in the existing shop, in Truck Storage, and in the existing and new Truck Repair Areas for the area (columns 1-19, D-F). The existing 10 Ton and 2 Ton cranes in that area are "underhung" cranes traveling on crane girders connected to both the building columns and suspended from the roof beams. Replacing those cranes with three 15 Ton cranes adds considerable load that must be accounted for by design modifications to the structure. Relying on crane anti-collision devices to prevent "crane bunching" is not a recommended design strategy for modifications to the structure. Can WMATA be more specific on their intent for crane use and requirements in this area? Can the crane capacity requirements be reduced to 10 Ton? Can permanent stops on the girder be utilized to maintain crane separation (which would also prevent "through traffic"). Can the new cranes be "underhung", to make use of, if possible, the existing crane girders? Would two (2) 10 ton cranes running end to end be sufficient? (DB Ref. 79)

Answer: In lieu of three (3) 15T cranes, two (2) 10T cranes and one (1) 15T crane may be provided with the 15T in the middle and a 10T crane on each side. All cranes need access to the entire area for multiple use options. Therefore, new cranes to have laser stops or perimeter sensors with hard stops only at extreme ends. New cranes may be the "underhung" type.

Question 105: What speeds are required for the bridge cranes? Please provide minimum speeds for bridge/trolley/hoist for each capacity of bridge crane (15, 5, and 3 Ton). (DB Ref. 101)

Answer: It is advised that the cranes utilize an infinitely variable flux vector control.

PROCUREMENT REQUIREMENTS

00100 SOLICITATION - REQUEST FOR PROPOSALS

This Section includes project information for proposers.

NOTICE TO OFFERORS

RFP-FN5008/FMP includes Project Manuals and Project Drawing Sets for:

PROJECT DESCRIPTION: RAIL YARDS EXPANSION PROJECT, APPENDIX A -
ALEXANDRIA YARD OPTION

PROPOSALS for the work described herein shall be submitted by the Proposers so as to be received at the Office of Procurement, Washington Metropolitan Area Transit Authority, Office of Procurement, **PRMT File Room 3C-02**, 600 Fifth Street, N.W., Washington, D.C. 20001 before the time and date listed in Section 00412 and 00413. Questions may be directed to the Contract Administrator.

DIRECTIONS FOR SUBMITTING OFFER: Read and comply with Section 00200, INSTRUCTIONS TO PROPOSERS. Proposal volumes shall be submitted in accordance with Section 00204. Proposal documents are contained in Section 00500, PROPOSAL FORMS AND SUPPLEMENTS.

The separate, sealed Proposal Volumes must be marked with offer under solicitation RFP NO. FN5008/FMP, Volume Number and Description. All amendments must be acknowledged on the Proposal Forms.

PROPOSALS MUST SET FORTH FULL, ACCURATE AND COMPLETE INFORMATION AS REQUIRED BY THIS REQUEST FOR PROPOSAL INCLUDING ANY AMENDMENTS.

NOTE TO PROPOSERS: THIS DOCUMENT IS NOT INTENDED TO BE A STAND-ALONE DOCUMENT AND IS TO BE CONSIDERED IN CONJUNCTION WITH THE PROJECT MANUAL: BOOK 1 - DESIGN/BUILD: RAIL YARDS EXPANSION PROJECT AT BRENTWOOD, GREENBELT, AND SHADY GROVE YARDS. ONLY THOSE AREAS OF REQUIREMENTS UNIQUE TO THE ALEXANDRIA OPTION ARE INCLUDED IN THIS APPENDIX A PROJECT MANUAL.

THIS PAGE NOT USED

00101 GENERAL STATEMENT OF WORK:

- A. This Appendix A to the Project Manual adds a separately-priced Option to the Shady Grove / Greenbelt Project for the Expansion of the Alexandria Yard. This work is to added as a priced Option to the Greenbelt /Shady Grove Project. The exercise of the Option is predicated on receipt of funding, Board approval, and environmental clearances. The scope of the Option will add 12 inspection and maintenance bays and extend the existing blow pit to support married pairs with necessary trackwork and expansion of Shop areas consistent with those to be performed at Shady Grove. The performance period is approximately 720 calendar days with work commencing upon exercise of the Option. The Option may be exercised at the sole discretion of the Authority within 270 calendar days of the award of the Greenbelt / Shady Grove Project. The target price established for the Alexandria Option is \$34 million.

END OF SECTION

THIS PAGE NOT USED

PROCUREMENT REQUIREMENTS

00200 INSTRUCTIONS FOR PROCUREMENT

- A. This solicitation is a competitive, "best value" selection process as described herein for the award of a Design-Build contract.
- B. This Section includes procedures with which proposers must comply and conditions affecting award of the Contract.

00201 GENERAL INSTRUCTIONS

- A. Method of Procurement:

This is a competitive, negotiated acquisition with a "best value" (Fixed Price / Best Design) selection process. Proposers shall submit separate proposal volumes in accordance with this Section, which the Authority will evaluate in accordance with the Authority's evaluation criteria as specified in this Section.

- B. Basis for Award:

The Alexandria Rail Yard Expansion Option will be evaluated separately for technical and price on a "fixed-price best design basis".

The Alexandria Rail Yard Expansion Option evaluations will be combined with those for the Greenbelt / Shady Grove Project to determine that Design-Builder who represents the best overall value to the Authority. The Brentwood Project will be evaluated and awarded separately, unless a combined award is determined to be in the best interests of the Authority. Proposers will be asked to provide a separate deduct amount to eliminate duplication of overhead and profit costs should the Brentwood Project be combined with the award of the Greenbelt / Shady Grove Project.

00204 PROPOSAL FORMAT, PROCEDURES AND EVALUATION FACTORS, AND INSTRUCTIONS

Volume 4: Technical Proposal, Alexandria Option				
Volume	Part	Title	Copies	Page Limits
4	A	Value of Design Solutions	6	N/A
4	B	WorkApproach/ScheduleCompliance	6	N/A
4	C	Management Resources	6	N/A

Volume 5: Price / Contract Proposal				
Volume	Part	Title	Copies	Page Limits
5	A	Alexandria Option Project Price w/ Detailed Narrative	6	N/A
5	B	Forms and Contractual Information	4	N/A

A. Since it is anticipated that multiple awards will result from this solicitation, Proposers must submit information requested under Phase Two separately as follows: Shady Grove and Greenbelt combined with Alexandria Option and Brentwood as a standalone project.

1. Value of Design Solutions

A. The RFP will describe several design and construction challenges or major activities that if not fully addressed would produce detrimental effects to the project. The proposers are required to address these and any other situations with detailed solutions that demonstrate that they understand the issues, have developed viable solutions and can implement these solutions in a timely manner to meet the schedule. These will include but are not limited to:

Alexandria Shop Expansion:

1. Contractor's approach to blow pit expansion:
 - Minimizing loss of blow pit service during the blow pit expansion.
 - Minimizing interference with track one operations.
 - Installing the raised grating in the existing and new blow pits.
2. Contractor's plans for expanding and extending various shop systems:
 - Replacement of compressed air plant while minimizing loss of service duration
 - Extension of electrical service without interrupting on going maintenance operations

- Expansion of heating, ventilation and plumbing into the new shop sections
- 3. Contractor's plans for modification of the yard signal control and interlocking system with minimal impact to ongoing operations and service reliability.
- 4. Contractor's plans for trackwork installation and realignment. Show phasing, staging and schedule to minimize impacts to the ongoing yard operations and service reliability.
- 5. Contractor's plans for construction of the west and east end sections with minimal interference with existing shop operations and work.
- 6. Contractor's approach to controlling dust, noise and particularly fume control when applying epoxy paint and while working in and/or adjacent to the active work areas of the shop and yard.

2. Work Approach / Schedule Compliance

No change.

3. Management Resources

No change.

B. Technical Proposal Instructions: The information provided should be complete and clearly presented. If the information requested under a factor is presented elsewhere in the proposal, the proposer should cross reference this information rather than duplicate it.

1. Complete, sign and submit the TECHNICAL PROPOSAL FORM (Section 00412)

C. Price Proposal Instructions: The information provided should be complete and clearly presented. If the information requested under a factor is presented elsewhere in the proposal, the proposer should cross reference this information that is provided elsewhere rather than duplicate it.

1. Instructions for Supplementary Items to Price Proposal

- a. Provide an estimated cash flow curve for the planned duration of the project showing the dollar values.
- b. Price proposals shall be supported by a detailed narrative which clearly explains the quality of design, construction, major equipment, etc. that is being offered in sufficient detail to permit a value analysis as well as cost information.

D. Oral Presentations:

1. The Authority reserves the right to schedule oral presentations. If oral presentations are scheduled, the oral presentations shall be requested only from proposers which have not been eliminated from the competition. The oral presentation shall address items and issues identified by the Authority. The oral presentation shall be provided by the proposed key members of the proposer's project team. Proposers' proposed major subcontractors/DBE representatives are also urged to attend. Total presentation time, including clarifications, shall be no longer than two hours with additional time allotted for technical discussions.
2. At its sole discretion, the Authority will schedule oral presentations at the Headquarters of the Washington Metropolitan Area Transit Authority at 600 Fifth Street, N.W., Washington, D.C. 20001. Requests from proposers to reschedule their oral presentations are discouraged. No rescheduling will be done unless determined necessary by the Authority.
3. If held at the Authority Headquarters, the presentations will be held in a conference room with conference room style seating. The Authority will provide only a projection screen.
4. Oral presentations shall be treated as a discussion.

END OF SECTION

PROCUREMENT REQUIREMENTS

00400 PROCUREMENT FORMS AND SUPPLEMENTS

This Section includes forms and supplements for submitting proposals.

00410 PROPOSAL FORMS

This Section includes Proposal Forms that are required to be submitted with the Offeror's Proposal.

00411 REQUEST FOR QUALIFICATIONS PROPOSAL FORM - NOT USED

THIS PAGE NOT USED

00412 TECHNICAL PROPOSAL FORM

DATE OF REQUEST: PHASE 2 - February 16, 2005

PROJECT: FN5008 METRO MATTERS: RAIL YARDS EXPANSION PROJECT, ALEXANDRIA
YARD OPTION

REQUEST FOR TECHNICAL PROPOSAL containing information requested herein shall be submitted by the Proposer so as to be received before: **2:00 p.m.** on **April 8, 2005** at the Washington Metropolitan Area Transit Authority, Office of Procurement, PRMT FILE Room 3C-02, 600 Fifth Street, N.W., Washington, D.C. 20001. Questions may be directed to the Contract Administrator, Fred M. Pohlmann at (202) 962-1529, FAX to (202) 962-6247.

In response to your Request For Technical Proposal for the above referenced Contract, the undersigned hereby proposes to furnish all labor, equipment and materials and perform all work to design and construct the Project in strict accordance with the Contract requirements for the consideration of the amount proposed on the Price Schedule under the Price Proposal. If awarded the Contract within the Proposal Acceptance Period, the undersigned agrees to execute the Design-Build Contract within 10 calendar days and to furnish, if required, performance and payment bonds on standard Authority forms with good and sufficient surety or sureties.

If the Contract is executed, the undersigned further agrees to commence the work within 10 calendar days after the receipt of Notice to Proceed and to complete the work within the time specified in the Contract.

The undersigned acknowledges receipt of the following amendments to the Request for Technical Proposal under RFP - FN5008/FMP (give number and date of each):

Amendment Number ____, dated _____.

Amendment Number ____, dated _____.

Amendment Number ____, dated _____.

Amendment Number ____, dated _____.

Note: Failure to acknowledge receipt of all amendments may cause the Technical Proposal to be considered not responsive to the request, which would require rejection of the Technical Proposal as unacceptable.

00430 PROCUREMENT FORM SUPPLEMENTS

This Section includes the Supplementary Proposal Forms that are required to be submitted with either the Technical Proposal or with the Price Proposal.

THIS PAGE NOT USED

00432 COMPLIANCE / EXCEPTION INFORMATION - **Submit with Technical Proposal**

Indicate whether the proposal submitted is intended to fully comply with the Requirements of this Request for Proposals, or if certain exceptions are taken. If exceptions are taken, the proposer shall clearly identify any exception to the requirements, terms, or conditions of any part of this RFP. Each exception must be specifically related to the particular part of the RFP to which the exception is taken. The proposer must support and explain the reason for any exceptions taken and explain the impact, if any, on the RFP requirements and state the necessity for or advantage of the exception.

Check one statement below. If exceptions are taken, explain the exceptions per the following instructions.

- The proposer certifies that its proposal is intended to comply fully with all Requirements.
- The proposer certifies that its proposal is intended to comply fully with all Requirements, except as noted (add additional sheets to explain).

00434 PRICE SCHEDULE - Submit with Price Proposal

A. DESCRIPTION OF WORK:

The Design-Builder shall Design and Build the Facilities satisfactorily completed for its intended use in the manner and at the locations set forth in the Requirements of the Project Manual and the Project Drawings of this solicitation, and in accordance with the Technical and Price Proposals as finally accepted by the Authority. The Design-Builder shall design the facility pursuant to the Authority's Design Criteria, and in full compliance with the Terms and Conditions of the Contract and the Rules and Regulations of the jurisdictional authorities, and shall construct the facility in strict accordance with the Final Design Specifications and Final Design Drawings and in full compliance with the Terms and Conditions of the Contract and the Rules and Regulations of the jurisdictional authorities.

Schedule F: ALEXANDRIA YARD OPTION

Item	Description	Unit	Amount
1	Sitework		
1-A	Demolition	LS	\$ _____
1-B	Earthwork	LS	\$ _____

SUBTOTAL Schedule F \$ 31,894,000

Schedule G: MISCELLANEOUS ALLOWANCES FOR ALEXANDRIA YARD OPTION

Item	Description	Unit	Amount
1	Partnering (Section 00890)	LS	\$ <u>20,000</u>
2	Disputes Review Board (Section 01260)	LS	\$ <u>86,000</u>
3	Minor Shop Equipment (Greenbelt Yard Only)	LS	\$ <u>1,500,000</u>
4	Spare Parts (Section 01780 1.07)	LS	\$ <u>500,000</u>

TOTAL Schedules F & G \$ 34,000,000

NOTES TO PROPOSERS:

1. The Contract(s) will be awarded to responsible contractor(s) on the basis of the proposal that provides the overall best value to the Authority in terms of design solutions, innovativeness, and technical factors based on an integrated assessment within the stated target price as shown in the Price Schedule for each Project. Multiple contracts will be awarded, however, it is required that proposals be submitted for both Projects and all items, therefore failure to submit an offer on all items may result in rejection of the proposal.
2. Unless otherwise specified, each LUMP SUM priced line item includes all labor, material, equipment, and other incidentals, ready for its intended use including, but not limited to, furnishing, installation and testing. The successful Offeror will be required to provide a detailed breakdown to the Authority Representative of all LUMP SUM items for payment purposes.
3. Schedule G of the Price Schedule is for items where a specific allowance is set-aside by the Authority for payment. This is an estimated amount subject to negotiation and is not guaranteed.

CONTRACTING REQUIREMENTS

00800 SUPPLEMENTARY CONDITIONS

This Section includes Modifications to the Section 00700 General Conditions for requirements unique to a specific project and are hereby incorporated into the General Conditions by reference to. This Section 00800, which specifies any modifications to the General Conditions, shall be read in conjunction with Section 00700 and which will be cited in the 00700 Section using the same last 2 digits of the Section number; i.e., a mod to Section 00724 is indicated as Section 00824.

00811 WORK BY DESIGN-BUILDER PERCENTAGE REQUIREMENTS

Modify General Conditions Section 00711, WORK BY DESIGN-BUILDER to delete Paragraph A. and substitute the following Paragraph:

- A. The Design-Builder shall perform, with its own organization, work equivalent to at least 15% for the construction work.

00825 PERIOD OF PERFORMANCE AND PROJECT SCHEDULE REQUIREMENTS

Modify General Conditions Section 00725, PERIOD OF PERFORMANCE AND PROJECT SCHEDULE to delete Paragraph A. and substitute the following Paragraph and subparagraphs:

- A. The Design-Builder shall perform, complete and advance all Work under this Contract in accordance with the following:
1. Interim Completion(s)
 - a. None.
 2. Final Completion after Option Exercise
 - a. Alexandria Yard Option NTP+ 720 calendar days
 3. See Section 00888 LIQUIDATED DAMAGES for Liquidated Damages associated with the Milestone(s) listed above.

b. PAID VACATIONS: Employees with one (1) year of service shall be entitled to a vacation of one (1) week; five (3) years of service are entitled to two (2) weeks; fifteen (10) years of service are entitled to three (3) weeks; twenty (20) years of service are entitled to four (4) weeks.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

In the listing above, the "SU" designation means that rates listed under the identifier do not reflect collectively bargained wage and fringe benefit rates. Other designations indicate unions whose rates have been determined to be

prevailing.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

- * an existing published wage determination
- * a survey underlying a wage determination
- * a Wage and Hour Division letter setting forth a position on a wage determination matter
- * a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour Regional Office for the area in which the survey was conducted because those Regional Offices have responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations

Wage and Hour Division

U.S. Department of Labor

200 Constitution Avenue, N.W.

Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

=====

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

In the listing above, the "SU" designation means that rates listed under the identifier do not reflect collectively bargained wage and fringe benefit rates. Other designations indicate unions whose rates have been determined to be prevailing.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

- * an existing published wage determination
- * a survey underlying a wage determination
- * a Wage and Hour Division letter setting forth a position on a wage determination matter
- * a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour Regional Office for the area in which the survey was conducted because those Regional Offices have responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations

Wage and Hour Division

U.S. Department of Labor

200 Constitution Avenue, N.W.

Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator

U.S. Department of Labor

200 Constitution Avenue, N.W.

Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board

U.S. Department of Labor

200 Constitution Avenue, N.W.

Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

WELDERS - Receive rate prescribed for craft performing operation to which welding is incidental.

=====

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

In the listing above, the "SU" designation means that rates listed under the identifier do not reflect collectively bargained wage and fringe benefit rates. Other designations indicate unions whose rates have been determined to be prevailing.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

- * an existing published wage determination
- * a survey underlying a wage determination
- * a Wage and Hour Division letter setting forth a position on a wage determination matter
- * a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour Regional Office for the area in which the survey was conducted because those Regional Offices have responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

=====
END OF GENERAL DECISION

THIS PAGE NOT USED

Serial Number: RFP-FN5008/FMP
Date of Issue: December 3, 2004
Proposal Due Date (Alexandria Option): April 8, 2005

**WASHINGTON METROPOLITAN AREA TRANSIT AUTHORITY
600 FIFTH STREET, N.W.
WASHINGTON, DC 20001**

March 30, 2005

**AMENDMENT NO. 5
TO**

**METRO MATTERS - Design/Build: Rail Yards Expansion Project
at Brentwood, Greenbelt, and Shady Grove Yards**

Phase II - Request for Technical / Price Proposals for the Alexandria Yard Option

CONTRACT NO. FN5008

TO WHOM IT MAY CONCERN:

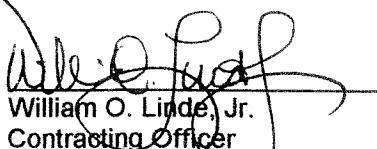

The proposal documents accompanying solicitation RFP-FN5008/FMP are hereby changed in part as follows:

1. The date established for Receipt of Proposals for the Alexandria Option is hereby extended to April 15, 2005 at 2:00 pm.
2. WMATA's responses to Proposer's Questions on the Alexandria Option received to date are attached.
3. Attached please find a separate Listing showing the additional information provided with this Amendment. Included under Item IX are revised drawings to reflect relocation of the wheel truing machine from Track 11 to Track 9A at Brentwood.
4. The Proposer's attention is directed to significant changes in Section 00262, Provision for Stipend and the addition of Supplemental Condition 00893, Steel Price Adjustment as reflected on the following revised and new pages:

Pg. 00200-29	Revised
Pg. 00800-15 to 00800-16	Revised
Pgs. 00800-16a to 00800-16c	New
Appendix A - Project Manual, Pg. 00400-11	Reissued
Appendix A - Project Manual, Pg. 00400-12	Revised

ACKNOWLEDGMENT

Offerors are required to acknowledge receipt of this amendment in writing on the Proposal Form in the space provided or by separate letter or telegram prior to the date established for receipt of proposals.

William O. Linde, Jr.
Contracting Officer
Office of Procurement and Materials

March 30, 2005

Note: For ease of reference, WMATA has indicated the Question Number as received from the Design-Builder in parenthesis at the end of each question (ex. DB ref. 22, if "a" is shown after number it refers to the Alexandria Option only).

Question 1: In reviewing the RFP documents, we were not able to locate As-Built documents which define the locations of existing utility lines. Sheets M255-206 and 207 indicate the as-built information for the train control and communications ductbanks. Sheet M215-103 indicates where the utility lines exit the existing shop, however we were not able to locate the routing of the lines outside of the building foot print. Can WMATA provide As-Built drawings indication the existing utility lines? (DB ref. 1a)

Answer: Reference Answer to Question 26. Additional as-built drawings for the Revenue Collection Facility Contract 1C0116 and the Central Maintenance Facility Contract 1C0115 are being included in this Amendment. With these two contracts and Contracts 1C0111 and 1C0113 provided in Amendment No. 4, all known as-builts have been provided.

Question 2: Can WMATA provide an electronic copy of the RFP drawings? (DB ref. 2a) (Similar to Question 28.)

Answer: Electronic copy included with this Amendment.

Question 3: We were not able to locate any geotechnical information for the Alexandria site. Item #1.05A of the Structural Program Criteria indicates that a Muesser Rutledge Subsurface Investigation Report was to be contained the RFP documents. We did not receive a copy of this report. Can WMATA please provide the geotechnical information? (DB ref. 3a)

Answer: No recent soils investigation has been conducted. Refer to Drawings M215-37 to M215-41 in the set of Section C-11b, Alexandria Service and Inspection Shop, drawings included with Amendment No. 4. Drawings contain soil boring information done at the time the Shop was constructed. Included with this Amendment one copy each of the following Mueser, Rutledge soils reports done at the time of the Alexandria Yard design and construction:

- Report No. 115, MRWJ Series, Section C011a, Huntington-Springfield Routes, Service and Inspection Yard, Subsurface Investigation, October 25, 1974.
- Report No. 116, MRWJ Series, Section C011a, Huntington-Springfield Routes, Service and Inspection Shop Building,

Subsurface Investigation, October 31, 1974.

Question 4: During a recent site visit to the Alexandria site, several questions were raised regarding the new inspection pit in Area 3A. These questions are as follows:

1. Sheet M1210-520 indicates that the existing stairs going down into the existing inspection pit are to be removed. During the site visit, we were informed that the platform East of the existing inspection pit was to remain. Is it really the intent to demolish the existing stairs into the existing inspection pit?
2. Sheet M1210-520 does not indicate new stairs between tracks 2 and 3 into the new inspection pits. During the site visit, the need to have stairs going from the platform West of the new inspection pit down into the new inspection pit. Please verify that a new stair shall be installed between the tracks for track #2 and track #3.
3. Sheet M1210-520 indicates that the existing wall along column line 20 to be demolished between tracks 2 and 3. During the site visit, it became apparent that this wall has structural concrete column supporting the roof steel on each end. In addition, this wall appears to have the controls for the existing stinger system. Is it really necessary to demolish this existing wall? (DB ref. 4a)

Answer:

1. Stairs will not be demolished. A revised Drawing M1210-520 reflecting this change is included with this Amendment.
2. New stairs will be installed between tracks 2 and 3. Revised drawing is being issued with this Amendment.
3. Yes, demolition of this wall is required for workflow transition and delivery of material to the pit.

Question 5: Note 1 on sheet M1210-520 indicates that "3rd rail servicing between tracks 2 and 3 to mirror 3rd rail servicing method in the existing building." During a recent site visit, we were unable to identify and 3rd rail service in the existing building. Does this requirement relate to providing stinger power in the new inspection pit similar to the stinger power in the existing inspection pit? (DB ref. 5a)

Answer: Yes, provide stinger power similar to existing operations.

Question 6: Section 1.06 of the Architectural Program Criteria states that "The design builder shall coordinate the procurement of equipment for the shops with WMATA's representative responsible for the purchasing of such equipment. The following equipment for each location shall be purchased using the specifications that follow, and is included within the Contract Documents."

Please Clarify that the Design-Builder is responsible for furnishing and installing the car maintenance equipment listed in section 1.06. (DB ref. 6a)

Answer: Design-Builder is responsible for furnishing and installing the car maintenance equipment listed in Architectural Program Criteria Section 1.06. Car Maintenance Equipment and installation shall be procured and installed in the same manner as the equipment and installation for the other three Metro Matters Shops.

Question 7: Sheet M1210-521 indicates that two of the truck repair hoists are future on the release track. Item 1.03.C.2.b indicates to "provide for two truck repair hoist to be installed in the future."

Please clarify what the Design-Builder's responsibilities are for these future truck repair hoists. Are we to provide blockouts in the concrete and electrical service to the area for these pits? Please clarify. (DB ref. 7a) (Similar to Question 40.)

Answer: The Design Builder shall provide all infrastructure required, (concrete pits, electrical power, etc) necessary to accommodate the installation of the lift at a later date. Lift manufacture shall supply a "street cover" designed and manufactured to allow for truck access over the future lift pits.

Question 8: The price schedule included in the RFP documents is a little misleading. The confusing items are as follows:

1. Item 3 appears to be a carryover from the Greenbelt Price schedule as we cannot locate any equipment numbers nor were we provided with a fixed equipment list.
2. It appears that Schedule G is also a carryover from the Greenbelt Price Schedule.

Please clarify if the Price schedule is correct as provided or provide a new price schedule. (DB ref. 8a)

Answer: Refer to Answer to Question 17. Revised Price Schedule addressing above question is being issued with this Amendment.

Question 9: Item 1.01.A.1 states that "the facilities will be designed to facilitate scheduled inspections, minor repairs, car cleaning, truck repair and replacement, and minor painting." Please define what minor painting will occur in this shop. Is any special ventilation requirements needed to accommodate the minor painting? (DB ref. 9a)

Answer: Paint booths or any special ventilation for painting is not included in the scope of work at this time.

Question 10: Item 1.03.C.3.b indicates that the Design Builder is to "provide restricted access to this space (blow pit)." Please clarify what is meant by restricted access? (DB ref. 10a)

Answer: Provision for restricted access is not required. Delete this requirement.

Question 11: On Page 0200-2 of the Alexandria Project Manual Book 1, Item 2 of the Value of Design Solutions requires a Contractor plan for "Replacement of compressed air plant while minimizing loss of service duration". Project Manual Book 2, Mechanical Design Criteria, Page 9, paragraph 1.11A.2 states "new compressors shall be rotary screw....." However, the existing plant appears to be in good working condition and according to the as-built mechanical drawings it consists of two (2) 75HP water-cooled compressors with summer cooling coils on the roof, and winter coils embedded in heating and ventilating unit HV-8. Can this plant continue to remain in long-term operation, and does the Design Builder have leeway to propose his best solution for overall compressed air needs, or is it a requirement to replace the existing compressed air plant? (DB ref. 11a)

Answer: The Design Builder has the option of proposing the best solution for the overall compressed air needs of the Alexandria Shop.

Question 12: On Page 2 of the Alexandria Project Manual Book, Architectural Design Criteria Item 5.a.1 requires that the three (3) vehicle lift systems shall be outfitted with body hoists and spinning posts. Please confirm that spinning posts are required on all proposed new lifts. (DB ref. 12a)

Answer: Confirmed. Spinning posts are required.

Question 13: Page 4 of the Mechanical Design Criteria states, generally, that the process piping shall be modified and expanded as required to accommodate the new additions. It is understood that a compressed air system will be required in the new spaces however, at the site visit it was evident that portable containers for waste oil, grease and lube oil systems were in use at Alexandria. No automated systems were found. Can the bidder assume there is no scope requirement for waste oil, grease and lube oil systems in the new spaces? If not, please provide a scope of work statement. (DB ref. 13a)

Answer: There are no requirements for waste oil, grease, or oil lube systems in the scope of work at this time.

Question 14: In order to properly analyze the capacity of the existing electrical system to determine expansion capability we would like to obtain the load demand

information for the Alexandria Shop. Specific information for only the shop building is desired. Since the VEPCO metering appears to be located within the traction power substation and apparently meters the shop and TP sub together, can WMATA supply utility, internal metering or billing information to help the bidders determine the expansion capacity of the existing electrical equipment? (DB ref. 14a)

Answer: See Answer to Question 51. The Dominion-Virginia Power system is different from PEPCO's system where WMATA has metering at various facilities. The Dominion-Virginia Power design is called a loop system where WMATA has two metering locations with two feeders per meter (therefore 4 feeders) that serve the entire segment from the Alexandria Yard to Franconia/Springfield. Each delivery point (i.e. station, traction substation, shop) has two feeds one from each metering location. WMATA has billing data for each metering point but unfortunately we can't specifically allocate electrical consumption and demand by each facility.

Question 15: The proposed shop lead tracks shown in the RFP documents are short and do not appear to be in compliance with the WMATA design criteria. Our investigation indicates that a fully compliant geometric design may not be possible given the site constraints? A short tangent length in front of the shop will require a wider opening of the shop doors to account for vehicle overhang. Also, given the short length of the lead tracks trains accessing the shop will appear to foul the existing lead ladder track until the trains are completely within the building. Is it safe to assume that WMATA will accept this operational condition?

Since we were not provided with geometric mathematization for the trackwork in the RFP, it appears that the "diagonal" shop lead track has limited clearance to the revenue control building tracks. Is this clearance acceptable? Will these tracks need to be relocated to accommodate the new proposed tracks? (DB ref. 15a)

Answer: WMATA is aware that Alexandria will not have a fully compliant geometric trackwork design, similar to Shady Grove, and is willing to accept this. WMATA will work with the Design-Builder to verify the alignment and grant the required waivers. Amendment 5 includes revisions to Drawing C11-A-04 (M1210-521) widening the overhead doors.

Question 16: The RFP package for the Alexandria site did not provide any preliminary stormwater requirements. According to the City of Alexandria any site that will have improvements made to an existing facility without stormwater controls currently in place will require that controls (ie. SWM pond, underground storage) be constructed to account for both new and existing drainage areas. In reviewing the site plans their may not be enough room

on the site to construct adequate stormwater management. Does WMATA have an agreement or can you obtain a waiver with the city or state that will allow for this site to be improved without on-site quantity and/or quality controls for new and existing stormwater drainage? (DB ref. 16a)

Answer: WMATA is initiating a SWM report for Alexandria, similar to what we did for the other three sites, and this subject will be discussed with the City.

Question 17: In Amendment #4, the Price Schedule (section 00434), lists an Item #3 under the Schedule F (Major Shop Equipment) and Item #3 on the Schedule G (Minor Shop Equipment) that appear to have been copied from the Greenbelt Price schedules. Please verify that this is correct, or revise these items on the price schedule to reflect the Alexandria project. (DB ref. 147)

Answer: Item #3 in Schedule F will be revised. Item #3 in Schedule G will be deleted. Revised pages are included in this Amendment.

Question 18: No "Fixed Equipment List" has been provided for the Alexandria project. Please provide, or confirm that no additional equipment is needed beyond what is described in the Architectural Program Criteria. (DB ref. 148)

Answer: No additional shop equipment is required beyond what is listed in the Architectural Program Criteria.

Question 19: The Architectural Program Criteria for the Alexandria project lists a Steam Cleaner Pressure Washer System (paragraph 1.06.A.5). This item was deleted from the other projects in Amendment 4, Question 4. Please verify that this item is not to be included with this option pricing, or provide additional technical information describing the requirements of this system. (DB ref. 149)

Answer: Steam Cleaner Pressure Washer is to be included, Better Engineering Model T-7000P or equal.

Question 20: Please clarify if there are any schedule constraints or suggested staging notes and/or sequences. (DB ref. 150)

Answer: West side construction to be completed before east side starts. Blow pit construction to be expedited to minimize down time.

Question 21: Please clarify the location of the proposed contractor's staging area. (DB ref. 151)

Answer: Staging area is limited. The triangle southwest of the shop where the Alstom trailers are located will be available. Also the ballasted area on the east side of the shop between track 3 and 4. Access can be provided across tracks 4, 5 and 6. Other than these areas nothing can be guaranteed. The area on the corner of Bluestone Road and Eisenhower Avenue, is a possibility but it may have environmental ramifications and will require further investigation.

Question 22: Please clarify the proposed location for the new dust collector for the Blow Down Pit extension. (DB ref. 152)

Answer: Dust collector may be located on roof or at any appropriate location that conforms to and complements the design.

Question 23: Drawing C11-A-05 indicates "insulating concrete roof fill". Please clarify if this is a project requirement, or are we able to use alternative roofing systems? (DB ref. 153)

Answer: Other approved roofing systems, as described as described in Project Manual Book 2 of RFP FN5008/FMP, will be considered by the Authority.

Question 24: The Architectural Program Criteria indicates that the entire blow pit platform shall have a "brush type edge seal". Please provide us with technical specifications for this product. (DB ref. 154)

Action: Included with Amendment on CD #1 is an electronic photo of a brush type seal. More information can be obtained on the Internet searching for "brush type seal". Refer to web sites such as Precision Brush or Memtech.

Question 25: The Architectural Program Criteria indicates that metal framed skylights are included in the project. Please clarify the extent of the metal framed skylights. (DB ref. 155)

Answer: Layout and spacing of new metal framed skylights to match existing. See as-built drawing C11b-A-5.

Question 26: Please provide us with drawings for the site improvements west of the existing service and inspection shop. We believe that this area was constructed with the Revenue Collection Facility Building contract. We would require the civil/site drawings in particular. (DB ref. 156)

Answer: Issued with this Amendment on CD #1 are electronic files in TIF format for the following as-built drawings:

- Revenue Collection Facility Contract 1C0116: Control,

General, Paving & Restoration, Survey Plot, Utilities, Trackwork, Landscape, Soils, Cover Sheet and Index drawings

- Cental Maintenance Facility Contract 1C0115: Complete as-built set of drawings.

Question 27: Please provide updates if any initial storm water management plans or design have been developed. In addition, provide any meeting minutes with Authorities. (DB ref. 157)

Answer: To date no Storm Water Management plans or studies have been developed or undertaken. There has been no coordination with jurisdictional authorities or utilities.

Question 28: Please provide us with an electronic copy of the complete RFP documents associated with the Alexandria Yard option. (DB ref. 158) (Similar to Question 2.)

Answer: Electronic copy is provided as an attachment to this Amendment on CD #1.

Question 29: The bid form Schedule F, item 4 lists Environmental Mitigation. Please clarify the scope of the environmental mitigation. Have any environmental site assessments been performed? Are soil contaminates known to exist? (DB ref. 159)

Answer: Environmental site assessments have not been performed to date, but are planned in the near future.

An electronic copy in PDF format of the Consolidated Plan (Hazardous Waste Contingency Plan; Spill Prevention, Control and Countermeasures Plan; and Stormwater Pollution Prevention Plan) for Alexandria Yard dated January 21, 2002 is included with this Amendment on CD #1. Similar Plans were provided for other three Yards.

Question 30: Please clarify where we are to relocate the existing salt dome. (DB ref. 160)

Answer: Salt dome does not have to be relocated. Drawing C11-C-01 (M1210-513) and C11-C-02 (M1210-514) will be revised to delete the proposed parking spaces immediately west of the salt dome and the curb work on its east side. Drawing are being reissued with this Amendment.

Question 31: The note on drawing C11-A-02 states to "Relocate (E) dust collector". The existing dust collector does not appear to be in adequate condition for it to

be cost effective to relocate this equipment. Please verify that we are to provide a new dust collector and "remove" the existing dust collector. (DB ref. 161)

Answer: Design-Builder to recommend to the Authority whether or not the dust collector should be relocated or replaced based on condition of equipment and cost-effectiveness.

Question 32: During our recent site visit, it was mentioned that "employee welfare areas" may be added to the current scope of this project. Please clarify if any "employee welfare areas" will be included in the project at this time. (DB ref. 162)

Answer: No employee welfare areas are included in the scope of work for this proposal at this time.

Question 33: Regarding the modifications to the existing truck elevator to accommodate truck access from the new expansion, please confirm that all modifications will occur at the top platform level only. Confirm that the lower platform will not be modified to receive trucks from the direction of the new expansion. (DB ref. 163)

Answer: It is the intent of the Authority that the truck elevator be accessible from the proposed release track in the new expansion. The Design Builder will be required to modify the elevator, including the lower platform, as necessary, to accommodate trucks from the new expansion.

Question 34: Regarding access to build the Inspection Pit Area Expansion at the east end of the facility, please confirm that it is acceptable to build a ramp from the adjacent parking lot and construct grade crossings on Tracks 4, 5, and 6. (DB ref. 164)

Answer: Accommodation will be made for the Design-Builder to access the work area from the adjacent roadway crossing tracks 4, 5 and 6. An approved construction phasing plan will be required.

Question 35: Regarding access to build the Blow Pit Area Expansion and the Truck & Body Hoist Area Expansion at the west end, please confirm that the existing temporary trailers will be relocated by others. (DB ref. 165)

Answer: Temporary trailers to be relocated by the Design-Builder. Current plans are to relocate the trailers from their existing location to the triangle just across the by-pass track next to the salt dome. WMATA will extend the electric and telephone service. No water or sewer hook-ups are needed.

Question 36: Are the existing light poles that conflict with the new expansions to be demolished and disposed of or salvaged and turned over to WMATA? (DB ref. 166)

Answer: Salvage if in good, re-usable condition. Design builder may re-use existing poles as necessary to maintain adequate yard lighting per the Authority's Design Criteria.

Question 37: Are there any additional security measures required at the Alexandria Yard because it also includes operations associated with revenue collection? (DB ref. 167)

Answer: No additional security measures required other than what is already specified.

Question 38: The as-built drawings show that the current inspection pit area was designed and built to accommodate a "future" center platform. Please confirm that we are not to include any provisions for a "future" center platform (ie footings). (DB ref. 168)

Answer: Confirmed

Question 39: We have been unable to find where the Civil Program Criteria requires the Design Build team to provide the track design required for the Alexandria Yard. Please clarify if the Design Build team is responsible for the complete and final design of the track for this option. (DB ref. 169)

Answer: Design-Builder responsible for complete and final design of all aspects of the Alexandria Shop expansion which will include track, traction power and train control. (Also reference Answer to Question 15.)

Question 40: Drawing C11-A-04 shows two future truck hoist openings. Please clarify what we are to provide to cover the opening so that the Release Track may extend through the pits. (DB ref. 170)

Answer: The Design Builder's Truck Hoist manufacturer shall supply a pre-manufactured street plate with running rails to cover pits of future truck hoist. (Also, reference Answer to Question 7.)

Question 41: On the north side of Track No. 2 in the Blow Pit Extension area, there will be a large gap between the new wall on column line C and the north side of the train. Is there a requirement to seal the north car side in the new Blow Pit Extension? If so, please provide us with additional information describing this condition. (DB ref. 171)

Answer: North side of track 2 blow pit to be sealed (with brush type seal) at the elevated platform level. It is the intent of the Authority to replace the existing bladder seal in the existing blow pit with new brush type seals to match the proposed seals to be used in the blow pit expansion. See Sheet. C11-A-05 for cross section. Drawing C11-A-02 will be re-issued in this amendment to show edge of platform. (Also reference Answer to Question 24.)

Question 42: There appears to be an existing sanitary line that was abandoned on the west side of the facility. When this line was abandoned, was the pipe filled? (DB ref. 172)

Answer: No further information is available regarding abandoned Sanitary Sewer at this time.

Question 43: At the Posted Rail Expansion shown on drawing C11-A-03, a drawing note indicates that we are to demolish the existing walls and stairs. Please verify that the existing stairs at the east end of the existing pits are to be removed. (DB ref. 173)

Answer: Existing stairs to remain. Revised drawing is being issued in this amendment.

Question 44: In the Yard Signal Program Criteria, page 3; para 1.04.B.6.b, the narrative describes a new Track 3AE at the East end of Shop Building. The narrative also describes replacing existing Signals 226, 228 & 230 because of this new Track 3AE. We have been unable to locate Track 3AE on the drawings. Please verify that there is no new Track 3AE and the existing Signals are to remain as is, if they don't interfere with the new Inspection Pit Expansion. (DB ref. 174)

Answer: There is no track 3AE on east side of the Alexandria shop. Only track work required is to support a two bay shop expansion on the east side. Design Builder shall modify track work, signals and traction power as necessary to accommodate a two bay expansion as shown on drawing C11-C-03 and C11-A-03. Alexandria Yard Signal Program Criteria has been revised to reflect this and is being reissued with this Amendment.

Question 45: Drawing C11b—52, Partial First Floor Plan-Segment 1-HVAC, shows existing below grade asbestos cement duct along column line C1 and column line 1. Partial Plan Blow & Inspection Pits-Segment 1-HVAC shows asbestos cement duct below the concrete floor slab parallel to column line 4. Since we are modifying the dust collection system are we to demolish the existing acid wash slabs and ground floor slabs to abate all the existing asbestos cement duct? Can the existing undisturbed asbestos cement duct

remain in place since it is inaccessible? (DB ref. 175)

Answer: Abatement of asbestos is only required when it is disturbed.

Question 46: Reference drawings C11b—52, 53, and 54 which show an existing 16" and 12" diameter asbestos cement duct running below the concrete slab on grade and parallel to column line C1 from column line 5 to column line 17. Are we to abate this existing asbestos cement duct? Please confirm. (DB ref. 176)

Answer: Abatement of asbestos cement duct is only required if disturbed. If construction doesn't require its disturbance, abatement is not required.

Question 47: On drawing C11b—1, Note 11 indicates that all underdrain piping shall be perforated asbestos cement. Drawing C11b—9 shows underdrain along the perimeter of the foundation wall. Please clarify if we are to abate the underdrain beyond the limits that we disturb. Please clarify if the underdrain system is to extend around the new shop expansion. (DB ref. 177)

Answer: Abatement of asbestos cement underdrain is only required if disturbed. No need to abate beyond limits of disturbance.

Question 48: Will parking for construction workers be allowed on the site? Could the existing areas in the far northeast and southwest corners of the WMATA property be temporarily converted to surface parking lots if they are fully restored upon completion? (DB ref. 178)

Answer: There is no space in the Yard for construction workers to park, except what would be available in the Design-Builders staging area. One possibility is to construct the 21 spaces in the program first and use them, keeping in mind that the triangular area where this new parking is to go is where the Alstom trailers will be relocated to. Another possibility is to park at the end of Bluestone Road, but this would have to be cleared with City of Alexandria, which currently enforces a two-hour limit for parking there. Track and Structures (TRST) has plans for the area in the far northeast corner which it will be implementing soon. The area in the far southwest corner outside the Yard loop track on the corner of Bluestone Road and Eisenhower Avenue, is a possibility, but it may have environmental ramifications and will require further investigation.

Question 49: The Mechanical Program Criteria specifies the use of an Automated Energy Management System (AEMS) but the existing drawing show pneumatic control of the existing equipment. Please clarify the following:

- Is there an existing automated energy management system?

- What is the existing system if there is an existing one?
- Will the existing system be able to interface with any other system?
- Is there any existing AEMS in any other site?
- Will it require remote communication and communication with the main office or among sites? (DB ref. 179)

- Answer:
1. There is an existing system call the AEMS currently monitoring power usage throughout the Metro system. The system also monitors and controls station HVAC, elevators, escalators, generators, lighting, etc.
 2. The existing system is a SCADA system manufactured by QEI providing control, status and analog functions.
 3. The system can be interface with other systems thru standard protocols such as Modbus. For this project, a digital interface will be required to the Allen/Bradley controller for all new elevators. All other equipment interfaces can be accomplish thru discreet wiring or a standard digital interface.
 4. There are existing AEMS RTU's at Shady Grove, Greenbelt and Alexandria Yard S & I shop. There is no RTU at Brentwood; it will have to be supplied by WMATA. The new buildings will require new RTU's to be provided by the Design-Builder.
 5. Communications from the RTU to an existing COMM room in the S&I shop will be required.

Question 50: Please confirm that the existing Dominion Power overhead 34.5KV power line located west of the existing shop building will be relocated by others in a timely manner that will not affect the construction schedule of the new shop addition. (DB ref. 180)

Answer: Existing Dominion Power line will be relocated under a WMATA work authorization prior to the Design-Builder starting work.

Question 51: From our site visits and electrical load calculations, it appears that the existing electrical rooms and equipment are not adequate to support the added electrical loads from the proposed expansions. Has WMATA had any meetings with Dominion Power to discuss the proposed expansion? Has WMATA preformed any calculations or load tests? Do you have an actual demand history? Is there any as-built information available on the incoming electrical service? (DB ref. 181) (Similar to Question 14.)

Answer: WMATA has not met with Dominion Power to discuss this matter.

WMATA's consultant is currently performing a load analysis.

The Dominion-Virginia Power system is different from PEPCO's system where WMATA has metering at various facilities. The Dominion-Virginia Power design is called a loop system where WMATA has two metering locations with two feeders per meter (therefore 4 feeders) that serve the entire segment from the Alexandria Yard to Franconia/Springfield. Each delivery point (i.e. station, traction substation, shop) has two feeds one from each metering location. WMATA has billing data for each metering point but unfortunately we can't specifically allocate electrical consumption and demand by each facility.

Available as-built information has been provided. WMATA will double-check with the Alexandria facility to see if something was missed.

Question 52: The Architectural Program Criteria, page 6; para 3.c states that "the entire blow pit floor shall be constructed and renovated to provide a non-conductive grating walking surface over a new concrete floor." Are we to remove the entire 1'-0" thick mat in the existing blow pit and repour a new concrete mat? (DB ref. 182)

Answer: Yes. The intent of the current criteria includes renovation of the existing blow pit floor, which would require removal of the existing concrete blow pit floor.

Question 53: As a follow-up to the RFI above, the Architectural Program Criteria, page 6; para 3.c also states that "the non-conductive walking surface shall be a constant 5'-0" below the top of the rail." The current shop floor is located 5'-0" below the top of the rail. In order to comply with this requirement, the entire existing slab must be removed and repoured at a lower elevation. This lowering of the slab will conflict with the existing footings that are supporting the center platform. This seems to be a costly and unique requirement (this is not a requirement at any of the other shops). Please verify that this is indeed the intent that you require for this space. (DB ref. 183)

Answer: This is the current intent for Alexandria and also Shady Grove, and should be included in the proposal. It could be reviewed in the future pending cost and schedule impacts.

be used post-award if such is determined to be in the best interests of the Authority. They will not be used for technical leveling of the proposals prior to award.

- # Designs of unsuccessful proposers who choose to accept the stipend payment may be used after selection on a best design basis has been completed and prior to actual award, but will not be used as part of the evaluation process for selection of the awardee.

Proposers will be required to indicate whether or not they will be accepting the stipend payment as part of their Final Proposal Revisions. #

END OF SECTION

SUBMITTAL PROCEDURES a certificate of compliance with the Fly America requirements. The Design-Builder agrees to include the requirements of this Paragraph in all subcontracts that may involve international air transportation.

L. Seismic Safety:

The Design-Builder agrees that any new building or addition to an existing building will be designed and constructed in accordance with the standards for Seismic Safety required in Department of Transportation Seismic Safety Regulations 49 CFR Part 41 and will certify to compliance to the extent required by the regulation. The Design-Builder also agrees to ensure that all work performed under this Contract including work performed by a subcontractor is in compliance with the standards required by the Seismic Safety Regulations and the certification of compliance issued on the project.

M. Energy Conservation:

The Design-Builder agrees to comply with standards and policies relating to energy efficiency which are contained in the state energy conservation plan issued in compliance with the Energy Policy and Conservation Act.

N. Recovered Materials:

The Design-Builder agrees to comply with all the requirements of Section 6002 of the Resource Conservation and Recovery Act (RCRA), as amended (42 U.S.C. 6962), including but not limited to the regulatory provisions of 40 CFR Part 247, and Executive Order 12873, as they apply to the procurement of the items designated in Subpart B of 40 CFR Part 247.

00893 STEEL PRICE ADJUSTMENT (Added by AM 5)

- A. A price adjustment clause is included in this Contract to provide additional compensation to the Contractor or a credit to WMATA for fluctuations in steel prices. This price adjustment is dependent upon either: an increase or decrease in the price of steel used in the production of products utilized on this project or an increase or decrease in the ratio of the Bureau of Labor Statistics - Producer Price Index listed below. Payment or credit for steel price adjustment will be evaluated under the following conditions. Payment or credit will be made under the Contract Pay Item: Provisional Sum - Steel Price Escalation.

- B. The conditions of this provision are as follows:
1. This provision shall only apply to material cost changes that occur between the date of bid opening and the date of certified invoice. The Contractor is expected to order materials promptly upon Notice to Proceed (or upon shop drawing approval) and take possession of materials as quickly as reasonably possible.
 2. A price adjustment to provide additional compensation to Contractor will be considered and paid only where the price increase in steel is due to market conditions beyond the control of Contractor and its suppliers or vendors. No adjustment is allowed under this provision for increases due to any other cause or peril (including, but not limited to, strike, weather, vendor backlog, and delay in fabrication). If a price adjustment is sought under this provision, the Contractor shall certify to WMATA that the price increase was due solely to market conditions beyond its control or that of its suppliers and that Contractor exercised its best efforts to mitigate any price increase. WMATA reserves the right to verify the accuracy of such certification as a condition of payment.
 3. This price adjustment clause only applies to structural steel, reinforcing steel, post tensioning steel and anchors, rail, steel excavation foundation support elements, and miscellaneous guideway steelwork including handrail elements and OCS pole anchor plates and bolt assemblies. To be considered, the category of material must have a total dollar value of \$25,000 or greater.
 4. The Contractor shall submit, within 10 days of Notice of Award, the fabricator's or Supplier's material price quotes for the items listed above that meet the requirements of Paragraph B.3. The Contractor must certify that they are the actual quoted prices incorporated into the Contractor's bid (or proposal) amount submitted to WMATA for the represented pay item. WMATA has the right to inspect the Contractor's bid (or proposal) preparation documents to verify the accuracy of such certification. Assuming such certification is accurate, these certified quotes will constitute the baseline steel material price. The quote must clearly identify the pay item(s) by number and description, describe the weights of the steel material, how the steel material will be utilized in the final project, and a breakdown of all costs including material, labor, equipment, overhead and profit. This steel price escalation provision shall only apply to the steel component of the material quote. It shall not apply to any other materials used in the fabrication of an item supplied to the Contractor.
 5. For the items listed above that meet the requirements of Paragraph B.3,

the increase or decrease in the steel materials unit cost must be in excess of 5 percent of the original quoted prices or the Producers Price Index (PPI) as described below, for a price adjustment to the Contract to be allowed.

6. If there is an increase or decrease in steel materials cost in excess of 5 percent from the original quoted unit prices (or the PPI as described in Paragraph E below), WMATA will evaluate and determine an increased or decreased payment(s) under this Contract as follows:

The adjustment will be determined by computing the mathematical difference between the unit price which is 5 percent above (or below or decreases in price) the base unit price (bid quote) and the actual invoice unit price of the steel component. The final dollar value will be determined by multiplying this adjustment by the represented quantity of steel.

- C. The Contractor shall submit to WMATA certified invoices as soon as steel material is purchased. The invoices shall be listed in chronological order and contain a tabulation of quantity, the order date, the date shipped from the steel manufacturer, and the price per unit weight (reflecting all deductions from quantity shipments) with a breakdown as stipulated in Paragraph B.4 above. Freight charges shall be listed separately and are not included in this price adjustment. These invoices shall be subject to audit verification.
- D. WMATA will verify the increased or decreased percentage between certified original quote and the actual invoice payment.
- E. This change shall be supported by the U.S. Department of Labor - Bureau of Labor Statistics index entitled "Producers Price Index". The values contained in the PPI are subject to revision 4 months after original publication. The price adjustment for steel shall be a function of the percentage of change to the price index for "Carbon Steel Scrap" Series ID WPU101211. Do not use seasonally adjusted indices. This index is available on the internet at: <http://data.bls.gov/labjava/outside.jsp?survey=wp>.
- F. The Producers Price Index (PPI) listed above must increase or decrease by at least 5 percent over the same time period for Paragraph B.4 to be valid.
- G. For price increases, if the invoiced price increase, expressed or decrease by at least 5 percent over the same time period for Paragraph B.4 to be valid.
- H. For price increases, if the invoiced price increase, expressed as a percentage exceeds the PPI increase, expressed as a percentage, for the same period, the adjustment will be based on the PPI percent increase; if the invoiced price

increase, expressed as a percentage, is less than the PPI increase, expressed as a percentage, for the same period, the adjustment will be based on the invoiced price increase.

- I. For price decreases, if the value of the invoiced price decrease, expressed as a percentage, is greater than the calculated value of the PPI decrease, expressed as a percentage, for the same period, the adjustment will be based on the value of the invoiced percent decrease. If the value of the invoiced price decrease, expressed as a percentage, is less than the value of the PPI decrease expressed as a percentage, for the same period, the adjustment will be based on the PPI percent decrease.
- J. If the PPI controls in determining the price adjustment, WMATA will review the PPI 4 months after initial publication to ensure that the data have not been revised. Final payments will be adjusted accordingly.

K. Adjustment Formulas:

1. If Invoice Price Controls:

a. Price Increase:

$$(1) \text{ Factor} = (PC/PB - 1.05)$$

If Factor is equal to or less than 0.0, no adjustment will be made.

If Factor is greater than 0.0, continue: $PA = \text{Factor} \times Q \times PB$

b. Price Decrease:

$$(1) \text{ Factor} = (PC/PB - 0.95)$$

If Factor is equal to or greater than 0.0, no adjustment is made.

If Factor is less than 0.0, continue: $PA = \text{Factor} \times Q \times PB$

Where: PA= Steel manufacturing price adjustment, in lump sum dollars
PB= Fabricator/supplier quoted price in bid (converted to dollars per pound)
PC= Current certified invoice price (converted to dollars per pound)
Q= Quantity of manufactured steel, in pounds

2. If PPI controls:

a. Price Increase

$$(1) \text{ Factor} = (IC/IB - 1.05)$$

If Factor is equal to or less than 0.0, no adjustment is made.

If Factor is greater than 0.0, continue: $PA = \text{Factor} * Q * PB$

b. Price Decrease:

(1) Factor - $(IC/IB - 0.95)$

If Factor is equal to or greater 0.0, no adjustment is made.

If Factor is less 0.0, continue: $PA = \text{Factor} * Q * PB$

Where: PA = Steel manufacturing price adjustment, in lump sum dollars

PB = Fabricator/supplier quoted price in bid (converted to dollars per pound)

IB = BLS PPI index at the time of bid

IC = BLS PPI index at the time material is purchased from mill (invoice date; after final US DOL BLS adjustments)

Q = Quantity of manufactured steel, in pounds

END OF SECTION

00434 PRICE SCHEDULE - Submit with Price Proposal

A. DESCRIPTION OF WORK:

The Design-Builder shall Design and Build the Facilities satisfactorily completed for its intended use in the manner and at the locations set forth in the Requirements of the Project Manual and the Project Drawings of this solicitation, and in accordance with the Technical and Price Proposals as finally accepted by the Authority. The Design-Builder shall design the facility pursuant to the Authority's Design Criteria, and in full compliance with the Terms and Conditions of the Contract and the Rules and Regulations of the jurisdictional authorities, and shall construct the facility in strict accordance with the Final Design Specifications and Final Design Drawings and in full compliance with the Terms and Conditions of the Contract and the Rules and Regulations of the jurisdictional authorities.

SECTION 10600

STORAGE RETRIEVAL SYSTEM

PART 1 - GENERAL

1.01 DESCRIPTION:

A. The general extent and scope of work to be performed under this Section consist of the furnishing and installation of a storage and retrieval system, including storage equipment noted below, in the new Component Parts Storage rooms at the Greenbelt Annex and the Shady Grove Shop. The existing storage and retrieval system in the Greenbelt Shop may be dismantled and reused in the Shady Grove Shop with modifications as necessary to generally conform to the requirements of this specification.

1. Storage and Retrieval System
2. Storage Cabinet, Drawer Type, 8-Drawer
3. Storage Cabinet, Drawer Type, 10-Drawer
4. Storage Cabinet, Drawer Type, 6-Drawer
5. Storage Cabinet, Drawer Type, Double Wide
6. Cabinet, Tool Lock-Up
7. Cage, Gas Cylinder
8. Shelving Unit, 18 in. Deep
9. Pallet rack (4'x9')
10. Storage Cabinet
11. Safety Storage Cabinet

B. The provisions of Section 11001, Equipment General Requirements, apply to work of this Section.

1.02 QUALITY ASSURANCE:

A. Experience: Equipment shall be produced by a manufacturer of established reputation with a minimum of five years experience supplying specified equipment.

B. Manufacturer's of drawer cabinet units shall provide documentation from an independent testing laboratory, certifying that the drawer suspension system has been tested under full rated load conditions and has experienced an average of 3,000 cycles without failure.

C. Reference Standards:

1. ANSI - American National Standards Institute
2. OSHA - Occupational Safety & Health

1.03 SUBMITTALS:

A. Submit the following for approval in accordance with the General Requirements and with the additional requirements as specified for each:

1. Certificates: Fourteen days prior to shipment, submit four copies of certification that equipment to be delivered is in compliance with applicable codes

2. Shop Drawings: In accordance with the requirements of Section 01330; Design Construction Submittal Procedures, submit six copies of complete shop drawings to the Authority for approval, including but not limited to:
 - a. Equipment arrangement
 - b. Equipment outline dimensions
 - c. Assembly and subassemblies
 - d. Air systems
 - e. Wiring diagrams and schematics
 - f. Installation

3. Operations and Maintenance Manual: Submit in accordance with the requirements of General Conditions, Section 01780; Closeout Submittals.

4. Operations and Maintenance Training: Submit in accordance with requirements of General Conditions, Section 01820; Demonstration and Training, and Section 11001; Equipment General Requirements

5. Contract Record Drawings: Submit in accordance with the General Requirements, Section 01330; Design Construction Submittal Procedures, and Section 01780, Closeout Submittals.

1.04 DELIVERY, STORAGE, AND HANDLING:

- A Ship equipment upon notification by the Engineer.
- B Package, handle and store to prevent damage

1.05 WARRANTY

- C Furnish warranty for the work in this Section in accordance with the General Conditions.
- D Provide a Manufacturer's full service, parts and labor, warranty for a period of 3 years from date of acceptance by the Authority.

1.06 TRAINING PROGRAM:

- A Design Builder is responsible for training as outlined in General Requirements Section 01820; Demonstration and Training, and Section 11001; Equipment General Requirements
- B Number of Personnel to be Trained and class size:

Level of Training	Approximate Number of Individuals to be Trained	Maximum Class Size	Minimum Number of classes
Level I	8	8	1
Level II	4	4	1

PART 2 - PRODUCTS

2.01 STORAGE RETRIEVAL SYSTEM:

- A. General: This specification covers a storage retrieval system employing 1) integral lifting forks mounted on top of 2) variable location racks which accept 3) removable steel pallets. It includes the physical and mechanical requirements of that equipment, as well as the engineering assistance to be supplied by the vendor.
- B. Features and Construction
1. Storage racks
 - a. The storage rack shall have a maximum capacity of 25,000 pounds per section and 50,000 pounds per bay.
 - b. The overall height of the storage rack shall be 13'-0"
 - c. The clear opening between columns shall be 1 ½" greater than the pallet width.
 - d. The overall depth of each rack shall be 1 ½" greater than the pallet depth.
 2. Columns
 - a. Columns shall be accurate and straight.
 - b. Columns shall be 13'-0" long.
 - c. Roll formed front columns shall be a minimum of 3 ½" wide (left to right) by a minimum 2 ½" deep by a minimum 12 gauge thick steel and shall rest on a 5 ½" by 8" (minimum of 44 sq. in.) Bearing pad
 - d. Formed rear columns shall be a minimum 7-7/8" wide (left to right) by a minimum 2-5/8" deep by a minimum 10 gauge steel and shall rest on a 5 ½" by 8" (minimum of 44 sq. in.) Bearing pad
 - e. Each bearing pad shall be anchored to the floor with a minimum of two ½" diameter expansion anchors.
 - f. Each bearing pad shall have a minimum ½" diameter leveling screw, independent of the anchors, with a vertical adjustment of 5/16" minimum.
 - g. Each column shall have pallet retainer notches spaced a maximum of 3-7/8" on center.
 - h. The notches on the front columns shall be hooked for positive pallet engagement, while the notches on the rear columns shall be designed to facilitate loading and unloading without resistance or snagging.
 - i. Column spacing shall be a maximum of 5" on center greater than the pallet width.

3 Bridge Assembly

- a. The bridge assembly shall run on rails mounted lengthwise on the top of the storage rack and shall support the trolley and mast assemblies free and clear above the floor.
- b. The bridge shall be constructed of rectangular welded box construction using 6" x 12 pound/ft wide flange beam construction and shall be capable of supporting 2,000 pounds live load.
- c. The bridge wheels shall be 9" diameter double flange type with needle roller bearings with pressure grease fittings.
- d. A rail sweep shall be mounted in front of each wheel for derailment protection.
- e. Bridge shall have a cantilevered extension at one end.

4 Trolley Assembly

- a. The trolley assembly shall run on four wheels inside the flanges of the bridge beam and shall support the mast assembly.
- b. The wheels shall be a minimum 5" diameter flange-less wheel with permanently lubricated ball bearings.
- c. The trolley must be capable of supporting 2,000 pounds live load and shall be constructed of integral flanged steel plate to prevent binding of the turntables.
- d. In addition to the load bearing wheels, four stabilizing bearings shall be used to keep the trolley aligned within the bridge.
- e. Multiple trolleys shall be provided to serve all aisles.

5 Rails

- a. The rails shall be constructed of a minimum 20 pound per yard ASCE steel.
- b. The rails shall be mounted with sufficient accuracy to provide a smooth riding runway and must be capable of supporting the weight of the bridge, trolley, mast assemblies, and a 2,000 pound load.
- c. Rails shall terminate with stops capable of restraining a fully loaded bridge/mast assembly.

6 Mast Assembly

- a. The mast shall be constructed of two 6" minimum steel channels connected by ladder type truss members and shall be mounted to the trolley with a 360 degree continuous rotation turntable.
- b. The turntable shall be a ball bearing type and capable of free rotation when carrying a 2,000 pound load.
- c. The rollers supporting the fork mounting plate assembly must operate inside the channels on high strength machined rails.

- d. There shall be sufficient rollers to keep the fork assembly square and stable as it is raised and lowered by the chain hoist.
 - e. The mast shall be provided with a positive stop lock mechanism to prevent free-fall of the fork assembly in case of hoist chain breakage. The mechanism must restrain the free falling load in 3/4" travel or less.
 - f. Mast operating handles shall be mounted outboard of the mast for ease of rotation and shall be shrouded to prevent operator injury.
 - g. A minimum of 1/4" thick Plexiglass viewing window that is a minimum of 17" square shall be located in the mast at eye level.
 - h. A protective canopy and a trolley stop shall be provided over the operator for operator safety
7. Forks
- a. The forks shall be mounted, adjustable for pitch and width, and have a 2,000 pound capacity measured 21" from the root.
 - b. The forks shall be minimum 4" wide by 1 1/4" thick by a minimum of 1" less than the depth of the pallet.
8. Pallets
- a. Steel pallets shall be capable of holding 2,000 pound uniformly distributed load
 - b. The pallets shall mate with the racks and be adjustable using the forks of the mast assembly described above.
 - c. The pallets shall be a minimum of No. 16 gauge steel and shall be reinforced with three to five "v" supports running left to right or perpendicular to the forks
 - d. The pallets shall have two-way (front to back) entry with enclosed fork guides on the front and shall have hooks at the front to provide self-centering engagement on the front columns
 - e. Provide 5 pallets per individual storage section. Design Builder to verify total number of pallets prior to shipping. Pallets shall each have a back lip 1 1/2" high and a magnetic label holder.
9. Tub Kits
- a. A tub kit shall consist of four sidewalls which can be attached to a pallet to form a tub.
 - b. Each tub shall be designed such that it can be divided into four equal size compartments using one partition (running back to front) and two dividers (running left to right).
 - c. Sidewalls, partitions, and dividers shall be a minimum No. 14 gauge steel

- d. Provide six tub kits, each with a wall height of 8 3/4".

10. Electrical Operation

- a. Each mast and trolley/bridge system shall be provided with an electrically operated hoist capable of raising and lowering a 2,000 pound load at a speed of 16 feet per minute.
- b. The hoist shall have a 1 HP motor and shall be dual voltage with electrical characteristics: 208 volt, 3 phase, 60 hertz, or 460 volt, 3 phase, 60 hertz. The hoist shall be wired for 208 volt, 3 phase, 60 hertz for this project. All 115V power requirements for controls and lights shall be provided through a step-down transformer.
- c. The hoist shall be provided with a mechanical load brake (positive-stop type) connected to the load sheave, a solenoid-operated spring set multiple disc-type motor brake, and an overload limiting clutch (wet cone type) located in the hoist transmission.
- d. An insulated four bar power system and sliding power collector with replaceable shoes shall be provided to supply the electrical power to the trolley/bridge as specified above. Three of the bars shall supply power and the fourth bar shall be ground.
- e. Up/down controls operating with 115V control circuit shall be by push-button and located on the mast assembly convenient to a standing operator.
- f. The system shall have a key-lock power on/off switch. The key shall not be removable in the ON position. All key-lock power switches shall be keyed alike.
- g. Two 150 watt minimum reflector type flood lights shall be mounted on the trolley/bridge to provide in-use illumination. The lights shall operate on 115 VAC.
- h. The light control shall be integral with the on/off switch such that the lights are on when the system is on.
- i. Electrical components of the system shall conform to the applicable standards of UL and NEMA. All items of the same type and rating shall be identical.
- j. All electrical wiring shall conform to the standards of the National Electric Code and applicable UL standards.
- k. Protective insulated bushings shall be provided at all places where wiring passes through openings in metal panels and frames.
- l. All electrical connections shall be suitably supported to prevent breakage and other damage.
- m. Wiring shall be coded so that each wire can be easily identified from maintenance manuals, wiring schematics, and other documentation.

11. Safety Mesh

- a. Safety Mesh shall be provided to cover the rear of the individual storage bays and the open ends.

12. Finish

- a. Color shall be manufacturer's standard blue for the storage support structure; green for the pallets and safety yellow for the mast.
- b. All painted surfaces shall be cleaned and iron phosphated and shall be coated with enamel and backed in accordance with supplier's directions.
- c. The finish shall level out to produce a smooth, uniform surface without runs, wrinkles, grit areas of thin film, and separation of color.

13. Manufacturer

- a. Specifications are based on equipment identified herein by Manufacturer's name and model, and shall serve as the basis for determining acceptable standards of quality, performance, workmanship, construction and minimum features. Storage and retrieval System as manufactured by:

Stanley Vidmar
11 Grammess Road
Allentown, Pennsylvania 18103
Telephone: (215) 797-6600;
or approved equal.

2.02 DRAWER TYPE STORAGE CABINETS

- A. Drawer type storage cabinets as specified herein shall be furnished and installed as indicated on the Contract Drawings.

1. Dimensions and Capacities:

- a. Overall Dimensions:
 - (1) 27 3/4 inches deep
 - (2) 30 inches wide
 - (3) 59 inches high
- b. Capacity: 400 lbs per drawer

2. Performance Criteria

- a. Drawers, loaded to their maximum rated capacity, shall perform minimum average of 3,000 cycles each without failure
- b. Drawers, loaded to one-half their maximum rated capacity, shall perform minimum average of 12,000 cycles each without failure.
- c. Test Parameters: Manufacturer shall provide documented evidence from an independent laboratory, that the drawer suspension system has been tested

under full rated load conditions and has experienced an average of 3,000 cycles without failure. A cycle shall be defined as full extension and return with a maximum required pull force of 50 pounds.

- d. All drawers shall extend 100% out of the housing exposing all contents to reach and visibility.
- e. **Useable Drawer Space:** Drawers shall be square measuring 25.5" x 25.5" with a minimum base drawer area of 650 sq. in. Drawers shall have a minimum 631 square inches of usable drawer space. Total useable drawer space of 631 square inches times the total number of drawers specified per each unit, times the quantity of units, establishes the total square inches of drawer space for this Project.

3. Features and Construction

- a. Draw cabinet shall be of unitary design and unwelded construction. Provide welded on pallet base with detachable kick-plates.
- b. All drawer runners and carriage brackets shall be manufactured from high strength steel to provide a hardened surface for bearing wear. All drawers shall have a capacity rating of 400 pounds and a fail-safe carriage and drawer stop system which is strong enough to repeatedly contain working drawers without damage. All drawers shall have full suspension carriage systems.
- c. Each drawer front shall have a drawer pull and label system at least 22" long, and so designed to accept a label at least 1-1/8" high. Label and its clear plastic shield shall be retained in a positive manner, with plastic end caps that shield the drawer pull end from sharp edges and contribute to an enclosed system.
- d. Each drawer cabinet shall have matching shelf cabinet securely mounted on top. The shelf cabinet shall be from the same manufacturer as the drawer unit. The shelf cabinet shall be 33 inches high and have matching width and depth dimensions with the drawer unit. Each shelf cabinet shall be equipped with two (2) shelves each with a capacity of 800 lbs
- e. Each drawer cabinet shall be lockable with a single built-in lock cylinder. One key for each cabinet shall be supplied
- f. All free standing cabinets shall be bolted together following manufacturer's recommendations and using manufacturer's hardware
- g. All cabinets shall be fully assembled with all partitions screwed in place and dividers installed.
- h. The finish shall be of durable enamel in the Manufacturer's standard color.

4. Model Numbers:

- a. Eight (8) drawer cabinets, Stanley Vidmar Model #SEP 3163-AL with 104 compartments, or equal.
- b. Ten (10) drawer cabinets, Stanley Vidmar Model #SEP 3110-AL with 164 compartments, or equal.

- c. Six (6) drawer cabinets, Stanley Vidmar Model #SEP 3203-AL with 64 compartments, or equal.

2.03 CABINETS, DRAWER, DOUBLE WIDTH

- A. Double wide, drawer type storage cabinets as specified herein shall be furnished and installed as indicated on the Contract Drawings
 - 1. Dimensions and Capacities:
 - a. Dimensions:
 - (1) 60 inches wide
 - (2) 27-3/4 inches deep
 - (3) 59 inches high
 - b. Capacities: 400 lbs per drawer
 - 2. Performance Criteria:
 - a. Drawers, loaded to their maximum rated capacity, shall perform minimum average of 3,000 cycles each without failure
 - b. Drawers, loaded to one-half their maximum rated capacity, shall perform minimum average of 12,000 cycles each without failure.
 - c. Test Parameters: Manufacturer shall provide documented evidence from an independent laboratory, that the drawer suspension system has been tested under full rated load conditions and has experienced an average of 3,000 cycles without failure. A cycle shall be defined as full extension and return with a maximum required pull force of 50 pounds
 - d. All drawers shall extend 100% out of the housing exposing all contents to reach and visibility
 - e. Useable Drawer Space: Drawers shall be square measuring 55.75" x 25.5" with a minimum base drawer area of 1422 sq in. Drawers shall have a minimum 1391 square inches of usable drawer space. Total useable drawer space of 1391 square inches times the total number of drawers specified per each unit, times the quantity of units, establishes the total square inches of drawer space for this Project.
 - 3. Features and Construction:
 - a. Draw cabinet shall be of unitary design and unwelded construction. Provide welded on pallet base with detachable kick-plates
 - b. All drawer runners and carriage brackets shall be manufactured from high strength steel to provide a hardened surface for bearing wear. All drawers shall have a capacity rating of 400 pounds and a fail-safe carriage and drawer stop system which is strong enough to repeatedly contain working drawers without damage. All drawers shall have full suspension carriage systems
 - c. Each drawer front shall have a drawer pull and label system at least 22" long, and so designed to accept a label at least 1-1/8" high. Label and its clear

plastic shield shall be retained in a positive manner, with plastic end caps that shield the drawer pull end from sharp edges and contribute to an enclosed system. Provide label and covers.

- d. Each drawer cabinet shall have matching shelf cabinet securely mounted on top. The shelf cabinet shall be from the same manufacturer as the drawer unit. The shelf cabinet shall be 33 inches high and have matching width and depth dimensions with the drawer unit. Each shelf cabinet shall be equipped with two (2) shelves each with a capacity of 800 lbs.
 - e. Each drawer cabinet shall be lockable with a single built-in lock cylinder. One key for each cabinet shall be supplied.
 - f. All free standing cabinets shall be bolted together following manufacturer's recommendations and using manufacturer's hardware
 - g. All cabinets shall be fully assembled with all partitions screwed in place and dividers installed.
 - h. The finish shall be of durable enamel in the Manufacturer's standard color.
4. Model Numbers:
- a. Seven (7) drawer cabinets, Stanley Vidmar Model Number RP 3457, with 68 compartments, or equal.

2.04 CABINET, TOOL LOCK-UP

- A. Tool Lock-Up/Storage cabinets, as specified here shall be furnished and installed as indicated on the Contract Drawings.
- 1. Dimensions and Capacities:
 - a. Dimensions:
 - (1) 27 3/4 inches deep
 - (2) 30 inches wide
 - (3) 59 inches high
 - b. Capacities: 800 lbs per shelf
 - 2. Features and Construction:
 - a. Tool cabinet shall be a Stanley Vidmar Model SD-340, with three (3) shelves, model CS-80L, or equal.
 - b. Each cabinet shall have a lockable door.
 - c. Each drawer cabinet shall have matching shelf cabinet securely mounted on top. The shelf cabinet shall be from the same manufacturer as the drawer unit. The shelf cabinet shall be 33 inches high and have matching width and depth dimensions with the drawer unit. Each shelf cabinet shall be equipped with two (2) shelves each with a capacity of 800 lbs.

- d. The finish shall be of durable enamel in the Manufacturer's standard color.

2.05 GAS CYLINDER CAGE

- A. Portable gas cylinder cage as specified herein shall be furnished and installed as indicated on the Contract Drawings.

- 1. Dimensions and Capacity:

- a. Dimensions:

- (1) 56 inches wide
- (2) 42 inches deep
- (3) 68-1/2 inches high

- b. Capacity: Sixteen (16), 9-inch diameter tanks

- 2. Features and Construction:

- a. All welded heavy angle frame construction with flattened expanded mesh on all four sides, and top.
- b. Two hinged doors, lockable.
- c. The finish shall be of durable enamel in the Manufacturer's standard color
- d. "NO SMOKING" sign riveted to door.
- e. Gas cylinder cage shall be a Hodge Manufacturing Co. Model EVC-4256, or equal

2.06 GENERAL SHELVING UNITS-36" WIDE

- A. Closed offset shelving unit shall be furnished, assembled and installed as indicated on the Contract Drawings

- 1. Dimensions and Capacities

- a. Dimensions:

- (1) 36 inches wide
- (2) 18 inches deep
- (3) 84 inches high
- (4) The installed shelf height from finish floor shall be

- (a) Top shelf; 84 inches
- (b) Second shelf; 75 inches
- (c) Third shelf; 66 inches
- (d) Fourth shelf; 52.5 inches
- (e) Fifth shelf; 36 inches
- (f) Sixth shelf; 19.5 inches
- (g) Bottom shelf; 1.5 inches

- b. Capacity:

- (1) Shelf: Minimum 1300 lbs per shelf for an evenly distributed load.
- (2) Upright: Minimum 10,000 lbs per upright.

2. Features and Construction:

- a. The shelf shall be of a Class 2 rating and constructed of 18 gauge steel with continuous roll formed channel along the shelf perimeters. Front and back edges shall be triple flanged, sides shall be double flanged. Front and rear shelf edge reinforcing angles shall be installed for all shelves.
- b. The uprights shall consist of T-Post rear and front upright, constructed of minimum 16 gauge steel with bracket slots punched on 1-1/2 inch centers for vertical shelf adjustment. The shelves shall be secured by slip-in shelf brackets to reinforce and securely lock shelves into place on all four corners.
- c. The shelving units shall be equipped with a back panel and side panels. Where shelving unit are placed back to back or side to side, one back panel for the two units will be acceptable.
- d. Label holders shall be provided for the length of each shelf.
- e. These units shall be designed for assembly and adjustment without tools.
- f. All units shall be anchored to the floor.
- g. The finish shall be of durable enamel in the Manufacturer's standard color.
- h. Shelving unit as manufactured by Lyon Metal Products, Aurora Illinois, or Lista International, Holliston, Massachusetts, or equal.

2.07 PALLET RACK (4'x 9')

A Pallet racks with wire metal decks shall be furnished and installed as indicated on the Contract Drawings.

1 Dimensions and Capacities

a Dimensions

- (1) Beams: 108 inches long x 6 inches high, minimum
- (2) Upright: 48 inches deep x 144 inches high
- (3) Upright Post: 3 inches x 3 inches, minimum
- (4) Installed height, top of beam to finished floor:

- (a) 48 inches
- (b) 96 inches
- (c) 144 inches

b Capacity

- (1) Beams: 10,000 lbs per pair, with max. deflection of 0.60" for an evenly distributed load
- (2) Uprights: 32,000 lbs per upright, with 60" max. vertical spacing of beams. Minimum 3 inch x 3 inch post constructed of 13 gauge steel
- (3) Decking: Minimum 4,000 lbs. capacity per section

2. Features and Construction:

- a. The upright frame shall be continuous steel uprights with heavy duty cross and diagonal members, fabricated from minimum 13 gauge steel. They shall be punched to accept horizontal beams, adjustable at 4 inch increments on center.
- b. The base plate shall be of heavy gauge steel arc welded to uprights with holes for anchoring to the floor.
- c. The beam construction shall be of a minimum 6" high, welded step-type minimum 14 gauge steel box channel. Step shall measure 1-5/8"H x 3/4"D. There shall be three pair per section.
- d. Decking shall be heavy wire mesh type. Decking shall measure 48"D x 52"W and shall be constructed of minimum #4 gauge wire on a 2" x 4" pattern, with reinforcing channels as required to support specified capacity. The reinforcing channels shall be designed to fit the step beam specified above. Decking shall be finished with an aluminum paint.
- e. The pallet racks shall be anchored to the floor using a minimum of two 1/2" x 3" expansion bolts per anchor plate.
- f. Post protectors shall be provided for the aisle side of the upright frame.
- g. The finish shall be of durable enamel in the Manufacturer's standard color.
- h. Pallet rack as manufactured by Material Storage Products, Valdosta, Georgia, or Republic Storage Systems Company, Canton, Ohio, or Lyon Metal Products, Aurora, Illinois, or equal

2.08 STORAGE CABINET

A. Storage Cabinets shall be furnished and installed as indicated on the Contract Drawings.

1. Dimensions and Capacities

a. Dimensions

- (1) Width: 36 inches
- (2) Depth: 20 inches
- (3) Height: 42 inches

b. Capacity: Minimum, 1400 pounds per shelf.

2. Features and Construction:

- a. Full welded construction
- b. Shelves adjustable in two inch increments
- c. Shelves: - 14 gauge steel
- d. Sides and Bottom Shelf 12 gauge, one piece wrap-around construction

- e Doors - 12 gauge; 8 gauge welded hinges; 200 degree swing
- f Handle: 3 point locking device.
- g. Storage cabinets, Strong Hold Products Model Number 33 5-202, or equal.

2.09 SAFETY STORAGE CABINET

- A. Safety storage cabinets shall be furnished and installed as specified herein and indicated on the Contract Drawings.
 - 1. Dimensions and Capacities:
 - a. Dimensions:
 - (1) 43 inches wide
 - (2) 18 inches deep
 - (3) 65 inches high
 - b. Capacity: 45 gallons per cabinet
 - 2. Features and Construction:
 - a. Flammable storage cabinets shall meet NFPA code #30 and OSHA requirements.
 - b. Cabinets shall have two middle shelves adjustable on 1 5/8 inch centers.
 - c. Each cabinet shall be equipped with self-closing doors
 - d. The finish shall be of durable enamel in safety yellow
 - e. Each cabinet shall be marked "FLAMMABLE MATERIALS" with minimum 3" red letters.
 - f. Safety storage cabinet as manufactured by Equipto, Aurora, Illinois, Model Number 1792SC or equal

PART 3 - EXECUTION

3.01 INSTALLATION:

- A. Install equipment specified herein in strict accordance with the approved shop drawings and manufacturer's installation instructions
- B. Install material storage units at locations indicated on the approved Design and Shop Drawing following installation procedures recommended by the manufacturer. Provide mounting hardware as required.

3.02 FIELD QUALITY CONTROL:

- A. Provide the services of a qualified manufacturer's representative to perform the following:
 - 1. Supervise installation

2. Supervise testing, in the presence of the Engineer to ensure proper operation of the equipment.
3. Provide instruction to the Authority's personnel in the proper operation and maintenance of the equipment.

AMENDMENT NO. 6
TO

METRO MATTERS - Design/Build: Rail Yards Expansion Project
at Brentwood, Greenbelt, and Shady Grove Yards

Phase II - Request for Final Technical / Price Proposals for all Projects

CONTRACT NO. FN5008

TO WHOM IT MAY CONCERN:

The proposal documents accompanying solicitation RFP-FN5008/FMP are hereby changed in part as follows:

1. Final Proposal Revisions are due no later than May 16, 2005 at 2:00 pm.
2. Attached please find a separate Listing showing the additional information provided with this Amendment. Included under Item IX are revised drawings to reflect relocation of the wheel truing machine from Track 11 to Track 9A at Brentwood.
3. The Proposer's attention is directed to significant changes in the Price Schedules associated with new Unit Prices (Lump Sums are to be inserted in the Price Schedule and Unit Prices will be determined by dividing the Lump Sum total by the total estimated quantities shown) for Environmental Mitigation and revised Fixed Prices for each facility. The following attached documents are to be submitted as part of your Final Proposal Revision:

Greenbelt/Shady Grove/Brentwood Projects

Pg. 00400-5 to 00400-6 Final Technical/Price Proposal Form
Pg. 00400-11 Compliance/Exception Information
Pg. 00400-15 to 00400-20a Price Schedule

Alexandria Project Option

Pg. 00400-5 to 00400-6 Final Technical/Price Proposal Form
Pg. 00400-9 Compliance/Exception Information
Pg. 00400-11 to 00400-13 Price Schedule

ACKNOWLEDGMENT

Offerors are required to acknowledge receipt of this amendment in writing on the Proposal Form in the space provided or by separate letter or telegram prior to the date established for receipt of Final Proposal Revisions

William O. Linde, Jr.
Contracting Officer

I. Interim Completion Dates and Liquidated Damages

- A. Interim Completion Dates added for Greenbelt construction. Division 0 Article 00825.A.1.a is hereby changed as follows:

Greenbelt Annex complete and operational -	NTP + 420 cd's
Greenbelt S&I Shop and Yard complete and operational -	NTP + 660 cd's

- B. Liquidated Damages for Greenbelt. Division 0 Article 00888 A.1.a is changed as follows:

Greenbelt Annex complete and operational -	\$2,940 per calendar day
Greenbelt S&I Shop and Yard complete and operational -	\$2,940 per calendar day

II. Revisions to Answers provided in previous amendments. Delete those answers and substitute the revised answer provided below:

- A. **Question 100 in Amendment No. 4:** Answer stated that two of the existing truck lifts in the Greenbelt Shop must always be operating and that temporary lifts would not be permitted. This requirement would result in phasing of work Areas 5 and 6

Revised Answer: Design-Builder is permitted access to areas 5 & 6 at the same time in order to minimize construction duration, with following constraints:

1. In north-south direction Design-Builder shall limit work to area just south of column line 8 where new truck tracks interface with existing truck tracks to the CMU wall just south of column line 19.
2. In the east west direction Design-Builder shall limit work to area just east of column line F to just east of the eastern most truck hoists. The truck hoist track and turntables closest to column line D must remain in operation to move truck assemblies to and from Tracks 6 and 7.
3. Existing 15 ton Overhead crane between column lines D and F must remain in operation to transport truck assemblies.
4. Since all four existing truck hoists will be out of service, Design-Builder shall furnish and install temporary mechanical lifts in area 4 while areas 5 & 6 are out of service. Temporary lifts must be compatible with track gauge (4' - 8 1/2") and load rating (12 tons) specified in Specification Section 14520, Truck Repair Hoist...., and provide the same inspection/maintenance capabilities as permanent lifts. Temporary lifts and their location shall be subject to approval

of WMATA. Four (4) temporary lifts are to be provided. Two of the temporary lifts shall be located in an area remote from Greenbelt Yard at the Branch Avenue Yard Shop. Costs for transportation and installation of all four temporary lifts shall be included in proposal. Training and manuals to be provided by the Design-Builder. Lifts to become property of WMATA upon installation and operation of permanent lifts.

- B. **Question 56 in Amendment 4** requested clarification on Program Criteria requiring that the Greenbelt Annex be 60 feet clear of adjacent Paint Shop and fact that loading dock intruded into this clear space. Answer stated that WMATA was coordinating with Prince George's County Fire Department to obtain a variance to the 60-foot requirement. Variance was not obtained, and therefore answer is revised as follows:

Revised Answer: To provide 60-foot clearance from Paint Shop, the footprint of Annex building shall remain as located, but loading dock will be flipped from east side of Annex next to Paint Shop to west side of Annex. This will cause first and second floor rooms to be flipped so storage room is on same side of building as loading dock, and the second floor passageway will now break into the corner of the lunch room of the existing Shop, reducing area of lunch room by about 220 SF out of about 1820 SF. New interior wall to be constructed in lunch room shall be glass. See following revised Drawings issued in Amendment 6:

<u>Drawing No.</u>	<u>File No.</u>	<u>Revision</u>
E11-A-09	M1210-061	Revised Floor Plan
E11-A-10	M1210-062	Revised Floor Plan
E11-A-16	M1210-068	Revised Floor Plan
E11-A-17	M1210-069	Revised Floor Plan
E11-A-18	M1210-070	Revised Floor Plan
E11-A-19	M1210-071	Revised Floor Plan

- C. **Question 39 in Amendment 4** requested clarification on inconsistencies in track design at Shady Grove between Track Plans and Architectural Drawings. Answer stated that the track alignment drawings would be revised to match the Architectural plans. Following Drawings have been revised and are being issued in Amendment No. 6:

<u>Drawing No.</u>	<u>File No.</u>	<u>Revision</u>
A16-TA-01	M1210-339	Revised track alignment in its entirety.
A16-TA-02	M1210-340	Revised track alignment in its entirety.

III. Additional Revisions to Criteria, Specifications and Drawings:

A **Deletion of Maintenance of Way Track Relocation at Greenbelt:** Refer to various Greenbelt drawings showing relocation fo Maintenance of Way FY-1 and FY-2 and replacement with a new 80-car parking lot, and Summary of Work Specification Section 01110, Sections 1.04 A.4.b. (3), (4) and (5)

- 1 Delete relocation of Maintenance of Way tracks and delete the construction of the new 80-space parking lot, with the following conditions:
 - a. Construction of new 26-space parking lot in Area M to remain.
 - b. Design-Builder to provide manpower and vehicles to transport materials stored in existing parking areas in the southwest and southeast corners of Greenbelt Yard to property owned by WMATA located in Prince George's County at the northeast corner of Britannia Way and Auth Place near Branch Avenue Station. Materials to be shrink-wrapped and placed on pallets for transportation and storage.
 - c. Design Builder to clear area of approximately 15,000 SF and provide a six-inch

compacted stone base, no grading to be done. Design-Builder to remove existing fence and scrap it, and then install approximately 250 LF of new six-foot high steel chain link fence with a 12-foot wide gate and barbed wire as specified in Specification Section 02820, Fencing, except fence posts may be driven into ground; concrete footings not required. Preparation of site and fencing to be approved by WMATA.

- d. Above work a. through c. to be performed prior to taking access of existing parking lot to be displaced by Annex building.

B Turntables: Refer to Specification Section 11300, Motorized Turntables.

1. WMATA will permit the use of non-motorized turntables in lieu of the motorized turntables currently specified. A revised specification will not be issued at this time. Non-motorized turntables shall meet the requirements of Section 11300, except for electric motor requirements. Final requirements for non-motorized turntables will be subject to the approval of WMATA. Additional requirements for non-motorized turntables include, but are not necessarily limited to, the following :

- a. The Turntable and support frame shall be all welded steel construction and shall be held in the center by an anti-friction bearing. The structural design of the Turntable shall meet criteria established in AISC (ASD 9th edition) while loaded with the specified static load and a 20% dynamic load factor, except for the suddenly applied load effect when wheel loads are transferred from the building floor rails to the Turntable rails. A 67% dynamic load factor shall be applied to the specified static load to account for the suddenly applied load effect. The center bearing shall be capable of supporting the loads including dynamic load factors while performing its primary function

- b. Operation

- (1) The Turntable shall be designed to be manually rotated by an average man when loaded with the specific weight.
- (2) The Turntable shall be capable of a rotation of 360° degrees in either direction.
- (3) Manual locking shall be provided at 90° degree positions and set to align the Turntable rails with the shop rails.
- (4) Locking devices, pit covers and other devices which protrude above floor level when the Turntables are being rotated shall be recessed below the floor deck.

C Removal of spoils from excavation at Shady Grove Yard. Reference Summary of Work Specification Section 01110.

1. Revise Article 1.04.A.4.c.(5) under Shady Grove Site Specific Features to add: "All spoils from excavation shall be removed from site and not stock-piled on site."

D. Maintenance of Way Tracks at Shady Grove

1. Revise Article 1.04.A.4.c.(7) under Shady Grove Site Specific Features to add: "Minimum two MOW tracks are required during construction totaling 900+ feet of storage track."

E. Electrical Program Criteria:

1. Revise Article 1.05.B.2.b for Brentwood Yard to add following: "Existing distribution can be reconfigured to free up two breakers to be used to feed new panelboard(s) for the new loads. Cabling to be modified, if required." Restriction on not tapping bus remains.
2. Article 1.05.B.3.c. for Shady Grove states: "Do not connect or reconnect to panelboards no longer available from their manufacturer, but replace with new equipment." Revise to say: "Where an existing panelboard is operational and not to be relocated, maintain it in use. Where an existing panelboard has to be physically relocated, replace it with a new panelboard."

F. Brentwood and Alexandria Fire and Intrusion Alarm System: Reference Summary of Work Specification Section 01110.

1. Revise Article 1.04.A.4.a.(7) for Brentwood to add: "Entire fire alarm system (existing and new) shall be addressable; each alarm shall be identified on the new panel."
2. Above requirement for Brentwood shall also apply to the Alexandria S&I Shop expansion.

G. Mechanical Program Criteria: FM200 fire suppression for electrical rooms

1. Mechanical Program Criteria, Article 1.10.I states: "Where fire suppression systems in electrical rooms are required by the local jurisdiction, Clean Agent (CF3CHFCF3) shall be provided in accordance with NFPA 2001 Standards and as follows:.....". Add the following: "Fire extinguishers in lieu of a clean agent system may be provided for electrical rooms if the following conditions are met:
 - a. Contents of room is 85% non-combustible.
 - b. Room is 3-hour rated.
 - c. Two-hour fire-rated door is provided."

H. Embedment material for shop tracks

1. Yards and Shops Program Criteria, page 3, Article 1.03M3.b. requires use of embedment material to fill the void between the rail and the edges of pocket that rail sits in. Reference Brentwood Drawing B5-TW-02 (M1210-187) and Shady Grove Drawing A16-TW-02 (M1210-350). Embedment material shall be engineered rubber railseal as manufactured by Performance Polymers, Inc. or equal, meeting all requirement of criteria article referenced above. Top of seal shall be flush with top of rail and top of floor, except for required flangeway. Installation shall be per manufacturers recommendations. Final railseal configuration and properties will be subject to WMATA approval.

IV. Proposers' Question received too late to address in Amendment 5

Question: In reviewing "Appendix A Project Manual Book 2" for Amendment 4, the Program Criteria for "Signal Control and interlocking System" page 2 section 1.04 Scope of Work, indicates the realignment of tracks on the East side of the S&I building. Specific sections are as Follows:

- 1.04.B.2a
- 1.04.B.3a
- 1.04.B.6b

The RFP drawings do not show any track realignment on the East side of the shop. During our site visit, we asked if there was to be any trackwork on the east of the S&I building. WMATA's response was that no realignment work was required.

Please confirm that no track realignment is required on the east side of the S&I building? (DB Ref17a)

Answer: Confirmed. See answer to Question 44 and revised Program Criteria pages issued in Amendment No. 5.

V. Major Subcontractors:

- A. Procurement Requirement 00204.D.3.D delete the following , "Identify all major subcontractors who will be performing twenty (20) percent or more of the work based on the target price for the project.." and insert the following "..... Identify the subcontractors to perform the following major areas of work, ATC, Communications, AC and DC Electrical, Traction Power, Mechanical and Trackwork"

VI. Section 01111 - Key Design-Builder Functions:

- A. Section 1.03.C - Design Professional: Add the following item 7: "The ATC and Communications systems shall be designed and sealed by a competent designer who shall

also be responsible for inspecting and approving the installation. The designer of record who seals these drawings shall supervise the testing and approval of all sub-systems and the overall system. The designer of record shall certify to WMATA that the systems function as designed and are safe for operation and use.

VII. Section 00204 - Proposal Format, Procedures and Evaluation Factors, and Instructions.

- A. Section 00204.D.2 - Work Approach / Schedule Compliance, item F, add the following: "A CPM Schedule shall be provided with the Final Proposal Revision (FPR). This schedule shall cover the first 120 days of the project in detail and will be used by the project in lieu of the traditional 90 day schedule required under section 01322".

VIII. Specification Section 01142, Coordination with Occupants and Operations, Under Article 1.06, Specific Conditions:

- A. Add Paragraph I to say: "Work may commence on the Brentwood Shop Ground Floor after the new Greenbelt Annex is operational and may run concurrently with modifications to the Greenbelt S&I Shop on condition that the Brentwood truck and wheel shop in Area 2 between column lines F and H and column lines 10 and 16 remains in service. This includes the wheel press, wheel boring machine, the four truck hoists and all associated equipment and furniture. Proposed work in this area to install new turntables and truck rail shall not begin until the expanded truck and wheel maintenance operation in the Greenbelt S & I Shop is operating. Should separate awards be made, contractor will need to coordinate work at Brentwood with contractor at Greenbelt."

00413 FINAL TECHNICAL/PRICE PROPOSAL FORM

DATE OF REQUEST: PHASE 2 - May 5, 2005

PROJECT: FN5008 METRO MATTERS: RAIL YARDS EXPANSION PROJECT
AT BRENTWOOD, GREENBELT, AND SHADY GROVE YARDS

REQUEST FOR PRICE PROPOSAL containing information requested herein shall be submitted by the Proposer so as to be received before: **2:00 p.m. on May 16, 2005** at the Washington Metropolitan Area Transit Authority, Office of Procurement, PRMT FILE Room 3C-02, 600 Fifth Street, N.W., Washington, D.C. 20001. Questions may be directed to the Contract Administrator, Fred M. Pohlmann at (202) 962-1529, FAX to (202) 962-6247.

In response to your Request For Price Proposal for the above referenced Contract, the undersigned hereby proposes to furnish all labor, equipment and materials and perform all work to design and construct the Project in strict accordance with the Contract requirements for the consideration of the amount proposed on the Price Schedule. If awarded the Contract within the Proposal Acceptance Period, the undersigned agrees to execute the Design-Build Contract within 10 calendar days and to furnish, if required, performance and payment bonds on standard Authority forms with good and sufficient surety or sureties.

If the Contract is executed, the undersigned further agrees to commence the work within 10 calendar days after the receipt of Notice to Proceed and to complete the work within the time specified in the Contract.

The undersigned acknowledges receipt of the following amendments to the **Request for Price Proposal under FN5008/FMP** (give number and date of each):

Amendment Number _____, dated _____
Amendment Number _____, dated _____
Amendment Number _____, dated _____
Amendment Number _____, dated _____

Note: Failure to acknowledge receipt of all amendments may cause the Price Proposal to be considered not responsive to the request, which would require rejection of the Price Proposal as unacceptable.

Representative Authorized To Act on Proposer's Behalf	Alternate Authorized Representative

DIRECTIONS FOR SUBMITTING OFFER:

1. Read and comply with the Solicitation Instructions. This form is to be submitted with your Price Proposal. The Price Proposal and Price Proposal Attachments shall be submitted separately from the Technical Proposal, and the Technical Proposal shall not contain any information relating to costs.
2. The Price Proposal Form and related required documents must be sealed, marked, and addressed as follows:

WASHINGTON METROPOLITAN AREA
TRANSIT AUTHORITY
PRMT FILE ROOM 3C-02
600 FIFTH STREET, N.W.
WASHINGTON, D.C. 20001

PRICE OFFER UNDER FN5008/FMP

**PRICE PROPOSALS SHALL BE TIMELY MAILED OR HAND DELIVERED TO REACH WMATA
BEFORE 2:00 p.m. (LOCAL TIME) ON DAY OF PROPOSAL CLOSING.**

00432 COMPLIANCE / EXCEPTION INFORMATION - Submit with Technical Proposal

Indicate whether the proposal submitted is intended to fully comply with the Requirements of this Request for Proposals, or if certain exceptions are taken. If exceptions are taken, the proposer shall clearly identify any exception to the requirements, terms, or conditions of any part of this RFP. Each exception must be specifically related to the particular part of the RFP to which the exception is taken. The proposer must support and explain the reason for any exceptions taken and explain the impact, if any, on the RFP requirements and state the necessity for or advantage of the exception.

Check one statement below. If exceptions are taken, explain the exceptions per the following instructions.

- The proposer certifies that its proposal is intended to comply fully with all Requirements.
- The proposer certifies that its proposal is intended to comply fully with all Requirements, except as noted (add additional sheets to explain).

TOTAL Schedules D + E \$ 42,071,000

TOTAL PROPOSAL PRICE (SCHEDULES A + B + C + D + E) \$140,392,000

NOTES TO PROPOSERS:

1. The Contract(s) will be awarded to responsible contractor(s) on the basis of the proposal that provides the overall best value to the Authority in terms of design solutions, innovativeness, and technical factors based on an integrated assessment within the stated target price as shown in the Price Schedule for each Project. Multiple contracts will be awarded, however, it is required that proposals be submitted for both Projects and all items, therefore failure to submit an offer on all items may result in rejection of the proposal.
2. Unless otherwise specified, each LUMP SUM priced line item includes all labor, material, equipment, and other incidentals, ready for its intended use including, but not limited to, furnishing, installation and testing. The successful Offeror will be required to provide a detailed breakdown to the Authority Representative of all LUMP SUM items for payment purposes.
3. Schedules C and E of the Price Schedule is for items where a specific allowance is set aside by the Authority for payment. This is an estimated amount subject to negotiation and is not guaranteed. Schedule C, Item 3 is for Minor Greenbelt Shop Equipment only, all Major Shop Equipment for Greenbelt Yard is to be priced under Schedule A, Item 3 as shown.
4. As part of the determination of responsibility, the pre-award data submitted must indicate compliance with the requirement that 15% of the work is to be performed by the Design/Build contractor.
5. The proposers are advised that this contract contains Davis-Bacon provisions. The

Contractor will be required to submit certified payrolls on a weekly basis. Also, the Authority will monitor compliance by performing Labor Standards Interviews of the labor force. The Authority will hold retainage in a sufficient amount as may be considered necessary for any under payments of wages and/or fringes until they are fully resolved in accordance with the Labor Provisions of the contract.

6. The offerors are advised that the Authority will complete a "Performance Evaluation" at the end of the contract. The Performance Elements will include: Quality of Work, Timely Performance, Effectiveness of Management, Compliance with labor Standards, Compliance with Safety Standards and an Overall Evaluation. The Performance Evaluation may be used in determinations of responsibility for future WMATA contracts.
7. DBE data (See Appendix B) shall be submitted with the Final Proposal Revisions (FPR) if the Total Proposal Price is \$500,000 or more. It is required that in order to be counted towards meeting the DBE goal established for each Project, proposed DBE firms must be pre-certified by WMATA prior to submittal of FPRs. Although non-certified DBE firms can be utilized, they will not be counted towards meeting the goal.

END OF PRICE SCHEDULE

00434 PRICE SCHEDULE - Submit with Price Proposal

A. DESCRIPTION OF WORK:

The Design-Builder shall Design and Build the Facilities satisfactorily completed for its intended use in the manner and at the locations set forth in the Requirements of the Project Manual and the Project Drawings of this solicitation, and in accordance with the Technical and Price Proposals as finally accepted by the Authority. The Design-Builder shall design the facility pursuant to the Authority's Design Criteria, and in full compliance with the Terms and Conditions of the Contract and the Rules and Regulations of the jurisdictional authorities, and shall construct the facility in strict accordance with the Final Design Specifications and Final Design Drawings and in full compliance with the Terms and Conditions of the Contract and the Rules and Regulations of the jurisdictional authorities.

- Pending Change Orders Included in This Modification PCO 003 (C-35B not issued)

The Contract is hereby changed as follows:

I. Compensate the Design-Builder for expenses incurred in procuring the plumbing permit for the new Annex Building. The WSSC System Development Charge (SDC) is an Owner obligation and not covered in the base contract price.

II. As a result of this change, add the following new pay item to the Contract Unit Price Schedule:

Pay Item No.	Description	Quantity	Unit	Amount
M00100	WSSC System Development Charge	1	L. S.	\$49,546.00

FINAL

III. Any adjustment in the Contract value as a result of performing the work described above shall be included for purposes of measuring the Contractor's performance relative to the goal for Disadvantaged Business Enterprise (DBE) Participation as specified in Article 00453 of the Special Provisions of the Contract and Appendix B.

IV. The terms and conditions of this contract modification constitute a full accord and satisfaction for all costs and time of performance related to the actions described or referenced herein.

Change in Contract Time:	None	Change in Contract Amount:	INCREASE \$49,546.00
--------------------------	------	----------------------------	-------------------------

Except as provided herein all terms and conditions of the Contract as heretofore modified remain unchanged.
